

The Sizewell C Project

6.4 Volume 3 Northern Park and Ride Chapter 7 Terrestrial Ecology and Ornithology Appendix 7A of the Environmental Statement: Annex 7A.5 - Draft Great Crested Newt Licence

Revision: 2.0

Applicable Regulation: Regulation 5(2)(a)

PINS Reference Number: EN010012

September 2021

Planning Act 2008 Infrastructure Planning (Applications: Prescribed Forms and Procedure) Regulations 2009

Template for Method Statement to support application for licence under Regulation 55(2)(e) of The Conservation of Habitats and Species Regulations 2017 (as amended) in respect of great crested newts

Triturus cristatus. Form WML-A14-2 (Version April 2020)

Instructions for completion of Method Statement template

Introduction

This template is designed to make the process easier for applicants, by providing standard responses where possible and by indicating optional and mandatory fields, plus making clear the level and type of information required. It will also facilitate assessment of applications, as information will be presented in a standard way.

The Macros in this workbook enable the rows to expand with the text where this is indicated, but will require the users to hit enter to leave each cell, to avoid harmless error messages appearing on screen and to ensure that the text can be seen. Please retain page scaling at 130% to avoid the text becoming obscured.

This spreadsheet has two main sections: Instructions and advice, and the Method Statement template itself. The instructions should help you complete the Method Statement, as well as providing advice on some common areas of confusion in mitigation. These are designed to assist you in deciding whether to apply for a licence, and if you do, what kind of survey and mitigation should be proposed. Note: that this is offered as general advice and in the event of any enforcement investigation the original legislation must be referred to.

Entering information into the template

(Pale red) Indicates mandatory fields

(Pale green; dashed outline except in some tables) Indicates fields that are either optional or will be necessary in some cases depending on the circumstances. In many cases it is helpful to fill in green fields to provide more detail. Where the spreadsheet can detect a necessary field from data you have already given, a green field will turn red. It is your responsibility to ensure any necessary information is included.

(Pale blue) Indicates a field that is automatically completed by the spreadsheet, based on data you have entered.

IMPORTANT: Only enter data in pale red or pale green fields. Do not enter or alter any data in other coloured fields, including whitespace, as this may affect spreadsheet function. Please do not re-format text, except to underline or make 'bold' any changes if you are submitting an amendment.

It is your responsibility to ensure the completed template provides all information necessary for licence determination. Although we have tried to make the template as helpful as possible, some features may not be suitable for accepting the information for your scheme, and occasionally the automatic spreadsheet coding may produce unusual results. If this happens you must take care to explain the scheme on additional sheets, and not rely on the standard responses or automatic spreadsheet coding. It will not be acceptable to submit a Method Statement that provides misleading or incomplete information, and attribute such shortcomings to the template format

Fill in the spreadsheet in order, as some data you enter is used in subsequent calculations or questions. Please be concise with your descriptions and keep information only to what is required. Several questions have standard responses suitable for a maximum of 10 ponds; should your scheme involve >10 ponds provision for additional data is included in the Additional Records tab.

Viewing: You may find it helpful to zoom in and out by scrolling your mouse wheel while holding down CTRL (or View > Zoom). Sometimes parts of a text box can appear "cut off", depending on your computer set-up. Zooming in or out may help, and all the text should be readable if you click inside the

Printing: To print the whole spreadsheet: *File > Print... > Print what > Entire workbook.* To print selected worksheets only, select the appropriate tabs (use shift to select a continuous range, and CTRL for non-adjacent worksheets), then *File > Print > Print what > Active sheet(s).Please print on both sides.*

Method Statement structure

The Method Statement is divided into two sections:

- (I) Background and supporting information (worksheets with lavender-coloured tabs)
- (II) Delivery information (worksheets with blue-coloured tabs)

Within each section, there are subdivisions, e.g. for survey, impact assessment, etc. For modifications to projects already licensed (non-annexed or where significant changes are proposed), or re-submissions following a Further Information Request response, when submitting a hard or an electronic copy it will currently be necessary to re-submit the document in its entirety detailing where changes have been made. If submitting resubmissions or new applications electronically, send the whole template file (plus maps and appendices) because attempting to extract worksheets will cause coding problems; in any case it is no additional effort to send the whole file. See website below for current instructions on the format of licence application submission.

 $\underline{https://www.gov.uk/government/publications/great-crested-newts-apply-for-a-mitigation-licence}$

Important notes on technical mitigation issues

Use the *Great crested newt mitigation guidelines* (English Nature, 2001) and information on .GOV.UK here: https://www.gov.uk/guidance/great-crested-newts-surveys-and-mitigation-for-development-projects

This template is designed to record licence application data for a range of common development scenarios. However, this does not restrict the use of novel mitigation practice, where this is appropriate. If you wish to employ a method, approach or level of effort that deviates from the standard recommendations in the guidelines, you must point this out, and provide either: (a) direct evidence from other projects or research that it is likely to be effective; or, if no direct evidence is available (b) a sound rationale for why you think it is appropriate and likely to be effective.

Note that applications that involve reductions compared to standard recommendations (e.g. reduced capture effort or habitat provisions) may only be acceptable if you provide clear logistical and ecological reasons.

Notes on licence assessment

"Development" in this Method Statement means an activity that you believe to meet the requirements of Regulation 55(2)(e). It does not refer solely to construction-related activity.

This Method Statement is the evidence on which you must demonstrate compliance with Regulation 55(9)(b) (the "favourable conservation status test"). The "no satisfactory alternative" and "purpose" tests are assessed using other criteria.

"Pond" in this Method Statement means any waterbody that is likely to be used by GCN for foraging, resting or breeding.

Application tools

(1) "Do I need a licence?" - rapid risk assessment

Background

In recent years there has been a trend towards increasingly precautionary applications, resulting from a risk-averse approach to mitigation. Whilst considering potential risks to great crested newts is laudable, many recent mitigation schemes were designed for developments that actually had very little or no effect on the newt population. In part this is because it can be difficult to assess whether newts will be affected by certain activities, especially when they take place at some distance from breeding ponds. Newts tend to be present at increasingly low density the further one looks from ponds, and the task of detecting and capturing them becomes more problematic. Further from ponds, there is a corresponding reduction in the scale of impact on populations. Given that great crested newts can disperse over 1km from breeding ponds, the potential for offences may seem vast, yet the probability of an offence outside the core breeding and resting area is often rather small, and even if an offence takes place, the effect on the population may be negligible.

Natural England is concerned about the trend for increasingly risk-averse mitigation for several reasons. Primarily, there is no legal need, and little benefit to great crested newt conservation, in undertaking mitigation where there are no offences through development. Even where there technically is an offence, such as the destruction of a small, distant area of resting place habitat, it is arguable that impacts beyond the core area often have little or no tangible impact on the viability of populations. Mitigation in such circumstances is of questionable value in conservation terms. There are, however, substantial costs: developers delay projects and spend large sums on mitigation. Sometimes the mitigation project itself has environmental costs, especially when it entails substantial lengths of newt fencing. In some cases long newt fences are employed with no justification. Natural England wishes to see newt fencing used more appropriately, i.e. only where there is a reasonable risk of capturing, containing and/or excluding newts.

Natural England recognises that the two key factors leading consultants to adopt this risk-averse approach are: (a) uncertainty over the presence of newts and whether there will be an offence in areas distant from ponds; (b) undertaking mitigation under licence "just in case", so that there is no perceived risk of litigation for their client. Natural England wishes to see mitigation planning shift away from such a highly risk-averse starting point. The domestic legislation protecting great crested newts arises largely from the Habitats Directive, which has a central aim to restore scheduled species to a favourable conservation status. A more proportionate approach to mitigation, addressing tangible impacts on populations whilst giving lower priority to negligible effects, is consistent with the aims of the Directive. The loss of the "incidental result" defence from the legislation may create a tension with this approach, but it is hoped that the guidance here will assist.

This simple risk assessment can inform the decision as to whether to apply for a licence. It remains the responsibility of the developer - normally acting through their consultant - to decide whether to apply. Early consideration of options can often result in no licence being required - see **Non-licensed avoidance measures** tool, later in the Instructions section. A sound survey and careful comparison with development plans will often be the best guide to whether a licence should be obtained.

Guidance on use

The rapid risk assessment is done by **completing the table later in the instruction section**. Consider the impacts of the development **without any licensed mitigation**. For each "component", select a likely effect from the drop-down menu. It may help to produce a map of the land marked with 100m and 250m radii around each great crested newt breeding pond, overlaid with the development boundary. The land categories refer to <u>all</u> land, not just that used by newts. N.B. this risk assessment is not part of your application, and there is no obligation to use it; it is a tool to help you decide whether to apply for a licence

Each effect is assigned a notional probability of leading to an offence. Note that these are purely notional for the purpose of this generic assessment, and should not be taken as definitive in a given real case. The score takes into account that some activities (e.g. killing newts) are not entirely predictable. The maximum notional probability is then used to derive a conclusion, which is displayed as red (probability \geq 0.65), amber (0.3-0.65) or green (<0.3) in the "risk assessment result" box. Further information on interpreting the result is given below the table. Following this, you may wish to amend details of the development, and include additional precautions (see tool later in instructions), in order to avoid impacts on newts. You can then re-select the likely effects, to re-calculate the assessment based on the modified development, in order to see whether the risk has been reduced further. This process is in line with the general approach of avoiding offences wherever possible.

Remember you should enter the likely effects as if the development were to proceed without any licensed mitigation - i.e. no trapping or fencing, etc. This may mean, for instance, that killing newts is likely as the development would destroy areas they use (though we have taken into account in the probability score that it is often uncertain as to whether newts would be killed by development in a given location away from ponds). You should consider likely effects after taking any appropriate unlicensed precautions to reduce risks - e.g. groundworks during daylight only. Further guidance on this is given in the Non-licensed avoidance measures tool, later in the Instructions section.

Caveats and limitations

This risk assessment tool has been developed as a general guide only, and it is inevitably rather simplistic. It has been generated by examining where impacts occurred in past mitigation projects, alongside recent research on newt ecology. It is not a substitute for a site-specific risk assessment informed by survey. In particular, the following factors are not included for sake of simplicity, though they will often have an important role in determining whether an offence would occur: population size, terrestrial habitat quality, presence of dispersal barriers, timing and duration of works, detailed layout of development in relation to newt resting and dispersal. The following factors could increase the risk of committing an offence: large population size, high pond density, good terrestrial habitat, low pre-existing habitat fragmentation, large development footprint, long construction period. The following factors could decrease the risk: small population size, low pond density, poor terrestrial habitat, substantial pre-existing dispersal barriers, small development footprint, short construction period. You should bear these mitigating and aggravating factors in mind when considering risk.

It is critical that, even if you decide not to apply for a licence, you ensure that any development takes account of potential newt dispersal. Where great crested newts are present, landuse in that area must ensure there is adequate connectivity. Retaining and improving connectivity will often involve no licensable activities.

Likely effect (select one for each component; select the most harmful option if more than one is likely; lists are in order of harm, top to bottom)	Notional offence probability score
No effect	0
Maximum:	0
GREEN: OFFENCE HIGHLY UNLIKELY	
	the most harmful option if more than one is likely; lists are in order of harm, top to bottom) No effect No effect No effect No effect No effect Mo effect Mo effect Mo effect Mo effect

Guidance on risk assessment result categories

"Green: offence highly unlikely" indicates that the development activities are of such a type, scale and location that it is highly unlikely any offence would be committed should the development proceed. Therefore, no licence would be required. However, bearing in mind that this is a generic assessment, you should carefully examine your specific plans to ensure this is a sound conclusion, and take precautions (see Non-licensed avoidance measures tool) to avoid offences if appropriate. It is likely that any residual offences would have negligible impact on conservation status, and enforcement of such breaches is unlikely to be in the public interest.

"Amber: offence likely" indicates that the development activities are of such a type, scale and location that an offence is likely. In this case, the best option is to redesign the development (location, layout, methods, duration or timing; see Non-licensed avoidance measures tool) so that the effects are minimised. You can do this and then re-run the risk assessment to test whether the result changes, or preferably run your own detailed site-specific assessment. Bear in mind that this generic risk assessment will over- or under-estimate some risks because it cannot take into account site-specific details, as mentioned in caveats above. In particular, the exact location of the development in relation to resting places, dispersal areas and barriers should be critically examined. Once you have amended the scheme you will need to decide if a licence is required; this should be done if on balance you believe an offence is reasonably likely.

"Red: offence highly likely" indicates that the development activities are of such a type, scale and location that an offence is highly likely. In this case, you should attempt to re-design the development location, layout, timing, methods or duration in order to avoid impacts (see Non-licensed avoidance measures tool), and re-run the risk assessment. You may also wish to run a site-specific risk assessment to check that this is a valid conclusion. If you cannot avoid the offences, then a licence should be applied for.

(2) Conversions

Return to Impact assessments

All area figures in this Method Statement template should be entered in hectares, to allow consistent calculations. Some ecologists prefer to work in m², especially for smaller figures such as pond surface areas. Use this tool to easily convert between the two units.

Enter area in m²:	=	0.0000 ha
Enter area in ha:	=	0 m ²

(3) Non-licensed avoidance measures

Background

Licensable activities should ideally be designed out of developments during the early planning stages. This should result in avoiding harm to great crested newt populations, and can save developers the time and expense of licensed mitigation measures. Many potentially licensable activities can in fact be avoided by careful planning of the development combined with simple precautionary measures. In many cases, adopting such an approach may mean that no licence is required (as no offence would be committed). Even when a licence is applied for because you decide an offence is likely, such measures can still be employed to reduce the level of harm to newt populations. This application tool helps you to plan non-licensed avoidance measures for common development scenarios. You may also use them in licensed projects to reduce impacts.

Guidance on use, caveats and limitations

Check the list below for suggestions for avoiding impacts that might be appropriate for your project. You can use this in combination with the "Do I need a licence? Rapid risk assessment" tool to help you plan mitigation and decide on whether to apply for a licence. For schemes that cover a large area, you might use these tools to decide that only part(s) of the development should be subject to a licence. This section is based on an examination of approaches considered in recent projects, and is obviously generic. The suggestions may not be appropriate for your particular development, or may require fine-tuning to be helpful. Neither are they exhaustive: we encourage you to develop your own ideas and let us know so that we can include them in future guidance.

If you determine that no offences would be committed and therefore decide not to apply for a licence, it may be useful to keep a copy of the decision-making steps, and any precautions that will be taken. In some cases these might form the basis of a non-licensed method statement, to help a developer and their contractors understand how to carry out works with a minimal risk of breaching the law. If soundly produced, this might act as an audit trail and a "defence" in the event of any future queries about the development's effects on newts. Similarly, if you use these tools to determine that only part(s) of the development area should be subject to a licence, then it is helpful to include this rationale in the licence application, so that we can see why and how you have included and excluded particular areas in the licensed work.

Project element	Suggestions for avoidance measures
Location & layout	(a) Locate site as far as possible from potential breeding ponds and high quality terrestrial habitat. (b) Locate in areas subject to high pre-existing fragmentation. (c) Locate on hard, compacted ground with few fissures. (d) Design layout so that any hard landscaping is as far as possible from ponds, with retained habitat and soft landscaping toward ponds.
Timing & duration	(a) Restricting works to the winter period (when newts are rarely active above ground) is sensible if the project would not harm hibernation habitat. Projects with temporary habitat disruption and reinstatement, such as some pipelines, could potentially be carried out without any licensable activity in this way. (b) Keep duration of groundworks as short as possible. (c) Undertake during the day works that might only affect newts above ground.
Construction methods and special precautions	(a) Backfill trenches and other excavations before nightfall, or leave a ramp to allow newts to easily exit. (b) Raise stored materials (that might act as temporary resting places) off the ground, e.g. on pallets. (c) For pipelines, use directional drilling to cross areas of core habitat and dispersal routes. (d) Avoid installing structures that act as barriers close to ponds, or include gaps at ground level where walls or fences are unavoidable.

(4): Survey data - what kind, how much, how old? Background

Survey data are essential for any mitigation licence application. Consultants frequently seek advice on requirements for the level of effort, type of survey and age of survey data. The answer to this is that sufficient data need to be provided to demonstrate the level of impact on the population, plan effective mitigation, and allow an assessment of development and mitigation effects. Data requirements will be proportionate to the level of impact of the development. Clearly these will vary from case to case. The Great crested newt mitigation guidelines and .GOV.UK

 $\underline{(https://www.gov.uk/guidance/great-crested-newts-surveys-and-mitigation-for-development-projects)}\\$

provide general comments and technical advice on methods. This application tool provides further guidance to assist with planning pond survey effort and Method Statement preparation. It deals only with standard newt pond surveys and Habitat Suitability Index (HSI) assessments. Other kinds of surveys, e.g. terrestrial newt surveys, may be appropriate either as a substitute or in addition, depending on the situation.

Guidance on use, caveats and limitations

Using the **table further down the instructions section in** *Survey Guidance Table*, check the likely type of impact that your development would have, and then read across to see which types of surveys are indicated. The table is divided into permanent and temporary habitat loss; the latter occurs when there is rapid reinstatement to appreciably similar conditions following development (e.g. typical pipeline projects). Where both presence/absence and population size class assessment surveys are indicated, these can run together. Note that the indications in this table are meant as minimum standards, and are inevitably generic. **The circumstances of a particular scheme may indicate that more surveys are required**. For example, additional effort or other types of surveys (e.g. terrestrial dispersal survey, capture-mark-recapture [CMR]) should be done where there is a sound case. Note that **different survey types and effort may be appropriate for different ponds on (or close to) the same development site**, especially for large schemes where impacts vary across the footprint.

The figures on extent of habitat loss here do not take into account overall habitat availability. **You will need to consider the spatial layout of habitat, and in particular barriers to dispersal**. So, for example, if 0.1ha of land were to be lost at a distance of 70m from a pond, and that 0.1ha seems likely (from maps, aerial photos or a walk-over survey) to provide the majority of good quality terrestrial habitat for the nearest population, then a population size class assessment should be done (contrary to the standard recommendation in the table). Conversely, for example, if this habitat were separated by major roads and built land, you may decide that no survey is necessary as it is unlikely to be used by newts. Furthermore, this table focuses on typical habitat loss/damage, and does not take into account all possible impact types, such as disturbance only. Again the general advice is to devise surveys appropriate to the level of potential impact.

Geographical limits of survey

In keeping with a proportionate and risk-based approach, surveys need reasonable boundaries. The *Great crested newt mitigation guidelines* explain that surveys of ponds up to around 500m from the development might need to be surveyed. The decision on whether to survey depends primarily on how likely it is that the development would affect newts using those ponds. For developments resulting in permanent or temporary habitat loss at distances over 250m from the nearest pond, carefully consider whether a survey is appropriate. Surveys of land at this distance from ponds are normally appropriate when all of the following conditions are met: (a) maps, aerial photos, walk-over surveys or other data indicate that the pond(s) has potential to support a large great crested newt population, (b) the footprint contains particularly favourable habitat, especially if it constitutes the majority available locally, (c) the development would have a substantial negative effect on that habitat, and (d) there is an absence of dispersal barriers.

That is not to say that all development proposals over 250m from a pond will not require surveys. There are cases where large numbers of newts have been found at 250-500m from ponds, and so impacts are potentially significant, but such cases are rare and can often be predicted by the presence of especially favourable habitat. Developments beyond 500m from the nearest pond would very rarely merit newt surveys.

Age of survey data

Newt survey data must be sufficient to accurately reflect the status of the site at the time the licence application is submitted. The older the survey data, the more likely it is to misrepresent status, and in general you are advised to carry out surveys as close as possible to submission. The larger the predicted impacts, the more important it is to have recent data. Particular care must be taken if there have been changes to the habitats on or adjacent to the site since the last survey. A walk-over survey, at the least, should be undertaken within 3 months prior to submission to check for habitat changes since the survey was carried out. If circumstances have changed, then only those areas affected by the changes need to be re-surveyed.

Re-assessment of the impacts will need to be undertaken after any re-surveys, and this may require changes to mitigation plans. The far right column in the table gives maximum acceptable age of survey, from date undertaken to date of licence submission. Note that this **assumes no significant habitat changes on or adjacent to the site since last survey**. This must be confirmed, e.g. by walk-over survey, within 3 months prior to licence application submission. Whenever you rely on old surveys, mention their key findings in the main body of your Method Statement, and attach the full survey as an annex.

Survey guidance table

Impact type and location	Potential terrestrial habitat - loss or damage (ha)	Presence/ likely absence survey	Population size class assessment	HSI	Maximum age of survey data (# breeding
Permanent habitat loss or da	image	•		•	,
Pond(s) lost or damaged, with or without other habitat loss or damage	≥0	YES	YES	YES	2
No ponds lost or damaged, development within 50m of	≤0.01	YES	NO	YES	3
nearest pond	>0.01	YES	YES	YES	2
No ponds lost or damaged, development 50-100m from	≤0.2	YES	NO	NO	3
nearest pond	>0.2	YES	YES	YES	2
No ponds lost or damaged, development 100-250m from	≤0.5	YES	NO	NO	4
nearest pond	>0.5	YES	YES	YES	3

No ponds lost or damaged, development >100m from	≤5	YES	NO	NO	4
nearest pond	>5	YES	NO	YES	4

Example: Survey undertaken in 2011 between April to June. Application submitted in autumn 2013 using the 2011 survey. The survey supporting the application would not suffice and the 2011 survey is actually 3 survey seasons old by autumn 2013 (i.e. 1st survey season = 2011, 2nd survey season = 2012 and 3rd survey season = 2013). If the application had been submitted in March/April or even May 2013 it may have been acceptable if fully justified why no further survey effort was

requirea.

Measuring turbidity and vegetation cover. These factors can greatly influence survey counts, so it is important to measure them consistently. In the Method Statement, we ask you to use the following convention:

Vegetation cover score (0-5); 0 = no vegetation obscuring survey; 5 = water completely obscured by vegetation.

Turbidity score (0-5): 0 = completely clear; 5 = very turbid.

(5): Use of the great crested newt Habitat Suitability Index (HSI)

The great crested newt Habitat Suitability Index (HSI) is quantitative measure of habitat quality (source: Oldham R.S., Keeble J., Swan M.J.S. & Jeffcote M. (2000). Evaluating the suitability of habitat for the Great Crested Newt (*Triturus cristatus*). Herpetological Journal 10 (4), 143-155). The HSI is number between 0 and 1, derived from an assessment of ten habitat variables known to influence the presence of newts. An HSI of 1 is optimal habitat (high probability of occurrence), while an HSI of 0 is very poor habitat (minimal probability of occurrence). The HSI is calculated on a single pond basis, but takes into account surrounding terrestrial habitat and local pond density.

Application to great crested newt mitigation

The great crested newt HSI is potentially a useful tool in survey and mitigation. One benefit is that it can be undertaken in a single field visit (with supporting desk work), and at any time of the year (though some variables are more easily measured in spring and summer). Its main uses are:

- 1) in **surveys**, to assess habitat quality in a repeatable, objective manner. In particular, the HSI allows individual factors that influence newt presence to be easily identified. These factors could help explain a very high or very low count. A high HSI can justify employing additional survey effort or methods if no newts are found initially.
- 2) in **impact assessments**, to allow a measure of how damaging a development could be. HSI might also be used as a screening tool to select no impact or minimal impact options in conjunction with (3) below.
- 3) in **risk assessments**, helping to decide whether an offence might be committed, and therefore whether a licence should be applied for. If a pond has a very low HSI score (say <0.5) then there would typically be a minimal chance of great crested newt presence. Hence, with due care and in limited circumstances (see also caveats below), the HSI might be used in the absence of newt survey to help conclude that an offence is highly unlikely and therefore work could proceed in that area without a licence. This application of the HSI should only be used where the predicted impacts were newts to be present would be low (e.g. development at least 100m from pond, permanent habitat loss <0.5ha or temporary habitat loss <5ha). The developer and consultant should realise that there would still be a risk of committing an offence, but it would typically be so low as to be negligible. Obviously, note that if HSI >0.5, this is not confirmation of newt presence; a newt survey would be required to confirm this.
- 4) in **habitat enhancement**, HSI could be used to identify the low-scoring factors in an existing pond that need addressing to improve its quality for newts.
- 5) in **post-development monitoring**, to allow an assessment of habitat condition.

HSI in licence Method Statements

Natural England recommends that consultants engaged in great crested newt mitigation familiarise themselves with the HSI by reading the original paper by Oldham et al (2000). For field use in mitigation practice, we recommend that consultants follow the slightly simplified version adapted for the National Amphibian and Reptile Recording Scheme (NARRS). A helpful guidance note has been produced by The Herpetological Conservation Trust, available to download at:

www.narrs.org.uk/documents/HSI%20guidance.pdf

The survey sections of this template include fields for entering HSI data. The preceding guidance on survey data explains when it might be used most effectively.

Caveats and limitations

The HSI is not a substitute for undertaking newt surveys; it indicates but cannot confirm presence or absence. A licence application that infers great crested newt presence solely from HSI data (i.e. no newt survey data presented) will be rejected. Very low HSI scores may be used along with scheme details to infer a minimal chance of committing an offence in low impact situations, as explained above. This is on a risk assessment basis and consultants should be aware of the potential hazards of this approach. Whilst current data indicate a generally good relationship, HSI scores should not be used to predict population size. Care should be taken when interpreting low HSI scores; for example, a low scoring pond close to an occupied newt pond may still support newts. Whilst appropriate for most pond types, the HSI may lead to unusual scores for some atypical types (possibly including large expanses of marshes, and complex series of depressions in quarry floors). You are asked in the form to comment on any limitations of the HSI approach in your case, and if these are serious then it may be appropriate not to calculate HSI scores.

Post development monitoring advice and guidance

Licences can only be issued where Natural England is confident there will be no detriment to maintaining the conservation status of the newt population at a favourable level, and in some cases a package of monitoring and remedial action will be required to provide that confidence.

All mitigation schemes carry a risk of failure. If mitigation measures fail, then the resulting impact on the conservation status of the newts may mean that the "Favourable Conservation Status test" (FCS test) will not have been met. This risk is greatest for activities that are judged to have a medium or high impact. Post-development monitoring has a role in providing confidence in any judgement that there will be no detriment to favourable conservation status by detecting problems that may lead to such a detrimental effect and enabling appropriate remedial action to be taken to avoid it.

Post-development monitoring will be expected for most medium and high impact cases. Monitoring and remedial action will form an important component of the mitigation package in these cases and will be a key prerequisite to an application for a mitigation licence passing the FCS test.

The success of mitigation commonly depends on measures undertaken following the main phase of construction and newt capture (e.g. Edgar, Griffiths & Foster, 2005; Lewis, Griffiths & Barrios, 2007). Deficiencies in newly created ponds are a common problem and both aquatic and terrestrial habitat features may require several years of management to achieve a high value for newts. Monitoring is necessary to inform that management. Monitoring great crested newt numbers and breeding can also be used to identify the need for action.

When assessing applications, Natural England considers whether post-development monitoring proposals, in conjunction with the other mitigation measures, will be sufficient to ensure that the FCS test will be met. The need for monitoring, and the type of monitoring required, is related to the impact of the development and the status of the great crested newt population. In this way, monitoring requirements are proportionate to the risk of potential impacts on conservation status. For developments having low impacts, monitoring will not normally be required. Developers reducing the impact of their projects will therefore benefit from having lower costs following construction. For further details, see table below.

Site status assessment/	Impact type and size				
population size class	Low	Medium	High		
Small population/ low	None	Presence/absence; 2	Presence/absence; 4		
Medium population/	None	Pop size class	Pop size class		
High population/ high	pop size class	Pop size class	Pop size class		

Return to E5.2

In addition to being necessary in some cases to support a conclusion of no detriment to maintenance of favourable conservation status, data produced in accordance with monitoring conditions helps Natural England and others to assess the effectiveness of mitigation measures. This in turn can feed back into good practice, so that future mitigation can be made more effective (these improvements can also help with cost effectiveness). The UK government has a duty to report to the European Commission on derogations, and for this we rely on data collected under mitigation licences.

Additional Advice for completing the Method Statement Template

Masterplan Guidance

For phased developments you are required to submit a detailed, stand alone, Masterplan to help assess the overall impacts of the entire works on the GCN population and the future mitigation across the whole scheme. A Masterplan to support a licence application must be specific to licensing (it is not appropriate to submit planning documents). As a minimum Natural England expects the Licensing Masterplan to include:

- 1. A map of the overall site (i.e. the entire area the proposed development will cover) to show the terrestrial and aquatic habitat types and areas CURRENTLY present.
- 2. Maps showing:
 - Where each construction phase or plot is to be located and where each mitigation licence will be required within these.
 - The impacts of each phase which requires a licence (loss and damage)
 - All proposed receptor areas, habitat compensation areas (which may be discrete from the receptor areas) sites, mitigation areas and development footprints
 - Post-development connectivity across the site (i.e. how will mitigation and compensation habitats link to each other and the wider landscape)
- 3. The proposed phasing programme (to include information on the number of phases (i.e. which need a licence) and indicative time frames for their construction start and end dates.
- 4. Brief, explanatory text to describe:
- The overall size of the site (ha) and what it currently consists of (habitat types and areas).
- Total terrestrial habitat losses (type and areas) and those for each individual phase.
- Total aquatic habitat losses which will be incurred and those for each individual phase.
- The impacts caused by the phasing of the development in the absence of mitigation
- The total terrestrial habitat compensation proposed and that for each individual phase.
- The total aquatic habitat compensation proposed and that for each individual phase.
- Where captured newts will be translocated during each individual phase.
- How post-development connectivity will be maintained across the entire site.
- How the potential for double-handling will be avoided (i.e. the recapture of newts trapped during early phases of the scheme in subsequent phases).
- Post development monitoring (in line with recommendations in the *Great crested newt mitigation quidelines*)
- 5. A map to show the location and extent of all of the GCN specific habitat measures proposed.
- 6. A detailed Habitat Maintenance and Management Plan (specific to GCN) to describe how mitigation/compensation areas will be managed and maintained in the long term to benefit GCNs (to include the time frame that it will cover).
- 7. Assurance of the long term security of the GCN population and confirmation that any proposals are not left as open-ended options before the application is submitted.
- 8. Guarantees that proposed receptor sites will be safe-guarded and free from future development pressures.

Important notes on capture methods and effort

Pitfall trapping minimum effort

Trapping may cease once there have been 5 zero capture days in suitable conditions. These <u>5 zero capture days may be the last 5 of the minimum capture period, but not earlier</u>. Note: The shortest minimum capture period listed (25 days) is only appropriate in exceptional circumstances, e.g. small population size class and minor development impacts predicted. Deviations from the recommendations within the Great crested newt mitigation guidelines should be fully explained and justified. A minimum of 25 nights trapping will be acceptable for linear developments (such as pipelines, boreholes, archaeological investigations) which incur temporary impacts only (e.g. where habitats will be fully re-instated to their previous status and no ponds will be lost or damaged).

Seasonal considerations in pitfall trapping and fence installation

Natural England advises that pitfall traps are closed once newts begin to hibernate (generally after the first frosts) and reopened in suitable weather conditions in the spring when newts become active again above ground. Although some newts
may become active during the winter period, their behaviour is unpredictable and many individuals will remain in hibernation
sites, where they are unavailable for capture. Furthermore, strong directional movements, which are best for trapping, are
much less common during this period. Pitfall trapping over the winter period also has welfare implications for both target
and non-target species caught in traps. Any animal caught in a pitfall trap is protected under the Animal Welfare Act 2006
and the operator has a duty of care to ensure that captured animals do not endure suffering whilst in captivity. Natural
England will not therefore licence the terrestrial capture of great crested newts over the winter period, even during bouts of
milder weather.

For applications proposing newt capture in autumn, Natural England expects consideration to be given to the possibility that weather conditions may become unsuitable for newt capture, whereby pitfall traps must be closed and trapping re-started the following spring in suitable weather conditions. In cases such as this it is advisable for 'Work schedule E6a' to reflect possible delays and ensure it is clear that no construction works are scheduled to take place until the agreed capture effort is completed and that traps will be closed and re-opened the following spring.

Amphibian fencing should only be installed in winter if there is no risk of harming dormant or hibernating newts. For example, installing fence lines across ground with no opportunities for refuge (e.g. compacted ground, amenity grassland) pose the least risk to newts. The key point to examine is whether the fence is to be installed in an area likely to be used by wintering newts.

Night searching

(1) Application. This capture method is appropriate only in certain circumstances, as follows: (a) capture area within 100m of pond, unless clear resting place feature more distant and no dispersal barriers (b) newts clearly visible when above ground, i.e. even ground surface, even topography and no or very little vegetation (e.g. even quarry floors, amenity grassland, hardstanding), (c) carried out during period of reasonable dispersal, i.e. March to late June, late August to end October. It may also be used in addition to pitfall trapping, and this may increase capture rates and allow an earlier finish to capture operations.

In the following cases night searching as the *sole capture method* may be used instead of pitfall trapping: where all the conditions listed previously for applicability are met, and one of the following is the case: (a) ground conditions mean installation of pitfall traps is impractical, (b) vandalism is likely to be so severe that even with standard safeguards pitfall trapping is impractical or dangerous for the newts, (c) other site-specific rationale to believe that night searching would be more effective than trapping. In such cases night searching capture effort proposals are expected to mirror that for pitfall trapping (e.g. 30 nights night searching for a small population in suitable weather conditions and ceasing only when the above criteria have been met - see pitfall trapping minimum effort). Deviations from the mitigation guidelines recommendations should be fully explained and justified).

(2) Method. Drift fences erected in lengths forming rough arcs around pond, with some cross-ways lengths. Lay refuges next to fence and any likely resting place features. Searching to be done by highly experienced newt ecologist with high power torch (at least 1M cp). Search on warm nights during rain or shortly after rain. Start around 22.00 even if dark earlier. Search for approx. 3 hours (more on very large sites), repeat scanning areas to check for newts emerging from ground. Check along fence lines (first and last checks) but also search other areas. Walk slowly scanning torch in front; check refuges. Cease search if much leaf fall as this makes newts difficult to detect. Take great care to avoid stepping on newts.

Destructive searching and hand searching

These methods are only appropriate for distinct habitat features that can be carefully dismantled by hand or machine, with minimal risk of harm, and after other capture methods are expended. Examples: rubble pile, topsoil mound, patio, fractured hard-standing. Not to be used on extents of habitat such as grassland or scrub. Not to be undertaken in winter when newts are inactive or in extremely hot periods in summer; capture should only be carried out in suitable weather conditions as per the *Great crested newt mitigation guidelines*.

GCN Method Statement WML-A14-2 (Version April 2020) The Conservation of Habitats and Species Regulations 2017 (as amended) Method Statement to support application for licence under Regulation 55(2)(e) in respect of Great crested newts Triturus cristatus Section A. Site/project name: Sizewell C - Darsham Park and Ride Applicant (developer) name: SZC Co. Named Ecologist: Is this application for a new Method Statement (not previously licensed), a modification to a licensed Method Statement (non-annexed only), or a re-submission following a "Further Information Request" notice? New method statement; not previously licensed If a re-submission, please give previous application reference (eg EPSL, EPSM 20XX-3142A, 20XX XXX EPS MIT): NB: For re-submissions and modifications (non-annexed) the Method Statement should be resubmitted in its entirety, including all maps, appendices, reports, etc. You must clearly show any changes from the previously submitted version by underlining relevant text (CTRL-U) or by changing the font colour. In undertaking this mitigation project, I agree to comply with good practice as set out in the Great crested newt mitigation guidelines (GCNMG) (English Nature, 2001). [Note: if you do not check the box to comply with good practice your application will almost certainly be rejected. See comments on Technical mitigation issues in Instructions] ✓ Yes NB: Please be concise with your information and descriptions provided within your Method Statement Section B Introduction You have provided a brief description of proposal in the application form, please provide the following additional background and site information. Relationship with impacts due to other nearby development **B1.1** Is this application part of a phased/multi-plot development? See: Advice on Masterplan guidance For example, is it part of a phased mineral extraction, housing development or one plot in a multiple ownership residential scheme?..... If No, go to Question B1.2 √ Yes If yes, how many great crested newt (GCN) licences will be required? 3 1 of 3 What licence application phase is this? e.g. licence application 1 of 3. Note: sections in this Method Statement on impact assessment and mitigation measures must explicitly relate to impacts only from the development currently proposed. Your separate master plan document is expected to take due regard of the overall project. This is important to ensure that in-combination effects are considered, and mitigation measures across the whole project are both sufficient and coherent. Confirm you provided: Yes ✓ No A Separate Masterplan document..... ✓ Yes ✓ No Separate Masterplan figures..... Yes ✓ No A Habitat Management and Maintenance Plan?...

If you have selected 'No' to any of the above questions, please explain why as these are considered necessary and important documents for determination of your application. Not to provide them is likely to result

in delays to being able to determine your application whilst we come back to you for this information.

This is a draft EPS licence to be submitted in support of the Development Consent Order (DCO) for the proposed Sizewell C power station. As well as the main nuclear site development, the application includes associated development such as rail routes, link roads and park and ride schemes. Three separate GCN licences are required to facilitate the scheme, Northern Park and Ride, to which this application applies, Sizewell Link Road, and Green Rail Route which will be submitted as further applications. Northern Park and Ride and Sizewell Link Road are 1.4km apart and Northern Park and Ride and Green Rail Route are 6.9km apart and the impacted metapoulations are not connected.

Given the geographic separation of the sites and no likley pathways for direct or indirect incomination impacts a masterplan is not considered to be needed.

For clarity the proposed Northern Park and Ride development has three stages. These are:

- 1) Conversion of the site from an arable field to an active car park with associated landscaping;
- 2) Usage of the park and ride for the duration of the construction (approximately 10 years) for this period GCN will be excluded from the site;
- 3) Restoration of the site to an arable field after the completion of the Sizewell C development, GCN fencing will be removed at this stage
- N.B. For the purposes of this licence, the end stage of the licensable period is the reversion of the site to an arable field. GCN are proposed to be excluded for the duration of the operational phase of the development to prevent the need for double handling.

Please provide below a brief summary of how the current application relates to the larger project.

The proposed Sizewell C nuclear power station would comprise two UK EPR™ units with an expected net electrical output of approximately 1,670 megawatts (MW) per unit, giving a total site capacity of approximately 3,340MW. The design of the UK EPR™ units is based on technology used successfully and safely around the world for many years, which has been enhanced by innovations to improve performance and safety. The UK EPR™ design has passed the Generic Design Assessment process undertaken by UK regulators (Office for Nuclear Regulation and Environment Agency), and has been licenced and permitted at Hinkley Point C. Once operational, Sizewell C would be able to generate enough electricity to supply approximately six million homes in the UK.

In addition to the key operational elements of the UK EPR™ units, the Sizewell C Project comprises other permanent and temporary development to support the construction and operation of the Sizewell C nuclear power station. This application applies to one of these elements. These are:

Two temporary park and ride sites; one to the north-west of Sizewell C at Darsham (the 'northern park and ride' - to which this application applies), and one to the south-west at Wickham Market (the 'southern park and ride') to reduce the amount of traffic generated by the construction workforce on local roads and through local villages;

A permanent road to bypass Stratford St Andrew and Farnham (referred to as the 'two village bypass') to alleviate traffic on the A12 through the villages;

A permanent road linking the A12 to the Sizewell C main development site (referred to as 'Sizewell link road') to alleviate traffic from the B1122 through Theberton and Middleton Moor;

Permanent highway improvements at the junction of the A12 and B1122 east of Yoxford (referred to as the 'Yoxford roundabout') and other road junctions to accommodate Sizewell C construction traffic;

A temporary freight management facility at Seven Hills on land to the south-east of the A12/A14 junction to manage the flow of freight to the main development site:

A temporary extension of the existing Saxmundham to Leiston branch line into the main development site ('the green rail route') and other permanent rail improvements on the Saxmundham to Leiston branch line, to transport freight by rail in order to remove large numbers of HGVs from the regional and local road network; and

Green rail route extension and rail improvements to the Saxmundham to Leiston branch line.

The components of the Project listed above are referred to collectively as the 'Sizewell C Project'. Current application comprises a park and ride car park for the the main development site (Sizewell C, the new puclear

For this method statement also include a map FIG. B1.1 - see Sum & Figs. tab.

B1.2 Apart from any mentioned in B1.1, are there other GCN mitigation projects which might affect the

B - Background & Site Info

target population? You must make reasonable efforts to establish this, including discussions with your client and the LPA.
Notes: Include any projects within 100m of site boundary, and any further away that are likely to seriously impact on the population at the site. Include current projects, any from the last 5 years, and any planned to happen within the next 5 years.
If yes, provide summary information here, including site names, dates, and - if known - licence reference No.s:
A review of the planning applications viewable on the East Suffolk Council planning portal found no evidence of forthcoming projects taking place within the next 5 years that have the potential to affect the target GCN population for this application. Similarly, a review of MAGIC for granted European Protected Species applications within the past five found none to be present within 100m of the site. Three historic applications (references: EPSM2009-1044, EPSM2009-1450 and EPSM2012-460) dated between 2009 and 2014 were discovered between 1.7km and 5km of the site. Given that these granted licences were restricted to enabling the destruction of GCN resting places, in addition to their distance from the site, it is considered unlikely that there are other GCN mitigation projects that may affect the target population for this application.
NB: Locations of other GCN sites must be shown on FIG. B1.2 - see Sum & Figs. tab

C Survey and site assessment

C1 Pre-existing survey information on GCN at survey site (eg previous to the survey data used to inform this application)

C1.1 Indicate conclusion on newts at development site from pre-existing survey data, if any. You should make reasonable efforts to find this data, including consulting the NBN Gateway and Local Records Centres.

Pre-existing survey indicates likely great crested newt presence

C1.2 Age of pre-existing survey data (years between now and latest survey)

Between 1 and 3 years

C1.3 Source(s) of pre-existing survey data; also include a copy or summary in an appendix

Pre-existing data of the ponds surrounding the site is included within Sizewell C Environmental Statement Volume 3 Appendix 7A which includes desk study data and survey data from Amec (2011), and Arcadis (2015 and 2019).

C2 Status of GCNs in the local area

C2.1 Local status (within approx 10km). Note: often there will be only patchy data on newt distribution, but you may feel able to assign one of the categories below when combined with pond density figures for the local area. Note: this is only a rough measure.

Frequent - known or likely to occur at c. >5 ponds per square km

Further information on local status

Local biological record centre search (taken from Environmental Statement for the proposed scheme) and MAGIC search. Of the 16 records of GCN that were returned within 2km of the site, none are located within or adjacent to the site, with the closest record originating 480m north of the site.

643 records of GCN within 10km on NBN. This equates to ~6 record per km2. There is a high density of ponds within the 10km area surrounding the site and, indeed, Suffolk as a county holds a very high density of ponds. Nevertheless, analysis of 900 of Suffolk's 22,000 estimated ponds between 2004 to 2007 (Bullion, 2009), revealed that whilst over 14% of the ponds surveyed contained GCNs, large and established populations were only recorded at a small number of ponds (sunny, well-vegetated ponds with good surrounding habitat), and the majority of Suffolk's ponds were found to be unsuitable for GCN (due to heavy shade and organic matter, and/or the presence of predatory fish or damagingly high duck populations).

C3 Recent survey (to inform this mitigation project)

C3.1 Objective of survey

Co. I Objective of survey			
To confirm presence of great crested newts in a spec	cified area		
 C3.2 Survey area and justification Clearly state which areas were surveyed If Other, please provide comments below: 	Survey Area 250m	● 500m	Other
Ponds on site and within 500m, where access was av	/ailable.		
Select which ponds were surveyed If Other, please provide comments below:	Ponds Surveyed All Ponds	Some Ponds	Other
Shown on Figures C3 2a and C3 2h			

Provide justification for the area surveyed (whether 250m or 500m of the site)

A 500m survey area was adopted in accordance with Natural England's recommended buffer area for surveying ponds for GCN. Of the 24 ponds present within 500m of the site, two were not surveyed due to a lack of granted access by the relevant landowners (as shown on Figure C3.2a). In addition, a further ten were not surveyed as they were considered to be terrestrially isolated from impacts associated with the proposals, should great crested newts be present within them. The A12 is situated between the site and these ponds. This busy A road is defined in part by high kerbs with drainage gullies, such that it is considered to form a barrier to the dispersal of great crested newts to some degree. Further, due to the suboptimal terrestrial habitat present within the site and a lack of potential breeding ponds to the west of it, there appears to be no motivation for GCN to disperse across the site from the direction of these ponds. Accordingly, these ten ponds were deemed to be sufficiently isolated from the site and were scoped out from survey. Finally, one pond was not extant.

NB: to accompany the survey section you must identify the survey area and <u>all</u> ponds within that area, indicating those surveyed from those not surveyed, on FIG. C3.2(a) and the 250m and 500m radii limits around the development boundary. An aerial photograph of the site and surrounding area is also useful.

Please label as FIG. C3.2(b) if included. See Sum & Figs. tab.

C3.3 Habitat description: waterbodies

C3.3i Briefly describe all waterbodies within your survey area. Please provide only a short text description, e.g. "Pond 1 is a small garden pond in the northwest of the site. Pond 2 is a marl pit pond in the centre of the site". Includepond references (names). Do not include Habitat Suitability Index (HSI) data here; this is to be added later in the Method Statement.

Pond ref	Description
P078	Small pond located in rough grassland in an arable field margin.
P217	Garden pond located to the east of the site boundary
P218	Garden pond located to the east of the site boundary
P219	Garden pond located to the east of the site boundary
P227	Agricultural field pond with scrub/trees around some of its margin, south of the order limits
P220	Garden pond located to the east of the site boundary
P221	Garden pond located to the east of the site boundary
P083	Woodland pond located to the north of the site boundary.
P084	Woodland pond located to the north of the site boundary.
P085	Woodland pond located to the north of the site boundary.

Add further records to the Additional Records tab.

C3.3.ii Waterbodies: distance from development site boundary and other ponds.

Provide distance (to the nearest 10m) from the development site boundary for each pond within the survey area. If pond is on site, enter "0". If a pond on site or close to the development was not surveyed for GCNs, still give the distance, and provide reason for not surveying.

Pond ref	Distance (m)	Surveyed or not?	If selected 'No- other reason' explain below
P078	0	Yes	
P217	25	Yes	
P218	25	Yes	
P219	25	Yes	
P227	190	Yes	
P220	25	Yes	
P221	25	Yes	
P083	320	Yes	
P084	360	Yes	
P085	420	Yes	

Add more records here Additional records page

C3.4 Habitat description: terrestrial habitats.

What is the total area (ha) of the development site?

27.94

- Please provide a broad breakdown (ha and habitat type) of terrestrial habitat present on the development site. **Note** that this total should be the same as the area included above.
- Also, briefly describe the terrestrial habitats present on adjacent areas likely to support GCNs. If there is no defined boundary to development site, please explain the habitats affected by the works and within the surrounding area.
- The habitats described in this section should be clearly shown and identified on Figure C3.2(a)

The site is dominated by arable farmland, which is bordered by a semi-improved species-poor (2m wide) grassland margin. The site itself is bordered by species-poor hedgerows, interspersed with stands of mature Oak (Quercus robur) and Ash (Fraxinus excelsior) on three sides, and by a block of broadleaved woodland (Little Nursery Wood) on the western boundary. A single pond is located within the site (Pond 078), whilst a small number of ponds were identified within gardens immediately adjacent to the eastern boundary, with a further small pond (considered defunct) located within Little Nursery Wood. Little Nursery Wood consisted of primarily mature Ash with a dry ditch running along the eastern boundary and a running stream through the centre.

Being dominated by arable fields, the majority of the site comprises low value terrestrial GCN habitat (approx. 24.56ha) that does not offer resting opportunities. However, small areas of suitable terrestrial habitats for GCN are located within the site boundary, including the areas of poor semi-improved grassland and field margins (approx. 0.7ha) and the hedgerows that bound the site (approx. 1,408m).

The site also includes areas of existing roads etc. which are within the redline of the site which will not be impacted.

NB: Photographs showing the habitats on site should be provided - FIG. C3.4 see Sum & Figs. tab

C3.5 Waterbodies: quantitative assessment.

A Habitat Suitability Index (HSI) score should be calculated for each pond that would be subject to activities likely to result in adverse impacts on the local GCN population. See guidance in the Instructions section (Survey data and HSI tabs). It is not required for ponds subject to low impacts, though can be entered if you wish; this may be useful, for example, to provide objective evidence that the population affected is likely to be small.

In the boxes below, enter the Pond reference (or name) then the SI scores. The spreadsheet will automatically calculate the HSI. It is expected that, for each HSI, all ten SI scores should be entered in most cases. If you did not calculate a particular SI score, leave blank (**do not** enter "0"). If more than two variables are missing, the HSI should be treated as provisional and you should comment on this below. If more than 10 waterbodies need HSI scores, include additional information in an appendix, in the same format as below.

Please comment and describe any constraints on HSI data if appropriate. If ponds did not under go a HSI assessment please also explain why:

As previously discussed, access to Ponds 86 and 87 was not granted, whilst ponds 88 – 95 were scoped out due to their relative isolation from the site. Pond 225 was considered defunct

C4 Amphibian survey C4.1 Terrestrial amphibian survey Was a terrestrial survey undertaken?
Which are a use as mission of fau town atrial are which is an a
Which area was surveyed for terrestrial amphibians?
Explain terrestrial survey area(s). Also mark on map, and give map reference here:
Applicants must ensure they retain or have access to the records set out in the technical advice note, and used to support the licence application, for at least 12 months after the first licence return (dates
for which will be set out in any licence granted).

Fill in the boxes to show methods, timing, effort and results:

Add more records here Additional records page

It is only acceptable to use Accredited Agents under a GCN survey licence to collect eDNA samples if it can be demonstrated that they are adequately trained and competent in GCN ecology, conventional survey techniques, trained in the collection of eDNA samples and are experienced GCN surveyors even if they do not hold their own GCN survey licences. The named ecologist and applicant are responsible for ensuring that this condition is met.

Results of eDNA survey data must be clearly depicted on Figure C3.2a.

Next Section

C4.3 Aquatic amphibian survey (conventional methods) - GCN results - Pond 1

Was an aquatic amphibian survey done? If no, proceed to next section. Yes

Total no. of ponds surveyed: If >10 ponds or >8 visits for a pond, provide further data... See additional Survey ponds 11-20 sheet

Surveyor name(s): Ana Pino Blanco, Duncan Sweeting, Rob Regan, Andrew Ross, David Orchard

Important. Read before completing this section: Enter GCN survey data in relevant boxes in the table below (for Pond 1) and those on subsequent sheets (for up to 9 other ponds). Enter "0" where you did a survey and found no newts; leave box blank if no survey was done. This format is designed for a typical single season survey with typical methods and effort. Explain atypical methods/effort later. For multiple year surveys, give details in annex (convert data to this format if possible). Use these tables to provide details only for the most recent season's survey. Append older survey results in full. Automatic yellow highlight indicates possible detectability problem (see Evaluation & interpretation section, later).

Pond refere	nce (e.g. "F	ond 1") - be	elow	Method:		Torch		l	Bottle-tra	р		Net		Egg search	Larvae

				Adult totals:		0			0			0			
	Peak	adult count	for this pon	d in any one	visit (by t	orch, tra	p or net):	12							

Comments and constraints: Other amphibians: smooth newt (max count 1).

Constraints: dense scrub cover along 40-60% of the banks hindered access for torching and bottle-trapping. High turbidity on visit 5 and pollen cover on water surface on visit 6 restricted visibility during torching.

C4.3 Aquatic amphibian survey (conventional methods)- GCN results (cont - Pond 2)

NB: This page prints in landscape format

Pond refere	ence (e.g. Po	ond 2)		Method:		Torch			Bottle-tra	p		Net		Egg search	Larvae

(8) Date:	Air temp	Veg cover	Turbidity												
				Adult totals:	(0			0			
	Peak adult count for this pond in any one visit (by torch, trap or ne						or net):	47							

Comments and constraints: Other amphibians: smooth newt (max count 14).

Constraints: dead water shrew found in bottle-trap during survey visit 1, so no bottle-trapping was undertaken during visits 2-6. High turbidity during visit 4 restricted visibility during torching. Dense vegetation along 40-50% of bank hindered access for torching.

Other comments: egg search not undertaken after visit 1 as GCN eggs were confirmed.

C4.3 Aquatic amphibian survey (conventional methods) - GCN results (cont - Pond 3)

NB: This page prints in landscape format

				Adult totals:		0)			0			
	Peak	adult count	for this pon	d in any one	visit (by t	orch, tra	p or net):	9							

Comments and constraints: Other amphibians: smooth newt (max count 1).

Constraints: dead water shrew found in bottle-trap during survey visit 1, so no bottle-trapping was undertaken during visits 2-6. Dense common reed growing along the pond's edge made only 10% of the banks accessible for torching on visits 3 and 4. During visits 5 and 6, the reeds covered 100% of the pond's edge making it inaccessible. Other comments: egg search not undertaken after visit 1 as GCN eggs were confirmed.

C4.3 Aquatic amphibian survey (conventional methods) - GCN results (cont - Pond 4)

NB: This page prints in landscape format

(8) Date:	Air temp	Veg cover	Turbidity												
				Adult totals:		0)			0			
	Peak	adult count	for this pon	d in any one	visit (by t	orch, tra	p or net):	0							

Comments and constraints: Constraints: dense vegetation along 80-90% of the pond's edge during visits 3 to 6 hindered access for torching and bottle-trapping. High turbidity during all visits except for visit 2. Water surface completely covered with pollen and algae during visits 5 and 6. Bottle-trapping not undertaken visit 4 because a water shrew was found within nearby pond and visit 6 due to high temperatures.

Comments: no aquatic vegetation present visits 1 and 6, no egg search undertaken.

0		0		0.41			

*Note: The detectability column will state "Caution" if your data suggest any survey was done in poor conditions (temp<5C, veg cover>3, turbidity>3 or torch power <500,000 cp); otherwise it is blank. Aquatic newt surveys should not be carried out when air temp is <5C or with weak torches as results can be misleading. Whilst careful timing can sometimes avoid vegetation and turbidity problems, they are inevitable at some sites. It may be appropriate to undertake more detailed surveys and interpretation techniques (e.g. CMR). If this column returns "Caution", or there is any other reason to suspect detectability problems, you should be especially careful about interpreting counts, and comment on this in the constraints box below.

Peak total site count** for all ponds surveyed:

Population size class for all ponds surveyed:

^{**} This figure is derived as follows. For each survey visit, the spreadsheet picks the highest count of adult newts obtained by torch, net or bottle-trap for each pond. These individual pond counts are then summed to give a site count for each visit. The peak total site count is then the highest of these figures, i.e. highest summed count across all ponds attained on any one visit. This figure may derive from counts using a mixture of methods (torch, bottle-trap or net) - see adjacent table which shows how the figure is derived. The calculations assume survey visits per pond are undertaken within similar timeframes, if this is not the case, this Peak total site count should be calculated by hand and reasons for it explained in the general comments text box below.

^{***} this automatically generated size class assumes that it is appropriate to aggregate counts from all ponds, i.e. there is likely to be newt movement between ponds, for example where each pond is within approx 250m of

C - Survey summary

another, with no significant barriers to dispersal. If you believe the automatically generated size class is incorrect for your site, provide your ecological justification in box below and give alternative accounts of peak total site counts and population size class for the site. Where there are meta-populations explain which ponds form each meta-population. For surveys of >10 ponds, data should be added to appendix provided, and note that peak counts etc will need to be derived separately.

N/A

Site status assessment (see Section 5.8.5 of *Great crested newt mitigation guidelines* for guidance):

Quantitative	Moderate importance - medium population
Qualitative	Moderate - breeding on site; habitats common in area
Functional	Moderate importance - probably some dispersal to/from nearby population(s)
Contextual	Unknown

General comments on overall site status, and constraints to interpretation and evaluation - How did the constraints affect your interpretation of your survey?

• Account for the presence of any barriers to dispersal and explain how this affects your assessment of the distribution of newts across the site and the presence of meta-populations

The ten ponds located to the east of the A12 were scoped out of the GCN survey due to the presence of the A12 between the site and the ponds, which is bordered in part by high kerbs and supports a number of drainage gullies. As the A12 is partly lined by hedgerows and areas of grassland, and a small number of drop kerbs are also present, this feature is not considered to form a complete barrier to GCN dispersal but is likely to restrict/inhibit GCN movements to various degrees dependant on distance from GCN ponds and motivators on the 'other side' of the 'barrier'. Moreover, given the suboptimal terrestrial habitat present within the site, it is considered that there is little to no motivation for habitation of the site and, accordingly, these ten ponds were deemed to be sufficiently isolated from the site. Therefore, it is considered unlikely that GCN, should they be present within these offsite ponds, will make use of the site/be affected by the works.

• Acknowledge any survey constraints e.g. low detectability warnings (as highlighted in section C5 above), deviation from survey recommendations in the GCNMG (methodology, timings, effort) etc.

All constraints during survey are mentioned within the survey forms, if not listed below.

There are low detectability warnings for all five ponds surveyed due to the following reasons:

P078 - Turbidity 4 on visit 5.

P217 - Turbidity 4 on visit 4.

P218 - Veg cover 5 on visit 5.

P219 - Veg cover 4-5 on visits 3-6.

P227 - Turbidity 4-5 on 5 out of 6 visits.

In addition due to the discovery of traped water shrews within bottle-traps at ponds P217, P218 and P219 during survey visit 1, bottle-trapping was no longer used as a survey technique during the subsequent five surveys at these ponds.

No great crested newts were detected within P227 during the surveys despite the eDNA test indicating presence of great crested newt eDNA in this pond. Turbidity was high during five out of six visits and there was dense vegetation along 80-90% of the pond's edge during four out of six visits, hindering torching and placement of bottle-traps. Additionally, bottle-trapping was not undertaken during two survey visits. These are considered significant survey constraints and great crested newt presence is therefore assumed within P227 as a precautionary approach.

Conventional great crested newt population surveys were not undertaken at P220 and P221 as access permission could not be obtained until late in the season (10/06/2021). eDNA testing indicated presence of great crested newt. Both ponds had a poor HSI, and the adjacent ponds (P218 and P219) supported small populations so, at best, it is considered that P220 and P221 also support a small population.

C - Survey summary
 Justify why constrained survey data is considered to accurately represent the size and distribution of the GCN population(s) present Standard procedures were always followed during GCN surveys. Turbidity does not interfere with the estimation of population size class of P078 as it was only above 3 on one visit (visit 5) and bottle trapping was undertaken on this visit. As such, the population size calss data can be relied upon to provide a robust estimate. Turbidity and veg cover only exceeded 3 on P217 and P218 respectively during one visit (shown above).
Despite this, the numbers of individuals recorded were similar during following visits to these waterbodies where conditions were more favourable suggesting the constraints in question did not influence the results of the torching surveys.

C - Survey summary	
Next section	

Impact maps must be of a suitable scale to clearly show the following:

- The development site boundary
- 50m, 250m and 500m radii around each GCN pond boundary
- Temporary and permanent impacts and habitats affected (to include a key to show the habitat types).
- Fragmentation impacts and/or barriers to dispersal.

More than one map may be required for larger schemes.

NB: Impacts must be shown on FIG. D - ensure all habitats types that will be affected by the proposals and impacts on them (indicating whether temporary or permanent) are clearly indicated and 50m, 250m and 500m radii are shown around GCN ponds.

See Sum & Figs. tab.

Next section

E1 The mitigation solution being proposed in the Method Statement should be the one that delivers the 'need' with the least impact on the newt population.

Please explain why this design was chosen over other potential solutions - set out what other mitigation proposals were considered and why they were not feasible, for example:

- if the proposal is to construct a new road and it will destroy breeding ponds, explain why it is not possible to retain the ponds in the proposed design etc; or,
- if a residential development results in a net loss of habitat, explain why it was not possible to reduce the housing footprint: or.
- if pond drain down is planned for the summer months when newts are breeding please explain why it is not possible to schedule this in, followed by pond destruction, in late September onwards; or
- if your proposal includes a non-standard approach to meeting the 'need'.

The proposed development works comprise the creation of a park and ride area, along with associated access roads, within an area of arable land considered to be of low value to GCN. The scheme has been designed to avoid the loss of any ponds, with all ponds being retained.

Accordingly, given the domination of the development area by suboptimal GCN habitat (comprising mainly arable land), it is considered unlikely that the proposed scheme will have a significant negative impact on the GCN population in this area. Nevertheless, in the absence of mitigation there is the potential to injure/ kill individual GCN and, as such, a number of mitigation measures have been proposed.

Mitigation is outlined for the construction, operational and decomissioning phase of the develoment. Construction mitigation comprises hand searches in the areas grassland present at the margins of the arable land prior to a staged vegetation clearance to be undertaken in these areas, in addition to installing one-way directional newt fencing around the eastern perimeter of the works (to sperate these areas from the pond and habitat area to the east of the site), to prevent great crested newts from entering the development area but allow them to move into the retained areas to the east. Any GCN found during the construction phase will be moved by hand into this safeguarded area.

Fencing would be sited to ensure that Pond 78 is excluded from the site during the operational phase of the development.

This approach eliminates the need to translocate great crested newts away from the landscaped areas of the park and ride once this is returned to agricultural use (after approximately 9 years of the site being utilised as a park and ride scheme). This fencing would be installed at the start of the first phase of construction, maintained throughout operation and would remain in place until the end of the site restoration works, with biannual checks on the fencing structure undertaken during the operational use of the site. In any GCN were found incidenally during the works, these will be moved by hand to the vicinity of the pond in the retained pond on site.

Accordingly, the proposed development is predicted to have non-significant, minor temporary impacts on the great crested newt population. Once construction is complete the site area will be restored, therefore the impacts are considered to be negligible and only for the duration of the works. The vast majority of the affected terrestrial habitats are considered to be of low value for great crested newts providing few refuges

o la	Receptor site selection. NB: this relates to the place(s) where any captured newts will be released. It bes not just refer to distant receptor sites or need to be the entire compensation area; where GCN will be aced must be clearly indicated on the relevant map. Enter details below unless no newts will be captured captured.
Е	3: Location of the receptor site in relation to the development site must be provided on FIG. E2
	<u>see Sum & Figs. tab</u>
2	2.1 Existing GCN status at receptor site(s)
r	reat crested newt present; medium population size class
	2.2 Survey information for receptor site if different from the survey for the application proposal.

The receptor site for terrestrial GCN is proposed to be located in the grassland surrounding pond 78 (if GCN are encountered)

E2.3 Receptor site locations. *Must include:*

Please record further sites in Additional Records tab

Site name	OS grid ref eg AB12345678	Administration area - if different from development site	Distance from development site (m).
P078 Receptor Area	TM407700	Within the site	0m

E2.4 Receptor site(s): ownership and land status. *Please note that any receptor site must be free from future development proposals/threats.*Additional records tab.

Site name	Site Ownership	Conservation Designation?
P078 Receptor Area	Within site ownership	No

E2.5 Receptor site: habitat description, size (ha) & adjacent land use.

Additional Records tab

•	. , , ,		
Site name	Habitat description	Size (ha)	Adjacent Land Use
P078 Receptor Area	Area of rough grassland directly surrounding P078 within the site		Arable land on site and offsite residential garden

E3 Habitat creation, restoration and/or enhancement

The left side of table below summarises the impacts you specified in section D. Enter the habitat creation, restoration and/or enhancement that will be undertaken to compensate for these impacts in the right hand column.

Should you wish to convert ha to m² or m² to ha please <u>use this converter</u>

Aquatic	Impacts			Compensation		
habitat	Effect	Number	Total Area (m²)	Measure	Number	Total Area (m²)
CCN nanda	Lost	0	0	Created	0	0
GCN ponds	Damaged	0	0	Restored / reinstated / enhanced	0	0

Terrestrial	Impa	acts	Compe	ensation
habitat	Area lo	st (ha)	Area gained (ha)	
	Permanent	Temporary	Created	Restored / reinstated / enhanced
Core	0.0	0.8	0.0	0.8
Intermediate	0.0	13.1	0.0	13.1
Distant	0.0	11.7	0.0	11.7
Totals	0.0	25.6	0.0	25.6

NB: All habitat creation, restoration and enhancement measures must be shown on FIG. E3.1 - see Sum & Figs. tab

If a net loss of habitat (ha) is proposed please provide in the text box below an ecological justification to explain why the habitat measures proposed are considered sufficient to compensate for the impacts of the development. Some reduction in terrestrial habitat area may be acceptable provided there is an appreciable increase in habitat quality.

The vast majority of the development area comprises arable land that is of low value for GCN, lacking resting/overwintering opportunities and providing limited foraging opportunities only. Further, based on the location of the GCN ponds and suitable terrestrial habitats, it is unlikely that this habitat facilitates significant dispersal. The proposed habitat creation will significantly improve this, replacing the arable land with semi-improved grassland and hedgerow planting, supplemented by hibernacula, that provide overwintering opportunities for GCN.

E3.1 Describe the creation, restoration or enhancement of aquatic habitats (include design and water body dimensions as per *mitigation guidelines* and waterbody location. Dimensions these will be included in any annexed licence issued).

NB: Only put timing of aquatic creation, restoration or enhancement in the timetable E6a.

Pond reference	Surface Area (m²)	Max. Depth (m)	Design / enhancement measures and location
N/A	0	0	N/A

П			

E Mitigation & compensation (continued)

E3.2 Terrestrial habitat measures

State number/area/length of any terrestrial habitat measures. Leave blank if not applicable. *Dimensions of hibernacula are expected to be *at least* that recommended in the mitigation guidelines.

	Number/area (ha)/length**	
	Created	Reinstated / Restored / Enhanced
Hedgerow planting		
Grassland re-seeding		
Grassland management (just for GCN)		
Scrub planting		
Woodland planting		
Hibernacula creation*	2	
Refuge creation		

^{**} Information must be consistent with Table E3.

Please describe management methods and explain any novel designs, non-standard proposals or techniques in the free text box below. Also describe any other terrestrial habitat measures, including locations & design. (Confirm landowner agreement for these measures, if they are to be created on land outside of the applicant's ownership, in Declaration worksheet J).

NB: Do not put in specific dates here; add these into E6a (separate document).

No management of the newly created terrestrial habitats is proposed. Landowner agreement will be sought for the creation of two hibernacula/ refuges/ brash piles which will be installed in close proximity to the receptor sites identified for newts captured within terrestrial habitats under the licence agreement.

 E3.3 Integration with roads and other hard landscapes. Explain any measures you will take to integrate mitigation with roads and other hard landscapes. If you propose any connectivity measures, such as underpasses, please specify: Design (to include length, width, height and guide fencing) Monitoring (to include methodology and duration) 						
Maintenance (to detail how long-term functionality of the underpass(es) and entrances will be ensured NB: Locations & details of any proposed connectivity measures must be provided on FIG. E3.3 - see: Sum & Figs. tab	1)					
NB: If you have identified fragmentation as an impact this is something you should address.						

E Mitigation & compensation (continued)

E4 Capture, exclusion & translocation: <u>Please do not refer to any dates in this section</u> - these should be provided in E6.

State capture +/or exclusion methods, with effort levels.	Pls Read Advice Notes	
	Use method?	Minimum capture effort
	Yes/no	(days)
At pond: bottle-trap, net, hand search &/or drain down	No	
At pond: ring-fence, pitfall trap (+ fence & refuges)	No	
Away from pond: hand search	Yes	
Away from pond: destructive search	Yes	
Away from pond: fence, pitfall trap (& refuges)	No	
Away from pond: night search	No	
Away from pond: exclusion fence only	Yes	
Other or additional method(s) - state below:	No	

Given that only terrestrial GCN habitat is to be impacted by the proposed works, it is considered sufficient to undertake hand searches during the staged vegetation removal exercise in order to safeguard GCN during the proposed works.

NB: • A minimum of 25 nights trapping will only be acceptable in exceptional circumstances which are fully justified and explained. See <u>guidance on capture effort</u>

NB: Locations of all capture/exclusion activities must be shown on FIG. E4(a)

- Any non-standard capture/exclusion measures should be detailed on FIG. E4(b) see H Figures tab.
- if timings of works are different for different meta-populations please separate out in your work schedule.

Briefly explain your capture/exclusion proposals, for example:

• Justify the use of non-standard methodologies and/or deviation from recommendations in the Great crested newt mitigation guidelines

Exclusion fencing will encircle the development area in order to prevent GCN from entering the site during the

• Explain differing capture effort in trapping compartments

NB: If a very complex capture operation is proposed the methodology should be explained in detail below.

construction activities. The areas of grassland present within the margins of the arable land will be cleared by way of a precautionary two stage strimming exercise, with hand searches for newts being undertaken immediately following the first stage of the clearance.

E Mitigation & compensation (continued)

E5 Post-development site safeguard. Refer to Section 8.5 of the Great crested newt mitigation guidelines.

E5.1 Habitat management & maintenance					
Is any specific post-development habitat management and site maintenance planned?					
Yes If no, proceed to population monitoring section E5.2.					
State which of the following habitat management operations will occur:					
Aquatic vegetation management in water bodies No					
· • •	No				
·	Yes				
	No				
-	No				
	No				
NB: Details of site management and maintenance should be shown on FIG. E5.1 see "H Sum & Figs"	tab.				
Indicate which areas (including which ponds) the management and maintenance plan will apply to.					
Chata which of the fallowing site majertaneous arrantisms will account					
State which of the following site maintenance operations will occur:					
	No				
	No				
<u> </u>	No				
Reinstatement following fire, acute pollution or other major damage	No				
Repair or replace fences Yes					
Maintain tunnel, underpass, guide fencing in good condition	Yes				
Repair or replace interpretation boards	No				
Other (state below)	No				
State the period for which habitat management and maintenance plan will continue:	4 years				
j j	-				
NOTE: A separate, detailed plan must also be attached if					
(a) population size class is large and impacts are moderate-high,					
(b) regionally important population and impacts are moderate-high,					
(c) losses of > 2 breeding water bodies on site supporting medium size class population, or					
(d) phased or multi-plot developments.					
If your proposal meets one of the above (a - d), confirm that such a document is attached:					
Yes No					
Please note, if you have selected 'No', you are likely to receive a Further Information Request.					
1 10000 11010, ii jou have collected 140, you are interpreted to receive a rainfer information recognists.					
E5.2 Post-development population monitoring (refer to Section 8.5.2 of the <i>Great crested newt mitigation</i>					
guidelines and advice at beginning of this template).					
NB: Details of ponds which will be monitored post development must be shown and referenced on FIG. E5.2.					

see Sum & Figs. tab				
NB: It is the licensee's responsibility to ensure that post development monitoring is carried out and that remedial action is taken if compensation measures are failing.				
Is population monitoring required? Y/N No				
Please refer to table in the post development monitoring advice section				
If no, proceed to section E5.3				
Indicate timing and type of post-development population monitoring:				
Timing (years post-dev't):				
Type of monitoring:				
Specify which ponds will be monitored. Additionally, if your post-development monitoring proposals do not follow the GCNMG please provide your ecological justification below. Comments on monitoring period, methods or effort.				
NB: A Natural England mitigation licence will not confer rights of access to monitor water bodies or other habitats				
which lie outside the licensee's ownership. Permission/s should be granted prior to applying for a licence. Please see Declaration section in worksheet I.				
See Decidiation Section in worksheet i.				
E5.3 Site safeguard				
Mechanism(s) for site safeguard.				
Is there a mechanism in place to secure site safeguard? Yes V/A				
If N/A, please briefly explain why.				
Pond will be secured through licencing arrangement agreed with the landowner				
If yes, please confirm which apply to your scheme:				
i) Restrictive Covenant				
ii) Clause to relinquish future development rights in S106 agreement				
iii) NERC Act agreement				
iv) Explicit recognition of site in local planning documents				
v) Designation as County Wildlife Site or similar				
vi) other				
Please confirm that the receptor site and mitigation and / or compensation land is free from future				
development.				
✓ Yes No				

Note: if you state 'No' your application will almost certainly be rejected; provide justification below.

NOTE: A copy of any significant document, such as a Section 106 agreement, must be included with your application. It must be clear within any s106, or other legal document/agreement, where the specific reference to GCN is.

E6 Work Schedule

Please complete a separate <u>Work Schedule for Great crested newt Annexed Licence</u>, and submit with your application.

Next section

F - Final post development Layout

F1 Final Post development Layout Figure F1 is required

NB: Please show the final layout on FIG. F1. - see "H and list of figures" below. This must show the final development layout <u>and</u> include ponds, buildings, roads, GCN tunnels, other mitigation or compensation measures, etc.

G - Checklist of Documents, figures, maps and diagrams to include

You must provide maps, photographs and diagrams to adequately explain the mitigation plans. Use the checklist below to understand what is required for your application. All maps and figures must be included as individual files. Additional maps, photos or diagrams should be included where necessary.

Map / Figure guidance: Ensure each map / figures includes the following:

- Site name and figure reference
- · Scale bar and Direction of North
- Date DD/MM/YYYY

H - List of figures

Figure reference	Mandatory or not?	What it must show (also see details above on site reference, dating and naming).
Figure B1.1 Included	Yes, if the application is part of a phased or multi-plot development	Masterplan map showing the location of each individual phase or plot associated with the overall scheme. The phase to which the current application refers should be highlighted
Figure B1.2 Included	Yes, if there are other GCN mitigation projects nearby which might affect the target population	Map to show location of other nearby GCN mitigation sites to show development boundaries and compensation/mitigation areas.
Figure C3.2a ✓ Included	Yes	Survey map to show development site location, survey area and ponds. The terrestrial and aquatic habitats described in sections C3.3 and C3.4 should also be shown. Indicate which ponds were found to support GCN, including specifying results of any eDNA sampling if relevant.
Figure C3.2b Included	-	Aerial photograph of site for information only to help better inform the application.

Photos C3.4 Included	Yes	Photographs to show terrestrial and aquatic habitats on the development site and surrounding area (to include the receptor area).
Figure D Included	Yes	Impact map to show the location and extent of the different habitat types to be temporarily and/or permanently lost/damaged (as detailed in section D of the Method Statement). Radii of 50, 250 and 500m around each GCN pond which will be impacted must be shown.
Figure E2 Included	Yes	Receptor site map to show the location of the receptor site(s) in relation to the development.
Figure E3.1 Included	Yes, if habitat creation, enhancement or restoration is proposed	Habitat measures map to show the location and extent of all terrestrial and aquatic habitat measures detailed in section E3 of the Method Statement).
Figure E3.3 Included	Yes, if measures to improve connectivity are proposed	Connectivity map to show the location of any measures employed to improve connectivity e.g. underpasses/tunnels, newt friendly traffic and /or drainage features (dropped kerbs/set-back gully pots) etc.
Figure E4a Included	Yes	Capture and exclusion map to show how GCNs will be cleared from the development site and prevented from entering during construction. A clear differentiation should be made between different types of amphibian fencing (e.g. permanent, temporary, perimeter, drift, ring, one-way etc). Direction of travel over one-way fences should also be shown.
Figure E4b Included	Yes, if non-standard measures are proposed	Non-standard capture and exclusion measures – diagrams or photographs to show designs/specifications.
Figure E5.1 Included	Yes, if habitat management and maintenance is proposed	Post-development management and maintenance map to show the location and extent of the terrestrial and aquatic habitats to be managed and maintained in accordance with section E5.1 of the Method Statement. To include tunnels/underpasses/guide fencing if applicable. Ponds to be managed and maintained must be clearly referenced.
Figure E5.2 Included	Yes, if monitoring has been proposed	Post-development monitoring map to show, and reference, all of the waterbodies to be monitored (as detailed in section E5.2 of the Method Statement). To include tunnel/underpass/guide fencing if applicable.

Figure F1 Included	Yes	Final development layout map to show both the development layout (e.g. buildings, rail, roads) and all of the mitigation/compensation measures proposed (e.g. including ponds, tunnels, receptor areas)		
List of documents				
Documen	t	Mandatory or not?
