ENERGY WHITE PAPER

# Ministerial foreword

The government presents this white paper at a time of unprecedented peacetime challenge to our country.

Coronavirus has taken a heavy toll on our society and on our economy. But we will overcome COVID-19 and rebuild our economy, building back better and levelling up the country.

As we do so, we must address the inter-generational challenge of climate change. Unchecked, the impact of rising global temperatures represents an existential threat to the planet. So, building back better means building back greener.

The UK has set a world-leading net zero target, the first major economy to do so, but simply setting the target is not enough – we need to achieve it. Failing to act will result in natural catastrophes and changing weather patterns, as well as significant economic damage, supply chain disruption and displacement of populations.

Tackling climate change will require decisive global action and significant investment and innovation by the public and private sectors, creating whole new industries, technologies, and professions.

But fighting climate change offers huge opportunity for both growth and job creation. The global markets for low-carbon technologies, electric vehicles and clean energy are fast growing: zero emission vehicles could support 40,000 jobs by 2030, with exports of new technologies such as CCUS having the potential to add £3.6 billion GVA by 2030. The time is now to seize these opportunities.

This white paper puts net zero and our effort to fight climate change at its core, following the Prime Minister's Ten Point Plan for a Green Industrial Revolution. The Ten Point Plan sets out how government investment will leverage billions of pounds more of private investment and support up to 250,000 jobs by 2030.

This includes building on our leadership in offshore wind to target 40GW by 2030 – enough to power every home in the UK – which alone will support up to 60,000 jobs.

The way we produce and use energy is therefore at the heart of this. Our success will rest on a decisive shift away from fossil fuels to using clean energy for heat and industrial processes, as much as for electricity generation.

These are more than academic considerations; the shift to net zero will affect us all. This white paper presents a vision of how we make the transition to clean energy by 2050 and what this will mean for us as consumers of energy in our homes and places of work, or for how businesses use energy to produce goods and services.

It sets out the changes which will be required. We will reduce emissions through shifting from gas to electricity to heat our homes and by better insulating the buildings in which we live and work. We will end the sale of petrol and diesel cars and vans, and accelerate the transition to clean, zero tailpipe emission vehicles. We will start to capture carbon emissions from power generation and from industry. And we will switch to new, clean fuels such as hydrogen for heat, power and industrial processes.

As we leave fossil fuels behind us and increasingly rely on clean electricity, our experiences as energy consumers will be very different. Smart technologies are revolutionising how we can engage the market. Smart meters and a range of smart appliances, backed by new smart tariffs, will give us control about how we use energy and help us manage our bills – running the washing machine or charging the electric vehicle when demand is low and electricity is cheap, even selling surplus power back to the grid at a profit.

And we will do this with affordability at the front of our minds. The costs of renewables have fallen sharply over the last five years. Offshore wind prices in renewable Contracts for Difference auctions have fallen from £120/MWh in 2015 to around £40/MWh in last year's auction.

Greater competition and more innovation will drive down the costs of our energy system even further. We expect energy companies to ensure that the benefits of a more efficient system result in a fair deal for consumers. Where we use taxpayers' money to fund the transition to clean energy, we will leverage private capital as much as we can.

Across the board, as a result of our policies, energy bills will remain affordable over the 2020s. A major push on improving the energy efficiency of our homes will mean households can significantly reduce demand and save money on their bills.

We understand the effect that COVID-19 has had on household incomes, and therefore commit to protecting those who are particularly vulnerable. Lower income households can receive up to £10,000 to improve the energy efficiency of their homes via the Green Homes Grant scheme, saving up to £600 each year on bills on average. Through this white paper, we are expanding the Warm Home Discount to around three million homes to provide £150 a year off electricity bills, representing £1.9 billion of extra support for households in fuel poverty. This builds on the Ten Point Plan's commitment to extend the Energy Company Obligation to 2026.

This is an ambitious domestic agenda on which we will also seek to secure equally ambitious international action, through the UK's presidency of COP26, the UN's climate conference being held in Glasgow in November 2021. The actions we take as a result of this white paper, as part of our wider climate agenda, are intended to show leadership and vision and demonstrate to our partners around the world that now is the time to take the bold steps to tackle climate change. The UK is leading from the front in the transition to clean energy, while ensuring that we leave no one behind as we build back greener.

### **Rt Hon Alok Sharma MP**

Secretary of State for Business,  
Energy and Industrial Strategy

## INTRODUCTION

# We are on the cusp of a global Green Industrial Revolution.

The Prime Minister's Ten Point Plan has set out the measures that will help ensure the UK is at the forefront of this revolution, just as we led the first over two centuries ago.

As nations move out of the shadow of coronavirus and confront the challenge of climate change with renewed vigour, markets for new green products and services will spring up round the world. Taking action now will help ensure not just that we end our contribution to climate change by achieving our target of net zero emissions. It will help position UK companies and our world class research base to seize the business opportunities which flow from it, creating jobs and wealth for our country.

Following on from the Ten Point Plan and the National Infrastructure Strategy, the Energy White Paper provides further clarity on the Prime Minister's measures and puts in place a strategy for the wider energy system that:

- ▶ **Transforms energy**, building a cleaner, greener future for our country, our people and our planet
- ▶ **Supports a green recovery**, growing our economy, supporting thousands of green jobs across the country in new green industries and leveraging new green export opportunities
- ▶ **Creates a fair deal for consumers**, protecting the fuel poor, providing opportunities to save money on bills, giving us warmer, more comfortable homes and balancing investment against bill impacts

# THE COMPELLING CASE FOR TACKLING CLIMATE CHANGE

We are reminded on a daily basis why we need this Green Industrial Revolution: climate change is having a real effect on our planet.

The melting of glaciers and ice sheets is accelerating, contributing to rising sea levels across the globe, with melting rates of ice sheets in Greenland and Antarctica matching the Intergovernmental Panel on Climate Change's worst-case climate warming scenarios.<sup>1</sup> All ten of the warmest years in the UK's temperature record have taken place since 2002.<sup>2</sup> Rainfall over Scotland is up 10 per cent from the start of the 20th century.<sup>3</sup> The record-breaking European summer heatwave of 2003 resulted in at least 70,000 deaths across the continent,<sup>4</sup> and such heatwaves are projected to become the norm in the UK by the 2040s at current rates of warming.<sup>5</sup>

We need to act urgently. The future impacts of climate change depend upon how much we can hold down the rising global temperature. To minimise the risk of dangerous climate change, the landmark Paris Agreement of 2015 aims to halt global warming at well below 2°C, while pursuing efforts to limit it to 1.5°C, increasing measures to adapt to climate change, and aligning financial systems to these goals.<sup>6</sup>

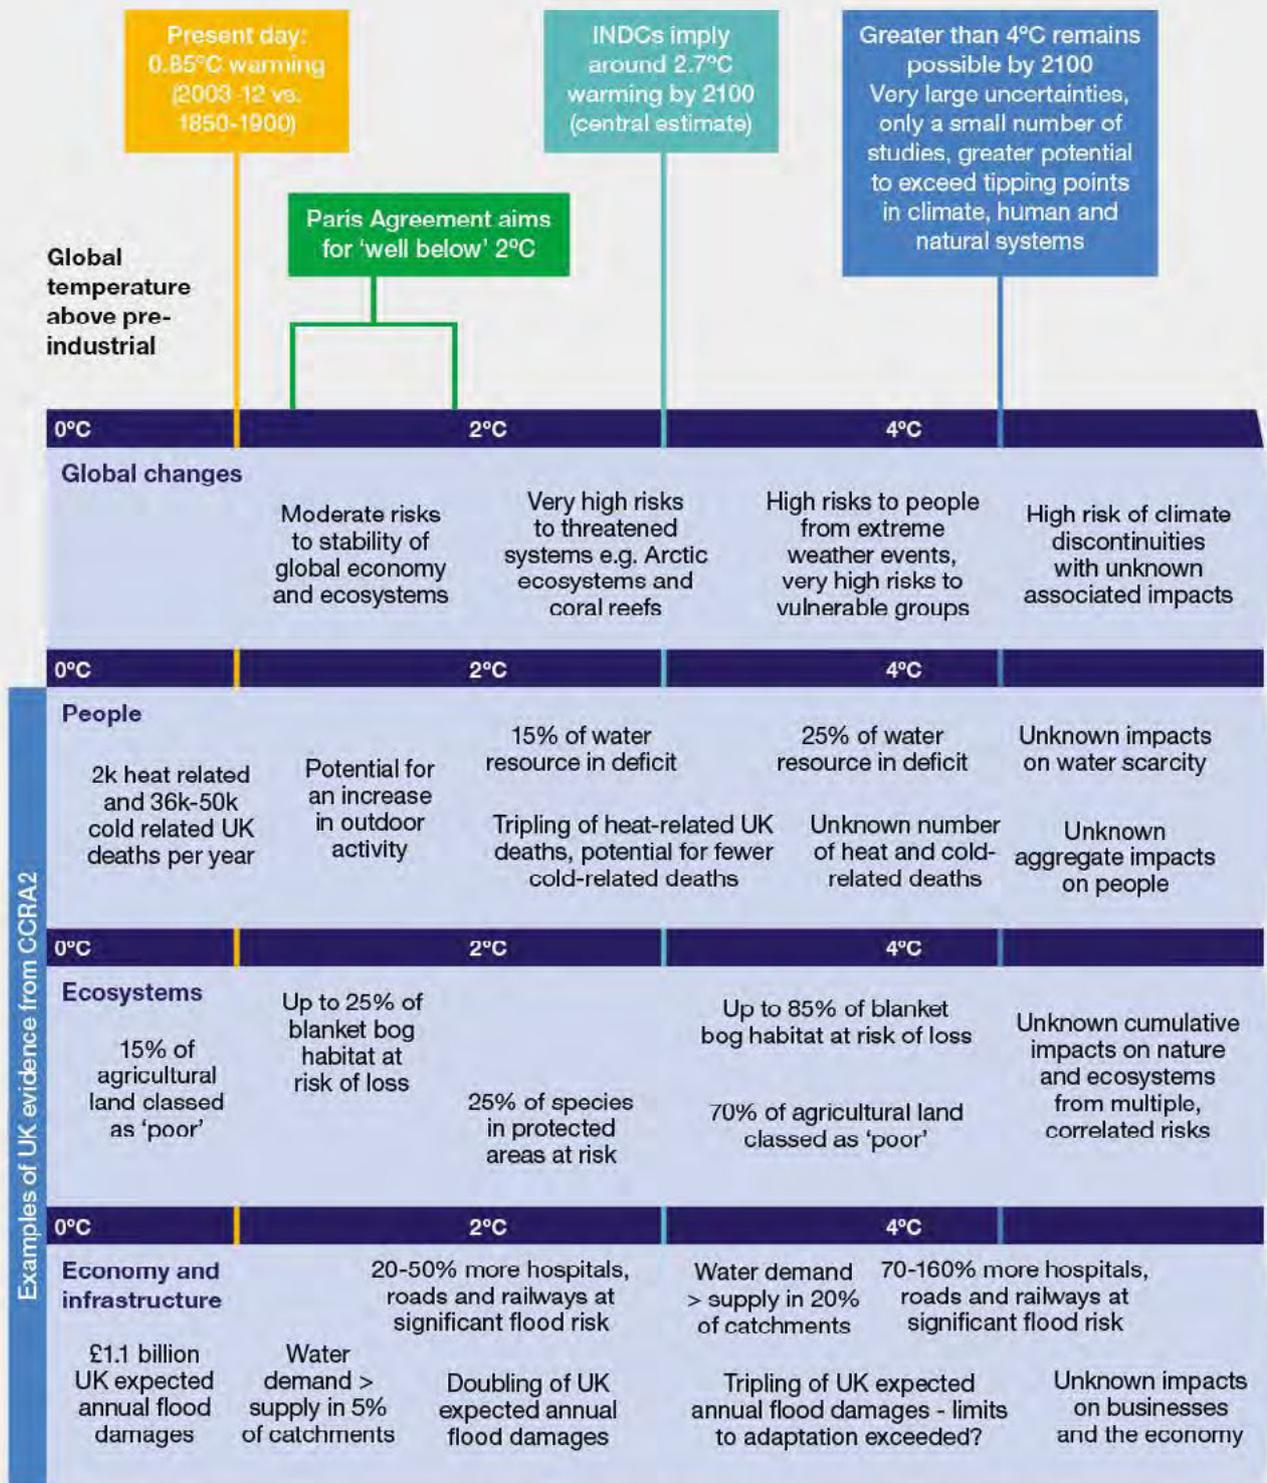

At the global scale, however, we are not presently on track to reach the temperature goal of the Paris Agreement. Based on current national pledges, and assuming the level of ambition does not change, the world is heading for around 3°C of warming by the end of the century.<sup>7</sup>

The cost of inaction is too high.<sup>8</sup> We can expect to see severe impacts under 3°C of warming. Globally, the chances of there being a major heatwave in any given year would increase to about 79 per cent, compared to a five per cent chance now.<sup>9</sup> Many regions of the world would see what is now considered a 1-in-100-year drought happening every two to five years.<sup>10</sup>

At 3°C of global warming, the UK is expected to be significantly affected, seeing sea level rise of up to 0.83 m.<sup>11</sup> River flooding would cause twice as much economic damage and affect twice as many people, compared to today,<sup>12</sup> while by 2050, up to 7,000 people could die every year due to heat, compared to approximately 2,000 today.<sup>13</sup> And, without action now, we cannot rule out 4°C of warming by the end of the century, with real risks of higher warming than that.<sup>14</sup> A warming of 4°C would increase the risk of passing thresholds that would result in large scale and irreversible changes to the global climate, including large-scale methane release from thawing permafrost and the collapse of the Atlantic Meridional Overturning Circulation.<sup>15</sup> The loss of ice sheets could result in multi-metre rises in sea level on time scales of a century to millennia.<sup>16</sup>

To meet the temperature goal of the Paris Agreement, the world must collectively and rapidly reduce global emissions to net zero over the next 30 years. Success will mean we are less exposed to flood and heat risks and preserve our national security, our prosperity, and our natural world which are threatened by the global disruption of climate change.

## OUR DOMESTIC AGENDA

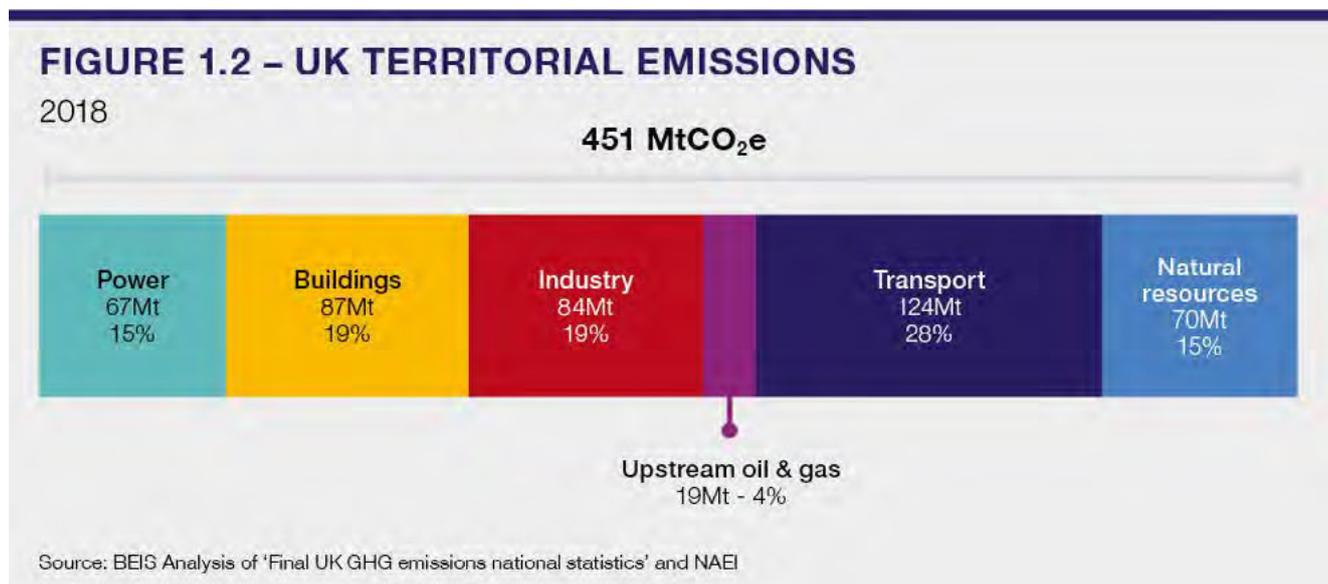

As we tackle climate change, we will have the interests of consumers at the front of our mind, now and for future generations.

We are committed to ensuring that the cost of the transition to net zero is fair and affordable. We have consistently balanced spending on measures that decarbonise the energy system with the need to help consumers save money on their bills. Thanks to early investment, many low-carbon technologies are now cheaper than their fossil fuel counterparts.

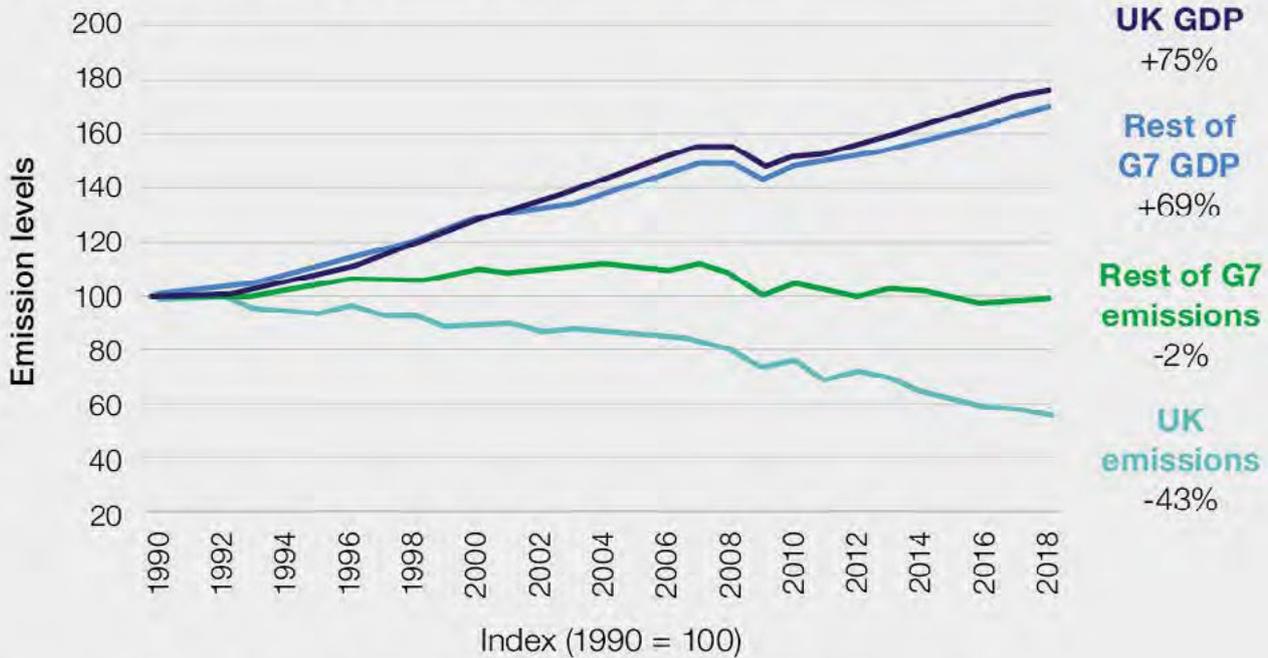

Our vision is of a system with consumers at its heart, able to make money or save on bills through using the new technologies net zero will require. So our approach means not just deploying measures that save energy and reduce bills, but also ensuring the energy system is fit for a net zero world, making markets efficient, incentivising people to move to clean energy solutions, or making sure system rules are agile and flexible to accommodate new technologies and new ways of doing things.

But affordability does not mean compromising our ambition. Achieving our 2050 goal requires action across the economy. The measures in this white paper will reduce emissions from power, buildings, industry, upstream oil and gas, and address the implications for the energy system of electrifying surface transport. We will publish our wider Transport Decarbonisation Plan in the spring.

Action on energy will be consistent with our wider environmental commitments, as we balance new technologies and the need for new infrastructure with protecting the environment, including air quality. Our 25 Year Environment Plan aims to improve the environment within a generation. Through the Environment Bill, we are placing this ambitious set of proposals on a legal footing, including a commitment to bring forward new legally binding environmental targets (on air quality, biodiversity, water, and resource efficiency and waste reduction) by October 2022.

**FIGURE 1.3 – UK VS REST OF G7 GDP AND EMISSIONS**

Source: World Bank, UNFCCC National Inventory Submissions, ONS, BEIS Greenhouse Gas Inventory 1990-2018.

Our National Adaptation Programme, which was updated in 2018, sets out the actions which the government is, and will be taking, to address the risks and opportunities posed by climate change in response to the Climate Change Risk Assessment. This includes a dedicated chapter on infrastructure, including actions to build the energy sector’s resilience to climate change.

No one doubts the challenge of achieving net zero emissions, but the UK is able to build on 30 years of successfully reducing emissions while simultaneously growing our economy. Between 1990 and 2018, emissions fell by 43 per cent while GDP rose by 75 per cent, with the UK decarbonising faster than any other G20 country since 2000 (Figure 1.3).<sup>18</sup>

Energy has led the way. In 2019, greenhouse gas emissions (MtCO<sub>2</sub>e) from electricity generation were down 13 per cent on 2018 levels and 72 per cent lower than 1990 levels,<sup>19</sup> as we have switched from

coal to gas and renewable power together with the continued contribution of nuclear. In April 2017, the UK experienced its first coal free day since the industrial revolution. From April to June 2020, the total coal-free period lasted 67 days.<sup>20</sup>

Over the past decade, and with government support, the amount of renewable capacity connected to the grid has increased from 8GW in 2009 to 48GW at the end of June this year, an increase of 500 per cent.<sup>21</sup> The share of low-carbon electricity generation has risen to 54 per cent in 2019, with renewables at a record 37 per cent.<sup>22</sup>

Through a mix of early policy action, increased competition, innovation, and growth in deployment, our sustained support for clean electricity has helped secure dramatic falls in the costs of some renewables and provided developers and private investors with long term certainty.

The cost of offshore wind projects contracted in 2019 fell by 30 per cent for example, relative to those contracted in 2018.<sup>23</sup> There are even early signs of some renewable technologies deploying without direct policy support.<sup>24</sup>

But there is still much more to do. Our energy system is dominated by the use of fossil fuels and will need to change dramatically by 2050 if we are to achieve net zero emissions (see figure 1.4).

Decarbonising the energy system over the next thirty years means replacing - as far as it is possible to do so - fossil fuels with clean energy technologies such as renewables, nuclear and hydrogen.

30

**years of successfully reducing UK emissions** while simultaneously growing our economy

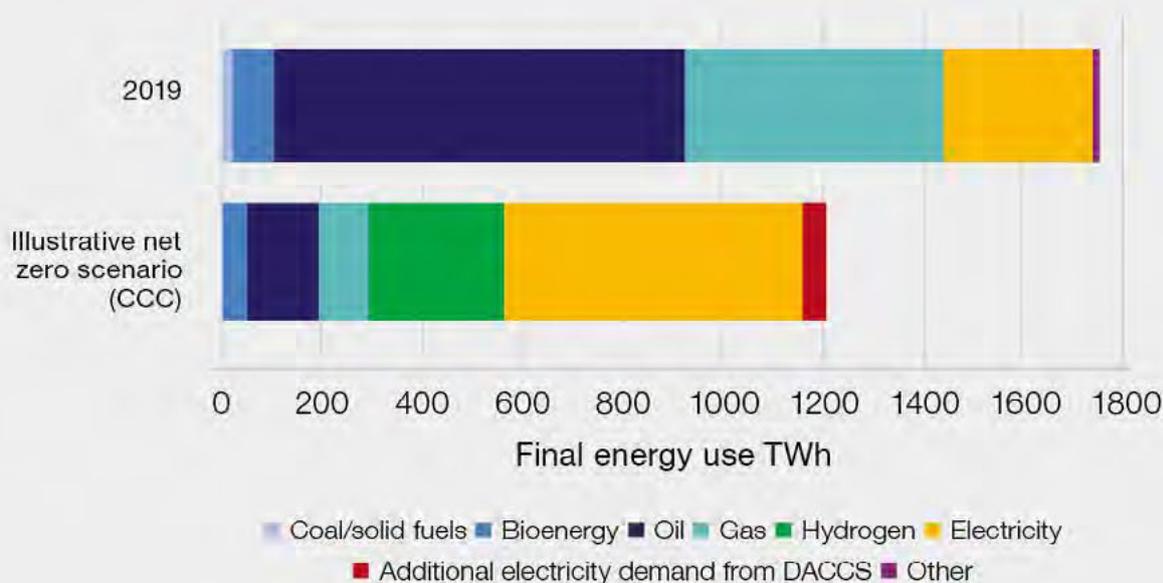

500%

**increase in the amount of renewable capacity** connected to the grid from 2009 to 2020

72%

**reduction in greenhouse gas emissions** from electricity generation between 1990-2019

**FIGURE 1.4 – ILLUSTRATIVE UK FINAL ENERGY USE IN 2050**

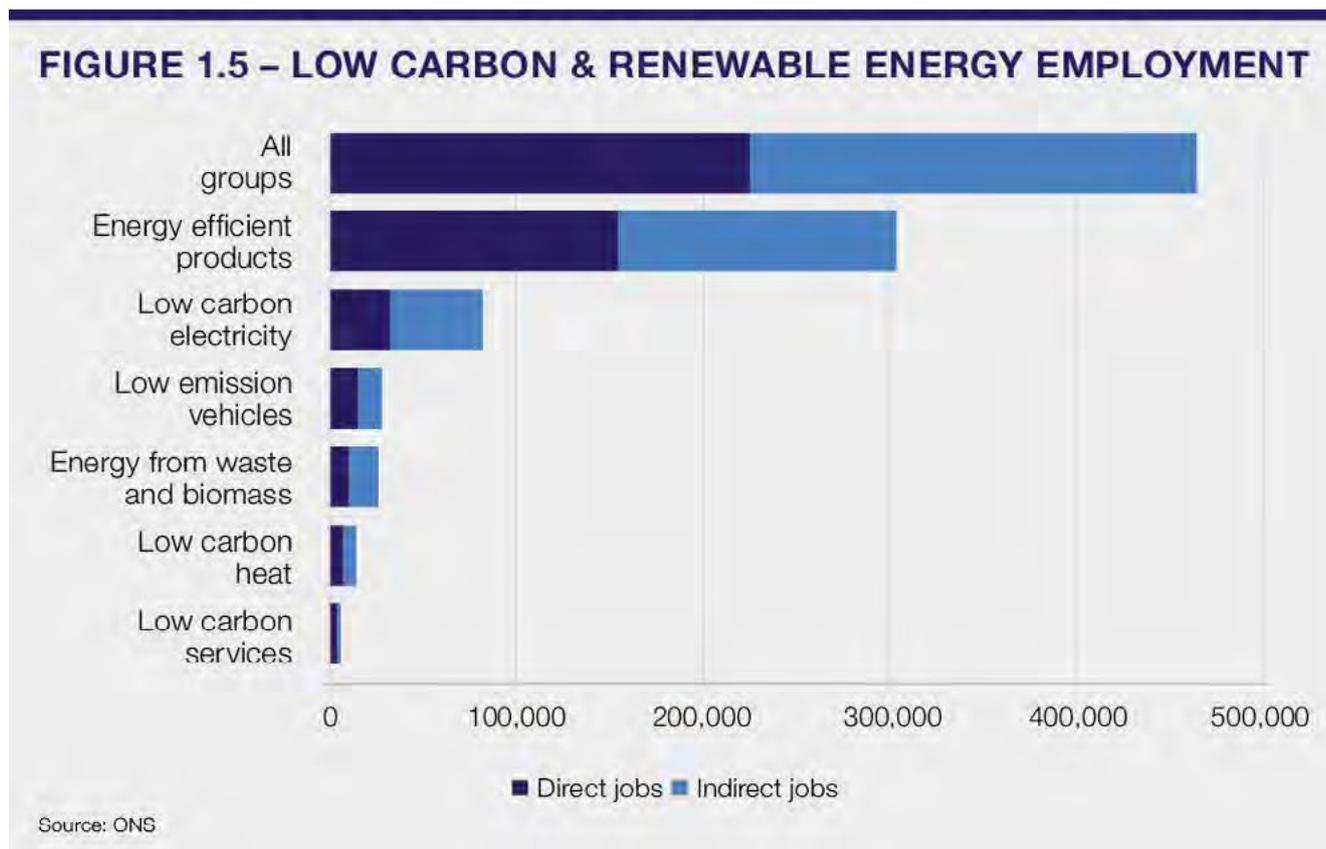

Source: Energy Trends table 1.2; CCC Net Zero Report

This is a significant and historic undertaking. It means ending our dependency on oil to power nearly half of our economy. It means largely eliminating the use of natural gas to heat our homes, and make them considerably more efficient – but as 20 per cent of homes currently overheat even in cool summers we will need to ensure that our homes are not just efficient, but adapted to the future climate.<sup>25</sup> This will apply throughout the system.

Clean electricity will become the predominant form of energy, entailing a potential doubling of electricity demand and consequently a fourfold increase in low-carbon electricity generation. We must secure this transition while retaining the essential reliability, resilience and affordability of our energy, as the bedrock of a modern, productive economy driving almost every facet of our home and working lives.

Delivering this transition will require billions of pounds of investment in clean energy infrastructure or new low-carbon technologies, and a major shift away from spending in fossil fuels. As set out in the National Infrastructure Strategy,<sup>26</sup> delivering this volume of private investment will require multiple policy levers and the right market frameworks to encourage competition and drive down costs. This challenge is set against the backdrop of an economy which has been hit by the largest recession in 300 years as a result of the COVID-19 pandemic. Our commitments to new and improved buildings, infrastructure and energy sources will support near-term investment and jobs in the UK. It will also establish world-leading capabilities in the new technologies which will be needed globally to tackle climate change, growing our capability to trade UK expertise around the world.

Across the UK almost half a million people are already employed in the low-carbon economy and its supply chains (Figure 1.5).<sup>27</sup> These jobs are frequently outside the South East of England, including electric vehicle manufacturing in the Midlands and North East, and reconditioning and recycling in the North East and West Midlands. The offshore wind sector supports an estimated 7,200 direct jobs as a whole, with a burgeoning industry on the north east coast of England, centred around the Humber and the Tees.

But this is just the beginning. In November 2020, the Prime Minister announced his Ten Point Plan to lay the foundations for a Green Industrial Revolution. We will start by supporting 90,000 jobs across the UK in this Parliament, and up to 250,000 by 2030. The response to the pandemic has been a reminder of the excellence of British science, a research and development (R&D) capability

which engineers, fitters, construction workers and many others will harness to develop the clean energy technologies of the future and forge new industries to service new markets at home and abroad.

We will generate new clean power with offshore wind farms, nuclear plants and by investing in new hydrogen technologies. We will use this energy to carry on living our lives, running our cars, buses, trucks and trains, ships and planes, and heating our homes while keeping bills low. And to the extent that we still emit carbon, we will pioneer a new British industry dedicated to its capture and return to under the North Sea. Together these measures will reinvigorate our industrial heartlands, creating jobs and growth, and pioneering world-leading SuperPlaces that unite clean industry with transport and power.

# THE PRIME MINISTER'S TEN POINT PLAN

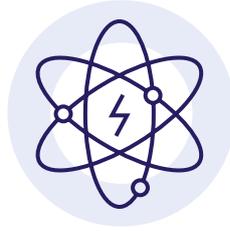

## GREEN PUBLIC TRANSPORT, CYCLING AND WALKING

We will accelerate the transition to more active and sustainable transport by investing in rail and bus services, and in measures to help pedestrians and cyclists. We will fund thousands of zero-emission buses and give our towns and cities cycle lanes worthy of Holland.

## HYDROGEN

Working with industry the UK is aiming for 5GW of low-carbon hydrogen production capacity by 2030. We are also pioneering hydrogen heating trials, starting with a Hydrogen Neighbourhood and scaling up to a potential Hydrogen Town before the end of this decade.

## NUCLEAR POWER

Nuclear power provides a reliable source of low-carbon electricity. We are pursuing large-scale nuclear, whilst also looking to the future of nuclear power in the UK through further investment in Small Modular Reactors and Advanced Modular Reactors.

## OFFSHORE WIND

By 2030 we plan to quadruple our offshore wind capacity so as to generate more power than all our homes use today, backing new innovations to make the most of this proven technology and investing to bring new jobs and growth to our ports and coastal regions.

## JET ZERO AND GREEN SHIPS

By taking immediate steps to drive the uptake of sustainable aviation fuels, investments in R&D to develop zero-emission aircraft and developing the infrastructure of the future at our airports and seaports, we will make the UK the home of green ships and planes.

## GREENER BUILDINGS

Making our buildings more energy efficient and moving away from fossil fuel boilers will help make people's homes warm and comfortable, whilst keeping bills low. We will go with the grain of behaviour, and set a clear path that sees the gradual move away from fossil fuel boilers over the next fifteen years as individuals replace their appliances and are offered a lower carbon, more efficient alternative, supporting 50,000 jobs.

## CARBON CAPTURE, USAGE & STORAGE (CCUS)

Our ambition is to capture 10Mt of carbon dioxide a year by 2030 - the equivalent of four million cars' worth of annual emissions. We will invest up to £1 billion to support the establishment of CCUS in four industrial clusters, creating 'SuperPlaces' in areas such as the North East, the Humber, North West, Scotland and Wales. We will bring forward details in 2021 of a revenue mechanism to bring through private sector investment into industrial carbon capture and hydrogen projects via our new business models to support these projects.

## PROTECTING OUR NATURAL ENVIRONMENT

We will safeguard our cherished landscapes, restore habitats for wildlife in order to combat biodiversity loss and adapt to climate change, all whilst creating green jobs.

## ZERO EMISSION VEHICLES

From 2030 we will end the sale of new petrol and diesel cars and vans, 10 years earlier than planned, and provide a £2.8 billion package of measures to support industry and consumers to make the switch to cleaner vehicles.

## GREEN FINANCE AND INNOVATION

We have committed to raising total R&D investment to 2.4 per cent of GDP by 2027 and in July 2020 published the UK Research and Development Roadmap. The next phase of green innovation will help bring down the cost of the net zero transition, nurture the development of better products and new business models, and influence consumer behaviour.

## LEADING GLOBAL ACTION

The UK accounts for less than one per cent of annual global emissions.<sup>28</sup> We therefore need to help other nations reduce their emissions in line with the Paris Agreement.

Our leadership is based on taking practical domestic action, which in turn creates business opportunities for the UK to export clean technology, skills and know-how.

We use our international partnerships and work through multilateral fora to influence international agreements on climate change and clean energy issues which help reinforce our domestic and international priorities. The principal vehicle we work through is the United Nations Framework Convention on Climate Change (UNFCCC), which delivered the Paris Agreement.

We will continue to demonstrate international leadership by building on the policies set out in the UK's National Energy and Climate Plan (NECP) and a number of other publications. This white paper goes even further than the ambitions set out in the NECP for renewables and energy efficiency.

Our presidency of the UN Climate Change Conference of the Parties (COP26), which will meet in Glasgow in November 2021, provides the opportunity to drive further ambitious action on climate change and unite the world on a path to a net zero economy, including through our COP26 Energy Transition Campaign and co-leadership of the Powering Past Coal Alliance.

**Around 120 countries** are committed to, developing plans or advancing consultations on **long-term climate or carbon neutral targets**

We are already seeing encouraging signs. In March, the European Union (EU) Commission proposed the first European Climate Law, which would commit the EU to achieving net zero greenhouse gas (GHG) emissions by 2050. In September, China announced that it would achieve carbon neutrality by 2060 and enhance its 2030 Nationally Determined Contribution (NDC). In October, both Japan and South Korea committed to achieving net zero by 2050. And thanks to the efforts of the UK, the EU, and other nations, there are now around 120 countries that are committed to, are developing plans or advancing consultations on long-term climate or carbon neutral targets.<sup>29</sup>

The countries delivering on these commitments will need to radically change their energy, transport, buildings and land use sectors. By driving forward UK action now, we can build companies that can win the lion's share of these new global markets in the future.

## WHAT THE WHITE PAPER DELIVERS – AND BEYOND

This white paper builds on the Prime Minister’s Ten Point Plan to set the energy-related measures the Plan announced in a long-term strategic vision for our energy system, consistent with net zero emissions by 2050.

It establishes our goal of a decisive shift from fossil fuels to clean energy, in power, buildings and industry, while creating jobs and growing the economy and keeping energy bills affordable. It addresses how and why our energy system needs to evolve to deliver this goal. And it provides a foundation for the detailed actions we will take in this Parliament to realise our vision.

We estimate the measures in this paper could reduce emissions across power, industry and buildings by up to 230MtCO<sub>2</sub>e in the period to 2032 and enable further savings in other sectors such as transport. In doing so, they will support up to 220,000 jobs per year by 2030. These figures include the energy measures from the Prime Minister’s Ten Point Plan as well as additional measures provided in this white paper.<sup>30</sup>

We recognise that more will need to be done to meet key milestones on the journey to net zero, including our ambition for Carbon Budget 6, which we will set next year, taking into account the latest advice from the Climate Change Committee. In the run-up to COP26 we will bring forward a series of sectoral strategies, and our overarching Net Zero Strategy, which will set out more detail on how we will meet our net zero target and ambitious carbon budgets.

**FIGURE 1.6 – ESTIMATED CUMULATIVE EMISSION SAVINGS TO 2032 FROM THE ENERGY WHITE PAPER**

Source: BEIS analysis

# Overview of key commitments

This white paper sets out the government's policies and commitments that will put us on course to net zero, levelling up the country and strengthening the union as we achieve this goal. We will:

## TRANSFORM ENERGY

Building a cleaner, greener future for our country, our people and our planet, by measures including:

- ▶ **Targeting 40GW of offshore wind by 2030**, including 1GW floating wind, alongside the expansion of other low-cost renewables technologies.
- ▶ **Supporting the deployment of CCUS in four industrial clusters** including at least one power CCUS project, to be operational by 2030 and putting in place the commercial frameworks required to help stimulate the market to deliver a future pipeline of CCUS projects.
- ▶ **Establishing a new UK Emissions Trading System**, aligned to our net zero target, giving industry the certainty they need to invest in low-carbon technologies.
- ▶ **Aiming to bring at least one large-scale nuclear project to the point of Final Investment Decision** by the end of this Parliament, subject to clear value for money and all relevant approvals.

- ▶ **Consulting on whether it is appropriate to end gas grid connections to new homes being built from 2025**, in favour of clean energy alternatives.
- ▶ **Growing the installation of electric heat pumps**, from 30,000 per year to 600,000 per year by 2028.
- ▶ **Building world-leading digital infrastructure for our energy system** based on the vision set out by the independent Energy Data Taskforce, publishing the UK's first Energy Data Strategy in spring 2021, in partnership with Ofgem.

## SUPPORT A GREEN RECOVERY FROM COVID-19

Growing our economy, supporting thousands of green jobs across the country in new green industries and creating new export opportunities, by measures including::

- ▶ **Increasing the ambition in our Industrial Clusters Mission four-fold**, aiming to deliver four low-carbon clusters by 2030 and at least one fully net zero cluster by 2040.

- ▶ **Investing £1 billion up to 2025 to facilitate the deployment of CCUS in two industrial clusters** by the mid-2020s, and a further two clusters by 2030, supporting our ambition to capture 10MtCO<sub>2</sub> per year by the end of the decade.
- ▶ Working with industry, **aiming to develop 5GW of low-carbon hydrogen production capacity by 2030.**
- ▶ **Assessing what market framework changes may be required to facilitate the development and uptake of innovative tariffs and products** that work for consumers and contribute to net zero, engaging with industry and consumer groups throughout 2021 before a formal consultation.
- ▶ **Ensuring the retail market regulatory framework adequately covers the wider market**, consulting by spring 2021 on regulating third parties such as energy brokers and price comparison websites.

## CREATING A FAIR DEAL FOR CONSUMERS

Protecting the fuel poor, providing opportunities to save money on bills, giving us warmer, more comfortable homes and balancing investment against bill impacts, by measures including:

- ▶ **Creating the framework to introduce opt-in switching**, consulting by March 2021 on how it should be designed, tested and incrementally scaled up.
- ▶ **Considering how the current auto-renewal and roll-over tariff arrangements could be reformed** to facilitate greater competition, consulting by March 2021 on how opt-out switching could be tested as part of any future reforms.
- ▶ **Establishing the Future Homes Standard** which will ensure that all new-build homes are zero carbon ready.
- ▶ **Consulting on regulatory measures to improve the energy performance of homes**, and are consulting how on how mortgage lenders could support homeowners in making these improvements.
- ▶ **Requiring that all rented non-domestic buildings will be Energy Performance Certificate (EPC) Band B by 2030**, barring lawful exceptions.
- ▶ **Extending the Energy Company Obligation to 2026** and expanding the Warm Home Discount to £475 million per year from 2022 to 2025/2026.

In addressing these issues we respect the devolution settlements with Scotland, Wales and Northern Ireland. All proposals in this white paper which touch on devolved matters will be progressed in accordance with those settlements.

CHAPTER 01

# Consumers

## OUR GOAL

We are committed to making the right reforms that will protect the interests of consumers and create opportunities to reduce bills and carbon emissions.

In partnership with the Office of Gas and Electricity Markets (Ofgem), we will:

- ▶ Create a **fair deal for consumers**
- ▶ **Protect the fuel poor**
- ▶ Provide **opportunities to make savings** on energy bills

CONSUMERS

# The strategic context

Energy is integral to everything we do, from work, to travel, to leisure, to just relaxing at home. Whether it be for heating and lighting our homes or powering appliances, we all rely on secure, affordable energy every day. But the way we use energy in the home is changing.

Smart technologies, enabled by our increasingly digital world, offer new products and services which help us to take control of our energy use and reduce bills. And, over the next 30 years, electricity will become a significant proportion of the energy we use at home, powering electric cars, replacing petrol and diesel, and enabling the installation of electric heat pumps which reduce the need for oil and gas to heat our homes.

Over the next 30 years, **electricity will become a significant proportion of the energy we use**

This transformation of energy in our homes will only accelerate over the coming decade. The government and Ofgem have an important role to play, making regulatory reforms which place fairness and affordability at the heart of our efforts to protect the interests of consumers and create opportunities to save money.

This means:

▶ **Creating a fair deal for consumers.**

We will increase competition throughout the energy retail market to benefit consumers and, as we transition to net zero, we will make sure the costs of doing so are distributed fairly;

▶ **Protecting the fuel poor.** We will offer additional protections to the vulnerable and fuel poor, through our Energy Company Obligation (ECO) and expanded Warm Home Discount (WHD) schemes and the Green Homes Grant, providing financial support of at least £6.7 billion over the next six years (see 'Buildings' chapter);

▶ **Providing opportunities to make savings on energy bills.** We will create opportunities for consumers to reduce bills and carbon emissions by upgrading the energy performance of homes (see 'Buildings' chapter), switching to clean energy, or using energy when it is cheapest thanks to smart technology.

## SMARTER, CLEANER ENERGY FOR ALL CONSUMERS

Traditionally, households have been passive consumers of energy from fossil fuels.

Smart technology is unlocking new opportunities to give consumers more control, choice and flexibility over their energy use. We are seeing retail offers that will help consumers engage in the market and save money in the process.

### SMART METERS

Smart meters are replacing traditional gas and electricity meters in homes and small businesses across Great Britain as part of an essential infrastructure upgrade to make the energy system more efficient and flexible, helping to deliver net zero emissions cost-effectively.

Smart meters are also modernising energy services by ending manual meter readings, delivering accurate bills and enabling prepayment customers to conveniently track their usage and top-up credit without leaving home. The In-Home Display (IHD), which households are offered when they have smart meters installed, gives accurate information about energy consumption and costs so consumers can easily understand how to save money on their bills.

The real-time information about energy use, recorded by smart meters, ensures that consumers are accurately charged by their suppliers. Smart meters also enable consumers to access innovative solutions such as smart tariffs, including 'time of use' tariffs. These tariffs reward consumers financially for using less electricity at peak times of demand or using more when overall demand is low and there is surplus generation available, for example on a sunny or windy weekend. This can reduce the cost of using clean electricity to power homes, businesses and electric vehicles, making the system more efficient and saving consumers money.

## SMART TARIFFS

Smart tariffs include: tariffs where costs vary by the time of use, based on the cost of electricity; export tariffs, for those with generation technology such as solar panels; load control tariffs that can manage when appliances are used to ensure consumers use the cheapest energy; and tariffs designed for consumers with low-carbon technology, for example, electric vehicles, to ensure they can charge at the cheapest times.

There are now new ways for households to find the best energy products and services to match their specific needs. This ensures consumers are getting the best deal available and can help them choose new ways to engage with the energy system.

Consumers can be rewarded for playing a bigger role in our energy system. There are plenty of ways to save money, from installing energy saving measures to making the most of new technologies, such as batteries, heating controls or smart washing machines and dishwashers. Consumers can also generate their own electricity through roof-top solar panels, store it in batteries, and even sell any excess power back to the grid to generate a profit at times of higher demand.

## CASE STUDY: SMART TARIFF COMPARISON TOOL

### Smarter Tariff – Smarter Comparison, Vital Energi

Vital Energi is leading a consortium of experts to develop a comparison tool that gives consumers an easy way to find the most suitable smart tariff. Smart tariffs are often not included on price comparison websites and consumers have little visibility of their benefits. For example, many electric vehicle owners are unaware that there are dozens of tariffs designed specifically for them.

Supported with government funding, the project is developing a tool which will help people find the best smart tariff to match their needs. Consumers can use their actual smart meter data as an input to get personalised, accurate comparisons and, after they switch, see if they have achieved the expected savings. It eliminates the need to manually provide estimated electricity bills and integrates time-of-use tariffs and use of low-carbon technologies in the tariff search. Consumer research indicates that many people would be more likely to use a smart comparison tool such as this.

At the end of the project in March 2021, the proof of concept will be free for anyone to reuse. This means that suppliers, comparison websites and others will be able to integrate it into their services or reuse it. The research findings will be made public so they can be used by innovators in the market.

## CASE STUDY: SMART TARIFF

### **Agile Octopus Tariff, Octopus Energy**

Agile Octopus is a 'time-of-use' tariff, which gives consumers access to half-hourly electricity prices, tied to wholesale prices, which are updated daily. So when energy prices drop, so could bills. Sometimes prices even go 'negative' - meaning that consumers can be paid to use energy during that period. Octopus also cap prices at 35p/kWh to protect consumers during price spikes.

Octopus calculate that, on this tariff, customers could save £120 a year by shifting electricity use outside of the 4pm to 7pm peak.<sup>31</sup> This is best suited for households with lots of electricity demand during those periods. For example, households with electric heating or electric vehicles.

## CASE STUDY: CONNECTED HOME

### Core4Grid, geo

Through the 'Core4Grid' trial, battery storage and smart meters have been installed in 24 houses that already had solar panels, electric heating or electric vehicle chargers. Using Core - its "energy brain" - the technologies have been integrated to run as a whole system within each home.

Core responds to signals from the electricity system to make decisions on when to use energy or charge the batteries, using either excess solar generated by the household's panels or grid electricity imported during cheaper periods.

The trial has been running since March, with participating homes sourcing over half of the energy they used from their solar and batteries. The houses have generated almost 30MWh of local generation (equivalent to ten times a typical dual fuel household's annual electricity use<sup>32</sup>) for the period.

Electric vehicles will accelerate this trend (see Transport breakout box). By using a smart charger when powering up their electric vehicle, consumers will play an essential role in helping manage electricity demand, avoiding the expensive peak periods. Increasingly, consumers will also be able to export energy from their electric vehicle back to the grid. In doing so, they could significantly reduce their energy costs and help maximise the amount of solar and wind energy used to charge their vehicle.

## CASE STUDY: SMART ELECTRIC CAR CHARGING AND 'VEHICLE-TO-GRID' TRIAL

### Project Sciurus, Kaluza, Ovo Energy

Project Sciurus is the largest domestic 'vehicle-to-grid' (V2G) demonstration in the world - with 323 V2G chargers supplying electricity to the grid at times of high energy demand. These operate on the 'Kaluza' platform, which receives live signals from the grid so that consumers can charge their vehicle when prices are low, and sell electricity back to the grid at times of peak demand.

The Sciurus project is part of a £30 million Innovate UK competition, with a diverse consortium of participants taking part. The majority of trial participants have found V2G capability to be valuable. Consumers have changed how and when they were charging their electric vehicles to help reduce costs for themselves and the grid, all while helping balance the energy system and saving money.

And some local communities are coming together to establish their own approach to managing energy demand in their areas. Smart local energy systems are community-based initiatives which bring together a range of energy issues, typically including heat, power and transport, to reduce emissions in an integrated way, while also promoting local jobs and businesses. Local Authorities are key to delivering these systems by combining energy into their wider statutory work on housing, transport, waste and planning, making delivery more cost-effective and preparing for a net zero future. Government provides funding for Local Authorities to deliver programmes that support decarbonisation and will continue to work with communities to enable projects to be tailored and delivered to meet local needs.

## **CASE STUDY: COMMUNITY ENERGY**

### **Energy Local Clubs, Energy Local**

Energy Local has designed a local energy market. Households and small renewable generators form a Local Energy Club, the first of which started in a small town called Bethesda, in North Wales back in 2016. Through this, households use their smart meters to show how much power they are using.

They agree a 'match' tariff with local generators that pays them a price for the power they produce when households are using it. This keeps more money local and offers consumers the chance to reduce household bills by using energy when it's cheaper. They also partner with a supplier (Octopus Energy) to buy more power when there's not enough locally.

It benefits suppliers, generators and communities, giving a fair price to renewable generators and developing a suitable package of improved energy controls in the home, particularly for those at risk of fuel poverty as the benefits of local generation can be shared with anyone who joins the Local Energy Club, without having to pay a high capital cost.

# HOUSEHOLD ENERGY BILLS

The average household’s dual fuel energy bill in 2019 was similar to 2010 (figure 2.1).

However, the underlying costs have changed. Over the past decade, electricity prices have gone up, because of rises in policy and network costs, while gas prices have fluctuated, reflecting movements in the wholesale gas price. However, consumers have used less energy, which has balanced out the cost increase.<sup>34</sup>

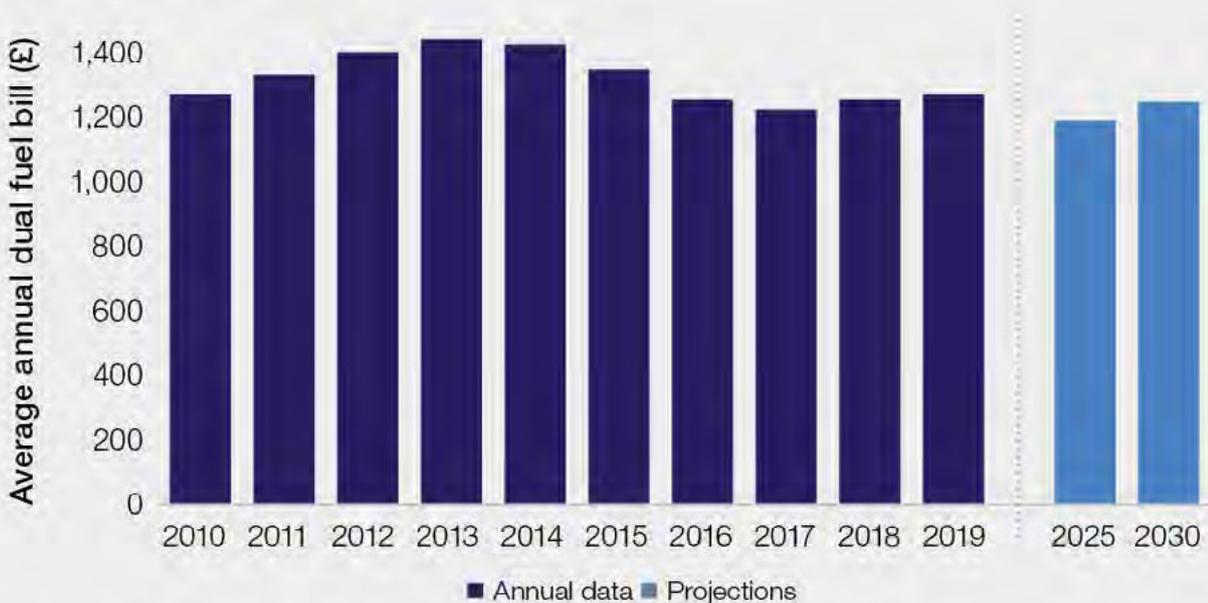

Overall, households who install energy saving measures will see significant savings and can offset the costs. Through targeting our energy saving schemes, such as extended ECO,<sup>35</sup> expanded WHD,<sup>36</sup> and the Green Homes Grant, many of the people making savings will be low-income or vulnerable

households on benefits, whose homes currently have poor energy efficiency ratings. For such households, energy represents a significant share of their outgoings, so these savings can have a significant impact on their disposable income.

Our ECO and expanded WHD schemes will provide at least £4.7 billion of extra support to low-income and vulnerable households between 2022 and 2026. Under the Green Homes Grant, we expect £500 million to be spent on low-income households through Local Authority Delivery. In addition, £500 million of the £1.5 billion voucher scheme is also intended for low-income households.

**FIGURE 2.1 – AVERAGE HOUSEHOLD DUAL FUEL BILL**

2010 to 2030 (2020 prices)

Source: BEIS analysis. This graph is based on a limited set of assumptions and shows average net costs. The cost of policies still being developed, such as heat pump deployment, are not included. Individual bills will vary depending on consumer characteristics and behaviour. See references for more detail. <sup>33</sup>

For example, a household in receipt of Universal Credit and living in an old, inefficient home could enjoy bill savings worth over £400, making them warmer, healthier and reducing their carbon emissions.

Over the next ten years, increases in network costs, along with funding for clean energy and supporting vulnerable households could push gas and electricity prices up. Based on the policies in this white paper with agreed funding, we estimate that household dual fuel bills will be, on average, broadly similar in both 2025 and 2030 to 2019 (figure 2.1). These policies are estimated to amount to a net increase of around two per cent on average,<sup>37</sup> though households who take up measures stand to make material net savings. This depends on a range of uncertain and variable factors, including future fossil fuel prices and how consumers use energy. We have used a central set of assumptions for these drivers.

## ENERGY BILL COMPONENTS

### Wholesale costs:

The amount energy suppliers pay to buy gas and electricity.

### Network costs:

The costs to build, maintain and operate the pipes, wires and cables that transport gas and electricity from producers to consumers.

### Supplier costs and margins

The administrative costs of running the supply business, including customer service, marketing, metering, plus profits.

### Policy costs:

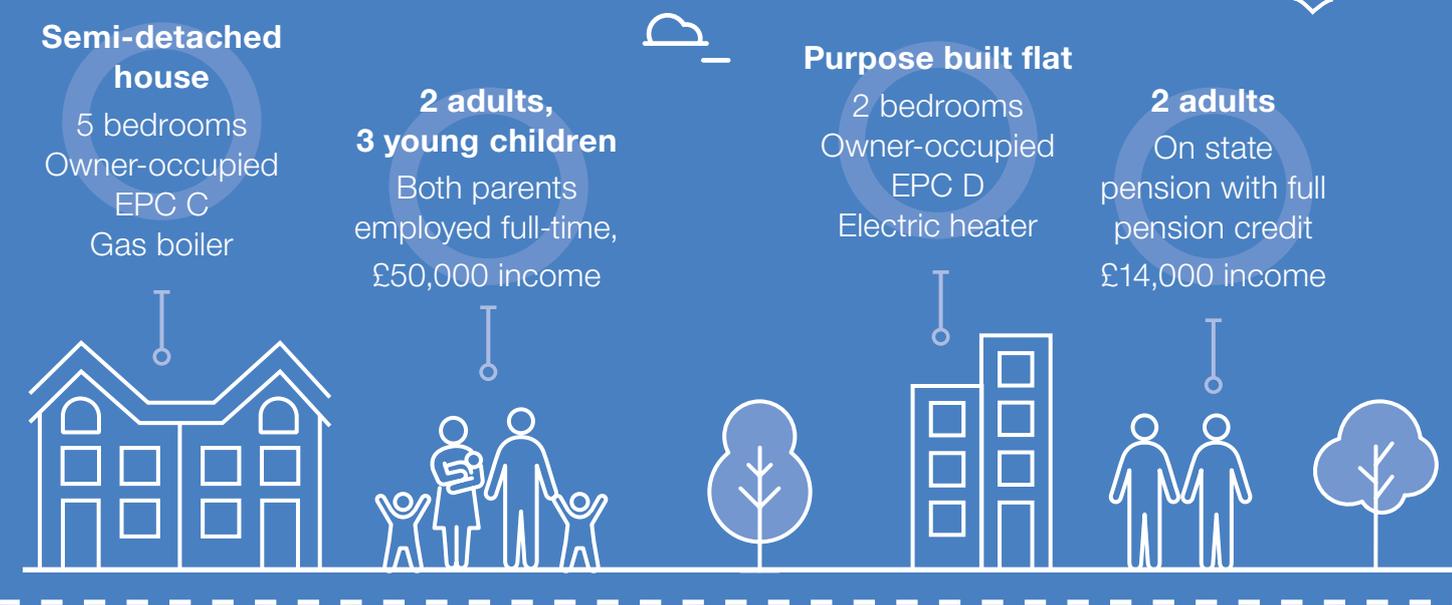

Cost of programmes to save energy, reduce emissions, and provide financial support to the fuel poor.

# ILLUSTRATIVE ANNUAL BILL SCENARIOS

Our assessment sets out the average picture. Underlying this, households could see net savings or costs depending on whether they take up measures. The graphic below sets out some illustrative case studies of how an individual household's bill may change because of the policies announced in this white paper.

## FAMILY 1

## FAMILY 2

### Illustrative measure

#### Green Home Grants

Floor insulation, delay start thermostat, time temperature zone control

### Illustrative measure

#### Warm Home Discount

A rebate of £150 on the annual electricity bill

### FAMILY 1 ANNUAL BILL

Prior to white paper	£1,100
With white paper impacts before savings	£1,200
Potential energy bill savings	£110
<b>WITH ENERGY BILL SAVINGS</b>	<b>£1,090</b>

### FAMILY 2 ANNUAL BILL

Prior to white paper	£1,300
With white paper impacts before savings	£1,390
Potential energy bill savings	£150
<b>WITH ENERGY BILL SAVINGS</b>	<b>£1,240</b>

Details are provided on the household's characteristics and the composition of the household, including income. These are designed to be hypothetical households that can take advantage of certain policies (either Green Home Grants, ECO or WHD). They are not a complete list of qualifying criteria, and both a household's eligibility for certain policies and its potential savings will vary according to its characteristics, composition, and, in some cases, whether the household proactively chooses to apply for a measure.

Example bills are for the year 2025. The exact measures or level of rebate available under the future ECO and WHD schemes are subject to future consultation. For households who access schemes, there are opportunities for saving to significantly outweigh upward pressure on bills. Access to these opportunities depends on the policy. Schemes such as ECO are targeted at fuel poor households whereas the Green Home Grants is open to applications from a wider set of households.

### FAMILY 3

#### Mid-terraced house

3 bedrooms  
Private rented  
EPC D  
Gas boiler

#### 1 adult, 2 young children

Unemployed, on  
Universal Credit  
£11,000 income

### FAMILY 4

#### Semi-detached house

3 bedrooms  
Owner-occupied  
EPC E  
Gas boiler

#### 1 adult, 2 young children

Employed part-time,  
on Universal Credit  
£14,000 income

#### Illustrative measure

#### Warm Home Discount

A rebate of £150 on the annual electricity bill

#### Illustrative measure

#### Energy Company Obligation

External solid wall insulation, hot water tank insulation, delay start thermostat, time temperature zone control

#### FAMILY 3 ANNUAL BILL

Prior to white paper	£1,200
With white paper impacts before savings	£1,230
Potential energy bill savings	£150
<b>WITH ENERGY BILL SAVINGS</b>	<b>£1,080</b>

#### FAMILY 4 ANNUAL BILL

Prior to white paper	£1,200
With white paper impacts before savings	£1,280
Potential energy bill savings	£500
<b>WITH ENERGY BILL SAVINGS</b>	<b>£780</b>

# Our key commitments

---

## AFFORDABILITY AND FAIRNESS

It matters how much consumers pay for their energy, particularly when household budgets are tight.

The government will work with the regulator, Ofgem, to take the necessary steps to help households manage their bills. We have already introduced a price cap to ensure that the market does not excessively penalise consumers who do not frequently shop around for better deals.

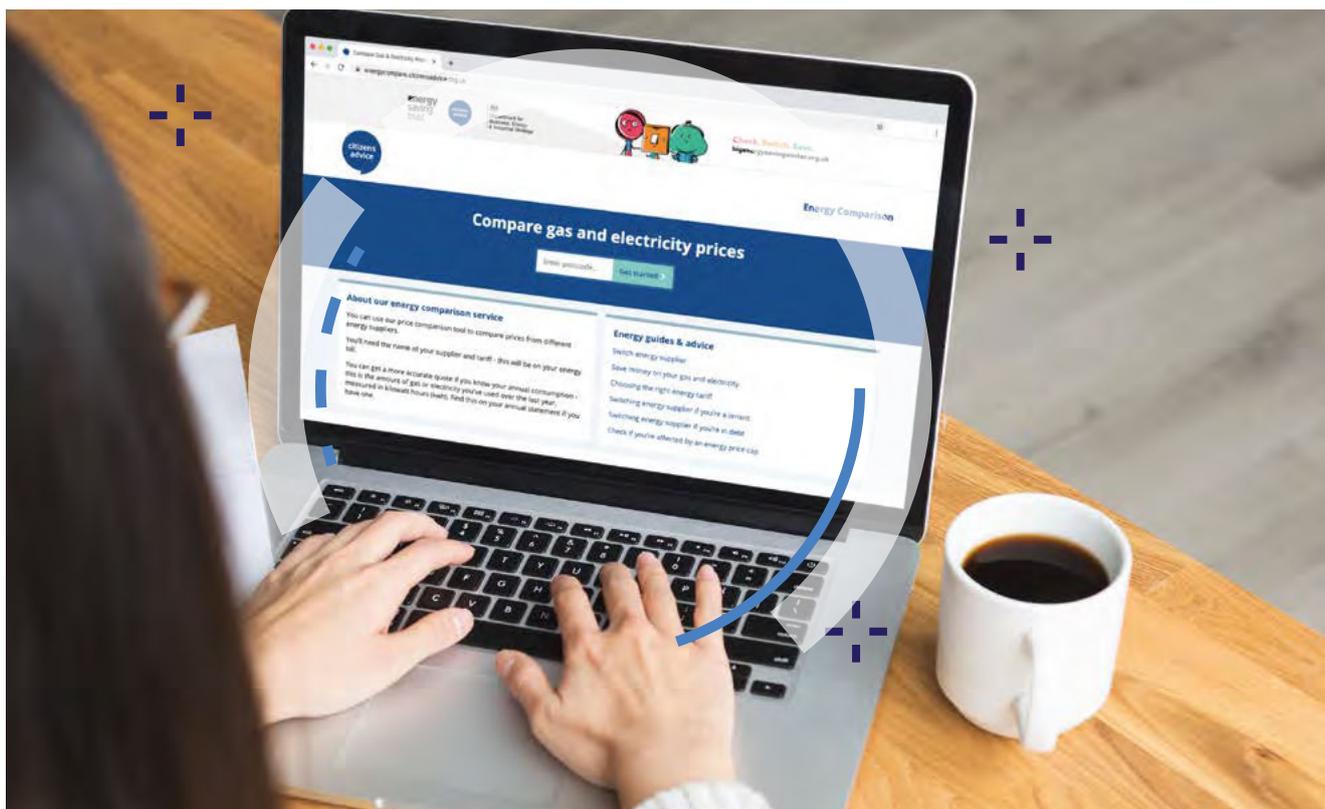

As we move to a clean energy system, fairness will be at the heart of our approach. Every household and business should be confident that everyone is paying their fair share of the costs of the transition. The members of the Climate Assembly UK identified “fairness within the UK, including for the most vulnerable” as one of the top two principles that should guide decisions around net zero.<sup>38</sup> We agree.

► **We will publish a call for evidence by April 2021 to begin a strategic dialogue between government, consumers and industry on affordability and fairness.**

We will work across the sector to identify existing distortions in the system and gain insights into the trade-offs involved in the distribution of energy costs. This will allow us to take decisions on how energy costs can be allocated in a way which is fair and incentivises cost-effective decarbonisation.

The nature of costs in a smart, clean energy system will be different. The largest part of our electricity bill is the cost to our energy supplier from buying power. This cost has traditionally been determined by the underlying price of gas or coal but this is changing. Gas will set the electricity price for some years to come but, over time, will do so less frequently, as more and more wind and solar connect to the electricity system. These are technologies which do not have a fuel cost. What we are paying for is the cost of building and operating the wind or solar farms, not the fuel cost. This trend fundamentally reshapes the costs of the system we must pay for. How consumers are charged will need to reflect this.

Ensuring that costs are fairly allocated between all consumers will be a central challenge for government. We need to strike the right balance between different households, between domestic consumers and businesses, including the big energy users in industry. The way that the costs are passed through to bills can incentivise or disincentivise certain types of consumer behaviour, including how the costs of decarbonising energy are apportioned between gas and electricity bills.

This can be a particular barrier to electrifying heat, which will be crucial for the transition to low-carbon buildings (see ‘Buildings’ chapter). It will be essential to ensure that price incentives are fair and help achieve our net zero target.

We are also mindful that, as we rightly encourage households to adopt new technologies such as roof-top solar and home energy storage, this change could affect how consumers pay for their energy in a way which is unfair to others. Households which self-generate electricity and store it, even sell it back to the grid, will be able to reduce how much they pay towards the fixed costs of the electricity system, while still relying on the system when they are not self-supplying. It could leave other consumers to pay a greater share, some of whom may not be able to take advantage of new technologies.

For all these reasons, the time is now right to reflect carefully on the nature of energy costs, who pays for them and how. HM Treasury has already launched a review of how the transition to net zero would be funded and where the costs would fall. An interim report will be published in December 2020, with a view to completing the review in spring 2021. This white paper sets out what we currently do to enshrine fairness in the way consumers are treated in the energy sector and puts forward new policy proposals to go even further. Building on this foundation, we will start a conversation with consumers and the energy industry about the fairness and affordability of the cost of moving to clean energy over the long-term. We are clear that the outcome of this work is a net zero world which continues to ensure a fair distribution of costs and maintains support in society and business for our climate goals.

## ROLLING OUT SMART METERS

It remains our ambition to achieve market-wide roll-out of smart meters as soon as practicable, enabling homes and small businesses to access digital energy services that put them in charge of their energy use.

Second generation smart meters – which are compatible with all energy suppliers from the point of install – are now being rolled out as standard across Great Britain, while the enrolment of first generation smart meters into the national communications system will ensure these stay smart when consumers switch energy supplier.

We have introduced a new smart meter obligation on suppliers, which will start in July 2021. This will drive consistent, long-term investment, by setting annual targets and providing regulatory certainty. We are committed to exploring ways to encourage consumer uptake.

We are working with industry and delivery partners to help energy suppliers develop successful strategies for consumer engagement which improve the installation and operational performance rates of new meters, while stimulating consumer demand.

To allow consumers to make the most of the data recorded by smart meters, it needs to be combined with half-hourly settlement for suppliers. This will allow households to access more real-time prices, should they wish. Most households are currently billed at a fixed price, based on an estimate of when they use electricity during the day. Half-hourly settlement provides the option for different prices in each 30-minute period of the day. Ofgem's analysis estimates that half-hourly settlement would bring net benefits for consumers of between £1.6 billion and £4.6 billion by 2045.<sup>39</sup> Ofgem intend to publish their final decision in spring 2021 on how and when to implement half-hourly settlement.

## FACILITATING COMPETITION AND TACKLING THE LOYALTY PENALTY

We are already seeing the value of innovation in smart controls and tariffs, as well as household batteries and solar panels.

To ensure that the growth in technological innovation goes from strength to strength, we need to ensure markets provide consumers with access to the services they want and offer fair value to all consumers. This is especially pressing as the system becomes more complex. Vulnerable consumers may need additional protections appropriate to their circumstances.

Consumers who have been automatically rolled onto a default tariff when their introductory tariff ends, or who start off on an auto-roll-over tariff, such as when they move into a new house, often pay much more for their energy, even when significantly cheaper alternatives are available. Over 50 per cent of consumers remain on default tariffs, despite almost all consumers knowing they can switch.<sup>40</sup> Many remain in this position for a long time, paying a 'loyalty penalty',<sup>41</sup> while other suppliers struggle to compete to provide these consumers with a better deal.

The price cap currently limits the extent of the loyalty penalty, but we believe competition is the most effective and sustainable way to keep prices low for all consumers over the long-term. Where the market and policy conditions for effective competition are not yet in place, we are prepared to ensure that proportionate price protection remains.

We have set out options for long term measures to protect consumers from the loyalty penalty in the joint government and Ofgem consultation ‘Flexible and responsive energy retail markets’ of July 2019.<sup>44</sup> With the measures set out in this white paper, we aim to address barriers to consumer engagement and the current nature of default tariff arrangements, the two leading causes of the loyalty penalty.

## OPT-IN SWITCHING

► **We will create the framework to introduce opt-in switching, consulting by March 2021 on how it should be designed, tested and incrementally scaled up.**

We know from today’s energy market that, for some consumers, the existence of cheaper deals is not sufficient in itself to drive consumer behaviour. Ofgem has found in recent trials that opt-in switching and similar tools can facilitate greater consumer engagement with the energy market.<sup>45</sup>

We will learn from these trials and create the framework to enable the introduction of opt-in switching by 2024. This will be implemented once we have reformed the exemption that smaller energy suppliers have from paying for energy efficiency measures (ECO) and from offering a discount for customers in fuel poverty (WHD).

### OPT-IN SWITCHING TRIALS

Since 2017, Ofgem has run trials to develop and test new prompts to increase consumer engagement. Ofgem found that customers who have not switched energy tariff for many years can be prompted to do so following simple, well designed letters and emails. The trials included over 1.1 million customers and resulted in over 94,000 of them switching to new energy tariffs, with most of them making an active choice about their energy tariff for the first time in years. In total, these customers have saved around £21.3 million between them.<sup>42</sup>

The most successful trials were the opt-in collective switching trials.<sup>43</sup> These removed as many steps as possible from the switching process and provided additional reassurances, such as independent support. Between 19-30 per cent of consumers switched their tariff – five to ten times higher than the control group, which had rates of 2.6 - 4.5 per cent.

## DEFAULT TARIFF ARRANGEMENTS AND OPT-OUT SWITCHING

- ▶ **We will consider how the current auto-renewal and roll-over tariff arrangements could be reformed to facilitate greater competition, consulting by March 2021 on how opt-out switching could be tested as part of any future reforms.**

Default or roll-over tariffs are important for ensuring continuous supply and service for consumers, even where they have not agreed a specific deal. However, these tariffs also enable passive engagement with the market, which limits competition and allows suppliers to charge such consumers excessive prices.

We want energy markets to be truly competitive. We do not think that energy suppliers should expect to roll over or continue contracts with customers indefinitely. Where consumers do not opt-out, reforms could move consumers on default tariffs to a new, cheaper contract through a competitive process. We will test how moving consumers to new contracts, with the option to opt-out, could work best for consumers, consulting by March 2021. We will engage closely with stakeholders to consider the design of the testing, including which consumers should be targeted, how the new tariff is determined and what safeguards should be in place to ensure beneficial outcomes.

## REMOVING MARKET DISTORTIONS

We will work with industry to reduce the barriers to consumer engagement so that more households make informed choices about the products and services they receive.

### TRANSPARENCY

- ▶ **We will ensure consumers are provided with more transparent and accurate information on carbon content when they are choosing their energy services and products, consulting on reforms in early 2021.**

Smart digital technology is not just giving consumers more control, choice and flexibility in their energy use. It allows consumers to make a personal contribution to delivering a clean energy system.

So, it is important that they have clear and easily accessible information on the options to do so. We will assess how effectively the market provides consumers with clear information on costs and clean energy choices.

This will be the key to helping consumers make informed decisions. We will consult in 2021 on how to ensure consumers receive transparent information when choosing an energy product, for example quantifying the additional environmental benefits of a tariff marketed as 'green'.

## POLICY OBLIGATIONS

We will consult on how:

- ▶ **The energy supplier thresholds of ECO can be removed without incurring disproportionate costs on suppliers, including potentially introducing a buy-out mechanism as part of reforms to the scheme beyond 2022.**
- ▶ **The energy supplier thresholds of WHD can be removed as part of reforms to the scheme beyond 2022 to ensure administrative simplicity and consistency.**

ECO and WHD are obligations on suppliers that tackle fuel poverty by providing targeted energy efficiency measures and discounts on bills (see 'Buildings' chapter for more detail).

Supplier thresholds for these schemes were introduced to avoid creating significant administrative barriers to market entry for new suppliers. The thresholds exempt suppliers with fewer customers from some of the costs to which their larger competitors are exposed. However, these thresholds may create market distortions as smaller suppliers are able to undercut other suppliers who still have to pay the costs.

For WHD, the threshold also creates barriers to switching for the fuel poor, as some suppliers are not required to offer the discount. We want to remove policy obligation thresholds but ensure that schemes can be extended, without creating significant administrative burdens for small suppliers. This will mean that fuel poor consumers who receive WHD can have greater confidence that switching to a cheaper tariff with an alternative supplier.

## RETAIL REGULATORY FRAMEWORK

- ▶ **We will assess what market framework changes may be required to facilitate the development and uptake of innovative tariffs and products that work for consumers and contribute to net zero, engaging with industry and consumer groups throughout 2021 before a formal consultation.**

Consumers can benefit and contribute more effectively to net zero through an energy retail regulatory framework that accommodates emerging and innovative business models. Consumers are best placed to decide which business models suit their needs through market participation, but they could include peer-to-peer trading; energy as a service, where customers buy an outcome for an agreed price, such as a guaranteed temperature at home or guaranteed level of heat pump performance, rather than paying for units of gas or electricity; or the bundling together of utilities, such as water and energy.

The market framework will need to enable innovation and competition, while protecting consumers. We will continue to review whether the current supply licence framework strikes this balance effectively. We will assess whether incremental changes, alongside wider sectoral initiatives, are sufficient or whether more fundamental changes are required.

# PROTECTING CONSUMERS AS TECHNOLOGIES AND SERVICES EVOLVE

Consumers must be able to benefit from robust and consistent protection when engaging the energy market, no matter where they obtain their products and services.

## THIRD PARTY ENERGY PRODUCTS AND SERVICES

- ▶ **We will ensure the retail market regulatory framework adequately covers the wider market, consulting by spring 2021 on regulating third parties such as energy brokers and price comparison websites.**

The energy market is evolving rapidly as technology advances and consumer behaviour changes. Consumers can engage in the market in new ways. When the current licensing framework was developed, the majority of consumers would engage directly with their new supplier when arranging a switch but this is less common now, as consumers increasingly use price comparison websites. Ofgem does not currently regulate third parties like energy brokers and price comparison websites and we need to ensure that consumers can be confident that they are protected when engaging with any energy product or service through these channels.

This principle of protection does not just apply to households. In its Microbusiness Strategic Review, Ofgem identified harms to microbusinesses from some brokers such as mis-selling and misrepresentation. Government and Ofgem will work together to ensure microbusinesses have appropriate protection from bad practices.

## SMART APPLIANCES

- ▶ **We will take powers to regulate smart appliances based on principles including interoperability, data privacy and cyber security, legislating when Parliamentary time allows.**

The market for smart appliances, such as smart fridges, washing machines and heating systems, is just emerging. Regulation of these devices, in particular relating to interoperability, data privacy, and cyber security, is required to support its development and to ensure that appropriate consumer protection is in place ahead of time. Devices should be able to link with any service provider's systems so that consumers cannot be locked into a single provider. It is also important that devices are cyber secure, to ensure consumers' data remains private and the energy system as a whole is protected. Industry is developing standards for smart appliances in line with these principles, which will be published by summer 2021.

We will ensure that the approach adopted for regulating smart appliances is compatible with the Department for Digital, Culture, Media and Sport's existing commitment to take powers to regulate the cyber security of consumer smart devices.

# Our key commitments

We will **publish a call for evidence by April 2021** to begin a strategic dialogue between government, consumers and industry on affordability and fairness.

We will **create the framework to introduce opt-in switching**, consulting by March 2021 on how it should be designed, tested and incrementally scaled up.

We will **consider how the current auto-renewal and roll-over tariff arrangements could be reformed** to facilitate greater competition, consulting by March 2021 on how opt-out switching could be tested as part of any future reforms.

We will **ensure consumers are provided with more transparent and accurate information on carbon content** when they are choosing their energy services and products, consulting on reforms in early 2021.

We will **consult on how the energy supplier thresholds of ECO can be removed** without incurring disproportionate costs on suppliers, including potentially introducing a buy-out mechanism as part of reforms to the scheme beyond 2022.

We will **consult on how the energy supplier thresholds of WHD can be removed** as part of reforms to the scheme beyond 2022 to ensure administrative simplicity and consistency.

We will **assess what market framework changes may be required to facilitate the development and uptake of innovative tariffs and products** that work for consumers and contribute to net zero, engaging with industry and consumer groups throughout 2021 before a formal consultation.

We will **ensure the retail market regulatory framework adequately covers the wider market**, consulting by spring 2021 on regulating third parties such as energy brokers and price comparison websites.

We will **take powers to regulate smart appliances** based on principles including interoperability, data privacy and cyber security, legislating when Parliamentary time allows.

CHAPTER 02

# Power

## OUR GOAL

Electricity is a key enabler for the transition away from fossil fuels and decarbonising the economy cost-effectively by 2050.

We will:

- ▶ **Accelerate the deployment of clean electricity generation** through the 2020s
- ▶ **Invest £1 billion in UK's energy innovation programme** to develop the technologies of the future such as advanced nuclear and clean hydrogen
- ▶ Ensure that the transformation of the electricity system **supports UK jobs and new business opportunities, at home and abroad**

POWER

# The strategic context

Decarbonising the power sector has led the UK's efforts to reduce greenhouse gas emissions.

In 1990, electricity generation accounted for 25 per cent of UK emissions. In 2018, it was only 15 per cent.<sup>46</sup> 30 years ago, fossil fuels provided nearly 80 per cent of electricity supply.<sup>47</sup> Today, the country gets over half of its power from low-carbon technologies.<sup>48</sup> The rapid growth of renewables has been a critical feature of this transformation. Renewable capacity has grown fivefold since 2010, driven by the deployment of wind, solar and biomass. The UK had 10GW of operational offshore wind by 2019, up from just over 1GW in 2010.<sup>49</sup>

>50%

of the UK's power comes from **low-carbon technologies** today

5x

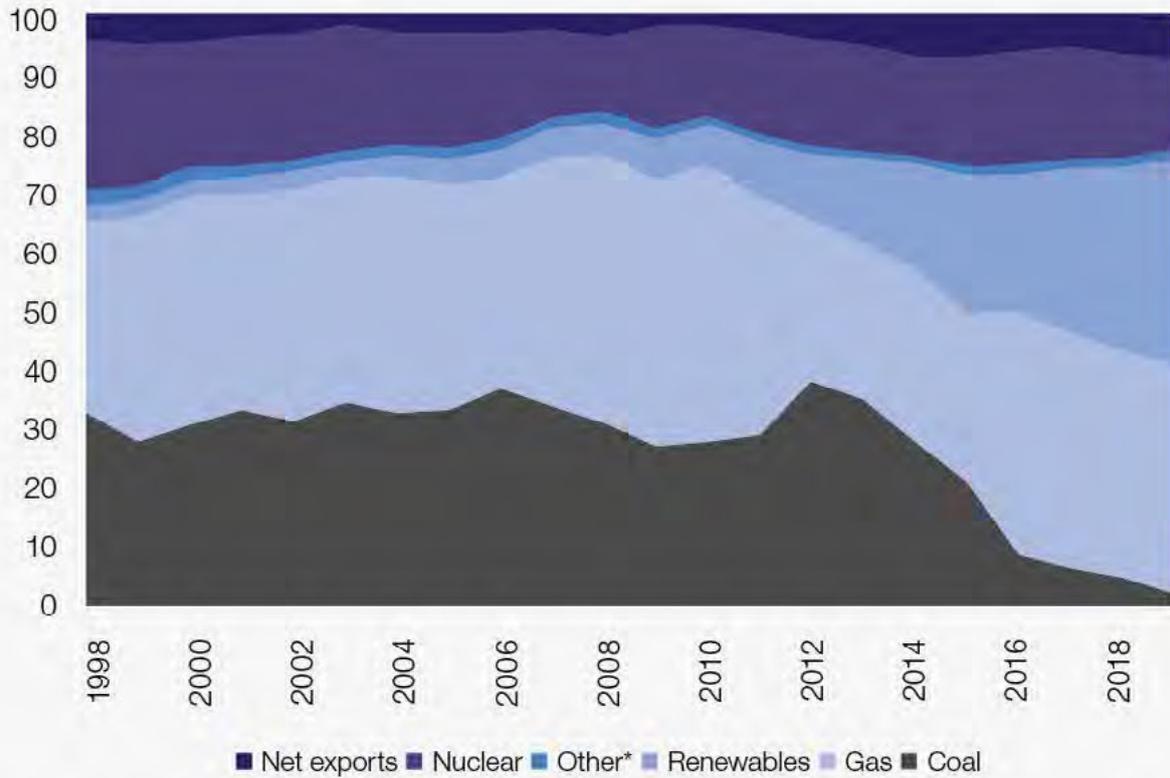

**renewables capacity has grown five-fold** since 2010

~9GW

**increase in operational offshore wind** since 2010

**FIGURE 3.1 - CHANGE IN POWER SUPPLY**

1998 - 2019

Source: Energy Trends, table 5.1. \*Other includes oil, pumped storage, and other thermal generation.

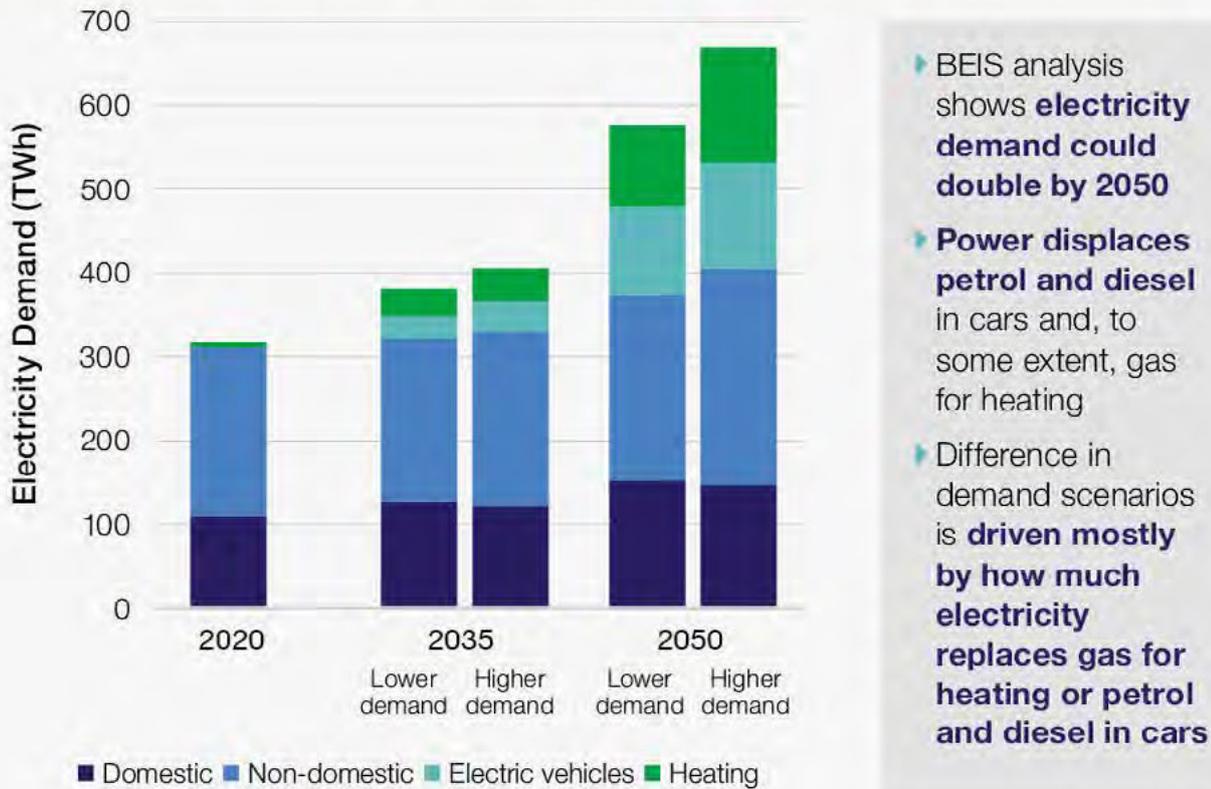

Renewables now account for over one third of electricity generation, up from seven per cent in 2010. Yet, this green revolution has been delivered without disruption to the reliability of our electricity supply and the scale of deployment has contributed to a significant reduction in the cost of renewables. Increasingly, green power is the cheapest power.<sup>50</sup>

Building on this foundation, we need to go further. With the exception of Sizewell B and Hinkley Point C, which is under construction, all of the existing nuclear power plants are due to have ceased generating by the end of 2030. We have already committed to ending coal in the electricity mix no later than 2025.

Today, as a signal of our further ambition and to encourage other countries along the path to phasing out coal, we are publishing a consultation over the option to bring forward our coal closure date to 2024.<sup>51</sup> Subject to this consultation, we will introduce legislation to give legal effect to the end date.

While retiring capacity will need to be replaced to keep pace with existing levels of demand, our modelling suggests that overall demand could double out to 2050. This is because of the electrification of cars and vans and the increased use of clean electricity replacing gas for heating. As a result, electricity could provide more than half of final energy demand in 2050, up from 17 per cent in 2019.<sup>52</sup>

**FIGURE 3.2 - ELECTRICITY DEMAND, NET ZERO SCENARIOS**

Source: BEIS analysis

This would require a four-fold increase in clean electricity generation with the decarbonisation of electricity increasingly underpinning the delivery of our net zero target.

Given the pivotal role of electricity in delivering net zero emissions, we must aim for a fully decarbonised, reliable and low-cost power system by 2050. Low emissions in power does not necessarily mean higher costs. Carbon intensity, the amount of CO<sub>2</sub> emitted to generate 1kWh of electricity, can fall to very low levels without costs rising significantly. This will depend on the level of demand, and the cost and availability of other low-carbon technologies, particularly low-cost clean hydrogen.

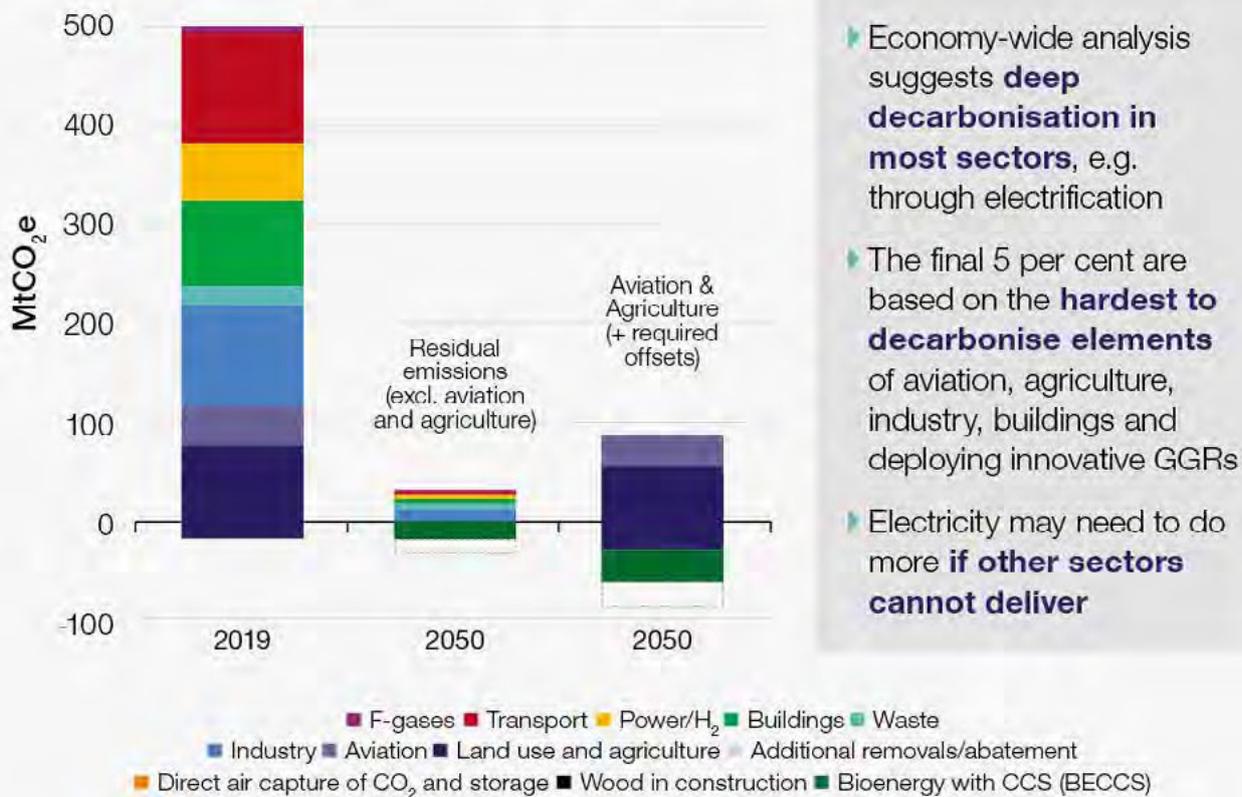

Our understanding of what is required from the electricity sector to support the delivery of net zero emissions will change over time.

Our views will be informed by what we learn about the costs of decarbonising other sectors of the economy and by the costs and availability of negative emissions technologies, such as Bioenergy with Carbon Capture and Storage (BECCS) or Direct Air Carbon Capture and Storage (DACCS).

We are not targeting a particular generation mix for 2050, nor would it be advisable to do so. We have already reduced power sector emissions 58 per cent between 2010 and 2018,<sup>53</sup> and to stay on a course for a fully decarbonised system we will continue that progress through the 2020s and have an overwhelmingly decarbonised power system in the 2030s.

The electricity market should determine the best solutions for very low emissions and reliable supply, at a low cost to consumers.

### FIGURE 3.3 - UK EMISSIONS, NET ZERO SCENARIO

Source: CCC 2020 Progress Report.

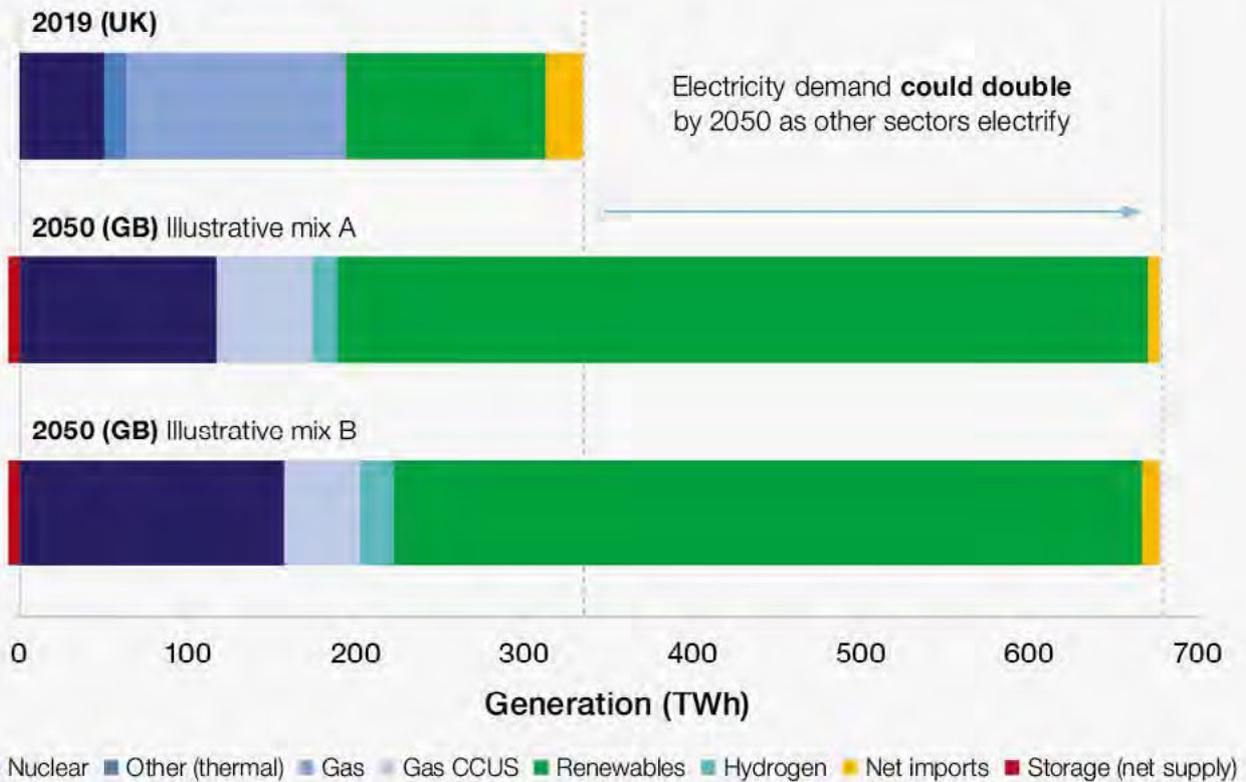

- ▶ Economy-wide analysis suggests **deep decarbonisation in most sectors**, e.g. through electrification
- ▶ The final 5 per cent are based on the **hardest to decarbonise elements** of aviation, agriculture, industry, buildings and deploying innovative GGRs
- ▶ Electricity may need to do more **if other sectors cannot deliver**

Competition should be a spur to greater investment in technologies which are cheaper and more efficient; or to the innovation which will reduce the costs of existing options. We have seen very rapid falls in the costs of renewables over the last five years and want to maintain the market conditions which stimulate these cost reductions. The government's role is to ensure a market framework which promotes effective competition and delivers an affordable, secure and reliable system, consistent with net zero emissions by 2050. This market framework should enable the deployment of the most efficient, low-cost technologies and mitigate delivery risk associated with a particular technology. We will intervene to address any potential market failures, as government did through the introduction of the Capacity Market, to ensure enough supply at periods of peak demand.

We will continue to invest in innovation which helps commercialise new technologies and reduce overall technology costs.

While we are not planning for any specific technology solution, we can discern some key characteristics of the future generation mix. A low-cost, net zero consistent system is likely to be composed predominantly of wind and solar. But ensuring the system is also reliable, means intermittent renewables need to be complemented by technologies which provide power, or reduce demand, when the wind is not blowing, or the sun does not shine. Today this includes nuclear, gas with carbon capture and storage and flexibility provided by batteries, demand side response, interconnectors (see 'Energy system' chapter) and short-term dispatchable generation providing peaking capacity, which can be flexed as required.

**FIGURE 3.4 - ELECTRICITY MIX TODAY & ILLUSTRATIVE 2050 MIXES**

Source: Energy Trends, table 5.1 and 6.1; BEIS analysis.

By 2050, we expect low-carbon options, such as clean hydrogen and long-duration storage, to satisfy the need for peaking capacity and ensure security of supply at low cost, likely eliminating the reliance on generation from unabated gas.

Figure 3.4 illustrates how the system could meet a doubling of demand, while reducing emissions. It shows just two of many scenarios which decarbonises electricity to very low levels of emissions at low cost. It serves to emphasise how much additional generation capacity we will need to build and how much electricity it produces to satisfy high levels of demand. Very different mixes can also provide low-cost solutions for the same demand scenario.

We are publishing the details of our electricity system analysis alongside this white paper.<sup>54</sup> We have modelled almost 7,000 different

electricity mixes in 2050, for two different levels of demand and flexibility, and 27 different technology cost combinations. It has produced a dataset comprising of over 700,000 unique scenarios, allowing us to identify common features of a low emissions, low-cost electricity system.

The analysis allows us to better prepare for an electricity system which is consistent with net zero emissions, even if we do not know the precise generation mix in 2050. It informs the actions we need to take to support the deployment of clean electricity technologies, including how we can direct our innovation support most effectively. We can target the technologies which have a key role in the system of the future, such as low-carbon peaking capacity and long-duration storage, which enable us to integrate high volumes of low-cost intermittent generation.

# Our key commitments

## AFFORDABLE CLEAN ELECTRICITY

This white paper sets out the actions which we are taking to put the country on the path to a low-cost, clean electricity system by 2050.

It will comprise the technologies which allow us to drive deep reductions in carbon emissions at a low cost, while maintaining the reliability and resilience of the system. Our actions are a strong signal to project developers and the wider investor community about the government's commitment to delivering clean electricity. This should stimulate the continued deployment of key low-carbon technologies in the near term, while encouraging innovation in the technologies of the future which offer the greatest potential to reduce costs.

### RENEWABLES

► **We will target 40GW of offshore wind by 2030, including 1GW floating offshore wind, alongside the expansion of other low-cost renewable technologies.**

A highly competitive Contracts for Difference (CfD) allocation round in 2019 led to the procurement of 5.5GW of offshore wind and 275MW of remote island wind, at strike prices around £40/MWh (2012 prices) for projects expected to start generating electricity by 2024.<sup>55</sup> This contrasts with prices for offshore wind of £150/MWh for projects which became operational in 2017.<sup>56</sup>

Our ambition is to have **40GW offshore wind by 2030**, a fourfold increase on today's installed capacity

As announced in the Prime Minister's Ten Point Plan for a Green Industrial Revolution, we will continue to hold regular CfD auction rounds every two years to bring forward a range of low-cost renewable technologies. The next auction in late 2021 will be open to onshore wind, solar photovoltaics and other established technologies, as well as offshore wind. Subject to sufficient projects coming through the planning pipeline to maintain competitive tension, we plan to double the capacity awarded in the last round with the aim to deploy around 12GW of low-cost renewable generation. Onshore wind and solar will be key building blocks of the future generation mix, along with offshore wind. We will need sustained growth in the capacity of these sectors in the next decade to ensure that we are on a pathway that allows us to meet net zero emissions in all demand scenarios.

Following our recent Call for Evidence on the potential of marine energy projects, we have set an ambition of deploying 1GW of floating offshore wind by 2030, supported by CfDs and innovation funding. Acting now will drive higher volumes of deployment in the 2030s and beyond, subject to cost reductions. We will work closely with the devolved administrations, the Crown Estate and Crown Estate Scotland to address issues such as seabed leasing and protecting the marine environment and to ensure the UK captures the economic benefits of deploying the technology. This will provide the foundation for a sustainable, competitive supply chain and enable floating offshore wind projects to scale up and accelerate cost reduction.

We will consider the role of wave and tidal energy, following further evaluation of the commercial and technical evidence. We will also identify and utilise synergies between hydrogen and the deployment of offshore wind.

It is vital that CfDs offer value for money to consumers and continue to deliver low prices. We will structure the 2021 and future auctions to keep the CfD allocation process highly competitive, supported by a number of technical changes to the auction. Alongside this white paper, we are issuing a new Call for Evidence seeking views on how the CfD scheme could evolve beyond the 2021 auction, including how longer-term changes to the CfD or wider electricity market design can enable the effective integration of increasing renewables capacity.<sup>57</sup>

We want to understand how generators can best be exposed to market signals which stimulate innovation and incentivise generators to minimise the overall system costs of large amounts of renewables. We will also be asking about the broader evolution of the electricity market (see ‘Energy system’ chapter). We will seek a balance between options for further reform of the market with maintaining the success of the CfD in deploying low-cost renewables at scale.

We will establish a Ministerial Delivery Group, which brings together the relevant government departments to oversee the expansion of renewable power in the UK. This group will provide the cross-government coordination and collaboration necessary to achieve our ambition for renewable electricity. It will tackle barriers such as the impact of wind turbines on radar systems, maintaining a flourishing and biologically diverse marine environment and the development of appropriate network infrastructure to support future renewables deployment. We will also work to reduce consenting delays and ensure that planning guidelines and environmental regulations are fit for purpose. The Ministerial Delivery Group will make use of existing cross-government mechanisms, such as the Offshore Wind Enabling Actions programme, a £4.3 million initiative to be run jointly by Defra and BEIS and funded by HM Treasury (HMT).

## POWER CCUS

► **We will support the deployment of at least one power CCUS project, to be operational by 2030, and put in place the commercial framework required to help stimulate the market to deliver a future pipeline of power CCUS projects.**

In the power sector, gas-fired generation with CCUS can provide flexible, low-carbon capacity to complement high levels of renewables. These characteristics mean that deployment of power CCUS projects will play a key role in the decarbonisation of the electricity system at low cost.

We will support at least one power CCUS plant to come forward and be operational by 2030 and will put in place a commercial framework which will enable developers to finance the construction and operation of a power CCUS plant and stimulate a pipeline of projects. This will enable at least one power CCUS project to be developed in one of the four industrial clusters as part of our mission to decarbonise them (See ‘Industrial energy’ chapter). Following the publication of the government response to our CCUS business models consultation in August 2020,<sup>58</sup> we will introduce a business model based on the existing CfD framework, adapted so that price signals incentivise power CCUS to play a role in the system, which complements renewables. We set out our plans for the deployment of transport and storage infrastructure in the ‘Industrial energy’ chapter.

► **We will consult on steps to ensure that new thermal plants can convert to low-carbon alternatives.**

Since 2009, our Carbon Capture and Readiness requirements have ensured that planning consent is only granted to thermal plants for which it will be technically and economically feasible to retrofit CCUS. However, we believe the current 300MW minimum threshold creates a costly market distortion, by disincentivising the deployment of gas plants larger than 300MW, which tend to be more efficient. The threshold also means that the requirements only apply to a small proportion of new build thermal plants. Furthermore, the requirements do not reflect recent technological advances, including alternative options for decarbonising gas plants, such as conversion to firing clean hydrogen. Therefore, we intend to consult in early 2021 over proposals to update the requirements to reflect technological advances and apply them more broadly, by removing the 300MW threshold.

**NUCLEAR**

► **We will aim to bring at least one large-scale nuclear project to the point of Final Investment Decision (FID) by the end of this Parliament, subject to clear value for money and all relevant approvals.**

Nuclear power continues to be an important source of reliable clean electricity, currently supplying around 16 per cent of our needs.<sup>59</sup> It is an energy-dense technology which provides large volumes of power from very little land area and can reduce system costs at low levels of emissions. In 2016, the government agreed contracts related to the first new nuclear power station in a generation.

of the country's current electricity needs will be **delivered by Hinkley Point C**

**jobs could be supported** during construction of a large-scale nuclear power plant

expected **reduction in the cost of nuclear new build projects** by 2030

Hinkley Point C is due to commission in the mid-2020s and will deliver around seven per cent of the country's current electricity needs - enough to power the equivalent of around six million homes.<sup>60</sup> But, with the existing nuclear fleet largely retiring over the next decade, we propose to go further. Our analysis suggests additional nuclear beyond Hinkley Point C will be needed in a low-cost 2050 electricity system of very low emissions. We must be ready for this.

We aim to bring at least one further large-scale nuclear project to the point of FID by the end of this Parliament, subject to clear value for money for both consumers and taxpayers and all relevant approvals.

As noted in the Ten Point Plan, a large-scale nuclear power plant could support a peak of around 10,000 jobs during construction.<sup>61</sup> We will remain open to further projects later if the nuclear industry demonstrates that it is able to reduce costs and deliver to time and budget.

We expect the sector to deliver the goal it set for itself in our Nuclear Sector Deal, published in 2018,<sup>62</sup> to reduce the cost of nuclear new build projects by 30 per cent by 2030.

Last year, we consulted on a Regulated Asset Base (RAB) model for private investment in new nuclear generation.<sup>63</sup> Today we are publishing a summary of the responses which have indicated that a RAB model remains credible for funding large-scale nuclear projects.<sup>64</sup>

The government will continue to explore this, alongside a range of financing options, with the developer of the next large-scale project in the pipeline and other relevant stakeholders, including other nuclear developers. Raising enough private capital to finance a nuclear power station is challenging given the significant investment needed for a developer to reach a point of FID. In considering the financing options, we will examine the potential role of government finance during construction, provided there is clear value for money for consumers and taxpayers.

## ADVANCED NUCLEAR INNOVATION

- ▶ We will provide up to £385 million in an Advanced Nuclear Fund for the next generation of nuclear technology aiming, by the early 2030s, to develop a Small Modular Reactor (SMR) design and to build an Advanced Modular Reactor (AMR) demonstrator.

The UK continues to be a leader in the development of nuclear technologies.

SMRs have the potential to provide cost-competitive nuclear power as early as the 2030s. Pending regulatory approval, innovative manufacturing techniques and modular construction could mean that SMRs are faster to build than large-scale nuclear plants and are potentially suitable for deployment in a wider number of sites across the country.

### SMALL MODULAR REACTOR

Small Modular Reactors (SMRs) are usually based on proven water-cooled reactors similar to current nuclear power station reactors, but on a smaller scale. They use nuclear fission to generate low-carbon electricity. SMRs are called modular reactors as their components can be manufactured in factories using innovative techniques and then transported to site to be assembled.

---

**£385m** Advanced Nuclear Fund created

---

**£400bn** estimated worth of SMRs and AMRs by 2035

---

Subject to future HMT Spending Reviews, we have provided a £385 million in an Advanced Nuclear Fund with up to £215 million investment to develop a domestic SMR design that could potentially be built in factories and then assembled on site. It is expected to unlock up to £300 million private sector match-funding.

To help bring advanced nuclear technologies to the market, we will also invest an additional £40 million in developing the regulatory frameworks and supporting UK's supply chain. As the first major commitment of the programme, in 2021 we will open the Generic Design Assessment to SMR technologies, the regulatory process through which developers can obtain approval for their proposed design approach.

Supporting the development of our supply chain now will increase our chances of having indigenous expertise capable of leading the world in developing the nuclear technologies of the future - SMRs and AMRs - a global market estimated by some to be worth approximately £250 billion to £400 billion by 2035.<sup>65</sup>

## ADVANCED MODULAR REACTOR

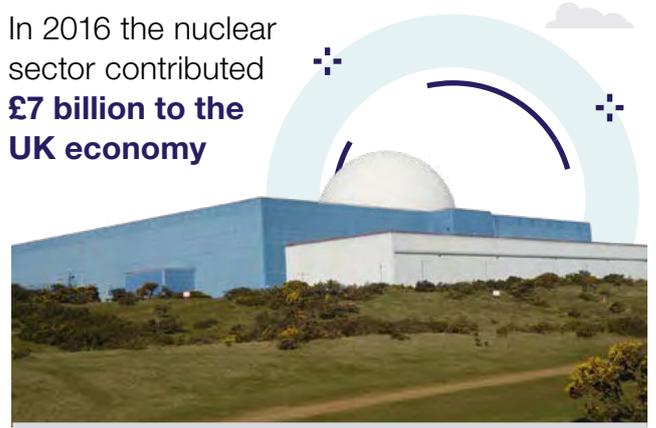

Advanced Nuclear Reactors (AMRs) are reactors which use novel cooling systems or fuels and may offer new functionalities (such as industrial process heat). These reactors could operate at over 800°C and the high-grade heat could unlock efficient production of hydrogen and synthetic fuels.

We are also committing up to £170 million of the Advanced Nuclear Fund to a R&D programme on AMRs – the next generation of nuclear technologies. Our aim is to build a demonstrator by the early 2030s at the latest to prove the potential of this technology and put the UK at the cutting edge against international competitors.

► **We aim to build a commercially viable fusion power plant by 2040.**

Fusion energy would offer low-carbon, continuous, and effectively unlimited power generation. The basic science and engineering involved in the production of fusion energy is now well advanced and fusion energy is expected to play an important role over the longer term to decarbonise global energy production.

In 2016 the nuclear sector contributed **£7 billion to the UK economy**

The UK is a world leader in the most promising fusion technologies with research capabilities across the technical challenges of fusion. This means that the UK is uniquely well-placed to lead the future commercialisation of this technology. The government has already committed over £400 million towards new UK fusion programmes. The aims are to develop a concept design for the Spherical Tokamak for Energy Production (STEP) – expected to be the world’s first compact fusion power plant, to be built in the UK by 2040 – and to invest in facilities and infrastructure to make the UK a global fusion industry hub. In December 2020, the STEP programme published an open call for communities across the UK to apply to be the host site for STEP.<sup>66</sup>

# NET ZERO INNOVATION PORTFOLIO

The Ten Point Plan announced a new £1 billion Net Zero Innovation Portfolio that will help bring down the cost of the net zero transition, nurture the development of better products and new business models, and influence consumer behaviour.

A £1 billion Net Zero Innovation Portfolio aims to accelerate the commercialisation of innovative low-carbon technologies, systems and processes in power, buildings and industry to set the UK on the path to net zero and create world-leading industries and new jobs. The portfolio will focus on ten priority areas to decrease the costs of decarbonisation and underpin innovation across the whole energy system.

As well as accelerating the commercialisation of novel clean energy technologies, innovation also plays an important role in driving economic growth, anchoring new technology to the UK, delivering levelling-up across the country and reducing our significant exposure to the risks of climate change.

An ambitious and well-designed energy innovation strategy could, by 2050, annually generate £54 billion of business opportunities for the UK.<sup>67</sup>

The current BEIS £505 million Energy Innovation Programme is delivering some of the UK’s most significant advances in low-carbon technologies, leveraging £200 million industry investment:

- ▶ **The UK’s first CCUS plant** at Tata Chemicals, Cheshire (£17 million total investment)
- ▶ **The world’s largest “Cryogenic” energy storage plant** at Manchester (over £70 million total investment)
- ▶ **The UK’s largest innovative heat pump trial** (750 homes, over £15 million total investment)
- ▶ **The UK’s first Venture Capital fund solely focussed on Cleantech** (over £40 million total investment).

## NET ZERO INNOVATION PORTFOLIO - PRIORITY AREAS

**Advanced Modular Reactors**

**Floating offshore wind**

**Hydrogen**

**Bioenergy**

**Industrial fuel switching**

**Advanced CCUS**

**Homes**

**Disruptive technologies**

**Direct air capture**

**Energy storage and flexibility**

## BIOENERGY INNOVATION

- ▶ **By 2022, we will establish the role which BECCS can play in reducing carbon emissions across the economy and, as part of a wider biomass strategy, set out how the technology could be deployed.**

Biomass is unique amongst renewable technologies in the wide array of applications in which it can be used as a substitute for fossil-fuel based products and activities, from power generation to hydrogen production and even new forms of plastics. Along with its ability to deliver negative emissions, this makes biomass one of our most valuable tools for reaching net zero emissions.

### BIOMASS

**Biomass refers to any material of biological origin (including wastes) which is used as a fuel for bioenergy (conventional combustion, gasification, energy from waste and low-carbon fuels like hydrogen) or in products (such as chemicals, bio-plastics and timber for construction).**

In the government's response to Climate Change Committee's (CCC) latest annual progress report to Parliament, we announced that we will publish a new Biomass Strategy in 2022. As part of this strategy, we will set out the results of a review of the amount of sustainable biomass available to the UK, and how this resource could be best utilised across the economy to help achieve our net zero greenhouse gas emissions target by 2050.

Our review will assess the UK's current biomass sustainability standards, which are already some of the world's most stringent, to see where and how we can improve them even further. Our review will also consider the role biomass can play in delivering our wider environmental targets, including on air quality.

We will shortly issue a call for evidence: 'Biomass for net zero', to inform the development of our strategy. We will issue a preliminary position paper by summer 2021, once the evidence has been reviewed.

Critical to our consideration will be the role of BECCS in our energy system. BECCS plants could deliver negative emissions, by capturing the carbon released during biomass combustion, gasification and other processes, provided supply chain emissions are sufficiently low. There are a number of applications for BECCS across the economy, including clean hydrogen production, power generation, waste management and in heat for industrial processes and we need to ensure that it is deployed where it has the greatest value in reducing emissions.

For example, current support for electricity generation, which converted from coal to using biomass as a fuel source, expires in 2027. BECCS could provide a long-term future for this capacity.

## THE POTENTIAL OF GREENHOUSE GAS REMOVAL (GGR) TECHNOLOGIES

Greenhouse gas removal technologies actively remove greenhouse gases from the atmosphere and are diverse, ranging from engineered to nature-based solutions. The CCC has been clear that, in order to achieve net zero by 2050, GGRs will be necessary to balance residual emissions from some of the most difficult to decarbonise sectors, such as parts of the agriculture and aviation sectors. The CCC has estimated 75MtCO<sub>2</sub> of negative emissions could be required annually in order to reach net zero greenhouse gas emissions by 2050.<sup>68</sup>

The government is already taking steps to accelerate the development and deployment of GGRs in the UK.

In June 2020, we announced up to £100 million of funding for research and development of DACCS and other GGR methods.<sup>69</sup> This funding seeks to demonstrate feasible GGR approaches at scale, as well as better our understanding of governance and ethics of GGRs. We have also published a call for evidence earlier in December,<sup>70</sup> which seeks views on mechanisms and governance principles to help bring GGR technologies like DACCS to deployment in the UK. Alongside this, both BEIS and the National Infrastructure Commission will conduct research projects to develop the evidence based on GGRs in order to support future policy in this area.

# A PLANNING FRAMEWORK FOR ENERGY INFRASTRUCTURE

- ▶ **We will complete a review of the existing energy National Policy Statements (NPS), with the aim of designating updated NPS by the end of 2021.**

The suite of energy NPS establish the need for new energy infrastructure and set out a framework for the consideration of applications for development consent. We have decided that it is appropriate to review the NPS, to ensure that they reflect the policies set out in this white paper and that we continue to have a planning policy framework which can deliver the investment required to build the infrastructure needed for the transition to net zero. Work on this review will start immediately, with the aim of designating updated NPS by the end of 2021.

This white paper shows that the need for the energy infrastructure set out in energy NPS remains, except in the case of coal-fired generation. While the review is undertaken, the current suite of NPS remain relevant government policy and have effect for the purposes of the Planning Act 2008. They will, therefore, continue to provide a proper basis on which the Planning Inspectorate can examine, and the Secretary of State can make decisions on, applications for development consent. Nothing in this white paper should be construed as setting a limit on the number of development consent orders which may be granted for any type of generating infrastructure set out in the energy NPS. Other restrictions outside the planning regime (in particular the Emissions Performance Standard) mean that no new coal infrastructure projects can come forward.

# THE ECONOMIC BENEFITS OF CLEAN ELECTRICITY

The UK should harness more of the economic benefit from the accelerated deployment of renewable technologies. This will help position the whole of the UK to reap economic benefits.

- ▶ **We will support the delivery of the industry's target of 60 per cent UK content in offshore wind projects by 2030, through more stringent requirements for the CfD supply chain plan process.**

We will invest in the growth of the UK's offshore wind manufacturing infrastructure to create jobs and opportunity in the UK supply chain. We will use our Offshore Wind Sector Deal with the renewables sector to ensure that domestic deployment creates jobs and raises skills levels across the country, and to support overseas trade and investment opportunities for UK-based companies. We will require developers who are awarded a CfD, to honour their supply chain plans.

► **We have announced a £160 million scheme and launched a competitive process in early December to support the development of offshore wind manufacturing infrastructure.**

The £160 million funding announced in October 2020 and the competitive process launched in early December will support the development of major port-side infrastructure hubs, strengthening UK offshore wind manufacturing. This will have a major impact on our ability to develop a competitive UK supply chain for domestic and overseas markets.<sup>71</sup> It will help attract inward investment to manufacturing in the UK and increase our global competitiveness and expertise. The investment will support major new offshore wind manufacturing capacity which is needed to develop a competitive industrial base capable of servicing UK and international markets. Our Ten Point Plan set out how the investment alongside 40GW offshore wind will support the industry’s target to achieve 60 per cent UK content by 2030.<sup>72</sup> And we will use it as the platform to target a five-fold increase in exports of offshore wind goods and services to at least £2.6 billion a year by 2030. The sector could bring £3 billion GVA a year by 2030, of which £1 billion is export related.<sup>73</sup>

This new investment, could create around 2,000 construction jobs, representing high quality employment opportunities in many coastal regions around the country. This investment alongside other offshore wind commitments will enable the offshore wind sector to support up to 30,000 direct jobs and 30,000 indirect jobs in ports, factories and the supply chains by 2030.<sup>74</sup>

---

**£2.6bn** **target annual exports** of offshore wind goods and services by 2030

---

**£7bn** **contributed by the nuclear sector** to the UK economy in 2016

---

**60,000** **direct and indirect jobs** could be supported by the offshore wind sector by 2030

---

The nuclear sector also makes a significant contribution to the UK economy - some £7 billion GVA in 2016.<sup>75</sup> The nuclear industry currently employs around 60,000 people.<sup>76</sup> Building, operating and decommissioning our nuclear assets takes place in some of the most remote areas of the UK. Developing the domestic supply chain for the sector has the potential to transform the prosperity of these regions. It provides high-value and skilled employment opportunities, unlocking investment to support infrastructure projects and growing manufacturing and industrial capability.

## CASE STUDY: GRIMSBY PORT REVIVAL

North East Lincolnshire is home to the Port of Immingham which is the UK's largest port by tonnage - handling around 11 per cent of the UK's cargo.<sup>77</sup> It serves a diverse range of industries and is an international gateway.

Today Grimsby sits in the 10 per cent of England's most deprived regions,<sup>78</sup> however it has strong maritime history and the wider strengths in the energy sector. Its location close to the majority of the UK's offshore wind farm developments presents a major opportunity for the Port of Grimsby and the town with around £10 million being invested in the port and facilities.<sup>79</sup>

Since the first wind farms, notably Lincs and Lynn and Inner Dowling were built in 2009,<sup>80</sup> the Port of Grimsby has developed and is now recognised as the centre for operations and maintenance (O&M) services to the offshore wind farms. It is a major base for businesses such as Ørsted, E.ON, Innogy and GLID/Siemens

These global leaders in offshore renewable energy offer many high skilled jobs for the area. The rapid growth of the renewable energy industry in the UK has presented new economic opportunities for Grimsby in the last decade. Ørsted recently opened its expanded O&M base, creating the world's largest O&M base, employing 350 people (83 per cent workers live within one hour's distance<sup>81</sup>), – with the port estimating that over 650 are employed on offshore wind O&M services.<sup>82</sup>

In addition, the Offshore Renewable Energy Catapult project, now based in Grimsby's Port Offices, plan to create a Centre of Excellence. This will serve as a leading testing facility for the development of next generation technologies benefiting the whole of the UK. Direct industry input into projects at the Operations and Maintenance Centre of Excellence is expected to be £90 million over the next 10 years.<sup>83</sup>

At Hinkley Point C, the developer expects that 64 per cent of the construction contracts, by value, will go to UK-based companies.<sup>84</sup> But the potential for the domestic supply chain beyond Hinkley Point C is greater than this, given the capability of UK companies across the nuclear lifecycle; from enrichment and fuel fabrication, through new-build construction, plant operation, world leading R&D, future nuclear technologies to waste management and decommissioning and final disposal.

In the Nuclear Sector Deal, we committed to help the UK supply chain become more productive and competitive.<sup>85</sup> This includes supporting established companies to strengthen their ability to compete for high-value work and we will reduce barriers to entry for innovative companies, especially Small and Medium-sized Enterprises. We are working with the sector to develop a national and regional supply chain productivity improvement programme to achieve these objectives and target at least £2 billion of domestic and export contracts for UK companies by 2030.

# Our key commitments

We will **target 40GW of offshore wind by 2030**, including 1GW floating wind, alongside the expansion of other low-cost renewable technologies.

We will **support the deployment of at least one power CCUS project**, to be operational by 2030, and put in place the commercial frameworks required to help stimulate the market to deliver a future pipeline of power CCUS projects.

We will consult on steps to **ensure that new thermal plants can convert to low-carbon alternatives**.

We will **aim to bring at least one large-scale nuclear project to the point of FID** by the end of this Parliament, subject to clear value for money and all relevant approvals.

We will **provide up to £385 million in an Advanced Nuclear Fund** for the next generation of nuclear technology aiming, by the early 2030s, to develop a SMR design and to build an AMR demonstrator.

We aim to **build a commercially viable fusion power plant** by 2040.

By 2022, we will **establish the role which BECCS can play in reducing carbon emissions across the economy** and, as part of a wider biomass strategy, set out how the technology could be deployed.

We will **complete a review of the existing energy NPS** and designate updated NPS by the end of 2021.

We will **support the delivery of the sector's target of 60 per cent UK content in offshore wind projects by 2030**, through more stringent requirements for the CfD supply chain plan process.

We have announced a £160 million scheme and launched a competitive process in early December to **support the development of offshore wind manufacturing infrastructure**.

EXPLAINER

# Modelling energy

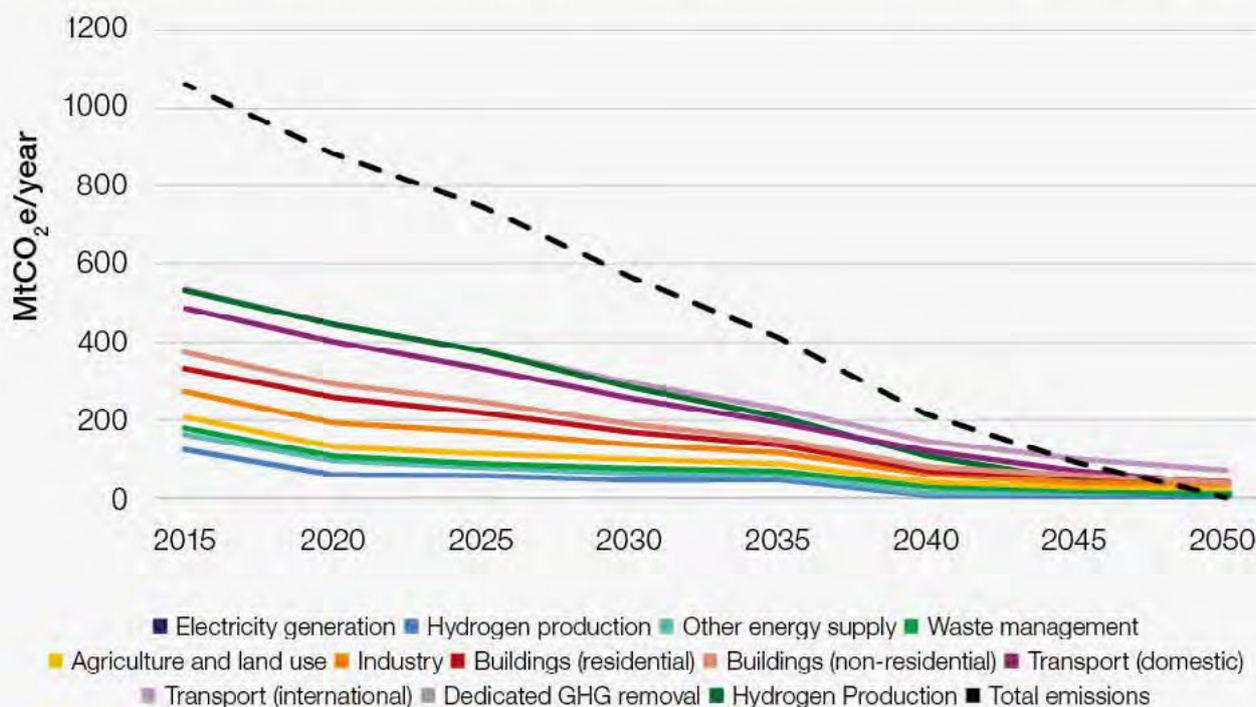

## SETTING THE SCENE

Developing the policies we need to achieve net zero is challenging. We need to manage uncertainties ranging from the cost of fuel, when and whether certain technologies will be available, and how people will behave when they are asked to use new ways of heating their homes.

To help us do so, we can use models of the economy and the energy system. These digital tools help us understand the linkages and interdependencies between different parts of the system and how our policies impact consumers.

The models we use perform functions ranging from strategic analysis of long-term decarbonisation to improving our understanding of how proposed policies will work in practice. For example, our Mackay Carbon Calculator provides illustrative pathways to reaching net zero by 2050 (figure 4.1).<sup>86</sup>

It is important that the results from models are understood and used correctly. This means reflecting uncertainties, being clear on assumptions and combining modelling evidence with, and testing it against, other forms of evidence.

**FIGURE 4.1 – ILLUSTRATIVE PATHWAY TO NET ZERO EMISSIONS**

Source: Mackay Carbon Calculator

Many of our models have been developed in-house and in close collaboration with academia. We now want to increase our ability to access the best modelling expertise available. We will implement a new modelling strategy that will increase transparency and collaboration. This will improve our insights and increase confidence in policy. We will build on the recommendations of the Energy Data Taskforce,<sup>87</sup> and have published the Mackay Carbon Calculator and the National Household Model.<sup>88</sup>

## OUR LAST MODELLING STRATEGY

- ▶ **Consolidated and simplified** the “modelling landscape” by developing models that can support more than one policy;
- ▶ **Built collaboration** by
  - Developing academic links for long term energy modelling;
  - Publishing our 2050 Calculator & National Household Model;
- ▶ **Improved how we treat the many inputs** to our models; and,
- ▶ **Implemented standard quality assurance processes.**<sup>89</sup>

# TRANSFORMING OUR MODELLING

Our modelling strategy will ensure our suite of models, data, assumptions and management processes are:

- ▶ **Effective** in supporting evidence-based policy making;
- ▶ **Accessible** for policy teams, open to all and trusted by the department and wider stakeholders;
- ▶ **Coherent** and coordinated;
- ▶ **Consistent** and / or transparent in the use of assumptions;
- ▶ **Efficient** in the use of resources; and
- ▶ **Robust** - capable of being maintained and meeting quality standards.

## THE NEXT PHASE

The next phase of our modelling strategy will improve our approach to modelling:

- ▶ **Transparency:** We will set up and test a protocol for publishing our models. There will be specified exemptions such as models in development or models including with sensitive commercial or security information commercially.
- ▶ **Intra-energy system modelling:** We will review and update our long term, whole energy system models and their inter-operation with sector specific models, taking in the latest ideas from Digital Twins.<sup>90</sup>

- ▶ **Infrastructure:** We will develop and implement our IT strategy to make it easier for analysts, contractors and collaborators to develop and maintain models by harmonising development languages and providing a development environment for our partners.

## THIS APPROACH WILL:

- ▶ Increase the **agility** of government decision and ensure policies to reflect the **best evidence** by:
  - Collaborating with a range of stakeholders on our modelling approaches and
  - Ensuring our models and their inputs adapt to a fast-changing market.
- ▶ Ensure our we **use the latest methodologies, software and technology** by continuing to invest in partnering to develop models of our energy systems.
- ▶ Stimulate **innovation**.

## TO EXECUTE OUR STRATEGY:

- ▶ **We will improve and test the proposition of open sourcing models** by:
  - Developing a protocol for releasing our models
  - Developing an Open Modelling Environment to share modelling capability in a trusted space;

- Investigating providing an open access data source for the National Household Model;
- Opening access to a new version our long term energy systems model; developed in collaboration with University College London, and;
- Running modelling improvement competitions to leverage 3rd party knowledge - initially running a competition to improve econometric equations at the heart of BEIS Energy Demand Model – used to produce our Energy and Emissions Projections.<sup>91</sup>

- ▶ **We will establish a protocol for regular publication of quasi-statistical publications** such as Energy and Emissions Projections using voluntary application of the Code of Practice for Statistics.<sup>92</sup>
- ▶ **We have published an updated energy calculator.** The new calculator is named in honour of the late David Mackay. The Calculator was his brainchild. One important new feature will be the ability to alter start and finish dates for each lever. This is an important contribution for the global calculator community.

CHAPTER 03

# Energy system

## OUR GOAL

To deliver energy reliably, while ensuring fair and affordable costs and accelerating our transition to clean energy, we need to create investment opportunities across the UK to enable a smarter, more flexible energy system, which harnesses the power of competition and innovation to the full.

In partnership with the Office of Gas and Electricity Markets (Ofgem), we will:

- ▶ **Work to minimise the costs to consumers** of getting energy to homes and businesses, by promoting more innovation and competition in networks and in national and local energy markets
- ▶ **Ensure electricity networks are able to integrate increasing renewable generation** and more electric vehicles (EVs), while controlling system costs
- ▶ **Make sure that energy system information about supply and demand is used to drive greater efficiency and lower costs**, as well as promote more innovation and new services for consumers
- ▶ **Ensure that the system's rules and governing institutions support the transition away from fossil fuels** to clean energy

ENERGY SYSTEM

# The strategic context

The UK's energy system is one of the most developed and successful anywhere in the world.

It was designed and built for the age of fossil fuels which, even today, are predominant in final energy use. Though they are now at record low levels, fossil fuels, primarily petroleum products and natural gas, still accounted for just over 79 per cent of energy supply in 2019, with electricity representing only 17 per cent of final energy use by consumers.<sup>93</sup>

This dependency on fossil fuels will change dramatically over the next 30 years. By 2050, electricity could provide over half of final energy demand, as it displaces petrol and diesel in cars and light vehicles and, to some degree, gas for heat in homes. As we set out in the 'Power' chapter, this could mean that electricity demand doubles from today's 345TWh.<sup>94</sup>

This change necessitates a very different approach, and not just because the energy system must support the deployment of clean energy technologies. It will also have to adapt to a world in which energy is far more decentralised.

## ELECTRICITY DISTRIBUTION NETWORKS

Smaller regional networks that transport electricity from the transmission lines and small-scale generators, into our homes and businesses – the ‘A and B roads’ of our energy network. There are 14 licenced distribution network operators (DNOs), owned by six different groups.

## ELECTRICITY TRANSMISSION NETWORKS

The high-voltage networks that transport electricity across Britain and nearby offshore waters – the ‘motorways’ of our energy network. Owned and maintained by three different Transmission Owners (TOs) for England and Wales; southern Scotland; and northern Scotland and the Scottish islands groups, and by individual Offshore Transmission Owners (OFTOs) for the connections between offshore windfarms and the onshore grid.

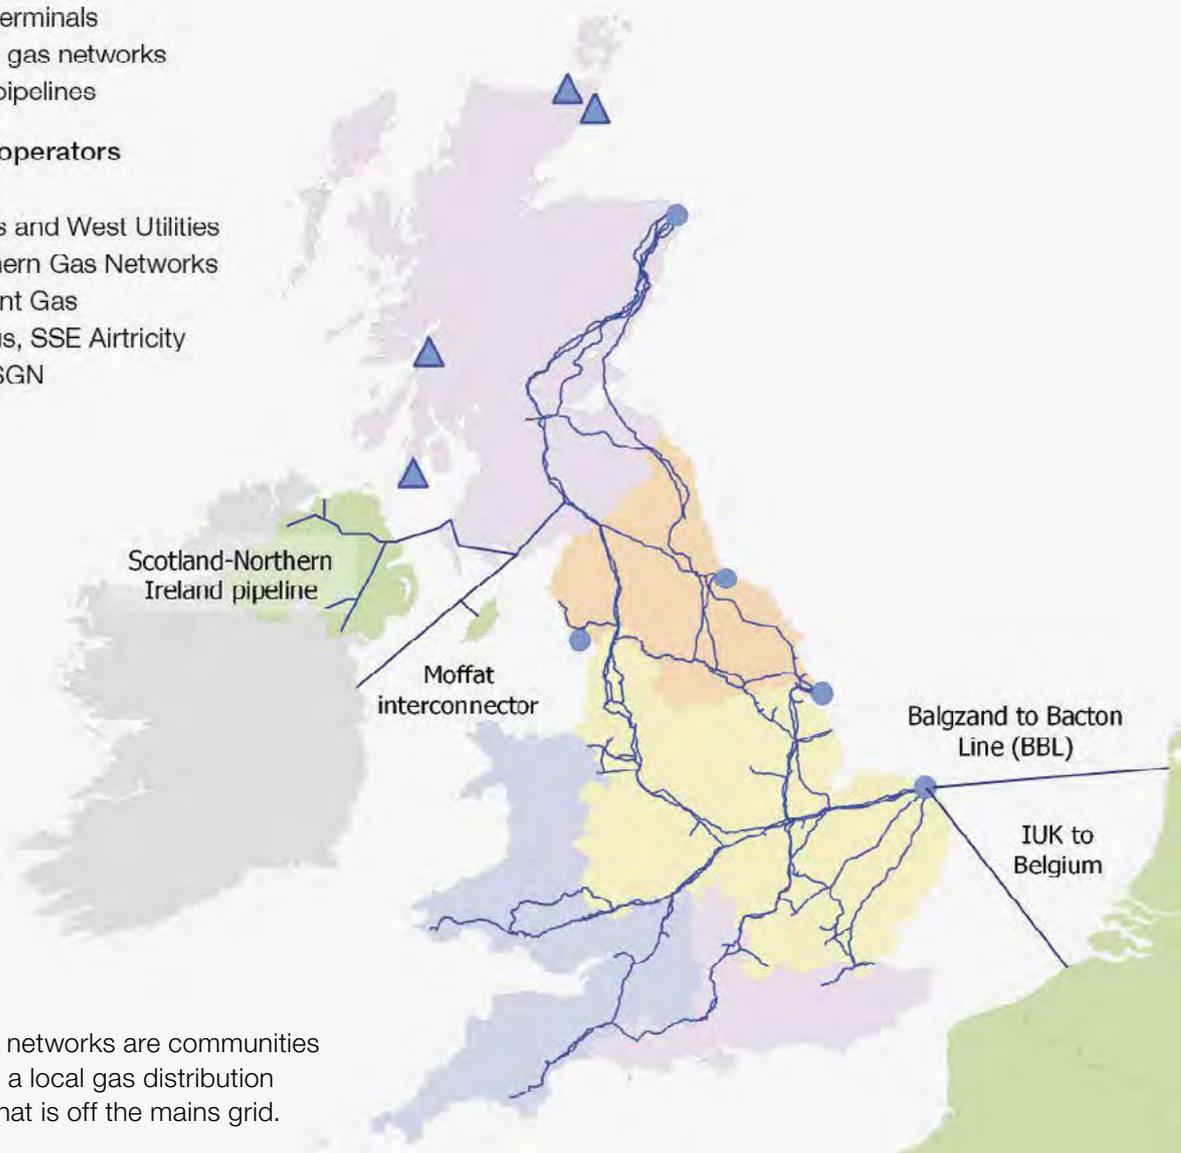

**FIGURE 5.2 - UK GAS NETWORKS AND DISTRIBUTION AREAS**

**Gas network**

- Wales and West Utilities
- Northern Gas Networks
- Cadent Gas
- Firmus, SSE Airtricity and SGN

Local gas networks are communities served by a local gas distribution network that is off the mains grid.

**GAS DISTRIBUTION NETWORKS**

Smaller regional networks that transport gas from the transmission pipes, into our homes and businesses. There are eight licenced gas distribution networks (GDNs), owned by four different groups.

**GAS TRANSMISSION NETWORK**

The high-pressure pipes that transport gas to smaller networks, or directly to gas power stations and large industrial consumers. Owned and operated by National Grid Gas plc (NGG).

Gas currently represents almost **30 per cent of final energy consumption** and 40 per cent of electricity generation

**79%**

of **energy supply** in 2019 came from **fossil fuels**

**17%**

of consumers **final energy use** was **electricity**

**>50%**

of final energy demand could be **provided by electricity** by 2050

Demand will be satisfied as much by local solutions as by a nationally organised and operated system. Smart technologies, enabled by pervasive digitalisation, are already opening new possibilities, facilitating a transformation to faster and more efficient solutions which will only accelerate over the coming decade.

The switch to clean electricity has particularly profound implications. Separate networks for electricity, gas for heating and petrol or diesel for cars and vans, which today run independently of each other, will increasingly merge into one system, as electricity becomes the common energy currency. It puts new demands on electricity, to reflect how we use heat and power our cars and will require a new approach to how the system is managed. And the energy system will have to adapt further, to accommodate the production and use of clean hydrogen or the transport and storage of carbon dioxide from industry or power generation.

The costs of transporting energy and managing the balance between supply and demand make up around 25 per cent of an average household's energy bill currently.<sup>96</sup> As we move to clean energy, the system will comprise a more complex series of functions which it will need to discharge while keeping costs affordable.

The prize is an energy system which is not only cleaner but also smarter; one that gives customers more control, delivering the energy we need efficiently, and at a fair cost.

Securing this outcome requires a comprehensive approach, with evolution across all elements of the energy system so that it is fit for the future. It is not just about ensuring a cost-effective and resilient network of pipes and wires, critical though this is. It means exploiting a new digital infrastructure which will complement the system's physical infrastructure to liberate the potential of smart, flexible technologies.

# THE SMART ELECTRICITY SYSTEM

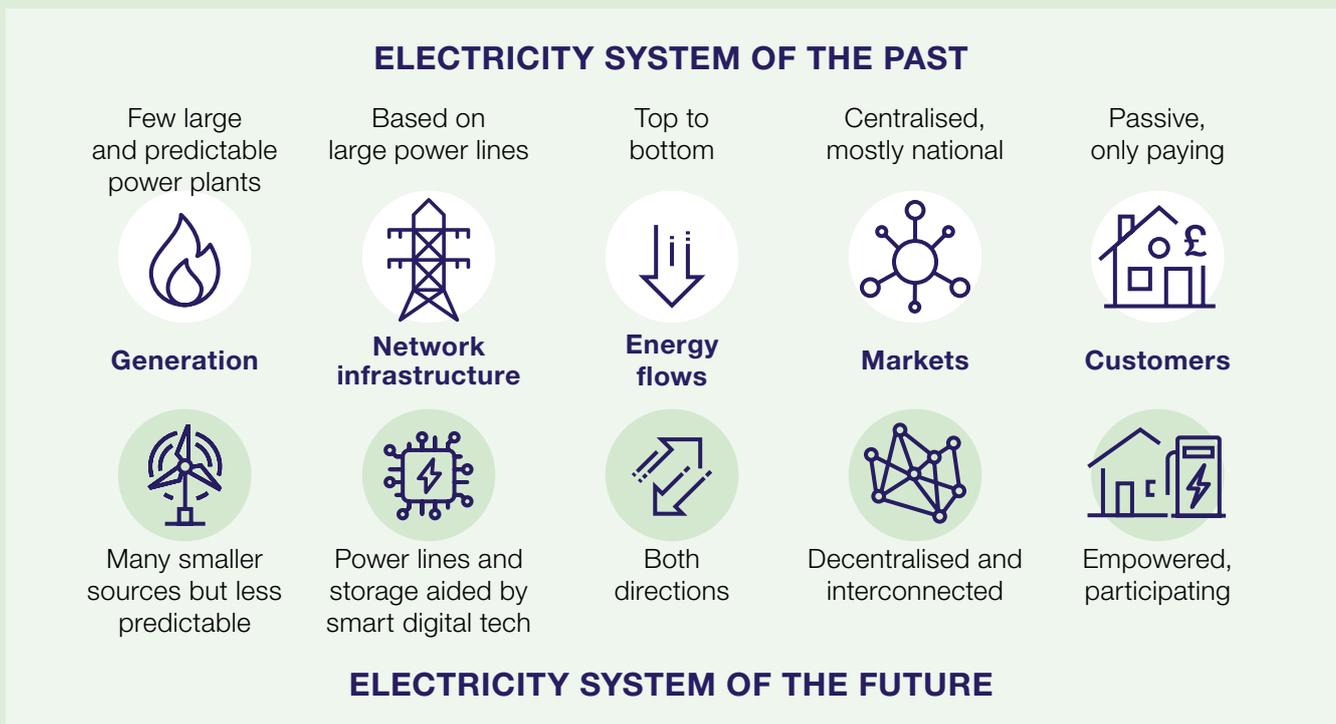

The electricity network is now becoming more decentralised.

This means there will be more numerous and smaller sites of generation across the country, not just the large, centralised power stations with which we are familiar. There will be new sources of demand, as millions of EVs and heat pumps connect to the system. A previously one-directional system is transforming into something more dynamic.

But it is not a matter of adding ever more generating capacity and cables. The transformation of the electricity system is an opportunity to exploit new forms of system flexibility in how energy is generated and consumed. This flexibility allows supply and demand to be shifted in time or location, so they are matched in the most efficient way – keeping costs down for consumers. For example, smart technology and time-of-use tariffs can help consumers charge EVs during off-peak periods – when energy is cheaper and cleaner.

Our analysis suggests that a smarter, more flexible system could unlock savings of up to £12 billion per year by 2050 (2012 prices), compared to a system with low levels of flexibility<sup>97</sup> – primarily because being able to respond more quickly and shift electricity around more easily means less generation and network needs to be built. This will lower costs for the customer of the future.

By 2050, the domestic market for smart systems and flexibility solutions, including EV smart chargers and smart network equipment, could contribute almost £1.3 billion to the nation’s economy, with exports of these products and services adding a further £2.7 billion (2020 prices). The domestic market for smart systems equipment and related services could support 10,000 jobs by 2050, with a further 14,000 jobs supported by export markets.<sup>98</sup>

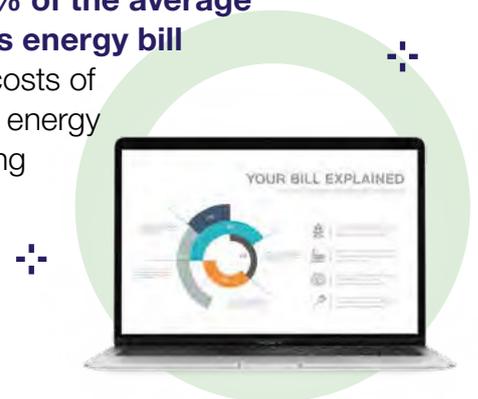

We have to instil competition deep into the operation of our energy markets to drive cost reductions and open the system to innovative new services for the benefit of consumers, while also incentivising the significant private sector investment that will make it possible to update our energy system. And we need an approach to managing the operation of the system which is flexible and responsive, and aligned to the demands of a net zero future.

**Around 25% of the average consumer's energy bill**

is from the costs of transporting energy and balancing supply and demand

# Our key commitments

## EFFICIENT ELECTRICITY MARKETS

Electricity markets need to adapt as the deployment of renewable generation increases.

Balancing supply and demand becomes more complex because most renewables are, by their nature, intermittent and generate electricity only when the wind blows or the sun shines.

Gas-fired power stations have traditionally provided the flexibility needed to match supply to demand at peak hours, or when renewables output is low. Increasingly, flexibility will come from new, cleaner sources, such as energy storage in batteries, increased interconnected capacity from neighbouring electricity markets, or from consumers using smart technologies to reduce how much energy they use or shift when they use the energy to different times in the day. New forms of flexibility could lower future costs for consumers, by minimising expensive network reinforcement or reducing the need for additional generation, especially peaking capacity which needs to be deployed quickly to meet spikes in demand.

### ELECTRICITY SYSTEM OPERATOR

The whole transmission system is operated by a single Electricity System Operator (ESO), who is responsible for keeping it stable and secure. National Grid ESO perform this function.

- ▶ **We will publish a new Smart Systems Plan in spring 2021, jointly with Ofgem, and define electricity storage in law, legislating when Parliamentary time allows.**

We need open, competitive markets which harness the full value of flexibility. In 2017, the government and Ofgem published the first Smart Systems and Flexibility Plan.<sup>99</sup> We have implemented two-thirds of the policies in the plan and are on track to deliver it in full by 2022, removing barriers to energy storage, enabling smart homes and businesses and properly rewarding providers of flexibility services. But we are now ready to take the next step in driving flexibility deep into the energy system.

In partnership with Ofgem, we will publish a new Smart Systems Plan in spring 2021, which will include a new framework for monitoring flexibility across electricity markets. We will legislate when Parliamentary time allows to define electricity storage in law, removing another barrier to flexibility.

► **Through the Net Zero Innovation Portfolio, we will launch a major competition to accelerate the commercialisation of first-of-a-kind longer duration energy storage, as part of our £100 million investment in storage and flexibility innovation, with delivery from spring 2021.**

Storing excess low-carbon generation over longer periods of time could enable us to decarbonise the energy system more deeply at lower costs.

Novel energy storage technologies show promising cost reductions<sup>100</sup> but some have yet to be demonstrated at scale. First-of-a-kind demonstrations are required to enable cost reduction and de-risk private investment. The Prime Minister's Ten Point Plan announced a further £100 million to address energy storage and flexibility innovation challenges, one of the key priority areas in the over £1 billion Net Zero Innovation Portfolio.

To promote energy storage innovation, we will further accelerate the commercialisation of innovative technologies, excluding proven technologies such as lithium ion and pumped hydro storage. Our support will build on the success of previous funding under the current Energy Innovation Programme.

It will focus on long-duration storage technologies that could be deployed at large scale and provide novel services or system benefits. The first competition to address energy storage and flexibility innovation challenges will be launched in spring 2021 with stakeholder engagement and information days.

Some flexibility solutions could be better delivered through local markets, in which organisations with a more in-depth knowledge of their communities can provide solutions to local need more quickly than responses at the national level. But local and national actions need to complement one another. We will work towards a market framework which ensures that national and local electricity markets are fully co-ordinated and satisfy the full suite of system requirements. We look to the Electricity System Operator (ESO), Distribution Network Operators (DNOs) and market participants to work closely together to facilitate this enhanced co-ordination, and government will keep progress on this under review to ensure the system enables optimal levels of flexibility.

DNOs, the companies which own the regional electricity networks, are already creating local flexibility markets. In 2020, they awarded contracts for around 1.2GW of flexibility services, including the first contracts to provide local services which pay households for using the aggregated electricity capacity from a collection of domestic batteries.<sup>101</sup> We will encourage more local solutions and open up as many services as possible to competition. We expect network operators to go much further, fully opening their networks to flexibility technologies while mitigating real or perceived conflicts of interest.

## CASE STUDY

### Creating New Marketplaces

Piclo Flex is an independent flexibility marketplace which allows DNOs and flexibility providers to find and contract with each other. It enables distributed resources such as electric vehicles or battery energy storage to identify where flexibility is needed via a dashboard, receive notification of relevant auctions, and bid for DNO payments. Overall, the platform helps to identify flexibility market opportunities and lowers barriers for entry for flexibility providers.

As part of the £505 million BEIS-funded Energy Innovation Programme, Piclo is now expanding its platform to support trading with the ESO, as well as trading between flexibility providers. Another competition winner, Electron, are also creating innovative digital solutions for flexibility trading.

Actions should include steps to implement standardised flexibility products as soon as possible and ensure that distributed flexibility is able to participate in all markets. We will keep open the option of legislating in support of local flexibility markets, should DNOs fail to make sufficient progress.

Due to the unique characteristics of electricity, there is a need to match supply and demand on a second-by-second basis. The government works in partnership with the ESO and Ofgem to ensure the reliable operation of the system and the security of electricity supplies. Security of supply will always be a priority, but our approach must also adapt to reduce carbon emission and costs.

Our markets should also incentivise the integration of the different types of energy assets which are now connecting to the energy system. We expect Ofgem and the ESO to ensure existing balancing services are fully transparent and competitively procured, while enabling new markets to emerge. We support the steps which they are taking to facilitate wider access to balancing services and embed more efficient processes into the operation of balancing markets, including establishing closer-to-real time markets and enabling greater automation.

As well as making sure the system is stable on a day-to-day basis, we need the assurance over the course of each year that there is enough generation capacity to satisfy even exceptional periods of demand or to back-up renewables when the wind does not blow, or the sun is not shining. The Capacity Market (CM) is our primary policy mechanism for delivering this security of electricity supply. It provides generators and flexibility providers with a payment for reliable capacity to ensure they deliver more electricity, or reduce demand, when required.

To date, the CM has supported investment in over 10GW of new capacity, including smart technologies such as battery storage and demand-side response.<sup>102</sup> We have made a number of reforms since its introduction in 2014, such as allowing certain renewables to participate and implementing carbon emissions limits in future auctions. In our five-year review, published in 2019, we committed to retaining the CM as a guarantee of system reliability and to making further incremental improvements to its design.<sup>103</sup> The next review will take place by 2024. We will ensure that the mechanism acts in concert with other markets to incentivise investment in the right type of capacity, in the right place at the right time.

Over the longer term, as generation moves towards a predominantly renewables mix, we want electricity markets to incentivise the right behaviours from generators and offer value for money to consumers, while continuing to ensure low-carbon solutions can deploy at the scale needed for net zero emissions. Our current market framework emphasises the cost of fuels such as gas and coal, but renewable technologies, such as wind, do not use fuel at all. It is also poor at valuing some services which will become increasingly important to the system, such as local balancing.

Increasing levels of renewable generation are likely to impact wholesale market prices and the ways in which markets determine which assets can most efficiently dispatch power, or reduce use, to balance the system. We need markets to incentivise both significant levels of new investment and efficient operation, in a system which mixes existing generation with increasing levels of renewables and the flexible technologies which complement them. We will support the technologies required for this transition and look for ways to adapt our policies to reflect emerging market dynamics; for instance, through our call for evidence on the future of renewable support schemes, published alongside this white paper, and in our new Smart Systems Plan, to be published in spring 2021. Beyond this, we will consider how our policies should continue to evolve, developing our approach as required in consultation with industry and other stakeholders.

## NETWORK INFRASTRUCTURE

Electricity and gas transmission networks transport energy large distances around the country, while regional distribution networks connect our homes and places of work to the grid.

The vast majority of households are connected to the electricity network. The relatively few homes that are off grid, have their own electricity generator and might self-generate, using solar photovoltaics for example. Britain's gas network is one of the most efficient, resilient and advanced operations in the world, connecting over 23 million users through 284,000 km of pipelines.<sup>104</sup> Around four million households live off the gas grid, many of them in remote locations and using stored oil or gas for heating and for hot water.<sup>105</sup>

Britain has been at the forefront of introducing competition to networks and regulating these natural monopolies. This approach has served consumers well, promoting innovation, and lowering costs. Since privatisation, our gas and electricity networks have become more resilient and delivered better value for customers. The cost of transporting a unit of electricity has fallen by 17 per cent since the mid-1990s, while investment has increased. Reliability and customer service have improved, and the number of power cuts has almost halved.<sup>106</sup>

The transformation of our energy system will require growing investment in physical infrastructure, to extend or reinforce the networks of pipes and wires which connect energy assets to the system and maintain essential resilience and reliability. As well as creating a low-carbon system we need enhanced preparedness for climate risks. Government is supporting the efforts of key stakeholders in this important endeavour.

Under the Climate Change Act's Adaptation Reporting Power over 90 organisations have committed to report on their preparatory actions by the end of 2021, including those responsible for electricity generation, and the transmission and distribution of gas and electricity.<sup>107</sup>

While the gas network will need continual updating, the electricity network faces a complete step-change in approach and scale. Working with Ofgem, we need to deliver investment in our existing electricity network at the lowest possible cost to consumers while ensuring the network can keep pace with burgeoning demand for power, for example, from the accelerated adoption of EVs and heat pumps.

► **We will legislate, when Parliamentary time allows, to enable competitive tendering in the building, ownership and operation of the onshore electricity network.**

We need market and regulatory frameworks which promote greater competition and more innovation in the construction and operation of energy networks. Competition in network assets is key to reducing network costs. Since 2009, awarding the ownership and operation of offshore wind network connections through a competitive tender process is estimated to have saved consumers in excess of £800 million.<sup>108</sup> We now need a similar competitive regime for onshore networks, where currently only incumbent network operators can build, own and operate network assets.

**Britain's gas network connects 23 million users**

through 284,000 km of pipelines

Allowing other parties to compete for onshore network projects will deepen the pool of capital available for the significant amount of investment needed in our networks as we transition to clean energy. Competitive pressure in these networks will improve efficiency, saving consumers more money, and encourage further innovations in system design and operation. It will also provide Ofgem with better price information, which it can utilise in setting its periodic price control mechanism.

We therefore intend to introduce legislation, when Parliamentary time allows, to enable competitive tendering for building, owning and operating onshore electricity network assets. We intend the legislation to allow the Secretary of State to appoint an appropriate party to run the tender processes. We propose that competitive tendering could be opened up at the distribution network level, as well as in the transmission network, should evidence suggest that this will secure value for consumers. This competitive regime will extend widely, addressing network constraints across Wales, Scotland and England. We also intend to open network innovation funding to third parties and encourage more whole-system innovation in gas and electricity networks. We will consider amending legislation to achieve this, should it be necessary.

- ▶ **We will support the rollout of charging and associated grid infrastructure along the strategic road network, to support drivers to make the switch to EVs ahead of the phase out of the sale of new petrol and diesel cars and vans by 2030, and hybrids with significant zero emission capability by 2035.**

Following extensive consultation with car manufacturers and dealers, the Prime Minister has confirmed that the UK will end the sale of new petrol and diesel cars and vans by 2030, ten years earlier than planned. The sale of hybrid cars and vans that can drive a significant distance with no carbon emissions will continue until 2035.

This accelerated transition requires scaling-up the rollout of EV chargepoints and, in turn, an associated expansion in electricity generation and network capacity, to meet the increase in demand for power. With the necessary investment in new infrastructure and the adoption of smart charging, we are confident that the system will cope with the transition.

As part of a £2.8 billion package announced in the Prime Minister's Ten Point Plan, the government will provide funding of £1.3 billion to accelerate the rollout of chargepoints for EVs in homes, workplaces, streets and on motorways across England, so people can more easily and conveniently charge their cars. We will invest £950 million of this funding in future proofing grid capacity along the strategic road network, to prepare ahead of need for 100 per cent take-up of zero emissions cars and vans.

## CASE STUDY

### EV Charging on the Strategic Road Network

Over 95 per cent of people in England use the Strategic Road Network at least once a year.<sup>109</sup> We will support the roll out of charging infrastructure along England's Strategic Road Network by investing £950 million in future proofing grid capacity at motorway and major A road service areas. This will ensure the private sector can continue to expand the charging network at pace in the 2020s.

By 2030, we expect the network to be extensive and ready for more people to benefit from the switch to electric cars. We are planning for there to be around 2,500 high powered chargepoints across England's motorways and major A roads. By 2035 we expect around 6,000 high powered chargepoints across England's motorways and major A roads.<sup>110</sup> This will be a vital investment for our future, and key to reducing consumer anxiety about long-distance journeys.

We expect the mass uptake of EVs to create significant new demand for power, but it also represents an opportunity for enhanced system flexibility. Smart charging can help mitigate peak demand; for example, charging overnight rather than in the early evening when an EV owner might plug in their vehicle after returning home from work but also the time when electricity demand tends to peak. Vehicle-to-grid technology can then utilise the electricity stored in car batteries to supply power or services to the grid during periods of high demand. To capture these system benefits, the deployment of charging infrastructure needs to run ahead of the uptake of EVs. Only then will consumers have the confidence that they can charge their vehicles conveniently and cost-effectively.

The Prime Minister's Ten Point Plan also set an ambition to reach 600,000 electric heat pump installations per year by 2028, as one option to accelerate the decarbonisation of heating. Along with the rollout of EVs, the electrification of heat will further drive the need for anticipatory investment in the network but equally create opportunities to exploit system flexibility. Deployed in conjunction with storage and smart meters, heat pumps are able to avoid periods of high demand, benefitting the grid, and reducing running costs.

We are working closely with Ofgem to ensure that the regulator's network price control mechanism enables the investment needed in EV charging infrastructure, heat pumps and other low-carbon technologies. Price control must be as agile as possible in approving future network upgrade projects when the need becomes clear, while keeping costs down, now and in the future.

Given the key role of electricity distribution networks in being able to accommodate low-carbon technologies such as EVs and heat pumps, the government wrote to Ofgem in October 2020 to outline relevant policy in advance of Ofgem setting its final methodology for the next distribution price control, which covers the period 2023 to 2028.<sup>111</sup> Our letter highlighted the importance of appropriate investment to enable timely connection of new low-carbon technologies, and gathering and sharing the data needed to optimise the use of networks. We are also working with Ofgem, and partners across the energy and transport systems to address barriers which can prevent the efficient connection of chargepoints to the electricity grid. This will include ensuring there is easily accessible and accurate information for commercial customers on the costs and opportunities of rolling out chargepoints in different locations, to give them confidence to make informed choices around the switch to EVs.

Interconnection increases the ability of the GB electricity market to trade with other markets, enhances the flexibility of our energy system and has been shown to have clear benefits for decarbonisation. Alongside this white paper, we are publishing a report into the impact of interconnectors on decarbonisation, which demonstrates how a higher level of interconnector capacity could decrease cumulative emissions in Great Britain by up to 199MtCO<sub>2</sub>e by 2050, as well as reducing total system costs.<sup>112</sup>

We will work with Ofgem, developers and our European partners to realise at least 18GW of interconnector capacity by 2030. This represents a three-fold increase from current levels and will position us as a potential net exporter of excess green energy, helping to keep wind turbines generating even when GB electricity demand has been met.

► **To minimise the impact on local communities, we will implement a more efficient approach to connecting offshore generation to the mainland grid.**

The current regime for connecting offshore wind farms to the onshore grid has encouraged single point-to-point connections. Each project has a separate cable route and associated onshore infrastructure. We recognise the impact this is having on the coastal communities which host this infrastructure and will act quickly to take the necessary steps to address the situation, particularly given our ambition to have 40GW offshore wind by 2030. We have launched the Offshore Transmission Network Review to improve the delivery of transmission connections for offshore wind generation.<sup>113</sup> This will consider the full impacts on affected communities, particularly on the east coast of England, while making sure the whole of the UK benefits from a more strategic approach.

The review will seek the appropriate balance between environmental, social and economic costs. It will also consider the potential of hybrid, multi-purpose interconnectors, which are already being explored by developers in the UK and the Netherlands, to get the most from our offshore wind and transmission assets. These hybrid projects could integrate the transmission links we need to connect offshore wind to our grid with interconnectors to neighbouring markets.

---

**40GW**

**offshore wind by 2030** is our ambition

---

**£6bn**

**in consumer savings** could be delivered by 2050

---

These projects would allow us to sell excess green power in other markets, or, when our wind output is low, import electricity through cross-border trade.

Initial outputs from the ESO, delivered as part of the review, have shown that taking a more coordinated approach could deliver up to £6 billion in consumer savings by 2050, significantly reducing environmental and social impacts on coastal communities.<sup>114</sup> This analysis showed benefits not just for the east of England, but also Scotland and Wales. We are working closely with the Scottish and Welsh Devolved Administrations through the review.

In order to start delivering these benefits, we will encourage projects already in development, where early opportunities for coordination exist, to consider becoming pathfinder projects. This will help inform the design of the enduring regime. We will consider changes to the current regulatory framework which enable developers to implement innovative approaches, including on anticipatory investment. For the 2030s and beyond, we will redesign the current regime to incentivise more extensive coordination and minimise environmental, social and economic costs.

## DIGITAL INFRASTRUCTURE

We need a modern digital infrastructure to underpin markets and optimise physical networks. This requires new ways of creating, collecting, analysing and sharing energy data from different sources.

► **We will build world-leading digital infrastructure for our energy system, based on the vision set out by the independent Energy Data Taskforce, publishing the UK's first Energy Data Strategy in spring 2021, in partnership with Ofgem.**

Data will help us to discover cheaper ways of delivering the energy we need by making information available to those who can provide solutions to reduce costs and improve services to consumers. For example, better data can help local authorities make the best decisions about where to install chargepoints for EVs.

Open and secure data is also essential to the efficient integration of low-carbon technologies, such as solar panels, heat pumps and batteries, into our electricity networks. Information about the scale and nature of demand, the capability of networks, or the location and size of generation and storage capacity will enable markets to optimise the use of assets across the system. This information can be combined with data from transport, homes and commercial buildings to enable whole-system strategic planning and investment decisions. Smart meter data can help DNOs to identify system constraints and enable them to direct investment more efficiently, including where network reinforcement is required to support an increase in heat pumps or EVs.

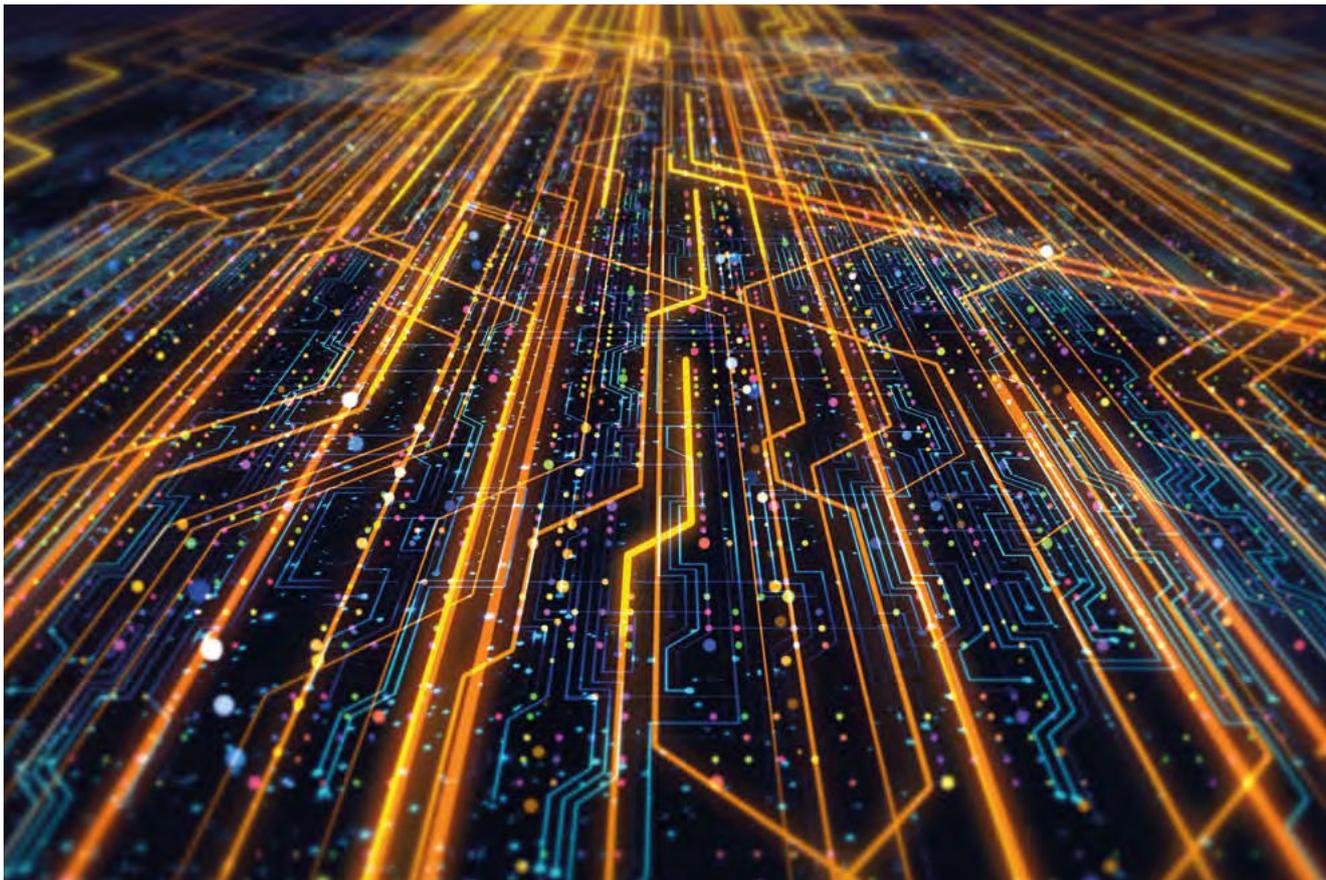

In all such activities, we will ensure that new technologies are introduced in a way that empowers consumers and protects their data at all times.

### CASE STUDY

#### Batteries and Machine Learning

Habitat Energy are using artificial intelligence and machine learning to provide optimisation and trading services to owners of battery storage and other flexible energy assets. Habitat uses algorithms to process data from individual assets and trading platforms to optimise the batteries across multiple markets.

This data-driven approach maximises the revenue that can be achieved while also carefully managing the degradation of the battery to preserve asset life. Improved co-ordination between markets and better quality data about network condition and performance enable innovators like Habitat to optimise assets to meet system needs, thereby reducing costs for consumers.

In 2018, the government and Ofgem launched the independent Energy Data Taskforce. The Taskforce's final report in 2019 highlighted how the move towards a modern, digital energy system is being hindered by poor quality or missing data, while data which is valuable can be hard to find or subject to restricted access.<sup>115</sup> The report set out a strategy to fill data gaps, improve the quality of data and make data more open.

We are implementing all of the Taskforce's recommendations through 'Modernising Energy Data', a joint programme with Ofgem and Innovate UK. We will publish an energy data and digitalisation strategy jointly with Ofgem in spring 2021. The strategy will set out the progress that we have made against specific recommendations and show how better use of data is realising our objective of a fully digital and clean energy system.

Our approach will be aligned with the overarching principles set out in the National Data Strategy and aims to help establish the energy sector's role in growing the UK's data economy.<sup>116</sup>

The Taskforce showed that a lack of access to energy data creates a barrier to innovation in the new technologies and services required to achieve net zero emissions. We are therefore creating a national energy data catalogue to make data more visible and reduce the costs of accessing this information. A prototype of the service will be launched by summer 2021. Market participants will be able to use this data to identify opportunities for creative new solutions, such as supplying more efficiently groups of customers who have similar needs.

Data owners often default to not sharing the information they create. We will develop a 'data triage' process which provides practical support to energy companies for making data more readily available, while ensuring cyber-security and data privacy. It will represent a clear guide for market participants on how to share data appropriately. Ofgem will consult on this guidance and associated licence conditions by summer 2021. It will complement the digitalisation strategies of the network companies which have recently been published to set out operators' plans for improving the use of data.

We will also develop the tools and processes which allow innovators to make full use of the data once they have access to it. The Modernising Energy Data innovation competitions will enable providers of new services to link energy data with information from other sectors such as transport, heat and buildings, integrating the UK's different infrastructure.<sup>117</sup>

For example, the £2 million Modernising Energy Data Access competition will help develop the digital structures needed for innovators to build new apps and products that are compatible across different systems and sectors. The early outputs from these competitions are expected to be available by autumn 2021.

As the energy system becomes increasingly reliant on digital technologies, cyber security will be ever more important for the stability and security of the energy system. Our smart metering system has already been developed with security experts from government and industry and we will continue to ensure cyber security plays a key role in the actions we are taking to facilitate a smart, digital and secure energy system.

## OUR COMMITMENTS TO MODERNISE ENERGY SYSTEM DATA

### Getting data into the open

A clear new process to guide industry

### Making sure data is easy to find

Open-access Energy Data Catalogue

### Fully harnessing the value of data

Government-funded Modernising Energy Data innovation competitions

**UK's first Energy Data and Digitalisation Strategy**

## THE ROLE OF NATURAL GAS

Gas currently represents almost 30 per cent of final energy consumption and 40 per cent of electricity generation.<sup>118</sup>

We will continue to rely on natural gas for some years, even as we work to largely eliminate carbon emissions from the entire energy system including those from gas.

► **We will consult on updates to the Gas Act to ensure we decarbonise gas supplies while continuing to provide the right price signals to market participants.**

We will therefore make sure the natural gas markets and networks evolve in a way which enables continued investment and ensure secure supplies but also promotes the use of low-carbon options, wherever possible. This will reduce emissions now and help build the networks of the future which will need to accommodate technologies such as hydrogen and Carbon Capture, Usage and Storage. We will need investment in the gas network to support the ambition set out in the Prime Minister's Ten Point Plan for a potential Hydrogen Town before the end of the decade.

But while natural gas continues to play a role in powering and heating our homes, we will need to maintain security of supply and ensure network operators have the right market and regulatory signals to ensure the necessary levels of investment in resilient, efficient infrastructure.

### GAS SYSTEM OPERATOR

**The whole transmission system is operated by a single Gas System Operator (GSO), who is responsible for keeping it stable and secure. National Grid Gas Transmission (NGGT) perform this function.**

Our gas markets operate effectively but it is important they continue to provide the right incentives consistent with our overall strategic goals. We will therefore review the overarching market framework set out in the Gas Act to ensure the appropriate powers and responsibilities are in place to facilitate a decarbonised gas future. This will include a review of gas quality standards to enable the widest range of gasses to be used to decarbonise energy. We will work with Ofgem to remove distortions within the gas market, such as reviewing the Domestic Load Connection Allowance which acts as a subsidy for extensions to the gas grid rather than allowing competition with other lower carbon options. These changes are important to make sure the right price signals are in place to maintain security of supply while also enabling the decarbonisation of gas.

Starting in 2021, through a series of workshops and consultation, we will work with network operators, suppliers and consumer groups on the future of gas as we transition to a clean energy system. Our dialogue with stakeholders will also consider the implications for networks, gas wholesale and retail markets and for final energy use by consumers.

## ENERGY SYSTEM INSTITUTIONS AND GOVERNANCE

The markets and networks that deliver our energy are governed by a series of standards and rules.

Our current standards are geared to the safety of our energy system and the rules we have in place protect customers and ensure fair competition. This process is overseen by institutions including Ofgem, and the system operators who keep supply and demand in balance.

► **We will ensure that the institutional arrangements governing the energy system are fit for purpose for the long term, consulting in 2021 over organisational functions, including system operation and energy code governance.**

Our approach to system governance needs to evolve. The roles of Ofgem, the electricity and gas system operators and the transmission and distribution network operators still largely reflect the model from 30 years ago and need to be updated. As we decarbonise the energy system, the regulator, networks, industry and government will need to work together to consider the potential solutions.

Interactions within the energy system are becoming more complex. The system operators need to take on new responsibilities and the regional network owners need to play a more proactive role in delivering an open, flexible and efficient system.

We need the operation of national and local energy markets to be managed impartially, without conflict of interest, ensuring they are fully open to competition. We need a robust process for setting and enforcing system rules, an approach which ensures that the rules promote competition and innovation, not act as a barrier to change. There is also a need for a greater co-ordination to drive collaboration between different parts of the energy system which are currently too siloed.

We need to consider, at both the transmission and distribution level, whether the roles which discharge these functions are undertaken by government, Ofgem, industry parties such as the system operator, or by an entirely new body. We will review the right long-term role and organisational structure for the ESO, in light of the reforms to the system operator instituted in April 2019. It is possible that there will need to be greater independence from the current ownership structure, should it be appropriate to confer additional roles on the system operator.

These new roles should help the system achieve our net zero ambitions and meet consumers' needs. Without them, we risk having an energy system which makes less effective investment and operational decisions, resulting in excessive costs for consumers or a failure to reduce emissions in line with our net zero target.

The detailed technical and commercial rules of the energy system, established in a collection of codes and engineering standards, also need an overhaul to ensure that they are fit for purpose as we transition to a clean energy system. Many rules have only seen minimal change since the 1950s.

We will consider the best future framework for energy codes and consult on options for reform in 2021, building on the government and Ofgem's joint review of code governance<sup>119</sup> and the work of the independent panel on engineering standards.<sup>120</sup>

Ofgem is clear that helping to deliver a clean energy system consistent with net zero emissions protects consumers' interests, which is Ofgem's principal statutory objective. However, as the pace of this transformation accelerates, it will be important that Ofgem has clear sight of the government's policy priorities for the decarbonisation of energy, including how we approach the electrification of road transport and heat.

► **We will set out our vision for energy as a guide to Ofgem, by consulting in 2021 on a Strategy and Policy Statement for the regulator.**

The Strategy and Policy Statement will set out the strategic priorities of our energy policy, the outcomes we seek to achieve and the roles of government, Ofgem and other parties which are collectively responsible for delivering these goals. Subject to Parliamentary approval, the Strategy and Policy Statement will require the Secretary of State and Ofgem to carry out their regulatory functions in a manner which is consistent with securing the government's policy outcomes, including delivering a net zero energy system while ensuring secure supplies at lowest cost for consumers. This will enable not just Ofgem, but energy consumers and industry as well, to better understand the government's ambitions for the energy sector.

# Our key commitments

We will **publish a new Smart Systems Plan in spring 2021**, jointly with Ofgem, and define electricity storage in law, legislating when Parliamentary time allows.

Through the Net Zero Innovation Portfolio, we will **launch a major competition to accelerate the commercialisation of first-of-a-kind longer duration energy storage**, as part of our £100 million investment in storage and flexibility innovation, with delivery from spring 2021.

We will legislate, when Parliamentary time allows, **to enable competitive tendering** in the building, ownership and operation of the onshore electricity network.

We will **support the roll out of charging and associated grid infrastructure along the strategic road network**, to support drivers to make the switch to EVs ahead of the phase out of the sale of new petrol and diesel cars by 2030, and hybrids by 2035.

To minimise the impact on local communities, we will **implement a more efficient approach to connecting offshore generation to the mainland grid**.

We will **build world-leading digital infrastructure for our energy system**, based on the vision set out by the independent Energy Data Taskforce, publishing the UK's first Energy Data Strategy in spring 2021, in partnership with Ofgem.

We will **consult on updates to the Gas Act**, ensuring we decarbonise gas supplies while continuing to provide the right price signals to market participants.

We will **ensure that the institutional arrangements governing the energy system are fit for purpose for the long term**, consulting in 2021 over organisational functions, including system operation and energy code governance.

We will **set out our vision for energy as a guide to Ofgem**, by consulting in 2021 on a Strategy and Policy Statement for the regulator.

EXPLAINER

# Transport

## SETTING THE SCENE

Transport is an important aspect of our everyday lives and fundamental in connecting us together.

Our cars, buses, trains and planes allow us to travel long distances to meet with our families, friends and colleagues; and our lorries, vans, and ships ensure our goods and mail are delivered safely to our businesses and homes.

Yet while transport helps to connect people and places, boosting economic growth and opportunity, it now contributes over a quarter (28 per cent) of UK domestic greenhouse gas (GHG) emissions.<sup>121</sup>

Over 90 per cent of these emissions come from our roads, with passenger cars, heavy goods vehicles and light duty vehicles contributing the most. Despite dramatic progress to improve fuel efficiency of new passenger cars, emissions reductions have been largely offset by their increased use.<sup>122</sup>

The Department for Transport will publish its plan to decarbonise the UK's entire transport system in spring 2021, putting us on a pathway to reach net zero. The Transport Decarbonisation Plan is focused on six strategic priorities.

**FIGURE 6.1 - DOMESTIC AND ROAD TRANSPORT EMISSIONS**

**Domestic transport emissions 2018**

**Road transport emissions 2018**

Source: BEIS Analysis

## SIX STRATEGIC PRIORITIES FOR THE TRANSPORT DECARBONISATION PLAN, TO DELIVER A NET ZERO TRANSPORT SYSTEM

### ACCELERATING MODAL SHIFT TO PUBLIC AND ACTIVE TRANSPORT

- ▶ Help make **public transport and active travel** the natural first choice for daily activities
- ▶ **Support fewer car trips** through a coherent, convenient and cost-effective public network; and explore how we might use cars differently in future
- ▶ **Encourage cycling and walking** for short journeys
- ▶ Explore how to best **support the behaviour change** required

### PLACE-BASED SOLUTIONS

- ▶ **Consider where, how and why emissions occur** in specific locations
- ▶ Acknowledge a single solution will **not be appropriate for every location**
- ▶ **Address emissions at a local level** through local management of transport solutions
- ▶ **Target support for local areas**, considering regional diversity and different solutions

### DECARBONISING HOW WE GET OUR GOODS

- ▶ **Consider future demand** and changing consumer behaviour for goods
- ▶ **Transform 'last-mile' deliveries** - developing an integrated, clean and sustainable delivery system
- ▶ **Optimise logistics efficiency** and explore innovative digitally-enabled solutions, data sharing and collaborative platforms

### DECARBONISATION OF VEHICLES

- ▶ **Support the transition to zero emission road vehicles** through:
  - Regulatory framework
  - Strong consumer base
  - Market conditions
  - Vehicle supply
  - Refuelling and recharging infrastructure
  - Energy system readiness
- ▶ **Maximise benefits** through investment in innovative technology development and development of sustainable supply chains

## UK AS A HUB FOR GREEN TRANSPORT TECHNOLOGY AND INNOVATION

- ▶ Utilise the UK's world-leading scientists, business leaders and innovators to position the UK as an internationally recognised leader of environmentally sustainable technology and innovation in transport
- ▶ Build on expertise in the UK for technology development and capitalise on near market quick wins

## REDUCING CARBON IN A GLOBAL ECONOMY

- ▶ Lead international efforts in transport emissions reduction
- ▶ Recognise aviation and maritime are international by nature and require international solutions
- ▶ Harness the UK as a global centre of expertise, driving low-carbon innovation and global leadership, boosting the UK economy

# THE ELECTRIC VEHICLE REVOLUTION IS ALREADY UNDERWAY

The emissions from passenger cars and light goods vehicles make up over two thirds of all transport emissions, so decarbonising those forms of transport is a priority.

Following extensive consultation with car manufacturers and sellers, the Prime Minister has confirmed that the UK will end the sale of new petrol and diesel cars and vans by 2030, ten years earlier than planned. From 2035, all new cars and vans must be zero emissions at the tailpipe. Between 2030 and 2035, any new cars and vans sold that emit from the tailpipe must have significant zero emission capability, for example plug in and full hybrids. The meaning of ‘significant zero emission capability’ will be defined by consultation in 2021. The government has also committed to providing a delivery plan in 2021 to realise these new ambitious phase out dates. The delivery plan will provide key milestones, and government will work with stakeholders to ensure these phase out dates can be met.

The UK car industry already manufactures a significant proportion of Europe’s electric vehicles (EVs), including one of the most popular models in the world.

To support this acceleration, the Prime Minister has announced:

- ▶ **£1.3 billion to accelerate the rollout of chargepoints for EVs** in homes, workplaces, streets and on motorways across England, so people can more easily and conveniently charge their cars.
- ▶ **£582 million in grants for those buying zero or ultra-low emission vehicles** to make them cheaper to buy and incentivise more people to make the transition.

- ▶ **Nearly half a billion to be spent in the next four years for the development and mass-scale production of electric vehicle batteries** (gigafactories) and other strategic technologies, as part of our commitment to provide up to £1 billion to support development of the electric vehicle supply chain, boosting investment in the automotive sector, including existing clusters of activity in the Midlands and North East.

In 2019, the UK was the third largest market for ultra-low emission vehicles (ULEVs) in Europe and is a global leader in their development and manufacture.<sup>123</sup> Nearly 10 per cent of zero emission cars bought in Europe in 2019 were built in the UK.<sup>124</sup> As at 30 June 2020, there were nearly 320,000 ULEV vehicles registered in the UK, up from just over 140,000 at the end of 2017. The vast majority of those ULEVs are cars, accounting for nearly 300,000 vehicles.<sup>125</sup>

EVs will create significant new demand for electricity, and we are already taking action to ensure the energy system now, and in the future, is ready for this shift. The transition to mass uptake of EVs will also have a big impact on how households consume energy. This is why the government has established the Electric Vehicles Energy Taskforce, to ensure consumers are placed at the heart of this journey.

We expect the mass uptake of EVs to create significant new demand for power but also offer opportunities for enhanced system flexibility. As discussed further in the ‘Energy system’ chapter smart charging and vehicle-to-grid technology can provide benefits for the consumer and the grid.

**320,000** ultra low emission vehicles registered in the UK as of June 2020

**#3**

In 2019 the **UK was the third largest market for ULEVs** in Europe

Under the Automated and Electric Vehicles Act 2018 government have the powers to mandate all smart functionality for chargepoints, enabling consumers to drive home from work, plug their car in, and automatically charge when electricity is cheaper, or greener, rather than in the evening, when it is more expensive. We intend to bring forward regulations in 2021 to mandate that private EV chargepoints must be smart, and in the ‘Buildings’ chapter we discuss the ongoing work to introduce chargepoints into all new homes and non-residential buildings. Consumers will need to access accurate, trusted information to enable them to make an informed decision about electric vehicle charging. Government wants consumers to have confidence that they will be offered choice, convenience, and appropriate protections.

Information from these chargepoints will inform planning and operation of electricity systems, and help customers save money. Government is working to ensure security and privacy measures are in place to protect chargepoint users.

As well as building new network infrastructure where needed, it is important that we use the existing network to enable the deployment of chargepoints at the lowest cost to the consumer. The ‘Energy system’ chapter sets out how we will further support the roll out of charging infrastructure along the strategic road network.

## CASE STUDY

### Bus2Grid

In January 2018, the Office for Low Emission Vehicles and the Department for Business, Energy and Industrial Strategy awarded almost £30 million, through an Innovate UK vehicle-to-grid programme, where EVs can supply electricity to the grid at times of high energy demand.

Bus2Grid is part of this programme and is exploring the commercial value and social benefits to the energy and passenger transportation systems. The project will develop services to support National Grid, local Distribution Network Operators (DNOs), bus operators and transport authorities and at the same time will consider bus fleet consumer engagement approaches necessary for its commercial implementation. Bus2Grid claims to be developing the “world’s largest bus to grid site” and is bolstered by a diverse project consortium, including: SSE Enterprise, automotive manufacturer Build Your Dreams (BYD), the Distribution Network Operator UK Power Networks (UKPN) and the University of Leeds.

The project is a first of a kind large scale, multi-megawatt, demonstration of vehicle-to-grid technology in electric bus depots located in London. This process is managed by an aggregation platform that enables the 28 e-bus batteries to interact with the energy system by charging or exporting energy to support the grid in times of high energy demand.<sup>126</sup>

## ALTERNATIVES FOR HEAVY DUTY VEHICLES

After passenger cars, heavy goods vehicles (HGVs) are the biggest contributor to domestic transport emissions in the UK, and zero emissions solutions for HGVs, particularly the heaviest vehicles, are much less developed by comparison.

The Prime Minister's 'Ten Point Plan for a Green Industrial Revolution' announced that we will consult on a date for phasing out the sale of new diesel HGVs.

Battery Electric Vehicles (BEVs) are well placed to deliver the bulk of decarbonisation for cars and vans and now also smaller HGVs in short distance and medium weight applications, such as urban distribution. However, the solution for larger, long-haul, road freight vehicles is not yet clear and so we will invest £20 million next year in freight trials to pioneer hydrogen and other zero emission truck technologies to support industry to develop cost-effective, zero emission HGVs in the UK.

In our 'Oil and gas' chapter we mention the work being undertaken in the downstream oil and gas sector on low-carbon fuels, and we are continuing to explore alternatives, including through a £40 million innovation programme looking at the best fuel/vehicle combinations to decarbonise construction, mining and other off-road heavy vehicles by 2030.

We are also supporting the decarbonisation of buses. Early next year, the Department for Transport will publish a National Bus Strategy, which will set out ambitious plans to transform the sector, including delivering higher frequency of service, simpler fares, improved routes and more green buses.

As set out in the Ten Point Plan and the Spending Review 2020, the government will invest £120 million in 2021/22 to start the delivery of the 4,000 zero emission buses announced by the Prime Minister in February. Government will support both battery electric buses and hydrogen buses where the market favours their use.

## RAIL DECARBONISATION

For areas of the rail network with significant freight flows or long-distance high-speed services, electrification is a proven technology that is able to support these service types.

Analysis suggests that electrification may also be the best whole-life cost solution for more intensively used areas of the network. Away from these areas of operation the deployment of emerging technologies such as battery traction and hydrogen rolling stock on both an interim and permanent basis may offer alternative solutions to help in achieving decarbonisation of rail at a lower cost.

## AVIATION AND MARITIME

We are making the UK the home of green ships and planes.

We have established the Jet Zero Council to accelerate the development and adoption of new technologies to help develop our strategy to reach net zero aviation, along with investing £15 million into FlyZero as well as running a £15 million competition to support the production of sustainable aviation fuels in the UK.

As we are preparing the Transport Decarbonisation Plan, which will also include actions to get the maritime sector on track to net zero, we continue to implement the commitments in Clean Maritime Plan, building on the government's ambitious vision for the future of UK zero emission shipping. This includes the launch of a £20 million Clean Maritime Demonstration Competition, which will support the UK design and development of clean maritime technology, including hydrogen, and will lay the foundation for a network of real-world projects.

On 16 November, the Department for Transport published the Union connectivity review: call for evidence.<sup>127</sup> The review, led by Sir Peter Hendy, will look at how the quality and availability of transport infrastructure can support quality of life in communities across the UK while also aiding economic recovery and will consider the environmental impact of current and future infrastructure. Sir Peter is expected to publish his final recommendations in summer 2021.

---

**£20m**

competition to support the design and development of **clean maritime technology**

---

**£15m**

competition to support the production of **sustainable aviation fuels in the UK**

---

**40,000**

**new jobs supported** by accelerating the shift to zero emission vehicles

---

As we decarbonise across transport, energy requirements will change in many sectors, from trains, to boats and planes. This will create new demands on our energy systems. Accelerating the shift to zero emission vehicles could support around 40,000 new jobs by 2030. More details on ensuring all modes of transport are on a pathway to net zero will be set out in the forthcoming Transport Decarbonisation Plan.

CHAPTER 04

# Buildings

## OUR GOAL

Delivering our net zero target means largely eliminating emissions from domestic and commercial buildings by 2050.

We will:

- ▶ **Drive greatly improved energy performance** in both existing and new buildings to reduce consumption and help keep bills affordable
- ▶ **Support the transformation of heating for homes and workplaces** from oil and gas to clean energy sources
- ▶ **Use the switch to clean energy to support up to 50,000 jobs** across the UK by 2030

BUILDINGS

# The strategic context

We need the energy we use to heat or cool our homes and workplaces to be reliable and affordable, and support comfortable, healthy surroundings in which to live and work.

But emissions from homes and from commercial and public sector buildings account for 19 per cent of total UK greenhouse gas emissions.<sup>128</sup> It makes buildings the second largest source of emissions after transport. Buildings also indirectly contribute to power sector emissions through electricity-using products in our homes.

#2

buildings are the **second largest source of emissions in the UK**

90%

**of homes in England currently use fossil fuels** for heating, cooking and hot water

66%

of homes are at **Energy Performance Certificate D or worse**

**FIGURE 7.1 - UK TERRITORIAL EMISSIONS** <sup>129</sup>

2018

Source: BEIS Analysis of 'Final UK GHG emissions national statistics' and NAEI

Our challenge is to transform how buildings use energy in line with our net zero target. We need to minimise the disruption to consumers as we go through this change and keep bills affordable, while safeguarding the quality of the environment in our building stock.

Almost 90 per cent of homes in England currently use fossil fuels, predominantly for heating but also for cooking and hot water.<sup>130</sup> The vast majority of these homes, some 85 per cent, are connected to the gas grid.<sup>131</sup> Those that are not connected use mostly oil, liquified propane gas or electricity, or are connected to a shared heat network. While proportions differ between Scotland, Northern Ireland, Wales and England, fossil fuels dominate heating across the UK.<sup>132</sup>

The installation of energy efficiency measures and tighter building regulations have improved the energy performance of buildings, lowering consumption and helping to reduce household dual fuel bills by an average of £30 to £40 per year over the last 10 years.<sup>133</sup> Emissions from buildings across the UK have fallen by 18MtCO<sub>2</sub>e, 17 per cent, over the last 30 years.<sup>134</sup> But we need to go further and secure a reduction in emissions by 2050 five times greater than we have achieved over this period.

## ENERGY PERFORMANCE CERTIFICATE

**Energy Performance Certificates** (EPCs) are required in the UK to provide a prospective owner or tenant with information on the energy performance of a building and recommendations for improvement. EPCs for homes use an A-G rating scale based on the modelled energy bill costs of running the building.

The energy performance of too many existing homes is not good enough. Around 16 million homes in England, 66 per cent of the total, are at Energy Performance Certificate D or worse.<sup>135</sup> In the private rental sector, existing legislation requires that all buildings have a minimum standard of energy performance only of Band E at the point of rental. The modelled annual energy cost of the average Band C rated home is around £750 less than the average Band E rated home, assuming both homes are being adequately heated (see figure 7.2).<sup>136</sup>

There are about 1.8 million non-domestic properties in England and Wales.<sup>137</sup> Buildings in the commercial and public sectors account for around a third of the total final energy consumed for buildings purposes (i.e. excluding industrial, agricultural or transport).<sup>138</sup> Large premises of 1,000 square meters or larger represent only 10 per cent of commercial and industrial buildings but emit over half of all the carbon from the building stock.<sup>139</sup>

90%

said it is important or very important that the UK makes a **full transition towards greener heating systems**

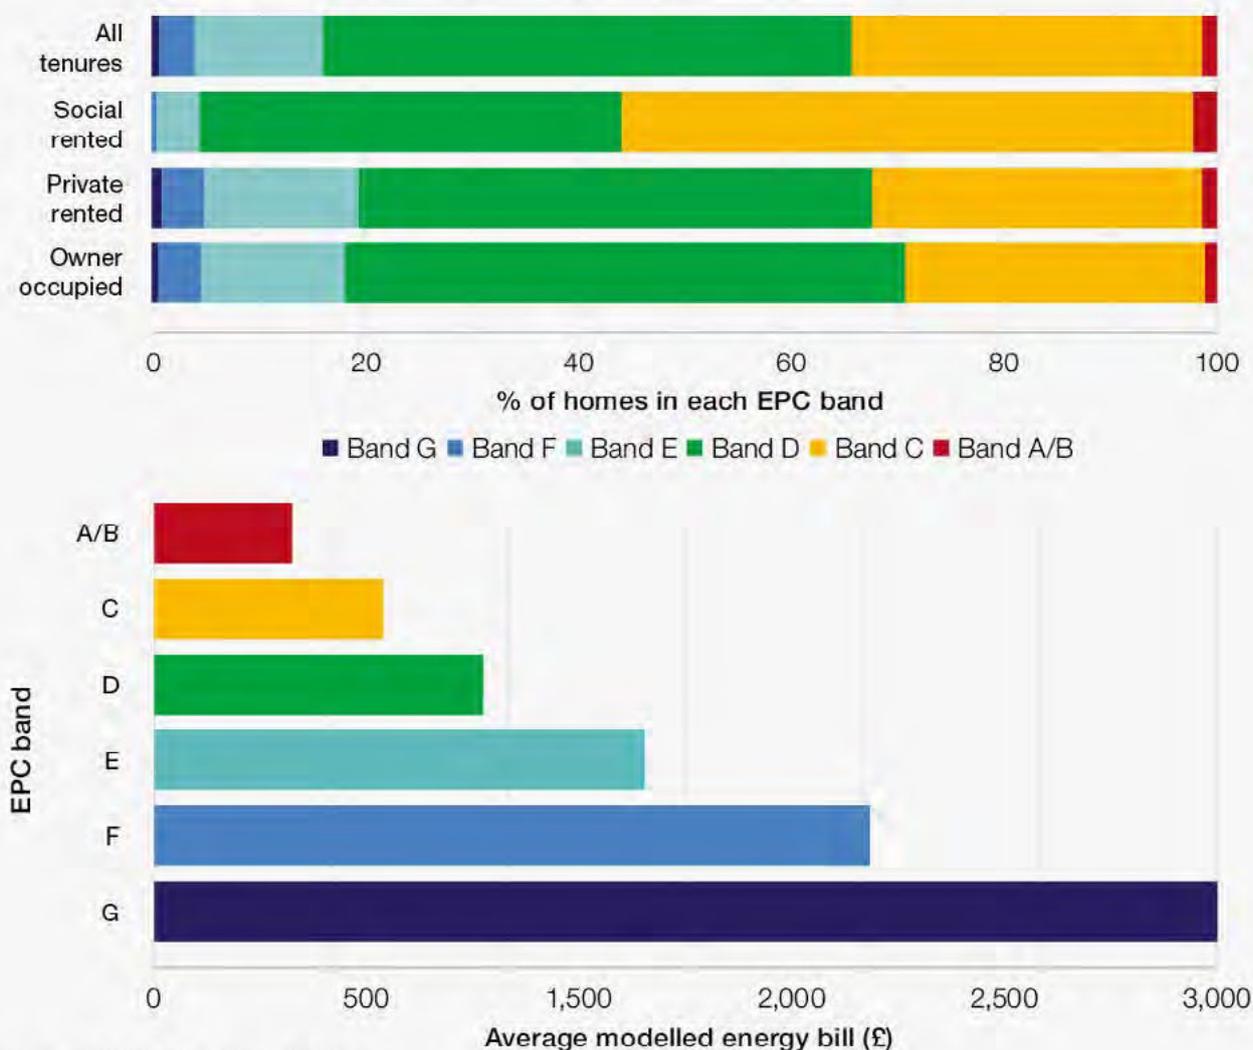

£9.2bn

**commitment to invest in the energy efficiency** of homes, schools and hospitals

Public awareness is low about the connection between climate change and how we heat homes and workplaces. Research by BEIS suggests that the majority of the population has not heard of low-carbon heating technologies.<sup>140</sup> Almost a third of gas-users stated they were on 'environmentally-friendly heating', suggesting a general under-appreciation of what the transition to low-carbon heating could mean in practice. Encouragingly, however, the survey shows that there is strong support for carbon reduction policies. Almost 90 per cent of respondents said it is important or very important that the UK makes a full transition towards greener heating systems.

Tackling emissions from buildings will take many years to deliver but it is a journey which must start now. The 2020s must be a decade of action to put the country on the path to net zero emissions by 2050. Depending on fossil fuels for heat or tolerating wasteful loss of energy in poorly insulated buildings is not sustainable. Action now will put us on a pathway to affordable, green and healthier buildings. Inaction will mean more disruption when we do eventually address the challenge, as well as higher bills and a lower quality of life in our homes and places of work.

**FIGURE 7.2 - EPC RATING OF HOMES IN ENGLAND AND AVERAGE MODELLED ENERGY BILL BY EPC BAND**

This white paper builds on our Manifesto commitment to invest £9.2 billion in the energy efficiency of homes, schools and hospitals. It sets out concrete actions to reduce how much energy we use and to support the move to low-carbon heat. We will publish a dedicated Heat and Buildings Strategy in early 2021 which will set out our ambitious plans in further detail, including the suite of policy levers that we will use to encourage consumers and businesses to make the transition.

Offices, retail space, hospitality and industrial buildings account for **around 80 per cent of private sector buildings energy demand**

# Our key commitments

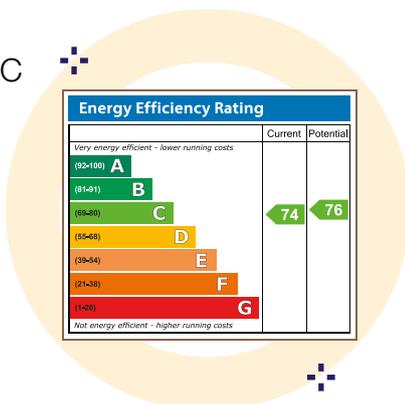

## IMPROVED BUILDING ENERGY PERFORMANCE

Ensuring our homes and workplaces use energy efficiently makes good financial sense, as well as supporting better health and well-being.

Energy efficiency measures help bill payers to reduce consumption and keep bills affordable. The asset value of homes can increase based on improved energy performance. Conversely, poor energy performance means that too many bill payers pay more than they should to heat or cool their homes and workplaces comfortably.

In November 2020, the Prime Minister announced £1 billion of funding to continue our support for the decarbonisation of buildings through improved energy efficiency. This will be allocated across several existing government schemes, including the Green Homes Grant Voucher Scheme, the Public Sector Decarbonisation Scheme and Social Housing Decarbonisation Fund.

Upgrading all UK homes to EPC C could provide **annual energy bill savings of £7.5 billion**

### NEW BUILDINGS

► **The Future Homes Standard will ensure that all new-build homes are zero carbon ready.**

The Future Homes Standard will require new-build homes to be fitted with low-carbon heating, and high levels of energy efficiency. Homes built to the Future Homes Standard will be zero carbon ready and have 75 to 80 per cent lower carbon emissions than those built to current standards. We will seek to implement the standard as soon as possible. As a stepping stone to the Future Homes Standard, we have consulted on an interim uplift in standards which would result in a 31 per cent reduction in carbon emissions from new homes compared to current standards.<sup>141</sup> We will publish the government response to the consultation and set out a roadmap to the Future Homes Standard, as soon as possible.

We have separately published guidance for drafting building specifications to support the installation of smart meters in new build homes to avoid the need for costly retrofitting. We will work with the industry to incorporate smart technologies, such as heating controls, into the methodology for assessing the energy performance of homes.

This will give occupants the ability to manage their energy consumption easily, reduce their energy bills and maximise the use of energy from renewable sources.

We have committed to consulting on mitigating overheating risk in new homes and a range of methods will be considered to demonstrate compliance with new requirements.

We will consult shortly on increased standards for non-domestic buildings so that new buildings have high levels of energy efficiency and low-carbon heating. We are also taking action on introducing new building regulations to require electric vehicle chargepoints in all new homes and in non-residential buildings.<sup>142</sup> We will respond to the consultation in early 2021.

## EXISTING HOMES

- ▶ **We want as many existing homes as possible to hit EPC Band C by 2035, where practical, cost-effective and affordable.**

While we face the huge challenge of preparing almost 27 million existing homes for a clean energy future, we have already taken significant steps to reduce the carbon footprint of homes, in line with our Manifesto pledge. The Green Homes Grant Voucher and Local Authority Delivery schemes, together worth £2 billion, were launched in September 2020 and the Prime Minister's Ten Point Plan confirmed that the schemes will be extended for another year, helping to support the development of the supply chain and grow the market ahead of the introduction of regulatory measures later in the 2020s.

The £1.5 billion voucher element offers homeowners and landlords a voucher covering up to two thirds of the cost of upgrading energy performance, to a maximum of £5,000. A voucher of up to £10,000 is available for low-income households, with no contribution required. Low-income households can also benefit from the £500 million of the Green Homes Grant that has been ringfenced for Local Authority Delivery.<sup>143</sup>

The schemes could enable more than 600,000 homes in England to be more energy efficient, saving these households up to £600 year on their energy bills.<sup>144</sup> Vouchers can be spent on a range of measures from cavity wall and loft insulation and air-source heat pumps, to draught proofing and replacing single glazing with double or triple glazing.

We will also take action to improve the energy efficiency of homes in the private rental sector. In September 2020, we issued a consultation on proposals for an estimated 2.8 million privately rented homes to meet a minimum energy performance standard of EPC Band C by 2028, where practical, cost-effective and affordable.<sup>145</sup> These proposals could reduce energy bills by an average of £230 per property annually, cutting fuel poverty, saving 9.5MtCO<sub>2</sub>e by 2032 and supporting 80,000 jobs in the energy sector annually between 2025 and 2028.<sup>146</sup>

44 per cent of all social rented homes in England, approximately 1.8 million, have an EPC Rating below C.<sup>147</sup> In our manifesto, we committed to invest in upgrading a significant number of these homes to at least EPC Band C. In July 2020, the government announced £50 million for 2020/21 to kickstart delivery of this ambition, piloting innovative retrofit projects across the UK and committed further funding in the Prime Minister's Ten Point Plan, announced in November.<sup>148</sup>

£50m

to support delivery of **upgrading homes to meet EPC band C**

£2bn

**Green Homes Grant voucher scheme**, plus further funding this year

- ▶ **We will consult on regulatory measures to improve the energy performance of owner occupied homes, and are consulting on how mortgage lenders could support homeowners in making these improvements**

Meeting our commitments to decarbonise and improve the energy performance in buildings will require the mobilisation of around £100 billion of capital across homes, businesses and the public sector over the 2020s alone.<sup>149</sup> It is investment that must come principally from businesses and homeowners, and from landlords of domestic and commercial premises. Growing the market for green finance products will be essential to leveraging this scale of private capital and demands a partnership between the financial services sector and suppliers, manufacturers and energy services companies. We are consulting on how mortgage lenders can help homeowners to improve the energy performance of their homes. The proposals are intended to kickstart the green home finance market and support homeowners to improve the energy efficiency of their homes as we move towards our target of reaching as many existing homes as possible at EPC Band C or above by 2035.<sup>150</sup>

## CASE STUDY

### Whole House Retrofit Grant

In summer 2019, the government launched the Whole House Retrofit Grant competition as part of the government's £505 million Energy Innovation Programme. The aim of the programme was to demonstrate the importance of taking a 'whole house retrofit' approach to improving the energy performance of the UK's buildings and in doing so, tackle one of the most challenging components of our decarbonisation agenda. The competition is based around an innovative 'fabric first' approach, while also introducing some low-carbon heating elements.

As an initial push towards achieving the government's Buildings Mission target of halving the cost of retrofits by 2030, the Whole House Retrofit programme also seeks to achieve cost reductions through process innovations and economies of scale and scope. Ultimately this will make it both cheaper and easier for all homeowners to improve the energy performance of their properties.

Retrofits should also deliver improvements in the health and well-being of occupants, including reduction of risk to summertime overheating and damp or mould growth.

The three projects selected are led by Local Authorities. More than 300 houses will be retrofitted in total, with a focus on socially rented properties across a range of housing archetypes. The projects are aiming to achieve retrofit cost reductions of between 5 and 20 per cent per property, making the properties not only warmer and more comfortable to live in, but less costly to run as well. The work will help pave the way for further cost reductions, and mass deployment of the whole-house approach as we head towards 2030.

At the same time as driving down install costs, a further objective of the competition is to increase expertise in the workforce and build capability of the supply chain, while ensuring resident health and comfort is placed at the centre of the whole house retrofit process.

Alongside a package of incentives, we can create a long-term regulatory framework to improve the energy performance of homes. We will seek primary powers to enable this. This will provide certainty to the market and clear signals to homeowners. We will consult in 2021 on options for these measures.

In September 2020, the government launched the Energy Performance Certificates Action Plan, which set out a pathway to improve the EPC system. The Action Plan will help to increase the energy efficiency of the building stock by exploring ways to increase the quality of EPCs, build consumer trust and increase engagement.

It will support policies which strengthen regulatory compliance and ensure that the data infrastructure underpinning EPCs is fit for the future. We anticipate that changes may be needed to the Energy Performance of Buildings (England and Wales) Regulations 2012 to deliver progress. We will need a new primary power to change the legislation after the Transition Period ends on 1 January 2021, which we will seek through an appropriate legislative vehicle in 2021, if Parliamentary time allows.

We also need to make energy-using products, such as household appliances, more efficient, helping to reduce bills and encourage innovation. Policies to increase the energy efficiency of products have been an effective lever and represent one of the most cost-effective ways to reduce energy bills and carbon emissions. The findings from our recent call for evidence will help to inform a best-in-class regulatory framework for energy-using products.

Our current estimates show that, taken together with related energy labelling requirements, ecodesign requirements will lead to emissions reductions of 8MtCO<sub>2</sub>e to 2020.<sup>151</sup> Through our world-class energy-related products policy, to be launched in spring 2021, we will push for greater energy and carbon savings. This year the government published a Call for Evidence and Consultations for ecodesign and energy labelling regulations across a range of products. We are currently reviewing the scope of our powers for achieving our energy efficiency ambition and, if necessary, will look to take additional powers through legislation.

## COMMERCIAL & INDUSTRIAL PROPERTIES

### ► All rented non-domestic buildings will be EPC Band B by 2030, where cost-effective.

Offices, retail space, hospitality and industrial buildings account for around 80 per cent of private sector buildings energy demand.<sup>152</sup> Around a half of all energy consumed in commercial and industrial buildings in England and Wales is in the rented sector, placing the onus on landlords to make energy efficiency and heating improvements.<sup>153</sup> We will therefore tighten minimum standards for this sector to reach EPC Band B by 2030 where cost-effective.

We will consult shortly on improving the implementation and enforcement of this target. This will reduce carbon emissions, help make businesses more productive and grow the energy efficiency market.

We are proposing a performance-based rating scheme for large commercial and industrial buildings to provide businesses and their investors with more information on how to reduce energy consumption and lower both carbon emissions and energy bills. We will consult in early 2021 on how the scheme will work and plan to launch the first phase by 2022/23.

Improving energy efficiency is one of the most cost-effective mechanisms for businesses to reduce their energy bills, while reducing their carbon emissions. But a lack of information and the upfront capital costs of installation can deter investment by small businesses in measures such as insulation and energy management systems. We will continue to explore how we can stimulate a thriving market for business energy efficiency through the proposed new energy efficiency scheme focused on small businesses. As well as providing access to advice, the scheme will facilitate the installation of efficiency measures through either an auction process or an energy efficiency obligation so they can improve the energy performance of their premises. We will consult on our proposals in 2021.

The Energy Savings Opportunity Scheme aims to drive energy and carbon savings in businesses by improving the quality of the audits of the energy used by their buildings, industrial processes and transport. We will consult in 2021 on strengthening the scheme, taking forward options identified in the comprehensive scheme evaluation and Post Implementation Review published in February 2020.

## PUBLIC SECTOR BUILDINGS

► **As announced in the Prime Minister's Ten Point Plan, we will extend the Public Sector Decarbonisation Scheme for a further year**

Public sector buildings account for nine per cent of emissions from buildings.<sup>154</sup> There is a particular onus on the public sector to demonstrate leadership by improving the energy performance of its building stock. By doing so, it can support a growing private sector energy services sector, helping to support jobs and new business opportunities.

As part of our Manifesto commitment to reduce emissions from the public sector, the Chancellor has already committed the first £1 billion of our funding pledge to upgrade schools, hospitals and other

buildings. The Public Sector Decarbonisation Scheme, which was launched at the end of September 2020, will help the public sector play its part in delivering net zero emissions, with improved energy efficiency and clean heat investment.<sup>155</sup>

The £1 billion first tranche of funding is expected to cut emissions by up to 1.3MtCO<sub>2</sub>e by 2032, equivalent to taking nearly 45,000 cars off the road. In addition to catalysing green investment in the public sector, the scheme will support the supply chain, providing clean energy jobs in communities throughout UK.

## A FAIR AND AFFORDABLE TRANSITION

The benefits of well-insulated homes, on health and well-being and on bills, should not be the preserve of households which can afford to pay for energy efficiency measures.

People in fuel poverty will not be left behind. Indeed, our support will mean that fuel poor homes will be amongst the first beneficiaries of the energy transition. In line with our net zero goal, we will reduce energy consumption and lower energy bills by upgrading homes, focusing on the least energy efficient housing stock first.

There is currently no minimum energy efficiency standard which applies in the social rented sector except the requirement in the Decent Homes Standard which stipulates that homes should provide a reasonable degree of thermal comfort and be free of excess cold. This expectation is broadly equivalent to EPC Band F. The government has committed to a review of the Decent Homes Standard to consider how it can better support the decarbonisation and energy performance of homes, particularly with regard to the ambition set out in the Clean Growth Strategy that all homes should meet EPC C by 2035, where practical, cost-effective and affordable. We will work closely with the housing sector to carry out this review.

The government has also committed to further funding for the Social Housing Decarbonisation Fund, which will upgrade a significant amount of the social housing currently below EPC Band C to at least that standard.

Details of our multi-billion-pound plan to transform the poorest quality housing will be set out in our updated Fuel Poverty Strategy for England, due to be published in early 2021.

### FUEL POVERTY

The government definition of fuel poverty is where a household has fuel costs that are above average and, were they to pay that amount, would be left with a residual income below the official poverty line.

Building on ‘Cutting the Cost of Keeping Warm’, our 2015 strategy, this refreshed update will set out our approach to tackling fuel poverty in the context of net zero emissions and the nation’s recovery from the COVID-19 pandemic. In addition to outlining our plan for reducing fuel bills through improved energy efficiency, the new strategy will set out how we will ensure the fuel poor benefit from a fair and functioning energy market. We will also provide details of our guiding principles for future fuel poverty policies.

### ENERGY COMPANY OBLIGATION

#### ► We will extend the Energy Company Obligation from 2022 to 2026 to support fuel poor consumers.

The current Energy Company Obligation (ECO) is an obligation on larger energy suppliers to provide energy efficiency and heating measures for fuel poor consumers across Great Britain. Since the programme began in 2013, nearly 2.9 million measures have been installed in over 2.1 million homes.<sup>156</sup> Eligible households can save up to £300 on their energy bills, compared to an identical household.<sup>157</sup> Households are eligible if they receive certain benefits or live in the least efficient social housing, or if they are referred by their local authority.

We will continue to prioritise low-income and vulnerable households and focus on those living in the least efficient homes to make their dwellings warmer and healthier. The next iteration of ECO will run from 2022 to 2026 and will focus primarily on improving the worst-quality homes across Great Britain, complementing the upcoming Home Upgrade Grant scheme in England and equivalent schemes in the Devolved Administrations. The Home Upgrade Grant scheme will upgrade the energy performance of the worst-quality off-gas grid homes in England by supporting the installation of energy efficiency measures and low-carbon heating. Both schemes will focus support on low-income households.

## WARM HOME DISCOUNT

- ▶ **We will expand the Warm Home Discount to around three million low-income households until at least 2025/26 and will consult on reforms to the scheme to better target fuel poverty.**

It can be a challenge for fuel poor households simply to pay their bills. The Warm Home Discount, currently worth £350 million per year, is a key policy to alleviate fuel poverty. Now in its tenth year, the scheme continues to provide £140 off electricity bills to over

two million low-income and vulnerable households each winter, when they need it the most. Over £2.7 billion of direct assistance has been provided by participating energy suppliers under the scheme.

Government recently concluded a consultation on extending the current scheme until March 2022. Further to this, we will extend the scheme from 2022 to 2025/26 and expand the total spending envelope from £350 million to £475 million<sup>158</sup> per annum to support around 750,000 additional households in or at risk of fuel poverty with paying their energy bills and almost three million households in total. This represents £1.9 billion of extra support for households in or at risk of fuel poverty.

We will also consult on reforms to improve fuel poverty targeting, such as using government data to provide automatic rebates to most recipients - making the scheme administratively simpler - and allowing smaller suppliers to participate at lower cost. Better targeting of Warm Home Discount will support a fair transition to a clean energy future for fuel poor households. It will contribute to our fuel poverty interim milestone for as many fuel poor households as reasonably practicable to achieve a minimum energy efficiency rating of Band D by 2025.

## CLEAN HEAT TECHNOLOGIES

As well as tackling energy performance, we need to decrease the emissions from heating and cooling our buildings.

We stand on the verge of a major transformation as clean energy alternatives replace fossil fuels. We need to complete this transformation while ensuring households continue to enjoy a reliable heating system and a comfortable, healthy and affordable home environment.

To achieve net zero emissions, we will have to transition completely away from traditional natural gas boilers for heating homes on the gas grid. There are currently around 1.7 million fossil fuel boiler installations every year<sup>159</sup> but by the mid-2030s we expect all newly installed heating systems to be low-carbon or to be appliances that we are confident can be converted to a clean fuel supply. There is no single technology alternative to fossil fuels.

Electric heat pumps and hydrogen, green gas and shared heat networks all have their part to play. So, while we are clear on the eventual outcome, we will be flexible in how we achieve it, always looking for the most cost-effective, consumer-friendly approach and open to innovative solutions.

We want to give households, suppliers, installers and equipment manufacturers long lead times to prepare for this transition. We will target the point of least disruption to consumers and minimise the impact on the housing market and will therefore look to use natural trigger points, such as the replacement cycle for existing heating systems. And we need to ensure consumers are receiving fair value as they switch to clean heat, which means working with the market to reduce costs and addressing barriers to the deployment of new technologies.

► **We will consult on whether it is appropriate to end gas grid connections to new homes, in favour of clean energy alternatives.**

We need to ensure that the right legislation is in place to support the heating market through the transition to net zero. We will review the overarching regulatory framework set out in the Gas Act 1995 to ensure the appropriate powers and responsibilities are in place to facilitate a decarbonised gas future. In particular, to ensure the Gas Act is in line with the Future Homes Standard, we will seek views on the feasibility of ending the connection of new build homes to the natural gas grid.

## ELECTRIFICATION

► **As announced in the Prime Minister's Ten Point Plan, we will grow the installation of electric heat pumps from 30,000 per year to 600,000 per year by 2028, supporting up to 20,000 jobs by 2030.**

Heat pumps are a proven and commercially viable way to transform heat in buildings, which is also available now. Currently, however, fewer than one per cent of homes in England use a heat pump.<sup>160</sup>

### HEAT PUMP

A very efficient electrically-driven device that extracts heat from the air, ground or water and concentrates it to a higher temperature and delivers it elsewhere, for example to a central heating system. It can replace fossil fuel heating, such as a gas or oil boiler.

We want to open the market of homes not on the gas grid to heat pumps or other clean energy alternatives, representing some 50,000 to 70,000 installations a year.<sup>161</sup> We will therefore consult in early 2021 over new regulations to phase out fossil fuels in off-grid homes, businesses and public buildings, including a backstop date for the use of any remaining fossil fuel heating systems.

In setting a clear target for deploying the technology, there is an opportunity to expand the existing UK heat pump manufacturing base and exploit future export potential. The UK has a growing expertise in heat network design and is already home to several manufacturers of heat pumps. Annual global heat pump sales are expected to roughly double between 2019 and 2030 from 11.4 million to 20.8 million units.<sup>162</sup>

We need to take advantage of future export opportunities, particularly to markets in north-western Europe where high demand is expected.

But electrification is not just a solution for off-grid buildings. We believe that significantly increasing the deployment of heat pumps for on-gas grid homes through the 2020s, on a voluntary basis, will be beneficial, whatever the eventual mix of technologies for clean heat in 2050. We recognise that, to achieve this, we will have to increase business and public confidence in heat pump technology.

In April 2020, we launched our proposal for a Clean Heat Grant, due to launch in 2022, as a successor scheme to the domestic Renewable Heat Incentive. We will publish a government response in 2021. The Clean Heat Grant will be targeted at households and small, non-domestic buildings to support the installation of heat pumps and, in certain circumstances, biomass. The scheme will build upon the Green Homes Grant which provides support for heat pump deployment in the near-term.

Reducing emissions from buildings will require an annual market for heat pumps by 2028 at least 20 times the size of today's market, a scale which can help realise the economic benefits of a domestic supply chain. We will work with equipment manufacturers, wholesalers and installers to ramp up supply chain capacity and reduced technology and installation costs. In early 2021, we will consult on policy approaches to underpin the development of the UK heat pump market, including voluntary up-take by consumers in current on-gas-grid homes.

The electrification of heat has implications for the GB electricity system, given the increased demand for power and the prospect of different demand patterns which arise from using power for heat.

We need to electrify heat in buildings in a way which reduces the need for additional generation and network capacity. This could mean using thermal, hot water or battery storage, potentially in combination with a smart time of use tariff, enabled by smart metering, to shift heating demand away from more expensive peak periods. Managing this transition is a key priority for the development of our plans for low-carbon electricity generation, detailed in the 'Power' chapter, and a smart energy system, as set out in the 'Energy system' chapter.

We are also considering how to further reduce market barriers to the deployment of energy efficiency, and how demand reduction is rewarded for the benefits it provides to the energy system. We want permanent electricity demand reduction to be a viable alternative to simply building more generation or network capacity. We will explore options to achieve this goal, building on the response to our call for evidence on Facilitating Energy Efficiency in the Electricity System, launched in July 2019.

## GREEN GAS

### ► We will increase the proportion of biomethane in the gas grid.

Biomethane is currently the only green gas commercially produced in the UK. It can be injected into the gas grid to accelerate the decarbonisation of gas supplies.

#### BIOMETHANE

A form of gas that is produced by processing biomass. It can be used for the same purposes as natural gas, like producing electricity or heat, and can use the same infrastructure for transmission and end-user equipment.

Budget 2020 confirmed that a green gas levy imposed on gas suppliers will fund a new support scheme to achieve this goal, the first of its kind applied to gas in Britain. The costs of the levy are expected to be passed onto gas bill payers. We are considering the responses to our consultation on the green gas levy design and intend to publish a government response in early 2021.

Subject to the outcome of the consultation, we expect the Green Gas Support Scheme (GGSS) to launch in autumn 2021 and run for four years. It will support continued deployment of anaerobic digestion biomethane plants in order to increase the proportion of green gas in the grid. We anticipate that the GGSS could deliver annual generation of 2.8TWh of renewable heat in 2030/31,<sup>163</sup> the equivalent of the gas requirements roughly 230,000 homes.<sup>164</sup> This scheme will be designed to minimise any associated negative environmental impacts from the anaerobic digestion process, such as ammonia emissions.

We believe that through these new measures, building on the success of existing government policies, we have the potential to treble the amount of biomethane in the grid between 2018 and 2030.

## CLEAN HYDROGEN

▶ **As announced in the Prime Minister's Ten Point Plan, we will work in partnership with industry to evaluate hydrogen as an option for heating our homes and workplaces and develop plans for a possible pilot hydrogen town before the end of the decade.**

Clean hydrogen could potentially provide a way to decarbonise our gas supplies on a much larger scale than reliance on biomethane alone.

This could offer consumers a future heating option which works for them in a very similar way to natural gas today, but no carbon emissions. However, unlike electric heat pumps and heat networks, the feasibility of using hydrogen for clean heat needs further testing and development. The practicalities and cost of safely converting or replacing existing networks and appliances to operate with pure hydrogen need to be fully evaluated.

The UK is already a world leader in investigating the use of hydrogen for heating. Both the government and the gas industry are currently running major studies and testing projects. We will increase the funding available for testing and trialling projects, working with the industry to ensure that the overall programme of work is comprehensive and fully coordinated. A range of further Research and Development (R&D) and testing projects are required, including an assessment of the options for major new hydrogen infrastructure, such as gas transmission networks and inter-seasonal storage.

Trials of hydrogen will also be key to evaluating the practicalities of converting existing boiler appliances and the way in which consumers experience hydrogen for heating in their own homes and workplaces. The Prime Minister's Ten Point Plan for a Green Industrial Revolution set out key milestones for a pioneering programme of trials. We will support industry to begin a Hydrogen Neighbourhood trial by 2023, and a large Hydrogen Village trial by 2025. The knowledge and experience gained in delivering trials in communities, together with the results of our wider R&D and testing programme, will enable a strategic decisions around the mid-2020s over the long-term role of hydrogen for heating and develop a plan for a potential Hydrogen Town before the end of the decade.

► **We will consult on the role of ‘hydrogen ready’ appliances in 2021.**

In advance of strategic decisions on the role of hydrogen for heating, we will assess the case for encouraging, or requiring, new gas boilers to be readily convertible to hydrogen, so-called ‘hydrogen-ready’ boilers, in preparation for any future conversion of the gas network. We are already supporting the development of prototype ‘hydrogen-ready’ boilers, cookers and fires, through the Hy4Heat programme, which is due to conclude in summer 2021. Subject to the results of Hy4Heat, we plan to issue a call for evidence later in 2021 to seek views from stakeholders.

To facilitate the transition and development of the gas network, we will continue to work with the Health and Safety Executive to enable up to 20 per cent hydrogen blending on the network by 2023. This is subject to the success of testing and trials.

## HEAT NETWORKS

We will use a new Heat Network Transformation Programme to co-ordinate our support for the roll out of district heating systems, including the switch to low or zero-carbon heat sources.

► **We are committing £122 million of funding towards a new Heat Network Transformation Programme and will implement local authority zoning by 2025.**

### HEAT NETWORK

A heat network, sometimes called district heating, is a system of insulated pipes that takes heat and cooling generated from a central source and distributes it to a number of domestic and non-domestic buildings.

Around half a million households in the UK take heat and hot water from shared heat networks.<sup>165</sup> These systems lend themselves particularly well to densely populated towns and cities. Networks with low-carbon heat sources, such as waste-heat recovery, large heat pumps, solar thermal or possibly hydrogen boilers, will reduce emissions from heating and can help consumers with lower energy bills. We are currently investing up to £320 million through the existing Heat Networks Investment Project (HNIP), using grants and loans to accelerate the growth of the market. This scheme will come to an end in 2022.

As part of our new Heat Network Transformation Programme, we are committed to funding the Green Heat Network Fund as the successor to HNIP.

This will deliver additional low-carbon networks, particularly focusing on the recovery of waste heat and the use of heat pumps. We published a consultation on the design of the scheme in November 2020. In addition, we will fund a widespread improvement in the performance of legacy networks and boost supply chains and workforce skills, as the basis of a comprehensive transformation programme for heat networks.

We intend to legislate in this Parliament for the regulation of heat networks to protect consumers and reduce carbon emissions. We will take powers to reduce the 90 per cent reliance on natural gas in heat networks, as well as enable consumer protection for heat network customers.

## CASE STUDY

### Tolent Construction

The UK's first large scale mine energy district heating system is being developed at Seaham, County Durham by Tolent Construction, with the help of the North East Local Energy Hub and in partnership with Durham County Council and the Coal Authority. The project has secured investment of £175 million with construction starting in December 2020.

The government has provided financial support to the council to develop the heat scheme through £3.8 million of Heat Network Investment Programme funding, £150,000 Garden Village grant and technical support from the Coal Authority, stimulating over £170 million of private sector funding.

The project is set to create 960 new jobs. A training academy will be established on site and will give young people apprenticeship opportunities to develop their skills to become trades men and women, as well as other professions.

The district heating will be made up of 1,500 homes, a primary school, shops and an innovation centre all heated by mine water heating, pumped using solar photovoltaics for carbon free heat. One quarter of properties in the UK sit on the coalfields giving huge potential to mine water heating as a low-carbon sustainable heat source.

£320m

invested to 2022 through the existing **Heat Networks Investment Project**

£270m

further funding from 2022 through the **Green Heat Network Fund**

£122m

allocated to the **Heat Network Transformation Project**

These powers will require heat networks to switch to low-carbon fuel sources as part of a natural replacement cycle, thereby minimising disruption to consumers connected to a network.

We will support Local Authorities to designate new heat network zones, no later than 2025. Zoning entails the identification of areas which can be readily connected to a low-carbon heat network and mandating connection unless it is not cost-effective to do so. The certainty of connection for projects, which zoning affords, will ensure that heat networks are better able to grow and deliver lower-cost, clean heat for consumers. We will consider how local heat network zoning can be most effectively integrated with wider local area planning for the environment, infrastructure and place. We will work with local authorities to optimise delivery of this and related interventions by working with local authorities and through our consultation due to be published in spring 2021.

# THE ECONOMIC BENEFITS OF TRANSFORMING ENERGY IN BUILDINGS

Upgrading the energy performance of our building stock cuts energy bills and, for businesses, helps to reduce other day-to-day operating costs which they face.

The Energy Efficiency Infrastructure Group estimates that upgrading all UK homes to EPC C could provide annual energy bill savings of £7.5 billion.<sup>166</sup> Better energy efficiency can therefore support a persistent uplift in productivity and consumer spending to drive economic growth, particular as the country recovers from the COVID-19 pandemic.

And transforming the nation's homes with improved energy performance and new clean heat solutions will also grow the UK's manufacturing base and construction industry. It offers the prospect of hundreds of thousands of high-quality green jobs right across the UK. Building projects are typically labour intensive so scaling up delivery will support more jobs per pound spent than in most other areas of the transition to net zero emissions. The measures announced by the Chancellor in July 2020, worth £3.05 billion, will alone support up to 140,000 jobs over the next year.<sup>167</sup>

Improving the quality of our building stock will contribute substantially to our agenda to level up the country. Wales and, in England, the North East, the West Midlands, the North West and the Yorkshire and the Humber region have the highest per capita energy efficiency investment need across the UK.

► **We will develop a strategy for upskilling through the 'Green Jobs Taskforce' and a National Skills Fund, to be launched in 2021.**

Analysis by the London School of Economics estimates that over six million people have skills which will be affected by the transition to clean energy, representing 21 per cent of current jobs.<sup>168</sup> This is a major opportunity to develop new skills across a range of career pathways and ensure key sectors, such as construction, which employs around 2.2 million people, are fit for a clean energy future.<sup>169</sup> Principally, we will need more installers to retrofit existing buildings with energy efficiency and clean heat measures or ensure new-build homes are zero carbon ready. In September 2020, we launched the Green Homes Grant Skills Training Competition to provide £6.9 million funding to a range of energy efficiency and low-carbon heat skills providers and support delivery of the Green Homes Grant scheme.<sup>170</sup>

We are establishing a Green Jobs Taskforce with key industry bodies to produce an action plan for net zero skills across a range of sectors with the goal of two million net zero jobs by 2030. The taskforce will pinpoint the skills needed now and over long term. It will support high quality green jobs and a diverse workforce, and manage the transition for people working in high carbon industries. The action plan will be published in spring 2021.

# Our key commitments

The Future Homes Standard will **ensure that all new-build homes are zero carbon ready**.

We want as many **existing homes as possible to hit EPC Band C by 2035**, where practical, cost-effective and affordable.

**All rented non-domestic buildings will be EPC Band B by 2030**, where cost-effective.

We will **consult on regulatory measures to improve the energy performance of homes**, and are consulting how on how mortgage lenders could support homeowners in making these improvements.

We will **extend the Public Sector Decarbonisation Scheme** for a further year.

We will **extend Energy Company Obligation from 2022 to 2026** to support fuel poor consumers.

We will **expand the Warm Home Discount to around three million low income households** until at least 2025/26 and will consult on reforms to the scheme to better target fuel poverty.

We will **consult on whether it is appropriate to end gas grid connections to new homes** being built from 2025, in favour of clean energy alternatives.

We will **grow the installation of electric heat pumps** from 30,000 per year to 600,000 per year by 2028, supporting up to 20,000 jobs by 2030.

We will **work in partnership with industry to evaluate hydrogen as an option for heating** our homes and workplaces and develop plans for a possible pilot hydrogen town before the end of the decade.

We will **increase the proportion of biomethane in the gas grid**.

We will **consult on the role of 'hydrogen ready' appliances** in 2021.

We are **committing £122 million of funding towards a new Heat Network Transformation Programme** and will implement local authority zoning by 2025.

We will **develop a strategy for upskilling through a 'Green Jobs Taskforce'** and a National Skills Fund, to be launched in 2021.

CHAPTER 05

# Industrial energy

## OUR GOAL

By 2050, emissions from industry will need to fall by around 90 per cent from today's levels.<sup>171</sup>

We will:

- ▶ **Create a sustainable future for UK manufacturing industry** through improved energy efficiency and the adoption of clean energy technologies
- ▶ **Establish the UK as a world leader in the deployment of CCUS and clean hydrogen**, supporting up to 60,000 jobs by 2030
- ▶ Ensure that the transformation of our industrial sectors **supports jobs, higher skills and new business opportunities** across the country
- ▶ **Introduce a UK Emissions Trading Scheme** which will be the world's first net zero emissions trading scheme, and will underpin the decarbonisation of energy in the UK

INDUSTRIAL ENERGY

# The strategic context

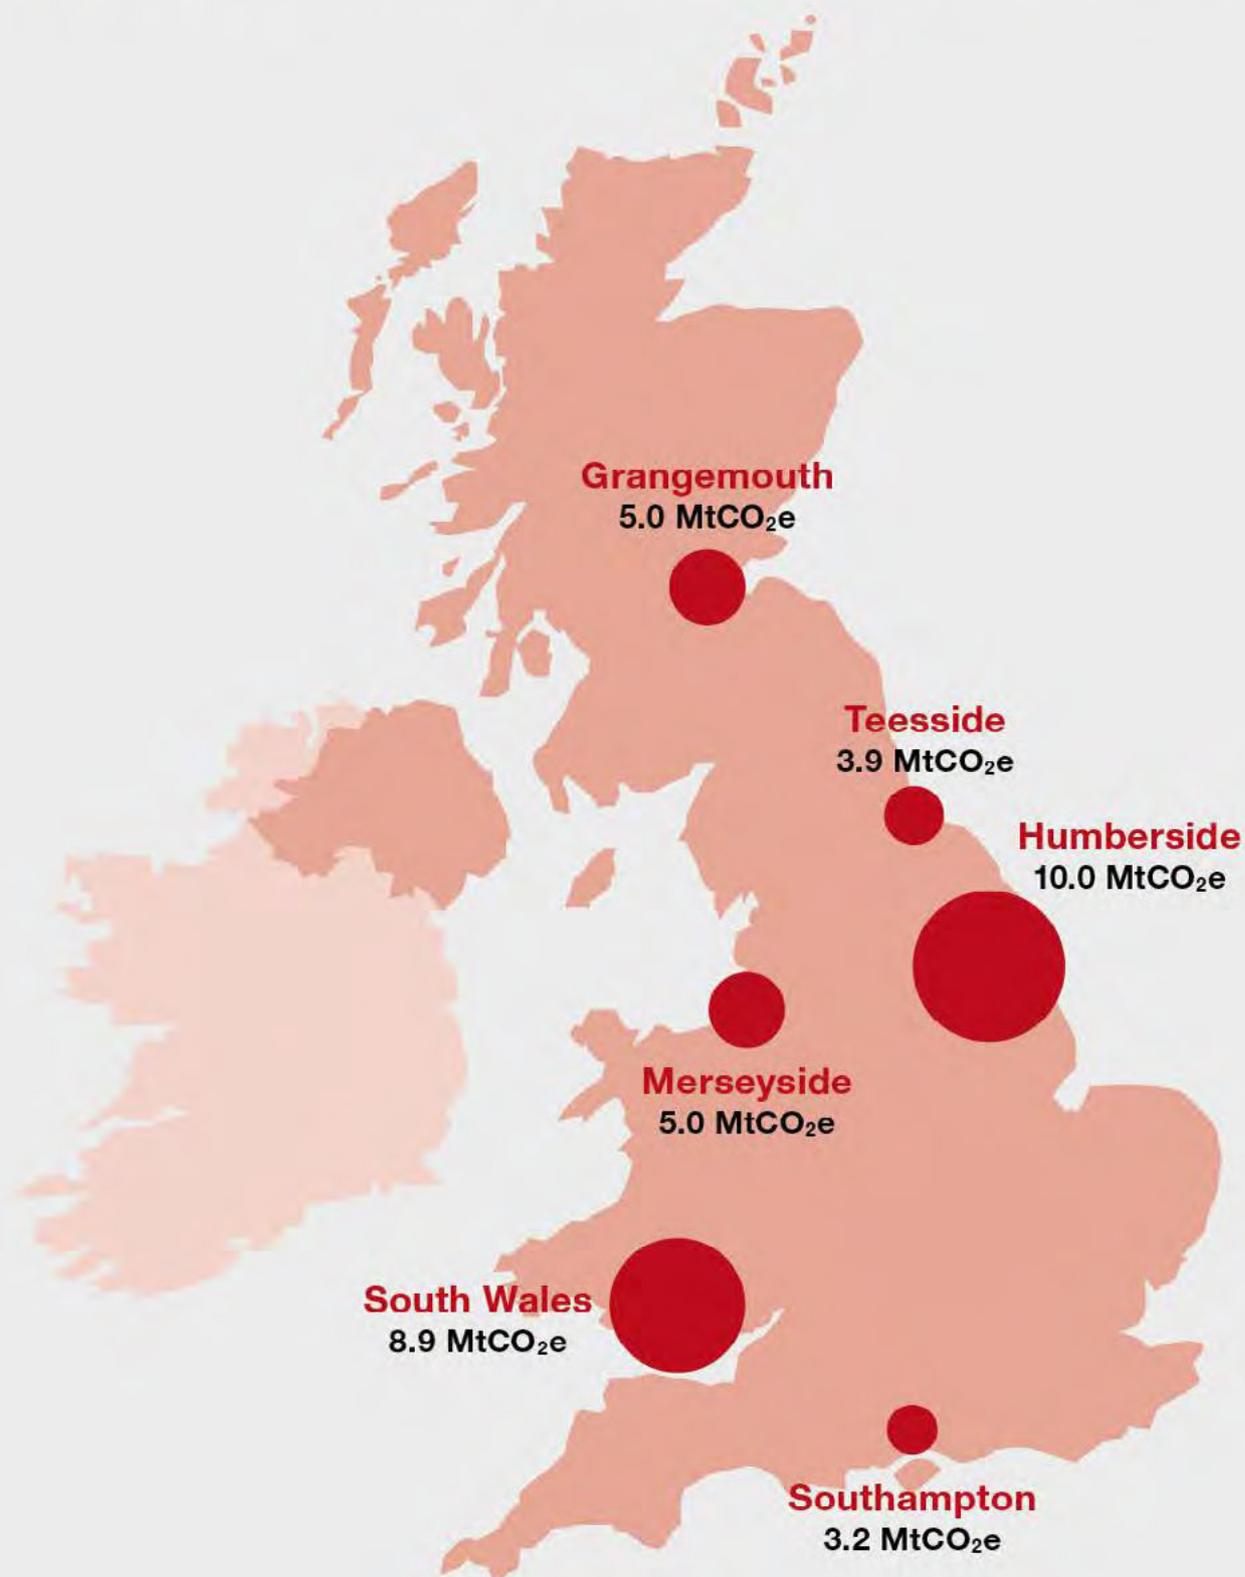

Manufacturing industry drives the UK economy. In 2018, the industrial sector contributed £170 billion to Gross Value Added (GVA), 42 per cent of British exports and employed 2.6 million people across the country.<sup>172</sup>

Almost all industry is located outside London and the South East and provides high value jobs across the four nations.<sup>173</sup> Investment in low-carbon technologies and renewing our industrial infrastructure will therefore help level up the UK and promote a green economic recovery.

Manufacturing and refineries, which form the bulk of industrial emissions, still account for around 16 per cent of the UK's greenhouse gas emissions.<sup>174</sup> Although emissions from industrial activity have fallen by half since 2000,<sup>175</sup> driven partially by greater energy efficiency in industrial processes, the sector will need to achieve significant decarbonisation over the next 30 years.

About half of emissions from manufacturing and refining are concentrated in the UK's major industrial clusters (see Figure 8.1).<sup>176</sup> These hubs are critical drivers of local and regional economic activity and a vital component of the UK's national economy.

**FIGURE 8.1 - LOCATIONS OF CLUSTERS AND 2018 EMISSIONS**

Source: NAEI Emissions from NAEI large point sources 2018. Clusters defined as all large emitters within 30km of a cluster centre

Improved efficiency in the energy performance of buildings and industrial processes will lay the groundwork for the transformation of industrial energy. But we cannot rely on energy efficiency alone to reduce emissions in line with our 2050 goal. Manufacturing industry will need to capture their carbon for onward storage and switch from using fossil fuels to low-carbon alternatives.

The successful decarbonisation of industry will mean overcoming a number of obstacles in manufacturing sectors which operate in highly competitive international markets and, in some cases, on tight profit margins. Lowering emissions and adopting clean energy technologies requires capital investment and could impact operating costs. It will be necessary to build additional infrastructure, such as the pipes and storage to transport captured carbon from industrial processes. Long lead-times to plan, design and install emissions-capture technologies, coupled with limited opportunities to undertake construction works, could present further barriers to businesses, even when they wish to act.

We will work with businesses to overcome these challenges and deliver the successful transformation of our vital industrial base. Markets are best placed over the long run to implement the most cost-effective solutions which deliver net zero industrial emissions, supported by a long term carbon price signal. But, for now, we cannot rely on market forces alone to see industry through the transition.

Manufacturing and refineries still account for around **16 per cent of the UK's greenhouse gas emissions**

The UK's industrial sectors need our continued support, particularly through the initial phase of decarbonisation, in which the risks and costs are highest. Our approach during the 2020s will be to stimulate action, investing in the critical infrastructure which enables the deployment of low-carbon technologies. We will support industry with the costs of improving energy performance and reducing emissions. We will maintain the ability of UK-based companies to compete and win in global markets and ultimately position them to capitalise on new commercial opportunities arising in a global net zero economy.

The cost of energy impacts the competitiveness of UK-based industry. We have taken steps to protect the manufacturing sectors which are most exposed to the impact of the UK's relatively higher electricity prices, compared to other major European markets. In 2019, we provided around £442 million to support qualifying energy intensive industries, including reductions in the policy costs of the transition to renewable electricity and compensation to partly offset the indirect impacts on electricity prices from the European Union Emissions Trading System (EU ETS) and the Carbon Price Support (CPS).

# Our key commitments

---

## A NEW STRATEGIC APPROACH TO CLEAN INDUSTRIAL ENERGY

In the 2030s, markets will be best placed to determine the most efficient approach to decarbonising industrial emissions. Our actions in the 2020s will create the right conditions to enable this transition.

► **We will publish an Industrial Decarbonisation Strategy in spring 2021 to set out the details of how the government will support the decarbonisation of manufacturing industry.**

Our strategy will set out a vision for a prosperous, low-carbon UK industrial sector in 2050. Working closely with our partners in the devolved administrations, we will establish how the transition to clean energy will support the UK's industrial competitiveness and a resilient, green economic recovery, including opportunities to exploit new markets at home and abroad.

A low-carbon and more resource efficient economy is not just about transforming existing industries and enabling a long-term sustainable future. It is the basis for new industrial sectors to flourish. It will catalyse innovation for new technologies, boost UK manufacturing and support thriving construction and operations sectors. It is a transformation which can help all the UK's manufacturing regions to become centres for the production of low-carbon goods. It will enhance long-term regional competitiveness, support a green recovery and insulate businesses from the impacts of a rising carbon price.

Domestic action is a platform for the UK's global leadership on climate change. With our leading role in industrial decarbonisation, we will be able to export technology, know-how and skills to the rest of the world. If global industry were to reduce emissions by around 70 per cent by 2050, relative to 2012 levels, UK exports of clean energy technologies in 2050 could support around £1.4 billion in annual GVA and support 18,000 jobs.<sup>177</sup>

► **In line with the increased ambition set out in the Ten Point Plan we will increase the Industrial Clusters Mission to support the delivery of four low-carbon clusters by 2030 and at least one fully net zero cluster by 2040.**

We will start with a focus on the UK's industrial clusters – centres where related industries have congregated and can benefit from utilising shared clean energy infrastructure, such as carbon capture utilisation and storage (CCUS) and low-carbon hydrogen production and distribution. Decarbonisation in clusters will enable economies of scale, reducing the unit cost for each tonne of carbon abated. Clusters provide high quality jobs which tend to pay above the UK average wage.<sup>178</sup>

Transitioning to clean energy will bring opportunities to all four UK nations. Many clusters are located in regions in need of economic revitalisation and decarbonising those clusters can act as a driver of prosperity for the surrounding areas. Investments in key technologies like hydrogen and CCUS, together with broader interventions, such as through helping people to retrain, will be crucial to enhancing local economic growth and creating jobs. These actions will also deliver wider environmental benefits such as improved air quality. We will work with local government and businesses to consider how an integrated strategic approach can most effectively be developed to enable local places to capitalise on this opportunity to build back greener. Supporting the delivery of four low-carbon clusters will enable greater decarbonisation, leading the way for a more sustainable industry.

# CARBON CAPTURE UTILISATION & STORAGE (CCUS)

The deployment of CCUS is fundamental to the decarbonisation of energy intensive industries such as steel, cement, oil refining and chemicals. CCUS can help secure the long-term future of these industries and enable production of clean hydrogen at scale.

- ▶ **We will invest £1 billion up to 2025 to facilitate the deployment of CCUS in two industrial clusters by the mid-2020s, and a further two clusters by 2030, supporting our ambition to capture 10MtCO<sub>2</sub> per year by the end of the decade.**

The UK is in a strong position to become a global technology leader in CCUS. We have the opportunity to develop a domestic supply chain by utilising the expertise of our existing oil and gas industry. Innovative start-up companies, spun out of the UK's world-class academic institutions, are focused on driving cost reductions and creating new UK-based innovative carbon capture technologies. With the potential to store more than 78 billion tonnes of carbon dioxide,<sup>179</sup> we can be a global leader in carbon storage services.

Deployment of CCUS could create new markets for UK businesses, at home and abroad, as other countries look to meet their emissions reduction commitments. Action now can harness the UK's strengths in engineering, procurement, construction, and management services, with export opportunities from CCUS estimated at £3.6 billion by 2030.<sup>180</sup>

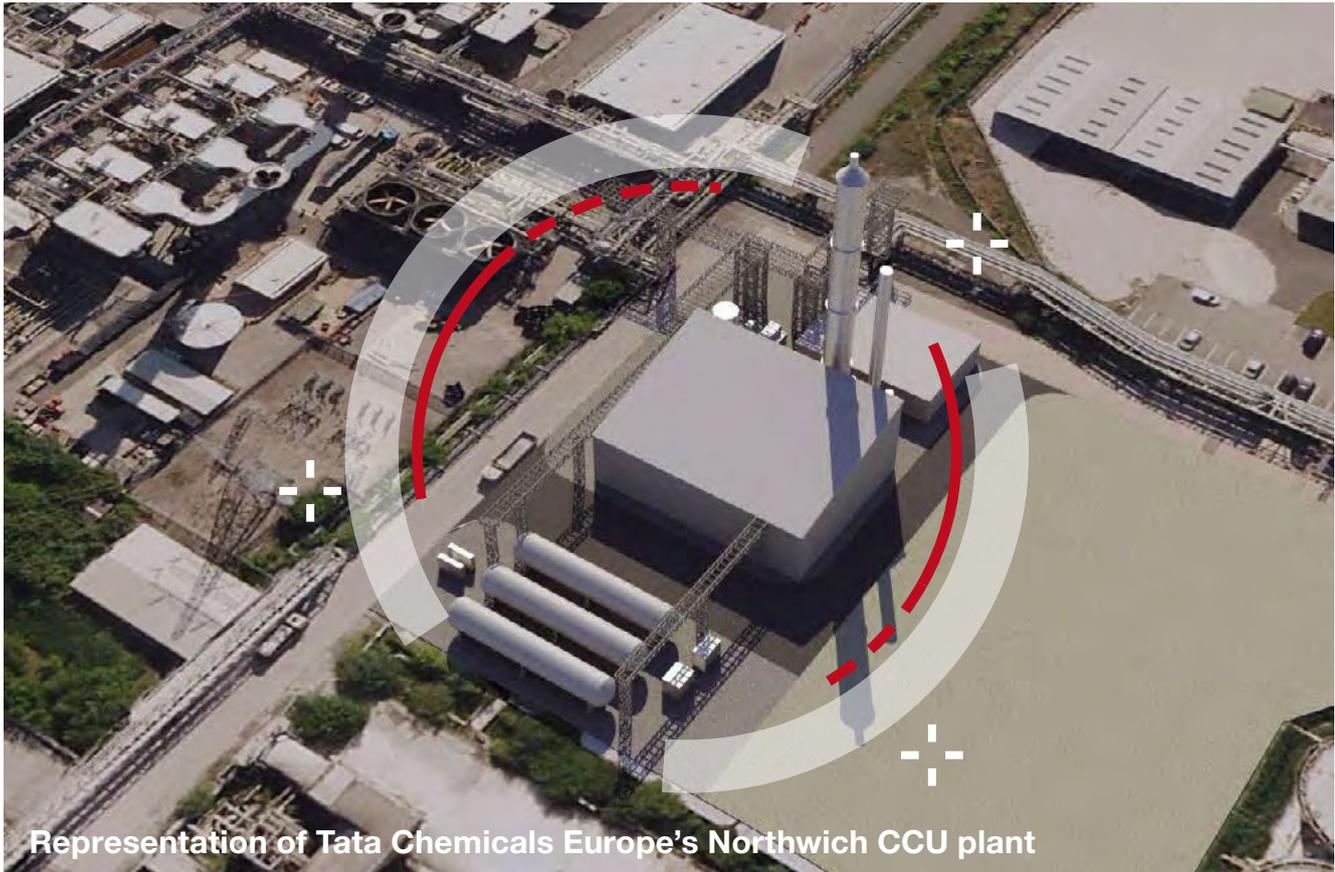

## CCUS

**The process of capturing carbon dioxide from industrial processes, power generation, certain hydrogen production methods and greenhouse gas removal technologies such as bioenergy with carbon capture and storage and direct air capture. The captured carbon dioxide is then either used, for example in chemical processes, or stored permanently in disused oil and gas fields or naturally occurring geological storage sites.**

## CASE STUDY

### Tata Carbon Capture and Utilisation (CCU)

Tata Chemicals Europe (TCE) are constructing, with the support of a £4.2 million grant from the Energy Innovation Programme, the UK's first industrial-scale CCU demonstration plant at their site in Northwich, for the manufacture of high purity sodium bicarbonate. The plant will be commissioned in 2021 and will be capable of capturing up to 40,000tCO<sub>2</sub>e per year, and will reduce carbon emissions at the plant by 11 per cent. TCE exports 60 per cent of its sodium bicarbonate production in the UK to over 60 countries across the globe. The CCU project will be a springboard for TCE to unlock further expansion into its export markets.<sup>181</sup>

Representation of Tata Chemicals Europe's Northwich CCU plant

We have created the Carbon Capture and Storage (CCS) Infrastructure Fund to commit the investment needed to realise this opportunity. In his Budget of March 2020,<sup>182</sup> the Chancellor committed at least £800 million through the Fund to support CCUS deployment. As announced in the Prime Minister's Ten Point Plan, we are now raising our commitment to £1 billion up to 2025 to facilitate the UK's deployment of operational CCUS in four industrial clusters by the end of the decade. This new carbon capture industry could support up to 50,000 jobs in the UK by 2030.<sup>183</sup> Developing carbon transport and storage infrastructure will require large upfront capital expenditure, to construct offshore and onshore pipelines and develop storage sites and wells. We will help to put in place this critical network, as the foundation for the scaling up of CCUS across the UK.

For the majority of industrial sectors, CCUS is not yet a viable investment. The market currently does not provide a sufficiently robust price signal to make industrial carbon capture viable. In addition, low-carbon products do not attract a price premium, making investment harder to justify without a support mechanism. It can be hard for early investors to fully reap the benefits of learning and innovation which is generated from backing this first-of-a-kind technology. This is why we are designing and implementing a business model to provide revenue support and improve companies' confidence for investing in carbon capture solutions. We aim to finalise a new commercial framework by 2022.

## CLEAN HYDROGEN

The production and use of clean hydrogen will be important in achieving net zero emissions by 2050.

As a gas that can be used as a fuel without emitting harmful greenhouse gasses, hydrogen will be critical in reducing emissions from heavy industry, as well as in power, heat and transport. When heavy goods transport or a process such as steel production relies on fuel for energy, hydrogen can provide a crucial, low-carbon alternative to fossil fuels.

► **We will publish a dedicated Hydrogen Strategy in early 2021 which positions the UK as a world leader in the production and use of clean hydrogen.**

Around 95 per cent of global hydrogen production is fossil-fuel based.<sup>184</sup> A complete switch to clean hydrogen is required, together with a major increase in production capacity. The UK currently makes up to 27TWh annually.<sup>185</sup> The Climate Change Committee (CCC) suggest we may need a ten-fold increase by 2050, with the option to go further depending on the scale of hydrogen use in heat, transport and power.<sup>186</sup>

### CLEAN HYDROGEN

**Hydrogen that is produced with significantly lower greenhouse gas emissions compared to current methods of production** – methods include reacting methane with steam to form hydrogen and then capturing the carbon dioxide by-product (steam methane reformation with CCUS) or using renewable electricity to split water into hydrogen and oxygen (electrolysis).

### CASE STUDY

#### ITM Gigastack

ITM Power are a manufacturer of PEM (proton exchange membrane) electrolysers, a technology which enables the generation of hydrogen from water. The company is based in Sheffield, UK. Coupled with a renewable energy supply, this production method is capable of producing zero carbon hydrogen. The Gigastack project explores the potential to scale up electrolyser size and integrate those units with offshore wind facilities. BEIS is currently supporting a consortium led by ITM Power along with Ørsted, Phillips 66, and Element Energy, funded as part of the £505 million Energy Innovation Programme.

**£240m**

available through  
**Net Zero Hydrogen Fund** up to 2024/25

**5GW**

**aim for low-carbon hydrogen production capacity by 2030**

**42TWh**

**annual low-carbon hydrogen production by 2030**

A variety of production technologies will be required to satisfy the level of anticipated demand for clean hydrogen in 2050. This is likely to include methane reformation with CCUS, biomass gasification with CCUS and electrolytic hydrogen using renewable or nuclear generated electricity.

► **Working with industry, our aim is for the UK to develop 5GW of low-carbon hydrogen production capacity by 2030.**

The exact mix of different end uses for clean hydrogen in 2050 will depend on a variety of factors including cost, availability and technical application. Action is needed now to enable hydrogen to be deployed flexibly in the future. We will need production at scale by the mid-2020s to provide assurance on safety, security, cost and the potential for emissions reduction, before we scale up even further during the 2030s. To put the UK on this pathway, we are aiming for 5GW of clean hydrogen production capacity in 2030, equating to 42TWh, and supporting up to 8,000 jobs by 2030 across our industrial heartlands and beyond.<sup>187</sup> We hope to see 1GW of hydrogen production capacity by 2025 on route to our 2030 goal.

Action now to deploy hydrogen during the 2020s will stimulate domestic supply chains, enabling UK businesses to capture increasing international demand for hydrogen goods and services. Ensuring this happens will be an important part of our upcoming Hydrogen Strategy.

► **We will create a Net Zero Hydrogen Fund to support low-carbon hydrogen production, providing £240 million of capital co-investment out to 2024/25.**

The Net Zero Hydrogen Fund will deliver a major boost to production capacity, ensuring that clean hydrogen can be utilised for decarbonising industrial clusters and play its role delivering net zero.

The Fund will help establish the technology and will ensure that existing mechanisms, such as the Renewable Transport Fuel Obligation, provide an appropriate level of support for renewable hydrogen. However, achieving our 2030 ambition for clean hydrogen will also require the right commercial frameworks which encourage sustained private sector investment. We will put the necessary building blocks in place now to provide confidence that clean hydrogen can be produced reliably and cost-effectively. We will introduce a commercial framework by 2022, which enables project sponsors of all types of clean hydrogen to finance their projects. We will consult on our preferred model in 2021.

## A UK EMISSIONS TRADING SCHEME

Creating a new UK carbon market will be the foundation on which the UK achieves net zero emissions cost-effectively.

► **We will implement the world's first net zero carbon cap and trade market, the UK Emissions Trading Scheme.**

The UK has been a pioneer of emissions trading since 2002. The European Union adopted our cap-and-trade approach to carbon pricing, and other countries around the world have followed our lead. There are now 28 trading systems operating across four continents.<sup>188</sup> Having left the EU, we are ready to lead the world again.

We will establish a UK Emissions Trading Scheme (ETS) to replace the UK's participation in the EU ETS. The UK ETS will be a market-based measure which will provide continuity for businesses. A cap is set on the greenhouse gases that businesses can emit (via the total number of allowances in circulation), which will decrease over time. Businesses then buy and sell emissions allowances through government auctions or secondary markets. The UK ETS will initially apply to energy-intensive industries, electricity generation and aviation.

### EMISSIONS TRADING SCHEME (ETS)

A method of putting a price on emissions. A cap is set on the total amount of certain greenhouse gases that can be emitted by participants. The cap is reduced over time so that total emissions fall. Within the cap, companies receive or buy emission allowances, which they can trade with one another as needed.

This mechanism of carbon pricing supports businesses to decarbonise at the least cost. Businesses who can abate cheaply will do so, and those that cannot purchase additional allowances to cover their emissions. Knowing that the ceiling on emissions will lower transparently over time enables business to plan and invest to decarbonise, while at the same time protecting the competitiveness of businesses and minimising the risk of carbon leakage.

Following the introduction of the UK ETS, we will consult in due course on how to align the cap with an appropriate net zero trajectory, meaning the system will significantly contribute to ensuring the UK meets our commitment to net zero emissions by 2050. The operation of the cap will provide certainty about the decarbonisation trajectory over the long term. It will deliver a robust carbon price signal; giving businesses the confidence to mobilise the scale of capital investment necessary to deploy clean energy technologies; and to capture new trade opportunities on the back of the energy transition.

The UK ETS will also allow us to expand carbon pricing across the economy and encourage innovation in emerging decarbonisation technologies. We have committed to exploring expanding the UK ETS to the two thirds of uncovered emissions, and will set out our aspirations to continue to lead the world on carbon pricing in the run up to COP26. This will also include how the UK ETS could incentivise the deployment of greenhouse gas removal technologies. In addition to this, the UK is open to linking the UK ETS internationally in principle and we are considering a range of options, but no decision on our preferred linking partners has yet been made.

## SUPPORT FOR BUSINESSES

Our strategy includes providing capital support to help industry become more energy efficient and to bring down the costs and risks of key decarbonisation technologies.

This investment will bring forward the date at which technologies such as CCUS and hydrogen can be commercially deployed in industry. However, we recognise that investors need revenue visibility of revenue, delivered by new business and commercial models, for the lifetime of a project, if they are to finance the upfront capital costs of decarbonisation projects.

► **We will bring forward details in 2021 of a revenue mechanism to bring through private sector investment into industrial carbon capture and hydrogen projects via our new business models to support these projects.**

The government is already providing capital support through a number of schemes for industry to decarbonise. The £18 million Industrial Heat Recovery Support programme is helping businesses reuse heat which would otherwise be wasted. The Climate Change Agreements Scheme reduces the amount of a tax that industry pays on energy, called the Climate Change Levy. It has supported industry with an estimated £200 million in tax discounts a year, in return for meeting agreed energy or carbon reduction targets and has now been extended by a further two years until March 2025.<sup>189</sup> The Industrial Energy Transformation Fund (IETF) was launched this year, with funding worth £315 million, to help businesses with high energy use to cut their bills and reduce carbon emissions.

Additionally, the £250 million Clean Steel Fund was announced in 2019 and is designed to support the resilience and longevity of the steel sector by supporting it onto a decarbonisation pathway consistent with net zero. We will also develop user-friendly digital services to improve access to funding for our stakeholders.

In addition, we intend to provide longer-term certainty to industry which goes beyond the need for time-bound support schemes dependent on direct government funding. Over the long term, cost reductions in low-carbon technologies, coupled with a robust carbon price signal and a thriving market for low-carbon products, will drive investment. In the near term, we will bring forward details of a revenue mechanism to bring through private sector investment in emerging technologies. Providing this visibility will enable industry to invest in new technologies, such as CCUS and clean hydrogen at scale, accelerating the decarbonisation of the sector and the economic opportunities which come with it.

Recognising this, we will bring forward further details in 2021 on the revenue mechanism which will encourage private sector capital into the new business models we are creating to support deployment of industrial carbon capture and clean hydrogen.

# Our key commitments

We will **publish an Industrial Decarbonisation Strategy in spring 2021** to set out the details of how the government will support the decarbonisation of manufacturing industry.

In line with the increased ambition set out in the Ten Point Plan we will **increase the Industrial Clusters Mission to support the delivery of four low-carbon clusters by 2030** and at least one fully net zero cluster by 2040.

We will **invest £1 billion up to 2025 to facilitate the deployment of CCUS in two industrial clusters** by the mid-2020s, and a further two clusters by 2030, supporting our ambition to capture 10MtCO<sub>2</sub> per year by the end of the decade.

We will **publish a dedicated Hydrogen Strategy in spring 2021** which positions the UK as a world leader in the production and use of clean hydrogen.

Working with industry, our **aim is for the UK to develop 5GW of low-carbon hydrogen production capacity** by 2030.

We will **create a Net Zero Hydrogen Fund** to support low-carbon hydrogen production, providing £240 million of capital co-investment out to 2024/25.

We will **implement the world's first net zero carbon cap and trade market**, the UK Emissions Trading Scheme.

We will bring forward details in 2021 of a **revenue mechanism to bring through private sector investment into industrial carbon capture and hydrogen projects** via our new business models to support these projects.

CHAPTER 06

# Oil and gas

## OUR GOAL

Delivering our net zero target by 2050 means transforming the oil and gas sector in the UK.

We will:

- ▶ Work with the sector to **transform the UK Continental Shelf to be a net zero basin** by 2050
- ▶ Provide **opportunities for oil and gas companies to repurpose their operations away from unabated fossil fuels to abatement technologies** such as carbon capture, utilisation and storage (CCUS) or clean energy production such as renewables and hydrogen
- ▶ Agree a **transformational North Sea Transition Deal** to deliver new business opportunities, jobs and skills as the sector, as well as protect the wider communities which rely on the oil and gas sector
- ▶ Ensure that the licensing of domestic oil and gas exploration and production **continues to be compatible with our climate change ambitions**

OIL AND GAS

# The strategic context

The UK's domestic oil and gas industry has a critical role in maintaining the country's energy security and is a major contributor to our economy

Much of the crude oil from the North Sea basin is exported, with the UK making extensive use of strong trading links to meet domestic refinery demand. Domestic production still met 46 per cent of the country's supply of gas in 2019, with the vast majority of this supplied from North Sea offshore production with a smaller proportion from the onshore oil and gas sector.<sup>190</sup>

145k

**jobs supported** directly or indirectly across the UK in 2018

80%

**drop in production of natural gas** (compared to 2017) could be possible by 2050

0.9%

**of 2019 UK GVA** was contributed by the offshore oil and gas sector

The offshore oil and gas sector contributed about 0.9 per cent to the UK's GVA in 2019 and has paid around £350 billion in production taxes since 1970/71.<sup>191</sup> The sector is a source of high-quality jobs, supporting directly or indirectly around 147,000 jobs in total across the UK in 2018.<sup>192</sup> Many jobs supported by the sector are located in Scotland, particularly in Aberdeen, a global hub for the oil and gas industry. Critical supply chain clusters have grown in the North, East and South East of England. These jobs and the additional 113,000 induced by the sector help support the wider UK economy.

While the Oil & Gas Authority (OGA) estimates that there are still around 10 to 20 billion barrels of oil equivalent remaining in the UK Continental Shelf,<sup>193</sup> domestic production has more than halved since 2000.<sup>194</sup> The Climate Change Committee (CCC) estimates that production of natural gas could drop by up to 80 per cent by 2050, compared to levels in 2017.<sup>195</sup> However, the projections for demand for oil and gas, though much reduced, is forecast to continue for decades to come.

The UK's offshore oil and gas sector and the smaller onshore sector have both been severely affected by COVID-19. The pandemic led directly to the global collapse in demand for oil and resulted in a roughly 65 per cent drop in the price of Brent Crude between January and April 2020.<sup>196</sup> Oil and Gas UK (OGUK) estimate that the UK sector will respond by cutting expected capital expenditure by around 30 to 40 per cent and operating expenditure by around 10 to 20 per cent compared with anticipated expenditure at the start of the year, while maintaining production levels.<sup>197</sup> During the early months of the UK lockdown, staffing on offshore rigs was reduced by more than a third compared to early March.<sup>198</sup>

The OGA estimates that there are still around **10 to 20 billion barrels of oil remaining in the UK Continental Shelf**

We have supported the oil and gas sector to bounce back from COVID-19 but a return to 'business as usual' is no longer an option. Government support is in the context of delivering our net zero target. The sector is already coming under significant pressure from investors and the public more widely to respond to the challenge. Shareholders, for example, are increasingly requiring listed companies to price carbon into their business models and demonstrate how they can reduce emissions from their operations or support the wider decarbonisation of the economy.<sup>199</sup>

Many oil and gas companies are now responding to the challenge. Their investment decisions are beginning to anticipate a world without fossil fuels beyond 2050.<sup>200</sup> There is great potential for the sector to play an important part in the energy transition and retain vital skills across key regional hubs around the country, supporting the CCUS and hydrogen "SuperPlaces" clusters announced in the Prime Minister's Ten Point Plan.<sup>201</sup>

## HOW UK COMPANIES ARE RESPONDING TO THE NET ZERO CHALLENGE

There is great potential for traditional oil and gas businesses to take advantage of the opportunities provided by the energy transition and transform their operating model, whether they are exploration and development companies, service providers, supermajors or independent companies.

Supermajors such as bp and Shell have set out major changes of strategy to achieve net zero by 2050, including addressing emissions that result of the use of their products. All have set aggressive emissions reductions targets. Other approaches include rebalancing their portfolios to increase their renewable energy holdings; investing in and partnering with renewable energy companies; investing in carbon dioxide sequestration, and expanding their consumer-facing offer, such as electric vehicle charging. Privately backed companies, such as Chrysaor, have also set out their emissions reductions targets, while investing in carbon capture and hydrogen in the UK.

We will continue to push for a high level of ambition amongst oil and gas companies, challenging them to go further to reduce their emissions consistent with our net zero target, while transitioning their operations into emerging energy technologies.

We expect to see the supply chain reflect this shift as well.

### Wood

Wood Plc has taken substantial steps to transform its business from a traditional oilfield services provider into broader engineering and consultancy work operating across the energy sector. In 2014, 96 per cent of Wood's revenue was derived from oil and gas work including 65 per cent from upstream activity compared with 2020 where upstream activity now accounts for just one third of its total revenue.<sup>202</sup>

Today, Wood offers a blend of consulting, projects and operations solutions including a fast-growing renewables business. It has been involved in solar projects, increasing global wind capacity as well as CCUS studies and has an increased presence in the hydrogen market. In parallel, the company has continued its commitment to the oil and gas sector through helping partners achieve their own energy transition goals.

A recent survey by OGUK revealed that more than half of its members had already diversified into other energy sectors, even as oil and gas remained their primary source of income.<sup>203</sup> The UK Petroleum Industry Association has set out scenarios and the technology pathways for how the refining and downstream sector can play an active part in achieving net zero emissions.<sup>204</sup> Many supply chain companies are diversifying into other energy sectors.

Reducing emissions from oil and gas will need careful management to avoid disruption to our daily lives and minimise rising costs, as well as to mitigate wider economic impacts. It requires a policy and regulatory framework which continues to promote good environmental practice, alongside effective stewardship of the North Sea by both regulators and oil and gas operators. To achieve this, we expect industry to respond effectively to the net zero challenge but will encourage continued healthy levels of investment. Ensuring that the UK remains an attractive destination for global capital is the best way to secure an orderly and successful transition away from traditional fossil fuels.

# Our key commitments

## A NET ZERO BASIN BY 2050

It is critical that the sector focuses on cutting the emissions associated with offshore oil and gas production.

- ▶ **Working with the regulators, we will drive the reduction of greenhouse gas emissions from all offshore oil and gas operations to make the UK continental shelf a net zero basin by 2050.**

In 2018, upstream oil and gas activities in the UK accounted for four per cent of UK greenhouse gas emissions.<sup>205</sup> According to OGUK, in order to meet net zero, the oil and gas sector will need to reduce its emissions from offshore production and operations to 0.5MtCO<sub>2</sub>e by 2050, from 19MtCO<sub>2</sub>e today.<sup>206</sup> Methane will be a special focus, given its potency as a greenhouse gas.

The industry has signed up to the OGUK-led ambition to achieve net zero emissions across all its upstream activities, as set out in the OGUK's Roadmap 2035.<sup>207</sup> It has already set itself the challenge of becoming a net zero basin by 2050, with a 50 per cent absolute emissions reduction by 2030 and 90 per cent by 2040.<sup>208</sup> The sector was amongst the first industrial sectors in the UK to make such a commitment. We expect real and ambitious change from industry to deliver this commitment. We want the industry to go further and faster, wherever possible.

The World Bank estimated that, in 2019, global levels of gas flaring had increased to approximately 150 billion cubic metres of natural gas, emitting about 400MtCO<sub>2</sub>e, in addition to the waste of the valuable resource.<sup>209</sup>

- ▶ **We will commit the UK to the World Bank's 'Zero Routine Flaring by 2030' initiative and will work with regulators towards eliminating this practice as soon as possible in advance of this date.**

The World Bank's 'Zero Routine Flaring by 2030' initiative invites governments and industry to put an end to the operational practice of routine flaring by 2030. Some UK Continental Shelf operators have reduced routine flaring but much more can be done to drive down the practice, notwithstanding the challenges posed by the maturity of the basin and its assets. The OGA will take a more robust stance to push for reductions in flaring and venting and the resulting greenhouse gas emissions, through its consents, field development process and project stewardship role.<sup>210</sup> As part of our discussions with the sector on emissions reduction in the North Sea Transition Deal, we will seek to end this practice before 2030.

We will also tackle regulatory and policy barriers to the use of clean electricity, such as offshore wind, to power offshore oil and gas facilities, as opposed to the current practice of using diesel or gas generators on platforms.

In addition to reducing emissions from direct operations, known as Scope 1 and 2 emissions, we will challenge the sector to address embodied emissions from the consumption of their products or from supply chain activities, so-called Scope 3 emissions.

## SCOPE 1,2 AND 3 EMISSIONS

The Greenhouse Gas Protocol Corporate Standard classifies a company's GHG emissions into three scopes:

- ▶ **Scope 1:** emissions directly from owned or controlled sources
- ▶ **Scope 2:** indirect emissions from the generation of purchased energy
- ▶ **Scope 3:** indirect emissions (not included in Scope 2) that occur in the value chain of the reporting company, including both upstream and downstream emissions

Many of the larger companies are already setting out plans for taking on this challenge. This will largely be achieved through changes to their corporate strategies to focus their business on abatement of emissions, and new low-carbon energy sources. The approach will vary according to the size and structure of individual companies. Any future government support is dependent on the sector adopting meaningful measures which reduce emissions and report transparently on progress, for example through adhering to the recommendations of the Taskforce on Climate-Related Financial Disclosures.

As we face the challenge of decommissioning end-of-life oil and gas infrastructure in the UK Continental Shelf, we will take account of the potential to use existing infrastructure in CCUS transport and storage supporting carbon capture from industry, power generation and hydrogen production. This will require giving appropriate consideration to responsible management of decommissioning costs.

- ▶ **We will support the UK oil and gas sector to repurpose its existing infrastructure in support of clean energy technologies.**

Using oil and gas assets at the end of their existing commercial life could realise significant cost savings in the deployment of CCUS and prove instrumental in getting the technology operational by the mid-2020s. Upfront capital cost savings for the developers of some CCUS projects could be in excess of £100 million, compared to the cost of building new offshore pipelines and associated infrastructure.<sup>211</sup> The re-use of existing assets can also lower the carbon footprint of the construction process.

In August 2020, we published our response to a consultation on the re-use of oil and gas assets for CCUS projects.<sup>212</sup> Our review has identified assets which could have the greatest potential for re-use in CCUS. We will now work with industry and regulators to provide clarity on the regulations for re-purposing assets and to develop technical guidance on how this can be done safely and securely.

# A REGULATORY REGIME WHICH INCENTIVISES THE SWITCH TO CLEAN ENERGY

It is vital that our regulators are well positioned to address the net zero basin challenge and help deliver our ambition.

We will work closely with the Offshore Petroleum Regulator for Environment and Decommissioning (OPRED) and the Oil & Gas Authority, the principal offshore oil and gas regulators, to ensure that their roles, powers and priorities reflect the government's policy for delivering net zero emissions, without imposing significant additional regulatory burdens.

► **We will undertake a review of the Offshore Petroleum Regulator for Environment and Decommissioning to ensure that it is fully equipped to drive up environmental standards in its regulatory role, as well as supporting the sector's progress towards net zero emissions.**

OPRED is the environmental and decommissioning regulator for offshore oil and gas, gas storage and offshore carbon capture and storage activities. OPRED will increase its focus on the further reduction of greenhouse gas emissions from all offshore oil and gas operations and will put in place a regulatory framework to support emerging decarbonisation technologies. This will include OPRED utilising its existing data collection system to track progress on emissions reduction.

The total **value of UK subsea output in 2019 stood at almost £7.8 billion**, with over 45,000 people employed in the sector.

The principal objective of the OGA, the upstream licensing regulator, is to maximise the economic recovery of petroleum from the UK Continental Shelf, a statutory goal established in the wake of the oil price crash in 2014. The OGA has supported the production of oil and gas in the most cost-effective way possible but its focus has been evolving.

► **We aim to lay a new strategy for the Oil & Gas Authority before the end of 2020 to bolster the regulator's ability to focus the sector on helping deliver net zero emissions.**

The OGA consulted over the summer of 2020 about its intention to refresh its core aim, including a requirement for industry to take appropriate steps to support the delivery of the government's net zero target.<sup>213</sup> We agree with the OGA's assessment that the sector must go considerably faster in reducing its own carbon footprint or risk losing its social licence to operate. The changes proposed in the OGA's consultation have the potential to make a significant contribution to achieving our goal.

The industry has the skills, technology and capital to unlock innovative solutions which could be instrumental in helping to deliver net zero emissions successfully for the whole economy. It can play a critical role in the deployment of CCUS, hydrogen production and renewable electricity generation, particularly offshore wind. The OGA is clear that consideration of the sector's contribution to this goal is a proper part of Maximising Economic Recovery.

The OGA will take wide ranging action to implement its revised strategy. This will include benchmarking greenhouse gas emissions to drive performance and creating a new asset stewardship expectation for net zero. The OGA will update its guidance and its economic assessments, which support regulatory decisions, to include full carbon costs.

A new strategic approach will allow the OGA to take a much greater role in driving the sector's contribution to the clean energy transition. It will further enhance the OGA's role as an environmentally responsible steward.

To respond to the changing landscape in which the UK oil and gas sector is operating, we are currently undertaking a review of policy on the future licensing of domestic offshore oil and gas exploration and production. This review seeks to ensure the continued compatibility of the UK's licensing regime with our climate obligations and delivering our net zero target by 2050. This review is an opportunity for the UK to demonstrate that effective climate leadership can be compatible with maintaining a strong economy and robust energy security.

► **To ensure that licensing continues to be compatible with our climate change ambitions over the coming decades, we are considering formalising aspects of our existing process.**

As we develop our policy options, we believe that a sensible step for the UK may be to develop the existing checkpoints in our processes before proceeding with future licensing rounds. Such a step could involve regularly seeking independent advice on how proceeding with future licensing would impact our climate and energy goals.

This could serve to further formalise existing processes and provide an extra layer of assurance that oil and gas licensing remains consistent with our future policy objectives. We will assess what added benefit such a move would bring as part of our review.

In addition to this measure, we are considering a spectrum of options to ensure that the regime continues to be consistent with our wider aims. We will assess all options against a range of factors, including our energy transition goals; emissions reductions; and impacts on the supply chain and jobs. We expect to publish our conclusions in early 2021.

## A NEW PARTNERSHIP BETWEEN GOVERNMENT AND INDUSTRY

In our Manifesto, the government committed to agreeing a Sector Deal with the offshore oil and gas industry which secures the sector's long-term future consistent with net zero.

- ▶ **We will agree a transformational North Sea Transition Deal with the industry during the first half of 2021, focused on the economic opportunities of net zero and providing support for the people and communities most affected by the move away from oil and gas production.**

The proposed North Sea Transition Deal represents a quid pro quo partnership between the government and industry for taking long-term action which transforms the sector and delivers the energy transition. We are negotiating the substance of the deal with the sector and aim to reach agreement by the first half of 2021. We will use the deal as a vehicle to create new jobs as well as trade and investment opportunities. The deal will also set out how we can retain existing skills and capabilities in the sector, many of which are of vital regional and national significance and which could give the UK first mover advantage in emerging low-carbon sectors.

The Prime Minister's Ten Point Plan included ambitious commitments on supporting the delivery of clean energy technologies such as hydrogen and CCUS. Given the proximity of UK oil and gas hubs – particularly Scotland and the North East of England, this presents a great opportunity for the sector to unlock additional funding through the North Sea Transition Deal. The sector can contribute meaningfully to the Green Industrial Revolution by providing essential skills across key regions of the UK economy.

### NORTH SEA TRANSITION SECTOR DEAL

#### Key deliverables

**Cleaner energy production** through rigorous emissions reductions;

Supporting the **delivery of CCUS**;

**Diversification of the oil and gas supply chain** into new energies;

Supporting the **development of hydrogen production**; and

**Safeguarding existing jobs and establishing tens of thousands of new high-quality jobs** across the sector in diversified energy technologies.

# SECURING NEW TRADE AND INVESTMENT OPPORTUNITIES

Through the UK’s international leadership on climate change action, we will seek new opportunities in overseas markets to export our expertise in subsea engineering, decommissioning and other supply chain capabilities.

- ▶ **We will use our North Sea Transition Deal to support the UK-based oil and gas supply chain to secure new low-carbon export opportunities in overseas markets, capitalising on the global reach of the UK’s world-class trade promotion and diplomatic resources.**

The UK’s offshore oil and gas supply chain sells a range of products, services and expertise to domestic and world markets. With innovative providers of oil field services and capability across all sub-sectors, including marine and sub-sea operations, it had an estimated turnover in 2018 of £27 billion and employs around 116,000 people.<sup>214</sup> Many of these capabilities are readily exportable to new markets, as the world decarbonises.

The UK is forecast to become the largest decommissioning market globally over the next decade, with decommissioning expenditure forecast to be around £1.5 billion per year for the next ten years.<sup>215</sup> This will enable the UK supply chain to develop a world-leading decommissioning industry. If the sector can decommission our offshore infrastructure in a safe, efficient and environmentally responsible manner, while also meeting the OGA’s ambitious cost reduction targets, it will be well-positioned to service the global market, by one estimate worth around £80 billion in the next decade<sup>216</sup> and near £270 billion from 2022 onwards.<sup>217</sup>

**£27bn**

**estimated turnover** of the UK’s offshore oil and gas supply chain in 2018

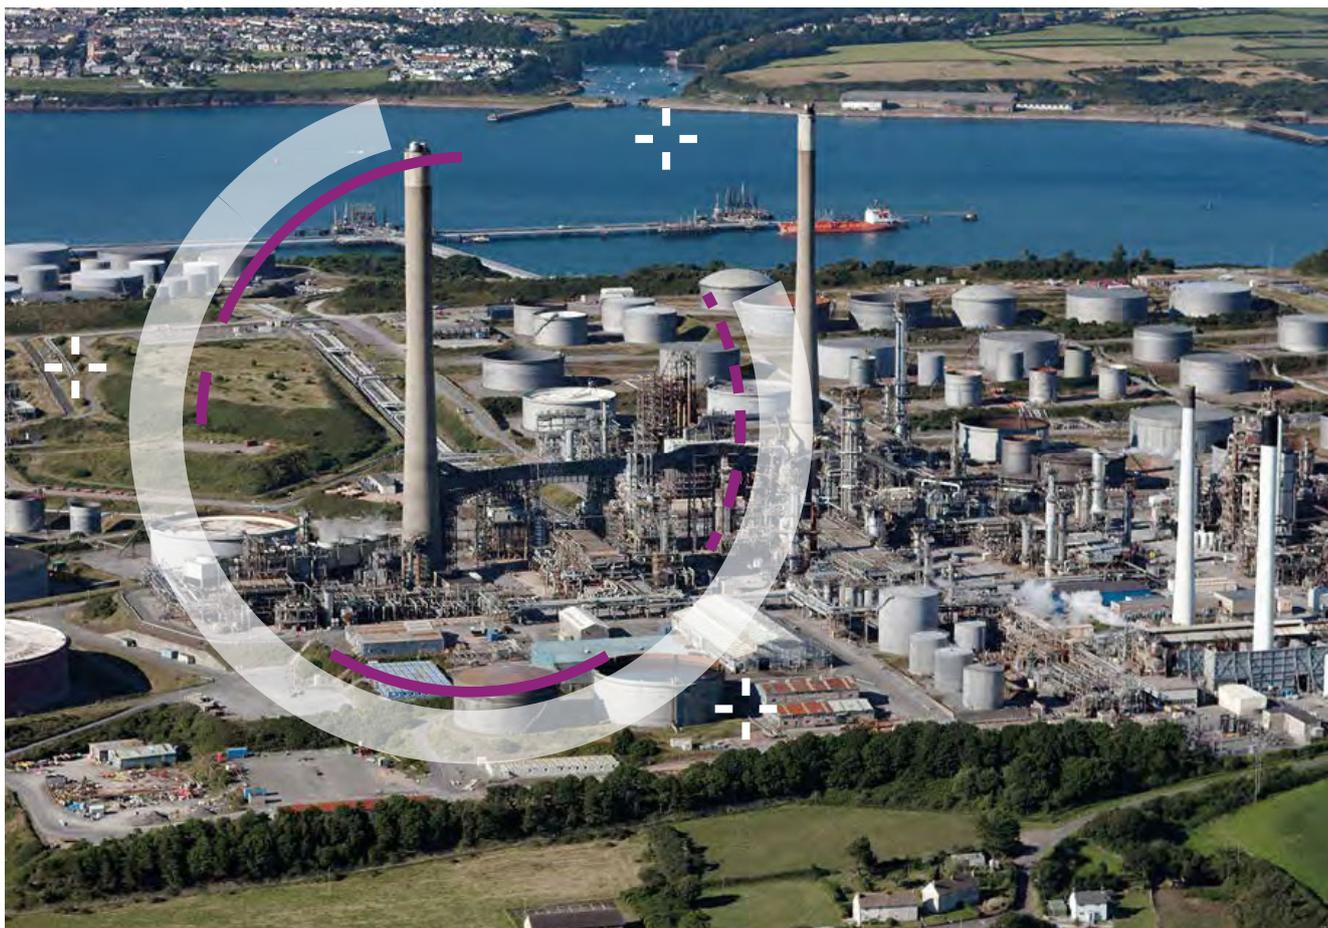

**£8bn**

**total value of UK subsea output** in 2018/19

**<1%**

UK contribution to **overall global greenhouse gas emissions**

**As announced in the 2020 Spending Review, we will commit funding towards the Global Underwater Hub in Aberdeen with satellites in North East England And Southern England.** This new economic development hub will take a strategic approach to growing our world-leading subsea engineering, technology and services sector as the global subsea market diversifies away from oil and gas and shifts towards supporting new marine growth sectors such as renewables.

In parallel with this white paper, we will publish proposals for helping develop decommissioning opportunities, both domestically and in overseas markets.

The UK's world-leading subsea engineering industry is already positioned for global growth across a range of diversified sectors which make up the so-called 'Blue Economy', economic activities relating to the world's oceans and coastlines. The total value of UK subsea output in 2018/19 stood at around £8 billion, with over 45,000 people employed in the sector.<sup>218</sup>

The UK contributes less than one per cent to overall global greenhouse gas emissions<sup>219</sup> so we must leverage our role as a world leader on climate change and ensure we use all available levers to support global clean growth opportunities.

This is why in January 2020 the Prime Minister announced that the UK government will no longer provide any new direct support for thermal coal mining or coal power plants. To bolster our commitment to supporting a clean energy transition, The Prime Minister has now announced that the UK government will no longer provide direct financial or promotional support for the fossil fuel energy sector overseas. Both announcements extend to any new official development assistance, investment, export credit and trade promotion activity. For oil and gas activities there will be a few - tightly bound - exemptions allowed for activities that support health and safety improvements, form part of wider clean energy transitions, support decommissioning, or are associated with a humanitarian response.

A public consultation process will take place on the implementation date for this policy and to help align government's support for clean technologies. The consultation will close in February 2021 and its findings will help form the North Sea Transition Deal. Our ambition is to lead by example, working towards establishing the UK at the forefront of the global supply chain and capitalising on the skills of the UK sector while working in close partnership with those seeking to transition to a cleaner future.

We will identify the international clean growth projects and emerging clean technology sectors in the UK which can benefit from our export finance mechanisms, from innovation to export, with a particular focus on technologies where the UK has first mover advantage. We will also help UK based companies to diversify and take advantage of the opportunities in emerging energy technologies.

## DOWNSTREAM OIL RESILIENCE

The downstream oil sector provided 96 per cent of the energy used in the transport sector in 2019.<sup>220</sup> It will continue to play a vital role in the transition to a net zero economy, delivering fuels to consumers.

The sector is already actively exploring the potential for low-carbon liquid fuels, particularly in aviation, shipping and heavy goods vehicles, which are more challenging to decarbonise.

We will work with industry to promote innovation and remove regulatory barriers which hinder the switch from fossil fuels. The Department for Transport will shortly publish a consultation over the use of fuels produced from non-biogenic waste, which is currently incinerated. It offers the potential to convert non-recyclable plastic and industrial waste gases to jet fuel or substitute for diesel and petrol in cars and vans.

As we make the transition away from fossil fuels, we must maintain secure supplies of fuel to the people and businesses whose livelihoods depend upon it.

### ► We will take powers to ensure we maintain a secure and resilient supply of fossil fuels during the transition to net zero emissions.

Our net zero future undoubtedly represents a challenge to the downstream oil sector, which has already been hit hard by falling demand and reduced refining margins resulting from the COVID-19 pandemic. We believe that it is necessary for government to have powers to monitor the resilience of the fuel supply market and, should it be necessary, to intervene to ensure there is an orderly transition to clean energy supplies. We will explore options for delivery and look to publish a draft Downstream Oil Resilience bill while we seek an opportunity to introduce these measures to Parliament

# Our key commitments

Working with the regulators, we will make **the UK continental shelf a net zero basin** by 2050.

We will **commit the UK to the World Bank's 'Zero Routine Flaring by 2030'**.

We will **support the UK oil and gas sector to repurpose its existing infrastructure** in support of clean energy technologies.

We will **undertake a review of the Offshore Petroleum Regulator for Environment and Decommissioning** to drive up environmental standards in its regulatory role, and support the sector's progress towards net zero emissions.

We aim to **lay a new strategy for the Oil & Gas Authority before the end of 2020** to bolster the regulator's ability to focus the sector on helping deliver net zero emissions.

To **ensure that licensing continues to be compatible with our climate change ambitions** over the coming decades, we are considering **formalising aspects of our existing process**.

We will **agree a transformational North Sea Transition Deal** with the industry during the first half of 2021.

We will use our North Sea Transition Deal to **support the UK-based oil and gas supply chain to secure new low-carbon export opportunities** in overseas markets.

We will take powers to **ensure we maintain a secure and resilient supply of fossil fuels during the transition** to net zero emissions.

# Glossary

Phrase	Meaning
<b>Advanced Nuclear</b>	Includes Small Modular and Advanced Modular Reactors.
<b>Advanced Nuclear Reactors</b>	Reactors which use novel cooling systems or fuels and may offer new functionalities (such as industrial process heat).
<b>Balancing</b>	Matching supply with demand, which is important to keep the gas and electricity systems within safe operating limits. For electricity this needs to be done on a second-by-second basis.
<b>Balancing services / balancing market</b>	The tools and markets that are used to make sure it is possible to match supply with demand.
<b>Bioenergy with Carbon Capture and Storage</b>	Refers to bioenergy processes (such as burning it for electricity) during which carbon is captured and stored. If carefully managed, using sustainable biomass, BECCS can generate ‘negative emissions’ because while providing energy it also captures and stores the atmospheric CO <sub>2</sub> that is absorbed by plants as they grow.
<b>Bioenergy</b>	Refers to heat or electricity produced using biomass or gaseous and liquid fuels with a biological origin such as biomethane produced from biomass.
<b>Biomass</b>	Refers to any material of biological origin used as a feedstock for products (e.g. wood in construction to make chemicals and materials, like bio-based plastics), or as a fuel for bioenergy (heat, electricity and gaseous fuels such as biomethane and hydrogen) or biofuels (transport fuels).
<b>Biomethane</b>	A form of gas that is produced by processing biomass. It can be used for the same purposes as natural gas, like producing electricity or heat, and can use the same infrastructure for transmission and end-user equipment.
<b>Capacity market</b>	Is our primary policy mechanism for delivering security of electricity supply. It provides generators and flexibility providers with a payment for firm (reliable) capacity to ensure they deliver electricity generation or demand reduction, when required.
<b>Carbon intensity</b>	The amount of CO <sub>2</sub> emitted when generating a unit of electricity, measured in gram of CO <sub>2</sub> per kWh of electricity produced.

Phrase	Meaning
<b>Carbon capture readiness</b>	Is a requirement imposed on thermal plants (such as coal and gas plants) to enable future capturing and storing of carbon following a plant upgrade. Such plants currently emit CO <sub>2</sub> directly into the atmosphere.
<b>Carbon Capture Utilisation and Storage (CCUS)</b>	The process of capturing carbon dioxide from industrial processes, power generation, certain hydrogen production methods and greenhouse gas removal technologies such as bioenergy with carbon capture and storage and direct air capture. The captured carbon dioxide is then either used, for example in chemical processes, or stored permanently in disused oil and gas fields or naturally occurring geological storage sites.
<b>Carbon Leakage</b>	Refers to the situation that may occur if, for reasons of costs related to climate pricing policies, businesses were to transfer production or reallocate future investments to other countries with laxer emission constraints or carbon pricing. This could lead to an increase in total global carbon emissions.
<b>Carbon Price</b>	A cost applied to carbon pollution to encourage polluters to reduce the amount of greenhouse gases they emit into the atmosphere.
<b>Clean Electricity</b>	Types of electricity generating technologies that emit little or no fossil fuel derived greenhouse gas from generation.
<b>Competitive tendering</b>	A process inviting eligible organisations to compete to carry out work or supply services, with the winner decided by who can offer the best price and quality.
<b>Contracts for Difference Scheme (CfD)</b>	The main support mechanism for large scale low-carbon electricity generation projects. Successful projects are awarded a long-term contract which secures a price to which they will either be topped up if electricity prices are low, or pay back to if electricity prices are high.
<b>Contract for Difference allocation round</b>	The competitive allocation process of CfD contracts. Participants bid the strike price they require to build their project with the cheapest ones winning on a pay-as-clear system.
<b>Data triage</b>	A logical step by step process to ensure energy data can be made openly available when it is secure and safe to do so.
<b>Decarbonisation</b>	A process of reducing the amount of carbon dioxide we release into the atmosphere.

Phrase	Meaning
<b>Demand Side Response (Solutions)</b>	Is when consumers adjust their energy usage in response to an external signal. Examples include either reducing it, delaying it, or using on-site generation or storage. DSR was historically provided by large industrial and commercial consumers, but technology development is making it easier for smaller consumers to provide these services for example by charging their electric car with a smart charger.
<b>Digitalisation</b>	Is the integration of digital technologies into a process, organisation, or system. For example, smart meters which automatically send meter readings to energy suppliers, meaning more accurate bills for customers.
<b>Direct Air Carbon Capture and Storage</b>	Use of engineered processes to capture carbon dioxide (CO <sub>2</sub> ) directly from the atmosphere, for storage or use.
<b>Dispatchable generation</b>	Is electricity generation that can be turned on, off, up or down as needed.
<b>Dispatch signals</b>	A pricing mechanism designed to encourage power stations to produce and send electricity to the grid when it is needed
<b>Distribution networks</b>	Regional networks that transport gas or electricity into homes and businesses and import electricity from small-scale generation.
<b>Distributed flexibility</b>	Technologies that can deliver flexibility (see flexibility) that are connected to the distribution network across the country.
<b>Domestic Load Connection Allowance</b>	The duty that network owners have to provide the first 10 metres of a gas connection free of charge to customers.
<b>Downstream Oil and Gas</b>	The industries and processes in which oil and gas are converted into finished products
<b>Electricity Capacity</b>	The amount of electrical power a generator can produce when it is running at maximum output.
<b>Electricity Generation</b>	Is the total electrical energy created over a period of time.
<b>Electricity System</b>	A system consisting of generators, interconnectors, transmission and distribution networks, and storage that deliver electricity to the final consumer (businesses, industry, public sector and homes). As well as the markets and control infrastructure such as smart and digital technologies, that play a key role in making sure the system balances supply and demand.
<b>Electrification</b>	Switching from using fuels such as gas or petroleum, to using electricity. For example, switching from a petrol car to an electric car.

Phrase	Meaning
<b>Emissions Trading System (ETS)</b>	A method of putting a price on emissions. A cap is set on the total amount of certain greenhouse gases that can be emitted by participants. The cap is reduced over time so that total emissions fall. Within the cap, companies receive or buy emission allowances, which they can trade with one another as needed.
<b>Energy codes</b>	The detailed technical and commercial rules of the energy system.
<b>Energy data</b>	Historical, current, and future information covering things such as how, where and when energy is generated, transported, used, and stored.
<b>Energy efficiency</b>	When something performs better using the same amount of energy, or delivers the same performance for less. The principle of energy efficiency can be applied to many things: buildings, products, appliances, manufacturing processes, to name a few.
<b>Energy Performance Certificate</b>	Energy Performance Certificates (EPCs) are required in the UK to provide a prospective owner or tenant with information on the energy performance of a building and recommendations for improvement. EPCs use an A-G rating scale based on the modelled energy bill costs of running the building.
<b>Engineering standards</b>	The specifications to which the energy system is designed and operated.
<b>Flaring</b>	The controlled burning of unwanted or excess natural gases.
<b>Flexibility</b>	The ability to change generation and/or demand in response to an external signal (e.g. price or contract terms). Flexibility enabling technologies include batteries, demand side response, interconnectors and fossil fuel generators.
<b>Fossil fuels</b>	Oil (and fuels derived from oil), coal and natural gas
<b>Fuel poverty</b>	The government definition of fuel poverty is where a household has fuel costs that are above average and, were they to pay that amount, would be left with a residual income below the official poverty line.
<b>Gas quality standards</b>	Are rules to ensure that the gases we use, including natural gas, biogas and hydrogen, meet all of the specifications needed to be safe and effective as an energy source.
<b>Gas system</b>	A system consisting of gas producers, refineries, interconnectors, transmission and distribution networks that delivers gas from its original sources to the final consumer (businesses, industry, public sector and homes). As well as the physical infrastructure, markets play a key role in making sure the system balances supply and demand.

Phrase	Meaning
<b>Generation mix</b>	A mix of technologies designed to meet electricity demand.
<b>Greenhouse Gas Emissions</b>	Addition to the atmosphere of gases that are a cause of global warming, including carbon dioxide, methane and others.
<b>Greenhouse Gas Removal Technologies (or negative emissions)</b>	Methods that actively remove greenhouse gases from the atmosphere, ranging from engineered to nature-based solutions.
<b>Gross value added (GVA)</b>	Gross value added is the value generated by any unit engaged in the production of goods and services.
<b>Heat network</b>	A heat network, sometimes called district heating, is a system of insulated pipes that takes heat or cooling generated from a central source and distributes it to a number of domestic and non-domestic buildings.
<b>Heat pump</b>	A device that extracts heat from the air, ground or water and concentrates it to a higher temperature and delivers it elsewhere, for example to a central heating system. It can replace traditional fossil fuel heating, such as a gas or oil boiler. Heat pump systems are designed to extract a greater amount of heat energy from the surrounding environment than the energy they consume in doing so, therefore they can act as a more efficient source of heat than a conventional electric heater, producing two to three times (or more for very efficient systems) as much heat output as they consume in electricity input.
<b>Hybrid interconnector projects</b>	Projects that combine electricity generation with the ability to feed electricity to two (or more) different markets. For example, an offshore wind project that has multiple connections and is able to provide electricity to both the UK market and to European markets.
<b>Hydrogen for heat</b>	The combustion of hydrogen produces no long-lived greenhouse gas emissions at point of use, making it a possible low-carbon replacement for natural gas as a fuel source for heating homes and other buildings.
<b>Clean hydrogen</b>	Hydrogen that is produced with significantly lower greenhouse gas emissions compared to current methods of production – methods include reacting methane with steam to form hydrogen and then capturing the carbon dioxide by-product (steam methane reformation with CCUS) or using renewable electricity to split water into hydrogen and oxygen (electrolysis).
<b>Industrial Sector</b>	Businesses and organisations involved in manufacturing, refining, coke production and mining.

Phrase	Meaning
<b>Interconnection</b>	Interconnectors are cables or pipes, that transport electricity or gas between different markets internationally. As Great Britain is an island our interconnectors tend to run underneath the sea.
<b>Low-carbon electricity generating technologies</b>	Types of electricity generating technologies that emit little or no carbon, which include renewables, nuclear, CCUS.
<b>Long-duration storage</b>	Storage technologies capable of storing energy for days, weeks or even seasons.
<b>Negative Emission</b>	Achieved by removing greenhouse gases from the atmosphere, for example, through direct air capture or bio-energy production with carbon capture.
<b>Net zero</b>	Refers to a point at which the amount of greenhouse gas being put into the atmosphere by human activity in the UK equals the amount of greenhouse gas that is being taken out of the atmosphere.
<b>Nuclear fusion</b>	Is the process that powers the sun: the fusing of hydrogen atoms into helium, which releases large amounts of energy. Scientists are developing technology to use this process to provide fusion energy, which could be clean, safe and inexhaustible with no long-lived radioactive waste.
<b>Ofgem</b>	The Office for Gas and Electricity Markets (Ofgem) is the independent GB energy regulator for gas and electricity. Its role is to protect consumers now and in the future by working to deliver a greener, fairer energy system.
<b>Peaking Capacity</b>	Electricity generators that don't normally operate but are ready to do so when needed at times of peak demand or low generation.
<b>Policy costs</b>	Cost on energy bills of programmes to save energy, reduce emissions, and provide financial support to the fuel poor.
<b>Price signals</b>	Changes in market price that send messages to consumers and producers about whether to enter or leave a market. For example, rising prices give a signal to consumers to reduce demand, and at the same time they give a signal to potential producers to increase supply.
<b>Real-time markets</b>	In the context of energy this is a market which has no, or very little, time between the finalisation of all trading activity and the physical delivery of energy to the customer. This is very difficult to achieve so the phrase "closer-to-real-time" is often used to indicate a direction of travel.

Phrase	Meaning
<b>Refineries</b>	Industrial facilities which converts crude oil and gas into specific products such as jet fuel or diesel.
<b>Renewable Energy</b>	Energy that is collected from resources which are naturally replaced in human timescales such as sunlight, wind, rain, tides and waves.
<b>R&amp;D</b>	Research and development: thinking up new ideas and applying them.
<b>Regulated Asset Base (RAB)</b>	A type of economic regulation typically used in the UK for monopoly infrastructure assets such as water, gas and electricity networks. The return on a RAB is regulated by an economic regulator.
<b>Small Modular Reactors (SMRs)</b>	SMRs are usually based on proven water-cooled reactors similar to current Nuclear Power station reactors, but on a smaller scale. They use nuclear fission to generate low-carbon electricity. SMRs are called modular reactors as their components can be manufactured in factories using innovative techniques and then transported to site to be assembled.
<b>Smart charging</b>	Connecting an electric vehicle to the electricity grid using a charging device which includes a data connection. This allows electric vehicles that are plugged in using smart chargers to be charged when it is the most efficient, in terms of cost for the consumer and/or from the point of view of balancing supply and demand across the electricity system.
<b>Smart meters</b>	The next generation of gas and electricity meters, which use a secure smart data network to automatically and wirelessly send meter readings to energy suppliers, enable remote topping up of balances for pre-payment customers and near real time energy consumption and expenditure to be visible to domestic energy consumers via an In-Home Display. Smart meters also enable innovations such as time of use tariffs which will help support delivery of our net zero objectives.
<b>Strike price</b>	The price a generator bids into a CfD allocation process. The strike price of the last successful project becomes the clearing price, which all successful generators are awarded in their contracts.
<b>Suppliers (retail energy suppliers)</b>	Licensed companies that buy gas and electricity primarily in the wholesale market and sell it to energy users including domestic and non-domestic consumers.
<b>System constraint</b>	A limit or restriction, which the current system does not have the ability to go beyond. For example, when electricity from a particular location is unable to be transported to the location of demand, due to restrictions on the network.

Phrase	Meaning
<b>System cost</b>	The annualised costs of building and operating the energy system, including generation, transmission and distribution, balancing and carbon costs.
<b>System operators</b>	Manage the whole energy system and keep it in balance so that gas and electricity are available when needed.
<b>Transmission networks</b>	National networks that transport gas and electricity long distances across Great Britain; the motorways of our energy network.
<b>Unabated (gas) generation</b>	Electricity generation where carbon from burning natural gas is not captured and stored.
<b>Upstream Oil and Gas</b>	The industries and processes involved in exploration and extraction of oil and gas
<b>Vehicle-to-grid</b>	Technologies that allow electric vehicles (and their charging equipment) to export energy back to the electricity grid in response to communications to and from the electricity network.
<b>Wholesale costs</b>	The amount energy companies pay to buy gas and electricity

- 29 COP25, Climate Ambition Alliance Press Release, <https://cop25.mma.gob.cl/en/climate-ambition-alliance/>, accessed 14/10/2020
- 30 The Ten Point Plan additionally covers jobs created in public transport, aviation, shipping and natural environment sectors. We have not included these in our estimates, instead focusing on jobs created directly or indirectly within energy.
- 31 Quoted savings based on a medium consumption as defined by Ofgem (3,100 kWh of electricity, 12,000 kWh of gas). Consumption savings based on shifting 75 per cent of electricity consumption to off peak times. <https://octopus.energy/agile/>
- 32 Ofgem, 'Typical Domestic Consumption Values', <https://www.ofgem.gov.uk/gas/retail-market/monitoring-data-and-statistics/typical-domestic-consumption-values>, accessed 13/10/2020.
- 33 Figure 2.1 – Average domestic dual fuel bills. Additional costs from the White Paper include: CfD uplift costs from increased renewables ambition; network reinforcement costs; Energy Company Obligation 4; Green Gas Levy; Warm Home Discount extension; Green Home Grants; Home Upgrade Grants; Social Housing Decarbonisation Fund; and changes to regulations in the housing lending and rented sectors. The impact of additional heat pump deployment has not been included as policy detail is still being developed; the bills impact of financing new nuclear beyond Hinkley Point C has not been included while our approach is in development. This also assumes that ECO support costs continue beyond 2026 despite the policy landscape still under development and additional efficiency benefits beyond ECO 4 have not been quantified. This is a central scenario based on an electrified system as the costs of hydrogen are considered too uncertain at present to include in future estimates of household bills. Figures will differ depending on several variables including wholesale gas prices, behavioural changes, outcomes of future Capacity Market and CfD auctions and additional policy decisions. This is based on an average bill for a dual fuel household – actual bills will vary depending on household characteristics and energy behaviour.
- 34 BEIS (2020), 'Annual Domestic Energy bills', tables 2.2.5 and 2.3.5, <https://www.gov.uk/government/statistical-data-sets/annual-domestic-energy-price-statistics>.
- 35 The Energy Company Obligation is an energy efficiency scheme under which obligated suppliers must mainly promote measures which improve the ability of low income, fuel poor and vulnerable households to heat their homes.
- 36 The Warm Home Discount is an obligation on energy suppliers with at least 150,000 customer accounts to provide £150 energy bill rebates to eligible low income and vulnerable households each winter.
- 37 BEIS Analysis, based on an average domestic dual fuel bill in 2030

# Climate Change Act 2008

## 2008 CHAPTER 27

An Act to set a target for the year 2050 for the reduction of targeted greenhouse gas emissions; to provide for a system of carbon budgeting; to establish a Committee on Climate Change; to confer powers to establish trading schemes for the purpose of limiting greenhouse gas emissions or encouraging activities that reduce such emissions or remove greenhouse gas from the atmosphere; to make provision about adaptation to climate change; to confer powers to make schemes for providing financial incentives to produce less domestic waste and to recycle more of what is produced; to make provision about the collection of household waste; to confer powers to make provision about charging for single use carrier bags; to amend the provisions of the Energy Act 2004 about renewable transport fuel obligations; to make provision about carbon emissions reduction targets; to make other provision about climate change; and for connected purposes. 9 [26th November 2008]

BE IT ENACTED by the Queen's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:—

### PART 1

#### CARBON TARGET AND BUDGETING

##### *The target for 2050*

#### 1 The target for 2050

- (1) It is the duty of the Secretary of State to ensure that the net UK carbon account for the year 2050 is at least [<sup>F1</sup>100%] lower than the 1990 baseline.
- (2) “The 1990 baseline” means the aggregate amount of—

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (a) net UK emissions of carbon dioxide for that year, and
- (b) net UK emissions of each of the other targeted greenhouse gases for the year that is the base year for that gas.

#### Textual Amendments

**F1** Word in s. 1(1) substituted (27.6.2019) by [The Climate Change Act 2008 \(2050 Target Amendment\) Order 2019 \(S.I. 2019/1056\)](#), arts. 1, 2

## 2 Amendment of 2050 target or baseline year

- (1) The Secretary of State may by order—
  - (a) amend the percentage specified in section 1(1);
  - (b) amend section 1 to provide for a different year to be the baseline year.
- (2) The power in subsection (1)(a) may only be exercised—
  - (a) if it appears to the Secretary of State that there have been significant developments in—
    - (i) scientific knowledge about climate change, or
    - (ii) European or international law or policy,
 that make it appropriate to do so, or
  - (b) in connection with the making of—
    - (i) an order under section 24 (designation of further greenhouse gases as targeted greenhouse gases), or
    - (ii) regulations under section 30 (emissions from international aviation or international shipping).
- (3) The developments in scientific knowledge referred to in subsection (2) are—
  - (a) in relation to the first exercise of the power in subsection (1)(a), developments since the passing of this Act;
  - (b) in relation to a subsequent exercise of that power, developments since the evidential basis for the previous exercise was established.
- (4) The power in subsection (1)(b) may only be exercised if it appears to the Secretary of State that there have been significant developments in European or international law or policy that make it appropriate to do so.
- (5) An order under subsection (1)(b) may make consequential amendments of other references in this Act to the baseline year.
- (6) An order under this section is subject to affirmative resolution procedure.

## 3 Consultation on order amending 2050 target or baseline year

- (1) Before laying before Parliament a draft of a statutory instrument containing an order under section 2 (order amending the 2050 target or the baseline year), the Secretary of State must—
  - (a) obtain, and take into account, the advice of the Committee on Climate Change, and
  - (b) take into account any representations made by the other national authorities.

---

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

---

- (2) The Committee must, at the time it gives its advice to the Secretary of State, send a copy to the other national authorities.
- (3) As soon as is reasonably practicable after giving its advice to the Secretary of State, the Committee must publish that advice in such manner as it considers appropriate.
- (4) The Secretary of State may proceed to lay such a draft statutory instrument before Parliament without having received a national authority's representations if the authority does not provide them before the end of the period of three months beginning with the date the Committee's advice was sent to the authority.
- (5) At the same time as laying such a draft statutory instrument before Parliament, the Secretary of State must publish a statement setting out whether and how the order takes account of any representations made by the other national authorities.
- (6) If the order makes provision different from that recommended by the Committee, the Secretary of State must also publish a statement setting out the reasons for that decision.
- (7) A statement under this section may be published in such manner as the Secretary of State thinks fit.

### *Carbon budgeting*

## **4 Carbon budgets**

- (1) It is the duty of the Secretary of State—
  - (a) to set for each succeeding period of five years beginning with the period 2008-2012 (“budgetary periods”) an amount for the net UK carbon account (the “carbon budget”), and
  - (b) to ensure that the net UK carbon account for a budgetary period does not exceed the carbon budget.
- (2) The carbon budget for a budgetary period may be set at any time after this Part comes into force, and must be set—
  - (a) for the periods 2008-2012, 2013-2017 and 2018-2022, before 1st June 2009;
  - (b) for any later period, not later than 30th June in the 12th year before the beginning of the period in question.

## **5 Level of carbon budgets**

- (1) The carbon budget—
  - (a) for the budgetary period including the year 2020, must be such that the annual equivalent of the carbon budget for the period is at least [<sup>F2</sup>34%] lower than the 1990 baseline;
  - (b) for the budgetary period including the year 2050, must be such that the annual equivalent of the carbon budget for the period is lower than the 1990 baseline by at least the percentage specified in section 1 (the target for 2050);
  - (c) for the budgetary period including any later year specified by order of the Secretary of State, must be such that the annual equivalent of the carbon budget for the period is—
    - (i) lower than the 1990 baseline by at least the percentage so specified, or

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (ii) at least the minimum percentage so specified, and not more than the maximum percentage so specified, lower than the 1990 baseline.
- (2) The “annual equivalent”, in relation to the carbon budget for a period, means the amount of the carbon budget for the period divided by the number of years in the period.
- (3) An order under this section is subject to affirmative resolution procedure.
- <sup>F3</sup>(4) .....

#### Textual Amendments

- F2** Word in s. 5(1)(a) substituted (31.5.2009) by [Climate Change Act 2008 \(2020 Target, Credit Limit and Definitions\) Order 2009 \(S.I. 2009/1258\)](#), arts. 1, **2(2)**
- F3** S. 5(4) omitted (31.5.2009) by virtue of [Climate Change Act 2008 \(2020 Target, Credit Limit and Definitions\) Order 2009 \(S.I. 2009/1258\)](#), arts. 1, **2(3)**

## 6 Amendment of target percentages

- (1) The Secretary of State may by order amend—
  - (a) the percentage specified in section 5(1)(a);
  - (b) any percentage specified under section 5(1)(c).
- (2) That power may only be exercised—
  - (a) if it appears to the Secretary of State that there have been significant developments in—
    - (i) scientific knowledge about climate change, or
    - (ii) European or international law or policy,
 that make it appropriate to do so, or
  - (b) in connection with the making of—
    - (i) an order under section 24 (designation of further greenhouse gases as targeted greenhouse gases), or
    - (ii) regulations under section 30 (emissions from international aviation or international shipping).
- (3) The developments in scientific knowledge referred to in subsection (2)(a) are—
  - (a) in relation to the first exercise of the power conferred by this section in relation to the percentage specified in section 5(1)(a), developments since June 2000 (the date of the Royal Commission on Environmental Pollution's 22nd Report, “Energy – the Changing Climate”);
  - (b) in relation to the first exercise of the power conferred by this section in relation to any percentage specified under section 5(1)(c), developments since the evidential basis for the order setting that percentage was established;
  - (c) in relation to a subsequent exercise of any of those powers, developments since the evidential basis for the previous exercise was established.
- (4) The power conferred by this section to amend the percentage in section 5(1)(a) includes power to amend or repeal section 5(4) (which directs that targeted greenhouse gases other than carbon dioxide are to be left out of account for the purposes of that provision).

---

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

---

(5) An order under this section is subject to affirmative resolution procedure.

## **7 Consultation on order setting or amending target percentages**

- (1) Before laying before Parliament a draft of a statutory instrument containing an order under section 5(1)(c) (order setting target percentage) or section 6 (order amending target percentage), the Secretary of State must—
  - (a) obtain, and take into account, the advice of the Committee on Climate Change, and
  - (b) take into account any representations made by the other national authorities.
- (2) The Committee must, at the time it gives its advice to the Secretary of State, send a copy to the other national authorities.
- (3) As soon as is reasonably practicable after giving its advice to the Secretary of State, the Committee must publish that advice in such manner as it considers appropriate.
- (4) The Secretary of State may proceed to lay such a draft statutory instrument before Parliament without having received a national authority's representations if the authority does not provide them before the end of the period of three months beginning with the date the Committee's advice was sent to the authority.
- (5) At the same time as laying such a draft statutory instrument before Parliament, the Secretary of State must publish a statement setting out whether and how the order takes account of any representations made by the other national authorities.
- (6) If the order makes provision different from that recommended by the Committee, the Secretary of State must also publish a statement setting out the reasons for that decision.
- (7) A statement under this section may be published in such manner as the Secretary of State thinks fit.

## **8 Setting of carbon budgets for budgetary periods**

- (1) The Secretary of State must set the carbon budget for a budgetary period by order.
- (2) The carbon budget for a period must be set with a view to meeting—
  - (a) the target in section 1 (the target for 2050), and
  - (b) the requirements of section 5 (requirements as to level of carbon budgets), and complying with the European and international obligations of the United Kingdom.
- (3) An order setting a carbon budget is subject to affirmative resolution procedure.

## **9 Consultation on carbon budgets**

- (1) Before laying before Parliament a draft of a statutory instrument containing an order under section 8 (order setting carbon budget), the Secretary of State must—
  - (a) take into account the advice of the Committee on Climate Change under section 34 (advice in connection with carbon budgets), and
  - (b) take into account any representations made by the other national authorities.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (2) The Secretary of State may proceed to lay such a draft statutory instrument before Parliament without having received a national authority's representations if the authority does not provide them before the end of the period of three months beginning with the date the Committee's advice was sent to the authority.
- (3) At the same time as laying such a draft statutory instrument before Parliament, the Secretary of State must publish a statement setting out whether and how the order takes account of any representations made by the other national authorities.
- (4) If the order sets the carbon budget at a different level from that recommended by the Committee, the Secretary of State must also publish a statement setting out the reasons for that decision.
- (5) A statement under this section may be published in such manner as the Secretary of State thinks fit.

## **10 Matters to be taken into account in connection with carbon budgets**

- (1) The following matters must be taken into account—
  - (a) by the Secretary of State in coming to any decision under this Part relating to carbon budgets, and
  - (b) by the Committee on Climate Change in considering its advice in relation to any such decision.
- (2) The matters to be taken into account are—
  - (a) scientific knowledge about climate change;
  - (b) technology relevant to climate change;
  - (c) economic circumstances, and in particular the likely impact of the decision on the economy and the competitiveness of particular sectors of the economy;
  - (d) fiscal circumstances, and in particular the likely impact of the decision on taxation, public spending and public borrowing;
  - (e) social circumstances, and in particular the likely impact of the decision on fuel poverty;
  - (f) energy policy, and in particular the likely impact of the decision on energy supplies and the carbon and energy intensity of the economy;
  - (g) differences in circumstances between England, Wales, Scotland and Northern Ireland;
  - (h) circumstances at European and international level;
  - (i) the estimated amount of reportable emissions from international aviation and international shipping for the budgetary period or periods in question.
- (3) In subsection (2)(i) “the estimated amount of reportable emissions from international aviation and international shipping”, in relation to a budgetary period, means the aggregate of the amounts relating to emissions of targeted greenhouse gases from international aviation and international shipping that the Secretary or State or (as the case may be) the Committee estimates the United Kingdom will be required to report for that period in accordance with international carbon reporting practice.
- (4) Such amounts may be estimated using such reasonable method or methods as the Secretary of State or (as the case may be) the Committee considers appropriate.

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

- (5) The duty in subsection (2)(i) applies if and to the extent that regulations under section 30 do not provide for emissions of targeted greenhouse gases from international aviation and international shipping in the budgetary period or periods in question to be treated as emissions from sources in the United Kingdom for the purposes of this Part.
- (6) Section 30(1) (emissions from international aviation and international shipping not to count as emissions from UK sources for the purposes of this Part, except as provided by regulations) does not prevent the Secretary of State or the Committee from taking into account the matter referred to in subsection (2)(i) for the purposes of this section.
- (7) Nothing in this section is to be read as restricting the matters that the Secretary of State or the Committee may take into account.

#### *Limit on use of carbon units*

### **11 Limit on use of carbon units**

- (1) It is the duty of the Secretary of State to set a limit on the net amount of carbon units that may be credited to the net UK carbon account for each budgetary period.
- (2) The “net amount of carbon units” means—
  - (a) the amount of carbon units credited to the net UK carbon account for the period in accordance with regulations under section 27, less
  - (b) the amount of carbon units debited from the net UK carbon account for the period in accordance with such regulations.
- (3) The limit for a budgetary period must be set—
  - (a) for the period 2008-2012, not later than 1st June 2009, and
  - (b) for any later period, not later than 18 months before the beginning of the period in question.
- (4) The Secretary of State must set a limit under this section by order.
- (5) The order may provide that carbon units of a description specified in the order do not count towards the limit.
- (6) An order under this section is subject to affirmative resolution procedure.
- (7) Before laying before Parliament a draft of a statutory instrument containing an order under this section in relation to a budgetary period, the Secretary of State must—
  - (a) take into account the advice of the Committee on Climate Change under section 34(1)(b) (advice on use of carbon units) in relation to that period, and
  - (b) consult the other national authorities.

#### *Indicative annual ranges*

### **12 Duty to provide indicative annual ranges for net UK carbon account**

- (1) As soon as is reasonably practicable after making an order setting the carbon budget for a budgetary period, the Secretary of State must lay before Parliament a report

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

setting out an indicative annual range for the net UK carbon account for each year within the period.

- (2) An “indicative annual range”, in relation to a year, is a range within which the Secretary of State expects the amount of the net UK carbon account for the year to fall.
- (3) Before laying a report under this section before Parliament, the Secretary of State must consult the other national authorities on the indicative annual ranges set out in the report.
- (4) The Secretary of State must send a copy of the report to those authorities.

*Proposals and policies for meeting carbon budgets*

**13 Duty to prepare proposals and policies for meeting carbon budgets**

- (1) The Secretary of State must prepare such proposals and policies as the Secretary of State considers will enable the carbon budgets that have been set under this Act to be met.
- (2) The proposals and policies must be prepared with a view to meeting—
  - (a) the target in section 1 (the target for 2050), and
  - (b) any target set under section 5(1)(c) (power to set targets for later years).
- (3) The proposals and policies, taken as a whole, must be such as to contribute to sustainable development.
- (4) In preparing the proposals and policies, the Secretary of State may take into account the proposals and policies the Secretary of State considers may be prepared by other national authorities.

**14 Duty to report on proposals and policies for meeting carbon budgets**

- (1) As soon as is reasonably practicable after making an order setting the carbon budget for a budgetary period, the Secretary of State must lay before Parliament a report setting out proposals and policies for meeting the carbon budgets for the current and future budgetary periods up to and including that period.
- (2) The report must, in particular, set out—
  - (a) the Secretary of State's current proposals and policies under section 13, and
  - (b) the time-scales over which those proposals and policies are expected to take effect.
- (3) The report must explain how the proposals and policies set out in the report affect different sectors of the economy.
- (4) The report must outline the implications of the proposals and policies as regards the crediting of carbon units to the net UK carbon account for each budgetary period covered by the report.
- (5) So far as the report relates to proposals and policies of the Scottish Ministers, the Welsh Ministers or a Northern Ireland department, it must be prepared in consultation with that authority.
- (6) The Secretary of State must send a copy of the report to those authorities.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

## **15 Duty to have regard to need for UK domestic action on climate change**

- (1) In exercising functions under this Part involving consideration of how to meet—
  - (a) the target in section 1(1) (the target for 2050), or
  - (b) the carbon budget for any period,the Secretary of State must have regard to the need for UK domestic action on climate change.
- (2) “UK domestic action on climate change” means reductions in UK emissions of targeted greenhouse gases or increases in UK removals of such gases (or both).

*Determination whether objectives met*

## **16 Annual statement of UK emissions**

- (1) It is the duty of the Secretary of State to lay before Parliament in respect of each year, beginning with the year 2008, a statement containing the following information.
- (2) In respect of each greenhouse gas (whether or not a targeted greenhouse gas), it must—
  - (a) state the amount for the year of UK emissions, UK removals and net UK emissions of that gas,
  - (b) identify the methods used to measure or calculate those amounts, and
  - (c) state whether any of those amounts represents an increase or decrease compared to the equivalent amount for the previous year.
- (3) It must state the aggregate amount for the year of UK emissions, UK removals and net UK emissions of all greenhouse gases.
- (4) If in accordance with international carbon reporting practice a change of method is such as to require adjustment of an amount for an earlier year in the same budgetary period, it must specify the adjustment required and state the adjusted amount.
- (5) If emissions of a greenhouse gas from international aviation or international shipping are not required to be included in the statement by virtue of subsection (2), it must state any amounts relating to such emissions that the United Kingdom is required to report for the year in accordance with international carbon reporting practice.
- (6) It must—
  - (a) state the total amount of carbon units that have been credited to or debited from the net UK carbon account for the year, and
  - (b) give details of the number and type of those carbon units.
- (7) It must state the amount of the net UK carbon account for the year.
- (8) It must state—
  - (a) the amount of net UK emissions of carbon dioxide for the year 1990,
  - (b) the amount of net UK emissions of each targeted greenhouse gas other than carbon dioxide for the year that is the base year for that gas, and
  - (c) a baseline amount for each greenhouse gas that is not a targeted greenhouse gas, determined on such basis as the Secretary of State considers appropriate.
- (9) The amount referred to in subsection (8)(c) may be—

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (a) the amount of net UK emissions of the gas for the year 1990 or a different year, or
  - (b) the average amount of net UK emissions of the gas for a number of years.
- (10) The statement required by this section must be laid before Parliament not later than 31st March in the second year following that to which it relates.
- (11) The Secretary of State must send a copy of the statement to the other national authorities.

## **17 Powers to carry amounts from one budgetary period to another**

- (1) The Secretary of State may decide to carry back part of the carbon budget for a budgetary period to the preceding budgetary period.

The carbon budget for the later period is reduced, and that for the earlier period increased, by the amount carried back.

- (2) The amount carried back under subsection (1) must not exceed 1% of the carbon budget for the later period.
- (3) The Secretary of State may decide to carry forward the whole or part of any amount by which the carbon budget for a budgetary period exceeds the net UK carbon account for the period.

The amount of the carbon budget for the next budgetary period is increased by the amount carried forward.

- (4) Before deciding to carry an amount back or forward under this section, the Secretary of State must—
- (a) consult the other national authorities, and
  - (b) obtain, and take into account, the advice of the Committee on Climate Change.
- (5) Any such decision must be made no later than 31st May in the second year after the end of the earlier of the two budgetary periods affected.

## **18 Final statement for budgetary period**

- (1) It is the duty of the Secretary of State to lay before Parliament in respect of each budgetary period a statement containing the following information.
- (2) In respect of each targeted greenhouse gas, it must state the final amount for the period of UK emissions, UK removals and net UK emissions of that gas.

That is the total of the amounts (or adjusted amounts) stated under section 16 (annual statement of UK emissions) in respect of that gas for the years included in the period.

- (3) It must—
- (a) state the final amount of carbon units that have been credited to or debited from the net UK carbon account for the period, and
  - (b) give details of the number and type of those carbon units.
- (4) It must state the final amount of the net UK carbon account for the period.

---

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

---

- (5) It must state whether the Secretary of State has decided to carry an amount back under section 17(1) (power to carry amount back from the budget for the next budgetary period), and if so what amount.
- (6) It must state the amount of the carbon budget for the period.  

That is the amount originally set, subject to any exercise of the powers conferred by section 17 (powers to carry amounts from one budgetary period to another) and any alteration of the budget under section 21.
- (7) Whether the carbon budget for a period has been met shall be determined by reference to the figures given in the statement laid before Parliament under this section in respect of that period.
- (8) If the carbon budget for the period has not been met, the statement must explain why it has not been met.
- (9) The statement required by this section must be laid before Parliament not later than 31st May in the second year following the end of the period to which it relates.
- (10) The Secretary of State must send a copy of the statement to the other national authorities.

## **19 Duty to report on proposals and policies for compensating for budget excess**

- (1) As soon as is reasonably practicable after laying a statement before Parliament under section 18 in respect of a period for which the net UK carbon account exceeds the carbon budget, the Secretary of State must lay before Parliament a report setting out proposals and policies to compensate in future periods for the excess emissions.
- (2) So far as the report relates to proposals and policies of the Scottish Ministers, the Welsh Ministers or a Northern Ireland department, it must be prepared in consultation with that authority.
- (3) The Secretary of State must send a copy of the report to those authorities.

## **20 Final statement for 2050**

- (1) It is the duty of the Secretary of State to lay before Parliament in respect of the year 2050 a statement containing the following information.
- (2) In respect of each targeted greenhouse gas, it must state the amount for that year of UK emissions, UK removals and net UK emissions of that gas.  

That is the amount stated for that year in respect of that gas under section 16 (annual statement of UK emissions).
- (3) It must—
  - (a) state the amount of carbon units that have been credited to or debited from the net UK carbon account for the year, and
  - (b) give details of the number and type of those carbon units.
- (4) It must state the amount of the net UK carbon account for that year.

---

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

---

- (5) Whether the target in section 1 (the target for 2050) has been met shall be determined by reference to the figures given in the statement laid before Parliament under this section.
- (6) If the target has not been met, the statement must explain why it has not been met.
- (7) The statement required by this section must be laid before Parliament not later than 31st May 2052.
- (8) The Secretary of State must send a copy of the statement to the other national authorities.

### *Alteration of budgets or budgetary periods*

## **21 Alteration of carbon budgets**

- (1) An order setting the carbon budget for a period may not be revoked after the date by which a budget for the period was required to be set.
- (2) An order setting the carbon budget for a period may be amended after the date by which a budget for the period was required to be set only if it appears to the Secretary of State that, since the budget was originally set (or previously altered), there have been significant changes affecting the basis on which the previous decision was made.
- (3) An order setting the carbon budget for a period may be amended after the period has begun only if it appears to the Secretary of State that there have been such changes since the period began.
- (4) An order setting the carbon budget for a period may not be amended after the period has ended.
- (5) An order revoking or amending an order setting a carbon budget is subject to affirmative resolution procedure.

## **22 Consultation on alteration of carbon budgets**

- (1) Before laying before Parliament a draft of a statutory instrument containing an order under section 21 (alteration of carbon budgets), the Secretary of State must—
  - (a) obtain, and take into account, the advice of the Committee on Climate Change, and
  - (b) take into account any representations made by the other national authorities.
- (2) The Committee must, at the time it gives its advice to the Secretary of State, send a copy to the other national authorities.
- (3) As soon as is reasonably practicable after giving its advice to the Secretary of State, the Committee must publish that advice in such manner as it considers appropriate.
- (4) The Secretary of State may proceed to lay such a draft statutory instrument before Parliament without having received a national authority's representations if the authority does not provide them before the end of the relevant period.
- (5) The relevant period is—

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (a) if the budgetary period to which the order relates has begun, one month beginning with the date the Committee's advice was sent to the authority, or
  - (b) otherwise, three months beginning with that date.
- (6) At the same time as laying such a draft statutory instrument before Parliament, the Secretary of State must publish a statement setting out whether and how the order takes account of any representations made by the other national authorities.
- (7) If the order makes provision different from that recommended by the Committee, the Secretary of State must also publish a statement setting out the reasons for that decision.
- (8) A statement under this section may be published in such manner as the Secretary of State thinks fit.

## 23 Alteration of budgetary periods

- (1) The Secretary of State may by order amend section 4(1)(a) so as to alter—
  - (a) the length of the budgetary periods, or
  - (b) the dates in the calendar year on which the budgetary periods begin and end.
- (2) This power may only be exercised if it appears to the Secretary of State necessary to do so in order to keep the budgetary periods under this Part in line with similar periods under any agreement at European or international level to which the United Kingdom is a party.
- (3) The power may not be exercised in such a way that any period falls outside a budgetary period.
- (4) An order may make such consequential amendments of the provisions of this Act as appear to the Secretary of State to be necessary or expedient.
- (5) Before making an order under this section the Secretary of State must consult the other national authorities.
- (6) An order under this section is subject to affirmative resolution procedure.

### Modifications etc. (not altering text)

C1 S. 23(4) power to amend conferred (18.12.2013) by [Energy Act 2013 \(c. 32\)](#), [ss. 1\(8\)\(a\)](#), 156(3)

## Targeted greenhouse gases

## 24 Targeted greenhouse gases

- (1) In this Part a “targeted greenhouse gas” means—
  - (a) carbon dioxide,
  - (b) methane,
  - (c) nitrous oxide,
  - (d) hydrofluorocarbons,
  - (e) perfluorocarbons,
  - (f) sulphur hexafluoride, and

---

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

---

- (g) any other greenhouse gas designated as a targeted greenhouse gas by order made by the Secretary of State.
- (2) The order may make such consequential amendments of the provisions of this Act as appear to the Secretary of State to be necessary or expedient.
- (3) Before making an order under this section, the Secretary of State must—
  - (a) consult the other national authorities, and
  - (b) obtain, and take into account, the advice of the Committee on Climate Change.
- (4) As soon as is reasonably practicable after giving its advice to the Secretary of State, the Committee must publish that advice in such manner as it considers appropriate.
- (5) If the order makes provision different from that recommended by the Committee, the Secretary of State must publish a statement setting out the reasons for that decision.
- (6) The statement may be published in such manner as the Secretary of State thinks fit.
- (7) An order under this section is subject to affirmative resolution procedure.

## 25 Base years for targeted greenhouse gases other than CO<sub>2</sub>

- (1) The base years for the purposes of this Act for targeted greenhouse gases other than carbon dioxide are—

<i>Gas</i>	<i>Base year</i>
methane	1990
nitrous oxide	1990
hydrofluorocarbons	1995
perfluorocarbons	1995
sulphur hexafluoride	1995

- (2) The Secretary of State may make provision by order amending the table in subsection (1) so as to—
  - (a) specify the base year for a gas designated as a targeted greenhouse gas by order under section 24(1), or
  - (b) specify a different base year from that for the time being specified in relation to any targeted greenhouse gas other than carbon dioxide.
- (3) An order may—
  - (a) designate a particular base year, or
  - (b) designate a number of base years and provide that the average amount of net UK emissions of a gas for those years is to be treated for the purposes of this Act as the amount of net UK emissions for the base year.
- (4) The power in subsection (2)(b) may only be exercised if it appears to the Secretary of State that there have been significant developments in European or international law or policy that make it appropriate to do so.
- (5) Before making an order under this section, the Secretary of State must—
  - (a) consult the other national authorities, and

---

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

---

- (b) obtain, and take into account, the advice of the Committee on Climate Change.
- (6) As soon as is reasonably practicable after giving its advice to the Secretary of State, the Committee must publish that advice in such manner as it considers appropriate.
- (7) If the order makes provision different from that recommended by the Committee, the Secretary of State must publish a statement setting out the reasons for that decision.
- (8) The statement may be published in such manner as the Secretary of State thinks fit.
- (9) An order under this section is subject to affirmative resolution procedure.

### *Carbon units, carbon accounting and the net UK carbon account*

## **26 Carbon units and carbon accounting**

- (1) In this Part a “carbon unit” means a unit of a kind specified in regulations made by the Secretary of State and representing—
  - (a) a reduction in an amount of greenhouse gas emissions,
  - (b) the removal of an amount of greenhouse gas from the atmosphere, or
  - (c) an amount of greenhouse gas emissions allowed under a scheme or arrangement imposing a limit on such emissions.
- (2) The Secretary of State may make provision by regulations for a scheme—
  - (a) for registering or otherwise keeping track of carbon units, or
  - (b) for establishing and maintaining accounts in which carbon units may be held, and between which they may be transferred, by the Secretary of State.

The regulations may, in particular, provide for an existing scheme to be adapted for these purposes.

- (3) The regulations may make provision—
  - (a) appointing a body to administer the scheme;
  - (b) establishing a body for that purpose and making such provision in relation to the appointment of members, staffing, expenditure, procedure and otherwise as the Secretary of State considers appropriate;
  - (c) conferring power on the Secretary of State to give guidance or directions to the body administering the scheme;
  - (d) conferring power on the Secretary of State to delegate the performance of any of the functions conferred or imposed on the Secretary of State by the regulations;
  - (e) requiring the payment by persons using the scheme of charges (of an amount determined by or under the regulations) towards the cost of operating it.
- (4) If an existing body is appointed to administer the scheme, the regulations may make such modifications of any enactment relating to that body as the Secretary of State considers appropriate.

## **27 Net UK carbon account**

- (1) In this Part the “net UK carbon account” for a period means the amount of net UK emissions of targeted greenhouse gases for the period—

---

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

---

- (a) reduced by the amount of carbon units credited to the net UK carbon account for the period in accordance with regulations under this section, and
  - (b) increased by the amount of carbon units that in accordance with such regulations are to be debited from the net UK carbon account for the period.
- (2) The net amount of carbon units credited to the net UK carbon account for a budgetary period must not exceed the limit set under section 11 (limit on use of carbon units) for the period.
- (3) The Secretary of State must make provision by regulations about—
- (a) the circumstances in which carbon units may be credited to the net UK carbon account for a period,
  - (b) the circumstances in which such units must be debited from that account for a period, and
  - (c) the manner in which this is to be done.
- (4) The regulations must contain provision for ensuring that carbon units that are credited to the net UK carbon account for a period cease to be available to offset other greenhouse gas emissions.
- (5) The regulations must contain provision—
- (a) for determining whether the total amount of carbon units allocated to the United Kingdom for each budgetary period under schemes or arrangements imposing a limit on emissions from sources in the United Kingdom represent an amount of net UK emissions of targeted greenhouse gases for the period greater than the carbon budget for the period, and
  - (b) for ensuring that, if this is the case, carbon units representing the amount of such emissions in excess of the budget are not used to offset greenhouse gas emissions in the United Kingdom or elsewhere.

## **28 Procedure for regulations under section 26 or 27**

- (1) The following provisions apply in relation to regulations under section 26 (carbon units and carbon accounting) or section 27 (net UK carbon account).
- (2) The regulations are subject to affirmative resolution procedure if—
- (a) they are the first regulations to be made under those sections,
  - (b) they specify a carbon unit of a kind not previously specified in regulations made under those sections,
  - (c) they alter the amount by which—
    - (i) a carbon unit that is credited to the net UK carbon account for a period reduces the net UK carbon account for that period, or
    - (ii) a carbon unit that is debited from the net UK carbon account for a period increases the net UK carbon account for that period, or
  - (d) they make modifications of an enactment contained in primary legislation.
- (3) Otherwise the regulations are subject to negative resolution procedure.
- (4) The Secretary of State must consult the other national authorities—
- (a) in the case of regulations subject to affirmative resolution procedure, before laying before Parliament a draft of a statutory instrument containing the regulations;

---

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

---

- (b) in the case of regulations subject to negative resolution procedure, before making the regulations.
- (5) The Secretary of State must obtain, and take into account, the advice of the Committee on Climate Change before laying before Parliament a draft of a statutory instrument containing—
- (a) the first regulations to be made under those sections, or
  - (b) regulations making provision of the kind described in paragraph (b) or (c) of subsection (2).

#### *Other supplementary provisions*

### **29 UK emissions and removals of greenhouse gases**

- (1) In this Part—
- (a) “UK emissions”, in relation to a greenhouse gas, means emissions of that gas from sources in the United Kingdom;
  - (b) “UK removals”, in relation to a greenhouse gas, means removals of that gas from the atmosphere due to land use, land-use change or forestry activities in the United Kingdom;
  - (c) the “net UK emissions” for a period, in relation to a greenhouse gas, means the amount of UK emissions of that gas for the period reduced by the amount for the period of UK removals of that gas.
- (2) The amount of UK emissions and UK removals of a greenhouse gas for a period must be determined consistently with international carbon reporting practice.

### **30 Emissions from international aviation or international shipping**

- (1) Emissions of greenhouse gases from international aviation or international shipping do not count as emissions from sources in the United Kingdom for the purposes of this Part, except as provided by regulations made by the Secretary of State.
- (2) The Secretary of State may by order define what is to be regarded for this purpose as international aviation or international shipping.
- Any such order is subject to affirmative resolution procedure.
- (3) The Secretary of State must, before expiry of the period ending with 31st December 2012—
- (a) make provision by regulations as to the circumstances in which, and the extent to which, emissions from international aviation or international shipping are to be regarded for the purposes of this Part as emissions from sources in the United Kingdom, or
  - (b) lay before Parliament a report explaining why regulations making such provision have not been made.
- (4) The expiry of the period mentioned in subsection (3) does not affect the power of the Secretary of State to make regulations under this section.
- (5) Regulations under this section—
- (a) may make provision only in relation to emissions of a targeted greenhouse gas;

---

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

---

- (b) may, in particular, provide for such emissions to be regarded as emissions from sources in the United Kingdom if they relate to the transport of passengers or goods to or from the United Kingdom.
- (6) Regulations under this section may make provision—
  - (a) as to the period or periods (whether past or future) in which emissions of the targeted greenhouse gas are to be taken into account as UK emissions of that gas, and
  - (b) as to the manner in which such emissions are to be taken into account in determining UK emissions of that gas for the year that is the base year for that gas.
- (7) They may, in particular—
  - (a) designate a different base year, or
  - (b) designate a number of base years,
 and provide for the emissions in that year, or the average amount of emissions in those years, to be treated for the purposes of this Act as UK emissions of that gas for the year that is the base year for that gas.
- (8) For the purposes of this section the base year for carbon dioxide is the year that is the baseline year for the purposes of this Part.

### **31 Procedure for regulations under section 30**

- (1) Before making regulations under section 30, the Secretary of State must obtain, and take into account, the advice of the Committee on Climate Change.
- (2) As soon as is reasonably practicable after giving its advice to the Secretary of State, the Committee must publish that advice in such manner as it considers appropriate.
- (3) If the regulations make provision different from that recommended by the Committee, the Secretary of State must publish a statement setting out the reasons for that decision.
- (4) The statement may be published in such manner as the Secretary of State thinks fit.
- (5) Regulations under section 30 are subject to affirmative resolution procedure.

## **PART 2**

### **THE COMMITTEE ON CLIMATE CHANGE**

#### *The Committee*

### **32 The Committee on Climate Change**

- (1) There shall be a body corporate to be known as the Committee on Climate Change or, in Welsh, as y Pwyllgor ar Newid Hinsawdd (referred to in this Part as “the Committee”).
- (2) Schedule 1 contains further provisions about the Committee.

---

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

---

### *Functions of the Committee*

#### **33 Advice on level of 2050 target**

- (1) It is the duty of the Committee to advise the Secretary of State on—
  - (a) whether the percentage specified in section 1(1) (the target for 2050) should be amended, and
  - (b) if so, what the amended percentage should be.
- (2) Advice given by the Committee under this section must also contain the reasons for that advice.
- (3) The Committee must give its advice under this section not later than 1st December 2008.
- (4) The Committee must, at the time it gives its advice under this section to the Secretary of State, send a copy to the other national authorities.
- (5) As soon as is reasonably practicable after giving its advice to the Secretary of State, the Committee must publish that advice in such manner as it considers appropriate.

#### **34 Advice in connection with carbon budgets**

- (1) It is the duty of the Committee to advise the Secretary of State, in relation to each budgetary period, on—
  - (a) the level of the carbon budget for the period,
  - (b) the extent to which the carbon budget for the period should be met—
    - (i) by reducing the amount of net UK emissions of targeted greenhouse gases, or
    - (ii) by the use of carbon units that in accordance with regulations under sections 26 and 27 may be credited to the net UK carbon account for the period,
  - (c) the respective contributions towards meeting the carbon budget for the period that should be made—
    - (i) by the sectors of the economy covered by trading schemes (taken as a whole);
    - (ii) by the sectors of the economy not so covered (taken as a whole), and
  - (d) the sectors of the economy in which there are particular opportunities for contributions to be made towards meeting the carbon budget for the period through reductions in emissions of targeted greenhouse gases.
- (2) In relation to the budgetary period 2008-2012, the Committee must also advise the Secretary of State on—
  - (a) whether it would be consistent with its advice on the level of the carbon budget for the period to set a carbon budget such that the annual equivalent for the period was lower than the 1990 baseline by 20%, and
  - (b) the costs and benefits of setting such a budget.
- (3) Advice given by the Committee under this section must also contain the reasons for that advice.
- (4) The Committee must give its advice under this section—

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

---

- (a) for the budgetary periods 2008-2012, 2013-2017 and 2018-2022, not later than 1st December 2008;
  - (b) for any later period, not later than six months before the last date for setting the carbon budget for the period (see section 4(2)(b)).
- (5) The Committee must, at the time it gives its advice under this section to the Secretary of State, send a copy to the other national authorities.
- (6) As soon as is reasonably practicable after giving its advice under this section the Committee must publish that advice in such manner as it considers appropriate.

### **35 Advice on emissions from international aviation and international shipping**

- (1) It is the duty of the Committee to advise the Secretary of State on the consequences of treating emissions of targeted greenhouse gases from—
- (a) international aviation, and
  - (b) international shipping,
- as emissions from sources in the United Kingdom for the purposes of Part 1.
- (2) The duty applies if and to the extent that regulations under section 30 do not provide for such emissions to be so treated.
- (3) Advice given by the Committee under this section must also contain the reasons for that advice.
- (4) The Committee must give its advice under this section—
- (a) when it gives its advice under section 34 for the budgetary period 2023-2027, and
  - (b) when it gives its advice under that section for each subsequent budgetary period.
- (5) The Committee must, at the time it gives its advice under this section to the Secretary of State, send a copy to the other national authorities.
- (6) As soon as is reasonably practicable after giving its advice to the Secretary of State, the Committee must publish that advice in such manner as it considers appropriate.

### **36 Reports on progress**

- (1) It is the duty of the Committee to lay before Parliament and each of the devolved legislatures each year, beginning with the year 2009, a report setting out the Committee's views on—
- (a) the progress that has been made towards meeting the carbon budgets that have been set under Part 1 and the target in section 1 (the target for 2050),
  - (b) the further progress that is needed to meet those budgets and that target, and
  - (c) whether those budgets and that target are likely to be met.
- (2) The Committee's report in the second year after the end of a budgetary period must also set out the Committee's general views on—
- (a) the way in which the budget for the period was or was not met, and
  - (b) action taken during the period to reduce net UK emissions of targeted greenhouse gases.

---

- (3) The first report under this section must be laid before Parliament and the devolved legislatures not later than 30th September 2009.
- (4) Each subsequent report under this section, other than one in the second year after the end of a budgetary period, must be laid before Parliament and the devolved legislatures not later than 30th June in the year in which it is made.
- (5) A report in the second year after the end of a budgetary period must be laid before Parliament and the devolved legislatures not later than 15th July in the year in which it is made.
- (6) The Secretary of State may by order extend the period mentioned in subsection (4) or (5).
- (7) Before making such an order the Secretary of State must consult the other national authorities.
- (8) Any such order is subject to negative resolution procedure.

### **37 Response to Committee's reports on progress**

- (1) The Secretary of State must lay before Parliament a response to the points raised by each report of the Committee under section 36 (reports on progress).
- (2) Before doing so, the Secretary of State must consult the other national authorities on a draft of the response.
- (3) The response to the Committee's first report under section 36 must be laid before Parliament not later than 15th January 2010.
- (4) Each subsequent response must be laid before Parliament not later than 15th October in the year in which the Committee's report is made.
- (5) The Secretary of State may by order extend that period.
- (6) Any such order is subject to negative resolution procedure.

### **38 Duty to provide advice or other assistance on request**

- (1) The Committee must, at the request of a national authority, provide advice, analysis, information or other assistance to the authority in connection with—
  - (a) the authority's functions under this Act,
  - (b) the progress made towards meeting the objectives set by or under this Act,
  - (c) adaptation to climate change, or
  - (d) any other matter relating to climate change.
- (2) In particular, the Committee must, at the request of a national authority—
  - (a) advise the authority about any limit proposed to be set by a trading scheme on the total amount of the activities to which the scheme applies, or
  - (b) assist the authority in connection with the preparation of statistics relating to greenhouse gas emissions.
- (3) The Committee must, at the request of a national authority other than the Secretary of State, provide advice, analysis, information or other assistance to the authority in connection with any target, budget or similar requirement relating to emissions of

greenhouse gas that has been adopted by the authority or to which the authority is otherwise subject.

### *Supplementary provisions*

#### **39 General ancillary powers**

- (1) The Committee may do anything that appears to it necessary or appropriate for the purpose of, or in connection with, the carrying out of its functions.
- (2) In particular the Committee may—
  - (a) enter into contracts,
  - (b) acquire, hold and dispose of property,
  - (c) borrow money,
  - (d) accept gifts, and
  - (e) invest money.
- (3) In exercising its functions, the Committee may—
  - (a) gather information and carry out research and analysis,
  - (b) commission others to carry out such activities, and
  - (c) publish the results of such activities carried out by the Committee or others.
- (4) The Committee must have regard to the desirability of involving the public in the exercise of its functions.

#### **40 Grants to the Committee**

A national authority may make grants to the Committee of such amount and subject to such conditions as the authority thinks fit.

#### **41 Powers to give guidance**

- (1) The national authorities may give the Committee guidance as to the matters it is to take into account in the exercise of—
  - (a) its functions generally, or
  - (b) any of its functions under Schedule 1.
- (2) The Secretary of State may give the Committee guidance as to the matters it is to take into account in the exercise of its functions under—
  - (a) Part 1 (carbon target and budgeting),
  - (b) section 33 (advice on level of 2050 target),
  - (c) section 34 (advice in connection with carbon budgets),
  - (d) section 35 (advice on emissions from international aviation and international shipping),
  - (e) section 36 (reports on progress),
  - (f) section 57 (advice on report on impact of climate change), or
  - (g) section 59 (reporting on progress in connection with adaptation).

Before giving guidance under any of paragraphs (a) to (f), the Secretary of State must consult the other national authorities.

---

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

---

- (3) A national authority that requests the Committee to provide advice, analysis, information or other assistance under—
- (a) section 38 (duty to provide advice or assistance on request), or
  - (b) section 48 (advice on trading scheme regulations),
- may give the Committee guidance as to the matters it is to take into account in responding to that request.
- If the request is made by two or more national authorities, the guidance must be given by them jointly.
- (4) The power to give guidance under this section includes power to vary or revoke it.
- (5) In performing its functions the Committee must have regard to any guidance given under this section.

## **42 Powers to give directions**

- (1) The national authorities may give the Committee directions as to the exercise of—
- (a) its functions generally, or
  - (b) any of its functions under Schedule 1.
- (2) The Secretary of State may give the Committee directions as to the exercise of its functions under—
- (a) Part 1 (carbon target and budgeting),
  - (b) section 33 (advice on level of 2050 target),
  - (c) section 34 (advice in connection with carbon budgets),
  - (d) section 35 (advice on emissions from international aviation and international shipping),
  - (e) section 36 (reports on progress),
  - (f) section 57 (advice on report on impact of climate change), or
  - (g) section 59 (reporting on progress in connection with adaptation).

Before giving directions under any of paragraphs (a) to (f), the Secretary of State must consult the other national authorities.

- (3) A national authority that requests the Committee to provide advice, analysis, information or other assistance under—
- (a) section 38 (duty to provide advice or assistance on request), or
  - (b) section 48 (advice on trading scheme regulations),
- may give the Committee directions as to the exercise of its functions in responding to that request.
- If the request is made by two or more national authorities, the directions must be given by them jointly.
- (4) The power to give directions under this section does not include power to direct the Committee as to the content of any advice or report.
- (5) The power to give directions under this section includes power to vary or revoke the directions.
- (6) The Committee must comply with any directions given under this section.

## *Interpretation*

### **43 Interpretation of Part 2**

Expressions used in this Part that are defined in Part 1 (carbon target and budgeting) have the same meaning as in that Part.

## **PART 3**

### TRADING SCHEMES

#### *Trading schemes*

### **44 Trading schemes**

- (1) The relevant national authority may make provision by regulations for trading schemes relating to greenhouse gas emissions.
- (2) A “trading scheme” is a scheme that operates by—
  - (a) limiting or encouraging the limitation of activities that consist of the emission of greenhouse gas or that cause or contribute, directly or indirectly, to such emissions, or
  - (b) encouraging activities that consist of, or that cause or contribute, directly or indirectly, to reductions in greenhouse gas emissions or the removal of greenhouse gas from the atmosphere.

### **45 Activities to which trading schemes may apply**

- (1) For the purposes of this Part activities are regarded as indirectly causing or contributing to greenhouse gas emissions if they involve, in particular—
  - (a) the consumption of energy,
  - (b) the use of materials in whose production energy was consumed,
  - (c) the disposal otherwise than for recycling of materials in whose production energy was consumed, or
  - (d) the production or supply of anything whose subsequent use directly causes or contributes to greenhouse gas emissions.
- (2) Correspondingly, for the purposes of this Part activities are regarded as indirectly causing or contributing to the reduction of greenhouse gas emissions if they involve a reduction under any of those heads.
- (3) This Part applies to activities carried on in the United Kingdom, regardless of where the related emissions, reductions or removals of greenhouse gas occur.

### **46 Matters that may or must be provided for in regulations**

- (1) Schedule 2 specifies matters that may or must be provided for in regulations under section 44.
- (2) In that Schedule—

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

---

Part 1 deals with schemes that operate by limiting or encouraging the limitation of activities that consist of the emission of greenhouse gas or that cause or contribute, directly or indirectly, to such emissions;

Part 2 deals with schemes that operate by encouraging activities that consist of, or that cause or contribute, directly or indirectly, to reductions in greenhouse gas emissions or the removal of greenhouse gas from the atmosphere;

Part 3 deals with administration and enforcement.

- (3) Regulations under section 44 may also make provision about the application of the regulations to the Crown.

### *Authorities and regulations*

#### **47 Relevant national authorities**

- (1) This section identifies “the relevant national authority” for the purposes of this Part.
- (2) The Scottish Ministers are the relevant national authority in relation to matters within the legislative competence of the Scottish Parliament.
- (3) The Welsh Ministers are the relevant national authority in relation to matters that—
- (a) are within the legislative competence of the National Assembly for Wales, or
  - (b) relate to limiting or encouraging the limitation of activities in Wales that consist of the emission of greenhouse gas, other than activities in connection with offshore oil and gas exploration and exploitation.
- (4) In subsection (3)(b)—
- “Wales” has the same meaning as in the Government of Wales Act 2006 (c. 32); and
  - “offshore oil and gas exploration and exploitation” has the same meaning as in the National Assembly for Wales (Transfer of Functions) Order 2005 (S.I. 2005/1958).
- (5) The Secretary of State or the relevant Northern Ireland department is the relevant authority in relation to reserved matters within the meaning of the Northern Ireland Act 1998 (c. 47).
- (6) The relevant Northern Ireland department is the relevant authority in relation to all other matters within the legislative competence of the Northern Ireland Assembly.
- (7) The Secretary of State is the relevant national authority in relation to all other matters.

#### **48 Procedure for making regulations**

- (1) Before making regulations under this Part, a national authority must—
- (a) obtain, and take into account, the advice of the Committee on Climate Change, and
  - (b) consult such persons likely to be affected by the regulations as the authority considers appropriate.
- (2) In particular, before making regulations under this Part that set a limit on the total amount of the activities to which a trading scheme applies for a trading period or

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

periods, a national authority must obtain, and take into account, the advice of the Committee on Climate Change on the amount of that limit.

- (3) Regulations under this Part are subject to affirmative resolution procedure if they contain provision—
- (a) setting up a trading scheme,
  - (b) extending the class of participants or activities to which a trading scheme applies,
  - (c) extending the duration of a trading scheme,
  - (d) making the overall requirements of a trading scheme significantly more onerous,
  - (e) conferring new powers to enforce the requirements of a trading scheme,
  - (f) imposing or providing for the imposition of new financial or other penalties or increasing the amount of existing financial penalties,
  - (g) creating an offence or increasing the penalties for an existing offence, or
  - (h) amending or repealing a provision of an enactment contained in primary legislation.
- (4) Regulations under this Part are subject to affirmative resolution procedure if they are the first such regulations to contain provision under paragraph 31 of Schedule 2 (appeals).
- (5) Other regulations under this Part are subject to negative resolution procedure.
- (6) The relevant Northern Ireland department may only make regulations under this Part dealing with a reserved matter within the meaning of the Northern Ireland Act 1998 (c. 47) with the consent of the Secretary of State.

#### **49 Further provisions about regulations**

- (1) Schedule 3 makes further provision about regulations under this Part.
- (2) In that Schedule—
- Part 1 relates to regulations made by a single national authority;
  - Part 2 relates to regulations made by two or more national authorities; and
  - Part 3 confers power to make provision by Order in Council.

#### *Other supplementary provisions*

#### **50 Information**

- (1) Schedule 4 confers powers to require information for the purposes of enabling a trading scheme to be established.
- (2) Paragraphs 1 to 5 of that Schedule shall cease to have effect on 1st January 2011.

#### **51 Powers to give guidance**

- (1) The relevant national authority may give guidance to the administrator of a trading scheme.
- (2) The power to give guidance under this section includes power to vary or revoke it.

---

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

---

(3) The administrator must have regard to any guidance given under this section.

## **52 Powers to give directions**

- (1) The relevant national authority may give directions to the administrator of a trading scheme.
- (2) The power to give directions under this section includes power to vary or revoke the directions.
- (3) The administrator must comply with any directions given under this section.

## **53 Grants to administrators and participants**

- (1) A national authority may make, or arrange for the making of, grants to—
  - (a) the administrator of a trading scheme, or
  - (b) the participants in a trading scheme.
- (2) A grant under this section may be made subject to such conditions as may be determined by, or in accordance with arrangements made by, the national authority that makes the grant.

## **54 Power to make consequential provision**

A national authority may by regulations—

- (a) make such provision amending, repealing or revoking any enactment as the authority considers appropriate in consequence of provision made by that authority by regulations under section 44 (trading schemes);
- (b) make such transitional provision and savings as the authority considers appropriate in connection with the coming into effect of such provision.

### *Interpretation*

## **55 Interpretation of Part 3**

In this Part—

“administrator”, in relation to a trading scheme, means a person appointed as the administrator of the scheme by regulations under paragraph 21 of Schedule 2;

“participant”, in relation to a trading scheme, means a person to whom the scheme applies by virtue of regulations under paragraph 4 or 15 of Schedule 2;

“trading period”, in relation to a trading scheme, means a period by reference to which the scheme is to operate by virtue of regulations under paragraph 2 or 13 of Schedule 2.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

## PART 4

### IMPACT OF AND ADAPTATION TO CLIMATE CHANGE

#### *National reports and programmes*

#### **56 Report on impact of climate change**

- (1) It is the duty of the Secretary of State to lay reports before Parliament containing an assessment of the risks for the United Kingdom of the current and predicted impact of climate change.
- (2) The first report under this section must be laid before Parliament no later than three years after this section comes into force.
- (3) Subsequent reports must be laid before Parliament no later than five years after the previous report was so laid.
- (4) The Secretary of State may extend the period for laying any such report, but must publish a statement setting out the reasons for the delay and specifying when the report will be laid before Parliament.
- (5) Before laying a report under this section before Parliament, the Secretary of State must take into account the advice of the Committee on Climate Change under section 57.
- (6) The Secretary of State must send a copy of each report under this section to the other national authorities.

#### **57 Advice of Committee on Climate Change on impact report**

- (1) It is the duty of the Committee on Climate Change to advise the Secretary of State on the preparation of each of the Secretary of State's reports under section 56.
- (2) The Committee must give its advice under this section in relation to a report not later than six months before the last date for laying the report before Parliament (see subsections (2) to (4) of section 56).
- (3) The Committee must, at the time it gives its advice under this section to the Secretary of State, send a copy to the other national authorities.
- (4) As soon as is reasonably practicable after giving its advice under this section the Committee must publish that advice in such manner as it considers appropriate.

#### **58 Programme for adaptation to climate change**

- (1) It is the duty of the Secretary of State to lay programmes before Parliament setting out —
  - (a) the objectives of Her Majesty's Government in the United Kingdom in relation to adaptation to climate change,
  - (b) the Government's proposals and policies for meeting those objectives, and
  - (c) the time-scales for introducing those proposals and policies,addressing the risks identified in the most recent report under section 56.

---

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

---

- (2) The objectives, proposals and policies must be such as to contribute to sustainable development.
- (3) Each programme under this section must be laid before Parliament as soon as is reasonably practicable after the laying of the report under section 56 to which it relates.
- (4) The Secretary of State must send a copy of each programme under this section to the other national authorities.

## **59 Reporting on progress in connection with adaptation**

- (1) Each report of the Committee on Climate Change under section 36 to which this section applies must contain an assessment of the progress made towards implementing the objectives, proposals and policies set out in the programmes laid before Parliament under section 58 (adaptation to climate change).
- (2) This section applies to the report in the second year after that in which the Secretary of State lays the first programme under section 58 before Parliament.
- (3) After that, this section applies to the report under section 36 in every second year after that in which the Committee last made a report to which this section applies, subject to any order under subsection (4).
- (4) The Secretary of State may by order provide that this section shall apply to the report under section 36 in the year specified in the order and in every subsequent year.
- (5) An order under subsection (4) is subject to negative resolution procedure.

## **60 Programme for adaptation to climate change: Northern Ireland**

- (1) It is the duty of the relevant Northern Ireland department to lay programmes before the Northern Ireland Assembly setting out—
  - (a) the objectives of the department in relation to adaptation to climate change,
  - (b) the department's proposals and policies for meeting those objectives, and
  - (c) the time-scales for introducing those proposals and policies,addressing the risks identified in the most recent report under section 56.
- (2) The objectives, proposals and policies must be such as to contribute to sustainable development.
- (3) The second and each subsequent programme under this section must contain an assessment of the progress made towards implementing the objectives, proposals and policies set out in earlier programmes.
- (4) Each programme under this section must be laid before the Northern Ireland Assembly as soon as is reasonably practicable after the laying before Parliament of the report under section 56 to which it relates.
- (5) The relevant Northern Ireland department must send a copy of each programme under this section to the other national authorities.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

### *Reporting authorities: non-devolved functions*

#### **61 Guidance by Secretary of State to reporting authorities**

- (1) The Secretary of State may issue guidance to reporting authorities about—
  - (a) assessing the current and predicted impact of climate change in relation to the authorities' functions,
  - (b) preparing proposals and policies for adapting to climate change in the exercise of their functions, and
  - (c) co-operating with other reporting authorities for that purpose.
- (2) This section does not apply to devolved functions.

#### **62 Directions by Secretary of State to prepare reports**

- (1) The Secretary of State may direct a reporting authority to prepare a report containing any of the following—
  - (a) an assessment of the current and predicted impact of climate change in relation to the authority's functions;
  - (b) a statement of the authority's proposals and policies for adapting to climate change in the exercise of its functions and the time-scales for introducing those proposals and policies;
  - (c) an assessment of the progress made by the authority towards implementing the proposals and policies set out in its previous reports.
- (2) The Secretary of State may direct two or more reporting authorities to prepare a joint report.
- (3) The Secretary of State may give directions about—
  - (a) the time within which a report must be prepared, and
  - (b) its content,
 and may, in particular, require it to cover a particular geographical area.
- (4) This section does not apply to devolved functions.

#### **63 Compliance with Secretary of State's directions**

- (1) A reporting authority must comply with any directions under section 62.
- (2) Where two or more reporting authorities are directed to prepare a joint report, they must take reasonable steps to co-operate with each other for that purpose.
- (3) In preparing a report, a reporting authority must have regard to the following, so far as relevant—
  - (a) the most recent report under section 56 (report on impact of climate change);
  - (b) the most recent programme under section 58 (programme for adaptation to climate change);
  - (c) any guidance issued by the Secretary of State under section 61.
- (4) If the authority—
  - (a) has functions that are exercisable in or as regards Wales, or
  - (b) has devolved Welsh functions,

---

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

---

it must also have regard, so far as relevant, to any guidance issued by the Welsh Ministers under section 66 and the most recent report under section 80 (report on climate change: Wales).

- (5) The authority must send a copy of the report to the Secretary of State.
- (6) The Secretary of State must publish the report in such manner as the Secretary of State considers appropriate.
- (7) This does not require the Secretary of State to publish—
  - (a) information the Secretary of State could refuse to disclose in response to a request under—
    - (i) the Freedom of Information Act 2000 (c. 36), or
    - (ii) the Environmental Information Regulations 2004 (S.I. 2004/3391) or any regulations replacing those regulations;
  - (b) information whose disclosure is prohibited by any enactment.
- (8) The authority must have regard to the report in exercising its functions other than its devolved functions.

#### **64 Consent of, or consultation with, devolved authorities**

- (1) The Secretary of State must obtain the consent of a devolved authority before issuing guidance under section 61 or giving a direction under section 62 relating to functions in relation to which—
  - (a) functions are exercisable jointly by that devolved authority and a Minister of the Crown, or
  - (b) functions are exercisable by a Minister of the Crown only with the agreement of that devolved authority.
- (2) The Secretary of State must consult a devolved authority before issuing guidance under section 61 or giving a direction under section 62 relating to functions in relation to which—
  - (a) functions are exercisable by that devolved authority other than jointly with a Minister of the Crown, or
  - (b) functions are exercisable by a Minister of the Crown only after consultation with that devolved authority.

#### **65 Report on exercise of power to give directions**

- (1) It is the duty of the Secretary of State to lay reports before Parliament setting out how the Secretary of State intends to exercise the power under section 62 to give directions to reporting authorities.
- (2) The reports must, in particular, identify—
  - (a) the circumstances in which directions are likely to be given, and
  - (b) the authorities or kinds of authority to whom the Secretary of State considers directions should be given as a matter of priority.
- (3) Nothing in a report under this section affects the exercise of the Secretary of State's power under section 62.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (4) Before laying a report under this section before Parliament the Secretary of State must consult such persons likely to be affected by the report as the Secretary of State considers appropriate.
- (5) The first report under this section must be laid before Parliament no later than 12 months after this Act is passed.
- (6) Subsequent reports must be laid before Parliament no later than the time when the next programme under section 58 is so laid.
- (7) The Secretary of State must send a copy of each report under this section to the other national authorities.

*Reporting authorities: devolved Welsh functions*

## **66 Guidance by Welsh Ministers to reporting authorities**

The Welsh Ministers may issue guidance to reporting authorities about—

- (a) assessing the current and predicted impact of climate change in relation to the authorities' devolved Welsh functions,
- (b) preparing proposals and policies for adapting to climate change in the exercise of those functions, and
- (c) co-operating with other reporting authorities for that purpose.

## **67 Directions by Welsh Ministers to prepare reports**

- (1) The Welsh Ministers may direct a reporting authority to prepare a report containing any of the following—
  - (a) an assessment of the current and predicted impact of climate change in relation to the authority's devolved Welsh functions;
  - (b) a statement of the authority's proposals and policies for adapting to climate change in the exercise of those functions and the time-scales for introducing those proposals and policies;
  - (c) an assessment of the progress made by the authority towards implementing the proposals and policies set out in its previous reports.
- (2) The Welsh Ministers may direct two or more reporting authorities to prepare a joint report.
- (3) The Welsh Ministers may give directions about—
  - (a) the time within which a report must be prepared, and
  - (b) its content,
 and may, in particular, require it to cover a particular geographical area.

## **68 Compliance with Welsh Ministers' directions**

- (1) A reporting authority must comply with any directions under section 67.
- (2) Where two or more reporting authorities are directed to prepare a joint report, they must take reasonable steps to co-operate with each other for that purpose.

---

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

---

- (3) In preparing a report, a reporting authority must have regard to the following, so far as relevant—
  - (a) the most recent report under section 56 (report on impact of climate change);
  - (b) the most recent programme under section 58 (programme for adaptation to climate change);
  - (c) any guidance issued by the Secretary of State under section 61;
  - (d) any guidance issued by the Welsh Ministers under section 66;
  - (e) the most recent report under section 80 (report on climate change: Wales).
- (4) The authority must send a copy of the report to the Welsh Ministers.
- (5) The Welsh Ministers must publish the report in such manner as they consider appropriate.
- (6) This does not require the Welsh Ministers to publish—
  - (a) information they could refuse to disclose in response to a request under—
    - (i) the Freedom of Information Act 2000 (c. 36), or
    - (ii) the Environmental Information Regulations 2004 (S.I. 2004/3391) or any regulations replacing those regulations;
  - (b) information whose disclosure is prohibited by any enactment.
- (7) The authority must have regard to the report in exercising its devolved Welsh functions.

## **69 Consent of, or consultation with, Secretary of State**

- (1) The Welsh Ministers must obtain the consent of the Secretary of State before issuing guidance under section 66 or giving a direction under section 67 relating to functions in relation to which—
  - (a) functions are exercisable by a Minister of the Crown jointly with the Welsh Ministers, the First Minister or the Counsel General, or
  - (b) functions are exercisable by the Welsh Ministers, the First Minister or the Counsel General only with the agreement of a Minister of the Crown.
- (2) The Welsh Ministers must consult the Secretary of State before issuing guidance under section 66 or giving a direction under section 67 relating to functions in relation to which—
  - (a) functions are exercisable by a Minister of the Crown other than jointly with the Welsh Ministers, the First Minister or the Counsel General, or
  - (b) functions are exercisable by the Welsh Ministers, the First Minister or the Counsel General only after consultation with a Minister of the Crown.

### *Interpretation*

## **70 Interpretation**

- (1) In sections 61 to 69 and this section “reporting authority” means—
  - (a) a person or body with functions of a public nature,
  - (b) a person who is or is deemed to be a statutory undertaker for the purposes of any provision of—

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (i) Part 11 of the Town and Country Planning Act 1990 (c. 8) (see section 262 of that Act), or
  - (ii) Part 10 of the Town and Country Planning (Scotland) Act 1997 (c. 8) (see section 214 of that Act), or
  - (c) a person who is a statutory undertaker within the meaning of [<sup>F4</sup>the Planning Act (Northern Ireland) 2011 (see section 250 of that Act)].
- (2) None of the following are reporting authorities for the purposes of those sections and this section—
- (a) a Minister of the Crown;
  - (b) either House of Parliament;
  - (c) a devolved authority;
  - (d) a devolved legislature.
- (3) In those sections and this section “devolved authority” means—
- (a) the Welsh Ministers, the First Minister or the Counsel General,
  - (b) the Scottish Ministers, the First Minister, the Lord Advocate or the Solicitor General for Scotland, or
  - (c) a Minister within the meaning of the Northern Ireland Act 1998 (c. 47) or a Northern Ireland department.
- (4) References in those sections to a reporting authority's “devolved functions” are to functions—
- (a) conferred or imposed by or under a Measure or Act of the National Assembly for Wales,
  - (b) exercisable in or as regards Wales and [<sup>F5</sup>capable of being conferred by provision falling within] the legislative competence of the National Assembly for Wales,
  - (c) exercisable in or as regards Scotland and relating to matters within the legislative competence of the Scottish Parliament,
  - (d) exercisable in or as regards Northern Ireland and relating to transferred matters within the meaning of the Northern Ireland Act 1998, or
  - (e) in relation to which functions are exercisable by a devolved authority,
- and in relation to which no functions are exercisable by a Minister of the Crown.
- (5) For this purpose functions are not to be regarded as exercisable by a Minister of the Crown in relation to a reporting authority's functions merely because—
- (a) the Minister of the Crown may exercise functions—
    - (i) under section 2(2) of the European Communities Act 1972 (c. 68),
    - (ii) by virtue of section 57(1) or under section 58 of the Scotland Act 1998 (c. 46) (Community and international obligations),
    - (iii) under section 27 or 28 of the Northern Ireland Act 1998 (international etc obligations),
    - (iv) by virtue of paragraph 5 of Schedule 3 to the Government of Wales Act 2006 (c. 32) or under section 82 of that Act (Community and international obligations), or
    - (v) under section 152 of that Act (intervention in case of functions relating to water etc),
- in relation to the reporting authority's functions,

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

- (b) the Minister of the Crown's agreement is required to the exercise of a function by a devolved authority in relation to the reporting authority's functions, or
  - (c) the Minister of the Crown must be consulted by a devolved authority about the exercise of a function in relation to the reporting authority's functions.
- (6) References in those sections to a reporting authority's "devolved Welsh functions" are to functions—
- (a) conferred or imposed by or under a Measure or Act of the National Assembly for Wales,
  - (b) exercisable in or as regards Wales and [<sup>F6</sup>capable of being conferred by provision falling within] the legislative competence of the National Assembly for Wales, or
  - (c) in relation to which functions are exercisable by the Welsh Ministers, the First Minister or the Counsel General.
- (7) For this purpose functions are not to be regarded as exercisable by the Welsh Ministers, the First Minister or the Counsel General in relation to a reporting authority's functions merely because—
- (a) the agreement of the Welsh Ministers, the First Minister or the Counsel General is required to the exercise of a function by a Minister of the Crown in relation to the reporting authority's functions, or
  - (b) the Welsh Ministers, the First Minister or the Counsel General must be consulted by a Minister of the Crown about the exercise of a function in relation to the reporting authority's functions.
- (8) In those sections and this section—
- (a) "Counsel General" and "Wales" have the same meanings as in the Government of Wales Act 2006 (c. 32);
  - (b) "Minister of the Crown" includes a government department.

#### Textual Amendments

**F975 Waste reduction provisions: roll-out or repeal**

**Textual Amendments**  
F9 Ss. 72-75 repealed (15.1.2012) by Localism Act 2011 (c. 20), ss. 47(b), 240(1)(e), Sch. 25 Pts. 8

*Collection of household waste*

**76 Collection of household waste**

In section 46 of the Environmental Protection Act 1990 (c. 43) (receptacles for household waste), after subsection (10) insert—

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

“(11) A waste collection authority is not obliged to collect household waste that is placed for collection in contravention of a requirement under this section.”.

### *Charges for <sup>F10</sup>carrier bags*

#### **Textual Amendments**

**F10** Words in Sch. 6 para. 2 substituted (N.I.) (28.4.2014) by [Carrier Bags Act \(Northern Ireland\) 2014 \(c. 7\), s. 1\(b\)](#)

#### **77 Charges for <sup>F10</sup>carrier bags**

- (1) Schedule 6 makes provision about charges for <sup>F10</sup>carrier bags].
- (2) In that Schedule—
  - Part 1 confers power on the relevant national authority to make regulations about charges for <sup>F10</sup>carrier bags];
  - Part 2 makes provision about civil sanctions;
  - Part 3 makes provision about the procedures applying to regulations under the Schedule.
- (3) In that Schedule “the relevant national authority” means—
  - (a) the Secretary of State in relation to England;
  - (b) the Welsh Ministers in relation to Wales;
  - (c) the Department of the Environment in Northern Ireland in relation to Northern Ireland.
- (4) Regulations under that Schedule are subject to affirmative resolution procedure if—
  - (a) they are the first regulations to be made by the relevant national authority in question under the Schedule,
    - <sup>F11</sup>(aa) they are the first regulations to be made by the Welsh Ministers under paragraph 4A of the Schedule,]
    - <sup>F12</sup>(aa) they are to be made by the Department of the Environment in Northern Ireland under paragraph 4A of the Schedule;]
    - <sup>F13</sup>(ab) they are to be made by the Department of the Environment in Northern Ireland and increase the minimum amount specified under paragraph 4 of the Schedule;]
  - (b) they contain provision imposing or providing for the imposition of new civil sanctions,
  - (c) they increase the amount or maximum amount of a monetary penalty or change the basis on which such an amount or maximum is to be determined, or
  - (d) they amend or repeal a provision of an enactment contained in primary legislation.
- (5) Otherwise regulations under that Schedule are subject to negative resolution procedure.
- <sup>F14</sup>(6) Section 17(5) of the Interpretation Act (Northern Ireland) 1954 applies to a power to make regulations under Schedule 6.]

#### *Renewable transport fuel obligations*

### 78 Renewable transport fuel obligations

Schedule 7 contains amendments to the provisions of the Energy Act 2004 (c. 20) relating to renewable transport fuel obligations.

#### *Carbon emissions reduction targets*

### 79 Carbon emissions reduction targets

Schedule 8 contains amendments to the provisions of the Gas Act 1986 (c. 44), the Electricity Act 1989 (c. 29) and the Utilities Act 2000 (c. 27) relating to carbon emissions reduction targets.

#### *Miscellaneous*

### 80 Report on climate change: Wales

- (1) It is the duty of the Welsh Ministers to lay before the National Assembly for Wales from time to time a report on—
  - (a) the objectives of the Welsh Ministers in relation to greenhouse gas emissions and the impact of climate change in Wales,
  - (b) the action that has been taken by the Welsh Ministers and others to deal with such emissions and that impact, and
  - (c) the future priorities for the Welsh Ministers and others for dealing with such emissions and that impact.
- (2) The report must, in particular, set out how the Welsh Ministers intend to exercise the power to give directions under section 67 (directions to reporting authorities to prepare adaptation reports).
- (3) Nothing in a report under this section affects the exercise of the Welsh Ministers' power under that section.
- (4) The second and each subsequent report under this section must contain an assessment of the progress made towards implementing the objectives mentioned in the earlier reports.
- (5) In this section “Wales” has the same meaning as in the Government of Wales Act 2006 (c. 32).

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

PROSPECTIVE

## 81 Climate change measures reports in Wales

- (1) The Climate Change and Sustainable Energy Act 2006 (c. 19) is amended as follows.
- (2) After section 3 insert—

### **“3A Local authorities in Wales to have regard to climate change measures reports**

- (1) The Welsh Ministers must from time to time publish a climate change measures report.
- (2) A local authority in Wales must, in exercising its functions, have regard to any current climate change measures report.
- (3) A “climate change measures report” means a report containing information about the local authority measures the Welsh Ministers consider would or might have any of the following effects—
  - (a) improving efficiency in the use of any description or source of energy;
  - (b) increasing the amount of energy generated, or heat produced, by microgeneration;
  - (c) increasing the amount of energy generated, or heat produced, by plant that relies wholly or mainly on a source of energy or a technology listed in section 26(2);
  - (d) reducing emissions of greenhouse gases;
  - (e) reducing the number of households in which one or more persons are living in fuel poverty;
  - (f) addressing the impact of climate change.
- (4) Before publishing a climate change measures report, the Welsh Ministers must consult such representatives of local government, and such other persons, as the Welsh Ministers consider appropriate.
- (5) The Secretary of State's consent is required to the publication in a climate change measures report of information about a local authority measure to which subsection (6) applies.
- (6) This subsection applies to a local authority measure if the Secretary of State has a function in relation to the measure of—
  - (a) making subordinate legislation,
  - (b) issuing guidance or directions, or
  - (c) making determinations or hearing appeals,and that function is exercisable in relation to Wales.
- (7) In this section—

“local authority” means any of the following—

  - (a) a county council;
  - (b) a county borough council;
  - (c) a community council;

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

“local authority measure” means anything a local authority in Wales may do in the exercise of its functions (including deciding not to exercise a power).”.

<sup>F15</sup>(3) .....

#### Textual Amendments

**F15** S. 81(3) omitted (26.5.2015) by virtue of [Deregulation Act 2015 \(c. 20\)](#), ss. [57\(4\)\(b\)](#), [115\(3\)\(e\)](#)

## 82 Repeal of previous reporting obligation

Section 2 of the Climate Change and Sustainable Energy Act 2006 (c. 19) (annual report on greenhouse gas emissions) is repealed.

## 83 Guidance on reporting

- (1) The Secretary of State must publish guidance on the measurement or calculation of greenhouse gas emissions to assist the reporting by persons on such emissions from activities for which they are responsible.
- (2) The guidance must be published not later than 1st October 2009.
- (3) The Secretary of State may from time to time publish revisions to guidance under this section or revised guidance.
- (4) Before publishing guidance under this section or revisions to it, the Secretary of State must consult the other national authorities.
- (5) Guidance under this section and revisions to it may be published in such manner as the Secretary of State thinks fit.

## 84 Report on contribution of reporting to climate change objectives

- (1) The Secretary of State must—
  - (a) review the contribution that reporting on greenhouse gas emissions may make to the achievement of the objectives of Her Majesty's Government in the United Kingdom in relation to climate change, and
  - (b) lay a report before Parliament setting out the conclusions of that review.
- (2) The report must be laid before Parliament not later than 1st December 2010.
- (3) In complying with this section the Secretary of State must consult the other national authorities.

## 85 Regulations about reporting by companies

- (1) The Secretary of State must, not later than 6th April 2012—
  - (a) make regulations under section 416(4) of the Companies Act 2006 (c. 46) requiring the directors' report of a company to contain such information as may be specified in the regulations about emissions of greenhouse gases from activities for which the company is responsible, or

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (b) lay before Parliament a report explaining why no such regulations have been made.
- (2) Subsection (1)(a) is complied with if regulations are made containing provision in relation to companies, and emissions, of a description specified in the regulations.

## 86 Report on the civil estate

- (1) It is the duty of the [<sup>F16</sup>Minister for the Cabinet Office] to lay before Parliament in respect of each year, beginning with the year 2008, a report containing an assessment of the progress made in the year towards improving the efficiency and contribution to sustainability of buildings that are part of the civil estate.
- (2) The report must, in particular, include an assessment of the progress made in the year to which it relates towards—
  - (a) reducing the size of the civil estate, and
  - (b) ensuring that buildings that become part of the civil estate fall within the top quartile of energy performance.
- (3) If a building that does not fall within the top quartile of energy performance becomes part of the civil estate in the year to which the report relates, the report must state the reasons why the building has nevertheless become part of the civil estate.
- (4) A report under this section must be laid before Parliament not later than 1st June in the year following the year to which it relates.
- (5) In this section “building” means a building that uses energy for heating or cooling the whole or any part of its interior.
- (6) For the purposes of this section, a building is part of the civil estate if it is—
  - (a) used for the purposes of central government administration, and
  - (b) of a description of buildings for which, at the passing of this Act, the Treasury has responsibilities in relation to efficiency and sustainability.
- (7) The [<sup>F17</sup>Minister for the Cabinet Office] may by order provide for buildings of a specified description to be treated as being, or as not being, part of the civil estate for the purposes of this section.
- (8) Any such order is subject to affirmative resolution procedure.

### Textual Amendments

- F16** Words in s. 86(1) substituted (13.4.2011) by [The Transfer of Functions \(Report on the Civil Estate\) Order 2011 \(S.I. 2011/740\)](#), arts. 1(2), 3
- F17** Words in s. 86(7) substituted (13.4.2011) by [The Transfer of Functions \(Report on the Civil Estate\) Order 2011 \(S.I. 2011/740\)](#), arts. 1(2), 3

### Modifications etc. (not altering text)

- C2** S. 86 transfer of functions (13.4.2011) by [The Transfer of Functions \(Report on the Civil Estate\) Order 2011 \(S.I. 2011/740\)](#), arts. 1(2), 2

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

## 87 Power of Ministers and departments to offset greenhouse gas emissions

- (1) An authority to which this section applies may acquire and dispose of units or interests in units representing—
- (a) a reduction in an amount of greenhouse gas emissions,
  - (b) the removal of an amount of greenhouse gas from the atmosphere, or
  - (c) an amount of greenhouse gas emissions allowed under a scheme or arrangement imposing a limit on such emissions.
- (2) This section applies to—
- (a) any Minister of the Crown or government department;
  - (b) the Scottish Ministers;
  - (c) the Welsh Ministers;
  - (d) any Northern Ireland department.
- (3) If the Treasury acquire such units or interests in units, until they are disposed of they shall be treated as held by the persons for the time being constituting the Treasury.

## 88 Fines for offences relating to pollution

- (1) In section 105(2) of the Clean Neighbourhoods and Environment Act 2005 (c. 16) (which postpones the increase by subsection (1)(b) in maximum fines under regulations under the Pollution Prevention and Control Act 1999 (c. 24) pending the commencement of section 154(1) of the Criminal Justice Act 2003 (c. 44)), for “Subsection (1)” substitute “ Subsection (1)(a) ”.

<sup>F18</sup>(2) .....

### Textual Amendments

**F18** S. 88(2) repealed (6.4.2010) by [The Environmental Permitting \(England and Wales\) Regulations 2010 \(S.I. 2010/675\)](#), reg. 1(1)(b), [Sch. 28](#) (with reg. 1(2), [Sch. 4](#))

## PART 6

### GENERAL SUPPLEMENTARY PROVISIONS

#### *Territorial scope of provisions relating to greenhouse gas emissions*

## 89 Territorial scope of provisions relating to greenhouse gas emissions

- (1) The provisions of this Act relating to emissions of greenhouse gases apply to emissions from sources or other matters occurring in, above or below—
- (a) UK coastal waters, or
  - (b) the UK sector of the continental shelf,
- as they apply to emissions from sources or matters occurring in the United Kingdom.
- (2) In subsection (1)—
- “UK coastal waters” means areas landward of the seaward limit of the territorial sea adjacent to the United Kingdom;

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

“the UK sector of the continental shelf” means the areas designated under section 1(7) of the Continental Shelf Act 1964 (c. 29).

- (3) This section is subject to section 30 (emissions from international aviation or international shipping not to count as emissions from UK sources for the purposes of Part 1, except as provided by regulations).

### *Orders and regulations*

## **90 Orders and regulations**

- (1) Orders and regulations under this Act must be made by statutory instrument, subject as follows.
- (2) The power of a Northern Ireland department to make regulations under Part 3 (trading schemes) or Schedule 6 (charges for <sup>F10</sup>carrier bags)—
  - (a) is exercisable by statutory instrument if the instrument also contains regulations under that Part or Schedule made or to be made by another national authority, and
  - (b) otherwise, is exercisable by statutory rule for the purposes of the Statutory Rules (Northern Ireland) Order 1979 (S.I. 1979/1573 (N.I. 12)).
- (3) An order or regulations under this Act may—
  - (a) make different provision for different cases or circumstances,
  - (b) include supplementary, incidental and consequential provision, and
  - (c) make transitional provision and savings.
- (4) Any provision that may be made by order under this Act may be made by regulations.
- (5) Any provision that may be made by regulations under this Act may be made by order.

### **Textual Amendments**

**F10** Words in Sch. 6 para. 2 substituted (N.I.) (28.4.2014) by [Carrier Bags Act \(Northern Ireland\) 2014 \(c. 7\), s. 1\(b\)](#)

## **91 Affirmative and negative resolution procedure**

- (1) Where orders or regulations under this Act are subject to “affirmative resolution procedure” the order or regulations must not be made unless a draft of the statutory instrument containing them has been laid before and approved by a resolution of each House of Parliament.
- (2) Where orders or regulations under this Act are subject to “negative resolution procedure” the statutory instrument containing the order or regulations is subject to annulment in pursuance of a resolution of either House of Parliament.
- (3) Any provision that may be made by an order or regulations under this Act subject to negative resolution procedure may be made by an order or regulations subject to affirmative resolution procedure.
- (4) This section does not apply to—
  - (a) regulations under Part 3 (trading schemes) (but see Schedule 3), or

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (b) regulations under Schedule 6 (but see Part 3 of that Schedule).

### *Interpretation*

#### **92 Meaning of “greenhouse gas”**

- (1) In this Act “greenhouse gas” means any of the following—
- (a) carbon dioxide (CO<sub>2</sub>),
  - (b) methane (CH<sub>4</sub>),
  - (c) nitrous oxide (N<sub>2</sub>O),
  - (d) hydrofluorocarbons (HFCs),
  - (e) perfluorocarbons (PFCs),
  - (f) sulphur hexafluoride (SF<sub>6</sub>).
- (2) The Secretary of State may by order amend the definition of “greenhouse gas” in subsection (1) to add to the gases listed in that definition.
- (3) That power may only be exercised if it appears to the Secretary of State that an agreement or arrangement at European or international level recognises that the gas to be added contributes to climate change.
- (4) An order under this section is subject to negative resolution procedure.

#### **93 Measurement of emissions etc by reference to carbon dioxide equivalent**

- (1) For the purposes of this Act greenhouse gas emissions, reductions of such emissions and removals of greenhouse gas from the atmosphere shall be measured or calculated in tonnes of carbon dioxide equivalent.
- (2) A “tonne of carbon dioxide equivalent” means one metric tonne of carbon dioxide or an amount of any other greenhouse gas with an equivalent global warming potential (calculated consistently with international carbon reporting practice).

#### **94 Meaning of “international carbon reporting practice”**

- (1) In this Act “international carbon reporting practice” means accepted practice in relation to reporting for the purposes of the protocols to the United Nations Framework Convention on Climate Change or such other agreements or arrangements at European or international level as the Secretary of State may specify by order.
- (2) An order under this section is subject to negative resolution procedure.

#### **95 Meaning of “national authority”**

- (1) In this Act “national authority” means any of the following—
- (a) the Secretary of State;
  - (b) the Scottish Ministers;
  - (c) the Welsh Ministers;
  - (d) the relevant Northern Ireland department.
- (2) Functions conferred or imposed by this Act on “the national authorities” are to be exercised by all of them jointly.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

## 96 Meaning of “relevant Northern Ireland department”

- (1) In this Act “the relevant Northern Ireland department”, in relation to a matter or provision, means the Northern Ireland department responsible for the matter or, as the case may be, for the matters to which the provision relates.
- (2) If more than one department is responsible, the reference is to all of them.
- (3) Any question as to the Northern Ireland department responsible for a matter is to be determined by the Department of Finance and Personnel in Northern Ireland.

## 97 Minor definitions

In this Act—

“devolved legislature” means—

- (a) the Scottish Parliament,
- (b) the National Assembly for Wales, or
- (c) the Northern Ireland Assembly;

“emissions”, in relation to a greenhouse gas, means emissions of that gas into the atmosphere that are attributable to human activity;

“enactment” includes—

- (a) an enactment contained in subordinate legislation within the meaning of the Interpretation Act 1978 (c. 30),
- (b) an enactment contained in, or in an instrument made under, an Act of the Scottish Parliament,
- (c) an enactment contained in, or in an instrument made under, Northern Ireland legislation, and
- (d) an enactment contained in, or in an instrument made under, a Measure or Act of the National Assembly for Wales;

“European law” means—

- (a) all the rights, powers, liabilities, obligations and restrictions from time to time created or arising by or under the [F19]EU Treaties, and
- (b) all the remedies and procedures from time to time provided for by or under the [F19]EU Treaties,

and “European policy” has a corresponding meaning;

“modifications”, in relation to an enactment, includes additions or amendments to, or omissions from, the enactment;

“primary legislation” means—

- (a) an Act of Parliament,
- (b) an Act of the Scottish Parliament,
- (c) a Measure or Act of the National Assembly for Wales, or
- (d) Northern Ireland legislation.

### Textual Amendments

**F19** Words in Act substituted (22.4.2011) by The Treaty of Lisbon (Changes in Terminology) Order 2011 (S.I. 2011/1043), arts. 2, 3, 6 (with art. 3(2)(3)4(2)6(4)6(5))

## 98 Index of defined expressions

In this Act the following expressions are defined or otherwise explained by the provisions indicated—

“the 1990 baseline” (in Parts 1 and 2)	section 1(2)
“administrator” (in Part 3)	section 55
“administrator” (in Schedule 6)	paragraph 6(1) and (4) of Schedule 6
“affirmative resolution procedure” (except in Part 3 and Schedule 6)	section 91(1)
“annual equivalent”, in relation to the carbon budget for a period (in Parts 1 and 2)	section 5(2)
“budgetary periods” (in Parts 1 and 2)	section 4(1)
“carbon budget” (in Parts 1 and 2)	section 4(1)
“carbon unit” (in Parts 1 and 2)	section 26(1)
“the chair” (in Schedule 1)	paragraph 1(1) of Schedule 1
[ <sup>F20</sup> “children” (in Schedule 6)]	[ <sup>F20</sup> paragraph 4B(2) of Schedule 6]
“civil sanction” (in Schedule 6)	paragraph 9(3) of Schedule 6
“the Committee” (in Part 2)	section 32
“Counsel General” (in sections 61 to 70)	section 70(8)
“the deputy chair” (in Schedule 1)	paragraph 2 of Schedule 1
“devolved authority” (in sections 61 to 70)	section 70(3)
“devolved functions”, in relation to a reporting authority (in sections 61 to 69)	section 70(4) and (5)
“devolved legislature”	section 97
“devolved Welsh functions”, in relation to	section 70(6) and (7)

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

a reporting authority (in sections 61 to 69)	
“discretionary requirement” (in Schedule 6)	paragraph 12(3) of Schedule 6
“electricity distributor” (in Schedule 4)	paragraph 2(3) of Schedule 4
“electricity supplier” (in Schedule 4)	paragraph 2(2) of Schedule 4
“emissions”	section 97
“enactment”	section 97
“environmental authority” (in Schedule 4)	paragraph 1(2) of Schedule 4
“European law”	section 97
“European policy”	section 97
“financial year” (in Schedule 1)	paragraph 23 of Schedule 1
“fixed monetary penalty” (in Schedule 6)	paragraph 10(3) of Schedule 6
“greenhouse gas”	section 92
“international carbon reporting practice”	section 94
“Minister of the Crown” (in sections 61 to 70)	section 70(8)
“modifications”, in relation to an enactment	section 97
“national authority”	section 95
“negative resolution procedure” (except in Part 3 and Schedule 6)	section 91(2)
“net UK carbon account” (in Parts 1 and 2)	section 27(1)
“net UK emissions” for a period, in relation to a greenhouse gas (in Parts 1 and 2)	section 29(1)
“non-monetary discretionary requirement” (in Schedule 6)	paragraph 12(4) of Schedule 6
[ <sup>F21</sup> “nuisance” (in Schedule 6)]	[ <sup>F21</sup> paragraph 4B(6) of Schedule 6]

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

“participant” (in Part 3)	section 55
[ <sup>F22</sup> “pollution” (in Schedule 6)]	[ <sup>F22</sup> paragraph 4B(3) of Schedule 6]
“potential participant” (in Schedule 4)	paragraph 3(2) of Schedule 4
“primary legislation”	section 97
“the relevant national authority” (in Part 3)	section 47
“the relevant national authority” (in Schedule 6)	section 77(3)
“the relevant Northern Ireland department”	section 96
“reporting authority” (in sections 61 to 70)	section 70(1) and (2)
“seller” (in Schedule 6)	paragraph 3 of Schedule 6
“[ <sup>F23</sup> carrier bag]” (in Schedule 6)	paragraph 5 of Schedule 6
“specified” (in Schedule 6)	paragraph 3(4) of Schedule 6
“targeted greenhouse gas” (in Parts 1 and 2)	section 24(1)
“trading period” (in Part 3)	section 55
“trading scheme”	section 44(2)
“UK emissions”, in relation to a greenhouse gas (in Part 1)	section 29(1)
“UK removals”, in relation to a greenhouse gas (in Part 1)	section 29(1)
“variable monetary penalty” (in Schedule 6)	paragraph 12(4) of Schedule 6
“Wales” (in sections 61 to 70)	section 70(8)
<sup>F24</sup>	<sup>F24</sup>
...	...
[ <sup>F25</sup> “young people” (in Schedule 6)]	[ <sup>F25</sup> paragraph 4B(8) of Schedule 6]

### *Final provisions*

## **99 Extent**

- (1) This Act, apart from the provisions listed below, extends to the whole of the United Kingdom.
- (2) The following provisions of this Act extend to England and Wales only—
  - (a) sections 71 to 75 and Schedule 5 (waste reduction schemes);
  - (b) section 76 (collection of household waste);
  - (c) section 81 (climate change measures reports in Wales);
  - (d) section 88 (fines for offences relating to pollution).
- (3) Section 77 and Schedule 6 (charges for [<sup>F10</sup>carrier bags]) extend to England and Wales and Northern Ireland only.
- (4) Section 79 and Schedule 8 (carbon emissions reduction targets) extend to England and Wales and Scotland only.

## SCHEDULES

### SCHEDULE 1

Section 32

#### THE COMMITTEE ON CLIMATE CHANGE

##### *Membership*

- 1 (1) The Committee shall consist of—
  - (a) a person appointed by the national authorities to chair the Committee (“the chair”), and
  - (b) not less than five and not more than eight other members appointed by the national authorities.
- (2) The national authorities must consult the chair before appointing the other members.
- (3) In appointing a member, the national authorities must have regard to the desirability of securing that the Committee (taken as a whole) has experience in or knowledge of the following—
  - (a) business competitiveness;
  - (b) climate change policy at national and international level, and in particular the social impacts of such policy;
  - (c) climate science, and other branches of environmental science;
  - (d) differences in circumstances between England, Wales, Scotland and Northern Ireland and the capacity of national authorities to take action in relation to climate change;
  - (e) economic analysis and forecasting;
  - (f) emissions trading;
  - (g) energy production and supply;
  - (h) financial investment;
  - (i) technology development and diffusion.
- (4) The Secretary of State may by order amend sub-paragraph (1)(b) so as to alter the minimum or maximum number of members of the Committee.
- (5) Such an order may only be made with the consent of the other national authorities.
- (6) Any such order is subject to negative resolution procedure.
- 2 The national authorities may, after consulting the chair, appoint one of the members as deputy to the chair (“the deputy chair”).

##### *Term of office*

- 3 A member holds and vacates office in accordance with the terms of the member's appointment.
- 4 A member may resign by giving written notice to the Secretary of State.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- 5 The national authorities may remove a member—
- (a) who has been absent from meetings of the Committee without its permission for a period of 6 months or more,
  - (b) who has become bankrupt or has made an arrangement with creditors,
  - (c) whose estate has been sequestrated in Scotland or who, under Scots law, has made a composition or arrangement with, or granted a trust deed for, creditors, or
  - (d) who in the opinion of the national authorities is otherwise unable or unfit to carry out the duties of that member.
- 6 A person ceases to be the chair or the deputy chair if the person—
- (a) resigns that office by giving written notice to the Secretary of State, or
  - (b) ceases to be a member.
- 7 A person who—
- (a) ceases to be a member, or
  - (b) ceases to be the chair or the deputy chair,
- may be reappointed to that office.

#### *Remuneration and pensions etc*

- 8 The Committee may pay to the members such remuneration and allowances as the national authorities may determine.
- 9 The Committee must, if required to do so by the national authorities—
- (a) pay such pensions, gratuities or allowances as the national authorities may determine to or in respect of any person who is or has been a member, or
  - (b) pay such sums as the national authorities may determine towards provision for the payment of pensions, gratuities or allowances to or in respect of such a person.
- 10 If the national authorities consider there are special circumstances which make it right for a person who has ceased to be a member to receive compensation, the Committee must pay the person such compensation as the national authorities may determine.

#### *Staff*

- 11 (1) The Committee must appoint a person to be chief executive, but may only appoint a person who has been approved by the national authorities.
- (2) The chief executive is an employee of the Committee.
- 12 The Committee may appoint other employees.
- 13 The Committee must, if required to do so by the national authorities—
- (a) pay such pensions, gratuities or allowances as the national authorities may determine to or in respect of any employee or former employee, or
  - (b) pay such sums as the national authorities may determine towards provision for the payment of pensions, gratuities or allowances to or in respect of any employee or former employee.

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

- 14 (1) In Schedule 1 to the Superannuation Act 1972 (c. 11) (kinds of employment to which section 1 of that Act applies), in the list of other bodies, at the appropriate place insert — “ The Committee on Climate Change. ”
- (2) The Committee must pay to the Minister for the Civil Service, at such times as the Minister may direct, such sums as the Minister may determine in respect of any increase attributable to sub-paragraph (1) in the sums payable out of money provided by Parliament under the Superannuation Act 1972.

#### *Sub-committees*

- 15 (1) The Committee may establish sub-committees.
- (2) A sub-committee may include persons who are not members of the Committee.
- (3) The Committee may pay such remuneration and allowances as the national authorities may determine to any person who—
- (a) is a member of a sub-committee, but
  - (b) is not a member of the Committee.
- (4) This paragraph does not apply in relation to the Adaptation Sub-Committee.

#### *The Adaptation Sub-Committee*

- 16 (1) There shall be a sub-committee of the Committee, to be known as the Adaptation Sub-Committee or, in Welsh, as yr Is-bwyllgor Addasu (referred to in this paragraph as “the ASC”).
- (2) The ASC shall consist of—
- (a) a person appointed by the national authorities to chair the ASC (“the ASC chair”), and
  - (b) not less than five other members appointed by the national authorities.
- (3) The national authorities must—
- (a) consult the chair before appointing the ASC chair, and
  - (b) consult the ASC chair before appointing the other members of the ASC.
- (4) A person ceases to be the ASC chair if the person—
- (a) resigns that office by giving written notice to the Secretary of State, or
  - (b) ceases to be a member of the ASC.
- (5) The ASC may include persons who are not members of the Committee.
- (6) Paragraphs 3 to 5 (term of office) apply to a person who is—
- (a) a member of the Committee, and
  - (b) a member of the ASC,
- in that person's capacity as a member of the ASC.
- (7) Those paragraphs and paragraphs 8 to 10 (remuneration and pensions etc) apply to a member of the ASC who is not a member of the Committee as they apply to a member of the Committee.
- (8) In the application of paragraph 5(a) by virtue of this paragraph, the reference to the Committee is a reference to the ASC.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (9) A person who—
- (a) ceases to be a member of the ASC, or
  - (b) ceases to be the ASC chair,
- may be reappointed to that office.
- (10) The ASC must provide the Committee with such advice, analysis, information or other assistance as the Committee may require in connection with the exercise of its functions under—
- (a) section 38(1)(c) (advice etc to national authorities on adaptation to climate change),
  - (b) section 57 (advice on report on impact of climate change), or
  - (c) section 59 (reporting on progress in connection with adaptation).

#### *Proceedings*

- 17 The Committee may regulate—
- (a) its own procedure (including quorum), and
  - (b) the procedure of any sub-committee (including quorum).
- 18 The validity of anything done by the Committee or any sub-committee is not affected by—
- (a) any vacancy in the membership of the Committee or sub-committee, or
  - (b) any defect in the appointment of any member of the Committee or sub-committee.
- 19 The Committee must publish the minutes of its meetings in such manner as it considers appropriate.

#### *Discharge of functions*

- 20 The Committee may authorise a sub-committee, member or employee to exercise any of the Committee's functions.

#### *Application of seal and proof of documents*

- 21 (1) The application of the Committee's seal must be authenticated by the signature of—
- (a) a member of the Committee who is authorised (generally or specially) for that purpose, or
  - (b) an employee who is so authorised.
- (2) A document purporting to be duly executed under the seal of the Committee or to be signed on behalf of the Committee shall be received in evidence and treated as so executed or signed unless the contrary is shown.
- (3) This paragraph does not apply in relation to Scotland.

#### *Reports and accounts*

- 22 (1) For each financial year the Committee must—
- (a) prepare an annual report on the discharge of its functions during the year, and
  - (b) send a copy to the national authorities within such period as the national authorities may direct.

*Status:* This version of this Act contains provisions that are prospective.

**Changes to legislation:** Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

- (2) A copy of each report received under this paragraph must be laid—
- (a) by the Secretary of State before Parliament,
  - (b) by the Scottish Ministers before the Scottish Parliament,
  - (c) by the Welsh Ministers before the National Assembly for Wales, and
  - (d) by the relevant Northern Ireland department before the Northern Ireland Assembly.
- 23 In this Schedule “financial year” means—
- (a) the period beginning with the day the Committee is established and ending with the next 31st March, and
  - (b) each subsequent period of 12 months ending with 31st March.
- 24 (1) The Committee must keep proper accounts and proper records in relation to the accounts.
- (2) For each financial year the Committee must—
- (a) prepare a statement of accounts in respect of that financial year, and
  - (b) send a copy of the statement to the national authorities and the Comptroller and Auditor General within such period as the national authorities direct.
- (3) The statement must be in such form as the national authorities may direct.
- (4) The Comptroller and Auditor General must—
- (a) examine, certify and report on the statement, and
  - (b) send a copy of the certified statement and the report to the national authorities as soon as possible.
- (5) A copy of each statement received under sub-paragraph (4) must be laid—
- (a) by the Secretary of State before Parliament,
  - (b) by the Scottish Ministers before the Scottish Parliament,
  - (c) by the Welsh Ministers before the National Assembly for Wales, and
  - (d) by the relevant Northern Ireland department before the Northern Ireland Assembly.

#### *Information*

- 25 (1) The Committee must provide the national authorities with such information as they may request about its property.
- (2) The Committee must provide the Secretary of State with such information as the Secretary of State may request about the exercise or proposed exercise of its functions under—
- (a) Part 1 (carbon target and budgeting),
  - (b) section 33 (advice on level of 2050 target),
  - (c) section 34 (advice in connection with carbon budgets),
  - (d) section 35 (advice on emissions from international aviation and international shipping),
  - (e) section 36 (reports on progress),
  - (f) section 57 (advice on report on impact of climate change), or
  - (g) section 59 (reporting on progress in connection with adaptation).

*Status: This version of this Act contains provisions that are prospective.*

**Changes to legislation:** Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

- (3) The Committee must provide a national authority with such information as the national authority may request about the exercise or proposed exercise of the Committee's functions under—
- (a) section 38 (duty to provide advice or assistance on request), or
  - (b) section 48 (advice on trading scheme regulations),
- in relation to that national authority.

If the information relates to the exercise or proposed exercise of those functions in relation to two or more national authorities, the request must be made by all of them jointly.

- (4) The Committee must provide the national authorities with such information as they may request about the exercise or proposed exercise of any of its other functions.
- (5) The Committee must also—
- (a) permit any person authorised by a national authority to inspect and make copies of any accounts or other documents of the Committee, and
  - (b) provide such explanation of them as that person or the national authority may require.
- (6) Before exercising a function under sub-paragraph (5), the national authority must consult the other national authorities.

#### *Publication of advice etc*

- 26 A requirement under this Act for the Committee to publish anything does not oblige it to publish—
- (a) information it could refuse to disclose in response to a request under—
    - (i) the Freedom of Information Act 2000 (c. 36), or
    - (ii) the Environmental Information Regulations 2004 (S.I. 2004/3391) or any regulations replacing those regulations;
  - (b) information whose disclosure is prohibited by any enactment.

#### *Status*

- 27 (1) The Committee is not to be regarded as the servant or agent of the Crown or as enjoying any status, privilege or immunity of the Crown.
- (2) The Committee is to be treated as a cross-border public authority within the meaning of the Scotland Act 1998 (c. 46) for the purposes of the following provisions of that Act—
- (a) section 23(2)(b) (power of Scottish Parliament to require persons outside Scotland to attend to give evidence or produce documents);
  - (b) section 70(6) (legislation of Scottish Parliament not to require certain cross-border public authorities to prepare accounts).

#### *Public Records Act 1958 (c. 51)*

- 28 In Schedule 1 to the Public Records Act 1958 (definition of public records), in Part 2 of the Table at the end of paragraph 3, at the appropriate place insert— “ The Committee on Climate Change. ”

*Status:* This version of this Act contains provisions that are prospective.

**Changes to legislation:** Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

*Parliamentary Commissioner Act 1967 (c. 13)*

29 In Schedule 2 to the Parliamentary Commissioner Act 1967 (departments etc subject to investigation)—

- (a) at the appropriate place insert— “ The Committee on Climate Change. ”, and
- (b) in the notes at the appropriate place insert—  
**Committee on Climate Change**

In the case of the Committee on Climate Change, no investigation is to be conducted in respect of any action taken by or on behalf of the Committee—

- (a) in the exercise in or as regards Scotland of any function to the extent that the function is exercisable within devolved competence (within the meaning of section 54 of the Scotland Act 1998), or
- (b) in connection with functions of the Committee in relation to Wales (within the meaning of the Government of Wales Act 2006).”

*House of Commons Disqualification Act 1975 (c. 24)*

30 In Part 2 of Schedule 1 to the House of Commons Disqualification Act 1975 (bodies of which all members are disqualified), at the appropriate place insert— “ The Committee on Climate Change. ”

*Northern Ireland Assembly Disqualification Act 1975 (c. 25)*

31 In Part 2 of Schedule 1 to the Northern Ireland Assembly Disqualification Act 1975 (bodies of which all members are disqualified), at the appropriate place insert— “ The Committee on Climate Change. ”

*Race Relations Act 1976 (c. 74)*

32 [F26 In Part 2 of Schedule 1A to the Race Relations Act 1976 (bodies and other persons subject to general statutory duty), at the appropriate place insert— “ The Committee on Climate Change. ”]

**Textual Amendments**

**F26** Sch. 1 para. 32 repealed (E.W.S.) (4.4.2011) by 2010 c. 15, Sch. 27 Pt. 1A (as inserted by [The Equality Act 2010 \(Public Authorities and Consequential and Supplementary Amendments\) Order 2011 \(S.I. 2011/1060\)](#), arts. 1(2), 3(3)(a), [Schs. 3](#))

*Freedom of Information Act 2000 (c. 36)*

33 In Part 6 of Schedule 1 to the Freedom of Information Act 2000 (other public bodies and offices which are public authorities), at the appropriate place insert— “ The Committee on Climate Change. ”

*Scottish Public Services Ombudsman Act 2002 (asp 11)*

34 (1) The Scottish Public Services Ombudsman Act 2002 is amended as follows.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (2) In section 7 (matters which may be investigated: restrictions), after subsection (6B) insert—

“(6C) The Ombudsman must not investigate action taken by or on behalf of the Committee on Climate Change in the exercise in or as regards Scotland of any function to the extent that the function is not exercisable within devolved competence (within the meaning of section 54 of the Scotland Act 1998).”

- (3) In Schedule 2 (persons liable to investigation), after paragraph 91A insert—

“91B The Committee on Climate Change.”

*Public Services Ombudsman (Wales) Act 2005 (c. 10)*

- 35 In Schedule 3 to the Public Services Ombudsman (Wales) Act 2005 (listed authorities), after the heading “Environment” insert— “The Committee on Climate Change.”

SCHEDULE 2

Section 46

TRADING SCHEMES

**PART 1**

SCHEMES LIMITING ACTIVITIES

*Introductory*

- 1 This Part of this Schedule deals with trading schemes that operate by limiting or encouraging the limitation of activities that consist of the emission of greenhouse gas or that cause or contribute, directly or indirectly, to such emissions.

*Trading periods*

- 2 The regulations must specify the period or periods by reference to which the scheme is to operate (a “trading period”).

*Activities*

- 3 (1) The regulations must identify the activities to which the trading scheme applies.
- (2) The regulations may identify the activities by reference to any, or any combination of, criteria and in particular—
- (a) may identify the activities by reference to the locations or locations at which they are carried on, or
  - (b) may be expressed to apply to all activities of a particular kind carried on in the United Kingdom or a part of the United Kingdom.
- (3) The regulations must specify the units of measurement of the activities for the purposes of the scheme.

*Status:* This version of this Act contains provisions that are prospective.

**Changes to legislation:** Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

- (4) The regulations may specify units of measurement by reference to—
  - (a) the activities themselves,
  - (b) anything consumed or used for the purposes of the activities,
  - (c) anything produced by the activities, or
  - (d) any other consequence of the activities.
- (5) The regulations may, in particular, make provision—
  - (a) for activities to be measured by reference to the amount (in tonnes of carbon dioxide equivalent) of the greenhouse gas emissions for which those activities are to be regarded as responsible; and
  - (b) as to the method by which that amount is to be measured or calculated.
- (6) The regulations may make different provision in relation to different descriptions of activity to which the scheme applies.

#### *Participants*

- 4 (1) The regulations must identify the persons to whom the trading scheme applies (the “participants”).
- (2) The regulations—
  - (a) may identify the participants by reference to any, or any combination of, criteria, or
  - (b) provide for their identification by a specified person or body.
- (3) The regulations may, in particular, identify or provide for the identification of the participants by reference to their responsibility for activities to which the trading scheme applies.
- (4) The regulations may provide for more than one person to be treated as a single participant.
- (5) The regulations may provide for persons to cease to be participants in circumstances specified in the regulations.

#### *Allocation of allowances*

- 5 (1) The regulations may provide for the allocation among the participants of allowances representing the right to carry on a specified amount of the activities in a trading period.
- (2) The regulations may set a limit on—
  - (a) the total amount of the activities for a trading period, and
  - (b) the total amount of the allowances to be allocated for the period.
- (3) The regulations may specify the method of allocation or provide for it to be determined in accordance with the regulations.
- (4) The regulations may not provide for allowances to be allocated in return for consideration.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

### *Use of allowances*

- 6
- (1) The regulations may require each participant to have or acquire enough allowances to match the participant's activities in a trading period, subject to any offsetting in accordance with provision made under paragraph 7.
  - (2) The regulations—
    - (a) may permit allowances held by a participant at the end of a trading period in excess of the participant's activities in the period to be used to cover the participant's activities in a later trading period,
    - (b) may permit allowances allocated to a participant for a trading period to be used to cover the participant's activities in an earlier trading period, and
    - (c) may in either case provide for such use of allowances to be subject to such conditions and limitations as may be specified in or determined in accordance with the regulations.
  - (3) The regulations must contain provision for ensuring that allowances used by a participant for the purposes of a trading scheme cannot be used by the participant for any other purpose.
  - (4) The regulations—
    - (a) may provide for the expiry of allowances after such period as may be specified in or determined in accordance with the regulations;
    - (b) may enable allowances to be cancelled by a person by whom they are held instead of being used for the purposes of a trading scheme.

### *Credits*

- 7
- (1) The regulations may enable participants to offset the carrying on of the activities in a trading period by acquiring credits representing—
    - (a) a reduction in an amount of greenhouse gas emissions, or
    - (b) the removal of an amount of greenhouse gas from the atmosphere.
  - (2) Regulations that make provision under this paragraph for a trading period must set a limit on the total amount of the activities for the period.
  - (3) If the regulations also provide for the allocation of allowances for the period, they must—
    - (a) set a limit on the total amount of the allowances to be allocated for the period, and
    - (b) require each participant to acquire enough credits to offset any activities carried on by the participant in the period in excess of those for which the participant has or has acquired allowances.
  - (4) Otherwise, such regulations must—
    - (a) set a limit on the amount of the activities that each participant may carry on in the period, and
    - (b) require each participant to acquire enough credits to offset any activities carried on by the participant in the period in excess of that limit.
  - (5) The regulations must specify—
    - (a) the descriptions of credits that may be used for offsetting a participant's activities,

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (b) the value of different descriptions of credit as regards the amount of the activities they are treated as offsetting, and
  - (c) the circumstances in which credits of any description may be used for the purposes of the trading scheme.
- (6) The regulations—
- (a) must contain provision for ensuring that credits used to offset activities under a trading scheme cannot be used by the participant for any other purpose;
  - (b) may enable credits to be cancelled by a person by whom they are held instead of being used for that purpose.

### *Payments*

- 8
- (1) The regulations may provide that a participant who does not have or acquire enough allowances or credits to match or offset the participant's activities in a trading period must pay an amount specified in or determined in accordance with the regulations within the period so specified.
  - (2) The regulations may require the payment to be made to—
    - (a) the administrator, or
    - (b) such other person as the regulations may specify.
  - (3) The provision that may be made about the amount of the payment includes, in particular, provision—
    - (a) for the amount to be determined by the administrator or a national authority;
    - (b) in a case where the payment is not made within the period specified in the regulations, for the amount to increase at the rate so specified until payment;
    - (c) for the amount of the payment, or of any amount by reference to which it is to be calculated, to be adjusted from time to time by reference to inflation or some other factor.
  - (4) Provision within sub-paragraph (3)(c) may refer, in particular, to an index or data specified in the regulations (including as modified from time to time after the regulations come into force).
  - (5) If the regulations provide for payments to be made to a person other than a national authority, they must provide for that person to pay the sums received to the national authority or authorities specified in or determined in accordance with the regulations.

### *Trading*

- 9
- (1) The regulations must provide for the participants in a trading scheme to trade in any allowances or credits under the scheme.
  - (2) The regulations may also provide for trading in the allowances or credits by third parties authorised in accordance with the regulations.
  - (3) The regulations must specify the circumstances in which trading is permitted.
  - (4) The regulations may require trading to be notified to the administrator of the trading scheme.

---

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

---

### *Permits*

- 10 (1) The regulations may provide that participants may only carry on activities to which the trading scheme applies, or specified activities to which the scheme applies, if they hold a permit.
- (2) The regulations may make provision about the issue, variation, transfer, surrender and revocation of permits.
- (3) The regulations may provide for conditions to be attached to permits.
- (4) References in this Schedule to the requirements of the scheme include requirements imposed by conditions attached to a permit.

### *Units under other schemes*

- 11 (1) The regulations may make provision for recognising any of the following as equivalent to allowances or credits under the trading scheme—
- (a) allowances, credits or certificates under another trading scheme for which provision is made by regulations under this Part of this Act;
  - (b) units under any other trading scheme (at United Kingdom, European or international level) relating to greenhouse gas emissions.
- (2) The regulations may provide—
- (a) for determining the value for the purposes of the scheme of any such allowances, credits, certificates or units, and
  - (b) for the use for the purposes of the scheme of any such allowances, credits, certificates or units to be subject to such conditions and limitations as may be specified in or determined in accordance with the regulations.

## **PART 2**

### **SCHEMES ENCOURAGING ACTIVITIES**

#### *Introductory*

- 12 This Part of this Schedule deals with trading schemes that operate by encouraging activities that consist of, or that cause or contribute, directly or indirectly to—
- (a) reductions in greenhouse gas emissions, or
  - (b) the removal of greenhouse gas from the atmosphere.

#### *Trading periods*

- 13 The regulations must specify the period or periods by reference to which the scheme is to operate (a “trading period”).

#### *Activities*

- 14 (1) The regulations must identify the activities to which the trading scheme applies.
- (2) The regulations may identify the activities by reference to any, or any combination of, criteria and in particular—

---

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

---

- (a) may identify the activities by reference to the locations or locations at which they are carried on, or
  - (b) may be expressed to apply to all activities of a particular kind carried on in the United Kingdom or a part of the United Kingdom.
- (3) The regulations must specify the units of measurement of the activities for the purposes of the scheme.
- (4) The regulations may specify units of measurement by reference to—
  - (a) the activities themselves,
  - (b) anything consumed or used for the purposes of the activities,
  - (c) anything produced by the activities, or
  - (d) any other consequence of the activities.
- (5) The regulations may, in particular, make provision—
  - (a) for activities to be measured by reference to the amount (in tonnes of carbon dioxide equivalent) of the reduction of greenhouse gas emissions, or removals of greenhouse gas from the atmosphere, for which those activities are to be regarded as responsible; and
  - (b) as to the method by which that amount is to be measured or calculated.
- (6) The regulations may make different provision in relation to different descriptions of activity to which the scheme applies.

#### *Participants*

- 15 (1) The regulations must identify the persons to whom the trading scheme applies (the “participants”).
- (2) The regulations—
  - (a) may identify the participants by reference to any, or any combination of, criteria, or
  - (b) provide for their identification by a specified person or body.
- (3) The regulations may provide for more than one person to be treated as a single participant.
- (4) The regulations may provide for persons to cease to be participants in circumstances specified in the regulations.

#### *Targets and obligations*

- 16 The regulations must, for each trading period—
  - (a) set a target for the total amount of the activities, and
  - (b) impose, or provide for the imposition of, an obligation on each participant in relation to the carrying on of a specified amount of the activities in the period.

#### *Certificates*

- 17 (1) The regulations must provide for the issue of certificates evidencing the carrying on of the activities in a trading period.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (2) The regulations may provide for certificates to evidence the carrying on of the activities—
  - (a) by the participant in question,
  - (b) by another participant in the trading scheme, or
  - (c) by a third party authorised in accordance with the regulations to obtain certificates for the purposes of the scheme.
- (3) The regulations must require each participant to have enough certificates at the end of each trading period to comply with the participant's obligations under the trading scheme.
- (4) The regulations must contain provision for ensuring that certificates used by a participant for that purpose cannot be used by the participant for any other purpose.
- (5) The regulations—
  - (a) may provide for the expiry of certificates after such period as may be specified in or determined in accordance with the regulations;
  - (b) may enable certificates to be cancelled by a person by whom they are held instead of being used for the purposes of a trading scheme.

#### *Payments*

- 18 (1) The regulations may provide that a participant who does not have enough certificates at the end of a trading period to comply with the participant's obligations under the trading scheme must pay an amount specified in or determined in accordance with the regulations within the period so specified.
- (2) The regulations may require the payment to be made to—
  - (a) the administrator, or
  - (b) such other person as the regulations may specify.
- (3) The provision that may be made about the amount of the payment includes, in particular, provision—
  - (a) for the amount to be determined by the administrator or a national authority;
  - (b) in a case where the payment is not made within the period specified in the regulations, for the amount to increase at the rate so specified until payment;
  - (c) for the amount of the payment, or of any amount by reference to which it is to be calculated, to be adjusted from time to time by reference to inflation or some other factor.
- (4) Provision within sub-paragraph (3)(c) may refer, in particular, to an index or data specified in the regulations (including as modified from time to time after the regulations come into force).
- (5) If the regulations provide for payments to be made to a person other than a national authority, they must provide for that person to pay the sums received to the national authority or authorities specified in or determined in accordance with the regulations.

#### *Trading*

- 19 (1) The regulations must provide for the participants in a trading scheme to trade in certificates.

---

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

---

- (2) The regulations may also provide for trading in certificates by third parties authorised in accordance with the regulations.
- (3) The regulations must specify the circumstances in which trading is permitted.
- (4) The regulations may require trading to be notified to the administrator of the trading scheme.

#### *Units under other schemes*

- 20 (1) The regulations may make provision for recognising any of the following as equivalent to certificates under the trading scheme—
  - (a) allowances, credits or certificates under another trading scheme for which provision is made by regulations under this Part of this Act;
  - (b) units under any other trading scheme (at United Kingdom, European or international level) relating to greenhouse gas emissions.
- (2) The regulations may provide—
  - (a) for determining the value for the purposes of the scheme of any such allowances, credits, certificates or units, and
  - (b) for the use for the purposes of the scheme of any such allowances, credits, certificates or units to be subject to such conditions and limitations as may be specified in or determined in accordance with the regulations.

### **PART 3**

#### ADMINISTRATION AND ENFORCEMENT

##### *The administrator*

- 21 (1) The regulations may appoint a person as the administrator of a trading scheme.
- (2) The regulations may confer or impose functions on the administrator for the purposes of the scheme.
- (3) Only the following may be appointed as the administrator of a trading scheme—
  - (a) the Secretary of State,
  - (b) the Scottish Ministers,
  - (c) the Welsh Ministers,
  - (d) the relevant Northern Ireland department,
  - (e) a body established by an enactment, or
  - (f) any combination of the above.
- (4) The same person may be appointed as the administrator of more than one trading scheme.
- (5) More than one person may be appointed as the administrator of the same trading scheme.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

### *Information*

- 22 (1) The regulations may require such information as may be specified in or determined in accordance with the regulations to be provided to—
- (a) the administrator of a trading scheme,
  - (b) a national authority, or
  - (c) participants or potential participants in the scheme,
- for purposes connected with the scheme.
- (2) The regulations may confer power on the administrator of a trading scheme to require information to be provided to any of those persons for those purposes.
- (3) The regulations must provide for a requirement by the administrator to provide information to be notified in writing to the person to whom it is made.
- (4) If the regulations confer functions on the administrator for the purposes of this paragraph, they may provide for the administrator to delegate the performance of any of those functions.
- (5) The regulations may provide for information held by or on behalf of the administrator of a trading scheme in connection with the administrator's functions to be disclosed to—
- (a) any other administrator of the scheme,
  - (b) the administrator of another trading scheme, or
  - (c) a national authority.

### *Registers*

- 23 (1) The regulations may provide for the creation and maintenance of a register or registers of information relating to a trading scheme and, in particular, for the register or registers to keep track of any of the following—
- (a) the participants in a trading scheme;
  - (b) any limits on or obligations applying to the participants' activities under the scheme;
  - (c) any allocation of allowances among the participants;
  - (d) the allowances, credits, certificates or other units held by the participants or others;
  - (e) trading in allowances, credits, certificates or other units;
  - (f) the use by the participants or others of allowances, credits, certificates or other units for the purposes of the scheme;
  - (g) the cancellation of allowances, credits, certificates or other units;
  - (h) permits held by the participants, and any conditions attached to those permits.
- (2) The regulations may, in particular, provide for the establishment and maintenance of accounts in which allowances, credits, certificates or other units may be held by the participants, the administrator or others and between which they may be transferred.
- (3) The regulations may provide for the same register to operate in relation to more than one trading scheme.
- (4) The regulations may make provision for the disclosure of information held in or derived from a register relating to a trading scheme—

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

- (a) for the purposes of the administration of another trading scheme for which provision is made by regulations under this Part of this Act, or
- (b) for the purposes of the administration of any other trading scheme (at United Kingdom, European or international level) relating to greenhouse gas emissions.

#### *Publication of information*

- 24 The regulations may confer or impose functions on the administrator of a trading scheme in relation to the publication of information relating to the scheme or its participants (including, in particular, information supplied to the administrator by the participants and others).

#### *Acquisition of units by the administrator*

- 25 The regulations may confer powers on the administrator of a trading scheme to acquire—
- (a) allowances, credits or certificates under another trading scheme for which provision is made by regulations under this Part of this Act, or
  - (b) units under any other trading scheme (at United Kingdom, European or international level) relating to greenhouse gas emissions.

#### *Charges*

- 26 (1) The regulations may—
- (a) require the payment by participants or other persons authorised to trade in allowances, credits or certificates of charges of an amount determined by or under the regulations by reference to the costs of operating the scheme, and
  - (b) provide for such charges to be imposed by—
    - (i) a national authority,
    - (ii) the administrator of the scheme, or
    - (iii) such other person as may be specified in or determined in accordance with the regulations.
- (2) If the regulations provide for charges to be payable to a person other than a national authority, they must provide for that person to pay the sums received to the national authority or authorities specified in or determined in accordance with the regulations.

#### *Monitoring compliance*

- 27 (1) The regulations may make provision for monitoring compliance with the requirements of a trading scheme.
- (2) The regulations may, in particular, make provision about—
- (a) the keeping of records by the participants,
  - (b) the provision of information by the participants and others,
  - (c) the audit and verification of that information, and
  - (d) the inspection of premises.
- (3) If the regulations confer functions on the administrator of the scheme for the purposes of this paragraph, they may provide for the administrator to delegate the performance of any of those functions.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

### *Enforcement*

- 28 (1) The regulations may confer powers on a person to whom this paragraph applies to—
- (a) require the production of documents or the provision of information,
  - (b) question the officers of a company,
  - (c) enter premises with a warrant, or
  - (d) seize documents or records.
- (2) The regulations must provide that the power in question may only be exercised where the person on whom it is conferred reasonably believes there has been a failure to comply with the requirements of a trading scheme.
- (3) This paragraph applies to—
- (a) a national authority,
  - (b) the administrator of the scheme, and
  - (c) such other person as may be specified in or determined in accordance with the regulations.

### *Penalties*

- 29 (1) The regulations may provide that a person is liable to a financial or other penalty if the person fails to comply with the requirements of a trading scheme.
- (2) The regulations may—
- (a) specify the amount of any financial penalty, or
  - (b) provide for the amount of any financial penalty to be determined in accordance with the regulations.
- (3) If the regulations provide for financial penalties to be payable to a person other than a national authority, they must provide for that person to pay the sums received to the national authority or authorities specified in or determined in accordance with the regulations.

### *Offences*

- 30 (1) The regulations may create offences relating to trading schemes.
- (2) The regulations may provide for such an offence to be triable—
- (a) only summarily, or
  - (b) either summarily or on indictment.
- (3) The regulations may provide for such an offence to be punishable on summary conviction—
- (a) with imprisonment for a term not exceeding such period as is specified in the regulations (which may not exceed the normal maximum term),
  - (b) with a fine not exceeding such amount as is so specified (which may not exceed £50,000), or
  - (c) with both.
- (4) The “normal maximum term” means—
- (a) in relation to England and Wales—
    - (i) in the case of an offence triable only summarily, 51 weeks, and

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (ii) in the case of an offence triable either summarily or on indictment, twelve months;
  - (b) in relation to Scotland—
    - (i) in the case of an offence triable only summarily, 6 months, and
    - (ii) in the case of an offence triable either summarily or on indictment, twelve months;
  - (c) in relation to Northern Ireland, six months.
- (5) Regulations that—
- (a) are made before the date on which section 281(5) of the Criminal Justice Act 2003 (c. 44) comes into force, and
  - (b) in relation to England and Wales, make provision for a summary offence to be punishable with a term of imprisonment exceeding six months,
- must provide that, where the offence is committed before that date, it is punishable with imprisonment for a term not exceeding six months.
- (6) Regulations that—
- (a) are made before the date on which [<sup>F27</sup>paragraph 24(2) of Schedule 22 to the Sentencing Act 2020] comes into force, and
  - (b) in relation to England and Wales, make provision for an offence triable either summarily or on indictment to be punishable on summary conviction with a term of imprisonment exceeding six months,
- must provide that, where the offence is committed before that date, it is punishable on summary conviction with imprisonment for a term not exceeding six months.
- (7) The regulations may provide for an offence to be punishable on indictment—
- (a) with imprisonment for a term not exceeding such period as is specified in the regulations (which may not exceed five years),
  - (b) with a fine, or
  - (c) with both.
- (8) The regulations may—
- (a) provide for defences against offences, and
  - (b) make provision about matters of procedure and evidence in proceedings relating to offences.

#### Textual Amendments

**F27** Words in [Sch. 2 para. 30\(6\)\(a\)](#) substituted (1.12.2020) by [Sentencing Act 2020 \(c. 17\), s. 416\(1\), Sch. 24 para. 443\(1\)](#) (with [Sch. 24 para. 447, Sch. 27](#)); [S.I. 2020/1236, reg. 2](#)

#### Appeals

- 31 (1) The regulations may confer rights of appeal against—
- (a) decisions made in relation to a trading scheme, and
  - (b) civil penalties imposed or enforcement action taken for failure to comply with the requirements of a trading scheme.
- (2) The regulations must specify the court, tribunal or person who is to hear and determine appeals in relation to a trading scheme.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (3) The regulations may, in particular, provide for appeals in relation to a trading scheme to be heard by—
- (a) a national authority, if not the administrator of the trading scheme, or
  - (b) a person appointed by a national authority for that purpose.
- (4) They may provide for an appeal to be determined by a person other than the person by whom the appeal was heard.

### SCHEDULE 3

Section 49

#### TRADING SCHEMES REGULATIONS: FURTHER PROVISIONS

#### PART 1

##### REGULATIONS MADE BY A SINGLE NATIONAL AUTHORITY

- 1 This Part of this Schedule applies in relation to an instrument containing regulations under this Part of this Act made by a single national authority.
- 2 (1) Where the instrument contains regulations that—
- (a) are to be made by the Secretary of State, and
  - (b) are subject to affirmative resolution procedure,
- the regulations must not be made unless a draft of the statutory instrument containing them has been laid before and approved by a resolution of each House of Parliament.
- (2) Where the instrument contains regulations that—
- (a) are to be made by a national authority other than the Secretary of State, and
  - (b) are subject to affirmative resolution procedure,
- the regulations must not be made unless a draft of the statutory instrument containing them has been laid before and approved by a resolution of the relevant devolved legislature.
- 3 (1) An instrument containing regulations made by the Secretary of State that are subject to negative resolution procedure is subject to annulment in pursuance of a resolution of either House of Parliament.
- (2) An instrument containing regulations made by the Scottish Ministers that are subject to negative resolution procedure is subject to annulment in pursuance of a resolution of the Scottish Parliament.
- (3) An instrument containing regulations made by the Welsh Ministers that are subject to negative resolution procedure is subject to annulment in pursuance of a resolution of the National Assembly for Wales.
- (4) An instrument containing regulations made by a Northern Ireland department that are subject to negative resolution procedure is subject to negative resolution within the meaning of section 41(6) of the Interpretation Act (Northern Ireland) 1954 (c. 33 (N.I.)) as if it were a statutory instrument within the meaning of that Act.
- 4 Any provision that may be made by regulations subject to negative resolution procedure may be made by regulations subject to affirmative resolution procedure.

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

## PART 2

### REGULATIONS MADE BY TWO OR MORE NATIONAL AUTHORITIES

- 5 This Part of this Schedule applies in relation to an instrument containing regulations under this Part of this Act made or to be made by any two or more of—
- (a) the Secretary of State,
  - (b) the Welsh Ministers, and
  - (c) a Northern Ireland department.
- 6 If any of the regulations are subject to affirmative resolution procedure, all of them are subject to that procedure.
- 7 Paragraphs 2 and 3 (affirmative and negative resolution procedure) apply to the instrument as they apply to an instrument containing regulations made by a single national authority.
- 8 (1) If in accordance with paragraph 3 (negative resolution procedure)—
- (a) either House of Parliament resolves that an address be presented to Her Majesty praying that an instrument containing regulations made by the Secretary of State be annulled, or
  - (b) a devolved legislature resolves that an instrument containing regulations made by a national authority be annulled,
- nothing further is to be done under the instrument after the date of the resolution and Her Majesty may by Order in Council revoke the instrument.
- (2) This is without prejudice to the validity of anything previously done under the instrument or to the making of a new instrument.
- (3) This paragraph applies in place of provision made by any other enactment about the effect of such a resolution.

## PART 3

### POWER TO MAKE PROVISION BY ORDER IN COUNCIL

- 9 (1) Her Majesty may by Order in Council make provision for trading schemes.
- (2) That power may only be exercised to make an Order in Council—
- (a) that extends or applies both to Scotland and to one or more of England, Wales and Northern Ireland, or
  - (b) that extends to Scotland only and contains both provision within the legislative competence of the Scottish Parliament and provision outside that competence.
- (3) The provision that may be made by an Order in Council under this paragraph includes any provision that may be made by a national authority by regulations under this Part of this Act.
- 10 No recommendation is to be made to Her Majesty in Council to make an Order in Council under paragraph 9 unless the requirements of section 48(1) and (2) as to advice and consultation have been complied with.

---

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

---

- 11 (1) This paragraph applies to an Order in Council under paragraph 9 containing any provision that, were it to be made by regulations under this Part of this Act, would be subject to affirmative resolution procedure.
- (2) No recommendation is to be made to Her Majesty in Council to make an Order in Council to which this paragraph applies unless—
- (a) in the case of an Order in Council containing provision that may be made by the Secretary of State by regulations under this Part of this Act, a draft of the statutory instrument containing the Order in Council has been laid before, and approved by a resolution of, each House of Parliament, and
  - (b) in the case of an Order in Council containing provision that may be made by a national authority other than the Secretary of State by regulations under this Part of this Act, a draft of the statutory instrument containing the Order in Council has been laid before, and approved by a resolution of, the relevant devolved legislature.
- 12 (1) This paragraph applies to an Order in Council under paragraph 9 other than one to which paragraph 11 applies.
- (2) An Order in Council to which this paragraph applies containing provision that may be made by the Secretary of State by regulations under this Part of this Act is subject to annulment in pursuance of a resolution of either House of Parliament.
- (3) An Order in Council to which this paragraph applies containing provision that may be made by the Scottish Ministers by regulations under this Part of this Act is subject to annulment in pursuance of a resolution of the Scottish Parliament.
- (4) An Order in Council to which this paragraph applies containing provision that may be made by the Welsh Ministers by regulations under this Part of this Act is subject to annulment in pursuance of a resolution of the National Assembly for Wales.
- (5) An Order in Council to which this paragraph applies containing provision that may be made by a Northern Ireland department by regulations under this Part of this Act is subject to negative resolution within the meaning of section 41(6) of the Interpretation Act (Northern Ireland) 1954 (c. 33 (N.I.)) as if it were a statutory instrument within the meaning of that Act.
- 13 (1) If in accordance with paragraph 12—
- (a) either House of Parliament resolves that an address be presented to Her Majesty praying that an Order in Council be annulled, or
  - (b) a devolved legislature resolves that an Order in Council be annulled,
- nothing further is to be done under the Order in Council after the date of the resolution and Her Majesty may by Order in Council revoke it.
- (2) This is without prejudice to the validity of anything previously done under the Order in Council or to the making of a new Order in Council.
- (3) This paragraph applies in place of provision made by any other enactment about the effect of such a resolution.

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

## SCHEDULE 4

Section 50

### TRADING SCHEMES: POWERS TO REQUIRE INFORMATION

#### *Introductory*

- 1 [F28(1) The powers conferred by this Schedule are exercisable by the following authorities—
- (a) the Secretary of State;
  - (b) the Scottish Ministers;
  - (c) the relevant Northern Ireland department;
  - (d) the Welsh Ministers;
  - (e) the Environment Agency;
  - (f) the Scottish Environment Protection Agency.
- (2) References in this Schedule to an “environmental authority” are to any of those authorities.]

#### **Textual Amendments**

**F28** Sch. 4 paras. 1-5 ceased to have effect (26.1.2009) by virtue of [Climate Change Act 2008 \(c. 27\)](#), [ss. 50\(2\), 100\(5\)](#)

#### *Information from electricity suppliers and distributors*

- 2 [F28(1) An environmental authority may, for the purposes of enabling a trading scheme to be established, by notice require an electricity supplier or electricity distributor to provide any of the following information—
- (a) information about the electricity meters and metering systems for which the supplier or distributor is responsible, including (in particular) their locations and any identifying features;
  - (b) information about the persons to whom electricity measured by those meters or systems is supplied or who purchase such electricity;
  - (c) information about the consumption by those persons of that electricity;
  - (d) any other information that the environmental authority considers necessary for identifying the potential participants in the scheme.
- (2) An “electricity supplier”—
- (a) in relation to England and Wales and Scotland means an authorised supplier within the meaning of the Electricity Act 1989 (c. 29) (see section 64(1) of that Act);
  - (b) in relation to Northern Ireland means—
    - (i) an electricity supplier within the meaning of the Electricity (Northern Ireland) Order 1992 (S.I. 1992/231) (N.I. 1) (see Article 3 of that Order), or
    - (ii) a person who may supply electricity to premises without a licence by virtue of an exemption under Article 9 of that Order.
- (3) An “electricity distributor”—

*Status: This version of this Act contains provisions that are prospective.*

**Changes to legislation:** Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

- (a) in relation to England and Wales and Scotland means an authorised distributor within the meaning of the Electricity Act 1989 (see section 64(1) of that Act);
  - (b) in relation to Northern Ireland means an electricity distributor within the meaning of the Electricity (Northern Ireland) Order 1992 (see Article 3 of that Order).
- (4) References in this Schedule to an electricity supplier or electricity distributor include an agent of such a supplier or distributor.]

#### Textual Amendments

**F28** Sch. 4 paras. 1-5 ceased to have effect (26.1.2009) by virtue of [Climate Change Act 2008 \(c. 27\)](#), [ss. 50\(2\), 100\(5\)](#)

#### *Information from potential participants in a trading scheme*

- 3 [F28(1) An environmental authority may, for the purposes of enabling a trading scheme to be established, by notice require a potential participant in the scheme to provide any of the following information—
- (a) information about whether the criteria specified in the notice are met by the potential participant, either alone or together with any other person or persons;
  - (b) information identifying any potential co-participant;
  - (c) contact details for the potential participant and any potential co-participant;
  - (d) information about the meters that measure electricity supplied to or purchased by the potential participant or any potential co-participant;
  - (e) information about the consumption of electricity by the potential participant and any potential co-participant;
  - (f) information about any climate change agreement (within the meaning of Schedule 6 to the Finance Act 2000 (c. 17)) entered into by or on behalf of the potential participant or any potential co-participant.
- (2) A “potential participant”, in relation to a trading scheme, means a person who the environmental authority considers—
- (a) will or may be a participant in the scheme, or
  - (b) will or may fall to be treated together with any other person or persons (a “potential co-participant”) as such a participant.]

#### Textual Amendments

**F28** Sch. 4 paras. 1-5 ceased to have effect (26.1.2009) by virtue of [Climate Change Act 2008 \(c. 27\)](#), [ss. 50\(2\), 100\(5\)](#)

#### *Requirements for a valid notice*

- 4 [F28(1) A notice under this Schedule must comply with the following requirements.
- (2) The notice must—
- (a) be in writing,

*Status: This version of this Act contains provisions that are prospective.*

**Changes to legislation:** Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

- (b) specify the information to be provided,
  - (c) specify the name and address of the person to whom the information is to be provided,
  - (d) specify the date by which the information is to be provided, and
  - (e) explain the consequences of failure to comply with the notice.
- (3) An environmental authority must not give a notice requiring information from a person unless—
- (a) the authority has previously sent the person a request in writing for the information, and
  - (b) the person has failed to provide the information within the period of 28 days beginning with the day on which the request was sent.]

#### Textual Amendments

**F28** Sch. 4 paras. 1-5 ceased to have effect (26.1.2009) by virtue of [Climate Change Act 2008 \(c. 27\)](#), ss. [50\(2\)](#), [100\(5\)](#)

#### *Failure to comply with notice etc an offence*

- 5 [F28(1) A person who—
- (a) fails without reasonable excuse to comply with a notice under this Schedule, or
  - (b) provides information in response to such a notice that the person knows or suspects to be false or misleading, commits an offence.
- (2) A person guilty of such an offence is liable on summary conviction to a fine not exceeding level 5 on the standard scale.]

#### Textual Amendments

**F28** Sch. 4 paras. 1-5 ceased to have effect (26.1.2009) by virtue of [Climate Change Act 2008 \(c. 27\)](#), ss. [50\(2\)](#), [100\(5\)](#)

#### *Disclosure of information*

- 6 (1) This paragraph applies to information obtained by an environmental authority (whether or not pursuant to a notice under this Schedule) from—
- (a) an electricity supplier or electricity distributor, or
  - (b) a potential participant,
- for the purposes of enabling a trading scheme to be established.
- (2) The information may be disclosed for the purposes of or in connection with the establishment, operation or enforcement of a trading scheme—
- (a) by an environmental authority to another environmental authority or the administrator of the scheme, or
  - (b) by the administrator of the scheme to any other administrator of the scheme or an environmental authority.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (3) This does not affect any other right to disclose information within sub-paragraph (1) apart from this paragraph.

## F29 SCHEDULE 5

Section 71

### Textual Amendments

**F29** Sch. 5 repealed (15.1.2012) by [Localism Act 2011 \(c. 20\)](#), ss. 47(a), 240(1)(e), [Sch. 25 Pts. 8](#)

## SCHEDULE 6

Section 77

### CHARGES FOR [F10 CARRIER BAGS]

#### PART 1

#### POWERS TO MAKE REGULATIONS ABOUT CHARGES

##### *General power*

- 1 The relevant national authority may make provision by regulations about charging by sellers of goods for the supply of [F10 carrier bags].

##### *Requirement to charge*

- 2 The regulations may make provision requiring sellers of goods to charge for [F10 carrier bags] supplied—
- [F30(a) at a place where goods are sold, for the purpose of enabling goods to be taken away, or]
  - [F30(b) for the purpose of enabling goods to be delivered.]

### Textual Amendments

**F30** Sch. 6 para. 2(a)(b) substituted (N.I.) (28.4.2014) by [Carrier Bags Act \(Northern Ireland\) 2014 \(c. 7\)](#), [s. 3\(1\)](#)

- [F31]2A The regulations may make provision for treating carrier bags as having been supplied for the purpose of enabling goods to be taken away if the carrier bags have been designed for that purpose.]

### Textual Amendments

**F31** Sch. 6 para. 2A inserted (N.I.) (28.4.2014) by [Carrier Bags Act \(Northern Ireland\) 2014 \(c. 7\)](#), [s. 3\(2\)](#)

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

### *Sellers of goods*

- 3 (1) “Seller”, in relation to goods, has the meaning given by the regulations which may define that term by reference (in particular) to—
- (a) a person's involvement in selling the goods,
  - (b) a person's interest in the goods, or
  - (c) a person's interest in the place at or from which the goods are sold,
- or any combination of those factors.
- (2) The regulations may make provision for regulations under this Schedule to apply—
- (a) to all sellers of goods,
  - (b) to sellers of goods named in the regulations,
  - (c) to sellers of goods identified by reference to specified factors, or
  - (d) to sellers of goods within paragraph (b) and sellers of goods within paragraph (c).
- (3) The specified factors may include—
- (a) the place or places at or from which a seller supplies goods;
  - (b) the type of goods that a seller supplies;
  - (c) the value of goods that a seller supplies;
  - (d) a seller's turnover or any part of that turnover.
  - <sup>F32</sup>(e) the number of a seller's full-time equivalent employees.]
- (4) In this Schedule “specified” means specified in regulations under this Schedule.
- <sup>F33</sup>(5) For the purposes of sub-paragraph (3)(e), the number of a seller's full-time equivalent employees is calculated as follows—
- Step 1* Find the number for full-time employees of the seller.
  - Step 2* Add, for each employee of the seller who is not a full-time employee, such fraction as is just and reasonable. The result is the number of full-time equivalent employees.]

#### **Textual Amendments**

- F32** Sch. 6 para. 3(5) inserted (N.I.) (28.4.2014) by [Carrier Bags Act \(Northern Ireland\) 2014 \(c. 7\), s. 4\(3\)](#)  
**F33** Sch. 6 para. 3(3)(e) inserted (N.I.) (28.4.2014) by [Carrier Bags Act \(Northern Ireland\) 2014 \(c. 7\), s. 4\(2\)](#)

### *Amount of charge*

- 4 The regulations may specify the minimum amount that a seller must charge for each <sup>F23</sup>carrier bag], or provide for that amount to be determined in accordance with the regulations.

#### **Textual Amendments**

- F23** Words in Act substituted (N.I.) (28.4.2014) by [Carrier Bags Act \(Northern Ireland\) 2014 \(c. 7\), s. 1\(a\)](#)

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

### *Destination of proceeds – Wales*

[<sup>F34</sup>4A (1) This paragraph applies to regulations made by the Welsh Ministers in relation to Wales.

(2) The regulations may provide for the application of the net proceeds of the charge to specified purposes.

[ The regulations may—

<sup>F35</sup>(2A) (a) provide for the time when and manner in which the gross or net proceeds of the charge are to be paid to the Department;  
(b) provide for the payment of interest for late payment of the gross or net proceeds of the charge to the Department.]

(3) Regulations under sub-paragraph (2) may (among other things)–

- (a) require sellers to apply the net proceeds of the charge to any one or more specified purposes;
- (b) provide for any duty imposed under paragraph (a) to be discharged (subject to any provision made under paragraph (c)) by the net proceeds of the charge being accepted by any one or more of the following persons–
  - (i) specified persons;
  - (ii) persons who fall within a specified category of person;
- (c) make provision about the arrangements under which the net proceeds of the charge are to be given by sellers to the persons mentioned in paragraph (b) or any other person;
- (d) require persons who accept any net proceeds of the charge under paragraph (b) to apply the proceeds to any one or more specified purposes;
- (e) provide for recovery by the Welsh Ministers of sums equal to the proceeds of the charge that have been accepted or applied otherwise than in accordance with provision made under sub-paragraph (2);
- (f) provide for the application of sums recovered under paragraph (e) to specified purposes (this includes making provision to the effect that such sums are not to be paid into the Welsh Consolidated Fund);
- (g) require the Welsh Ministers to give guidance about compliance with the regulations.

(4) The purposes that may be specified under sub-paragraph (2) are limited to purposes relating to any of the following–

- (a) preventing or reducing waste;
- (b) the collection, management, treatment or disposal of waste;
- (c) protecting or improving the environment in relation to pollution or nuisances;
- (d) educational or recreational activities for children or young people which relate to any of the matters specified in paragraphs (a) to (c).

(5) But purposes concerning the production of renewable energy for consumption in transport or the use of that energy in transport may not be specified under sub-paragraph (2).

(6) The regulations may make provision for regulations under this Schedule to apply to persons other than sellers, if the Welsh Ministers consider that such provision is appropriate for the enforcement of provision made under sub-paragraph (2) or for otherwise making such provision effective.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (7) The specified factors under paragraph 3(2)(c) may also include—
- (a) a seller's arrangements for applying the net proceeds of the charge, or
  - (b) any other factor that the Welsh Ministers consider appropriate, whether or not that factor is of the same kind as the factors listed in that paragraph.
- (8) The regulations may provide for exceptions and exemptions.]

#### Textual Amendments

- F34** Sch. 6 paras. 4A, 4B inserted (E.W.) (15.2.2011) by [Waste \(Wales\) Measure 2010 \(nawm 8\), ss. 1\(2\), 21\(2\)](#)
- F35** Sch. 6 para. 4A(2A) inserted (N.I.) (28.4.2014) by [Carrier Bags Act \(Northern Ireland\) 2014 \(c. 7\), s. 5](#)

[<sup>F36</sup>4A (1) This paragraph applies to regulations made by the Department in relation to Northern Ireland.

- (2) The regulations may require the seller to pay to the Department—
- (a) the gross proceeds of the charge, or
  - (b) the net proceeds of the charge.
- (3) Paragraph 7(3)(c) does not apply to any amount required by regulations made under this paragraph to be paid to the Department.
- (4) In this paragraph—
- “ the Department ” means the Department of the Environment in Northern Ireland;
  - “ gross proceeds of the charge ” means the amount received by the seller by way of charges for [<sup>F10</sup> carrier bags ] ;
  - “ net proceeds of the charge ” means the seller's gross proceeds of the charge reduced by such amounts as may be specified. ]

#### Textual Amendments

- F36** Sch. 6 para. 4A inserted (N.I.) (4.5.2011) by [Single Use Carrier Bags Act \(Northern Ireland\) 2011 \(c. 26\), s. 1\(1\)](#)

#### *Interpretation of paragraph 4A*

- [<sup>F34</sup>4B (1) This paragraph applies for the purposes of paragraph 4A.
- (2) “ Children ” means persons who have not attained the age of 18.
- (3) “ Pollution ” means pollution of the air, water or land which may give rise to any environmental harm, including (but not limited to) pollution caused by light, noise, heat or vibrations or any other kind of release of energy.
- (4) For the purposes of the definition in sub-paragraph (3), “ environmental harm ” means any of the following—
- (a) harm to the health of humans and other living organisms;
  - (b) harm to the quality of the environment, including—
    - (i) harm to the quality of the environment taken as a whole,

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (ii) harm to the quality of the air, water or land, and
  - (iii) other impairment of, or interference with, the ecological systems of which any living organisms form part;
  - (c) offence to the senses of human beings;
  - (d) damage to property;
  - (e) impairment of, or interference with, the amenity of the environment or any legitimate use of the environment.
- (5) For the purposes of sub-paragraphs (3) and (4), “ air ” includes (but is not limited to) air within buildings and air within other natural or man-made structures above or below ground.
- (6) “ Nuisance ” means an act or omission affecting any place, or a state of affairs in any place, which may impair, or interfere with, the amenity of the environment or any legitimate use of the environment.
- (7) “ Net proceeds of the charge ” has the same meaning as in paragraph 7(4).
- (8) “ Young people ” means persons who have attained the age of 18, but not the age of 25. ]

### *Administration*

- 6 (1) The regulations may appoint a person (an “administrator”) to administer provision made by regulations under this Schedule.
- (2) More than one person may be appointed as administrator.
- (3) The regulations may confer or impose powers or duties on an administrator and may (in particular) do so—
- (a) by making modifications to any enactment applying to the administrator, or
  - (b) by providing for any such enactment to apply, with or without modifications, for the purposes of regulations under this Schedule.
- (4) References in this Schedule to an administrator include a person appointed by an administrator.

### *Record-keeping and publication of records*

- 7 (1) The regulations may require records to be kept relating to charges made for [<sup>F10</sup>carrier bags].
- (2) The regulations may require—
- (a) the records, or such other information as may be specified, to be published at such times and in such manner as may be specified;
  - (b) the records, or such other information as may be specified, to be supplied on request and in such manner as may be specified to—
    - (i) the relevant national authority,
    - (ii) an administrator, or
    - (iii) members of the public.
- (3) The regulations may (in particular) require the publication or supply of records or information relating to any of the following—
- (a) the amount received by a seller by way of charges for [<sup>F10</sup>carrier bags];
  - (b) the seller's gross or net proceeds of the charge;
  - (c) the uses to which the net proceeds of the charge have been put.
  - [<sup>F41</sup>(d) payments of the gross or net proceeds of the charge made to the Department of the Environment in Northern Ireland.]
- [<sup>F42</sup>(3A) Regulations made by the Welsh Ministers may also require the publication or supply of records or information relating to the amount received by a person from a seller by way of net proceeds of the charge to be applied to purposes specified under paragraph 4A(2).]
- (4) In this paragraph—
- “gross proceeds of the charge” means the amount received by the seller by way of charges for [<sup>F10</sup>carrier bags];
  - “net proceeds of the charge” means the seller's gross proceeds of the charge reduced by such amounts as may be specified.

## **PART 2**

### CIVIL SANCTIONS

#### *Civil sanctions*

- 9 (1) The relevant national authority may make provision by regulations about civil sanctions for breaches of regulations under this Schedule.
- (2) For the purposes of this Schedule a person breaches regulations under this Schedule if, in such circumstances as may be specified, the person—
- (a) fails to comply with a requirement made by or under the regulations, or
  - (b) obstructs or fails to assist an administrator.
- (3) In this Schedule “civil sanction” means—
- (a) a fixed monetary penalty (see paragraph 10), or
  - (b) a discretionary requirement (see paragraph 12).

---

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

---

### *Fixed monetary penalties*

- 10 (1) The regulations may make provision conferring on an administrator the power by notice to impose a fixed monetary penalty on a person who breaches regulations under this Schedule.
- (2) The regulations may only confer such a power in relation to a case where the administrator is satisfied on the balance of probabilities that the breach has occurred.
- (3) For the purposes of this Schedule a “fixed monetary penalty” is a requirement to pay to an administrator a penalty of an amount specified in or determined in accordance with the regulations.
- (4) The regulations may not provide for the imposition of a fixed monetary penalty in excess of £5,000.

### *Fixed monetary penalties: procedure*

- 11 (1) Provision under paragraph 10 must secure that—
- (a) where an administrator proposes to impose a fixed monetary penalty on a person, the administrator must serve on that person a notice of what is proposed (a “notice of intent”) that complies with sub-paragraph (2),
  - (b) the notice of intent also offers the person the opportunity to discharge the person's liability for the fixed monetary penalty by payment of a specified sum (which must be less than or equal to the amount of the penalty),
  - (c) if the person does not so discharge liability—
    - (i) the person may make written representations and objections to the administrator in relation to the proposed imposition of the fixed monetary penalty, and
    - (ii) the administrator must at the end of the period for making representations and objections decide whether to impose the fixed monetary penalty,
  - (d) where the administrator decides to impose the fixed monetary penalty, the notice imposing it (“the final notice”) complies with sub-paragraph (4), and
  - (e) the person on whom a fixed monetary penalty is imposed may appeal against the decision to impose it.
- (2) To comply with this sub-paragraph the notice of intent must include information as to—
- (a) the grounds for the proposal to impose the fixed monetary penalty,
  - (b) the effect of payment of the sum referred to in sub-paragraph (1)(b),
  - (c) the right to make representations and objections,
  - (d) the circumstances in which the administrator may not impose the fixed monetary penalty,
  - (e) the period within which liability to the fixed monetary penalty may be discharged, which may not exceed the period of 28 days beginning with the day on which the notice of intent was received, and
  - (f) the period within which representations and objections may be made, which may not exceed the period of 28 days beginning with the day on which the notice of intent was received.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (3) Provision pursuant to sub-paragraph (1)(c)(ii) must include provision for circumstances in which the administrator may not decide to impose a fixed monetary penalty.
- (4) To comply with this sub-paragraph the final notice referred to in sub-paragraph (1)(d) must include information as to—
  - (a) the grounds for imposing the penalty,
  - (b) how payment may be made,
  - (c) the period within which payment must be made,
  - (d) any early payment discounts or late payment penalties,
  - (e) rights of appeal, and
  - (f) the consequences of non-payment.
- (5) Provision pursuant to sub-paragraph (1)(e) must secure that the grounds on which a person may appeal against a decision of the administrator include the following—
  - (a) that the decision was based on an error of fact;
  - (b) that the decision was wrong in law;
  - (c) that the decision was unreasonable.

#### *Discretionary requirements*

- 12 (1) The regulations may make provision conferring on an administrator the power by notice to impose one or more discretionary requirements on a person who breaches regulations under this Schedule.
- (2) The regulations may only confer such a power in relation to a case where the administrator is satisfied on the balance of probabilities that the breach has occurred.
- (3) For the purposes of this Schedule a “discretionary requirement” means—
  - (a) a requirement to pay a monetary penalty to an administrator of such amount as the administrator may determine, or
  - (b) a requirement to take such steps as an administrator may specify, within such period as the administrator may specify, to secure that the breach does not continue or recur.
- (4) In this Schedule—
 

“variable monetary penalty” means a requirement referred to in sub-paragraph (3)(a);

“non-monetary discretionary requirement” means a requirement referred to in sub-paragraph (3)(b).
- (5) The regulations must, in relation to each kind of breach of regulations under this Schedule for which a variable monetary penalty may be imposed—
  - (a) specify the maximum penalty that may be imposed for a breach of that kind, or
  - (b) provide for that maximum to be determined in accordance with the regulations.
- (6) The regulations may not permit discretionary requirements to be imposed on a person on more than one occasion in relation to the same act or omission.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

*Discretionary requirements: procedure*

- 13 (1) Provision under paragraph 12 must secure that—
- (a) where an administrator proposes to impose a discretionary requirement on a person, the administrator must serve on that person a notice of what is proposed (a “notice of intent”) that complies with sub-paragraph (2),
  - (b) that person may make written representations and objections to the administrator in relation to the proposed imposition of the discretionary requirement,
  - (c) after the end of the period for making such representations and objections, the administrator must decide whether to—
    - (i) impose the discretionary requirement, with or without modifications, or
    - (ii) impose any other discretionary requirement that the administrator has power to impose under paragraph 12,
  - (d) where the administrator decides to impose a discretionary requirement, the notice imposing it (the “final notice”) complies with sub-paragraph (4), and
  - (e) the person on whom a discretionary requirement is imposed may appeal against the decision to impose it.
- (2) To comply with this sub-paragraph the notice of intent must include information as to—
- (a) the grounds for the proposal to impose the discretionary requirement,
  - (b) the right to make representations and objections,
  - (c) the circumstances in which the administrator may not impose the discretionary requirement,
  - (d) the period within which representations and objections may be made, which may not be less than the period of 28 days beginning with the day on which the notice of intent is received.
- (3) Provision pursuant to sub-paragraph (1)(c) must include provision for circumstances in which the administrator may not decide to impose a fixed monetary penalty.
- (4) To comply with this sub-paragraph the final notice referred to in sub-paragraph (1)(d) must include information as to—
- (a) the grounds for imposing the discretionary requirement,
  - (b) where the discretionary requirement is a variable monetary penalty—
    - (i) how payment may be made,
    - (ii) the period within which payment must be made, and
    - (iii) any early payment discounts or late payment penalties,
  - (c) rights of appeal, and
  - (d) the consequences of non-compliance.
- (5) Provision pursuant to sub-paragraph (1)(e) must secure that the grounds on which a person may appeal against a decision of the administrator include the following—
- (a) that the decision was based on an error of fact;
  - (b) that the decision was wrong in law;
  - (c) in the case of a variable monetary penalty, that the amount of the penalty is unreasonable;
  - (d) in the case of a non-monetary discretionary requirement, that the nature of the requirement is unreasonable;

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (e) that the decision was unreasonable for any other reason.

*Discretionary requirements: enforcement*

- 14 (1) Provision under paragraph 12 may include provision for a person to pay a monetary penalty (a “non-compliance penalty”) to an administrator if the person fails to comply with a non-monetary discretionary requirement imposed on the person.
- (2) Provision under sub-paragraph (1) may—
- (a) specify the amount of the non-compliance penalty or provide for that amount to be determined in accordance with the regulations, or
  - (b) provide for the amount to be determined by the administrator or in some other way.
- (3) If the regulations make provision within sub-paragraph (2)(b), they must, in relation to each kind of failure for which a non-compliance penalty may be imposed—
- (a) specify the maximum penalty that may be imposed for a failure of that kind, or
  - (b) provide for that maximum to be determined in accordance with the regulations.
- (4) Provision under sub-paragraph (1) must secure that—
- (a) the non-compliance penalty is imposed by notice served by the administrator, and
  - (b) the person on whom it is imposed may appeal against that notice.
- (5) Provision pursuant to paragraph (b) of sub-paragraph (4) must secure that the grounds on which a person may appeal against a notice referred to in that sub-paragraph include the following—
- (a) that the decision to serve the notice was based on an error of fact;
  - (b) that the decision was wrong in law;
  - (c) that the decision was unfair or unreasonable for any reason (including, in a case where the amount of the non-compliance penalty was determined by the administrator, that the amount is unreasonable).

*Combination of sanctions*

- 15 (1) Provision may not be made under paragraphs 10 and 12 conferring powers on an administrator in relation to the same kind of breach of regulations under this Schedule unless it complies with the following requirements.
- (2) The provision must secure that the administrator may not serve a notice of intent referred to in paragraph 11(1)(a) on a person in relation to a breach where a discretionary requirement has been imposed on that person in relation to the same breach.
- (3) Such provision must secure that the administrator may not serve a notice of intent referred to in paragraph 13(1)(a) on a person in relation to a breach where—
- (a) a fixed monetary penalty has been imposed on that person in relation to the same breach, or
  - (b) the person has discharged liability to a fixed monetary penalty in relation to that breach pursuant to paragraph 11(1)(b).

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

### *Monetary penalties*

- 16 (1) If the regulations confer power on an administrator to require a person to pay a fixed monetary penalty, a variable monetary penalty or a non-compliance penalty under paragraph 14(1), they may include provision—
- (a) for early payment discounts;
  - (b) for the payment of interest or other financial penalties for late payment of the penalty, such interest or other financial penalties not in total to exceed the amount of that penalty;
  - (c) for enforcement of the penalty.
- (2) Provision under sub-paragraph (1)(c) may include—
- (a) provision for the administrator to recover the penalty, and any interest or other financial penalty for late payment, as a civil debt;
  - (b) provision for the penalty, and any interest or other financial penalty for late payment to be recoverable, on the order of a court, as if payable under a court order.

### *Costs recovery*

- 17 (1) Provision under paragraph 12 may include provision for an administrator, by notice, to require a person on whom a discretionary requirement is imposed to pay the costs incurred by the administrator in relation to the imposition of the discretionary requirement up to the time of its imposition.
- (2) In sub-paragraph (1), the reference to costs includes in particular—
- (a) investigation costs;
  - (b) administration costs;
  - (c) costs of obtaining expert advice (including legal advice).
- (3) Provision under this paragraph must secure that, in any case where a notice requiring payment of costs is served—
- (a) the notice specifies the amount required to be paid;
  - (b) the administrator may be required to provide a detailed breakdown of that amount;
  - (c) the person required to pay costs is not liable to pay any costs shown by the person to have been unnecessarily incurred;
  - (d) the person required to pay costs may appeal against—
    - (i) the decision of the administrator to impose the requirement to pay costs;
    - (ii) the decision of the administrator as to the amount of those costs.
- (4) Provision under this paragraph may include the provision referred to in paragraph 16(1)(b) and (c) and (2).
- (5) Provision under this paragraph must secure that the administrator is required to publish guidance about how the administrator will exercise the power conferred by the provision.

### *Appeals*

- 18 (1) The regulations may not provide for the making of an appeal other than to—

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (a) the First-tier Tribunal, or
  - (b) another tribunal created under an enactment.
- (2) In sub-paragraph (1)(b) “tribunal” does not include an ordinary court of law.
- (3) If the regulations make provision for an appeal in relation to the imposition of any requirement or service of any notice, they may include—
- (a) provision suspending the requirement or notice pending determination of the appeal;
  - (b) provision as to the powers of the tribunal to which the appeal is made;
  - (c) provision as to how any sum payable in pursuance of a decision of that tribunal is to be recoverable.
- (4) The provision referred to in sub-paragraph (3)(b) includes provision conferring on the tribunal to which the appeal is made power—
- (a) to withdraw the requirement or notice;
  - (b) to confirm the requirement or notice;
  - (c) to take such steps as the administrator could take in relation to the act or omission giving rise to the requirement or notice;
  - (d) to remit the decision whether to confirm the requirement or notice, or any matter relating to that decision, to the administrator;
  - (e) to award costs.

*Publicity for imposition of civil sanctions*

- 19 (1) The regulations may make provision enabling an administrator to give a publicity notice to a person on whom a civil sanction has been imposed in accordance with regulations under this Schedule.
- (2) A “publicity notice” is a notice requiring the person to publicise—
- (a) the fact that the civil sanction has been imposed, and
  - (b) such other information as may be specified in the regulations,
- in such manner as may be specified in the notice.
- (3) The regulations may provide for a publicity notice to—
- (a) specify the time for compliance with the notice, and
  - (b) require the person to whom it is given to supply an administrator with evidence of compliance within such time as may be specified in the notice.
- (4) The regulations may provide that, if a person fails to comply with a publicity notice, an administrator may—
- (a) publicise the information required to be publicised by the notice, and
  - (b) recover the costs of doing so from that person.

*Persons liable to civil sanctions*

- 20 The regulations may make provision about the persons liable to civil sanctions under regulations under this Schedule and may (in particular) provide for—
- (a) the officers of a body corporate to be so liable as well the body corporate itself, and
  - (b) for the partners of a partnership to be liable as well as the partnership itself,

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

in such circumstances as may be specified.

*Guidance as to use of civil sanctions*

- 21 (1) Where power is conferred on an administrator by the regulations to impose a civil sanction in relation to a breach of regulations under this Schedule, the provision conferring the power must secure that—
- (a) the administrator must publish guidance about the administrator's use of the civil sanction,
  - (b) the guidance must contain the relevant information,
  - (c) the administrator must revise the guidance where appropriate,
  - (d) the administrator must consult such persons as the provision may specify before publishing any guidance or revised guidance, and
  - (e) the administrator must have regard to the guidance or revised guidance in exercising the administrator's functions.
- (2) In the case of guidance relating to a fixed monetary penalty, the relevant information referred to in sub-paragraph (1)(b) is information as to—
- (a) the circumstances in which the penalty is likely to be imposed,
  - (b) the circumstances in which it may not be imposed,
  - (c) the amount of the penalty,
  - (d) how liability for the penalty may be discharged and the effect of discharge, and
  - (e) rights to make representations and objections and rights of appeal.
- (3) In the case of guidance relating to a discretionary requirement, the relevant information referred to in sub-paragraph (1)(b) is information as to—
- (a) the circumstances in which the requirement is likely to be imposed,
  - (b) the circumstances in which it may not be imposed,
  - (c) in the case of a variable monetary penalty, the matters likely to be taken into account by the administrator in determining the amount of the penalty (including, where relevant, any discounts for voluntary reporting of non-compliance), and
  - (d) rights to make representations and objections and rights of appeal.

*Publication of enforcement action*

- 22 (1) Where power is conferred on an administrator by the regulations to impose a civil sanction in relation to a breach of regulations under this Schedule, the provision conferring the power must, subject to this paragraph, secure that the administrator must from time to time publish reports specifying—
- (a) the cases in which the civil sanction has been imposed, and
  - (b) where the civil sanction is a fixed monetary penalty, the cases in which liability to the penalty has been discharged pursuant to paragraph 11(1)(b).
- (2) In sub-paragraph (1)(a), the reference to cases in which the civil sanction has been imposed do not include cases where the sanction has been imposed but overturned on appeal.
- (3) The provision conferring the power need not secure the result in sub-paragraph (1) in cases where the relevant authority considers that it would be inappropriate to do so.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

### *Compliance with regulatory principles*

- 23 A relevant national authority may not make any provision conferring power on an administrator to impose a civil sanction in relation to a breach of regulations under this Schedule unless the authority is satisfied that the administrator will act in accordance with the principles that—
- (a) regulatory activities should be carried out in a way that is transparent, accountable, proportionate and consistent;
  - (b) regulatory activities should be targeted only at cases in which action is needed.

### *Review*

- 24 (1) A relevant national authority must in accordance with this paragraph review the operation of any provision made by the authority conferring power on an administrator to impose a civil sanction in relation to a breach of regulations under this Schedule.
- (2) The review must take place as soon as practicable after the end of the period of three years beginning with the day on which the provision comes into force.
  - (3) The review must in particular consider whether the provision has implemented its objectives efficiently and effectively.
  - (4) In conducting a review under this paragraph the relevant national authority must consult such persons as the authority considers appropriate.
  - (5) The relevant national authority must publish the results of a review under this <sup>F47</sup>paragraph].
  - <sup>F48</sup>(6) The relevant national authority must lay a copy of a review under this paragraph before—
    - (a) Parliament (where the relevant national authority is the Secretary of State);
    - (b) the National Assembly for Wales (where the relevant national authority is the Welsh Ministers);
    - (c) the Northern Ireland Assembly (where the relevant national authority is the Department of the Environment in Northern Ireland)].

#### **Textual Amendments**

**F48** Sch. 6 para. 24(6) omitted (N.I.) (28.4.2014) by virtue of [Carrier Bags Act \(Northern Ireland\) 2014 \(c. 7\), s. 8\(2\)\(b\)](#)

### *Suspension*

- 25 (1) Where provision has been made by a relevant national authority conferring power on an administrator to impose a civil sanction in relation to a breach of regulations under this Schedule, the authority may direct the administrator—
- (a) where the power is power to impose a fixed monetary penalty, not to serve any further notice of intent referred to in paragraph 11(1)(a) in relation to a breach of that kind, and

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (b) where the power is power to impose a discretionary requirement, not to serve any further notice of intent referred to in paragraph 13(1)(a) in relation to a breach of that kind.
- (2) The relevant national authority may only give a direction under sub-paragraph (1) in relation to a breach of regulations under this Schedule if it is satisfied that the administrator has failed on more than one occasion—
- (a) to comply with any duty imposed on it under or by virtue of this Schedule in relation to a breach of that kind,
  - (b) to act in accordance with the guidance it has published in relation to a breach of that kind (in particular, the guidance published under paragraph 21), or
  - (c) to act in accordance with the principles referred to in paragraph 23 or with other principles of best practice in relation to the enforcement of a breach of that kind.
- (3) The relevant national authority may by direction revoke a direction given by it under sub-paragraph (1) if satisfied that the administrator has taken the appropriate steps to remedy the failure to which that direction related.
- (4) Before giving a direction under sub-paragraph (1) or (3) the relevant national authority must consult—
- (a) the administrator, and
  - (b) such other persons as the authority considers appropriate.
- (5) Where the relevant national authority gives a direction under this section, the authority must lay a copy before—
- (a) Parliament (where the relevant national authority is the Secretary of State);
  - (b) the National Assembly for Wales (where the relevant national authority is the Welsh Ministers);
  - (c) the Northern Ireland Assembly (where the relevant national authority is the Department of the Environment in Northern Ireland).
- (6) Where the relevant national authority gives a direction under this<sup>F49</sup> paragraph], the administrator must—
- (a) publish the direction in such manner as the authority thinks fit, and
  - (b) take such other steps as the administrator thinks fit or the authority may require to bring the direction to the attention of other persons likely to be affected by it.

#### Textual Amendments

**F49** Word in Sch. 6 para. 25(6) substituted (N.I.) (28.4.2014) by [Carrier Bags Act \(Northern Ireland\) 2014 \(c. 7\), s. 8\(3\)](#)

#### *Payment of penalties into Consolidated Fund*

- 26 (1) Where pursuant to any provision made under this Schedule an administrator receives—
- (a) a fixed monetary penalty, a variable monetary penalty or a non-compliance penalty under paragraph 14,
  - (b) any interest or other financial penalty for late payment of such a penalty, or

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (c) a sum paid in discharge of liability to a fixed monetary penalty pursuant to paragraph 11(1)(b),  
the administrator must pay it into the relevant Fund.
- (2) In sub-paragraph (1) “relevant Fund” means—
- (a) in a case where the administrator has functions only in relation to Wales, the Welsh Consolidated Fund,
  - (b) in a case where the administrator has functions only in relation to Northern Ireland, the Northern Ireland Consolidated Fund, and
  - (c) in any other case, the Consolidated Fund.

### PART 3

#### PROCEDURES APPLYING TO REGULATIONS

##### *Regulations made by a single authority*

- 27 (1) This paragraph applies in relation to an instrument containing regulations under this Schedule made by a single national authority.
- (2) Where the instrument contains regulations that—
- (a) are to be made by the Secretary of State, and
  - (b) are subject to affirmative resolution procedure,
- the regulations must not be made unless a draft of the statutory instrument containing them has been laid before and approved by a resolution of each House of Parliament.
- (3) Where the instrument contains regulations that—
- (a) are to be made by a national authority other than the Secretary of State, and
  - (b) are subject to affirmative resolution procedure,
- the regulations must not be made unless a draft of the statutory instrument containing them has been laid before and approved by a resolution of the relevant devolved legislature.
- (4) An instrument containing regulations made by the Secretary of State that are subject to negative resolution procedure is subject to annulment in pursuance of a resolution of either House of Parliament.
- (5) An instrument containing regulations made by the Welsh Ministers that are subject to negative resolution procedure is subject to annulment in pursuance of a resolution of the National Assembly for Wales.
- (6) An instrument containing regulations made by the Department of the Environment in Northern Ireland that are subject to negative resolution procedure is subject to negative resolution within the meaning of section 41(6) of the Interpretation Act (Northern Ireland) 1954 (c. 33 (N.I.)) as if it were a statutory instrument within the meaning of that Act.
- (7) Any provision that may be made by regulations subject to negative resolution procedure may be made by regulations subject to affirmative resolution procedure.

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

*Regulations made by two or more national authorities*

- 28 (1) This paragraph applies in relation to an instrument containing regulations under this Schedule made or to be made by any two or more of—
- (a) the Secretary of State,
  - (b) the Welsh Ministers, and
  - (c) the Department of the Environment in Northern Ireland.
- (2) If any of the regulations are subject to affirmative resolution procedure, all of them are subject to that procedure.
- (3) Sub-paragraphs (2) to (6) of paragraph 27 apply to the instrument as they apply to an instrument containing regulations made by a single national authority.
- (4) If in accordance with that paragraph—
- (a) either House of Parliament resolves that an address be presented to Her Majesty praying that an instrument containing regulations made by the Secretary of State be annulled, or
  - (b) a devolved legislature resolves that an instrument containing regulations made by a national authority be annulled,
- nothing further is to be done under the instrument after the date of the resolution and Her Majesty may by Order in Council revoke the instrument.
- (5) This is without prejudice to the validity of anything previously done under the instrument or to the making of a new instrument.
- (6) This paragraph applies in place of provision made by any other enactment about the effect of such a resolution.

*Hybrid instruments*

- 29 If a draft of an instrument containing regulations under this Schedule would, apart from this paragraph, be treated for the purposes of the standing orders of either House of Parliament as a hybrid instrument, it is to proceed in that House as if it were not such an instrument.

SCHEDULE 7

Section 78

RENEWABLE TRANSPORT FUEL OBLIGATIONS

*Introductory*

- 1 Chapter 5 of Part 2 of the Energy Act 2004 (c. 20) (renewable transport fuel obligations) is amended as follows.

*The Administrator*

- 2 For section 125 (the Administrator) substitute—

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

## **“125 Appointment of the Administrator**

### **“125 “125 Appointment of the Administrator**

- (1) For the purposes of provision made by or under this Chapter, an RTF order may—
  - (a) establish a body corporate, and
  - (b) appoint that body as the Administrator.
- (2) An RTF order may—
  - (a) make provision for the appointment of members of the body;
  - (b) make provision in relation to the staffing of the body;
  - (c) make provision in relation to the expenditure of the body;
  - (d) make provision regulating the procedure of the body;
  - (e) make any other provision that the Secretary of State considers appropriate for purposes connected with the establishment and maintenance of the body.
- (3) The provision that may be made by an RTF order by virtue of this section includes, in particular, provision conferring discretions on—
  - (a) the Secretary of State;
  - (b) the body itself; or
  - (c) members or staff of the body.

## **125A General functions of the Administrator**

### **125A 125A General functions of the Administrator**

- (1) An RTF order may—
  - (a) confer or impose powers and duties on the Administrator for purposes connected with the implementation of provision made by or under this Chapter;
  - (b) confer discretions on the Administrator in relation to the making of determinations under such an order and otherwise in relation to the Administrator's powers and duties; and
  - (c) impose duties on transport fuel suppliers for purposes connected with the Administrator's powers and duties (including, in particular, duties framed by reference to determinations made by the Administrator).
- (2) It is the duty of the Administrator to promote the supply of renewable transport fuel whose production, supply or use—
  - (a) causes or contributes to the reduction of carbon emissions, and
  - (b) contributes to sustainable development or the protection or enhancement of the environment generally.

---

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

## **125B Functions of the Administrator: supplementary**

### **125B 125B Functions of the Administrator: supplementary**

- (1) The powers that may be conferred on the Administrator by virtue of section 125A(1) include, in particular—
  - (a) power to require a transport fuel supplier to provide the Administrator with such information as the Administrator may require for purposes connected with the carrying out of the Administrator's functions;
  - (b) power to impose requirements as to the form in which such information must be provided and as to the period within which it must be provided;
  - (c) power to impose charges of specified amounts on transport fuel suppliers.
- (2) The Secretary of State may give written directions to the Administrator about the exercise of any power conferred on the Administrator by virtue of subsection (1)(a) or (b).
- (3) The power to give directions under subsection (2) includes power to vary or revoke the directions.
- (4) The Administrator must comply with any directions given under that subsection.
- (5) Sums received by the Administrator by virtue of provision within subsection (1)(c)—
  - (a) where the Administrator is the Secretary of State, must be paid into the Consolidated Fund, and
  - (b) otherwise, must be used for the purpose of meeting costs incurred in carrying out the Administrator's functions.
- (6) The Secretary of State may make grants to the Administrator on such terms as the Secretary of State may determine.

## **125C Transfer of functions to new Administrator**

### **125C 125C Transfer of functions to new Administrator**

- (1) The Secretary of State may by order—
  - (a) appoint a person as the Administrator (“the new Administrator”) in place of a person previously so appointed by order under this Chapter (“the old Administrator”), and
  - (b) provide for the transfer of the functions of the old Administrator to the new Administrator.
- (2) Only the following persons may be appointed as the Administrator by order under this section—
  - (a) the Secretary of State;
  - (b) a body or other person established or appointed by or under any enactment to carry out other functions;

---

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

---

- (c) a body corporate established by the order for appointment as the Administrator.
- (3) An order under this section that establishes a body for appointment as the Administrator may make any provision that may be made by an RTF order by virtue of section 125.
- (4) An order under this section may provide for the transfer of staff of the old Administrator, and of any property, rights or liabilities to which the old Administrator is entitled or subject, to the new Administrator and may, in particular—
- (a) provide for the transfer of any property, rights or liabilities to have effect subject to exceptions or reservations specified in or determined under the order;
  - (b) provide for the creation of interests in, or rights over, property transferred or retained or for the creation of new rights and liabilities;
  - (c) provide for the order to have effect in spite of anything that would prevent or restrict the transfer of the property, rights or liabilities otherwise than by the order.
- (5) The order may, in particular—
- (a) provide for anything done by or in relation to the old Administrator to have effect as if done by or in relation to the new Administrator;
  - (b) permit anything (which may include legal proceedings) which is in the process of being done by or in relation to the old Administrator when the transfer takes effect to be continued by or in relation to the new Administrator;
  - (c) provide for a reference to the old Administrator in an instrument or other document to be treated as a reference to the new Administrator;
  - (d) where the old Administrator was established by order under this Chapter, make provision for the dissolution of the old Administrator;
  - (e) make such modifications of any enactment relating to the old Administrator or the new Administrator as the Secretary of State considers appropriate for the purpose of facilitating the transfer.
- (6) An order under this section that provides for the transfer of staff of the old Administrator to the new Administrator must make provision for the Transfer of Undertakings (Protection of Employment) Regulations 2006 to apply to the transfer.
- (7) Subject to subsection (8), an order under this section is subject to the negative resolution procedure.
- (8) The power to make an order under this section is subject to the affirmative resolution procedure if the order—
- (a) contains provision by virtue of subsection (2)(c), or
  - (b) makes any modification of an enactment contained in—
    - (i) an Act of Parliament,
    - (ii) an Act of the Scottish Parliament,
    - (iii) a Measure or Act of the National Assembly for Wales, or
    - (iv) Northern Ireland legislation.”.

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

---

#### *Determination of amounts of transport fuel*

- 3 In section 126 (determination of amounts of transport fuel), after subsection (4) insert—
- “(5) If an RTF order makes provision for the counting or determination of amounts of transport fuel for the purposes of provision made by or under this Chapter by reference to any document, it may provide for references to the document to have effect as references to it as revised or re-issued from time to time.
- (6) The Secretary of State may give written directions to the Administrator about the exercise of any of the Administrator's functions in connection with the counting or determination of amounts of transport fuel for the purposes of provision made by or under this Chapter.
- (7) The power to give directions under subsection (6) includes power to vary or revoke the directions.
- (8) The Administrator must comply with any directions given under that subsection.”.

#### *Discharge of obligation by payment*

- 4 In section 128 (discharge of obligation by payment), for subsections (6) and (7) substitute—
- “(6) Where the Administrator is the Secretary of State—
- (a) sums received by the Administrator by virtue of this section must be paid into the Consolidated Fund, and
- (b) an RTF order may make provision for sums to be paid by the Administrator to transport fuel suppliers, or to transport fuel suppliers of a specified description, in accordance with the specified system of allocation.
- (7) Such an order must contain provision ensuring that the total of the sums so paid by the Administrator does not at any time exceed the total of the sums so received by the Administrator up to that time.
- (8) Where the Administrator is a person other than the Secretary of State, an RTF order may—
- (a) require the Administrator to use, to the specified extent, sums received by the Administrator by virtue of this section for the purpose of meeting costs incurred in carrying out the Administrator's functions, or
- (b) require the Administrator to pay, to the specified extent, sums so received to the Secretary of State.
- (9) Sums so received which are not dealt with in accordance with provision made under subsection (8) must be paid by the Administrator to transport fuel suppliers, or to transport fuel suppliers of a specified description, in accordance with the specified system of allocation.
- (10) The Secretary of State must pay sums received by the Secretary of State by virtue of provision made under subsection (8)(b) into the Consolidated Fund.”.

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

### *Civil penalties*

- 5 In section 129 (imposition of civil penalties), for subsection (7) substitute—
- “(7) Sums received by the Administrator by virtue of this section—
- (a) where the Administrator is the Secretary of State, must be paid into the Consolidated Fund, and
  - (b) otherwise, must be paid to the Secretary of State, who must pay them into the Consolidated Fund.”.

### *Disclosure of information*

- 6 After section 131 insert—
- “131A Disclosure of information held by Revenue and Customs**
- “131A “131A Disclosure of information held by Revenue and Customs**
- (1) This section applies to information held by or on behalf of the Commissioners for Her Majesty's Revenue and Customs in connection with their functions under or by virtue of the Hydrocarbon Oil Duties Act 1979.
  - (2) Such information may be disclosed to—
    - (a) the Administrator, or
    - (b) an authorised person,
 for the purposes of or in connection with the Administrator's functions.
  - (3) In this Chapter “authorised person” means a person who—
    - (a) provides services to, or exercises functions on behalf of, the Administrator, and
    - (b) is authorised by the Administrator to receive information to which this section applies.
  - (4) The Administrator may authorise such a person to receive information to which this section applies either generally or for a specific purpose.

### **131B Further disclosure of information**

#### **131B 131B Further disclosure of information**

- (1) This section applies to information disclosed under section 131A, other than information which is also provided to the Administrator or an authorised person otherwise than under that section.
- (2) Information to which this section applies may not be disclosed—
  - (a) by the Administrator,
  - (b) by an authorised person, or
  - (c) by any other person who obtains it in the course of providing services to, or exercising functions on behalf of, the Administrator,
 except as permitted by the following provisions of this section.
- (3) Subsection (2) does not apply to a disclosure made—
  - (a) by the Administrator to an authorised person,
  - (b) by an authorised person to the Administrator, or

---

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

---

(c) by an authorised person to another authorised person,  
for the purposes of, or in connection with, the discharge of the  
Administrator's functions.

(4) Subsection (2) does not apply to a disclosure if it is—

- (a) authorised by an enactment,
- (b) made in pursuance of an order of a court,
- (c) made for the purposes of a criminal investigation or criminal proceedings (whether or not within the United Kingdom) relating to a matter in respect of which the Administrator has functions,
- (d) made for the purposes of civil proceedings (whether or not within the United Kingdom) relating to a matter in respect of which the Administrator has functions,
- (e) made with the consent of the Commissioners for Her Majesty's Revenue and Customs, or
- (f) made with the consent of each person to whom the information relates.

### **131C Wrongful disclosure**

#### **131C 131C Wrongful disclosure**

(1) A person commits an offence if—

- (a) he discloses information about a person in contravention of section 131B(2), and
- (b) the person's identity is specified in the disclosure or can be deduced from it.

(2) In subsection (1) “information about a person” means revenue and customs information relating to a person within the meaning of section 19(2) of the Commissioners for Revenue and Customs Act 2005 (wrongful disclosure).

(3) It is a defence for a person charged with an offence under this section to prove that he reasonably believed—

- (a) that the disclosure was lawful, or
- (b) that the information had already and lawfully been made available to the public.

(4) A person guilty of an offence under this section is liable—

- (a) on conviction on indictment, to imprisonment for a term not exceeding two years or a fine or both, or
- (b) on summary conviction, to imprisonment for a term not exceeding twelve months or a fine not exceeding the statutory maximum or both.

(5) A prosecution for an offence under this section—

- (a) may be brought in England and Wales only with the consent of the Director of Public Prosecutions;
- (b) may be brought in Northern Ireland only with the consent of the Director of Public Prosecutions for Northern Ireland.

(6) In the application of this section—

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- (a) in England and Wales, in relation to an offence committed before the commencement of section 154(1) of the Criminal Justice Act 2003, or
  - (b) in Northern Ireland,
- the reference in subsection (4)(b) to twelve months is to be read as a reference to six months.”.

#### *Interpretation*

- 7 (1) Section 132(1) (interpretation of Chapter 5 of Part 2) is amended as follows.
- (2) For the definition of “Administrator” substitute—
- ““Administrator” means the person for the time being appointed as the Administrator by order under this Chapter;”.
- (3) In the appropriate place insert—
- ““authorised person” has the meaning given by section 131A(3);”;
- ““enactment” includes—
- (a) an enactment contained in subordinate legislation,
  - (b) an enactment contained in, or in an instrument made under, an Act of the Scottish Parliament,
  - (c) an enactment contained in, or in an instrument made under, Northern Ireland legislation, and
  - (d) an enactment contained in, or in an instrument made under, a Measure or Act of the National Assembly for Wales;”.
- (4) In section 196(1) of the Energy Act 2004 (c. 20) (general interpretation), in the definition of “enactment”, after “ “enactment”” insert “ (except in Chapter 5 of Part 2) ”.

## SCHEDULE 8

Section 79

### CARBON EMISSIONS REDUCTION TARGETS

#### *Gas Act 1986 (c. 44)*

- 1 (1) Section 33BC of the Gas Act 1986 (promotion of reductions in carbon emissions: gas transporters and gas suppliers) is amended as follows.
- (2) After subsection (1) insert—
- “(1A) The power to make orders under this section may be exercised so as to impose more than one carbon emissions reduction obligation on a person in relation to the same period or to periods that overlap to any extent.”.
- (3) In subsection (5) (provision that may be made by an order under section 33BC in relation to the obligations it imposes), after paragraph (b) insert—
- “(ba) requiring the whole or any part of a carbon emissions reductions target to be met by action relating to—

---

*Status:* This version of this Act contains provisions that are prospective.

*Changes to legislation:* Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes

---

- (i) persons of a specified description,
- (ii) specified areas or areas of a specified description, or
- (iii) persons of a specified description in specified areas or areas of a specified description;”.

(4) In subsection (13) (interpretation), at the appropriate place insert—

““specified” means specified in the order.”.

*Electricity Act 1989 (c. 29)*

2 In section 6(9) of the Electricity Act 1989 (definition of “electricity distributor” and “electricity supplier”), at the appropriate place insert—

““electricity generator” means any person who is authorised by a generation licence to generate electricity except where that person is acting otherwise than for purposes connected with the carrying on of activities authorised by the licence;”.

3 (1) Section 41A of that Act (promotion of reductions in carbon emissions: electricity distributors and electricity suppliers) is amended as follows.

(2) In subsection (1) (power by order to impose obligations on distributors and suppliers to achieve carbon emissions reductions targets)—

(a) before paragraph (a) insert—

“(za) on each electricity generator (or each electricity generator of a specified description);” and

(b) in the closing words, before “distributor” insert “ generator, ”.

(3) After that subsection insert—

“(1A) The power to make orders under this section may be exercised so as to impose more than one carbon emissions reduction obligation on a person in relation to the same period or to periods that overlap to any extent.”.

(4) In subsection (3) (power for order to specify criteria by reference to which the Gas and Electricity Markets Authority is to determine targets), before “electricity distributors” insert “ electricity generators, ”.

(5) In subsection (4) (duty of the Secretary of State and the Authority to carry out functions under the section in a way that does not inhibit competition), for the words from “no electricity distributor” to the end of the subsection substitute “—

(a) no electricity generator is unduly disadvantaged in competing with other electricity generators,

(b) no electricity distributor is unduly disadvantaged in competing with other electricity distributors, and

(c) no electricity supplier is unduly disadvantaged in competing with other electricity suppliers.”.

(6) In subsection (5) (provision that may be made by an order in relation to the obligations it imposes)—

(a) in paragraph (a), before “electricity distributors” insert “ electricity generators, ”,

(b) after paragraph (b) insert—

*Status: This version of this Act contains provisions that are prospective.*

*Changes to legislation: Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) View outstanding changes*

- “(ba) requiring the whole or any part of a carbon emissions reductions target to be met by action relating to—
- (i) persons of a specified description,
  - (ii) specified areas or areas of a specified description, or
  - (iii) persons of a specified description in specified areas or areas of a specified description;”,
- (c) in paragraph (d), before “distributors” insert “ generators, ”, and
- (d) in paragraph (f), before “distributors” insert “ generators, ”.
- (7) In subsection (6) (power for order to authorise the Authority to require the provision of information), before “distributor” insert “ generator, ”.
- (8) In subsection (7)(d) (power for order to make provision for transfer of person's target to another distributor or supplier or to a gas transporter or supplier), before “electricity distributor” insert “ electricity generator, ”.
- (9) In subsection (8)(d) (power for order to make different provision in relation to different distributors or suppliers), before “distributors” insert “ generators, ”.
- (10) In subsection (11) (duty to consult before making order), before “electricity distributors” insert “ electricity generators, ”.
- (11) In subsection (13) (interpretation), at the appropriate place insert—
- ““specified” means specified in the order.”.
- (12) In the heading, before “electricity distributors” insert “ electricity generators, ”.
- 4 (1) Section 42AA of that Act (publication of statistical information about performance of suppliers and distributors) is amended as follows.
- (2) In subsection (1) (duty of Gas and Electricity Consumer Council to publish information about performance and consumer complaints)—
- (a) in paragraph (a), before “electricity suppliers” insert “ electricity generators, ”, and
  - (b) in paragraph (b), before “suppliers” insert “ generators, ”.
- (3) In subsection (2) (definition of “complaints”), before “electricity suppliers” insert “ electricity generators, ”.
- 5 In section 64(1) of that Act (interpretation etc of Part 1), in the definition of “electricity distributor” and “electricity supplier”, after “ “electricity distributor”” insert “ , “electricity generator” ”.
- Utilities Act 2000 (c. 27)*
- 6 (1) Section 103 of the Utilities Act 2000 (overall carbon emissions reduction targets) is amended as follows.
- (2) In subsection (1)(b) (power by order to specify overall target for the promotion of measures mentioned in section 41A(2) of the 1989 Act), before “distributors” insert “ generators, ”.
- (3) After subsection (1) insert—

---

*Status:* This version of this Act contains provisions that are prospective.

**Changes to legislation:** Climate Change Act 2008 is up to date with all changes known to be in force on or before 05 August 2021. There are changes that may be brought into force at a future date. Changes that have been made appear in the content and are referenced with annotations. (See end of Document for details) [View outstanding changes](#)

STATUTORY INSTRUMENTS

---

**2019 No. 1056**

**CLIMATE CHANGE**

**The Climate Change Act 2008 (2050  
Target Amendment) Order 2019**

*Made - - - - 26th June 2019*

*Coming into force in accordance with article 1*

A draft of this instrument was laid before and approved by a resolution of each House of Parliament, in accordance with sections 2(6) and 91(1) of the Climate Change Act 2008 (“the Act”)(**1**).

Before the draft was laid, the Secretary of State—

- (a) obtained and took into account the advice of the Committee on Climate Change, in accordance with section 3(1)(a) of the Act; and
- (b) took into account representations made by the Scottish Ministers, the Welsh Ministers and the Department of Agriculture, Environment and Rural Affairs in Northern Ireland in accordance with section 3(1)(b) of the Act(**2**),

The Secretary of State considers that since the Act was passed, there have been significant developments in scientific knowledge about climate change that make it appropriate to amend the percentage specified in section 1(1) of the Act.

Accordingly, the Secretary of State, in exercise of the power conferred by section 2(1)(a) of the Act, makes the following Order:

**Citation and commencement**

**1.** This Order may be cited as the Climate Change Act 2008 (2050 Target Amendment) Order 2019 and comes into force on the day after the day on which it is made.

**Amendment of the target for 2050**

**2.—**(1) Section 1 of the Climate Change Act 2008 is amended as follows.

(2) In subsection (1), for “80%” substitute “100%”.

---

(1) [2008 c.27](#)

(2) see sections 95 and 96 of the Act for definitions of “national authority” and “relevant Northern Ireland Department”.

---

**Status:** This is the original version (as it was originally made). This item of legislation is currently only available in its original format.

---

26th June 2019

*Chris Skidmore*  
Minister of State  
Department for Business, Energy and Industrial  
Strategy

---

## EXPLANATORY NOTE

*(This note is not part of the Order)*

Article 2 of this Order amends section 1 of the Climate Change Act 2008 (c. 27) by altering the percentage amount in subsection (1). Section 1(1) imposes a duty on the Secretary of State as to the level of the “net UK carbon account” (the amount of net UK emissions of targeted greenhouse gases for a period adjusted by the amount of carbon units credited or debited to the account) for the year 2050. The duty is to ensure that the net UK carbon account is lower than the “1990 baseline” (the baseline of net UK emissions of targeted greenhouse gases against which the percentage amount in subsection 1(1) is applied) by a minimum percentage amount.

The amendment in this Order has the effect that the minimum percentage by which the net UK carbon account for the year 2050 must be lower than the 1990 baseline is increased from 80% to 100%.

A full impact assessment has not been produced for this instrument.

Department for  
Business, Energy  
& Industrial Strategy

# Executive summary

BEIS publishes annual projections of UK energy demand and greenhouse gas emissions<sup>1</sup>. This year, we have extended the projections to 2040 (from 2035 in EEP 2018). We base the estimates in this report and associated annexes on policy analysis from August 2019 and modelling from March 2020. We completed the latter before the coronavirus (Covid-19) pandemic. Therefore, our projections take no account of the impacts of this on future energy demand or emissions.

The Climate Change Act<sup>2</sup>, passed in 2008, committed the UK to reducing greenhouse gas emissions by at least 80% by 2050 in comparison with baseline levels<sup>3</sup>. It also established a system of legally-binding carbon budgets which limit the country's net greenhouse gas emissions in successive five-year periods. In June 2019, the UK became the first major economy to commit to reducing emissions to Net Zero by 2050<sup>4</sup>.

The Energy and Emissions Projections (EEP) are one way we monitor progress towards the UK's legislated targets. Between the baseline and 2018, the UK cut emissions by 346 MtCO<sub>2</sub>e or 43%. We project that they will fall a further 24% to 344 MtCO<sub>2</sub>e in 2040.

Each year, BEIS updates the projections to incorporate new evidence, policy development and methodology improvements. The new projections for UK territorial emissions are higher than in the previous edition (EEP 2018) for the third and fourth carbon budget period but lower for the fifth carbon budget period. UK territorial emissions include both emissions which fall under the EU Emissions Trading System (EU ETS), or "traded" emissions, and emissions outside this system ("non-traded" emissions). Traded emissions include almost all power sector emissions, domestic aviation (from 2012/13 onward) and energy-intensive industrial sectors. These do not directly affect performance against carbon budgets<sup>5</sup>.

---

<sup>1</sup> We use the Global Warming Potentials (GWPs) from Table 2.14 of Working Group 1 of the IPCC Fourth Assessment Report: Climate Change 2007: AR4 GWPs. See:

<https://www.ipcc.ch/site/assets/uploads/2018/02/ar4-wg1-chapter2-1.pdf>

This is consistent with the Greenhouse Gas Inventory and BEIS emission statistics.

<sup>2</sup> See this link:

<http://www.legislation.gov.uk/ukpga/2008/27/contents/enacted>

<sup>3</sup> The base year for comparison is 1990 for CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O, and 1995 for fluorinated gases:

<https://www.legislation.gov.uk/ukpga/2008/27/contents>

<sup>4</sup> The amendment is here:

<http://www.legislation.gov.uk/ukxi/2019/1056/article/1/made>

<sup>5</sup> Carbon budget performance is measured by the Net Carbon Account. In this calculation, emissions from the traded sector are set equal to the UK's share of the EU ETS cap (the total emissions permitted in the Emissions Trading System) rather than actual traded emissions. Further information on Net Carbon Account calculation can be found in Box 1.

Compared with EEP 2018, non-traded emissions projections are higher and traded emissions projections are lower. We explain the main reasons for specific changes in Chapter 6.

Because performance against carbon budget targets depends only on non-traded emissions, the projected shortfall between performance and carbon budget targets has risen since EEP 2018. We give more details about this in Chapter 2: this summarises the emissions projections and explains what this means for performance against carbon budgets.

# 1 Introduction

- This report contains projections of performance against UK greenhouse gas (GHG) carbon budget targets under existing policies.
- The Government sets legally binding carbon budgets for five-year periods. They aim to make sure the UK reaches its target of net zero emissions by 2050.
- The Net Carbon Account measures performance against carbon budgets. This primarily depends on the level of non-traded emissions. These are emissions not covered by the European Union Emissions Trading System (EU ETS).
- The legislated carbon budgets so far are: CB1 (2008 to 2012); CB2 (2013 to 2017); CB3 (2018 to 2022); CB4 (2023 to 2027); and CB5 (2028 to 2032). The Committee on Climate Change will advise the Government about the level for CB6 (2033 to 2037) in December 2020. The Government must set this budget by June 2021.

## 1.1 About this document

This report sets out the 2019 Energy and Emissions Projections<sup>6</sup>: EEP 2019. It includes a comparison with the previous edition (EEP 2018, published in April 2019). For this edition, we have extended the projections to 2040: in EEP 2018 the last projection year was 2035. We completed the modelling before the coronavirus (Covid-19) pandemic. Therefore, our assumptions and modelling take no account of any impacts this may have on future energy demand or emissions.

These projections bring together statistical and modelled information from many different sources<sup>7</sup>:

- The main source of energy consumption data is the annual Digest of UK Energy Statistics (DUKES). Its most recent figures are for 2018 (published July 2019). We therefore report energy consumption trends against a comparison year of 2018<sup>8</sup>.

---

<sup>6</sup> The report and annexes contain outputs from projections under various different macroeconomic assumptions. The “baseline” projection projects energy and emissions without policies brought in since the 2009 Low Carbon Transition Plan. This is the closest scenario to the UNFCCC “without measures” (WoM) projection. A WoM scenario has all mitigation removed. The UK does not produce a WoM projection because we cannot remove the impacts of pre-LCTP climate change measures. Our “existing policies” scenario matches the UNFCCC “with [existing] measures” (WEM) projection. It includes implemented and adopted measures but not planned policies. Our main projection, the reference scenario, includes planned policies too. This matches the UNFCCC “with additional measures” (WAM) scenario.

<sup>7</sup> Energy and emissions projections:

<https://www.gov.uk/government/collections/energy-and-emissions-projections>

<sup>8</sup> There is more detail here:

<https://www.gov.uk/government/collections/digest-of-uk-energy-statistics-dukes/#2019>

- The main source of emissions statistics is the Greenhouse Gas (GHG) Inventory which is updated each February. The most recent figures are for 2018 (published February 2020). We therefore report emission trends against this year unless we state otherwise.
- We combine these with other economic and demographic data to update equations that project future energy demand and emissions in the absence of government policy.

This report includes projections of the UK's progress towards its carbon budget targets for GHG emissions. The 2008 Climate Change Act established a long-term target for the UK to reduce its emissions in 2050 by at least 80% compared with a largely 1990-based baseline<sup>9</sup>. This target tightened in June 2019 when the UK became the first major economy to commit to reducing its emissions to net zero by 2050.

The Climate Change Act also established a system of legally binding interim limits on net greenhouse gas (GHG) emissions. These are called carbon budgets<sup>10</sup>. Each one spans five years and is set with the aim of keeping the UK on track for its 2050 target. Performance against these carbon budget targets is measured using the Net Carbon Account (see Box 1 for details).

All UK emissions count towards 2050 targets<sup>11</sup>. This includes those which the European Union Emissions Trading System (EU ETS) covers. However, these "traded" emissions do not affect the Net Carbon Account and therefore have no impact on performance against carbon budget targets. We therefore include separate, more detailed statistics and commentary for emissions that are outside the EU ETS ("non-traded" emissions).

The United Kingdom left the European Union on 31st January 2020 but remains a full participant in the EU ETS during the transition period until 1st January 2021. In line with the withdrawal agreement, the UK will remain in the European Union Emissions Trading System (EU ETS) until 31st December 2020. The Government set out its approach to negotiations in the UK's Approach to Negotiations<sup>12</sup>, published on 27th February 2020. In this edition, we base traded emissions and projections on the EU ETS definition of traded emissions and use EU ETS traded carbon value projections.

---

<sup>9</sup> The base year for comparison is 1990 for CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O, and 1995 for fluorinated gases: <https://www.legislation.gov.uk/ukpga/2008/27/contents>

<sup>10</sup> See page 143 of the Clean Growth Strategy for more background on carbon budgets: <https://www.gov.uk/government/publications/clean-growth-strategy>

<sup>11</sup> We use the Global Warming Potentials (GWPs) from Table 2.14 of Working Group 1 of the IPCC Fourth Assessment Report: Climate Change 2007: AR4 GWPs. See: <https://www.ipcc.ch/site/assets/uploads/2018/02/ar4-wg1-chapter2-1.pdf>

This is consistent with the Greenhouse Gas Inventory and BEIS emission statistics.

<sup>12</sup> For more information see:

[https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment\\_data/file/868874/The\\_Future\\_Relationship\\_with\\_the\\_EU.pdf](https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/868874/The_Future_Relationship_with_the_EU.pdf)

For discussion of potential alternatives see: <https://www.gov.uk/government/consultations/carbon-emissions-tax>

### **Box 1: The UK Net Carbon Account**

The Government assesses compliance with a carbon budget by comparing the UK “Net Carbon Account” (NCA) against the carbon budget level. The NCA is currently the sum of three components:

**1. Emissions allowances the UK receives under the EU Emissions Trading System (EU ETS)**

This is the UK’s share of tradable allowances for emissions in scope of the EU ETS. Emissions that are traded include most power sector emissions, domestic aviation (from 2012/13 onward) and those from energy-intensive industries. When we project performance against carbon budgets, we use the estimates for EU ETS allowances that the Government assumed at the time of setting each carbon budget. The UK’s actual future shares were not known at that time. We report these assumptions in the web tables.

**2. All UK GHG emissions not covered by EU ETS**

These are the actual level of “non-traded emissions” emitted by the UK i.e. those that are not traded under the EU ETS. This includes most emissions from: road transport, heating in buildings, agriculture, waste and light industry. Since EEP 2017, we have included emissions from “Energy from Waste” power plants under non-traded emissions. This mirrors the ETS directive.

**3. Credits/debits from other international credit systems**

## 1.2 The reference and other scenarios

Our main projection is the “reference scenario”. This is our core analysis of how the UK energy and emissions system could evolve under our central assumptions about how the system drivers will change. It includes government policies which have been implemented, adopted, or planned<sup>13</sup> as at August 2019. It excludes new policies and changes to existing policies which fall outside these categories<sup>14</sup>.

The results we report come from the reference scenario unless stated. Many other views of the future are possible: our annexes include some of these.

---

<sup>13</sup> This equates to expired, implemented, adopted, and planned policies as defined by the United Nations Framework Convention on Climate Change (UNFCCC). See Part II, Section V(A) paragraph 13, page 83 of:

<http://unfccc.int/resource/docs/cop5/07.pdf>

This is a UNFCCC “with additional measures” (WAM) scenario. Annex D gives details of the policies we include.

<sup>14</sup> Examples of policies announced or in consultation since August 2019 (and hence not included) are the introduction of the Green Home Grant, a consultation on changes to the taxation of red diesel and a green gas levy, and also a consultation on bringing forward the phase-out date for internal-combustion engine sales from 2040. If these were included, the projected level of emissions reported here would be lower.

There are significant uncertainties in these projections. We include illustrative confidence intervals based on the figures in EEP 2018 in some of our charts. This is to give a visual indication of how our confidence in our estimates reduces into the future. These bounds are approximate and it is possible that next year's reference scenario may lie outside the ranges we show. The potential impacts of the Covid-19 pandemic on future energy consumption and emissions are also highly uncertain, and this document does not seek to quantify them. We will keep this matter under review in light of the developments with the Covid-19 pandemic.

We produce projections of energy demand and emissions outside the power sector by applying standard statistical techniques. These project forward energy demand and emissions based on trends and relationships in past data. We adjust these projections to take account of the estimated impact of government policies (as of August 2019).

We base our projection of electricity supply on a model of supplier behaviour rather than statistical analysis of past trends. For this edition, we have changed our approach slightly so the power sector is more in line with the rest of the EEP models. Our assumptions now reflect implemented, adopted and planned policy<sup>15</sup> in the power sector. (In EEP 2018 and previous editions, the generation scenario included assumptions that went beyond current government policy).

We publish our projections for the reference scenario and other scenarios in annexes alongside this report. Each section notes the relevant annexes. The data underlying the report's tables and figures are in the web tables and web figures supplementary files. Section 8 lists these resources in full.

## 1.3 Comparison with the 2018 projections

Figure 1.1 compares the main emissions trends from EEP 2019 with those from EEP 2018. We give more detail about the changes to the projections in Chapter 6. When we compare emissions for carbon budget periods three to five in EEP 2019:

- We project higher UK total territorial emissions than EEP 2018 in carbon budget periods three and four. For the third carbon budget period they are 48 MtCO<sub>2e</sub> (2%) higher and for the fourth 7 MtCO<sub>2e</sub> or <0.5% higher. In the fifth carbon budget period emissions are lower than in EEP 2018—by 23 MtCO<sub>2e</sub> or 1%. We discuss these changes in Section 6.1.
- Non-traded emissions projections are higher than EEP 2018 for all carbon budget periods. In the third carbon budget the difference is 62 MtCO<sub>2e</sub> (4%), in the fourth 49 MtCO<sub>2e</sub> (4%) and in the fifth 8 MtCO<sub>2e</sub> or 1%. We examine changes in non-traded emissions in Section 6.2.

---

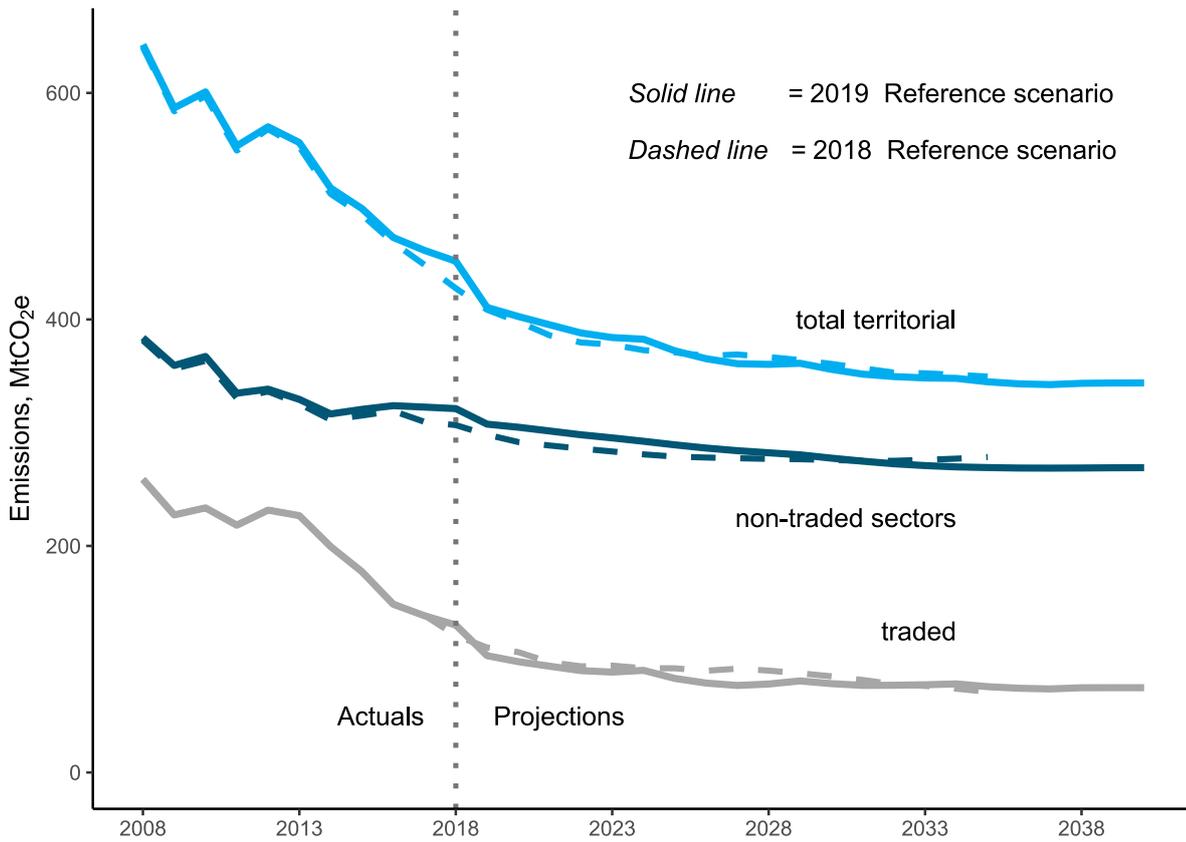

<sup>15</sup> This equates to expired, implemented, adopted, and planned policies as defined by the United Nations Framework Convention on Climate Change (UNFCCC). See Part II, Section V(A) paragraph 13, page 83 of:

<http://unfccc.int/resource/docs/cop5/07.pdf>

This is a UNFCCC “with additional measures” (WAM) scenario. Annex D gives details of the policies we include.

- Traded emissions projections are lower than in last year's edition for all carbon budget periods. They are lower by 14 MtCO<sub>2e</sub> (3%) in carbon budget three, by 42 MtCO<sub>2e</sub> (9%) in carbon budget four and by 31 MtCO<sub>2e</sub> (7%) in carbon budget five. We give a brief overview of the changes in traded emissions in Section 6.3.

**Figure 1.1:** Emission trends, MtCO<sub>2e</sub>

## 2 UK emissions projections

- The UK GHG Inventory reports emissions from 1990 onwards<sup>16</sup>. Between that year and 2018, territorial emissions from all sources reduced by 43% or 342 MtCO<sub>2e</sub>. We project that they will reduce by a further 24% (107 MtCO<sub>2e</sub>) to 344 MtCO<sub>2e</sub> in 2040.
- The UK met the first and second carbon budgets with headrooms of 36<sup>17</sup> and 384 MtCO<sub>2e</sub> respectively<sup>18</sup>. Under the reference scenario, we project that the UK will meet the third carbon budget with a headroom of around 26 MtCO<sub>2e</sub>.
- The projections show shortfalls against the fourth and fifth carbon budgets of 188 and 253 MtCO<sub>2e</sub>. The projections take account of policies that have been implemented, adopted or planned and where the policy design is sufficiently advanced to allow us to quantify impacts<sup>19</sup>.

This chapter looks at our projections for UK overall territorial, traded and non-traded emissions. It provides a summary of progress against the carbon budgets.

The UK GHG Inventory reports emissions from 1990 onwards<sup>20</sup>. Between that year and 2018, territorial emissions from all sources reduced by 43% or 342 MtCO<sub>2e</sub>. We project that they will reduce by a further 24% (107 MtCO<sub>2e</sub>) to 344 MtCO<sub>2e</sub> in 2040. Traded and non-traded emissions follow broadly similar trajectories (Figure 1.1)<sup>21</sup>. We project that traded emissions will fall by 55 MtCO<sub>2e</sub> (43%) to 75 MtCO<sub>2e</sub> in 2040. Non-traded emissions fall by 52 MtCO<sub>2e</sub> (16%) to 269 MtCO<sub>2e</sub> in 2040.

Figure 2.1 shows part of this series of actual and projected UK territorial emissions<sup>22</sup>. However, as with all such projections, there is substantial uncertainty around this analysis. We capture some of this uncertainty in our modelling<sup>23</sup>. The figure includes a “fan” to show what a range of possible outcomes might be. For this edition, we derived all the uncertainty analysis from the

---

<sup>16</sup> Note this is slightly different from the carbon budgets baseline.

<sup>17</sup> Note that performance against carbon budgets depends on the level of non-traded emissions. The actual level of traded emissions does not affect it under current carbon accounting rules.

<sup>18</sup> The Government fixes its carbon budget performance against emissions from the greenhouse gas inventory for the end of each budget period. Note that later inventories may adjust these emission estimates. Summary figures for the first two carbon budgets are in Table 9 of the Statistical Summary here:

<https://www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-to-2018>

<sup>19</sup> Some policies in the Clean Growth Strategy (October 2017) have not yet reached this stage. We will include the impacts of these in future EEP editions when they are more fully developed. We will also include any policies that may have reached this stage after August 2019. The Clean Growth Strategy:

<https://www.gov.uk/government/publications/clean-growth-strategy>

<sup>20</sup> Note this is slightly different from the carbon budgets baseline.

<sup>21</sup> Note that performance against carbon budgets depends on the level of non-traded emissions. The actual level of traded emissions does not affect it under current carbon accounting rules.

<sup>22</sup> The full series is in Annex A.

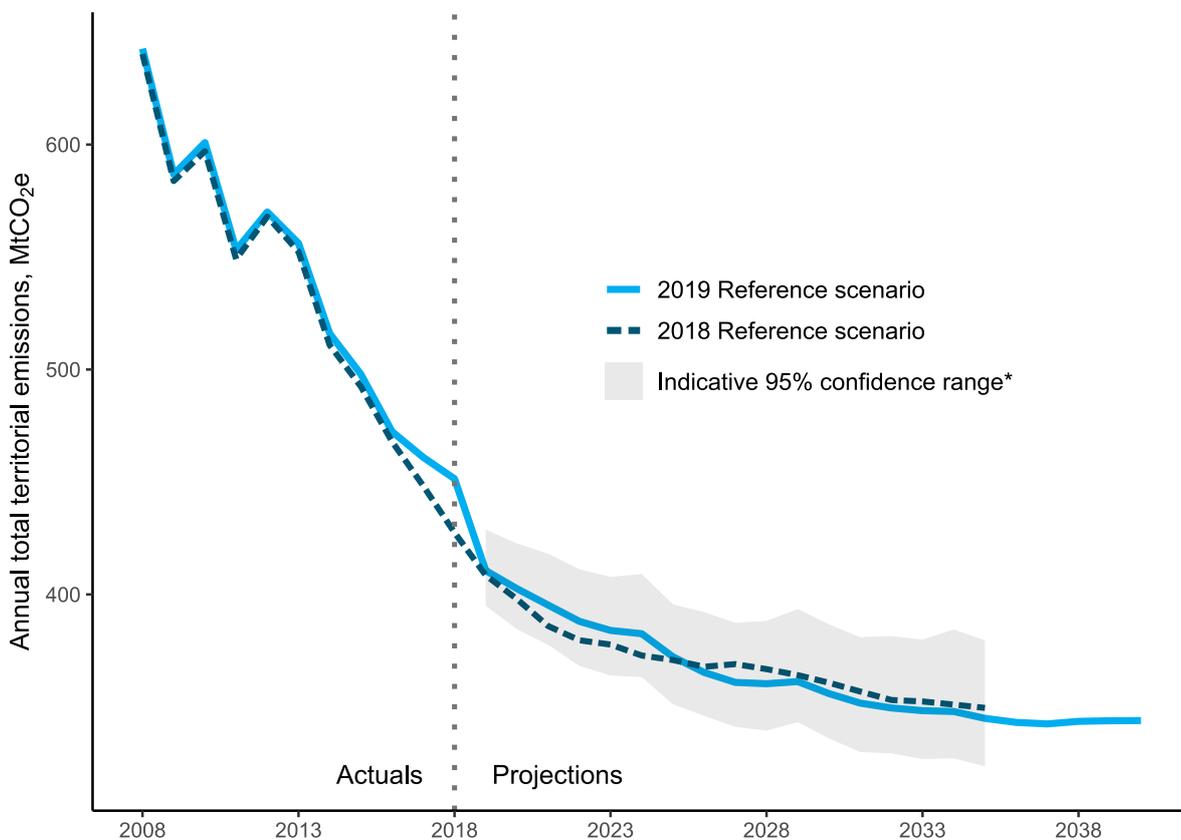

<sup>23</sup> In EEP 2018 we used Monte Carlo analysis to derive the uncertainty “fan”. This captured some aspects of uncertainty but with important exceptions. See Chapter 6 of:

[https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment\\_data/file/794590/updated-energy-and-emissions-projections-2018.pdf](https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/794590/updated-energy-and-emissions-projections-2018.pdf)

estimates we published in EEP 2018. This is due to time constraints at the time of analysis. Until further data on Covid-19 impacts are available, we have assumed the drivers of uncertainty are similar to previous years. We will keep this matter under review. We include the fan as a visual suggestion of how we are less sure of our estimates as we look to the next decade and beyond.

We give emissions by National Communication sector and greenhouse gas in Annex A. Annex B shows CO<sub>2</sub> emissions by DUKES sectors and Annex C gives CO<sub>2</sub> emissions for International Panel on Climate Change (IPCC) categories.

**Figure 2.1:** Uncertainty in UK projected emissions, MtCO<sub>2</sub>e

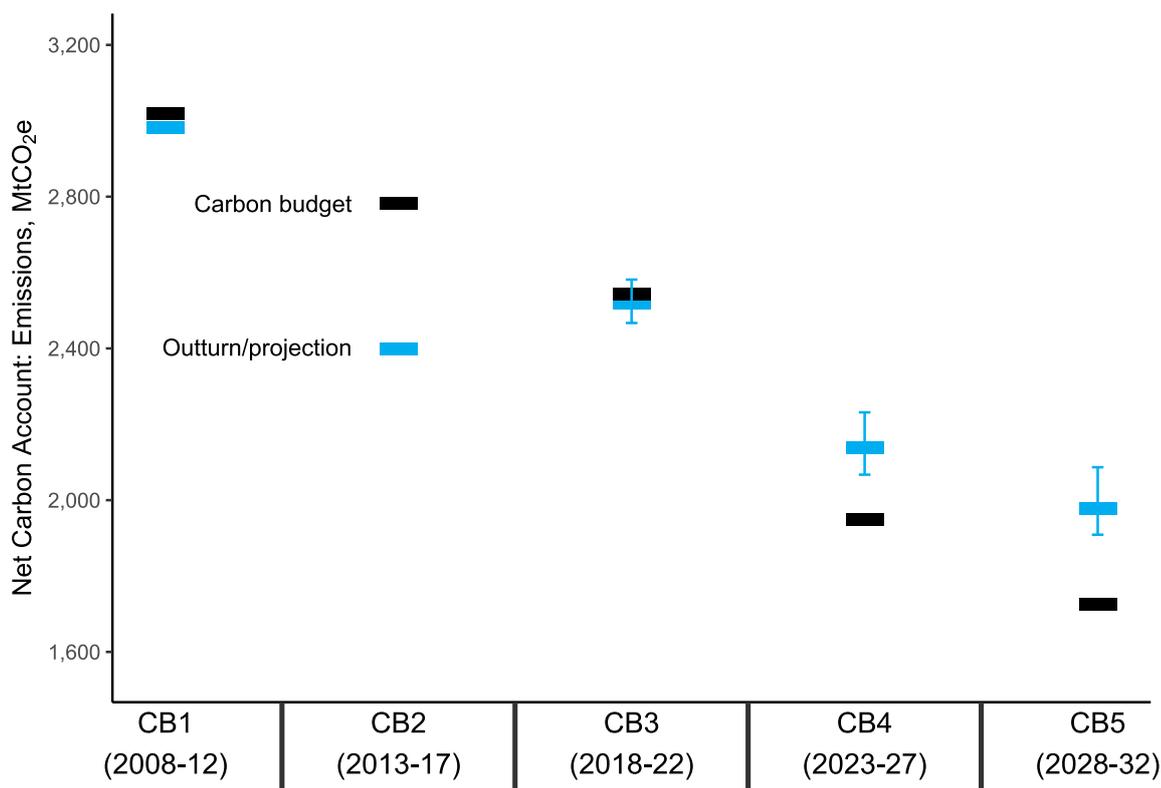

Notes:

\* The uncertainty ranges are indicative and are based on EEP 2018. The chart includes LULUCF.

## 2.1 Progress towards the carbon budgets

Between the carbon budgets baseline<sup>24</sup> and 2018, the UK cut emissions by 346 MtCO<sub>2e</sub> or 43%. Figure 2.2 shows actual and projected performance against the carbon budgets. The range it shows for each projection is indicative. We base the estimates on the 95% confidence intervals from EEP 2018. They give an approximate visual representation of the uncertainty in our figures. Table 2.1 shows how our projections compare with those in the previous edition.

**Figure 2.2:** Actual and projected performance against carbon budgets, MtCO<sub>2e</sub>

**Notes:**

Vertical bars show likely uncertainty in the projections. We based them on the 95% confidence intervals for the reference scenario of EEP 2018. They are approximate. Please note that the first and second carbon budgets use the actual net carbon accounts. The projections for the other carbon budgets use the traded cap assumed when the budgets were set<sup>25</sup>.

<sup>24</sup> The base year for comparison is 1990 for CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O, and 1995 for fluorinated gases:

<https://www.legislation.gov.uk/ukpga/2008/27/contents>

<sup>25</sup> EEP uses the UK allocation of EU ETS allowances assumed by the respective carbon budgets at the time they were set. This is because the allocations only become final after the budget period they relate to ends. See Box 1.

**Table 2.1:** Net carbon account performance against carbon budgets, MtCO<sub>2</sub>e and per cent

		Carbon budget				
		CB1 (2008-12) actual	CB2 (2013-17) actual	CB3 (2018-22) projected	CB4 (2023-27) projected	CB5 (2028-32) projected
Carbon Budget level [1]	emissions, MtCO <sub>2</sub> e	3,018	2,782	2,544	1,950	1,725
Average annual required reduction vs. base emissions	%	-24%	-30%	-36%	-51%	-57%

**EEP 2018**

Reference scenario	projected emissions, MtCO <sub>2</sub> e	2,982	2,398	2,456	2,089	1,970
--------------------	--	-------	-------	-------	-------	-------

**EEP 2019**

Reference scenario	projected emissions, MtCO <sub>2</sub> e	2,982	2,398	2,518	2,138	1,978
Result vs. Budget with reference case	emissions, MtCO <sub>2</sub> e	-36	-384	-26	188	253
Result vs. Budget with inclusion of CGS policy proposals [2]	emissions, MtCO <sub>2</sub> e	-36	-384	-26	158	173
Projected average annual reduction vs. base emissions [3]	%	-25%	-40%	-37%	-46%	-50%
Cumulative Result vs Budget	emissions, MtCO <sub>2</sub> e			-26	162	415

**Notes:**

1. This is the level of the third carbon budget in the 2009 legislation. The Government raised the budget level to 2,632 MtCO<sub>2</sub>e by carrying forward 88 MtCO<sub>2</sub>e of over-achievement from the second carbon budget period. See page 2 of:

<https://www.gov.uk/government/publications/annual-statement-of-emissions-for-2018>

2. This subset of early stage policies and proposals from the Clean Growth Strategy (CGS) gives an additional potential reduction of up to 30 and 80 MtCO<sub>2</sub>e over the fourth and fifth carbon budget periods respectively. Please see Box 1 for details of how we project future performance against the budgets.

3. Base emissions were around 797 MtCO<sub>2</sub>e<sup>26</sup>. Base year emissions estimates on which CB percentage reductions are based are revised annually and are therefore subject to change.

4. The UK Net Carbon Account (NCA) is fixed at the end of each CB period. The traded sector component of the NCA for CB1 and 2 is based on the actual UK share of EU ETS allowance, whereas for CB3, 4 and 5 it is based on the UK share of EU ETS allowances assumed at the time of setting the respective budgets. See 'Box 1' for further information on how the NCA is calculated.

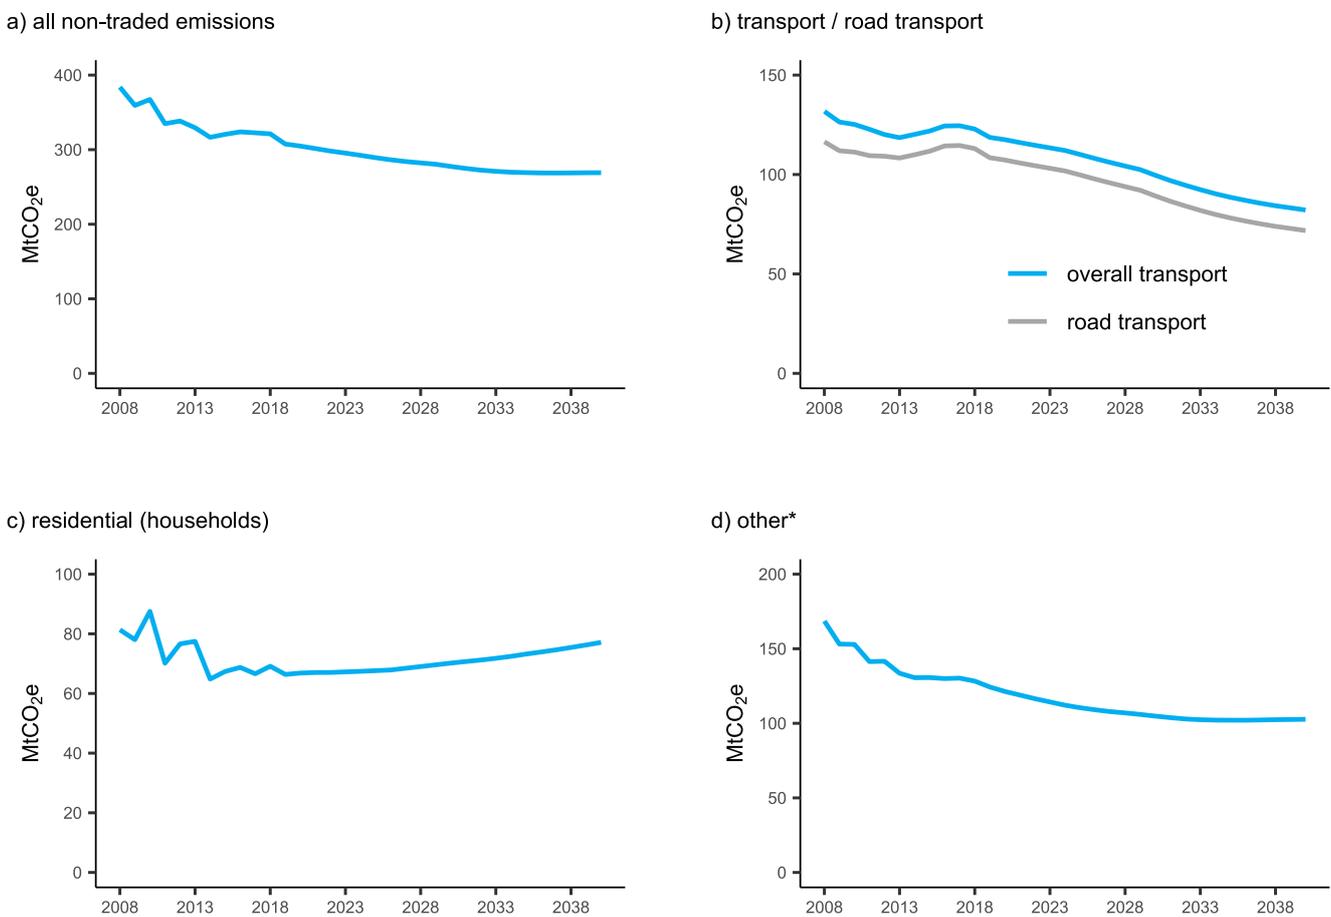

<sup>26</sup> The base year for comparison is 1990 for CO<sub>2</sub>, CH<sub>4</sub> and N<sub>2</sub>O, and 1995 for fluorinated gases:  
<https://www.legislation.gov.uk/ukpga/2008/27/contents>

## 2.2 Non-traded emissions projections by sector

Between 2018 and 2040, we project an overall fall in non-traded emissions of 52 MtCO<sub>2e</sub> (16%). However, by the end of the period, non-traded emissions will form a slightly larger proportion of all territorial emissions. Their proportion rises from 71% to 78%: this is 7 percentage points higher.

Figure 2.3 shows the trends we project for non-traded emissions by sector. The overall pattern for each is very similar to EEP 2018. The biggest changes are for transport and residential non-traded emissions in this EEP edition.

**Figure 2.3:** Non-traded emissions in the economy, MtCO<sub>2e</sub>

**Notes:**

\* Other emissions covers emissions which are not from the residential or transport sectors. This includes emissions from industry, commerce and agriculture.

By far the majority of transport emissions come from road transport. We project these will be slightly higher than in EEP 2018 in the early years of projections. However, they decline at a faster rate than in last year's edition by the late 2020s. EEP 2019 suggests road transport emissions for the year 2035 will be 78 MtCO<sub>2e</sub> whilst in EEP 2018 the figure was 90 MtCO<sub>2e</sub>; this is 13% lower. Much of this reduction reflects new CO<sub>2</sub> regulations for cars, vans and HGVs and the updated policy assumption that electric vehicle uptake will be higher. Over the fourth

and fifth carbon budgets these trends translate into emissions of 498 MtCO<sub>2e</sub> (3% higher than the previous edition) and 446 MtCO<sub>2e</sub> (3% lower than the previous edition) respectively.

In these projections the lower residential emissions reflect reduced forecasts for the number of UK households from those in EEP 2018: by 2035 the emissions are 4 MtCO<sub>2e</sub> lower in this edition. For carbon budgets four and five, this means residential non-traded emissions are 12 and 14 MtCO<sub>2e</sub> lower respectively. On average for the fourth and fifth carbon budget periods, this is around 4% lower than in EEP 2018.

Section 4 discusses the energy demand projections which lead to these emissions.

## 3 Effect of policies on emissions

- We project government policies will reduce non-traded emissions by around 189 MtCO<sub>2e</sub> in the third, 264 MtCO<sub>2e</sub> in the fourth and 333 MtCO<sub>2e</sub> in the fifth carbon budget period.
- Most of the savings are from policies the Government adopted after the Low Carbon Transition Plan (LCTP) of 2009<sup>27</sup>.
- Non-traded emissions savings from policies in EEP 2019 are 16 MtCO<sub>2e</sub> lower than in EEP 2018 in the third and 11 MtCO<sub>2e</sub> lower in the fourth carbon budget periods. This is due to revised savings estimates for some existing policies. They are 18 MtCO<sub>2e</sub> higher in the fifth carbon budget due to new transport policies.
- Policies under the Resources and Waste Strategy are new to EEP 2019. These are: the Deposit Return Scheme, the Reform of the UK Packaging Producer Responsibility System, and Consistency in Household and Business Recycling Collections.
- We estimate government policies reduced emissions in the Electricity Supply Industry (ESI) by 41 MtCO<sub>2e</sub> in 2018 alone.

In this chapter we focus on policies that produce savings in the non-traded sector since they directly contribute to meeting the carbon budgets<sup>28</sup>. We briefly discuss the impact of government policies in the Electricity Supply Industry (ESI) in Section 3.3. These are mostly traded emissions.

The Government estimates individual policy impacts by comparing modelled emissions from scenarios which contain a policy with scenarios which do not.

We group policies by whether they were adopted before or after the Low Carbon Transition Plan (LCTP) of 2009. This was the UK's first comprehensive plan for moving to a low carbon economy. In this chapter, we only quote savings for policies adopted after the LCTP ("post-LCTP") unless we state otherwise. These estimates are more robust than those for policies adopted before the LCTP ("pre-LCTP").

---

<sup>27</sup> The policies considered in this publication's projections do not include those announced by the Chancellor of the Exchequer on 8th July 2020 to increase the energy efficiency of buildings. These include £2 billion to improve the energy efficiency of housing with the Green Homes Grant; £50m for social housing; and £1 billion to improve the public sector's buildings' energy efficiency. The impact of these policies will be considered in the next publication.

<sup>28</sup> See Box 1.

### 3.1 Policies for non-traded emissions reduction

Table 3.1 shows that we estimate that government policies will reduce non-traded emissions by 785 MtCO<sub>2e</sub> over carbon budgets three to five<sup>29</sup>. We report policy savings in Annex D: this gives brief information about the policies we include.

**Table 3.1:** Non-traded GHG emissions savings from policies, MtCO<sub>2e</sub>

	Carbon budget			Total (2018-32)
	CB3 (2018-22)	CB4 (2023-27)	CB5 (2028-32)	
Savings from pre-LCTP policies	68	60	49	177
Savings from post-LCTP policies	121	204	283	608
<i>Savings from all policies</i>	<i>189</i>	<i>264</i>	<i>333</i>	<i>785</i>

### 3.2 Changes to non-traded policy savings since EEP 2018

In the short and medium term, we project lower non-traded GHG savings from government policies in EEP 2019 compared with the 2018 projections. Savings for the third carbon budget have decreased from 204 to 189 MtCO<sub>2e</sub> (16 MtCO<sub>2e</sub> less) while those for the fourth carbon budget have decreased from 275 to 264 MtCO<sub>2e</sub> (11 MtCO<sub>2e</sub> less).

In the long term we project higher policy savings than in EEP 2018. Savings for the fifth carbon budget have increased overall in EEP 2019, from 314 to 333 MtCO<sub>2e</sub> (a change of 18 MtCO<sub>2e</sub>).

Policies with the largest change in non-traded policy savings from last year's projections include:

- **Resources and Waste Strategy:** the Deposit Return Scheme, the Reform of the UK Packaging Producer Responsibility System, and the Consistency in Household and Business Recycling Collections policies are new to EEP 2019. Together, they contribute 1 MtCO<sub>2e</sub> and 4 MtCO<sub>2e</sub> of non-traded savings in the fourth and fifth carbon budget periods, respectively.
- **Vehicle Efficiency Policies:** for EEP 2019, the savings we attribute to Road Vehicle Efficiency policies are 5 MtCO<sub>2e</sub> lower in the fourth carbon budget period than in EEP 2018, driven by statistics which show consumers opting for larger and less efficient

<sup>29</sup> Our projections do not include the potential impacts of the Government's consultation on proposals to end the sales of new petrol, diesel and hybrid cars and vans by 2035 or earlier. We will include these when policy is more developed. The projections also do not include the £5 billion in new funding announced for cycling and buses in February 2020, but we will include this policy in EEP 2020.

vehicles in recent years. However, savings are 21 MtCO<sub>2</sub>e higher in the fifth carbon budget period than in the last edition. The main drivers are new CO<sub>2</sub> regulations for cars, vans and HGVs and an increased forecast of electric vehicle uptake.

- Agricultural policies<sup>30</sup>: projected agriculture sector savings for England are lower than EEP 2018 by 10 MtCO<sub>2</sub>e in the fourth and the fifth carbon budget periods. We revised savings of 4 MtCO<sub>2</sub>e per year (mostly associated with English agricultural policies) in EEP 2018 to 2 MtCO<sub>2</sub>e based on updated outturn evidence for the sector. Savings mostly come from improved nutrient management and land and soil management.

### 3.3 Emissions savings from policies in electricity supply

The EU ETS covers most emissions from electricity supply. These are traded emissions and do not affect the UK's Net Carbon Account<sup>31</sup>. A range of government policies have reduced emissions in the Electricity Supply Industry (ESI) since the 2009 Low Carbon Transition Plan.

Supply-side policies comprise:

- Large Combustion Plant Directive
- Industrial Emissions Directive
- EU ETS
- UK Carbon Price Support
- Feed-in-Tariffs (for small scale generation)
- Renewables Obligation and Contracts for Difference (for large-scale generation)
- Phase out of coal-fired generation

Power supply markets are highly interconnected. This means we cannot disentangle the impacts of individual policies. However, we estimate that in total these reduced emissions from the power sector by 41 MtCO<sub>2</sub>e in 2018 alone.

We project ESI policy savings will be 245 MtCO<sub>2</sub>e during the fourth carbon budget period. This compares with the 292 MtCO<sub>2</sub>e we projected in EEP 2018. The change in modelling approach we discuss in Chapter 5 explains most of this difference.

We report aggregated emissions savings from power supply policies in the "All, by sector" section of Annex D.

---

<sup>30</sup> "Agricultural policies" covers a range of resource efficiency and land management emission reduction measures. Please see Annex D for more information. Note that savings in the agriculture sector are not limited to these policies. There are impacts from other measures which do not have agriculture as their sole focus (see Annex D).

<sup>31</sup> See Box 1.

## 4 Demand for energy

- Our projections suggest that total final energy demand in 2040 will be around 135 million tonnes of oil equivalent (Mtoe)<sup>32</sup>. This is about 5 Mtoe (4%) lower than the demand in the year 2018. This represents around a 14% reduction in per capita demand.
- We project total primary energy demand in 2040 will be around 183 Mtoe, about 17 Mtoe (9%) less than the 2018 value.
- We project the proportion of all final energy demand met from electricity or renewables will rise from 23% in 2018 to 27% in 2035 and to 28% in 2040. In EEP 2018 the 2035 figure was 26%.

In this chapter we summarise the latest projections for final and primary energy demand.

### 4.1 Final energy demand

We project that total Final Energy Demand (FED)<sup>33</sup> will fall until the year 2026—to 133 Mtoe from 140 Mtoe in 2018 (a decrease of around 5%). Demand then rises slowly as the effects of policies diminish<sup>34</sup> and macroeconomic drivers continue to push it up. By 2040, we project total FED will be around 135 Mtoe, 4% lower than in the year 2018 (Fig 4.1 a). This represents around a 14% reduction in per capita demand.

In EEP 2019 we project slightly lower total final energy demand than in EEP 2018: in 2035 it is 5% lower than in the previous edition. This is mainly due to decreased demand for oil products in transport and for natural gas in the residential and industry sectors.

In this edition, FED for electricity is slightly lower than in EEP 2018. By 2035 the difference is around 2% (638 Mtoe less). Lower demand in the residential and services sectors outweighs higher demand for industrial and (especially) transport electricity.

The proportion of all FED met from electricity or renewables rises slowly from 23% in 2018 to 27% in 2035, and to 28% in 2040.

Patterns of demand vary across the four major energy consuming sectors of transport (Figure 4.1 b), residential (Figure 4.1 c), industry (Figure 4.1 d) and services (Figure 4.1 e).

---

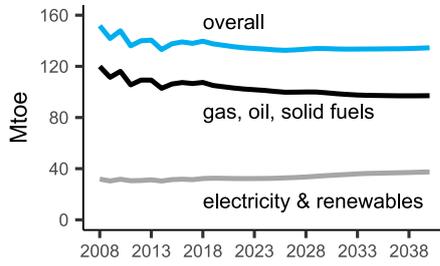

<sup>32</sup> These are the same units as DUKES uses for historical data.

<sup>33</sup> Final energy consumption is energy consumed by the final user—i.e. it excludes any losses during the transformation into other forms of energy. We follow the DUKES approach here and include international aviation but not international shipping demand. The emissions projections we discuss exclude both.

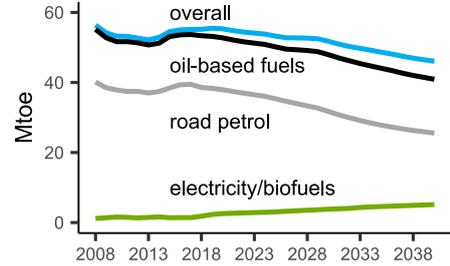

<sup>34</sup> The model projects energy demand and emissions in the absence of policy. We then remove emissions to match the emissions reductions we expect for the policies the scenario includes. So, if policy savings diminish (for example when a policy expires), the model's emissions increase towards the policy-off level.

**Figure 4.1:** Final energy demand by fuel and consumer sector, 2008 to 2040, Mtoe

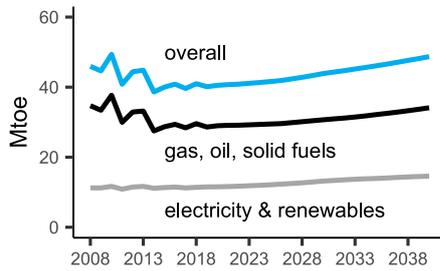

a) total

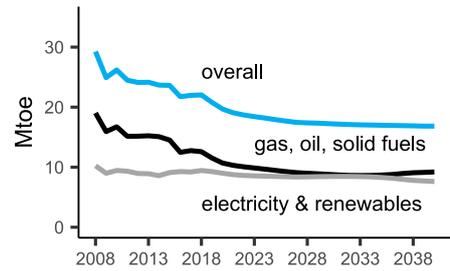

b) transport

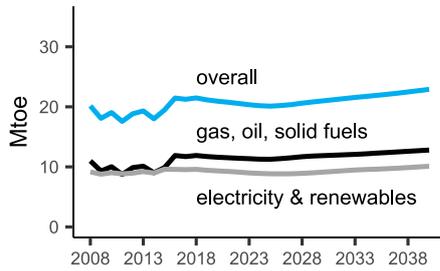

c) residential (households)

d) industry

e) services (including agriculture)

## Final energy demand by sector

The main trends in final energy demand for each sector are:

Transport (including international aviation; Figure 4.1 b)

- This had the largest final energy demand in 2018 (40% of the total).
- We project transport final energy demand will fall by 16% between 2018 and 2040. It will then be the second biggest sector behind the residential sector (34% of the total).
- In 2018, 97% of transport FED was from oil-based fossil fuels but by 2040 we project this will fall to 89%. This reflects more electric vehicles and increasing biofuels use.
- We project final energy demand in 2035 will be 8% lower than EEP 2018. The main reason is that new CO<sub>2</sub> regulations establishing emissions targets for cars, vans and HGVs lead to reduced demand for petroleum products.

Residential (Figure 4.1 c)

- This sector had the second highest final energy demand in 2018 (29% of the total).
- We project total residential FED will increase by 19% between 2018 and 2040 when the sector overtakes transport to become the largest sector (36% of the total demand). This change is a consequence of our assumptions about: the growth in the number of households, changes in household income, future weather and how retail fuel prices will change.
- In 2018, 28% of residential FED came from electricity and renewables<sup>35</sup>. We project this proportion will increase slightly to 30% by 2040.
- Our projection for overall residential final energy demand in 2035 is 4% lower than EEP 2018. Our projections for demand from each fuel are lower too. This is mainly because we assume lower future household numbers than in the previous edition.

Industry (Figure 4.1 d)

- This sector was 16% of total final energy demand in 2018.
- We project total industry FED will fall by 24% between 2018 and 2040.
- In 2018 around 43% of industrial final energy demand was for electricity or renewables. In 2040 this rises slightly to 45%.
- We project industry FED in 2035 will be 10% lower than EEP 2018 levels. Demand for electricity, solid fuels and renewables is higher, while FED for petroleum products and natural gas is lower. The main reasons are the DUKES 2019 reallocation of oil from

---

<sup>35</sup> The DUKES category "Bioenergy & waste". This includes geothermal, solar heat and heat pumps but excludes renewable electricity generation.

industry to service sectors<sup>36</sup> and improvements to our industry equations (see Section 6.2).

Services<sup>37</sup> (Figure 4.1 e)

- Services final energy demand was 15% of the total in 2018.
- We project this to increase by 7% between 2018 and 2040, reaching 17% of total FED.
- In 2018, 45% of services final energy demand was from electricity and renewables<sup>38</sup>. We project this share will remain roughly the same up to 2040.
- In EEP 2019 our projection for services FED in 2035 is 2% higher than in EEP 2018. We project final energy demand from electricity will decrease and demand for oil will increase. This follows from the demand equation improvements and the DUKES 2019 reallocation of oil from industry to service sectors which we describe in Section 6.2.2.

We give final energy demand projections by sector in annex F.

## 4.2 Primary energy demand

We project total primary energy demand<sup>39</sup> will fall by 11% between 2018 and 2025: from 200 to 179 Mtoe. It then stays at around this level before increasing from the mid-2030s. In 2040 it reaches 183 Mtoe, a reduction of 9% from the year 2018.

Total primary energy demand in 2035 is 7% lower than EEP 2018. This is driven by reduced demand for nuclear, renewables and waste and for oil in the 2019 edition. However, higher demand for imported electricity and natural gas offsets this somewhat.

---

<sup>36</sup> The impact of the DUKES changes is that the statistics now assign around 40% of industrial oil demand to other sectors. For more information see:

<https://www.gov.uk/government/publications/energy-trends-june-2019-special-feature-article-change-to-method-of-estimating-sector-demand-for-oil-products>

<sup>37</sup> Services comprises the commercial sector, public sector and agriculture.

<sup>38</sup> The DUKES category "Bioenergy & waste". This includes geothermal, solar heat and heat pumps but excludes renewable electricity generation.

<sup>39</sup> Fuels obtained directly from natural sources, e.g. coal, oil and natural gas. Primary energy includes primary electricity.

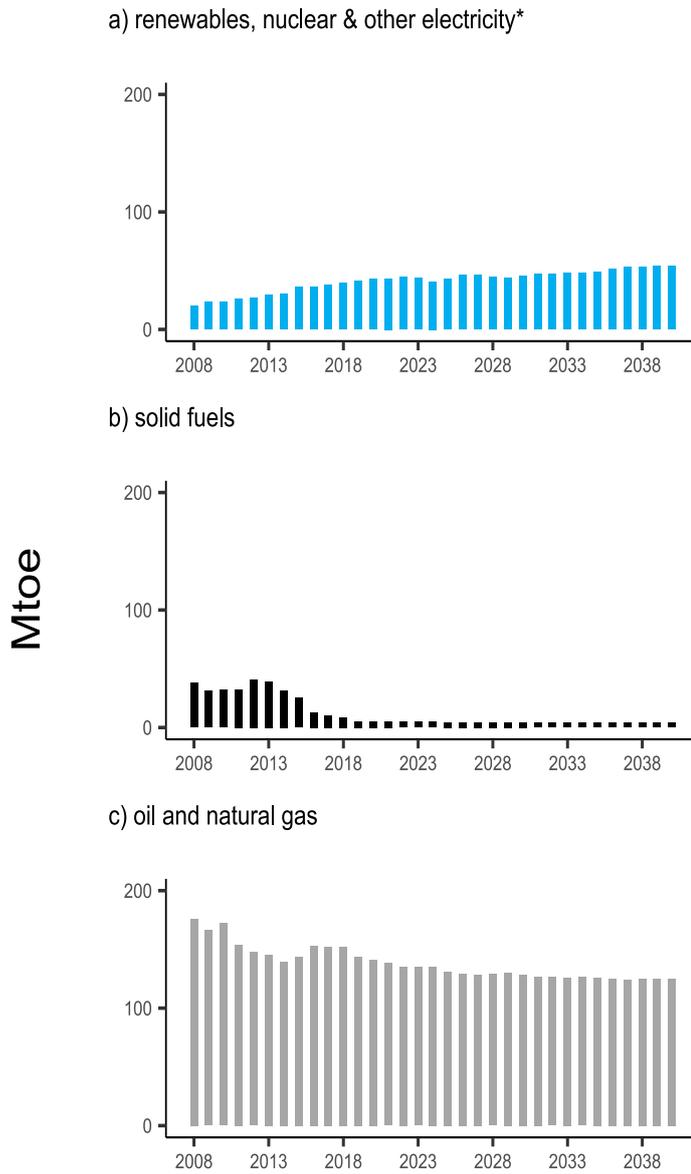

## Primary energy demand by fuel group

The trends we project for primary energy demand from different sources are similar to those in the previous edition (Figure 4.2):

- Renewables, nuclear and other electricity (Fig 4.2 a) demand increases steadily. Between 2018 and 2040, primary energy from these sources increases by 36% to reach 29% of total primary energy demand or 54 Mtoe.
- Solid fuels (mostly coal: Fig 4.2 b) use has fallen rapidly since 2013 as electricity generation has switched to using more renewables, waste and natural gas. By 2040 it meets only 2% (4 Mtoe) of demand. There is no coal-fired electricity generation after the government deadline of 2025.
- Demand for primary energy from oil and natural gas (Fig 4.2 c) declines by 18% between 2018 and 2040. Electricity and biofuels meet an increasing proportion of road fuel demand. Renewables and nuclear displace electricity generation from natural gas.

We give primary energy demand projections for each fuel in Annex E.

**Figure 4.2: Primary energy demand by fuel, Mtoe**

Notes:  
 \* Other electricity is mainly electricity from waste.

## 5 Electricity supply

- For this year’s publication, we aligned the power sector modelling approach with the rest of EEP by only including assumptions that reflect implemented, adopted and planned policy<sup>40</sup>. BEIS will also publish two illustrative strategic scenarios showing what a Net Zero-consistent power sector could look like. These go beyond current government policy and do not indicate a preferred outcome<sup>41</sup>.
- We project that the low carbon share of UK electricity generation<sup>42</sup> will rise from 51% in 2018 to 83% in 2040. This is the proportion of all generation from renewables, nuclear or Carbon Capture and Storage (CCS) power producers.

We undertook the electricity supply sector modelling in March 2020 using BEIS’s “Dynamic Dispatch Model” (DDM)<sup>43</sup>. The DDM models the impact of relevant policies including small scale Feed-in Tariffs, the Renewables Obligation, Contracts for Difference (CfD), Carbon Price Support, the Capacity Market and Industrial Emissions Directive.

This year, we have changed the modelling approach slightly so the power sector is more in line with the rest of EEP modelling. Our reference scenario assumptions now attempt to reflect implemented, adopted and planned policy<sup>44</sup>. In previous editions the modelling assumed current government policy continued. For example, some of the impacts of this are that the EU ETS trajectory is now the same as other sectors post 2030 and there are no CfD auctions after 2030. Some of the installations included within these projections depend on future decisions by government and regulators. These decisions will be taken on a case-by-case basis at the appropriate moment and will be subject to value for money assessment if additional funding is required.

As in previous years, the report annexes give separate results for “Major Power Producers” (MPPs: annexes G-I) and “All Power Producers” (which includes autogenerators: annexes J-L). In 2018, MPPs accounted for around 95% of the UK’s electricity generation.

---

<sup>40</sup> This equates to expired, implemented, adopted, and planned policies as defined by the United Nations Framework Convention on Climate Change (UNFCCC). See Part II, Section V(A) paragraph 13, page 83 of: <http://unfccc.int/resource/docs/cop5/07.pdf>

This is a UNFCCC “with additional measures” (WAM) scenario. Annex D gives details of the policies we include.

<sup>41</sup> We will give more detail about these in the report published as Annex O once published.

<sup>42</sup> The figures we quote in this chapter are for “All Power Producers”. They do not include electricity imports or exports.

<sup>43</sup> For background information on the DDM please see:

<https://www.gov.uk/government/publications/dynamic-dispatch-model-ddm>

<sup>44</sup> This equates to expired, implemented, adopted, and planned policies as defined by the United Nations Framework Convention on Climate Change (UNFCCC). See Part II, Section V(A) paragraph 13, page 83 of: <http://unfccc.int/resource/docs/cop5/07.pdf>

This is a UNFCCC “with additional measures” (WAM) scenario. Annex D gives details of the policies we include.

## 5.1 Summary of projections

The projections show a slightly lower overall demand for electricity than in EEP 2018. We discuss this in Section 4.1. The biggest power sector changes from last year's edition are in the generation mix.

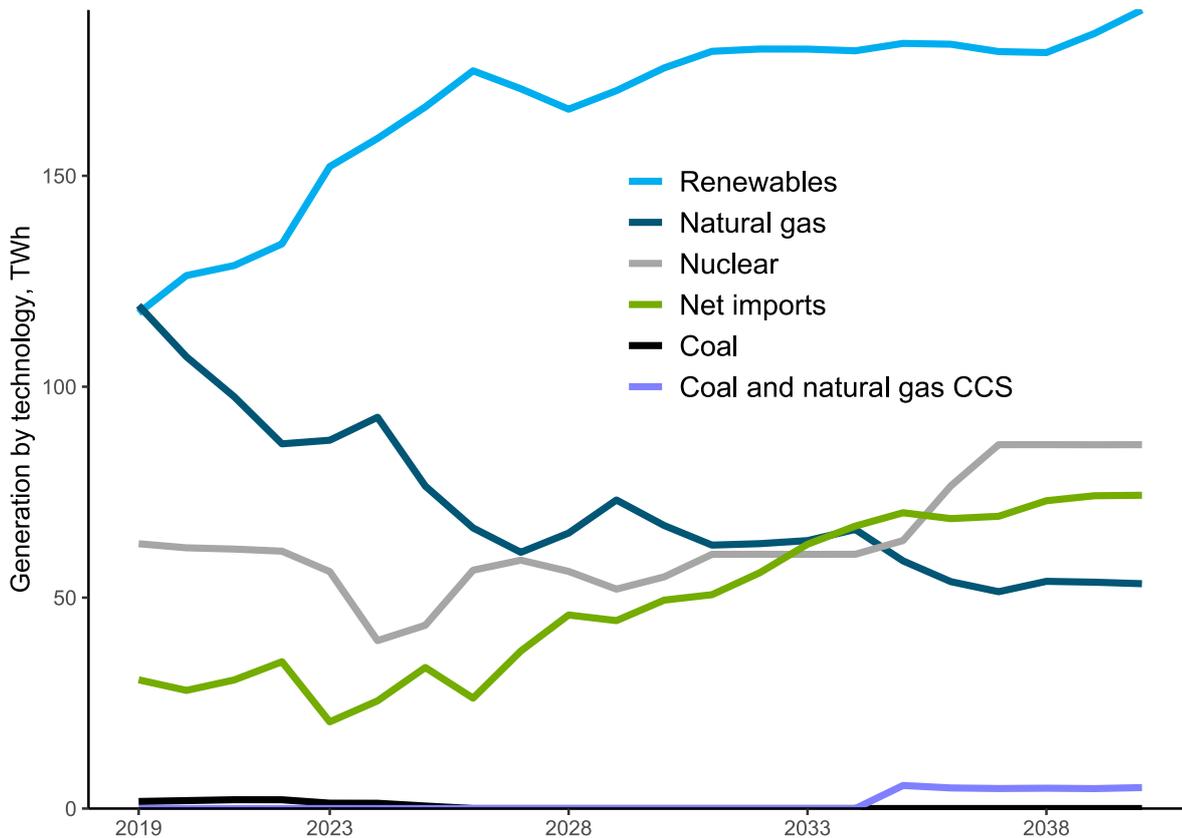

Figure 5.1 shows our projections of generation by technology for all power producers up to 2040:

- Over time, low carbon generation (renewables, gas CCS and nuclear) increases. It makes up 83% of UK generation by 2040. This is around a 32 percentage point increase in the low carbon share from 51% in 2018.
- As in the previous EEP edition, we project generation from renewables will rise. However, this year's modelling approach (which reflects implemented and planned policies rather than a trajectory consistent with an 80% emissions reductions target as we assumed in EEP 2018) means the increase is lower as there is less capacity throughout the 2030s. In 2035 this amounts to 30 TWh (14%) less generation compared with EEP 2018: imports and gas generation make up the shortfall. Total renewables generation reaches 56% of UK generation by 2040.
- Natural gas generation responds to increasing low carbon generation by falling rapidly until the late 2020s. It then stabilises as less new low carbon generation capacity comes online. By 2035 it will be around 59 TWh, 55% lower than 2018 levels. This compares with 34 TWh in the previous edition (25 TWh higher). In 2040, 53 TWh of demand is from gas generation, 16% of the total.
- Nuclear generation increases with the opening of new capacity between the mid-2020s and mid-2030s. There are dips as existing plants retire. Our assumption of lower capacity<sup>45</sup> in EEP 2019 means less nuclear generation than in EEP 2018 (41 TWh lower in 2035).
- We project net imports from interconnectors will rise as more connections with neighbouring markets open in the 2020s. Imports are higher than in EEP 2018 as they largely offset the lower increases in renewables and nuclear generation.

---

<sup>45</sup> The modelling takes into account the suspension of work on Wylfa Newydd nuclear power station and the subsequent withdrawal of Hitachi from the project.

**Figure 5.1:** Electricity generation by fuel source, TWh

We project emissions from electricity production will fall steadily as generation switches away from fossil fuels (annexes B and C).

## 5.2 Net Zero-consistent power sector scenarios

BEIS has worked extensively on the Net Zero target since EEP 2018. This includes modelling two illustrative scenarios showing what a Net Zero-consistent power sector could look like. These will be published in the *Net Zero and the Power sector* publication as Annex O to EEP 2019. This will discuss this modelling and its implications in more detail.

## 6 Detailed comparisons with EEP 2018

This chapter gives more information about the major changes to the projections since EEP 2018. We presented summary figures in Section 1.3.

### 6.1 Changes in territorial projections since EEP 2018

**Table 6.1:** Changes which affect total territorial emissions (in comparison with EEP 2018), MtCO<sub>2e</sub>

Type of change since EEP 2018	Carbon budget period		
	CB3 (2018-22)	CB4 (2023-27)	CB5 (2028-32)
Model inputs	72	35	24
Policy savings updates	12	9	-19
Modelling improvements	-36	-37	-28
<b>Total change since EEP 2018</b>	<b>48</b>	<b>7</b>	<b>-23</b>

The differences between this edition and EEP 2018 stem from model improvements, and updates to policy savings and other inputs. We summarise the main changes since EEP 2018 which affect overall *territorial emissions* in table 6.1. These are:

- Policy savings updates for climate change policies lead to higher projected territorial emissions in the third and fourth carbon budgets (by 12 MtCO<sub>2e</sub> and 9 MtCO<sub>2e</sub> respectively), but lower territorial emissions (by 19 MtCO<sub>2e</sub>) in the fifth carbon budget. The biggest changes from policy updates are in the transport sector. For example, compared with EEP 2018, updated outturn data for vehicle emissions cause higher emissions in the third and fourth carbon budgets (by 7 MtCO<sub>2e</sub> and 4 MtCO<sub>2e</sub>) but 20 MtCO<sub>2e</sub> lower emissions in the fifth carbon budget as changes in electric vehicle ownership and efficiency have an impact. We discuss policy savings in Chapter 3.
- Revisions to model inputs mean that territorial emissions projections are higher than EEP 2018 in each of carbon budget periods three to five. The emissions are higher by 72, 35 and 24 MtCO<sub>2e</sub> respectively. The main reason is a fall in fossil fuel prices since EEP 2018 which encourages their greater use. However, lower household numbers somewhat offset this in the fourth and fifth carbon budget periods.
- Modelling improvements lead to lower territorial emissions than in EEP 2018 in each of carbon budget periods three to five. The emissions are lower by 36, 37 and 28 MtCO<sub>2e</sub> respectively. We have lowered projected iron and steel demand since the last edition to

better match recent energy use trends in the sector<sup>46</sup>. This model change caused the greatest fall in territorial emissions.

In this report our main focus has been the *non-traded emissions* element of territorial emissions. This is because these affect performance against carbon budgets (see Box 1 for more details).

## 6.2 Changes in non-traded projections since EEP 2018

This section focuses on changes in non-traded emissions since EEP 2018. Table 6.2 below shows the main changes and their impacts on non-traded emissions in the third, fourth and fifth carbon budget periods.

**Table 6.2:** Changes which affect non-traded emissions (in comparison with EEP 2018), MtCO<sub>2e</sub>

Type of change since EEP 2018	Carbon budget		
	CB3 (2018-22)	CB4 (2023-27)	CB5 (2028-32)
Model inputs	40	26	11
Modelling improvements	10	14	18
Policy savings updates	13	8	-21
<b>Total change since EEP 2018</b>	<b>62</b>	<b>49</b>	<b>8</b>

The main reasons for changes in projected non-traded emissions<sup>47</sup> since the last edition are:

- Revised model inputs mean projections of non-traded emissions are 40, 26 and 11 MtCO<sub>2e</sub> higher than in EEP 2018 in the third, fourth and fifth carbon budget periods respectively. We cover the impact of input updates in Section 6.2.2.
- Modelling improvements led to projected non-traded emissions which are 10 MtCO<sub>2e</sub> higher in the third, 14 MtCO<sub>2e</sub> higher in the fourth and 18 MtCO<sub>2e</sub> higher in the fifth carbon budget periods. The main improvements in the projection methodology were to emissions accounting for industry and services (the traded/non-traded split), and to demand projections for commerce, public oil, residential oil and industry. We give more information about this in Section 6.2.1.
- Policy savings updates for climate change policies led to 13 MtCO<sub>2e</sub> and 8 MtCO<sub>2e</sub> higher projected non-traded emissions in the third and fourth carbon budgets

<sup>46</sup> Recent changes in the sector include the closure of Redcar's steel plant in 2015 and declining production of manufactured solid fuels such as coke oven coke.

<sup>47</sup> Our attributions are approximate here. It is not possible to fully isolate the impact of every change.

respectively. In the fifth carbon budget period, these changes result in 21 MtCO<sub>2e</sub> lower non-traded emissions. We discuss policy savings in detail in Chapter 3.

## 6.2.1 Improvements in the projection methodology

Since we published EEP 2018, the BEIS modelling team have concentrated on quality assurance<sup>48</sup> and modelling methodology updates. All model changes use more up to date data and evidence to improve the accuracy of the projections. Our modelling improvements cause non-traded emissions to be higher in each of carbon budget periods three to five: by 10, 14 and 18 MtCO<sub>2e</sub> respectively.

**Table 6.3:** Improvements in the projection methodology which affect non-traded emissions (in comparison with EEP 2018), MtCO<sub>2e</sub>

Modelling improvements	Carbon budget		
	CB3 (2018-22)	CB4 (2023-27)	CB5 (2028-32)
Traded/non-traded emissions split	11	12	12
Commerce and public demand projections	3	7	10
Industry demand projections	-4	-3	-2
Residential demand projections	-3	-3	-3
Other [1]	2	1	2
<b>Total change from modelling improvements</b>	<b>10</b>	<b>14</b>	<b>18</b>

Notes:

1. "Other" includes inputs with impacts less than 5 MtCO<sub>2e</sub> across the combined total of carbon budgets three, four and five.

The main modelling improvements that affected non-traded emissions projections are:

- Revisions to the traded/non-traded emissions split: We improved the alignment of the model to the GHG Inventory and EU ETS data. This made the proportion of non-traded emissions in the projections higher.
- Commerce and public demand projections: We revised commerce and public oil demand upwards to match the revised estimates of past consumption in DUKES<sup>49</sup>.

<sup>48</sup> See BEIS Modelling Quality Assurance tools and guidance here:

<https://www.gov.uk/government/collections/quality-assurance-tools-and-guidance-in-decc>

<sup>49</sup> The impact of the DUKES changes is that the statistics now assign around 40% of industrial oil demand to other sectors. For more information see:

<https://www.gov.uk/government/publications/energy-trends-june-2019-special-feature-article-change-to-method-of-estimating-sector-demand-for-oil-products>

- Industry demand projections: Changes to these caused lower industry gas and oil consumption projections. We revised the equations because changes in the sector meant the model no longer matched recent trends<sup>50</sup>.
- Residential demand projections: Our revised approach led to lower residential oil consumption projections. We made this change because our existing equations were not reflecting past trends as well as in other sectors.

## 6.2.2 Changes due to input updates

We list the main input updates and their effects on emissions in Table 6.4. The overall impact of changes to inputs is to give higher emissions: by 40, 26 and 11 MtCO<sub>2e</sub> in carbon budget periods three, four and five.

**Table 6.4:** Input updates which affect non-traded emissions (in comparison with EEP 2018), MtCO<sub>2e</sub>

Input update	Carbon budget		
	CB3 (2018-22)	CB4 (2023-27)	CB5 (2028-32)
LULUCF and Non-CO <sub>2</sub>	29	27	25
Fossil fuel price projections	14	16	14
GHG Inventory (2019)	15	7	7
Transport	3	7	6
DUKES [1]	-8	-3	-4
Power sector updates & interaction	-1	-3	-11
GHG Inventory (2020)	-6	-12	-11
Household numbers	-7	-13	-16
Other [2]	1	-1	0
<b>Total change due to input updates</b>	<b>40</b>	<b>26</b>	<b>11</b>

*Notes:*

1. The DUKES update row does not include transport: the “Transport” row captures these changes. It also excludes the indirect impact of our projection equation adjustments which we made after the DUKES revisions to past oil demand.

2. “Other” includes inputs with impacts less than 5 MtCO<sub>2e</sub> across the total of carbon budgets three to five.

<sup>50</sup> We last reviewed industry in depth in 2016.

Compared with EEP 2018, the biggest upwards revisions to non-traded emissions come from updates to:

- LULUCF and Non-CO<sub>2</sub> emission data: updated historic data and new projections of Land Use, Land Use Change and Forestry (LULUCF) / non-CO<sub>2</sub> emissions mean that emissions are higher than in EEP 2018—by 29 MtCO<sub>2</sub>e in the third, 27 MtCO<sub>2</sub>e in the fourth and 25 MtCO<sub>2</sub>e in the fifth carbon budget periods. The main reason for the increases was a correction to GHG removals from forest land in the GHG Inventory (2019)<sup>51</sup> (this also affected the main Inventory CO<sub>2</sub> emissions inputs: see below).
- Fossil fuel price projections: we assume future prices of fossil fuels will be lower than in EEP 2018<sup>52</sup>. This makes it economically attractive to use more of them. The higher fossil fuel use leads to higher emissions than in EEP 2018. Non-traded emissions are 14, 16 and 14 MtCO<sub>2</sub>e higher in the third, fourth and fifth carbon budget periods respectively.
- GHG Inventory (2019): this update led to higher non-traded emissions. In the third carbon budget period, emissions were 15 MtCO<sub>2</sub>e higher. In the fourth and fifth budget periods emissions are also higher—by 7 MtCO<sub>2</sub>e in the fourth and 7 MtCO<sub>2</sub>e in the fifth. The main reason for the upward revisions was a correction to GHG removals from forest land<sup>53</sup>.
- Transport: the latest statistics showed higher than expected fuel consumption from road transport<sup>54</sup>. This led us to revise our fuel efficiency assumptions downwards. The impact is higher emissions.

Compared with EEP 2018, the biggest downwards revisions to non-traded emissions come from updates to:

- DUKES: DUKES 2019 made significant revisions to oil consumption<sup>55</sup>. It reallocated a lot from the industry sector to commerce, public and agriculture. These changes lead to slightly lower non-traded emissions in the projections. This reflects our projection that emissions will fall more quickly in the sectors receiving the reallocations than in industry.
- Power sector updates and interaction: we have revised the power sector assumptions since EEP 2018. Most of the sector is in the EU ETS and so its emissions are traded.

---

<sup>51</sup> See Section 6.2.7 of UK Greenhouse Gas Inventory, 1990 to 2017: Annual Report for Submission under the Framework Convention on Climate Change:

[http://uk-air.defra.gov.uk/reports/cat07/1905151122\\_ukghgi-90-17\\_Main\\_Issue\\_2\\_final.pdf](http://uk-air.defra.gov.uk/reports/cat07/1905151122_ukghgi-90-17_Main_Issue_2_final.pdf)

<sup>52</sup> We give these assumptions in Annex M.

<sup>53</sup> See Section 6.2.7 of UK Greenhouse Gas Inventory, 1990 to 2017: Annual Report for Submission under the Framework Convention on Climate Change:

[http://uk-air.defra.gov.uk/reports/cat07/1905151122\\_ukghgi-90-17\\_Main\\_Issue\\_2\\_final.pdf](http://uk-air.defra.gov.uk/reports/cat07/1905151122_ukghgi-90-17_Main_Issue_2_final.pdf)

<sup>54</sup> Latest transport statistics:

<https://www.gov.uk/government/statistical-data-sets/energy-and-environment-data-tables-env#fuel-consumption-env01>

<sup>55</sup> The impact of the DUKES changes is that the statistics now assign around 40% of industrial oil demand to other sectors. For more information see:

<https://www.gov.uk/government/publications/energy-trends-june-2019-special-feature-article-change-to-method-of-estimating-sector-demand-for-oil-products>

However, some generation from Combined Heat and Power (CHP) plants is outside the scheme and its emissions are non-traded. We no longer assume any new CHP plants will be built. This means our projections now only reflect generation from existing CHP installations. We assume that any of these plants which close will not be replaced. The lower projected non-traded emissions reflect reduced future CHP generation.

- GHG Inventory (2020): this update led to lower non-traded emissions. They are 6 MtCO<sub>2e</sub> lower in the third, 12 MtCO<sub>2e</sub> lower in the fourth and 11 MtCO<sub>2e</sub> lower in the fifth carbon budget periods.
- Household numbers: non-traded emissions are lower by 7, 13 and 16 MtCO<sub>2e</sub> in carbon budgets three, four and five respectively. This reflects lower household number forecasts than in EEP 2018<sup>56</sup>. The demand for energy in the residential sector is closely linked to household numbers and is therefore lower. This leads to reduced emissions.

## 6.3 Changes in traded projections since EEP 2018

Compared with EEP 2018, the biggest downwards revisions to traded emissions come from:

- Changes to our projections of future iron and steel demand (see Section 6.1)
- Our revisions to the traded/non-traded emissions split (Section 6.2.1) and
- Our changes to the commerce and public demand projections (Section 6.2.1).

Of these, the changes to the iron and steel demand projections had the largest impact.

---

<sup>56</sup> We give these assumptions in Annex M.

# 7 Lists of supporting material

## 7.1 Annexes

Annex A: Greenhouse gas emissions by source

Annex B: Carbon dioxide emissions by source

Annex C: Carbon dioxide emissions by IPCC category

Annex D: Policy savings in the projections

Annex E: Primary energy demand

Annex F: Final energy demand

Annex G: Major power producers' generation by source

Annex H: Major power producers' cumulative new electricity generating capacity

Annex I: Major power producers' total electricity generating capacity

Annex J: Total electricity generation by source

Annex K: Total cumulative new electricity generating capacity

Annex L: Total electricity generating capacity

Annex M: Growth assumptions and prices

Annex N: 2019 non-CO<sub>2</sub> GHG emissions projections report

Annex O: Net Zero and the power sector scenarios

Our annexes contain projections for the following scenarios which we publish each year:

<b>Scenario</b>	<b>Description</b>
<b>Reference Scenario</b>	Based on central estimates of economic growth and fossil fuel prices. Contains all policies where decisions on policy design are sufficiently advanced to allow robust estimates of impact (i.e. including “planned” policies). See annex D on policy savings for definitions of each policy implementation status.
<b>Low Prices</b>	Similar assumptions to reference scenario but with lower projected fossil fuel prices.
<b>High Prices</b>	Similar assumptions to reference scenario but with higher projected fossil fuel prices.
<b>Low Growth</b>	Similar assumptions to reference scenario but with lower projected economic growth.
<b>High Growth</b>	Similar assumptions to reference scenario but with higher projected economic growth.
<b>Existing Policies</b>	Contains central price and growth assumptions but without planned policies included.
<b>Baseline Policies</b>	Contains central price and growth assumptions but only policies that existed before the Low Carbon Transition Plan of July 2009.

Once Annex O (Net Zero and the power sector scenarios) has been published, we will also provide annexes G to L for the Net Zero strategic reference scenarios:

<b>Scenario</b>	<b>Description</b>
<b>Net Zero (Higher)</b>	Net Zero strategic reference scenario with higher power sector electricity demand.
<b>Net Zero (Lower)</b>	Net Zero strategic reference scenario with lower power sector electricity demand.

## 7.2 Web tables and figures

We publish web tables and figures alongside this report. Some of these replicate tables and figures in the report text while others are supplementary.

### Data tables

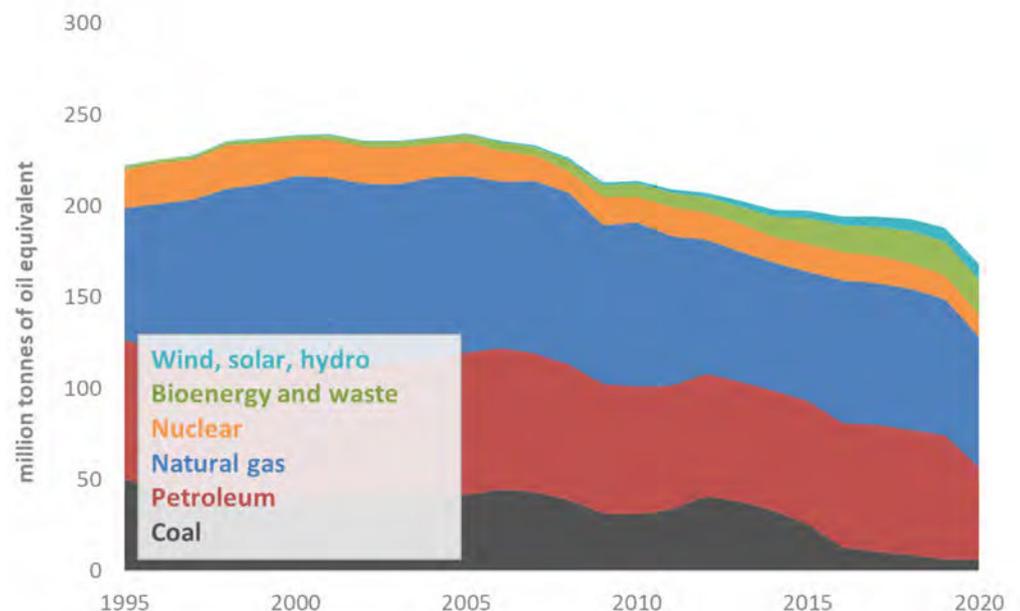

See the [full list of tables](#) and [annexes](#) for more information. Additional data are available online as part of the DUKES series:

- [Total energy](#)
- [Coal and derived gases](#)
- [Oil and oil products](#)
- [Gas](#)
- [Electricity](#)
- [Renewables](#)

This publication is based on a snapshot of survey data from energy suppliers. New data are incorporated in line with the [revisions policy](#).

**Last year saw an unprecedented drop in energy demand** as lockdown restrictions in place to curb the spread of Covid-19 affected economic output, leisure, and travel. The demand for energy in 2020 was similar to that seen in the 1950s when the UK has a far smaller population and notably different demands.

### Demand for energy in the UK, 1995 – 2020

The fall in demand was most keenly felt in transport as people travelled less for work and leisure. **Transport demand dropped by 29 per cent compared to 2019**, led by a fall in aviation demand, down 60 per cent.

Diesel demand was down 17 per cent and petrol demand down 21 per cent, taking demand for all transport fuels back to the 1980s. **Industrial demand and demand for energy in shops, hotels, and offices also fell** broadly in line with the activity in the wider economy.

Whilst the annual drop was unprecedented, it was not in any way sustained. The reduced demand for fuel was most evident in the second quarter of the year and **demand increased month-on-month from June through to the end of the year** as activity levels returned to closer to normal.

The UK's electricity generation landscape continued to evolve and move away from fossil fuels and towards renewable alternatives. Windy conditions in the Spring of 2020 meant that renewable generation reached record levels and **contributed a 43.1 per cent share of generation, outpacing for the first-time annual fossil fuel generation** which contributed 37.7 per cent of generation, a record low and down from 75.4 per cent in 2010. Despite record low output from nuclear, **strong renewable performance pushed low carbon generation to a record 59.3 per cent.**

# Chapter 1: Total energy

Kevin Harris 0300 068 5041 [energy.stats@beis.gov.uk](mailto:energy.stats@beis.gov.uk)

## Key headlines

**Energy demand in 2020 was at levels last seen in the 1950s** as Covid-19 restrictions affected industrial output, work, leisure, and travel. **Energy requirements for industrial use and services (e.g. shops, restaurants, offices) are both down 6 per cent on 2019.** Despite warmer weather, domestic demand was up as more people stayed at home.

**Transport fuel demand dropped 29 per cent compared to 2019**, led by a fall in aviation fuel, down 60 per cent to levels last seen in the mid-1980s. Diesel demand was down 17 per cent and petrol down 22 per cent. These decreases also takes road transport fuel demand back to the 1980s.

For both transport and other consumption, **the decrease in demand was closely linked to activity** with the indices of production and services both showing substantial contraction during 2020 and substantially reduced demand for air and road transport. **Monthly data available show consumption hitting near record lows in the summer then increasing throughout the year as restrictions eased.**

**Total final consumption was down 13 per cent on last year, and 11 per cent on a temperature and seasonally adjusted basis.** On the adjusted basis, falls in transport (down 29 per cent), industry (down 6 per cent), and services (down 4 per cent) were not offset by an increase in domestic demand (up 6 per cent).

Renewable generation, as a percentage of generation, continued to grow and **reached a record 43.1 per cent in 2020, outpacing for the first-time annual fossil fuel generation.** Over the last ten years, renewable generation has increased from 6.9 per cent to the current record high. Wind generation is a critical element of renewable's performance, reaching a record high 24.2 per cent up from 2.7 per cent in 2010.

**Fossil fuel generation reached a record low**, dropping from 75.4 per cent of generation to 37.7 per cent over the last ten years. **Coal generation fell to a new record low**, generating just 1.8 per cent in 2020 down from 28.2 per cent in 2010.

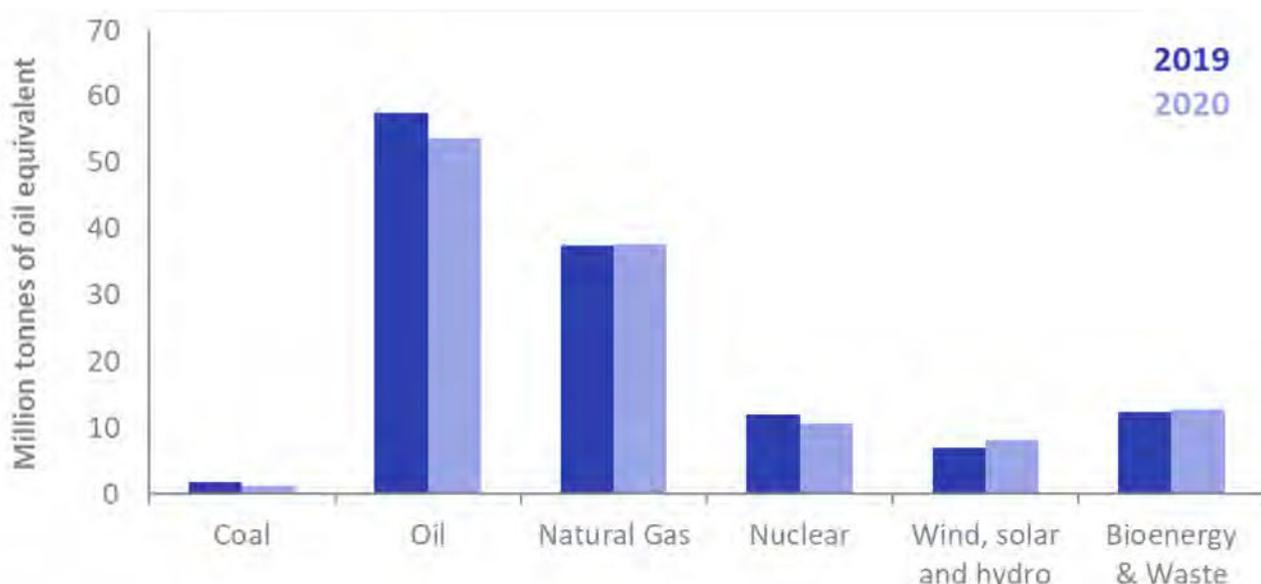

**Low carbon generation also reached a record high of 59.3 per cent** despite a **drop in nuclear output** due to maintenance outages.

In contrast, **renewable generation capacity changed very little in 2020**, up only 2 per cent on last year. The strong generation figures owe much to the storm activity of the first quarter of 2020. Whilst capacity has grown five-fold since 2010, the growth rate in recent years has been smaller.

**Energy production dropped 3 per cent in 2020**, with falls in petroleum production and nuclear production, the latter dropping to a record low due to maintenance outages. Coal production also reached a new record low, down to 1.7 million tonnes from 18.3 million tonnes in 2010.

**Total renewables** accounted for 13.6 per cent of total energy consumption in 2020, up from 11.7 per cent in 2019.

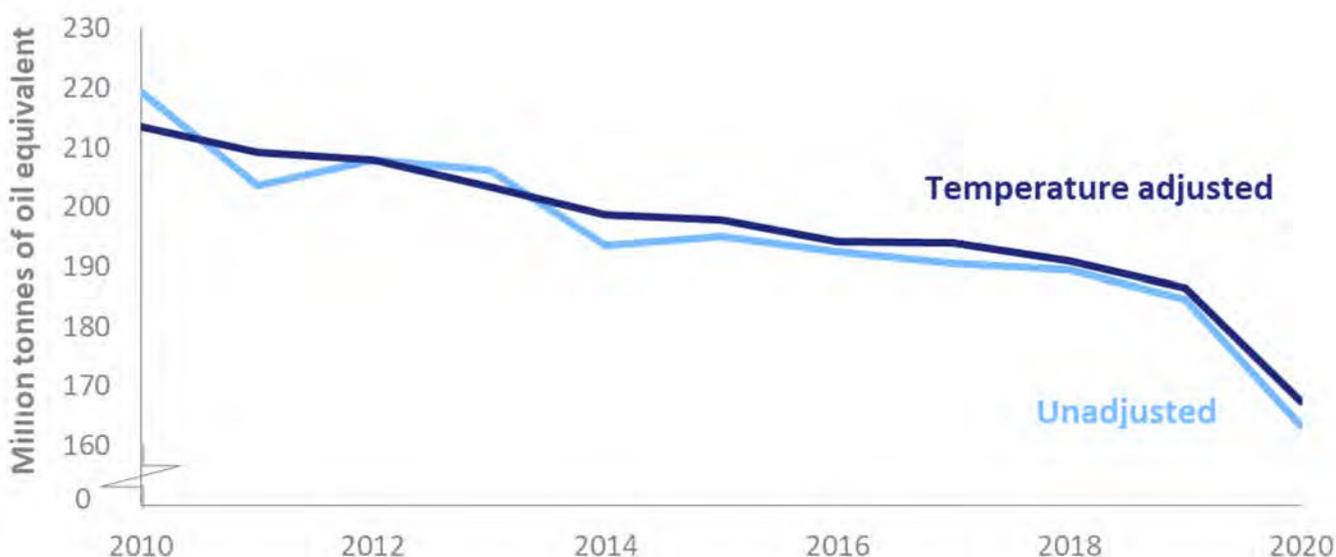

**Chart 1.1 Production by fuels, 2019 and 2020 (DUKES Tables 1.1-1.3)**

**In 2020 total production was 124.1 million tonnes of oil equivalent (mtoe), 3.1 per cent lower than in 2019.** Growth in renewable sources (bioenergy & waste, wind, solar & hydro) was offset by reduced fossil fuel (coal, oil & gas) and nuclear output, due to reduced demand and disruption arising from the Covid-19 pandemic, and numerous outages at UK nuclear power stations. UK production has fallen year on year since 2018, and production is now 58 per cent below the peak recorded in 1999.

In 2020 coal production fell by 35 per cent to a record low level, whilst output from oil & gas fell by 3.7 per cent due to maintenance activities being delayed in 2020 to the second half of the year because of the Covid-19 pandemic. Nuclear output fell by 11 per cent to a record low level due to prolonged maintenance outages throughout the year which reduced operational capacity at some time for all eight of the UK's nuclear power stations. Wind, solar and hydro output rose by 16 per cent, to a record high level, due to small increases in offshore wind and solar capacity, and more favourable weather conditions. In 2020 the average wind speed was 9.1 knots, 0.8 knots higher than in 2019, as ten named storms affected the UK during the year. Production of bioenergy and waste rose by 3.2 per cent.

**Chart 1.2 Primary energy consumption, 2010 to 2020 (DUKES Tables 1.1-1.3)**

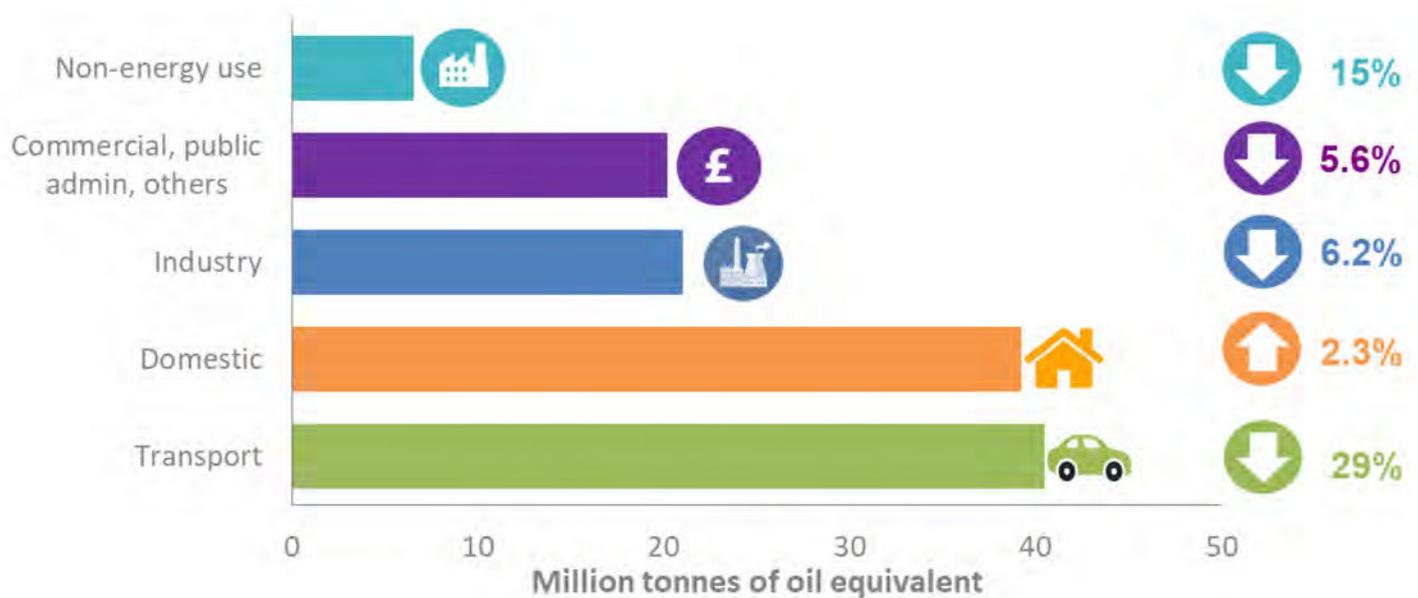

**In 2020 total primary energy consumption was 163.3 mtoe, 11 per cent lower than in 2019, and to levels last seen in the 1950s.**

Primary energy consumption includes use by consumers, fuel used for electricity generation and other transformation. On a seasonally adjusted and annualised rate that removes the impact of temperature on demand consumption was 167.3 mtoe, 10 per cent lower than in 2019.

In 2020 total primary energy consumption shrank massively, with a noticeably sharp reduction in petroleum consumption as demand for transport fuels fell due to the Covid-19 pandemic lockdowns in place in the UK throughout 2020. Consumption of oil fell by a quarter, to a record low, with sharp falls in petrol, diesel and aviation fuel due to travel restrictions imposed during the Covid-19 lockdown periods. Consumption of coal and other solids fell by 8.2 per cent, to a record low, and consumption of natural gas fell by 5.7 per cent as electricity generators made more use of renewable sources. Consumption of bioenergy & waste rose by 2.9 per cent. Primary electricity consumption fell by 2.5 per cent, within which nuclear fell by 11 per cent to a record low level due to prolonged outages during 2020, but wind, solar and hydro rose by 16 per cent to a record high level, due to small increases in offshore wind and solar capacity and more favourable weather conditions.

**Chart 1.3 Final energy consumption by sector, 2020** ([DUKES Tables 1.1-1.3](#))

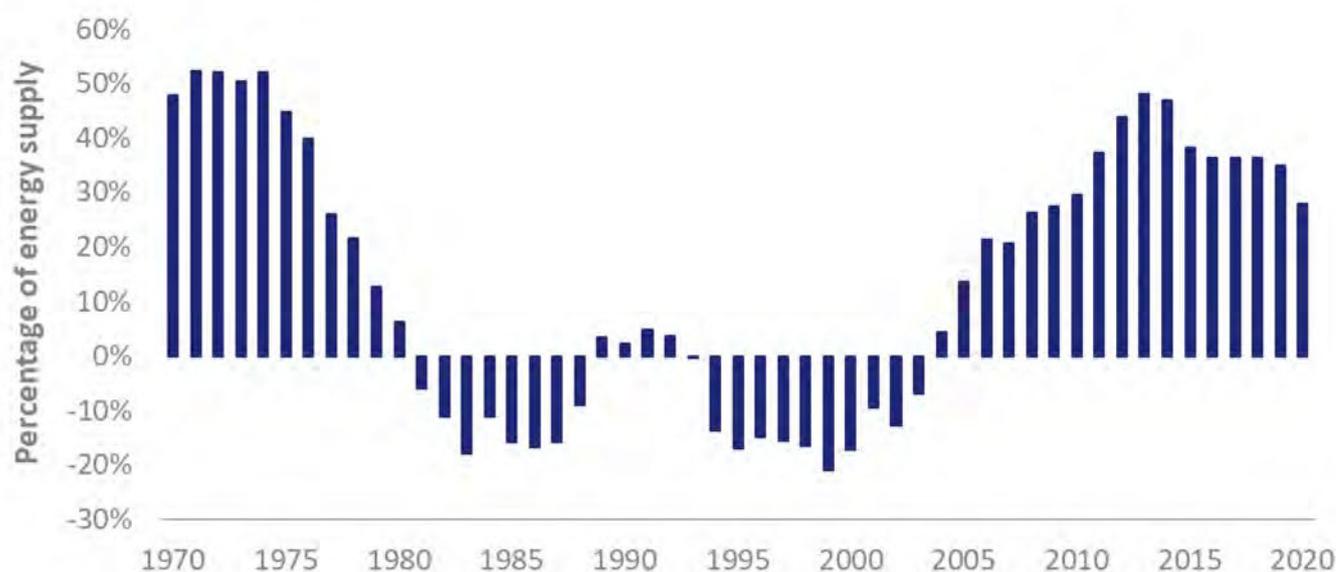

**In 2020 total final energy consumption including non-energy use was 127.5 mtoe, 13 per cent lower than in 2019, again matching demand levels from earlier decades.**

Consumption levels in 2020 were severely impacted by the Covid-19 pandemic lockdowns imposed from March 2020 onwards. Consumption was also reduced by warmer temperatures in 2020 with the average number of heating degree days down from 5.4 to 5.1.

Domestic sector consumption rose by 2.3 per cent reflecting increased home working, however transport sector consumption fell by 29 per cent due to the introduction of travel restrictions during lockdown, with road transport consumption falling by 18 per cent and air consumption falling by 60 per cent. Industrial sector consumption fell by 6.2 per cent and service sector consumption fell by 5.6 per cent as factories, shops, offices and schools were all forced to closed for a period of time during lockdown.

Final energy consumption excluding non-energy use also fell by 13 per cent, whilst on a temperature corrected basis consumption fell by 11 per cent. Domestic consumption on a temperature corrected basis rose by 6.4 per cent.

Chart 1.4 Net import dependency, 1970 to 2020 (DUKES Table 1.1.3)

In 2020 net import dependency was 27.8 per cent<sup>1</sup>, 7.1 percentage points lower than in 2019, and at the lowest level since 2009.

Imports in 2020 at 122.4 mtoe were 18 per cent lower than in 2019, and 32 per cent lower than their peak in 2013. The UK imported less fuel to meet reduced demand in 2020 due to the impact of the Covid-19 pandemic, with falls in imports of coal, primary oil, petroleum products, gas and electricity. The fall in imports of primary oil led to the UK becoming a net exporter of primary oil for the first time since 2004. Exports in 2020 at 74.6 mtoe were 7.5 per cent lower, as rises in coal, gas and electricity imports were offset by falls in primary oils and petroleum products.

Net imports at 47.7 mtoe were 30 per cent lower than in 2019 and accounted for 27.8 per cent of consumption in 2020, down from 34.8 per cent in 2019.

Whilst net imports were down, **the UK continued to increase the use of low carbon fuels**. The main fossil fuel sources in the UK are coal, gas and oil. The low carbon sources include nuclear and renewables such as wind; hydro; solar photovoltaics (pv) and biofuels. In 2020, the share of primary energy consumption from fossil fuels decreased further to a record low of 76.5 per cent, whilst that from low-carbon sources increased to a record 21.5 per cent share, up from 18.9 per cent last year and 10.1 per cent in 2010.

<sup>1</sup> Net imports as a proportion of primary supply (including an addition for the energy supplied to marine bunkers).

[coalstatistics@beis.gov.uk](mailto:coalstatistics@beis.gov.uk)

## Key headlines

**Demand for coal fell by 11 per cent in comparison with 2019** to 7.1 million tonnes in 2020. This decrease was driven by a drop in consumption by electricity generators, as coal-fired generation is phased out of the UK energy mix.

**Consumption of coal for electricity generation fell to a record low, down 20 per cent from 2019** to 2.3 million tonnes in 2020. This decline reflected a lower overall demand for generation in the face of Covid-19 pandemic, the closure of two coal-fired generation plants in March 2020 and included a record time spent using coal-free electricity generation in the Spring of 2020.

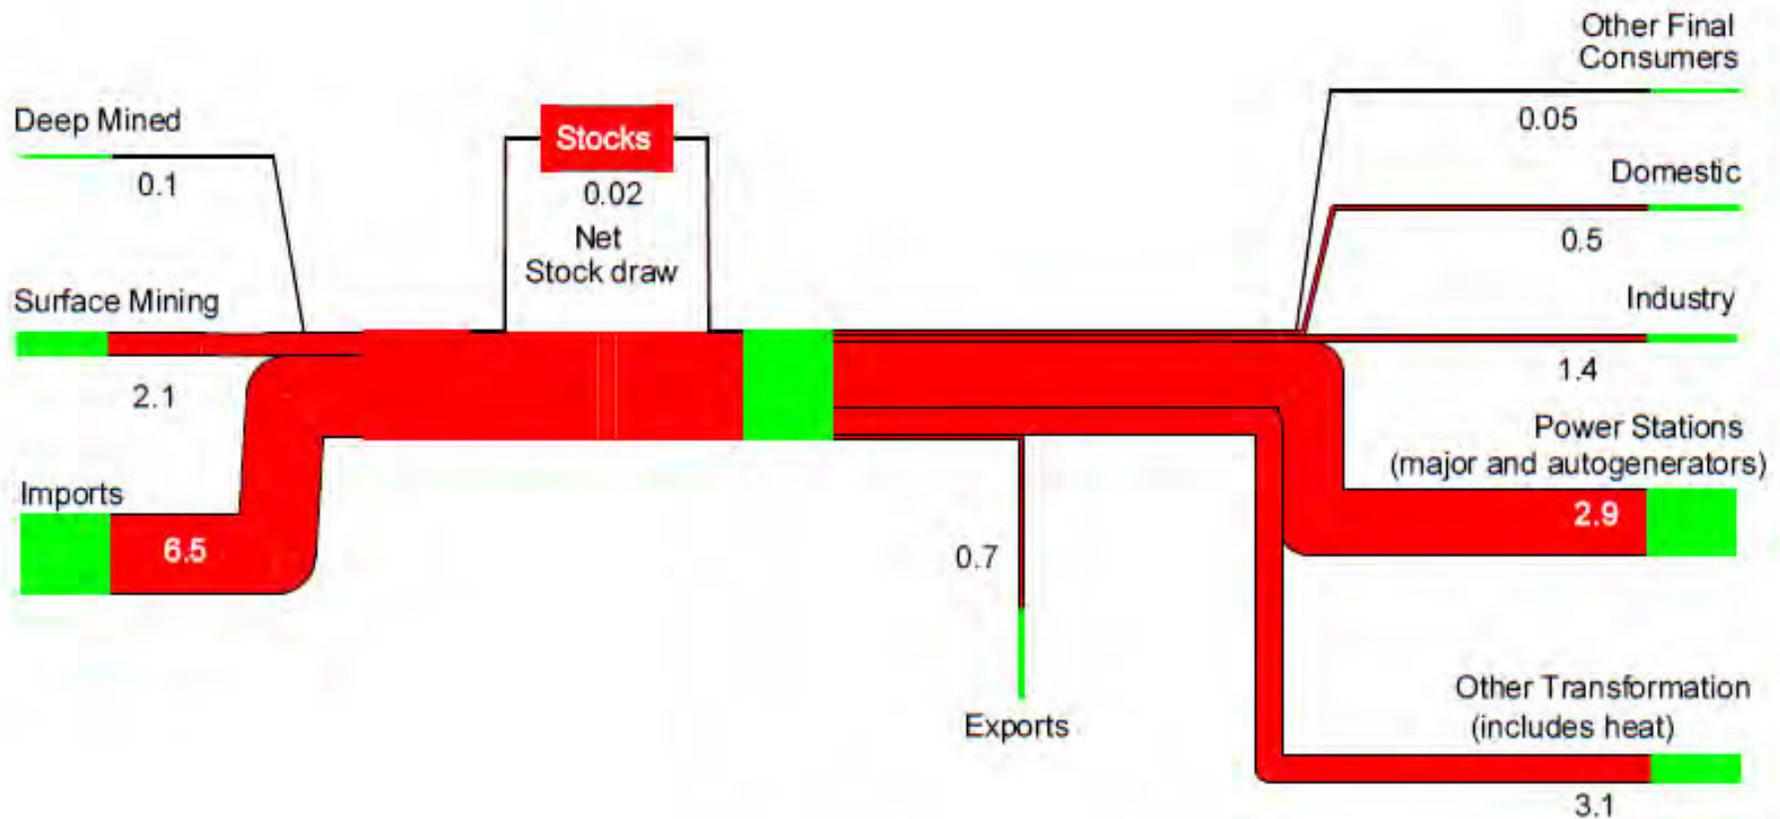

**Production of coal fell to another record low, down 35 per cent from 2019** to 1.7 million tonnes. Surface mining production fell to a record low of 1.6 million tonnes due to mine closures, restrictions in coal mines due to Covid-19, bad weather and a flood in one of the mines as well as the falling demand for coal by electricity generators. In the last ten years, UK coal production has fallen by 91 per cent.

**Coal imports fell 27 per cent in comparison with 2019** to just 4.5 million tonnes in 2020. Net imports accounted for 45 per cent of supply in 2020. Three countries accounted for 79 per cent of total coal imports: Russia (36 per cent), the USA (22 per cent) and Venezuela (21 per cent).

In 2020, coal comprised 2.9 per cent of UK energy demand, up slightly from 2.8 per cent in 2019 as demand for other fuels contracted more sharply due to the Covid-19 pandemic. Over a longer period, the trend reflects the transition away from coal in the UK's energy mix; coal demand has fallen from a 16 per cent share of UK energy demand in 2000. Most of this coal is used for electricity generation, coke manufacture, or in blast furnaces in the steel industry.

The chart on the next page shows flows of coal from production and imports, through to consumption. It is a way of simplifying the figures that can be found in the commodity balance for coal in Table 2.4. The chart illustrates the flow of coal from the point of supply (on the left) to its eventual final use (on the right).

## Coal flow chart 2020 (million tonnes)

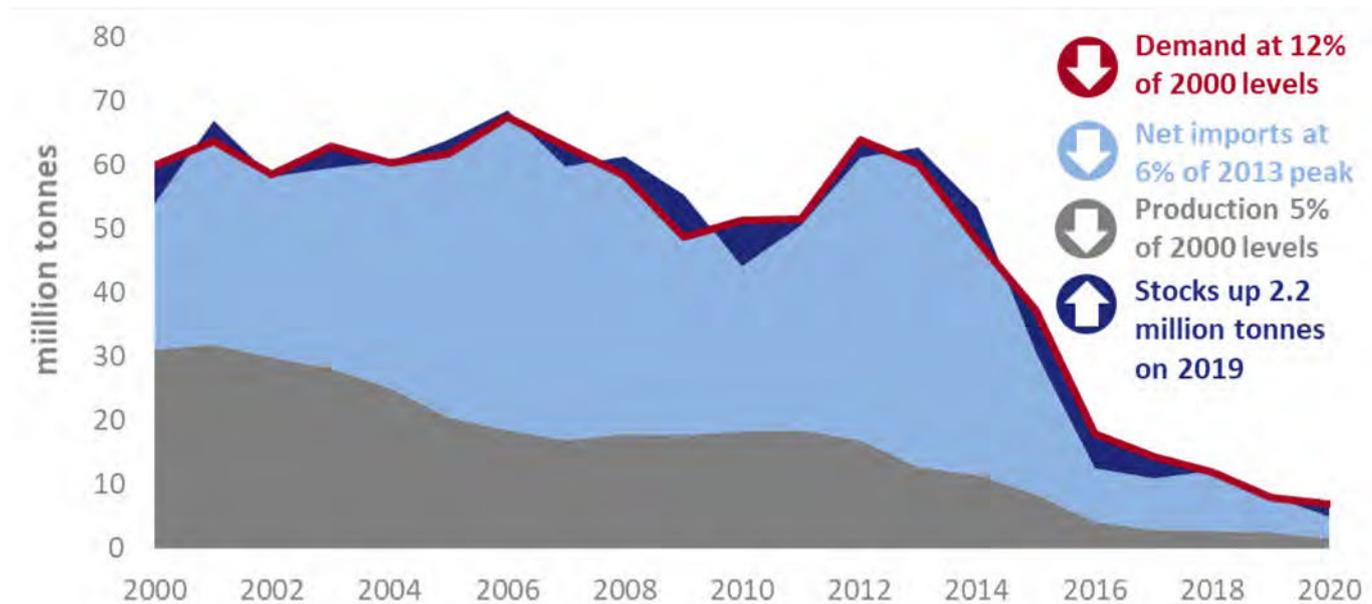

### Note:

This flow chart is based on the data in Tables 2.1 and 2.4.  
The numbers on either side of the flow chart will not match due to losses in transformation.

**Reduced demand for coal drove a substantial contraction in supply, with UK coal production down 91 per cent in the past ten years.** In 2020, coal production fell to a record low of 1.7 million tonnes, down 35 per cent on 2019 (Chart 2.1). In that period just under a quarter of demand was met by domestic production, 45 per cent by net imports and 31 per cent was drawn from stocks.

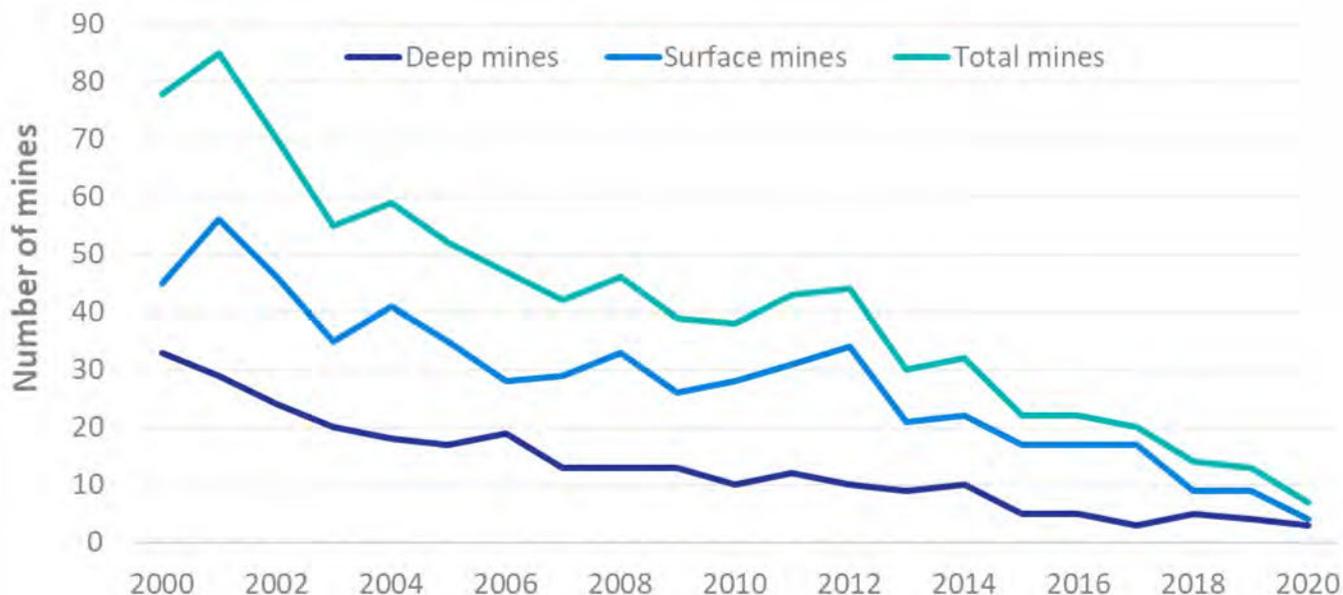

**Chart 2.1 UK coal supply and demand, 2000 – 2020 (Table 2.1)**

Deep mined production rose to 107 thousand tonnes, mainly due to Aberpergwm colliery increasing production, and was 6.4 per cent of total production. In 2015 deep mined production provided nearly a third of total coal production. This was the year that the last large three deep mines in operation closed - Hatfield, Thoresby and Kellingley. There were no further closures of deep mines in 2020 with nine remaining open, of which two were under care and maintenance. Three deep mines reported coal production in 2020.

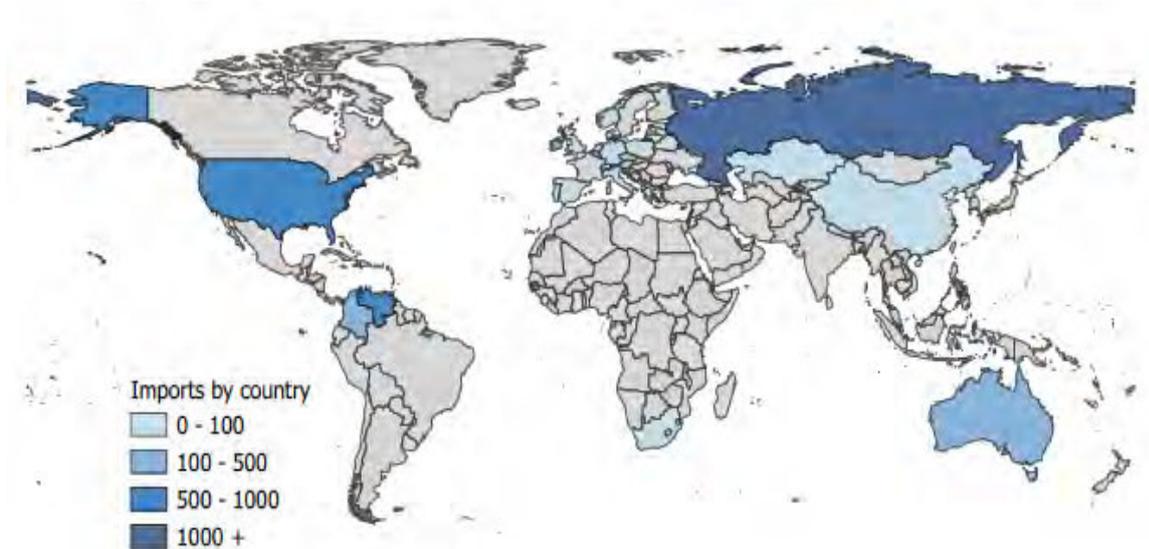

Surface mine production was down 37 per cent, to a new record low of 1.6 million tonnes due to lower demand for electricity generation, restrictions in coal mines due to Covid-19, bad weather and a flood in one of the mines. Six surface mines closed in 2020, with just four remaining.

**Chart 2.2 Number of coal mines producing in the UK, 2000 – 2020 (Table 2.7)**

**Net imports of coal also fell substantially, down 91 per cent from the peak in 2013.** This is again a result of the sharp fall in demand for coal. In 2020, net imports fell by 27 per cent from 2019 levels to just 4.5 million tonnes. However, this reduction in imported coal has occurred at a slower pace than the reduction in domestic production, leading to the proportion of net imports in the UK coal supply increasing over the past 20 years. In 2020 imports accounted for 45 per cent of the UK’s supply, up 7 percentage points from the proportion in 2000.

**Map of UK Coal Imports in 2020 (thousand tonnes)**

For more detail on coal imports and exports see DUKES table G.2:  
<https://www.gov.uk/government/statistics/dukes-foreign-trade-statistics>

Steam coal imports were 39 per cent lower at 2.4 million tonnes in 2020 compared to 2019. In 2020 Venezuela became the highest supplier of steam coal imports for the first time rising from 126 thousand tonnes in 2019 to 968 thousand tonnes. There was also a decrease of steam coal imports from Russia of 47 per cent. Steam coal imports from Colombia fell by 86 per cent. Venezuela (40 per cent) Russia (37 per cent) in 2020 represented 77 per cent of steam coal imports. Steam coal accounted for 53 per cent of total coal imports.

Coking coal imports were down 5.5 per cent at 2.1 million tonnes compared to 2019. The decrease was mainly due to the fall of 24 per cent from Australia.

**Coal stocks continued to decline year-on-year.** In line with much of what we see with coal, the main change to coal stocks came post 2014 when stocks began to decline each year and power plants closed. Coal stocks fell to 3.2 million tonnes in 2020, which was 41 per cent lower than in 2019.

**As of June 2021, the Coal Authority estimates that overall there are 3,814 million tonnes of coal resources,** including prospects (Table 2.8), down 2.4 per cent from 3,906 million tonnes assessed in June 2020. Of the economically recoverable and minable coal resource in current operations (including those in the planning or pre-planning process) 986 million tonnes is in underground mines and 46 million tonnes in surface mines. Overall England had a 84 per cent share of UK current mines and licenced resources, followed by Scotland with 9 per cent and Wales 7 per cent.

In prospects, there were 2,050 million tonnes suitable for underground mining and 778 million tonnes suitable for surface mining. Table 2.8 gives details of the resource assessment by England, Scotland and Wales as at 22 June 2021.

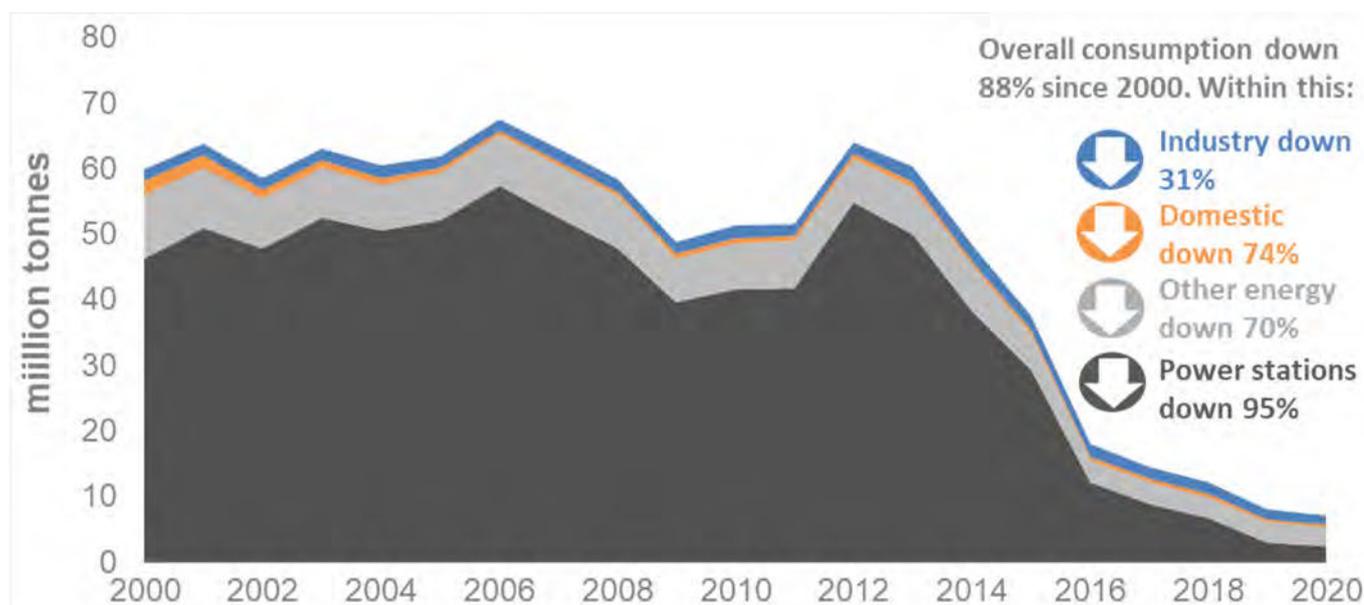

**Demand for coal fell by 11 per cent to 7.1m tonnes in 2020, compared to 2019 (table 2.4).** Amongst this, demand for coal for electricity generation fell by 20 per cent, final consumption by industry fell by 9 per cent, and transformation for coke manufacture and in blast furnaces fell by 6 per cent.

**The Covid-19 pandemic led to a significant fall in demand for electricity, and therefore a fall in demand for coal from power stations for coal-fired generation.** Restrictions began on 23<sup>rd</sup> March 2020 and resulted in closures across the private and public sector, with wide scale closures of schools, shops, offices and industrial facilities.

During this period, Great Britain set a record for its longest coal-free period of generation, with no coal-fired electricity being produced for 67 days from 10<sup>th</sup> April 2020. On 16<sup>th</sup> June, one of the remaining coal-fired power stations came briefly back online during maintenance work, adding power to the national grid. However, there was no coal-fired electricity on the GB grid for a further 55 days from 18<sup>th</sup> June to 12<sup>th</sup> August 2020. The period without coal-fired generation ended in August, as coal-fired generators were required due to maintenance outages in nuclear plants, low wind speeds, and as gas-fired generators struggled to generate at their maximum capacity in unusually high temperatures. Great Britain operates on a separate electricity network to Northern Ireland, where some coal generation continued during this period. However, coal-fired generation remained less economically favourable due to low gas prices and higher carbon pricing.

**A reduction in generation capacity contributed to the downwards trend in coal consumption.** There have been multiple closures of coal-fired power plants in recent years, and March 2020 saw the closures of Fiddlers Ferry and Aberthaw B. This trend appears set to continue in the coming years, with plans to phase out the remaining four coal-fired power plants in the UK by 2024. Coal use has declined since the early 1970's as new fuels (gas and renewables) entered the market, and 2020 saw an increase in renewable electricity generation, with favourable weather conditions for increased wind generation.

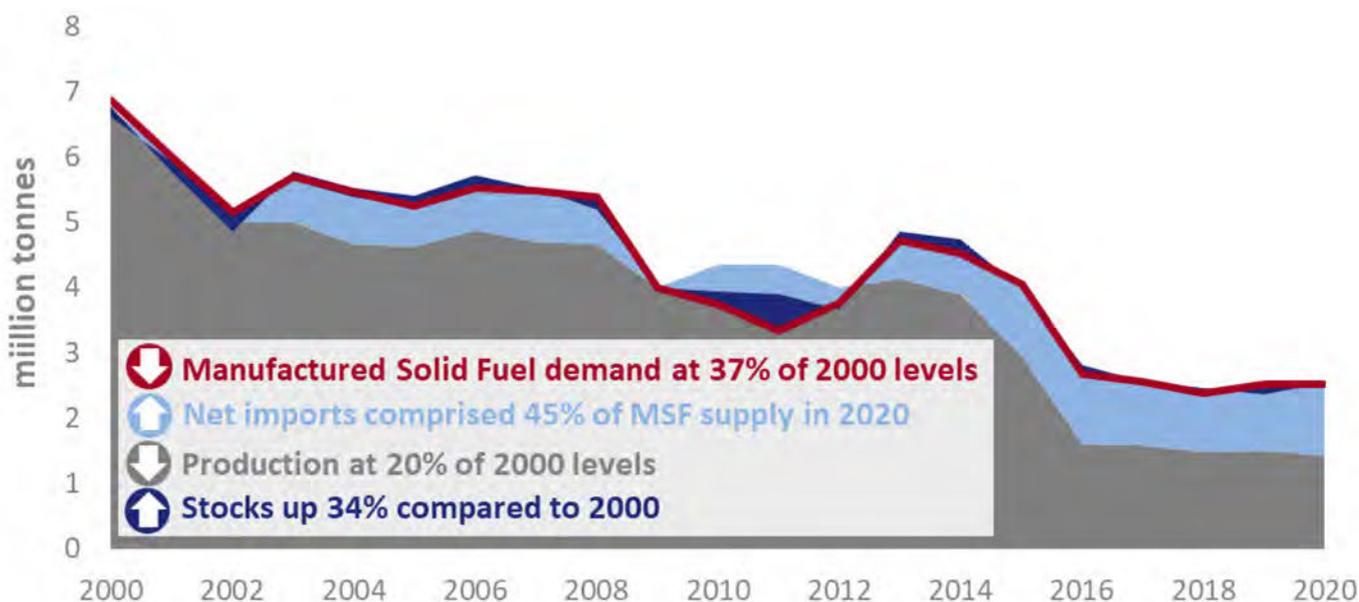

**Chart 2.2 Coal consumption, 2000 – 2020 (Table 2.4)**

The iron and steel industry is one of the main non-generation users of coal. In 2015, it used 5.2 million tonnes compared to 2.8 million tonnes in 2020 (47 per cent drop). In terms of total share, it comprised 14 per cent of UK coal consumption in 2015, and 39 per cent in 2020.

**In addition to coal production and consumption, the UK has significant (but decreasing) supply and demand for a range of manufactured solid fuels that are used for domestic, industrial and transformational processes.** Coke is the solid product obtained from the carbonisation of coal, principally coking coal, at high temperature and is used for smelting iron and steel.

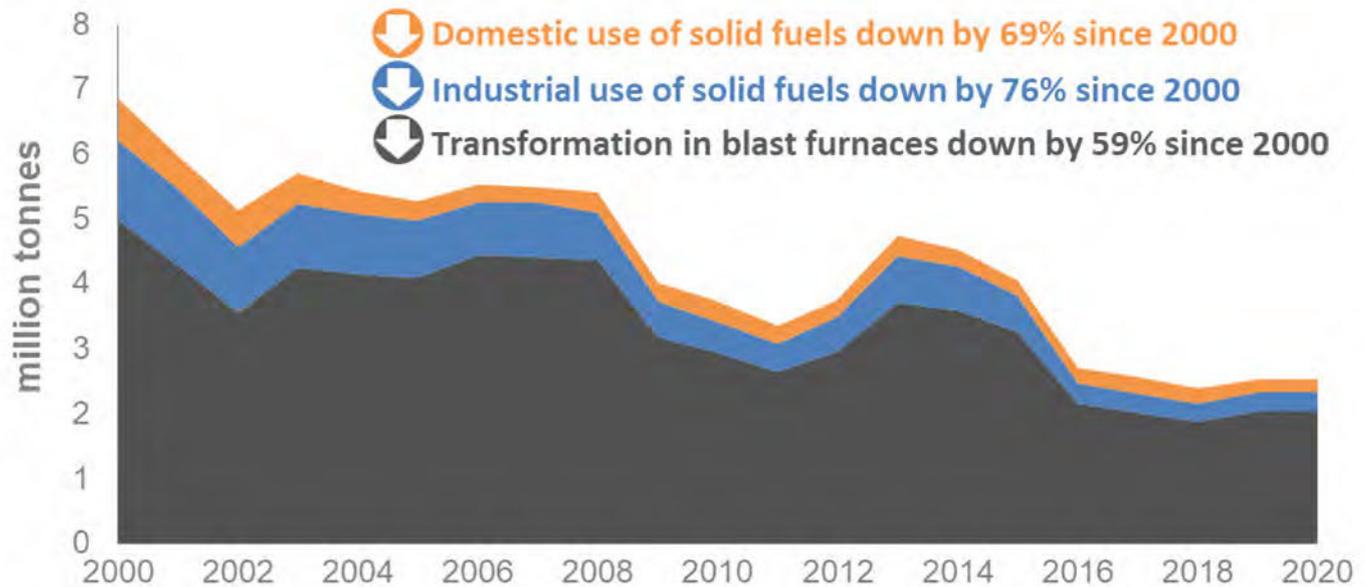

**Chart 2.3 Total manufactured solid fuels supply and demand, 2000 - 2020 (Table 2.5)**

**In 2020, indigenous coke oven coke fell by 7.2 per cent to 1.2 million tonnes compared to 2019 (Chart 2.5).** It has been relatively stable in the last four years. Monckton Coke and Chemicals, the only dedicated coke plant in the UK closed in December 2014. There has been a fall in steel production in the UK since 2015. Notably, SSI steelworks at Redcar ceased production in mid-September 2015 (with the subsequent closure in October). Since then coke has still being produced and used at steelworks, mainly Port Talbot and

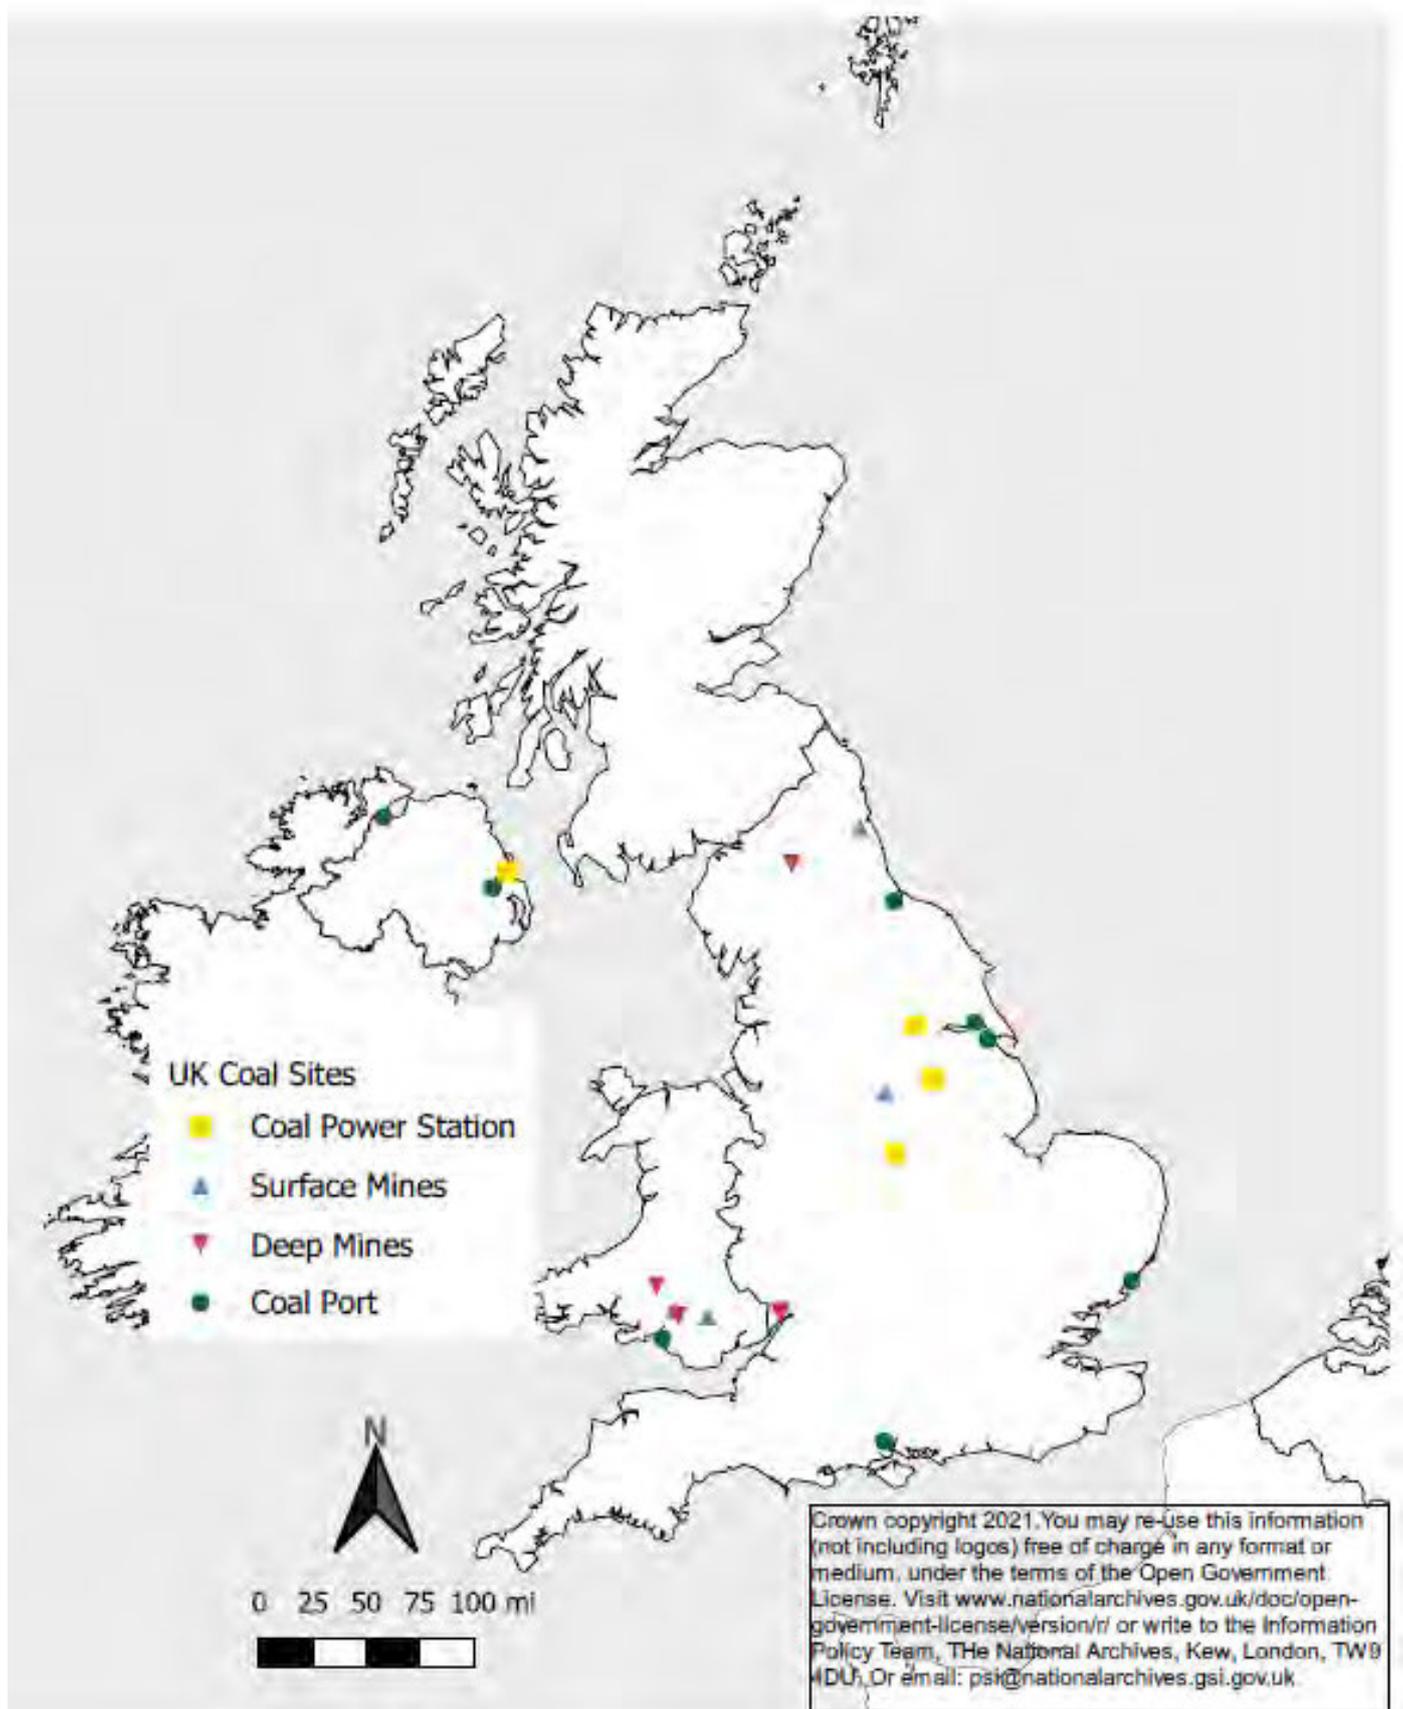

Scunthorpe. Coke breeze fell 16 per cent to 16 thousand tonnes. Other manufactured solid fuels (patent fuels) rose by 8.8 per cent to 198 thousand tonnes.

**Chart 2.4 Total manufactured solid fuels consumption in the UK, 2000 – 2020** ([Table 2.5](#))

**In 2020, coke oven coke comprised 69 per cent of demand for manufactured solid fuels**, with coke breeze at 23 per cent and other manufactured solid fuels at 8 per cent. Almost all coke oven coke and coke breeze in the UK is used in blast furnaces for steelmaking. As the iron and steel industry is a critical industry it was less impacted by the Covid-19 pandemic and volumes have been broadly stable in recent years.

## Map 2A Showing location of UK coal production sites and ports as at end 2020

# Chapter 3: Oil and Oil Products

Steve Rose      0300 068 5101      [oil-gas.statistics@beis.gov.uk](mailto:oil-gas.statistics@beis.gov.uk)  
Damon Ying      020 7215 2942

## Key headlines

**Oil formed one-third of total energy demand in 2020 compared to nearly half in 2019.** Demand for petroleum products reached a record low in 2020, down 23 per cent compared to 2019 as restrictions from the Covid-19 pandemic limited activity. Most oil demand is typically for transport fuels which were heavily impacted as movement was restricted. The largest contraction was in demand for jet fuel, down 60 per cent on 2019, the lowest level since 1984. Demand for road fuels was also reduced, petrol fell to the lowest level since 1963 and down by 22 per cent on 2019; diesel also fell by 17 per cent.

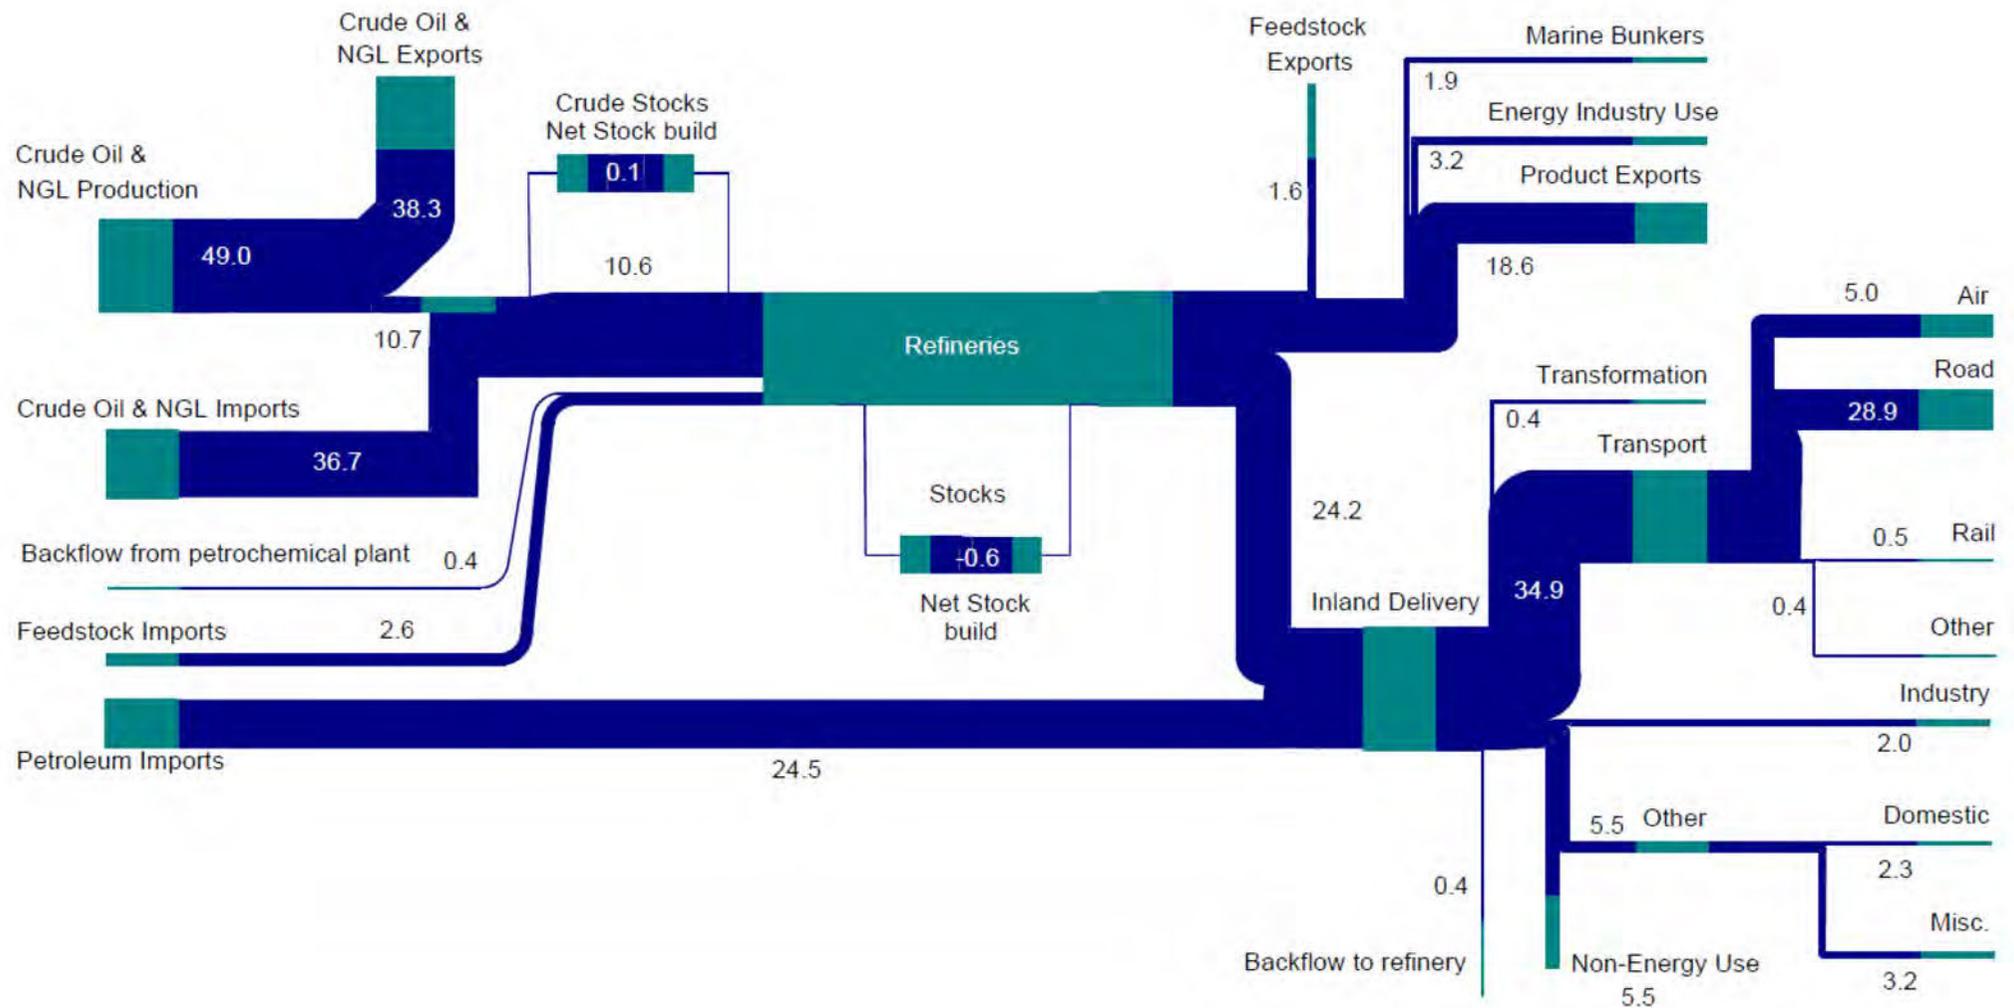

**The impact of the Covid-19 pandemic also affected trade.** Net imports of petroleum products halved in 2020 as the UK imported less fuel to meet the reduced demand. The UK became a net exporter of primary oils, by 0.5 million tonnes, for the first time since becoming a net importer in 2004.

**In 2020 the UK's total production of oil from the North Sea exceeded refinery demand for the first time since 2004.** Total demand for primary oils was down 18 per cent on 2019 with refinery production following suit, dropping to its lowest ever level. In contrast production of crude from the UK Continental Shelf (UKCS) retained its 42 per cent share of total UK energy production. Much of this was exported abroad.

Other sectors were also impacted by Covid-19 restrictions. For example, non-energy use fell 9.6 per cent in 2020 compared to 2019 after several years of growth. Conversely, domestic consumption saw an increase of 5 per cent because of low prices early in the year and as more people stayed at home.

The flow chart on the following page shows the movement of primary oils and petroleum products, illustrating how crude oils are supplied and transformed in refineries, and products imported (on the left) to transformation and consumption in the various sectors of the UK's economy (on the right). The widths of the bands are proportional to the size of the flow they represent.

## Petroleum flow chart 2020 (million tonnes)

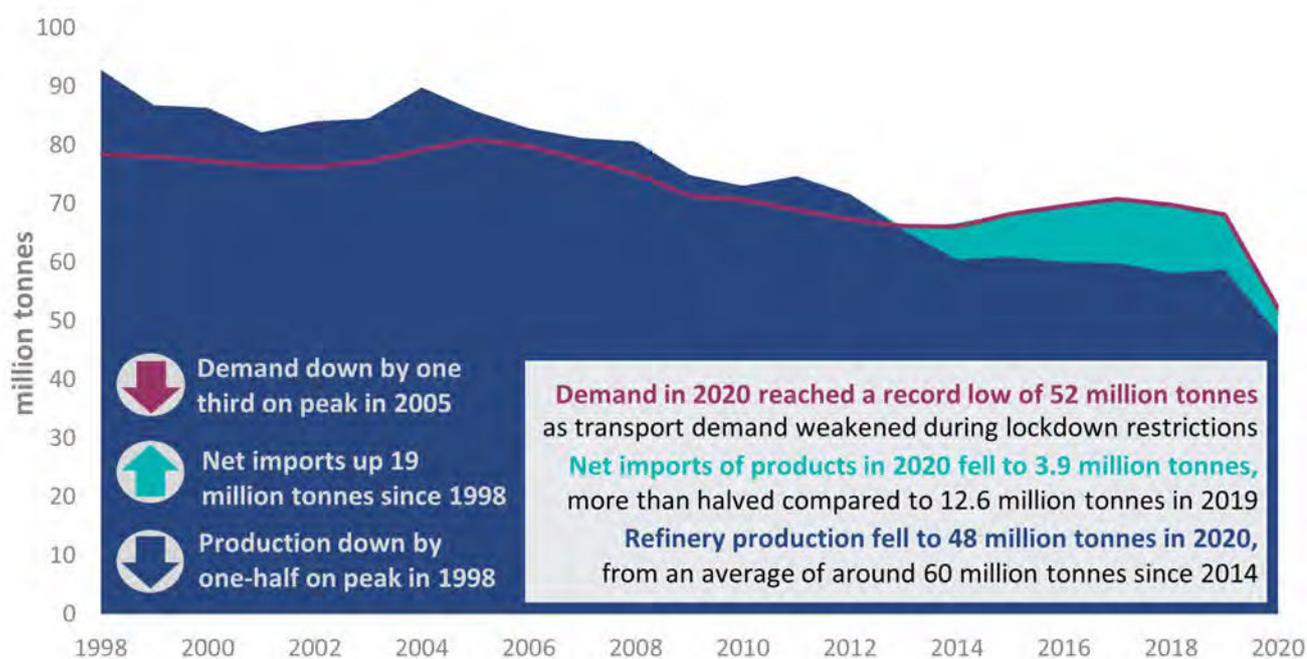

### Note:

This flow chart is based on the data in Tables 3.1 and 3.2.  
 The numbers on either side of the flow chart will not match due to losses in transformation.  
 Biofuels are not included.

**Demand for petroleum products reached a record low in 2020, down by 23 per cent compared to 2019.** Most oil demand is for transport fuels, lockdown and other restrictions put in place to curb the spread of Covid-19 reduced demand substantially. Overall demand for petroleum products in 2020 was the lowest since 1962 at 52.1 million tonnes (see [DUKES Table Crude oil and petroleum: Production, imports and exports](#)).

**Chart 3.1 Supply and demand for petroleum products, 1998 – 2020 ([DUKES Table 3.1](#))**

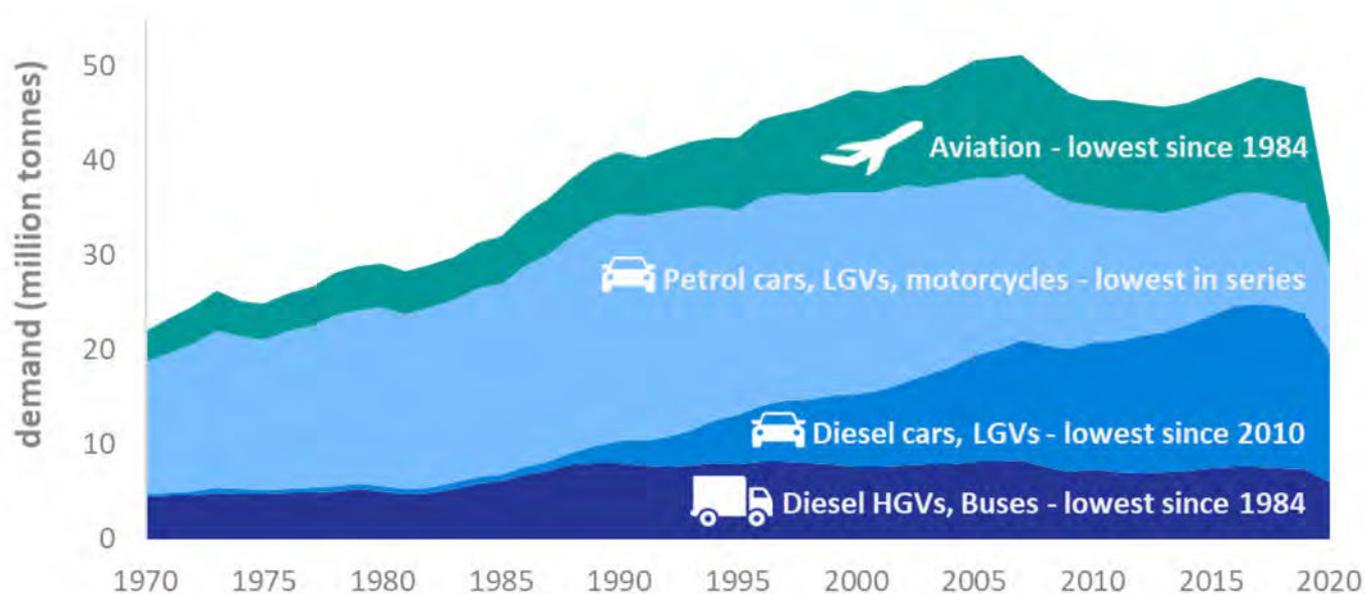

Refinery operators reacted by slowing production in response to the demand destruction brought about by the pandemic, meaning that refinery production also reached a record low of 48 million tonnes in 2020. This was down by more than 10 million tonnes compared to 2019<sup>2</sup>. While the UK remained a net importer of petroleum products, with net imports up by 19 million tonnes since 1998, in 2020 there was a sharp fall and net imports dropped by half to just 6.0 million tonnes from 12.1 million tonnes in 2019.

**Covid-19 restrictions saw demand for road fuels fall markedly in 2020 compared to 2019.** This follows several years of static demand at around 35 million tonnes. In 2020, demand for petrol and diesel fell 22 and 17 per cent respectively compared to 2019. Staggeringly, over the year demand for petrol reached the lowest recorded since 1963 owing to the sharp dip in the second quarter. This was less dramatic for diesel, demand reaching the lowest recorded since 2005. There are several reasons for this disparity; demand for petrol was impacted more than diesel because commercial fleets tend to be diesel-engine vehicles, and these continued to operate during the UK's periods of restricted movement. In addition, there has been slowing growth in the diesel vehicle fleet in recent years following changes to vehicle taxation and diesel vehicles have become more efficient. As 2020 progressed and restrictions were lifted demand continued to recover through the year, reaching near normal levels despite subsequent lockdowns by the end of the year (for quarterly data see [Energy Trends Table 3.4](#)).

**Demand for jet fuel was down 60 per cent in 2020 compared to 2019,** at just 5.0 million tonnes this was the lowest level since 1984. This was caused by international travel restrictions which remained in place for large parts of the year. Unlike the road fuels, which have shown remarkable signs of recovery, demand for aviation fuel remained flat in 2020.

<sup>2</sup> For further detail on the UK's refineries and nameplate capacity, please see [Table 3A](#) and the map of UK refineries and major import terminals in the [methodology note](#).

**Chart 3.2 Annual demand for road and aviation fuels since, 1970 - 2020 (DUKES Table 3B)**

**The restrictions imposed in response to the pandemic had differing effects on specific sectors.**

Domestic consumption increased by 5.0 per cent as more people stayed at home due to the pandemic. In addition, low oil prices in early 2020 caused by excess stocks, and an oil price war between Russia and Saudi Arabia, led to a bump in demand early in the year as consumers took advantage of lower prices to fill domestic heating tanks.

Chart 3.3 shows that consumption by industry and other final users decreased by 1.6 per cent, although this masks variation within the subsector. Domestic demand was up by 5.7 per cent, largely because of exceptional demand early in the year during a period of very low prices owing to the collapse of OPEC+ talks. However, industry demand was down by 3.2 per cent and commercial by 5.0 per cent because of closures due to restrictions in place to control the spread of Covid-19.

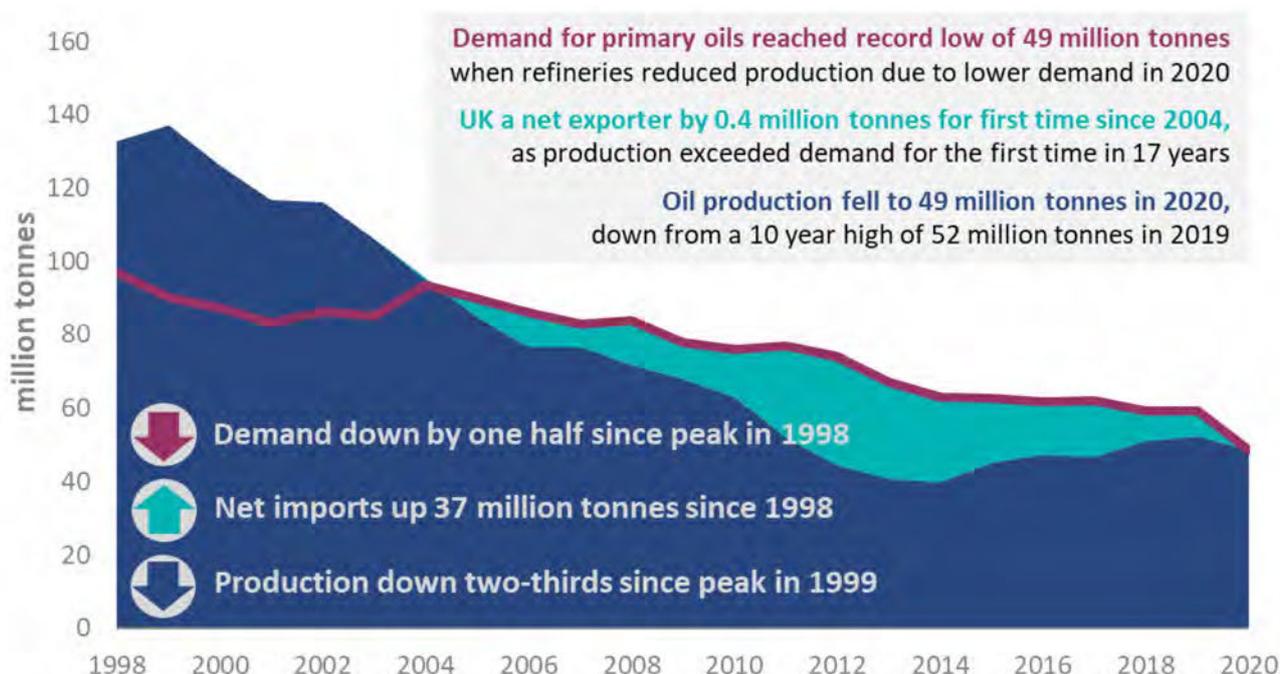

Non-energy use of oil products was down by 9.6 per cent compared to 2019. Use of oil in the energy industry dropped by 15 per cent as demand for generation fell to a record low during a year of record renewables generation.

**Chart 3.3 Oil consumption in the UK, 2019 to 2020 (DUKES Table 3.2 to 3.4)**

**In 2020 the UK's total production of primary oils exceeded refinery demand for the first time since 2004.** Demand for primary oils was down by 18 per cent on 2019 whereas production remained relatively robust, down just 7.0 per cent compared to 2019.

**Chart 3.4 Supply and demand for primary oils, 1998 – 2020 (DUKES Table 3.2 to 3.4)**

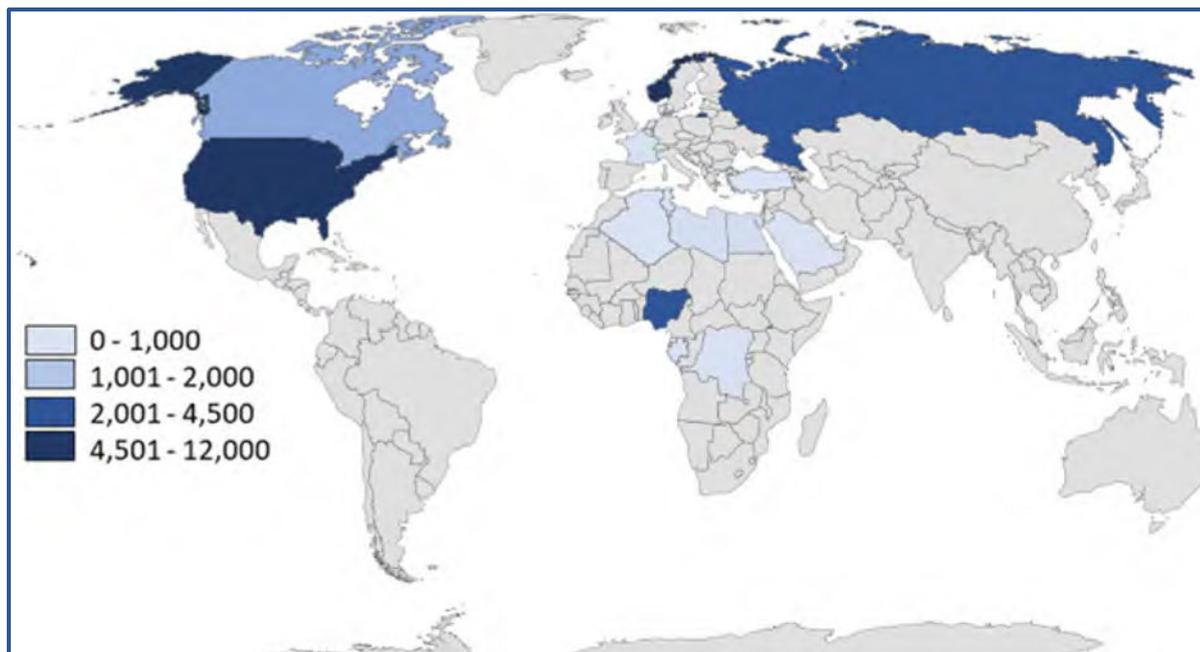

In the longer term, from a peak of 137 million tonnes in 1999 UKCS production of primary oils has dropped by nearly two-thirds to 49 million tonnes in 2020. The UK became a net importer of primary oils in 2005, but net imports fell to a 17-year low in 2020, and the UK became a net exporter for the first time since 2004.

**Despite this, the UK remains reliant on imports to meet refinery demand for specific crude blends.** UK refineries took receipt of 8.6 million tonnes of crude produced from the UKCS in 2020 (a five-year high, see Energy Trends Table 3.10), this met 18 per cent of refinery demand. This in addition to reduced demand saw imports of crude fall by a quarter in 2020 compared to 2019.

Sources of crude imports are shown in Map 3A; the main source has historically been Norway given its proximity to the UK. Imports from Norway remained stable in 2020 compared to 2019, with Norway providing 34 per cent of total UK imports. However, this stability follows recent sharp decreases; in 2016 Norway provided 62 per cent of UK imports (Table 3.9). Imports from the US remained stable in 2020 at the record set in 2019 of 11.4 million tonnes.

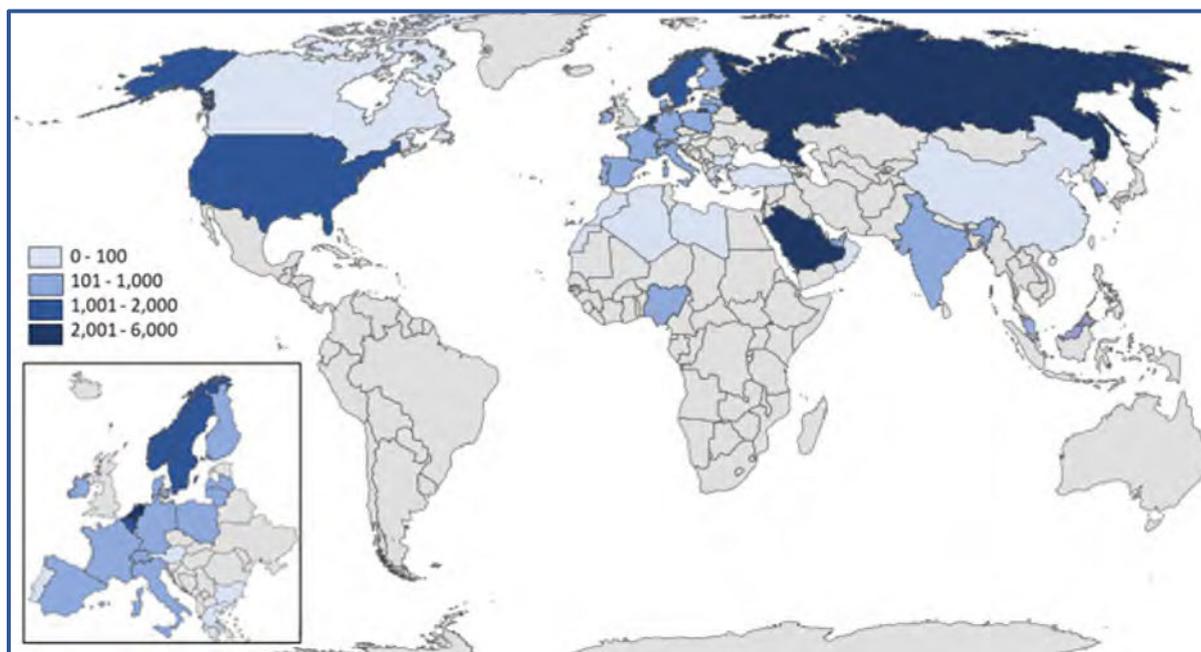

The US share of UK imports reached 32 per cent in 2020 from 26 per cent in 2019 mainly at the expense of imports from Norway and Algeria. Imports from OPEC countries accounted for 13 per cent of the UK's crude imports in 2020 at 4.6 million tonnes, this is almost half the figure for 2019. The UK is a significant exporter of crude oils, and these remained comparatively stable at 36 million tonnes in 2020 compared to 41 and 40 million tonnes in 2019 and 2018 respectively, which followed strong production and favourable price spreads resulting in strong demand for Brent crude from Asia (Table 3.10).

**Map 3A Sources of UK crude oil imports 2020 (thousand tonnes, [DUKES Table 3.9](#))**

**As with crude oil, imports of petroleum products are critically important to meet UK demand.** Despite the Covid-19 pandemic leading to as sharp reduction in imports of petroleum products in 2020, the UK has been a net importer since 2013 and remained so in 2020. In common with many other countries, domestic supply and demand are not matched on a product-by-product basis. The UK's refineries were developed to produce petrol and fuel oil for electricity generation. However, as demand for diesel and jet fuel have increased UK refineries have not been able to keep pace and now produce a surplus of petrol. To balance demand the UK trades widely and is one of the largest importers of jet fuel and road diesel in the OECD, and one of the largest exporters of petrol.

**Map 3B Sources of UK petroleum product imports 2020 (thousand tonnes, [DUKES Table 3.9](#))**

Map 3B shows the principal product trading partners with the UK. Historically the bulk of products have come via the Netherlands, which acts as a major trading hub (the fuel might have been refined elsewhere in Europe or beyond). Russia, the Netherlands, and Saudi Arabia were large sources of road diesel in 2020; these three countries accounted for 62 per cent of total road diesel imports in 2020.

**Another effect of the pandemic has been the impact on emergency reserves of oil.** Under international commitments to the International Energy Agency, and until 1 January 2021 the European Union, the UK is obliged to hold oil stocks to offset the impact of significant disruptions to the global oil market. Such disruptions are relatively rare, but since the Arab Israeli war of 1974 there have been three globally co-ordinated releases of oil in response to the Gulf War (1990–1991), Hurricane Rita (2005), and the civil war in Libya (2011).

At the end of 2020, the UK held 14.9 million tonnes of stocks (DUKES Table 3.7). Of this total, 12.8 million tonnes were held for emergency purposes, broadly equivalent to just over 61 days of typical consumption. These stocks have historically been held both in the UK, and overseas under contractual arrangements that allow stocks to be repatriated to the UK if necessary. At the end of 2020, just over 3.8 million tonnes were held in other EU countries, most notably in the Netherlands. However, following the demand destruction brought about in 2020, stocks held in the UK reached a ten year high of 11.1 million tonnes.

Leaving the EU has also had an impact on emergency oil reserves, notably because previously the UK was obliged to hold stocks as a Member State of the EU as well as the International Energy Agency (IEA). However, because since 1 January 2021 the UK has no longer been an EU Member State, we are now only required to meet the IEA obligation. The level obligation under the IEA accounts for the fact that the UK has significant volumes of offshore production, meaning that since January 2021 companies have been directed to hold less stock than under the EU obligation. Impacts of this on more recent data can be seen in [Energy Trends Table 3.11](#).

# Chapter 4: Natural Gas

Jeremy Burton 0300 068 5101 [oil-gas.statistics@beis.gov.uk](mailto:oil-gas.statistics@beis.gov.uk)

Damon Ying 020 7215 2942

## Key headlines

**Natural gas demand was down 6.0 per cent compared to 2019**, to 811 TWh, the lowest level seen since 2015 because of reduced activity across the economy during restrictions in place to curb the spread of Covid-19.

**There were declines in gas demand for electricity generation, industry, and services** because large parts of the economy shutdown in line with government restrictions. Demand from industry fell to a new record low.

**Domestic demand for gas marginally up from 2019.** Despite the warmer weather in 2020, and the warmest year since 2014, domestic demand increased because of stay-at home orders.

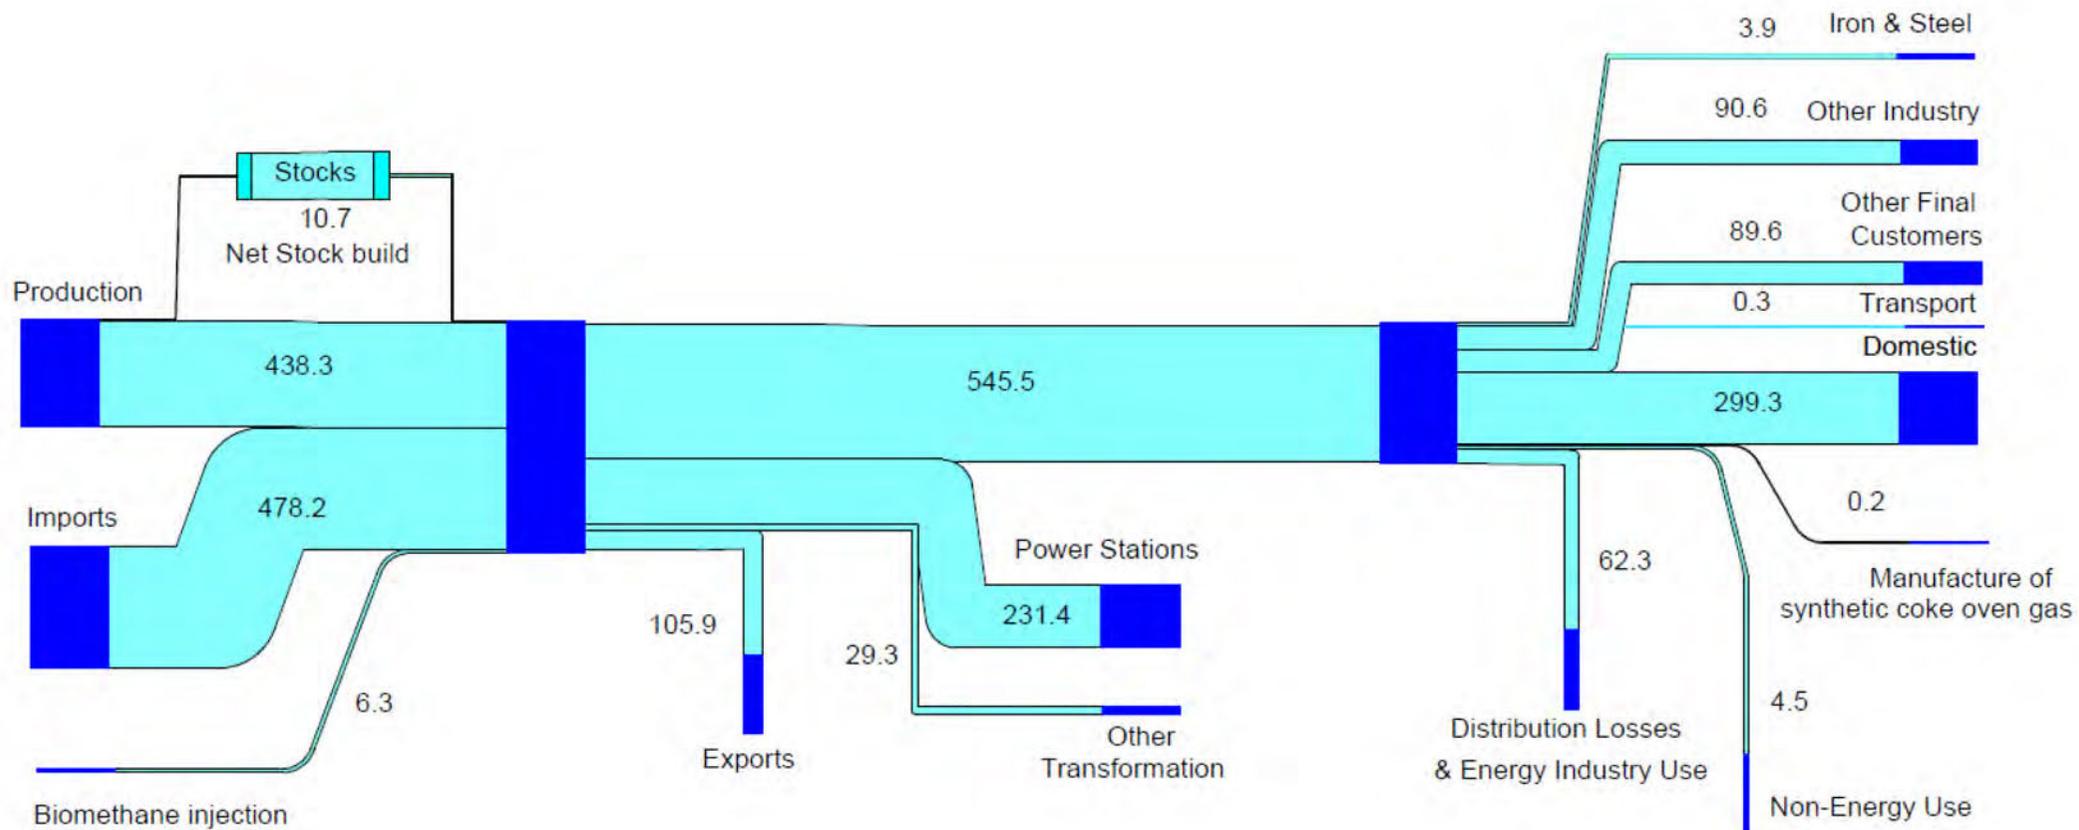

**Net imports fell 12 per cent on 2019**, in line with reduced demand. Despite this a growing Liquefied Natural Gas (LNG) market saw another record year for LNG imports, which reached the highest level since the peak in 2011. Global liquefaction capacity has increased consecutively for the last six years, and notably UK imports from the US were up by more than 70 per cent compared to 2019 as the US shale revolution continues to take hold.

**Exports were up by almost a fifth on 2019** as the Bacton-Balgzand Line (BBL) was converted from an import pipeline to an interconnector allowing for trade in both directions. This conversion aims to support a UK oversupply in summer months as well as meet Dutch demand. As a result, there were record exports to the Netherland in 2020.

**Gross gas production was stable compared to 2019** despite a challenging year for maintenance. Gas production has been broadly stable for close to a decade and the UK remains the third largest natural gas producer in Europe.

The flow chart on the following page shows the flows of natural gas from production and imports through to consumption. It illustrates the flow of gas from the point at which it becomes available from indigenous production or imports (on the left) to the final use of gas (on the right), as well as volumes transformed into other forms of energy or exported. The widths of the bands are proportional to the size of the flow they represent.

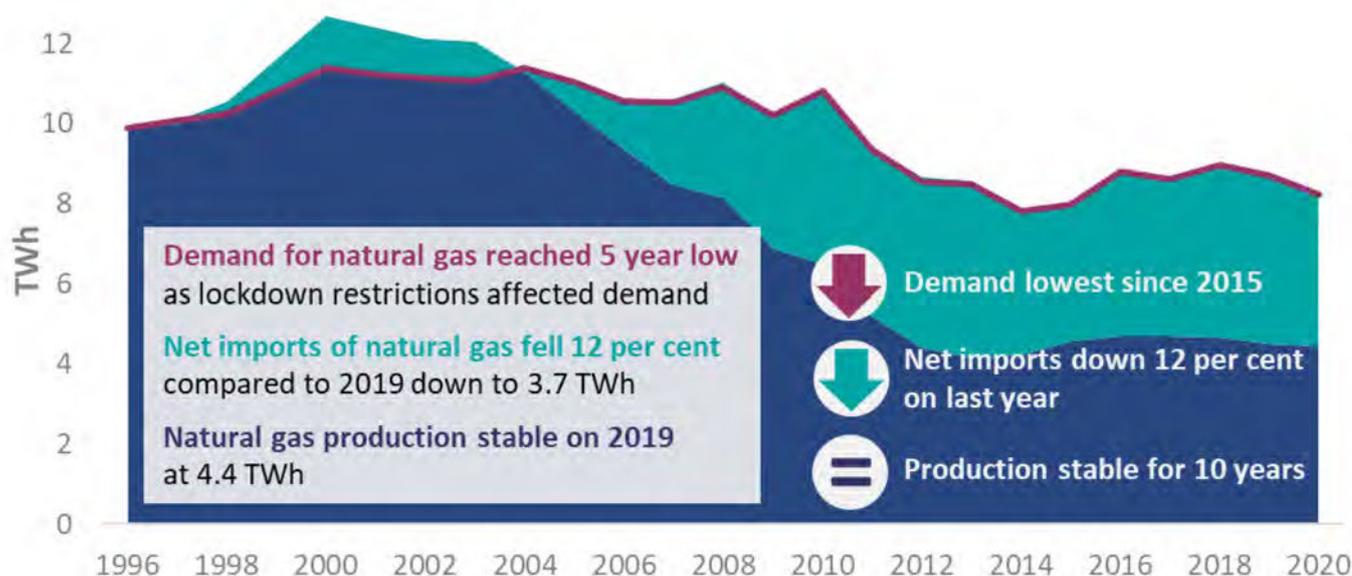

## Natural gas flow chart 2020 (TWh)

### Note:

This flow chart is based on data that appear in Table 4.1, excluding colliery methane.

**Chart 4.1 Supply and demand for natural gas, 1996-2020 (DUKES Table 4.1)**

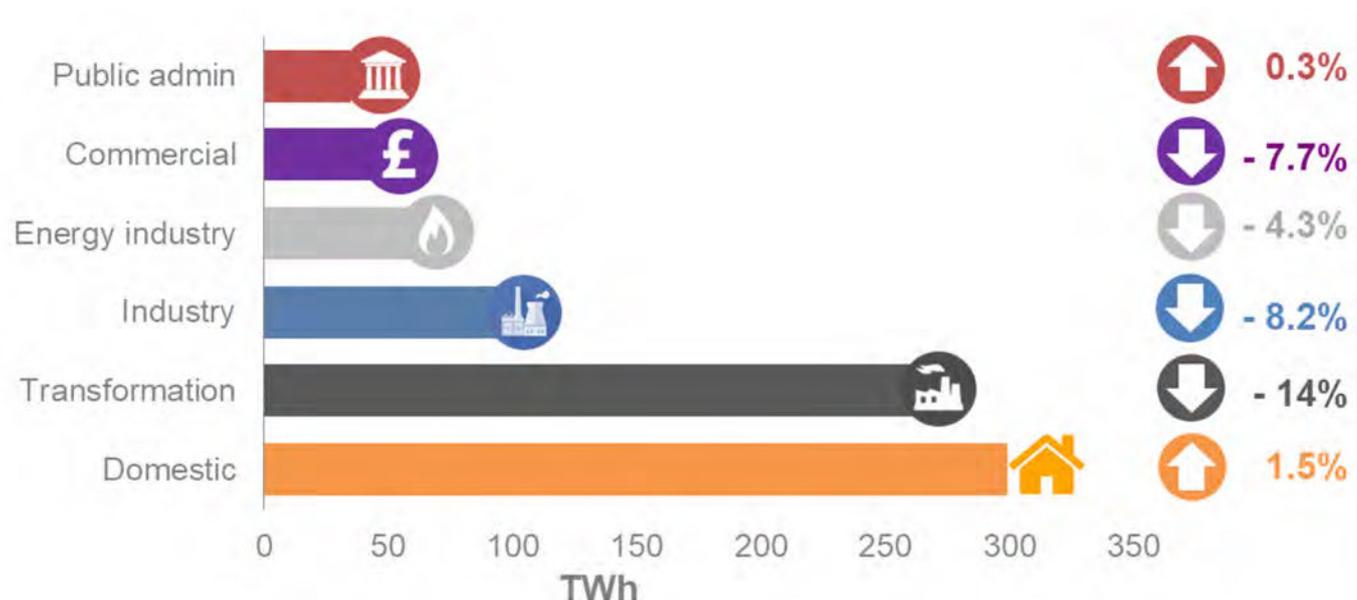

Natural gas is an important part of the UK energy mix, accounting for 30 per cent of UK energy production in 2020, and 40 per cent of demand. **UK gas demand decreased 6.0 per cent in 2020 compared to 2019**, following several years of stable demand and was largely a result of restrictions in place to curb the Covid-19 pandemic. However, trends in demand varied by sector.

**In 2020, UK gross gas production was 439 TWh, stable on 2019.** UK gas production has been broadly stable for close to a decade following several years of decline since the peak in 2000. Despite this the UK remains a major producer of natural gas, sitting within the top 20 gas producing countries globally and the third largest in Europe. The Oil and Gas Authority produces analysis on oil and gas reserves which can be found [in the Oil and Gas reserves publication](#).

In 2020, indigenous production met more than half of demand with the remainder supplied via imports. Net imports fell by 12 per cent in 2020 compared to 2019 despite exports increasing 17 per cent as the Bacton to Balgzand Line (BBL) was converted to an interconnector allowing trade in both directions. Conversely imports fell to a 10-year low because demand was impacted by restrictions put in place to curb the spread of Covid-19.

**Chart 4.2 Sectoral consumption of natural gas, 2019 to 2020 (DUKES Table 4.1)**

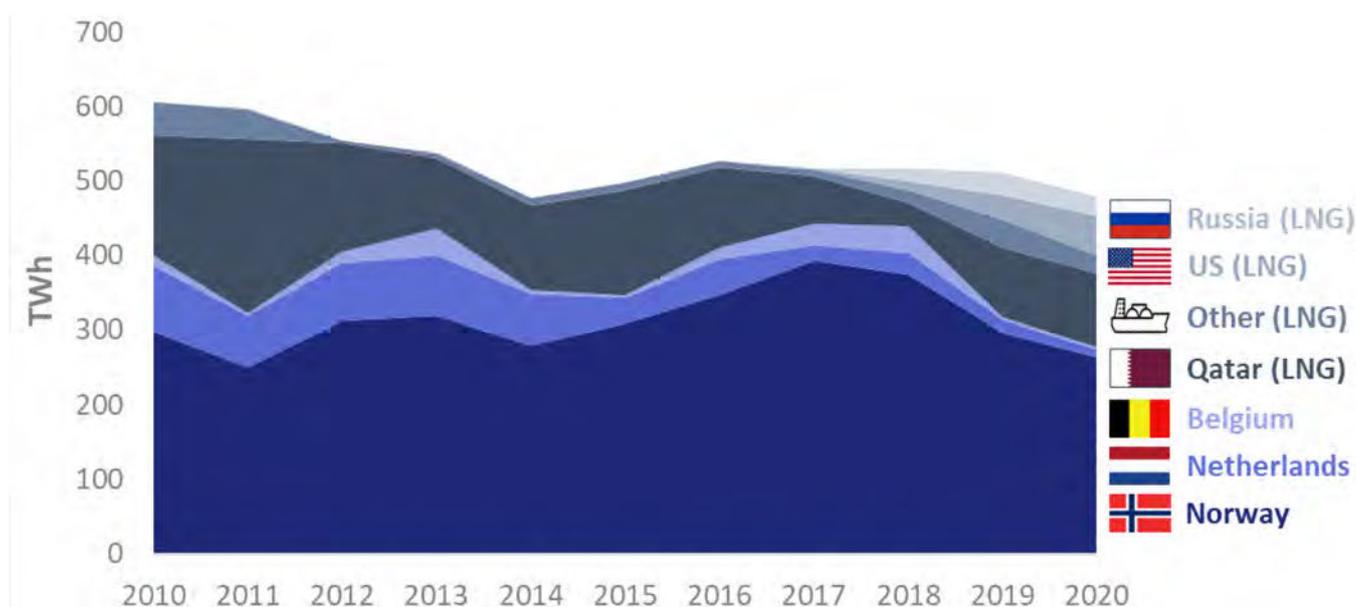

**Domestic demand increased marginally, up 1.5 per cent in 2020 compared to 2019.** This was despite warmer temperatures and a result of national restrictions in place to control the spread of Covid-19. Most domestic natural gas consumption is used for space and water heating as well as in appliances such as ovens and hobs. More people stayed at home changing their behaviour in line with national lockdowns and other restrictions. Overall, natural gas met two-thirds of total domestic energy demand in 2020.

**In contrast, gas demand for electricity generation fell 15 per cent compared to 2019.** This was due to a combination of reduced demand for electricity because of restrictions in place to curb the Covid-19 pandemic and from strong renewable generation reducing generation from fossil fuels (see [Chapter 5](#)).

**Demand for gas by industry fell 8.3 per cent compared to 2019.** At 95 TWh demand for gas by industry was the lowest on record in 2020 because industries slowed or ceased production in line with social distancing guidelines, particularly in the second quarter of the year, which reduced energy consumption across the sector.

**Demand for natural gas by services fell 3.9 per cent in 2020 compared to 2019.** Gas demand by the commercial sector was down 7.7 per cent as non-essential retail and hospitality venues were closed for large parts of the year. Conversely, gas demand by public administration was relatively stable in the face of warmer weather; despite school, university and office closures, hospitals remained open through periods of exceptional demand on their services.

**Chart 4.3 Imports of natural gas, 2010-2020 ([DUKES Table 4.5](#))**

**In 2020, imports were down 6.5 per cent on 2019.** This was partly due to low demand. Imports arrive via pipeline; the UK imports natural gas via pipeline from Norway, Belgium and the Netherlands, or as liquefied natural gas (LNG) via ship.

**Pipeline imports from Norway accounted for a third of total supply,** the second largest source of natural gas following indigenous production. Imports of natural gas from Norway account for more than half of total imports. This is largely because of the UK's proximity to Norway and shared infrastructure in the North Sea. However, whilst substantial, imports of natural gas from Norway were down 11 per cent in 2020 compared to 2019 as imports of LNG displaced Norway's share to some extent.

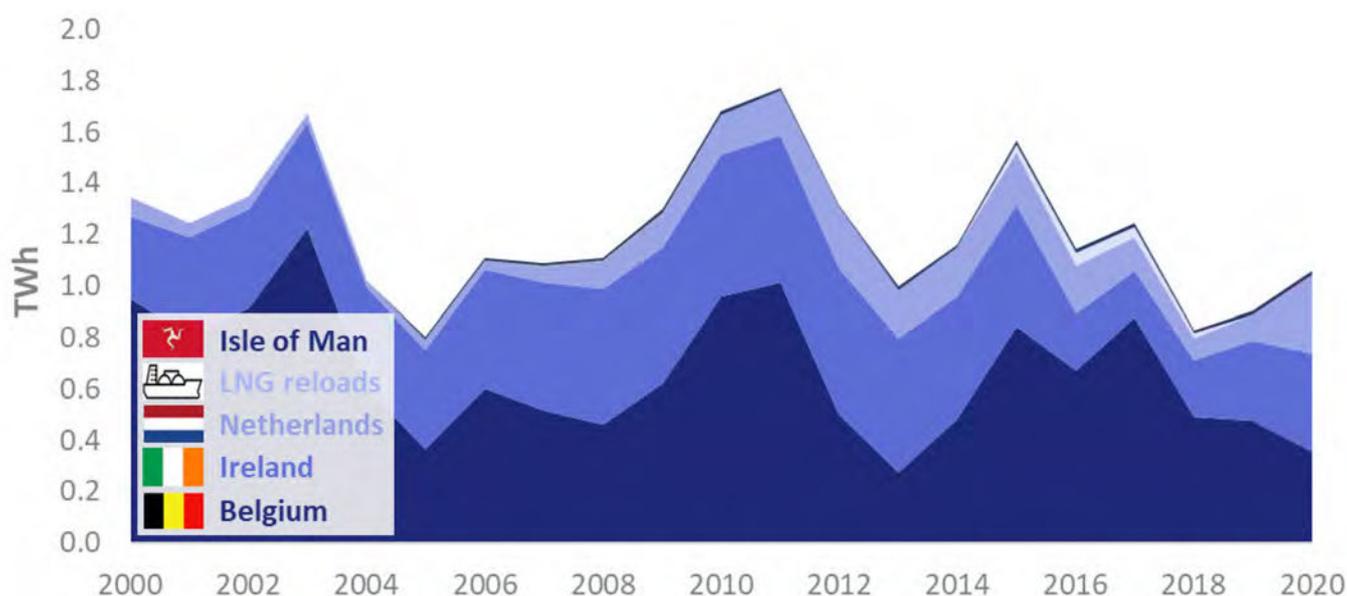

**Imports of LNG increased again reaching near record highs.** Despite low demand in 2020 market changes meant imports of LNG remained substantial. This follows record growth in 2019 when imports of LNG more than doubled as the UK played an important role in balancing an oversupplied market. Growth in 2020 was muted, up 2.9 per cent compared to 2019, because of substantial levels of gas in European storage followed by restrictions in response to the Covid-19 pandemic. For more information on the [supply of LNG see the special feature article](#).

Chart 4.4 UK LNG import sources by volume, 2020 ([DUKES Table 4.5](#))

**LNG import sources have diversified, so improving UK security of supply.** Historically, a large proportion of LNG imports have come from Qatar and this accounted for just under half of total LNG imports in 2020, compared to 98 per cent when they peaked in 2011. The UK imported LNG from a further nine sources; notably imports from the US increased by 72 per cent in 2020 compared to 2019. Increased import sources are attributable to growing global LNG liquefaction capacity and a rapidly growing commodity market.

Chart 4.5 Exports of natural gas, 2000-2020 ([DUKES Table 4.5](#))

\*Minimal exports to Norway have been excluded from this chart.

**Exports increased by almost a fifth in 2020 compared to 2019,** largely due to record exports to the Netherlands following the conversion of the Bacton-Balgzand Line (BBL) from an import pipeline to an interconnector in 2019, allowing trade in either direction and with substantial exports beginning in spring 2020. This aims to manage UK oversupply in summer months following the closure of storage facilities and will also support Dutch security of supply as production at Groningen gas field, the largest in Europe, will halt in 2022.

Exports to the Republic of Ireland continue to grow, up 22 per cent in 2020 compared to 2019. This follows declining production at the Corrib gas field which accounts for most Irish indigenous production. Increasing exports to the Netherlands and Republic of Ireland outstrip a decline in exports to Belgium. Exports to Belgium continue to fall, down a quarter in 2020 compared to 2019, the second lowest level recorded. This decline is due to the termination of the Bacton-Zeebrugge interconnector contract.

# Chapter 5: Electricity

Vanessa Martin

020 7215 2995

[electricitystatistics@beis.gov.uk](mailto:electricitystatistics@beis.gov.uk)

## Key headlines

**Electricity demand reached a record low in 2020 of 330.0 TWh, down 4.6 per cent compared to 2019.**

Though electricity demand has been declining year on year since 2015, the larger reduction seen in 2020 was primarily a result of the response to the Covid-19 pandemic.

**Restrictions in response to Covid-19 led to decreased industrial and commercial electricity consumption, but higher domestic consumption.** Industrial use of electricity, including iron and steel, was down 9.3 per cent in 2020 compared to 2019, and consumption by other final users, including the commercial sector, decreased by 11.2 per cent. Conversely, domestic consumption increased by 3.9 per cent in 2020, in comparison with 2019.

**Renewable technologies generated more electricity than fossil fuels in 2020 for the first time in the published time series.** Renewable sources generated 134.6 TWh in 2020, a 12.6 per cent increase compared to 2019 and higher than the 117.8 TWh from fossil fuel. This was in the context of electricity generation falling to record low levels in 2020, with total electricity generation in 2020 of 312.0 TWh. This reflects the lower demand for electricity during 2020 as a result of the UK's Covid-19 restrictions. In 2020, 43.1 per cent of UK generation came from renewables.

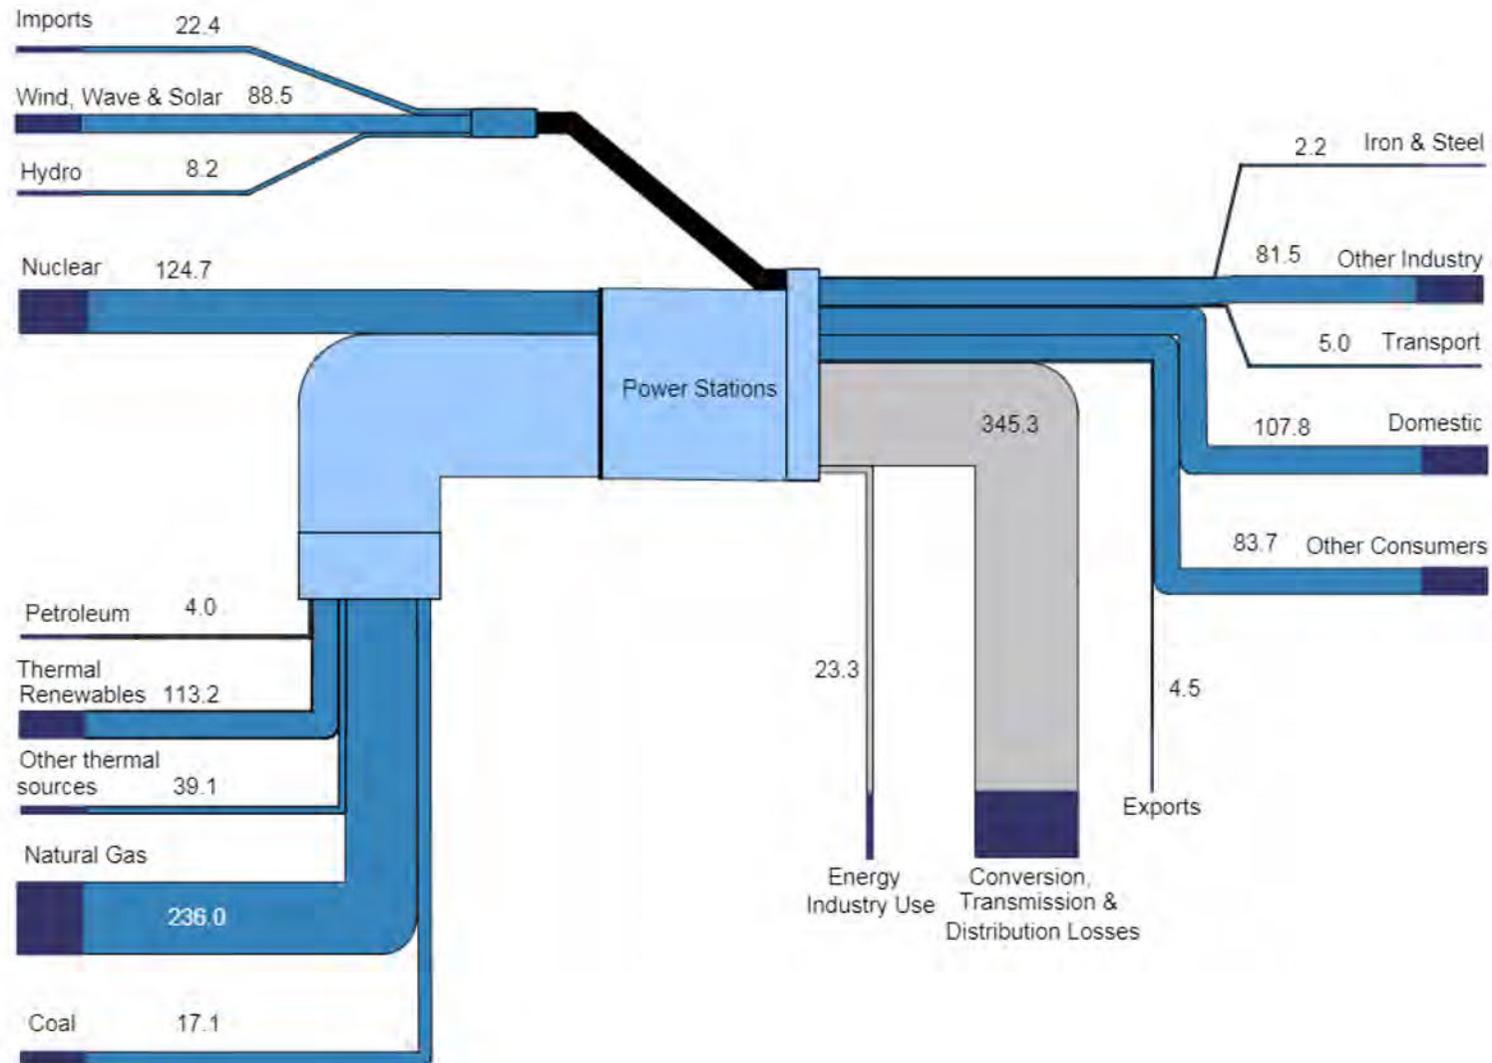

**Fossil fuel generation was at a record low in 2020.** Low demand for electricity and high generation from renewable sources reduced the need for generation from fossil fuels. Gas continued to be the dominant fuel, but generation was down 16 per cent compared to 2019. Nuclear electricity generation was down 11 per cent due to a series of statutory and unplanned outages at the UK's nuclear plants over the year. In 2020, 37.7 per cent of UK generation came from fossil fuels.

**The total fuel used for electricity generation decreased substantially in 2020 down 5.2 per cent to 55.6 Million Tonnes of Oil Equivalent (Mtoe).** Fuel use has fallen year on year since 2013 due to decreasing demand for electricity and growth in non-thermal renewables, but the larger decrease in 2020 was because of the unusually low demand and generation as a result of the Covid-19 restrictions.

**Net imports in 2020 were 17.9 TWh, the lowest level since 2017.** Net imports were 5.4 per cent of electricity supplied in 2020.

**Total generation capacity decreased in 2020 to 75.8 GW, a 2.7 per cent decrease on the 77.9 GW capacity in 2019.** While there were increases in renewable capacity, in particular off-shore wind, this was offset by the closure of coal power station Fiddler's Ferry and nuclear station Dungeness B.

## Electricity flow chart 2020 (TWh)

### Notes on flow chart

This flow chart is based on the data in Tables 5.1 (for imports, exports, use, losses and consumption) and 5.6 (fuel used).

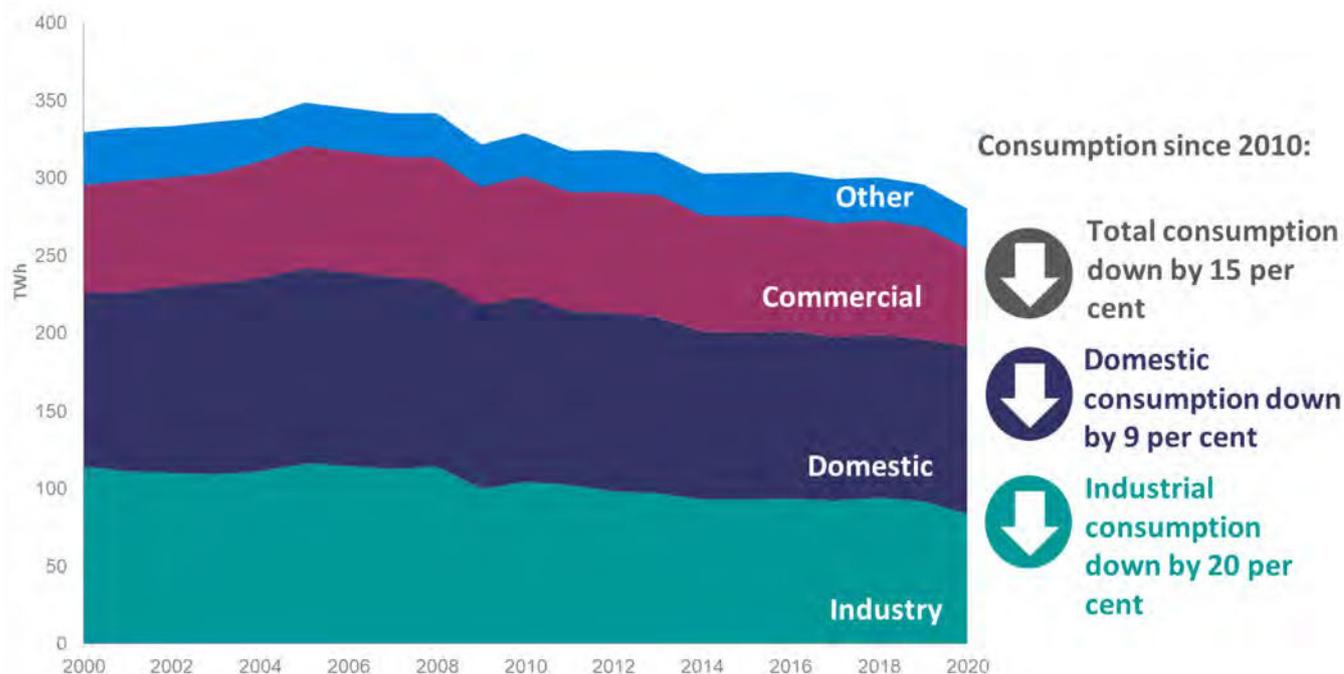

1. Hydro includes generation from pumped storage while electricity used in pumping is included under Energy Industry Use.

2. Conversion, Transmission and Distribution Losses are calculated as fuel used (Table 5.6) minus generation (Table 5.6) plus losses (Table 5.1).

**Electricity demand reached a record low in 2020 of 330.0 TWh, down 4.6 per cent compared to 2019.**

Though electricity demand has been declining year on year since 2015, the larger reduction seen in 2020 was primarily a result of the response to the Covid-19 pandemic, which restricted the activity of business and industry from March. Similarly, there was a 5.3 per cent fall in levels of final consumption of electricity compared to 2019. 'Final consumption' refers to electricity consumption by end users, excluding electricity consumed in the process of generation and transmission or distribution losses.

**Chart 5.1 Electricity consumption by sector, 2000-2020 (Table 5.1)**

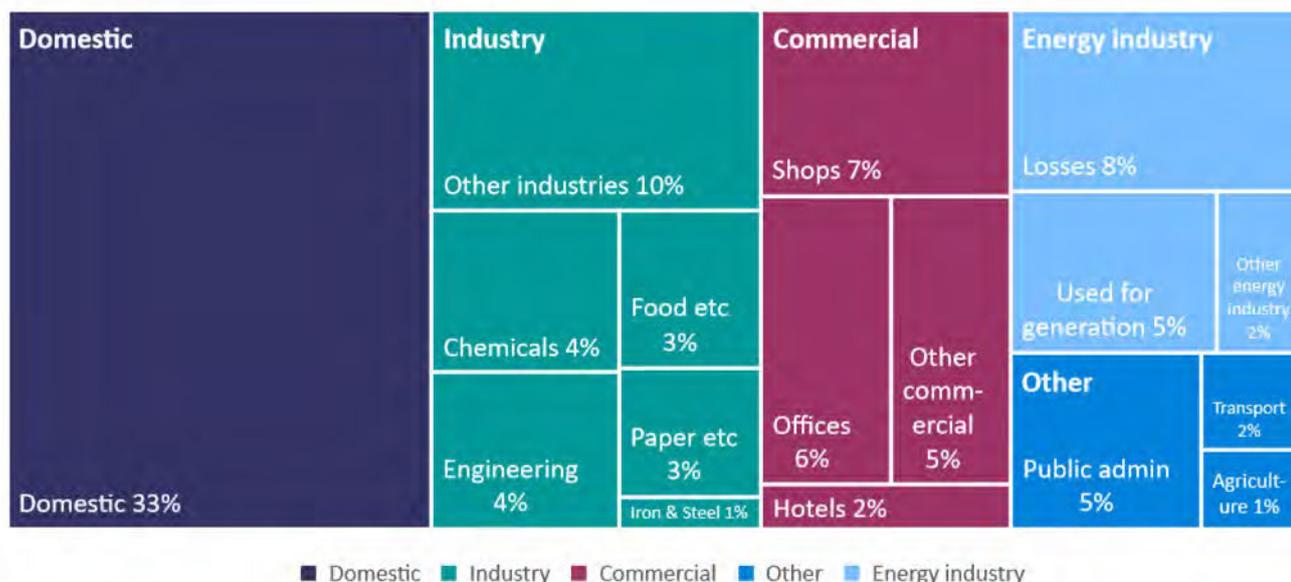

**Restrictions in response to Covid-19 led to decreased industrial and commercial electricity consumption, but higher domestic consumption.**

Industrial use of electricity, including iron and steel, was down 9.3 per cent in 2020 compared to 2019, and consumption by other final users, including the commercial sector, decreased by 11.2 per cent. This was due to restrictions placed on the activity of business and industry in response to the Covid-19 pandemic. Conversely, domestic consumption increased by 3.9 per cent in 2020, in comparison with 2019. This reflects the increase in time spent at home, including working from home, raising domestic consumption. This increase is despite higher average temperatures in 2020 than in 2019, which would usually be expected to reduce domestic electricity demand for heating.

Total electricity demand is larger than electricity consumption. This is because total demand also accounts for electricity consumed in the process of generation or to produce fuel for generation, as well as for electricity lost in transmission or distribution from where it is generated to where it is consumed.

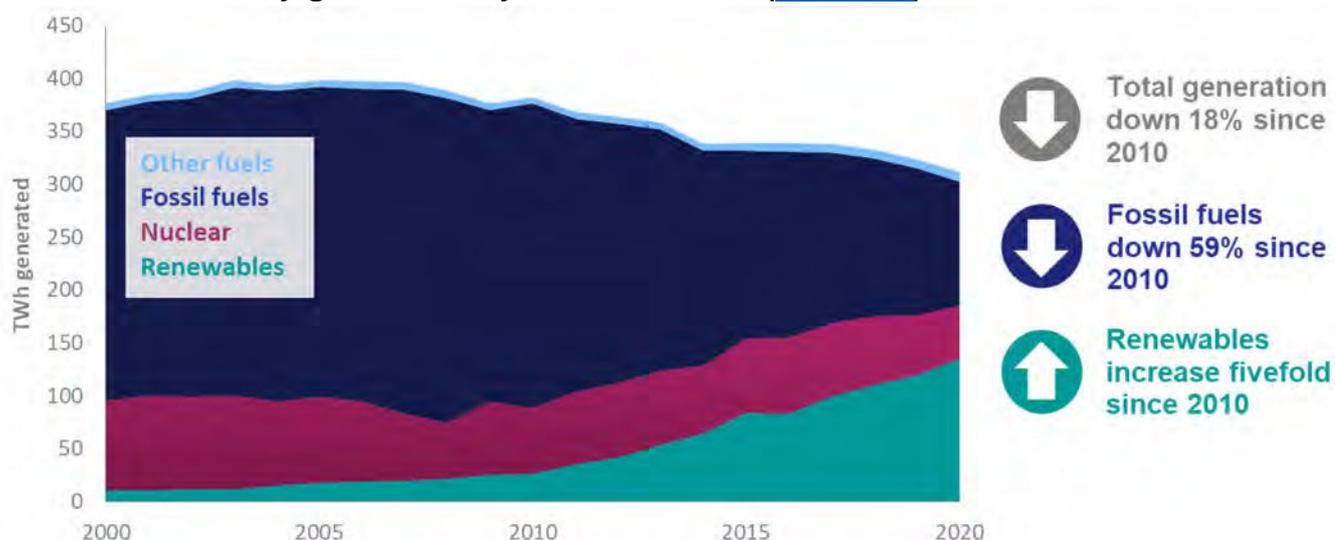

**Chart 5.2 Share of total electricity demand split by sector, 2020** (Table 5.2)

**Domestic users accounted for almost a third (32.7 per cent) of total electricity demand in 2020, higher than the share in 2019 (30.0 per cent).** Consumption by industry represented 25 per cent and commercial consumption represented 19 per cent. Compared to 2019, the domestic share increased by 2.7 percentage points, whereas the industrial share decreased 1.3 percentage points and the commercial share by 1.7 percentage points, in line with the effects of Covid-19 restrictions in 2020.

**Electricity generation and supply fell in 2020, due to reduced demand for electricity.** Demand for electricity is mainly met by UK generation and supplemented with imports from Europe. Electricity generation measures what is generated while electricity supply measures what was supplied to the grid, excluding the electricity used in the process of generation. Total electricity supplied plus imports needs to match with demand to ensure there is always enough electricity available. Total electricity supplied in 2020 was 329.9 TWh, with net imports of 17.9 TWh, 5.4 per cent of electricity supplied.

**Chart 5.3 Electricity generation by fuel, 2000-2020** (Table 5.6)

**Electricity generation fell to record low levels in 2020, with total electricity generation in 2020 of 312.0 TWh, 3.6 per cent less than in 2019.** This reflects lower demand for electricity during 2020 as a result of the UK's Covid-19 restrictions. 2020 also continued the shift away from generation by Major Power Producers (MPPs), which was down 5.1 per cent to 253.9 TWh, partly offset by a 3.8 per cent increase in generation from autogenerators and other generators to 56.7 TWh. The generation by MPPs was the lowest value on the published data series, partly due to the lower demand but also the ongoing trend towards smaller renewable sites.

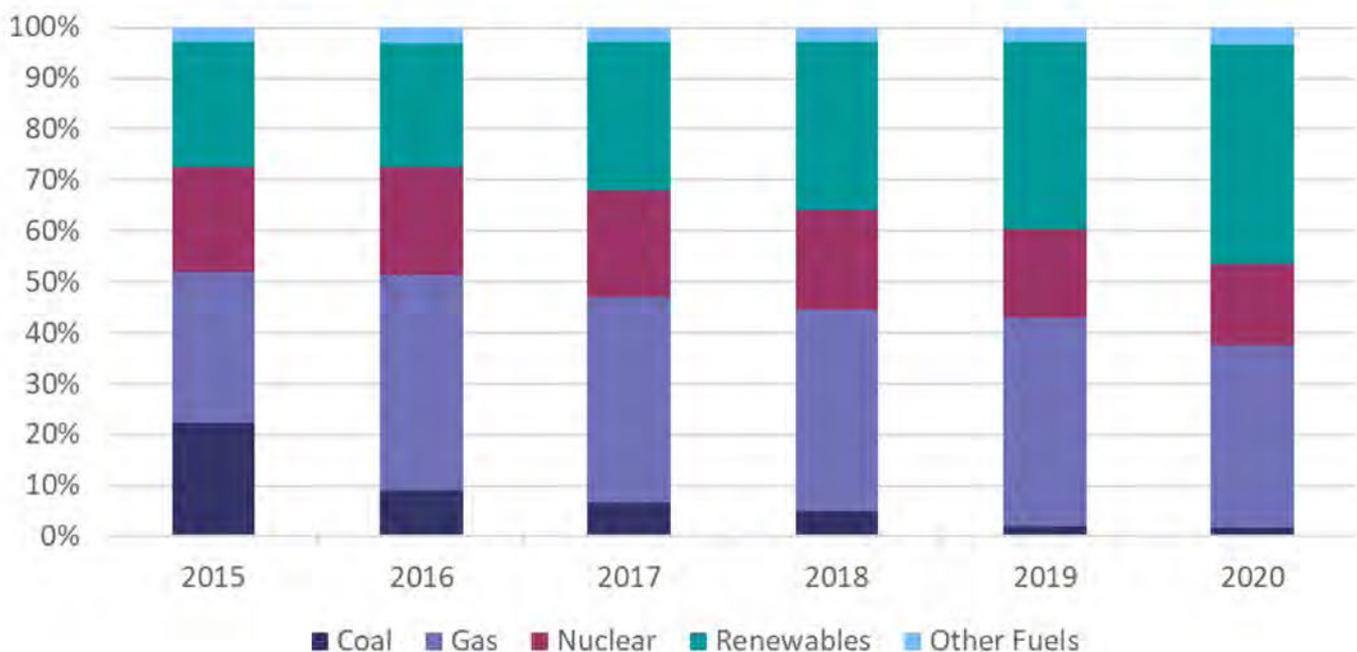

**Generation from renewable sources in 2020 was higher than fossil fuels for the first time in the published time series.** Renewable sources generated 134.6 TWh in 2020, a 12.6 per cent increase compared to 2019 and higher than the 117.8 TWh from fossil fuel. The high renewable generation was driven by increased wind generation, up by 18 per cent compared to 2019 to 75.4 TWh. This reflected favourable conditions for generation and increased capacity, particularly for offshore wind, which generated 27 per cent more electricity in 2020 than in 2019. In particular, the East Anglia One offshore wind farm became fully operational in 2020, adding 0.7 GW to the UK's offshore wind capacity. Weather conditions were also favourable for hydro generators, which saw a 15.5 per cent increase compared to 2019, to 6.8 TWh. There was also a 5.4 per cent increase in generation from bioenergy, in line with increased capacity.

**Fossil fuel generation was at a record low in 2020, down 15.9 per cent to 117.8 TWh.** This came as low demand for electricity and high renewables generation reduced the need for generation from fossil fuels. Gas continued to be the dominant fuel, generating 111.4 TWh in 2020 but this was down 16 per cent compared to 2019. During 2020 there were several substantial periods with no coal-fired generation in Great Britain, including a record 67 day period between April and June 2020. Northern Ireland operates on a separate electricity network where some coal generation continued. Just four coal-fired power stations remain in the UK, following the closure of Fiddlers Ferry and Aberthaw B in March 2020, with plans to phase these out by 2025.

**Nuclear electricity generation was 50.3 TWh in 2020, down 11 per cent compared to the previous year.** This was the lowest amount in more than twenty years as all of the UK's nuclear plants were on outage at times during the year. While some of these were statutory outages (planned in advance for maintenance purposes), there were also a number of unplanned outages for repairs, including Dungeness B being unable to generate all year. This also included Sizewell B operating at half capacity from May to September at the request of National Grid because of the lower demand for electricity.

As well as absolute generation, it is also useful to consider the overall shares of generation, which are less affected by changes in demand. This is particularly important for 2020, which saw unusual demand patterns as a result of Covid-19 restrictions.

**Chart 5.4 Shares of electricity generation by fuel, 2015-2020 (Table 5.6)**

**In 2020, the proportion of electricity generation coming from renewable sources exceeded that of fossil fuels for the first time in the published data series.** The renewable share rose sharply in 2020, to 43.1 per cent of UK generation, an increase of 6.2 percentage points compared to 2019. This was substantially higher than the share of generation from fossil fuels (37.7 per cent) for the first time in the published data series. All the renewable technologies including bioenergy saw increases in generation shares

in 2020, with the largest being a 3.7 percentage point increase in wind generation share. Wind provided 24 per cent of the total generation in 2020. The share of generation from low carbon sources increased again in 2020 to 59.3 per cent, up 5.0 percentage points compared to 2019, because of the high share of generation from renewables.

**The fossil fuel share of generation was the lowest on the published data series, down by 5.5 percentage points to 37.7 per cent.** Gas continues to be the dominant fuel in the UK generation mix, generating 35.7 per cent of the total in 2020, although this was down 5.0 percentage points on 2019. The fall in the use of fossil fuels has largely been driven by a significant reduction in coal generation, which has fallen from a fifth of generation in 2015 to just 1.8 per cent in 2020.

**Nuclear share of electricity generation fell to its lowest level since 2010, accounting for 16.1 per cent of generation in 2020,** down 1.2 percentage points on 2019.

**The total fuel used for electricity generation decreased substantially in 2020, down 5.2 per cent to 55.6 Million Tonnes of Oil Equivalent (Mtoe).** This was the lowest value on the published data series with fuel use falling year on year since 2012. In the last ten years, total fuel use has fallen 28 per cent due to decreasing demand for electricity and growth in non-thermal renewables which do not incur conversion losses<sup>3</sup>. The larger decrease in 2020 compared to 2019 was because of the unusually low demand and generation as a result of the Covid-19 restrictions.

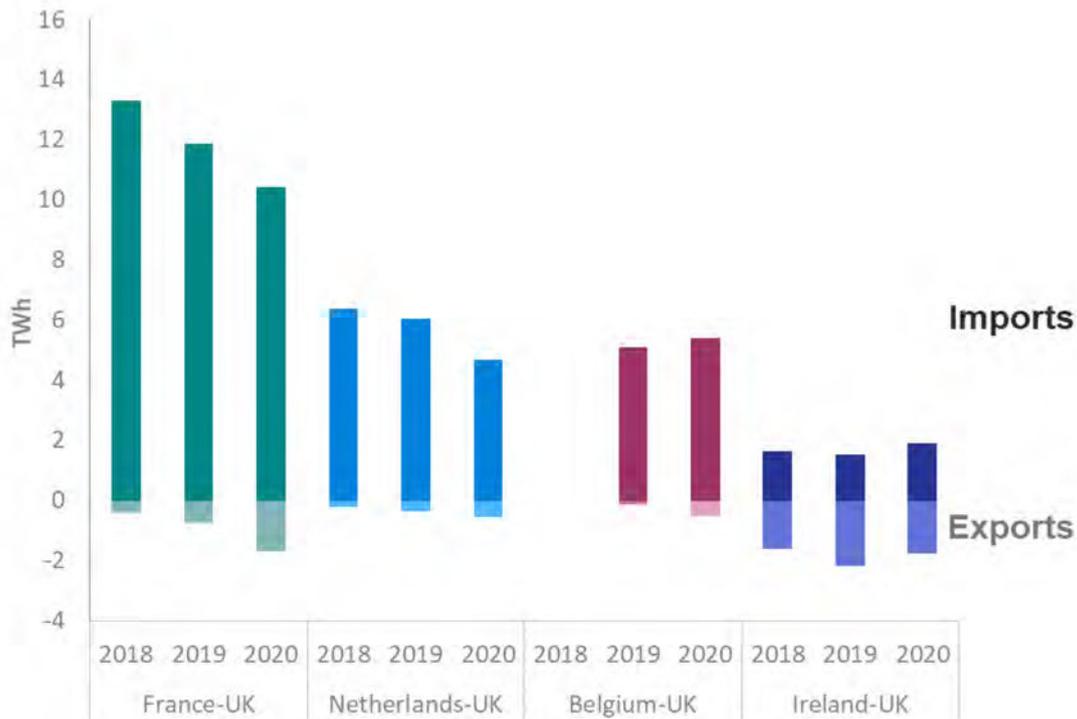

Trends in fuel used mirror those in electricity generation, with record low amounts of fossil fuel used, record low use of nuclear fuel and record highs for fuel used by renewable generators. Gas continues to dominate the UK generation mix, with 20.3 Mtoe used in 2020, while coal use has continued to decline with just 1.47 Mtoe used in 2020. This was a 21 per cent reduction on 2019 and 94 per cent lower than 2010 levels.

**The UK continued to support its own generation by importing electricity from Europe to meet demand, though total net imports were down by 15 per cent in 2020.** Net imports in 2020 were 17.9 TWh, the lowest level since 2017 and represented 5.4 per cent of total electricity supplied, down 0.7 percentage points on 2019. Total imports were 22.4 TWh in 2020 (down 8.8 per cent compared to 2019) while total exports were up 32 per cent on 2019 to 4.5 TWh.

---

<sup>3</sup> For wind, hydro and solar, the fuel used is assumed the same as the electricity generated, unlike thermal generation where conversion losses are incurred. Therefore, for example, if one unit of electricity produced from coal is switched to wind, the fuel used will show a fall from around three units (as coal's thermal efficiency is around one-third) to one unit.

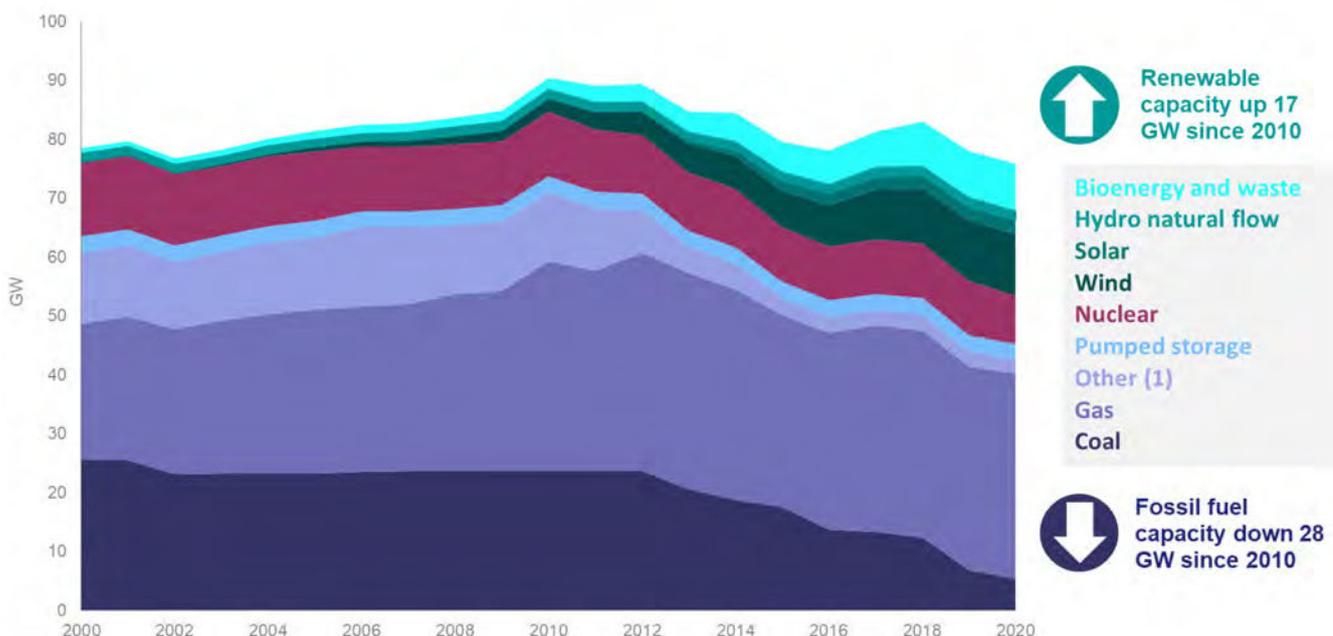

**Chart 5.5 Electricity imports from Europe (Table 5.13)**

Just under half of the UK’s electricity imports (47 per cent) were from France, with the French IFA interconnector providing net imports of 8.7 TWh, although this was down 22 per cent on 2019. Belgium and the Netherlands also have substantial amount of net imports, 4.9 and 4.1 TWh respectively, though the lower demand in 2020 meant that both saw a decrease compared to 2019. The Northern Ireland – Ireland interconnector remains the only interconnector where exports of electricity exceed imports with net imports of –0.8 TWh in 2020.

UK electricity is generated from a range of technologies and fuels which will be used at different times in response to demand and to changes in weather. Monitoring capacity along with load factors allows us to see how the capacity is being used and monitor the security of electricity supply.

**Chart 5.6 Installed capacity of UK electricity generation assets by fuel, 2000 to 2020 (Table 5.7)**

**Total generation capacity decreased in 2020 to 75.8 GW, a 2.7 per cent decrease on the 77.9 GW capacity in 2019.** While there were increases in renewable capacity, in particular offshore wind, these were offset by the closure of two large coal power stations and nuclear station Dungeness B. These large plant closures meant that the peak demand for electricity during the winter 2020/21<sup>4</sup> was equivalent to 75.5 per cent of UK MPP generation capacity, up 3.2 percentage points compared to 2019. In this section, wind, small scale hydro and solar PV capacity is de-rated to account for intermittency, to enable direct comparison with conventional fuels which are less dependent on the weather.

**The largest reduction in generation capacity during 2020 was seen in coal-fired generation, which fell to 5.4 GW,** with the closure of Fiddlers Ferry (2.0 GW). This leaves just four coal plants operating in the UK, with plans to phase these out by 2025, and reflects the shift away from coal for electricity generation. Nuclear capacity fell by 12.1 per cent with the closure of Dungeness B<sup>5</sup>. Gas-fired generation capacity remained relatively stable, up by 0.6 per cent.

**Renewable generation capacity continued to increase in 2020,** with 0.4 GW of renewable capacity added to take the total to 22.4 GW. Without derating, this is an increase of 1.0 GW which brings the total installed capacity for renewable generation to 47.8 GW, as detailed in Table 6.4. Half of the additional capacity was for offshore wind generation, including the opening of East Anglia One which added 0.5 GW over the course of the year. Solar generators and municipal solid waste generation also saw additional capacity.

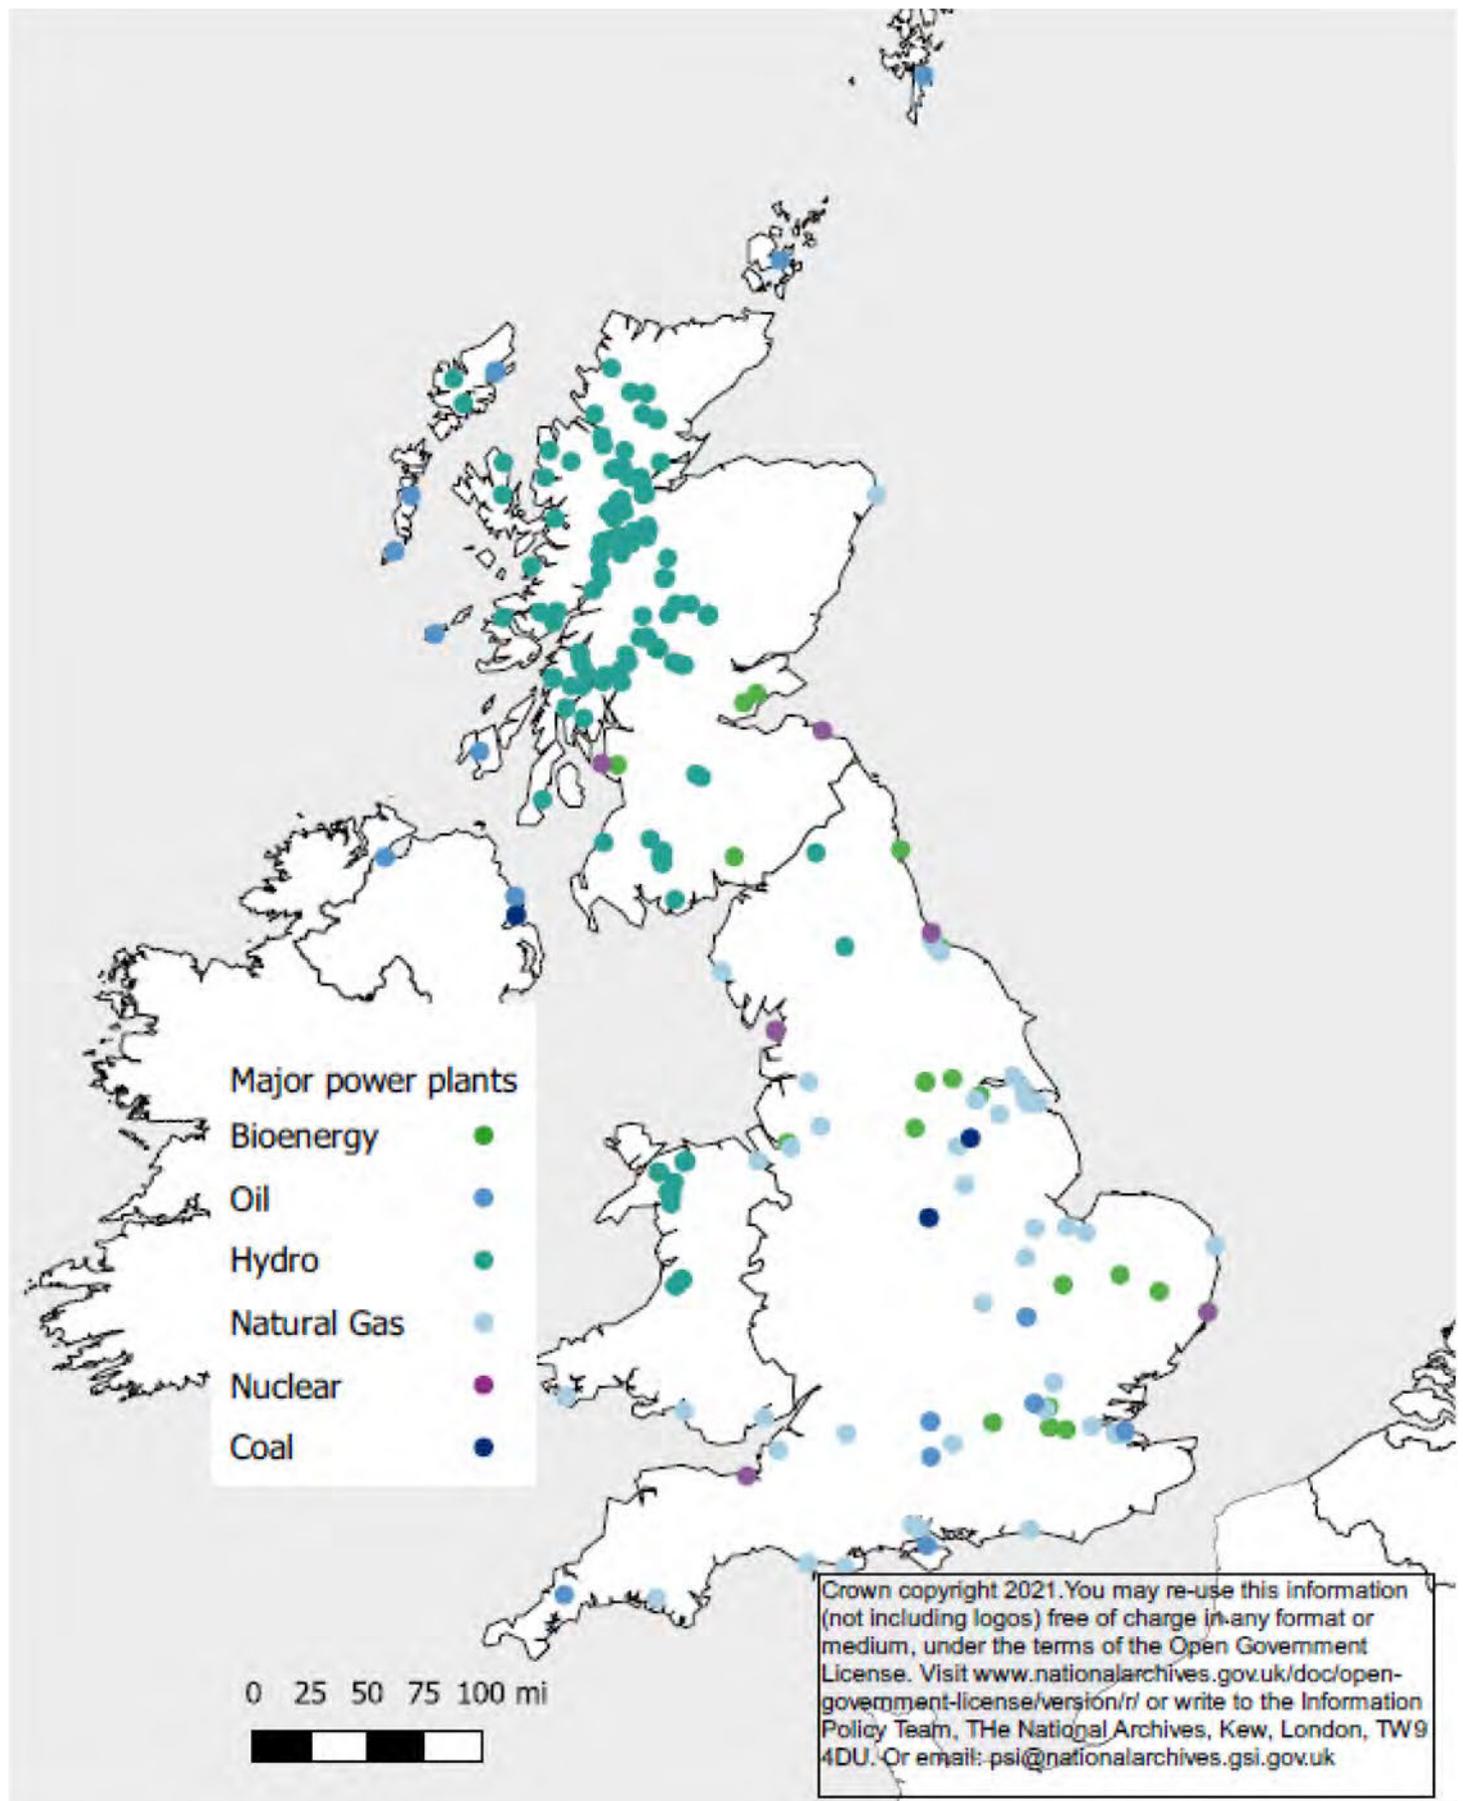

**In addition to decreased capacity, the MPP power plants were less intensively deployed than they were last year, with a load factor of 41.6 per cent.** Load factors indicate the proportion of the time the plant is producing electricity and decreased by 0.7 percentage points compared to 2019. Load factors vary by technology, with nuclear stations the highest at 59.8 per cent and the lowest being pumped storage hydro at 5.8 per cent. Full load factors for renewable generation are given in Table 6.5.

---

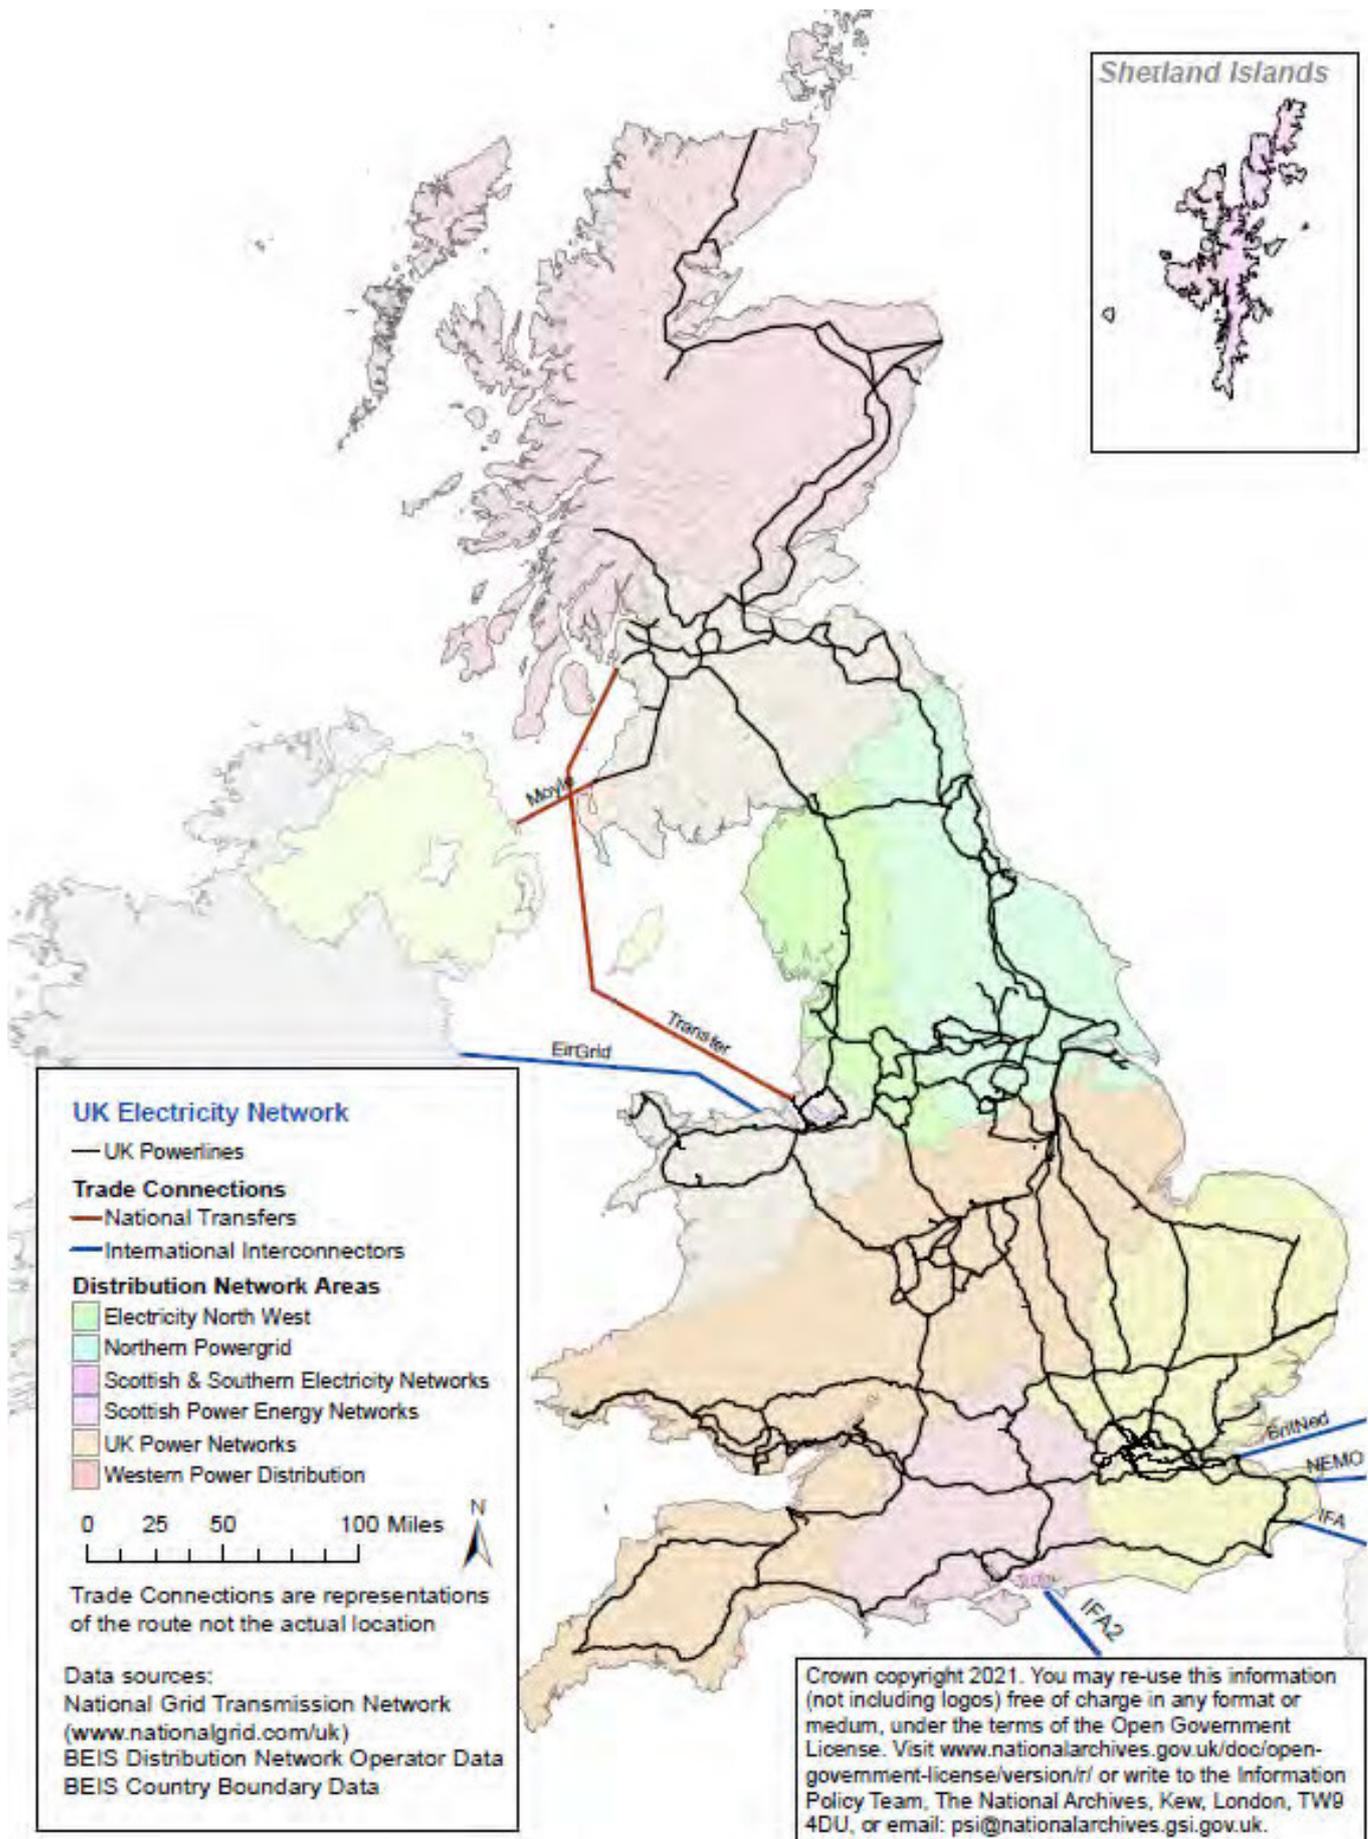

<sup>4</sup> 7<sup>th</sup> January 2021 in the half hour ending 17:00

<sup>5</sup> It was announced in June 2021 that Dungeness B would begin defueling prior to closure. It has not generated since 2018, so has been excluded from the 2020 capacity tables.

## Map of Major Power Producers in the UK (operational May 2021)

# UK Distribution Network Operating Areas and GB Power Lines Map

# Chapter 6: Renewable sources of energy

Liz Waters 0300 068 5735 [renewablesstatistics@beis.gov.uk](mailto:renewablesstatistics@beis.gov.uk)

## Key headlines

**The proportion of renewable generation outstripped fossil fuels for the first time in 2020 as a result record renewable generation.** Renewable electricity now represents 43.1 per cent of total generation, up from 36.9 per cent in 2019.

**Growth in new renewable capacity continued to slow with just 1.0 GW added in 2020, the lowest since 2007.** Covid-19 restrictions are likely to have contributed to the slowdown in growth in 2020 but at just 2.1 per cent, this is the slowest growth rate since 2002.

**Renewable generation increased by 15.1 TWh (13 per cent), 11.6 TWh of which can be attributed to wind generation** (2.9 TWh onshore, and 8.7 TWh offshore). Despite the modest increase in capacity, favourable weather conditions (notably the exceptionally high wind speeds during storms Ciara and Dennis in the first quarter of 2020) contributed to the increase in wind generation.

**Total renewable fuel use increased by 1.6 mtoe (6.8 per cent);** as renewable fuel use continues to be dominated by those used for electricity generation (74 per cent), almost two thirds of the increase can be attributed to the increase in wind generation. **Renewable heat increased by 0.3 mtoe (6.3 per cent) and grid injected biogas increased by 9.0 per cent, though from a relatively low base (0.5 mtoe).**

The renewable energy flow chart overleaf summarises the flows of renewables from fuel inputs through to consumption for 2019 and includes energy lost in conversion. The data are sourced from the commodity balance Table 6.1 and Table 6.4 for electricity outputs.

It also shows net imports for those renewable fuels which are transportable; utilising natural resources such as wind, solar and hydro are localised in nature resulting in a high proportion of domestically produced renewable sources which in 2020, represented approximately 80 per cent of renewable demand. Excluding primary generation and biogases, net imports represent around half of the demand, the majority of which is wood pellets used in electricity generation.

Renewable energy flow chart (Tables 6.1 and 6.4)

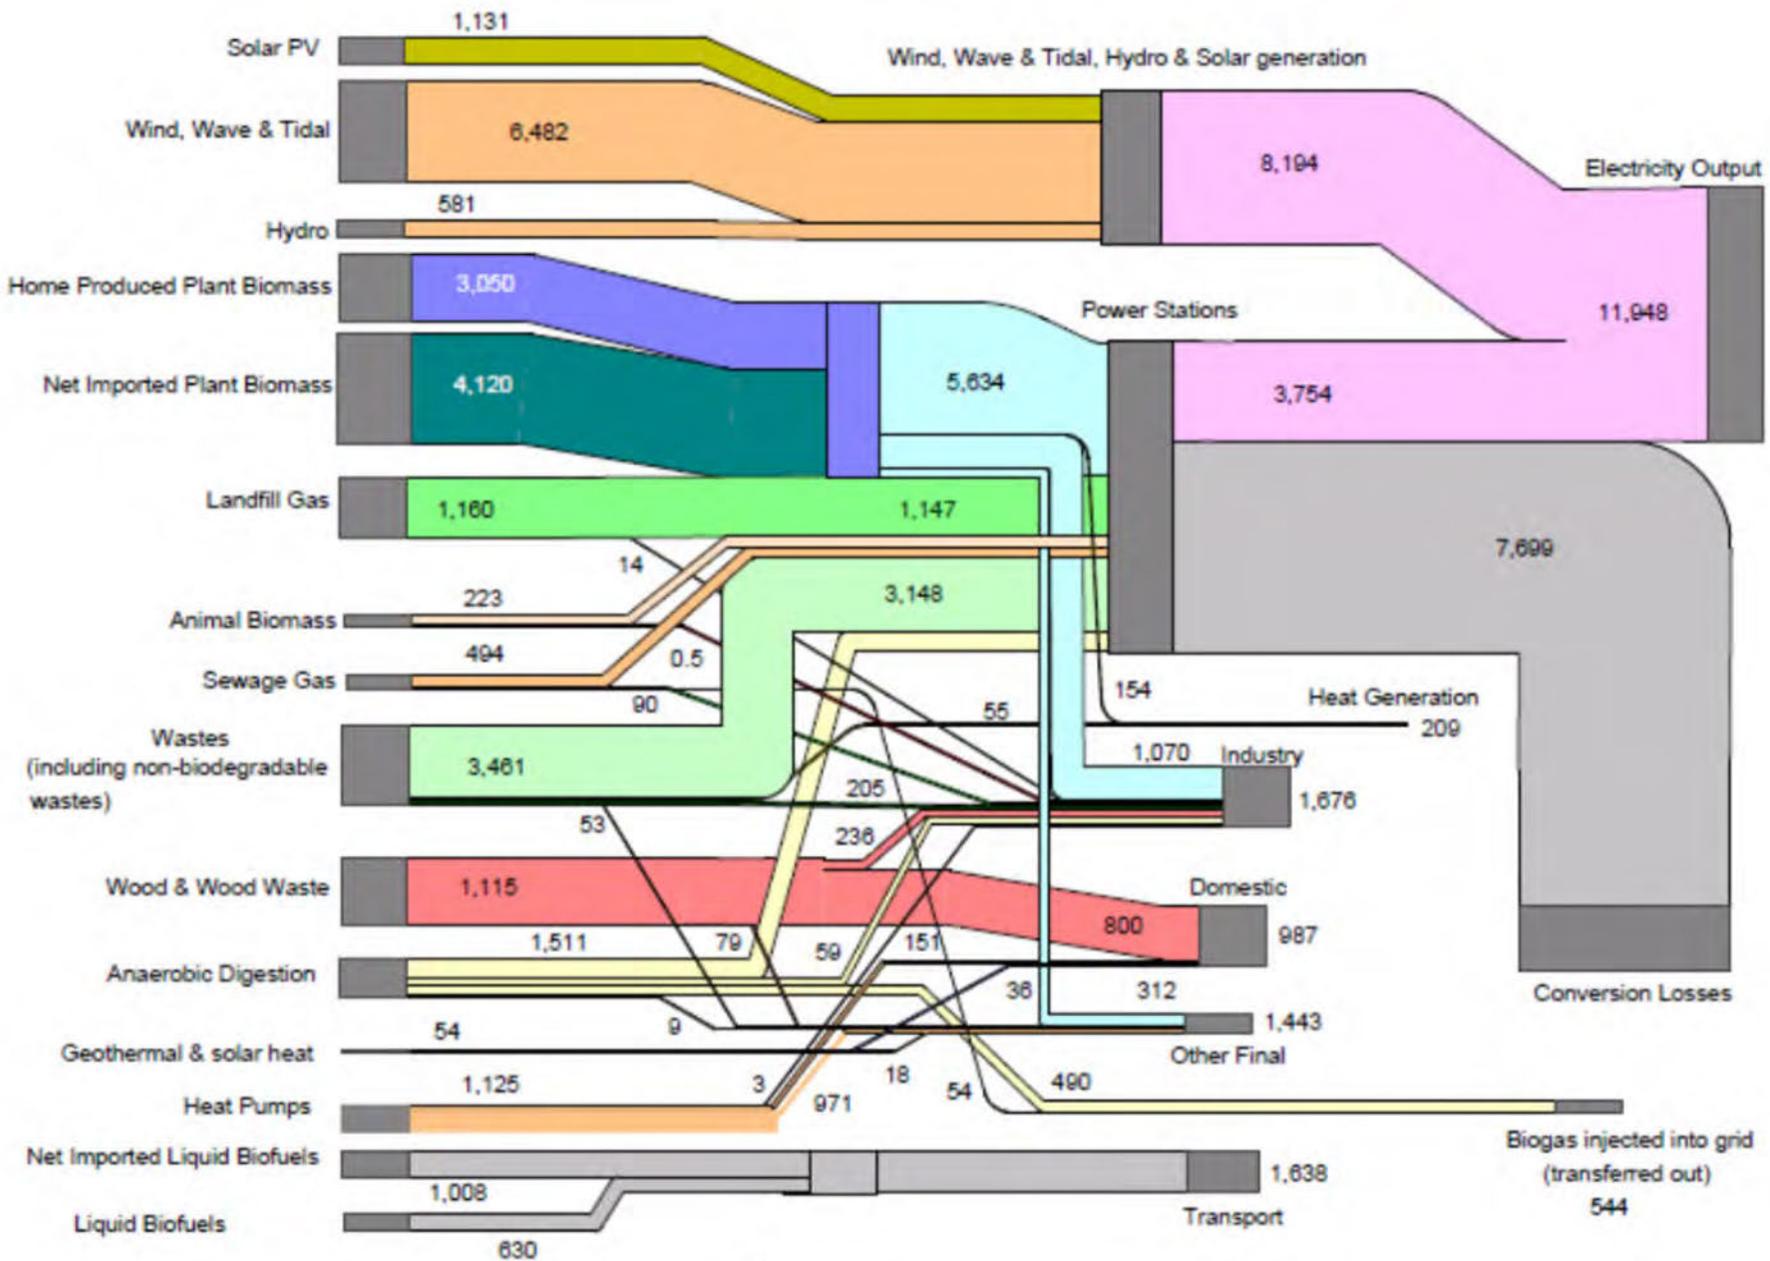

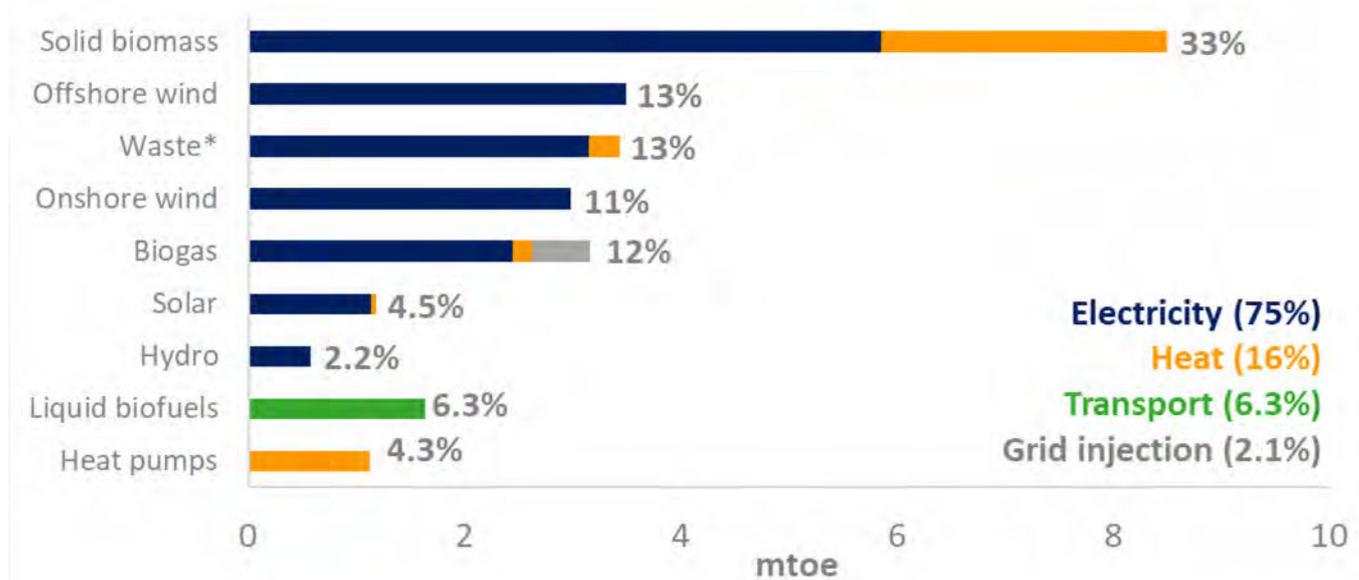

Chart 6.1 shows each of the renewable fuels and the end use of these fuels be that for electricity, heat, transport, or injection of biogas into the national grid.

**Chart 6.1 Use of renewable fuels, 2020 (Table 6.6)**

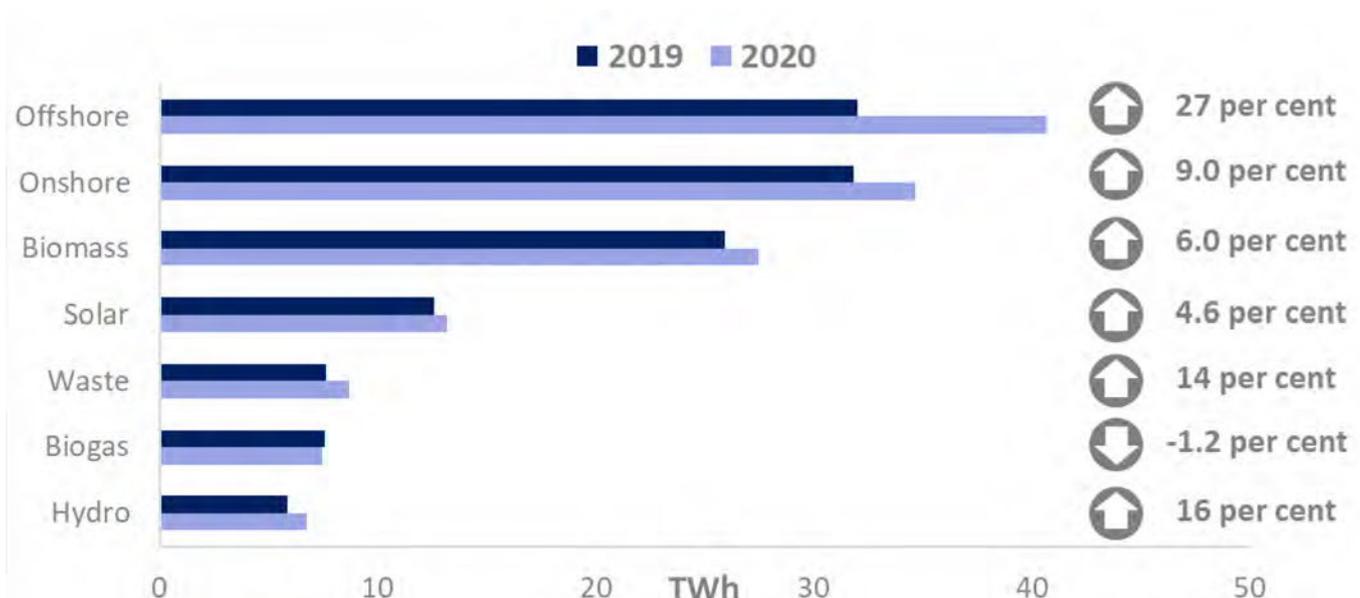

\*Including non biodegradable waste

Solid biomass, including wood, waste wood, animal and plant biomass, represented 33 per cent of total renewable demand in 2020 with approximately two thirds being used in electricity generation and the remaining third to produce heat. Biogas (landfill and sewage gas, and anaerobic digestion) has historically been used in generation and heat but has more recently been injected into the gas grid. Over three quarters, however, is still being used for electricity generation with 17 per cent being injected into the grid (up from 11 per cent in 2016, the first year data became available).

Although solid biomass accounts for the largest share of renewable fuel, on an output basis (i.e. generation after conversion losses in thermal generation), offshore and onshore wind show a higher share at 29 per cent and 25 per cent respectively in 2020. Chart 6.2 shows the change in generation between 2019 and 2020. With low-capacity growth in 2020 generally, some weather dependent renewable sources showed higher growth rates compared to thermal generation due to favourable wind speeds and rainfall.

**Chart 6.2 Growth in generation by fuel 2019 – 2020 (Table 6.4)**

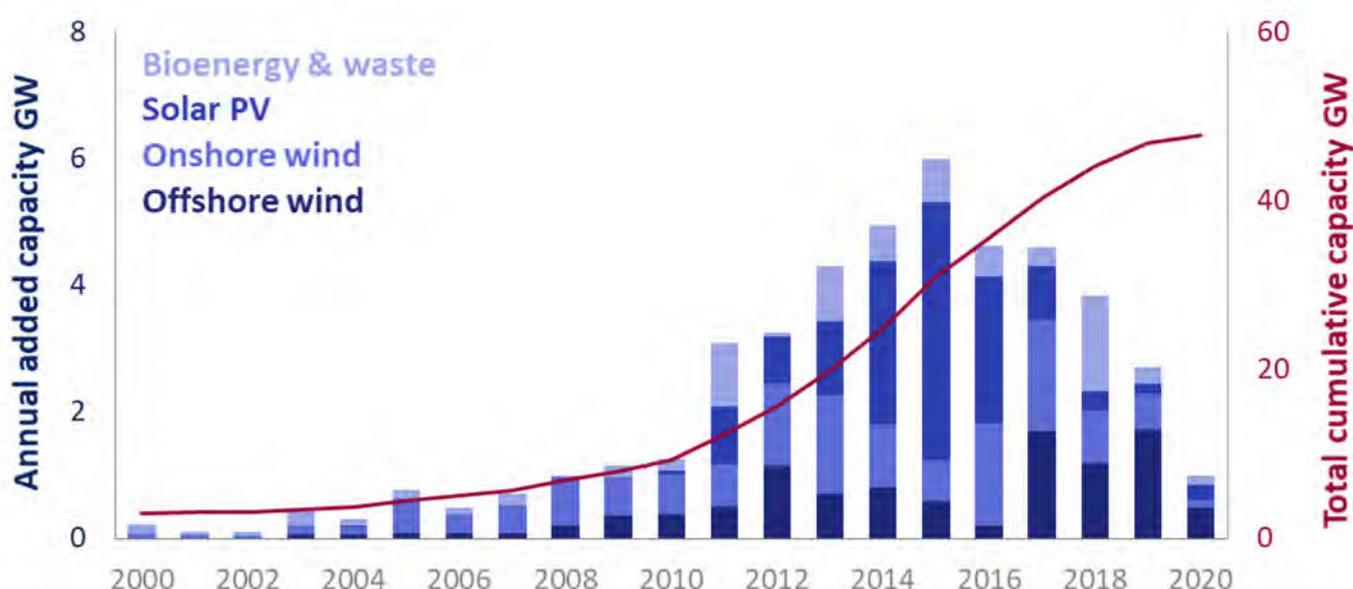

**Offshore wind generation showed the highest increase in both absolute and percentage growth terms (by 8.7 TWh or 27 percent)**, with onshore also growing strongly (by 2.9 TWh, or 9.0 per cent). Although offshore wind did see some added capacity during 2020 (0.5 GW, or 5.0 per cent), the dominant effect on wind generation was the exceptionally high windspeeds particularly during the first quarter when Storms Ciara and Dennis hit the UK.

**Generation from hydro also increased in 2020, by 0.9 TWh to 6.8 TWh**, a 16 per cent rise. Installed capacity for hydro is stable and the additional growth was due to higher levels of rainfall compared to 2019. Energy from waste plants increased their capacity in 2020 which provided an additional 0.5 TWh in generation (1.1 TWh including non-biodegradable waste).

**Only biogas saw a reduction in generation** due to falling extraction rates at landfill gas sites, generation reached a peak in 2011 and has fallen by 34 per cent since then to 3.5 TWh.

Chart 6.3 shows the growth in new capacity over time. **New capacity reached a peak in 2015** when a total of 6.0 GW was installed, 4.1 GW of which was in solar PV. In 2020, just 1.0 GW was installed though some projects may have been deferred due to Covid-19 restrictions. Chart 6.3 shows new capacity in the year of installation by technology compared to the cumulative total capacity.

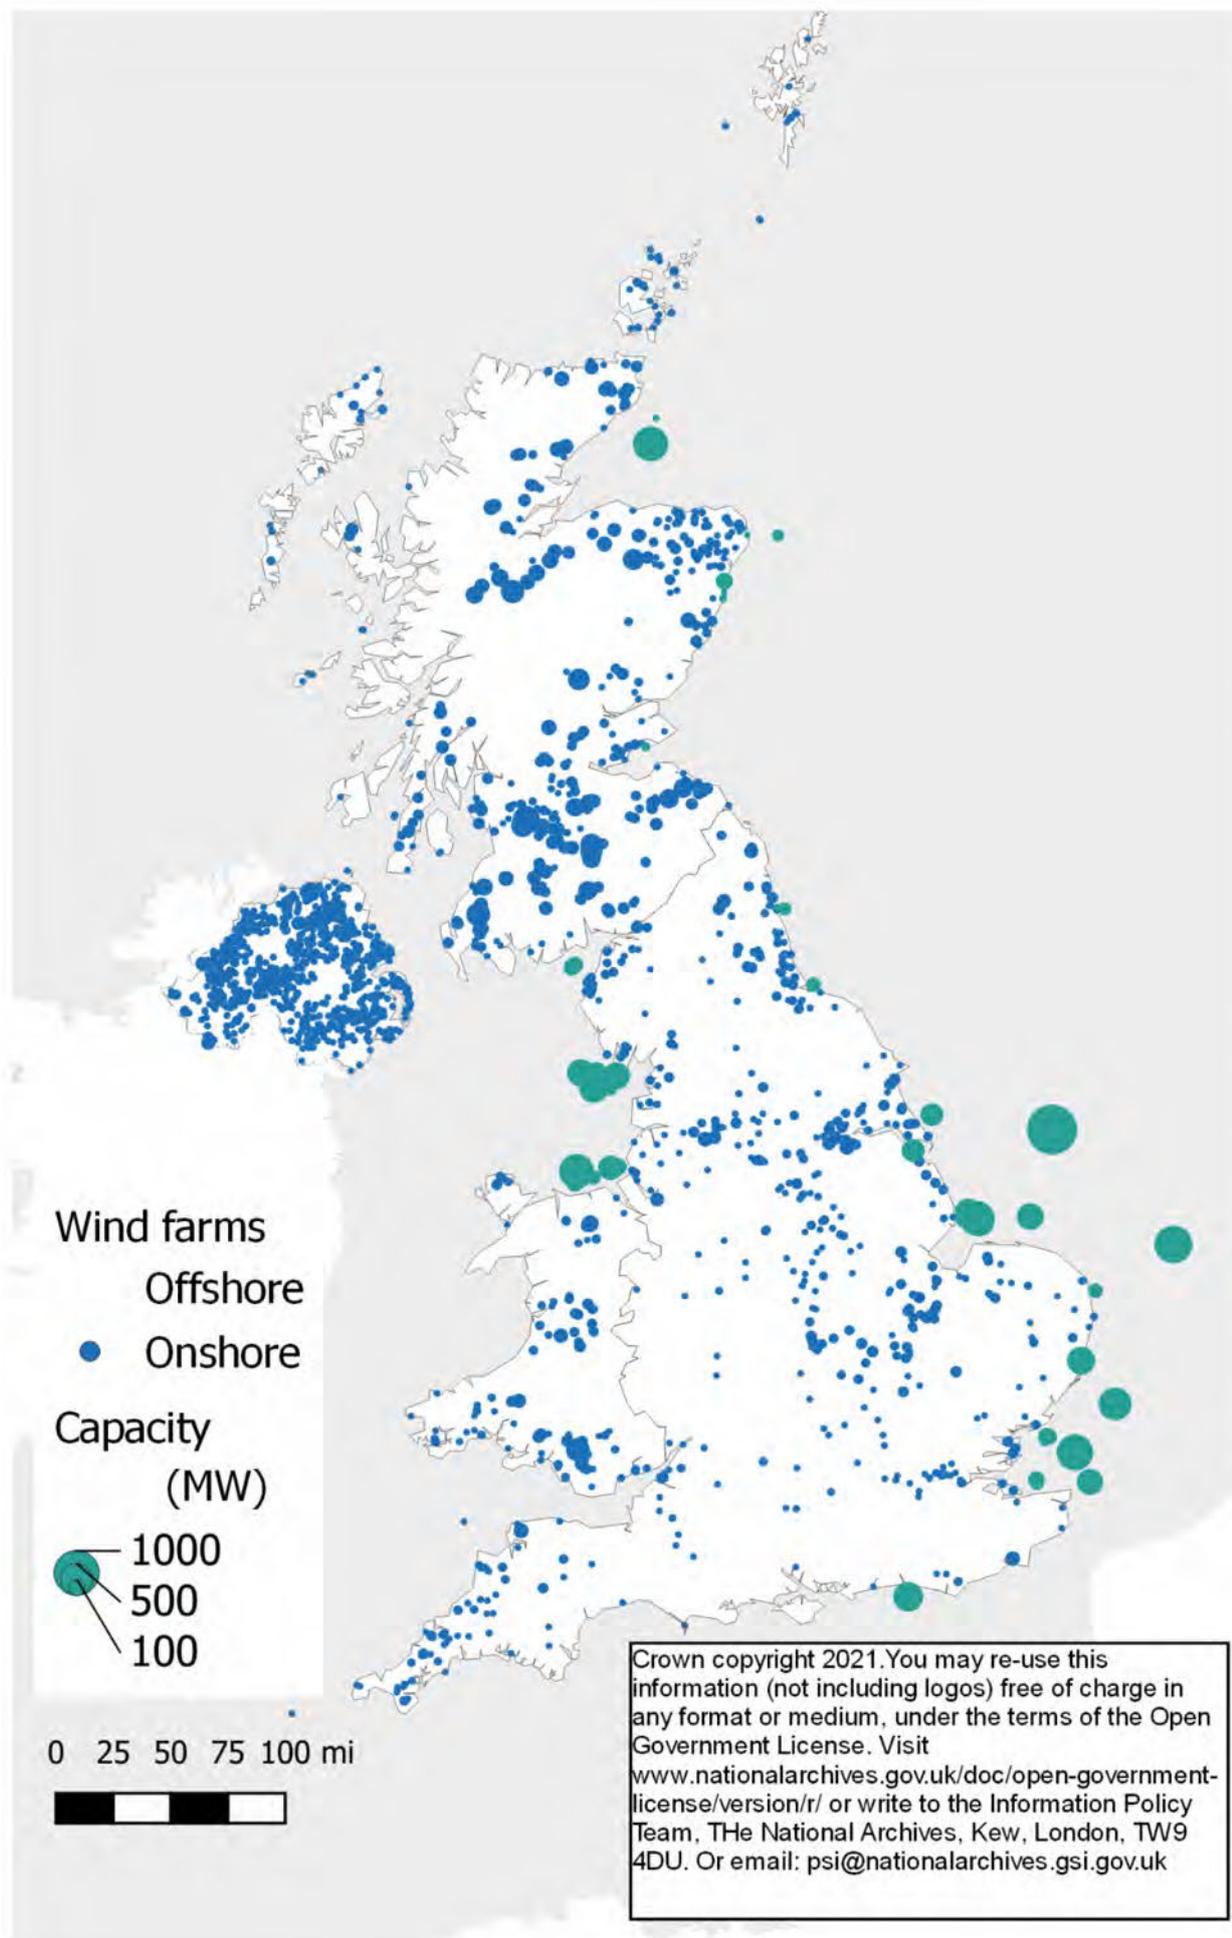

**Chart 6.3 Annual added capacity 2000 to 2020 (Table 6.4)**

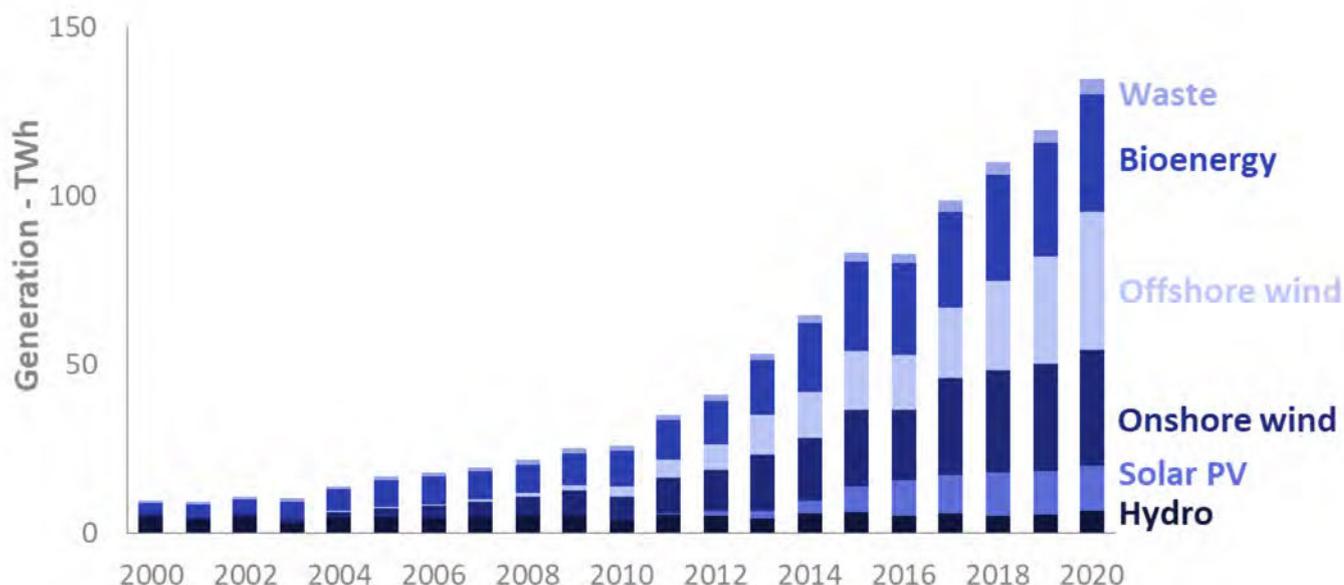

Prior to 2011, solar PV capacity formed a very small part of the renewable energy mix representing just 1.0 per cent of total capacity. However, since then and up until 2017, it increased significantly with capacity added during those years accounting for 87 per cent of the current installed capacity. Although growth has slowed since 2017, solar PV's share of the renewable mix stands at 28 per cent in 2020. Growth in new wind sites has been more stable particularly onshore wind, though it has slowed markedly over recent years with just 0.1 GW added in 2020, an increase less than one per cent. Offshore wind has seen higher levels of new capacity in recent years with almost half being installed since 2016. Wind now represents over half total installed capacity (see wind map on next page showing location by capacity band).

Despite the slowdown in new capacity, the overall picture of increasing generation since 2000 remains positive with new records regularly being set including total generation in 2020 which at 134.6 TWh was 13 per cent higher than in 2019. Chart 6.4 shows how each technology has contributed to this strong growth.

## Map of UK wind capacity 2020

**Chart 6.4 Trends in generation by technology 2000 to 2020** ([Table 6.4](#))

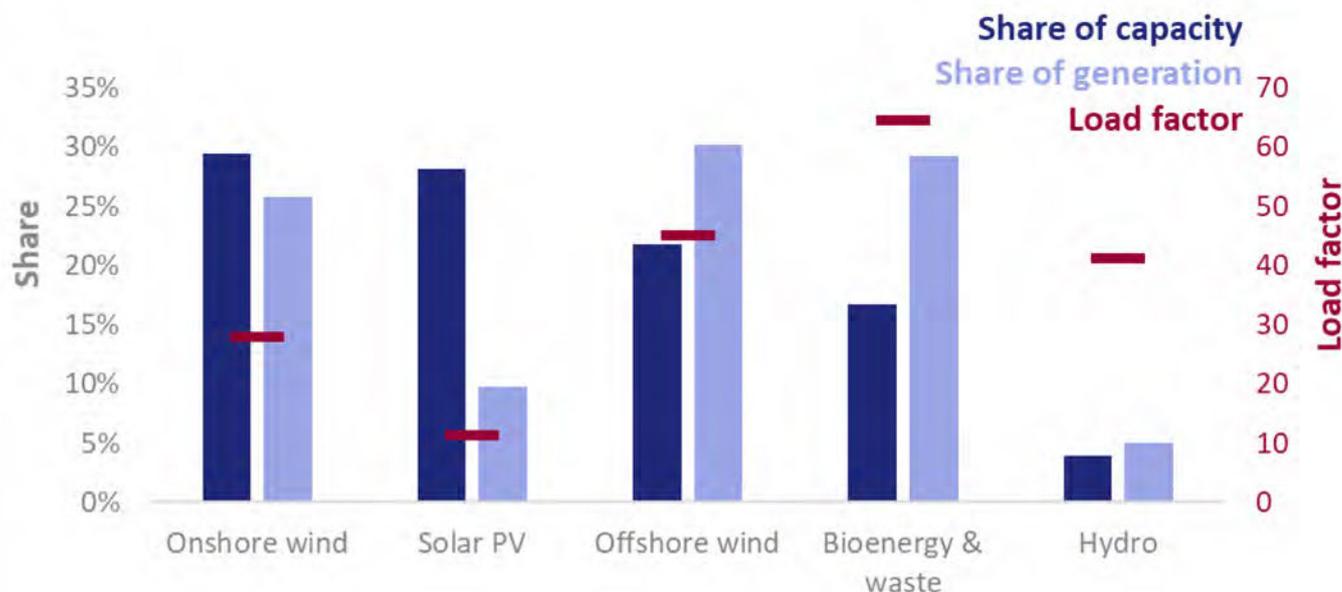

Hydro is a mature technology and generation tends to fluctuate from year to year in line with rainfall. In contrast, solar PV generation only started proliferating from 2012 reflecting the surge in new capacity incentivised via the Feed in Tariff (FiT) support scheme, increasing its share of renewable generation from 3.3 per cent in 2012 to 9.8 per cent in 2020.

Bioenergy saw rapid growth in the years from 2012 as several large power stations converted from coal to plant biomass. Generation from biogas had been fairly stable initially with some generation from landfill and sewage gas plants but as extraction rates have declined at landfill sites, increasing amounts of anaerobic digestion have offset this decrease.

Technologies with a high share of capacity do not necessarily have the highest share of generation because generation is dependent on the load factor. Load factors are the ratio of how much electricity was generated as a proportion of the total generating capacity. Within renewables, load factors can be heavily influenced by weather conditions, wind speeds on wind load factors, sun hours for the load factor for solar PV and, to a lesser extent, rainfall on load factor for hydro. Chart 6.5 compares the key technologies' share of capacity and generation alongside the load factor for 2020.

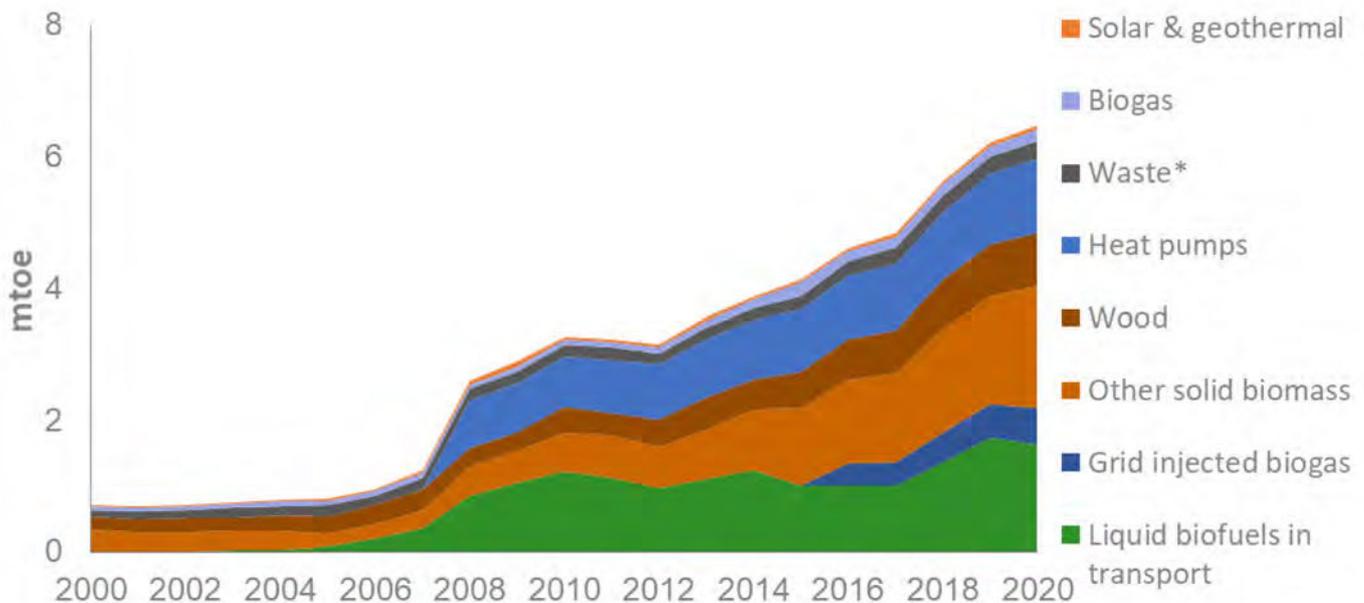

**Chart 6.5 Relative share of capacity and generation and load factors 2000** ([Table 6.5](#))

Thermal generation such as bioenergy and waste tend to have high load factors as indicated by the relatively high share of generation compared to capacity. Conversely, solar PV has a very low load factor due to limited hours of sunlight.

In 2020, the load factor for overall renewables was the highest ever reported. On an unchanged configuration basis, where only sites operating for the full year are included, the load factor was 41.6 per cent, the highest since 2008. Favourable weather conditions such as strong wind speeds and high rainfall contributed to the increase, and potentially increasing efficiencies in thermal generation.

**Chart 6.6 Other renewable fuel uses; heat, transport, and grid injected biogas (Table 6.6)**

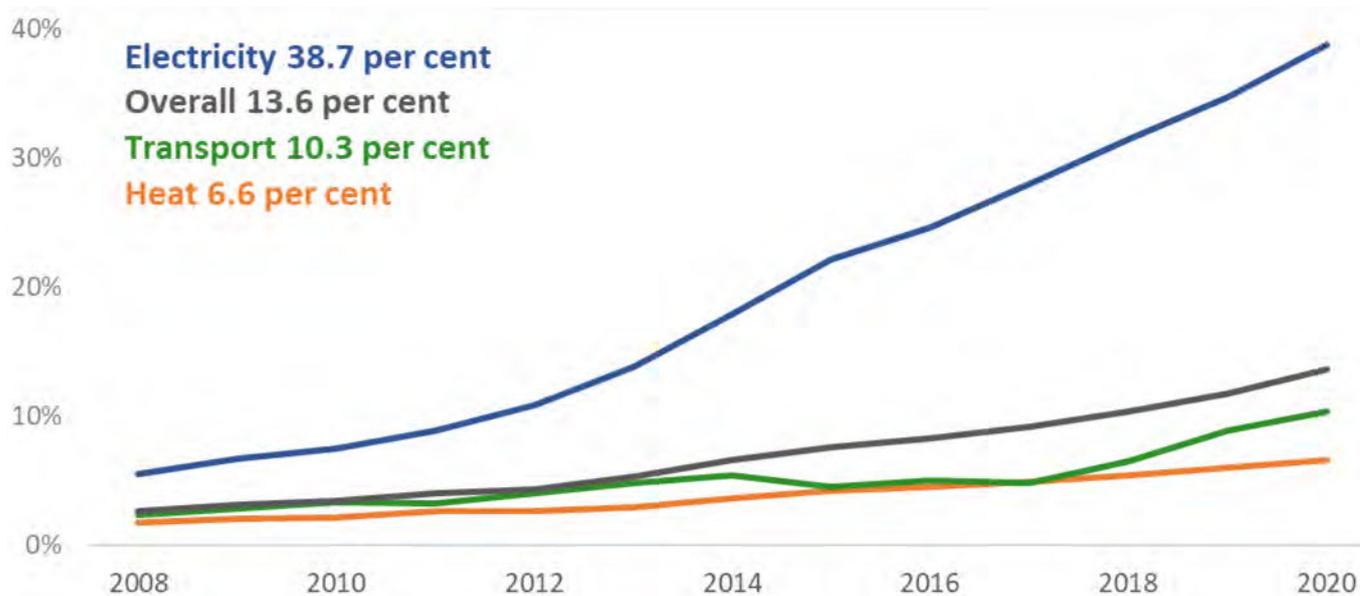

\*Including non biodegradable waste

Whilst electricity generation represents three quarters of renewable fuel demand, heat also accounts for a sizable proportion (16 per cent) with liquid biofuels (6.3 per cent) and of increasing importance, biogas injected into the grid (2.1 per cent). Between 2019 and 2020, renewable heat increased by 7.6 per cent with most of the increase in plant biomass though heat pumps also increased by 4.1 per cent with new installations.

Liquid biofuel in transport fell in 2020 by 5.6 per cent. Liquid biofuels are blended with diesel and motor spirit and the drop in demand is due to markedly lower demand for transport fuels due restrictions arising from the Covid-19 pandemic.

Until 2016, only minimal amounts of biogas from anaerobic digestion sites were injecting into the grid; with support from the Renewable Heat Incentive, it is of increasing importance in the renewable energy mix increasing by 9.0 per cent in 2020. It also now includes some sewage gas being injected (still just representing 10 per cent but increasing at a higher rate than anaerobic digestion sites).

Chart 6.7 Renewable energy as a proportion of total final consumption ([Table 6.7](#))

Progress in the growth of renewable energy as a proportion of final consumption was separately monitored as part of a European Union Directive, the Renewable Energy Directive (RED). The RED set the UK a target to derive 15 per cent of total energy consumption by 2020 from renewable sources. The overall target covered electricity<sup>6</sup>, heat<sup>7</sup>, and transport, there was a separate target for transport to derive 10 per cent from renewable sources, including liquid biofuels and renewable electricity. The final outcome for the RED was **13.6 per cent against the 15 per cent overall target and 10.3 per cent for transport, an 11 percentage point increase since 2008.**

<sup>6</sup> The proportion of renewable electricity using RED methodology was 38.7 per cent, lower than the 43.1 per cent referenced in the key points section. This is due to the 'normalised' methodology in the RED, whereby wind generation is calculated using an average of the load factors.

<sup>7</sup> Domestic wood consumption has been revised downwards following new estimates arising from a Defra study on domestic consumption. This resulted in a change from 2,241 ktoe to 733 ktoe in the 2018 reference year which has been applied to the time series to 2008. The heat pump series has also been back corrected to 2008, removing a previous step change in 2015. The methodology note ([link](#)) provides further detail.

# Chapter 7: Combined Heat and Power (CHP)

Liz Waters 0300 068 5735

[elizabeth.waters@beis.gov.uk](mailto:elizabeth.waters@beis.gov.uk)

## Key headlines

In 2020, there were 2,659 CHP sites, 81 more than in 2019. This represented an additional 50 MW of electrical capacity, a 0.8 per cent increase.

CHP qualifying output represented 7.7 per cent of total electricity generation, a 0.4 percentage point increase on 2019.

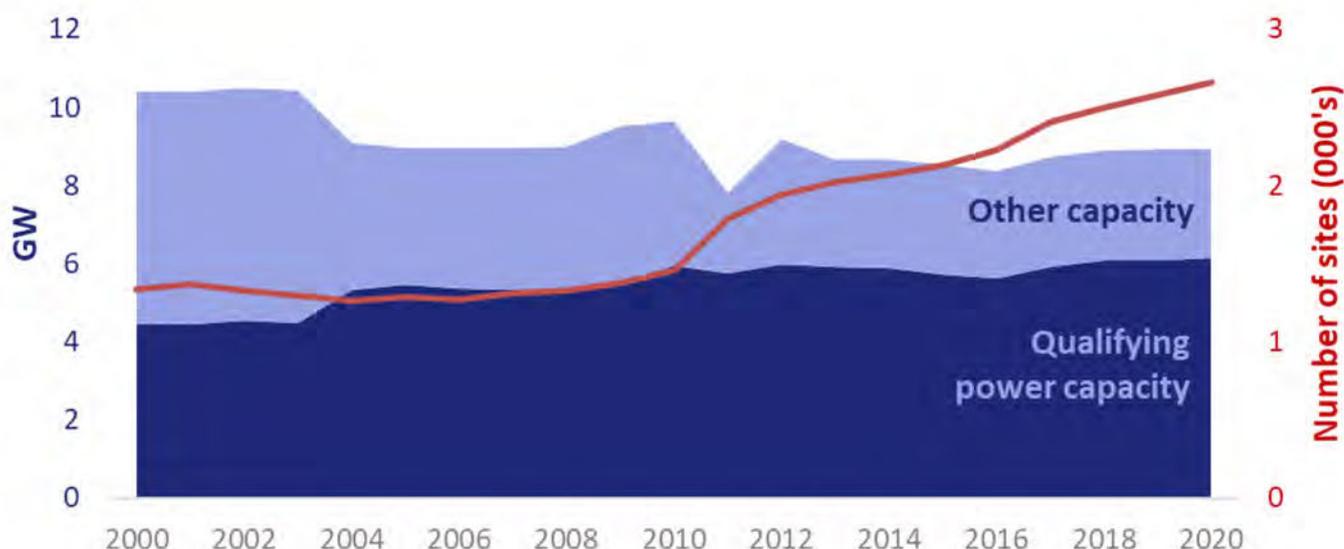

Gas continues to be the main fuel consumed in CHP plants (almost three quarters of fuel input), representing 8.5 per cent of gas demand.

In 2020, renewable fuel accounted for 15 per cent of total CHP fuel, similar to 2019.

Emissions savings from cogeneration (compared to generating electricity and heat separately) was 9.66 MtCO<sub>2</sub> in 2020 compared to all fossil fuels, 3.14 MtCO<sub>2</sub> when including renewables and nuclear.

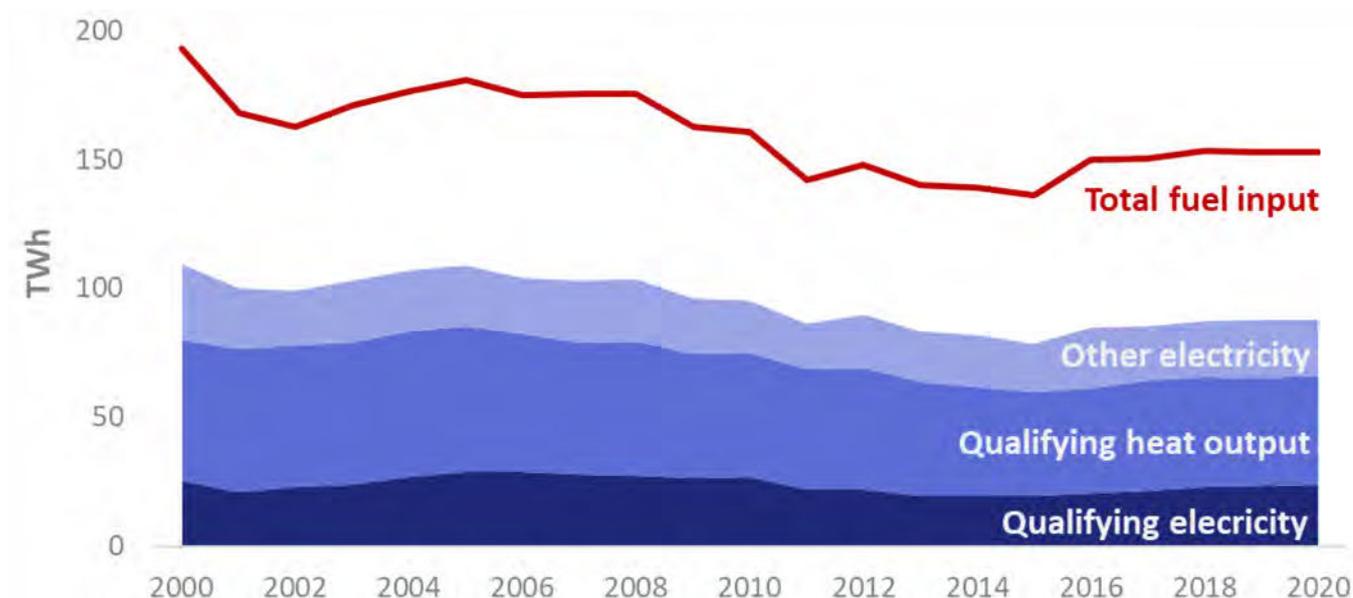

CHP, sometimes referred to as cogeneration, is the simultaneous generation of electricity and heat resulting in improved efficiencies when compared to meeting electricity and heat demands separately. The data for this section is primarily collected in support of the CHP Quality Assurance programme (CHPQA) but is supplemented with other sources to provide as comprehensive a picture as possible for UK CHP statistics. The CHPQA programme assesses and certifies schemes eligible for various incentives; not all output from a scheme is eligible, but where it is, it is referred to as 'good quality', or qualifying. Chart 7.1 shows the qualifying and other (non-qualifying) capacity compared to the number of schemes.

Chart 7.1 Comparison of total and qualifying electrical capacity from 2000

Since 2000, the number of schemes has almost doubled and although total capacity has fallen by 14 per cent, qualifying capacity has increased by 38 per cent resulting in its share increasing from 43 per cent in 2000 to 69 per cent in 2020. Chart 7.2 shows CHP outputs qualifying and non-qualifying compared to total fuel input.

**Chart 7.2 Comparison of total fuel and CHP outputs from 2000**

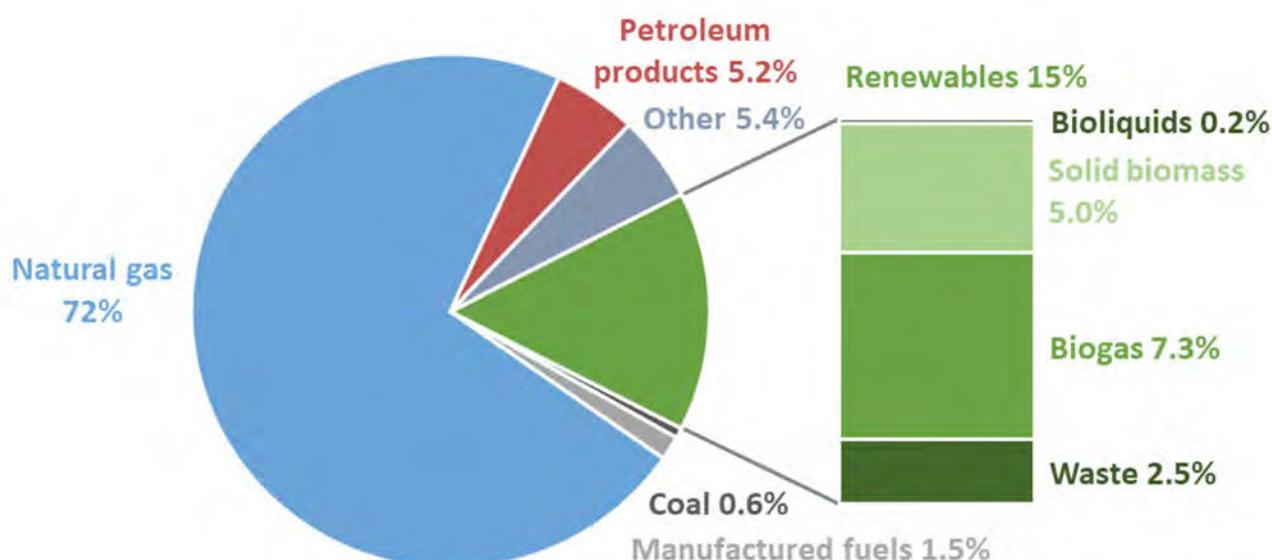

In 2020, three quarters of CHP outputs were deemed to be qualifying, around two thirds of which was heat. Although not a perfect relationship, CHP outputs tend to be driven by the underlying difference between the price of gas and electricity, the spark gap; the larger the gap, the cheaper gas is relative to electricity which makes cogeneration more economically viable. This explains the decline from 2006 to 2015 and the subsequent turnaround following a widening of the spark gap in 2013.

**The efficiency of CHP schemes in 2020 is estimated at 69.1 per cent** for qualifying electricity and heat. This compares with 48.5 per cent when taking into account qualifying electricity only; although this estimate relies on a notional methodology for allocating CHP fuel to heat and electricity, it is in line with the overall electricity efficiency for combined cycle gas turbines ([Table 5.10](#)), the leading CHP technology accounting for half of all schemes.

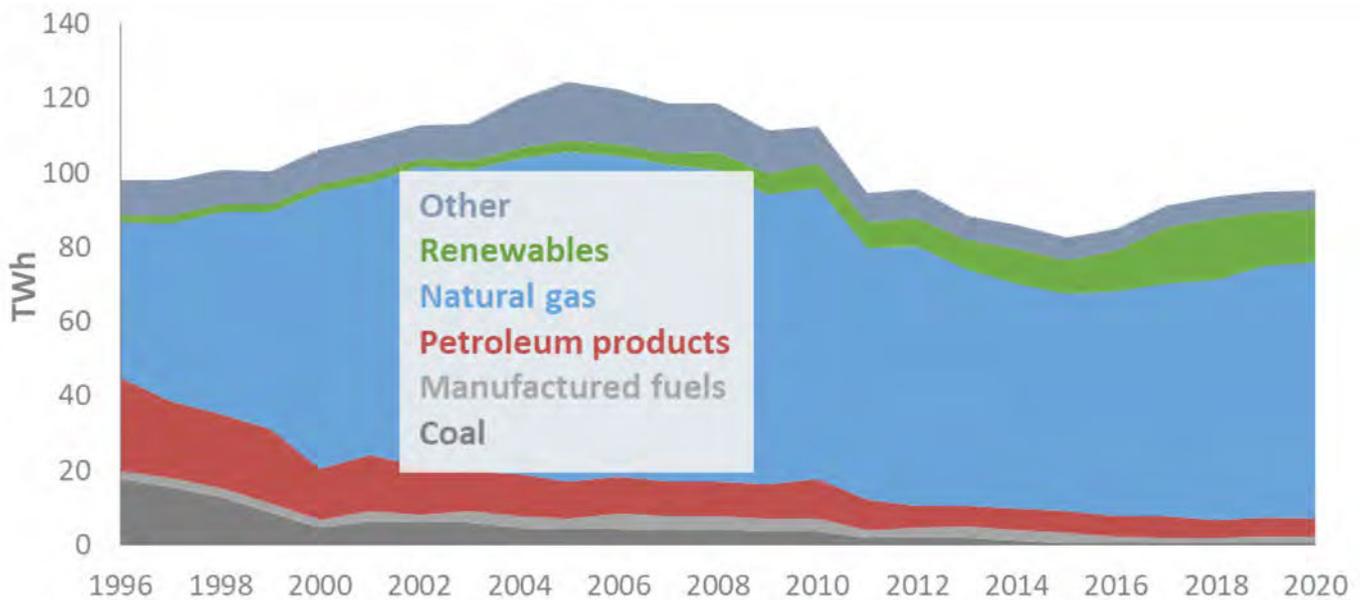

**Gas remains the main fuel consumed by CHP schemes representing 72 per cent of the total in 2020**, with renewables accounting for the next highest share at 15 per cent. Fossil fuels other than gas now account for just 7.5 per cent.

**Chart 7.3 Fuel mix in 2020 ([Tables 7.2 and 7.9](#))**

Over the longer term, the fuel mix has changed little since 2000 following rapid changes between 1996 (the first year data became available) and 2000. Chart 7.4 shows this long-term trend with the increasing share of natural gas evident alongside the falling use of coal.

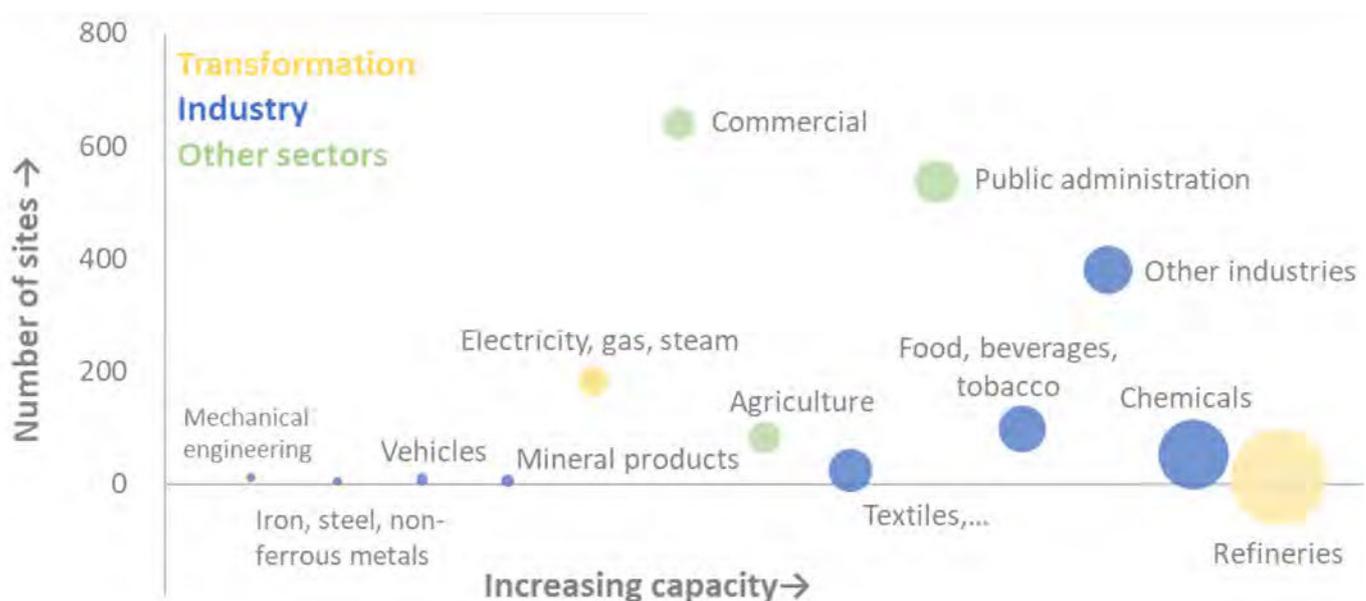

**Chart 7.4 Trends in fuel demand for CHP 1996 to 2020** ([Table 7.9](#))

In 1996, natural gas' share was just 49 per cent. By 2000, it had risen to 70 per cent and has remained fairly consistent since. Conversely, coal and manufactured fuels' share represented 20 per cent in 1996 but had plummeted to 6.3 per cent by 2020. Use of renewables was fairly constant at around 2 per cent until as recently as 2008 but has steadily increased to a maximum of 2018 at 18 per cent, though it has fallen off slightly to 15 per cent in 2020.

CHP is deployed across a variety of sectors including power generation, refineries, industry and commercial. Chart 7.5 shows the relationship between capacity by sector and the number of schemes.

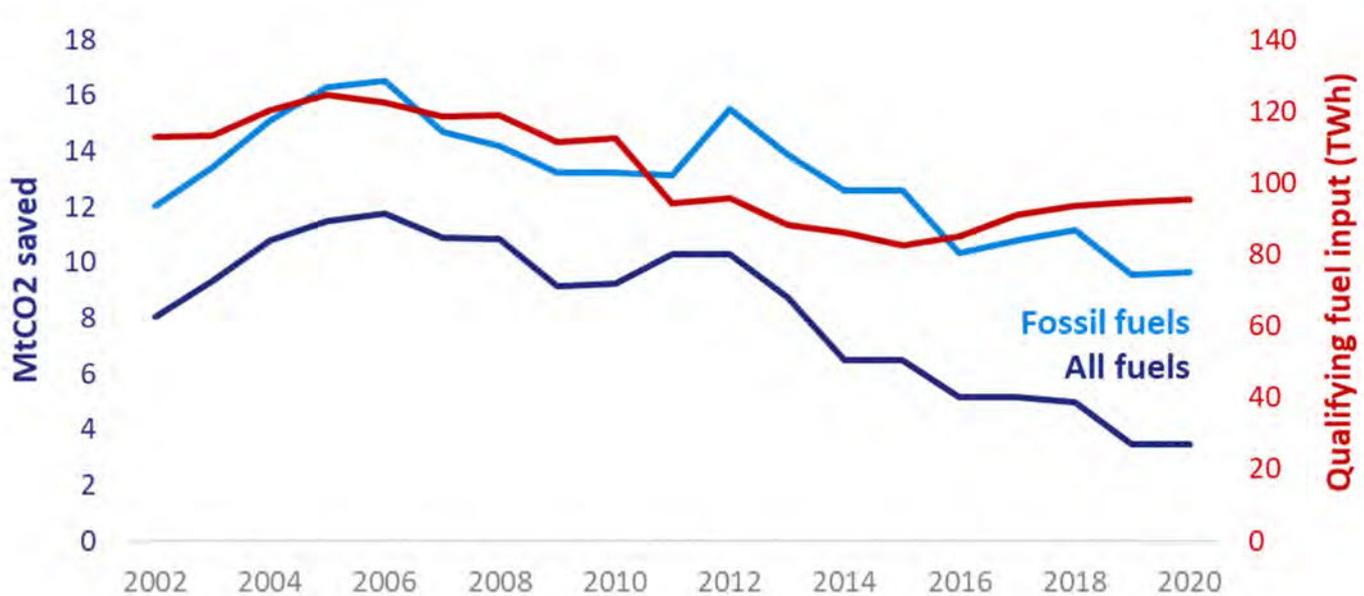

**Chart 7.5 CHP capacity and proliferation by sector** ([Table 7.8 \(b\)](#))

Although refineries account for the largest share of capacity, 36 per cent, it represents just 0.6 per cent of the number of sites. In contrast, the commercial sector has 31 per cent of the sites but accounts for just 3.8 per cent of the capacity.

The efficiency gains through cogeneration offer emissions savings, the key driver behind government support for CHP. An estimate of these savings is shown in Table 7.11, a new table included this year to show a longer time series. Total emissions from CHP are dependent on the fuel consumed by schemes but the emissions saved are additionally dependent on the fuel mix of the electricity displaced, i.e., the carbon intensity of the grid which is falling due to the increasing proportions of primary nuclear and renewables from wind, solar, and hydro. As CHP is mostly thermal generation, a comparison is also made with fossil fuels only.

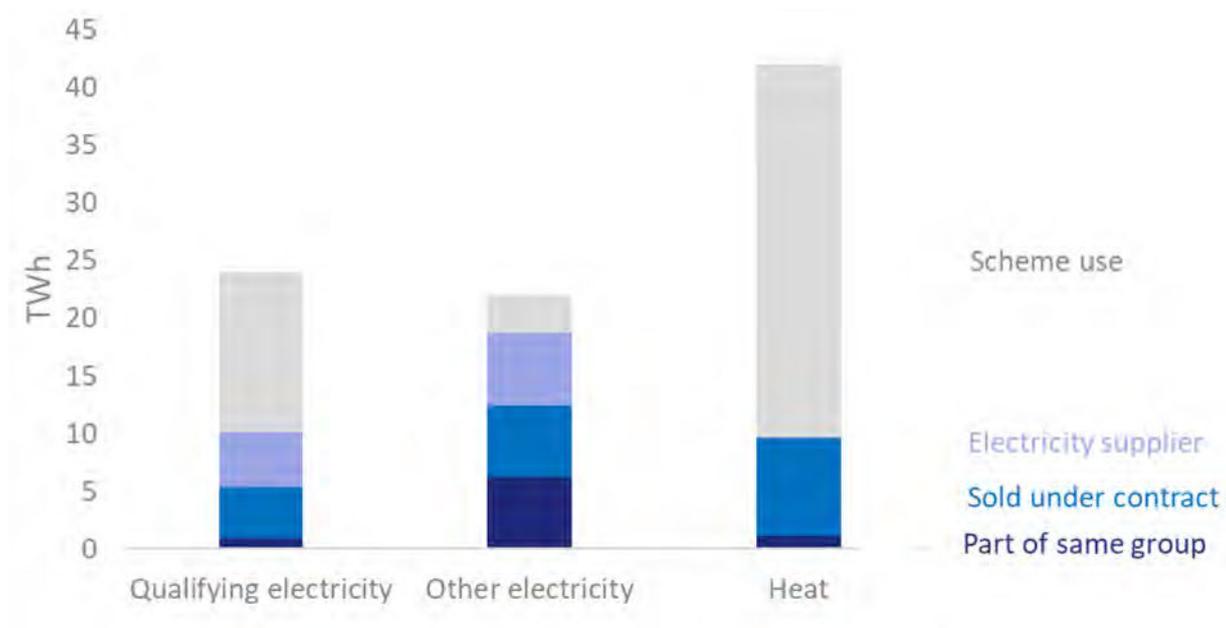

**Chart 7.6 Emissions saved through qualifying CHP 2002-2020**

Carbon savings for CHP are falling in line with the carbon intensity of the grid overall though when considering fossil fuels only, the trend is more stable with fluctuations year on year rather than a definite trend.

**In 2020, 30 per cent of qualifying outputs (heat and electricity) were exported** with the remaining 70 per cent being used within the scheme. Exports are classified as being either exported to a consumer within the same qualifying group of companies, to an electricity supplier, or sold under contract (i.e. to a consumer not part of the same group). Chart 7.7 shows a comparison for exports compared to own use by heat, qualifying and other electricity generation.

**Chart 7.7 CHP exports and own use 2020**

Less than half of qualifying electricity is exported (42 per cent) with the majority being split between power suppliers and sold under contract. Other generation, however, is mostly exported (85 per cent) with exports fairly evenly distributed across the output sectors. Heat is mostly consumed within the CHP scheme but of the heat which is exported, the majority is sold under contract (this heat is reported under the 'heat sold' column in [DUKES Table 1.1](#)).

# Data tables in this release

## Chapter 1 Energy

- 1.1-1.3 Aggregate energy balance
- 1.4-1.6 Value balance of traded energy
- 1.7 Sales of electricity and gas by sector

### **Total energy long term trends**

- 1.1.1 Inland consumption of primary fuels and equivalents for energy use
- 1.1.2 Availability and consumption of primary fuels and equivalents (energy supplied basis)
- 1.1.3 Comparison of net imports of fuel with total consumption of primary fuels and equivalents
- 1.1.4 Primary energy consumption, gross domestic product, and the energy ratio
- 1.1.5 Energy consumption by final user (energy supplied basis)
- 1.1.6 Expenditure on energy by final user
- 1.1.7 Mean air temperatures (deviations)
- 1.1.8 Mean heating degree days
- 1.1.9 Mean air temperatures (averages)

## Chapter 2 Solid fuels and derived gases

- 2.1-2.3 Coal: Commodity balances
- 2.4 Supply and consumption of coal
- 2.5 Supply and consumption of coke oven coke, coke breeze, and other manufactured solid fuels
- 2.6 Supply and consumption of coke oven gas, blast furnace gas, benzole, and tars
- 2.7 Deep mines and surface mines in production, December 2020
- 2.8 Identified GB coal resource assessment, June 2021
- 2.9 Imports of coal, 2020

### **Solid fuels long term trends**

- 2.1.1 Coal production and stocks
- 2.1.2 Inland consumption of solid fuels

## Chapter 3 Petroleum

- 3.1 Primary oil: Commodity balances
- 3.2-3.4 Petroleum products: Commodity balances
- 3.5 Supply and disposal of petroleum
- 3.6 Additional information on inland deliveries of selected products
- 3.7 Stocks of crude oil and petroleum products at end of year
- 3.8 Additional information on inland deliveries for non-energy uses
- 3.9 Imports of crude oil and petroleum products by country of origin
- 3.10 Exports of crude oil and petroleum products by country of destination

### **Oil long term trends**

- 3.1.1 Crude oil and petroleum products: production, imports, and exports
- 3.1.2 Inland deliveries of petroleum

## Chapter 4 Natural gas

- 4.1 Commodity balances
- 4.2 Supply and consumption of natural gas and colliery methane
- 4.3 UK continental shelf and onshore natural gas production and supply
- 4.4 Gas storage sites and import/export facilities in the United Kingdom, November 2020
- 4.5 Natural gas imports and exports
- 4.6 Liquefied Natural Gas imports by terminal

### **Gas long term trends**

- 4.1.1 Natural gas and colliery methane production and consumption

## **Chapter 5 Electricity**

- 5.1 Commodity balances
- 5.2 Commodity balances, public distribution system and other generators
- 5.3 Fuel used in generation
- 5.4 Fuels consumed for electricity generation (autogeneration) by main industrial groups
- 5.5 Electricity supply, net electricity supplied, electricity available, electricity consumption, sales
- 5.6 Electricity fuel use, generation, and supply
- 5.7 Plant capacity – United Kingdom
- 5.8 Major Power Producers Plant capacity – England and Wales, Scotland, and Northern Ireland
- 5.9 Capacity of other generators
- 5.10 Plant loads, demand, and efficiency
- 5.11 Power stations in the United Kingdom, May 2021
- 5.12 Plant installed capacity, by connection - United Kingdom
- 5.13 Capacity, net imports and utilisation of interconnectors
- 5.14 Estimated carbon dioxide emissions from electricity supplied
- 5.15 CHP generation and capacity overview

### **Electricity long term trends**

- 5.1.1 Fuel input for electricity generation
- 5.1.2 Electricity supply, availability, and consumption
- 5.1.3 Electricity generated and supplied

## **Chapter 6 Renewable sources of energy**

- 6.1-6.3 Commodity balances
- 6.4 Capacity of, and electricity generated from, renewable sources
- 6.5 Load factors for renewable electricity generation
- 6.6 Renewable sources used to generate electricity and heat and for transport fuels
- 6.7 Renewable sources data used to indicate progress under the 2009 EU Renewable Energy Directive (measured using net calorific values)

### **Renewables long term trends**

- 6.1.1 Renewable sources used to generate electricity and heat; electricity generated from renewable sources

## **Chapter 7 Combined heat and power**

- 7.1 CHP installations by capacity and size range
- 7.2 Fuel used to generate electricity and heat in CHP installations
- 7.3 Fuel used by types of CHP installation
- 7.4 CHP - electricity generated by fuel and type of installation
- 7.5 CHP - electrical capacity by fuel and type of installation
- 7.6 CHP - heat generated by fuel and type of installation
- 7.7 CHP - heat capacity by fuel and type of installation
- 7.8 CHP capacity, output, and total fuel use by sector
- 7.9 CHP - use of fuels by sector
- 7.10 Large scale CHP schemes in the United Kingdom, December 2019
- 7.11 CHP – savings of carbon dioxide emissions

### **CHP long term trends**

- 7.1.1 Combined Heat and Power: capacity, generation, and fuel use
- 7.1.2 Combined Heat and Power: capacity and electricity generation by capacity band

## **Symbols used in data tables**

.. not available                    - nil or not separately available                    r revised since the previous edition

Individual entries in the tables are rounded independently and this can result in totals, which are different from the sum of their constituent items. Some of the data shown in this Digest may contain previously unpublished revisions and estimates of trade from HM Revenue and Customs and the Office for National Statistics. These data are included in Annex G.

# Annexes and annex tables

Full annex documents and tables can be found by visiting [the DUKES collection page](#).

## **Annex A: Energy and commodity balances, conversion factors, calorific values and density of fuels**

- A.1 Estimated average calorific values of fuels 2020
- A.2 Estimated average gross calorific values of fuels 1980, 1990, 2000, 2010 and 2018 to 2020
- A.3 Estimated average net calorific values of fuels, 1980, 1990, 2000, 2010 and 2018 to 2020
- A.4 Estimated average density of fuels 2002 to 2020

## **Annex B: Glossary and acronyms**

## **Annex C: Further sources of UK energy publications**

## **Annex D: Major events in the energy industry**

## **Annex E: Energy and the environment**

- E.1 Gas flared and vented by oil and gas fields and terminals

## **Annex F: Oil and gas resources**

- F.1 Crude oil and Natural Gas Liquids production
- F.2 Gas production
- F.3 Natural Gas Liquids net production
- F.4 Disposals of crude oil

## **Annex G: Foreign Trade**

- G.1 Imports and exports of fuels
- G.2 Imports and exports of solid fuels
- G.3 Imports and exports of crude oil and petroleum products
- G.4 Imports and exports of crude oil by country
- G.5 Physical imports and exports of gas
- G.6 Imports and exports of wood pellets and other wood
- G.7 Value of imports and exports of fuels

## **Annex H: Flow charts**

## **Annex I: Energy balance net calorific values**

- I.1 Aggregate energy balance: net calorific values, 2004 to 2020

## **Annex J: Heat reconciliation**

- J.1 Heat sold reallocation, 1999 to 2020

# Additional information

This section outlines the key principles when presenting energy statistics to help you understand the balance data tables. More information can be found in Annex A: Energy and commodity balances, conversion factors, calorific values and density of fuels. Annex B contains a glossary, which provides definitions of technical terms used. Annexes A and B can be accessed from [the main DUKES page](#).

## Balance principles

Balances are divided into two types, each of which performs a different function:

1. Commodity balance - a balance for each energy type that uses specific measurement units usually associated with that commodity. It shows the flow of the commodity from its sources of supply through to its final use. Commodity balances are presented in the individual fuel chapters of this publication.
2. Energy balance - presents the commodity balances in a common unit and places them alongside one another in a manner that shows the dependence of the supply of one commodity on another. The energy balance format is used in Chapter 1.

Both types show the flow of the type of energy from its supply through to its final use. The following sections give an overview of the supply and demand flows shown in each type of balance.

## Supply to the energy balances

### Production

This covers indigenous production and generation or manufacture of energy using other energy sources as fuel (for example, heating water using gas to produce steam turbine electricity).

### Other sources

This covers sources that do not represent “new” supply. These may be recycled products, recovered fuels (slurry or waste coal), electricity from pumped storage plants, or transfers of ethane, propane, and butane from gas stabilisation plants at North Sea terminals.

### Imports and exports

These figures relate to energy moving into or out of the UK. Exported commodities are produced in the UK and imported commodities are for use within the UK. The figures thus exclude commodities that move into and out of HM Revenue and Customs bonded areas.

### Marine bunkers

These are deliveries of fuels (usually fuel oil or gas oil) to ships of any flag for consumption during their voyage to other countries.

### Stock changes

Additions to and withdrawals from stocks held by producers and transformation industries correspond to withdrawals from (- sign) and additions to supply (+ sign), respectively.

### Transfers

A movement of a fuel out of one type is shown with a negative sign, to indicate that it has been withdrawn from supply. The movement into the other fuel is shown as a positive. The transfers row would ideally sum to zero, but differences in calorific values can result in non-zero values. There are several reasons why quantities may be transferred from one commodity balance to another:

- a commodity may no longer meet the original specification and be reclassified.
- the name of the commodity may change through a change in use.
- to show quantities returned to supply from consumers. These may be by-products rather than fuels.

The total supply available for national use is obtained by summing these flows in the balance.

## Statistical differences

Any excess or shortfall in supply compared to demand is shown as a statistical difference. A negative figure indicates that demand exceeds supply. These arise because data has been gathered from a variety of independent sources and reflect differences in timing, in definition of activity or commodity. Differences also arise in the measurement of the flow of the commodity. A non-zero statistical difference is normal and, within reason, is preferable to a statistical difference of zero, which would suggest that a data provider has adjusted a figure to balance the account.

## Demand in the energy balances

The demand section is divided into demand for transformation, for use in the energy industries, and a section covering uses by final consumers.

### Transformation

This covers processes and activities that transform the original primary (and sometimes secondary) commodity into another type. Most transformation corresponds to an industry whose main business is to manufacture a particular type of energy such as electricity generators. Some activities produce another commodity as a by-product. All are included in the energy balances.

### Electricity generation

Quantities of fuels burned for the generation of electricity. The activity is divided into two parts, covering the major power producers (for whom the main business is the generation of electricity) and autogenerators (who produce electricity as a by-product of another process). Where a generator uses combined heat and power plant, the figures include only the part of the fuel use corresponding to the electricity generated.

### Heat generation

Quantities of fuel burned to generate heat that is sold under contract to a third party. This includes heat that is generated and sold by combined heat and power plants and by community heating schemes (also called district heating).

### Petroleum refineries

Crude oil, natural gas liquids and other oils needed by refineries for the manufacture of finished oil products.

### Coke manufacture and blast furnaces

Quantities of coal for coke ovens and all fuels used within blast furnaces. The consumption of fuels for heating coke ovens and the blast air for blast furnaces are shown under Energy industry use.

### Patent fuel manufacture

Coals and other solid fuels used for the manufacture of solid patent fuels.

### Other

Any minor transformation activities not specified elsewhere.

### Energy industry use

Consumption by both extraction and transformation industries to support the transformation process (but not for transformation itself). Typical examples are the consumption of electricity in power plants, or the use of extracted gases on oil and gas platforms.

### Losses

Intrinsic losses that occur during the transmission and distribution of electricity and gas (including manufactured gases). Other metering and accounting differences for gas and electricity are within the statistical difference, as are undeclared losses in other commodities.

## Final consumption

This covers consumption of commodities for energy and non-energy uses. The energy disappears from the account after use. Final consumption for energy purposes is divided into use by sector of economic activity. The classification of consumers according to their main business follows, as far as practicable, Standard Industrial Classification codes (SIC 2007). The section on Sector breakdowns below shows the breakdown of final consumers used, and how this corresponds to SIC codes 2007.

## Sector breakdowns

Categories for final consumption are defined by Standard Industrial Classification codes 2007:

Category of user	SIC 2007
Fuel producers	05-07, 09, 19, 24.46, 35
Iron and steel	24 (excluding 24.4, 24.53 and 24.54)
Other industry	08, 10-18, 20-23, 24.4 (excluding 24.46), 24.53, 24.54, 25-33, 36-39, 41-43
Transport	49-51
Agriculture	01-03
Commercial	45-47, 52-53, 55-56, 58-66, 68-75, 77-82
Public administration	84-88
Other services	90-99
Domestic	Not covered by SIC, defined as deliveries to residential properties

The qualifications to, and constraints on, use of the classification are described in [the energy balance methodology note](#).

# Technical information

## Methodology

More detailed notes on the methodology used to compile the figures and data sources are available on the collection pages for each fuel. The figures have not been adjusted for temperature or seasonal factors except where noted. Percentage changes relate to the corresponding period a year ago. They are calculated from unrounded figures. They are shown as (+) or (-) when very large. Figures relate to the United Kingdom unless otherwise indicated. Further information is available from the Oil & Gas Authority at [www.ogauthority.co.uk/](http://www.ogauthority.co.uk/).

## Standard conversion factors

This Digest uses the tonne of oil equivalent (toe) as the common unit of energy for comparing and aggregating fuels. The following table gives factors for converting between this unit and alternative units of energy found in this and other publications (see Chapter 1, Technical notes and definitions and Annex A).

To	Ktoe	TJ	GWh	million therms	To	toe	GJ	kWh	therms
From	Multiply by				From	Multiply by			
Ktoe	1	41.868	11.63	.39683	toe	1	41.868	11.63	396.83
TJ	.023885	1	.27778	.0094778	GJ	.023855	1	277.78	9.4778
GWh	.085985	3.6	1	.034121	kWh	.000085985	.003600	1	.034121
million therms	2.52	105.51	29.307	1	therms	.00252	.105510	29.307	1

toe = tonne of oil equivalent

ktoe = thousand tonne of oil equivalent

## A selection of estimated average gross calorific values for 2020 (see also Annex A)

Fuel category	GJ per tonne	Fuel category	GJ per tonne
Solid fuels		Renewable sources	
Coal		Domestic wood	16.3
All consumers (weighted average)	26.9	Industrial wood	20.3
Power stations (including imports; weighted average)	26.5	Municipal solid waste	9.9
Iron and steel	30.4	Petroleum	
Other industries (weighted average)	26.7	Crude oil (weighted average)	45.7
Imported coal (weighted average)	28.4	Petroleum products (weighted average)	46.2
Exported coal (weighted average)	28.0	Petrol	47.0
Coke	29.8	Gas/diesel oil	45.3
Coke breeze	29.8	Road diesel	45.6
Other manufactured solid fuel	29.6	Fuel oil	43.4
Gases			
Natural gas (produced)	39.9		
Landfill gas	21-25		
Sewage gas	21-25		

## Geographical coverage

The geographical coverage of the statistics is the United Kingdom. However, within UK trade statistics, shipments to the Channel Islands and the Isle of Man from the United Kingdom are not classed as exports. Supplies of solid fuel and petroleum to these islands, from the UK, are therefore included as part of United Kingdom inland consumption or deliveries.

## Revisions policy

Figures for the latest periods are provisional and are liable to subsequent revision. The [BEIS statistical revisions policy](#) sets out the revisions policy for these statistics, which has been developed in accordance with the UK Statistics Authority [Code of Practice for Statistics](#). BEIS's [statements of compliance with the Code](#) are available online, as well as the [UK Statistics Authority reports on their regular assessments of BEIS's energy statistics](#). The authority's recommendations have been incorporated into this publication and other BEIS energy statistical publications and outputs.

DUKES tables contain revisions to some of the previously published figures, and where practicable the revised data have been indicated by an 'r'. The 'r' marker is used whenever the figure has been revised from that published in the prior Digest, even though some figures may have already been amended on the published version of the tables. A table showing the size of revisions to key aggregates is shown below. Statistics on energy in this Digest are classified as National Statistics. This means that they are produced to high professional standards as set out in the UK Statistics Authority's Code of Practice for Official Statistics. The Code of Practice requires that all the public bodies that produce official statistics "Publish a revisions policy for those outputs that are subject to scheduled revisions, and provide a statement explaining the nature and extent of revisions at the same time that they are released". The following statement outlines the policy on revisions for energy statistics.

It is intended that any revisions should be made to previous years' data only at the time of the publication of the Digest. In exceptional circumstances previous years' data can be amended between Digest publication dates, but this will only take place when quarterly Energy Trends is published. The reasons for substantial revisions will be explained in the 'Highlights' sheet of the table concerned.

Valid reasons for revisions of Digest data include:

- Revised and validated data received from a data supplier.
- The figure in the Digest was wrong because of a typographical or similar error.
- In addition, when provisional annual data are published in Energy Trends in March, growth rates are liable to be distorted if the prior year's data are constrained, when revisions are known to be required. In these circumstances the prior year's data will be amended for all affected tables in Energy Trends and all affected Digest tables will be clearly annotated to show that the data has been updated in Energy Trends.

All validated amendments from data suppliers will be updated when received and published in the next statistical release.

All errors will be amended as soon as identified and published in the next statistical release.

Data in energy and commodity balances format will be revised on a quarterly basis, to coincide with the publication of Energy Trends.

This year, the revisions window for DUKES has been opened back to 2008 to include more accurate data on the supply and demand of domestic wood and heat pumps in the bioenergy and waste commodity balances.

## Revisions since DUKES 2020

Thousand tonnes of oil equivalent	2018	2019	Percentage revisions to 2019 data
Production	-1,119	-2,039	-1.6%
Primary supply	-2,841	-4,990	-2.5%
Primary demand	-2,369	-4,532	-2.3%
Transformation	-57	1,082	-3.3%
Energy industry use	-47	-163	-1.3%
Final consumption	-2,240	-3,122	-2.1%
Industry	185	80	0.4%
Transport	18	-20	0.0%
Other	-2,444	-3,203	-5.1%
Non energy use	0	21	0.3%

## Background to the Digest

This issue of the Digest of United Kingdom Energy Statistics (DUKES) continues a series which commenced with the Ministry of Fuel and Power Statistical Digest for the years 1948 and 1949, published in 1950. The Ministry of Fuel and Power Statistical Digest was previously published as a Command Paper, the first being that for the years 1938 to 1943, published in July 1944 (Cmd. 6538).

The current publication consists of seven chapters and four annexes. The first chapter deals with overall energy. The other chapters cover the specific fuels, renewable sources of energy and combined heat and power. The annexes cover conversion factors and calorific values, a glossary of terms, further sources of information and major events in the energy industries.

Where necessary, data have been converted or adjusted to provide consistent series. However, in some cases changes in methods of data collection have affected the continuity of the series. The presence of remaining discontinuities is indicated in the chapter text or in footnotes to the tables.

Chapters 6 and 7 summarise the results of surveys conducted by Ricardo Energy & Environment on behalf of BEIS, which complement work undertaken by BEIS. These chapters estimate the contribution made by renewable energy sources to energy and combined heat and power (CHP) production and consumption in the United Kingdom.

## Acknowledgements

Acknowledgement is made to the main coal producing companies, the electricity companies, the oil companies, the gas pipeline operators, the gas suppliers, National Grid, the Institute of Petroleum, the Coal Authority, the United Kingdom International Steel Statistics Bureau, Ricardo Energy & Environment, the Department for Environment, Food and Rural Affairs, the Department for Transport, OFGEM, Building Research Establishment, HM Revenue and Customs, the Office for National Statistics, and other contributors to the enquiries used in producing this publication.

# National Statistics and user engagement

## National statistics

This is a National Statistics publication. National Statistics status means that our statistics meet the highest standards of trustworthiness, quality, and public value, and it is our responsibility to maintain compliance with these standards.

The United Kingdom Statistics Authority has designated these statistics as National Statistics, in accordance with the Statistics and Registration Service Act 2007 and signifying compliance with the UK Statistics Authority: Code of Practice for Statistics.

The continued designation of these statistics as National Statistics was confirmed in September 2018 following a compliance check by the Office for Statistics Regulation. The statistics last underwent a full assessment against the Code of Practice in June 2014.

Designation can be broadly interpreted to mean that the statistics:

- meet identified user needs.
- are well explained and readily accessible.
- are produced according to sound methods, and
- are managed impartially and objectively in the public interest.

Once statistics have been designated as National Statistics it is a statutory requirement that the Code of Practice shall continue to be observed.

## Pre-release

Some ministers and officials receive access to these statistics up to 24 hours before release. Details of the arrangements for doing this and a list of the ministers and officials that receive pre-release access to these statistics can be found in the [BEIS statement of compliance](#) with the Pre-Release Access to Official Statistics Order 2008.

## User engagement

Users are encouraged to provide comments and feedback on how these statistics are used and how well they meet user needs. Comments on any issues relating to this statistical release are welcomed.

Enquiries about statistics in this publication should be made to the contact named at the start of the relevant chapter. Brief extracts from this publication may be reproduced provided that the source is fully acknowledged. General enquiries about the publication, and proposals for reproduction of larger extracts, should be addressed to BEIS.

The Department for Business, Energy and Industrial Strategy (BEIS) reserves the right to revise or discontinue the text or any table contained in this Digest without prior notice.

# Related statistics

The Department for Business, Energy and Industrial Strategy make available other publications related to energy supply and demand that may be of interest. A full list of these and other related energy publications can be found in DUKES Annex C: Further sources of UK energy publications.

## **Energy Trends**

More frequent monthly and quarterly data are available for total energy, solid fuels and derived gases, petroleum, gas, electricity, and renewables:

[www.gov.uk/government/organisations/department-for-business-energy-and-industrial-strategy/about/statistics](http://www.gov.uk/government/organisations/department-for-business-energy-and-industrial-strategy/about/statistics)

## **Energy prices**

Monthly and quarterly prices by consumption sector and international comparisons of prices paid:

[www.gov.uk/government/organisations/department-for-business-energy-and-industrial-strategy/about/statistics](http://www.gov.uk/government/organisations/department-for-business-energy-and-industrial-strategy/about/statistics)

## **Energy Flow Chart**

Annual publication illustrating the flow of primary fuels from home production and imports to their eventual final uses. They are shown in their original state and after being converted by secondary fuel producers:

[www.gov.uk/government/collections/energy-flow-charts](http://www.gov.uk/government/collections/energy-flow-charts).

## **UK Energy in Brief**

Annual publication summarising the latest statistics on energy production, consumption, and prices in the United Kingdom. The figures are taken from this Digest of UK Energy Statistics:

[www.gov.uk/government/collections/uk-energy-in-brief](http://www.gov.uk/government/collections/uk-energy-in-brief)

## **Sub-National Energy Consumption**

Annual publication supporting local and regional decision making to deliver national energy policy objectives:

[www.gov.uk/government/organisations/department-for-business-energy-and-industrial-strategy/about/statistics](http://www.gov.uk/government/organisations/department-for-business-energy-and-industrial-strategy/about/statistics)

## **UK Greenhouse Gas Emissions**

Show progress against the UK's goals, both international and domestic, for reducing greenhouse gas emissions:

[www.gov.uk/government/collections/uk-greenhouse-gas-emissions-statistics](http://www.gov.uk/government/collections/uk-greenhouse-gas-emissions-statistics)

## Annex E: Energy and the environment

Emissions statistics [Chris.Waite@beis.gov.uk](mailto:Chris.Waite@beis.gov.uk) 0207 215 8285

Oil released and gas flaring [Damon.Ying@beis.gov.uk](mailto:Damon.Ying@beis.gov.uk) 0207 215 2942

### Carbon dioxide emissions

Provisional 2020 results for UK Greenhouse Gas emissions and progress towards targets were published on 25<sup>th</sup> March 2021. A copy of the statistical release and associated data tables are available at:

<https://www.gov.uk/government/collections/provisional-uk-greenhouse-gas-emissions-national-statistics>

### Oil pollution and oil releases

The total amount of oil released offshore during 2020 was approximately 7.9 tonnes. The amount of oil released around the coast of the United Kingdom and offshore in the North Sea is small in relation to total oil production. The number of oil release reports recorded in 2020 was 167, down from 215 in 2019. There was 1 incident where oil released exceeded 1 tonne (1.7 tonnes), down from 4 in 2019.

In 2020, the average content of oil in water was 23.9 milligrams per litre, compared to 19.8 in 2019. The Offshore Petroleum Activities (Oil Pollution Prevention and Control) Regulations 2005 (OPPC) came into effect in August 2005. Under OPPC installations are granted a permit for activities discharging oil contaminated water to sea, but the oil content must not exceed 20 milligrams per litre.

Data on oil releases is available via the [Environmental and Emissions Monitoring System \(EEMS\)](#) which is maintained by the Offshore Petroleum Regulator for Environment and Decommissioning (OPRED).

### Gas flaring

Under the terms of petroleum production licenses, gas may be flared only with the consent of the Oil and Gas Authority (OGA) (formerly the Secretary of State). Flaring in 2020 was estimated to be 992 million cubic this was down more than 20 per cent on 2020. This reduction was largely due to fewer planned shutdowns because of the Covid-19 pandemic. In addition, 2020 saw an increase in use of flare reduction technology.

An additional 265 million cubic metres was vented. Cumulatively gas flared and vented accounted for the equivalent of 3.2 per cent of gross gas production, down from 4 per cent in 2019.

Gas flared and vented has declined in line with production since 2001. A time series of gas flared and vented at terminals, oil fields and gas fields can be found in [Table E.1](#).

Business, Energy  
& Industrial Strategy

# Annex F: Oil and gas resources

[Zoe.Clark@beis.gov.uk](mailto:Zoe.Clark@beis.gov.uk)

020 7215 8170

[Damon.Ying@beis.gov.uk](mailto:Damon.Ying@beis.gov.uk)

020 7215 2942

Data are received via the Oil and Gas Authority's (OGA) Petroleum Production Reporting System (PPRS). Further information is available via the [OGA](#). The following supplementary tables can be downloaded [here](#):

- Table F.1 Crude oil and Natural Gas Liquids Production
- Table F.2 Gas Production
- Table F.3 Natural Gas Liquids Net Production
- Table F.4 Disposals of Crude Oil
- For long term trends:
  - Oil 3.1.1 Crude oil and petroleum products: production, imports and exports
  - Gas 4.1.1 Natural gas and colliery methane production and consumption

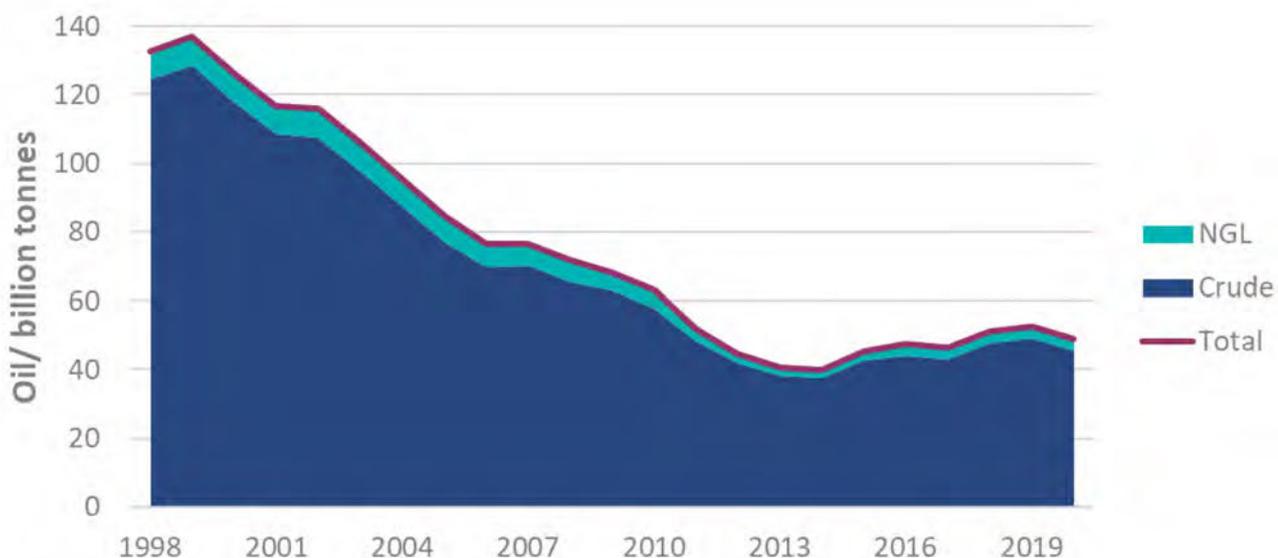

## Oil and gas reserves

Data on oil and gas reserves is available from the [OGA](#).

## Production

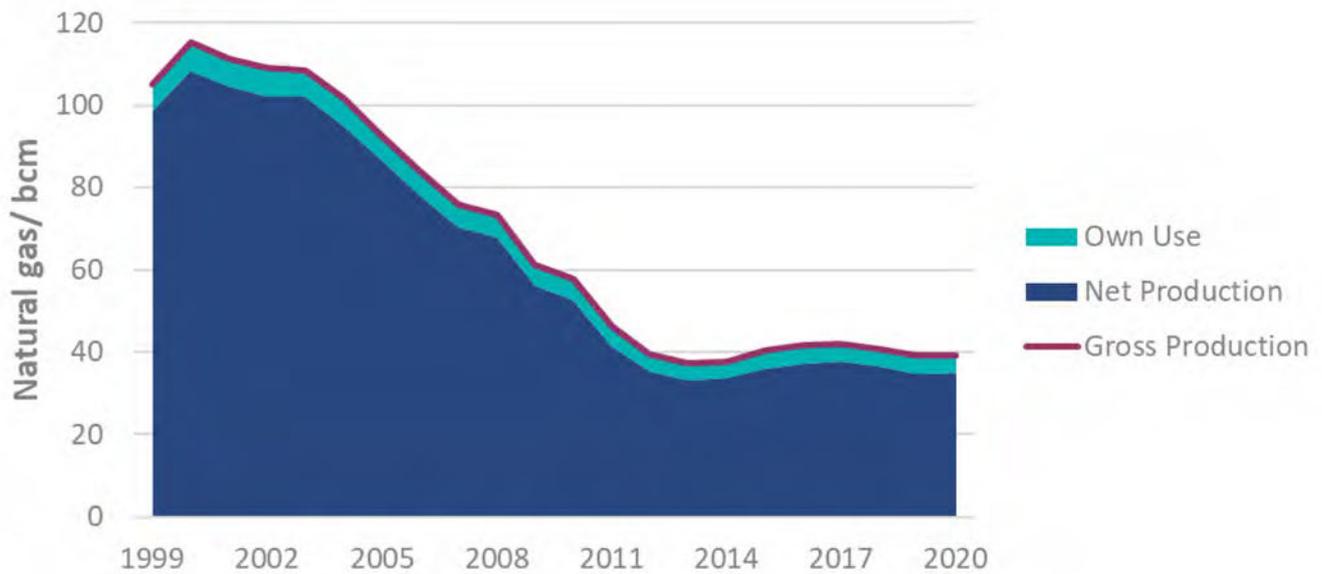

Tables F.1-F.3 show production of crude oil, natural gas and natural gas liquids (NGLs). Following the introduction of the Petroleum Production Reporting System (PPRS) in 2001, aggregate production figures are calculated using mainly terminal level data. Prior to this aggregate production figures were calculated using field level well-head data. The new method is more accurate because oil that leaves the terminal has been stabilised, that is any water, NGLs or other organic compounds have been removed. Field level data is still available via the [OGA](#).

**Chart F.1 Oil and NGL production 1998-2020, UK**

Crude oil production peaked in 1999 at 137 million tonnes. Following this production has generally declined. Small increases from 2014 are due to new investment and the completion of new projects. In 2020, oil production was 48 million tonnes, 35 per cent of the peak but stable on 2019.

**Chart F.2 Gas Production 1999-2020, UK**

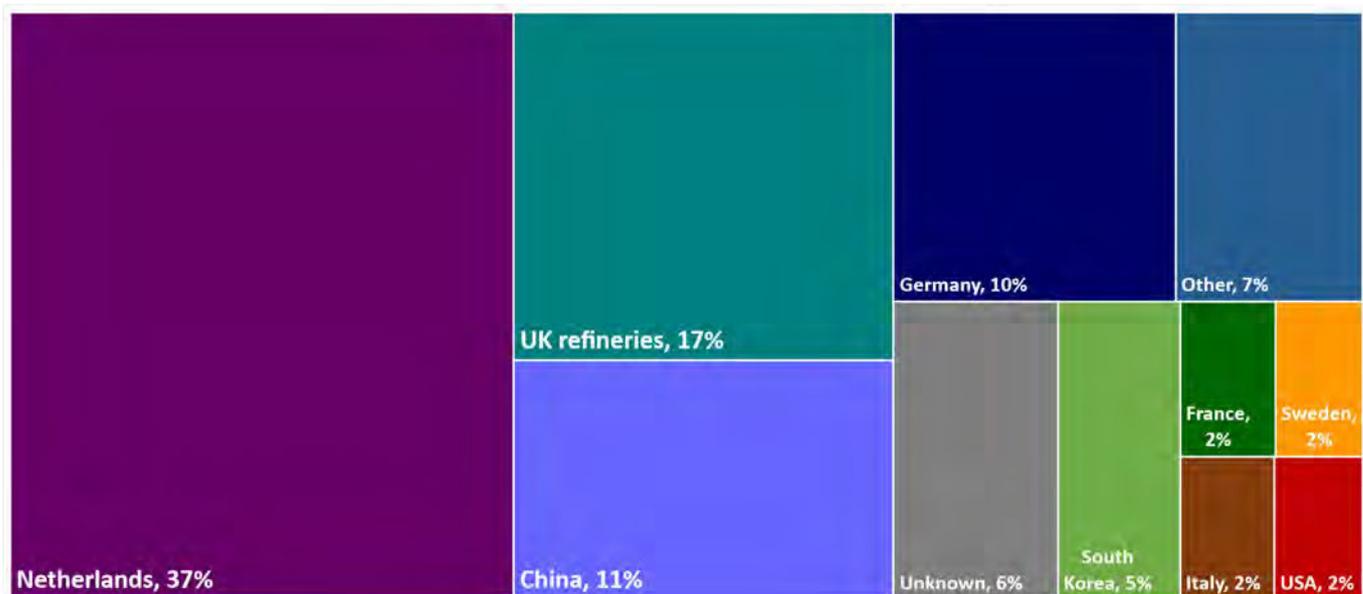

Natural gas production peaked in 2000 at 115 billion cubic metres. Similar to oil production, this peak was followed by several years of decline until 2015. Unlike oil, since 2017 declines in production from well-established fields have outstripped any gains following investment. In 2020, gas production was 39 billion cubic metres, 34 per cent of the peak. However, this was stable on 2019 despite a challenging year for maintenance.

### Disposals of Crude Oil

Table F.4 and chart F.3 show the disposals of crude oil following extraction from the UKCS in 2020; disposals include deliveries to UK refineries and exports abroad. Disposals to the Netherlands were the largest accounting for 37 per cent of the total, this was followed by disposals to UK refineries which accounted for 17 per cent. The other category includes 13 countries each accounting for 1 per cent or less of the total. The UK exported to Brunei for the first time in 2020.

**Chart F.3 Disposals of crude from the UK in 2020**

Other of which, Portugal 1.3%, Norway 1.2%, Spain 1.0%, Gibraltar 0.9%, Poland 0.6%, Brunei 0.6%, India 0.3%, Canada 0.2%, Greece 0.2%, Bulgaria 0.2%, Finland 0.2%, Belgium 0.1%, Denmark 0.1%.

The export figure in table F.4 and chart F.3 may differ from those in Chapter 3 or published by the United Kingdom Petroleum Industry Association (UKPIA). These figures also include oil that has previously been imported and therefore is not part of UKCS production.

Business, Energy  
& Industrial Strategy

## Annex G: Foreign trade

William Nye 020 7215 5073 [energyprices.stats@beis.gov.uk](mailto:energyprices.stats@beis.gov.uk)

### Main points for 2020

Provisional data from HMRC show that:

- There was a total of 125.6 million tonnes of oil equivalent (mtoe) of fuels for energy use imported to the UK in 2020 which was 13 per cent lower than the amount imported in 2019 (Table G.1).
- Exports of fuels rose in 2020 by 2 per cent to 88.2 mtoe (Table G.1).
- The energy trade deficit stood at £1.3 billion (Overseas Trade Statistics basis), 62 per cent less than in 2019 (Table G.7).

By fuel type:

- Coal imports fell by 24 per cent to 5.4 million tonnes in 2020 (Table G.2).
- The UK was, for the first time since 2004, a net exporter of crude oil in 2020, net exports were 0.7 million tonnes (Table G.3).
- HMRC data shows that the UK was a net importer of petroleum product in 2020 by 2.2 million tonnes which was 80 per cent less than in the previous year (Table G.3).
- Gas imports in 2020 at 478 TWh were 8 per cent lower than previous year. There was an 11 per cent drop in imports of gas via the Norway pipelines to 200 TWh (Table G.5).

### Introduction

This annex provides an overview of published trade data by HM Revenue and Customs (HMRC) on energy products in the UK. The data for this annex are presented in Tables G.1 – G.7 of DUKES, also available from [the HMRC website](#); it provides an overview of the UK energy trade commodities which also corresponds with that published in the Overseas Trade Statistics for the United Kingdom. The first section covers energy trade volumes and the second covers energy trade value.

Volume information focuses on the declaration made to HMRC on UK imports and exports in relation to countries outside the European Union (EU) as well as on arrivals and despatches (equivalent to imports and exports respectively) in relation to EU member states. In Table G.1 BEIS has converted HMRC data into million tonnes of oil equivalent (mtoe), so that energy sources can be combined to provide an overview of total trade. The value information previously corresponded to that published by the Office for National Statistics energy trade value data but data for 2016 onwards uses data direct from source, the HMRC UK Trade Info data.

In this annex, BEIS has used estimates based on its industry trade reports for some recent gas data to improve on the accuracy and quality of the data. Those estimates are indicated and footnoted in the tables. There are some differences in methodology between the HMRC energy trade data and the Department for Business, Energy and Industrial Strategy's data presented in the main chapters of DUKES. In the main chapters, the trade data are produced from a combination of data from HMRC and direct from companies responding to BEIS statistical surveys.

### Volume

#### Overview - Import and export of fuels

In the 1970s the UK was a net importer of energy. Discoveries of oil and gas from the North Sea and the price spikes of 1973 led to a large rise in domestic UK crude oil production. In the early 1980s the UK became a net exporter of energy. However, because of the Piper Alpha disaster in 1988 oil production fell, leading to the UK reverting to being a net importer of energy. The UK once again became a net exporter in the mid-1990s because of growth in the North Sea production, but after the peak in 1999, North Sea production slowed and

since 2004 the UK once again became and has remained a net importer of fuels. Chart G.1 shows the UK net import dependence level (net imports compared to supply) from 1970 to 2020, based on BEIS data. Following the peak in 2013 net import dependency has fallen, with a sharp fall in 2015 (down 8.7 percentage points). Net import dependency also fell sharply in 2020 (down 7.1 percentage points on the previous year).

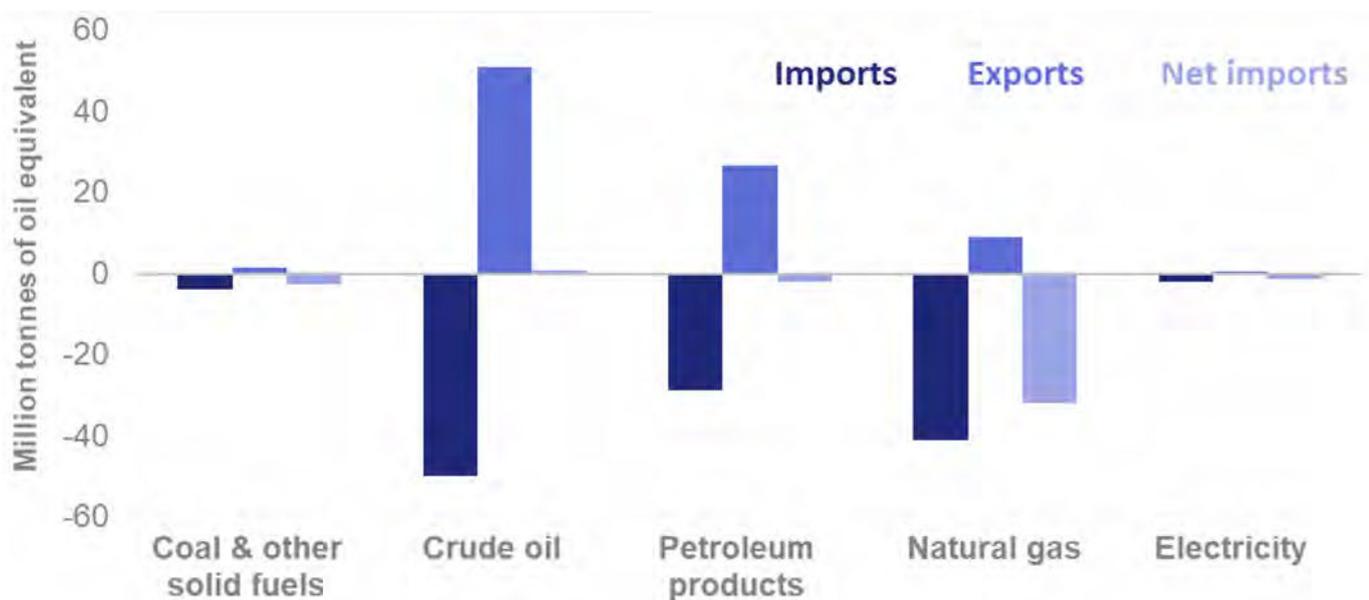

**Chart G.1: UK import dependency, 1970 – 2020**

Source: BEIS

Chart G.2 illustrates trade by fuel type based on HMRC volume data for coal, crude oil, and petroleum products and BEIS energy trends data on natural gas and electricity. The UK had for a long time been a net exporter of petroleum products. However, since 2014 the UK has become and remains a net importer of petroleum products (though remained a net exporter for some of the refined products). In 2020, the UK net import of petroleum products was around 2 million tonnes of oil equivalent which was 82 per cent less than in the previous year.

**Chart G.2: Imports and exports by fuel type, 2020**

#### Coal and manufactured solid fuels

Imports of coal peaked in 2006. Since then, there has been a gradual decrease, as coal demand for electricity generation has fallen. Generation from coal became more attractive again between 2012 and 2013 as gas prices peaked, resulting in increased imports.

Coal imports have since fallen steeply as less coal is used in electricity generation. In 2020, the UK recorded 5,147 hours of no coal use in generating electricity, up from 3,666 in 2019. In 2020, the UK imported 5.4 million tonnes of coal and other solid fuels, 24 per cent (1.7 million tonnes) less than in the previous year. Chart G.3 illustrates the trends in the imports of coal by country for the years 2004-2020.

**Chart G.3 Imports of coal by country of origin, 2004 – 2020**

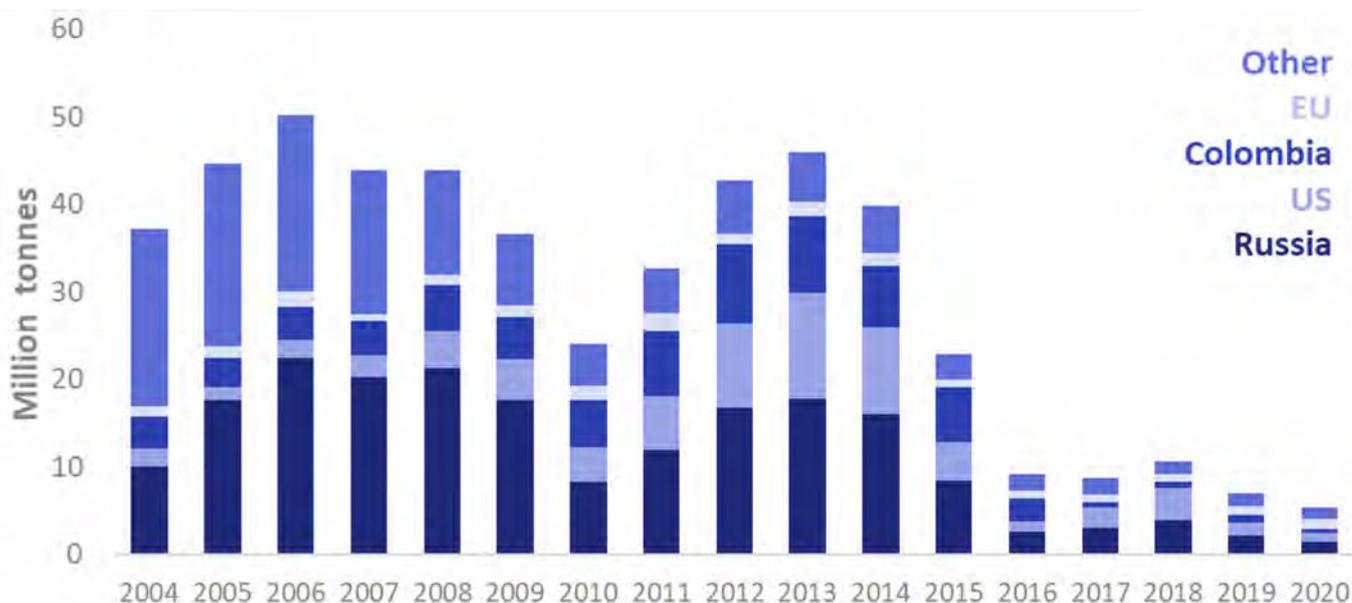

Table G.2, provides a breakdown of HMRC imports and exports of steam coal, coking coal (including coke and semi-coke of coal), anthracite and other solid fuels by country of origin and destination. Coal imports from Russia have been steadily increasing and in 2005, Russia overtook South Africa to become the UK's largest coal provider. Though it has since continued to be so; over the recent years imports of coal from Russia have declined sharply.

The bigger shares of coal imports in 2020, have been from Russia (27 per cent) and the EU (22 per cent). The EU taking over the second place from the US. In 2020 coal imports decreased by 24 per cent as imports from Russia and the US decreased by 33 per cent. Imports from the EU increased by 17 per cent. In 2020, coal from the US made up 19 per cent, and coal from Colombia made up 8 per cent of coal imports to the UK.

Of the total coal imported in 2020, 27 per cent was steam coal, 61 per cent was coking coal and the rest anthracite and other solid fuels. In 2020, steam coal imports were down by 53 per cent with imports from Russia down by 56 per cent to 0.6 million tonnes, from the US imports were down by 97 per cent to 0.02 million tonnes and from Colombia steam coal imports were down by 73 per cent to 0.1 million tonnes.

In 2020, 30 per cent of the UK coking coal imports (including coke and semi-coke of coal) came from the US followed by 26 per cent from Russia and another 15 per cent from Australia. The bulk of anthracite and other solid fuels imports were from EU countries.

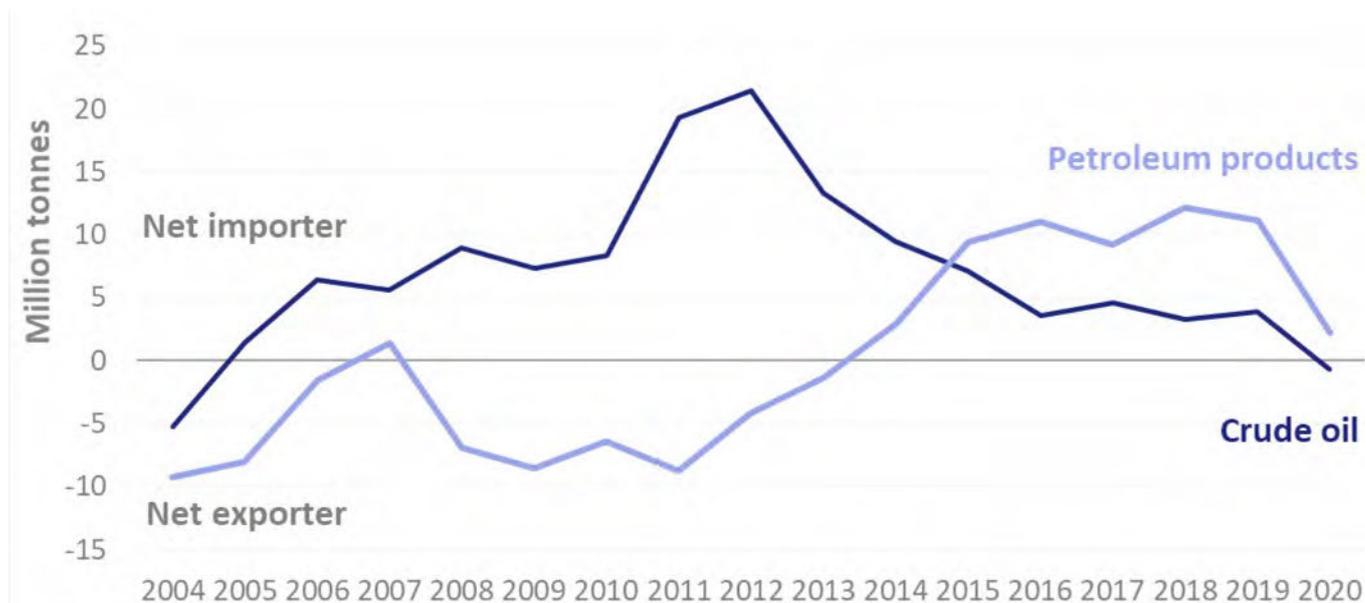

Exports of coal and other solid fuels rose by 88 per cent to 1.9 million tonnes in 2020 of which 23 per cent were to Germany and 19 per cent were to the Irish Republic.

### Crude oil and petroleum products

Trade quantities, in thousands of tonnes, of crude oil and refined petroleum products are shown in in Table G.3. In the table, the import values per tonne are expressed on a cost, insurance and freight (c.i.f) basis while the export values are on a free on board (f.o.b) basis (e.g., costs of goods to the purchaser abroad) – see Value section for more details.

Table G.4 provides trade data in crude oil by country where the import data, as far as possible, are on a 'country of origin' (or production) basis. Since becoming a net importer of crude oil in 2005, the UK's net imports of crude oil have steadily increased, rising significantly between 2010 and 2012. Net imports of crude oil as reported by HMRC (and BEIS) have since been on the decline. In 2020, the UK became a net exporter of crude oil for the first time since 2004 (Chart G.4).

**Chart G.4 Net trade of crude oil and petroleum products, 2004 – 2020**

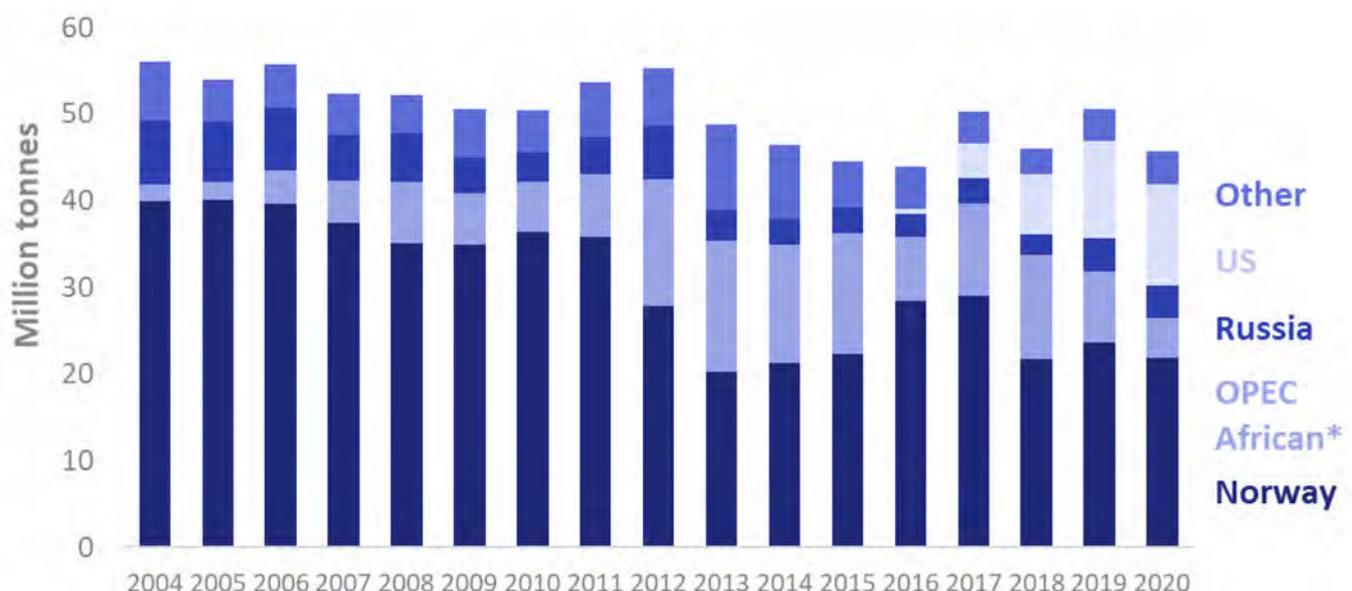

Norway remains the major crude oil supplier to the UK, supplying 48 per cent of all imports (chart G.5). In 2020, Norway imports were 7.5 per cent lower than the previous year and 24 per cent lower than the recent high in 2017. Of the remaining total crude imports 10 per cent (which was 44 per cent less than in the previous year) was from the OPEC African countries, namely Algeria, Libya, and Nigeria; 25 per cent was from the US while imports from Russia were 8.3 per cent of the total.

In 2020, exports of crude oil dropped by 0.9 per cent on the previous year while exports to EU countries were up by 14 per cent and accounted for 75 per cent of the UK's total exports of crude oil.

The UK's two largest markets in the EU are the Netherlands (up 27 per cent), followed by Germany (up 18 per cent); the bulk of the exports to Germany are for refining and consumption, whilst exports to the Netherlands include oil destined for onward trade to other countries. The largest non-EU markets for crude oil in 2020 were China, down 43 per cent on the previous year and accounting for 55 per cent of the total non-EU exports.

**Chart G.5 Imports of crude oil by country of origin, 2004 – 2020**

\* OPEC African members are Algeria, Angola, Nigeria and Libya

The main refined petroleum products imported into the United Kingdom remained as gas diesel oil, which accounted for 43 per cent of the total followed by jet fuel (kerosene type jet fuel), which accounted for 22 per

cent. The main refined petroleum products exported in 2020 were motor & aviation spirits which accounted for 22 per cent of the total exported. Other light oils and spirit accounted for 21 per cent and gas diesel oil accounted for a further 19 per cent and fuel oils 19 per cent. Jet fuel exports accounted for 6 per cent.

On a net trade basis, in 2020 HMRC data show that the UK was again a net importer of petroleum products with net imports of 2.2 million tonnes (Chart G.4), which was 8.9 million tonnes less than in the previous year. In 2020 the UK net imports of jet fuel were 4.5 million tonnes and of gas diesel oil 6.9 million tonnes. However, in 2020 the UK was also a net exporter of some petroleum products, including petrol (3.2 million tonnes) and fuel oils (2.5 million tonnes).

### Imports and exports of natural gas

Between 1997 and 2003 the UK was a net exporter of gas. UK gas production peaked in 2000 and has since been in general decline and broadly flat in recent years. As a result, the UK has sought to access additional supplies of gas from a range of sources to bridge the gap between indigenous production and demand as reserves on the UK Continental Shelf deplete.

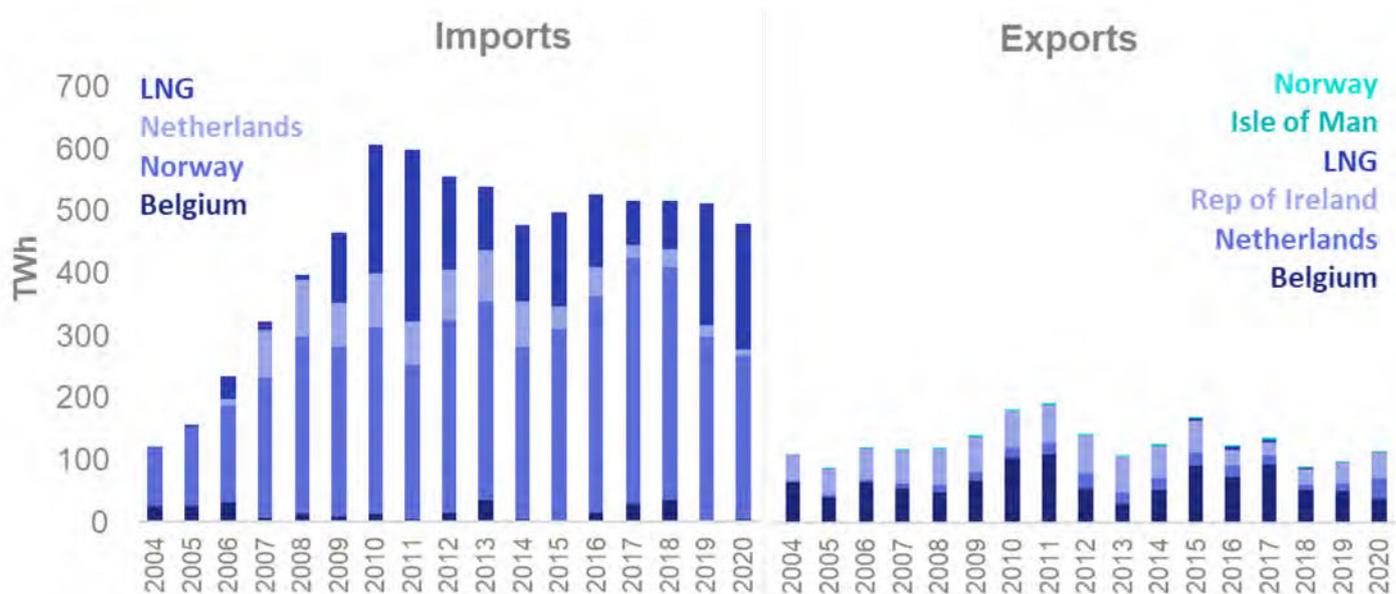

Since 1999 natural gas imports had been increasing sharply, reaching a peak in 2010 since when imports levels have declined, remaining broadly level in recent years. In 2020 gas imports were down by 6.5 per cent from the previous year. More than half (55 per cent) of gas imports came via the Norway pipelines, with 42 per cent coming via LNG. Chart G.6 depicts the trends in natural gas imports and exports by country. It also includes trends in the volume of LNG imports (see Chart G.7 for country breakdown of LNG imports).

The UK has one of the world's largest LNG import capacities, and the largest at a single installation in Europe at South Hook near Milford Haven. The UK also has an established pipeline structure to trade natural gas with the continent. Between 2015 and 2018 the UK exported LNG as 'reloads' because a long-term supply contract fixed lower acquisition prices, making it financially viable to export. However, following the ending of this contract the UK has not exported LNG but has taken advantage of the low spot market prices to secure LNG supply from a diverse range of sources.

Table G.5 gives a breakdown of imports and exports of natural gas by country of origin and destination. The data in the table are physical flows as reported by the pipeline or terminal operators to BEIS. Whilst the data presented in the table differ from the nominated flows reported in Chapter 4, the overall net flows (e.g., net imports or net exports) are the same.

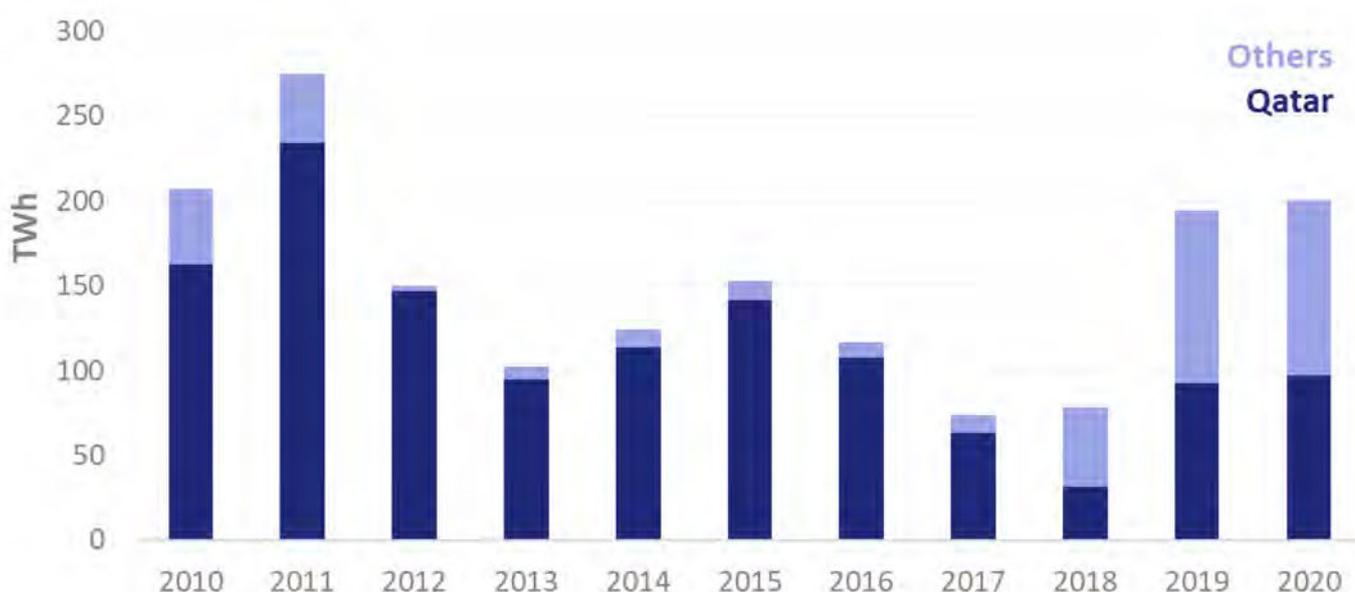

In 2020 the UK exported 106 TWh of gas which was 17 per cent higher than in 2020. Belgium was one of the main destinations of UK gas exports (from where it could be shipped elsewhere in mainland Europe), exporting 36 TWh of gas in 2020, a 25 per cent drop on the previous year. The Republic of Ireland was another where 38 TWh was exported, a 22 per cent increase on the previous year. The other main destination of UK gas exports was the Netherlands via the UK share gas fields using the Dutch WGT pipeline system to Den Helder and Uithuizen. The UK exported 31 TWh of gas to the Netherlands in 2020, more than tripling the volume in 2019.

**Chart G.6 Imports and exports of natural gas by country, 2004 – 2020**

LNG imports from various sources (Chart G.7) almost trebled and accounted for 38 per cent of total gas imports in 2019. These levels of LNG imports have continued into 2020, with LNG making up 42 per cent of all gas imports. LNG imports from Qatar accounted for 48 per cent of total LNG imports in 2020. Other sources of LNG came from the US, 27 per cent of the total, and Russia, 12 per cent of the total.

**Chart G.7 Imports of LNG by country, 2010 – 2020**

### Imports and exports of electricity

For over a decade, the UK has been a net importer of electricity. In 2020, imports of electricity were mainly from France (10.4 TWh) and the Netherlands (4.7 TWh); whilst exports were mainly to Ireland (1.8 TWh) and France (1.7 TWh). In 2020, imports of electricity fell by 9 per cent to 22.4 TWh as falls in imports from France and Netherlands were only partially offset by increases in imports from Belgium and Ireland. Exports of electricity rose by 32 per cent to 4.5 TWh as exports to France, Belgium and the Netherlands rose. Overall net imports of electricity in 2020 was down by 15 per cent from 21.2 TWh to 17.9 TWh.

### Imports and exports of renewables

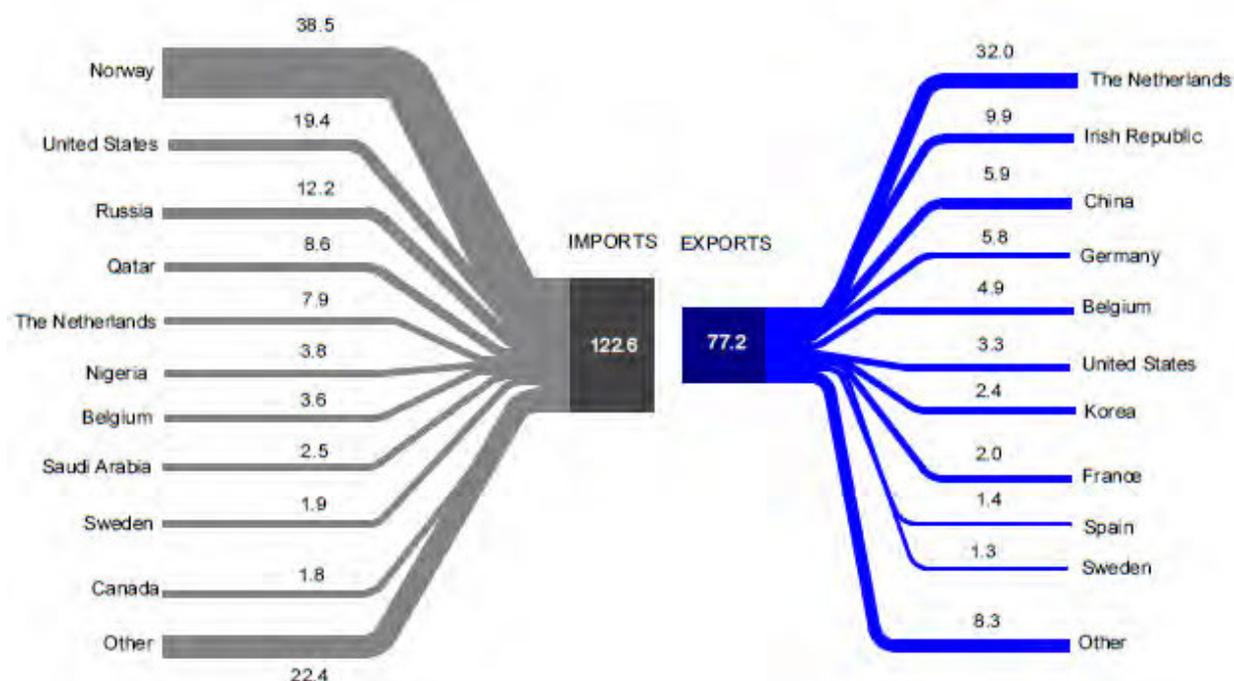

Apart from wood pellets and biodiesel, HMRC do not collect any other specific data on the imports of renewables intended to be used for energy purposes. In 2020, wood pellet imports to the UK, mainly from the United States, were around 8.9 million tonnes, an increase of 3 per cent on the previous year (table G.6). In 2020 BEIS estimates of total renewables imports to the UK which include wood, wood waste, biomass and

liquid biofuels were 5.7 mtoe, up 3 per cent on the previous year. Liquid fuels imports remained broadly stable (down just 0.2 per cent) and wood and wood waste imports were the same on the previous year.

### UK markets in 2020

Chart G.8 shows the UK's ten largest markets in volume trade of coal, primary oils and oil products, gas, electricity, and renewables in 2020. Nearly one-third (31 per cent) of the total imports to the UK were from Norway, followed by 16 per cent from the United States and 10 per cent from Russia. Just over 40 per cent (42 per cent) of total UK exports were to the Netherlands and 13 per cent were to the Irish Republic.

**Chart G.8 UK trade by country for imports and exports, million tonnes of oil equivalent**

Source DUKES 2021

## Value

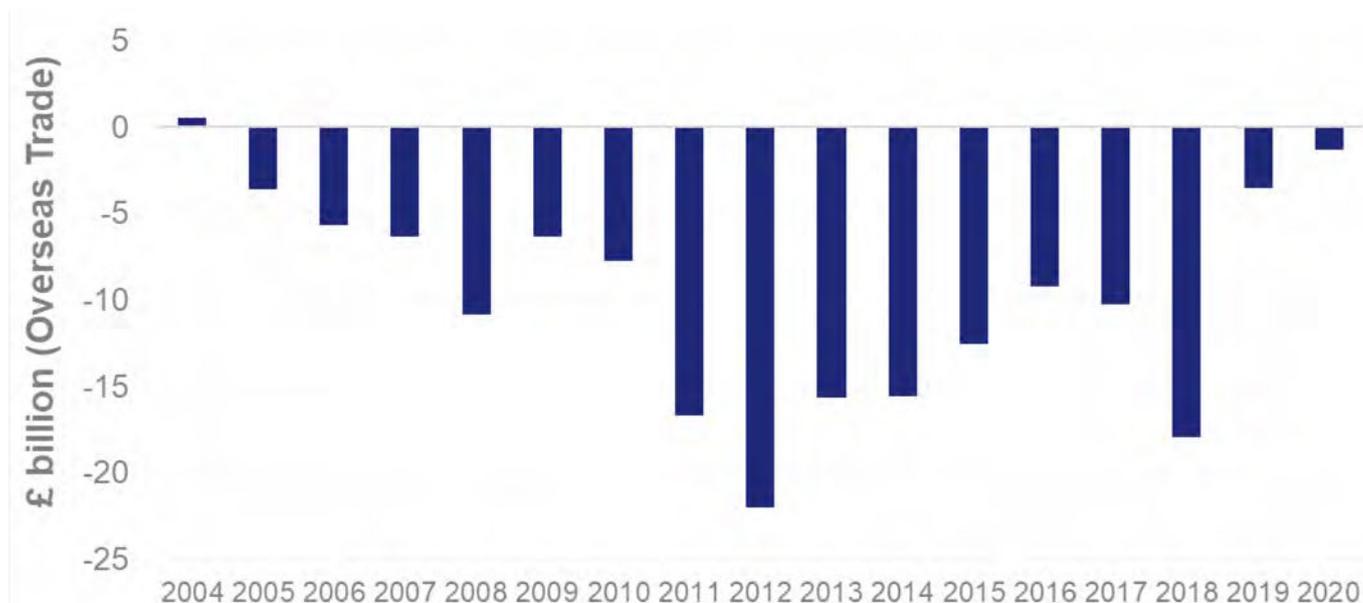

### Imports and exports of fuels (Overseas Trade Statistics basis)

For statistical purposes, the UK adopts the valuation basis for overseas trade statistics as recommended in the International Merchandise Trade Statistics Concepts & Definitions published by the United Nations. This means that the valuation of exports and dispatches is on a free on board (fob) basis (e.g., costs of goods to the purchaser abroad) while the valuation of imports and arrivals is on a cost, insurance, and freight (cif) basis which includes all the incurred expenses in moving the goods to the point of entry into the UK but excludes any duty or tax chargeable in the UK.

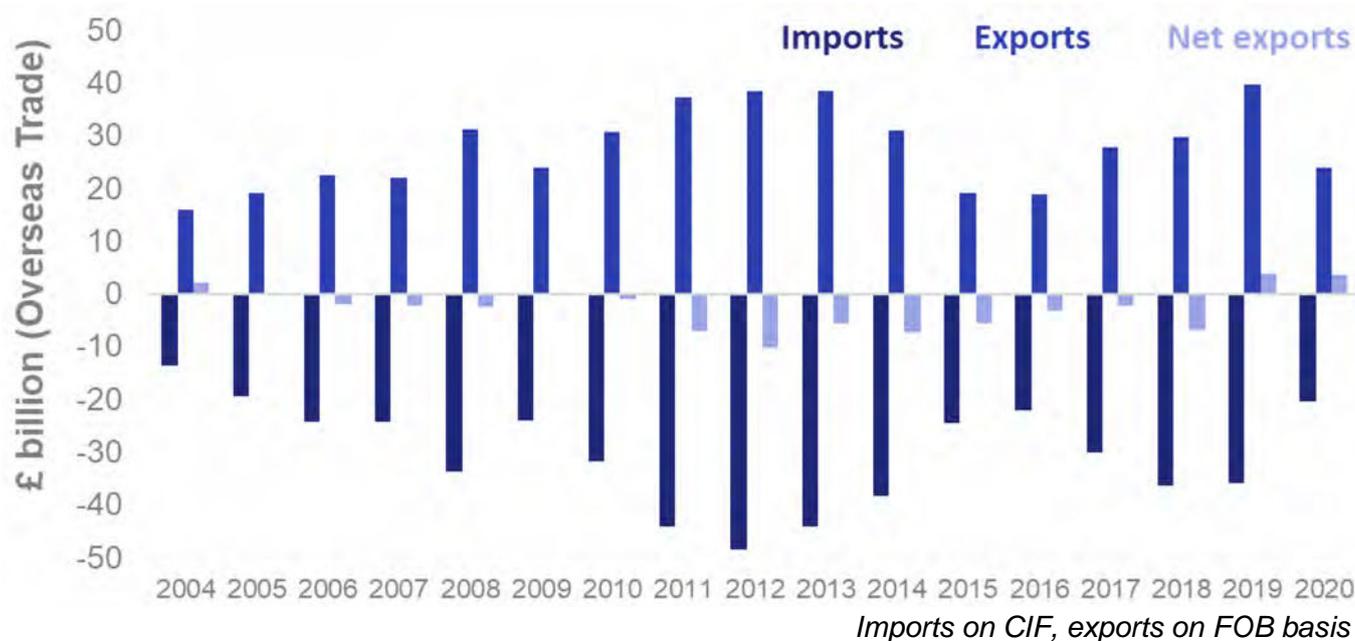

On an Overseas Trade Statistics basis, following the switch from the energy trade surplus of £0.6 billion in 2004, the UK has remained in deficit (Chart G.9). Between 2005 and 2008, the energy trade deficit grew steadily but fell back in 2009 reflecting lower oil prices. It then continued to grow significantly reaching £22 billion in 2012 before falling back again between 2013 and 2016 driven by a fall in the deficit of crude oil and petroleum products. In 2018 the energy trade deficit rose by 73 per cent to around £18.1 billion including an increase in deficit in oil and petroleum products as crude oil and gas prices increased.

In 2020 the energy trade deficit at £1.3 billion, was 62 per cent lower than in the previous year and on the same Overseas Trade Statistics basis there was a surplus in crude oil given the falls in crude oil prices. As a result, the combined surplus in crude oil and petroleum products at £3.5 billion (compared to a £2.2 billion surplus in 2004 – see chart G.10) was down by 9 per cent on the previous year.

**Chart G.9 Value of net exports of fuel, 2004 – 2020**

**Chart G.10 Value in trade of oils, 2004 – 2020**

### Imports and exports of fuels (Balance of Payment basis)

To conform with the International Monetary Fund (IMF), the Office for National Statistics (ONS) compiles their energy trade data on a Balance of Payment basis in which the value of goods is the value at the point of the exporting country (e.g., the freight and insurance costs to the UK is excluded from the value recorded by HMRC).

Chart G.11 shows the net exports of fuels in value terms on a Balance of Payments basis since 1970. The United Kingdom's trade in fuels was dominated by imports until exports started to grow substantially in the mid-1970s, when production from the North Sea started, resulting in a trade surplus in 1981. This surplus was sustained between 1981 and 2003, except for a small deficit in 1989, and amounted to just under £80 billion over that period. However, these surpluses were reduced by the fall in oil prices in 1986, and then by the fall in North Sea production following the Piper Alpha accident in 1988 and the resulting safety works. Although the trade surplus increased steadily from 1992 to 1996, there were falls in 1997 and 1998 due to the drop in the price of crude oil. Prices of crude oil and petroleum products increased in 1999 and again in 2000 giving it, in current price terms, the highest net surplus. In 2001 the value of the trade surplus fell, reflecting falls in the

price of crude oil and petroleum products; however, this was partly reversed by a 6.2 per cent increase in the net trade surplus during 2002.

Since 2005 the UK has been a net importer of fuels. The deficit increased sharply in 2008 due to a sharp rise in the price of crude oil with Brent prices increasing by \$26 per barrel to \$98 per barrel, before falling back to \$63 per barrel in 2009. In 2011 there was another sharp increase in the size of the energy trade deficit, which more than doubled that in 2010, from £9.5 billion to £20.2 billion; this was mainly due to the oil deficit increasing from £4.3 billion to £10.9 billion, as oil prices rose sharply from an average of \$80 per barrel in 2010 to \$111 per barrel in 2011. Between 2013 and 2017 deficit fell as crude oil prices fell, reaching a low of \$45 in 2016. In 2018 deficit increased, as the other fuels deficit increased.

In 2019 and 2020, the total deficit fell and was £2.4 billion in 2020, £1.6 billion less than in the previous year. This has been driven by a fall in the deficit in other fuels and a surplus in oil net exports. The price of crude oil fell by \$22 per barrel to \$42 in 2020.

**Chart G.11: Value of net exports of fuels on a balance of payment basis, 1970 – 2020**

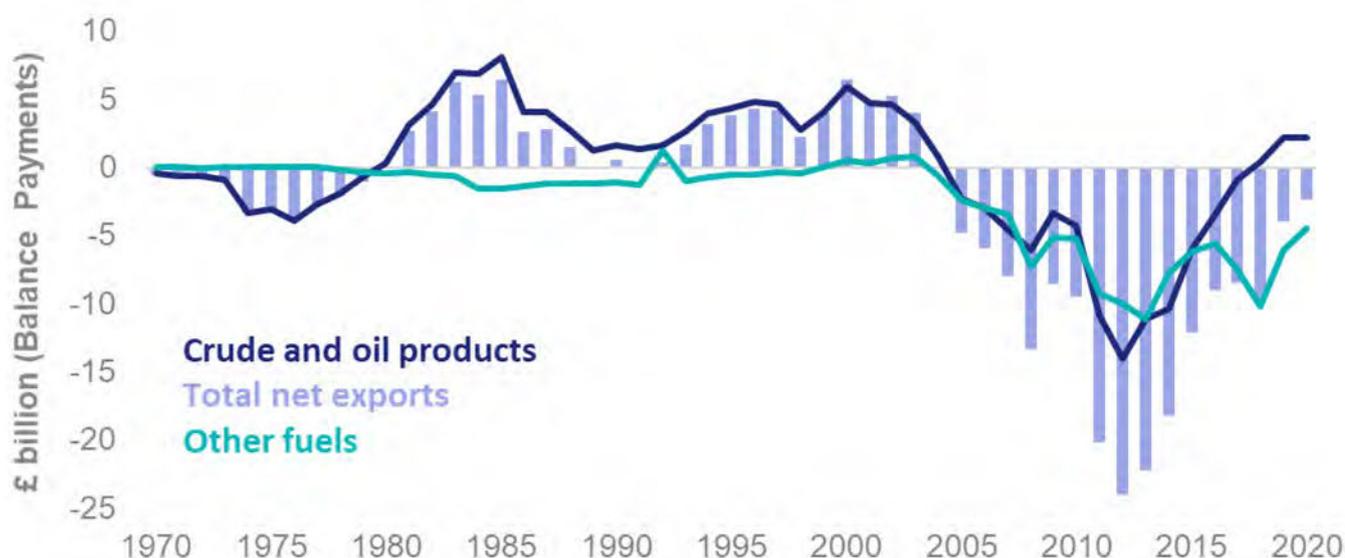

Table G.7 shows the trends in the UK trade values from 1970 to 2020 both on an Overseas Trade Statistics and Balance of Payments basis. Import values on a f.o.b. basis are also included in the table, to allow net exports to be presented on a comparable f.o.b. basis over the same period.

## Technical notes and definitions

The figures of imports and exports quoted in this annex are derived from notifications to HM Revenue and Customs and may differ from those for actual arrivals and shipments, derived from alternative and/or additional sources, in the sections of the Digest dealing with individual fuels. Data in Table G.1 also include unpublished revisions to Customs data, which cannot be introduced into Tables G.3 to G.5.

All quantity figures in Table G.1 have been converted to million tonnes of oil equivalent to allow data to be compared and combined. This unit is a measure of the energy content of the individual fuels; it is also used in the Energy section of this Digest and is explained in Annex A, paragraphs A.45 to A.46. The quantities of imports and exports recorded in the Overseas Trade Statistics, in their original units of measurement, are converted to tonnes of oil equivalent using weighted gross calorific values and standard conversion factors appropriate to each division of the Standard International Trade Classification (SITC). The electricity figures are expressed in terms of the energy content of the electricity traded.

Except as noted in Table G.7, values of imports are quoted "c.i.f.". Briefly this value is the price that the goods would fetch at that time, on sale in the open market between buyer and seller independent of each other, with delivery to the buyer at the port of importation, the seller bearing freight, insurance, commission, and all other costs, etc, incidental to the sale and delivery of the goods except for any duty or tax chargeable in the United Kingdom. Values of exports are "f.o.b.", which is the cost of the goods to the purchaser abroad, including packing, inland and coastal transport in the United Kingdom, dock dues, loading charges and all other costs, charges and expenses accruing up to the point where the goods are deposited on board the exporting vessel or at the land boundary of Northern Ireland.

Figures of the value of net exports in Tables G.7 are derived from exports and imports measured on a Balance of Payments basis. The figures are consistent with the European System of Accounts 1995, the basis on which they are published by the Office for National Statistics and since 2016 HMRC through their UK Trade Info dataset. This means exports as recorded by HM Revenue and Customs on any other basis, will differ from those recorded by the Office for National Statistics and UK Trade Info on a Balance of Payment basis.

### **G.41 Figures correspond to the following items of [SITC \(Rev 3\)](#):**

Coal	321.1 and 321.2
Other solid fuels	322 and 325 (part)
Crude oil	333
Petroleum products	334,335,342,344 (plus Orimulsion reclassified to division 278 in 1994)
Natural gas	343
Electricity	351

In 1993, the Single European Market was created. At that time, a new system for recording the trade in goods between member states, called INTRASTAT, was introduced. As part of this system only obliges small traders to report their annual trade and as some trading supply returns are late, it is necessary to include adjustments for unrecorded trade. This is particularly true of 1993, the first year of the system and of coal imports in that year.

# Annex H: Flow charts

[Kevin.Harris@beis.gov.uk](mailto:Kevin.Harris@beis.gov.uk) 0300 068 5041

## Introduction

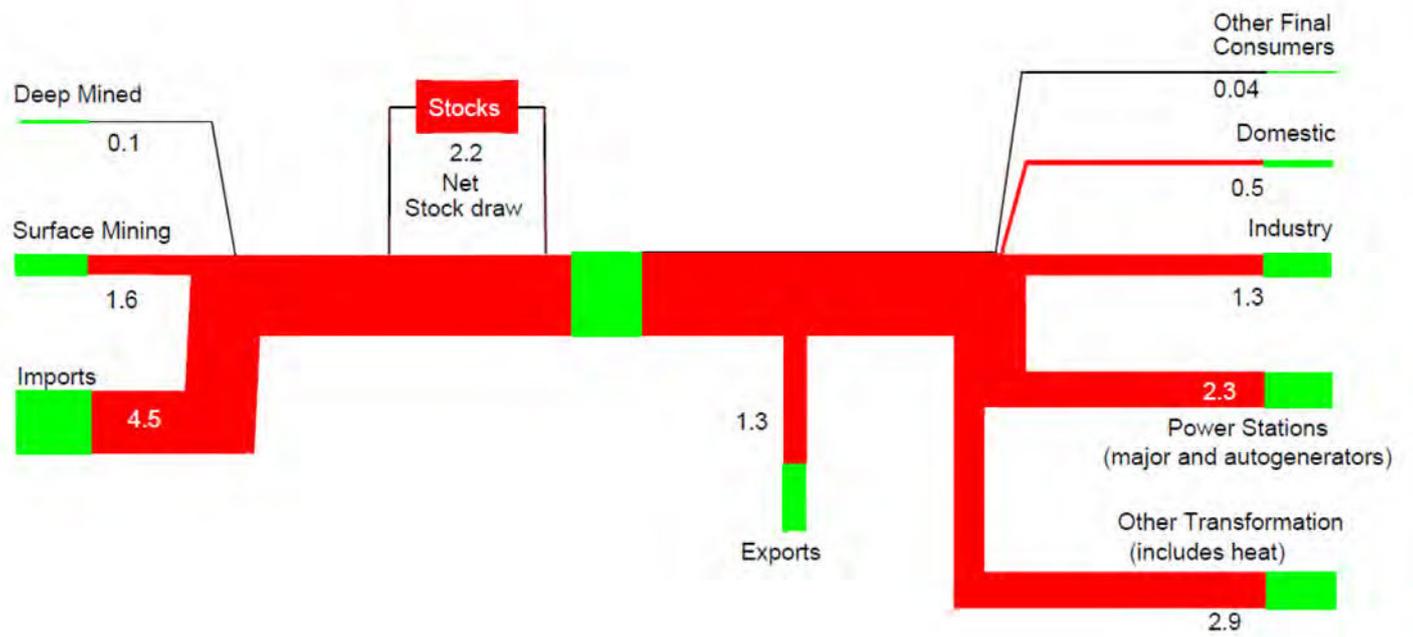

This section brings together the flow charts for individual fuels contained in the main Digest publication. Chart H.1 is for Coal, Chart H.2 is for Petroleum, Chart H.3 is for Natural Gas, Chart H.4 is for Electricity and Chart H.5 is for Renewables. Annual updates will appear in subsequent editions of the main Digest publication and on the BEIS section of the GOV.UK website.

Also included within the annex is an additional flow chart for Manufactured Solid Fuels (H.6). Annual updates will appear on the BEIS section of the GOV.UK website.

## Summary flow chart

The summary flow chart updates the last energy flow chart which showed data for 2019. It is based on statistics taken from the main Digest publication, [Table 1.1 – Energy Balance 2020](#). The chart is a simplification of the energy balance figures, illustrating the flow of primary fuels from the point at which they become available from home production or imports (on the left) to their eventual final uses (on the right). They are shown in their original state and after being converted into different kinds of energy by the secondary fuel producers. The flows are measured in million tonnes of oil equivalent, with the widths of the bands approximately proportional to the size of the flow they represent. The flow charts for individual fuels have been produced on a similar basis.

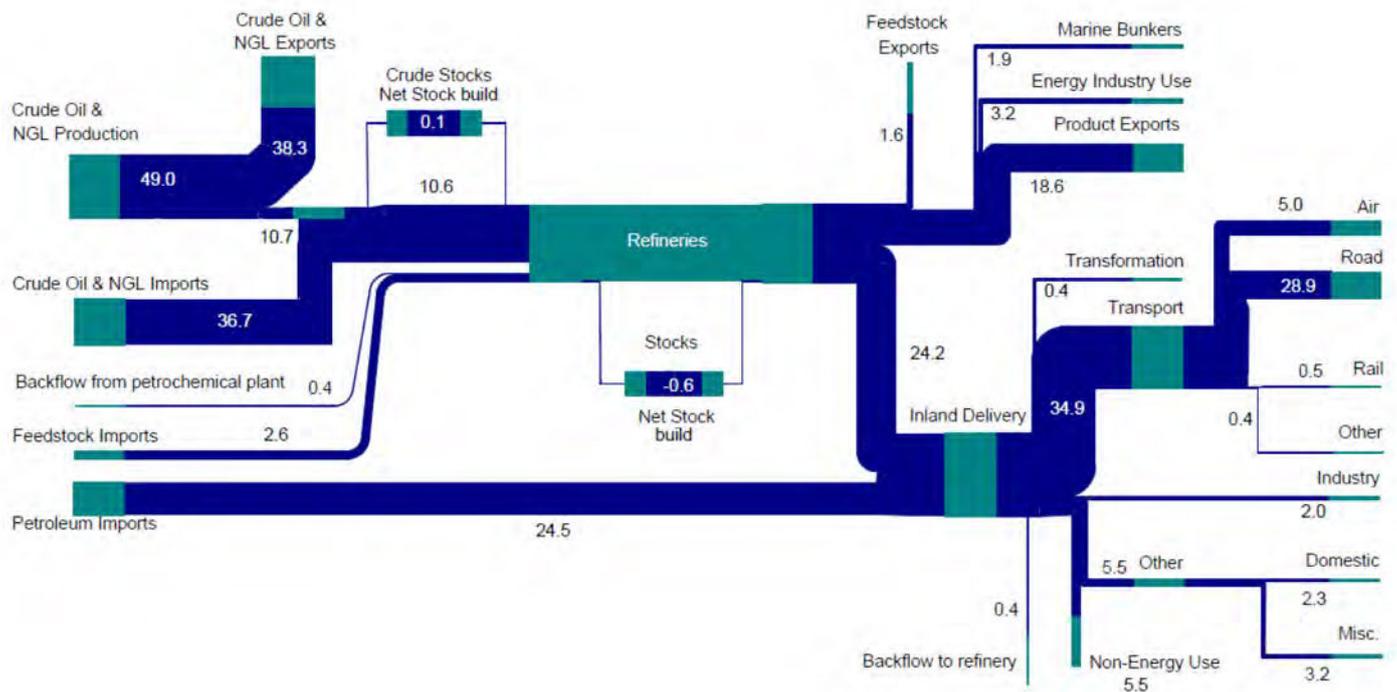

**Chart H.1: Coal flow chart 2020 (million tonnes of coal)**

**Note:**

This flow chart is based on the data that appear in [DUKES tables 2.1 and 2.4](#).

**Chart H.2: Petroleum flow chart 2020 (million tonnes)**

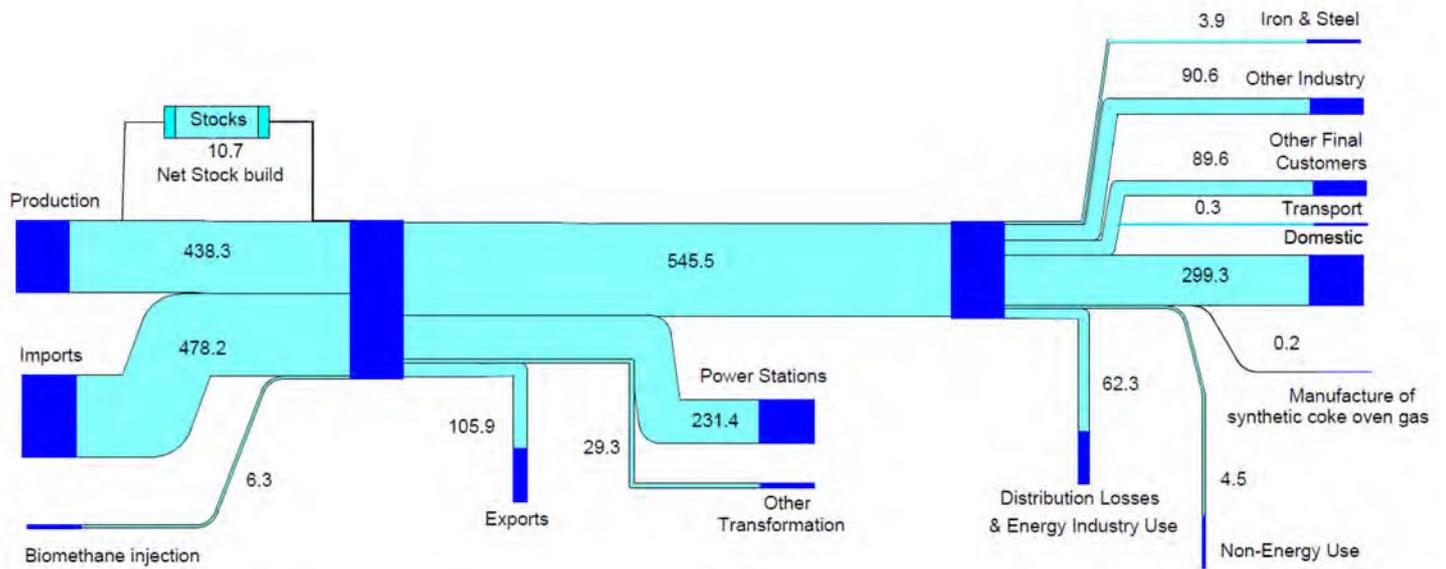

**Notes:**

This flow chart is based on the data that appear in [DUKES tables 3.1 and 3.2](#).

The numbers on either side of the flow chart will not match due to losses in transformation.

Biofuels are not included.

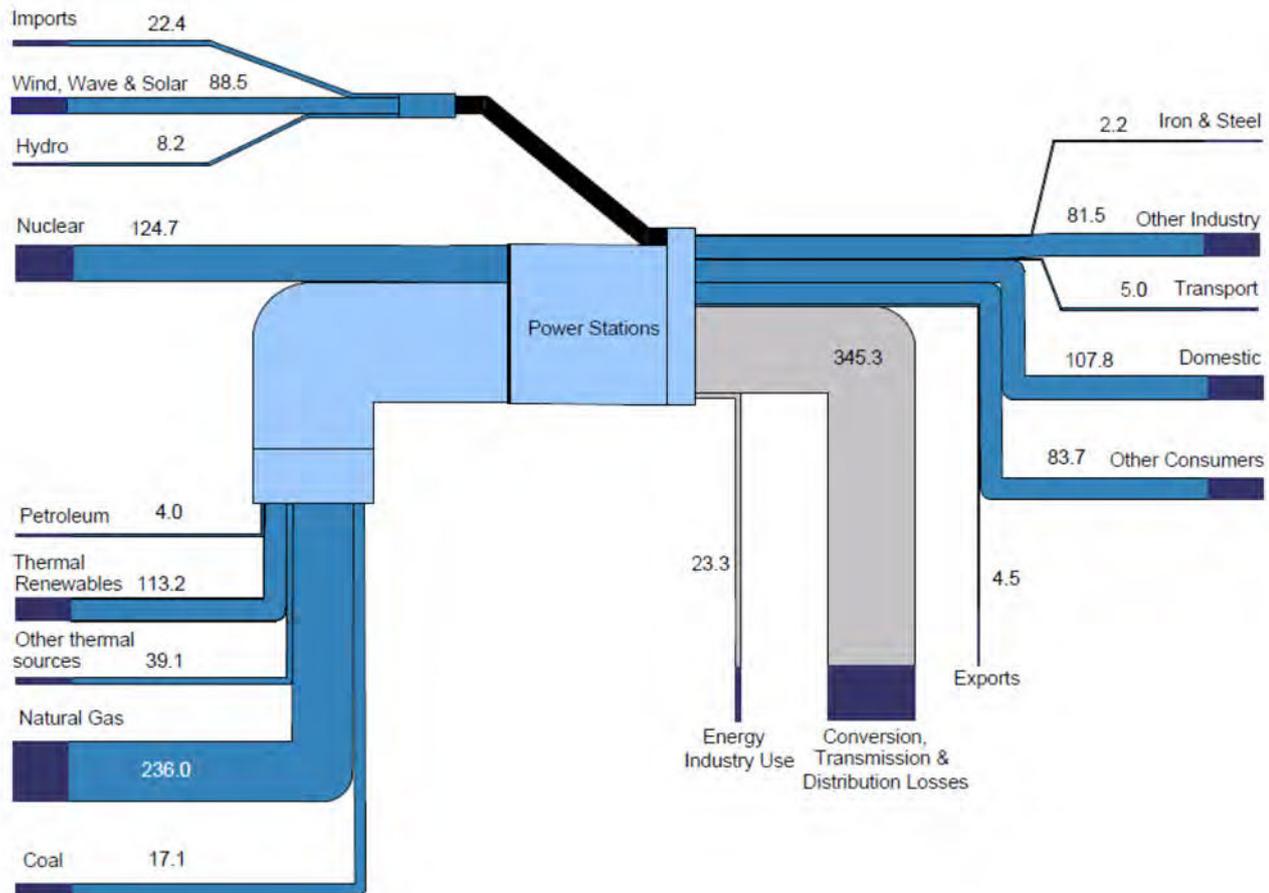

**Chart H.3: Natural gas flow chart 2020 (TWh)**

Note:

This flow chart is based on the data that appear in [DUKES table 4.1](#), excluding colliery methane.

**Chart H.4: Electricity flow chart 2020 (TWh)**

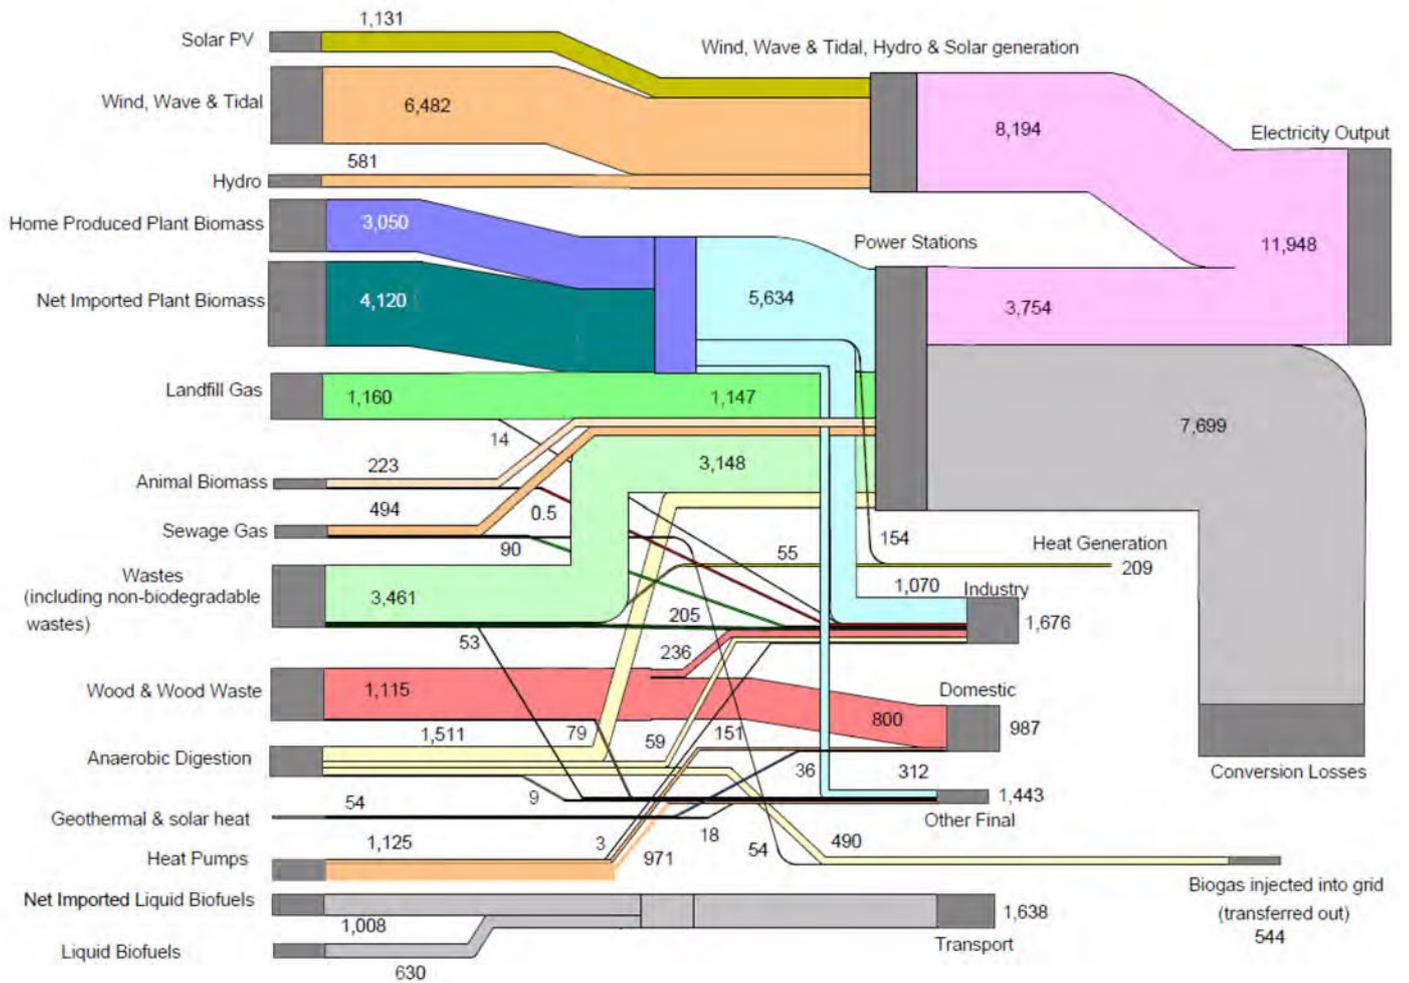

**Notes:**

This flow chart is based on the data in [DUKES tables 5.1 \(for imports, exports, use, losses and consumption\) and 5.6 \(fuel used\)](#).

Hydro includes generation from pumped storage while electricity used in pumping is included under Energy Industry Use

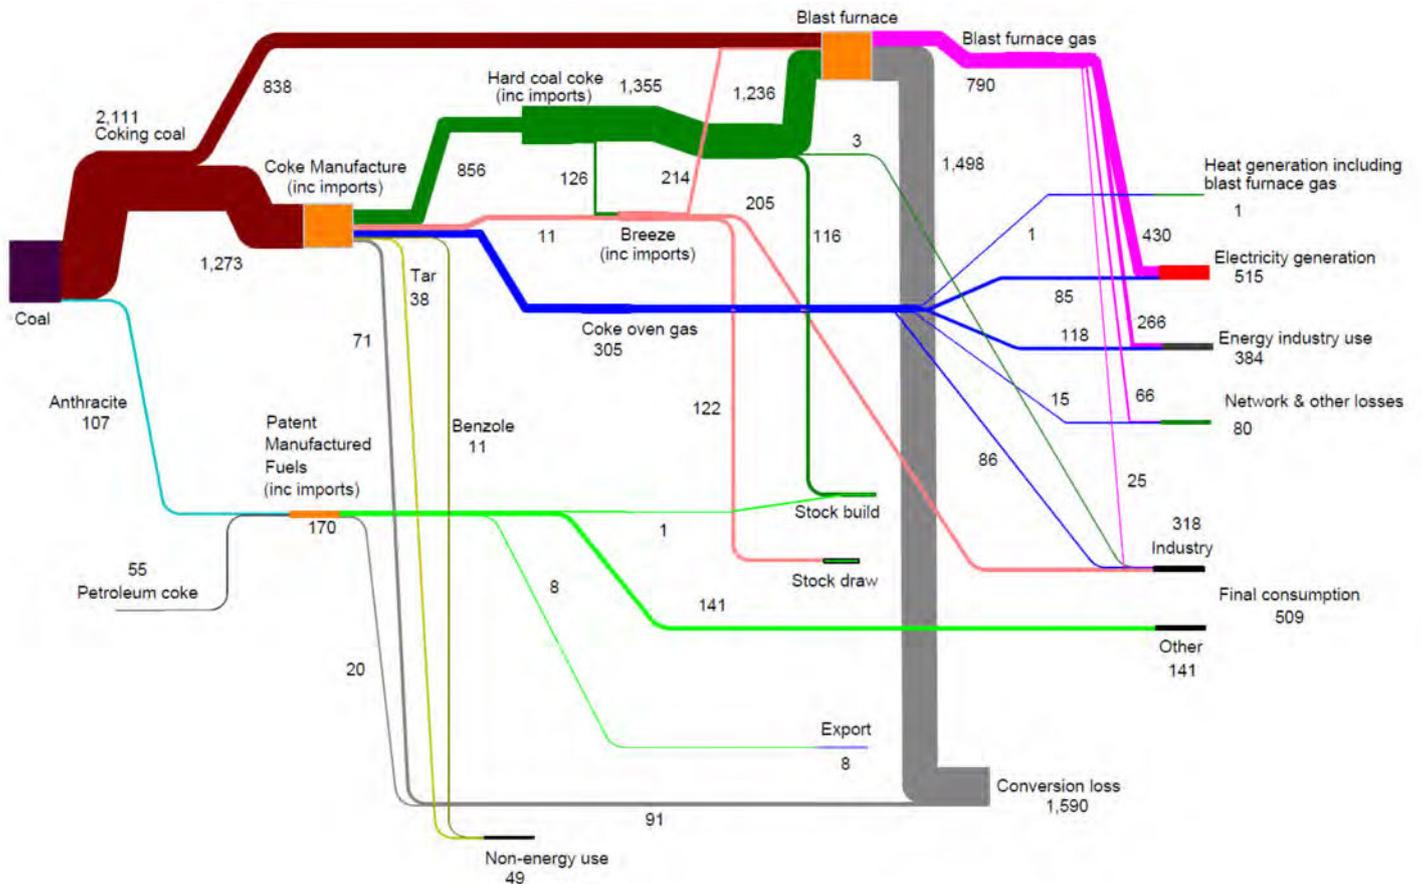

Conversion, Transmission and Distribution Losses is calculated as fuel used (Table 5.6) minus generation (Table 5.6) plus losses (Table 5.1)

**Chart H.5: Renewables flow chart 2020 (thousand tonnes of oil equivalent)**

Note: This flow chart is based on data that appear in [DUKES tables 6.1 and 6.4](#).

**Chart H.6: Manufactured Solid Fuels flow chart 2020 (thousand tonnes of oil equivalent)**

Business, Energy  
& Industrial Strategy

# Annex J: Heat reconciliation

[Elizabeth.Waters@beis.gov.uk](mailto:Elizabeth.Waters@beis.gov.uk)

0300 068 5735

## Introduction

Heat sold has been separately identified in the energy balances since 1999. It is defined as heat that is produced and sold under the provision of a contract. The introduction of heat sold into the energy and commodity balances did not affect the individual fuel totals, since the energy used to generate the heat has been deducted from the final consumption section of the energy balances and transferred to the transformation section. Annex J tables show the detailed analysis of the heat generation row of the main energy balances, by sector generating the heat, and are available at:

[www.gov.uk/government/statistics/energy-chapter-1-digest-of-united-kingdom-energy-statistics-dukes](http://www.gov.uk/government/statistics/energy-chapter-1-digest-of-united-kingdom-energy-statistics-dukes)

For transparency, data on the quantity of fuel by consuming sector used to produce heat that is subsequently sold are being made available in the tables that accompany this annex.

## Methodology

Data sources used to compile heat generation and heat sold are primarily from the Combined Heat and Power Quality Assurance Program (CHPQA) <sup>1</sup> and also data collected for the Heat Metering and Billing Regulations<sup>2</sup> with some assumptions being carried over from the previous estimates prior to these regulations being in force.

### CHPQA data

These data are supplied to BEIS annually by Ricardo Energy and Environment and form the basis of DUKES Chapter 7; Combined Heat and Power<sup>3</sup>. The data include heat exported and whether it's being exported to an entity declared 'not part of same qualifying group', in which case it is deemed to be sold under a contract thus satisfying the definition set out above.

A sectoral analysis of heat generators has shown that certain suppliers are classified as 'Electricity, gas, steam, and air conditioning supply'. This sector falls within the transformation sector in the energy balances and as such can't be deducted from any sector in final consumption and their main business is deemed to be supplying a heat network. It is therefore included in the heat generation row and for transparency, as an 'of which heat networks' row below this in the annex tables.

### Non CHPQA data

Following the publication of experimental statistics collected in respect of the Heat, Metering and Billing Regulations (HMBR) database in the March 2018 edition of Energy Trends<sup>4</sup>, the data have been evaluated and incorporated into the heat generation figures presented in this annex. As there are gaps in this data, CHPQA data have been used where possible. For other schemes, various assumptions were applied to the HMBR dataset:

---

<sup>1</sup> [www.gov.uk/guidance/chpqa-guidance-notes](http://www.gov.uk/guidance/chpqa-guidance-notes)

<sup>2</sup> [www.gov.uk/guidance/heat-network](http://www.gov.uk/guidance/heat-network)

<sup>3</sup> [www.gov.uk/government/statistics/combined-heat-and-power-chapter-7-digest-of-united-kingdom-energy-statistics-dukes](http://www.gov.uk/government/statistics/combined-heat-and-power-chapter-7-digest-of-united-kingdom-energy-statistics-dukes)

<sup>4</sup> [www.gov.uk/government/publications/energy-trends-march-2018-special-feature-article-experimental-statistics-on-heat-networks](http://www.gov.uk/government/publications/energy-trends-march-2018-special-feature-article-experimental-statistics-on-heat-networks)

- Heat supplied was assumed to be heat sold
- The fuel input has been estimated by assuming the previous efficiency
- Where the fuel categories are not sufficiently disaggregated, historic proportions have been applied
- For those networks which have mixed final consumers, it is difficult to assign heat supplied to each sector. To address this, the average generation for domestic consumers (residential properties display considerably less variation compared to industrial and commercial consumers) was used with the remainder being allocated across industrial consumers, and the commercial and public sectors.

The decision not to use the HMRB data set for CHP schemes was deemed to be appropriate due to the CHPQA administration data being timely and subject to quality assurance. It also provides the correct level of detail such as fuel type, sector generating heat, and final customer types. In contrast, the previous non-CHP estimates were previously derived from the Building Research Establishment's "National Survey of Community Heating" that was carried out in 1997, a database of community heating schemes in social housing in 2000, and Community Heating Sales Surveys undertaken between 2003 and 2005. The estimates from these sources have been used to derive heat sold figures since 1999; these estimates are now considered less relevant than the more up to date data collected in the HMRB database despite having to use assumptions to achieve the correct estimates across generators and final customers.

Annex A – Commission recommendations following review of the draft NECP and UK government responses	205
Annex B – Further information pursuant to requirements under Annex III of the Governance Regulation	212

On 31 January 2020, the UK left the European Union (EU) and the Withdrawal Agreement we concluded with the EU entered into force. The UK is seeking a relationship with the EU which is based on friendly cooperation between sovereign equals, centred on free trade. At the end of 2020, the process of transition to that relationship will be completed. The UK will no longer be a part of the EU Single Market or the EU Customs Union. As the UK is no longer a Member State, we will not contribute to EU targets in the areas of energy and climate change.

The UK is submitting this National Energy and Climate Plan in order to uphold our commitments under the Withdrawal Agreement. The content within is wholly accurate up to 31 January 2020, the date the UK left the EU.<sup>1</sup> Since then, analysis in the National Energy and Climate Plan has been updated to ensure it provides an accurate overall picture of the UK's plans. However, policy announcements and publications after 31 January 2020 have not been incorporated and the National Energy and Climate Plan does not supersede those announcements that we have made domestically. This means that impacts from COVID-19 are also not taken into account.

The UK's approach to tackling and responding to climate change is set in legislation through the Climate Change Act 2008. The Act also established the Committee on Climate Change, the independent statutory body that provides expert advice to the UK government on climate change mitigation and adaptation.

On 27 June 2019, the UK government set a legally binding target to achieve net zero greenhouse gas emissions from across the UK economy by 2050, which will bring to an end our contribution to climate change. In the lead-up to COP26 in Glasgow in 2021, we continue to drive climate ambition on the global stage. As COP26 President, the UK will work with all partners to deliver on the Paris Agreement. Further policies and strategies to meet our net zero target will be set out in domestic publications, such as our Energy White Paper.<sup>2</sup>

This Plan has been completed according to the EU's reporting framework for National Energy and Climate Plans (italicised in each section), as specified in Annex I to the EU Regulation 2018/1999 on the Governance of the Energy Union and Climate Action.<sup>3</sup>

---

<sup>1</sup> Analysis based on data up to 31 January 2020, does not account from impacts resulting from COVID-19.

# 1. Overview and process for establishing the plan

## 1.1 Executive summary

### *i Political, economic, environmental, and social context of the plan*

The UK was one of the first countries to recognise and act on the economic and security threats of climate change and has been among the most successful countries in the developed world at growing its economy while reducing emissions. Since 1990, the UK has cut emissions by over 40% whilst growing the economy by over two-thirds (see Figure 1).

**Figure 1: GDP and emissions for the UK and G7<sup>4</sup>**

Internationally, the UK together with the EU played a central role in securing the United Nations (UN) 2015 Paris Agreement. The UK is fully committed to working with other countries to achieve the Paris Agreement goals. The UK is one of the largest contributors of international climate finance, having committed to spending £5.8 billion on this between 2016 and 2021<sup>5</sup> and at least £11.6 billion between 2021/22 and 2025/26.<sup>6</sup> Additionally, the UK is promoting global alliances to encourage clean growth, such as the Powering Past Coal Alliance, to reduce emissions from the most polluting fuel.

<sup>4</sup> Data sourced from World Bank, UNFCCC National Inventory Submissions, ONS and BEIS Greenhouse Gas inventory.

## The Climate Change Act

The Climate Change Act 2008 set in legislation the UK's approach to tackling and responding to climate change. It introduced the UK's long-term legally binding 2050 target to reduce greenhouse gas emissions by at least 80% relative to 1990 levels. It also introduced 'carbon budgets', which cap emissions over successive five-year periods and must be set 12 years in advance. The Act also established the Committee on Climate Change (CCC), the independent statutory body that provides expert advice to the UK government on climate change mitigation and adaptation.

Policies and proposals for mitigating climate change go through an established development process. As the development is completed, the impact of policies is quantified in updated Energy and Emissions Projections (EEP), which are published by the UK government annually. This is a continuous process and the latest EEP, published in April 2019, shows future emissions under the suite of policies that were fully developed as of 2018.

The Climate Change Act also requires the UK to produce a UK Climate Change Risk Assessment (CCRA) every 5 years. The CCRA assesses current and future risks to and opportunities for the UK from climate change. In addition, the Climate Change Act requires the UK government to produce a National Adaptation Programme to respond to the risk assessment. Finally, the Climate Change Act gives powers to the UK government to require certain organisations to report on how they are adapting to climate change through the Adaptation Reporting Power.

## Net zero

The UK is committed to maintaining a robust climate framework that takes into account evolving scientific knowledge on climate change. Following the publication in October 2018 of the Intergovernmental Panel on Climate Change's (IPCC) special report on global warming of 1.5°C, the UK government, Welsh Government and Scottish Government asked our independent experts, the CCC, for their advice on the implications of the Paris Agreement for the UK's long-term emissions reduction targets, including on setting a net zero target.<sup>7</sup>

In May 2019, the CCC provided that advice, recommending that the UK legislate as soon as possible to reach net zero greenhouse gas emissions by 2050.

On 27 June 2019, the UK government set a legally binding target to achieve net zero greenhouse gas emissions from across the UK economy by 2050, via an amendment to the Climate Change Act. This world-leading target will bring to an end our contribution to climate change.

## The Clean Growth Strategy and Clean Growth Grand Challenge

In October 2017, the UK government published its Clean Growth Strategy (CGS)<sup>8</sup> setting out ambitious policies and proposals, through to 2032 and beyond, to reduce emissions across the economy and promote clean growth.

---

<sup>7</sup> UK climate targets: request for advice from the Committee on Climate Change, October 2018, [www.gov.uk/government/publications/uk-climate-targets-request-for-advice-from-the-committee-on-climate-change](http://www.gov.uk/government/publications/uk-climate-targets-request-for-advice-from-the-committee-on-climate-change)

<sup>8</sup> Clean Growth Strategy: [www.gov.uk/government/publications/clean-growth-strategy](http://www.gov.uk/government/publications/clean-growth-strategy)

In November 2017 the UK government published its Industrial Strategy, which includes a Clean Growth Grand Challenge<sup>9</sup>. The Grand Challenge aims to put the UK at the forefront of industries of the future, by maximising the advantages for UK industry from the global shift to low-carbon.

## 25 Year Environment Plan

Building on the proposals set out in the CGS, the UK outlined its plans to improve the environment in the 25 Year Environment Plan. The 25 Year Environment Plan<sup>10</sup> was published in January 2018 and sets out the UK's approach to deliver on our ambition to leave our environment in a better state than we inherited, and to fully seize the opportunities of clean growth.

## The second National Adaptation Programme (NAP) and the third strategy for Adaptation Reporting Power (ARP)

The Climate Change Act mandates that on a five-yearly cycle the UK government produce a Climate Change Risk Assessment (CCRA), followed by a National Adaptation Programme (NAP), setting out actions to address the risks identified in the CCRA.<sup>11</sup> The second CCRA (published January 2017) endorsed the six priority risk areas identified by the independent evidence report produced by the Adaptation Sub-Committee in July 2016. These are:

- Flooding and coastal change risks to communities, built environment and infrastructure
- Risks to health and wellbeing and productivity from high temperatures
- Risk of shortages in the public water supply and for agriculture, energy generation and industry with impacts on freshwater ecology
- Risks to natural capital including terrestrial, coastal, marine and freshwater ecosystems, soils and biodiversity
- Risks to domestic and international food production and trade
- New and emerging pests and diseases, and invasive non-native species affecting people, plants and animals

The second NAP was published in July 2018 and addresses the key risks highlighted in the second CCRA, showing the actions the UK government is, and will be, taking to address the risks and opportunities posed by a changing climate over the following five-year period. This was developed working with and drawing on the UK government's 25 Year Environment Plan. The NAP presents a set of actions in a broad range of areas: natural environment, infrastructure, people and the built environment, business and industry, and local government. This includes actions related to building resilience of energy infrastructure to flooding.

The NAP is primarily for England but also covers reserved and non-devolved matters. Devolved Administrations lead their own adaptation programmes. In October 2019, the government responded to the Adaptation Sub-Committee's biennial report on adaptation

<sup>10</sup> 25 Year Environment Plan: [www.gov.uk/government/publications/25-year-environment-plan](http://www.gov.uk/government/publications/25-year-environment-plan)

<sup>11</sup> Climate change: a second national adaptation programme (2018 to 2023), July 2018, [www.gov.uk/government/publications/climate-change-second-national-adaptation-programme-2018-to-2023](http://www.gov.uk/government/publications/climate-change-second-national-adaptation-programme-2018-to-2023)

progress under the second NAP<sup>12</sup>. In 2019, Scotland, Wales and Northern Ireland all published their climate adaptation programmes, setting out planned adaptation action over the next five years.<sup>13</sup>

## Adaptation Reporting Power (ARP)

The Adaptation Reporting Power (ARP)<sup>14</sup>, a discretionary power under the Climate Change Act 2008, helps ensure that ‘persons or bodies with a function of a public nature’ and ‘statutory undertakers’ (reporting organisations) are taking actions to adapt to climate change by reporting on how they are addressing current and future climate impacts. The adaptation reporting process has been through two complete cycles so far. Reports submitted in the second round of adaptation reporting are available on GOV.UK.<sup>15</sup>

In the second cycle of adaptation reporting in 2013, the UK government chose a voluntary and flexible approach to reporting. Similarly, the third Adaptation Reporting strategy, published alongside the NAP in 2018, adopts a voluntary and sector-focused approach, with the reporting cycle running from the beginning of 2019 to the end of 2021. As of December 2018, over 90 organisations have committed to submit a report on their preparedness to climate change risks.<sup>16</sup> Gas and electricity companies, including transmission and distribution, are among those who will report on how they are strengthening resilience to the risks set out in the second CCRA, and what actions are being taken to reduce the vulnerability of core national infrastructure. In the third Strategy for Adaptation reporting, a number of key CCRA risks were identified for the energy sector to report on, including: cascade failures due to interdependencies; risks from flooding; risks to pipelines from high river flows and bank erosion; risks from high winds and lightning; risks to offshore infrastructure from storms and high waves. As part of the Resilient Electricity Networks for Great Britain (RESNET) consortium, researchers from the University of Manchester and Newcastle University have developed models that combine climate change projections with information about the National Grid to assess its long-term resilience. Electricity network companies spent £130 million on flood defence work from 2010-15, with a further £100 million due to be spent on flood defence by networks before 2021. Work is based around revised design guidelines (ETR138), which state that primary substations with over 10,000 connections should be defended against 1/1000-year flood events.<sup>17</sup>

## Strategies and legislation in Northern Ireland, Scotland and Wales

Energy policy is mainly devolved to Northern Ireland and partly devolved to Wales and Scotland. Climate change policy is devolved to Wales, Scotland and Northern Ireland, although the UK government retains control over many energy policy areas and also some other important policy areas which deliver emissions reductions.

### Northern Ireland

In Northern Ireland energy policy and the independent regulation of energy companies are devolved matters. Northern Ireland's current energy strategy is set out in the Strategic Energy Framework (SEF) for the period 2010-2020. Northern Ireland's future energy strategy is likely to concentrate on a more consumer-led decentralised energy system and decarbonisation in areas such as electricity, heat and transport. The Department for the Economy NI is currently developing a new Energy Strategy for NI. A Call for Evidence will close in early 2020 and the department intends to publish an options paper for consultation by the end of March 2021, following the consultation, and subject to securing Ministerial and Executive approval, the aim is for the final strategy to be in place by November 2021.

The Single Electricity Market (known as the 'SEM') is a single, shared wholesale electricity market between Ireland and Northern Ireland. It was formed in November 2007 and underwent a reform programme in 2018 called the Integrated Single Electricity Market (or 'I-SEM'). These reforms to the market aim to integrate the all-island electricity market with European energy markets (as part of the internal energy market – or 'IEM'). They are designed to introduce efficiencies of interconnector flows, encourage new investment in the market, apply downward pressure on prices, create enhanced trading opportunities and options through the introduction of continuous trading in the intra-day, day-ahead, forwards, and balancing timeframes and facilitate the integration of renewables and continue to provide security of supply. The SEM one year ahead auction in December 2018 secured just under 2 gigawatts (GW) of capacity for Northern Ireland, which ensured that there would be sufficient capacity to meet demand in Northern Ireland during winter 2019-20.

The four year ahead capacity auction on 28 March 2019 secured 1.9GW of capacity for Northern Ireland with an auction clearing price of £43,030 per megawatts (MW) per year, which ensures sufficient capacity to meet expected demand for the year 2022-23.

### Scotland

Scotland's climate change legislation requires Scottish Ministers to reduce emissions in Scotland to net-zero by 2045, with interim targets of 56% reduction (from a 1990 baseline) by 2020, 75% reduction by 2030, 90% reduction by 2045 and annual targets for each other year to net-zero.

The Climate Change Plan published in February 2018 sets out the Scottish Government's comprehensive package of policies and proposals for meeting emissions reduction targets under the Climate Change (Scotland) Act 2009 over the period to 2018 to 2032 – these targets have subsequently been increased (as above) through the Climate Change (Emissions Reduction Targets) (Scotland) Act 2019. The second annual report monitoring progress towards the Plan was published in December 2019.<sup>18</sup> The Scottish Government has committed to update the Plan in December 2020 to reflect the increased ambition of the 2019 Act targets. The Climate Change (Scotland) Act 2009 required Scottish Ministers to reduce emissions in

---

<sup>18</sup> Second annual report monitoring progress towards Scotland's 2018 Climate Change Plan, Dec 2019, [www.gov.scot/publications/climate-change-plan-monitoring-report-2019/](http://www.gov.scot/publications/climate-change-plan-monitoring-report-2019/)

Scotland by at least 80% by 2050, with an interim target of 42% by 2020 and annual targets for each year to 2050.

The Scottish Government also published an Energy Strategy<sup>19</sup> in December 2017, which sets out a vision for the future of energy in Scotland to 2050. The Energy Strategy was developed alongside, and is fully consistent with, the existing Climate Change Plan, taking a wider view of the long-term transformational change required in the energy sector. Together, the Energy Strategy and the Climate Change Plan provide the strategic framework for Scotland's transition to an inclusive, innovative, low-carbon economy; reducing greenhouse gas emissions whilst maximising the social and economic opportunities. The framework covers reserved areas as well as devolved, focusing action on those areas that the Scottish Government can directly affect.

## **Wales**

The Environment (Wales) Act 2016<sup>20</sup> requires Welsh Ministers to reduce emissions in Wales by at least 80% by 2050. This Act also requires Welsh Ministers to set interim emissions reduction targets for the years 2020, 2030 and 2040, and establish a system of carbon budgeting that together create an emissions reduction pathway to the 2050 target.

Regulations passed by the National Assembly for Wales in December 2018 set the 2020 target at 27%, the 2030 target at 45% and the 2040 target at 67%. The first two carbon budgets (2016-20 and 2021-25) were also set in legislation. Since then, the Welsh Government has accepted the CCC's recommendation to increase Wales' 2050 target to 95% and has requested the CCC's advice on how this affects the interim targets and carbon budgets set in 2018. It has also asked the CCC to explore how Wales might go beyond 95%. The Welsh Government will ask the Senedd (Welsh Parliament) to amend the targets and budgets legislation early in 2021.

The Act requires Welsh Ministers to publish a plan for meeting each carbon budget. The plan for the first carbon budget, Prosperity for All: A Low Carbon Wales, was published in March 2019 and contains 100 policies and proposals from all emissions sectors and Ministerial portfolios.<sup>21</sup> The plan for the second carbon budget will be published in 2021.

The Welsh Government has set targets to drive deployment of renewables and to ensure Wales benefits from new energy developments. Wales has targets to produce 70% of the electricity used from renewable sources by 2030, and of 1GW of locally owned renewable energy capacity by 2030. There is also an expectation that new all renewable energy projects developed in Wales from 2020 have an element of local ownership. The National Development Framework will set out the Welsh Government's vision for how renewable energy should be delivered in Wales to help respond to the climate emergency.

### *ii Strategy relating to the five dimensions of the EU's Energy Union*

## **Decarbonisation**

Through the Climate Change Act, the UK has established in law the first five carbon budgets covering the period from 2008-32, with the sixth carbon budget due to be set in 2021. The UK

---

<sup>19</sup> Scottish Energy Strategy: The Future of Energy in Scotland, 2017, [www.gov.scot/publications/scottish-energy-strategy-future-energy-scotland-9781788515276/](http://www.gov.scot/publications/scottish-energy-strategy-future-energy-scotland-9781788515276/)

<sup>20</sup> Environment (Wales) Act 2016, <https://gov.wales/topics/environmentcountryside/consmanagement/natural-resources-management/environment-act/?Lang=en&skip=1&lang=en>

<sup>21</sup> Prosperity for all: A low carbon Wales, <https://gov.wales/prosperity-all-low-carbon-wales>

has met the first two carbon budgets (2008-12 and 2013-17) and latest emissions projections suggest we are on track to meet the third (2018-22). We recognise the need for further action to meet the fourth and fifth carbon budgets (2023-2032).

Scotland has statutory annual emissions reduction targets. The most recently reported target (for 2017) was missed, but the preceding three years (2014, 2015 and 2016) were all met. Actual emissions from Scotland have been reduced by almost half (47%) between the 1990 baseline and 2017.<sup>22</sup>

The most recent data for Wales estimates that emissions totalled 42.2 metric tonnes of carbon dioxide equivalent (MtCO<sub>2</sub>e) in 2017, a fall of 25% compared to base year emissions.<sup>23</sup> This represents a 13% decrease compared to 2016, reflecting the volatile nature of Welsh emissions. The CCC believes that “if Wales can maintain this progress it will be on track to meet its first carbon budget”.<sup>24</sup>

## Energy efficiency

To meet the UK's 2050 net zero climate change target, emissions from buildings will need to be near zero, coupled with action on industrial processes. This requires improving energy efficiency and energy management and decarbonising nearly all heating and cooling of buildings. Adapting to climate change risks, including overheating, can also reduce energy demand. New building developments can incorporate mechanical or passive ventilation systems to provide natural cooling limiting air conditioning use. The UK is taking a range of actions including addressing barriers to energy efficiency and low-carbon investment, such as supporting organisations to access finance.

The CGS provides a framework for driving UK policy on energy efficiency. Some policies and measures on energy efficiency that have already been implemented include commitments to fund energy efficiency improvements in the public sector, industry, business and homes. On 15 October 2019, the UK government published its response to the CCC's annual report, which included key proposals to improve the energy performance of non-domestic buildings. The UK government launched consultation on a future target of Energy Performance Certificate (EPC) Band B by 2030 for minimum energy efficiency standards in non-domestic rented buildings, and committed to consult in 2020 on introducing mandatory in-use energy performance ratings for non-domestic buildings in the private sector, which will be key to helping businesses to understand and improve the actual energy performance of their buildings.

Northern Ireland contributes to the UK's energy efficiency targets with the Northern Ireland Sustainable Energy Programme (NISEP) delivering up to 200GWh per year of energy savings as required by Article 7 of the Energy Efficiency Directive<sup>25</sup>. Northern Ireland is currently developing a new Energy Strategy, a key theme of which will be energy efficiency. Through the work to develop the Energy Strategy, the aim is to ensure co-ordinated and effective delivery of

<sup>22</sup> Scottish greenhouse gas emissions 2017, June 2019 [www.gov.scot/publications/scottish-greenhouse-gas-emissions-2017/](http://www.gov.scot/publications/scottish-greenhouse-gas-emissions-2017/)

<sup>23</sup> Devolved Administrations - Greenhouse Gas Reports, National Atmospheric Emissions Inventory (2019) [http://naei.beis.gov.uk/reports/reports?section\\_id=4](http://naei.beis.gov.uk/reports/reports?section_id=4). The baseline year for each greenhouse gas is 1990 (carbon dioxide, methane, nitrous oxide) or 1995 (hydrofluorocarbons, perfluorocarbons, sulphur hexafluoride, nitrogen trifluoride)

<sup>24</sup> The Committee on Climate Change (2019), Reducing UK emissions – 2019 Progress report to Parliament, [www.theccc.org.uk/publication/reducing-uk-emissions-2019-progress-report-to-parliament/](http://www.theccc.org.uk/publication/reducing-uk-emissions-2019-progress-report-to-parliament/)

<sup>25</sup> UK National Energy Efficiency Action Plan 2014, [www.gov.uk/government/publications/the-uks-national-energy-efficiency-action-plan-and-building-renovation-strategy](http://www.gov.uk/government/publications/the-uks-national-energy-efficiency-action-plan-and-building-renovation-strategy).

energy efficiency policies and programmes across Northern Ireland and to examine the merits of establishing a new energy efficiency target for Northern Ireland if appropriate.

In Scotland, Energy Efficient Scotland was launched in May 2018.<sup>26</sup> This ambitious 20-year programme contains a set of actions to make Scotland's buildings near zero carbon wherever feasible by 2050 and to do so in a way that is socially and economically sustainable.

Energy Efficient Scotland will help to remove poor energy efficiency as a driver for fuel poverty and will reduce greenhouse gas emissions through more energy efficient buildings and decarbonising Scotland's heat supply. Over the lifetime of Energy Efficient Scotland, an estimated £10 to £12bn from public and private sources will be invested in improving the energy efficiency of Scotland's buildings generating economic opportunity across the whole of Scotland.

In Wales, the Welsh Government has invested more £265m in the Warm Homes Programme demand led Nest Scheme and Arbed area-based scheme since 2009, which has improved the energy efficiency of over 50,000 homes. By the current funding period in March 2021, Welsh Government investment will have reached £344m in the Warm Homes Programme and benefitted more than 75,000 homes. Nearly 130,000 people have received energy efficiency advice through the Warm Homes Programme since 2011.

### **Energy security**

The UK is committed to ensuring there are secure supplies for consumers, regardless of the energy mix, and the CGS sets out actions to enhance energy security by delivering a more diverse and reliable energy mix. The UK is supporting smarter, flexible networks thereby enabling the integration of clean generation. Further detail on strengthening the resilience of the energy sector to climate change risks can be found in the section above (see - the third strategy for Adaptation Reporting Power (ARP)).

The UK government recognises a range of benefits that interconnection can provide and strongly supports greater electricity trading with our European partners. The electricity system in Great Britain is currently connected to north-west Europe via 4GW of interconnector capacity. 1GW of interconnection also links Great Britain with the Single Electricity Market on the island of Ireland. In addition to the 5GW already operational, 4.8GW of capacity is already in construction, and a further 8.1GW is progressing through regulatory process. This is expected to increase our level of interconnection by 2030.

We continue to support developing liberalised markets and successfully using competition to drive down energy prices. We are embracing the opportunity to increase renewable generation, decarbonise the economy and maintain affordability. We are implementing rules for a well-functioning UK market and our Electricity Market Reform introduced measures on, for example, Contracts for Difference and wholesale market liquidity. The CGS outlines the UK's commitment to move towards a more dynamic market, empowering the consumer and realising the potential of renewables, small scale generation, greater flexibility, smart metering and the digital revolution.

---

<sup>26</sup> Energy Efficient Scotland Route Map, May 2018, [www.gov.scot/publications/energy-efficient-scotland-route-map/pages/1/](http://www.gov.scot/publications/energy-efficient-scotland-route-map/pages/1/)

## Research, innovation and competitiveness

The UK's early action on clean growth means that it has nurtured a broad range of low-carbon industries, including some sectors in which we have world leading positions. This success is built upon wider strengths – the UK's scientific research base, expertise in high-value service and financial industries, and a regulatory framework that provides long-term direction and support for innovation and excellence in the design and manufacturing of leading-edge technology.

This progress has been aided by the falling costs of many low-carbon technologies: renewable power sources like solar and wind are comparable in cost to coal and gas in many countries; energy efficient light bulbs are over 80% cheaper today than in 2010; and the price of lithium-ion batteries has fallen by 85% since 2010<sup>27</sup> and is expected to more than halve again by 2030 according to industry.<sup>28</sup> As a result of this technological innovation, new high value jobs, industries and companies have been created. This is driving a new, technologically innovative, high growth and high value 'low-carbon' sector of the UK economy.

Due to the UK's world leading expertise in technologies such as offshore wind, power electronics for low-carbon vehicles and electric motors, and global leadership in green finance, we are successfully exporting goods and services around the world. For example, in 2018, 1 in every 5 battery electric cars sold in Europe was built in the UK.<sup>29</sup> This progress means there are nearly 400,000 jobs in low-carbon businesses and their supply chains, employing people in locations across the country.<sup>30</sup>

Capturing part of the global opportunity while continuing to drive down carbon emissions from our own activities provides a huge economic opportunity for the UK. By one estimate, the UK low-carbon economy could grow by an estimated 11% per year between 2015 and 2030 – 4 times faster than the rest of the economy – and could deliver between £60 billion and £170 billion of export sales of goods and services by 2030.<sup>31</sup> This means that clean growth can play a central part in our Industrial Strategy – building on our strengths to drive economic growth and boost earning power across the country.

The Department for Business, Energy and Industrial Strategy (BEIS) holds the responsibility for strategic oversight of climate and energy science and innovation across UK government, promoting and protecting the UK government's policy interests. Its Science and Innovation for Climate and Energy Directorate (SICE) provides the science and engineering evidence and data to support, constructively challenge and enable development and delivery of national energy policy.

Wider prioritisation of activity, research and innovation spending on energy is co-ordinated through the UK government's Energy Innovation Board (EIB), with SICE providing the

secretariat for this. There is currently no separate energy research and innovation strategy. Prioritisation decisions are informed by the Industrial Strategy and the CGS.

*iii Overview table with key objectives, policies and measures of the plan*

As of 31 January 2020, the UK has left the EU and is no longer part of the Energy Union. However, UK policies and measures relating to the five dimensions of the EU's Energy Union are detailed in [section 3.1.1](#).

The Climate Change Plan sets out the Scottish Government's policies and proposals to reduce emissions over the period to 2032 in line with the reduction target in the 2009 Act.

The plan for the first Welsh carbon budget, Prosperity for All: A Low-Carbon Wales, was published in March 2019 and contains 100 policies and proposals from all emissions sectors and Ministerial portfolios.<sup>32</sup> The Welsh Government's plan for meeting Wales' second carbon budget will be published in 2021.

## 1.2 Overview of current policy situation

*i National energy system and policy context of the national plan*

The strategy of the EU's Energy Union consists of five dimensions which inform the structure and content of this plan. As of 31 January 2020, the UK has left the EU and is no longer part of the Energy Union. The UK government's CGS sets out the UK's proposals to deliver increased economic growth and decreased emissions:

- Accelerating clean growth
- Improving business and industry efficiency
- Improving UK homes
- Accelerating the shift to low-carbon transport
- Delivering clean, smart, flexible power
- Enhancing the benefits and value of our natural resources
- Leading in the public sector

*ii Current energy and climate policies and measures relating to the five dimensions of the EU Energy Union*

As stated above, UK policies and measures relating to the five dimensions of the EU's Energy Union are detailed in [section 3.1.1](#).

The Climate Change Plan sets out the Scottish Government's policies and proposals to reduce emissions over the period to 2032 in line with the reduction target in the 2009 Act.

The Welsh Government's plan for meeting Wales' second carbon budget will be published in 2021.

---

<sup>32</sup> Prosperity for All: A Low Carbon Wales, Welsh Government, 2019: <https://gov.wales/prosperity-all-low-carbon-wales>

*iii Key issues of cross-border relevance*

Northern Ireland and Ireland have a shared wholesale single electricity market (SEM). It was formed in November 2007 and underwent a reform programme in 2018 called the Integrated Single Electricity Market (or 'I-SEM'). The reforms introduced new and more efficient wholesale trading arrangements, closer integration with other electricity markets and a more competitive capacity mechanism. While Northern Ireland is wholly dependent on Great Britain for its natural gas supply, it has gas interconnection with Ireland and gas security of supply is considered on a national and regional basis.

The UK is part of the wider North Seas region, which has a large renewable energy potential. More information on this cooperation is set out in section 1.4(ii).

Another forum for regional cooperation is the Energy Work Sector under the British Irish Council (BIC). This provides opportunities for the governments of the UK, Ireland, Scotland, Wales, Isle of Man, Jersey and Guernsey to share information and work together on energy issues of common interest.

*iv Administrative structure of implementing national energy and climate policies*

The UK government has a legally binding climate change framework under the Climate Change Act 2008. To ensure the UK is on an appropriate emissions reduction pathway, the UK government is obliged to set legally binding five-year caps on emissions twelve years in advance (carbon budgets), informed by advice from our independent statutory adviser, the CCC. Additionally, the UK is required to publish a report setting out the policies and proposals to meet budgets after setting each carbon budget. See Table 1 for the UK's actual and projected performance against the carbon budgets.

**Table 1: Performance against carbon budgets<sup>33</sup>**

Carbon budget:	1	2	3	4	5
	(2008-12)	(2013-17)	(2018-22)	(2023-27)	(2028-32)
	Actual	Actual	No carry forward/ (with carry forward)		
	Actual	Actual	Projection	Projection	Projection
Carbon budget level: cumulative emissions	3,018	2,782	2,544 (2,632)	1,950	1,725
Average required reduction vs 1990 emissions <sup>34</sup> , %	-24%	-30%	-36%	-51%	-57%
Projected emissions, Mt	2,982 (actual)	2,398 (actual)	2,456	2,059	1,890
Result vs budget level, Mt	-36 Mt	-384 Mt	-88Mt (-176 Mt)	+109 Mt	+165 Mt
Result vs budget, %	-1%	-14%	-3% (-7%)	+6%	+10%

The Climate Change Act established the Committee on Climate Change (CCC) to advise the UK government and the Devolved Administrations on setting and meeting carbon budgets and other related matters.

The Scottish Parliament passed the Climate Change (Scotland) Act in 2009, establishing Scotland's 2050 target and the supporting framework of interim and annual targets. The Scottish Government is required to publish reports every five years setting out the policies and proposals to meet annual targets over periods of around the next fifteen years. The Climate Change (Scotland) Act also establishes Scotland specific roles for the CCC as an independent advisory body. On 25 September 2019, the Scottish Parliament approved the Climate Change (Emissions Reductions Targets) (Scotland) Act. Following advice received from the CCC, the Act sets a net zero emissions target for 2045. It also includes interim targets of a 75% reduction by 2030 and a 90% reduction by 2040 and makes provision for the establishment of a Citizens Assembly on Climate Change.

<sup>33</sup> Actual emissions (carbon budgets 1 and 2) - Source: BEIS, Final UK GHG emissions statistics 1990-2017 (table 9)

[www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-2017](http://www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-2017)

Projected emissions (carbon budgets 3, 4 and 5) - Source: BEIS, Energy and Emissions Projections 2018 (web table 2.3), [www.gov.uk/government/publications/updated-energy-and-emissions-projections-2018](http://www.gov.uk/government/publications/updated-energy-and-emissions-projections-2018)

<sup>34</sup> Base year emissions are revised each year, so the percentage reductions against carbon budgets are subject to change.

The National Assembly for Wales passed the Environment (Wales) Act in 2016<sup>35</sup>, which includes Wales's 2050 target and allows for the establishment of an advisory body. The CCC currently exercises these functions. The National Assembly passed secondary legislation in 2018 to set decadal interim targets and the first two carbon budgets. Since then, the Welsh Government has accepted the CCC's recommendation to increase Wales's 2050 target to 95% and has requested the CCC's advice on how this affects the interim targets and carbon budgets set in 2018. The Welsh Government will ask the Welsh Parliament to amend the targets and budgets legislation in 2020.

## 1.3 Consultations and involvement of national and EU entities and their outcome

### *i Involvement of the national parliament*

In accordance with the Climate Change Act, a carbon budget must be made by order, subject to affirmative resolution procedure.<sup>36</sup> Before laying a draft statutory instrument containing an order setting a carbon budget, the UK government must take into account the advice of the CCC as well as any representations made by the Devolved Administrations.

A carbon budget must be set with a view to meeting the 2050 target and complying with international obligations of the UK. The Climate Change Act sets out a number of matters that must also be taken into account when deciding the level of a carbon budget.<sup>37</sup>

In Scotland, the Climate Change (Scotland) Act 2009, requires that Scottish Ministers set annual targets, in secondary legislation, for each year from 2010 to 2050. Scottish Ministers also take advice from the CCC on the targets before these are set.

In Wales, the Welsh Ministers must lay interim targets and carbon budgets in the Welsh Parliament. Before doing so, they must obtain and have regard to advice from the CCC. The Environment (Wales) Act 2016 sets out the matters Welsh Ministers must take into account when setting a carbon budget and those the CCC must consider in its advice.<sup>38</sup>

### Reporting to Parliament

The UK government must lay before Parliament an Annual Statement of Emissions by 31 March in the second year following that to which it relates. It must also prepare and lay a Final Statement for each budgetary period by 31 May in the second year following the end of the period to which it relates, setting out, among other things, the final amount for the period of UK emissions, removals and net emissions of each greenhouse gas.

In June each year (and in July in the second year after the end of a budgetary period), the CCC must lay before Parliament a report setting out its views on progress against the carbon budgets and 2050 target, to which the UK government is required to respond by October. In

---

<sup>35</sup> Environment (Wales) Act 2016, [www.legislation.gov.uk/anaw/2016/3/part/2/enacted](http://www.legislation.gov.uk/anaw/2016/3/part/2/enacted)

<sup>36</sup> More information on the affirmative resolution procedure can be found at: [www.parliament.uk/site-information/glossary/affirmative-procedure/](http://www.parliament.uk/site-information/glossary/affirmative-procedure/)

<sup>37</sup> See s10(2) of the CCA: [www.legislation.gov.uk/ukpga/2008/27/section/10](http://www.legislation.gov.uk/ukpga/2008/27/section/10)

<sup>38</sup> Environment (Wales) Act 2016, [www.legislation.gov.uk/anaw/2016/3/part/2/enacted](http://www.legislation.gov.uk/anaw/2016/3/part/2/enacted)

the second year after the end of a budgetary period the report will also set out the CCC's views on how the UK performed on meeting the last carbon budget.

In Scotland, Scottish Ministers must lay before the Scottish Parliament an annual report that states whether the annual target has been met. The CCC must lay before the Scottish Parliament an annual report setting out Scotland's progress against achieving its targets and the Scottish Government provide a response to this report.

In Wales, the Welsh Ministers must lay a statement in the Senedd no later than two years after the end of each budget outlining the final amount of net Welsh emissions and the number of offsets used. If the carbon budget has not been met, Welsh Ministers must within three months lay before the Senedd a report setting out proposals and policies to compensate for the excess emissions in later budgetary periods. Welsh Ministers must also lay a statement in the Senedd, within two years of each interim target year outlining the final amount of net Welsh emissions for the target year, the number of offsets used for the year and why the target has been met or missed.

Welsh Ministers must also lay CCC progress reports on carbon budgets and interim targets before the Senedd, and Ministers' respond to the points raised by the CCC within six months.

#### *ii Involvement of local and regional authorities*

The BEIS Local Energy Programme has now supported Local Energy Strategies for each of the 38 Local Enterprise Partnerships in England. These documents are feeding into Local Economic planning at local and regional levels. These strategies form the basis of new Local Energy Hubs, which are resourced to support the development of commercially viable low-carbon energy projects. This includes raising awareness, building partnerships with green finance as well as developing the pipeline of projects. To support the hubs, we are also building a number of tools including the SCATTER tool which will support Local Authorities to report on action and also to help prioritise actions.

Alongside the Local Energy Programme, we have launched a UK wide innovation programme, Prospering from the Energy Revolution, which is working with Local Authorities across the UK to demonstrate and design future local energy systems.

The Scottish Government has an ambition to achieve 1GW of community and locally owned renewables by 2020, and 2GW by 2030, as well as an ambition to spread the economic benefits of commercial renewables schemes through shared ownership with communities.<sup>39</sup> As of June 2017, there was an estimated minimum of 666 MW of community and locally owned renewable energy capacity operating in Scotland. Local government in Scotland is already playing a key role in delivering energy efficiency programmes, primarily for the domestic sector. The Scottish Government sees a stronger role for local government in the future. In 2017, there was a consultation on the possible introduction of a statutory duty on local authorities to develop Local Heat and Energy Efficiency Strategies (LHEES), to be delivered in consultation with local stakeholders and in collaboration with community planning partners. This would provide the link between the delivery of long-term targets and national policies, and the delivery of energy efficiency and heat decarbonisation on the ground. A position paper on Local Energy Systems in Scotland has been developed, further to a commitment made in the Energy Strategy, and is due to be published in Autumn 2020.

---

<sup>39</sup> Source: Renewable and low carbon energy, Scottish Government website, [www.gov.scot/policies/renewable-and-low-carbon-energy/local-and-small-scale-renewables/](http://www.gov.scot/policies/renewable-and-low-carbon-energy/local-and-small-scale-renewables/)

The Welsh Government is supporting local authorities in the development of energy plans. There are transformative opportunities in developing local or regional energy plans, driven by network and/or national regional energy data, which will help decision-making and enable us to meet decarbonisation objectives in Wales. The Welsh Government has committed to providing support to enable regional strategic energy plans to be developed, as part of the Cardiff City Region and the Mid Wales and North Wales Growth Deals work. This will build on earlier work undertaken in the Swansea Bay City Region by the Institute of Welsh Affairs and Regen.<sup>40</sup> Using the learning from this work, the Welsh Government will explore the potential for developing more locally owned energy plans, which could lead to pipelines of energy projects and provide more clarity on the energy infrastructure required for a low-carbon energy system in Wales.

The Welsh Government has set a target to produce 70% of the electricity Wales uses from renewable sources by 2030, and for 1GW of locally owned renewable energy capacity by 2030. In 2018 Wales generated enough renewable electricity to meet 50% of its power use. At the end of 2018 there was 783MW of renewable energy in local ownership in Wales. 540MW of this capacity is renewable electricity and 243MW is renewable heat. In total there are over 64,600 locally owned renewable energy projects in Wales.<sup>41</sup>

*iii Consultations of stakeholders, including the social partners, and engagement of civil society and the general public*

The UK is committed to proper public participation and consultation and is committed to meeting its obligations under Article 7 of the Aarhus Convention, which are set out in the UK's published Consultation Principles.<sup>42</sup>

Ahead of the UK government setting a carbon budget, it is required to consider the advice of the CCC on the appropriate budget level, as well as any representations made by the Devolved Administrations. For the fifth carbon budget, the CCC published its advice in November 2015 and the budget was set in June 2016, in line with the requirements of the Climate Change Act. In preparing its advice on the level of the fifth carbon budget, the CCC ran a public call for evidence in mid-2015, to which 51 organisations responded. These organisations included representatives from the power, transport, buildings, industrial and agricultural sectors, as well as Non-Governmental Organisations (NGOs) and others. In addition, the CCC ran more than ten roundtable and workshop discussions with business stakeholders, including trade associations, and more than 200 meetings with individual stakeholders across all sectors including areas such as fuel poverty, competition and technological progress.

In the Clean Growth Strategy, the UK government stated that it welcomed views and comments on our approach to decarbonising the economy. An opportunity to provide feedback on the Strategy was provided between 12 October and 31 December 2017, and we received 132 responses from a wide range of stakeholders, including individuals, companies from different sectors, academia, trade associations, NGOs and local government.

As the policies and proposals in the Clean Growth Strategy are developed and implemented over time, they are subject to public consultation as part of the normal regulatory process.

<sup>40</sup> Swansea Bay City Region: A Renewable Energy Future, April 2018, [www.iwa.wales/wp-content/uploads/2018/04/Regen-SBCR-A-Renewable-Future-FINAL.pdf](http://www.iwa.wales/wp-content/uploads/2018/04/Regen-SBCR-A-Renewable-Future-FINAL.pdf)

<sup>41</sup> Energy generation in Wales, Welsh Government website, <https://gov.wales/energy-generation>.

<sup>42</sup> UK Consultation Principles, July 2012, [www.gov.uk/government/publications/consultation-principles-guidance](http://www.gov.uk/government/publications/consultation-principles-guidance)

The UK government has conducted a number of public consultations on issues relating to the five dimensions of the EU's Energy Union, including on the UK Industrial Strategy Green paper.<sup>43</sup> A list of stakeholder and public consultations is set out below.

In summer 2018, the Welsh Government consulted on early ideas for meeting the Wales 2030 target across all emissions sectors.<sup>44</sup> Further policy-specific engagement and consultation will follow as appropriate.

The Scottish Energy Strategy committed the Scottish Government to publishing an Annual Energy Statement to monitor the strategy's delivery. The first of these was published on 15 May 2019 alongside a new Annual Compendium of Scottish Energy Statistics (ACSES).

The statement highlights the key developments in the sector which will have an impact upon Scotland's ability to deliver the strategy, progress made to date, and key plans for the coming year and beyond.

The Scottish Government has also consulted with the Scottish Energy Advisory Board (SEAB) on progress of the Energy Strategy and is working towards agreeing a new structure of expert advisory groups – one that is consistent with, and ensures effective coverage of, the strategic priorities set out in the strategy.

The Scottish Government's Climate Change Programme is supported by a range of engagement activities. The Big Climate Conversation included strands for the public sector, private sector and members of the public. This is an important part of shaping Scotland's response to the global climate emergency and all government portfolios are encouraged to engage with the events.

The public engagement element consisted of a series of 10 large scale, open public workshops designed to ascertain the public's awareness of the issue as a national endeavour and the appetite for particular societal changes and actions required to meet Scotland's goals. The workshops were supplemented by a programme of digital engagement through Twitter and Facebook and a free toolkit and funding were provided to enable groups to conduct their own sessions and contribute to the conversation. Over 2,500 people across Scotland participated in the Big Climate Conversation. The findings were summarised in the Big Climate Conversation Report that was published on 30 January 2020.<sup>45</sup>

With regards to public sector engagement a written consultation on the role of the public sector in tackling climate change, ran from September to December 2019. There is also a series of face-to-face engagements using existing networks such as the Scottish Leaders Forum, Convention of Highlands and Islands, and the Sustainable Scotland Network. Business engagement is happening with both multi-stakeholder and sector specific events. The Cabinet Secretaries for Finance, Economy and Fair Work will host a Business Summit in October; the Cabinet Secretary for Environment, Climate Change and Land Reform will host a climate change workshop at the Business in Parliament event in November; and other workshop events are being planned for small businesses (with FSB) and larger businesses (with CBI). In parallel, additional sector specific, portfolio-led business engagement events are being

planned, including the Energy Intensive Industry roundtable and an event focusing on decarbonising transport fleets.

The Department for the Economy in Northern Ireland has been considering how to advance proposals for an energy strategy that will enable new and challenging decarbonisation targets. Following a Call for Evidence in December 2019 the department will consider the responses and plans to establish five working groups on consumers, energy efficiency, heat, power and transport. A summary report of responses will be published in June 2020. The department intends to develop an Energy Transition Model for the entire energy system which will test different scenarios and pathways to estimate the impact on energy demand. An options paper will be published by end of March 2021 with the aim of a final strategy in place by November 2021.

The UK held a 'Green Great Britain & Northern Ireland Week' in October 2018, to showcase the opportunities clean growth offers the UK and raise understanding of how business and the public can contribute to tackling climate change. Next year, the UK will host the UN climate change conference COP26, in Glasgow with our partners, Italy. The UK is committed to working with all countries and joining forces with civil society, companies and people on the frontline of climate change to inspire action ahead of COP26.

#### *iv Consultations of EU Member States*

As of 31 January, the UK has left the EU and is no longer a Member State. While a Member State the UK worked closely with Member States party to the North Seas Energy Cooperation (NSEC). The UK also worked with Member States on various technical and policy aspects of the draft NECP during workshop sessions at the NECP Technical Working Groups meetings. UK government officials attended workshops in France, Germany and the Netherlands to share ideas and comment on their respective NECPs. UK government officials also engaged in discussions with officials from Member States on preparation of their respective NECPs during meetings of the Concerted Action on the Energy Efficiency Directive (CA-EED).

#### *v Iterative process with the Commission*

A representative from BEIS attended NECP Technical Working Group meetings in 2018 and 2019 during the development of Member States' National Energy and Climate Plan (NECPs), taking onboard Commission advice in the development of the draft and final NECP.

Following the submission of the UK's draft NECP in December 2018, the Commission published a suite of documents under the Governance Regulation assessment and recommendations process. This included 11 formal recommendations for the UK to consider in its final NECP and an assessment of the draft NECP, which underpinned the Recommendations document. The UK government has considered all of the Commission's recommendations carefully in view of the UK's departure from the EU as of 31 January 2020, and has provided a response to each at Annex A to this NECP document.

## 1.4 Regional cooperation in preparing the plan

### *i Elements subject to joint or coordinated planning*

### *ii Explanation of how regional cooperation is considered in the plan*

#### North Seas Energy Cooperation

The UK is part of the wider North Seas region, which has a large renewable energy potential.

Offshore wind generation and grid infrastructure projects may have cross-border effects on energy prices, security of supply and the environment, including availability of marine space as well as the pace of innovation. The North Seas countries therefore have benefits to gain from cooperation.

The NSEC a voluntary, market-oriented, regional cooperation initiative established in 2016.<sup>46</sup>  
The NSEC is a voluntary, market-oriented, regional cooperation initiative established in 2016.<sup>47</sup>  
It aims to coordinate and facilitate further cost-effective deployment of offshore renewable energy, in particular wind, ensuring a sustainable, secure and affordable energy supply in the North Seas countries.

### **Regional cooperation**

The UK made use of the NSEC in preparing this plan, by experts in the support groups sharing information, best practice and experiences on specific issues, for example on barriers to offshore wind and grid development and on aggregating national renewable energy trajectories for offshore wind by 2030.

The UK furthermore consulted on its NECP in the area of planned offshore wind deployment until 2030 and related grid planning aspects with the other North Seas countries, while a member.

---

<sup>47</sup> The North Seas Energy Cooperation, [https://ec.europa.eu/energy/topics/infrastructure/high-level-groups/north-seas-energy-cooperation\\_en](https://ec.europa.eu/energy/topics/infrastructure/high-level-groups/north-seas-energy-cooperation_en)

## 2. National objectives and targets

### 2.1. Decarbonisation

#### 2.1.1 Greenhouse Gas (GHG) emissions and removals

*i The elements set out in Article 4(a)(1) of Regulation (EU) 2018/1999*

*ii Where applicable, other national objectives and targets consistent with the Paris Agreement and the existing long-term strategies. Where applicable, other objectives and targets, including sector targets and adaptation goals, if available*

The Paris Agreement on climate change entered into force on 4 November 2016. It was ratified by the UK on 18 November 2016. Parties to the Paris Agreement are required to prepare, communicate and maintain successive Nationally Determined Contributions (NDCs). The UK will come forward with an enhanced NDC well ahead of the 26th UN Climate Change Conference of the Parties (COP26).

The first joint EU/Member State NDC for the period of 2021-2030 was published in 2015. This commits the EU to at least 40% reduction in greenhouse gas emissions by 2030 compared to 1990 levels. The EU has adopted a legally binding domestic framework to meet its NDC commitments in both the traded sector (covered by Directive 2003/87/EC) and the non-traded sector. The EU's non-traded sector is covered by the following legislation.

#### **Effort Sharing Regulation**

EU Member States have binding annual greenhouse gas emission targets for 2021-2030 for those sectors of the economy that fall outside the scope of the EU Emissions Trading System (EU ETS), such as transport, buildings, waste and agriculture. As a whole, the EU has committed to reduce emissions in these sectors by 30% by 2030 compared to 2005.

As of 31 January 2020, the UK has left the EU, and therefore will not contribute to EU targets or be bound by the Effort Share Regulation after the Transition Period ends. The estimated emission trajectory and the resulting annual emission limits are set out in the table below.

**Table 3: Calculated annual indicative GHG emission allocations for the UK from 2021 to 2030.**

These are calculated on the basis Global Warming Potentials from the IPCC's 4th Assessment Report.

Year	2005 (base year) <sup>48</sup>	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030
Annual Emission Allocation (MtCO <sub>2</sub> e) <sup>49</sup>	416	321	315	308	301	295	288	282	275	268	262

### Land use, land use change and forestry (LULUCF)<sup>50</sup>

Under further EU legislation adopted in May 2018, EU Member States agreed to ensure that greenhouse gas (GHG) accounted emissions from land use, land use change and forestry (LULUCF) are offset by at least an equivalent accounted sink for the periods from 2021-25 and from 2026-30 individually, as specified in Article 4 of the Regulation (EU) 2018/841. There are several flexible mechanisms to help Member States comply. As of 31 January 2020, the UK has left the EU, and will therefore not contribute to EU targets after the Transition Period ends.

### The UK Climate Change Act 2008, including carbon budgets

This is explained in 1.1(ii) and 1.3(i).

### Devolved Climate Change Legislation

Climate change policy is devolved to Wales, Scotland and Northern Ireland, although the UK government retains control over many policy areas that have great potential for emissions reduction.

The Environment (Wales) Act 2016<sup>51</sup> requires Welsh Ministers to reduce emissions in Wales by at least 80% in 2050. This Act also requires Welsh Ministers to set interim emissions reduction targets for the years 2020, 2030 and 2040, and establish a system of carbon budgeting that together create an emissions reduction pathway to the 2050 target. Regulations passed by the National Assembly for Wales in December 2018 set the 2020 target at 27%, the 2030 target at 45% and the 2040 target at 67%. The first two carbon budgets (2016-20 and 2021-25) were also set in legislation. Since then, the Welsh Government has accepted the CCC's recommendation to increase Wales's 2050 target to 95% and has requested the CCC's advice on how this affects the interim targets and carbon budgets set in 2018. It has also asked the CCC to explore how Wales might go beyond 95%. The Welsh Government will ask the Senedd to amend the targets and budgets legislation in early 2021.

Scotland's climate change legislation requires Scottish Ministers to reduce emissions in Scotland to net-zero by 2045, with interim targets of 56% reduction (from a 1990 baseline) by

<sup>48</sup> 2005 data from ESD dataset 2018 (data used was originally taken from ESD dataset 2019 which has since been revised) : [www.eea.europa.eu/data-and-maps/data/esd-2](http://www.eea.europa.eu/data-and-maps/data/esd-2)

<sup>49</sup> Starting point for Annual Emission Allocations calculated by taking average of 2016, 2017 and 2018 UK ESD emissions from ESD dataset 2019: [www.eea.europa.eu/data-and-maps/data/esd-2](http://www.eea.europa.eu/data-and-maps/data/esd-2)

<sup>50</sup> This analysis is based on reported emissions, not on accounted emissions following the regulation 2018/841.

<sup>51</sup> Environment (Wales) Act 2016, [www.legislation.gov.uk/anaw/2016/3/contents/enacted](http://www.legislation.gov.uk/anaw/2016/3/contents/enacted)

2020, 75% reduction by 2030, 90% reduction by 2045 and annual targets for each other year to net-zero.

The Climate Change Plan published in February 2018 sets out the Scottish Government's comprehensive package of policies and proposals for meeting emissions reduction targets under the Climate Change (Scotland) Act 2009 over the period to 2018 to 2032 – these targets have subsequently been increased (as above) through the Climate Change (Emissions Reduction Targets) (Scotland) Act 2019. The second annual report monitoring progress towards the Plan was published in December 2019.<sup>52</sup> The Scottish Government has committed to update the Plan in December 2020 to reflect the increased ambition of the 2019 Act targets. The Climate Change (Scotland) Act 2009 required Scottish Ministers to reduce emissions in Scotland by at least 80% by 2050, with an interim target of 42% by 2020 and annual targets for each year to 2050.

## 2.1.2 Renewable energy

### *i The elements set out in point (a)(2) of Article 4 of Regulation (EU) 2018/1999*

The UK is producing record levels of renewable energy. We have performed particularly strongly with regards to renewable electricity – by the end of 2018 we had already achieved our original ambition of 31% for that sector in 2020, as set out in our 2010 National Renewable Energy Action Plan.<sup>53</sup> We continued our progress in the power sector with a record 38.9% of total electricity generation coming from renewables in the third quarter of 2019.<sup>54</sup> Offshore wind is a particular British success story, with new projects awarded contracts at record low prices creating opportunities for jobs and economic growth. Building on our achievements to date, the UK supports continued deployment of cost-effective renewable energy through the 2020s in line with our ambitious domestic decarbonisation objectives.

The EU has a target under the Renewable Energy Directive of 32% of energy coming from renewable sources in 2030, with Member States required to set their own non-binding contributions to collectively achieve the EU target. As of 31 January 2020, the UK has left the EU and will therefore not contribute to EU targets or be bound by the Renewable Energy Directive after the Transition Period ends.

However, to comply with our commitments under the Withdrawal Agreement with respect to the NECP, the UK has set out a proportion of renewables in final energy consumption in 2030 of between 22%-29%,<sup>55</sup> based on estimates of the level of renewables deployment which may be required to meet our carbon budgets and net zero target.<sup>56</sup> Future policies and strategies for encouraging deployment of renewable energy will be set out in forthcoming publications such as our Energy White Paper and Heat and Buildings Strategy.

---

<sup>52</sup> Second annual report monitoring progress towards Scotland's 2018 Climate Change Plan, Dec 2019, [www.gov.scot/publications/climate-change-plan-monitoring-report-2019/](http://www.gov.scot/publications/climate-change-plan-monitoring-report-2019/)

<sup>53</sup> UK National Renewable Energy Action Plan (NREAP) 2010, available at: [www.gov.uk/government/publications/national-renewable-energy-action-plan](http://www.gov.uk/government/publications/national-renewable-energy-action-plan)

<sup>54</sup> Energy Trends: December 2019, section 6.3: [www.gov.uk/government/statistics/energy-trends-section-6-renewables](http://www.gov.uk/government/statistics/energy-trends-section-6-renewables)

<sup>55</sup> The UK will not contribute to the EU's renewable energy target. Should a point number be required for the purposes of Article 4(a)(2) of the Governance Regulation, this should be taken from the minimum bound of this range (i.e. 22%).

<sup>56</sup> Analysis does not account for impacts resulting from COVID-19.

The data in Table 4 show a trajectory to reach a 22%-29% proportion of renewable energy in 2030.

**Table 4: Illustrative trajectory for proportion of renewable energy in final energy consumption.**

Year	2020 Target	2022	2025	2027	2030
Proportion of renewables in final energy consumption	15%	16% - 18%	18% - 21%	20% - 24%	22% - 29%

*ii Estimated trajectories for the sectoral share of renewable energy in final energy consumption from 2021 to 2030 in the electricity, heating & cooling, and transport sector*

The UK supports cost-effective deployment of renewable and low-carbon energy to meet our domestic emissions reduction goals. It is likely that the balances between different sectors could change as we develop further policies and take additional action to decarbonise the UK energy system during the 2020s. The estimated trajectories in the electricity, heating & cooling and transport sectors shown in Table 5 and 6 below are therefore potential pathways for the purpose of complying with our commitments under the Withdrawal Agreement. They should not be taken as fixed targets for – or limits to – the UK’s ambition for renewables deployment to 2030.

**Table 5: Pathway 1, estimated trajectories for the sectoral proportion of renewable energy in final energy consumption**

Sector	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030
Electricity	38%	39%	45%	46%	48%	50%	49%	48%	49%	50%
Heating & Cooling	10%	10%	10%	10%	11%	11%	12%	12%	13%	13%
Transport (including multipliers) <sup>57</sup>	11%	12%	13%	13%	14%	14%	15%	15%	16%	16%

<sup>57</sup> Transport data include the double weighting of some biofuels, as permitted under the Renewable Energy Directive.

**Table 6: Pathway 2, estimated trajectories for the sectoral share of renewable energy in final energy consumption**

Sector	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030
Electricity	38%	39%	45%	48%	52%	58%	62%	65%	70%	75%
Heating & Cooling	10%	11%	11%	12%	13%	13%	14%	15%	16%	17%
Transport (including multipliers) <sup>58</sup>	11%	12%	13%	13%	14%	14%	15%	15%	16%	16%

Note: Individual sectoral shares may not necessarily sum to the overall renewable share

*iii Estimated trajectories by renewable energy technology to achieve the overall and sectoral trajectories for renewable energy from 2021 to 2030 including expected total gross final energy consumption per technology and sector in Mtoe and total planned installed capacity (divided by new capacity and repowering) per technology and sector in MW*

## Electricity

The UK is looking at several options and technology pathways in 2020 for expanding our deployment of renewables in the electricity sector in order to help reach net zero in 2050. This will include publication of an Energy White Paper and a range of other documents to support our climate ambitions. In light of where we are in terms of domestic policy development, we are unable to provide a breakdown for the renewable electricity technology mix at this point.

## Heat

The CGS identifies heat as the most difficult decarbonisation challenge facing the country: meeting our net zero target will require virtually all heat in buildings to be decarbonised, and heat in industry to be reduced to close to zero carbon emissions. This will involve large-scale transformation of energy systems and markets, changing the way we supply heating and cooling to over 28 million buildings – the vast majority of which (85% of households, and 70% of all heat use) currently use natural gas in our extensive gas network.

Due to the UK's natural resources and historical investment and infrastructure decisions, the UK has one of the highest dependencies globally on natural gas for heating.<sup>59</sup>

In 2018, the UK government published a review of the options for the UK to meet our legally binding emissions reduction in heat target by 2050.<sup>60</sup> This report outlined the different options for decarbonising heat – including heat networks, heat pumps, low-carbon hydrogen, and biogas – and concluded that there is no clear consensus on the best approach to decarbonising heat at scale in the UK. This makes it extremely difficult to estimate with any certainty the technology mix for renewable heat over the next ten years.

<sup>58</sup> Transport data include the double weighting of some biofuels, as permitted under the Renewable Energy Directive.

<sup>59</sup> International Comparisons of heating, cooling and heat decarbonisation policies, [www.gov.uk/government/publications/international-comparisons-of-heating-cooling-and-heat-decarbonisation-policies](http://www.gov.uk/government/publications/international-comparisons-of-heating-cooling-and-heat-decarbonisation-policies)

<sup>60</sup> UK Government evidence review, 'Clean Heat: Transforming Heating' - [www.gov.uk/government/publications/heat-decarbonisation-overview-of-current-evidence-base](http://www.gov.uk/government/publications/heat-decarbonisation-overview-of-current-evidence-base)

Following the publication of our report, we are committed to publishing a Heat and Buildings Strategy, which will set out the immediate actions we will take for reducing emissions from buildings. These actions include the deployment of additional energy efficiency measures and low-carbon heating, as part of an ambitious programme of work required to enable key strategic decisions on how we achieve the mass transition to low-carbon heat and set us on a path to decarbonising all homes and buildings. In light of where we are in terms of domestic policy development, we are unable to provide a breakdown for the renewable heat technology mix at this point.

## Transport

The UK's domestic policy for renewable transport fuels, the Renewable Transport Fuel Obligation, has set in law a biofuels volume target of 12% to 2032.<sup>61</sup> Transport has a huge role to play in the UK economy reaching net zero. The UK is developing an ambitious plan to accelerate the decarbonisation of transport. As with the heat and electricity sectors, in light of where we are in terms of domestic policy development, we are unable to provide a breakdown for the renewable transport technology mix at this point.

*iv Estimated trajectories on bioenergy demand, disaggregated between heat, electricity and transport, and on biomass supply by feedstocks and origin (distinguishing between domestic production and imports). For forest biomass, an assessment of its source and impact on the LULUCF sink*

## Bioenergy demand

Current biomass policy has been informed by the CCC's 2011 Bioenergy Review and the UK government's 2012 Bioenergy Strategy. The strategy recommended support for sustainably produced biomass that delivers real greenhouse gas savings, is cost effective, taking into account wider impacts across the economy and that possible key risks from biomass (such as to food security and air quality) continue to be monitored and managed. The CCC published its 2018 Bioenergy Review (Biomass in a low-carbon economy)<sup>62</sup> in November 2018.

Biomass is an important technology, helping the UK on its path to a low-carbon economy. The CGS sets out the need to lay the groundwork for setting up decisions that will be made in the first half of the next decade about the long-term future of heat; the role that bioenergy can play in this is currently being explored. The Renewable Heat Incentive, which supports solid biomass and biogas technologies for heat, and biomethane injection to the gas grid, has budget confirmed to 2021. The UK government, however, recognises that there are scenarios where bioenergy could further support the decarbonisation of heat, for example in buildings that are currently dependent on coal and oil, and for which electrification is not the most suitable option, or where high temperature dispatchable heat is required for industry.

Bioenergy for transport is expected to be used in all forms of transport including for aviation fuels. It is incentivised via the RTFO and is expected to deliver around 27 Terawatt hours (TWh) of biomass derived energy in transport in 2032.<sup>63</sup>

<sup>61</sup> Guidance: Renewable Transport Fuel Obligation: [www.gov.uk/guidance/renewable-transport-fuels-obligation](http://www.gov.uk/guidance/renewable-transport-fuels-obligation)

<sup>62</sup> Biomass in a low carbon economy (2018): [www.theccc.org.uk/publication/biomass-in-a-low-carbon-economy](http://www.theccc.org.uk/publication/biomass-in-a-low-carbon-economy)

<sup>63</sup> Renewable Transport Fuel Obligations Order: government response (2017), [www.gov.uk/government/publications/renewable-transport-fuel-obligations-order-government-response](http://www.gov.uk/government/publications/renewable-transport-fuel-obligations-order-government-response)

## Biomass supply

In the UK the main biomass feedstocks are:

- a. **Biomass wastes** – sourced from food, sewage, or the biomass portion of mixed black bag waste – if not used for biomass these wastes may go to landfill and produce methane.<sup>64</sup> Use in the energy sector avoids these additional emissions and provide generators a fee for accepting the waste.<sup>65</sup>
- b. **Woody/dry biomass residues** – sourced from sustainably managed forestry residues or by-products from agriculture (such as straw) or timber production. The effects of this harvesting are reported in the UK emission inventory.<sup>66</sup> The UK also imports woody biomass from North America and Europe which is reported in accordance with the source country's inventory.
- c. **Energy crops** – domestically produced, these include fast-growing trees or grasses grown on low grade farmland that is not suitable for food production.
- d. **Other crops** – domestically and internationally produced, these include food crops such as oil seed rape and sugar beet.

The Renewable Heat Incentive scheme<sup>67</sup> has imposed restrictions on the use of energy crops, to encourage the use of at least 50% agriculture and food waste feedstocks rather than energy crops. This change came into effect on 22 May 2018.

In transport, the RTFO includes a cap on the amount of incentive available for fuels made from 'other crops'. This is set at 4% in 2018/19 and reduces to 2% in 2032.<sup>68</sup> Detailed data is available on the origin and type of biomass feedstocks used to supply biofuels in the UK market. Nearly one third of biomass is sourced domestically and the remainder is imported. In 2018, nearly 70% of renewable transport fuels supplied were made from wastes.<sup>69</sup> Information on the volumes and types of biomass expected to be used to meet the RTFO targets in the period to 2032 is available in the cost benefit analysis that accompanied the legislation.<sup>70</sup>

For electricity, biomass electricity plants supported under our incentive schemes are required to provide information on biomass use to Ofgem. The latest information can be found via Ofgem's website.<sup>71</sup>

---

<sup>64</sup> For example, the Renewable energy directives provides a credit for the avoided emissions from methane when using wet wastes such as manure in anaerobic digestion (<http://publications.jrc.ec.europa.eu/repository/bitstream/JRC104759/ld1a27215enn.pdf>).

<sup>65</sup> Anaerobic digestion plants are paid between £0-65 per tonne to take source separated food waste. Energy from waste incinerators are paid between £26 and £144 per tonne to process 'refuse derived fuel'. *v Where applicable, other national trajectories and objectives, including those that are long term or sectoral (e.g. share of renewable energy in district heating, renewable energy use in buildings, renewable energy produced by cities, energy communities and self-consumers, energy recovered from the sludge acquired through the treatment of wastewater)*

Not applicable.

## 2.2 Energy efficiency

*i The elements set out in point (b) of Article 4 of Regulation 2018/1999, where the elements in point (b) are:*

*(a) An indicative contribution to the Union's energy efficiency targets of at least 32.5% in 2030 (either Primary Energy Consumption (PEC) or Final Energy Consumption (FEC))*

The EU has a headline target under the Energy Efficiency Directive to reduce energy consumption by 32.5% in 2030, with Member States required to set their own indicative contributions to the EU target. As of 31 January 2020, the UK has left the EU and will therefore not contribute to EU targets or be bound by the Energy Efficiency Directive after the Transition Period ends.

However, to comply with our commitments under the Withdrawal Agreement with respect to the NECP, the UK has set out at Table 7 a trajectory that leads to a primary energy consumption in 2030 of 151 Mtoe (Net Calorific Value (NCV)).<sup>72</sup> This is consistent with the pathway for energy efficiency policy presented in the UK's 2017 CGS.

Energy efficiency has an important role to play in helping the UK to decarbonise, and future policies and strategies to better incentivise the deployment of energy efficiency measures in line with our net zero target will be set out in domestic publications, such as our forthcoming Heat and Buildings Strategy.

Although we are ambitious in our domestic plans for energy efficiency, it is important that we maintain flexibility in the policy mix throughout the 2020s as we develop further measures and take additional action to ensure we are decarbonising in the most cost-effective way. It should also be noted that energy consumption is impacted to a large extent by external factors which are difficult to predict, such as weather conditions, oil prices and economic performance.

---

<sup>72</sup> Analysis based on data up to 31 January 2020, does not account for impacts resulting from COVID-19.

**Table 7: Estimated trajectory for Primary Energy Consumption and Final Energy Consumption 2021-2030 by Net Calorific Value (NCV)**

	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030
<b>Primary Energy Consumption (NCV)</b>	168	165	164	162	157	156	157	155	153	154	151
<b>Final Energy Consumption (NCV)</b>	131	131	130	129	129	125	125	123	122	123	121

*(b) The cumulative end-use energy savings achieved 2021-30 due to EE obligation schemes*

EU Member States are required under Article 7 of the Energy Efficiency Directive to achieve energy savings of 0.8% as an annual average between 2021-2030 through supplier obligations and/or alternative measures. As of 31 January 2020, the UK has left the EU and will therefore not contribute to EU targets or be bound by the Energy Efficiency Directive after the Transition Period ends. However, to comply with our commitments under the Withdrawal Agreement, the UK has calculated the cumulative end-use energy savings for 2021-2030 as 719 TWh.

The UK has already introduced a wide range of policies to help households, businesses and the public sector reduce their energy use and save money, including supplier obligations, building regulations and taxation measures. Please see Annex B for the UK's Article 7 methodology and a list of these measures.

*(c) the Long-Term Renovation Strategy (LTRS) elements listed in ii) below*

See section 2.2(ii).

*(d) the total floor area to be renovated or equivalent annual energy savings to be achieved from 2021-30 under Article 5 of Directive 2012/27/EU on the exemplary role of public bodies' buildings*

Article 5 of the Energy Efficiency Directive requires EU Member States either to renovate, each year from 2021 to 2030, 3% of the floor space of their central government building stock that does not meet minimum energy performance standards in eligible buildings, or to take alternative measures to achieve equivalent energy savings by end 2030 in eligible buildings owned and occupied by central government.

As of 31 January 2020, the UK has left the EU and will not be required to achieve the energy savings envisaged under Article 5 after the Transition Period ends. However, to comply with our commitments under the Withdrawal Agreement, we have calculated the equivalent annual energy savings for 2021-2030 as 716.8 GWh.

During the period 2014-2020 the UK has been able to achieve energy savings in eligible buildings considerably in excess of the EU requirement. Moving into the 2020s and beyond, our central government buildings are expected to continue to play an exemplary role in respect of energy efficiency. Future energy savings and greenhouse gas reductions in government buildings will be in line with the wider public sector ambitions set out in the Clean Growth

Strategy. Further information will be provided in our next set of Greening Government Commitments (GGCs),<sup>73</sup> along with commitments on waste, water, transport and other sustainability priorities.

*ii The indicative milestones for 2030, 2040 and 2050, the domestically established measurable progress indicators, an evidence-based estimate of expected energy savings and wider benefits, and their contributions to the Union's energy efficiency targets as included in the roadmaps set out in the long-term renovation strategies for the national stock of residential and non-residential buildings, both public and private, in accordance with Article 2a of Directive 2010/31/EU*

The UK government's full Long-Term Renovation Strategy (LTRS) for the UK building stock is currently in development and is expected to be published separately in 2020, as permitted under the derogation found in Article 53 of Regulation 2018/1999. As of 31 January 2020, the UK has left the EU, and will therefore not contribute to EU targets after the Transition Period ends.

The following pages contain the advance elements of the LTRS required for the NECP in accordance with Articles 3 and 4 of Regulation (EU) 2018/1999:

- The indicative milestones for 2030, 2040 and 2050.
- The roadmap with domestically established measurable progress indicators.
- An evidence-based estimate of expected energy savings and wider benefits, and the contributions to the Union's energy efficiency targets.

This content is indicative and subject to revision upon publication of the UK's full LTRS.

The content of this advance LTRS focuses on policies and initiatives owned primarily by the UK government. A wide range of additional initiatives are being undertaken by the Devolved Administrations. These will be set out in more detail in the UK's full LTRS, following consultation with the governments of Northern Ireland, Scotland and Wales.

## Overview and indicative milestones of the UK's Long-Term Renovation Strategy

### Overview

Our homes as well as industrial and commercial buildings have become more efficient in the way they use energy, which is helping to reduce emissions and cut energy bills. Greenhouse gas emissions from the UK's housing sector (excluding electricity supply) fell by nearly 16% between 1990 and 2018<sup>74</sup>, despite an increase in the total number of homes in the UK. We have also improved the energy efficiency of non-domestic buildings since 1990, with emissions 18% lower in 2015.<sup>75</sup> However, the UK building stock continues to account for a significant proportion of the UK's greenhouse gas emissions and energy use, and further progress will be required in order to underpin the UK's legally binding 2050 net-zero target.

There are a number of possible technological pathways leading to the decarbonisation of the building stock. One illustrative pathway to meet the UK's carbon budget 5 (which covers emissions over 2028-2032) could involve emissions from business and industry falling by 30%

---

<sup>73</sup> Greening Government Commitments: [www.gov.uk/government/collections/greening-government-commitments](http://www.gov.uk/government/collections/greening-government-commitments)

<sup>74</sup> Provisional UK greenhouse gas emissions national statistics, 2018: [www.gov.uk/government/statistics/provisional-uk-greenhouse-gas-emissions-national-statistics-2018](http://www.gov.uk/government/statistics/provisional-uk-greenhouse-gas-emissions-national-statistics-2018)

<sup>75</sup> Clean Growth Strategy, 2017: [www.gov.uk/government/publications/clean-growth-strategy](http://www.gov.uk/government/publications/clean-growth-strategy)

and from homes by 19% between 2017 and 2032 from 2017 levels. This could be delivered in a number of ways including significant improvements in energy efficiency, phasing out high carbon fossil fuels in off-gas grid properties, rolling out heat networks where appropriate, reducing energy use per unit of output and drastically reducing emissions from electricity generation through increased use of renewables and a smarter power grid.

### Indicative milestones

We cannot at this stage predict the exact technological changes or policy solutions that will help us deliver on our ambitions, particularly as we approach 2050. Some technologies, processes and business models will develop faster than expected, making it easier to reduce emissions. Others may develop less quickly than we hope. It is also challenging to predict exactly what the UK economy will look like in 2030, 2040 or 2050.

Given these elements of uncertainty, the UK's indicative milestones focus on our core objective of reducing greenhouse gas emissions, in line with our carbon budgets and 2050 net zero target. While the 2017 CGS forms the basis for these calculations, the UK government is expecting further advice in 2020 from its independent advisors, the CCC, on pathways to net zero in 2050. This will include advice on what level to set the sixth carbon budget (2033-2037). The below indicative milestones are provided without prejudice to that advice, which will further inform the UK government as we establish a pathway to net zero by 2050.

**Table 8: The UK's indicative milestones for 2030, 2040 and 2050<sup>76</sup>**

Milestone	2030	2040	2050
<b>1. Residential greenhouse gas emissions</b>	Around 60 (MtCO <sub>2</sub> e) <sup>77</sup>	Proportionate progress on pathway to 2050 milestone	Eliminate emissions from residential buildings by 2050.
<b>2. Non-residential: private/business greenhouse gas emissions<sup>78</sup></b>	Around 9 (MtCO <sub>2</sub> e) <sup>79</sup>	Proportionate progress on pathway to 2050 milestone	Eliminate emissions from non-domestic buildings by 2050.
<b>3. Non-residential: public greenhouse gas emissions</b>	Around 5 (MtCO <sub>2</sub> e) <sup>80</sup>	Proportionate progress on pathway to 2050 milestone	Eliminate emissions from non-residential public sector buildings by 2050.
<b>4. Total buildings emissions</b>	Around 155(MtCO <sub>2</sub> e)	Proportionate progress on pathway to 2050 milestone	Eliminate emissions from the UK building stock by 2050.

<sup>76</sup> Based primarily on the 2032 and 2050 pathways set out in the Clean Growth Strategy.

<sup>77</sup> In line with the 2032 pathway set out in the Clean Growth Strategy.

<sup>78</sup> This segment includes greenhouse gas emissions created as a result of industrial processes, which are challenging to fully disaggregate from greenhouse gas emissions created purely from building energy use. However, building energy use does constitute the majority of this combined figure.

<sup>79</sup> In line with the 2032 pathway set out in the Clean Growth Strategy.

<sup>80</sup> In line with the 2032 pathway set out in the Clean Growth Strategy.

## Outline roadmap of policies and measures including domestically established measurable progress indicators

### Outline roadmap of policies and measures

The CGS sets out the UK's strategy for achieving its legally binding emissions reductions targets, known as carbon budgets, through to 2032, and includes indicative decarbonisation pathways out to 2050, as referred to in the previous section.

The pathways set out in the CGS provide an overview of how the impacts of its policies and proposals may map out over time. They include future policy development such as publications, key decisions, reviews and consultations, which aim to unlock future carbon savings.<sup>81</sup>

Achieving net zero will mean going further, virtually eliminating emissions from the UK's building stock. Decarbonising heat is our most difficult policy and technology challenge in meeting our carbon targets. The UK government is currently developing its low-carbon heat policy for the 2020s and beyond. We are working on a Heat and Buildings Strategy, which will set out the immediate actions we will take for reducing emissions from buildings. These actions include the deployment of energy efficiency measures and low-carbon heating as part of an ambitious programme of work required to enable key strategic decisions on how we achieve the mass transition to low-carbon heat and set us on a path to decarbonising all homes and buildings. (see [section 2.1.2](#) above).

This LTRS sets out the UK's outline roadmap in accordance with the CGS and subsequent UK government documents – content is subject to revision in final version of the LTRS, expected to be published separately later in 2020.

Residential and non-residential buildings, both public and private, are dealt with in turn.

### Residential buildings

#### 2020-2032

Homes in the UK account for 15% of greenhouse gas emissions, or 22% including electricity use.<sup>82</sup> The UK has already made considerable progress in this sector with residential emissions having reduced by about 16% since 1990<sup>83</sup> despite there being over 20% more homes.<sup>84</sup>

We want to further reduce emissions while ensuring everyone has a home that is comfortable, healthy and affordable to run. Our objective is to ensure our policies will encourage people to improve their homes where it is cost effective and affordable for them to do so. Our aspiration, as set out in the CGS, is that fuel poor homes should be upgraded to an Energy Performance Certificate (EPC) rating of at least Band C by 2030, and more broadly that as many existing

---

<sup>83</sup> BEIS(2019), BEIS, Final UK greenhouse gas emissions statistics 1990-2017:

[www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-2017](http://www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-2017)

<sup>84</sup> Live tables on house building: new build dwellings, 2019: [www.gov.uk/government/statistical-data-sets/live-tables-on-house-building](http://www.gov.uk/government/statistical-data-sets/live-tables-on-house-building)

homes as possible are improved to at least EPC Band C by 2035, where practical, cost-effective and affordable.<sup>85</sup> At present, 70% of homes fall below this standard in England.

The CGS, and subsequent UK government documents, set out policies and proposals to decarbonise this sector over the coming years, including:

#### *Complete*

- Strengthening domestic Private Rented Sector regulations to require landlords to contribute up to £3,500 towards improving their property to EPC Band E;
- Supporting around £3.6 billion of investment to upgrade around one million homes through the Energy Company Obligation (ECO), and confirming extended support for home energy efficiency improvements until 2028 at the current level of ECO (£640m per year);
- Sponsoring new standards (PAS 2035:2019 & PAS 2030:2019<sup>86</sup>) covering the end-to-end delivery of energy efficiency measures;
- Supporting a new TrustMark government-endorsed quality scheme for energy efficiency improvements to ensure consumers get what they are expecting and have suitable financial protections in place;
- Incorporating TrustMark and the new PAS standards into the Energy Company Obligation;
- Launching Simple Energy Advice, a new digitally led advice service that provides tailored advice to homeowners, landlords, and tenants on how they can improve their home's energy efficiency.

#### *In progress*

- Committing to introducing a Future Homes Standard which will see new build homes future-proofed with low-carbon heating and world-leading standards of energy efficiency by 2025. We expect new homes built to the new standard to produce 75-80 per cent lower CO<sub>2</sub> emissions compared to current levels. These homes will be 'zero carbon ready', with the ability to become fully zero carbon homes over time as the electricity grid decarbonises, without the need for further costly retrofitting work.
- As a stepping-stone to the Future Homes Standard, we have consulted on a meaningful and achievable interim increase to the energy efficiency standards for new homes. The preferred option set out in consultation is a standard that should result in a 31% further reduction in emissions, compared to current standards.
- We will respond to the Future Homes Standard consultation in full in the autumn (2020). As part of this, we intend to review the roadmap to the Future Homes Standard to ensure that implementation takes place to the shortest possible timeline. To work towards ensuring that all new homes are fit for a zero-carbon future we will also explore options for the future of energy efficiency standards beyond the Future Homes Standard.

---

<sup>85</sup> Clean Growth Strategy, 2017, [www.gov.uk/government/publications/clean-growth-strategy](http://www.gov.uk/government/publications/clean-growth-strategy)

<sup>86</sup> PAS 2035/2030:2019 is a key document in a framework of new and existing standards on how to conduct effective energy retrofits of existing buildings, developed by the British Institute of Standards (BSI): [https://shop.bsigroup.com/ProductDetail/?pid=00000000030400875&creative=366703430328&keyword=%2Bpas%20%2B2030&matchtype=b&network=g&device=c&clid=EAlalQobChMIxuu1gZaO7AIVR-btCh31pAyfEAAYASAAEgla7\\_D\\_BwE](https://shop.bsigroup.com/ProductDetail/?pid=00000000030400875&creative=366703430328&keyword=%2Bpas%20%2B2030&matchtype=b&network=g&device=c&clid=EAlalQobChMIxuu1gZaO7AIVR-btCh31pAyfEAAYASAAEgla7_D_BwE)

- A further consultation will follow in due course, proposing changes to the energy efficiency standards for new non-domestic buildings; for building work to existing homes and non-domestic buildings; and on mitigating overheating in new dwellings.
- Consulting on strengthening domestic Private Rented Sector regulations, with a longer-term aim of upgrading as many private rented homes as possible to EPC Band C by 2030, where practical, cost-effective and affordable<sup>87</sup>.
- Consulting on standards for social housing. The social housing Green Paper published in August 2018<sup>88</sup> asked, among other things, whether the energy performance of social homes should be upgraded. Government is currently considering the responses to the consultation and will publish a Social Housing White Paper for implementing social housing reform soon.
- Consulting on setting requirements for lenders to improve the energy efficiency of the homes they lend to and launching a £5m Green Home Finance Innovation Fund which will support the development and piloting of innovative green mortgages and other green home finance products.
- Launching a £10m Whole House Retrofit Innovation Competition to explore ‘at scale’ delivery of whole house energy efficiency retrofit, aiming to demonstrate the cost reduction potential of large-scale roll-out, and initiating a longer-term cost reduction trajectory.
- Testing six different approaches to delivering whole house retrofit in local areas across England that could be replicated at a broader scale, by providing support for local supply chain integration, skills training and project coordination.
- Providing funding to a number of local authorities to produce a series of feasibility studies to test means of encouraging homeowners to improve the energy efficiency of their properties through retrofit measures.
- Publishing an Action Plan to improve the EPC framework, following our public Call for Evidence. More robust EPCs will play a key role in underpinning various energy efficiency-related policies over the coming years.
- Updating the Fuel Poverty Strategy<sup>89</sup> (for England), including the mix of subsidy, regulations and incentives required to meet the fuel poverty target.
- Manifesto commitments of a £3.8bn Social Housing Decarbonation Fund to deliver transformational change in the social housing sector, and a £2.5bn Homes Upgrade Grant sector targeting fuel poor households in private housing.

## **Beyond 2032**

Reducing demand for energy will not be enough on its own to meet our ambitions for homes. By 2050, we will likely need to fully decarbonise how we heat our homes. There are several low-carbon heating technologies with the potential to support the scale of change needed, including heat pumps, low-carbon gases such as hydrogen (using the existing gas grid) and

district heat networks. However, at present, it is not certain which approaches will work best at scale and offer the most cost-effective long-term answer.

## **Non-residential buildings - private non-domestic**

### **2020-2032**

Business and industry in the UK are responsible for around 20% of greenhouse gas emissions, or 30% including energy use.<sup>90</sup> In the CGS, the UK government set an ambition to support businesses to improve their energy efficiency by at least 20% by 2030. This could deliver up to £6 billion in cost savings by 2030 and contribute up to 22 MtCO<sub>2</sub>e of non-traded carbon savings towards the fifth carbon budget.<sup>91</sup>

The CGS committed the UK government to consult on a package of measures to support businesses to improve how productively they use energy, including actions that could be taken to improve the take up of energy efficiency measures across buildings. This would build on the significant existing measures to promote energy efficiency in business and industry such as the Climate Change Agreement (CCA) Scheme and the Energy Savings Opportunity Scheme (ESOS).

The CGS, and subsequent UK government documents, set out policies and proposals to decarbonise this sector over the coming years, including:

#### *Complete*

- Utilising environmental taxes to encourage businesses to operate in more environmentally friendly ways. There are taxes and schemes for different types and size of business.
- Requiring that from 1 April 2018, landlords of privately rented property in England or Wales ensure that their properties reach at least an Energy Performance Certificate (EPC) rating of E before granting a tenancy to new or existing tenants.
- Completing the compliance period for Phase 2 of the Energy Savings Opportunity Scheme (ESOS), which required large businesses, by 5 December 2019, to carry out audits of their energy use in buildings, processes and transport and receive recommendations on energy efficiency improvement actions they can take.
- Requiring large or quoted UK businesses to disclose their annual energy and carbon emissions in annual reports under the Streamlined Energy and Carbon Reporting (SECR) framework, which came into force in April 2019, following an earlier consultation.<sup>92</sup> This aims to simplify reporting requirements while increasing corporate transparency, further incentivising energy efficiency and reducing emissions.
- Completing the Electricity Demand Reduction Pilot which offered organisations £6m of funding for projects which could improve energy efficiency and security of supply through delivery of electricity savings at peak times. This pilot has finished, and we published the evaluation in July 2019<sup>93</sup>, alongside a call for evidence which ran to

<sup>93</sup> Electricity Demand Reduction pilot, 2019: [www.gov.uk/guidance/electricity-demand-reduction-pilot](http://www.gov.uk/guidance/electricity-demand-reduction-pilot)

September 2019.<sup>94</sup> These initiatives will help us better understand how we can facilitate energy efficiency in the electricity system.

- Published a call for evidence on a new Small Business Energy Efficiency Scheme.<sup>95</sup>

### *In progress*

- Published a consultation on a preferred future requirement of EPC Band B by 2030 for minimum energy efficiency standards in privately rented non-domestic buildings.
- Committing to consult in 2020 on introducing mandatory in-use energy performance ratings for business buildings.
- We are initiating the demonstration phase of the 'Boosting Access for SMEs (small and medium-sized enterprises) to Energy Efficiency' (BASEE) innovation competition in March 2019. This offers up to £6m to fund the development of new, innovative scalable business models or solutions that reduce costs, simplify processes and encourage the take up of energy efficiency by SMEs at scale. We have awarded eight contracts to pilot their solutions which will complete in March 2021.
- Publishing the evaluation and post implementation review of ESOS in 2020 and expect to publish a consultation in 2021 which sets out proposals for strengthening future phases of the scheme.
- Commencing work with the British Standards Institute (BSI) to develop Publicly Available Specification (PAS) standards for the installation of energy efficiency measures in the non-domestic sector to ensure consistency in the market and provide confidence to consumers.

### **Beyond 2032**

To meet the UK's 2050 net zero target, the deep decarbonisation of industry and private sector non-domestic buildings will need to take place alongside wider measures, such as Carbon Capture, Usage and Storage (detailed in section 2.5(ii)) and the widespread decarbonisation of electricity and heat provision (as outlined in the residential roadmap and detailed in [section 2.1.2](#) of this NECP).

### **Non-residential buildings - public non-domestic**

#### **2020-2032**

The public sector in the UK is responsible for around 2% of direct greenhouse gas emissions, or 3% including indirect emissions from electricity use.<sup>96</sup> The government is taking a leading role in reducing greenhouse gas emissions through the Greening Government Commitments to reduce central government emissions by 43% by the end of 2019/20 compared to 2009/10 – having met the previous target of a 32% reduction three years early.<sup>97</sup> Good progress is being

<sup>96</sup> Final UK greenhouse gas emissions national statistics: 1990-2017, 2019:

[www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-2017](http://www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-2017)

<sup>97</sup> Greening Government Commitments, 2019: [www.gov.uk/government/collections/greening-government-commitments](http://www.gov.uk/government/collections/greening-government-commitments)

made towards our 43% reduction target, with the latest Greening Government Commitment Annual Report showing that we have delivered a 39% reduction in emissions by 2017/18<sup>98</sup>.

Our illustrative pathway to 2032 sees emissions from the public sector falling by around 50% compared to a 2017 baseline.<sup>99</sup>

The CGS, and subsequent UK government documents, set out policies and proposals to decarbonise this sector over the coming years, including:

#### *Complete*

- Continuing to enable greenhouse gas emission reductions through the Public Sector Energy Efficiency Loan Scheme. The capital pot for England stands at £312m as of the end of 2019/20 and is planned to increase to a total of £385m by 2020/21. This funding, managed by Salix Finance, has delivered over 17,000 projects, significantly improving energy performance in the public sector, with estimated emissions reductions of over 800,000 tonnes per year.
- Modern Energy Partners, an innovation programme working to develop a toolkit to reduce greenhouse gas emissions from campus-scale public sector sites. The pilot phase concluded in March 2019 and the second phase of the project commenced in April 2019.

#### *In progress*

- Committed to publish a roadmap on the next steps for reducing public sector emissions in 2020.
- A manifesto commitment of £2.9bn for a Public Sector Decarbonisation Programme.

#### **Beyond 2032**

The CGS sets out the challenge facing the public sector in meeting the UK's 2050 target, and the leadership role the public sector can play in reducing carbon emissions. Central government has already shown what is possible through its Greening Government Commitments which include a greenhouse gas reduction target.<sup>100</sup> However, to meet the UK's 2050 target, emissions from the buildings and activities of the public sector will need to be near zero. This will mean improving energy efficiency and energy management and decarbonising the heating and cooling of buildings.<sup>101</sup>

#### **Indicative progress indicators**

Given the uncertainties surrounding the exact technological changes and policy solutions that will help us deliver on our ambitious milestones, particularly as we approach 2050, it is challenging to predict exactly which progress indicators will prove the most relevant over the long term, or whether new indicators will emerge.

The proposed progress indicators may be used by government in relation to the UK's indicative milestones for 2030, 2040 and 2050, and some are published publicly on a regular basis. Though it is not possible to set how any single indicator should change over the next 30 years,

---

<sup>98</sup> Greening Government Commitments, 2019: [www.gov.uk/government/collections/greening-government-commitments](http://www.gov.uk/government/collections/greening-government-commitments)

<sup>99</sup> Clean Growth Strategy, 2017, [www.gov.uk/government/publications/clean-growth-strategy](http://www.gov.uk/government/publications/clean-growth-strategy)

<sup>100</sup> Greening Government Commitments, 2019: [www.gov.uk/government/collections/greening-government-commitments](http://www.gov.uk/government/collections/greening-government-commitments)

<sup>101</sup> Clean Growth Strategy, 2017, [www.gov.uk/government/publications/clean-growth-strategy](http://www.gov.uk/government/publications/clean-growth-strategy)

it is clear that the landscape of metrics set out in the following table will need to, as a whole, display proportionate change in line with our milestones and clear, legally binding 2050 net zero target.

**Table 9: Indicative progress indicators of the LTRS**

Progress indicator (metric)	Building stock sector(s)	Link to milestones
Dwellings' EPC ratings (proportion at each EPC band)	Domestic	Buildings with better fabric and/or own renewable energy generation are likely to be responsible for fewer greenhouse gas emissions.
Energy intensity (MWh/household)	Domestic	Lower energy use (notwithstanding any rise in total no. of households) likely to lead to lower carbon emissions from sector.
Carbon intensity (tCO <sub>2</sub> e /household)	Domestic	Lower carbon energy sources and lower energy use (notwithstanding any rise in total no. of households) likely to lead to lower carbon emissions from sector.
ECO measures installed (no. installed by measure type and obligation)	Domestic	Buildings with better fabric / heating systems are likely to be responsible for fewer greenhouse gas emissions.
Greenhouse gas emissions from building stock (MtCO <sub>2</sub> e, by sector)	Domestic, non-domestic, public	Lower emissions from any one sector will contribute to the overall milestones.
Energy use per £ million output (MWh/£ million)	Non-domestic	Lower energy use (notwithstanding any rise in total output) likely to lead to lower carbon emissions from sector.
Emissions intensity energy use (tCO <sub>2</sub> e/kWh)	Non-domestic	Lower emissions intensity (notwithstanding any rise in total generation) likely to lead to lower total carbon emissions from sector.

### Expected Energy Savings and contributions to the Union's energy efficiency targets pursuant to Directive 2012/27/EU

As set out in section 2.2(i), the UK has left the EU and will therefore not contribute to EU targets after the Transition Period ends.

### Evidence-based estimates of expected energy savings and wider benefits resulting from the Long-term renovation strategy

In reaching our indicative milestones and net zero, we want to decarbonise our economy at lowest cost. Energy efficiency can play an important role in supporting this, reducing the quantity of heat required and the costs of future heat decarbonisation. It will also deliver a

range of wider economic benefits (explored in the next section) including lower energy bills, increased energy security, better air quality, and improved health. However, the optimal level of energy efficiency is subject to wider drivers, for example, our strategic choices around heat decarbonisation, future cost reductions, and technology innovation.

The above roadmap sets out numerous measures which will improve the energy efficiency of the building stock, and the CGS sets out how building energy efficiency improvements could contribute to the UK's 2032 pathway to meeting carbon budget 5:

**Table 10: Possible building energy efficiency improvements under the 2032 pathway**

	2015	2032
<b>Home energy use per household (MWh/household)</b>	17	15
<b>Non-industrial business and public energy use per £ million output (MWh/£ million)</b>	164	79

### **Wider benefits resulting from measures in the Long-Term Renovation Strategy**

The reduction in greenhouse gas emissions and improvements in energy efficiency resulting from the measures and targets outlined in this LTRS will have numerous wider benefits applying at individual, macroeconomic and societal dimensions.

The UK government explicitly recognises these benefits. HM Treasury's Green Book<sup>102</sup> is the central government document setting out a framework for the appraisal and evaluation of policies, programmes and projects. It applies to all proposals that concern public spending, taxation, changes to regulations, and changes to the use of existing public assets and resources.

The updated 2018 edition of the Green Book sees a much-increased focus on environmental factors, improving the ability of UK policymakers to factor these into decision-making. It directs government to identify the social costs from policies' carbon emissions and to evaluate wider impacts on natural capital. It provides guidance on assigning value to greenhouse gas emissions and energy efficiency in recognition of their wider societal costs. The Green Book makes clear that energy efficiency has a social value in addition to the value of a reduction in greenhouse gas emissions, given its direct impact on society.

More broadly, the measures and milestones outlined in the LTRS have the potential to, for example:

Improve health: There is a clear link between cold homes and ill-health. The Building Research Establishment (BRE) has estimated that the cost of cold and damp homes to the NHS is approximately £760m per year.<sup>103</sup> The Health Impact of Domestic Energy Efficiency Measures

<sup>102</sup> The Green Book: appraisal and evaluation in central government, 2019:

[www.gov.uk/government/publications/the-green-book-appraisal-and-evaluation-in-central-government](http://www.gov.uk/government/publications/the-green-book-appraisal-and-evaluation-in-central-government)

<sup>103</sup> Building Research Establishment (2011) The cost of poor housing to the NHS (Building Research Establishment), 2015: [www.bre.co.uk/healthbriefings](http://www.bre.co.uk/healthbriefings)

(HIDEEM) model<sup>104</sup> was developed for government to quantify indoor environmental conditions and monetise the health impacts associated with energy efficiency changes.

Generate economic benefits: The UK low-carbon economy could grow by an estimated 11% annually between 2015 and 2030 (four times faster than the wider the economy)<sup>105</sup> and could deliver between £60bn and £170bn of export sales of goods and services by 2030<sup>106</sup>. There is significant potential for the retrofit supply chain to generate employment, driving UK manufacturing and expertise. In 2016 the domestic and non-domestic energy efficiency sectors employed 140,000 people, with turnover of £20bn.<sup>107</sup>

**Reduce costs for consumers:** Actions taken to tackle emissions and reduce energy use have already helped to reduce average energy bills - average household energy bills have fallen by 16.7% in real terms between 2013 and 2018.<sup>108</sup> The recently released Future Homes Standard consultation<sup>109</sup> outlines possible average annual bill savings of between £59 and £257 resulting from improving standards for future new build homes.

**Reduce costs for businesses and government:** Emissions from central government fell by 39% between 2009/10 and 2017/18, delivering savings to the taxpayer of an estimated £112 million in 2017/18 through reduced energy consumption.<sup>110</sup> The CGS set out our ambition to improve business and industry energy efficiency by at least 20% by 2030 compared to 2015 levels, which will reduce energy bills by up to £6 billion by 2030.<sup>111</sup>

**Reduce fuel poverty:** By reducing the heating costs of homes, energy efficiency reduces the breadth and depth of fuel poverty. The latest iteration of the Energy Company Obligation (ECO3) is a fuel poverty focused scheme which incentivises the treatment of properties which are expensive to heat.

**Increase energy security:** Delivering the 2032 pathway would result in changes in fuel consumption across the whole economy, with coal and gas use falling by an additional 38% and 23% respective over and above current plans. Reductions in fossil fuel consumption will reduce imports and in turn boost the UK's energy security.

*iii Where applicable, other national objectives, including long term targets or strategies and sectoral targets, and national objectives in areas such as energy efficiency in the transport sector and with regard to heating and cooling.*

<sup>111</sup> Clean Growth Strategy, 2017, [www.gov.uk/government/publications/clean-growth-strategy](http://www.gov.uk/government/publications/clean-growth-strategy)

The UK government's ambition for decarbonising road transport and developing zero and low emission vehicles is clearly set out in recent strategies, including the Road to Zero, CGS and Industrial Strategy.

By 2040, the UK government expects the majority of new cars and vans sold to be 100% zero emission and all new cars and vans to have significant zero emission capability<sup>112</sup>. By 2030, the UK government wants to see at least 50% and as many as 70% of new car sales to be ultra-low emission, and up to 40% of new van sales.

The road freight sector has agreed a voluntary industry-wide commitment to reduce HGV CO<sub>2</sub> emissions by 15% by 2025. This was announced in the Road to Zero Strategy<sup>113</sup> in July 2018 and was welcomed by road freight trade bodies. We will work with industry to help operators contribute to this commitment by reducing their CO<sub>2</sub> emissions.

## 2.3 Energy security

### *i The elements set out in point (c) of Article 4*

The UK government's ambition for interconnector capacity is set out in the CGS, which states that project assessments to date indicate at least a further 8.1GW of interconnection by the early to mid-2020s will be in consumers' interests, in addition to the 5GW currently operational and 4.8GW that is currently under construction.

The UK government also has an objective to establish a best-in-class regulatory framework to harness the full potential of smart and flexible energy solutions such as storage and demand side response. We are working closely with Ofgem and industry to support the transition to a smarter, more flexible energy system and to deliver the actions set out in the 2017 Smart System and Flexibility Plan<sup>114</sup> and 2018 Progress Update<sup>115</sup> by 2022. This Plan is discussed in more detail in section 2.3(iv).

More information on resilience of our energy systems is set out in the Security of Supply report<sup>116</sup> Also see 2.3(ii) and (iv).

### *ii National objectives with regard to increasing the diversification of energy sources and supply from third countries for the purpose of increasing the resilience of regional and national energy systems*

BEIS works with industry, regulators, sector bodies and other stakeholders to improve and maintain the resilience of the energy infrastructure, networks and assets, to reduce vulnerabilities, and ensure an effective response to actual or potentially disruptive incidents. The UK government recognises a range of benefits that interconnection can provide. By giving access to generation beyond national borders it can improve security of supply when market prices reflect scarcity and flows across interconnectors follow prices. Interconnection can also

---

<sup>113</sup> The Road to Zero Strategy, 2018: [www.gov.uk/government/publications/reducing-emissions-from-road-transport-road-to-zero-strategy](http://www.gov.uk/government/publications/reducing-emissions-from-road-transport-road-to-zero-strategy)

<sup>114</sup> Upgrading our Energy System: Smart Systems and Flexibility Plan, July 2017, [www.gov.uk/government/publications/upgrading-our-energy-system-smart-systems-and-flexibility-plan](http://www.gov.uk/government/publications/upgrading-our-energy-system-smart-systems-and-flexibility-plan)

<sup>115</sup> Upgrading Our Energy System: Progress Update, October 2018, [www.gov.uk/government/publications/upgrading-our-energy-system-smart-systems-and-flexibility-plan](http://www.gov.uk/government/publications/upgrading-our-energy-system-smart-systems-and-flexibility-plan)

<sup>116</sup> Security of Supply Report, [www.gov.uk/government/collections/statutory-security-of-supply-report](http://www.gov.uk/government/collections/statutory-security-of-supply-report)

help with the integration of intermittent sources of energy and the associated system balancing. In terms of interconnection with third countries, the NorthConnect project between Great Britain and Norway has been granted a Cap and Floor regime in principle and the UK government continues to explore the potential of further projects with Norway and Iceland.

The UK's import dependency in 2018 was just under 50% and the UK benefits from a diverse range of supply sources of both piped gas and liquified natural gas (LNG). Gas interconnectors between the UK and Ireland, Belgium and the Netherlands means that this supply diversity and resilience is of benefit regionally as well as nationally. The UK currently has an import deliverability of ~56 billion cubic metres per year (bcm/y) from Norway, ~43bcm/y from continental Europe and ~49bcm/y from LNG import terminals.<sup>117</sup> This supply diversity and resilience is of benefit regionally as well as nationally.

The UK is connected to global gas markets through three LNG import terminals. The UK currently has the infrastructure capacity to import around 49bcm/y of LNG through the two terminals at Milford Haven (South Hook and Dragon, 21bcm/y and 8bcm/y respectively) and through the Isle of Grain terminal in Kent (20bcm/y).<sup>118</sup> This means the UK has the second largest LNG infrastructure in Europe in terms of capacity, after Spain.<sup>119</sup>

These terminals connect the UK to any LNG producing country, and the UK's LNG supply is becoming more diversified as a wider range of new LNG supply sources come online. In 2018 the UK received LNG from 10 different countries including Qatar, the USA, and Trinidad and Tobago, among others. Though the majority of UK LNG receipts are still from Qatar, imports from Qatar decreased from around 12.1% of total UK gas supply in 2016, to 3.6% in 2018.<sup>120</sup>

**Figure 2: Gas import source and dependence, UK and EU member states<sup>121</sup>**

*iii Where applicable, national objectives with regard to reducing energy import dependency from third countries, for the purpose of increasing the resilience of regional and national energy systems*

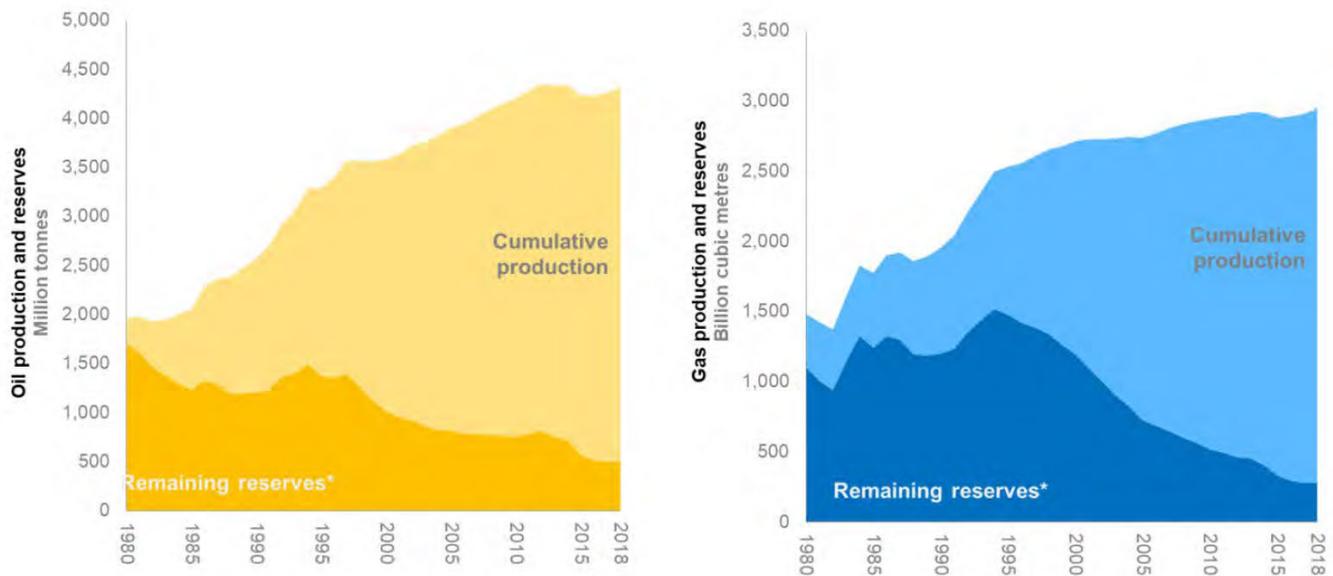

The UK set out a strategy to maximise economic recovery of petroleum from the United Kingdom Continental Shelf (UKCS), based on the UKCS Maximising Recovery Review (2014 Wood Review).<sup>122</sup> Based on the recommendations of the review, the UK government established an independent regulator, the Oil and Gas Authority (OGA, a Government Company) with new competences under the Energy Act 2016 to enable maximising economic recovery of UKCS hydrocarbons. The OGA issued the Maximising Economic Recovery UK Strategy in March 2016. Its Central Obligation states that “relevant persons must take the steps necessary to secure that the maximum value of economically recoverable petroleum is recovered from the strata beneath UK waters.”. The Strategy is due to be reviewed in 2020 including with a view to integrating expressly into the Strategy relevant aspects where industry can assist the Secretary of State in meeting the net zero target. Assisting in achieving net zero forms a part of a proper consideration of the Maximising Economic Recovery Strategy.

The UK government introduced changes to the fiscal regime over 2 budgets including measures abolishing the Petroleum Revenue Tax and cutting the supplementary charge from 32% to 10% and has supported seismic surveys in under-explored areas of the UKCS. Operators in the UKCS will be able to transfer part of their tax history when assets change

<sup>121</sup> BEIS chart, data taken from: ACER ‘Market Monitoring Report 2017’ <https://acer.europa.eu/en/Electricity/Market%20monitoring/Pages/Current-edition.aspx>; Eurostat ‘Energy Dependence by Product’ [https://ec.europa.eu/eurostat/tgm/refreshTableAction.do?tab=table&plugin=1&pcode=sdg\\_07\\_50&language=en](https://ec.europa.eu/eurostat/tgm/refreshTableAction.do?tab=table&plugin=1&pcode=sdg_07_50&language=en); Eurostat ‘Final Energy Consumption by Product’ <https://ec.europa.eu/eurostat/tgm/refreshTableAction.do?tab=table&plugin=1&pcode=ten00095&language=en>  
<sup>122</sup> [www.gov.uk/government/uploads/system/uploads/attachment\\_data/file/471452/UKCS\\_Maximising\\_Recovery\\_Review\\_FINAL\\_72pp\\_locked.pdf](http://www.gov.uk/government/uploads/system/uploads/attachment_data/file/471452/UKCS_Maximising_Recovery_Review_FINAL_72pp_locked.pdf)

hands in order to facilitate the transfer of late-life oil and gas assets. This will allow new investors to benefit from tax relief when assets are eventually decommissioned and help extend field life.

**Figure 3: UK Oil and gas production and reserves, 1980-2018\*<sup>123</sup>**

\*From 2015, contingent resources have been re-categorised and removed from the probable and proven reserves category.

Exploration and appraisal drilling have been declining in the UKCS since the mid-2000s. The OGA is continuing to support exploration and appraisal drilling through licensing rounds, including making significant quantities of high quality seismic and other exploration data openly available in support of these rounds.

### Unconventional gas resources

The UK government is committed to a low-carbon and affordable future for our energy. Gas still meets over a third of our primary energy demand and we will need it for many years to come. However, it is the UK government's view that hydraulic fracturing should only take place if it is safe and environmentally appropriate to do so.

A range of measures specific to hydraulic fracturing and the nascent industry have been put in place to ensure that shale gas exploration is safe and environmentally sound. The Infrastructure Act 2015 introduced thirteen technical and legislative conditions that need to be met before a hydraulic fracturing consent will be issued; this includes an equivalent assessment of the financial resilience of the company proposing to carry out hydraulic fracturing, including its ability to fund decommissioning costs.

Following analysis of hydraulic fracturing operations in 2018, the OGA has found that it is not currently possible to accurately predict the probability or magnitude of earthquakes linked to hydraulic fracturing operations. On this basis and following the significant disturbance that has been caused to local people following seismic events in August 2019, due to further operations at Preston New Road, Lancashire, on 2 November 2019 the BEIS Secretary of State

<sup>123</sup> UK energy in brief 2019, [www.gov.uk/government/statistics/uk-energy-in-brief-2019](http://www.gov.uk/government/statistics/uk-energy-in-brief-2019)

announced a moratorium with immediate effect. On 4 November 2019, the UK government issued a Written Ministerial Statement<sup>124</sup> that sets out its position – namely that the UK government will no longer be supporting further hydraulic fracturing activities in England at this time. The statement sets out that there will be a presumption against Ministers issuing further Hydraulic Fracturing Consents, which would only be altered if compelling new evidence comes to light.

In 2018, onshore oil and gas licensing powers in Scotland and Wales were devolved to both Scottish and Welsh Ministers respectively and Wales and Scotland have adopted their own policy positions with respect to unconventional oil and gas exploration (UOG).<sup>125</sup>

Following consultation in 2018, Wales will not undertake any new petroleum licensing or support applications for hydraulic fracturing petroleum licence consents.<sup>126</sup> Fossil fuel extraction is not compatible with Wales's decarbonisation and renewable energy generation targets and is placed at the bottom of the hierarchy in Planning Policy Wales.<sup>127</sup> On 3 October 2019, the Scottish Government confirmed its finalised policy position of no support for unconventional oil and gas development in Scotland. This means development connected to the onshore exploration, appraisal or production of coal bed methane or shale oil or shale gas using unconventional oil and gas extraction techniques, including hydraulic fracturing and dewatering for coalbed methane.

## Government incentives to promote exploration and production, changes in upstream regulatory regime

The UK government announcements have included:

- The establishment of the Oil and Gas Authority to be a strong and independent regulator and supporter of the oil and gas industry;
- In its 2015 and 2016 budgets, the UK government provided a £2.3bn fiscal package to support the offshore industry. This included zero rating the Petroleum Revenue Tax and cutting the supplementary charge from 32% to 10%;
- Providing £40m (in two tranches) for seismic surveys in under-developed areas of the UK Continental Shelf and £5m to support exploration;
- A £250m Aberdeen City Region Deal in collaboration with Scottish Government, which included £180m for the new Oil and Gas Technology Centre (£90m from each government); and
- In the Autumn budget 2017, the UK government announced that operators in the UKCS will be able to transfer part of their tax history when assets change hands in order to facilitate the transfer of late-life oil and gas assets. This will allow new investors to benefit from tax relief when assets are eventually decommissioned and help extend field life.

<sup>126</sup> <https://gov.wales/written-statement-petroleum-extraction-policy-statement>

<sup>127</sup> Planning Policy Wales, Edition 10, December 2018, <https://gov.wales/planning-policy-wales>

*iv National objectives with regard to increasing the flexibility of the national energy system, in particular by means of deploying domestic energy sources, demand response and energy storage*

National objectives about increasing flexibility of the national energy system are set out in the 'Smart Systems and Flexibility' section in 2.4.3(i).

*v) addressing constrained or interrupted supply of an energy source, for the purpose of improving the resilience of regional and national energy systems, including a timeframe for when the objectives should be met*

The UK government continually monitors and assesses the UK's gas security of supply, including the potential for disruption caused by constrained or interrupted gas supplies. UK government analysis over the past 10 years has shown that Great Britain's gas system is resilient and well-placed to respond effectively to unexpected changes in supply and demand including supply constraints. The resilience of Great Britain's gas system is based on:

- A mature and liquid gas market;
- An effective regulatory regime and dynamic pricing signals; and,
- A diversity of flexible import infrastructure and spare import capacity.

The UK government's monitoring and analysis forms part of a five-year cycle of reviews announced by the Secretary of State for Energy and Climate Change in October 2015, the most recent of which was published in October 2017.<sup>128</sup>

## 2.4 Internal energy market

As of 31 January 2020, the UK has left the EU and will not be part of the internal energy market after the Transition Period ends. The UK is open to an agreement on energy with the EU that would provide efficient cross-border electricity and gas trade, with technical cooperation between network operators and organisations in the planning and use of energy infrastructure.

### 2.4.1 Electricity interconnectivity

*i The level of electricity interconnectivity aimed for in 2030*

The UK government recognises the potential for further interconnection to contribute to energy security, affordability and decarbonisation objectives and supports projects which support these outcomes. The Great Britain electricity system is currently connected with north-west Europe via 4GW interconnector capacity – 2GW with France, 1 GW with Belgium and 1GW with the Netherlands. 1GW of interconnection also links Great Britain and the Single Electricity Market (SEM) on the island of Ireland.<sup>129</sup>

The UK provides a supportive policy environment for further interconnection projects, including through the regulatory route of the Cap and Floor regime and an exempted route for merchant

---

<sup>128</sup> Gas Security of Supply: a strategic assessment, Department for Business Energy and Industrial Strategy, [www.gov.uk/government/publications/gas-security-of-supply-strategic-assessment-and-review](http://www.gov.uk/government/publications/gas-security-of-supply-strategic-assessment-and-review)

<sup>129</sup> Electricity Interconnectors, Ofgem, [www.ofgem.gov.uk/electricity/transmission-networks/electricity-interconnectors](http://www.ofgem.gov.uk/electricity/transmission-networks/electricity-interconnectors)

projects. In addition to the 5GW already operational, 4.8GW of capacity is already in construction, linking GB with Norway, France, and Denmark. A further 8.1GW is progressing through regulatory process. This is expected to increase our level of interconnection by 2030.

The UK has been involved in the North Seas Energy Cooperation (NSEC) work on concrete concepts for joint offshore projects or cluster projects. The NSEC identified a list of potential areas and projects in the region, where joint projects could be most beneficial. This showed that there is considerable potential for such projects in UK waters.

## 2.4.2 Energy transmission infrastructure

*i Key electricity and gas transmission infrastructure projects, and, where relevant, modernisation projects*

There are a number of key electricity transmission projects in the UK, such as the recently completed Western high-voltage direct current (HVDC) link which is helping to transport renewable energy from Scotland to England and Wales.<sup>130</sup>

Also, the fourth list of Projects of Common Interest published by the European Commission on 31 October 2019 included a number of UK-impacted Projects of Common Interest, which are set out in Table 11.

**Table 11: UK-impacted Projects of Common Interest<sup>131</sup>**

PCI No.	Name	Description	Size (GW)
1.14	Viking Link	Interconnection between Revsing (DK) and Bicker Fen (UK)	1.4
1.15	Nautilus	Interconnection between the Antwerp area (BE) and the vicinity of Kemsley (UK)	1.4
1.16	New GB - NL	Interconnection between Netherlands and United Kingdom	1-2
1.2	NeuConnect	Interconnection between Germany and United Kingdom	1.40
12.2	CO2-Sapling	Transportation infrastructure component of the Acorn full chain CCS project (UK, in further phases Netherlands, Norway)	N/A
1.10.1	North Sea Link	Interconnection between Blythe (UK) and Kvilldal (NO)	1.40
1.10.2	NorthConnect	Interconnection between Peterhead (UK) and Simadalen (NO)	1.40
1.12.3	CARES	3 Compressed air energy storage in Middlewich	0.50
1.12.4	Cruachan II	Hydro-pumped electricity storage at Cruachan II	0.60

<sup>130</sup> Electricity transmission networks: major projects update, 2018, [www.gov.uk/government/publications/electricity-transmission-networks-major-projects-update](http://www.gov.uk/government/publications/electricity-transmission-networks-major-projects-update)

<sup>131</sup> 4th list of Projects of Common Interest, European Commission 2019, [https://ec.europa.eu/info/news/commission-publishes-4th-list-projects-common-interest-making-energy-infrastructure-fit-energy-union-2019-oct-31\\_en](https://ec.europa.eu/info/news/commission-publishes-4th-list-projects-common-interest-making-energy-infrastructure-fit-energy-union-2019-oct-31_en)

PCI No.	Name	Description	Size (GW)
1.7.1	FAB	Interconnection between Cotentin (FR) and the vicinity of Exeter (UK)	1.40
1.7.3	ElecLink	Interconnection between Coquelles (FR) and Folkestone (UK)	1.00
1.7.5	Gridlink	Interconnection between the vicinity of Dunkerque (FR) and the vicinity of Kingsnorth (UK)	1.40
1.9.1	Greenlink	Interconnection between Wexford (IE) and Pembroke, Wales (UK)	0.50
2.13.1	North-South	Connection between Woodland (IE) and Turleenan (UK)	1.50
2.13.2	RIDP1	Interconnection between Srananagh (IE) and Turleenan (UK)	1.50

In the gas sector, the iron mains risk reduction programme which seeks to replace fractured iron mains pipe with plastic is also improving the efficiency of the gas network by reducing leaks of uncombusted gas. Ofgem intend to consult on the RII02 price control mechanism for the period from 2021.<sup>132</sup> This will help direct investment in the gas network, including expenditure on resilience and decarbonisation.

There is also investment in new natural gas infrastructure in Northern Ireland through two significant gas extension projects, which will build on existing gas networks which only commenced development since 1996.

ii Where applicable, main infrastructure projects envisaged other than Projects of Common Interest (PCIs)

In addition to the list for PCI interconnector projects, the NeuConnect interconnector project has been granted regulatory approval in principle through Ofgem's Cap and Floor regime.<sup>133</sup> Further projects, which have not yet applied for regulatory approval, are listed on the Ten Year Network Development Plan.<sup>134</sup>

The UK government requires the electricity transmission operator to submit updates on the progress of infrastructure projects on a quarterly basis. This information is published online.<sup>135</sup>

<sup>132</sup> [www.ofgem.gov.uk/regulating-energy-networks/2021-price-control-review-riio-gd2](http://www.ofgem.gov.uk/regulating-energy-networks/2021-price-control-review-riio-gd2)

### 2.4.3 Market integration

*i National objectives related to other aspects such as increasing system flexibility, in particular related to the promotion of competitively determined electricity prices in line with relevant sectoral law, market integration and coupling, aimed at increasing the tradeable capacity of existing interconnectors, smart grids, aggregation, demand response, storage, distributed generation, mechanisms for dispatching, re-dispatching and curtailment, and real-time price signals, including a timeframe for when the objectives shall be met.*

#### **Smart Systems and Flexibility**

We are working closely with the energy regulator (Ofgem) and industry to support the transition to a smarter, more flexible energy system. Our aim is to establish a best-in-class regulatory framework to harness the full potential of smart and flexible energy solutions such as storage, demand side response and interconnection.

In July 2017, BEIS and Ofgem published the Smart Systems and Flexibility Plan.<sup>136</sup> The plan outlines the underlying principles of our approach to enable the transition to a smart and flexible system and sets out 29 actions for the UK government, Ofgem and industry to implement.

The actions are split across three core themes:

- removing barriers to smart technologies, such as electricity storage – for example, ending double payment of network and policy costs by storage providers;
- enabling the use of smart solutions, including demand side response, in homes and businesses – for example, rolling out smart meters, implementing market-wide half hourly settlement and regulating smart appliances; and
- ensuring markets fairly reward flexibility and smart solutions – for example, enabling access of aggregators to the balancing mechanism and encouraging development of new local flexibility markets.

In October 2018, BEIS and Ofgem published a Progress Update<sup>137</sup> to the Plan which announced that we have now implemented over half of the original actions in the plan. This update also identified nine new actions which continue to support the transition to a smart and more flexible energy system.

*ii Where applicable, national objectives related to the non-discriminatory participation of renewable energy, demand response and storage, including via aggregation, in all energy markets including a timeframe for when the objectives are to be met.*

National objectives are outlined in the ‘Smart Systems and Flexibility’ section in 2.4.3(i).

*iii Where applicable, national objectives with regard to ensuring that consumers participate in the energy system and benefit from self-generation and new technologies, including smart meters.*

<sup>137</sup> Upgrading Our Energy System: Progress Update, October 2018,

[www.gov.uk/government/publications/upgrading-our-energy-system-smart-systems-and-flexibility-plan](http://www.gov.uk/government/publications/upgrading-our-energy-system-smart-systems-and-flexibility-plan)

## Self-Generation

The Feed-in Tariffs scheme supports a range of small-scale, low-carbon electricity generation projects (with capacity up to 5MW for solar PV, wind, hydropower and anaerobic digestion, and up to 2kW for combined heat and power), and was designed to be accessible to organisations, businesses, communities and individuals that have not traditionally engaged in the electricity market. Generators receive three benefits:

- Generation tariff - a payment for every kWh generated (the rate being dependent on the technology, the capacity of the installation, and the date installed);
- Export tariff - an additional payment for every kWh that is exported to the electricity network, and
- Bill savings - additional benefit from usage of electricity 'onsite' as opposed to paying the retail price for importing that energy from the grid.

Following a consultation process, the scheme closed to new applications in March 2019 – however projects that have previously qualified will continue to be supported by the scheme.

In December 2018, the UK government proposed to introduce a new market-led Smart Export Guarantee (SEG), which aims to ensure that eligible small-scale low-carbon generators who export electricity to the network can receive payment for it. This received Parliamentary approval in June 2019 and came into force on 1 January 2020. More information on the SEG is included in 3.1.2(iii).

## Smart meters

Smart meters are replacing traditional gas and electricity meters across Great Britain as part of an important national upgrade that will build a smart grid, digitise our energy system and drive innovation. In September 2019, the UK government published a consultation on a post-2020 policy framework to further drive investment and maintain momentum towards a market-wide roll out that will deliver consumer and system benefits as soon as practicable.<sup>138</sup>

Smart meters offer a range of intelligent functions and provide consumers with more accurate information on their energy usage and cost. Every domestic consumer is also offered an In-Home Display, which gives consumers easy access to their energy consumption data in pounds and pence to help them manage and reduce their energy consumption, save money and reduce emissions.

The UK government's latest Cost Benefit Analysis estimates the roll-out of smart meters in Great Britain will deliver total net benefits of around £bn, the majority of which come from consumer energy savings and industry operational cost savings.<sup>139</sup> Without the flexibility enabled by smart metering, modelling for the CCC estimates the costs of delivering net zero emissions by 2050 could be up to £16bn higher each year.<sup>140</sup>

---

<sup>138</sup> Smart meter policy framework post 2020, September 2019, [www.gov.uk/government/consultations/smart-meter-policy-framework-post-2020](http://www.gov.uk/government/consultations/smart-meter-policy-framework-post-2020)

<sup>139</sup> Smart meter roll-out: cost-benefit analysis 2019, [www.gov.uk/government/publications/smart-meter-roll-out-cost-benefit-analysis-2019](http://www.gov.uk/government/publications/smart-meter-roll-out-cost-benefit-analysis-2019)

<sup>140</sup> Analysis of Alternative UK Heat Decarbonisation Pathways, for the Committee on Climate Change, August 2018, [www.theccc.org.uk/wp-content/uploads/2018/06/Imperial-College-2018-Analysis-of-Alternative-UK-Heat-Decarbonisation-Pathways.pdf](http://www.theccc.org.uk/wp-content/uploads/2018/06/Imperial-College-2018-Analysis-of-Alternative-UK-Heat-Decarbonisation-Pathways.pdf)

As at 30 September 2019 there were 15.6 million smart and advanced meters operating in homes and businesses across Great Britain<sup>141</sup>, allowing consumers to take control of their energy consumption, making it easier for them to switch energy supplier, paving the way towards a smart energy system,<sup>142</sup> and playing a key role on the road to decarbonisation and net zero.

The UK government has developed a comprehensive consumer engagement strategy to help consumers benefit from smart metering. Energy suppliers hold the primary consumer engagement role as the main point of contact for customers before, during and after the smart meter installation. A mandatory installation code of practice requires energy suppliers to take consumers' specific needs into account. This ensures that all consumers, particularly vulnerable consumers, can access the benefits of smart metering. In addition, Smart Energy GB, an independent body funded by energy suppliers, is delivering a national engagement programme to raise awareness and drive behaviour change. As part of this work Smart Energy GB is partnering with grassroots organisations around Great Britain to reach all types of consumers including the most vulnerable.

Millions of energy consumers are already benefitting from smart meters and the overwhelming majority are having a good experience, which is testament to the hard work, skill and dedication of all the organisations involved in delivering the rollout:

- 9 in 10 people with smart meters say they were satisfied with the installation process.<sup>143</sup>
- 8 in 10 people with smart meters say they have a better idea of their energy costs.<sup>144</sup>
- 9 in 10 smart pre-payment customers say that topping up has become easier since getting a smart meter.<sup>145</sup>

The Scottish Government is working to deliver a Smart Meter Advice Project (SMAP) delivered through Home Energy Scotland to enable customers to make the most of the energy use data provided by their smart meters. Home Energy Scotland now has a network of advisors trained to provide general smart meter information and recruit customers for SMAP. Each centre has a smart meter specialist fully trained to use the SMAP tool. Home Energy Scotland will routinely ask customers about their meter and, if they have a smart meter, ask their permission to use their data to improve the service provided.

*iv National objectives with regard to ensuring electricity system adequacy, as well as for the flexibility of the energy system with regard to renewable energy production, including a timeframe for when the objectives are to be met*

## Capacity Market

The UK government has established in law a reliability standard for system adequacy in Great Britain. This is set at 3 hours Loss of Load Expectation (LOLE), i.e. the expectation that there will be three hours per year on average where generation in the market may not meet demand,

---

<sup>141</sup> Statistical release and data: Smart Meters, Great Britain, quarter 3 2019, published November 2019, [www.gov.uk/government/statistics/statistical-release-and-data-smart-meters-great-britain-quarter-3-2019](http://www.gov.uk/government/statistics/statistical-release-and-data-smart-meters-great-britain-quarter-3-2019)

<sup>142</sup> Smart meters: unlocking the future, published December 2018, [www.gov.uk/government/publications/smart-meters-unlocking-the-future](http://www.gov.uk/government/publications/smart-meters-unlocking-the-future)

<sup>145</sup> BEIS, Smart Meter Customer Experience Study: Post-installation survey, August 2017, [www.gov.uk/government/publications/smart-meter-customer-experience-study-2016-18](http://www.gov.uk/government/publications/smart-meter-customer-experience-study-2016-18)

and other measures may be needed. Capacity Market (CM) auctions are held one (T-1) and four (T-4) years ahead of the delivery year with targets set at the level needed to meet this reliability standard. Existing generators compete against a range of other technologies to obtain agreements under which they commit to making their capacity available when needed, in return for guaranteed payments.

Section 3.3(i) contains information on flexibility.

*v Where applicable, national objectives to protect energy consumers and improve the competitiveness of the retail energy sector*

The UK's plans for the next 10 years include:

### **Default Tariff Cap:**

- On 1 January 2019, the Default Tariff Cap came into force in Great Britain.<sup>146</sup> This will remain in place until the end of 2020 but can be extended each year until 2023. Analysis from Ofgem (the independent GB energy market regulator) suggests that the cap will save around 11 million default tariff customers c.£75-100/year compared to if the cap was not introduced.<sup>147</sup> As of October 2019, the default tariff cap was set at £1,179/year for a typical domestic customer.<sup>148</sup>
- Ofgem implemented the measure following the passing of the Domestic Gas & Electricity (Tariff Cap) Act 2018 in July 2018.<sup>149</sup> The legislation was put in place following the Competition & Markets Authority's (CMA) Energy Market Investigation conducted in 2016, which found that in total domestic customers of the six largest energy companies were paying an average of £1.4bn a year more than they would in a truly competitive market. The Default Tariff Cap is designed as an interim measure to protect consumers on standard variable and default tariffs from overpaying for their energy.

### **Engaging consumers:**

- Ofgem are introducing a principles-based approach which allows bills to be simplified with information presented in a way that works for consumers. This approach balances the protection of consumers, with greater room for flexibility and innovation in the future.
- Ofgem are also conducting trials to discover what works to appropriately engage consumers. These trials may be scaled up and rolled out nationally if successful.

### **Future Retail:**

- The joint BEIS-Ofgem Future Retail Markets Review launched in November 2018 is looking at how the regulatory framework might need to evolve to ensure the energy market is fit for the future, so that consumers can take advantage of the increased flexibility and lower costs of a smart, low-carbon energy system. The review will seek to

---

<sup>146</sup> Default Tariff Cap: [www.ofgem.gov.uk/gas/retail-market/market-review-and-reform/default-tariff-cap](http://www.ofgem.gov.uk/gas/retail-market/market-review-and-reform/default-tariff-cap)

<sup>147</sup> Figure based on typical domestic consumption values of 3100kwh electricity, 12000kwh gas. <sup>149</sup> Domestic Gas and Electricity (Tariff Cap) Act 2018, [www.legislation.gov.uk/ukpga/2018/21/contents/enacted/data.htm](http://www.legislation.gov.uk/ukpga/2018/21/contents/enacted/data.htm)

ensure that consumers are appropriately protected no matter what energy related products and services they sign up to.

- In July 2019 the joint team published the consultation ‘Flexible and Responsive Energy Retail Markets’, setting out a vision for the future of the energy retail markets, including key opportunities and challenges.<sup>150</sup> The consultation closed on 16 September 2019. The team are currently analysing the responses from the wide range of stakeholders. We plan to use the responses and continue to work with stakeholders to help us shape the development of more detailed reforms over the coming months.

#### **Use of data:**

- The UK government and Ofgem are revising the Midata programme so that domestic consumers can quickly, securely and easily share their energy data with trusted third parties. This will enable services including, but not limited to, faster and more accurate tariff comparisons.
- Price comparison websites are to be granted access to the Electricity Central Online Enquiry Service and gas and electricity customers’ data to reduce errors in switching process. There will be an annual report on the development of this work.
- Smart meters are replacing traditional gas and electricity meters across Great Britain as part of an important national upgrade that will build a smart grid, digitise our energy system and drive innovation. The UK government has published a consultation on a post-2020 policy framework to further drive investment so that momentum continues that will deliver a market-wide roll out and all consumer and system benefits as soon as practicable.<sup>151</sup>
- Building on the functionality provided by smart metering, Ofgem is considering the move to market-wide half-hourly electricity settlement; and intend to reach a decision on the approach and timeframe for implementing it in Q1 2021.<sup>152</sup>

#### **Faster switching:**

- Ofgem and the UK government are moving to faster and more reliable switching for customers.

The Scottish Government published the Energy Consumer Action Plan in May 2019.<sup>153</sup> The Action Plan establishes a framework to guide devolved energy policy and influence change in areas reserved to UK government. Building on two Scottish Energy Summits held in 2016 and 2018 and delivering on a commitment in the Scottish Energy Strategy, the Energy Consumer Action Plan sets out a collaborative approach to ensuring consumers are informed, engaged and empowered as the energy system evolves.

The Scottish Government also announced in October 2017, an ambition to establish a public energy company with the aim of supporting efforts to tackle fuel poverty and helping to achieve

---

climate change targets.<sup>154</sup> It will be publicly owned and run on a not-for-profit basis. The company will offer energy at a fair price and ultimately will contribute to economic development through supporting renewable energy ambitions. An outline business case is currently being finalised and will be published once considered by Ministers and potential local authority partners.

#### 2.4.4 Energy poverty

*i Where applicable, national objectives with regard to energy poverty including a timeframe for when the objectives are to be met.*

Energy poverty, known as fuel poverty in the UK, is a devolved issue, with separate objectives to address fuel poverty in each administration which are set out below. Each administration is also able to set out specific policies to support their objective. Some of the policies implemented by the UK government extend to more than one administration, where this is the case the geographical extent is specified.

##### **England**

The Fuel Poverty (England) Regulations 2014<sup>155</sup> created an objective for improving the energy performance of as many fuel poor homes in England as is reasonably practicable to a minimum energy efficiency rating of Band C by 31 December 2030. The fuel poverty strategy for England includes interim milestones for as many fuel poor homes as is reasonably practicable to achieve a minimum energy efficiency rating of Band E by 2020 and Band D by 2025.

An annual assessment of the number of households living in fuel poverty is undertaken in England. Currently fuel poverty is measured using the Low Income High Cost indicator. In 2019 Government consulted on a proposal to update this to a new measure of fuel poverty 'Low Income Low Energy Efficiency', further details on this proposal is set out in the Consultation on the Fuel Poverty Strategy for England.<sup>156</sup> Data is collected through the English Housing Survey to produce annual fuel poverty statistics. The 2019 Report<sup>157</sup> provides the latest statistics on the number of households living in fuel poverty in England, analysis of the composition of the fuel poor group in 2017 and projections of the number of households in fuel poverty in 2018 and 2019. The proportion of households in England in fuel poverty was estimated to be 10.9% in 2017, approximately 2.53 million households.

In 2017, further progress was made towards the fuel poverty interim milestones and fuel poverty target. Table 12 highlights the percentage of fuel poor households that have an energy efficiency rating corresponding to the milestones and target and highlights the percentage change since 2010:

**Table 12: Progress towards fuel poverty interim milestones and fuel poverty target in England<sup>158</sup>**

Target year	Target	2010 (%)	2017 (%)	Percentage point change
2020	E or above	81.1	92.2	+11.1
2025	D or above	32.7	65.9	+33.2
2030	C or above	1.5	10.0	+8.5

### Northern Ireland

In Northern Ireland a household is considered to be living in fuel poverty if it needs to spend more than 10% of its income on fuel to obtain a satisfactory level of heating - that is, 21°C in the living room and 18°C in other occupied rooms. Essentially fuel poverty means not being able to keep your home adequately warm at a reasonable cost. It is generally caused by a combination of three factors:

- poor household energy efficiency (this is the factor addressed by the Affordable Warmth Scheme)
- low income
- high fuel costs

The 2016 House Condition Survey estimated that approximately 22% (160,000) of households in Northern Ireland were in fuel poverty.

The Northern Ireland Executive's fuel poverty strategy is delivered mainly through the Affordable Warmth Scheme.<sup>159</sup> The 2019/20 Fuel Poverty target for the Affordable Warmth Scheme and Boiler Replacement Scheme is to deliver 3,900 energy efficiency measures to 2,600 homes through the Affordable Warmth Scheme and to deliver a further 1,300 replacement boilers to 1,300 homes through the Boiler Replacement Scheme.

### Scotland

The Fuel Poverty (Targets, Definition and Strategy) (Scotland) Act ('the 2019 Act')<sup>160</sup> was passed by Parliament with unanimous support in June 2019 and received Royal Assent on 18 July 2019. It sets statutory targets for reducing fuel poverty, introduces a new definition which aligns fuel poverty more closely with relative income poverty and requires Scottish Ministers to produce a comprehensive strategy to show how they intend to meet the targets. This Strategy is due to be published in 2021.

<sup>158</sup> Annual fuel poverty statistics report: 2019, June 2019, [www.gov.uk/government/statistics/annual-fuel-poverty-statistics-report-2019](http://www.gov.uk/government/statistics/annual-fuel-poverty-statistics-report-2019)

<sup>159</sup> Northern Ireland Affordable Warmth Scheme, [www.nihe.gov.uk/index/benefits/affordable\\_warmth\\_scheme.htm](http://www.nihe.gov.uk/index/benefits/affordable_warmth_scheme.htm); current AWS Fuel Poverty Strategy, [www.communities-ni.gov.uk/publications/fuel-poverty-strategy](http://www.communities-ni.gov.uk/publications/fuel-poverty-strategy)

<sup>160</sup> The Fuel Poverty (Targets, Definition and Strategy) (Scotland) Act 2019, [www.legislation.gov.uk/asp/2019/10/enacted](http://www.legislation.gov.uk/asp/2019/10/enacted)

## Targets

The statutory targets set by the 2019 Act are that in 2040:

- no more than 5% of households should be in fuel poverty
- no more than 1% of households should be in extreme fuel poverty
- the median fuel poverty gap of households in fuel poverty is no more than £250 in 2015 prices before adding inflation

Each of these 2040 targets must be achieved not only in Scotland as a whole, but also within each of the 32 local authority areas. This is to ensure that no part of the country is left behind. There are also interim targets set for the same metrics at 2030 and 2035. However, the interim targets only need to be met at a national level.

## New definition and provisions for remote and island communities

The 2019 Act establishes a new two-part definition whereby a household is considered fuel poor if:

- more than 10% (20% for extreme fuel poverty) of their after-housing costs adjusted net income is required to pay for their reasonable fuel needs; and
- after further adjustments for childcare costs and receipt of specified benefits, their remaining adjusted net income is insufficient to maintain an acceptable standard of living, defined as being at least 90% of the UK Minimum Income Standard.

To take account of the generally higher costs of living in Scotland's remote and island communities, the legislation provides for uplifts to be applied to the Minimum Income Standard for households in these areas.

## Fuel Poverty Statistics for 2018

The latest statistics on fuel poverty were published on 21 January as part of the [Scottish House Condition Survey](#) and relate to 2018. The figures presented in the 2018 survey are a best estimate of fuel poverty under the new definition. The headline figures are:

- The level of fuel poverty was 25.0% (around 619,000 households). This is similar to the rate in 2016 and 2017 but lower than the peak of 31.7% (761,000 households) in 2013.
- The level of extreme fuel poverty was 11.3%, equivalent to around 279,000 households. Levels of extreme fuel poverty have been decreasing since the peak in 2013 of 16.0% (384,000 households).
- While fuel poverty rates for households in urban and rural areas were similar in 2018, extreme fuel poverty rates were higher in rural areas compared to urban areas; 17% compared to 10%, respectively.
- Overall rates of extreme fuel poverty were similar between the social (13%) and private sector (10%) in 2018, although levels of extreme fuel poverty in housing association households have decreased from 18% in 2017 to 11% in 2018.
- 69% of fuel poor households are also income poor, similar to 2017.
- 28% of households report owning an energy monitoring device – a nine percentage point increase on the previous year.

- Fuel poor and extreme fuel poor households are more likely to monitor energy use (62% and 65% respectively compared to 57% for non-fuel poor households) but less likely to have monitoring devices at home (23% for both compared to 29% for non-fuel poor households).

By the end of 2021, the Scottish Government will have allocated over £1bn since 2009 to tackling fuel poverty and improving energy efficiency and is on track to deliver its 2016 Programme for Scottish Government commitment to make half a billion pounds available over four years to address these issues, making people's homes warmer and cheaper to heat.

The Scottish House Condition Survey<sup>161</sup> shows that just over two-fifths (44%) of homes in 2018 were rated EPC band C or above, an increase from 35% in 2014, based on the SAP 2012 (RdSAP v9.92) methodology. In the delivery of Scotland's Energy Efficient Scotland Programme, priority will be given to improving the homes of fuel poor households. The programme sets a target for all Scottish homes to achieve an EPC band C by 2040 (where technically feasible and cost effective). To support the ambition of eradicating fuel poverty by removing poor energy efficiency as a driver the Scottish Government have consulted on setting a more ambitious target for those households in fuel poverty - for all homes with households in fuel poverty to reach EPC Band C by 2030 and EPC Band B by 2040 (where technically feasible and cost effective).

## Wales

The Warm Homes and Energy Conservation Act 2000 as amended by the Energy Act 2013, imposes a requirement on the Welsh Ministers in relation to Wales to publish and implement a strategy for reducing fuel poverty; to require the setting of targets for the implementation of that strategy, and for connected purposes.

Targets for eradicating fuel poverty in Wales were initially published in 2003, in the Welsh Assembly Government's A Fuel Poverty Commitment for Wales. The 2010 Strategy replaced the commitment, although the targets remained in place. As far as reasonably practicable, the objective is the eradication of fuel poverty:

- Amongst vulnerable households by 2010;
- In social housing by 2012; and
- By 2018, there would be no-one in Wales living in fuel poverty.

Under the Strategy, fuel poverty in Wales is measured by the number of people having to spend more than 10% of income on all household fuel used to maintain a satisfactory heating regime. Where expenditure on all household fuel exceeds 20% of income, households are defined as being in severe fuel poverty.

On 22 May 2019, new headline estimates for Fuel Poverty in Wales were published and detailed analysis was published in August.<sup>162</sup> In 2018, it is estimated:

- 155,000 households in Wales were living in fuel poverty, equivalent to 12% of households.

---

<sup>161</sup> Scottish House Condition Survey, 2017, Table 18, [www.gov.scot/publications/scottish-house-condition-survey-2017-key-findings/pages/5/](http://www.gov.scot/publications/scottish-house-condition-survey-2017-key-findings/pages/5/)

<sup>162</sup> Fuel poverty estimates for Wales, 2019, <https://gov.wales/fuel-poverty-estimates-wales>

- Of these households, 32,000 households were living in severe fuel poverty<sup>163</sup>, equivalent to 2% of households.
- 130,000 vulnerable<sup>164</sup> households in Wales were living in fuel poverty, equivalent to 11% of vulnerable households.
- 19,000 vulnerable households were living in severe fuel poverty, equivalent to 2% of vulnerable households.

From October to December 2020, the Welsh Government is consulting on a new draft plan for tackling fuel poverty. The aim of the new plan is to set out the actions to be taken by the Welsh Government to support efforts to reduce the number of homes in Wales living on a lower income in 'Fuel Poverty'. It will set out a range of new targets, policy goals, objectives and activities designed to collaborate with partners towards the objective of eradicating fuel poverty for people living on a lower income where it is practicable to do so, whilst contributing to the Welsh Government's commitments to tackle climate change by reducing carbon emissions.

## 2.5 Research, innovation and competitiveness

i National objectives and funding targets for public and, where available, private research and innovation including, where appropriate, a timeframe for when the objectives are to be met.

Through our Industrial Strategy, the UK government has set a Clean Growth Grand Challenge to put the UK at the forefront of the industries of the future. The UK government will maximise the advantages for UK industry from the global shift to clean growth – through leading the world in the development, manufacture and use of low-carbon technologies, systems and services that cost less than high carbon alternatives. As part of this Grand Challenge, the UK will:

1. Develop smart systems for cheap and clean energy across power, heating and transport.
2. Transform construction techniques to dramatically improve efficiency (with up to £170m available through wave 2 of the Industrial Strategy Challenge Fund up to 2021).
3. Work with industry to make the UK's energy intensive industries competitive in the clean economy.
4. Put the UK at the forefront of the global move to high-efficiency agriculture.
5. Make the UK the global standard-setter for finance that supports clean growth.

The UK government has significantly increased its investment in low-carbon innovation. From 2015 to 2021 we expect to invest more than £2.5bn in research, development and the demonstration of low-carbon energy, transport, agriculture and waste.<sup>165</sup> This includes:

- Up to £505m from BEIS's Energy Innovation Programme, which aims to accelerate the commercialisation of innovative clean energy technologies and processes.

---

<sup>163</sup> The sample sizes for severe Fuel Poverty are small and these estimates are not considered as robust as those for Fuel Poverty.

<sup>164</sup> A vulnerable household is defined as those with a person aged 60 years or over, a child or young person under the age of 16 years and/or a person who is disabled or has a long-term limiting condition.

<sup>165</sup> Energy Innovation, [www.gov.uk/guidance/energy-innovation](http://www.gov.uk/guidance/energy-innovation)

- Up to £1.2bn of funding from the combination of UK Research Councils and Innovate UK – now being brought into one organisation with the creation of UK Research and Innovation. These investments include funding for the Energy Systems Catapult and the Offshore Renewable Energy Catapult.
- Up to £246m for the Faraday Challenge, which will ensure the UK builds on its strengths and leads the world in the design, development and manufacture of electric batteries.
- Up to £620m from a range of UK government departments, including BEIS, Department for Transport (DfT), Department for International Development (DfID) and Department for Environment, Food and Rural Affairs (Defra) and additional Industrial Strategy Challenge Fund support.
- In addition to this UK government funding, in the current price control Ofgem is making £720m of regulated expenditure available to gas and electric companies in Great Britain, to support smarter, more flexible, efficient, and resilient networks.
- The UK government is also stimulating industry-academia collaboration for example through the Agri-tech catalyst, which will help improve agricultural productivity and contribute to more environmentally sustainable agricultural systems.

The UK's Office of National Statistics (ONS) publishes estimates of total private sector research and development, but this is not broken down by Energy Technology Research, Development and Innovation (ETRDI). We are not aware of any formal reporting of data broken down in this way as there is no formal record of different private sector ETRDI projects.

The UK government actively encourages private sector participation in public ETRDI Programmes, recognizing the clear economic benefits such as supporting jobs and increasing export potential.

## Co-ordination of UK energy research and innovation activity

The Energy Innovation Board was formed in November 2016 and replaces and builds on the work of the former Low Carbon Innovation Coordination Group (LCICG), as the strategic body aligning low-carbon innovation investments across the UK government and regulated bodies (Ofgem). It plays a strategic role in aligning domestic and international clean tech investments across the UK government.

The Board is currently chaired by the UK Government Chief Scientific Advisor and is attended by senior civil servants across BEIS, Innovate UK, Research Councils, Ministry of Housing, Communities and Local Government, Department for International Development, Department for Transport, Ofgem, and with the Treasury as observers. The Board is internal to the UK government but is seeking external members with industry insights to provide external challenge. The Board meets on a regular basis to discuss a range of clean technology innovation topics.

## Prioritisation of UK energy research and innovation activity

The Energy Innovation Needs Assessment (EINA) project is a two-phased effort to develop a set of reports to provide evidence for the innovation needs of a range of clean energy technologies, and the systems and processes in which they are utilised. These reports build on the evidence developed as part of the Technology Innovation Needs Assessment (TINA) project, conducted during the 2010-2015 Parliament. The objectives of the EINAs are:

- To create a methodology for conducting assessments of future innovation needs in a way that will produce comparable outputs across different technologies.
- To facilitate efforts across government to identify strategic energy innovation areas for investment.
- To analyse the role of technologies in the energy system.
- To quantify the scale of the opportunity to UK and regions of:
  - reducing technology costs
  - expanding economic growth
- To help understand the uncertainty associated with the above estimates.

The EINAs assess themes such as power generation including bioenergy, carbon capture and storage, hydrogen, demand and supply of heating and transport.

The methodology has been tested through a small-scale pilot of heating technologies to test the effectiveness of the methodology. The EINAs were published in November 2019 and will be used as a key information resource for planning spending towards delivering the UK's international and net zero commitments.

In Scotland, the Energy Strategy emphasised the importance of attracting, retaining and developing low-carbon innovators who will shape the future. Alongside the publication of the Scottish Energy Strategy in December 2017, the Scottish Government announced the creation of a £20m Energy Investment Fund, building on the success of the Renewable Energy Investment Fund, and a £60m Low Carbon Innovation Fund, to provide support for renewable and low-carbon infrastructure over and above wider interventions to support innovation.<sup>166</sup> The programme aims to stimulate commercial interest and investment, maximising Scotland's vast potential in the low-carbon sector, building on the success of the Low Carbon Infrastructure Transition Programme (LCITP) which has allocated around £40m to 16 low-carbon capital projects since 2015. The invitation for the LCITP Low Carbon Innovation Fund launched in January 2018, seeking applications in three priority areas: Low Carbon Heat, Integrated Energy Systems and Ultra Low Emission Vehicle Infrastructure: 14 projects have received offers of development support.

The energy sector in Wales has benefited considerably from European structural funds. The funding awarded includes building research capacity at Welsh universities, enabling collaborative research, development and demonstrators, and investment in renewables and marine energy development. During the period 2014-2018 over £60m has been invested. In addition, the Smart Living Programme works with local authorities and other key stakeholders

---

<sup>166</sup> Low Carbon Infrastructure Transition Programme, [www.gov.scot/policies/renewable-and-low-carbon-energy/low-carbon-infrastructure-transition-programme/](http://www.gov.scot/policies/renewable-and-low-carbon-energy/low-carbon-infrastructure-transition-programme/)

to develop innovative demonstrators in Smart Living.<sup>167</sup> Examples of projects which have received EU funding include:

- **FLEXIS<sup>168</sup>**: World-leading energy research scheme, involving collaborations with industry and research organisations in Wales, Europe and around the world. FLEXIS investigates how multiple energy sources can be supplied to consumers through more flexible and efficient systems that integrate traditional and renewable energy sources.
- **Active Building Centre<sup>169</sup>**: Developing and delivering the first examples of buildings as power stations which are able to generate, store and release their own energy both thermal and electrical.
- **Caerau Local Heat Scheme**: Using underground mine-water to warm 150 homes in Caerau Bridgend. Water in the underground mine workings of the former Caerau colliery has been naturally heated by the earth and will be harnessed using heat pump technology and a network of pipes as a geothermal source of energy.
- **WaveSub**: Enabling the design, manufacture and testing of a prototype Wave Energy Converter within the Haven Waterway Enterprise Zone.

*ii Where available, national 2050 objectives related to the promotion of clean energy technologies and, where appropriate, national objectives including long term targets (2050) for deployment of low-carbon technologies, including for decarbonising energy- and carbon-intensive industrial sectors and, where applicable, for related carbon transport and storage infrastructure*

Our future research and innovation activities will be designed to achieve our legally binding domestic carbon budgets and our new commitment to achieve net zero greenhouse gas emissions from the UK by 2050. Our research and innovation priorities and related spending to deliver these targets are in the process of being considered and agreed, but in the meantime, our intention is to remain closely engaged in international research and innovation activities to meet these world leading commitments. We have an overall target of spending an amount equal to 2.4% of GDP on UK research and innovation more generally, with energy research and innovation a part of this.

In the meantime, the CGS, published in 2017, included three illustrative pathways to meeting what was then our long-term target of reducing emissions by at least 80% relative to 1990 levels by 2050. These did not represent the most likely or preferred pathways to meeting the previous 2050 target, but showed that the 2032 pathway would leave open a wide range of options for 2050 - different pathways within this range, and beyond this range, were also possible. The pathways explored were:

- An Electricity pathway - where all cars and vans are electric, four in five buildings use electric heating, electricity is the main low-carbon energy source for the industry sector and around one in five buildings uses a largely low-carbon district heat network.
- A Hydrogen pathway- where all cars and vans are fuelled by hydrogen, the majority of buildings use hydrogen for heat, with CCUS capturing and storing the emissions during Hydrogen production.

---

<sup>167</sup> Smart Living, Welsh Government website, July 2018, <https://gov.wales/low-carbon-living-smart-living-annual-review-2018-2019>

<sup>168</sup> Meeting the energy demands of the future, [www.flexis.wales/](http://www.flexis.wales/)

<sup>169</sup> Active Buildings website, <http://specific.eu.com/>

- A Negative Emissions pathway- where negative emissions in the electricity sector create 'headroom' for other sectors such as transport, buildings and agriculture to decarbonise more slowly.

## Scotland

The Scottish Energy Strategy sets two ambitious targets for 2030:

- The equivalent of 50% of Scotland's heat, transport and electricity consumption to be met from renewable sources, and
- An increase of 30% in the productivity of our energy use across the Scottish economy.

The Scottish Government has also set interim targets for 100% of Scotland's electricity and for 11% of Scotland's non-electrical heat demand to come from renewable sources by 2020. As well as a 12% reduction in energy consumption by 2020.

Like the CGS, the Scottish Energy Strategy is not prescriptive in setting out the pathway by which decarbonisation will ultimately be delivered – instead it offers two illustrative examples, a Hydrogen Future and an Electric Future, both of which are consistent with Scotland's Climate Change targets. These are designed to aid the consideration of developments in the near-term, and the influence they may have on the eventual shape of the system.

In terms of low-carbon and renewable transport, the Scottish Government have committed to phasing out the need for new petrol and diesel cars and vans by 2032, through expanding the electric charging infrastructure in Scotland, accelerating the procurement of ultra-low emission vehicles (ULEV) in the public and private sectors, and introducing large scale pilots to remove barriers to and encourage private motorists to use ULEVs.

### *iii Where applicable, national objectives with regard to competitiveness*

Public investment in economic infrastructure will have doubled over the decade leading up to 2022-2023. This investment will be delivered through a strengthened institutional framework, with longer-term budgets, the advice of the National Infrastructure Commission, an increased focus on the effective delivery of projects in departments, and five-year capital investment programmes for road, rail, water and flooding.

The UK government will take a more strategic approach to our investment in the design of relevant markets, focusing on three principles. We will:

- Invest in ways that support all the objectives of the Industrial Strategy: increasing innovation, developing skills, growing business, and driving productivity and earning power in urban and rural locations across the UK.
- Take greater account of disparities in productivity and economic opportunity between different parts of the UK, ensuring our investments drive growth across all regions of the UK.
- Invest to increase UK competitiveness in relation to long-term global economic changes, such as the shift to clean growth. These will be positive choices that enable the UK economy to flourish in the context of these transformational changes.

Innovation in clean growth will be important for low-cost, low-carbon infrastructure systems, as well as for realising industrial opportunities. We will increase support for clean growth innovation by making this a strategic priority for the Industrial Strategy Challenge Fund.

This will build on the UK government investment in low-carbon innovation set out in the CGS, which has grown to more than £3bn between 2015 and 2021.<sup>170</sup> In addition to the Faraday Challenge for battery technology, the UK government has announced three new Industrial Strategy programmes in Clean Growth across energy, construction and agriculture. We will continue to build our international partnerships in clean growth research and innovation: the UK is a proud member of Mission Innovation – a global initiative that aims to reinvigorate and accelerate the global clean energy revolution. We will strengthen support to commercialise new clean technologies through our investments in patent capital, beginning with a new equity fund for which we will provide up to £2m.

We will use all the UK government tools available to support innovation in a low-carbon economy including market design, taxation and regulation. We will also aim to accelerate private investment and promote market growth.

We will promote overseas investment in the UK's clean economy and strengthen our support for UK exporters through better identification of overseas opportunities, industry briefings, overseas missions, pavilions at key international events and campaigns for sectors and industries that are delivering clean growth. We will also promote the UK's exceptional expertise through the Green is GREAT campaign to amplify the UK's global reputation for excellence in this area.<sup>171</sup>

In Scotland, the Energy Strategy highlights the huge economic opportunity that the transition to a low-carbon economy presents. Scotland has a well-established oil and gas sector, a proud engineering heritage and enviable natural resources, which has provided the platform for the recent growth in renewable energy deployment. Building on these strengths will help the UK as a whole to create a modern, integrated, low-carbon energy system, and support the delivery of the ambitions and priorities set out in Scotland's Economic Strategy. Scotland's rich energy history and expertise will support greater internationalisation by strengthening renewable supply chains and research dissemination. The Scottish Government is committed to building on Scotland's international reputation for excellence in energy, and to forging partnerships between the UK and other countries.

<sup>171</sup> Industrial Strategy, 2017, [www.gov.uk/government/publications/industrial-strategy-building-a-britain-fit-for-the-future](http://www.gov.uk/government/publications/industrial-strategy-building-a-britain-fit-for-the-future)

## 3. Policies and measures

### 3.1 Decarbonisation

#### 3.1.1 GHG emissions and removals

*i Policies and measures as referred in section 2.1.1 and covering all key emitting sectors and sectors for the enhancement of removals, with an outlook to the long-term vision and goal to become a low emission economy and achieving a balance between emissions and removals in accordance with the Paris Agreement*

The UK has a significant package of policies and measures to meet its targets. Many of the policies described cross different sectors and involve a number of delivery mechanisms.

Table 13 below was published in the UK's 7th National Communication in December 2017<sup>172</sup> and summarises these policies, some of which have been updated. Not all of these policies apply across all of the Devolved Administrations.

In Scotland, the policies and proposals for meeting statutory emissions reduction targets are set out in the Scottish Government's Climate Change Plan<sup>173</sup> published in February 2018, and the Energy Strategy<sup>174</sup> published December 2017. The specific policies and proposals that apply to Scotland are therefore not listed below but can be accessed through these documents.

Prosperity for All: A Low Carbon Wales was published in March 2019 and sets out the policies and proposals for meeting the first Welsh carbon budget (2016-2020).<sup>175</sup> The plan for the second carbon budget will be published in 2021.

---

<sup>172</sup> Seventh National Communication – Annex I, <https://unfccc.int/node/28527>

<sup>173</sup> Climate Change Plan: third report on proposals and policies 2018-2032 (RPP3):

[www.gov.scot/publications/scottish-governments-climate-change-plan-third-report-proposals-policies-2018/](http://www.gov.scot/publications/scottish-governments-climate-change-plan-third-report-proposals-policies-2018/)

<sup>174</sup> Scottish Energy Strategy: The Future of Energy in Scotland, 2017, [www.gov.scot/publications/scottish-energy-strategy-future-energy-scotland-9781788515276/](http://www.gov.scot/publications/scottish-energy-strategy-future-energy-scotland-9781788515276/)

<sup>175</sup> <https://gov.wales/prosperity-all-low-carbon-wales>

**Table 13: Summary of the UK's policies updated from the UK's 7th National Communication**  
**Energy supply**

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
Climate Change Levy (CCL)	2001 (Implemented)	Economic, Regulatory, Fiscal	System of carbon pricing, ESR
<p>The Climate Change Levy (CCL) was introduced in 2001. It is levied on the supply of energy to business and public sector consumers. Each of the four main groups of taxable commodities (electricity, gas, solid fuels, and liquefied petroleum gas [LPG]) has its own main rate per unit of energy. The main rates of the CCL are intended to incentivise businesses to reduce their energy consumption. Eligible energy-intensive industries may pay reduced main rates of CCL through CCAs, or be exempt from the CCL for mineralogical/metallurgical processes.</p>			
Renewables Obligation (RO)	2002-2019 (Implemented)	Regulatory, Economic	System of carbon pricing, ESR
<p>Sets an annual obligation on electricity suppliers to source a proportion of their generation from renewable sources. The RO was introduced in 2002 in Great Britain, and in 2005 in Northern Ireland. It closed to most new applicants on 31 March 2017. Limited grace periods extended the deadline for certain projects up to 31 January 2019 in Great Britain, and to 31 March 2019 in Northern Ireland. Stations receive support for up to 20 or 25 years until final closure of the scheme on 31 March 2037.</p>			
Carbon Pricing	2005 (Implemented)	Economic	System of carbon pricing, ESR
<p>Until the end of 2020 the UK will continue to participate in the EU ETS, which sets a limit (cap) on industrial and power sector emissions, which reduces year-on-year, on the total number of greenhouse gas emissions that can be emitted by scheme participants. Emitters must acquire and surrender enough allowances to cover their emissions each year.</p> <p>In May 2019 the UK consulted on The Future of Carbon Pricing outlining proposals for future carbon pricing policy in the UK.</p>			
Large Combustion Plant Directive	2007 (Expired)	Regulatory	System of carbon pricing, ESR
<p>The Large Combustion Plant Directive (LCPD, 2001/80/EC) sets limits on emissions of sulphur dioxide, nitrogen oxides, and dust from combustion plants with a thermal capacity of 50 MW or greater. Has now been replaced by the Industrial Emissions Directive.</p>			

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
Additional renewables in generation (Renewable Energy Strategy)	2009 (Implemented)	Regulatory, Economic	System of carbon pricing, ESR
Increases Renewable Obligation (RO) targets in electricity supply so as meet the UK's overall renewables target for 2020 as set out in the Renewables Directive (RED, 2009/28/EC).			
Feed in Tariffs (FIT) (GB only)	2010-2019 (Implemented)	Regulatory, Economic	System of carbon pricing, ESR
Feed-in Tariffs (FIT) support organisations, businesses, communities and individuals to generate low-carbon electricity using small-scale (5 MW or less total installed capacity) systems. Electricity suppliers are obliged to pay the regulated tariffs to eligible generators. The FIT scheme closed to new applications on March 31st, 2019.			
Carbon Price Support	2013 (Implemented)	Economic	System of carbon pricing, ESR
The Carbon Price Floor (CPF) is designed to further reduce the use of emission-intensive fossil fuels and increase the proportion of electricity generation and supply from low-carbon sources.			
Contract for Difference (CfD) (2014-2020) (GB only)	2014-2020 (Implemented)	Economic	System of carbon pricing, ESR
Offers Contracts for Difference (CfDs) in the electricity generation market for low-carbon and renewable sources. CfDs replaced the Renewables Obligation which closed to most new applications in 2017 (with extensions to 2019 for certain projects). Current policy offers CfDs for new capacity through competitive auctions.			
Industrial Emissions Directive (as it applies to Large Combustion Plant)	2016 (Implemented)	Regulatory	System of carbon pricing, ESR
As transposed into UK law, the IED replaced the LCPD from 1 January 2016 with similar although more stringent provisions set out in chapter III of the Industrial Emissions Directive (2010/75/EU) (IED). Those provisions already apply in respect to any plant newly permitted since 7 January 2013. Three compliance routes were available to generating plants; to abate emissions and comply with more stringent limits by 2020; to comply with less stringent limits but face a 1,500 hour per year load factor constrain; or to close by 2023.			

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
Capacity Mechanism	2014 (Implemented)	Economic	System of carbon pricing, ESR
Part of the UK Government's Electricity Market Reform package, the Capacity Market ensures that sufficient capacity is available to meet peak demand, encouraging construction and use of a wide variety of new low-carbon generation capacity.			
CCL Budget 2016 Changes	2019 (Adopted)	Economic, Regulatory	System of carbon pricing, ESR
Budget 2016 announced that CCL rates will increase from April 2019, moving to an electricity-to-gas ratio of 2.5:1 compared to the previous 2.9:1 ratio. In the longer term, the UK Government intends to rebalance the rates further, reaching a ratio of 1:1 by 2025. The changes in CCL between 2019 and 2021 were announced in the Budget 2018, but the rates from 2021 onwards, have not yet been announced.			
Contract for Difference (CfD) (2021-2035)	2021-2035 (Planned)	Economic	System of carbon pricing, ESR
Planned continuation of Contracts for Difference (CfDs) for new low-carbon capacity after 2020.			
Smart Export Guarantee (from 2020)	From 2020	Economic	System of carbon pricing, ESR
In July 2019 legislation was passed requiring most (larger) suppliers to offer at least one tariff for exported electricity, to eligible small-scale low-carbon electricity generation projects, that meets Smart Export Guarantee requirements. This came into force on 1 January 2020.			

## Energy consumption across homes, business & public sector

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
Carbon Trust measures	2002-2012 (Expired)	Information, Education	System of carbon pricing, ESR
The Carbon Trust provides a range of measures from general advice to in-depth consultancy and accreditation, to reduce emissions and save energy and money to businesses and public sector organisations of all sizes.			
England & Wales - Building Regulations Part L (2002+2005/6)	2002 (Implemented)	Regulatory	System of carbon pricing, ESR
Scotland - Building Regulations 2007 (section 6)	2002 & 2007 (Implemented)	Regulatory	System of carbon pricing, ESR
Building Regulations set minimum energy performance standards for new buildings and when people carry out controlled 'building work' to existing properties including extensions, conversions and certain categories of renovation and replacement windows and boilers.			
Small and Medium Enterprises (SME) Loans	2004-2012 (Expired)	Economic	System of carbon pricing, ESR
The Carbon Trust provided interest free loans of £3,000 - £400,000 for small and medium sized businesses to invest in energy efficiency equipment and renewable technologies. These loans were designed so that in most cases the forecast reduction in energy costs would be similar to the total repayment amount.			
Energy Performance of Buildings Directive (EPBD) 2002/91/EC	2007 (Implemented)	Regulatory, Information	System of carbon pricing, ESR
The Directive sought to improve the energy performance of domestic and non-domestic buildings which required energy certificates and the inspection of air conditioning systems. Energy Performance Certificates (EPCs) give information on a building's energy efficiency expressed on a scale of A+ to G (or A to G in the case a building that is a dwelling) with G representing the least energy efficient rating.			

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
CRC Energy Efficiency Scheme	2010 (Implemented)	Economic, Information	System of carbon pricing, ESR
<p>The CRC Energy Efficiency Scheme is a mandatory UK-wide emissions trading scheme (launched in 2010). It encourages the uptake of energy efficiency measures in large non-energy intensive private and public sector organisations that use energy not covered by the EU ETS or Climate Change Agreements. It covers around 5000 medium and large users of energy across the business and public sector. The scheme is split into phases. Phase 1 ran from 1 April 2010 until 31 March 2014. Phase 2 covers emissions from 1 April 2014 until 31 March 2019. In the 2016 Spring Budget, the Chancellor announced there would be no further sales of CRC allowances after Phase 2 (i.e. following the 2018/19 compliance year) and legislation was laid in July 2018 to close the scheme after Phase 2. From April 2019, the CCL was increased to recover the revenue forgone from CRC allowances and a new streamlined energy and carbon reporting framework for quoted companies of all sizes and large unquoted companies and large Limited Liability Partnerships will come into force UJ-wide.</p>			
Building Regulations 2010 Part L	2010 (Implemented)	Regulatory	System of carbon pricing, ESR
<p>Building Regulations set minimum energy performance standards for new buildings and when people carry out controlled 'building work' to existing properties including extensions, conversions and certain categories of renovation and replacement windows and boilers.</p>			
Renewable Heat Incentive	2011 non-domestic GB, 2014 domestic GB (Implemented)	Economic	System of carbon pricing, ESR
<p>The Non-Domestic Renewable Heat Incentive (RHI) is a Great Britain (GB) wide scheme which provides financial incentives to increase the uptake of renewable heat by businesses, the public sector and non-profit organisations. Eligible installations receive quarterly payments for 20 years based on the amount of heat generated.</p> <p>The Domestic RHI is a GB wide scheme which provides financial incentives to promote the use of renewable heat in domestic properties. Eligible installations receive quarterly payments for seven years based on either the estimated amount of renewable heat generated, or their metered heat use.</p> <p>In Northern Ireland, separate Renewable Heat Incentive schemes operated before being suspended on 29 February 2016.</p>			

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
Smart Metering	2012-2020 (Implemented)	Information/regulatory	System of carbon pricing, ESR
<p>The Smart Metering Implementation Programme aims to replace up to 53 million meters with smart electricity and gas meters in all domestic properties, and smart or advanced meters in smaller non domestic sites in Great Britain. Smart meters will provide consumers with near-real time information on their energy consumption to help them control energy use, and avoid wasting energy and money. They will provide energy networks with better information upon which to manage and plan current activities. Smart meters will also assist the move towards smart grids which support sustainable energy supply and will help reduce the total energy needed in the system. As at 30 September 2019 there were 15.6 million smart and advanced meters operating across Great Britain, and the UK Government published a consultation in September 2019 on a post-2020 policy framework to maintain roll out momentum.</p>			
Climate change agreements (CCA)	2013-2023 (Implemented)	Economic, Voluntary Agreement/negotiated agreement	System of carbon pricing, ESR
<p>Climate Change Agreements offer participating energy-intensive industries a discount from the Climate Change Levy (CCL) in return for meeting targets for energy reductions. From 2013 these are a 90% discount for electricity and a 65% discount for other fuels. From April 2019 this will increase to a 93% discount for electricity and 78% discount for other fuels to reflect changes to the CCL from this date. The UK Government due to evaluate the effectiveness of the current CCA Scheme in April 2020, which provides CCL discounts to March 2023.</p>			
England - Building Regulations 2013 Part L	2013 (Implemented)	Regulatory	System of carbon pricing, ESR
<p>Building Regulations set minimum energy performance standards for new buildings and when people carry out controlled 'building work' to existing properties including extensions, conversions and certain categories of renovation and replacement windows and boilers.</p>			
Scotland - Building Regulations 2015 (section 6)	2015 (Implemented)	Regulatory	System of carbon pricing, ESR
<p>Building Regulations set minimum energy performance standards for new buildings and when people carry out controlled 'building work' to existing properties including extensions, conversions and certain categories of renovation and replacement windows and boilers.</p>			

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
Energy Savings Opportunity Scheme (ESOS)	2014 (Implemented)	Regulatory/ Information	System of carbon pricing, ESR
<p>A mandatory energy assessment scheme for all large undertakings (non-SMEs) in response to requirements contained Article 8 of the EU Energy Efficiency Directive (2012/27/EU). Organisations in scope must measure their total energy consumption and carry out audits of the energy used by their buildings, industrial processes and transport to identify cost-effective energy saving measures or comply with the alternative routes to compliance, by 5 December 2015 and every four years thereafter. It is estimated that around 10,000 organisations are participating in the scheme.</p>			
Private Rented Sector (PRS) Energy Efficiency Regulations	2016, 2018 (Implemented)	Regulatory, Information	System of carbon pricing, ESR
<p>'There are two distinct parts to the Private Rented Sector Energy Efficiency Regulations. The first part represents the 'Tenants' energy efficiency improvements' provisions, which came into force in 2016. The second part represents the 'Minimum level of energy efficiency' provisions which were implemented in 2018. This implies a requirement for any properties rented out in the private rented sector to have a minimum energy performance rating of E on an Energy Performance Certificate (EPC), unless the property meets the conditions for an exemption, and that exemption has been registered on the PRS Exemptions Register. The regulations came into force for new lets and renewals of tenancies in England and Wales with effect from 1 April 2018 and for all longer-term tenancies on 1 April 2020 (1 April 2023 for non-domestic properties). In April 2019 these regulations were further strengthened with respect to the domestic sector only, to require a contribution of up to £3,500 from landlords towards the cost of improving their property towards EPC Band E (previously landlords of domestic properties were only required to take action where third party funding was available to meet the improvement costs). It will be unlawful to rent a property which breaches the requirement for a minimum E rating, unless one of the limited number of exemptions applies.</p> <p>There is no minimum requirement for private rented sector properties in Northern Ireland currently.</p>			
Energy Performance of Buildings Directive (EPBD) 2017 Cost Optimal Review and Nearly Zero Energy Buildings (NZEB) (2018 and 2020)	2018 (Delivered)	Regulatory, Information	System of carbon pricing, ESR
<p>In July 2018 the UK Government submitted the second cost optimal assessment of energy performance requirements for the United Kingdom (UK) as required by the Energy Performance of Buildings Directive. Gibraltar submitted its own standalone report later in 2018.</p> <p>Cost-optimal energy performance means that the lifetime cost-benefit analysis is positive. Minimum energy performance requirements must be compared against calculated cost-optimal levels using the Comparative Methodology Framework.</p>			

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
Products Policy	2008 and 2017 (Adopted)	Regulatory	System of carbon pricing, ESR
<p>The EU Ecodesign Directive and the Energy Labelling Framework Regulation operate by setting minimum energy performance and information requirements for energy-related products placed to take the least efficient products off the market and to give consumers clear information to make informed purchasing decisions. This is implemented domestically through product specific EU regulations.</p>			
Amendments to Heat Networks Metering & Billing Regulations (2014)	2017 (Planned)	Regulatory	System of carbon pricing, ESR
<p>UK legislation requiring heat network operators to submit data on networks and to install heat meters/heat cost allocators in buildings on networks unless it is not cost-effective to do so. The amendments will revise the cost-effectiveness methodology and address ambiguities in the existing legislation.</p>			
Public Sector Energy Efficiency Loans Scheme	2004-2021 (Implemented)	Economic	System of carbon pricing, ESR
<p>The Public Sector Energy Efficiency Loans Scheme, managed by Salix Finance Ltd, provides interest-free loans in England, Scotland and Wales to public sector organisations for energy efficiency schemes. These loans are intended to provide the capital cost of energy efficiency retrofit work and other measures to be installed. These loans have a payback period of five years (eight for schools) during which the repayments are met with the energy bill savings from the energy efficiency measures. Thus, once the loan has been paid off, the organisations continue to benefit from energy savings for the lifetime of these measures. This funding is then recycled once it has been returned to the Scheme and once again loaned out. BEIS provides the most amount of funding to the Scheme but there is also some funding from the Scottish Government, the Welsh Government and the Department for Education. Wales will have invested approximately £80 million in public sector energy efficiency and renewable energy projects by 2020. The loans are further supported by the provision of expert technical, commercial and financial expertise through the Welsh Government Energy Service. The service has enabled £55 million of zero-interest loans across the public sector in Wales between 2016 and 2018 and also supported the delivery of a further £27.5 million of energy and energy efficiency projects, where finance was secured from alternative routes. The projects supported will realise savings of £183 million for the public sector over the life of the installed technologies and also reduce carbon emissions by 820,000 tonnes<sup>176</sup>.</p>			

<sup>176</sup> Written Statement - Increasing the Scale and Rate of Residential Energy Efficiency Retrofit in Wales, November 2017, <https://gov.wales/about/cabinet/cabinetstatements/2017/energyretrofits/?lang=en>.

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
Energy Performance of Buildings Directive (EPBD) Recast 2010	2013 (Transposed)	Regulatory, Information	System of carbon pricing, ESR
Recast of the EPBD 92010/31/EU) in July 2013, the principal regulations extended DEC's to public buildings over 500 square metres. This size threshold was on 9 July 2015 to include buildings over 250 square metres.			
Warm Front	2000-2013 (Expired)	Economic	System of carbon pricing, ESR
Warm Front installed heating and insulation measures to make homes warmer and more energy efficient for private sector households in England vulnerable to fuel poverty. The scheme offered a package of heating and insulation measures of up to £3,500 (or £6,000 where oil central heating or other alternative technologies are recommended).			
EEC1, EEC2 (2002-2008) & Baseline Carbon Emissions Reductions Target (CERT) (2008-2010)	2002-2009 (Expired)	Regulatory	System of carbon pricing, ESR
Energy Efficiency Commitment I (EEC I): GB wide regulation that required all electricity and gas suppliers with 15,000 or more domestic customers to achieve a combined energy saving of 62 TWh by 2005 by incentivising their customers to install energy-efficiency measures in homes.  EEC II - energy suppliers with more than 50,000 domestic customers required to deliver a total of 130 TWh lifetime energy use reductions in GB households, primarily through the promotion of energy efficiency measures. Carbon Emission Reduction Target (CERT) – GB regulation that required all domestic energy suppliers with a customer base in excess of 50,000 domestic customers to make savings in the amount of CO2 emitted by householders.			
Community Energy Saving Programme (CESP)	2009-2012 (Expired)	Regulatory	System of carbon pricing, ESR
Community Energy Saving Programme (CESP) - area based regulation that targeted households across Great Britain, in areas of low income, to improve energy efficiency standards, and reduce fuel bills. CESP was funded by an obligation on larger energy suppliers and also the larger, electricity generators.			

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
Carbon Emissions Reduction Target (CERT) Uplift and Extension (2010-2012)	2010-2012 (Expired)	Regulatory	System of carbon pricing, ESR
<p>CERT extension - increased the targets originally set under CERT by 20% and required domestic energy suppliers with a customer base in excess of 50,000 (later increased to 250,000) to make savings in the amount of CO<sub>2</sub> emitted by householders. The extension also refocused subsidy towards insulation measures and away from electricity saving measures such as low energy lighting - and introduced a super priority group (households in receipt of certain means-tested benefits) to make energy reductions in low income and vulnerable households.</p>			
Energy Company Obligation 1 and 2	2013-2017 (Expired)	Economic, Regulatory	System of carbon pricing, ESR
<p>The Energy Company Obligation (ECO) is a statutory obligation on energy suppliers with over 250,000 domestic customers and delivering over a certain amount of electricity or gas to make reductions in carbon emissions or achieve heating cost savings in domestic households. ECO focuses on insulation measures, and also heating improvements to low income and vulnerable households. It ran until March 2017. ECO initially ran to March 2015 (also known as 'ECO1') and was extended in April 2014 to March 2017 ('ECO2').</p>			
Heat Networks Investment Project	2017-2021 (Implemented)	Economic	System of carbon pricing, ESR
<p>The Heat Networks Investment Project (HNIP) is a capital funding scheme across England and Wales to encourage the development of heat networks. The HNIP is expected to support up to 200 projects by 2022 through grants and loans and other mechanisms and to lever in up to wider investment, reducing bills, cutting carbon and forming a key part of wider urban regeneration in many locations. The scheme will be open for applications from heat networks for up to three years and allocate commercialisation and construction funding through a competitive process. The key objective of the project is to build a sustainable market for heat networks to support the decarbonisation of heat in buildings, helping the UK reach the carbon budget targets.</p>			
Energy Company Obligation 2 Extension	2017-2018 (Expired)	Economic, Regulatory	System of carbon pricing, ESR
<p>The 2015 Spending Review announced that ECO will be replaced with a new, lower cost scheme that will run for 5 years (April 2017 to March 2022) and will tackle the root causes of fuel poverty. The 5-year extension will take place in two phases, with the ECO 2 Extension (April 2017 - September 2018) acting as a bridge between the expired ECO scheme and the new fuel poverty focused scheme, ECO 3, which will run from autumn 2018 to March 2022.</p> <p>The Local Authority Flexible Eligible mechanism was introduced under ECO2 Extension, enabling LAs to determine eligibility and refer households to obligated suppliers. Up to 10% of Affordable Warmth could be delivered through this route.</p>			

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
Energy Company Obligation 3	2018 -2022 (Implemented)	Regulatory	ESR
The reformed scheme (ECO 3) will run from autumn 2018 to March 2022. The scheme focusses completely on low income and vulnerable households. Supplier thresholds were lowered to 200,000 domestic customers from 2019, and 150,000 domestic customers from 2020. A new 'Innovation' element was introduced to incentivise new better performing measures and cost-effective delivery techniques (up to 10% of scheme), and up to a further 10% of scheme for a monitoring regime to better understand measure performance. The LA Flexible Eligibility mechanism was increased to up to 25% of the scheme.			
Building Regulations 2020 Part L	2020 (Planned)	Regulatory	System of carbon pricing, ESR
Building Regulations set minimum energy performance standards for new buildings and when people carry out controlled 'building work' to existing properties including extensions, conversions and certain categories of renovation and replacement windows and boilers.			
Boiler Plus (standards for domestic boiler installations)	2018 (Implemented)	Regulatory	System of carbon pricing, ESR
The policy objectives of Boiler Plus are to deliver additional energy and carbon savings from the domestic heating sector in England by lowering overall gas demand from domestic properties. It aims to do this by increasing the deployment of devices which increase the efficiency of domestic heating systems, through controls and measures to make gas boilers heat homes more efficiently. The policy instrument is a technical standard set through statutory guidance under the Building Regulations framework. This requires existing households in England to install an additional energy saving measure from a choice list at the point of installing a new or replacement combi gas boiler in an existing dwelling.			
Streamlined energy and carbon reporting framework for business (SECR)	2019 (Implemented)	Information, Regulatory	System of carbon pricing, ESR
SECR is a reporting framework which obligates all large (as defined by the Companies Act 2006) UK registered companies to report their energy use and associated emissions relating to electricity, gas and transport in their annual reports. Companies will also be required to provide an intensity metric and disclose any energy efficiency actions undertaken during the reporting period. Quoted companies will in addition be required to report their global energy use and GHG emissions.			

## Transport

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
PSV Fuel Efficiency Policies	2006/07-2019 (Implemented)	Regulatory, Information, Voluntary Agreement	ESR
<p>The Green Bus Fund (GBF) allowed bus companies and local authorities in England to compete for funds to help them buy new low-carbon emission buses. The four rounds of the fund, which ran from 2009- 2014, added around 1250 Low Carbon Emission Buses onto England's roads. The GBF was replaced in 2015 by the Low Emission Bus Fund (LEBS) which offered £30m for bus operators and local authorities across England and Wales to bid for low emission buses and supporting infrastructure. This scheme funding was open from 2016-2019 and the successful bidders were announced in July 2016, adding more than 300 extra low emission buses to fleets. In Autumn 2016, a further £100m was announced to increase the amount of low emission buses on the road. £11.1m was used to fund those who narrowly missed out on LEBS funding, and £48m formed the Ultra- Low Emission Bus Scheme which was launched in March 2018. Winners of this scheme were announced in February 2019. The remaining funding formed the Clean Bus Technology Fund, which was used to fund retrofitting solutions for existing bus fleets to a minimum Euro VI standard, and the winners of this fund was announced in February 2018. This was in addition to the previous £27m of Clean Bus Technology Fund rounds in 2013 and 2015. There was also a £5m Clean Vehicle Technology Fund in 2014. These funding schemes have contributed to an extra 5000 low emission buses on the road.<sup>177</sup></p>			
Renewable Transport Fuel Obligation, (RTFO)	2007 - 2032 (Implemented)	Regulatory	ESR
<p>The RTFO sets phased targets for renewable fuel use by diesel and petrol suppliers to be achieved by 2020 and on to 2032. Targets are by volume rather than by energy. This implements the EU Renewable Energy Directive (2009/28/EC) and ILUC Directive (EU) 2015/1513.</p>			
Advanced Biofuel Demonstration Competition	2014-2018 (Expired)	Economic	ESR
<p>The Advanced Biofuel Demonstration Competition made available £25 million to enable the construction of two demonstration-scale advanced biofuel plants.</p>			

<sup>177</sup> Renewable transport fuel obligations order: government response (2017), [www.gov.uk/government/publications/renewable-transport-fuel-obligations-order-government-response](http://www.gov.uk/government/publications/renewable-transport-fuel-obligations-order-government-response)

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
Local Sustainable Transport Fund	2011-2016 (Expired)	Regulatory	ESR
<p>£600m of capital and revenue funding between 2011 and 2015 to support sustainable travel investments by local government. The projects include promoting public transport, encouraging uptake of cycling and walking, and raising awareness of the alternative transport modes available to commuters and residents awards were made through competitive bidding processes.</p> <p>Since then central government has made an additional Local Sustainable Transport Fund revenue funding of £65m (2015/16) and Access Fund £20m (p.a. 2016/17 to 2019/20) available for similar schemes.<sup>178</sup></p>			
Car Fuel Efficiency Policies	2012 (Implemented) 2019 (Adopted)	Regulatory, Information, Voluntary Agreement	System of carbon pricing, ESR
<p>EC Regulation 443/2009 sets fuel efficiency targets for new cars to be achieved by 2015 and 2020. The regulation translates a fleet average CO<sub>2</sub> tailpipe emissions target for new vehicles sold into the EU market into specific targets for individual manufacturers according to the mass of their fleet. Heavy fines are imposed for non-compliance. The 2021 target is for a fleet average of 95g CO<sub>2</sub>/km across the single market, with a Transition Period where 95% of a manufacturer's fleet must meet the 95g target by 2020.</p> <p>New stretching CO<sub>2</sub> reduction targets (EU Regulation 2019/631) have been introduced for 2025 and 2030 based on the 2021 Worldwide Harmonised Light Vehicle Test Procedure (WLTP) measurements. As a result, the new passenger cars and light duty vehicles CO<sub>2</sub> regulation came into force in January 2020. The Road Vehicle Emission Performance Standards (Cars and Vans) (EU Exit) (Amendment) Regulations 2019 in March 2019 ensure the UK's existing ambition and targets out to 2024 still apply after the end of the Transition Period.</p> <p>Complementary measures are a collection of technologies that could improve 'real world' fuel efficiency of cars which would not be fully captured in new car CO<sub>2</sub> target and could improve fuel efficiency within the existing fleet. These include gear shift indicators, tyre pressure monitoring systems, more efficient mobile air-conditioning and low rolling resistance tyres. EC Regulation 661/2009 sets minimum requirements and introduces labelling for the rolling resistance, wet grip and external rolling noise of tyres.</p> <p>Measures to support the uptake of ultra-low emission vehicles include the Plug-in Grant funding for ultra-low emission vehicle (ULEV) cars, vans, motorcycles and taxis as well as various tax incentives including lower rates for Vehicle Excise Duty and Company Car Tax. Electric vehicle (EV) infrastructure is directly supported through the Workplace Charging Scheme grants for EV charge points for employees and fleets, the Electric Vehicle Homecharge Scheme grants towards home EV charge points, the On-street Residential Chargepoint Scheme and the public-private £400 million Charging Infrastructure Investment Fund, launched in September 2019. Highways England have committed £15 million to ensure that 95% of the Strategic Road Network will be within 20 miles (32.2km) of a charging point.</p>			

<sup>178</sup> Government response to call for evidence: Cycling and walking Investment Strategy (Safety Review), [www.gov.uk/government/consultations/cycling-and-walking-investment-strategy-cwis-safety-review](http://www.gov.uk/government/consultations/cycling-and-walking-investment-strategy-cwis-safety-review)

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
Van Fuel Efficiency Policies	2012 (Implemented) 2019 (Adopted)	Regulatory, Information, Voluntary Agreement	ESR
<p>EC Regulation 510/2011 sets fuel efficiency targets for new Light Commercial Vehicles (LCV) to be achieved by 2017 and 2020. EC Regulation 661/2009 sets minimum requirements and introduces labelling for the rolling resistance, wet grip and external rolling noise of tyres. The regulation translates a fleet average CO<sub>2</sub> tailpipe emissions target for new vehicles sold into the EU market into specific targets for individual manufacturers according to the mass of their fleet. Heavy fines are imposed for non-compliance. The 2020 target is for a fleet average of 147g CO<sub>2</sub> /km and represents a reduction of 19% from the 2012 average.</p> <p>New stretching CO<sub>2</sub> reduction targets (EU Regulation 2019/631) have been introduced for 2025 and 2030 based on the 2021 Worldwide Harmonised Light Vehicle Test Procedure (WLTP) measurements. As a result, the new passenger cars and light duty vehicles CO<sub>2</sub> regulation came into force in January 2020. The Road Vehicle Emission Performance Standards (Cars and Vans) (EU Exit) (Amendment) Regulations 2019 in March 2019 ensure the UK's existing ambition and targets out to 2024 still apply after the end of the Transition Period.</p> <p>To help address payload penalty issues and encourage uptake of cleaner vans, a derogation from the European Union third Driving Licence Directive (2006/126/EC) has been introduced to allow Category B (car) licence holders to operate alternatively fuelled vehicles up to a maximum authorised mass of 4.25 (rather than 3.5) tonnes.</p> <p>Complementary measures to support the uptake of ultra-low emission vans include the Plug-in Van Grant and various tax incentives; for instance zero emission vans only pay a small proportion of the van benefit charge and are not subject to the van fuel benefit charge. Electric vehicle (EV) infrastructure is directly supported through the Workplace Charging Scheme grants for EV charge points for employees and fleets, the Electric Vehicle Homecharge Scheme grants towards home EV charge points, the On-street Residential Chargepoint Scheme and the public-private £400 million Charging Infrastructure Investment Fund, launched in September 2019. Highways England have committed £15 million to ensure that 95% of the Strategic Road Network will be within 20 miles (32.2km) of a charging point.</p>			
HGV Fuel Efficiency Policies	2012 (Implemented)	Regulatory, Information, Voluntary Agreement	ESR
<p>EC Regulation 661/2009 sets minimum requirements and introduces labelling for the rolling resistance, wet grip and external rolling noise of tyres. Industry and government are taking a range of actions to reduce freight emissions, including the Freight Transport Association's Logistics Carbon Reduction Scheme, which encourages members to record, report and reduce emissions from freight.</p> <p>The Mode Shift Revenue Support scheme encourages modal shift from road to rail or inland waterway where the costs are higher than road, and where there are environmental benefits to be gained. It currently helps to remove around 800,000 lorry journeys a year from Britain's roads. A similar scheme, Waterborne Freight Grant, can provide assistance with the operating costs associated with coastal or short sea shipping.</p> <p>A voluntary, industry-supported commitment to reduce HGV greenhouse gas emissions by 15% by 2025, from 2015 levels, was introduced in 2018.</p>			

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
HGV natural gas policy	2012 (Implemented)	Economic, Research	ESR
<p>The UK government has implemented measures to encourage alternatively fuelled HGVs including through reduced fuel duty rates for road fuel gases and increasing rewards for renewable gaseous fuels under the Renewable Transport Fuel Obligation.</p> <p>The UK government has helped operators establish and run fleets of alternatively fuelled HGVs through the Low Carbon Truck Trial. £11.3 million funding has been provided, via competition, to part fund and test around 370 commercial vehicles, with most using a gas or dual fuel system (diesel and gas), and to develop refuelling infrastructure.</p> <p>Savings for this policy are captured within HGV fuel efficiency policies.</p>			
Rail Electrification	2013-2019 (Implemented)	Economic	System of carbon pricing, ESR
<p>Programme of rail electrification underway to replace older diesel trains with modern, low-emission electric or bi-mode trains.<sup>179</sup> Network Rail is leading a strategy that will inform the scale and pace of rail decarbonisation.</p> <p>This means that operators are contractually obliged to meet emissions levels based on running modern electric rather than diesel traction. Trans Pennine Express (TPE) and Northern are examples where 11% and 17% reductions in CO<sub>2</sub>e emissions per vehicle km respectively were contracted based on electrification schemes. Reducing costs: electric trains tend to be cheaper to buy, operate and maintain than diesels. They are also lighter so do less damage to the track. So whilst there is clearly a large capital cost associated with installing new electrification infrastructure, this can be compensated over time by the lower operational costs of electric trains. Increasing capacity and reliability and reducing journey times: electric trains tend to outperform equivalent diesels in terms of reliability, acceleration and carrying capacity. Reducing environmental impacts: electric trains are quieter and more carbon efficient than diesels and zero emission at point of use which helps with local air quality.</p>			
Future Fuels for Flight and Freight Competition	2018-2021 (Adopted)	Economic	ESR
<p>The Future Fuels for Flight and Freight Competition makes £22 million of funding available to projects that will produce low-carbon waste-based fuels to be used in aviation and freight. In December 2019, KEW Projects and Rika Biogas were awarded a share of £6.5 million to build plants which aim to provide fuel for heavy goods vehicles.<sup>180</sup></p>			

<sup>179</sup> DfT Rolling Stock Perspective, Third Edition (2017). Section 6.5 Sustainable Development Principles.

<sup>180</sup> [www.gov.uk/government/news/orange-peel-rubbish-and-fatbergs-the-fuels-behind-the-future-of-green-transport](http://www.gov.uk/government/news/orange-peel-rubbish-and-fatbergs-the-fuels-behind-the-future-of-green-transport)

**Industrial processes**

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
Ozone Depleting Substances Regulation	2001 and 2009 (Implemented)	Regulatory	ESR
This regulation implements obligations under the Montreal Protocol and EU Regulations (2037/2000/EC and 1005/2009/EC) on ozone depleting substances. With the exemption of some critical use exemptions, CFCs and halon use is banned and HCFC use was banned from 2015. Most ozone depleting substances are potent greenhouse gases, so reductions in their use both protects the ozone layer and provides some GHG emissions mitigation.			
Fluorinated GHG Regulation	2007 (Implemented)	Regulatory	System of carbon pricing, ESR
Control (containment, prevention and reduction) of F-gas emissions through recovery, leak reduction and repair and some very limited use bans. Mandatory certification requirements to work with F gases.			
F-gas regulation 2014	2015 (Implemented)	Regulatory	ESR
Introduced a 79% phase down in the quantities of hydrofluorocarbons (HFCs), the main group of F gases, that can be placed on the EU market delivered via a gradually reducing quota system; a number of bans on the use of certain F gases in some new equipment; a ban on the use of very high GWP HFCs for the servicing of certain types of refrigeration equipment; some strengthening of obligations in 2006 Regulation related to leak checking, repairs, F gas recovery and technician training.  In November 2017 the UK ratified the Kigali Amendment to the Montreal Protocol, committing to an 85% reduction in the UKs consumption of HFCs, from a 2011-2013 baseline level, by 2036. A UK led review of the F-gas Regulation, to be completed by the end of 2022 at latest, will be used to assess what further reductions can be made.			
Industrial Heat Recovery Support (IHRS) Programme	2018 (Implemented)	Information, Economic	System of carbon pricing, ESR
The policy aims to increase industry confidence to invest in the technology potential to recover heat from industrial processes and increase the deployment of such technologies across manufacturing and data centres in England and Wales. It establishes a fund for feasibility studies that examine the potential for industrial businesses to adopt heat recovery technologies and a fund to subsidise the deployment of heat recovery technologies.			

## Waste, Agriculture, Land Use and Forestry

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
Waste measures	Various (earliest 1996) (Implemented)	Fiscal, regulatory	ESR
<p>There are a number of waste measures with the aim of increasing recycling/reuse and reduce harmful disposal.</p> <p>The Waste Framework Directive (2008/98/EC) is the general framework of waste management requirements and sets rules governing the separate collection of waste.</p> <p>The Landfill Directive (1999/31/EC) sets rules governing the disposal of waste to landfill.</p> <p>The UK Landfill Tax escalates tax on waste sent to landfill, including biodegradable waste.</p> <p>There are other waste measures targeting other waste streams, such as the Industrial Emissions Directive (2010/75/EU). The overall effect is reducing environmental impacts of waste, such as landfilling biodegradable waste and its associated CH4 emissions.</p>			
Environmental Stewardship (Entry Level Schemes and Higher Level Stewardship)	2005 (Implemented)	Economic	ESR
<p>Provides income foregone support under Pillar 2 of the Common Agricultural Policy (CAP) for farmers to undertake management options that benefit biodiversity, resource protection and water quality.</p>			
Catchment Sensitive Farming	2006 (Implemented)	Economic, information	ESR
<p>Delivers practical solutions and targeted support to enable farmers and land managers to take voluntary action to reduce diffuse water pollution from agriculture to protect water bodies and the environment.</p>			
Soils For Profit	2009-2013 (Expired)	Education	ESR
<p>Provides on farm reviews and training on soils manures and nutrients. The programme closed in 2013.</p>			
Agricultural Action Plan	2010-2022 (Implemented)	Voluntary Agreement, Information, Education	ESR
<p>The Agricultural Action Plan covers a range of resource-efficiency and land management measures to reduce emissions to meet UK carbon budgets.</p>			

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
Nitrates Action Plan	2013 (Implemented)	Regulatory, Information	ESR
This ensures improved compliance with the Nitrate Directive (91/676/EEC). Designated revised 'Nitrate Vulnerable Zones' (NVC) established a range of mandatory measures to reduce nitrate pollution to water in each NVC. It includes also code of good practice for areas outside NVZs.			
Agri- Tech Strategy	2014 (Implemented)	Economic	ESR
Co-funded by industry and addressing industry priorities. Funding is split between projects – 'the Agri-Tech Catalyst' – and new Centres of Agricultural Innovation. These technologies can contribute to agricultural efficiency and reduce GHG emissions.			
CAP Cross Compliance	2015 (Implemented)	Regulatory	LULUCF
<ul style="list-style-type: none"> <li>• Good Agricultural and Environmental Conditions in place to ensure minimum soil cover, to maintain soil organic matter and to minimise erosion.</li> <li>• Implementation of the Nitrates Directive.</li> <li>• Retention of permanent pasture (up to 2014 – now under Greening measures).</li> </ul>			
Common Agricultural Policy (CAP) Greening	2015 (Implemented)	Regulatory	LULUCF
<ul style="list-style-type: none"> <li>• Obtain consent before improving grassland that has not been cultivated for 15 years or more (Environmental Impact Assessment/EIA).</li> <li>• Select a range of Ecological Focus Area (EFA) measures to meet new standards: relevant actions include enhanced buffer strips, cover crops and growing N-fixing crops.</li> <li>• In Wales consent must be obtained to improve grassland that has less than 25% rye grass.</li> <li>• In Northern Ireland, under CAP Greening, farmers can select a number of relevant EFA measures including, landscape features, fallow land, agro-forestry, short rotational coppice and nitrogen fixing crops.</li> </ul>			
Forestry Act, Felling Licence Regulations and Environmental Impact (Forestry) regulations	1999 (Implemented)	Regulatory	LULUCF
Strong regulatory framework that controls felling, only allows deforestation for purposes of nature conservation and prevents afforestation of deep peat. Legislation updated 1999.			

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
Rural Development Programme	2007-2020 (Implemented)	Economic	LULUCF
Woodland creation grants provided through EU co-financed Rural Development Programmes in all four countries of the UK.			
Woodland Carbon Code	2011 (Implemented)	Voluntary Agreement, Information	LULUCF
Voluntary Code and associated carbon registry (2013) for UK domestic woodland carbon schemes to encourage private sector funding for woodland creation projects. Recognised as component of net GHG emissions reporting for businesses in Government's Environmental Reporting Guidelines.			
Wood fuel Implementation Plan	2011-2014 (Expired)	Information, Education, Economic	LULUCF
Initiative to develop supply chains, including through support for harvesting/processing and woodland access, to increase wood fuel supply from existing woodland.			
Grown in Britain	2013 (Implemented)	Voluntary Agreement, Information, Education	LULUCF
Industry-led action plan announced in the UK government's Forestry and Woodlands Policy Statement (2013) which aspires to encourage businesses to invest in woodland creation and sustainable forest management practice.			
Woodland Creation Planning Grant	2015 (Implemented)	Information, Education, Economic	LULUCF
Grant to support the planning of large-scale productive woodlands, compliant with the UK Forestry Standard.			
Woodland Carbon Fund	2016 (Implemented)	Voluntary Agreement, Information	LULUCF
The Woodland Carbon Fund is an exchequer-funded grant to support the creation of large-scale productive woodlands which also enhance natural capital.			
Revised UK Forestry Standard	2017 (Implemented)	Regulatory, Information	LULUCF
Revised (2017) national standard for sustainable forest management including a new guideline on climate change (2011), covering both adaptation and mitigation.			

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
Forestry Investment Zone	2018 (Implemented)	Voluntary Agreement, Information	LULUCF
A pilot Forestry Investment Zone has been opened in Cumbria, North West England. A FIZ will establish the conditions necessary to create a more favourable investment environment for forestry, conducive to large scale tree planting, and create a supportive framework with local stakeholders to promote this.			
Northern Forest	2018 (Implemented)	Voluntary Agreement	LULUCF
'Kickstart' funding for a new forest covering a 150-mile-wide stretch of northern England.			
Natural England's Strategic Approach to the Restoration of Blanket Bog	2015 (Implemented)	Information	LULUCF
Natural England published the Strategy for the Restoration of Blanket Bog in England in 2015. The approach sets out the extent, nature and importance of the blanket bog resource across England and what is currently being done to conserve it, as well as setting out the required management and timeframe for delivery to achieve an improvement in site condition across the resource at a strategic level.			
Natural Environment White Paper (NEWP) targets on horticultural peat	2011 (Implemented)	Information, Other	LULUCF
The Sustainable Growing Media Taskforce was set up to look at ways in which the barriers to the use of peat alternatives could be overcome. The UK government published its response to the Task Force's report and draft roadmap in 2013 which set out where our resources will be focused. A policy review was published in 2017 assessing the delivery of the roadmap and identifying further actions necessary to achieve a transition to sustainable growing media and reduced peat use.			
Peat Restoration Northern Ireland	2018 (Implemented)	Voluntary	LULUCF
Northern Ireland (NI) will include peatland restoration measures within the new agri-environment scheme, the Environmental Farming Scheme (EFS), as part of its Northern Ireland Rural Development Programme 2014-2020.			
Peatland Area Designations	2004 (Implemented)	Regulatory	LULUCF
3 out of 12 Nature Improvement Areas (NIA, 2012) are focused on peatland restoration. 47% England's wetlands are protected by Sites of Special Scientific Interest (SSSIs).			

Policy name	Status	Type of measure	Impacting traded or non-traded sectors
Peatland Code	2011 (Implemented)	Economic, Information, Voluntary	LULUCF
A UK Voluntary Code to encourage and support private sector funding for peatland restoration projects. Provides standards and robust science to give business supporters confidence that their financial contribution is making a measurable and verifiable difference.			

*ii Where relevant, regional cooperation in this area*

The Powering Past Coal Alliance (PPCA) was launched by the United Kingdom (UK) and Canada at COP23 in 2017 and has since grown to 91 members. The aim of the PPCA is to accelerate the global transition from unabated coal fired power generation by international leadership through sustaining and growing an Alliance of progressive members. The UK works closely with European members to achieve this aim.

The UK is a founding member of the Green Growth Group (GGG), a group of ambitious European countries established in 2013 whose membership currently comprises 17 EU Member States and Norway. The GGG provides a forum for progressive ministers and officials to meet to discuss contemporary issues concerning climate ambition and identify opportunities for driving forward greater climate action.

*iii Without prejudice to the applicability of state aid rules, financing measures, including Union support and the use of Union funds, in this area at national level, where applicable*

Not applicable.

### 3.1.2 Renewable energy

*i Policies and measures for renewable energy and trajectories as referred to in point (a)(2) Article 4, and, where applicable or available, the elements referred to in section 2.1.2, including sector- and technology-specific measures*

#### Electricity

The UK already has a world-leading offshore wind sector and is well placed to benefit from further investment in renewables innovation to accelerate cost reduction. The Offshore Wind Sector Deal, published on 7 March 2019, builds on this global leadership, setting out a pathway for up to 30 GW<sup>181</sup> of generating capacity by 2030 whilst creating thousands of high-quality jobs, a strong supply chain and a fivefold increase in exports. This will help the UK to maintain itself as the anchor market in Europe and support economic growth across the UK, particularly in coastal communities.

The UK government expects to invest around £900 million of public funds between 2015 and 2021 in research and innovation in the power sector, including around £177 million in partnership with the Research Councils and Innovate UK to further reduce the cost of

<sup>181</sup> The recent manifesto commitment seeks to increase this ambition to 40 GW of offshore wind capacity by 2030.

renewables. Innovation opportunities are likely to arise in a number of areas, including floating offshore wind platforms and advanced solar PV technologies.<sup>182</sup>

The UK government is working to improve the route to market for renewable technologies. The 2019 Contracts for Difference allocation round saw 5.8GW of projects offered contracts, including offshore wind, Remote Island wind and Advanced Conversion Technologies, with offshore wind clearing prices 30% lower than the 2017 allocation round.<sup>183</sup> The UK government intends to run subsequent auctions around every 2 years.<sup>184</sup>

The UK government is also working to support small scale electricity generation as the cost of these technologies approach market competitiveness, by introducing the Smart Export Guarantee. This ensures that the owners of various low-carbon technology projects can access the electricity market and receive payment for any electricity they export. This is a market-led approach with no set prices and is designed to be compatible with smart meters that are being rolled-out across Great Britain (see [section 2.4.3](#)) and the growth of small-scale electricity storage.

## Heat

In 2018, 7.3% of UK energy for heating and cooling came from renewable sources.<sup>185</sup> Through the Renewable Heat Incentive (RHI), the UK government has committed to spend £4.5 billion between 2016 and 2021 to support innovative low-carbon heat technologies in homes and businesses, such as heat pumps, biomass boilers and solar water heaters.<sup>186</sup> The government has also announced its intention to extend the Domestic RHI for 12 months to provide further support for the deployment of building level technologies, so it will remain open to new applicants until 31 March 2022, with funding committed until March 2024. Following the RHI, in April 2022, we propose to launch a new £100 million Clean Heat Grant scheme, providing targeted support to consumers and small businesses for heat pumps and some limited biomass. This scheme will be open for two years.

Beyond the RHI and Clean Heat Grant, our ambition is to phase out the installation of high carbon fossil fuel heating in new and existing off gas grid buildings during the 2020s, starting with new homes as these lend themselves more readily to other forms of low-carbon heating.<sup>187</sup>

In May 2018, the UK government launched the Buildings Mission<sup>188</sup>, the first mission under the Clean Growth Grand Challenge, which aims to at least halve the energy use of new buildings by 2030, reduce the cost of retrofitting efficiency measures in existing buildings, and ensure homes and businesses are heated by clean energy sources. The Mission was backed by £170 million of public money through the Transforming Construction Industrial Strategy Challenge

<sup>186</sup> Domestic RHI, [www.gov.uk/government/publications/domestic-rhi-mechanism-for-budget-management-estimated-commitments](http://www.gov.uk/government/publications/domestic-rhi-mechanism-for-budget-management-estimated-commitments); Non-Domestic RHI, [www.gov.uk/government/publications/rhi-mechanism-for-budget-management-estimated-commitments](http://www.gov.uk/government/publications/rhi-mechanism-for-budget-management-estimated-commitments)

<sup>187</sup> Clean Growth Strategy, [www.gov.uk/government/publications/clean-growth-strategy](http://www.gov.uk/government/publications/clean-growth-strategy)

<sup>188</sup> The Grand Challenge Missions, [www.gov.uk/government/publications/industrial-strategy-the-grand-challenges/missions](http://www.gov.uk/government/publications/industrial-strategy-the-grand-challenges/missions)

Fund.<sup>189</sup> We expect this will be matched by £250 million of private sector investment, meaning over £400 million will be invested in new construction products, technologies and techniques.

In Spring 2019, the UK Chancellor announced that we will introduce a Future Home Standard by 2025 to ensure that all new build homes are future-proofed with low-carbon heating and world-leading levels of energy efficiency. We are consulting on amendments to Part L of the Building Regulations for England to deliver this policy.<sup>190</sup> The Future Homes Standard could pull through a significant amount of low-carbon heating, particularly heat pumps and heat networks, delivering up to nearly 9MtCO<sub>2</sub>e of emissions savings by the end of the fifth carbon budget.

The RHI also currently supports the injection of biomethane into the gas grid. The RHI has supported the injection of an estimated 9.3 TWh of biomethane (as of October 2019), of which 3 TWh was produced in the last 12 months. In 2019, we announced that we would seek to accelerate the decarbonisation of our gas supplies by increasing the amount of 'green gas' in the grid, and to consult on an appropriate mechanism to achieve this.

Heat networks form an important part of our plan to reduce carbon and cut heating bills for customers (domestic and commercial). The Heat Networks Investment Project is delivering £320 million<sup>191</sup> of capital investment support to increase the volume of heat networks built, deliver carbon savings for carbon budgets, and help create the conditions for a sustainable market that can operate without direct government subsidy.<sup>192</sup> Delivering continued market growth beyond the lifetime of HNIP will require the establishment of a long-term policy framework. In December 2018, the UK government published 'Heat Networks: ensuring sustained investment and protecting consumers' which sets out the priorities for the market framework, and we have consulted on that framework. We will use the consultation responses we have received to help us refine our policy proposals, and we will continue to discuss emerging issues with stakeholders. We will consult further in 2020 or 2021 on any significant changes to our proposals or new issues if required and we will publish a government response to our first consultation in late 2020.

The Northern Ireland RHI Scheme commenced in 2012, based on the RHI Scheme introduced in the rest of the UK but with differences in tariffs and tariff structures.<sup>193</sup> The Northern Ireland RHI schemes were suspended for new applicants on 29 February 2016.

In Scotland, the Scottish Government has established the District Heating Loan Fund (DHFLF) which offers low rate, unsecured capital loans to overcome a range of technical and financial barriers. Since 2011, the DHFLF has offered over £15m to 50 different projects across Scotland. Additionally, the Low Carbon Infrastructure Transition Programme (LCITP) can offer support for the development of investment grade business cases to help projects secure public and private capital finance and can provide financial support for capital.

## Transport

See section 3.1.3(iii).

*ii Where relevant, specific measures for regional cooperation*

Not relevant.

*iii Specific measures on financial support for the promotion of the production and use of energy from renewable sources in electricity, heating and cooling, and transport*

## Renewables Obligation

The Renewables Obligation (RO) (enacted through the ROS and NIRO in Scotland and Northern Ireland respectively) was introduced to England, Wales and Scotland in 2002, and to Northern Ireland in 2005. The scheme was previously the main financial mechanism to incentivise the deployment of renewable electricity generation in the UK.<sup>194</sup> It closed to new applications on 31 March 2017, but limited grace periods extended the deadline for certain projects up to 31 March 2019. Early projects receive support for 25 years. Since 2008, new projects are supported for 20 years or until final closure of the scheme on 31 March 2037, whichever is earlier.

The scheme operates by putting an obligation on UK electricity suppliers to present a certain number of Renewables Obligation Certificates (ROCs) to Ofgem in respect of each MWh of electricity supplied during an obligation year. Suppliers buy these ROCs from renewable generators (or traders). Generators obtain them free of charge from Ofgem in relation to the renewable electricity they generate. The scheme is paid for by consumers through their energy bills and the UK government is committed to keeping these bills as low as possible. By the end of March 2018, 26,422 stations had been accredited, with a renewable energy capacity of 32.7GW. In 2017/18, 75.2TWh of renewable electricity was generated at a scheme cost of £5.3 billion.<sup>195</sup> The RO has now been replaced by the Contracts for Difference scheme in GB.

## The Feed-in-Tariffs Scheme

The Feed-in Tariffs (FIT) scheme was introduced to England, Wales and Scotland on 1 April 2010, under powers in the Energy Act 2008. The intention was to encourage deployment of micro-scale and small-scale low-carbon electricity generation (up to 5MW), particularly by organisations, businesses, communities and individuals that have not traditionally engaged in the electricity market.<sup>196</sup>

The technologies supported under the scheme are solar PV, onshore wind, hydropower, anaerobic digestion (AD), and micro (<2kW) combined heat and power (micro-CHP).

Under the scheme, generators receive three sources of income/savings:

- Generation tariff - a payment for every kWh generated, dependent on the technology and capacity of the installation, and date installed
- Export tariff - an additional payment for every kWh exported to the local electricity network

---

<sup>194</sup> About the RO, OFGEM, [www.ofgem.gov.uk/environmental-programmes/ro/about-ro](http://www.ofgem.gov.uk/environmental-programmes/ro/about-ro)

<sup>195</sup> Renewables Obligation (RO) Annual Report 2017-18, [www.ofgem.gov.uk/publications-and-updates/renewables-obligation-ro-annual-report-2017-18](http://www.ofgem.gov.uk/publications-and-updates/renewables-obligation-ro-annual-report-2017-18)

<sup>196</sup> About the FIT Scheme, OFGEM, [www.ofgem.gov.uk/environmental-programmes/fit/about-fit-scheme](http://www.ofgem.gov.uk/environmental-programmes/fit/about-fit-scheme)

- Bill savings - additional benefit from usage of electricity 'on-site' as opposed to paying the retail price for importing that energy from the grid

Tariffs are calculated to give rates of return that encourage investment but prevent overcompensation. Payments to generators are made quarterly by electricity suppliers and then passed on to consumers through electricity bills.

Since its introduction, the FIT scheme has supported over 850,000 installations, or 6GW of capacity. 99% of installations are solar, which consist of 80% of overall capacity<sup>197</sup>.

A periodic review of the scheme was conducted in the second half of 2015, as required by the EU State Aid approval. The purpose of the review was to ensure tariff levels provided sufficient incentive to potential generators whilst not over-compensating them. Following the review, the UK government also introduced a capping mechanism to bring costs under control to protect households and businesses. Our measures sought to put the scheme on a more sustainable footing which would maintain a viable small-scale renewables industry which could continue to reduce its costs and move towards subsidy free deployment. The closure of the generation tariff after March 2019 was also announced.

Growth in the small-scale low-carbon generation sector must be sustainable; driven by competition and innovation, not direct subsidies. The UK government therefore published a consultation on 19 July 2018 proposing to close the current FIT flat rate export tariff alongside the generation tariff from 31 March 2019, which reflects our desire to move towards fairer, cost reflective pricing and the continued drive to minimise support costs on consumers as set out in the Control for Low Carbon Levies.

On the same day, a call for evidence was also published to further understand the challenges and opportunities for small-scale low-carbon generation, including rooftop solar.

The call for evidence sought to identify:

- The challenges to, and opportunities for, small-scale low-carbon electricity generation in contributing to the UK government's objectives for clean, affordable, secure and flexible power; and
- The role for the UK government and the private sector in overcoming these challenges and realising these opportunities.

Legislation was introduced to close the FIT scheme in full to all new applications after 31 March 2019 subject to a number of time-limited extensions and a grace period. Existing generators will continue to receive generation and export tariff payments for the duration of their support under the scheme.

The importance of maintaining a route to market for small-scale low-carbon renewable generation after 31 March 2019 was stressed by many stakeholders and the UK government subsequently published a consultation on specific proposals for a Smart Export Guarantee in January 2019.

---

<sup>197</sup> Monthly feed-in tariff commissioned installations, 2014, [www.gov.uk/government/statistics/monthly-small-scale-renewable-deployment](http://www.gov.uk/government/statistics/monthly-small-scale-renewable-deployment)

## **The Smart Export Guarantee (SEG)**

In June 2019, following two public consultations, the UK government introduced legislation to implement the 'Smart Export Guarantee', which came into force on 1 January 2020. This enables anaerobic digestion, hydro, onshore wind, and solar photovoltaic generators with up to 5MW capacity, as well as micro-combined heat and power with up to 50kW capacity, to receive payment for electricity they export to the grid. It was introduced in the context of falling costs for low-carbon technologies, and a concern that due to their small size some of these small generators may otherwise find it difficult to access a competitive market for the electricity they produce.

Licensed electricity suppliers with 150,000 and over domestic customers will be required to provide at least one tariff offer for exported power (and they are free to offer more than one tariff); other suppliers may participate on a voluntary basis.

The SEG is very much a market-led policy. To provide space for the small-scale export market to develop, there will not be any specified minimum tariff rate, other than that suppliers must provide payment greater than zero at all times of export. To provide space for innovative approaches suppliers will be free to choose the form of the tariff they offer – provided they meet the requirements of the SEG. This will allow for relatively simple tariff offers to be implemented quickly, with an expectation that with time increasingly smart approaches will be implemented.

Exported power must be metered, with a meter capable of measuring export at half-hourly intervals, and meters must also be registered for settlement (though the SEG design is flexible and does not necessarily require half-hourly readings).

Recognising that smart systems may take various forms, the SEG therefore provides suppliers with the flexibility to purchase power from more complex systems including small-scale storage, and other forms of generation, if they choose to do so (provided they are co-located with a SEG installation). To benefit from the SEG, installations should be certified to suitable standards, and installations using anaerobic digestion meet sustainability criteria and feedstock requirements.

## **Contracts for Difference (CfD) Scheme**

The Contracts for Difference (CfD) scheme was introduced in GB in 2014 and is the UK government's main mechanism for supporting new low-carbon electricity generation projects.<sup>198</sup> The scheme has been a success, delivering substantial new investment and helping deliver significant reductions in the costs of some renewable technologies.

A CfD is a 15-year private law contract between a low-carbon electricity generator and the Low Carbon Contracts Company (LCCC), a UK government-owned company. On top of market revenues generators are paid the difference between the strike price and the reference price for the electricity they generate. The cost of any top up is met by consumers via a levy on electricity suppliers. When the reference price is above the strike price then generator must 'pay back' the difference.

Contracts are awarded in a series of competitive 'pay as clear' auctions, with the lowest price bids being successful, which drives efficiency and cost reduction. The clearing price for new

---

<sup>198</sup> Electricity Market Reform: Contracts for Difference, [www.gov.uk/government/collections/electricity-market-reform-contracts-for-difference](http://www.gov.uk/government/collections/electricity-market-reform-contracts-for-difference)

offshore wind projects, for example, fell from £114.39 per MWh<sup>199</sup> (2012 prices) in the first auction in 2015 to £39.65 per MWh<sup>200</sup> (2012 prices) in the third auction in 2019.

The CfD scheme<sup>201</sup> has awarded contracts to 58 renewable electricity projects<sup>202</sup> across a range of technologies, totalling around 16GW of renewable electricity capacity. The combined estimated budget spend for all three allocation rounds at the time of contract award is £491 million (2012 prices).<sup>203</sup>

Below is the capacity per technology offered contracts:

- Advanced Conversion Technologies – 159.91MW;
- Biomass Conversion – 1,065MW;
- Dedicated Biomass with Combined Heat and Power – 384.64MW;
- Energy from Waste with Combined Heat and Power - 94.75MW;
- Offshore Wind – 13,008MW;
- Onshore Wind - 748.55MW;
- Remote Island Wind – 275.22MW;
- Solar PV - 71.55MW.

The CGS announced up to £557 million of annual support for further CfDs, providing developers with the confidence they need to invest in bringing forward new projects.<sup>204</sup>

The third CfD allocation round saw 5.8GW of projects offered contracts, including offshore wind, Remote Island Wind and Advanced Conversion Technologies, with offshore wind clearing prices 30% lower than the 2017 allocation round.<sup>205</sup> The UK government plans to hold another allocation round in 2021 and further auctions around every two years after that.

*iv Where applicable, the assessment of the support for electricity from renewable sources pursuant to Article 6(4) of Directive (EU) 2018/...*

Not applicable.

---

<sup>199</sup> CfD First Round allocation results,

[www.gov.uk/government/uploads/system/uploads/attachment\\_data/file/407059/Contracts\\_for\\_Difference\\_-\\_Auction\\_Results\\_-\\_Official\\_Statistics.pdf](http://www.gov.uk/government/uploads/system/uploads/attachment_data/file/407059/Contracts_for_Difference_-_Auction_Results_-_Official_Statistics.pdf)

<sup>200</sup> CfD Third Round allocation results, [www.gov.uk/government/publications/contracts-for-difference-cfd-allocation-round-3-results/contracts-for-difference-cfd-allocation-round-3-results](http://www.gov.uk/government/publications/contracts-for-difference-cfd-allocation-round-3-results/contracts-for-difference-cfd-allocation-round-3-results)

<sup>201</sup> In addition to the three auctions held between 2015 and 2019, early contracts were also awarded through the Final Investment Decision Enabling for Renewables (FIDER) scheme, which was put in place to help developers of low carbon electricity projects make final investment decisions ahead of the Contract for Difference scheme being introduced as part of Electricity Market Reform.

<sup>202</sup> Including projects that did not sign or failed their milestone requirements.

<sup>203</sup> The estimated budget impact did not increase after the AR3 results because due to all strike prices being below the reference prices forecast at the time of the auction, the estimated budget impact in the valuation years considered was zero.

*v Specific measures to introduce one or more contact points, streamline administrative procedures, provide information and training, and facilitate the uptake of power purchase agreements*

*Summary of the policies and measures to promote and facilitate the development of renewable self-consumption and renewable energy communities*

The UK has a relatively healthy short-term PPA market for renewables which a number of our policies have facilitated, however there has been limited growth in the long-term PPA market. The design of the Renewables Obligation encouraged suppliers to sign PPAs as a way of securing the corresponding certificates (ROCs). Similarly, the Contracts for Difference scheme, being based on wholesale market price, prompts PPAs to be signed which will provide revenues corresponding to market reference price for the CfD. Additionally, the SEG will allow small scale generators to secure some of the route-to-market benefits of a PPA-type agreement. We now see an established and liquid market for short-term PPAs, predominantly signed between generators and utilities. Single sites or portfolio projects regularly retender in a competitive field of over 40 offtakers. Value retention is therefore relatively high for generators.

The UK has recently seen a rise in the number of corporate offtakers signing PPAs with low-carbon generators. This is providing a route to market for some renewables projects. However, volumes remain small at present as there is a relatively limited amount of corporates that are able to enter into long-term agreements with generators.

A summary of the policies and measures to promote and facilitate the development of renewable self-consumption and renewable energy communities are outlined in 2.4.3(iii).

*vi Assessment of the necessity to build new infrastructure for district heating and cooling produced from renewable sources*

In 2014 the UK carried out the first comprehensive assessment of the investment picture and pipeline in the UK energy sector.<sup>206</sup> The assessment identified an enormous investment opportunity for new and renewable forms of heating, including heat networks. In the right circumstances, particularly where there is high heat demand, a high proportion of non-domestic consumers, new buildings and/or proximity to low-cost large-scale heat sources, heat networks are a highly cost effective and non-disruptive way to reduce carbon emissions.

The UK government is committed to significantly expanding the district heating sector. The CGS makes clear that heat networks have the potential to play a significant role in the decarbonisation of heat. In each of the Strategy's three illustrative pathways to 2050, heat networks are projected to meet 17% of heat demand in homes and up to 24% of heat demand in the non-industrial business and public sector buildings. There are currently over 14,000 heat networks in the UK. Of these, approximately 12,000 are communal heat networks (serving only one building) and 2,000 are district heat networks (serving multiple buildings). District heat networks currently supply around 10TWh of annual heat demand.<sup>207</sup>

---

<sup>206</sup> Delivering UK Energy Investment, July 2014, [www.gov.uk/government/publications/delivering-uk-energy-investment-2014](http://www.gov.uk/government/publications/delivering-uk-energy-investment-2014)

<sup>207</sup> Energy Trends: March 2018, Experimental statistics on heat networks: [www.gov.uk/government/publications/energy-trends-march-2018-special-feature-article-experimental-statistics-on-heat-networks](http://www.gov.uk/government/publications/energy-trends-march-2018-special-feature-article-experimental-statistics-on-heat-networks)

A study<sup>208</sup> commissioned by the CCC in 2015 developed three core scenarios for deployment of district heating to 2050. Under the central scenario analysis, this study estimates that 18% of buildings' heat will need to be supplied by heat networks by 2050 if the UK is to meet its carbon budgets cost effectively. While the majority of schemes in the UK are currently based on Gas CHP, this study expects gas CHP to play a limited role in the longer term and forecasts the use of a wide range of heat supply technologies by 2050 (primarily heat pumps, biomass and waste heat) reflecting the variety in locally-available secondary heat sources. In 2015 the UK also published its national comprehensive assessment of the potential for district heating and cooling in the UK.<sup>209</sup>

The UK government plans to publish further details on the approach to delivering a future market framework that will enable sustained investment in heat networks, strengthen consumer protections and move towards low-carbon heat sources.

The regulation of heat is devolved to Scotland. The Scottish Government has also set out its ambitions for a growth in heat networks<sup>210</sup> and in March 2018 there were over 800 district and communal heating networks in Scotland supplying over 25,000 final customers.<sup>211</sup>

The Scottish Government is currently preparing legislation that would introduce a regulatory framework and licensing system which aims to provide certainty to the sector and investors, reduce the risk premium on the cost of capital faced by projects by setting clear standards and providing the kind of rights that other utility companies receive, as well as raising consumer acceptance and awareness. In 2015 the Scottish Government published a Heat Policy Statement setting out how low-carbon heat can reach more householders, businesses and communities and a clear framework for investment in the future of heat in Scotland. The ambition is to achieve 1.5TWh of Scotland's heat demand to be delivered by district or communal heating and to have 40,000 homes connected by 2020.<sup>212</sup> The Scottish Government is in the process of developing a Heat Decarbonisation Policy Statement and Action Plan, to be published later in 2020. The Scottish Government's Climate Change Plan, published in 2018, sets out a pathway for low-carbon heat that will see around 45% of buildings' heat met by low-carbon sources by 2032. To support this, the Scottish Government is developing the Energy Efficient Scotland programme, and as part of this, in 2017 and 2018 consulted on the development of a policy and regulatory system to develop heat networks in a strategic manner, and provide appropriate conditions on the ground to accelerate the delivery of heat networks and to grow this market.

Northern Ireland is currently developing a long-term energy strategy, looking to 2030 and beyond, which will include considerations around heat policy. The future Energy Strategy will set out a pathway and timeline for decarbonising heat, and the most effective way to measure

<sup>212</sup> Heat Policy Statement, Scottish Government 2015, <https://beta.gov.scot/publications/heat-policy-statement-towards-decarbonising-heat-maximising-opportunities-scotland/>

progress between now and 2030, and subsequently to 2050. The future policy options for decarbonising heat are being considered by taking a holistic view of energy in terms of energy efficiency, power, heat and transport, whilst also considering the impact on society as a whole, and consumers individually.

### **Policy initiatives to support district heating**

In 2013, the UK government set up the Heat Network Delivery Unit (HNDU) to support local authorities in England and Wales through the early stages of heat network project development. Through HNDU support the UK government has invested over £17 million in grant funding to more than 200 projects across 140 local authorities.<sup>213</sup>

The UK government is investing £320 million in efficient heat network projects through the Heat Networks Investment Project (HNIP). The funding will be allocated from April 2019 for up to three years, with £18.5 million of funding already allocated to eight pilot projects.<sup>214</sup>

The GB Renewable Heat Incentive scheme (RHI) supports the deployment of heat networks by incentivising the take up of those technologies that will play a strategic role in the long-term decarbonisation of the UK; for example, large biomass and heat pumps. Heat network projects can become accredited to the non-domestic RHI to secure a tariff guarantee, so long as their heat generation plant meets the scheme criteria. The Northern Ireland RHI schemes were suspended for new applicants on 29 February 2016.

In Scotland, the Heat Network Partnership was set up in 2015 to support the development of heat networks and low-carbon heat projects.<sup>215</sup> Support includes provision of the Scotland Heat Map<sup>216</sup>, and the District Heating Loan Fund, which offers loans to support the development of district heating networks. Since 2011, more than £15 million has been lent to 50 different projects across Scotland.<sup>217</sup> Additionally, since its launch in 2015, the Low Carbon Infrastructure Transition Programme (LCITP) has awarded over £50 million of funding to low-carbon demonstration projects that encourage replication and wider uptake of innovative renewable technology across Scotland, which includes committing over £25 million of grant funding to low-carbon heat network projects across Scotland that encourage the replication and wider uptake of innovative renewable technology. LCITP is a collaborative partnership led by the Scottish Government, working with Scottish Enterprise, Highlands and Islands Enterprise, Scottish Futures Trust and Resource Efficient Scotland.

Heat policy is not devolved to Wales, though Welsh Government received some powers under the Wales Act 2017. The UK government supports development of heat networks in Wales with revenue grants through the Heat Network Development Unit and capital through the Heat Network Investment Programme.

The Welsh Government Energy Service (WGES) is carrying out regional energy planning for power, heat and transport, which will feed into growth deals in Wales and help regions in developing the energy system of the future. Mapping has also been used to shape of the Welsh Government's spatial policy, with Priority Areas for District Heat Networks being identified in the draft National Development Framework. The heat map data has also been

incorporated into Lle, the Welsh Government digital resource. This will make it available to support regional and local energy planning activity, which we are supporting through the WGES.

*vii Where applicable, specific measures on the promotion of the use of energy from biomass, especially for new biomass mobilisation taking into account:*

- biomass availability, including sustainable biomass: both domestic potential and imports from third countries*
- other biomass uses by other sectors (agriculture and forest-based sectors); as well as measures for the sustainability of biomass production and use*

### **Promotion of the use of energy from biomass**

In 2018, biomass made up 21.4% of renewable electricity generation.<sup>218</sup> The UK has mandatory sustainability criteria for heat and power generation, which include criteria focusing on the land from which the biomass is sourced and greenhouse gas criteria which account for the life cycle emissions of the biomass.

Biomass is incentivised for electricity through the schemes outlined in section 3.1.2(iii) and generators only receive subsidies for the electricity output which complies with our sustainability criteria.

The Scottish Government is currently developing a Bioenergy Policy Update, which will set out its direction of travel to gather further evidence on how bioenergy can support meeting its net zero targets. This will help to develop a Bioenergy Action Plan going forward. Research was commissioned to assess the potential contribution that bioenergy can make towards meeting Scottish energy demand, considering scale, local restrictions and bioenergy resources. It concluded that there is potential for bioenergy to deliver another source of renewable energy; one that is low in cost and will help to tackle fuel poverty in Scotland.<sup>219</sup>

### **Renewable Heat Incentive (RHI)**

The non-domestic RHI was introduced in 2011, with the domestic RHI following in 2014. The schemes are designed to help bridge the gap between the costs of fossil fuel heating technologies and low-carbon alternatives. Participants receive a tariff, set in pence per kilowatt hour of heat used, for either seven (domestic RHI) or 20 years (non-domestic RHI), which is set at a level to cover the additional costs of the low-carbon heating installation. Both RHI schemes cover a range of technologies, including solid biomass heating, and for the non-domestic scheme, biogas heating and biomethane injection to the gas grid.

The UK government has confirmed funding for new applications for the non-domestic RHI scheme until the end of March 2021, and the end of March 2022 for the domestic scheme. In December 2016, a series of wide-ranging reforms to the domestic and non-domestic RHI schemes were announced. The first tranche of reforms was implemented in September 2017, and the second tranche was implemented in 2018.

---

<sup>218</sup> Digest of UK Energy Statistics (DUKES) 2019, Table 6.4, available at:

[www.gov.uk/government/statistics/renewable-sources-of-energy-chapter-6-digest-of-united-kingdom-energy-statistics-dukes](http://www.gov.uk/government/statistics/renewable-sources-of-energy-chapter-6-digest-of-united-kingdom-energy-statistics-dukes)

<sup>219</sup> The potential contribution of bioenergy to Scotland's energy system, published May 2019:

[www.climatexchange.org.uk/research/projects/the-potential-contribution-of-bioenergy-to-scotland-s-energy-system/](http://www.climatexchange.org.uk/research/projects/the-potential-contribution-of-bioenergy-to-scotland-s-energy-system/)

These reforms were designed to refocus the RHI to ensure that it:

- Focusses on long-term decarbonisation
- Offers better value for money and protects consumers
- Supports supply chain growth and challenges the market to deliver

First introduced in May 2018, Tariff Guarantees offer investment certainty to large scale renewable heat generation projects which contribute towards the UK government's commitment to meeting our legally binding carbon targets. Under the initial round of Tariff Guarantees, applicants were required to commission projects in line with industry standards by 31 January 2020. On 31 May 2019, the Department for Business, Energy and Industrial Strategy announced its intention to extend the allocation of Tariff Guarantee applications on the Renewable Heat Incentive to 31 January 2021. The legislation extending the period for Tariff Guarantee applications came into force on 17 July 2019.

This change further supports the transition to low-carbon heating in Great Britain, helping generate renewable heat for homes and businesses across the country. Since the scheme's implementation, as of October 2019, the UK government has granted 47 tariff guarantees for large scale projects, the majority of which produce biomethane for injection to the gas grid.

### **Renewable Transport Fuel Obligation (RTFO)**

Introduced in 2008 under the Energy Act, the RTFO scheme is the main mechanism to ensure the deployment of sustainable renewable fuels in transport.

The RTFO requires fuel suppliers to ensure that a specified proportion of their overall fuel supply into the UK market is from a renewable source. Suppliers can choose to meet their obligation by:

- Supplying fuel that meets the relevant sustainability criteria
- Buying RTF certificates from others who have supplied fuel that meets the criteria
- Paying a 'buy-out' in respect of each litre of shortfall in meeting their obligation.

The RTFO has developed over time, introducing mandatory sustainability criteria to implement the Renewable Energy Directive and more recently to introduce restrictions on the use of food crops to address concerns around indirect land use change. The latest changes were introduced in April 2018. These include:

- Setting a target trajectory for low-carbon fuels to 2032 (rising from ~3% of transport energy today to ~7% by 2032)
- Establishing a sub target for advanced fuels from wastes
- Extending eligibility to low-carbon aviation fuels
- Limiting the contribution of crops from a maximum of 4% in 2020, declining to a maximum of 2% in 2032

### 3.1.3 Other elements of decarbonisation

*i Where applicable, national policies and measures affecting the EU ETS sector and assessment of the complementarity and impacts on the EU ETS*

Until the end of 2020 the UK will continue to participate in the EU ETS. UK government and Devolved Administrations are firmly committed to carbon pricing as an effective tool for achieving carbon emissions reductions and a consultation on The Future of UK Carbon Pricing was carried out from May to July in 2019, to seek stakeholder views on policy proposals after the UK's exit from the EU. Emissions from installations in the EU ETS are falling as intended (decreasing by 4% between 2017 and 2018).<sup>220</sup> The 2020 target is a 21% ETS reduction below 2005 levels.<sup>221</sup>

In Scotland, the EU ETS has helped to drive reductions in actual Scottish emissions. Emissions from energy supply are down 70% from the baseline and those from business and industrial processes are down 32% and 72% respectively.<sup>222</sup> In Wales, the majority of emissions come from heavy industry and electricity generation, referred to as the 'traded sector' under the EU ETS.<sup>223</sup>

#### **The Carbon Price Support**

In Great Britain, the Total Carbon Price (TCP) for energy generation is made up of the EU Emissions Trading System price and the Carbon Price Support (CPS) rate. CPS is an HMT-led policy that was introduced to strengthen the then weak price signal provided by EU ETS prior to EU ETS reforms. The EU ETS price and the 'top-up' CPS tax sum to a total carbon price. The CPS has played a key role in incentivising the rapid reduction in UK coal fired power generation, supporting our commitment to phase out unabated coal generation by 2025. The CPS rate does not apply to energy generators in Northern Ireland.

HM Treasury confirms CPS rates in advance of delivery at Budget, and all revenue from the CPS is retained by the Treasury.

#### **Past rates**

The CPS rate was introduced in April 2013. At Budget 2014<sup>224</sup>, the UK government announced that the CPS rate would be capped at £18/tCO<sub>2</sub> from 2016-17 to 2019-20 to limit the competitive disadvantage faced by business and reduce energy bills for consumers. At Budget 2016, the cap was maintained at £18/tCO<sub>2</sub> from 2016-17 to 2019-20.<sup>225</sup> At Budget 2019, the UK government announced that CPS rates will be frozen at £18/CO<sub>2</sub> in 2021-22 following the rise in the EU ETS price.

## Small Emitters and Hospital Opt-Out Scheme

The UK's Small Emitter and Hospital Opt-Out Scheme (Article 27 of the EU Emissions Trading Scheme Directive<sup>226</sup>) provisions recognise the fact that lower emitters on average face a much higher cost of compliance per tonnes of CO<sub>2</sub> equivalent (tCO<sub>2</sub>eq) than larger emitters. This means that administration costs are significantly higher for smaller emitters, with larger emitters taking advantage of economies of scale to keep costs down.

An assessment of the administrative costs faced by UK operators during Phases I (2005-2007) and II (2008-2012) of the ETS found that smaller emitters accounting for 2% of emissions, incurred approximately 20% of the total administrative burden (across the 60% of all installations covered by the assessment). The largest 8% of emitters were responsible for 60% of emissions and incurred 45% of the administrative burden.

The UK government continues to pursue its 'better regulation' agenda<sup>227</sup>, which aims to reduce regulatory burdens on business, thereby helping to boost economic growth. In climate change policy terms, this translates into a commitment to ensuring that regulatory effort is focused on those areas of greatest risk to achieving our climate emission reduction goals and that the administrative costs of delivering these goals are minimised. Therefore, all effort should be made to reduce the compliance burden on small emitters.

The UK's Small Emitter and Hospital Opt-Out Scheme (Article 27) allowed eligible installations to face a reduced administrative burden during Phase 3 (2013 to 2020) of the EU ETS. The scheme was approved by the European Commission.

The current UK opt-out scheme was designed in consultation with industry and aims to offer a simple, deregulatory alternative to the EU ETS whilst maintaining the incentives for emission reductions. The opt-out scheme offers deregulatory savings through:

- an option for risk-based auditing of emissions instead of third-party verification
- no requirement to hold an active registry operator holding account
- the replacement of the requirement to surrender allowances with an installation emission reduction target
- a less burdensome procedure for adjusting targets to take into account changes in capacity

As part of the consultation on the Future of UK Carbon Pricing, the UK government and Devolved Administrations have consulted on proposals for continuing to offer a Small Emitter and Hospital Opt-Out. In addition the Consultation sought views on proposals to also offer an Ultra-Small Emitter exemption, which is a feature of Phase IV of the EU ETS and would allow for installations with emissions less than 2,500 tonnes of carbon dioxide equivalent, excluding emissions from biomass, to be exempted from the UK ETS.

For more details please visit the Future of UK Carbon Pricing consultation<sup>228</sup>, which outlines the proposals in more detail.

## Indirect compensation payments

Article 10a (6) of the revised EU Emissions Trading Scheme Directive, which took effect on 8 April 2018, requires Member States to publish annually, from 2018, the amount of compensation paid to sectors exposed to “genuine risk of carbon leakage due to significant indirect costs that are actually incurred from greenhouse gas emission costs passed on in electricity prices”. While a Member State in 2018, the UK published a report detailing the amount of EU ETS Indirect Cost Compensation awarded in 2017:

**Table 14: 2017 indirect cost compensation report<sup>229</sup>**

Sector	No. of Businesses	EU ETS compensation (£)
Iron & Steel	10	19.2 million
Chemicals	12	17.3 million
Paper	30	12.8 million
Non-ferrous metals	6	1.00 million
Other	3	0.6

The UK government’s current commitment is to provide compensation until 2020.

*ii Policies and measures to achieve other national targets, where applicable*

Not applicable.

*iii Policies and measures to achieve low emission mobility (including electrification of transport)*

## Transport

The UK government recognises that transport is one of the key areas where we must step up the pace of progress in reducing emissions. Our main focus is road transport, which accounts for over 80% of transport greenhouse gas emissions and a significant proportion of air pollutant emissions.<sup>230</sup> The UK government is also taking action to support modal shift, enabling people to choose the most sustainable mode of travel for their journey. We are investing in public transport and walking and cycling, as well as driving down emissions from aviation and shipping.<sup>231</sup>

### Cars, vans, motorcycles and taxis

In the Road to Zero strategy, published in 2018, the UK government reaffirmed that it will end the sale of new conventional petrol and diesel cars and vans by 2040. The 2040 target was conceived as ambitious but achievable. The government’s aim is to put the UK at the forefront of the design and manufacturing of zero emission vehicles, and for all new cars and vans to be

<sup>229</sup> The Future of Carbon Pricing consultation, published 2019: [www.gov.uk/government/consultations/the-future-of-uk-carbon-pricing](http://www.gov.uk/government/consultations/the-future-of-uk-carbon-pricing)

<sup>230</sup> Department for Transport (2019), Statistical data set, Energy and environment: data tables (ENV) [www.gov.uk/government/statistical-data-sets/tsqb03](http://www.gov.uk/government/statistical-data-sets/tsqb03)

<sup>231</sup> BEIS (2018) Final UK greenhouse gas emissions national statistics: 1990 – 2016 (online): [www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissionsnational-statistics-1990-2016](http://www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissionsnational-statistics-1990-2016)

effectively zero emission by 2040. Going beyond this, we will now consult on the earliest date we can phase out the sale of new conventional petrol and diesel cars and vans, while minimising the impact on drivers and businesses. By 2050 we want almost every car and van in the UK to be zero emission.

The public sector is leading the switch to ultra low emission vehicles by example, by ensuring 25% of the central government car fleet is ultra low emission by 2022, and that all new car purchases are ultra low emission by default, ensuring 100% of the central government car fleet to be ultra low emission by 2030.

The UK government offers a range of incentives to help consumers make the shift to cleaner vehicles, including through the tax system, direct grants for vehicles and charging infrastructure and other financial support. To achieve our ambitions, we are investing nearly £1.5 billion between April 2015 and March 2021.

As part of this, the UK government will continue to offer grants for plug-in cars, vans, taxis and motorcycles until at least 2020, with consumer incentives in some form continuing beyond that date. To accelerate the shift to zero emission vehicles, all zero emission models will pay no company car tax in 2020-21, 1% in 2021-22 before returning to the planned 2% rate in 2022-23 – a significant tax saving for employees and employers.

Thanks to UK government leadership, a growing private sector and continuous local authority engagement, the UK now has over 17,000 devices providing over 24,000 public chargepoints. At least 2,400 are rapid devices; one of the largest networks in Europe. Since 2013, the UK government has supported the installation of over 120,000 domestic chargepoints and 5,000 workplace sockets through grant support schemes. 54 local authorities have successfully been awarded funding through the On-street Residential Chargepoint Scheme since 2017, which has allocated £8.5 million in grant funding towards the cost of installing on-street chargepoints through to 2020. The UK has also invested over £20 million across 27 local authorities to deliver over 900 chargepoints dedicated to taxis and private hire vehicles. The eight cities funded through the £40m Go Ultra Low Cities Scheme continue to deliver a range of pioneering local initiatives and charging infrastructure projects – including the UK's first 350kW enabled electric vehicle charging station, in Sunderland. These grant schemes and the £400-million public-private Charging Infrastructure Investment Fund will see thousands more electric vehicle chargepoints installed across the UK.

The UK government has also taken new powers through the Automated and Electric Vehicles Act 2018 to ensure that chargepoints can be easily accessed and used across the UK, and that they are smart ready. Consultations on electric vehicle smart charging and proposals for chargepoints to be installed with all newly built homes in England, where appropriate, closed in October 2019.<sup>232</sup>

## **HGVs and road freight**

The UK government's long-term goal for HGVs is the development and deployment of zero emission technologies. As solutions emerge, it remains essential to scale up and expand efficiency measures that can reduce emissions now. The UK government is supporting this by:

- Working with industry to develop an Ultra-Low Emission Truck standard to provide clarity on its emission reduction expectations.

---

<sup>232</sup> The Road to Zero, 2018: [www.gov.uk/government/publications/reducing-emissions-from-road-transport-road-to-zero-strate](http://www.gov.uk/government/publications/reducing-emissions-from-road-transport-road-to-zero-strate)

- Working at a European level to implement the new ambitious CO2 performance standards for new trucks.
- A new industry-wide voluntary target for reducing HGV greenhouse gas emissions by 15% by 2025, from 2015 levels.
- Maintaining the small and medium-sized enterprise HGV fleet review scheme, which advises companies on ways to reduce carbon dioxide emissions.
- Extending the Longer Semi-Trailer trial to further demonstrate the efficiencies gained through more effective use of the road network.
- Extending the plug-in van grant to cover all HGVs weighing more than 3.5 tonnes – the Plug in Van Grant provides 20% of the price of a qualifying vehicle to a maximum grant amount of £8,000, or £20,000 for the first 200 large vans (3.5 tonnes plus) or trucks.
- OLEV and Innovate UK awarding £20 million of grant funding to 20 projects under the Low Emissions Freight and Logistics Trial<sup>233</sup> and £18 million R&D funding focused solely on innovative low emission HGV technologies.
- Progressing planning for trials of HGV platoons, which could bring significant fuel and emissions savings, with real-world trials in 2020.

## Rail freight

Rail freight offers benefits to the environment, helps reduce road congestion and is important to UK businesses. Rail is one of the most carbon efficient ways of moving goods over long distances. Carbon emissions per freight tonne fell by 4.1% in 2018/2019 (ORR: Rail Emissions 2018-19). Rail freight is estimated to remove 7.2 million HGV journeys and 1.5 billion HGV kilometres from the roads annually (ORR: 2018-19 Q4).

The main way to achieve rail freight decarbonisation is to stop using diesel traction, through direct government intervention to roll out further electrification. Network Rail is leading the Traction Decarbonisation Network Strategy (TDNS), which will inform decisions about the scale and pace of decarbonisation between now and 2050. The challenge for rail freight is that current alternatives to overhead electrification, such as hydrogen and battery, do not have sufficient power to pull heavy freight trains. There is potential for bi-modes to reduce emissions. We have recently funded, through Innovate UK and RSSB, competitions that provided over £4 million for projects to drive decarbonisation across passenger and freight.

Government recognises the economic and environmental benefits of rail freight; the sector plays an essential part of the UK economy. Government has invested £235m in the Strategic Freight Network over CP5 (2014-2019) to improve the capacity and capability of the rail network for freight. Government is also providing freight grant schemes to support the carriage of freight by rail and water on routes where road haulage has a financial advantage. The scheme is providing up to £15.6 million in 2019/20 and helps to remove around 900,000 lorry journeys a year from Britain's roads.

## Rail

Rail is currently a relatively green mode of transport – making up 10% of GB kilometres travelled but only 2% of UK transport GHG emissions (about 0.5% of economy-wide emissions). Rail's carbon emissions are also going down: CO2 emissions per passenger km in 2018-19 were 10.3% lower than in 2017-18, a continuation of a general trend of falling

---

<sup>233</sup> TRL, Low Emissions Freight and Logistics Trial, <https://left.trl.co.uk/>

emissions per passenger km. In recent years this trend has mostly been due to grid decarbonisation, but still illustrates that rail remains a low-carbon travel option.

Nevertheless, if the UK is to meet its net zero target across the economy by 2050, the Government believes that the rail sector must play its part in decarbonising transport. To reduce carbon emissions from trains we will need to both reduce use of diesel trains and take advantage of grid decarbonisation. As the organisation responsible for railway infrastructure, Network Rail (NR) are developing a Traction Decarbonisation Network Study (TDNS), which will inform the scale and pace of rail decarbonisation. The strategy outcomes will identify the areas of the network likely to need electrification, and which would be better suited to novel technologies such as hydrogen and battery in order to decarbonise the railway. The Government has recently invested over £4.5 million innovation projects through RSSB and Innovate UK, which will help novel low-carbon technologies such as hydrogen-powered trains reach maturity.

## Buses

As for other road vehicles, the UK government ultimately wants to see all buses become zero emission. The UK government has built on previous investments with the Ultra-Low Emission Bus Scheme, providing £48 million to accelerate the uptake of these buses and related infrastructure in England and Wales.<sup>234</sup> The UK government has also announced £220 million funding in September 2019 to transform bus services and promote the development of an all-electric bus town or city.<sup>235</sup>

The UK government also works to increase bus usage. The £220 million Clean Air Fund is available for investment in a range of measures, including bus priority measures, which improve reliability and reduce journey times.<sup>236</sup> The £2.45 billion Transforming Cities Fund is also providing support for public transport in some of England's largest cities.<sup>237</sup>

The Bus Services Act 2017 gives local authorities new powers to work with operators to improve passengers' experience of bus travel. It introduces new bus franchising powers for local authorities, and powers to allow local authorities and bus operators to work in partnership, among other tools. Regulations made under the new open data provisions and new ticketing powers will make it easier for passengers in England (outside London) to use buses, move between different modes of transport and, from 2020, to access timetables, routes, fares, tickets, real time information and the actual location of bus services. To facilitate the improvement of information available to bus passengers, and ease their travel decisions based on complete, accurate and timely data, the UK government is developing a new digital platform to support the development of bus travel apps.

More generally, the UK government already provides around £2 billion to bus operators and local authorities to support bus services, and £250 million is provided via the Bus Service Operators Grant, with £43 million of this directly devolved to local authorities to support bus services that are not commercially viable.<sup>238</sup> The UK government also supports free off-peak

travel for older and disabled persons through the English National Concessionary Travel Pass.<sup>239</sup>

### **Low carbon fuels**

The UK government introduced legislation in April 2018 to almost double the use of low-carbon fuels in transport, increasing the obligation level under the Renewable Transport Fuels Obligation to 9.75% by volume in 2020, and rising to 12.4% by volume in 2032.<sup>240</sup> The UK government has also launched the £22 million Future Fuels for Flight and Freight Competition to develop proposals for advanced fuels production plants. In December 2019, two projects were awarded a share of £6.5 million to build plants, which aim to provide fuel for heavy goods vehicles.<sup>241</sup>

### **Walking and cycling**

The UK government is now implementing the Cycling and Walking Investment Strategy (CWIS), which was published in April 2017<sup>242</sup>, supported nearly £1.2 billion to promote cycling and walking out to 2020/2021. The ambition for England by 2040 is to make cycling and walking the natural choices for shorter journeys, or as part of a longer journey. The CWIS also sets out some nearer term aims and targets for 2025, including an aim to double cycling to 1.6 billion stages by 2025. Since the strategy's publication, local councils and metro mayors have been greatly attracted by the benefits of cycling and walking, and they have allocated an additional £700 million to safe infrastructure and other Active Travel projects. The result is that almost £2 billion is being invested in this area over this Parliament. This represents an expected uplift of nearly 60% on the investment levels projected in 2017, reflecting the growing importance of this agenda.

Further investment in cycling and walking is being provided as part of the £2.45 billion Transforming Cities Fund, the £5.5 billion Housing Infrastructure Fund, the £1 billion Sport England Strategy, the £220 million Clear Air Fund and through the HS2 road safety fund. The £675 million High Streets fund and expanded £3.6 billion Stronger Towns fund is also expected to provide further funding opportunities. Our response to the CWIS Safety Review, published in November 2018, contained 50 commitments to make roads safer for those who cycle and walk.

### **Aviation and shipping**

The UK government is continuing to decarbonise its aviation and shipping sectors, both through international action, such as standards and offsetting schemes, and domestically; for example, by working with industry to develop sustainable alternative fuels, improved design efficiency and new propulsion technologies. We have published our Maritime 2050 strategy, our Clean Maritime Plan and our Green Paper 'Aviation 2050 - The future of UK aviation'. The CCC provided the UK government with specific advice on international aviation and shipping emissions on 24 September 2019. It is critical that aviation plays its part in delivering the UK's

---

<sup>239</sup> Free bus passes for older and disabled people protected for the future, published April 2018:

<sup>240</sup> Renewable Transport Fuel Obligation Order, Government Response to the consultation on amendments, 2017: [www.gov.uk/government/publications/renewable-transport-fuel-obligations-order-government-response](http://www.gov.uk/government/publications/renewable-transport-fuel-obligations-order-government-response)

<sup>241</sup> Press notice, December 2019: [www.gov.uk/government/news/orange-peel-rubbish-and-fatbergs-the-fuels-behind-the-future-of-green-transport](http://www.gov.uk/government/news/orange-peel-rubbish-and-fatbergs-the-fuels-behind-the-future-of-green-transport)

<sup>242</sup> Department for Transport, Cycling and Walking Investment Strategy (2017): [www.gov.uk/guidance/renewable-transport-fuels-obligation](http://www.gov.uk/guidance/renewable-transport-fuels-obligation)

net zero ambitions and the Government is still planning to consult on our position on aviation and climate change later this year followed by our ambitious Aviation Strategy.

In developing these and future strategies, we have considered, and we will continue to consider the implications of our net zero target for 2050 while developing a robust and comprehensive approach to tackling aviation and shipping greenhouse gas emissions.

The Aviation Strategy will put in place a framework for tackling carbon emissions from UK aviation out to 2050. The UK government will consider all cost-effective measures to ensure that the sector contributes to the UK's emissions reduction obligations. Industry and the UK government have made a joint £3.9 billion commitment between 2013 and 2026 to the development of new aircraft technology with the Aerospace Technology Institute. The Renewable Transport Fuel Obligation has also been extended to include incentives to use renewable fuels in aviation. The UK government played an instrumental role in the International Civil Aviation Organisation (ICAO) agreeing the first worldwide scheme to tackle CO2 emissions in any single sector - the Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA) - in October 2016. The UK is now negotiating for ICAO to agree a long-term emissions reduction goal for international aviation by its 41st Assembly in 2022.

In 2019 the UK government and the Devolved Administrations consulted on options to replace the EU Emissions Trading System (EU ETS) when it leaves the EU ETS at the end of the Transition Period, which included proposals for the aviation sector.

On domestic shipping, the Clean Maritime Plan identifies ways to tackle air pollutants and GHG emissions while securing clean growth opportunities for the UK. It delivers on the Industrial Strategy by placing the UK at the forefront of the global transition to clean maritime technologies.

Implementation of the Clean Maritime Plan is an essential component of the Government efforts to meet the legislative target of net zero emissions by 2050 across the UK economy.

By 2025 we expect that:

- All new vessels ordered for UK waters are being designed with zero emission propulsion capability, that all vessels operating in UK waters are maximising the use of energy efficiency options, and that zero emission commercial vessels are in operation in UK waters.
- The UK is building clean maritime clusters focused on innovation and infrastructure associated with zero emission propulsion technologies, including bunkering of low or zero emission fuel.

By 2035 we expect that:

- The UK is home to a world-leading zero emissions maritime sector, with a strong UK export industry, cutting-edge R&D activities, and the global centre for maritime services related to clean maritime growth.
- The UK has built a number of clean maritime clusters, which combine infrastructure and innovation for the use of zero emission technologies. Low or zero emission bunkering options are readily available across the UK.

Good progress was made in 2019 on delivering the commitments in the Clean Maritime Plan, including by launching a ‘Greening Finance/Financing Green’ for Maritime initiative at London International Shipping Week. We provided seed funding to contribute to the establishment of MarRI-UK, ensuring strong collaboration between Government, industry and academia in the field of clean maritime innovation, funding two competitions for innovation grant funding in clean maritime. The first was through the Department for Transport’s Transport Technology Research and Innovation Grants (T-TRIG). The second is the Clean Maritime Call, in which MarRI-UK is administering a £1.5m provided by Government. Both initiatives will provide funding to early stage innovation projects in the field of maritime emissions reduction.

On international shipping, the UK was instrumental in reaching a global deal at the International Maritime Organization (IMO) in April 2018 that will see these greenhouse gas emissions reduced by at least 50% by 2050, against a 2008 baseline, while pursuing efforts to phase out these emissions entirely as soon as possible. Domestically, the UK government is working with ship owners and ports to identify the barriers faced in supplying and using sustainable alternative fuels and cleaner emissions technologies, to explore possible solutions. In addition, operational improvements are expected to play a role, including better use of ship capacity. In July 2019, the UK government published a Clean Maritime Plan, the environmental route map of the Maritime 2050 strategy, which addresses the challenge of tackling the maritime sector’s emissions of greenhouse gases and air pollutants and sets out our ambition for all new ships for UK waters ordered from 2025 to be designed with zero-emission capable technologies. The plan also includes a £1 million competition to find innovative ways to reduce maritime emissions and is published alongside a call for evidence to reduce emissions on UK waterways and domestic vessels, which closed in January 2020.<sup>243</sup>

*iv Where applicable, national policies, timelines and measures planned to phase out energy subsidies, in particular for fossil fuels*

The UK has support schemes for renewables, which are described in 2.3(iii) and 3.1.2 and listed in Table 15 below:

**Table 15: List of UK energy subsidies**

Energy Subsidy	Details
Renewables Obligation (RO)	Replaced by the competitive Contracts for Difference support scheme
Contracts for Difference (CfD)	<p>The Contracts for Difference (CfD) scheme was introduced in GB in 2014 and is the UK government’s main mechanism for supporting new low-carbon electricity generation projects.<sup>244</sup></p> <p>A CfD is a 15-year private law contract between a low-carbon electricity generator and the Low Carbon Contracts Company (LCCC), a UK government-owned company. Planned continuation of CfDs for new low-carbon capacity after 2020 until 2035. A generator is paid for the electricity they generate, the difference between the strike price and the reference price. The cost is met by consumers via a levy on electricity suppliers.</p>

<sup>243</sup> Domestic shipping air pollution: call for evidence: [www.gov.uk/government/consultations/domestic-shipping-air-pollution-call-for-evidence](http://www.gov.uk/government/consultations/domestic-shipping-air-pollution-call-for-evidence)

<sup>244</sup> Electricity Market Reform: Contracts for Difference: [www.gov.uk/government/collections/electricity-market-reform-contracts-for-difference](http://www.gov.uk/government/collections/electricity-market-reform-contracts-for-difference)

Energy Subsidy	Details
Feed in Tariffs Scheme (FIT)	<p>The Feed-in Tariffs (FIT) scheme was introduced to England, Wales and Scotland on 1 April 2010, under powers in the Energy Act 2008. The intention was to encourage deployment of micro-scale and small-scale low-carbon electricity generation (up to 5MW), particularly by organisations, businesses, communities and individuals that have not traditionally engaged in the electricity market.<sup>245</sup></p> <p>Closed to new applications from 31 March 2019.</p>
Great Britain Renewable Heat Incentive (RHI)	<p>The non-domestic RHI was introduced in 2011, with the domestic RHI following in 2014. The RHI scheme has confirmed funding for new applications until 1 April 2021 in the non-domestic scheme and 1 April 2022 in the domestic scheme.</p> <p>The UK government is currently developing its low-carbon heat policy for the 2020s and beyond. We are working on a Heat Policy Roadmap which will set out key steps required to make key strategic decisions in the first half of the 2020s on how we achieve mass transition to low-carbon heating. We aim to publish this roadmap in mid-2020.</p>
Renewable Transport Fuel Obligation (RTFO)	<p>The RTFO scheme was introduced in 2008 and is the main mechanism to ensure the deployment of sustainable renewable fuels in transport.</p> <p>The RTFO requires fuel suppliers to ensure that a specified proportion of their overall fuel supply into the UK market is from a renewable source.</p>

The Feed-Tariff scheme was closed to new installations on the 31st March 2019. The Renewables Obligation has closed to new applicants (but will continue to provide support to accredited generators for a fixed period). Its successor, the CfD, largely allocates support through a competitive auction. The competitive nature of these auctions drives cost reductions and value for money for consumers. In future we expect generators for some technologies to bid close to the market price for power, and it is possible that some of these contracts may end up paying back to the consumer over the length of the scheme.

The UK uses the definition of fossil fuel subsidies developed with other G20 Member States to respond to the G20 commitment to phase out such subsidies. The definition, based on the approach of the International Energy Agency, is –

*A fossil-fuel subsidy is any government measure or program with the objective or direct consequence of reducing below world-market prices, including all costs of transport, refining and distribution, the effective cost for fossil fuels paid by final consumers, or of reducing the costs or increasing the revenues of fossil-fuel producing companies.*

Using this definition, the UK has no fossil fuel subsidies.

<sup>245</sup> About the FIT Scheme, Ofgem, [www.ofgem.gov.uk/environmental-programmes/fit/about-fit-scheme](http://www.ofgem.gov.uk/environmental-programmes/fit/about-fit-scheme)

## 3.2 Energy efficiency

Planned policies, measures and programmes to achieve the indicative national energy efficiency contributions for 2030 as well as other objectives referred to in [section 2.2](#), including planned measures and instruments (also of a financial nature) to promote the energy performance of buildings, in particular with regard to the following:

*i Energy efficiency obligation schemes and alternative policy measures under Articles 7a and 7b and Article 20(6) of Directive 2012/27/EU and to be prepared in accordance with Annex III to this Regulation*

See Annex B.

The Energy Company Obligation (ECO) is a statutory scheme that places an obligation on energy suppliers to deliver energy efficiency (for example; solid wall insulation, loft insulation) and heating measures to domestic households in Great Britain.

ECO has been in place since April 2013. As of July 2019, it had delivered 2.5 million measures to approximately 2 million homes. The 2015 Spending Review committed £640 million per annum from April 2017 to March 2022. The CGS announced that domestic energy efficiency would be funded to at least this level until 2028.

The new ECO scheme came into force on 3 December 2018 and will run until March 2022. The new scheme focusses support to low income, vulnerable and fuel poor households.<sup>246</sup>

*ii Long-term renovation strategy to support the renovation of the national stock of residential and non-residential buildings, both public and private<sup>247</sup>, including policies, measures and actions to stimulate cost-effective deep renovation and policies and actions to target the worst performing segments of the national building stock, in accordance with Article 2a of Directive 2010/31/EU*

The UK government's full Long-Term Renovation Strategy (LTRS) for the UK building stock is currently in development and is expected to be published separately in 2020. The requirement to submit the LTRS will be fulfilled through the publication of a Heat and Buildings Strategy. This will build on existing analysis from the Clean Growth Strategy in order to set out the UK government's long-term vision of how it will improve the energy performance of both residential and non-residential properties in support of the delivery of its legally-binding emissions and fuel poverty targets.

The required advance elements of the LTRS have been included in [section 2.2](#). This content is indicative and subject to revision upon publication of the UK's full Strategy.

*iii Description of policy and measures to promote energy services in the public sector and measures to remove regulatory and non-regulatory barriers that impede the uptake of energy performance contracting and other energy efficiency service models<sup>248</sup>*

---

<sup>246</sup> ECO Scheme, [www.ofgem.gov.uk/environmental-programmes/eco](http://www.ofgem.gov.uk/environmental-programmes/eco)

<sup>247</sup> In accordance with Article 2a of Directive 2010/31/EU.

<sup>248</sup> In accordance with Article 18 of Directive 2012/27/EU.

The UK government has made available a model Energy Performance Contract,<sup>249</sup> which includes guidance notes and a guide to best practices for the public sector, and a list of registered energy service providers.<sup>250</sup>

In the business sector, BEIS has previously published research that it had commissioned to understand the potential size of the energy services market and the drivers and barriers to further growth.<sup>251</sup> The UK government also published a call for evidence to seek views on how the UK government could help businesses improve the way they use energy, including whether the UK government could stimulate the energy services market for businesses.

*iv Other planned policies, measures and programmes to achieve the objectives referred to in section 2.2 (for example measures to promote the exemplary role of public buildings and energy-efficient public procurement, measures to promote energy audits and energy management systems<sup>252</sup>, consumer information and training measures<sup>253</sup>, and other measures to promote energy efficiency<sup>254</sup>)*

Further information on these are set out in 3.2(viii) and 5.1(iii).

*v Where applicable, a description of policies and measures to promote the role of local energy communities in contributing to the implementation of policies and measures in sections i, ii, iii and iv*

The UK government recognises that local delivery is critical to achieve objectives set out in the national Industrial Strategy and CGS. In 2017 BEIS launched a Local Energy Programme<sup>255</sup> which has committed almost £20 million funding to local areas to date. This has funded all Local Enterprise Partnerships (LEPs) in England to develop their own local energy strategy; five Local Energy Hubs across England to increase the capacity of LEPs and local authorities to identify and deliver local energy projects and undertake the initial stages of project development to help attract investment; and a range of good practice guidance and toolkits.

As part of the Local Energy Programme, the Rural Community Energy Fund (RCEF) re-opened in May 2019 offering £10 million to support rural communities in England to develop renewable energy projects. RCEF offers grants for feasibility studies and pre-development of the project up to the point where there is an investable business case, and it is being delivered by the five Local Energy Hubs.

As highlighted in the CGS, the UK government is also committed to supporting local leadership and has already given additional powers and responsibilities through the Cities and Local Government Devolution Act 2016. A number of Local Devolution deals have been agreed between the UK government and local areas including Greater Manchester, West Midlands, West of England, Cornwall, Greater Peterborough and Greater Cambridgeshire, Sheffield, Liverpool City Region, Tees Valley, North of Tyne. Many of these deals incorporate energy

<sup>252</sup> In accordance with Article 8 of Directive 2012/27/EU.

<sup>253</sup> In accordance with Articles 12 and 17 of Directive 2012/27/EU.

<sup>254</sup> In accordance with Article 19 of Directive 2012/27/EU.

<sup>255</sup> Clean Growth Strategy, 2017, October 2017, [www.gov.uk/government/publications/clean-growth-strategy](http://www.gov.uk/government/publications/clean-growth-strategy)

commitments, including support for home energy efficiency, deep geothermal, tidal power and community energy initiatives.

## Scotland

Scotland has a legacy of strong community engagement in local renewable generation, often led by remote rural and island communities. The Scottish Government is defining a distinctive approach to Scotland's future energy provision, including:

- Putting communities at the heart of decisions about their local energy system
- Empowering them to take an economic stake in new developments

The Scottish Government is committed to continuing to empower Scottish communities, supporting the development of innovative and integrated local energy systems and networks. There is already a flagship scheme in place to support the growth of community and local energy throughout Scotland; the Community and Renewable Energy Scheme (CARES). This scheme, which is delivered locally by Development Officers based throughout Scotland, is a one stop shop offering free independent advice and funding options to support communities in taking forward projects or taking a stake in commercial schemes.

Up to £4.5 million is available to applicants through CARES in 2020/21. This support includes:

- Enablement grants of up to £25,000
- Development loans and grants of up to £150,000
- Capital grants of up to £150,000

Since its inception CARES has supported approximately 600 renewable energy projects across Scotland.

Furthermore, in the 2017 Scottish Energy Strategy, Innovative Local Energy was highlighted as one of our strategic priorities and, as such, the Scottish Government has set the following targets:

- 1 GW of community and locally-owned renewable energy capacity by 2020
- 2 GW of community and locally-owned renewable energy capacity by 2030
- Half of newly consented renewable energy projects to have an element of shared ownership by 2020

Scotland has made considerable progress in achieving these ambitious targets: As of March 2019, almost 0.7 GW of capacity was operational – with a further 0.6 GW in the pipeline.

Welsh Government has set targets around local ownership to ensure the benefits are captured for Wales from new energy developments. There is an expectation for all new energy projects in Wales to include at least an element of local ownership, in order to retain wealth within Wales and provide real benefit to communities.

The Welsh Government Energy Service provides support to public sector organisations and communities to help them develop energy efficiency and renewable energy schemes which generate benefit for Wales from the transition to a low-carbon energy economy. Building on

experience and learning over recent years, the service offers a wide range of technical, commercial, strategic and project management skills.

Local Authorities are supported through the Welsh Government Energy Service with 0% loans to support the delivery of new projects which support decarbonisation. The Welsh Government Local Energy Loan Fund supports community-led renewable energy projects and enable groups to buy into projects. The Welsh Government Energy Service is also supporting regional energy mapping, which will feed into growth deals and help regions in developing the energy system of the future, identifying greater regional benefits than the current system delivers for Wales. This will include power, heat and transport.

*vi Description of measures to develop measures to utilise energy efficiency potentials of gas and electricity infrastructure<sup>256</sup>*

The Ofgem assessment of the energy efficiency potential of Great Britain's gas and electricity infrastructure was published in 2015, in line with the Energy Efficiency Directive. The report assessed the energy efficiency potential of gas and electricity infrastructure and described measures in place and their expected benefits alongside potential measures that could improve energy efficiency in future.<sup>257</sup> These measures continue to be progressed under the mechanisms described in 3.4 below.

*vii Regional cooperation in this area, where applicable*

BEIS participates in a number of international fora aimed at promoting product energy efficiency policies globally. The Super-efficient Equipment and Appliances Deployment Initiative is made up of 18 member governments including Chile, the European Commission, Canada, India, South Africa and Germany, and its primary aim is to support energy efficiency policies in developing economies. The Energy Efficient End-use Equipment (4E) initiative is a Technology Collaboration Programme under the aegis of the IEA and CEM with 15 member governments including the Netherlands, Sweden, France, US, Japan, Australia and New Zealand, it aims to promote the sharing of policy best practice and conduct research studies on energy efficiency.

*viii Financing measures in the area at national level*

The CGS set out an aspiration for as many homes as possible to be EPC B and C by 2035, where practical, cost-effective and affordable. To achieve this aspiration, the UK government will:

1. Support around £3.6 billion of investment to upgrade around a million homes through the Energy Company Obligation (ECO), and extending support for home energy efficiency improvements until 2028 at the current level of ECO funding (i.e. £640 million per annum).
2. Build a market for energy efficiency by making it as easy as possible for people to pay for and make home energy efficiency improvements. Alongside the CGS, the UK government published a Call for Evidence on Building a Market for Energy efficiency that sought views on additional measures to encourage home energy performance

---

<sup>256</sup> In accordance with Article 15(2) of Directive 2012/27/EU.

<sup>257</sup> Energy Efficiency Directive: An assessment of the energy efficiency potential of Great Britain's gas and electricity infrastructure, 2015: [www.ofgem.gov.uk/publications-and-updates/energy-efficiency-directive-assessment-energy-efficiency-potential-great-britain-s-gas-and-electricity-infrastructure](http://www.ofgem.gov.uk/publications-and-updates/energy-efficiency-directive-assessment-energy-efficiency-potential-great-britain-s-gas-and-electricity-infrastructure)

improvements.<sup>258</sup> Following an analysis of the responses, the UK government outlined several of its resulting actions in the July 2019 Green Finance Strategy and published the summary of responses, to the call for evidence, alongside the strategy.

3. Review the Green Deal Framework to improve and simplify this. Launched in 2013, the Green Deal enables consumers to take out loans to pay for energy efficiency improvements in their properties, with repayments made through their energy bill. The UK government intends to improve the Framework, so that it can best support future use of 'pay as you save', as well as simplify and reduce costs, whilst providing adequate protection for consumers. A Call for Evidence was published late in 2017 and the summary of responses to the Call for Evidence was published in July 2018. A consultation will follow on any proposed changes.
4. Consult on a long-term trajectory for energy performance standards in the Private Rented Sector (PRS) in England and Wales, with the aim of as many private rented homes as possible being upgraded to EPC Band C by 2030, where practical, cost-effective and affordable. We have been working with stakeholders to develop policy design options for the trajectory during the summer of 2019 and we plan to consult on this in the Autumn.

The UK government has made strong progress since the publication of the CGS. As part of its long-term PRS trajectory, for example, on 1st April 2018 it introduced the PRS Minimum standard regulations, which require landlords to bring their properties to EPC Band E or above or register an exemption if one applies. These regulations were further strengthened in April 2019 to require a contribution of up to £3,500 from landlords towards the cost of improvements. The UK government is also taking action in the social rented sector. The Social Housing Green Paper published in August 2018<sup>259</sup> asked, among other things, whether the energy performance of social housing should be upgraded. Government is currently considering the responses and will publish a Social Housing White Paper for implementing social housing reform in due course.

Measures have also been introduced to improve the supply of energy efficiency measures and stimulate demand. For example, the UK government currently makes available a reduced rate of VAT of 5% for the installation of certain energy saving materials in residential properties, including insulation, draught stripping for windows and doors and heating controls. As set out in [section 2.2](#), the UK government has also made the following finance available for demonstration projects:

- £2.5 million to improve retrofit supply chain integration and coordination across England;
- £5 million to support the development of innovative green finance products through the Green Finance Home Innovation Fund;
- And £10 million to fund projects demonstrating a cost reduction trajectory for whole house retrofit.

There is also potential for the energy services market to deliver more investment in energy efficiency to businesses. The CGS sets out the UK government's ambition to reduce business energy use by 20% by 2030. Achieving this ambition will require action across all businesses. The UK government's modelling suggests that the majority of improvements could come from

---

<sup>258</sup> Building a market for energy efficiency: call for evidence, 2017:

[www.gov.uk/government/consultations/building-a-market-for-energy-efficiency-call-for-evidence](http://www.gov.uk/government/consultations/building-a-market-for-energy-efficiency-call-for-evidence)

<sup>259</sup> [www.gov.uk/government/news/social-housing-green-paper-a-new-deal-for-social-housing](http://www.gov.uk/government/news/social-housing-green-paper-a-new-deal-for-social-housing)

improving the efficiency of how energy is used in commercial and industrial buildings, in both the private rented sector and owner-occupied sectors.

The Scottish Government is committed to improving energy and resource efficiency while reducing carbon output across business and public sector and to continuing sustainable economic growth for Scotland. The Resource Efficient Scotland (RES) programme funded by the Scottish Government offers free independent, specialist advice and support to businesses, third sector and public sector organisations to implement energy, material resource and water efficiency measures that will translate into cost savings, increased economic competitiveness and reduced emissions. RES provides a degree of assistance to businesses of all sizes, but SMEs have a particular focus.

The Resource Efficient Scotland SME Loan scheme provides interest free loans up to £100,000 to small and medium sized Scotland based businesses for the installation of resource efficiency measures and renewable energy technologies. The scheme is currently offering, subject to availability, cashback funding of 15% of the total loan value (up to a maximum of £10,000) and is payable after the measures have been installed by the business. Available cashback has resulted in a higher uptake of the loan scheme over the past year (2018 – 2019).

The UK government is working with business and finance stakeholders to improve the market for energy services, building confidence across commercial and industrial customers. Delivering our ambition will present opportunities for green finance.

The CGS also set out the challenge facing the public sector in meeting the UK's 2050 target. The pathway set out to 2032 sees emissions from the public sector falling by around 50% compared to 2017. This will require UK government to go further with longer term emissions reduction targets across the public sector, addressing the barriers to energy efficiency and low-carbon investment, and making the case for action internally.

The UK government has already shown what is possible through the Greening Government Commitments which include a greenhouse gas emissions reduction target and has recently set a new, higher target of a 43% reduction by 2020 from a 2009-10 baseline across the central government estate. The UK government has also introduced a voluntary target - the Emissions Reduction Pledge - for the wider public sector and higher education sector, of a 30% reduction in greenhouse gas emissions by 2020 from a 2009-10 baseline, and will explore the possibility of moving to a more ambitious target during the 2020s.

A call for evidence was launched in October 2017: Leading by example: cutting energy bills and carbon emissions in the public and higher education sectors. A summary of responses was published in July 2018 and further analysis will feed into a review of carbon reduction policies across the public sector. The UK government has committed to publishing a roadmap on the next steps to take us towards delivering the ambition set out in the Clean Growth Strategy for the public sector to reduce greenhouse gas emissions.

We continue to enable greenhouse gas emission reductions through the Public Sector Energy Efficiency Loan Scheme. The capital pot for England stands at £312m as of the end of 2019/20 and is planned to increase each year to a total of £385 million by 2020/21. This funding, managed by Salix Finance, has delivered over 17,000 projects, significantly improving energy performance in the public sector. This revolving loan scheme will continue to be recycled to at least 2025. The UK government is also supporting development of the energy services market, helping public bodies access energy services procurement frameworks.

## 3.3 Energy security

### *i Policies and measures related to the elements set out in section 2.3*

A greater number of electricity generation technologies provide increased diversity and enhanced energy security. In addition, we believe that low-carbon ‘firm’ (i.e. always available) power will be required in order to ensure a low-cost, stable, reliable, low-carbon system in 2050. Nuclear is one of the technologies currently available to provide this large-scale firm, low-carbon power and we should continue to support the development of new nuclear plant in this regard.

The UK has successfully maintained for many years, and intends to continue to maintain, a secure long-term supply of nuclear fuel through the use and implementation of risk-assessed security of supply policies for each utility. These policies apply both separately and holistically across each and all of the individual components of the fuel cycle (uranium supply, conversion, enrichment, fabrication, and finished fuel stocks). The policies are enabled and supported by the maintenance of market expertise and engagement such that genuine intelligent customer status is, and will be, retained in the utilities to assess and monitor security of supply risks (near and long term). Through the creation of alternatives and flexibilities in supply arrangements and the avoidance of exclusivity, there is recognition of, and proactive action and mitigation in response to, market evolution and shocks.

The approach includes consideration, as a minimum, of the following aspects:

- That there are multiple facilities and contracting entities to diversify risk against technical failure, accident, environmental events, commercial issues, geopolitical intervention/constraint (such as sanctions or counter sanctions), and regulatory impact
- That a number of those facilities are located in politically stable countries with which the UK has good relations and appropriate legislative arrangements, such as nuclear co-operation agreements, to allow the supply of material subject to nuclear proliferation safeguards
- That no market cartelisation through excessive concentration of facility ownership – whether horizontally or vertically integrated – has a dominant influence on security of supply
- That the potential for disruption of transport – whether environmental, regulatory, commercial or physical – is minimised and mitigated
- That physical stock holdings are matched to risks, predicted dispute/recovery times, processing durations and operating patterns
- That due consideration is given to the nuclear liability regimes in place in supplying countries, together with the implications for the financial and legal risk to the utility, so that a secure fuel supply does not introduce significant other risk
- That consideration is also given to the credit risk of counterparties and their risk of default (elective or non-elective) should market conditions change
- The ultimate source of material/service supplied and the ability of any intermediary (e.g. broker or trader) to guarantee future deliveries especially at times of market stress
- The sustainability credentials (environmental, economic, and social) of any entity or material introduced into the supply chain

- The quality implications of the choice of source, service provider, storage duration and conditions and/or material state on any physical stock holdings
- The development and maintenance of supply routes and the readiness to use (on a temporary or long-term basis and in both a regulatory and commercial context) alternatives to conventional mined natural uranium based supplies through the likes of ‘underfed’ enrichment output/tails re-enrichment, reprocessed uranium, down-blended highly enriched uranium, and mixed oxide fuels

Policies and measures related to system flexibility are outlined in 3.4.3 (ii).

*ii Regional cooperation in this area*

## Gas security of supply

The United Kingdom is a member of both the United Kingdom and Norway Risk Groups for the purposes of implementing the EU Regulation on Gas Security of Supply (2017/1938). Common Risk Assessments, submitted to the European Commission in 2018, by both risk groups detail the regional cooperation measures undertaken by the United Kingdom and the other risk group member states for the purposes of gas security of supply.

In addition, there are a number of existing and planned agreements and protocols which govern gas security of supply arrangements between the United Kingdom and Ireland, including:

- Intergovernmental agreements, including solidarity arrangements that are currently in development
- Transportation arrangements between UK and Irish TSOs
- Load shedding protocols
- The undertaking of a joint risk assessment for the purposes of Ireland meeting the N-1 infrastructure standard – see the UK Risk Group Common Risk Assessment
- Regional communication fora

## Intergovernmental Agreements

### 1993 and 2004 Intergovernmental Agreements

In 1993, the Irish and UK government signed an Intergovernmental Agreement regarding the transmission of natural gas by pipeline between the UK and Ireland. Specifically, the purpose of the Intergovernmental Agreement was to facilitate the construction and operation of a pipeline between Moffat in Scotland and Loughshinny in Ireland for the transmission of natural gas. Additionally, in 2004, the Irish and UK government signed a second Intergovernmental Agreement to facilitate the construction and operation of a second interconnector.

The Intergovernmental Agreements contain provisions regarding pipeline consents, ownership, operation, safety, security arrangements and co-operation in the event of disruption of supply. With reference to providing gas supply to Northern Ireland and the Isle of Man, the Intergovernmental Agreements state that a portion of gas capacities shall be allocated to Northern Ireland and the Isle of Man.

## **Solidarity Arrangements**

Pursuant to Article 13 of Regulation 2017/1938, the United Kingdom and Ireland are currently in the process of developing arrangements for Solidarity measures. These measures are designed to facilitate the sharing of gas in the event of an emergency situation where the UK or Ireland request solidarity.

## **Transportation Arrangements**

### **Connected Systems Agreement (GB-Ireland Interconnectors)**

The Connected Systems Agreement (CSA) between NGG and BGE (UK) for GB-Ireland gas interconnectors came into effect on the 1st of October 1998. Under the CSA, it was agreed that BGE shall be entitled to have the BGE gas system connected to National Grid's gas system at the Connected System Points (CSPs). It was agreed and that the CSA shall not be amended, except by agreement between NGG and BGE. The provisions within the CSA address issues such as compatibility of connection facilities, operating procedures, provision of information, site maintenance and emergency co-operation.

### **Transportation Agreement between BGE (UK) and PTL**

The Transportation Agreement was signed on the 21st August 1996. The Transportation Agreement involves Premier Transmission Ltd (PTL) and BGE (UK), and relates to provision of capacity from Moffat to Twynholm. The provisions within the Transportation Agreement address issues such as pipeline capacity, obligations of delivery and transportation, operation and maintenance, third party carriage, information and access, pipeline and facilities costs, pressure, pressure facilities and emergency arrangements. The Agreement ends in 2020 and discussions are ongoing between PTL and GNI (UK) on a replacement agreement.

## **Load Shedding Protocols**

The NGG and GNI (UK) Joint Protocol for Load Shedding outlines the load shedding arrangements in place between NGG and GNI (UK) in the event of a Gas Deficit Emergency affecting either operator's gas transportation network. Specifically, these protocols address the scenarios of a:

- Network gas supply emergency in Great Britain
- Gas emergencies downstream of Moffat (e.g emergency on SWSOS, ICs, SNIP and SNP), which can affect gas supplies to Ireland, Northern Ireland and the Isle of Man

In the context of a gas supply emergency in GB that could affect the availability of gas to the Moffat network exit point, the overriding principle that is applied is one of proportionality. In a Network Gas Supply Emergency, any reduction of flows through the Moffat interconnector will be proportionate with actions being enacted on the GB network, unless specific geographical circumstances occur which require proportionally higher or lower load reduction in the north of GB.

In this way, domestic consumers in Ireland, Northern Ireland and the Isle of Man would be given the same priority as domestic consumers in GB unless there were geographical circumstances that required proportionally higher or lower load reduction in the north of the UK.

## Regional Communication Fora

Co-operation between the UK and Ireland on issues pertaining to gas security of supply are facilitated through the UK and Ireland Emergency Planning Group, and previously the All-Island Emergency Planning Group.

The UK and Ireland Emergency Planning Group comprises the three government departments (BEIS, DCCAE and DfE), the three regulators (Ofgem, CRU and UREGNI), and the gas and electricity TSOs. Meetings take place every six months. As part of its work, the group is working towards applying a regional approach to risk analysis, preventative measures and emergency response. This includes the establishment of protocols between the gas TSOs to link emergency plans of each jurisdiction. Emergency exercises are also carried out by the TSOs in GB, Northern Ireland and Ireland on an annual basis and plans are refined based on the learning from the exercises. Additionally, the forum is used to discuss the implementation of the Regulation and the plans and assessments carried out by each jurisdiction in compliance with the Regulation.

## Capacity Market

The Capacity Market (CM) is at the heart of the UK government's plans for a secure and reliable electricity system. It ensures sufficient investment in the overall level of reliable capacity (both supply and demand sides) needed to provide secure electricity supplies. The CM's design is consistent with the EU principle of technology neutrality, which requires State aid approved electricity resource adequacy schemes (like the CM) to enable participation by all technologies capable of the required technical performance. The CM is a technology neutral mechanism to achieve security of supply, however, to implement requirements of the EU Electricity Regulation, amendments were made to the Capacity Market Rules in July 2019 to introduce CO<sub>2</sub> emissions limits requirements applying to all auctions held in 2020 onwards. New build plants that exceed the limit have been excluded from competing in auctions from 2020 and existing plants that exceed the limit will be excluded from being awarded agreements or receiving payments from 1 July 2025 at the latest.

A Call for Evidence as part of the Five-year Review of the CM<sup>260</sup> found that the CM has been important in ensuring security of supply. Capacity agreements have been awarded to a diverse mix of energy technologies, including significant amounts of flexible and smart technologies, such as Demand Side Response, batteries and reciprocating engines. This has been positive in facilitating the transition to a smarter, more flexible electricity system. Three capacity auctions scheduled to take place in early 2020 will secure the majority of Great Britain's capacity needs out to 2023/24.

## Electricity security of supply

The UK is in the process of taking the action needed in order to comply with Regulation (EU) 2019/941 on risk preparedness in the electricity sector. This includes the identification of regional electricity crisis scenarios for our region which will form the basis of our risk-preparedness plans covering national, regional and, possibly, bilateral measures. We will work together with Ireland in the preparation of these plans and the underlying regional crisis scenarios. We will cooperate with Ireland in a spirit of solidarity in order to prevent and manage electricity crises and offer assistance where possible.

---

<sup>260</sup> Capacity Market: Five-year Review (2014 to 2019), [www.gov.uk/government/publications/capacity-market-5-year-review-2014-to-2019](http://www.gov.uk/government/publications/capacity-market-5-year-review-2014-to-2019)

## Oil stocks

Ireland is bound by the same IEA and EU rules. The obligations enable member countries to co-operate on and respond collectively to major disruptions to the global oil market.

*iii Where applicable, financing measures in this area at national level*

Not applicable.

## 3.4 Internal energy market

### 3.4.1 Electricity infrastructure

*i Policies and measures to achieve the targeted level of interconnectivity as set out in point (d) of Article 4*

These are outlined in section 2.4.

*ii Regional cooperation in this area<sup>261</sup>*

This is outlined in section 1.4.

*iii Where applicable, financing measures in this area at national level*

Several interconnectors between the UK and EU have received European Investment Bank financing. This includes €150 million for the BritNed electricity interconnector (2009) connecting it with the Netherlands<sup>262</sup> and €425 million for the UK-Belgium gas interconnector (1996),<sup>263</sup> and €300 million for the Eirgrid East-West electricity interconnector between Ireland and Wales (2009).<sup>264</sup>

A number of UK projects have received grant funding from the Connecting Europe Facility. As of 31 January 2020, this provided grant funding of over €70 million for electricity transmission projects in the UK and over €30 million for gas transmission projects in the UK bringing a cross border benefit.<sup>265</sup>

### 3.4.2 Energy transmission infrastructure

*i Policies and measures related to the elements set out in section 2.4.2, including, where applicable, specific measures to enable the delivery of Projects of Common Interest (PCIs) and other key infrastructure projects*

Energy network companies in England, Scotland and Wales are regulated by Ofgem, the independent energy regulator, via a price control process called RII. This process ensures that energy network companies maintain a safe and secure network and invest in new infrastructure where needed whilst ensuring value for money for consumers.

---

<sup>261</sup> Other than the PCI Regional Groups established under Regulation (EU) No 347/2013.

<sup>262</sup> [www.eib.org/en/projects/loan/loan/20070229](http://www.eib.org/en/projects/loan/loan/20070229)

<sup>263</sup> [www.eib.org/en/projects/loan/loan/19941152](http://www.eib.org/en/projects/loan/loan/19941152)

<sup>264</sup> [www.eib.org/en/projects/loan/loan/20080326](http://www.eib.org/en/projects/loan/loan/20080326)

<sup>265</sup> <https://ec.europa.eu/inea/en/connecting-europe-facility/cef-energy/cef-energy-projects-and-actions>

Ofgem introduced a 'Cap and Floor' regulatory regime for interconnection in 2014.<sup>266</sup> The 'Cap and Floor' regime has reduced risks and unlocked substantial investment in interconnection, reflected in the number of new interconnectors under construction from Great Britain and those that have received regulatory approval for projects.

Electricity interconnectors developed under this regime can earn revenue from the allocation of capacity to users who want to flow electricity between GB and its neighbours. The floor is the minimum amount of revenue that an interconnector can earn, which means that if an interconnector does not receive enough revenue from its operations, its revenue will be 'topped up' to the floor level. These funds are transferred from National Grid, which will in turn recover the sum from transmission charges applied to all users of the national electricity transmission system. The cap is the maximum amount of revenue an interconnector can earn; if an interconnector's revenue exceeds the cap, it will transfer the excess revenue to National Grid, which will in turn reduce transmission charges. For consumers, the cap on revenues provides benefits in return for their exposure in underwriting the floor.

As an alternative to the cap and floor, interconnector developers can seek an exemption from the regulatory regime. Exempt interconnectors would usually apply for exemptions from European legislation to facilitate this route. Under this exemption, an interconnector developer would face greater upside and downside risks on their investment.

*ii Regional cooperation in this area<sup>267</sup>*

This is outlined in section 1.4.

*iii Where applicable, financing measures in this area at national level*

Energy network companies are regulated by Ofgem in Great Britain, the independent energy regulator through a price control process called RIIO.<sup>268</sup> GB energy network investment is funded by bill payers through network charges and the companies are financed via a combination of debt and equity investment. All equity investment is made by private sector investors, mostly through private ownership but in some cases via the purchase of shares on the stock exchange (i.e. for publicly listed companies). Most debt finance is raised in the capital markets via the issuing of bonds, or otherwise via commercial banks loans. Some network companies in the GB have also received lending from the European Investment Bank (EIB). EIB loans typically have lower interest rates than commercial bank debt, all else being equal.

### 3.4.3 Market integration

*i Policies and measures related to the elements set out in section 2.4.3*

Policies and measures related to system flexibility are set out in section 3.4.3 ii.

*ii Measures to increase the flexibility of the energy system with regard to renewable energy production such as smart grids, aggregation, demand response, storage, distributed generation, mechanisms for dispatching, re-dispatching and curtailment, real-time price signals, including the roll-out of intraday market coupling and cross-border balancing markets*

---

<sup>266</sup> Electricity interconnectors: [www.ofgem.gov.uk/electricity/transmission-networks/electricity-interconnectors](http://www.ofgem.gov.uk/electricity/transmission-networks/electricity-interconnectors)

<sup>267</sup> Other than the PCI Regional Groups established under Regulation (EU) No 347/2013.

<sup>268</sup> Network regulation – the 'RIIO' Model: [www.ofgem.gov.uk/network-regulation-riio-model](http://www.ofgem.gov.uk/network-regulation-riio-model)

## Smart Systems and Flexibility

In July 2017, the UK government and Ofgem jointly published the Smart Systems and Flexibility Plan.<sup>269</sup> The Plan outlines 29 actions for UK government, Ofgem and industry to implement by 2022 in order to realise the transition to a more flexible system and remove barriers to smart technologies, such as storage and DSR, so that they can compete fairly alongside other new or established energy solutions. In October 2018, BEIS and Ofgem published a Progress Update<sup>270</sup> to the Plan, which identified 9 new actions beyond those set out in the original Plan. We have now implemented over half of the actions in the plan and progress update. Analysis undertaken on behalf of the UK government estimates that a smart and more flexible energy system can save £17-40 billion by 2050.<sup>271</sup>

Actions in the Smart Systems and Flexibility Plan and Progress Update are split across three core themes:

### 1) Removing barriers to smart technologies, such as electricity storage

The Smart Systems and Flexibility Plan and Progress Update set out key measures that the UK government, Ofgem and/or industry will take to remove policy and regulatory barriers to storage, with the aim of creating a best in class regulatory framework. For example, clarifying the regulatory status of storage within the electricity system including a modified generation licence for storage and reviewing its treatment within the planning system.

Important actions focused on storage also include reforming network charges and policy costs faced by storage to ensure they are proportionate and ensuring the network connections process for storage is appropriate and does not present any undue burdens.

### 2) Enabling the use of smart solutions in homes and businesses

The Smart Systems and Flexibility Plan and Progress Update include a number of actions for UK government, Ofgem and industry to enable and develop DSR, including:

- Rolling out smart meters to households and small businesses across Great Britain as part of a national infrastructure upgrade that will help make our energy system cheaper, cleaner and more efficient.
- Moving to half-hourly electricity settlement on a market-wide basis to enable smart tariffs and other innovative products and services. Ofgem plan to make a decision and publish a full business case in Q1 2021.
- Setting standards for smart appliances, in order to stimulate the market and increase consumer demand. The UK government has now consulted on smart appliances and committed to taking powers to set regulatory requirements for a certain cohort of these appliances. In tandem, we are working with industry to develop standards.

---

<sup>269</sup> Upgrading our Energy System: Smart systems and Flexibility Plan, July 2017, [www.gov.uk/government/publications/upgrading-our-energy-system-smart-systems-and-flexibility-plan](http://www.gov.uk/government/publications/upgrading-our-energy-system-smart-systems-and-flexibility-plan)

<sup>270</sup> Upgrading Our Energy System: Progress Update, October 2018, [www.gov.uk/government/publications/upgrading-our-energy-system-smart-systems-and-flexibility-plan](http://www.gov.uk/government/publications/upgrading-our-energy-system-smart-systems-and-flexibility-plan)

<sup>271</sup> See: [www.carbontrust.com/news/2016/12/capturing-the-benefit-of-a-smart-flexible-energy-system/](http://www.carbontrust.com/news/2016/12/capturing-the-benefit-of-a-smart-flexible-energy-system/)

### 3) Ensuring markets provide the right incentives for flexibility and smart solutions

The Smart Systems and Flexibility Plan sets out the need for markets which reflect the true value of flexibility to the system and allow flexibility providers to stack revenues across multiple markets. Actions include:

- National Grid ESO opening up access to existing balancing services markets to a wider range of flexible technologies. Ongoing reforms will rationalise these services into a smaller number of more competitive, technology neutral products whilst increasing transparency and accessibility.
- Simplification of metering requirements for those offering DSR and enabling DSR component reallocation<sup>272</sup> in the Capacity Market; and allowing the stacking of revenues between the Capacity Market and ancillary services.<sup>273</sup>
- Distribution Network Operators (DNOs) opening up network requirements to competition with flexibility services<sup>274,275</sup>, creating new markets for flexibility at the distribution level and improving co-ordination across transmission and distribution to deliver whole system approaches. Industry is leading on the delivery of these changes through the Energy Networks Association's Open Networks Project. In July 2019, UK government and Ofgem jointly published a letter setting out their views on the progress of the ENA's work, and their expectations for this work going forwards.<sup>276</sup>

Launching an Energy Data Taskforce to deliver recommendations to reduce costs and facilitate competition and innovation in the energy sector, through improving data availability and transparency. The Taskforce published their report in June 2019, which includes specific recommendations for the UK government, Ofgem and industry as part of a strategy for a modern and digitalised energy system. The UK government and Ofgem are now considering how we can realise the vision set out in this report.

*iii Where applicable, measures to ensure the non-discriminatory participation of renewable energy, demand response and storage, including via aggregation, in all energy markets*

See section 3.4.3 (ii).

*iv Policies and measures to protect consumers, especially vulnerable and, where applicable, energy poor consumers, and to improve the competitiveness and contestability of the retail energy market*

There are around 60 energy suppliers in the domestic retail energy market<sup>277</sup>. Evidence shows competition continues to benefit household consumers who are able and willing to shop

---

<sup>277</sup> Ofgem, Data Portal - Retail Energy Indicators [www.ofgem.gov.uk/data-portal/retail-market-indicators](http://www.ofgem.gov.uk/data-portal/retail-market-indicators)

around, meaning they can usually get a good deal. However, competition is not working well for consumers who are less active. 53% of non-prepayment consumers are on a default tariff, such as a Standard Variable Tariff, which are around £260 more expensive each year than the cheapest fixed-term deals for a typical consumer.<sup>278</sup>

To achieve an innovative and competitive market, the UK government and Ofgem have introduced measures including:

- rolling out smart meters to households and small businesses across Great Britain
- moving to faster and more reliable switching for customers
- Ofgem trials including writing letters to disengaged customers offering cheaper market deals

To protect disengaged consumers who are on poor value tariffs, the UK government has introduced the temporary Tariff Cap, which will be in place until 2020, when Ofgem must report on the conditions for effective competition in the market and recommend to the UK government whether it should be extended. The cap can be extended annually for a year at a time up to the end of 2023 at the very latest.

See section 2.4.4(i).

*v Description of measures to enable and develop demand response including those addressing tariffs to support dynamic pricing<sup>279</sup>*

See section 3.4.3(ii).

### 3.4.4 Energy poverty

*i Where applicable, policies and measures to achieve the objectives set out in section 2.4.4*

There are specific initiatives introduced by the UK government that seek to address fuel poverty, which are summarised below.

The Energy Company Obligation (ECO) is a requirement on larger energy suppliers to deliver energy efficiency measures to domestic premises in **England, Scotland and Wales**. The scheme has delivered over 2.6 million measures since it was introduced in 2013. In 2018, the UK government reformed the scheme so that support is entirely focused on low income and vulnerable households. The scheme provides support worth up to £640m per year and will run to 2022. The 2017 Clean Growth Strategy committed to funding for home energy efficiency to continue to 2028 at least at the current level of ECO and that the scheme would be reviewed beyond 2022.

The Minimum Energy Efficiency Standards for landlords (found in The Energy Efficiency (Private Rented Property) (England and Wales) Regulations 2015) focus on the least energy-efficient private rental properties in **England and Wales** – those rated EPC Band F or G. Around 40% of households in such properties live in fuel poverty. The Minimum Energy Efficiency Standards require private landlords to improve their properties to at least EPC Band E, and, if they cannot source sufficient external funding, are required to make a financial

---

<sup>278</sup> Ofgem, State of the energy market 2019, [www.ofgem.gov.uk/publications-and-updates/state-energy-market-2018](http://www.ofgem.gov.uk/publications-and-updates/state-energy-market-2018)

<sup>279</sup> In accordance with Article 15(8) of Directive 2012/27/EU.

contribution of up to £3,500 including VAT. This establishes the principle that landlords are expected to play an important role in funding improvements to the properties they own.

In addition to support to improve home energy efficiency, over 2 million low income and vulnerable households in **England, Scotland and Wales** receive a £140 rebate off their winter energy bill through the Warm Home Discount scheme and 11 million households are protected from poor value standard variable and default tariffs through the energy price cap. The Warm Home Discount scheme has been extended until at least 2021. The price cap will be in place until the end of 2020 and may be extended by a year at a time until the end of 2023 at the latest. The decision to lift the price cap will be informed by a review into whether the conditions for effective competition are in place.<sup>280</sup> In addition, the Winter Fuel Payment provides support worth up to £300 to help ensure pension aged households can afford to heat their homes over the winter and additional payments are made to low income and vulnerable households during periods of cold weather through the Cold Weather Payments.

## England

The Warm Homes and Energy Conservation Act 2000 as amended by the Energy Act 2013 requires the Secretary of State to publish and implement a strategy in relation to England that sets out a comprehensive package of measures for achieving the 2030 fuel poverty target. The current fuel poverty strategy for England was published in 2015<sup>281</sup> and in July 2019 the UK government published a consultation on proposals to update the fuel poverty strategy for England.<sup>282</sup> One proposal in the consultation is to introduce a sustainability principle to align Government strategy on fuel poverty, decarbonisation and air quality to ensure that the fuel poor are not left behind in the energy transition and that action to meet the fuel poverty targets is consistent with wider objectives.

## Northern Ireland

The Northern Ireland Executive's fuel poverty strategy is delivered mainly through the Affordable Warmth Scheme.<sup>283</sup> The Scheme identifies and assists those low-income households most at risk of fuel poverty. Since its inception in September 2014 the Affordable Warmth Scheme has invested more than £66 million improving the energy efficiency of more than 16,000 low income households.

## Scotland

By the end of 2021, the Scottish Government will have invested over £1 billion in energy efficiency programmes that help make homes warmer and cheaper to heat. National and local action ensures that delivery meets the needs of a wide range of communities, as well as supporting individual households.

The Home Energy Scotland service provides free and impartial expert advice to people on how to make homes cheaper and easier to heat, support on switching energy supplier and a referral service for benefit maximisation.

---

<sup>280</sup> Ofgem (2019) [www.ofgem.gov.uk/publications-and-updates/developing-framework-assessing-whether-conditions-are-place-effective-competition-domestic-supply-contracts](http://www.ofgem.gov.uk/publications-and-updates/developing-framework-assessing-whether-conditions-are-place-effective-competition-domestic-supply-contracts)

<sup>281</sup> [www.gov.uk/government/publications/cutting-the-cost-of-keeping-warm](http://www.gov.uk/government/publications/cutting-the-cost-of-keeping-warm)

<sup>282</sup> [www.gov.uk/government/consultations/fuel-poverty-strategy-for-england](http://www.gov.uk/government/consultations/fuel-poverty-strategy-for-england)

<sup>283</sup> Northern Ireland Affordable Warmth Scheme, [www.nihe.gov.uk/index/benefits/affordable\\_warmth\\_scheme.htm](http://www.nihe.gov.uk/index/benefits/affordable_warmth_scheme.htm); current AWS Fuel Poverty Strategy, [www.communities-ni.gov.uk/publications/fuel-poverty-strategy](http://www.communities-ni.gov.uk/publications/fuel-poverty-strategy)

The Scottish Government's national fuel poverty scheme Warmer Homes Scotland is delivered on a regional basis, including a separate islands region, to ensure those households who are living in or at risk of living in fuel poverty in the more remote parts of the country get the same level of service as those living in urban areas.

Warmer Homes Scotland has a strong focus on heating and insulation measures, to improve the energy efficiency, warmth and comfort of fuel poor households. Q-Bot robotic underfloor insulation and new renewable measures have been added to the suite of measures already available for eligible households, including ground source heat pumps, micro-hydro, micro wind and micro-CHP.

These measures provide opportunities for greener, more innovative solutions, that may be of particular benefits to those households in remote and rural areas that are not served by the gas grid. It also provides the Scottish Government with the building blocks for using innovative technologies and tackling fuel poverty in the future through providing opportunities to build up the skills and accreditations of contractors to undertake new types of work in the renewables sector.

In addition, new enabling measures such as asbestos removal and the replacement of existing unsafe oil storage tanks have been added to the Scheme. This will help those households who are most in need of help to gain access to the scheme where financial constraints would previously have prevented them from doing so, allowing more fuel poor homes to benefit from Warmer Homes Scotland.

Since 2013, the Scottish Government has invested over £373 million through its Area Based Schemes supporting over 85,000 households and helping hundreds of local communities to tackle fuel poverty. Every council in Scotland has been enabled to design and deliver energy efficiency programmes targeting fuel poor areas. The design and delivery of these projects draws upon local knowledge and housing strategies, as well as reflecting the additional costs of delivery in remote rural and island communities.

Home Energy Scotland loans of up to £38,500 per home are also available to owner occupiers and eligible registered private sector landlords in Scotland. This covers a range of energy efficiency improvements, including up to £17,500 for home renewables systems or connections to an approved district heating scheme powered by a renewable energy source. The HEEPS Equity loan pilot scheme was extended in June 2018 from Glasgow, Perth & Kinross and Argyll and Bute areas to cover additional areas Inverclyde, Renfrewshire, Stirling, Dundee and Western Isles.

## **Wales**

In Wales, investment through the Welsh Government's Warm Homes Programme, including European, UK and Welsh Government funding has reached more than £327m delivering the demand-led Nest Scheme and Arbed area based on Scheme since 2009, which has improved the energy efficiency of more than 55,000 homes in Wales. By the current funding period in March 2021, Welsh Government investment will have reached more than £344m in the Warm Homes Programme. Funding that will have benefitted more than 75,000 homes. More than 129,506 people have received energy efficiency advice through the Warm Homes Programme since 2011.

In Prosperity for All: A Low Carbon Wales, the Welsh Government recognised the need for greater understanding of the economic, environmental social and cultural impacts associated

with decarbonisation. It has committed to creating a Climate Just Advisory Group to advise Welsh Ministers on the transition from a fossil fuel economy.

## 3.5 Research, innovation and competitiveness

### *i Policies and measures related to the elements set out in section 2.5*

Our future research and innovation activities will be designed to achieve our legally binding domestic carbon budgets and our new commitment to achieve net zero greenhouse gas emissions from the UK by 2050. Our research and innovation priorities and related spending to deliver these targets are in the process of being considered and agreed, but in the meantime, our intention is to remain closely engaged with EU and international research and innovation activities to meet these world leading commitments. We have an overall target of spending an amount equal to 2.4% of GDP on UK R&I more generally, with energy R&I a part of this.

The UK government has set out a Clean Growth Grand Challenge to put the UK at the forefront of the industries of the future. This is set out in section 2.5(i). Some specific examples of activity included in what now amounts to more than £3 billion of UK spending are included below for illustrative purposes.<sup>284</sup>

### BEIS Energy Innovation Programme

BEIS has a £505 million Energy Innovation Programme which aims to accelerate the commercialisation of innovative clean energy technologies and processes into the 2020s and 2030s.<sup>285</sup> As set out in the CGS, the BEIS Energy Innovation Programme<sup>286</sup> will invest around:

- £70 million in smart systems
- £90 million in the built environment (energy efficiency and heating)
- £100 million in industrial decarbonisation and carbon capture, use and storage (CCUS)
- £180 million in nuclear innovation (fission)
- £15 million in renewables innovation
- £50 million in support for energy entrepreneurs and green financing

From the BEIS Energy Innovation Programme, the UK is progressing well in terms of contractually committing funding to projects and will be adding to this list over the duration of the programme. These include:

### Renewable Innovation

- The UK is working with other countries to develop shared solutions to reduce the cost of renewable energy technologies. This includes UK investments through the European Research Area Network (ERANet) of around £700,000 in bioenergy demonstration projects and up to £8 million in the 'DemoWind' programme to reduce the cost of offshore wind technologies.

---

<sup>284</sup> Energy Innovation, [www.gov.uk/guidance/energy-innovation](http://www.gov.uk/guidance/energy-innovation)

<sup>285</sup> Energy Innovation, [www.gov.uk/guidance/energy-innovation](http://www.gov.uk/guidance/energy-innovation)

<sup>286</sup> Clean Growth Strategy, 2017: [www.gov.uk/government/publications/clean-growth-strategy](http://www.gov.uk/government/publications/clean-growth-strategy)

- Up to £1.3 million in an Offshore Renewable Innovation Hub, which is led by the Offshore Renewable Energy Catapult and Knowledge Transfer Network to bring the offshore wind industry together to solve common innovation challenges.

### **Smart Systems Innovation**

- Up to £9 million to reduce the cost of energy storage technologies (including electricity storage, thermal storage, and power-to-gas technologies).
- Up to £600,000 on feasibility studies for a potential first of a kind large-scale future energy storage demonstrator. Up to £20 million to fund innovative large-scale, long-duration storage projects that can provide an alternative to conventional commercial storage technologies.
- Up to £7.6 million for innovative demonstrations of energy DSR technologies in UK businesses or public sector organisations to reduce their energy use in peak times and provide flexibility to the energy system.
- Up to £30 million (£18 million from the BEIS Energy Innovation Programme, £12 million from the Office for Low Emission Vehicles) for an electric vehicle-to-grid programme to invest in demonstrators and feasibility studies.
- Up to £600,000 to fund flexible market feasibility studies, as part of the Upgrading our Energy System: Smart Systems and Flexibility Plan.
- Up to £4 million to fund the development of Flexibility Exchanges. Flexibility Exchanges are online market platforms for flexibility providers to view and bid for flexibility requirements across multiple markets. This funding followed on from the earlier work on flexibility market feasibility studies.
- Up to £9.78 million from 2018-2021 to support innovative domestic applications of DSR technologies and business models.
- Up to £8.8 million to develop innovative approaches to energy management using smart meter data, tailored to the needs of smaller non-domestic sites in three priority sectors (retail, hospitality and schools).

### **Nuclear Innovation**

- Up to £20 million over 2016-2018 to support innovation in the civil nuclear sector.
- Up to £7 million to ensure UK regulators are able to build the capability and capacity required to support the development of advanced technologies.

### **Industrial Innovation**

- Up to £9.2 million over the next 4 years on an industrial energy efficiency accelerator to seek industry-specific solutions which are close to commercialisation, by leveraging private sector investment and strengthening UK supply chains to reduce energy costs for UK industry.
- Up to £20 million to design and construct carbon capture and utilisation (CCU) demonstration projects.
- Up to £20 million to stimulate early investment in fuel switching processes and technologies, so that a range of technologies are available by 2030 and beyond.

## **Energy Entrepreneurs and Green Financing**

- Up to £13 million for phase 5 and up to £11 million for phase 6 of the BEIS Energy Entrepreneurs Fund, which seeks the best ideas from the public and private sector, particularly aimed at small and medium-sized enterprises, and supports the demonstration of state-of-the-art energy technologies.
- Up to £20 million of new investment to support clean technology early stage funding.

## **Built Environment Innovation**

- Up to £9.8 million for the second phase of work led by the Energy Systems Catapult on the 'Smart Systems and Heat' programme. The programme will help develop local energy plans alongside Local Authorities and support the development of low-carbon heating projects across the UK.
- Up to £25 million to investigate the potential uses of hydrogen gas for heating and testing the possibility of domestic gas pipes and appliances.
- Up to £10 million to develop technologies that reduce the carbon emissions associated with providing heat and hot water to UK buildings.
- Up to £10 million to develop technologies and approaches to improving the energy efficiency of existing UK buildings.
- We are partnering internationally, to accelerate the development of innovative, clean energy technologies, driving forward our own transition to a low-carbon economy and positioning the UK as a world leader in these areas.

## **Carbon capture, usage and storage**

Carbon capture, usage and storage (CCUS) is likely to play a vital role in meeting our target to reach net zero greenhouse gas emissions by 2050 and supporting our Industrial Strategy. CCUS can add value to the economy and help tackle hard to decarbonise sectors of the economy, creating new high value jobs and export opportunities whilst reducing emissions.

Since 2011, the UK government has invested significantly to develop CCUS in the UK. The UK government is continuing this support by committing to spend up to £100 million from BEIS's Energy Innovation Programme to support industry and CCUS innovation and deployment in the UK with over £50 million of innovation funding announced in 2018, to drive down the cost of CCUS and support the development of the technology. This funding includes:

- A £20 million CCU Demonstration Programme to fund design and construction of CCU demonstration plants in the UK, including £4.2 million to support a CCU plant at Tata Chemicals in North West England.
- A £15 million CCUS Call for Innovation, supporting a new CCUS international testing centre near Rotherham and supporting engineering studies and planning for projects in Scotland, Yorkshire, Merseyside and Teesside.
- £6.5 million of UK funding to the second international call of the Accelerating Carbon Technologies research programme, a €30 million fund supporting CCUS research across 11 countries that can lead to safe and cost-effective development of CCUS technology.

The UK government is also committed to maintaining a leading position in global collaboration and capacity building on CCUS and to work internationally to drive down the cost and

accelerate deployment of CCUS. In May 2018, the UK took on leadership (with Saudi Arabia and Mexico) of the Carbon Capture Challenge under Mission Innovation.

The UK continues to support developing countries and emerging economies to develop their technical and institutional knowledge of CCUS through our £70m international CCUS programme, which uses Official Development Assistance (ODA)

Furthermore, to help industry decarbonise, we have launched an Industrial Energy Transformation Fund, worth up to £315m. This will provide funding for transformative decarbonisation investments, potentially including fuel switching and carbon capture.

## Hydrogen

Hydrogen is an energy carrier with potential to support the UK's efforts to transform and decarbonise the energy system in line with our 2050 net zero target. We are committed to exploring the option of hydrogen as a strategic decarbonised energy carrier, alongside electricity and other decarbonised gases.

The UK government is currently investing up to £121m in a range of innovation programmes to explore and develop the potential of low-carbon hydrogen across the value chain from production through to end use:

- Up to £121m in a range of innovation programmes to explore and develop the potential of hydrogen.
- £33m in a Hydrogen Supply programme to reduce the costs of bulk low-carbon hydrogen production.
- £20m in a Fuel Switching Competition to support the switch to lower carbon fuels in industry, including hydrogen.
- £20m in a Storage at scale competition to demonstrate large scale energy storage, including power-to-gas.
- £23m in a Hydrogen for Transport programme to support deployment of hydrogen vehicles and growth of refuelling infrastructure.
- £25m in the Hy4Heat programme to ensure the safe use of 100% hydrogen in buildings.

We are also exploring the development of sustainable policy and market frameworks for hydrogen. In July 2019, we published a hydrogen chapter of the CCUS business models consultation, which explored the main challenges a hydrogen business model needs to address.

## Scotland

Scotland's energy sector has benefited from EU funding for energy infrastructure projects and research and development, particularly in the pursuit of new, low-carbon technologies and enabling infrastructure, such as offshore wind, marine renewables and integrated hydrogen solutions. For example:

- Orkney is home to what was the UK's first smart grid, connecting renewable generation to Orkney's distribution network at a considerably lower cost than conventional network connection. The 'Surf 'n' Turf' project demonstrates a fully integrated energy model, with hydrogen produced using electricity from tidal and onshore wind turbines. This is stored in a fuel cell, and used to provide low-carbon heat, power and transport. A European-

funded project called 'BIG HIT' will build on the Surf 'n' Turf project in Orkney by producing hydrogen from renewable sources for transport and heating.<sup>287</sup>

- The Scottish Government launched the Low Carbon Infrastructure Transition Programme (LCITP) in March 2015, in partnership with Scottish Enterprise, Highlands and Islands Enterprise, Scottish Futures Trust and sector specialists. It is a Strategic Intervention supported by the European Structural and Investment Funds, and European match funding for the LCITP is guaranteed up until Autumn 2021.<sup>288</sup>

## Wales

Through its Smart Living Initiative<sup>289</sup>, the Welsh Government has been encouraging a portfolio of innovative pilots/demonstrators to help learning and shaping of future energy solutions. As a catalyst the initiative is facilitating the development of place-based and themed based concepts and feasible solutions from zero carbon areas, smart intelligent towns to hydrogen themed initiatives.

*ii Where applicable, cooperation with EU Member States in this area, including, where appropriate, information on how the SET Plan objectives and policies are being translated to a national context*

Whilst a Member State, the UK was a very active contributor to the ongoing work of the EU's Strategic Energy Technology (SET) Plan, providing the Chair for two of its governance bodies (SET Plan Bureau and Joint Actions Working Group). The UK participated in ten (out of fifteen) temporary working groups for the implementation of the integrated SET Plan, co-leading the one on nuclear safety. In addition, the UK has participated in 6 ERA-NETs launched under H2020 (CCS, Bioenergy, Wind, Smart grids, Ocean energy and Solar Energy). Regarding Horizon 2020, the UK has historically been involved in almost half of all successful H2020 Energy project proposals enabling UK organisations to benefit from the results.

For Horizon 2020, the UK was involved in almost half of all successful H2020 Energy project proposals, providing evidence of the significant strengths and engagement from the UK's energy research and innovation community towards delivering SET Plan objectives. SET Plan delivery continues to form a major driver of the priorities and spending under H2020's energy theme.

SET Plan objectives and policies in the energy technology areas relevant to the UK, already align well with our existing activities and we are actively looking for opportunities to increase bilateral and multilateral collaboration in these areas through the SET Plan's governance structures.

UK International Energy Innovation activity can be split into 4 main areas:

- UK government funding for R&D collaboration with developed countries
- UK government funding for R&D collaboration with, in or targeting developing countries (usually classified as Overseas Development Assistance or ODA)
- European funding for UK organisations

---

<sup>287</sup> Building Innovative Green Hydrogen Systems in Isolated Territories: [www.bighit.eu/](http://www.bighit.eu/)

<sup>288</sup> Renewable and low carbon energy, Scottish Government website: [www.gov.scot/policies/renewable-and-low-carbon-energy/low-carbon-infrastructure-transition-programme/](http://www.gov.scot/policies/renewable-and-low-carbon-energy/low-carbon-infrastructure-transition-programme/)

<sup>289</sup> Smart Living review: <https://gov.wales/low-carbon-living-smart-living-annual-review-2018-2019>

- UK membership of multilateral organisations and fora

The UK government funding in this area is delivered by different organisations, pursuing slightly different objectives. For example, UKRI typically focusses on excellent science and academic collaboration, whereas BEIS Energy Innovation focuses on industrial collaborations.

The UK's Energy Innovation Board has an International Working Group (sub-Group to the EIB) tasked with developing cross-government co-operation opportunities and knowledge sharing related to international research and innovation collaboration. As part of its work, it has been developing an International Strategic Framework. Pooling a wide range of inputs from government funding organisations and stakeholders, the Framework identifies international objectives, key technology development needs, which countries have strengths in these areas and existing co-operation initiatives. The objective is to arrive at a menu of opportunities for international collaboration that can then be prioritised and pursued.

### Examples of existing cross-Government activity

1. **Energy Catalyst:** Since 2013, BEIS, UKRI and DfID (since 2016) have provided funding enabling the Energy Catalyst programme to invest almost £100 million in grant funding across more than 750 organisations and 250 projects, via six rounds of open competition. Since DFID joined in round four, the programme has included international Overseas Development Assistance (ODA) alongside the original UK focus.
2. **International Climate Fund / Energy Innovation:** The BEIS portion of the International Climate Fund, jointly administered with DFID and DEFRA, includes a commitment to invest £40 million on Energy Innovation projects. Officials are currently designing this in close consultation with other departments.

### Steel

A vibrant steel sector is of vital importance to the UK economy. Steel is a fundamental material input to a variety of industries and the sector makes a significant contribution to local economic growth and prosperity. However, the UK steel sector is also a significant source of emissions and faces a significant decarbonisation challenge, with specific barriers, including varying technology readiness, long lead in and pay back periods and the need to align with long term equipment replacement cycles. Consequently, we believe the time is right to provide dedicated support to our steel industry, to help put it on a pathway to decarbonisation in line with our net zero commitments. As a signal of that support, on 29th August, the UK government announced a £250 million Clean Steel Fund:

- To help set the UK steel sector on a pathway to decarbonisation that is consistent with the UK's net zero target under the Climate Change Act
- To maximise longevity and resilience in the UK steel sector by building on longstanding expertise and skills and harnessing clean growth opportunities

Recognising that availability of low-carbon hydrogen at scale is a constraint to large industrial users considering fuel switching, the UK government also announced a new £100 million Low Carbon Hydrogen Production Fund alongside the Clean Steel Fund. The Low Carbon Hydrogen Production Fund aims to:

- Deploy low-carbon hydrogen production capacity to enable greater use of hydrogen as a decarbonisation option across the energy system

- Encourage future private sector investment in low-carbon hydrogen to support scale up and market development that aligns with the UK's clean growth objectives

## UK government funding for R&D collaboration with developed countries

Across the UK government, we expect to launch R&D collaborations with developed countries including the US, Canada and South Korea. UKRI (both Research Councils and Innovate UK) have run several competitions with these countries in the current spending review period. As part of future collaborations, BEIS and UKRI will discuss the possibility of co-funding calls.

The draft International Research and Innovation Strategy has recognised the issue of a relative lack of funding for collaboration with developed countries within the broader international research context and is proposing a new non-ODA fund to support such collaboration.

## UK government funding for R&D collaboration with, in or targeting developing countries (usually classified as ODA)

As part of the UK's Overseas Development Aid (ODA) funding, the UK government has a substantial activity of R&D collaboration in developing countries, part of a wider set of ODA activities which span the full spectrum from R&D to technical assistance, and supporting innovation in market design and regulatory frameworks.

UK ODA funding for international energy innovation is delivered through many programmes and organisations, namely: BEIS (Newton Fund, Global Challenge Research Fund, and International Climate Fund); UKRI (Newton Fund, Global Challenge Research Fund); and DfID.

## European funding for UK organisations

EU funding for energy innovation is largely delivered through two programmes: Horizon 2020 (the EU's main R&D programme) & Euratom, and the European Regional Development Fund (ERDF).

For further information, see section 3.4(ii).

The UK is a member of several multilateral organisations which aim to share information on energy innovation activity including:

- Mission Innovation
- Clean Energy Ministerial
- International Energy Agency (the UK is active in IEA Governance structures including providing a Vice-Chair to the CERT. The UK is also active in the Energy Technology Network's Technology Collaboration Programmes - UK organisations participate in c22 of these)
- International Renewable Energy Agency
- World Bank Group, particularly the Energy Sector Management Assistance Programme (ESMAP)

## Areas of potential interest identified for UK international energy activity

1. Efficient, resilient, smart networks (including: off-grid access, mini-grids and embedded mini-grids; storage and system balancing, and vehicle charging)
2. Electricity Supply – low-cost renewables (also nuclear, CCS)
3. Heating and Cooling in Buildings
4. Industrial Energy Efficiency
5. Energy for Mobility
6. Land use and land waste (Including land-use for bioenergy)
7. Hydrogen
8. Supporting potentially disruptive technologies, systems and materials
9. Skills and capacity to support the energy transition
10. Increased Global Access to Affordable, Reliable Energy
11. Common Financial and Non-Financial Barriers
12. Supporting new supply chains, business models and customer value propositions

## Mission Innovation

There is strong momentum behind Mission Innovation.<sup>290</sup> Since Mission Innovation (MI) launched in 2015, MI estimates that members have committed in excess of US\$31 billion to accelerate innovation in clean energy, three new members have joined Mission Innovation, it has brought together over 3,000 technical experts and innovators and more than 20 new international partnerships in clean energy between MI members have been announced.

The UK has a considerable leadership role in the initiative and as part of our involvement has pledged to double central government funding for energy innovation, to in excess of £400 million in 2020/21. The UK took over as Head of the Secretariat from the US on 1 October 2017. We are Vice-Chair of the Steering Committee and a member of all Innovation Challenges. The UK led the development of seven Innovation Challenges to deepen collaboration and information sharing between members. We are a member of all seven and co-lead the Affordable Heating and Cooling in Buildings Innovation Challenge with the UAE and EC.

The key Mission Innovation and UK priorities through to 2021 are:

- Deliver a substantial boost in public-sector investment in clean energy R&D
- Increase private sector engagement and investment in energy innovation
- Build new or strengthened international networks and partnerships in energy innovation
- Increase awareness of the transformational potential of energy innovation, the progress being made, and the remaining gaps and opportunities

---

<sup>290</sup> Mission Innovation, <http://mission-innovation.net/>

As part of Mission Innovation, the UK is working with both the Breakthrough Energy Coalition (BEC) and the World Economic forum (WEF). At the One Planet Summit in Paris (December 2017), Breakthrough Energy founder Bill Gates announced public-private collaborations with five Mission Innovation members: Canada, European Commission, France, Mexico, and the United Kingdom. By combining government expertise and the Coalition's convening power the partnership aims to focus on ensuring that the UK is one of the most attractive places in the world to invest in clean energy innovation and more rapidly bring breakthroughs from the lab to market.

We are building on the WEF's System Initiative on Shaping the Future of Energy to explore whether the outcomes of that project are relevant to the UK context.

*iii Where applicable, financing measures in this area at national level*

Our vision for a knowledge-led economy is underpinned by world-leading research, world-class facilities and international collaborations that push scientific frontiers and attract the brightest talents, from Nobel Prize winners to ambitious graduate students. 'Innovation clusters' will form and grow around our universities and research organisations, bringing together world-class research, business expertise and entrepreneurial drive. These clusters can create thousands of skilled jobs in R&D, innovation and wider sectors, driven by the growth in science, technology, engineering and maths (STEM) skills led by new teachers and more doctorates.

We will work with industry in the coming months to develop a roadmap for meeting this target. This will provide a framework to drive business investment in R&D and focus on key sectors, technologies and clusters, including by optimising government investment to drive private investment in R&D and considering further opportunities to improve the business environment, including access to finance, regulatory frameworks, and intellectual property. This will maximise the impact of public investment in science and innovation to support businesses to invest more and drive outputs to realise our commitment to invest 2.4% of GDP in R&D.

Increasing investment in R&D to 2.4% of GDP in a decade is ambitious and will require concerted effort by the UK government and business. As a first step we will invest an additional £2.3 billion over what was previously planned in 2021/22, raising total public investment in R&D to approximately £12.5 billion in that year alone. This investment will see public R&D spending increase as a share of GDP every year. It means that we will have raised public investment in R&D from around £9.5 billion in 2016/17 to around £12.5 billion in 2021/22.

This is an extra £7 billion over five years – the biggest ever increase in public funding of R&D. The UK government will invest strategically in technologies and ideas closer to market to drive UK competitiveness, while also continuing to fund the curiosity-driven research that is fundamental to the quality of our work and ensures our place as a world-leading knowledge economy.

## Section B: Analytical basis

# 4. Current situation and projections with existing policies and measures<sup>291</sup>

In this section we provide historical context for energy use and emissions and then show how we expect these to change in the future. We cover macroeconomic and price forecasts in the later section on projections.

## 4.1 Projected changes in the main outside factors that influence the UK's energy system and its GHG emissions

### 4.1.i Macroeconomic forecasts (GDP and population growth)

Table 16 presents the short to medium-term GDP growth projections that are provided in the OBR's Economic and Fiscal outlook report, published in March 2019. This report is usually published twice a year alongside the Budget and Spring Statement.

**Table 16: OBR's Short to Medium-term GDP Growth Projections - Per cent<sup>292</sup>**

Projections, released March 2019.

	2019	2020	2021	2022	2023
GDP Growth – Per cent	1.2	1.4	1.6	1.6	1.6

Table 17 provides the OBR's long-term GDP growth projections, which were released in their Fiscal Sustainability report in July 2018. This report is released every other year, presenting long term projections for public spending and tax revenue and setting out summary indicators of the long-term sustainability of public finances.

**Table 17: OBR's Long-term GDP Growth Projections - Per cent<sup>293</sup>**

Projections, released July 2018.

	2017-18 to 2027-28	2027-28 to 2037-38	2037-38 to 2047-48	2047-48 to 2057-58	2057-58 to 2067-68
GDP Growth – Per cent	1.6	2.2	2.2	2.2	2.2

<sup>291</sup> Analysis based on latest available data up to 31 January 2020, does not account from impacts resulting from COVID-19. Some statistics may have been updated in publications released after 31 January 2020.

<sup>292</sup> OBR's Economic Fiscal Outlook, March 2019, <https://obr.uk/efo/economic-fiscal-outlook-march-2019/>

<sup>293</sup> OBR's Fiscal Sustainability Report, July 2018, <https://obr.uk/fsr/fiscal-sustainability-report-july-2018/>

**Table 18: ONS's Projected Population of the UK, mid-2018 to mid-2043 - Millions<sup>294</sup>**

Projections, released October 2019.

	2018	2023	2028	2033	2038	2043
UK Population - Million	66.4	68.1	69.4	70.5	71.4	72.4

#### 4.1.ii Sectoral changes with impacts on the energy system and GHG emissions

Projections of energy demand in manufacturing industries and construction and in the commercial sector are calculated using projections of sectorial economic growth. Growth projections are calculated using historical relationships with GDP.

These are set out in [section 4.2.1](#).

#### 4.1.iii. Global energy trends, international fossil fuel prices, EU ETS carbon price

### Fossil fuel prices, carbon prices and exchange rates

BEIS updates fossil fuel price projections<sup>295</sup> and carbon price projections<sup>296</sup> annually. Table 19 sets out key fossil fuel and carbon price values and Table 20 gives exchange rates.

**Table 19: Central Fossil Fuel and Carbon Prices, 2018 prices**

Projections.

2018 prices	2018	2020	2025	2030	2035
Crude oil (Brent 1 month), \$/bbl	73.7	71.7	77.7	84.7	84.7
Gas (NBP), p/therm	57.0	48.0	56.0	63.0	63.0
Coal (CIF ARA), \$/tonne	89.7	85.7	85.7	86.7	86.7
EU ETS short-term traded carbon values for modelling purposes, £/tCO <sub>2</sub> *	12.8	13.8	17.7	42.7	42.7

\*Following the end of the Transition Period, the UK will no longer continue to be part of the EU ETS. The UK government is committed to carbon pricing policy and the future approach will be as least as ambitious as the EU ETS.

<sup>294</sup> ONS's Population Projections, October 2019,

[www.ons.gov.uk/peoplepopulationandcommunity/populationandmigration/populationprojections/bulletins/nationalpopulationprojections/2018based](http://www.ons.gov.uk/peoplepopulationandcommunity/populationandmigration/populationprojections/bulletins/nationalpopulationprojections/2018based)

<sup>295</sup> Fossil Fuel Price Assumptions, 2018, [www.gov.uk/government/publications/fossil-fuel-price-assumptions-2018](http://www.gov.uk/government/publications/fossil-fuel-price-assumptions-2018)

<sup>296</sup> Carbon valuation, April 2019, [www.gov.uk/government/collections/carbon-valuation--2](http://www.gov.uk/government/collections/carbon-valuation--2)

**Table 20: Exchange Rates, Against Sterling**

2018 prices	2018	2020	2025	2030	2035
Euros (€ per £)	1.1	1.1	1.1	1.1	1.1
US Dollars (\$ per £)	1.4	1.4	1.4	63.0	63.0

Making assumptions about fossil fuel prices far into the future is very challenging, as they depend on many unknowns (e.g. future economic growth rates across the world, development of new technologies, global climate change policies, technological developments and strategies of resource holders). BEIS produces a set of fossil fuel price assumptions based on available evidence around fundamentals and their potential development over time to yield a plausible range for future prices. We need these assumptions for long-term modelling of the UK energy system and economic appraisal. They are not forecasts of future energy prices.

We combine scenarios of high supply with low demand and low supply with high demand to construct the long term low and high price assumptions for each fuel. This yields long term price assumptions that span a wide range of possible outcomes. While the long-term demand projections and supply outlooks are from different sources, we consider that these combinations are plausible for each fuel.

## The Carbon Price

Carbon pricing provides a cost-effective and technology-neutral way of reducing carbon emissions and mobilising the private sector. In the UK, the EU Emissions Trading System (EU ETS) and the Carbon Price Support (CPS) in GB, have already helped to drive a switch from coal to gas generation in the power sector.

Until the end of 2020 the UK will continue to participate in the EU ETS. UK government and Devolved Administrations are firmly committed to carbon pricing as an effective tool for achieving carbon emissions reductions and a consultation on The Future of UK Carbon Pricing, was carried out from May to July in 2019, to seek views on policy proposals after the UK's exit from the EU. The UK future approach will be at least as ambitious as the current EU ETS, will provide a smooth transition for relevant sectors and will form part of the UK's pathway to its net zero target to end its contribution to global warming by 2050.

BEIS' short-term traded carbon values for modelling purposes, under current arrangements, are used to demonstrate the financial cost of purchasing allowances under the EU ETS. Its counterpart, the short-term traded carbon values for UK public policy appraisal are produced for the period up to 2020 under all three scenarios (central, high and low), and are linearly extended beyond 2020 to reach BEIS's long-term carbon values for the period from 2030 onward. BEIS's latest short-term traded values can be found in the Updated Short-Term Traded Carbon Values publication.<sup>297</sup>

### 4.1.iv Technology cost developments

Electricity generation costs are a fundamental part of energy market analysis, and a good understanding of these costs is important when analysing and designing policy.

<sup>297</sup> Carbon valuation, April 2019, [www.gov.uk/government/collections/carbon-valuation--2](http://www.gov.uk/government/collections/carbon-valuation--2)

BEIS regularly produces updated estimates of the costs and technical specifications for different generation technologies.

Costs in the report are presented as levelised costs, which is a measure of the average cost per MWh generated over the full lifetime of a plant including planning costs, construction costs, operating costs, and carbon costs. It reflects the cost of building, operating and decommissioning a generic plant for each technology. Potential revenue streams are not considered.

BEIS's most recent assessment of electricity generation costs can be found in the Electricity Generation Cost Report<sup>298</sup> which covers both renewable and non-renewable technologies; Table 21 (below) gives the most recent levelised cost estimates for key technologies in a range of commissioning years from this report.

**Table 21: Levelised Cost Estimates for NOAK Projects Commissioning in 2025**

Technology-specific Hurdle rates, £/MWh, 2018 prices	CCGT H Class	OCGT 600MW (500hrs)	Offshore Wind	Large Scale Solar PV	Onshore Wind
Pre-Development Costs	0	5	3	3	3
Construction Costs	7	63	31	30	27
Fixed O&M	2	18	19	10	10
Variable O&M	4	4	3	0	6

## 4.2 Decarbonisation

### 4.2.1 GHG emissions and removals

#### *i Trends in current GHG emissions and removals in the EU ETS, effort sharing and LULUCF sectors and different energy sectors*

In this section we first examine historic trends of GHG emissions in the UK as well as historical development in emissions by sector. Projections of future emission trends in the UK are then discussed, which are based on the 2018 GHG inventory.<sup>299</sup>

#### **Historical emissions trends**

This section references statistics from the UK's latest Greenhouse Gas Emissions Inventory (1990-2017).<sup>300</sup> The UK GHGI is an inventory tool that provides insight into the sources and magnitudes of greenhouse gas emissions in the UK. The UK GHGI is compiled in line with international guidance from the International Panel on Climate Change (IPCC) and contains the UK's official estimates of greenhouse gas emissions from 1990 to the latest available year of reporting, currently 2017. Note that the latest projected emissions referenced in the next section (Energy and Emissions Projections 2018284) are based on a slightly older inventory (1990-2016).<sup>301</sup> Any other datasets are referenced throughout.

UK net GHG emissions decreased by 42% between 1990 and 2017 as shown by Figure 4.<sup>302</sup> This has been driven by several factors such as restructuring in the energy supply industry (concerted move away from coal towards the use of gas and renewables), energy efficiency, pollution control measures in the industrial processes sector and other policies that reduced emissions of non-CO<sub>2</sub> GHGs, most notably the increase in landfill methane capture and oxidation. Between 1990 and 2017, UK net CO<sub>2</sub> emissions decreased by 37%. In 2017, net CO<sub>2</sub> emissions made up approximately 81% of all net GHG emissions. More details can be found in the UK's annual GHG emissions inventory.

---

<sup>299</sup> Updated UK energy and emissions projections: 2018 [www.gov.uk/government/publications/updated-energy-and-emissions-projections-2018](http://www.gov.uk/government/publications/updated-energy-and-emissions-projections-2018)

<sup>300</sup> Final Greenhouse Gas Emissions Statistics: 1990-2017, BEIS, [www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-2017](http://www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-2017)

<sup>301</sup> Final UK greenhouse gas emissions national statistics 1990-2016 [www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-2016](http://www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-2016)

<sup>302</sup> Covers total UK emissions excluding the impact of Gibraltar.

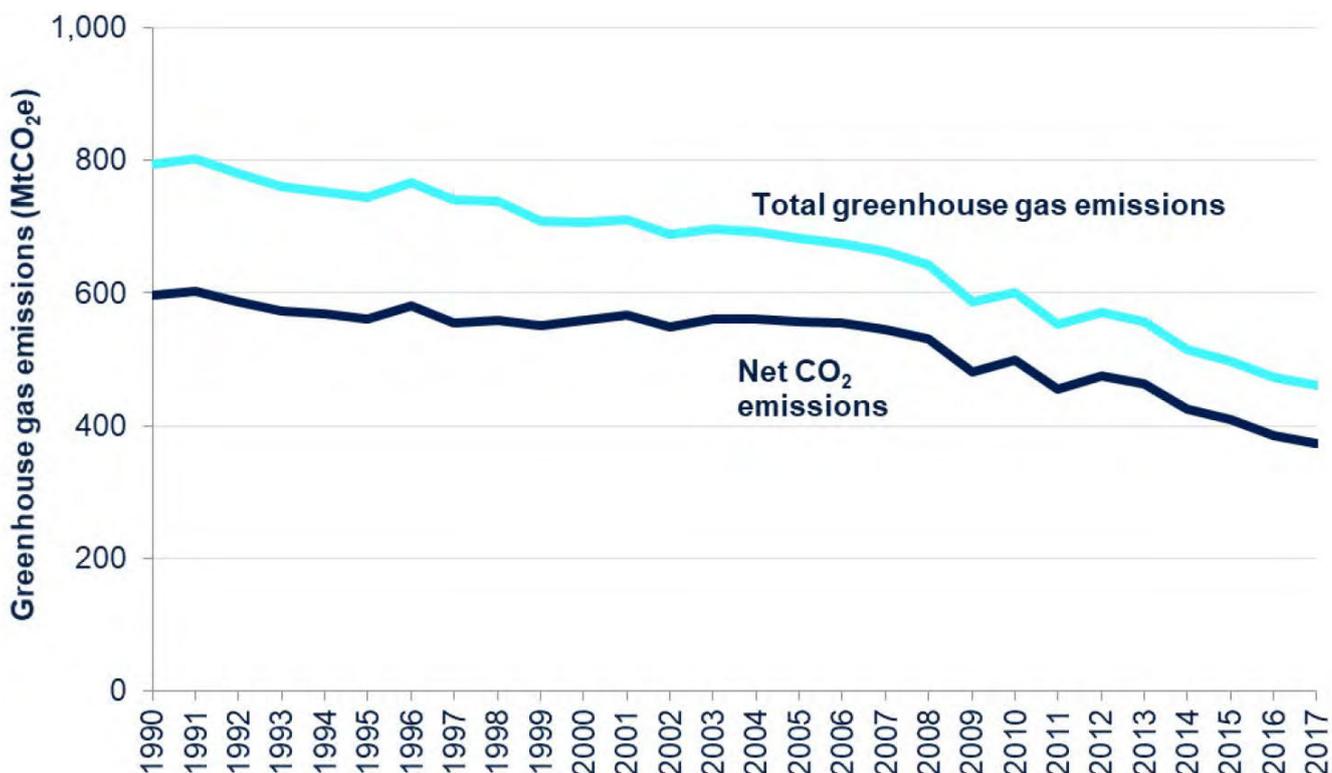

**Figure 4: UK net GHG emissions, UK only, 1990–2017, MtCO<sub>2</sub>e**

Table 22 below summarises the UK’s historical GHG emissions by National Communications source sector.

**Table 22: Net UK GHG emissions by national communications source sector, UK only, 1990-2017, MtCO<sub>2</sub>e**

Source sector	1990	1995	2000	2005	2010	2015	2016	2017
Transport	128.1	129.7	133.3	136.0	124.5	123.5	125.9	125.9
Energy supply	277.9	238.0	221.6	231.5	207.4	145.3	121.8	112.6
Business	114.0	111.8	115.4	108.9	94.1	85.1	81.4	80.1
Residential	80.1	81.6	88.7	85.7	87.5	67.4	69.8	66.9
Agriculture	54.0	52.9	50.3	47.9	44.6	45.1	45.2	45.6
Waste management	66.6	69.1	62.9	49.0	29.7	20.6	20.0	20.3
Industrial processes	59.9	50.8	27.1	20.6	12.6	12.7	10.6	10.8
Public	13.5	13.3	12.1	11.2	9.5	8.0	8.2	7.8
LULUCF	0.3	-1.7	-3.9	-7.1	-9.1	-9.7	-9.8	-9.9
Total	794.4	745.6	707.5	683.7	600.9	498.0	473.1	460.2

The emissions in Figure 4 and Table 22 above have been reported on the same basis as the UK Climate Change Act, covering the UK only and excluding Gibraltar.

## Historical developments by sector

### Transport

The transport sector consists of emissions from road transport, railways, domestic aviation, shipping, fishing and aircraft support vehicles. Transport accounted for just over a quarter (27%) of UK GHG emissions in 2017. Since 1990 emissions in this sector have reduced by around 2%. These emissions are predominantly from road transport, and the volume of road traffic increased over this period.<sup>303</sup> However, this was largely offset by lower petrol consumption outweighing an increase in diesel consumption<sup>304</sup> and, more recently, improvements in fuel efficiency of both petrol and diesel cars.<sup>305</sup> The number of registered vehicles increasing over the same period from 24.7 million to 37.7 million.<sup>306</sup>

### Energy supply

The energy supply sector consists of emissions from fuel combustion for electricity generation and other energy production sources. In 2018, CO<sub>2</sub> emissions from power stations accounted for nearly 18% of the UK's total CO<sub>2</sub> emissions.<sup>307</sup> However, overall emissions per GWh of electricity generated have been decreasing as the mix of fuels used has changed. There have been large reductions in coal use and big increases in renewables, with biomass conversions also playing an important transitional role. This is also coupled with general improvements in the efficiency of our economy.

For context, in 2018, nearly 53% of our electricity came from low-carbon sources, with the rest mainly coming from gas.<sup>308</sup> Coal use fell to record low levels in 2017; on 21 April 2017, Great Britain did not use any coal for a 24-hour period for the first time since 1882.<sup>309</sup> Further, in May 2019, the UK went a record 18 days without using coal.<sup>310</sup> The UK government has also committed to ending all unabated coal generation from 2025, while at the same time ensuring a secure supply of electricity.

### Business

The business sector includes emissions from combustion in industrial/commercial sectors, industrial off-road machinery, and refrigeration and air conditioning. In 2017, emissions from this sector were estimated to be 30% below 1990 levels and represented an estimated 17% of

<sup>308</sup> Digest of UK Energy Statistics (DUKES) 2019, Chapter 5 [www.gov.uk/government/statistics/electricity-chapter-5-digest-of-united-kingdom-energy-statistics-dukes](http://www.gov.uk/government/statistics/electricity-chapter-5-digest-of-united-kingdom-energy-statistics-dukes)

<sup>309</sup> Financial Times (2017) Britain passes historic milestone with first days of coal-free power [www.ft.com/content/fc2c8d12-191d-11e6-bb7d-ee563a5a1cc1](http://www.ft.com/content/fc2c8d12-191d-11e6-bb7d-ee563a5a1cc1) BEIS (2017) Energy Trends June 2017 [www.gov.uk/government/collections/energy-trends](http://www.gov.uk/government/collections/energy-trends)

<sup>310</sup> <https://environmentjournal.online/articles/uks-longest-ever-coal-free-run-comes-to-an-end/>

total emissions. Several factors contributed to this decrease; primarily due to a reduction in emissions from industrial combustion, including iron and steel, which has led to a 41% reduction in CO<sub>2</sub> emissions since 1990. Each tonne of steel produced in the UK requires 40% less energy to produce than 40 years ago.<sup>311</sup>

## **Residential**

Emissions in the residential sector arise from fuel combustion for heating, cooking, garden machinery, and fluorinated gases released from aerosols and metered dose inhalers (such as those used for asthma sufferers). In 2017 residential sector emissions made up 15% of the UK total, estimated as 67 MtCO<sub>2</sub>e, compared to 1990 emissions of 80 MtCO<sub>2</sub>e, a reduction of 16%. A number of factors have had a major influence on emissions from homes, including a growth in demand for underlying energy services (such as warmer homes and hot water) and background improvement in energy efficiency.

## **Agriculture**

The agriculture sector consists of emissions from livestock and agricultural soils, stationary combustion sources and off-road machinery (e.g. tractors). There are also small amounts of emissions of CO<sub>2</sub> from the breakdown of pesticides. It is estimated to have been responsible for 10% of UK greenhouse gas emissions in 2017. In 1990, GHG emissions from agriculture were estimated to be 54 MtCO<sub>2</sub>e or 7% of total UK GHG emissions. Emissions from this sector have fallen by an estimated 16% between 1990 and 2017. This was driven by a fall in animal numbers over the period, together with a decrease in synthetic fertiliser use.

## **Waste management**

The waste management sector includes emissions from waste disposed to landfill sites, waste incineration, and the treatment of waste water. It is estimated to have been responsible for 4% of UK greenhouse gas emissions in 2017. The vast majority of these emissions are from landfill sites. Emissions from disposal of waste have decreased by 69% since 1990. This was due to a combination of factors, including improvements in the standards of landfilling, changes to the types of waste going to landfill (such as reducing the amount of biodegradable waste), and an increase in the amount of landfill gas being used for energy.

## **Industrial processes**

The industrial processes sector consists of emissions from industry except for those associated with fuel combustion. It is estimated to have been responsible for 2% of UK greenhouse gas emissions in 2017. The largest source of emissions was cement production, with other processes such as sinter, lime, and iron and steel production also contributing significantly. Industrial process emissions have decreased by an estimated 82% since 1990. This was most notably due to a large reduction in emissions from adipic acid production and halocarbon production between 1998 and 1999 (combined emissions from which are now almost zero).

## **Public sector**

The public sector consists of emissions from combustion of fuel in public sector buildings. It is estimated to have been responsible for less than 2% of UK greenhouse gas emissions in 2017. The main source of emissions from this sector is the use of natural gas for heating public

---

<sup>311</sup> WSP and Parsons Brinckerhoff & DNV GL (2015) Report prepared for DECC & BIS: Industrial Decarbonisation & Energy Efficiency Roadmaps to 2050 [www.theccc.org.uk/2015/03/27/industrial-decarbonisation-and-energy-efficiency-roadmaps-to-2050/](http://www.theccc.org.uk/2015/03/27/industrial-decarbonisation-and-energy-efficiency-roadmaps-to-2050/)

buildings. Public sector emissions fell from an estimated 13 MtCO<sub>2</sub>e in 1990 to 8 MtCO<sub>2</sub>e in 2017, a reduction of 42%.<sup>312</sup>

### Land use, land use change and forestry (LULUCF)

The LULUCF sector consists of emissions and removals from forest land, cropland, grassland, settlements and harvested wood products. In the UK the LULUCF sector is estimated to have gone from a small net emitter of greenhouse gases in 1990 (0.3 MtCO<sub>2</sub>e) to a net sink in every year from 1991-2017, with the estimated size of the sink in 2017 being 9.9 MtCO<sub>2</sub>e. This has been driven by a reduction in emissions from land being converted to cropland and an increase in the sink provided by forest land. There has also been some reduction in emissions since 1990 due to less intensive agricultural practices.

### EU Effort Sharing Decision

Under the ESD, the United Kingdom has a target of reducing its total emissions to 16% below the 2005 level by 2020 for non-ETS sectors.

In November 2018 the European Commission confirmed for each Member State their performance against ESD for 2016.<sup>313</sup> UK greenhouse gas emissions for 2016 under the ESD were confirmed to be 333.9 MtCO<sub>2</sub>e, 11.3 MtCO<sub>2</sub>e below the UK's annual limit for 2016 of 345.2 MtCO<sub>2</sub>e, meaning that the UK met its fourth annual target in the period. Provisional estimates indicate that greenhouse gas emissions for 2017 under the Effort Sharing Decision will also be below the annual emissions limit, by around 29 MtCO<sub>2</sub>e.

**Table 23: Progress towards the EU Effort Sharing Decision, UK and Gibraltar, 2013-2017, MtCO<sub>2</sub>e**

	2013	2014	2015	2016	2017
Total greenhouse gas emissions excl. LULUCF and NF3 (A)	566.5	524.0	503.5	482.8	470.5
Total verified emissions from stationary installations under the EU ETS (B)	225.3	197.9	175.9	147.4	137.0
CO <sub>2</sub> emissions from civil aviation (C)	1.7	1.6	1.6	1.5	1.6
Total ESD emissions (D = A - B - C)	339.5	324.4	326.0	333.9	331.9
Annual emissions allocation (E)	358.7	354.2	349.7	345.2	360.4
<b>Difference (E - D)</b>	<b>19.3</b>	<b>29.8</b>	<b>23.7</b>	<b>11.3</b>	<b>28.5</b>

### EU Emissions Trading System

Until the end of 2020 the UK will continue to participate in the EU ETS. UK government and Devolved Administrations are firmly committed to carbon pricing as an effective tool for achieving carbon emissions reductions and a consultation on The Future of UK Carbon Pricing

<sup>313</sup> Greenhouse Gas Emissions under the Effort Sharing Decision 2018 dataset, European Environment Agency: [www.eea.europa.eu/data-and-maps/data/esd-1](http://www.eea.europa.eu/data-and-maps/data/esd-1)

was carried out from May to July in 2019, to seek stakeholder views on policy proposals after the UK's exit from the EU.

Phase II of the EU ETS coincided with the first Kyoto Commitment Period (2008-12). During this period each Member State held a specific quantity of allowances based on their EU-approved National Allocation Plan (NAP). This then resulted in net 'sales' or 'purchases' of emissions allowances reported from UK installations depending on whether total emissions were below or above the UK's Phase II allocation.<sup>314</sup>

The third phase of the EU ETS (2013-20) builds upon the previous two phases and has been significantly revised to make a greater contribution to tackling climate change. Amongst other changes to the operating rules, the system shifted away from NAPs in favour of an EU-wide cap on the number of available allowances across Member States. In the absence of a UK-specific allocation plan, a notional cap has been estimated for the purpose of calculating carbon budget performance. Further details of this methodology are laid out in the UK's Annual Statement of Emissions.<sup>315</sup>

---

<sup>314</sup> A negative net value indicates that the reported emissions from UK installations in the EU ETS were below the cap, i.e. there was a net selling or withholding of units by UK installations. This means that emissions are either emitted elsewhere or emitted at a later stage, so they may not be used to offset UK emissions. The opposite occurs when reported emissions from EU ETS installations exceed the cap.

<sup>315</sup> UK Annual Statement of emissions for 2017: [www.gov.uk/government/publications/annual-statement-of-emissions-for-2017](http://www.gov.uk/government/publications/annual-statement-of-emissions-for-2017).

**Table 24: EU ETS net trading position as reported for carbon budgets performance, UK, 2008-2017, MtCO<sub>2</sub>e<sup>316,317</sup>**

	Phase 1					Phase 2				
	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017

Net UK domestic aviation emissions against aviation cap	-	-	-	-	-	(0.1)	(0.3)	(0.2)	(0.3)	(0.3)
Net UK purchases/(sales)	20.2	(12.6)	(6.7)	(24.0)	(13.6)	44.1	58.8	28.9	1.0	(27.9)

## Emission projections

The 2018 Energy and Emissions Projections<sup>318</sup> underpin the discussion of future trends below. In them, our estimates of future energy demand and greenhouse gas emissions extend to 2035. They incorporate information from the 2018 Inventory (latest actuals 2016). This means that the figures underlying the projections we discuss are slightly different to those in the section on historical trends, which uses data from the 2019 Inventory. However, the broad patterns we present are unlikely to change much when we incorporate the new data.<sup>319</sup> The UK updates its national emissions projections for CO<sub>2</sub> and the other GHGs annually to take account of new data. These include revisions to policy savings estimates, fossil fuel prices, carbon price projections, growth projections, and cost estimates for the power sector. We also regularly review and improve the underlying energy and emissions projection models. Projections presented here are from the 'with existing measures' scenario in contrast to the national emissions projections report which refers to 'with additional measures' (also called the reference scenario).

<sup>316</sup> At the end of Phase II of the EU ETS, the UK was required to cancel all allowances which have not been either issued or auctioned by that point. Consequently, allowances totalling 4.5 MtCO<sub>2</sub>e were cancelled in 2012. This had the effect of reducing the overall cap for the whole of Phase II. For presentational purposes, this amount has been distributed evenly over the five years 2008-2012, effectively reducing the cap by 0.9 MtCO<sub>2</sub>e each year, [www.gov.uk/government/statistics/final-statement-for-the-first-carbon-budget-period](http://www.gov.uk/government/statistics/final-statement-for-the-first-carbon-budget-period). Domestic aviation emissions are included in carbon budgets accounting from 2013. From 2013, the EU ETS entered its third phase, which will end in 2020. Changes to the operating rules in this period mean that Member States no longer receive a national cap as the ETS operates at installation level. Therefore a 'notional' cap is estimated for the purpose of carbon budgets accounting.

<sup>317</sup> At the end of Phase II of the EU ETS, the UK was required to cancel all allowances which have not been either issued or auctioned by that point. Consequently, allowances totalling 4.5 MtCO<sub>2</sub>e were cancelled in 2012. This had the effect of reducing the overall cap for the whole of Phase II. For presentational purposes, this amount has been distributed evenly over the five years 2008-2012, effectively reducing the cap by 0.9 MtCO<sub>2</sub>e each year. Domestic aviation emissions are included in carbon budgets accounting from 2013.

From 2013, the EU ETS entered its third phase, which will end in 2020. Projections of sectoral developments with existing national and Union policies and measures at least until 2040 (including for the year 2030).

<sup>318</sup> Updated EEP 2018, [www.gov.uk/government/publications/updated-energy-and-emissions-projections-2018](http://www.gov.uk/government/publications/updated-energy-and-emissions-projections-2018)

<sup>319</sup> This statistical release explains how the Inventory has changed:

[https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment\\_data/file/776085/2017\\_Final\\_emissions\\_statistics\\_-\\_report.pdf](https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/776085/2017_Final_emissions_statistics_-_report.pdf)

We use a set of key assumptions about future UK economic growth, demographic changes and fuel price trajectories to underpin the projections. These mainly come from the forecasts made by the UK's Office for Budget Responsibility and the Office for National Statistics (BEIS produces the fuel prices). We publish all the main assumptions we use with the projections.<sup>320</sup>

The UK produces energy and emissions projections to 2035. The development required to produce projections to 2040 is ongoing and we will publish projections to 2040 under our national reporting framework from 2020 onwards.

## **The Carbon Price**

Putting a price on emissions provides a cost-effective and technology-neutral way of reducing carbon emissions and mobilising the private sector. In the UK, pricing policies like Carbon Price Support (CPS), and the EU Emissions Trading System (EU ETS) have already helped to drive a switch from coal to gas generation in the power sector.

## **The Carbon Price Support rate**

In Great Britain, the Total Carbon Price (TCP) for energy generation is made up of the EU Emissions Trading System price and the Carbon Price Support (CPS) rate. The CPS was implemented to support the EU ETS and underpins the price of carbon at a level that drives low-carbon investment and taxes fossil fuels used to generate electricity. The CPS rate does not apply to energy generators in Northern Ireland.

HM Treasury confirms CPS rates in advance of delivery at Budget, and all revenue from the CPS is retained by the Treasury.

## **Past rates**

The CPS rate was introduced in April 2013. At Budget 2014, the UK government announced that the CPS rate would be capped at £18/tCO<sub>2</sub> from 2016-17 to 2019-20 to limit the competitive disadvantage faced by business and reduce energy bills for consumers. At Budget 2016, the cap was maintained at £18/tCO<sub>2</sub> from 2016-17 to 2019-20. At Budget 2018, the UK government announced that CPS rates will be frozen at £18/CO<sub>2</sub> in 2020-21 following the rise in the EU ETS price. From 2021-22, the UK government will seek to reduce CPS rates if the TCP remains.

The UK considers that long-term certainty on carbon pricing is crucial for businesses, and, as set out in the CGS, is committed to a robust carbon price. The UK remains firmly committed to carbon pricing as an emissions reduction tool, whilst ensuring energy and trade intensive businesses are appropriately protected from any detrimental impacts on competitiveness.

BEIS' short-term traded carbon values for modelling purposes are used to demonstrate the financial cost of purchasing allowances under the EU ETS. The short-term traded carbon values for UK public policy appraisal are produced for the period up to 2020 under all three scenarios (central, high and low), and are linearly extended beyond 2020 to reach BEIS's long-term carbon values for the period beyond 2030. These long-term carbon values reflect the costs required to limit global temperature increases to 2 degrees centigrade above pre-

---

industrial levels. BEIS's latest short-term traded values can be found in the Updated Short-Term Traded Carbon Values publication.<sup>321</sup>

*4.2.1. ii Projections of sectoral developments with existing national policies and measures at least until 2040 (including for the year 2030)*

### **Emissions projections by sector**

In this section, we present values from the 'With Existing Measures' projection scenario. These include those policies which have been implemented or adopted: they exclude planned measures. These data are taken from the 2018 Energy and Emissions Projections (EEP).<sup>322</sup> The primary purpose of the EEP is to provide an indication of the UK's performance against carbon budgets. The last carbon budget set, carbon budget 5, ends in 2032, and the UK has not yet produced a projection out to 2040. The development required to produce projections to 2040 is ongoing and we will publish projections to 2040 under our national reporting framework from 2020 onwards.

We project that UK GHG emissions including LULUCF will be around 399 MtCO<sub>2</sub>e, (about 50% below the 1990 level) by 2020 and roughly 365 MtCO<sub>2</sub>e by 2030 (54% below the 1990 level).<sup>323</sup> The percentages are very similar if we exclude LULUCF. Table 25 shows our projections of emissions by sector.

**Table 25: Projected greenhouse gas emissions by sector, MtCO<sub>2</sub>e (with existing measures, UK coverage)**

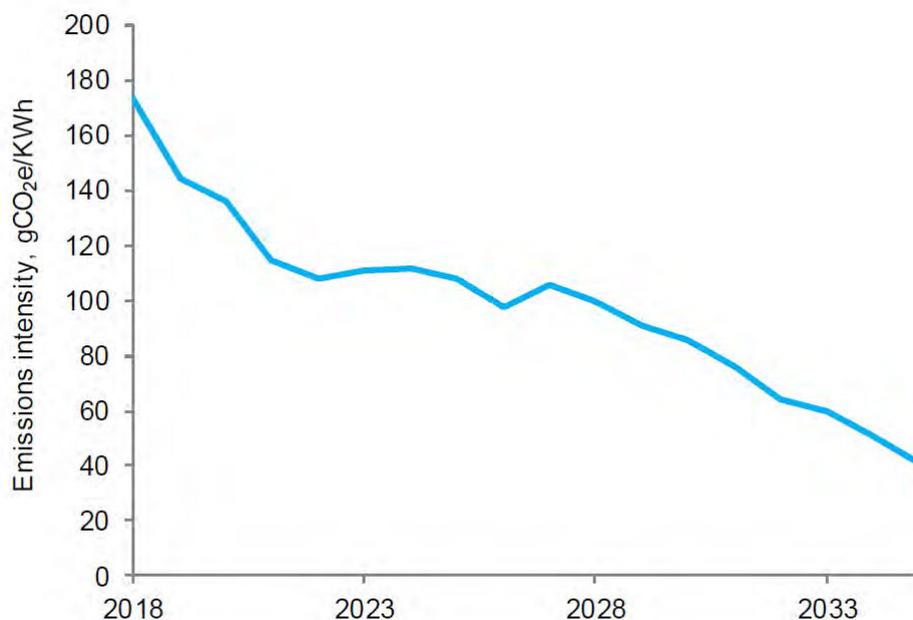

Sector	Projections, MtCO <sub>2</sub> e				
	2018	2020	2025	2030	2035
Transport	120	116	109	105	102
Energy supply	82	70	59	56	45
Business	89	83	73	69	69
Residential	71	68	70	73	77
Agriculture	46	44	42	41	41
Waste management	18	16	15	14	13
Industrial processes	11	11	10	9	9
Public	7	7	7	7	8
LULUCF	-16	-16	-14	-11	-8
<b>Total</b>	<b>428</b>	<b>399</b>	<b>370</b>	<b>365</b>	<b>356</b>
<i>Change from 1990 (%)</i>	<i>-46</i>	<i>-50</i>	<i>-53</i>	<i>-54</i>	<i>-55</i>

## Transport

We project transport emissions will be around 10% lower than 1990 levels by 2020 and 18% lower by 2030. We also project that the underlying growth in road transport use will resume following the interruption of the recession in 2008. However, we expect that measures to improve vehicle efficiency or to directly reduce emissions (such as mandating greater use of biofuels and providing incentives to encourage the adoption of electric vehicles), will reduce annual emissions between now and 2030.

Energy Supply By 2020, we project energy supply emissions will be 75% lower than 1990 levels and 80% lower by 2030. Following recent sharp falls in coal-fired generation, we project a further gradual decline in fossil fuel-based generation out to 2035: it is displaced by more renewables and (eventually) nuclear generation in the 2030s. As a consequence, we project emissions from electricity production will fall steadily over the full period to 2035. Figure 5 shows this.

**Figure 5: Emissions intensity of electricity supply (UK coverage, with additional measures), gCO<sub>2</sub>e/KWh**

### Business

We project that emissions in this area will be 28% lower than 1990 levels by 2020, and 40% lower by 2030. We can attribute improvements over time to the impact of policies that encourage energy efficiency, such as building regulations and minimum energy efficiency standards for new products, together with economic measures such as the Carbon Reduction Commitment and the Renewable Heat Incentive.

### Residential

The principal long-term driver of emissions from UK households is household numbers themselves. We project these will increase over the whole period due both to population growth in the UK and to a continuing trend for households to be smaller. Up to 2020, the impact of increases in population and housing are offset by the impact of existing energy and emission reduction policies through (for example) improved insulation of homes. The overall impact of these factors is projected to increase domestic emissions by 7 MtCO<sub>2</sub>e (9%) by 2035 compared with 2018.

### Agriculture

Our projections suggest that emissions from this sector will decline by around 7% between 2020 and 2030. The CGS set out further proposals for the agricultural sector: we want low emission, highly productive land while ensuring we pass the environment on to the next generation in a better state than we received it.

### Waste management

Waste emissions from landfill have fallen since 1990 because more waste is being preferentially disposed of in alternative ways (incineration, biological waste treatment (BWT) and recycling). This is largely due to introduction of the Landfill Tax in 1996 and small improvements in landfill efficiency. Emissions are expected to continue to fall due to government measures, including actions outlined in the Resources and Waste Strategy for England, incentivising material to be managed higher up the waste hierarchy. These include

introduction of consistency in recycling collections, extended producer responsibility for packaging and a deposit return scheme for drinks containers for which we will consult on our final proposals in 2021. Targets to recycle 65% of municipal waste (by weight) by 2035 and reduce municipal waste sent to landfill to 10% or less by 2035 are also set to reduce the tonnage of material sent to landfill and the resulting GHG emissions.

### **Industrial processes**

By 2020, we project that emissions from industrial processes will fall to 82% below 1990 levels and 84% below by 2030.

### **Public**

We project emissions from public services will remain broadly constant until the mid-2020s before rising slightly in the late 2020s and 2030s.

### **Land Use, Land Use Change and Forestry**

The UK tracks progress by annually projecting removals and emissions in the land use, land use change and forestry (LULUCF) inventory sector, based on the most recent emission inventory. Projections in Table 25 above show that the sector is expected to remain a net sink but of smaller magnitude over the coming decade.

The UK has domestic carbon targets which are to deliver a reduction of 57% in 2028 to 2032 compared to 1990 on a reported basis. To assist with meeting these targets there are a number of recent policy initiatives that will further reduce emissions and strengthen removals in the sector.

- The UK Clean Growth Strategy puts land in a central role in delivering climate mitigation. We are committed to; accelerating tree planting, having a stronger and more effective domestic carbon offsetting market, unlocking private sector investment through forestry investment zones, restoring peatlands and encouraging the use of wood in construction. We will seek to overcome the decline in soil health and support innovation in the forestry sector.
- The 25 Year Environment Plan provides a strategy to protect and enhance the natural environment. The Plan provides targets for a range of environmental outcomes which include cutting greenhouse gas emissions including from land use, land use change, the agriculture sectors.
- Forest development will be supported through rural development programmes, the woodland creation planning grant helps enable projects to develop and the Forestry Investment Zones.
- The Woodland Carbon Fund announced in 2016, supports the planting of large productive woodland in England.
- The Woodland Carbon Guarantee, announced during the Autumn 2018 Budget Statement, will support the price of woodland carbon credits. The scheme is intended to provide up to £50m of support over its lifetime and helps to meet our commitment in the 25 Year Environment Plan and Clean Growth Strategy to strengthen the market for domestic offsets.
- In the 2018 Autumn Budget Statement, £10m of funding for up to 130,000 urban trees was announced leading to the Urban Tree Challenge competition.

- The UK government have provided grants to encourage the restoration of English peatlands for example in 2018 they provided £10m for 4 landscape scale projects seeking to restore 6,850 hectares.
- In Northern Ireland, Scotland and Wales responsibility sits with the relevant Devolved Administration who have funded a number of landscape carbon mitigation initiatives. For example; the Scottish Government has committed £11m to restore 20,000 hectares of peatland by 2020 and 250,000 by 2030. The Welsh Government is seeking to restore 66,000 ha of seminatural bog to good condition.

## 4.2.2 Renewable energy

*i Current share of renewable energy in gross final energy consumption and in different sectors (heating and cooling, electricity and transport) as well as per technology in each of these sectors*

All tables used in this section are 2018 outturn data, taken from Digest of UK Energy Statistics 2019, Tables 6.6 and 6.7.<sup>324</sup> Tables 26 to 29 use data from Table 6.7 which is measured using net calorific values; it also normalises wind and hydro generation and includes only heat pumps with a seasonal performance factor above 2.5. In contrast, Tables 30 to 33 use data from Table 6.6 which uses gross calorific values and includes all heat pumps.

Table 26 shows that renewable energy makes up 11% of capped gross final energy consumption. Of all final consumption of renewable energy, electricity generation makes up over 60%, heating and cooling almost 30% and transport biofuels less than 10%.

**Table 26: Overall renewables**

Sector	Thousand tonnes of oil equivalent (measured using net calorific values)
Electricity generation	9,395
Heating and cooling	4,073
Transport biofuels (restricted to those meeting sustainability criteria from 2011)	1,270
Total Final Consumption of Renewable Energy	14,738
Capped Gross Final Energy Consumption (CGFEC)	134,230
Share of renewable energy in gross final energy consumption (headline 2009 Renewable Energy Directive percentage) <sup>325</sup>	11.0%

<sup>324</sup> Digest of UK Energy Statistics 2019, [www.gov.uk/government/statistics/digest-of-uk-energy-statistics-dukes-2019](http://www.gov.uk/government/statistics/digest-of-uk-energy-statistics-dukes-2019)

<sup>325</sup> Includes adjustments for losses, and generation own use of electricity, combined with the capping mechanism for air transport as specified in the Directive.

Table 27 shows the renewable make up of the electricity generation component; over 30% of all electricity came from renewable sources. This component has the highest renewable share, versus heating and cooling and transport. Half of all renewable electricity came from wind generation.

**Table 27: Electricity generation component**

Component	Thousand tonnes of oil equivalent (measured using net calorific values)
Total renewable generation from all compliant sources <sup>326</sup>	9,395
Total Gross Electricity Consumption <sup>327</sup>	30,237
Percentage of electricity from renewable sources	31.1%

Table 28 shows the renewable make-up of the heating component; around 7% of all heating and cooling came from renewable sources.

**Table 28: Heat component**

Component	Thousand tonnes of oil equivalent (measured using net calorific values)
Renewable energy for heating and cooling	4,073
Total Gross energy consumption for heating and cooling	56,042
Percentage of heating and cooling energy from renewable sources	7.3%

Table 29 shows the renewable make-up of the transport component. DUKES (2019)<sup>328</sup> states that around 6% of all energy used for transport came from renewable sources. This is largely made up of renewable electricity and compliant biofuels. However, this is an estimate; see DUKES (2018)<sup>329</sup> data for the most recent published actuals.

<sup>326</sup> The electricity figure under overall directive target excludes the renewable electricity component of transport to prevent double counting – this is the cause of the 4 ktoe discrepancy between renewable energy used for electricity generation and total renewable generation from all compliant sources.

<sup>327</sup> Excludes generation from pumped storage.

<sup>328</sup> See page 110 for transport component, DUKES 2019, [www.gov.uk/government/statistics/digest-of-uk-energy-statistics-dukes-2019](http://www.gov.uk/government/statistics/digest-of-uk-energy-statistics-dukes-2019)

<sup>329</sup> DUKES 2018, dataset for main report, [www.gov.uk/government/statistics/digest-of-uk-energy-statistics-dukes-2018-main-report](http://www.gov.uk/government/statistics/digest-of-uk-energy-statistics-dukes-2018-main-report)

**Table 29: Transport component (excluding air transport)**

Component <sup>330</sup>	Thousand tonnes of oil equivalent (measured using net calorific values)
Total transport component numerator (including weighted components)	1,270
Total transport component denominator (including weighted components)	41,620
Percentage of transport energy from renewable sources	6.2%

Table 30 shows the renewable sources used to generate electricity. Bioenergy makes up the largest proportion of this (58%), with plant biomass being the largest contributor within this. Onshore wind and offshore wind make up the next largest proportion of this; 17% and 15% respectively.

**Table 30: Renewable sources used to generate electricity**

Source	Energy values, thousand tonnes of oil equivalent (measured using gross calorific values)	Share of total
Onshore Wind	2,958	17%
Offshore Wind	2,295	15%
Marine energy <sup>1</sup>	1	0%
Solar photovoltaics	1,106	7%
Small scale hydro	111	1%
Large scale hydro <sup>2</sup>	361	2%
Bioenergy:	8,956	58%
of which Landfill gas	1,284	8%
of which Sewage gas	325	2%
of which Biodegradable energy from waste	1,405	9%
of which Co-firing with fossil fuels	0	0%
of which Animal biomass <sup>3</sup>	219	1%
of which Anaerobic digestion	879	6%

<sup>330</sup> Some sustainable biofuels are double weighted in the numerator of this calculation, as specified by the Directive.

Source	Energy values, thousand tonnes of oil equivalent (measured using gross calorific values)	Share of total
of which Plant biomass <sup>4</sup>	4,843	31%
Total	15,428	100%
Non-biodegradable wastes <sup>5</sup>	1,411	-

<sup>1</sup> Wave and tidal stream, including EMEC test facility

<sup>2</sup> Excluding pumped storage stations.

<sup>3</sup> Includes heat from farm waste digestion, and meat and bone combustion.

<sup>4</sup> Includes heat from straw, energy crops, paper and packaging.

<sup>5</sup> Non-biodegradable part of municipal solid waste plus waste tyres, hospital waste, and general industrial waste.

Note: For wind, solar PV and hydro, the figures represent the energy content of the electricity supplied but for bioenergy the figures represent the energy content of the fuel used.

Table 31 shows the renewable sources used to generate heat. Similar to electricity, bioenergy makes up by far the largest proportion (81%), of which wood is the largest contributor (41% of total).

**Table 31: Renewable sources used to generate heat**

Source	Energy values, thousand tonnes of oil equivalent (measured using gross calorific values)	Share of total
Active solar heating	53	1%
Bioenergy:	4,412	81%
of which Landfill gas	14	0%
of which Sewage gas	83	2%
of which wood	2,239	41%
of which waste wood	321	6%
of which Animal biomass <sup>331</sup>	26	0%
of which Anaerobic digestion	394	7%
of which Plant biomass <sup>332</sup>	1,245	23%
of which Biodegradable energy from waste	91	2%
Deep geothermal	1	0%

<sup>331</sup> Includes heat from farm waste digestion, and meat and bone combustion.

<sup>332</sup> Includes heat from straw, energy crops, paper and packaging.

Source	Energy values, thousand tonnes of oil equivalent (measured using gross calorific values)	Share of total
Heat Pumps	979	18%
Total	5,445	100%
Non-biodegradable wastes <sup>333</sup>	165	-

Table 32 shows the renewable sources used as transport fuels. Biodiesel makes up the largest proportion, at 69%, while bioethanol makes up 31%.

**Table 32: Renewable sources used as transport fuels**

Fuel	Energy values, thousand tonnes of oil equivalent (measured using gross calorific values)	Share of total
Bioethanol	429	31%
Biodiesel	935	69%
Total	1,364	100%

Table 33 shows the renewable sources used for total renewable energy. Bioenergy is the largest proportion, at over 60%, followed by onshore wind (12%) and offshore wind (10%).

**Table 33: Total use of renewable sources and wastes**

Source	Energy values, thousand tonnes of oil equivalent (measured using gross calorific values)	Share of total
Solar heating and photovoltaics	1,158	5%
Onshore wind	2,598	12%
Offshore wind	2,295	10%
Marine energy (wave and tidal stream)	1	0%
Hydro	472	2%
Bioenergy	13,369	60%

<sup>333</sup> Non-biodegradable part of municipal solid waste plus waste tyres, hospital waste, and general industrial waste.

Source	Energy values, thousand tonnes of oil equivalent (measured using gross calorific values)	Share of total
Deep geothermal	1	0%
Heat Pumps	979	4%
Transport biofuels	1,364	6%
Total	22,236	100%
Non-biodegradable wastes <sup>334</sup>	1,364	-

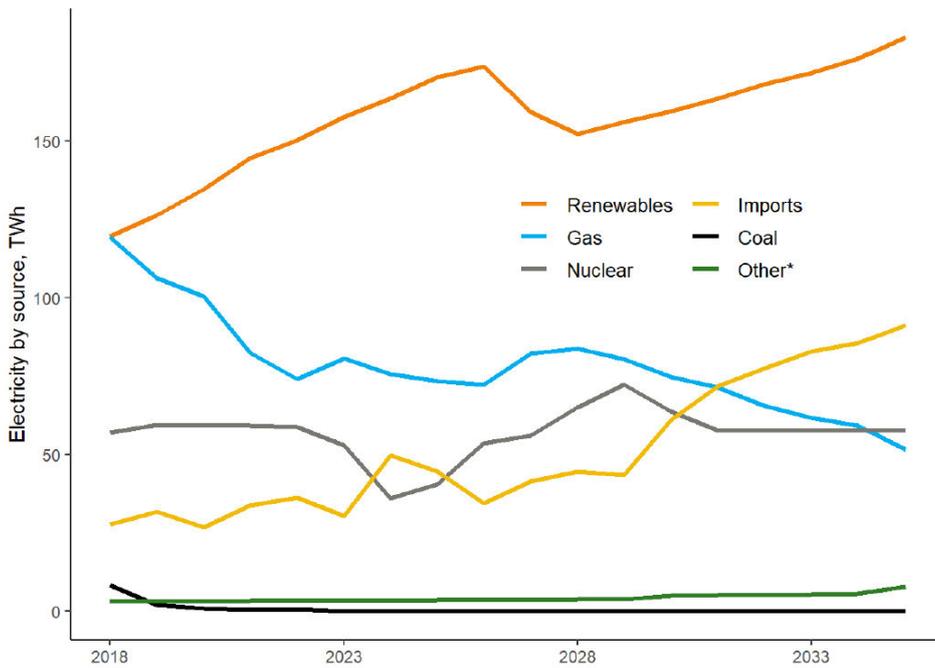

*ii Indicative projections of development with existing policies for the year 2030 (with an outlook to the year 2040)*

Under existing policies, EEP 2018 projects 159 TWh of renewable electricity generation by 2030. This is likely to be just over 50% of total electricity capacity. If we include planned policies, there could be 185 TWh of renewable electricity generation by then. This would be about 60% of all electricity generation. Note that up to 2020, this scenario reflects current power sector policies. After that year, it includes some assumptions that go beyond existing UK government policy and is therefore illustrative: the results do not indicate a preferred outcome.

We expect that renewables deployment will be sensitive to fossil fuel prices: if these are high, there could be as much as 209 TWh of renewable generation (65%) by 2030. Figure 6, below, shows the projections of generation by technology for all power producers to 2035.

<sup>334</sup> Non-biodegradable part of municipal solid waste plus waste tyres, hospital waste, and general industrial waste.

**Figure 6: UK electricity by source technology, TWh (with existing measures)**

\* Other includes generation from coal/gas Carbon Capture and Storage (CCS), oil, and from other thermal plants as well as electricity storage

Under the RTFO, renewable transport energy is expected to be 16% of total generation when including multipliers in 2030. This is expected to rise to 17% by 2032 which is where current projections finish. Forecasts show that there will be 33 TWh of renewable transport generation (excluding multipliers) in 2030, rising to 33.5 TWh by 2032.

Due to uncertainty on heat policy, please see section 2.1.2(ii) for indicative trajectories out to 2030.

## 4.3 Energy efficiency

*i Current primary and final energy consumption in the economy and per sector (including industry, residential, service and transport)*

**Table 34: Primary and Final Energy Consumption<sup>335</sup>**

Energy consumption	2007	2015	2016	2017	2018	Unit
primary energy consumption	212.1	183.0	179.6	177.7	177.3	Mtoe (ncv)
total final energy consumption	145.2	131.0	132.8	132.6	134.0	Mtoe (ncv)
of which;						
industry	28.9	23.0	21.2	21.4	21.4	Mtoe (ncv)
transport (passenger)	42.2	38.1	38.4	39.2	39.2	Mtoe (ncv)
transport (freight)	14.4	13.9	14.5	14.7	14.6	Mtoe (ncv)
household	41.7	37.2	38.0	36.8	38.1	Mtoe (ncv)
services (excl agriculture)	17.2	17.8	19.2	19.0	19.2	Mtoe (ncv)
agriculture	0.9	1.0	1.5	1.5	1.5	Mtoe (ncv)

*ii Current potential for the application of high-efficiency cogeneration and efficient district heating and cooling<sup>336</sup>*

### Cogeneration & district heating

In 2016, the Department of Energy & Climate Change published the national comprehensive assessment of the potential for combined heat and power (CHP) and district heating and cooling in the UK<sup>337</sup>, which laid out the technical and socially cost-effective potential for CHP (referred to as high-efficiency cogeneration in Member States) and efficient district heating and cooling in the UK, up to 2030. Table 35 sets out the conclusions of cost and benefit analysis to determine the social cost-effectiveness under three potential scenarios:

1. A scenario where there is no government policy around de-risking investments in infrastructure, and with IAG 2014 central scenario carbon prices ('full financing costs').
2. A scenario where the cost of securing the necessary finance is set at zero; in other words, a totally de-risked capital-raising scenario and with IAG central scenario carbon prices ('zero financing costs').

<sup>335</sup> Digest of UK Energy Statistics 2019, [www.gov.uk/government/statistics/digest-of-uk-energy-statistics-dukes-2019](http://www.gov.uk/government/statistics/digest-of-uk-energy-statistics-dukes-2019)

<sup>336</sup> In accordance with Article 14(1) of Directive 2012/27/EU.

<sup>337</sup> Ricardo Energy & Environment (2015) Report for DECC: National Comprehensive Assessment of the Potential for Combined Heat and Power and District Heating and Cooling in the UK, [www.gov.uk/government/publications/the-national-comprehensive-assessment-of-the-potential-for-combined-heat-and-power-and-district-heating-and-cooling-in-the-uk](http://www.gov.uk/government/publications/the-national-comprehensive-assessment-of-the-potential-for-combined-heat-and-power-and-district-heating-and-cooling-in-the-uk)

3. A scenario with a very high carbon price of £500/tCO<sub>2</sub> for all years and the same assumption as 1 for cost of capital ('extreme carbon price').

**Table 35: Summary of UK cost-effective potential of high-efficiency solutions by scenario, TWh of heat output pa**

Solution	i) Full financing costs TWh pa	ii) Zero financing costs TWh pa	iii) Extreme carbon price TWh pa

<sup>338</sup> DUKES 2019, [www.gov.uk/government/statistics/combined-heat-and-power-chapter-7-digest-of-united-kingdom-energy-statistics-dukes](http://www.gov.uk/government/statistics/combined-heat-and-power-chapter-7-digest-of-united-kingdom-energy-statistics-dukes)

In the UK, Good Quality CHP denotes schemes that have been certified as being highly efficient through the UK's CHP Quality Assurance (CHPQA) programme. The criteria used are in line with the requirements for high efficiency CHP set down in the Energy Efficiency Directive (2012/27/EU). Table 36 shows the change in installed CHP capacity since 2001, when the CHPQA programme began. Installed capacity is now at 5,985 MWe, with 68 new schemes between 2017 and 2018.

In March 2018 BEIS published the first Experimental statistics on heat networks<sup>339</sup>, based on data collected under the Heat Network (Metering and Billing) Regulations. According to these, there are 2,087 heat networks in the UK, which supply 10,074 GWh of heating and hot water and 202 GWh of cooling.

*iii Projections considering existing energy efficiency policies, measures and programmes as described in section 1.2.(ii) for primary and final energy consumption for each sector at least until 2040 (including for the year 2030)<sup>340</sup>*

The UK's 2032 pathway, as set out by the CGS<sup>341</sup>, would result in changes in fuel consumption across the whole economy, with estimated impacts set out in Table 37 below. In total, the 2032 pathway would reduce final consumption by around 14% in 2032 relative to projected energy consumption under existing policies outlined in the 2016 EEP. This is as a result of further improvements in fuel efficiency. The reduction in fossil fuel consumption will help improve energy security but the pathway is also characterised by a shift from end-user fossil fuel consumption towards biomass and electricity.

**Table 37: Change in Annual Final Energy Consumption in 2032, Relative to the Existing Policies Scenario<sup>342</sup>**

	Potential saving (-) or additional consumption (+) in 2032 (TWh/year)	Percentage impact relative to existing policies
Electricity	+14	+4%
Gas	-124	-23%
Coal	-6	-38%
Oil	-126	-25%
Bioenergy	+28	+29%
<b>Total</b>	<b>-215</b>	<b>-14%</b>

*iv Cost-optimal levels of minimum energy performance requirements resulting from national calculations, in accordance with Article 5 of Directive 2010/31/EU*

The UK has submitted a report to the European Commission that contains this information.<sup>346</sup>

## 4.4 Energy security

*i Current energy mix, domestic energy resources, import dependency, including relevant risks*

In 2018, the share of primary energy consumption from fossil fuels decreased further to a record low of 79.4% whilst that from low-carbon sources increased from 18.3% to a record 19% share.

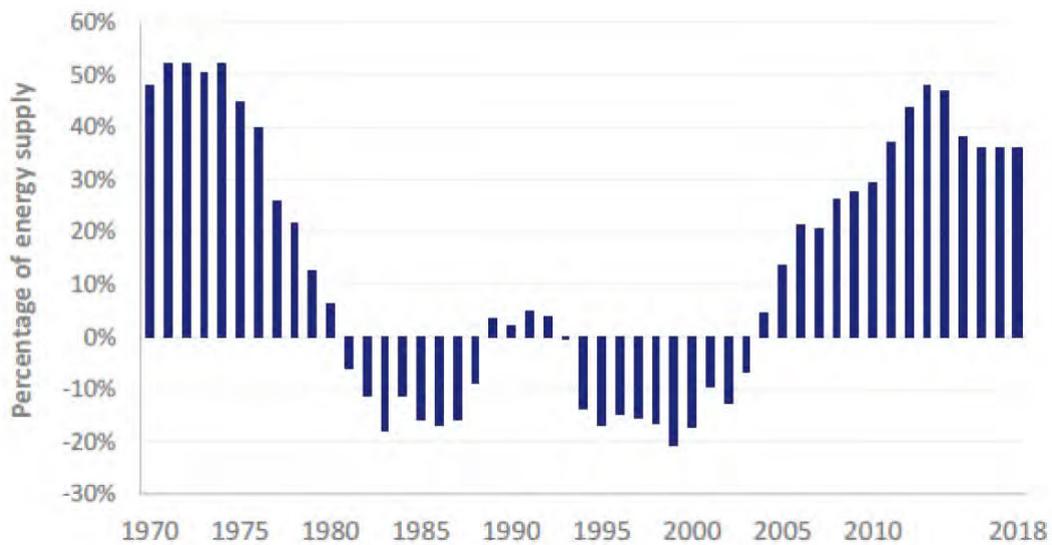

The UK's net import dependency has fallen 2.2% since 2015 but still accounts for 36% of energy supplies. Figure 10 below shows that the UK's net import dependency has fluctuated since 1970.<sup>347</sup>

<sup>345</sup> Committee on Climate Change's 2019 Progress Report: Government Response, [www.gov.uk/government/publications/committee-on-climate-changes-2019-progress-reports-government-responses](http://www.gov.uk/government/publications/committee-on-climate-changes-2019-progress-reports-government-responses)

<sup>346</sup> The Energy Performance of Buildings Directive, MHCLG, available at: [www.gov.uk/government/publications/energy-performance-of-buildings-directive-second-cost-optimal-assessment](http://www.gov.uk/government/publications/energy-performance-of-buildings-directive-second-cost-optimal-assessment)

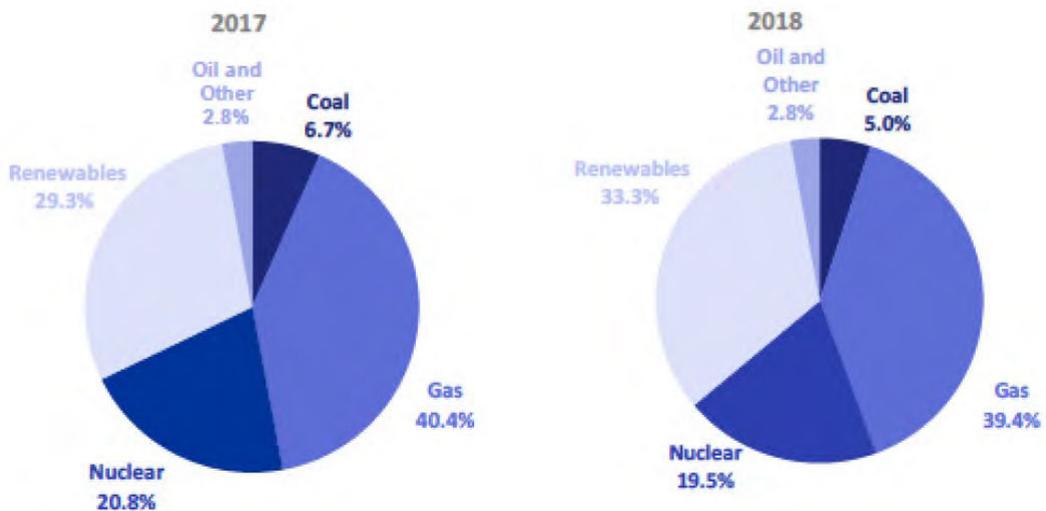

<sup>347</sup> DUKES 2019, Main Chapter and Annexes, available at: [www.gov.uk/government/statistics/digest-of-uk-energy-statistics-dukes-2019](http://www.gov.uk/government/statistics/digest-of-uk-energy-statistics-dukes-2019)

**Figure 10: The UK's net import dependency since 1970**

The UK's sources of electricity generation can be seen in Figure 11 below. This shows the shift in fuel mix away from coal and a rise in low-carbon generation including renewables, which now account for 33.3% of UK's electricity supply. The UK remained a net importer of electricity in 2018, accounting for 5.4% of total supply, up from 4.2% of supply in 2017.<sup>348</sup>

**Figure 11: UK electricity generation by fuel type**

<sup>348</sup> DUKES 2019, Chapter 5 available at: [www.gov.uk/government/statistics/electricity-chapter-5-digest-of-united-kingdom-energy-statistics-dukes](http://www.gov.uk/government/statistics/electricity-chapter-5-digest-of-united-kingdom-energy-statistics-dukes)

## Gas

Domestic UKCS production (also referred to as North Sea gas) is a key source of gas for the UK. In 2018, UKCS production was equivalent to approximately 51%<sup>349</sup> of UK gas supply, however, by 2035, it is estimated that UKCS production will fall to the equivalent of just 28% of gas demand. The 'Projections of UK Oil and Gas Production and Expenditure Report' published in March 2019, estimates that UK oil and gas production over the period 2016–2050 is projected to be 3.9 billion barrels of oil equivalent (boe) higher than projections four years ago (in March 2015). The UK remains, along with the Netherlands, one of the two major gas-producing nations within the EU.

Natural gas plays a key role in the UK economy, powering industry, heating homes (85% of the households (in the UK) currently use gas for heating, and 56% for cooking) and supporting a flexible and resilient electricity system. The reliability and flexibility afforded by gas-fired electricity generation also enables ever greater levels of intermittent renewables to come forward. The UK has a diverse range of sources of gas supply, including domestic production, pipeline imports from Norway and mainland Europe, LNG from global markets, and storage (which is not strictly speaking a 'source' of gas but is an important source of system flexibility).

Currently, the UK has an import capacity<sup>350</sup> of ~56 bcm/y from Norway, ~43 bcm/y from capacity connected to the Continent, and ~49 bcm/y from LNG import terminals<sup>351</sup>. As UKCS production declines, imports will play an increasing role in meeting UK gas demand.

## Oil

The Oil and Gas Authority estimates that there are 507 million tonnes of proven and probable (2P) oil reserves at the end of 2018, of which 360 million tonnes are proven reserves.<sup>352</sup>

### Crude Oil

The UK is a net importer of crude oils, although there are large volumes of crude oil exports depending on the prevailing market conditions. Gross crude oil exports increased by nearly one-fifth in 2018 to reach over 40 million tonnes – the highest level since 2009. - This is due mainly to the new North Sea projects that opened in late 2017, which were exported. Crude oil was principally exported to the Netherlands, Germany, Korea and China, which together comprised 80% of total crude exports in 2018.<sup>353</sup>

The UK's own production of crude oil would have been sufficient to meet roughly 90% of UK refinery demand in 2018, but an increase in the diversity of sources coming into the UK has reduced the impact of a disruption to any one source of supply on the UK. In 2018, 12% of UK crude oil production was used by UK refineries.

<sup>353</sup> Statutory security of supply report: 2018, [www.gov.uk/government/publications/statutory-security-of-supply-report-2018](http://www.gov.uk/government/publications/statutory-security-of-supply-report-2018)

## Refined product

In 2018, UK refinery production was around 30% petrol, 20% diesel and 9% aviation fuel, with the remaining volumes primarily being other light and heavy distillates. This is significantly different from the demand pattern. To balance demand, the UK trades widely and is one of the largest importers of jet fuel and road diesel in the OECD and one of the largest exporters of petrol.<sup>354</sup>

Approximately 40% of fuel produced by UK refineries in 2018 was exported, of which nearly half was petrol.

Imports of diesel road fuel and jet fuel to the UK are increasing. In 2013, the UK became a net importer of petroleum products for the first time since 1984. In 2018, the UK was a net importer by 13.0 million tonnes, up 14% on 2017.

### *ii Projections of development with existing policies and measures at least until 2040 (including for the year 2030)*

Each year National Grid publishes its Future Energy Scenarios.<sup>355</sup> This publication sets out a range of credible projected scenarios for Great Britain's energy landscape to 2050. These four scenarios are based on the speed of decarbonisation (driven by policy, economics and consumer attitudes) and the level of decentralisation (proximity of production and management of energy to the end consumer). This is not a UK government publication, however the scenarios can be used as an illustration of the potential development of the UK's energy mix. The 2019 scenarios were developed prior to the introduction of the UK government's net zero target. National Grid included a sensitivity to provide an indication about the potential implications of this increase in government policy ambition.

## Scenarios:

1. **Consumer Renewables:** sets out what Great Britain's energy system could look like if the 2050 decarbonisation target is met and there is a more decentralised energy landscape.

- Achieves the 2050 decarbonisation target.
- Decentralised pathway.

In Community Renewables, local energy schemes flourish, consumers are engaged

and improving energy efficiency is a priority. UK homes and businesses transition to mostly electric heat. Consumers opt for electric transport early and simple digital solutions help them easily manage their energy demand. Policy supports onshore generation and storage technology development, bringing new schemes which provide a platform for other green energy innovation to meet local needs.

2. **Two Degrees:** explores how the 2050 decarbonisation target can be achieved using large, centralised technologies.

- Achieves the 2050 decarbonisation target.

---

<sup>354</sup> Statutory security of supply report: 2018, [www.gov.uk/government/publications/statutory-security-of-supply-report-2018](http://www.gov.uk/government/publications/statutory-security-of-supply-report-2018)

<sup>355</sup> National Grid, Future Energy Scenarios 2019, <http://fes.nationalgrid.com/fes-document/>

- Large-scale centralised solutions.

In Two Degrees, large-scale solutions are delivered and consumers are supported to choose alternative heat and transport options to meet the 2050 target. UK homes and businesses transition to hydrogen and electric technologies for heat. Consumers choose electric personal vehicles and hydrogen is widely used for commercial transport. Increasing renewable capacity, improving energy efficiency and accelerating new technologies such as carbon capture, usage and storage are policy priorities.

3. **Steady Progression:** predicts a scenario in which Great Britain makes progress towards but does not meet the 2050 decarbonisation target using centralised technologies.

- 2050 decarbonisation target not met.
- Large-scale centralised solutions.

In Steady Progression, the pace of the low-carbon transition continues at a similar rate to today but then slows towards 2050. Consumers are slower to adopt electric vehicles and take up of low-carbon alternatives for heat is limited by costs, lack of information and access to suitable alternatives. Although hydrogen blending into existing gas networks begins, limited policy support means that new technologies such as carbon capture, usage and storage and battery storage develop slowly.

4. **Consumer Evolution:** a more decentralised scenario which makes progress towards the decarbonisation target but fails to achieve 80% carbon emissions reduction by 2050.

- 2050 decarbonisation target not met.
- Decentralised landscape.

In Consumer Evolution, there is a shift towards local generation and increased consumer engagement, largely from the 2040s. In the interim, alternative heat solutions are taken up mostly where it is practical and affordable, e.g. due to local availability. Consumers choose electric vehicles and energy efficiency measures. Cost-effective local schemes are supported but a lack of strong policy direction means technology is slow to develop, e.g. for improved battery storage.

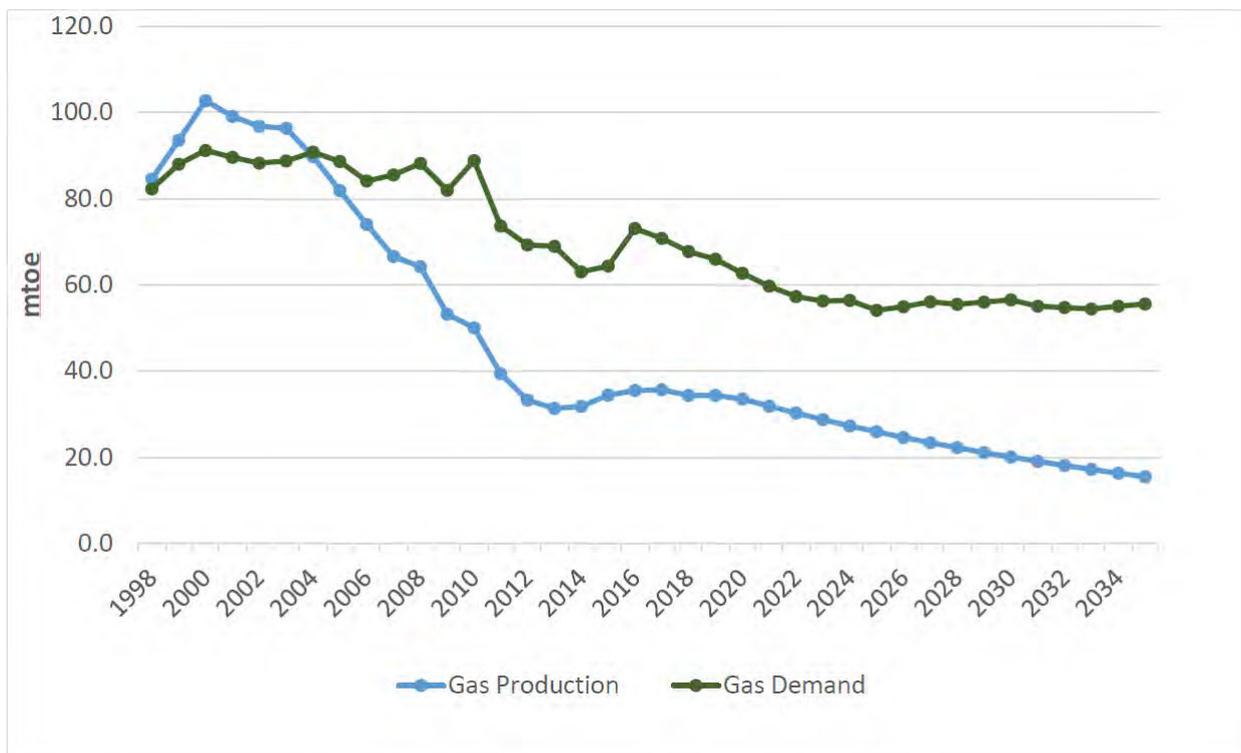

## Gas

The UK imports a large portion of its supply – in 2018 49% of total gas supply came from imports<sup>356</sup>- and this is expected to increase, even if we assume the most ambitious domestic production projections alongside reductions in natural gas demand (see Figure 12).

---

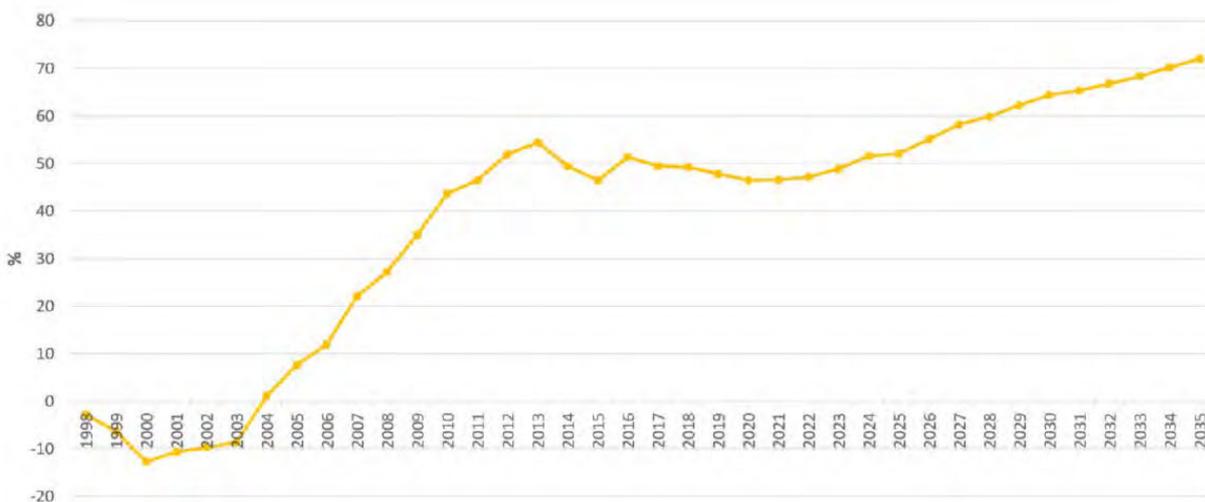

<sup>356</sup> National Statistics Digest of UK Energy Statistics (DUKES) 2019 Chapter 4 Natural gas (Commodity Balances - DUKES 4.1: using net import figures), [https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment\\_data/file/820686/DUKES\\_4.1.xls](https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/820686/DUKES_4.1.xls)

**Figure 12: UK gas production and demand projections<sup>357</sup>**

The long-term decline in UK production means that imports will play an increasing role in meeting UK gas demand (see Figure 13 below).

**Figure 13: Gas import dependency projection to 2035<sup>358</sup>**

The UK is well placed to adapt to the changing profile of supply sources due to the significant investment in additional gas supply and flexibility which has been delivered by the market since GB became a net importer of gas in 2004, including direct connections with Norway, the Netherlands and Belgium, and LNG terminals including Europe’s largest in terms of LNG storage capacity.

<sup>357</sup> OGA Projections of UK Oil and Gas Production and Expenditure March 2019, page 12.

<sup>358</sup> OGA Projections of UK Oil and Gas Production and Expenditure March 2019, page 12.

As is currently the case across Europe, in the future there will be competition between traditional piped gas suppliers and liquified natural gas (LNG), and how this will play out in the future remains uncertain. However, the UK consistently has one of the largest and most liquid gas markets in Europe, supported by an effective regulatory regime and dynamic pricing signals. This ensures that the UK is well-placed to attract gas supplies, and to respond to future changes in supply sources.

## 4.5 Internal energy market

### 4.5.1 Electricity interconnectivity

#### *i Current interconnection level and main interconnectors<sup>359</sup>*

The GB electricity system is connected with north-west Europe via 4GW interconnector capacity; 2GW with France (IFA), 1GW with the Netherlands (BritNed) and 1GW with Belgium (Nemo). 1GW of interconnection also links GB and the Single Electricity Market (SEM) on the island of Ireland (Moyle 500MW and East-West Interconnector 500MW). An overview of existing and future interconnector projects can be found on Ofgem's website.<sup>360</sup>

#### *ii Projections of interconnector expansion requirements (including for the year 2030)*

The UK government will work to ensure significant private investment in new electricity interconnectors, which will help reduce prices for consumers, ensure a more secure grid and help integrate clean generation. In addition to the 5GW already operational, 4.8GW of capacity is already in construction, and a further 8.1GW is progressing through regulatory process. This is expected to increase our level of interconnection by 2030.<sup>361</sup>

### 4.5.2 Energy transmission infrastructure

#### *i Key characteristics of the existing transmission infrastructure for electricity and gas<sup>362</sup>*

This is set out in 2.4.2(i).

#### *ii Projections of network expansion requirements at least until 2040 (including for the year 2030)<sup>363</sup>*

The system operator for Great Britain, National Grid Electricity System Operator, publishes two main reports each year which consider the future needs of the electricity system. The first is the Network Options Assessment<sup>364</sup>, which describes the major projects considered to meet the needs of GB's electricity transmission system as described by the Electricity Ten Year

---

<sup>359</sup> Overviews of operational interconnector capacity can be found at the following websites: EWIC [www.eirgridgroup.com/customer-and-industry/interconnection/](http://www.eirgridgroup.com/customer-and-industry/interconnection/), Moyle [www.mutual-energy.com/](http://www.mutual-energy.com/), NemoLink [www.nemolink.co.uk/](http://www.nemolink.co.uk/), BritNed [www.britned.com/](http://www.britned.com/), IFA <http://ifa1interconnector.com/>

Statement.<sup>365</sup> The second is the Future Energy Scenarios document, which identifies long term demand options where scenarios are unconstrained by network issues.<sup>366</sup>

### 4.5.3 Electricity and gas markets, energy prices

#### *i Current situation of electricity and gas markets, including energy prices*

#### **Wholesale**

The GB wholesale electricity market is where generators and suppliers trade electricity products ahead of final delivery to the consumer.

Energy companies are legally required to be licensed by the Office of Gas and Electricity Markets (Ofgem) to operate in the market. Trading occurs within GB, but also with European partners over electricity interconnectors. British electricity generation comes from diversified sources comprising nuclear, natural gas, coal, and varied renewable sources including wind, solar, and biomass. The GB wholesale electricity market is well connected with neighbouring countries, including France, Ireland, Belgium and the Netherlands, with substantial capacity of further interconnection planned. Most electricity is generated at large power stations connected to the national transmission network, but it can also be generated in smaller scale power stations that are connected to the regional distribution networks, or even generated off-grid.

The Single Electricity Market (known as the 'SEM') is a single, shared wholesale electricity market between Ireland and Northern Ireland. Following reforms, the new market is designed to put downward pressure on consumer electricity prices, facilitate the integration of renewables and continue to provide security of supply. The SEM one-year ahead auction in December 2018 secured just under 2GW of capacity, which ensures that there will be sufficient capacity to meet demand in Northern Ireland during winter 2019/20.

The four-year ahead capacity auction on 28 March 2019 secured 1.9GW of capacity for Northern Ireland with an auction clearing price of £43,030 per MW per year, which ensures sufficient capacity to meet expected demand for the year 2022-2023.

The SEM was established following the signing of a Memorandum of Understanding (MoU) by the UK and Irish Governments in 2006 and required parallel legislation to be enacted in Northern Ireland (NI) and Ireland (IE).

The SEM is operated by the SEM Operator (SEMO), which is a joint venture between EirGrid (the Ireland System Operator) and SONI (the System Operator of Northern Ireland). Both SONI and SEMO are part of the EirGrid Group.

The SEM Committee is the decision-making forum for SEM regulatory matters. The SEM Committee is formed of the separate committees of the Ireland regulator: the Commission for Regulation of Utilities (CRU), and the Northern Ireland Utility Regulator (UR) and is made up of representatives of each regulator and an independent and a deputy independent member.

The UK has one of the largest and most liquid gas markets in Europe. High levels of liquidity on the UK's natural gas trading hub, the National Balancing Point (NBP), are evidenced by the

---

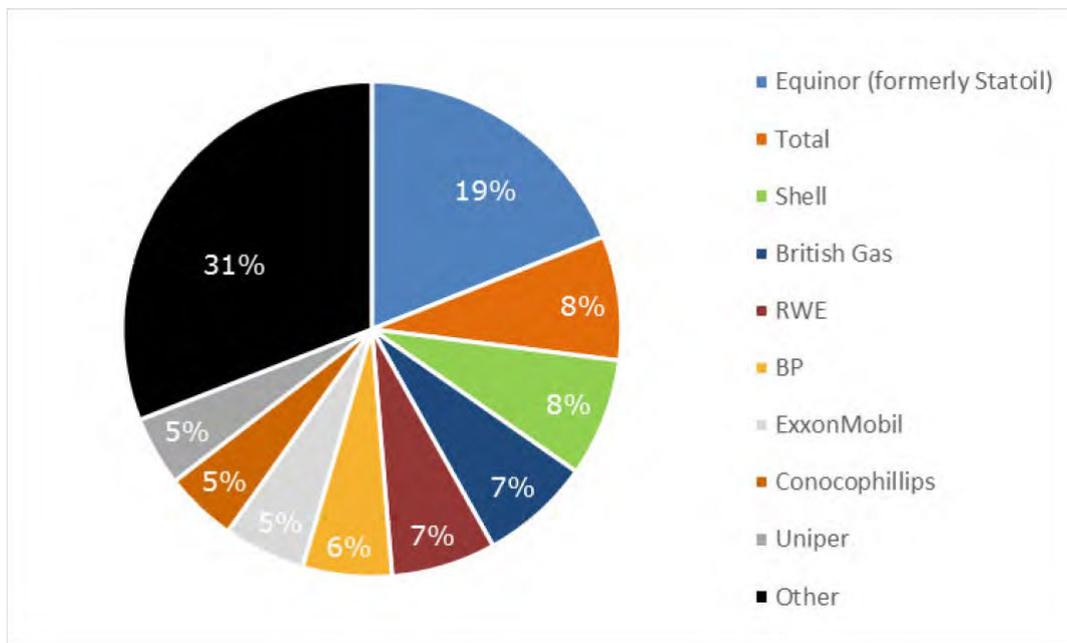

<sup>365</sup> [www.nationalgrid.com/sites/default/files/documents/ETYS%202017.pdf](http://www.nationalgrid.com/sites/default/files/documents/ETYS%202017.pdf)

<sup>366</sup> <http://fes.nationalgrid.com/media/1363/fes-interactive-version-final.pdf>

level of trades there: alongside the Netherlands the UK dominates gas trade in Europe.<sup>367</sup> In 2018, there were 158 licensed entities trading in the NBP market.<sup>368</sup>

There is a low level of concentration in the wholesale gas market, and this is reflected in the large number and diversity of gas producers. The six largest gas suppliers accounted for 55% of the market in 2018/19 (see Figure 14 below) compared to 58% in 2016-17. The level of concentration in the wholesale gas market, as measured by the HHI, remained relatively low at 1329 in 2018<sup>369</sup>, the lowest in the EU (see Figure 15 below). This level of HHI is below the threshold of 2,000, above which the CMA generally considers the market to be highly concentrated. This suggests that gas suppliers are unlikely to be able to exercise unilateral market power to increase the price of wholesale gas.

**Figure 14: Share of UK gas supply 2018/2019<sup>370</sup>**

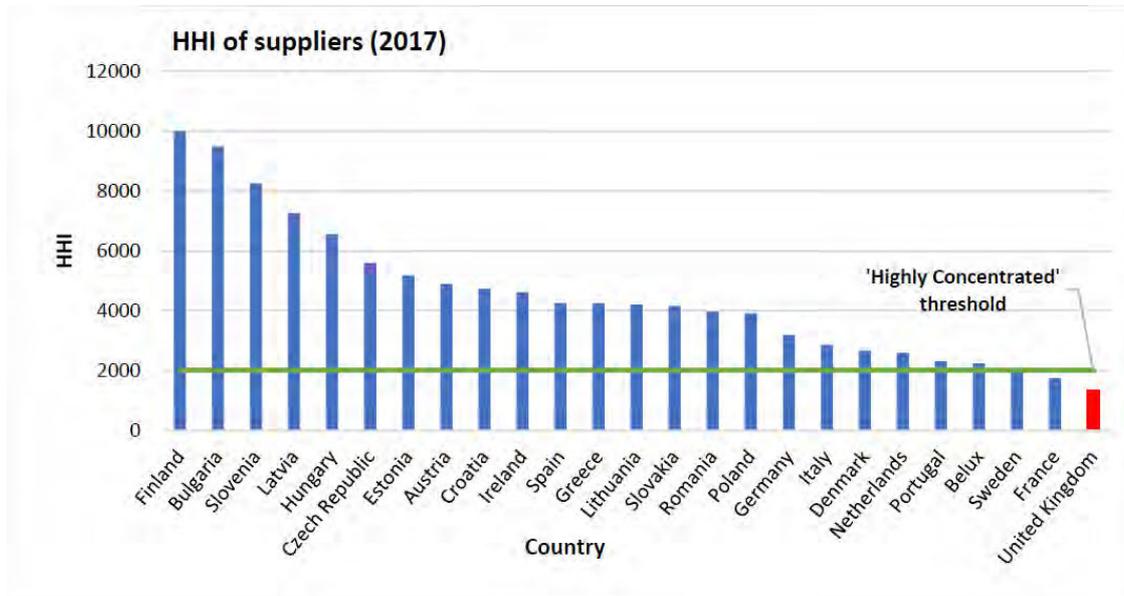

<sup>367</sup> European Commission, Quarterly Reports on European Gas Markets, <https://ec.europa.eu/energy/en/data-analysis/market-analysis>

<sup>368</sup> Ofgem, State of the Energy Market 2019, [www.ofgem.gov.uk/publications-and-updates/state-energy-market-2019](http://www.ofgem.gov.uk/publications-and-updates/state-energy-market-2019)

<sup>369</sup> Ofgem, State of the Energy Market 2019, [www.ofgem.gov.uk/publications-and-updates/state-energy-market-2019](http://www.ofgem.gov.uk/publications-and-updates/state-energy-market-2019)

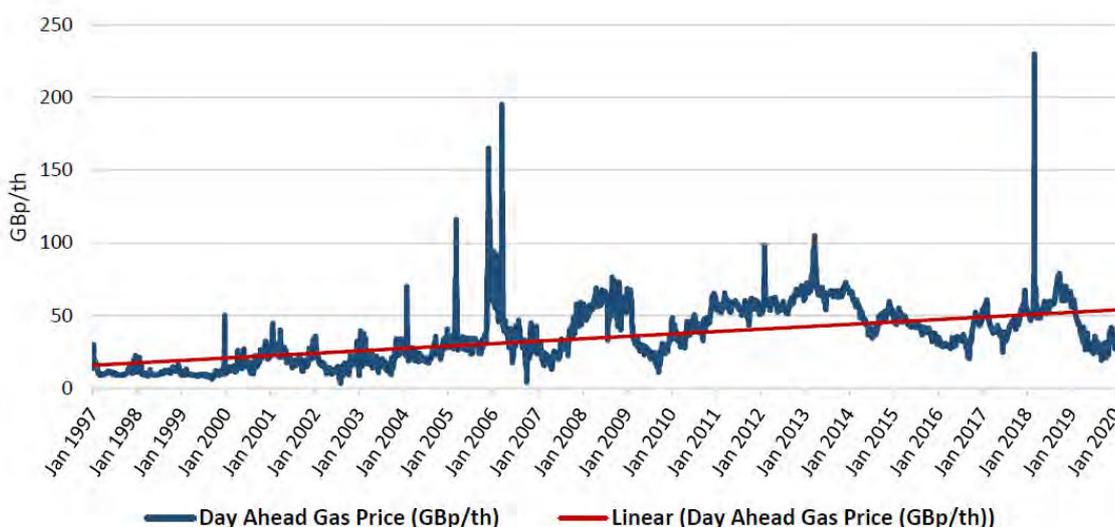

<sup>370</sup> Ofgem, State of the Energy Market 2019, [www.ofgem.gov.uk/publications-and-updates/state-energy-market-2019](http://www.ofgem.gov.uk/publications-and-updates/state-energy-market-2019)

**Figure 15: The Herfindahl-Hirschman Index (HHI) of Suppliers, EU excluding Malta and Cyprus (2017)<sup>371</sup>**

GB wholesale gas prices correlate with global conditions since imports make up a large portion of GB gas supply. Wholesale prices have been increasing since the early 2000's as a result of decreased GB production and upwards pressure on European prices, and throughout most of 2018 prices traded higher than in previous years. The average day ahead trading price in September and October 2018 was 73.5p/therm and 67.0p/therm (see Figure 16 below).<sup>372</sup> Since 2019 gas prices have notably fallen as an LNG supply glut led to an oversupplied global market, causing gas prices to fall around the globe. The global market is expected to rebalance in the coming years, with gas prices forecasted to increase in the long term.

**Figure 16: Wholesale gas prices: day ahead contracts, GB<sup>373</sup>**

<sup>373</sup> ICIS HEREN National Balancing Point Day Ahead Contract Prices.

Electricity prices have generally been increasing as well in the long run, in large part because of the importance of gas in electricity generation in the UK.<sup>374</sup> The correlation coefficient between day ahead gas and electricity prices in the year up to April 2019 was 0.90.<sup>375</sup> Coal prices play a decreasing role in determining electricity prices, reflecting the declining importance of coal in electricity generation. Carbon costs have also driven up the price in recent years, particularly with the implementation of the Carbon Price Support (CPS). Divergence between this and the EU Emissions Trading System (ETS) has contributed to differences in electricity prices between GB and other European countries, even as increased interconnection capacity has worked to align international prices. The increase in ETS price in recent years has meant a greater share of price impacts comes from the ETS relative to the CPS (see Figure 17 below).<sup>376</sup>

**Figure 17: Carbon price impact on wholesale electricity price (£/MWh, nominal)<sup>377</sup>**

## Retail

On 1 January 2019, the Default Tariff Cap came into force in Great Britain. This will remain in place until the end of 2020 but can be extended each year until 2023. Analysis from Ofgem (the independent regulator) suggests that the cap will save around 11 million default tariff customers c.£75-100/year compared to if the cap was not introduced.<sup>378</sup> From October 2019, the default tariff cap was set at £1,179/year for a typical domestic customer, with the level updated by the regulator every six months based on changes in underlying costs.<sup>379</sup> This sits

<sup>376</sup> Ofgem, State of the Energy Market 2019, [www.ofgem.gov.uk/publications-and-updates/state-energy-market-2019](http://www.ofgem.gov.uk/publications-and-updates/state-energy-market-2019)

<sup>377</sup> Ofgem, State of the Energy Market 2019, [www.ofgem.gov.uk/publications-and-updates/state-energy-market-2019](http://www.ofgem.gov.uk/publications-and-updates/state-energy-market-2019)

<sup>378</sup> Figure based on typical domestic consumption values of 3100kwh electricity, 12000kwh gas. Source: Ofgem, Higher wholesale costs push up default and pre-payment price caps from April, [www.ofgem.gov.uk/publications-and-updates/higher-wholesale-costs-push-default-and-pre-payment-price-caps-april](http://www.ofgem.gov.uk/publications-and-updates/higher-wholesale-costs-push-default-and-pre-payment-price-caps-april)

<sup>379</sup> Figure based on typical domestic consumption values of 3100kwh electricity, 12000kwh gas. Source: Ofgem, default tariff cap level – Letter (1 April 2019 to 30 September 2019). [www.ofgem.gov.uk/publications-and-updates/default-tariff-cap-level-1-april-2019-30-september-2019](http://www.ofgem.gov.uk/publications-and-updates/default-tariff-cap-level-1-april-2019-30-september-2019)

alongside a prepayment meter price cap introduced in April 2017, which continues to protect the c.4 million households with prepayment meters.<sup>380</sup>

In the second quarter of 2019, there were 56 suppliers offering both gas and electricity in the GB domestic retail market, in addition to five gas-only, and three electricity-only suppliers. The six largest suppliers serve just over 70% of domestic gas and electricity customers. These suppliers together lost around six percentage points of gas and five percentage points of electricity market share between the second quarter of 2018 and the second quarter of 2019. British Gas, owned by parent company Centrica, is the largest supplier, covering 28% of the gas market and 19% of the electricity market.<sup>381</sup>

As of June 2019, there were 23.5 million gas meter points and 28.5 million electricity meter points in the domestic market, accounting for 60% (309 TWh) and 35% (105 TWh) of total (domestic and non-domestic) gas and electricity demand respectively and spending around £30 billion per year.<sup>382</sup>

Concentration of the domestic energy market is declining due to sustained new entry and expansion of new suppliers. This follows the trend of recent years, as shown in Figure 18 below. In June 2019, the Herfindahl-Hirschman Index (HHI) of concentration was around 1,224 in gas and around 987 in electricity. Typically, the Competition and Markets Authority (CMA) regards markets with an HHI below 1,000 as un-concentrated, markets with HHI between 1,000 and 2,000 as concentrated, and markets with an HHI above 2,000 as highly concentrated.<sup>383</sup>

**Figure 18: Evolution of concentration and number of active licensed suppliers<sup>384</sup>**

In Northern Ireland, there are five active domestic electricity suppliers, and nine industrial and commercial suppliers. Analysis using figures for Q3 2019 highlights how, at 56.1%, a significant number of customers remain with the previously incumbent supplier Power NI, whose retail prices are currently subject to a price control for domestic consumers. However, the 43.9% of customers with a non-incumbent supplier marks an increase from 42.8% in Q3 2018.<sup>385</sup>

### Prices

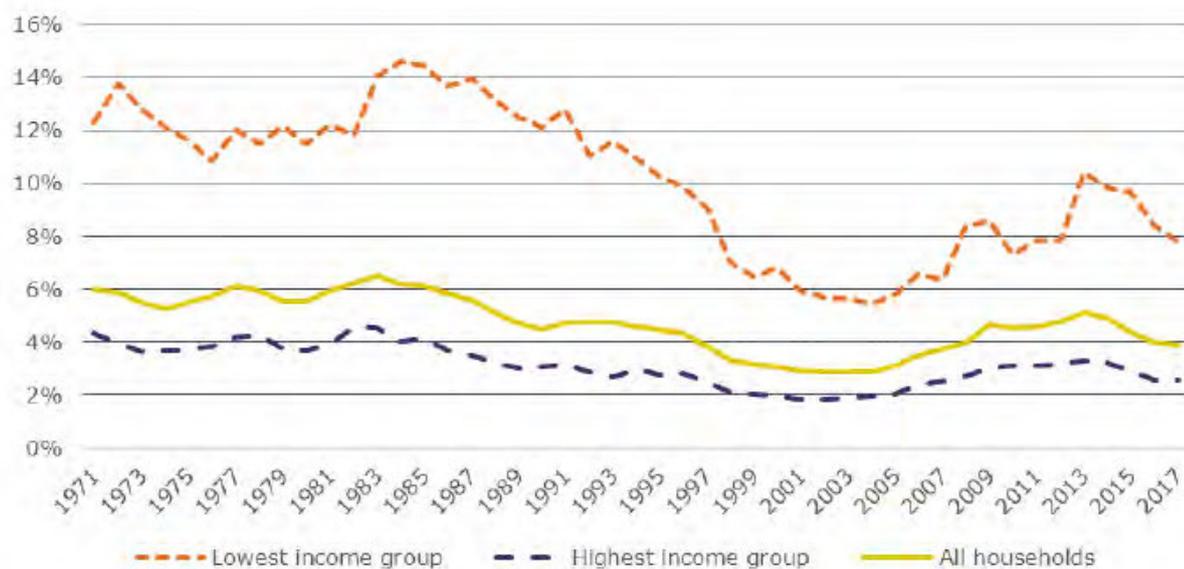

The average dual-fuel energy bill for a consumer in Great Britain with one of the large energy suppliers was £1,184 in 2018. This was an increase of 4% in real terms relative to the previous year. As a proportion of household spending, energy accounted for 3.9% (7.8%) of average income (low-income) households in the financial year 2017/18. This is below the high in 2013 (see Figure 19 below).<sup>386</sup>

*ii Projections of development with existing policies and measures at least until 2040 (including for the year 2030)*

### Long term price projections

Retail gas prices across domestic, industrial and commercial sectors are forecast to increase throughout the 2020s and up to 2030. The same is also true for retail electricity prices, although to a much lesser extent (see Table 38 below). However, UK government-published statistics show retail gas and electricity prices flatlining beyond 2030.<sup>388</sup> This is because uncertainty in many of the drivers of energy prices is considered too great to form a meaningful judgement on long-term future price trends. For instance, macroeconomic indicators, such as GDP, income and population levels, and long-term climate conditions are particularly important here since uncertainty compounds over time.<sup>389</sup> Additionally, factors such as the possibility of technological breakthroughs or changes in strategic behaviour of major resource holders are highly difficult to predict and are key drivers for fossil fuel prices, including gas, which in turn drive the electricity price.<sup>390</sup>

Uncertainty with current energy policies on prices in the future is small compared to that of wider economic and climate conditions.<sup>391</sup> Beyond 2030, however, it is speculative to predict what policies will be in place as new energy policies develop in response to external factors, both economic and environmental. Generally, the low-carbon transition suggests that carbon

<sup>387</sup> Ofgem, State of the Energy Market 2019, [www.ofgem.gov.uk/publications-and-updates/state-energy-market-2019](http://www.ofgem.gov.uk/publications-and-updates/state-energy-market-2019)

## 4.6 Research, innovation and competitiveness

Consumers are at the heart of our development of the system, which can give them choice and control over how they use electricity, including any that they generate themselves. Our approach is firmly rooted in enabling competition and markets to deliver on price, quality and choice, and we want flexible solutions to compete with each other and with more traditional solutions.

*i Current situation of the low-carbon-technologies sector and, to the extent possible, its position on the global market (that analysis is to be carried out at Union or global level)*

In 2018, nearly 53% of the UK's electricity came from low-carbon sources<sup>394</sup> and coal use has fallen dramatically, with periods of coal free generation in both 2017 and 2018.

The CGS outlines how UK homes and commercial buildings have become more efficient in the way they use energy which helps to reduce emissions and also cut energy bills; for example, in 2016, average household energy consumption fell by 17% compared with 1990 levels. Automotive engine technology has helped reduce emissions per kilometre driven by up to 16% and driving a new car bought in 2015 will save car owners up to £200 on their annual fuel bill, compared to a car bought new in 2000. In 2016, England recycled nearly four times more than it did in 2000.<sup>395</sup>

This progress has been aided by the falling costs of many low-carbon technologies: renewable power sources like solar and wind are comparable in cost to coal and gas in many countries; energy efficient light bulbs were over 80% cheaper in 2016 than in 2010; and the cost of electric vehicle battery packs has tumbled by over 70% in this time.<sup>396</sup>

As a result of this technological innovation, new high value jobs, industries and companies have been created. And this is driving a new, technologically innovative, high growth and high value 'low-carbon' sector of the UK economy. Not only are we rapidly decarbonising parts of the domestic economy, but thanks to our world leading expertise in technologies such as offshore wind, power electronics for low-carbon vehicles and electric motors, and global leadership in green finance, we are successfully exporting goods and services around the world; for example, in 2018 one in every five electric vehicles sold in Europe was made in the UK. The latest published data found that in 2017 there were nearly 400,000 jobs in low-carbon businesses and their supply chains, employing people in locations across the country.<sup>397</sup>

This progress has altered the way that we see many of the trade-offs between investing in low-carbon technologies that help secure our future but that might incur costs today. It is clear that actions to cut our emissions can be a win-win: cutting consumer bills, driving economic growth, creating high value jobs and helping to improve our quality of life<sup>398</sup>.

<sup>398</sup> The Clean Growth Strategy, [www.gov.uk/government/publications/clean-growth-strategy](http://www.gov.uk/government/publications/clean-growth-strategy)

*ii Current level of public and, where available, private research and innovation spending on low-carbon-technologies, current number of patents, and current number of researchers*

This is set out in section 2.5(i).

The UK's Office of National Statistics (ONS) publishes estimates of total private sector R&D, but this is not broken down by ETRDI. We are not aware of any formal reporting of data broken down in this way as there is no formal record of different private sector ETRDI projects.

The UK government actively encourages private sector participation in public ETRDI Programmes, recognizing the clear economic benefits such as supporting jobs and increasing export potential.

iii Breakdown of current price elements that make up the main three price components (energy, network, taxes/levies)

### UK Energy price breakdowns 2018<sup>399</sup>

**Table 39: Household Gas and Electricity price breakdowns**

<i>Per MWh</i>	Gas (D2)		Electricity (DC)	
	Euros	Pounds	Euros	Pounds
Energy & Supply	32.20	28.70	95.60	85.00

*iv Description of energy subsidies, including for fossil fuels*

As set out in section 3.1.3(iv), the UK uses a definition of fossil fuel subsidies agreed and used by the Commission, and Member States which are members of the G20, in making returns to the G20. Unlike the definition used in the Commission's Energy Prices and Costs Report of earlier this year, this definition excludes tax treatment. The UK has no fossil fuel subsidies.

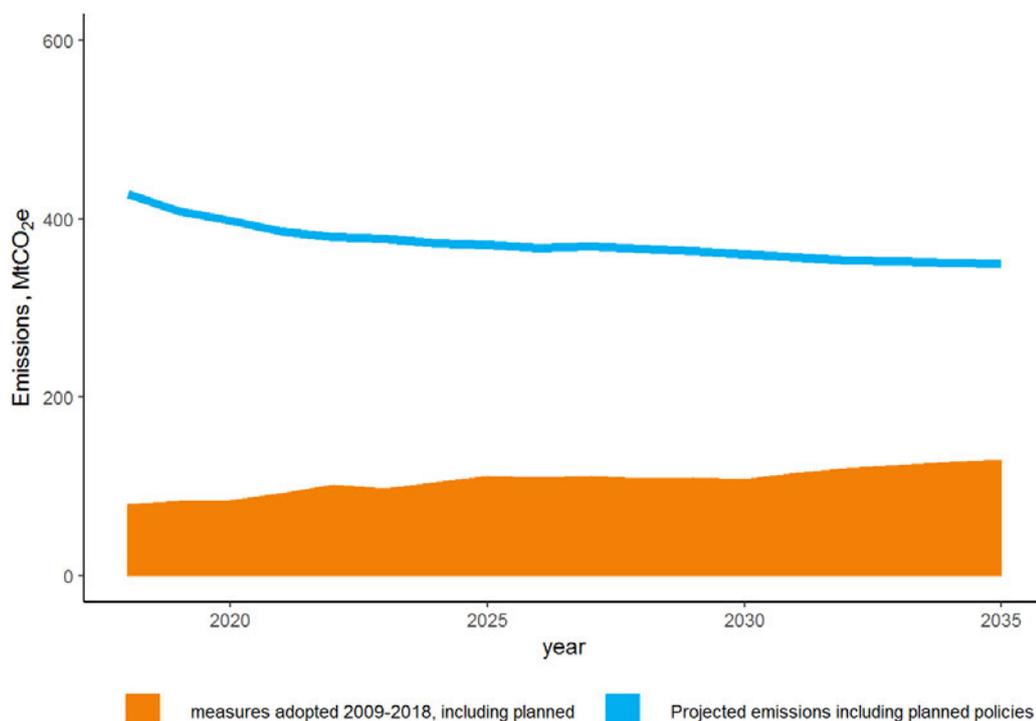

## 5. Impact assessment of planned policies and measures

### 5.1 Impacts of planned policies and measures described in section 3 on energy system and GHG emissions and removals including comparison to projections with existing policies and measures (as described in section 4)

*i Projections of the development of the energy system and GHG emissions and removals as well as, where relevant of emissions of air pollutants in accordance with Directive (EU) 2016/2284 under the planned policies and measures at least until ten years after the period covered by the plan (including for the last year of the period covered by the plan), including relevant Union policies and measures*

The projections presented in [section 4](#) (the ‘with existing measures’ scenario) include the impact of all the UK’s implemented and adopted policies and measures. It does not include those policies which are classified as planned. Policies and proposals for mitigating climate change go through an established development process. As the development is completed, the impact of policies is quantified in updated Energy and Emissions Projections (EEP), which are published by the UK government annually. This is a continuous process and the latest EEP, published in April 2019, shows future emissions under the suite of policies that were fully developed as of 2018.

The UK treats the policies adopted before 2009, when carbon budgets were set at the time of the 2009 Budget and the Low Carbon Transition Plan (LCTP), as part of the baseline. Figure 20 and Table 42 show the estimated emissions savings and the effect on projected emissions attributable to policies adopted between April 2009 and July 2018, as published in the 2018 UK EEP. For example, in 2020 we project that existing UK policies adopted since the LCTP will deliver emissions reductions of over 84 MtCO<sub>2e</sub>. Further emissions reductions are expected from planned policies.

**Figure 20: Projected impact of policies**

To avoid double counting in the calculation of savings from policies, our projections use a hierarchy of mitigation actions which consider energy demand and emissions reductions after the application of measures further up the hierarchy. This hierarchy considers the level of imperative imposed by a policy, that is to say whether there is regulation, incentive or advice, and the date of implementation of a policy.

**Table 42: Projected impact of policies adopted in the period 2009-2018, MtCO<sub>2</sub>e<sup>400</sup>**

Scenario	2018	2020	2025	2030	2035
Baseline	514	490	488	475	486
...with existing measures	428	398	370	364	356
...with additional measures	428	398	371	361	350

The differences in projected emissions between scenarios does not exactly match the sum of emissions reductions provided by individual policies due to price interactions and adjustments to policy impacts to improve accuracy.

The CGS set out over fifty policies and proposals that will drive emissions down throughout the next decade and beyond. Through preparing this Strategy, the UK government identified areas where it will need to see the greatest progress, both through technological breakthroughs and large-scale deployment, in order to meet its national emissions reduction targets.

<sup>400</sup> Updated Energy and Emissions Projections, 2018, Annex A [www.gov.uk/government/publications/updated-energy-and-emissions-projections-2018](http://www.gov.uk/government/publications/updated-energy-and-emissions-projections-2018)

## Air quality

The UK government has pledged that this will be the first generation to leave the environment in a better state than we inherited it.

The UK has ambitious 2020 and 2030 emission reduction commitments in place for five key air pollutants. The UK government published a comprehensive Clean Air Strategy in January 2019 setting out a plan to meet these goals and reduce emissions, with subsequent technical analysis published in March. To measure progress towards these commitments, the UK government annually compiles national air pollutant emissions in the National Atmospheric Emissions Inventory (NAEI), which includes the UK Greenhouse Gas Inventory, used for reporting to the UNFCCC. We also produce air pollutant emissions projections for 2020, 2025 and 2030 which rely on data from various sources, key among which are the Updated Energy and Emissions Projections which take account of measures in place as far as is possible, given the data available.

UK government analysis indicated in its NAPCP that our selected PaMs have the potential to reduce GHG emissions by between 2.2 and 2.9 Mt CO<sub>2</sub>e per annum by 2030. We will work across government to realise the opportunities for mitigating climate change and improving air quality building on the work already achieved. The Clean Air Strategy included a commitment to consult on making coal to biomass conversions ineligible for future rounds of the Contracts for Difference scheme.

We also consulted on banning new Renewable Heat Incentive (RHI) biomass applications installed in urban areas that are on the gas grid, as well as introducing mandatory maintenance checks for those installations already accredited on the RHI. The RHI is a UK government subsidy scheme for eligible renewable heating technology, including biomass. The RHI has air quality requirements that participants using biomass are required to meet before they can claim support under the scheme. These include: limits on the emissions of particulate matter (PM) and oxides of nitrogen (NO<sub>x</sub>), a requirement to use sustainable fuel that is listed on the emissions certificate of the accredited boiler, and an annual obligation to submit relevant permits and exemptions to evidence compliance with all local and national environmental regulations, including those relating to air quality impacts.

As outlined in the Clean Air Strategy, the UK Department for Environment, Food and Rural Affairs (DEFRA) and BEIS have worked together to ensure air quality is considered at the outset of policy development, and that appropriate tools and evidence are used to assess the impact on air pollution emissions. Building on the framework established for bioenergy, we seek to strengthen the collaboration between DEFRA and BEIS, so that we fairly and objectively articulate the trade-offs between energy and air pollution emissions when developing strategies to meet air quality and carbon targets. Similarly, the UK Department for Transport has committed to end the sale of conventional petrol and diesel cars and vans by 2040, which is factored into the NAPCP air quality analysis.

*ii Assessment of policy interactions at least until the last year of the period covered by the plan, in particular to establish a robust understanding of the impact of energy efficiency / energy savings policies on the sizing of the energy system and to reduce the risk of stranded investment in energy supply*

To avoid double counting in the calculation of savings from policies, our projections use a hierarchy of mitigation actions; energy demand and emissions reductions for a given policy are considered after the application of measures further up the hierarchy. This hierarchy considers the level of imperative imposed by a policy (i.e. whether it enforces regulation, incentive or advice) and the date of implementation of a policy.

The Updated EEP 2018, Annex D<sup>401</sup>, gives details on how policy interactions are addressed in our modelling of energy savings. For example, when evaluating the potential savings of a particular policy, the savings of existing policies are taken into account to ensure that the savings are only attributed to one policy. New policies will be incorporated once they are sufficiently advanced to meet the criteria set out in the UNFCCC definitions. Where possible, policies are modelled by incorporating them into the BEIS Energy and Emissions Projection Model. Other policies enter the model as demand reductions or as an off-model adjustment.

*iii Assessment of interactions between existing policies and measures and planned policies and measures*

This information is set out in 3.1.1, which details the policies and measures drawn from, and updated since, the 7th National Communication.<sup>402</sup>

Table 43 provides a summary of impact assessments of energy efficiency policies and regulations expected up to 2030.

**Table 43: Summary of energy efficiency policy impact assessments expected up to 2030**

Policy	Description	Total NPV (Social)	Carbon Savings
<a href="#">The Private Rented Sector Energy Efficiency Regulations - Domestic</a>	This policy is intended to amend the current domestic Private Rented Sector Energy Efficiency Regulations to ensure that action is taken to upgrade the energy efficiency of the sector. The intended effects are to: make progress against the UK government’s statutory fuel poverty and climate change commitments; reduce energy demand in the Private Rented Sector, thereby lowering energy bills and improving energy security; and improve thermal comfort and associated health outcomes.	£580m (2017 Prices)	0.4 MtCO <sub>2</sub> e over CB4

<sup>401</sup> Updated Energy and Emissions Projections, 2018, Annex D [www.gov.uk/government/publications/updated-energy-and-emissions-projections-2018](http://www.gov.uk/government/publications/updated-energy-and-emissions-projections-2018)

<sup>402</sup> 7th National Communication, December 2017, [http://unfccc.int/files/national\\_reports/annex\\_i\\_natcom/submitted\\_natcom/application/pdf/19603845\\_united\\_kingdom-nc7-br3-1-gbr\\_nc7\\_and\\_br3\\_with\\_annexes\\_\(1\).pdf](http://unfccc.int/files/national_reports/annex_i_natcom/submitted_natcom/application/pdf/19603845_united_kingdom-nc7-br3-1-gbr_nc7_and_br3_with_annexes_(1).pdf)

Policy	Description	Total NPV (Social)	Carbon Savings
<a href="#">The Private Rented Sector Energy Efficiency Regulations – Non-Domestic</a>	This policy is intended to amend the current domestic Private Rented Sector Energy Efficiency Regulations to ensure that action is taken to upgrade the energy efficiency of the sector. The intended effects are to: make progress against the UK government’s statutory fuel poverty and climate change commitments; reduce energy demand in the Private Rented Sector, thereby lowering energy bills and improving energy security; and improve thermal comfort and associated health outcomes.	£2bn (2013 Prices)	3 MtCO <sub>2</sub> e over CB3 and CB4
<a href="#">Energy Savings Opportunity Scheme</a>	The objectives of the policy are to promote the take up of cost effective energy efficiency measures whilst minimising the cost to business of complying with the mandatory auditing requirements. By providing enterprises with tailored information about how they can make cost-effective savings ESOS should increase the take up of cost effective energy efficiency measures. This will increase productivity, support higher economic growth, reduce carbon emissions and improve security of supply.	£1.6bn (2014 prices)	10.1 MtCO <sub>2</sub> e over 2014-2030
<a href="#">Streamlined Energy and Carbon Reporting Framework (SECR)</a>	The policy objectives of a SECR framework are to reduce the overall administrative burdens on participants, whilst improving the incentive for organisations to save energy through energy efficiency – thus reducing energy bills and carbon emissions. Requiring organisations to report on their energy use is intended to drive behaviour change by raising awareness of energy efficiency with organisational decision makers, and increasing the importance of energy efficiency to organisations through reputational drivers. Increased transparency for investors and others will make them more able to hold companies to account.	£1,549m (2017 Prices)	12.9 MtCO <sub>2</sub> e over 2019 - 2035
<a href="#">Smart metering (Non-domestic)</a>	To roll-out smart metering to GB residential and small and medium sized non-domestic gas and electricity customers in a cost-effective way, optimising the benefits to consumers, energy suppliers, network operators and other energy market participants and delivering environmental and other policy goals.	£5,746m (2011 Prices)	29.67 MtCO <sub>2</sub> e over lifetime of the policy (2013-2027)

Policy	Description	Total NPV (Social)	Carbon Savings
<a href="#">Carbon Emissions Reduction Target</a>	The purpose of the CERT obligation is to help electricity and gas consumers in the household sector to reduce the carbon impact (footprint) of their home by using energy more efficiently, reducing consumption and using energy from renewable/microgeneration sources. In doing so they will reduce their fuel costs (and/or enjoy greater comfort). Through achieving carbon dioxide savings, the primary aim of the CERT is to make a significant contribution to the UK's legally binding target under the Kyoto protocol to cut greenhouse gas emissions by 12.5% below 1990 levels by 2008–2012 and its domestic goal to cut emissions of carbon dioxide by 20% below 1990 levels by 2010. It is expected that it will also contribute to the alleviation of fuel	£10.3bn (2007 Prices)	154 MtCO <sub>2e</sub> over the lifetime measures (2008-2051)  4.2 MtCO <sub>2</sub> over 2008-2011
<a href="#">Community Energy Savings Programme</a>	Community Energy Savings Programme has the twin objective of significantly reducing the fuel bills of some of those living in deprived areas (proposed to be defined as Super Output Areas in bottom decile of the income domain of the Indices of Multiple Deprivation); and contributing to the improvement of the energy efficiency of the existing housing stock in order to reduce the UK's GHG emissions.	£122mn (2009 Prices)	2.9 MtCO <sub>2e</sub> Over 2009-2011
<a href="#">Energy Company Obligation – ECO3</a>	The policy is intended to drive uptake of energy efficiency measures in the residential sector that would not have occurred in the absence of intervention, in particular among low income and vulnerable households in or at risk of fuel poverty. The intended effects are to: make progress against the UK government's statutory fuel poverty and climate change commitments; reduce energy demand in the residential sector, thereby lowering energy bills and improving energy security; improve thermal comfort and subsequent health outcomes; and support jobs and growth.	£718m (2017 Prices)	1.32 MtCO <sub>2e</sub> over CB5 (2028-2032)  11.08 MtCO <sub>2e</sub> over the lifetime of policy measures

Policy	Description	Total NPV (Social)	Carbon Savings
<a href="#">Boiler Plus</a>	The policy objectives are to deliver additional energy and carbon savings from the domestic heating sector in England by lowering overall gas demand from domestic properties, thereby reducing fuel bills for these properties and contributing towards meeting the UK's legally binding carbon budgets. It aims to do this by increasing the deployment of devices which increase the efficiency of domestic heating systems, through controls and measures to make gas boilers heat homes more efficiently.	£483m (2016 Prices)	2 MtCO <sub>2</sub> e in CB4,  3.2 MtCO <sub>2</sub> e in CB5

The UK government has a rigorous monitoring and reporting framework to track progress against its domestic and international targets. Each year the UK government publishes its Greenhouse Gas Inventory, and Energy and Emissions Projections.

The Climate Change Act (2008) requires the UK government to set five yearly carbon budgets, and then produce a plan to meet these budgets. The most recent was the Clean Growth Strategy, published in October 2017. The CCC, the UK's independent advisory body, published an assessment of this plan in January 2018.

The CCC also produces an annual progress report, with the UK government laying a response before Parliament later in the same year. From 2018, the UK government has used its response to the CCC's annual progress report to bring together reporting against the Clean Growth Strategy on the Emissions Intensity Ratio, metrics and actions. The UK government also provides updates on key elements of the Strategy, as we look ahead towards setting the sixth carbon budget by the statutory deadline of 30 June 2021.

See section 1.1(ii) for more detail on the CCC's net zero recommendation and other UK commitments.

## 5.2 Macroeconomic and, to the extent feasible, the health, environmental, employment and education, skills and social impacts including just transition aspects (in terms of costs and benefits as well as cost-effectiveness) of the planned policies and measures described in section 3 at least until the last year of the period covered by the plan, including comparison to projections with existing policies and measures

It is clear that the continued transition away from coal generation, which has been underway for some years, will have an impact on jobs and communities given the number of people employed at a typical power station. In addition, jobs associated with supply chains, such as port and rail infrastructure will be affected, as will the coal mining industry, although there remain other markets for UK coal. These changes can have a secondary effect on local economies.

Our analysis suggests that the majority of coal plants are likely to close ahead of the intervention in 2025. However, regardless of whether the end of the coal generation sector is a result of direct intervention or other factors, we recognise that there will be an effect on a number of people, largely in the Yorkshire/Humber region, and in South Wales.

The UK government is clear that we need to build an economy that delivers good, skilled, well-paid jobs and creates the conditions for competitive, world leading businesses to prosper and grow right across the UK. Since the consultation was held in November 2016, the UK government has published the Clean Growth Strategy<sup>403</sup> and the Industrial Strategy White Paper.<sup>404</sup>

The move to cleaner growth, including through low-carbon technologies, is one of the most significant and foreseeable global economic trends, and represents one of the greatest industrial opportunities of our time. The UK is well placed to benefit; according to one estimate, our clean economy could grow at four times the rate of GDP. We are determined to make the most of these opportunities. We are already seeing jobs, regional investment and export sales flowing from UK supply chains for clean power technologies, as a result of the on-going transition to a cleaner, smarter power sector. We expect that the losses in activity associated with the closure of unabated coal generators will be compensated by increased activity in new, clean generation. There is a notable opportunity for the UK to become one of the most advanced economies for smart energy and related technologies. The Smart Systems and Flexibility Plan<sup>405</sup> we launched in July 2018 aims to grow the markets for these technologies, and the new innovation challenge announced in our Industrial Strategy, 'Prospering from the energy revolution', aims to accelerate innovation so that cutting edge technologies and systems are developed in the UK.

The UK is likely to feel the impact of climate change both directly and through impacts in other parts of the world. In its recent UK Climate Change Risk Assessment, the UK government

<sup>404</sup> Building a Britain fit for the future, 2017, available at [www.gov.uk/government/publications/industrial-strategy-building-a-britain-fit-for-the-future](http://www.gov.uk/government/publications/industrial-strategy-building-a-britain-fit-for-the-future)

<sup>405</sup> Upgrading our energy system: Smart systems and flexibility plan, 2017, available at: [www.gov.uk/government/publications/upgrading-our-energy-system-smart-systems-and-flexibility-plan](http://www.gov.uk/government/publications/upgrading-our-energy-system-smart-systems-and-flexibility-plan)

endorsed the six key climate change risks for the UK identified in an independent review by the Adaptation Sub-Committee: flooding and coastal change; shortages in public water supply; risks to health, wellbeing and productivity from high temperatures; risks to natural capital and our ecosystems; risks to food security and trade; and new pests and diseases. Therefore, future investments are likely to be highly sensitive to how climate change evolves over the next two to three decades.

Actions to mitigate climate change can have wider positive impacts on the economy, the environment and health, beyond the direct benefits of avoided climate change. Co-benefits can include substantial air quality improvements from avoided fuel combustion, the health and wellbeing benefits of active travel, and warmer homes that have lower bills.

The transition to a net zero economy also presents a major opportunity for the UK to be a world-leading hub for jobs, businesses and exports in low-carbon sectors. Already there are almost 400,000 jobs in low-carbon businesses and their supply chains across the country and low-carbon exports are worth billions of pounds each year. According to one estimate, the UK low-carbon economy could grow more than four times faster than the rest of the economy between 2015 and 2030 – delivering up to £170 billion of exports and supporting up to 2 million jobs.

To realise these opportunities, the UK government has placed Clean Growth at the heart of our Industrial Strategy by making it one of four 'Grand Challenges' – global trends that the UK is determined to be at the forefront of. By aligning our Clean Growth and Industrial Strategies, we are ensuring that our policies across government on skills, business support, innovation, infrastructure and regional growth help to deliver emissions reductions and promote our strengths in low-carbon technologies, systems and services.

We are focusing on areas where the UK has established or emerging strengths, in order to capitalise on significant future markets and export opportunities. These include technologies and approaches central to the shift to a net zero economy such as electric vehicles, smart systems, green finance and offshore wind. For example, the UK is a global leader in offshore wind with the largest installed capacity in the world, and our Offshore Wind Sector Deal sets out how we will work with industry to deliver increased capacity while boosting the economy, creating new export opportunities and thousands of new jobs.

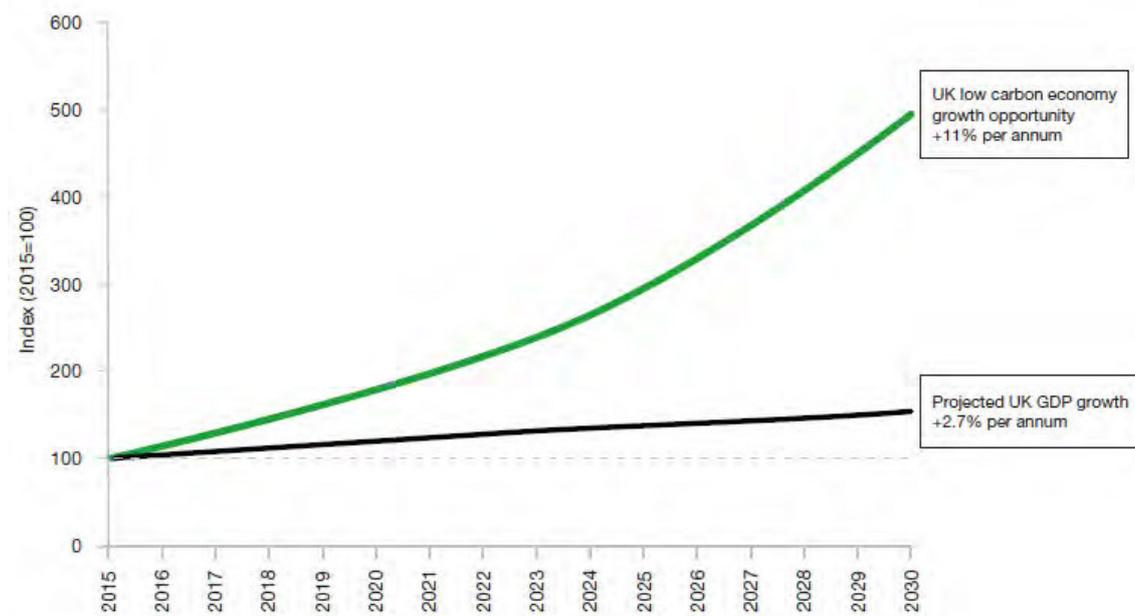

We are investing in the UK's most important asset – our workforce – to ensure that people have the right skills to deliver the low-carbon transition and thrive in the high-value jobs this will create. STEM, digital and technical skills will be essential, and the UK government has announced substantial spending commitments to develop these skills in schools. We have also introduced T Levels as the technical equivalent of A Levels – including T Levels for Construction, which will help to develop the skills needed for sustainable construction so that our buildings are energy efficient and fit for the future.

Industry has pledged to provide 1,000 work placements for T Level students through the Construction Sector Deal. In addition, the Offshore Wind Sector Deal commits to supporting the development of a sector-wide curriculum to deliver a skilled and diverse workforce across the country, whilst challenging the sector to more than double the proportion of women working in the industry to at least 33% by 2030.

As our economy evolves, it is vital that this transition is managed in a way that is fair and just. This is why alongside the UK government's announcement of legislating for net zero, it also announced that HM Treasury will be conducting a review into the costs of decarbonisation

including how to achieve this transition, in a way that works for households, businesses and public finances, as well as the implications for UK competitiveness. We are committed to supporting workers and communities who may face disruption as we move away from high-carbon industries, by providing them with opportunities to retrain and re-skill so that the benefits of clean growth are experienced by people across the UK. This was underlined when the UK signed up to the Silesia Declaration in December 2018, promoting efforts to ensure that no workers or communities are left behind in this transition.

**Figure 21: Potential Growth in the UK Low Carbon Economy<sup>406</sup>**

However, there is inherent uncertainty around projecting what any existing or future policy can achieve, and this uncertainty becomes even more challenging when looking at the longer-term economy out to 2050. Recent years have shown that we should be flexible in our approach to our future energy mix, as global action can transform the cost and installation of different technologies. Other uncertainties include macroeconomic factors, such as gas prices, policy impacts and how society will respond to incentives, developments in the science evidence base, and future shifts in consumer and business behaviour.

In the CGS, we outlined how we explore this uncertainty by testing different potential versions of the future, based on current knowledge, and we described one possible pathway (the ‘2032 pathway’) for meeting the fifth carbon budget through domestic action. Delivering the 2032 pathway would result in a wide range of costs and benefits as illustrated in Table 44 below.

<sup>406</sup> The Clean Growth Strategy, 2017 [www.gov.uk/government/publications/clean-growth-strategy](http://www.gov.uk/government/publications/clean-growth-strategy)

**Table 44: Costs and benefits of the 2032 pathway<sup>407</sup>**

<b>Capital and operating costs</b>	The incremental costs of installing and running low carbon technologies
<b>Finance costs</b>	The real social cost of providing finance for capital investments, which varies between sectors
<b>Energy savings</b>	The value of lower energy use due to improved efficiency of energy consumption, or switching from fossil fuels to low carbon alternatives
<b>Greenhouse Gas emissions impacts</b>	The benefits associated with reduced emissions. Where emissions are covered by the EU ETS, this benefit will be the avoided financial cost of purchasing EU emissions allowances. Reductions in non-traded emissions are valued using the government's non-traded carbon values.
<b>Impacts on air quality</b>	The benefits associated with lower emissions of NO <sub>x</sub> , PM <sub>2.5</sub> and other air pollutants detrimental to the health of individuals.
<b>Other cost and benefits</b>	These include the hassle cost to households for installing measures, benefits of shorter journey times due to low congestion, less noise pollution and warmer homes from energy efficiency improvements.

These costs and benefits can vary significantly. In particular, they will depend on a wide range of social and economic factors such as growth in population and gross domestic product, on how innovation results in new and lower cost low-carbon technologies, and on the precise actions that are taken in the years ahead.

The extent of these costs and benefits is not fully known at this time because they will depend on the final design of the policies and proposals to meet carbon budgets. When setting the fifth carbon budget, an indicative set of costs and benefits was estimated and set out in the accompanying impact assessment.<sup>408</sup> Overall, it was estimated that meeting the fifth carbon budget through domestic action alone could be achieved with a net benefit to the UK of up to £5.5 billion over the fifth carbon budget period. The impact assessment also set out the sensitivity of these estimates to a range of underlying social and economic factors. These factors in particular included uncertainty around technology costs, energy prices, underlying drivers of UK emissions, and non-cost barriers to delivery.

As noted, these estimates only provide an illustration of the potential scale of impacts. The 2032 pathway shows what is considered possible through domestic action, although this is only one of several plausible pathways. As the UK government continues to deliver the Clean Growth Strategy and finalise policies, these will be accompanied with their own impact assessments where appropriate, which will set out the specific costs and benefits of the proposals.

<sup>407</sup> Costs and benefits of the 2032 pathway, page 150 of the Clean Growth Strategy, published 2017 [www.gov.uk/government/publications/clean-growth-strategy](http://www.gov.uk/government/publications/clean-growth-strategy)

<sup>408</sup> DECC (2016) Impact Assessment for the level of the fifth carbon budget [www.legislation.gov.uk/ukSI/2016/785/impacts](http://www.legislation.gov.uk/ukSI/2016/785/impacts) section 4.1.

## 5.3 Overview of investment needs

*i existing investment flows and forward investment assumptions with regard to the planned policies and measures*

The CGS set out proposals across the economy, – in homes, business, transport, and the natural environment; building on the progress made so far, to meet the UK’s carbon budgets.

**Table 45: Examples of UK Investment Pledges in the Clean Growth Strategy<sup>409</sup>**

Investment Amount	Investment Area
£2.5 billion, with more recent announcements increasing this to £3 billion <sup>410</sup>	Supporting low-carbon innovation from 2015 to 2021.
£162 million	Research and innovation in energy, resource and process efficiency.
Up to £20 million	Support new clean technology early investment funding.
Up to £100 million	Innovation in carbon capture usage and storage technologies.
£14 million	Support innovative energy technologies and processes through the Entrepreneurs Fund.
Around £3.6 billion	Upgrade around a million homes through the Energy Company Obligation (ECO), and to extend support for home energy efficiency improvements until 2028 at the current level of ECO funding.
£4.5 billion	Invest in low-carbon heating, reforming the Renewable Heat Incentive and supporting innovative low-carbon heat technologies in homes and businesses between 2016 and 2021.
£1.5 billion	Supporting the take-up of ultra low emission vehicles.
£184 million + two new £10 million innovation programmes	Develop new energy efficiency and heating technologies to enable lower cost low-carbon homes.
£80 million	Electric vehicle charging infrastructure deployment.

<sup>409</sup> The Clean Growth Strategy, 2017, [www.gov.uk/government/publications/clean-growth-strategy](http://www.gov.uk/government/publications/clean-growth-strategy). This is not an exhaustive list of all future UK Government investments.

<sup>410</sup> BEIS internal analysis.

Investment Amount	Investment Area
£250 million (matched by industry)	Research, development and demonstration of Connected and Autonomous Vehicle technologies.
£841 million	Innovation in low-carbon transport technology and fuels.
Up to £557 million	Further Contract for Difference auctions.
£900 million	Innovation in smart systems, renewable and nuclear energy.
£99 million	Innovation technology and research for agri-tech, land use, greenhouse gas removal technologies, waste and resource efficiency.
£255 million	Funding for public sector energy efficiency improvements in England.

Since publishing the CGS the UK has announced a range of further measures to drive investment in support of our climate targets. For example, since setting the net zero target in June 2019, the UK has committed more than £2 billion to support decarbonisation in sectors across the economy from industry to transport, including:

- £390 million of investment in hydrogen and low-carbon technology to [reduce emissions from industry](#), including steel - which accounts for 15% of industry emissions in the UK;
- up to [£1 billion additional funding](#) to develop and embed the next generation of cutting-edge electric vehicle technologies;
- £400 million of investment in new charging infrastructure for electric vehicles;
- plans to use [new financing models](#) to roll out more new nuclear, including up to £18 million for the UK's first mini nuclear reactor to be operational in the early 2030s - creating 40,000 jobs at its peak and powering 750,000 homes;
- £26 million of additional funding for carbon capture technology, including investment in the [UK's largest project to be operational by next year](#);
- £222 million [investment](#) in a visionary fusion reactor design programme;
- £5 million to help the financial sector develop green financial products, including green mortgages;
- £10 million innovation fund to cut the cost of retrofitting old homes.

More broadly, the National Productivity Investment Fund will provide an additional £4.7 billion, with an extra £2 billion a year by 2020-21, representing the largest increase in public spending on UK science, research and innovation since 1979.<sup>411</sup>

<sup>411</sup> The Clean Growth Strategy, 2017 [www.gov.uk/government/publications/clean-growth-strategy](http://www.gov.uk/government/publications/clean-growth-strategy)

## The Green Finance Strategy

Green finance will be central in delivering the Clean Growth Strategy and the UK's international climate objectives. The UK government's Green Finance Strategy<sup>412</sup>, published on 2 July 2019, sets out the UK's approach to accelerating green finance, with the overarching objective to align private sector financial flows with clean, environmentally sustainable and resilient growth, and strengthen the competitiveness of the UK financial sector.

The Strategy sets out the UK governments approach to accelerating green finance, with actions grouped under three themes:

1. **Greening finance:** Integrating climate and environmental factors into mainstream decision making in the private sector to ensure climate-related financial risks and opportunities are effectively managed.
2. **Financing green:** accelerating investment to support the UK's Clean Growth and Environmental ambitions, and international objectives.
3. **Capturing the opportunity:** ensuring the UK is well placed to capture the commercial opportunities in green finance.

The Green Finance Strategy is in part a response to the work of the Green Finance Taskforce, which was established in 2017 by the UK government to provide recommendations on how to accelerate the growth of green finance. The Taskforce identified a range of barriers to green investment, such as access to climate data and transparency of green investment opportunities; and set out a series of recommendations to overcome them in their report published in March 2018.<sup>413</sup> The UK government has taken action to implement the Taskforce's recommendations in a range of areas, for example:

- Announcing the establishment of a new Green Finance Institute with the overarching mission to accelerate the domestic and global transition to a clean, resilient and environmentally sustainable economy through accelerating UK leadership in green finance.
- Launching a new clean growth venture capital fund to support the development and commercialisation of innovation clean technologies.
- Strengthening engagement with local actors on green finance through a series of regional green finance workshops and conferences.
- Introducing new regulation to clarify and strengthen trustees' investment duties in relation to ESG factors, including climate change.
- Setting out an expectation for all listed companies and large asset owners to disclose in line with the Task Force on Climate-related Financial Disclosures (TCFD) recommendations by 2022.
- Setting out a package of measures to drive demand and supply of green lending products, such as through a new Green Home Finance Innovation Fund.

---

<sup>412</sup> The Green Finance Strategy, 2019 [www.gov.uk/government/publications/green-finance-strategy](http://www.gov.uk/government/publications/green-finance-strategy)

<sup>413</sup> Accelerating green finance: Green Finance Taskforce report, 2018, [www.gov.uk/government/publications/accelerating-green-finance-green-finance-taskforce-report](http://www.gov.uk/government/publications/accelerating-green-finance-green-finance-taskforce-report)

We continue to work closely with stakeholders to build our understanding of investment barriers and risks, for example, through hosting the inaugural Public Sector Green Finance Summit on 17 October 2019.

The UK clean growth sector has invested over £94 billion of public and private green investment in clean energy in the UK since 2010.<sup>414</sup> The UK was the first country in the world to establish a Green Investment Bank (GIB) attracting much needed private finance to address the challenge of climate change. Thanks in part to the GIB, the green investment market has improved in terms of the private sector capital available, which in turn has meant that green investment has now become more mainstream.

Through the UK's Clean Growth Strategy, the 25 Year Environment Plan and the Industrial Strategy the UK government is putting in place policy frameworks capable of building on this momentum.

The UK has put in place supporting policies to leverage private investment in key clean growth sectors:

**Power:**

- The sector has attracted more than £94 billion of investment in clean energy in the UK since 2010 (BNEF 2019).

**Homes:**

- The Heat Networks Investment Project seeks to leverage in around £1 billion of private sector and other investment.
- The Private Rented Property EPC E Minimum Standard for England and Wales has the potential to attract around £500 million of investment.
- The Clean Growth Strategy's aspiration of upgrading as many homes as possible to EPC Band C is estimated to require investment of between £35 billion and £65 billion.

**Transport:**

- We are investing nearly £1.5 billion between April 2015 and March 2021, with grants available for ULEV cars, vans, lorries, buses, taxis, and motorcycles, and schemes to support charge point infrastructure at home and workplaces on residential streets.
- The UK government has announced up to £1 billion of additional funding to develop UK supply chains for the large-scale production of electric vehicles, and for further EV research and development.

**Business and Industrial Energy Use:**

- The £315 million Industrial Energy Transformation Fund will support businesses with high energy use transition to a low-carbon future and cut their bills through increased energy efficiency.

---

<sup>414</sup> Bloomberg NEF (2018), Statement of Clean Energy Investment, <https://about.bnef.com/clean-energy-investment/>

- We are developing an Industrial Energy Transformation Fund, backed by up to £315 million of investment, to support businesses with high energy use to transition to a low-carbon future and to cut their bills through increased energy efficiency. The UK government has consulted on the design of the fund.

#### **Public sector:**

- Fund improvements in the public sector through the public sector energy efficiency loan scheme.

To improve access to finance the UK government has allocated substantial resource to fund investment in clean energy and natural capital growth. These funds are leveraging in larger sums from the private sector in order to achieve the overall level of investment required. For example, the Heat Networks Investment Project, provided as 'gap funding' to grow the market, aims to have a transformational impact on the development of cost-effective carbon savings required to meet the UK's future carbon reduction commitments. In return for a public investment of £320 million, the project is aiming to lever in around £1 billion of private and other capital by 2021.

The UK government is expanding its portfolio of blended innovation funds to ensure that public investment acts as a catalyst, increasing access to finance for promising new technologies and investment models:

- A new clean growth venture capital fund will be launched with £20 million capital contribution from BEIS with a view to attracting a matching or potentially greater capital sum from the private sector. In addition to catalysing clean growth equity financing market, this money will be invested on commercial terms in UK companies seeking to commercialise promising clean technologies.
- The £400 million Charging Infrastructure Investment Fund will accelerate the roll-out of charging infrastructure by providing access to finance to companies that deliver public charge points. The UK government will invest up to £200 million in the Fund, to be matched by private investors.
- We are developing an Industrial Energy Transformation Fund, backed by up to £315 million of investment, to support businesses with high energy use to transition to a low-carbon future and to cut their bills through increased energy efficiency. The UK government has consulted on the design of the fund.
- We are investigating options to increase the size of the Public Sector Energy Efficiency Loan Scheme (managed by Salix Finance). The scheme has funded over 17,000 projects, enabling public sector organisations to reduce their bills, with savings recycled into a dedicated fund for reinvestment.

Through the Green Finance Strategy, the UK government has also committed to developing and enhancing our approach for measuring progress on our objectives, including how best to monitor flows of green finance in the UK.

#### *ii sector- or market-risk factors or barriers in the national or regional context*

Decarbonisation must be achieved while maintaining security of supply (including a diversity of generation) and in the most cost-effective way, to provide affordable electricity for consumers and the UK economy more generally.

New low-carbon generators and investors often have to overcome relatively high barriers to market entry. High construction costs and market liquidity make it more difficult for low-carbon generation to compete with fossil fuels and impede market access. Small and independent players are also particularly affected by the risk of not being able to find long-term buyers for their electricity.

As highlighted by the CCC, greenhouse gas removal (GGR) technologies are likely to have an important role to play in offsetting difficult to cut emissions, by removing greenhouse gases from the air. However, there are uncertainties around their costs, deployment potential and impacts on the environment.

*iii analysis of additional public finance support or resources to fill identified gaps identified under section ii*

The Contracts for Difference (CfD) scheme for renewables is designed to decarbonise the electricity system cost-effectively, making the development of renewable generation cheaper for both investors and consumers. The CfD is designed to increase certainty over returns to the generator in order to bring forward investment in new low-carbon electricity generating capacity at minimum cost to consumers, whilst retaining the need for the generator to sell its power in the commercial market. The CfD provides greater long-term predictability of revenues to developers by reducing the exposure to volatile wholesale prices, thereby reducing the cost of capital and thus the level of support required. The two-way nature of the CfD also reduces or removes support for generators when electricity wholesale prices are high.

The CfD also mitigates problems faced by independent generators by reducing the long-term price risk they face, which will make Power Purchase Agreements (PPAs) simpler and less costly for offtakers to provide and should lead to greater competition in the market. The 'Offtaker of Last Resort' scheme provides eligible independent renewable generators holding a CfD with a guaranteed 'backstop' route-to-market, which enables them to have more flexibility in their contracting strategy for the sale of their power, supporting competition and reducing overall support costs. The total budget of the CfD scheme (as set out in the State aid approval for the scheme, 2014) is £15 billion. In the first auction held in 2014/15, developers of 27 projects (over 2GW) were offered contracts. At the time of contract award, the estimated budget spend was calculated as £315 million (2012 prices). In the second auction in 2017, developers of 11 projects (3.3GW capacity) were offered contracts. At the time of contract award, the estimated budget spend was calculated as £176 million (2012 prices). In the third auction in 2019, developers of 12 projects (5.8GW capacity) were offered contracts. At the time of contract award, due to all strike prices being below the reference prices forecast at the time of the auction, the estimated budget impact in the valuation years considered was calculated as zero.

To help promote and support GGR technologies, the UK government has created a programme of research and development, which aims to improve our understanding and overcome uncertainties. We have been working with the Research Councils, who launched a new £8.6 million research programme looking at all GGR technologies in April 2017. The UK government will also consider the scope for removing barriers and strengthening incentives to support the deployment of FFR, for example by developing a carbon offset market and exploring how UK timber could be used in construction.

The Smart Export Guarantee has been introduced to address concern that smaller-scale generators of low-carbon electricity may find it difficult to access a competitive market for the electricity they produce. It requires most licensed electricity suppliers to provide at least one

tariff for power exported from small-scale low-carbon installations. It does this in an intentionally flexible manner that enables a range of smart approaches such as small-scale electricity storage to be incorporated. By allowing suppliers to choose both the type, and the level, of the tariff(s) they offer, this policy encourages the creation of a competitive market between suppliers. The UK government has asked independent market regulator Ofgem to report annually on the provisions made by suppliers for smaller scale exporters, including the range, nature and uptake of tariffs offered by suppliers in response to SEG obligations (as well as any other similar tariffs suppliers are willing to share details of).

## 5.4 Impacts of planned policies and measures described in section 3 on EU Member States and regional cooperation at least until the last year of the period covered by the plan, including comparison to projections with existing policies and measures

*i Impacts on the energy system in neighbouring EU Member States in the region to the extent possible*

The UK remains a net importer of electricity and imported 19.1 TWh of electricity in 2018.

**Table 46: Net Imports Via Interconnectors, 2016-2018<sup>415</sup>**

### Net Imports (GWh)

	France – GB	Ireland – N. Ireland	Netherlands – GB	Ireland – Wales	Total
<b>Capacity (MW)</b>	2,000	540	1,000	500	4,040
<b>Net Imports (GWh)</b>					
2016	9,728	399	7,306	313	17,745
2017	7,181	-110	6,858	831	14,760
2018	12,890	-471	6,185	504	19,108
<b>Utilisation (%)</b>					
2016	71%	19%	86%	33%	63%
2017	67%	14%	83%	46%	61%
2018	78%	26%	75%	47%	67%

*ii Impacts on energy prices, utilities and energy market integration*

The new Capacity Market that was introduced as part of the redesign of the SEM has provided a significant saving in terms of the overall cost to the consumer of making sure that sufficient capacity is available to meet demand. The cost of the previous capacity arrangements was

<sup>415</sup> Figures taken from the demand data available on the National Grid website at

[www2.nationalgrid.com/UK/Industryinformation/Electricity-transmission-operational-data/Data-Explorer](http://www2.nationalgrid.com/UK/Industryinformation/Electricity-transmission-operational-data/Data-Explorer)

Figures taken from data available on the SEMO website at

[www.semo.com/marketdata/pages/energysettlement.aspx](http://www.semo.com/marketdata/pages/energysettlement.aspx)

Utilisation is total imports and exports across the interconnector in the year divided by the total possible imports and exports.

around £500 million per year for the whole island.<sup>416</sup> There have now been three T-1 auctions to secure capacity between 2018 and 2021. These have averaged £309 million per year, offering a clear saving which is passed directly to consumers. The redesign of the SEM to align with the European Target Model also allows for implicit / efficient electricity trading over interconnectors, with the SEM having access to the Single Day Ahead Coupling mechanism until the end of the Transition Period. Both of these factors have placed a downwards pressure on wholesale electricity prices. The future model of electricity trading over interconnectors the SEM will enjoy is dependent on the energy outcome of the UK-EU Future Relationship. In the absence of an agreed outcome, default arrangements are likely to be less efficient, with possible inflationary impacts on prices and a negative effect on security of supply.

Since its introduction in 2007, the SEM has been an excellent example of energy market integration. The structures which have been put in place to govern the SEM require cooperation at regulatory, technical and governmental levels.

*iii Where relevant, impacts on regional cooperation*

Not applicable.

# Annex A – Commission recommendations following review of the draft NECP and UK government responses

	Commission Recommendation	UK Government Response
1	<p>Further specify and quantify the impacts of the additional policies and measures, also beyond the building and transport sectors, to achieve the 2030 greenhouse gas target for sectors not covered by the EU emissions trading system of -37% compared to 2005. This includes the corresponding commitment under Regulation (EU) 841/2018 of the European Parliament and of the Council that land use, land use change and forestry emissions do not exceed removals and requires applying the underpinning accounting rules.</p>	<p>We have provided a list of our policies and measures in section 3.1.1. The Clean Growth Strategy includes ambitious policies on housing, business, transport and the natural environment, and the UK government is already transparent in publishing quantitative data on the impact of those policies in the National Archives.<sup>417</sup> As we said in the Strategy, some policies and proposals are yet to be fully developed, and these go through an established development process and are quantified at the appropriate time. As this work is completed, the impact of these policies is reflected in our updated energy and emissions projections, which are published each year.</p> <p>As of 31 January 2020, the UK has left the EU and will therefore not contribute to EU targets after the Transition Periods ends. The UK’s legally binding domestic carbon emissions reduction targets are among the most stringent in the world. Our fifth carbon budget requires an average reduction in emissions of 57% over 2028-32, compared with a 1990 baseline. We have met our first two carbon budgets and are on track to meet the third. The latest published emissions projections suggest we are on track to deliver over 90% of the required performance against 1990 levels for the fourth and fifth carbon budgets, even before many of the policies and proposals in the Clean Growth Strategy are taken into account.</p>

<sup>417</sup> Legislation.gov.uk delivered by the National Archives, [www.legislation.gov.uk/ukia](http://www.legislation.gov.uk/ukia)

Commission Recommendation		UK Government Response
2	<p>Put forward, as United Kingdom’s contribution to the EU 2030 target for renewable energy, a renewable energy share of at least 27 % indicated by the formula in Annex II under Regulation (EU) 2018/1999. Include an indicative trajectory in the final integrated national energy and climate plan that reaches all the reference points pursuant to Article 4(a)(2) of Regulation (EU) 2018/1999 in accordance with that share, in view of the need to increase the level of efforts for reaching this target collectively. Put forward detailed and quantified policies and measures that are in line with the obligations laid down in Directive (EU) 2018/2001 of the European Parliament and of the Council, to enable a timely and cost-effective achievement of this contribution. Increase the level of ambition in the heating and cooling sector to meet the indicative target included in Article 23 of Directive (EU) 2018/2001, and increase the level of ambition to meet the transport target in Article 25 of Directive (EU) 2018/2001. Provide additional details on the enabling frameworks for renewable self-consumption and renewable energy communities, in line with Articles 21 and 22 of Directive (EU) 2018/2001.</p>	<p>See section 2.1.2.</p>
3	<p>Set national contributions that would be substantially more ambitious than the projections from the modelling quoted in the draft integrated national energy and climate plan in view of the need to increase the level of efforts to reach the Union’s 2030 energy efficiency target. Propose more ambitious policies and measures that would deliver additional energy savings by 2030. Indicate policies and measures for the whole 2021 to 2030 period. Provide an impact assessment for the planned policies and measures in energy efficiency, in particular in terms of expected energy savings they are to deliver.</p>	<p>See section 2.2.</p> <p>Policies and proposals for mitigating climate change go through an established development process. As the development is completed, the impact of policies is quantified in updated EEP, which are published by the UK government annually.</p> <p>A summary of policies that would contribute to energy efficiency savings up to 2030 and their impact assessments is set out in section 5.1(iii).</p>

Commission Recommendation		UK Government Response
4	Specify the measures supporting the energy security objectives on diversification and reduction of energy dependency, including measures ensuring flexibility and the long-term supply of nuclear fuel, in view of the possible development of its nuclear generation capacity.	See section 2.3(ii).
5	Define forward-looking objectives and targets concerning market integration, in particular outline a strategy and timeline for progressing towards fully market-based prices.	<p>See sections 2.4.2(i), 2.4.3 and 4.5.3. Given that interconnection from the UK to most neighbouring markets requires subsea connection, this has meant the UK has historically had lower levels of interconnection relative to other European countries.</p> <p>With regard to the Great Britain electricity market, the UK's Clean Growth Strategy has stated that there is potential for at least 17.9GW of interconnection to the Great British electricity market. This figure is based on projects that have all either entered the construction phase or undergone regulatory assessment, and which are all targeting delivery by 2030. This strong pipeline of projects will significantly increase the UK level of interconnection by 2030.</p> <p>We are continuing to develop more electricity interconnection to open-up trade with neighbouring markets, with interconnector capacity in Great Britain recently increasing by 25% with the construction of Nemo Link between England and Belgium. The development of further interconnection is supported by Ofgem's Cap and Floor regime, which is the regulated route for interconnector investment in Great Britain (England, Scotland and Wales).</p>

	Commission Recommendation	UK Government Response
		<p>This regime has reduced risks with financing interconnector projects and unlocked substantial investment in interconnection, reflected in the number of new interconnectors under construction, including from England to France, Norway and Denmark, and those that have received regulatory approval for projects.</p> <p>In addition to this, the Single Electricity Market on the island of Ireland increases UK capacity through existing shared transmission lines and a future North-South interconnector, linking the wholesale electricity systems of Ireland and Northern Ireland.</p> <p>There are two temporary price caps in place in GB's retail energy market, the Default Tariff Cap and the Pre-Payment Meter (PPM) Cap, both of which strike the balance between protecting consumers and ensuring competition. In 2018, the UK the Domestic Gas and Electricity (Tariff Cap) Act placed a duty on Ofgem, the GB energy market regulator, to introduce a cap on the rate at which suppliers could charge consumers on standard variable and default rate tariffs ('the Default Tariff Cap'). The temporary measure is a response to the 2016 energy market investigation (EMI) conducted by the Competition and Markets Authority (CMA), which found consumers to be paying £1.4 billion per annum more than they would do in a fully competitive market. The Default Tariff Cap will cease to have effect by the end of 2023 at the latest, although may be removed beforehand. The Pre-Payment Meter (PPM) Cap (the 'PPM Cap') was put in place in 2017 by order of the CMA following its 2016 EMI, which found pre-payment meter customers were overpaying for their energy and were less able to switch tariffs than other energy consumers.</p>

Commission Recommendation		UK Government Response
		The PPM Cap is also a targeted measure to protect consumers on variable and default pre-payment tariffs from being overcharged, and is now being maintained by Ofgem. These measures are focused interventions designed to protect a specific segment of consumers from non-competitive pricing practices by limiting the upper boundary of charges. Therefore, market participants remain in control of how they purchase wholesale energy and setting their retail tariffs.
6	Clarify the national objectives and funding targets in research, innovation and competitiveness, specifically related to the Energy Union, to be achieved between 2023 and 2030, so that they are readily measurable and fit for purpose to support the implementation of targets in the other dimensions of the integrated national energy and climate plan. Underpin such objectives with specific and adequate policies and measures, including those to be developed in cooperation with other Member States, such as the Strategic Energy Technology Plan.	See section 2.5. As of 31 January 2020, the UK has left the EU and is no longer part of the Energy Union. Our future research and innovation activities will be designed to achieve our legally binding domestic carbon budgets and our new commitment to achieve net zero greenhouse gas emissions from the UK by 2050. Our research and innovation priorities and related spending to deliver these targets are in the process of being considered and agreed, but in the meantime, our intention is to remain closely engaged with international research and innovation activities to meet these world leading commitments. We have an overall target of spending an amount equal to 2.4% of GDP on UK research and innovation more generally, with energy research and innovation a part of this.
7	Build on the framework of the North Seas Energy Cooperation regarding the exchange of good practices for offshore wind support schemes and potential projects, in order to deliver on the Energy Union objectives of greater energy security, sustainability and competitiveness. In light of the United Kingdom's decision to leave the European Union, it should foresee measures to ensure continued regional cooperation with Ireland on emergency preparedness and response for electricity, and security of supply for gas and oil.	Section 1.4 includes text on the UK's participation in the North Seas Energy Cooperation. Sections 1.4 and 3.3 include further detail on gas and electricity security of supply, emergency preparedness and oil stocking arrangements, all in relation to regional cooperation (particularly with Ireland). As of 31 January 2020, the UK has left the EU and is no longer part of the Energy Union.

Commission Recommendation		UK Government Response
8	<p>Improve its analysis of investment expenditures and sources across Energy Union dimensions, including appropriate financing at national and regional level, which is currently provided for a list of areas, and complement it by a general overview of investment needs, risks and barriers.</p>	<p>Section 5.3 (i) sets out the supportive policies in place to leverage private investment in key clean growth sectors.</p> <p>As of 31 January 2020, the UK has left the EU and is no longer part of the Energy Union. Green finance will be central in delivering the UK's emission reduction targets and the UK's international climate objectives. The UK government's Green Finance Strategy, published on 2 July 2019, set out the UK's approach to accelerating green finance, with the overarching objective to align private sector financial flows with clean, environmentally sustainable and resilient growth, and strengthen the competitiveness of the UK financial sector. As part of the Green Finance Strategy the UK government has committed to developing and enhancing our approach for measuring progress on our green finance objectives, including how best to monitor flows of green finance in the UK.</p>
9	<p>List all energy subsidies, including in particular for fossil fuels, and actions undertaken as well as plans to phase them out.</p>	<p>See sections 3.1.3(iv) and 4.6(iv).</p>
10	<p>Present the impacts on air pollution for the various scenarios, providing underpinning information, and considering synergies and trade-off effects.</p>	<p>See section 5.1(i). The UK government has pledged that this will be the first generation to leave the environment in a better state than we inherited it.</p> <p>The UK has ambitious 2020 and 2030 emission reduction commitments in place for five key air pollutants. The UK government published a comprehensive Clean Air Strategy in January 2019 setting out a plan to meet these goals and reduce emissions, with subsequent technical analysis published in March.</p>

Commission Recommendation		UK Government Response
		<p>To measure progress towards these commitments, the UK government annually compiles national air pollutant emissions in the National Atmospheric Emissions Inventory (NAEI), which includes the UK Greenhouse Gas Inventory, used for reporting to the UNFCCC. We also produce air pollutant emissions projections for 2020, 2025 and 2030 which rely on data from various sources, key among which are the Updated Energy and Emissions Projections which take account of measures in place as far as is possible, given the data available.</p>
11	<p>Detail just and fair transition aspects, notably by designating the assessment of energy poverty, stating related objectives and describing the social, employment and skills impacts of the policies, measures and objectives. Special attention should be given to coal and carbon-intensive regions and how they will be impacted by the energy transition. Include a dedicated assessment of energy poverty issues, along with any related objectives or specific policies or measures, as required by the Regulation (EU) 2018/1999.</p>	<p>The UK government carries out a full impact assessment for each carbon budget at the point when that budget is set. The latest impact assessment available is that for the fifth carbon budget (2028-32) and was published in 2016. This included a set of costs and benefits that was indicative because the extent of these costs and benefits was not fully known at the time, as they were dependent on the final design of policies and proposals. The impact assessment also set out the sensitivity of these estimates to a range of underlying social and economic factors. As the UK government continues to deliver the Clean Growth Strategy and to finalise policies in line with established development processes, these policies will be accompanied with their own impact assessments where appropriate, which will set out the specific costs and benefits. The sixth carbon budget (2033-37) must be set by June 2021 and the UK government will produce a full impact assessment ahead of introducing any legislation to set it.</p> <p>Further information on energy poverty, which is a devolved area, has been provided in sections 2.4.4 and 3.4.4 to address this recommendation.</p>

## Annex B – Further information pursuant to requirements under Annex III of the Governance Regulation

Methodology pursuant to point 5 of Annex V to Directive 2012/27/EU for the operation of the energy efficiency obligation schemes and alternative policy measures referred to in Articles 7a and 7b and Article 20(6) of that Directive.

1. Calculation of the level of the energy savings requirement to be achieved over the whole period from 1 January 2021 to 31 December 2030, showing how the following elements are taken into account:

	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030
<b>Cumulative savings (ktoe)</b>	1,124	2,248	3,372	4,496	5,620	6,745	7,869	8,993	10,117	11,241

(a) the annual final energy consumption, averaged over the most recent three-year period prior to 1 January 2019;

	Final Energy Consumption (ktoe)			
	2016	2017	2018	Average over 2016-18
<b>All sectors</b>	140,789	139,397	141,346	140,511

(b) the total cumulative amount of end-use energy savings to be achieved;

<b>Total savings before exemption (ktoe)</b>	<b>61,825</b>
--	---------------

(c) data used in the calculation of final energy consumption and sources of such data;

<b>Data Source</b>	<b>Energy Emissions Projections 2018<sup>418</sup></b>
--------------------	--

The Energy Emissions Projections (EEP) give an accurate picture of the UK's final energy consumption after incorporating the effects of energy policies and macroeconomic drivers behind energy demand.

Our calculations for Article 7 take the final energy consumption data (including aviation) from the EEP to form an average over 2016-2018. The required 0.8% level of savings to be achieved annually is then calculated from this average cumulatively from 2021 to 2030. This results in total energy savings of 61,825 ktoe to be achieved by 2030 (or 719 TWhs).

<sup>418</sup> Energy and Emissions Projections 2018, available at: [www.gov.uk/government/publications/updated-energy-and-emissions-projections-2018](http://www.gov.uk/government/publications/updated-energy-and-emissions-projections-2018)

2. Calculation of the level of the energy savings to be achieved over the whole period from 1 January 2021 to 31 December 2030

As of 31 January 2020, the UK has left the EU and will not be bound by EU targets after the Transition Period ends. Beyond the end of the Transition Period, the UK has already put in place a range of policies and measures domestically which are projected to achieve significant energy savings between 2021-2030 (see Table 1). Total estimated energy savings are equivalent to around 938 Terawatt hours (TWh).

**Table 1: Estimated energy savings from UK policies 2021 - 2030 (TWh)**

Policy	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	Total (TWh)
Energy Company Obligation	5	5	5	5	5	5	5	5	5	5	49
Building Regulations - non-domestic (Existing build)	12	14	15	16	17	18	20	21	22	23	177
Building Regulations - domestic (Existing build)	13	14	15	16	17	18	19	20	21	21	172
Building Regulations - domestic (New build)	7	8	9	10	11	12	13	14	14	15	114
Building Regulations - non-domestic (New build)	5	6	7	7	8	8	9	9	10	10	79
Climate Change Agreements	2	2	2	2	1	1	1	1	1	1	14

Note: totals may not sum due to rounding

### 3. Policy measures in view of the achievement of the savings requirement referred to in Article 7(1) of Directive 2012/27/EU

As of 31 January 2020, the UK has left the EU and will not be bound by the Energy Efficiency Directive after the Transition Period ends. However, for the purposes of this Annex we provide a description of policy measures below which are projected to achieve significant energy savings for the UK between 2021-2030.

#### 3.1. Energy efficiency obligation schemes referred to in Article 7a

Measure	Description	Obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure	Specific actions and share of savings to be achieved in households affected by energy poverty	Savings achieved by energy service providers or other third parties	'Banking and borrowing' in accordance with point (b) of Article 7a(6)	Information on trading of energy savings
Energy Company Obligation (ECO)	The Energy Company Obligation (ECO) scheme is set by the Department for Business, Energy and Industrial Strategy (BEIS) and administered by the Office of Gas and Electricity Markets (Ofgem). ECO is a GB energy efficiency scheme.  ECO places an obligation on larger energy suppliers to	Ofgem is the administrator of the ECO scheme. Currently, energy suppliers with over 200,000 domestic customer accounts and supply volumes of over 1,100 GWh/year gas and/or 400 GWh/year electricity are obligated under the scheme and from April 1 2020, suppliers with over 150,000 domestic customer accounts	This policy targets low income, vulnerable and fuel poor homes. It is open to all domestic tenures with certain restrictions for social and private rented sector housing.	Details of eligible measures are contained in the statutory instrument <sup>419</sup> and set out in Ofgem guidance. <sup>420</sup>  Eligible measures include insulation (for example, solid, cavity, underfloor and loft) and heating	The current ECO scheme is fully focused on those who are low income, vulnerable or fuel poor.  The target for the current scheme, which has been running since December 2018, is £8.253bn in notional	The obligated energy suppliers are ultimately responsible for ensuring the measures are delivered under the ECO scheme. This saving is currently estimated	In previous iterations of ECO, as well as the current scheme, we have allowed obligated suppliers to 'carry over' certain measures from a previous obligation to the next. This enables suppliers to deliver above their obligation to manage risk, enabling surplus savings to count towards a future scheme. Whether this will be permitted beyond March 2022 will depend on what	Suppliers may, subject to approval, trade energy savings as it may simplify administration of their obligation. Suppliers may also choose to trade all or part of their obligation, subject to approval, as this could be economically more efficient. Ofgem

<sup>419</sup> [www.legislation.gov.uk/ukxi/2018/1183/contents/made](http://www.legislation.gov.uk/ukxi/2018/1183/contents/made) and [www.legislation.gov.uk/ukxi/2019/1441/contents/made](http://www.legislation.gov.uk/ukxi/2019/1441/contents/made)

<sup>420</sup> [www.ofgem.gov.uk/publications-and-updates/eco3-measures-table](http://www.ofgem.gov.uk/publications-and-updates/eco3-measures-table)

Measure	Description	Obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure	Specific actions and share of savings to be achieved in households affected by energy poverty	Savings achieved by energy service providers or other third parties	'Banking and borrowing' in accordance with point (b) of Article 7a(6)	Information on trading of energy savings
	<p>deliver energy efficiency and heating measures to low income, vulnerable and fuel poor homes. The scheme is funded at an estimated £640m per year and has been in place since January 2013; delivering around 2.6 million improvements in over 2 million homes.</p> <p>The current iteration of the ECO scheme runs till 31 March 2022.</p>	<p>and supply volumes of over 700GWh/year gas and/or 300 GWh/year electricity.</p> <p>It is the energy suppliers' responsibility to deliver set lifetime energy bill savings targets through the installation of specified measures. These are generally delivered by installers who are contracted by the energy suppliers.</p> <p>The target for the current scheme is £8.253bn in notional lifetime bill savings to be achieved by March 2022. These are apportioned to suppliers based on their market share.</p>		<p>measures (gas, electric, district and renewable).</p> <p>There is also an allowance and process for encouraging measures not previously installed under the scheme.</p>	<p>lifetime bill savings to be achieved by March 2022. Suppliers' individual targets are based on their market share.</p>	<p>to be 49 TWh over the eligible period.</p>	<p>policy follows the current scheme.</p>	<p>administers the trading process.</p>

3.2 Alternative measures referred to in Article 7b and Article 20(6) of Directive 2012/27/EU (except taxation)

Measure	Description	Implementing public authorities, obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure
<p>Building Regulations – Domestic and Non-Domestic (New and existing build)</p>	<p>Building Regulations in England are set and administered by the Ministry of Housing, Communities &amp; Local Government (MHCLG). In Scotland, Wales and Northern Ireland, the administration of Building Regulations are a devolved matter, and are made and maintained by the Welsh Government and the Northern Ireland Department of Finance and Personnel. The regulatory framework is similar to that in England (regulations supported by guidance) having similar target sectors.</p> <p>In England and Wales, enforcement of the regulations can be carried out by either the local authority or the private sector (approved inspectors). However, the enforcement of the Northern Ireland building regulations is carried out by District Councils.</p>	<p>Ministry of Housing, Communities &amp; Local Government (MHCLG), Welsh Government, Northern Ireland Government.</p> <p>Local authority or private sector building control bodies in England &amp; Wales. District councils in Northern Ireland.</p> <p>The person carrying out building work is responsible for ensuring that the work complies with the relevant requirements of the building regulations. They usually arrange for their work to be checked by an independent third party to make sure that their work meets the required standards. In some cases, the installer can certify themselves that their work complies.<sup>421</sup></p>	<p>New homes, new non-domestic buildings and when building work is carried out to existing properties for which Part L of the building regulations applies including extensions, conversions, renovation of the building envelope and replacement boilers and windows.</p>	<p>Details of eligible measures are contained in the statutory guidance (Approved Documents).</p> <p>These Approved Documents set minimum standards for new buildings for the thermal transmittance for walls, roofs, windows and doors together with minimum efficiency standards for heating systems. Work to existing buildings must meet similar standards when extensions and conversions are planned together with standards for replacement heating systems (e.g. the requirement to fit a high efficiency condensing boilers).</p>

<sup>421</sup> Details of building regulations and enforcement can be found: [www.gov.uk/government/policies/providing-effective-building-regulations-so-that-new-and-altered-buildings-are-safe-accessible-and-efficient/supporting-pages/building-control-system](http://www.gov.uk/government/policies/providing-effective-building-regulations-so-that-new-and-altered-buildings-are-safe-accessible-and-efficient/supporting-pages/building-control-system)

Measure	Description	Implementing public authorities, obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure
Climate Change Agreements	<p>Climate Change Agreements (CCAs), which were introduced alongside the Climate Change Levy (CCL), have the dual policy aims of mitigating the impact of the CCL on energy intensive industry and delivering energy/carbon savings. CCAs are voluntary agreements giving participants from eligible sectors a discount on the main rates of CCL in exchange for signing up to energy efficiency or carbon reduction targets. As of 1 April 2019, the relief currently provides a 93% CCL discount on electricity and 78% discount on gas and other taxable fuels. These are increased discount rates introduced on 1 April 2019 to take account of the increased rates of CCL which took effect on the same date.</p> <p>The current CCA scheme will be in place until 31 March 2023.</p>	<p>Participation in the Scheme is on a voluntary basis. Once entered into, the conditions of a CCA are binding in order to claim the discount on the CCL.</p> <p>The scheme is administered by the Government's Environment Agency (EA). The EA enters into Umbrella Agreements with sector trade associations and underlying agreements with CCA participants or 'Target Units'. The role of the EA as administrator includes administration of applications from companies wishing to join the scheme and the unit targets of companies, the reporting process, administration of buyout and surplus, and audits and compliance. Government is responsible for eligibility of sectors and setting of sector commitments.</p>	<p>The scheme covers 53 sectors, chiefly in industrial energy-intensive sectors.</p>	<p>Targets were set in 2012 on a biannual basis (with 4 target periods covering 2013 to 2020) and cover electricity and non-traded direct emissions. Scheme participants or 'target units' ('Tus') are able to meet their targets either by direct action, or by using a buy-out mechanism for any shortfall against targets. The buy-out was increased in 2017 from £12/t to £14/t CO<sub>2</sub>e. Any over-achievement by a target unit ('surplus') may be banked and used by that target unit in subsequent target periods.</p>

Measure	Description	Implementing public authorities, obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure
<p>CRC Energy Efficiency Scheme</p>	<p>The CRC Energy Efficiency Scheme (CRC, formally the Carbon Reduction Commitment) is a mandatory scheme aimed at improving energy efficiency and cutting emissions in large users of energy in the public and private sectors. These organisations are responsible for around 10% of the UK’s greenhouse gas emissions.</p> <p>The scheme features a range of drivers which aim to encourage organisations to develop energy management strategies that promote a better understanding of energy usage. It is designed to target energy supplies not already covered by Climate Change Agreements (CCAs) and the EU Emissions Trading System.</p> <p>The Environment Agency administers the scheme for the UK i.e. maintaining the CRC Registry into which information on energy use is entered by participants, through which allowances are obtained through trading on the secondary market – and surrendered, and from which the annual reports on emissions are generated for publications.</p>	<p>Organisations within the UK fell within the CRC if they had:</p> <ul style="list-style-type: none"> <li>• At least one settled half hourly electricity meter</li> <li>• Consumed at least 6,000 megawatt hours (MWh) or more of qualifying electricity supplied on the settled half hourly market.</li> </ul> <p>Some public bodies were required to take part in CRC regardless of how much electricity they used. These are called mandated participants and they include all UK central government departments and devolved administrations.</p>	<p>Non-domestic large energy users.</p>	<p>The CRC is technology neutral and so incentivises a range of measures (measuring, recording, reporting and managing of energy use). The modelling distinguished between behavioural and technical measures. Behavioural measures may not have a capital cost associated with them but require a change in use of energy consuming products to generate savings. Technical measures in contrast require a piece of equipment to be installed to generate energy savings and have a capital cost.</p>

Measure	Description	Implementing public authorities, obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure
	<p>The 2018/19 financial year was the final CRC compliance year, with the scheme having now closed (other than requirements for participants to keep records for potential auditing and some duties on the scheme administrator which run to 2025).</p>			
<p>Energy Savings Opportunity Scheme (ESOS)</p>	<p>The Energy Savings Opportunity Scheme (ESOS) is an energy assessment scheme that is mandatory for all large undertakings (non-SMEs) in the UK.</p> <p>The objectives of the policy are to promote the take up of cost-effective energy efficiency measures whilst minimising the cost to business of complying with the mandatory energy auditing requirements. By providing enterprises with tailored information about how they can make cost-effective savings ESOS should increase the take up of cost-effective energy efficiency measures. This will increase productivity, support higher economic growth, reduce carbon emissions and improve security of supply.</p>	<p>ESOS is mandatory for large undertakings registered in the UK. These are organisations that carry out a trade or business which employ 250 or more people or employ fewer than 250 people but have both an annual turnover exceeding €50m and a balance sheet exceeding €43m. An undertaking will also qualify for ESOS if it is part of a corporate group containing at least one 'large undertaking' as defined above.</p> <p>The UK Environment Agency (EA) is responsible for administering the scheme, and the EA and regional agencies are responsible for enforcing and auditing compliance with the scheme. Energy audits will be carried out by the private sector.</p>	<p>Non-domestic sector (non-SMEs enterprises).</p>	<p>Energy audits carried out for/by non-SMEs in scope of the scheme will result in recommendations being made to those organisations of measures that could be taken in order to make energy savings. The nature of the recommended measures will depend on the nature of the audited organisation's energy use and will be determined on a case-by-case basis by the auditors in question, depending on the energy efficiency opportunities that are relevant to participant organisations.</p> <p>Organisations which are in scope of ESOS must carry out energy audits on assets and activities relating to buildings, industrial processes and transport, that account for at least 90% of their total annual energy consumption to identify cost-effective energy saving measures.</p>

Measure	Description	Implementing public authorities, obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure
	<p>SMEs across the UK are encouraged through ESOS guidance to undertake an energy audit on a voluntary basis to identify ways to reduce energy consumption and to demonstrate their commitment to energy efficiency. Those who notify compliance have their details published by the Environment Agency to show they have complied. Research conducted by BEIS in 2017 showed that 42% of organisations of a medium size (50-249 employees) had undertaken an energy audit.</p> <p>ESOS is a regulation that does not have an end date i.e. it will remain active until such time that it is repealed through legislation.</p> <p>There are intermediate obligation periods of 4 years for conducting ESOS assessments (with deadlines to confirm compliance by December 2019 and every 4 years thereafter).</p>			

Measure	Description	Implementing public authorities, obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure
Low Emission Vehicles	<p>The policy purpose of the Office for Low Emission Vehicles (OLEV) is to reduce the level of greenhouse gas emission (particularly CO<sub>2</sub>) from road transport by supporting the early market for ultra-low emission vehicles. Ultra-Low Emission Vehicles (ULEVs) will present opportunities for better and more efficient energy management.</p>	<p>OLEV is made up of officials from the Department for Transport and the Department for Business, Energy and Industrial Strategy. OLEV work across UK government to support the early market for ULEVs. OLEV provides support to position the UK at the global forefront of ULEV development, manufacture and use. This support is intended to contribute to economic growth and help reduce greenhouse gas emissions and air pollution on UK roads.</p>	<p>Transport sector – road.</p>	<p>The UK government’s investment in low-carbon vehicles has a primary aim of saving carbon which is met through a combination of energy efficiency and low-carbon energy sources. The energy savings presented are the net final energy saving. Two schemes run to incentivise low-emission light vehicles (one for vans and one for cars). These cover new cars and vans, with type approval and meeting certain performance criteria, with CO<sub>2</sub> emissions below 75g/km. Manufacturers must demonstrate that vehicles meet these criteria: a list of eligible vehicles is published on the gov.uk website<sup>422</sup>.</p> <p>The increase in ULEVs will present opportunities for better and more efficient energy management. This will be particularly true with the introduction of intelligent power supply networks (smart grids) and the roll-out of electricity and gas smart meters to domestic properties (and several million smaller non-domestic businesses) which is underway in Great Britain.</p>

<sup>422</sup> [www.gov.uk/plug-in-car-van-grants/overview](http://www.gov.uk/plug-in-car-van-grants/overview)

Measure	Description	Implementing public authorities, obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure
<p>Private Rented Sector Regulation (England &amp; Wales) – Domestic and Non-Domestic</p>	<p>This policy is intended to ensure that action is taken to upgrade the energy efficiency of the sector. The intended effects are to make progress against the UK government’s statutory fuel poverty and climate change commitments; reduce energy demand in the Private Rented Sector, thereby lowering energy bills and improving energy security; and improve thermal comfort and associated health outcomes.</p> <p>This policy required landlords improve their properties to an EPC rating of E or above prior to entering into new tenancies, or the renewal/extension of an existing tenancy.</p> <p>Domestic landlords of EPC Band F and Band G rated homes are required to invest, or co-invest, in improving the energy performance of these properties to EPC Band E, if no third-party funding is available or is insufficient. The landlord spend requirement is capped at £3,500 inclusive of VAT.</p>	<p>Local authorities are the enforcement authorities. Landlords owning domestic and non-domestic private rented sector properties which are below an EPC rating of E are required to improve their property to at least an EPC rating of E or register an exemption.</p>	<p>The policy is primarily aimed at improving the energy performance of the least energy efficient properties in the domestic and non-domestic private rented sector.</p>	<p>Landlords are required to install ‘relevant energy efficiency improvements’ which are defined under the regulations, to meet the minimum EPC E rating.</p> <p>The landlord may register for exemptions, including where the cost of measures exceeds the £3,500 domestic cost cap, or fails to meet the 7-year payback for non-domestic properties.</p>

Measure	Description	Implementing public authorities, obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure
	<p>Prohibition on granting a new tenancy or renewing / extending a tenancy applied from the 1 April 2018. The backstop date from which the regulations will apply to all existing tenancies is the 1 April 2020 for domestic properties, and 1 April 2023 for non-domestic properties.</p>			
<p>Rail Electrification</p>	<p>The Department for Transport (DfT) set out a rail electrification policy and associated funding for nominated schemes through its former Rail Investment Strategy covering rail investments in the period 2014 to 2019.</p> <p>Some of the planned electrification schemes under development have been delivered, including part of the Midland Main Line and Great Western Main Line. Some of the electrification schemes were paused when the programme was re-scoped.</p> <p>DfT is now working with Network Rail, the owner of the rail infrastructure in the UK, on a Traction Decarbonisation Network Strategy (TDNS). This will consider the most appropriate technology, including electrification, for decarbonisation of the remaining unelectrified lines in the country.</p>	<p>Network Rail, the owner of the rail infrastructure in the UK, is responsible for delivering the electrification schemes identified with the funding agreed with DfT.</p>	<p>Transport sector – railway.</p>	<p>The UK government’s investment in rail electrification is driven by the cost savings, carbon benefits and improved reliability and performance of running electric trains instead of diesels. A significant element of the cost savings arise from the improved energy efficiency of electric trains combined with the use of electricity instead of diesel as a fuel.</p> <p>Following the completed electrification schemes, 80% of passenger km are undertaken on the electrified network.</p>

Measure	Description	Implementing public authorities, obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure
Re:Fit	<p>The Re:Fit programme is a procurement framework for public sector organisations to procure energy efficiency improvements to their buildings from Energy Service Companies (ESCOs). This is an embryonic market in the UK, and the Greater London Authority provides support for public bodies in accessing this novel contracting arrangement within London. BEIS and Local Partnerships work jointly to provide similar support in the rest of England.</p> <p>Government support, through BEIS, for the current Re:Fit programme is due to end in March 2020. Local Partnerships and Welsh Government are currently designing a successor programme which will operate without BEIS support.</p> <p>In Wales, the Re:Fit Cymru Programme Implementation Unit<sup>423</sup> provides end to end support to the Welsh public sector to develop and implement projects using the Re:Fit framework.</p>	<p>The Re:Fit framework is open to all public sector bodies. They are able to use the framework in order to make energy efficiency improvements to their estate. It is an entirely voluntary programme; the public bodies chose to make use of the framework, securing financing and working with ESCOs to ensure the measures are properly designed and implemented. The role of the ESCO is to design and implement the energy efficiency improvements, then monitor their performance to guarantee the energy savings.</p>	<p>All public sector buildings in England and Wales.</p>	<p>Re:Fit is an output based procurement tool – as such any energy efficiency building improvement measure that relates to the fabric of the building is within scope.</p>

<sup>423</sup> [www.gov.wales/topics/environmentcountryside/energy/efficiency/re-fit-cymru/?lang=en](http://www.gov.wales/topics/environmentcountryside/energy/efficiency/re-fit-cymru/?lang=en)

Measure	Description	Implementing public authorities, obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure
Salix Public Sector Finance	The Public Sector Energy Efficiency Loan Scheme <sup>424</sup> provides interest-free loans, via a revolving fund, to public sector and higher education organisations, for energy efficiency projects. Total funds will rise to £385m by 2020.	<p>Salix Finance is funded by BEIS, and the Welsh and Scottish Governments and provides interest-free loans to Public Sector bodies to fund energy efficiency improvement projects.</p> <p>The energy savings made enable the Public Sector body to repay the loan to Salix over an agreed repayment period. The majority of repayments are then allocated to further energy-efficiency projects by agreeing further loans.</p> <p>Salix loans are available to all public sector bodies, other than central government and NDPBs.</p>	Public sector organisations.	<p>Salix Finance supports a broad range of energy-efficiency technologies, which all have lifetime energy saving estimates based on an established methodology. Examples of commonly funded energy-efficiency technologies include:</p> <ul style="list-style-type: none"> <li>• Energy efficient lighting eg. LED/T5 lamps</li> <li>• Installation and upgrading of building energy management systems</li> <li>• Energy efficient street lighting eg. part night dimming systems/LED replacements</li> <li>• Improvements to heating systems eg. implementing heat recovery and switching from oil to gas boilers</li> <li>• Building fabric insulation improvements, such a cavity wall and loft insulation</li> </ul>

Measure	Description	Implementing public authorities, obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure
<p>Smart Metering (Non-Domestic)</p>	<p>Smart Meters are the next generation of gas and electricity meters and provide consumers with more accurate information, putting an end to estimated billing. Smart meters can provide near real-time information to help consumers control and manage their energy use, save money and reduce emissions. Alongside the roll-out of smart meters to all homes in Great Britain (GB), the Government's vision is for all smaller non-domestic premises to benefit from smart metering.</p> <p>In the period to end-September 2019, over 1.1 million smart and advanced meters are in operation in smaller non-domestic sites.<sup>425</sup></p> <p>Energy suppliers are responsible for the provision and installation of smart meters in non-domestic premises and are required under conditions in their licences to take all reasonable steps to install smart (or advanced) meters in all relevant non-domestic premises by the end of 2020.</p>	<p>Energy suppliers are responsible for the provision and installation of smart meters in non-domestic premises. They are required under conditions in the gas and electricity supply licences to take all reasonable steps to install smart (or advanced) meters in all non-domestic premises covered by the rollout by the end of 2020, and report progress to Ofgem, the GB independent energy regulator with a responsibility for regulating the roll-out.</p>	<p>Smaller and medium-sized non-domestic premises in GB. This captures electricity meters in profile classes 3 and 4 (Non-domestic Unrestricted Customers and Non-domestic Economy 7 Customers) and gas meters where average annual gas consumption is below 732MWh. These are the least energy intensive non-domestic customers and are, typically, smaller non-domestic organisations.</p>	<p>The non-domestic roll-out covers around three million meters in around two million sites. These sites are very varied, including private and public sector organisations, small shops to chain stores and compact industrial units to schools.</p> <p>Microbusiness consumers must be provided with a smart meter which complies with the latest version of the Smart Metering Equipment Technical Specification (SMETS2). Non-microbusiness consumers can be offered a choice between a SMETS2 meter and an Advanced meter (these meters provide half-hourly data, and are established in the larger industrial and commercial sector).</p>

<sup>425</sup> BEIS (2019) Statistical release and data: Smart Meters, Great Britain, quarter 3 2019, available at: [www.gov.uk/government/statistics/statistical-release-and-data-smart-meters-great-britain-quarter-3-2019](http://www.gov.uk/government/statistics/statistical-release-and-data-smart-meters-great-britain-quarter-3-2019)

Measure	Description	Implementing public authorities, obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure
	<p>Since June 2019 the ‘new and replacement obligation’ has applied, which (subject to certain exceptions) requires energy suppliers to take all reasonable steps to ensure a smart is installed where a meter is replaced or installed for the first time (e.g. in new build premises). In September 2019 the Government consulted on a number of proposals to help inform the policy framework for energy suppliers to continue installing smart meters after 31 December 2020, when the current rollout duty ends.<sup>426</sup></p>			
<p>Northern Ireland Sustainable Energy Programme (NISEP)</p>	<p>The NISEP is a voluntary energy efficiency programme in which money is collected from electricity customers through a Public Service Obligation (PSO). The charge is a flat rate (around 0.113 pence) per kilowatt hour which means that customers who use higher volumes pay more than those who use less. A competition to bid for funds to run energy efficiency schemes is carried out on an annual basis.</p>	<p>NISEP is set up and overseen by the Northern Ireland Authority for Utility Regulation (UR).</p> <p>The Energy Saving Trust (EST) acts as Programme Administrator to manage the programme on behalf of UR.</p> <p>NIE Ltd, the owner of the distribution network in NI, collects the fund and pays it out to organisations running approved energy saving schemes, in accordance with a condition in its distribution licence.</p>	<p>Domestic &amp; non-domestic buildings, where 80% of the funding is ring-fenced for schemes that target priority (vulnerable/low-income) households. The other 20% of funding is used for schemes that target non-priority domestic households and/or the commercial sector. All energy types are targeted for savings including electricity, gas, oil, coal etc.</p>	<p>Insulation – loft, cavity wall, solid wall (internal or external), hot water cylinder and pipe;</p> <p>Heating systems, including high heat retention storage heaters and boiler and controls – natural gas or oil (if not on the gas network);</p> <p>Energy efficient lighting (in domestic sector can be included in a scheme but lighting only schemes are no longer allowed);</p> <p>Domestic refrigeration and appliances (these measures have not been included in schemes for a number of years);</p>

<sup>426</sup> [www.gov.uk/government/consultations/smart-meter-policy-framework-post-2020](http://www.gov.uk/government/consultations/smart-meter-policy-framework-post-2020)

Measure	Description	Implementing public authorities, obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure
		<p>All Northern Ireland licenced electricity and gas companies are eligible to become Primary Bidders and bid for funds to undertake schemes – in practice only five electricity and gas suppliers participate in the programme – Power NI, SSE Airtricity, firmus energy, Energia and Electric Ireland.</p> <p>Primary Bidders are totally responsible for the undertaking of their schemes and must sign an agreement with UR to agree to undertake the schemes in accordance with the NISEP Framework Document.</p>		<p>Other technologies for commercial sector e.g. variable speed drives and compressors, heat exchangers, high bay lighting and liquid refrigerant pumping technology.</p> <p>This is not an exhaustive list, other measures will be considered if they are proven technologies that meet or exceed relevant standards (e.g. safety, quality), the present value of the lifetime customer benefits exceeds the cost of the measures and if approved by the Energy Savings Trust.</p> <p>There should be no overlap with other grant or incentive schemes external to the NISEP for the particular measure eg. most renewable micro generation measures are no longer eligible for NISEP funding since Government incentives have been introduced.</p>

Measure	Description	Implementing public authorities, obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure
<p>Welsh Government Energy Service</p>	<p>The Welsh Government Energy Service succeeds Green Growth Wales and offers technical, commercial and financial support for Welsh energy efficiency, renewable and heat projects.</p> <p>Available to public sector organisations, the capital finance is available through Salix (above) and is interest-free.</p> <p>With funding from the Welsh Government, Salix Finance SEELS (Salix Energy Efficient Loan Scheme) loans have been used by 47 different Welsh public sector bodies since 2009. More than £80m has been invested by our clients in Welsh energy efficiency projects which, over their lifetime, are forecasted to save approximately £140m. The service has further stimulated another £27m of investment from other sources.</p>	<p>Paid for by Welsh Government, the fund is administered by Salix.</p>	<p>Public sector organisations.</p>	<p>Only those projects where the resultant energy savings, over the lifetime of the project, go directly back to the public sector and the public sector gains a direct financial benefit are eligible.</p>

Measure	Description	Implementing public authorities, obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure
<p>Warm Homes Programme</p>	<p>The Welsh Government's Warm Homes Programme has been in place since 2009. Investment has reached over £327m in the past decade. It has improved the energy efficiency of more than 55,000 homes in Wales. By the end of the current funding period in March 2021, Welsh Government investment will have reached more than £344m and over 75,000 homes will have benefitted. Over 129,506 people have received energy efficiency advice through the programme since 2011.</p> <p>As part of the programme, the Warm Homes Nest and Arbed Schemes have supported some of the most vulnerable people in society by improving their resilience to avoidable ill health and preventing premature death.</p>	<p>The programme has received funding from European, UK and Welsh Governments.</p>	<p>Domestic households living in fuel poverty.</p>	<p>Between 2018-19, the Nest scheme has helped people claim their entitlement to a Warm Homes Discount from their energy supplier and more than 3,800 homes have benefited from home energy efficiency measures during this reporting period.</p> <p>Although the Arbed Scheme is not predominantly a decarbonisation scheme, it's approach to retrofitting housing does contribute to wider decarbonisation efforts.</p>

Measure	Description	Implementing public authorities, obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure
Boiler Plus	<p>The policy objectives are to deliver additional energy and carbon savings from the domestic heating sector in England by lowering overall gas demand from domestic properties, thereby reducing fuel bills for these properties and contributing towards meeting the UK's legally binding carbon budgets. It aims to do this by increasing the deployment of devices which increase the efficiency of domestic heating systems, through controls and measures to make gas boilers heat homes more efficiently.</p> <p>New standards for domestic boilers in the Building regulations for England came into force in April 2018 and will remain in force indefinitely.</p>	<p>The standards create an obligation on the person carrying out the work when a gas boiler is installed in an existing dwelling in England. Compliance and enforcement of standards pertaining to fixed building services is the responsibility of Building Control, which are teams of surveyors responsible for checking all aspects of construction.</p>	<p>Existing domestic buildings in England dependent on gas boilers.</p>	<p>The measure applies to all households in England in the domestic sector with an existing combi gas boiler.</p> <p>The standards require:</p> <p>All gas boilers installed into existing systems to have Energy Related Products (ErP) methodology rating of at least 92%;</p> <p>Time and temperature controls to be installed at the same time, if not already present and working;</p> <p>Combination boiler replacements to include the provision of an additional energy efficiency measure to be installed at the same time. But to reflect the diverse needs and circumstances of homes and households, the requirement will provide flexibility to allow a wide range of technology options to be considered.</p>

Measure	Description	Implementing public authorities, obligated parties and their responsibilities	Target sectors	Eligible actions provided for under the measure
Streamlined Energy and Carbon Reporting Framework (SECR)	<p>SECR reporting came into force on 1 April 2019 to coincide with the removal of the CRC Energy Efficiency Scheme allowance price and the increase in CCL rates. SECR aims to reduce the administrative burdens of the current overlapping suite of reporting requirements while increasing corporate transparency, further incentivising energy efficiency and reducing carbon emissions.</p> <p>SECR builds on – but does not replace – existing requirements that companies may face, such as mandatory greenhouse gas (GHG) reporting for quoted companies, the Energy Savings Opportunity Scheme (ESOS), Climate Change Agreements (CCA) Scheme, and the EU Emissions Trading Scheme (ETS).</p>	SECR extends the reporting requirements for quoted companies and mandates new annual disclosures for large unquoted and limited liability partnerships (LLPs).	Large or quoted UK businesses.	Requiring organisations to report on their energy use is intended to drive behaviour change by raising awareness of energy efficiency with organisational decision makers and increasing the importance of energy efficiency to organisations through reputational drivers. Increased transparency for investors and others will make them more able to hold companies to account.

### 3.3. Information on taxation measures

Taxation Measure	Description	Duration	Implementing public authority	Expected cumulative and annual amount of savings	Target sectors and segment of taxpayers	Calculation methodology
Climate Change Levy	The CCL is a levy on the supply of energy to business and public-sector consumers. Each of the four main groups of taxable commodities (electricity, gas, coal, and liquefied petroleum gas) has its own main rate per unit of energy. The main rates of the CCL are intended to change business behaviour to reduce energy consumption. CCL rates will be increased from 1 April 2019 by 31% on electricity and 40% for gas and other taxable fuels. <sup>427</sup>	The CCL was introduced in 2001. There is no planned end date so is assumed to continue for the whole period 2014-2020. The CCL rate is set each year by HMRC.	HM Revenue & Customs	<p>The estimated energy savings from the CCL over the period 2014-20 have been set out in Table 1. These are presented as annual savings over the seven-year period.</p> <p>The savings presented are based on the impact of the duty charged that is additional to the EU Energy Taxation Directive (ETD) minimum rates for CCL taxable commodities.</p>	<p>The main rates of climate change levy are paid on supplies of taxable commodities to business consumers including consumers in industry, commerce, agriculture, public administration, and other services. The main rates of CCL do not apply to taxable commodities supplied for use by domestic consumers or to charities for non-business use, while use in metallurgical and mineralogical processes, non-fuel and dual use applications, transport and the production of electricity and energy products is exempt.</p> <p>Commodities must register with HMRC and account for tax due on a quarterly basis.</p>	<p>The calculation of energy savings has been made based on long-run price elasticities applicable to the sectors within the UK from published academic literature.</p> <p>Organisations within a range of sectors can claim partial exemption from the CCL if they have a Climate Change Agreement (CCA).</p> <p>For participants within the Climate Change Agreement, their CCL rate is reduced to approximately the Energy Tax Directive (ETD) minimum rate. Savings within the CCA sector are presented separately.</p> <p>Given the CCL is an existing policy measure the analysis estimates what increase in energy consumption would be observed if the CCL was not charged above the ETD minimum.</p>

<sup>427</sup> [www.gov.uk/government/publications/rates-and-allowances-climate-change-levy/climate-change-levy-rates](http://www.gov.uk/government/publications/rates-and-allowances-climate-change-levy/climate-change-levy-rates)

4. Calculation methodology for measures notified under Articles 7a and 7b and Article 20(6) of Directive 2012/27/EU (except for taxation measures)

Scheme/Measure	Measurement methods used	Method to express the energy savings (primary or final savings)	Lifetime of measures	Description of the calculation methodology	Information on how double counting of energy savings is avoided	Climatic variations and approach used
Energy Company Obligation (ECO)	<p>Scoring is delegated to the administrator of the scheme, Ofgem. Ofgem work with the Building Research Establishment to produce 'deemed' scores for each energy efficiency measure.</p> <p>Savings from this policy are considered deemed savings.</p>	Final savings.	<p>Assumptions are made about the lifetime of each eligible energy efficiency measure under the scheme. The lifetime assumptions are integrated into scores attributed to each energy efficiency measure delivered under the scheme.<sup>428</sup></p>	Deemed scores are lifetime scores and they relate to the average treatable area for the measure type.	We model the scheme net of the counterfactual and consider overlap with other related policies.	There is no variation based on climatic conditions.

<sup>428</sup> [www.ofgem.gov.uk/publications-and-updates/eco3-deemed-scores](http://www.ofgem.gov.uk/publications-and-updates/eco3-deemed-scores)

Scheme/Measure	Measurement methods used	Method to express the energy savings (primary or final savings)	Lifetime of measures	Description of the calculation methodology	Information on how double counting of energy savings is avoided	Climatic variations and approach used
<p>Building Regulations – Domestic and Non-Domestic (New and existing build)</p>	<p>Savings are calculated by measuring the uplifts to Part L of building regulations against a counterfactual scenario of energy savings that would have occurred without Part L changes.</p>	<p>Final savings.</p>	<p>Assumptions were made about the approximate asset life of each measure.</p> <p>Building fabric (external walls, floors, roofs) – 60 years</p> <p>External windows and doors – 30 and 25 years respectively.</p> <p>Heating, ventilation and air conditioning (HVAC) equipment and lighting – 15 and 20 years respectively.</p> <p>The policy is assumed to apply to all building developments over a 10-year period from introduction.</p>	<p>Calculation of overall building energy performance for new buildings is undertaken using the UK National Calculation Methodology approved for use in transposition of Article 3 of Directive 2010/31/EU. This considers the range of criteria set out within Annex 1 of that Directive and is applied for new dwellings through the UK government’s Standard Assessment Procedure (SAP) and, for new non-domestic buildings, the Simplified Building Energy Model (SBEM).</p>	<p>The policy impacts estimated does not overlap with other policies, so any estimated impacts are considered additional.</p>	<p>The methodology for calculating the energy performance of buildings approved by the regulations includes climate data. The UK methodology for dwellings (SAP<sup>429</sup>) applies average UK data for heating load assessment and regional factors for solar radiation and cooling loads. The UK methodology for non-domestic buildings (SBEM39) does include a number of climate zones across the UK.</p>

<sup>429</sup> [www.bre.co.uk/sap2009/](http://www.bre.co.uk/sap2009/)

Scheme/Measure	Measurement methods used	Method to express the energy savings (primary or final savings)	Lifetime of measures	Description of the calculation methodology	Information on how double counting of energy savings is avoided	Climatic variations and approach used
			<p>The estimated energy savings and incremental costs associated with tightening the Regulations are accumulated and discounted over the 60-year life of each building developed during the policy period.</p>	<p>Calculation of the performance of building elements is demonstrated through reference to the relevant standards.</p>		
<p>Climate Change Agreements</p>	<p>Targets are set for the energy use of a firm. To set relative targets a throughput measure is needed that relates accurately to energy consumption or carbon emissions - the actual production level in the target year is compared with the energy that would have been used for the same level of production and mix of products at the efficiency of production in the base year.</p>	<p>Final savings.</p>	<p>It is not possible to give an estimate of the average lifetime of these measures as conditions may vary between technologies and sectors.</p>	<p>CCAs have been in place since 2001 and DECC has collected data from a consultation exercise and has received feedback from participants; this forms the basis of much of this analysis. Many of proposals been consulted on previously and have provided further evidence that has improved the quantification of costs and benefits.</p>	<p>A CCA double counting mechanism ensures there is no double counting. Where an operator has surplus EU ETS allowances, this is offset by the CCA target being tightened to become more demanding. This is an emissions reduction but is achieved by tightening the CCA target to make it more demanding.</p>	<p>These are not deemed significant in the non-domestic sector.</p>

Scheme/Measure	Measurement methods used	Method to express the energy savings (primary or final savings)	Lifetime of measures	Description of the calculation methodology	Information on how double counting of energy savings is avoided	Climatic variations and approach used
					<p>Alternatively, if operators do not want to use the double counting mechanism they can avoid it completely by retiring all their surplus EU ETS allowances that form the overlap. Any failure to retire all the surplus EU ETS allowances leads to the full implementation of the double counting mechanism, with no allowance being made for any part of the EU ETS surplus that might have been retired.</p>	

Scheme/Measure	Measurement methods used	Method to express the energy savings (primary or final savings)	Lifetime of measures	Description of the calculation methodology	Information on how double counting of energy savings is avoided	Climatic variations and approach used
CRC Energy Efficiency Scheme	The analysis on the impact of CRC on energy savings is based on modelling take up rates <sup>430</sup> of energy efficiency potential in response to carbon prices. It assumes that CRC organisations will take up measures that equate to a cost of up to the corresponding price of CRC allowances.	Final savings.	The weighted average lifetime of technical/capital measures is nine years, while behavioural measures are assumed to be replaced/reintroduced every three years. The analysis also assumes that measures continue to be replaced at an annual rate of 0.3% a year (however the actual rate may be higher than this if the introduction of the CRC stimulates additional research and development).	Analysis on the impacts of the CRC on carbon savings and energy bills is based on two databases of technological and behavioural measures: BRE's abatement cost curves for the non-domestic sector and the ENUSIM model for industrial sectors as modified by Enviro for the Energy Efficiency Innovation Review (2005). It assumes that over time (and in response to the introduction of the scheme) the existing cost-effective potential for emission reductions will be taken up by participant organisations.	These measures are expected to target energy savings potential not already covered by the policies operational at the time CRC was conceived (i.e. CCA and EU ETS). The analysis then deducts the impact of other policies that were implemented before the actual start of CRC and would have overlapped with the scheme, which include non-domestic Smart Meters, Energy Performance of Building Directive, Green Deal and Products Policy.	These are not deemed significant in the non-domestic sector.

<sup>430</sup> Energy Efficiency and Trading Part II: Options for the Implementation of a New Mandatory UK Emissions Trading Scheme. Department for the Environment, Food and Rural Affairs. 28 April 2006.

Scheme/Measure	Measurement methods used	Method to express the energy savings (primary or final savings)	Lifetime of measures	Description of the calculation methodology	Information on how double counting of energy savings is avoided	Climatic variations and approach used
					<p>The scheme coverage has been adjusted to account for the exclusion of metallurgical and mineralogical processes from the CRC, following the introduction of an exemption from the Climate Change Levy (CCL) for energy used for these processes.<sup>431</sup></p> <p>Finally, energy savings have been adjusted to remove the impact of savings incentivised by these policies prior to 2014. This is done by removing legacy savings of technologies that the abatement potential analysis suggests will be adopted up to 2013.</p>	

<sup>431</sup> The impacts of this change have been presented in the February 2014 Impact Assessment – ‘Finalising CRC simplification: treatment of renewable energy & the metallurgical and mineralogical sectors’: [www.gov.uk/government/consultations/finalising-crc-simplification-treatment-of-renewable-energy-the-metallurgical-and-mineralogical-sectors](http://www.gov.uk/government/consultations/finalising-crc-simplification-treatment-of-renewable-energy-the-metallurgical-and-mineralogical-sectors)

Scheme/Measure	Measurement methods used	Method to express the energy savings (primary or final savings)	Lifetime of measures	Description of the calculation methodology	Information on how double counting of energy savings is avoided	Climatic variations and approach used
Energy Savings Opportunity Scheme (ESOS)	Energy savings from energy efficiency measures implemented as a result of ESOS assessments. This is net of the counterfactual in which measures would be implemented due to rising energy prices of another government policy.	Final savings.	Organisations in scope of ESOS will not be legally obligated to implement energy efficiency measures recommended through an ESOS assessment.  Therefore, we cannot anticipate the lifetime of energy efficiency measures implemented, though it would be reasonable to assume measures implemented will be permanent rather than temporary.	For the building sector, the estimate of technical potential is based on the Non-Domestic Energy and Emission Model (N-DEEM) dataset, which provides data on the total potential in non-domestic buildings and the associated capital costs. The costs are incurred upfront, and have been adjusted to include the cost of replacement for measures.  For industrial processes, cost and potential estimates are based on a number of datasets from AEA and Arup.	Energy savings are calculated compared to the counterfactual. Overlaps with other policies are currently being considered.	These are not deemed significant in the non-domestic sector.

Scheme/Measure	Measurement methods used	Method to express the energy savings (primary or final savings)	Lifetime of measures	Description of the calculation methodology	Information on how double counting of energy savings is avoided	Climatic variations and approach used
Low Emission Vehicles	Data is collated for each vehicle sold, meaning information is held on how many vehicles emitting a certain level of CO2 have been sold.	Final savings.	The DVLA database indicates that the typical operational lifetime of a car is around twelve years, so it is expected that vehicles already purchased with the support of OLEV will remain in the UK fleet until the mid to late 2020s.	Total emissions from vehicles receiving grant funding can be calculated and compared to average emissions from the UK fleet.	Dealerships are required to check the identity of grant claimants to ensure they are UK residents. The claims progress through a number of stages prior to payment. The key stage is an online verification process which automatically cross checks the vehicle's registration number against the DVLA database to ensure it is an eligible vehicle and has not already received the grant.	Not applicable. Vehicles supported under OLEV schemes are in use throughout the UK and designed for use in a range of European climatic conditions.

Rail Electrification	Savings data is an output of Department for Transport's Rail Emission Model (REM). REM estimates energy consumption of each rail passenger service operating in GB on the basis of each service's characteristics (stock type, stopping pattern, speed, etc.). The model is calibrated to actual annual energy (gas oil and electricity) consumption as reported by individual train operating companies. REM was run twice, once with rail electrification schemes and once without.	Final savings.	60 years which is the nominal life of the electrification infrastructure.	REM was run twice, once with rail electrification schemes and once without. The expected savings are the difference between the outputs of these two runs, converted to TWh. The savings presented by electrification are considered additional to business as usual. This is because government intervention – both in terms of policy and funding - is required to deliver rail electrification schemes. This is partly because of the high capital costs involved but also because of the impact of electrification on the wider rail system (such as the need to introduce new electric trains).	We model the scheme net of the counterfactual and consider overlap with other related policies.	The design of electrification schemes takes account of expected changes in climate eg. wind loadings and temperature variation, over the design life of the infrastructure.

Re:Fit	<p>Energy saving estimates are based on the performance of previous projects under the London Re:Fit scheme, which have been used to estimate:</p> <ul style="list-style-type: none"> <li>• The expected number of projects that will be completed each year</li> <li>• The expected average capital value of projects</li> <li>• The expected average payback timescale of the projects</li> </ul>	Final savings.	Given the wide variety of measures, there is a large range of lifetimes, as is standard in energy efficiency measures, for the improvements from 6-15 years.	<p>Energy saving estimates are considered deemed savings which are based on the performance of previous projects under the London Re:Fit scheme, which have been used to estimate:</p> <ul style="list-style-type: none"> <li>• The expected number of projects that will be completed each year</li> <li>• The expected average capital value of projects</li> <li>• The expected average payback timescale of the projects.</li> </ul> <p>This has been used to estimate the average annual energy bill saving arising from the projects, which has been combined with an assumed electricity price to estimate the total energy savings from Re:Fit projects in a particular year out to 2020.</p>	The Re:Fit team checks estimated savings and ensures that these are reported through the client's mechanism with Re:Fit maintaining an overview.	Every proposal under the scheme contains a measurement and verification plan which takes account of climatic variation in calculating the technological savings to be achieved.

Scheme/Measure	Measurement methods used	Method to express the energy savings (primary or final savings)	Lifetime of measures	Description of the calculation methodology	Information on how double counting of energy savings is avoided	Climatic variations and approach used
				<p>This has been used to estimate the average annual energy bill saving arising from the projects, which has been combined with an assumed electricity price to estimate the total energy savings from Re:Fit projects in a particular year out to 2020.</p> <p>All projects within the scheme are additional and we have assumed that all savings are expressed as electricity.</p>		

Scheme/Measure	Measurement methods used	Method to express the energy savings (primary or final savings)	Lifetime of measures	Description of the calculation methodology	Information on how double counting of energy savings is avoided	Climatic variations and approach used
Salix Public Sector Finance	The forecast number of Salix projects is determined by the level of funding. While some elements are confirmed due to the recycling of funding from loan repayments, there is no guarantee that the scheme will receive new funding in any year.	Final savings.	<p>Where a public sector body identifies that a project will be installed on a site with an estimated lifespan which is lower than the technology lifespan, the site life will be used in the lifetime savings calculations.</p> <p>A distribution of persistence factors has been calculated based on the persistence factors for different types of energy efficiency projects. The energy savings from an energy efficiency project are assumed to reduce with time. Energy savings are assumed to reduce from 100% in years 1, 2, 3 and 4 to 98% in year 5 and 96% in year 6.</p>	An average annual energy saving of 2.6 kWh per £1 invested is assumed, and this is based on SEELS projects carried out in 2012/13, 2013/2014 & 2014/2015. There are a number of factors which can affect this, primarily the mix of projects which reduce heating consumption (predominantly gas) or electricity use. It is worth noting that Salix has funded a number of projects, largely CHP, which give carbon and financial savings through a reduction in electricity consumption, but result in a net increase in kWh consumption, due to the increase in gas usage. These projects are factored into the average.	All applications are subject to the same technical assessment procedures. Checks made include a comparison of variables such as payback with a knowledgebase consisting of previously funded projects. This allows Salix to check for any which fall out of normal limits. Additional checks include manual review of supporting information such as calculations and technical literature for the proposed energy-efficiency technology.	The impact of climatic variation, such as varying hours of darkness or heating degree-days, may have on the savings estimated for projects will differ dependent on the type and location of the project being undertaken. As public sector bodies are aware of the specific climatic variations for their region and how these impact projects, this impact will form part of their estimation of savings prior to submission to Salix.

Scheme/Measure	Measurement methods used	Method to express the energy savings (primary or final savings)	Lifetime of measures	Description of the calculation methodology	Information on how double counting of energy savings is avoided	Climatic variations and approach used
				In this analysis it has been assumed that over two-thirds of the energy savings are additional to existing measures and would not have been realised without Salix.		
Smart Metering	<p>In the non-domestic sector, we assume that smart/advanced meters, together with provision of data, reduce energy consumption by 2.8% (electricity) and 4.5% (gas) per meter in central scenarios. The primary source of evidence for this is a trial of advanced metering in 538 SME sites carried out by the Carbon Trust in 2007.<sup>434</sup></p> <p>The savings for this policy are considered deemed savings.</p>	Final savings.	An installed smart meter has an assumed lifetime of 15 years. Savings are included since the beginning of the smart meter rollout in 2013.	The calculation methodology used is consistent with the approach set out in the 2019 Smart Meter Cost Benefit Analysis <sup>435</sup> .	Double counting is avoided by the method utilised. An energy savings rate is calculated, and then applied to a fixed average consumption figure for non-domestic properties covered by the smart meters mandate. The energy savings percentage was derived from a controlled study, which removed any possible impacts from other energy saving measures.	No climatic variations are considered in the analysis. Energy savings assumptions have been informed by trials both in the UK and internationally and, as a result of this, the observed energy reduction anticipated will already reflect climatic variations.

<sup>434</sup> [www.carbontrust.com/resources/reports/technology/advanced-metering-for-smes](http://www.carbontrust.com/resources/reports/technology/advanced-metering-for-smes)

<sup>435</sup> [www.gov.uk/government/publications/smart-meter-roll-out-cost-benefit-analysis-2019](http://www.gov.uk/government/publications/smart-meter-roll-out-cost-benefit-analysis-2019)

Scheme/Measure	Measurement methods used	Method to express the energy savings (primary or final savings)	Lifetime of measures	Description of the calculation methodology	Information on how double counting of energy savings is avoided	Climatic variations and approach used
Northern Ireland Sustainable Energy Programme (NISEP)	The Energy Saving Trust (EST) uses a SAP based model <sup>436</sup> as the main source of assessing the energy savings from domestic schemes. The model calculates the energy requirements of domestic dwellings and estimates the likely savings resulting from energy efficiency improvements.	Final savings.	Cavity wall insulation (40 years) Internal/external solid wall insulation (36 years) Loft insulation (30 years) Efficient boiler (15 years) Hot water cylinder and pipe insulation (10 years) Energy efficient lighting (various) Domestic refrigeration and appliances (various) Commercial technologies (various)	Primary Bidders are required, as part of the post-implementation reporting of schemes, to fill in a spreadsheet with the number of and types of measures installed in different types of properties. The spreadsheet, compiled by EST, then automatically calculates the energy savings achieved. So that the savings of different fuels can be expressed in a consistent manner, the savings are calculated in 'fuel standardised' terms that reflect the fuel's carbon content. The carbon factors used are consistent (with the exception of electricity which is derived from the generation mix on the island of Ireland) with those published by Defra.	UR/EST works with the Northern Ireland Housing Executive/ Department for Communities (DfC) to ensure there is no double counting of measures installed under NISEP with the DfC funded Affordable Warmth Scheme.  This includes annual assessment of data provided by DfC/NIHE.	Not applicable. The NISEP funding is only for measures installed within Northern Ireland and there is no substantial climatic variation across the country.

<sup>436</sup> Housing model build using the government's Standard Assessment Procedure (SAP) methodology 2012.

Scheme/Measure	Measurement methods used	Method to express the energy savings (primary or final savings)	Lifetime of measures	Description of the calculation methodology	Information on how double counting of energy savings is avoided	Climatic variations and approach used
Welsh Government Energy Service	The project is deemed completed when all installations have taken place, the equipment has been commissioned and has started generating savings for the PSB and all internal completion documents have been signed off. Only then will funding be provided.	Final savings.	<p>Where a public sector body identifies that a project will be installed on a site with an estimated lifespan which is lower than the technology lifespan, the site life will be used in the lifetime savings calculations.</p> <p>A distribution of persistence factors has been calculated based on the persistence factors for different types of energy efficiency projects. The energy savings from an energy efficiency project are assumed to reduce with time. Energy savings are assumed to reduce from 100% in years 1, 2, 3 and 4 to 98% in year 5 and 96% in year 6.</p>	The repayment value is expected as a direct result from savings projected in energy bills achieved from the completion of the project, making the funding self-sufficient.	All applications are subject to the same technical assessment procedures. Checks made include a comparison of variables with a knowledge base consisting of previous projects.	Not applicable.

Scheme/Measure	Measurement methods used	Method to express the energy savings (primary or final savings)	Lifetime of measures	Description of the calculation methodology	Information on how double counting of energy savings is avoided	Climatic variations and approach used
Warm Homes Programme	The average improvement in the energy performance rating (which is measured by Standard Assessment Procedure, or SAP) of each property receiving assistance in 2018/19 was 14.1 points.	Final savings.	Not currently estimated as beneficiaries of the schemes are not currently able to apply for a further grant once a grant for works has been approved.	Warm Homes Programme schemes publish annual reports setting out carbon savings for schemes during the reporting year.	Improvements in energy efficiency are reported to Welsh Government by the scheme agents. Benefits delivered by the scheme agents using funding from UK government schemes are disaggregated.	Not applicable. The Warm Homes Programme treats Wales as a single climatic zone and offers the same set of range of solutions to all households regardless of location and local climate.
Boiler Plus	The energy savings estimates as a result of this regulation change are considered in terms of how the energy savings benefits will accrue in the case that all households make the same technology choice e.g. the installation of load compensators.	Final savings.	Heating controls are expected to have a lifetime of 15 years, so this policy covers one replacement cycle of the English household stock. The benefits are continued to be collected for a further period of 15 years from the last year of installations.	Consumers are assumed to be driven by two distinct motives when making the choice, cost minimisation (minimise up-front costs, so choosing the lowest technology cost option i.e. load compensator) or benefit maximisation (optimising annual bill savings over the lifetime i.e. choose the highest performing technology of the choice list which is the learning thermostat).	The policy impacts estimated does not overlap with other policies, so any estimated impacts are considered additional.	Not applicable.

Scheme/Measure	Measurement methods used	Method to express the energy savings (primary or final savings)	Lifetime of measures	Description of the calculation methodology	Information on how double counting of energy savings is avoided	Climatic variations and approach used
Streamlined Energy and Carbon Reporting Framework (SECR)	In addition to information on GHG emissions, energy usage and a chosen emissions intensity ratio, reports must include a narrative description of measures taken to improve the businesses' energy efficiency in that year. Where possible, resulting energy saving from the actions reported should also be stated. If no measures have been taken this should also be included.	Final savings.	Reporting is done annually.	The methodology used by companies must be disclosed in their reporting and although no methodology is prescribed, it must be robust, transparent and widely accepted.	Detailed guidance published to assist companies in adopting best practice and thereby avoid double counting.	Not applicable. Reporting is done at entity level.

5. Monitoring and verification

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
Energy Company Obligation (ECO)	<p>There is a statutory requirement on OFGEM, the administrator of the ECO scheme to determine whether an obligated supplier has achieved its obligation.</p> <p>In line with requirements under EED, OFGEM requires suppliers to conduct technical and score monitoring inspections on ECO measures to ensure the required standards of installation are met and measures are scored accurately. Technical monitoring verifies whether measures have been installed to the relevant installation standards by a person of appropriate qualification and expertise. Score monitoring verifies that the installer of a measure has selected the correct deemed score based on the characteristics of the property where the measure was installed</p>	<p>OFGEM is currently required to oversee monitoring of the ECO scheme and verify that an obligated supplier has met its targets.</p> <p>It was recently decided to integrate a Government Endorsed Quality Scheme, TrustMark, into the ECO scheme, requiring that relevant measures must be installed by a TrustMark registered business or equivalent. The greater oversight across the market, provided by Trustmark, is expected to increase standards and give the consumers better protection.</p>	<p>Monitoring must be carried out by a suitably qualified monitoring agent which is independent from the obligated supplier, installer, any party involved in the installation or assessment of the measure and any party that has control or ownership of the premises.</p>	<p>When notifying an installed measure to OFGEM, obligated suppliers provide information about that measure. OFGEM may audit suppliers' compliance with their legislative requirements so suppliers must make sure that they have relevant documents available on request.</p> <p>OFGEM is required to submit to the Secretary of State a report each month setting out the progress which participants have made towards achieving their obligation.</p> <p>BEIS publishes monthly government statistics on ECO.<sup>437</sup></p>	<p>OFGEM, which is also the energy market regulator, deals with compliance and enforcement. There has only been minor non-compliance since the scheme began in 2013, which has generally been dealt with by way of 'alternative action' agreed between OFGEM and the relevant supplier, such as non-statutory undertakings or assurances to ensure future compliance or voluntary action by a company. For example, in one case a supplier paid into a redress fund. OFGEM also has statutory enforcement options including issuing final/provisional orders, imposing financial penalties and making consumer redress orders.</p> <p>Where OFGEM has concerns around a supplier's delivery progress, they increase the level of engagement to identify what the delivery barriers are and assist where possible in overcoming them.</p>

<sup>437</sup> <https://data.gov.uk/dataset/1656fb7d-1ca3-462d-a11b-8078acc33275/household-energy-efficiency-statistics>

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
	<p>To ensure that monitoring conducted by a supplier is representative of both the installers used and the measure types notified, for both technical and score monitoring, a supplier must:</p> <p>Monitor at least 5% of measures of each measure type notified in a quarter;</p> <p>Monitor at least 3% of measures notified as being installed by a single installer in a quarter;</p> <p>Monitor at least one measure for any subset that is fewer than 100 measures.</p> <p>Using notification data, OFGEM can determine whether these 'minimum monitoring rates' have been met. Where they haven't, they request further inspections.</p> <p>For each installer, OFGEM set a minimum pass rate. If this is not met, OFGEM will place the set of measures on a pathway to compliance, which requires suppliers to take further actions to provide them with confidence in the quality and accuracy of the measures concerned.</p>	<p>The TrustMark Framework requires compliance and certification with installation standards for relevant ECO measures and has developed systems for checking that certification is current and in place for the measures being delivered by installers.</p> <p>TrustMark is in the process of creating a monitoring framework that takes over from Ofgem the responsibility of administering technical monitoring for measures delivered within the TrustMark framework. The expectation is that responsibility for technical monitoring will start to be transitioned to TrustMark for such measures. TrustMark is due to begin a pilot programme during spring 2020 as part of the development of their framework.</p>			<p>With regard to those measures that are to be installed by TrustMark registered businesses, to ensure a smooth transition embedding the new TrustMark quality scheme into the ECO scheme, OFGEM will retain a role in dealing directly with compliance and enforcement of specific installation standards and financial protection requirements for a transitional period, after which compliance and enforcement in respect of those specific requirements will be directly dealt with by TrustMark in line with its own framework.<sup>438</sup></p>

<sup>438</sup> [www.trustmark.org.uk/docs/default-source/framework-operating-requirements/trustmark-framework\\_version-1\\_4oct2018.pdf?sfvrsn=51659307\\_12](http://www.trustmark.org.uk/docs/default-source/framework-operating-requirements/trustmark-framework_version-1_4oct2018.pdf?sfvrsn=51659307_12)

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
		<p>During this pilot programme, we expect Ofgem to continue to administer technical monitoring as normal. TrustMark will assume full responsibility for technical monitoring for measures delivered within the TrustMark framework once the pilot is completed successfully, which is expected by June 2021 at the latest.</p>			

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
<p>Building Regulations – Domestic and Non-Domestic (New and existing build)</p>	<p>The Building Regulations require that an approved methodology be used for showing compliance with energy performance requirements. The national calculation methodology for setting and showing compliance with the energy performance requirements for new houses and apartments is the Standard Assessment Procedure (SAP). For most non-residential buildings the approved methodology is the Simplified Building Energy Model (SBEM). Dynamic Simulation Models are approved for use to calculate energy performance requirements for more complex non-residential buildings. These approved methodologies take into account all of the requirements of the common general framework for the calculation of energy performance at Annex 1 of the Energy Performance of Buildings Directive (EPBD).</p>	<p>Building control bodies check that building work has been carried out according to the building regulations. Building control bodies can either be from the local council or the private sector (called 'approved inspectors'). In some cases the installer can certify themselves that their work complies.</p> <p>The Ministry of Housing, Communities and Local Government (MHCLG) is in charge of authorising competent person schemes. To make sure that the standards are consistent, there are rules that scheme operators must follow and conditions of authorisation they must meet including having robust systems for assessing members competences, physically checking members work and effective sanctions for cases of non-compliance or breaches of scheme rules.</p>	<p>Only Building Regulations compliance submissions that use approved calculation methodologies and software applications will be accepted as evidence of compliance by Building Control Bodies enforcing the energy performance requirements. Building Control Bodies cannot give a compliance certificate for a new building until they are satisfied that the building's actual carbon dioxide emission rate does not exceed its target emission rate as calculated using approved calculation methodologies and their software applications.</p>	<p>Not applicable. Compliance and enforcement of standards pertaining to fixed building services is the responsibility of Building Control.</p>	<p>The Local Authority has a duty to enforce the Building Regulations in its area and will seek to do so by informal means wherever possible. If a person carrying out building work contravenes the Building Regulations, the Local Authority may decide to take them to the magistrates' court where they could be fined up to £5,000 for the contravention, and up to £50 for each day the contravention continues after conviction (section 35 of the Building Act 1984). This action will usually be taken against the builder or main contractor, and proceedings must be taken within two years from the completion of the work.</p> <p>Alternatively, or in addition, the local authority may serve an enforcement notice on the owner requiring them to alter or remove work which contravenes the regulations (section 36 of the 1984 Act).</p>

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
			<p>Similarly, only qualified and accredited energy assessors using approved calculation methodologies and software applications can lodge data onto the national register of energy performance certificates. Register security protocols automatically prevent all other software and persons from doing so.</p>		

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
Climate Change Agreements	<p>Data on scheme participants' energy use or total number of tonnes of carbon dioxide equivalent emitted is reported to the Environment Agency by Target Units every two years.</p> <p>A report is published by the Environment Agency following the end of each Target Period. Guidance on data reporting and verification is contained within the CCA Operations Manual (Chapter 10).<sup>439</sup> Audits may be conducted by the Environment Agency.</p> <p>The Environment Agency carries out audits on selected target unit operators and sector associations through the lifetime of the scheme to verify eligibility and performance. This follows a mixed risk based and random selection approach. There is no quota for the number of participants to be audited. If an operator does not take action in response to audit recommendations within the agreed timescale, a penalty may be imposed on the operator or, in the worst case, their agreement may be terminated due to non-compliance.</p>	Environment Agency (EA)	The EA is independent of obligated parties.	Data on scheme participants' energy use or total number of tonnes of carbon dioxide equivalent emitted is reported to the Environment Agency by Target Units every two years.	<p>As part of the milestone reviews, the EA may issue financial penalties to an operator. In line with article 13 the penalty system in the new CCA scheme is designed to be flexible and aims to promote compliance to ensure the success of the scheme. Financial penalties may be issued on the basis that an operator:</p> <p>Fails to report by 1 May following the end of the target period;</p> <p>Fails to provide any further information the EA has requested by the deadline set;</p> <p>Provides inaccurate information;</p> <p>Doesn't tell the EA about any changes to their operations that would affect its CCA.</p>

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
CRC Energy Efficiency Scheme	<p>CRC participants must keep records to validate any information they have submitted about their organisation, energy supplies and use. They should keep this in an evidence pack that the regulators can examine during an audit. They also need to carry out their own internal audit of their records at least once a year. Their evidence pack must include an audit certificate signed by a senior officer.</p>	<p>The CRC is fully monitored by the Environment Agency (EA). The EA ensures compliance amongst participants with a programme of audits based on risk assessment with additional financial penalties levied on those found not to have complied, along with publication of non-compliance. The enforcement action is set in legislation and a guide is published to help participants understand how this works.</p>	<p>An organisation's regulator in England, Scotland, Wales or Northern Ireland may carry out an audit to check they are keeping sufficient records in their evidence pack and reporting their emissions accurately.</p> <p>The regulator will either carry out the audit itself or use its trained and approved contractors.</p>	<p>CRC participants must keep records to validate any information they have submitted about their organisation, energy supplies and use. They should keep this in an evidence pack that the regulators can examine during an audit. They also need to carry out their own internal audit of their records at least once a year. Their evidence pack must include an audit certificate signed by a senior officer.</p>	<p>The Environment Agency can issue civil penalties to organisations that don't comply with the CRC obligations by the deadlines set. It can also publish on this website the name of the organisation receiving the civil penalty, details of the failure and the penalty amount.</p> <p>Organisations could incur civil penalties if they don't:</p> <ul style="list-style-type: none"> <li>• Register</li> <li>• Disclose info on registration</li> <li>• Submit an annual report on time</li> <li>• Provide accurate info or notifications</li> <li>• Provide an accurate annual report</li> <li>• Surrender allowances</li> <li>• Maintain an evidence pack</li> </ul>

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
Energy Savings Opportunity Scheme (ESOS)	ESOS audits can be conducted in-house or by external professionals but audits must be reviewed for compliance with ESOS by a qualified lead assessor, who must belong to a register maintained by a professional body and approved by the scheme administrator. ISO 50001 is also a valid compliance route if covering at least 90% of an organisations total energy consumption, requiring a valid ISO certification.	The Environment Agency is the scheme administrator for the whole of the UK. As such, it is responsible for receiving notifications of compliance from ESOS participants, maintaining guidance on compliance and approving registers of Lead Assessors. Responsibility for compliance and enforcement rests with the EA in England and the equivalent devolved agencies in Scotland, Wales and Northern Ireland.	Responsibility for monitoring and enforcing ESOS will lie with independent public bodies (the EA in England, the Scottish Environment Protection Agency, Natural Resources Wales and, in Northern Ireland, the Northern Ireland Environment Agency).	Qualifying organisations must measure their total energy consumption and carry out audits of the energy used by their buildings, industrial processes and transport to identify cost-effective energy saving measures, to help stimulate uptake of cost-effective energy efficiency potential by 5 December 2015 and every four years thereafter.	<p>Three types of notice are available under the ESOS Regulations.</p> <ol style="list-style-type: none"> <li>1. A compliance notice – This is an information request from the regulator to the participant requesting information to enable the regulator to determine if the participant is complying with its obligations under ESOS</li> <li>2. An enforcement notice – informing the participant what to do to comply with a requirement of ESOS</li> <li>3. A penalty notice – this imposes civil penalties for breaches of the ESOS regulations.</li> </ol> <p>Participants who fail to comply with the scheme could be fined in the region of £5,000 to £50,000 for non-compliance as per paragraph 43-47 of the ESOS Regulations; however penalties are subject to the nature of the non-compliances and are at the discretion of the regulators.</p>

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
<p>Low Emission Vehicles</p>	<p>Vehicles are accepted onto the scheme on the basis of a clear, published set of eligibility criteria.<sup>440</sup> Applications are assessed by an expert panel made up of officials from Vehicle Certification Agency (VCA), Department for Transport (DfT) and Department for Business, Energy and Industrial Strategy (BEIS).</p> <p>Dealerships are required to check the identity of grant claimants to ensure they are UK residents. Plug-in grant claims are submitted by dealerships via an online claims portal administered on behalf of OLEV by DVLA-. The key stage is an online verification process which automatically cross checks the vehicle's registration number against the DVLA database to ensure it is an eligible vehicle – i.e. one that meets the PICG eligibility criteria and is registered for use on UK roads.</p> <p>In order to be eligible for the grants, vehicles must meet criteria for carbon emissions and zero emission range.</p>	<p>OLEV is made up of officials from DfT and BEIS. OLEV is a team working across UK government to support the early market for ultra-low emission vehicles (ULEVs). OLEV provides support to position the UK at the global forefront of ULEV development, manufacture and use.</p>	<p>Vehicles are assessed by a cross-departmental panel of BEIS, DfT and VCA specialist experts on their eligibility criteria, including checking the emissions of the vehicles.</p>	<p>5% of claims are randomly selected for audit through the online claims process. The current sample size is dependent on the level of inaccuracies found so is kept under review. This audit is administered by DVLA who administer the online claims process. Those selected are required to produce additional documentation including invoices to demonstrate that a sale of an eligible vehicle took place, and that the grant was applied correctly. OLEV are in contact with manufacturers whose responsibility it is to ensure that the claims are accurate.</p>	<p>Not applicable. There are no penalties outlined for non-compliance as it is not a statutory scheme.</p>

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
<p>Private Rented Sector Regulation (England &amp; Wales) – Domestic</p>	<p>When a tenant makes a request for consent for energy efficiency improvements under the Regulations, the installation of those improvements must be undertaken by a person who meets the relevant installer standards.</p> <p>Where works are paid for by a Green Deal finance plan, only an authorised Green Deal Installer can install energy efficiency improvements. Additionally, only authorised installers can identify themselves as 'Green Deal Installers' and use the Green Deal Quality Mark.</p>	<p>The Regulations state that Local Authorities will be the enforcement body for the domestic sector.</p>	<p>A review of the regulations is required at least every 5 year. An evaluation has been commissioned to collect evidence on the impact of the regulations and is being delivered by an independent.</p>	<p>There are no formal reporting duties for local authorities who are the enforcement body for the domestic PRS.</p>	<p>Enforcement bodies will determine whether and when a civil penalty should be imposed. Any penalty notice must be reviewed by the enforcement body at the landlord's request, and in the event of a dispute, the matter may be referred to a Tribunal.</p> <p>Non-compliance occurs where a private rental property leased to a new tenant or a renewing tenant after 2018 (or all tenants after the back-stop date) which does not meet the E EPC rating and is not registered on the PRS Exemptions database. There are also penalties for providing false or misleading information.</p>

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
<p>Private Rented Sector Regulation (England &amp; Wales) – Non-Domestic</p>	<p>The enforcement authority is responsible for ensuring properties meet the minimum energy efficiency standards of EPC E.</p> <p>They have access to the PRS Exemptions Register and rights to issue compliance notice and penalties to ensure properties in scope meet requirements.</p>	<p>The Regulations state that local weights and measures authorities will be the enforcement body for the non-domestic sector.</p>	<p>A review of the regulations is required at least every 5 years.</p> <p>The enforcement authority may carry out audits on exemptions registered on the PRS Register to verify evidence submitted.</p>	<p>There are no formal reporting duties for local weights and measures who are the enforcement body for the domestic PRS.</p>	<p>Enforcement bodies will determine whether and when a civil penalty should be imposed. Any penalty notice must be reviewed by the enforcement body at the landlord's request, and in the event of a dispute, the matter may be referred to a Tribunal.</p> <p>Non-compliance occurs where a private rental property leased to a new tenant or a renewing tenant after 2018 (or all tenants after the back-stop date) which does not meet the E EPC rating and is not registered on the PRS Exemptions database. There are also penalties for providing false or misleading information.</p>

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
<p>Rail Electrification</p>	<p>Trains using this new electrification infrastructure will be fitted with energy meters complying with accuracy limits prescribed by domestic (Railway Group Standards) or EU Regulations that will measure electricity consumption and allow this to be compared to historic diesel consumption data. Network Rail has established a comprehensive protocol governing how this data is provided through a metering data interface specification. In this way the energy and carbon benefits (using diesel and power generating emission factors) can be accurately assessed.</p>	<p>Railway Group Standards</p>	<p>As part of its rail franchising programme, the Department for Transport will require operators of train franchises to collect robust data on environmental impacts including energy consumption and carbon emissions. This includes a requirement to have environmental and energy management systems compliant with and audited against ISO14001 and ISO50001.</p>	<p>In order to be billed for electricity consumption, the electrification infrastructure provider (Network Rail) requires train operators to introduce appropriate monitoring and verification processes and also stipulates minimum accuracy requirements for the electricity meters themselves.</p>	<p>The fitting of energy metering equipment (on ground and on board) is now covered in the EU Energy Technical Specification for Interoperability; 'COMMISSION IMPLEMENTING REGULATION (EU) 2018/868 of 13 June 2018 amending Regulation (EU) No 1301/2014 and Regulation (EU) No 1302/2014 as regards provisions on energy measuring system and data collecting system'. These standards are enforced by the ORR under the Railways Interoperability Regulations 2011.</p>

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
Re:Fit	<p>All contractors will have been through an OJEU tender process to verify their suitability to be part of the Re:Fit framework. Overall the public body is assessing the contractor's ability to deliver alongside its partner fit with the public sector for the duration of the project.</p> <p>Public bodies wishing to procure energy efficiency improvements through the Re:Fit scheme detail the requirement for the tender in terms of the nature of their buildings, the amount of capital they are prepared to invest, the level of energy saving they would like to achieve and the payback periods. A mini procurement competition is then run amongst the pre-tendered panel of 13 Energy Service Companies (ESCOs) who will produce bids based on the requirement including visiting the buildings.</p>	<p>Local Partnerships, which runs the England-wide roll-out of Re:Fit, provides BEIS with quarterly returns detailing the projects delivered under the scheme and the level of estimated savings attached to each, along with any additional information that is required. If it became clear the scheme was not delivering value for money Local Partnerships and BEIS would consider whether it was appropriate to continue to fund the programme.</p>	<p>How the ESCOs monitor is a contractual decision between the ESCO and the client. Some choose to employ third parties, whilst others will leave the monitoring to the relevant ESCO.</p>	<p>After bidding, the ESCOs will then produce an investment grade proposal including the detailed design of the improvements along with a guaranteed forecast for how the building's energy bills will reduce. The forecast energy savings do not include energy price inflation and exclude savings in maintenance costs.</p> <p>The performance of the improvements is then monitored through the energy bills of the relevant buildings relative to the ESCO's plan.</p> <p>There is a requirement for ESCOs to monitor built into both the Re:Fit framework and the contract between the ESCOs and the client.</p>	<p>Not applicable. If the agreed cost savings are not met, ESCOs must install extra measures to reach the agreed cost savings or pay the clients the difference. This model provides a financial motivation for the ESCOs to ensure the guaranteed savings are achieved.</p>

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
Salix Public Sector Finance	<p>The assessment methodology undertaken by Salix does not in itself directly confirm that the reported savings will be achieved. It is a framework that delivers energy saving measures, ensuring that everything possible is done to complete the projects and realise the associated energy savings.</p> <p>The methodology includes procedures for detecting those projects with unusual costs or forecast savings so that Salix can check that the approach taken by the Public Sector bodies is appropriate for estimating the likely savings.</p>	As the key funder of the Salix scheme, if the scheme does not effectively perform, BEIS can simply cease funding.	Salix has engaged KPMG LLP (UK) (Chartered Accountants) to provide assurance over the application of the procedures and processes which Salix operates in order to ensure the consistency of approach, reliability and appropriateness of the estimates of carbon savings generated by clients for the projects which they undertake. As part of this audit, projects committed in the previous financial year are selected at random so that they can be tested, and the client interviewed to ensure all required processes have been followed. If an audit highlighted any issue, it would be raised with the board. If the issue continued, DECC could be consulted.	Business cases for larger projects include details of monitoring and verification plans to be put in place on completion of projects. Post-project audits on specific funded projects are undertaken as part of the limited assurance audit and this will include confirming that the savings have been achieved.	Not applicable. There are no penalties outlined for non-compliance as it is not a statutory scheme.

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
Smart Metering	Energy suppliers are required to install smart meters which are compliant with the Smart Metering Equipment Technical Specifications (or advanced meters which meet the requirements of gas and electricity supply licence conditions).	Ofgem's role as the energy industry regulator is to ensure that consumers remain protected during the rollout and to monitor suppliers' compliance with their obligations, as well as enforce these where needed through their financial penalties and consumer redress policy.	Ofgem is the GB independent energy regulator.	<p>Energy suppliers are required by licence conditions to submit plans and report the progress of their non-domestic smart meter roll out to Ofgem.</p> <p>For larger suppliers, these plans must consist of two sections:</p> <p>a) progress against annual milestones, including quantitative data highlighting the percentage of domestic and smaller non-domestic premises which have a smart or relevant advanced meter installed by the end of the calendar year;</p> <p>b) a narrative section, in which suppliers explain any difference between their submitted milestone for the previous calendar year and their actual performance.</p>	<p>Ofgem hold all responsibility for imposing penalties in the case of non-compliance, as laid out in the Gas Act 1986 and the Electricity Act 1989. The Acts provide that any penalty must be reasonable. Ofgem must have regard to its statement of policy with respect to penalties, which provides that penalties should be proportionate and act as a deterrent; penalties imposed must pay regard to the principle that 'non-compliance should be more costly than compliance' and that enforcement should deliver strong deterrence against future non-compliance.<sup>441</sup></p> <p>Ofgem have outlined that they will consider enforcement action where annual milestones have been missed, as well where the overall 2020 obligation has not been achieved.<sup>442</sup></p>

<sup>441</sup> [www.ofgem.gov.uk/publications-and-updates/statement-policy-respect-financial-penalties-and-consumer-redress](http://www.ofgem.gov.uk/publications-and-updates/statement-policy-respect-financial-penalties-and-consumer-redress)

<sup>442</sup> [www.ofgem.gov.uk/publications-and-updates/decision-supplier-reporting-ofgem-during-smart-meter-rollout](http://www.ofgem.gov.uk/publications-and-updates/decision-supplier-reporting-ofgem-during-smart-meter-rollout)

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
				<p>Smaller suppliers are required to submit annual progress updates on the number of smart meters they have installed by the end of the preceding calendar year.</p> <p>Ofgem have also published proposals for a new reporting framework in light of the Government consultation on a proposed new post-2020 smart meter rollout obligation.<sup>443</sup></p>	

<sup>443</sup> [www.ofgem.gov.uk/publications-and-updates/statutory-consultation-post-2020-smart-meter-rollout-reporting-requirements](http://www.ofgem.gov.uk/publications-and-updates/statutory-consultation-post-2020-smart-meter-rollout-reporting-requirements)

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
Northern Ireland Sustainable Energy Programme (NISEP)	<p>The Energy Saving Trust (EST) engages a professionally qualified auditor or accountant to carry out audits on all completed schemes to ensure Primary Bidders are implementing the schemes as required. This includes checking paperwork that provides evidence that the quality assurance requirements have been carried out. If any quality issues are discovered at the audit stage, the Primary Bidder will be asked to rectify them and any incentive payment (Primary Bidders can earn an incentive by exceeding cost-effectiveness targets set for individual schemes) due will be withheld until the necessary work has been carried out. The Utility Regulation (UR) will seek assurance from Primary Bidders that any quality issues with previous schemes have been sorted out before any further funding is awarded in the next round of bidding.</p>	<p>The UR oversee the NISEP and have overall responsibility, including final approval of decisions and policy direction, for the programme.</p> <p>The EST acts as Programme Administrator responsible for day to day management of the programme including liaison with Primary Bidders (organisations undertaking schemes), processing payment claims, reporting and auditing.</p>	<p>Primary Bidders are responsible for quality assurance and monitoring of installations carried out under their schemes. Primary Bidders must engage a qualified inspector, independent from the party carrying out the installations, to carry out the quality inspections.</p> <p>The Primary Bidder must meet all relevant standards in accordance with the Framework Document. It is the responsibility of the Primary Bidder to ensure that any work carried out by scheme participants conforms to best practice customer satisfaction and quality standards, and that all customers are provided with the appropriate guarantees and warranties.</p>	<p>The EST selects a sample of schemes from each Primary Bidder for audit. The audit covers, financial information, procurement, installation of measures, delivery mechanisms, energy savings, additionality and monitoring (customer and quality) processes.</p>	<p>Agreement between UR and the Primary Bidder permits the UR to ask for the return of any funds that have been mis-spent or not spent in accordance with the Framework Document. The UR adopts a policy of zero intolerance to fraud and as part of the registration process to become a Primary Bidder a company's policy on fraud must be submitted.</p>

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
			<p>The Primary Bidder must apply for Building Control for all domestic measure installs i.e. heating and insulation, evidence of which is requested as part of the monthly claim process and the audit. A valid cavity wall insulation guarantee certificate must be provided to the customer when cavity wall insulation work has been completed. A copy of the certificate is requested as part of the monthly claim process and the audit.</p>		

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
<p>Welsh Government Energy Service</p>	<p>The project is deemed complete when all installations have taken place, the equipment has been commissioned and has started generating savings for the Public Sector Body (PSB) and all internal completion documents have been signed off. At this stage the applicant will submit the Completion Certificate to Salix, clearly outlining any changes to costs and scope of the project since application and the reasons. Any changes to the project scope, which includes the number of fittings or size of equipment and their impact on energy savings, must be supported by the submission of a compliance tool with the updated annual energy savings figures and attached savings calculations to support the changes.</p>	<p>The key funder of the energy service is the Welsh Government.</p>	<p>Responsibility for monitoring and enforcing will lie with Salix. Where required, Salix will conduct a technical assessment on the revisions before proceeding with the completion and payment steps.</p>	<p>Successful applicants must provide regular updates on progress of the project in order to ensure that project completion is progressing as agreed. Failure to do so may result in funding being returned.</p> <p>Projects which increase in cost to the extent that they are no longer compliant with the programme's criteria cannot be funded unless the public sector body is prepared to cover the additional costs.</p> <p>Clear visibility on key project milestones, inclusion of contingencies and evaluation of any risks to the project delivery is included in the application and forms a key part of the technical assessment.</p>	<p>Not applicable. There are no penalties outlined for non-compliance as it is not a statutory scheme.</p>

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
Warm Homes Programme	The measures installed will depend on the recommendations of a qualified and independent energy assessor following a Whole House Assessment of each property.	Welsh Government	The Warm Homes Programme are subject to independent periodic evaluation and subject to scrutiny by the Office of the Auditor General for Wales.	Not applicable. Compliance and enforcement of standards is the responsibility of the Office of the Auditor General for Wales.	Not applicable. There are no penalties outlined for non-compliance as it is not a statutory scheme.
Boiler Plus	The standards create an obligation on the person carrying out the work when a gas boiler is installed in and existing dwelling in England.	Compliance and enforcement of standards pertaining to fixed building services is the responsibility of Building Control.	Building Control have direct responsibility for ensuring quality standards are met, while the Gas Safe Register also contributes to quality assurance, although required only to monitor safety considerations. The boiler industry also adopts a range of self-regulation procedures, most notably the Benchmark checklist.	Not applicable. Compliance and enforcement of standards pertaining to fixed building services is the responsibility of Building Control.	Enforcement of these standards will be conducted through the present Building Regulations framework.  The Local Authority has a duty to enforce the Building Regulations in its area and will seek to do so by informal means wherever possible. If a person carrying out building work contravenes the Building Regulations, the Local Authority may decide to take them to the magistrates' court where they could be fined up to £5,000 for the contravention, and up to £50 for each day the contravention continues after conviction (section 35 of the Building Act 1984). This action will usually be taken against the builder or main contractor, and proceedings must be taken within two years from the completion of the work.

Scheme/Measure	Description of the monitoring and verification system and the process of verification	Implementing public authority	Independence of monitoring and verification from obligated parties	Reporting obligations for obligated parties	Member State law on penalties to be applied in the case of non-compliance
Streamlined Energy and Carbon Reporting Framework (SECR)	Qualifying companies will need to include information in line with the SECR framework in their Directors' Report, or an equivalent Energy and Carbon Report for LLPs, for financial years beginning on or after 1 April 2019.	Department for Business, Energy and Industrial Strategy (BEIS)	Whilst not a requirement, external verification or assurance is recommended as best practice to ensure the accuracy, completeness and consistency of data for both internal and external stakeholders.	<p>The reporting requirements differ for quoted companies, large unquoted companies and LLPs. Requirements include energy use from electricity, gas and transport fuel, GHG emissions and emissions intensity metric for the current and previous reporting periods.</p> <p>Reporting exemptions exists for companies that can confirm their energy use is low - 40MWh or less over the reporting period. These companies will still need to include a statement in their report confirming that they are a low energy user. If preparing a group report, the low energy user threshold applies to the energy consumption of the parent group and its subsidiaries.</p>	Aligned with requirements for UK companies to submit annual reports to Companies House – with, for example, financial (civil) penalties for late or incomplete filings.

# Progress in reducing emissions

## 2021 Report to Parliament

Progress in reducing emissions  
2021 Report to Parliament

Climate Change Committee  
June 2021

Presented to Parliament pursuant to Section 36(1) and Section 59 (1) of the Climate Change Act 2008. This report is published in two volumes. Volume 1 (Progress in reducing emissions – 2021 Report to Parliament) and Volume 2 (Progress in adapting to climate change – 2021 Report to Parliament)

Both volumes were laid before Parliament on 24 June 2021 and are available online at:  
[www.theccc.org.uk/publications](http://www.theccc.org.uk/publications)

Book 1 of 2

The Committee would like to thank:

**The team that prepared this report and its analysis:** This was led by Chris Stark, Mike Thompson and David Joffe and included Tom Andrew, Owen Bellamy, Marili Boufounou, Peter Budden, Eoin Devane, Aaron Goater, Rachel Hay, Mike Hemsley, Jenny Hill, Jaya Jassi, Miriam Kennedy, Ewa Kmietowicz, Bianca de Farias Letti, Luke Maxfield, Richard Millar, Chloe Nemo, Simon Rayner, Victoria Root, Vivian Scott, Indra Thillainathan, Emma Vause and Louis Worthington.

**Other members of the Secretariat who contributed to this report:** Jo Barrett, Kathryn Brown, Victoria de la Cruz, Tom Dooks, Brendan Freeman, Gemma Holmes, Cara Labuschagne, James Lees, Annabella Okene, Penny Seera, David Style, and Sean Taylor.

**A number of organisations and stakeholders for their support, including** the Department for Business, Energy & Industrial Strategy; the Department for Environment, Food & Rural Affairs; and the Department for Transport.

**A wide range of stakeholders** who engaged with us or met with the Committee bilaterally.

**Our design and digital agencies:** Pali Palavathanan and Anoushka Rodda (TEMPLO) and Mat Burhouse (Slingshot).

# Joint Foreword

---

The UK's Climate Change Act had extraordinary foresight. It laid the groundwork for the nation's escalating climate ambition. It anticipated, correctly, the need to cajole governments into climate plans that would not otherwise fit the political cycle. It has kept UK climate policies rooted in the scientific realities and the technical feasibilities.

That framework now faces its sternest test, as demand grows to see Net Zero delivered; as the urgency becomes more obvious; and as the inadequacies of our planning for the impacts of climate change become clear.

The rigour of the Climate Change Act helped bring COP26 to the UK, but it is not enough for Ministers to point to the Glasgow summit and hope that this will carry the day with the public. Leadership is required, detail on the steps the UK will take in the coming years, clarity on tax changes and public spending commitments, active engagement with people and businesses across the country. These steps are essential, so people can see opportunity in climate-positive choices. We cannot rely on good will alone.

This demands a step change in Government action, but it is hard to discern any comprehensive strategy in the climate plans we have seen in the last 12 months. There are gaps and ambiguities. Climate resilience remains a second-order issue, if it is considered at all. We continue to blunder into high-carbon choices. Our Planning system and other fundamental structures have not been recast to meet our legal and international climate commitments.

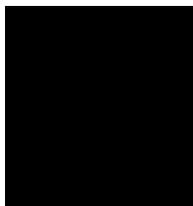

We commend Ministers for accepting our advice on the future path for UK emissions. The setting of the UK's 2030 NDC, the passing into law of the Sixth Carbon Budget, the decision to bring international aviation and shipping emissions within the UK carbon budgets; all were made on the Committee's recommendation. But the Committee's advice to step-up the ambition and resourcing of adaptation continues to go unheeded. And the willingness to set emissions targets of genuine ambition contrasts with a reluctance to implement the realistic policies necessary to achieve them.

It has therefore been a year of climate contradictions. Important statements of ambition, like the agreement to phase out the sale of petrol and diesel cars and vans, have been undermined by delays to essential legislation and much-needed plans to decarbonise buildings and improve their climate resilience. We await a Treasury Net Zero Review, once promised in autumn 2020. The transport decarbonisation plan is still slated, somewhat optimistically, for spring 2021. A pattern has emerged of Government strategies that are later than planned and, when they do emerge, short of the required policy ambition.

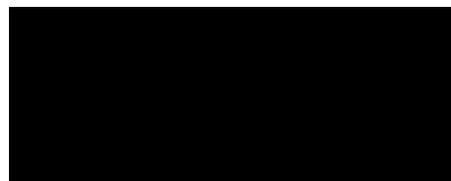

There is still time to address this. This Progress Report offers more than 200 policy recommendations, covering every part of Government. The opportunity to implement them is there. Before COP26, a Net Zero Strategy is promised, which will carry the greatest weight if it is accompanied by Treasury's review of funding. The Government's climate change risk assessment, due in early 2022, can change the tone on adaptation and climate risk management. But it is time for the Government to implement these changes with the urgency that the science demands.

COVID-19 casts a long shadow, but there are three broad lessons from the pandemic: first, we have seen the critical importance of effective planning for high-impact eventualities; second, we have experienced the ability of government to act with pace and scale when it is required; and third, we have learned that people are willing to support change when they have the information before them.

These lessons can shape a successful COP26 summit in November. With strong climate plans at home, the UK Presidency can have global influence. Our message to Government is simple: act quickly – be bold and decisive. Your moment has arrived.

Lord Deben  
Chairman, Climate Change Committee

Baroness Brown  
Chair of the Adaptation Committee

# Overall progress in climate policy: Net Zero and adaptation

The 2020s must be a decisive decade for climate action.

We are in the decisive decade for tackling climate change. Global emissions of greenhouse gases are as high as they have ever been. Nevertheless, green shoots of progress suggest this can change. And it must. The 2010s was the hottest decade on record globally, driving dangerous weather patterns and affecting societies and ecosystems around the world. Without a much stronger and urgent effort, we will breach 1.5°C of warming in the early 2030s and remain ill-prepared for the future.

The world needs to cut emissions and adapt to climate risks.

Global emissions must be cut rapidly to Net Zero, integrated with actions to adapt to the climate risks and impacts. Action must occur across the world, with richer countries acting earliest, while offering support for poorer countries. As host of the upcoming UN climate talks ('COP26') the UK has a particular responsibility to implement effective climate action and drive global efforts.

The UK's record to date is strong in parts, but it has fallen behind on adapting to the changing climate and has not yet provided a coherent plan to reduce emissions in the critical decade ahead:

The UK has a strong track record on climate action, but it is incomplete.

- **Statutory framework for climate.** The UK has a strong climate framework under the Climate Change Act (2008), with legally-binding emissions targets, a process to integrate climate risks into policy, and a central role for independent evidence-based advice and monitoring. This model has inspired similar climate legislation across the world.
- **Emissions targets.** The UK has adopted ambitious territorial emissions targets aligned to the Paris Agreement: the Sixth Carbon Budget requires an emissions reduction of 63% from 2019 to 2035, on the way to Net Zero by 2050. These are comprehensive targets covering all greenhouse gases and all sectors, including international aviation and shipping.
- **Emissions reduction.** The UK has a leading record in reducing its own emissions: down by 40% from 1990 to 2019, the largest reduction in the G20, while growing the economy (GDP increased by 78% from 1990 to 2019). The rate of reductions since 2012 (of around 20 MtCO<sub>2e</sub> annually) is comparable to that needed in the future.
- **Climate Risk and Adaptation.** The UK has undertaken three comprehensive assessments of the climate risks it faces, and the Government has published plans for adapting to those risks. There have been some actions in response, notably in tackling flooding and water scarcity, but overall progress in planning and delivering adaptation is not keeping up with increasing risk. The UK is less prepared for the changing climate now than it was when the previous risk assessment was published five years ago.
- **Climate finance.** The UK has been a strong contributor to international climate finance, having recently doubled its commitment to £11.6 billion in aggregate over 2021/22 to 2025/26. This spend is split between support for cutting emissions and support for adaptation, which is important given significant underfunding of adaptation globally. However, recent cuts to the UK's overseas aid are undermining these commitments.

The UK's record on climate change compares well with that of other countries. But despite the recent willingness of the Government to raise ambition to cut emissions, delays in policy and implementation continue. Much greater urgency is now required from Ministers:

Delivery must accelerate and broaden.

- **The ambition of the last year must be turned into policy and real-world delivery.** The UK has begun to reinforce its new emissions targets with clear ambition for specific sectors in line with the required path (e.g. 40 GW offshore wind by 2030, phase-out of petrol and diesel cars and vans by 2030, 30,000 hectares annual afforestation by 2025). However, some commitments fall short and key strategies have been delayed, leaving holes in ambition. Policies to deliver on the commitments are mostly still to be developed.
- **Progress must extend across the economy.** The relative success of reducing emissions in the electricity sector to date has not been matched in transport, buildings, industry, or agriculture. Only a few sectors have strong plans to adapt to the current and future climate, leaving key risks to the UK's infrastructure and natural environment. Some government departments are not sufficiently prioritising climate change, and none are yet moving at the pace required.
- **A robust plan is needed for adaptation.** The UK does not yet have a vision for successful adaptation to climate change, nor measurable targets to assess progress. Not one of the 34 priority areas assessed in this year's progress report on adaptation is yet demonstrating strong progress in adapting to climate risk. Policies are being developed without sufficient recognition of the need to adapt to the changing climate. This undermines their goals, locks in climate risks, and stores up costs for the future.
- **The climate challenge must be reflected throughout policy and planning.** Climate risks affect all aspects of society, while any new source of emissions could put the Net Zero path at risk. Climate change must therefore be integrated throughout policy and planning decisions, and must be a key consideration in the Government's proposed planning reforms.

Adaptation policy needs a step change in ambition and action.

As the UK rebuilds after the COVID-19 pandemic, there is an opportunity to make systemic changes that will fill the gaps in the UK's climate response. Now is the time to invest in the UK's future through accelerated action to cut emissions and adapt to the changing climate, while supporting the global transition.

The Net Zero Strategy, due ahead of COP26, should complete the picture on how the UK will cut its emissions.

- **Delivering Net Zero.** The Government has promised a Net Zero Strategy before COP26. It must set clear and integrated ambitions across the economy that will meet the Sixth Carbon Budget, and indicate how they will be funded fairly. Efforts must then shift quickly to focus on implementation and delivery. The pace of policy development must accelerate. Credible policies should be fully functioning and properly funded by the end of the current Parliament (i.e. by 2024) to ensure that almost all investments and purchases are low-carbon by the end of the decade or soon after.
- **Adapting to climate risks.** The Government should set out its vision for a UK that is well-prepared for climate change. It should include clear quantified targets, supported by policies and regulations. Climate adaptation must be embedded in core policies if they are to succeed. Key current and upcoming policies include: the Plan for Growth, the National Infrastructure Strategy, the Environment Bill, the Environmental Land Management

Scheme, the Tree and Peat Action Plans, the Net Zero Strategy, the Planning Bill and developments in energy, housing and health policy.\*

Adaptation is vital to achieving society's goals and must be embedded throughout government policies.

- **Integrating climate policy.** Achieving Net Zero will require effective adaptation. The programmes must be properly integrated. For example, as the energy efficiency of buildings is improved, they must also be protected from overheating. The vast carbon stores of the UK's peatlands and soils must be protected. Trees planted to draw CO<sub>2</sub> from the atmosphere and/or to provide timber should be suited to the future climate and, where possible, provide services such as flood defences, enhancing ecosystems, urban cooling, and accessible green space.
- **Embedding climate action across society.** Reducing emissions and adapting to climate change will require a whole-of-society endeavour. Success will require the public to be engaged in the challenge, building public consent for the changes with a broader understanding of what is required and why. Workers will need help to develop the required skills and to fill the jobs created during the transition. Businesses must be encouraged, and in some cases required, to invest in solutions and make low-carbon, climate-resilient choices.
- **Reinstating overseas aid commitments.** Climate challenges are fundamentally integrated with wider challenges for ecosystems and economies. This means climate finance and climate action are not fully isolated from cuts to the UK's Official Development Assistance (ODA) in practice. The Government has said the cut to ODA is temporary; now that the UK's economic recovery is underway, the Government should provide a firm timeline for reinstating its previous commitment.

Government must lead the change. Reducing emissions and adapting to climate change must be embedded throughout policy. All parts of government have a role, requiring strong coordination and an effective devolution of powers and responsibilities to drive delivery. We set out detailed recommendations for each government department and the national Governments of Scotland, Wales and Northern Ireland in an annex of Tables at the end of this report. We will revisit progress against them at our next annual progress report in a year's time. Our next major report will be a thorough appraisal of the UK's Net Zero Strategy.

Reaching Net Zero and addressing climate risks can help to build a better UK.

The transition to Net Zero and the climate adaptation programme offer a positive vision for the UK's future and for the world. They involve an investment boost that can support the economic recovery. This investment will be rewarded with reduced running costs and reduced costs of adapting to climate change in the future. It will support good-quality new jobs across the country, and bring opportunities to enhance our natural environment, our health and our well-being.

The UK can and should be a global leader on climate change.

The challenge of responding to climate change will not end with COP26 in the autumn or with the completion of the UK Presidency a year later. Global commitments are increasingly moving into line with the Paris Agreement, but we have entered a critical decade of action to consolidate and to deliver them. UK action must continue to provide an attractive model of success to maintain our climate leadership in support of a global response that meets the global challenge.

\* Some of these UK policies only cover England. Equivalent devolved policies must also reflect climate change.

# The Committee

**The Rt. Hon John Gummer, Lord Deben,  
Chairman**

Lord Deben was the UK's longest-serving Secretary of State for the Environment (1993 to 1997). He has held several other high-level ministerial posts, including Secretary of State for Agriculture, Fisheries and Food (1989 to 1993). Lord Deben also runs Sancroft, a corporate responsibility consultancy working with blue-chip companies around the world on environmental, social and ethical issues.

**Professor Keith Bell**

Keith Bell is a co-Director of the UK Energy Research Centre (UKERC), a Chartered Engineer and a Fellow of the Royal Society of Edinburgh. He has been at the University of Strathclyde since 2005, was appointed to the Scottish Power Chair in Smart Grids in 2013 and has been involved in energy system research in collaboration with many academic and industrial partners.

**Professor Nick Chater**

Nick Chater is Professor of Behavioural Science at Warwick Business School. He has particular interests in the cognitive and social foundations of rationality, and applying behavioural insights to public policy and business. Nick is Co-founder and Director of Decision Technology Ltd, a research consultancy.

**Professor Michael Davies**

Michael Davies is Professor of Building Physics and Environment at the UCL Institute for Environmental Design and Engineering (IEDE). At UCL his research interests relate to the complex relationship between the built environment and human wellbeing. He is also Director of the Complex Built Environment Systems Group at UCL and a member of the Scientific Advisory Committee of 'Healthy Polis'.

**Professor Piers Forster**

Piers Forster is Director of the Priestley International Centre for Climate and Professor of Physical Climate Change at the University of Leeds. He has played a significant role authoring Intergovernmental Panel on Climate Change (IPCC) reports, and has a coordinating lead author role for the IPCC's sixth assessment report.

**Dr Rebecca Heaton FICFor**

Rebecca Heaton is responsible for Drax Group's efforts to mitigate climate change, ensuring that sound science underpins climate change policies and business strategy. She is also responsible for developing sustainability and climate change research programmes. Rebecca has a 20-year global career working at the interface between business, science and policy.

**Paul Johnson CBE**

Paul Johnson is Director of the Institute for Fiscal Studies and a visiting professor at University College London (UCL). He is widely published on the economics of public policy, and he co-wrote the 'Mirrlees review' of tax system design. He was previously Chief Economist at the Department for Education (2000 to 2004).

**Professor Corinne Le Quéré FRS**

Corinne Le Quéré is a Royal Society Research Professor at the University of East Anglia (UEA), specialising in the interactions between climate change and the carbon cycle. She was lead author of several assessment reports for the UN's Intergovernmental Panel on Climate Change (IPCC) and she currently Chairs the French Haut Conseil pour le Climat.

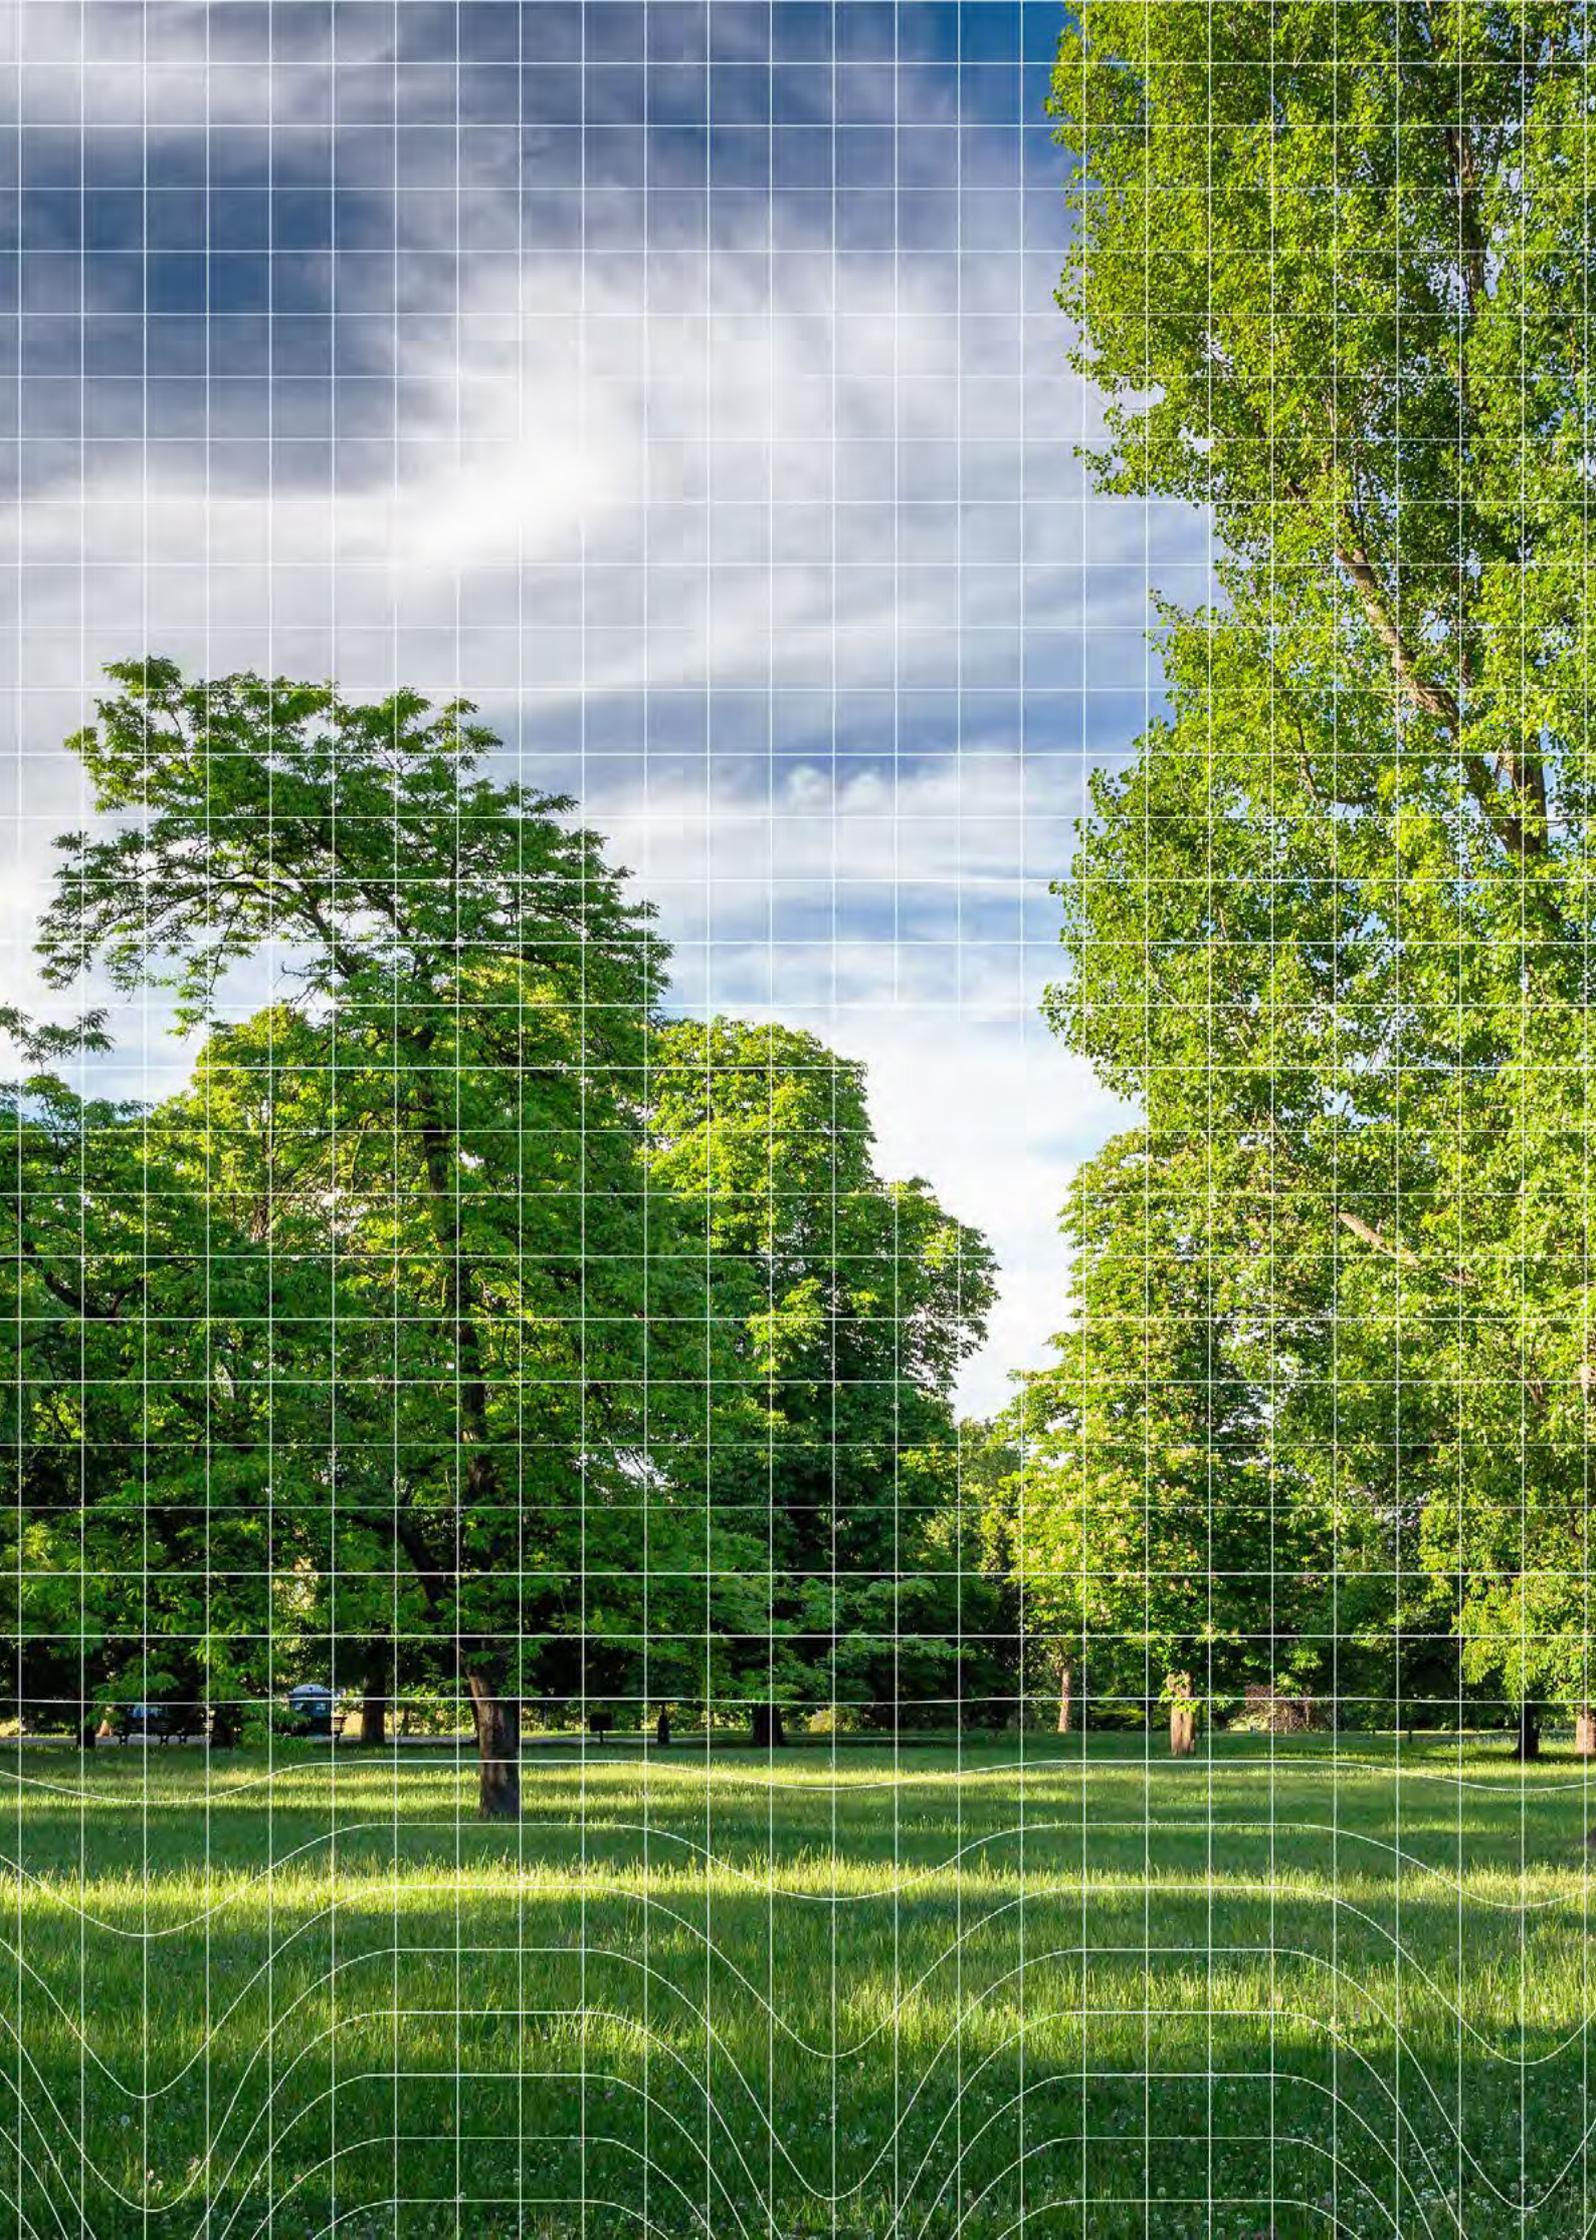

**Pete Betts**  
Expert Adviser to the Committee

Pete was a career civil servant and until 2018 led UK policy on international climate change and energy. He was also Lead Negotiator for the European Union in the UNFCCC negotiations. His current portfolio includes roles at the European Climate Foundation; Willis Towers Watson; IRENA; Grantham School and Chatham House.

# Executive Summary

---

1. Emissions in 2020 and underlying progress on decarbonisation	19
2. Ambition on the path to Net Zero	22
3. Policy progress on the path to Net Zero	26
4. Policy priorities and broadening progress across Government	29
5. The Committee's changing role	33

We welcome the setting of the Sixth Carbon Budget in accordance with our recommendations.

With the adoption of the Sixth Carbon Budget, in accordance with the Committee's recommendations, the UK has committed to an ambitious path to Net Zero. We welcome this decision and the inclusion of emissions from international aviation and international shipping in the legal scope of carbon budgets for the first time. The Sixth Carbon Budget requires a 63% reduction in emissions from 2019 to 2035 (78% relative to 1990).

The challenge has shifted decisively from target-setting to delivery. This decade will be crucial in getting on track to Net Zero.

This is now the foundation for the necessary scale-up of policy action in all sectors. The challenge has shifted decisively from target-setting to delivery. The steps taken during this Parliament, and the action taken in this decade, will be crucial. The Committee's focus must also shift, towards real-world progress and tougher scrutiny of Government plans.

The Net Zero Strategy has huge significance in setting out the UK's vision for meeting its ambitious targets.

The Net Zero Strategy, promised ahead of November's UN climate talks in Glasgow ('COP26'), now has huge significance. It must set out a coherent vision. It must make plans for the jobs transition, and the necessary supply of skills. It will be the basis of the essential public engagement that must take place on the changes ahead. And it must address the unanswered question of how the transition will be funded in a fair way. Effective leadership, coordination and governance across Government has never been more important.

In assessing the UK's progress in the last year, we acknowledge the increase in the scale of Government efforts. But progress is not yet in step with the urgency of the challenge:

- **Effective policies must be developed at greater pace.** The path to Net Zero requires a rapid scale-up in low-carbon investment and low-carbon choices across the economy. Government must lead that change with more urgency than we have seen so far. Many vital and long-promised plans, such as the Heat and Buildings Strategy and the Treasury's Net Zero Review, have been delayed by a year or more. As a result, there is a large *policy gap*: credible policies for delivery currently cover only around 20% of the required reduction in emissions to meet the Sixth Carbon Budget.
- **The Government has made significant commitments, but there are still important gaps in ambition.** Where ambitions have been set over the last year, they have tended to be a significant step up. Many are now aligned with the path to Net Zero (e.g. 40 GW offshore wind by 2030, phasing out petrol and diesel cars and vans by 2030). However, gaps remain in the Government's stated ambitions (e.g. on diets, aviation demand, waste, low-carbon heat networks), while some announcements fall short of what is likely to be needed (e.g. on peatlands, heat pumps, carbon capture and storage). Together these imply a significant *ambition gap*: current Government commitments that align to the Committee's published pathways cover less than half of the emissions reductions to 2035.
- **Efforts must be increased markedly, especially in the lagging areas.** There are signs of a multi-speed approach within Government to raising ambition and putting in place effective policies. Some departments (e.g. Defra, MHCLG, but also parts of BEIS and the Treasury) are lagging behind others and appear timid in their approach. The path to Net Zero requires high ambition and an effective policy framework in all areas.

The full Net Zero Strategy provides an opportunity for the Government to demonstrate that it means what it says on climate action. It should fill the gaps in ambition, set up a programme of accelerated policy development, tackle the cross-cutting challenges in a joined-up way and ensure alignment of all policy decisions with Net Zero so that the 2020s becomes the decisive decade it must be.

- **The public must be brought along with the transition.** Better public information is needed on the changes that people should expect, and on the timing of their implementation. Meaningful public engagement will help build stronger public consent for the transition, and people should expect to understand the rationale for changes. They should also be able to see a benefit from making low-carbon choices and have easy access to the information and funding required to make changes happen.
- **The Net Zero Strategy must clarify ambition across the economy to match the targets in a credible way.** Quantified, credible pathways for sectoral decarbonisation, technology deployment and behaviour changes must be set out, and backed by specific policies as far as possible. If ambition falls short of the Committee's pathways in some areas the Government must explain how this shortfall will be made up elsewhere. The Net Zero Strategy must include demand-side action, which can come with a range of co-benefits (e.g. healthier diets, more exercise and better air quality), and be backed-up by policies that are carefully designed and implemented.
- **The Treasury must ensure a fair and long-term approach to funding the transition.** The Net Zero Strategy must be underpinned by an approach to funding that distributes the costs, savings and wider benefits of decarbonisation fairly. It must encourage action across society, while protecting vulnerable people and companies at risk of adverse competitiveness impacts. A move to longer-term funding streams and low-risk financing of Net Zero investments will be essential to making sustained progress.
- **The Strategy should set clear timelines for policy development that match the urgency of the challenge.** A strong, coherent and joined-up policy framework is needed. Credible policies to deliver the ambitions of the Net Zero Strategy should be fully in place by the end of the current Parliament at the latest (i.e. by 2024) to ensure that almost all investments and purchases (e.g. cars, heating appliances, new energy supplies) are low-carbon by 2030 or shortly after. All departments must increase their pace.
- **The Strategy should initiate a strengthened role for local delivery.** All levels of government have committed to ambitious climate action: UK, devolved administrations, city regions and local authorities. Better coordination and support is required across these levels, including workable business models, the removal of barriers to action, dedicated funding and an approach that enables sub-national action to complement action at the national level.
- **All policy decisions must be compatible with the Government's climate commitments.** The Net Zero Strategy should set out how the Government will achieve this, for example by introducing an explicit test to ensure compliance. Both the Net Zero Strategy itself and policy more widely must recognise the challenges of adapting as the climate changes. Planning policy (both at UK and devolved level) must also reflect these challenges.

Transport emissions fell sharply in 2020, but will rebound to some degree as we move out of lockdown. Action is required to keep positive changes.

Emissions fell sharply in 2020 (by 13%) to 435 MtCO<sub>2e</sub>, 48% below 1990 levels. The fall was primarily in transport sectors as a result of the COVID-19 pandemic and lockdowns. Much of the 2020 fall is likely to be temporary, although that partly depends on the Government's choices. Action now can lock in beneficial changes seen on walking, cycling and remote working for those that want it, for example through investment in broadband, active travel and public transport. More widely, there is an opportunity to accelerate low-carbon investments, for example on energy infrastructure, homes and electric vehicles.

An effective Net Zero Strategy will support the UK to genuinely 'build back better' and provide authority on the global stage into COP26 and beyond.

The rest of this executive summary is set out in five sections:

1. Emissions in 2020 and underlying progress on decarbonisation
2. Ambition on the path to Net Zero
3. Policy progress on the path to Net Zero
4. Policy priorities and broadening progress across Government
5. The Committee's changing role

We provide our full recommendations, department by department, covering all aspects of the Net Zero challenge, in an annex at the end of this report.

# 1. Emissions in 2020 and underlying progress on decarbonisation

The COVID-19 pandemic and the resulting restrictions caused a substantial drop in emissions, which fell to a level almost half those of 1990. But lasting changes to UK emissions remain far from certain. The Committee's provisional estimate is that UK emissions fell by around 13% in 2020 to 435 MtCO<sub>2</sub>e, with the vast majority of the fall associated with reductions in emissions from surface and air transport (Figure 1 and Box 1).

Estimated UK consumption emissions (i.e. the UK's carbon footprint, including emissions embedded in imports) are considerably higher than the UK's 'territorial' emissions. They rose slightly in 2018, the most recent year for which data are available, following a gradual decline over the preceding decade.

The impact of COVID-19 on travel demand led to an unprecedented 29% fall in transport emissions in 2020.

The impact of COVID-19 on travel demand led to an unprecedented 29% fall in transport emissions in 2020. The impact has been particularly pronounced on demand for public transport, which fell more deeply and recovered more slowly than private car travel following lockdowns being lifted. A new challenge for decarbonisation policy is rebuilding the public's confidence in the safety of public transport to avoid a 'car-led' recovery, and providing people with reliable alternatives to car travel.

The huge changes required during this period to how society operates are not a model for the sustained changes needed for Net Zero, but nevertheless have been instructive, across a range of sectors. We have learned that changes to working and travel behaviour can be made rapidly if required. A consensus has developed that the capital investment required for Net Zero can act to boost the economy as it recovers. The importance of good broadband and telecoms provision has become clearer, and we have seen that there is considerable scope to manage offices and other non-residential buildings in a more energy-efficient manner, especially when they are unoccupied.

Emissions in 2021 may well be higher than in 2020, even with positive developments.

As travel returns, we can expect a significant rebound in transport emissions, even if some of the positive behaviour changes (e.g. increased cycling, less business travel) made in response to the pandemic can be locked in through investment in active travel and broadband. But even with progress in reducing emissions from other sectors, UK emissions in 2021 may well be higher than in 2020.

Sustained progress in reducing emissions will need underlying, structural changes.

The focus must be on underlying progress in order to make lasting reductions in territorial and consumption emissions. Underlying progress to date has been insufficient outside electricity generation:

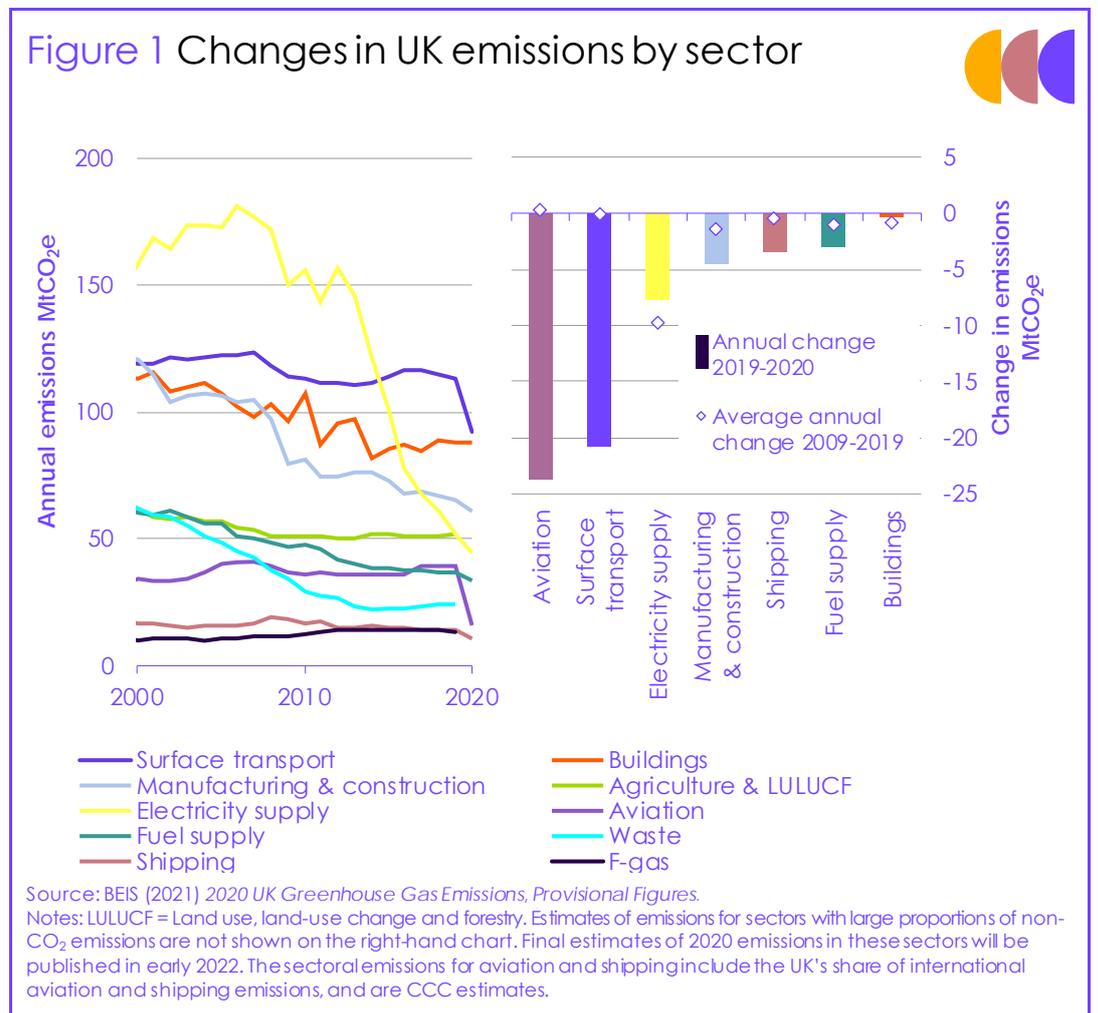

- There has been little of the necessary progress in upgrading the **building stock**. Insulation rates remain well below the peak market delivery achieved up to 2012 before key policies were scrapped, demonstrating clear potential for growth if an effective policy package is put in place. Despite a small improvement in the rates of heat pump installation, these remain far below the levels that are necessary.
- Progress in **agriculture and land use** has repeatedly failed to meet the indicators (e.g. for tree planting and on-farm efficiency measures) outlined in the Committee's progress reports in recent years. There are signs of potential consumer willingness to shift towards less carbon-intensive diets in

future, but this has not yet translated to reduced meat consumption or been backed up by policy to support the change.

- Progress in reducing emissions from **waste** has stalled in recent years following a period of steep emissions reduction from the late-1990s caused by the diversion of waste from landfill.
- Deployment of **renewable electricity generation** has scaled up rapidly. Although the increase in 2020 was at a much slower rate than the average achieved over the previous five years, the growing project pipeline means that this slowdown is likely to be temporary.
- Sales of **electric vehicles** and the deployment of supporting charging infrastructure have increased considerably in recent years. Policies will be required to drive the accelerated uptake required throughout the 2020s (e.g. a zero-emission vehicle mandate). There are also concerning trends, notably the rapid growth in car and van travel during the past decade.
- Although there have been emissions reductions in **industry**, it is unclear how far this reflects structural changes driven by wider factors or genuine improvements in efficiency and carbon intensity.

UK emissions are nearly 50% below 1990 levels, but the journey to Net Zero is far from half done.

UK emissions are nearly 50% below 1990 levels, but the journey to Net Zero is far from half done. Government must now match its bold statements of ambition with effective policies and implementation, and it must move at pace if it is to deliver against the UK's stretching targets.

## Box 1

### Impacts of the COVID-19 pandemic on UK emissions in 2020

Lockdown measures led to a record decrease in UK emissions in 2020 (Figure 1). Emissions fell by around 13% overall with the largest falls in aviation (-60%), shipping (-24%) and surface transport (-18%). Home energy use increased, with residential buildings the only sector to show an overall increase in emissions (+2%).

The fall in emissions in 2020 will have practically zero impact on the UK's past and future contribution to global warming.

Most of the falls in sectoral emissions observed in 2020 are likely to be transient, as they do not reflect structural changes in the underlying economic, social, energy, transportation or land systems. In the absence of these underlying changes, emissions are likely to rebound to some extent in most sectors in 2021.

However, the last year has seen some large changes in patterns of behaviour due to the pandemic. The extent to which these changes will endure is currently unclear. In particular, there is potential for lasting impacts from new working patterns and changes to personal transport choices, with complex and uncertain implications for how our domestic and international transport systems work and the demand for energy in homes and workplaces.

The lasting impacts of the pandemic are still far from certain, but the experience from the last year has shown:

- Emissions fell rapidly, but they can rebound just as quickly. In the absence of underlying structural changes emissions are likely to rebound in most sectors in 2021.
- There is a limited window to change behaviours. If sources of 'behavioural friction' in moving from one pattern of living and working to another can be overcome, people and organisations can often adapt quickly. There are now significant opportunities to lock in and build on positive developments, especially – though not exclusively – regarding travel demand.
- The need for increasingly resilient networks and infrastructure. Our energy (and digital) networks have demonstrated they can be resilient to profound changes in use. The transition towards Net Zero will only increase the challenges of operating an electricity system with high shares of variable and inflexible generation. The non-residential buildings stock can also be improved to respond more efficiently to variations in occupancy.
- Lockdown is not a blueprint for decarbonisation. The fall in UK emissions in 2020 was larger than the annual change needed on the pathway to Net Zero, but did not materially affect the structural changes that are needed to reach Net Zero. Lockdowns heavily restricted movement and had damaging economic and social consequences. This stands in contrast to the fair, well-planned and sustainable transition to Net Zero that is possible. Net Zero should bring improvements to quality of life: new jobs, cleaner air, quieter streets, more green spaces, comfortable homes and healthier lifestyles.

It will be important to sustain climate-positive changes that have developed during the pandemic, but also to act decisively to mitigate the negative changes that could jeopardise efforts towards Net Zero.

## 2. Ambition on the path to Net Zero

The Government has moved to align many of its sectoral commitments with those implied by a Net Zero pathway, significantly strengthening its ambitions since the 2017 Clean Growth Strategy. Individual plans and policies published in recent months have set ambitions closer to those recommended by the Committee. But a notable overall shortfall is now emerging between what has been announced so far and the Committee's detailed recommendations for the Sixth Carbon Budget. The late publication of several strategies is also disappointing and means that we have only a partial picture of ambition:

Announced ambition in many areas is in line with, or close to, the necessary level.

- A number of the important elements of the overall Net Zero Strategy have been delayed. At the time of finalising this report, a range of strategies expected in 2020 had not yet been published, including the Heat and Buildings Strategy, the Transport Decarbonisation Plan, the Treasury's final Net Zero Review, the Aviation Decarbonisation Strategy and the Nature Strategy. Even with these, there are likely to be gaps. We highlight the need to fill a range of gaps on strategy and policy in section 4.
- Announced ambition for electric cars and vans, offshore wind, low-carbon hydrogen production, industrial decarbonisation to 2030 (but not to 2035) and tree planting to 2025 is broadly in line with the Committee's scenarios (Table 1). This is commendable. Together, areas where ambition is beginning to align with the CCC pathway cover almost half of the emissions reduction required for the Sixth Carbon Budget (Figure 2). We expect this to rise further during 2021, as additional strategies are released.
  - These clear commitments have seen responses in the market and from the public. For example, announcements from car manufacturers and increased interest in electric cars have followed the Government's commitment to phase out petrol and diesel cars and vans by 2030. However, clear policies will be required to make this a reality.
  - In other areas, companies are also voicing support for increased ambition, such as for full electricity decarbonisation by 2035, phasing out installation of high-carbon heating systems, rebalancing electricity and gas prices to support electrification, and support for fitting carbon capture, utilisation and storage (CCUS) on Energy from Waste plants.
- However, where ambition has diverged from the CCC pathway to meet the Sixth Carbon Budget, there has been a tendency for ambition to fall short rather than go further (e.g. heat pump deployment that is a third lower in 2028, total CCS ambition that is around half in 2030) (Figure 3).

However, there has been a tendency for ambition to fall short of our recommended pathway to meet the Sixth Carbon Budget.

The Government is not required to commit to the Committee's detailed sectoral pathways, nor to follow our policy advice. But it must set out a credible alternative approach where it chooses not to. Our pathways are designed to be stretching across the economy, so it is difficult to compensate for lower ambition in one area with greater ambition elsewhere. The **Net Zero Strategy**, released later this year, will have to address the shortfall, strengthening weaker commitments to be closer to the Committee's pathways or setting out how emissions can be cut faster in other areas to compensate.

Important gaps remain in Government ambition, particularly on the demand side, and other ambitions need clarification.

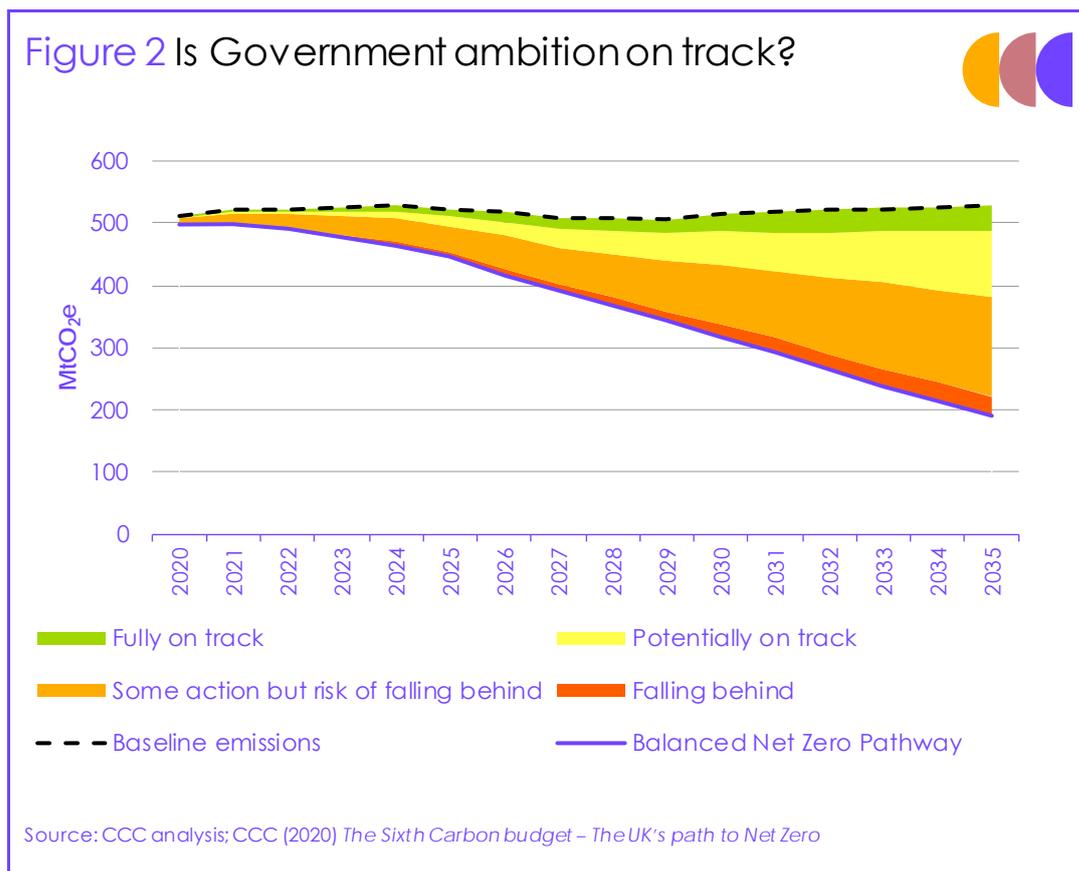

Important gaps also remain in terms of the scale of the Government's ambition in certain sectors, while there is a danger that several of the broad ambitions announced are implemented in a way that would fall short of the CCC scenarios:

- Consumer choices.** So far, the Government's announcements have focused on technologies and largely ignored the potential for changes in consumer choices to reduce emissions. These are particularly important to limit emissions in 'hard to abate' sectors, such as aviation and agriculture. We note that there are a wide range of levers available to promote low-carbon choices, including enabling measures and nudges, ensuring supporting infrastructure is available, and more interventionist measures using regulations and the tax system.
- Ambiguity in ambition.** While some commitments have been made that could be at least as ambitious as our pathways, there remain risks that real-world implementation could fall short. For example, the announced 2030 phase-out date for sale of petrol and diesel cars and vans will allow sale of vehicles with 'significant zero-emission capability' until 2035, well after the 2032 date by which we recommend all such vehicles should be fully zero-emission. The definition of which vehicles can be sold after 2030, currently subject to consultation, will be crucial in ensuring that emissions and motoring costs are kept as low as possible by prioritising fully zero-emission vehicles over hybrids.

The Net Zero Strategy will need to ensure that ambition across the board adds up to a credible approach to meeting the targets.

There also remain a range of issues that have not yet been tackled, and which do not fit neatly into sectoral strategies (see section 4). The Net Zero Strategy will need to fill remaining gaps, clarify existing ambitions, set out a vision for the governance of the transition and ensure that the ambition across the board adds up to a credible and quantified approach to meeting the Sixth Carbon Budget and Net Zero target.

Figure 2 Is Government ambition on track?

**Table 1**

Government commitments compared to the CCC Pathway between 2025-2035

Headline actions	Government commitment <sup>1</sup>	CCC pathway
Offshore wind	40 GW by 2030	40 GW by 2030
Electric vehicles	Phase-out of new fossil fuelled vehicle sales by 2030, with allowance for some hybrids out to 2035	Phase-out of all new fossil-fuelled vehicle sales by 2032
Heat pumps in homes	600,000 heat pump installations / year by 2028	900,000 heat pump installations / year by 2028 1.1 million installations / year by 2030
Low-carbon heat networks (all buildings) <sup>2</sup>	2 TWh of low-carbon heat networks by 2030	25 TWh of low-carbon heat networks by 2030
Low-carbon hydrogen	5 GW (up to 42 TWh) by 2030	30 TWh by 2030
Carbon Capture and Storage <sup>3</sup>	10 MtCO <sub>2</sub> captured and stored annually by 2030, across four industrial clusters, including at least one power project	22 MtCO <sub>2</sub> /year captured and stored in 2030, across at least five industrial clusters, including multiple power projects
Emissions reduction in manufacturing and refining	Around two-thirds by 2035, compared to 2018	73% by 2035, compared to 2018
Tree-planting	30,000 hectares / year by 2025	30,000 hectares / year by 2025 50,000 hectares / year by 2035
Peatland restoration <sup>4</sup>	32,700 hectares / year by 2025	67,000 hectares / year by 2025
Greenhouse gas removals	Innovation support provided, in recognition that engineered removals will be needed, but no firm commitment on deployment yet	5 MtCO <sub>2</sub> /year by 2030
Nuclear power <sup>5</sup>	Final Investment Decision on at least one new nuclear power plant by the end of this Parliament	One new nuclear plant operational by 2030, and a further plant by 2035

Source: CCC analysis.

Notes:

<sup>1</sup> Based on actions in the Ten Point Plan, Energy White Paper, Industrial Decarbonisation Strategy and England Tree and Peat Action Plans between 2025 and 2035 and the CCC's Balanced pathway from the Sixth Carbon Budget.

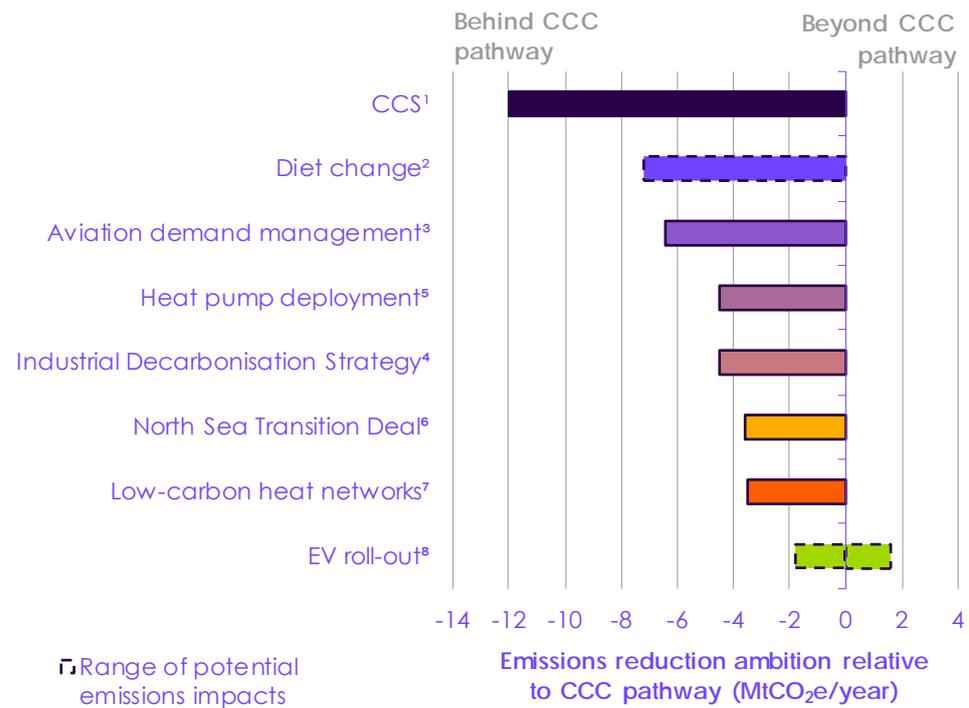

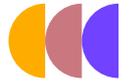

<sup>2</sup> Government commitment on low-carbon heat network deployment is illustrative, and has been inferred from Government spending commitments, using assumptions around expected leveraged investment and the proportion of funding targeted at low-carbon networks.

<sup>3</sup> The difference in carbon captured and stored annually largely comes from projects in the power sector in CCC scenarios, so other technologies could compensate for this shortfall.

<sup>4</sup> Government peatland restoration commitments include Scotland, Wales and England. CCC peatland restoration numbers in 2025 are UK-wide.

<sup>5</sup> The Balanced Pathway produced for the CCC's Sixth Carbon Budget assumed that two new nuclear power stations would be in operation by 2035, in addition to Hinkley Point C.

**Figure 3** Differences in stated Government ambition compared to CCC pathway

Notes: Comparisons are against the Balanced Net Zero Pathway ('CCC pathway') published in the Committee's *Sixth Carbon Budget* advice.

<sup>1</sup> Government CCS ambition for is 10 MtCO<sub>2</sub>/year in 2030, compared to 22 MtCO<sub>2</sub>/year in the CCC pathway.

<sup>2</sup> The level of diet change without explicit policy to support it is uncertain. Emissions could be up to 7.2 MtCO<sub>2</sub>e/year higher than the CCC pathway in 2030.

<sup>3</sup> Lack of ambition for aviation demand management would result in higher emissions of 6.4 MtCO<sub>2</sub>e/year in 2030 relative to the CCC pathway for aviation emissions.

<sup>4</sup> The Industrial Decarbonisation Strategy aims for a 67% reduction by 2035, compared to 73% in the CCC pathway.

<sup>5</sup> Government ambition is for 600,000 installations in homes in 2028, compared to 900,000 in 2028 in the CCC

Pathway. The abatement gap in 2030 is inferred, based on an assumed trajectory of uptake to 2028 under the Government's plans, with annual deployment remaining constant to 2030.

<sup>6</sup> The North Sea Transition deal commits to a reduction that falls short of the CCC pathway by 3.7 MtCO<sub>2</sub>e/year in 2030.

<sup>7</sup> Based on announced Government heat network investment of £0.7 billion (assumed to leverage £2.2 billion, leading to a total investment of £2.9 billion, of which we estimate £1.7 billion will be for low-carbon, with resulting deployment estimated by CCC).

<sup>8</sup> A strict 2030 phase-out of petrol and diesel vehicles would be more ambitious than the CCC pathway, but this depends on the timing of when plug-in hybrid electric vehicles are phased out.

### 3. Policy progress on the path to Net Zero

Policy progress is being made, but it is not yet happening at the necessary pace.

Comprehensive policy frameworks are needed to drive the major scale-up in delivery required by the path to Net Zero. Of the 92 recommendations we made in our 2020 progress report, 72 (i.e. over 75%) have been either achieved, partly achieved or are underway. Clearly, policy progress is being made, but it is not yet happening at the necessary pace – only 11 have been achieved in full.

In many cases, a strategic commitment has been made, but details of policy implementation have not yet caught up with the high-level ambition (Figure 4).

- Progress on setting out policies is significantly behind that on ambition, with only one-fifth of the emissions savings for the Sixth Carbon Budget having policies that are 'potentially on track' for full delivery (e.g. renewable electricity generation).
- In many other areas, some policy plans have been set out but these lack detail and/or do not comprehensively cover the necessary set of issues. Together, areas in which policy is in danger of falling behind cover around three-fifths of the emissions reduction required to 2035.
- A further one-fifth of the emissions reductions still have major policy gaps, including on demand-side action and tackling emissions from landfill and waste incineration. We highlight the need to fill a range of policy gaps in section 4.

The Government has recognised the need to extend delivery, and has launched or begun development of a major programme of strategies, consultations and policies covering all the major emitting sectors (i.e. energy supply, industry, transport, buildings, agriculture and land use). That process is ongoing as this report is published (Box 2).

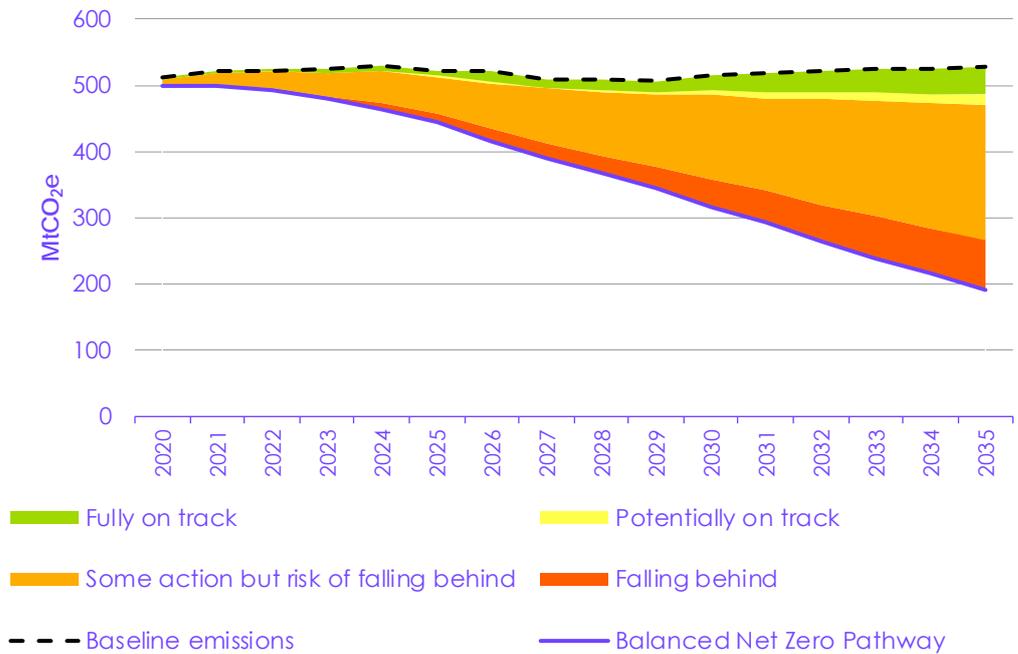

We have also seen, through the failure of the Green Homes Grant, the challenges of real-world implementation and the need for well-designed and well-executed schemes that properly address the barriers to decarbonisation. Failures cannot be avoided completely, but it is critical that effective replacement policies are put in place quickly, drawing on the experience of previous schemes. The Net Zero transition requires a consistent framework that enables supply chains and public buy-in to build over time, without confidence being undermined by sudden policy changes or poor delivery. While the Local Authority Delivery part of the Green Homes Grant scheme has been more successful, there is an urgent need for well-designed, fully-funded policy that works for deployment of energy efficiency improvements and low-carbon heat in the rest of the residential sector.

A coherent approach is needed to achieving Net Zero. All Government policies need to be compatible with the transition to Net Zero and the need to adapt to climate change.

More generally, there is a need for a coherent approach to achieving Net Zero and to ensure that all Government policies are compatible with the transition to Net Zero, together with adapting to climate change. Decisions on road building, planning, fossil fuel production and expansion of waste incineration are not only potentially incompatible with the overall need to reduce emissions but also send mixed messages and could undermine public buy-in to the Net Zero transition. We recommend implementation of a 'Net Zero Test' to ensure that all Government policy decisions are compatible with the legislated emissions targets.

The Government should now focus on delivering their stated policy aims, scaling up the rate of delivery rapidly and putting in place a comprehensive policy framework this Parliament (i.e. to 2024).

Figure 4 Are Government policies on track?

### Box 2

#### Highlights of recent and upcoming policy developments

There have been several high-profile policy publications in the last eight months:

- The **Ten Point Plan for a Green Industrial Revolution** and the accompanying **National Infrastructure Strategy** set a series of headline commitments across the economy that could contribute to Net Zero. Key commitments by 2030 include: 40 GW of offshore wind capacity, 5 GW of hydrogen production capacity, phasing out petrol and diesel cars and vans by 2030 (with some hybrids permitted until 2035), four CCS clusters capturing 10 MtCO<sub>2</sub> annually and 600,000 heat pumps installed annually (by 2028). The Plan allocated initial funding including a £1 billion **Net Zero Innovation Portfolio** and kicked off processes to support delivery of the headline goals and others such as tree planting, sustainable aviation fuels, low-carbon buses and HGVs, greenhouse gas removals, nuclear power, and green finance. Job creation was a key objective, supported by the launch of a **Green Jobs Taskforce**.
- The **Energy White Paper** took further steps to support the Ten Point Plan. These included consultations and explorations of policy options to support a fairer and more flexible energy system, commitments to support at least one power CCS project by 2030, an aim for a final investment decision on one nuclear power plant this Parliament and additional funding for advanced nuclear innovation, a review of institutional arrangements for the energy system, support for electric vehicle charging, a commitment to phase out installation of fossil gas boilers by the mid-2030s, a commitment to set up a UK ETS and to align its cap to the path to Net Zero, and announcements on hydrogen, CCS, industry and oil and gas extraction.
- The **Industrial Decarbonisation Strategy** set a goal to cut industry emissions by around two-thirds from 2018 to 2035. It committed to several calls for evidence, set out preferred options for some funding mechanisms and allocated some initial funding.

- The **North Sea Transition Deal** set targets to reduce emissions from oil and gas supply by 10% in 2025, 25% in 2027, and 50% in 2030 against a 2018 baseline. In addition, the deal outlined how the oil and gas sector could support the deployment of hydrogen and CCS, as well as help hydrocarbon workers during the energy transition.
- The **Peat and Trees Action Plans** published in May sets out England's ambition for peat restoration (30,000 hectares by 2025) and new woodland (7,000 hectares per year by 2025). The Nature for Climate Fund will be the main source of public funding during this period, providing £50 million for peat and £500 million for trees, with options being developed to leverage private sector finance. There is no stated ambition beyond 2025 for either restoration or tree planting, although there is a commitment in the Plan to consult in 2022 on the long-term woodland creation target.

Other publications that have been promised but not yet delivered (by early June 2021, when this report was finalised) include:

- **Treasury Net Zero Review.** HM Treasury (HMT) released its interim review in December, concluding that reaching Net Zero is essential for long-term prosperity, that the costs of tackling climate change are relatively small and depend on policy choices, that a mix of policy levers will be required, and that well-designed policy can reduce costs and risk for investors as well as supporting innovation and the deployment of new technologies. The final report will look at reducing policy uncertainty to encourage innovation, the scope for addressing risks to competitiveness, more detailed analysis of household impacts, and crucially, how HMT can incorporate climate considerations into spending reviews and fiscal events and how to embed the principles of the Net Zero Review into policy making.
- The **Heat and Buildings Strategy** will set out further detail on the Government's plans for decarbonising heating in the UK, along with the 'suite of policy levers' it intends to 'use to encourage consumers and businesses to make the transition'.
- The **Transport Decarbonisation Plan** is the Department's 'plan to decarbonise the UK's entire transport system'. It will cover active travel (i.e. walking and cycling) and public transport; the transition to zero-emission road vehicles (e.g. electric cars) from the perspective of the consumer, suppliers and the energy system; freight and logistics; and aviation and shipping.
- **Net Zero Aviation Strategy.** In light of the UK's new Net Zero target, the Government has committed to a new consultation on aviation decarbonisation in 2021, followed by a Net Zero aviation strategy before COP26.
- The **Hydrogen Strategy** will consider how to support the scale-up of low-carbon hydrogen production, as well as the interaction with storage, distribution and potential end-use demand. It will set out details of hydrogen business models and a revenue mechanism for bringing through private-sector investment, and support for the demand side such as heating trials and support for hydrogen in shipping.
- The **Biomass Strategy** will coordinate across Government departments to assess how biomass should be sourced and used across the economy to contribute best to Net Zero. It will review the UK's current biomass sustainability standards and outline the role of BECCS in delivering greenhouse gas removals.
- **National Food Strategy.** Part Two of the Strategy will cover the environmental impact of our diets (including GHG emissions) and land use.

Alongside these major statements, there have been many smaller, but important, policy developments, including in the buildings sector ahead of the delayed strategy. These are covered in Chapter 4 of this report.

Source: Quotes on future policy plans taken from the Ten Point Plan, Energy White Paper, Net Zero Review: Interim Report, National Infrastructure Strategy, Industrial Decarbonisation Strategy.

## 4. Policy priorities and broadening progress across Government

There has been important progress in the last year. However, we see evidence of a multi-paced Government.

Overall, there has been important progress in the last year. However, we see evidence of a multi-paced Government, with some departments lagging behind others (Table 2):

- The **Ministry of Housing, Communities & Local Government (MHCLG)** is not fully supporting local government to play its part in the transition to Net Zero. Progress has fallen short to date on ensuring that building standards are fit for purpose and properly enforced. The current Planning Bill misses the powerful opportunity to ensure that developments and infrastructure are compliant with Net Zero and appropriately resilient to climate change.
- While the **Department for Environment, Food & Rural Affairs (Defra)** has made important steps forward on ambition for afforestation and peat restoration, progress on agriculture and land use remains slow and partial, and gaps in ambition remain. On waste, large gaps remain both on banning materials from landfill and getting a grip on the rapid expansion of Energy from Waste facilities.
- Even within departments that are performing better overall there are pockets of poor or slow performance. For example, **BEIS's** Heat and Buildings Strategy has been delayed by almost a year, while the **Department for Transport** has not set out any plans for limiting growth in aviation demand.
- More generally, Government progress has been slow on overarching challenges towards Net Zero, which has now been law for two years. The most notable delay is to **HM Treasury's** Net Zero Review, but there are delays and uncertainty to a suite of other challenges: the just transition, jobs and skills, public engagement. In the Spending Review later this year, the Treasury must prioritise Net Zero, ensuring departments are fully equipped to deliver the carbon budgets. There is also a need for strong governance of the transition within Government, including ensuring that wider policy decisions are routinely made compatible with Net Zero.

All parts of Government must play their full role to deliver the path to Net Zero.

For the full programme to align to the challenge, and to provide the leading example that the Government wishes to take to COP26, these failures will have to be addressed.

- **A plan for achieving a just transition** for people, workers, consumers and regions, which ensures that opportunities are taken to create jobs and improve the skills base while maintaining international competitiveness. Alongside this, a credible plan is needed for the fair funding of the transition, starting with completion of the Treasury's Net Zero Review, as well as ensuring that investment is supported by strong financing.
- **Public engagement** around the need for climate action, the health co-benefits of low-carbon choices, information about how individual actions can contribute to reducing emissions and involvement in decisions on how best to achieve the transition.
- **A framework for local delivery** to deliver ambitious climate objectives at different scales (i.e. devolved administrations, regions and local authorities), through workable business models, removal of barriers to action, dedicated resource and an approach that facilitates sub-national action to complement action at the national level.
- **Plans must make climate adaptation an integrated part of the transition to Net Zero.** Across multiple areas, and in particular on buildings and land use, there are benefits to thinking holistically about how policy can reduce emissions, while ensuring it improves resilience to the UK's changing climate. Like Net Zero, climate adaptation will also need to be integrated into core Government policy.

## Essential elements of the transition to Net Zero

We have identified seven indispensable elements to the transition, on which it is crucial that good progress is made.

Progress is needed across a wide range of areas in order to get on track to Net Zero. However, there are several indispensable parts to the transition. We have identified seven priority areas for the Government in which it is crucial that good progress is made, covering a subset of the approximately 200 recommendations for UK Government departments and the devolved administrations for the next year. These are primarily focused on delivery:

- Develop and implement a comprehensive policy package to enable the delivery of the 2030 transition to **electric vehicles**, to build on the phase-out announcement and the positive response of automakers and motorists. This should include a full strategy for widespread deployment of charging infrastructure and a mandate requiring manufacturers to sell a rising proportion of zero-emission vehicles.
- Implement a comprehensive policy package for **buildings decarbonisation**, and enshrine the long-term standards framework in regulation and law, to deliver the ambitions of the upcoming Heat and Buildings Strategy and finalise the roadmap for decarbonising the UK building stock.
- Implement comprehensive delivery mechanisms for landscape-scale **land use change for afforestation and peatland restoration** and a high take-up of **low-carbon farming practices**. This should cover mechanisms for private and public financing and a strategy to address non-financial barriers. Interim policies will be needed to avoid a hiatus in action while awaiting the implementation of the new mechanisms.
- Advance policy for **manufacturing decarbonisation** by establishing incentive mechanisms to support fuel switching and implementing CCS proposals. Alongside this, initiate the development of product and construction standards both to improve energy and resource efficiency

and to develop the option of managing carbon leakage by applying carbon policy to imports.

- Continue **auctions for low-carbon power generation**, together with supporting actions to enhance system flexibility, to deliver an emissions intensity of 50 gCO<sub>2</sub>/kWh or better in electricity generation by 2030.
- Deliver a **Hydrogen Strategy** that sets out a vision of the role of hydrogen on the path to Net Zero and the steps needed to realise it. The strategy should focus on hydrogen use in sectors that cannot decarbonise without it and low-carbon hydrogen production routes to 2035 with aims to start large-scale hydrogen trials in the 2020s.
- **Enable domestic engineered greenhouse gas removals (GGR)** to contribute to UK carbon budgets and Net Zero, and establish GGR support mechanisms and monitoring, verification and reporting (MRV) structures in the UK that ensure that GGR is timely, sustainable and verifiable.

## Gaps that must be addressed

There are specific policy gaps that must be addressed on unabated gas generation, demand-side action, waste and aviation demand.

Our assessment of strategies and policies announced to date has identified specific key gaps that need to be addressed by Government policy:

- Commit to **phasing out unabated gas-fired electricity generation** by 2035, subject to ensuring security of supply. Publish a comprehensive long-term strategy for unabated gas phase-out, including ensuring new gas plants are properly CCS- and/or hydrogen-ready as soon as possible and by 2025 at the latest, and thoroughly assessing the market challenges that will emerge as part of the transition to a fully decarbonised electricity system.
- Include contributions in the Net Zero Strategy from **demand-side action**, on aviation, a shift towards healthier diets and a switch away from cars towards active travel and public transport. This should be accompanied by public engagement to explain how low-carbon choices can contribute to Net Zero and wider co-benefits to health, and policy frameworks that seek to encourage and incentivise these changes.
- Address with urgency the rising emissions from, and use of, **Energy from Waste (EfW)**, including by ensuring that the capacity and utilisation of EfW plants is consistent with necessary improvements in recycling and resource efficiency, providing support to enable existing EfW plants to begin to be retrofitted with CCUS from the late 2020s, and introducing policy to ensure that any new EfW plants are built either with CCUS or are 'CCUS ready'.
- The overdue **Net Zero Aviation Strategy** must set out credible pathways and policies to encourage technological development in the sector but also recognise the potential need to manage aviation demand in future, should improvements in sustainable aviation fuels and low-carbon aircraft fall short of Government and industry ambitions. An assessment of the UK's airport capacity strategy and a mechanism for aviation demand management should be part of the aviation strategy.

We make a comprehensive set of recommendations in the Departmental tables at the end of this report.

We make a more comprehensive set of recommendations in the departmental recommendation tables at the end of this report.

## 5. The Committee's changing role

As Government makes the shift to focusing on implementation, the CCC's task must also evolve to focus on real-world progress and tougher scrutiny of Government plans.

As Government makes the shift to focusing on implementation, the Committee's task must also evolve towards a focus on real-world progress and tougher scrutiny of Government plans. Over the coming year the Committee will develop deeper metrics of progress and consider a better dashboard of indicators. We are also broadening our outlook:

- **Broader view of real-world progress.** The transition to Net Zero requires changes that go beyond the deployment-related metrics we have tended to track to date. We will seek to broaden our assessment of real-world progress, including public attitudes, corporate commitments, finance and the green recovery, as well as consumption emissions and the factors affecting them.
- **Governance and enabling delivery.** The challenge of tackling climate change mitigation and adaptation in a joined-up, coherent way requires a governance structure within central Government and at different geographical scales. We will increasingly look at coordination within UK Government and the interactions with action at the devolved government and local levels.
- **Non-government action.** The transition of UK society towards Net Zero must involve a wide range of actors. We will seek to broaden our advice to give more attention to enabling lifestyle changes and low-carbon choices, corporate strategies, local authority action and community action.
- **The UK as part of global action.** We will seek increasingly to locate the UK's transition within the wider international transition, which is set to gain pace, with important implications for technologies, options and costs, and for policy design (e.g. because of carbon-border adjustment mechanisms). We have also been engaging and sharing lessons with similar bodies to the CCC around the world.
- **Fairness and the just transition.** We are focusing more on fairness, jobs, skills and the equitable distribution of costs and benefits over the transition.

The Committee's next major UK report will be an assessment of the Net Zero Strategy.

We look forward to assessing the Government's Net Zero Strategy later this year, and will aim to align our progress metrics and monitoring with the Government's proposals where we consider those to be credible.

The rest of this report is set out in four chapters:

1. The global context
2. UK emissions and drivers
3. Underlying progress and enablers of progress
4. Policy progress and gaps

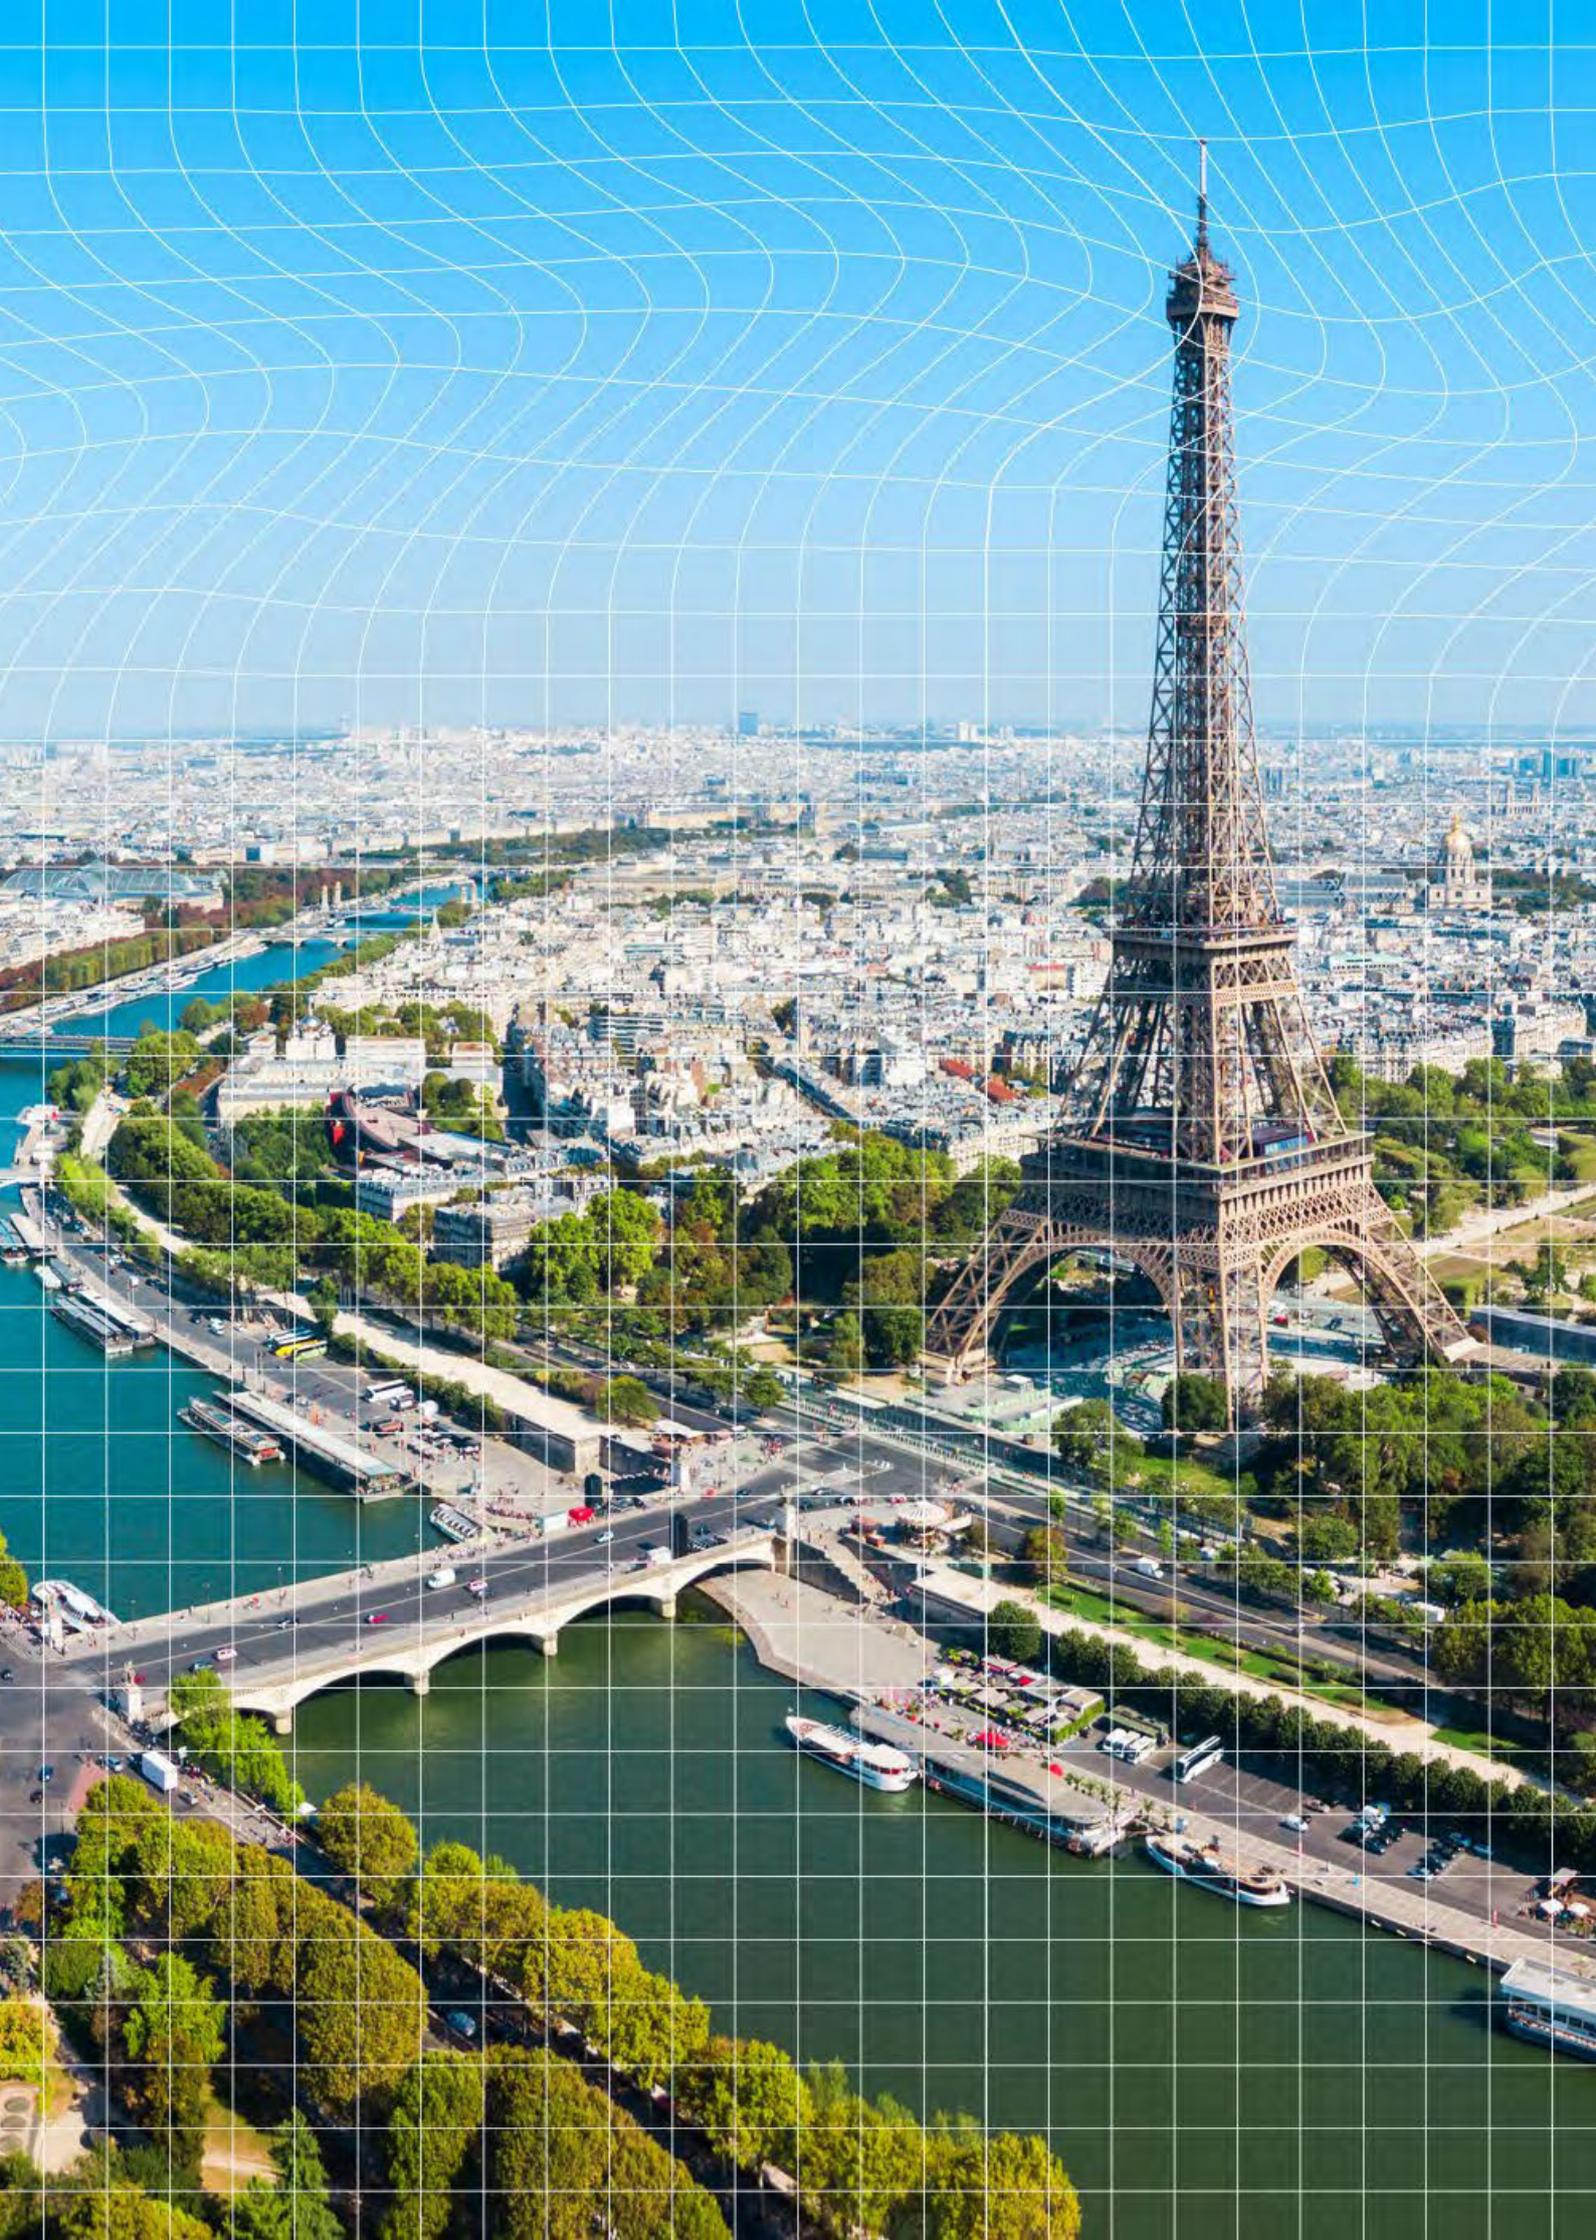

We then set out detailed recommendations for each UK Government department and the national Governments of Scotland, Wales and Northern Ireland in an annex of tables at the end of this report.

# Chapter 1

---

## The global context

1. Global climate, emissions and energy use in 2020	37
2. Global progress in decarbonisation indicators	41
3. Progress in international climate policy	47

## Introduction

This chapter summarises global developments in tackling climate change ahead of COP26.

The 26<sup>th</sup> Conference of Parties (COP26) to the United Nations Framework Convention on Climate Change (UNFCCC), which will take place in Glasgow later this year, was conceived under the Paris Agreement as a key moment to raise global ambition. This chapter outlines global progress in tackling climate change ahead of the COP26 negotiations.

Our conclusions are:

- **COVID-19 related measures had a large, but temporary, impact on global emissions in 2020.** Global emissions fell by 6% in 2020 relative to 2019 levels for the year as a whole, with significantly larger falls in individual countries (particularly developed countries) at the height of lockdowns. These reductions in emissions have proved temporary, with global emissions rates increasing when lockdown measures were lifted. Sustained reductions of similar magnitude to those in 2020 will be required over several decades to achieve the Paris Agreement long-term temperature goal. Fundamentally different ways of reducing emissions to those in 2020 will be required to achieve this, although behavioural changes (e.g. reduced long-haul business travel) could have long-term benefits if maintained.
- **Transitions to low-carbon and low-cost alternatives in electricity and road transport are now underway around the world but need to be scaled up.** Rapid falls in the costs of renewable electricity generation and electric vehicles (EVs) mean that these technologies are now (or very soon will be) at cost-parity with fossil fuel-based alternatives in large parts of the world. In these areas commitments from Governments and companies are being made that would imply a rapid transition. However, commitments need to be delivered and become more global to achieve the emissions reductions over this decade consistent with the Paris Agreement. The provision of supporting infrastructure (e.g. charging points for EVs) will also be necessary to deliver this.
- **There has been a significant increase in global ambition ahead of COP26, but even if met, expected emissions in 2030 would remain well above Paris Agreement compatible pathways.** Most G7 countries have now raised ambition, with pledged decarbonisation pathways from these countries approaching alignment (on aggregate) with those seen in modelled global pathways consistent with the Paris Agreement. Significant additional ambition will be required to close the remaining global 'emissions gap' to pathways expected to keep warming 'well-below' 2°C, or ideally to 1.5°C, above preindustrial levels. These necessitate rapid transitions in developing and emerging economies, that are expected to make up the majority of future emissions. Developed countries have an important role in helping other countries to increase ambition, including through climate finance. Achieving progress on issues of climate finance and adaptation at COP26 will be essential for achieving increases in global ambition on reducing emissions.

Our analysis is summarised in three areas:

1. Global climate, emissions and energy use in 2020
2. Global progress in decarbonisation indicators
3. Progress in international climate policy

# 1. Global climate, emissions and energy use in 2020

2020 was one of the warmest years on record, with climate impacts felt around the world. Global greenhouse gas (GHG) emissions remain high compared to historical levels. This is despite emissions and energy use in 2020 being significantly affected by the measures to combat the global COVID-19 pandemic, with a mixture of short-lived and longer-lasting effects.

This section covers the key indicators of global climate change and its drivers in three subsections:

- a) Global climate change
- b) Global greenhouse gas emissions
- c) Global energy use

## a) Global climate change

Global temperatures continue to rise rapidly – with human influence the driver.

Estimated global human-induced warming has now reached around 1.2°C above 1850-1900 (an approximation for preindustrial levels) (Figure 1.1):\*

- Global mean surface temperature in 2020 was the joint warmest or second warmest year on record across all prominent global temperature datasets, with the six most recent years being the warmest six-year period in the observational record.†
- All of the present day observed warming is estimated to be due to human activities (+/- 20% uncertainty). Natural climate cycles and events (e.g. volcanic eruptions) are not thought to make a significant contribution to the current level of global temperature above preindustrial levels.
- Human-induced warming is rising at around 0.25°C per decade.‡ At this present rate of increase, human-induced warming would exceed 1.5°C above preindustrial levels (the lowest level referred to in the Paris Agreement long-term temperature goal) by the early 2030s.

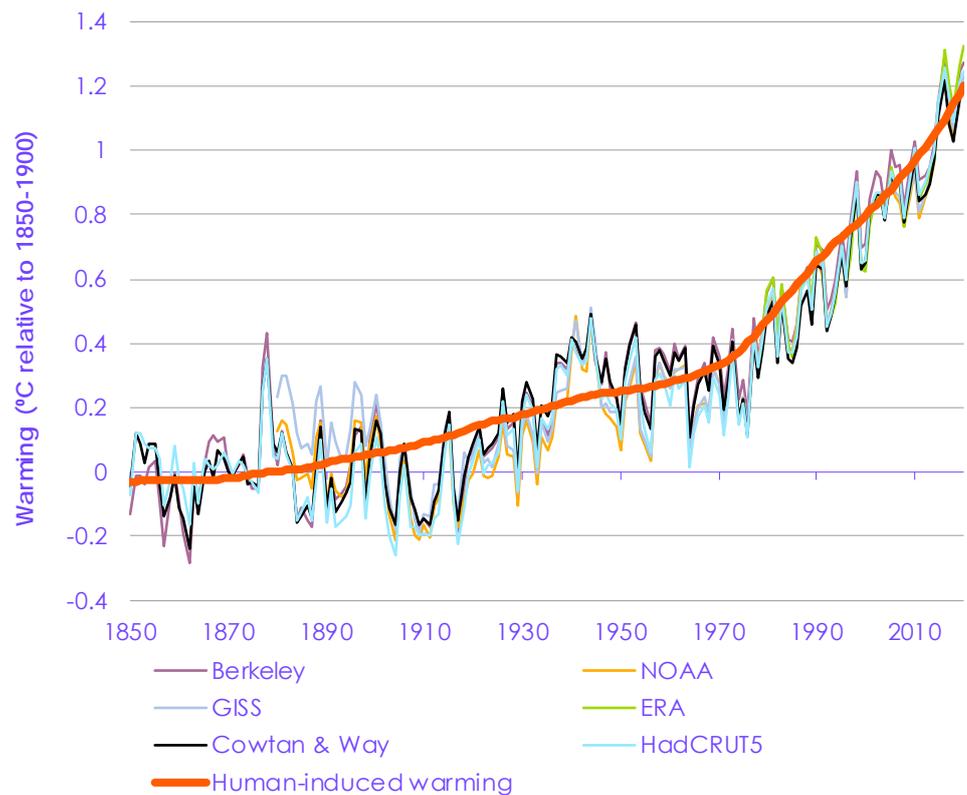

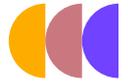

The temporary falls in global CO<sub>2</sub> emissions in 2020 associated with measures to address COVID-19 (section b) did not significantly affect the evolution of atmospheric carbon dioxide concentrations, global temperature or climate hazards, all of which continued to increase as they are primarily determined by cumulative global CO<sub>2</sub> emissions over time.

\* Revisions to UK Met Office dataset (HadCRUT), including providing more spatially complete estimates of global temperature have contributed to higher levels of warming above 1850 – 1900 and therefore contributed somewhat to increases in the estimate human-induced warming compared to previous years.

† The direct observational record of global temperature extends back to the mid-nineteenth century. In some records 2020 was the joint warmest year (with 2016) and in some the second warmest.

‡ This rate of increase in human-induced warming is based on a linear trend over the past decade.

Figure 1.1 Global average surface air temperature change

Source: CCC analysis

Notes: Each thin line represents a different global temperature dataset. The NOAA, GISS and ERA datasets are expressed relative to 1850 - 1900 using the offset over the 1981-2000 period from the HadCRUT5 dataset. Human-induced warming is taken from [globalwarmingindex.org](http://globalwarmingindex.org).

## b) Global greenhouse gas emissions

COVID-19-related measures had a large impact on global emissions in 2020 – particularly in developed countries and the transport sector.

For the year as a whole, global CO<sub>2</sub> emissions from energy fell by around 6% in 2020 (relative to 2019 levels), largely resulting from the effects of measures to address COVID-19.<sup>1</sup> This drop in global emissions varied significantly across different regions, sectors and GHGs:

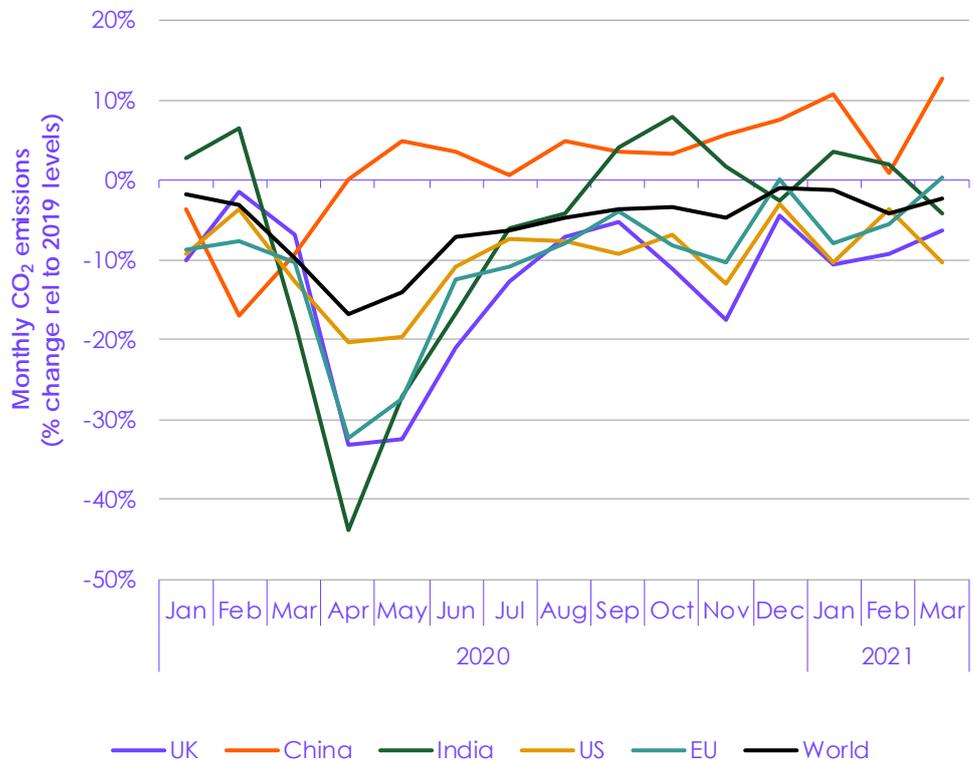

- **Sectors.** Transport emissions displayed the biggest fall of all sectors through 2020 as it was most affected by the COVID-19 lockdowns. Around half of all global emissions reductions came from transport. This reduction comes largely from road transport emissions but aviation emissions were particularly affected in proportional terms – falling around 50% below 2019 levels.
- **Regions.** The largest falls in emissions came from developed countries (e.g. the United States and the European Union) where sectors that were particularly impacted by COVID-19 lockdowns (such as transport) make up a large share of emissions. China's 2020 CO<sub>2</sub> emissions increased by around 1% over 2019 levels – this was in part due to the earlier impact of COVID-19 in China giving more time for economic stimulus to drive up emissions.
- **Greenhouse gases.** Accurate global data on GHG emissions from non-energy sectors and for other GHGs is not yet available. It is expected that there would be much more limited COVID-19-related impacts on these

emissions than energy related CO<sub>2</sub> emissions as the industries responsible for non-CO<sub>2</sub> emissions (e.g. agriculture) were generally less disrupted.

Emissions rates around the world have now significantly recovered.

Temporary reductions due to COVID-19-related measures have now mostly recovered as restrictions have been relaxed. Where significant restrictions are in place emissions remain somewhat suppressed below 2019 levels (Figure 1.2).

Figure 1.2 Monthly CO<sub>2</sub> emissions from the UK and large emitters over the COVID-19 pandemic

Source: Carbon Monitor

### c) Global energy use and economic growth

Global GDP decreased in 2020 with knock-on impacts on energy use.

Global GDP is estimated to have fallen by around 3.3% from 2019 levels in 2020 as a result of the pandemic.<sup>2</sup> Contractions in GDP were generally larger in advanced economies than developing ones, but with significant variation across countries (e.g. India saw GDP decline by around 7% relative to 2019 levels).

This large fall in economic activity had large impacts on the patterns of energy use in 2020:<sup>3</sup>

- **Global energy use** fell by 4% in 2020, with the largest and most sustained reductions occurring in advanced economies.
- **Fossil fuel use** fell, with particularly large falls in oil use (9%) due to the large curtailment in transport activity. Coal use fell by 4% primarily due to lower electricity demand and the prioritisation of generation with low marginal costs (e.g. renewables). Gas use was less affected than other fossil fuels,

Fossil fuel use was more affected than energy use overall and global electricity use only declined slightly.

only falling by 2% relative to 2019 levels, in part due to increased switching to gas use in the power sector.

- **Electricity** demand fell by 1% in 2020 relative to 2019 levels largely due to curtailment of industrial and commercial use in the first half of 2020. Generation from renewable sources grew at the largest rate ever – they now generate 29% of total electricity, up from 27% in 2019 (with the total low-carbon generation share now at 39%).

Global emissions are expected to grow in 2021, but will likely remain below 2019 levels.

Current expectations are for a large rebound in 2021 in global GDP (~6% above 2020 levels, 3% above 2019 levels), energy use (~4.5% above 2020 levels, 0.5% above 2019 levels) and CO<sub>2</sub> emissions (~5% above 2020 levels, 1% below 2019 levels).<sup>3</sup> This would see annual global CO<sub>2</sub> emissions rise back to close to (but still slightly below) 2019 levels in 2021. Significant uncertainty remains regarding the level of global emissions in 2021, which will be affected by both the continuing course of the pandemic and the effects of the economic recovery efforts underway around the world.

## 2. Global progress in decarbonisation indicators

This section looks at progress in the development and deployment of decarbonisation options around the world.

The previous section described the considerable reductions in global energy use and GHG emissions that occurred in 2020 as a result of measures to address the COVID-19 pandemic. Although the impacts on global emissions were large, they are proving temporary as economic activity recovers.

Achieving the global emissions pathways expected to be consistent with the Paris Agreement long-term temperature goal requires rates of emissions reduction nearly as large as those seen in 2020 to be sustained over several decades.\* This will need a rapid and sustained transformation towards a global economy without GHG emissions – very different from the lockdown-related causes of emissions reduction in 2020.

This section describes progress across several leading indicators of the global transition towards Net Zero emissions. This is summarised in three sub-sections:

- a) Transitions with emerging low or no cost low-carbon alternatives
- b) Deep decarbonisation transitions needed for global Net Zero
- c) Transitions in global land-use

### a) Transitions with emerging low or no cost low-carbon alternatives

Cost reductions means that low-carbon alternatives in power and road transport now have no or limited additional costs.

Significant progress has been made in reducing the cost of several key low-carbon technologies particularly driven through learning-by-doing following large-scale deployment over the last decade.<sup>4</sup> In two areas critical to rapid global emissions reductions this decade, low-carbon technologies are now, or soon to be, as or more cost-effective than high-carbon alternatives:

- **Renewable electricity generation.** Analysis from the International Renewable Energy Agency (IRENA) indicates that more than half of installed renewable electricity generation capacity in 2019 was cheaper than new coal plant alternatives.<sup>5</sup> IRENA estimated that over half of existing coal capacity in 2020 would produce more expensive electricity than replacement with new utility-scale solar PV generation. Renewables are also now increasingly cost-competitive with gas-fired generation with some solar generation sources now producing the cheapest electricity in history.<sup>6</sup>
- **Electric Vehicles.** Analysis from Bloomberg New Energy Finance indicates that the cost of batteries (the most expensive part of an EV) has fallen by nearly 90% over the last decade and EVs are expected to be cheaper than fossil fuel vehicles by the mid-2020s across a range of different vehicle types.<sup>7</sup>

The emerging cost-competitiveness of low-carbon options in these two areas supports the prospect of a rapid global shift towards these technologies to meet demand for new investments in electricity generation and road transport. A large and rapid increase in the market penetration of these technologies is key to

\* Global annual CO<sub>2</sub> emissions fell by around 2.5 GtCO<sub>2</sub> in 2020, with falls of around 1 – 2 GtCO<sub>2</sub> per year in the global emissions rate required each year over the 2020s and beyond to keep warming to the Paris Agreement long-term temperature goal. Le Quéré, C, et al. (2021) Fossil CO<sub>2</sub> emissions in the post-COVID-19 era. *Nature Climate Change*, 11, 197–199.

supporting the large reductions in global emissions by 2030 required in global pathways expected to be consistent with the Paris Agreement long-term temperature goal.

Momentum is gathering behind accelerated deployment in these sectors.

Commitments and intentions from major markets suggest momentum is gathering behind a transition in several areas, but further and faster progress is still needed to make a big impact on global emissions:

- **Major car manufacturers are committing to a transition to EVs.** A growing number of car manufacturers are making commitments to end sales of internal combustion engine cars. For example, Jaguar has committed to only selling EVs from 2025, Volvo has committed to becoming an electric only retailer by 2030, General Motors by 2035, and Honda by 2040 (including fuel-cell vehicles). These manufacturer commitments support end dates for new international combustion engine cars targeted by several large car markets such as Japan (2035 date for ending petrol and diesel sales), California (2035 phase-out date) and the UK (2030).
- **EVs are rapidly growing as a market share of new car sales, but these growth rates need to be sustained.** In 2020, the EV share of new sales in some large regions reached new highs (e.g. 10% in Europe and 6% in China). Despite the overall decline in passenger car sales these increased shares correspond to increased numbers of EVs sold, but the impact of COVID-19 on the global car market creates uncertainty about how the EV sales share will change over the coming years. Most major car markets will need to see battery EVs reach 100% of new sales by 2030 – 2040 under pathways expected to keep warming well-below 2°C.
- **Large electricity markets are signalling a shift to low-carbon sources.** The USA (the world's second largest electricity producer) has stated its intention to achieve a carbon-free electricity grid by 2035. Pathways to achieve this target require a large scale-up of low-carbon sources with the share of US electricity generation coming from low-carbon sources (mainly renewables) increasing from 37% today to 70-85% by 2030.<sup>8</sup> China, the world's largest electricity producer, has recently raised its target for the non-fossil electricity generation share for 2030 from 20% to 25%.
- **Projections for renewable deployment are being revised upwards, but investment needs to scale up faster.** More than 80% of new electricity capacity added in 2020 came from renewable sources.<sup>9</sup> The International Energy Agency (IEA) recently increased their forecast for capacity installations for wind and solar electricity generation over the coming years by around 40% relative to a year ago.<sup>10</sup>

Accelerating global deployment significantly this decade will require that other barriers are also addressed.

Other factors will also be important for supporting a rapid increase in the market penetration of these technologies. This includes adapting electricity systems for increasing generation shares from variable renewable sources and ensuring that sustainable supply chains, charging infrastructure, and recycling for the key mineral resources are in place to support a widespread, rapid scale-up in global EV sales.

The existing coal plants in the global power system must also be tackled.

Achieving rapid global emissions reduction this decade will also require addressing the trends that are opposing emissions reduction (e.g. increasing sales of large sports utility vehicles around the world) and tackling the existing high-carbon capital stock in the global power sector which needs to be rapidly retired and replaced (Box 1.1).

## Box 1.1 Emissions from coal-fired power generation

Rapidly reducing global CO<sub>2</sub> emissions from coal electricity generation is one of the key elements to rapid global emissions reductions consistent with the Paris Agreement. The IEA Net Zero by 2050 pathway requires no new coal-fired power plants from today with unabated coal generation eliminated from developed countries by 2030 and all countries by 2040.

Current trends are far from consistent with a rapid reduction pathway:

- The global pipeline for planned new coal power plants held constant in 2020 (following falls each year since 2015). This was almost entirely due to expansion in China (which was the location for 76% of new capacity commissioned) as part of stimulus measures related to COVID-19. New Chinese plants completed in 2020 more than offset the net retirements in the rest of the world, increasing the global coal generation capacity by 12.5 GW.
- Net retirements in coal capacity have thus far largely occurred in developed regions with older coal fleets. Today around 60% of the current global coal capacity is under 20 years old (typical lifetimes can be 40 years or more) and is concentrated in emerging and developing economies. If current plants are run to the end of their natural economic lifetimes, then they will account for a large fraction of the total cumulative CO<sub>2</sub> emissions consistent with keeping warming to the Paris Agreement long-term temperature goal.
- Projections for global coal-fired generation over the coming years indicate an expected plateau, as opposed to a significant decrease. Early retirement and retrofitting with carbon capture and storage on large fractions of the young-life global coal fleet will be needed to achieve emission reductions consistent with the Paris Agreement.

Although the vast majority of young-life and planned coal-fired power plants are in emerging and developing countries, financial institutions in developed countries still play an important role in supporting the planned coal pipeline. A study estimates that developed countries are linked with financing for nearly 40% of cumulative emissions from the existing global coal pipeline on a 'financed-emissions' basis.<sup>11</sup> Action from developed countries to end support for coal finance from public sources (as recently pledged by the G7 countries) and to create frameworks for similar action from the private sector can therefore contribute to a more rapid global coal phase-out.

Source: Global Energy Monitor (2021) *Boom and Bust: Tracking the global coal plant pipeline*; IEA (2020) *World Energy Outlook 2020*; Manych, N. et al. (2021) *Finance-based accounting of coal emissions*. *Environmental Research Letters*, 16, 044028.

## b) Deep decarbonisation transitions needed for global Net Zero

Other technologies outside of power and road transport need to be developed further this decade to enable an at-scale global roll-out towards Net Zero.

A pathway to global Net Zero emissions around or soon after mid-century will require large-scale global deployment of decarbonisation options beyond the power and road transport sectors. Unlike in electricity generation and road transport, low-carbon alternatives in these sectors generally have a cost premium associated with them today, although costs are falling in many areas. Development and deployment of decarbonisation options in these areas this decade will be important for enabling a rapid large-scale global deployment in the following decade.

Around the world there are relevant initiatives underway in several areas:

- **Carbon capture and storage (CCS).** There are presently 65 CCS projects on power and industry in operation or in development globally.<sup>12</sup> Most operating facilities are in North America, supported through tax incentives and in most cases income from use of the captured CO<sub>2</sub> for enhanced oil

recovery. In Europe, a handful of projects based around using CO<sub>2</sub> storage under the North Sea are in advanced stages of planning.

- **Greenhouse Gas Removals (GGR).** There is growing international research and development into engineered GGRs, with a small number of test facilities in operation globally. Additionally, several major global companies have recently made commitments to purchase GGRs to compliment the use of renewables and improved resource efficiency to meet their Net Zero targets. Although small at present, corporate commitments such as these, if replicated more widely, could provide an early market for dedicated GGR credits – helping to facilitate the development and cost discovery needed for engineered removals to play a role in reaching Net Zero.
- **Hydrogen.** By 2030, significant electrolyser capacity (for hydrogen production) is being planned for in France, Germany and the Netherlands (5 GW, 6.5 GW and 3-4 GW respectively) and the European Commission has recently released a new hydrogen strategy aiming to reach 40 GW of electrolyser capacity across the EU.

Rapidly moving from demonstration projections towards constructing clear business models to help support wider deployment will be important to enable global use at scale over the coming decades. Behavioural changes will also be an important complement to moving towards global Net Zero. The IEA recently published a roadmap for how these key pillars of decarbonisation can be deployed together to reach global Net Zero CO<sub>2</sub> emissions by 2050. This roadmap can act as a global guide to investment decisions that may (or may not) be aligned with the more ambitious end (i.e. 1.5°C) of the Paris Agreement long-term temperature goal (Box 1.2).

### Box 1.2

#### International Energy Agency Net Zero Energy 2050 pathway

In May 2021 the International Energy Agency (IEA) published *Net Zero by 2050 A Roadmap for the Global Energy Sector (NZE2050)*. This set out a comprehensive pathway to global Net Zero CO<sub>2</sub> energy and industry emissions (around three-quarters of global GHG emissions) consistent with limiting peak warming to 1.5°C (~50% probability).

The scenario keeps biomass use, residual fossil fuel use, and engineered greenhouse gas removals to the low end of the range from global pathways assessed by the IPCC, and does not use offsetting removals in the land sector. The pathway also involves rapid and deep reductions in methane emissions from the energy sector (falling by 75% by 2030).

Rapid transitions to low-carbon options are required in all energy sectors in the IEA roadmap, with many parallels with the CCC pathway for the UK:

- **Power sector:** Rapid build-out of renewables (particularly solar and wind) enables Net Zero emissions from the power sector to be reached by 2035 in advanced economies, and by around 2040 in developing economies. In 2050 nearly 90% of global power generation is from renewable sources (solar, wind, hydro and bioenergy), with nuclear contributing most of the remainder.
- **Transport:** CO<sub>2</sub> emissions from transport fall 90% by 2050 (from today's levels) despite global passenger demand doubling by 2050 and freight transport increasing by two and a half times. Globally, almost all new light duty vehicle sales are zero emissions vehicles (mostly battery electric) by 2035, and nearly all heavy-duty vehicle sales are fuel cell or electric by 2050. Low-carbon fuels and behaviour change help reduce emissions from aviation and shipping.
- **Buildings:** Widespread retrofitting of existing buildings and requiring all new builds across the world by 2030 to be zero-carbon-ready leads to emissions falling by 40% by 2030 and more than 95% by 2050 relative to today. From 2025, oil and coal boiler

sales end and all new gas boilers installed are hydrogen-ready. Heat pumps become the main space heating technology worldwide from around 2045.

- **Industry:** Fuel-switching to hydrogen and carbon capture both play a major role in decarbonising emissions from industry, which fall 20% by 2030 and 90% by 2050. Key technologies are demonstrated during the 2020s such that from 2030 all new industrial facilities are near-zero emissions.
- **Fuel supply:** No new oil and gas fields and coal mines are approved for development (beyond already committed projects) in the IEA pathway. Low-carbon hydrogen is produced from both natural gas with CCS and electrolysis.

Behaviour change plays a role in almost two thirds of the emissions reductions. Most of this comes through consumer adoption of low-carbon technologies such as electric cars, but 8% of total emissions reductions come from directly changing practices such as reduced business flights.

The IEA estimate that all the technologies required to achieve deep reductions in global emissions by 2030 exist today, with real-world examples of policies to drive their adoption. Sustaining the required rates of decarbonisation after 2030 will require further commercialisation and development this decade of additional options for deeper decarbonisation. The investment for the transition could bring significant additional benefits to global GDP (additional 4% increase in 2030), global energy sector jobs (9 million net increase in employment in 2030) and development (universal access to clean energy by 2030 and major air quality improvements for millions across the world).

Source: International Energy Agency (2021) *Net Zero by 2050 A Roadmap for the Global Energy Sector*.

### c) Land-use transitions

Reducing emissions from global land use change is a key part of pathways towards Net Zero.

CO<sub>2</sub> emissions from land-use change and forestry are about 13% of total global GHG emissions, arising primarily from tropical deforestation of land with very high carbon content, often associated with agricultural expansion.\* Many global pathways consistent with the long-term temperature goal of the Paris Agreement transform this net source of emissions into a net sink over the next few decades.

The world is not on track to achieve its deforestation reduction targets – although some progress has been made.

There has been some progress towards reversing global forest loss (Figure 1.3) but the world is not on track to achieve the UN Strategic Plan for Forests target to increase the global forest area by 3% by 2030 (relative to 2015 levels). Forest cover is still being lost overall as deforestation more than offsets forest expansion:

- **Deforestation.** Around 95% of deforestation occurs within the tropics – 17% of global deforestation occurs within Brazil alone (by area).<sup>13</sup> Around 10–15% of global deforestation is driven by demand for agricultural and food products (e.g. beef) for export to developed countries.<sup>14</sup>
- **Forest expansion.** Forest expansion is comprised of afforestation (intentional creation of new forests) and natural forest expansion (return of forest to previously forested land). Afforestation rates are highest in China where over one million hectares per year are being planted. Natural regeneration contributes another one million hectares per year of increasing forest cover in China – meaning that over 40% of global forest expansion is located there. Net loss of forest is largely concentrated in South America and Africa.

Rapidly reducing tropical deforestation is essential to significantly reducing global land-use change emissions.

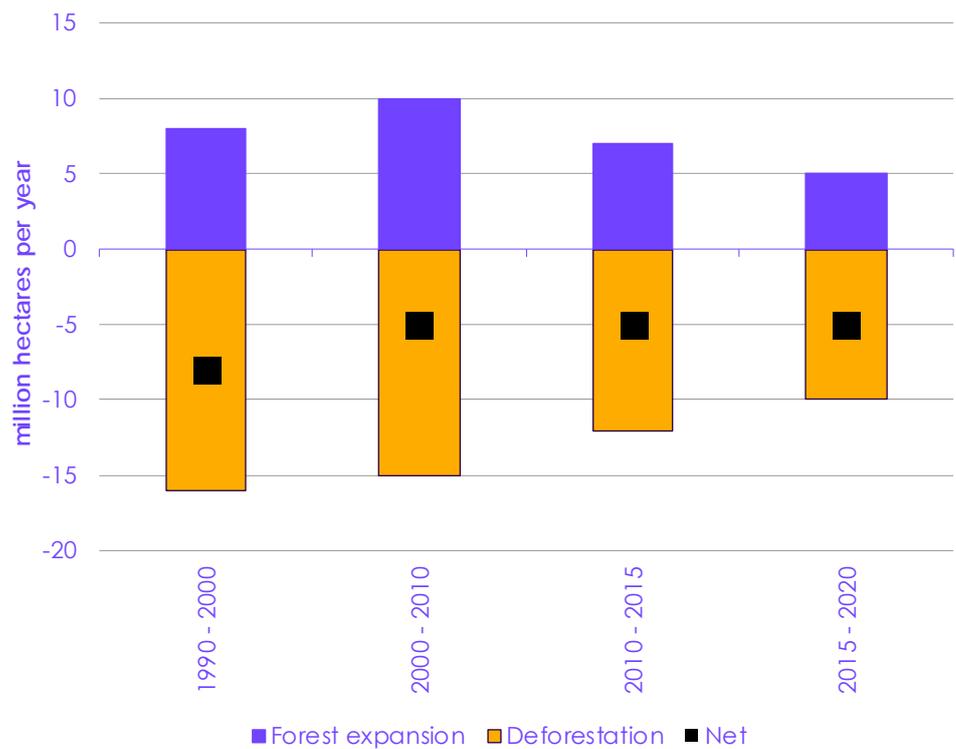

Reducing global emissions from land-use change requires a focus on ending tropical deforestation. This is because deforestation in this part of the world is primarily removing very high-carbon stock primary forest that has never been cut

\* Including agricultural emissions around 25% of total global GHG emissions come from the agricultural and land-use sectors. IPCC (2019) *Special Report on Climate Change and Land*.

before, leading to very large carbon losses into the atmosphere. Emissions from tropical deforestation cannot be compensated with equal areas of afforestation in other parts of the world, although afforestation efforts elsewhere in the world are also important levers for the global effort to reduce emissions and restore biodiversity.

Tropical deforestation is primarily driven by agricultural expansion (for both domestic consumption and export). Developed countries can support ending tropical deforestation by improving corporate supply chain standards to provide incentives for tropical exporters to avoid deforestation, and capacity building to improve agricultural yields in tropical countries to reduce the pressure to convert forested land.

Figure 1.3 Trends in global forest cover

Source: FAO (2021) *State of the World's Forests 2020*.

Notes: Forest expansion is a combination of intentional afforestation and natural forest regeneration.

### 3. Progress in international climate policy

This section looks at progress in all aspects of the Paris Agreement long-term goal.

The Paris Agreement has three aspects to its long-term goal:

1. **Mitigation.** Holding warming to 'well below' 2°C above preindustrial levels and 'pursuing efforts' to limit it to 1.5°C above preindustrial levels.
2. **Adaptation.** Enhancing adaptive capacity, strengthening resilience and reducing vulnerability to climate change.
3. **Finance.** Aligning financial flows with a pathway towards low greenhouse gas emissions and climate-resilient development.

COP26, to be held in Glasgow in November 2021, is an opportunity to assess progress and raise global ambition across all three aspects of the Paris Agreement long-term goal.

This section looks at progress in all three aspects in turn, before summarising the path to COP26 and the UK's role as the COP26 president.

#### a) Progress in mitigation policy

Countries were expected to 're-communicate' their Nationally Determined Contributions (NDCs) including emissions reduction commitments for the period to 2030, by the end of 2020. Countries were also asked to submit mid-century long-term low GHG emission development strategies by the same date. There is an expectation from many parties that NDC ambition should be raised as parties re-submit their plans, consistent with the ambition 'ratchet' mechanism envisaged under the Paris Agreement.

Countries have been submitting strengthened emissions reduction pledges ahead of COP26.

Strengthening of national emissions reduction targets has focused on two separate time horizons:

- **Mid-century.** More global Net Zero commitments are being made with dates of Net Zero around the middle of the century. Several large emitters including China, USA, EU and Japan have Net Zero commitments for mid-century (2050 – generally including all GHGs – except for China, which has a 2060 commitment). It is estimated that 68% of GDP and 61% of global GHG emissions are now covered by some kind of national Net Zero commitment for mid-century.<sup>15\*</sup> The stringency of these Net Zero commitments varies, with most coverage being from 'aspirational' targets that aren't backed up by law or official policy documents.
- **Near-term.** There has been less commitment for enhanced emissions reduction for the period to 2030 (the period for the first NDCs). The UNFCCC estimated that 40% of countries had submitted revised 2030 NDCs by end of 2020. Significant increases in ambition have been adopted by large G7 emitters over recent months (including the USA, EU, Japan, UK and Canada), aligning their NDC commitments with mid-century Net Zero targets. Under current pledges for 2030, emissions are expected to be

\* These Net Zero targets are of variable stringency, with a wide range of standards applied. Corporate action, including the UN sponsored 'Race to Zero', have also significantly expanded over recent years with even greater variation in the associated conditions.

around 15% lower than 2019 levels (around 5% lower than 2010 levels).<sup>16</sup> It remains unclear whether a significant increase in ambition from China (~25% of global emissions) will be seen ahead of COP26.

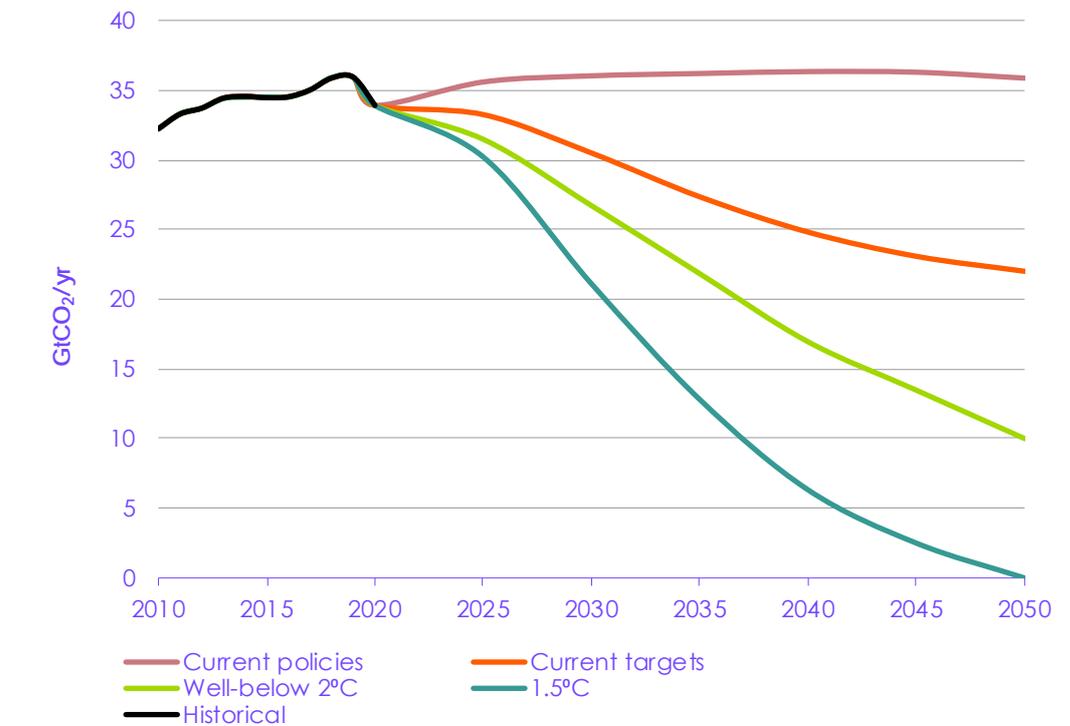

Current trajectories indicate a plateau for global emissions over the coming decade, with a significant gap to Paris Agreement consistent pathways.

If achieved, current commitments (both for 2030 and mid-century), could be consistent with pathways keeping expected (central estimate) warming by 2100 to around 2°C above preindustrial levels. However, global emissions in 2030 would be far above emissions in pathways expected to keep warming to 'well-below' 2°C or 1.5°C (Figure 1.4). Significant increases in Chinese ambition to 2030 will be essential to any efforts to close this gap alongside enhanced commitments from other large emitters that have yet to strengthen their 2030 commitments.

In nearly all cases significant strengthening of climate policies will be required to deliver on the pledged emissions reduction commitments. Current policies imply emissions continuing at recent levels, which would lead to expected warming by 2030 of around 3°C above preindustrial levels.

There is an increasing prevalence of 'framework' climate laws around the world alongside an increasing number of expert climate advisory bodies. These can help provide a structure to support delivery of NDCs and long-term targets if they are designed with robust governance standards to hold Governments effectively to account on delivery over both the long- and short-terms.<sup>17</sup>

Figure 1.4 Global emissions gaps to Paris Agreement consistent pathways

Source: IEA (2021) *Net Zero By 2050: A roadmap for the Global Energy Sector*; IEA (2020) *World Energy Outlook 2020*. Notes: 'Current policies' uses the IEA Stated Policies Scenario (STEPS), 'Current targets' the IEA Announced Pledges Case, the 'Well-below 2°C' the IEA Sustainable Development Scenario (SDS) and '1.5°C' the IEA Net Zero Emissions 2050 scenario. Emissions are CO<sub>2</sub> only emissions from energy and industrial process emissions.

## b) Progress in adaptation

Making progress on adaptation is a key priority for COP26.

Climate impacts are already being experienced around the world at today's level of warming and will increasingly make the achievement of some of the global Sustainable Development Goals (SDGs) more challenging. 81% of developing countries are taking steps to develop National Adaptation Plans, while 20 countries have submitted full plans.\* Around 70% of countries have adopted at least one national-level adaptation planning instrument, but with large variation in their detail.<sup>18</sup> Making progress on the global adaptation goal has been signalled as one of the key priorities for COP26 by the incoming UK Presidency.

Countries can support the raised adaptation ambition across at least three areas:

All countries can do more to mainstream adaptation considerations into policy making.

- **Embedding adaptation in national policy making.** Adaptation considerations need to be mainstreamed across national policy to properly help limit future climate risks. Integration into planning systems will be particularly important to reduce the risks of locking in climate exposure through long-lived infrastructure under construction around the world today. Similarly, adaptation considerations need to be integrated better with mitigation plans to ensure that efforts to achieve NDC and mid-century targets are not compromised by climate risks and that co-benefits for reducing climate risks are maximised.
- **International collaboration.** Building capacity around the world is key to improving resilience to climate impacts. Collaboration between countries to share best practices, technical expertise and policy structure can help accelerate this. New international alliances such as the Climate Adaptation Alliance – launched by the UK and others at the end of 2020 – can help facilitate these collaborations and skill-sharing.
- **Improving the evidence base for effective adaptation.** In many parts of the world taking evidence-based actions to improve climate resilience is hampered by a lack of good data sources on past and present local weather hazards and their impacts. For example, there is a lack of documented data on the history of heatwaves impacts across Africa, making it harder to construct effective early warning systems and heat action plans.<sup>19</sup> The evidence base for assessing the effectiveness of adaptation interventions for reducing climate risks also needs to be improved across the world. The global research capacity can be directed to help close these important evidence gaps.

Better evidence bases – particularly in developing countries – will be key to improving resilience to climate risks.

A successful COP26 outcome will not be possible without significant progress on issues related to global adaptation to climate impacts being experienced today and expected for the future. Developed countries also have a key role to play through the provision of climate finance, and technology/knowledge transfer.

## c) Progress in finance

Delivering the rapid reductions in global emissions needed to restrict warming to the Paris Agreement long-term temperature goal, while building resilience to climate impacts, requires a large shift in global investment patterns. Access to capital sources for this investment is key to realising this, particularly in developing countries.

\* 14 countries have submitted Adaptation Communications (detailing the action that they are taking on adaptation) to the UNFCCC as requested under Article 7 of the Paris Agreement.

Developed countries are not on track to deliver the \$100 billion per year climate finance goal pledged for 2020.

Prior to the Paris Agreement, parties to the UNFCCC adopted a goal of reaching a \$100 billion per year flow of climate finance from developed to developing countries by 2020. Indications are that this commitment has not been met:

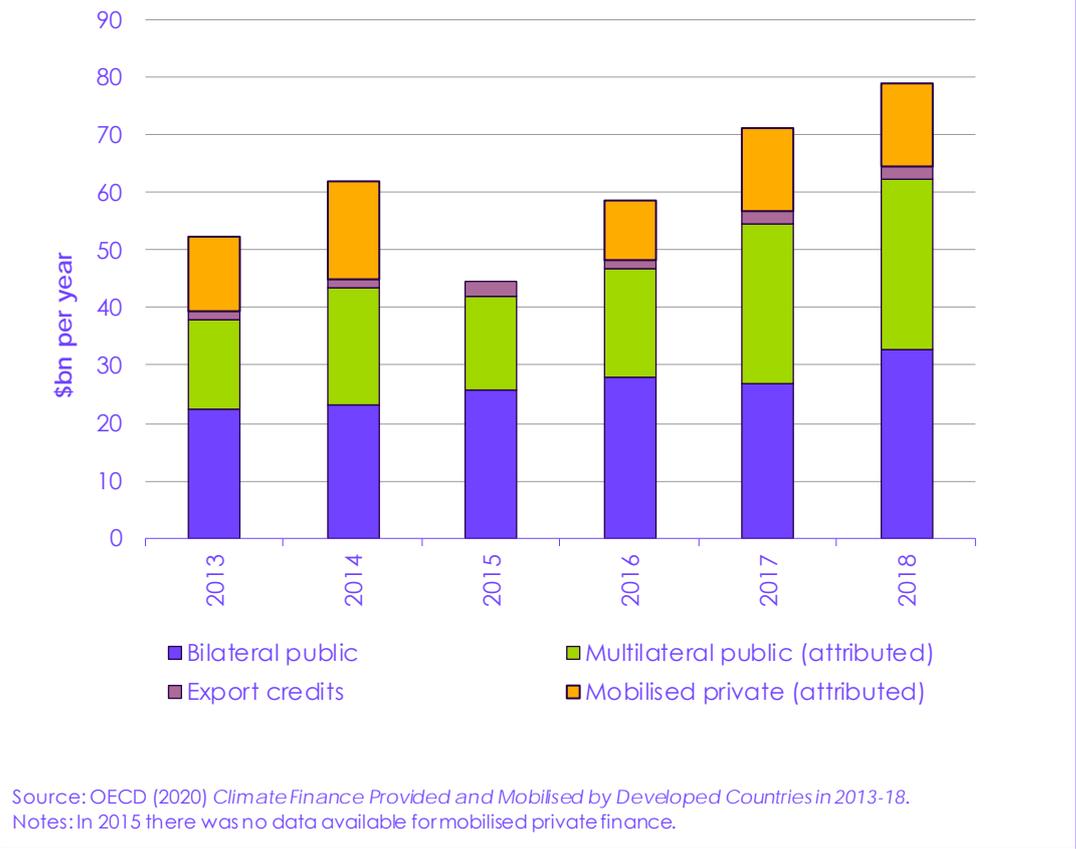

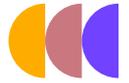

- There is currently no agreed way to measure these climate finance flows, but a report by the UN indicated that it was highly unlikely that the \$100 billion per year commitment was achieved in 2020.<sup>20</sup> The OECD estimates that \$78 billion was mobilised by developed countries in 2018 (Figure 1.5).
- The \$100 billion per year in mobilised climate finance is itself a small fraction of the global investments needed to transform the global economy but has large political significance. Many developing countries see it as a key test of whether developed countries will take their commitments seriously. Many 'conditional' NDCs from developing countries explicitly mention needing climate finance to deliver on the higher level of ambition.
- Due to the effects of COVID-19, spending on emergency healthcare investments and economic relief has restricted many developing countries' capacity for financing adaptation and resilience. Investment in adaptation fell globally in 2020 despite a record number of floods, droughts, wildfires and storms affecting more than 50 million people worldwide.<sup>21</sup> The vast majority (~80%) of adaptation finance is from public sources, but adaptation finance is only around 20% of total climate finance mobilised by developed countries. Developed countries can improve the access to finance for adaptation by allocating it a much larger share of their climate finance spending and by supporting private sector investment.\*

A more equal split between mitigation and adaptation climate finance is needed.

Meeting this commitment is a key expectation from developing countries ahead of COP26. Countries have also agreed that \$100 billion per year in mobilised climate finance should be a floor level for beyond 2020 with an expectation for a new higher goal to be set by 2025. Negotiations on this are expected to start at COP26.

\* For example the UN has launched a 'Race to Resilience' initiative to involve non-state actors (including companies) to reduce vulnerability to climate impacts.

Figure 1.5 Progress towards the \$100 billion per year climate finance goal from developed countries

## d) The path to COP26 and beyond

The period ahead of COP26 is critical for a successful outcome in Glasgow.

The coming months contain several events which will lay the groundwork for a successful COP26. These include important multilateral forums (such as the G20) which present key opportunities for countries to bring forward new commitments on climate finance and emissions reductions from large economies. UNFCCC negotiations sessions in June and at the pre-COP in October will also be critical for securing the negotiated outcome at COP26 itself in Glasgow.

The UK has an important role in ensuring sufficient progress is being made over the months before COP26 as incoming COP president.

The UK has now submitted a full set of commitments to the UNFCCC as required under its international obligations (Box 1.3). Its focus now should be on best utilising the COP26 presidency to secure a genuinely beneficial outcome (Box 1.4).

### Box 1.3

#### The UK's submissions to the UNFCCC in 2020

In December 2020, the UK submitted a set of documents to the UNFCCC in accordance with its international obligations.

- **The UK's first NDC.** The NDC submission contained a target to reduce aggregated GHG emissions by at least 68% in 2030 (relative to 1990 levels) in accordance with the Committee's advice. This headline target does not include the UK's share of emissions from international aviation and shipping – as advised by the Committee. A commitment to include these emissions within the Sixth Carbon Budget has now been made by the Government. The NDC document specified that the Government intends to achieve the target through domestic emissions reductions.
- **Adaptation Communication.** The Government submitted an Adaptation Communication, separate to the UK's NDC. This document summarises the climate risks facing the UK and actions being taken to address them – including the National Adaptation Programme. Progress on adapting to climate change in the UK is assessed in the companion report to this one which finds that, despite progress, significant gaps remain to deliver improved resilience to climate impacts in the UK. No new commitments to raise UK adaptation ambition beyond the actions and policies already being implemented were provided in either the NDC or Adaptation Communication.
- **Finance Biennial Communication.** The document provided a summary of the activities that the UK has supported through its climate finance provision. It also mentions the UK's 2019 commitment to provide £11.6 billion in dedicated climate finance over the 2021/22 – 2025/26 period. This is double the level of support over the previous five-year period and is protected at this level against the announced temporary cuts in UK Official Development Assistance (ODA) from 0.7% to 0.5% of Gross National Income. The £11.6 billion funding is additional to the UK's contribution to the 'core' budget of large multi-lateral development banks, some of which will be used to support climate-related projects. The UK has also committed to align the full extent of its ODA spend with the Paris Agreement and has implemented an end to export finance for overseas fossil fuel investments. The communication also reiterated the UK's commitment to maintaining an approximately equal split between mitigation and adaptation projects in its climate finance.

These documents, together with the legislation of the UK's Sixth Carbon Budget, represent a full summary of the UK's current level of ambition in tackling climate change. The UK should update its mid-century long-term low greenhouse gas emission development strategy with the UNFCCC (currently the *Clean Growth Plan* - targeting the previous long-term target of an 80% reduction in emissions by 2050) with its new Net Zero Strategy when it is published ahead of COP26. This will provide a vision of the actions and policies that will be brought forward to achieve the domestic carbon budgets and Net Zero target.

## Box 1.4

### The UK's role in delivering a COP26 with global climate benefits

The UK will have an important role in delivering a successful COP26 outcome as the COP President (in partnership with Italy), alongside its presidency of the G7 group of countries this year. Updated NDCs are expected from all countries ahead of the main COP26 negotiations and will not be negotiated directly at the conference.

There are several aspects where the UK will be required to play an important role:

- **Continuing to support increases in ambition and implementation.** Several large emitter nations have now updated their 2030 NDCs. However, other large emitters (including China) have yet to update their headline ambition. The UK will need to continue to champion increased NDC ambition through to COP26 and should also bring focus to improving implementation plans to achieve these strengthened targets. Internationally agreed commitments on key aspects of delivery (e.g. ending coal fired power generation) could help facilitate this.
- **Securing buy-in from all countries for a COP26 outcome.** UNFCCC outcomes need to be unanimously agreed by all parties. The UK presidency has a critical role in building support across all countries ahead of the conference. This will mean giving issues of adaptation, climate finance, and loss and damage prominence in the negotiations. The UK can support this by providing a clear commitment ahead of COP26 on the timetable by which the UK's ODA contribution will return to 0.7% of Gross National Income, and by helping to leverage additional finance commitments from other developed countries to demonstrate a clear pathway to achieving and exceeding the \$100 billion per year goal.
- **Championing a 'climate-aligned' recovery from COVID-19.** The global aggregate effects of economic recovery measures resulting from the ongoing COVID-19 pandemic are not consistent with the investment profile needed to sustain continued declines in global emissions this decade.<sup>22</sup> These investments are critical for the trajectory of global emissions this decade and keeping the Paris Agreement long-term temperature goal in reach. Having taken on leadership of UN work on 'Recovering Better For Sustainability', the UK should use its presidency to support a step up in efforts on this front globally. The UK should also be sensitive to the wider challenges facing developing countries emerging from the COVID-19 pandemic and contribute actively to international efforts to address this.
- **Carbon markets and the Paris Agreement rulebook.** A major focus of the negotiations is expected to be finalising the outstanding aspects of the rulebook for the Paris Agreement, including rules on carbon markets and transparency of NDCs under the Agreement. As COP President, the UK has an essential role to ensure that any new rules for international carbon markets have the highest standards, ensuring that they are genuinely supportive of efforts to reduce global emissions. Postponing agreement on market rules at COP26 (as at COP25) would still be preferable to a compromised deal that could lock in a system which may undermine global ambition and accountability. The UK presidency can also champion high-integrity standards in voluntary carbon markets through its COP26 Finance workstream.

Action in these areas, alongside the recommendations to align domestic policy ambition with the UK's Net Zero target, NDC and Sixth Carbon Budget elsewhere in this report, can help the UK maximise the chances of delivering a successful COP26 with genuine benefits for the global effort to address climate change.

The UK should prioritise maintaining international momentum for tackling climate change over the period between COP26 and the global stocktake in 2023.

After COP26 the next significant moment in the Paris Agreement cycle is anticipated to be the first global stocktake in 2023. The UK can help maintain international momentum for the post-COP26 period by championing longer-term initiatives that can help ensure activities and outcomes feeding into COP26 (such as the COP26 campaigns) are maintained and lead to long-term benefits for global efforts to tackle climate change.

As part of this, the UK should publish a new strategy for its international climate policy during its COP26 presidency (which extends for a year after COP26) to refresh its strategy and signal its commitment to supporting international climate action over the long term.\* This should include a recognition of the need for countries to produce credible plans now to deliver on strengthened emissions reduction commitments. The UK's recent commitment to include international aviation and shipping emissions within the Sixth Carbon Budget can also be leveraged internationally, including through international forums to agree a Paris Agreement compatible emissions target for international aviation and a mechanism to deliver it that is fit for purpose.

\* This strategy should flesh out the UK's commitment to place climate change as the number one priority in the recent Integrated Review of foreign and defence policy and ensure that a joined-up perspective is maintained on how the UK's climate finance is spent.

## UK emissions and drivers

1. Progress reducing UK emissions	60
2. Impacts of COVID-19 on emissions and behaviours in 2020	71
3. Progress reducing the UK's carbon footprint	84

## Introduction

This chapter outlines UK progress towards reducing the UK's greenhouse gas emissions, including the UK's share of international aviation and shipping emissions as covered by the Sixth Carbon Budget.

UK emissions have reduced consistently since 1990, with average annual falls of around 18 MtCO<sub>2</sub>e since 2012, similar to those needed to meet the Sixth Carbon Budget. However, progress so far has been dominated by the power sector, while progress in future will need to cover the whole economy.

The pandemic and resulting restrictions have caused sharp falls in economic activity, energy demand and emissions in 2020.\* UK emissions and output will almost certainly increase as lockdown restrictions are lifted, but the permanent impact of the pandemic on UK emissions and economic activity is still unclear.

Our key messages are:

- **UK greenhouse gas emissions were 499 MtCO<sub>2</sub>e in 2019.** This includes the UK's share of international aviation and shipping emissions.
- **Our greenhouse gas consumption footprint was 703 MtCO<sub>2</sub>e in 2018.** This includes emissions embedded in the goods and services consumed in the UK even if they are produced overseas. Consumption emissions were 37% higher than production emissions in 2018. Data for 2019 will be published next year.
- **From 1990 to 2019, UK emissions fell by 40%, while the economy grew by 78%.** The UK's consumption footprint has fallen at a comparable rate since 2007, but by less (29%) since 1990 (Figure 2.1).
- **UK emissions fell by a record 13% in 2020 to 435 MtCO<sub>2</sub>e,** 48% below 1990 levels. The fall in 2020 was almost entirely due to the impacts of the pandemic, particularly reductions in road and air travel, as well as lower overall energy demands.
- **It is unclear how far the impacts of the pandemic on emissions will persist in future,** but transport emissions are likely to rebound to some extent in 2021 as lockdown measures are lifted.
- **Progress outside the power sector has been limited.** If annual changes in emissions return to the same per-sector trend as the previous decade, the Sixth Carbon Budget will be missed by a huge margin. Now is the time to extend progress across all sectors of the economy.

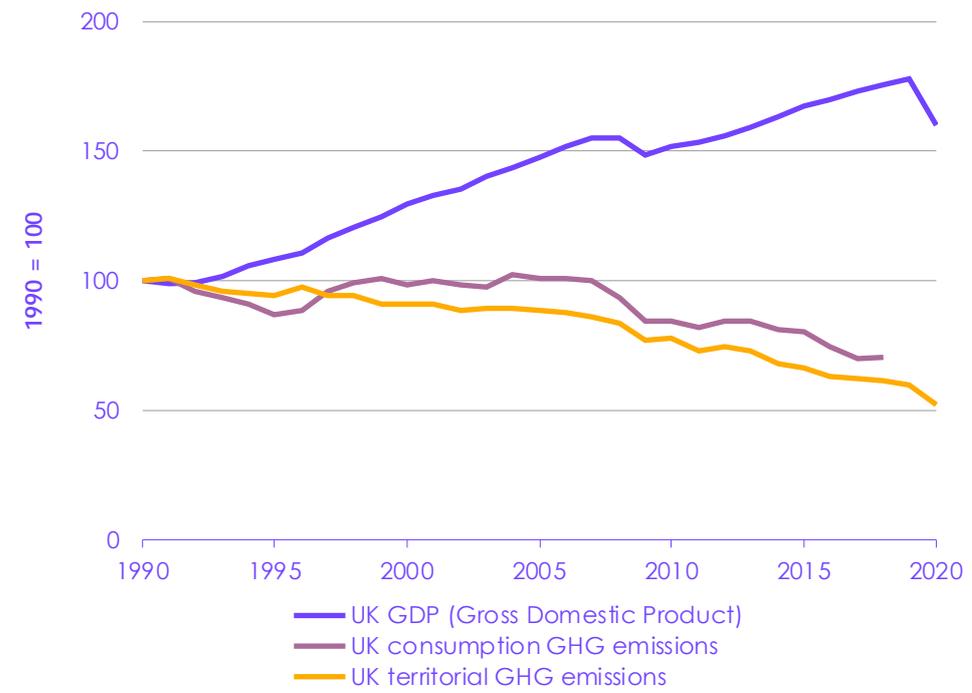

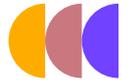

We set out our analysis in the following three sections:

1. Progress reducing UK emissions
2. Impacts of COVID-19 on emissions and behaviours in 2020
3. Progress reducing the UK's carbon footprint

\* Estimates of the UK consumption footprint for 2020 are not yet published, but they will certainly be lower than in 2019 due to both lower territorial emissions and a fall in goods imported to the UK in 2020.

The UK economy has grown by nearly 80% from 1990 to 2019 while both territorial and consumption emissions have fallen.

**Figure 2.1** The UK economy has grown while territorial and consumption emissions have fallen

Source: BEIS (2021) 2020 UK Greenhouse Gas Emissions, Provisional Figures; ONS (2020) Gross Domestic Product: chained volume measures: Seasonally adjusted £m; Defra (2019) UK's carbon footprint; CCC analysis.  
 Notes: The UK's share of International aviation and shipping emissions is included in both the territorial and consumption emissions statistics.

# 1. Progress reducing UK emissions

This section reviews trends in UK emissions in the decade up to 2019, and the change in emissions in 2020 during the pandemic.

In 2020 emissions fell at a record rate, almost entirely due to the COVID-19 lockdowns and the resulting reduced demand for energy, particularly for travel.\* Without action now to lock in beneficial changes to the way people work and travel, these factors are likely to be mostly temporary and will not significantly contribute to the fundamental changes that will be needed to achieve Net Zero, which must be more structural in nature (see Chapter 3).

To meet the Sixth Carbon Budget, UK emissions outside of the power sector must fall by an average of around 17 MtCO<sub>2</sub>e over the next fifteen years – compared to an average fall of just 5 MtCO<sub>2</sub>e per year from 2009 to 2019 – and emissions in the power sector must continue to fall in the context of growing demand.

## a) UK greenhouse gas emissions before 2020

Prior to 2020, electricity decarbonisation was a major success story, but other sectors including surface transport, buildings, agriculture and land use had made little progress in reducing emissions.

Emissions reductions varied significantly across sectors in the ten years before 2020 (Figure 2.2). Our 2020 Progress report set out a detailed breakdown of progress in reducing emissions in each sector since 2008. The key trends in sectoral emissions prior to the pandemic were:

- **Electricity supply was the major success story** of the past decade. Emissions decreased by 65% over the period 2009-2019, while the carbon intensity of the grid fell from nearly 500 gCO<sub>2</sub>/kWh in 2009 to 200 gCO<sub>2</sub>/kWh in 2019. Electricity generated from variable renewables was 9 TWh in 2009 (3% of total generation), and rose to 73 TWh in 2019 (26%).
- **Surface transport is off track**, and since 2015 has been the highest-emitting sector in the UK. Emissions have been broadly flat over the past decade, falling only 1% between 2009 and 2019. Improvements to the efficiency of cars have been lost to a trend towards both driving larger vehicles and driving more miles.
- **Industry saw significant reductions in emissions**, largely resulting from a combination of the changing structure of the UK's manufacturing sector (responsible for around 20% of the fall), improved energy intensity (40%) and a shift to lower-carbon fuels (40%), while overall output has grown.†
- **Buildings saw some progress** from policy-driven action in the first half of the past decade. Temperature-adjusted emissions fell by 7% between 2009 and 2016, but have risen since. The overall efficiency of the boiler stock has improved, but there has been minimal progress on improving insulation or switching to low-carbon heating in recent years.

\* This fall in emissions was also due to warmer than average temperatures, which tend to suppress heating demand, increase cooling demand and on balance decrease overall energy demand, particularly in homes.

† A decomposition analysis covering the period 2012-2017 shows that UK industrial output grew 14%. The 12% fall in direct CO<sub>2</sub> emissions across that period can be attributed to a structural movement towards a less carbon-intensive mix of industrial output (accounting for 20% of the change), improvements in energy intensity (40%) and changes in fuel mix (40%). It is not clear whether these reductions were driven by policy.

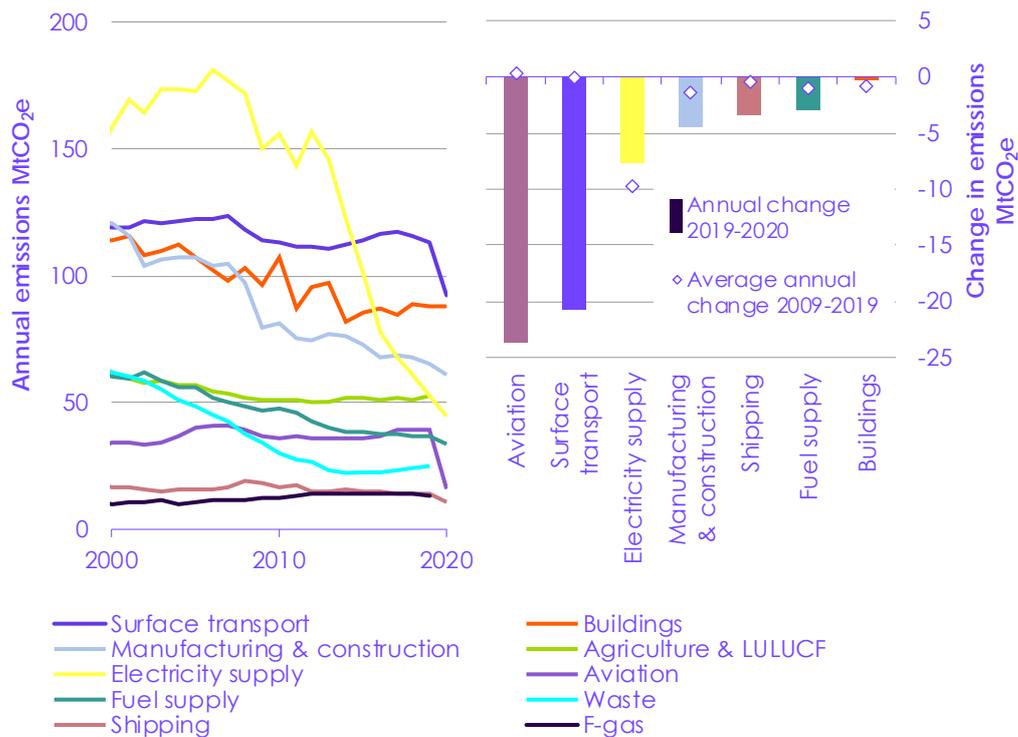

- **Agriculture and land use emissions were broadly flat**, increasing by 2% over the period 2009-2019. These sectors repeatedly failed to meet the indicators outlined in the Committee's progress reports (e.g. for tree planting and on-farm efficiency measures).
- **Aviation emissions and passenger numbers were increasing**. Over the 2009-2019 period, the total number of UK terminal passengers rose by 36% to nearly 300 million in 2019. Efficiency improvements were not enough to offset this rise in demand, with emissions up 7% from 2009 levels to 40 MtCO<sub>2</sub>e in 2019.
- **Shipping emissions fell**, mostly due to reductions in domestic shipping along coasts and in international export shipping. In particular, fewer tonnes of dry and liquid bulk (including coal and crude oil) were transported by ship, although container and roll-on/roll-off freight increased. Emissions in 2019 were 24% lower than in 2009.
- **Waste sector falls were driven exclusively by reductions in landfill emissions**. Waste emissions fell by 28% from 2009 to 2019, but this was primarily due to the landfill tax diverting biodegradable waste away from landfill to other waste treatment, particularly Energy from Waste (EfW) incineration. Recycling rates plateaued, and more local authority waste is now processed by EfW than is recycled or composted in England.
- **F-gas emissions increased, but began to fall towards the end of the 2010s** as new regulations restricting the use of the most harmful gases took effect. Emissions increased by 20% from 2009 to 2017, but fell by 7% in two years to 13.4 MtCO<sub>2</sub>e in 2019.

If progress does not extend outside the power sector, the Sixth Carbon Budget will be missed by a huge margin.

To meet the Sixth Carbon Budget and to deliver the UK's 2030 Nationally Determined Contribution to the Paris Agreement, progress will have to extend quickly beyond the power sector. If annual changes in emissions return to the same per-sector trend as the previous decade, the Sixth Carbon Budget will be missed by a huge margin (Figure 2.3).

Progress has been uneven among sectors in the last decade.

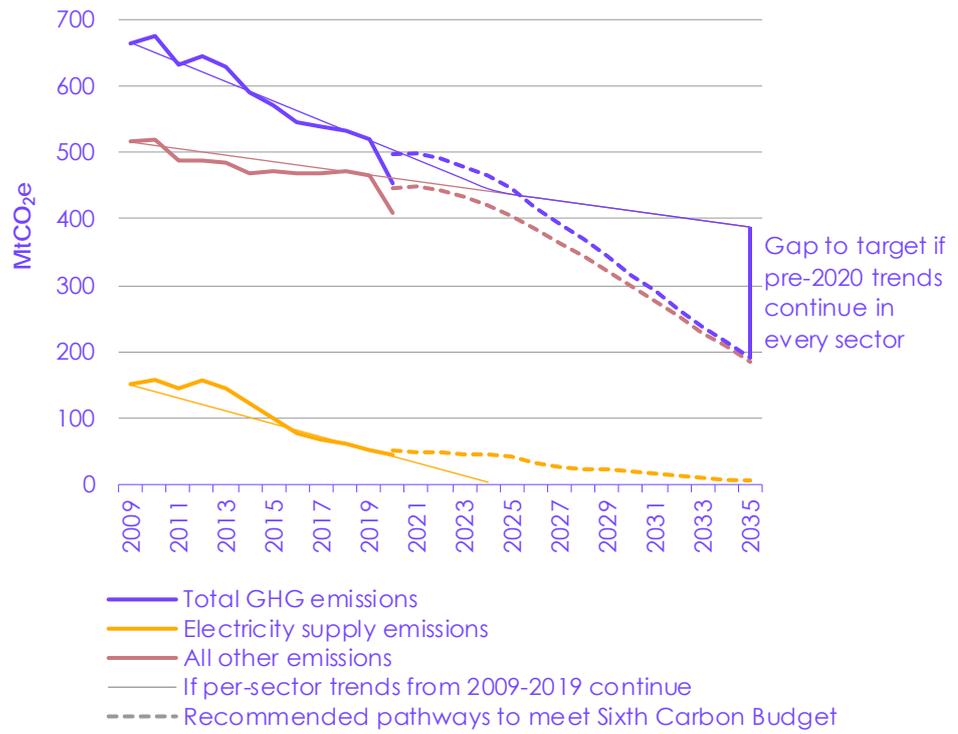

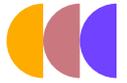

Figure 2.2 Changes in UK emissions by sector

Source: BEIS (2021) 2020 UK Greenhouse Gas Emissions, Provisional Figures.  
 Notes: LULUCF = Land use, land-use change and forestry. Estimates of emissions for sectors with large proportions of non-CO<sub>2</sub> emissions are not shown on the right-hand chart. Final estimates of emissions in these sectors will be published in early 2022. Aviation and shipping include the UK's share of international aviation and shipping emissions.

If individual sectoral emissions stay on the same trend as the last decade, the Sixth Carbon Budget will be missed by a huge margin.

**Figure 2.3** Concerted action is required beyond electricity to meet the Sixth Carbon Budget

Source: BEIS (2021) 2020 UK Greenhouse Gas Emissions, Provisional Figures; CCC analysis.

Notes: Emissions in this chart are adjusted for future increases to the Global Warming Potentials (GWPs) of non-CO<sub>2</sub> gases, and therefore do not match the total published in the latest greenhouse gas inventory. The Sixth Carbon Budget target was recommended on this basis (see Box 2.2).

## b) UK greenhouse gas emissions in 2020

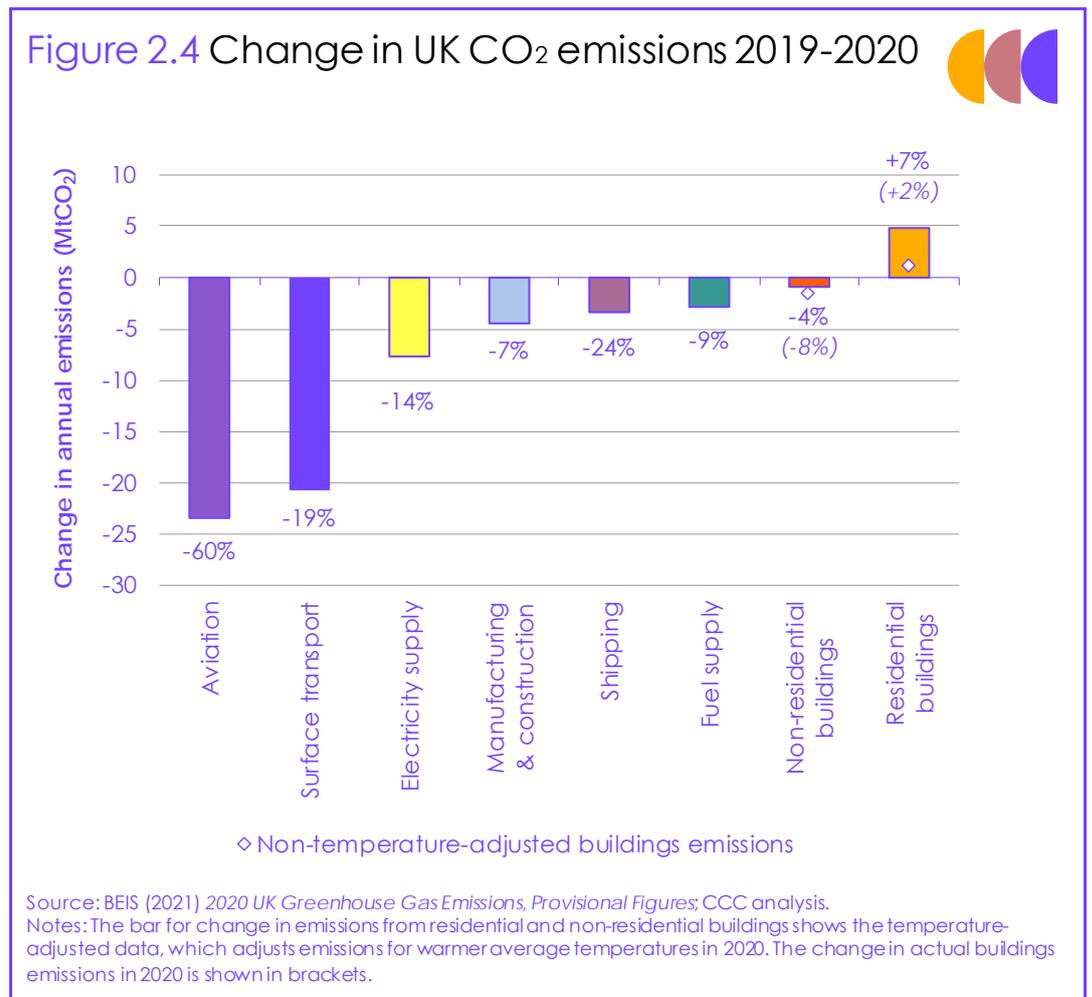

The COVID-19 pandemic and the resulting restrictions caused a substantial drop in emissions, but the lasting changes on UK emissions remain far from certain. Section 2 of this Chapter explores the short-term impacts of COVID-19 on UK emissions in more detail.

Emissions fell by 13% in 2020, almost entirely due to the impacts of lockdown measures.

The Committee's provisional estimate (Box 2.1) shows that UK emissions fell by around 13% in 2020, with the vast majority of the fall associated with reductions in emissions from transport (Figure 2.4).

2020 was the UK's third warmest year on record. Warmer temperatures, particularly during winter months, led to reduced demand for heating and lower greenhouse gas emissions. The temperature-adjusted emissions data presented in Figure 2.4 shows the 'true' underlying change in emissions (i.e. a bigger increase) from 2019 to 2020 if temperatures had instead been average. The temperature effect alone, which has its biggest impact in the residential buildings sector, caused around a 5% fall in UK emissions.

Milder winter temperatures mean that emissions were lower than they would have been in a year of average temperatures.

Estimates of all sources of emissions in 2020 are available, but some (particularly non-CO<sub>2</sub>) estimates are less reliable.

### Box 2.1

#### The provisional estimate of UK emissions in 2020

BEIS have published a provisional estimate of emissions for 2020 that covers most sources, based on various analytical approaches. To produce a complete estimate of UK emissions, the Committee has added its own estimate for international transport emissions that is based on official statistics:

- **CO<sub>2</sub> emissions in the major 'energy system' sectors** are based on fuel consumption data, and therefore account for the impacts of the pandemic (electricity supply, buildings, manufacturing and construction, fuel supply, surface transport and domestic aviation & shipping).
- **CO<sub>2</sub> emissions from other sectors** – particularly CO<sub>2</sub> emissions that are not associated with the combustion of fossil fuels – are held constant from their final estimates for 2019 (mostly in waste, agriculture, LULUCF).
- **Non-CO<sub>2</sub> emissions** are assumed to fall in line with the latest BEIS emissions forecasts for 2019 to 2020. This simple approach does not capture any impact of the pandemic, although we can expect these emissions to be less affected by lockdowns than emissions related to energy use.\*
- BEIS do not publish a provisional estimate of **international aviation and shipping (IAS)** emissions. This year, the Committee has produced a provisional independent estimate of the UK's share of international aviation and shipping emissions based on fuel sales data in 2020.†

These estimates for 2020 are all provisional and will vary to some extent from the final BEIS data for 2020, which will be published in 2022.

Previous large annual falls in emissions were very different to those in 2020, and were driven by cold winter temperatures, recession and/or genuine underlying progress in the electricity sector.

Other years that saw large falls in emissions often reflected temporary factors that saw emissions rebound the following year. While the fall in emissions in 2020 is structurally different (Figure 2.5) to previous falls, it is likely to be largely temporary. There are likely to be lasting, but highly uncertain, changes in behaviour (see section 2) that will have consequences for UK emissions in the future:

- In 2009, the global financial crisis hit multiple sectors, most notably manufacturing and construction, electricity supply, and surface transport. Emissions rebounded in 2010 as the economy began to recover.
- 2011 saw a significant fall of just over 20% in emissions from residential buildings. This was almost entirely driven by milder winter temperatures and lower demand for gas compared to the previous year. The underlying changes were far less significant, with temperature-adjusted emissions actually increasing by around 2% in residential buildings in 2011. Emissions from buildings increased in the following year as temperatures fell relative to 2011.
- In 2014, there was another 17% fall in emissions in residential buildings, again driven by milder winter temperatures, and equivalent to a 1% rise in emissions from residential buildings when temperature-adjusted. That year did, however, see the acceleration of a major success story in electricity generation, with a 16% fall in power sector emissions. This was driven by structural changes in the GB electricity market, and emissions from this sector have continued to fall in every year since.

\* For example, emissions from landfills, livestock or forest growth were less affected by lockdown restrictions than fuel consumption for travel or manufacturing.

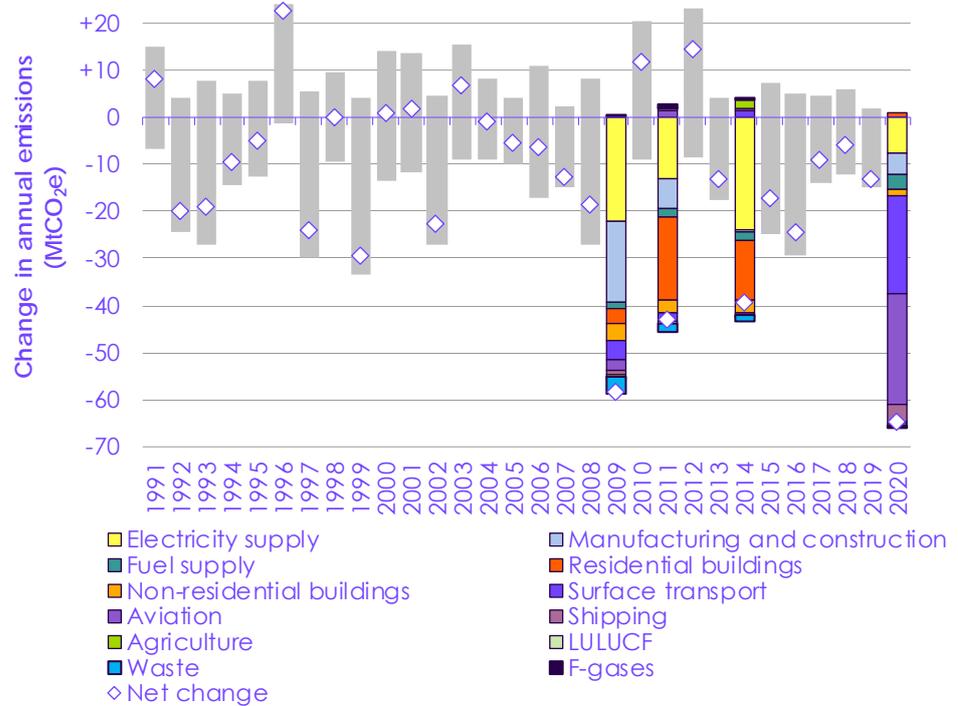

† This is a change from our approach in previous reports, where IAS emissions were held constant at the previous year's level. The pandemic means that this approach would not have produced a valid estimate of IAS emissions in 2020.

- In 2020, the vast majority (74%) of the total fall in emissions was associated with unprecedented pandemic-related reductions in air, sea and land travel. The pandemic also led to falls in emissions from fuel supply and manufacturing and construction (-7%), of a scale that would have been seen as significant in a 'normal' year.

It therefore seems likely that at least some of the fall in emissions made in 2020 will be reversed in 2021, with some increase in transport emissions to be expected. We explore this risk further in the next section and in Chapter 3 seek to identify underlying progress that could underpin sustained progress.

Emissions reductions in 2020 were largely due to pandemic-related restrictions, with little contribution from underlying structural progress.

**Figure 2.5 Annual change in UK emissions, 1990 to 2020**

Source: BEIS (2021) 2020 UK Greenhouse Gas Emissions, Provisional Figures; CCC analysis.  
 Notes: The years containing the most significant annual fall in emissions have been highlighted by sector.

## c) Changes to the UK inventory

The UK produces an annual greenhouse gas inventory, a consistent time series of all estimated sources and sinks of UK greenhouse gas emissions from 1990 onwards.

Every year, the inventory is updated to reflect the best available evidence and latest IPCC guidance.

Each year, the UK greenhouse gas inventory is updated to include emission estimates for any new sources identified in the UK, revised estimates for sources where there is an improved understanding of emissions (i.e. new data sources or a more accurate estimation methodology), and data revisions (for example to energy statistics) (Box 2.1).

The most significant change to the UK inventory this year was due to large revisions in the land use, land-use change and forestry (LULUCF) sector (Figure 2.6). These result from new estimates for peatlands emissions consistent with the 2013 IPCC Wetlands Supplement.<sup>1</sup> There were also revisions of around -1.5 MtCO<sub>2</sub>e to the estimation of annual wastewater methane emissions compared to the previous inventory.

Our Sixth Carbon Budget recommendation anticipated an increase in the estimate of UK emissions due to peatlands of between 17 and 21 MtCO<sub>2</sub>e in 2018. The published revision in UK peatland emissions in the latest inventory is similar to, though marginally smaller than, the range assessed in the Sixth Carbon Budget report, and does not affect the recommended level of the target (Box 2.2).

### Box 2.2

#### Recent and future changes to the UK inventory

Methodology changes to the UK inventory are designed to increase the transparency, accuracy, consistency, comparability, and completeness of the inventory. There are three primary sources of uncertainty in the UK inventory:

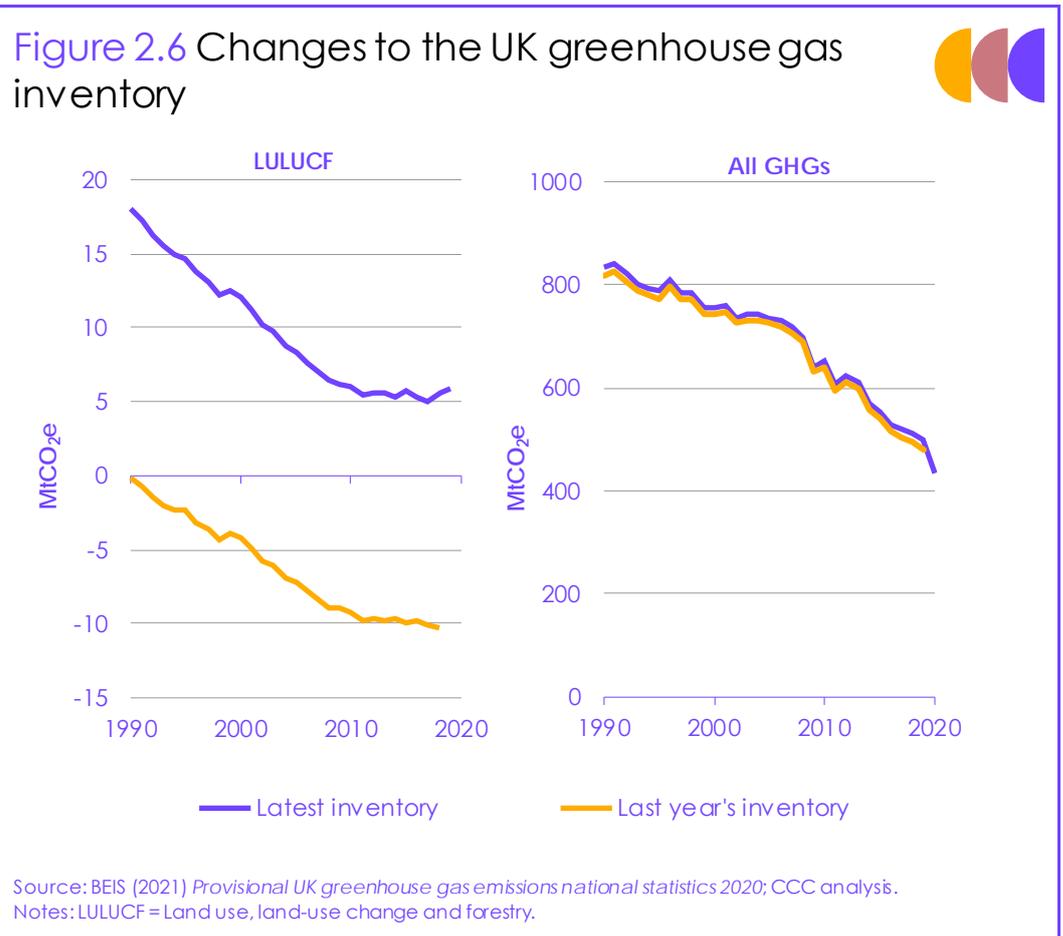

- **Changes to the scope of the inventory.** Certain sources of emissions and activities can be added to or removed from the scope of the UK inventory – adding to (or reducing) overall GHG estimates.
  - **Peatlands.** The most significant change to the UK inventory this year is due to a change of scope, with large revisions to the land use, land-use change and forestry (LULUCF) sector. These result from new estimates for peatlands emissions consistent with the 2013 IPCC Wetlands Supplement. This change added around 15 MtCO<sub>2</sub>e to the UK inventory in 2018 (Figure 2.6) and has turned the LULUCF sector from a net sink (of around 10 MtCO<sub>2</sub>e) to a net source of GHG emissions of almost 6 MtCO<sub>2</sub>e in 2019.
  - **Blue Carbon.** The term 'Blue Carbon' refers to the carbon stored in coastal and marine habitats such as salt marsh, mangroves, and sea grasses. These have had an increasingly important role in both climate change mitigation and adaptation. Chapter 4 of the Wetlands Supplement (Coastal Wetlands) has not yet been adopted in the UK inventory, and uncertainties remain. More research is needed to better understand how much carbon is stored in coastal and marine eco-systems, the annual flux of carbon release and rate of sequestration, and the impact on these of habitat restoration. Government should set out a comprehensive plan to assess the latest science and research gaps with a view to developing measurement protocols to enable emissions impacts of these habitats to be included in the GHG inventory.
- **Changes to Global Warming Potentials (GWPs)** assigned to GHGs. GWPs are used to convert emissions from different gases into a single comparable metric (tonnes of CO<sub>2</sub>-equivalent, or tCO<sub>2</sub>e), and are agreed internationally. There have been multiple changes to the GWP estimates used for CH<sub>4</sub>, N<sub>2</sub>O and F-gases since the inception of the inventory.

The UK inventory will update its GWPs before 2024, adding between 3 and 20 MtCO<sub>2</sub>e to the latest estimate of UK emissions, depending on the methodology that is used.\* We expect further updates when available when the IPCC AR6 (Working Group 1) report is published in August 2021.

- **Uncertainty in the current GHG inventory.** This comprises the statistical uncertainty in emission factors and activity data used in estimating emissions. It is internal to the inventory, is well quantified, and it is possible to formally assess the probability of errors through methods set out in IPCC guidelines. For the most recent inventory publication, the uncertainty was estimated as ±3% with 95% confidence for the UK as a whole. At sector level, land use emissions estimates have the highest uncertainty, followed by waste management and agriculture.

The UK inventory will continue to be updated each year in line with the latest IPCC guidance and to include the most up to date statistics and estimation methodologies.

The land use, land-use change and forestry (LULUCF) sector has seen the biggest changes in emissions. Around 15 MtCO<sub>2</sub>e of annual emissions from UK peatlands have now been included in the scope of the inventory. This change was expected.

\* At COP24 in December 2018 the international community decided to standardise reporting under the Paris Agreement transparency framework using the GWP100 metric (the GWP evaluated over a 100-year time frame). The values to be used are those from the IPCC 5th Assessment Report (AR5). There are two methodologies presented in AR5, with different GWPs, and it is not yet clear which will be used.

## d) Emissions in Scotland, Wales and Northern Ireland

The governments of Scotland, Wales and Northern Ireland will have an increasingly important role to play in tackling climate change as progress extends beyond the power sector and into sectors where key powers are devolved.

Emissions data for the devolved administrations are only available up to 2018 (Figure 2.7). New data for 2019 were due to be published in June 2021, but this was too late for inclusion in this report. The Committee will comment in more detail on 2019 emissions in our annual Scottish Progress Report later this year.

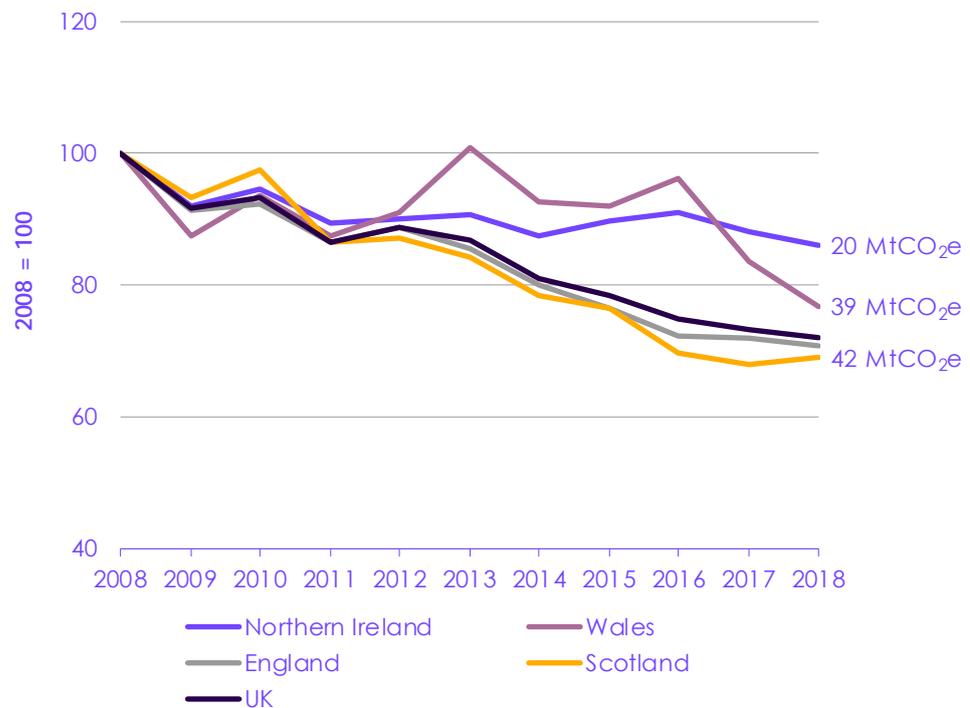

Emissions data for Scotland, Wales and Northern Ireland lags the UK data by more than a year.

Scotland has decarbonised faster than the UK average, while Wales and Northern Ireland have been slower. The most significant factor determining the relative rates of decarbonisation in Scotland, Wales and Northern Ireland compared to the UK average has been the speed and scale of power sector decarbonisation (Figure 2.8).

Emissions data up to 2018 shows that the power sector was the biggest driver of changes in emissions.

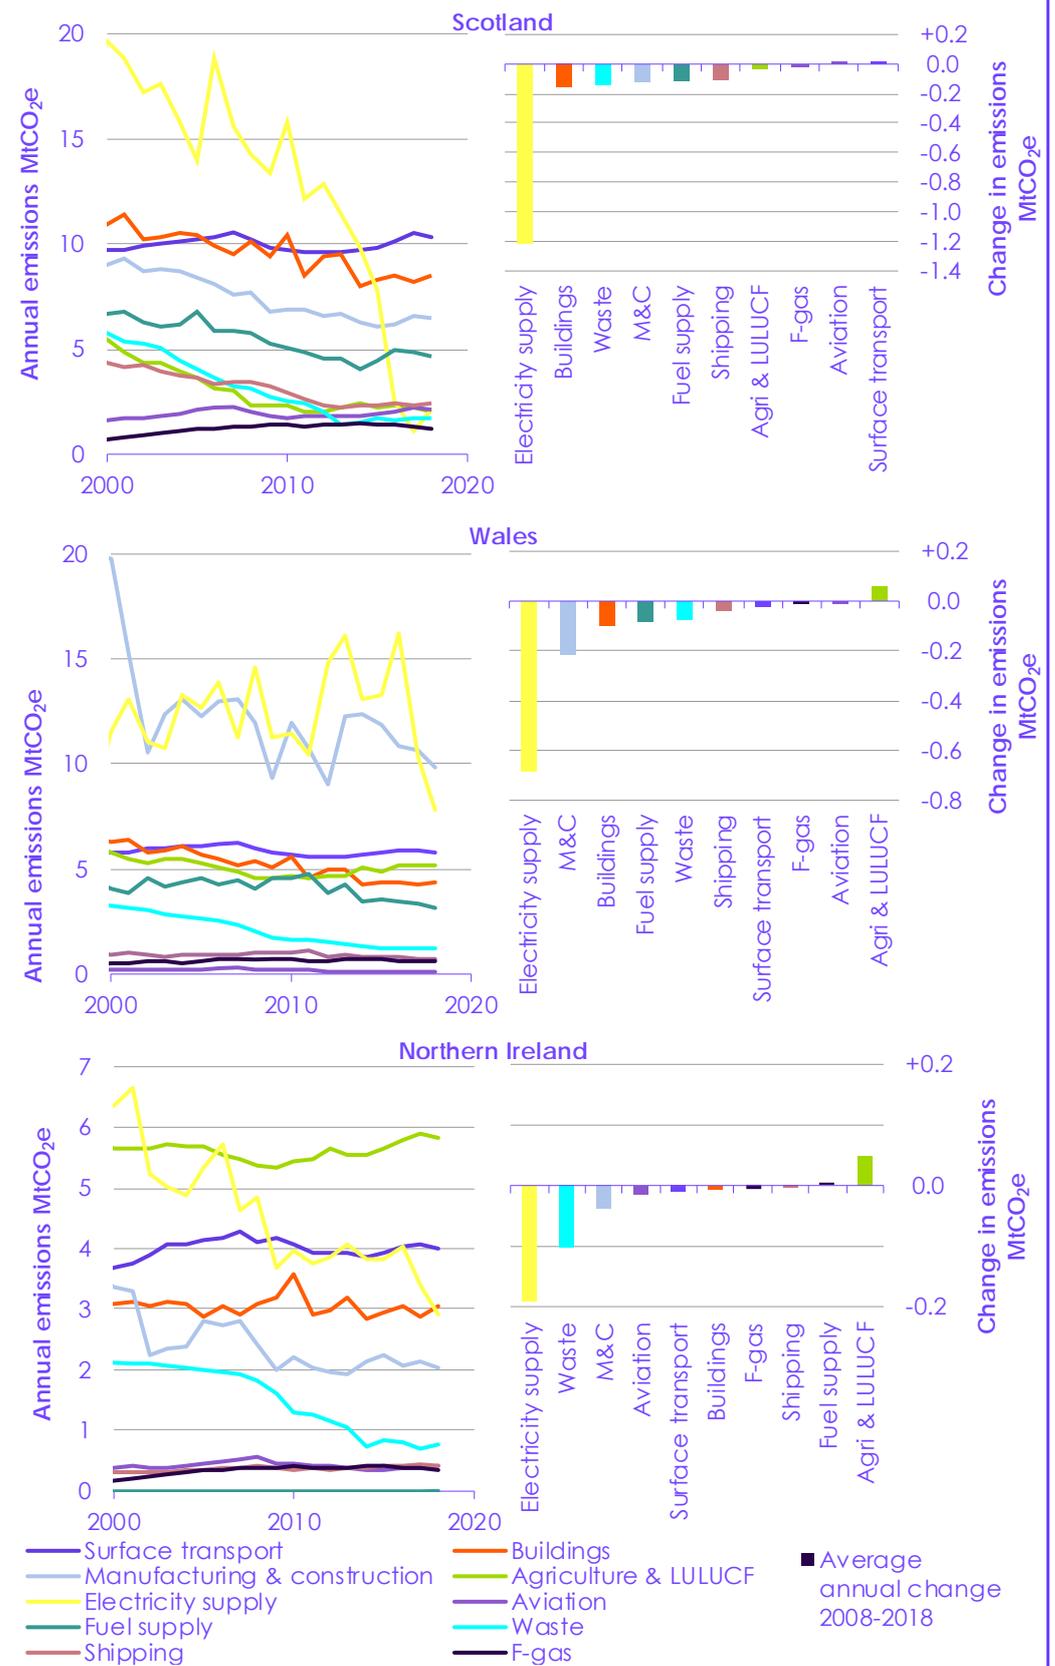

As UK-wide emissions reductions extend beyond the power sector, the next decade presents an opportunity for Scotland, Wales and Northern Ireland to match or exceed UK Government action in key devolved areas such as agriculture, tree planting, waste management, buildings efficiency, and public transport.

## 2. Impacts of COVID-19 on emissions and behaviours in 2020

In this section, we analyse the major changes that caused the sharp drop in emissions in 2020, and identify how lasting changes in behaviour could affect UK emissions in future.

Lockdown measures led to a record decrease in UK emissions in 2020. Most of the falls in sectoral emissions observed in 2020 are likely to be temporary.

Lockdown measures led to a record decrease in UK emissions in 2020. Most of the falls in sectoral emissions observed in 2020 are likely to be transient, as they do not reflect structural changes in the underlying economic, social, energy, transportation or land systems. In the absence of underlying changes, emissions are likely to rebound in most sectors in 2021.

The temporary fall in emissions in 2020 will have practically zero impact on the UK's past and future contribution to global warming. Sustained reductions are needed.

However, the last year has seen some large changes in patterns of behaviour due to the pandemic, and it is currently unclear the extent to which these changes will endure (Table 2.1). It is important to sustain some of the climate-positive changes that have developed during the pandemic, and important to act decisively to mitigate the negative changes that could jeopardise efforts towards Net Zero (Chapter 4).

Some behavioural changes could last that would have a significant impact on decarbonisation – particularly home-working and travel choices.

There is potential for longer-lasting impacts brought about by permanent changes in working and transport behaviour in some sectors, particularly surface transport, buildings and aviation:

- **Working patterns** are likely to be affected long term – people want to continue working from home to some degree,<sup>2</sup> many can continue to do so effectively<sup>3</sup> and many employers are already adapting to this new reality.<sup>4</sup>
  - **Business travel** demand may fall, with a shift to remote working and video conferencing during the pandemic enabling a longer-term reduction in business travel emissions, in both surface transport and aviation. Corporate travel budgets may also be constrained due to increased financial pressures even as the global economy recovers. Business travellers accounted for a significant proportion (25% at Heathrow, and around 15% at other major UK airports) of all UK passengers prior to the pandemic.<sup>5</sup>
  - **Home-working** is likely to affect energy demand in homes and workplaces, while changes to commuting patterns will affect emissions from transport. Around 25% of typical annual car mileage is due to commuting,<sup>6</sup> so reducing this could offer significant scope for reducing these emissions. However, estimating the net impact on UK emissions is complex and far from certain, as increases in emissions from residential buildings could exceed savings in non-residential buildings. Potential lasting effects also include workers moving out of cities, and undertaking less frequent but longer commutes.
- **Personal transport choices** may see enduring changes that could affect travel behaviour, demand and emissions in the future:

- **Decreases in non-business flying.** Aviation demand may be suppressed in the medium term, especially if COVID-19 transmission continues worldwide to some degree. Survey data show that people intend to fly less after lockdowns are lifted.<sup>7</sup> Government should not plan for unconstrained leisure flying at or beyond pre-pandemic levels in its strategy for airport capacity and demand management.
- **Increases in cycling and walking** could be sustained. Nearly 95% of people said they were likely to continue walking and cycling more after the pandemic.<sup>8</sup> Sustained Government investment in infrastructure to support walking and cycling can help encourage these positive changes.
- **Decreases in public transport use.** Hesitancy to use public transport may continue in the medium term. Around half of people surveyed said they will rethink how they use public transport in the future, reducing use compared to before the pandemic.<sup>9</sup> Shifting private car travel to public transport is important for decarbonisation and brings significant co-benefits for air quality, reduced congestion and public health. Government must act to address concerns about safety that could deter use of public transport.

**Table 2.1**  
Potential short- and long-term impacts of COVID-19 by sector

Sector	Average annual change required for CB6	Emissions change 2018-19	Emissions change 2019-20	Shorter-term COVID impacts	Medium- / longer-term COVID impacts
Aviation	+6%	+1%	-60%	<p>Passenger numbers 78% lower in August 2020 compared to 2019.<sup>9</sup></p> <p>Travel restrictions and concerns around safety likely to result in lower passenger numbers compared to pre-pandemic levels over the next year.<sup>10</sup></p>	<p>Impact on business travel is uncertain – the shift to remote working and videoconferencing during the pandemic may result in a lasting reduction in business travel, especially aviation.<sup>11,12</sup></p> <p>Leisure travel may also be impacted – survey data suggest some people intend to fly less than they did before the pandemic.<sup>13</sup></p> <p>The size of the aviation sector that will emerge post-pandemic is still unclear.</p>
Shipping	0%	-2%	-24%	<p>9% drop in global maritime trade in 2020 and comparable fall in tonnes of goods traded in the UK.<sup>14,15</sup></p> <p>Lower trade than pre-pandemic levels expected in 2021.<sup>16</sup></p>	<p>Rebound likely – though economic scarring could have permanent reduction in shipping volume in some sectors.</p>

Surface transport	-5%	-2%	-18%	<p>Demand for travel dropped considerably across all transport modes except walking and cycling during periods of national lockdown.</p> <p>Demand rebounded during the period between lockdowns, but the extent of this varied across modes, with car demand recovering more quickly.</p> <p>Public transport use remains far below pre-pandemic levels, with safety concerns remaining for many.<sup>17</sup></p> <p>Record falls in new car purchases.</p>	<p>Substantial uncertainty around how the impact of COVID-19 will influence the transport system in the longer term.</p> <p>Some of the increase in home-working seen during the pandemic is likely to remain, which could result in fewer (but potentially longer distance) commuting trips.<sup>18</sup></p> <p>Increases in walking and cycling could last, especially if support for necessary infrastructure is maintained and enhanced.</p> <p>Reduced use of public transport may endure – 32% of people said they will reduce use compared to before the pandemic.<sup>19</sup></p>
Residential buildings	-3%	-1%*	+7%*	<p>Changing patterns of occupancy and energy use due to the pandemic response meant direct emissions from homes increased by 7%* and fell by 4% from non-residential buildings.<sup>20</sup></p>	<p>Home-working may be sustained over the long term which would have consequences for occupancy of workplaces and energy use in homes and in non-residential buildings.</p>
Non-residential buildings	-3%	-1%*	-4%*		
Electricity supply	-6%	-14%	-15%	<p>Reduction in non-domestic electricity use resulting in a 4.7% drop in total consumption in 2020, with domestic energy consumption up by 2%.<sup>21</sup></p>	<p>Possible changes in profile of electricity demand, depending on extent of structural shifts such as more flexible working patterns.</p>
Fuel supply	-5%	-1%	-8%	<p>Low oil and gas prices resulted from worldwide lockdowns and associated falls in demand. Output in the UK oil and gas sector also fell as a result.</p> <p>Global oil and gas demand partially recovered since the beginning of the pandemic. Prices are close to pre-pandemic levels.<sup>22</sup></p>	<p>Assessments of long-term impacts of COVID-19 on oil and gas markets vary, with some expecting demand to reach 2019 levels by 2021-22<sup>23</sup> and others suggesting peak oil will be reached earlier than previously expected.<sup>24</sup></p>
Manufacturing & construction	-5%	-3%	-7%	<p>Short-term fall due to national lockdowns, manufacturing revenues temporarily fell to 65-70% of pre-COVID level, and largely recovered.</p>	<p>Rebound likely – though economic scarring could have permanent reduction on emissions in some sectors.</p>
Notes: *Based on temperature-adjusted emissions.					

## a) Aviation (60% fall in emissions in 2020)

Aviation emissions have been most heavily impacted by COVID-19 and continue to face the greatest uncertainties.

We estimate that total emissions from aviation fell by 60% between 2019 and 2020 to 16 MtCO<sub>2</sub>e.

Of all emitting sectors, aviation emissions have been most impacted by COVID-19 and continue to face the greatest uncertainties. We estimate that total emissions from aviation fell by 60% between 2019 and 2020 to 16 MtCO<sub>2</sub>e.

International aviation is likely to continue to be constrained in the medium term, as the UK implements restrictions on international travel and concerns around the safety of international and domestic air travel continue. Longer-term impacts are harder to assess:

- The easing of restrictions during summer 2020 resulted in an increase in flights between June and September, although flights remained far below pre-pandemic levels – air passenger numbers in August were only at 22% of August 2019 levels. Between June and July 2020, the number of passengers departing and arriving in UK airports went from 2% to 12% of 2019 levels.<sup>25</sup> This suggests that pent-up demand may result in surges in flight bookings as travel restrictions are eased.
- The International Air Transport Association (IATA) forecasts a recovery in air passenger numbers to pre-pandemic levels by 2024 and sustained average growth of 2.2% per year to 2030 in all European markets.<sup>26</sup> Their new outlook for the global airline industry points to lower passenger numbers in 2021 than their forecast made in 2020, due to a new surge in virus cases and associated increase in global travel restrictions. The result has been a significant increase in airline debt in 2020,<sup>27</sup> which could impact the longer-term viability of some airlines.
- Health concerns around flying also remain – 88% of people taking part in the National Travel Survey still had concerns with taking flights in August and September 2020, and 55% of respondents said they did not intend to plan an overseas holiday by plane within the next year.<sup>28</sup>

While it is unclear what the combined impact of these factors will be on the size of the sector in the longer term, this year should be used as an opportunity to develop a strategy for managing aviation demand.

This should be based on a reasonable level of international aviation for the UK, consistent with a Net Zero by 2050 target for the sector, and include an assessment of the UK's airport capacity. Government must recognise that planning for an ever-growing aviation sector is not consistent with the UK's Net Zero target as part of its aviation decarbonisation consultation and strategy, due to be published ahead of COP26.

See Chapter 4 for further details on next steps for aviation policy.

## b) Shipping (24% fall in emissions in 2020)

Shipping saw the second-largest sectoral fall in emissions in terms of percentage change. Uncertainties remain around the future level of shipping activity.

Our estimates suggest UK emissions from shipping fell by 24% between 2019 and 2020, to 11 MtCO<sub>2</sub>e. Proportionately, this was the second-largest sectoral fall in emissions. Uncertainties also remain around the future level of shipping activity, especially while COVID-19 remains widespread globally. The World Trade Organisation's latest forecasts suggest a 9.2% decline in the volume of world goods traded in 2020 followed by a 7.2% rise in 2021, while highlighting the high degree of uncertainty surrounding these forecasts as they depend on the pandemic and global responses to it.<sup>29</sup>

Provisional 2020 data show that total freight shipped through the UK's major ports fell by 10% in 2020,<sup>30</sup> largely due to the impacts of the COVID-19 pandemic:

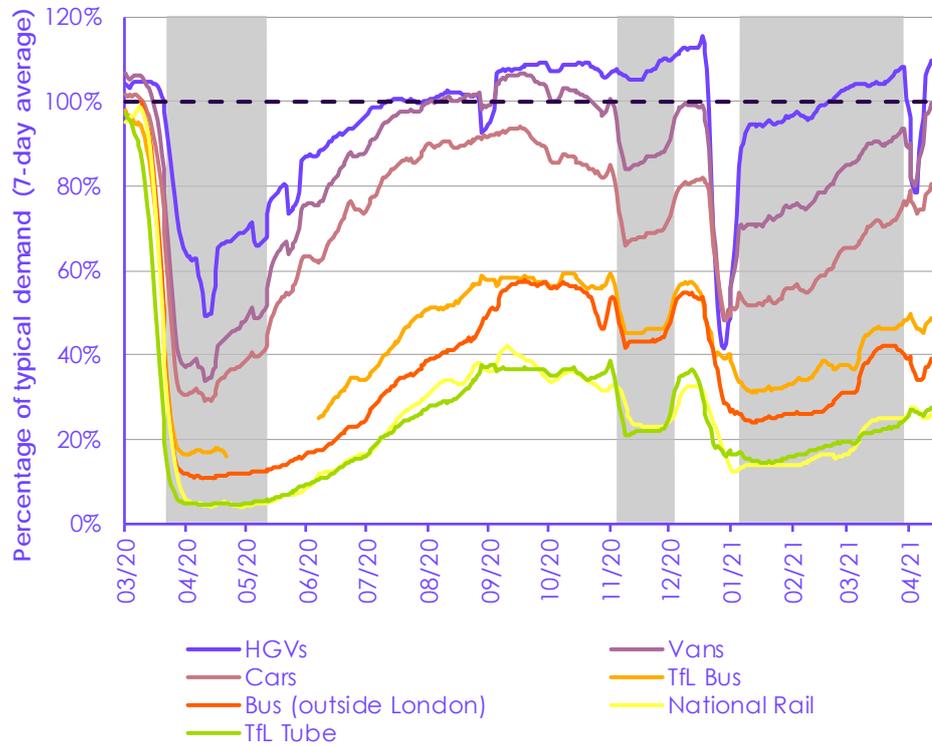

- This effect was particularly pronounced in Quarter 2 of 2020, when freight volumes were 18% lower than normal.
- We expect the impacts to continue to be felt in 2021 as the UK comes out of lockdown, but volumes are expected to return to normal levels of demand by 2022. However, the long-term impacts of COVID-19 on the global shipping sector are uncertain.
- The shipping sector has also been impacted by the uncertainty surrounding the UK's exit from the European Union. This may have caused some part of the reduction in demand seen during 2020.

## c) Surface transport (18% fall in emissions in 2020)

Emissions from surface transport fell by 18% due to lockdown restrictions.

Emissions from the surface transport sector fell by 18% in 2020. This is almost entirely due to the impacts of the COVID-19 pandemic and the resulting restrictions on travel, which have lowered demand across modes (Figure 2.9). There is substantial uncertainty around how the impact of COVID-19 will influence the transport system in the longer-term.

Figure 2.9 Travel demand by mode during the COVID-19 pandemic

Source: DfT (2021) *Transport use during the coronavirus (COVID-19) pandemic*; CCC analysis.

Notes: Figure shows travel relative to typical demand on an equivalent day. For rail and TFL data, this equivalent day is the same week in 2019, whereas for road transport and non-London bus travel, it is a day in early 2020. Therefore, these road and bus figures have not been normalised for any seasonality. The shaded regions represent the periods of national lockdown in England. TFL = Transport for London.

Impacts were different across different travel modes. Cycling increased dramatically, public transport use remains very low, and car, van and HGV use seem to be moving back towards pre-pandemic levels.

During the periods of national lockdown\* (shown by the shaded regions in Figure 2.9), demand for travel dropped considerably across all transport modes, except cycling and walking. Demand rebounded during the period between lockdowns, but the extent of this varied across modes.

- Travel by public transport both fell more deeply during the lockdown periods than private car demand and rebounded more slowly following the first lockdown. As of April 2021, public transport usage remained 50-80% lower than pre-pandemic levels, and car travel around 20% lower.
- Van and HGV travel fell slightly less sharply than car travel in the first lockdown, but levels are now similar to those pre-COVID-19.

\* The shaded regions show the lockdown periods for England. Those in Scotland, Wales and Northern Ireland will vary.

- Cycling rates rose dramatically during the first lockdown and into the summer 2020, but then declined back close to normal during the second half of 2020. Cycling rates are now around pre-pandemic levels, but these may increase again as commuting resumes and the weather improves.
- Walking is the only way of getting around that people are now doing more regularly. Survey evidence shows that 56% of people are walking three times a week or more, compared with 36% before the pandemic.<sup>31</sup>

The impacts on travel behaviour are currently uncertain, but there is likely to be some lasting impact of the pandemic in the medium to long term.

Working from home increased sharply and is likely to stay. This will have implications for commuting patterns as well as home and workplace energy consumption.

Public transport use remains much lower than pre-pandemic levels.

Underpinning these trends are significant changes people have made in their normal way of life and the development of new social behaviours and values. For travel patterns, key changes have been observed in the car market, attitudes towards public transport, increased home-working and online shopping.

- **Home-working and avoiding non-essential travel.** Periods of lockdown and guidance on avoiding non-essential journeys led to lower travel demand, including a significant reduction in commuting as home-working increased dramatically. This led to large reductions in emissions from surface transport, although the overall emissions impacts are complex and uncertain (Box 2.3). It is likely that some of this shift will be retained beyond the pandemic.
- **Public transport use.** The reduction in public transport use was driven by restrictions on travel, social distancing rules and the perception of it being unsafe. Research shows that the pandemic has had a negative impact on people's attitudes towards public transport use, but that there is a gap between perception and experience.
  - In a survey conducted in February 2021,<sup>32</sup> half of respondents said they will rethink how they use public transport in the future, with 32% reporting they are expecting to reduce use compared to before the pandemic. This was more marked for people with disabilities, and less likely for younger people.
  - Nearly 40% of people were concerned about their financial circumstances in the future, which could impact on public transport use. This was higher for ethnic minorities, households with children and younger age groups. Similar concerns could apply to ride-sharing and car-pooling schemes, which could hinder progress in increasing average car occupancy.
  - These results suggest that there are risks that public transport use will take time to recover, particularly as most people report having alternative travel choices. It is likely to be a difficult transition period for operators as social distancing rules reduce capacity and they need to regain trust in services.
- Total **new car sales** in 2020 fell by 30% in 2020 to 1.6 million, the lowest level since 1992.<sup>33</sup> Sales in the second-hand market fell by 15%.<sup>34</sup> However, the car market began to rebound during late-2020 and evidence<sup>35</sup> suggests that consumer purchasing confidence is rebuilding. Where new vehicles are purchased, the Government and vehicle manufacturers should look to prioritise electric vehicle sales wherever possible (see Chapter 4).

New car sales have fallen to the lowest levels since 1992.

- Overall, recent research<sup>36</sup> suggests that the pandemic has been reported as being a greater factor in reducing car ownership than it has been in increasing it to date, with one-quarter of those choosing to give up their car citing a change in work situation or not needing the car as much as before.
- Going forward, the market is likely to be affected by economic considerations, perceptions of safety of public transport and environmental decisions.
  - The increased priority consumers are now placing on health considerations may further stimulate the recovery of this market, although economic factors such as affordability may hinder this.
  - Potential changes in consumer purchasing power as a result of COVID-19 could risk further progress if more affordable EVs, appropriate purchase incentives and a robust second-hand market are not made available.

### Box 2.3

#### The potential impact of increased levels of working from home on transport demand and emissions

The number of people who work at home has generally increased over time, but this shifted dramatically during the COVID-19 pandemic.

- Before the pandemic, around 5% of people in employment worked mainly from home, while a further 12% did so occasionally.<sup>37</sup> As a result of the COVID-19 pandemic, levels of home-working have risen substantially, with an average of around 30% of the workforce working exclusively from home each week between May and December 2020.<sup>38</sup>
  - Both before and during the pandemic, those with higher-skilled occupations\* were more likely to work from home than lower-skilled workers. Those working in administrative and secretarial occupations saw an increase in home-working from 37% to 57% between 2019 and 2020.<sup>39,40</sup>
  - In April 2020, levels of home-working were highest in London, with 57% of workers doing some work from home – 92% of these people citing COVID-19 as the main reason why. Home-working levels were lowest in the West Midlands, with 35% of workers doing some work from home, compared to the UK average of 47%.<sup>41</sup>
- A recent study<sup>42</sup> found that if people continue to work from home at least two days per week in the future, then the number of commuting trips by car would fall by 14%.
  - Our analysis suggests that this could lead to an overall reduction of 15 billion car-kilometres each year, potentially avoiding over 2 MtCO<sub>2</sub>e of emissions per year. For comparison, the abatement delivered by reducing car travel and modal shift in our Balanced Pathway in 2030 is around 7 MtCO<sub>2</sub>e/year.
  - Around a quarter of workers surveyed said that they would work from home a little or much more in the future, with 23% saying they would conduct business meetings online that they would have previously travelled for.
  - Major companies have responded by allowing for more flexible working, with some expecting that employees will work from home for around two days per week.
- The overall impacts of home-working are uncertain and complex.
  - At the household level, working from home increases residential energy demand for heating and electricity in homes and reduces transport energy demand for commuting.

\* Professional, associate professional, technical occupations and managers, directors and senior officials.

A study by the IEA<sup>43</sup> suggests that the net impact of these is a reduction in overall energy consumption where private vehicles are the main means of commuting. The impact may increase emissions, however, where people normally walk, cycle or use public transport.

- There is likely to be reduced energy consumption from office buildings, with the net impact being context-specific. In the UK, offices include a greater share of electric heating suggesting they could also be lower-emission.
- A review of 30 studies<sup>44</sup> suggested that in most cases there was some improvement in energy use and emissions from home-working.
- Wider and potential rebound impacts, such as changing consumption patterns and where people choose to live and work, are also important and add to the uncertainty.

## d) Buildings (4% increase in temperature-adjusted emissions in 2020)

Emissions from homes increased and emissions from non-residential buildings decreased due to changes in occupancy.

Temperature-adjusted buildings emissions in 2020 were 96 MtCO<sub>2</sub>e – an increase of 4% on 2019. Changes to emissions were driven by shifting patterns of occupancy due to the pandemic response:

- Temperature-adjusted emissions from homes increased by 7% due to increased occupancy.
- Temperature-adjusted emissions from non-residential buildings fell by 4%: commercial buildings fell by around 8%, while those from public buildings increased slightly by 1%.

There is potential to improve the design and operation of buildings and their systems to better respond to variations in occupancy.

The net effects of the pandemic on emissions from public buildings appear to have been relatively insignificant, in part expected to be associated with the diverse nature of public buildings, which include hospitals and schools.

Despite dramatic reductions in occupancy,<sup>45</sup> the reduction in emissions from commercial buildings was limited. Analysis suggests that savings achieved across the stock vary widely, but are constrained by limits on adjusting levels of heating and ventilation – particularly in buildings which remain partially occupied, or have older plant and controls.<sup>46</sup> There is scope to enhance the design and operation of buildings and their mechanical and electrical systems, to better respond to variations in occupancy.

It is unclear to what extent shifts in occupancy patterns and behaviour brought about by the COVID-19 pandemic will persist; the impacts of such changes on emissions are uncertain and complex. The overall effects will depend on the levels of increases in energy consumption in residential buildings and decreases in non-residential buildings, and their relative efficiencies, as well as secondary impacts on patterns of living and travel.<sup>47,48</sup>

## e) Manufacturing, construction, fuel supply and electricity generation (average 10% fall in emissions in 2020)

Emissions across these sectors fell by an average of 10% between 2019 and 2020. This was primarily driven by a short-term fall in economic activity and energy demand due to UK and international lockdowns:

Manufacturing and construction revenues and emissions fell temporarily, but are likely to recover as lockdown measures are lifted.

- Manufacturing revenues temporarily fell by 30-35%, and have since largely recovered to pre-COVID levels.<sup>49</sup> Manufacturing emissions fell by around 7% across the year.
- Emissions in fossil fuel production in the UK fell by 8% in 2020, as production fell in response to low prices resulting from low global demand for oil.
  - UK demand fell for road fuels (-20%) and jet fuels (-60%) compared to 2019. Global demand for petroleum products was also down by around 9%.<sup>50</sup> This was a driving force for lower production of petroleum products in the UK, which was down by 17%.<sup>51</sup>
  - UK demand for gas decreased by 6% compared to 2019 levels, reflecting lower demand particularly for electricity generation. Gas production in the UK was stable, while imports were down 6% and exports increased by 17%. The UK remains a significant net importer of natural gas, importing around five times more than was exported in the last five years.<sup>52</sup>
  - Assessments of the long-term impacts of COVID-19 on oil and gas markets vary,<sup>53</sup> but it is expected that demand could potentially return to 2019 levels as early as 2021-22.<sup>54</sup> Sustained impacts on fossil fuel demand largely depend on potential sustained changes in travel patterns (see earlier subsections). Recovery plans that accelerate the pace of a transition for transport towards electrification could contribute to reducing oil demand and reaching peak oil earlier than previously expected.
- Lockdown restrictions had a significant impact on the electricity system over the course of 2020. Lower electricity demand, coupled with higher renewables output, highlighted some of the challenges that will need to be overcome in future for Net Zero (Box 2.4).

Fossil fuel demand fell worldwide, with impacts on the volume of oil produced in the UK. It is unclear how long these changes in demand will last and the impacts on the UK market.

The medium- to long-term impacts in these sectors will depend on UK and international economic recoveries post-COVID. A rebound is likely, although economic scarring or sustained low oil and gas prices could lead to a permanent reduction in emissions in some sectors.

## Box 2.4

### Impacts of COVID-19 on the UK electricity system in 2020

Restrictions that were put in place during 2020 had a significant impact on the electricity system, with reduced demand during lockdown periods. Combined with higher renewable output, this highlighted some of the challenges that will need to be overcome in the future as electricity generation decarbonises.

- Electricity demand fell significantly during the lockdown periods in 2020, but was similar to previous years outside those periods.
  - Electricity demand in 2020 as a whole was only 5% lower than in 2019.
  - The biggest COVID-19 impacts were felt in the lockdown periods, particularly in the second quarter where demand was 12% lower than the same period in 2019.
  - During the lockdown periods, the profile of demand was flatter as well as being lower in aggregate, with within-day peaks much less pronounced (particularly for the morning peak) and differences being smaller between weekdays and weekends.
- The carbon intensity of electricity generation fell, through a combination of higher renewables output and lower demand.
  - Renewables output was 15% higher in 2020 compared to 2019, due to exceptionally windy and sunny conditions early in the year.
  - To compensate for lower demand and higher renewables output, the share of fossil generation fell from 43% in 2019 to 38% in 2020. The country set a record 67-day period without using coal between April and June 2020.
- The combination of lower demand and higher renewables output had implications for the running of the electricity system, and led to lower wholesale prices and rising costs of running the network.
  - The wholesale cost of electricity was 42% lower in the second quarter of 2020 compared to the same period in 2019, reflecting both lower demand and the higher share of zero-marginal-cost generation in the mix. Periods of negative prices were common.
  - The electricity system was able to remain balanced even with lower demand and with record-breaking levels of intermittent renewable generation (e.g. wind generation set new daily records in 2020 for both level of power – 17 GW, and for share of generation – 60%). However, keeping the electricity system balanced was more challenging. Balancing costs rose by 50%, and curtailment costs (paying generators to switch off or reduce their output) doubled.

The challenges of operating with high shares of variable and inflexible generation are likely to be increasingly felt over the coming decade as the electricity system decarbonises. They highlight the importance of a system that is more flexible and provides adequate dispatchable low-carbon generation, and the need for market arrangements which enable that.

## f) Other impacts and lessons learned

Estimates of emissions from other sectors in 2020, including agriculture, land use and waste have not yet been produced, though emissions in these sectors are less linked to energy demands and therefore the impacts of lockdown are less certain. However, there are several impacts are notable outside those outlined in previous subsections:

There is some evidence that less food was wasted during lockdown, and some of those effects remained when restrictions were eased.

- **Reduced food waste.** A survey of over 4,000 people undertaken by WRAP on how the pandemic had impacted people's relationship with food revealed that during the first lockdown, people adopted behaviours to better manage food, including freezing, batch cooking and using up leftovers. It is estimated that levels of food waste declined by 43% between November 2019 and April 2020. Even with the easing of lockdown, some of these behaviours persisted and by November 2020, the amount of food wasted was over a fifth less compared to November 2019. Centre for Climate Change and Social Transformations (CAST) survey data also suggest people reduced their food waste during the pandemic, although some of this progress may have reversed between the first lockdown and third lockdowns – 89% of people said they threw away at least some food in October 2020, compared to 84% in May, and 92% before the pandemic.<sup>55</sup>
- **Climate change attitudes.** Concern over the pandemic does not seem to have dampened concern with climate change and other environmental issues. 74% of people surveyed by CAST agreed that tackling climate change was urgent in separate surveys carried out in May and October 2020, compared to 62% in August 2019. Support for measures to tackle climate change (e.g. walking and cycling more, reducing meat and dairy consumption, replacing gas boilers) was high throughout the pandemic (with different measures receiving different levels of support), increasing between May and October 2020.<sup>56</sup>
- **Just transition and inequality.** The pandemic has affected all people in the UK negatively, but has harmed some groups more than others. Inequality has been highlighted – and in many cases increased – across multiple demographic groups, including by age, income, ethnicity, employment type, and geography. Mortality rates from COVID-19 in the most deprived areas in England are double those in the least deprived<sup>57</sup> and were higher in both Black and South Asian ethnic groups than the national average.<sup>58</sup> The lowest-earning 10% of workers were much more likely to work in sectors that closed during lockdown, and less likely to be able to work from home.<sup>59</sup> At the same time, others have been able to work from home and accumulate savings due to reduced opportunities to spend. The need to ensure the transition to Net Zero is a fair and equitable one is arguably even greater now than before the pandemic (see Chapter 3).
- **Air quality.** Positive air quality outcomes can be linked to virtually all of the changes needed to get to Net Zero, and is likely to be amplified further if similar strategies are adopted neighbouring countries.<sup>60</sup> The most pronounced changes in UK air quality during lockdown were in the urban environment, notably for nitrogen oxides (NO<sub>x</sub>) as emissions from vehicles fell. Urban NO<sub>x</sub> concentrations over the lockdown period up to 30 April 2020 were typically 30-40% lower than average. Impacts of lockdown on exposure to other pollutants were not necessarily positive – particulate matter (PM<sub>2.5</sub>) concentrations increased but this was largely due to weather effects, and urban ozone (O<sub>3</sub>) concentrations increased due to secondary air chemistry effects caused by the fall in nitric oxide (NO) emissions.<sup>61</sup>

Support for climate action remains high.

There is a renewed focus on inequalities. The need for a just transition is arguably greater than ever.

The experience from 2020 has highlighted several key lessons for decarbonisation. We have considered these in our policy advice and reflected them where possible (Chapter 4):

There are new lessons we can draw from the experience in 2020 to sustain climate-positive changes that have developed and mitigate the negative changes that could jeopardise efforts towards Net Zero.

- **Emissions fell rapidly, but they can rebound just as quickly.** Across several sectors, including manufacturing & construction, surface transport and freight, activities are beginning to return to near pre-pandemic levels. In general, this should be welcomed as a positive return to economic activity as lockdowns are eased. However, there are some instances where beneficial changes could be lost unless action is taken to support them.
- **There is a limited window to change behaviours.** There are behavioural sources of 'friction' in moving from one pattern of living and working to another, but if those frictions can be overcome, people and organisations can often adapt quickly.<sup>62</sup> In the light of the changes in response to COVID-19, there are now significant opportunities to lock in and build on positive developments, especially – though not exclusively – regarding levels of demand for transport. This includes:
  - Sustaining increases in 'active travel' by providing support for walking, cycling and e-bikes.
  - The possible need for active measures to encourage people back onto public transport, where there has been a shift to car travel.
  - The opportunity to change the narrative on the need for an ever-increasing number of flights and accompanying airport expansion.
- **The need for increasingly resilient networks and infrastructure.** Our energy (and digital) networks have demonstrated they can be resilient to profound changes in use. The transition towards Net Zero will only increase the challenges of operating an electricity system with high shares of variable and inflexible generation. The non-residential buildings stock can be improved to respond more efficiently to variations in occupancy. Our systems need to be more flexible as well as low-carbon, and that can be delivered through long-term planning and clear market mechanisms that incentivise flexibility.
- **Lockdown is not a blueprint for decarbonisation.** The fall in UK emissions in 2020 was much larger than the annual change needed on the pathway to Net Zero. However, it did not materially affect the structural changes that are needed in our underlying economic, social, energy, transportation or land systems to reach Net Zero. In order to combat COVID-19, people in the UK have heavily restricted their movement with damaging economic and social consequences. This stands in contrast to the fair, well-planned and sustainable transition to Net Zero that is possible. It can bring improvements to our quality of lives: new jobs, cleaner air, quieter streets, more green spaces, comfortable homes and healthier lifestyles.

The pandemic has also demonstrated the importance of preparing for known risks and the value of scientific advice, which will both be vital in successfully confronting the climate challenge. It will be important to sustain the beneficial changes that have developed during the pandemic, but also to act decisively to mitigate the negative changes that could jeopardise efforts towards Net Zero.

### 3. Progress reducing the UK's carbon footprint

Under the UK carbon budgets and the Paris Agreement, the UK's greenhouse gas (GHG) emissions reduction targets are based on the UK territorial emissions (i.e. emissions physical occurring within the boundaries of the UK), in accordance with internationally agreed rules for emissions accounting.\*

Tracking the UK's carbon footprint can help us identify actions to reduce emissions from our supply chains and the goods and services we consume.

It is also important to examine the UK's total carbon footprint which allocates GHG emissions along economic supply chains, no matter where in the world they occur. This method allocates emissions to the country where the consumer of the final good or service is based. This is known as *consumption-based accounting* or as the *carbon footprint* of a country. Tracking the UK's consumption emissions footprint is important to consider alongside the legally binding targets set out for UK territorial emissions as it can help identify additional actions that UK consumers and companies can take to help reduce the emissions along their supply chains (such as using low-carbon suppliers) that are not covered within the UK's territorial emissions targets.

Our consumption emissions footprint has fallen over the last decade.

Our 2020 Progress Report showed a sustained decline in the UK's consumption emissions footprint over the last decade (Figure 2.10). Over the period 2009 to 2017, the UK's consumption emissions footprint fell by around 2% per year on average, driven by improvements in the energy- and carbon-intensity of the UK and global economy outweighing the effect of increased overall consumption and changes in the structure of the global economy. This fall in the UK's consumption emissions is slower than for territorial emissions, but there is little evidence that this is associated with 'offshoring' UK territorial emissions as part of decarbonisation efforts over the last decade.

Updated data are now available for the UK's consumption emissions footprint in 2018, showing a 1% increase in emissions relative to 2017 levels.† This small change is likely to be well within the estimated margin of uncertainty for the UK's consumption emissions account (previously estimated to be 3.5-5.5%,<sup>‡</sup> although this may have reduced with recent improvement to the methodology). As such, analysing the breakdown underpinning this change is not useful for identifying robust underlying changes in actions that create emissions at home and abroad.‡

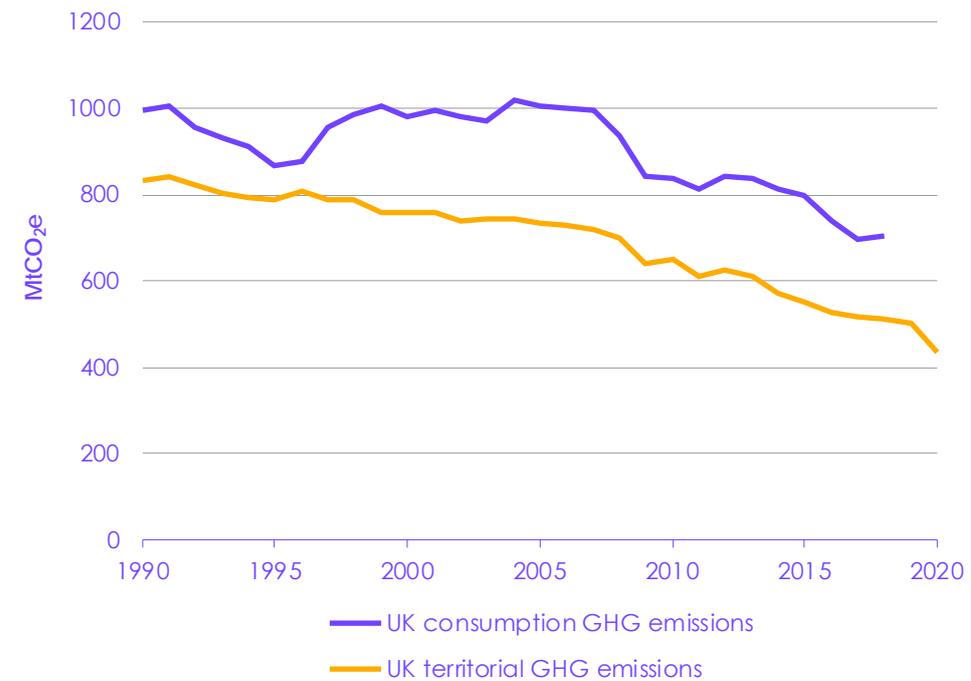

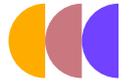

As consumption emissions accounts are generally more variable year-to-year than territorial emissions accounts, looking at the trend over several years is likely to be a more representative picture of underlying trends than year-to-year changes.

\* Emissions from international aviation and shipping are included for the Sixth Carbon Budget.

† F-Gases are included within the UK's carbon footprint statistics for the first time this year.

‡ The consumption emissions statistics suggest this increase was a combination of an increase in UK-sourced emissions and overseas emissions, in particular those arising from the European Union and other OECD countries. On a source basis, increases in emissions from domestic heating (2018 contained a cold winter with the 'Beast from the East' cold snap) and (non-household) transport outweighing decreases from electricity generation and agriculture.

Figure 2.10 Changes in UK consumption and territorial emissions since 1990

Source: Defra (2021) *The UK's carbon footprint*; BEIS (2021) *Final UK greenhouse gas emissions national statistics*.  
 Notes: Emissions from international aviation and shipping are included within both the UK's consumption and territorial emissions accounts in this figure. Emissions from land-use, land-use change and forestry (LULUCF) are not currently included within the UK's consumption emissions accounts.

We outlined exploratory future scenarios for the UK's carbon footprint in our advice on the UK's Sixth Carbon Budget report. These scenarios showed 3-7% average annual reductions between now and 2050 could be possible, depending on UK actions and the degree of global decarbonisation.

Nearly half (45%) of the UK carbon footprint emissions occurring outside the UK are associated with the production of inputs for a domestic economic activity (e.g. imported raw materials or parts, as opposed to finished products or services for an end user).

In our Sixth Carbon Budget Advice Report we highlighted corporate action to reduce emissions along their supply chain as one of the levers that could help reduce this part of the UK's carbon footprint. Recent estimates indicate that around 75% of FTSE100 companies disclose some information related to their Scope 3 emissions (share of emissions arising from the upstream and downstream supply chains), with around one-third having a target to reduce their Scope 3 emissions.<sup>64</sup>

Recent context changes will affect estimated UK consumption emissions – the UK's trade patterns have been changing due to the end of the transition period for exiting the European Union and have been disrupted due to the COVID-19 pandemic, which has also changed UK consumption patterns. The effects of these changes will not be apparent within the UK's consumption emissions accounts until 2023-2024. The climate considerations in the UK's new trade agreement (including with the EU) are summarised in Box 2.5.

Changing trade patterns present both a risk and opportunity for the UK's consumption emissions and support of global decarbonisation efforts.

As the UK's trade relationships continue to change, this presents for risks and opportunities for further decreasing the UK's consumption emissions. Increased trade with high-carbon producers could lead to increased overseas supply-chain emissions, while also potentially undermining domestic decarbonisation efforts through increased availability of low-cost imported products with a high carbon footprint.

Conversely, new trade deals and/or implementation of carbon-border policies could help support global decarbonisation. The UK should explicitly consider climate-related issues when agreeing trade deals and consider supporting trade-related measures such as carbon border adjustments and product standards, to help minimise the global emissions footprint of its international trade.

### Box 2.5

#### Climate considerations in the UK's trade agreements

Since deciding to leave the European Union, the UK has been working to put in place a number of bilateral trade deals to cover trade flows that were previously covered under the European Union's agreements.

The most significant commitments regarding climate change within these trade deals is contained within the **UK-EU Trade and Cooperation Agreement**:

- **Commitment to the Paris Agreement.** The Cooperation Agreement reaffirms both parties' commitment to achieving the goals of the Paris Agreement. Efforts to tackle climate change under the Paris Agreement is referenced as an 'essential element' of the Agreement, violations of which by either side could lead to the Agreement being suspended.
- **Maintaining domestic ambition on climate change.** Commitments are included that both sides will maintain and strive to improve their 'climate level of protection' (which refers to their emissions reductions targets for 2030). The Agreement specifically refers to the EU's previous 40% reduction NDC (relative to 1990 levels) and the UK's share of this target (which the Committee previously estimated to be around a 57% reduction in emissions). This has now been superseded by increased emissions reduction ambition for both the EU (55% reduction relative to 1990 levels) and the UK (a 68% reduction relative to 1990 levels).
- **Cooperation on climate change.** Climate change and emissions reduction is explicitly highlighted as an area for cooperation between the UK and EU, alongside the role of trade as a relevant driver of GHG emissions. The UK is no longer part of the European Energy Union or EU Emissions Trading Scheme (EU ETS). The Agreement commits both parties to work together to find a system for sharing electricity through interconnectors and to 'give serious consideration' to the possibility of linking the new UK ETS to the EU ETS. No decision on whether the UK ETS will be linked with the EU ETS has yet been made.

Aside from the UK-EU Cooperation Agreement there is limited concrete detail related to climate change in other UK trade deals. The need for new trade deals not to contradict existing ones means that the climate commitments within the UK-EU deal could be used more widely as a template for other trade deals agreed by the UK in the future.

# Underlying progress and enablers of progress

1. Tracking underlying progress	94
2. Underlying progress on key enablers of the path to Net Zero	96
3. Underlying progress by sector	106

## Introduction

Delivering the Sixth Carbon Budget will require an immediate scale-up in action across the economy, building an annual investment programme reaching around £50 billion per year by 2030, up from around £10 billion per year today. This must be accompanied by significant changes in individual and organisational behaviours, alongside major changes in the way we farm and use our land.

This chapter sets up (but does not conclude) a discussion of how to monitor Government progress towards the Sixth Carbon Budget.

The transformation presents a major policy challenge for Government and a delivery challenge for UK business. Both Government and businesses have signalled their commitment to meeting these challenges, but much remains to be done. Now that the Net Zero target and Sixth Carbon Budget have been set, focus must switch to delivery.

In this new context, the Committee's role must also evolve. This chapter sets up (but does not conclude) the discussion of metrics of progress and the right way to monitor Government action.

We look forward to assessing the Government's full Net Zero Strategy later this year, and will aim to align our progress metrics and monitoring with the Government's proposals where we consider those to be credible.

The key messages of this chapter are:

- **Focus on delivery.** Our Sixth Carbon Budget advice identified and quantified many of the changes that need to happen in the next three decades. Now that the target has been set, focus must switch to delivery.
  - Decreases in non-business flying. Aviation demand may be suppressed in the medium term, especially if COVID-19 transmission continues worldwide to some degree. Survey data show that people intend to fly less after lockdowns are lifted.<sup>1</sup> Government should not plan for unconstrained leisure flying at or beyond pre-pandemic levels in its strategy for airport capacity and demand management.
- **There are some signs of progress on key enablers of the path to Net Zero.**
  - The transition to Net Zero requires changes that go beyond the deployment-related metrics we have tended to track to date. We will seek to broaden our assessment of real-world progress, including governance, public attitudes, corporate commitments, finance, just transition and the green recovery, as well as consumption emissions and the factors affecting them.
  - Early signs of progress on key enablers include two Cabinet Committees, the UK Climate Assembly, Scotland's Just Transition Commission, publication of the interim report of the HM Treasury Net Zero Review, and a rapid increase in climate commitments and action from UK businesses.
- **The pace of progress varies across sectors.** Some sectors of the economy are making strong progress towards Net Zero, while others are lagging behind:

- Sales of **electric vehicles** and the deployment of supporting charging infrastructure have increased considerably in recent years. Policies will be required to drive the accelerated uptake required throughout the 2020s (e.g. a zero-emission vehicle mandate). There are also concerning trends, notably the rapid growth in car and van travel and shift towards larger vehicles during the past decade.
- There has been almost none of the necessary progress in upgrading the **building stock**. Despite a small improvement in rates of heat pump installation, these remain far below levels that are necessary. Insulation rates remain well below the peak market delivery achieved up to 2012 before key policies were scrapped, demonstrating clear potential for growth if an effective policy package is in place.
- Deployment of **renewable electricity generation** has scaled up rapidly. The increase in 2020 was at a much slower rate than the average achieved over the previous five years, however, the growing project pipeline means that this slowdown is likely to be temporary.
- Progress in **agriculture and land use** has repeatedly failed to meet the indicators (e.g. for tree planting and on-farm efficiency measures) outlined in the Committee's progress reports in recent years. There are signs of potential consumer willingness to shift towards less carbon-intensive diets, but this has not yet translated to reduced meat consumption or been backed up by policy to support the change.
- Progress in reducing **emissions from waste** have stalled in recent years following a period of steep emissions reductions from the late 1990s caused by the diversion of waste from landfill.
- In the decade prior to 2020, **air passenger** demand increased by 36%. Efficiency improvements were not enough to offset this rise in demand, leading to a rise in emissions.
- Although there have been emissions reductions in **industry**, it is unclear how far this reflects structural changes driven by wider factors or genuine improvements in efficiency and carbon intensity. Tracking progress against our recommended pathway for manufacturing and construction is currently challenging because of a lack of data, which in some cases is because the technologies or approaches are still at an early stage of deployment.

This Chapter is set out in three sections:

1. Tracking underlying progress
2. Underlying progress on key enablers of the path to Net Zero
3. Underlying progress by sector

# 1. Tracking underlying progress

## a) Why we care about underlying progress

Tracking underlying progress is important, to understand whether lasting changes are being put in place that will lead to the necessary emissions reductions later on.

The end goal of domestic emissions reduction policy is to reduce UK greenhouse gas emissions to Net Zero by 2050. Reporting changes in annual greenhouse gas (GHG) emissions and setting targets to reduce those emissions is a fundamental element of monitoring the UK's progress on tackling climate change.

However, reporting annual GHG reductions does not tell the complete story. Chapter 2 sets out how the largest changes in annual emissions in the last decade were driven not only by reductions in the power sector, but also by external factors including winter temperatures, economic recessions, and most recently by lockdown measures during the pandemic (Figure 2.5).

Tracking underlying progress is therefore crucial to understanding what is driving current and future trends in UK emissions, and for identifying areas where the UK is performing well or falling behind.

In particular, we are interested in identifying a sustained shift towards low-carbon investments and behaviours (e.g. an expansion of renewable electricity generation, an increase in the share of electric cars being bought, higher rates of planting trees, a shift from car use towards walking/cycling).

## b) Our basis for monitoring underlying progress in future

In December 2020 the Committee published a Balanced Pathway to Net Zero as the basis for the recommended Sixth Carbon Budget, along with a range of alternative pathways to Net Zero. These pathways identify the changes in investments, choices and behaviours that would deliver the budget and put the UK on track to Net Zero. They give us a reasonable basis against which progress can be measured.

We can compare real-world deployment to the CCC pathway to see whether things are on track.

We recognise that there are options and uncertainties associated with pathways to meet the Net Zero 2050 target and the Sixth Carbon Budget. While the Balanced Pathway – referred to in this report simply as the 'CCC pathway' – sets a basis for the budget, it is not intended to be prescriptive. Rather it is illustrative of what a broadly sensible path without extreme assumptions would look like. A little more or a little less may be achieved in any given area, or alternative low-carbon solutions could be used, but the overall level of ambition and delivery must match. Since the pathway is, by design, stretching in all areas there is only limited scope to diverge significantly in any one area, as credible options to go significantly further in others are limited.

Our pathway modelling approach for the Sixth Carbon Budget was rooted in the technologies, investments and behaviours that are needed to decarbonise. This approach allows us to produce a large range of quantitative metrics of what is needed to achieve Net Zero. These are referenced throughout this chapter.

We will extend our progress reporting in the next year to cover a wider set of underlying drivers of emissions reductions

However, we have not fully quantified all the leading indicators and enablers needed to deliver them, such as strengthening of supply chains, expansions of the skilled workforce, or changes in public attitudes. Over the next year, the Committee will work towards a more complete set of indicators that also aim to track those real-world drivers of underlying progress.

Where we assess them to be credible, we will aim to align our progress monitoring to the Government's plans and proposals.

The Committee's ability to monitor Government performance on climate change also rests heavily on publication of the UK's Net Zero strategy, anticipated later this year. This publication will raise two key questions that will guide the Committee's scrutiny of underlying Government progress in future reports:

- Does the Net Zero Strategy set out a credible pathway to the Sixth Carbon Budget and Net Zero targets?
- Is the Government on track to deliver what was promised in its own Net Zero strategy?

We will aim to align our progress metrics and monitoring with the Government's proposals where we consider those to be credible and practical.

## 2. Underlying progress on key enablers of the path to Net Zero

This section reviews some of the key cross-cutting enablers for delivering Net Zero, and identifies underlying progress in each theme. Our future work will expand on each of these themes in more detail.

### a) Governance and delivery

Government will need to work together effectively at all levels to deliver the pathway to Net Zero.

Good governance will be crucial in enabling delivery of the path to Net Zero. Mitigating and adapting to climate change are challenges that cut across the entire economy, requiring Government to work together at all levels. There has been some activity on this challenge in the last year:

- There are now two Cabinet sub-committees (for Climate Action Strategy, chaired by the Prime Minister, and Climate Action Implementation, chaired by the Secretary of State for Business, Energy and Industrial Strategy). The Government does not report on the content or frequency of these meetings, but it is clear from the increased policy activity and the Committee's own experience that they are being used.
- The Government has recently separated the roles of Secretary of State for Business, Energy and Industrial Strategy and President of COP26.
- At senior official level there is a Climate Change National Strategy Implementation Group, a Net Zero Steering Board and various coordinating working groups. The Business and Energy Secretary has also recently convened a new Net Zero Expert Group as part of Task Force Net Zero, which aims to adopt a whole-system approach to decarbonising the UK economy.
- The Government has set the Bank of England a new mandate to support the Net Zero transition.<sup>2</sup> It has also established a Net Zero Business Champion (see part e) of this section).
- In the past year, parliamentary Select Committees have opened at least 20 inquiries into aspects of the UK's path to Net Zero.
- Both the National Audit Office (NAO) and the Institute for Government (IfG) have made recommendations<sup>3,4</sup> based on their assessments of what structures and approaches would be best within the centre to coordinate the work that is required across all areas of Government business. The recent Dasgupta Review<sup>5</sup> suggested including natural capital within an 'inclusive wealth' approach to national accounting systems to appropriately value sustainable economic growth and development.

This process of embedding Net Zero throughout Government departments must continue through the 2021 Spending Review, for which plans to contribute to Net Zero should be a key criterion.

Government must set a clear strategy for how Net Zero will be delivered across the whole system.

There are further challenges beyond central Government. There will need to be a strong, clear strategy set from the centre, with clear lines of responsibility and accountability alongside appropriate empowerment of those tasked with delivery. The UK Government must coordinate effectively with devolved governments and there must be a clear expectation of, and support for, local government.

- Net Zero and the recent legislation of the Sixth Carbon Budget set a clear direction, but these now need to be developed into a full strategy for delivering the necessary decarbonisation. The build-up to COP26 provides an opportunity for the UK to show leadership in setting out ambitious decarbonisation plans and a roadmap for delivering these. This momentum and Government ambition must be sustained and built upon beyond COP26.
- Each of the devolved administrations contributes to the UK's overall Net Zero target, while Scotland and Wales each have their own Net Zero targets. As such, each devolved administration is developing and implementing policy to reduce emissions – this presents both challenges in terms of aligning policy signals and outcomes, and also opportunities to learn from best practice.
- A lot of the delivery required for Net Zero is inherently local in nature, but local actors (including local authorities, sectoral bodies and business groups) are frequently not properly empowered and supported to deliver the actions required.
  - Nearly three-quarters of local authorities have declared a climate emergency. However, there can be uncertainty around what actions they should take to address this, and delivery of Net Zero can be a challenge in the context of funding shortfalls and competing needs to deliver statutory obligations.
  - As part of our advice on the Sixth Carbon Budget, we commissioned an assessment of the role of local government.<sup>6</sup> This produced several recommendations for how to enable collaborative delivery, including the need for an agreed framework incorporating local and national action, the importance of aligning policy and local powers with ambition and the requirement for appropriate long-term programmatic funding.

Much of the activity that is required to deliver Net Zero will be carried out at the local level. Therefore, it is vital that local actors are properly empowered and supported to deliver these actions.

We intend to consider the governance challenges further during the 2021-22 year, including the work of other organisations and potential lessons from other delivery challenges. We will report back on our findings in our 2022 Progress Report.

## b) People and public engagement

Meeting the Sixth Carbon Budget and the Net Zero target will require increased action from people, as consumers, workers, households, businesses and citizens. Our analysis shows that over half the emissions reductions needed to meet the Sixth Carbon Budget involve people making low-carbon choices, whether adjusting to the different characteristics of low-carbon technologies (e.g. electric cars), or by changing their current consumption patterns (e.g. by eating less meat).

The experience of the Climate Assembly UK shows that people will support the transition to Net Zero if they understand what is needed and why, if they have options and can be involved in decision-making processes. However, for wider society in general, while there is an increased awareness of the need for climate action, there is still a gap in understanding what this means for them. For example, while 80% of people are concerned about climate change, only half are aware that their gas boiler produces emissions.<sup>7</sup> Climate Assembly UK also demonstrated that there is much that government can learn from citizens' lived experience and values that can help in formulating better policy.

The Climate Assembly UK was an important start in engaging the public more in climate policy decisions.

There is a clear requirement for the Government to tell a better story on how people can engage in the transition, while also learning from people's experiences. The need for a Government public engagement strategy was identified as a key policy priority area in our Sixth Carbon Budget advice.

Our future work will include looking at 'what works' for public engagement, further analysing what meeting the Sixth Carbon Budget means for individual choices, and assessing the Government's own public engagement plans.

The Committee will be undertaking further work on how people can be engaged effectively on this path, with a view to making more detailed recommendations to Government in 2022. The work will be informed by stakeholder engagement, literature review, survey data and work with the Climate Citizens project at Lancaster University. It will cover:

- Establishing the principles of what good public engagement for Net Zero looks like. This will include a synthesis of the main findings of different public engagement strategies and models used in the UK and overseas, both within climate change and other policy areas, in order to demonstrate what works and what we can learn from successful engagement.
- Unpacking the key Sixth Carbon Budget actions that actively involve people changing how they do things. This will allow us to identify:
  - Priority areas for engagement.
  - The most appropriate engagement model(s), policies and key delivery partners, drawing on evidence from case studies.
  - The key indicators and survey data with which to track progress against and identify key data gaps.
- Assessing the public engagement aspects of the Government's Net Zero Strategy.

## c) Just Transition – who pays and who gains?

The costs and the benefits must be shared in a way that is fair and is perceived to be fair.

A key challenge on the path to Net Zero is how to spread the costs and benefits of the transition across the economy: for households, businesses and the Exchequer.

The Treasury published their initial findings on this challenge in December, in the interim report of their Net Zero Review. Its conclusions echoed the Committee's in our Net Zero report and in the Sixth Carbon Budget, as well as the conclusions of our Expert Advisory Group on the costs and benefits of Net Zero.<sup>8</sup> Conclusions include that the effects of decarbonisation on economic growth are likely to be small and that the costs of the transition are uncertain but can be minimised with good policy, which should rely on a range of levers (Box 3.1).

There is currently an imbalance between gas and electricity prices. This does not fairly spread the costs of polluting nor incentivise the right decarbonisation decisions.

In the long term, the transition should result in lower energy costs and energy bills, but in the coming decade our scenarios involve further increases in electricity costs before these begin to fall. To date, climate policy costs have been primarily added to electricity prices rather than to gas prices. This has adversely affected particular groups (those with electric heating, who are often fuel poor) and had a distortionary effect by undermining the case for electrification, which should play a major role in meeting the Sixth Carbon Budget both in homes and in industry.

There is growing consensus on the need to tackle the imbalance between electricity and gas prices. For example:

- Public First, supported by five major energy companies, produced an assessment of policy options for energy bill reform that would remove the running cost disincentive on electrified heating, while maintaining affordability of heating for average households across the country, not substantially increasing costs for the fuel poor and without putting an undue fiscal burden on public finances.<sup>9</sup> The 750,000 electrically-heated fuel poor households would benefit. Particular issues include how better to target fuel-poor households and impacts on people moving in and out of fuel poverty (fuel poverty 'churn'), who would be hit by a large bill increase under their proposals.
- In their Fourth Annual Report, the Committee on Fuel Poverty (CFP) recognised the adverse incentives under the current system, which discourage the necessary move away from gas or oil to electricity. The CFP's preference is that climate policy costs are not passed on to consumers via bills but rather recovered in income taxation. However, in the short term they support a shift of policy costs to gas bills, as long as measures are taken to protect fuel-poor households against any resulting bill increases.<sup>10</sup>

Reaching Net Zero will bring tangible benefits to people's lives that overwhelmingly outweigh the negatives. These benefits should be shared as widely as possible.

Alongside the benefits in mitigating climate change, and the potential for lower energy prices in the long term and economic benefits, there are additional benefits on the path to Net Zero. These include significant, tangible improvements to public health, the environment and biodiversity:

- Chapter 5 of the Sixth Carbon Budget set out in detail the range of co-impacts that are likely to arise from decarbonising our economy. The Committee appointed an expert advisory group on health to support our advice on the Sixth Carbon Budget, which concurred strongly with our previous assessment that climate action could bring significant benefits to health, including through healthier diets, more exercise and better air quality.

HM Treasury's Net Zero Review final report is now two years in the making and has many questions still to answer.

- We concluded in the Sixth Carbon budget that the positive co-impacts of reaching Net Zero overwhelmingly outweigh the negatives, especially if supported by the right policy decisions from the Government to maximise societal benefits and minimise the risks.

The final report of the Treasury's Net Zero Review, which was planned for Spring 2021, has been delayed and is now expected later this year – over two years since the Committee recommended it. We expect the Review to address many of the issues around who pays and who gains from a transition to Net Zero, including:

- Developing a plan for funding decarbonisation and reviewing the distribution of costs for businesses, households and the Exchequer. This should set out the main areas where action and funding will be required, the principles on which the distribution of costs should be determined and clarity over how costs will be allocated.
- Considering near-term as well as long-term decarbonisation funding needs and policy implications. One Government cannot make funding commitments that bind future Governments, but the review can set out principles to inform the scale and nature of long-term Government funding and make concrete proposals for action and funding over the next five to ten years, or at least be accompanied by a spending review or budget which does the same.
- Reforming price signals, including the potential to raise offsetting revenues by greater use of carbon taxes (e.g. for sectors like aviation that are currently under-taxed and where equity concerns are less present) and the need to rebalance policy costs between gas and electricity to ensure the take-up of low-carbon electricity solutions is not hindered.

For climate action to be effective, it must reduce global emissions, not just UK territorial emissions. Emissions reductions from UK industry must result from reduced UK consumption and from decarbonising the UK's own industries, rather than 'offshoring' production to other countries (i.e. 'carbon leakage'). It is vital therefore to consider competitiveness as part of the just transition.

Emissions can be reduced while maintaining competitiveness, but this will require policy to support UK industries.

Our advice on the Sixth Carbon Budget identified how emissions can be reduced while managing competitiveness. Government has also set out a vision of how this can be achieved, through strategies including the Industrial Decarbonisation Strategy. The Strategy stated that 'In the immediate future, government's preferred method for mitigating the risk of carbon leakage will continue to be free allocation of UK ETS emissions allowances, which will be decreasing throughout the 2020s.' The Government is consulting on the future of free allocation.

Going forward, we will monitor progress on the development of these policies and consider indicators to track progress on managing competitiveness. We will also consider how policies to manage competitiveness can be designed to reduce the embodied emissions of UK imports.

Managing the transition fairly will be an ongoing process and must continue beyond the publication of the final report of the Treasury's Net Zero Review. We will continue to monitor the Government's progress in delivering a transition that shares costs and benefits fairly across different groups. Our further work on this theme, in addition to tracking government progress, will depend on the findings of the Net Zero Review.

### Box 3.1

#### Findings of the interim report of HM Treasury's Net Zero Review

In May 2019 the Committee's Net Zero report recommended that the Treasury undertake a review of how the costs of achieving Net Zero emissions should be distributed and the benefits returned. The Treasury agreed to undertake the review and published its interim report in December 2020. Key findings of the interim report include:

- **Reaching Net Zero is essential for long-term prosperity.** Global action to limit greenhouse gas emissions is needed to avoid catastrophic climate change with almost unimaginable consequences for societies across the world. But this transformation will also create opportunities for the UK economy, like new industries and jobs that emerge as existing sectors decarbonise or give way to low-carbon equivalents.
- **The effect of UK and global climate action on UK economic growth is likely to be relatively small.** The scale, distribution and balance of new growth opportunities and challenges will depend on how the economy and policy respond to the changes required.
- **The costs of the transition to Net Zero are uncertain and depend on policy choices.** Investment requirements to reach Net Zero and impacts on operating costs are affected by a range of factors which are subject to significant uncertainty (e.g. the precise path of the transition, changes in behaviour and the rate at which technology costs fall and efficiency gains are made).
- **Government needs to use a mix of policy levers to address multiple market failures and support decarbonisation.** Government policy should seek to target market failures directly where possible, subject to distributional and international competitiveness impacts. Carbon pricing is an important lever in addressing the negative externality problem but should be supplemented by other policies.
- **Well-designed policy can reduce costs and risk for investors, support innovation and the deployment of new technologies.** A clear policy framework setting out the government's approach at different levels of technological development can help address uncertainties. Where uncertainty is at its greatest, government may need to provide more direct support.
- **The risk of carbon leakage will increase with efforts to reduce emissions.** Changes required for the transition could lead to carbon leakage if policies achieve their goal of lowering emissions in one jurisdiction but inadvertently increase emissions elsewhere. The size of the risk depends on each sector's costs of decarbonising, their trade exposure and international policies. The government has a number of ways to seek to mitigate this risk, including through its climate diplomacy and the design of policies to support the transition.
- **Government needs to consider household exposure to the transition through their consumption, labour market participation and asset holdings in designing policies.** Different types of household will have different levels of exposure to the transition. Where costs fall will depend on a range of factors, including the cost of decarbonising each sector, the availability of alternative low-carbon products and the distribution of new green jobs in the economy. Government will need to be mindful of these issues as they consider the best way to design policy to support the transition.

## d) Just Transition – workers and skills

There is a transition risk to employment, as high-carbon activity declines and new low-carbon industries are created.

A strategy is needed to ensure a just transition for workers.

The transition to Net Zero will need more of some jobs and fewer of others. There is no reason to think that the total number of jobs should be any lower than in a high-carbon world – a recent report by the Confederation of British Industry set out the potential for the transition to Net Zero to create 240,000 new green jobs by 2030 across the UK,<sup>11</sup> and the International Energy Agency's Roadmap for the Global Energy Sector results in 14 million jobs created globally by 2030.<sup>12</sup> But the shift in jobs from some areas to others brings a significant transition risk.

The transition will affect the whole of the UK, with impacts differing across regions, sectors and workers. Risks of negative localised impacts must be a particular focus for policy. The deindustrialisation that has occurred in the UK to date has already left some regions disproportionately worse off, with previous efforts in the UK to transition workers in declining industries to new jobs achieving limited success.<sup>13</sup> A strategy for the just transition is required to ensure no group is left behind.

Key developments over the last year include publication of the final report of the Scottish Just Transition Commission, establishment of the Green Jobs Taskforce and the Government's plans for a Skills and Post-16 Education Bill:

- The Scottish Just Transition Commission published its final report in March 2021.<sup>14</sup> The report acknowledged that transitioning to Net Zero means a fundamental transformation of the nation's economy, which offers great opportunities, but must be implemented fairly. It made 24 recommendations to ensure the transition is made "by the people of Scotland, not done to the people of Scotland", including four practical recommendations to equip people with the skills and education they need to transition to Net Zero:
  - A flexible and accessible skills and education system.
  - A skills guarantee for workers in carbon-intensive sectors.
  - Support for small and medium enterprises to invest in their workforces.
  - Equipping farmers and land managers with the skills, training and advice they need.
- The Green Jobs Taskforce was convened by BEIS to focus on both immediate and longer-term challenges of delivering skilled workers for the transition to Net Zero. It will produce a Green Jobs Action Plan with solutions and recommendations. These documents had not been published as this year's Progress Report was being finalised and its recommendations were not considered as part of our assessment of progress.
- The 2021 Queen's Speech set out plans for the Government's Lifetime Skills Guarantee, which will offer adults loans to retrain in later life and help them "to gain in-demand skills and open up further job opportunities", as part of the Skills and Post-16 Education Bill. The Bill will also aim to realign the education system around the needs of employers to fill skills gaps in sectors including construction, digital, clean energy and manufacturing.<sup>15</sup>

We will continue our work in this area, drawing on existing external research and analysis and identifying knowledge gaps which the Committee could help to fill.

We will draw on the pathways we developed for the Sixth Carbon Budget and consider in particular the implications for employment and skills policy, and consider what indicators could be used to track success in ensuring a just transition.

### e) Other key drivers of progress

We will continue to develop our understanding of what progress towards Net Zero looks like for businesses, the financial system, UK innovation, carbon pricing, international engagement, and more.

Further enabling actions will be required to meet Net Zero. The Committee's future work on cross-cutting areas will build on previous reports and explore new areas. As with policy development more generally (see Chapter 4), there has been progress in these areas in the last year.

- **Business action.** While the UK government must set the frameworks for the transition and citizens must make low-carbon choices, the private sector must invest and transform their business models. This will often be driven and supported by the third sector. Increasingly, businesses are delivering on these ambitions, by procuring low-carbon electricity, switching to electric vehicles and decarbonising their own operations. Our future work will aim to help businesses make informed decisions that are in line with Net Zero (see Box 3.2) and track how corporate commitments are progressing in the UK. Key developments in the past year include:
  - The UK had the largest share of companies (94 out of 300) in the Financial Times' Europe's Climate Leaders list of companies that have achieved the greatest reduction in greenhouse gas (GHG) emissions intensity\* since 2014.<sup>16</sup>
  - The BSI Net Zero Barometer found that 7 out of 10 businesses in the UK have made or are considering making a commitment to Net Zero, but the vast majority (82%) require more guidance if they are to achieve the target, with cost cited as the biggest barrier.<sup>17</sup>
  - Nearly one in three FTSE100 companies have signed up to the UN's Race to Zero campaign.<sup>18</sup> Small and micro businesses are now also being encouraged to commit to cutting their emissions (in half by 2030 and to Net Zero by 2050 or sooner) through the Together for our Planet campaign and newly-established UK Business Climate Hub.
  - The Government has established a Net Zero Business Champion with direct responsibility to support as many UK businesses as possible to commit to net-zero emissions targets.

**Investment and finance.** The Committee's Expert Advisory Group on Net Zero finance concluded that the investment programme required for the Sixth Carbon Budget is deliverable, but that delivering at the lowest overall cost is dependent on policy in both the 'real' and 'financial' economies. The Group highlighted the need for a regular assessment of investment needs and financial flows for climate action in the UK. Such an assessment would consider the level and sufficiency of capital investment flows made by households, firms and public authorities to achieve the UK's climate goals of Net Zero, adaptation and a just transition. It would also aim to assess the overall alignment of the UK's stock of financial assets with the Paris Agreement and for Net Zero and resilience at both a UK and global scale. Key recent developments in low-carbon finance include:

\* This ranking covers only Scope 1 and Scope 2 emissions, and does not cover Scope 3 emissions from companies' supply chains and the end-use of their products and services.

- London remained top of the Global Green Finance Index (GGFI).<sup>19</sup> The index ranks cities based on the quality and depth of their green finance offerings, capabilities and mechanisms. Ratings rose in almost all centres globally, but Western Europe continues to be the most mature market, accounting for nine of the top 10 and 12 places across the respective rankings.
  - From May 2019 to May 2021, the UK climbed from eight to fourth in EY's rankings for international attractiveness of renewable energy investment and deployment opportunities.<sup>20</sup>
  - The UK has announced its intention to make Task Force on Climate-related Financial Disclosures (TCFD) aligned disclosures mandatory across the economy by 2025, with a significant portion of mandatory requirements in place by 2023.
  - The UK Government announced at least £15 billion of 'green gilts' sovereign bonds for this financial year, and the Bank of England's climate change stress test will be published in June 2021.
  - The remits of the Bank of England's Monetary Policy Committee (MPC) and Financial Policy Committee (FPC) were updated to reflect the Government's economic strategy to achieve economic growth that is consistent with Net Zero.
  - The Prime Minister's Finance Adviser for COP26 has published a Private Finance Strategy for climate change.
- **Innovation and infrastructure** have played a critical role in driving down the costs and improving the efficiencies of the low-carbon technologies we use today. Sustained support for innovation – at all stages of the technology life cycle, including deployment – can ensure costs and efficiencies continue to improve in the future. Scaling up low-carbon technologies will rely on new infrastructure (e.g. electric vehicle charging points, electricity network upgrades and new CO<sub>2</sub> storage and hydrogen networks). This must be reflected in infrastructure decisions in the 2020s and be resilient to a changing climate. Monitoring progress will involve tracking technology costs and uptake, funding available for Net Zero research and innovation, as well as whether the necessary infrastructure is being built. Key recent developments include:
    - HM Treasury confirmed a new Net Zero Innovation Portfolio (NZIP) with funding totalling £1 billion. Funding will be allocated on a competitive basis to sectors including long-duration energy storage; floating offshore wind; biomass and regenerative agriculture.
    - Progress has been made on plans and funding for infrastructure, including the National Infrastructure Strategy, Plan for Growth, and the establishment of the UK Infrastructure Bank.
  - **Cross-economy carbon pricing and obligations.** To incentivise the transition to Net Zero, prices will need to reflect carbon content sufficiently to favour low-carbon options over high-carbon options. That can be achieved through explicit carbon pricing or other financial levers, although these will not be sufficient by themselves and must be backed up by other policy. In principle, all sectors of the economy could be exposed to carbon pricing, although care must be taken in managing impacts when doing so.

Monitoring the impact of carbon pricing will involve tracking the price of emitting (or removing) carbon in the UK, the scope of emissions that is covered by such a scheme, and the impact it is having on real-world decisions. The UK Emissions Trading System (UK ETS) launched at the start of the year. The Government has committed to consulting by September 2021 on a cap for the UK ETS consistent with the Sixth Carbon Budget.

- **International / engagement with other 'Climate Councils' worldwide.** The Committee is working with over 20 other climate councils from around the world to share knowledge and insights, recognising the significant common ground and importance of independent, evidence-led advice in implementing the Paris Agreement. This is being taken forward as a formal international network with events planned around the COP and in future years.

### Box 3.2

#### The role of business in delivering the Sixth Carbon Budget

Corporate action is already driving significant change across the UK and internationally, and accelerating this action will enable the policy, technological, behavioural, and business model changes needed for a zero-carbon society. Yet many businesses within the UK are increasingly looking for information and a better understanding of the future context in which they will operate.

Alongside our advice on the Sixth Carbon Budget we developed a briefing note on how businesses in the UK can act to support the UK's transition to Net Zero. This suggests the following principles to guide business ambition in the UK:

- **Do the basics well – measure, disclose, target, act, adjust.** Companies should account for, and take action on, all emissions they are responsible for and be transparent about their objectives to reduce emissions, and how they plan to do it.
- **Adopt the highest possible ambition,** acknowledging that some, particularly large, businesses may be able to achieve Net Zero earlier than the UK's national objective.
- **Address all emissions, and go beyond.** In particular companies should look at the emissions that occur in their supply chains ('Scope 3' emissions), and go beyond this. In particular we identify two areas to advance progress:
  - Companies can lead the transition to electric vehicles in the UK, and should switch their vehicle fleets to EVs over the 2020s
  - Companies should ensure corporate renewables procurement pays for new low-carbon electricity to be installed, rather than just purchasing existing renewables.
- **Ensure Climate Change is addressed at the highest levels** of corporate leadership, including ensuring climate action is given board level and CEO responsibility.
- **Minimise offsets, phase them out, and ensure only permanent emissions removals remain,** in line with our recommendations around how the UK should meet its national carbon budgets.

Source: CCC (2020) *The role of business in delivering the UK's Net Zero ambition*.

### 3. Underlying progress by sector

This section assesses underlying progress by sector, showing changes in the 'key metrics' that could be used to track progress against our recommended pathway to Net Zero and discussing broader underlying developments that are likely to affect technology deployment, changes in individual and business behaviours, and ultimately UK emissions in future years.

These key metrics are not yet a full indicator framework, but many of these metrics will continue into future progress reports.

#### a) Surface transport (113 MtCO<sub>2e</sub>, 23% of UK emissions in 2019)

Surface transport remains the UK's highest-emitting sector. Delivery of the Balanced Net Zero Pathway ('CCC pathway') from our 2020 Sixth Carbon Budget Report will require substantial progress over the coming years:

During the 2020s, we need to see rapid uptake of EVs, supported by widespread deployment of charging infrastructure.

- Rapid ramp-up of sales of fully electric cars and vans through the 2020s, reaching almost 50% of all new sales by 2025 and 100% by 2030.
- This will need to be supported by the deployment of almost 280,000 public charge points across the country by 2030.
- Trials of zero-emission HGVs to commence in the early 2020s, alongside logistics and efficiency improvements for existing HGV fleets.
- Investment in high-quality public transport and active travel infrastructure, to support a 6% reduction in demand for car travel by 2030 relative to baseline forecasts.

Government needs to invest in attractive alternatives to car travel, to reduce the use of high-carbon transport.

Key surface transport indicators cover emissions intensity, new vehicle efficiency, electric vehicle (EV) take-up, biofuels and travel demand (Table 3.1).

**Table 3.1**

Key metrics for surface transport in the CCC Pathway to meet the Sixth Carbon Budget

Metric		Latest Indicator			Milestones in the CCC pathway				
		Year	Annual change	Value	2025	2030	2035	2050	Trend
Intensity	BEV car registrations (thousands)	2020	+184%	108	1,290	2,750	2,960	3,360	
	Market share (%)	2020		6.5%	48%	97%	100%	100%	
	PHEV car registrations (thousands)	2020	+92%	67	698	0	0	0	
	Market share (%)	2020		4.1%	26%	0%	0%	0%	
	Electric van registrations (thousands)	2020	+64%	6	237	439	460	502	
	Market share (%)	2020		2.0%	56%	99%	100%	100%	
	New car CO <sub>2</sub> emissions (gCO <sub>2</sub> /km)	2020	-12%	113.0	51.4	3.3	0.0	0.0	
	New van CO <sub>2</sub> emissions (gCO <sub>2</sub> /km)	2020	-2%	163.0	74.7	0.1	0.0	0.0	
	HGV emissions intensity (gCO <sub>2</sub> /km)	2020	-12%	592.0	537.0	450.0	246.0	8.1	
	Biofuel uptake (% fuel sales by energy)	2020	+16%	4.7%	4.2%	4.7%	6.3%	17.0%	
Demand	Car-km per driver (km)	2020	-25%	10,000	12,500	12,300	12,100	11,100	
	Car distance driven (billion kms)	2020	-25%	351	441	453	466	483	
	Van distance driven (billion kms)	2020	-9%	84	92	99	107	122	
	HGV distance driven (billion kms)	2020	-6%	28	26	25	26	28	

Source: DfT, SMMT and HMRC (2021); CCC analysis

 Notes: 1. New car CO<sub>2</sub> figures are calculated on an NEDC test-cycle basis, to enable comparison with previous years. 2. While indicators that are calculated using travel demand (car-km per driver, car distance driven, van distance driven and HGV distance driven) currently look on track to meet or ahead of CCC Pathway milestones, it is important to note that travel demand in 2020 was significantly lower compared to previous years as a result of COVID-19.

Sales of EVs and the deployment of supporting charging infrastructure have increased considerably in recent years. This will need to accelerate throughout the 2020s. However, there are also concerning trends, notably the rapid growth in car and van travel during the past decade.

EV sales rose to record levels during 2020. Manufacturers are increasingly scaling up their EV offerings.

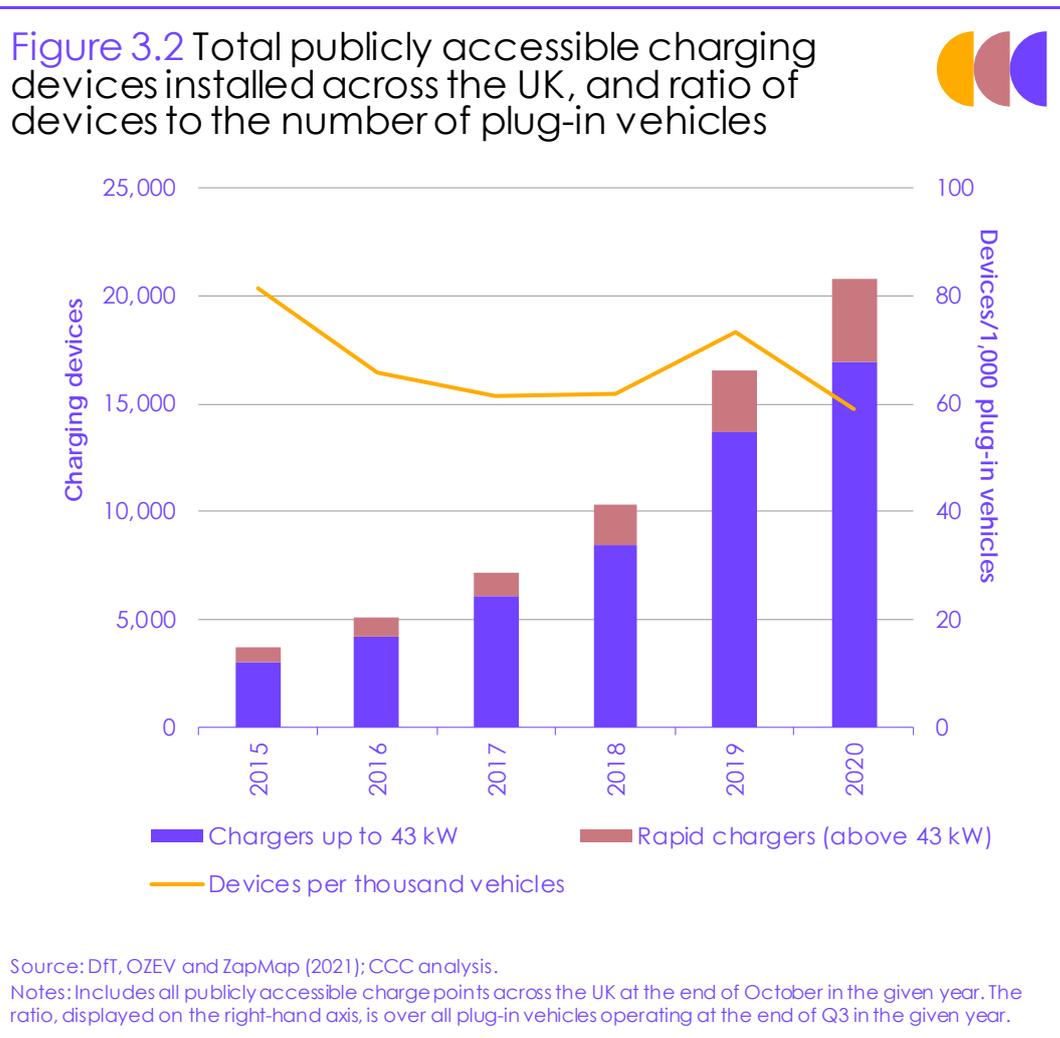

- While total car sales fell 30% in 2020, sales of EVs more than doubled, to 175,000 vehicles or 10.6% of all new car sales (Figure 3.1). There has also been a shift towards battery-electric vehicles (BEVs) from plug-in hybrids (PHEVs) – BEVs now represent over 60% of EV sales, from around 50% in 2019.
  - Manufacturers are increasingly scaling up their EV offerings. There are now around 45 BEV car models on the market, with at least a further 3 expected over the remainder of 2021.
  - Advancing EV technologies are lengthening driving ranges and cutting prices.<sup>21</sup> Research shows that battery prices have fallen by 13% from 2019 to 2020<sup>22</sup>, and popular EV manufacturers<sup>23</sup> have been reducing prices in 2021.
  - Evidence<sup>24</sup> suggests consumers are giving increasing consideration to environmental issues as part of their purchasing decisions.

**Figure 3.1** Number of UK new electric car sales and market share of total car sales

There are now over 20,000 public EV chargers in the UK. Deployment needs to continue to accelerate to make charging readily available across all areas of the country.

- The UK's public charge point network is expanding quickly (Figure 3.2), and there are now 20,800 public EV charge points across the UK, up from 16,500 at the end of 2019.<sup>25</sup> This provision is inconsistent across the country. On a per-capita basis, charge points in England and Northern Ireland are lower than in Scotland and Wales. A disproportionate share of public charge points in England are located in London and other urban areas in the South East.

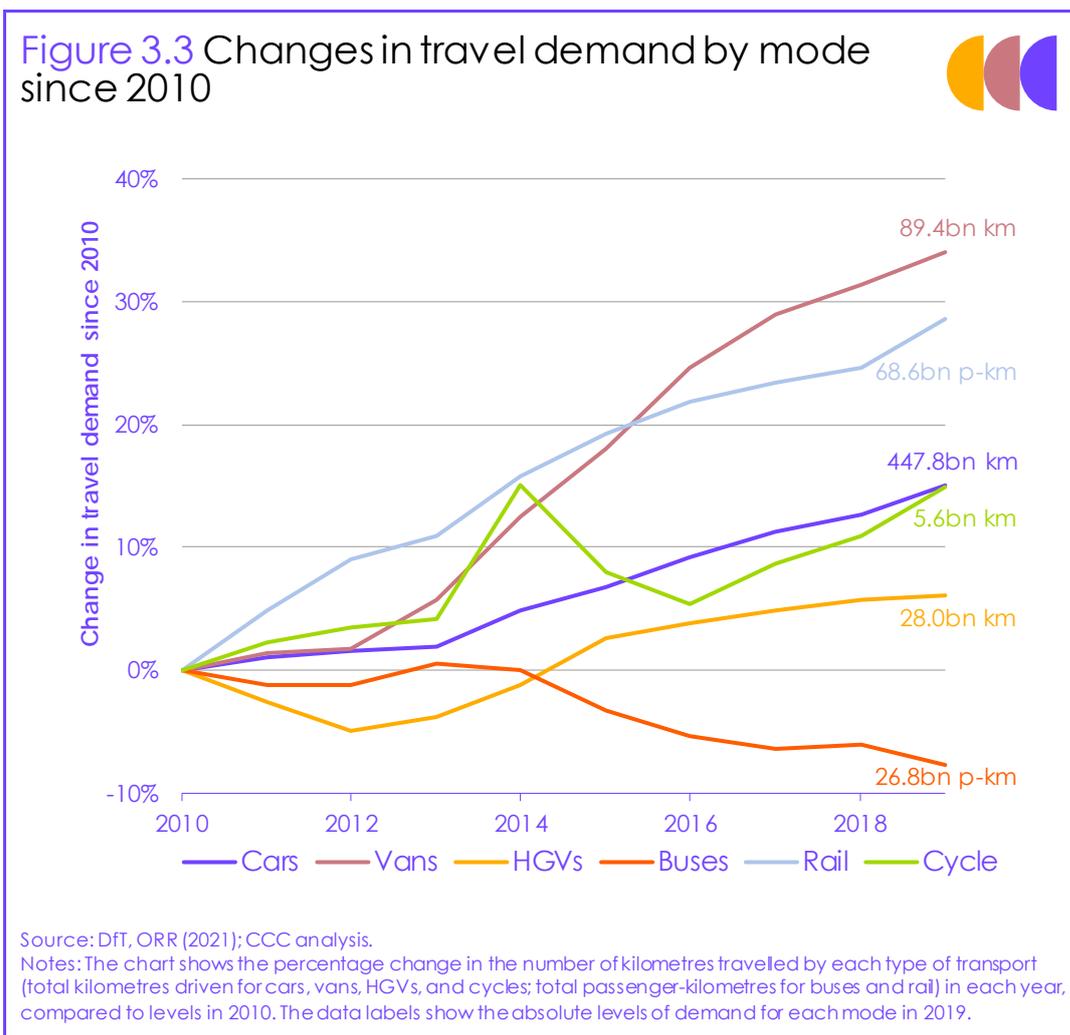

New car CO<sub>2</sub> intensities have risen in recent years, driven by the high proportion of large SUVs purchased.

- Between 2007 and 2016, the average CO<sub>2</sub> emissions of a new car decreased by 27%. This trend reversed between 2017 and 2019, mainly due to increasing sales of higher emitting SUVs. Efficiency improved again in 2020 by 12%<sup>26</sup>, but this was almost entirely due to record sales of electric vehicles (EVs). The high proportion of SUVs, representing one in four new car sales, remains a concern.

Demand for road transport has continually grown year-on-year in recent decades. This is partly due to the falling real-terms cost of driving.

- Road transport demand has risen markedly over the past decade\*, which continued with a 2% increase in 2019 (Figure 3.3). The falling real cost of driving, a large increase in van travel (due in part to the growth in online shopping<sup>27</sup>) and slower growth in HGV demand are key contributors.
  - Over the past decade, the average cost of driving has risen by less than average wages and the cost of living, whereas rail and bus fares have increased more steeply.<sup>28</sup> A recent study<sup>29</sup> linked the freeze in fuel duty since 2011 to a 4% increase in traffic levels, 60 million fewer rail journeys, 200 million fewer bus journeys and 4.5 MtCO<sub>2</sub> of emissions in 2017.
  - From 2021 to 2022, rail fares will increase by the Retail Price Index (RPI) plus 1%, a 2.6% rise.<sup>30</sup> In contrast, the long-haul rates of Air Passenger Duty will increase in line with RPI and short-haul rates will not rise.<sup>31</sup>

The Committee intends to continue tracking these key indicators of EV uptake, charging infrastructure deployment, vehicle efficiency and travel demand by mode, for the Sixth Carbon Budget pathway, in future progress reports. We will also explore opportunities to monitor other key enablers of the transition, including public attitudes to various modes of travel, the scaling-up of EV supply chains and the availability of safe, reliable and attractive alternatives to car travel.

\* The reductions in travel demand seen in 2020 were due to the impacts of the COVID-19 pandemic, and not reflective of the underlying trends observed over recent years.

## b) Buildings (88 MtCO<sub>2</sub>e, 18% of UK emissions in 2019)

The path to Net Zero set out in our advice on the Sixth Carbon Budget sees substantial near-term growth in the deployment of energy efficiency measures and heat pumps as two of four priority areas over the next decade, alongside roll-out of low-carbon heat networks and hydrogen trials. We should not delay on heat pumps or low-carbon heat networks as viable solutions for most of the country – hydrogen can be part of the mix but has not yet been proven at scale and should not be a cause to delay other options.

Substantial near-term growth is needed in the deployment of energy efficiency measures and heat pumps, but delivery rates have continued to stagnate.

Despite this, progress in upgrading the building stock with the necessary measures over the last decade has been very poor. Underlying delivery rates continued to stagnate, with a small improvement in heat pump delivery rates driven by retrofit installations under the Renewable Heat Incentive (RHI) (Table 3.2).<sup>32</sup>

**Table 3.2**  
Key metrics for buildings in the CCC Pathway to meet the Sixth Carbon Budget

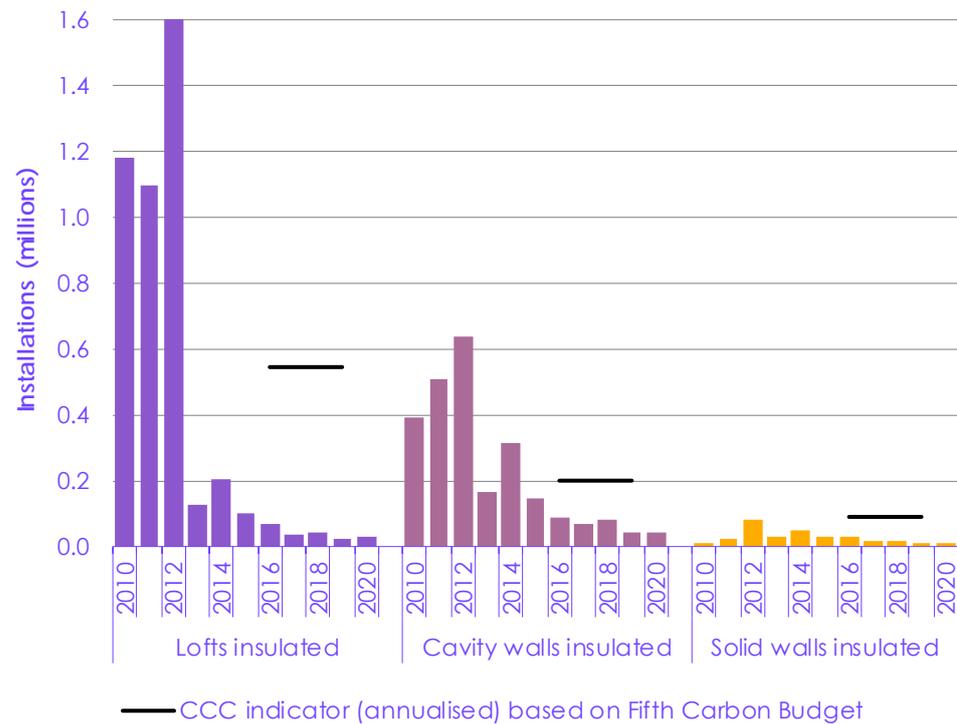

Metric	Latest Indicator			Milestones in the CCC pathway				
	Year	Annual change	Value	2025	2030	2035	2050	Trend
Heat pump installations (thousand per year)	2020	9%	36	415	1,075	1,435	1,525	
Lofts insulated (thousand per year)	2020	26%	32	710	675	200	0	
Cavity walls insulated (thousand per year)	2020	-3%	40	215	175	55	0	
Solid walls insulated (thousand per year)	2020	-22%	10	255	245	45	0	

Source: CCC analysis; BSRIA (2021) *Heat pumps market analysis 2020: United Kingdom*, BSRIA *World Market Intelligence*; BEIS (2021) *Household Energy Efficiency Statistics: Headline Tables*.

Notes: Our scenarios deploy the majority of domestic energy efficiency measures in the 2020s, given the carbon, bill and health benefits, and the need to prepare the stock for widespread low-carbon heat uptake in the 2030s. For this reason, in-year energy efficiency deployment declines in later years relative to deployment levels in the coming decade. Out-turn data for heat pump installations may include some installations which serve multiple dwellings, slightly underestimating the number of homes heated by heat pumps relative to the milestones.

Insulation rates remain well below the peak market delivery achieved up to 2012 (the point at which the Carbon Emissions Reduction Target and the Community Energy Saving Programme ended), which illustrate the growth potential where an effective policy package is in place (Figure 3.4).

**Figure 3.4** Home insulation rates by measure and year

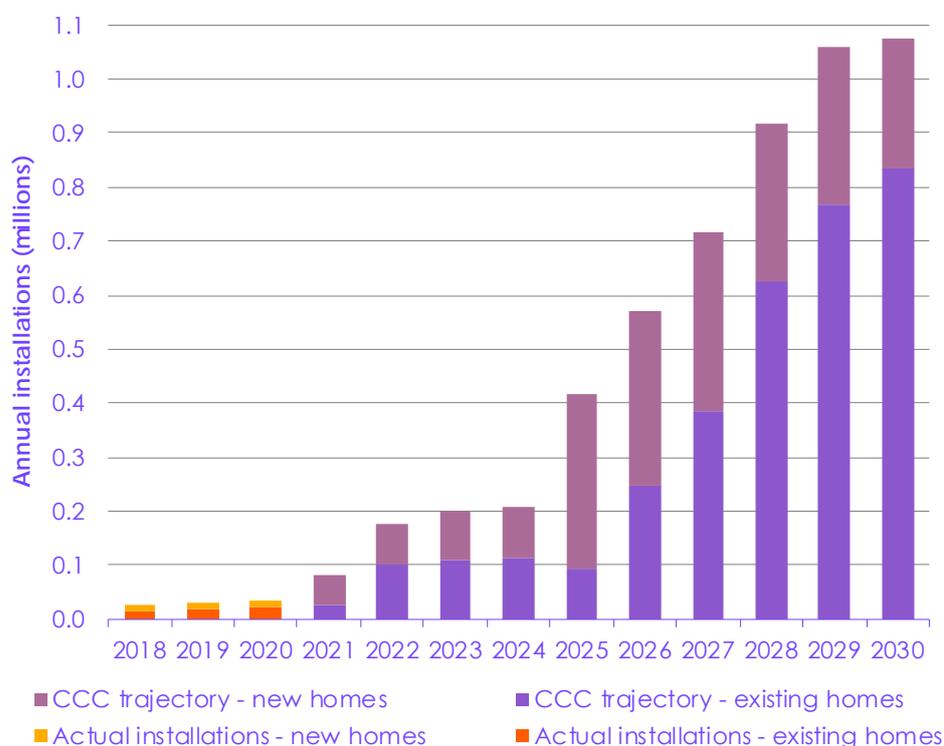

Source: DECC (2014) *Data tables: Green Deal, ECO and Insulation Levels, up to March 2014*, *Green Deal, Energy Company Obligation (ECO) and Insulation Levels in Great Britain*; BEIS (2021) *Household Energy Efficiency Statistics: Headline Tables*; CCC analysis.

Notes: The CCC indicator shown represents the annualised rates of installation based on the Committee's 2015 advice on the Fifth Carbon Budget, which we judged to be a realistic and appropriate annualised installation rate at that time.

Annual heat pump installations in homes rose slightly from 33,000 in 2019 to 36,000 in 2020, driven mainly by an increase in retrofit installations to just under 23,000. This remains significantly below the rates needed over the next few years, which require just over 400,000 heat pump installations per year by 2025, rising to just over 900,000 per year by 2028 (Figure 3.5). These deployment rates remain a fraction of current annual boiler sales of around 1.8 million per year. Deployment in non-domestic buildings also remains very limited, with installations (for systems <50 kW) currently running at less than 1000 per year.

Figure 3.5 Current heat pump installation rates in homes set against the CCC's Balanced Pathway

Source: CCC analysis; BSRIA (2021) *Heat pumps market analysis 2020: United Kingdom*, BSRIA World Market Intelligence.

We will be developing a new indicator framework over the coming year. There is a need for public statistics to evolve to better support monitoring of the low-carbon transition.

We are developing a new indicator framework over the coming year, consistent with the path to Net Zero and the Sixth Carbon Budget:

- We will continue to monitor key areas including heat pump sales and insulation installations alongside biomethane injection. There is substantial scope for publicly available statistics here to be improved to consolidate data on the quantity and nature of UK heat pump and insulation installations, including those outside of government schemes.
- In two key areas there are no annual public statistics: on low-carbon heat networks and on insulation rates in public and commercial buildings. Government should prioritise annual reporting on total heat delivered through heat networks, split by heating technology. We will set out our indicators for public and commercial buildings next year.
- We will also be considering what new indicators may be appropriate, for instance on consumer attitudes, building performance, measures to address overheating and ventilation, building level flexibility, supply chain development and skills.

- Finally, we will put in place a set of policy milestones which factor in Government ambition in the forthcoming Heat and Buildings Strategy, Net Zero Strategy, Hydrogen Strategy, buildings regulations and heat networks policy developments, along with the key phase-out dates from the Sixth Carbon Budget.

### c) Manufacturing and construction (65 MtCO<sub>2e</sub>, 13% of UK emissions in 2019)

The recommended pathway set out in our advice on the Sixth Carbon Budget sees emissions from manufacturing and construction reduce by 43% by 2030 and 71% by 2035 from 2018 levels.

The path to Net Zero set out in our advice on the Sixth Carbon Budget sees emissions from manufacturing and construction reduce by 43% by 2030 and 71% by 2035 from 2018 levels, through improved resource and energy efficiency, material substitution, fuel switching and CCS, as set out in Table 3.3 and Figure 3.6. In addition, supply chains scale up at pace in the pathway, more workers acquire skills to implement low-carbon measures, and the availability of finance increases. The Government's Industrial Decarbonisation Strategy set out a similar pathway, with slightly lower ambition due to lower levels of electrification (see Chapter 4).

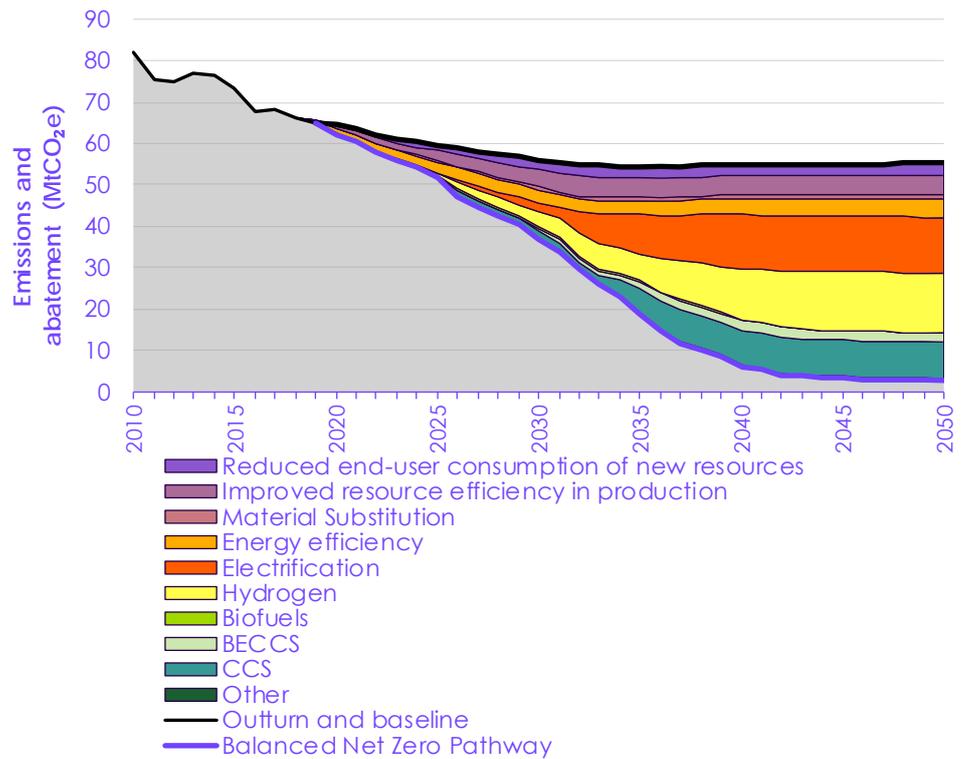

**Table 3.3**

Key metrics for manufacturing and construction in the CCC Pathway to meet the Sixth Carbon Budget

Metric		Latest indicator			Milestones in the CCC pathway				
		Year	Annual change	Value	2025	2030	2035	2050	Trend
Efficiency	Increase in longevity of electronics vs 2019	2019	-	0%	30%	80%	120%	120%	
Electrification, hydrogen and carbon capture and storage	Manufacturing energy use from electricity or hydrogen	2019	+2% points (+8%)	27%	27%	37%	52%	76%	
	CCS in manufacturing (MtCO <sub>2</sub> )	2020	-	0	0.2	2	6	9	

Source: CCC analysis; BEIS (2020) *Digest of UK Energy Statistics (DUKES) 2020*

**Figure 3.6** Source of abatement in the CCC Pathway for the manufacturing and construction sector

Source: CCC analysis, BEIS (2020) *Provisional UK greenhouse gas emissions national statistics 2019*.  
 Notes: The abatement from BECCS in this graph does not include the carbon captured, which is accounted for in the removals subsection of Chapter 3.

Tracking progress against our pathway for manufacturing and construction is currently challenging because of a lack of data, which in some cases is because the technologies or approaches are still at an early stage of deployment.

The limited current data indicate that energy efficiency in manufacturing may have improved and there are examples of early developments with fuel switching and CCS.

The limited current data indicate that energy efficiency in manufacturing may have improved, and there are examples of early developments with fuel switching and CCS.

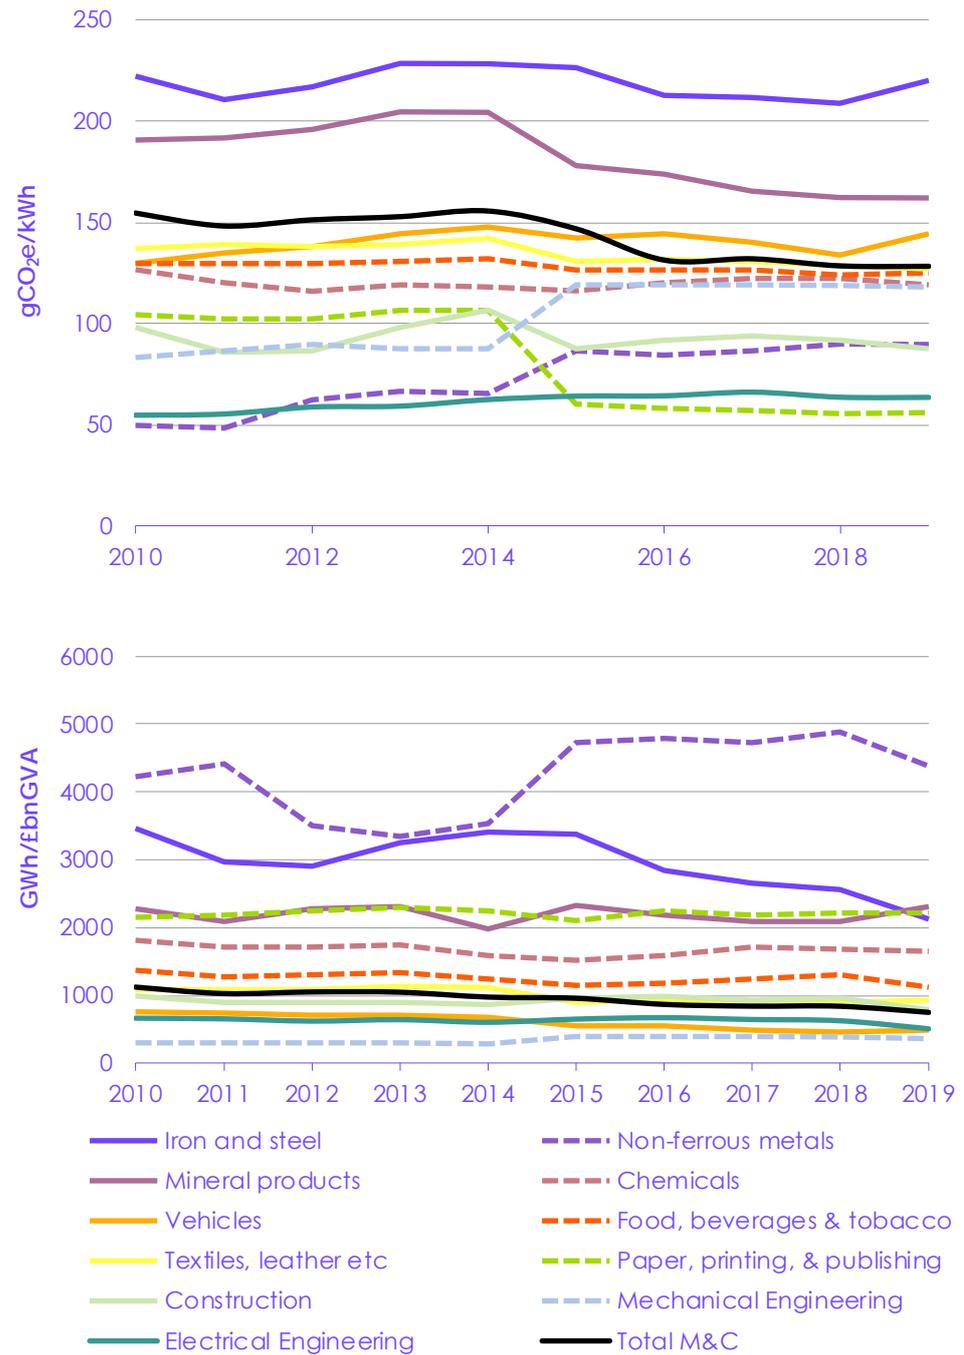

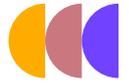

- The energy intensity of manufacturing output fell from 1,120 GWh/£bnGVA in 2010 to 837 GWh/£bnGVA in 2018 and further to 747 GWh/£bnGVA in 2019. However, this partly reflects shifts of GVA from more-energy-intensive subsectors to less-energy-intensive subsectors rather than energy efficiency improvements. At a subsector level (Figure 3.7), energy intensity of manufacturing output has fallen in the 2010-19 period in seven subsectors but risen in four. Within these sectors, this could still reflect shifts from higher-energy-intensity operations to lower-energy-intensity operations, rather than energy efficiency – the available data are not clear.
- However, Government estimate that existing energy efficiency policies<sup>33</sup> in industry have led to abatement of at least 1.1 MtCO<sub>2</sub>e in 2019, up from 0.9 MtCO<sub>2</sub>e in 2018, according to BEIS Energy and Emissions Projections.<sup>34</sup>

- The UK's household recycling rate has plateaued at 44% from 2012 to 2018, indicating that progress on this aspect of resource efficiency has stalled. It will be important for recycling rates to rise to at least 68% by 2030, together with actions to reduce material inputs and increase product longevity, reuse and sharing in order for resource efficiency to contribute fully to achieving the emissions reductions necessary for the Sixth Carbon Budget.
- The carbon intensity of energy use in manufacturing has fallen more slowly than energy intensity, from 155 gCO<sub>2</sub>e/kWh in 2010 to 129 g/kWh in 2018, with no change between 2018 and 2019. The long-term reduction is a result of falling shares from coal and petroleum products, and rising relative contributions from natural gas, bioenergy and waste, and electricity. At a subsector level (Figure 3.7), the emissions intensity of energy in manufacturing has fallen in the 2010-19 period in six subsectors (including paper and pulp, mineral products, and textiles), but risen in five (including non-ferrous metals, construction and mechanical engineering).
- Fuel-switching pilots, such as a commercial-scale biodiesel trial for glass manufacturing, have begun under the Government's Industrial Fuel Switching competition, with the intention of assessing the merits of different low-carbon fuels. CCS pilots are supported under the Carbon Capture and Utilisation Demonstration competition. Some (low) levels of fuel switching for heating in manufacturing have also been supported by the Renewable Heat Incentive, which Government estimate to have contributed 1.9 MtCO<sub>2</sub>e of emissions abatement in 2019, up from 1.7 MtCO<sub>2</sub>e in 2018.<sup>35</sup> This abatement is largely due to uptake of bioenergy supported by the Renewable Heat Incentive.<sup>36</sup>
- The Renewable Transport Fuels Obligation incentivises fuel suppliers for transport and off-road mobile machinery to provide a certain level of biofuels – currently set at 9.75% in 2020 and increasing to 12.4% by 2032.

We will develop an indicator framework for the M&C sector and will monitor progress against this framework beginning with next year's Progress Report.

The Committee will develop an indicator framework based on available data for the manufacturing and construction sector and will monitor progress against this framework beginning with next year's Progress Report. The Government should seek to improve collection and reporting of relevant data to allow for progress to be monitored more effectively.

Figure 3.7 Energy intensity of GVA and direct emissions intensity of energy in manufacturing and construction: 2010 - 2019

Source: DUKES, ONS - GDP low-level aggregates; CCC Analysis

Notes: Unclassified and Other Industry are not shown. In the lower plot, only direct emissions are considered, i.e. not including emissions from electricity production or upstream fuel production.

## d) Agriculture and LULUCF (52 MtCO<sub>2</sub>e, 10% of UK emissions in 2020)

Reaching the Sixth Carbon Budget will mean taking action to reduce emissions on farms, removing emissions from the atmosphere using natural land sinks, shifting to lower-carbon diets and reducing food waste.

The path to meeting the Sixth Carbon Budget and the Net Zero target in 2050 requires a reduction in agricultural emissions of around 30% from 2019 to 2035, and a reversal of the land use sector from a net source currently to a net sink by the mid-2030s. Delivery will require substantial action over the coming years:

- A high take-up of farming practices and technologies to reduce non-CO<sub>2</sub> emissions from managing soils and livestock, and a switch away from fossil fuel use in agricultural machinery to low-carbon alternatives such as electricity.
- Sustainable improvements in agricultural productivity to deliver higher crop yields and increased livestock stocking rates on grassland.
- A significant release of land out of agricultural production (9% by 2035) to enable an acceleration in the planting of trees, hedges, energy crops and the restoration of degraded peatland, all of which can be achieved while delivering other essential functions of land, including maintaining food production and adapting to climate impacts. Other measures include sustainable management of existing broadleaf woodlands and lowland agricultural peat.
- A significant shift in behaviours by 2030, with 20% less meat and dairy consumed on average, and the volume of food waste falling by half.

Key land-based indicators cover agricultural and land use emissions, agricultural productivity, societal behaviour change, and land use change (Table 3.4)

**Table 3.4**

Key metrics for agriculture and LULUCF in the CCC Pathway to meet the Sixth Carbon Budget

Metric		Latest Indicator			Milestones in the CCC pathway				
		Year	Annual change	Value	2025	2030	2035	2050	Trend
Agriculture and land use - GHG emissions	Agriculture (MtCO <sub>2</sub> e)	2019	+1%	55.4	48.6	41.5	39.3	34.9	
	Land use, forestry and peat sector <sup>1</sup> (MtCO <sub>2</sub> e)	2019	+3%	12.9	10.4	6.5	0.9	-19	
Agricultural practices	Crop yields (wheat t/ha), equivalent increases for other crops	Average 2017-19	0	8.2	8.6	9.1	9.5	11.0	
	Livestock numbers <sup>2</sup> (million)	2019	-1%	48	46	41	39	35	
Demand reduction	Weekly meat consumption <sup>3</sup> (g/person) (includes fresh and processed meat)	2020	0	1,045	950	840	800	680	
	Food waste (edible) (million tonnes)	2018	-	8.0	6.5	5.3	5.2	4.7	
Land use	Afforestation (000 hectares/year)	2019 / 2020	+1%	13.7	30	30	50	50	
	Energy crops (000 hectares/year) <sup>4</sup>	2018	0	10	6	27	30	30	
	Peat area restored (000 hectares/year) <sup>5</sup>	2020	-	8.5	67	67	67	9	
	Active broadleaf woodland management (%)	2020	0	20%	40%	80%	80%	80%	

Source: CCC analysis

Notes: 1. Land use net GHG emissions for 2019 is based on the high forestry peat estimate; 2. Covers cattle, sheep and pigs; 3. Per person. 2020 value is an estimate based on the average of the two previous years; 4. 2018 value is total area of SRC and miscanthus in England only; 5. Restoration in 2020 funded by the National Peatlands Action Programme, 2020 (Wales), the £10m Peat Capital Grant Scheme, 2019/20 (England) and Scottish Government funding, 2020.

Underlying progress to reduce emissions from agriculture and land is currently falling behind.

Underlying progress to meet our ambition remains short in most of these areas:

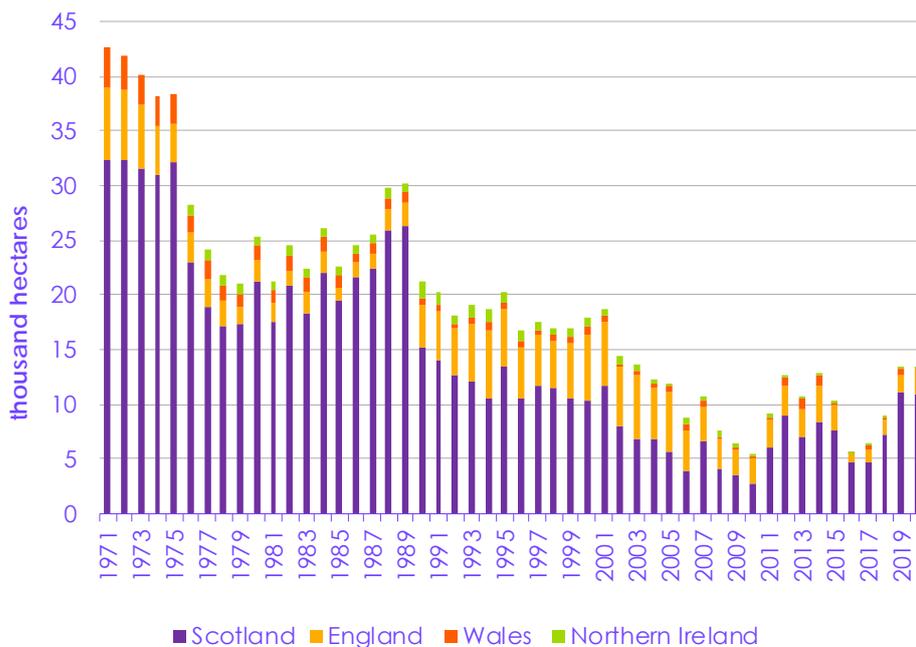

- Releasing land out of agriculture requires an improvement in agricultural productivity. Cereal crop yields have largely plateaued in the last two decades, but better agronomic practices coupled with advances in crop breeding are required to deliver sustainable yield increases. Increasing the utilisation of grassland area by grazing livestock from around 50% currently could allow for increases in stocking rates without impacting feed requirements (quantity and quality), thereby allowing some grassland area to switch to other uses.

- Current rates of UK afforestation of over 13,000 hectares/year in 2018/19 and 2019/20 remain well below the level required to meet the Government's commitment (as set out in the *England Tree Strategy consultation (2020)*), which matches the Sixth Carbon Budget recommendation of 30,000 hectares/year in 2025 (Figure 3.8).
- Peat restoration has been focused on the uplands to date, but meeting the Sixth Carbon Budget pathway will require both an acceleration in the levels of upland restoration to 50,000 hectares/year, and extending activity to lowland peat, which can emit ten times more emissions per hectare compared to the uplands. Options to sustainably manage the area of lowland peat that remains in agricultural production need to be developed.
- The area planted with perennial energy crops (miscanthus and short rotation coppice) totals 10,000 hectares (England only),<sup>37</sup> which has fallen by over a quarter since 2008. The planting of short rotation forestry for bioenergy is non-existent. Combined annual planting rates of all three biomass types need to ramp up to over 25,000 hectares by 2030.
- Take-up of on-farm practices to reduce soil, livestock and waste emissions needs to increase significantly; emissions in agriculture have remained flat for the last ten years. Agricultural survey data reveal more farmers are considering emissions when making decisions on land, with 64% reporting that it was 'very' or 'fairly' important in 2020,<sup>38</sup> increasing from the 49% surveyed in 2017. The same survey found that 66% of farmers were taking actions to reduce emissions, up from 56% in 2017.
- Decarbonising agricultural vehicles will require the market commercialisation of low-carbon solutions beyond the current use of biofuels, including electrification of large machinery (e.g. tractors), which is still at the proto-type stage.
- Official data show that consumption of meat and meat products rose 3% between 2015/16 and 2018/19.<sup>39</sup> There has been a reduction in fresh meat products, but this is more than offset by a rise in processed meat. More recent survey data suggests an increased willingness to eat less meat in the future, with 65% of over 2,000 people surveyed stating that more knowledge on how to plan and cook less meat dishes would help them to cut back.<sup>40</sup>
- Reducing food waste is resource efficient and could free up agricultural land for natural sequestration options. The Waste Reduction Action Programme (WRAP) announced last year that the UK was halfway to achieving the UN's Sustainable Development Goal 12.3 to cut post-farm gate food waste in half by 2030. As of September 2020, around 260 organisations, including 16 retailers and 162 producers/manufacturers had signed up to the Road Map.

The measures outlined above to meet the Sixth Carbon Budget pathway will deliver wider benefits to the natural environment critical to all other economic activity and human well-being. These include flood protection, improved air quality, health and recreation benefits of woodlands, water regulating services as well as improving the natural environment's ability to adapt to climate impacts.

Current levels of tree planting are well below where they need to be. The majority of all UK tree planting in the last five years has happened in Scotland.

Figure 3.8 UK Afforestation rates (1971-2020)

Source: Forestry Commission, Natural Resources Wales, Forest Service and Forestry Commission statistics.  
Notes: Planting year ends end March. Data not available for Northern Ireland from 1971-1975.

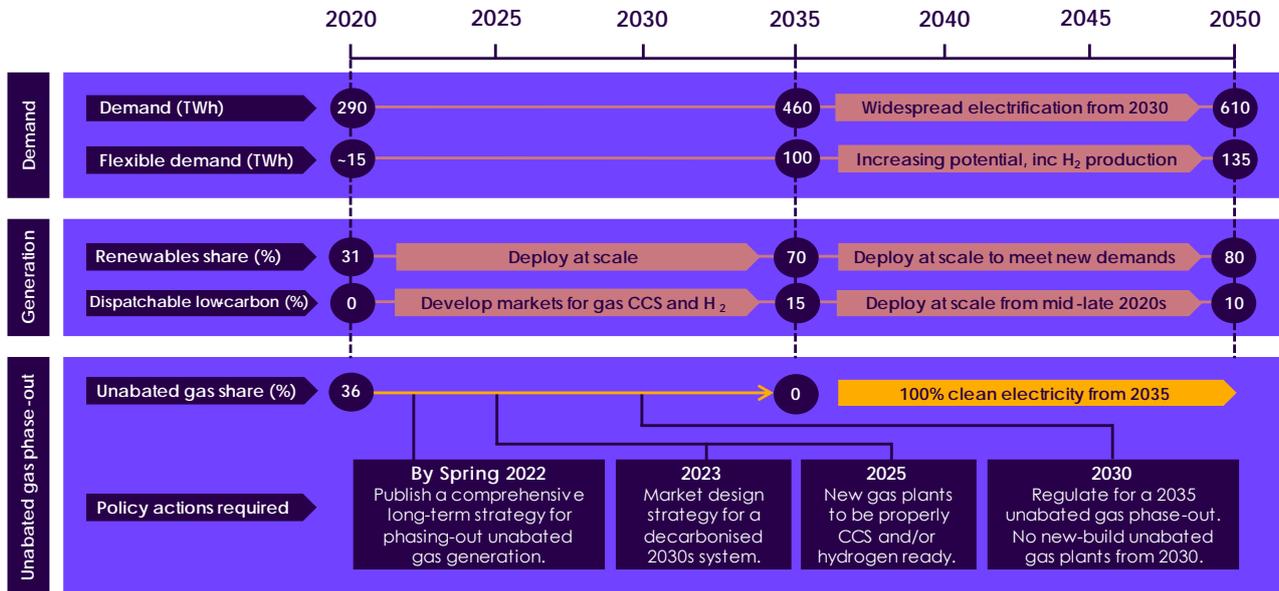

To allow the Committee to track progress against the Sixth Carbon Budget Pathway, we will be developing a comprehensive indicator framework for the agriculture and land use sectors to be included in next year's Progress Report. Key indicators that we will be developing include: agricultural emissions by source (e.g. soils, enteric fermentation) and GHG type; take-up of particular low-carbon farming practices and measures; planting rates of trees on-farm; peat restoration by type (e.g. lowland, upland and forestry); attitudes to diet change and reducing food waste; and the impact of non-financial barriers to changes in land.

## e) Electricity supply (52 MtCO<sub>2e</sub>, 10% of UK emissions in 2019)

Electricity generation should be fully decarbonised by 2035, to enable full benefits to be drawn from the widespread electrification that is needed for Net Zero.

Electricity generation should be fully decarbonised by 2035, while meeting a 50% increase in annual demand. This will require large-scale deployment of new low-carbon generating capacity that is resilient to a changing climate, phasing out unabated gas-fired generation, action on contracting models and on planning and consenting regimes, as well as ensuring networks are ready to accommodate new demands and generation (Figure 3.9).

Figure 3.9 Timeline of key outcomes and policy requirements for electricity generation under the CCC Pathway (2020-50)

Source: CCC (2020) *Policies for the Sixth Carbon Budget and Net Zero*.

Notes: Renewables share includes wind and solar. Dispatchable low-carbon generation includes gas CCS, BECCS, and hydrogen plants. Demand is lower than generation, accounting for losses, flexibility services, and interconnection.

The reductions seen in the power sector in the past five years reflect genuine underlying progress.

Power sector emissions fell by 15% in 2020, in line with the average rate over the preceding five years. That reflects an increase in the capacity and utilisation of low-carbon generation, together with lower demand due to the COVID-19 pandemic that reduced required fossil generation (Table 3.5):

- **Installed capacity of variable renewables** increased in 2020 by 0.8 GW. This is a much slower rate than the average of 3.8 GW achieved over the previous 5 years, although the slowdown is likely to be temporary.
  - Half of the increase in capacity was offshore wind increasing to 10.4 GW of operational capacity. The 0.4 GW increase compares to a minimum growth of 4 GW required per year from the mid-2020s onwards in order to meet the Government's target for 40 GW installed capacity in 2030.
  - This slowdown is likely to be temporary, given the pipeline of new offshore wind projects underway:
    - Offshore wind capacity under construction increased by 60% in 2020 to 7.2 GW, with a further 2.6 GW having secured Government contracts.

- 20 GW of capacity is in development and/or pre-planning.
- In February 2021 the Crown Estate auctioned seabed leases for an additional 8 GW of capacity.

Low-carbon generation increased 5% in 2020. Offshore wind generation increased by 26% due to particularly windy conditions early in the year.

- **Low-carbon generation** increased by 5% in 2020 compared to 2019, against a backdrop of lower overall demand due to COVID-19 restrictions.
  - The majority of that increase was accounted for by offshore wind generation, which rose by 26% due to particularly windy conditions early in the year.
  - As a result, low-carbon generation increased to 62% of total electricity generation in 2020, up from 57% in 2019. The share of variable renewables in total generation increased from 26% to 31%.

Fossil generation fell by 17% in 2020, as unabated gas was squeezed out by higher renewables output, lower demand, and the continued decline of coal.

- **Fossil generation** decreased by 17% in 2020, the largest annual percentage fall in the last 20 years. The reduction was primarily in gas-fired generation, but coal use also continued to decline.
  - Unabated gas generation fell by 17%, as it was squeezed out by a combination of increased renewables output and lower overall demand. As a result, unabated gas comprised 36% of the overall generation mix. This needs to continue to fall, to zero by the mid-2030s, in order to meet the Sixth Carbon Budget.
  - Coal generation fell by 21% in 2020, as further coal plants were closed at Aberthaw and Fiddlers Ferry. This meant coal-fired generation only comprised 2% of total generation in 2020, continuing the long-term decline towards the Government's target of phasing out coal use in the power sector by 2024.

Emissions intensity fell 10% in 2020, reflecting lower demand, higher renewables output and reduced fossil generation.

- **Grid intensity.** The combination of lower demand, increased renewables output, and reduced fossil generation meant the carbon intensity of electricity fell by 10% in 2020 to 182 gCO<sub>2</sub>/kWh. This needs to continue to fall substantially over the 2020s, to less than 50 gCO<sub>2</sub>/kWh in 2030 and around 10 gCO<sub>2</sub>/kWh in 2035.\*

\* Our recommendation is for a fully decarbonised electricity generation sector by 2035. That is consistent with a small positive emissions intensity, which reflects some residual emissions (e.g. from gas CCS) and that negative emissions from use of bioenergy with carbon capture and storage (BECCS) are accounted for separately.

**Table 3.5**

Key metrics for electricity supply in the CCC Pathway to meet the Sixth Carbon Budget

Metric	Latest Indicator			Milestones in the CCC pathway				
	Year	Annual change	Value	2025	2030	2035	2050	Trend
Grid intensity (gCO <sub>2</sub> /kWh)	2020	-20	182	125	45	10	2	
Offshore wind capacity (GW)	2020	+0.4 GW	10.4	25	40	50	95	
Variable renewable generation (%) *	2020	+5% points	31%	45%	55%	70%	80%	
Dispatchable low-carbon generation (%)**	2020	0	0	0	10%	15%	10%	
Unabated gas generation (%)	2020	-5% points	36%	30%	10%	0	0	

Source: CCC analysis based on BEIS (2021) *EnergyTrends*.

Notes: \*Wind and solar generation. \*\*Includes gas with carbon capture and storage, hydrogen and bioenergy with carbon capture and storage.

We will continue to track these milestones over the coming year, while developing additional indicators for assessing the use of flexibility on the demand-side (e.g. through heat pumps and electric vehicles).

### f) Aviation (40 MtCO<sub>2</sub>e, 8% of UK emissions in 2019)

Air passenger demand saw annual growth of around 1.5% per year before 2020. The size of the sector that will emerge post-pandemic is uncertain.

While aviation emissions fell significantly in 2020 this reduction was not driven by underlying progress in decarbonising the sector but rather was a result of the pandemic and associated restrictions.

While there is still uncertainty around the size of the sector that will emerge post-pandemic (see Chapter 2), passenger demand is expected to increase again after travel restrictions are eased, potentially recovering to close to pre-pandemic levels by the mid-2020s. Action to accelerate efficiency improvements and some demand management will therefore be needed to drive emissions gradually down to 2035:

- The pathway used to determine the Sixth Carbon Budget includes an increase in aviation emissions out to 2024 as travel restrictions are eased. Emissions reduce gradually thereafter due to efficiency improvements, demand management and a modest contribution from sustainable aviation fuels (SAF) starting in the mid-2020s. Emissions fall by 16% and 23% to 2030 and 2035 respectively, from 2019 levels.
- Efficiency, as measured by fuel consumption per passenger-kilometre, improved by 1.5% between 2018 and 2019, following on from an average annual improvement of 2.1% between 2008 and 2018. Progress will need to continue at pace to meet the Sixth Carbon Budget – in our pathway fuel

Improvements in flight efficiency must be sustained to meet the Sixth Carbon Budget.

efficiency improves by 1.7% each year between 2020 and 2050, reaching 0.25 kWh/passenger-km by 2050, from 0.44 kWh/passenger-km in 2019.

- Demand, as measured by plane-km flown per person, increased by 1.9% between 2018 and 2019, following on from an average annual increase of 1.5% between 2008 and 2018. The pandemic and related restriction led to a major reduction in demand in 2020. Our pathway assumes some recovery in demand over the first half of the 2020s, to close to pre-pandemic levels, and assumes a modest increase in plane-km per person thereafter (0.3% each year). This growth is considerably less than a 'business as usual' baseline, though clearly what happens next is highly uncertain. Some moderation of demand growth is likely to be required to meet the legislated emissions targets, as pre-pandemic trends in demand growth exceed what we expect can be accommodated in a Net Zero world.

**Table 3.6**  
Key metrics for aviation in the CCC Pathway to meet the Sixth Carbon Budget

Metric		Latest indicator			Milestones in the CCC pathway				
		Year	Annual change	Value	2025	2030	2035	2050	Trend
Demand	Passenger-km per person	2019	+2.0%	5,400	5,500	5,500	5,700	6,800	
Efficiency and hybrids	Fuel consumption (kWh of fuel used per passenger-km)	2019	-1.5%	0.41	0.39	0.36	0.33	0.25	
	Electric-hybrids (% of km flown)	2020	-	-	-	-	-	9	
Sustainable aviation fuels	SAF fuel share (%)	2020	-	-	0.1	2	8	25	

Source: CCC analysis and Department for Transport analysis of Civil Aviation Authority passenger-km data.

Notes: the demand milestone corresponds to passenger-km from departing flights only, which is the convention when measuring aviation demand. This differs to the aviation demand milestones reported in the Sixth Carbon Budget report (Table 2, p27 of the main report), which relate to both departing and arriving flights; CO<sub>2</sub> emissions are from fossil fuel sources only. Fuel efficiency improvements also differ to those cited in the Sixth Carbon Budget (Table 8.1, p261 of the methodology report) as they are based on fuel consumption per passenger-km, and Sixth Carbon Budget figures are based on CO<sub>2</sub>/passenger.

## g) Fuel supply (37 MtCO<sub>2</sub>e, 7% of UK emissions in 2019)

The fuel supply sector covers fossil fuel\*, hydrogen, and bioenergy supply. While new emissions could arise from the production of low-carbon hydrogen in the future, current emissions in the sector come from fossil fuel supply only. In future, we will include in this sector any emissions associated with hydrogen production for use as a fuel in the energy end-use sectors (but not hydrogen produced for other uses, such as fertiliser production).

Fossil fuel supply is currently the only source of emissions in fuel supply.

Emissions associated with hydrogen and bioenergy are currently accounted for in other sectors of the UK inventory and other sections of this chapter.

- Section d) of this chapter covers emissions associated with the cultivation of energy crops and UK forestry.
- Section c) accounts for emissions from current UK high-carbon hydrogen and ammonia production (e.g. for use in industry and agriculture) as well as bioenergy conversion.
- Sections a) f) and i) include emissions from transporting fuels and biomass by land, air and sea.

**Table 3.7**  
Key metrics for fuel supply in the CCC Pathway to meet the Sixth Carbon Budget

		Latest Indicator			Milestones in the CCC pathway				
		Year	Annual change	Value	2025	2030	2035	2050	Trend
Hydrogen	Low-carbon hydrogen production (TWh)	2020	-	-	1	30	105	225	
Fossil fuel production	Demand for unabated oil and gas (TWh)	2019	-1%	1750	1500	1050	665	110	
	Fall in emissions from 2018 levels - fossil fuel supply (%) <sup>1</sup>	2019	1% point fall	-1%	-22%	-54%	-77%	-97%	
	Fall in emissions from 2018 levels - oil and gas production and processing (%) <sup>2</sup>	2019	1% point increase	+1%	-28%	-68%	-87%	-98%	

Source: CCC analysis; BEIS (2020) *2020 UK Greenhouse Gas Emissions, Provisional Figures*; BEIS (2020) *Digest of UK Energy Statistics (DUKES)*

Notes: All figures in TWh have been rounded to the nearest 5. 1. Abatement from fossil fuel supply is relative to 2018 levels. This category refers to emissions associated with oil refining, oil and gas production, oil and gas production terminals (including compression stations and LNG terminals), gas distribution networks, and open and closed coal. 2. Abatement from offshore oil and gas production is relative to 2018 levels. This category comprises emissions from oil and gas platforms and terminals in line with the scope of the North Sea Transition Deal.

\* Fossil fuel supply covers oil refining, oil and gas production, oil and gas processing terminals, gas transmission and distribution networks and open and closed coal mines.

There have been limited emissions reductions resulting from active efforts to decarbonise the sector. Emissions will need to fall sharply across the sector to align to our Sixth Carbon Budget advice, in which emissions reduce by around 75% by 2035.

There have not yet been strong efforts to decarbonise fossil fuel supply

- **Coal production.** The use of coal across the economy has decreased notably due to reduced demand associated with the phase out of coal in electricity supply. In addition, the closure of the last deep coal mine in 2016, and recent closures of surface mines in England have contributed to reducing emissions from 22 MtCO<sub>2e</sub> in 1990 to less than 1 MtCO<sub>2e</sub> in 2020. Around 75% of remaining emissions can be attributed to the leakage of methane from closed coal mines.
- **Electrification and reduced methane flaring and venting** in oil and gas production is limited. There will need to be a rapid ramp up to achieve the required 68% emissions reductions from oil and gas production by 2030 underlying the path to the Sixth Carbon Budget (Table 3.7).
- **Methane leakage** has reduced due to the Iron Mains Risk Reduction Programme, which has contributed to reducing emissions. However, it is unclear whether this policy alone is sufficient to achieve the additional 2.3 MtCO<sub>2e</sub> of abatement required in our analysis by 2030, particularly in the context of possible network decommissioning due to reduced use of natural gas.
- **Carbon capture and storage** can be used in refineries to reduce emissions in the sector, especially in clusters around other manufacturing and power generation sites (see section c)). Our scenarios for the Sixth Carbon Budget advice included use of CCS to reduce emissions by 1.3 MtCO<sub>2e</sub> in 2030. This will require wider deployment of CCS infrastructure to support decarbonisation of industry and electricity generation as well as contributing to Net Zero through hydrogen production and greenhouse gas removals.

Emissions reductions in fossil fuel supply will need to increase rapidly to align to UK targets

The Committee will develop a new set of indicators to track progress in fuel supply in next year's Progress Report, potentially including indicators on the early-stage developments in hydrogen production, the emissions intensity of oil and gas production, private sector plans/commitments, and the monitoring of methane leakage from gas networks.

Government should seek to improve collection and reporting of relevant data to allow for progress to be monitored more effectively.

## h) Waste (25 MtCO<sub>2e</sub>, 5% of UK emissions in 2019)

The path to Net Zero set out in our Sixth Carbon Budget advice sees emissions in the waste sector reduce by 78% compared to today's levels by 2050.

To align to our recommended Net Zero pathway urgent action is needed to address emissions from landfill and Energy from Waste plants, primarily through improvements to recycling and waste prevention.

To get on track, urgent action is needed to reduce methane emissions from landfill, alongside improvements to recycling and resource efficiency, with minimisation of the quantity of waste going to Energy from Waste (EfW) and the emissions from those plants:

- The UK's combined recycling rate\* needs to increase from 52% to at least 59% by 2025 (45% to 50% for household waste), from which point key biodegradable waste streams should be banned from going to landfill.
- Energy from Waste (EfW) emissions, which have been rising rapidly, need to be constrained at approximately today's levels through increased waste prevention, re-use and recycling, and policy to enable EfW plants to be fitted with CCS from the late 2020s.
- Methane capture rates need to increase from 55% to 80% by 2050 to address fugitive emissions from landfill, while further actions are needed to reduce methane emissions from composting and wastewater treatment.

**Table 3.8**  
Key metrics for waste in the CCC Pathway to meet the Sixth Carbon Budget

		Latest Indicator			Milestones in the CCC pathway				
		Year	Annual change	Value	2025	2030	2035	2050	Trend
Resource Efficiency	Residual waste per capita (kg/yr)	2018	+2%	490	400	310	280	300	
Recycling	Combined (Household + C&I) Recycling Rate for UK (%) <sup>1</sup>	2018	+1% point	52	59	68	68	68	
	Household Recycling Rate for UK (%)	2018	-0.5% point	45	50	56	56	56	
Landfill	Biodegradable Waste Sent to Landfill in UK (Million tonnes)	2018	-3%	7.2	1.2	0.9	0.9	0	
	Landfill Methane Capture Rate (%) <sup>2</sup>	2019	-1% point	55	60	64	68	80	
Energy from Waste	Energy from Waste Emissions (MtCO <sub>2</sub> e)	2019	+12%	5.5	6.5	5.0	5.1	0.4	

Source: Milestones: CCC analysis, Methane Capture Rates: NAEI UK GHG Inventory 2019, Household Recycling Rate and Biogenic Municipal Waste to Landfill: DEFRA UK Waste Statistics Publication 2018

Notes: 1. There are inconsistencies in the way waste arisings and recycling data are reported across the UK, and significant data gaps remain – most notably around the availability of recycling data for Commercial and Industrial waste (C&I). Our Balanced Pathway for Waste uses a 'Combined' Recycling Rate for the UK, comprised of Household (approximately equivalent to Waste from Household statistics) and C&I (municipal and non-municipal). The C&I portion of this indicator and associated milestones are based on assumptions of C&I recycling rates. 2. Currently DEFRA only publishes statistics on municipal biodegradable waste to landfill, which is a reasonable proxy for overall biodegradable waste to landfill.

We understand DEFRA is in the process of developing new waste and recycling indicators and statistics, including for municipal and C&I recycling, and biodegradable waste to landfill, which we will seek to reflect in future iterations of this indicator framework.

\* The CCC Pathway for Waste uses a 'Combined' Recycling Rate for the UK, comprised of Household (approximately equivalent to Waste from Household statistics) and C&I (municipal and non-municipal).

Progress in reducing emissions from landfill and in improving recycling have stalled in recent years, while emissions from Energy from Waste plants have risen sharply.

Progress in reducing emissions from waste at a UK level has stalled in recent years as reductions in landfilling of biodegradable municipal waste and improvements to recycling rates have slowed, and landfill methane capture rates have declined.

- The amount of biodegradable municipal waste being sent to landfill in 2019 was around 80% lower than 1995 levels but has plateaued at between 7-8 million tonnes a year since 2015 (Figure 3.10)
- Following rapid improvements through the 2000s\* UK recycling rates have remained at around 44% since 2012 and the EU-derived target of achieving 50% recycling by 2020 looks almost certain to have been missed.
- Landfill methane capture rates peaked at over 74% in 2016 but have since declined to 55%.
- Wales continues to outperform the rest of the UK in terms of recycling, with a 'waste from households'<sup>†</sup> rate of well over 50%, and a municipal recycling rate of 65% in 2019 (Figure 3.11).

Meanwhile, recent years have seen sharp increases in emissions from EfW which has become an increasingly popular waste treatment solution for Local Authorities.<sup>41</sup>

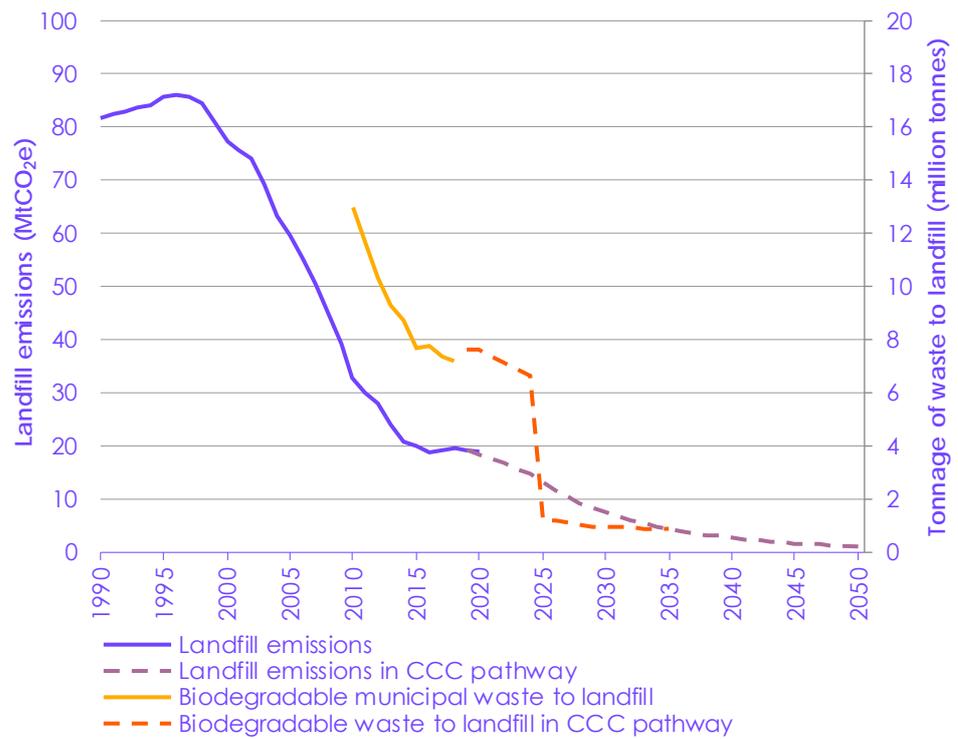

- In 2019, the latest year for which emissions data is available, emissions from EfW increased by over 10% on 2018, putting it on course to overtake emissions from coal power in 2020.
- If EfW usage continues to rise unchecked, then its emissions will exceed the CCC pathway while potentially undermining recycling and re-use efforts.

We are in the process of developing our indicator framework for the waste sector with a view to reporting on this from 2022. This will seek to provide better alignment to UK waste reporting statistics, greater granularity at a devolved administration level and improved coverage of resource efficiency.

\* England's Local Authority Combined Recycling Rate increased from 12% in 2000 to 40% in 2020.

<sup>†</sup> 'Waste from Households (WfH)' is the agreed harmonised UK measure that was previously used to report household recycling to comply with the Waste Framework Directive (2008/98/EC). Under this Directive the UK was required to meet a target to recycle 50% of household waste by 2020.

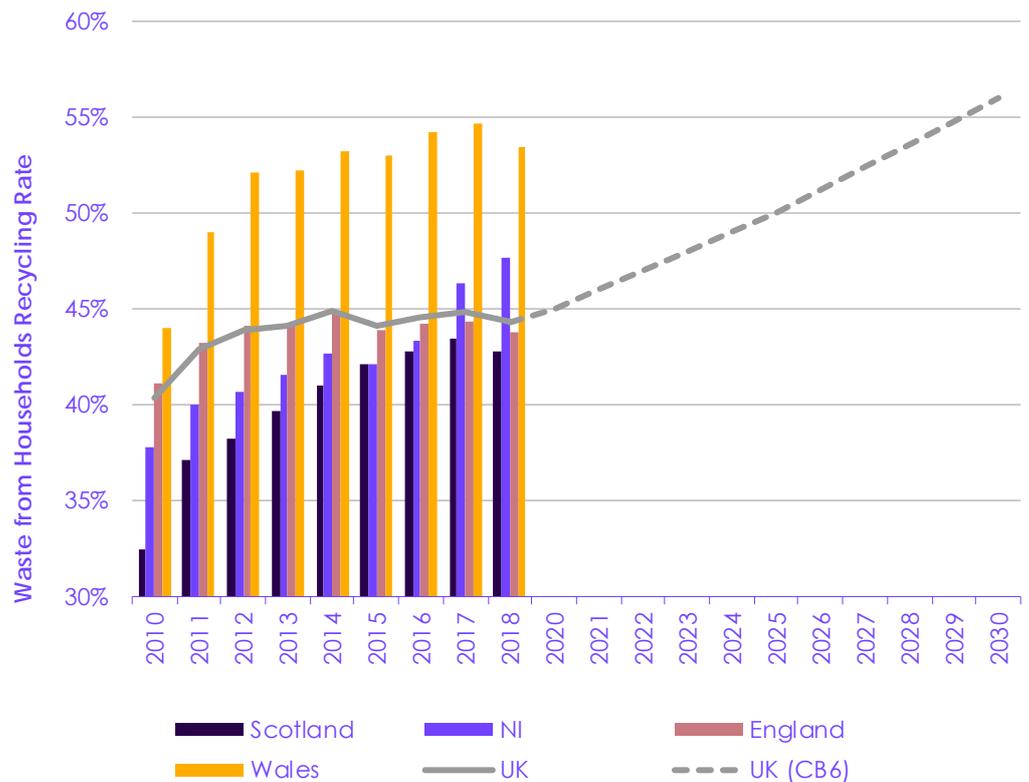

Figure 3.10 UK emissions from Landfill and tonnages of Biodegradable Waste to Landfill

Notes: UK (CB6) is the 'Balanced' pathway for household recycling rates set out in our Sixth Carbon Budget Report.

Welsh progress on recycling and resource efficiency is an example to the rest of the UK. Statutory requirements and sustained investment have been key factors to its success to date.

### Box 3.3

#### Welsh Progress on Recycling and Resource Efficiency

Wales continues to lead by example on waste prevention, re-use and recycling, driven by ambitious targets, continued investment in infrastructure and services, and a holistic approach to resource efficiency policy.

- 2019 again saw improvements in recycling, with municipal recycling rates up to 65% from 63% in the previous year – one of the highest recycling rates in the world.
- Key measures to boost recycling have included the setting of statutory Local Authority recycling targets, over £1 billion of investment in recycling services and the provision of separate food waste collections.
- By 2025, Wales has set ambitious targets to reach a 70% recycling rate, and send zero waste to landfill, alongside a 50% reduction in avoidable food waste arisings.
- In March 2021, the Welsh Government published 'Beyond Recycling' – its updated circular economy strategy. This includes a commitment to become zero-waste by 2050 and to make resource efficiency part of Welsh culture.
- The Welsh Government has provided funding and set out robust policy measures to follow through on their commitments, including through an £80m Circular Economy Fund, requirements for non-domestic recycling and Extended Producer Responsibility.
- The Strategy demonstrates an understanding of the need to take a systems approach to resource efficiency, including measures to prevent recyclable materials being diverted to Energy from Waste, efforts to tackle all unnecessary

single-use items (as opposed to just plastics) and consideration of a technical standard for embodied carbon in buildings.

If the activities and commitments set out in the 'Beyond Recycling' strategy are successfully delivered, they would significantly reduce Wales' emissions from waste. The UK Government and other Devolved Administrations should seek to replicate the strong progress made by the Welsh Government in this area, including by learning from the Welsh approach.

### i) Shipping (14 MtCO<sub>2e</sub>, 3% of UK emissions in 2019)

Low-carbon fuels make up the large majority of shipping emissions savings in our CCC Pathway. This will require investment and R&D during the 2020s.

Within the path to Net Zero set out in our Sixth Carbon Budget advice, over 80% of shipping abatement is due to the transition to low-carbon fuels, such as ammonia (Table 3.9). This will require important enabling actions over the coming years:

- While uptake of these fuels in volume is not expected until the 2030s, investment and research and development should ramp-up during the 2020s to showcase proof-of-concept and develop an early market.
- Global shipping emissions have risen by 7% over the decade to 2019. The UK should lead in working with the International Maritime Organisation (IMO) and other willing partners to strengthen international targets and policy mechanisms to meet them.

Global shipping emissions are still rising – the UK should lead in working internationally to reverse this.

**Table 3.9**

Key metrics for shipping in the CCC Pathway to meet the Sixth Carbon Budget

	Latest Indicator			Milestones in the CCC pathway				
	Year	Annual change	Value	2025	2030	2035	2050	Trend
Use of low-carbon fuels (% of demand)	2020	-	0.0%	0.0%	0.2%	34%	91%	
Use of electricity (% of demand)	2020	-	0.0%	0.2%	1%	2%	4%	

Source: CCC analysis.

Notes: Low-carbon fuels comprise the large majority of the emissions savings from shipping within our Balanced Pathway. Deployment of these fuels is expected to ramp up mainly during the 2030s – R&D and market development, alongside progress on vessel efficiency and shore-side electrification, are needed during the 2020s.

Over the decade to 2019, domestic shipping activity fell by 26% and outbound international freight shipping reduced by 7% (Figure 3.12).<sup>42</sup> Overall freight tonnages have fallen by 3%,<sup>43</sup> driven by substantial reductions in imports of oil and coal.

Figure 3.12 UK international and domestic total port traffic, by freight volume

Source: DfT (2020) *Port and domestic waterborne freight statistics*.

Notes: Domestic figures include both coastwise and one-port shipping. International imports are shown with a dashed line since they will typically refuel outside the UK and are thus not included within our UK emissions inventory. See the Section 3 of Chapter 2 on consumption emissions for further discussion.

Global shipping carbon intensities have improved by around 30% over 2008-2018.<sup>44</sup> The IMO has recently introduced new binding energy efficiency and carbon intensity indicators which will increase this to a 40% improvement by 2030. However, there are concerns<sup>45</sup> that this may be insufficient to drive emissions reductions across the sector.

Increasing investment in and use of low-carbon energy and improvements to vessel efficiency will be key indicators of progress in this sector.

In future Progress Reports, we will seek to monitor progress in the enabling actions required to increase availability of low-carbon fuels and vessel efficiency in the shipping sector.

- Government's March 2021 consultation on the future of the Renewable Transport Fuel Obligation (RTFO) proposes to extend the scope of the RTFO to make renewable fuels of non-biological origin (RFNBOs; including hydrogen, ammonia and methanol) for use in the shipping sector eligible for support. We will monitor the levels of investment and production that result from this change.
- Clean maritime clusters and other innovative trials, such as the proposed hydrogen transport hub in Tees Valley, will be important in stimulating the emergence of a market for low-carbon shipping.
- Further improvements could be delivered through shore-side electrification (which could also offer strong air quality benefits<sup>46</sup> by avoiding the use of fossil-fuelled engines in ports, but will require action to surmount barriers to its deployment), provision of the requisite supporting infrastructure and smart efficiency measures, which are all included within the recently launched Clean Maritime Demonstration Competition.

The Committee will seek to monitor progress in each of these areas as part of a fuller indicator framework, which will be used to monitor progress from next year's Progress Report, in 2022.

## j) F-gas emissions (13 MtCO<sub>2</sub>e, 3% of UK emissions in 2019)

The majority of the required fall in emissions of F-gases is expected to fall under strict existing regulations. Our 'baseline' scenario for emissions sees existing regulations drive F-gas emissions down by 75% from current levels by the time of the Sixth Carbon Budget period.

There is some limited evidence that underlying progress is being made against the additional measures we have identified outside the baseline.

- **Enforcing regulations.** Regulations are only as good the rate of compliance. The Environment Audit Committee has reported evidence of suspected non-compliance, especially as the EU F-Gas Regulation increases demand for refrigerants with lower Global Warming Potential (GWP), and a lack of resources for the Environment Agency to carry out adequate inspections.<sup>47</sup>
- **Inhalers.** High GWP metered dose inhalers (MDIs) are still the main type of inhaler used in the UK.
  - NHS England's Long Term Plan has set targets to deliver significant and accelerated reductions in the total emissions from the NHS by moving to lower-carbon inhalers, such as dry powder inhalers (DPIs) that are used widely in Europe.
  - Two major pharmaceutical suppliers to the NHS have committed to action on reducing the carbon impact of their MDIs and, from 2025, reformulating their inhalers so they can be used with low-GWP propellants.
- **Alternative refrigerants.** There is some potential for the low-GWP HFC-32 to be replaced by an ultra-low-GWP alternative. Doing so could reduce F-gas emissions below the level in our Sixth Carbon Budget pathway. Preliminary research is being done into the technical capacity for hydrocarbons to replace HFC-32.

## k) Greenhouse gas removals

Our assessment is that both engineered Greenhouse Gas Removals (GGR) and land-based removals (such as tree planting and peatland restoration - see section d) above), will be essential for reaching Net Zero.

Engineered Greenhouse Gas Removal technologies, presently in early stages of development, will need to make a key contribution to reaching Net Zero.

Engineered removals via Bioenergy with Carbon Capture and Storage (BECCS) applied in a variety of sectors, and Direct Air Capture with Carbon Capture and Storage (DACCS) are at an early stage of development. A small number of BECCS and DACCS test facilities are presently in operation worldwide. Investment in research and development needs to be complemented with policy design to support engineered GGR scale-up during the mid-to-late 2020s.

**Table 3.10**  
Key metrics for greenhouse gas removals in the CCC Pathway to meet the Sixth Carbon Budget

		Latest indicator		Milestones in the CCC pathway				
		Year	Value	2025	2030	2035	2050	Trend
Removals (all values in MtCO <sub>2</sub> )	Total	2020	-	<1	-4.8	-22.5	-58.3	
	BECCS	2020	-	-	-4.6	-22.3	-52.9	
	DACCS	2020	-	-	-	-	-5	
	Wood in Construction	2020	-	-0.1	-0.2	-0.2	-0.4	

Source: CCC analysis.

Notes: Present usage of wood in construction is included in land use, land use change and forestry (LULUCF) inventory account.

A key milestone on the Sixth Carbon Budget pathway is progress towards the commissioning of the first commercial-scale BECCS plant in the late 2020s. This will need to be underpinned by the construction of CO<sub>2</sub> pipeline and storage infrastructures as part of the wider establishment of CCS in the early 2020s, which are capable of timely expansion to accommodate CO<sub>2</sub> from BECCS or DACCS. Progress towards this underpinning infrastructure delivery and the development of support policies for GGR deployment will be considered in next year's Progress Report, in 2022.

## Policy progress and gaps

1. The delivery challenge	142
2. Stated ambition and policy progress	146
3. Policy priorities and gaps	157
4. Sectoral progress and next steps for policy	162

## Introduction

Two years ago, the UK was aiming to reduce emissions to at least 80% below 1990 levels, by 2050 (from 48% below 1990 levels in 2020\*). As of 2019, the emissions reduction goal for 2050 is now at least 100% ('Net Zero') and the Government has committed to a reduction in emissions of 78% by 2035, based on the Committee's 2020 advice on the Sixth Carbon Budget.

Having set the level of the Sixth Carbon Budget, the Government must develop a comprehensive set of policies to ensure that it is met. Importantly, the Sixth Carbon Budget will be the first to include emissions from international aviation and shipping (IAS). This ensures that, from now on, the Government's emissions reductions strategies have a formal requirement to cover all areas of the economy, rather than merely leaving 'headroom' for IAS emissions as in previous strategies.

This year is the start of a new era of UK climate action, with the Sixth Carbon Budget legislated, the publication of new evidence for the third Climate Change Risk Assessment (CCRA3) and the UK's hosting of the 26<sup>th</sup> United Nations Framework Convention on Climate Change (UNFCCC) Conference of the Parties (COP26) in Glasgow in November. Government policy needs to ramp up to match. We expect the Government's forthcoming Net Zero Strategy, ahead of COP26, to provide a blueprint for action over the coming decades.

As part of our advice on the Sixth Carbon Budget, we published a report on *Policies for the Sixth Carbon Budget and Net Zero*. This set out potential ways to address what needs to be done in each emitting sector and an overview of the policy challenges. With Net Zero by 2050 in mind, policy needs to enable a scale-up and roll-out of low-carbon technologies and behaviours, so that by the early 2030s nearly every new investment and purchase is low-carbon.

Our policy report is still the most current overview of the policy challenge for the Sixth Carbon Budget. This chapter recaps the main aspects of that report and covers key developments since. It also offers an appraisal of the Government's current plans, looks back on progress departments have made on last year's recommendations and identifies priority policy recommendations and gaps that need to be addressed.

The key messages in this chapter are:

- **The early foundations for a decade of delivery are being put into place.** The Government is starting to demonstrate that it is taking the Net Zero challenge seriously. It has set up climate action committees on strategy and delivery in Cabinet, it has published a Ten Point Plan for a Green Industrial Revolution, an Energy White Paper, an Industrial Decarbonisation Strategy, an interim Net Zero Review from HM Treasury on the fair allocation of costs during the transition and launched a new UK Emissions Trading Scheme.
- **However, several key strategies and plans are not yet published,** or have been delayed. At the time of finalising this report at the start of June, the Heat and Buildings Strategy, the Transport Decarbonisation Plan, the final HM Treasury Net Zero review, the Net Zero Aviation Strategy and the Nature Strategy had not yet been published. These are needed in order to extend

\* This reduction reflects the impact COVID-19 had on emissions in 2020, much of which is not expected to be permanent. The fall in emissions between 2019 and 1990 was 40%.

action to reduce emissions into all areas of the economy, within a portfolio of policy that accelerates a fair and just transition to Net Zero.

- **The Government has made significant commitments, but there are still significant gaps in ambition.** Where ambitions have been set over the last year, they have tended to be a significant step up. Many are now aligned with the path to Net Zero (e.g. 40 GW of offshore wind, phasing out petrol and diesel cars and vans by 2030). However, gaps remain in the Government's stated ambitions (e.g. on diets, aviation demand, waste, and low-carbon heat networks), while some announcements fall short of what is likely to be needed (e.g. on peatlands, heat pumps, and carbon capture and storage). Together these imply a significant ambition gap: current Government commitments that align to the Committee's published pathways cover less than half of the path to Net Zero.
- **Efforts must be increased markedly, especially in the lagging areas.** There are signs of a multi-speed approach within Government to raising ambition and putting in place effective policies. Some departments (e.g. Defra, MHCLG, but also parts of BEIS and HM Treasury) are lagging behind others, and appear timid in their approach. The path to Net Zero requires high ambition and an effective policy framework in all areas.
- **A major delivery challenge will remain** even once the Net Zero Strategy sets out how the Government intends to drive the transition. Of the 92 recommendations from last year's Progress Report, just 11 have been achieved in full, with 29 partly achieved and 34 underway. Translating strategy into effective policy across the wide range of emitting sectors will require continued focus across Government over the rest of this Parliament and beyond. We set out several priority areas for action as well as approximately 200 recommendations for UK Government departments and the devolved administrations.

This chapter is set out in four sections:

1. The delivery challenge
2. Stated ambition and policy progress
3. Policy priorities and gaps
4. Sectoral progress and next steps for policy

# 1. The delivery challenge

Achieving Net Zero and the Sixth Carbon Budget will require a significant scale-up in delivery of low-carbon policies and actions.

The Committee's December 2020 advice on the Sixth Carbon Budget set out a pathway to achieving the UK's Net Zero 2050 target, based on a comprehensive programme of delivery in the 2020s that covers all areas of decarbonisation. If the required scale-up over the coming decade is to occur, the key building blocks of policy must be introduced in the coming months and developed over the next few years (Figure 4.1, Table 4.1). This Government must be the one to shift the UK decisively onto the path that ends its contribution to global warming.

The Government has committed to set out its plans in the Net Zero Strategy, required by the Climate Change Act and due ahead of the COP26 UN climate talks in Glasgow in November this year. COP26 gives the Net Zero Strategy added significance. Setting out a strong and credible policy package to deliver the scale-up over the next decade would put the UK firmly on track to Net Zero, greatly strengthening its credibility as a climate leader.

The transformational change required means Net Zero and climate adaptation must be integrated into all policymaking.

The Government has accepted the overall challenge by setting the UK's Nationally Determined Contribution (NDC) to the Paris Agreement for 2030 and legislating the Sixth Carbon Budget for 2033-37. Given the scale of the challenge and the often-complex interactions involved, a piecemeal or sector-specific approach will not be enough. Net Zero should be integrated into all policymaking, as should climate adaptation.

## a) Scaling up and rolling out low-carbon technologies and behaviours

The next decade is critical for building supply chains, with policy focussing on widespread roll-out of measures thereafter.

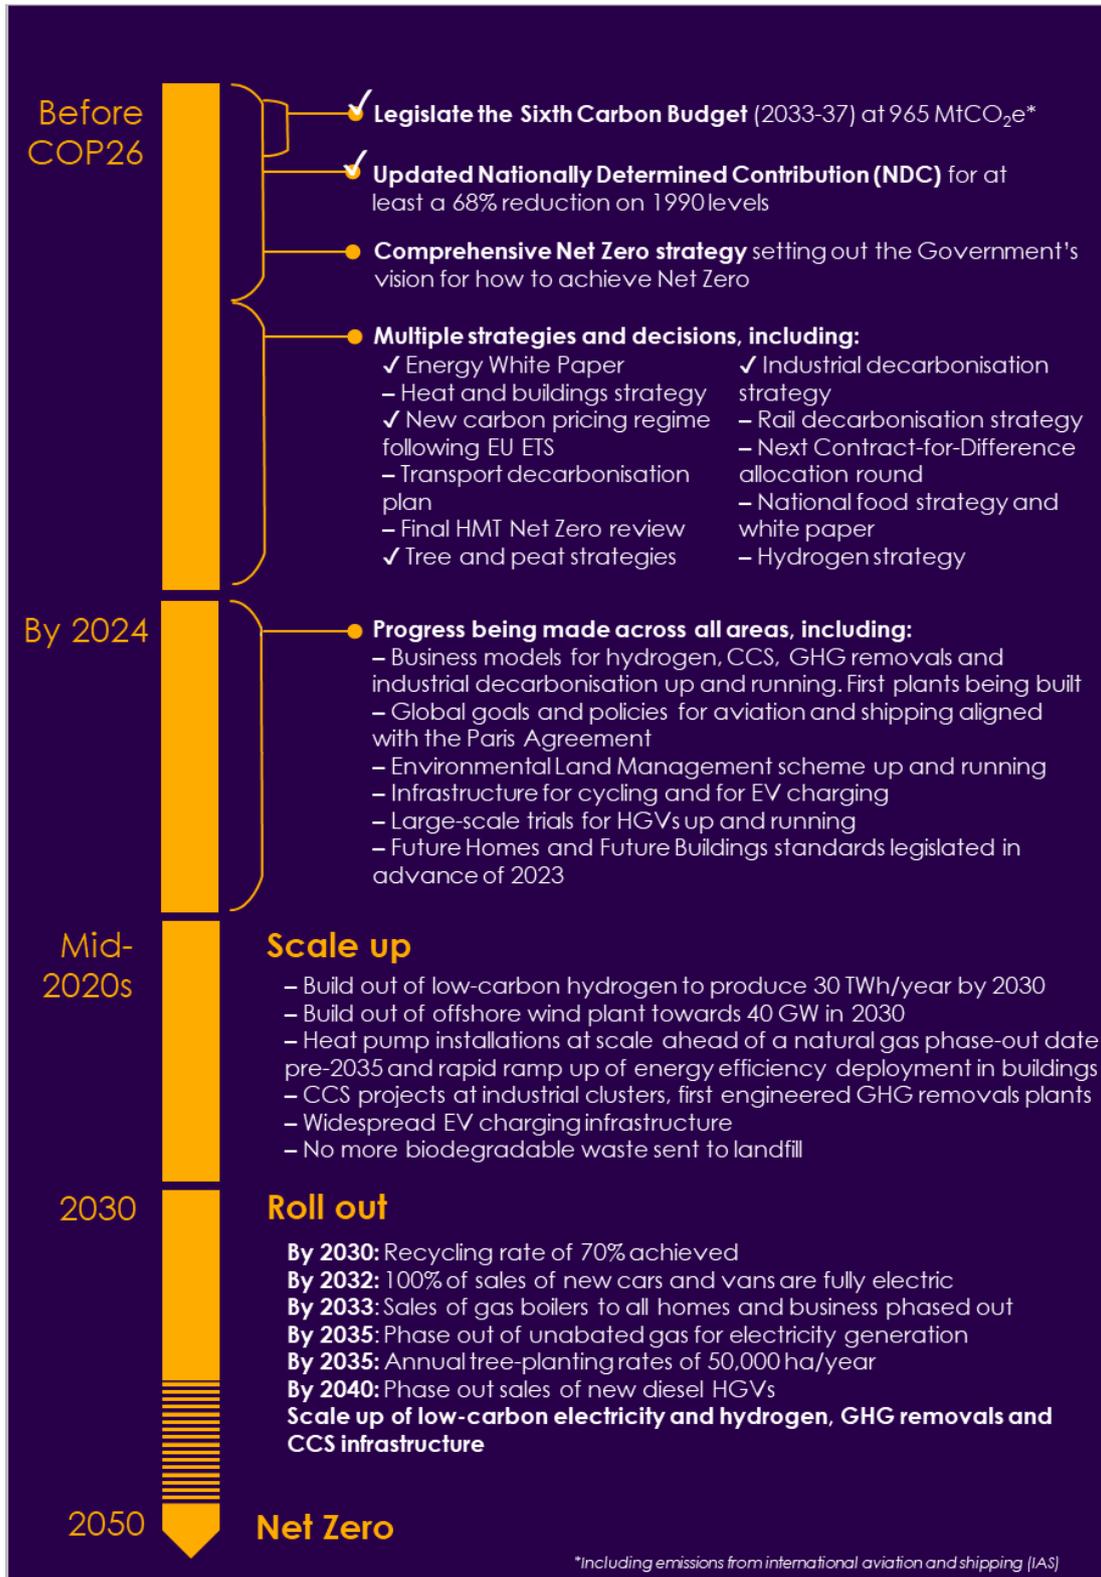

Accompanying our advice on the Sixth Carbon Budget was a report on *Policies for the Sixth Carbon Budget and Net Zero* ('the Sixth Carbon Budget policy report'), which provides recommendations on how to achieve a transition that involves two distinct phases for UK climate policy, with the next decade being vital:

- **The 2020s: scale-up.** The UK must build supply chains and new markets for low-carbon consumer offerings (e.g. electric cars and heat pumps) so that these can scale from being niche offerings to dominating the market and fully pushing out sales of high-carbon alternatives by 2030, or soon after. Alongside this, new options must be developed and scaled up for industrial decarbonisation such as carbon capture and storage (CCS), low-carbon hydrogen and engineered emissions removals, while finishing the job of power sector decarbonisation. Annual tree-planting rates must increase from 13,000 hectares per year today to 30,000 by 2025 in line with the Government's commitment – and continue to rise to 50,000 year by 2035.
- **From the early 2030s to 2050: roll-out.** Having scaled up the required markets for low-carbon technology sales, these will then take around 15 years to flow through the stock of vehicles and buildings as high-carbon assets reach the end of their lives. Mechanisms driving implementation in industry and land use should be well developed and continue to drive roll-out at similar rates. Policy will be less about aiming to scale up markets, instead focusing on continuing achieved rates of roll-out, tackling emerging barriers and systems challenges and ensuring fairness across society.

Most of the recommendations in our Sixth Carbon Budget policy report still stand. What follows in this chapter are the priorities already set out in that report and

updates where recent policy developments have occurred. Government progress on tackling the delivery challenge to date is also addressed. Key milestones for policy and delivery are set out in Table 4.1 and Figure 4.1.

Figure 4.1 Timeline for the decade of delivery, and beyond

Notes: Ticks mark refer to actions that have been concluded.</p>		

## 2. Stated ambition and policy progress

Material progress has been made since our last Progress Report to Parliament in June 2020. The Government has accepted the Committee's advice on the level of the Sixth Carbon Budget, and the level of the UK's NDC for 2030, setting the UK on an ambitious decarbonisation pathway towards 2050.

Setting the level of the Sixth Carbon Budget and the UK's 2030 NDC are significant steps in the last year and Government is starting to develop policy across all areas.

The Government has also recognised the need for extensive policy strengthening and has started to develop plans in all areas of UK emissions, with significant policy announcements having been set out in the Ten Point Plan for a Green Industrial Revolution, Energy White Paper, Industrial Decarbonisation Strategy and England Trees and Peat Action Plans (Table 4.2).

These publications have significantly strengthened commitments, with many headline ambitions now aligned to the CCC pathway (e.g. 40 GW offshore wind by 2030, phase-out of conventional petrol and diesel cars by 2030, 30,000 hectares afforestation annually by 2025). However, some of the specific targets in these announcements, while improvements on previous commitments, fall short of those in the CCC pathway (e.g. heat pump deployment that is a third lower in 2028, total carbon capture and storage ambition in 2030 that is around half of what we set out) – see Figure 4.2.

There are still gaps and ambiguity in government ambition, including around influencing consumer choices on issues like aviation and diets.

Some important ambition gaps remain in certain sectors, while there is a danger that several of the broad ambitions announced are implemented in a way that would fall short of the CCC scenarios:

- **Consumer choices.** So far, the Government's announcements have focused on technologies and largely ignored the potential for changes in consumer choices to reduce emissions. These are particularly important to limit emissions in 'hard to abate' sectors, such as aviation and agriculture. There are a wide range of levers available to promote low-carbon choices, including enabling measures and nudges, ensuring supporting infrastructure is available, as well as more interventionist measures using regulations and the tax system.
- **Ambiguity in ambition.** While some commitments have been made that could be at least as ambitious as our pathways, there remain risks that real-world implementation could fall short. For example, the announced 2030 phase-out date for sale of petrol and diesel cars and vans will allow sale of hybrid vehicles with "significant zero-emission capability" until 2035, well after the 2032 date by which we recommend all such vehicles should be fully zero-emission. The definition of which vehicles can be sold after 2030, currently subject to consultation, will be crucial in ensuring that emissions and motoring costs are kept as low as possible by prioritising fully zero-emissions vehicles over hybrids.

The Net Zero Strategy will have to make up for emerging shortfalls in ambition and bring together action across every sector.

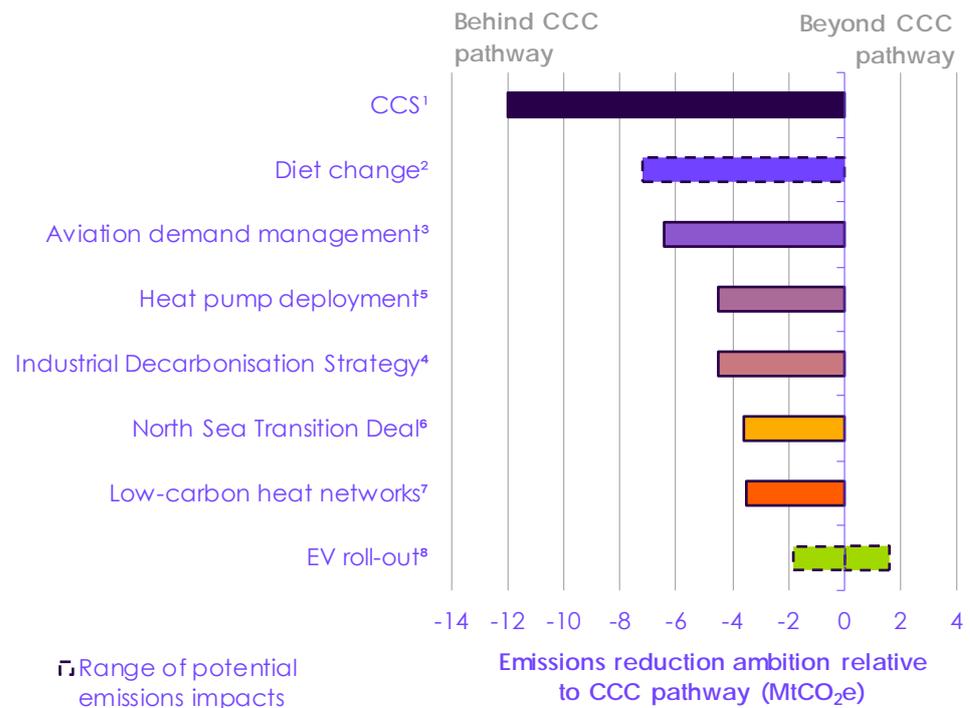

We expect the Government's forthcoming Net Zero Strategy, promised for this year, to provide a blueprint for action over the coming decades. The Net Zero Strategy will need to make up for the shortfalls in ambition illustrated in Figure 4.2 and Table 4.2 and clarify policy mechanisms to meet that ambition:

- The Government is not required to commit to the Committee's detailed sectoral pathways, nor our policy advice. But it must set out a credible alternative approach where it chooses not to.

Our pathways are designed to be stretching across the economy, so it is difficult to compensate for lower ambition in one area with greater ambition elsewhere.

- The Net Zero Strategy, released later this year, will have to address the shortfall, strengthening weaker commitments to be closer to the Committee's pathways or setting out how emissions can be cut faster in other areas to compensate.
- With the path to 2050 becoming clearer, plans must translate into near-term action and Government must organise for the major delivery challenge of Net Zero.

**Figure 4.2** Differences in stated Government ambition compared to CCC Pathway

Notes: Comparisons are against the Balanced Net Zero Pathway ('CCC pathway') published in the Committee's *Sixth Carbon Budget* advice.

<sup>1</sup> Government CCS ambition for is 10 MtCO<sub>2</sub>/year in 2030, compared to 22 MtCO<sub>2</sub>/year in the CCC pathway.

<sup>2</sup> The level of diet change without explicit policy to support it is uncertain. Annual emissions could be up to 7.2 MtCO<sub>2e</sub> higher than the CCC pathway in 2030.

<sup>3</sup> Lack of ambition for aviation demand management would result in higher annual emissions of 6.4 MtCO<sub>2e</sub> in 2030 relative to the CCC pathway for aviation emissions.

<sup>4</sup> The Industrial Decarbonisation Strategy aims for a 67% reduction by 2035, compared to 73% in the CCC pathway.

<sup>5</sup> Government ambition is for 600,000 installations in homes in 2028, compared to 900,000 in 2028 in the CCC Pathway. The abatement gap in 2030 is inferred, based on an assumed trajectory of uptake to 2028 under the Government's plans, with annual deployment remaining constant to 2030.

<sup>6</sup> The North Sea Transition deal commits to a reduction that falls short of the CCC pathway by 3.7 MtCO<sub>2e</sub> in 2030.

<sup>7</sup> Based on announced Government heat network investment of £0.7 billion (assumed to leverage £2.2 billion, leading to a total investment of £2.9 billion, of which we estimate £1.7 billion will be for low-carbon, with resulting deployment estimated by CCC).

<sup>8</sup> A strict 2030 phase-out of petrol and diesel vehicles would be more ambitious than the CCC pathway, but this depends on the timing of when plug-in hybrid electric vehicles are phased out.

**Table 4.2**  
Government commitments compared to the CCC Pathway between 2025-2035

Headline actions	Government commitment <sup>1</sup>	CCC pathway
Offshore wind	40 GW by 2030	40 GW by 2030
Electric vehicles	Phase-out of new fossil fuelled vehicle sales by 2030, with allowance for some hybrids out to 2035	Phase-out of all new fossil fuelled vehicle sales by 2032
Heat pumps in homes	600,000 heat pump installations / year by 2028	900,000 heat pump installations / year by 2028 1.1 million installations / year by 2030
Low-carbon heat networks (all buildings) <sup>2</sup>	2 TWh of low-carbon heat networks by 2030	25 TWh of low-carbon heat networks by 2030
Low-carbon hydrogen	5 GW (up to 42 TWh) by 2030	30 TWh by 2030
Carbon Capture and Storage <sup>3</sup>	10 MtCO <sub>2</sub> / year captured and stored by 2030, across 4 industrial clusters, including at least one power project	22 MtCO <sub>2</sub> / year captured and stored by 2030, across at least 5 industrial clusters, including multiple power projects
Emissions reduction in manufacturing and refining	Around two-thirds by 2035, compared to 2018	73% by 2035, compared to 2018
Tree-planting	30,000 hectares / year by 2025	30,000 hectares / year by 2025 50,000 hectares / year by 2035
Peatland restoration <sup>4</sup>	32,700 hectares / year by 2025	67,000 hectares / year by 2025
Greenhouse gas removals	Innovation support provided, in recognition that engineered removals will be needed, but no firm commitment on deployment yet	5 MtCO <sub>2</sub> / year by 2030
Nuclear power <sup>5</sup>	Final Investment Decision on at least one new nuclear power plant by the end of this Parliament	One new nuclear plant operational by 2030, and a further plant by 2035

Notes:

<sup>1</sup> Based on actions in the Ten Point Plan, Energy White Paper, Industrial Decarbonisation Strategy and England Tree and Peat Action Plans between 2025 and 2035 and the CCC's Balanced pathway from the Sixth Carbon Budget.

<sup>2</sup> Government commitment on low-carbon heat network deployment is illustrative, and has been inferred from Government spending commitments, using assumptions around expected leveraged investment and the proportion of funding targeted at low-carbon networks.

<sup>3</sup> The difference in carbon captured and stored annually largely comes from projects in the power sector in CCC scenarios, so other technologies could compensate for this shortfall.

<sup>4</sup> Government peatland restoration commitments include Scotland, Wales and England. CCC peatland restoration numbers in 2025 are UK-wide.

<sup>5</sup> The Balanced Pathway produced for the CCC's Sixth Carbon Budget assumed that two new nuclear power stations would be in operation by 2035.

## a) Progress against last year's recommendations

11 of the Committee's 94 recommendations from last year have been fully achieved, 29 partly achieved and 32 are underway.

We are reporting on a moving picture of progress as several critical policy documents have not yet been published, with many of these delayed.

We see evidence of a multi-speed Government, with some departments' progress lagging behind others.

The Committee made 92 recommendations to Government departments in our June 2020 Progress Report. Of these, 11 have been achieved in full (which includes the critical cross-cutting recommendations on the level of the Sixth Carbon Budget and the UK's 2030 NDC). Some progress is being made, or is expected soon, against many others, with 29 recommendations partly achieved and 34 underway. Seven recommendations are overdue and 13 have not been achieved (Table 4.3).

While several critical policy documents have been published over the last year, other key strategies and plans remain to be published, or have been delayed:

- At the time of finalising this report in early June, the Heat and Buildings Strategy, the Transport Decarbonisation Plan, the final HM Treasury Net Zero review, the Net Zero Aviation Strategy and the Nature Strategy had not yet been published. These are needed to extend action to reduce emissions into all areas of the economy, within a portfolio of policy that accelerates a fair and just transition to Net Zero.
- The absence of these documents means we are reporting on a moving picture. It will only be possible to judge the overall approach to meet the Sixth Carbon Budget and the Net Zero target when the Government's Net Zero Strategy, as well as other overdue and underway documents, are published.

As the disparities in progress in Table 4.3 illustrate, we see evidence of a multi-paced Government, with some departments lagging behind others:

- The **Ministry of Housing, Communities & Local Government (MHCLG)** is not fully supporting local government to play its part in the transition to Net Zero. Progress has fallen short to date on ensuring that building standards are fit for purpose and properly enforced. The current Planning Bill does not ensure that developments and infrastructure are compliant with Net Zero and appropriately resilient to climate change. It would be serious were this opportunity to be missed.
- While the **Department for Environment, Food & Rural Affairs (Defra)** has made important steps forward on ambition for afforestation and peat restoration – though the latter is short of the CCC pathway and implementation is slow – progress on agriculture and land use remain slow and partial, and gaps in ambition remain. On waste, large gaps remain both on banning materials from landfill and getting a grip on the rapid expansion of Energy from Waste facilities.
- Even within Departments that are performing better overall there are pockets of poor or slow performance. For example, the **Department for Business, Energy and Industrial Strategy's (BEIS)** Heat and Buildings Strategy has been delayed by almost a year, while the **Department for Transport (DfT)** has not set out any plans for limiting growth in aviation demand.
- More generally, Government progress has been slow on overarching challenges towards Net Zero, which has now been law for two years. The most notable delay is to the **HM Treasury's** Net Zero Review, but there are delays and uncertainty to a suite of other challenges: the just transition, jobs and skills, public engagement. With a Spending Review later this year, it is essential that the Treasury clarifies its strategic priorities for the remaining carbon budget in the UK. There is also a need for strong governance of the

transition within Government, including ensuring that wider policy decisions are routinely made compatible with Net Zero.

For the full programme to align to the challenge, and provide the leading example that the Government wishes to take to COP26, government will have to address these failures.

**Table 4.3**  
Progress against departmental recommendations in the Committee's 2020 Progress Report to Parliament

Department	Progress against last year's recommendations
Cabinet Office & No. 10	● ○ ○ ●
FCDO, BEIS & the COP26 Unit	● ○ ○ ● ● ●
HM Treasury	● ● ● ● ● ● ●
Department for Business, Energy and Industrial Strategy	● ● ● ● ○ ○ ○ ○ ○ ○ ○ ○ ○ ○ ● ● ● ● ● ● ● ● ● ● ● ● ● ● ● ●
Department for Environment, Food and Rural Affairs	● ○ ● ● ● ● ● ● ● ● ● ●
Department for Transport	● ● ● ○ ○ ○ ○ ● ● ● ● ● ● ● ● ● ●
Ministry of Housing, Communities and Local Government	● ● ● ● ● ● ● ●
Department for Education	○ ○
Department for International Trade	○ ○ ●
Department of Health and Social Care	○ ●
Ministry of Defence	● ○ ○
Home Office & Ministry of Justice	○ ○
Department for Digital, Culture, Media and Sport	○ ○ ● ●
Department for Work and Pensions	○ ○

● = action achieved, ○ = underway, ● = partly achieved, ● = overdue, ● = not achieved.

Notes: Based on recommendations in the CCC's 2020 Progress Report to Parliament. Recommendations for all departments, or those relating to adaptation are not included in this table. Some recommendations apply to more than one department, so the sum of recommendations in this table does not add up to the 92 cited in the text. Tables of recommendations and scores is in the supplementary material published alongside this report.

Delivering Net Zero by 2050 will require strong policy frameworks across all levels of Government, and collaboration between the governments of Wales, Scotland and Northern Ireland with Westminster to develop the required policies. The past year has also seen important developments in climate policy in the devolved administrations (Box 4.1), including:

- The Scottish Government updated its Climate Change Plan, which integrates the 2045 Net Zero target and its new interim targets into its delivery plan for emissions reductions out to 2032.
- The Welsh Government increased its 2050 emissions target to Net Zero, from a 95% reduction on 1990 levels, following advice from the Committee.
- The Northern Ireland Assembly is working towards legislating a Climate Change Bill before the next Assembly election in 2022.
- Both Scotland and Wales created ministerial portfolios that focus on Net Zero and decarbonisation following the May 2021 elections.

#### Box 4.1

#### Policy progress in Scotland, Wales and Northern Ireland

The past year has seen significant developments in climate policy in Scotland, Wales and Northern Ireland, even in the midst of the response to the pandemic. This box sets out major climate policy developments since our 2020 Progress Report.

##### Scotland:

- The Scottish Government committed to significant spending in low-carbon areas in its **Budget and Programme for Government**, including £1.8 billion for low-carbon infrastructure and £1.6 billion for heat and energy efficiency measures (or: including £2 billion to decarbonise travel and heating, and promote woodland creation).<sup>1,2</sup>
- Published an **update to the Climate Change Plan** to integrate the 2045 Net Zero target and new interim targets into the plan for the delivery of Scottish emissions reductions until 2032. The update aligns sectoral emissions pathways to the higher ambition of the 2045 goal. We will scrutinise elements of that update in our 2021 Scottish Progress Report.<sup>3</sup>
- Following the May 2021 election, the Scottish Government created a new cabinet position for **Minister for Net Zero, Energy and Transport**, with a portfolio that includes the delivery of Net Zero and COP26, as well as transport, biodiversity, infrastructure and circular economy.
- The **Just Transition Commission** published its final report, and the findings from **Scotland's Climate Assembly** are due to be published around the same time as this Progress Report.<sup>4</sup>
- Scotland's **Draft Heat in Buildings Strategy** was published, setting out a pathway for achieving Net Zero emissions in Scotland's buildings.

##### Wales:

- The Welsh Government legislated a **2050 Net Zero target** and a set of targets on the pathway to that goal, in line with the Committee's advice.<sup>5</sup>
- Published a **Transport Strategy (Llwybr Newydd)**, which places decarbonisation by 2050 at the centre of transport and infrastructure planning.<sup>6</sup>
- Published 'Beyond Recycling', a **circular economy strategy** that sets out policy to promote resource efficiency and make Wales 'zero waste' by 2050.<sup>7</sup>
- Continues to work on the second **Low Carbon Delivery Plan**, which will outline the delivery of the Second Welsh Carbon Budget and beyond.

- Following the May 2021 election, the Welsh Government has created a new cabinet position **Minister for Climate Change**, with responsibilities including decarbonising transport, the housing sector and energy generation.

#### Northern Ireland:

- The Executive requested the **Committee's advice on setting emissions targets** that reflect Northern Ireland's equitable contribution to the UK's 2050 Net Zero target. We published this advice in December 2020.<sup>8</sup>
- The Northern Ireland Assembly is in the process of legislating a **Climate Change Bill** before the next Assembly election in 2022. The Committee will continue to provide evidence throughout the legislative process.
- In March 2021, the Northern Ireland Executive consulted on an **Energy Strategy** and published a set of **decarbonisation scenarios** that would see Northern Ireland's energy systems reach net-zero carbon by 2050. The final strategy is scheduled for publication in November 2021.<sup>9,10</sup>

## b) Judging progress towards the Sixth Carbon Budget

We have assessed Government progress towards the Sixth Carbon Budget by judging whether sufficient ambition is in place, and whether policy is being developed to meet that ambition, for each source of abatement in the CCC pathway to Net Zero\*. Figure 4.3 illustrates our assessment of progress against required emissions abatement, and Table 4.5 sets out our scoring and justification across some of the most significant sources of abatement in the economy. We find a mixed picture:

- **Ambition is beginning to align with what is needed, although there is more limited action or major risks** for almost half of the abatement in the CCC pathway (e.g. heat networks, emissions from landfill and waste incineration, developing greenhouse gas removals). Precise intentions still need to be clarified for around a third of the remaining abatement that is broadly aligned with the targets (e.g. zero-emission cars, energy efficiency in buildings).
- **Progress in setting out policies is significantly behind ambition**, with less than one-fifth of the emissions savings for the Sixth Carbon Budget having policies that are 'potentially on track' or 'fully on track' for delivery (e.g. renewable electricity generation).
  - In many other areas, some policy plans have been set out but these lack detail and/or do not comprehensively cover the necessary set of issues (e.g. in terms of funding, appropriate mechanisms, timing). Together, areas in which policy is in danger of falling behind cover over three-fifths of the emissions reduction required to 2035.
  - A further one-fifth of the emissions reductions still have major policy gaps, including on demand-side action and tackling emissions from landfill and waste incineration. We highlight the need to fill a range of policy gaps in section 4.

Progress in setting out policies is significantly behind ambition, which is broadly on track with some important gaps.

\* The 'CCC pathway' refers to the Balanced pathway to Net Zero developed by the Committee in our December 2020 report, CCC (2020) *Sixth Carbon Budget – The UK's path to Net Zero*.

Table 4.4 provides an overview of the scoring criteria which informed the Committee's judgement in Figure 4.3. A list of scores for all sources of abatement is available in the supplementary materials accompanying this report.

Effective policies must be developed at greater pace. The path to Net Zero requires a rapid scale-up in low-carbon investment and low-carbon choices across the economy. Government must lead that change with more urgency than we have seen so far, and **speed up delivery, which will need to accelerate even where ambition is broadly on track**, for example:

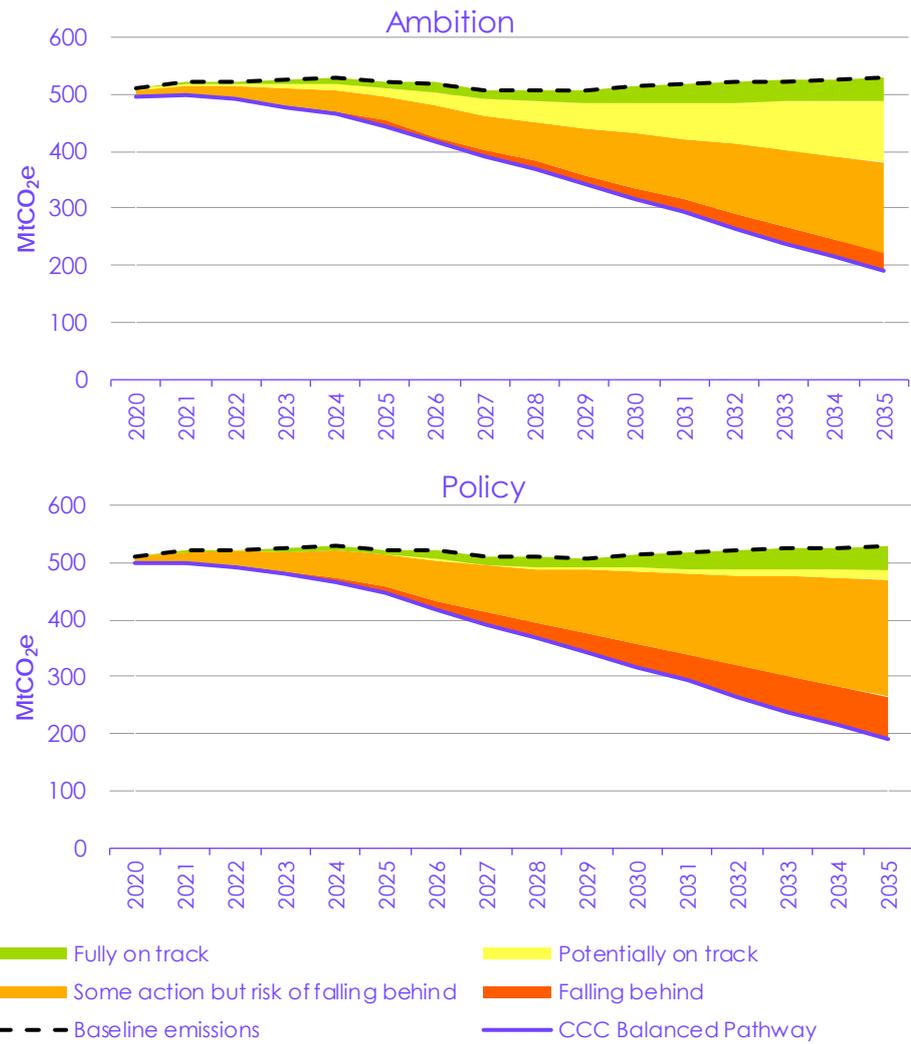

- Although the Government's 2030 target for **offshore wind** is in line with the CCC pathway, a minimum of 4 GW of additional offshore wind capacity will be needed each year from the mid-2020s onwards, significantly greater than the current 2 GW per year.
- The Ten Point Plan set a direction to phase out new internal combustion engine van sales by 2030, which is broadly in line with the pace of the transition required to meet the Sixth Carbon Budget, provided only a limited role for hybrid vehicles is allowed beyond this point. However, the **battery-electric van** market share was only 2% in 2020.
- Government ambition on **tree planting**, which reaches 30,000 hectares of trees each year, is in line with the CCC pathway out to 2025 (although there is not yet a commitment post 2025) but only 13,000 hectares were planted in 2019/20.

Delivery is falling short even where ambition is broadly on track.

**Table 4.4**  
Scoring criteria for ambition and policy against each source of abatement in the CCC pathway

	High-level ambition	Specific policies in place (or imminent)
Fully on track, limited risks	Clear ambition <b>fully in line with or beyond CCC recommendations</b>	<b>Credible, proven policy</b> that is already working
Potentially on track, some risks	<b>Broadly in line with CCC recommendations</b> , subject to clarification	<b>Credible policy</b> in place (or imminent) <b>but not yet proven</b> , or <b>policy only covers the next few years</b> of scale-up but not out to Sixth Carbon Budget period (2033-37)
Some action, more significant risks	Some commitments but there are <b>gaps, or commitments are not ambitious enough</b>	<b>Policy in place</b> (or imminent) that is <b>limited in ambition</b> , or policy is in place but there are <b>risks of it ending without replacement</b>
Falling behind, major risks	<b>No, or very limited, ambition</b> stated	<b>None, very limited, or clearly ineffective policy</b> in place

Figure 4.3 Is Government progress on track?

Source: CCC analysis; CCC (2020) *The Sixth Carbon budget – The UK's path to Net Zero*.

**Table 4.5**

Ambition and policy progress on significant sources of abatement

	Abatement source	Ambition	Policy	Rationale
Surface transport	Zero-emission cars			The confirmation of a 2030 phase-out date is a welcome step, but policy is lacking for how to deliver it. The market share of new battery-electric cars reached 6.5% in 2020, up substantially from 1.6% in 2019.
	Demand-side behaviour change and modal shift			Despite the recent 'Gear Change' and 'Bus Back Better' strategies, Government focus on reducing the need to travel and increasing car occupancy is lacking. Substantial road-building investment continues and car demand is increasing.
Buildings	Residential – low-carbon heat in existing homes			UK Government has only set a clear fossil phase-out ambition for homes off the gas grid i.e. 15% of all homes. 600,000 heat pumps a year committed to by 2028, which is below the 900,000 required in the CCC pathway. Insufficient financial support planned for heat pumps or low-carbon heat networks.
	Residential – energy efficiency and low-carbon heat in new homes			Uplifts in buildings standards announced, but ambition lags for energy efficiency and airtightness, and legislation is not planned until 2024. Risks policy design may not drive heat pump uptake needed from 2021 – heat pumps were installed in 5% of new homes in 2020, far behind the 20% level required by 2021 in the CCC pathway.
	Residential – energy efficiency in existing homes			Success contingent on a comprehensive framework of standards, Energy Performance Certificates and Standard Assessment Procedure (SAP) being made fit for purpose to drive the right measures, and on a successor to the Green Homes Grant. Installations of loft and solid wall insulation are only a third of the rate needed by 2021 in the CCC pathway.
	Non-residential – energy efficiency and behaviour change			Commitments of 20% efficiency savings in business and 50% reduction of public emissions by 2032 are in line with the CCC pathway. Policy proposals only cover private-rented and larger buildings to date and there is little evidence for reduced energy demand at present.
Manufacturing and construction	Resource efficiency			The Waste Prevention Programme consultation sets out planned actions, but is not backed up with sufficient ambition on pace or estimated abatement, which is mostly not indicated.
	Energy efficiency			Abatement from energy efficiency in the Industrial Decarbonisation Strategy is in line with our Sixth Carbon Budget analysis, but it is not clear that this could be delivered by existing policies, such as Climate Change Agreements and the Industrial Energy Transformation Fund.
	Electrification			There is a lack of ambition on future levels of electrification, no specific business models have been developed and there is insufficient policy to address the cost issues around electrification.
	Hydrogen			Ambition potentially exceeds the level in the CCC pathway. BEIS have published updates on a potential hydrogen supply business model. The proposals could provide some support for hydrogen use in manufacturing but may falter as they are not designed for this purpose.

CCS in manufacturing and refining				The Industrial Decarbonisation Strategy has a target of 3 MtCO <sub>2</sub> captured from industry by 2030 that aligns to our advice. Government has also set out a 'minded to' position for an industrial carbon capture business model, although some aspects of the model are yet to be set out in detail.
Fuel Supply – electrification of oil and gas production				The North Sea Transition Deal stated an ambition of 50% emissions reductions by 2030 (from 2018 levels), which falls well below the underlying 68% in the CCC pathway. No credible policy has been implemented beyond the EU Emissions Trading Scheme, which alone was not sufficient to incentivise decarbonisation.
Electricity supply	Offshore wind			The Government's 40 GW target for 2030 is stretching, and Contracts for Difference (CfDs) have been working well to deliver capacity, though clarity is needed on the auction schedule and pathway of volumes to be procured to 2030.
	Other renewables			While onshore wind and solar are now eligible for CfDs, there is no clear medium- to long-term ambition. CfDs are a proven policy for delivering new capacity, but clarity is needed on the auction schedule and pathway of volumes to be procured to 2030.
	Nuclear			Government has made a commitment for at least one further plant and recognises the potential for advanced nuclear innovation. The CCC pathway assumes two large-scale plants are operational by the mid-2030s. Further clarity is needed on contracting models, and deployment of already contracted capacity is falling behind schedule.
	Dispatchable low-carbon generation			Government has committed to deliver at least one Power CCS project by 2030 but there is no equivalent for hydrogen, both of which fall short of the CCC pathway. No commercial deployment but trials are underway globally.
Agriculture and Land use	Diet change			There has been no stated ambition on the role of diet change in meeting climate targets or policy development aimed at diets.
	Peatland restoration			Defra's restoration target of 30,000 hectares by 2025 is less ambitious than the CCC pathway and there is no target beyond 2025. The ban on rotational burning introduced in May 2021 only covers 40% of all upland bog in England, while the commitment to end the sale of peat in horticulture by 2024 captures the amateur market only.
Aviation – demand management				No recognition that demand needs to be managed and several policies (e.g. proposed Air Passenger Duty reductions and airport expansion) are encouraging growth in the sector. Passenger-kilometres travelled per person have been increasing (pre-COVID-19) faster than can be accommodated in the CCC pathway.
Waste				Despite some progress in 2021, e.g. Defra's Waste Prevention Programme for England, delivery of key measures has been delayed and critical gaps remain. Recycling rates have stalled and Energy from Waste emissions are rising.
Removals				Recognition of need for removals but expected amount/timing unspecified. Growing innovation funding committed, but underlying policy frameworks and CCS infrastructure need urgent delivery.
<p> <span style="color: red;">■</span> = falling behind, major risks   <span style="color: orange;">■</span> = some action, more significant risks   <span style="color: yellow;">■</span> = potentially on track, some risks   <span style="color: green;">■</span> = fully on track, limited risks </p> <p>Notes: See Table 4.4 for further description of the 'ambition' and 'policy' scores given to each source of abatement.</p>				

### 3. Policy priorities and gaps

We have identified cross-cutting priorities, essential elements of the transition and significant policy gaps, alongside a detailed set of departmental recommendations for this Progress Report.

We recommend implementation of a Net Zero test to ensure policy is compatible with climate objectives.

Priorities include a Net Zero Strategy, a plan for a just transition and public engagement, a framework for local delivery and integration of adaptation in climate plans.

Through our analysis for the Sixth Carbon Budget and an updated assessment of progress for this report, we have identified a set of five cross-cutting policy priorities and seven essential elements of the Net Zero transition, as well as four significant policy gaps which require urgent action. We make a detailed and comprehensive set of approximately 200 recommendations for UK Government departments and the devolved administrations in the tables in the Annex to this report. These tables also include recommendations on climate change adaptation, which are covered in detail in the Adaptation Progress Report to Parliament.

#### a) Cross-cutting priorities

There is a need for a coherent approach to achieving Net Zero and to ensuring that all Government policies are compatible with the transition to Net Zero. Decisions on road building, fossil fuel production, planning and expansion of waste incineration are not only potentially incompatible with the overall need to reduce emissions but also send mixed messages and could undermine public buy-in to the Net Zero transition. We recommend implementation of a **'Net Zero Test'** to ensure that all Government policy decisions are compatible with the legislated emissions targets.

Several cross-cutting issues must be addressed to enable sector-specific strategies and plans to be rolled out effectively. These are essential in calibrating the public's expectations for what lies ahead and building broad public support for the changes:

- **A comprehensive Net Zero Strategy** is needed this year to fill gaps in ambition and pull together a coherent story of how sectoral efforts fit together to achieve the Net Zero target and interim budgets. The inclusion of international aviation and shipping in targets from the Sixth Carbon Budget and onwards allows for the first comprehensive look at a pathway to Net Zero covering *all* sectors. It should also commit to a 'Net Zero Test' to ensure that all Government decisions are compatible with the legislated emissions targets.
- **A plan for achieving a just transition** for people, workers, consumers and regions, which ensures that opportunities are taken to create jobs and improve the skills base while maintaining international competitiveness. Alongside this, a credible plan is needed for the fair funding of the transition, building on HM Treasury's Net Zero Review, as well as ensuring that investment is supported by strong financing.
- **Public engagement** around the need for climate action, the co-benefits to health of low-carbon choices, information about how individual actions can contribute to reducing emissions and involvement in decisions on how best to achieve a transition.
- **A framework for local delivery** to deliver ambitious climate objectives at different scales (i.e. devolved administrations, regions and local authorities), through workable business models, removal of barriers to action, dedicated resource and an approach that facilitates sub-national action to complement action at the national level.

The economic recovery following COVID-19 should accelerate the transition to Net Zero, avoiding harmful lock-ins and an overshoot in emissions.

- **Plans must make climate adaptation an integrated part of the transition to Net Zero.** Across multiple areas, and in particular on buildings and land use, there are benefits to thinking holistically about how policy can reduce emissions, while ensuring it improves resilience to the UK's changing climate. Like Net Zero, climate adaptation will also need to be integrated into core Government policy.

The Government must also ensure that public funding and investments to encourage an economic recovery are consistent with its Net Zero commitments and the need to adapt to climate change, and avoid harmful lock-ins in emissions or stranded assets. An overshoot in emissions relative to the CCC pathway as the economy recovers from the pandemic – as occurred following the financial crisis of 2008 – can be avoided with the right policies (Box 4.2).

## b) Essential elements of the transition to Net Zero

While progress is needed across a wide range of areas in order to get on track to Net Zero, there are several indispensable parts to the transition. We have identified seven priority areas for the Government, within the approximately 200 recommendations for the next year developed for this report, on which it is crucial that good progress is made. These are primarily focused on delivery:

Delivery priorities for the next year include EV charging infrastructure, a policy package for buildings decarbonisation, delivery mechanisms for land use change, comprehensive manufacturing policy, further auctions for low-carbon power, a hydrogen strategy and GGR support mechanisms.

- Develop and implement a comprehensive policy package to enable the delivery of the 2030 transition to **electric vehicles**, to build on the phase-out announcement and the positive response from automakers and motorists. This should include a full strategy for widespread deployment of charging infrastructure and a mandate requiring manufacturers to sell a rising proportion of zero-emission vehicles.
- Implement a comprehensive policy package for **buildings decarbonisation**, and enshrine the long-term standards framework in regulation and law, to finalise the roadmap for decarbonising the UK building stock.
- Implement comprehensive delivery mechanisms for landscape-scale **land use change for afforestation and peatland restoration** and a high take-up of **low-carbon farming practices**. This should cover mechanisms for private and public financing and a strategy to address non-financial barriers. Interim policies will be needed to avoid a hiatus in action while awaiting the implementation of the new mechanisms.
- Advance policy for **manufacturing decarbonisation** by establishing incentive mechanisms to support fuel switching, implementing CCS proposals, and initiating the development of product and construction standards both to improve energy and resource efficiency and to develop the option of managing carbon leakage by applying carbon policy to imports.
- Continue **auctions for low-carbon capacity**, together with supporting actions to enhance system flexibility, to deliver an emissions intensity of 50 gCO<sub>2</sub>/kWh or better in electricity generation by 2030.
- Deliver a **Hydrogen Strategy** that sets out a vision of the role of hydrogen on the path to Net Zero and the steps needed to realise it. The strategy should focus on hydrogen use in sectors that cannot decarbonise without it and low-carbon hydrogen production routes to 2035 with aims to start large-scale hydrogen trials in the 2020s.

- **Enable domestic engineered greenhouse gas removals (GGR)** to contribute to UK carbon budgets and Net Zero, and establish GGR support mechanisms and monitoring, verification and reporting (MRV) structures in the UK that ensure that GGR is timely, sustainable and verifiable.

### c) Gaps that must be addressed

Key gaps that must be addressed include phasing out unabated gas power generation, public engagement and encouraging behaviour change, addressing emissions from EfW and a Net Zero aviation strategy that addresses airport capacity.

Our assessment of strategies and policies announced to date has identified specific key gaps that need to be addressed by Government policy:

- Commit to **phasing out unabated gas-fired electricity generation** by 2035, subject to ensuring security of supply. Publish a comprehensive long-term strategy for unabated gas phase-out, including ensuring new gas plant are properly CCS- and/or hydrogen-ready as soon as possible and by 2025 at the latest, and thoroughly assessing the market challenges that will emerge.
- Include contributions in the Net Zero Strategy from **demand-side action** – on aviation, a shift towards healthier diets and a switch away from cars towards active travel and public transport. This should be accompanied by public engagement to explain how low-carbon choices can contribute to Net Zero and wider co-benefits to health, and policy frameworks that seek to encourage and incentivise these changes.
- Address with urgency the rising emissions from, and use of, **Energy from Waste (EfW)**, including by ensuring that the capacity and utilisation of EfW plants is consistent with necessary improvements in recycling and resource efficiency, providing support to enable existing EfW plants to begin to be retrofitted with CCS from the late 2020s, and introducing policy to ensure that any new EfW plant are built either with CCS or are 'CCS ready'.
- The overdue **Net Zero Aviation Strategy** must set out credible pathways and policies to encourage technological development in the sector but also recognise the potential need to manage aviation demand in future, should improvements in sustainable aviation fuels and low-carbon aircraft fall short of Government and industry ambitions. An assessment of the UK's airport capacity strategy and a mechanism for aviation demand management should be part of the aviation strategy.

Section 4 of this chapter provides further insights into our assessment of progress in each sector, identifies policy priorities and gaps and provides context for the sectoral recommendations for the next year.

## Box 4.2 Policy for a 'green recovery'

The pandemic and the public health response have had far-reaching consequences for the UK and global economy. As economies locked down, the world has seen recessions, lost jobs and higher Government debt.

This has resulted in a shift in the underlying conditions for reducing emissions and adapting to climate change. Although we are now seeing the start of an economic recovery in the UK, with the Bank of England predicting a 7.25% increase in GDP in 2021, this follows on from a 9.9% decline in 2020.<sup>11</sup> Government support to businesses and individuals affected by the pandemic has boosted the prospect of an economic recovery but also resulted in increased fiscal pressures (Government borrowing reached £355 billion in 2020-21 and is expected to be £234 billion in 2021-22). The pandemic has also highlighted existing wealth- and health-inequality and opened up new dimensions of inequality that were previously perceived as being less significant (for example the ability to work at home, quality of housing, or access to gardens and green spaces).

The Committee previously set out six principles to help guide the recovery in this economic context. These principles remain a useful framing for thinking about short and longer-term recovery from the pandemic:

- **Use climate investments to support the economic recovery and jobs.** Government can act to bring forward investment needed to reduce emissions and manage the social, environmental and economic impacts of climate change, often without direct public funding or by co-financing to accelerate private investment.
- **Lead a shift towards positive long-term behaviours.** There is an opportunity to encourage a 'leap forward' rather than a return to business as usual, on some of the new social norms resulting from the pandemic that benefit wellbeing, improve productivity, and reduce emissions, especially for travel. Government can lead the way through its own operations, public communications and infrastructure provision, and investing in measures to facilitate social distancing on public transport.
- **Tackle the wider 'resilience deficit' on climate change.** Comprehensive plans to reduce emissions and to prepare for climate change are not yet in place. Strong policies from across Government are needed to reduce our vulnerability to the destructive risks of climate change and to avoid a disorderly transition to Net Zero. Business must also play its part, including through full disclosure of climate risks.
- **Embed fairness as a core principle.** The crisis has exacerbated existing inequalities and created new risks to employment in many sectors and regions, placing even greater priority on the fair distribution of policy costs and benefits. The benefits of acting on climate change must be shared widely, and the costs must not burden those who are least able to pay or whose livelihoods are most at risk as the economy changes.
- **Ensure the recovery does not 'lock-in' greenhouse gas emissions or increased climate risk.** It is right that actions are taken to protect jobs and industries in this immediate crisis, but the Government must avoid 'lock-in' to higher emissions or increased vulnerability and exposure to climate change impacts over the long term. Support for carbon-intensive sectors should be contingent on them taking real and lasting action on climate change, and new investments should be resilient to climate change.
- **Strengthen incentives to reduce emissions when considering fiscal changes.** Changes in tax policy can aid the transition to Net Zero emissions. Many sectors of the UK economy do not currently bear the full costs of emitting greenhouse gases. Revenue could be raised by setting or raising carbon prices for these sectors, and low global oil prices provide an opportunity to offset changes in relative prices without hurting consumers.

The UK has taken initial steps towards a green recovery, in line with the principles we set out:

- Doubling the capacity to be contracted in this year's **Contract-for-Difference (CfD)** auction for renewable electricity to up to 12 GW.

- An initial £250 million of funding out of a package of investment of £2 billion over five years for new **cycling and walking** infrastructure and a £5 billion funding package over five years to improve **bus services** and cycle links across the country.
- £40 million of funding for **nature-based investments** such as tree planting and peatland restoration via the Green Recovery Challenge Fund, as well as a £10 million Natural Environment Investment Readiness Fund to encourage private sector investment in nature.
- £5 billion of investment over five years on **flood protection**.
- The **Green Homes Grant** scheme, which provided grants to support investments in greening residential and public buildings, was announced in September 2020 with a budget of £2 billion. However, it reached just 10% of the 600,000 homes it set out to improve and was cancelled by the Government in March 2021. The Government must learn from this experience to develop a replacement to the Green Homes Grant that works (Box 4.3).

Other Government announcements could also contribute to fund a green recovery, if the right rules are developed and put in place:

- A capital investment **super deduction** was announced in the March Budget, which aims to bring forward capital investment in plant and machinery. The transition to Net Zero will be capital intensive, but the super deduction in its current formulation does not rule out investment in high-carbon assets, which could lead to lock-in of higher emissions from these assets.
- The remits of the **Bank of England's Monetary Policy Committee (MPC)** and **Financial Policy Committee (FPC)** were updated to reflect the Government's economic strategy to achieve economic growth that is consistent with Net Zero. The MPC remit update could tilt the preference of the central bank's asset purchases towards low-carbon assets, potentially lowering borrowing costs for these assets.
- A **National Infrastructure Bank (NIB)** with £12 billion in capital and the aim of funding £40 billion worth of public and private projects was announced, with a remit to encourage Net Zero. The NIB is forecast to invest £1.5 billion a year<sup>12</sup>, only a fraction of the investment previously provided by the European Investment Bank each year (around £7 billion), which the UK lost access to after EU exit.
- The Government is issuing **green sovereign bonds** for the first time, committing to issuing £15 billion worth of green bonds in 2021. The rules on what will count as green spend have not been announced. This guidance should ensure that revenue raised through green bonds is used to fund policies that will genuinely contribute to Net Zero.

While fiscal pressures remain, overall UK investment continues to be low. More can be done to boost private investment and increase tax revenues while accelerating decarbonisation. Government announcements, while encouraging, do not go far enough to deliver the level of decarbonisation needed to achieve Net Zero.

## 4. Sectoral progress and next steps for policy

This section revisits key sectoral priorities and gaps identified in the Sixth Carbon Budget policy report and sets out progress since.

The Committee's December 2020 report, *Policies for the Sixth Carbon Budget and Net Zero*, set out comprehensive proposals for policy development across all sectors. This continues to be a relevant guide to policy development. This section revisits key sectoral priorities and gaps identified in the Sixth Carbon Budget policy report and sets out progress since, in sectors where significant developments have occurred. There are no specific sections for shipping and F-gases as material progress has not occurred in these sectors since December 2020 – here the Sixth Carbon Budget policy report continues to be our most up to date assessment of progress and priorities.

Based on this assessment we have put together approximately 200 recommendations for UK Government departments and the devolved administrations. Key priorities within these recommendations were set out in section 3 of this chapter, and the full lists of recommendations are in the Annex to this report.

### a) Surface Transport

We have set out the core requirements of a policy package in transport in the Sixth Carbon Budget policy report. The past year has seen considerable progress in the ambition and strategy for decarbonisation of the UK's transport sector, although specific policies and delivery plans are now needed to deliver on this increased ambition. Key progress over the past year has included:

- The commitment to a 2030 phase-out date for new petrol and diesel cars and vans in the Government's Ten Point Plan for a Green Industrial Revolution. Provided the focus is on a transition to fully electric vehicles (EVs) and the role allowed for hybrids is limited, this should deliver a transition which meets our Sixth Carbon Budget trajectory and delivers cost savings to society. Detailed supporting policies and implementation plans are now required, including:
  - A Zero-Emission Vehicle Mandate, requiring manufacturers to produce a rising percentage of EVs each year, alongside more ambitious CO<sub>2</sub> emissions regulations.
  - Support continues to be offered for purchases of plug-in cars and has been extended to 2022-23, although the maximum value of these grants was recently reduced by £500 to £2,500. Sustained financial support for the cleanest vehicles and disincentives to drive higher emitting cars will help shift the market.
  - The Ten Point Plan also confirmed plans to support the development of UK-based EV supply chains (including giga-factories for battery production) and to accelerate charge point roll-out with increasing focus on on-street charge points near homes and workplaces. A coordinated national strategy for charging infrastructure is needed, to ensure that provision is sufficient and appropriate across all regions of the country and that deployment is meeting the needs of the consumers who rely on public charging (in particular those without private off-street parking).

The commitment to a 2030 phase-out of new petrol and diesel cars and vans is welcome. The focus needs to be on fully battery-electric vehicles, rather than hybrids.

Now is an opportunity to reinforce the increase in walking and cycling and positive public responses to lower air pollution following the pandemic.

Public transport will need support to rebuild public confidence and avoid a car-led recovery.

Trials of zero-carbon HGVs will generate data on the best options for this sector. In the short-term, efficiency and logistics improvements are also needed.

- The Gear Change strategy<sup>13</sup> set out Government's vision for increasing active travel and using modal shift as a cost-effective way of reducing transport emissions.
  - The focus on high-quality infrastructure that would provide an attractive alternative to car use and on delivery through Local Authorities (including recognition that different solutions will be appropriate for different areas) within this strategy are important.
  - Government should reinforce the increase in walking and cycling, and positive public responses to reduced air pollution, that occurred during the COVID-19 pandemic to deliver lasting longer-term travel behaviours.
- The Bus Back Better strategy<sup>14</sup> aims to improve services across the country, including through better connectivity, simplified fares and increased use of prioritisation measures, to encourage more people to use the bus, rather than the car, as we build back from the COVID-19 pandemic.
  - This strategy included funding for UK production and purchase of zero-emission buses and was accompanied by a consultation<sup>15</sup> on phasing out new sales of diesel buses.
  - Further empowerment of, and support for, Local Authorities is likely to be needed to deliver improvements to bus services and simultaneously continue driving zero-emission bus take-up.
  - The public transport sector will require particular support to rebuild public confidence in its safety and avoid a car-led recovery. Bus and train operators may need further support as social distancing rules reduce capacity and impact profitability.
- The Scottish Government's Climate Change Plan Update<sup>16</sup> included a commitment to reduce car-kilometres by 20% by 2030. A comprehensive package of measures to support active travel, shared mobility and public transport, as well as reducing the need for some types of journey, will be needed to deliver this transformation.
- The Welsh Government launched LLwybr Newydd: the Wales Transport Strategy,<sup>17</sup> setting out its intention to improve the quality, reliability and affordability of public transport and provide better active travel and EV charging infrastructure to encourage people to switch to more sustainable modes of transport.
- The Ten Point Plan also committed £20 million in initial funding for trials of zero-emission heavy-goods vehicles (HGVs) and promised an upcoming consultation on a phase-out date for new sales of diesel HGVs.
  - This funding is being made available through two innovation competitions – one<sup>18</sup> proposing to test battery-electric trucks in real-world operation, and a second<sup>19</sup> to conduct pre-deployment planning for separate trials of an electric road system and hydrogen fuel-cell HGVs.

- Separate development and demonstration projects have also received funding this year, including Advanced Propulsion Centre grants<sup>20</sup> for development of electric HGV propulsion systems with better range and improved energy efficiency and a commitment<sup>21</sup> to establish a hydrogen transport hub in the Tees Valley.

The Transport Decarbonisation Plan will be important in setting out how the Government plans to deliver Net Zero across the whole transport system.

The upcoming **Transport Decarbonisation Plan** is expected to provide further detail on how the Government plans to deliver Net Zero for the transport sector.

Alongside this, it will be important to embed the positive behavioural changes that have been developed during the COVID-19 pandemic, but also to act decisively to mitigate those more negative consequences which could jeopardise the sector's decarbonisation pathways. Key priorities as the economy emerges from the pandemic should be:

- To restore confidence in and use of public transport. This is important not only for transport emissions, but to ensure all people have access to affordable and safe transport.
- To prioritise funding away from car use. The costs of car travel have fallen relative to both average wages and to bus and rail.<sup>22</sup> This needs to be rebalanced away from cars, the most carbon-intensive mode, and towards public transport and walking and cycling.
- To encourage behaviours that reduce travel demand such as working from home or using technology in place of business trips. Prioritisation of investment in improved digital connectivity rather than road-building would help achieve this, contributing towards a greener recovery.
- To encourage behaviours which improve efficiency of travel such as increased car sharing.

## b) Buildings

We have set out the core requirements of a policy package in buildings in the Sixth Carbon Budget policy report. UK Government's Heat and Buildings strategy, which was originally due by summer 2020, had not been published as this year's Progress Report was being finalised.

At its core, the strategy needs to set out the trajectory of standards on energy efficiency and heating emissions with policy proposals to deliver on this ambition in a way that works for households. It must signal a clear route to expanding heat pump and heat network supply chains now, while kicking off the process to clarify the role for hydrogen in any locations where it may be a viable option, as well as those where it is not. There are critical questions to resolve around who pays for buildings decarbonisation, along with considerations around how to ensure resilience measures are integrated and co-benefits (e.g. for health and fuel poverty alleviation) maximised.

## i) Key developments in the past year

### Strategy and implementation

A number of important publications have been released over the past year including the Ten Point Plan, the Energy White Paper, the Scottish Government Draft Heat in Buildings Strategy, consultations on new build standards, the Northern Irish Energy Strategy consultation and the Welsh plan on tackling fuel poverty – amongst others. Developments have included the following:

Key developments over the past year have included a commitment to phase out the installation of natural gas boilers by 2035 UK-wide, and to require zero or near zero carbon heating from as early as 2025 in Scotland.

BEIS and the Scottish Government have developed new proposals for energy efficiency standards for owner-occupied homes, with further proposals from BEIS for an in-use performance scheme for large commercial buildings.

- **Owner occupier energy efficiency.** The Scottish Government committed to consulting on detailed proposals for requiring owner-occupied private housing to meet Energy Performance Certificate (EPC) C at trigger points such as point of sale from 2023-25 onwards, with a backstop standard by 2035.\* UK Government consulted on a framework for lenders to disclose the energy performance of their portfolios, and on an associated target for all lenders to meet a portfolio average of EPC C by 2030. The Energy White Paper also announced a commitment to consult on regulatory measures to improve the energy performance of owner-occupied homes.
- **Private rented sector energy efficiency.** UK Government consulted on requiring all properties with new tenancies to meet EPC C from 2025, with properties for all tenancies required to reach the standard by 2028. The Scottish Government also committed to requiring private-rented sector properties to meet EPC C by 2028. The 2020 Energy White Paper confirmed that the future trajectory for the non-domestic minimum energy efficiency standards will be EPC B by 2030 – BEIS are now consulting on proposals to tighten enforcement and an interim target.
- **Energy efficiency in social homes.** The UK Government Social Housing White Paper commits to reviewing whether the Decent Homes Standard should be updated and how it can better support decarbonisation and energy efficiency. In Scotland, plans were announced to bring forward the review on strengthening the EPC B target. The Welsh Government launched the optimised retrofit programme to pilot approaches to retrofit.
- **Other commercial energy efficiency.** BEIS have published proposals for a new in-use performance rating for commercial and industrial buildings over 1,000 square metres, with a view to introducing standards on in-use performance based on the successful Australian NABERS scheme and in line with our advice. Success relies on absorbing lessons from the original scheme, including the role of public procurement in establishing the standard.
- **Metrics.** UK Government published the EPC action plan examining the steps needed to improve the reliability, impact, and data infrastructure of EPCs. The Scottish Government also committed to consult on proposed reforms to EPCs in 2021.
- **New buildings.** UK Government has announced an interim standards uplift for new homes to apply from 2021, and proposed to legislate in 2024 for the Future Homes Standard to be introduced in 2025. This standard will require carbon savings of 75% relative to today and the Government plans to consult on whether to end gas grid connections to new homes built from 2025. UK Government have also consulted on the Future Buildings Standard, with implementation proposed as starting in 2025. Consultations have also been undertaken in the devolved administrations, with the Scottish Government targeting new buildings consented from 2024 for zero emissions heating (and cooling).

\* A range of commitments here and elsewhere have been made around requiring homes to meet an EPC C standard, which is broadly consistent with the level of home insulation in our pathways, provided EPCs are made fit for purpose. This means that they must be designed to drive deployment of the necessary energy efficiency measures - all practicable lofts and cavities insulated alongside other low-regret measures, with solid wall insulation deployed where this supports low-carbon heat and wider benefits; to do so on a holistic basis (i.e. to address issues such as overheating and ventilation simultaneously); whilst not disincentivising low-carbon heat or treating onsite generation as a replacement for energy efficiency or low-carbon heat. See below for further discussion.

- **Low-carbon heat.** The Scottish Government have proposed regulations to require installation of zero or near zero emissions heating in existing buildings at trigger points (such as heating system replacement) from 2025, with a backstop requirement for all buildings to meet this standard no later than 2045. UK Government have set an ambition for all newly installed heating systems from the mid-2030s to be low carbon, or appliances which can be converted to a clean fuel supply. UK Government have also announced an ambition to deliver 600,000 heat pump installations per year by 2028, alongside plans for hydrogen trials from 2023 and a plan to consult on the role of hydrogen-ready appliances. The details of the Green Gas Support scheme, supporting biomethane, have also been announced.
- **Heat networks.** BEIS is finalising proposals for the £270 million Green Heat Network Fund, which will shift the focus away from gas Combined Heat and Power to lower-carbon networks. The Heat Networks Bill is going through the Scottish Parliament, including ambitious proposals for zoning.
- **Skills.** The Green Jobs Taskforce was launched, with a commitment to publishing an action plan this spring.
- **Wood in construction.** The England Trees Action Plan commits Government to developing a policy roadmap on use of timber in construction, to increase public demand for sustainably sourced timber through procurement policies and to conduct further research.

A full table of progress to date against the CCC's previous recommendations can be found in supplementary material published alongside this report. It should be noted that the ratings are assigned on the basis of UK progress, reflecting the majority position. For this reason they often do not, in isolation, reflect the pace of progress in the devolved administrations. Nevertheless, following publication of the Draft Heat in Buildings Strategy, it remains the case that Scotland demonstrates a strong example of action to develop an effective policy framework. We will comment on progress in Scotland in more detail in our Scottish Progress Report in late 2021.

While important progress on ambition has been made or is imminent, effective policy has yet to be designed or implemented in many areas.

HM Treasury committed over £3 billion of public funding in the 2020-21 financial year to buildings decarbonisation as part of the Green Recovery. This included over £1 billion for public sector decarbonisation, alongside home efficiency schemes.

### Delivery and the Green Recovery

The case for investing in buildings retrofit as part of economic recovery remains strong – there are major benefits in terms of emissions reduction, cost savings and wider benefits; it is labour-intensive and spread across the country. Fundamentally this is something that needs to happen on the path to Net Zero and supply chains are well below the levels they need to be at in order to deliver Government commitments on fuel poverty, energy efficiency and heat over the next decade.

Significant time pressure and issues with the private sector contractor led to the £1.5 billion Green Homes Vouchers scheme being scrapped prematurely with only £264 million allocated to date.

In recognition of these points, Treasury committed over £3 billion of public funding in the 2020-21 financial year, including over £2 billion grant funding for home retrofit and £1 billion funding for public sector decarbonisation.

The very significant time constraints for spending the funding have led to mixed results, with severe consequences for the Green Homes Grant voucher scheme due to the requirement to undertake the work before payment is issued:

- Where the decision was taken to commit spending by the end of the financial year but actually undertake the work in 2021/22, funds were successfully committed. This includes the £1 billion Public Sector

Decarbonisation Fund, the £500 million Local Authority Delivery programme for the Green Homes Grant, focussed on fuel poor, and the £50 million Social Housing Decarbonisation Fund Demonstrator.

- The £1.5 billion Green Homes voucher scheme was conceived as the only direct-to-household offer, with a requirement to undertake the work within the 2020/21 financial year. Major delivery issues with the private sector administrator led to the scheme cancellation in March 2021 with only £264 million allocated to date (of which £211 million to low income households).<sup>23</sup> The Government has agreed to honour existing vouchers meaning a portion of the spend will fall under the 2021/22 financial year.

It is essential that lessons are learnt. Government must now come forward with plans for a successor scheme in the next fiscal event, committing to long-term funding and taking sufficient time to develop and test a scheme so that we get one which works.

To avoid further harm to supply chains at this stage, it is essential that Government comes forward with plans for a successor to the Green Homes Grant voucher scheme in the next fiscal event— ensuring this time that it is thoroughly tested, provides a long-term funding commitment, and builds on lessons learnt (Box 4.3).

The initial success of the public sector scheme means that there is a template to build on now. Our scenarios imply funding levels of £1 billion a year through the next decade, with a growing role for low-carbon heat alongside energy efficiency. The next stages must now pivot to longer-term planning cycles, with clear roles for local authorities backed by funding, and strong integration with wider heat policy including the heat networks roll-out. The funding streams must also be designed so as to be accessible to smaller public bodies, who anecdotally have not had the resources to bid into the Public Sector Decarbonisation Scheme and who have been affected by the merging of Salix funding with this pot.\*

For the public sector, the key is moving now to longer term planning cycles, with clear roles for Local Authorities backed by funding, and strong integration with wider heat policy including the heat networks roll-out.

### Box 4.3

#### Lessons from the Green Homes Grant

The £1.5 billion Green Homes Grant voucher scheme opened for applications in September 2020, a few months after it was announced by the Treasury. It is the first publicly funded direct-to-household offer on home energy efficiency since the demise of the Green Deal scheme in 2015.

The scheme aimed to improve the energy efficiency of over 600,000 homes, with grants focussed on fabric efficiency measures and low-carbon heating primarily. Grants of up to £5,000 were issued, covering two-thirds of the cost. Households in receipt of certain benefits were eligible for grants of up to £10,000, covering 100% of the cost of improvements.

#### Lessons for the successor scheme

There are a number of important lessons to take into account in the design of a successor scheme, along with an important positive story on demand:

- **Demand for the scheme.** The scheme generated a significant amount of interest from the public, with close to 2 million views of the Simple Energy Advice GHG eligibility checker in a 4-month period and 170,000 measures applied for over seven months. By comparison, only 20,000 measures were funded through Green Deal loans between 2013 and 2015. Media reports covered people unable to apply due to the lack of local approved suppliers. The fact that it was announced by the Treasury may have helped raise the profile, along with the relative simplicity of the basic offer to consumers.
- **Timelines and the need for a policy package approach.** From the outset there were calls for the Treasury to extend the funding window beyond March 2021 to allow supply chains time to scale up and provide more certainty to businesses to invest, develop and retain skills in the sector. These calls were backed by significant

\* Salix funding provides Government funding to the public sector to improve energy efficiency, reduce carbon emissions and lower energy bills. Salix is funded by the Department for Business, Energy and Industrial Strategy, the Department for Education, the Welsh Government and the Scottish Government.

evidence of the negative impacts on home insulation markets from short-term subsidy schemes in England and Wales, including job losses of 30,000 following the end of the Green Deal. There is also evidence of poor-quality installations linked to the surge in funding in the final year of the Supplier Obligation schemes, which shows the impact of scaling up too quickly without the skills in place to deliver. Government can move forward by announcing a successor scheme in the next fiscal event alongside proposals for a timetable of standards, with funding designed to support market stability and long-term investment planning.

- **The need for testing with installers.** The timelines for getting the scheme up and running also put pressure on scheme development. In the £50 million Social Housing Decarbonisation Fund Demonstrator fund launched in parallel, market testing had already taken place through the Whole House Retrofit competition meaning there was evidence to draw on. A key learning from the Green Homes Grant voucher scheme is the need to workshop the consumer journey and practicalities with a group of installers/practitioners covering the core trades. This could have flagged a number of issues with the IT system including (but not limited to) the importance of being able to track existing applications, the difficulties with delivery around Christmas, and ways to streamline evidencing so as not to rely on consumers acting following installation.
- **Procurement and use of existing systems.** The issues with the scheme contractor are currently subject to review by the National Audit Office (NAO). There remain important questions over the procurement and contracting, as well as the decision not to make use of existing IT systems such as the one used on the ECO scheme, or to make more use of existing commercial relationships and expertise, including through local authorities.
- **Accreditation.** Households need to be confident that when they upgrade their property they will see genuine improvements and technology that works. Government has undertaken a considerable programme of work following the recommendations of the 2014 Each Home Counts review to improve standards and accreditation, notably through its support of the PAS2030 and PAS2035 standards overseen by Trustmark. The Microgeneration Certification Scheme (MCS) similarly has accredited installers of low-carbon heat under the Renewable Heat Incentive. However, there were a number of issues with the accreditation process for Trustmark, particularly for low-carbon heating measures already covered by MCS which created bottlenecks in the supply chain and meant that consumer demand remained unmet, with strong geographical variation.

It is essential that these lessons are taken into account in a successor scheme to create a long-term stable market which can deliver the major upgrade of the housing stock to EPC C over the next decade.

## ii) Next steps for buildings decarbonisation

As part of our Sixth Carbon Budget advice we set out our view of the four necessary components of a policy package for the decarbonisation of heat in buildings: setting a clear direction, making low-carbon financially attractive, implementing enabling measures, and getting on with it.

As summarised above, a number of important commitments have been made over the past year, but important gaps also remain at a UK level in every area:

- **A clear direction.** We do not yet have a long-term trajectory of standards in place to deliver the efficiency upgrades and fossil fuel phase-out that is needed. There is not yet a sufficiently strong commitment to the role of electrification – in particular, the current Government ambition of 600,000 heat pumps a year by 2028 will almost certainly fall short of the 2030 NDC

Major gaps include a clear trajectory of standards on efficiency and heat; funding proposals and interventions to make low-carbon choices attractive; green buildings passports and a governance framework to drive decisions on heat infrastructure and zoning from the mid-2020s, including a role for area-based energy plans.

target (given the lack of any stated ambition on heat networks) as well as falling short of the Committee's pathway to meeting the Sixth Carbon Budget.

There is no support in place now for commercial heat pumps over 45kW – a key supply chain.

- **Making low-carbon financially attractive.** There is currently no plan for how price signals will be reformed to drive low-carbon choices (i.e. to correct the current distortions that work against electrification), and a number of existing funding routes are set to fall away. A multi-year programmatic funding regime is needed to replace them. In particular, there are major risks given the lack of support mechanism for commercial heat pumps over 45 kW after the Renewable Heat Incentive closed to new applications. Grants of up to £4000 are unlikely to be sufficient for medium-sized installations up to 45 kW given capital costs of £750-1550 per kW.\* Equity and consideration of the fair distribution of costs will be critical to designing the price signal reforms and funding programmes necessary.
- **Enabling measures.** While progress has been made, more is needed to ensure householders have access to high quality information and can have confidence that work will be delivered to high standards. The forward roadmap should include plans for incorporating in-use performance and transitioning to green building passports.

EPCs are not fit for purpose – further reforms are essential.

- Government plan to increase the reliance on EPCs as a key policy lever. As such it is critical they are made fit for purpose, robust and enforceable and make use of energy consumption data. The EPC action plan is a positive step forward but further action is needed to ensure EPCs and Standard Assessment Procedure (SAP) deliver the energy efficiency measures needed and do so in a holistic way which supports (rather than disincentivises) low-carbon heat deployment and actively drives measures to simultaneously address ventilation, damp and overheating (rather than simply communicating risks). Onsite generation, such as solar PV, should not be treated as a substitute for energy efficiency or low-carbon heat, and needs to be valued proportionately to its benefits (factoring in seasonality and any on-site storage). Biomass boilers must not be encouraged in areas where they will impact public air quality and biofuels in buildings should be minimised (for example, through efficient use in hybrid heat pumps rather than 'drop-in' biofuel boilers) given our assessment of economy-wide best use being elsewhere.

Other barriers need to be addressed, including poor compliance and enforcement and the risk of high connection charges.

- The reforms in the Buildings Safety Bill create a framework to improve the efficacy of building regulations, including those relating to climate change mitigation and adaptation.<sup>24</sup> This should be strengthened through an explicit responsibility for sustainability alongside buildings safety and performance. It will be important to ensure the buildings safety regulator is sufficiently equipped to monitor and enforce compliance across all building regulations and to ensure that local authorities are properly funded for enforcement activities.
- Barriers to deployment of key measures, such as the risk posed by the current connection charging regime to the uptake of low-carbon technology such as heat pumps, need to be addressed.

\* Range based on an air-to-air heat pump at the lower bound, and a low-temperature air-to-water heat pump at the upper bound, Sixth Carbon Budget published dataset, available online.

It will be difficult if not impossible to develop the full mix of heat options (i.e. low-carbon heat networks and hydrogen alongside building-scale technology) without any planning or clear roles for local authorities, networks and other actors.

- **Getting on with it.** Recognition is needed of the importance of a geographically planned approach to heat decarbonisation, with plans introduced to deliver it. Commitments are lagging in areas with potential for early progress.
  - There is an urgent need to formalise a governance framework to drive decisions on heat infrastructure and zoning from the mid-2020s, including a role for area-based energy plans. This should be underpinned by a programme of research initiated in 2021 to identify areas unlikely to be suitable for hydrogen (a key enabler to efficiently targeting early electrification and network development) alongside priority candidate areas for hydrogen.
  - Levers such as the 2021 buildings standards uplift have potential to drive early growth in heat pumps, but it remains unclear to what extent they will do so.

The priority now must be on implementing a comprehensive policy package, and enshrining the long-term standards framework in regulation and law, to finalise the roadmap for decarbonising the UK building stock.

Climate adaptation and resilience is an essential part of this, including good ventilation to manage overheating risks, green sustainable urban drainage systems and water efficiency measures.

Progress in decarbonising buildings must go hand in hand with adapting them to the changing climate. An integrated approach to housing and thermal comfort is required to manage overheating risk and ensure good ventilation.\* Programmes to improve energy efficiency of the housing stock provide an opportunity also to undertake work to adapt properties to possible heat and flood risks and improve water efficiency.

## c) Manufacturing and construction

This year has seen a substantial increase in the Government's stated ambition on decarbonisation of manufacturing. However, progress on developing and delivering policy has been slower than required with large gaps in policy remaining.

### i) Progress in the past year

In March, the Government's Industrial Decarbonisation Strategy (IDS) set out ambition to reduce emissions from manufacturing and refining by around two thirds by 2035 from 2018 levels. This represents a substantial step forward in the Government's ambition, but it is still below the CCC pathway, in which the equivalent emissions are reduced by 73% by 2035.

Underlying this ambition, the Government has made several commitments in the past year to deliver fuel switching, CCS and energy and resource efficiency, through the IDS, Waste Prevention Programme and business model updates.

- **Fuel switching.** The IDS set an ambition that at least 20 TWh of fuel use will switch to low-carbon energy by 2030, which is close to, but below, the 24.5 TWh in the CCC pathway.

The Government's Industrial Decarbonisation Strategy set out ambition to reduce emissions from manufacturing and refining by around two thirds by 2035 from 2018 levels.

\* High levels of energy efficiency measures installed in new and existing homes can increase the retention of heat and airtightness of the building. This can increase the risk of overheating and exposure to indoor air pollutants if appropriate adaptation and ventilation measures are not implemented at the same time.

Government has set out a 'minded to' business model for industrial carbon capture, but only and small commitment to 'set out initial steps to support uptake of electrification'.

- **Hydrogen.** Government has committed to consult on a hydrogen supply business model that would incentivise hydrogen use by subsidising the cost of hydrogen production.
- **Electrification.** Government has made a smaller commitment to 'set out initial steps to support uptake of electrification'. It also committed to publish a call for evidence on energy affordability and fairness, by April 2021, which may consider the distribution of energy levies and taxes.
- **Mandatory requirements.** Government has committed to explore the option of making it a mandatory requirement for upgraded equipment to be low-carbon ready in the 2020s, which is also likely relevant to CCS.

- **CCS.** The IDS set an ambition for around 3 MtCO<sub>2</sub>e of industrial CCS by 2030, which is broadly in line with the CCC pathway\*. The Government also set out a 'minded to' position for an industrial carbon capture business model, although some aspects of the model are yet to be detailed.
- **Resource and Energy Efficiency.** The Waste Prevention Programme consultation proposed policies to improve resource efficiency, although the sectoral scope of these proposals is often limited, the pace of proposals modest and the emissions impact is not estimated. Further details are set out in sub section (f) on waste. Government also agreed an updated set of Climate Change Agreements with industry to encourage energy efficiency.
- **Material Substitution.** The England Trees Action Plan commits Government to developing a policy roadmap on use of timber in construction and to increase public demand for sustainably sourced timber through procurement policies.

The Waste Prevention Programme consultation proposed policies to improve resource efficiency.

Government has also set out several plans that could provide cross-cutting support for different decarbonisation measures and maintaining industrial competitiveness:

- **Carbon and energy pricing.** The UK Emissions Trading System (UK ETS) launched at the start of the year. Government has committed to consulting by September 2021 on a cap for the UK ETS consistent with the Sixth Carbon Budget.
- **Product standards.** Government has committed to a call for evidence on low-carbon industrial product standards within a year, highlighting the potential for mandatory standards to be introduced in the mid-to-late 2020s.

Government has committed to consult on a target-consistent cap for the UK ETS and a call for evidence on product standards.

Government has made mixed progress with awarding **existing capital funding**. £170 million was awarded from the Industrial Decarbonisation Challenge, but progress awarding funding from the £315 million Industrial Energy Transformation Fund has continued to be too slow since its announcement in October 2018 and the £250 million Clean Steel Fund appears to have made no progress.

Overall, while progress has been made, development and delivery of policy to decarbonise manufacturing and construction will need to broaden and accelerate.

Overall, while progress has been made, development and delivery of policy to decarbonise manufacturing and construction will need to broaden to fill several policy gaps, and accelerate if it is to deliver abatement levels consistent with the CCC pathway.

\* Note that this 3MtCO<sub>2</sub>e of CCS includes CCS on refineries which falls within our Fuel Supply sector. We have compared to our pathway on an equivalent basis.

## ii) Next steps on manufacturing and construction policy

Our Sixth Carbon Budget policy report set out the core requirements of a policy package for decarbonising manufacturing and construction. In this subsection, we set out key near-term policy actions required to deliver the longer-term actions recommended in our Sixth Carbon Budget advice. Full details are set out in the tables of departmental policy recommendations at the end of this report. These policy actions should address the shortfalls of existing decarbonisation policy for manufacturing and construction, and ensure longer-term policy has the right ambition, delivers key measures, strengthens incentive mechanisms, maintains industrial competitiveness, and develops infrastructure and skills.

### **Ambition**

Government has stated that it will revisit its ambition for decarbonisation of manufacturing and refining in its Net Zero Strategy. It should take this opportunity to align its ambition with the CCC pathway for manufacturing or identify other areas of the economy to make up for this shortfall. The strategy must also set out the Government's ambitions and plans to decarbonise off-road mobile machinery.

It should also set out which policies will enable this ambition and quantify how much abatement Government expects to be enabled by each policy, particularly for resource and energy efficiency abatement through the 2020s.

### **Delivering specific measures**

Government should establish incentive mechanisms to support fuel switching, implementing CCS proposals and initiating the development of standards to improve energy and resource efficiency. The Government should:

- Establish funding mechanism(s) to support operational and capital costs of both electrification and hydrogen use in manufacturing, as soon as possible, with the aim of awarding funding in 2022. It should also deliver industrial carbon capture contracts to enable final investment decisions on the first industrial carbon capture projects in the first half of 2022.
- Consult on detailed proposals for product standards and extended producer responsibility to improve the resource efficiency of consumer goods' lifecycles by spring 2022. It should also implement policies to drive more resource-efficient construction and use of existing low-carbon construction materials, including a substantial increase in the use of timber in construction, on the same timetable. This should include finalising the reporting methodology for whole-life carbon standards for buildings, roads and infrastructure.

### **Cross-cutting incentives and maintaining competitiveness**

Government should also work towards strengthening its cross-measure incentive mechanisms and start to develop the crucial framework for maintaining long-term competitiveness, which will require development of measurement standards.

The Government should:

- Set a cap for the UK ETS consistent with the path through the Sixth Carbon Budget to Net Zero. It should also reform energy and carbon pricing for manufacturers not covered by the UK ETS, to provide a clear and strong incentive for decarbonisation.

Government should establish incentive mechanisms to support fuel switching, implementing CCS proposals and initiating the development of standards to improve energy and resource efficiency.

Government should also work towards strengthening its cross-measure incentive mechanisms and start to develop the crucial framework for maintaining long-term competitiveness, which will require development of measurement standards.

- Consult on reforms to electricity pricing to remove disincentives to electrification, based on consideration of the strategic and fair allocation of legacy policy costs associated with past deployment of less-mature low-carbon electricity generation. It should also consider the balance of existing taxes, such as the Climate Change Levy, on different energy sources.
- Start to develop the options of applying either border carbon tariffs or minimum standards to imports of selected emissions-intensive products. This should include developing carbon-intensity measurement standards, encouraging the international development of these (e.g. through the G7 and COP26 presidencies) and fostering international consensus around trade policies.

### Infrastructure, skills and jobs

Implementation of manufacturing decarbonisation will require development of supporting policies on infrastructure and skills, and a focus on jobs. The recommendations tables in the annex of this report detail our recommendations in full, capturing their cross-sectoral and cross-departmental nature:

- On infrastructure, Government should deliver the CCS Transport and Storage Regulatory Investment Model; develop plans for CO<sub>2</sub> transport from dispersed sites; deliver plans to ensure electricity networks can accommodate large localised increases in demand; and formalise the process for decisions on the conversion to hydrogen of (zones of) the gas networks.
