Dear Sir

Regarding the widely-acknowledged looming environmental crisis, it is absolutely crucial to make the future as “green” as possible. Wind, solar and tidal power are all “green and clean,” unlike nuclear power with all its many environmental problems and risks, not to mention its prohibitive financial costs and risks (ironically, even the nuclear industry acknowledges that renewables are cheaper and quicker).

The Sizewell C project has no place in a “green future.” Not only would it disastrously affect this whole area in so many ways, but it is also said that Sizewell C could well be obsolete by the time it is built.

In addition, and as already mentioned, “nuclear power” is fabulously expensive and dangerous, with radioactive-waste-storage being another really costly and dangerous long-term problem.

As can plainly be seen, “green” is the colour of the future, and the future is right here, right now.

Yours sincerely

John Pigneguy
