This report covers work carried out by MaTSU at the request of the Offshore Division of the Health and Safety Executive (HSE) to update the database of collision incidents on the UKCS and the collision frequency analysis provided in the report of MaTR0447.

Data has been collected from a number of collision incident record sources to confirm or complete previous records and to expand the database up to October 2001. The database has expanded from 494 records in MaTR0447 to 557 records. The database of operating experience has been recompiled and extended to encompass all mobile and fixed installations operating on the UKCS and takes into account recent abandonments.

The database has been sorted into incidents involving "passing vessels" and "attendant vessels". Fortunately, over the whole period of the study, collision incidents involving the former have occurred only 8 times. Nonetheless, the potential exists for major structural damage, possibly even catastrophic, from even a glancing blow by a passing merchant vessel.

As in the previous report (OTO 1999/080) the main database only includes actual collisions and does not include 'near misses'. However, in an attempt to gain a better understanding as to the scale and nature of the 'near miss' events, this report (Appendices E, F and G) does include 'near miss' data from a variety of sources; and interprets the findings in section 6.

This report and the work it describes were funded by the HSE. Its contents, including any opinions and/or conclusions expressed, are those of the authors alone and do not necessarily reflect HSE policy.

# Executive Summary

This report covers work carried out by MaTSU at the request of the Offshore Division of the Health and Safety Executive to update the database of collision incidents on the UKCS and the collision frequency analysis provided in the report of MaTR0447.

Data has been collected from a number of collision incident record sources to confirm or complete previous records and to expand the database up to October 2001. The database has expanded from 494 records in MaTR0447 to 557 records. The database of operating experience has been recompiled and extended to encompass all mobile and fixed installations operating on the UKCS and takes into account recent abandonments.

By combining data of collision incidents with installation operating experience, it has been possible to establish the variation of incident frequency with time, and the likely confidence limits that may be placed on them. This has been done for each of the major installation types. This variation has been considered for all incidents and, separately, for those resulting in damage categorised as moderate or severe. The definition of moderate being damage requiring repair in the medium (up to 6 months) or longer term (over 6 months); and severe being damage affecting the integrity of an installation sufficient to require repair in the immediate or short term (up to 1 month).

With certain exceptions, i.e., in 1997, in the last 5 years the mean incident frequency has generally shown a downward trend, particularly for those incidents that resulted in moderate or severe damage.

The database has been sorted into incidents involving "passing vessels" and "attendant vessels". Fortunately, over the whole period of study, collision incidents involving the former have occurred only 8 times. Nonetheless, the potential exists for major structural damage, possibly even catastrophic, from even a glancing blow by a passing merchant vessel.

The probability of a collision incident per installation year for all incidents, those by passing vessels and for those where the installation/rig required repair were found to be:

## **Summary of mean incident frequencies of all reported incidents and moderate or severe damage category incidents (all vessel types)**

Mean incident frequency: 1975 to 31/10/2001		
Installation/rig type	All reported incidents/year	Incidents resulting in moderate or severe damage/year
All installations	0.0987	0.0152
Fixed installations	0.0630	0.0095
Semi-submersibles	0.2379	0.0487
Jack-ups	0.1413	0.0054

**Summary of mean incident frequencies of all reported incidents and moderate or severe damage category incidents (passing vessels)**

Mean incident frequency: 1975 to 31/10/2001		
Installation/rig type	All reported incidents/year	Incidents resulting in moderate or severe damage/year
All installations	0.0014	0.0004
Fixed installations	0.0012	0.0002
Semi-submersibles	0.0000	0.0000
Jack-ups	0.0054	0.0018

Notwithstanding the figures quoted in the tables above, data interpretation should be carried out with caution as it is highly likely that some degree of under reporting of incidents has occurred. Primarily this is thought to be of those incidents where little or no damage resulted to the installation, however, it may also include more serious incidents to normally unattended installations.

As in the previous report (OTO 1999 080) the main database only includes actual collisions and does not include 'near misses'. However, in an attempt to gain a better understanding as to the scale and nature of 'near miss' events, this report (Appendices E, F and G) does include 'near miss' data from a variety of sources; and interprets the findings in Section 6. In recent work by the HSE, UKOOA and others the definition of 'near miss' has been agreed to be 'the approach by any vessel that caused any part of the Duty Holder's emergency response plan to be activated'. Though it has not been possible to strictly apply that definition to this data, an attempt has been made to interpret the data in the light of that definition. Using such an interpretation it was found that there were 14 such events. These ranged in severity from a precautionary mustering of personnel to an actual down manning of an installation.

Collision threat causation factors have been developed from the "primary cause" field in the database, though almost exclusively, this information comes from personnel on board the installation and may lack subjectivity. Nonetheless, the primary cause of the majority of incidents involving "attendant vessels" was linked to some form of control failure; either human or mechanical while watchkeeping failure was assessed as the primary cause in each "passing vessel" incident.

The most frequent 'activity' that attendant vessels were engaged on when a collision with an installation occurred was "cargo transfer", although "approaching installation" also figured highly, perhaps also being the precursor to cargo operations.

Geographical location was found to have an effect on the likelihood of a "passing vessel" collision and it appears that installations in the Southern North Sea are at greater risk than those in other areas. This is perhaps understandable considering the traffic density in this area compared to the other relatively remote areas of the UKCS.

# 1 Introduction

A database of vessel/platform collision incidents on the United Kingdom Continental Shelf (UKCS) was originally created for the Health & Safety Executive, Offshore Safety Division (OSD) in 1985. It has subsequently been amended and extended on several occasions, in 1995 (MaTR0321) when it also underwent rigorous qualitative checking and most recently in 1997 (MaTR0447) when it was updated with incidents in intervening years.

MaTSU were requested by OSD to update the previous data evaluation exercise contained in MaTR0447 and also to search through various data sources to extend the database to include incidents which have occurred since the last review. The compilation of the database is described in more detail in Section 2 of this report.

Information has been extracted from the database to establish the variation of incident frequency with time for different types of offshore oil and gas installations and for different vessel types. The resulting analysis of incident statistics is necessarily broad, in line with the likely accuracy of the data, and is presented in Section 3 of this report.

An assessment of the implications of the results of analysis is presented in Section 4.

At OSD's request an analysis of the world fleet of platform support vessels (PSV) was carried out. The data used for this exercise came from information held by the Maritime Statistics Collection Agency, an organisation administered by the Department of Transport, Local Government and the Regions (DTLR) to collect information on the quantity and nature of commercial cargo passing through the UK's major ports. Using this information it was possible to:

- Quantify the number, size and type of vessels that have carried cargo between the UK's major ports and the UKCS and hence develop a guideline measure of vessels that transit UKCS oil fields as part of their normal activities;
- Develop an understanding of the way in which PSV dimensions and tonnages have changed in recent years;
- Identify the extent to which stand-by vessels (SBV) have been utilised for carrying cargo to/from offshore installations on the UKCS.

The results of these analyses are presented in Section 5.

The database only contains details of collision incidents that have actually occurred. There exists a separate record of incidents which, although not resulting in actual contact between vessel and installation, resulted in a so called "near miss". This is discussed further in Section 6.

The conclusions to the report are contained in Section 7.

## 2 Compilation of Database

### 2.1 COLLISION INCIDENT DATABASE

For this study an incident has been defined as a reported impact in terms of the OIR/9A incident report, between a vessel and a fixed or mobile installation (jack-up or semi-submersible).

The original 1985 collision incident database was compiled from studies performed by the National Maritime Institute Ltd. (NMI) (Refs. 1 and 2) and the International Association of Drilling Contractors (IADC) (Ref. 3). An update in 1991 by Advanced Mechanics and Engineering Limited (AME) (Ref. 4) used incident records taken from OSD's OIR/9A files.

The Collision Incident Database produced under MaTSU reports MaTR0321 (1995) and MaTR0447 (1997) (Refs. 5 and 6) have been extended and further cross-checked. The complete database is included as Appendix A to this report wherein a total of 557 incidents of vessels contacting offshore oil and gas installations have been recorded in the period from 1 January 1975 to 31 October 2001. These data have been developed from a number of sources; the prime source being that recorded in the "Information Source" field. Where data have been supplemented or confirmed from an independent source this have been recorded in the "Other Source Confirms" field. Collision incidents confirmed (in part or whole) or added in the current study have been extracted from the following sources:

- Marine Accident Investigation Branch (MAIB) using the search criteria "offshore installations - collisions and contacts" - (Ref. 7).
- 'Orion' Safety System of the OSD using search criteria "collision", "impact", "contact", "collide", "hit", "landed"- (Ref. 8).
- World Offshore Accident Database (WOAD) using search criteria "collision", "contact" - (Ref. 9).

Despite the large literature search a number of inconsistencies and unconfirmed data have been highlighted within the database. A series of asterisk (\*\*) adjacent to an entry indicate the following areas of concern:

- \*\*\* Rig Registration No. could not be confirmed from information provided by OSD.
- \*\*\*\* Vessel name, type or gross tonnage could not be confirmed by Anchor Handling Tugs and Supply Vessels of the World (Ref. 10), Stand-by Vessels of the World (Ref. 11) or Lloyd's Maritime Directory 1986 (Ref. 12).
- \*\*\*\*\* In the author's opinion text entries appear to be incomplete, erroneous or inconsistent but due to the lack of other data sources have been retained.

The database contained in Appendix A has been compiled according to the following sort criteria:

- First: “Passing Vessel” (vessels which shouldnot have contravened the safety zone) and “Attendant Vessel” (vessels working in the vicinity of the installation) categories.
- Second: Severity of “Installation Damage Class”, severe, moderate, minor, none, unspecified, not applicable.
- Third: Date of incident.

## 2.2 CODING AND CATEGORIES

For clarity and ease of interpretation the use of codes within the fields has been kept to a minimum.

### 2.2.1 Information source & Other source confirms

- DEn Data extracted from Draft Report MaTR0141 - (Ref. 13);
- OTN 92 235 Data extracted from OTN 92 235 - (Ref. 14).
- LMIS Data supplied to MaTSU by Lloyds Maritime Information Service – (Ref. 15);
- NMI National Maritime Institute Ltd. - (Ref. 1, 2);
- HSE Data supplied by OSD - (Ref. 16);
- BOMEL Data extracted from Billington Osborne-Moss Engineering Limited – Drawing No. C/587/R002.22 - (Ref. 17);
- MAIB Data supplied to MaTSU by Marine Accident Investigation Branch – (Ref. 7);
- WOAD World Offshore Accident Database - (Ref. 9).

### 2.2.2 Installation damage class

In order to permit more meaningful evaluation of the database all incidents have been placed into a damage severity category, labelled “Installation Damage Class”, in accordance with the following criteria. In some instances, where the damage class was not originally reported or was clearly inaccurate, the category has been assigned by the author based on the extent of reported damage and the criticality of the member involved:

- Severe: Damage affecting the integrity of an installation sufficient to require repair in the immediate or short term (up to 1 month). Where the actual date of repair could not be determined then the criticality of the damage damaged member was considered where this was available. In the absence of other repair information damage to non redundant members was considered severe;
- Moderate: Damage requiring repair in the medium (up to 6 months) or longer term (over 6 months);
- Minor: Damage not affecting the integrity of the installation;
- None: No damage occurred;
- Unspecified: Damage believed to have occurred but was not specified in reports;
- Not Applic.: Report of incident which was not applicable to installation’s structure.

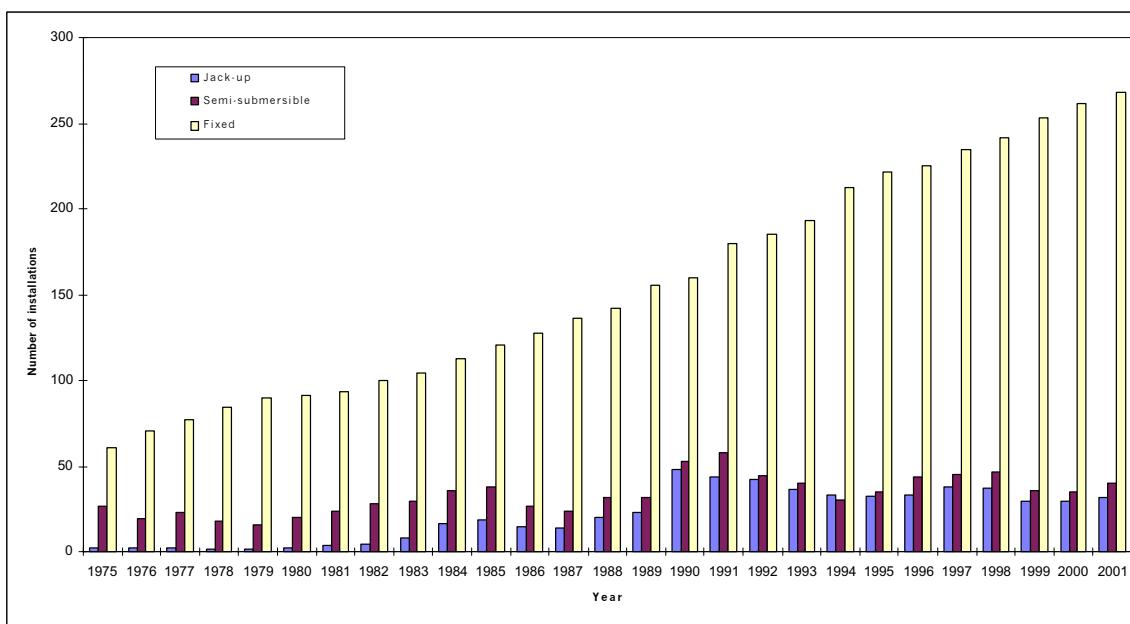

## 2.3 DATA ON OPERATING EXPERIENCE

For the purposes of this study an installation is defined as a fixed platform or group of platforms linked by bridges or walkways and may be of either steel or concrete construction. Operating experience of fixed installations is presented in “installation years” rather than platform years because in the southern North Sea a supply vessel, for example, is only likely to approach those platforms installed with a crane or living quarters when carrying cargo. In these circumstances it would be unrealistic to include every individual platform in the count of operating experience as not all will be visited by vessels.

Operating experience of fixed structures has been determined using information provided by OSD. This contained the ‘start-up’ date and ‘abandonment’ date, where appropriate.

Mobile rig operating experience on the United Kingdom Continental Shelf (UKCS) has been determined from information provided by Rigzone (Ref. 18) and refers to any jack-up, semi-submersible or variant. The operating experience of semi-submersible or monohull production facilities and floating storage units (as supplied by OSD) has been added to the monthly figure to determine the total experience of this type of unit.

A summary of operating experience for fixed installations/complex and mobile units over the period of study is contained in Table 1 (overleaf) and represented graphically in Figure 1.

**Figure 1: Fixed installations and mobile rig utilisation**

**Table 1: Operating experience for fixed installations and mobile units on the UKCS**

Year	Mean installations operating in year				Operating experience: date of installation to year end (installation years)

# **3 Analysis of Historical Data**

## **3.1 INTRODUCTION**

This Section presents an analysis of collision incident statistics for the UKCS in the period from 1 January 1975 to 31 October 2001. For statistical analysis purposes a total incident population of 557 has been used throughout. When determining incident frequencies for 2001 installation operating experience has been prorated to 31 October of that year.

Data were analysed for all reported incidents and separately for those classified as moderate or severe, to investigate any trends which might exist. While it is reasonable to anticipate that not all minor incidents would be reported, it is believed that most, if not all, incidents resulting in moderate or severe installation damage should have been. Thus, there should be increased confidence in the observed trends in the more serious incidents.

Additionally, incidents resulting in moderate or severe damage are more likely to exceed normal operational loading and are therefore of greater interest in comparing design against accidental damage.

The main areas covered in this Section are:

- Variation of incident frequency and confidence limits with time for different damage categories and types of installations;
- Variation of incident numbers with time for different types of vessels.

Where possible tables, graphs or histograms have been used to illustrate the various aspects of collision incidents that have occurred.

As in other studies (Refs. 19 and 20) it has been assumed that the incident likelihood follows a Poisson distribution. With this assumption 5% and 95% confidence limits for fixed installations and mobile rigs have been calculated and are shown in Figures 5, 6, 9, 10, 13, 14, 17 and 18. The interval between the limits reflects the number of incidents and causes the line connecting the upper and lower confidence limit to be longer where there are fewer incidents. 5% and 95% confidence limits have been calculated using accepted methodology (note Refs. 19 and 20) including those occasions where no collision incidents have been reported.

## **3.2 VARIATION OF INCIDENT FREQUENCY WITH TIME**

The variation of incident frequency with time for fixed installations and mobile units have been analysed both together and separately. Incident frequencies for all reported incidents and those categorised as resulting in moderate or severe damage have also been analysed separately.

### 3.2.1 All installations

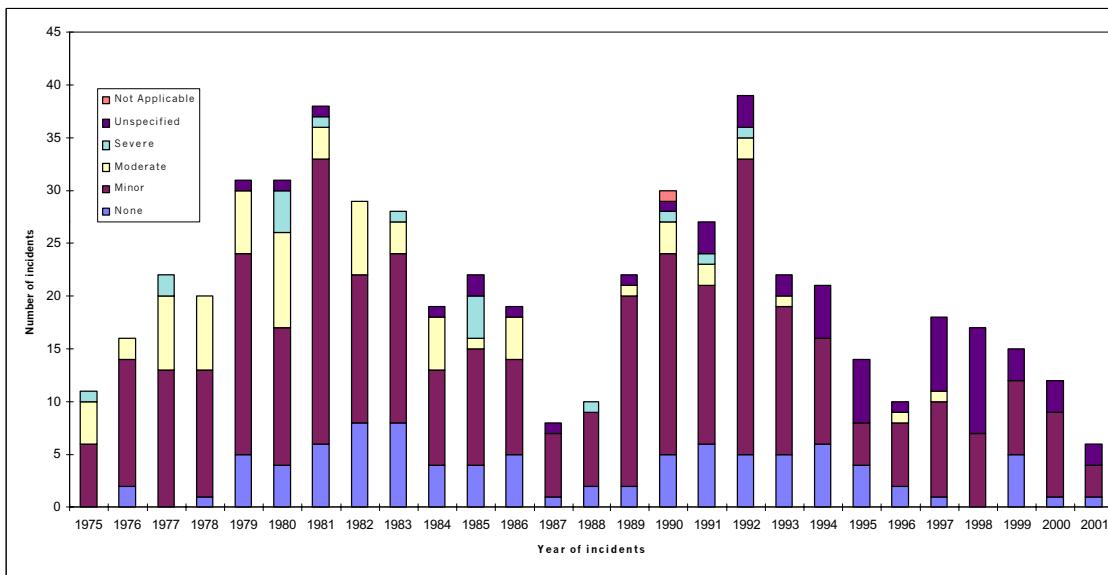

Table 2 and Figure 2 summarise the number and damage category of all recorded incidents to fixed installations and mobile units, by year, since 1975. Seventeen incidents were classed as severe, 69 incidents as moderate and the remainder classed under minor or no damage, including 55 incidents where the damage was not specified but is believed to be minor or none.

**Table 2: Damage resulting from incidents to all installations per year**

Year	Installation damage class						<b>TOTAL</b>
	<b>None</b>	<b>Minor</b>	<b>Moderate</b>	<b>Severe</b>	<b>Unspecified</b>	<b>Not Applicable</b>	
1975	0	6	4	1	0	0	<b>11</b>

To 31 October 2001

**Figure 2: Damage resulting from incidents to all installations per year**

A summary and chart of impact vessel types is produced as Table 3 and Figure 3. This indicates that the vast majority of incidents, as would be expected, have occurred with attendant vessels. Of the attendant vessels, 353 incidents were with “Supply Vessels”, 87 were “Stand-By Vessels” with the remaining being either “Unspecified”, with 35 incidents or “Other Attendant Vessels”, 74 incidents. The latter category comprising the following vessel types:

- Anchor handler 18 incidents
- Barge (pushed by tug) 1 incident
- Diver support 36 incidents
- Maintenance 1 incident
- Merchant tanker (approaching/at loading terminal) 9 incidents
- Research 3 incidents
- Survey 2 incidents
- Tug 4 incidents

**Table 3: Incidents per year by all vessel types**

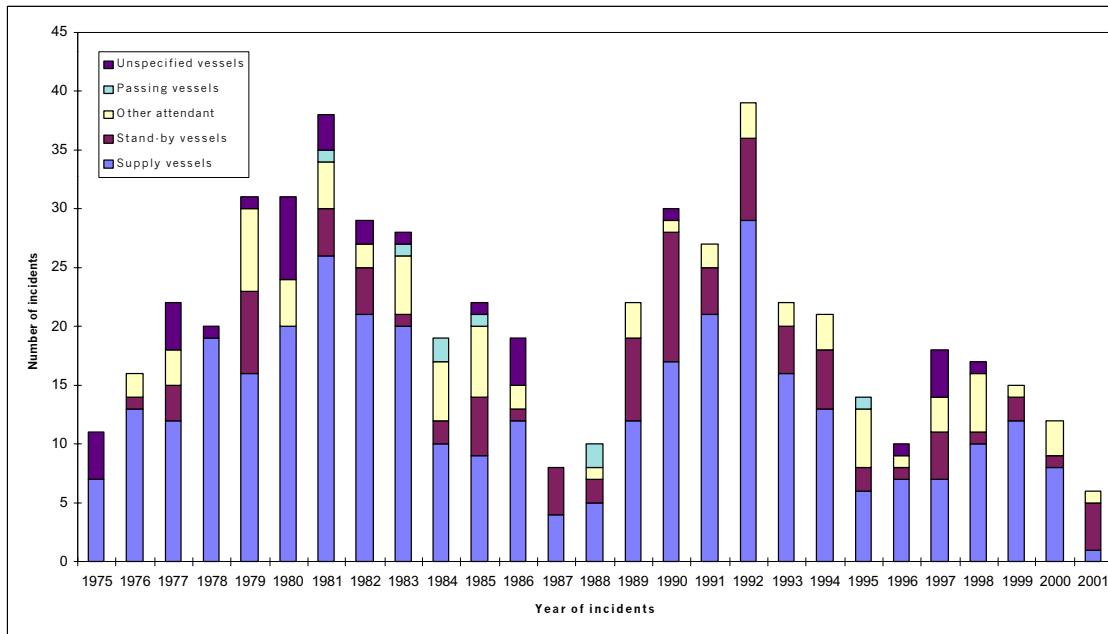

Year	Collision vessel type					<b>TOTAL</b>
	Supply vessels	Stand-by vessels	Other attendant	Passing vessels	Unspecified vessels

To 31 October 2001

In view of the potentially catastrophic consequences of a ‘passing vessel’ collision on the integrity of an installation, details of the 8 incidents where this has occurred have been separated from the ‘attendant vessels’ incidents in the database presented in Appendix A. The sort criteria of the database in Appendix A are outlined in more detail in Section 2.1 of this report.

**Figure 3: Incidents per year by all vessel types**

Table 4 and Figure 4 summarise the trend for incidents occurring with respect to month for all different vessel types. Despite several slight anomalies, possibly caused by the small number of data for some vessel categories, broadly speaking more incidents have occurred during the period October to February. For supply vessels engaged in cargo transfer this is perhaps understandable when weather conditions are more likely to be adverse with high winds and storms. Conversely, in the months normally associated with better weather (July to September) the incidence of stand-by vessel collision has increased, possibly caused by more installation overside work being carried out and the need for close support. The months between May and October also see an increase in the number of incidents involving diver support vessels when annual inspections and repairs to installations tend to take place.

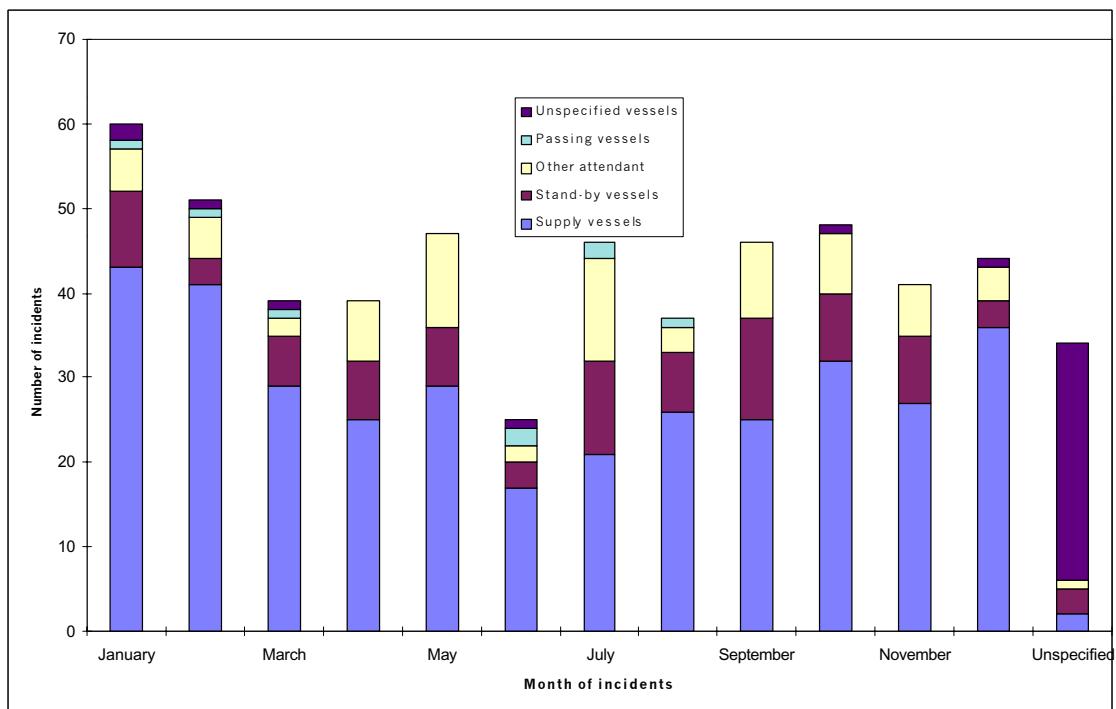

**Table 4: Incidents per month by vessel type**

Month	Collision vessel type					TOTAL	
	Supply vessels	Stand-by vessels	Other attendant	Passing vessels	Unspecified vessels		
January	43	9	5	1	2	<b>60</b>	<b>10.8%</b>

To 31 October 2001

**Figure 4: Incidents per month by vessel type**

Tables 5 and 6 respectively, show the mean frequency and confidence limits of all reported incidents and those categorised as resulting in moderate or severe damage occurring to all installations by year. Table 7 summarises the mean frequency in the year in question and also cumulatively to any year end from 1975. Figures 5, 6 and 7 graphically represent the variation in the results summarised in these tables.

**Table 5: Frequency of all reported incidents to all installations per year**

Year	Number of incidents in year (r)	Mean installations operating in year (T)	Incident frequency (per installation per year)		
			5% confidence limit	Mean = (r/T)	95% confidence limit

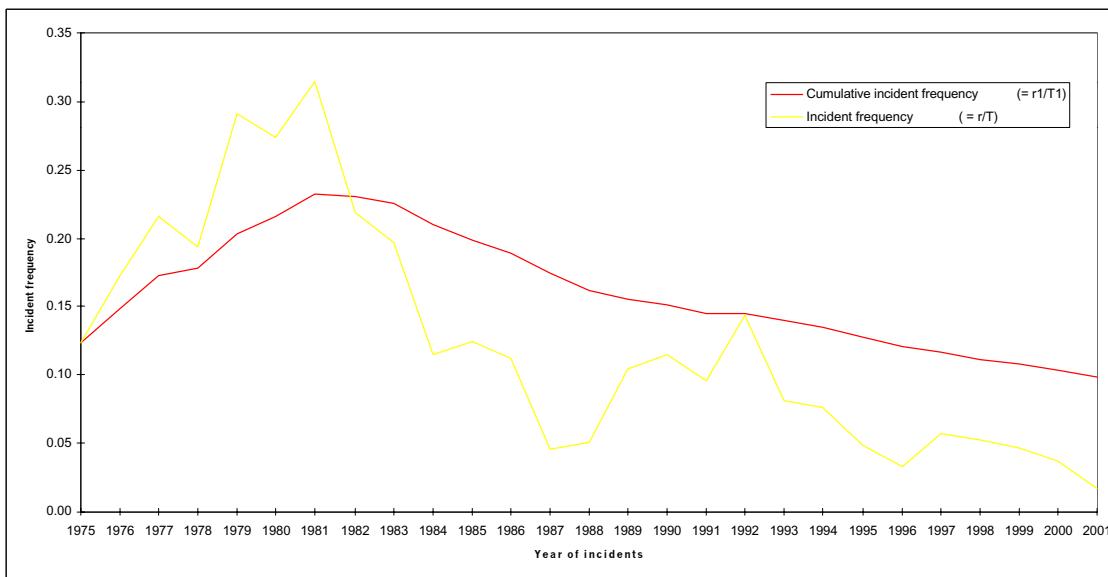

**Figure 5: Frequency of all reported incidents to all installations per year**

**Figure 6: Frequency of moderate or severe damage to all installations per year**

**Figure 7: Mean and cumulative frequency of all reported incidents to all installations**

There is a large spread in the annual incident frequency but generally the number of reported incidents tends to increase to a peak in 1981 before declining quite rapidly to a minimum in 1987. A second, lesser, peak occurred in 1992 before declining again. The rise in the mean incident frequency in 1992 can almost entirely be accounted for by the rise in the number of reported incidents involving semi-submersibles, and to a lesser extent jack-ups. This is broadly in line with the increase in mobile rig utilisation during this period with its attendant collision risks, for example when anchor handling.

Though the average, all incident frequency, has fluctuated considerably over the period of study the probability is on average 0.099 per year. Using the total operating experience this equates to 1 incident every 10.14 installation years or approximately 33 per annum for the current year level of installation activity. The analysis for reported incidents resulting in damage categorised as moderate or severe indicates the probability is on average 0.015 per year (1 incident every 65.64 years or approximately 5 every year for the current level of installation activity). These statistics are clearly at odds with the actual number of recorded incidents in recent years and highlight the general improvements made in support vessel operating practices.

### **3.2.2 Fixed installations**

To provide a more meaningful statistical base, especially for installation types with smaller populations, the following types of installation have been included in this category. A total of 268 incidents were recorded where the installation type was stated to be in this category, or could be determined to be, with the following breakdown:

- Fixed steel installation                            243 incidents
- Fixed concrete installation                        20 incidents
- Tension leg platform                              2 incidents
- Unspecified installation type                    3 incidents

Table 8 and Figure 8 summarise the number and damage category of all incidents occurring to fixed installations. Eight incidents were classed as severe, 32 incidents as moderate and the remainder classed under minor or no damage, including 22 incidents where the damage was not specified but is believed to be minor or none.

**Table 8: Damage resulting from incidents to fixed installations by year**

<b>Year</b>	<b>Installation damage class</b>						<b>TOTAL</b>

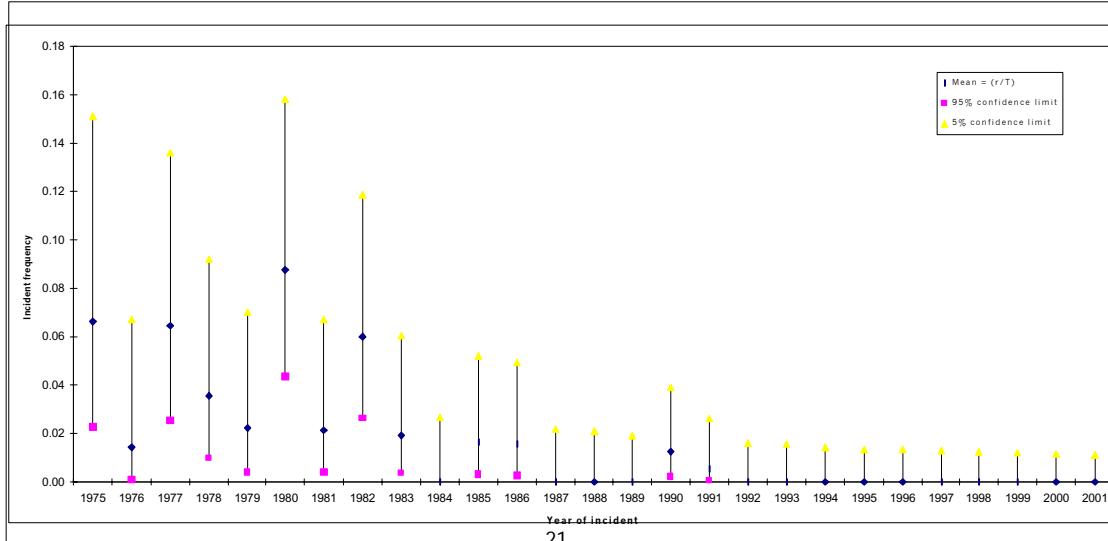

**Figure 8: Damage resulting from incidents to fixed installations per year**

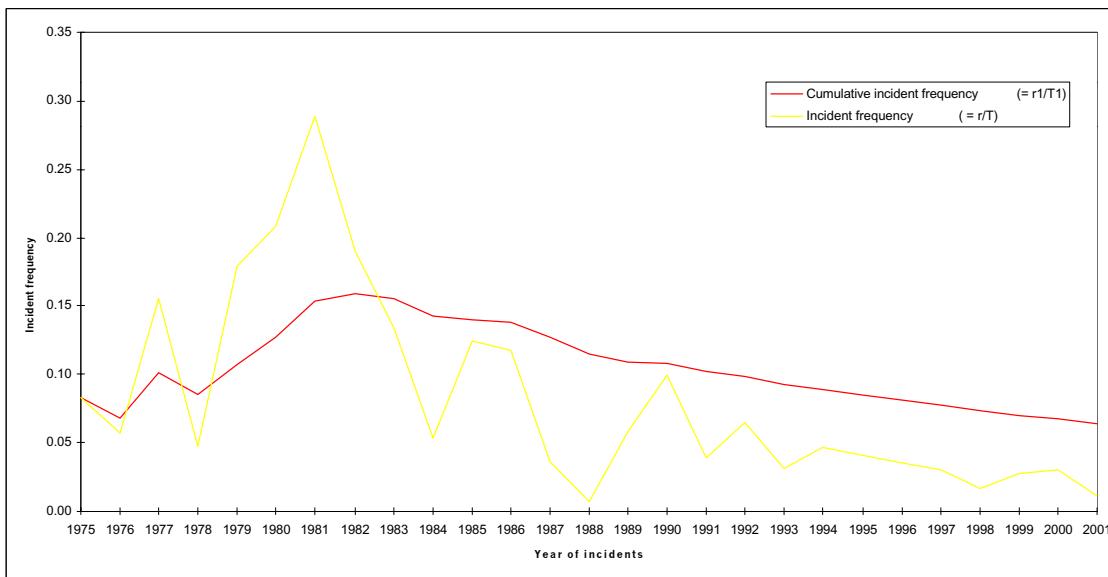

**Figure 9: Frequency of all reported incidents to fixed installations per year**

**Figure 10: Frequency of moderate or severe damage to fixed installation per year**

**Figure 11: Mean and cumulative frequency of all reported incidents to fixed installations**

Apart from 1978, in the early years of the study the mean incident frequency rose dramatically until 1981. Subsequent to this the incident frequency rose and fell over a relatively narrow range caused by an erratic number of incidents occurring each year and, prior to 1994, a reasonably consistent increase in the number of installations operating.

Over the whole period of study the probability of an incident occurring is on average 0.064 per year (1 incident every 15.68 years or approximately 17 every year for the current level of installation activity). The analysis for reported incidents resulting in damage categorised as moderate or severe indicates the probability is on average 0.009 per year (1 incident every 105.09 years or approximately 2.5 every year for the current level of installation activity). Recent experience indicates that these figures are an exaggeration of the actual number and are probably skewed by the larger incident frequencies in the early years of study adversely affecting the figure for the current level of activity.

### 3.2.3 Floating installations

Once again for statistical purposes a number of different installation types have been included in this category. All, however, are either floating units or such that the surface part can move with the action of the sea, i.e., articulated loading columns or single point moorings. A total of 210 incidents were recorded to installations of this type, with the following breakdown:

- Semi-submersible drilling 158 incidents
- Semi-submersible production 6 incidents
- Semi-submersible crane barge 2 incidents
- Semi-submersible emergency support 3 incidents
- Semi-submersible mobile support 5 incidents
- Semi-submersible accommodation 16 incidents

- Single buoy mooring 3 incidents
- Single point mooring 3 incidents
- Articulated loading column 1 incident
- Floating production and storage 10 incidents
- Floating storage 1 incident
- Drill ship 1 incident
- Barge 1 incident

Table 12 and Figure 12 summarise the number and damage category of all incidents occurring to floating installations. Eight incidents were classed as severe, 35 incidents as moderate and the remainder resulting in minor or no damage, including 20 incidents where the damage was not specified but is believed to be minor or none.

**Figure 12: Damage resulting from incidents to floating installations by year**

The mean frequency and confidence limits of all reported incidents and those categorised as resulting in moderate or severe damage occurring to semi-submersibles by year are summarised in Tables 13 and 14 respectively. Table 15 summarises the mean frequency in the year in question and also cumulatively to any year end from 1975. Figures 13, 14 and 15 graphically represent the variation in these results.

**Table 13: Frequency of all reported incidents to floating installations per year**

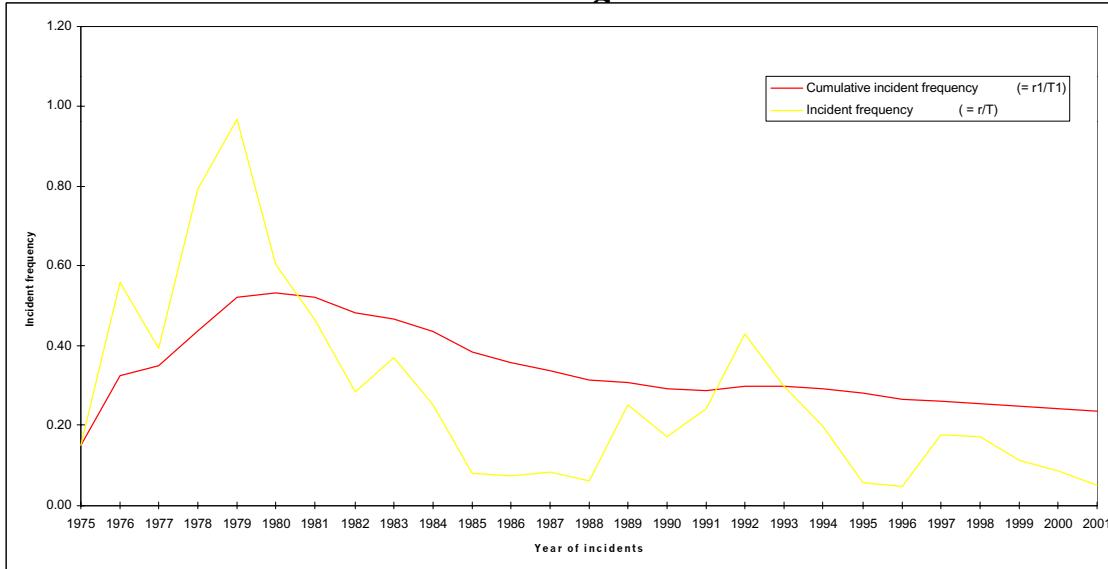

**Figure 13: Frequency of all reported incidents to floating installations per year**

**Figure 14: Frequency of moderate or severe damage to floating installations per year**

**Figure 15: Mean and cumulative frequency of all reported incidents to floating installations**

Overall there is a large spread in the annual incident frequency. The number of reported incidents increased to a peak in 1979 before declining to a minimum in the years 1986 to 1988. An increase in the annual incident frequency then occurred up to a second, lesser, peak in 1992, this generally being in line with the increase in semi-submersible utilisation. A minimum frequency occurred in 1995 and 1996, however, in more recent years the frequency has again increased before gradually decreasing again.

Over the whole period of study the probability of an incident occurring is on average 0.238 per year (1 incident every 4.20 years or approximately 9 every year for the current level of installation activity). The analysis for reported incidents resulting in damage categorised as moderate or severe indicates the probability is on average 0.049 per year (1 incident every 20.53 years or approximately 2 every year for the current level of installation activity). Recent experience indicates that these figures are an exaggeration of the actual number.

The probability of a floating installation suffering damage categorised as moderate or severe is five times more likely than that for fixed installations and nine times more likely than for jack-ups. The reasons for this increased susceptibility are not clear however, it may be explained by floating installations being mobile and therefore it is possible that they may be prone to errors in manoeuvrability or slight movement while moored. Increased risk may also result from the need for anchor handling, which other types of installations do not require, as this is likely to bring attendant vessels into close proximity more frequently leading to the possibility of collision. Further investigation of the database reveals that anchor handling was given as the “Operating Circumstance” in 18 of 180 incidents where this data was recorded for floating installations.

### **3.2.3.1 Floating Production, Storage and Offloading and Floating Storage Units**

Over approximately the last decade the UKCS has seen an increasing trend towards the use of floating production, storage and offloading (FPSO) and floating storage units (FSU) as a cost effect method, particularly in deep waters, of producing and holding oil prior to transfer to onshore terminals

As the data set has expanded it was considered appropriate to look at this class of installation in greater detail than is possible when they are incorporated within the large ‘Floating Installations’ grouping. Accordingly, an overview of the incidents affecting FPSO has been developed:

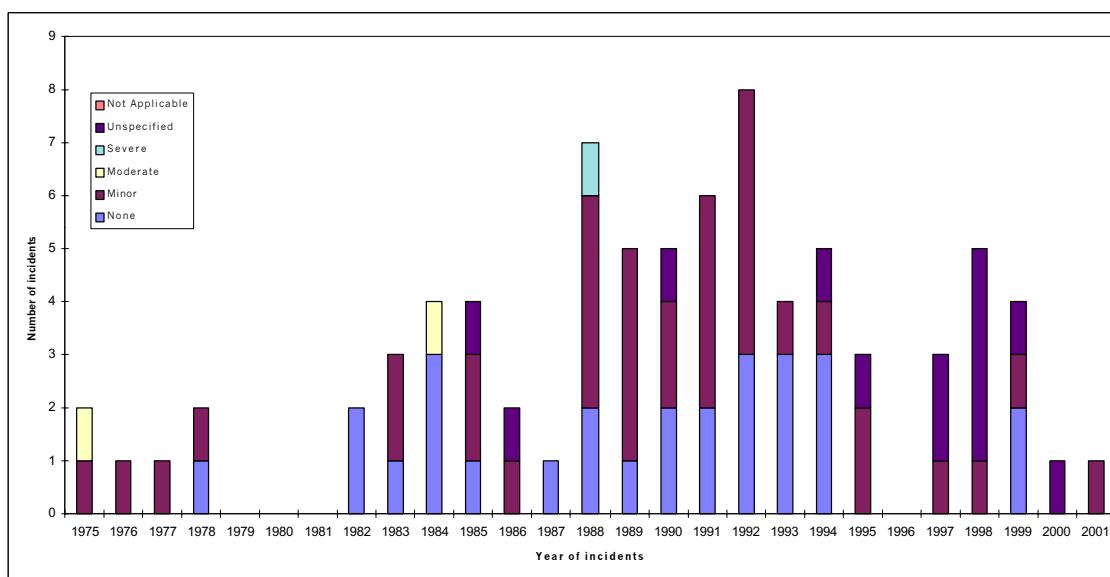

- 10 incidents to FPSOs and 1 incident to a FSU since 1992 (1 in 1992, 3 in 1993, 4 in 1997 and 3 in 1998).
- 3 incidents occurred in February, 1 incident in March, 2 incidents in April, 2 incidents in July, 1 incident in August and 2 incidents in September.
- 5 incidents occurred in the ‘Central North Sea’, 3 incidents in the ‘Northern North Sea’, 2 incidents ‘West of Shetlands’ and the location was ‘unspecified’ in 1 incident.
- 1 incident with an anchor handler, 1 incident with a stand by vessel, 6 with a supply vessel and 3 incidents with an offloading shuttle tanker.
- 3 incidents resulted in ‘unspecified’ damage to the FPSO and 8 incidents resulted in ‘minor’ damage.

- ‘Anchor handling’ was the operating circumstance in 2 incidents, ‘bunkering operations in 1 incident, ‘cargo transfer’ (cargo of the colliding vessel being transferred to the FPSO/FSU) in 5 incidents and oil transfer to the shuttle tanker in 3 incidents.
- ‘Mechanical control failure’ (i.e., bowthruster failure, D.P. control failure, D.P. failure) was the primary cause in 4 incidents; ‘human control failure’ was the primary cause in 3 incidents (i.e., misjudgement, operator error); ‘external factors’ (i.e., weather conditions) was the primary cause in 2 incidents and was ‘unspecified’ in 2 incidents.

### 3.2.4 Jack-ups

A total of 79 incidents were recorded to installations of this type. Table and Figure 16 summarise the number and damage category of all incidents occurring to jack-ups. One incident (Glomar Labrador 1/Irving Forest - 23/06/88) was classed as severe, 2 incidents as moderate and the remainder resulting in minor or no damage, including 13 incidents where the damage was not specified but is believed to be minor or none.

To 31 October 2001

The mean frequency and confidence limits of all reported incidents and those categorised as resulting in moderate or severe by year are summarised in Tables 17 and 18 respectively. Table 19 summarises the mean frequency in the year in question and also cumulatively to any year end from 1975. Figures 17, 18 and 19 graphically represent the variation in these results.

**Table 17: Frequency of all reported incidents to jack-up installations per year**

Year	Number of incidents in year (r)	Mean installations operating in year (T)	Incident frequency (per installation per year)		
			5% confidence limit	Mean = (r/T)	95% confidence limit

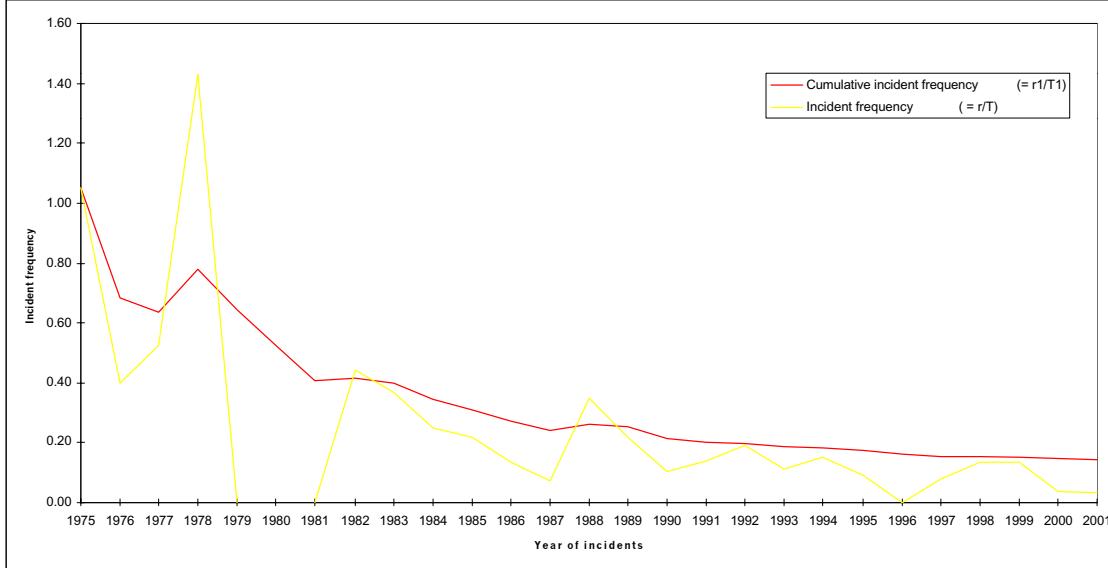

**Figure 17: Frequency of all reported incidents to jack-up installations per year**

**Figure 18: Frequency of moderate or severe damage to jack-up installations per year**

**Figure 19: Mean and cumulative frequency of all reported incidents to jack-up installations**

The relatively small jack-up population, especially in the early years of the study, has to a degree devalued the data. Post 1983 jack-up utilisation increased four fold from two years previously and thereafter mean incident frequency remained within a reasonably narrow band in relation to the constraints imposed by a small population.

Over the whole period of study the probability of an incident occurring is on average 0.141 per year (1 incident every 7.08 years or approximately 4.5 every year for the current level of installation activity). The analysis for reported incidents resulting in damage categorised as moderate or severe indicates the probability is on average 0.005 per year (1 incident every 186.4 years or approximately 1 every 6 years for the current level of installation activity). Recent experience indicates that these figures are an exaggeration of the actual number and is probably skewed by the larger incident frequencies in the early years of study adversely affecting the figure for the current level of activity.

### **3.2.5 Summary of incident frequencies**

A summary of incident frequencies for all vessel types and those involving passing vessels is presented as Table 20 and Table 21, respectively. The tables have been generated using both the number of all recorded incidents and those which only resulted in damage classified as severe or moderate. Installation types have been analysed both cumulatively and separately.

**Table 20: Summary of mean incident frequencies of all reported incidents and moderate or severe damage category incidents (all vessel types)**

Mean incident frequency: 1975 to 31/10/2001		
Installation/rig type	All reported incidents/year	Incidents resulting in moderate or severe damage/year
All installations	0.0987	0.0152
Fixed installations	0.0638	0.0095
Semi-submersibles	0.2379	0.0487
Jack-ups	0.1413	0.0054

**Table 21: Summary of mean incident frequencies of all reported incidents and moderate or severe damage category incidents (passing vessels)**

Mean incident frequency: 1975 to 31/10/2001		
Installation/rig type	All reported incidents/year	Incidents resulting in moderate or severe damage/year
All installations	0.0014	0.0004
Fixed installations	0.0012	0.0002
Semi-submersibles	0.0000	0.0000
Jack-ups	0.0054	0.0018

### 3.3 OPERATING CIRCUMSTANCES

A wide variety of ‘operating circumstances’ have been reported by those making the collision incident report. In the context of the database the operating circumstance is a fairly broad grouping of categories of what activity the vessel was engaged in when the collision occurred. Table 22 presents an overview of the activities that were reported together with a measure of what proportion of the total number of incidents a particular operating circumstance was mentioned.

The most common type of activity leading to a collision with the installation is one involving the transfer of cargo whereas the second most frequent involves vessels that are approaching the installation, possibly to transfer cargo. This is not surprising as it is by far the most frequent occurrence that puts a vessel into close proximity to an installation and one that requires the vessel to maintain station with respect to the installation. Depending on the level of vessel’s equipment, i.e., dynamic positioning, conventional thrusters or a standard propeller and rudder, the possibility of excursion and contact with the installation is more or less likely to occur.

**Table 22: Operating circumstances at time of incident**

Operating circumstances	Number of occurrences	
Anchor Handling	18	3.2%
Approaching Installation	103	18.5%
Awaiting Cargo Transfer	1	0.2%
Bunkering Operations	4	0.7%
Cargo Loading	11	2.0%
Cargo Transfer	128	23.0%
Cargo Unloading	63	11.3%
Cargo Unloading - Containers	11	2.0%
Close Support	29	5.2%
Departing Installation	6	1.1%
Disconnecting Towing Line	1	0.2%
Diving Operations	23	4.1%
Loading Crude Oil	5	0.9%
Maintenance	1	0.2%
Man Overboard Drill	2	0.4%
Passing Cargo Vessel	2	0.4%
Passing Fishing Vessel	5	0.9%
Passing Supply Vessel	1	0.2%

Unspecified	131	23.5%
<b>TOTALS</b>	<b>557</b>	<b>100.0%</b>

To 31 October 2001

### 3.4 CAUSATION FACTORS

The database contains a “Primary Cause” field wherein the perceived cause of the incident has been stated. These data have been recorded for 375 incidents. Although the database records the primary cause as precisely as possible, to gain a clearer understanding of the causation factors the primary causes have been broken down into 4 main categories. In the author’s opinion, analysis of the primary cause field has yielded the main categories to be; external factors; mechanical control failure; human control failure; watchkeeping failure. Table 23 lists the primary cause and number within each category.

**Table 23: Primary cause factors**

External factors		Mechanical control failure		Human control failure		Watchkeeping failure		Unspecified
Sub-categories	Number of occurrence	Sub-categories	Number of occurrence	Sub-categories	Number of occurrence	Sub-categories	Number of occurrence	Number of occurrence
Anchor Dragged	11	Anchor Chain Broke	1	D.P. Operator Error	1	Post/Operation Neglected	15	182
Anchor Dragged Due Weather	2	Autopilot Failure	2	Error in Mooring Procedure	2	-	-	-
Obscured Vision	1	Bowthruster Failure	2	Manoeuvring Misjudgement	3	-	-	-
Poor Visibility	1	Clutch Failure	1	Misjudgement	124	-	-	-
Weather Conditions	67	Crane Failure	1	Misjudgement by Poor Visibility	2	-	-	-
-	-	D.P. Computer Failure	2	Misjudgement by Poor Weather	1	-	-	-

-	-	Thruster Failure	9	-	-	-	-	-
-	-	Total Power Loss	6	-	-	-	-	-
<b>TOTALS</b>	<b>82</b>	-	<b>126</b>	-	<b>152</b>	-	<b>15</b>	<b>182</b>
	<b>14.7%</b>	-	<b>22.6%</b>	-	<b>27.3%</b>	-	<b>2.7%</b>	<b>32.7%</b>

To 31 October 2001

Analysis of the results indicates, as perhaps is to be expected, that the majority of incidents involving “attendant vessels” has a primary cause linked to some form of control failure; be it either human or mechanical. Furthermore, while the category of external factors contains predominantly environmental causes, it may be argued that these too should fall within the human control failure as perhaps the operation should have been aborted or postponed if conditions were so severe so as to possibly lead to a collision.

Watchkeeping failure was assessed as the primary cause in each “passing vessel” incident. Unfortunately, the precise nature of the watchkeeping failure is unknown, and is unlikely to remain so unless an impartial, third party investigation into the full circumstances of the accident is initiated and reported.

### 3.5 GEOGRAPHICAL DISTRIBUTION

For the purposes of this analysis all installation types have been combined. Jack-up installations are rarely used in the Northern North Sea, and similarly semi-submersibles are less likely in the shallower waters of the Southern North Sea. To analyse the data by individual installation types may suggest that some types have experienced less incidents in certain areas, when in reality their populations are very small.

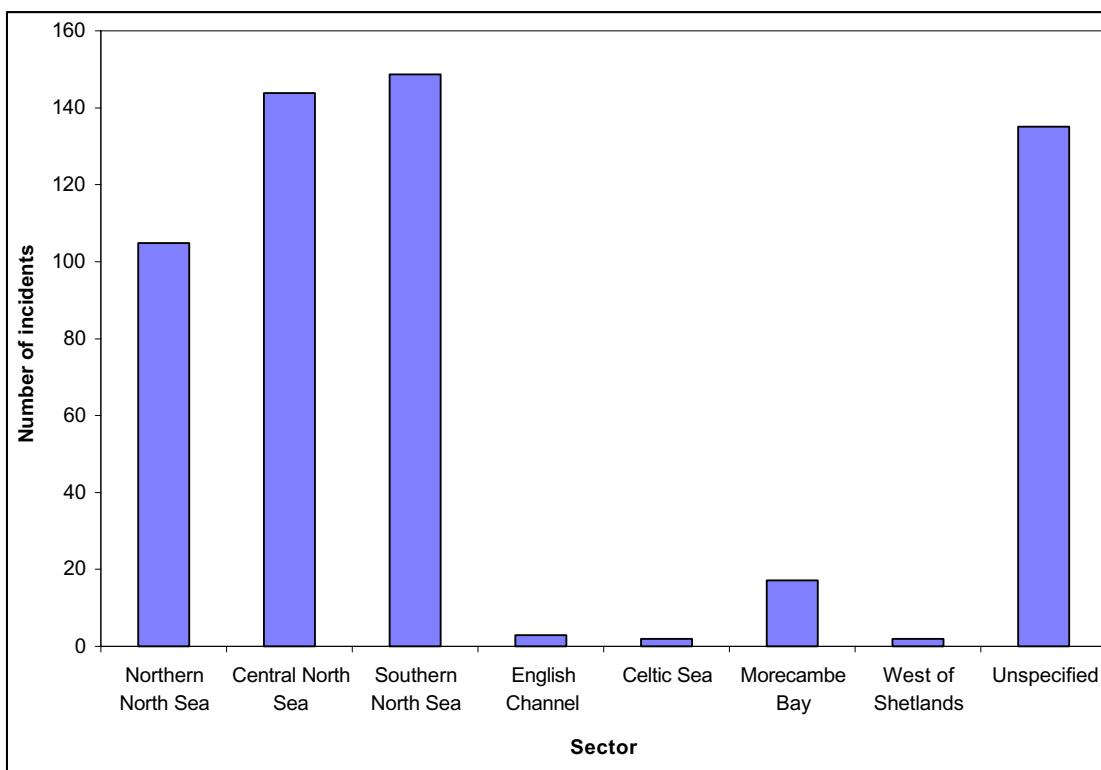

A simple comparison of the number of incidents occurring in each sector of the UKCS has been produced in Table 24 and graphically in Figure 20. These highlight those areas that have historically suffered most incidents, however, it should be viewed against the very different levels of activity between sectors. Unless the number of incidents is compared with the total number of installations operating in that sector a relative frequency is impossible to determine. Unfortunately, sector activity throughout the period of study is difficult to achieve with any degree of accuracy as mobile units move location frequently even when engaged under the same contract.

**Table 24: Geographical distribution of incidents**

<b>Sector</b>	<b>Incidents</b>	
	<b>Number</b>	<b>Percentage</b>
Northern North Sea	105	18.85%
Central North Sea	144	25.85%
Southern North Sea	149	26.75%
English Channel	3	0.54%
Celtic Sea	2	0.36%
Morecambe Bay	17	3.05%
West of Shetlands	2	0.36%
Unspecified	135	24.24%

To 31 October 2001

**Figure 20: Geographical distribution of incidents**

Of particular interest is the geographical distribution of “passing vessel” incidents as these tend to be more location specific than those of “attendant vessels”. The 8 passing vessels incidents all occurred in the Southern North Sea.

# **4 Discussion**

## **4.1 INCIDENT FREQUENCIES**

In the period since 1992 the mean incident frequency has generally shown a downward trend, particularly for those incidents which, in accordance with the outlined criteria, result in moderate or severe damage. For the most part this may be due to the adoption of improved working practices by installation operators and of better standards of attendant vessel repair and maintenance by their owners/operators. The exception to this is the frequency of incidents to semi-submersibles, where, in 1996 and 1997, the frequency increased slightly resulting in an almost constant cumulative incident frequency. The reasons for this increase could not be explained, other than perhaps to suggest that there was a degree of under reporting in the previous years.

## **4.2 DATA COMPLETENESS**

Despite exhaustive cross-checking, a number of otherwise unsubstantiated incidents are contained within the database. While this is perhaps to be expected in the early part of the study it has even occurred in more recent years (post 1990), predominantly for incidents where little or no damage has resulted. To some extent this is not surprising. Individual O.I.M.'s are responsible for the completion of OIR/9A forms, and where a minor contact has occurred, possibly not resulting in any damage to the installation, the need to complete a report may not be apparent. In this respect it is believed that the database has suffered a degree of under-reporting such that undue confidence should not be placed in the completeness of the 'minor', 'unspecified' and 'none' damage categories. Further, these concerns are compounded by the unknown accuracy of incidents to normally unattended installations.

The quantification of confidence in the various damage categories is extremely difficult to predict with accuracy. Using only the 'minor', 'unspecified', and 'none' damage categories, if the number of incidents where a confirming source is recorded is compared to the total number, the figure is 31.7% (149 confirmed of 470 incidents). Conversely, where damage categorised as 'moderate' or 'severe' has occurred, the same method produces a figure of 48.8% (42 confirmed of 86 incidents). When the years 1991-2001 are considered (1991 being the year in which the MAIB database, as a supporting source, commenced) figures of 30.7% and 78% are produced for, respectively, 'minor', 'unspecified', 'none'; and 'moderate', 'severe' categories.

## **4.3 PASSING VESSELS**

Fortunately, over the whole period of study, collision incidents involving "passing vessels" have occurred very infrequently. Of the 557 recorded incidents only 8 have involved passing vessels and either fixed steel or jack-up installations; that other installation types have not been involved would seem to be fortuitous rather than due to anything inherent in their design. The potential for severe damage, possibly even catastrophic, is greatly

increased when passing vessels infringe the 500 metres safety zone, whether by accident or design. The kinetic energy possessed by passing cargo vessels and tankers may result in even a glancing blow causing major structural damage. The potential for a passing vessel to collide with an installation is to a large extent outside the control of the installation operator and its attendant stand-by vessel, though if timely action is taken to warn an errant vessel it may be possible to influence their actions.

All passing vessel collisions have occurred in the Southern North Sea and to some extent this is not surprising. The waters in this area are more densely populated with passing commercial shipping traffic engaged on domestic coastal voyages, shorts sea international traffic between UK ports and the near continent and long international voyages between ‘foreign’ ports and North European ports. To this should be added the large numbers of inshore and near water fishing vessels from both East Coast UK and near continent ports.

Coupled to the increase in traffic density is the need for much of this traffic to follow traffic lanes rather than being able to follow their courses at will. Many of the traffic lanes are in the form of International Maritime Organisation (IMO) adopted traffic separation schemes whereas others have developed over time and are now ‘customary’ routes.

The historic development of the oil and gas industry in the region has seen a relatively large number of installations in locations in fairly close proximity to the traffic lanes, both customary and mandatory, and what is perhaps more surprising are the relatively few passing vessel incidents when viewed against this backdrop. Certainly, based on anecdotal evidence of vessel/vessel collisions it is felt the incident frequency for vessel/platform collisions is far lower than for vessel/vessel collisions in the same area. However, this assumption is not based on any formal analysis rather than on the MAIB’s simple accident data not taking into account populations etc.

It can be argued that in some respects the existence of large numbers of vessels and installations in close proximity ought to lead to a heightened awareness among vessel watchkeepers compared to areas where vessels/installations are less numerous. Unfortunately, the passing vessel data do not reinforce this argument and it appears that installations in the Southern North Sea are at greater risk than those in other areas; probably because the increased awareness of vessel watchkeepers fails to keep pace with the increase in risk in congested areas.

#### **4.4 PRIMARY CAUSE**

In apportioning a “primary cause” to an incident great faith has been placed in the contents of the OIR/9A forms. Almost exclusively, these have been completed by personnel on board the installation who may, or may not, have contacted those on board the relevant vessel to determine their opinion of the circumstances. It is quite possible that where, for instance, the primary cause is stated to be ‘judgement’, this may be the Offshore Installation Manager’s (O.I.M.) assessment based on second hand information from those witnessing the incident, rather than after discussion with subject vessel’s Master.

# **5 Analysis of Platform Supply Vessel Fleet and Commercial Shipping Trends on the UKCS**

## **5.1 INTRODUCTION**

With the entering into statute of The Statistical Returns (Carriage of Goods and Passengers by Sea) Regulations 1997 (S.I. No. 2330/97) and the advent of the Maritime Statistics Collection Agency (MARSTATS) on 1 January 2000 it has become possible to develop information about a number of factors that may have an impact on ship/platform collision incidents generally. At HSE's request data about several related issues were obtained from the data set held by MARSTATS of behalf of the Department of Transport, Local Government and the Regions (DTLR).

Information about the number of voyages into and out of U.K. ports from/to the UKCS, the identity of the vessels involved and the type of cargo carried by those vessels has been extracted from MARSTATS. The statutory duty on shipping lines or their agents to supply the information is limited to cargo loaded/discharged at the U.K.'s 'major' ports. These are defined as ports having a total annual throughput exceeding 1 million tonnes, of which there are 52 in the U.K. There is no reporting requirement for vessels loading/discharging in ports that handle less than 1 million per year, of which several are involved in the offshore oil and gas industry, for example, Montrose and Lowestoft, therefore it is certain that the data analysed does not represent all offshore traffic. Furthermore, although it is a legal requirement for shipping lines or their agents to supply the data it is almost inevitable that there may be a degree of under reporting in even the 'major' ports; the extent of which is not known with certainty. Bearing these in mind, the figures presented below represent the minimum estimate of vessels actively engaged in platform supply operations or shuttle tanker activity.

## **5.2 PLATFORM SUPPLY VESSELS**

For some time there has been an unsubstantiated belief among some in HSE that the development of platform supply vessels (PSV) over time has led to a gradual increase in size, both in terms of their external dimensions and tonnages. The Maritime Statistics Collection Agency holds a listing of all currently registered commercial vessels together with detailed information about their type, dimensions, tonnages, year of build, speed and flag etc. Although information about a vessel's displacement is not included in the MARSTATS fleet list, at HSE's request an attempt has also been made to determine this by using the other available parameters as well as an assumed block coefficient of 0.77. The block coefficient figure was chosen in consultation with staff within HSE.

Using the primary search criterion of 'type = offshore supply' an extract of the fleet list was taken to assess how the main vessel criteria have changed. The search produced a total of 2827 current vessels. The oldest vessel listed as 'offshore supply' was built in 1943 and

of the vessels built between then and 1960 only 33 are listed as current. For statistical purposes vessels built prior to 1961 have been excluded.

It is stressed that the information produced depends entirely on the correct classification of vessel type within the fleet list. It is believed, for instance, that a number of vessels that are now working as Emergency Response and Rescue Vessels (ERRV) but where previously PSV still retain their original classification as 'offshore supply'. Furthermore, some vessels that are actually diver support vessels are classified as 'offshore supply'. The latter misclassification will have a bearing on the analyses, particularly on the comparison of vessel dimensions, because of the generally larger size of these vessels that will tend to increase the averages disproportionately. Notwithstanding this, the figures presented are believed to give a good appreciation of the trends in changing of vessel dimensions/tonnages if not a comparison in absolute terms.

Although the fleet list held by MARSTATS contains a large number of vessels listed as 'offshore supply' there are a number of gaps within the data and where certain of the parameters for a particular vessel are unknown then a '0' is recorded. This has occurred in for various parameters i.e., dimensions, tonnages, speed etc. To avoid skewing the results of the parameter analysis it has been necessary to exclude those vessels where a parameter is unknown. For example, of the 35 vessels listed as being built in 1997 the vessel's length was not known in 1 case and the deadweight not known in 6 cases. The average vessel length for 1997 built vessels was based on the 34 vessels where this was known and, similarly, for the deadweight, was based on 29 vessels.

Parallel analyses were carried out to derive the average parameters for all vessels classified as 'offshore supply' and, separately, for those reported as active on the UKCS since 1 January 2000 through MARSTATS. This was based on their year of build.

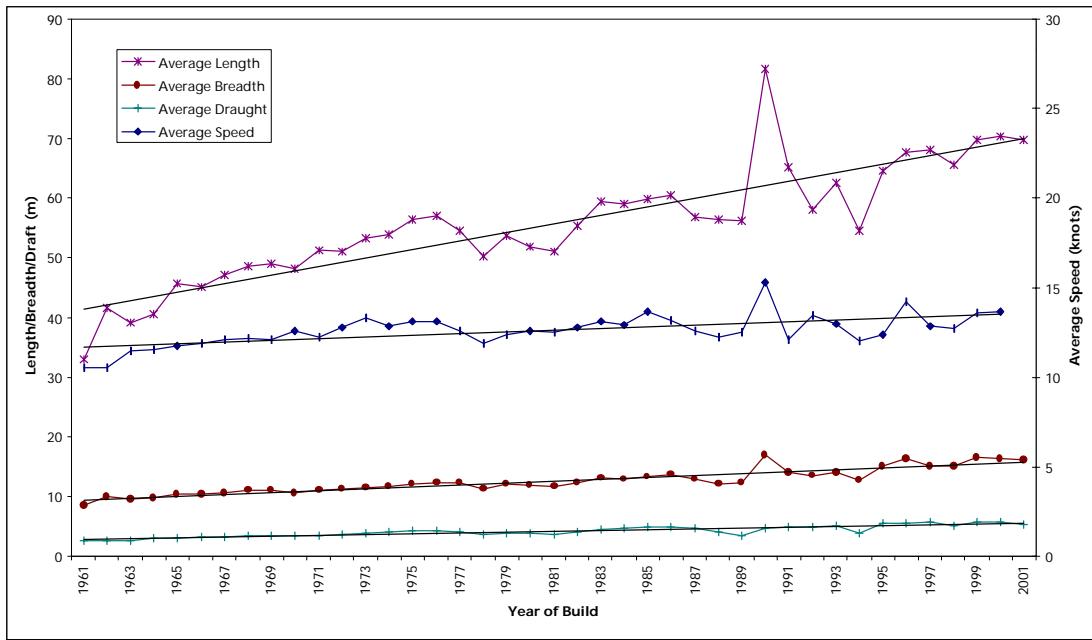

A graphical representation of the year on year average of the main vessel dimensions and speed is presented in Figure 21 for all vessels listed as 'offshore supply' and in Figure 22 for those that have been active on the UKCS. Similarly, Figures 23 and 24 present a representation of the year on year average of tonnages.

Although the information in the graphs is as accurate as the raw data allows, it should be remembered that certain factors may have an influence on how the data appear. This is particularly true, for example, in 1990 when there were only 5 new builds and all were of approximately the same dimensions. This has led to an apparent anomaly in the data compared to the preceding and following years. In an attempt to minimise the effects of such occurrences a linear trend line has been inserted over each parameter. This has the effect of calculating the least squares fit for a line represented by the equation:

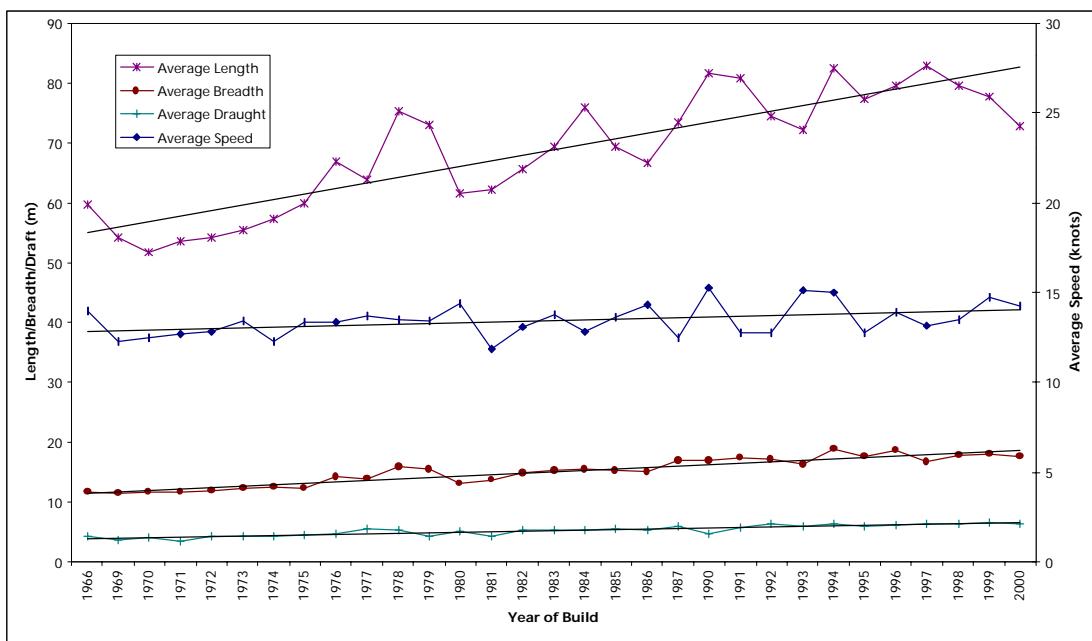

$$y = mx + b \quad \text{where } m \text{ is the slope and } b \text{ is the intercept.}$$

As will be noted, there has been an increase to varying degrees in all the assessed parameters over time. This is the case for both all the current offshore supply vessels and those active on the UKCS.

**Figure 21: All offshore supply vessels average dimensions over time**

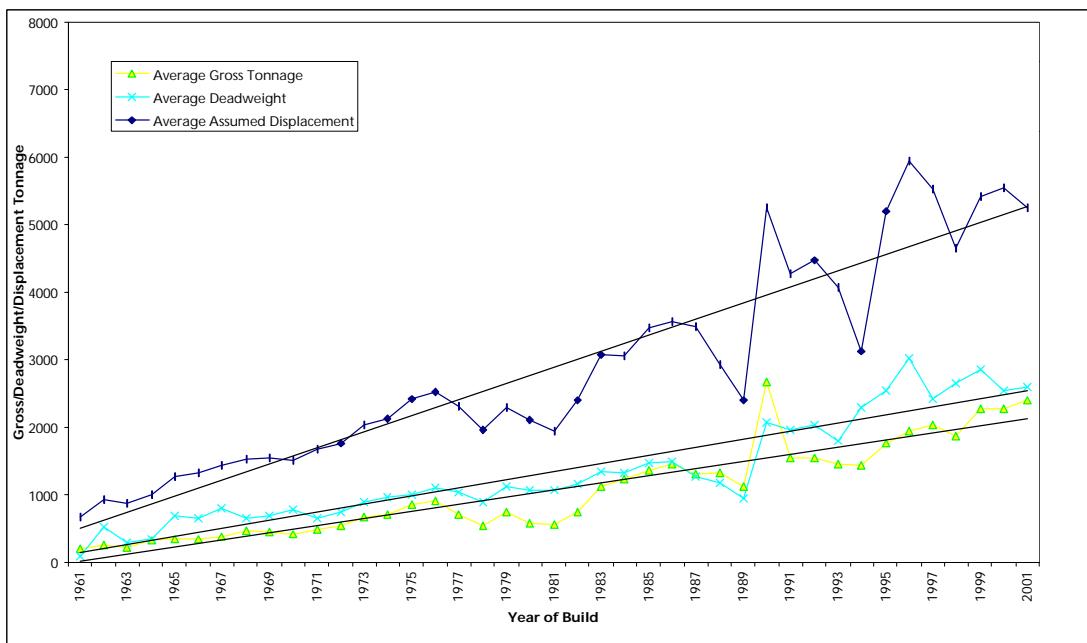

**Figure 22: UKCS offshore supply vessels average dimensions over time**

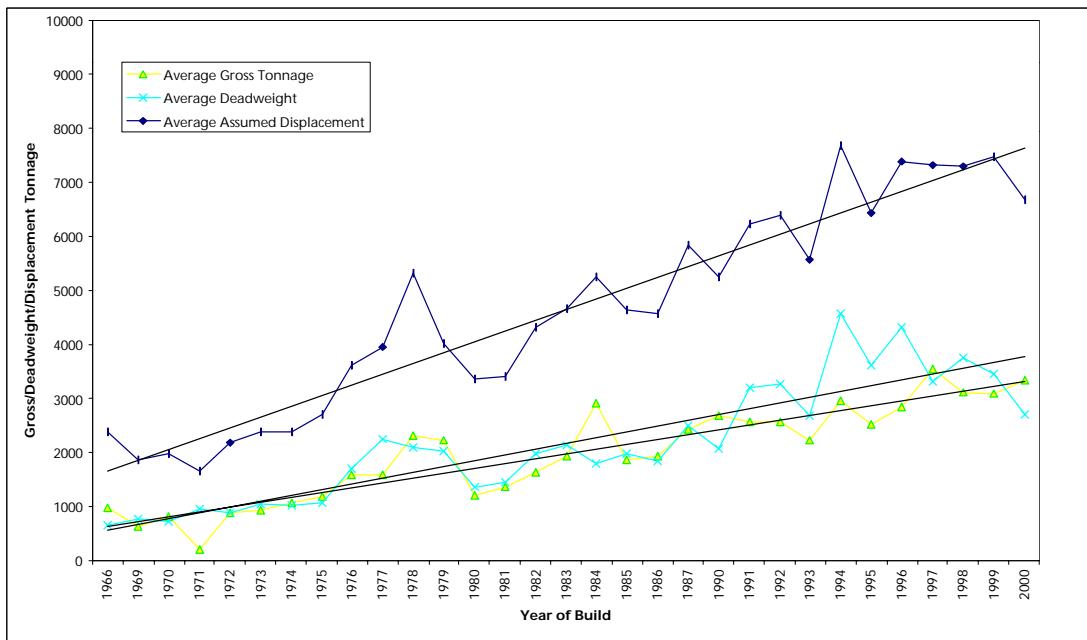

NB: The apparent omission of data for 1967 – 1968 and 1988 – 1989 occurred because there were no vessels built in these years operating on the UKCS and reporting cargo through MARSTATS. The inclusion of 'zero' data for these years would have unjustly skewed the average figures and trend lines.

**Figure 23: All offshore supply vessels average tonnages over time**

**Figure 24: UKCS offshore supply vessels average tonnages over time**

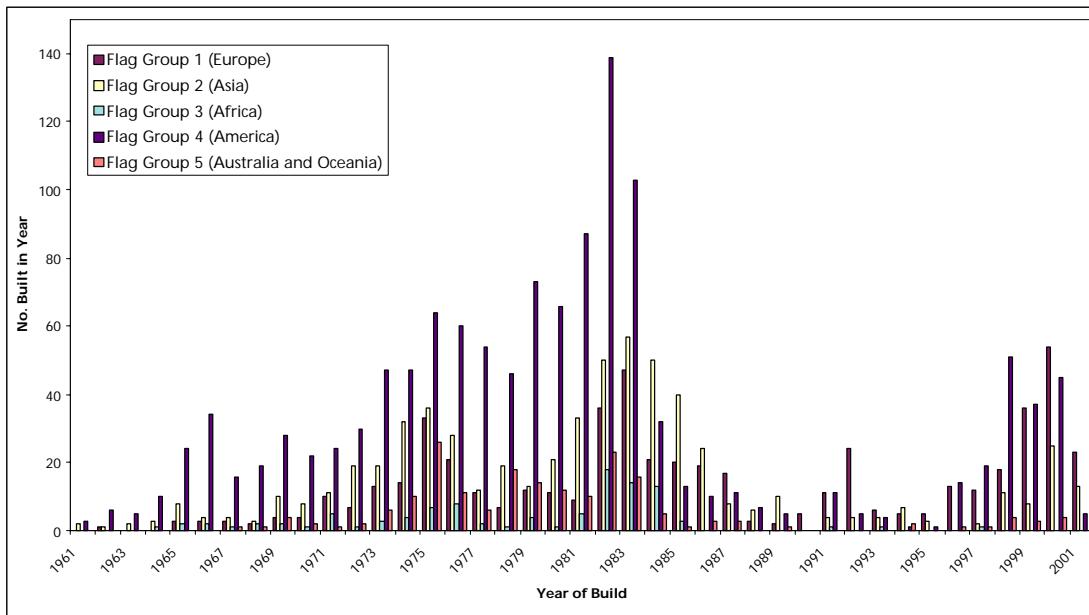

NB: The apparent omission of data for 1967 – 1968 and 1988 – 1989 occurred because there were no vessels built in these years operating on the UKCS and reporting cargo through MARSTATS. The inclusion of 'zero' data for these years would have unjustly skewed the average figures and trend lines.

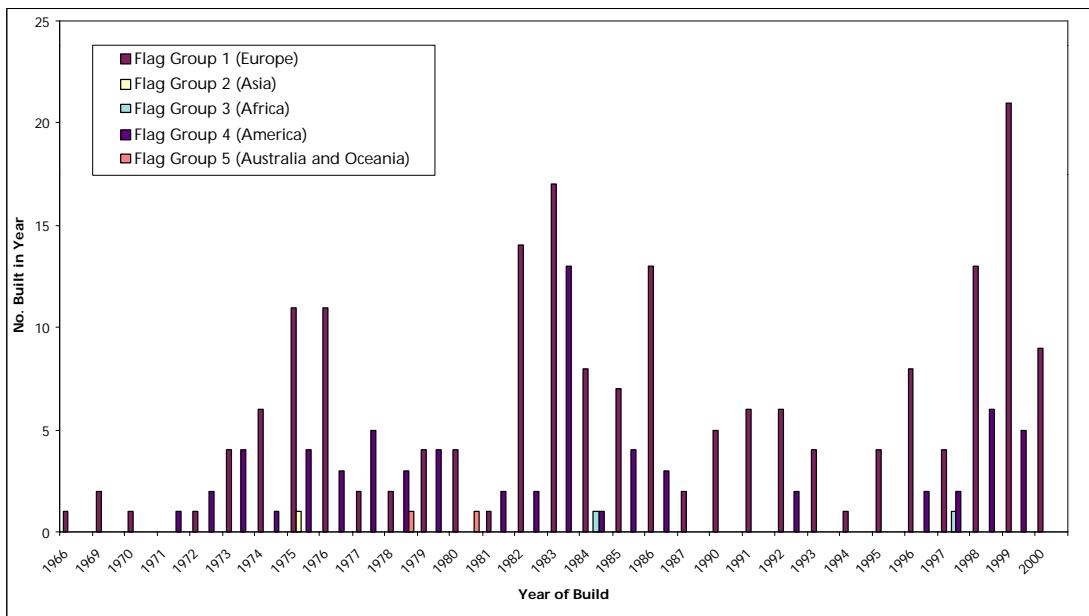

Other information held in the fleet list refers to a vessel's current flag. Using data correct as of 30 June 2001 the entire fleet of 'offshore supply' and those active on the UKCS have been assessed in terms of their flag. For ease of representation all flags have been divided into groups based on the continents, i.e., Europe, Asia, Africa, America and Australia/Oceania and grouped according to the vessels year of build.

It will be noted that the majority of vessels operating on the UKCS appear to be of more recent build than the world fleet average and the majority are registered in European countries. It is perhaps to be expected that vessels operating in European waters would be registered in European countries and no inference should be drawn from this.

**Figure 25: All offshore supply vessel flags over time**

**Figure 26: UKCS offshore supply vessel flags over time**

NB: The apparent omission of data for 1967 – 1968 and 1988 – 1989 occurred because there were no vessels built in these years operating on the UKCS and reporting cargo through MARSTATS. The inclusion of 'zero' data for these years would have unjustly skewed the average figures and trend lines.

### **5.3 COMMERCIAL SHIPPING BETWEEN UKCS AND U.K.**

In an effort to develop and understanding of the magnitude of commercial vessel traffic between the UKCS and various ports on the U.K. mainland the MARSTATS was requested to provide a breakdown of all vessels where the port of loading/unloading was the UKCS. It was intended that this would capture all voyages where, for instance, cargo or stores were carried out to offshore installations or brought back from them. Further, that all occurrences of shuttle tanker operations between UKCS loading terminals and U.K. ports could be analysed.

As with all other data obtained from MARSTATS it should be borne in mind that the responsibility for reporting rests with the shipping lines or their agents and so the data analysed represents the minimum amount of traffic in and around installations on the UKCS.

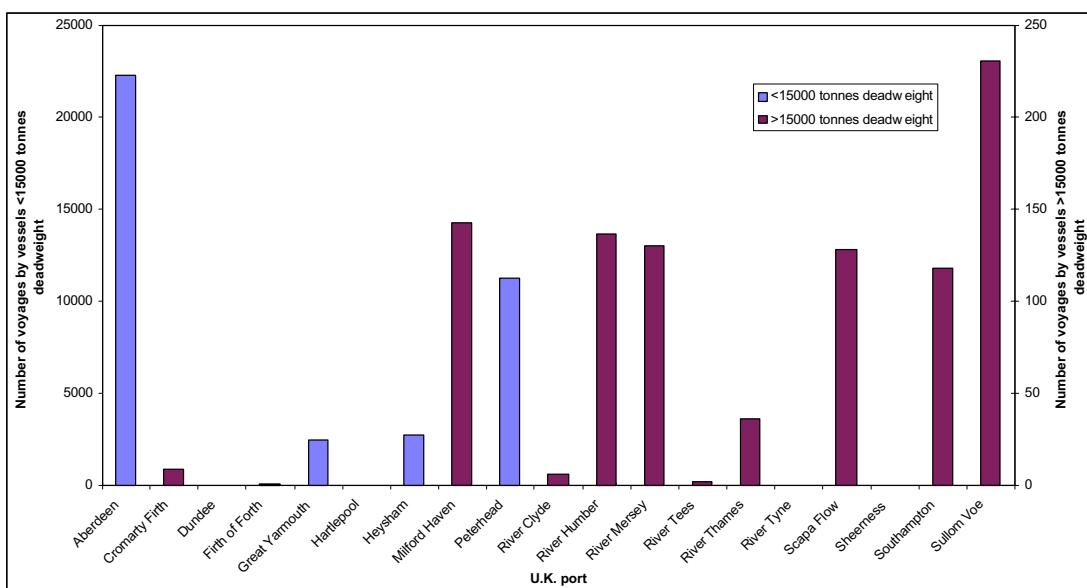

Another limitation is the absence of data on vessels in ballast and also those where although the loading port may have been on the UKCS the discharge port may be outside the U.K. There is no requirement for shipping lines or agents to make statistical returns to MARSTATS when a vessel is not carrying cargo nor when it does not come to a U.K. port.

In conclusion, it is highly likely there are an even greater number of voyages where cargo is being carried not to mention vessels in ballast.

A breakdown of the results, sorted by U.K. port and then year/quarter, is presented in Appendix B. It provides the number of voyages by vessels of various deadweight groupings. The deadweight referred to is the maximum of the vessel, i.e., loaded to the summer loadline, and does not necessarily represent the vessel's deadweight at the time the voyage occurred.

Figure 27, overleaf, is a graphical representation of the total number of voyages where cargo was carried between U.K. ports and the UKCS in the period between 1 January 2000 and 30 June 2001. It demonstrates that Aberdeen is the busiest port in terms of number of voyages followed by Peterhead. However, when the graph is compared with the table in Appendix B it shows that the bulk of the voyages are carried out by relatively small vessels compared to other ports that are used as discharge ports for shuttle tankers, such as the Sullom Voe, Milford Haven, River Humber, River Mersey and Scapa Flow.

**Figure 27: Vessels carrying commercial cargo between U.K. ports and UKCS**

## 5.4 EMERGENCY RESPONSE AND RESCUE VESSELS

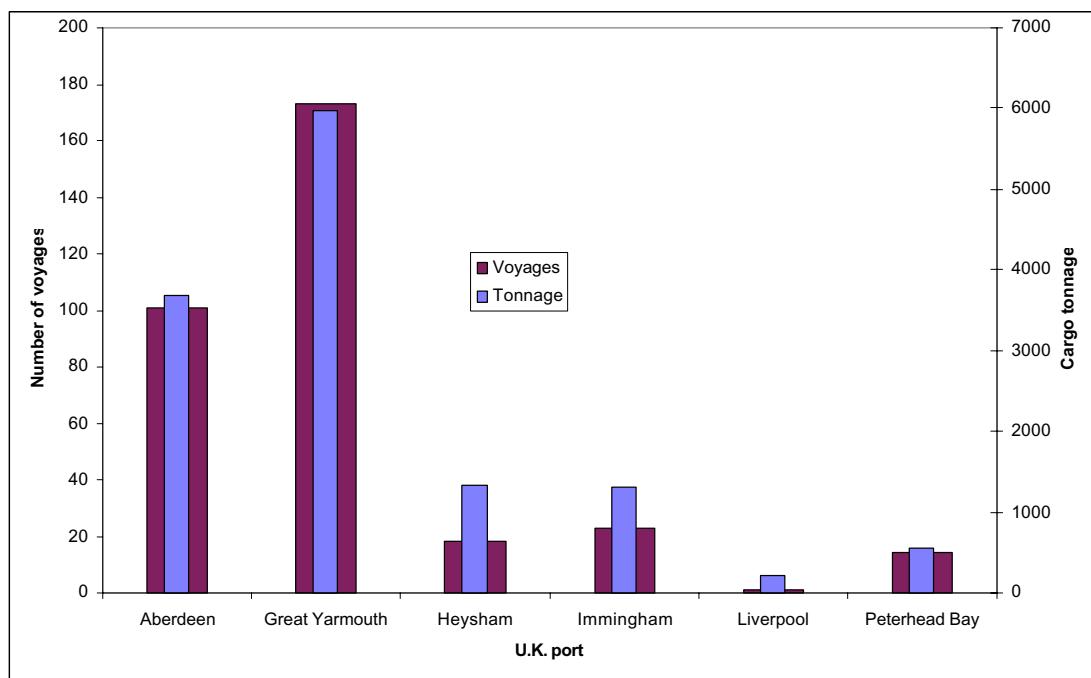

HSE made a further request of the MARSTATS in an attempt to quantity the number and extent of commercial cargo being carried on ERRV.

Shipping lines or agents are required to supply details of the cargo carried to/from U.K. ports by ERRV in just the same manner as for all other vessels and data analysis was undertaken using information about the identity of ERRV provided by HSE. It is understood that ERRV vessel identities, in the form of their LRN, was provided to HSE via a recent research project. MARSTATS was interrogated using the LRN provided by HSE to determine how many of the ERRV had also been reported as carrying commercial cargo to or from the UKCS.

The results of the search produced a total of 17 different vessels having made a total of 154 voyages into a U.K. port from the UKCS and 176 outward voyages. A total of 5703 tonnes of predominantly general cargo was brought into the U.K. and 7382 tonnes was taken out to the UKCS. A listing of these, detailing the number of voyages, the year and quarter when the voyage occurred, the U.K. port where the vessel arrived at or sailed from, whether it was inwards or outwards and the type and tonnage of cargo, is presented in Appendix C.

A graphical representation of the comparison of ports used for ERRV vessels when carrying commercial cargo is presented in Figure 28. This demonstrates that in terms of both the number of voyages and cargo tonnage Great Yarmouth is the most usual port of loading/discharge for ERRV while Aberdeen is the second most usual.

**Figure 28: ERRV carrying commercial cargo between U.K. ports and UKCS**

# **6 ‘Near Miss’ Information**

## **6.1 INTRODUCTION**

In the 1997 review of the database the view was put forward that a large body of anecdotal evidence exists to suggest that ‘near misses’ occur frequently in all areas of the UKCS which, in the context of that report, was defined as an infringements of the 500 metre safety zone. At the time it was also concluded that a more comprehensive reporting of such incidents by surface installations would lead to a better understanding of the magnitude of the problem and may well lead to conclusions about the causation factors involved. In this respect, the causation factors for ‘near misses’ could well be similar to those resulting in a “passing vessel” collision as in many cases it is believed that these occurrences are the result of poor watchkeeping on board the vessel or the failure to recover from a dangerous situation.

In an attempt to develop a better understanding of the ‘near miss’ situation a number of new initiatives have been implemented in the period between the compilation of the 1997 review and this report:

- HSE ‘Orion’ system using search keyword “POS COLLISION OFF” (28 incidents – 14 classified as ‘near miss’ – 14 classified as not ‘near miss’)
- HSE ‘Orion’ system SZI section and OIR9A reports (59 incidents – not possible to determine whether ‘near miss’)
- ERRVA Warning Off Reports (246 incidents – not possible to determine whether ‘near miss’)

In the period between 1996 and 1999 HSE (OD) Legal and Strategy Team were responsible for Safety Zone Infringement Database (SZI), however since 1999 HSE Inspection Teams have been responsible for collating safety zone infringement information within their jurisdictions.

Furthermore, HSE have recently revisited their definition of the term ‘near miss’ and determined that only incidents that lead to the activation of any part of the Duty Holder’s Emergency Response Plan should be classified as a ‘near miss’. This is a better criterion for definition than, for example, one that refers to an approaching vessel’s closest point of approach (CPA) because of the different external factors and circumstances prevalent in different areas of the UKCS. The busier waters of the Southern North Sea will lead to many more close approaches by vessels than West of Shetlands where a potentially errant vessel may cause alarm more readily because it is a relatively rare event.

Although the reporting routes outlined above have led to an increasing amounts of reports being received by HSE and ERRVA, many of which yield important information about an event, it is somewhat debatable whether all should be classified as a ‘near miss’ within the confines of the recent definition. Some of the doubt is centred on the inability to determine whether an installation’s Emergency Response Plan was activated purely from the information contained within the report; this is particularly true for the ERRVA

Warning Off Reports which it appears are completed and filed by the ERRV without recourse to the installation.

Bearing this in mind, it is therefore not straightforward to compile an accurate overview of the magnitude of the ‘near miss’ situation when so few of the reports contain information enabling the occurrence to be determined. However, for the purposes of data analysis, it has been decided to assess the records where it was possible to determine if a ‘near miss’ occurred separately from those where it was not, i.e. data in Section 6.2 was analysed separately from that in Sections 6.3 and 6.4.

## **6.2 ‘ORION’ USING KEYWORD “POS COLLISION OFF”**

So far as being able to determine whether a ‘near miss’ actually occurred using the new definition, the information gathered by HSE and stored on the ‘Orion’ system using the keyword “POS COLLISION OFF” forms a better guide. This is because the amount of free text permitted in the report enables a good assessment of whether a “near miss” actually occurred even though it may not be explicit.

A search produced 28 records that were found to be relevant to the scope of this report, though several others were produced that were considered beyond the scope, for example reports of helicopter collisions offshore. From the reports it was possible to determine that 14 incidents had occurred where part of the Duty Holder’s Emergency Response Plan would have been activated.

A more extensive analysis of this data is contained in Section 6.5. A complete list of the data from the 28 records of the ‘near miss’ database, beginning on 17 June 1996 and ending on 15 October 2001, is contained in Appendix D.

## **6.3 ‘ORION’ SZI SECTION AND OIR9A REPORTS**

Information from these sources, particularly the OIR9A forms are submitted by installations and are primarily a factual account of an event that may be used for follow up enforcement activities. Data in the SZI section of ‘Orion’ appears to come from the OIR9A forms however the narrative section of the entry is somewhat limited. However, by inspection of the relevant original OIR9A form it is possible to develop a full understanding of events.

Analysis of this data is contained in Section 6.6. A list of the data from the 59 records of the SZI section of ‘Orion’ and the OIR9A reports, beginning on 29 December 1995 and ending on 24 February 2000, is contained in Appendix E.

## **6.4 ERRVA WARNING OFF REPORTS**

Although the ERRVA Warning Off Reports appear to be less helpful in assessing ‘near misses’, they do offer some important information about other factors that perhaps is beyond the scope of their original intention. Primarily, data may be developed about the

efficiency of EERV radar under different environmental conditions as the data provides the range of first detection of an approaching vessel.

The absence of qualitative data concerning the whether an incident was a 'near miss' within the HSE definition should not be seen as a criticism of the EERVA members or their vessel crews, rather than of the Warning Off Report forms they complete. Apart from a short section about what prompted the warning off action, whether on the vessel's own initiative or at an OIM's request, there is very little information about EERV/platform interaction prior to, during, or after an event.

A further area in which the EERVA Warning Off Report may be used to provide meaningful data is if information about the range from the installation at which an approaching vessel took avoiding action. Such information would be useful to both Duty Holders and the HSE in their development of procedure to manage collision risk.

Analysis of this data is contained in Section 6.6. A list of the data from the 246 records of the EERVA Warning Off Reports, beginning on 17 April 2001 and ending on 6 January 2002, is contained in Appendix F.

## 6.5 ANALYSIS OF 'NEAR MISS' DATA (POS COLLISION OFF)

The relatively small number of incidents under this heading has resulted in the data being presented in tabular format.

**Table 25: 'Near Miss' Data Analysis**

Number of reports	'Near Miss'		Not 'Near Miss'		
	14	14	14	14	
Sector	Northern North Sea	2	14.29%	3	21.43%
	Central North Sea	2	14.29%	4	28.57%
	Southern North Sea	5	35.71%	4	28.57%
	Morecambe Bay	1	7.14%	0	0.00%
	West of Shetlands	0	0.00%	1	7.14%
	Unspecified	4	28.57%	2	14.29%
Threatening vessel type	Anchor Handler	0	0.00%	1	7.14%
	Barge	2	14.29%	0	0.00%
	Cargo	1	7.14%	0	0.00%
	Diver Support	0	0.00%	2	14.29%
	Fishing	3	21.43%	1	7.14%
	Research	0	0.00%	1	7.14%
	Stand By	0	0.00%	3	21.43%
	Supply	1	7.14%	3	21.43%

## 6.6 ANALYSIS OF SZI AND ERRVA DATA

### 6.6.1 Number of reports

- Total reports from SZI/OIR9A 59 records
- Total reports from ERRVA 246 records

### 6.6.2 Number of EERV reporting (ERRVA data only)

- Total EERV in UKCS fleet 146 vessels
- Total ERRVA reporting 32 vessels

The UKCS EERV fleet has been determined from the output from the HSE's recently completed DC Deployment Database project. The actual number of vessels in use at any time will probably differ from this total because of vessel lay-ups, out of service for repairs, scrapping or sale and removal from the UKCS. An accurate number for the UKCS fleet and hence the percentage of vessels reporting can be obtained from ERRVA.

### 6.6.3 Number of serious warnings (ERRVA data only)

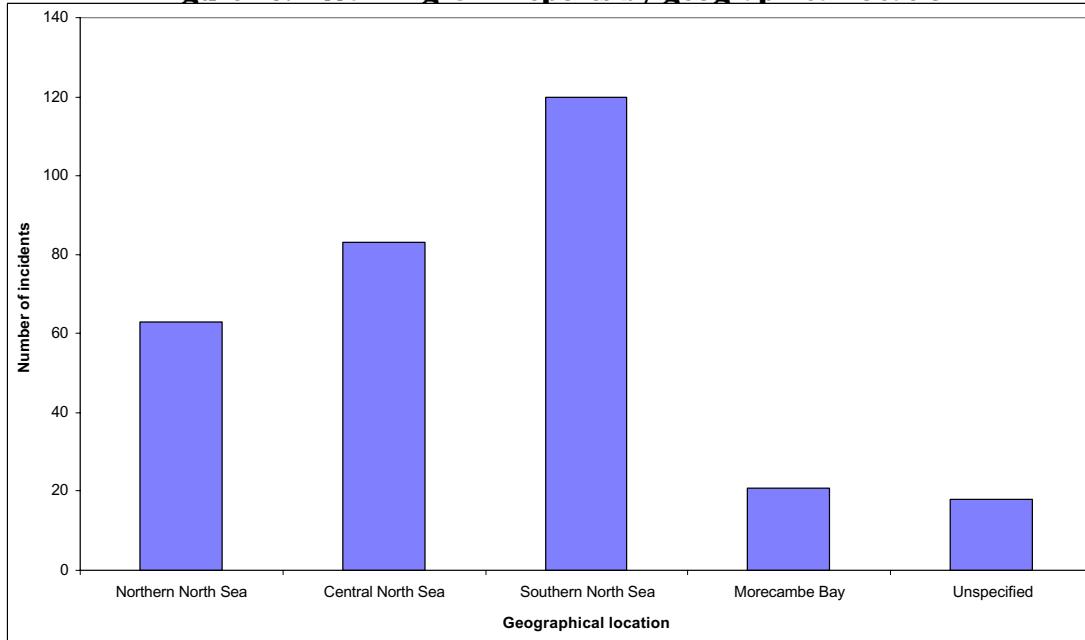

- The criterion for this is where no communications were established 8 records

The inclusion of this data is somewhat subjective. With the current format of ERRVA warning off reporting there is little to rank what should be considered a 'serious' incident compared to other events.

### 6.6.4 Reports by geographical location (combined data)

- Northern North Sea 63 records
- Central North Sea 83 records
- Southern North Sea 120 records
- Morecambe Bay 21 records
- Unspecified 18 records

**Figure 29: Warning Off Reports by geographical location**

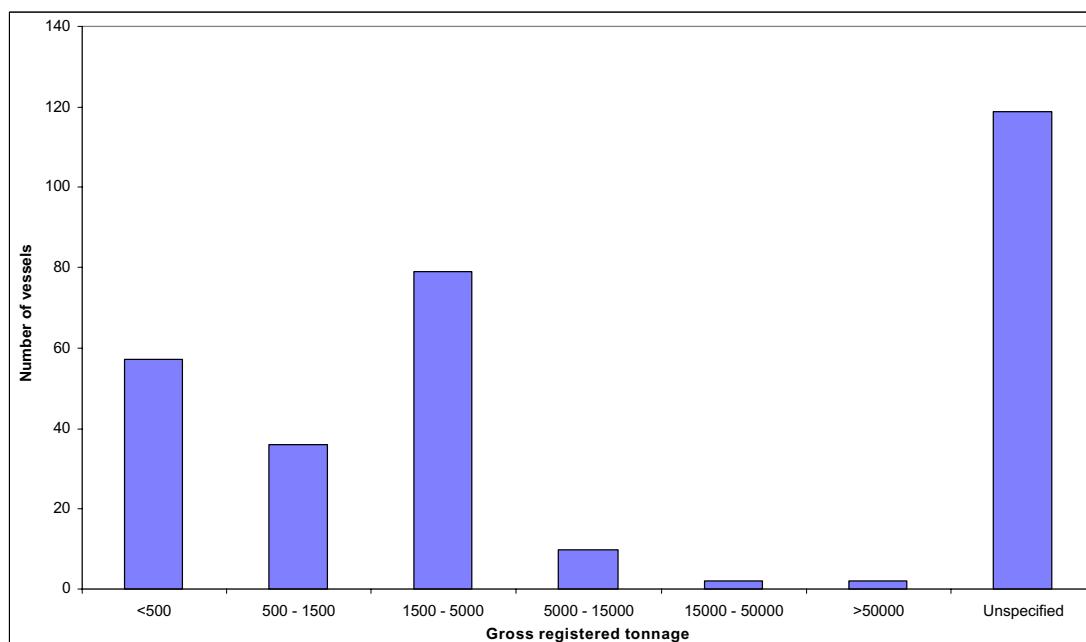

### **6.6.5 Type classification of threatening vessel (combined data)**

- Total reports of Cargo vessels 89 records
- Total reports of Derrick Barges 1 record
- Total reports of Diver Support vessels 2 records
- Total reports of Drilling vessels 1 record
- Total reports of Fishery Protection vessels 1 record
- Total reports of Fishing vessels 141 records
- Total reports of Passenger vessels 1 record
- Total reports of Research vessels 1 record
- Total reports of Sail Training vessels 3 records
- Total reports of Stand By vessels 2 records
- Total reports of Supply vessels 24 records
- Total reports of Tankers 14 records
- Total reports of Tugs 2 records
- Total reports of Yachts 13 records
- Total reports of Unspecified vessels 10 records

### **6.6.6 Gross registered tonnage of threatening vessels (combined data)**

- Gross tonnage less than 500 g.r.t. 57 records
- Gross tonnage between 500 – 1500 g.r.t. 36 records
- Gross tonnage between 1500 – 5000 g.r.t. 79 records
- Gross tonnage between 5000 – 15000 g.r.t. 10 records
- Gross tonnage between 15000 – 50000 g.r.t. 2 records
- Gross tonnage greater than 50000 g.r.t. 2 records
- Unspecified gross tonnage 119 records

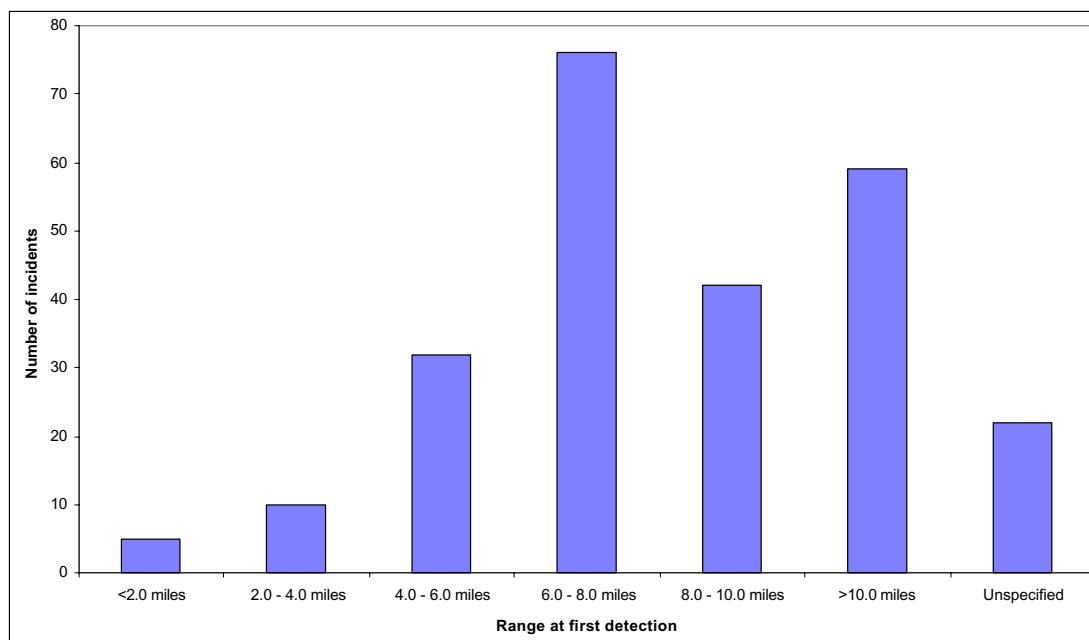

**Figure 30: Gross registered tonnage of threatening vessel**

### 6.6.7 Radar range at first detection (ERRVA data only)

- |  |            |
|--|------------|
| • First detection at less than 2.0 miles     | 5 records  |
| • First detection between 2.0 to 4.0 miles   | 10 records |
| • First detection between 4.0 to 6.0 miles   | 32 records |
| • First detection between 6.0 to 8.0 miles   | 76 records |
| • First detection between 8.0 to 10.0 miles  | 42 records |
| • First detection at greater than 10.0 miles | 59 records |
| • Unspecified range of first detection       | 22 records |

**Figure 31: Radar range at first detection**

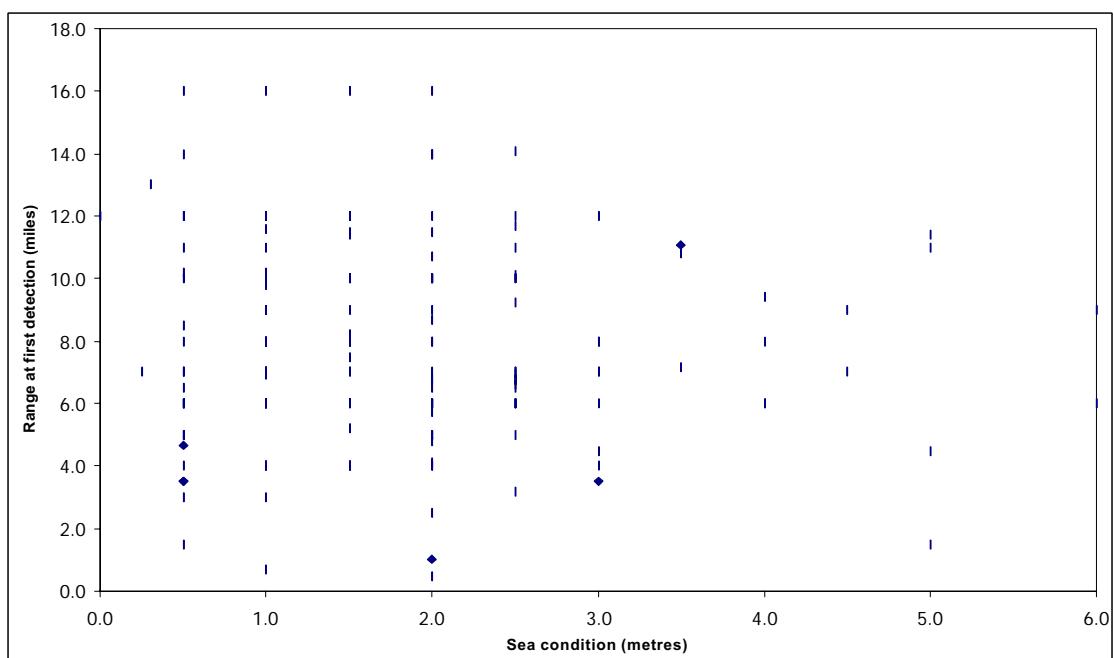

### 6.6.8 Radar range at first detection in prevailing sea condition (ERRVA data only)

Data in Figure 32 appears as it does because of the normal seagoing practice of reporting the sea condition to the nearest 0.5 metre of wave height. Indeed, it is considered extremely difficult to be even more precise when attempting to determine the wave height from a vessel's deck or bridge when the vessel is rolling/pitching in a seaway.

Bearing the foregoing in mind, there appears not to be a clearly discernible trend from an analysis of this data. Radar detection range was in most cases good regardless of the prevailing sea condition although if further analysis was undertaken, particularly with respect to the size, type, construction material and aspect of the target vessel, better information may be available. For example, the detection of large, angular, steel vessels, such as car carriers or container vessels will inevitably be better at longer ranges and in worse weather conditions than the detection of smaller fibreglass or wooden fishing vessels at shorter ranges and in less severe weather.

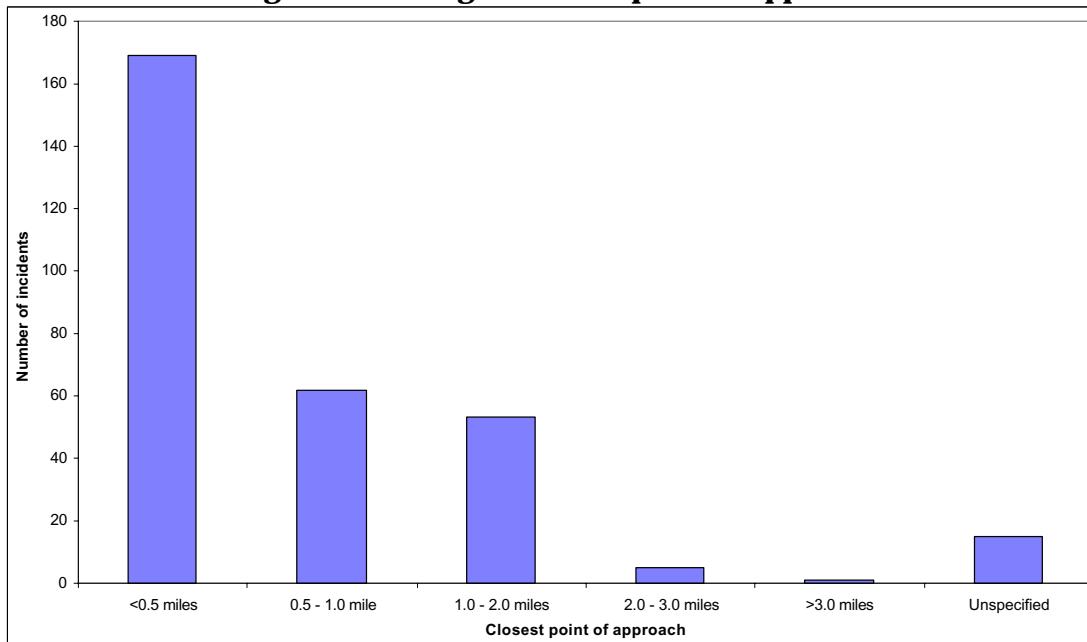

**Figure 32: Radar range at first detection in prevailing sea condition**

#### 6.6.9 Range at closest point of approach (combined data)

- CPA less than 0.5 mile 169 records
- CPA between 0.5 - 1.0 mile 62 records
- CPA between 1.0 - 2.0 miles 53 records
- CPA between 2.0 - 3.0 miles 5 records
- CPA greater 3.0 miles 1 record
- Unspecified CPA 15 records

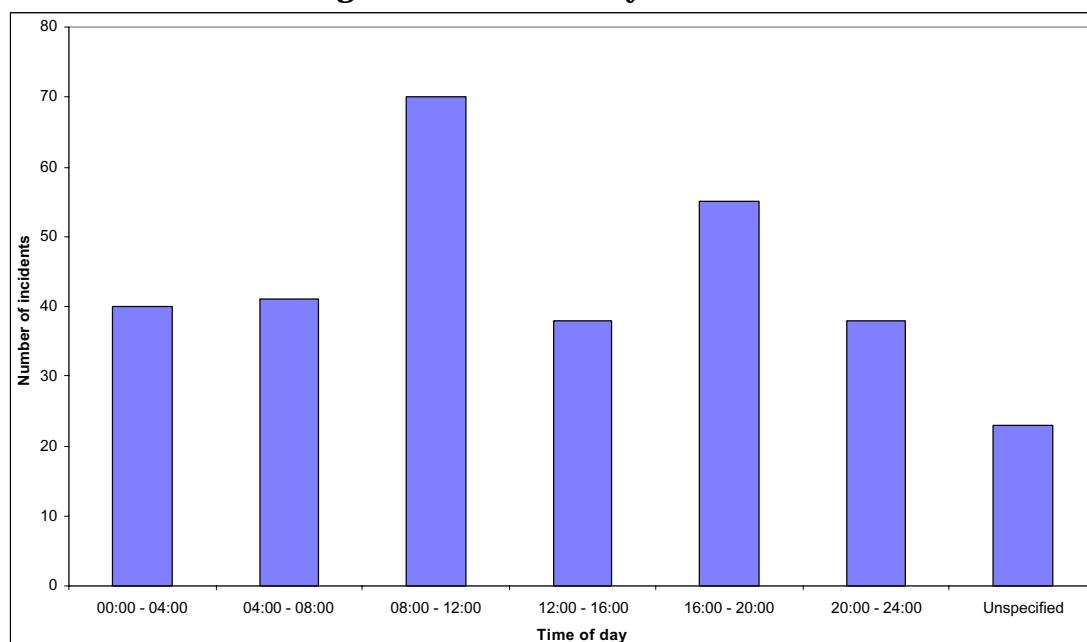

**Figure 33: Range at closest point of approach**

### **6.6.10 Time of incident (combined data)**

- Total incidents between 00:00 - 04:00 40 records
- Total incidents between 04:00 - 08:00 41 records
- Total incidents between 08:00 - 12:00 70 records
- Total incidents between 12:00 - 16:00 38 records
- Total incidents between 16:00 - 20:00 55 records
- Total incidents between 20:00 - 24:00 38 records
- Unspecified time of incident 23 records

**Figure 34: Time of day of incidents**

## 7 Conclusion

The database contains a compilation of ship/platform collision data from several widely differing sources and as such probably represents the most complete record of collision incidents on the UKCS.

Data interpretation should be carried out with caution as it is highly likely that some degree of under reporting of incidents has occurred. Primarily this is thought to be of those incidents where little or no damage resulted to the installation, however, may also include more serious incidents to normally unattended installations.

Bearing in mind the likely confidence with which the database should be viewed, it is important to stress that it represents the “best case” so far as the frequency of incidents is concerned. In reality it is likely that the frequency of incidents which result in less serious damage should be higher than indicated in this report. In more recent years it is believed that a much higher degree of accuracy has been achieved, particularly for more serious incidents, such that it provides a useful starting point from which to address the issue of vessel collision and its mitigation.

Due to their increasing usage over the last decade and as the data set has expanded and an analysis of accidents involving FPSO and FSU was carried out. Although only 10 incidents have been reported, oil transfer to a shuttle tanker was the operating circumstance on 3 occasions. The point of note with these incidents was the potential for seriousness. Shuttle tankers are predominantly large vessels and even a slow speed collision can have very serious consequences because of the kinetic energy involved. In mitigation, it is believed that shuttle tankers have a high degree of sophistication in their manoeuvring and propulsion equipment and properly trained, experienced and certified crew therefore the likelihood of a incident may be less than for other vessels that routinely approach FPSO and FSU.

At HSE’s request a number of other analyses have been undertaken. These have utilised data from the Maritime Statistics Collection Agency (MARSTATS) and primarily dealt with the number and size of commercial cargo carrying vessels that may have cause to be in and around offshore installations on the UKCS. While it is likely that the figures presented are an understatement of the actual number, they do go some way in at least beginning to quantify the population of vessels that UKCS installations may encounter.

Separately, but using the same MARSTATS data source, information was developed about the extent of cargo carrying activities on EERV between U.K. ports and the UKCS. While not strictly within the scope of the update to the ship/platform collision database as the vessels could be expected to be in the vicinity of the installations, it will give HSE some information about how widespread this newly adopted and growing activity has become when before all that existed was anecdotal evidence.

One of the conclusions of the 1997 report suggested that “A more comprehensive reporting of ‘near misses’ by surface installations would lead to a better understanding of the magnitude of the problem, and may well lead to conclusions about the causation

factors involved.” Since the last update of the ship/platform collision incident database a larger data set of ‘near miss’ incidents has been collated by both the HSE and, since April 2001, by ERRVA. The latter source of data should more properly be considered as ‘warning off’ because it contains little to independently support the new definition of a ‘near miss’, i.e., when any part of an installation’s emergency response plan is activated. Notwithstanding this, the ‘warning off’ data is still valuable in its own right as it helps to:

- Quantify the amount of potentially errant traffic.
- Provide information on the range at which approaching vessels may take avoiding actions.
- Outline the effectiveness of radio contact or other means to warn of installation’s presence.

This report has addressed the issue of near misses in more detail than in previous issues and concluded that the data set of such incidents is increasing. Even though the definition of a ‘near miss’ has been made clearer there were still 14 such events. These ranged in severity from a precautionary mustering of personnel to an actual downmanning of an installation.

Data from other sources such as the Canadian and United States Coast Guards that were included in the previous version of the database have been removed. Unfortunately, when the database was last updated differences in the method of presentation and in the amount and diversity of data prevented a full analysis so it was decided to not include it in the report on this occasion.

<b>PASSING VESSEL COLLISIONS</b>								
1	Impacted horizontal and vertical cross brace on row 2 between legs A2 and B2, severe bend (up to 26°) in brace member at -18 to +27 levels and slight bend (7°) to horizontal brace at -27'. Minor dents in way.	Yes	Complete replacement of upper half vertical cross brace on row 2. Box plating of dented areas.	-	Severe	Severe damage to starboard side of bow (crushing of plating/frames). Proceeded to port for repairs.	HSE, LMIS, OTN 92/235 & BONEL	
2	Severe damage to a 5.5m section of 1 leg rendered helideck unsafe and personnel had to be evacuated.	Yes	70 tonnes steelwork renewed.	-	Severe	Forecastle above waterline, windlass destroyed and 1 anchor lost.	HSE, WOD & LMIS	
3	Vertical member of boat landing stage bent 0.9 m out over 1.2 - 1.5 m.	-	-	-	Severe	Bows stow in.	HSE	
4	Slight damage.	-	-	-	Minor	All port side at fin above waterline.	HSE & LMIS	
5	Boat tender ripped off north-west leg, damage to cellar deck drain line, torn mooring rope.	-	-	-	Minor	Dent in trawler.	HSE	
6	5' paint scraped off leg B2.	-	-	-	Moderate	Unspecified hull damage including leaks in starboard diesel tank.	WOD	
7	-	No	-	-	Severe	Wooden bows caved-in, taking in water.	HSE	
8	Impact at +55m level, no damage.	No	-	None	-	-	-

Conse. No.	Installation Damage Details	Repaired	Repair Details	ATTENDANT VESSEL COLLISIONS		Vessel Damage Class	Vessel Damage Details	Other Source Confirms
9	Two braces damaged (18" x 0.5" and 20" x 0.5"). 36° brace bent. 2 braces detached (24" x 0.5" and 12" x 0.5") and bent towards each other. Non redundant member. Damage between 20' - 33' level. Non redundant member.	Yes	Extensive repair needed. Brace between rows 3 and 4 replaced in 1978.	Minor	-	-	-	WOAD, OTN 92/235 & BOMEL
10	Cross bracing on row A at elevation +17' severed at A1 and fell off to seabed. Redundant member. 450mm long tear in leg A1 in way of well to brace. Non redundant member at 11'.	Yes	Brace replaced in 1978.	-	-	-	-	OTN 92/235 & BOMEL
11	One end of leg member virtually severed other end had 2 x 13mm cracks in cross member at 11'.	Yes	Damaged member removed.	-	-	-	-	-
12	Horizontal barge bumper support torn from top of leg A1 + 9' elevation causing weld crack of total 80mm length. Non redundant member.	Yes	Leg reinforcing plate fitted in 1981.	-	-	-	-	-
13	Unspecified, severe damage.	Yes	Towed to yard for repair.	-	-	-	-	-
14	Vertical diagonal and horizontal brace on row B between legs B3 and B4 severed at leg B3 at 21' elevation. Has 43mm x 0.60mm (W x D). Cracks in welds on underwater nodes of brace. 2nd brace on row B3 at 18' elevation. Non redundant members.	Yes	Member replaced and repair clamped in 1986.	-	-	-	-	OTN 92/235 & BOMEL
15	14 long x 6" deep gash in S/S 2 column at 84' elevation. Ring frame in way bent. Lifeboat struts, davit and deck under lifboat bent.	Yes	Urgent repairs needed. Decided brace damage had effective total loss of comp strength, well shaft-in and rig evacuated.	Severe	Unspecified heavy damage.	-	-	HSE
16	Dent to 2.44 m base C3. 1.83m x 5.48mm x 0.66m (H x W x D). LRS case 1/1.024.	Yes	Underwater inspection required plus MPI of node welds. Temporary repair followed by permanent repair in 1983/84.	-	-	-	-	HSE & OTN 92/235
17	Brace between legs B2 and B3 at +16' elevation close to leg B3. Members bent inwards and downwards by 4" and flattened, torn and distorted drafting. Holed at 16' level and fractured. Bulkhead buckled over 20'.	Yes	Renewal of plating, stiffeners and fractured bulkhead.	-	-	-	-	OTN 92/235, WOAD & LMIS
18	Brace between legs A3 & A4 indented 0.13m at 1.5m x 1.5m (H x W x D) Brace bent by 15". Weld cracks found.	Yes	Bracing repaired in 1985. MPI inspection of node welds.	-	-	-	-	BOMEL & HSE
19	Dent of column platting 3.75m x 4.50m x 0.55mm (H x W x D). 3 vertical stiffeners buckled. 4 damaged. 1 ring stiffener severely damaged.	Yes	Temporary repairs undertaken pending repair of both plating and stiffeners.	Moderate	Damage to breast plate, deck plates at bow forecastle hatch and to forecastle.	-	-	-
20	36" gash in steel platting. 18" - 24" indent in side shell.	-	-	-	-	-	-	HSE
21	Horizontal brace on row A between legs A2 - A3 severed at A3 and leading tube indented 90mm. 4x50mm x 120mm (H x W x D) posed 80mm. 3 others, damaged. Fractured welds on leg A3. Horizontal brace sheared, knee stiffener fatigued and sheared. Redundant member.	Yes	Member removed leaving a 1.5m stub at leg A2. Repair plate installed over hole in 1991.	Severe	4" - 5" gash above waterline in bow section. Towed to Witterness by "Beydon Elder" for temporary repairs and later to Lowestoft.	-	-	OTN 92/235, WOAD & LMIS
22	Unspecified severe damage. Structure at Great Yarmouth awaiting tow when incident occurred.	-	-	-	-	-	-	MAIB
23	Welds of horizontal brace between legs B4 and B5 cracked at both ends (B4 for 45% circumferential, B5 for 75% circumferential) at +11' elevation. Brace bent 9" +7.5" elevation. Member buckled by 2". Redundant member.	Yes	Member replaced in 1974.	-	-	-	-	-
24	Welds of horizontal brace between legs B4 and B5 cracked at both ends (B4 for 45% circumferential, B5 for 75% circumferential) at +11' elevation. Brace bent 9" +7.5" elevation. Member buckled by 2". Redundant member.	Yes	Replaced by new member with redesigned end connections in 1974.	-	-	-	-	-
25	600mm long x 1mm deep weld crack on horizontal brace on row 1 between legs A1 and B1 at 11' long. Long weld crack at joint on horizontal brace member on row A between legs A3 and A4 at 1.5' elevation.	Yes	Replacement insert piece in 1981.	-	-	-	-	-
26	Collided with vertical column No. 22, dent 36" x 1" x 2" (L x W x D). 6" long fracture on ring stiffener.	-	-	-	-	-	-	BOMEL
27	Unspecified damage.	Yes	-	-	-	-	-	-
28	Dent and internal damage to centre port column. Platting penetrated in port centre column.	-	-	-	-	-	-	-
29	Horizontal brace member on row B between leg B6 and B7 at B7 pulled out of leg at +11' elevation. Redundant member.	Yes	Member replaced with redesigned joint in 1978.	-	-	-	-	BOMEL
30	14" long weld track and 4" - 6" bend on diagonal brace member on row A between legs A3 and A4 at +3.5' elevation.	Yes	Brace replaced in 1980.	-	-	-	-	-
31	16" long weld crack on horizontal brace on row 1 between legs A1 and B1 at +7.5' elevation.	Yes	Cracks rewelded and spilt sleeve installed in 1977.	-	-	-	-	-
32	Redundant member.	-	-	-	-	-	-	-
33	Damage to deck and lifeboat below deck.	-	-	-	-	-	-	-
34	Dent 3.05m x 3.05m (H x W x D) between 4" - 6" above waterline. 3 horizontal stiffeners set in and distorted. Platting fractured 50 mm at horizontal stiffener.	-	-	-	-	-	-	-
35	Cross member (W) above watertite bent, distortion of spiled-deck.	-	-	-	-	-	-	-
36	Plating dent 0.84m x 0.41m x 0.025 m (H x W x D). Stiffener ring bent 50mm upwards and broken away from platting.	Yes	Minor	Not serious, repaired during annual inspection	-	-	-	-
37	Unspecified damage.	Yes	-	-	-	-	-	-
38	Unspecified damage.	Yes	-	-	-	-	-	-
39	Significant crack on vertical cross brace on row A between legs A4 (-21' elevation) and A3 (+22' elevation).	Yes	Spilt sleeve installed in 1979.	-	-	-	-	BOMEL
40	Stiffener buckled and partially torn over 5'. Ring stiffener at 90° buckled between stiffeners 6 and 7. 8 mm hole in platting.	-	-	-	-	-	-	-
41	Dent in 24" OD x 0.688" WT riser 0.358m x 0.25m x 0.037m (H x W x D).	Yes	Riser operated at downrated pressure pending metallurgical report.	-	-	-	-	OTN 92/235
42	Indent of all sides of column 3 and fore side of column 4. Platting penetrated.	Yes	Moderate	Temporary repairs effected, ship yard repairs required.	-	-	-	BOMEL
43	Vertical stiffener twisted and 4" dent on column No. 25, 3" dent on column No 24.	Yes	Sleeve welded in place in 1980.	-	-	-	-	-
44	Dent 1.75m x 1.75m x 0.17m (H x W x D) between ring stiffeners 3 and 4. Webs or stiffeners bulged, no cracks.	Yes	-	-	-	-	-	-
45	Vertical diagonal brace on row A between legs A1 and A2 indented 16" x 10" x 3" (H x W x D) and bent inwards by 3".	Yes	Sleeve welded in place in 1980.	-	-	-	-	OTN 92/235
46	Horizontal brace on row 4 between legs C4 and D4 cracked, bent and indented damage to spider-deck.	Yes	Requested by LRS. Brace replaced in 1979.	-	-	-	-	OTN 92/235

Conse. No.	Installation Damage Details	Repaired	Repair Details	ATTENDANT VESSEL COLLISIONS		Vessel Damage Class	Vessel Damage Details	Other Source Confirms
47	2 dents, 1.52m x 1.22m x 0.025m and 2m x 0.1m x 2m (H x W x D). Transverse stringer set in 25 mm.	Yes	Within 6 months.	-	-	-	-	-
48	Dent at 90° level over 7 damaged, 3 vertical stiffeners below and above ring also damaged.	-	-	-	-	-	-	-
49	Unspecified damage.	Yes	-	-	-	-	-	-
50	Dent 1.3m x 2m x 0.17m (H x W x D). 2 stiffeners bulged.	Yes	-	-	-	-	-	-
51	Unspecified damage.	Yes	-	-	-	-	-	-
52	5mm wide crack on vertical diagonal brace on row B from leg B3 to B4 at intersection with gusset plate at approx. +12° elevation. Brace indented 12" x 16" x 2" (L x W x D) at +15° elevation.	Yes	Saddle plate added, gusset plates cut back and welded split sleeve in 1981.	-	-	BOMEL	-	-
53	Horizontal brace on row A between legs A1 and A2 at +6° elevation bent 12° upwards and 8° inwards.	Yes	Additional brace installed in 1981.	-	-	BOMEL	-	-
54	Horizontal brace bent and cracked.	Yes	Crack rewelded in 1981.	-	-	OTN 92/235	-	-
55	Horizontal brace on row B from leg B2 to B3 at +15° elevation indented 18" x 12" x 6" (L x W x D) and bent 12° upwards. Horizontal brace on row B between legs B1 and B2 at +15° elevation bent 6° downwards.	Yes	Additional member installed in 1981.	-	-	-	-	-
56	Dent 1.22m x 1.22m x 0.15m (H x W x D).	Yes	Crop plating, renew both plating and associated stiffener.	-	-	-	-	-
57	Crack in concrete 3m above mean sea level. Leakage of water through crack at dry shaft, 5 litres/minute.	Yes	Temporary and permanent repairs made consisting of concrete replacement in 1980.	-	-	WOAD & BOMEL	-	-
58	Concrete spalled off 1m x 0.25m x 0.025m (H x W x D). Slight ingress of water from previous damage.	-	-	-	-	WOAD	-	-
59	Boat fender support member on leg A4 shared off leaving hole in jacket leg. Non redundant member.	Yes	Plate inserted in hole in 1982.	-	-	-	-	-
60	Unspecified dent in leg.	Yes	GROUTED and clamped in 1982.	-	-	-	-	-
61	Shell indent 0.76m x 0.76m x 0.075mm (H x W x D) close to waterline - slight ingress of water. Stiffener ring frame at +15° level cracked. Plating 125 mm tear.	Yes	Temporary repair, cement box fitted.	-	-	HSE	-	-
62	Unspecified dent with hole in leg.	Yes	Patch plate welded over.	-	-	-	-	-
63	1.6mm wide crack on vertical cross brace on row B between legs B1 (-21° elevation) and B2 (+22° elevation).	Yes	Split sleeve installed in 1982.	-	-	BOMEL	-	-
64	2dents on horizontal brace on row C between legs C1 and D1 at +7.5° elevation. Longer indent with 210mm tear in centre and member bowed by 75mm.	Yes	Tear rewelded in 1984.	-	-	-	-	-
65	Extensive damage to boat bumper, centre support sheared off at connection to lower can support.	Yes	Replacement of affected boat bumper.	-	-	HSE	-	-
66	Unspecified damage to hanging foghorn platform.	Yes	-	-	-	-	-	-
67	35° of diagonal member between 2 columns heavily set in 4.57m x 1.52m x 0.61m (H x W x D). Member severed and weld damage at connection between top plate of diagonal and lower hull connection.	Yes	Towed to Peterhead for repairs.	-	-	HSE & WOAD	-	-
68	160 mm indentation to port stern leg. 3 vertical diagonal and horizontal braces on row 1 near legs A1 and B1 and between legs A1 and B1 bowed 10-15 degrees. Minor dents and cracking. Redundant members. Landing stage damaged.	Yes	"K" Brace replaced by new diagonal in 1983.	-	-	OTN 92/235, BOMEL & HSE	-	-
69	Unspecified dent with hole in leg.	Yes	Patch plate welded over in 1983.	-	-	-	-	-
70	Column D' damaged at 28m level. Column C' damaged in 3 places, 2 at 28m, 1 at 27m levels.	Yes	Temporary repair undertaken.	Minor	-	-	-	-
71	Plating holed at 82° mark.	Yes	Temporary patch applied.	-	-	HSE	-	-
72	Dent 1.83m x 0.1m (H x D). Fine boom cut in half, bumper bars damaged.	Yes	Fine boom repair.	Moderate	Damage to funnel and helideck supports.	HSE	-	-
73	4 vertical frames displaced +50mm.	Yes	-	-	-	HSE	-	-
74	150mm gash in shell of platform above waterline.	Yes	-	-	-	HSE	-	-
75	Dent over two levels approx. 12° depth, weld crack over 6" 7 stiffeners buckled at 18".	Yes	Taken out of service, stiffened against ship collision.	-	-	HSE	-	-
76	Steel plating of deck set in 1.52m x 1.83m x 0.18m (H x W x D), 16" crack at 61.5° level, 2 vertical stiffeners buckled.	Yes	Temporary repair carried out pending permanent repair.	-	-	HSE	-	-
77	Dent 0.92m x 0.92m x 0.025m (H x W x D). 2 stiffeners bent smoothly over 1.5m. 5 wooden stiffeners broken or lost.	Yes	Replace 1.2m x 1.2m of plating and angle of stiffeners.	-	-	HSE	-	-
78	Unspecified weld crack in diagonal member.	-	Sleeve welded in 1983.	-	-	BOMEL	-	-
79	Vertical diagonal brace on row 3 at row E to row B. Complete severance at butt weld 3 above node at -36 elevation. Brace indented 30" x 12" x 2" (L x W x D) just above water-line. Redundant member.	Yes	Member replaced.	-	-	-	-	-
80	Indent in brace C3 between columns C and D. Ring stiffeners distorted, web torn, longitudinal stiffener set in.	Yes	-	-	-	-	-	-
81	Damage to vertical and horizontal stiffeners. Stiffeners bent inwards over an area 18" x 12" at 65° -70° level.	Yes	-	-	-	HSE	-	-
82	Dent in C5 tank, 5.7" x 7" x 10" (H x W x D). C5 longitudinal stiffener indented 3". Plating damage 4" x 2" at 220m level relative to keel. Ring stiffener 4 and 5 indented on No. 6 ring.	-	-	-	-	-	-	-
83	Unspecified dent in horizontal member.	Yes	Patch plate welded over in 1992.	-	-	-	-	-

Conse. No.	Inst allation Damage Details	Repaired	ATTENDANT VESSEL COLLISIONS			Other Source
			Vessel Class	Repair Details		
84	1" diameter hole in hull plate. Leak rate of 3 tons/hour. Damage to drill water tank.	-	-	-	-	HSE
85	No damage to compressor platform. 1 ribular support on bridge between AP and AC platforms flattened. Damage to pipeline riser gland, starway gland, between main and cellar deck; Indentation in starboard forward leg. Im x 2m x 0.3m (H x W x D). Associated frames and floor buckled, watertight integrity intact.	-	-	-	Minor	HSE & WOAD & MAIB
86	Port flare boom twisted and crushed.	-	-	-	Minor	HSE & WOAD & MAIB
87	Damage to fire boom.	-	-	-	Moderate	HSE
88	Wrecked lifeboat.	-	-	-	Moderate	HSE
89	Indentation 1" x 20' x 18' (D x H x W) area. Split 29" x 2" (L x W) at 75' level. Internal stiffeners in way bent and cracked.	Unknown	-	-	-	MAIB
91	Two indentations in shell of Column 2 and distortion of internal vertical stiffeners in way.	-	-	-	-	-
92	Column shell plating indented 12" x 8" x 10' at approx. 6' above water line. Several vertical and one horizontal internal stiffeners in way are distorted.	-	-	-	-	-
93	Horizontal brace on row A between legs A1 and B1 at +20' elevation indented 150mm and 100mm deep and bent 8°.	No	-	-	-	-
94	Shell plating deflected 1.22m x 1.83m x 0.1m (H x W x D) just above waterline.	-	-	-	-	-
95	Dent 0.61m x 0.61m x 0.15m (H x W x D).	-	-	-	-	-
96	Dent 1.32m x 0.91m x 0.15m (H x W x D) at bulkhead between locker and pump room.	-	-	-	-	-
97	Dent 0.91m x 0.61m x 0.18m (H x W x D) at 50' draught. 2 vertical ribs bent. Weld cracks.	-	-	-	-	-
98	Superficial damage to leg chord.	-	-	-	Severe	WOAD
99	Unspecified minor damage.	-	-	-	Minor	Slight damage to vessel rubbing strake.
100	Boat landing destroyed.	Yes	-	-	-	-
101	Unspecified minor damage.	-	-	-	-	-
102	V-shaped dent in plating 1.22 m horizontally. Vertical stiffener set back 250mm 175mm x 100mm x 1.5mm (D x W x D). Circumference stiffener buckled 50mm other side. V-shaped dent in plating 2.44 m horizontally. Vertical stiffener set back 300 mm. 3 vertical angle stiffener deflected 175mm x 100mm x 9.5mm (H x W x D). Weld crack.	-	-	-	-	-
103	Shell deflected 3" in 7.5m diameter column. 1 horizontal and 4 vertical frames damaged. Leg remained water tight.	-	-	-	-	-
104	Denting of column.	-	-	-	-	-
105	Plating deflected 0.3m x 0.3m x 0.05m (H x W x D) at 74' elevation.	-	-	-	-	-
106	Dent in diagonal member 0.91m x 0.91m x 0.15m (H x W x D).	-	-	-	-	-
107	Dent at deck 5' level 3.5m x 4m x 0.02m (H x W x D). Damage to load mooring pad eye and tie stiffening web buckling it, puncture 0.05m x 0.2m.	-	-	-	-	-
108	Unspecified minor damage.	-	-	-	-	-
109	Collided twice, 1st: no damage to boat bumper. Dent on second collision between first and second ring frames at 83' draft. 0.91m x 1.07m x 0.064m (H x W x D).	-	-	-	Severe	Holed causing significant flooding.
110	Unspecified minor damage.	-	-	-	-	-
111	4 collisions, barge being pushed by tug.	-	-	-	-	-
112	Vertical diagonal brace on row B from leg B2 to diagonal brace between leg B1 and B2 bent 6°.	-	-	-	-	-
113	Unspecified minor damage.	No	-	-	-	-
114	Unspecified minor damage.	-	-	-	-	-
115	Damage to five main, 2m main and handrails.	No	-	-	-	-
116	Dent in sleeve 0.8m x 0.8m x 0.1m (H x W x D) at 1m above waterline.	No	-	-	-	-
117	Hit north leg causing damage to bumpers.	-	-	-	-	-
118	2 Dents, one 1.2m x 2.8m x 0.1m (H x W x D) 1m above waterline, stiffener set down 75mm over 3' in length.	-	-	-	-	-
119	Damage to five main, 2m main and handrails.	-	-	-	-	-
120	Minor damage to both platforms only superficial.	-	-	-	-	-
121	Minor damage to starboard hull plating, superstructure and mast.	-	-	-	-	-

			ATTENDANT VESSEL COLLISIONS			
162	Unspecified minor damage.	-	-	-	-	-
163	Dent 1.83m x 1.26m x 0.1m (H x W x D) between 2nd. and 3rd. ring frames at 79' draft.	-	-	-	-	-
164	Paint scrape only visible damage.	No	-	-	-	-
165	Heavy contact whilst moored alongside (substantial damage).	-	-	-	-	-
166	3' - 5' above waterline. Cellar deck cawlk torn. 24' slip pontoon dented with 6" indent.	-	-	-	-	-
167	Partial tearing of boat bumper.	-	-	-	-	-
168	Scoring to leg.	-	-	-	-	-
169	Removal of coating on piping.	-	-	-	-	-
170	Unspecified minor damage.	-	-	-	Minor	-
171	Unspecified minor damage.	-	-	Severe	Vessel holed above waterline in way of No. 5 fresh water tank.	-
172	Unspecified minor damage.	-	-	-	-	-
173	Unspecified minor damage.	-	-	-	-	-
174	Unspecified minor damage.	-	-	-	-	-
175	Brace indented 30" x 17" x 3" (L x W x D) at .9' elevation.	Yes	Following further damage member was replaced in 1982.	-	-	-
176	Dent 2m x 2m x 0.1m (H x W x D) in C-9 tank at 22m.	-	-	-	-	-
177	Damage to spider deck stayway support/movement of rope shock absorber clamp.	-	-	-	-	-
178	Dent in B-9 tank at 24' in level 1m x 1m x 0.05m and 0.8 x 0.7m x 0.08m (H x W x D).	-	-	-	-	-
179	Dent 0.8m x 0.2m x 0.06m (H x W x D) at 25 m depth (elevation tank 208)	-	-	-	HSE	-
180	24" rise pipe in monobathe dented. Cracks in clamp welds at cellar deck level.	-	-	Minor	Unspecified minor damage.	HSE
181	Navigation light and part of platform demolished.	-	-	-	-	HSE
182	Bent 0.10m - 0.15m.	-	-	-	-	-
183	Timber fenders and holders damaged.	-	-	-	-	HSE
184	Damage to hull of West No. 1 lifeboat.	No	-	Moderate	Loss of 3m mast.	HSE
185	Torn monel cladding and damage to cruciform strut on E1 leg.	-	-	-	-	-
186	Impact caused platform to shake.	No	-	-	-	HSE
187	Unspecified minor damage.	-	-	-	-	-
188	Unspecified minor damage.	-	-	-	-	-
189	Displacement of upper can leg A2 boat bumper, damage to starboard support.	-	-	-	-	HSE
190	Brace C3 indented 0.45m x 0.45m x 0.063m (H x W x D). Cracks in 3 places between hull and stiffener.	-	-	Minor	-	HSE
191	Bottom can bumper indented and top can displaced.	-	-	-	-	HSE
192	Paint scraped off C-9 tank.	-	-	-	-	-
193	Elliptical dent, 250mm x 150mm x 7mm without skin penetration.	-	-	Minor	Fender dented, stern plating set in 0.07m over 0.8m.	HSE
194	Small indentation on cross member C1 - D1.	-	-	None	No damage.	-
195	Riser bent 12° - 18° at 10' above waterline. C2 pile guide also affected.	-	-	Severe	Vessel hull pierced by pile follower in two places and loss of boat aerials.	HSE
196	15' above waterline.	-	-	Minor	Slight/crash damage to bow plating.	HSE
197	Unspecified minor damage.	-	-	-	-	-
198	Unspecified minor damage.	-	-	-	-	-
199	Denting of redundant conduit attached to leg.	-	D.P. operational procedures altered as a result of incident.	Minor	Scrapping of paint.	-
200	Unspecified dent to diagonal brace and main deck supports. 2 lifeboats damaged.	Yes	Repainted at Rotterdams.	Severe	Taking in water. Taken to Lowestoft for repairs.	WOAD & LMIS

Conse. No.	Installation Damage Details	Repaired	Repair Details		Vessel Class	Other Source
			ATTENDANT VESSEL COLLISIONS			
201	Superficial damage to member coating/paintwork.	-	-	-	-	HSE
202	Paint removed.	-	-	-	-	HSE
203	Slight dent in steel can around tyres of B1 log boat bumper at ~2' from waterline.	-	-	-	None	No damage.
204	Unspecified minor damage.	-	-	-	-	-
205	Timber fender(s) spayed; minor damage to tender shear plate.	-	-	-	-	HSE
206	Severe buckling to lower can boat bumper. Crust plate between stabilizing guide, hullbar and leg double rib torn off. Slight denting to leg.	-	-	-	-	-
206	Damages at 24m level on column. Dent 0.9m x 0.22m x 0.05m (H x W x D). 2 deck beams and brackets distorted; no sections.	-	-	-	-	HSE
207	5 items on horizontal brace on row between legs A1 and B1 at -7.5' elevation. Worst indent 250mm x 305mm x 50mm (L x W x D) with local cresting. Redundant member.	No	-	-	-	-
208	No damage.	No	Internal examination of column wall by O.I.M.	Moderate	Vessel's boat bumper badly buckled above waterline.	-
210	Denting 2m x 2m x 0.05m (H x W x D), 80° draft on column SC2 aft.	No	-	-	-	HSE
211	Horizontal member damaged by 4"- 6" at 17.5' level together with diagonal members attached to underside of fl.	-	-	-	-	HSE
212	No report on damage. Occurred just above waterline.	-	-	-	-	-
213	Minimal damage to diagonal bracing between 64'- 74' level.	-	-	-	-	HSE
214	Brazing column B10 deck node 2 indented 0.61m x 0.61m x 0.1m (H x W x D) at 1m above waterline.	-	-	-	-	HSE
215	Slight scraping and indentation of boat bumper.	No	-	Minor	Scraped paintwork.	HSE
216	Impact on leg A1 brace, spider deck walkway and deck plating on MSF.	-	-	-	-	HSE
217	Paint removed.	-	-	-	-	HSE
218	Breakdown of structural coating/removal of marine fouling.	-	-	-	-	-
219	Dent 1.0m x 3.85m x 0.08m (H x W x D) at 23.5m draft. Stiffener No. 6 pushed in 40 mm.	-	-	-	-	HSE
220	No structural damage; dent in SW mooring fender.	-	-	Moderate	Plating dented 0.1m - 0.125m between frames over 1.5m length.	HSE
221	Dent 0.48m x 0.91m x 0.025m (H x W x D), 90° level part forward column.	-	-	-	-	HSE
222	Dent 1.52m x 1.52m x 0.13m (H x W x D) at 24m mark. Dent in ring stiffener.	-	-	None	No damage.	HSE
223	Some paint loss.	No	-	Severe	Serious damage to bow; fractured welds and damaged stiffeners.	HSE
224	Boat bumper disconnected at top; suspected bolt sheared on impact and wave action shock bumper free.	-	-	-	-	HSE
225	Indentation of jacket leg; minor paint stuff to leg.	-	-	Minor	Dent on vessel stern.	HSE
226	Walkways damaged; loss of access ladder and scoring on PC2 stability buster.	No	-	Moderate	Main mast stepped off.	HSE
227	Superficial damage to leg attachments (ladder/torn fender brackets).	-	-	Moderate	2 punctures in stern plating above waterline.	HSE
228	150- 250mm deep dent in diagonal brace between bottom of No. 6 caisson and top of No. 5 caisson.	-	-	-	-	HSE
229	Dent 1.82m x 3.0m x 0.2m (H x W x D), 3 of 7 internal ribs dented in E9 dry tank.	-	-	-	-	HSE
230	75mm deep dent at 87' draught; over circular area 0.9m diameter.	-	-	-	-	HSE
231	Protective coating removed.	-	-	-	-	HSE
232	Unspecified weld damage.	-	-	-	-	HSE
233	Dent 0.25m x 0.15m x 0.05m (H x W x D) at sea level.	-	-	-	-	HSE
234	Loss of navigation light on leg and damage to mountings.	No	-	Minor	Trivial damage to helideck fencing.	HSE
235	Indentation at 1 wateline.	-	-	-	-	-
236	2 diagonal walkway supports bent at +5m level; timber fender at +3m damaged and tender relating metal ring; access ladder to sea at +2.5m damaged.	-	-	-	-	HSE
237	Slight set to gasket plate between horizontal and diagonal bracings.	-	-	-	-	HSE
238	Dent 0.5m x 0.3m x 0.1m (H x W x D). Slight indent of vertical bracing member.	-	-	-	-	HSE
239	Minor dent to fender and some paint removal.	-	-	-	-	HSE

Conse. No.	Installation Damage Details	Repaired	ATTENDANT VESSEL COLLISIONS			Other Source
			Vessel Class	Repair Details		
240	Fracture of biocide injection line/wave.	-	-	-	Minor	Damaged railing amidships.
241	Only minor damage to hand rail.	No	-	-	Moderate	Starboard rail mast broken.
242	5' long weld crack on joint between vertical diagonal brace on row 2 adjacent to leg D2 and horizontal member at 20' elevation.	-	-	-	-	HSE
243	Indent 600mm x 400mm x 100mm (L x W x D) on diagonal brace on row 3, 150mm below joint at leg A3 at +18' elevation.	No	-	-	-	-
244	Superficial scratches on a platform member.	No	Member inspected, no repair needed.	-	-	-
245	Port burner boom/EMD exhaust lines.	-	-	-	-	-
246	Brace between legs B4 and D4 bowed by 20mm and deated.	-	-	Minor	Paint damage.	OINN 99 205 & HSE
247	Impacted leg D4 at 9m level, paint damage only. Impacted leg B4, damage to Nos. 2 and 3 fenders.	-	-	Minor	0.20m indentation on port side. Damage to port side fuel tank No. 22.	-
248	Riser protection indented by 1". Struck 24" deepwell protection frame casting dent 0.25m x 0.2m x 0.15m (H x W x D).	-	-	-	-	-
249	Damage to fender on SW leg.	-	-	Minor	Slight Indentation to vessel rubbing band.	-
250	A2 boat bumper severely buckled, 150mm tear in horizontal gasket plate. Slight denting of leg brace.	-	-	-	-	-
251	Indentation to fender protecting NW leg.	-	-	Minor	Dent on stern.	HSE
252	Vessel impacted between leg B5 and C5. Damage to palisade and structure coating.	-	-	Minor	Damage to the forepeak lights and forecastle.	HSE
253	Scaffolding took full brunt of collision. Dent in SW leg 3.5" x 0.5" x 0.88" (H x W x D). Marine growth removed on diagonal cross member.	-	-	-	-	-
254	8" dent in horizontal and vertical piles/girdle stiffener at +4m elevation. Lower adder on leg A1 destroyed.	-	-	-	-	-
255	Collision with fender on No. 5 leg, no damage to platform.	No	-	Minor	Top mast bent, navigation lights smashed.	HSE
256	Impact between legs D2 and D4. Walkways and handrails at +9m level severely damaged.	-	-	Moderate	Extensive damage sustained by bridge including damage to main engine controls and loss of steering.	HSE, WO/D & LMS
257	Dent over and under fleg spant No. 20, 1.2m x 0.5m x 0.2m (H x W x D).	-	-	-	-	-
258	Damage to No. 3 port column shell plating 3m x 3m x 0.1m (H x W x D). Boat bumper (set in 8" - 12") and access stairway from main deck to platform damaged.	-	-	-	-	-
259	Dent on bow leg chord (Ø diameter 0.5" at +149 level, 2" below point where horizontal brace meets leg chord).	-	-	Minor	Details unknown, sustained damage above waterline at bow, stern undamaged.	-
260	Slight damage to cradle of ratchet launched liferaft.	-	-	Minor	-	-
261	Impact starboard aft, dent 0.61m x 0.61m x 0.1m (H x W x D).	-	-	Minor	-	-
262	Vessel became entangled in service hoses, 2 x 5" & 1 x 4" hoses torn. 1 x 5" gate valve damaged.	-	-	Minor	Bent off mast.	-
263	No damage observed.	No	-	Minor	Vessel damaged, details unknown.	-
264	Edge broken off tooth at level 7 on leg No. 2, front rack.	-	-	-	-	-
265	Minor damage to platform.	-	-	None	No damage.	-
266	Platform damage undetermined.	-	-	Minor	Minor dent to stern.	-
267	Small dent and scratch marks on big bottom plating.	-	-	Minor	Unspecified.	-
268	No damage reported.	No	-	None	No details, assumed to be no damage.	HSE
269	Coating damage to a 2" square area on diagonal cross brace at sea level.	-	-	Minor	Stern roller sustained a 2" x 2" dent.	-
270	Elliptical damage to C5 (0.7" x 2" x 2" (H x W x D), 36" x 16" removal of surface coating, 3" square denting) of radius on C1, 2, 3 above LAT.	-	-	Minor	Damage to rubbing stroke.	HSE
271	0.5" indentation of shell/plating 4m above water line. Superficial paint damage.	-	-	None	No damage.	-
272	No damage to SPM body. Walkways and handrails bent and twisted.	-	-	-	-	-
273	Sacrificial anode above waterline dislodged from leg No.3.	No	-	Severe	Damage to stern and No. 11 ballast water tank pierced.	-
274	Tug hit No.7 fairlead heavily.	No	-	None	No damage.	-
275	Small walkway took impact and parted at supports at 6m.	-	-	Minor	No details.	HSE
276	Paint removed from platform bracing.	-	-	Minor	Superficial damage occurred to driver's landing stage.	-
277	Caused indent.	-	-	-	-	-
278	No details, any damage appears to be superficial.	No	-	-	-	HSE

Conse. No.	Installation Damage Details	Repaired	ATTENDANT VESSEL COLLISIONS			Other Source
			Repair Details	Vessel Class		
279	Denting 0.02m x 0.1m x 0.02m (H x W x D) 2m - 3m above sea level. Damage to diagonal brace.	-	-	Minor	Damage to ship's aerial.	-
280	Damage to bulk loading hoses and to scaffolding.	-	-	Minor	-	-
281	Slight dent on Elvoid tank 12" x 43" x 0.25" (H x W x D) at +22 m level. Lifeboat holed with two 0.5m cracks in starboard forward section.	-	-	-	-	HSE
282	Top horizontal bracing on boat landing significantly dented. Slight damage to cellar deck handrail.	-	-	-	Damage to port side including a crack amidships. Radio aerials and navigation lights damaged.	HSE & WOAD
283	Paint damage to leg and damage to spider deck grating.	-	-	Moderate	-	-
284	Plating damage on starboard pontoon.	-	-	-	-	HSE
285	Paint deposited on leg.	-	-	-	-	HSE
286	Unspecified minor damage.	-	-	-	-	-
287	Surface damage to fender.	-	-	-	-	HSE
288	2 of the 8 bow fenders were dented just above sea level and possible damage to coaming.	-	-	Minor	Dent in stern of vessel.	HSE
289	Slight damage to handrail and paint marks on leg.	-	-	-	-	-
290	Damage in area of port anchor assembly 1m x 6m (H x W) on leg No. 1 on port side.	-	-	Sewage	Hole in bow just below waterline. Bow mast bent backwards. 2 tanks believed to be ruptured.	HSE & WOAD
291	Leg access ladder dented. 4" water bunting hose severed.	-	-	Moderate	Central mast severely damaged.	-
292	Superficial damage approx 10' above sea level on leg at south-east corner.	-	-	-	-	WOAD
293	Plating rounded, forward corner indented 1m x 1m x 0.15m (H x W x D). Internal vertical BP stiffener displaced.	-	-	Minor	Paint loss on port quarter rubbing band.	HSE
294	Minor damage to boat bumper frame. One section of hose damaged but no spillage.	-	-	None	No damage.	HSE
295	Unspecified minor damage.	-	-	Minor	Unspecified minor damage.	-
296	Marks on leg at 1.5m above sea level.	-	-	Minor	3 long hull dent.	-
297	Last escape ladder, life raft and survival superficial damage.	-	-	Minor	Minimal damage to vessel funnel.	HSE
298	Boat bumper ring bent upwards. Paint damage to leg.	-	-	-	-	HSE
299	Twisting of access ladder.	-	-	Minor	Superficial damage.	HSE
300	Deformation damage to bracing structure but no loss of structural integrity.	-	-	None	No damage.	HSE
301	Paint damage to leg. Forward port anchor dislodged from cradle. 0.625" steel cleaver attached to the forward mooring broken.	-	-	Minor	Damage to mast and bow starboard bulwark.	HSE & MAB
302	Minor damage to horizontal brace.	-	-	-	-	HSE & MAB
303	No damage sustained to rig.	-	-	-	-	-
304	Large dent in steel cover of fire fender protecting leg 3.	-	-	-	-	HSE
305	Hit port leg causing superficial damage.	-	-	-	-	HSE & MAB
306	Unspecified dent.	-	-	-	-	HSE
307	Indentation 0.7m? x 1.2m x 1.4m (D x W x H) in column. ****	-	-	-	-	HSE
308	Gearing blow to production platform riser guard heel passed beneath bridge linking production & drilling platforms.	-	-	-	-	HSE & OTN 32
309	Vertical diagonal member on row B between elevations -3° and +20° bowed by 30mm and indented 10mm.	-	-	-	-	255
310	No serious damage.	-	-	-	-	HSE
311	Unspecified minor damage.	-	-	-	-	-
312	Dent at 20m above water 2.5m x 1.2m x 0.1m (H x W x D). Damage to internal tank stiffening. Walkways/handrails damaged.	-	-	Minor	Port bridge wing, lights, funnel damaged. Hull plates buckled. Holed at deck/hull plate area.	HSE & MAB
313	Access ladder platform buckled and brackets pulled from column.	-	-	-	-	HSE
314	Slight damage to jack up - not serious.	-	-	-	-	HSE
315	Indent in leg/cross steel plating in view of No. 9 carbon stiffener ring at vertical stiffener No. 5.	-	-	-	-	HSE
316	Vessel lodged No. 2 anchor chain and hit starboard column.	-	-	Minor	-	HSE & MAB
317	Indentation at 22m draft level on starboard side.	-	-	-	-	HSE

No.	ATTENDANT VESSEL COLLISIONS	Vessel Damage Details		Confirms
		Damage Class	Severity	
356	Little damage.	-	Sewer vessel holed by leg "foot plate".	-
357	Minor damage.	-	Minor None.	-
358	Light paint damaged on bulwark.	-	-	-
359	Portable water and oil based mud and oil pipelines pulled away from platform at loading station.	-	-	-
360	Scaffolding walkways external to M221 ready worker Built metal and portable water hard pipes and manifold valves broken and/or displaced and flexible hoses broken.	-	None None.	-
361	Leg ladder bent.	-	Minor Unspecified dent.	-
362	Structural damage to south-west navigation light station and lighting stanchion damage.	-	Minor Mast damaged.	-
363	Paint damage at 1m above water.	-	Minor Coating damage.	-
364	Paintwork scratched.	-	Minor Unspecified damage to bow and railings.	-
365	Indentation 0.25m x 1.5m x 2m (D x H x W) area at 80° level. 2 internal stiffeners in way bent and twisted.	Unknown.	None None.	-
366	Paint damage and slight indentation to base of an internal diagonal cross brace at +40 m elevation.	-	Minor Bent and buckled aft crane sheave check plate.	-
367	Minimal damage to brackets MB21 and MB41.	-	-	-
368	Buoy of No. 3 lifeboat misplaced and damaged by covl on top of vessels port funnel. Davit out of commission; liferaft previously removed therefore not damaged.	-	Minor Damage to covl on top of port funnel.	-
369	Superficial damage to port log.	-	-	-
370	Column dented in way of contact. Internal distorted in way.	-	None No damage.	-
371	Superficial damage to NEF leg.	-	Minor	-
372	-	-	-	-
373	3 bolts sprung on redundant 8" glycol riser approx. 12' above L.A.T.	-	-	MAB
374	-	-	-	-
375	Slight indentation to column. Separate contact with Nos. 5 and 6 anchor chasing permanent.	-	Minor New joystick fitted. Software adjustments made to system, resulting in improved reaction times to command instruction. A azimuthing thruster reaction increased to match transverse thruster time so both act in tandem and not against each other. Other adjustm	-
376	Bent boat fender.	-	Moderate Sbd, FRC and davit badly damaged from contact with anchor chasing permanent.	-
377	-	-	Minor Bent fender and split weld.	-
378	-	-	Minor Paint damaged.	-
379	Heavy indent damage to a shell plate in way of a wing ballast tank.	-	-	-
380	Profile damage to the fire pump cason.	-	-	-
381	Some unspecified structural damage.	-	-	-
382	Structural damage to the port and starboard aft liferaft platforms and bulk hose race on all end of unit.	-	-	-
383	-	-	-	-
384	Damage to the ladder's vertical and scraping the outer concrete surface of the installation.	-	-	-
385	Scratching on 2 teeth of outboard cord in port aft log.	-	-	Hole in vessel "bath rail".
386	Frame 93-94, sld0 bend approximately 3 - 5cm inside water ballast tank 6 port.	-	-	-
387	Indentation to hull 2 x 4' - no breach to tank.	-	-	-
388	-	-	-	-
389	Some timber splintering on the boat bumper arrangement, no structural damage.	-	-	-
390	Small dent in water well.	-	Minor Two small punctures on port quarter.	-
391	Platform north side diesel bunker hose burst causing a spillage of approximately 10 gallons. No structural damage.	-	-	-
392	Number 9 starboard water ballast tank and approximately 5 metres of handrails.	-	-	Damaged pipework on bow.
393	Paintwork damage only.	-	-	-

<b>Consec. No.</b>	<b>Operating Circumstances</b>	<b>Primary Cause</b>	<b>Other Source Confirms</b>
1	Cargo vessel lost power and was drifting towards the rig. Drilling operations suspended and down manning took place. Local vessels gave assistance to get a tow line attached and pull the vessel clear of the rig.	Total Power Loss	
2	Vessel reported engine failure while positioned up wind of drilling rig. Relative bearing observation indicated vessel would drift past close but not collide with rig. Monitoring continued. Stand by vessel proceeded with attempts to place tow line onto vessel. Tow was secured and CPA was increased to in excess of 100 yards. Tug arrived on scene and secured tow line on vessel. Tow line had parted shortly after being secured. Vessel later recovered power.	Engine Failure	Appendix E (see Consec. No. 18)
3	Tanker was passing installation on SW corner. Closest point to installation was 1.5 nautical miles. Tanker lost all engine power when due west of installation and started to drift directly towards it. 10 minutes after power had been lost engine power was regained.	Engine Failure	
4	Tanker's closest point to installation during this power loss was 1.08 nautical miles.  Whilst preparing for rig move of jack up drilling rig - anchor handling vessel suffered total loss of power. Vessel started drifting and narrowly missed colliding with platform.	Total Power Loss	
5	Supply vessel was in a position at the stern of the rig with a potable water hose connected transferring potable water and off-loading containerised deck cargo. Vessel was positioned on a northerly heading and in attempting to reposition encountered manoeuvring difficulties and made contact with rig's No. 5 anchor wire on port aft side. Rig was de-ballasted to transit draught for wire inspection. Some strand damage was evident on No. 5 anchor wire.	Manoeuvring Misjudgement	
6	Shuttle tanker secured to FPSO and GPS signals were poor and both DARPS and DGPS were deselected from DP console. Shuttle maintained position using Artemis only but this failed for a short period and DP system reverted to model control'. Due to software problem this caused shuttle tanker to manoeuvre astern causing mooring hawser to be tensioned. The off-position alarm sounded and control of shuttle established by using DGPS absolute system. This caused shuttle to manoeuvre ahead and stabilise in normal offloading position.	D.P. Control Failure	
7	During crane operations with the supply vessel a 1 tonne container was knocked over on the vessel deck due to sudden vessel movement. During operations to regain control the vessel then moved close to the riser access tower. Wind speed - 27 knots. Direction - 144 degrees. Wave height - 3 metres. Visibility - fine and clear.	Manoeuvring Misjudgement	
8	Engine failure of one engine on stand by vessel. Weather conditions 7-8 metres seas 45 knot winds. Vessel unable to carry out stand by duties and had to hold station.	Engine Failure	
9	Beam trawler entered 500 metres safety zone while fishing.	Post/Operation Neglected	
10	Vessel 6 nautical miles away. Coastguard alerted. Helicopter available for precautionary downmanning. Supply vessel in field prepared to take undertow.	-	
11	Standby vessel contacted installation control room and informed them that a trawler had no engine power and was drifting toward installation and current position was 2 miles from north east side of installation. Wind 145 degrees, 25/30 knots, 2/3 metre seas, visibility poor in mist, down to 200 metres in places, cloud cover 8 oktas. Another fishing vessel was on location but unable to offer any assistance. Installation OIM was called out and platform emergency procedures for collision activated. Stand by vessel launched its FRC and the crew transferred a handline from accompanying vessel to the drifting vessel so that a 3" wire tow line could be connected between the vessels. Accompanying vessel took up slack on wire tow rope and vessel was towed past on installation's north face at 750 metres,	Engine Failure	
12	Incident occurred during normal crude oil export transfer operations between the FSU and shuttle tanker. Shuttle tanker suffered loss of propeller pitch control, the propeller failing to zero pitch with the resultant loss of thrust. Shuttle tanker later re-established pitch control and initiated a pump shutdown by breaking the telemetry link.	Thruster Control Failure

Consec. No.	Operating Circumstances	Primary Cause Other Source Confirms
13	Installation's standby vessel was observed from the platform not displaying any navigational lights. The platform was advised that the standby vessel had lost all power and was drifting towards the platform. The OIM initiated emergency procedures onboard the platform and notified HM Coastguard. A nearby installation's standby vessel transferred to the scene and attended the drifting vessel. Vessel drifted north of the installation and later reported that all power and main engines had been restored. Drifting vessel reported that the loss of power was due to a generator tripping causing all load to be transferred to another generator which then shutdown due to overload causing total loss of electrical and consequential loss of main engines.	Total Power Loss
14	Whilst moving the vessel from the southern side to the eastern side of the platform there was a failure of the ship's starboard 'taut wire boom' causing the vessel to swing starboard. At the time the vessel was engaged in ROV work at platform.	D.P. Control Failure
15	Oil tanker was on a collision course with installation. All radio calls went unheeded and 10 persons evacuated from the installation. When the tanker changed course distance from installation was half a mile.	Post/Operation Neglected
16	Standby vessel reported that a supply vessel was heading towards the platform on a possible collision course and they had been unable to contact the vessel. Platform GPA and muster initiated and emergency response plan implemented. Contact was established approx 20 minutes before the closest point of approach and the vessel altered course.	Post/Operation Neglected
17	Supply vessel was working cargo at an installation when an alarm sounded on the bridge. Control of the vessel's port main engine (PME) was lost and vessel's Master took manual control of the vessel and communicated with the Chief Engineer. A further alarm on the joystick desk indicating a thruster failure and the Master made the decision to pull clear of the installation. The platform deck crew was warned by the vessel to stand clear of the potable water hose that subsequently parted. The vessel cleared the installation to outside the 500 metres zone to effect repairs.	Engine Control Failure
18	ROV support vessel was using platform as way mark on auto pilot. Auto pilot not switched off until vessel 10 to 60 metres from installation.	Post/Operation Neglected
19	Having failed to make contact with an approaching vessel, the standby vessel launched their fast rescue boat. The FRC came alongside the approaching vessel.	Post/Operation Neglected
20	After an oil export the shuttle tanker and FPSO assumed fixed headings close to their weather vaning headings and began disconnection operation. During disconnection the ESD2 automatic disconnect facility was inhibited while crew reconnected messenger lines and paid these out. During recovery of oil export hose FPSO experienced reduction in electrical power availability; thrusters automatically tripped and power to oil export hose reel reduced increasing time taken to recover hose. Whilst hawser and messengers were being recovered, FPSO heading changed rapidly; 55 degrees in about 2 minutes. Shuttle tanker Master took manual control of tanker and manoeuvred it, using minimum power, to safe position ending disconnect operation with ship stopped 10 - 30 metres away from FPSO at 90 degrees difference in heading. Wind SE, force 3-4. Slight /mod sea state. Sea /swell Ht sig 2.6 metres, max 4.6 metres, period 8 secs. Swell predom westerly.	Power Failure
21	Fishing boat infringed the installation's safety zone when it came as close as 40 metres from the SW corner of the installation. Installation was evacuated but the vessel could not be raised on the radio by the standby vessel.	Post/Operation Neglected

<b>Consec. No.</b>	<b>Operating Circumstances</b>	<b>Primary Cause</b>	<b>Other Source Confirms</b>
22	Shuttle tanker was making its approach in preparation for cargo offloading. At a distance of approximately 200 metres shuttle tanker experienced failure of main propeller pitch control. This initiated a sequence of events which resulted in a 100% ahead pitch demand from the DP system. The vessel started to move ahead and manual control was selected. The vessel was steered to starboard and arrested 120 metres from the FPSO's stern at approximately 90 degrees.	D.P. Computer Failure	
23	A large object was sighted on a potential collision course with platform. Investigation found object to be an RAF target pontoon 19m x 4m x 2.5m (20 tonnes). Pontoon taken in tow by standby vessel until salvage vessel took control.	Post/Operation Neglected	
24	Drilling rig was moving from the NW bell location to the standoff location. When it became free at the NW bell location, it unexpectedly moved towards the wellhead. The footprint of the jack-up port leg overlapped the footprint of the protection frame on the wellhead. Well and pipeline were shut in and depressurised.	-	
25	Research vessel suffered a loss of steering whilst inside the platform 500 metres zone. The vessel pulled away under reverse power and using remote steering. Closest approach to the platform was 150 metres.	Steering Failure	
26	An 800 feet dumb barge being towed by two tugs came into contact with the dive station and detached it from its moorings while a diver was operating inside cell 1 attached to the dive station by an umbilical line. The diver was not injured but was immediately removed from the water and diving operations suspended.	-	
27	Flotel was at the stand off position and was also retrieving two of the last four anchors. An unexpected squall came through the area from a direction of 200 degrees causing the fletol to pivot in a direction towards the installation. With the backup resources at hand, e.g. the vessel's propulsion and the four anchor handling vessels, the fletol was brought back under full control in a timely manner. The air gap between the fletoland the installation was reduced. During this situation the installation's OIM was informed and they decided to go into alert and shutdown their platform.	Weather Conditions	
28	Standby vessel reported unidentified vessel approaching the rig, speed 6-8 knots, CPA 0.2 nautical miles. Weather was thick fog with south easterly x 30 knot wind. Rig was moored to 8 anchors and drilling 2 1/4" hole with water based mud. Unidentified vessel had passed within 0.5 nautical miles of nearby installation and her standby vessel had been unable to raise vessel on VHF or see it for identification. Standby vessel tried unsuccessfully to contact on VHF. Drilling operations were suspended and anchor winches all clutched out in preparation to move off location. Aberdeen Coastguard informed that approaching vessel was 1.8 nautical miles from the rig CPA 0.12 nautical miles. OIM instructed standby vessel to fire flares across approaching vessel's bow to warn vessel. Abandon rig alarm sounded. Muster at aft boats. Men positioned port fwd. Radio contact established and all hands stood down.	Appendix F (see Consec. No. 198) Post/Operation Neglected
