## Glossary

Term	Definition		
Appropriate Assessment	An assessment to determine the implications of a plan or project on a European		
(AA)	site in view of the site's Conservation Objectives. An AA forms part of the		
	Habitats Regulations Assessment and is required when a plan or project is likely		
	to have a significant effect on a European site.		
Common guillemot	The north east Atlantic breeding population of guillemot which includes the Uria		
biogeographic	aalge albionis and Uria aalge aalge subspecies and includes individuals from the		
population	Flamborough and Filey Coast SPA (Stroud et al., 2016). Proposed compensation		
	measures will be undertaken within this populations breeding and migratory		
	range.		
Compensation /	If an Adverse Effect on the Integrity on a designated site is determined during		
Compensatory	the Secretary of State's Appropriate Assessment, compensatory measures for		
Measures	the impacted site (and relevant features) will be required. The term		
	compensatory measures is not defined in the Habitats Regulations.		
	Compensatory measures are however, considered to comprise those measures		
	which are independent of the project, including any associated mitigation		
	measures, and are intended to offset the negative effects of the plan or project		
	so that the overall ecological coherence of the national site network is		
	maintained.		
Development Consent	An order made under the Planning Act 2008 granting development consent for		
Order (DCO)	one or more Nationally Significant Infrastructure Projects (NSIP).		
HRA Derogation	Provisions set out under Regulations 64 and 68 of the Conservation of Habitats		
Provisions and Species Regulations 2017 and Regulations 29 and 36 of the Co			
	Offshore Marine Habitats and Species Regulations 2017 that permit a plan or		
	project with AEOI on a European site(s) to be consented provided the tests		
	derived from Article 6(4) are met i.e. there are no alternative solutions, there are		
	imperative reasons of overriding public interest and that necessary		
	compensation measures are secured.		
European site	A Special Area of Conservation (SAC) or candidate SAC (cSAC), a Special		
	Protection Area (SPA) or a site listed as a Site of Community Importance (SCI).		
	Potential SPAs (pSPAs), possible SACs (pSACs) and Ramsar sites are also		
	afforded the same protection as European sites by the National Planning Policy		
	Framework – para 176 (Ministry of Housing, Communities and Local		
	Government, 2019). European offshore marine sites are also referred to as		
	"European sites" for the purposes of this document.		
Habitats Directive	European Council Directive 92/43/EEC on the Conservation of Natural Habitats		
	and of Wild Fauna and Flora		
Habitats Regulations	The Conservation of Habitats and Species Regulations 2017 and the		
	Conservation of Offshore Marine Habitats and Species Regulations 2017		
Habitats Regulations	A process which helps determine likely significant effects and (where		
Assessment (HRA)	appropriate) assesses adverse impacts on the integrity of European sites. The		
	process consists of up to four stages: screening, appropriate assessment,		
	assessment of alternative solutions and assessment of imperative reasons of		
	over-riding public interest (IROPI) and compensatory measures		

Term	Definition
Hornsea Project Four	The proposed Hornsea Project Four Offshore Wind Farm project. The term
Offshore Wind Farm	covers all elements of the project (i.e., both the offshore and onshore). Hornsea
	Four infrastructure will include offshore generating stations (wind turbines),
	electrical export cables to landfall, and connection to the electricity
	transmission network. Hereafter referred to as Hornsea Four.
In-Combination Effect	The effect of Hornsea Four in-combination with the effects from other plans and
	projects on the same feature/receptor.
National Site Network	The network of European Sites in the UK. Prior to the UK's exit from the EU and
	the coming into force of the Conservation of Habitats and Species (Amendment)
	(EU Exit) Regulations 2019 these sites formed part of the EU ecological network
	knows as "Natura 2000".
Nature Directives	The EU Habitats Directive (European Council Directive 92/43/EEC on the
	Conservation of Natural Habitats and of Wild Fauna and Flora) and EU Wild
	Birds Directive (79/409/EEC amended in 2009 to become Directive
	2009/147/EC)
Net zero by 2050	The UK governments legally binding target of achieving net zero greenhouse
commitment	gas emissions by 2050 as set out in the Climate Change Act 2008 (2050 Target
	Amendment) Order 2019
Northern gannet	The east Atlantic breeding population of gannet which includes individuals from
biogeographic	the Flamborough and Filey Coast SPA (Stroud et al., 2016). Proposed
population	compensation measures will be undertaken within this populations breeding and
	migratory range:
Offshore Ornithology	The Hornsea Four Offshore Ornithology Engagement Group means the group
Engagement Group	that will assist, through consultation the undertaker in relation to the delivery of
(OOEG)	each compensation measures as identified in the <del>gannet and</del> kittiwake
	compensation plan, the gannet compensation plan and the gannet razorbill and
	guillemot and razorbill compensation plan. Matters to be consulted upon to be
	determined by the Applicant and will include site selection, project/study
	design, methodology for implementing the measure, monitoring, and adaptive
	management options as set out in the gannet and kittiwake compensation plan.
	the gannet compensation plan and the <del>gannet razorbill and</del> guillemot <u>and</u>
	razorbill compensation plan.
Orsted Hornsea Project	The Applicant for the proposed Hornsea Project Four Offshore Wind Farm
Four Ltd.	Development Consent Order (DCO).
Planning Inspectorate	The agency responsible for operating the planning process for Nationally
(PINS)	Significant Infrastructure Projects (NSIPs).
Razorbill biogeographic	The breeding population of razorbill which includes Alca torda islandica and
population	includes individuals from the Flamborough and Filey Coast SPA (Stroud et al.,
population	2016). Proposed compensation measures will be undertaken within this
	populations breeding and migratory range
Report to Inform	The information that the Competent Authority needs to inform an Appropriate
Appropriate Assessment	Assessment at Stage 2 of the HRA process and which has been provided by the
ppi opilate / toocooment	Applicant in [the RIAA (Volume 2, Annex 2: Report to Inform Appropriate
	Assessment (Part 1 (submitted at Deadline 5), REP2-005, AS-013, REP1-012 and
	<u>APP-171-APP-178<del>APP-169-178</del>)</u> ).

Term	Definition	
Special Area of	Strictly protected sites designated pursuant to Article 3 of the Habitats	
Conservation (SAC)	Directive (via the Habitats Regulations) for habitats listed on Annex I and species	
	listed on Annex II of the directive.	
Special Protection Area	Strictly protected sites designated pursuant to Article 4 of the Birds Directive	
(SPA)	(via the Habitats Regulations) for species listed on Annex I of the Directive and	
	for regularly occurring migratory species.	
The Hornsea Four	The Hornsea Four Offshore Ornithology Engagement Group means the group	
Offshore Ornithology	that will assist, through consultation the undertaker in relation to each	
Engagement Group	compensation measure, site selection, project/study design, methodology for	
	implementing the measure, monitoring, and adaptive management options as	
	identified in the gannet and kittiwake compensation plan, the gannet	
	compensation plan and the gannet razorbill and guillemot and razorbill	
	compensation plan.

#### 1 Introduction

### 1.1 Background

- 1.1.1.1 Orsted Hornsea Project Four Limited (hereafter the 'Applicant') is proposing to develop Hornsea Project Four Offshore Wind Farm (hereafter 'Hornsea Four'). Hornsea Four will be located approximately 69 km offshore the East Riding of Yorkshire in the Southern North Sea and will be the fourth project to be developed in the former Hornsea Zone. Hornsea Four will include both offshore and onshore infrastructure including an offshore generating station (wind farm), export cables to landfall, and connection to the electricity transmission network. Detailed information on the project design can be found in Volume A1.4, Chapter 1: Project Description (APP-010), with detailed information on the site selection process and consideration of alternatives described in Volume A1.4, Chapter 3: Site Selection and Consideration of Alternatives (APP-009).
- 1.1.1.2 The Hornsea Four Agreement for Lease (AfL) area was 846 km² at the Scoping phase of project development. In the spirit of keeping with Hornsea Four's approach to Proportionate Environmental Impact Assessment (EIA), the project has given due consideration to the size and location (within the existing AfL area) of the final project that is being taken forward to Development Consent Order (DCO) application. This consideration is captured internally as the "Developable Area Process", which includes Physical, Biological and Human constraints in refining the developable area, balancing consenting and commercial considerations with technical feasibility for construction.
- 1.1.1.3 The combination of Hornsea Four's Proportionality in EIA and Developable Area Process has resulted in a marked reduction in the array area taken forward at the point of DCO application. Hornsea Four adopted a major site reduction from the array area presented at Scoping (846 km²) to the Preliminary Environmental Information Report (PEIR) boundary (600 km²), with a further reduction adopted for the Environmental Statement (ES) and DCO application (486 km²) due to the results of the PEIR, technical considerations and stakeholder feedback. The evolution of the Hornsea Four Order Limits is detailed in Volume A1., Chapter 3: Site Selection and Consideration of Alternatives (APP-009) and Volume A4., Annex 3.2: Selection and Refinement of the Offshore Infrastructure (APP-037).
- 1.1.1.3 The Applicant is submitting an application for a DCO to the Planning Inspectorate (PINS), supported by a range of plans and documents including an ES which sets out the results of the EIA. The Applicant is also submitting a Report to Inform Appropriate Assessment (RIAA) (B2.2: Report to Inform Appropriate Assessment (APP-167-178)) which sets out the information necessary for the competent authority to undertake a Habitats Regulations Assessment (HRA) to determine if there is any Adverse Effect on Integrity (AEoI) on the national site network.
- 1.1.1.4 Following the Applicant's DCO submission—of the DCO application, the Applicant has revisited its conclusion of no-potential for an adverse effect on integrity (AEoI) in respect of the kittiwake feature of the Flamborough and Filey Coast Special Protection Area (FFC SPA) from Hornsea Four in-combination with other plans and projects and concluded AEoI on the FFC SPA in combination with other plans and projects. The Applicant maintains its position of no AEoI alone or in combination for all other qualifying species (guillemot, razorbill and gannet) of the FFC SPA and for all other European sites.
- 1.1.1.5 In the DCO Application the Applicant's proposed without prejudice compensatory measures for gannet and kittiwake were presented together in a single **B2.7 Gannet and Kittiwake**

Compensation Plan (APP-186). However, as set out in the Applicant's position paper (G1.5 Kittiwake AEol Conclusion (AS-023)), the Applicant has updated the Applicant's Report to Inform Appropriate Assessment (RIAA) (B2.2 Report to Inform Appropriate Assessment Part 1 (submitted at Deadline 5) and Part 4 (REP1-012), and its derogation case (B2.5 Without Prejudice Derogation Case (REP1-014)) based on an overall conclusion that there is potential for an AEol on kittiwake at the FFC SPA from Hornsea Four in-combination with other projects.

#### 1.1.1.4

1.1.1.51.1.1.6 This document sets out the "without prejudice" Compensation Plan for common guillemot Uria aalge (guillemot), and razorbill Alca torda and northern gannet Morus bassanus (gannet) associated with the Flamborough and Filey Coast (FFC) Special Protection Area (SPA). Collectively it has been termed the Gannet, Guillemot and Razorbill Compensation Plan (GRCP). It has been developed in support of Hornsea Four should the Secretary of State disagree with the conclusions of the Applicant's RIAA in relation to the impact of the proposed wind farm on these species and find that adverse effects on the integrity of the FFC SPA cannot be ruled out.

1.1.1.61.1.1.7 Specifically, this plan sets out how the preferred measures for compensation for gannet, guillemot and razorbill population can be secured at the time of DCO approval grant (should the Secretary of State determine they are required). The compensation measures for gannet, guillemot and razorbill have the potential to be delivered either individually or as a suite of measures that benefit in terms of their flexibility and scalability (see Section 1.3). The flexibility of the measures relates to the implementation of a specific measure to compensate for one species (e.g. the possibility of bycatch to compensate for guillemot at the numbers presented in Revision 2 of B2.6: Compensation measures for FFC SPA Overview (updated at Deadline 5)) to the implementation of an entire suite of measures to compensate for all species. The scalability of the measures relates to the ability of each individual measure to be scaled to compensate at variable levels (calculations submitted in G1.41 Calculation Methods of Hornsea Four's Proposed Compensation Measures for Features of the FFC SPA (REP1-063), submitted at Deadline 1), e.g. the bycatch measure can be scaled from the compensation of 70 breeding individuals to ~267 breeding individuals by increasing the number of vessels from 7-30 respectively).

1.1.1.7
1.1.1.8 The implementation of the respective compensation measures are so outlined in the Gannet, Guillemot and Razorbill Compensation Implementation and Monitoring Plan (GGRCIMP), for approval by the Secretary of State, with the aim of ensuring that the compensation package as a whole compensates for the number of gannet, guillemot and razorbill affected. All compensation measures are feasible and can be secured while providing flexibility and scalability.

1.1.1.8].1.1.9 In this scenario, a draft DCO requirement is presented in this report that the Secretary of State could include in the final DCO for the delivery of the gannet, guillemot and razorbill compensation package (see Section 6).

1.1.1.91.1.1.10

Further details on the delivery methodology for the measures, their flexibility and scale wouldwill be provided in a GGRIMPGRCIMP, which wouldwill be submitted to the Secretary of State to be approved in consultation with Natural England and the MMO, so that the compensation measures could be implemented at least one year

prior to the operation of any wind turbine generator. An outline of the GGRIMPGRCIMP (which details its proposed content) is presented in Revision 2 of B2.8.7: Outline Guillemot and Razorbill Compensation Implementation and Monitoring Plan (submitted at Deadline 5).

#### 1.2 Predicted Effects

- 1.2.1.1 This Gannet, Guillemot and Razorbill Compensation Plan relates to the potential displacement (and combined collision for gannet only) mortality effect from the operation and maintenance phase of Hornsea Four. The predicted magnitude of this impact on the gannet, guillemot and razorbill features of the FFC SPA (cited within B2.2: Report to Inform Appropriate Assessment (APP-167-178)) is presented in Table 2 of Revision 2 of B2.6: Compensation Measures for FFC SPA Overview (updated at Deadline 5).
- 1.2.1.2 The Applicant has undertaken a robust RIAA (B2.2: Report to Inform Appropriate Assessment (Part 1 (submitted at Deadline 5), REP2-005, AS-013, REP1-012 and APP-171-APP-178) (APP-167-178) and concluded that based on the available evidence relating to the potential for, and consequence of, displacement to-gannet, guillemot and razorbill, it does not consider there to be potential for adverse effect on integrity (AEoI) (for either species) to the conservation objectives of the FFC SPA either from project alone or incombination with other plans and projects.

### 1.3 Compensation Measures

#### 1.3.1 Background

#### 1.3

- 1.3.1.1 In the event that the Secretary of State is unable to reach a conclusion of no AEoI onf the FFC SPA for gannet and / or guillemot and / or razorbill, the Applicant has developed a number of "without prejudice" package of compensation measures that could be applied to compensate at scalable levels for predicted displacement impact on gannet and / or guillemot and / or razorbill, from Hornsea Four. For example, two compensation options are proposed to offset the effects upon quillemot and razorbill (bycatch and predator eradication and/or control<sup>1</sup>), in addition to the fish habitat enhancement resilience measure. Should the bycatch measure deliver the scale required to compensate for guillemot (70 breeding adults) and razorbill (3 breeding adults) then the predator eradication measure may not be progressed beyond the implementation phase (2022-2023). Should the scale of compensation increase from beyond the 70 guillemot and 3 razorbill breeding adults (to be determined by the SoS in the final HRA), but remain below the anticipated2 maximum potential delivery threshold of the measure to compensate (~-267 breeding individuals: approximately 30 boats at ~9 individuals per boat) then the predator eradication measure may not be progressed beyond the implementation phase (2022-2023). Alternatively, a decision may be made to only progress only with predator eradication.
- 1.3.1.2 The proposed compensation measures for gannet, guillemot and razorbill are outlined in Table 1 and are presented in detail in Sections 3 to 5. The location of the search area for

<sup>\*</sup>In absence of the ability to maintain a full eradication for the lifetime of the project (e.g., islands easily accessible by predators from nearby landmasses), predator control can be implemented to reduce the impact of predators on seabird populations. Although predator control may not eliminate the predator, the reduction in numbers could increase productivity and aid seabird population growth (Igual et al., 2005; Jones et al., 2008). Where we refer to predator eradication throughout this document we also include 'and/or control.'

<sup>&</sup>lt;sup>2</sup> Based upon the evidence collated to date.

these measures (as well as the other measure being proposed for Hornsea Four) is shown in Figure 1. A suite of measures are proposed, which provides the benefits of flexibility and scalability, as out lined above. The Applicant is confident that each of the measures on their own is robust and deliverable, the inclusion of committing to a number of measures provides stakeholders with additional comfort on the level of compensation that can be provided. It is important to note that if deemed necessary, the Applicant can deliver all relevant compensatory measures and the resilience measure for all relevant species (i.e. predator eradication, bycatch reduction and fish habitat enhancement for guillemot and razorbill).

- 1.3.1.3 There are two potential primary compensation measures being proposed for guillemot and razorbill. The objective of the first is to reduce bycatch (also applicable to gannet) at a chosen fishery or fisheries hence reducing the number of direct mortalities per annum. The second is to attain 100% removal of predators undertake a predator eradication programme or implement a control plan (dependent on location i.e. control for islets that are accessible during low tide) for a chosen island(s)/ islet(s) and which will achieve an improvement in guillemot and/ or razorbill population numbers as a consequence of the removal of this pressure. Finally, as part of the package of measures to support gannet, guillemot and razorbill (and as outlined within the Kittiwake and Gannet Compensation Plan and Gannet Compensation Plan), fish habitat enhancement wouldwill also be undertaken at a chosen location(s). The habitat restored (namely, seagrass) wouldwill support a number of fish species upon which gannet, guillemot and razorbill (and seabirds more generally including kittiwake and gannet) target as prey resource, therefore, this measure serves as a more indirect means to offer resilience to the gannet, guillemot and razorbill populations within the targeted area(s).
- 1.3.1.4 Sections 3 to 5 provide a detailed account of the various key stages of each of the compensatory measures presented in Table 1-2. All compensation options will be progressed through feasibility (2022-2023) and early phase implementation (2024-2025) prior to a project decision gate on the required compensation option(s) to be taken forward to development (2025 onwards). Should the bycatch measure deliver the scale of compensation required (to be established through monitoring of Bycatch technology selection phase at the levels presented in B2.6: Compensation measures for FFC SPA Overview) for guillemot and razorbill, then the predator eradication measure may not need to be progressed beyond the early implementation phase (2022-2023). The Applicant has already gathered a significant amount of evidence at this stage to deliver (if necessary) the compensation measure outlined below. This is to provide the Secretary of State with sufficient confidence at the point of authorising Hornsea Four that the compensation wouldwill deliver the required outcomes.
- 1.3.1.5 Information is presented in Sections 3 to 5 on a measure-by-measure basis and draws on evidence presented in the associated evidence reports (B2.8.1 Compensation measures for FFC SPA: Bycatch Reduction: Ecological Evidence (APP-194); B2.8.3 Compensation measures for FFC SPA: Predator Eradication: Ecological Evidence (APP-196); and B2.8.5 Compensation measures for FFC SPA: Fish Habitat Enhancement: Ecological Evidence (APP-198)). To avoid repetition, this document should be read alongside each relevant Evidence Report. However, a brief summary of the key evidence that underpins the compensation measure is provided in this report.
- 1.3.1.6 It should be noted that for each of the proposed measures a roadmap document has also been produced by the Applicant which details the next steps that wouldwill be undertaken

should the compensation measure be required. These roadmaps accompany the DCO application and are documents Revision 4 of B2.8.2 Compensation measures for FFC SPA: Bycatch Reduction: Roadmap (updated at Deadline 5), Revision 4 of B.2.8.4 Compensation measures for FFC SPA: Predator Eradication: Roadmap (updated at Deadline 5) and Revision 4 of B2.8.6 Compensation measures for FFC SPA: Fish Habitat Enhancement: Roadmap (updated at Deadline 5). These documents demonstrate that the compensation measures are feasible and can be secured.

#### 1.3.2 Strategic Compensation

- 1.3.2.1 The Applicant has amended the DCO wording in Section 6 to reflect their intention to rely upon the option to discharge their obligation of compensation through the delivery of strategic compensation. The detail of strategic compensation approach and the Marine Recovery Fund (MRF) is set out in within G5.8 Ørsted's approach to strategic ecological compensation (submitted at Deadline 5). and set out in the Roadmaps. If the Applicant has elected to pay a contribution to the Marine Recovery Fund ("MRF") or equivalent fund then the relevant section in the KCIMP shall include the sum of the contribution as agreed between the Applicant and the Department for Environment Food and Rural Affairs (Defra) in consultation with the OOEG. If the contribution is in substitution for one or more of the compensation measures, then the relevant sections in the KCIMP will not be completed as they will no longer be required. For the avoidance of doubt, the Applicant's obligations to deliver compensation measures shall either be discharged through the delivery of strategic compensation through the contribution to the MRF, or through the delivery of compensation measures as set out within this compensation plan, with either option detailed within the KCIMP.
- 1.3.2.2 Alternatively, if the contribution to the MRF is an adaptive measurement measure then the relevant section of the KCIMP shall include details as to the trigger for payment of the contribution (see **Section 6**).

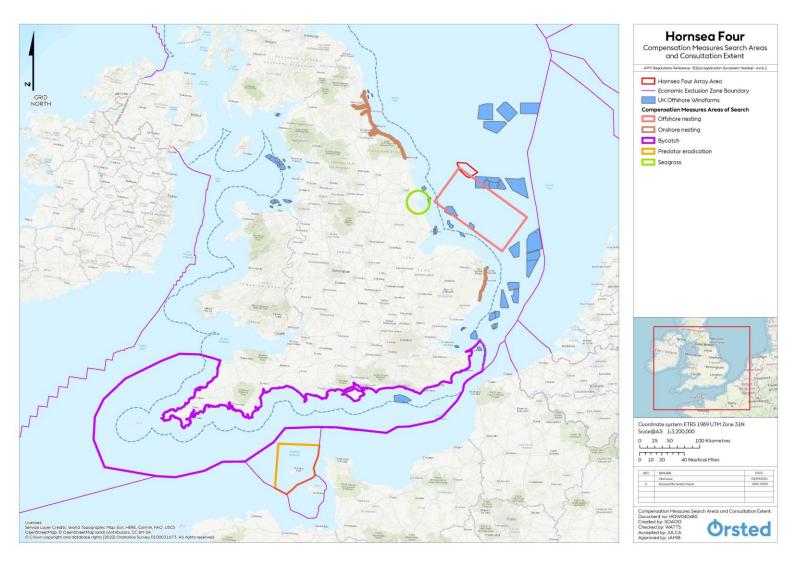

Figure 11-1: Location of areas of search for all compensation measures proposed for Hornsea Four.

Table 1<del>1-2</del>: Compensation Measures proposed by Hornsea Four for <del>gannet,</del> guillemot and razorbill.

Compensation Measure	Target Species	Summary
Bycatch reduction	Guillemot	Measures involve the initial identification of gannet,
	Razorbill	guillemot and razorbill bycatch rates in UK fisheries and
	Gannet	techniques that may be deployed to reduce this.
		Following the implementation of a method/ methods
		monitoring will be undertaken to assess the bycatch
		rates of gannet, guillemot and razorbill. See Section 4
		for further details.
Predator Eradication <del>/ Control</del>	Guillemot	Measures involve the initial identification of a suitable
(dependent on location)	Razorbill	island(s) or islet(s) with guillemot and razorbill
		colony/colonies which also supports a population of
		predators. Following a successful <del>feasibility</del>
		implementation assessment, an eradication project
		would take place with subsequent monitoring for
		productivity of the guillemot and razorbill population.
		Biosecurity is a key site management protocol to limit
		potential invasions during eradication and re-
		infestations following the eradication project. For a
		control project, this would be set up and monitored over
		the course of the project with biosecurity measures to
		help reduce numbers present. This would form the
		second stage of the delivery of this measure. See
		Section 3 for further details.
Fish Habitat Enhancement	Guillemot	This measure would comprise the enhancement of <u>athe</u>
	Razorbill	chosen site <del>(s)</del> where seagrass beds have been known to
	Gannet	previously exist and works undertaken to restore (or
		reinstate) this habitat The success of the reinstatement
		would be monitored along with the recording of
		increased biodiversity within the habitats including fish
		species. See Section 5 for further details.

### 1.4 Stakeholder Engagement

- 1.4.1.1 The Applicant has undertaken extensive consultation with relevant stakeholders (namely, Natural England, Joint Nature Conservation Committee (JNCC), the Royal Society for the Protection of Birds (RSPB), the Marine Management Organisation (MMO), the Planning Inspectorate (PINS), Defra, The Crown Estate, The Wildlife Trust, East Riding or Yorkshire Council (ERYC) and The National Federation of Fishermen's Organisations, on the compensation measures for Hornsea Four. Further detail on this consultation is presented in the Record of Consultation (B2.9: Record of Consultation (APP-201)).
- 1.4.1.2 If the Secretary of State determines that compensation is required, following the DCO being <a href="mailto:granted-made">granted-made</a>, a Hornsea Four Offshore Ornithology Engagement Group (OOEG) <a href="would-will">would-will</a> be established with core members being the relevant <a href="Statutory Nature Conservation Bodies">Statutory Nature Conservation Bodies</a> <a href="SNCB(s)">[SNCB(s)]</a> and the MMO. The RSPB <a href="would-will">would-will</a> also be invited to form part of the OOEG, as an advisory member. The purpose of this group <a href="would-will">would-will</a> be to help shape and inform the

nature and delivery of the compensation post consent.

1.4.1.3 The Applicant wouldwill engage with and report to the OOEG at least annually in the establishment phase and as needed, and as documented in GGRIMPGRCIMP throughout the monitoring period. Terms of Reference wouldwill be agreed between the parties which wouldwill also be submitted to the Secretary of State for approval. The Applicant wouldwill be the chair and convener of the OOEG.

#### 2 Guidance

### 2.1 European Commission Guidance

- 2.1.1.1 This Gannet, Guillemot and Razorbill Compensation Plan takes into consideration guidance information from Defra 2012 Guidance<sup>3</sup>, Defra Best Practice Guidance for developing compensatory measures in relation to Marine Protected Areas 2021 (in consultation),<sup>4</sup> European Commission (EC) 2018 Managing Natura 2000 sites<sup>5</sup>, the Planning Inspectorate's Advice Note Ten<sup>6</sup>, and Tyldesley and Chapman's Habitats Regulations Assessment (HRA) Handbook<sup>7</sup>. The EC 2018 guidance identifies that the following criteria be considered when developing compensatory measures:
  - Coordination and cooperation between Natura 2000 authorities, assessment authorities and the proponent of the plan or project;
  - Clear objectives and target values according to the site's conservation objectives;
  - Description of the compensatory measures, accompanied by a scientifically robust explanation of how they will effectively compensate for the negative effects and how they will ensure the overall coherence of Natura 2000 is protected;
  - Demonstration of the technical feasibility of the measures in relation to their objectives;
  - Demonstration of the legal and/or financial feasibility of the measures according to the timing required;
  - Analysis of suitable locations and acquisition of the rights to the land to be used;
  - Timeframe in which the compensation measures are expected to achieve their objectives;
  - Timetable for implementation of compensation and co-ordination with the schedule for the project implementation;
  - Public information and/or consultation stages;
  - Specific monitoring and reporting schedules; and
  - Financing programme.
- 2.1.1.2 Where appropriate, these have been addressed through the subsequent sub-headings in this Gannet, Guillemot and Razorbill Compensation Plan and also in the accompanying roadmaps (Revision 4 of B2.8.2 Compensation measures for FFC SPA: Bycatch Reduction: Roadmap (updated at Deadline 5), Revision 4 of B.2.8.4 Compensation measures for FFC SPA: Predator Eradication: Roadmap (updated at Deadline 5) and Revision 4 of B2.8.6

Compensation measures for FFC SPA: Fish Habitat Enhancement: Roadmap (updated at Deadline 5))}.

### 2.2 Conservation Objectives

- 2.2.1.1 The Conservation Objectives for the FFC SPA are to ensure that the integrity of the site is maintained or restored as appropriate and ensure that the site contributes to achieving the aims of the Birds Directive, by maintaining or restoring (see B2.2: Report to Inform Appropriate Assessment (REP1-010, REP2-005, AS-013, REP1-012 and APP-171-APP-178APP 167-178) for further detail):
  - The extent and distribution of the habitats of the qualifying features;
  - The structure and function of the habitats of the qualifying features;
  - The supporting processes on which the habitats of the qualifying features rely;
  - The population of each of the qualifying features; and,
  - The distribution of the qualifying features within the site.
- 2.2.1.2 Given the potential impact pathway of Hornsea Four wind farm for which compensation is required, it is the latter two points only which are of relevance. The evidence presented within this Gannet, Guillemot and Razorbill Compensation Plan and supporting annexes demonstrates that the proposed measures are capable of more than compensating for the estimated impact of Hornsea Four wind farm on the qualifying gannet, guillemot and razorbill (as determined by the Secretary of State). Whilst the measure cannot be undertaken within the FFC SPA, the birds that the compensation measure will generate will assimilate into the biogeographic population of gannet, the biogeographic population of guillemot and the biogeographic population of razorbill and thereby ensure the coherence of the national site network in the UK is maintained. Further information to support this is provided in (B2.8.G3.4.1: Compensation measures for FFC SPA: Ecological Connectivity of Compensation Measures Annex 1 (REP3-034) (submitted at Deadline 3)))Compensation measures for FFC SPA: Byeatch Reduction: Ecological Evidence: Appendix A).

### 3 Predator Eradication and/or control

### 3.1 Introduction

- 3.1.1.1 This Gannet—Guillemot and Razorbill Compensation Plan would only take effect if the Secretary of State determines that Hornsea Four would have an AEoI on guillemot and / or razorbill feature of the FFC SPA and imposes a DCO requirement for the provision of compensation. The following sections provide an overview of the key aspects which have been evidenced by the Applicant to date to provide the Secretary of State with sufficient confidence in predator eradication as a compensation measure for Hornsea Four. This has included the following key aspects:
  - Evidencing that the eradication and/or of predators can provide benefits to guillemot and razorbill colonies;
  - Evidencing that predator eradication and general island enhancement efforts are feasible and supported by a wealth of evidence;
  - Identifying a set of suitable locations where a predator eradication and/or control scheme could be undertaken to benefit guillemot and razorbill;
  - Evidencing the anticipated population response by guillemot and razorbill following the predator eradication and/or control project; and

- Evidence for monitoring, bio-security measures and adaptive management measures to demonstrate the long-term sustainability of the measure.
- 3.1.1.2 While the following sections provide a brief overview of the evidence in support of the measure for guillemot and razorbill, to avoid repetition a detailed overview of the evidence supporting this compensation measure is provided in B2.8.3: Guillemot and Razorbill Predator Eradication Evidence Report (APP-196). Therefore, the evidence report should be read alongside this Compensation Plan.
- 3.1.1.3 The EC Guidance recognises that the feasibility of the identified compensation measure must be based on the best scientific knowledge available. The novelty of developing compensation for guillemot and razorbill increases the importance of pre- and post-implementation monitoring. There will, following award of consent, be a phase of further evidence gathering followed by monitoring which will continue through operation. Where necessary, monitoring and adaptive management will ensure, in line with Guidance, that the proposals are developed in the most appropriate manner and can be flexible to enable modifications to be made where evidence suggests it is merited. It is important to recognise that the compensatory measure proposed here is part of a package of one or more compensation measures which provide resilience across the compensation actions for guillemot and razorbill. This high level of precaution must be factored in when considering any uncertainty in the measure. These topics are covered in the following sections of the report.
- 3.1.1.4 Should this compensation measure be deemed necessary, the next steps required to implement it by the Applicant are set out in a Predator Eradication Roadmap (<u>Revision 4 of B2.8.4 Compensation measures for FFC SPA: Predator Eradication: Roadmap (updated at Deadline 5)</u>).

### 3.2 Summary of Evidence

- 3.2.1.1 Globally, guillemot and razorbill encounter many factors which influence adult survival and breeding success. Factors such as overfishing and over-exploitation of sand-eels (Nettleship, 2018) are leading to shortages of high energy foods needed for rearing chicks (Wanless et al., 2005). There are indications that the decline in sandeel stocks is linked to increasing sea surface temperatures (Heath et al., 2009) which poses risk to razorbills due to their restricted diet (Sandvik et al., 2005). Guillemot are also sensitive to variations in sea surface temperatures, with a 1°C change in temperature linked to an annual population decline of approximately 10% (Irons et al., 2008). Alongside these pressures, invasive predators (e.g., O'Hanlon and Lambert, 2017), fisheries bycatch (Northridge et al., 2020), oil pollution (Biliavskiy and Golod, 2012; Furness, 2013), increases in plastic pollution also represent threats to guillemot and razorbill populations.
- 3.2.1.2 Colony population and nest surveys are undertaken to assess the overall adult breeding population and breeding success of a colony which can be consequently linked to external factors influencing a population (Gjerdrum et al., 2003). Predation of seabird eggs, nestlings and adult birds has been shown to be one such influencing factor. Guillemot and razorbill have been evidenced to be vulnerable to numerous species of predator, especially those breeding on islands (Thomas et al., 2017) such as American mink (e.g., Olsson, 1974; Barrett, 2015) and black and brown rats (e.g., Swann, 2002; Mavor et al., 2004; Russell, 2011).
- 3.2.1.3 There is also the potential for other mammalian predators to impact guillemot and razorbill

in the UK such as feral ferrets, house mice and hedgehogs. However, most evidence of UK mammalian predation on both guillemot and razorbill comes from both brown and black rats. There is strong evidence that predator eradication and/or control programmes increase seabird breeding success. The excessive predation by rats on guillemot and razorbill can result in exceptionally low chick mean survival rates (Barrett, 2015), declines in productivity (O'Hanlon and Lambert, 2017) and potentially the elimination or redistribution of nesting seabird colonies, forcing the remaining concentration onto inaccessible locations to rats (Booker et al., 2018; Andersson, 1999; Mavor et al., 2004).

- 3.2.1.4 Recent evidence from Lundy Island in the south west of England provides one example of compelling support for rat eradication to benefit breeding guillemot and razorbill (with further more detailed examples provided in B2.8.3 Compensation measures for FFC SPA: Predator Eradication: Ecological Evidence (APP-196)).
- 3.2.1.5 Lundy Island is situated 19km off the Devon coast in the UK's Bristol Channel. Lundy is occupied by eleven seabird species, including razorbill and guillemot. The island was also occupied by both brown and black rat, which led to the establishment of the Seabird Recovery Project in 2001. The projects main aim was to improve the conditions for burrownesting seabirds (such as puffin and European storm petrels) through the eradication of brown and black rats, however it was also anticipated that other species wouldwill also benefit. From 2002–2004 a ground-based eradication operation was undertaken, and in 2006 Lundy was officially declared rat-free (Booker et al., 2018).
- 3.2.1.6 The seabird populations of Lundy have been well studied with detailed regular data collection spanning the last 35 years. Over the last decade, as a result of rat removal, seabird numbers on the island have doubled and European storm petrels have colonised. By 2013, the breeding population of Manx shearwaters increased more than ten-fold to an estimated 3,451 pairs (JNCC, 2020). With regard to guillemot and razorbill, both species had reduced populations prior to the eradication programme, with increases in populations at the sites following eradication. Table 2 shows the pre- and post-eradication population of guillemot and razorbill at Lundy.

Table 2<del>3-1</del> Seabird populations at Lundy before and after eradication. Count type: IND. Source: BTO/JNCC (JNCC, 2021) and recording coordinated by the Lundy Field Society.

Count year	Guillemot	Razorbill
1992	2629	785
1996	1921	959
2000	2348	950
	Predator eradication 20	002-2004
2004	2321	841
	2006 - Lundy declar	red rat-free
2008	3302	1045
2013	4114	1324
2017	6198	1735
2019	6415	1955
2020	8252	2177
2021	9880	3533

3.2.1.7 National trends reported by JNCC show that Lundy's seabirds are generally faring better

when compared to the wider UK (JNCC, 2020). The latest trend information for guillemots have increased by 5% nationally between 2000 and 2015 and razorbills by 32% in the same period (JNCC, 2016). However, the population increases for Lundy are considerably higher for these species at 164% and 82% respectively between 2000 and 2017 (Booker et al., 2018). The population of guillemot at Lundy as of 2017 is at a level not seen since the late 1940s (Davis and Jones, 2007). Additional years of survey data have been collected since the publication of Booker et al. (2018) showing further increases in the populations of guillemot and razorbill nesting at Lundy. These show that there has been a population increase of 321% for guillemot and 272% for razorbill from 2000 (before rat eradication) to 2021 (15 years after the island was declared rat-free).

- 3.2.1.8 On a regional scale, when comparing the populations of guillemot and razorbill from before and after the Lundy eradication with other neighbouring colonies, results show that there has been a significant increase at Lundy compared to other nearby colonies since 2004, including Skomer and Castlemartin Coast. This population change is documented in full in the Guillemot and Razorbill Predator Eradication Evidence Report (B2.8.3 Compensation measures for FFC SPA: Predator Eradication: Ecological Evidence (APP-196)).
- 3.2.1.9 The site specific evidence shows that substantial increases in guillemot and razorbill numbers have occurred since 2004 with Lundy now supporting almost three times the number of guillemots recorded in 2004 with the population currently at a level not recorded since the late 1940s (Davis and Jones, 2007). This pattern is also coincident with the increase in Manx shearwaters (Booker and Price, 2014). Booker et al. (2018) and Price et al. (2014) suggest that the absence of rats is the likely main driver for such positive changes. An increase in productivity of both species since the eradication has also been shown (Wheatley and Saunders, 2011), with Sherman (2020) showing an increase in guillemot productivity in particular between 2008-2019 at certain locations of the colony.
- 3.2.1.10 Other notable changes reported by Booker et al. (2018) were the prevalence of birds, including guillemots, razorbills and puffins now exploiting previously unoccupied areas of broken ground where the cliff top meets the steep grassy coastal slopes. These areas were previously occupied by rats but are now available as safe nest sites. Alongside these areas, seabirds are generally colonising new sites, with sizeable increases in numbers along the south coast as well as from Jenny's Cove northwards with the change being particularly apparent at Jenny's Cove where breeding numbers of most species have seen the biggest increase Booker et al. (2018).
- 3.2.1.11 The Lundy predator eradication provides an insight into the anticipated benefits to guillemot and razorbill as a result of removing predator species from island seabird colonies. Those benefits being:
  - Increase in the population of guillemot and razorbill present at the colony;
  - Increases in breeding success; and
  - Recolonisation of breeding sites within the colony.
- 3.2.1.12 Despite the Lundy predator eradication scheme focusing primarily on the recovery of Manx shearwater and European storm petrel, long term monitoring has shown the benefits to other seabird species, including guillemot and razorbill.
- 3.2.1.13 The focus on burrow nesting species, such as Manx shearwater and European storm petrel is commonplace in predator eradication and/or projects across the UK, and for similar species elsewhere in the world. In the UK, both species of burrow nester are listed under Annex 1 of

- the EU Birds Directive and are largely confined to islands (Mitchell *et al.*, 2014). The positive effects of predator eradication to Manx shearwater and European storm petrel, and other species for that matter, can be profound. A review of the positive responses of other seabird species as a result of UK eradication and/or projects is presented by Thomas *et al.*, (2017).
- 3.2.1.14 Based on the evidence briefly outlined here and in further detail in the Guillemot and Razorbill Predator Eradication Evidence Report (B2.8.3 Compensation measures for FFC SPA: Predator Eradication: Ecological Evidence (APP-196)), this compensation measure, therefore, would will address the occurrence of predators at a guillemot and/ or razorbill colony(ies) in the UK via the initiation of an invasive species island predator eradication and/or project.

### 3.2.2 Objective and Scale

- The objective of this compensatory measure is to attain 100% removaler adicate of target predator species or implement a control plan (dependent on location i.e., control plan for i<del>slets that are accessible during low tide) f</del>or the chosen island(s) or islet(s) <del>and as a result to</del> achieve an improvement into benefit guillemot and razorbill productivity at the chosen colony or colonies. The target species for the eradication and/or control programme would be black and/or brown rats (depending on the species of rat present on the island(s)/ islet(s) of the proposed eradication and/or control programme, noting other invasive species would also be considered). While the full extent of the recovery will not be seen until successive breeding seasons after the 100% eradication and/or control of the target predator species, the eradication and/or control will start reducing the predation pressure relatively quickly, particularly if implemented during the non-breeding season when forage available to rats is likely to be limited. It is therefore expected that benefits to the breeding seabird populations would will be evident the first breeding season following the initiation of the eradication and/ or control programme. Following predator eradication and/ or control, if monitoring demonstrates that the island(s)/ islet(s) meets the qualifying criteria for an SPA (and the location is within UK or Channel Islands), Hornsea Four wouldwill work with relevant stakeholders to provide evidence for designation.
- 3.2.2.2 The final location(s) <u>within the Bailiwick of Guernsey</u> and, therefore, scale of this measure <u>wouldwill</u> be agreed post-ground truthing (described below). It is important to note that the island/ islet locations presented in the Site Selection section of this report are cumulatively able to deliver significantly more nesting habitat to guillemot and razorbill than is required by the compensation (both in terms of the Applicant's position and the assessment approach <u>used for recent DCO decisions</u>). Guillemot have the smallest breeding territories of any Atlantic breeding seabird (Harris & Birkhead, 1985) and are therefore able to breed at very high densities in suitable habitat. Some UK colonies support a density of 20 pairs per square metre on flat rocks and up to 70 pairs per square metre where the surface is uneven (Harris & Birkhead 1985). While breeding density is likely to be lower for razorbill based on their preference at some colonies to nest in crevices and burrows, the number of pairs required by the compensation measure is significantly lower.
- 3.2.2.3 Based on a 1:2 ratio, t\_he number of nesting pairs required to produce the predicted impact are detailed within Table 2 of Revision 2 of B2.6: Compensation Measures for FFC SPA Overview (updated at Deadline 5)... Consequently, a relatively low amount of habitat would be required to support the number of pairs required at the short-listed location. Furthermore, predator eradication is a scalable compensation option which can be implemented at

multiple feasible locations to achieve the required amount of breeding habitat to support the target compensation population. Based upon a precautionary assessment, the Applicant would consider predator eradication at 1-3 locations, which would be determined following a predatorn ground-truthing studies eradication implementation study. This scale would will provide considerable compensation over and above the potential impact of Hornsea Four.

3.2.2.4 Biosecurity measures <u>wouldwill</u> be put in place, from the beginning of the eradication scheme, to limit the chances of invasion during and re-infestation following the eradication. An adaptive management approach <u>wouldwill</u> be taken in order to ensure that there is sufficient flexibility and that the required compensation is delivered. The compensation measures are clearly effective, viable and can be secured.

#### 3.3 Site Selection

#### 3.3.1 Introduction

3.3.1.1 The following sections summarise the results of the site selection process undertaken to date, which is provided in the Guillemot and Razorbill Predator Eradication Evidence Report (B2.8.3 Compensation measures for FFC SPA: Predator Eradication: Ecological Evidence (APP-196)), and the future site refinement approach (via-informed by the implementation study) that will be undertaken to identify a candidate island(s) or islet(s) for an eradication project.

#### 3.3.2 Island Identification

- 3.3.2.1 The <u>initial</u> site selection process<del>to date has</del> highlighted a number of potential locations which support populations of guillemot and/ or razorbill colonies<sup>8</sup>, rats (brown and/or black rats<sup>9</sup>) and where a predator eradication scheme is potentially feasible. These are<sup>10</sup>:
  - Bailiwick of Guernsey:
    - Alderney: A number of islands/ islets around the main island;
    - o Herm: Including Herm, The Humps and Jethou; and
    - o Sark: A number of islands/ islets around the main island.
  - Isles of Scilly: A number of Islands/ islets;
  - Rathlin Island; and
  - Several islands/ islets along the south coast of England.
- 3.3.2.2 Further details on how these sites were selected are provided in the Guillemot and Razorbill Predator Eradication Evidence Report (B2.8.3 Compensation measures for FFC SPA: Predator Eradication: Ecological Evidence (APP-196)).

### 3.3.3 Further Site Refinement & Island Ground Truthing

3.3.3.1 The initial location options for predator eradication presented in Section 3.3.2, were

<sup>&</sup>lt;sup>8</sup> Note that all of the following overarching locations contain populations of nesting guillemot and razorbill, however, not all islands and islets around these locations, that may be considered for eradication, have both species present.

<sup>&</sup>lt;sup>9</sup> Presence of black rats has been confirmed at, at least two sites.

<sup>&</sup>lt;sup>10</sup> Note that exact island names for some locations are not disclosed due to confidentiality/ on-going discussions which are commercially sensitive.

identified as a result of the initial site selection process. The next step will be to determine the most suitable location for predator eradication from the above list via a f\_urther process of site refinement was. This will likely undertaken involvinge preliminary site visits by island enhancement experts, site managers and/ or ornithologists to provide further evidence in support of the eradication proposal. This process will bewas undertaken alongside continued consultation with site/ reserve managers, wardens, landowners, NGOs, the local community and other relevant stakeholders to determine a location's feasibility. From the initial location options presented in Section 3.3.2, the following islands have been selected for a potential predator eradication scheme:

### Bailiwick of Guernsey:

- Alderney: A number of islands/ islets around the main island;
- Herm: Including Herm, The Humps and Jethou; and
- Sark: A number of islands/ islets around the main island.
- 3.3.3.2 The Applicant has presented evidence that guillemot and razorbill originating from North Sea colonies (i.e. in proximity to FFC SPA) are likely to migrate through or disperse to the waters in the English Channel/ Channel Islands (G3.4.1: Compensation measures for FFC SPA: Ecological Connectivity of Compensation Measures Annex 1 (REP3-034) (submitted at Deadline 3)) and therefore demonstrated the connectivity to the UK National Site Network and benefit to the UK National Site Network populations.
- 3.3.3.13.3.3.3 Once the list of locations has been refined aA ground truthing exercise in the form of an eradication implementation study will is being undertaken by the Applicant (prior to the grant of the DCO) to gather further evidence to ensure maximise the chances of success of the eradication project, and feed into the decision making process. As mentioned above in Section paragraph 3.1.1.4, the Predator Eradication Roadmap (B2.8.4 Compensation measures for FFC SPA: Predator Eradication: Roadmap (updated submitted at Deadline 35)) sets out the planned next steps. The ground truthing exercise will include site feasibility implementation assessments, focussed on understanding in greater detail the following topics detailed in paragraphs 3.3.3.4-3.3.3.9. Where previous island <u>predator</u> eradication feasibility assessments have been undertaken, documents will be reviewed and discussed with eradication experts to judge whether the previous reports are still relevant to the scope of the planned eradication, or whether an update is required to collect more recent information. Each consideration will be presented in a black, red, amber, green (BRAG) matrix approach to allow a transparent rank-based decision-making process to be documented. If following these studies it is considered that further sites should be explored, the Applicant will return to the original long-list of potential sites for further ground truthing and site refinement (see B2.8.3 Compensation measures for FFC SPA: Predator Eradication: Ecological Evidence Appendix 1 (APP-196)).

<u>Logistical considerations for undertaking an eradication scheme</u>

3.3.3.23.3.3.4 This will The implementation study has considered whether or not a predator eradication project could be technically feasible at the location, including factors such as access and other logistical requirements. This has been would be undertaken in conjunction with landowners, site managers and island enhancement experts to provide a site specific and informed opinion.— Through the findings of the implementation study to date, the Applicant is confident that a predator eradication project will be technically feasible at the chosen location of the Bailiwick of Guernsey. Resident questionnaires have shown that the

majority of people support control and/ or eradication of rats. There is also support for predator control (and eradication at the surrounding islets) at Alderney from AWT and the States of Alderney (see Letter of Comfort in Appendix A of Revision 4 of **B8.4**: Compensation measures for FFC SPA: Predator Eradication: Roadmap (submitted at Deadline 5)). Further information is presented in the predator eradication implantation update (G5.4 Predator Eradication Implementation Update (submitted at Deadline 5)). The implementation study will continue through to August, and is therefore not complete at the time of writing. Further updates from the implementation study will be sent to the relative stakeholders if required.

#### Presence of target predator species

- 3.3.3.3.5 This section will determine the species and degree of predator presence at island locations and the level of overlap between the predator occurrence and guillemot and razorbill nesting locations. It is likely that this would be This is being conducted by predator eradication specialists and/or ecologists to allow realistic abundance estimates to be made and a prediction of the effort required to achieve their eradication or the most effective methods (Roy et al. 2015).
- 3.3.3.43.3.3.6 Previous methods used in the UK have included the use of chewsticks (wooden spatulas saturated with margarine or lard that are chewed and bitten by rats) which were set around the island and checked or replaced daily during a period of 6 months (typically during winter when populations are likely to be lowest) (Zonfrillo, 2001). Additionally, cage traps, camera traps and ink tunnels can also be used (Roy et al. 2015). Undertaking the survey during the non-breeding season-would avoids disturbance to breeding seabirds, but depending on the timing, could limit access to islands during periods of severe weather and therefore the timeframes will be have been considered carefully in the design of the surveys. Predator surveys wouldwill be undertaken during and after the eradication project to monitor the abundance/presence of invasive predators, using appropriate methods that will be defined in due course.

#### Additional site-specific evidence of predation pressure

3.3.3.53.3.3.7 Surveys of the islands wouldare being undertaken to document further site-specific evidence of predation of guillemot and razorbill eggs, nestlings or adults. The survey wouldwill look to collect data such as egg caches, gnawed seabird carcasses, photographic evidence from cameras, invasive predator tissue testing (such as stable isotope analysis of caught individuals)), or other methods determined as appropriate.

#### Potential nesting habitat assessment

3.3.3.63.3.3.8 An assessment of colony habitat wouldis being undertaken to determine the amount of potential nesting habitat available to guillemot and razorbill following the removal of the predators. This wouldis being undertaken by ornithologists and subsequently analysed to determine potential nesting space (see G1.33 Predator eradication island suitability assessment: Bailiwick of Guernsey submitted at Deadline 5). Islands where guillemot and razorbill populations have historically been larger wouldwill be considered to have proven capacity for increased productivity.

#### Colony Census

3.3.3.73.3.9 A complete island seabird census wouldwill also be undertaken following methods presented in Walsh et al., (1995) and wouldwill include collection of productivity data and species population estimates. This wouldwill form the baseline for future population and

productivity assessment if the island is included in the eradication project. Long-term seabird monitoring is described in the sections below. Information may also be collected on other flora and fauna and general island enhancement following the removal of the invasive species.

#### 3.3.4 Additional considerations

- 3.3.4.1—There are also a number of other considerations which wouldwill be incorporated into the decision-making process in a qualitative manner. For example, guillemot and razorbill are known to be at risk of potential displacement from offshore wind farms (Bradbury et al., 2014).
- 3.3.4.2 3.3.4.1 Therethere is additional biosecurity risk from human populations on islands (the larger the population the greater the risk of invasive species arriving), and therefore preference would be given to uninhabited islands or islands with a low human population. As a result, the large islands of Alderney and Sark are not being proposed for eradication, rather their small, isolated islands and islets would be included. This process is detailed within the respective Rroadmap (B2.8.4 Compensation measures for FFC SPA: Predator Eradication: Roadmap (updated at Deadline 35) which details the process to identifying the most suitable island for eradication. It is important to note that all shortlisted islands currently included by the Applicant are appropriate for eradication. The predator eradication implementation update (G5.4 Predator Eradication Implementation Update (submitted at Deadline 5)) will provide further information which informs the refinement of the island(s) and islet(s) outline which islands being considered are most suitable to compensate for the potential impact of Hornsea Four. The studies being undertaken by predator eradication experts are expected to conclude in autumn 2022 and will inform the selected island(s)/islet(s).
- 3.3.4.3 3.3.4.2 The FFC SPA is designated for a number of breeding seabird species including (in addition to guillemot and razorbill): kittiwake, gannet and a breeding seabird assemblage consisting of fulmar, puffin, herring gull, shag and cormorant. Those species nesting in burrows (such as puffin) or on the ground/in accessible areas (such as razorbill, shag and cormorant) have increased vulnerability to predation from predators when compared to cliff nesting species. Burrow nesting species are known to benefit from predator eradication projects, with multiple reports of increased breeding success following the removal of key predators. It is, therefore, likely that numerous species wouldwill benefit from eradication projects in addition to the reduced predation pressure on just a single target seabird species (Ratcliffe et al. 2019). In order to ascertain the assemblage of other seabird species breeding at each island, the JNCC SMP wouldwill also be used to explore other breeding seabird species.
- 3.3.4.43.3.4.3 Unassisted re-invasion of islands by predators is a potential threat to islands previously eradicated which are within swimming distance of infested islands or the mainland (Tabak et al. 2015). Protocols to limit potential re-invasions wouldwill be instated at islands during and following the eradication programme and are further detailed in the biosecurity measure section below.

### 3.3.5 Stakeholder Engagement

3.3.5.1 The Applicant wouldwill continue to work with all necessary stakeholders as part of the

Offshore Ornithology Evidence Group (OOEG) throughout this process to ensure suitable locations are identified and that any work is reflective of current best practice. Shortlisted Leocations have been identified in other UK countries, or outside the UK (but with connectivity to the national site network) may and have been included within the require Applicant's eradication implementation study which has covered engagement from respective country conservation bodies (both statutory and non-statutory). Further information is found within the predator eradication Repadage (Revision 4 of B2.8.4 Compensation measures for FFC SPA: Predator Eradication: Roadmap (updated at Deadline 5).

3.3.5.2 The Applicant recognises the importance of the local community in the implementation (and maintenance) of <u>the predator eradication and</u> biosecurity measures. The Applicant wouldwill therefore consult with the local community (where one is present) and any relevant local organisations such as wildlife trusts. Efforts wouldwill also be taken to learn from previous predator eradication programmes such as on the Isles of Scilly Seabird Recovery Project<sup>11</sup>.

#### 3.3.6 Timescale

3.3.6.1—Once the list of islands has been refined, a Apredatorn ground truthing exerciseeradication implementation study will is currently being undertaken by the Applicant to gather further evidence to ensuremaximise the chances of success of the eradication project, and feed into the decision making process of which island(s)/islet(s) to take forward. The study is expected to conclude in autumn 2022 and will include the results of the full breeding bird survey and further analysis to inform implementation. Although this evidence will not be available until after the Examination the confidence in the feasibility and likely success of the measure is not in question. The purpose of the additional evidence is to ensure the Applicant can implement the measure without delay. Based on the evidence collected during the site visits, eradication implementation studies and presented within G5.4: Predator Eradication Implementation Study Update, the Applicant is highly confident it has determined locations where predator eradication is highly feasible, deliverable and will result in benefits to guillemot and razorbill. Further information is found within the Ppredator Eeradication Rroadmap (Revision 4 of **B2.8.4 Compensation measures for FFC SPA: Predator Eradication:** Roadmap (updated at Deadline 5) and the G.5.4 Predator Eradication Implementation Study Update (submitted at Deadline 5)). Some rat surveys and habitat suitability surveys are already planned for 2021-2022. It is planned that this site refinement and ground truthing exercise would be undertaken before the DCO is granted. This would ensure data is collected to inform the decision making process and inform the eradication process at the chosen location(s).

3.3.6.1

### 3.3.6.2 <u>Delivery Process - Eradication Programme</u>

- 3.3.6.3.3.3.6.2 Following the BRAG approach outlined above, members of the OOEG wouldwill be consulted as part of the site selection process for the predator eradication programme and further landowner discussions wouldwill be undertaken, where applicable.
- 3.3.6.43.3.6.3 The approach taken to the delivery of predator eradication will be detailed in the Gannet, Guillemot and Razorbill Compensation Implementation and Monitoring Plan

<sup>11</sup> https://ios-seabirds.org.uk/

(GRIMPGRCIMP). Additionally, implementation of the compensation measure wouldwill also take into account the UK Rodent Eradication Best Practice Toolkit (2018), and any relevant additional consideration of location specific issues. Predator eradication will be undertaken by professional island enhancement experts using well established methods evidenced throughout the wealth of previous island enhancement examples from the UK and further afield. Previous eradication projects have used rodenticide which wouldwill be first tested against the target predator population to ensure no resistance. Other methods of eradication may also be deemed feasible. If this is found to be the case, alternative methods wouldwill be explored in conjunction with the OOEG.

### 3.3.7 Biosecurity

- 3.3.7.1 At the initiation of the eradication of predators from the chosen location, biosecurity measures wouldwill be put in place to prevent invasion of further target predators. This wouldwill be carried on following the removal of the target predator to prevent reinfestation. For example, previous projects have implemented vector control including vessel control and bait traps at arrival points to minimise chance of reinvasion and surveillance procedures including chew sticks at points around islands to identify early signs of reinvasion. Previous successful biosecurity measures have been implemented on islands in the UK that have undergone predator eradication such as at Canna and Sanday, measures consisting of continuous monitoring (wax blocks and kill traps), quarantine and contingency plans have prevented the reinvasion of rats since being declared rat free in 2008 (Luxmoore et al., 2019).
- 3.3.7.2 Biosecurity measures wouldwill be in-line with the current RSPB Biosecurity for LIFE project which was initiated to safeguard the UK's internationally important seabird islands (European Commission, 2019). The RSPB project aims to improve biosecurity measures across all of the UKs 41 seabird island SPAs and establish response plans when invasive species are reported at island SPAs (RSPB, 2019). The biosecurity measures wouldwill aim to replicate the RSPB Biosecurity for LIFE project in conjunction with the OOEG, including the RSPB who have significant experience in island biosecurity.
- 3.3.7.3 The Applicant has already undertaken site visits to locations where predator eradication schemes have been undertaken to understand the potential level of biosecurity controls (for example, St. Agnes and Gugh on the Isles of Scilly). Such information will complement and inform biosecurity planning at a site specific level of detail for the compensatory measure.

#### 3.4 Implementation Criteria and Monitoring

#### Proposed implementation criteria

3.4.1.1 The primary aim of the scheme is to completely remove the target species from the chosen area, but in the context of islands connected at low tide the primary aim is to reduce the population of the target species. After the eradication is complete,. Two years intensive monitoring for the presence of the eradicated animal predators is required in order to receive the invasive free status (Nathan et al., 2015; Russell et al., 2017). will be undertaken to verify successful eradication. For example, this was the process taken for the eradication of rats on Canna and Sanday under contract by Wildlife Management International Ltd, starting in late 2005. By February 2006 the last rat sign was detected, and after a two year period of intensive monitoring, the island was declared rat free in 2008 (see Bell, et al., 2011). However, as stated above in Section 3.2.1, benefits to breeding seabirds are expected from

#### the first breeding season following the eradications initiation.

- 3.4.1.2 Consequently, any eradication programme needs to be coupled with adequate biosecurity protocols to prevent the reinvasion or new invasion of an invasive species. While this is not a success criteria *per se*, it is vital that a set of biosecurity measures are installed to sustain the subsequent population response of breeding seabirds.
- 3.4.1.3 As a result of the key considerations given above, a summary of proposed key criteria for an eradication programme is:
  - Identify the necessary amount of suitable nesting habitat;
  - Target predator removal and/or control from location;
  - Implementation of adequate biosecurity measures;
  - and
  - Seabird monitoring of the following<sup>12</sup>;
    - Productivity rates;
    - o Breeding population; and
    - Distribution of breeding birds.

#### Monitoring

- 3.4.1.4 A monitoring package including the frequency, duration and nature of the monitoring methodology, wouldwill be designed with the delivery partner and in consultation with the OOEG. Monitoring wouldwill focus on the progress and confirmation of eradication, and guillemot and razorbill productivity at the location. The objective of the monitoring is to record the population response at the chosen locations.
- 3.4.1.5 Invasive monitoring <u>wouldwill</u> commence following the baiting or trapping campaign and <u>wouldwill</u> follow the established methods outlined by the eradication contractor. It is anticipated that this monitoring <u>wouldwill</u> last at least two years to record the removal of target species from the location.
- 3.4.1.6 Monitoring for re-infestation on the location <u>wouldwill</u> continue for the operational phase of the project, at a frequency to be approved with the relevant approval authority. This <u>wouldwill</u> be included with the biosecurity compensatory measures.
- 3.4.1.7 In order to monitor guillemot and razorbill and explore the response of other species of seabird at the location to the removal of (invasive) predators, a breeding seabird census project <a href="wouldwill">wouldwill</a> be initiated to collect population data. Details of seabird monitoring <a href="wouldwill">wouldwill</a> be determined after initial ground truthing surveys have been completed. To show the changes as a result of the predator eradication project, population increases <a href="wouldwill">wouldwill</a> be provided in the context of local, regional and national trends. This <a href="wouldwill">wouldwill</a> involve undertaking seabird censuses at other local/ regional guillemot and razorbill colonies (the number of which <a href="wouldwill">wouldwill</a> be determined at a later stage in consultation with the OOEG), while comparing the national trend to JNCC seabird population analysis publications <a href="wouldwill">wouldwill</a> be assessed. This <a href="wouldwill">wouldwill</a> show population changes at the colony where an eradication has been undertaken relative to a regional level change. As an example, this was explored within the Lundy Island case study presented within the Guillemot and Razorbill

B2.8

<sup>&</sup>lt;sup>12</sup> Noting that changes in populations and productivity must be considered in the context of natural variation. Any long-term challenges to the effectiveness of predator eradication relating to prey resource should be viewed in a region specific context and in consideration of natural variability and climate change. Furthermore, monitoring for certain metrics will be based on risk of disturbing nesting species . A decision on exact monitoring will be made following the identification of the island and in discussion with the OOEG.

Predator Eradication Evidence Report (B2.8.3 Compensation measures for FFC SPA: Predator Eradication: Ecological Evidence (APP-196)) where the Lundy Island guillemot and razorbill population had increased above the percentage change experienced by local razorbill and guillemot colonies within the region. This suggests predation pressure from rats was likely to have had an impact beyond what other external influences had.

- 3.4.1.8 Monitoring <u>would will</u> continue for the operational phase of the project, at a frequency to be detailed in the <u>GGRIMPGRCIMP</u>. It is envisaged that the delivery partner <u>would will</u> lead the monitoring component of this measure.
- 3.4.1.9 The breeding population detailed in Table 2 of Revision 2 of B2.6: Compensation Measures for FFC SPA Overview (updated at Deadline 5) is predicted to provide the number of chicks that would survive to adulthood to offset the impact of Hornsea Four. There are examples of predator eradication schemes resulting in population increases for both species which are significantly greater than this size, see Guillemot and Razorbill Predator Eradication Evidence Report (B2.8.3 Compensation measures for FFC SPA: Predator Eradication: Ecological Evidence (APP-196)).
- 3.4.1.10 This number of birds would be required to be produced <u>for</u> each year (on average) that the Hornsea Four wind farm is in operation (and therefore when the impact may take place). The compensation measure is a long-term commitment, with monitoring and adaptive management built in to ensure the long-term success of the measure. A key function of the OOEG would be to help define appropriate and proportionate success criteria, the detail of which <u>wouldwill</u> be presented within the final <u>GGRIMPGRCIMP</u>.
- 3.4.1.10
  3.4.1.11 Any mortality debt accrued by the compensation measure will be paid of relatively quickly in relation to the lifetime of the offshore wind farm. It is highly likely that a mortality surplus will be accrued by the end of Hornsea Four's lifetime. Mortality debt and surplus will be informed by monitoring and will be discussed with stakeholders via the OOEG process.
- 3.4.1.11 Monitoring wouldwill be necessary to evidence any changes to guillemot and razorbill productivity. However, changes in populations and productivity must be considered in the context of natural variation. Any long-term challenges to the effectiveness of predator eradication relating to prey resource should be viewed in a region specific context and in consideration of natural variability and climate change.
- 3.4.1.12 As highlighted in 3.2.1.13, and in further detail in Thomas et al., (2017), positive population responses are also expected to occur (and likely to be an even greater extent that for guillemot and razorbill) to other seabird species present at the predator eradication location. The scale of these positive population responses will depend on the final location(s) of the eradication project. All seabird species present at the location will be monitored concurrently with guillemot and razorbill to document the response of seabird population responses, in addition to the target of the compensatory measure. This will include population census as a minimum. Historic records of breeding species and habitat assessments for other potential breeding species will be sought to determine the chances of species repatriation/ establishment following eradication. For example, the first Manx shearwater chick to fledge on Lundy for almost 50 years, and the first of that species to fledge in living memory from the island of St. Agnes and Gugh on the Isles of Scilly were the result of rat eradication projects (Thomas et al., 2017).
- 3.4.1.133.4.1.14 It is also important to note the Hornsea Four Outline Ornithological

Monitoring Plan report (F2.19: Outline Ornithological Monitoring Plan (APP-254)) which outlines the proposed approach and objectives of any ornithological monitoring required by the Deemed Marine Licences (DMLs) prior to the granting of development consent. The report considers both guillemot and razorbill along with other seabird species (including gannet and kittiwake).

### 3.4.2 Adaptive Management

- 3.4.2.1 If monitoring indicates that the compensation measure is not fully achieving its objectives as planned eradication attempts prove unsuccessful, the reasons for this the lack of success would will be investigated, the OOEG would will be consulted and options identified for improving the eradication programme. If it is deemed feasible, a reattempt of the eradication will be undertaken. If the long term biosecurity risk proves too high at the initial location, another location may be chosen for eradication (such as those considered in the long list short list of sites) in consultation with the OOEG.
- 3.4.2.2 Adaptive monitoring <u>would will</u> also contextualise the colony population responses of other seabird species (such as Manx shearwater, European storm petrel and puffin) to the eradication project. This <u>would will</u> be accomplished by the multi-species population monitoring mentioned above.
- 3.4.2.3 Measures presented by the Applicant (presented in **Table 1**) have been developed to be flexible and scalable and therefore can be increased as necessary to respond to feedback or requirements identified by the adaptive management process.
- 3.4.2.3 3.4.2.4 An alternative approach than that outlined in paragraph 3.4.2.1 is for the Applicant to contribute to a fund as an adaptive management measure. Reference can be made to the Marine Net Gain Consultation on the principles of marine net gain dated 7th June 2022 (Defra, 2022), which includes reference to the newly announced Marine Recovery Fund (MRF). The MRF proposes a "contributions based approach" to net gain requirements, but has been given a broad application to be used to develop strategic compensation. The MRF forms part of the Offshore Wind Environmental Improvement Package of the BESS. The Applicant has proposed some wording below in Section 6 in relation to the option to contribute to the MRF for adaptive management.

#### 3.4.3 Reporting

3.4.3.1 Initial ground truthingSeabird colony information (such as population size) will be collected during the predator eradication implementation study with the production of subsequent reports would be produced to provide a characterisation of the island(s). Annual reports wouldwill be produced throughout the eradication process (or different frequency to be agreed with the OOEG), with subsequent seabird monitoring reports being delivered every two years in line with colony census timescales.

#### 3.5 Outline Timeline

3.5.1.1 The activities required to carry out the actions set out above (which would will be outlined in the GGRIMPGRCIMP) are well understood due to previous UK experience of island enhancement. Hornsea Four are have commissioned the world's most experienced eradication experts to undertake the predator eradication implementation study—a.nd subsequent eradication. The Applicant undertook site visits to short listed locations during

the summer of 2021 with further and more detailed site investigations being undertaken across shortlisted locations within the Bailiwick of Guernsey as part of the predator eradiation implementation study. planning to undertakinge surveys of rats and habitat suitability on Alderney and potentially other sites during 2021-2022. The Applicant wouldwill seek to develop the measures as soon as possible following a legally secure consent decision, with all surveys being complete prior to Financial Investment Decision. The GGRIMPGRCIMP wouldwill be supplied to the Secretary of State prior to the operation of any wind turbine, and the GGRIMPGRCIMP wouldwill be approved by the Secretary of State in consultation with relevant key stakeholders before the operation of any wind turbine generator.

3.5.1.2 The Policy paper 'British Energy Security Strategy'<sup>13</sup> (BESS) published by BEIS in April 2022 recognises the even greater need for rapid development of offshore wind farms committing to 'cut the process time by over half' and 'helping to speed up delivery timelines'.

3.5.1.1

3.5.1.23.5.1.3 Predator eradication measures could be initiated relatively quickly once the site feasibility implementation assessments as part of the ground truthing process are complete and following DCO consent award. However, the length of eradication process wouldwill be dependent on the population of target species and size of island. Based on previous examples explored in the Guillemot and Razorbill Predator Eradication Evidence Report (B2.8.3 Compensation measures for FFC SPA: Predator Eradication: Ecological Evidence (APP-196)), island eradication usually takes place over a period of up to two years, but it is anticipated that benefits to guillemot and razorbill populations would be evident the first breeding season following the eradication start (due to a reduction in the number of predators present). Following the identification of the final location, a more accurate precise timeframe would will be determined by the predator eradication specialists. Productivity monitoring for guillemot and/or razorbill wouldwill be evaluated over a number of breeding seasons and will be detailed in the GGRIMPGRCIMP. Hence this measure wouldwill be implemented prior to the project impact (displacement from an operational turbine array) arising (see timelines in Revision 4 of B2.8.4 Compensation Measures for FFC SPA Predator **Eradication Roadmap** (updated at Deadline 5).

### 3.5.2 Island <u>D</u>designation <u>S</u>status

3.5.2.1 If an island is not a non-designated site (such as a SPA-Ramsar site) island-but is selected as the a location of for the compensation delivery, it could then subsequently be eligible for designation either individually or as an extension of a designated site as an SPA, providing that it meets the qualification requirements and is within the UK or European Union.

### 3.6 Habitat <u>Ee</u>nhancement and <u>Ceorvid Ceontrol</u>

3.6.1.1 Following the identification of the location intended for predator eradication, engagement with the OOEG <u>will</u>could also look to identify habitat management measure (such as the removal of invasive plant species) to increase the resilience of the measure and potential increase nesting habitat available to guillemot and razorbill. Furthermore, corvid control, such as through the use of trap cages used at Cap Fréhel - Cap d'Erquay for local regulation, may also be put in place if deemed to be an influencing factor on the guillemot and razorbill

<sup>&</sup>lt;sup>13</sup> https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment\_data/file/1069969/british-energy-security-strategy-web-accessible.pdf

population at the colony.

### 4 Bycatch Reduction

#### 4.1 Introduction

- 4.1.1.1 The Applicant is proposing to reduce fishing bycatch of gannet, guillemot and razorbill as compensation for Hornsea Four. This compensation measure is feasible and can be secured.
- 4.1.1.2 -The following sections provide an overview of the key aspects which have been evidenced by the Applicant to provide the Secretary of State with sufficient confidence in bycatch reduction as a compensation measure for Hornsea Four. This has included the following key aspects:
  - Evidencing that a high degree of gannet, guillemot and razorbill bycatch occurs within certain fisheries;
  - Evidencing that particular locations, which have connectivity with gannet, guillemot and razorbill from Southern North Sea breeding populations, have particularly high levels of bycatch;
  - Identifying a set of bycatch reduction techniques available to reduce bycatch to gannet, guillemot and razorbill;
  - Evidencing the anticipated reduction in gannet, guillemot and razorbill mortality following the implementation of bycatch reduction as a compensation measure; and
  - Evidence for monitoring and adaptive management measures to demonstrate the long-term sustainability of the measure.
- 4.1.1.3 While the following sections provide a brief overview of the evidence in support of the measure for-gannet, guillemot and razorbill, to avoid repetition a detailed overview of the evidence supporting this compensation measure is provided in the Gannet, Guillemot and Razorbill\_Bycatch Reduction Evidence Report (B2.8.1 Compensation measures for FFC SPA: Bycatch Reduction: Ecological Evidence (APP-194)). Therefore, the evidence report should be read alongside this Compensation Plan.
- 4.1.1.4 The EC Guidance recognises that the feasibility of the identified compensation measure must be based on the best scientific knowledge available. The novelty of developing compensation for gannet, guillemot and razorbill increases the importance of pre- and post-implementation monitoring. There wouldwill, following award of consent, be a phase of further evidence gathering followed by monitoring which would continue through operation. Where necessary, monitoring and adaptive management wouldwill ensure, in line with appropriate Guidance, that the proposals are developed in the most appropriate manner and can be flexible to enable modifications to be made where evidence suggests it is merited. It is important to recognise that the compensatory measure proposed here is part of a suite of compensation measures which provides the benefits of flexibility, scalability and resilience across the compensation actions for gannet, guillemot and razorbill. This high level of precaution must be factored in when considering any uncertainty in the measure. These topics are covered in the following sections of the report.
- 4.1.1.5 The process for identifying, securing and finalising a suitable fishery/ location, bycatch reduction technology selection, implementation, monitoring and adaptive management measures (in so far as the ecological aspects are concerned) is discussed further in Section 4.4 of this report with full details provided in the Gannet, Guillemot and Razorbill-Bycatch

Reduction Evidence Report (B2.8.1 Compensation measures for FFC SPA: Bycatch Reduction: Ecological Evidence (APP-194)).

4.1.1.6 Should this compensation measure be deemed necessary, the next steps required to implement it by the Applicant are set out in a Bycatch Reduction Roadmap (B2.8.2 Compensation measures for FFC SPA: Bycatch Reduction: Roadmap (APP-195submitted at Deadline 5)).

#### 4.2 Evidence

- 4.2.1.1 The impact of bycatch from commercial fishing activity on global seabird populations is an acknowledged concern (Žydelis et al., 2013; Anderson et al., 2011; Miles et al., 2020). Dias et al. (2019) reports that seabird bycatch is one of the top three threats to global seabird numbers, affecting just under 100 species globally and being responsible for the greatest average impact on seabird numbers. A large focus on fisheries bycatch research and subsequent bycatch reduction has focused on long line fisheries, however, it has been reported that gillnet fisheries are likely to pose a greater risk to global seabird populations (Žydelis et al., 2013; Pott and Weidenfeld, 2017; Dias et al., 2019). Žydelis et al. (2013) conservatively estimated that 400,000 seabirds are killed each year globally in gillnet fisheries. Despite this, bycatch monitoring and reporting is vastly underestimated, with low onboard observer monitoring coverage compared to the scale of commercial fishing (Pott and Wiedenfeld, 2017). Many estimates of bycatch mortality are derived from incidental recordings of bycatch. There are few monitoring programmes of long-term datasets available and fewer from dedicated bycatch monitoring programmes (ICES, 2018).
- 4.2.1.2 Gannet, guillemot and razorbill are all vulnerable to bycatch at the surface and pelagic zone whilst also being vulnerable to deep waters techniques during the deployment and hauling of nets (Bradbury et al., 2017). Globally, the Report of the Workshop to Review and Advise on Seabird Bycatch (ICES, 2013) found guillemot and razorbill to be a likely or known bycaught species of the following types of gear; trammel nets and set gillnets, set longlines and purse seines, and gannet to be a likely or known bycaught species of the following types of gear; trammel nets and set gillnets, set longlines, purse seines, bottom otter trawls, and pelagic trawls.
- 4.2.1.3 In the UK, a preliminary assessment (running since 1996) has focused on quantifying protected species bycatch, through an at-sea observer data collection programme under the UK Bycatch Monitoring Programme (BMP). The UK BMP have collected data from over 21,000 monitored fishing operations from around the UK and adjacent waters with the aim to collect operational, environmental, and catch/bycatch data, to estimate bycatch rates of several protected species. Between 1996 and 2018, bycatch was measured for three gear types: static net (set gillnet), midwater trawl and longline. Recent analysis of the data collected by the UK BMP has helped to close some knowledge gaps and identify areas of concern (Northridge et al., 2020; Miles et, 2020). It was estimated that between 1,800 to 3,300 guillemots, and 100 to 200 razorbill, and a few hundred gannet are bycaught in UK fisheries every year (Northridge et al., 2020). The Gannet, Guillemot and Razorbill Bycatch Reduction Evidence Report (B2.8.1 Compensation measures for FFC SPA: Bycatch Reduction: Ecological Evidence (APP-194)) provides a detailed and comprehensive review of bycatch evidence in UK waters and provides further analysis of bycatch estimates relative

to<del>gannet,</del> guillemot and razorbill.

4.2.1.4 There is therefore the potential to alleviate bycatch for these species by implementing bycatch reduction techniques within areas of high bycatch. This compensatory measure, therefore, would seek to address the bycatch rate of gannet, guillemot and razorbill at fisheries in the UK via the initiation of a bycatch reduction project.

### 4.2.2 Objective and Scale

- 4.2.2.1 The objective of this compensatory measure is to attain a reduction in the rate of bycatch mortality for gannet, guillemot and razorbill in UK waters by the implementation of bycatch reduction techniques. The upper scale of compensation required would be defined in the Secretary of State's Appropriate Assessment.
- 4.2.2.2 The scale of the implementation wouldwill be dependent dependent on the level of existing bycatch at a particular fishery, and the efficiency of reduction bycatch by the chosen bycatch reduction technique. An example of potential scale based on existing evidence and previous bycatch reduction trials is provided within the Gannet, Guillemot and Razorbill Bycatch Reduction Evidence Report (B2.8.1 Compensation measures for FFC SPA: Bycatch Reduction: Ecological Evidence (APP-194)). However, as noted above in paragraph 4.3.2.1, further fisheries identification and bycatch reduction technology selection is proposed by the Applicant to increase confidence in the selected technology. The Applicant has developed an innovative an innovative, novel study-testing the efficiency of the Looming Eyes Bouy (an above water deterrent) at reducing guillemot and razorbill bycatch in gillnet fisheries. The first year of the bycatch technology selection phase has been completed with promising initial results. The outcomes from the bycatch reduction selection phase will inform the implementation of bycatch reduction as compensation (findings submitted within G5.13 Bycatch Reduction Implementation Study 2021/2022 Summary) (submitted at <u>Deadline 5)</u>). Further information including timelines of the bycatch reduction selection phase is provided withing the Bycatch Roadmap (Revision 4 of B2.8.2 Compensation measures for FFC SPA: Bycatch Reduction: Roadmap (APP-192) (updated at Deadline 5)). The bycatch technology selection phaseis would will be discussed with OOEG members and presented within the GGRIMP GRCIMP for approval by the Secretary of State.
- 4.2.2.3—Further information is currently being sought to further the knowledge base for this measure.

  This would include obtaining additional bycatch datasets (where they exist and it is possible to obtain them) and other information relating to bycatch evidence (such as necropsy data of stranded birds).
- 4.2.2.44.2.2.3 The final location(s) bycatch technology selection phase has provided confidence in the measure, scale and locations and, therefore, scale of this measure wouldwill be agreed in line withas set out within the Bycatch Roadmap (B2.8.2 Compensation measures for FFC SPA: Bycatch Reduction: Roadmap (APP-192)). Based upon the initial bycatch technology selection phase, a precautionary assessment the Applicant would will consider provision of bycatch reduction measures across on approximately 7 108 vessels, which wouldwillhave be confirmed en informed following the bycatch reduction technology selection phase (see findings within G5.13 Bycatch Reduction Implementation Study 2021/2022 Summary) (submitted at Deadline 5)see Section 1.3). Following the bycatch reduction technology trialselection phase, the number of vessels (and extent of the predator eradication programme) may increase or decrease depending on the outcome of the bycatch trialtechnology selection phase. These compensation measures have the benefit of being

flexible and scalable to enable successful delivery of the compensation.

#### 4.3 Fisheries Selection

4.3.1.1 The following sections describe the site selection process that <u>wouldhas</u> be<u>en</u> used to identify fisheries suitable for the bycatch reduction project, with worked examples presented where relevant.

#### 4.3.2 Introduction

- 4.3.2.1 The Gannet, Guillemot and Razorbill—Bycatch Reduction Evidence Report (B2.8.1 Compensation measures for FFC SPA: Bycatch Reduction: Ecological Evidence (APP-194)) provides a detailed update<sup>14</sup> to the Northridge et al., (2020) estimates by incorporating more recent fishing effort data and other analyses (such as bycatch risk mapping) (Bradbury et al., 2017) to identify the following:
  - Annual trends over a longer period of time;
  - Recent possible bycatch estimates;
  - Spatial bycatch trends;
  - Seasonal bycatch trends; and
  - Areas of high bycatch risk.

### 4.4 Delivery Process

#### 4.4.1 Fishery Type

- 4.4.1.1 The likelihood of—gannet, guillemot and razorbill being caught in fishing gear varies depending on many factors, including: gear type (longline, net, trawl, and active/passive), depth in water column (surface, demersal, benthic), net size, and time of day (day/night). Northridge et al., (2020) provides an analysis of the UK BMP dataset for seabird bycatch numbers in different gear types in the UK including gannet, guillemot and razorbill.
- 4.4.1.2 Guillemots account for approximately 75% of bycatch observed in static net fisheries, both coastal and offshore, and 85% from midwater trawls, with no observations of guillemot being caught in longline fishing. Annual bycatch mortality of guillemot is estimated in the region of between 1,600 to 2,500 individuals per year, with the majority of these attributed to coastal net fisheries (Northridge et al., 2020).
- 4.4.1.3 Razorbill were observed in coastal static net fisheries, English Channel midwater trawl fisheries, and few recorded in longline fisheries. The majority of mortalities are attributed to static net fisheries with estimated mortality approximately 100-200 birds per annum in static net and midwater trawls (Northridge et al., 2020).
- 4.4.1.4 Gannet were observed to be caught within longline and static net fisheries, in estimates of hundreds per year (mostly from longline fisheries). The highest bycatch locations were within Scotland and off the southwest coast of the UK.
- 4.4.1.54.4.1.4 While the majority of guillemot and razorbill bycatch is a result of gillnet fisheries (see analysis by Northridge et al., 2020 and updated estimates in the Guillemot and Razorbill Bycatch Reduction Evidence Report (B2.8.1 Compensation measures for FFC SPA: Bycatch Reduction: Ecological Evidence (APP-194)), Northridge et al. (2020) also stated midwater

B2.8 Ver. B

<sup>&</sup>lt;sup>14</sup> Detailed update only available for guillemot and razorbill due to lack of longline fishing effort data.

trawlers catch guillemot and razorbill, through evidence <u>obtained</u> from the UK BMP. However, guillemot and razorbill are not thought to be affected by midwater trawls through warp strike or through diving into the nets due to not being attracted to vessels. Instead, it has been suggested that guillemot and razorbill are bycaught due to foraging within the same area of the vessel (Simon Northridge *pers. comm.*). The individuals will be caught whilst foraging and will ultimately be drowned within the catch prior to the net being hauled back onto the boat. As larger vessels pump the catch onto a separator then into cold water containers at a high speed, birds can easily be missed therefore bycatch counts would be inaccurate. This would be particularly apparent for guillemot and razorbill due to their small size (Simon Northridge *pers. comm.*). Due to this reason, it is likely that bycatch from midwater trawls is greatly underestimated and could be of concern for seabird populations.

4.4.1.6 A review of this, alongside other available literature and information obtained from fishermen and bycatch specialists has been undertaken by the Applicant to identify potential fishery types that have high guillemot and razorbill bycatch rates. The Applicant has also made significant endeavours at this stage to attempts to collaborate and synergise workstreams regarding seabird bycatch. Efforts will continue to ensure efficiency across industry and conservation bodies, while also eliminating duplication of efforts.

#### 4.4.2 Fishery Location

- 4.4.2.1 Initial bycatch risk mapping (see B2.8.1 Compensation measures for FFC SPA: Bycatch Reduction: Ecological Evidence (APP-194) identifies distinct spatial and temporal points where bycatch rate is high for guillemot and razorbill. These are generally located within the autumn and winter months, inshore, and along the south coast of England (the English Channel). Two locations are particularly apparent from the process, the south east of England, and the south west of England. Based on the findings presented in Appendix A of the Guillemot and Razorbill Bycatch Reduction Evidence Report (B2.8.1 Compensation measures for FFC SPA: Bycatch Reduction: Ecological Evidence (APP-194)), guillemot and razorbill originating from North Sea colonies (i.e., in proximity to FFC SPA) are likely to migrate through or disperse to the waters in the English Channel (G3.4.1: Compensation measures for FFC SPA: Ecological Connectivity of Compensation Measures Annex 1 (REP3-034) (submitted at Deadline 3)). This finding partially explains the increased densities of both species in the non-breeding season within this area, with birds bycaught in the English Channel during this period potentially being from breeding colonies along the north east coastline of England. Furthermore, fisherman consultation has been undertaken with both static net fishermen and midwater trawlers and the results are summarised in B2.8.1 Compensation measures for FFC SPA: Bycatch Reduction: Ecological Evidence (APP-194).
- 4.4.2.2—Fishing effort and location vary from year to year. In order to identify the proposed location(s) for the bycatch reduction, the most recent fishing effort dataset will be obtained from the Marine Management Organisation (MMO). To understand current fishery locations, the Applicant's consultant will extract fishing effort by days fishing per ICES rectangle which will subsequently be mapped in ArcGIS to understand the key fishing locations. This data would also be assessed to understand temporal fishing locations and identify seasonal trends.
- 4.4.2.3—The above points will be presented to the OOEG members, and relevant stakeholders from the fishing community to discuss the most suitable location to deliver compensation, taking

#### into consideration the coherence of the national site network.

4.4.2.2 The above information was shared with SNCBs. The SNCBs agreed that the south west and south east coast of England was the most appropriate location for bycatch reduction of guillemot and razorbill in gillnet fisheries (Natural England and RSPB Pers comm. (meetings held 28<sup>th</sup> July 2021 and 7<sup>th</sup> February 2022), F3.4 Statement of Common Ground between Hornsea Project Four and Natural England: Derogation Matters (APP-257) and Deadline 4 Submission - Appendix C4 — Comments on G3.4 Compensation measures for Flamborough and Filey Coast (FFC) Special Protection Area (SPA) Compensation Connectivity Note (REP4-056)).

### 4.4.3 Bycatch risk mapping

- 4.4.3.1 A process outlined by Bradbury et al., (2017) has been followed using seabird density and other variables to highlight areas of increased bycatch risk. This process is outlined in B2.8.1 Compensation measures for FFC SPA: Bycatch Reduction: Ecological Evidence (APP-194). Furthermore, bycatch rates have been estimated in Northridge et al. (2020) through an average of bycatch recorded per haul by the UK Bycatch Monitoring Programme (BMP). These estimates will bewere combined with the most recent fishing effort (extracted from the MMO) to highlight the current level of UK bycatch.
- 4.4.3.2 As the Northridge et al. (2020) estimates do not consider spatial or temporal differences, bycatch risk mapping will bewas completed to identify "risk zones" of areas of high seabird density and high fishing effort. These zones will help identified important areas for bycatch reduction, identifying the south west and south east of England as important areas to focus within for bycatch reduction as compensation, and would be This information was shared with OOEG members SNCBs to and informed the site selection process for the bycatch technology selection phase (noting agreement of the selected locations with the SNCBs).
- 4.4.3.2 The initial results from the bycatch technology selection phase show an increased bycatch rate compared with the rate identified by Northridge et al. (2020), aligning with the bycatch risk mapping. The initial findings of the bycatch technology selection phase are presented within G5.13 Bycatch Reduction Implementation Study 2021/2022 Summary (submitted at Deadline 5).

#### 4.4.4 Bycatch \*Reduction Technique Selection

- 4.4.4.1 A variety of bycatch reduction measures have been tested globally for a range of fishing gear and seabird species. An extensive literature review has been completed to understand the effectiveness of different bycatch reduction methods and to identify potential techniques that may reduce guillemot\_and, razorbill and gannet\_bycatch rates in UK fisheries. This is presented within the Gannet, Guillemot and Razorbill Bycatch Reduction Evidence Report (B2.8.1 Compensation measures for FFC SPA: Bycatch Reduction: Ecological Evidence (APP-194)).
- 4.4.4.2 In light of the findings of this review<u>and the results of the bycatch technology selection</u>
  phase, it is proposed that potential bycatch reduction techniques for guillemot and razorbill focus initially on above water deterrents (the Looming Eye Buoy) (see B2.8.1 Compensation measures for FFC SPA: Bycatch Reduction: Ecological Evidence (APP-194) for rationale).
- 4.4.4.3 Gannet bycatch reduction techniques have been identified for longline, static gillnet, and

trawl fisheries. Techniques used to deter individuals from warp lines (trawls) or reduce access to the hooks (longlines) reduce access to all seabirds and therefore, would be a successful bycatch reduction technique for gannet (see **B2.8.1 Compensation measures for FFC SPA: Bycatch Reduction: Ecological Evidence** for further information).

4.4.4.3 It is proposed to carry out The Applicant entered the bycatch reduction technology selection phase in November 2021 to identify which bycatch measure(s) would be best to use in the bycatch reduction project for guillemot and razorbill. The trial(sselection phase) would involves at sea deployment of bycatch reduction devices (the Llooming Eeves Bbuoy (LEB)) within an experimental setting either as part of network fishery, or as a simulated deployment with guidance from fishing experts. The trial selection phase also would involves control nets as well as experimental nets where specific bycatch reduction technology will has been trialled. The methods of the trial selection phase will be has been developed in conjunction with collaborators (such as NGO's and fishermen) and bycatch reduction technology developers to ensure best practice and a robust approach. The Applicant is undertaking the LEB selection phase with two companies:

#### • 1) FishTek Marine Ltd

FishTek are a global leader in developing bycatch reduction techniques, and techniques and have previously developed techniques which have successfully aided in reducing bycatch in fisheries (e.g., Hookpod, Lumo lead, pingers).

#### • 2) SeaScope Fisheries Research

- SeaScope are an independent consultancy who specialise in fisheries monitoring and research.
- 4.4.4.4 Through collaborating with two companies which have both undertaken successful studies within fisheries science, the Applicant is confident with the progress of the testing of the LEB and that the measures required for a successful study have been undertaken.
- 4.4.4.5—If deemed necessary by the SoS, bycatch reduction measures relevant to gannet would be employed at relevant fisheries at a scale deemed appropriate by further information gathering. As stated in the Bycatch Evidence Report (B2.8.1 Compensation measures for FFC SPA: Bycatch Reduction: Ecological Evidence), bycatch reduction methods for soaring seabirds (such as gannet) are well evidenced and will achieve the required bycatch reduction due to the similarity in fishing techniques (i.e. long lining with baited hooks accessible to seabirds).
- 4.4.4.5 The first year of the bycatch reduction technology selection phase has been completed with promising initial results. The outcomes from the bycatch technology selection phase are presented within **G5.13 Bycatch Reduction Implementation Study 2021/2022 Summary** (submitted at Deadline 5).
- 4.4.4.6 Further information in relation to next steps for bycatch reduction technology selection is presented in the Bycatch Roadmap document (B2.8.2 Compensation measures for FFC SPA:

  Bycatch Reduction: Roadmap (APP-195submitted at Deadline 5)). The Applicant would will work with relevant stakeholders to test and supply, the relevant bycatch reduction technique measures. The bycatch reduction trial would be undertaken by selected

<sup>&</sup>lt;sup>15</sup> Note that bycatch reduction techniques likely to be used for gannet have previously undergone testing and would therefore unlikely to need a trial.

#### commercial fishermen.

### 4.4.5 Stakeholder Engagement

4.4.5.1 The Applicant willould continue to engage with the OOEG and other relevant stakeholders (including the fishing industry) to ensure the most suitable and effective success of the fisheries-bycatch reduction techniques are used supplied implementation and that any work is reflective of current best practice. During early fisheries consultation, fishermen were asked "Would you be willing to adopt any proposed measures in a pilot study, should they be paid for by Ørsted?". The response was positive, with 80% of fishersmen in Cornwall saying they would participate (42 out of 52 responses). This shows the willingness of positive relationship between the Applicant and members of the fishing industry to participate in the exercise – which is paramount to its success., with strong engagement. Furthermore, fishers from the first year of the bycatch reduction technology selection phase have agreed to take part within the second year and in the implementation of the bycatch reduction technique in 2022/2023. The Applicant is also currently securing more fishers, increasing the total number of fishers included within using the bycatch reduction technology selection phase and implementation. This positive relationship with the fisheries industry and willingness of fishers to participate will aid the Applicant when deploying the compensation measures post DCO consent, the pilot studybycatch technology selection phase and provides further confidence to securing and delivering the compensation measures.

### 4.5 Implementation of the Bycatch Reduction Project

- 4.5.1.1 Following the trialsbycatch technology selection phase, a final bycatch reduction technique, or combination of techniques, will be determined for the compensation measure. The results of the bycatch technology selection phase and potential adaptive management are presented within G5.13 Bycatch Reduction Implementation Study 2021/2022 Summary (submitted at Deadline 5). -Members of the OOEG willwould be consulted on a final fishery/ fisheries location, and the intended bycatch reduction technique for the compensation measure. Relevant fisheries stakeholder discussions willoud also be undertaken.
- 4.5.1.2 The approach taken to the delivery of bycatch reduction willowld be discussed with the OOEG as part of the development of the GGRIMPGRCIMP, taking into account the considerations of fisheries stakeholders and any relevant additional consideration of location specific issues.
- 4.5.1.3 The implementation of the bycatch reduction project willoud be overseen by a suitably qualified delivery partner such as a commercial fisherman/ technical specialist contractor.

### 4.6 Implementation Criteria and Monitoring

4.6.1.1 The primary aim of the scheme is to reduce the bycatch of gannet, guillemot and razorbill to offset the impacts of Hornsea Four. As highlighted in Section 1.2, and set out in full within the Gannet, Guillemot and Razorbill—Bycatch Reduction Evidence Report (B2.8.1 Compensation measures for FFC SPA: Bycatch Reduction: Ecological Evidence (APP-194)) the scale willoude be dependent on the final impact derived from the Secretary of State's Appropriate Assessment. However, based on the Applicant's position presented in the Hornsea Four RIAA, the number of possible mortalities as a result of displacement by Hornsea Four per annum is presented in Table 2 of Revision 2 of B2.6: Compensation

#### Measures for FFC SPA Overview (updated at Deadline 5).

4.6.1.2 Based upon a precautionary assessment the initial-bycatch reduction technology selection phase, the Applicant willowld consider provision of provide bycatch reduction measures across approximately 7 108 vessels (see findings within G5.13 Bycatch Reduction Implementation Study 2021/2022 Summary) (submitted at Deadline 5)), which would be confirmed following the bycatch reduction technology selection phase. This would equate to an over-compensation for the estimated potential impact of Hornsea Four and is viable and deliverable. The number of vessels will be discussed with SNCBs within the OOEG.

#### **Monitoring**

- 4.6.1.3 A monitoring package would will be designed with the delivery partner; in line with the camera monitoring system used within the bycatch reduction technology selection phase, and will be discussed with the OOEG (see monitoring methods within G5.13 Bycatch Reduction Implementation Study 2021/2022 Summary) (submitted at Deadline 5)). Monitoring wouldwill focus on the progress and confirmation of a reduction in bycatch numbers for gannet, guillemot and razorbill. This wouldwill be informed by the bycatch reduction technology selection phase (comparing the bycatch of the control nets to the experimental nets). Due to the high resolution of the camera system used during the bycatch reduction technology selection phase, the same system may be used at times during the lifetime of the project to complement the other monitoring measures. The monitoring of results would be dependent on the implementation method. However, bycatch reduction monitoring for bycatch of other taxa is well known and synergies can be drawn and incorporated into the monitoring relevant to guillemot and razorbill. This wouldwill be developed with experienced stakeholders from both a conservation and fisheries background to ensure monitoring requirements are met.
- 4.6.1.4 Monitoring wouldwill continue for the operational phase of the project, at a frequency to be detailed in the GRIMPGRCIMP. It is envisaged that the delivery partner wouldwill lead the monitoring component of this measure. See the Bycatch Roadmap (Revision 4 of B2.8.2 Compensation measures for FFC SPA: Bycatch Reduction: Roadmap (APP-192) updated at Deadline 5) for further information on monitoring.
- 4.6.1.5 As stated above, it is also important to note the Hornsea Four Outline Ornithological Monitoring Plan report (F2.19: Outline Ornithological Monitoring Plan (APP-254)) which outlines the proposed approach and objectives of any ornithological monitoring required by the Deemed Marine Licences (DMLs) prior to the granting of development consent. The report considers both guillemot and razorbill along with other seabird species (including gannet and kittiwake).

### 4.6.2 Adaptive Management

4.6.2.1 Adaptive management is an iterative, post-consent process which combines management measures and subsequent monitoring with the aim of improving effectiveness, whilst also updating knowledge and improving decision making over time. An adaptive management plan wouldwill be produced and outlined in the GGRIMPGRCIMP which wouldwill list a set of options to ensure the long-term resilience of the measure if monitoring indicates that the bycatch reduction measures are performing unfavourably or failing to be implemented by fisheries. This process wouldwill be developed in consultation with the OOEG. If the bycatch mitigation technique proves to be unsuccessful during trialimplementation, another

- technique or fishery type may be chosen for bycatch reduction in consultation with the OOEG.
- <u>4.6.2.2</u> Measures presented by the Applicant (presented in **Table 1**) have been developed to be scalable and therefore can be increased as necessary to respond to feedback or requirements identified by the adaptive management process.
- 4.6.2.2 4.6.2.3 An alternative approach than that outlined in paragraph 4.6.2.1 is for the Applicant to contribute to a fund as an adaptive management measure. Reference can be made to the Marine Net Gain Consultation on the principles of marine net gain dated 7th June 2022 (Defra, 2022), which includes reference to the newly announced Marine Recovery Fund (MRF). The MRF proposes a "contributions based approach" to net gain requirements, but has been given a broad application to be used to develop strategic compensation. The MRF forms part of the Offshore Wind Environmental Improvement Package of the BESS. The Applicant has proposed some wording below in Section 6 in relation to the option to contribute to the MRF for adaptive management.

### 4.6.3 Reporting

4.6.3.1 Initial bycatch reduction technology selection reports wouldhave been produced by the Applicant to provide an overview of the results (G5.13 Bycatch Reduction Implementation Study 2021/2022 Summary). The bycatch reduction technology selection phase is planned was undertaken during for 2021/2022 (commenced November 2021), and therefore the Further reporting is expected to be available late 2022 or early summer 2023. Technical update reports would will be developed throughout the project lifetime at a frequency and discussed with OOEG members. These technical update reports would will include a description of number of vessels using the technology, locations, duration of use and results of any bycatch monitoring.

### 4.7 Outline Timeline

- 4.7.1.1 The activities required to carry out the actions set out above (and wouldwill be outlined in the GRIMPGRCIMP) are well understood due to a strong relationship between the Applicant and the commercial fishing industry.
- 4.7.1.2 The Applicant is currently Hornsea Four are planning to undertakingehas undertaken trials of the bbBycatch rrReduction ttTechnologyies sSelection pPhase and surveys of bycatch inthroughout 2021/2022 (see timescales within the Bycatch Roadmap (Revision 4 of B2.8.2 Compensation measures for FFC SPA: Bycatch Reduction: Roadmap (APP-192) updated at Deadline 5)). The measure could be implemented relatively quickly following consent decision and would will be in place prior to operation of the wind turbine generators.
- 4.7.1.3 The Policy paper 'British Energy Security Strategy' 16 (BESS) published by BEIS in April 2022 recognises the even greater need for rapid development of offshore wind farms committing to 'cut the process time by over half' and 'helping to speed up delivery timelines'.

4.7.1.2

4.7.1.34.7.1.4 The GGRIMPGRCIMP wouldwill be supplied to the Secretary of State prior to the commencement of any wind turbine construction, and that this plan must be approved by

<sup>&</sup>lt;sup>16</sup> https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment\_data/file/1069969/british-energy-security-strategy-web-accessible.pdf

the Secretary of State in consultation with relevant key stakeholders before the commencement of any wind turbine generator.

### 5 Resilience Measures – Fish Habitat Enhancement and Prey Rresource

### 5.1 Introduction

- 5.1.1.1 As part of the suite of measures to support gannet, guillemot and razorbill (and as outlined within the Kittiwake Compensation Plan and Gannet Compensation Plan as well), Efish habitat enhancement restoration is proposed to be undertaken as a resilience measure at a chosen location(s) to support the primary compensation measures for kittiwake, gannet guillemot and razorbill. The habitat restored (namely, seagrass) would will support a number of fish species upon which kittiwake, gannet, guillemot and razorbill (and seabirds more generally including kittiwake) as well as other seabird species) target as prey resource, therefore, this measure serves as a more indirect means to offer resilience to the guillemot and razorbill populations within the targeted area(s). This resilience measure is feasible and can be secured.
- 5.1.1.2 The Applicant has Hornsea Four have undertaken an extensive review of the evidence base supporting the use of this measure. The results of this review are presented in the accompanying Fish Habitat Enhancement Evidence Report B2.8.5 Compensation measures for FFC SPA: Fish Habitat Enhancement: Ecological Evidence (APP-198). The Evidence Report covered utilisation of seagrass habitats by key prey fish species associated with guillemot, gannet, razorbill and kittiwake and assessed how enhancing forage fish species may increase seabird prey resource. It highlightsed the importance of seagrass habitat and provides evidence of seagrass meadows functioning as a nursery for juvenile forage fish species, the importance of this habitat for prey fish species for the foufour resource and seagrass habitat enhancement.restoration methodology.
- 5.1.1.3 This section should also be read alongside the fish habitat enhancement roadmap (Revision 2 of Revision 4 of B2.8.6 Compensation measures for FFC SPA: Fish Habitat Enhancement: Roadmap (updated revision submitted at Deadline 5)(REP1-024)) which sets out the next steps that will be undertaken should this measure be required.

### 5.2 Seagrass Enhancement Restoration Projects

- 5.2.1.1 Seagrass enhancement restoration projects have been undertaken for over 50 years (MMO, 2019). For example example, in Chesapeake bay Chesapeake Bay in the US, 3000 hectares of seagrass have been restored since the first survey in 1984 from once lifeless habitats, with rapid recovery of their ecosystem services now being observed (Orth et al. 2020). The restored seagrass meadows in Chesapeake bay Chesapeake Bay have recorded rapidly increasing ecosystem service provision from maturing restored seagrass meadows that have become indistinguishable from natural meadows (Orth et al. 2020).
- 5.2.1.2 In recent years, a number of seagrass <a href="enhancement\_restoration">enhancement\_restoration</a> projects have been undertaken in the UK. Project Seagrass and Swansea University led the UK's first major <a href="enhancement\_restoration">enhancement\_restoration</a> project in Dale in West Wales. <a href="Several\_Oorganisations">Several\_Oorganisations</a> are undertaking research and trials to expand or restore seagrass habitat, with the Yorkshire <a href="Wildlife Trust aiming to expand\_the remaining">Wildlife Trust aiming to expand\_the remaining 20\_ha of seagrass at Spurn Point Nature Reserve. As part of this restoration work, the Yorkshire Wildlife Trust are undertaking trials to discover the optimal conditions for gathering and germinating seagrass seeds (Yorkshire">Yorkshire</a>

Wildlife Trust, 2021).

- 5.2.1.3 In Plymouth Sound and the Solent the largest <u>enhancement\_restoration</u> project began in April 2021, a partnership project led by Ocean Conservation Trust (OCT) and involving Natural England, and numerous other stakeholders and volunteers (OCT, 2021). The project aims to plant seagrass bags across a total of <u>8 haeight hectares</u> of seagrass meadows <u>4 haefour hectares</u> in Plymouth Sound and <u>4 haefour hectares</u> in the Solent Maritime Special Area of Conservation (SAC). By planting seagrass, the project hopes to create more seagrass meadows which provide homes for juvenile fish and protected creatures like seahorses and stalked jellyfish (OCT, 2021).
- 5.2.1.4 The Applicant is exploring opportunities to expand an existing seagrass enhancement restoration projects that is are already underway and opportunities to create new projects with the academic community that could potentially form a add resilience to the primary compensation measures. The site selection process has identified the Humber Estuary as the most suitable location these broad locations are (illustrated in Figure 1: and has already completed the restoration of 2 hectares of seagrass.

### 5.3 Seagrass Enhancement Restoration Techniques

- 5.3.1.1 Seagrass enhancement restoration has been formally conducted for over 50 years and the means of doing this can principally be split into two major techniques:
  - replanting; and
  - reseeding.
- 5.3.1.2 Both techniques have their relative merits and have exhibited varying levels of success. Reseeding and replanting techniques have sometimes been used together. Using seeds possibly in conjunction with adult plants, may in some instances prove more effective (van Katwijk et al. 2016). A broad overview of the literature illustrates that although a lot is now known about seagrass enhancement restoration, there are research gaps and as a result the success rate of enhancement restoration projects can vary, demonstrating that it is vital that studies are undertaken to assess the feasibility and site selection and ensure the efficacy of the measure (Unsworth and & Butterworth, 2021).
- 5.3.1.3 The use of reseeding generally relates to the collection and targeted redistribution (and sometimes processing) of wild seed. Adult shoot replanting normally involves harvesting plants from an existing meadow and transplanting them to the enhancement restoration site. The reproductive fronds of wild seed is collected by hand by SCUBA divers. The seeds collected by recent projects have obtained permits/consent from Natural England and Natural Resources Wales. Recent reports from the Environment Agency highlight the need for seagrass enhancement restoration to increasingly depend upon nursery grown propagules.
- 5.3.1.4 In most cases, shoot planting involves some means of anchoring the shoots to the bottom until the roots can take hold (root into the bottom). Replanting uses either labour intensive diving techniques or various mechanistic approaches to planting various sizes and ages of seagrass plants into new localities. Planting of seedlings in the UK is typically undertaken by a team of divers who are transported to the site by boat. Seeds can also be directly deployed from the boat and often hessian bags are used to help anchor the seeds in place during germination. It is expected that up to two vessels would be required for the seagrass

enhancement restoration at each location.

- 5.3.1.5 Seagrass enhancement restoration requires consideration of a range of factors necessary to make it a success. A recent review of the success of enhancement restoration projects globally found that success relates to the severity of the habitat degradation (van Katwijk et al. 2016). Seeds, adult plants and sods are not significantly different, although seedlings show lower success rates. A short distance to the donor site is also related to success.
- 5.3.1.6 Some seagrass enhancement restoration projects particularly the trials of small/medium sized projects have funding secured. The Applicant will look has looked to fund additional areas for seagrass enhancement restoration that does not currently have funding secured and therefore provide additional benefit rather than contribute to projects that are part of normal practice and site/habitat management of the designated sites. Evidence gathering by the Applicant is ongoing and discussions with stakeholders on enhancement restoration projects and techniques is continuing. However, currently all types of enhancement restoration methods are being considered and may be combined using the best techniques at the time of enhancement restoration for the greatest success.

#### 5.4 Location

- 5.4.1.1 The Applicant has commenced seagrass restoration efforts with a trial scheme at Spurn Point in the Humber Estuary with support from the Yorkshire Wildlife Trust (YWT)—and the University of Hull (UoH). In addition to a detailed site implementation study, the trial seagrass restoration planting willhas determined the success at a small scale, prior to expanding the scheme to a wider area 30 hectares which will commence following DCO consent. To date, the YWT has planted—5 acres two hectares of seagrass for Hornsea Four and a further two hectares will commence in 2022. Surveys are being undertaken by the University of Hull to demonstrate the connectivity of seagrass in the Humber Estuary with guillemot and razorbill prey found in the North Sea.
- 5.4.1.1—Exploration of potential broad areas for seagrass enhancement restoration is, however, if needed for adaptive management is ongoing. The main areas that are being considered consistently support all of the target seabird species and therefore provide options for seagrass enhancement restoration as well as supporting other compensation measures, therefore increasing the resilience of the measures. Ocean Ecology Limited (OEL) and Swansea University (SU) are supporting the Applicant by conducting an implementationthis wider study for seagrass restoration. with the aim of establishing how the resilience measure could be continued and expanded to establish a large-scale restoration site or sites. OEL and SU will provide a detailed site selection assessment which will result in a shortlist of potential sites that are not only suitable for restoration but will also provide suitable resilience to the wider package of compensation measures, if required for adpaped tive management.
- 5.4.1.2 From April to July (breeding season), both guillemot and razorbill are located tightly around their colonies (around the coasts of the UK except for the Humber to the Isle of Wight). Outside of the breeding season, both species move further offshore, then start moving south. By December both species are located offshore around all UK coasts. As seabird distributions change throughout the year, the composition of their prey can also change, for example guillemot have a more varied diet in winter (Furness and Tasker, 2000). It will therefore be important to evaluate temporal variations when undertaking site selection

analysis for the purpose of planning compensation measure locations.

- 5.4.1.35.4.1.2 Potential existing seagrass meadows located within proximity to the primary gannet, razorbill and guillemot compensation measures i.e. bycatch and predator eradication, with reported connectivity with the wider site network and the North Sea populations include the Solent, Channel Islands, Cornwall, Isles of Scilly, Essex, Rathlin Island and Humber Estuary (see <u>Figure 1-1</u>). All of these locations are being considered for potential implementation trialsfeasibility trails and future implementation.
- 5.5 Implementation, <u>OOo</u>peration, <u>MmM</u>onitoring and <u>AaA</u>daptive <u>MmM</u>anagement
- 5.5.1.1 Prior to any field studies large-scale seagrass restoration commencing, detailed implementation feasibility studies would will have been undertaken to assess the physical parameters for seagrass to be restored and undertake further stakeholder engagement. The Applicant recognises the need for implementation feasibility studies to consider site selection and methodology to increase the likelihood of a successful enhancement restoration programme and efficacy of the compensation measure. Factors that would will have been considered prior to large-scale restoration enhancement efforts being initiated to ensure the viability of seagrass enhancement restoration included looking for a sites:
  - being sheltered from wave action;
  - with suitable topographical and hydromorphological conditions including sedimentation rates;
  - sufficient nutrients and available light;
  - good water quality; and
  - avoid sites with activities that could cause significant physical disturbance.
- 5.5.1.2 These factors would also be considered for any site required for adaptive management. For an adaptive management site, surveys may be required to establish the levels of activity at the potential locations.
- 5.5.1.25.5.1.3 The levels of activity and any potential risks to seagrass restoration were fully understood by YWT and considered in the site selection process. The site was chosen due to the minimal risks and activity in the seagrass bed and surrounding seabed and the ability to manage activities due to the ownership of the seabed by YWT and protective byelaw for seagrass. Planting seagrass at sites previously known to support seagrass and known to have appropriate conditions for seagrass wouldwill likely result in increased biodiversity and ecosystem service provision (Unsworth, 2021). Part of the site selection process to determine the chosen site in the Humber Estuary and for any adaptive management locations wouldwill take evidence of previous seagrass locations as is a key consideration (Green et al., 2021). At Spurn Point in the Humber Estuary there is an existing seagrass bed covering approximately 20 hectares with a further 2 hectares recently planted for Hornsea Four, therefore providing confidence in the suitable conditions and considerable scope within the remaining protected area which is currently sparsely or un-colonised.
- 5.5.1.3 5.5.1.4 For a new enhancement-restoration project, physical surveys (e.g. particle size, depth, slope, light, temperature, total suspended solids, redox layer) and biological surveys may be conducted as well as habitat mapping at each site, these could involve the use of camera drops and diver surveys to assess the suitability of the potential locations. When undertaking site selection studies the health and or nutrient status of the closest seagrass meadows or patch would will be examined. A geomorphological and suspended sediment analysis of the

Humber Estuary at Spurn Point has been undertaken by the University of Hull for Hornsea Four. The analysis of the proposed restoration site is considered to be stable and appears suitable for replanting, with minimal identified risk of smothering. Levels of surface chlorophyll also remain stable and do not indicate a risk of algal bloom or eutrophication. The Fish Habitat Enhancement: Implementation Study and Fish Connectivity Survey Summary will provide further details on the analysis at Deadline 6. Fish nursery and bird surveys have already commenced at the Humber Estuary for the Hornsea Four seagrass restoration project.

- 5.5.1.45.5.1.5 It may be necessary, especially with the potential scale of enhancement restoration, that for adaptive management potential sites a series of surveys would be needed to identify potential seagrass meadows for future seed collections. This would be conducted in consultation with Natural England and other stakeholders. When planning the enhancement restoration project the focus would be on facilitating natural recovery through alleviating recruitment limitation. The seed collection and planting within the Humber Estuary is consented by Natural England. YWT have been working with Natural England, and have agreed a suite of rolling permissions and consents for the seagrass restoration and accompanying survey works, including seagrass seed collection, two methods of seagrass planting, and benthic, environmental and fisheries surveys.
- 5.5.1.5 5.5.1.6 The Applicant-would will undertake studies to understand has considered the most appropriate scale for any resilience measure, and consider how to maximise the benefits of spatial overlap/proximity to the other compensation measures. The Applicant recognises the importance of encouraging long-term survival by promoting self-facilitation through implementation at a large-enough scale. The Applicant wouldwill ensure that significant contingency, which may include reseeding/replanting, is built into the measure to provide the necessary confidence that it wouldwill have sufficient resilience, offset the impact and efficacy as a resilience compensation measure. The Applicant has committed to restore 30 hectares of seagrass following DCO consent, in addition to the 4 hectares being planted as part of the implementation studies in the Humber Estuary (2 hectares of seagrass have already been planted at Spurn Point).
- 5.5.1.65.5.1.7 Engagement with statutory and non-statutory bodies and local stakeholders and landowners wouldwill be undertaken to share and discuss our ambitions, plans and to ensure the success of the measures. The Applicant wouldwill is working with academics and organisations with experience of previous enhancement restoration projects in order to ensure that activities build on the outcomes of best practice and lessons learnt.
- 5.5.1.75.5.1.8 For any adaptive management locations, fFollowing the site suitability surveys, a site selection process (potentially using a decision matrix) wouldwill be used to select the optimal site(s) for enhancementrestoration. Environmental baseline surveys of the site(s) wouldwill be undertaken so that change over time can be assessed accordingly. Enhancement Restoration of the seagrass using replanting and/ or reseeding methods wouldwill be undertaken following the methodology devised through engagement with academics and stakeholders. A pilot trial planting scheme is likely to be undertaken particularly for any new enhancement restoration location. Following the implementation feasibility trials to gather further evidence on the efficacy of the seagrass enhancement restoration, the sites and methods wouldwill be selected to take forward.
- 5.5.1.8 5.5.1.9 There are several seagrass enhancement restoration projects being considered by a number of organisations in the UK and it may be that a project has already undertaken the

required site selection and trials, and is looking for the resource to undertake a larger scale scheme.

5.5.1.9 5.5.1.10 The Applicant has been discussing these options with academics and stakeholders and has identified a suitable project that is already underway that the Applicant could contribute towards to expand the enhancement project. During 2021/2022, the Applicant is planning to fund a trial at a proposed enhancement site. To date, the YWT has planted on behalf of the Applicant-5 acres (2 ha) 2 hectares of seagrass within the Humber Estuary, 2.5 acres in October 2021 and 2.5 acres in March 2022 at a 1 m² planting density. The Estuary. The trial would be up to 2 ha in size and the Applicant is fundeding the seed collection in 2021 in order to facilitate this trial scheme in the Humber.

5.5.1.10

The Applicant is confident that the measures extensive large-scale seagrass enhancement restoration (up to a total of 30 ha) would will provide resilience to the measures and compensate as part of a suite of measures for Hornsea Four. Implementation of the trial seagrass enhancement restoration project commenced prior to obtaining DCO consent, to allow for monitoring of the trial scheme and to enable further research studies to commence in order to fill some of the evidence gaps highlighted in the B2.8.5 Compensation measures for FFC SPA: Fish Habitat Enhancement: Ecological Evidence (APP-198) and increase confidence in the contribution of seagrass restoration as part of the compensation package for Hornsea Fourwould begin following determination of the DCO application by the Secretary of State if required. All necessary permissions and consents have would been obtained for the trial scheme and will be obtained for any further larger-scale restoration efforts.

between seagrass in the UK and non-grazing seabirds and the level of the role of seagrass supporting forage fish for seabirds such as razorbill, guillemot, gannet and kittiwake. Nonetheless, there is clear evidence of the ecological benefits of seagrass and for prey species. Whilst the broad understanding of the links between seagrass meadows and fisheries are well understood (Kritzer et al. 2016; Unsworth et al. 2019), there is currently limited evidence for this role at a UK level, with most data collected from only a handful of sites (Bertelli and Unsworth 2014; Peters et al. 2015). Understanding about temporal and spatial variability is also lacking (Unsworth and Butterworth, 2021). Whilst it is known that forage fish species clupeids, gadoids and sand eels all utilise UK seagrass meadows at periods of the life cycle the nature of this role hasn't been quantified (Unsworth and Butterworth, 2021). The Evidence Report (B2.8.5 Compensation measures for FFC SPA: Fish Habitat Enhancement: Ecological Evidence (APP-198)) sets out the ecological evidence for fish habitat enhancement as a compensation measure in further detail.

5.5.1.12 A key component of the fish habitat enhancement compensation measure will be research, to gather evidence to contribute towards further understanding links between seagrass and target seabird species filling these knowledge gaps. The Applicant has identified a number of initial potential research topics to be undertaken projects (in addition to the implementation feasibility studies). As part of the restoration efforts in the Humber Estuary the University of Hull is undertaking several studies that the research could cover including:

• A As part of the restoration efforts in the Humber Estuary the University of Hull is undertaking several studies. This will include flish nursery assessment; and

- Connectivity surveys, which will include fish samples in the Humber and near Hornsea Four and the wider North Sea and Stable Isotope Analysis to determine connectivity.
- Connectivity surveys, which will include fish samples in the Humber and near/in
   Hornsea Four and Stable Isotope Analysis to determine connectivity. Foraging
   seagrass habitat study for seabirds including species counts, behavioural observations
   and habitat mapping;
- Fish surveys within seagrass meadows using seine and/or fyke netting; and

•—

Migratory fish tagging to understand fish movements.

<del>5.5.1.13</del> 5.5.1.14	These research topics will be explored in greater detail and a research
programme will be	devised to support of the measures with many of these projects starting
in <del>2021/</del> 2022	

<del>5.5.1.14</del> <u>5.5.1.15</u>	<del>Hornsea F</del>	<del>our is</del>	expected	<del>to </del>	<del>operate</del>	for	<del>35 у</del>	<del>ears</del>	following

<del>enhancement</del> rest	oration.								

5.5.1.15 Adaptive management is an iterative process which combines management measures and subsequent monitoring with the aim of improving effectiveness whilst also updating knowledge and improving decision making over time. Adaptive management wouldwill be an important component of the resilience measure and wouldwill be used as a method to address unforeseen issues or deviations from expected time scales (i.e. additional infill planting required).

### 5.6 Summary of Fish Habitat Enhancement Next Steps

- 5.6.1.1 In summary, the Applicant has commenced seagrass restoration in the Humber Estuary with support from the YWT and the University of Hull. To date, 2 hectares acres (2 ha) has of seagrass have been planted within the Humber Estuary. Further implementation studies are being conducted by OEL and SU to establish how the resilience measure could be continued and expanded to establish a large-scale restoration site or sites in the Humber Estuary or at other sites within the UK, if required for adaptive management. is proposing to fund the expansion of an existing enhancement project that is already underway. During 2022, the Applicant is planning to fund a trial at this proposed enhancement site. The trial would be up to 2 ha in size and the Applicant is funding seed collection in 2021 in order to facilitate this trial. Implementation of the seagrass enhancement project would begin following determination of the DCO application by the Secretary of State if required.
- 5.6.1.2 The enhancement-restoration of seagrass is considered an effective, feasible and securable measure that can be implemented prior to the impact occurring and sustainable for the lifetime of the project. In designing this compensation measure the Applicant has consulted and worked with academics, Natural England, JNCC, the RSPB, The Wildlife Trust, other statutory bodies, and other relevant stakeholders to ensure this compensation measure is

both robust and deliverable.

### 6 Draft DCO Wording

#### Commentary:

Article 40 of the draft DCO currently gives effect to Schedule 16 of the draft DCO:

### **Compensation provisions**

**40.** Schedule 16 (compensation to protect the coherence of the national site network) has effect.

Part 1 and Part 2 of Schedule 16 makes provision for compensatory measures for kittiwake.

Part 3 of Schedule 16 makes provision for a contribution to the Marine Recovery Fund.

Part 4 of Schedule 16 makes provision for fish habitat enhancement.

If necessary, the Secretary of State could amend Schedule 16 to secure compensatory measures for gannet, guillemot and razorbill, in accordance with the draft provisions set out below.

For the avoidance of doubt, no amendment would be required to article 40, which as noted above already gives effect to the entirety of Schedule 16.

### Schedule 16

COMPENSATION TO PROTECT THE COHERENCE OF THE NATIONAL SITE NETWORK

#### Part 1

#### OFFSHORE ORNITHOLOGY ENGAGEMENT GROUP

#### 1. In this Schedule—

"Defra" means the Department for the Environment, Food and Rural Affairs.

"the FFC" means the site designated as the Flamborough and Filey Coast Special protection Area; "GCIMP" means the gannet compensation implementation and monitoring plan for the delivery of measures to compensate for the predicted loss of adult gannet from the FFC as a result of the authorised development;

"GRCIMP" means guillemot and razorbill compensation implementation and monitoring plan for the delivery of measures to compensate for the predicted loss of adult guillemot and razorbill from the FFC as a result of the authorised development;

"KCIMP" means the kittiwake compensation implementation and monitoring plan for the delivery of measures to compensate for the predicted loss of adult kittiwakes from the FFC as a result of the authorised development;

"the gannet compensation plan" means the document certified as the gannet compensation plan by the Secretary of State for the purposes of this Order under article 38 (certification of plans and documents, etc);

"the guillemot and razorbill compensation plan" means the document certified as the guillemot and razorbill compensation plan by the Secretary of State for the purposes of this Order under article 38 (certification of plans and documents, etc);

"the Hornsea Four Offshore Ornithology Engagement Group" or "H4 OOEG" means the group that will assist, through consultation, the undertaker in the delivery of the compensation measures identified in the kittiwake compensation plan, the gannet compensation plan and the guillemot and razorbill compensation plan;

"the kittiwake compensation plan" means the document certified as the kittiwake compensation plan by the Secretary of State for the purposes of this Order under article 38 (certification of plans and documents, etc.);

2. "the Marine Recovery Fund" means the fund operated by Defra pursuant to the Offshore Wind Environmental Improvement Package of the British Energy Security Strategy (April 2022) for the implementation of strategic compensation or any equivalent fund established by a Government body for that purpose.

"the offshore compensation measures" means, as the context requires, bycatch reduction and/or the offshore nesting structure(s); and "the onshore compensation measure" means, as the context requires, predator eradication and/or the onshore nesting structure(s).

3. Work Nos. 1, 2, 3, 4 and 5 together with any associated development offshore may not be commenced until a plan for the work of the H4 OOEG has been submitted to and approved by the Secretary of State, such plan to include—

terms of reference of the H4 OOEG:

details of the membership of the H4 OOEG which must include—

the MMO and the relevant statutory nature conservation body as core members for the offshore compensation measures;

the relevant local planning authority and statutory nature conservation body as core members for the onshore compensation measures;

the RSPB and The Wildlife Trust as advisory members, for both the onshore compensation measures and/or the offshore compensation measures subject to their area of expertise;

<u>details of the proposed schedule of meetings, timetable for preparation of the KCIMP, the</u> GCIMP and the GRCIMP and reporting and review periods;

the dispute resolution mechanism and confidentiality provisions; and

4. the scope of work to be limited to the topics for discussion as identified by the appointed chair to include in relation to the compensation measure, monitoring and adaptive management.

#### Part 2

#### KITTIWAKE COMPENSATION

- 1. Following consultation with the H4 OOEG, the KCIMP must be submitted to the Secretary of State for approval in consultation with the MMO and relevant statutory nature conservation body for the offshore compensation measure (if required), and with the relevant local planning authority and relevant statutory nature conservation body for the onshore compensation measure (if required). The KCIMP must be based on the strategy for kittiwake compensation set out in the kittiwake compensation plan and include—
  - a. details of location where the compensation measure will be delivered, and in the event an onshore structure is required, details of landowner agreement(s) and in the event an offshore structure is required, details of any relevant seabed agreement(s);
  - b. details of the design of the artificial nesting structure; including the projected number of nests that will be accommodated on the structure, and how risks from avian or

- mammalian predation and for an onshore nesting structure how unauthorised human access will be mitigated;
- c. an implementation timetable for delivery of the artificial nesting structure, such timetable to ensure that the structure is in place to allow for at least three full kittiwake breeding seasons prior to operation of any turbine forming part of the authorised development. For the purposes of this paragraph each breeding season is assumed to have commenced on 1st April in each year and ended on 31st August;
- d. details of the maintenance schedule for the artificial nesting structure;
- e. details for the proposed ongoing monitoring of the measure including
  - i. survey methods;
  - ii. survey programmes; and
  - iii. colony and productivity counts;
- f. recording of H4 OOEG consultations;
- g. details of any adaptive management measures, with details of the factors used to trigger any such measures; and
- h. provision for reporting to the Secretary of State, to include details of the use of the structure by breeding kittiwake to identify barriers to success and target any adaptive management measures.
- i. provision for the option to be exercised at the sole discretion of the undertaker to pay a contribution (in addition to the sum stipulated in Part 3 of this Schedule) to the Marine Recovery Fund wholly or partly in substitution for the onshore compensation measure and/or the offshore compensation measure or as an adaptive management measure for the purposes of paragraph 1.g. of this Part of this Schedule. The sum of the contribution to be agreed between the undertaker and Defra in consultation with the OOEG and included in the KCIMP.
- 2. Paragraphs 3, 4 and 5 of this Part of this Schedule shall not apply to the extent that a contribution to the Marine Recovery Fund has been elected in substitution for the onshore compensation measure and/or the offshore compensation measure for the purposes of paragraph 1(i) of this Part of this Schedule.
- 3. The undertaker must construct the artificial nesting structure as set out in the KCIMP approved by the Secretary of State.
- 4. The undertaker must notify the Secretary of State of completion of construction of the artificial nesting structure as set out in the KCIMP.
- 5. The artificial nesting structure must not be decommissioned without prior written approval of the Secretary of State in consultation with relevant statutory nature conservation body.
- 6. The KCIMP approved under this Schedule includes any amendments that may subsequently be approved in writing by the Secretary of State. Any amendments to or variations of the approved KCIMP must be in accordance with the principles set out in the kittiwake compensation plan and may only be approved where it has been demonstrated to the satisfaction of the Secretary of State that it is unlikely to give rise to any materially new or materially different environmental effects from those considered in the kittiwake compensation plan.

#### Part 3

#### CONTRIBUTION TO MARINE RECOVERY FUND

1. No turbine forming part of the authorised development may begin operation until the undertaker has paid the sum of £500,000 (five hundred thousand pounds) to the Marine Recovery Fund.

#### PART 4

#### FISH HABITAT ENHANCEMENT

1. No turbine forming part of the authorised development may begin operation until arrangements for the implementation of fish habitat enhancement measures have been put in place in accordance with the principles set out in the KCIMP, the GCIMP and the GRCIMP.

#### PART 5

#### **GANNET COMPENSATION**

- 2. Following consultation with the H4 OOEG, the GCIMP must be submitted to the Secretary of State for approval in consultation with the MMO and relevant statutory nature conservation body for the offshore compensation measure(s) (if required), and with the relevant local planning authority and relevant statutory nature conservation body for the onshore compensation measure (if required). The GCIMP must be based on the strategy for gannet compensation set out in the gannet compensation plan and must include:
  - a. for the artificial nesting structure measure:
    - i. details of the location where compensation measure will be delivered, and in the event an onshore structure is required, details of landowner agreement(s) and in the event an offshore structure is required, details of any relevant seabed agreement(s);
    - <u>ii.</u> details of the design of the artificial nesting structure; including the projected number of nests that will be accommodated on the structure, and how risks from avian or mammalian predation and for an onshore nesting structure how unauthorised human access will be mitigated;
    - iii. an implementation timetable for delivery of the artificial nesting structure, such timetable to ensure that the structure is in place to allow for at least three full gannet breeding seasons prior to operation of any turbine forming part of the authorised development. For the purposes of this paragraph each breeding season is assumed to have commenced on 1st April in each year and ended on 31st August
    - iv. details of the maintenance schedule for the artificial nesting structure;
    - v. details for the proposed ongoing monitoring of the measure including
      - vi. 1. survey methods;
      - vii. 2. survey programmes; and
      - viii. 3. colony and productivity counts:
    - ix. recording of H4 OOEG consultations;
    - x. details of any adaptive management measures, with details of the factors used to trigger any such measures; and
    - xi. provision for reporting to the Secretary of State, to include details of the use of the structure by breeding gannet to identify barriers to success and target any adaptive management measures;
    - xii. provision for the option to be exercised at the sole discretion of the undertaker to pay a contribution (in addition to the sum stipulated in Part 3 of this Schedule) to the Marine Recovery Fund wholly or partly in substitution for the onshore and/or offshore artificial nesting structures or as an adaptive management measure for the purposes of paragraph 1.a.vii of this Part of this Schedule. The sum of the contribution to be agreed between the undertaker and Defra in consultation with OOEG and included in the GCIMP.
  - b. for the bycatch reduction measure:

- <u>i.</u> details of relevant technology supply agreements and arrangements with <u>fishers to use the bycatch reduction technology that will be or have been</u> secured by the undertaker;
- <u>ii.</u> an implementation timetable for provision of the bycatch reduction measure, such timetable to ensure that contract(s) are entered into with fishers for the provision and use of bycatch reduction technology no later than one year prior to the operation of any turbine forming part of the authorised development;
- <u>iii.</u> details for the proposed ongoing monitoring of the measure including collection of data from participating fishers;
- iv. recording of H4 OOEG consultations;
- v. details of any adaptive management measures and details of the factors used to trigger any such measures; and
- <u>vi.</u> provision for annual reporting to the Secretary of State, to identify barriers to success and target any adaptive management measures.
- vii. provision for the option to be exercised at the sole discretion of the undertaker to pay a contribution (in addition to the sum stipulated in Part 3 of this Schedule) to the Marine Recovery Fund wholly or partly in substitution for the bycatch measures or as an adaptive management measure for the purposes of paragraph 1.b.v of this Part of this Schedule The sum of the contribution to be agreed between the undertaker and Defra in consultation with OOEG and included in the GCIMP.
- 3. Paragraphs 3, 4 and 5 of this Part of this Schedule shall not apply to the extent that a contribution to the Marine Recovery Fund has been elected in substitution for the onshore compensation measure and/or the offshore compensation measure and/or the bycatch compensation measure for the purposes of paragraphs 1.a.ix and 1.b.vii of this Part of this Schedule.
- 4. The undertaker must construct the artificial nesting structure and enter into contract(s) with fishers for the provision and use of bycatch reduction technology as set out in the GCIMP approved by the Secretary of State.
- 5. The undertaker must notify the Secretary of State of completion of construction of the artificial nesting structure and the entering into contract(s) with fishers for the provision and use of bycatch reduction technology as set out in the GCIMP.
- 6. The artificial nesting structure must not be decommissioned without prior written approval of the Secretary of State in consultation with relevant statutory nature conservation body.
- 7. The GCIMP approved under this Schedule includes any amendments that may subsequently be approved in writing by the Secretary of State. Any amendments to or variations of the approved GCIMP must be in accordance with the principles set out in the gannet compensation plan and may only be approved where it has been demonstrated to the satisfaction of the Secretary of State that it is unlikely to give rise to any materially new or materially different environmental effects from those considered in the gannet compensation plan.

### PART 6

### GUILLEMOT AND RAZORBILL COMPENSATION

- 1. Following consultation with the H4 OOEG, the GRCIMP must be submitted to the Secretary of State for approval in consultation with the MMO and relevant statutory nature conservation body for the offshore compensation measure, and with the relevant statutory nature conservation body and the relevant local planning authority and relevant conservation trusts for the onshore compensation measure. The GRCIMP must be based on the strategy for guillemot and razorbill compensation set out in the guillemot and razorbill compensation plan and include:
  - a. for the predator eradication measure:

- i. details of the location(s) where the compensation measure will be delivered;
- <u>ii.</u> details of how any necessary access rights, licences and approvals have or will <u>be obtained and any biosecurity measures will be or have been secured;</u>
- iii. an implementation timetable for delivery of the predator eradication measure, such timetable to ensure that the predator eradication method has commenced no later than two years prior to operation of any turbine forming part of the authorised development;
- iv. details for the proposed ongoing monitoring of the measure including:
  - v. 1. survey methods;
  - vi. 2. survey programmes;
  - vii. 3. productivity rates;
  - viii. 4. breeding population; and
  - ix. 5. distribution of breeding birds;
- x. recording of H4 OOEG consultations;
- <u>xi.</u> details of any adaptive management measures, with details of the factors used to trigger any such measures; and
- xii. provision for reporting to the Secretary of State, to include details of the use of the location(s) by breeding guillemot and razorbill to identify barriers to success and target any adaptive management measures.
- xiii. provision for the option to be exercised at the sole discretion of the undertaker to pay a contribution (in addition to the sum stipulated in Part 3 of this Schedule) to the Marine Recovery Fund wholly or partly in substitution for the predator eradication measures or as an adaptive management measure for the purposes of paragraph 1.a.vi. of this Part of this Schedule) The sum of the contribution to be agreed between the undertaker and Defra in consultation with OOEG and included in the GRCIMP.
- b. for the bycatch reduction measure:
  - i. details of relevant technology supply agreements and arrangements with fishers to use the bycatch reduction technology that will be or have been secured by the undertaker;
  - ii. an implementation timetable for provision of the bycatch reduction measure, such timetable to ensure that contract(s) are entered into with fishers for the provision and use of bycatch reduction technology no later than one year prior to the operation of any turbine forming part of the authorised development;
  - <u>iii.</u> details for the proposed ongoing monitoring of the measure including collection of data from participating fishers;
  - iv. recording of H4 OOEG consultations;
  - v. details of any adaptive management measures and details of the factors used to trigger any such measures; and
  - vi. provision for annual reporting to the Secretary of State, to identify barriers to success and target the adaptive management measures.
  - vii. provision for the option to be exercised at the sole discretion of the undertaker to pay a contribution (in addition to the sum stipulated in Part 3 of this Schedule) to the Marine Recovery Fund wholly or partly in substitution for the bycatch eradication measures or as an adaptive management measure for the purposes of paragraph 1.b.vi of this Part of this Schedule] The sum of the contribution to be agreed between the undertaker and Defra in consultation with OOEG and included in the GRCIMP.

- 2. Paragraphs 3 and 4 of this Part of this Schedule shall not apply to the extent that a contribution to the Marine Recovery Fund has been elected in substitution for the predator eradication measure and/or the bycatch compensation measure for the purposes of paragraphs 1.a.viii and 1.b.vii of this Part of this Schedule.
- 3. The undertaker must carry out the predator eradication method and enter into contract(s) with fishers for the provision and use of bycatch reduction technology as set out in the GRCIMP approved by the Secretary of State.
- 4. The undertaker must notify the Secretary of State of completion of the predator eradication method and entering into contract(s) with fishers for the provision and use of bycatch reduction technology set out in the GRCIMP.
- 5. The GRCIMP approved under this Schedule includes any amendments that may subsequently be approved in writing by the Secretary of State. Any amendments to or variations of the approved GRCIMP must be in accordance with the principles set out in the guillemot and razorbill compensation plan and may only be approved where it has been demonstrated to the satisfaction of the Secretary of State that it is unlikely to give rise to any materially new or materially different environmental effects from those considered in the guillemot and razorbill compensation plan.

#### Commentary:

Article 40 of the draft DCO currently gives effect to Schedule 16 of the draft DCO:

#### **Compensation provisions**

40. Schedule 16 (compensation to protect the coherence of the national site network) has effect.

Part 1 of Schedule 16 makes provision for compensatory measures for kittiwake.

Part 2 of Schedule 16 makes provision for fish habitat enhancement.

If necessary, the Secretary of State could amend Schedule 16 to secure compensatory measures for gannet, guillemot and razorbill, in accordance with the draft provisions set out below. These adopt the drafting for kittiwake compensation specified in the draft DCO submitted at Deadline 2, with necessary amendments to apply to gannet, guillemot and razorbill compensation.

For the avoidance of doubt, no amendment would be required to article 40, which as noted above already gives effect to the entirety of Schedule 16.

#### Schedule [16]

COMPENSATION TO PROTECT THE COHERENCE OF THE NATIONAL SITE NETWORK Ornithology

Compensation Measures

PART PART 1

### OFFSHORE ORNITHOLOGY ENGAGEMENT GROUP The Hornsea Four Offshore Ornithological Engagement Group

#### ——In this Schedule—

"the FFC" means the site designated as the Flamborough and Filey Coast Special protection Area; "GCIMP" means the gannet compensation implementation and monitoring plan for the delivery of measures to compensate for the predicted loss of adult gannet from the FFC as a result of the authorised development;

"GRCIMP" means guillemot and razorbill compensation implementation and monitoring plan for the delivery of measures to compensate for the predicted loss of adult guillemot and razorbill from the FFC as a result of the authorised development;

<u>"KCIMP" means the kittiwake compensation implementation and monitoring plan for the delivery of measures to compensate for the predicted loss of adult kittiwakes from the FFC as a result of the authorised development;</u>

"the gannet compensation plan" means the document certified as the gannet compensation plan by the Secretary of State for the purposes of this Order under article 38 (certification of plans and documents, etc):

<u>"the guillemot and razorbill compensation plan" means the document certified as the guillemot and razorbill compensation plan by the Secretary of State for the purposes of this Order under article 38 (certification of plans and documents, etc);</u>

"the Hornsea Four Offshore Ornithology Engagement Group" or "H4 OOEG" means the group that will assist, through consultation, the undertaker in the delivery of the compensation measures identified in the kittiwake compensation plan, the gannet compensation plan and the guillemot and razorbill compensation plan;

"the kittiwake compensation plan" means the document certified as the kittiwake compensation plan by the Secretary of State for the purposes of this Order under article 38 (certification of plans and documents, etc.);

<u>"the offshore compensation measures" means, as the context requires, bycatch reduction</u> <u>and/or the offshore nesting structure(s); and "the onshore compensation measure" means, as</u> <u>the context requires, predator eradication and/or the onshore nesting structure(s).</u>

Work Nos. 1, 2, 3, 4 and 5 together with any associated development offshore may not be commenced until a plan for the work of the H4 OOEG has been submitted to and approved by the Secretary of State, such plan to include—

### terms of reference of the H4 OOEG;

details of the membership of the H4 OOEG which must include—

 $\frac{\text{the MMO} \text{ and the relevant statutory nature conservation body as core members for the }{\text{offshore compensation measures};}$ 

the relevant local planning authority and statutory nature conservation body as core members for the onshore compensation measures;

the RSPB and The Wildlife Trust as advisory members, for both the onshore compensation measures and/or the offshore compensation measures subject to their area of expertise;

details of the proposed schedule of meetings, timetable for preparation of the KCIMP, the GCIMP and the GRCIMP and reporting and review periods;

the dispute resolution mechanism and confidentiality provisions; and

the scope of work to be limited to the topics for discussion as identified by the appointed chair to include in relation to the compensation measure, monitoring and adaptive management.

#### 1. In this Schedule:

"The FFC" means the site designated as the Flamborough and Filey Coast Special Protection Area;

"the gannet and kittiwake compensation plan" means the document certified as the gannet and kittiwake compensation plan by the Secretary of State for the purposes of this Order under article 38 (certification of plans and documents etc.);

"the gannet guillemot and razorbill compensation plan" means the document certified as the gannet razorbill and guillemot compensation plan by the Secretary of State for the purposes of this Order under article 38 (certification of plans and documents etc.);

"the Hornsea Four Offshore Ornithology Engagement Group" or "H4 OOEG" means the group that will assist, through consultation, the undertaker in the delivery of the compensation measures identified in the gannet and kittiwake compensation plan and the gannet razorbill and guillemot compensation plan;

"the offshore compensation measures" means, as the context requires, bycatch reduction and/or the offshore nesting structure(s); and

"the onshore compensation measures" means, as the context requires, predator eradication and/or predator control measures and/or the onshore nesting structure(s).

- 2. Work Nos. 1, 2, 3, 4 and 5 together with any associated development offshore may not be commenced until a plan for the work of the "H4 OOEG" has been submitted to and approved by the Secretary of State. Such plan to include:
  - a) terms of reference of the H4 OOEG;
  - b) details of the membership of the H4 OOEG which must include:
    - i. the MMO and the relevant statutory nature conservation body as core members for offshore compensation measures and
    - ii. the relevant local planning authority and statutory nature conservation body as core members for onshore compensation measures;
    - iii. the RSPB and The Wildlife Trust and the National Federation of Fishermens
      Organisations as advisory members, for both onshore compensation measures
      and/or offshore compensation measures subject to their area of expertise;
  - c) details of the proposed schedule of meetings, timetable for preparation of the gannet and kittiwake implementation and monitoring plan ("the KGCIMP") and the gannet, guillemot and razorbill implementation and monitoring plan ("GGRIMP") and reporting and review periods;
  - d) the dispute resolution mechanism and confidentiality provisions;

e) the scope of the H4 OOEG to be limited to the topics for discussion as identified by the Applicant as chair of the H4 OOEG to include in relation to each compensation measure, site selection, project/study design, methodology for implementing the measure, monitoring and adaptive management options.

#### PART 2

#### **Gannet and Kittiwake Compensation Measures**

- 3. The GKCIMP must be submitted to the Secretary of State for approval in consultation with the MMO and relevant statutory nature conservation body for offshore compensation measures (if required), and with Natural England and the relevant local planning authority for onshore compensation measures (if required). The KCGIMP must be based on the strategy for gannet and kittiwake compensation set out in the gannet and kittiwake compensation plan and include:
  - a) details of locatons where compensation measures will be deployed, and in the event onshore structures are required, details of landowner agreements and in the event new offshore structures are required, details of the seabed agreements with the relevant owner of the foreshore;
  - b) details of designs of artifical nesting structure(s); and how risks from avian or mammalian
    predation and for onshore nesting structures how unauthorised human access will be
    mitigated;
  - c) an implementation timetable for delivery of the artificial nesting structure, such timetable to ensure that in the event of the implementation of:
    - a new or repurposed onshore or offshore structure that does not host an existing colony, the structure is in place to allow for two kittiwake and gannet breeding seasons prior to operation of any turbine forming part of the authorised development; or
    - ii. a repurposed onshore or offshore structure that hosts an existing colony the structure is in place to allow for one kittiwake and gannet breeding season prior to operation of any turbine forming part of the authorised development;
    - For the purposes of this paragraph each breeding season is assumed to have commenced on 1 April in each year and ended on 31st August.
  - d) details of the proposed ongoing monitoring of the measures including: survey methods; survey programmes and colony and productivity counts;
  - e) recording of H4 OOEG consultations;
  - details of any adaptive management measures, with details of the factors used to trigger any such measures;
  - g) provision for reporting to the Secretary of State, to include details of the use of each site by breeding kittiwake and gannet to identify barriers to success and target any adaptive management measures; and
  - h) details of the artificial nesting site maintenance schedule for the articial nesting structure.;
  - i) in the event that the undertaker must implement bycatch reduction measures for gannet the information listed in paragraph 9(b)
- 4. The undertaker must construct the compensation measures as set out in the GKCIMP approved by the Secretary of State.

- 5. The undertaker must notify the Secretary of State of completion of implementation of the measures set out in the GKCIMP.
- 6. The artificial nest structure must not be decommissioned without prior written approval of the Secretary of State.
- 7. The GKCIMP approved under this Schedule includes any amendments that may subsequently be approved in writing by the Secretary of State. Any amendments to or variations of the approved KCGIMP must be in accordance with the principles set out in the gannet and kittiwake compensation plan and may only be approved where it has been demonsrated to the sastisfaction of the Secretary of State that it is unlikely to give rise to any materially new or matterially different environmental effects from those considered in the gannet and kittiwake compensation plan.

  PART 2

#### KITTIWAKE COMPENSATION

Following consultation with the H4 OOEG, the KCIMP must be submitted to the Secretary of State for approval in consultation with the MMO and relevant statutory nature conservation body for the offshore compensation measure (if required), and with the relevant local planning authority and relevant statutory nature conservation body for the onshore compensation measure (if required). The KCIMP must be based on the strategy for kittiwake compensation set out in the kittiwake compensation plan and include—

details of location where the compensation measure will be delivered, and in the event an onshore structure is required, details of landowner agreement(s) and in the event an offshore structure is required, details of any relevant seabed agreement(s);

details of the design of the artificial nesting structure; including the projected number of nests that will be accommodated on the structure, and how risks from avian or mammalian predation and for an onshore nesting structure how unauthorised human access will be mitigated;

an implementation timetable for delivery of the artificial nesting structure, such timetable to ensure that the structure is in place to allow for at least three full kittiwake breeding seasons prior to operation of any turbine forming part of the authorised development. For the purposes of this paragraph each breeding season is assumed to have commenced on 1st April in each year and ended on 31st August;

details of the maintenance schedule for the artificial nesting structure;

details for the proposed ongoing monitoring of the measure including—

survey methods;

survey programmes; and

colony and productivity counts;

recording of H4 OOEG consultations;

details of any adaptive management measures, with details of the factors used to trigger any such measures; and

provision for reporting to the Secretary of State, to include details of the use of the structure by breeding kittiwake to identify barriers to success and target any adaptive management measures.

The undertaker must construct the artificial nesting structure as set out in the KCIMP approved by the Secretary of State.

The undertaker must notify the Secretary of State of completion of construction of the artificial nesting structure as set out in the KCIMP.

The artificial nesting structure must not be decommissioned without prior written approval of the Secretary of State in consultation with relevant statutory nature conservation body.

The KCIMP approved under this Schedule includes any amendments that may subsequently be approved in writing by the Secretary of State. Any amendments to or variations of the approved KCIMP must be in accordance with the principles set out in the kittiwake compensation plan and may only be approved where it has been demonstrated to the satisfaction of the Secretary of State that it is unlikely to give rise to any materially new or materially different environmental effects from those considered in the kittiwake compensation plan.

#### PART 3

#### FISH HABITAT ENHANCEMENT Gannet Guillemot and Razorbill Compensation Measures

- No turbine forming part of the authorised development may begin operation until arrangements for the implementation of fish habitat enhancement measures have been put in place in accordance with the principles set out in the KCIMP, the GCIMP and the GRCIMP.
- 8.—The GGRIMP must be submitted to the Secretary of State for approval in consultation with the MMO and the relevant statutory nature conservation body for offshore compensation measures, and with the relevant statutory nature conservation body and the relevant local planning authority and relevant conservation trusts for onshore compensation measures. The GGRIMP must be based on the strategy for gannet, guillemot and razorbill compensation set out in the gannet guillemot and razorbill compensation plan and include:
  - a)—in the event that the undertaker must implement predator eradication and/or predator control measures
    - i.—details of locatons where compensation measures will be deployed;
    - ii. details of how any necessary access rights, licences and approvals have or will be obtained and any biosecurity measures will or have been secured;
    - iii. an implementation timetable for delivery of the predator eradication and/or predator control measure that ensures that the measure has been implemented two years prior to operation of any turbine forming part of the authorised development;
    - iv. proposals for monitoring and reporting on the effectiveness of the measures, including productivity rates; breeding population and distribution of breeding birds;
    - v.—recording of H4 OOEG consultations;
    - vi.—details of any adaptive management measures, with details of the factors used to trigger any such measures; and
    - vii.—provision for reporting to the Secretary of State, to include details of the use of each site by breeding guillemot and razorbill to identify barriers to success and target the adapative management measures.
  - b) in the event that the undertaker must implement bycatch reduction measures

- i.—details of relevant technology supply agreements and arrangements with fishers to uptake the bycatch reduction technology that will or has been secured;
- ii.—an implementation timetable for provision of the bycatch reduction measures that ensures that the measures are in place prior to the operation of any turbine forming part of the authorised development;
- iii. proposals for monitoring and reporting on the effectiveness of the measures, including the collection of data from participating fishers;
- iv.—recording of H4 OOEG consultations;
- v. details of any adaptive management measures and details of the factors used to trigger adaptive management measures for each species; and
- vi. provision for annual reporting to the Secretary of State, to identify barriers to success and target the adapative management measures.
- 9. The undertaker must implement the compensation measures as set out in the GGRIMP approved by the Secretary of State.
- 10. The undertaker must notify the Secretary of State of completion of implementation of the measures set out in the GGRIMP.
- 11. The GGRIMP approved under this Schedule includes any amendments that may subsequently be approved in writing by the Secretary of State. Any amendments to or variations of the approved GGRIMP must be in accordance with the principles set out in the gannet, guilemot and razorbill compensation plan and may only be approved where it has been demonsrated to the sastisfaction of the Secretary of State that it is unlikely to give rise to any materially new or matterially different environmental effects from those considered in the kittiwake compensation plan.

#### PART 4

### Fish Habitat Enhancement PART 4

### **GANNET COMPENSATION**

- Following consultation with the H4 OOEG, the GCIMP must be submitted to the Secretary of State for approval in consultation with the MMO and relevant statutory nature conservation body for the offshore compensation measure(s) (if required), and with the relevant local planning authority and relevant statutory nature conservation body for the onshore compensation measure (if required). The GCIMP must be based on the strategy for gannet compensation set out in the gannet compensation plan and must include:
  - <u>for the artificial nesting structure measure:</u>
    - details of the location where compensation measure will be delivered, and in the event an onshore structure is required, details of landowner agreement(s) and in the event an offshore structure is required, details of any relevant seabed agreement(s);
    - details of the design of the artificial nesting structure; including the projected number of nests that will be accommodated on the structure, and how risks from avian or mammalian predation and for an onshore nesting structure how unauthorised human access will be mitigated;

- —an implementation timetable for delivery of the artificial nesting structure, such timetable to ensure that the structure is in place to allow for at least three full gannet breeding seasons prior to operation of any turbine forming part of the authorised development. For the purposes of this paragraph each breeding season is assumed to have commenced on 1st April in each year and ended on 31st August
- -details of the maintenance schedule for the artificial nesting structure;
- —details for the proposed ongoing monitoring of the measure including
  - 1. survey methods;
  - 2. survey programmes; and
  - 3. colony and productivity counts;
- -recording of H4 OOEG consultations;
- <u>details of any adaptive management measures, with details of the factors used to trigger any such measures; and</u>
- provision for reporting to the Secretary of State, to include details of the use of the structure by breeding gannet to identify barriers to success and target any adaptive management measures;
- for the bycatch reduction measure:
  - <u>details of relevant technology supply agreements and arrangements with</u> <u>fishers to use the bycatch reduction technology that will be or have been</u> <u>secured by the undertaker;</u>
  - —an implementation timetable for provision of the bycatch reduction measure, such timetable to ensure that contract(s) are entered into with fishers for the provision and use of bycatch reduction technology no later than one year prior to the operation of any turbine forming part of the authorised development;
  - <u>details for the proposed ongoing monitoring of the measure including collection of data from participating fishers;</u>
  - -recording of H4 OOEG consultations;
  - <u>details of any adaptive management measures and details of the factors used to trigger any such measures; and</u>
  - provision for annual reporting to the Secretary of State, to identify barriers to success and target any adaptive management measures.
- The undertaker must construct the artificial nesting structure and enter into contract(s) with fishers for the provision and use of bycatch reduction technology as set out in the GCIMP approved by the Secretary of State.
- The undertaker must notify the Secretary of State of completion of construction of the artificial nesting structure and the entering into contract(s) with fishers for the provision and use of bycatch reduction technology as set out in the GCIMP.
- The artificial nesting structure must not be decommissioned without prior written approval of the Secretary of State in consultation with relevant statutory nature conservation body.
- The GCIMP approved under this Schedule includes any amendments that may subsequently be approved in writing by the Secretary of State. Any amendments to or variations of the approved GCIMP must be in accordance with the principles set out in the gannet compensation plan and may only be approved where it has been demonstrated to the satisfaction of the Secretary of State that it is unlikely to give rise to any materially new or materially different environmental effects from those considered in the gannet compensation plan.

12. No turbine forming part of the authorised development may begin operation until the fish habitat enhancement measures have been implemented in accordance with the principles as set out in the GKCIMP and the GGRIMP (as relevant).

#### PART 5

### **GUILLEMOT AND RAZORBILL COMPENSATION**

- Following consultation with the H4 OOEG, the GRCIMP must be submitted to the Secretary of State for approval in consultation with the MMO and relevant statutory nature conservation body for the offshore compensation measure, and with the relevant statutory nature conservation body and the relevant local planning authority and relevant conservation trusts for the onshore compensation measure. The GRCIMP must be based on the strategy for guillemot and razorbill compensation set out in the guillemot and razorbill compensation plan and include:
  - for the predator eradication measure:
    - -details of the location(s) where the compensation measure will be delivered;
    - <u>details of how any necessary access rights, licences and approvals have or will be obtained and any biosecurity measures will be or have been secured;</u>
    - —an implementation timetable for delivery of the predator eradication measure, such timetable to ensure that the predator eradication method has commenced no later than two years prior to operation of any turbine forming part of the authorised development;
    - —details for the proposed ongoing monitoring of the measure including:
      - 1. survey methods;
      - 2. survey programmes;
      - 3. productivity rates;
      - 4. breeding population; and
      - 5. distribution of breeding birds;
    - -recording of H4 OOEG consultations;
    - <u>details of any adaptive management measures, with details of the factors used to trigger any such measures; and</u>
    - —provision for reporting to the Secretary of State, to include details of the use of the location(s) by breeding guillemot and razorbill to identify barriers to success and target any adaptive management measures.
  - for the bycatch reduction measure:
    - <u>details of relevant technology supply agreements and arrangements with</u> <u>fishers to use the bycatch reduction technology that will be or have been secured by the undertaker;</u>
    - —an implementation timetable for provision of the bycatch reduction measure, such timetable to ensure that contract(s) are entered into with fishers for the provision and use of bycatch reduction technology no later than one year prior to the operation of any turbine forming part of the authorised development;
    - <u>details for the proposed ongoing monitoring of the measure including collection of data from participating fishers;</u>
    - -recording of H4 OOEG consultations;
    - —<u>details of any adaptive management measures and details of the factors</u> used to trigger any such measures; and

— <u>provision for annual reporting to the Secretary of State, to identify barriers to success and target the adaptive management measures.</u>

- The undertaker must carry out the predator eradication method and enter into contract(s) with fishers for the provision and use of bycatch reduction technology as set out in the GRCIMP approved by the Secretary of State.
- The undertaker must notify the Secretary of State of completion of the predator eradication method and entering into contract(s) with fishers for the provision and use of bycatch reduction technology set out in the GRCIMP.
- The GRCIMP approved under this Schedule includes any amendments that may subsequently be approved in writing by the Secretary of State. Any amendments to or variations of the approved GRCIMP must be in accordance with the principles set out in the guillemot and razorbill compensation plan and may only be approved where it has been demonstrated to the satisfaction of the Secretary of State that it is unlikely to give rise to any materially new or materially different environmental effects from those considered in the guillemot and razorbill compensation plan.

### 67 Funding

6.1.1.17.1.1.1 The Applicant has identified the costs associated with the development, implementation and ongoing monitoring of the proposed measures. These costs have been included within a detailed Funding Statement (B2.10: The Without Prejudice Derogation Funding Statement (APP-202)). This statement is supplemental to the Funding Statement submitted as part of the suite of Application documents (Volume E.1.1 Funding Statement (REP2-018)(APP-224)). The Without Prejudice Derogation Funding Statement outlines the overall project cost based on the capital expenditure and operational expenditure assumptions in the "Review of Renewable Electricity Generation Cost and Technical Assumptions" (DECC, 2016). The Without Prejudice Derogation Funding Statement also details the corporate structure and a robust explanation to allow the Secretary of State to conclude that the necessary funding to deliver the measures can be secured.

### **78** Conclusion

- 7.1.1.18.1.1.1 This document sets out the Compensation Plan for common guillemot *Uria aalge* (guillemot) and, razorbill *Alca torda* and northern gannet *Morus bassanus* associated with the Flamborough and Filey Coast (FFC) Special Protection Area (SPA). Collectively it has been termed the Gannet Guillemot and Razorbill Compensation Plan. It has been developed in support of Hornsea Four should the Secretary of State disagree with the conclusions of the Applicant's RIAA in relation to the impact and find that adverse effects on the integrity of the FFC SPA cannot be ruled out.
- 7.1.1.28.1.1.2 A suite of compensation measures are proposed for gannet, guillemot and razorbill which are outlined below in Table 1.
- 7.1.1.38.1.1.3 There are two potential primary compensation measures being proposed. The objective of the first is to attain removal of (invasive) predators or implement control (dependent on location i.e. control plan for islets that are accessible during low tide) for a chosen location and monitor the response of guillemot and/or razorbill population numbers as a consequence of the removal of this pressure. The second measure has the objective of reducing bycatch at a chosen fishery or fisheries hence reducing the number of direct mortalities per annum. Finally, as part of the package of measures to support—gannet, guillemot and razorbill (and as outlined within the Kittiwake Compensation Plan and Gannet Compensation Plan as well), fish habitat enhancement is being undertaken within the

Humber Estuary as a resilience measure with the potential for restoration at another would also be undertaken at a chosen location(s) following implementation studies. The habitat restored (namely, seagrass) would will support a number of fish species upon which guillemot and razorbill (and seabirds more generally including kittiwake and gannet) target as prey resource, therefore, this measure serves to offer resilience to the gannet, guillemot and razorbill populations within the targeted area (s).

Table 38-1: Compensation Measures proposed by Hornsea Four for gannet, guillemot and

<del>razorbill.</del>

———Compensation	——Target —	<del>Summary</del>
<del>Measure</del>	<del>Species</del>	
Predator Eradication/ Control (dependent on location)	— Guillemot — Razorbill	Measures involve the initial identification of a suitable location with guillemot and razorbill colony/colonies which also supports a population of (invasive) predators Following a successful feasibility implementation assessment, are radication project would take place with subsequent monitoring for productivity of the guillemot and razorbill population.  Biosecurity is a key site management protocol to limit potential invasions during eradication and re-infestations following the eradication project. For a control project, this would be set up and monitored over the course of the project with biosecurity measures to help reduce numbers present. This would form the second stage of the delivery of this measure. See Section 3 for further details.
Bycatch reduction	— Guillemot — Razorbill — Gannet — —	Measures involve the initial identification of gannet, guillemot and razorbill bycatch rates in gillnets and techniques that may be deployed to reduce this. Following the implementation of a method/methods monitoring will be undertaken to assess the bycatch rates of gannet, guillemot and razorbill. See Section 4 for further details.

— Fish Habitat	Guillemot	This measure would comprise the
Enhancement	— Razorbill — Gannet	enhancement of a chosen site(s) where seagrass beds have been known to previously exist and works undertaken to restore (or reinstate) this habitat. The success of the reinstatement would be monitored along with the recording of
		increased biodiversity within the habitats including fish species. See Section 5 for further details.

- 7.1.1.48.1.1.4 Hornsea Four are confident that each of the measures on their own is securable, deliverable and capable of maintaining the coherence of the national site network. The inclusion of a suite of measures provides stakeholders with additional comfort on the level of compensation that can be provided as does the inclusion of the option to discharge the compensation requirements through the delivery of strategic compensation. There is clear evidence to support the suite of measures. The Applicant has presented detailed reviews of the evidence base supporting each of the compensation measures which can be found in the following documents: B2.8.1 Compensation measures for FFC SPA: Bycatch Reduction: Ecological Evidence (APP-194); B2.8.3 Compensation measures for FFC SPA: Predator Eradication: Ecological Evidence (APP-196); and B2.8.5 Compensation measures for FFC SPA: Fish Habitat Enhancement: Ecological Evidence (APP-198)).
- 7.1.1.58.1.1.5 In terms of next steps, should thesefor these compensation and resilience measures, be required a Rroadmap document has been produced for each measure which details the process that wouldwill be undertaken for delivery of the measure if required. These roadmaps accompany the DCO application and are: Revision 4 of B2.8.2 Compensation measures for FFC SPA: Bycatch Reduction: Roadmap (updated at Deadline 5), Revision 4 of B.2.8.4 Compensation measures for FFC SPA: Predator Eradication: Roadmap (updated at Deadline 5) and and Revision 4 of B2.8.6 Compensation measures for FFC SPA: Fish Habitat Enhancement: Roadmap (updated at Deadline 5). The compensation measures are viable, effective, feasible and can be secured and delivered to successfully compensate for the potential impacts of Hornsea Four.
