JUNCTION MITIGATION DESIGNS

1. PROJECT BACKGROUND

1.1. SIZEWELL C PROPOSALS

- 1.1.1. EDF Energy is proposing to expand the existing nuclear power station at Sizewell on the Suffolk coast on land immediately to the north of the existing Sizewell B site. The Sizewell C Project (the Project) would be one of the biggest and most technologically complex construction projects ever built in the UK.
- 1.1.2. The construction of Sizewell C would involve the daily movement of large numbers of construction workers as well as the movement of large amounts of building materials and equipment. The peak construction workforce for Sizewell C is anticipated to be 7,900 construction workers and 600 associated development workers. The current proposals include:
- Options for an on-site accommodation campus, as well as a number of caravans on nearby land east of Eastlands Industrial Estate (LEEIE), helping to significantly reduce the number of workforce journeys through towns and villages close to the construction site;
 - Two park and ride sites, one for construction workers approaching Sizewell from the north on the A12 and the other for those approaching from the south on the A12;
 - Direct bus services operating from Ipswich, Lowestoft and Leiston and Knodishall, as well as shuttle buses from Saxmundham rail station and the LEEIE;
 - Junction improvement at A12 / B1122 Yoxford;
 - Junction improvement at A12 / A144;
 - A Two Village bypass, around Farnham and Stratford St Andrew; and
 - Sizewell Link Road, joining the A12 south of Yoxford to the B1122 east of Theberton.

1.2. STRATEGIC TRAFFIC MODELLING

- 1.2.1. A VISUM traffic model was developed for the purposes of assessing Sizewell C traffic impacts. The study area and modelled network for the VISUM model was agreed with the local highway authority, Suffolk County Council (SCC) and extends to Lowestoft to the north, Ipswich to the south and the A140 to the west.
- 1.2.2. A VISUM Base Model of the existing road network has been developed using a wide range of Manual Classified Counts (MCC) and Automatic Traffic Counts (ATC) on the local road network which were conducted in May 2015, and from count information from the Highway England Traffic Flow Data System (TRADS) which holds information on traffic flows at sites on the motorway and trunk road network. In addition, SCC provided count data from a number of their permanent count sites.
- 1.2.3. A number of forecast scenarios were modelled in VISUM to represent 2023, 2028 and 2034. Each year was modelled as a Reference Case, without the addition of Sizewell C related traffic and a 'with-Sizewell' scenario known respectively as the Early Years, Peak Construction and Operational Phase scenarios. The Reference Case scenarios assume increases in traffic levels arising from general growth as well as the additional traffic associated with major development sites nearby. Committed highway schemes are also included in these scenarios. The forecast Sizewell C VISUM scenarios were developed based on assumptions about construction traffic provided by EDF and results from a bespoke gravity model.

- 1.2.4. The VISUM model was developed for seven individual hours; three AM hour models and four PM hour models as follows:
- 06:00 to 09:00 hours
 - 15:00 to 19:00 hours
- 1.2.5. Details of the VISUM model development are provided in chapters 6 to 8 of the Sizewell C Transport Assessment.

1.3. PURPOSE OF VISSIM MODELLING

- 1.3.1. The Sizewell C Joint Local Authority Group (JLAG) raised concerns about the operation of the highway network at Yoxford and at Darsham at a meeting on 17 July 2015. The purpose of this modelling study is to determine the impact of Sizewell C traffic on the area around Yoxford, with particular emphasis on the A12 junctions, including the A1120 and B1122 in Yoxford and the A144. The study would also inform design of the Darsham Park & Ride access and consider the interaction of these works with the remainder of the highway network in the area.
- 1.3.2. The VISSIM modelling reported here draws on the gravity modelling and VISUM strategic traffic modelling and adopts the same forecast years and construction traffic movement assumptions made for those studies. The VISUM strategic modelling includes trips associated with the periodical outages at Sizewell B (typically over a six week period every 18 months) as agreed with SCC.
- 1.3.3. In turn, all of the VISSIM modelling presented in this note includes Sizewell B outage trips, thus representing a worst-case scenario which allows a robust network performance assessment to be undertaken.

2. METHODOLOGY

- 2.1.1. A VISSIM microsimulation model was developed in VISSIM 9.00-12. The first step in this process was to produce a base traffic network within the VISSIM scenario management framework. This base network includes all settings, network objects and base data, and serves as a template which forms the basis of all model scenarios. Full details of the base model development are provided in Chapter 3.
- 2.1.2. A total of fourteen scenarios were created within the scenario managed file by applying various combinations of modifications to the base network. A brief description of each of the fourteen scenarios that have been modelled is given in Table 1.

Table 1 – Modelled Scenarios

Scenario Number	Name	Description
1 - 2	2015 AM/PM	2015 Base Year – base 2015 flows.
3 – 4	2023 RC AM/PM	2023 Reference Case – 2023 flows with no Sizewell traffic and no mitigation.
5 – 6	2023 EY AM/PM	2023 Early Years - 2023 flows with early Sizewell traffic and no mitigation.
7 – 8	2028 RC AM/PM	2028 Reference Case – 2028 flows with no Sizewell traffic and no mitigation.
9 – 10	2028 PC AM/PM	2028 Peak Construction – 2028 flows with Sizewell traffic and the following embedded mitigations: A12 / B1122 roundabout, A12 / A144 upgrade, Darsham P&R, new P&R roundabout and Sizewell Link Road.
11 – 12	2034 RC AM/PM	2034 Reference Case – 2034 flows with no Sizewell traffic and no mitigation.
13 – 14	2034 OP AM/PM	2034 Operational Phase – 2034 flows with Sizewell traffic and the following embedded mitigations: A12 / B1122 roundabout, A12 / A144 upgrade and Sizewell Link Road.

- 2.1.3. The AM scenarios were modelled from 06:00 to 09:00, while the PM scenarios were from 15:00 to 19:00. Longer modelled periods were deliberately selected so that the assessment could take into account both the traditional highway peak periods when general traffic flows are high and Sizewell traffic is anticipated to be low and also the early morning and afternoon periods (07:00-08:00 and 15:00-16:00) when general traffic is lower but Sizewell traffic is at its peak.
- 2.1.4. Scenarios 1 and 2 represent the current base year conditions. Base year traffic was obtained from Manual Classified Counts, which were processed to estimate complete origin-destination routes and coded into the model as dynamic OD matrices. For the purposes of base year calibration and validation, three time periods were selected: 08:00 – 09:00, 15:00 - 16:00 and 17:00 - 18:00. The base model was validated against 2015 junction queue lengths and journey time data for these three hours. The base year model validation and calibration is detailed in Chapter 4.

- 2.1.5. Scenarios 3 to 6 model the forecast year 2023. Growth in background traffic and Sizewell C construction traffic were obtained from the strategic highway model (VISUM) and assigned dynamically to the VISSIM model. A small number of roads are included in the micro-level VISSIM model but are not included in the macro-level VISUM model. For trips originating or terminating at these locations, growth has been estimated using TEMPro growth factors instead of the VISUM model.
- 2.1.6. Scenarios 3 and 4 represent the 2023 Reference Case scenario, which predicts the operation of the highway network under a “do nothing” scenario – i.e. forecast population and employment growth, but no Sizewell C construction activity. Scenarios 5 and 6 represent the 2023 Early Years scenario, which adds the Sizewell C construction traffic to the Reference Case scenario. The transport network and traffic demand assumptions used to build the Early Years scenario and a summary of its performance compared to the Reference Case and Base Year are detailed in Chapter 5.
- 2.1.7. Scenarios 7 to 10 represent the forecast year 2028. This year marks the period of peak construction activity at Sizewell C. Scenarios 7 and 8 develop the Reference Case, which predicts the operation of the highway network under a “do nothing at Sizewell” scenario. Scenarios 9 and 10 represent the 2028 Peak Construction scenario, which adds the Sizewell C peak construction traffic to the Reference Case scenario. The transport network and traffic demand assumptions used to build the Peak Construction scenario and a summary of its performance compared to the Reference Case and Base Year are detailed in Chapter 6.
- 2.1.8. Scenarios 11 to 14 model the forecast year 2034. This year represents the normal operation of Sizewell C once it has been fully constructed. Scenarios 11 and 12 model the Reference Case scenario, which predicts the operation of the highway network under a “do nothing at Sizewell” scenario. Scenarios 13 and 14 represent the 2034 Operational Phase scenario, which adds the Sizewell C operational traffic to the Reference Case scenario. The transport network and traffic demand assumptions used to build the Peak Construction scenario and a summary of its performance compared to the Reference Case and Base Year are detailed in Chapter 7.

3. BASE MODEL DEVELOPMENT

3.1. STUDY AREA

- 3.1.1. The VISSIM model network extent has been chosen based on the anticipated Sizewell C area of impact which includes a number of network locations which are more sensitive to growth in traffic flows. The modelled extent covers the A12 between Yoxford and the A12 junction with the A144, including junctions with the A1120, B1122, Westleton Road, Darsham service station, The Street, Willow Marsh Lane, Lymballs Lane and A144.
- 3.1.2. The extent of the B1122 is sufficient to capture the rail level crossing just east of Rookery Park. The level crossings on the A12 at Darsham station and on Willow Marsh Lane are also included within the model along with the Darsham Service Station entrance / exit.
- 3.1.3. The modelled area is shown in Figure 1.

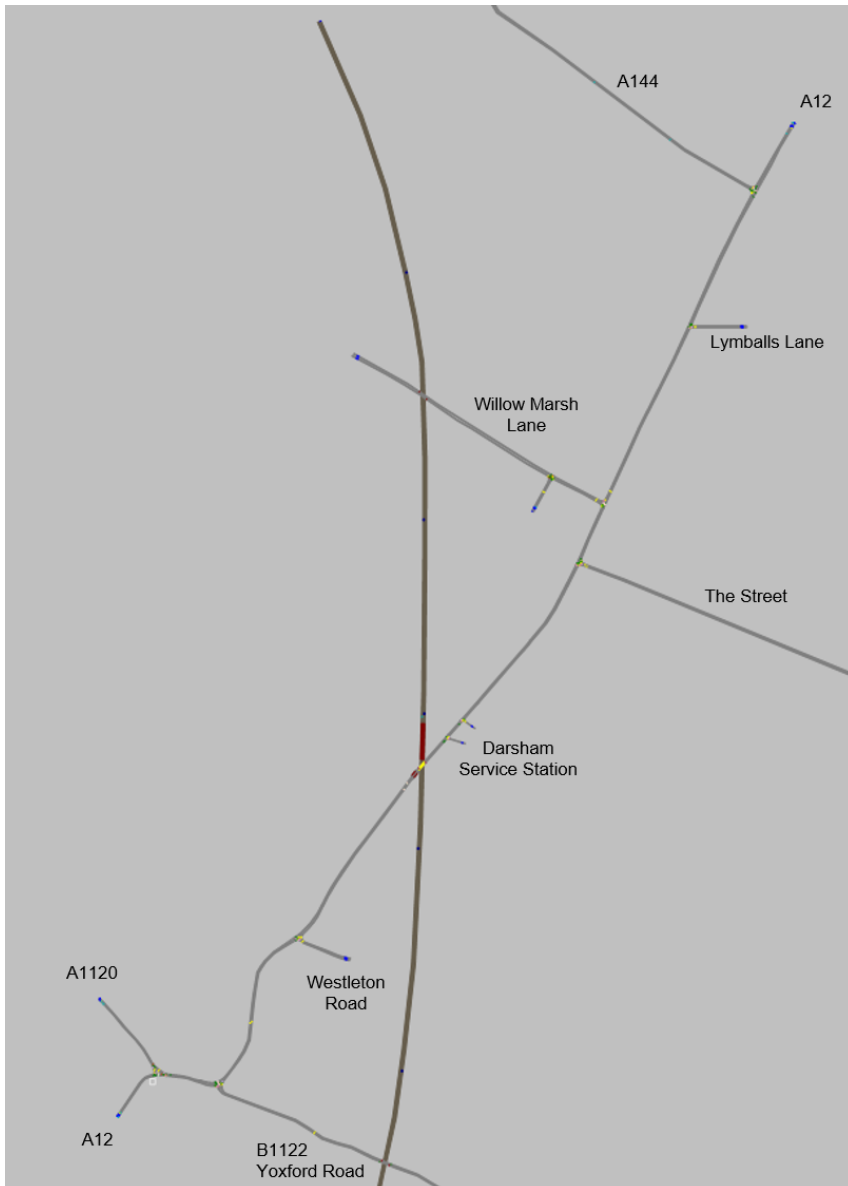

Figure 1 – Modelled Study Area

3.2. DATA COLLECTION

TRAFFIC COUNTS AND QUEUE LENGTHS

- 3.2.1. Manual classified counts (MCCs) and queue length observations were recorded at each of the major junctions in the study area to allow the VISSIM model to be calibrated. The strategic VISUM modelling represents an average Monday to Thursday during AM modelled hours and a Friday during PM modelled hours, as this was shown to be busier than other weekdays. In line with this, MCCs and queues were collected for the purpose of the VISSIM modelling on Friday 8 May 2015 (3-7pm) and Monday 11 May 2015 (6-10am) at the following locations:
- A12 Brook Street / A1120 High Street, Yoxford;
 - A12 Brook Street / B1122 Middleton Road;
 - A12 Main Road / Petrol Filling Station near Darsham; and
 - A12 London Road / A144.
- 3.2.2. Additional MCCs and queue lengths were collected along the A12 to infill the MCC and queue data collected in May 2015. MCCs and queue lengths were recorded on Wednesday 30 September 2015 (6-10am, 12-2pm, 3-7pm) at the following locations:
- A12 / Westleton Road;
 - A12 / The Street;
 - A12 / Willow Marsh Lane; and
 - A12 / Lymballs Lane.
- 3.2.3. Queue lengths and barrier down times were also recorded at the level crossings on the A12 near Darsham and on the B1122.
- 3.2.4. All traffic surveys were conducted using cameras installed on-site by Traffic Survey Partners (TSP). Traffic counts were reported in 15-minute time segments and queue lengths were reported in 5-minute time segments. TSP also provided video files for later analysis and verification of processed data. Figure 2 shows the locations of the junctions that were surveyed.

JOURNEY TIMES

3.2.5. Highway journey time observations were extracted from TrafficMaster data for four segments along the A12. Journey times from TrafficMaster represent the average weekday travel time across May 2015. Journey times were aggregated from 15-minute segments into whole hours across Monday to Thursdays in May. Journey time data was separated by direction (northbound and southbound) and time period (8-9am, 3-4pm and 5-6pm). The journey time segments are shown in Figure 3.

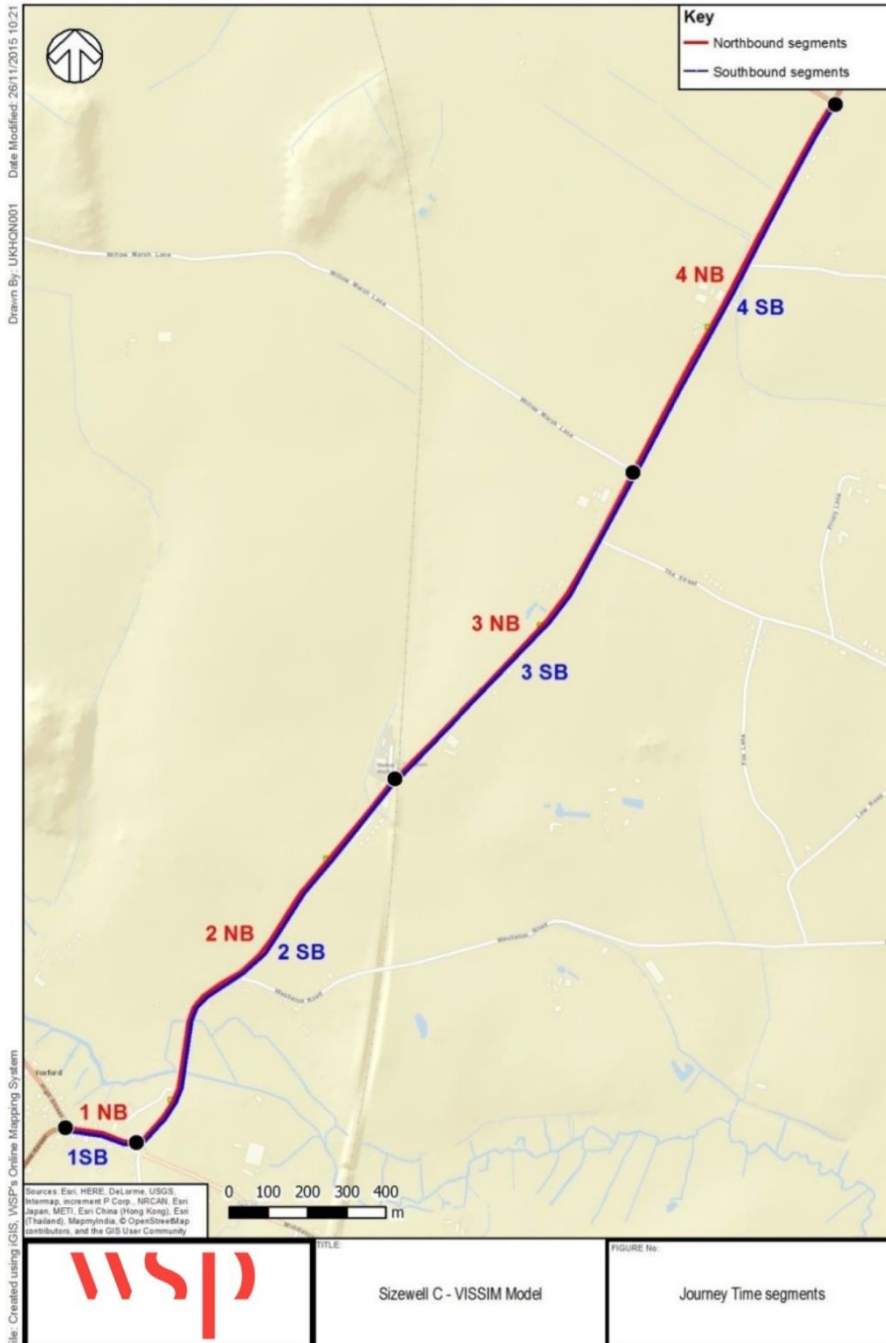

Figure 3 – Observed Journey Time Segments

3.2.6. The observed average journey time data is shown in Table 2.

Table 2 – TrafficMaster Observed Journey Times (seconds)

Section	AM Peak (08:00-09:00)		Inter Peak (15:00-16:00)		PM Peak (17:00-18:00)	
	NB	SB	NB	SB	NB	SB
1	14	13	13	23	16	15
2	60	61	58	62	57	62
3	68	66	72	85	67	72
4	52	48	60	51	48	49
Total	194	187	203	222	188	197

LEVEL CROSSING SURVEY

3.2.7. The operation of the level crossing on the A12 near Darsham and the level crossing on the B1122 Yoxford Road was surveyed on Wednesday 30 September 2015 during the AM, Inter and PM peak periods. Using video footage provided by TSP, the level crossing barrier closures were recorded to determine the time of closure and duration of each closure. Figure 4 shows the location of the level crossing surveys.

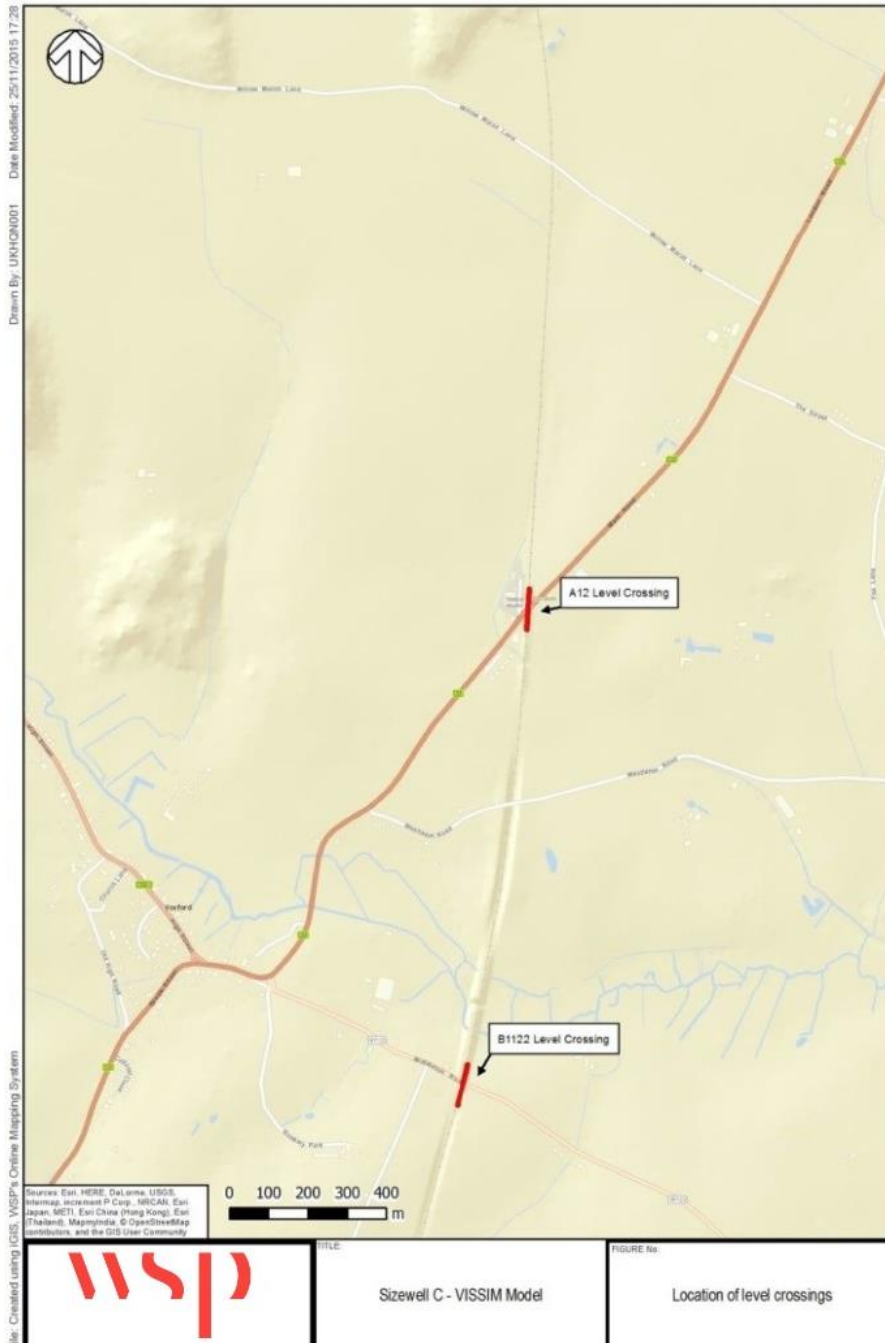

Figure 4 – Level Crossing Survey Locations

3.2.8. The average observed level crossing barrier down time is shown in Table 3.

Table 3 – Level Crossing Barrier Closure Duration (seconds)

Train Arrival Direction and Crossing Location	8-9 AM	3-4 PM	5-6 PM
Northbound train at B1122	31	35	33
Southbound train at B1122	31	37	33
Northbound train at A12	45	45	45
Southbound train at A12	102	135	70

3.2.9. The barrier down time is significantly longer when southbound trains approach the A12 crossing. This is because Darsham railway station is positioned immediately north of the A12 crossing and the barrier is lowered whilst the southbound train dwells at the station before using the crossing.

3.3. MODEL CONSTRUCTION

BASE NETWORK STRUCTURE

- 3.3.1. The modelled study area is described in Section 3.1. This area of road network has been constructed in VISSIM using Ordnance Survey Mastermap as an indication of kerb lines. The extent was chosen so that the key junctions of interest were included, as well as sufficient areas of the surrounding network to allow traffic arriving at the key junctions to be accurately modelled, e.g. platooning. The modelled area was also extended where necessary to accommodate current and forecast queues.
- 3.3.2. The majority of network links were coded as “Inter-urban (motorized) W99” links using the Wiedemann99 car-following model. The number of “observed vehicles” was increased from two to four to improve driver-vehicle interaction, but otherwise driver behaviour parameters were kept as the VISSIM defaults. A small number of multi-lane links were adjusted to use the “free lane selection” link type to allow vehicles to select the most appropriate lane based on their route, e.g. a right turning vehicle selecting the right-hand lane.
- 3.3.3. Desired speed profiles were created for car, motorcycle and bus as per Transport for London’s default VISSIM model template. These speed profiles cover the following speed limits: 10mph, 20mph, 30mph, 40mph, 50mph and 60mph. Each speed profile ranges between a lower and upper limit to replicate driver tendency to travel at speeds not exactly equal to the sign-posted speed. The speed profiles for 30mph and 40 mph were adjusted during calibration to a linear distribution with tighter boundaries to allow observed speeds to be better replicated. The speed profiles result in the formation of natural platoons on the A12 as faster moving vehicles catch-up with slower moving vehicles. Desired Speed Decisions (DSDs) were applied using these speed profiles in the model to replicate speed limit changes. The speed limit applied on the A12 through Yoxford was 30mph and north of the River Yox the speed limit increases to 40mph. The speed limit of 60mph north of Willow Marsh Lane was also applied. The B1122, Willow Marsh Lane and other connecting roads were assigned speed limits of 30mph, whilst the A1120 Yoxford High Street was assigned a desired speed of 20mph to reflect the nature of this area.

- 3.3.4. Reduced Speed Areas (RSAs) were assigned across the model to replicate the need for vehicles to slow down on sharp bends and at junctions. Initially a reduced speed distribution of 10mph was used universally for all reduced speed areas. Reduced speed area distributions were then adjusted during calibration to allow observed queues to be matched. This resulted in changing the reduced speed areas to 20mph at the major junctions (A12 / A1120, A12 / B1122 and A12 / A144) and on the A12 level crossing.
- 3.3.5. Priority rules were applied at junction conflict points to replicate gap acceptance behaviour. Where appropriate, separate time and distance gap rules were applied. Rules were separated for cars and HGVs where required. Gap acceptance times were selected depending on the nature of the conflict and to calibrate the observed queuing behaviour. Higher gap acceptances were required to achieve safe priority behaviours within the 60mph section of the A12.
- 3.3.6. Level crossings were modelled using VISSIM's Vehicle Actuated Programming (VAP) language. VAP files were created to close the rail barriers (by means of a red signal) when a train approached the crossing. Approaching trains were detected using "virtual loop detectors" on the rail alignment sections. Closure times were programmed to replicate those observed on-street (see Table 3). Priority rules were also used at level crossings to keep the rail tracks clear of queuing traffic. Reduced speed areas of 20mph were added to the level crossing to simulate traffic slowing whilst passing over the crossing.
- 3.3.7. Two VAP files were created:
- LevelXingA12_v2.VAP – for the A12 level crossing; and
 - LevelXing_v2.VAP – for the B1122 and Willow Marsh Lane crossings.
- 3.3.8. T-junctions with flares were modelled by adding an extra lane at the stopline or by extending the appropriate turning connectors to allow two cars to sit side by side whilst waiting to pull out.
- 3.3.9. Nodes were created at each junction and entry to the model for the dynamic assignment of the origin – destination matrices. The nodes at the entry to the model represent the model zones and they are connected to the network by using "parking lots". Table 4 contains the list of zones used in the model. Zone 902 (Darsham Park and Ride) is included in the base year model as an empty zone that will be used in the forecast year scenarios.

Table 4 – Zoning System

Zone	Name	Zone	Name
506	The Street	15350	B1122
902	Darsham Park and Ride	16000	Westleton Road
14828	A1120	16001	Petrol Station
14830	A12 S	16002	Willow Marsh Lane
14834	A144	16003	Lymballs Lane
15048	A12 N		

- 3.3.10. Junction nodes are used in dynamic assignment to allow / prohibit certain movements (defined as "edges" in VISSIM) in the junction. Edges have been closed where appropriate to avoid vehicle

movements that would not happen in reality. Junction nodes have also been used for validation and delay evaluation purposes.

- 3.3.11. Travel time measurements were introduced along the A12 for validation and evaluation purposes, replicating the sections from the observed data shown in Figure 3.
- 3.3.12. Queue counters were added at all give way lines at each of the junctions to allow the modelled queues to be calibrated to the observed queue lengths and to allow a comparison of queues to be made in the forecast scenarios.

BASE YEAR MATRIX DEVELOPMENT

- 3.3.13. The Yoxford VISSIM model contains a total of 11 zones, as specified in Table 4.
- 3.3.14. Five vehicle types were used in the base year model:
 - Car (100);
 - LGV (700);
 - HGV (200);
 - Bus (300); and
 - Train (400).
- 3.3.15. Car, LGV, bus and train use the default 2D / 3D model distribution. HGV contains both OGV1 and OGV2 models with a share of 50% each, as observed in the MCC data.
- 3.3.16. Vehicle compositions are used to determine the percentage of each vehicle type in a specific vehicle input or matrix. Matrices have been generated for Car, LGV and HGV separately, so the vehicle compositions are also defined for each vehicle type separately.
- 3.3.17. Vehicle classes are used to group vehicle types for dynamic assignment and evaluation purposes. Vehicle classes have been created for each individual vehicle type.
- 3.3.18. Car, LGV and HGV demand was included in the model as dynamic assignment matrices. Traffic flow spreadsheets were prepared using the surveyed traffic flows to balance total in-flow and out-flow at adjacent traffic counts. As almost all junctions were surveyed there were only minor discrepancies between adjacent counts.
- 3.3.19. The matrices for the model cover the AM period (06:00 – 09:00) and PM period (15:00 – 19:00). As mentioned in the methodology, these periods were selected so that the assessment could take into account both the traditional highway peak periods and also the periods (06:00-07:00 and 15:00-16:00) when general traffic is lower but Sizewell traffic is at its peak.
- 3.3.20. Matrix trips were loaded onto the zones in 15-minute segments based on the traffic flow spreadsheets. A 15-minute warm-up period was applied to allow traffic to build up in the modelled network prior to the start of the core modelled period, so that traffic conditions are realistic at the beginning of the modelled period.
- 3.3.21. Junction turning flow diagrams are provided for each time period in Appendix A.

Convergence

- 3.3.22. As mentioned above, traffic flows have been input to the network as dynamically assigned matrices. Although there are no route choices available in the network, dynamic assignment has been used as it is a more efficient way to generate Origin – Destination trips than using fixed routes.

- 3.3.23. An iterative convergence procedure takes place by assigning vehicles to different paths until equilibrium is reached. The criterion for model convergence in the model has been set as follows:
- Travel time on paths: change of up to 20% on 85% of links;
 - Volume on edges: change of up to 50 vehicles on 98% of edges; and
 - Minimum simulation runs: four.
- 3.3.24. Convergence was reached for each scenario in the minimum permitted amount of simulation runs as there is no route choice in the network.

PUBLIC TRANSPORT SERVICES

- 3.3.25. Three public bus services were identified as running through the study area:
- Borderbus service no. 521 (Halesworth – Aldeburgh);
 - Framlingham High School services TM01 (Leiston – Framlingham); and
 - TM02 (Reydon – Framlingham).
- 3.3.26. These bus services were added to the model according to published timetables. Table 5 lists the frequency of each bus service as they have been included in the model in each time period.

Table 5 – Public Bus Services Frequencies per 3hr (AM) or 4hr (PM) period

Service and Direction	6-9 AM	3-7 PM
No. 521 northbound	0	2
No. 521 southbound	1	1
TM01 westbound	1	0
TM01 southbound	0	1
TM02 northbound	0	1
TM02 southbound	1	0

- 3.3.27. Bus services were included in the model as fixed public transport lines and in lieu of observed dwell time information, a dwell time distribution has been applied to provide some variation in dwell times with an average of 20 seconds. This is considered to be reasonable for a rural bus service where passenger numbers are unlikely to be large.
- 3.3.28. Train services were included in the model as fixed public transport routes with a stop at Darsham station. Modelling the train services allowed the realistic replication of the level crossing barriers which impact flows on the A12, Willow Marsh Lane and the B1122. The northbound and southbound train services were added to the model according to the published timetable, applying an entry offset equal to the time taken by the train between the entry to the model and the stop at the station. Trains were assumed to stop at Darsham station for an average of 60 seconds which was selected to allow the level crossing barrier down time to be calibrated to observed data. Whilst a southbound train dwells at Darsham Station, the level crossing barrier is closed so the length of train dwell time directly impacts barrier down time Table 6 shows the train services that were included in the model for each time period.

Table 6 – Train Service Frequency per 3hr (AM) and 4hr (PM) period

Service and Direction	6-9 AM	3-7 PM
Lowestoft – Ipswich	4	5
Ipswich - Lowestoft	2	5

4. BASE MODEL CALIBRATION AND VALIDATION

4.1. CRITERIA

4.1.1. The base year scenario was calibrated against traffic flows and queue length data and independently validated against observed journey times to confirm that the model is able to represent current (2015) traffic conditions. Three time periods were selected for validation and calibration: 08:00 – 09:00 (AM peak hour), 15:00 – 16:00 (Inter peak hour) and 17:00 – 18:00 (PM peak hour). The calibration and validation criteria used was based on Department for Transport (DfT) guidelines set out in TAG Unit M3.1 Highway Assignment Modelling.

CALIBRATION

4.1.2. Modelled turning flows at junctions were compared against observed counts using the two criteria set out in Table 7. The first criterion uses differences in flow whilst the second criterion uses the GEH statistic which offers a reliable method of comparing the similarity of two flows irrespective of their magnitude, as shown below.

$$GEH = \sqrt{\frac{(M - C)^2}{(M + C)/2}}$$

where: GEH is the GEH statistic;
M is the modelled flow; and
C is the observed flow.

Table 7 – Traffic Flow Calibration Criteria (source: TAG Unit 3.1)

Table 2 Link Flow and Turning Movement Validation Criteria and Acceptability Guidelines		
Criteria	Description of Criteria	Acceptability Guideline
1	Individual flows within 100 veh/h of counts for flows less than 700 veh/h	> 85% of cases
	Individual flows within 15% of counts for flows from 700 to 2,700 veh/h	> 85% of cases
	Individual flows within 400 veh/h of counts for flows more than 2,700 veh/h	> 85% of cases
2	GEH < 5 for individual flows	> 85% of cases

4.1.3. Observed queue data has also been used to calibrate the model by comparing modelled and observed queues in 5-minute intervals. Queue lengths were measured as the maximum occurring during each 5-minute interval. There are no formal queue length comparison criteria prescribed by industry guidance, but in general the length, variability and profile of modelled queues throughout the hour should be similar to those observed.

VALIDATION

4.1.4. Journey times from the model were compared to observed journey times by way of an independent validation check. The WebTAG criteria set out in Table 8 has been used to assess the model validation.

Table 8 – Journey Time Validation Criteria (source: TAG Unit 3.1)

Table 3 Journey Time Validation Criterion and Acceptability Guideline	
Criteria	Acceptability Guideline
Modelled times along routes should be within 15% of surveyed times (or 1 minute, if higher than 15%)	> 85% of routes

4.2. TRAFFIC FLOW CALIBRATION

4.2.1. Modelled turning flows at each junction were compared against observed turning flows by vehicle type (Car, LGV and HGV) and for all vehicle types combined. As the observed traffic flows were directly input into the model, this check was considered to be calibration rather than an independent validation of the model’s ability to replicate observations. Traffic flow calibration tables are provided in Appendix B for the AM, Inter and PM peak hour models.

AM PEAK HOUR (08:00 – 09:00)

4.2.2. The AM peak hour was found to closely replicate observed turning flows for all vehicle types.

4.2.3. Overall the model slightly over-predicted observed flows (+1.1%) but overall flow totals were within DfT validation criteria (GEH < 5.0) with an average GEH value of 0.2. Table 9 provides a summary of the AM peak hour flow validation against DfT criteria.

Table 9 – AM Peak Hour Turn Flow Validation Summary

	GEH Statistics - AM			Individual Flows		
	GEH < 5	GEH < 6	GEH < 10	f < 700	700 < f < 2700	f > 2700
Car	100.0%	100.0%	100.0%	100.0%	No Data	No Data
LGV	100.0%	100.0%	100.0%	100.0%	No Data	No Data
HGV	100.0%	100.0%	100.0%	100.0%	No Data	No Data
All Veh.	100.0%	100.0%	100.0%	100.0%	No Data	No Data

4.2.4. Figure 5 shows how the modelled and observed turning flows compare and demonstrates that the correlation between the two is strong. The gradient is higher than 1.0 (1.0125) which confirms the slight overestimate of flows. The R² value (0.9996) is very close to 1, which indicates that the modelled flows do correlate with observed flows and confirms that a good level of flow calibration has been achieved.

Figure 5 – AM Peak Hour Plot of Modelled vs. Observed Turn Flows

INTER PEAK HOUR (15:00 – 16:00)

4.2.5. The Inter peak hour model replicated observed junction turn flows for all vehicles types in the hour well. Overall the model slightly over-predicted observed flows (+0.1%) but flow totals were within DfT validation criteria (GEH < 5.0) with an average GEH of 0.1. All individual surveyed turn movements met DfT flow validation criteria with a GEH value of less than 5.0. Table 10 provides a summary of the Inter peak hour flow validation against DfT criteria.

Table 10 – Interpeak Hour Turn Flow Validation Summary

	GEH Statistics - IP			Individual Flows		
	GEH < 5	GEH < 6	GEH < 10	f < 700	700 < f < 2700	f > 2700
Car	100.0%	100.0%	100.0%	100.0%	No Data	No Data
LGV	100.0%	100.0%	100.0%	100.0%	No Data	No Data
HGV	100.0%	100.0%	100.0%	100.0%	No Data	No Data
All Veh.	100.0%	100.0%	100.0%	100.0%	No Data	No Data

4.2.6. Figure 6 shows a plot of modelled against observed junction turn flows showing that the correlation between modelled and observed flows was very good. The gradient is more than 1.0 (1.0026) which confirms the slight overestimate of flows. The R² value (0.9997) is very close to 1, showing tight correlation with observed flows.

Figure 6 – Inter Peak Hour Plot of Modelled vs. Observed Turn Flows

PM PEAK HOUR (17:00 – 18:00)

4.2.7. The PM peak hour model replicated observed junction turn flows for all vehicles types in the hour very well. Overall the model perfectly predicted observed flows (0.8% difference) with an average GEH of 0.2. All individual surveyed turn movements met DfT flow validation criteria with a GEH value of less than 5.0. Table 11 provides a summary of the PM peak hour flow validation against DfT criteria.

Table 11 – PM Peak Hour Turn Flow Validation Summary

	GEH Statistics - PM			Individual Flows		
	GEH < 5	GEH < 6	GEH < 10	f < 700	700 < f < 2700	f > 2700
Car	100.0%	100.0%	100.0%	100.0%	No Data	No Data
LGV	100.0%	100.0%	100.0%	100.0%	No Data	No Data
HGV	100.0%	100.0%	100.0%	100.0%	No Data	No Data
All Veh.	100.0%	100.0%	100.0%	100.0%	No Data	No Data

4.2.8. Figure 7 shows a plot of modelled against observed junction turn flows showing that the correlation between modelled and observed flows was very good. The gradient is more than 1.0 (1.0088) which confirms the slight overestimate of flows. The R² value (0.9997) is very close to 1, showing tight correlation with observed flows.

Figure 7 – PM Peak Hour Plot of Modelled vs. Observed Turn Flows

4.3. QUEUE LENGTH CALIBRATION

- 4.3.1. Queue lengths were observed at the ten locations identified in Section 3.2. Queue lengths were also recorded at the two level crossings on the A12 near Darsham and on the B1122 Yoxford Road. Queue length calibration graphs are provided in Appendix B for the AM, Inter and PM peak hours.
- 4.3.2. Observed queue lengths at most of the junctions were very short (typically less than two vehicles). The model was able to replicate this and therefore a more detailed comparison was not made. Slightly longer queues were observed at the following junctions:
- A12 / A1120;
 - A12 / B1122; and
 - A12 / A144.
- 4.3.3. The model showed some variation in queue lengths between iterations and across the peak hours, in line with fluctuations in demand, but the model generally replicated the observed queue lengths very well. At some approaches the model shows a slight over-prediction of queue length, but still within a reasonable range of the observations.

AM PEAK HOUR (08:00 – 09:00)

- 4.3.4. Figure 8 and Figure 9 show the observed and modelled queue lengths at the A12 and B1122 level crossings respectively.

Figure 8 – A12 Level Crossing Queue Length Validation (AM peak)

- 4.3.5. The level crossing on the A12 was closed twice during the AM peak, once at 08:07 for a northbound train and once at 08:21 for a southbound train. This resulted in queues forming northbound and southbound on the A12 at two distinct points in the hour.
- 4.3.6. Queue lengths are highly dependent on the nature of the traffic platoon which arrives when the barrier is closed and so there was significant variability shown in modelled queue lengths across individual model runs. Considering this variability, and the fact that the observed queues represent a single day, modelled and observed queues were shown to be reasonably well matched.

Figure 9 – B1122 Level Crossing Queue Length Validation (AM peak)

- 4.3.7. The B1122 level crossing also closed twice during the AM peak hour and the model accurately reflected the timing and magnitude of observed queues. Traffic flows on the B1122 were much lower than on the A12 and so queue lengths were therefore also much shorter. The similarity of modelled and observed queues were again generally good, considering the variability in traffic platooning and the fact that the queue length survey represents a single day.
- 4.3.8. Overall the model replicated observed queue lengths well in the AM peak hour.

INTER PEAK HOUR (15:00 – 16:00)

- 4.3.9. Figure 10 and Figure 11 show the observed and modelled queue lengths in the Inter peak hour at the A12 and B1122 level crossings respectively.

Figure 10 – A12 Level Crossing Queue Length Validation (Inter peak)

4.3.10. The level crossing on the A12 was recorded as closing three times during the Inter peak hour; at 15:00 and 16:00 for northbound trains, and once at 15:49 for a southbound train. There was a slight time offset between the observed closures and the scheduled train timetable which informs the modelled trains and this difference is therefore reflected in the graph. However, the magnitude of queue lengths reported from the model still match observed queue lengths on the A12.

Figure 11 – B1122 Level Crossing Queue Length Validation (Inter peak)

- 4.3.11. Modelled queue lengths at the level crossing on the B1122 were much shorter than on the A12 and matched the observed queue profile. The eastbound modelled queue was shorter than that observed, but this is thought to be due to the nature of the platoon arrival when the barrier was down and the fact that the queue length survey was carried out on one day only.
- 4.3.12. Overall the model replicated observed queue lengths well in the Inter peak hour.

PM PEAK HOUR (17:00 – 18:00)

- 4.3.13. Figure 12 and Figure 13 show the observed and modelled queue lengths at the A12 and B1122 level crossings respectively.

Figure 12 – A12 Level Crossing Queue Length Validation (PM peak)

4.3.14. The level crossing on the A12 closed twice during the PM peak, once at 17:49 for a southbound train and once at 18:00 for a northbound train. This resulted in queues forming northbound and southbound on the A12 at two distinct points in the hour. Overall queue lengths matched observed reasonably well.

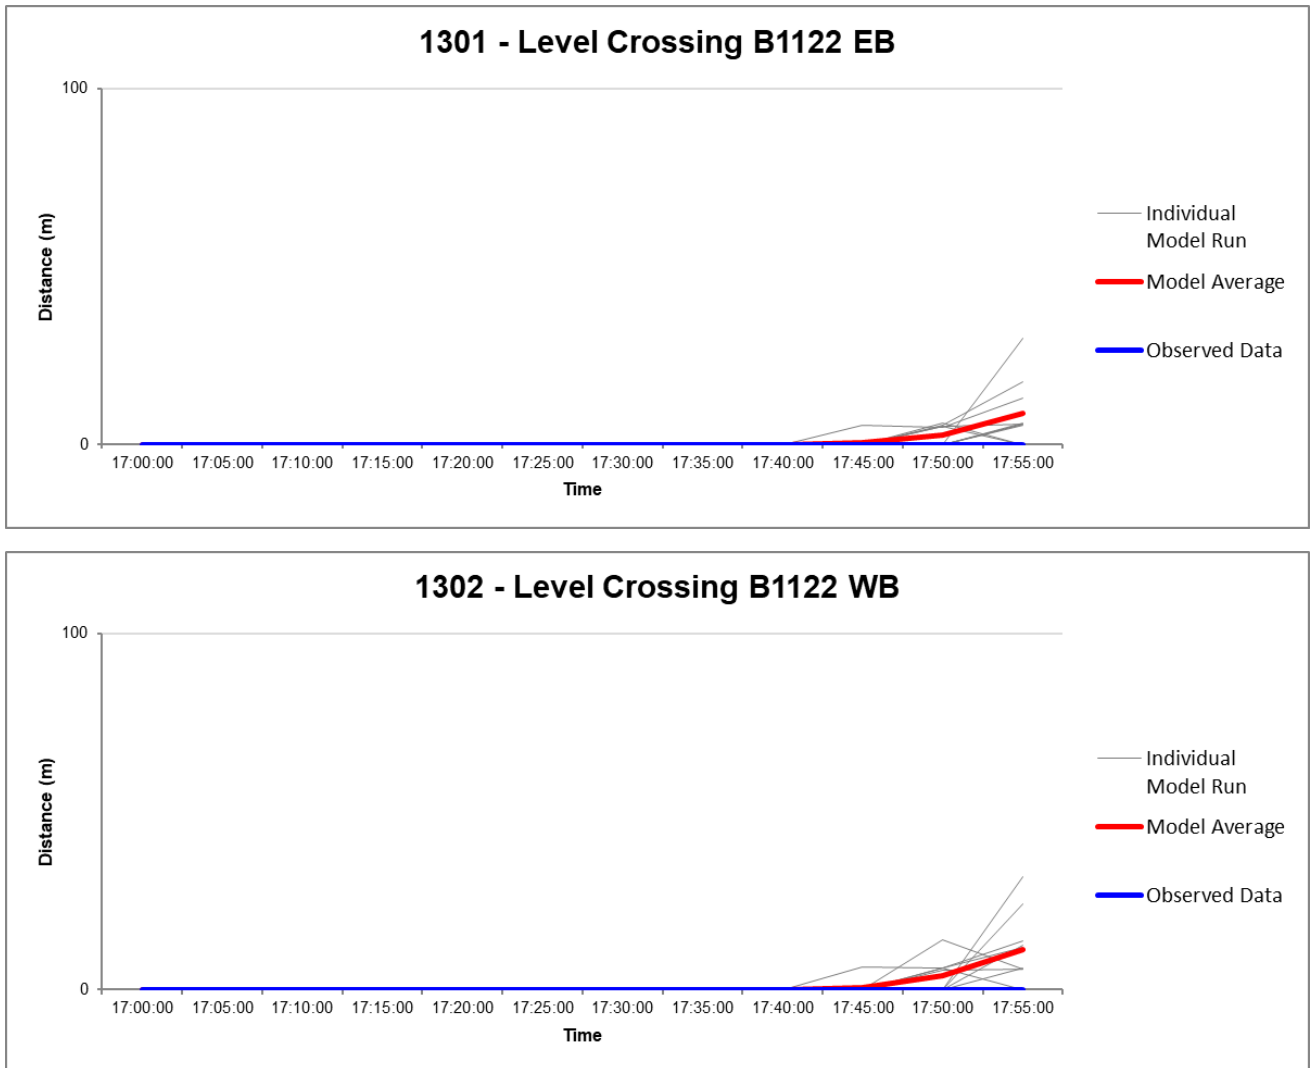

Figure 13 – B1122 Level Crossing Queue Length Validation (PM peak)

4.3.15. Queues at the level crossing on the B1122 were very small in the PM peak hour as reflected in the model. Overall the model replicated observed queue lengths well in the PM peak hour.

4.4. JOURNEY TIME VALIDATION

4.4.1. Journey time validation tables and graphs are provided in Appendix B for the AM, Inter and PM peak hours.

AM PEAK HOUR (08:00 – 09:00)

4.4.2. Modelled northbound and southbound A12 journey times matched AM peak hour observed journey times well along the full route. Table 12 shows the observed average and modelled journey times on the A12 for each recorded section. There were small differences along individual segments, but overall the model showed a good fit. Figure 14 shows the modelled and observed journey times for each segment.

Table 12 – AM Peak Hour Observed and Modelled Journey Times

Route:	Observed (S)	Modelled (S)	Diff (S)	Diff (%)	Distance (m)	WebTAG Criteria
1 - Section 1 NB	14	14	0	2.8%	185	PASS
2 - Section 2 NB	60	68	8	13.3%	1115	PASS

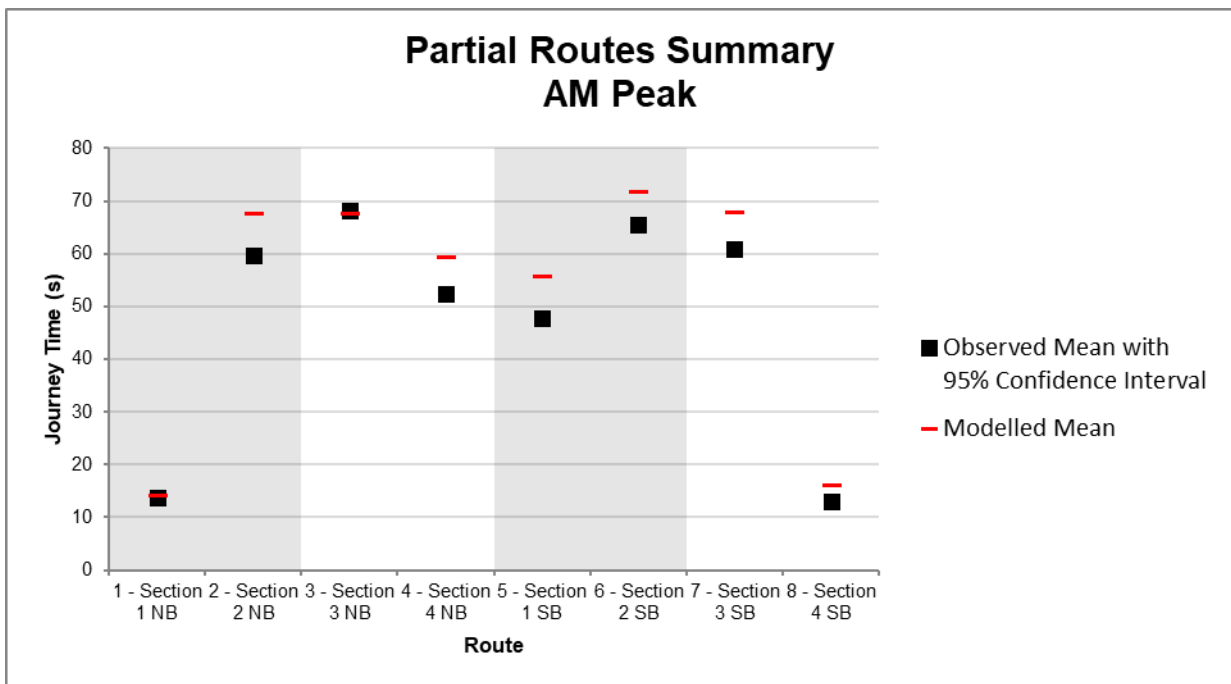

Figure 14 – AM Peak Hour Journey Time Segments

4.4.3. Figure 15 and Figure 16 show the cumulative journey times in the northbound and southbound directions respectively. Cumulative journey times were shown to be within DfT criteria ($\pm 15\%$) in both directions.

Figure 15 – AM Peak Hour Journey Time Northbound

Figure 16 – AM Peak Hour Journey Time Southbound

INTER PEAK HOUR (15:00 – 16:00)

4.4.4. Modelled northbound and southbound A12 journey times matched Inter peak hour observed journey times well along the full route. Table 13 shows the observed average and modelled journey times on the A12 for each recorded section. There were small differences along individual segments, but overall the model showed a good fit. Figure 17 shows the modelled and observed journey times for each segment.

Table 13 – Inter Peak Hour Observed and Modelled Journey Times

Route:	Observed (S)	Modelled (S)	Diff (S)	Diff (%)	Distance (m)	WebTAG Criteria

Figure 19 – Inter Peak Hour Journey Time Southbound

PM PEAK HOUR (17:00 – 18:00)

4.4.6. Modelled northbound and southbound A12 journey times matched PM peak observed journey times well along the full route. Table 14 shows the observed average and modelled journey times on the A12 for each recorded section. There were small differences along individual segments, but overall the model showed a good fit. Figure 20 shows the modelled and observed journey times for each segment.

Table 14 – PM Peak Hour Observed and Modelled Journey Times

Route:	Observed (S)	Modelled (S)	Diff (S)	Diff (%)	Distance (m)	WebTAG Criteria
1 - Section 1 NB	16	14	-2	-12.3%	185	PASS

Figure 20 – PM Peak Hour Journey Time Segments

4.4.7. Figure 21 and Figure 22 show the cumulative journey times in the northbound and southbound directions respectively. Cumulative journey times were shown to be within DfT criteria (+/- 15%) in both directions.

Figure 21 – PM Peak Hour Journey Time Northbound

Figure 22 – PM Peak Hour Journey Time Southbound

4.5. SUMMARY OF MODEL CALIBRATION AND VALIDATION

- 4.5.1. Modelled traffic flows at junctions were shown to match observed turn flows very well across the modelled network. Overall modelled junction flows were slightly less than observed (-1%) but met DfT turn flow criteria in all three peak hours.
- 4.5.2. At some locations the model predicted that there would be significant variability between individual simulation runs and in some cases this leads to a discrepancy between observed and modelled queue lengths. However, comparison of the observed and modelled queue lengths across the hour confirmed that the model was generally able to replicate the location, length and time of queues well across the modelled network.
- 4.5.3. Observed journey times northbound and southbound on the A12 were replicated well by the model meeting DfT criteria (within +/- 15%) during all peak hours. Journey times for individual segments were also compared to confirm that delays were in the correct locations along the full route.

5. FORECAST SCENARIO – 2023 EARLY YEARS

5.1. SCENARIO ASSUMPTIONS

- 5.1.1. 2023 represents the 'Early Years' stage of the construction of Sizewell C. During this year, an initial workforce of 1,500 workers is deployed at Sizewell C construction site. From this amount, 600 will be residing in 400 caravans at land east of Eastlands Industrial Estate (LEEIE) and the rest as per the gravity model.
- 5.1.2. Whilst 2023 does not represent the full demand in terms of the number of workers, it does represent a scenario where the workforce has begun to arrive but most mitigation is yet to be provided. It is important to test 2023 to establish the level of impact that may occur whilst the mitigation schemes are being built and therefore not yet providing their intended relief.
- 5.1.3. In addition to the 1,500 main site construction workers, a further 730 workers are deployed to Additional Development (AD) sites as follows:
- 100 workers at Two Village bypass construction site;
 - 300 workers at Sizewell Link Road construction site;
 - 100 workers at Darsham Park & Ride construction site;
 - 100 workers at Wickham Market Park & Ride construction site;
 - 30 workers at A12/B1122 Yoxford roundabout construction site; and
 - 100 workers at the Freight Management Facility.
- 5.1.4. It is assumed that workers at the A12/B1122 roundabout construction site will park at the Darsham P&R construction site, and a shuttle bus service will transport workers between the two sites.
- 5.1.5. All these construction sites have their associated HGV deliveries per day, travelling along the A12 from the north and south on fixed routes, as follows:
- SZC main development site – 300 HGVs each way;
 - Two Village bypass – 60 HGVs each way;
 - Sizewell Link Road – 100 HGVs each way;
 - Darsham Park & Ride – 21 HGVs each way;
 - Wickham Market Park & Ride – 21 HGVs each way; and
 - A12/B1122 Yoxford roundabout – 10 HGVs each way.
- 5.1.6. It is also assumed that HGVs to the main SZC site will use the B1122. The proposed HGV delivery profile across the day, at all sites, is shown in Figure 23 below.

Figure 23 – Proposed HGV delivery profile

TRANSPORT NETWORK ASSUMPTIONS

5.1.7. The transport network being used in the 2023 model scenarios remains similar to that used in the base year, with no embedded mitigation assumed to be completed. The only network changes included in the ‘with development’ models are the provision of a number of accesses to serve the different construction sites in the study area.

Figure 24 shows the access to the A12 / B1122 roundabout construction site. A temporary bus stop and HGV deliveries access has been placed east of the junction, accessed from the B1122. This bus stop is provided to facilitate the shuttle bus service moving construction workers from the temporary Darsham Park & Ride to the A12 / B1122 site. Detailed planning of how this construction site will operate bus drop offs and deliveries is yet to be undertaken so these assumptions have been made within the model to allow the estimated bus and HGV trips to be accommodated. The locations and operation of these facilities will be better defined at a later stage of planning and the assumptions used within the modelling do not represent a preferred location or an indication of the site management strategy.

Figure 24 – Temporary bus stop and HGV delivery access at Yoxford junction

5.1.8. As the Darsham Park & Ride and associated access roundabout on the A12 are likely to be under construction by 2023, a temporary access has been included in the 2022 Early Years network. Figure 25 shows the temporary access to the Darsham Park & Ride construction site, modelled as a simple T junction on Willow Marsh Lane. As with the A12 / B1122 construction site, a detailed site operation plan is not yet available so an assumption was made about how access to the construction site might be made in 2023.

Figure 25 – Darsham P&R site access

TRAFFIC DEMAND ASSUMPTIONS - 2023

5.1.9. Two new layers of traffic demand were included in the forecast year scenarios; ‘Growth traffic’ and ‘Sizewell C traffic’. The number of vehicle types in the model therefore increases from five in the base year to twelve in the 2023, 2028 and 2034 scenarios, as listed below:

- Car (100), **Car Growth (101)**, **Car SZC (102)**;
- LGV (700), **LGV Growth (701)**, **LGV SZC (702)**;
- HGV (200), **HGV Growth (201)**, **HGV SZC (202)**;
- Bus (300), **Bus SZC (302)**; and
- Train (400).

5.1.10. Traffic flows were extracted from the strategic VISUM model described in Section 1.2. A subnetwork of each VISUM model (one for each hour) was created for the study area which allowed origin-destination matrices to be extracted. Figure 26 shows the extent of the VISUM subnetwork.

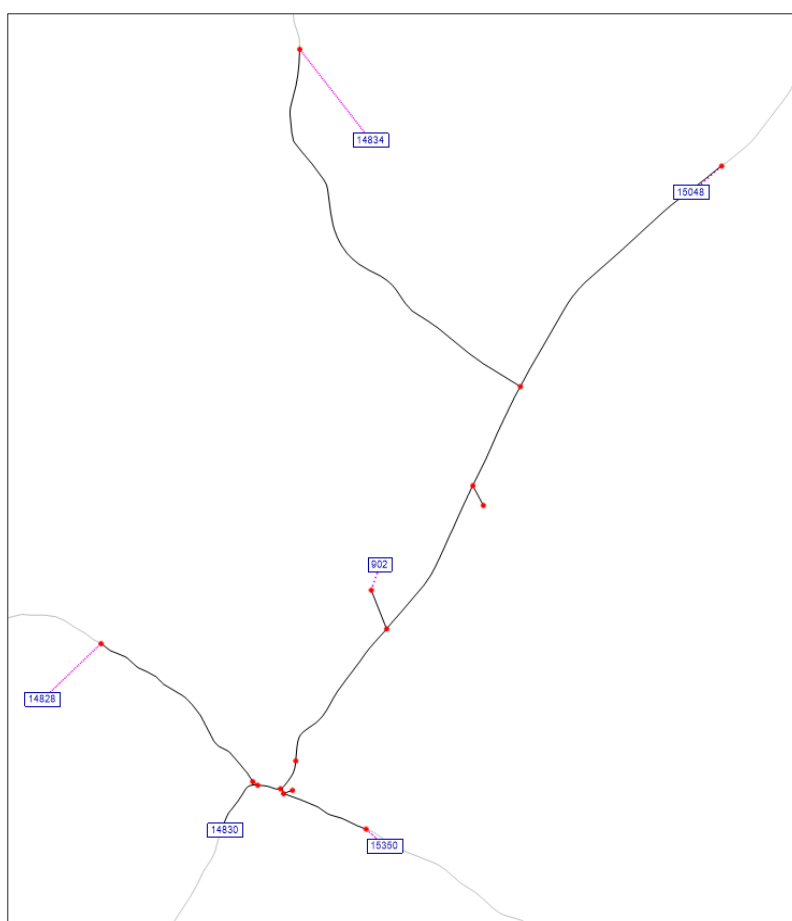

Figure 26 – VISUM subnetwork in the modelled area

5.1.11. A total of seven zones are included in the VISUM sub-network, connected on to the A12 South, A1120, B1122, P&R access, The Street, A144 and A12 North. For the purposes of this report, these zones are classified as major roads, whilst additional zones within the study area that are not included in the VISUM model have been termed ‘minor roads’. A list of the roads deemed minor and major is provided in Table 15.

Table 15 – Major and minor road classification

	Demand Category
Major Roads (included in VISSIM and VISUM)	<ul style="list-style-type: none"> • A12 South • A1120 • B1122 • P&R access • The Street • A144 • A12 North
Minor Roads (included in VISSIM but <u>not</u> in VISUM)	<ul style="list-style-type: none"> • Lymballs Lane • Willow Marsh Lane • Darsham Service Station • Westleton Road

5.1.12. The VISUM model contains the following matrices:

- Car (base + growth);
- LGV (base + growth);
- HGV (base + growth);
- Car SZC: car trips associated with Sizewell C;
- LGV SZC: LGV trips associated with Sizewell C;
- Car SPR: car trips associated with the nearby Scottish Power (SPR) ‘East Anglia One’ construction; and
- Car SZB RF: car trips associated with Sizewell B Relocation Facility.

VISSIM Matrices

5.1.13. The VISUM models have been used to generate the VISSIM forecast matrices, which build on top of the base year matrices obtained from observed data. As the VISUM models do not separate base and growth traffic in the forecast scenarios, the VISUM base year flows have been subtracted from the forecast year flows to calculate the ‘major road’ growth flows. This method resulted in a small number of negative values where the base flows were slightly higher than the forecast flows. These negative values have been subtracted from the base year matrices. The hourly origin-destination growth matrices have been converted into 15-minute matrices by using the base year profiles.

5.1.14. Growth on ‘minor road’ flows were estimated by applying a TEMPro growth factor (NTEM¹ dataset 7.2) to the observed base flows on these roads.

5.1.15. The ‘minor road’ and ‘major road’ growth flows were put together to create 11x11 matrices to cover the whole VISSIM study area. These have been input into the VISSIM model as the “Growth” matrices for each 15- minute period.

¹ National Trip-End Model

- 5.1.16. The Scottish Power development flows are also growth flows but have been kept separate in the VISSIM model with a 1-hour profile.
- 5.1.17. The Sizewell C construction worker private car traffic was extracted from the 2023 Early Years VISUM model which assumed a total construction workforce of 1,500 workers at Sizewell C, plus an additional 730 workers on Associated Development sites. The SZC construction traffic assigned in VISSIM matrices is formed of construction worker private car movements to and from:
- Darsham Park & Ride site;
 - Sizewell C construction site; and
 - Sizewell Link Road and Two Village bypass construction sites (A12 south).
- 5.1.18. Table 16 provides a summary of the different layers of traffic input and how they have been incorporated into the model.

Table 16 – 2023 Demand input sources

	Major to Major	Major to Minor	Minor to Major	Minor to Minor
Base flows	Observed data (15-minute)	Observed data (15-minute)	Observed data (15-minute)	Observed data (15-minute)
Growth flows	Calculated from VISUM matrices (15-minute)	Growth factor applied to observed data (15-minute)	Growth factor applied to observed data (15-minute)	Growth factor applied to observed data (15-minute)
	SPR VISUM matrices (1-hour)			
Sizewell C flows	SZC VISUM matrices (1-hour)			

- 5.1.19. Table 17 and Table 18 show the total demand for the model by hourly time period for the Reference Case and Early Years scenarios respectively.

Table 17 – 2023 Network Traffic Reference Case (in vehicles per hour)

	6–7 am	7–8 am	8–9 am	3-4 pm	4-5 pm	5-6 pm	6-7 pm
Base 2023	515	1,173	1,378	1,542	1,614	1,465	1,086
Background Growth	178	173	124	190	113	166	210
SPR	-	-	24	-	-	25	-

Sizewell C	92	306	64	28	52	244	166
Total	784	1,637	1,581	1,742	1,783	1,870	1,458

Sizewell C Bus services and HGV deliveries

5.1.20. In addition to the private worker traffic input as matrices in the model, there are other vehicle movements associated with Sizewell C:

- Buses shuttling workers between Darsham Park & Ride site and A12/B1122 Yoxford roundabout construction site.
- HGVs delivering construction materials and plant movements to and from:
 - Sizewell C construction site;
 - Darsham Park & Ride site;
 - Wickham Market Park & Ride site;
 - A12/B1122 Yoxford junction;
 - Two Village bypass; and
 - Sizewell Link Road.

5.1.21. Table 19 details the Sizewell bus services for 2023. As the park and ride sites are still under construction in 2023, the bus services are limited to a small number of services from the northern park and ride site towards the A12/B1122 Yoxford junction in the AM period and the reverse direction in the PM period. Bus services were coded into VISSIM as Public Transport Lines with fixed routes, departing from the temporary northern park and ride site and making a 5-minute drop-off stop at A12/B1122 Yoxford junction before returning to the northern park and ride site.

Table 19 – 2023 Early Years Sizewell Bus services

Service	Direction	6-7 am	7-8 am	8-9 am	3-4 pm	4-5 pm	5-6 pm	6-7 pm
Northern park and ride site to A12 / B1122 construction site	Southbound	0	2	0	0	0	0	0
	Northbound	0	0	0	0	0	2	0
Total		0	2	0	0	0	2	0

5.1.22. Table 20 shows the HGV deliveries to Sizewell C construction site as well as the deliveries to the associated development sites for each hour. These HGVs were modelled as vehicle type “202: HGV SZC” and are assigned to Public Transport Lines with fixed routes and equally spaced departure times.

Table 20 – 2023 Early Years HGV deliveries

Delivery Site	Direction	6-7 am	7-8 am	8-9 am	3-4 pm	4-5 pm	5-6 pm	6-7 pm
Sizewell C	Inbound	14	31	31	23	13	7	2
	Outbound	0	1	9	17	19	20	18

Total		17	41	49	49	41	32	25

5.2. SCENARIO PERFORMANCE COMPARISON

5.2.1. This section presents the performance comparison between the validated base year scenario (“2015”), the Reference Case scenario for 2023 (“2023 RC”), and the 2023 Early Years scenario (“2023 EY”) with Sizewell C construction traffic.

NETWORK-WIDE PERFORMANCE

5.2.2. Table 21 provides a number of network-wide statistics that were extracted from the three different VISSIM scenarios.

Table 21 – Network Performance Model Results

Overall Network Statistics	AM (6-9am)			PM (3-7pm)		
	2015	2023 RC	2023 EY	2015	2023 RC	2023 EY
Total Time Taken (h)	230	275	316	409	471	518
Total Distance (km)	13,622	16,150	18,324	23,941	27,256	29,603
Total Vehicles	3,118	3,604	4,156	5,831	6,558	7,146
Total Delay (h)	23	29	35	43	53	63
Avg. Time (s) / Vehicle	266	274	274	253	258	261
Avg. Time (s) / Mile	98	99	100	99	100	101

Avg. Distance (m) / Vehicle	4,370	4,482	4,409	4,105	4,156	4,143
Avg. Speed (mph)	37	37	36	36	36	35
Avg. Speed (kph)	59	59	58	59	58	57
Avg. Delay / Vehicle (s)	26	29	30	26	29	32

- 5.2.3. During the AM and PM peaks, the network-wide statistics show that time, distance and delay have a linear relationship with the number of vehicles in the network. The extra vehicles generated by Sizewell C do not cause a significant increase in the time, distance or delay per vehicle compared to the Reference Case scenario and impact is therefore minimal.
- 5.2.4. Reviewing the relative statistics, it is possible to observe that there is little variation between the different scenarios. For example, the VISSIM model predicts that the average driver will experience no increase in their journey time in 2023 Early Years AM peak compared to the Reference Case, and a 1 second (+3.4%) increase in delay. During the PM peak, the average travel time per vehicle is increased by 3 seconds (+1.2%) and the delay by 3 seconds (+10.3%). The average speed in the network remains almost the same across all the scenarios. The VISSIM model is sensitive to differences in scenarios so minor changes in delay should not be interpreted as a difference in performance and should instead be viewed as no change.
- 5.2.5. Figure 27 shows the average journey time along the A12 for each scenario. The graph demonstrates that the journey times along the main road show very little change for either direction or time period.

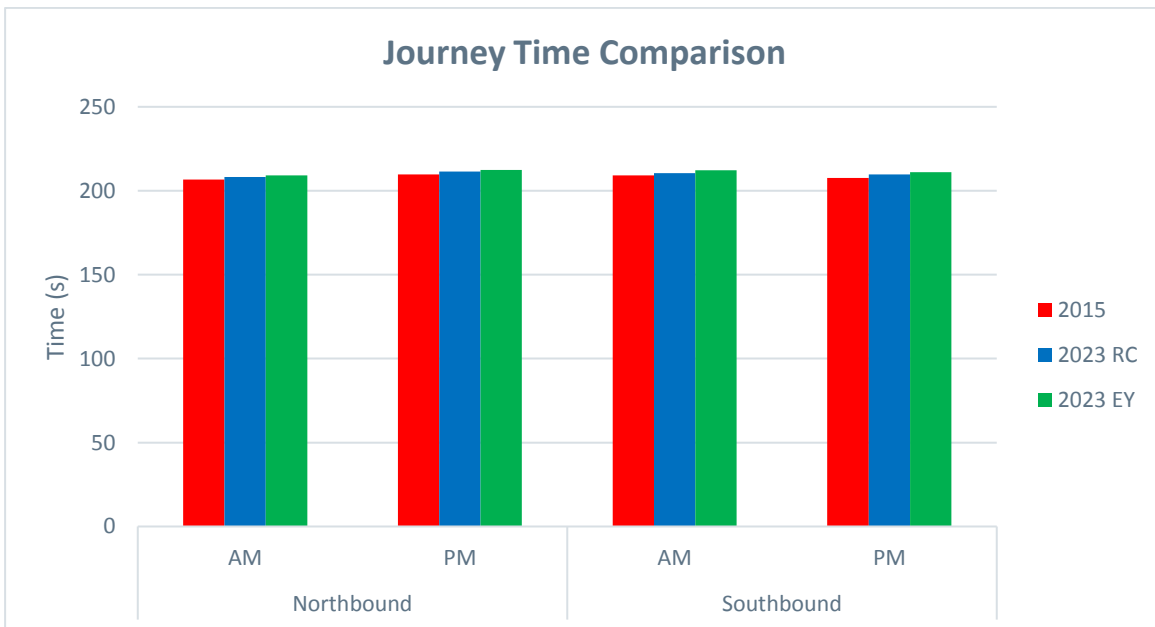

Figure 27 – 2023 A12 Journey Time comparison

- 5.2.6. Overall the network-wide statistics show that the impact felt by the average driver as a result of the Sizewell C Early Years construction traffic will be negligible both in the AM and PM periods.

JUNCTION PERFORMANCE

5.2.7. Queue and average delay results have been collected for all junctions in the model in order to assess the performance of each junction.

5.2.8. Figure 28 shows the average delay for each junction over the whole AM and PM periods. The values shown below represent the average of all turning movements in the junction.

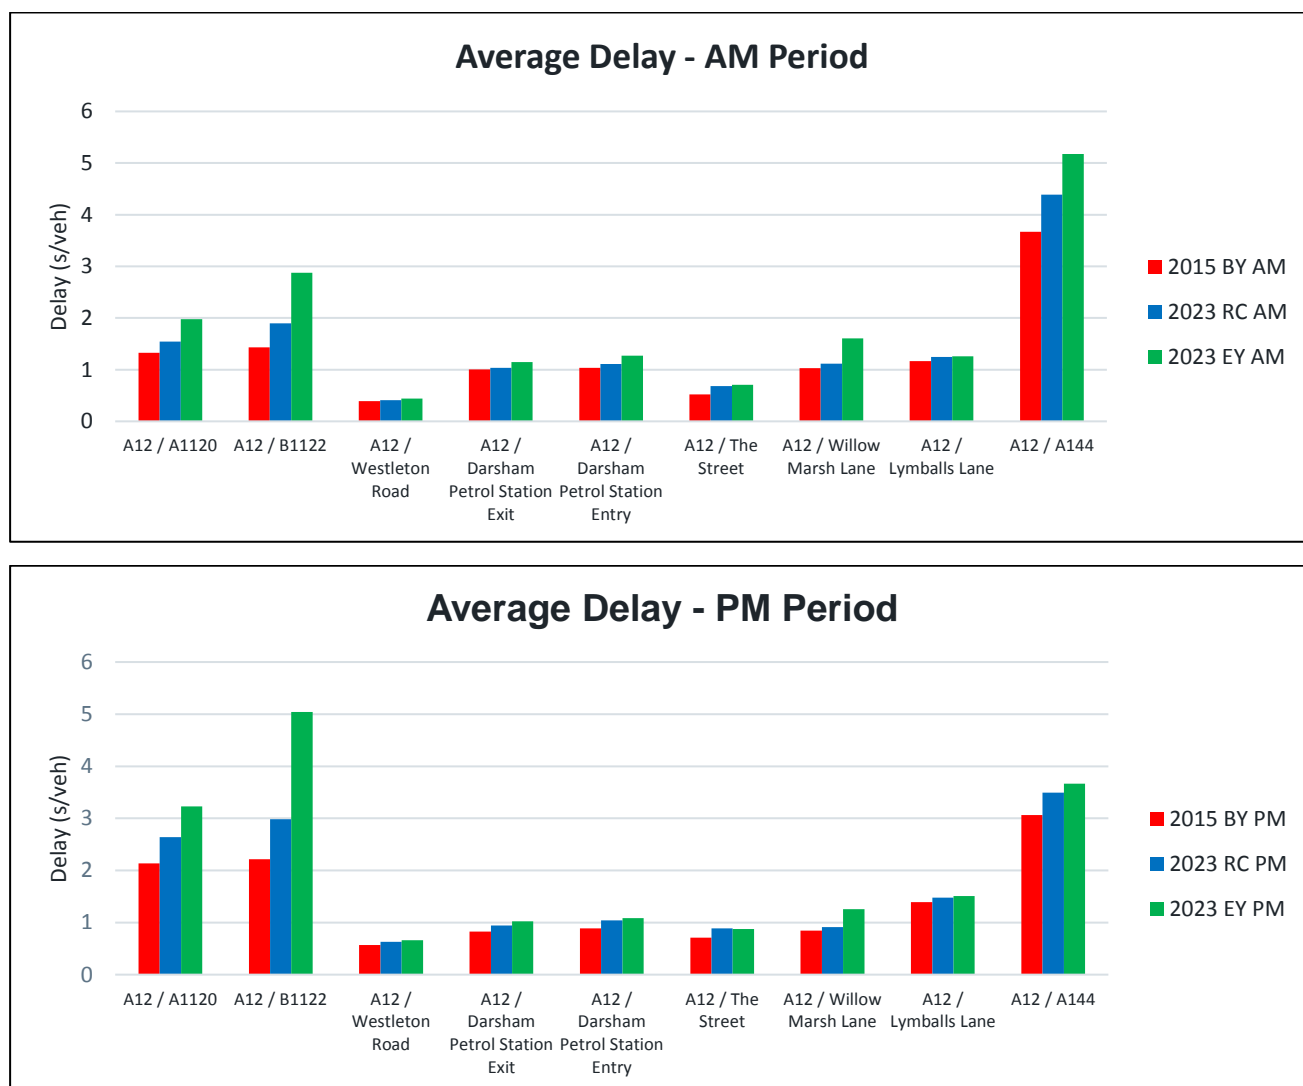

Figure 28 – Junction Average Delay

5.2.9. The graphs show that the level of delay is very low at the A12 junctions with Westleton Road, Darsham Petrol Station, The Street, Willow Marsh Lane and Lymballs Lane. A higher level of delay is observed at the A12 / A1120, A12 / B1122 and A12 / A144 junctions. The addition of Sizewell construction traffic increases delays by an average of 2 seconds per vehicle at the A12 / B1122 junction during the AM and PM periods and by approximately 1 second at the A12 / A144 junction during the AM period.

5.2.10. A more detailed results analysis of the peak hour queue lengths, and where appropriate delay, is provided below for the main junctions in the VISSIM network. The graphs shown below represent

the maximum queue recorded during each 5-minute period, averaged for all the simulation runs in each scenario. A full set of queue graphs for all junctions can be found in Appendix C.

A12 / A1120

5.2.11. Figure 29 shows the modelled queue lengths during the AM period at the A12 / A1120 junction. The graphs indicate that there is no queuing between 6 and 7 am, and that queues remain short (no more than 40m / 7 vehicles) during the rest of the AM period. There is little variation between the Reference Case and Early Years scenarios.

Figure 29 – A12 / A1120 AM Queue lengths

5.2.12. Due to the proximity between the A12 / A1120 and A12 / B1122 junctions, a more detailed analysis has been performed on the A12 southbound approach to the A1120 Yoxford High Street junction to assess the impact on the upstream junction, shown in Table 22. When the individual simulation runs are analysed, a large variability in queue length is shown in the model on the A12 southbound movement (queue counter #302) over time and between simulation runs. This is due to the varying gaps in A12 northbound traffic that opposes this movement. The variability in the presence of right-

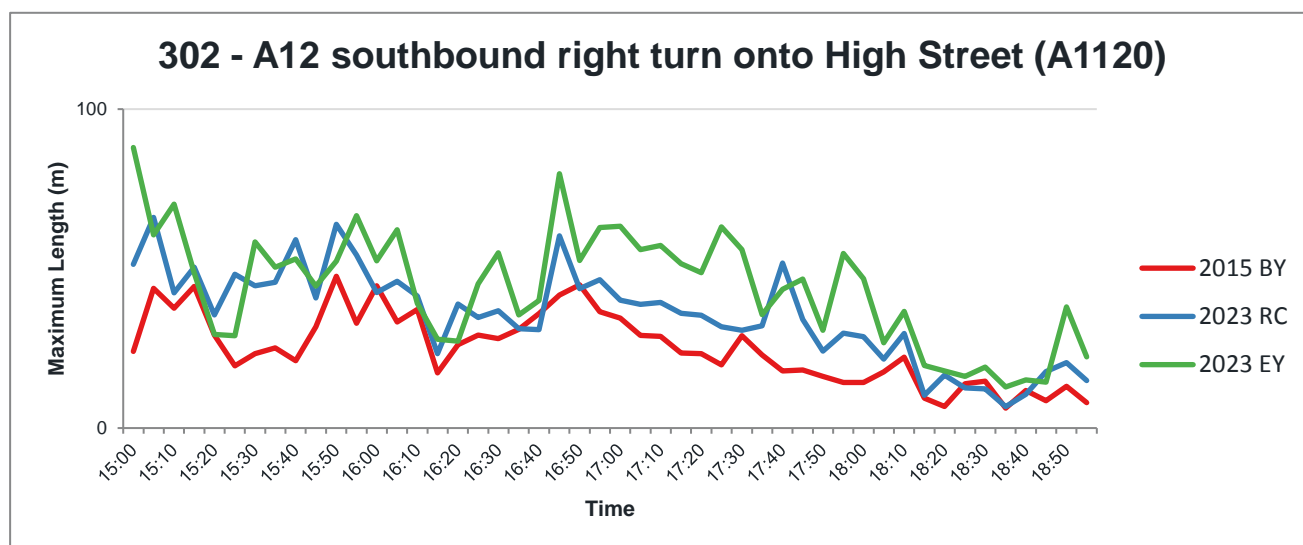

turning traffic, and the gaps in the northbound flow, results in fluctuating queue lengths which could reach back to the existing A12 / B1122 junction which is located approximately 150m upstream.

- 5.2.13. During the AM period, one out of ten runs in the 2023 Reference Case scenario and one out of ten runs in the 2023 Early Years scenario show a maximum queue of more than 150m at least once during the simulation, thus reaching the existing A12 / B1122 junction. This level of queueing occurs for less than five minutes in all runs.

Table 22 – A12 / A1120 queue spillback analysis – AM period

Scenario	Queuing distance between A12 / A1120 and existing A12 / B1122 (m)	Percentage of runs where queue reaches existing B1122 junction (%)	Length of time during which queue reaches existing B1122 junction	Absolute maximum queue (m)
2015 Base Year	150	0%	-	123
2023 Reference Case	150	10%	< 5 mins	155
2023 Early Years	150	10%	< 5 mins	166

- 5.2.14. Figure 30 shows the queue lengths during the PM period at the A12 / A1120 junction. The right-turn queues from the A12 southbound approach are higher in the PM period compared to the AM period. The queue in the Early Years Scenario are most noticeably higher than the Reference Case between 17:00 and 18:00, where the queue is approximately 30m longer but, on average, they do not exceed the 150m stacking area available. The queues on the High Street remain low during the modelled period.

Figure 30 – A12 / A1120 PM Queue lengths

5.2.15. As with the AM period, a more detailed analysis has been conducted on the A12 southbound approach to determine the impact on the upstream junction, as shown in Table 23. This indicated that no runs in the 2023 Reference Case scenario and four out of ten runs in the 2023 Early Years scenario show a maximum queue of more than 150m at least once during the simulation, thus reaching the existing A12 / B1122 junction. This level of queueing occurs for less than five minutes in all runs and therefore impact is confined to a short period of time.

Table 23 – A12 / A1120 queue spillback analysis – PM period

Scenario	Queuing distance between A12 / A1120 and existing A12 / B1122 (m)	Percentage of runs where queue reaches existing B1122 junction (%)	Length of time during which queue reaches existing B1122 junction	Absolute maximum queue (m)
2015 Base Year	150	0%	-	122
2023 Reference Case	150	0%	-	144
2023 Early Years	150	40%	< 5 min	234

A12 / B1122

5.2.16. Figure 31 shows the modelled queue lengths during the AM period at the existing A12 / B1122 junction. The graph indicates that queues for the right turning movement from the A12 northbound onto the B1122 are predicted to be approximately 14m (2 vehicles) during the Reference Case scenario which is expected to increase to a maximum queue of 36m (6 vehicles) in the 2023 Early Years scenario.

5.2.17. The queues on the B1122 approach in the 2023 Reference Case are predicted to increase slightly compared to the 2015 Base scenario. An increase in queues on the B1122 can be observed from a

maximum of 25m (4 vehicles) in the Reference Case scenario to 44m (7 vehicles) in the Early Years scenario, especially from 07:15-08:00. This indicates that the Sizewell C traffic will have a small impact on the junction for a short period of time during the AM Peak.

Figure 31 – A12 / B1122 AM Queue lengths

- 5.2.18. Due to the queuing on the B1122, additional analysis has been performed for the time period from 07:00-08:00 for the main movements at the junction. This analysis is shown in Table 24.
- 5.2.19. There is an increase in delay on the B1122 in the Early Years scenario compared to the Reference Case. The delay increases from 7 seconds to 14 seconds on the left turn and from 16 to 30 seconds on the right turn. On the right turn from the A12 south to the B1122, the delay per vehicle increases from 5 seconds in the Reference Case to 8 seconds in the Early Years scenario.

Table 24 – A12 / B1122 delay analysis

	Movement Delay (s/veh) 07:00 – 08:00		
	A12 S – B1122	B1122 - A12 S	B1122 - A12 N
2023 Reference Case	5	7	16
2023 Early Years	8	14	30

- 5.2.20. Due to the proximity between the A12 / A1120 and A12 / B1122 junctions, a more detailed analysis has been performed on the A12 northbound approach to the existing B1122 junction (queue counter #401) to determine the impact on the upstream A1120 junction, as shown in Table 25. This table shows that the queue for the right turn into the B1122 does not block back to the A1120 junction in any of the scenarios.

Table 25 – A12 / B1122 queue spillback analysis – AM period

Scenario	Queuing distance between A12 / A1120 and existing A12 / B1122 (m)	Percentage of runs where queue reaches A1120 junction (%)	Length of time during which queue reaches A1120 junction	Absolute maximum queue (m)
2015 Base Year	150	0	-	31
2023 Reference Case	150	0	-	33
2023 Early Years	150	0	-	115

- 5.2.21. Figure 32 shows the queue lengths during the PM period at the existing A12 / B1122 junction. The first graph shows that the queues at the A12 northbound right-turn lane are slightly increased in the Early Years Scenario compared to the Reference Case.
- 5.2.22. The queues on the minor arm (B1122) are generally higher during the PM period than in the AM period. They are moderately increased in the Early Years scenario compared to the Reference Case, especially from 17:00- 17:30. The maximum queue length for the Early Years scenario is 78m (thirteen vehicles), compared to 49m (eight vehicles) in the Reference Case.

Figure 32 – A12 / B1122 PM Queue lengths

- 5.2.23. Due to the long queues seen on the B1122 an additional analysis on the delay between 17:00 and 18:00 for the main movements at the junction is shown in Table 26.
- 5.2.24. There is a moderate increase in delay from the B1122 in the Early Years scenario compared to the Reference Case. The delay increases from 9 seconds to 24 seconds per vehicle on the left turn and from 26 to 45 seconds per vehicle on the right turn.

Table 26 – A12 / B1122 PM delay analysis

	Movement Delay (s/veh) 17:00 – 18:00		
	A12 S – B1122	B1122 - A12 S	B1122 - A12 N
2023 Reference Case	5	9	26
2023 Early Years	6	24	45

5.2.25. As with the AM period analysis, a more detailed analysis has been performed on the A12 northbound approach (queue counter #401) for the PM period, as shown in Table 27. The table shows that the right turn queue into the B1122 does not reach the A1120 junction in any scenarios or runs.

Table 27 – A12 / B1122 queue spillback analysis – PM period

Scenario	Queuing distance between A12 / A1120 and existing A12 / B1122 (m)	Percentage of runs where queue reaches A1120 junction (%)	Length of time during which queue reaches A1120 junction	Absolute maximum queue (m)
2015 Base Year	150	0	-	23
2023 Reference Case	150	0	-	38
2023 Early Years	150	0	-	38

5.2.26. The AM and PM results for the A12 / B1122 junction indicate that the Sizewell C traffic will have a slight impact on the junction during both peak periods but the existing t-junction is not expected to become over-capacity in 2023. If it is found that the Sizewell C traffic has an impact on the performance of the minor arm in 2023, it may be possible to provide additional bus services to/from Sizewell C prior to the provision of the proposed roundabout mitigation scheme. The Sizewell C related traffic flows using the B1122 at this junction are mainly heading towards the A1120, A144 and B1117.

A12 / A144

5.2.27. Figure 33 shows the queue lengths during the AM period at the A12 / A144 junction. The first graph shows that the queues on the A12 southbound right-turn lane are small in all scenarios. The second graph shows an increasing trend in queue lengths for the A144 approach, with the 07:00-08:15 period experiencing the longest queue lengths. The extra vehicles from the Early Years scenario increase the queue length only during this time period with relatively little impact felt during the rest of the AM period. During the AM peak period, the average queue is 6m (one vehicle) longer than the Reference Case, and an overall maximum queue of 72m (twelve vehicles) compared with 63m (ten vehicles) in the Reference Case. However, this increase does not have a significant effect on the overall junction performance as the maximum queue lengths quoted are not consistently present during each 5-minute interval as queues at this location are quite variable.

Figure 33 – A12 / A144 AM Queue lengths

5.2.28. Figure 34 shows the queue lengths during the PM period at the A12 / A144 junction. As in the AM period, there is barely any queuing at the A12 southbound right-turn lane during the PM. The queues on the A144 are much shorter in the PM compared to the AM period, with maximum queues of 47m (eight vehicles). There is little difference in queue lengths between the 2023 Reference Case and Early Years scenario.

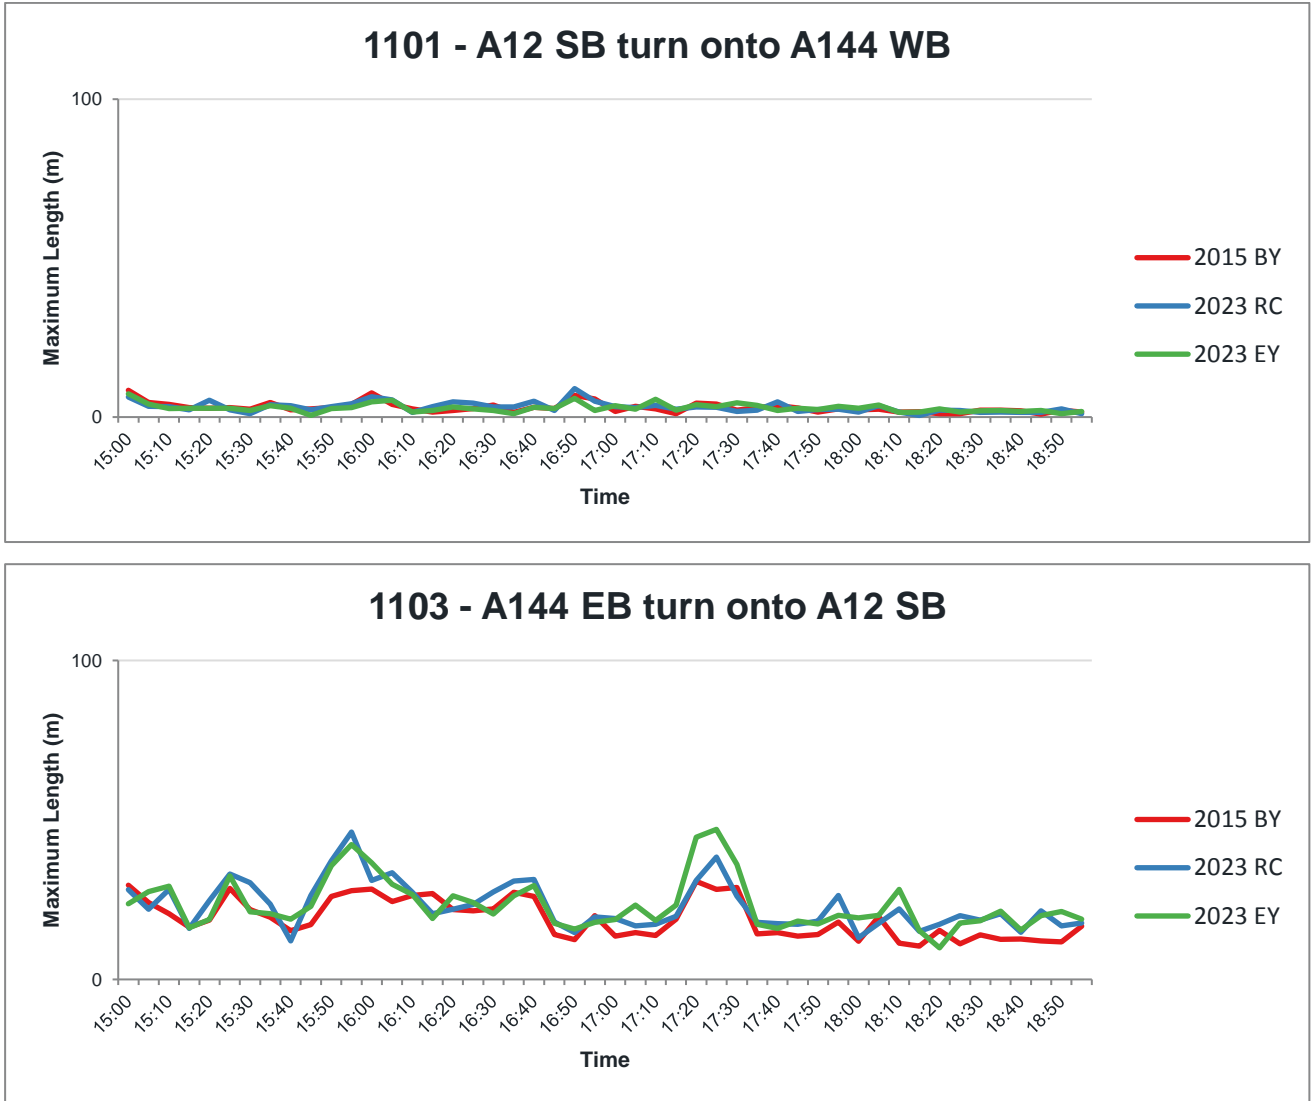

Figure 34 – A12 / A144 PM Queue lengths

PERFORMANCE SUMMARY

- 5.2.29. The Sizewell C construction traffic in 2023 does not have a significant impact in the overall highway network around Yoxford but it does have a small effect in some localised areas.
- 5.2.30. The network performance statistics indicate that the average time, distance and delay that vehicles experience in the network remains virtually unchanged and the journey time for vehicles travelling along the A12 would show very little change.
- 5.2.31. However, the addition of Sizewell C construction traffic does result in some increases in queues and delays on the B1122 approach from 07:30-08:00 and 17:00-18:00 in the 2023 Early Years scenario prior to the park and ride sites and B1122 roundabout being opened. If it is found that the Sizewell C traffic has an impact on the performance of the minor arm in 2023, it may be possible to provide additional bus services to/from Sizewell C prior to the provision of the proposed roundabout mitigation scheme.
- 5.2.32. There is also a small increase in queuing on the A144 during the AM peak from 07:00-08:15, although the queues at all other peak times are similar to the Reference Case.

- 5.2.33. In addition, the right turn queue from the A12 southbound onto the A1120 would occasionally reach back to the upstream junction. However, this situation is only likely to occur for less than five minutes before the queue dissipates and it is therefore unlikely to have a significant impact on delays in this area.

6. FORECAST SCENARIO – 2028 PEAK CONSTRUCTION

6.1. SCENARIO ASSUMPTIONS

- 6.1.1. 2028 represents the peak construction year of Sizewell C. A total of 7,900 workers would be deployed at the Sizewell C construction site, with a further 600 associated development workers. From these, 2,400 workers will reside in the on-site campus, 600 will stay in the 400 caravans on LEEIE and the rest travel from other locations as predicted by the gravity model.
- 6.1.2. By 2028 the Wickham Market and Darsham P&R sites will be fully operational and will have a high-frequency service connecting them to the Sizewell C construction site. In addition, direct bus services will be provided from Lowestoft and Ipswich via the A12.
- 6.1.3. Two mitigation measures are proposed south of the modelled area:
- A Two Village bypass at Farnham and Stratford St Andrew and
 - Sizewell Link Road, joining the A12 south of Yoxford to the B1122 east of Theberton.
- 6.1.4. VISSIM has been used to assess the 2028 Peak Construction busiest day scenario which assumes 500 HGV deliveries per day (each way) will be made to the construction site. The proposed HGV delivery profile across the day is the same as that assumed in 2023, which is shown in Figure 23.
- 6.1.5. All Sizewell C HGVs and buses are assumed to route via the A12, with those from the south using the proposed Sizewell Link Road. Those from the north would use the B1122 and join the Sizewell Link Road west of Middleton Moor.

TRANSPORT NETWORK ASSUMPTIONS

- 6.1.6. The 2028 Peak Construction scenario assumes three main changes in the network within the VISSIM model extent. The first one is the embedded mitigation at the A12 / B1122 junction, which changes from a T junction to a roundabout by 2028. Figure 35 shows how the junction was included in the model both before and after the mitigation implementation. Priority rules were included at each arm to replicate gap acceptance behaviour. Different rules were set up for each lane of the approach, for light and heavy vehicles and for time and distance rules as per the guidance in the VISSIM user manual.

Figure 35 – A12 / B1122 junction before and after embedded mitigation

6.1.7. The second major change in the transport network is the introduction of the northern park and ride site access. The northern park and ride is assumed to be located north of Darsham Railway Station and west of the A12, and will be accessed through a new roundabout on the A12. Willow Marsh Lane will be severed from the A12 at its existing connection point, and will be accessed via a new T-junction accessed via the new roundabout on the A12. Figure 36 shows the modelled northern park and ride site access before and after its construction. Priority rules were included on each arm of the roundabout to replicate gap acceptance behaviour. Different rules were set up for each lane of the approach, for light and heavy vehicles and for time and distance rules as per the guidance in the VISSIM user manual.

Figure 36 – Northern park and ride site access before and after construction

6.1.8. The third major change in the transport network is the embedded mitigation at the A12 / A144 junction, where the T-junction is assumed to be upgraded from a ghost-island T-junction to a single lane dualled t-junction. The junction would be widened to accommodate a central island which would provide more space between the two A12 carriageways for vehicles right turning from the A144. This would allow light vehicles right turning from the A144 to make the movement in two steps, stopping in the central reservoir if necessary. Figure 37 shows the modelled A12/A144 junction before and after its construction.

Figure 37 – A12 / A144 junction before and after construction

6.1.9. The detailed drawing of all the mitigations can be found in Appendix F.

TRAFFIC DEMAND ASSUMPTIONS - 2028

VISSIM matrices

- 6.1.10. As in the 2023 forecast scenario, the base, growth and Sizewell C private vehicle traffic was included in the model as dynamically assigned matrices calculated from the VISUM model. The same method of extracting and calculating the forecast matrices for VISSIM has been used.
- 6.1.11. Sizewell C construction traffic was extracted from the 2028 Peak Construction VISUM model which assumed a total peak construction workforce of 7,900 workers with an additional 600 AD workers.
- 6.1.1. Table 28 and Table 29 show the breakdown of total input matrix flows for the whole network by hourly time period for the Reference Case and Early Years scenarios respectively.

Table 28 – 2028 Network Traffic Reference Case (in vehicles per hour)

	6-7 am	7-8 am	8-9 am	3-4 pm	4-5 pm	5-6 pm	6-7 pm
Base 2028	515	1,168	1,374	1,525	1,593	1,465	1,086
Background Growth	203	232	188	227	202	228	265
SPR	-	-	24	-	-	25	-
Sizewell C	-	-	-	-	-	-	-
Total	718	1,400	1,586	1,752	1,795	1,718	1,351

Table 29 – 2028 Network Traffic Peak Construction (in vehicles per hour)

	6–7 am	7–8 am	8–9 am	3-4 pm	4-5 pm	5-6 pm	6-7 pm
Base 2028	503	1,133	1,333	1,474	1,550	1,410	1,056

Sizewell Bus services and HGV Deliveries

6.1.2. In addition to the private worker traffic input as matrices in the model, there are other vehicle movements associated with Sizewell C:

- Buses shuttling workers between:
 - Northern park and ride site and Sizewell C construction site;
 - Lowestoft and Sizewell C construction site.
- HGVs delivering construction materials and plant movements to and from Sizewell C construction site.

6.1.3. Bus services to/from Leiston, Knodishall, Ipswich and Wickham Market Park & Ride and the Sizewell C construction site are included in the VISUM models but are not relevant to the VISSIM model.

6.1.4. Table 30 shows the Sizewell C bus services included in the 2028 Peak Construction scenario. These figures include the shuttle buses from Darsham Park & Rides to Sizewell as well as the direct bus lines to Lowestoft. The bus services were modelled in VISSIM as “Public Transport Lines” on fixed routes.

Table 30 – 2028 Sizewell C Bus services

Service	6-7am	7-8am	8-9am	3-4pm	4-5pm	5-6pm	6-7pm
Darsham Park & Ride - SZC	9	9	5	8	5	9	8
SZC - Darsham Park & Ride	9	9	5	8	5	9	8
Lowestoft - SZC	2	1	0	1	0	2	2
SZC - Lowestoft	2	1	0	1	0	2	2
Total	22	20	10	18	10	22	20

6.1.5. Table 31 shows the HGV deliveries on the busiest day, per hour, to Sizewell C construction site in the 2028 Peak Construction scenario. This table only takes into account the HGV deliveries from the north, as the deliveries coming from the south will use the Sizewell Link Road, which falls outside of

the VISSIM model extent. These HGVs were modelled as vehicle type “202: HGV SZC” and assigned to “Public Transport Lines” with fixed routes and equally spaced departure times.

Table 31 – 2028 Sizewell C HGV deliveries

Delivery Site	Direction	6-7am	7-8am	8-9am	3-4pm	4-5pm	5-6pm	6-7pm
Sizewell C	Inbound	4	11	9	8	5	2	2
	Outbound	0	0	4	5	6	7	7
Total		4	11	13	13	11	9	9

6.2. SCENARIO PERFORMANCE COMPARISON

- 6.2.1. This section presents the performance comparison between the validated base year scenario (“2015”), the Reference Case scenario for 2028 (“2028 RC”), and the 2028 Peak Construction scenario (“2028 PC”) with Sizewell C construction traffic.

NETWORK-WIDE PERFORMANCE

- 6.2.2. Table 32 shows a series of network-wide statistics that were extracted from the outputs of the three different scenarios.

Table 32 – Network Performance Model Results

	AM			PM		
	2015	2028 RC	2028 PC	2015	2028 RC	2028 PC
Total Time Taken (h)	230	285	331	409	487	538
Total Distance (km)	13,622	16,724	18,966	23,941	28,065	30,516
Total Vehicles	3,118	3,745	4,428	5,831	6,751	7,421
Total Delay (h)	23	31	41	43	56	66
Avg. Time (s) / Vehicle	266	274	269	253	260	261
Avg. Time (s) / Mile	98	99	101	99	101	102
Avg. Distance (m) / Vehicle	4,370	4,466	4,284	4,105	4,157	4,112
Avg. Speed (mph)	37	36	36	36	36	35
Avg. Speed (kph)	59	59	57	59	58	57
Avg. Delay / Vehicle (s)	26	29	33	26	30	32

- 6.2.3. During the AM and PM peaks, the network-wide statistics show that time, distance and delay have a linear relationship with the number of vehicles in the network. This means that the addition of the Sizewell C vehicles result in little change to the distance and delay per vehicle when compared to the Reference Case and thus the network is not affected.

- 6.2.4. Reviewing the relative statistics, it is possible to observe that the variation between the different scenarios is low. For example, the VISSIM model predicts that the average driver will experience a delay increase of 4 seconds (+14%) in the 2028 PC AM period scenario compared to the 2028 Reference Case. During the PM peak, the average delay per vehicle is increased by 2 seconds (+6%).
- 6.2.5. This increased level of average delay is relatively low and hence does not have a significant impact in the network. The average speed throughout the network only decreases by 1 mph in the AM period and 2 mph during the PM period in the Peak Construction scenario compared to the 2028 Reference Case.
- 6.2.6. Figure 38 shows the average journey time along the A12 for each scenario.

Figure 38 – 2028 Journey Time Comparison

- 6.2.7. The Peak Construction scenario has an average increase in journey time of 12 seconds compared to the Reference Case. This increase is mostly due to the introduction of both roundabouts (Northern park and ride access and B1122) along the A12, which add slight delay to the A12 movements. As the daily variation in travel times is likely to exceed a difference of 12 seconds, it is unlikely that a change of this magnitude would be perceivable to A12 road users.

JUNCTION PERFORMANCE

- 6.2.8. Queue and average delay results have been collected for all junctions in the model in order to assess the performance of each junction.
- 6.2.9. Figure 39 shows the average delay for each junction over the whole AM and PM periods. The values shown below represent the average of all turning movements in the junction.

Figure 39 – Junction Average Delay

6.2.10. The graphs show that the level of delay is very low at the A12 junctions with Westleton Road, Darsham Petrol Station, The Street, Willow Marsh Lane and Lymballs Lane. A higher level of delay is observed at the A12 / A1120, A12 / B1122, A12 / A144 and A12 / P&R junctions. The addition of the Sizewell C construction traffic has a moderate impact on the A12 / A144 and A12 / B1122 junctions during the AM Period.

6.2.11. A detailed results analysis is provided below for the main junctions in the network; A12 / A1120, A12 / B1122, A12 / A144 and Darsham Park & Ride roundabout. The graphs shown below represent the maximum queue recorded during each 5-minute period, averaged over each iteration by scenario. A full set of queue graphs can be found in Appendix D.

A12 / A1120

6.2.12. Figure 40 shows the queue lengths during the AM period at the A12 / A1120 junction. The right-turn queues from the A12 southbound approach are similar in the 2028 Peak Construction compared to the Reference Case scenario. The queues on the High Street remain very low during the whole period in all scenarios.

Figure 40 – A12 / A1120 AM Queue lengths

6.2.13. Due to the proximity between the A12 / A1120 and A12 / B1122 junctions, a more detailed analysis has been performed on the A12 southbound approach (queue counter #302) to determine whether the queue reaches the B1122 junction. As a result of the upgrade of the A12 / B1122 junction to a roundabout in the Peak Construction scenario, the stacking distance between the B1122 and A1120 junctions is increased from 150m (current layout) to 230m. Table 33 shows that the queue from the right turn into the A1120 doesn't reach the B1122 junction in any of the scenarios.

Table 33 – A12 / A1120 queue spillback analysis – AM period

Scenario	Distance between A12 / A1120 and A12 / B1122 (m)	Percentage of runs where queue reaches A12/B1122 junction (%)	Length of time during which queue reaches A12/B1122 junction	Absolute maximum queue (m)
2028 Reference Case	150	0	-	101
2028 Peak Construction	230	0	-	115

6.2.14. Figure 41 shows the queue lengths during the PM period at the A12 / A1120 junction. The right-turn queues from the A12 southbound are similar in the Peak Construction scenario compared to the 2028 Reference Case.

6.2.15. Queues on the A1120 High Street approach onto the A12 are largely unaffected in the Peak Construction scenario.

Figure 41 – A12 / A1120 PM Queue lengths

6.2.16. Due to the proximity between the A12 / A1120 and A12 / B1122 junctions, a more detailed analysis has been undertaken on the A12 southbound approach (queue counter #302) to determine the impact on the upstream junction, shown in Table 34. In the Reference Case, the queue reaches the upstream B1122 junction in 30% of the runs. Even though the absolute maximum queue on the A12 southbound approach is longer in the Peak Construction scenario, it never reached the upstream A12 / B1122 junction (due to it being further away), which helps to mitigate any impact that could be created by the Sizewell C traffic.

Table 34 – A12 / A1120 queue spillback analysis – PM period

Scenario	Distance between A12 / A1120 and A12 / B1122 (m)	Percentage of runs where queue reaches A12/B1122 junction (%)	Length of time during which queue reaches A12/B1122 junction	Absolute maximum queue (m)
2028 Reference Case	150	30	< 5 min	159
2028 Peak Construction	230	0	-	216

A12 / B1122

6.2.17. Figure 42 shows the queue lengths during the AM period at the A12 / B1122 junction. This junction was modelled as a t-junction in the 2015 and 2028 RC scenarios and as a roundabout in the 2028 Peak Construction scenario. The graph indicates that the queue lengths on the A12 northbound and B1122 westbound remain low in the Peak Construction scenario. There is likely to be some queuing on A12 southbound approach due to the introduction of the roundabout, with a maximum queue length of 26m (five vehicles). This queue would occur on the approach to Yoxford, rather than in the village itself and dissipates quickly.

Figure 42 – A12 / B1122 AM Queue lengths

6.2.18. Due to the proximity between the A12 / A1120 and A12 / B1122 junctions, a more detailed analysis has been performed on the A12 northbound approach (queue counter #401) to determine the impact on the upstream A1120 junction, as shown in Table 35. This table shows that the upstream A1120 junction would not be blocked in any of the scenarios and the absolute maximum queue is far from reaching the A1120 junction.

Table 35 – A12 / B1122 AM spillback analysis

Scenario	Distance between A12 / A1120 and A12 / B1122 (m)	Percentage of runs where queue reaches A1120 junction (%)	Length of time during which queue reaches A1120 junction	Absolute maximum queue (m)
2028 Reference Case	150	0	-	70
2028 Peak Construction	230	0	-	64

6.2.19. Due to the change of the A12/B1122 junction from a T-junction to a roundabout, the arms experiencing queues are different to those in the Reference Case. Thus, an additional assessment has been conducted to assess the delay during the most congested hour (08:00 – 09:00) as shown in Table 36.

6.2.20. This shows a reduction in delay on the B1122 approach. Conversely, the delay on the A12 is slightly increased, but remains low.

Table 36 – A12 / B1122 AM delay analysis

	Movement Delay (s/veh) 08:00 – 09:00					
	A12 S – A12 N	A12 S – B1122	A12 N – A12 S	A12 N – B1122	B1122 – A12 S	B1122 – A12 N
2028 Reference Case	0	7	1	1	7	20
2028 Peak Construction	2	3	5	3	4	7

6.2.21. Figure 43 shows the queue lengths during the PM period at the A12 / B1122 junction. In the Peak Construction scenario, the queue lengths remain the same or lower than the Reference Case for the B1122 approach (minor arm, T-junction), but they increase on the A12 approaches, especially southbound due to the introduction of the roundabout.

6.2.22. The new roundabout creates a short-term, intermittent queue on the A12 southbound approach for the Peak Construction scenario, with a maximum queue length of 33m (six vehicles). Queues dissipate quickly and are generally moving rather than stationary so little impact is felt at this location.

Figure 43 – A12 / B1122 PM Queue lengths

6.2.23. Due to the proximity between the A12 / A1120 and A12 / B1122 junctions, a more detailed analysis has been performed on the A12 northbound approach (queue counter #401) to determine the impact on the upstream A1120 junction, shown in Table 37. The table shows that the A12 northbound queue never reaches the A1120 junction in any of the scenarios and the absolute maximum queue is far from reaching this location.

Table 37 – A12 / B1122 queue spillback analysis – PM period

Scenario	Distance between A12 / A1120 and A12 / B1122 (m)	Percentage of runs where queue reaches A1120 junction (%)	Length of time during which queue reaches A1120 junction	Absolute maximum queue (m)
2028 Reference Case	150	0	-	84
2028 Peak Construction	230	0	-	95

6.2.24. Due to the change of the A12/B1122 junction from a t-junction to a roundabout, the arms experiencing queues are different to those in the Reference Case. Thus, an additional analysis on the delay during the most congested hour (16:00-17:00) is shown in Table 38.

6.2.25. The level of delay experienced on the B1122 approach to the existing A12 junction in the Reference Case scenario during the PM period is significant. As a result of the upgrade to a roundabout, the B1122 traffic delay is reduced from 20s per vehicle for southbound traffic and 36s per vehicle for northbound traffic to 5-7s per vehicle. On the other hand, the delay on the A12 is slightly increased, but still remains low.

Table 38 – A12 / B1122 PM maximum delay analysis

	Movement Delay (s/veh) 16:00 – 17:00					
	A12 S – A12 N	A12 S – B1122	A12 N – A12 S	A12 N – B1122	B1122 – A12 S	B1122 – A12 N
2028 Reference Case	0	6	1	1	20	36
2028 Peak Construction	3	4	5	3	5	7

A12 / A144

6.2.26. Figure 44 shows the queue lengths during the AM period at the A12 / A144 junction. The queue on the A12 southbound right turn remains at a similar level in all scenarios. Although the junction has been upgraded, the queue length on the A144 approach is longer in the Peak Construction scenario than the Reference Case, most noticeably between 07:30 and 08:00. This is due to the much higher flow on the A144 due to the Sizewell C traffic. The maximum queue observed in the Peak Construction scenario is 93m (sixteen vehicles) compared to 67m (eleven vehicles) in the Reference Case.

Figure 44 – A12 / A144 AM Queue lengths

6.2.27. Figure 45 shows the queue lengths during the PM period at the A12 / A144 junction. As with the AM period, there is little queuing on the A12 southbound right-turn lane during the PM period. The queues on the A144 are much shorter in the PM compared to the AM period and there is little difference in queue lengths between the Peak Construction and Reference Case scenarios.

Figure 45 – A12 / A144 PM Queue lengths

Northern park and ride roundabout

6.2.28. Figure 46 shows the queue lengths during the AM period at the proposed northern park and ride roundabout. The maximum queue observed at the A12 northbound approach is 36m (six vehicles). The queues on the other approaches are not significant.

Figure 46 – P&R roundabout AM Queue lengths

- 6.2.29. The implementation of the roundabout results in a delay increase of 4 seconds per vehicle on the A12 northbound and southbound movements. This level of delay is very low and likely to be imperceptible.
- 6.2.30. Figure 47 shows the queue lengths during the PM period at the northern park and ride roundabout. The maximum queue observed is on the A12 northbound approach and is 35m (six vehicles) in the Peak Construction scenario. The queues on the other approaches are insignificant.

Figure 47 – Northern park and ride roundabout PM Queue lengths

6.2.31. The implementation of the roundabout results in a delay increase of 4 seconds on the A12 northbound and southbound movements in both scenarios. This level of delay is low and likely to be imperceptible.

PERFORMANCE SUMMARY

6.2.32. Journey times along the A12 are expected to increase by 12 seconds due to the extra vehicles on the network and the construction of the A12/B1122 and Darsham Park and Ride roundabouts.

6.2.33. The minor junctions in the study area do not experience a significant impact in their performance due to the addition of Sizewell C construction traffic. However, some impact is observed at the major junctions:

- The upgrade of the A12 / B1122 junction to a roundabout significantly reduces the level of delay at the B1122 approach, especially during the PM period. Even though the upgrade of the junction to a roundabout leads to a slight increase in delay on the A12, this remains low and the roundabout operates efficiently. The queues at the A12 northbound approach to the roundabout remain low in all scenarios and do not reach the upstream A1120 junction;
- The queue length on the A12 southbound approach to the A1120 junction is similar in the 2028 Reference Case and 2028 Peak Construction scenarios. Although the absolute maximum queue is longer in the Peak Construction scenario, the likelihood of the maximum queue reaching the upstream A12/B1122 junction is reduced compared to the Reference Case due to the increased stacking distance between the A1120 and B1122 because of the upgraded A12 / B1122 junction;
- The implementation of a roundabout for the northern park and ride site has a slight impact on queues and delays on the A12 approaches. However, these delays are minimal and the roundabout operates efficiently in the Peak Construction scenario.
- The maximum average queue on the A144 approach to the A12 increases from 67m in the Reference Case to 93m in Peak Construction scenario during the AM period. This is due to the large increase in flow on the A144 approach due to Sizewell C. Queues in the PM peak are lower than the AM and are similar in the Reference Case and Peak Construction scenarios.

7. FORECAST SCENARIO – 2034 OPERATIONAL PHASE

7.1. SCENARIO ASSUMPTIONS

- 7.1.1. 2034 represents the normal operation of Sizewell C following construction. A total of 900 workers would be deployed at Sizewell C, all travelling from locations as predicted by the gravity model.
- 7.1.2. Following the completion of the construction of Sizewell C, the northern park and ride site would be removed and the original A12 T-junction with Willow Marsh Lane would be restored.
- 7.1.3. The proposed roundabout at the junction of the A12/B1122 would remain in place as would the upgraded A12/A144 junction.
- 7.1.4. The two mitigation measures proposed south of the modelled area would remain in place:
 - A Two Village bypass at Farnham and Stratford St Andrew and
 - Sizewell Link Road, joining the A12 south of Yoxford to the B1122 east of Theberton.
- 7.1.5. The following daily HGV deliveries associated with Sizewell C will be made, on a typical day:
 - To/from Sizewell C: 10 HGVs each way; and
 - To/from MasterLord Industrial Estate: 5 HGVs each way.
- 7.1.6. All SZC HGVs and buses will route via the A12, with those from the south using the proposed Sizewell Link Road. Those from the north would use the B1122 and join the Sizewell Link Road west of Middleton Moor.

TRANSPORT NETWORK ASSUMPTIONS

- 7.1.7. The 2034 Operational Phase scenario assumes two main changes in the network within the VISSIM model extent, compared to the Reference Case. The first one is the embedded mitigation at the A12 / B1122 junction, which is changed from a T-junction to a roundabout. Figure 35 shows how the junction was included in the model both before and after the mitigation implementation.
- 7.1.8. The second change in the transport network is the embedded mitigation at the A12 / A144 junction, where the T-junction has been upgraded from a ghost-island to a single lane dualling type of T-junction. Figure 37 shows the modelled A12 / A144 junction before and after its construction.
- 7.1.9. The detailed drawing of the mitigation measures can be found in Appendix F.

TRAFFIC DEMAND ASSUMPTIONS - 2034

VISSIM matrices

- 7.1.10. As in the 2023 and 2028 forecast scenarios, the base, growth and Sizewell C private vehicle traffic was included in the model as dynamically assigned matrices calculated from the VISUM model. The same method of extracting and calculating the forecast matrices for VISSIM has been used.
- 7.1.11. Sizewell C construction traffic was extracted from the 2034 Operational Phase VISUM model which assumed a total workforce of 900 workers.
- 7.1.12. The Scottish Power Development that was included as explicit matrices in the 2023 and 2028 forecast scenarios has assumed to be completed by 2034 so is not included in the 2034 VISUM models.

7.1.13. Table 39 and Table 40 show the breakdown of total input matrix flows for the whole network by hourly time period for the Reference Case and Early Years scenarios respectively.

Table 39 – 2034 Network Traffic Reference Case (in vehicles per hour)

	6-7 am	7-8 am	8-9 am	3-4 pm	4-5 pm	5-6 pm	6-7 pm

Sizewell C HGV Deliveries

7.1.14. Table 41 shows the HGV deliveries per hour to the Sizewell C Master Lord Industrial Estate in the 2034 Operational Phase scenario. These HGVs were modelled as vehicle type “202: HGV SZC” and assigned to “Public Transport Lines” with fixed routes and equally spaced departure times.

Table 41 – 2034 Sizewell C HGV deliveries

Delivery Site	Direction	6-7am	7-8am	8-9am	3-4pm	4-5pm	5-6pm	6-7pm
Master Lord Industrial Estate	Inbound	0	1	0	0	0	0	0
	Outbound	0	0	1	0	0	0	0
Total		0	1	1	0	0	0	0

7.2. SCENARIO PERFORMANCE COMPARISON

7.2.1. This section presents the performance comparison between the validated base year scenario (“2015”), the Reference Case scenario for 2034 (“2034 RC”), and the 2034 Operational Phase scenario (“2034 OP”) with Sizewell C construction traffic.

NETWORK-WIDE PERFORMANCE

7.2.2. Table 42 shows a series of network-wide statistics that were extracted from the outputs of the four different scenarios.

Table 42 – Network Performance Model Results

	AM			PM		
	2015	2034 RC	2034 OP	2015	2034 RC	2034 OP
Total Time Taken (h)	230	302	302	409	526	517
Total Distance (km)	13,622	17,579	17,501	23,941	29,992	29,604
Total Vehicles	3,118	3,936	3,862	5,831	7,207	7,021

Avg. Distance (m) / Vehicle	4,370	4,467	4,532	4,105	4,162	4,217
Avg. Speed (mph)	37	36	36	36	35	36
Avg. Speed (kph)	59	58	58	59	57	57
Avg. Delay / Vehicle (s)	26	31	33	26	33	32

7.2.3. During the AM and PM peaks, the network-wide statistics show that time, distance and delay have a linear relationship with the number of vehicles in the network. This means that the Sizewell C extra vehicles experience a similar time, distance and delay as the vehicles from the Reference Case and thus the network is not impacted.

7.2.4. Reviewing the relative statistics, it can be seen that the variation between the different scenarios is low. For example, the VISSIM model predicts that the average driver will experience a delay increase of 2 seconds (+6%) in the 2034 OP AM period scenario compared to the Reference Case whilst during the PM peak, the average delay per vehicle is decreased by 1 seconds (-3%).

7.2.5. This change in average delay is relatively low and hence does not have a significant impact in the network. The average speed throughout the network stays the same during both peak periods in the Operational Phase scenario compared to the Reference Case.

7.2.6. Figure 48 shows the average journey time along the A12 for each scenario.

Figure 48 – 2034 Journey Time Comparison

7.2.7. The Operational Phase scenario has an average increase in journey time of 4 seconds compared to the Reference Case. This increase is mostly due to the introduction of both roundabouts (Northern park and ride site access and B1122 roundabout) along the A12, which add slight delay to the A12 movements. As the daily variation in travel times is likely to exceed a difference of 4 seconds per vehicle, it is unlikely that a change of this magnitude would be perceptible to A12 road users.

JUNCTION PERFORMANCE

7.2.8. Queue and average delay results have been collected for all junctions in the model in order to assess the performance of each junction.

7.2.9. Figure 49 shows the average delay for each junction over the whole AM and PM periods. The values shown below represent the average of all turning movements in the junction.

Figure 49 – Junction Average Delay

- 7.2.10. The graphs show that the level of delay is low at the A12 junctions with Westleton Road, Darsham Petrol Station, The Street, Willow Marsh Lane and Lymballs Lane. A higher level of delay is observed at the A12 / A1120, A12 / B1122 and A12 / A144 junctions. The addition of Sizewell construction traffic does not have a significant impact on any of the junctions. The A12 / B1122 junction upgrade to a roundabout leads to improvements in delay during the PM period.
- 7.2.11. Detailed results analysis is provided below for the main junctions in the network; A12 / A1120, A12 / B1122 and A12 / A144. The graphs shown below represent the maximum queue recorded during each 5-minute period, averaged over each iteration by scenario. A full set of queue graphs can be found in Appendix E.

A12 / A1120

- 7.2.12. Figure 50 shows the queue lengths during the AM period at the A12 / A1120 junction. The right-turn queues from the A12 southbound approach are predicted to be slightly shorter in the Operational Phase scenarios compared to the Reference Case, with a maximum queue length of 51m (nine vehicles) compared to 62m (ten vehicles). The queues on the High Street remain low during the entire modelled period in all scenarios.

Figure 50 – A12 / A1120 AM Queue lengths

7.2.13. Due to the proximity between the A12 / A1120 and A12 / B1122 junctions, a more detailed analysis has been performed on the A12 southbound approach (queue counter #302) to determine whether the queue reaches the B1122 junction. As a result of the upgrade of the A12 / B1122 junction to a roundabout in the Operational Phase scenario, the stacking distance between the B1122 and A1120 junctions is increased from 150m (current layout) to 230m. Table 43 shows that the queue from the right turn into the A1120 doesn't reach the B1122 junction in the Operational Phase scenario.

Table 43 – A12 / A1120 queue spillback analysis – AM period

Scenario	Distance between A12 / A1120 and A12 / B1122 (m)	Percentage of runs where queue reaches A12/B1122 junction (%)	Length of time during which queue reaches A12/B1122 junction	Absolute maximum queue (m)
2034 Reference Case	150	1	< 5 min	188
2034 Operational Phase	230	0	-	139

7.2.14. Figure 51 shows the queue lengths during the PM period at the A12 / A1120 junction. The queue lengths are similar or slightly shorter in the Operational Phase compared to the Reference Case.

Figure 51 – A12 / A1120 PM Queue lengths

7.2.15. Due to the proximity between the A12 / A1120 and A12 / B1122 junctions, a more detailed analysis has been undertaken on the A12 southbound approach (queue counter #302) to determine the

impact on the upstream junction, shown in Table 44. Even though the queue on the A12 southbound approach is sometimes longer in the Operational Phase scenario, the queue only reaches the upstream B1122 junction in 10% of runs, compared to 70% of the runs in the Reference Case. This is due to the increased stacking capacity provided by the introduction of the B1122 roundabout which is located further north than the existing junction. The queues that do form are only present briefly and quickly dissipate.

Table 44 – A12 / A1120 queue spillback analysis – PM period

Scenario	Distance between A12 / A1120 and A12 / B1122 (m)	Percentage of runs where queue reaches A12/B1122 junction (%)	Length of time during which queue reaches A12/B1122 junction	Absolute maximum queue (m)
2034 Reference Case	150	70	< 5 min	197
2034 Operational Phase	230	10	< 5 min	238

A12 / B1122

7.2.16. Figure 52 shows the queue lengths during the AM period at the A12 / B1122 junction. This junction was modelled as a T junction in the 2015 and 2034 RC scenarios and as a roundabout in the 2034 Operational Phase scenario. The graph indicates that the queue lengths in the Operational Phase scenario remains very low on the A12 northbound approach. There would be some queuing on A12 southbound approach due to the introduction of the roundabout but the maximum queue length is only 41m (seven vehicles). This queuing would occur on the approach to Yoxford, rather than in the village itself. On the B1122 the queue length is smaller in the Operational Phase scenario due to the introduction of the roundabout.

Figure 52 – A12 / B1122 AM Queue lengths

7.2.17. Due to the proximity between the A12 / A1120 and A12 / B1122 junctions, a more detailed analysis has been performed on the A12 northbound approach (queue counter #401) to determine the impact on the upstream A1120 junction, shown in Table 45. This table shows that the upstream A1120 junction would not be blocked in any of the scenarios and the absolute maximum queue is far from reaching the A1120 junction.

Table 45 – A12 / B1122 AM spillback analysis

Scenario	Distance between A12 / A1120 and A12 / B1122 (m)	Percentage of runs where queue reaches A1120 junction (%)	Length of time during which queue reaches A1120 junction	Absolute maximum queue (m)
2034 Reference Case	150	0	-	40
2034 Operational Phase	230	0	-	61

- 7.2.18. Due to the change of the A12/B1122 junction from a T-junction to a roundabout, the arms experiencing queues are different to those in the Reference Case. Thus, additional analysis on the delay during the most congested hour (08:00-09:00) is shown in Table 46.
- 7.2.19. There is a reduction in delay at the junction, most significantly on the B1122 approach. The slight increase in delay on the A12 southbound remains low and is not significant.

Table 46 – A12 / B1122 AM maximum delay analysis

	Movement Delay (s/veh) 08:00 – 09:00					
	A12 S – A12 N	A12 S – B1122	A12 N – A12 S	A12 N – B1122	B1122 – A12 S	B1122 – A12 N
2034 Reference Case	0	8	1	1	9	26
2034 Operational Phase	2	3	5	3	4	6

- 7.2.20. Figure 53 shows the queue lengths during the PM period at the A12 / B1122 junction. Due to the introduction of the roundabout in the Operational Phase scenario, the queue lengths are significantly lower than the Reference Case on the B1122 approach. They do however increase on the A12 approaches, with a maximum queue on the northbound approach of 48m (eight vehicles). Despite this queue, the junction does operate effectively in all scenarios. Queues dissipate quickly and are generally moving rather than stationary so little impact is felt at this location.

Figure 53 – A12 / B1122 PM Queue lengths

7.2.21. Due to the proximity between the A12 / A1120 and A12 / B1122 junctions, a more detailed analysis has been performed on the A12 northbound approach (queue counter #401) to determine the impact on the upstream A1120 junction, shown in Table 47. The table shows that the A12 northbound queue doesn't reach the A1120 junction in any of the scenarios and the absolute maximum queue does not reach this location.

Table 47 – A12 / B1122 queue spillback analysis – PM period

Scenario	Distance between A12 / A1120 and A12 / B1122 (m)	Percentage of runs where queue reaches A1120 junction (%)	Length of time during which queue reaches A1120 junction	Absolute maximum queue (m)
2034 Reference Case	150	0	-	64
2034 Operational Phase	230	0	-	113

- 7.2.22. Due to the change of the A12/B1122 junction from a T-junction to a roundabout, the location of the queues at the approaches have changed. Thus, an additional analysis on the delay during the most congested hour (16:00 – 17:00) is shown in Table 48.
- 7.2.23. The level of delay experienced on the B1122 approach to the existing A12 junction in the Reference Case scenario during the PM period is significant. As a result of the upgrade to a roundabout, the B1122 traffic delay is reduced from 31s for southbound traffic and 49s for northbound traffic to 5-8s per vehicle. On the other hand, the delay on the A12 is slightly increased, but still remains low.

Table 48 – A12 / B1122 PM maximum delay analysis

	Movement Delay (s/veh) 16:00 – 17:00					
	A12 S – A12 N	A12 S – B1122	A12 N – A12 S	A12 N – B1122	B1122 – A12 S	B1122 – A12 N
2034 Reference Case	0	7	1	1	31	49
2034 Operational Phase	3	4	5	3	5	8

A12 / A144

- 7.2.24. Figure 54 shows the queue lengths during the AM period at the A12 / A144 junction. The second graph shows that the queue length at the A144 approach has similar queues in the Operational Phase when compared to the Reference Case. On the A12 southbound approach the queues are small in all scenarios.

Figure 54 – A12 / A144 AM Queue lengths

7.2.25. Figure 55 shows the queue lengths during the PM period at the A12 / A144 junction. As in the AM period, there is little queuing on the A12 southbound right-turn lane during the PM period. The queues on the A144 are slightly shorter in the Operational Phase scenario compared to the Reference Case and are shorter overall in the PM compared to the AM period.

Figure 55 – A12 / A144 PM Queue lengths

PERFORMANCE SUMMARY

- 7.2.26. The impact of the Sizewell C construction traffic in the Operational Phase scenario on the network around Yoxford in 2034 is reasonably low.
- 7.2.27. The minor junctions in the study area do not experience a significant impact in their performance due to the addition of Sizewell C construction traffic. However, a small amount of impact is observed at the major junctions:
 - The upgrade of the A12 / B1122 junction to a roundabout significantly reduces the level of delay at the B1122 approach, especially during the PM period. Even though the upgrade of the junction to a roundabout results in slight increases in delay on the A12, these remain low and the roundabout operates efficiently. The queues at the A12 northbound approach to the roundabout remain low in all scenarios and never reach the upstream A1120 junction;
 - The average queues on the A12 southbound approach to A1120 are similar in the Reference Case and Operational Phase. Although the average maximum queue length is longer in the Operational Phase compared to the Reference Case, the likelihood of this queue reaching the upstream A12/B1122 junction is reduced from 70% in the Reference Case to 10% in the Operation Phase scenarios as the new roundabout would be placed further north;
 - The average queues on the A144 approach to the A12 show a similar or small decrease in the Operational Phase compared to the Reference Case.

8. CONCLUSIONS

- 8.1.1. The VISSIM model provides a robust evidence base which has been used to assess the operational performance of the network in 2023, 2028 and 2034 with and without the Sizewell C construction traffic. Key conclusions from the study are set out below.

2023 Early Years

- 8.1.2. The addition of Sizewell C vehicle trips in the 2023 Early Years scenario during the AM and PM period on the local road network in Yoxford does result in some temporary localised impacts.
- 8.1.3. The right turn queue from the A12 southbound onto the A1120 during the PM peak is predicted to occasionally reach back to the upstream B1122 junction. However, any queues reaching the B1122 are predicted to be present for no more than five minutes before dissipating and are therefore unlikely to have a significant impact on delays.
- 8.1.4. Relative to the Reference Case, queues and delay on the B1122 approach to the A12 during the AM and PM periods increase for short periods, although the junction still operates within capacity as queues do not continue to propagate during the modelled period. If it is found that the Sizewell C traffic has an impact on the performance of the B1122 minor arm in 2023, it may be possible to provide additional bus services to/from Sizewell C prior to the provision of the proposed roundabout scheme by 2028.
- 8.1.5. Relative to the Reference Case, queues on the A144 approach to the A12 increase slightly during parts of the AM period, but do not impact the overall junction performance.

2028 Peak Construction

- 8.1.6. The Sizewell C additional vehicle trips in the 2028 Peak Construction scenario have some impact on the local road network around Yoxford. Journey times along the A12 and congestion levels are increased, but the increase is unlikely to be outside of daily variation and therefore not perceptible.
- 8.1.7. The maximum queue on the A12 southbound approach to the A1120 junction increases due to the additional Sizewell C traffic. However, the likelihood of this queue reaching the upstream B1122 junction is lower because of the presence of the provision of the B1122 roundabout which provides an increased stacking distance between the A11220 and B1122.
- 8.1.8. Due to the proposed A12 / B1122 roundabout, delays are significantly reduced on the B1122 approach relative to the Reference Case, especially during the PM period. Even though the junction upgrade is predicted to result in slight increases in delay on the A12, delay per vehicle is predicted to remain low and the roundabout is forecast to operate efficiently with minimal queues. Queues on the A12 northbound approach to the B1122 remain low in all scenarios and are unlikely to reach the upstream A1120 junction.
- 8.1.9. The proposed new roundabout for the northern park and ride site has a slight impact on queues and delays on the A12 approaches in the Peak Construction scenario, however these delays are low and the roundabout is predicted to operate efficiently.
- 8.1.10. Queue lengths and delays are expected to increase on the A144 approach to the A12 in the AM peak during the Peak Construction scenario due to an increase in flows on this approach. The maximum queue on the minor arm (A144) is expected to occur from 06:30 - 08:30 and is likely to reach approximately 11 vehicles in length in the 2028 Reference Case and up to 16 vehicles in

length in the Peak Construction scenario. During the other morning periods and throughout the afternoon periods the queues in the Peak Construction scenario are broadly similar to the 2028 Reference Case scenario.

- 8.1.11. The average delay per vehicle on the A144 approach increases during the morning periods in the 2028 Peak Construction scenario compared to the 2028 Reference Case due to the increase in flows. The largest increase in delay is found from 07:00-08:00, resulting in an average delay of 33s (Level of Service D) in the 2028 Peak Construction scenario compared to 16s (Level of Service C) in the 2028 Reference Case scenario. This is an increase of 17 seconds per vehicle on average which is likely to be within daily variation.
- 8.1.12. Whilst VISSIM suggests that the proposed mitigation scheme does not mitigate all of the impact caused by the additional Sizewell C traffic it is likely to improve throughput and safety at this location. Due to the additional complexity of the give-way behaviour between those waiting to use the central reservation and those already using it, the single lane dualled layout is more difficult to represent in VISSIM. The VISSIM model setup for the single lane dualled layout is considered to be more conservative in the way that the give-way behaviour rules are applied compared to the ghost island layout. The Peak Construction results are therefore felt to be a worst case and the A144 minor arm is likely to perform better than predicted by VISSIM.

2034 Operational Phase

- 8.1.13. The impact of the Sizewell C traffic in the 2034 Operational Phase is relatively low. Journey times along the A12 are predicted to increase slightly but not outside of daily variation and are therefore unlikely to be noticeable.
- 8.1.14. The junction improvements at the A12 / B1122 and A12 / A144 reduce queues at these locations in the Operational Phase compared to the Reference Case. At the A12 / A1120 junction, queues are similar to the Reference Case.

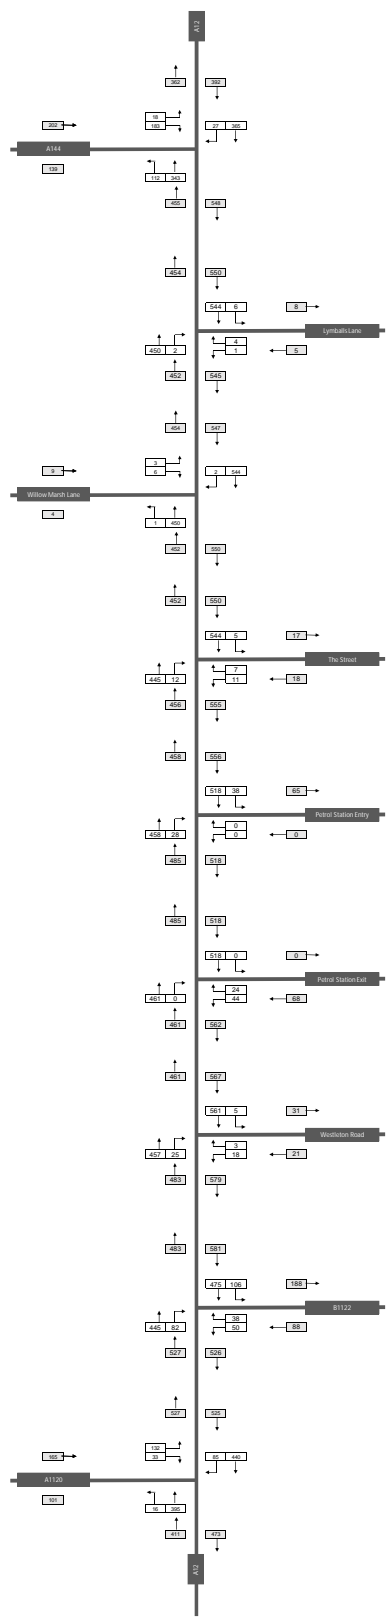

9. LIMITATIONS

- 9.1.1. The VISSIM modelling carried out for this assessment is based on traffic count and queue length data collected on a single day. It aims to represent a typical day through its validation against journey time data that has been collected over a number of days. It does not reflect unusual or periodic fluctuations in traffic demand or traffic conditions.
- 9.1.2. The VISSIM model has been developed for the purposes of assessing the impacts of additional traffic demand generated by the Sizewell C project, as well as associated proposed highway improvements. The level of detail within the model is proportionate to its purpose.

DRAINAGE

- IN THE AREA OF TIE-IN ON EXISTING A12 THE CURRENT HIGHWAY GULLIES ARE TO BE RETAINED
- IN THE AREA OF A12 DIVERGENCE TO NEW ROUNDABOUT AND FOR NEW ROAD HIGHWAY DRAINAGE IS TO BE TO SWALES.
- LOCATION OF SWALES IS INDICATIVE, CROSS SECTION TO BE FIXED FOLLOWING CONFIRMATION OF ACHIEVABLE INFILTRATION RATE.
- ROUNDABOUT HIGHWAY DRAINAGE IS TO BE TO GULLIES AND/OR COMBINED KERB, DRAINS WILL OUTFALL TO SWALE AND INFILTRATION POND.
- FOOTPRINT FOR INFILTRATION POND IS INDICATIVE, SIZE TO BE FIXED FOLLOWING CONFIRMATION OF ACHIEVABLE INFILTRATION RATE.

DRAINAGE

- HIGHWAY DRAINAGE OF NORTHERN APPROACH - A12, SOUTH-EASTERN APPROACH - B1122 AND ROOKERY LODGE ACCESS ROAD TO GULLIES DISCHARGING TO INFILTRATION POND.
- HIGHWAY DRAINAGE OF WESTERN APPROACH - A12 TO GULLIES DISCHARGING TO INFILTRATION POND, WHERE LEVELS PERMIT, WHERE LEVELS DO NOT PERMIT, EXISTING GULLIES TO BE RETAINED.
- FOOTPRINT FOR INFILTRATION POND IS INDICATIVE, SIZE TO BE DETERMINED FOLLOWING CONFIRMATION ON ACHIEVABLE INFILTRATION RATE.
- IN THE EVENT THAT INFILTRATION IS NOT ACHIEVABLE, POND WILL BE JOINT ATTENUATION/INFILTRATION POND. AN OUTFALL CONNECTION WILL BE MADE TO THE EXISTING HIGHWAY DRAIN IN YOXFORD. REDUCTION OF PEAK FLOW RATE TO BELOW THAT CURRENTLY DISCHARGED WILL BE REQUIRED TO ENSURE NO INCREASE IN FLOOD RISK WITHIN YOXFORD.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle.

File summary

File Description

Title	A140 / B1078
Location	52.150570°, 1.085415°
Site number	1
Date	11/10/2016
Version	
Status	(new file)
Identifier	
Client	
Jobnumber	
Enumerator	UKWSPGROUP\ukjgm001
Description	

Units

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units
m	mph	Veh	Veh	perHour	s	-Min	perMin

Flows show original traffic demand (left)
Streams (downstream) show RFC (%)

The junction diagram reflects the last run of Junctions.

Analysis Options

Vehicle length (m)	Calculate Queue Percentiles	Calculate detailed queueing delay	Calculate residual capacity	RFC Threshold	Average Delay threshold (s)	Queue threshold (PCU)
5.75				0.85	36.00	20.00

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle.

File summary

File Description

Title	B1078 / B1079
Location	52.142756°, 1.221817°
Site number	2
Date	11/10/2016
Version	
Status	(new file)
Identifier	
Client	
Jobnumber	
Enumerator	UKWSPGROUP\ukjgm001
Description	

Units

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units

A1	✓	100.000	100.000

Base Year, 6-7 AM

Data Errors and Warnings

Severity	Area	Item	Description
Warning	Major arm width	C - B1079 North - Major arm geometry	For two-way major roads, please interpret results with caution if the total major carriageway width is less than 6m.

Junction Network

Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
J2	B1078 / B1079	T-Junction	Two-way		3.52	A

Junction Network Options

Driving side	Lighting
Left	Normal/unknown

Arms

Arms

Arm	Name	Description	Arm type
A	B1079 East		Major
B	B1078		Minor
C	B1079 North		Major

Major Arm Geometry

Arm	Width of carriageway (m)	Has kerbed central reserve	Has right turn bay	Visibility for right turn (m)	Blocks?	Blocking queue (PCU)
C - B1079 North	5.15			76.8	✓	0.00

Geometries for Arm C are measured opposite Arm B. Geometries for Arm A (if relevant) are measured opposite Arm D.

Minor Arm Geometry

Arm	Minor arm type	Lane width (m)	Visibility to left (m)	Visibility to right (m)
B - B1078	One lane	3.34	18	25

Slope / Intercept / Capacity

Priority Intersection Slopes and Intercepts

Stream	Intercept (Veh/hr)	Slope for A-B	Slope for A-C	Slope for C-A	Slope for C-B
B-A	513	0.097	0.245	0.154	0.350
B-C	662	0.105	0.266	-	-
C-B	618	0.248	0.248	-	-

The slopes and intercepts shown above do NOT include any corrections or adjustments.

Streams may be combined, in which case capacity will be adjusted.

Values are shown for the first time segment only; they may differ for subsequent time segments.

Traffic Demand

Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D1	Base Year	6-7 AM	ONE HOUR	05:45	07:15	15	✓

Junction Network Options

Driving side	Lighting
Left	Normal/unknown

Arms

Arms

Arm	Name	Description
A	B1116 North-West	
B	B1078 South-West	
C	B1078 South-East	
D	A12 Slip-Road	

Roundabout Geometry

Arm	V - Approach road half-width (m)	E - Entry width (m)	I' - Effective flare length (m)	R - Entry radius (m)	D - Inscribed circle diameter (m)	PHI - Conflict (entry) angle (deg)	Exit only
A - B1116 North-West	3.00	3.00	0.0	12.9	46.0	42.0	
B - B1078 South-West	3.40	8.20	6.8	47.5	46.0	20.0	
C - B1078 South-East	3.50	7.40	3.7	15.2	46.0	29.0	
D - A12 Slip-Road	3.40	4.20	26.9	3.2	46.0	63.0	

Slope / Intercept / Capacity

Arm Intercept Adjustments

Arm	Type	Reason	Direct intercept adjustment (PCU/hr)
A - B1116 North-West	Direct		-50
B - B1078 South-West	None		
C - B1078 South-East	None		
D - A12 Slip-Road	None		

Roundabout Slope and Intercept used in model

Arm	Final slope	Final intercept (PCU/hr)
A - B1116 North-West	0.438	797
B - B1078 South-West	0.618	1570
C - B1078 South-East	0.546	1315
D - A12 Slip-Road	0.338	787

The slope and intercept shown above include any corrections and adjustments.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle.

File summary

File Description

Title	B1069 / A1094 (Snape Road, East)
Location	52.178882°, 1.537732°
Site number	5
Date	12/10/2016
Version	
Status	(new file)
Identifier	
Client	
Jobnumber	
Enumerator	UKWSPGROUP\ukjgm001
Description	

Units

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units
m	kph	Veh	Veh	perHour	s	-Min	perMin

Flow shown originates from demand (100%)
 Streams shown represent 100%

The junction diagram reflects the last run of Junctions.

Analysis Options

Vehicle length (m)	Calculate Queue Percentiles	Calculate detailed queueing delay	Calculate residual capacity	RFC Threshold	Average Delay threshold (s)	Queue threshold (PCU)
5.75				0.85	36.00	20.00

Data Errors and Warnings

No errors or warnings

Junction Network

Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
J5	B1069 / A1094 (Snape Road, East)	T-Junction	Two-way		4.19	A

Junction Network Options

Driving side	Lighting
Left	Normal/unknown

Arms

Arms

Arm	Name	Description	Arm type
A	A1094 West		Major
B	B1069 Snape Road (North)		Minor
C	A1094 East		Major

Major Arm Geometry

Arm	Width of carriageway (m)	Has kerbed central reserve	Has right turn bay	Visibility for right turn (m)	Blocks?	Blocking queue (PCU)
C - A1094 East	6.07			51.0	✓	0.00

Geometries for Arm C are measured opposite Arm B. Geometries for Arm A (if relevant) are measured opposite Arm D.

Minor Arm Geometry

Arm	Minor arm type	Lane width (m)	Visibility to left (m)	Visibility to right (m)
B - B1069 Snape Road (North)	One lane	3.00	30	33

Slope / Intercept / Capacity

Priority Intersection Slopes and Intercepts

Stream	Intercept (Veh/hr)	Slope for A-B	Slope for A-C	Slope for C-A	Slope for C-B
B-A	504	0.091	0.231	0.145	0.330
B-C	645	0.099	0.249	-	-
C-B	603	0.233	0.233	-	-

The slopes and intercepts shown above do NOT include any corrections or adjustments.

Streams may be combined, in which case capacity will be adjusted.

Values are shown for the first time segment only; they may differ for subsequent time segments.

Traffic Demand

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle.

File summary

File Description

Title	B1069 / A1094 (Snape Road, East)
Location	52.178882°, 1.537732°
Site number	5
Date	12/10/2016
Version	
Status	(new file)
Identifier	
Client	
Jobnumber	
Enumerator	UKWSPGROUP\ukjgm001
Description	

Units

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units
m	mph	Veh	Veh	perHour	s	-Min	perMin

Flow shows original traffic demand (left) and the development (right)

The junction diagram reflects the last run of Junctions.

Analysis Options

Vehicle length (m)	Calculate Queue Percentiles	Calculate detailed queueing delay	Calculate residual capacity	RFC Threshold	Average Delay threshold (s)	Queue threshold (PCU)
5.75				0.85	36.00	20.00

Data Errors and Warnings

No errors or warnings

Junction Network

Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
J5	B1069 / A1094 (Snape Road, East)	T-Junction	Two-way		4.28	A

Junction Network Options

Driving side	Lighting
Left	Normal/unknown

Arms

Arms

Arm	Name	Description	Arm type
A	A1094 West		Major
B	B1069 Snape Road (North)		Minor
C	A1094 East		Major

Major Arm Geometry

Arm	Width of carriageway (m)	Has kerbed central reserve	Has right turn bay	Visibility for right turn (m)	Blocks?	Blocking queue (PCU)
C - A1094 East	6.07			51.0	✓	0.00

Geometries for Arm C are measured opposite Arm B. Geometries for Arm A (if relevant) are measured opposite Arm D.

Minor Arm Geometry

Arm	Minor arm type	Lane width (m)	Visibility to left (m)	Visibility to right (m)
B - B1069 Snape Road (North)	One lane	3.00	45	51

Slope / Intercept / Capacity

Priority Intersection Slopes and Intercepts

Stream	Intercept (Veh/hr)	Slope for A-B	Slope for A-C	Slope for C-A	Slope for C-B
B-A	517	0.094	0.237	0.149	0.339
B-C	656	0.100	0.253	-	-
C-B	603	0.233	0.233	-	-

The slopes and intercepts shown above do NOT include any corrections or adjustments.

Streams may be combined, in which case capacity will be adjusted.

Values are shown for the first time segment only; they may differ for subsequent time segments.

Summary of junction performance

	6-7 AM				7-8 AM				8-9 AM				3-4 PM				5-6 PM			
	Queue (Veh)	Delay (s)	RFC	LOS	Queue (Veh)	Delay (s)	RFC	LOS	Queue (Veh)	Delay (s)	RFC	LOS	Queue (Veh)	Delay (s)	RFC	LOS	Queue (Veh)	Delay (s)	RFC	LOS
2023 Early Years																				
A - A12 North	0.5	5.13	0.33	A	3.0	15.49	0.76	C	4.1	19.60	0.81	C	4.6	20.96	0.83	C	3.1	14.88	0.76	B
B - A1094	0.2	4.17	0.15	A	0.8	7.44	0.44	A	0.7	7.72	0.42	A	1.3	10.29	0.56	B	1.9	12.76	0.67	B
C - A12 South	0.0	0.00	0.00	A	0.0	0.00	0.00	A	0.0	0.00	0.00	A	0.0	0.00	0.00	A	0.0	0.00	0.00	A
D - Old A12 (Farnham)	0.7	4.73	0.41	A	4.9	17.55	0.84	C	4.6	17.22	0.83	C	4.3	15.32	0.82	C	4.3	15.36	0.82	C

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle.

File summary

File Description

Title	A12 / A1094
Location	52.191814°, 1.468510°
Site number	6
Date	22/08/2019
Version	
Status	(new file)
Identifier	
Client	
Jobnumber	
Enumerator	CORP\INJV01568
Description	

Units

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units
m	mph	Veh	Veh	perHour	s	-Min	perMin

Flows show original traffic demand (veh/hr).
The junction diagram reflects the last run of Junctions.

Analysis Options

Vehicle length (m)	Calculate Queue Percentiles	Calculate detailed queueing delay	Calculate residual capacity	RFC Threshold	Average Delay threshold (s)	Queue threshold (PCU)
5.75				0.85	36.00	20.00

Demand Set Summary

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D6	2023 Early Years	6-7 AM	ONE HOUR	05:45	07:15	15	✓
D7	2023 Early Years	7-8 AM	ONE HOUR	06:45	08:15	15	✓
D8	2023 Early Years	8-9 AM	ONE HOUR	07:45	09:15	15	✓
D9	2023 Early Years	3-4 PM	ONE HOUR	14:45	16:15	15	✓
D10	2023 Early Years	5-6 PM	ONE HOUR	16:45	18:15	15	✓

Analysis Set Details

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle.

File summary

File Description

Title	A12 / A1094
Location	52.191814°, 1.468510°
Site number	6
Date	22/08/2019
Version	
Status	(new file)
Identifier	
Client	
Jobnumber	
Enumerator	CORP\INJV01568
Description	

Units

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units
m	mph	Veh	Veh	perHour	s	-Min	perMin

Flow shows original traffic demand (with)

The junction diagram reflects the last run of Junctions.

Analysis Options

Vehicle length (m)	Calculate Queue Percentiles	Calculate detailed queueing delay	Calculate residual capacity	RFC Threshold	Average Delay threshold (s)	Queue threshold (PCU)
5.75				0.85	36.00	20.00

Demand Set Summary

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle.

File summary

File Description

Title	A12 / B1119
Location	52.217006°, 1.476932°
Site number	7S a
Date	12/12/2016
Version	
Status	(new file)
Identifier	
Client	
Jobnumber	
Enumerator	UKWSPGROUP\ukjgm001
Description	

Units

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units
m	kph	Veh	Veh	perHour	s	-Min	perMin

Flow shows original traffic demand (in left lane) and demand (in right lane) at RFC.

The junction diagram reflects the last run of Junctions.

Analysis Options

Vehicle length (m)	Calculate Queue Percentiles	Calculate detailed queueing delay	Calculate residual capacity	RFC Threshold	Average Delay threshold (s)	Queue threshold (PCU)
5.75				0.85	36.00	20.00

ID	Include in report	Network flow scaling factor (%)	Network capacity scaling factor (%)
A1	✓	100.000	100.000

Base Year, 6-7 AM

Data Errors and Warnings

No errors or warnings

Junction Network

Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
J7S a	A12 / B1119	T-Junction	Two-way		1.20	A

Junction Network Options

Driving side	Lighting
Left	Normal/unknown

Arms

Arms

Arm	Name	Description	Arm type
A	A12 (N)		Major
B	B1119 Rendham Rd		Minor
C	A12 (S)		Major

Major Arm Geometry

Arm	Width of carriageway (m)	Has kerbed central reserve	Width of kerbed central reserve (m)	Has right turn bay	Width for right turn (m)	Visibility for right turn (m)	Blocks?	Blocking queue (PCU)
C - A12 (S)	7.90	✓	9.45	✓	3.62	99.5	✓	11.10

Geometries for Arm C are measured opposite Arm B. Geometries for Arm A (if relevant) are measured opposite Arm D.

Minor Arm Geometry

Arm	Minor arm type	Width at give-way (m)	Width at 5m (m)	Width at 10m (m)	Width at 15m (m)	Width at 20m (m)	Estimate flare length	Flare length (PCU)	Visibility to left (m)	Visibility to right (m)
B - B1119 Rendham Rd	One lane plus flare	10.00	10.00	8.90	6.30	5.00	✓	3.00	67	94

Slope / Intercept / Capacity

Priority Intersection Slopes and Intercepts

Stream	Intercept (Veh/hr)	Slope for A-B	Slope for A-C	Slope for C-A	Slope for C-B
B-A	704	0.097	0.246	0.154	0.351
B-C	778	0.109	0.277	-	-
C-B	729	0.259	0.259	-	-

The slopes and intercepts shown above do NOT include any corrections or adjustments.

Streams may be combined, in which case capacity will be adjusted.

Values are shown for the first time segment only; they may differ for subsequent time segments.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle.

File summary

File Description

Title	A12-A1120
Location	52.264749°, 1.511117°
Site number	12a
Date	05/07/2017
Version	v1
Status	
Identifier	
Client	EDF Energy
Jobnumber	50400326
Enumerator	UKEWS001
Description	

Units

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units
m	kph	Veh	Veh	perHour	s	-Min	perMin

Please check original traffic demand (with stream labels) and see TRC 3

The junction diagram reflects the last run of Junctions.

Analysis Options

Vehicle length	Calculate Queue	Calculate detailed queueing	Calculate residual	RFC	Average Delay	Queue threshold
----------------	-----------------	-----------------------------	--------------------	-----	---------------	-----------------

(m)	Percentiles	delay	capacity	Threshold	threshold (s)	(PCU)
5.75				0.85	36.00	20.00

Data Errors and Warnings

No errors or warnings

Junction Network

Junctions

Junction	Name	Junction type	Major road direction	Use circulating lanes	Junction Delay (s)	Junction LOS
J12a	A12-A1120	T-Junction	Two-way		1.09	A

Junction Network Options

Driving side	Lighting
Left	Normal/unknown

Arms

Arms

Arm	Name	Description	Arm type
A	A12 West		Major
B	A1120 North		Minor
C	A12 East		Major

Major Arm Geometry

Arm	Width of carriageway (m)	Has kerbed central reserve	Has right turn bay	Visibility for right turn (m)	Blocks?	Blocking queue (PCU)
C - A12 East	7.50			45.0	✓	0.00

Geometries for Arm C are measured opposite Arm B. Geometries for Arm A (if relevant) are measured opposite Arm D.

Minor Arm Geometry

Arm	Minor arm type	Lane width (m)	Visibility to left (m)	Visibility to right (m)
B - A1120 North	One lane	3.92	102	30

Slope / Intercept / Capacity

Priority Intersection Slopes and Intercepts

Stream	Intercept (Veh/hr)	Slope for A-B	Slope for A-C	Slope for C-A	Slope for C-B
B-A	574	0.098	0.247	0.155	0.353
B-C	702	0.101	0.254	-	-
C-B	600	0.217	0.217	-	-

The slopes and intercepts shown above do NOT include any corrections or adjustments.

Streams may be combined, in which case capacity will be adjusted.

Values are shown for the first time segment only; they may differ for subsequent time segments.

Traffic Demand

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle.

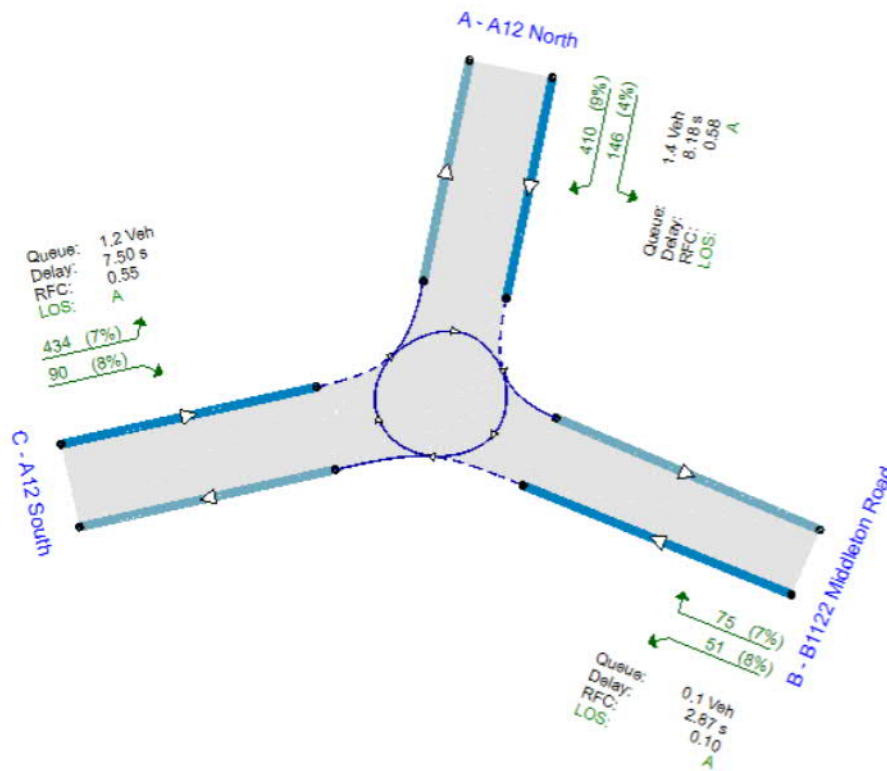

File summary

File Description

Title	A1094 / B1069 (Church Road)
Location	52.179898°, 1.502522°
Site number	14
Date	16/12/2016
Version	
Status	(new file)
Identifier	
Client	
Jobnumber	
Enumerator	UKWSPGROUP\ukjgm001
Description	

Units

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units
m	kph	Veh	Veh	perHour	s	-Min	perMin

Flows show original traffic demand (left) Streams (downstream end) and RFC (right)

The junction diagram reflects the last run of Junctions.

Analysis Options

Vehicle length (m)	Calculate Queue Percentiles	Calculate detailed queueing delay	Calculate residual capacity	RFC Threshold	Average Delay threshold (s)	Queue threshold (PCU)
5.75				0.85	36.00	20.00

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle.

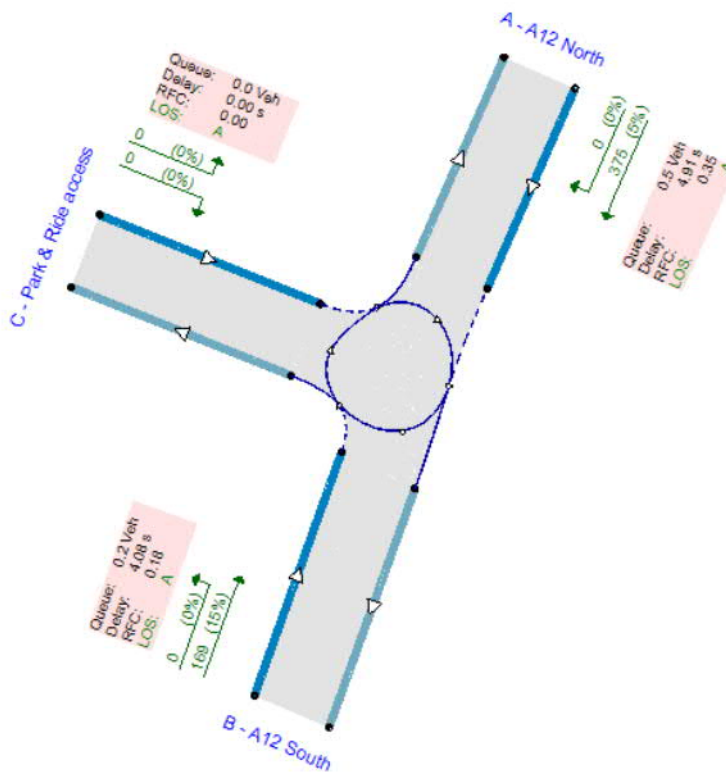

File summary

File Description

Title	Park and Ride (Darsham)
Location	52.281784°, 1.534037°
Site number	17
Date	21/03/2017
Version	
Status	(new file)
Identifier	
Client	
Jobnumber	
Enumerator	UKWSPGROUP\ukcxm014
Description	

Units

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units
m	mph	Veh	Veh	perHour	s	-Min	perMin

Flow show original traffic demand (veh/h)

The junction diagram reflects the last run of Junctions.

Analysis Options

Vehicle length (m)	Calculate Queue Percentiles	Calculate detailed queueing delay	Calculate residual capacity	RFC Threshold	Average Delay threshold (s)	Queue threshold (PCU)
5.75				0.85	36.00	20.00

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle.

File summary

File Description

Title	A12 / A14 / A1156 Seven Hills Interchange
Location	52.026165, 1.254641
Site number	21
Date	01/04/2019
Version	
Status	Skeleton Model
Identifier	
Client	
Jobnumber	
Enumerator	JV
Description	The entry to exit separation has been calculated for Arm C and Arm E, as it is the major arm with significant separation. Arm E (A14 North-West) has bypass for left turn movement. The circulating flow shall be added after receiving the flows.

Units

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units
m	mph	Veh	Veh	perHour	s	-Min	perMin

Analysis Options

Vehicle length (m)	Calculate Queue Percentiles	Calculate detailed queueing delay	Calculate residual capacity	RFC Threshold	Average Delay threshold (s)	Queue threshold (PCU)
5.75				0.85	36.00	20.00

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle.

File summary

File Description

Title	A12 / A14 / A1156 Seven Hills Interchange
Location	52.026165, 1.254641
Site number	21
Date	01/04/2019
Version	
Status	Skeleton Model
Identifier	
Client	
Jobnumber	
Enumerator	JV
Description	The entry to exit separation has been calculated for Arm C and Arm E, as it is the major arm with significant separation. Arm E (A14 North-West) has bypass for left turn movement. The circulating flow shall be added after receiving the flows.

Units

Distance units	Speed units	Traffic units input	Traffic units results	Flow units	Average delay units	Total delay units	Rate of delay units
m	mph	Veh	Veh	perHour	s	-Min	perMin

Analysis Options

Vehicle length (m)	Calculate Queue Percentiles	Calculate detailed queueing delay	Calculate residual capacity	RFC Threshold	Average Delay threshold (s)	Queue threshold (PCU)
5.75				0.85	36.00	20.00

2019 Base Year, 6-7 AM

Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	D - A14 South-East - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.

Junction Network

Junctions

Junction	Name	Junction type	Use circulating lanes	Arm order	Junction Delay (s)	Junction LOS
J21	A12/ A14 / A1156 Seven Hills Interchange	Large Roundabout		A, E, D, C, B	3.24	A

Junction Network Options

Driving side	Lighting
Left	Normal/unknown

Arms

Arms

Arm	Name	Description
A	A12 North	
B	A14 North-West	
C	A1156 South-West	
D	A14 South-East	
E	Unnamed Road North-East	

Roundabout Geometry

Arm	V - Approach road half-width (m)	E - Entry width (m)	I' - Effective flare length (m)	R - Entry radius (m)	D - Inscribed circle diameter (m)	PHI - Conflict (entry) angle (deg)	Exit only
A - A12 North	7.40	9.60	5.5	24.5	160.0	41.0	
B - A14 North-West	2.80	4.80	5.1	40.4	160.0	36.0

D - A14 South-East	5.70	7.60	40.0	44.6	163.3	35.0	
E - Unnamed Road North-East	2.50	4.50	10.2	29.9	160.0	16.0	

Large Roundabout Data

Arm	Circulating flow (PCU/hr)	Entry-to-exit separation (m)
A - A12 North	179	75.10
B - A14 North-West	362	128.00
C - A1156 South-West	844	80.70
D - A14 South-East	745	131.50
E - Unnamed Road North-East	1073	37.20

Bypass

Arm	Arm has bypass	Bypass utilisation (%)
A - A12 North		
B - A14 North-West	✓	100
C - A1156 South-West		
D - A14 South-East		
E - Unnamed Road North-East		

Slope / Intercept / Capacity

Arm Intercept Adjustments

Arm	Type	Reason	Direct intercept adjustment (PCU/hr)
A - A12 North	Direct	Please refer column "V" in "modelled vs Observed" worksheet in "Queue validation" spreadsheet	-475
B - A14 North-West	None		
C - A1156 South-West	Direct	Please refer column "V" in "modelled vs Observed" worksheet in "Queue validation" spreadsheet	-550
D - A14 South-East	Direct	Please refer column "V" in "modelled vs Observed" worksheet in "Queue validation" spreadsheet	-515
E - Unnamed Road North-East	None		

Roundabout Slope and Intercept used in model

Arm	Final slope	Final intercept (PCU/hr)
A - A12 North	1.129	2652
B - A14 North-West	0.733	1626
C - A1156 South-West	0.888	1941
D - A14 South-East	0.971	2146
E - Unnamed Road North-East	0.675	1739

The slope and intercept shown above include any corrections and adjustments.

Traffic Demand

Demand Set Details
