ADDITIONAL INFORMATION:

(e.g. Sketch of sample locations, any anomalous sample results and a justification for any sample recount, any advice sought from RPA)

None noted

13.2 - 15.3 Soil Sample - Test 3 (Scint probe. (Si Sa, Cley SAND).

Notes:

1. *B/G refers to the background count rate; AL refers to the action limit (AL in this case refers to a positive response)*
2. *If the counting location changes a new B/G must be recorded*
3. *The B/G should be reviewed at least once every 2 hours of operation and at any time where results may seem unusual.*
4. *Where a sample exceeds the AL follow procedures outlined in the monitoring plan*

ES107 WAC7	11:28 15:55	14:20	MGS.2019.D 4.0	Soil sample Scint probe (gravelly SAND)	N

ADDITIONAL INFORMATION:

(e.g. Sketch of sample locations, any anomalous sample results and a justification for any sample recount, any advice sought from RPA)

Notes:

1. *B/G refers to the background count rate; AL refers to the action limit (AL in this case refers to a positive response)*
2. *If the counting location changes a new B/G must be recorded*
3. *The B/G should be reviewed at least once every 2 hours of operation and at any time where results may seem unusual.*
4. *Where a sample exceeds the AL follow procedures outlined in the monitoring plan*

Borehole Summary

Robertson Geo were contracted by Structural Soils Limited to conduct borehole logging for Sizewell C, located on the Suffolk coast.

Work commenced on the 14th October 2019 and continued through until the 19th December 2019. Each site visit is documented below.

Visit	Borehole	Date Logging Commenced	Depth Range (m)	Runs	Final Casing Shoe Depth (m bgl)	Probes Run
1	DCBH2019_3	14/10/2019	44.00 - 99.64	6	44.00	Acoustic Televiewer, Borehole Geometry, Electric Log, Triple Sonic
2 & 3	SDBH2019_3	30/10/2019	0.00 - 119.5	11	45.50	Acoustic Televiewer, Borehole Geometry, Electric Log, Triple Sonic, PSLogger
3	SD2019_4	05/11/2019	0.00 - 110.77	11	46.50	Acoustic Televiewer, Borehole Geometry, Electric Log, Triple Sonic, PSLogger
4	SD2019_3	13/11/2019	3.00 - 41.5	1	50.00	PSLogger

	SBP2009_S	18/11/2019	3.00 - 116.0	1	120.00	PSLogger
6	CH2019_R2	19/12/2019	2.00 - 120.0	1	120.00	Triple Sonic, Dual Induction, PSLogger

General Logging Methodology

Wireline geophysical downhole logging was carried out in accordance with relevant American and British Logging Standards.

Overall Logging

The purpose-built logging vehicle was positioned adjacent to the borehole. The winch wireline was then run into the borehole from a boom or over a tripod as appropriate. The probes were attached to the wireline and run into the borehole using the winch as required.

Depth Set and Correction

All probes were set to ground level before running into the borehole, with measurements being referenced to the bottom of the tool. This was done differently depending on the set up and the position of casings. In general, the top of the probe was lowered to ground level and then the depth set was the probe's length. For occurrences where the casing was above ground level, the top of the probe was placed level with the top of the casing. The measured stickup was then deducted from the probe length to determine the depth set.

When it came to data processing, depth correction was required on some logs. Since the majority of our probes have natural gamma measurement, we used this reading to line up each run in WellCAD. Gamma readings were corrected to each other and known changes in lithology.

All remaining probes without gamma readings were depth corrected using the location of the casing shoe as this was a reliable constant between logs.

Logging Direction

Each tool used during the logging procedures was run in an upwards direction, from the base (drill depth) to the top (ground level) of the borehole. This logging direction is favoured as tools with caliper arms can only be safely and accurately run upwards to prevent the arms getting caught on uneven surfaces and/or breaking. This direction prevents slip stick of the tools and keeps them completely independent of the borehole walls when moving upwards. It also allows constant tension to be maintained on the cable and winch, therefore providing a more stable rate of logging.

Onsite Equipment Checks

Borehole Geometry Probe

Before each run, any tool with caliper arms was tested at the surface to ensure the functionality of the arms was efficient (i.e. arms open and close with correct current increase) before running the tool downhole. If there was any indication of functionality issues with these arms, they were calibrated on site using an appropriate caliper calibration jig which always accompanied the tool to site.

Quality Assurance

Probe Calibration

Each probe was calibrated at the Robertson Geo test borehole, and each relevant calibration certificate was attached to the final composite log produced per borehole.

P and S Wave (PS) Logger quality control

After every run using the PS logger, each shot was picked for waveform velocity in the field by the logging engineer and then double checked by the second engineer. On return to the office, the data was then re-checked for accuracy and consistency by a third engineer.

Potential reasons for poor PS Logger data quality, are stated below:

In general, P waves are less susceptible to borehole factors than S waves. As the P waves are the first arrivals, usually, they can be readily identified. The S waves arrive in conjunction with earlier wave arrivals i.e. the P waves and possibly the direct fluid arrivals. Therefore, as the signal becomes more distorted the characteristics of the S waves can be hidden.

There are several factors which may affect the quality of the data received, mostly owing to ground conditions and any potential background noise occurring near the surface. Some of these ground conditions include the rugosity of the rock, cavities, fractures and the competency of the rock.

The main cause of poor data collection is thought to be as a result of inadequately consolidated material which is predominantly found close to the surface. Competent rocks and fine-grained compacted formations produce the best data; therefore, data quality often improves with depth. Layers of gravel or pebbles or layers with loose mixed material can severely degrade data quality.

Rugosity is defined as a measure of small-scale variations or amplitude in the height of a surface. The retransmission of waves back into the borehole fluid from the wall is affected by the roughness or rugosity of the surface. A smooth borehole wall will re-transmit a smooth coherent waveform. As the irregularity increases the re-transmitted waves become more and more distorted.

Cavities and drop outs in the borehole wall will degrade the signal quality. Sharp edges within the cavity can cause diffraction waves where the edge acts as another point source. In extreme cases the S waves can become unrecognizable. The effect is most evident when either the source or a receiver is at exactly the same depth as the cavity and is characterised by a jagged appearance in the S waveforms.

Closed fractures should not markedly affect data quality. Open fractures can give rise to multiples, which occur when a seismic wave reverberates within a layer. The higher velocity contrast from open factures amplifies this effect. Multiples can give a jagged appearance to the S waves caused by the superposition of different ray paths.

For land-based work, ambient or background noise is generally not an issue. In all cases the effects of noise will become more pronounced at shallower depths as data is acquired near the surface. Vibration from generators, engines and other motorised devices can propagate to the probe via the winch cable directly or through metal casing, ultimately affecting the data. Traffic noise can also seriously affect data quality.

High Resolution Acoustic Televiewer (HRAT) quality control

In Acoustic Televiewer amplitude logs, lighter areas show a strong signal return from smooth or hard materials. Darker areas show open fractures or voids. The reflection of waves back into the borehole fluid from the wall is affected by the roughness or rugosity of the surface. A smooth borehole wall will re-transmit a smooth coherent waveform. As the irregularity increases the reflected waves become more and more smeared. This attenuated signal manifests as dark areas on the acoustic log. If a large portion of the acoustic log appears dark, this could be explained by very loose and/or broken material.

Limitations

Borehole Instability

Where necessary, casing pulls were conducted per borehole to expose as much open hole as possible with minimal chance of collapse. Each tool was therefore run several times at different depths of exposed hole in accordance with these casing levels and pulls.

To ensure the best possible coverage of the exposed borehole was achieved, the next tool runs that were conducted after a casing pull overlapped the previous logged section and the above casing by 3m on either side where possible.

ISO 9001 Quality Policy

Since 1979, Robertson Geo has been the global pioneer developer of geophysical logging technologies and techniques, and a leading logging services provider.

We are committed to ensuring customer satisfaction by meeting and exceeding customer requirements in all areas of our business.

The Management and staff of Robertson Geo are committed to:

- Fully understanding and communicating customer requirements to all persons working for or on behalf of the company;

- Identifying risks and opportunities, and effectively managing these through risk-based thinking;
- Delivering our products and services within budget and on time;
- Working in close liaison with our suppliers and subcontractors to ensure the highest levels of quality at all times;
- Complying with all relevant legislation, regulations, professional and industry standards and codes of practice applicable in the countries where we operate;
- Managing and developing our business processes and quality objectives to ensure continual performance improvement;
- Setting and reviewing measurable objectives for quality continual improvement on a regular basis.

In order to demonstrate our commitment to quality we have implemented and maintain a Quality Management System certificated to BS EN ISO 9001:2015.
