VOLUME 4 APPENDIX 4A: CONSTRUCTION AND OPERATIONAL NOISE ASSESSMENT

Construction noise assessment

- 1 Specific construction activities have been considered within each of the construction and post-operational phases, and the noise impacts then assessed at each of the noise sensitive receptors A-D, as shown in **Figure 4.1** of **Chapter 4**. The construction phases have been identified and described as follows:
 - Enabling works;
 - Excavations and earthworks (including bund forming);
 - Construction of parking and circulation routes;
 - Utilities and building construction;
 - Final surfacing of parking and circulation routes; and
 - Removal and reinstatement (post-operation).
- 2 Each of the phases described above will involve a range of activities that will require the use of both fixed and mobile plant. Methods may vary between contractors however it is possible to undertake an assessment of the noise and vibration based on the expected methods of working gained from experience of similar developments.
- 3 For each set of activities, the sound power level of the required plant has then been used to predict the resultant façade sound level at each noise sensitive receptor in accordance with the methodology within BS 5228-1. These predictions at each receptor take into account ground absorption and any screening from natural or formed topography.
- 4 The formation of the bund will be undertaken early in the construction programme, following the enabling works. Predictions of construction sound levels at noise sensitive receptors from the phases that follow the formation of the bund therefore take account of the presence of a 3 metre high earth bund located as indicated in the Description of Development.
- 5 The time taken to complete each phase of the construction will vary in the length, and there may be some overlap between the phases. With the exception of the central buildings, construction activity will move around the site as a whole. Sets of plant and equipment will therefore only likely be located at any one position for a period which may be as short as a few days. In the construction phase calculations, typical working areas have been assessed at points closest to each of the receptors and therefore predicted noise levels are considered to be representative of typical busy working days.
- 6 Traverse lengths for mobile plant, and haul routes for movement of materials by dump trucks have been included in the predicted sound level calculations. Some materials are

required to be imported to site, and therefore the expected peak number of vehicle movements has been adopted for the calculations to represent a robust worst case.

- 7 Finally, during the removal and reinstatement phase, it is assumed that the earth bund would be left in place till the end of the phase. Once removal and reinstatements of hard standing and circulation routes has taken place, the earth bund will be reduced to ground level and the top-soil material distributed across the site during reinstatement to agricultural use.
- 8 **Table 1** shows the assumed activities for each phase.

Table 1: Assumed activities for each phase

| Phase | Activities |
|---------------------------|--|
| Enabling works | <p>Assume plant will operate only during 08:00 - 18:00 hours within overall working hours of 07:00 - 19:00 hours.</p> <p>Clearance of vegetation, erection of fencing, installation of cabins and creation of site entrance.</p> <p>Main works area centred on entrance. Chainsaws and brush cutters only likely to be required for occasional use.</p> <p>Temporary fencing not likely to be embedded in ground but Heras style fencing for compound and site entrance areas, and all working areas.</p> <p>Excavator not moving considerable distances but working within an area centred on site entrance off A12 therefore considered static for assessment.</p> |
| Earthworks and excavation | <p>Assume plant will operate only during 08:00 - 18:00 hours within overall working hours of 07:00 - 19:00 hours.</p> <p>Stage involves the removal of top-soil and sub-soil and formation of bunding.</p> <p>Assume one excavator removing soil in eastern half of site, the other at bund forming area.</p> <p>Assume one dozer with each excavator these activities static.</p> <p>Dumpers hauling material between positions, 32 dump truck movements per day.</p> <p>Central 500m long haul route for material movements across site.</p> |

| Phase | Activities |
|-------------------------------------|---|
| Parking and circulation routes | <p>Assume plant will operate only during 08:00 - 18:00 hours within overall working hours of 07:00 - 19:00 hours.</p> <p>Dump trucks delivering materials internally to where needed (32 movements per day), excavators moving it locally and vibratory roller compacting.</p> <p>Installation of drainage and kerbs so cutting and associated concreting and cutting plant - Central to site.</p> <p>Vibratory roller at work area generally closest to each receptor treat as stationary as traverse lengths so small compared with distance to receptor.</p> <p>Some plant assumed as centralised, with two work areas for kerbs etc simultaneously where excavators and dozers.</p> |
| Utilities and building construction | <p>Assume plant will operate only during 08:00 - 18:00 hours within overall working hours of 07:00 - 19:00 hours.</p> <p>Phase for construction of buildings, shelters, fencing and lighting.</p> <p>Fencing and lighting installation plant is single set, calculations are therefore worst case few days at each receptor till activity moves further away.</p> <p>Building construction assumed traditional and located as per plan.</p> |
| Final surfacing | <p>Assume plant will operate only during 08:00 - 18:00 hours within overall working hours of 07:00 - 19:00 hours.</p> <p>Delivery of asphalt to site for immediate use.</p> <p>One set of equipment operating at only one place at any one time.</p> |
| Removal and reinstatement | <p>Assume plant will operate only during 08:00 - 18:00 hours within overall working hours of 07:00 - 19:00 hours.</p> <p>Single set of equipment going round site breaking surfaced areas.</p> <p>Two sets of equipment plus vibratory roller (as per earth moving in Phase 2) to restore land levels.</p> |

9 The calculation of the predicted noise levels during each construction phase at each of the four noise sensitive receptors is detailed in **Appendix 4B1**. These predictions are summarised in **Table 2**.

Table 2: Summary of predicted construction noise levels at the nearest noise sensitive receptor locations around the site

| Receptor Ref. | Predicted Sound Level $L_{Aeq,day}$ dB | | | | | |
|---------------|--|-------------------------|------------------------------|-----------------------------------|-----------------|---------------------------|
| | Enabling Works | Earthworks & Excavation | Parking & Circulation Routes | Utilities & Building Construction | Final Surfacing | Removal and Reinstatement |
| | | | | | | |

| | | | | | | |
|---|----|----|----|----|----|----|
| A | 45 | 51 | 53 | 47 | 48 | 53 |
| B | 42 | 47 | 49 | 42 | 43 | 49 |
| C | 38 | 45 | 48 | 43 | 45 | 49 |
| D | 36 | 45 | 46 | 41 | 43 | 48 |

Operational noise assessment

- 10 The SoundPLAN noise modelling software package has been used to predict the noise levels from the proposed operational park and ride facility at Wickham Market to the noise sensitive receptors around it.
- 11 SoundPLAN calculates L_{Aeq} levels at defined receptors in accordance with the appropriate British and International standards. The calculation is based on a number of input parameters, including; source noise level data, acoustic barriers, receptor positions, local topography and intervening ground conditions. In this instance, the appropriate Standard for the prediction of noise propagation used was ISO 9613 – “Acoustics – Attenuation of Sound Outdoors – Part 2: General Method of Calculation”.
- 12 The model includes the location and dimensions of the physical elements of the proposed development such as location and dimensions of the buildings and shelters, parking areas, circulation routes etc. as well as the landform including the earth bunds.
- 13 The model has been programmed with the assumptions as set out in **Chapter 4** and the estimated vehicle movements/changeovers that will take place during the shift change-over periods over the course of 24 hours as set out in the main **ES** noise and vibration chapter text.
- 14 Details of the vehicle movements per shift changeover and period of the day that have been input into the predictive noise model, based on data from the transportation assessment. During the day (0700 to 2300 hours) there are predicted to be 569 vehicle movements and during the night (2300 to 0700 hours) there are predicted to be 283 movements.
- 15 Predicted sound levels at noise sensitive receptors for the proposed Wickham Market park and ride facility operational phase are illustrated as follows:
 - $L_{Aeq,16hour\ daytime}$ – **Figure 4.5**;
 - $L_{Aeq,8\ hour\ night-time}$ – **Figure 4.6**; and
 - $L_{Amax\ day\ and\ night}$ – **Figure 4.7**.
- 16 The noise sensitive receptor locations A, B, C and D have been assessed from the predictive model, and the predicted operational noise level results are summarised in **Table 3**.

Table 3: Summary of predicted façade noise levels at noise sensitive receptors for operational phase of the park and ride facility

| Receptor | Predicted level, dB | | |
|----------|------------------------|-----------------------|-------------------|
| | Day | Night | |
| | L _{Aeq, 16 h} | L _{Aeq, 8 h} | L _{Amax} |
| A | 29 | 30 | 38 |
| B | 29 | 29 | 39 |
| C | 23 | 24 | 31 |
| D | 23 | 22 | 31 |

Appendix 4A1 Construction phase calculations (in accordance with BS 5228) to noise sensitive receptors.

Enabling Works

| Receptor | Plant item | L _{WA'} (dB) | Distance (m) | Attenuation (dB) | | | Façade reflection correction | Resultant L _{Aeq,T} (dB) | Correction for on-time (dB) | Predicted L _{Aeq,12hour} (dB) |
