---

To whom it may concern.

I am a subject matter expert on renewable energy and the impact on the environment and infrastructure.

Nuclear power has proved to be immensely expensive and risky with every project over running by many years with the associated cost increases.

The disposal of waste and de-commissioning of such establishments just hands our children and their forebears huge intractable problems.

For a number of years other forms of energy generation have proved to be efficient, with a much lower risk, cost and impact on the environment.

These include on & off-shore wind farms and home based to enormous photo-voltaic cell arrays.

The capital investments for the latter systems are far lower as is the risk and running costs. Sizewell C represents a step backwards and a missed opportunity.
