---

There are so many questions that remain unanswered regarding Sizewell C and I'm left feeling very unhappy indeed at EDF's cavalier approach to this enormous construction of two reactors.

We've recently learned that we, as a country, are doing very badly when it comes to biodiversity, and building on SSIs doesn't seem to be a very sensible idea.

A few miles down the coast from Sizewell, there is a lot of work being done to safeguard the crumbling cliffs, but as we all know, it's merely a sticking plaster on a potential gaping wound, and with global emergency looming, nobody could possibly think building twin reactors could possibly be a sensible idea.

And then there's the problem of water, which, as we're in the driest part of the country, must, or should be an enormous headache for EDF and as yet they've not come up with an adequate solution.

Suffolk is a largely rural county that attracts people who love solitude and nature, so do you suppose they'll still come when there's the largest construction site in Europe lasting at least ten years and our quiet country roads are full of lorries and light and noise pollution?

We're told there will be numerous jobs available, but as the large workforce will relocate from Hinckley I doubt there will be many exciting opportunities available. Sizewell A and B have certainly not brought prosperity to Leiston!

By the time Sizewell C is up and running, and there's no guarantee that it ever will, technology will have moved on and who knows, tidal energy may well be the reliable form of energy that we can rely on, as well as green hydrogen and who knows what.

These large reactors are outdated and Sizewell is very definitely the wrong place.

Sally Barley.
