Mr M Cotter, [REDACTED]

UNIQUE REF EA2-AFP057
UNIQUE REF EA1N-AFP057

My house is located less than a few hundred metres north of the proposed substation. I bought the house in a run down state in 2012 and have renovated it over the last eight years. For clarity I was not even allowed to change a window frame without listed building planning permission as it might compromise the buildings curtilage and the setting. Now it seems it's ok for a Spanish conglomerate to totally destroy My house's setting, Friston and most of the surrounding area all the way to Thorpeness cliffs with massive and not required infrastructure. This is indeed very wrong and if permission is given It will be a travesty of of what is right for our county. My house was to be my retirement, to sell in later years with a little for my children. I am now sixty, a substation of this vast scale as my neighbour will render my investment worthless and steal my children's inheritance.

If building of the substation goes ahead I will not be able to move for a least 15 years I will be an old man! I will have spent my twilight years listening to major construction, It makes me very sad.

This power is not needed for Suffolk its to fuel the rising population of our country which is a result of the government not legislating correctly for immigration, put the substation in London, that's where the power is required!

The countryside surrounding my property is not replaceable. If you allow its destruction it's gone forever, I have a badger sett in my garden and barn owls patrol my meadow for voles, you will hammer nails into their coffins if this monstrosity is constructed.

Why allow a DCO process for a proposal that is so ridiculous? The rules need to be changed so a proposal is considered for its technical and environmental merit and to be meaningful before it is accepted for consideration.

We all know that there are much better alternatives than the destruction of the Suffolk countryside.

Just a thought that should also be considered, if the current and future planned power connections to the Sizewell grid goes ahead there is potential to put 4.5 gigawatts through the lines. If there where a fault which is a postulated fault that took all circuits down there is the potential due to the frequency dip to severely compromise the country's electricity supply, this needs consideration also. Don't put all are eggs in one basket.

To sum up, I am for wind power that is delivered and engineered in a green way, this DCO application is certainly not that and I vehemently oppose the application in its current guise.

I support the views of our MP Theresa Coffee, SEAS, SASES, the councils and all the other learned organisations whom are telling you this is not the correct approach. You know what is the correct approach and what should be done, there is time to do these projects correctly, please make the correct decisions for the sake of future generations.

Kind Regards

Martin Cotter, [REDACTED]
