- On skills and jobs, Government should develop a strategy for the development and roll-out of manufacturing training and skills and design industrial decarbonisation policies to support and create jobs, especially in regions with reliance on industrial jobs.

## d) Agriculture and land use

While the UK Government and the devolved administrations have set out elements of their ambition to reduce emissions from land, there has been limited implementation of policy in these sectors over the past year. Key announcements on peat and trees in England were published in their respective Action Plans in May 2021.<sup>25</sup>

### i) Progress in the past year

#### Trees

The UK Government has committed<sup>26</sup> to the planting of 30,000 hectares of woodland per year by 2025 across the UK, in line with the CCC pathway:

- England's share is around 7,000 hectares per year based on Defra's commitment to treble tree planting rates from the 2,340 hectares achieved in 2019/20.
- The Scottish Government intends to deliver 18,000 hectares per year by 2024/25.<sup>27</sup> The Welsh Government's current ambition remains at 2,000 hectares a year, with a commitment to increase that to 4,000 hectares by

Implementation of manufacturing decarbonisation will require development of supporting policies on infrastructure and skills and a focus on jobs.

UK Government's afforestation targets are in line with the CCC pathway for 2025.

an unspecified time. Northern Ireland's target of 18 million trees during this decade averages 900 hectares per year.<sup>28</sup>

£500 million of funding has been committed through the Nature for Climate Fund to meet England's woodland creation target. Scottish Forestry will receive £100 million to reach its afforestation target and Northern Ireland launched a £4 million Small Woodland Grant Scheme.

£500 million from the Nature for Climate Fund will be the main source of public funding to meet England's woodland creation target to 2025. This will provide grants for conventional planting in urban and rural areas (including trees on farms), as well as natural colonisation. Focus will be given to the planting of native broadleaves, and extra funding will be provided for planting that can deliver wider benefits such as riparian shading (trees planted along water courses can reduce the risks to freshwater species from higher water temperatures), biodiversity, water filtration and flood risk alleviation.

To meet the 2024/25 afforestation target in Scotland, Scottish Forestry will receive £100 million, £30 million will go to Forestry and Land Scotland and £20 million to boost tree nursery capacity. Northern Ireland launched the £4 million Small Woodland Grant Scheme at the end of 2020 to encourage the integration of trees on farmland.

### Peat

Defra's new £50 million Nature for Climate Peatland Grant Scheme funded by the Nature for Climate Fund will support the Government's target for restoring 35,000 hectares of peatland in England by 2025. Of this area, around 5,000 hectares is expected to come from the restoration of lowland agricultural land to peat habitat.

The Government's peat restoration commitments for England falls short of the CCC pathway.

This falls short of the Committee's pathway for the restoration of 56,000 hectares of peatland in England by 2025, which includes 8,000 hectares of lowland rewetted to peat habitat. Defra is expected to publish details on the options to manage sustainably the area of lowland peat that remains in agriculture in 2022.

Legislation introduced in May 2021 prevents the rotational burning of certain blanket bog sites in England with immediate effect.\* The partial ban covering an area of around 142,000 hectares accounts for around 40% of all blanket bog in England.<sup>29</sup> Of the area covered by the ban, around 52,000 hectares hold a live consent to burn, with the remainder either being subject to a consent that is not exercised or has no current relevant consent. This partial ban is less ambitious than our recommendation that all rotational burning in England and the devolved administrations should cease immediately. Data on the area of land that is burned each year is poor as the requirement to notify the authorities only covers newer consents.

The Government's partial ban on rotational burning of peat is less ambitious than the CCC's recommendation that all burning in England and the devolved administrations should cease immediately.

The sale of peat in compost is to end in England by 2024 subject to a consultation later this year on a range of measures to achieve this. The consultation will also consider extending the sales ban to the professional market, by an as yet unspecified date. These proposals are less ambitious than our recommendation that all peat extraction, along with its sale in both the amateur and professional horticultural market should end by 2023. This should also apply to imported peat, which makes up two-thirds of peat sold in the UK.

In Wales, between 600-800 hectares of peat will be restored annually between 2020 and 2025 under the Government's National Peatland Action Programme (NPAP). Launched in November 2020, around 680 hectares was directly delivered through the NPAP in 2020/21.

\* Sites of Special Scientific Interest that are also a Special Area of Conservation or a Special Protection Area.

Pilots focused on delivering eight land-based management standards are being funded through the Sustainable Farming Incentive ahead of national roll-out in 2022.

## Agriculture

Defra is funding pilots under the Sustainable Farming Incentive (SFI) this year ahead of a national roll-out in 2022. The SFI, which is part of the new Environmental Land Management Scheme (ELMS) will see farmers pilot actions focused on delivering eight land-based management standards covering arable land, grasslands, horticultural soils, hedgerows, agroforestry and water buffers. In addition to delivering emissions reduction and carbon sequestration, many of the actions will deliver other benefits such as improved wildlife habitat, reduced diffuse water pollution and improvements to air quality.

The Welsh Government introduced legislation to extend coverage of Nitrate Vulnerable Zones to all of Wales in line with our recommendation. In force since April this year, mandatory measures covering manure management and fertiliser use to reduce nitrate run-off into water courses will also deliver reductions in N<sub>2</sub>O emissions.

## Nature

Defra recently announced it will be amending the Environment Bill to require a legally-binding target for species abundance, aiming to halt the decline of nature by 2030.<sup>30</sup> This will apply to species within protected sites, the wider countryside and urban areas. The exact target level and broader details will be set in secondary legislation following consultation and further evidence gathering.

### ii) Next steps for decarbonising agriculture and land use

Existing ambition in England and the devolved administrations falls short of the trajectory needed to meet the Sixth Carbon Budget on the path to Net Zero. Ambition needs to be raised and gaps addressed quickly as delayed action now puts future targets at risk given the time profile of carbon sequestration. Policy voids should be addressed quickly (e.g. what will replace the Common Agricultural Policy in Scotland and Northern Ireland):

- Defra and the devolved administrations should set out targets for woodland creation and peat restoration beyond 2025. These bodies should work together to ensure that the combined levels are in line with the UK ambition set out in our Sixth Carbon Budget Advice (e.g. 30,000 hectares of new woodland each year from 2025, increasing to 50,000 hectares in 2035).
- Authorities should develop and implement further mechanisms to leverage private sector finance to help support woodland creation and peat restoration targets in England and the devolved administrations. This includes increasing participation in the Woodland Carbon Guarantee, and assessing the scope for and merits of including trees and peat in the UK Emissions Trading Scheme. Further development of the Peatland Code is needed to widen eligibility to a range of peatlands and enable accreditation by the UK Accreditation Service.
- The Sustainable Farming Incentive pilots are currently focused on land management actions. The pilots should be extended to include the full range of available low-carbon farming measures set out in our Sixth Carbon Budget advice, aimed at reducing other sources of emissions (e.g. enteric emissions from cattle and sheep). Future piloting of the Local Nature Recovery and Landscape Recovery schemes, which make up the other two ELM schemes should incentivise landscape-scale change such as afforestation and peat restoration.

Ambition in England and the devolved administration falls short of what is needed to achieve the Sixth Carbon Budget and Net Zero. Gaps must be addressed quickly given the time profile of carbon sequestration.

Gaps in ambition and policy include targets for woodland creation and peat restoration beyond 2025; extending the Sustainable Farming Incentive pilots to additional low-carbon farming measures; expediting legislation to ban rotational burning of all upland peat and ending the sale of peat for all horticultural use by 2023.

- Legislation to ban rotational burning of all upland peat sites in England (and elsewhere in the UK) should be expediated to come into force before the start of the burn season in October 2021. The ban on horticultural peat sales (including imports) should cover both the amateur and professional markets and be brought forward to start in 2023 – a year earlier than planned. Damaging peat extraction practices should stop for all uses by 2023. These recommendations apply to all of the UK.
- The ongoing Industrial Strategy Fund for agriculture (i.e. Transforming Food Production Challenge), and the roll-out of future productivity schemes such as Defra's Farming Investment Fund and the Innovation Research and Development Scheme must cover funding of measures to improve agricultural productivity while reducing the GHG impact of farming.
- Measures to address non-financial barriers to increase the take-up of low-carbon farming practices and land-use change need to be addressed. For example, both England and Scotland's respective Plans identified a range of barriers that could impede the planting of more trees, and work must now proceed to find solutions to address these.
- The Scottish Government should develop a new rural support scheme that builds towards its climate goals. The Northern Ireland Executive should set out the future direction of its post-CAP policy and how this will be used to deliver emissions reduction and carbon sequestration in the sector.

## e) Electricity Supply

The Sixth Carbon Budget report set out the key elements of a policy package to fully decarbonise electricity generation. That includes the need to follow the coal phase-out with phase-out of unabated gas generation while keeping pace with growing demand from electrification, by deploying variable renewable generation at scale, developing markets for dispatchable low-carbon capacity, and ensuring that the enabling infrastructure and market arrangements are in place to accommodate this.

### i) Progress in the past year

The main policy developments in the past year have been the publication of the Government's Ten Point Plan and Energy White Paper, which committed to increasing the capacity of offshore wind significantly over the coming decade. Progress was also made around the processes for delivering this, and on the longer-term future of electricity markets.

The Government has committed to increasing offshore wind capacity from 10 GW today to 40 GW by 2030, and to support power CCUS and additional nuclear investment.

- **Ten Point Plan and Energy White Paper.** These included headline commitments to increase the level of offshore wind capacity four-fold by 2030, to make onshore wind and solar eligible for low-carbon contracts once more, and to take forward carbon capture utilisation and storage (CCUS), nuclear, and demand-side flexibility.
  - **Offshore wind.** The Government committed to increasing capacity of offshore wind from 10 GW today to 40 GW by 2030. That includes 1 GW of floating offshore wind, which is likely to be increasingly important over the period to 2050.
  - **Low-carbon auctions.** The Government confirmed that the fourth round of auctions for low-carbon electricity will take in place in late 2021. These will now include onshore wind and solar, and the capacity

limit has been doubled to 12 GW compared to the last auction round in 2019.

– **Power CCUS, nuclear, and demand-side flexibility** all featured additional commitments to:

- Support at least one power CCUS project by 2030. Currently, only new power plants above 300 MW are required to be CCS-ready. The White Paper commits to removing this distorting threshold.
- Bring at least one large-scale nuclear plant to point of Final Investment Decision this Parliament, and to provide up to £385 million of funding to develop a Small Modular Reactor (SMR) design and to build an Advanced Modular Reactor (AMR) demonstrator.
- Publish a new Smart Systems Plan and a new Energy Data Strategy in 2021, to unlock more of the potential for demand-side flexibility.

The Government has commissioned a review of the regime for connecting offshore projects to the onshore network.

- **Offshore Transmission Network Review.** Following our recommendation in the 2020 Progress Report, the Government has commissioned a review of the regime for connecting offshore projects to the onshore electricity network. This will explore whether a more coordinated approach for connections would be cost-effective in the context of increased ambition for offshore wind.
- **Call for evidence on market design.** A future electricity system with high shares of variable renewable generation is likely to require a different market design compared to the current arrangements. This call for evidence aimed to understand more about how to continue to maintain deployment of renewable generation at scale while minimising costs and supporting innovation in a high-renewable system.

## ii) Next steps for decarbonising electricity generation

The Ten Point Plan and Energy White Paper made a significant step towards a low-carbon electricity system with the commitment to 40 GW of offshore wind by 2030. However, gaps remain and further policies are needed to meet the Sixth Carbon Budget. Priorities include:

- **Unabated gas phase-out.** The Government should commit to phasing-out the use of unabated gas for electricity generation by 2035, subject to ensuring security of supply. It should publish a comprehensive long-term strategy in 2021 for achieving this. That should include through developing and deploying CCUS and hydrogen in electricity generation, and by ensuring new gas plant are property CCUS- and/or hydrogen-ready as soon as possible and by 2025 at the latest.
- **Renewables delivery.** While the Government has committed to regular auctions for low-carbon electricity, it should set out a schedule and clear pathway of volumes to be procured in order to provide visibility to the supply chain. It will need to address potential barriers to deploying and using low-carbon generation at scale (e.g. the planning and consenting regime for renewables and networks).
- **Networks.** The CCC Pathway has a 50% increase in electricity demand by 2035 and a two-to-three-fold increase by 2050 as the economy increasingly electrifies. The Government will need to work with Ofgem to deliver the

The Government should commit to phasing-out the use of unabated gas for electricity generation by 2035, subject to ensuring security of supply.

Barriers to delivery will need to be addressed, and investment will be needed to ensure networks can accommodate higher demand.

The Government should start planning for the market arrangements needed for a fully decarbonised electricity system in the 2030s.

strategic investment required to ensure that electricity networks can accommodate this.

- **Market design.** Given lead times for potential changes to market arrangements, the Government will need to go beyond their recent call for evidence and develop a strategy as soon as possible on market design for the medium- to long-term for a fully decarbonised, resilient electricity system in the 2030s and onwards.

## f) Fossil fuel supply

We previously set out the core requirements of a policy package for fuel supply in the Sixth Carbon Budget Policy report.

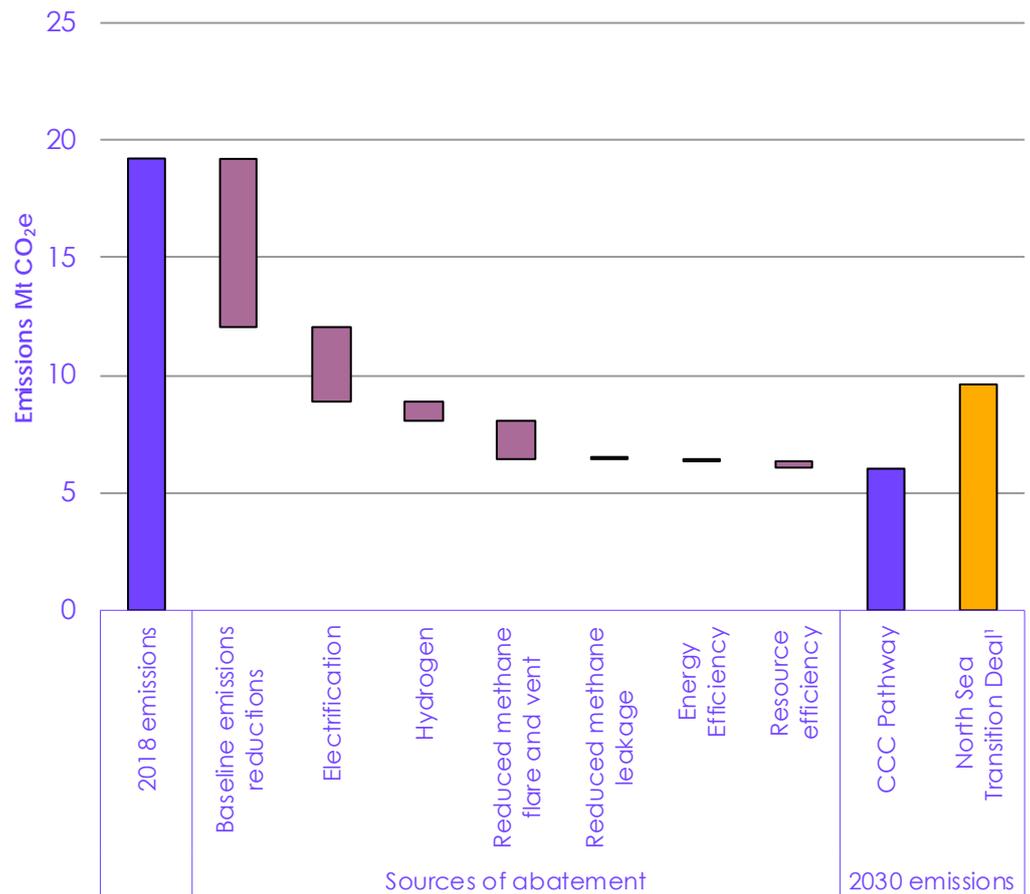

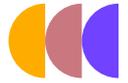

### i) Progress in the past year

The key development in the past year has been the North Sea Transition Deal (NSTD), which commits to reducing the greenhouse gas footprint of North Sea oil and gas production and processing by 50% by 2030 relative to 2018 levels. This target is less ambitious than our Sixth Carbon Budget recommendation of reducing emissions by 68% for the same period (Figure 4.4). We strongly advise that ambition on reducing emissions from North Sea fossil fuel production and processing be strengthened to be consistent with the CCC Pathway and the Sixth Carbon Budget:

The targets of the North Sea Transition Deal should be strengthened.

- The commitment for a reduction in emissions occurs in the context of declining oil and gas production in the North Sea. While it is difficult to forecast precise levels of production out to 2030, our baseline scenario – before actions to reduce the footprint of production – implies a 37% reduction in emissions by 2030 on 2018 levels.
- Electrification offers opportunities to reduce emissions from fossil combustion emissions associated with oil and gas production, by a further 17% of 2018 emissions. However, the degree of electrification assumed in the NSTD targets falls short of our estimate for cost-effective action. Stronger action is needed to reduce the emissions footprint of fossil fuels consumed in the UK.
- The CCC Pathway sets out a further 8% of emissions reductions from 2018 levels through measures to reduce flaring and venting. The NSTD also falls short of this level of ambition – by aiming to only permit flaring and venting for safety reasons by 2030. We have recommended this should be done by 2025, which would contribute to accelerating the pace of emissions reductions in the sector.
- The announcement of 'climate compatibility checkpoint' reviews prior to licensing rounds can ensure new fossil fuel production is consistent with the UK's climate commitments, including zero direct emissions from energy use by 2027. These reviews would need to present a transparent and coherent case for there to be a potential justification for proceeding with new licenses.

Figure 4.4 Emissions reductions in oil and gas production and processing in the CCC Pathway & the North Sea Transition Deal

Source: CCC analysis, BEIS (2021) *North Sea Transition Deal*.

Notes: Abatement in oil and gas production reflects emissions reduction from oil and gas platforms and processing terminals but does not include LNG terminals or compression stations. 1. North Sea Transition Deal residual emissions assume 50% emissions reductions from 2018 levels.

## ii) Next steps for fossil fuel production

Meeting Net Zero will involve transitioning almost entirely away from the unabated use of fossil fuels. Indeed, the CCC pathway set out in the Sixth Carbon Budget entails unabated fossil fuel use falling from 1,750 TWh in 2019 to 110 TWh in 2050, with use in 2050 limited predominantly to aviation.

Specifically, petroleum use in the CCC pathway decreases by 85% in 2050, by which time oil products are combusted exclusively used in aviation. In a similar vein, unabated gas is only 3 TWh by 2050, which represents less than 1% of current gas use.

As the energy system transitions towards low-carbon energy carriers such as hydrogen, low-carbon electricity and bioenergy, some fossil fuels can be used in a way that is consistent with UK targets:

- Unabated gas use and oil should decline by 62% in 2035 to be consistent with the Sixth Carbon Budget. However, some oil will still be needed,

Fossil fuel use should decrease by 95% by 2050.

In the transition towards low-carbon fuels, some fossil fuel use can be consistent with UK targets.

predominantly in surface transport (135 TWh), aviation (123 TWh) and shipping (42 TWh).

- In addition, there is uncertainty on the role of fossil gas in the UK, as some sectors are likely to use gas with carbon capture and storage (CCS) as a means to decarbonise. Our analysis found that 50 to 105 TWh could be used across the economy in 2035, with that range widening further in 2050 from 60 to 445 TWh.<sup>31</sup> As use of fossil gas with CCS only reduces emissions by up to around 85% compared to unabated fossil gas use, use of zero-carbon energy is preferable where it can feasibly be deployed.

Reducing the footprint of fossil fuel use is crucial to limit the impact on global GHG emissions.

Remaining fossil fuel use in the UK will need to consider the emissions footprint associated with oil and gas production in order to limit the impact on GHG emissions:

- The Sixth Carbon Budget requires the emissions of UK oil and gas production and processing to fall by 87% in 2035, relative to 2018 levels. For the same year, active efforts to move towards electrification and reduced methane flaring and venting should contribute to reducing emissions by 22% and 6% respectively below 2018 levels, beyond the expected decline in oil and gas production.
- However, current projections of the North Sea oil and gas production suggest it is unlikely to be sufficient to meet future UK needs. This suggests that there is likely to continue to be a need for some additional fossil fuel supply and/or imports of Liquefied Natural Gas (LNG).
- Given the demand for fossil fuels during the transition, it will be important to consider the upstream emissions from oil and gas production in the UK against those of imports in order to limit the impact on global GHG emissions. Implementation of standards on the emissions footprint of fossil fuels supplied for UK use could both drive reductions in fossil fuels supply emissions in countries supplying fuels to the UK and provide a level playing field for UK production that means more stringent standards than embodied in the NSTD can be implemented without losing market share.

Reducing demand for fossil fuels and the emissions footprint of UK oil and gas production and processing are key to limiting the impact on global GHG emissions, reinforcing the need for more ambitious targets that more closely align to a 68% emissions reductions in 2030 against 2018 levels.

## g) Waste

Our Sixth Carbon Budget advice set out the policies and measures required to get the waste sector on track to deliver the UK's pathway to Net Zero. The Government has made progress in some of these areas but there are still key gaps which must be addressed quickly.

## i) Progress in the past year

Government has made some progress in developing policies to deliver on its 2018 Resources and Waste Strategy for England, which set out its ambition to double resource efficiency and eliminate avoidable wastes by 2050, achieve 65% municipal recycling by 2035 and eliminate food waste to landfill by 2030.

Defra's Waste Prevention Programme, and BEIS' Industrial Decarbonisation Strategy set out a number of important initiatives on waste and resource efficiency.

Defra's Waste Prevention Programme, which was launched for consultation in March 2021, is central to this. It includes several measures aimed at driving more resource-efficient approaches to product design and consumer behaviour, including:

- Extended Producer Responsibility (EPR) schemes for several key waste streams so that producers bear the cost of waste disposal, incentivising more efficient and sustainable product design.
- New product standards and product information to reflect how reusable, recyclable and repairable a product is, with the aim of minimising premature obsolescence.
- A plastics tax and new charges on certain single-use plastic items.

Also, as mentioned under the section on manufacturing and construction, BEIS published their Industrial Decarbonisation Strategy which sets out a number of measures to improve resource efficiency, including:

- Exploring low-carbon product standards and labelling which will consider embodied carbon, as well as broader environmental impacts.
- A £30 million UKRI Circular Economy Research Programme aimed at working with industry to develop new approaches to resource efficiency.

Delivery timelines for waste and resource efficiency policies are too slow and important gaps remain, in particular around the landfilling of biodegradable waste, recycling and emissions from Energy from Waste plants.

However, despite this progress, delivery timelines are too slow, policy is weak in some areas and key gaps remain. For example:

- The Environment Bill, which contains key powers to deliver on the Resources and Waste Strategy and Waste Prevention Programme, has been delayed and is yet to be passed into law.
- The Waste Prevention Programme itself is only now out for consultation – over two years after the Resources and Waste Strategy was published, while specific consultations on key elements of the programme, such as some Extended Producer Responsibility schemes, are not expected for a number of years.
- A number of aspects need to be strengthened, in particular raising the level of recycling targets, increasing the plastics tax threshold and extending the commitment to end landfilling of food waste to cover all major biodegradable waste streams – and implementing this in 2025 rather than 2030.

Of particular concern is a lack of policy or guidance governing the use of, and emissions from, Energy from Waste (EfW) plants. If EfW usage is left to grow unchecked, EfW emissions will quickly exceed those of the CCC pathway while undermining recycling and re-use efforts. A recent policy statement indicating EfW plants will be eligible for CCS support is encouraging, but further action is urgently needed in this space.

## ii) Next steps on waste policy

To deliver the CCC pathway urgent action is needed to ban biodegradable waste from landfill from 2025 while improving recycling, re-use and waste prevention.

Full details of all the policies needed to get the waste sector on track to Net Zero are set out in our Sixth Carbon Budget policies report and the Departmental Recommendations tables at the end of this report. The following actions should be prioritised by Government in the next few years:

- The Environment Bill should be legislated this year and should be used to strengthen commitments on waste and resource efficiency including:
  - Raising recycling targets for England from 65% by 2035 to at least 68% by 2030. Experience in Wales has shown that this is feasible.
  - Sending a policy signal to ban the main biodegradable waste streams (i.e. paper, card, textiles, wood, food and garden waste) from landfill from 2025.
- Delivery of the Waste Prevention Programme must be accelerated so that key measures such as Extended Responsibility Schemes and product standards are in place well before 2025.
- In order to avoid unintended consequences, Government must take a whole system approach to improving waste prevention, re-use and recycling, including by:
  - Encouraging investment in recycling and re-use services and infrastructure to ensure that, as far as possible, waste is not diverted from landfill to EfW plants.
  - Ensuring a holistic policy approach to reduce waste arisings, for example by expanding measures aimed at reducing single-use plastic waste to cover other single-use items and materials.
  - Phasing out exports of waste by 2030 at the latest while strengthening tracking and enforcement, to ensure waste intended for recycling or recovery are treated as such.
- Government must urgently address rising emissions from, and use of, EfW, including by:
  - Setting out capacity and utilisation requirements for EfW which are consistent with plans to improve recycling and waste prevention, by the end of 2021.
  - Consulting on the introduction of a carbon price on EfW emissions (either as part of the UK ETS or a separate carbon tax), by the end of 2022.
  - Providing the necessary support to enable existing EfW plants to begin to be retrofitted with carbon capture, utilisation and storage (CCUS) from the late 2020s, and introducing policy to ensure that any new EfW plants are built either with CCUS or are 'CCUS ready'.

A systems approach to waste management and prevention is crucial to avoid merely shifting emissions from one source to another, for example from landfill to Energy from Waste or from the UK to overseas.

Delivering these actions requires different Departments to work closely together so Government should consider establishing new cross-Whitehall governance on waste and resource efficiency.

The formal inclusion of international aviation in the Sixth Carbon Budget is an important step towards tackling these emissions alongside other UK emissions

## h) Aviation

The Government announced that international aviation (and shipping) emissions would be formally included in carbon budgets for the first time when accepting the Committee's recommendation on the level of the Sixth Carbon Budget. We strongly welcome this significant step, which recognises that international aviation emissions need to be tackled alongside other UK emissions, and look forward to seeing legislation on the formal inclusion of international aviation and shipping laid before Parliament soon.

### i) Progress in the past year

There have been a few minor policy developments since we published the Sixth Carbon Budget, but the Net Zero Aviation Strategy is overdue:

- The new UK Emissions Trading Scheme (UK ETS, a replacement to the EU ETS), which will cover emissions from domestic UK flights and flights between the UK and the European Economic Area, was launched and ran its first auctions in May 2021.
- DfT published a consultation on implementing monitoring, reporting and verification requirements of the Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA) as its first voluntary phase commences, including options for interaction between CORSIA and the UK ETS for flights that are covered by both schemes.<sup>32</sup>
- The Civil Aviation Authority published the Airspace Modernisation Strategy (AMS), a plan for the use of UK airspace up to 2040 which aims to deliver quicker, quieter and cleaner journeys. DfT also announced a funding support package for initiatives within the AMS that support the post-pandemic recovery of the aviation sector and decarbonisation.<sup>33</sup>
- The Ministry of Defence announced a change in RAF aviation fuel standards, allowing RAF aircraft to utilise up to 50% of sustainable aviation fuels (SAF) in the future.<sup>34</sup>
- An aviation Net Zero Consultation and Strategy were planned for 2020. At the time of finalising this report the Government's consultation on decarbonising aviation had not yet been published. The Government intends to publish a Net Zero Aviation Strategy following the consultation, ahead of COP26.

### ii) Next steps for decarbonising aviation

We have set out the core requirements of a policy package in aviation in the Sixth Carbon Budget policy report.

There remain significant gaps within the policy framework for aviation. Government support at present is focused on innovation funding and demonstration activities, but without clear long-term policy mechanisms driving SAF uptake or valuing negative emissions in the UK. These policy gaps should be addressed in the Aviation Strategy:

- The **Road Transport Fuel Obligation** development fuels sub-mandate is unlikely to drive significant development of jet fuels, as it can be met with cheaper fuels.

- There is currently no price signal for **GHG removals** in the UK.
- There is a lack of larger-scale **deployment support and policy frameworks** specifically for sustainable aviation fuel and GHG removals.

While SAF and technological innovations in aircraft provide an opportunity to reduce emissions in the aviation sector, our analysis for the Sixth Carbon Budget suggests that these measures alone are unlikely to go far enough in reducing emissions. The CCC pathway allows for some further growth in aviation demand, but below growth in a 'business as usual' case. Government must recognise the need for demand management as part of a wider strategy to decarbonise aviation, which should include:

- **An aviation decarbonisation pathway.** Although the UK aviation industry has committed to a Net Zero goal for 2050 (via the Sustainable Aviation coalition), this is not yet a policy goal for Government. A sector emissions trajectory is needed to inform demand management and airport capacity policies.
- **An assessment of airport capacity.** Several UK airports are in the process of seeking planning permission to expand, or have already sought permission to expand and are challenging planning permission rejections (see Box 4.4). Government has not made commitments to review its airport capacity strategy nor stated a clear position on this issue. Our advice from the Sixth Carbon Budget remains unchanged – there should be no net expansion of UK airport capacity unless the sector is on track to outperform its net emissions trajectory. Government needs to assess its airport capacity strategy and develop and put in place a demand management framework to assess and, if required, control sector GHG emissions and non-CO<sub>2</sub> effects.
- **Appropriate price incentives.** Reforming aviation taxation, alongside wider reform of carbon pricing, will be critical to achieving Net Zero. The Government's current proposals for air passenger duty (APD) reform<sup>35</sup> are largely going in the wrong direction:
  - Proposals include halving domestic APD to improve domestic connectivity. Current price signals mean that flights are often cheaper than lower carbon alternatives (e.g. rail). Redressing this requires both higher taxes for flights (where there is an alternative to flying) and subsidies on trains. Rather than reducing APD to incentivise domestic flights, policy to improve domestic connectivity should focus on reducing the cost and improving the service for surface transport, especially rail.
  - Where surface transport is not an option, relaxed requirements in APD could relate not to distance but to the time taken to travel by alternative routes. Favourable treatment may be justified for small islands in Scotland which would take hours to reach by other means, or for Northern Ireland, but not for example for travel from London to Newcastle or London to Edinburgh which can be done by train easily and relatively quickly.
  - Government should seek to embed positive behaviours that have emerged during COVID-19, such as a reduction in business travel, through taxation.

Managing aviation demand is a critical part of achieving the Net Zero target, future airport capacity needs must be considered alongside appropriate price incentives.

The Government is at present developing legislation on the implementation of CORSIA. These regulations should be used to maximise opportunities to tackle climate change impacts of aviation, including non-CO<sub>2</sub> effects:

CORSIA credits should only be used towards ETS obligations if and when these meet minimum eligibility criteria. Non-CO<sub>2</sub> effects of aviation must start to be measured.

- Government's CORSIA consultation includes options for interaction between CORSIA and the UK ETS. Any such interaction should ensure credits used to offset aviation emissions meet minimum credibility criteria.
- Non-CO<sub>2</sub> effects of aviation can have significant warming impacts. While it is true that further research is needed to better understand these impacts, and estimates may change as the science evolves, the data needed to enable these estimates should start to be collected now. Government should include a requirement within CORSIA regulations for monitoring and reporting of non-CO<sub>2</sub> effects.

#### Box 4.4

##### Airport capacity expansion

Several UK airports are in the process of seeking planning permission to expand or have already sought permission to expand and are challenging planning permission rejections:

- A Supreme Court ruling in December 2020 overturned a previous court decision that had blocked the plan to build a third runway at Heathrow airport on environmental grounds, although airport operators still need to apply for planning permission for the expansion to go ahead.
- Expansion plans for Leeds Bradford airport were given conditional approval by Leeds city council. Government later issued a direction preventing councillors from granting planning permission without special authorisation. In April 2021, Government postponed deciding on this request, providing no timescales for its resolution.
- London airports, as well as many other regional airports, are seeking to push ahead with expansion proposals.

The UK already has more than enough capacity to accommodate the demand increases in our Balanced Net Zero Pathway. Our advice in the Sixth Carbon Budget was therefore that there should be no net expansion of UK airport capacity, unless the sector is on track to sufficiently outperform its net emissions trajectory and can accommodate the additional demand:

- Outperforming the net emissions trajectory means making significant progress on nascent and untested technologies like hybrid electric planes, and developing and scaling up markets for sustainable aviation fuels (SAF) and greenhouse gas removals.
- It is not possible to have certainty today over the pace of development of these technologies in future. It is therefore difficult at present to justify capacity expansion on the basis of outperforming the emissions trajectory, particularly given the uncertainty around the permanence of impacts on aviation demand from COVID-19.

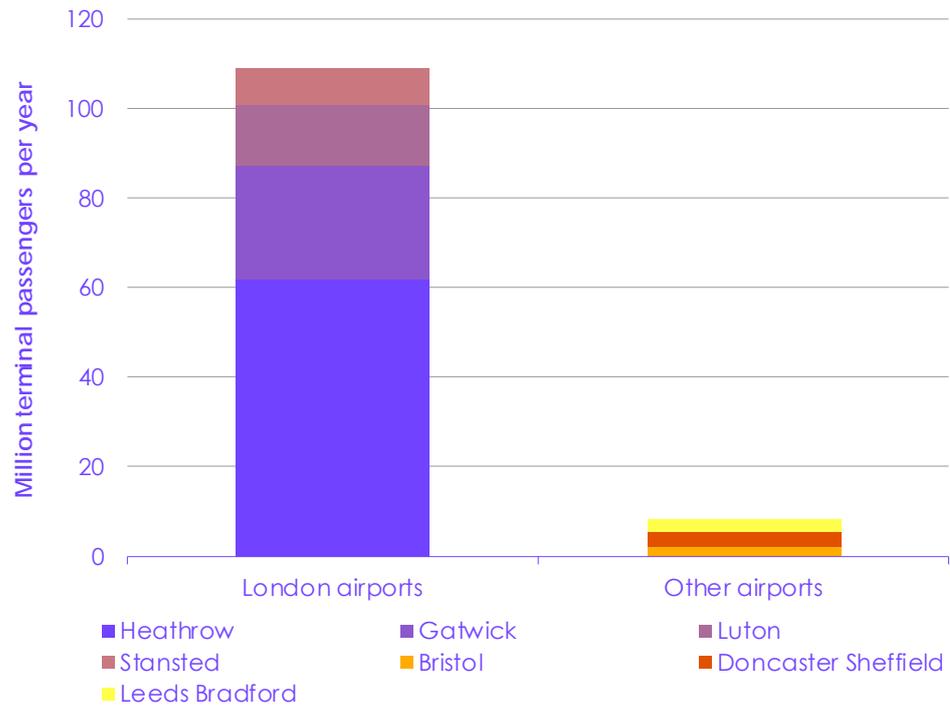

The fact that we have enough capacity in aggregate to achieve our emissions targets does not mean that capacity is always in the right place:

- Airport capacity around London far exceeds capacity elsewhere in the country, as does planned capacity expansion in London compared to regional airports' plans.
- While demand is greater in and around London, other areas see economic potential in increasing their local airport capacity and improving their connectivity. There could be some emissions savings from better allocation of capacity across the country (e.g. some emissions reduction from flying from a local airport rather driving or flying to London).
- Conversely, arguments for increasing capacity in hub airports, such as Heathrow, include reducing emissions from less holding and better air traffic management.

Further work is needed to understand how capacity can best be utilised and managed across the UK to increase efficiency and minimise emissions. A mechanism for managing

demand should be developed and put in place alongside an assessment of the Government's airport capacity strategy. This could act to control sector GHG emissions and non-CO<sub>2</sub> effects if required and could also allow Government to address issues around UK connectivity.

Figure B4.4 Airport capacity expansion plans

Source: CCC analysis based on AEF UK Airport Expansion Guide (<https://www.aef.org.uk/uk-airport-expansions/>), Heathrow Airport Expansion Consultation (<https://www.heathrow.com/company/about-heathrow/expansion/documents>), Gatwick Long Term Plans (<https://www.gatwickairport.com/business-community/future-plans/long-tem-plans/>), Doncaster Sheffield Masterplan ([https://flydsa.co.uk/dsaadmin/wp-content/uploads/2020/07/DSA\\_Masterplan.pdf](https://flydsa.co.uk/dsaadmin/wp-content/uploads/2020/07/DSA_Masterplan.pdf)). Includes airports with planning application submissions, that are challenging planning permission refusals as well as airports that have recently publicly stated that they intend to pursue expansion plans, where impacts of expansion plans on passenger numbers were available.

## i) Removals

We have set out the core requirements for ensuring the timely delivery of Greenhouse Gas Removals (GGR) in the Sixth Carbon Budget policy report.

Key developments in the past year are new funding to GGR research and development through the UK Research and Innovation's GGR demonstrators programme,<sup>36</sup> selection of phase one of the BEIS Direct Air Capture and GGR competition,<sup>37</sup> and inclusion of GGR within the Scottish Government's Emerging Energy Technologies Fund.<sup>38</sup>

Alongside, during 2020-21 BEIS carried out a call for evidence on GGR.<sup>39</sup> This invited submissions on the contribution of GGR to reaching Net Zero, on GGR governance, and on possible approaches to GGR support mechanisms.

## i) Next steps towards GGR delivery

The Net Zero Strategy should set out expected amounts and timings of land-based and engineered removals (i.e. bioenergy with CCS (BECCS) and direct air carbon capture and storage (DACCS)) in contributing to meeting the Sixth Carbon Budget and the Net Zero target. These should avoid over-reliance on these solutions.

Building on the results of the BEIS GGR consultation, policy on governance and support mechanisms should be developed over the next year in order to enable GGR scale-up during the mid-late 2020s. This should include enabling domestic engineered removals to contribute to UK carbon budgets and Net Zero, establishing GGR monitoring, verification and reporting structures that ensure that GGR is sustainable and verifiable, and setting out support mechanisms that align with the expectations for the role and timing of GGR contribution to UK emissions reductions.

More generally, as GGR by BECCS and DACCS is reliant on CCS infrastructures for the storage of the removed CO<sub>2</sub>, it is critical that CCS is established in a consistent timeframe and in a manner that allows for the usage of CO<sub>2</sub> pipeline and storage for removals.

**Table A1**  
Recommendations for Number 10 and Cabinet Office

Timing

Cross-cutting	Use the <b>Cabinet Committees</b> on Climate Strategy and Climate Action to drive home the need for more pace in policy development across Departments. Consider whether additional governance mechanisms such as independent delivery bodies are required in particular areas, such as heat decarbonisation.	2021-22 Priority recommendation
	Commit to a ' <b>Net Zero Test</b> ' to ensure that all Government decisions are compatible with the legislated emissions targets.	2021 Priority recommendation
	Develop (with BEIS) a <b>public engagement strategy</b> for Net Zero which builds on the findings of the UK Climate Assembly by involving people in decision-making, providing trusted information on decarbonisation choices and the need to reduce emissions and adapt to climate change. The strategy should also identify preferred policy options to empower people to contribute fully towards the path to Net Zero.	2021-22 Priority recommendation
	Support <b>local government</b> (with MHCLG) to play a full role in the Net Zero transition, including through increased resourcing, guidance, involvement in local area energy plans, statutory reporting on the emissions from their estate and reforming the planning framework to enable delivery of low-carbon and climate-resilient measures.  This is likely to require additional funding for staffing and resources for local delivery plans, alongside a 'duty to collaborate' to encourage authorities to work with local, regional and national partners to deliver their climate ambitions.	2021-23  (funding for local authorities at next Budget) Priority recommendation
	Cabinet Office should ensure that <b>adaptation</b> is integrated into major upcoming policies in the next two years related to the priority CCRA3 risk for which it has lead responsibility, coordinating work with other relevant departments as necessary:  <ul style="list-style-type: none"> <li>Multiple risks to the UK from climate change impacts overseas</li> </ul> In addition, for the coming five-year period (2023-2028), Cabinet Office should outline appropriate actions in the next <b>National Adaptation Programme</b> to address the adaptation gap identified for the other risks and opportunities in the CCRA3 for which it is the lead department (see Adaptation Report Annex).	By 2023  Priority recommendation
	Review <b>guidance documents</b> used in policy and business case development (e.g. the Green Book) and ensure these are consistent with the requirements of Net Zero and account for the impacts of climate change.	2022
	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing
	Cabinet Office should build a strong <b>climate resilience capability</b> for the UK, including making use of storyline or 'what-if' scenarios to assess risks, in addition to or instead of using 'reasonable worst-case' approaches. It should develop an early warning system for global climate shocks. It should consider how more allowance and flexibility can be built into policy making and policy implementation. This could include enhancing the ability of the Government to make fast decisions by bringing in technical advice and expertise quickly when needed, and both protecting, and enhancing, monitoring and surveillance systems to enable faster reactions as events unfold.	By 2023
	Develop and implement fully-funded plans towards making all <b>public buildings and vehicle fleets</b> zero-carbon in the long term. This must include a move to multi-year programmatic funding to deliver the stated ambitions of switching to ultra-low emission vehicles by 2030 and to halve emissions from public buildings by 2032, supported by cross-government strategy (including an ambitious new set of Greening the Government commitments) and capital funding levels in the order of £1 billion/year for buildings.	2021-22
	As the public sector, lead the shift to other positive behaviours that <b>reduce travel demand</b> , for example encouraging home-working.	2021
International (With BEIS and the COP Unit)	Work towards securing more <b>climate finance commitments</b> from developed countries to get back on track for mobilising \$100 billion a year in climate finance as soon as possible.	2021
	Work to bring forward additional <b>emissions reduction ambition</b> from countries that haven't yet strengthened commitments ahead of COP26.	H2 2021
	Place aligning <b>global COVID-19 recovery plans</b> with the goals of the Paris Agreement as a core goal of the UK's G7 and COP26 presidencies.	2021-22
	Ensure that any outcome on <b>international carbon markets</b> at COP26 has high integrity and genuinely supports global ambition to tackle climate change.	H2 2021
	Develop the option of applying either <b>border carbon tariffs or minimum standards to imports</b> of selected embedded-emission-intense industrial and agricultural products and fuels. This should include initiating development of carbon intensity measurement standards and fostering international consensus around trade policies through the G7 and COP presidencies.	2021 Priority recommendation

Table A2 Recommendations for the COP Unit, the Foreign, Commonwealth and Development Office (FCDO) and the Department for International Trade (DIT)		Timing
Cross-cutting	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing
Action in the run-up to COP26	Work towards securing more <b>climate finance commitments</b> from developed countries to get back on track for mobilising \$100 billion a year in climate finance as soon as possible.	2021 (COP26)
	Work to bring forward additional <b>emissions reduction ambition</b> from countries that haven't yet strengthened commitments ahead of COP26.	H2 2021
	Provide a clear commitment prior to COP26 regarding the timescale by which the <b>UK's official development assistance (ODA) contribution</b> will return to 0.7% of GNI given the UK's commitment to align its ODA spend with Paris Agreement requirements and the need for increased finance to achieve the Paris Agreement.	H2 2021
	Place aligning <b>global COVID-19 recovery</b> plans with the goals of the Paris Agreement as a core goal of the UK's G7 and COP26 presidencies.	2021-22
	Ensure that any outcome on <b>international carbon markets</b> at COP26 has high integrity and genuinely supports global ambition to tackle climate change.	H2 2021
	Develop the option of applying either <b>border carbon tariffs or minimum standards to imports</b> of selected embedded-emission-intense industrial and agricultural products and fuels. This should include initiating development of carbon intensity measurement standards and fostering international consensus around trade policies through the G7 and COP presidencies.	2021 Priority recommendation
Ongoing climate action	For the coming five-year period (2023-2028), FCDO should outline appropriate actions in the next <b>National Adaptation Programme</b> to address the adaptation gap identified for the risks in the CCRA for which it is the lead department (see Adaptation Report Annex).	2023 Priority recommendation
	Publish a new strategy for the UK's <b>international climate policy</b> for after COP26 - ensuring that the initiatives for the COP26 presidency have long-term benefits for global emissions over the coming decade and supports the implementation of policies to deliver on strengthened national targets.	H1 2022
	For the coming five-year period (2023-2028), DIT should outline appropriate actions in the next <b>National Adaptation Programme</b> to address the adaptation gap identified for the risks and opportunities in the CCRA3 for which it is the lead department (see Adaptation Report Annex).	2023
	DIT should use trade policy to <b>encourage increased ambition</b> on both climate change mitigation and adaptation in other countries, including considering the role for border carbon adjustments and standards to <b>prevent carbon leakage</b> .	Spring 2022

Table A3 Recommendations for the HM Treasury (HMT)		Timing
	Complete the overdue <b>Net Zero Review</b> , which should: <ul style="list-style-type: none"> <li>Develop a plan for funding decarbonisation fairly, reviewing the distribution of costs for businesses, households and the Exchequer.</li> <li>Set approach to near-term and long-term decarbonisation funding needs.</li> <li>Consider policy implications for a just transition.</li> </ul>	2021 Priority recommendation
	The <b>spending review(s)</b> should ensure departments are fully equipped to deliver the necessary actions across climate change mitigation and adaptation, during the rest of this Parliament and beyond.	2021 Priority recommendation
	For the coming five-year period (2023-2028), outline appropriate actions in the next <b>National Adaptation Programme</b> to address the adaptation gap identified for the risks in the CCRA for which it is the lead department (see Adaptation Report Annex).	2023 Priority recommendation
	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing
Funding	Increase resources for <b>local government</b> to play a full role in the Net Zero transition.	2021-23 (funding for LAs at next budget) Priority recommendation
	Fund plans towards making all <b>public buildings and vehicle fleets</b> zero-carbon in the long term. This must include a move to multi-year programmatic funding to deliver the stated ambitions of switching to ultra-low emission vehicles by 2030 and halving emissions from public buildings by 2032, supported by cross-government strategy (including an updated set of Greening the Government commitments) and capital funding levels in the order of £1 billion/year for buildings.	2021-22
	Provide a clear commitment prior to COP26 regarding the timescale by which the <b>UK's official development assistance (ODA) contribution</b> will return to 0.7% of GNI given the UK's commitment to align its ODA spend with Paris Agreement requirements and the need for increased finance to achieve the Paris Agreement.	H2 2021
	Establish mechanisms (with BEIS) to close the substantial funding gap for <b>heat networks</b> , with a multi-year funding programme needed of sufficient scale to deliver the growth in network deployment, and transition to low-carbon heat sources.	2022
Taxation, carbon and energy pricing	Work with BEIS on the <b>Heat and Buildings Strategy</b> : to ensure that relative prices favour a shift to low-carbon technologies, consulting widely including with the Committee on Fuel Poverty; to ensure that sufficient funding is available; and to consider the role of tax incentives (e.g. Stamp Duty differentials). Work with MHCLG and the new buildings safety regulator to ensure that local authorities are properly funded to enforce buildings standards.	2021 Priority recommendation
	Consult on <b>reforms to electricity pricing</b> to remove disincentives to electrification, based on consideration of the strategic and fair allocation of legacy policy costs associated with the past deployment of less-mature low-carbon electricity generation. Also consider the balance of existing taxes, such as the Climate Change Levy, on different energy sources. These reforms in combination with wider sectoral incentives, standards and carbon pricing should remove price barriers to electrification.	H1 2022
	Consult (with BEIS) on the introduction of a <b>carbon tax</b> (either as part of the UK ETS or a separate instrument) aimed at curbing rising emissions from Energy from Waste.	2022
	Reform <b>Vehicle Excise Duty</b> , with larger differentials across all vehicle types, to provide stronger incentives to purchase zero-emission vehicles and reverse the shift towards cars that have higher lifecycle emissions. The reforms should consider the impact and design of second and subsequent year rates, to ensure they encourage the purchase of zero-emission vehicles in the second-hand market.	H1 2022
	<b>Aviation tax reform</b> should seek to address price imbalances between aviation and surface transport, encouraging the low-carbon alternative (e.g. rail) for journeys where one exists. Taxation should also be used, alongside improvements in broadband, to embed positive behaviours that have arisen during the pandemic (e.g. replacing business travel with videoconferencing and online collaboration).	2021-22
	Create a clear incentive for manufacturing facilities not currently covered by the UK ETS to switch to low-carbon energy sources by reforming the suite of energy and carbon policies, which could include rebalancing the <b>Climate Change Levy</b> rates for electricity and gas.	2023
	Set out a clear plan for ensuring that carbon prices and taxes on manufacturers, energy producers and aviation encourage emissions reductions in line with the CCC Pathway, planning for revised (and likely higher) carbon prices from 2023. This should include setting out a <b>cap for the UK ETS</b> consistent with a credible path to the Sixth Carbon Budget for consultation by Q3 2021.	2021
	Develop (with DIT) the option of applying either <b>border carbon tariffs or minimum standards to imports</b> of selected embedded-emission-intense industrial and agricultural products and fuels. This should include initiating development of carbon intensity measurement standards and fostering international consensus around trade policies through the G7 and COP presidencies.	2021 Priority recommendation

Table A3 Recommendations for the HM Treasury (HMT)		Timing
Green finance	Develop further ways to embed Net Zero and climate risk in <b>financial decisions</b> by UK firms, building on the UK's Green Finance Strategy. This should include implementing mandatory climate disclosure, adoption of a robust green taxonomy with clear guidance on how it should be used. It should also consider the recommendations of the Committee's Finance Advisory Group, such as making Net Zero and adaptation plans mandatory for financial institutions and monitoring financial flows into climate action.	2021-25
	In the <b>green gilt framework</b> , setting out the rules on what spending green sovereign bonds can be used for, ensure that revenue is used to fund expenditure that will genuinely contribute to Net Zero and improved climate resilience.	2021

Table A4 Recommendations for the Department for Business, Energy and Industrial Strategy (BEIS)		Timing
Cross-cutting	<p>Publish the overall <b>Net Zero Strategy</b>. It should:</p> <ul style="list-style-type: none"> <li>• Provide a comprehensive plan for achieving Net Zero, the 2030 NDC and the carbon budgets, setting out ambition for sectors and key technologies and behaviours that together will meet the challenge.</li> <li>• Set out the approach to the key cross-cutting challenges of fair funding, just transition, skills, public engagement, local delivery, governance.</li> <li>• Set timelines for how policies will start to deliver decarbonisation with the required urgency, and ensure that wider policy development is consistent with the UK's climate goals.</li> <li>• Ensure adaptation is properly integrated in the plan, maximising synergies and minimising trade-offs, while recognising the risks and impacts from climate change (see Adaptation Progress Report for more details).</li> <li>• Introduce processes for monitoring progress and mechanisms to course-correct over time.</li> </ul>	2021 Priority recommendation
	<p>Ensure that <b>adaptation is integrated</b> into major upcoming policies in the next two years related to the eight priority risks identified in the Committee's advice on the third UK Climate Change Risk Assessment (CCRA3) for which BEIS has lead responsibility, coordinating work with other relevant departments as necessary:</p> <ul style="list-style-type: none"> <li>• Risks to the supply of food, goods and vital services due to climate-related collapse of supply chains and distribution networks (with Defra and DIT).</li> <li>• Risks to people and the economy from climate-related failure of the power system.</li> </ul> <p>In addition, for the coming five-year period (2023-2028), BEIS should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the other risks and opportunities in the CCRA for which it is the lead department (see Adaptation Report Annex).</p>	By 2023 Priority recommendation
	<p>Develop a <b>public engagement</b> strategy for Net Zero which builds on the findings of the UK Climate Assembly by involving people in decision-making, providing trusted information on decarbonisation choices and the need to reduce emissions. The strategy should link to engagement on adaptation and identify preferred policy options to empower people to contribute fully towards the path to Net Zero.</p>	2021-22 Priority recommendation
	<p>Ensure <b>all departmental policy decisions</b>, and procurement decisions, are consistent with the Net Zero goal and reflect the latest understanding of climate risks.</p>	Now and ongoing
International	<p>Update the UK's long-term <b>low greenhouse gas emission development strategy with the UNFCCC</b> to reflect a formulated economy-wide plan to achieve Net Zero by 2050 (expected to be the Net Zero Strategy).</p>	H2 2021
	<p>Place aligning <b>global COVID-19 recovery plans</b> with the goals of the Paris Agreement as a core goal of the UK's G7 and COP26 presidencies.</p>	H2 2022
	<p>Publish a new strategy for the UK's <b>international climate policy for after COP26</b> - ensuring that the initiatives for the COP26 presidency have long-term benefits for global emissions over the coming decade and support the implementation of policies to deliver on strengthened national targets.</p>	H1 2022
Jobs and skills	<p>Working with DWP, DfE, the Home Office and MHCLG, develop a strategy for a <b>Net Zero workforce</b> that ensures a just transition for workers transitioning from high-carbon to low-carbon and climate-resilient jobs, integrates relevant skills into the UK's education framework and actively monitors the risks and opportunities arising from the transition. This strategy should include the development and roll-out of plans for training and skills, with buildings and manufacturing being priority areas.</p>	2021 Priority recommendation
	<p>Design industrial decarbonisation policies to <b>support and create jobs</b>, especially in regions with reliance on industrial jobs.</p>	Now and ongoing

Table A4 Recommendations for the Department for Business, Energy and Industrial Strategy (BEIS)		Timing
Supporting business action	<b>Support businesses</b> to play their full role in the Net Zero transition and in adapting to climate risks and opportunities, for example by extending and expanding the role of the Net Zero Business Champion beyond COP26, building on the Race to Zero and Race to Resilience campaigns and providing sufficient resources to fully support businesses of all sizes to engage in the transition, to input to policy development and to set their own robust Net Zero and adaptation action plans.	2021-22
	Develop further ways to embed Net Zero and climate risk in <b>financial decisions</b> by UK firms, building on the UK's Green Finance Strategy. This should include implementing mandatory climate disclosure, adoption of a robust green taxonomy with clear guidance on how it should be used. It should also consider the recommendations of the Committee's Finance Advisory Group, such as making Net Zero and adaptation plans mandatory for financial institutions and monitoring financial flows into climate action.	2021-25
	Determine appropriate regulatory arrangements, rules and guidance for the use of <b>carbon offsetting by UK corporates</b> within their Net Zero strategies, recognising the growing demand for offsetting markets, the interactions with the UK ETS and currently accredited schemes (i.e. the Woodland Carbon Code and the Peatland Code), and the need to avoid double-counting or negative outcomes for non-carbon objectives.	2021-22
Research and data	Drawing on the Energy Innovation Needs Assessments ensure <b>innovation funding</b> (e.g. through UKRI, Catapults, the Industrial Strategy Challenge Funding, BEIS Innovation Programme and the Net Zero Innovation Portfolio) drives forward an extensive research and innovation package for delivering a Net Zero, climate-resilient future.	Now and ongoing
	<b>Make monitoring and data analysis</b> of climate risks more accessible, alongside better digitisation of past records. Further efforts should be taken to make the evidence on climate risks more usable for decision makers through co-design of research programmes with end users, where the user drives the research question from the beginning of the process. A major gap is the lack of projections of impacts in 2°C and 4°C scenarios; this needs addressing as an urgent priority ahead of CCRA4.	2022
	Review plan for improving <b>data collection</b> and statistical reporting for the purposes of monitoring and informing the low-carbon transition, as part of the broader work the ONS are already undertaking to improve the collection of climate-related data.	2022
	Work with ONS to put in place plans to <b>collect and report data</b> annually on low-carbon heat networks, specifically the amount of heat delivered (split by DUKES consumption sector, i.e. Residential/Public/Commercial/Industry, and where possible, by source of heat supply). This should be part of a plan for improving data collection and statistical reporting for the purposes of monitoring and informing the low-carbon transition.	2022
	Improve the collection and reporting of <b>industrial decarbonisation data</b> to allow for progress to be monitored more effectively, particularly on energy and resource efficiency.	2022
	Energy / carbon pricing and emissions trading	Set out a clear plan (with HMT) for ensuring that carbon prices and taxes on manufacturers, energy producers and aviation encourage emissions reductions in line with the CCC Pathway, planning for revised (and likely higher) carbon prices from 2023. This should include setting out a <b>cap for the UK ETS</b> consistent with a credible path to the Sixth Carbon Budget for consultation by Q3 2021.
Consult (with HMT) on <b>reforms to electricity pricing</b> to remove disincentives to electrification, based on consideration of the strategic and fair allocation of legacy policy costs associated with the past deployment of less-mature low-carbon electricity generation. It should also consider the balance of existing taxes, such as the Climate Change Levy, on different energy sources. These reforms in combination with wider sectoral incentives, standards and carbon pricing should remove price barriers to electrification.		H1 2022
Consult (with HMT) on the introduction of a <b>carbon tax</b> (either as part of the UK ETS or a separate instrument) aimed at curbing rising emissions from Energy from Waste.		2022
Commit (with DfT) not to use credits from the <b>Carbon Offsetting and Reduction Scheme for International Aviation</b> (CORSIA) for flights covered by the UK ETS unless and until they can satisfy strict eligibility criteria (equivalence, additionality, permanence, sustainability).		2021-22
Develop (with DfT) the option of applying either <b>border carbon tariffs</b> or <b>minimum standards to imports</b> of selected embedded-emission-intense industrial and agricultural products and fuels. This should include initiating development of carbon intensity measurement standards and fostering international consensus around trade policies through the G7 and COP presidencies.		2021 Priority recommendation

Table A4 Recommendations for the Department for Business, Energy and Industrial Strategy (BEIS)		Timing
Buildings	Produce a robust, equitable and ambitious <b>heat strategy</b> to eliminate emissions from buildings through a clear direction for the next 30 years. This must include: <ul style="list-style-type: none"> <li>Standards covering all segments of the building stock, with support for consumers through the transition.</li> <li>Plans to rebalance policy costs - in consultation with the Committee on Fuel Poverty and wider stakeholders - while making low-carbon solutions more financially attractive.</li> <li>Plans to introduce Green Building Passports.</li> <li>Formalisation of a governance framework to drive decisions on heat infrastructure including a role for area-based energy plans and zoning of heat networks.</li> </ul>	2021 Priority recommendation
	Provide a stable long-term policy framework to support sustained <b>energy efficiency and heat pump</b> growth at sufficient scale (i.e. 600,000 heat pumps per year in existing homes by 2028). This must include a replacement for the Green Homes Grant voucher scheme which works, backed by standards and support for non-residential heat pump installations. Create a level-playing field for hybrid heat pumps off the gas grid and ensure hybrid heat pumps are an integral part of PAS2035 retrofit coordinator advice.	2021 Priority recommendation
	Establish mechanisms to close the substantial funding gap for <b>heat networks</b> , with a multi-year funding programme of sufficient scale to deliver the growth in network deployment, and transition to low-carbon heat sources, needed. Finalise policy on the future market framework for heat networks, including requiring new district heat schemes to utilise low-carbon sources from 2025 at the latest and setting regulations for the conversion of legacy fossil fuel schemes to low-carbon sources.	2022
	Publish proposals for standards to phase out the installation of <b>new liquid and solid fossil fuel heating</b> by 2028 at the latest. Send clear signals on the phase-out of gas heating, including the roles for area-based planning and standards in phasing out gas installations (as in Scotland).	2021
	Move to <b>multi-year programmatic funding</b> to deliver the stated ambition of halving emissions from public buildings by 2032. This must be supported with cross-government strategy (either independent or integrated with the Net Zero or Buildings Strategies) and funding levels in the order of £1 billion/year. Support mechanisms must be designed so that smaller public bodies can access them.	2022
	Set requirements for all <b>new gas boilers to be hydrogen-ready</b> by 2025 at the latest, while ensuring that all new boilers outperform current and expected future air quality standards.	2021
	Implement improvements to the <b>Energy Performance Certificate (EPC) and Standard Assessment Procedure (SAP)</b> framework, including: <ul style="list-style-type: none"> <li>Ensuring EPCs drive deployment of the necessary energy efficiency measures and do so on a holistic basis to address overheating, ventilation, and moisture-risk.</li> <li>Supporting delivery objectives across both energy efficiency and low-carbon heat, and valuing properly the benefits of low-carbon and flexible technologies.</li> <li>Formally integrating a forward trajectory for declining grid carbon-intensity, in line with Government projections.</li> <li>Addressing wider issues of quality/robustness, with a commitment to integrate in-use performance metrics from 2023.</li> <li>Plans for the future role of Green Building Passports.</li> </ul>	2022
	Improve understanding of and support action on <b>overheating in existing residential buildings</b> and encourage retrofit of passive cooling measures. The Heat and Building Strategy must consider overheating risks. The following steps are needed: <ul style="list-style-type: none"> <li>Further research to understand when overheating occurs in existing homes, including ongoing monitoring of temperatures in the housing stock, monitoring of overheating exceedances in homes, and the number of homes currently adapted.</li> <li>Guidance and information for homeowners with the steps that can be taken if their homes overheat. This should include an outline of behavioural options and the measures that can be installed to reduce internal temperatures. Green Building Passports and home retrofit plans could provide holistic guidance and help to unlock green finance.</li> <li>Overheating risk considered and mitigated against if necessary when doing energy efficiency retrofit programmes.</li> <li>Making finance available to install adaptation measures. This could be via grant schemes or green finance for private owners, with public funding targeted at low-income or vulnerable households alongside energy efficiency retrofit.</li> </ul>	2022
	Bring forward the date to reach EPC C in <b>social homes</b> to 2028, in line with the Private Rented Sector (PRS) proposals and finalise the delivery mechanism. Implement ambitious <b>PRS standards</b> for homes which drive fabric efficiency, while valuing deployment of cost-effective low-carbon heat alongside this. Implement the EPC B target for <b>PRS non-domestic buildings</b> in line with new proposals. Consult on options to cover the regulatory policy gap for <b>owner-occupied homes</b> .	2021

Table A4 Recommendations for the Department for Business, Energy and Industrial Strategy (BEIS)		Timing
Power	Publish a plan for reaching an emissions intensity of 50 gCO <sub>2</sub> /kWh by 2030, with a total of around 350 TWh of low-carbon generation. Set out a schedule for regular auctions to procure <b>low-carbon generation</b> , with a clear pathway of volumes to be procured and robust contingency for uncertainties in demand and delivery. Address potential barriers to deploying and using low-carbon generation at scale (e.g. the planning and consenting regime for renewables and networks, exposure to climate risks) and, with Ofgem, develop a framework under which sufficient supply resilience can be ensured.	2022 Priority recommendation
	Commit to phasing out <b>unabated gas generation</b> by 2035, subject to ensuring security of supply.	2021 Priority recommendation
	Publish a comprehensive long-term strategy for <b>unabated gas phase-out</b> , including ensuring new gas plant are properly CCS- and/or hydrogen-ready as soon as possible and by 2025 at the latest.	By Spring 2022 Priority recommendation
	Develop a strategy as soon as possible on <b>market design</b> for the medium to long term for a fully decarbonised, resilient electricity system in the 2030s and onwards.	2023
	Develop mechanisms for strategic investment in coordination with Ofgem to ensure that <b>electricity networks</b> can accommodate increased future demand levels, including large localised demand increases associated with electrification in manufacturing, transport and buildings, and that lack of network capacity does not cause delays in emissions reduction.	2023
	Develop a strategy to coordinate the development of <b>interconnectors</b> , connections for offshore wind farms and the enhancement of inter-area transfer capacity for the onshore network, ensuring cost-effective, timely delivery, bringing forward any legislation necessary to enable it.	H1 2022
	Work in partnership with Ofgem to publish and implement a new <b>Smart System Plan and Energy Data and Digitalisation Strategy</b> , including working with DCMS on cyber-security, in order to continue to unlock the full benefits of electricity system flexibility. Ensure that, alongside smart standards for heating, all electricity users have access to half-hourly metering and the option of tariffs that encourage flexibility in use of electric heat and electric vehicle charging.	2021
	Improve information sharing on climate risks to infrastructure interdependencies at a local level, especially for <b>electricity, digital and ICT networks</b> . As reported in our previous assessment in 2019, NAP actions to enhance arrangements for information sharing between local infrastructure operators and improve understanding of critical risks arising from interdependencies have not been completed. Defra's link with Local Resilience Forums is key, and BEIS and DCMS should engage with utility companies to encourage standardised benchmarking and data sharing on climate risks to electricity networks, digital & ICT.	Now and ongoing
Waste	Set out capacity and usage requirements for <b>Energy from Waste</b> consistent with plans to improve recycling and waste prevention. Issue guidance to align local authority waste contracts and planning policy to these targets.	2021 Priority recommendation
	Introduce the necessary planning guidance and policy to ensure any <b>new Energy from Waste</b> plants (including incineration, gasification & pyrolysis facilities) are built with carbon capture usage and storage (CCUS) or are 'CCUS-ready'.	Spring 2022 Priority recommendation
	Set out how <b>existing Energy from Waste</b> plants will be supported to be retrofitted with CCUS from late 2020s onwards, with 2050 a backstop date for full CCUS coverage.	2022

Table A4 Recommendations for the Department for Business, Energy and Industrial Strategy (BEIS)		Timing
Manufacturing and construction	Establish funding mechanism(s) to support operational and capital costs of both <b>electrification and hydrogen-use in manufacturing</b> , as soon as possible, with the aim of awarding funding in 2022. There must be mechanisms for both options, not only hydrogen, and the mechanism(s) should be designed to ensure that, in the medium term, hydrogen-use and electrification compete on a level playing field, to ensure the best value for consumers and taxpayers. Support for electrification may be combined with reforms to electricity pricing.	2022 Priority recommendation
	Continue to support <b>innovation</b> and demonstration of fuel switching and CCS technologies for decarbonising manufacturing and construction. Ensure that a full range of options is developed, filling previous gaps in support, such as encouraging electrification projects to come forward.	Spring 2022
	Set out which policies will deliver the pathway to 4 MtCO <sub>2</sub> e of <b>industrial energy efficiency</b> abatement set out in the Industrial Decarbonisation Strategy and quantify how much abatement will come from each policy: <ul style="list-style-type: none"> <li>Set out the future role of Climate Change Agreements (CCAs) and any required CCA reforms.</li> <li>Consult on mandating the use of Energy Management Systems and on Government support and incentives for implementing energy management standards.</li> <li>Set out the role of energy efficiency standards and audit programmes.</li> <li>Develop resources such as direct advice and training to address capacity and expertise gaps, and highlight available energy efficiency solutions, particularly for SMEs.</li> </ul>	Spring 2022
	Ensure the policy package for decarbonising manufacturing addresses manufacturers' low appetite for investments with long <b>payback times</b> , either using grants or favourable loans, particularly for energy efficiency.	2022
	Work with the minerals industries to develop a detailed joint plan for <b>CO<sub>2</sub> transport from dispersed sites</b> .	Spring 2022
	Commit to <b>targets</b> for ore-based steelmaking and cement production in the UK to reach near-zero emissions by 2035 and 2040, respectively.	2021
	Deliver industrial <b>carbon capture contracts (ICC)</b> to enable final investment decisions on the first ICC projects by mid-2022.	H1 2022
	Deliver the proposed <b>CCS transport and storage</b> regulatory investment model to enable final investment decisions by mid-2022 that are consistent with establishing at least two CCS transport and storage clusters in the mid-2020s.	H1 2022
	Create a clear incentive for <b>manufacturing facilities not currently covered by the UK ETS</b> to switch to low-carbon energy sources by reforming the suite of energy and carbon policies, which could include rebalancing the Climate Change Levy rates for electricity and gas.	2023
	Set out a strategy for decarbonisation of <b>off-road mobile machinery</b> and work with industry to identify potential policies to increase uptake of low-carbon off-road mobile machinery. This will require work across BEIS, MHCLG, DfT and Defra.	2021

Table A4 Recommendations for the Department for Business, Energy and Industrial Strategy (BEIS)		Timing
Resource efficiency in manufacturing and construction	<p>Step up efforts (with Defra) to deliver the <b>waste prevention and resource efficiency</b> improvements required as part of the pathway to Net Zero, including by:</p> <ul style="list-style-type: none"> <li>Accelerating delivery of the Waste Prevention Programme so that key policies, such as Extended Producer Responsibility and new product standards, are on track to be in place well before 2025.</li> <li>Setting out how levels of resource efficiency improvements identified within the Industrial Decarbonisation Strategy will be delivered.</li> <li>Beginning to develop and implement any additional policies needed to deliver these resource efficiency improvements, by the end of 2022.</li> <li>Ensure cross-departmental working, potentially through new cross-Whitehall governance focused on resource efficiency.</li> </ul>	<p>Spring 2022 <b>Priority recommendation</b></p> <p>(end 2022 for additional policies)</p>
	<p>Develop policies (with MHCLG, Defra and DfT) to drive more <b>resource-efficient construction</b> and use of existing low-carbon materials, including a substantial increase in the use of <b>wood in construction</b>. Policies should include:</p> <ul style="list-style-type: none"> <li>Reviewing and clarifying the position of structural timber in the ban on combustible materials, underpinned by further research and testing where necessary, and ensuring there are no barriers to the safe use of timber in buildings. The buildings safety regulator to play a role in overseeing this on an ongoing basis.</li> <li>The development of a fully-funded policy roadmap on the use of timber, including policies to support the development of UK wood supply chains.</li> <li>Finalising the reporting methodology for whole-life carbon standards.</li> <li>Setting out a plan for phasing in mandatory whole-life reporting followed by minimum whole-life standards for all buildings, roads and infrastructure by 2025, with differentiated targets by function, scale, and public/private construction.</li> </ul>	Spring 2022
	<p>Consult on detailed proposals (with Defra) for <b>product standards and extended producer responsibility</b> to improve the resource efficiency of consumer goods' lifecycles. The proposals should include all consumer goods with high environmental impact and cover how products are made, through indicators such as the level of recycled content and critical material content, and the reparability, durability and upgradability of a product.</p>	Spring 2022
	<p>Work with business to encourage and <b>enable consumers to share</b>, lease and use products for longer while discouraging 'disposable' business models.</p>	Spring 2022
Transport	<p>Continue to support (with DfT and Ofgem) widespread deployment of <b>EV charging infrastructure</b>:</p> <ul style="list-style-type: none"> <li>This should ensure it can support high EV uptake levels. Project Rapid has the right ambition for the strategic road network and should be developed into a full strategy for the 2020s and beyond.</li> <li>Further investment is needed to support on-street and other urban charging solutions for those without off-street parking and destination charging.</li> <li>Government should aim for there to be around 150,000 public charge points operating by 2025. These should be widely available across all regions of the UK.</li> <li>Implement the recommendations of the EV Energy Taskforce, in particular improving the consumer charging experience and making smart-charging accessible, appealing and cost-effective for as many EV users as possible.</li> </ul>	Now and ongoing <b>Priority recommendation</b>
	<p>Produce a clear assessment (with DfT) of how best to re-use and <b>recycle EV batteries</b> and fund development of competitive, large-scale battery recycling facilities in the UK.</p>	2021-22
	<p>Continue innovation and demonstration support (with DfT) for <b>zero-carbon fuel technologies</b> and their use in shipping, and ship efficiency measures. Develop incentives for zero-carbon ammonia and hydrogen supply chains.</p>	Early 2020s

Table A4 Recommendations for the Department for Business, Energy and Industrial Strategy (BEIS)		Timing
Greenhouse gas removals (GGRs)	The overall Net Zero Strategy should place <b>GGRs in context</b> of a wider strategic approach to reaching Net Zero, setting out a plan for development and deployment of removals, but also for actions elsewhere to limit the need for them.	2021 Priority recommendation
	Building on the Greenhouse Gas Removals (GGR) call for evidence, launch consultation on Government's preferred <b>GGR strategy</b> and long-term expected requirement for GHG removals, including a proposed market design, a set of governance principles and proposals that recognise the need for a long-term price signal.	H1 2022 Priority recommendation
	Support the <b>demonstration of engineered GGR</b> at scale in the 2020s, either through amending existing policies or introducing new support mechanisms.	2022 Priority recommendation
	Build on the recently commenced <b>innovation programmes</b> , the Direct Air Capture and other Greenhouse Gas Removals Competition and UK Greenhouse Gas Removal Demonstration Programme, to support both the demonstration and commercialisation of more advanced greenhouse gas removal technologies (taking these from technology readiness level 5 to 8), and alongside undertake research and development into less advanced removal approaches including through pilots and field experiments.	Now and ongoing
	Ensure that a <b>public engagement strategy</b> for Net Zero includes national, regional, and local communities to improve the public's understanding of GGR approaches and both the local and system-wide implications of different options - awareness is currently very low, and support is mixed or uncertain.	2021-22
	Align with adaptation policies to ensure long-term <b>resilience and effectiveness of GGRs</b> in the face of climate impacts and exploit potential for co-benefits (e.g. choice of tree species, protecting new infrastructure from flood risks).	Before 2025
Fuel supply	Develop a <b>Hydrogen Strategy</b> out to 2035 that determines plans and sets out pathways to appropriate hydrogen use across power, industry, transport, and buildings; low-carbon hydrogen production options; and the associated infrastructure. Ensure that large-scale hydrogen trials begin in the early 2020s.	2021 Priority recommendation
	Deliver a <b>Biomass Strategy</b> that is aligned to the UK's path to Net Zero, and which reflects recommendations on governance, monitoring and best-use from the Committee's 2018 Biomass report and 2020 Land Use report. The UK should also continue to take a global lead on further developing and improving UK and international biomass governance and sustainability criteria.	2022 Priority recommendation
	Set new requirements for CCS-readiness at <b>biofuel conversion facilities</b> of all scales. This should include dates beyond which new facilities should be built with CCS, and dates for when CCS will need to be retrofitted to biofuel facilities already in operation.	2022
	Set out policies to reduce <b>upstream emissions from oil and gas</b> production by 68% by 2030, relative to 2018 levels: <ul style="list-style-type: none"> <li>Develop policies to reduce emissions from existing oil and gas platforms, including developing carbon-intensity measurement standards for gas and oil.</li> <li>Set a requirement for new plans for offshore oil and gas platforms and associated installations to use low-carbon energy for their operations, aligning to zero direct emissions from operational energy use by 2027.</li> <li>Make plans to ensure flaring and venting is only permitted for safety reasons from 2025.</li> </ul>	2021
	Work with Ofgem to make explicit how current and future policies will reduce emissions associated with <b>methane leakage</b> from the gas networks in a way that is consistent with the Sixth Carbon Budget.	2021
	Formalise the process, governance framework and timeline for decisions on the <b>conversion to hydrogen</b> of appropriate parts of the gas pipeline networks. This should include starting a programme of research with Ofgem to identify areas which are unlikely to be suitable (such that electrification and alternatives can be prioritised), alongside priority candidate areas for hydrogen.	2021

Table A5 Recommendations for the Department for Environment, Food and Rural Affairs (Defra)		Timing
Cross-cutting	<p>The next <b>National Adaptation Programme</b>, due in 2023, should ramp up adaptation ambition, implementation and evaluation. It should:</p> <ul style="list-style-type: none"> <li>• Set out the Government's vision for a well-adapted UK, alongside the measurable outcomes that the Government is aiming to achieve by the end of the next NAP period (2023 – 2028).</li> <li>• Include a detailed monitoring and evaluation framework, including which indicators will be used to monitor progress in reducing risk and showing the effectiveness of different adaptation responses for each risk in CCRA3.</li> <li>• Report how departments have addressed the top eight priority risks set out in the CCRA3 Advice Report for urgent action between 2021 and 2023.</li> <li>• Set out how adaptation is being integrated into policy, and the measurable actions by department for adaptation across each of the 61 risks and opportunities set out in the CCRA3 Technical for the period 2023-2028.</li> <li>• Ensure the adaptation actions and the programme as a whole are framed around the principles for good adaptation outlined in the CCRA3 Advice Report: <ul style="list-style-type: none"> <li>– Adapt to 2°C warming, assess the risks for 4°C</li> <li>– Prepare for unpredictable extremes</li> <li>– Assess interdependencies</li> <li>– Understand threshold effects</li> <li>– Integrate adaptation into relevant policies</li> <li>– Ensure adaptation is sufficiently financed</li> <li>– Avoid lock-in</li> <li>– Address inequalities</li> <li>– Consider opportunities from climate change</li> </ul> </li> <li>• Specific actions to manage international climate risks should be included, setting out the direct response to the risks identified in CCRA3.</li> </ul>	2023 onwards Priority recommendation
	<p>Ensure that <b>adaptation is integrated</b> into major upcoming policies in the next two years related to the priority CCRA3 risks for which Defra has lead responsibility, coordinating work with other relevant departments as necessary:</p> <ul style="list-style-type: none"> <li>• Risks to the viability and diversity of terrestrial and freshwater habitats and species from multiple hazards.</li> <li>• Risks to soil health from increased flooding and drought.</li> <li>• Risks to natural carbon stores and sequestration (trees, soils and wetlands) from multiple hazards.</li> <li>• Risks to crops, livestock, and commercial trees from multiple hazards.</li> </ul> <p>In addition, for the coming five-year period (2023-2028), Defra should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the other risks and opportunities in the CCRA for which it is the lead department (see Adaptation Report Annex).</p>	By 2023 Priority recommendation
	<p>Implement a <b>public engagement programme about national adaptation objectives</b>, acceptable levels of risk, desired resilience standards, how to address inequalities, and responsibilities across society. The findings from the programme should feed into the vision and desired outcomes of the next National Adaptation Programme.</p>	2021 Priority recommendation
	<p>Implement measures to address <b>non-financial barriers to tackling emissions from land use and agriculture</b>, including awareness and improving skills in sustainable forestry and peatland management; scaling up supply chains; streamlining application processes and addressing contractual and tax issues where they are acting as barriers. Delivery plans should also set out measures to:</p> <ul style="list-style-type: none"> <li>• Improve knowledge exchange of low-carbon farming practices to provide confidence to farmers to take up measures to reduce on-farm GHGs.</li> <li>• Improve the science and evidence base for woodlands and peatlands, to deliver GHG reductions and multiple other benefits, ensure the right tree is planted in the right place and that they are resilient to future climate impacts.</li> </ul>	2021-25 Priority recommendation

Table A5 Recommendations for the Department for Environment, Food and Rural Affairs (Defra)		Timing
Cross-cutting	Legislate the <b>Environment Bill</b> this year, using it to strengthen commitments on waste, resource efficiency, agriculture and land-use.	2021
	Develop (with DIT) the option of applying either <b>border carbon tariffs or minimum standards to imports</b> of selected embedded-emission-intense industrial and agricultural products and fuels. This should include initiating development of carbon intensity measurement standards and fostering international consensus around trade policies through the G7 and COP presidencies.	2021 Priority recommendation
	Ensure <b>all departmental policy decisions</b> , and procurement decisions, are consistent with the Net Zero goal and reflect the latest understanding of climate risks.	Now and ongoing
Research and data	Fund a programme of work to design and populate the appropriate new <b>priority adaptation indicators</b> for England. These should complement other environmental and social indicators collated by Government. The CCC could be tasked to coordinate this activity in partnership with other relevant organisations such as the Office for Environmental Protection and Environment Agency.	2021
	Continue to monitor <b>consumption emissions</b> . These are important to ensure that action to decarbonise UK-based activities does not result in emissions moving offshore, and to track progress in decarbonisation of imports to the UK, which in turn can inform future policy (e.g. border carbon adjustments).	Now and ongoing
	Improve the collection and reporting of <b>industrial decarbonisation data</b> to allow for progress to be monitored more effectively, particularly on energy and resource efficiency.	2022
Nature and land use	Extend current ambition set out by the UK government and the devolved administrations to implement a comprehensive delivery mechanism to address <b>degraded peatland</b> : <ul style="list-style-type: none"> <li>17% of upland peat is restored, equivalent to 200,000 hectares (and where this is not possible, stabilise the peat) by 2025; 58% by 2035 (700,000 hectares) and the remaining area by 2045.</li> <li>Rewet and sustainably manage 12% of lowland peat used for crops by 2025 (24,000 hectares), rising to 38% by 2035 (72,000 hectares).</li> <li>Rewet 8% of lowland grassland area by 2025 (18,000 hectares), rising to 25% by 2035 (54,000 hectares).</li> <li>Remove all low-productive trees (i.e. less than YC8) from peatland (equivalent to 16,000 hectares by 2025), and restore all peat extraction sites by 2035 (equivalent to 50,000 hectares by 2025).</li> </ul>	2021-25 Priority recommendation
	Extend current ambition set out by the UK government and the devolved administrations to implement a comprehensive <b>delivery mechanism for new woodland</b> to create at least 30,000 hectares per year across the UK by 2025 (in line with the Government's commitment) and an average of 40,000 hectares per year in the 2030s.	2021-25 Priority recommendation
	Introduce legislation to: <ul style="list-style-type: none"> <li>Extend the <b>ban on rotational burning of peat</b> from certain protected upland bog sites to all peatland before the start of the burn season in 2021</li> <li>End peat extraction, and ban its sale for all horticultural uses including in the professional sectors and apply this to imports by 2023.</li> <li>Mandate water companies to restore peatland under their ownership.</li> <li>Ensure lowland peat soils are not left bare.</li> </ul>	2021-23 Priority recommendation
	Publish an overarching strategy that clearly outlines the relationships and <b>interactions between the multiple action plans</b> in development for the natural environment, including those for peat, trees, nature and plant biosecurity. This must clearly outline how the different strategies will combine to support the Government's climate change goals on both Net Zero and adaptation, along with the wider environment and other goals.	2021
	Make <b>long-term targets for biodiversity</b> , set out under the Environment Bill, and associated timeframes outcome-based and linked directly to the goals set out in the Government's 25-Year Environment Plan.	H1 2022
	Make <b>interim targets for biodiversity</b> statutory and link them clearly to the long-term targets set out in the Environment Bill.	H1 2022
	The commitment in the 25 Year Environment Plan to achieve 75% <b>restoration for terrestrial and freshwater</b> protected sites should be extended to include all priority habitat sites.	2021
	Set out a clear mechanism to account for the consequences of <b>higher water temperatures and low flows</b> (including drying up) in water bodies for freshwater habitats and species, and for meeting the Water Framework Directive (WFD) targets. This is lacking in current plans to revise the River Basin Management Plans (RBMPs).	H1 2022
	Extend the statutory requirements of <b>marine plan policies</b> to the decisions of public and private organisations. At present only public authorities are duty bound under law to apply the plan policies to their decisions meaning there is a significant gap in the protections they are designed to provide.	Now

Table A5 Recommendations for the Department for Environment, Food and Rural Affairs (Defra)		Timing
Agriculture and food	<p>Provide <b>incentives and address non-financial barriers</b> across all of the UK to:</p> <ul style="list-style-type: none"> <li>Plant <b>trees</b> on 2% of farmland by 2025 while maintaining their primary use, rising to 5% by 2035.</li> <li>Extend <b>hedgerows</b> by 20% by 2035 and better manage existing hedgerows.</li> <li>Increase the area growing <b>energy crops</b> across the UK to 6,000 hectares per year by 2025, and 30,000 hectares per year by 2035.</li> </ul>	2021-25 Priority recommendation
	<p>Implement measures to encourage consumers to <b>shift diets and reduce food waste</b> across the supply chain, including:</p> <ul style="list-style-type: none"> <li>Low-cost, low-regret actions to encourage a 20% shift away from all meat by 2030, rising to 35% by 2050, and a 20% shift from dairy products by 2030. Develop an evidence-based strategy to establish options for successful behaviour shifts and demonstrate public sector leadership.</li> <li>Policy to reduce food waste by 50% by 2030 and 60% by 2050, with the public sector taking a lead through measures such as target setting and effective product labelling.</li> </ul>	Start now and review mid-2020s for diet change Priority recommendation
	<p>Introduce a strong <b>post-CAP regulatory baseline</b>, and adopt and retain existing EU rules that benefit GHG mitigation into UK legislation. These include low-cost, low-regret on-farm measures to reduce emissions; extending coverage of Nitrate Vulnerable Zones across all of the UK; including measures that reduce enteric methane emissions in the Clean Air Strategy, specifically under the proposal to extend environmental permitting to the dairy and intensive beef sectors; and mandating UK feed producers to incorporate methane inhibiting additives in compound feed and mineral supplements.</p>	2021-23
	<p>Set out measures to ensure the resilience of the <b>food supply chain</b>, including to the risks of extreme weather in England and internationally, as part of its white paper responding to the independent review of the National Food Strategy for England.</p>	2022
	<p>Introduce a comprehensive plan and incentives to deliver <b>emissions reduction across all UK farms</b> through:</p> <ul style="list-style-type: none"> <li>High take-up of low-carbon agricultural measures (60-75% by 2050) covering livestock (diets, breeding, and health), soils (cover crops and grass-legume mix) &amp; waste management (anaerobic digestion and slurry covers).</li> <li>Measures to incentivise the take-up of near-zero-emissions options for agricultural machinery and vehicles from the mid-2020s, and develop options where they are not currently available.</li> </ul>	2021-25
	<p>The landscape-level and on-farm measures set out above should:</p> <ul style="list-style-type: none"> <li><b>Leverage private and public finance</b> (e.g. a trading scheme or auctioned contracts). New and existing funding streams should continue during the transition period to this system to avoid a hiatus in deployment.</li> <li>Be accompanied by a strong <b>monitoring, reporting and verification</b> system that uses the latest monitoring tools and technologies to create a strong institutional framework to verify actions across the UK.</li> </ul>	2021-25
	<p>Set out a strategy for decarbonisation of <b>off-road mobile machinery</b> and work with industry to identify potential policies to increase uptake of low-carbon off-road mobile machinery. This will require work across BEIS, MHCLG, DfT and Defra.</p>	2021

Table A5 Recommendations for the Department for Environment, Food and Rural Affairs (Defra)		Timing
Waste	Introduce the necessary planning guidance and policy to ensure any new <b>Energy from Waste</b> plants (including incineration, gasification & pyrolysis facilities) are built with carbon capture usage and storage (CCUS) or are 'CCUS ready'.	Spring 2022 Priority recommendation
	Set out how existing <b>Energy from Waste</b> plants will be supported to be retrofitted with CCUS from late 2020s onwards, with 2050 a backstop date for full CCUS coverage.	2022 Priority recommendation
	Set out capacity and usage requirements for <b>Energy from Waste</b> consistent with plans to improve recycling and waste prevention. Issue guidance to align local authority waste contracts and planning policy to these targets.	2021 Priority recommendation
	Set out <b>funding arrangements for local authorities</b> to provide the recycling, composting and waste management services and infrastructure required to deliver at least the commitments in the Environment Bill, Waste Prevention Programme and Resources and Waste Strategy, by 2022.	2022-25
	Consult on the introduction of a <b>carbon tax</b> (either as part of the UK ETS or a separate instrument) aimed at curbing rising emissions from Energy from Waste.	2022
	Set a target for a 68% <b>recycling rate</b> by 2030 covering all wastes in England via the Environment Bill and announce new policies to meet this target. Northern Ireland to set a 70% target for 2030. Scotland and Wales to set new targets for 2030 that go beyond their 70% targets for 2025.	2021
	<b>Composting facilities</b> should be incentivised to install forced aeration as a method of reducing on-site emissions.	From 2022
	Mandatory <b>business food waste</b> reporting to be introduced by 2022, building on WRAP's existing voluntary scheme.	2022
	Legislate for (in England via the Environment Bill, and in Wales, Scotland, and Northern Ireland via new legislation) and implement a <b>ban on landfilling of the main biodegradable waste</b> streams from 2025 (both municipal and non-municipal). There must be sufficient recycling/composting/AD treatment capacity made available before the ban comes into force, so that significant increases in energy-from-waste are avoided.	2021
	Long-term plans should be announced for eventual <b>diversion of all wastes from landfill</b> (except for where no alternative treatment or disposal method exists) but with a date conditional on sufficient action on reduction, re-use and recycling, and installation of CCS at energy-from-waste plants, to avoid a surge in fossil emissions when the ban comes into force.	Mid-2020s
	Introduce policies and funding for increased <b>methane capture and oxidation at landfill sites</b> , to decrease fugitive landfill methane emissions significantly.	2022
Phase out <b>exports of waste</b> by 2030 at the latest, through improvements in waste prevention and domestic recycling and recovery, while strengthening tracking and enforcement to ensure that any exports intended for recycling are being treated appropriately.	2020s	
Greenhouse gas removals and offsets	Build on the recently commenced innovation programmes (with BEIS), the Direct Air Capture and other Greenhouse Gas Removals Competition and UK Greenhouse Gas Removal Demonstration Programme, to support both the <b>demonstration and commercialisation of more advanced greenhouse gas removal</b> technologies (taking these from technology readiness level 5 to 8), and alongside undertake research and development into less advanced removal approaches including through pilots and field experiments.	Now and ongoing
	Align with adaptation policies to ensure long-term <b>resilience and effectiveness of GGRs</b> in the face of climate impacts and exploit potential for co-benefits (e.g. choice of tree species, protecting new infrastructure from flood risks).	Before 2025
	Consider (with BEIS) the appropriate regulatory arrangements, rules and guidance for the use of <b>carbon offsetting by UK corporates</b> within their Net Zero strategies, recognising the growing demand for offsetting markets, the interactions with the UK ETS and currently accredited schemes (i.e. the Woodland Carbon Code and the Peatland Code), and the need to avoid double-counting or negative outcomes for non-carbon objectives.	2021-22

Table A5 Recommendations for the Department for Environment, Food and Rural Affairs (Defra)		Timing
Resource efficiency	<p>Step up efforts to deliver the <b>waste prevention and resource efficiency</b> improvements required as part of the pathway to Net Zero, including by:*</p> <ul style="list-style-type: none"> <li>Accelerating delivery of the Waste Prevention Programme so that key policies, such as Extended Producer Responsibility and new product standards, are on track to be in place well before 2025.</li> <li>Setting out how levels of resource efficiency improvements identified within the Industrial Decarbonisation Strategy will be delivered.</li> <li>Beginning to develop and implement any additional policies needed to deliver these resource efficiency improvements, by the end of 2022.</li> <li>Ensure cross-departmental working, potentially through new cross-Whitehall governance focused on resource efficiency.</li> </ul>	<p>Spring 2022 Priority recommendation</p> <p>(end 2022 for additional policies)</p>
	<p>Consult on detailed proposals for <b>product standards and extended producer responsibility</b> to improve the resource efficiency of consumer goods' lifecycles. The proposals should include all consumer goods with high environmental impact and cover how products are made, through indicators such as the level of recycled content and critical material content, and the reparability, durability and upgradability of a product.</p>	Spring 2022
	<p>Develop policies (with BEIS, MHCLG and DfT) to drive more <b>resource-efficient construction</b> and use of existing low-carbon materials, including a substantial increase in the use of <b>wood in construction</b>. Policies should include:</p> <ul style="list-style-type: none"> <li>Reviewing and clarifying the position of structural timber in the ban on combustible materials, underpinned by further research and testing where necessary, and ensuring there are no barriers to the safe use of timber in buildings. Buildings safety regulator to play a role in overseeing this on an ongoing basis.</li> <li>The development of a fully funded policy roadmap on the use of timber, including policies to support the development of UK wood supply chains.</li> <li>Finalising the reporting methodology for whole-life carbon standards.</li> <li>Setting out a plan for phasing in mandatory whole-life reporting followed by minimum whole-life standards for all buildings, roads and infrastructure by 2025, with differentiated targets by function, scale, and public/private construction.</li> </ul>	Spring 2022
	<p>Work with business to encourage and enable consumers to share, lease and use products for longer whilst <b>discouraging 'disposable' business models</b>.</p>	Spring 2022
Buildings and infrastructure	<p>Make changes ahead of the next round of reporting under the <b>Adaptation Reporting Power (ARP)</b>. When used effectively, the ARP can present updated risks and adaptation actions that allows for an assessment of preparedness of all infrastructure sectors and their interdependencies. In particular:</p> <ul style="list-style-type: none"> <li>The next round of reporting must be mandatory.</li> <li>The deadline for reporting must allow sufficient time for consideration of all the reports in the fourth UK Climate Change Risk Assessment, and the CCC's statutory assessment of progress on adaptation.</li> <li>The list of organisations reporting should be expanded to ensure comprehensive coverage of critical infrastructure and services, such as canals and food supply chains, as recommended by the ARP3 consultation.</li> </ul>	2023
	<p>Work with the Environment Agency to set out the measures being taken to improve the uptake of <b>property-level flood resilience (PFR)</b> following stakeholder responses to its PFR call for evidence and consultation. This should include improved data collection to monitor progress. Plans for the new national flood risk assessment and 2025 long-term investment scenarios must ensure that the evidence they provide can be used to identify the most effective locations for PFR, and smart targets for their installation with timescales.</p>	2022
	<p>Work with <b>Port Operators and the British Ports Association</b> to ensure the format of reporting under the Adaptation Reporting Power is appropriate for port operators and that the right operators are being asked to report, as well as to identify what further support could be offered to enable more comprehensive reporting on adaptation by the ports sector.</p>	2023
	<p>Improve information sharing on climate risks to infrastructure interdependencies at a local level, especially for <b>electricity, digital and ICT networks</b>. As reported in our previous assessment in 2019, NAP actions to enhance arrangements for information sharing between local infrastructure operators and improve understanding of critical risks arising from interdependencies have not been completed. Defra's link with Local Resilience Forums is key, and BEIS and DCMS should engage with utility companies to encourage standardised benchmarking and data sharing on climate risks to electricity networks, digital &amp; ICT.</p>	Now and ongoing

Table A5 Recommendations for the Department for Environment, Food and Rural Affairs (Defra)		Timing
Waste and wastewater	Work with the Environment Agency, Ofwat and other stakeholders to set out targets and supporting measures for <b>reducing water use by business</b> . This could be through ensuring that any water reduction targets linked to the Environment Bill include business as well as household water use, and responding to advice and recommendations from Defra's new Senior Water Demand Reduction Group.	2022
	Commit innovation funding to development and demonstration of novel <b>wastewater treatment</b> process that achieve a step change improvement in direct process emissions.	2022
	Outside of the municipal wastewater sector, incentivise <b>industrial wastewater plants</b> to reduce their process emissions.	From 2022

Table A6 Recommendations for the Department for Transport (DfT)		Timing
Cross-cutting	For the coming five-year period (2023–2028), DfT should outline appropriate actions in the next <b>National Adaptation Programme</b> to address the adaptation gap identified for the risks and opportunities in the CCRA for which it is the lead department (see Adaptation Report Annex).	2023 Priority recommendation
	Decisions on <b>investment in roads</b> should be contingent on analysis justifying how they contribute to the UK's pathway to Net Zero. This analysis should demonstrate that the proposals would not lead to increases in overall emissions. Wherever possible, investment in roads should be accompanied by proportionate investment in EV charging infrastructure and in active travel and public transport.	2021-22
	Develop policies (with BEIS, Defra and MHCLG) to drive more <b>resource-efficient construction</b> and use of existing low-carbon materials. DfT's focus should be on: <ul style="list-style-type: none"> <li>Finalising the reporting methodology for whole-life carbon standards</li> <li>Contributing to a plan for phasing in mandatory whole-life reporting followed by minimum whole-life standards for all roads and infrastructure by 2025, with differentiated targets by function, scale, and public/private construction.</li> </ul>	Spring 2022
	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing
Electric vehicles	Develop a comprehensive policy package to <b>support the supply and uptake of EVs</b> to enable delivery of the 2030 phase-out of new petrol and diesel cars and vans. This will require: <ul style="list-style-type: none"> <li>Strong consumer incentives to purchase zero-emission vehicles, whether in the form of purchase subsidies or preferential tax rates and duties. These should be fair across consumer groups and scaled back as costs of EVs fall.</li> <li>Introducing a zero-emission vehicle mandate requiring car manufacturers to sell a rising proportion of zero-emission vehicles (specifically, fully battery-electric vehicles), reaching nearly 50% by 2025 and 100% by 2030, with only a very small proportion of hybrids allowed alongside until 2035. This will benefit air quality and consumers, as well as greenhouse gas emissions.</li> <li>Setting out ambitious UK regulations on new car and van CO<sub>2</sub> intensities to 2030, with more regular intervals than the EU's five years, requiring around a 55% reduction by 2025 and 97% by 2030.</li> </ul>	Policy package: 2021 Support: Now and ongoing  Priority recommendation
	Continue to support widespread deployment of <b>EV charging infrastructure</b> : <ul style="list-style-type: none"> <li>This should ensure it can support high EV uptake levels. Project Rapid has the right ambition for the strategic road network and should be developed into a full strategy for the 2020s and beyond.</li> <li>Further investment is needed to support on-street and other urban charging solutions for those without off-street parking and destination charging.</li> <li>Government should aim for there to be around 150,000 public charge points operating by 2025. These should be widely available across all regions of the UK.</li> <li>Implement the recommendations of the EV Energy Taskforce, in particular improving the consumer charging experience and making smart-charging accessible, appealing and cost-effective for as many EV users as possible.</li> </ul>	Now and ongoing Priority recommendation
	Produce a clear assessment of how best to re-use and <b>recycle EV batteries</b> and fund development of competitive, large-scale battery recycling facilities in the UK.	2021-22

Table A6 Recommendations for the Department for Transport (DfT)		Timing
Public transport and active travel	Strengthen support for, and provision of, schemes to support <b>walking, cycling and public transport</b> to reduce demand for higher-carbon travel: <ul style="list-style-type: none"> <li>Provision of infrastructure for active travel and other support schemes, as well as measures to make it less attractive to drive, are needed.</li> <li>This should include maintaining positive behaviour shifts and addressing risks resulting from the COVID-19 pandemic.</li> <li>Working across delivery bodies (e.g. local authorities) is critical.</li> </ul>	2021-22 Priority recommendation
	Government should support the <b>public transport and shared mobility</b> sectors to recover from the COVID-19 pandemic: <ul style="list-style-type: none"> <li>Positive communications and messaging will be required to rebuild public confidence in the safety of public transport.</li> <li>Financial support for the sector should be maintained while confidence and demand are rebuilt, to avoid the risk of operators cutting service provision.</li> <li>Government should seek to reverse the increasing relative price advantage of car travel over public transport.</li> </ul>	2021-22
	Set out a clear vision to deliver Net Zero in <b>rail</b> , and support Network Rail and other bodies in delivering the target to remove all passenger diesel trains by 2040. This should cover a mix of zero-emission technologies (e.g. track electrification, battery-electric, hydrogen and hybrid trains). The strategy should be published by 2021 as recommended by the National Infrastructure Commission.	2021
	Mandate a <b>phase-out</b> of new sales of all <b>diesel buses and coaches</b> by 2040 at the latest. <ul style="list-style-type: none"> <li>This should include a requirement for new sales of diesel vehicles operating on shorter, urban routes to end considerably sooner.</li> <li>Local authorities should be empowered to continue driving zero-emission bus take-up and to deliver improvements to bus services.</li> </ul>	2021-22
	Implement large-scale <b>trials of zero-emission HGVs</b> in the early-2020s to demonstrate the commercial feasibility of these technologies and establish the most suitable and cost-effective technology mix.	Early 2020s
Freight and off-road mobile machinery	Set out and implement a <b>strategy to transition to zero-carbon freight</b> , including: <ul style="list-style-type: none"> <li>Ending sales of new diesel HGVs by 2040 at the latest.</li> <li>Stronger purchase and other incentives for zero-emission HGVs.</li> <li>Infrastructure plans and support (e.g. ultra-rapid chargers for battery-electric HGVs and hydrogen refuelling stations for hydrogen HGVs).</li> <li>Clean air zones.</li> </ul>	2021
	Implement schemes to <b>reduce HGV and van use</b> in urban areas (e.g. e-cargo bikes and use of urban consolidation centres), to reduce traffic and improve the safety of active travel.	2021
	Set out a strategy for decarbonisation of <b>off-road mobile machinery</b> and work with industry to identify potential policies to increase uptake of low-carbon off-road mobile machinery. This will require work across BEIS, MHCLG, DfT and Defra.	2021
	Build on the <b>Clean Maritime Plan</b> and formal inclusion of international shipping in CB6 and Net Zero to set a Net Zero 2050 goal for UK shipping (including international shipping) and a pathway to get there.	2021
Shipping	Take a leadership role in working with the <b>International Maritime Organisation (IMO)</b> and other willing partners on global shipping policies, research funding, tighter efficiency targets and other initiatives to reduce shipping emissions. Work to strengthen the IMO 2050 global target.	2021-22
	Commit to the UK's first <b>clean maritime cluster(s)</b> operating at commercial scale (supplying at least 2 TWh/year of zero-carbon fuels) by 2030 at the latest, with zero-carbon fuels expanding to 33% of UK shipping fuel use by 2035.	2021-22
	Continue <b>innovation and demonstration support for zero-carbon fuel</b> technologies and their use in shipping, and ship efficiency measures. Develop incentives for zero-carbon ammonia and hydrogen supply chains.	Early 2020s
	Provide support for ports' investment in <b>shore power</b> and electric recharging infrastructure.	Early 2020s
	Start monitoring <b>non-CO<sub>2</sub> effects</b> of shipping and decide on how best to tackle them alongside UK climate targets.	2021

Table A6 Recommendations for the Department for Transport (DfT)		Timing
Aviation	Commit to a Net Zero goal and pathway for UK aviation as part of the forthcoming <b>Aviation Decarbonisation Strategy</b> , with UK international aviation reaching Net Zero emissions by 2050 at the latest, and domestic aviation potentially earlier. Plan for residual emissions (after efficiency, low-carbon fuels, and demand-side measures) to be offset by verifiable greenhouse gas removals, on a sector net emissions trajectory to Net Zero.	2021 Priority recommendation
	Assess the Government's <b>airport capacity strategy</b> in the context of Net Zero and any lasting impacts on demand from COVID-19, as part of the aviation strategy. There should be no net expansion of UK airport capacity unless the sector is on track to sufficiently outperform its net emissions trajectory and can accommodate the additional demand. A demand management framework will need to be developed (by 2022) and be in place by the mid-2020s to annually assess and, if required, control sector GHG emissions and non-CO <sub>2</sub> effects.	2021-22 Priority recommendation
	Take a leadership role within the <b>International Civil Aviation Organisation (ICAO)</b> , and work with other high-ambition nations, to set a long-term goal for aviation consistent with the Paris Agreement, strengthen the CORSIA scheme and align CORSIA to this long-term goal.	2021-22
	Continue innovation and demonstration support for <b>sustainable aviation fuel (SAF)</b> technologies, aircraft efficiency measures, hybrid, full electric and hydrogen aircraft development and airspace modernisation. Set out a policy package for supporting the near-term deployment of commercial SAF facilities in the UK (with carbon capture and storage where applicable).  Longer-term, support for SAF should transition to a more bespoke, enduring policy to drive uptake.	Now and ongoing Policy package in 2021
	Use <b>aviation tax reform</b> to address price imbalances between aviation and surface transport, encouraging the low-carbon alternative (e.g. rail) for journeys where one exists. Taxation should also be used, alongside improvements in broadband, to embed positive behaviours that have arisen during the pandemic (e.g. replacing business travel with online networking).	2021-22
	Commit to not use credits from the <b>Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA)</b> for flights covered by the UK ETS unless and until they can satisfy strict eligibility criteria (equivalence, additionality, permanence, sustainability).	2021-22
	Start monitoring <b>non-CO<sub>2</sub> effects</b> of aviation (including through CORSIA for eligible aeroplane operators), set a minimum goal of no further warming after 2050, research mitigation options, and consider how best to tackle non-CO <sub>2</sub> effects alongside UK climate targets without increasing CO <sub>2</sub> emissions.	2021-22

Table A7 Recommendations for the Ministry of Housing, Communities and Local Government (MHCLG)		Timing
Cross-cutting	<p>Support <b>local government</b> to play a full role in the Net Zero transition, including through increased resourcing, guidance, involvement in local area energy plans, statutory reporting on the emissions from their estate and reforming the planning framework to enable delivery of low-carbon and climate resilient measures.</p> <p>This is likely to require additional funding for staffing and resources for local delivery plans, alongside a 'duty to collaborate' to encourage authorities to work with local, regional and national partners to deliver their climate ambitions.</p>	<p>2021-23 <b>Priority recommendation</b></p> <p>(funding for local areas at next budget)</p>
	<p>Ensure that <b>adaptation is integrated</b> into major upcoming policies in the next two years related to the priority CCRA3 risks for which MHCLG has lead responsibility, coordinating work with other relevant departments as necessary:</p> <ul style="list-style-type: none"> <li>Risks to human health, wellbeing and productivity from increased exposure to heat in homes and buildings (with DHSC).</li> <li>In addition, for the coming five-year period (2023-2028), MHCLG should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the risks and opportunities in the CCRA for which it is the lead department (see Adaptation Report Annex).</li> </ul>	<p>By 2023 <b>Priority recommendation</b></p>
	<p>Working with BEIS, DWP, DfE and the Home Office, develop a strategy for a <b>Net Zero workforce</b> that ensures a just transition for workers transitioning from high-carbon to low-carbon and climate-resilient jobs, integrates relevant skills into the UK's education framework and actively monitors the risks and opportunities arising from the transition. This strategy should include the development and roll-out of plans for training and skills, with buildings and manufacturing being priority areas.</p>	<p>2021 <b>Priority recommendation</b></p>
	<p>Ensure that developments and infrastructure are compliant with <b>Net Zero</b> and appropriately <b>resilient to climate change</b> through proposed amendments to the Planning Bill.</p>	<p>2021-22</p>
	<p>Introduce an <b>urban greenspace</b> target to reverse the decline and ensure towns and cities are adapted to more frequent heatwaves in the future and that the 25-Year Plan goals are met.</p>	<p>2022</p>
	<p>Ensure all departmental policy decisions, planning decisions and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b>.</p>	<p>Now and ongoing</p>
Flooding	<p>Ensure that all types of current and future <b>flood risk</b> are included in policies to assess flood risk to new developments. Housing targets for local authorities should take account of flood risk, amongst other environmental issues. Assessments and management of flood risk in new developments must as a minimum:</p> <ul style="list-style-type: none"> <li>Include evidence that the development will be safe over its full lifetime, with a consideration of the downstream interactions and impacts of new developments (i.e. it should not increase flooding in other areas).</li> <li>Include an assessment of current and future flood risk under both 2°C and 4°C global climate scenarios.</li> <li>Assess and manage the risk of flooding to local infrastructure as well as housing.</li> <li>Include a consideration of better preparedness as set out in the Government's recent FCERM Policy Statement.</li> <li>Ensure there are properly funded and trained staff in local authorities.</li> </ul>	<p>2022</p>
	<p>To help improve the <b>information on SuDS and surface water flood risk</b>, urgently begin collecting data on sewer capacity and SuDS location, type and capacity. This would bring the level of information in line with that for river and coastal flood risk defences.</p>	<p>2021</p>
	<p>To address the issue of increased risk of <b>surface water flooding</b> in new developments, commit to ensuring that new developments do not put more water into the public sewers than what was there before, taking into account climate change. To incentivise this, end the automatic right to connect to the public sewer; planning reforms should enact Schedule 3 of the Flood and Water Management Act (2010); and technical SuDS standards should be made mandatory and be updated to deliver SuDS that provide multiple economic, social and environmental benefits.</p>	<p>2022</p>
	<p>The <b>consultation process for surface water flood risk</b> must be improved. This should be done by adding statutory consultees for all development type and sizes. Consultees must have the appropriate skills to provide advice on surface water flood mitigation. Ensure that Local Authorities fully justify planning decisions where applications can proceed either without or going against formal flood risk mitigation advice.</p>	<p>2022</p>

Table A7 Recommendations for the Ministry of Housing, Communities and Local Government (MHCLG)		Timing
Buildings	<p>Implement a <b>strong set of standards – with robust enforcement</b> – that ensure both new and existing buildings are designed for a changing climate and deliver high levels of energy efficiency and low-carbon heat. Including:</p> <ul style="list-style-type: none"> <li>Publish robust definitions of the Future Homes Standard and Future Buildings Standard which are legislated in advance of 2023 and ensure no fossil fuels are burnt in new buildings. This must include coordination with DfE, MoJ, DHSC as well as BEIS and HMT.</li> <li>Regulate the overheating requirement as set out in the Future Buildings Standard consultation. Expand the requirement to cover refurbishments of existing buildings and conversions of non-residential buildings to residential.</li> <li>Work with BEIS on the Heat and Buildings Strategy and use standards to set a clear direction for retrofit across the buildings stock.</li> <li>Ensure that the remit of the new buildings safety regulator covers climate change mitigation and adaptation, strengthened through an explicit responsibility for sustainability; and is fully equipped to monitor and enforce compliance with buildings standards.</li> <li>Work with HM Treasury to ensure that local authorities are properly funded to enforce buildings standards.</li> <li>Close loopholes allowing homes to be built which do not meet the current minimum standards for new dwellings. This includes provisions around the expiry of planning permission and permitted development rights relating to change of use. Make accurate performance testing and reporting widespread, committing developers to the standards they advertise.</li> </ul>	2021-22 <b>Priority recommendation</b>
	<p>Develop and implement plans to make all <b>public-sector buildings and vehicle fleets</b> within the department's remit zero-carbon in the long term, switching to ultra-low emission vehicles by 2030 and halving emissions from public buildings by 2032. This must be part of a coherent cross-government strategy including an updated set of Greening the Government commitments, multi-year spending commitments and annual reporting.</p>	2021-22
	<p>Implement improvements to the <b>Energy Performance Certificate (EPC) and Standard Assessment Procedure (SAP)</b> framework, including:</p> <ul style="list-style-type: none"> <li>Ensuring EPCs drive deployment of the necessary energy efficiency measures and do so on a holistic basis to address overheating, ventilation, and moisture-risk.</li> <li>Supporting delivery objectives across both energy efficiency and low-carbon heat, and valuing properly the benefits of low-carbon and flexible technologies.</li> <li>Formally integrating a forward trajectory for declining grid carbon-intensity, in line with Government projections.</li> <li>Addressing wider issues of quality/robustness, with a commitment to integrate in-use performance metrics from 2023.</li> <li>Plans for the future role of Green Building Passports.</li> </ul>	2022
Construction	<p>Step up efforts to deliver the <b>waste prevention and resource efficiency</b> improvements required as part of the pathway to Net Zero, including by:</p> <ul style="list-style-type: none"> <li>Setting out how levels of resource efficiency improvements in construction identified within the Industrial Decarbonisation Strategy will be delivered.</li> <li>Beginning to develop and implement any additional policies needed to deliver these resource efficiency improvements, by the end of 2022.</li> <li>Ensure cross-departmental working, potentially through new cross-Whitehall governance focused on resource efficiency.</li> </ul>	Spring 2022 <b>Priority recommendation</b>  (end 2022 for additional policies)
	<p>Develop policies (with BEIS, Defra and DfT) to drive more <b>resource-efficient construction</b> and use of existing low-carbon materials, including a substantial increase in the use of <b>wood in construction</b>. Policies should include:</p> <ul style="list-style-type: none"> <li>Reviewing and clarifying the position of structural timber in the ban on combustible materials, underpinned by further research and testing where necessary, and ensuring there are no barriers to the safe use of timber in buildings. Buildings safety regulator to play a role in overseeing this on an ongoing basis.</li> <li>The development of a fully funded policy roadmap on the use of timber, including policies to support the development of UK wood supply chains.</li> <li>Finalising the reporting methodology for whole-life carbon standards.</li> <li>Setting out a plan for phasing in mandatory whole-life reporting followed by minimum whole-life standards for all buildings, roads and infrastructure by 2025, with differentiated targets by function, scale, and public/private construction.</li> </ul>	Spring 2022
	<p>Set out a strategy for decarbonisation of <b>off-road mobile machinery</b> and work with industry to identify potential policies to increase uptake of low-carbon off-road mobile machinery. This will require work across BEIS, MHCLG, DfT and Defra.</p>	2021

Table A8 Recommendations for the Department for Digital, Culture, Media and Sport (DCMS)		Timing
Cross-cutting	Support BEIS in developing a <b>public engagement strategy</b> for Net Zero which builds on the findings of the UK Climate Assembly by involving people in decision-making, providing trusted information on decarbonisation choices and the need to reduce emissions and adapt to climate change. The strategy should also identify preferred policy options to empower people to contribute fully towards the path to Net Zero.	2021-22 Priority recommendation
	For the coming five-year period (2023-2028), outline appropriate actions in the next <b>National Adaptation Programme</b> to address the adaptation gap identified for the risks and opportunities in the CCRA for which it is the lead department (see Adaptation Report Annex).	2023 Priority recommendation
	Work in partnership with Ofgem to publish and implement a new <b>Smart System Plan and Energy Data and Digitalisation Strategy</b> , including on cyber-security, in order to continue to unlock the full benefits of electricity system flexibility. Ensure that, alongside smart standards for heating, all electricity users have access to half-hourly metering and the option of tariffs that encourage flexibility in use of electric heat and electric vehicle charging.	2021
	Ensure <b>sport and culture strategies</b> align to other departments' plans for lower-carbon buildings, more active travel and improved public health.	2021
	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing
Digital infrastructure	Ensure plans for a <b>digital transition and fibre roll-out</b> can complement changing work patterns and travel behaviours, leading to lower-carbon working. Co-ordinate with DfT to invest in digital infrastructure to lock in positive behaviours that reduce travel demand (e.g. home-working).	2021
	<b>Resilience standards for the digital sector</b> must include requirements pertaining to climate change risks. In addressing the National Infrastructure Commission recommendations from the Resilience Study, Government should incorporate consideration of climate change risks and adaptation actions into any new standards being developed. Standards for digital infrastructure operators should include requirements to: <ul style="list-style-type: none"> <li>Assess climate risks under both 2°C and 4°C global climate scenarios.</li> <li>Consider interdependencies with other critical infrastructure, and</li> <li>Set out actions to reduce risk and monitor progress.</li> </ul>	2022
	Improve information sharing on climate risks to infrastructure interdependencies at a local level, especially for <b>electricity, digital and ICT networks</b> . As reported in our previous assessment in 2019, NAP actions to enhance arrangements for information sharing between local infrastructure operators and improve understanding of critical risks arising from interdependencies have not been completed. Defra's link with Local Resilience Forums is key, and BEIS and DCMS should engage with utility companies to encourage standardised benchmarking and data sharing on climate risks to electricity networks, digital & ICT.	Now and ongoing

Table A9 Recommendations for the Department for Education (DfE)		Timing
	Working with BEIS, DWP, MHCLG and the Home Office, develop a strategy for a <b>Net Zero workforce</b> that ensures a just transition for workers transitioning from high-carbon to low-carbon and climate-resilient jobs, integrates relevant skills into the UK's education framework and actively monitors the risks and opportunities arising from the transition. This strategy should include the development and roll-out of plans for training and skills, with buildings and manufacturing being priority areas.	2021 Priority recommendation
	Support BEIS in developing a <b>public engagement strategy</b> for Net Zero which builds on the findings of the UK Climate Assembly by involving people in decision-making, providing trusted information on decarbonisation choices and the need to reduce emissions and adapt to climate change. The strategy should also identify preferred policy options to empower people to contribute fully towards the path to Net Zero.	2021-22 Priority recommendation
	For the coming five-year period (2023-2028), DfE should outline appropriate actions in the next <b>National Adaptation Programme</b> to address the adaptation gap identified for the one risk in the CCRA for which it is the lead department (see Adaptation Report Annex).	2023 Priority recommendation
	Develop and implement plans to make all <b>public-sector buildings and vehicle fleets</b> within the department's remit zero-carbon in the long term, switching to ultra-low emission vehicles by 2030 and halving emissions from public buildings by 2032. This must be part of a coherent cross-government strategy including an updated set of Greening the Government commitments, multi-year spending commitments and annual reporting.	2021-22
	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing

Table A10 Recommendations for the Department for Work and Pensions (DWP)		Timing
	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing
	Working with BEIS, DfE, MHCLG and the Home Office, develop a strategy for a <b>Net Zero workforce</b> that ensures a just transition for workers transitioning from high-carbon to low-carbon and climate-resilient jobs, integrates relevant skills into the UK's education framework and actively monitors the risks and opportunities arising from the transition. This strategy should include the development and roll-out of plans for training and skills, with buildings and manufacturing being priority areas.	2021 Priority recommendation
	Design industrial decarbonisation policies to <b>support and create jobs</b> , especially in regions with reliance on industrial jobs.	Now and ongoing
	Develop and implement plans to make all <b>public-sector buildings and vehicle fleets</b> within the department's remit zero-carbon in the long term, switching to ultra-low emission vehicles by 2030 and halving emissions from public buildings by 2032. This must be part of a coherent cross-government strategy including an updated set of Greening the Government commitments, multi-year spending commitments and annual reporting.	2021-22

Table A11 Recommendations for the Department of Health and Social Care (DHSC)		Timing
	For the coming five-year period (2023–2028), DHSC should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the risks and opportunities in the CCRA for which it is the lead department (see Adaptation Report Annex).	2023 Priority recommendation
	Assess <b>health sector vulnerability</b> to existing and future climate risks, particularly for care homes and home-based care. Following this, develop a cross-sector approach to address risks. This cross-sector approach should include input from DHSC, CQC, PHE, NHS, MHCLG and local level public health bodies.	2022
	Fund the strengthening and widening of vector and pathogen surveillance and early-warning mechanisms, due to the increasing risk of <b>disease spread</b> as a result of climate change and other factors.	Now and ongoing
	Develop and implement plans to make all <b>public-sector buildings and vehicle fleets</b> within the department's remit zero-carbon in the long term, switching to ultra-low emission vehicles by 2030 and halving emissions from public buildings by 2032. This must be part of a coherent cross-government strategy including an updated set of Greening the Government commitments, multi-year spending commitments and annual reporting.	Now and ongoing
	Support the NHS in delivering on its Net Zero plan.	Now and ongoing
	Take an active role in climate policy development that also has <b>health benefits</b> , such as active travel, access to green space, air quality, better buildings and healthier diets.	Now and ongoing
	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing

Table A12 Recommendations for the Home Office and the Ministry of Justice (MoJ)		Timing
	For the coming five-year period (2023–2028), MoJ should outline appropriate actions in the next <b>National Adaptation Programme</b> to address the adaptation gap identified for the risks in the CCRA for which it is the lead department (see Adaptation Report Annex).	2023 Priority recommendation
	Home Office, BEIS, DWP, DfE and MHCLG, should develop a strategy for a <b>Net Zero workforce</b> that ensures a just transition for workers transitioning from high-carbon to low-carbon and climate-resilient jobs, integrates relevant skills into the UK's education framework and actively monitors the risks and opportunities arising from the transition. This strategy should include the development and roll-out of plans for training and skills, with buildings and manufacturing being priority areas.	2021 Priority recommendation
	Develop and implement plans to make all <b>public-sector buildings and vehicle fleets</b> within the department's remit zero-carbon in the long term, switching to ultra-low emission vehicles by 2030 and halving emissions from public buildings by 2032. This must be part of a coherent cross-government strategy including an updated set of Greening the Government commitments, multi-year spending commitments and annual reporting.	2021-22
	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing

Table A13 Recommendations for the Ministry of Defence (MoD)		Timing
	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing
	Develop and implement plans to make all <b>public-sector buildings and vehicle fleets</b> within the department's remit zero-carbon in the long term, switching to ultra-low emission vehicles by 2030 and halving emissions from public buildings by 2032. This must be part of a coherent cross-government strategy including an updated set of Greening the Government commitments, multi-year spending commitments and annual reporting.	2021-22
	Assess the potential for <b>alternative fuels</b> (such as low-carbon electricity, hydrogen or bioenergy) to be used for land vehicles, ships and aircraft, and consider opportunities to support wider use of low-carbon technologies in civil applications (e.g. through research or demonstration).	Now and ongoing

Table A14 Recommendations for the Office of Gas and Electricity Markets (Ofgem)		Timing
	<p>Continue to support widespread deployment of <b>EV charging infrastructure</b>:</p> <ul style="list-style-type: none"> <li>This should ensure it can support high EV uptake levels. Project Rapid has the right ambition for the strategic road network and should be developed into a full strategy for the 2020s and beyond.</li> <li>Further investment is needed to support on-street and other urban charging solutions for those without off-street parking and destination charging.</li> <li>Around 150,000 public charge points will need to be operating by 2025. These should be widely available across all regions of the UK.</li> <li>Implement the recommendations of the EV Energy Taskforce, in particular improving the consumer charging experience and making smart-charging accessible, appealing and cost-effective for as many EV users as possible.</li> </ul>	Now and ongoing <b>Priority recommendation</b>
	Ensure all regulatory decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing
	Develop mechanisms for strategic investment in coordination with BEIS to ensure that <b>electricity networks</b> can accommodate increased future demand levels, including large localised demand increases associated with electrification in manufacturing, transport and buildings, and that lack of network capacity does not cause delays in emissions reduction.	2023
	Start a programme of research with BEIS to identify <b>areas which are unlikely to be suitable for hydrogen</b> (such that electrification and alternatives can be prioritised), <b>alongside priority candidate areas for hydrogen</b> . Distribution Network Operators should gather and share detailed information on network capacity (at least to substation level) to feed into this.	2021
	Set out reforms to encourage the <b>utilisation of existing network capacity</b> and ensure that costs of local network upgrades are shared fairly and do not disincentivise the roll-out of low-carbon technologies.	2021
	Work in partnership with BEIS to publish and implement a new <b>Smart System Plan and Energy Data and Digitalisation Strategy</b> , including working with DCMS on cyber-security, in order to continue to unlock the full benefits of electricity system flexibility. Ensure that, alongside smart standards for heating, all electricity users have access to half-hourly metering and the option of tariffs that encourage flexibility in use of electric heat and electric vehicle charging.	2021
	Develop (with BEIS) a strategy to coordinate the development of <b>interconnectors</b> , connections for offshore wind farms and the enhancement of inter-area transfer capacity for the onshore network, ensuring cost-effective, timely delivery, bringing forward any legislation necessary to enable it.	H1 2022
	Work with BEIS to make explicit how current and future policies will reduce emissions associated with <b>methane leakage</b> from the gas networks in a way that is consistent with the Sixth Carbon Budget.	2021

Table A15 Recommendations for the Water Services Regulation Authority (Ofwat)		Timing
	Ensure all regulatory decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing
	Include <b>decarbonisation</b> as one of Ofwat's core principles, to assist the water industry's goal of decarbonising by 2030, and the need to roll out advanced anaerobic digestion systems.	2021
	Work with Defra, the Environment Agency and other stakeholders to set out targets and supporting measures for <b>reducing water use by business</b> . This could be through ensuring that any water reduction targets linked to the Environment Bill include business as well as household water use as well as responding to advice and recommendations from Defra's new Senior Water Demand Reduction Group.	2022

Table A16 Recommendations for the Office for National Statistics (ONS)		Timing
	Review plan for improving <b>data collection</b> and statistical reporting for the purposes of monitoring and informing the low-carbon transition, as part of the broader work the ONS are already undertaking to improve the collection of climate-related data.	2022
	Work with BEIS to put in place plans to collect and report data annually on <b>low-carbon heat networks</b> , specifically, the amount of heat delivered (split by DUKES consumption sector, i.e. Residential/Public/Commercial/Industry, and where possible, by source of heat supply).	2022
	Improve the collection and reporting of <b>industrial decarbonisation data</b> to allow for progress to be monitored more effectively, particularly on energy and resource efficiency.	2022

**Table A17**  
Recommendations for the Scottish Government

Timing

Scale up delivery across all sectors in line with the ambition set out in the recent <b>Climate Change Plan Update</b> .	Now and ongoing
<p>Publish the finalised <b>Heat in Buildings strategy</b>.</p> <ul style="list-style-type: none"> <li>This must include finalising the regulatory framework and role of different trigger points (including area-based plans), and setting in train the legislation needed to underpin these.</li> <li>Consult on the trajectory of reform for metrics such as EPCs, to ensure they are robust and enforceable, fit for purpose to deliver the measures needed on a holistic basis, do not disincentivise low-carbon heat, integrate in-use performance metrics from 2023, and include plans for the future role of Green Building Passports.</li> <li>Provide further detail on the ambition for heat networks and heat pumps over the coming decade, and determine how funding for energy efficiency and low-carbon heat will be allocated to meet strategic priorities.</li> </ul>	2021
Proposals in Scotland's Updated Climate Change Plan 2018-32 to set out a <b>route map for agricultural transformation</b> should be scaled up, with the development of environmental conditionality that incentivises emission reduction and carbon sequestration measures in the land sector that build towards Scotland's climate goals. It is essential that appropriate incentives are in place to drive early action, given the time (often decadal) needed for some measures to reduce and sequester carbon (e.g. afforestation and peat restoration).	2021
<p>Renew efforts to improve <b>recycling and resource efficiency</b>, including by:</p> <p>Bringing forward the planned circular economy package for legislating within the forthcoming Programme for Government.</p> <p>Putting in place the policy and support to ensure the 2025 targets (including the 70% recycling target) within the package are delivered, and setting new ambitious targets for 2030.</p> <p>Legislating to ban key biodegradable waste streams going to landfill from 2025, and ensuring this is delivered through increased resource efficiency and recycling.</p>	2021
<p>Publish a strategy setting out how the Scottish Government will achieve a 20% reduction in <b>car-kilometres</b> by 2030 and deliver 20-minute neighbourhoods. This should be supported by:</p> <p>Continuing to strengthen schemes to support walking, cycling, and public transport.</p> <p>Investment in infrastructure connectivity to lock in positive behavioural changes that reduce travel demand (e.g. home-working).</p> <p>Supporting the public transport and shared mobility sectors to recover from the COVID-19 pandemic, including through recovery funding and positive communication and messaging.</p>	2021
Continue to support the expansion of Scotland's <b>public EV charge point network</b> , to ensure the EV transition works for all road users in Scotland.	Now and ongoing
Maintain the provision of <b>interest-free loans</b> for EVs (now including second-hand EVs) on top of existing UK government grants. Plan for a transition to fiscally-neutral incentives as EV costs fall.	2021-22
Taxation should be used, alongside improvements in broadband, to <b>embed positive behaviours</b> that have arisen during the pandemic, replacing business travel with videoconferencing and online collaboration.	2021-22
Seek to address price imbalances between aviation and surface transport, once <b>aviation taxation</b> is devolved to Scotland, encouraging the low-carbon alternative (e.g. rail) for journeys where one exists.	2021-22
Play a leading role in decarbonising the <b>shipping</b> sector by exploring opportunities to transition ferries operated by Transport Scotland to low-carbon energy and establishing appropriate business models to encourage their adoption.	Now and ongoing

Table A18 Recommendations for the Welsh Government	Timing
Publish a new <b>Net Zero Delivery Plan</b> that sets out a long-term vision for meeting the Net Zero goal in 2050, with a particular focus on the Third Carbon Budget and beyond.	2021
Publish a coherent, <b>long-term strategy for heat and energy</b> efficiency in Welsh homes and other buildings, setting a framework for progress in areas of devolved responsibility.  As part of this, energy efficiency policy should be designed so as to ensure that funds go as far as possible in reducing the fuel poverty gap and improving the energy efficiency of homes, by focusing on the most cost-effective interventions (including upgrading homes to EPC B and EPC C where applicable).	2021
Deliver on the priorities set out in Llbwyr Newydd to <b>reduce demand for higher-carbon travel</b> . This includes: <ul style="list-style-type: none"> <li>• Delivering a better, more integrated, decarbonised bus system.</li> <li>• Developing a network of connected local routes for walking and cycling.</li> <li>• Investing in infrastructure connectivity to enable delivery of the ambition for 30% of the workforce to work remotely on a regular basis.</li> <li>• Supporting the public transport and shared mobility sectors to recover from the COVID-19 pandemic, including through recovery funding and positive communication and messaging.</li> </ul>	2021-22
Support delivery of a <b>charging network</b> that meets the ambition set out in the Electric Vehicle Charging Strategy, to ensure the EV transition works for all road users in Wales.	Now and ongoing
The Welsh Government's second statutory decarbonisation plan (LCDP2), due out later this year, should set out policies to <b>accelerate afforestation rates</b> to deliver its share of the UK target to plant 30,000 hectares in 2025.	2021
Build on strong progress made on <b>recycling and resource efficiency</b> , including by: <ul style="list-style-type: none"> <li>• Implementing the policies set out in the recent 'Beyond Recycling' strategy.</li> <li>• Legislating and progressing towards the existing 70% recycling target, and set new ambitious targets for 2030.</li> <li>• Legislating to ban key biodegradable waste streams going to landfill from 2025, and ensuring this is delivered through increased resource efficiency and recycling.</li> </ul>	2021

Table A19 Recommendations for the Northern Ireland Executive	Timing
Legislate a credible <b>long-term emissions reduction target</b> that is backed up by evidence on its deliverability and a clear plan for how it can be achieved in a way that is fair for Northern Ireland's citizens – the Committee previously advised that an 82% reduction on 1990 levels by 2050 is Northern Ireland's appropriate contribution to the Paris Agreement and the UK Net Zero goal.	2021-22
Publish a final energy strategy that sets out how Northern Ireland will achieve a <b>net-zero-carbon energy system</b> by 2050, in line with the pathways recommended in our December 2020 advice.	2021
<p>Publish a coherent, <b>long-term strategy for heat and energy efficiency</b> in Northern Ireland's homes and other buildings; encompassing regulatory, policy and funding commitments to facilitate delivery.</p> <ul style="list-style-type: none"> <li>• The strategy should include a trajectory of regulatory standards for energy efficiency, supported by reforms to relevant metrics (such as EPCs) to ensure they drive the measures needed on a holistic basis and do not disincentivise low-carbon heat. Reforms should ensure metrics are robust and enforceable such that standards targeted are achieved in practice.</li> <li>• Publish proposals on the phase-out of fossil fuel heating, including standards to phase out the installation of new liquid and solid fossil fuel heating. Proposals should recognise the critical role of heat pumps and hybrid heat pumps in these homes, minimising the use of biofuels to reflect economy-wide needs.</li> </ul>	2022
Consult on an ambitious trajectory of <b>new-build standards</b> uplifts, including ensuring all new homes are designed for a changing climate, are ultra-efficient and use low-carbon heating from 2025.	2021
Set out provisions to integrate a <b>post-CAP framework</b> that helps the land sector contribute to Northern Ireland's climate goals as soon as the climate legislation is introduced. This should include providing incentives for landowners and tenants to deliver low-carbon farming practices and change the use of land to reduce emissions and increase carbon sequestration.	2022
<p>The Northern Ireland Executive should bring forward a <b>resource efficiency package</b> which matches the ambition of Wales and Scotland, including by:</p> <ul style="list-style-type: none"> <li>• Setting a target for 70% recycling across all wastes by 2030.</li> <li>• Policies to deliver such a target, as well as improving waste prevention and re-use.</li> <li>• Legislating to ban key biodegradable waste streams going to landfill from 2025, and ensuring this is delivered through increased resource efficiency and recycling.</li> </ul>	2022
<p>Strengthen support for and provision of schemes to support <b>walking, cycling and public transport</b> to reduce Northern Ireland's high levels of car-dependence:</p> <ul style="list-style-type: none"> <li>• Strengthen schemes to ensure access to local amenities without dependency on cars.</li> <li>• Invest in infrastructure connectivity to lock in positive behavioural changes that reduce travel demand, e.g. home-working.</li> <li>• Support the public transport and shared mobility sectors to recover from the COVID-19 pandemic, including through recovery funding and positive communication and messaging.</li> </ul>	2021-22
Support the deployment of <b>public charge points</b> across Northern Ireland, to address the issue that Northern Ireland currently has the fewest EV charge points per capita of any of the UK nations.	Now and ongoing
Resume collecting and publishing <b>data on vehicle-kilometres</b> travelled by mode in Northern Ireland. This will help identify which actions are effective in encouraging modal shift away from car travel.	2021-22
<b>Long-haul air passenger duty</b> , which is devolved to Northern Ireland, should be increased at least in line with UK-wide long-distance APD, to better reflect the climate change impact of flying.	2021-22

# Progress in adapting to climate change

## 2021 Report to Parliament

Progress in adapting to climate change  
2021 Report to Parliament

Climate Change Committee  
June 2021

Presented to Parliament pursuant to Section 36(1) and Section 59 (1) of the Climate Change Act 2008. This report is published in two volumes. Volume 1 (Progress in reducing emissions – 2021 Report to Parliament) and Volume 2 (Progress in adapting to climate change – 2021 Report to Parliament).

Both volumes were laid before Parliament on 24 June 2021 and are available online at:  
[www.theccc.org.uk/publications](http://www.theccc.org.uk/publications)

Book 2 of 2

Overall progress in climate policy: Net Zero and adaptation	9
The Committee	12
<b>Executive Summary</b>	<b>14</b>
<b>Chapter 1</b>	<b>37</b>
1.1 Observed and projected climate change	39
1.2 The CCC adaptation assessment framework	46
<b>Chapter 2</b>	<b>53</b>
2.1 Introduction	55
2.2 Terrestrial habitats and species	58
2.3 Farmland habitats and species	70
2.4 Freshwater habitats and species	75
2.5 Coastal and marine habitats and species	82
2.6 Commercial forestry	92
2.7 Agricultural productivity	98
2.8 Water management	103
2.9 Commercial fisheries and aquaculture	106
<b>Chapter 3</b>	<b>112</b>
3.1 Introduction	114
3.2 Flood risk management and climate change	115
3.2.1 River and coastal flood alleviation	121
3.2.2 Development in areas at risk of river or coastal flooding	124
3.2.3 Surface water flood alleviation	130
3.2.4 Development and surface water flood risk	134
3.2.5 Property-level flood resilience (PFR)	138
3.2.6 Capacity to recover from flooding	143
3.3 Coastal erosion risk management	148
3.4 Water demand in the built environment	152
3.5 Public health and wellbeing	158
3.5.1 Health impacts from heat and cold	159
3.5.2 Risks to people from pathogens	172
3.5.3 Air quality	177
3.6 Effectiveness of the emergency planning system	181

<b>Chapter 4</b>	<b>193</b>
4.1 Introduction	195
4.2 Infrastructure interdependencies	198
4.3 Design and location of new infrastructure	203
4.4 Energy generation, transmission and distribution	206
4.5 Public water supply infrastructure	212
4.6 Ports and airports	215
4.7 Rail network	220
4.8 Strategic road network	225
4.9 Local road network	229
4.10 Telecoms, digital and ICT infrastructure	231
<b>Chapter 5</b>	<b>236</b>
5.1 Introduction	238
5.2 Impact on business from extreme weather events	239
5.3 Supply chain interruptions	247
5.4 Water demand by industry	252
5.5 Business opportunities from climate change adaptation	256

The Committee would like to thank:

**The team that prepared the analysis for this report:** Brendan Freeman, Gemma Holmes, Cara Labuschagne, Miriam Kennedy, Richard Millar, David Style and Kathryn Brown.

**Other members of the Secretariat who contributed to this report:** Jo Barrett, Tom Dooks, Rachel Hay, Jaya Jassi, Ewa Kmietowicz, Indra Thillainathan, James Lees, Simon Rayner, Penny Seera, Vivian Scott, Sean Taylor, Victoria De la Cruz, Mike Thompson and Chris Stark.

**Organisations that carried out research or additional analysis for the report:** ADAS (Charles Ffoulkes, Ben Hockridge, Harriet Illman, George Holmes, Frances Manning and Lucy Wilson)

**Organisations and individuals that have contributed towards our research and analysis:** British Ports Association; British Red Cross; BSI; CDP; Cabinet Office; Department for Business, Energy and Industrial Strategy; Department for Education; Department for Environment, Food and Rural Affairs; Department of Health and Social Care; CIBSE; CIWEM; Eco Act; Energy Networks Association; Environment Agency; Forestry Commission; Highways England; Infrastructure and Projects Authority; Marine Management Organisation; Ministry of Housing, Communities and Local Government; Ministry of Justice; National Farmers Union; Natural England; Network Rail; Greener NHS; Public Health England; RSPB; Tech UK; Water UK; Waterwise; Wildlife and Countryside Link.

**Our design and digital agencies:** Pali Palavathanan and Anoushka Rodda (TEMPLO) and Mat Burhouse (Slingshot).

The Adaptation Committee would also like to thank all of the organisations that provided updates on the actions listed in the National Adaptation Programme.

# Joint Foreword

---

The UK's Climate Change Act had extraordinary foresight. It laid the groundwork for the nation's escalating climate ambition. It anticipated, correctly, the need to cajole governments into climate plans that would not otherwise fit the political cycle. It has kept UK climate policies rooted in the scientific realities and the technical feasibilities.

That framework now faces its sternest test, as demand grows to see Net Zero delivered; as the urgency becomes more obvious; and as the inadequacies of our planning for the impacts of climate change become clear.

The rigour of the Climate Change Act helped bring COP26 to the UK, but it is not enough for Ministers to point to the Glasgow summit and hope that this will carry the day with the public. Leadership is required, detail on the steps the UK will take in the coming years, clarity on tax changes and public spending commitments, active engagement with people and businesses across the country. These steps are essential, so people can see opportunity in climate-positive choices. We cannot rely on good will alone.

This demands a step change in Government action, but it is hard to discern any comprehensive strategy in the climate plans we have seen in the last 12 months. There are gaps and ambiguities. Climate resilience remains a second-order issue, if it is considered at all. We continue to blunder into high-carbon choices. Our Planning system and other fundamental structures have not been recast to meet our legal and international climate commitments.

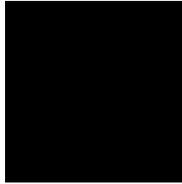

We commend Ministers for accepting our advice on the future path for UK emissions. The setting of the UK's 2030 NDC, the passing into law of the Sixth Carbon Budget, the decision to bring international aviation and shipping emissions within the UK carbon budgets; all were made on the Committee's recommendation. But the Committee's advice to step-up the ambition and resourcing of adaptation continues to go unheeded. And the willingness to set emissions targets of genuine ambition contrasts with a reluctance to implement the realistic policies necessary to achieve them.

It has therefore been a year of climate contradictions. Important statements of ambition, like the agreement to phase out the sale of petrol and diesel cars and vans, have been undermined by delays to essential legislation and much-needed plans to decarbonise buildings and improve their climate resilience. We await a Treasury Net Zero Review, once promised in autumn 2020. The transport decarbonisation plan is still slated, somewhat optimistically, for spring 2021. A pattern has emerged of Government strategies that are later than planned and, when they do emerge, short of the required policy ambition.

There is still time to address this. This Progress Report offers more than 200 policy recommendations, covering every part of Government. The opportunity to implement them is there. Before COP26, a Net Zero Strategy is promised, which will carry the greatest weight if it is accompanied by Treasury's review of funding. The Government's climate change risk assessment, due in early 2022, can change the tone on adaptation and climate risk management. But it is time for the Government to implement these changes with the urgency that the science demands.

COVID-19 casts a long shadow, but there are three broad lessons from the pandemic: first, we have seen the critical importance of effective planning for high-impact eventualities; second, we have experienced the ability of government to act with pace and scale when it is required; and third, we have learned that people are willing to support change when they have the information before them.

These lessons can shape a successful COP26 summit in November. With strong climate plans at home, the UK Presidency can have global influence. Our message to Government is simple: act quickly – be bold and decisive. Your moment has arrived.

Lord Deben  
Chairman, Climate Change Committee

Baroness Brown  
Chair, Adaptation Committee

# Overall progress in climate policy: Net Zero and adaptation

The 2020s must be a decisive decade for climate action.

We are in the decisive decade for tackling climate change. Global emissions of greenhouse gases are as high as they have ever been. Nevertheless, green shoots of progress suggest this can change. And it must. The 2010s was the hottest decade on record globally, driving dangerous weather patterns and affecting societies and ecosystems around the world. Without a much stronger and urgent effort, we will breach 1.5°C of warming in the early 2030s and remain ill-prepared for the future.

The world needs to cut emissions and adapt to climate risks.

Global emissions must be cut rapidly to Net Zero, integrated with actions to adapt to the climate risks and impacts. Action must occur across the world, with richer countries acting earliest, while offering support for poorer countries. As host of the upcoming UN climate talks ('COP26') the UK has a particular responsibility to implement effective climate action and drive global efforts.

The UK's record to date is strong in parts, but it has fallen behind on adapting to the changing climate and has not yet provided a coherent plan to reduce emissions in the critical decade ahead:

The UK has a strong track record on climate action, but it is incomplete.

- **Statutory framework for climate.** The UK has a strong climate framework under the Climate Change Act (2008), with legally-binding emissions targets, a process to integrate climate risks into policy, and a central role for independent evidence-based advice and monitoring. This model has inspired similar climate legislation across the world.
- **Emissions targets.** The UK has adopted ambitious territorial emissions targets aligned to the Paris Agreement: the Sixth Carbon Budget requires an emissions reduction of 63% from 2019 to 2035, on the way to Net Zero by 2050. These are comprehensive targets covering all greenhouse gases and all sectors, including international aviation and shipping.
- **Emissions reduction.** The UK has a leading record in reducing its own emissions: down by 40% from 1990 to 2019, the largest reduction in the G20, while growing the economy (GDP increased by 78% from 1990 to 2019). The rate of reductions since 2012 (of around 20 MtCO<sub>2</sub>e annually) is comparable to that needed in the future.
- **Climate Risk and Adaptation.** The UK has undertaken three comprehensive assessments of the climate risks it faces, and the Government has published plans for adapting to those risks. There have been some actions in response, notably in tackling flooding and water scarcity, but overall progress in planning and delivering adaptation is not keeping up with increasing risk. The UK is less prepared for the changing climate now than it was when the previous risk assessment was published five years ago.
- **Climate finance.** The UK has been a strong contributor to international climate finance, having recently doubled its commitment to £11.6 billion in aggregate over 2021/22 to 2025/26. This spend is split between support for cutting emissions and support for adaptation, which is important given significant underfunding of adaptation globally. However, recent cuts to the UK's overseas aid are undermining these commitments.

The UK's record on climate change compares well with that of other countries. But despite the recent willingness of the Government to raise ambition to cut emissions, delays in policy and implementation continue. Much greater urgency is now required from Ministers:

Delivery must accelerate and broaden.

- **The ambition of the last year must be turned into policy and real-world delivery.** The UK has begun to reinforce its new emissions targets with clear ambition for specific sectors in line with the required path (e.g. 40 GW offshore wind by 2030, phase-out of petrol and diesel cars and vans by 2030, 30,000 hectares annual afforestation by 2025). However, some commitments fall short and key strategies have been delayed, leaving holes in ambition. Policies to deliver on the commitments are mostly still to be developed.
- **Progress must extend across the economy.** The relative success of reducing emissions in the electricity sector to date has not been matched in transport, buildings, industry, or agriculture. Only a few sectors have strong plans to adapt to the current and future climate, leaving key risks to the UK's infrastructure and natural environment. Some government departments are not sufficiently prioritising climate change, and none are yet moving at the pace required.
- **A robust plan is needed for adaptation.** The UK does not yet have a vision for successful adaptation to climate change, nor measurable targets to assess progress. Not one of the 34 priority areas assessed in this year's progress report on adaptation is yet demonstrating strong progress in adapting to climate risk. Policies are being developed without sufficient recognition of the need to adapt to the changing climate. This undermines their goals, locks in climate risks, and stores up costs for the future.
- **The climate challenge must be reflected throughout policy and planning.** Climate risks affect all aspects of society, while any new source of emissions could put the Net Zero path at risk. Climate change must therefore be integrated throughout policy and planning decisions, and must be a key consideration in the Government's proposed planning reforms.

Adaptation policy needs a step change in ambition and action.

As the UK rebuilds after the COVID-19 pandemic, there is an opportunity to make systemic changes that will fill the gaps in the UK's climate response. Now is the time to invest in the UK's future through accelerated action to cut emissions and adapt to the changing climate, while supporting the global transition.

The Net Zero Strategy, due ahead of COP26, should complete the picture on how the UK will cut its emissions.

- **Delivering Net Zero.** The Government has promised a Net Zero Strategy before COP26. It must set clear and integrated ambitions across the economy that will meet the Sixth Carbon Budget, and indicate how they will be funded fairly. Efforts must then shift quickly to focus on implementation and delivery. The pace of policy development must accelerate. Credible policies should be fully functioning and properly funded by the end of the current Parliament (i.e. by 2024) to ensure that almost all investments and purchases are low-carbon by the end of the decade or soon after.
- **Adapting to climate risks.** The Government should set out its vision for a UK that is well-prepared for climate change. It should include clear quantified targets, supported by policies and regulations. Climate adaptation must be embedded in core policies if they are to succeed. Key current and upcoming policies include: the Plan for Growth, the National Infrastructure Strategy, the Environment Bill, the Environmental Land Management

Scheme, the Tree and Peat Action Plans, the Net Zero Strategy, the Planning Bill and developments in energy, housing and health policy.\*

Adaptation is vital to achieving society's goals and must be embedded throughout government policies.

- **Integrating climate policy.** Achieving Net Zero will require effective adaptation. The programmes must be properly integrated. For example, as the energy efficiency of buildings is improved, they must also be protected from overheating. The vast carbon stores of the UK's peatlands and soils must be protected. Trees planted to draw CO<sub>2</sub> from the atmosphere and/or to provide timber should be suited to the future climate and, where possible, provide services such as flood defences, enhancing ecosystems, urban cooling, and accessible green space.
- **Embedding climate action across society.** Reducing emissions and adapting to climate change will require a whole-of-society endeavour. Success will require the public to be engaged in the challenge, building public consent for the changes with a broader understanding of what is required and why. Workers will need help to develop the required skills and to fill the jobs created during the transition. Businesses must be encouraged, and in some cases required, to invest in solutions and make low-carbon, climate-resilient choices.
- **Reinstating overseas aid commitments.** Climate challenges are fundamentally integrated with wider challenges for ecosystems and economies. This means climate finance and climate action are not fully isolated from cuts to the UK's Official Development Assistance (ODA) in practice. The Government has said the cut to ODA is temporary; now that the UK's economic recovery is underway, the Government should provide a firm timeline for reinstating its previous commitment.

Government must lead the change. Reducing emissions and adapting to climate change must be embedded throughout policy. All parts of government have a role, requiring strong coordination and an effective devolution of powers and responsibilities to drive delivery. We set out detailed recommendations for each government department and the national Governments of Scotland, Wales and Northern Ireland in an annex of Tables at the end of this report. We will revisit progress against them at our next annual progress report in a year's time. Our next major report will be a thorough appraisal of the UK's Net Zero Strategy.

Reaching Net Zero and addressing climate risks can help to build a better UK.

The transition to Net Zero and the climate adaptation programme offer a positive vision for the UK's future and for the world. They involve an investment boost that can support the economic recovery. This investment will be rewarded with reduced running costs and reduced costs of adapting to climate change in the future. It will support good-quality new jobs across the country, and bring opportunities to enhance our natural environment, our health and our well-being.

The UK can and should be a global leader on climate change.

The challenge of responding to climate change will not end with COP26 in the autumn or with the completion of the UK Presidency a year later. Global commitments are increasingly moving into line with the Paris Agreement, but we have entered a critical decade of action to consolidate and to deliver them. UK action must continue to provide an attractive model of success to maintain our climate leadership in support of a global response that meets the global challenge.

\* Some of these UK policies only cover England. Equivalent devolved policies must also reflect climate change.

# The Committee

**Baroness Brown of Cambridge DBE FRS**  
Chair, Adaptation Committee

Baroness Brown of Cambridge DBE FREng FRS (Julia King) is an engineer, with a career spanning senior engineering and leadership roles in industry and academia. She currently serves as Chair of the CCC's Adaptation Committee; non-executive director of the Offshore Renewable Energy Catapult; and Chair of the Carbon Trust.

**Professor Michael Davies**

Michael Davies is Professor of Building Physics and Environment at the UCL Institute for Environmental Design and Engineering (IEDE). At UCL his research interests relate to the complex relationship between the built environment and human wellbeing. He is also Director of the Complex Built Environment Systems Group at UCL and a member of the Scientific Advisory Committee of 'Healthy Polis'.

**Professor Richard Dawson**

Richard Dawson is Professor of Earth Systems Engineering and Head of Water in the School of Engineering at Newcastle University. Over the last two decades his research has focused on the analysis and management of climatic risks to civil engineering systems, including the development of systems modelling of risks to cities, catchments and infrastructure networks.

**Ece Ozdemiroglu**

Ece Özdemiroğlu is an environmental economist and the founding director of eftec (Economics for the Environment Consultancy). Her work uses economic value evidence for natural capital and applies this evidence in accounting and appraisal. Ece is also the convenor of the British Standards Institution's Assessing and Valuing Natural Capital Committee who wrote the BSI8632 on Natural Capital Accounting for Organizations. She is Associate Editor of the Journal for Environmental Economics and Policy and a Fellow of the RSA.

**Rosalyn Schofield LLB**

Rosalyn Schofield is a solicitor. She was Director of Company Secretariat at Associated British Foods plc, where she had global responsibility for the environmental sustainability and impact of the business. Rosalyn is also a Council Member of the University of Hull and Chair of the Audit and Risk Committee there as well as at the CCC. She has previously worked as Legal Director at JD Wetherspoon plc and was a commercial property lawyer in private practice.

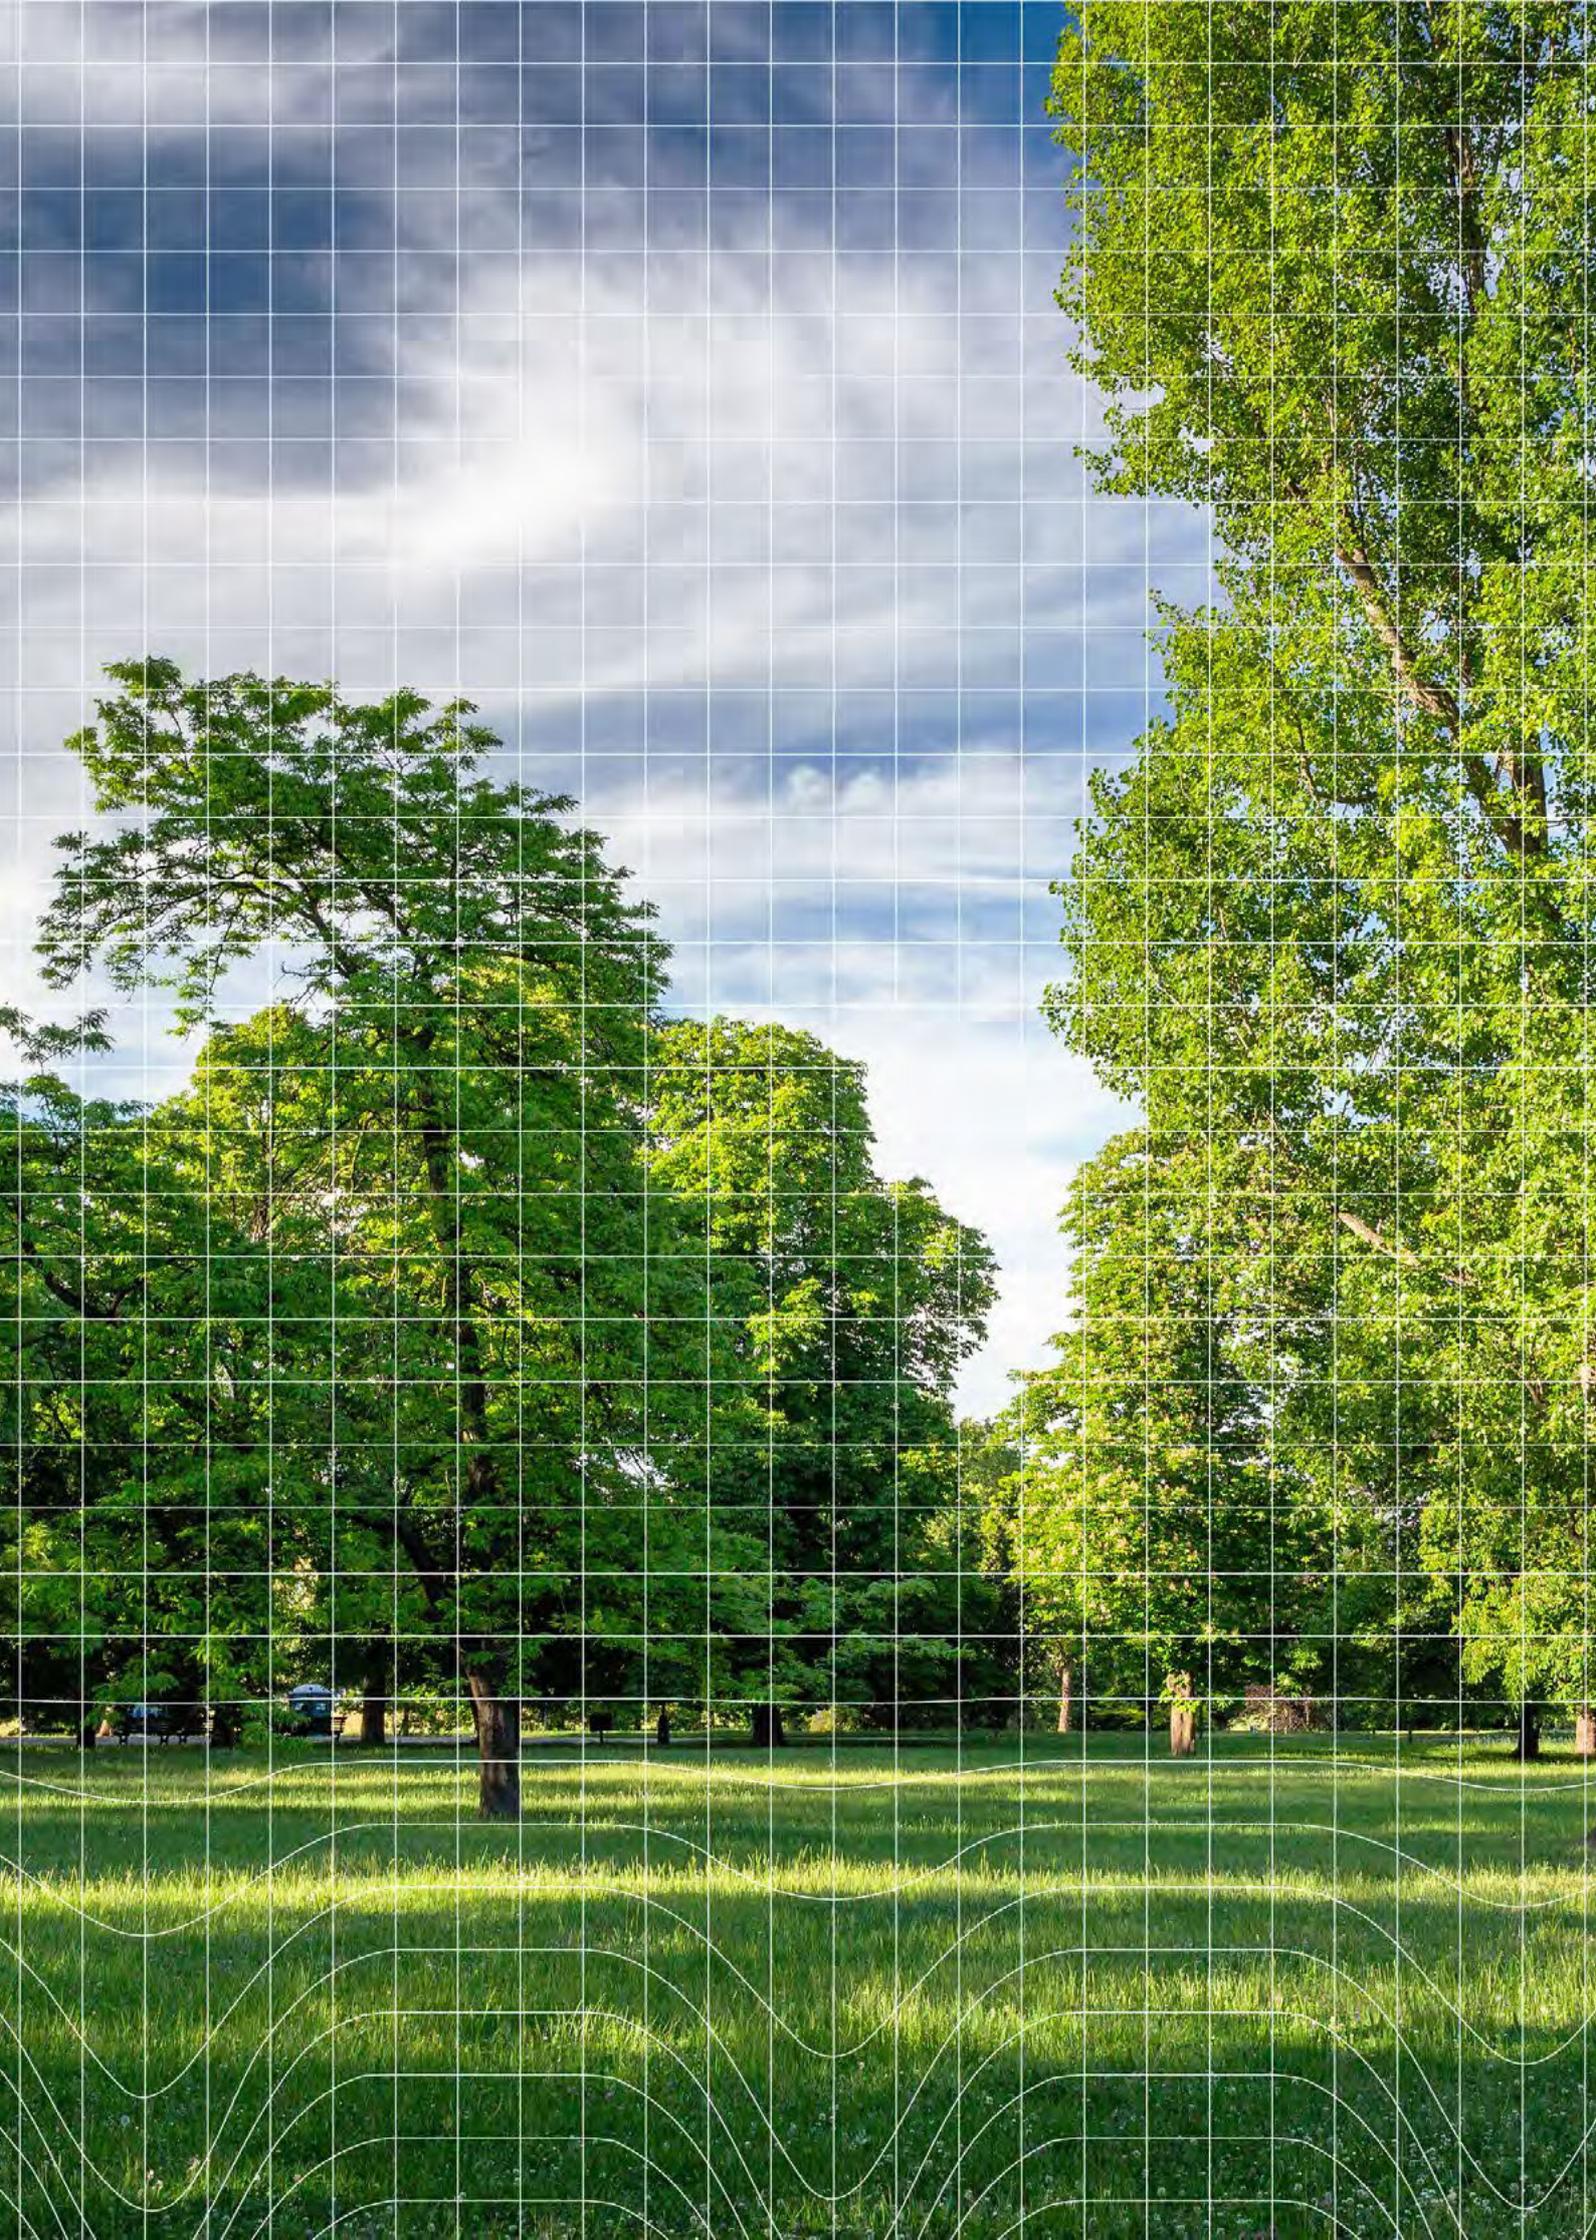

**Professor Kate Jones**  
Expert Adviser to the Adaptation Committee

Kate is Professor of Ecology and Biodiversity at University College London. Her work focuses on crossing disciplinary boundaries to address critical global challenges, especially at the interface of ecological and human health. Professor Jones has made key advances in monitoring the status and trends in biodiversity and particularly in modelling and forecasting zoonotic disease outbreaks in humans (Ebola, SARS), breaking down traditional barriers between ecology, climate change and public health to inform global policy.

# Executive Summary

---

**Climate change impacts are increasing, but the UK Government's National Adaptation Programme has not delivered the necessary improved resilience to the changing climate as was intended under the UK Climate Change Act.**

As the UK enters its third statutory cycle of national risk assessment and adaptation planning, it is essential that the Government is more ambitious in the forthcoming 3<sup>rd</sup> National Adaptation Programme, with a comprehensive set of actions linked to the efforts for economic recovery from the Covid-19 pandemic and to the levelling up agenda. This is critical if country is to realise a resilient recovery from coronavirus and deliver on key policies including Net Zero.

The Government should set a clear vision for a well-prepared UK, and back that with quantifiable targets to embed adaptation in policies across the natural environment, planning, infrastructure, homes and transport as they advance in the coming 12 months and beyond.

This report follows our advice on the CCRA3 Independent Risk Assessment and focusses on adaptation implementation in England. We set out eight key messages (Box ES.1), and make 50 specific recommendations to improve progress, ten of which are joint adaptation/ mitigation recommendations that are also included in the Mitigation Progress Report.

**Box ES.1**

**The Committee's key messages on adaptation progress**

- The global and UK climate will continue to change out to mid-century at least.
- Warming at much higher levels than a 2°C increase in global temperature remain possible in the second half of the century.
- The National Adaptation Programme has not developed national preparedness for a 2°C rise in global temperature, let alone higher levels of warming.
- Our assessment shows limited changes in progress scores since 2019. Adaptation needs to be integrated into a range of key policies before the next National Adaptation Programme is published in 2023. There are signs of improvement across a number of sectors that if continued, could help to achieve this.
- The Government needs to reinstate support services and resourcing for local adaptation action.
- There are no actions in the National Adaptation Programme to respond to the risks to the UK from climate change overseas. As we stated in our last report and in our advice on the CCRA, these risks need to be included in the next Programme due in 2023.
- The next 12 months will be important for making improvements to how we measure and monitor adaptation in the UK. Global interest in monitoring and evaluation is growing in the run up to COP26 - with a focus on the UK's approach. To be world-leading, Government needs to resource new work to improve existing datasets and identify and create new ones.
- The UK is entering its third cycle of risk assessments and National Adaptation Plans. The third iteration of the National Adaptation Programme must be more ambitious; more comprehensive; and better focussed on implementation than its predecessors, in order to improve national resilience to climate change.

Below, we set out our eight key messages in more detail, drawing on the analysis in this report.

## The global and UK climate will continue to change out to mid-century at least

**Global temperatures are now around 1.2°C above pre-industrial levels, with the UK showing a similar change.** The world is currently warming by around 0.25°C per decade due to human emissions of greenhouse gases. Globally, the six most recent years (2015 to 2020) have been the hottest years on record. In England, episodes of extreme heat are becoming more common, rainfall patterns are changing, and sea level is rising.

**Even with ambitious global efforts to reduce greenhouse gas emissions, further climate change is inevitable.** With these changes will come increasing climate impacts from a wide range of weather hazards: more and stronger heatwaves, flooding, drought, wildfire, and potential changes to storms and wind patterns. The following changes are expected by 2050 relative to a 1981-2000 baseline:

- Warmer and wetter winters. Average winter temperatures are projected to increase by around 1°C and rainfall by +5% (central estimates), with an uncertainty range of up to 2.5°C warmer and 20% wetter. Increasing winter rainfall intensity will increase the risks of flash flooding.
- Drier and hotter summers. Average summer temperatures are projected to increase by 1.5°C and rainfall to decrease by 10% with an uncertainty range of up to 3°C hotter and 30% drier. Summer rainfall, when it occurs, will be more intense increasing the risk of flooding; and hotter summers will increase the risk of excess deaths and affect productivity.
- Continuing sea level rise, of around 10-30 cm with possible rises extending up to 30 – 40 cm across the UK. Depending on the location in the UK, this will increase the risks of coastal flooding under extreme high tides, and affect the functioning of coastal infrastructure.

## Warming at much higher levels than a 2°C increase in global temperature remain possible in the second half of the century

**Climate commitments are strengthening but global warming of up to 4°C above pre-industrial levels by 2100 cannot yet be ruled out.** The Paris Agreement aims to keep global temperature increase to well below 2°C above pre-industrial levels, and ideally to 1.5°C. Recent pledges from national governments to reduce greenhouse gas emissions are closing the gap to the Paris goal but are not yet ambitious enough to meet it. Furthermore, policies are generally not yet in place to meet the pledges that have been set and are expected to only hold global emissions approximately flat over the next decade. This level of ambition, if not strengthened would imply reaching around 3°C of global warming above pre-industrial levels by 2100, with a warming of around 4°C above pre-industrial levels by 2100 still possible due to climate response uncertainty.

## The National Adaptation Programme has not developed national preparedness for a 2°C rise in global temperature, let alone higher levels of warming

**Government action has been inadequate to drive progress in most areas.** This report highlights some areas where there has been progress.

These areas tend to be where Government has intervened and taken a leading role, such as producing a National Floods Strategy, mandating reporting under the Taskforce on Climate-Related Financial Disclosure (TCFD) or setting clear planning requirements for the water sector. However, in most areas there has not been equivalent action, both from Government and other stakeholders like business and the third sector. There are various barriers preventing adaptation in these sectors such as gaps in awareness about the risks, the presence of externalities and missing markets, financial constraints and various behavioural barriers.

**The gap between future levels of risk and planned adaptation has widened in the last 5 years.** Neither the first nor second iteration of the National Adaptation Programme (published in 2013 and 2018 respectively) has delivered a minimum level of resilience to current and inevitable climate change. The Committee's recent advice to Government on the third UK Climate Change Risk Assessment highlights that over half (56%) of the risks have been given the highest urgency score, signalling that more action is needed than is currently planned for. In contrast, only around one third (36%) of the risks were given the highest urgency score in the 2016 assessment.

**Planning for 2°C and consideration of 4°C warming is still not happening.** Our detailed assessment of progress in England presented in this report shows that planning for 2°C and consideration of 4°C warming is still not happening in 27 of the 34 adaptation priorities considered; the exceptions being the infrastructure sectors with high plan scores shown in Figure ES.1 below (flood and water management, road, rail, energy and the design of new critical infrastructure).

**The UK is leading in diagnosis but lagging in policy and action.** The UK has world-leading climate science expertise. But this record is not matched in policy ambition and implementation. We have good evidence on future climate risks, good evidence on the importance of prudent risk planning and good evidence on the benefits of UK adaptation. In the wake of the Covid-19 pandemic, it has never been clearer that we need robust, well-resourced plans for known risks, however small or distant they seem and even if the decision is not to act at the end.

## Our assessment shows limited change in progress scores since 2019

**Improved assessment scores have been given to only five out of 34 adaptation priorities (Figure ES.1).** The Committee has updated its assessment of the quality of adaptation plans, and actions to reduce risk, using the same framework as our 2019 report and taking into account evidence provided by government and stakeholders.

**No sector achieves the highest risk management score.** We have still been unable to award any sector a high score for risk management which means that vulnerability and exposure to climate change are not being managed appropriately nor in line to meet relevant government goals, such as public health protection or enhancing biodiversity. This remains unchanged from 2019.

Five areas have improved plan scores:

### River and coastal flood alleviation

- The Government published a new, major flood and coastal erosion Policy Statement in 2020 which sits alongside the Environment Agency's updated Flood and Coastal Erosion Risk Management (FCERM) Strategy.

The FCERM Strategy puts in place measures that will allow for climate adaptation, seeking to better prepare for a 2°C rise in global temperature, as well as planning for higher scenarios, such as a 4°C rise in global temperature for flood and coastal erosion risk.

- Alongside the new plans, significant announcements have also been made to boost investment in flood defence schemes and supporting projects, including £5.2 billion to create around 2,000 new flood and coastal defences for 336,000 properties. There is still a gap in developing a national monitoring and evaluation strategy, but work is underway to consider which metrics should be used to measure progress.

#### **Surface water flood alleviation**

- The new FCERM Strategy has several commitments for the Environment Agency to work with Ofwat, water companies and other Risk Management Authorities to improve resilience to surface water and drainage flood risks and encourage long-term adaptive planning. All Lead Local Flood Authorities (LLFAs) now have published surface water flood management strategies, a key recommendation from our earlier progress reports.

#### **Extreme weather impacts on business**

- There has been significant progress by government in the last two years to help businesses better prepare for the impacts of climate change. There is a new plan for mandatory disclosures for physical risk under the Taskforce on Climate-related Financial Disclosure (TCFD), which will apply to listed and UK-registered companies, banks and building societies, insurers, and some pension schemes.
- In 2022, a further refresh of the Government's Green Finance Strategy is expected, along with the next Bank of England Stress Test which is focussed on climate change risks. The Taskforce on Nature-related Financial Disclosures (TNFD) has launched since our last progress report and aims to serve the same strategic role as TCFD.

#### **Supply chain interruptions**

- The first part of the National Food Strategy has been published and Government has made further commitments to report and develop a better understanding of issues related to food supply chains, including climate change. However, despite an improvement in the plan score, the risk management score for supply chains has dropped (see below).

#### **Commercial fisheries**

- Climate change adaptation was included as one of eight priorities under the Fisheries Act (2020) and requires the Marine Management Organisation (MMO) to set out how this objective will be met. There are currently no specific plans for adapting to a minimum 2°C rise in global temperature, which if/when such plans are published by the MMO could improve the plan score further in the future.

In three cases, scores have become worse since 2019:

#### **Supply chain interruptions**

- Despite some improvements in planning, the score for managing risk has dropped due to the increased evidence since 2019 of greater vulnerability in supply chains than previously estimated. This reflects both the experience of the Covid-19 pandemic and survey evidence showing the high costs of disruptions. The level of adaptation underway has remained roughly the same. Further work on building resilience into supply chains was highlighted as one of the UK's top national priorities in our recent advice to Government on the third UK Climate Change Risk Assessment.

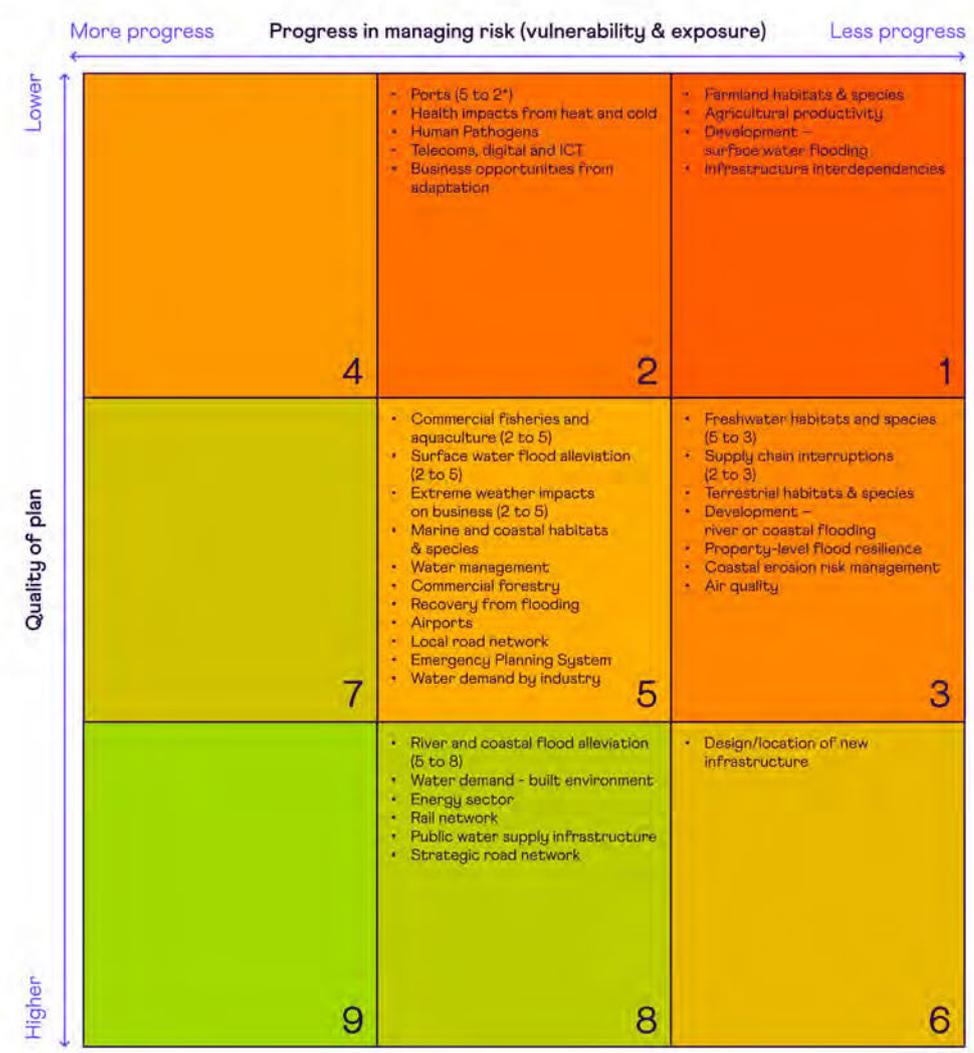

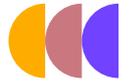

#### **Ports**

- In this assessment we have split out our assessment of airports from ports. This has resulted in a lower plan score for ports. Resilience standards for ports are left to individual operators and due to their commercial nature, there is limited information available on the extent of planning for climate change impacts, and the resulting impacts on the movement of goods. Several ports declined to participate in the last round of the Adaptation Reporting Power and expected participation in the current round is unclear.

#### **Freshwater habitats**

- While general plans to build the resilience of freshwater habitats to climate change are in place, they have had only limited impact on managing pressures on biodiversity to date. Available species metrics indicate that populations are remaining stable, but the long-term declines in the ecological status of water bodies in England persist. Surface water temperatures across England have consistently exceeded their long-term mean in recent decades, yet details on the ongoing revisions to River Basin Management Plans suggest risks from higher water temperatures are still not given sufficient consideration.

Figure ES.1 The Adaptation Committee's scoring of adaptation priorities (2021)

Source: CCC

Notes: Definitions for each of the score boxes are given in Chapter 1. Adaptation priorities where scores have changed since 2019 are highlighted with the change in score provided in brackets.

\*The score for ports has dropped from 5 to 2, but this is due to the splitting of a joint airports/ports priority in 2019 into separate priorities for this report. The level of planning has not changed for ports since 2019.

**The lack of change in scores hides some signs of progress that present opportunities to drive adaptation forward, if adaptation is integrated effectively into policies.**

There are key opportunities for new policies to integrate adaptation over the coming 12 months, in the run up to COP26 and the publication of the Government's next adaptation programme.

In our advice on the Third UK Climate Change Risk Assessment we set out eight risk areas where there are major upcoming policy announcements, and in this report we have highlighted specific policy opportunities for England in more detail:

### Natural environment

- The current overhaul of policies and plans for protecting the natural environment has not yet adequately integrated adaptation. Without this integration, the aims of the Government's 25-Year Environment Plan are unlikely to be met because climate change will reduce habitat condition, soil and water quality and quantity, threatening further the health of ecosystems and the natural environment, which are already in serious decline.
- The Government needs to set outcome-based, long-term targets for widespread habitat restoration, with statutory interim targets to drive the early action that is needed now to improve resilience.
- Actions that reduce vulnerability and exposure to climate change across all environmental public good outcomes\* should be rewarded under the forthcoming Environmental Land Management scheme (ELM). We made a series of recommendations to this effect in 2019. None have been implemented, but it is not too late to do so as policies are still under development.

### Infrastructure

- The National Infrastructure Commission has identified climate change as one of three key challenges for infrastructure resilience. The 2020 National Infrastructure Strategy states that climate change should be fully considered at the design stage and cost-effective adaptation actions should be built in over the whole life cycle of the asset.
- In our advice to Government on CCRA3, we point to the vulnerability of the power system as a key priority for further action now.
- The new UK National Infrastructure Bank, launching in interim form in 2021, is a key component of the National Infrastructure Strategy and can support adaptation through stimulating investment in green infrastructure.
- The Treasury's Supplementary Green Book Guidance (*Accounting for the Effects of Climate Change*) supports analysts and policymakers to identify if and how their proposals could be affected by climate risks and how to design adaptation measures in response.
- The Infrastructure and Projects Authority is working in collaboration with the CCC to incorporate tests for climate change into assurance processes for all projects on the Government's Major Project Portfolio.
- In the water sector, the next round of water company plans will incorporate the latest UK climate projections, and set stricter targets for leakage, aiming for a 50% reduction by 2050.
- In aviation, a new 2050 strategy, consulted on in 2019 but not yet published, is expected to include actions for improving resilience.

\* Environmental public good outcomes refer to the Government's objectives to protect, improve and expand the natural environment to ensure it continues to provide the market and non-market goods and services that are essential to society.

## Health and the built environment

- New housing developments continue to be built without resilience to heat, or a focus on water efficiency and in some cases to flooding, especially from surface water. This is despite the Committee's consistent advice, which has highlighted fundamental gaps in policy since it began to assess these issues ten years ago.
- More information is required to understand the Government's intentions with planning reform and the forthcoming Planning Bill. Some draft proposals (such as the extension of permitted development rights, moving to a single sustainability test that may not adequately take account of climate change mitigation and adaptation, and removing the duty to cooperate) may make adaptation more difficult to achieve.
- A more forward-looking outlook on flood risk is required for new developments. There may be no material increase in present day flood risk from some limited building in the floodplain, but these developments increase exposure in the event of defence breaches and future climate and population changes. If building on the floodplain continues at the current level, the funding required to build and maintain new defences, will continue to rise.
- The planning system is not designed to incentivise 'green' Sustainable Drainage Systems, and some homes are being built in areas at risk of surface water flooding without any expert flood mitigation advice.
- Potential progress on taking steps to manage overheating risk in new residential buildings should come through MHCLG's proposed overheating standard. This proposal is strongly welcomed by the Committee, and now needs to become reality.
- There remains a substantial gap in addressing overheating in existing homes and health and care facilities. There has been better planning for 2°C and 4°C in schools and prisons.
- There are opportunities across multiple policies to improve urban greening including the Environment Bill, updates to National Planning Policy including implementation of biodiversity net gain (if gains are real) and the forthcoming Net Zero Strategy.
- The outcome of the 2019 consultation on measures to reduce personal water use, expected in 2021, presents a key opportunity to introduce more stretching water efficiency targets.

## Business

- Consultations on pension scheme regulations, the future of audit and criteria for public procurement have set out proposals for greater consideration of climate change, which now need to be enacted.
- The new SME Climate Hub offers tools and resources to help small businesses develop their climate strategy and contribute to efforts to reduce UK emissions to Net Zero. There is an opportunity improve promotion and integration of adaptation through this or a similar initiative.
- Stronger assurance is required for the resilience of supply chains, particularly key supply chains such as for food and medical supplies, as part of the Government's new Plan for Growth.

- More should be done to explore how current uses of green finance for adaptation could be replicated or scaled up across regions in England.
- There has been progress in planning for a green recovery in response to the economic impacts from COVID-19. However, the measures announced, such as the Ten Point Plan for a Green Industrial Revolution and the Green Jobs Taskforce, focus almost exclusively on achieving Net Zero and miss out on the opportunities for climate change adaptation. There are good examples to draw on, such as exploring potential revenue streams in areas such as natural capital and resilience, new financial products such as green and sustainability bonds and regional initiatives such as the Greater Manchester IGNITION project. Again, there are still opportunities in the next 12 months to integrate adaptation more fully into these policies.

This list is not comprehensive, but it emphasises the urgency of integrating adaptation into current policy to avoid lock-in and unnecessary future expenditure.

### The Government needs to reinstate support services and resourcing for local adaptation

**Support services need to respond to the needs of business and promote the importance of adaptation alongside achieving Net Zero.** The UK Climate Impacts Programme and subsequently Climate Ready was the lead national adaptation support service for businesses, as well as other sectors, and was responsible for developing tools and guidance before its closure in 2016. This created a gap and lack of assurance that smaller businesses and organisations in particular would be aware of and able to access resources and the latest expertise on climate risk and adaptation. As mentioned above, the new SME Climate Hub aims to provide a 'one-stop-shop' for SMEs to make a climate commitment and access 'best-in-class' tools and resources. It already offers several resources for physical risk and understanding climate impacts, though it should aim to improve integration and promotion of adaptation alongside reducing emissions to Net Zero. It will be important to monitor feedback for the SME Climate Hub and whether action from Government is required to develop resources to ensure the needs of different types of business and organisations are met.

**The Government should ensure that local authorities are properly funded with resources and training available to tackle climate change.** This includes ensuring that local authorities have the capacity to respond to extreme weather events such as flooding; provide clear guidance for how adaptation should be included in development plans; ensure local authorities are properly resourced and have trained personnel to enforce building regulations; and ensure long-term resource budgets are in line with capital investments in flood risk management. Local authorities should have powers to require enhanced building standards in areas where climate impacts are particularly significant – for example higher water efficiency standards in areas with growing populations which will be increasingly drought-prone.

### There are no actions in the National Adaptation Programme in response to the risks to the UK from climate change overseas

**As we stated in our last report and in our advice on the CCRA, the risks to the UK from climate change overseas need to be included in the next National Adaptation Programme due in 2023.**

The urgency of UK action for some overseas climate risks is greater than previously assessed as there is now more evidence on the scale and number of risks as shown in the CCRA3 Technical Report. The majority of these are scored as 'more action needed', including risks to UK food availability, international supply chains, public health and systemic risks from multiple impacts that will cascade across the globe. The Covid-19 pandemic, while not a climate-driven risk, has shown how quickly systemic risks can propagate and affect all aspects of society and the economy.

**The Government needs to include specific actions to manage international climate risks to the UK in the next National Adaptation Programme. These should include:**

- Reviewing the environmental governance and exposure to climate risks in emerging free trade agreements.
- Addressing food access inequality and informing dietary choices, given that the UK imports over 50% of its food. This action would reduce vulnerability to the risk of decreasing nutritional quality of food produced due to climate change
- Increasing the resilience of international trade systems, reducing reliance on long, just-in-time supply chains which are susceptible to shocks
- Real-time monitoring of transmission pathways for emerging diseases, alongside increased surveillance of wildlife, people and other imports; and improvement of public and professional level information
- Planning for increasing unpredictability and the potential for sudden shifts in the climate, which are possible even at lower levels of warming.

**The next 12 months will be important in improving how adaptation is measured and monitored in the UK**

**Global interest in monitoring and evaluation is growing in the run up to COP26 - with a focus on the UK's approach.** Measuring progress is fundamental to understanding whether adaptation is working. The Committee published a set of recommended adaptation indicators in 2019 for Defra to populate, but little has happened to progress this. We have highlighted the following key issues related to metrics in this report:

- The use of habitat condition and species abundance as proxy indicators for the vulnerability of biodiversity to climate change only offers a simplistic assessment of progress. Development of more sophisticated metrics is needed to help inform how ecosystems and biodiversity are responding to climate change, and the components or functions that are most vulnerable, so that adaptation responses can be better focussed. For instance, the use of remote sensing tools will provide new data to improve our understanding of changes in water flow, fractional vegetation cover, impervious surface area mapping and drought predictions based on soil water index.
- For flooding and coastal change, the Government must deliver a well-established monitoring and evaluation framework and national set of indicators to monitor trends and policy impact effectively. Improved indicators need to include data on the uptake and type of sustainable drainage systems being installed both in new build and retrofit.

- While surveillance programmes exist in England for disease vectors such as ticks and mosquitoes, the current level of surveillance should be improved and expanded. The new Health Security Agency provides an opportunity for climate change to be considered in the context of disease spread, expand current surveillance across the UK, and provide suitable indicators to measure vector abundance.
- There is a continuing lack of data on the vulnerability of infrastructure to extreme weather and the steps being taken to manage interdependencies between sectors. When used effectively, the Adaptation Reporting Power (ARP) can present updated risks and adaptation actions, allowing an assessment of preparedness of all infrastructure sectors and their interdependencies. Very few ARP3 reports have been available for this assessment due to a misalignment of timeframes with the CCC's mandatory reporting schedule, and the voluntary nature of the ARP reporting means there is no guarantee of sector-wide coverage. These reports are intended to be a key input to the development of the NAP and the CCRA; but to date it has not been possible to use them effectively in this way.

The Government should resource new work to improve existing datasets and identify and create new ones. Improved understanding of how adaptation actions lead to better outcomes is needed, following the approach set out in the Government's Magenta Book (Guidance for Evaluation). Funding is also needed to support the sustained measurement of relevant indicators like soil health, and to consider how to bring together different organisations and groups that collect data to streamline and share data. In the coming months, prior to COP 26, the CCC would be willing to coordinate this work if requested to do so by Defra, in collaboration with other relevant organisations such as the Office for Environmental Protection.

### **The third iteration of the National Adaptation Programme must be more ambitious; more comprehensive; and better focussed on implementation**

**In this report, we have prioritised what needs to be done by Government in England – and brigaded our climate recommendations by Government Department as an aid to better policy (Table 1).** We stated in 2019 that the country was at risk of becoming complacent on climate change adaptation. Since then, there have been some signs that Government is taking climate change risks more seriously. Adaptation is one of the key themes for COP26, and the Government has appointed a dedicated Adaptation Champion. Some policy milestones have been met, such as spelling out the need for adapting to 2°C and planning for 4°C in the updated Treasury Green Book guidance on appraising policies, projects and programmes; which all departments are expected to follow. But the specific actions that need to be delivered have not taken place in many sectors. Adaptation is not being sufficiently resourced, and must not continue to be the poor relation to climate change mitigation as the Government prepares for the spending review later this year.

Our recommendations for the key actions needed before the publication on the next National Adaptation Programme are shown in below by department.\*

**Table 1**  
The Adaptation Committee's Recommendations for Adaptation

No.	Department	Sector	Recommendation	Timing
1	All (Joint adaptation/mitigation recommendation)	All	Ensure all policy decisions , and procurement decisions, are consistent with the Net Zero goal and reflect the latest understanding of climate risks.	Now and ongoing
2	All (Joint adaptation/mitigation recommendation)	All	Review guidance documents used in policy and business case development (e.g. the Green Book) and ensure these are consistent with the requirements of Net Zero and account for the impacts of climate change. Consider options for introducing a Net Zero Test to ensure that all policies and decisions are compliant with Net Zero.	2022
3	All (Joint adaptation/mitigation recommendation)	All	Work towards securing more climate finance commitments from developed countries to get back on track for mobilising \$100 billion a year in climate finance as soon as possible.	2021 (COP26)
4	COP Unit, FCDO, DIT	All	Provide a clear commitment prior to COP26 regarding the timescale by which the UK's official development assistance (ODA) contribution will return to 0.7% of GNI given the UK's commitment to align its ODA spend with Paris Agreement requirements and the need for increased finance to achieve the Paris Agreement.	2021
5	Defra	All	The next National Adaptation Programme, due in 2023, should ramp up adaptation ambition, implementation and evaluation. It should: <ul style="list-style-type: none"> <li>• Set out the Government's vision for a well-adapted UK, alongside the measurable outcomes that the Government is aiming to achieve by the end of the next NAP period (2023 – 2028).</li> <li>• Include a detailed monitoring and evaluation framework, including which indicators will be used to monitor progress in reducing risk and showing the effectiveness of different adaptation responses for each risk in CCRA3.</li> <li>• Report how departments have addressed the top eight priority risks set out in the CCRA3 Advice Report for urgent action between 2021 and 2023 (see recommendations by department below).</li> <li>• Set out how adaptation is being integrated into policy, and the measurable actions by department for adaptation across each of the 61 risks and opportunities set out in the</li> </ul>	2023 onwards

\* Recommendations that are joint with the Mitigation Progress Report are highlighted as such.

			<p>CCRA3 Technical for the period 2023 – 2028 (see recommendations by department below).</p> <ul style="list-style-type: none"> <li>• Ensure the adaptation actions and the programme as a whole are framed around the principles for good adaptation outlined in the CCRA3 Advice Report: <ul style="list-style-type: none"> <li>– Adapt to 2°C warming, assess the risks for 4°C</li> <li>– Prepare for unpredictable extremes</li> <li>– Assess interdependencies</li> <li>– Understand threshold effects</li> <li>– Integrate adaptation into relevant policies</li> <li>– Ensure adaptation is sufficiently financed</li> <li>– Avoid lock-in</li> <li>– Address inequalities</li> <li>– Consider opportunities from climate change</li> </ul> </li> <li>• Specific actions to manage international climate risks should be included, setting out the direct response to the risks identified in CCRA3.</li> </ul>	
6	Defra	All	<p>Ensure that adaptation is integrated into major upcoming policies in the next two years related to the priority CCRA3 risks for which it has lead responsibility, coordinating work with other relevant departments as necessary:</p> <ul style="list-style-type: none"> <li>• Risks to the viability and diversity of terrestrial and freshwater habitats and species from multiple hazards</li> <li>• Risks to soil health from increased flooding and drought</li> <li>• Risks to natural carbon stores and sequestration from multiple hazards</li> <li>• Risks to crops, livestock, and commercial trees from multiple hazards</li> </ul> <p>In addition, for the coming five year period 2023-2028, Defra should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the other risks and opportunities in the CCRA for which it is the lead department (see Annex).</p>	By 2023
7	Defra	All	<p>Implement a public engagement programme about national adaptation objectives, acceptable levels of risk, desired resilience standards, how to address inequalities, and responsibilities across society. The findings from the programme should feed into the vision and desired outcomes of the next National Adaptation Programme.</p>	2021

8	Defra	All	Fund a programme of work to design and populate the appropriate new priority adaptation indicators for England. These should complement other environmental and social indicators collated by Government. The CCC could be tasked to coordinate this activity in partnership with other relevant organisations such as the Office for Environmental Protection and Environment Agency.	2021
9	Defra (joint adaptation/ mitigation recommendation)	Natural environment	Publish an overarching strategy that clearly outlines the relationships and interactions between the multiple action plans in development for the natural environment, including those for peat, trees, nature and plant biosecurity. This must clearly outline how the different strategies will combine to support the Government's climate change goals on both Net Zero and adaptation, along with the wider environment and other goals.	2021
10	Defra	Natural environment	The commitment in the 25 Year Environment Plan to achieve 75% restoration for terrestrial and freshwater protected sites should be extended to include all priority habitat sites.	2021
11	Defra	Natural environment	Make long-term targets for biodiversity, set out under the Environment Bill, and associated timeframes outcome-based and linked directly to the goals set out in the Government's 25-YEP.	June 2022
12	Defra	Natural environment	Make interim targets for biodiversity statutory and link them clearly to the long-term targets set out in the Environment Bill.	June 2022
13	Defra (joint adaptation/ mitigation recommendation)	Natural environment	Introduce legislation to extend the ban on rotational burning of peat from certain protected upland bog sites to all peatland before the start of the burn season in 2021; end peat extraction, and ban its sale for all horticultural uses including in the professional sectors and apply this to imports by 2023; mandate water companies to restore peatland under their ownership; and ensure lowland peat soils are not left bare.	2021-2023
14	Defra (joint adaptation/mitigation recommendation)	Natural environment	Extend current ambition set out by the UK government and the devolved administrations to implement a comprehensive delivery mechanism to address degraded peatland (hectares given are for the UK): <ul style="list-style-type: none"> <li>• 17% of upland peat is restored, equivalent to 200,000 hectares (and where this is not possible, stabilise the peat) by 2025; 58% by 2035 (700,000 hectares) and the remaining area by 2045;</li> <li>• Rewet and sustainably manage 12% of lowland peat used for crops by 2025 (24,000 hectares), rising to 38% by 2035 (72,000 hectares);</li> <li>• Rewet 8% of lowland grassland area by 2025 (18,000 hectares), rising to 25% by 2035 (54,000 hectares);</li> <li>• Remove all low-productive trees of less than YC8 from peatland (equivalent to 16,000 hectares by</li> </ul>	2021-2025

			2025), and restore all peat extraction sites by 2035 (equivalent to 50,000 hectares by 2025).	
15	Defra	Natural environment	Set out a clear mechanism to account for the consequences of higher water temperatures and low flows (including drying up) in water bodies for freshwater habitats and species, and for meeting the Water Framework Directive (WFD) targets. This is lacking in current plans to revise the River Basin Management Plans (RBMPs).	June 2022
16	Defra	Marine	Extend the statutory requirements of marine plan policies to the decisions of public and private organisations. At present only public authorities are duty bound under law to apply the plan policies to their decisions meaning there is a significant gap in the protections they are designed to provide.	Now
17	Defra	Infrastructure	Make changes ahead of the next round of reporting under the Adaptation Reporting Power (ARP). When used effectively, the ARP can present updated risks and adaptation actions that allows for an assessment of preparedness of all infrastructure sectors and their interdependencies. In particular: <ul style="list-style-type: none"> <li>• The next round of reporting must be mandatory.</li> <li>• The deadline for reporting must allow sufficient time for consideration of all the reports in the fourth UK Climate Change Risk Assessment, and the CCC's statutory assessment of progress on adaptation.</li> <li>• The list of organisations reporting should be expanded to ensure comprehensive coverage of critical infrastructure and services, such as canals and food supply chains, as recommended by the ARP3 consultation.</li> </ul>	2023
18	Defra	Infrastructure	Work with Port Operators and the British Ports Association to ensure the format of reporting under the Adaptation Reporting Power is appropriate for port operators and that the right operators are being asked to report. Defra should work with these organisations to identify what further support could be offered to enable more comprehensive reporting on adaptation by the ports sector.	2023
19	Defra; BEIS; DCMS	Infrastructure	Improve information sharing on climate risks to infrastructure interdependencies at a local level, especially for electricity, digital and ICT networks. As reported in our previous assessment in 2019, NAP actions to enhance arrangements for information sharing between local infrastructure operators and improve understanding of critical risks arising from interdependencies have not been completed. Defra's link with Local Resilience Forums is key, and BEIS and DCMS should engage with utility companies to encourage standardised benchmarking and data sharing on climate risks to electricity networks, digital & ICT.	Now and ongoing

20	Defra	Flooding	Work with the Environment Agency to set out the measures being taken to improve the uptake of property-level flood resilience (PFR) following stakeholder responses to its PFR call for evidence and consultation. This should include improved data collection to monitor progress. Plans for the new national flood risk assessment and 2025 long-term investment scenarios must ensure that the evidence they provide can be used to identify the most effective locations for PFR, and smart targets for their installation with timescales.	2022
21	Defra	Food security	Set out measures to ensure the resilience of the food supply chain, including to the risks of extreme weather in England and internationally, as part of its white paper responding to the independent review of the National Food Strategy for England.	2022
22	Defra	Water	Work with the Environment Agency, Ofwat and other stakeholders to set out targets and supporting measures for reducing water use by business. This could be through ensuring that any water reduction targets linked to the Environment Bill include business as well as household water use, as well as responding to advice and recommendations from Defra's new Senior Water Demand Reduction Group.	2022
23	MHCLG	All	<p>MHCLG should ensure that adaptation is integrated into major upcoming policies in the next two years related to the priority CCRA3 risks for which it has lead responsibility, coordinating work with other relevant departments as necessary:</p> <ul style="list-style-type: none"> <li>Risks to human health, wellbeing and productivity from increased exposure to heat in homes and buildings (with DHSC)</li> </ul> <p>In addition, for the coming five year period 2023-2028, MHCLG should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the risks and opportunities in the CCRA for which it is the lead department (see Annex).</p>	By 2023
24	MHCLG (joint adaptation/mitigation recommendation)	Planning	Ensure that developments and infrastructure are compliant with Net Zero and appropriately resilient to climate change through proposed amendments to The Town and Country Planning Order.	2021-22
25	MHCLG	Flooding (Planning reform)	<p>Ensure that all types of current and future flood risk are included in policies to assess flood risk to new developments. Housing targets for local authorities should take account of flood risk, amongst other environmental issues. Assessments and management of flood risk in new developments must include as a minimum:</p> <ul style="list-style-type: none"> <li>Evidence that the development will be safe over its full lifetime, with a consideration of the downstream interactions and impacts of new developments i.e. not increase flooding in any other areas</li> </ul>	2022

			<ul style="list-style-type: none"> <li>• An assessment of current and future flood risk under both a 2°C and 4°C global climate scenarios.</li> <li>• Assess and manage the risk of flooding to local infrastructure as well as housing.</li> <li>• A consideration of better preparedness as set out in the Government's recent FCERM Policy Statement.</li> <li>• Ensure there are properly funded and trained staff in local authorities.</li> </ul>	
26	MHCLG	Flooding	To address the issue of increased risk of surface water flooding in new developments, commit to ensuring that new developments do not put more water into the public sewers than what was there before, taking account of climate change. To incentivise this, end the automatic right to connect to the public sewer; planning reforms should enact Schedule 3 of the Flood and Water Management Act (2010); and technical SuDS standards should be made mandatory and be updated to deliver SuDS that provide multiple economic, social and environmental benefits.	2022
27	MHCLG	Flooding	To help improve the information on SuDS and surface water flood risk, urgently begin collecting data on sewer capacity and SuDS location, type and capacity. This would bring the level of information in line with that for river and coastal flood risk defences.	2021
28	MHCLG	Flooding	The consultation process for surface water flood risk must be improved. This should be done by adding statutory consultees for all development type and sizes. Consultees must have the appropriate skills to provide advice on surface water flood mitigation. Ensure that Local Authorities fully justify planning decisions where applications can proceed either without or going against formal flood risk mitigation advice.	2022
29	MHCLG	Building safety (overheating)	<p>Implement a strong set of standards - with robust enforcement - that ensure both new and existing buildings are designed for a changing climate and deliver high levels of energy efficiency and low-carbon heat. Including:</p> <ul style="list-style-type: none"> <li>• Publish robust definitions of the Future Homes Standard and Future Buildings Standard which are legislated in advance of 2023 and ensure no fossil fuels are burnt in new buildings. This must include coordination with DfE, MoJ, DHSC as well as BEIS and HMT.</li> <li>• Regulate the overheating requirement as set out in the Future Buildings Standard consultation. Expand the requirement to cover refurbishments of existing buildings and conversions of non-domestic buildings to residential.</li> <li>• Work with BEIS on the Heat and Buildings Strategy and use standards to set a clear direction for retrofit across the buildings stock.</li> </ul>	2021-22

			<ul style="list-style-type: none"> <li>• Ensure that the remit of the new building safety regulator covers climate change mitigation and adaptation, strengthened through an explicit responsibility for sustainability; and is fully equipped to monitor and enforce compliance with buildings standards.</li> <li>• Work with HM Treasury to ensure that local authorities are properly funded to enforce buildings standards.</li> <li>• Close loopholes allowing homes to be built which do not meet the current minimum standards for new dwellings. This includes provisions around the expiry of planning permission and permitted development rights relating to change of use. Make accurate performance testing and reporting widespread, committing developers to the standards they advertise.</li> </ul>	
30	MHCLG	Planning reform	Introduce an urban greenspace target to reverse the decline and ensure towns and cities are adapted to more frequent heatwaves in the future and that the 25-Year Environment Plan goals are met.	2022
31	BEIS	All	<p>Ensure that adaptation is integrated into major upcoming policies in the next two years related to the eight priority risks identified in the Committee's advice on the third UK Climate Change Risk Assessment (CCRA3) for which BEIS has lead responsibility, coordinating work with other relevant departments as necessary:</p> <ul style="list-style-type: none"> <li>• Risks to the supply of food, goods and vital services due to climate-related collapse of supply chains and distribution networks (with Defra and DIT)</li> <li>• Risks to people and the economy from climate-related failure of the power system</li> </ul> <p>In addition, for the coming five-year period 2023-2028, BEIS should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the other risks and opportunities in the CCRA for which it is the lead department (see Annex).</p>	By 2023
32	BEIS	All	BEIS should ensure that Net Zero and adaptation are considered together in the forthcoming Net Zero Strategy. There should be a focus on maximising synergies and minimising trade-offs between mitigation and adaptation actions and the risks from climate change to achieving Net Zero. Actions that have multiple benefits across climate change mitigation, adaptation, biodiversity and health should be high on the Government's agenda for action over the next five-year period.	2021
33	BEIS and MHCLG	Building safety (overheating)	Improve understanding of and support action on overheating in existing residential buildings and encourage retrofit of passive cooling measures. The	2022

			<p>Heat and Building Strategy must consider overheating risks. The following steps are needed:</p> <ul style="list-style-type: none"> <li>• Further research to understand when overheating occurs in existing homes, including: ongoing monitoring of temperatures in the housing stock, monitoring of overheating exceedances in homes, and number of homes currently adapted</li> <li>• Guidance and information for homeowners with the steps that can be taken if their homes overheat. This should include an outline of behaviour options and the measures that can be installed to reduce internal temperatures. Green Building Passports and home retrofit plans could provide holistic guidance and help to unlock green finance.</li> <li>• Overheating risk considered and mitigated against if necessary when doing energy efficiency retrofit programmes.</li> <li>• Making finance available to install adaptation measures. This could be via grant schemes or green finance for private owners, with public funding targeted at low-income or vulnerable households alongside energy efficiency retrofit.</li> </ul>	
34	BEIS (joint adaptation/mitigation recommendation)	Businesses	Support businesses to play their full role in the Net Zero transition and in adapting to climate risks and opportunities, for example by extending and expanding the role of the Net Zero Business Champion beyond COP26, building on the Race to Zero and Race to Resilience campaigns and providing sufficient resources to fully support businesses of all sizes to engage in the transition, to input to policy development and to set their own robust Net Zero and adaptation action plans.	2021-22
35	BEIS and HM Treasury (joint adaptation/mitigation recommendation)	Businesses	Develop further ways to embed Net Zero and climate risk in financial decisions by UK firms, building on the UK's Green Finance Strategy. This should include implementing mandatory climate disclosure, adoption of a robust green taxonomy with clear guidance on how it should be used. It should also consider the recommendations of the Committee's Finance Advisory Group, such as making Net Zero and adaptation plans mandatory for financial institutions and monitoring financial flows into climate action.	2021-25
36	BEIS	Research	Make monitoring and data analysis of climate risks more accessible, alongside better digitisation of past records. Further efforts should be taken to make the evidence on climate risks more usable for decision makers through co-design of research programmes with end users, where the user drives the research question from the beginning of the process. A major gap is the lack of projections of impacts in 2°C and 4°C scenarios; this needs addressing as an urgent priority ahead of CCRA4.	2022

37	Cabinet Office	All	<p>Cabinet Office should ensure that adaptation is integrated into major upcoming policies in the next two years related to the priority CCRA3 risk for which it has lead responsibility, coordinating work with other relevant departments as necessary:</p> <ul style="list-style-type: none"> <li>Multiple risks to the UK from climate change impacts overseas</li> </ul> <p>In addition, for the coming five year period 2023-2028, Cabinet Office should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the other risks and opportunities in the CCRA3 for which it is the lead department (see Annex).</p>	By 2023
38	Cabinet Office	All	<p>Cabinet Office should build a strong climate resilience capability for the UK, including making use of storyline or 'what-if' scenarios to assess risks, in addition to or instead of using 'reasonable worst-case' approaches. It should develop an early warning system for global climate shocks. It should consider how more allowance and flexibility can be built into policy making and policy implementation. This could include enhancing the ability of the Government to make fast decisions by bringing in technical advice and expertise quickly when needed, and both protecting, and enhancing, monitoring and surveillance systems to enable faster reactions as events unfold.</p>	By 2023
39	DHSC	All	<p>For the coming five year period 2023-2028, DHSC should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the four risks and opportunities in the CCRA for which it is the lead department (see Annex).</p>	2023
40	DHSC	Building safety	<p>Assess health sector vulnerability to existing and future climate risks, particularly, for care homes and home-based care. Following this, develop a cross-sector approach to address risks. This cross-sector approach should include input from CQC, PHE, NHS, MHCLG and local level public health bodies.</p>	2022
41	DHSC	Public health - vector-borne diseases	<p>Fund the strengthening and widening of vector and pathogen surveillance and early warning mechanisms, due to the increasing risk of disease spread as a result of climate change and other factors.</p>	Now and ongoing
42	HM Treasury	All	<p>For the coming five year period 2023-2028, HMT should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the risks in the CCRA3 for which it is the lead department (see Annex).</p>	2023
43	HM Treasury (Joint adaptation/mitigation recommendation)	All	<p>The spending review(s) should ensure departments are fully equipped to deliver the necessary actions across climate change mitigation and adaptation, during the rest of this Parliament and beyond.</p>	2021

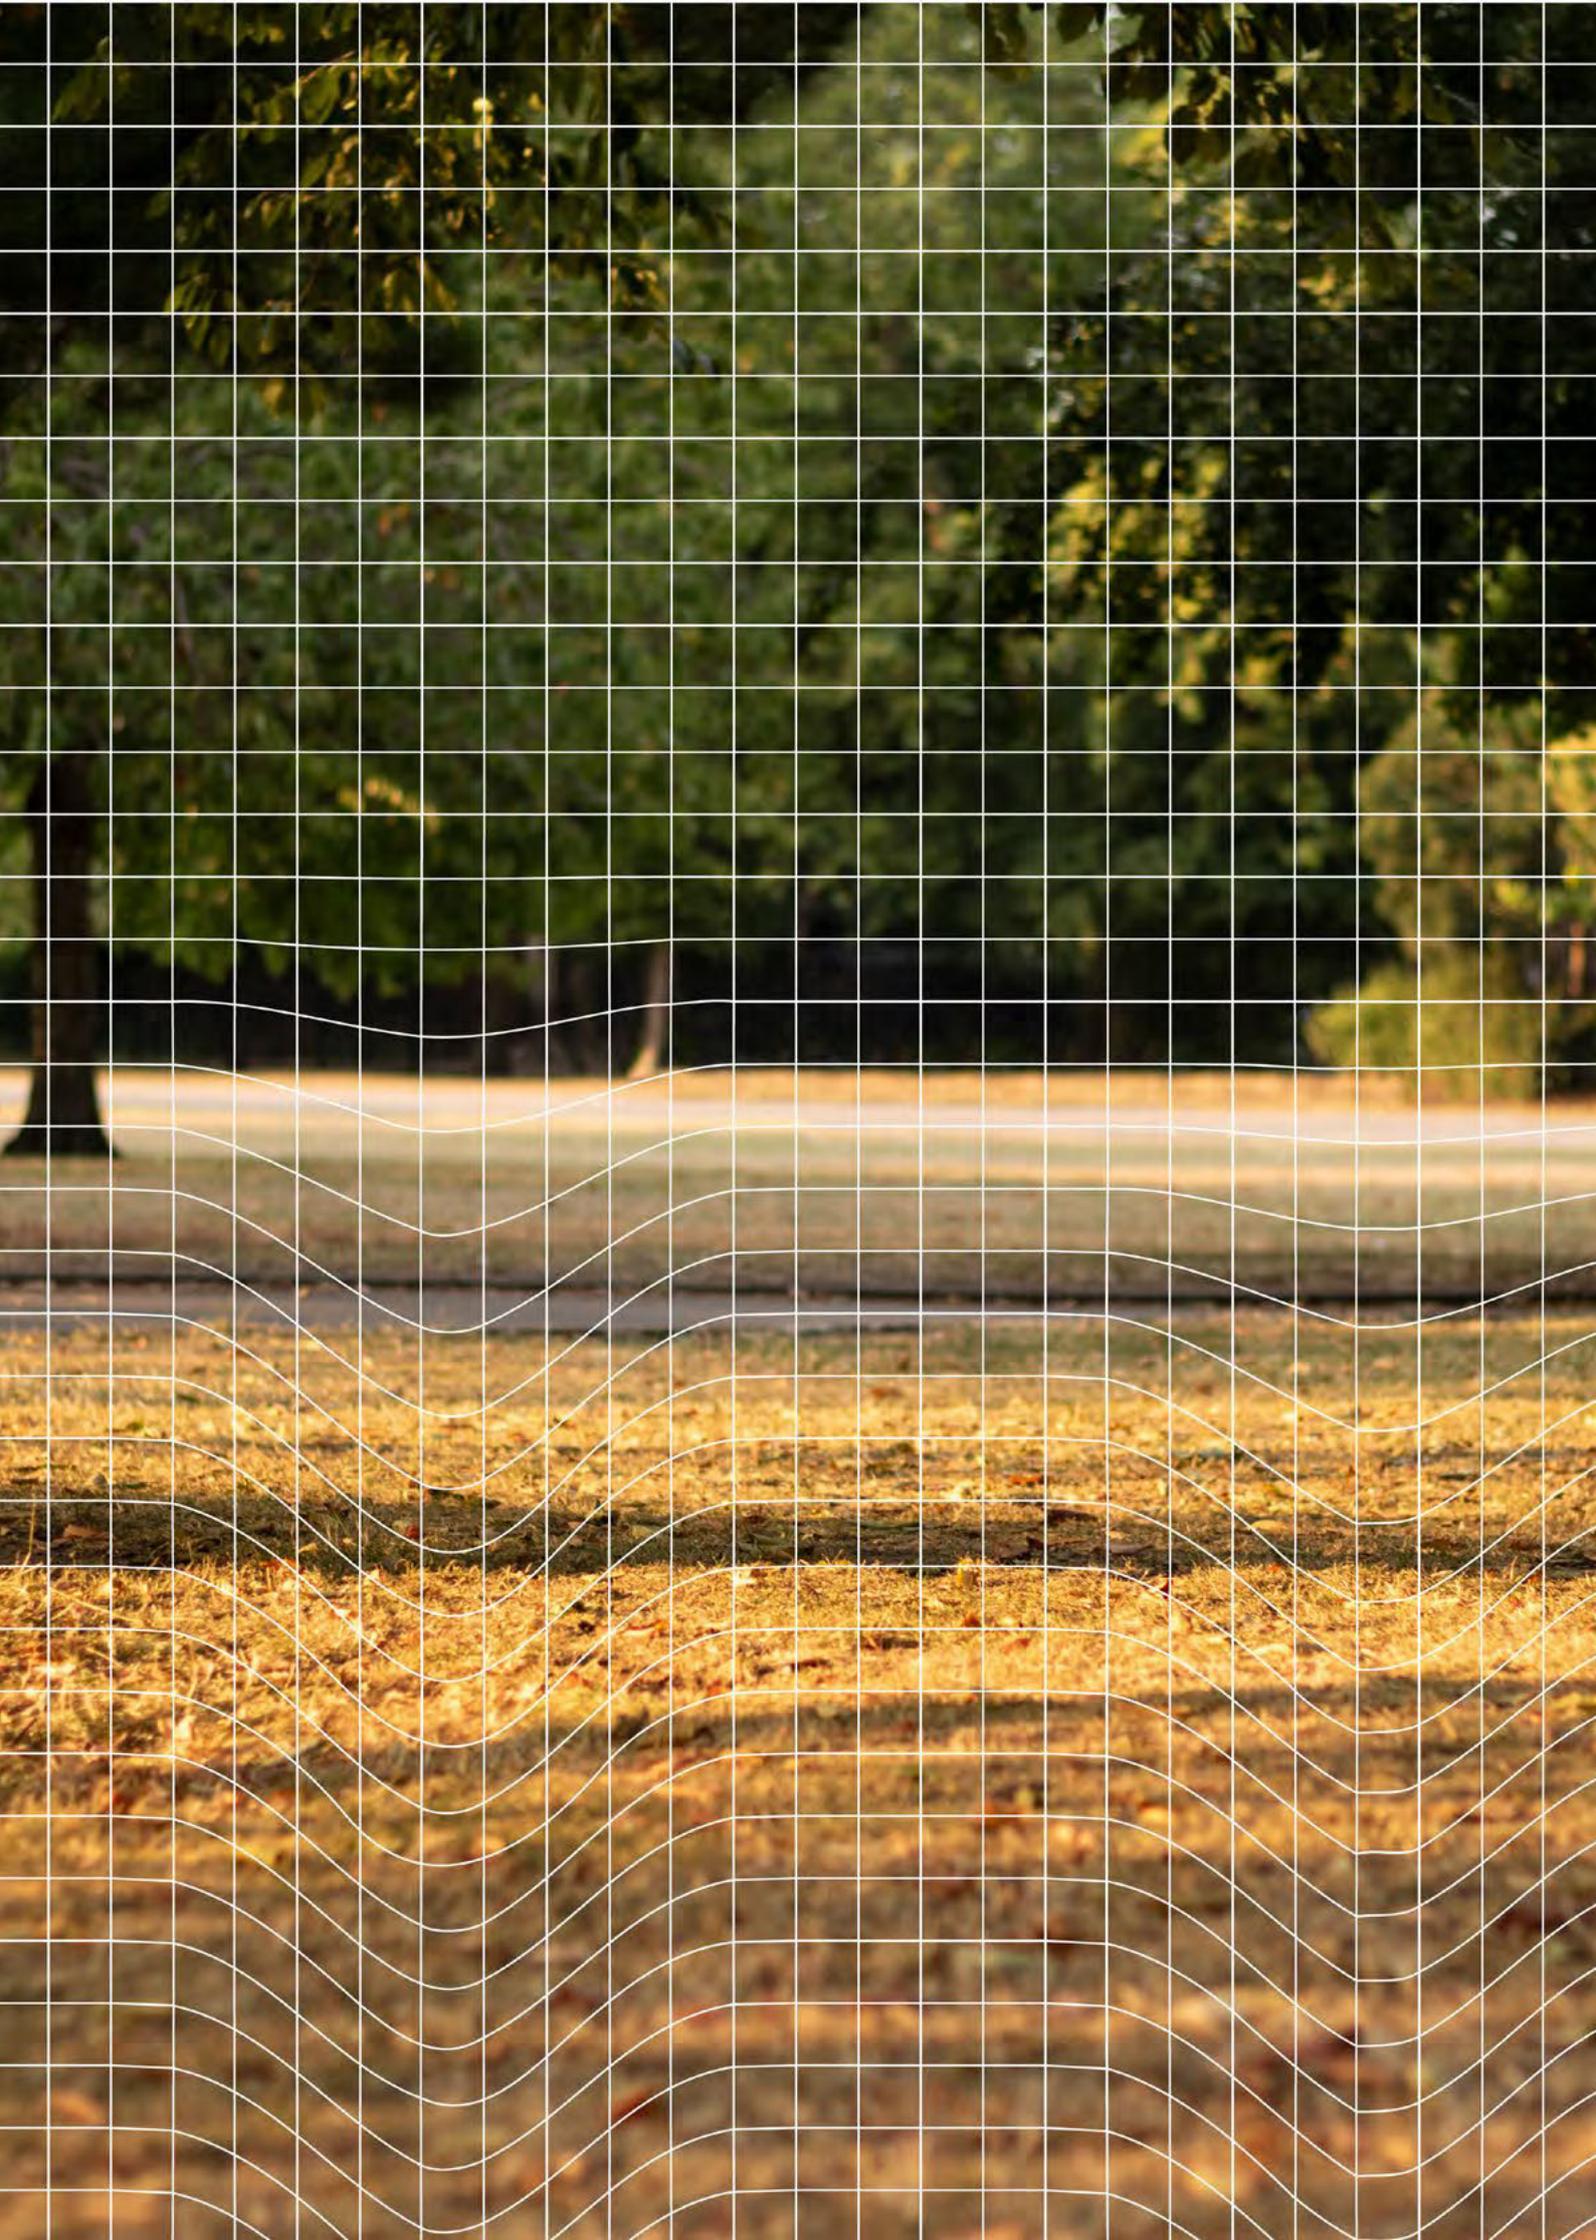

44	DCMS	All	For the coming five year period 2023-2028, DCMS should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the risks and opportunities in the CCRA for which it is the lead department (see Annex).	2023
45	DCMS	Infrastructure	Resilience standards for the digital sector must include requirements pertaining to climate change risks. In addressing the National Infrastructure Commission recommendations from the Resilience Study, Government should incorporate consideration of climate change risks and adaptation actions into any new standards being developed. Standards for digital infrastructure operators should include requirements to: <ul style="list-style-type: none"> <li>• assess climate risks under both 2°C and 4°C global climate scenarios,</li> <li>• consider interdependencies with other critical infrastructure, and</li> <li>• set out actions to reduce risk and monitor progress.</li> </ul>	2022
46	FCDO	All	For the coming five year period 2023-2028, FCDO should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the risks in the CCRA for which it is the lead department (see Annex).	2023
47	DfT	All	For the coming five year period 2023-2028, DfT should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the risks and opportunities in the CCRA3 for which it is the lead department (see Annex).	2023
48	DIT	All	For the coming five year period 2023-2028, DIT should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the risks and opportunities in the CCRA3 for which it is the lead department (see Annex).	2023
49	MoJ	All	For the coming five year period 2023-2028, MoJ should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the risks in the CCRA for which it is the lead department (see Annex).	2023
50	DfE	All	For the coming five year period 2023-2028, DfE should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the risks in the CCRA for which it is the lead department (see Annex).	2023

# Chapter 1

---

## Introduction

1.1 Observed and projected climate change	39
1.2 The CCC adaptation assessment framework	46

# 1.1 Observed and projected climate change

This section summarises observed and possible future changes in the UK's weather and climate.

This section covers the most up-to-date evidence regarding observed and projected changes in the UK's weather and climate. It highlights that several recent trends in UK's weather and climate can be linked to human-induced climate change – with further changes expected over coming decades.

## Global climate change

Global temperatures continue to rise rapidly – with human influence the driver.

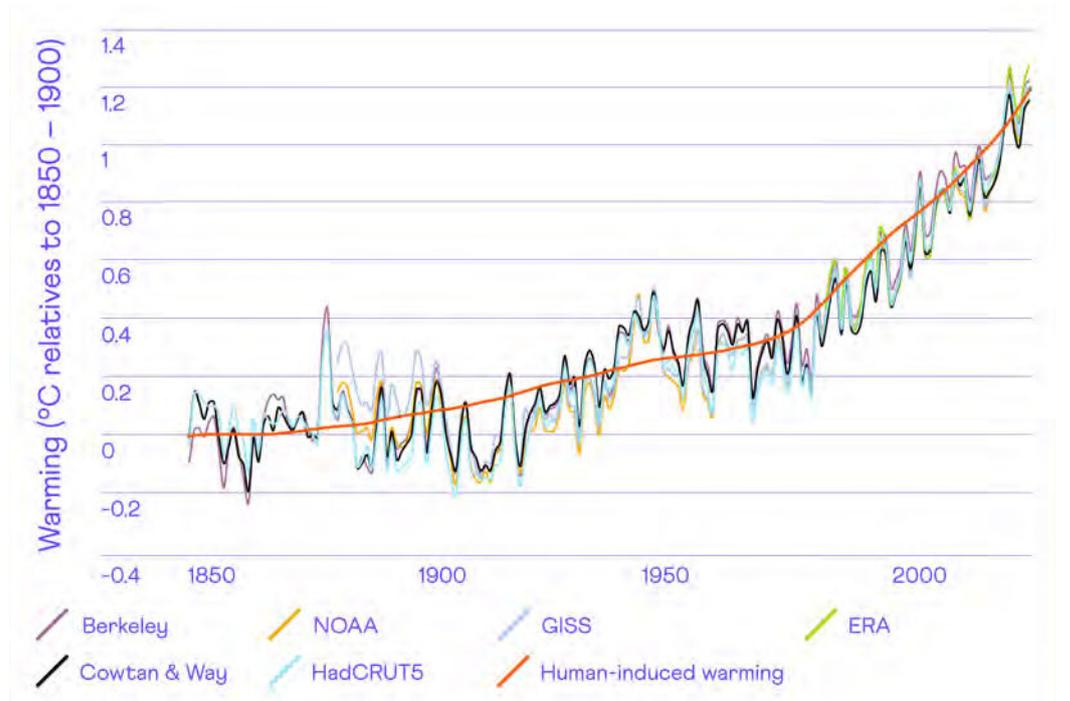

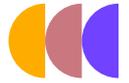

Global temperature observations over recent years are fully consistent with those expected from continuing long-term global warming resulting from human activity:

- Annual global mean surface temperature in 2020 was the joint warmest or second warmest on record across all prominent global temperature datasets (Figure 1.1). 2020 global temperature was similar to that in 2016, in which global temperature was boosted by a very strong El Niño. The six most recent years were the six warmest years globally in the observational record.
- Estimated human-induced warming has now reached around 1.2°C above 1850-1900 (an approximation for preindustrial levels). Human-induced warming is estimated to explain 100% ( $\pm 20\%$  uncertainty) of the observed warming since 1850 – 1900.
- Human-induced warming is increasing at around 0.25°C per decade leading to further increases in global and UK climate hazards in the future. At this present rate of increase, human-induced warming would exceed 1.5°C above preindustrial levels (the lowest level referred to in the Paris Agreement long-term temperature goal) by the early 2030s.

COVID-19 related impacts on emissions will not have a long-term effect on climate risks.

In 2020 the impact of measures to address the COVID-19 pandemic on global energy demand caused global annual energy-related CO<sub>2</sub> emissions to fall by around 6% relative to 2019 levels.<sup>1</sup> Global emissions rates have since recovered to be closer to 2019 levels. This temporary fall in global CO<sub>2</sub> emissions did not significantly affect atmospheric CO<sub>2</sub> concentrations, global temperature or climate impacts, as these are primarily determined by cumulative global CO<sub>2</sub> emissions over time. Changes in the global climate, and climate hazards, will continue until global emissions fall to close to zero.

Figure 1.1 Global average surface air temperature change

Source: CCC analysis

Notes: Each thin line represents a different global temperature dataset. The NOAA, GISS and ERA datasets are expressed relative to 1850 - 1900 using the offset over the 1981-2000 period from the HadCRUT5 dataset. Human-induced warming is taken from [globalwarmingindex.org](http://globalwarmingindex.org).

## Observed climate change in the UK

Changes in aspects of the UK's weather and climate are already being seen.

The latest observations of UK weather and climate continue to document several clear recent trends<sup>2</sup> in aspects of UK climate (Figure 1.2):

- **Warmer average temperature.** The UK's annual average temperature has risen by around 0.6°C above the average of the 1981 - 2000 period, consistent with a trend of nearly 0.3°C per decade since the 1980s. Human-induced climate change in the UK is estimated to have raised UK average temperature above preindustrial levels by a similar amount to the global average.
- **Higher average sea levels.** The level of the seas around the UK has risen by around 6.5 cm since 1981 - 2000. They are currently estimated to be rising at around 2.5 cm per decade.\*
- **Changed temperature extremes.** The shifting UK climate is having a clear effect on observed temperature extremes.<sup>3</sup>

\* Based on a linear trend over the past 20 years.

- The warmest temperature recorded each year has increased over time. Averaged across the UK, the warmest temperature of the year has increased to around 27°C today from around 25°C in the 1960s, with much more rapid rates of increase in the South East of England. The average duration of heatwaves (periods in which there are more than three days in excess of 25°C) has increased over time. For the UK as a whole, summers as hot as in 2018 (the joint warmest summer on record) are expected to occur in up to 25% of years, compared to less than 10% of years a few decades ago.
- The coldest temperature of the year has also increased over time. Averaged across the UK, the coldest temperature of the year is now around -7.5°C today. In the 1960s it was around -9°C.
- The number of icing days (days in which the maximum temperature remains below 0°C) across the UK was around six per year in the 1960s but has fallen to around three per year today. Individual years with a significantly greater number of icing days remains possible, such as in 2010.
- **Sunshine.** The most recent decade has been the sunniest on record in the UK (around 5% sunnier than over 1981 - 2000, with increases largely confined to winter and spring), however the causal link between this trend and human-induced climate change currently remains under investigation, with possible links to changes in aerosol emissions.<sup>4</sup>

In some aspects of the UK's weather and climate clear signals of global climate change have yet to emerge.

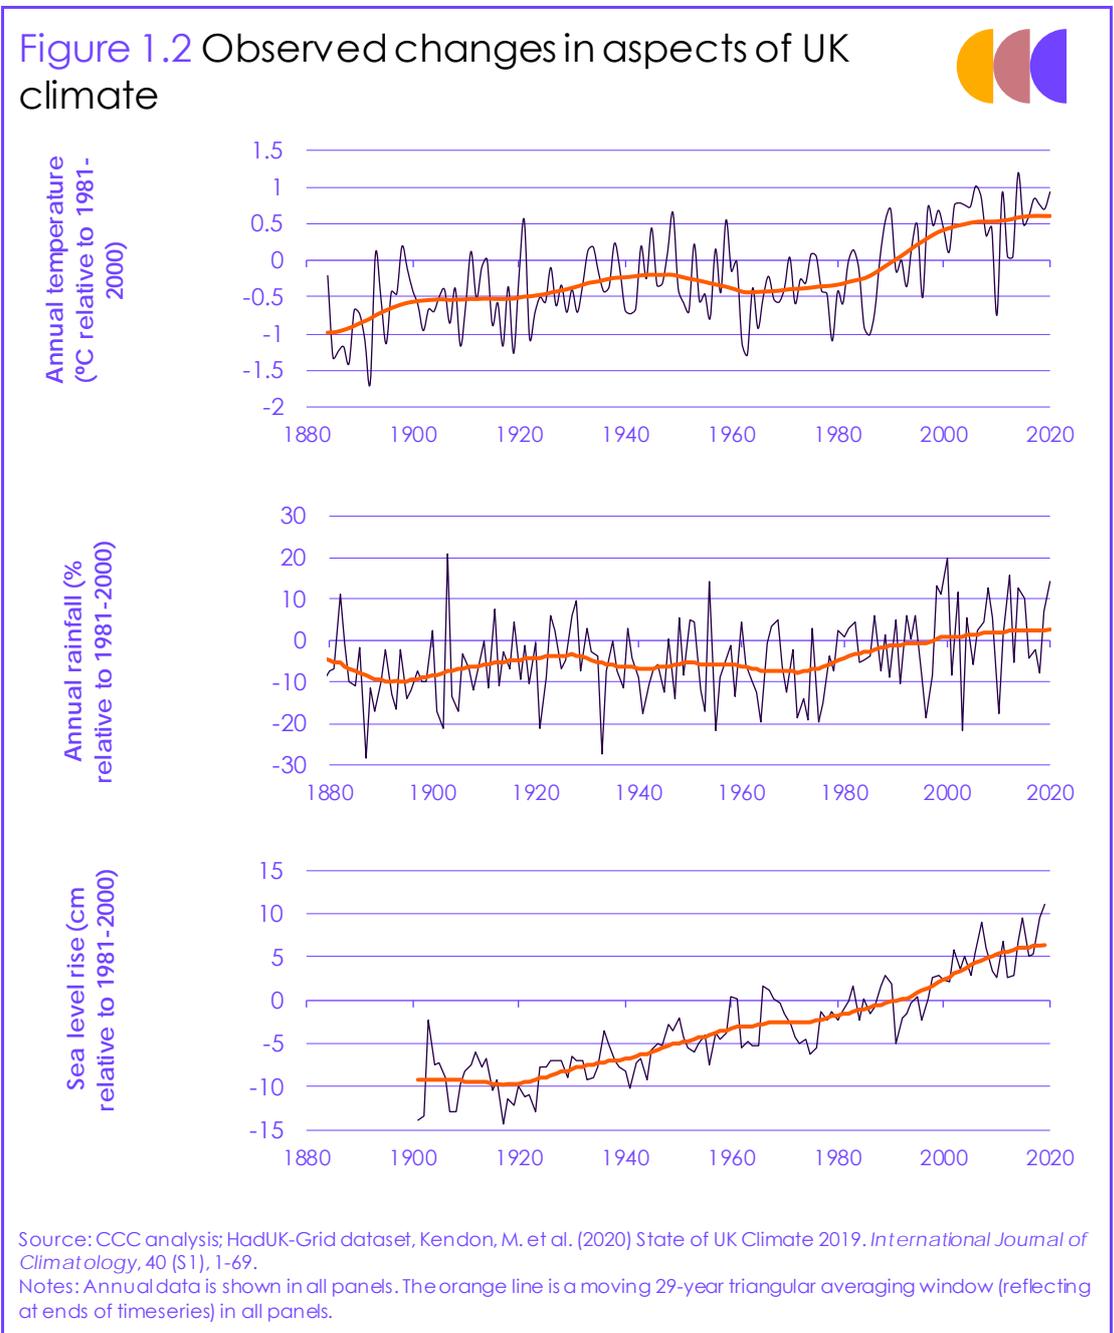

Signals of climate change may be emerging in other climate variables, but the strong annual and decadal variability in the UK's weather and climate still prevents their clear detection despite this being possible in other regions of the world:

- **Annual and seasonal precipitation.** Since the 1980s there has been an overall increase in the annual average amount of UK rainfall. The most recent decade was around 3% wetter than over 1981 - 2000, but interannual variability remains strong with both significantly wetter and drier years being observed. Western Scotland is the part of the UK with the most statistically significant trends to wetter years.<sup>5</sup> For the UK, winter and spring shows trends to being wetter and drier respectively, consistent with expected long-term trends due to climate change, but the statistical significance of these trends remains limited. The recent run of wet summers means that summers over the last decade have been around 20% wetter than over 1981 - 2000, despite projections for drier summers on average in the future. This highlights the continued impacts that annual and decadal variability have on near-term changes in some aspects of the UK's weather and climate.
- **Precipitation extremes.** Heavy rainfall metrics generally show an increase in very wet days across the UK, but the expected signal from climate change remains hard to distinguish from the large interannual variability in the observational record. Extreme event attribution studies have found robust signals that human-induced climate change has increased the likelihood of some observed UK precipitation extremes.<sup>6</sup>
- **Storminess.** Storms can bring heavy rainfall and strong winds to the UK (particularly in winter), with risks of flooding and wind damage.

There are no clear trends in UK storminess over the observed record.\* As UK storminess is strongly linked to the Jetstream improving understanding of how Jetstream variability may change in the future is an important area of research to better understand future UK climate hazards.†

Further changes in aspects of the UK's climate are expected.

The absence of clearly distinguishable observed trends in these aspects of UK weather and climate does not mean that there is no effect of climate change. For many variables (e.g. rainfall) there are good physical reasons to expect human-induced global warming to drive changes. Detectable changes in other aspects of UK climate are expected to emerge from natural climate variability as human-induced global warming continues to increase.

\* Storminess is here defined in terms of maximum wind gust speed.

† Evidence from the latest generation of climate models produced by the UK Met Office, which have improved representation of Jetstream variability, suggests a possible shift to more stormy winters on average in the future.

In the UK the year 2020 was the third warmest year on record and the fifth wettest. There were several notable extreme weather events in the UK over 2020, some of which have been demonstrated to have been made more likely by human-induced climate change (Box 1.1).

### Box 1.1

#### Extreme weather and climate events in the UK during 2020

Extreme weather and climate events occurred throughout 2020, across a range of different climate variables. Research over the last year has helped to provide insights into the relative role of human-induced climate change and natural climate variability as drivers:

- **Rainfall and storms in February.** A series of storms crossing the UK made February more than twice as wet as would be expected on average. This was the wettest February on record and the fifth wettest month ever recorded. This contributed to extensive flooding, particularly across Northern England and Wales, with peak flow rates recorded on many rivers.
- **Record sunshine in spring.** Following the wet end to the winter, the spring was exceptionally dry and sunny. Overall, the spring was the UK's sunniest spring on record (sunnier than most UK summers) and May was the driest May on record for England. This was largely driven by stable conditions in the North Atlantic Jetstream that brought repeated periods of high pressure over the UK. The spring sunshine in 2020 would still be a very sunny spring by the end of the century under all plausible future scenarios for global greenhouse gas emissions.
- **Heatwaves in August.** August saw a long-lasting heatwave affecting (primarily) southern England. Night-time temperatures were particularly affected with temperatures remaining above 20°C at some location in the UK for five nights. This heatwave was linked to a rise in the death rate above the average rate for the time of year. Summer heatwaves are becoming more common and hotter in the UK.
- **Record daily rainfall in October.** October saw the UK's wettest day on record. Robust trends in the UK's wettest day of the year have not yet emerged in the observational record, but a trend towards more intense rainfall extremes is expected as the atmosphere holds more water when it is warmer.

These events highlight that the combination of rare instances of natural climate variability and the background of continued human-induced climate change can combine to create highly unprecedented weather and climate events in today's climate. This emphasises the value of preparing for unprecedented climate impacts today, not just in the future, and that climate variability will remain a key driver of UK climate impacts in the future under all future climate scenarios.

## Projected changes in UK climate and weather

The Committee recently published its advice on the Third UK Climate Change Risk Assessment (CCRA3). This advice, supported by an extensive Technical Report, provides a detailed assessment of the changes in UK weather and climate that might be expected in the future.

The changes in UK weather and climate expected out to 2050 are:

- **Warmer and wetter winters.** By 2050 the UK's average winter could be around 1°C warmer (0.5°C cooler – 2.5°C warmer uncertainty range) than it was on average over 1981-2000 and around 5% wetter (10% drier – 20%

Further changes are expected in UK weather and climate over the next few decades.

wetter uncertainty range). An increase in both the intensity of winter rainfall and the number of wet days is expected.

- **Drier and hotter summers.** By 2050 the UK's average summer could be around 1.5°C warmer (0°C – 3°C uncertainty range) than it was on average over 1981-2000 and around 10% drier (30% drier – 5% wetter uncertainty range). A summer as hot as in 2018 (the joint hottest summer on record) for the UK as whole could be normal summer conditions by 2050. The temperature of the hottest days each year are expected to increase more than the average summer temperature increase. The intensity of summer rainfall (when it occurs) is expected to increase.
- **Continued sea-level rises.** The seas around the UK will continue to rise over the three decades to 2050. By 2050 sea levels could be around 10 – 30 cm higher than over 1981-2000, depending on the specific location in the UK.\*

These additional changes in the UK's climate to 2050 are largely insensitive to the pathway of global greenhouse gas (GHG) emissions over coming decades.

Beyond mid-century, the different possible future trajectories in global GHG emissions become the main source of uncertainty in global and UK climate changes. If global emissions continue at a high level through to mid-century and beyond, global temperature will continue to rise beyond 2050 and associated climate changes in the UK and elsewhere will continue in the second half of the century. If, however, global emissions have been significantly reduced by mid-century and are brought to Net Zero soon after, then many aspects of global and UK climate in the second half of the century can be kept close to that experienced at mid-century.†

Long-term UK climate risks therefore depend on both the ambition and implementation of global emissions reductions:

- Recent trends in costs of key technologies (e.g. renewable electricity) are helping the world move away from the futures with ever increasing global emissions. This means that exceeding 4°C of warming above preindustrial levels by 2100 is no longer the most likely estimate of current climate trajectory outcomes.
- Current ambition for global emissions reduction is expected to be consistent with a central estimate of around 3°C of warming above preindustrial levels by 2100.<sup>7</sup> Climate response uncertainty means that exceeding 4°C by 2100 (or keeping warming below 2°C) remains within the envelope of possibilities and cannot yet be ruled out as a possible outcome.
- Recent commitments to achieve Net Zero emissions by large emitters (including China and the USA) by around mid-century would, if delivered, move the central estimate for 2100 warming close to keeping below 2°C above preindustrial levels. There would remain a non-negligible chance of warming exceeding 2°C even if this scenario for global emissions were delivered.

\* Range (in 50<sup>th</sup> percentile) outcomes across UK capital cities is given here. Climate uncertainties means that changes could range from 30 – 40 cm above 1981 – 2000 levels across capital cities under a high climate response (95<sup>th</sup> percentile).

† Some aspects of the climate (e.g. sea level) will continue to change in the second half of the century regardless of global emissions trajectories continuing to increase hazards such as coastal flooding.

In the long-term, UK climate changes depend strongly on efforts to reduce global greenhouse gas emissions.

Keeping central estimates of warming 'well-below' 2°C, the Paris Agreement long-term temperature goal, would require significant strengthening of near-term commitments to emissions reductions by 2030 in addition to reaching Net Zero around mid-century.

It remains prudent to plan for a range of possible longer-term climate outcomes given the uncertainty in both the climate response and future trajectories of global GHG emissions when considering UK climate risks in the second half of the century.

## 1.2 The CCC adaptation assessment framework

### Purpose of this report

**This is the Adaptation Committee's second assessment of progress in delivering the current National Adaptation Programme, required under the UK Climate Change Act (2008).**

The UK Climate Act requires the CCC's Adaptation Committee to report on progress in adapting to climate change through the National Adaptation Programme, covering England and reserved matters, every two years. The Committee's first assessment in 2019 of the latest National Adaptation Programme (NAP2, published in 2018), considered how the National Adaptation Programme and other actions were changing vulnerability and exposure to climate risks in England.<sup>8</sup> That report concluded that:

- On the basis of the evidence available, England is not prepared for even a best-case scenario of a 1.5 - 2°C rise in global temperature (see above), let alone more extreme levels of warming that remain likely on the basis of current pledges to reduce greenhouse gas emissions.
- The National Adaptation Programme does not address all the risks and opportunities set out in the second UK Climate Change Risk Assessment (CCRA) in 2017, despite this being a requirement of the UK Climate Change Act.
- The institutional and support framework for adaptation in England has been eroded over the past ten years.
- Vulnerability and exposure to climate change continue to increase across a range of sectors that are classed in the CCRA as needing urgent action.
- There are pockets of excellence in adaptation planning and action across England, that need to be supported and scaled up over the next ten years.

The 2019 report concluded that the Government must raise the profile and strengthen governance for adaptation over the coming decade to prepare for the impacts of climate change. The Committee offered 12 recommendations, which the Government responded to in autumn 2019.<sup>9</sup> A further set of recommendations on adaptation was also included in the CCC's subsequent Mitigation Progress Report in 2020, to which the Government also responded.<sup>10,11</sup>

This report re-assesses progress for the same set of 'adaptation priorities' or sectors that were covered in 2019. Each chapter considers changes in relevant policy, and shows updated indicators of vulnerability, exposure, adaptation action and impact. We have provided an updated set of conclusions in the Executive Summary.

## The CCC's assessment framework and structure of this report

### The Adaptation Committee revised its assessment framework for its 2019 Progress Report, and we use the same framework here.

The 2019 report explains in detail the rationale and context for the assessment framework used by the Committee for adaptation. It is based on two questions:

- **Is there a good quality plan?** The Committee has reviewed whether plans are in place that include adaptation actions to prepare for inevitable change (approximately a 2°C rise in global temperature above pre-industrial levels), and a consideration the risks for that sector in a 4°C scenario. We also assess whether plans are SMART – specific, measurable, attainable, relevant and time-bound. A good plan will have clearly stated outcomes that are appropriate in the context of climate change, have considered the short-term and long-term effects of climate change, have an effective monitoring and evaluation framework and demonstrate clear links between the outcomes and corresponding actions. A weaker plan might have vague or unclear outcomes, make weaker links to the current and future effects of climate change, and may only include guidance but not require specific action.
- **Is progress being made in managing risk?** The Committee assesses indicators of vulnerability, exposure, adaptation action, and climate change impacts to assess how risk is changing, and whether goals remain on track to be met where this is relevant. For this step, we also consider how the actions set out in the National Adaptation Programme, and other relevant actions, are addressing risk. In this context, the Committee has considered to what extent the actions taking place relate to the risks identified in the Climate Change Risk Assessment and whether they are being implemented in accordance with NAP2. The assessment seeks evidence of what impact the actions are having on risk, wherever possible.

For each adaptation priority, an assessment score of high, medium or low is given for plans and managing risk using a set of defined criteria (Table 1.2). Those scores then place each adaptation priority on a 9-box grid.

### Across the chapters, each section includes a progress summary table explaining the differences in plan and risk scores between 2019 and now.

These are included as signposts for the reader. The analysis is then expanded below with a narrative on changes in the plan score, changes in the risk score, and an overall conclusion. The Committee's full set of indicators is provided in an annex to this report, but some of the key indicators that support the scores are highlighted in the chapters.

Recommendations related to each adaptation priority are provided in the relevant places in the text in this report. The complete set of adaptation recommendations is provided, by department, in the Executive Summary.

**Table 1.2**  
Adaptation Committee Assessment Criteria

Score	High	Medium	Low
<b>Plan Score</b>	<p><b>Good quality plan:</b></p> <p>Considers climate change, including a range of scenarios (adaptation planning for inevitable change i.e. a 2°C scenario, consideration of risks for a 4°C scenario)</p> <p><b>Sets out specific action – not just guidance</b></p> <p>SMART – specific, measurable goals with timescales</p> <p>Has effective monitoring and evaluation built in</p> <p>Can see links from the plan down to the actions</p> <p>Plans up to date</p>	<p><b>Medium quality plan:</b></p> <p>Considers climate change, though possibly vague on what scenarios are included</p> <p><b>Requires general action – not just guidance</b></p> <p>Some aspects of being SMART</p> <p>Some monitoring and evaluation</p> <p>Some links to action</p>	<p><b>Low quality plan:</b></p> <p><b>Minimal or no consideration of climate change</b></p> <p><b>No firm actions, not SMART</b></p> <p>No monitoring and evaluation</p> <p>No firm link through to actions</p> <p>Plans not up to date</p>
<b>Risk Management Score</b>	<p><b>Evidence that risk (vulnerability and exposure) is reducing at an appropriate rate, and/or is in line to meet goals</b></p> <p><b>Good evidence of impact of actions on risks</b></p>	<p><b>Mixed picture – some evidence of risk being managed, but other areas where progress is lacking</b></p> <p><b>Some evidence of impact of actions on risks</b></p>	<p><b>Evidence that risk is not reducing or is increasing, or lack of evidence to judge what is happening to risk</b></p> <p><b>No evidence that actions are having an impact on risk</b></p>

Source: Bold criteria are considered as key to that score; other criteria are also assessed but are of lesser importance.

International climate risks are important for a full understand of the possible impacts of climate change in the UK and actions to avoid them.

**The National Adaptation Programme does not include any actions on addressing the risks to the UK from climate change overseas. We include a joint section on international dimensions of risk in our accompanying mitigation Progress Report.** Both the CCRA2 Evidence Report and the recently published CCRA3 Evidence Report consider how international climate risks would directly and indirectly impact the UK. The elements of international risks that are especially relevant to the UK, identified by CCRA2 (and so relevant for NAP2), fall into the following categories: (1) global trade and supply chains, especially for food; (2) migration and displacement; and (3) broader geopolitical and macroeconomic issues. There are also risks specific to particular Government departments, such as risks to overseas military operations.

In particular, the CCRA2 Evidence Report assessed that extreme weather events have the potential to affect global food production, trade and supply chains, making prices more volatile and/or altering productivity in the long-term. Furthermore, weather-related events were identified as potential drivers of increased international human displacement with subsequent impacts on overseas development efforts. These risks were assigned to the ‘more action needed’ category.

However, the formal NAP2 actions do not cover any of the international risks from CCRA2. We have not, therefore, included an International Dimensions chapter in this Progress Report as there are no NAP actions against which to assess progress. A summary of our latest assessment of the importance of international dimensions of risk is provided in a joint section considering mitigation and adaptation in the accompanying report to this one on reducing UK emissions.

## Adaptation indicators

Better indicators and data are needed to understand more clearly the effectiveness of adaptation actions.

Measurement is fundamental to understanding if adaptation is working. Relevant measurement indicators are needed which effectively monitor progress in reducing climate change risk and show the effectiveness of different adaptation responses.

### **Current indicators for measuring progress and the effectiveness of adaptation actions are inadequate.**

Most currently available indicators measure progress towards policy targets or legal requirements. They are not necessarily aligned with the measurements needed to identify tangible reductions in climate risk or improvement of resilience. For example, for the natural environment sector, peatland condition and species abundance indicators can be used as proxy indicators for the vulnerability of the habitat to climate change; better condition and higher abundance can be interpreted as higher resilience. However, they do not confidently link how restoration activities can improve resilience of peatland and its services to reduce specific climate impacts. In addition, such indicators are only available for protected sites, not all peatlands.

By improving the ability to monitor the impact of adaptation interventions, the Government can plan more effective and cost-efficient adaptation actions. However, without appropriate indicators it is not possible to accurately determine whether sufficient funding is allocated towards the right actions in the right places. This is vital if the Government is to achieve its long-term policy aims, including delivering Defra's Environmental Land Management scheme outcomes, the 25-year Environment Plan (25 YEP) goals, and the objectives outlined in the Flood and Coastal Erosion Risk Management (FCERM) strategy.

As more countries are expected to come forward with National Adaptation Plans or Adaptation Communications in advance of COP26, attention will turn to measuring progress against these commitments. There is a window of opportunity for the Government to drive improvements in measuring progress on adaptation.

### **The Committee has reviewed its previous indicator framework following the 2019 Progress Report and identified key gaps.**

As part of its biennial review of progress in adapting to climate change in England, the Committee collects indicators to assess trends in risk factors: hazard, vulnerability and exposure. We also collect indicators to assess trends in adaptation actions, and climate impacts.

In order to assess the suitability of existing adaptation indicators with the increasing challenge of measuring adaptation progress, the Committee has conducted work to align its existing adaptation indicator framework with a theory of change (ToC) approach. A ToC is a methodology that helps establish links between inputs, outputs, outcomes and impacts. These can be defined as: inputs - specific actions implemented to bring about outputs or outcomes (e.g. funding levels, capacity building activities); outputs - products or events produced that result from the

completion of adaptation actions (e.g. area of peatland restored, energy efficient boilers installed in homes); outcomes – an intermediate prerequisite for meeting the Government’s overarching policy goals (e.g. meeting good ecological status benchmarks for water bodies); impacts – the contribution of outcomes to the achievement of goals that can be attributed to a particular intervention. (e.g. change in the number of properties flooded each year resulting from increased expenditure on flood risk management).

**A review of the Committee’s current set of adaptation indicators has identified significant gaps.**

The Committee’s work has included a rapid review of existing indicators against this ToC framework and producing an indicator wish-list for all sectors (see accompanying standalone annex to this report for more details). The results from the review show a high proportion of indicators within the Committee’s adaptation indicator framework measure the level of inputs to and outputs from given adaptation activities, however, there is a gap in metrics to measure progress towards outcomes (i.e. the effectiveness of adaptation actions). Furthermore, many indicators within the current set were originally designed for other purposes, and not to measure changes in risk vulnerability, so they can therefore be used only as proxy indicators at best.

The exercise has enabled the Committee to identify areas where the assessment process would benefit from future work to design and populate additional adaptation indicators. These include:

- **Natural environment** – a shortage of impact indicators that enable the assessment of: a) the effectiveness of adaptation actions in reducing climate risk; and b) changes in the natural environment that can be directly attributable to climate change.
- **People and the built environment** – a significant lack of data on sewer capacity and sustainable urban drainage (SuDS) uptake which makes it difficult to assess progress in surface water flood alleviation; and lack of monitoring of internal temperatures in homes and other buildings.
- **Infrastructure** – indicators that enable the assessment of impacts from disruption due to severe weather events on key infrastructure; indicators on the condition of slopes and embankments supporting the strategic and local road network; data on interdependent risks and resilience actions by infrastructure providers; data on the extent to which climate risk is being considered in the design and location of new infrastructure.
- **Business** – many of the current set of indicators are based on self-reported or survey evidence which may not be representative for businesses of different sizes or sectors; a shortage of impact indicators that enable a consistent assessment of the effectiveness of adaptation interventions over time.

**Defra should bring together relevant stakeholders to share data and knowledge.**

There are many UK organisations who recognise the challenges of measuring adaptation progress and are in the process of developing indicators. For example, within government, Defra is developing a range of adaptation metrics within its 25-YEP indicators framework, while the Environment Agency is exploring the design and use of indicators to measure progress towards the adaptation objectives set out in its FCERM strategy.

The CCC has been approached by the Interim Environmental Governance Secretariat to provide guidance around the adaptation indicators required for the proposed Office for Environmental Projection (OEP) to conduct its independent scrutiny of the Government's progress towards meeting the 25-YEP goals. Following a special interest group workshop, the British Ecological Society (BES) is also coordinating the production of a peer-reviewed manuscript investigating how a suite of indicators may be developed to track the effectiveness of adaptations actions in the natural environment, within a monitoring and evaluation framework.

Defra should consider how it can help to streamline these various processes and requirements, and bring together the different expertise available on developing and populating indicators.

**There is an urgent need for Government to fund work to develop new indicators to support the comprehensive assessment of adaptation progress.**

The next six months, in the run up to COP 26, would be a key time for the CCC to lead this work if requested by Government. In addition to a comprehensive framework for adaptation indicators, alignment of indicators across organisations and sectors will require coordination. The Committee is well placed to play a key role in harmonising indicators currently in development, drawing on expertise from different sectors and ensuring a consistent approach across organisations.

The CCC would work together with Defra, the Office for Environmental Protection, the Environment Agency, MHCLG, the British Ecological Society and others to identify, develop and source data for new indicators, create a framework for using them and coordinate ongoing work to ensure indicators remain appropriate and relevant. There is also a role for the Chief Scientific Advisers to coordinate action across all Government departments and to consider how to better resource monitoring and evaluation.

## Natural Environment

2.1 Introduction	55
2.2 Terrestrial habitats and species	58
2.3 Farmland habitats and species	70
2.4 Freshwater habitats and species	75
2.5 Coastal and marine habitats and species	82
2.6 Commercial forestry	92
2.7 Agricultural productivity	98
2.8 Water management	103
2.9 Commercial fisheries and aquaculture	106

## 2.1 Introduction

**This chapter considers progress in adapting the natural environment to climate change including both natural capital assets, and the ecosystem services they provide.**

The structure of this chapter follows the Natural environment and natural assets chapter in the Evidence Report for the 2021 UK Climate Change Risk Assessment. Its focus is the protection of the natural environment and goods and services that are provided directly from land, water and sea. Some of these services are covered in other chapters. For example, the business chapter covers a range of other provisioning services (minerals, energy); flood regulatory services are also covered in the infrastructure chapter; while water appears in several chapters across the report. Supporting services such as biodiversity and soil quality cut across all priorities so are not separately identified. Cultural services are not included in this discussion. The natural environment priorities covered in this chapter and their place in a natural capital framework are set out in Table 2.1.

**Table 2.1**  
Natural environment chapter priorities

Natural capital assets including biodiversity	Regulating services	Provisioning services
Terrestrial habitats and species Farmland habitats and species Freshwater habitats and species Marine and coastal habitats and species	Water management	Agricultural productivity Commercial forestry Commercial fisheries and aquaculture

Source: CCRA3 Technical Report

**The natural environment is critical for adaptation because all other sectors ultimately depend upon it.**

Many of the services that the natural environment provides not only underpin human well-being and economic activity, but are also key to societal resilience to climate change. They support livelihoods and economies, help to moderate the climate itself, and offer protection from climate-related impacts such as storms, landslides and flooding. This was recognised in the UK National Ecosystem Assessment<sup>1</sup>, which noted that appreciation of the full value of ecosystem services requires recognition of values that are shared.<sup>2</sup> For instance, the annual non-market benefits (e.g. recreation, carbon sequestration, pollution removal, urban cooling) of UK woodland were found to exceed the market benefits of timber by approximately 12 times.<sup>3</sup>

The type and scale of ecosystem services vary across contexts and scales. Provisioning services deliver resources (e.g. food, fibre) for economic activities such as agricultural production, fishing, timber and water supply.

Many of the services that the natural environment provides not only underpin human well-being and economic activity, but are also key to societal resilience to climate change.

<sup>1</sup> Estimate should be interpreted as the minimum value of the habitat, as a number of 'non-market' ecosystem services that support the valuation are not currently measured.

At local to catchment scales, ecosystems contribute to regulating water flow and flooding, water quality, soil quality and retention, the spread of pests and diseases, and help to moderate direct climate-related impacts. At the regional to global landscape scales, ecosystems provide climate regulation through carbon sequestration.

Supporting services, such as biodiversity and nutrient cycling, contribute to well-being and resilience by underpinning ecosystem function. Cultural services such as recreation are central to health and human well-being and contribute to economic activities like tourism. The Covid-19 pandemic has increased awareness of the value of cultural services, such as access to the natural environment and the benefits it provides for mental and physical well-being.

There remains only limited evidence of natural capital being considered in Government policy design, incentives for better environmental management and appraisal.

There are a growing number of practical tools that support this approach. For example, the Enabling a Natural Capital Approach (ENCA) online tool<sup>4</sup> provides practical advice, and easy access to data and references to better understand natural capital and how to take it into account. Accounting for natural capital has also influenced the long term thinking behind the 25 Year Environment Plan for England, and other advice from the Natural Capital Committee. However, there remains only limited evidence of natural capital being considered in Government policy design, incentives for better environmental management and appraisal.

### **Integrated, ecosystem-based approaches or nature-based solutions can contribute to adaptation for the natural environment and other sectors.**

Nature-based solutions (NbS) can help build the resilience of the natural environment to climate change impacts through delivering actions to protect, sustainably manage and restore natural or modified ecosystems in both urban and rural areas. For example, green and blue infrastructure are an increasingly important adaptation measure and generate a range of benefits both for wildlife (e.g., through habitat creation) and human health (e.g., reducing the Urban Heat Island effect, providing shading and surface water flood resilience; providing recreational opportunities; as well as potentially improving air quality).

### **Effective planning for Net Zero can also deliver climate change adaptation and wider environmental goals.**

There are both risks and opportunities from the effects of a changing climate for the natural environment and its contribution to Net Zero. It is vital that the impacts of climate change risks on the natural environment and its ability to contribute to mitigation are incorporated in the delivery of mitigation measures. For instance, peatlands are critical for carbon storage and water regulation. If peatlands are not in good condition, they are at much higher risk of degradation and carbon loss as the climate changes, as well as not delivering its other benefits.

It is vital that the impacts of climate change risks on the natural environment and its ability to contribute to mitigation are incorporated in the delivery of mitigation measures.

In addition, mitigation measures such as new tree and hedgerow planting, catchment-sensitive farming and peatland restoration have important benefits for building climate resilience. However, careful planning about species mix, location and management actions is necessary for such measures to deliver planned greenhouse gas removals as the climate changes. The Government must therefore ensure the future local climatic and ecological context is considered when implementing the measures. The changes that are needed will vary across the country because climate change impacts will vary spatially, as well as the quantity and condition of natural capital assets, local needs and demands.

### **The Government should leverage private sector financing to support climate adaptation and resilience activities.**

Government alone will not be able to finance the costs of addressing the adverse impacts of climate change, as well as fund the innovations needed to capitalise on any potential opportunities.

Environmental restoration and management to build climate resilience at the landscape level will result in private benefits as well as public goods. For many of these, specifically in the areas of flood risk management, carbon sequestration and water quality improvements, it is critical to encourage private investment alongside Government funding (e.g. such as through the Environmental Land Management schemes), in order to deliver the scale of transformation in land use and management that is required. Combining public sector funds with private sector capital (blended finance) could offer the potential to scale up the deployment of projects that deliver multiple environmental benefits, including climate change adaptation. The Government's Green Finance Strategy also looks to address this through aligning private sector financial flows with clean, sustainable and resilient economic growth.

However, further work in this area is needed if the scale of the challenges from climate change in England are to be met. The Government should encourage private sector participation in climate change adaptation activities through expanding its portfolio of blended, innovative funds and facilitating risk-sharing.

### **Monitoring the effectiveness of actions in the face of changing climate risks will be vital to assess how the extent and condition of the natural environment and the services it provides change over time.**

Research into developing more sophisticated metrics for the natural environment is urgently needed to help inform on how ecosystems and biodiversity are changing due to climate change, and the components or functions that are most vulnerable to climate change, so that adaptation responses can be better focussed.

Some of the indicators used in this chapter to assess changes in risk and effectiveness of adaptation plans are based around the Lawton principles, established in 2010, for improving the resilience of the natural environment by making habitats 'bigger, better, more numerous and more joined up'. Habitat condition and species abundance (whether impacted by climate change or not) are used as proxy indicators for the vulnerability of biodiversity as a whole, as they give a sense of how 'under pressure' different systems already are. However, this enables only a simplistic assessment of progress. As noted in chapter 1, research into developing more sophisticated metrics for the natural environment is urgently needed to help inform on how ecosystems and biodiversity are changing due to climate change, and the components or functions that are most vulnerable to climate change, so that adaptation responses can be better focussed.

### **There must be no regression in existing environmental protections.**

Any changes to existing environmental regulations must only proceed after consultation with experts such as Natural England and the new Office for Environmental Protection.

Our 2019 report identified a range of legislation designed to help protect the natural environment in England, several of which contain key mechanisms for reducing climate risks. The current lack of a non-regression commitment within the Environment Bill increases the danger of backsliding on environmental standards. The Government has tabled amendments to the Environment Bill to re-focus the habitats regulations to domestic priorities, including new secretary of state powers to amend the existing EU regulations. Ensuring the condition of all conservation areas, the wider countryside and urban environment are maintained is an important adaptation goal as set out in the Lawton Review noted above. Any changes to existing regulations must only proceed after consultation with experts such as Natural England and the new Office for Environmental Protection. Furthermore, to ensure that environmental protections are maintained in the future, the government should reaffirm in law its commitment to international nature conventions.

## 2.2 Terrestrial habitats and species

Progress summary – Terrestrial habitats and species		
2019 score:	What has changed since 2019:	2021 score:
3	<p><b>Plan score: medium</b></p> <ul style="list-style-type: none"> <li>The Government has published England action plans for peat and trees, while a range of other plans are in development (nature, soil health, plant health biosecurity). These should both individually and collectively help improve resilience of terrestrial habitats, but each must include careful consideration of future climate change.</li> <li>The Government has increased spending in biodiversity and climate change, however, it is unclear if funding levels will be sufficient to meet all commitments. Environment Improvements plans (EIPs) mandated under the Environment Bill still need to clearly outline measures to ensure plans meet the 25-year Environment Plan goals. EIPs must integrate climate risks into the delivery of all plan outcomes, and include actions that reduce vulnerability and exposure to climate change.</li> <li>Without statutory interim targets, linked to long-term targets, future EIPs risk becoming aspirational.</li> </ul> <p><b>Risk management score – low</b></p> <ul style="list-style-type: none"> <li>Metrics to monitor the vulnerability of terrestrial habitats and species continue to show slow progress or a decline. The majority of targets set out in the Government's Biodiversity 2020 strategy have not been met, with many falling well short.</li> </ul>	3
<p>Notes: See annex for full datasets            Key Indicators: Terrestrial SSSIs in England, by condition, Peatland SSSIs in England, by condition, Measure of woodland resilience to climate change, Woodland species indices: breeding birds in woodland in England, Number of Wildfire incidents</p>		

This adaptation priority covers semi-natural habitats classed by Natural England as terrestrial - woodlands, grasslands, heath, montane habitats and bogs, which together represent just over a quarter of total land cover in England.\* It excludes enclosed farmland and extensive grassland used for farming, which is covered in section 2.3. We consider trees in terms of woodland habitats here, but their provisioning services in section 2.6.

As with our previous progress reports, we have measured the vulnerability of biodiversity to climate change based on the principles set out in the Lawton Review (2010).† The high-level findings of the review suggested that habitats need to be in good condition, bigger, better and more joined up in order to have a greater chance of allowing the species they support to adapt naturally as the climate changes.

\* Based on ONS UK Natural Capital Land Cover in the UK, 2015. Total semi-natural terrestrial habitats comprise semi-natural grassland; broadleaf and conifer woodland; shrubland, bushland, heathland, barren; and sparsely vegetated areas.

† See a fuller description of the Lawton principles in CCC (2013) *Managing the land in a changing climate*.

We assess progress in adaptation as related to the changing condition and size of the habitats, but condition data is only available for Sites of Special Scientific Interest (SSSIs), which are a small percentage (ca.20%\*) of the overall area of terrestrial habitats covered in this chapter.

## Summary of 2019 report score

### **Terrestrial habitats and species scored a 3 rating in our 2019 report (medium plan score, low risk management score).**

Our 2019 report noted that whilst plans are in place, the measures outlined in them were not specific, with the effectiveness of many actions difficult to assess, especially for climate change adaptation. Furthermore, targets contained in the plans were narrow in scope and did not include all priority terrestrial habitats. There was evidence of actions being taken to restore species, habitats and ecosystems, but most were in the early stages of development.

## Has the plan score changed?

### **No. The plan score remains medium.**

### **It is as yet unclear how risks from climate change and actions to address them will be incorporated into plans for improving the condition of terrestrial habitats and species.**

A new range of separate action plans including those for peat and trees were recently published, or are being developed by Government, which should help build the resilience of terrestrial habitats. However, more detail is needed on how the different strategies will combine to support the Government's climate change adaptation goals.

### **There are several plans for the natural environment that should individually and collectively help to improve the resilience of terrestrial habitats and species.**

Restoration of peatlands, alongside woodland planting, was identified as a priority climate action measure in the CCC's Sixth Carbon Budget report.<sup>5</sup> The Government has now published separate actions plans for peat and trees in England.

#### **England Peat action plan**

Unless addressed in advance, some of the downside risks of climate change could result in irreversible loss of upland peat areas in England.<sup>6</sup>

The England Peat Action Plan reiterates the 25-Year Environment Plan (25-YEP) commitment for all of England's soils to be managed sustainably by 2030. Under the plan, a new Nature for Climate Peatland Grant Scheme (part of a broader £640m Nature for Climate Fund) will support the restoration of 35,000 hectares of degraded peatland in England, backed by over £50 million in funding between 2021 and 2025. While this is a step in the right direction, the scale of restoration targeted relates to only around 5% of total peatland area in England. Of this, 15% of the area restored by 2025 will involve the restoration of lowland agricultural land to peat habitat. It is not clear what the target will be beyond 2025.

\* 20% England figure calculated as semi-natural terrestrial SSSIs published by Natural England (<https://designatedsites.naturalengland.org.uk/NEInterimReports/ConditionByHabitat.aspx>) as a proportion of the total area of semi-natural habitats published in ONS UK Natural Capital Land Cover in the UK, 2015.

As outlined in the Plan, the sale of peat in compost for the amateur horticultural market will be banned in England by 2024, subject to a consultation later in 2021 on a range of legislative measures to achieve this. The consultation will also consider the ban on peat for the professional market. There are no new actions in relation to ending peat extraction in England. The Plan also does not contain any new actions to prevent the rotational burning of upland peat areas, in addition to the partial ban legislated with effect in 1st May 2021, which relates only to certain protected blanket bog sites. However, the government will keep under review the environmental and economic case for extending the approach to additional areas of blanket bog after assessing how the new regime works in practice (see below).

#### Recommendation (see CCC 2021 Joint Progress Report)

Extend current ambition set out by the UK government and the devolved administrations to implement a comprehensive delivery mechanism to address degraded peatland (hectares given are for the UK):

- 17% of upland peat is restored, equivalent to 200,000 hectares (and where this is not possible, stabilise the peat) by 2025; 58% by 2035 (700,000 hectares) and the remaining area by 2045;
- Rewet and sustainably manage 12% of lowland peat used for crops by 2025 (24,000 hectares), rising to 38% by 2035 (72,000 hectares);
- Rewet 8% of lowland grassland area by 2025 (18,000 hectares), rising to 25% by 2035 (54,000 hectares);
- Remove all low-productive trees of less than YC8 off peatland (equivalent to 16,000 hectares by 2025), and restore all peat extraction sites by 2035 (equivalent to 50,000 hectares by 2025).

Department: Defra, Timing: 2021-2025

#### Soil Health action plan

To help achieve the Government's commitment for all of England's soils to be managed sustainably by 2030, Defra are considering the potential scope for a soil health action plan as an appropriate means of supporting land managers and farmers. While broader in scope, since it will cover all soils in England, the draft Plan would be complementary to the England Peat Action Plan.

The draft plan will include developing and implementing a number of actions that support sustainable soil management and implementing new measuring and monitoring schemes for soil health. For example, the Sustainable Farming Incentive (SFI) will support sustainable approaches to farm husbandry to deliver for the environment. Plans also include developing a new Soil Health Monitoring Scheme (SHMS) for England to produce a new robust data baseline. A healthy soils indicator will be developed to feed into the SHMS and will inform a future target for soil health under the Environment Bill. Separately, a new Soil Structure Measuring and Monitoring Scheme is being developed to enable visual assessments to be carried out by farmers and land managers across all land use/soil types.

#### England Tree action plan

The CCC's land use report (2018) showed that woodland planting is a key measure for improving climate resilience; though much depends on ensuring that the right species are planted in the right location to ensure the delivery of multiple ecosystem services, in addition to carbon sequestration and storage.

Under the England Tree Action Plan, the Government will spend over £500 million of the £640 million Nature for Climate Fund on trees and woodlands between 2020 and 2025. The funding will support a trebling of current woodland creation rates, equating to ca. 7,000 ha per annum out to 2025. According to the Forestry Commission, this is broadly consistent with the Government's aspiration to increase woodland cover in England from 10% presently to 12% of total land area by 2060, but the expansion rate would need to be maintained to mid-century. Woodland expansion will include conventional planting in urban and rural areas (including trees on farms), as well as natural colonisation. To incentivise more biodiverse woodlands, higher payment rates will be offered to landowners creating predominantly native broadleaf woodland. Under the Woodland Creation Offer grant, a range of ecosystem services provided by woodlands will be recognised, and extra funding will be provided for planting that can deliver wider benefits such as riparian shading, biodiversity, water filtration and flood risk alleviation (see section 2.6).

The Government's new Environmental Land Management schemes will provide the main mechanism for publicly funded woodland creation after 2024. Work is being undertaken by Defra to determine the specific actions the ELM schemes will pay for, and quantify their contribution to climate adaptation. It is understood this work is being informed by detailed modelling, which will also test the resilience of these actions to climate uncertainty (see section 2.3).

### Plant Biosecurity Strategy

The 25-YEP includes a commitment to revise the 2014 Plant Health Biosecurity Strategy, which will set out the strategic framework to protect plant health in order to protect natural capital in England from invasive non-native species. The strategy was delayed due to the national election in 2019 and Covid-19 pressures, with plans now for it to be published in Autumn 2021.<sup>7</sup>

### Nature Strategy

The Government committed to a strategy for nature in England to implement commitments under the Convention on Biological Diversity (CBD). Government has already announced key elements of its strategy (e.g. on targets, legislative reform and new funding for nature based solutions) and will continue to develop its approach, including developing legally the binding biodiversity targets (see below) and updating its plans and strategies in response to the 15th Conference of the Parties to the CBD in October of this year.

### **An overarching 'wrapper strategy' would be useful to clearly outline the relationships and interactions between the multiple action plans both published and in development for the natural environment.**

This wrapper strategy should set out how the different strategies listed above will interact and combine to support meeting the Government's climate change adaptation goals, alongside broader objectives for the natural environment.

An overarching 'wrapper strategy' would be useful to clearly outline the relationships and interactions between the Government's various new action plans for the natural environment.

### Recommendation

Publish an overarching strategy that clearly outlines the relationships and interactions between the multiple action plans either published or in development for the natural environment, including those for peat, soil health, trees, nature and plant biosecurity. This must clearly outline how the different strategies will combine to support the Government's climate change adaptation goals.

Department: Defra, Timing: 2021.

**The Nature Recovery Network (NRN) is a key Government policy that will underpin the Nature strategy.**

As outlined in the 25-YEP, the NRN will aim to deliver on the recommendations of the Lawton Report that recovering biodiversity will require habitats in better condition; in bigger patches and that are more closely connected. Goals for the NRN set out in the 25-YEP include restoring 75% of terrestrial (and freshwater) protected sites to favourable condition, and creating or restoring 500,000 hectares of wildlife-rich habitat outside the protected site network, focusing on priority habitats. However, as noted in our 2019 progress report, in its current form, the 75% restoration target falls well short of the recognition in the Government's response to the CCC's 2017 report\* that much wider action is needed, in that it only applies to terrestrial protected sites. As noted above, protected sites cover only around one-fifth of the total area of semi-natural terrestrial habitats - the target should be extended to include all priority terrestrial sites.

Natural England is leading work to explore how climate change considerations can be incorporated into the NRN's design, both spatially and as a core principle. A NAP ecosystems and biodiversity group has been established to support this, which includes major landowners such as CLA, RSPB and National Trust. The group is used as a platform to discuss with a wider group of partners, issues including potential impacts under 2°C and 4°C degree global temperature scenarios.

**Recommendation**

Defra must extend its commitments outlined in the 25-Year Environment Plan. The commitment to achieve 75% restoration for terrestrial and freshwater protected sites should be extended to include all priority habitat sites.

Department: Defra, Timing: 2021.

**Legislation has been introduced to prevent the rotational burning of certain blanket bog sites in England with immediate effect.**

The partial ban applies only to protected sites† that are also a Special Area of Conservation or a Special Protection Area covering a total area of around 142,000 hectares, representing around 40% of all blanket bog in England. The England Peat Action Plan notes that the Government will continue to review the environmental and economic case for extending the approach to additional areas of blanket bog after assessing how the new regime works in practice. However, this ban is less ambitious than the recommendation set out in the CCC's Sixth Carbon Budget Advice<sup>8</sup> that all rotational burning in England should cease immediately.

**Recommendation (see CCC 2021 Joint Progress Report)**

Introduce legislation to extend the ban on rotational burning of peat from certain protected upland bog sites to all peatland before the start of the burn season in 2021; end peat extraction, and ban its sale for all horticultural uses including in the professional sectors and apply this to imports by 2023; mandate water companies to restore peatland under their ownership; and ensure lowland peat soils are not left bare.

Department: Defra, Timing: 2021-2023

\* In its response to recommendation 6 of the CCC's 2017 report to parliament, the Government recognised the need for action to be 'taken to enhance the condition of priority habitats and the abundance and range of priority species, both on protected sites and in the wider countryside'.

† Also referred to as Sites of Specific Scientific Interest (SSSIs)

### **Natural England and the RSPB have updated their joint Climate Change Adaptation Manual.**

The manual is a resource to support practical and pragmatic decision-making, by bringing together recent science, experience and case studies, and is intended to be an accessible entry point to a range of available resources and tools. Climate impacts and associated adaptation actions are presented by habitat. The guidance emphasises the importance of considering 2°C and 4°C warming scenarios.

### **Environment Improvements Plans (EIPs) mandated under the Environment Bill will need to clearly outline measures to ensure they meet Defra's 25-year environment plan goals.**

Delivering significant improvements across the whole of the natural environment is vital to building the ecosystem resilience required to adapt to climate change. The Environment Bill creates a new statutory cycle of monitoring, planning and reporting progress, including a duty on the Government to prepare rolling Environmental Improvement Plans (EIPs)\* and set requirements for what the plans must contain. The EIPs are necessary to provide the comprehensive and long-term vision that will guide legislation and policy to deliver better protection and enhancement of the natural environment.

However, the EIPs need to be strengthened to ensure that they include time bound, specific measures, which are more explicitly linked to the delivery of the environmental outcomes outlined in the 25-YEP. Furthermore, adaptation is a necessary pre-requisite to meeting the 25-YEP goals, because climate change will prevent the goals from being met without additional adaptation.<sup>9</sup> It is vital that climate change risks are considered in the delivery of all outcomes, and actions that reduce vulnerability and exposure to climate change must also be clearly identified and incorporated into the EIPs.

### **The government has committed to increase the amount of protected land in the UK to 30% by 2030.**

The Government has suggested that 26% of land in England is already protected for nature. However, the majority of this area is not specifically designated for nature's protection. Even where there are environmental designations in place, many are poorly-managed sites that are not in a good condition for nature and have not been regularly monitored.<sup>10</sup> This suggests significantly more resources will be required than that currently estimated by Government if the target is to be delivered effectively. To help achieve the 30% commitment, all sites contributing to the target must be monitored and in favourable condition or showing demonstrable signs of ecological recovery.

### **Action-based long-term targets will not be sufficient to ensure the Government's goals for biodiversity are met.**

The Environment Bill will mandate the government to set at least one long-term target in four priority areas (air quality, resource efficiency and waste reduction, water, and biodiversity) with each required to have a minimum duration of 15-years. The ability to set more than one long-term target within a given priority area will be particularly beneficial for biodiversity where a single measure will not be sufficient; different ecosystems, habitats and species are changing in different ways.

\* The 25-year Environment Plan is the Government's current Environmental Improvement Plan

In addition to the long-term targets, Defra confirmed in May 2021 it will also introduce a separate 2030 target for species abundance. The details will be set in secondary legislation following consultation and further evidence gathering.

It is vital that a range of outcome-based long-term targets, determined through an independent, evidence-led process of expert advice, stakeholder engagement, and public consultation, are set for biodiversity.

Proposals outlined in Defra's environmental targets policy paper suggest that for biodiversity, its long-term "outcome" targets may be limited to goals concerning the restoration of protected sites, whilst relying on "actions" targets for other important habitats. As noted above, protected sites represent around ca. 20% of the area of semi-natural terrestrial habitats in England. It is vital that a range of outcome-based long-term targets, determined through an independent, evidence-led process of expert advice, stakeholder engagement, and public consultation, are set for biodiversity. Furthermore, meaningful biodiversity measures to assess progress in meeting the targets need to be agreed with standardised methods. Failure to do so risks setting arbitrary targets, which meet legal requirements but do not lead to progress towards the 25-YEP outcomes.

**The Government will be required to periodically review its long-term targets, by carrying out a Significant Improvement Test at least every five years.**

This means that the Government must consider whether meeting its long-term targets, alongside any other relevant statutory environmental targets, would significantly improve the natural environment in England. The first test will be conducted by January 2023, three months after the October 2022 deadline for the long-term priority targets to be laid before parliament.

**Recommendation**

Long-term targets for biodiversity, set out under the Environment Bill, and associated timeframes must be outcome-based and linked directly to the goals set out in the Government's 25-YEP.

Department: Defra, Timing: June 2022.

Without legally binding interim targets which are linked to clear legally binding long-term targets, it is likely that the ten 25 YEP goals and future EIPs will become aspirational.

**Interim targets should be placed on a statutory footing to compel action now.**

Interim targets will also be included in the EIPs, which will set out government's five-year trajectory, progress of which will be updated annually. However, the interim milestones are non-mandatory meaning there is nothing to compel the Government to act now to meet targets, or to take future remedial action where targets are missed. Without legally binding interim targets which are linked to clear legally binding long-term targets, it is likely that the ten 25 YEP goals and future EIPs will become aspirational.

**Recommendation**

Interim targets for biodiversity must be made statutory and linked clearly to the long-term targets set out in the Environment Bill.

Department: Defra, Timing: June 2022.

Has the risk management score changed?

**No, the score remains low.**

**Indicators available to monitor the vulnerability of priority terrestrial habitats and species show no progress, or a decline. The majority of targets set out in the Government's Biodiversity 2020 strategy have not been met, with many falling well short.**

Indicators available to monitor the vulnerability of priority terrestrial habitats and species show no progress, or a decline.

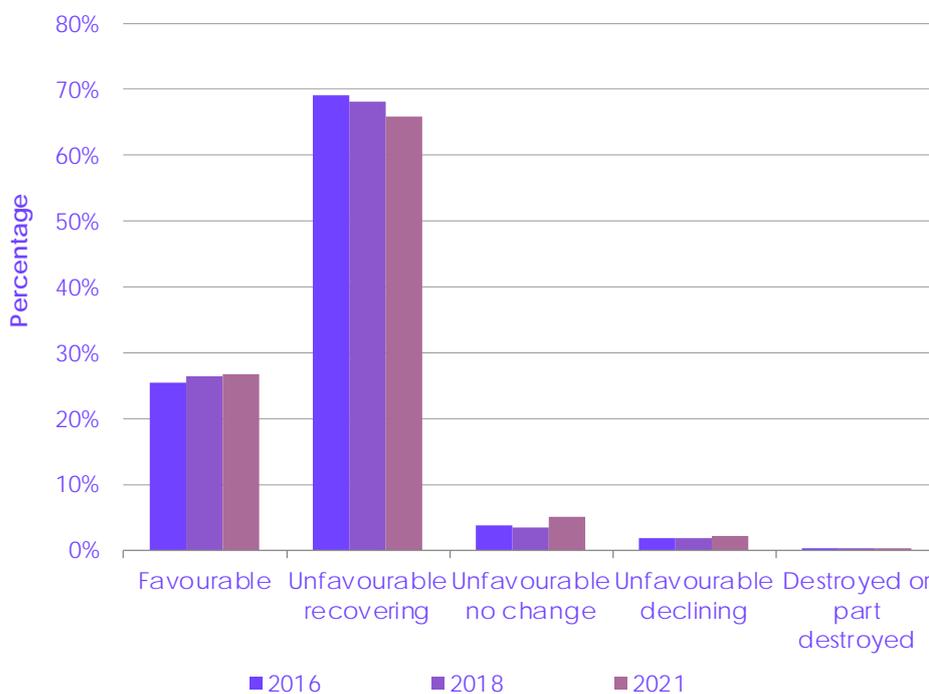

Changes in habitat condition and species abundance (whether impacted by climate change or not) act as proxy indicators for the vulnerability of biodiversity as a whole, as they give a sense of how 'under pressure' different systems already are. This aligns to the idea in the Lawton Review that ecosystems will withstand the risks from climate change more effectively if other pressures on them are reduced.

The Biodiversity 2020 strategy<sup>11</sup> contained a goal to achieve at least 50% of sites of special scientific importance (SSSIs) in favourable condition, while maintaining at least 95% in favourable or recovering condition.

**There has been little change in the condition of terrestrial SSSIs.**

The proportion of terrestrial SSSIs\* in England classed as in either 'favourable' or 'unfavourable recovering' condition declined from around 94% in 2016 to around 93% in 2021 (see figure 2.1). Within that, protected sites classed as in 'favourable' condition increased by 2% over the same period, although these represent only 27% of total terrestrial sites.

**Figure 2.1 Terrestrial SSSIs in England, by condition**

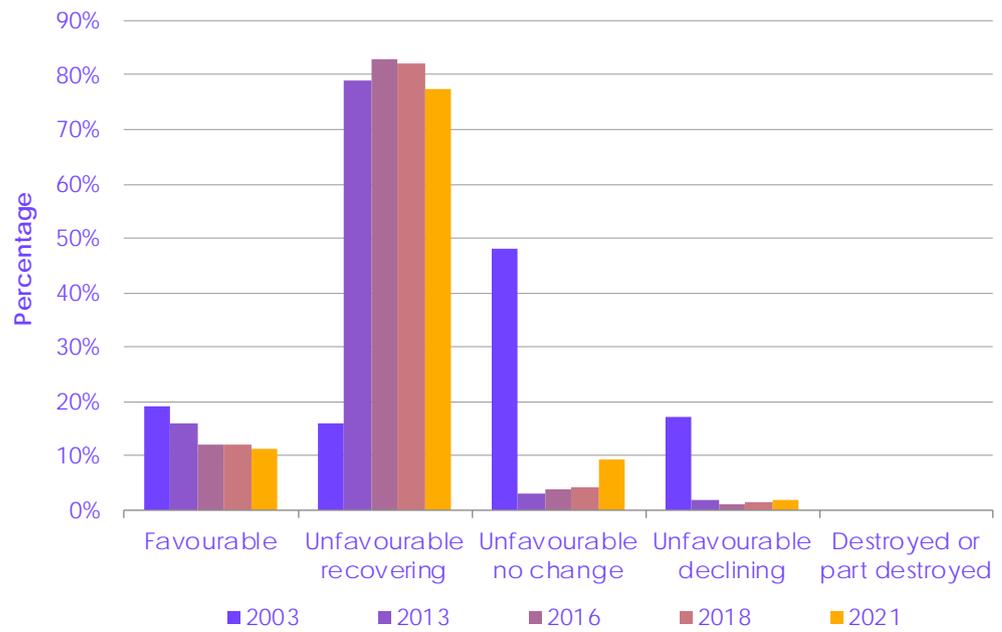

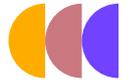

Source: Natural England, <https://designatedsites.naturalengland.org.uk/NE/interimReports/ConditionByHabitat.aspx>

**The percentage of upland peat SSSIs in favourable or unfavourable recovering condition has dropped since 2016.**

Approximately half of upland peatland in England are designated as SSSIs (51% as at 2018).<sup>12</sup> Since 2016, there has been a decrease in the area of upland peat blanket bog SSSI sites classed as in 'unfavourable recovering', down from 83% to 78% in 2021 (figure 2.2). This has coincided with an increase in sites classed as 'unfavourable no change', up from 4% in 2016 to 9% in 2021.

\* Also referred to as protected sites.

Figure 2.2 Upland blanket bog SSSIs in England, by condition

Source: For 2016 to 2021 data see Natural England: <https://designatedsites.naturalengland.org.uk/NEInterimReports/ConditionByHabitat.aspx>  
 For 2003 and 2013 data, see ECI (2013) for the CCC, Assessing preparedness of England's natural resources for a changing climate

**Without routine national monitoring of soil condition in England, it is difficult robustly assess the progress being made in managing vulnerability to climate change.**

The last national assessment of soil condition in England was published as part of the 2007 Countryside Survey, while the National Soil Inventory, which also covers soil condition, was last conducted 2003. As noted above, draft proposals for the soil health action plan indicate it will include a number of actions that support sustainable soil management and implementing new measuring and monitoring schemes for soil health

Without routine national monitoring of soil condition in England, it is difficult robustly assess the progress being made in managing vulnerability to climate change.

As part of the Nature for Climate Fund (see above) initiative Defra has commissioned a project to deliver an updated peatland map. The project's aim is to map England's peatlands by determining peat location, depth, condition and extent to improve spatial prioritisation of restoration work and more accurately estimate greenhouse gas emissions. The peatland map is scheduled to be delivered by 2024 and will form a part of the England Peat Action Plan.

UK CEH also started a scaled down version of the Countryside Survey in 2019, using a UKRI-NERC- funded research platform with an annual rolling program to measure soils and vegetation repeated every five years.

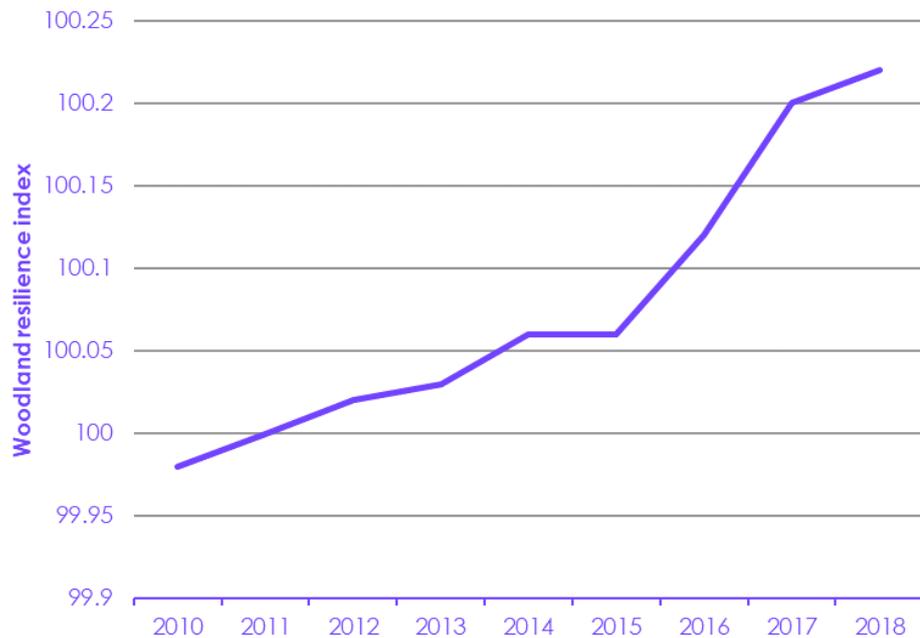

The aim is to revisit all the grid squares surveyed in 2007 survey, but with a reduced set of measurements, focusing on plant monitoring and soil sampling for basic soil chemistry. The impact of Covid-19 has caused delays to the survey since 2020, although it is understood it has recommenced.

**Some progress appears to have been made in improving woodland connectivity.**

Maintaining and improving connectivity is important in promoting biodiversity in a fragmented landscape, especially under a changing climate. However, it is very challenging to measure at the national scale.

The Forestry Commission has made some progress in this area, through its woodland resilience indicator, measured as the size and spatial configuration (i.e. connectivity) of patches of forests and woodlands, relative to 2011 values (assigned as 100). This indicator shows a consistent year-to-year increase in connectivity for forests and woodlands in England between 2011 and 2018 (figure 2.3).

Figure 2.3 Measure of woodland resilience to climate change

Source: Forestry Commission

Notes: Area of woodland created with support from the Rural Development Programme for England: both the English Woodland Grant Scheme (EWGS) and the Countryside Stewardship incentives. Areas of private-sector funded planting or planting supported by other Government funding streams are relatively small and not included.

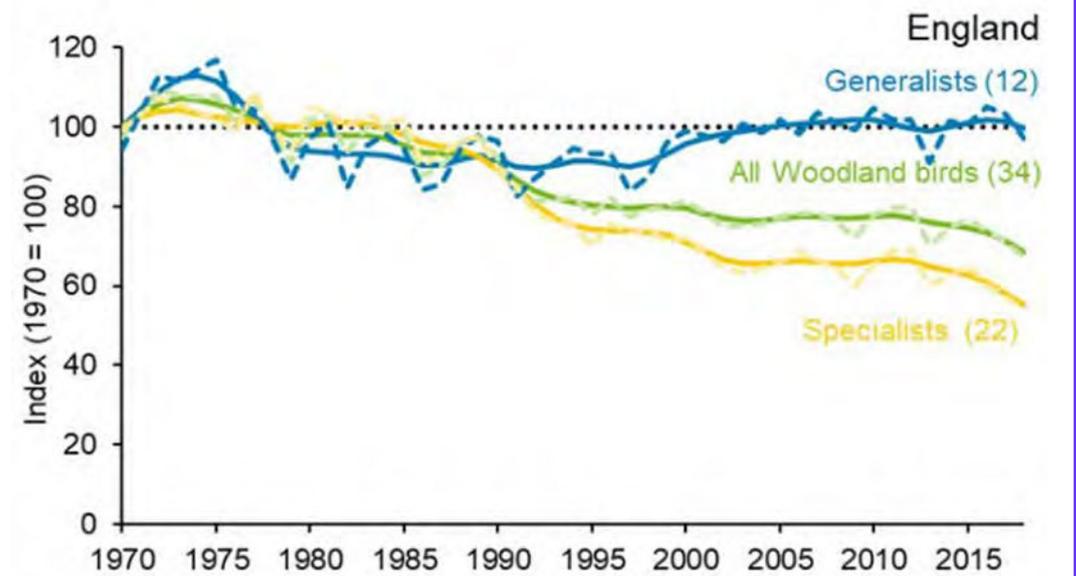

### Woodland bird species diversity is still declining.

Woodland ecosystems that are less diverse are less resilient to changes in climate, and indeed, other pressures. Species groups such as birds and butterflies provide a good indication of the broad state of the natural environment

Woodland species indicators suggest declining trends for both the long-and short-term.

Woodland species indicators suggest declining trends for both the long-and short-term. Between 1970 and 2018, the index for woodland bird specialists declined by 45% while the index for woodland bird generalist species increased by 3% (see figure 2.4). The long-term decline of the woodland bird indicator in England has been mostly driven by the decline of specialist woodland birds such as willow tit, spotted flycatcher and lesser redpoll (species restricted to or highly dependent on particular woodland habitats). A recent report by the Woodland Trust<sup>13</sup> also found just 7% of Britain's native woodlands are currently in good ecological condition.

Figure 2.4 Specialist and generalist woodland birds in England

Source: Defra biodiversity indicators 2020 update.

Notes: 1. The line graph shows the unsmoothed trends (dashed lines) and smoothed trends (solid lines). 2. The figures in brackets show the number of species in each index.

**There has been an increase in the number of wildfires and area burnt between 2015 and 2019.**

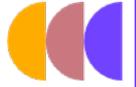

Wildfire is an emerging risk that requires more attention in adaptation planning, so we include it as an impact indicator here.<sup>14</sup>

The number of recorded wildfires in the natural environment have increased significantly since 2015.

Delays due to COVID-19 mean Forestry Commission has not been able to produce an update on wildfire statistics since the 2016-17 reference period. However, UK-wide data from the European Forest Fire Information System (EFFIS) suggest that the number of recorded wildfires have increased over the last few years, from less than 20 during 2015 to 2017, increasing to 79 in 2018 and 137 in 2019.<sup>15</sup> These data concur with analyses of Forestry Commission wildfire statistics data for England published in our 2019 progress report. In terms of the UK area burnt by wildfires, this has increased significantly in the last few years, from around 2,000 hectares in 2015 to 18,000 hectares in 2018 and 29,000 hectares in 2019 (figure 2.5).

The majority of the area burnt each year was classified as 'other natural land' and accounted for around 95% across each of the five years (2015-2019). This suggests that the majority of large wildfires over 30 hectares in size occur in natural habitats, rather than e.g. agricultural land.

Figure 2.5 Total UK wildfire area burnt, per annum, split by land cover class.

Source: ADAS for the CCC (2021) *Research to update indicators of climate-related risks and actions in England*.  
Notes: Area burnt (hectares) by wildfires larger than 30 hectares in size.

## 2.3 Farmland habitats and species

Progress summary – Farmland habitats and species		
2019 score:	What has changed since 2019:	2021 score:
1	<p><b>Plan score - low</b></p> <ul style="list-style-type: none"> <li>The forthcoming Environmental Land Management scheme has the potential to form a comprehensive plan to improve the resilience of the farmed countryside to climate change. The scheme's three-level design and the focus on 'payments by results' should support this. However, plans to date indicate adaptation is still not given sufficient consideration: it is not clear how climate risks will be incorporated in the delivery of private and public good outcomes, while explicit payments for actions that reduce vulnerability to climate change are still limited to flood risk.</li> </ul> <p><b>Risk management score – low</b></p> <ul style="list-style-type: none"> <li>Long-term downward trends in abundance indicators for key farmland species suggest agri-environment schemes have had only limited impact on managing pressures on biodiversity to date. Habitat condition indicators show the proportion of protected farmland habitats in favourable/ improving condition remains relatively high, but they only represent ca.1% of total farmland areas.</li> </ul>	1
<p>Notes: See annex for full datasets            Key Indicators: SSSIs in the farmed countryside, by condition, Changes in abundance of species (birds, butterflies) in the farmed landscapes (England), Changes in abundance of plant species in arable farmland habitat types (UK) –Experimental</p>		

The farmed countryside is the largest land use class across the UK, occupying around 70% of land area.<sup>16</sup> It is exposed similarly to the current and future pressures from climate change as those facing the terrestrial habitats and species priority. However, farmland areas are also exposed to significant other pressures from agricultural practices meaning they are likely to be highly vulnerable to climate change, hence we assess them separately.

### Summary of 2019 report score

**In our last report, Farmland habitats and species scored a 1 (low plan score, low risk management score).**

Our 2019 progress report highlighted that the adaptation plans in place for the farmed countryside would not be sufficient to address the risks identified in the Second UK Climate Change Risk Assessment. On progress in managing risk, we highlighted that the decline in abundance for key species in the farmed countryside suggest Agri-Environment schemes had had limited impact on managing pressures on biodiversity.

### Has the plan score changed?

**No, the plan score remains low.**

**While the Environmental Land Management scheme (ELM) has the potential to foster a sustained improvement in the condition of farmland habitats and species, plans to date indicate climate change adaptation is still not given sufficient consideration.**

Plans to date for the Government's proposed Environmental Land Management scheme indicate climate change adaptation is still not given sufficient consideration.

As outlined in the Government's second national adaptation programme (NAP2), the Government is currently working to develop a new long-term land management payments strategy to replace the former Common Agricultural Policy (CAP). The Environmental Land Management (ELM) scheme set out in the Agriculture Act 2020 will be a key mechanism in supporting the Government to improve the condition of the farmed countryside. Under current plans, the ELM scheme aims to deliver outcomes under six categories of public goods as identified in the 25-YEP: clean air, clean and plentiful water, thriving plants and wildlife, reducing risk from environmental hazards, mitigating and adapting to climate change, and enhanced beauty, heritage and engagement with the natural environment. Activities to improve and protect soil health will be central to delivering on these goals, although current plans do not include it as an outcome in itself. Existing plans for the scheme propose a three-scheme payment structure, with each one targeting a different geographic scale: These comprise:

- Sustainable Farming Incentive Scheme; pays farmers and land managers for actions taken (beyond regulatory requirements) to manage land in an environmentally sustainable way.
- Local Nature Recovery Scheme; pays for actions that support local nature recovery and deliver local environmental priorities. The focus is ensuring the right things are delivered in the right places.
- Landscape Recovery Scheme; supports the delivery of landscape and ecosystem recovery through long-term, land use change projects. This includes projects to restore wilder landscapes in places where that is appropriate, large-scale tree planting, peatland and salt marsh restoration projects.

The piloting and implementation of the three future schemes will be funded by gradual reductions in current Basic Payment Scheme\* payments between 2021 to 2027.

**ELM has the potential to form a comprehensive plan to improve the resilience of biodiversity in the farmed countryside to climate change.**

The three-level scheme design and the focus on 'payments for outcomes' (e.g. clean water) should support this. In particular, the Local Nature Recovery and Landscape Recovery schemes have the potential to drive systemic change, while the broader landscape focus of the latter could help deliver mitigation and adaptation co-benefits.

**The Government must build adaptive capacity through ensuring the local context is considered in ELM.**

The best use of land to support the delivery of public goods will vary depending on the local ecological and geographical context. The changes that are needed will differ across the UK because the effects from climate change will vary spatially, as well as the quantity and condition of natural capital assets, local needs and demands. For instance, as noted in section 2.1, carefully considered tree planting that ensures the right trees are planted in the right places can help deliver the Government's objectives for adaptation and mitigation. However, it is not yet clear how this spatial element of ELM will work.

The Government must build adaptive capacity through ensuring the local context is considered in its Environmental Land Management Scheme.

\* The Basic Payment Scheme (BPS) is the European Union's rural grants and payments to help the farming industry under the Common Agricultural Policy (CAP)

**It is vital that ELM design recognises adaptation as a necessary pre-requisite to meeting the scheme's other public good outcomes, and this is reflected in actions the schemes will pay for.**

Mitigating and adapting to climate change is one of the six environmental public goods that will be rewarded under the ELM schemes to contribute to delivering the 25-Year Environment Plan (25-YEP). Work is being undertaken to determine the specific actions the schemes will pay for, and quantify their contribution to mitigating and adapting to climate change alongside other policy levers. Defra has confirmed that this is being informed by detailed modelling, which will also test the resilience of these actions to climate uncertainty. Previous analysis by the CCC<sup>17</sup> has shown how difficult this is to do at a national level and that providing the right tools for local decision making may be a better approach from an adaptation perspective. Further details on the schemes will be published later in 2021.

**An integrated response to climate change, agriculture and the environment is needed.**

ELM must sit within a wider suite of climate and environmental policies. Defra has yet to set out how ELM, the Environment Bill, the 25-YEP and various policies planned for trees, peatlands and biodiversity will fit together. As noted in section 2.2, it is unclear how the different strategies together will support the Government's climate change adaptation goals.

**Defra has reported ongoing targeting of Agri-Environment Schemes (AES), such as Countryside Stewardship, on the maintenance and restoration of special sites of scientific interest (SSSIs) to deliver favourable condition of farmed habitats.**

Several research projects have been completed to evaluate and clarify the extent to which different factors may be inhibiting or masking the progress towards shifting SSSIs in AES to favourable condition, with a view to improving the implementation of current schemes and informing the development of future AES.<sup>18</sup> NAP2 also includes an action to conduct research on the resilience of AES to climate change, which has been completed. While there is evidence to suggest the range of activities incentivised through AES are making some contribution to improving the resilience of the farmed countryside,<sup>19</sup> biodiversity indicators for Farmland species show continuing declines in populations (see below). With the farmed countryside representing over two-thirds of land cover in England, analysis of progress is hindered by the same issues around monitoring as terrestrial habitats and species (section 2.2).

**The England Peat Action Plan includes activities to restore over 5,000 hectares of lowland agricultural land.**

Under the Plan, the Government has committed to restoring 35,000 hectares of degraded peatland in England by 2025. Of this, the Government's aim is for 15% of the area restored by 2025 to involve the restoration of lowland agricultural land to peat habitat. This compares to the CCC's recommendation in its Sixth Carbon Budget report for the restoration of 8,000 hectares of lowland peat by 2025.

Has the risk management score changed?

**No, the risk management score remains low.**

**Indicators show there has been no reversal in the long-term downward trend in abundance indicators for key farmland species, suggesting AESs have had only limited impact on managing pressures on biodiversity to date.**

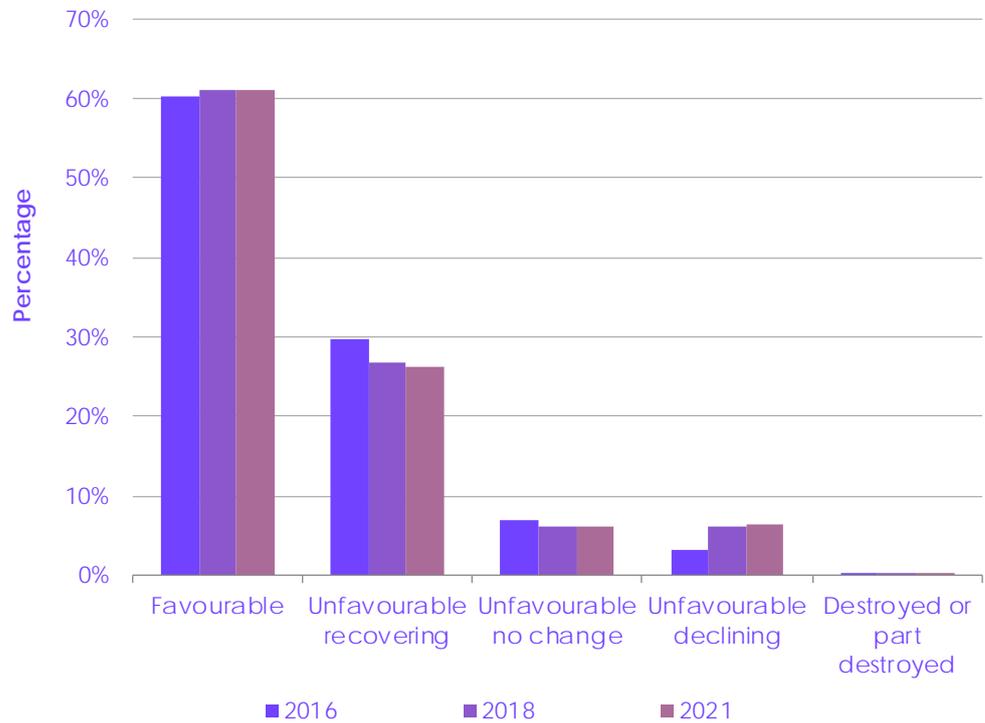

As noted above, the vast majority of land in England is farmed in some way<sup>20</sup> – so how this land is managed has a big impact on its condition and resilience to climate change.

It is vital that ELM design recognises adaptation as a necessary pre-requisite to meeting the scheme's other public good outcomes, and this is reflected in actions the schemes will pay for.

Data available on the percentage of SSSIs in the farmed countryside that are in favourable or unfavourable recovering condition remains relatively high (87%). However, designated sites such as these represent a very small proportion (less than 1%)<sup>21</sup> of the total area of farmed habitats (figure 2.6).

Indicators show there has been no reversal in the long-term downward trend in abundance indicators for key farmland species.

**Figure 2.6 Farmland SSSIs in England, by condition**

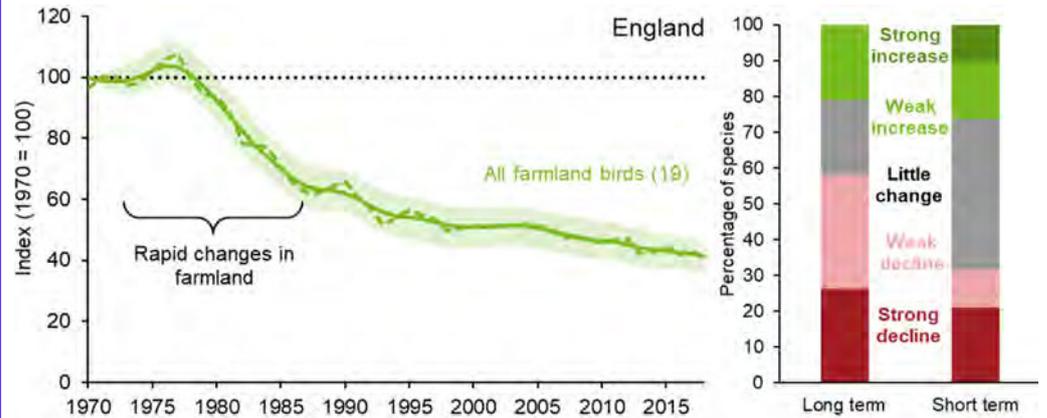

Source: Natural England, <https://designatedsites.naturalengland.org.uk/NEInterimReports/ConditionByHabitat.aspx>

**Breeding bird numbers on farmland in England are less than half the levels recorded in 1970.**

According to the Lawton principles, habitats need to be in good condition, bigger, and more joined up in order to have a greater chance of allowing the species they support to adapt naturally as the climate changes. Species groups such as birds and butterflies provide a good indication of the broad state of the farmed environment. In 2018, the England farmland bird index was less than half (43%) of its 1970 value (see figure 2.7). The majority of the decline occurred between the late 1970s and early 1980s at a time of rapid changes in many farmland management practices. Declines have continued in recent years, albeit at a slower rate.

Figure 2.7 Breeding birds on farmland in England

Source: Defra biodiversity indicators 2020 update.

Notes. 1. The line graph shows the unsmoothed trend (dashed line) and the smoothed trend (solid line) together with its 95% confidence interval (shaded). 2. The figure in brackets shows the number of species in the index. 3. The bar chart shows the percentage of species within the indicator that have increased, decreased or shown little change, based on set thresholds of annual change.

**Hedgerow habitats support resilience of the farmed countryside to climate change, but the absence of current data mean it is not possible to assess recent trends in their condition.**

Hedgerows are an important feature of agricultural landscapes. They deliver a range of biodiversity benefits by providing food and shelter for a range of birds, insects and mammals. They also facilitate movement through the landscape by providing respite for organisms such as flying insects.<sup>22</sup> Hedgerows also provide wider environmental benefits and regulatory services such as increasing water quality and regulation, increasing air quality, reducing flood risk, reducing soil erosion, maintaining climate regulation through carbon sequestration, and promoting pollination and pest control by providing habitat for pollinators and predators of crop pests. By acting as a physical barrier at a field edge, hedgerows are able to reduce the amount of fertiliser, pesticides and sediment, which may be included in surface water run-off, from reaching watercourses. They can also contribute to managing the flow of water run-off, which can support in reducing peak flows and the risk of flooding across the catchment.

Managed hedgerows provide significant value, both to farmers and wildlife, however, if these are neglected the value can greatly reduce or become negligible.<sup>23</sup> Similarly, where hedgerows are lost, the benefits associated with the hedgerows are lost alongside this, which can have negative impacts for biodiversity and regulatory services, and also result in an increase in carbon emissions.

In 2006, it was estimated that only 22% of the UK’s hedgerows were in a favourable state.<sup>24</sup> Furthermore, between 1984 and 2007, there was a 24% decrease in the length of ‘managed’ hedgerows in Great Britain. However, the absence of recent data on the condition and extent of hedgerows in England means that it is currently difficult to determine whether progress is being made in managing the vulnerability to climate change of this vital farmland habitat.

## 2.4 Freshwater habitats and species

Progress summary – Freshwater habitats and species		
2019 score:	What has changed since 2019:	2021 score:
5	<p><b>Plan score - medium</b></p> <ul style="list-style-type: none"> <li>The score has remained at medium. The Environment Agency has incorporated findings from national level risk assessments that consider climate impacts under 2°C &amp; 4°C scenarios into the River Basin Management Plan revisions process. However, current plans still do not give adequate consideration of risks to freshwater habitats from higher water temperatures and there is still no clear mechanism that accounts for the consequences of reductions in quality or flows due to climate change in meeting Government targets.</li> </ul> <p><b>Risk management score – low</b></p> <ul style="list-style-type: none"> <li>The score has changed to low from medium. Available freshwater species metrics indicate populations remain stable. However, there has been a recent decrease in the proportion of protected freshwater sites in ‘favourable’ or ‘unfavourable recovering’ condition, while broader measures of the health of all surface water bodies indicate persistent long-term declines in ecological status. New evidence shows water temperatures in freshwater environments have consistently exceeded their long-term mean in recent decades.</li> </ul>	3
<p>Notes: See annex for full datasets            Key Indicators: Protected freshwater sites in England, by condition, Proportion of water bodies in England meeting good status, Breeding wetland birds in England, England water temperature index - Annual variance from long-term mean</p>		

This adaptation priority covers all semi-natural freshwater habitats and the species they contain as classified by Natural England; rivers, streams, standing open water and canals. At a UK level, freshwater habitats cover around 12% of land.<sup>25</sup>

Freshwater habitats provide a wide array of important ecosystem services, including water supply (see section 2.8) pollution removal, and recreation (e.g. fishing and tourism). The annual value of these services, to the UK, has been estimated at approximately £1.3 billion per annum.<sup>26</sup> Though this estimate does not include all relevant ecosystem services, it will likely represent an undervaluation.

### Summary of 2019 report score

**In our last report, freshwater habitats and species scored a 5 (medium plan score, medium risk score).**

Our 2019 assessment found that while plans were in place to incorporate evidence on climate impacts under a range of future warming scenarios into the third cycle of the River Basin Management Plan, the revisions lacked adequate consideration of risks to the freshwater environment from higher water temperatures. On progress in managing risk, we highlighted that while the percentage of designated freshwater sites in favourable condition was improving, broader measures of the ecological condition of all surface water bodies assessed as part of the Water Framework Directive (WFD) indicated a worsening trend.

Has the plan score changed?

**No. The score remains the medium.**

**EU protections for the water environment in England have been fully transposed into UK law and thus have remained in place following EU exit.**

Historically, the European Union Water Framework Directive (EU WFD) has provided the framework for the management of freshwater resources in England. The EU legislation, and accompanying environmental standards and targets, were translated into UK law prior to the UK leaving the EU. They will continue to operate under the policy of “roll-over”. The UK Government’s Environment Bill also includes provision for water resources management now that the UK has left the EU.

**Plans are in place that consider the impact of reduced water availability as a result of climate change, contain clear outcomes and align to the goals for freshwater habitats outlined in the 25-Year Environment Plan (25-YEP).**

River Basin Management Plans (RBMPs) are a requirement of the UK Water Framework Directive (WFD) regulations and alongside national and river basin district activity, adopt a catchment-based approach, setting out how organisations, stakeholders and communities will collaborate to improve the environmental quality of fresh and saline water bodies. The RBMPs set out the actions that will be taken in England to improve the water environment (quality, quantity and habitat) and achieve statutory water body objectives by specified timescales. The Environment Agency are continuing the statutory process of reviewing and updating the third cycle of the RBMPs originally scheduled for publication in 2021, although it is understood the timetable may be revised in light of challenges due to the Covid-19 pandemic (e.g. obtaining stakeholder participation in the process).

The need to adapt to changing climatic conditions has been identified as integral to the RBMPs, which represent one of the Government’s key mechanisms to achieving its goals for water habitats set out in the 25-YEP. To support this, the Environment Agency has completed a programme of work to ensure that climate change projections of temperature, precipitation and sea level rise are in the RBMP revisions process. An early stage of the RBMP review process is to undertake a public consultation on significant water management issues (the challenges and choices consultation). As part of this stakeholders were encouraged to consider the impact of a changing climate on water, including considering environmental impacts from 2°C and 4°C warming scenarios through tools such as the Environment Agency’s climate change impact tool. Within the RBMPs, catchment partnerships have also been given the opportunity to outline the priorities for their catchments. To help them do this they have been given high level risk assessments to help consider challenges such as climate change. The ambition is next to develop the assessments at a more local level so as to build a better understanding of local impacts from climate change.

**More detail is needed on how freshwater habitats will support the Government’s strategy to build resilience to flood risk in England.**

The Environment Agency’s 2020 Flood and Coastal Erosion Risk Management (FCERM) strategy, outlines plans to make greater use of nature-based solutions (NbS) that take a catchment led approach to managing the flow of water to improve resilience to floods. Natural flood risk management (NFM) measures, such as restoring rivers and improving soil structure will build climate resilience through enhancing freshwater habitats’ ability to slow the flow of or store flood waters.

There is currently no clear mechanism in place that accounts for the consequences of changes in water temperature for meeting the WFD targets.

However, it is not clear currently clear which NFM measures are being considered to support the strategy.

**Guidance to inform land managers and advisors on actions to mitigate risks from higher water temperatures do not make sufficient consideration of impacts under different warming scenarios.**

In order to address the risks to freshwater species from higher water temperatures, more research is needed to refine further the strategic approach to riparian tree planting to provide cooling for species that are sensitive to higher temperatures.<sup>27</sup>

At present, however, there is no clear mechanism in place that accounts for the consequences of changes in water temperature for meeting the WFD targets. Risks from increasing water temperatures, combined with changes to flow, will make meeting and maintaining the WFD targets even more challenging.

NAP2 includes an action to develop guidance and tools to help practitioners address risks to freshwater habitats and species from high water temperatures. The rivers and streams section of the 2020 update to the Natural England and RSPB Adaptation Manual (see also section 2.2) highlights risks posed by warming temperatures to freshwater species; the role of riparian trees in addressing them; and the wider role of the restoration of natural function and processes in providing resilience. The guidance emphasises the importance of considering 2°C and 4°C warming, but does not outline how to assess actions under different warming scenarios.

The document also signposts the Woodland Trust's 'Keeping Rivers Cool: A Guidance Manual' for more detailed information. Tree planting is supported by Countryside Stewardship, targeting of which is informed by spatial data layers, including the Keeping Rivers Cool layer that Natural England and Forestry Commission advisors can access internally, and applicants can access via the Forestry Commission's web-browser. Forest Research will also publish a Riparian Woodland Practice Guide (see section 2.6) over the coming months to support implementation of the UK Forestry Standard.

#### Recommendation

Set out a clear mechanism to account for the consequences of higher water temperatures and low flows (including drying up) in water bodies for freshwater habitats and species, and for meeting the WFD targets. This is lacking in current plans to revise the River Basin Management Plans (RBMPs).

Department: Environment Agency, Timing: June 2022.

Has the risk management score changed?

**Yes, the risk management score has decreased from medium to low.**

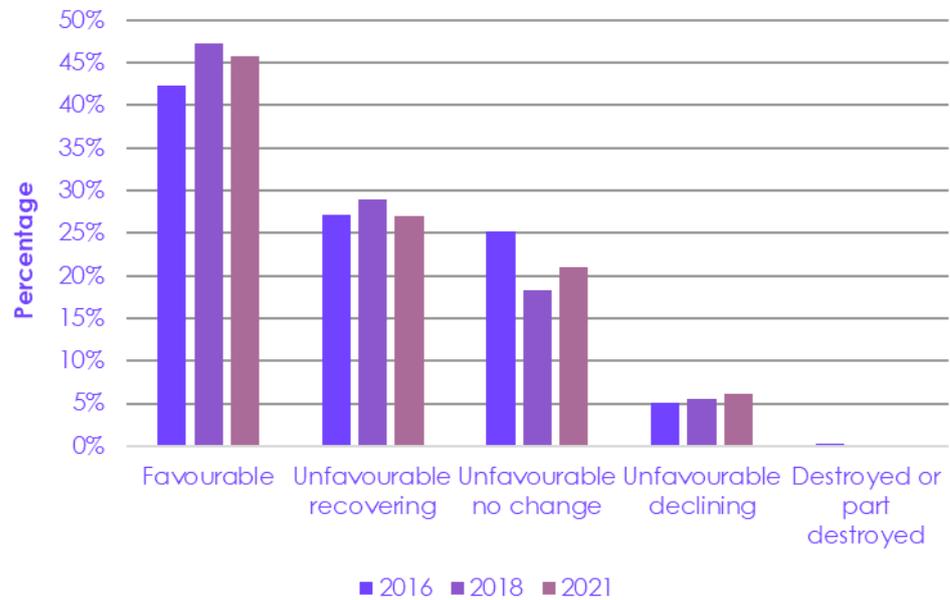

**Data on the percentage of protected freshwater sites in 'favourable' or unfavourable recovering' condition suggest a recent decline, while the ecological condition of all surface water bodies assessed as part of the WFD continues to worsen.**

Protected freshwater sites of special scientific interest (SSSIs) represent only around 8% of the total area of freshwater habitats in England, but are the only habitats for

which condition data is available.\* The latest data from Natural England on the condition of freshwater SSSIs show a slight decrease in proportion of sites in 'favourable' condition from 47% in 2018 to 46% in 2021, although they remain higher than 2016 (42%) (see figure 2.8). There has also been a decline in freshwater habitats classed as 'unfavourable recovering', down to 27% in 2021 from 29% in 2018.

There has been a recent decrease in the proportion of protected freshwater sites in 'favourable' or 'unfavourable recovering' condition, while broader measures of the health of all surface water bodies indicate persistent long-term declines in ecological status.

Figure 2.8 Freshwater SSSIs in England, by condition

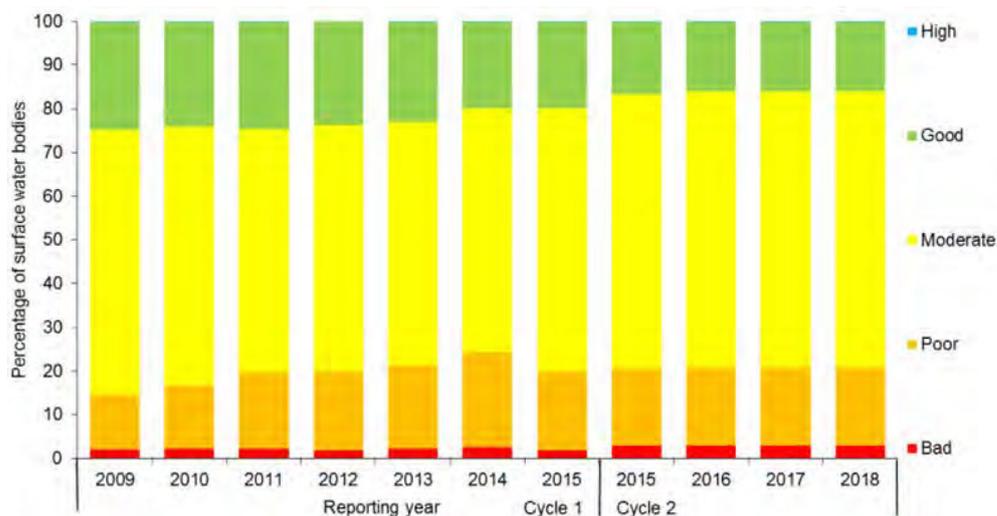

Source: Natural England, <https://designatedsites.naturalengland.org.uk/NEInterimReports/ConditionByHabitat.aspx>

In England, the Environment Agency has responsibility for monitoring and reporting on the status of surface water bodies and the reasons why good ecological status has not been achieved. There has been a decrease in the proportion of surface water bodies in England awarded high or good ecological status classification under the WFD since the indicator was first prepared in 2009 (figure 2.9). In 2018, only 16% of surface water bodies assessed under the WFD were in high or good status compared with 25% in 2009 and 23% in 2013. Declines have continued in recent years, albeit at a slower rate.

\* 8% calculated by comparing area of designated rivers and streams, and standing open waters and canals according to Natural England designated sites data, with data on total area of freshwater habitats published in the ONS Land Cover Account as at 2007

In 2018, only 16% of surface water bodies assessed under the WFD were in high or good status compared with 25% in 2009.

**Figure 2.9** Status classifications of surface water bodies in England under the Water Framework Directive

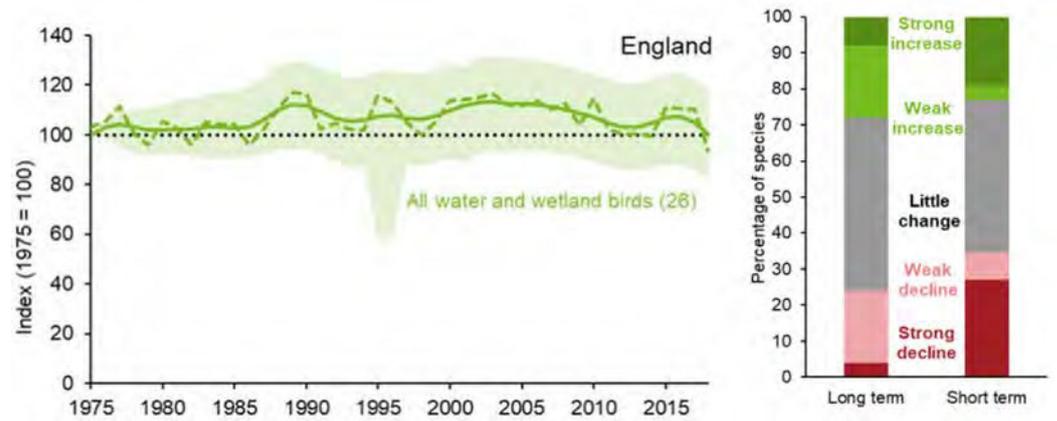

Source: Source: Defra biodiversity indicators 2020 update.

Notes. 1. Based on the numbers of surface water bodies classified under the Water Framework Directive (WFD) in England. 2. Surface water status is a composite measure that looks at both the chemical status and the ecological (including biological and habitat condition) status of a water body. The classification scheme for surface water ecological status includes five categories: high, good, moderate, poor and bad. 'High status' means no or very low human pressure. 'Good status' means a 'slight' deviation from this condition, 'moderate status' means 'moderate' deviation, and so on. Around 5,000 water bodies are assessed each year, including rivers, canals, lakes, estuaries and coastal waters.

Species abundance (whether impacted by climate change or not) is used as a proxy indicator for the vulnerability of biodiversity as a whole, as they give a sense of how 'under pressure' different systems already are.\* Wetlands, including rivers, lakes, ponds, reedbeds, grazing marshes and lowland raised bogs provide important habitats for breeding wetland birds. The water and wetland bird index has remained relatively stable for most of the period since data collection started in 1975. In 2018 the index was 9% lower than in 1975 (Figure 2.10). Numbers rose slightly in the early 2000s with the smoothed index showing a non-significant 2% increase between 2012 and 2017.

\* This is based on the idea in the review that ecosystems will withstand the risks from climate change more effectively if other pressures on them are reduced.

Figure 2.10 Breeding wetland birds in England

Source: Defra biodiversity indicators 2020 update.

Notes: 1. The line graph shows the unsmoothed trend (dashed line) and the smoothed trend (solid line) together with its 95% confidence interval (shaded). 2. The figure in brackets shows the number of species in the index. 3. The bar chart shows the percentage of species within the indicator that have increased, decreased or shown little change, based on set thresholds of annual change.

Higher water temperatures will increase the degradation of freshwater habitats, and compromise the viability of some freshwater species.<sup>28</sup> A recent assessment of climate-driven thresholds in UK freshwater habitats<sup>29</sup> looked at potential risks from temperature driven incidents of harmful algal blooms (HAB) in lakes. Such blooms can have wide ranging economic impacts, including on property values, water treatment costs, tourism and fisheries revenue. The study found present impact costs per annum from HAB in England under a 4°C warming scenario were predicted to increase by around 70% by the 2050s and almost triple by the 2080s.

**Water temperatures across England have been consistently above their long-term average in recent decades.**

Average annual water temperatures across England have been consistently above their long-term mean over the 2000-2019 period; 16 out of last 20 years for southern England, and 13 out of last 20 years for northern England (figure 2.11a and figure 2.11b).

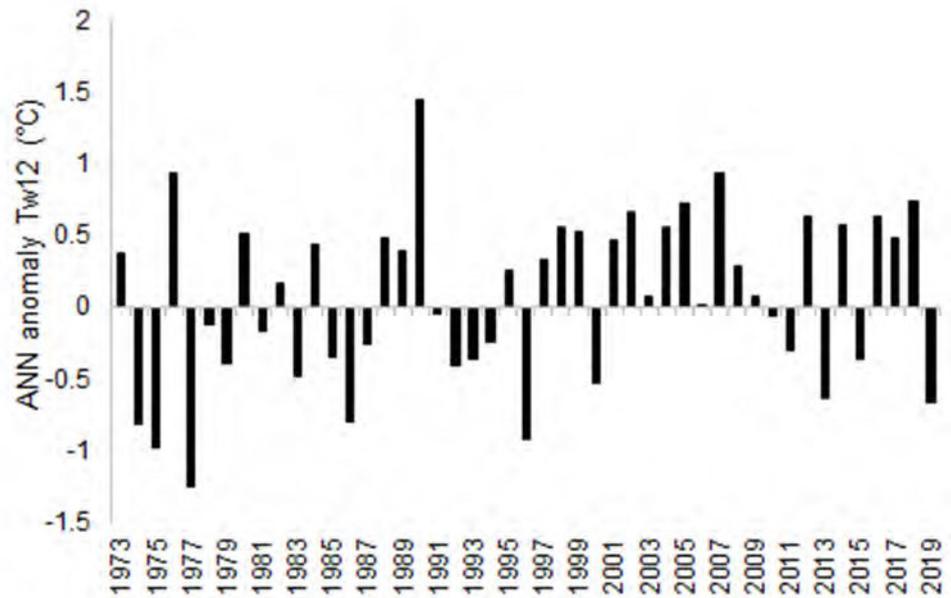

Figure 2.11a Southern England water temperature index - annual variance from long-term mean

New research suggests climate change is already affecting UK coasts and seas.</li> </ul>	5
<p>Notes: See annex for full datasets            Key Indicators: MCCIP report cards, Coastal SSSIs in England, by condition - Extent of marine protected areas, Breeding seabirds in England, Combined input of hazardous substances to the UK marine environment.</p>		

This adaptation priority covers all coastal and marine habitats and the species they contain around England.

The analysis of changes in risk vulnerability focuses on coastal and marine sites identified as being of nature conservation importance, as these are areas for which data is most available. For coastal habitats, this comprises sites which are designated under the Wildlife & Countryside Act 1981 as supporting habitats and/or species of national importance.<sup>\*</sup> A relatively high proportion of coastal priority habitats in England (between ca. 80% to 95% dependent on habitat type) fall within protected areas.<sup>30</sup>

For marine habitats, we assess sites classified as being Marine Protected Areas (MPAs), which cover around 40% (92,633 km<sup>2</sup>) of English inshore and offshore waters combined.<sup>†</sup> The total extent of MPAs is the combined area of: Nationally designated sites; National Nature Reserves (NNR), and Marine Conservation Zones (MCZ)); Internationally designated sites (Special Protection Areas (SPA) and Special Areas of Conservation (SAC)) under the European Union's Birds and Habitats

<sup>\*</sup> Also referred to as Sites of Specific Scientific Importance (SSSIs)

<sup>†</sup> English inshore waters contain 157 MPAs covering 51% of this region (26,126 km<sup>2</sup>). English offshore waters contain 40 MPAs covering 37% of this region (66,507 km<sup>2</sup>): <https://jncc.gov.uk/our-work/uk-marine-protected-area-network-statistics/>

Directives respectively; and Ramsar sites under the Convention on Wetlands of International Importance.

## Summary of 2019 report score

**In our 2019 report, Coastal and marine habitats and species scored a 5 (medium plan score, medium risk score).**

The assessment highlighted that plans are in place to conserve and improve marine and coastal habitats, which include requirements to consider how marine planning can take climate change into account. However, none included specific proposals to adapt to the key climate risks facing the marine environment. On progress in managing risk, available indicators suggested some improvement, although it was noted that more research was needed to assess the extent to which adaptive actions could increase the resilience of marine habitats and species to impacts from changes in acidity, dissolved oxygen content, temperature and ocean stratification.

## Has the plan score changed?

**No – score remains the same.**

**Marine Plans for the whole of the English area use UKCP18 projections to evaluate the longer-term risks and opportunities from climate change to marine habitats and species. Marine Protected Areas (MPAs) including Marine Conservation Zones (MCZs) are one of many factors considered within marine plans.**

The UK Marine Strategy (UKMS) provides a three-part regulatory framework for delivering marine policy at the UK level and sets out how the Government will achieve the vision of clean, healthy, safe, productive and biodiverse seas. The strategy includes overall ambitions for the marine environment, the targets to be achieved and the method to achieve those targets. Defra is currently investigating the possibility of incorporating climate considerations in UKMS assessments going forward.<sup>31</sup>

**The imminent adoption of an additional seven marine plans will meet the Government's 25-Year Environment Plan (25-YEP) commitment to complete the full series of England Marine Plans by 2021.**

Marine plans are developed by the Marine Management Organisation (MMO) and are agreed and adopted by Government under requirements laid out in the Marine and Coastal Act 2009. The plans set out statutory government policy to inform decision-making in the marine area. The environmental objectives and specific policies within the marine plans are informed by the high-level objectives, targets and indicators within the Marine Strategy. There are 11 Marine plans for the whole of the English marine environment in different stages of development.

Four Marine Plans have been officially adopted in England (see Table 2.2). Draft proposals for the remaining seven contain a number of policies to build the resilience of marine habitats to climate change. These include requiring plans to: demonstrate resilience to the impacts of climate change; ensure resilience to the impacts of climate change on the marine protected area network; protect adaptation measures already in place; protect habitats that provide carbon sequestration ecosystem services; not have significant adverse impacts on coastal change.

The adoption of a further seven regional marine plans by summer 2021, taking the total to 11, meets the Government's 25 Year Environment Plan commitment to complete the full series of England Marine Plans by 2021.

**Table 2.2**  
Status of English Marine Plans in England

Plan	Status	Review
Marine Plan for East inshore and East offshore areas inshore and East offshore areas	Adopted 2014	Decision taken by government in 2020 to update. Update scoping begins in 2021.
Marine Plan for South inshore and South offshore areas	Adopted 2018	First 3-year review to be completed in 2021, includes a recommendation to government on whether to amend or replace.
Draft Marine Plan for the North East inshore and North East offshore areas Draft Marine Plan for the North West inshore and North West offshore areas Draft Marine Plan for the South West inshore and South West offshore areas	Published for consultation 2020 – plans are a material consideration in decision making at this stage. Final adoption expected Spring 2021 - this will complete the first round of marine plans for all English seas.	1st review will be complete 3 years after adoption, including a recommendation on whether to amend or replace.

Source: MMO

**The Marine and Coastal Access Act (2009) sets out requirements for Marine Plans to take into account risks from climate change.**

While marine plans do not outline actions, and are not therefore SMART (see Chapter 1), the policies they contain are targeted as they relate to specific environmental concerns, and set out clear policy outcomes. The MMO considers a range of climate change scenarios, including UKCP18, when developing options to address the issues identified as relevant for marine planning. Under provisions set out in the Marine and Coastal Access (MCA) Act 2009, there is a statutory three-yearly review and reporting cycle, while the twenty-year lifetime of each plan makes them timebound.

**The statutory requirements of marine plan policies apply to decisions taken by public authorities only, meaning plans have a limited reach for managing activities of private organisations or other sea users that are not subject to public authority regulation.**

Section 58(1) of the MCA Act states that public authorities must take authorisation or enforcement decisions in accordance with the relevant marine plan policies. Furthermore, public authorities must have regard to relevant marine plan policies when exercising functions capable of affecting the marine area (Section 58(3)). However, only public authorities are duty bound under law to apply the policies. The plans only influence private organisations and other sea users if their activities require a public authority consent or authorisation, or if their activity is regulated and managed through other public authority functions, for example byelaw making powers, at which time marine plan policies will be taken into account by the relevant public authority. Furthermore, even at current levels, there is not enough evidence that sufficient financial and other resources are allocated for enforcement.

## Recommendation

The statutory requirements of marine plan policies must be extended to the decisions of public and private organisations. At present only public authorities are duty bound under law to apply the plan policies to their decisions meaning there is significant gap in the protections they are designed to provide.

Department: Environment Agency, Timing: June 2022.

### **The Fisheries Act 2020 and forthcoming Environment Bill should both create added protections for coastal and marine habitats and species.**

The Fisheries Act extends the powers of national authorities with regard to marine conservation in the UK. Under the Act, the Government will implement an ecosystem-based approach to fisheries management to make sure that negative impacts of fishing activities on the marine ecosystem are minimised, and to avoid degradation of the marine environment. Climate change is one of the eight objectives under the Act (see section 2.8 for further details).

Through the Environment Bill, the Government is setting the ambitious target of having all Marine Protected Areas (MPAs) in England in favourable condition by 2043. A legally binding target for MPAs will complement and bolster on-going work and existing legal obligation under the MCA Act and Conservation of Habitats and Species Regulations 2017 to meet established conservation objectives, by providing focus for the ambitions with clear aims and deadlines.<sup>32</sup>

### **The English component of the UK's contribution to a network of marine protected areas (MPAs) in the north east Atlantic is now complete.**

MPAs are designated by government under the Marine and Coastal Access Act 2009 to conserve the diversity of nationally rare, threatened and representative habitats and species. The second national Adaptation Programme (NAP2) includes an action to 'establish MCZs to contribute to an ecologically coherent network of Marine Protected Areas around England'. A third tranche of 41 sites was designated in May 2019 taking the total to 91.

Marine plan authorities are required to take account of the regime for MPAs and comply with obligations imposed in respect of them. This includes the obligation to ensure that the exercise of certain functions contribute to, or at least do not hinder, the achievement of the objectives of MCZs.

### **Government has completed analysis on controlling invasive non-native species (INNS) in the marine environment.**

In May 2019, the Government published a pathway analysis (as required then by EU Regulations) which identified three priority pathways for controlling INNS in the marine environment: (i) hull fouling, (ii) ballast water and (iii) contaminants of aquaculture animals. Further measures to provide increased prevention have been identified including: (i) ensuring vessels arriving or leaving UK waters have stringent hull cleaning and (ii) all ships to have a ballast water management plan.

### **The Committee's view is that the policy decisions within Shoreline Management Plans must be made statutory to ensure they are implemented.**

Shoreline Management Plans (SMPs) provide a framework to plan for coastal adaptation, investment and spatial planning over a 100-year time horizon (see also section 3.3). The Flood and Coastal Erosion Risk Management (FCERM) strategy notes the Environment Agency is working with coastal groups to refresh the SMPs in England to ensure they consider a range of future climate scenarios and are informed by the best available evidence, including the latest climate change projections. At present, it is not clear how this will be factored into revised plan

The non-statutory status of Shoreline Management Plans limits their effectiveness as a long-term strategy.

outcomes (including for both climate change responses and protecting habitats and species). The non-statutory status of SMPs severely undermines their effectiveness as the main vehicle that coastal authorities have to outline and implement their long-term strategy to prepare for the impact of climate change on coastal habitats and species.

Has the risk management score changed?

**No. The 'medium' score remains unchanged from 2019.**

**The proportion of protected coastal habitats in 'favourable' or 'unfavourable recovering' condition remains relatively high, while the extent of marine protected sites continues to increase.**

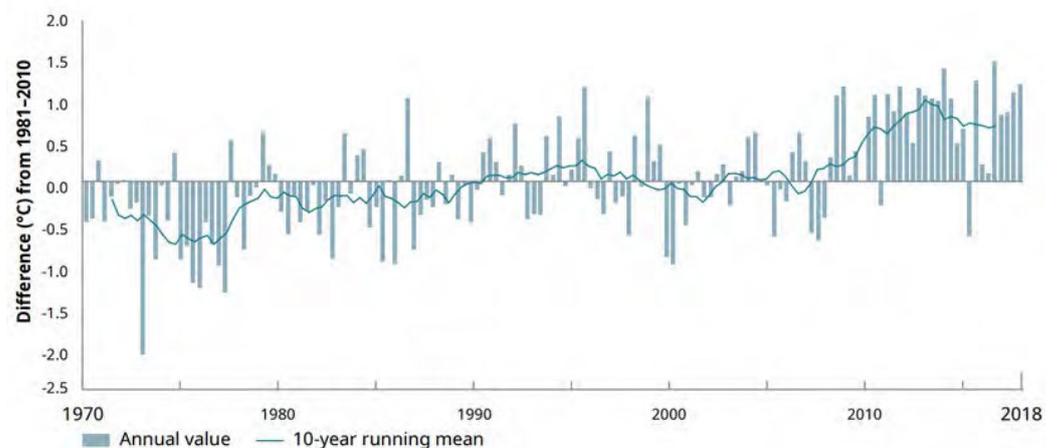

The indicators we have available to measure progress in adaptation of the coastal and marine environment include the condition of coastal sites of special scientific interest (SSSIs), and the area (but not condition) of marine protected sites. Indicators showing inputs of hazardous materials into the marine environment are also used as a proxy indicator of wider pressures that would reduce resilience to climate change overall. Unlike for terrestrial and freshwater habitats, the underlying hazard metrics that will affect marine biodiversity are also more straightforward to identify and so we include changes in these; sea surface temperature, and pH levels.

**Coastal sea surface temperatures have consistently been above their long-term average in recent decades.**

Changes in temperature of the seas around England can significantly influence the functioning of marine ecosystems. Long-term records show a warming trend in UK waters, despite short-term natural variability. On average, coastal sea surface temperatures have been 0.6°C warmer in the most recent decade compared to the 1961–1990 average (figure 2.12). Furthermore, eight of the 10 warmest years for UK sea surface temperature have occurred since 2002.

On average, coastal sea surface temperatures have been 0.6°C warmer in the most recent decade compared to the 1961–1990 average.

**Figure 2.12** Average annual sea surface temperatures for UK coastal waters, expressed as anomalies relative to the 1981 to 2010 average

Source: State of nature report, 2019

Notes: The blue bars show the annual anomalies relative to the 1981–2010 average, shown as the grey horizontal line, and the blue line shows the 10-year running mean.

**Adaptation plans outlined in NAP2 include the publication of climate impact evidence report cards by the Marine Climate Change Impacts Partnership.**

The UK Marine Climate Change Impacts Partnership (MCCIP) is a partnership between scientists, government, governmental agencies, non-governmental organisations (NGOs) and industry. Its 2020 report card covered 26 marine and coastal topics, supported by detailed peer reviewed topic reports which showed that:

- There is clear evidence that warming seas, reduced oxygen, ocean acidification and sea-level rise are already affecting UK coasts and seas. Increasingly, these changes are having an impact on food webs, with effects seen in seabed-dwelling species, as well as plankton, fish, birds and mammals.
- The upper range for the latest UK sea-level rise projections is higher than previous estimates, implying increased coastal-flood risk. The likelihood of compound effects from tidal flooding and extreme rainfall is increasing, which can greatly exacerbate flood impacts.
- Oxygen concentrations in UK seas are projected to decline more than the global average, especially in the North Sea.
- Impacts of climate change have already been observed at a range of heritage sites. Coastal assets will be subjected to enhanced rates of erosion, inundation and weathering or decay.

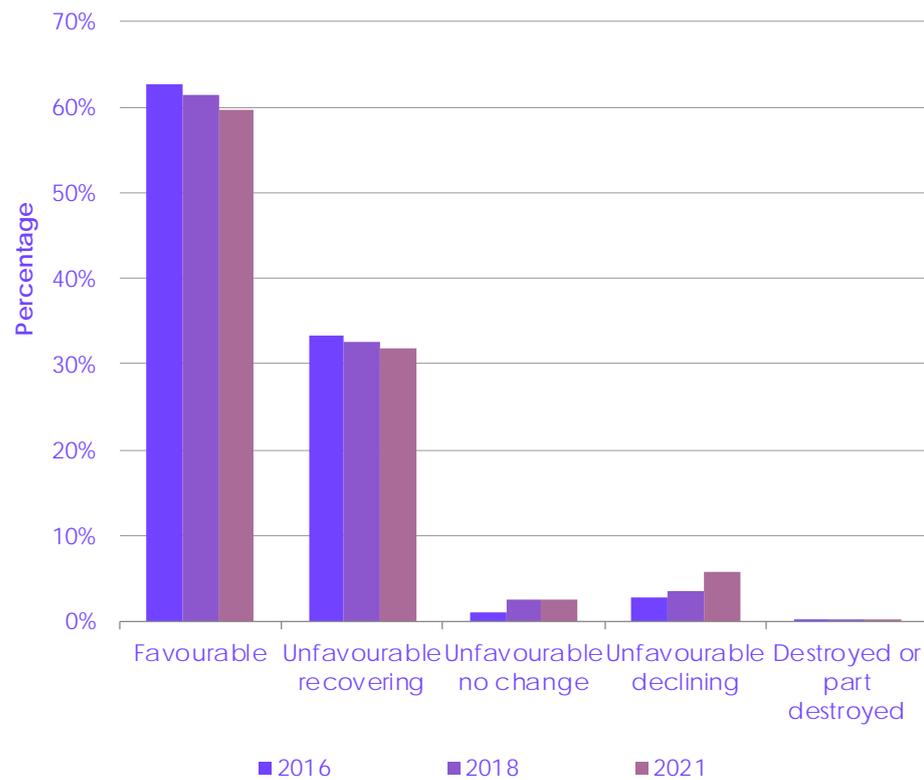

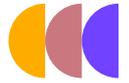

New research suggests climate change is already affecting UK coasts and seas.

The MCCIP have a new 5-year programme (2020-2025) currently underway. From 2021 onwards, the report cards will be replaced by rolling updates of marine climate evidence.

**There has been a decline in the overall condition of protected coastal sites.**

The proportion of coastal sites of special scientific interest (SSSIs) classed as in 'favourable' or 'unfavourable recovering' condition, declined from 96% in 2016 to 92% 2021 (see figure 2.13), but remains relatively high compared to terrestrial and freshwater habitats (see section 2.2 and section 2.4).

Figure 2.13 Coastal SSSIs in England, by condition

Source: Natural England, <https://designatedsites.naturalengland.org.uk/NEInterimReports/ConditionByHabitat.aspx>

**The area of marine protected sites around England have more than doubled since 2015.**

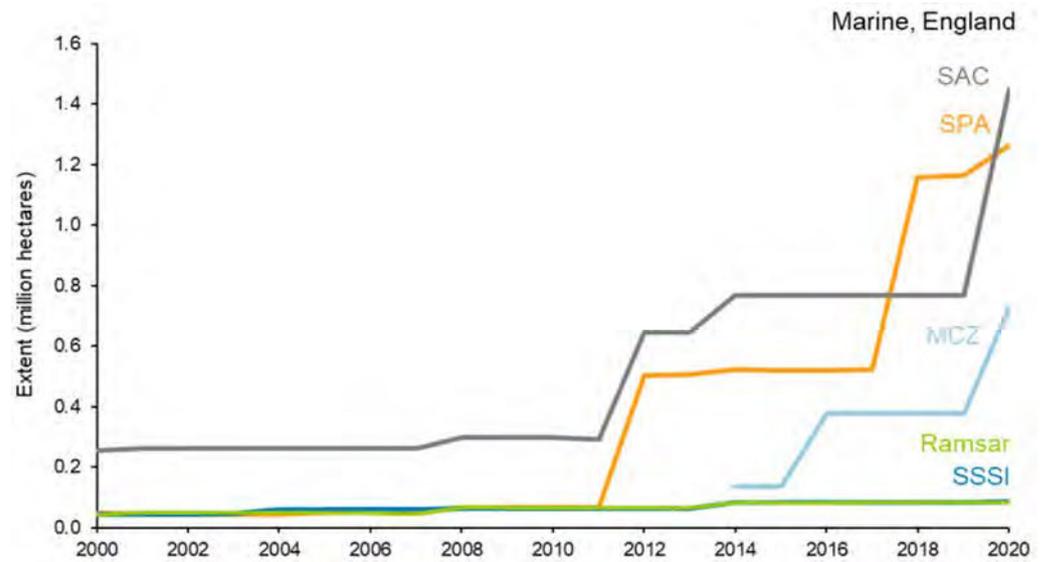

A well-designed and effectively managed network of marine protected areas (MPAs) is not just important for wildlife: it supports key sectors like tourism and recreation, safeguards habitats that store carbon, and enables fish stocks to replenish.<sup>33</sup> Increasing the area of MPAs is deemed to enhance the ability of marine habitats to manage vulnerability by reducing pressures through improving its condition. However, as noted above, without comprehensive powers to legally enforce marine plan policies, there is significant gap in the protections MPAs are designed to provide.

In the five years to 2020, the area of marine protected sites around the coast in England has more than doubled to 2.4 million hectares (Figure 2.14). A large contributor to this has been the designation of inshore marine sites under the European Birds and Habitats Directives.

As noted above, MCZ have also contributed substantially to the increase in the area of inshore marine sites around England, with the third phase of designations in May 2019 resulting in an increase of over 726,000 hectares.

In the five years to 2020, the area of marine protected sites around the coast in England has more than doubled to 2.4 million hectares.

**Figure 2.14** Extent of national and European protected sites at sea in England, by designation

Source: England biodiversity indicators 2020

Notes: 1. The extent of protected sites is the cumulative area assessed in March of each year shown. 2. Marine sites between mean low water and the 12 nautical mile limit are included; sites beyond 12 nautical miles, in UK waters, are excluded. These are included in the UK indicator on protected sites.

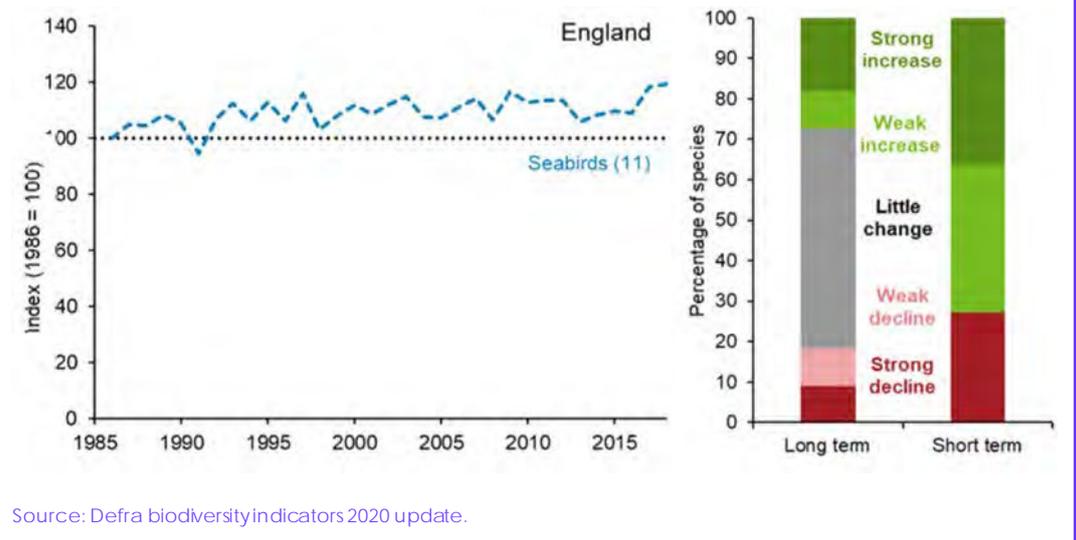

It should be noted that no data is currently available on the condition of non-protected sites.

**There have been some improvements in the abundance of breeding seabirds in England (although this trend is not seen when looking UK-wide).**

As top predators, seabirds are key indicators as to the magnitude of climate-induced changes in the marine realm; specialist seabirds in particular are known to also be very vulnerable to its impacts.<sup>34</sup> Generally, seabirds have highly specialised diets, being reliant on just a few prey species, the abundance and distribution of which can alter dramatically in response to abrupt environmental changes.

England’s coastline and offshore islands provide nesting sites for around seven million seabirds. Although fluctuating, the relative abundance of a suite of breeding seabird species has increased steadily since the late 1990s (Figure 2.15), recorded at the highest level in 2018, 19% higher than in 1986. Also, since 1986, a greater percentage of species show short term rather than the longer-term increase in abundance. However, this pattern is not reflective of the broader trend for breeding seabirds at the UK level, which has shown a 22% decline over the 1986 to 2015 period.<sup>35</sup> The difference could be due to the higher proportion of breeding seabirds being located outside of English marine waters.

Figure 2.15 Abundance of breeding seabirds in England

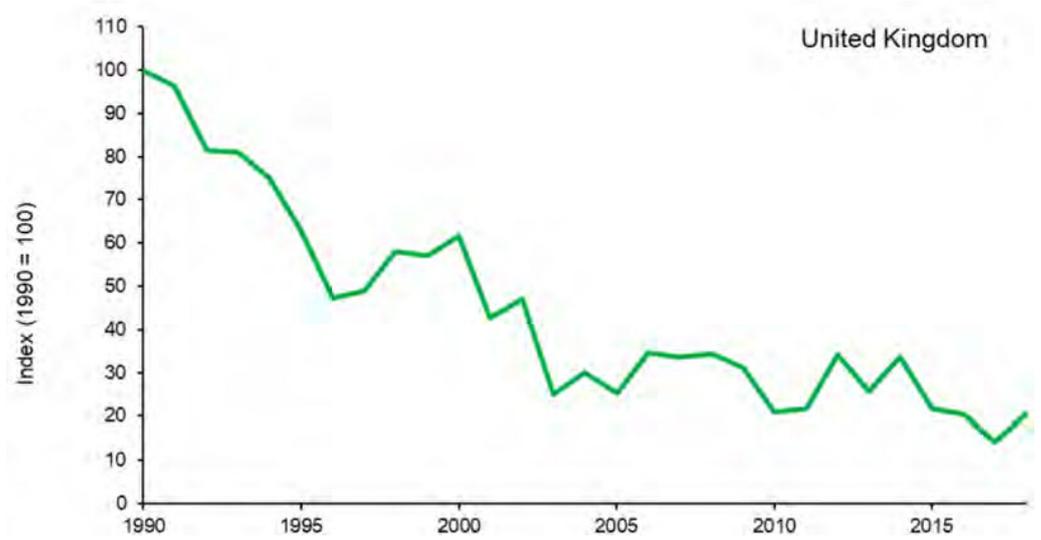

It is essential that regulatory protections around the emission of hazardous substances into marine environment be maintained and strengthened.

**Regulations on the emission of hazardous substances into the marine environment must not be relaxed if recent gains are to be retained.**

Reducing human stressors, such as pollution, on the marine environment helps strengthen its resilience to other pressures, including climate change and supports continued provision of ecosystem services. Trend data from the combined input of six of the most hazardous substances to the UK marine environment indicate a long-term decrease (-79% since 1990) (Figure 2.16). The introduction in 2018 of a new set of rules (as outlined in NAP2) for farmers and land managers to prevent pollutant emissions, protect water quality and improve soil health,<sup>36</sup> should continue to support the downward trend in emissions to the marine environment\*. However, it is essential that such regulatory protections around the emission of hazardous substances into marine (and broader) environment be maintained and strengthened if the gains achieved over recent decades are to be retained.

\* The rules set out what farmers must do or, consider to, manage risks posed by manures, manufactured fertilisers and soils through runoff, erosion and leaching.

Figure 2.16 Input of hazardous substances to the marine environment

Source: Defra biodiversity indicators 2020 update.

Notes: This indicator provides the combined input of six of the most hazardous substances to the UK marine environment: five heavy metals (cadmium, mercury, copper, lead and zinc) and one organic compound (lindane).

## 2.6 Commercial forestry

Progress summary – Commercial forestry		
2019 score:	What has changed since 2019:	2021 score:
5	<p><b>Plan score - medium</b></p> <ul style="list-style-type: none"> <li>Several medium quality adaptation plans are in place, although none directly consider climate impacts under different warming scenarios, supported by a set of actions. <p>Notes: See annex for full datasets            Key Indicators: Percentage of woodland in England under active management, Percentage of conifer and broadleaf species planted on the Nation's Forests, Total number of wildfire incidents in woodlands in England, Number of high priority forest pests in the UK Plant Health Risk Register.</p>		

### Summary of 2019 report score

**In our 2019 report, Commercial forestry scored a 5 (medium plan score, medium risk score).**

Our 2019 report found that climate change adaptation plans, which contain clear actions and outcomes, exist for the forestry sector, however, these lack clear targets and are near-term in risk outlook. Progress towards managing risk was mixed, with the Forestry Commission's target for increasing the area of forest under active management missed, although the diversity of tree planting continued to increase.

Has the plan score changed?

**No. The score is unchanged from 2019.**

**Adaptation plans are in place but these do not directly consider climate impacts under different warming scenarios, supported by a set of actions.**

The Forestry Commission has produced adaptation guidance for woodland management ('Managing England's woodlands in a Climate Emergency'), providing practical advice to landowners to manage climate change impacts on woodland. This document presents a summary of key climate change impacts covering different combinations of climatic drivers, and possible adaptation strategies for England's woodlands and forests including diversification of species, genetics, and stand structure.

While some consideration is given to possible impacts under future climate change in the guidance, these are more generic and not directly based on a range of warming scenarios.

**A UK Forestry Standard (UKFS) Practice Guide on adaptation is expected to be published during 2021.**

The guide aims to help forest managers and owners meet the adaptation requirements of the UKFS. The guide has been drafted and is undergoing Government review at time of writing. However, there is still limited information on how much of this adaptation guidance is actually being implemented, especially in the private forestry sector.

**There are online tools available to support practitioners select suitable tree species under climate change.**

The Climate Matching Tool provided by Forest Research shows regions in Europe with a similar current climate to the climate projection for any UK location. It is designed to help practitioners to consider the selection of better suited tree species from environments that England may experience in the future.

Underpinning the tool is UKCP18 climate data at 12km resolution using the RCP8.5 pathway in future projections. The climate matching tool should be seen as complementary to the Forest Commission's Ecological Site Classification tree selection tool, which shows how trees will perform in a future climate but does not take into account adaptation.

**The Forestry sector has developed a set of outcome-based actions, linked to specific climate threats, however, current plans lack timebound targets and do not take sufficient consideration of future climate impacts under different warming scenarios.**

The Government's Tree Health Resilience (THR) Strategy aims to improve the capacity of woodlands to adapt under climate change through minimising the impact of pests and diseases, as well as building resilience through selection of species and provenance. However, at present the 25-YEP and NAP2 do not include a measurable goal for managing and reducing the impact of existing plant and animal diseases including for forestry, and a clear deadline for achieving them.

The Forestry Climate Change Working Group (FCCWG), a cross-sector initiative, has developed a well-planned set of outcome-based actions to enhance the protection against pests and diseases over the next 5 years (published in 2018 as the Action Plan for Climate Change Adaptation of forests, woods and trees in England). The plan is integrated into the activities associated with the THR strategy. While the Plan contains a range of outcomes (24 in total) aligned, in varying degrees, to each of the priority actions, the outcomes do not include specific targets and timeframes over which to meet them. The FCCWG published its progress report in late 2019, which highlighted that despite progress in research and ongoing policy discussions, insufficient progress has been made in implementing adaptive actions.<sup>37</sup>

**Defra has published an England Tree Action Plan.**

Under the Plan, the Government has committed to supporting the FCCWG in implementing its adaptation plan. It will also launch a climate change competition to highlight best forestry practice, and the need to adapt new and existing woodlands to the effects of climate change (see also section 2.2). The Plan indicates the Government will develop a Woodland Resilience Implementation Plan to improve the ecological condition of woodlands in England and increase their resilience to climate change, including pests and diseases. It is understood there will also be requirements associated with choosing resilient species under the English Woodland Creation Grant.

At present there is no measurable goal for managing and reducing the impact of pest and diseases for forestry, and a clear deadline for achieving them.

The England Tree Action Plan indicates the Government will develop a Woodland Resilience Implementation Plan to improve the ecological condition of woodlands in England.

Has the risk management score changed?

**No. The risk management score remains medium.**

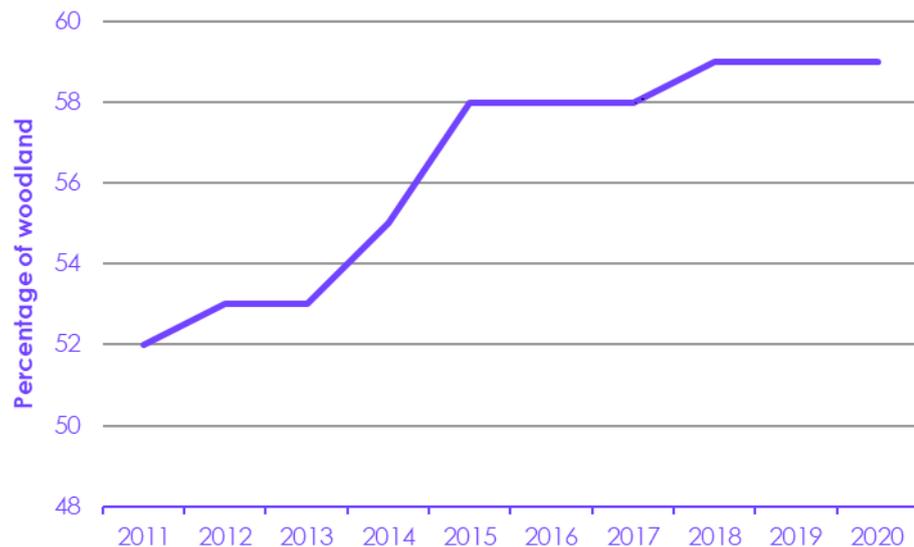

**The proportion of woodland under active management has remained largely unchanged since 2015.**

The percentage of woodland under active management has increase from 52% in 2011 to 59% in 2020, although it has remained largely unchanged since 2015.

Active woodland management for climate change adaptation involves anticipating future changes in temperature, rainfall, wildfire, and other extreme events to reduce risk exposure to both forestry and other ecosystem services and to thereby increase forest resilience. Immediate adaptation of forests and woodland to the changing climate is critical if society is to continue to benefit from the range of services they provide to wildlife, people and continue to produce timber for future generations. Active management, therefore, is an essential pre-requisite to proactively adapting commercial and other forests to climate change.

The percentage of woodland under active management has increase from 52% in 2011 to 59% in 2020, although there has only been a 1% increase since 2015 (Figure 2.17). The Government announced new funding to bring woodlands into management and increase sector capacity in the March 2020 budget as part of the Nature for Climate Fund (see Section 2.2).

**Figure 2.17** Percentage of woodland in England under active management, by area size (hectares)

Source: Forestry England.

Notes: As of 2020, 59 out of every 100 hectares of English woodland are actively managed, totalling 764,000 hectares of woodland in management.

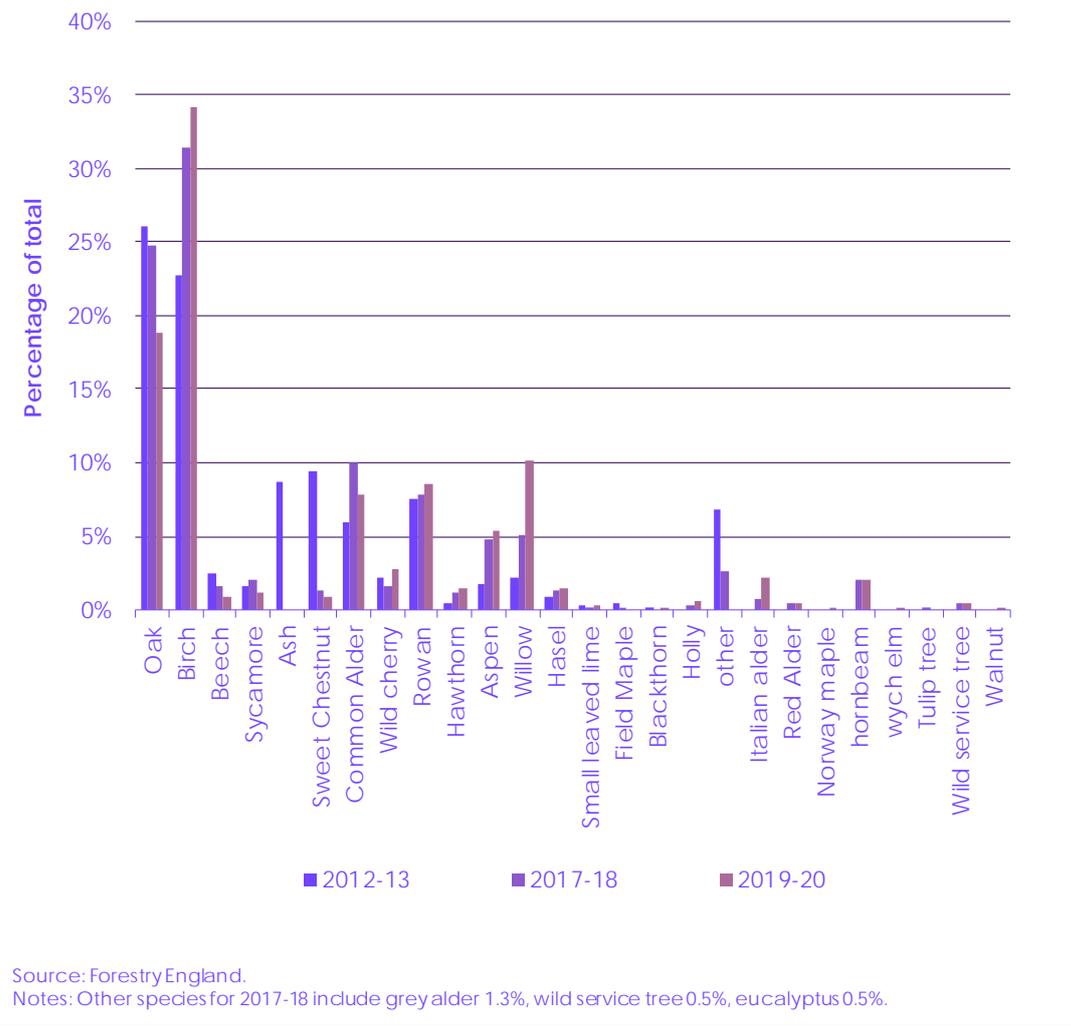

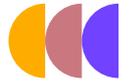

**There has been a consistent increase in the diversity of conifer and broadleaved species being planted each year.**

The number of different broadleaf species planted continues to rise; 23 major broadleaf species were planted in England's forests in 2019-20, up from 22 in 2017-18, and up from 17 in 2010-11 (see figure 2.18).

Increasing the diversity of tree species in new planting schemes is an important adaptation strategy designed to reduce threats from pests and diseases, and to help manage uncertainties around the suitability of particular species to future climate conditions.

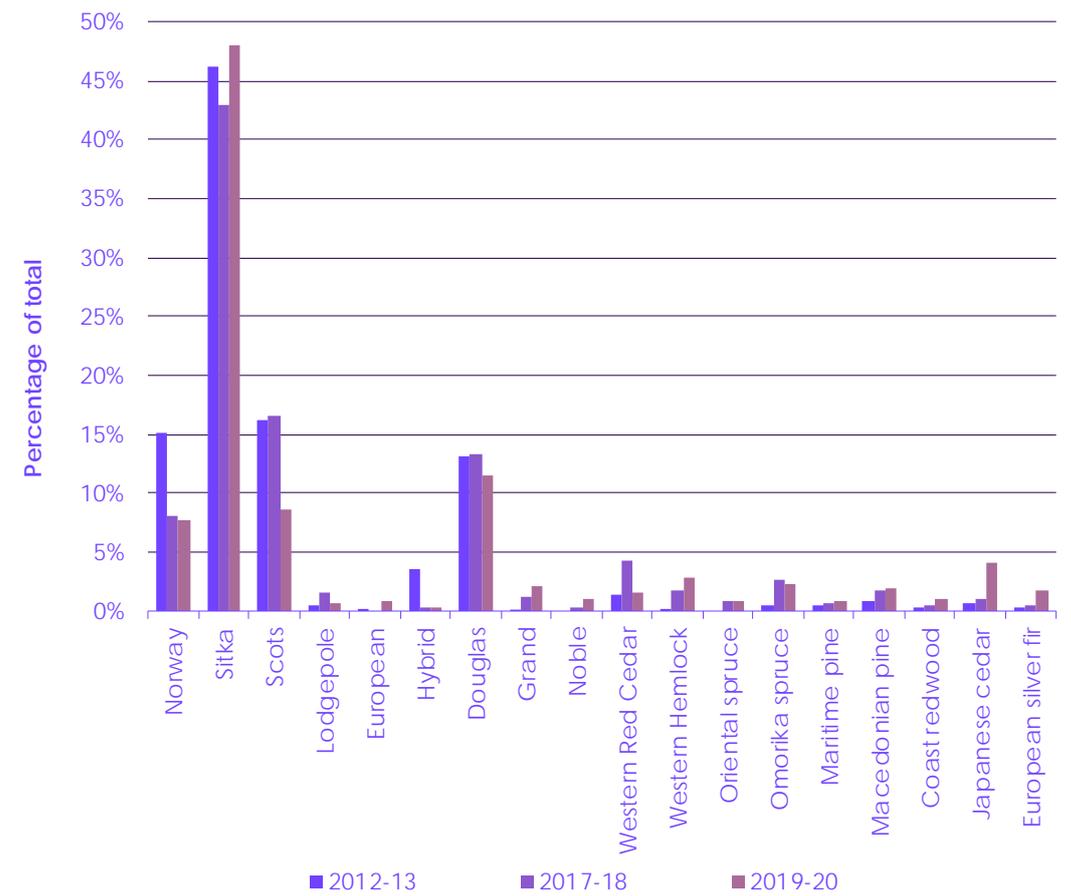

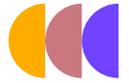

There has been a consistent increase in the diversity of conifer and broadleaved species being planted each year.

Figure 2.18 Percentage of broadleaf species planted in England's forests

The trend has also been positive for the diversity of conifer species. In 2019-20, 17 different major species of conifer tree were planted by Forestry England in the Nation's forests, up from 14 in 2017-18, and up from 8 in 2010-11 (Figure 2.19).

Figure 2.19 Percentage of conifer species planted in England's Forests

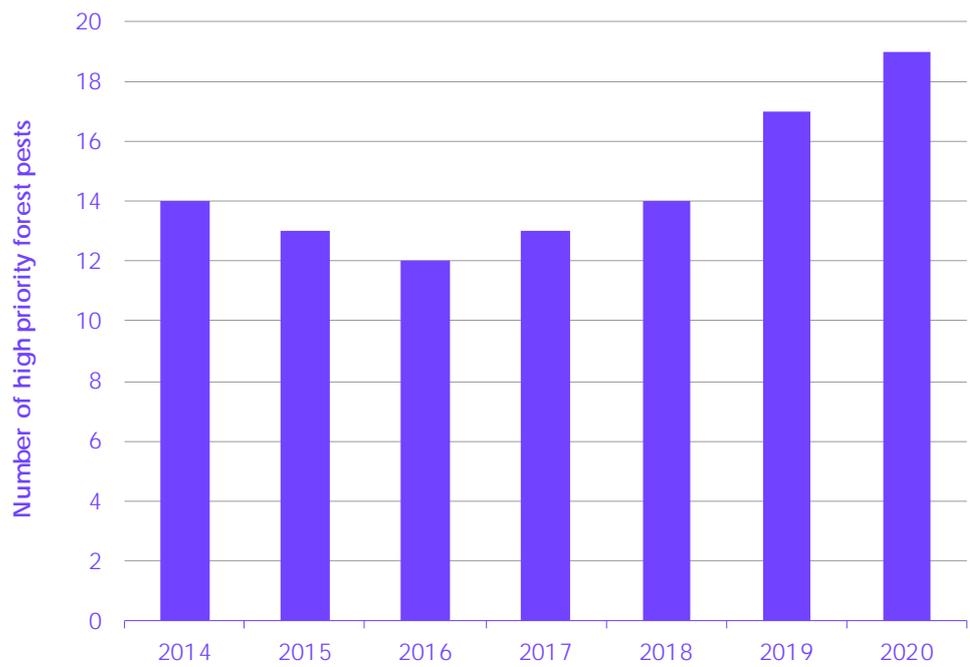

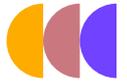

Source: Forestry England.

**Data on the number of high priority forest pests indicates a rise over the short-term.**

Pests, pathogens and invasive non-native species present serious risks to forest productivity, with consequences for livelihoods and businesses, as well as for the multiple ecosystem services that forests provide. The relationship of this risk with climate change is complex. Each problem species or micro-organism has its own specific climatic and ecological sensitivities that can favour their increased incidence. This includes parameters related to maximum and minimum temperature, moisture (both precipitation and specific/relative humidity can have an influence), and potentially wind (notably direction); these typically act in combination and are also related to duration or frequency of outbreaks.<sup>38</sup>

Despite evidence of actions to build resilience of England's forests to pests and diseases, the number of high priority forest pests in the UK Plant Health Risk Register (UKPHRR) has increased sharply in recent years, rising from 12 in 2016 to 19 in 2020. Although the data presented in figure 2.20 are for the UK, the UKPHRR report that nearly all listed forest pests present in the UK will also be present in England.

Figure 2.20 Number of high priority forest pests in the UK Plant Health Risk Register (UKPHRR)

## 2.7 Agricultural productivity

Progress summary – Agricultural productivity		
2019 score:	What has changed since 2019:	2021 score:
1	<p><b>Plan score - low</b></p> <ul style="list-style-type: none"> <li>Defra still lacks a strategy to ensure the agricultural sector remains productive as the climate changes. ELM plans to date are still limited largely to flood risk management, and do not consider the broader range of climate impacts (e.g. drought, pests and diseases) on agricultural productivity.</li> <li>There is some evidence of sector-led activity, although plans to date are narrow in scope (e.g. focusing only on drought and flood risks) and do not account for the effects of climate change under a range of future warming scenarios.</li> </ul> <p><b>Risk management score – low</b></p> <ul style="list-style-type: none"> <li>Although there have been declines in water abstraction by farmers, it is not clear if this represents any reduction in vulnerability to water scarcity. Additionally, while there is evidence of actions taking place to build the resilience of the sector, there are few appropriate indicators (e.g. soil health, agricultural R&amp;D) to support effective assessment.</li> </ul>	1
<p>Notes: See annex for full datasets Key Indicators: Wine Production - Area planted (ha) per year in England.</p>		

The agricultural productivity adaptation priority considers how climate change could affect the ability of the land to support domestic food production in the future as the climate changes. This priority considers the degree of innovation and flexibility in agriculture, the resilience of crops and livestock to climate change impacts including pests and diseases, and the resilience of the underpinning natural assets as they are needed to support agriculture – soil and water. If climate change degrades land capability overall, agricultural production will not be able to take advantage of any potential benefits from longer growing seasons.

### Summary of 2019 report score

**In our last report, agricultural productivity scored a 1 (low plan score, low risk management score).**

Analysis presented in the last report indicated there was a concerning absence of robust plans that considered the range of risks to and opportunities for the agricultural sector in England from climate change. Furthermore, a lack of effective indicators to monitor changes in the capability of agriculture in relation to climate change, meant that it was difficult to assess how the sector is managing current and future risk. As noted in the CCC's Sixth Carbon Budget report<sup>39</sup>, measures involving technological and land use changes in agriculture (e.g. improvements in crop productivity) will play an increasingly important role in achieving Net Zero. Building the resilience of the sector to climate change will be vital for the successful delivery of such measures.

### Has the plan score changed?

**No – the score remains unchanged from 2019.**

Defra still lacks a strategy to ensure the agricultural sector remains productive as the climate changes.

### **The agriculture sector still lacks a coherent strategy to ensure it remains productive under changing climatic conditions.**

A long-term strategy is required to prepare the agricultural sector in England for the range of risks to and opportunities from climate change, particularly with regard to water and soil management, and improving the technological capability of the sector to respond to threats such as changing pest and disease risks.

As set out above, the Government's proposed Environmental Land Management (ELM) scheme includes climate change adaptation in the defined list of public goods but content on threats to agricultural productivity is limited largely to building resilience with regard to flood risk management. There is no detail (as yet) on what will be required in terms of adaptation to the full range of risks to agriculture identified within the second UK Climate Change Risk Assessment (CCRA2-2017), including higher temperatures, drought, and increases in the spread of pests and diseases.

### **There are partial plans in place for protecting against the ongoing loss of lowland peat soils, although most plans are still in development.**

Lowland peat soils form part of the most productive agricultural land in England, but they are at high risk of loss as the climate changes.<sup>40</sup> Defra has created a new Lowland Agricultural Peat Taskforce with a remit to reduce the loss of lowland peat soils in England. The taskforce will help deliver the policy objectives outlined in the England Peat Action Plan (see section 2.2). Defra also concluded an internal evidence review of management practices with the potential to reduce soil loss and greenhouse gas emissions from lowland agricultural peatlands in England. The evidence will be presented as an input to the Task Force which is currently scheduled to report in July 2022.

### **Sector led plans indicate an increasing recognition of the need to adapt farming practices to the challenges of climate change, but gaps remain.**

Agriculture shows generally low levels of proactive planned adaptation, with most actions driven mainly by reactive and short-term adjustments rather than long-term decisions.<sup>41</sup>

A 2021 report by the National Farmers Union (NFU) lays out a blueprint for an Integrated Water Management strategy. The document aims to promote the implementation of contingency planning on farms to tackle the dual risks of flooding and water supply disruption.

There is some evidence of long-term adaptation planning by the Agriculture sector, although plans to date focus on drought and flood risks, and do not as yet account for the effects of climate change under a range of future warming scenarios.

Case study examples are presented in the report of on-farm planning for impacts of drought and flood on specific agri-product lines, and the policies needed to build resilience of agri-water infrastructure to climate change are outlined. The report also profiles a range of actions farmers and growers can take, and in many cases are already taking, to build the resilience of their businesses to the impacts related to flood and drought risk. These include: increasing water storage capacity and the use of water-saving techniques; adopting improved soil cultivation techniques to lock moisture into soils; implementing on-farm flood and drought risk management and contingency planning; and incorporating best practice in crop management.

While the report includes information on impacts to agricultural productivity from flood and drought risks, it does not consider the potential impacts and associated actions under 2°C and 4°C global warming scenarios. It is understood similar plans for the broader range of climate impacts (e.g. higher temperatures) are in the early stages of development by the NFU.

The Agriculture sector does not have a comprehensive plan to address the potential risks facing the agriculture sector from pests, pathogens and invasive non-native species.

**There is still no comprehensive plan to address the potential risks facing the agriculture sector from pests, pathogens and invasive non-native species.**

NAP2 includes actions to manage existing plant and animal diseases and lower the risk of new ones (see also section 2.2 Terrestrial habitats and species). As noted in CCRA3<sup>42</sup>, climate driven increases in the spread of pests, pathogens and invasive non-native species (INNS) present serious risks to agricultural productivity. Large-scale outbreaks or invasions may have serious ramifications for food security. Adaptation actions can include research into building the resilience of crops grown through diversifying their genetic composition, and measures to improve control for pests and diseases. However, the agricultural sector in England currently lacks a strategic-level plan, which includes coordinated surveillance and monitoring, and improved risk assessments with space and time dimensions to evaluate changing dynamics of individual pests, pathogens and INNS.

The Government has provided some funding to support long-term research into the genetic improvement of arable crops and fresh produce via the development of Genetic Improvement Networks (GINS). Defra allocated £5.5 million in 2018 over a five-year period. The research includes work to identify crop varieties which have better levels of resistance to pest and disease. The GINs are required to report on research annually, to 2023.

**Initiatives to develop research and improve agriculture efficiency should help boost the industry's resilience to climate change and reduce emissions.**

Recent research initiatives relevant to improving resilience include:

- The Countryside Productivity Small Grant (CPSG) scheme provides funding for farmers to purchase equipment to improve the productivity of their farm. Eligible activities under the scheme include more efficient use of water for irrigation, and to secure water supplies for crop irrigation by the construction of on-farm reservoirs. The Government is providing a further £21m in 2021 bringing the total investment to £60m.
- A Farming Investment Fund to support innovation and productivity is being established where grants will be available for farmers to invest in equipment, technology and infrastructure with an aim to build the efficiency of farm businesses, including on-farm water storage. The fund was announced by Defra as part of a package of measures to support the transition from the Basic Payment Scheme towards the new ELM scheme. It is understood the fund is scheduled to launch in autumn 2021.

Has the risk management score changed?

**No – the risk management score remains low.**

**Indicators to measure how the capability of the agricultural sector is changing in relation to climate change remain very limited (e.g. lack soil health metrics). It is, therefore, not possible to conduct a robust assessment of changes in the vulnerability of agricultural production to climate change.**

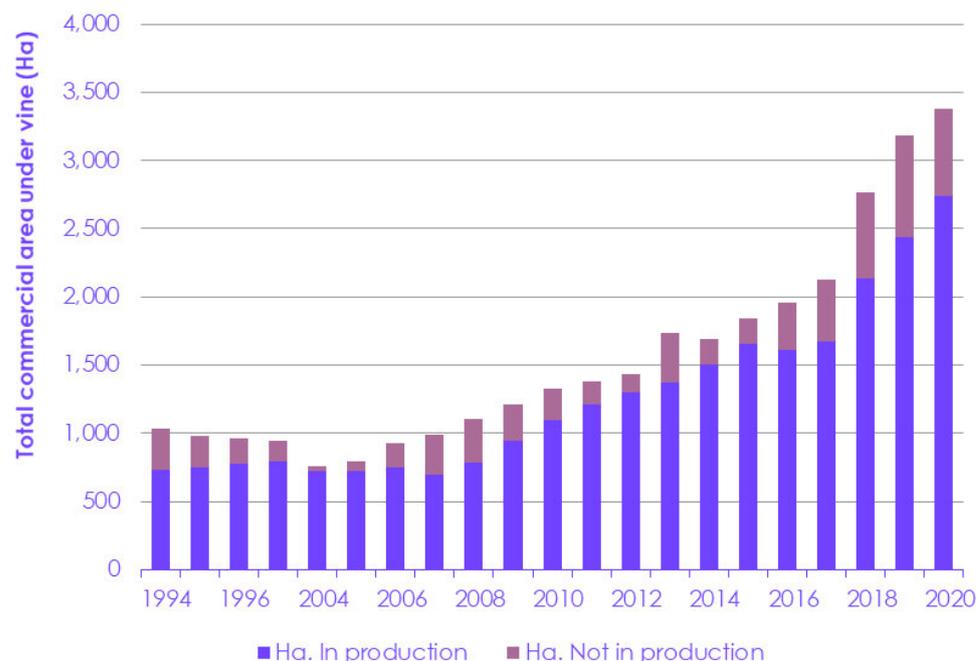

**There is presently limited information on the establishment and spread of new crops.**

Crops that are likely to become more viable commercially in the UK as the climate changes include peaches, apricots, tea, sunflowers, sweet potatoes, watermelons, walnuts, and truffles.<sup>43</sup>

While there is some evidence of actions taking place to build the resilience of the Agriculture sector, there are few appropriate indicators currently available (e.g. soil health, agricultural R&D in adaptation) to support effective assessment.

Commercial wine production is becoming viable over larger areas in England. The total commercial area under vine in England and Wales has more than doubled in the last decade from 1,384 hectares in 2011, to an estimated 3,380 hectares in 2020 (Figure 2.21). These values are for commercial vineyards only and do not include 'hobby vineyards' and 'abandoned vineyards\*'.<sup>1</sup>

**Figure 2.21 Wine Production - Area planted (ha) per year in England**

Source: ADAS for the CCC (2021) *Research to update indicators of climate-related risks and actions in England.*

There is no indication in the datasets as to whether this increase in area is being driven by improving climatic conditions for the vines, or whether there are other economic reasons for the increase in area. However, it is anticipated that the climate is becoming more suitable for vine production and thus opening up an opportunity for growers interested in wine production.

**Adaptation actions to improve monitoring and measuring of water (to ensure optimal use) and the identification of innovative techniques to reduce demand and reuse water are required both at a farm and catchment scale.**

Long-term declines are evident in the volume of water abstractions from non-tidal sources for both agricultural and fish farming sectors (see section 2.8 and section 2.9). However, the reasons for this are not clear and on its own it does not suggest whether the vulnerability of the agriculture sector to water scarcity is changing.

\* In 2020, 'hobby vineyards' and 'abandoned vineyards' accounted for an estimated additional 66 hectares and 54 hectares respectively.

**Better Indicators are needed to measure changes in the level of agricultural expenditure on adaptation.**

The amount of investment in agricultural research and development (R&D) on climate-specific issues is a useful indicator of action. The Office for National Statistics (ONS) publishes annual data on R&D investment for agriculture, forestry, fisheries and hunting. At present, however, sub-industry data for this indicator are not available, meaning we are unable to assess changes specific to the agriculture portion of R&D investment.

**Indicators are urgently needed to measure the ability of agricultural soils to support food production.**

Better Indicators are needed to measure changes in the level of agricultural expenditure on adaptation, and the ability of agricultural soils to support food production.

Soil degradation, through erosion and reduced organic matter, could cause an irreversible decline in the productive capacity of the land. In the case of agriculture, soils are being degraded by intensive farming practices in some areas (such as the Fens), with deep ploughing, short rotation periods and exposed ground leading to soil erosion from wind and heavy rain.

Defra are considering the potential scope for a soil health action plan (see section 2.2). Draft plans include developing a new Soil Health Monitoring Scheme (SHMS) for England to produce a new robust data baseline. A healthy soils indicator will be developed to feed into the SHMS and will inform a future target for soil health under the Environment Bill. Separately, a new Soil Structure Measuring and Monitoring Scheme is being developed to enable visual assessments to be carried by farmers and land managers across all land use/soil types.

## 2.8 Water management

Progress summary – Water management		
2019 score:	What has changed since 2019:	2021 score:
5	<p><b>Plan score - medium</b></p> <ul style="list-style-type: none"> <li>Revisions to the river basin management plans consider potential climate impacts under a range of warming scenarios. However, there is insufficient consideration of risks to water quality from higher temperatures in the current plans.</li> <li>The Environment Agency's second Flood and Coastal Erosion Risks strategy also considers adaptation for a range of climate scenarios and emphasises the potential for nature-based solutions to manage risks of flooding, including to agricultural land.</li> </ul> <p><b>Risk management score – medium</b></p> <ul style="list-style-type: none"> <li>There is a lack of appropriate indicators to show how the vulnerability of the freshwater environment for providing water for human use is changing.</li> <li>Progress has been made in supporting sustainable abstraction of water from the environment through the Environment Agency's Restoring Sustainable Abstraction Programme.</li> <li>The use of land for natural flood management remains poorly recorded.</li> </ul>	5
<p>Notes: See annex for full datasets Key Indicators: Progress made by Restoring Sustainable Abstraction Programme.</p>		

This adaptation priority considers the regulating services related to the availability and quality of water in the environment, and flood risk management provided by the natural environment. Freshwater biodiversity is covered in Section 2.3.

### Summary of 2019 report score

**In our last report, water management scored a 5 (medium plan score, medium risk management score).**

Our 2019 report highlighted that while plans are in place and actions are being implemented to address increased risks of water scarcity in vulnerable locations, there was insufficient consideration of risks from higher water temperatures. Furthermore, there were no goals set out in current policies for how land should be used to manage flood risk as the climate changes.

On progress in managing risk, the downward trend in abstraction of water for agriculture suggested a decline in vulnerability to future water deficits, although on its own it is a very limited indicator as change is influenced highly by demand. A lack of information on the use of land for natural flood management in England meant we were not able to assess progress in this area accurately.

Has the plan score changed?

**No. The score remains the same.**

Revisions to the river basin management plans lack sufficient consideration of risks to water quality from higher temperatures across the impacts identified.

**Revisions to the river basin management plans (RBMPs) that consider the potential climate impacts under a range of warming scenarios will support adaptation decisions on the use of water to address future risk. However, there is insufficient consideration of risks to water quality from higher temperatures in current plans.**

As part of the process of reviewing the RBMPs (see section 2.4), in 2020 the Environment Agency completed a 'Challenges and Choices' consultation. The consultation was used to raise awareness of the impact of climate change on water management in England and gather views from stakeholders on how to mitigate these risks. Climate related changes identified included: climate and biodiversity crisis, changes in water levels and flows, and invasive non-native species. This work has started a conversation around the challenges stakeholders and the communities they represent face in the future. The discussions have led to some initiatives to prepare for warmer water temperatures (e.g. keeping rivers cool project). However, there is still insufficient consideration of risks to water quality from higher temperatures across the impacts identified.

The Environment Agency has produced current and future pressure assessments for each of the RBMP challenges identified. The futures analysis component builds on current understanding by incorporating projections for climate change, population growth and land use change, and aims to improve such tools to inform future water planning.

**The Government's water abstraction plan provides a framework to manage risks of water scarcity, but does not give adequate consideration to risks to water quality as outlined in CCRA3.<sup>44</sup>**

The 25-Year Environmental Plan identifies the Water Abstraction Plan (WAP) 2017 as the Government's key tool to help meet its 'Clean and plentiful water' goal, and to meet the challenges of climate change both now and in the future. The plan has three main elements: addressing unsustainable abstraction; stronger catchment focus; and modernisation. The WAP refers to the link between climate change and sustainably abstracted water bodies and the benefits of a stronger catchment focus in delivering greater sustainability and access to water. It is understood outputs from the RBMP risk scenario assessments (see above and section 2.4) will feed into the WAP, but it is not clear how results will support appropriate actions.

**The second Flood and Coastal Erosion Risk Management (FCERM) strategy emphasises the potential for nature-based solutions (NbS) to manage the risks of flooding.**

Natural flood management (NFM) is a central feature in the Environment Agency's national FCERM Strategy, which makes several commitments to mainstream NbS citing the benefits of working with natural processes to manage current and future flood risk. The Environment Agency has also been developing evidence and knowledge sharing concerning NFM<sup>45</sup>, including case studies on different NFM approaches, as well collaborating internationally with the US Army Corps 'Atlas' work on 'engineering with nature'.

**Funding has been allocated to natural flood management projects, but early lessons are only just emerging and further evidence of the success of projects is needed.**

In 2017, the Environment Agency began a £15 million pilot programme to learn more about NFM, working with communities, land managers, catchment partnerships and coastal groups around England. The programme completed in April 2021, with 56 NFM projects across the country delivered with local community groups, and improving 4,000 hectares of habitat. Currently, the Environment Agency identifies 40 projects as part of their FCERM investment programme that

The Environment Agency has allocated funding to natural flood management projects, but early lessons are only just emerging and further evidence of the success of projects is needed.

include NFM measures, but recognise that further learning about NFM is needed to increase confidence in its use.

**As noted in NAP2, the Environment Agency has committed to producing a Natural Flood Management design manual by 2020.**

The manual will assist practitioners in selecting appropriate NFM measures. CIRIA\* has been commissioned to lead a project to develop the design manual on behalf of the Environment Agency. The project is scheduled to complete in winter 2021/22.

Has the risk management score changed?

**No, the score has remained medium.**

**There is a lack of indicators to show how the vulnerability of the natural environment for providing water for human use is changing.**

Effective water management is a fundamental function of agricultural production, whether it be through water storage or sustainable abstraction for irrigation used to water crops. A changing climate is likely to bring greater variability in rainfall and higher temperatures. This could result in less groundwater recharge and larger seasonal variations in river flow as well as changes to when and how extended dry periods occur. Sustainably abstracted water bodies will be more resilient to changes in climate and drought pressures so addressing unsustainable abstraction will help improve resilience to climate change. As noted above, through the WAP, the Environment Agency is looking to reduce the amount of water that can be abstracted under a licence based on historical long-term average use.

**Progress has been made in supporting the sustainable abstraction of water from the environment through the EA's Restoring Sustainable Abstraction Programme.**

Through the Restoring Sustainable Abstraction (RSA) programme, launched in 2008, the Environment Agency has been investigating and changing permanent abstraction licences that have caused environmental damage, reduced biodiversity and undermined ecosystem resilience to climate change. The RSA programme identifies abstraction licences for which there were concerns about an impact on the environment and, where possible, identifies options to make the abstraction sustainable. This is either through voluntary agreement with licence holders or using compulsory legal powers. As of March 2020, 85% of the RSA Programme had been delivered, equating to changes to 320 abstraction licences.

**Data to support the assessment of changes in the level of on-farm water storage capacity in England is no longer collected.**

In our 2019 assessment, we presented information taken from Defra's Farm Business Survey on the percentage of farms sourcing water from various water sources, including from on-farm water infrastructure. Data on this ceased to be collected as part of the survey beyond the 2015-16 financial year, so we are unable to assess recent progress in developing on-farm water storage capacity for this report.

Some progress has been made in supporting sustainable abstraction of water from the natural environment.

### Summary of 2019 report score

#### **Commercial fisheries and aquaculture scored a 2 in the 2019 report (low plan score, medium risk score).**

Our 2019 report highlighted that without an adequate plan for aquaculture, existing plans for the sector did not represent a sufficient strategy for adapting the industry to climate change. Available indicators suggested some progress has been made under the EU Common Fisheries Policy in introducing sustainable fisheries measures, while substantial research into the effect of climate change was underway.

#### Has the plan score changed?

#### **Yes. Medium levels plans are now in place for the sector.**

The UK marine fishing industry was worth ca. £1.5 billion in 2017 (total catches were worth £980.1 million) and employed 23,000 people, although this is rather unevenly distributed between sectors and around the UK.<sup>46</sup>

#### **The Fisheries Act. 2020 contains provisions to improve the ability of the Fisheries and Aquaculture industries to adapt to climate change, including a requirement for authorities to report triennially on how objectives will be met.**

The Fisheries Act (2020) replaces the EU's Common Fisheries Policy (CFP) in providing a framework for domestic fisheries policy governing foreign access to British fishing grounds, the licensing of fishing boats, and grants connected to fishing. The Act also extends the powers of national authorities with regard to marine conservation to the whole of the UK Economic Exclusion Zone (EEZ).

Climate change is listed as one of the eight objectives under the Act, notably reducing the impact of fisheries (e.g. through lowering emissions), and to fisheries (e.g. through improving its ability to adapt to the effects of climate change).

Climate change is listed as one of the eight objectives under the Fisheries Act. 2020.

The Act itself does not set out the specifics of how climate change objectives will be achieved. Rather, it creates a legal requirement for the UK's four national fisheries policy authorities (e.g. Marine Management Organisation (MMO) for England) to produce a Joint Fisheries Statement (JFS) that will lay out how these objectives will be met. The Act requires these authorities to produce the JFS within two years of the Fisheries Act being passed (November 2022). The Act also includes provisions to report on the JFS policies every three years, and to review the JFS every six years. This aims to ensure the policies will be responsive, and remain fit for purpose in order to achieve the fisheries' objectives. It is not clear at this stage the extent to which the impacts of climate under different warming scenarios will be included in the JFS.

**Policies to replace former EU protections must ensure gains made under the Common Fisheries Policy are maintained and built on.**

To support adaptation, policies for fisheries and aquaculture need to achieve at least two key aims: sustainable yields for populations; and flexibility through time in what species are caught, to mirror the changing species diversity and abundance in UK waters as the climate changes. Previously under the CFP, a number of tools were used to manage UK fisheries including: minimum landing sizes; mesh sizes; effort control (limiting days at sea, or power of vessels); area closures; technical measures specifying aspects of the design of the gear; and landing restrictions. The setting of a Total Allowable Catch was the primary means of controlling the number of fish removed from a stock. It is likely that EU-exit will have major implications for these fisheries, most notably in terms of changes in fisheries policy (quota arrangements, regulations etc.). It is vital that the policies implemented under the Fisheries Act ensure the gains made in improving the sustainability of the UK fishing industry are both maintained and increased.

**NAP2 includes the release of several reports by Seafish, the industry body with a remit to support the profitability and sustainability of the seafood industry.**

Seafish has produced a climate change adaptation report for the aquaculture side of the sector. The report considers the major impacts on the industry, from production to processing, that arise from five principal climate change drivers (sea level rise; changes in storms and waves; temperature change; ocean acidification; and changes in terrestrial rainfall) and sets out key areas for adaptation action. The report compliments a previous Seafish climate change adaptation report for the UK wild capture seafood side of the industry. The document also considered the major industry impacts arising from key climate change drivers and sets out major areas of adaptation action, and was produced in collaboration with key partners, for the UK Government under the first Climate Change Adaptation Reporting Power. However, while both reports comprehensively cover impacts from key climate threats, the assessments lack explicit consideration of 2°C and 4°C global temperature scenarios.

It is anticipated that evidence on climate change to inform potential responses will be collected on an ongoing basis for aquaculture in the form of an annual 'watching brief' as is currently the case for the wild capture seafood report.

Has the risk score changed?

**No, the risk score remains medium.**

Climate change drives modifications in marine ecosystems that affect fisheries' productivity and food security. Fish are an integral component of marine biodiversity. They are an important element of the food chain for seabirds, seals and cetaceans (e.g. whales) and are a source of food and employment for people.<sup>47</sup>

Adaptation plans have been produced for the aquaculture and wild capture sides of the fisheries sector, but as yet neither plan considers climate impacts under a range of warming scenarios.

There is increasing evidence of climate impacting on the off-shore fishing industry.

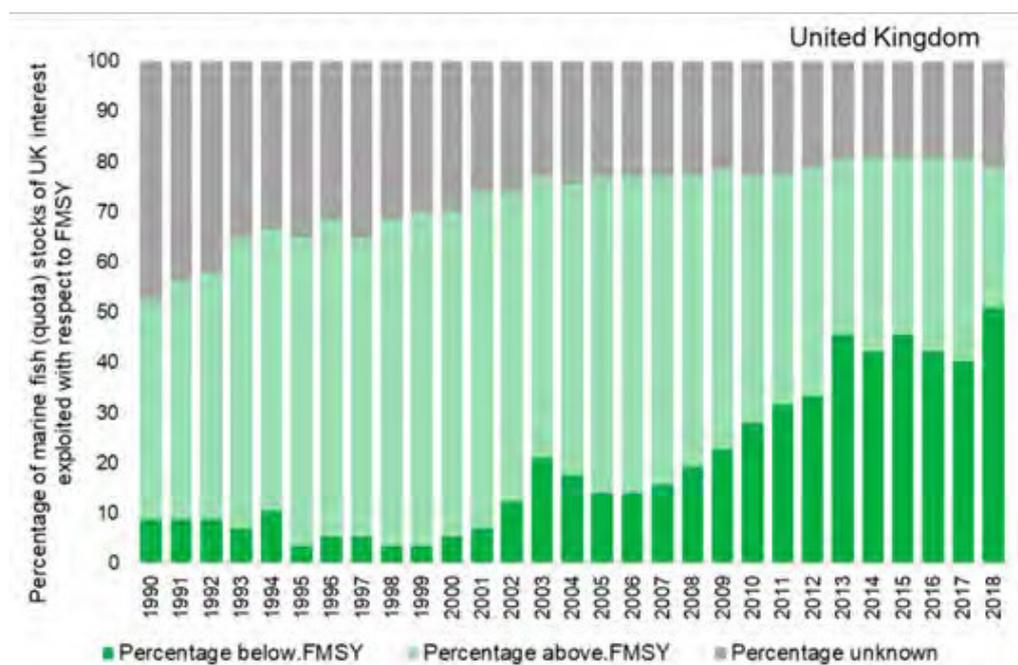

**The Marine Climate Change Impacts Partnership 2020 Report Card 2020 showed increasing evidence of climate impacting on the off-shore fishing industry.**

The report card states that fisheries productivity in some UK waters has been negatively impacted by ocean warming, including impacts to the timing of spawning among species, as well as substantial changes in fish communities in UK waters, linked to the appearance of warm-water species. There is also evidence to suggest warming, and associated oxygen solubility, appears also to be affecting the age at maturation, growth rates, and the maximum size fish can attain.

**Indicators of the extent and condition of recorded fish stocks suggest long-term improvement, however, it is not possible to assess fish species that are not under quota management.**

Maintaining sustainable fisheries helps to ensure marine ecosystems remain diverse and resilient, providing a long-term and viable fishing industry. The percentage of fish stocks at or below levels capable of producing maximum sustainable yield (MSY) has increased from 9% in 1990 to 51% in 2018 (Figure 2.22).

**Figure 2.22** Percentage of marine fish (quota) stocks of UK interest harvested sustainably

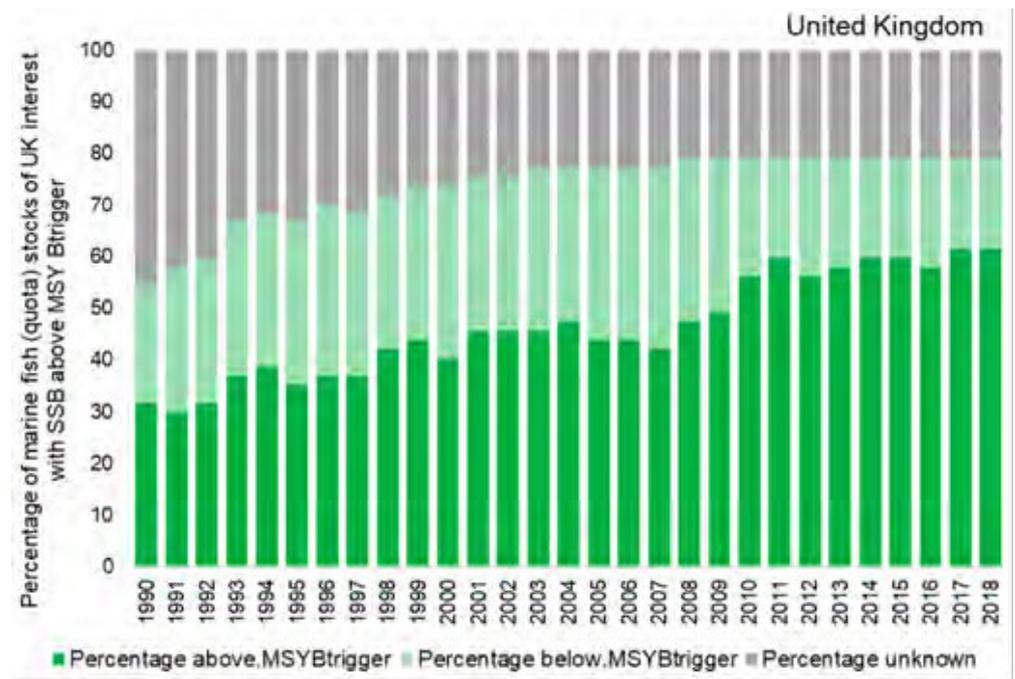

Source: Defra biodiversity indicators 2020 update.

Notes: 1. The list of stocks used within the indicator was expanded in 2017, so publications of the indicator using data prior to 2017 are not directly comparable. Note that Defra first published this indicator using the expanded list of stocks in 2019. 2. Also, not directly comparable with previous publication; As data are added to time-series and stock assessment models are refit, small changes can occur in past estimates even if the model structure is not itself revised.

The spawning biomass (SSB) of each respective fish stock should be at or above a level capable of producing maximum sustainable yield if the reproductive capacity of stocks is to be maintained. The percentage of stocks achieving this goal has also increased, from 32% in 1990 to 61% in 2018 (see figure 2.23). For 2020, the UK will have 67% of its Total Allowable Catches set at Maximum Sustainable Yield (MSY) out of the total stocks with MSY assessments.<sup>48</sup>

**Figure 2.23** Percentage of marine fish (quota) stocks of UK interest with biomass at levels that maintain full reproductive capacity

Source: Defra biodiversity indicators 2020 update.

Indicators show there are a greater proportion of marine stocks fished sustainably and within safe biological limits, both in the long and short term. However, existing metrics only include fish stocks covered by quota management.

The indicators presented in figure 2.22 and figure 2.23 only include UK fish stocks that are subject to quota management. Both are based on a group of 20 species in 57 stocks for which there are reliable estimates of fishing mortality and spawning biomass, together with MSY reference points for fishing mortality and biomass that allow the sustainability of the stocks to be evaluated. The indicator stocks include a range of local and widely distributed species of major importance to the UK fishing industry. Data limitations, however, mean it is not possible to assess the extent and condition UK fish stocks that are not subject to quota management.

**The absence of long-term monitoring datasets mean we are not able to assess the status of seafloor marine species.**

The use of bottom trawling by the fishing industry can have widespread impacts on the condition, and therefore vulnerability to climate change, of marine habitats and species. Physical disturbance can affect seafloor habitats adversely, with shifts in sea floor community composition being reported.<sup>49</sup> These shifts are driven by the replacement of larger, long-lived, slow-reproducing species with small, fast-growing species.<sup>50</sup> Data limitations mean changes in the status of seafloor marine species are not included in the assessment.

# Chapter 3

## People and the built environment

3.1 Introduction	114
3.2 Flood risk management and climate change	115
3.2.1 River and coastal flood alleviation	121
3.2.2 Development in areas at risk of river or coastal flooding	124
3.2.3 Surface water flood alleviation	130
3.2.4 Development and surface water flood risk	134
3.2.5 Property-level flood resilience (PFR)	138
3.2.6 Capacity to recover from flooding	143
3.3 Coastal erosion risk management	148
3.4 Water demand in the built environment	152
3.5 Public health and wellbeing	158
3.5.1 Health impacts from heat and cold	159
3.5.2 Risks to people from pathogens	172
3.5.3 Air quality	177
3.6 Effectiveness of the emergency planning system	181

## 3.1 Introduction

---

The vast majority of people in England live in built-up areas, with about 92% of the population living in cities and towns.\* The built environment therefore has a strong influence on how climate change will impact upon people and communities. For example, the level of flood risk to communities depends on: whether houses are built in areas exposed to flooding; the level of protection provided by flood alleviation schemes; and whether resilience measures are put in place at the individual household level. Housing quality determines whether people live in damp, excessively hot, or cold homes, with the health cost to the NHS of poor housing estimated to be around £1.4 billion per year.<sup>1</sup> The extent of permeable surfaces and urban green space impacts on the quantity and quality of water entering drainage networks and being discharged into watercourses. Green spaces also help to reduce temperatures in built-up areas.

The COVID-19 pandemic has led to people spending more time indoors – particularly their homes – potentially exacerbating exposure to other risks, including weather-related risks.<sup>2</sup> However, the impacts of COVID-19 may have raised awareness of the importance of understanding major threats that can disrupt lives and livelihoods, including low-probability, high-impact events (e.g. flood events).<sup>3</sup>

The third UK Climate Independent Assessment (CCRA3) has updated the evidence on the many, diverse climate change risks that impact upon people and the built environment. Most of these (55 out of 61 risks and opportunities) require more action or further investigation by Government.<sup>4</sup>

This chapter assesses whether climate change is being planned for, whether adaptation actions are taking place, and whether those actions are leading to reductions in vulnerability or exposure. Flooding (Section 3.2); coastal erosion (Section 3.3); water availability (Section 3.4); and health impacts from heat and cold, pathogens, and air pollution (Section 3.5), are all considered here as the key conduits for climate-impacts on people in the built environment. The capacity of responders to cope with climate-related emergencies is also considered (Section 3.6).

\* According to Defra's Official Statistics on Rural population 2018, excluding people living in sparsely populated areas and those in villages and hamlets, 83% of the English population lives in cities and urban towns and nearly 9% in rural towns.

## 3.2 Flood risk management and climate change

This section begins with an analysis of the overall flood risk and response, in the context of climate change. This is then followed by analysis of the CCC's more specific adaptation priorities: river and coastal flood alleviation; development in areas at risk of river or coastal flooding; surface water flood alleviation; development and surface water flood risk; property-level flood resilience; capacity of people and communities to recover from flooding.

The updated flood risk project for the third CCRA<sup>5</sup> found that 1,550,000 people in England currently face a 1 in 75 or greater flood risk (i.e. a 1.33% chance of flooding in any given year), and that direct Expected Annual Damages (EAD) to residential properties from flooding are currently £290 million. This covers all sources of flooding: river; coastal; surface water;\* and groundwater.†

By the 2080s, the projections suggest 2,150,000 people will be at risk under a 2°C scenario and 2,700,000 people under a 4°C scenario.

Assuming no population growth and enhanced adaptation,‡ by the 2050s the projected number of people at a 1:75 year or greater risk rises to around 2,000,000 under a 2°C scenario and 2,450,000 under a 4°C scenario.<sup>6</sup> By the 2080s, the projections suggest 2,150,000 people will be at risk under a 2°C scenario and 2,700,000 people under a 4°C scenario. Direct EAD for residential properties is projected to rise by 25-46% in the 2050s and 36%-84% in the 2080s, depending on the climate scenario used in the analysis.

Is there a good quality plan that presents a response to England's overall flood risk?

**Since 2019 the Government has published a National Policy Statement on flood and coastal erosion risk management, alongside the Environment Agency's national Flood and Coastal Erosion Risk Management (FCERM) Strategy and Action Plan (Box 3.1).**

The Policy Statement and Strategy together aim to ensure that England is more resilient to flooding and coastal erosion in the long-term:

- The Policy Statement forms part of the Government's wider commitment to tackle climate change, with many actions directly relevant. It sets out a long-term approach to commit to making better decisions about the actions and investments taken which account for future risks in a changing climate.
- The FCERM Strategy was laid in Parliament in 2020, as a requirement of the Flood and Water Management Act (2010). It provides a framework to guide the operational activities and decision-making of practitioners, in support of the direction set by the Policy Statement and the 25 Year Environment Plan.

\* Surface water flooding is considered separately from river and coastal flooding in this chapter. Different policies, plans, actors, and responses for these two categories, make their separation in this report, as well as in policy-making, convenient. However, there are also interactions and overlaps that should not be ignored. These include: policy (all flooding sources are covered in the FCERM and Policy Statement); shared flood defence and resilience funding streams; and shared physical drivers for different flooding sources such as high rivers and rising sea levels lead to blocking surface water drainage.

† Groundwater flooding is not examined in this report as there are few data and policies to examine. The issue requires further research.

‡ This 'current objectives+' scenario goes beyond the current implementation of policy (and recently introduced policy) to represent an enhanced whole-system approach to adaptation (i.e. implementation is in-line with the higher level of ambition).

It supports risk management authorities in considering a range of scenarios, including higher climate scenarios, such as a 4°C rise in global temperature.

- The FCERM Strategy Action Plan aims to help deliver the objectives set out in the Strategy with commitments from the Environment Agency, and a range of partners, that will be monitored, reviewed and updated every year.

The Policy Statement and Strategy should help to provide the required policy basis for increasing the level of ambition in tackling flood risk. However, it is too soon to tell what the resulting actions and subsequent risk reductions will be. Alongside this, while the updated flood risk projections for the third CCRA show that future risk can be reduced with continued adaptation action, residual risk remains high.

The FCERM Strategy and Policy Statement are revisited, where relevant, throughout this chapter. Section 2.7 (water management) in the Natural Environment chapter of this report refers to natural flood risk management.

### Box 3.1

#### New commitments in the Government's Flood Policy Statement and Environment Agency's Flood and Coastal Erosion Risk Management (FCERM) Strategy

The Policy Statement sets out the Government's long-term ambition to create a nation more resilient to future flood and coastal erosion risk. The Statement outlines five policy themes, aiming to accelerate progress and increase resilience to flooding and coastal erosion, in the face of more frequent extreme weather due to climate change:

1. Upgrading and expanding national flood defences and infrastructure.
2. Managing the flow of water more effectively.
3. Harnessing the power of nature to reduce flood and coastal erosion and achieve multi-benefits.
4. Better preparing communities.
5. Enabling more resilient places through a catchment-based approach.

These policies are supported by over 40 actions to drive progress and create a more resilient nation. These actions include:

- Reforming local flood and coastal erosion risk planning by 2026, so that every area of England will have a more strategic and comprehensive plan, that drives long-term local action and investment.
- £5.2 billion to create around 2,000 new flood and coastal defences to better protect 336,000 properties in England and reduce national flood risk by up to 11% by 2027.
- £200 million for the Environment Agency's Flood & Coastal Resilience Innovation Programme, for testing and developing innovative approaches to flood and coastal resilience as well as adaptation.
- Doubling the number of Government-funded projects which include nature-based solutions to reduce flood and coastal erosion risk.
- Consulting on changes to the FloodRe scheme, to encourage greater uptake of Property Flood Resilience among households at high risk of flooding across the UK.
- Reviewing national policy for Shoreline Management Plans.
- Developing a national set of indicators to monitor trends and the impact of policies by spring 2022.

The FCERM 2020 Strategy supports the ambition with a range of practical measures to help England strengthen its resilience to flooding and coastal change, for example by enhancing guidance for appraisal of flooding and coastal change projects, so that

investment decisions can better reflect a wider range of resilience actions and climate change scenarios.

The strategy also commits to:

- Enhancing the understanding of all sources of current and future flood risk through improving the National Flood Risk Assessment.
- Developing adaptive approaches and pathways in local places which equip practitioners and policy makers to better plan for future flood and coastal change and adapt to future climate hazards.
- Delivering innovative solutions to flood and coastal resilience in 25 places across the country, through the £150m Flood & Coastal Resilience Innovation Programme.
- Mainstreaming property flood resilience measures and to 'build back better' after flooding.
- Transforming the flood warning and informing service to better reach people living, working or travelling through flood risk areas.

In May 2021 the Environment Agency launched its first FCERM Strategy Action Plan. The plan aims to deliver the strategic objectives set out in the Environment Agency's FCERM Strategy and provides a wide-ranging list of actions. These include the Environment Agency working with:

- The National Flood Forum to expand the network of community flood groups, to support residents and local businesses to develop flood response plans and train flood wardens.
- The Property Flood Resilience Roundtable, to deliver a national suite of training for the property flood resilience industry.
- Partners in the Thames Estuary, Humber Estuary, Severn Valley and Yorkshire, to develop long term plans for adapting to future flooding and coastal change and climate hazards.
- The Local Government Association and ADEPT, to run workshops to help local authorities attract private sector investment and green finance as a means of improving flood and coastal resilience.
- The Town and Country Planning Association, to develop on-line training materials for town planners on flood risk and climate change.

Source: HM Government (2020) Flood and coastal erosion risk management Policy Statement; Environment Agency (2020) National Flood and Coastal Erosion Risk Management Strategy for England; Environment Agency (2021) Flood and Coastal Erosion Risk Management Strategy Action Plan 2021.

## Is progress being made in managing overall flood risk?

### **The Environment Agency's six-year FCERM investment programme has delivered a large number of risk management interventions.**

From April 2019 to March 2020, 176 FCERM schemes were completed, of which 73 improved protection from the risk of flooding from rivers and 36 improved protection from the risk of flooding from the sea. The schemes include interventions such as asset improvements and tidal flood barriers.<sup>7</sup> These schemes have helped to better protect nearly 50,000 homes from flooding and coastal erosion (3,900 of which were in areas of significant flood risk and economic deprivation). Since 2015, the Environment Agency and partners have completed more than 700 projects to better protect more than 300,000 homes, exceeding the programme's target to provide better protection for 300,000 homes between 2015 and 2021.<sup>8</sup>

A review conducted in 2017 focused on those schemes that accounted for a large proportion of the homes better protected.<sup>9</sup> This revealed that based on an improved Standard of Protection (SoP), most of the schemes were taking households from very significant risk, to low or moderate risk. Furthermore, most of

Since 2015, the Environment Agency and partners have completed more than 700 projects to better protect more than 300,000 homes.

the schemes were increasing the existing SoP and allowed for increased risk due to climate change in the design.

**Data regarding which risk bands homes have moved into and out of, for the different types of flooding, is not routinely collected and published.**

Whilst there has been a review of schemes, this type of information needs to be continually collected. Without it, it will not be possible to tell if the continued rate of investment and protection is sufficient to maintain current levels of risk.

**The Government has announced a substantial increase in the amount of capital funding for flood and coastal erosion risk management.**

In March 2020, the Government announced that the capital funding for FCERM would increase from £2.6 billion for the period 2015 to 2021, to £5.2 billion for the period 2021 to 2027. Beyond the £5.2 billion capital investment programme, the Government has also announced other funding measures for flood and coastal erosion risk management over the past two years which include:<sup>10</sup>

- £170 million to accelerate the building of 22 shovel-ready flood defence schemes.
- £150 million (of a £200 million fund) between 2021 and 2027 for a flood and coastal resilience innovation programme, managed by the Environment Agency. The programme will support 25 local areas in urban, rural and coastal areas to trial innovative approaches which increase resilience to flooding and coastal erosion.
- £8 million between 2021 and 2027 for development and implementation of adaptation pathway plans to manage long-term flooding and coastal change and investment, in Thames and Humber estuaries, Severn Valley and Yorkshire.
- £120 million was made available to the Environment Agency to repair assets damaged by Storms Dennis and Ciara during the 2019/20 winter.
- £640 million for a Nature for Climate Fund which will contribute to tree planting and peatland restoration. The Government has stated it will examine ways to secure secondary benefits for flood risk management.

The National Audit Office (NAO) assessed in its 2020 report on flood management that the funding in the first two bullet points meant £5.6 billion of new capital funding had been announced for flooding and coastal erosion up to the end of March 2027.<sup>11</sup>

**The Environment Agency's long-term investment scenarios (LTIS) set out the economic optimum level of investment for FCERM. It is expected that investment for the period 2021 to 2027 will exceed this, though some sources are determined on an annual basis and therefore provide insufficient long-term stability to manage climate risks.**

LTIS estimates the economic optimum level of investment for FCERM to be an annual average of £1.1 billion as a best estimate, possibly as high as £1.3 billion (both in real terms, 2019/20 prices), depending on policy choices, such as very high levels of protection and increased use of Property-level flood resilience (PFR) measures and natural flood management.<sup>12</sup> In real terms, the £5.2 billion of capital funding for FCERM is roughly £775m as an annual average for 2021/22 to 2026/27. LTIS includes flood and coastal capital schemes, asset maintenance and resource and investment associated with other flood and coastal risk management authorities.

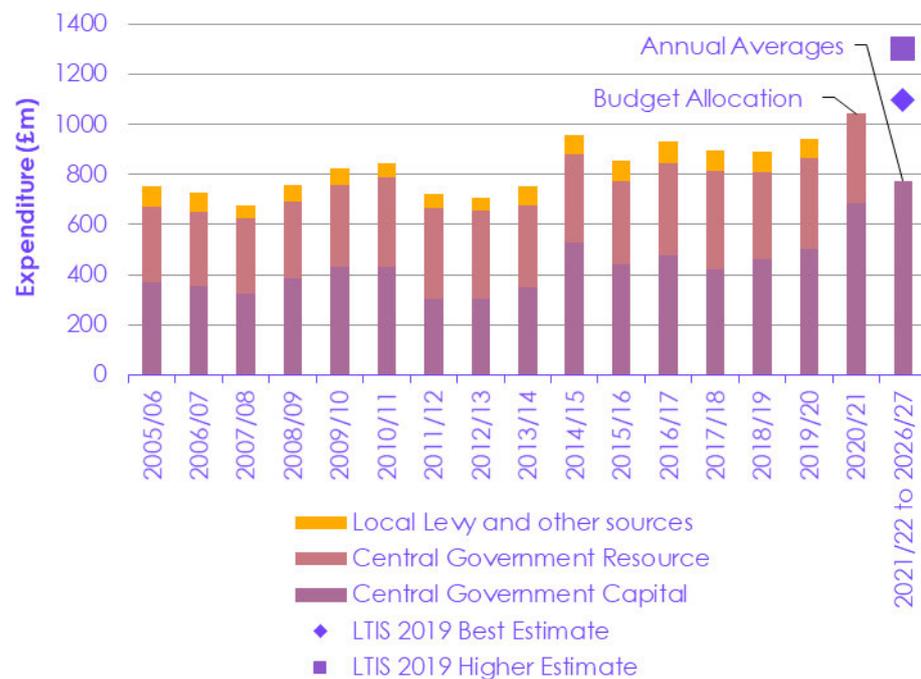

The capital funding for flooding will increase from £2.6bn for the period 2015 to 2021, to £5.2 bn for the period 2021 to 2027.

In real terms, the £5.2 billion of capital funding for FCERM is roughly £775m as an annual average for 2021/22 to 2026/27.

Based on resource and other funding in recent years, similar amounts should fill the gap between announced capital funding and the optimum identified by LTIS as shown in Figure 3.1.\*† However, except for the six-year capital programme, the level of resource funding for all other aspects of FCERM is determined on an annual basis and so remains uncertain.

The NAO stated in its 2020 report on flood management that Defra is confident that resource and other funding will exceed the optimum identified by LTIS. Investment in FCERM for the period 2015 to 2021 was consistent with the optimum identified by LTIS 2014, roughly £940 million (2019/20 prices) as an annual average based on a medium climate change scenario. By 2025 the Environment Agency will produce a new set of long-term investment scenarios to inform future policy and investment choices for achieving flood and coastal resilience.

**Figure 3.1** Spending on flood risk in England and the optimum identified by LTIS 2019 (real terms, 2019/20 prices)

Source: Defra (2021) *Central Government Funding for Flood and Coastal Erosion Risk Management in England*. Environment Agency (2019) *Long-Term Investment Scenarios (LTIS) 2019*. National Audit Office (2020) *Managing flood risk*. HMT (2021) *GDP deflators at market prices, and money GDP March 2021(Budget)*.

**Despite the increase in capital funding, there remain concerns about other aspects of funding flood and coastal erosion risk management. Government should provide greater assurance that all aspects of funding will be set and maintained to**

\* These figures do not include partnership funding raised by other risk management authorities, Internal Drainage Board funding raised from drainage charges and special levies, or local authority funding from their Settlement Funding Assessment (SFA) spent on flood or coastal erosion risk management. See Defra (2021) in Figure 3.1 for further details.

† The announced £170 million and £200 million are not included in the annual average for 2021/22 to 2026/27. This is because there is no annual profile for this funding and LTIS does not make an explicit allowance for funding for innovation.

There may need to be 30% to 80% more investment in asset maintenance to address the greater potential for deterioration from the impacts of climate change.

### **manage the risk, taking the latest evidence on the impacts of climate change into account.**

Recent reports by the NAO in 2020 and the House of Commons Environment, Food and Rural Affairs (EFRA) Committee in 2021, have highlighted concerns related to spending on flood risk.<sup>13</sup> The positive impacts of higher capital spending on flood risk could be undermined if spending on maintaining new and existing flood defence assets is not also increased. A research report published by the Environment Agency in 2017 on the impact of climate change on asset deterioration indicated that there may need to be 30% to 80% more investment in asset maintenance to address the greater potential for deterioration.<sup>14</sup> At present, it is uncertain what maintenance funding will be, since it is only determined on an annual basis.

The House of Commons EFRA Committee's 2021 report on flooding recommended that the Government should put in place a long-term resource budget settlement consistent with the capital investment programme, which would allow the Environment Agency and others to effectively plan and maintain flood and coastal erosion risk management assets. Government responded to this recommendation in April 2021.<sup>15</sup> The response stated that Government had significantly increased funding between 2015 and 2020 for the maintenance of assets and increased maintenance funding in 2020-21 relative to the previous year, with future spending to be determined by the 2021 Spending Review.

The NAO's 2020 report on managing flood risk stated that some beneficial projects are not being implemented because partnership funding is required but cannot be secured. This could lead to projects with partnership funding going ahead while other projects that offer better value for money (in terms of flood risk reduction benefits) do not. Analysis by the NAO in its 2020 report found that the Environment Agency secured £530m of partnership funding in the period 2015 to 2021, above its target of £390m, with £39 million or 7% of this from the private sector. Previous NAO analysis for the period April 2011 to March 2015, found the private sector accounted for £35 million or 25% of all partnership funding for that period.

The Environment Agency stated in its FCERM strategy that in the future there will need to be more partnership funding from non-public sources. There is no target or assessment of what proportion of partnership funding that non-public sources should account for, but Government amended the partnership funding rules in April 2020 and has since consulted on further improvements to increase contributions.

### **Capacity and skills shortages could affect delivery of flood and coastal erosion risk management if funding is inadequate.**

Funding may also be required to help ensure that capacity and skills shortages do not affect the Environment Agency's ability to deliver the FCERM strategy and the ability of lead local flood authorities (LLFAs) to fulfil their role. A wide range of skills are needed for risk management authorities, like the Environment Agency and LLFAs, to deliver the FCERM strategy – engineering, programme management, spatial planning and community engagement skills.

The NAO stated in its 2020 report on managing flood risk that the Environment Agency may also require a 20% increase in the number of engineers it employs, despite independent research finding that Environment Agency engineer salaries are not competitive with salaries on the open market. This is further compounded by a general shortage of engineers in England. LLFAs have also reported concerns about resource funding for maintenance and more general capacity issues.

## 3.2.1 River and coastal flood alleviation

Progress summary – River and coastal flood alleviation		
2019 score:	What has changed since 2019:	2021 score:
5	<p><b>Plan score - high</b></p> <ul style="list-style-type: none"> <li>The plan score has improved. Progress has been made in bringing together a policy statement and long-term strategy to support action on flood and coastal risk management. The Environment Agency's FCERM Strategy puts in place measures that will allow for climate adaptation, seeking to better prepare for a 2°C rise in global temperature, as well as planning for higher scenarios, such as a 4°C rise in global temperature. Significant announcements have also been made to boost investment in flood defence schemes and supporting projects.</li> </ul> <p><b>Risk management score - medium</b></p> <ul style="list-style-type: none"> <li>The risk management score remains the same. Good evidence exists of actions being taken through flood defence investment and the number of homes better protected, but there is a lack of evidence to quantify the resulting reduction in vulnerability or exposure of homes and people, which is needed to show good progress in managing future climate change risk. The Environment Agency failed to meet its target for 98% of 'high consequence' flood and coastal risk management assets to be in good condition in 2019/20. Long-term budgets are needed to ensure existing defences are maintained.</li> </ul>	8
<p>Notes: See annex for full datasets            Key Indicators: Flood defence asset condition, Investment in flood defences, Annual damages from river and coastal flooding, Change in property risk bands (not yet available), Nationally consistent future flood risk maps (not yet available).</p>		

### Summary of 2019 report score

**In our last report, river and coastal flood alleviation scored a 5 (medium plan score, medium risk management score).**

Our 2019 report highlighted a series of plans at the time that considered long-term risks from climate change including 2°C and 4°C scenarios, but there was no overarching plan with associated outcomes and targets that brought together the different strands, linked to indicators to measure progress. On progress in managing risk, our previous report highlighted that, despite corporate Environment Agency indicators on flood defence investment and defence maintenance being met, there remained a lack of evidence to assess whether progress in protecting properties was keeping up with the rate of climate change. This is because data is not routinely collected regarding which risk bands better-protected homes have moved into and out of, for different types of flooding, including river and coastal.

Has the plan score changed?

**Yes. The Committee's assessment is that progress has been made in bringing together a long-term plan to support action on flood risk management, and significant announcements have also been made to boost investment in flood defence schemes and supporting projects.**

The Government has produced a new Policy Statement on flood and coastal erosion risk management, which sits alongside the Environment Agency's updated long-term Flood and Coastal Erosion Risk Management (FCERM) Strategy.

The FCERM Strategy puts in place measures that will allow for climate adaptation, seeking to better prepare for a 2°C rise in global temperature, as well as planning for higher scenarios, such as a 4°C rise in global temperatures. There are also several new commitments and additions that bring together disparate aspects of river and coastal flooding (see Box 3.1).

The Strategy has the objective to develop better evidence to inform future risk assessment and investment. This includes: a new national assessment of flood risk by 2024, that will help local areas better plan and adapt to future risks from all sources of flooding; a new set of long-term investment scenarios to inform future policy and investment choices; and developing adaptive pathways to enable local areas to better plan for future flooding and coastal change, and adapt to future climate hazards. It will also require Risk Management Authorities to make greater use of funding and financing from non-public sector sources, including trialling new and innovative financing to improve flood and coastal resilience.

In May 2021 the Environment Agency launched its first FCERM Strategy Action Plan. The plan will aim to deliver the strategic objectives set out in the Environment Agency's FCERM Strategy and provides a wide-ranging list of actions and monitoring of actions to be taken forward by the Environment Agency and a range of partners.<sup>16</sup>

While evaluation and monitoring of the Policy Statement is not yet in place, actions are underway to produce a new national set of indicators. Strictly speaking, the current lack of an effective monitoring and evaluation system should retain the plan score as medium according to the Committee's criteria (see Chapter 1), but given the significant advances elsewhere, the Committee's view is that the significant progress that has been made should be recognised through an improvement on the plan score. However, the challenge now will be to move from strategic aspirations to delivery on the ground. If, by the time of the Committee's next report in 2023, this system is not well established, the plan score may return to medium.

Has the risk management score changed?

**No, the evidence available on managing risk remains the same as in 2019.**

**Good evidence exists of actions being taken through flood defence investment and the number of homes better protected, but there is a lack of evidence to quantify the resulting reduction in vulnerability or exposure of homes and people, which is needed to show good progress in managing future climate change risk.** As set out above, the current six-year investment programme has met its target to provide better protection for 300,000 homes between 2015 and 2021. Under the Policy Statement, the Government has committed to further upgrading and expanding of national flood defences and infrastructure. The Government announced in 2020, that £5.2 billion (Figure 3.1) would be awarded over the next six-year spending period on flood and coastal erosion risk management, primarily on developing new flood defences. This funding will support schemes to better protect an estimated 336,000 homes.

It remains unclear how the quantified level of risk of homes in England will change, as the risk bands which homes move into and out of, through improvements to flood defences, are not recorded as standard. This information is needed to understand the extent to which risk is being managed or not, and thereby for our assessment to provide a high-risk reduction score.

The Policy Statement includes an action for Government to develop a national set of indicators by 2022 to monitor trends over time to better understand the impacts of policies and it would be beneficial for information on the risk bands of homes to be included within these.

**The Environment Agency has not met its target for defences to be in a 'required condition'. Actions in the Policy Statement should improve how defences are monitored, inspected, and maintained. However, at present, future maintenance funding for defences is uncertain since this is determined on an annual basis.**

Another key indicator of progress is the Environment Agency's 'high consequence' flood and coastal risk management assets that are in the required condition.\* The 2018/19 target of 97.5% was exceeded.<sup>17</sup> The target was increased to 98% in 2019/20. However, the Environment Agency failed to achieve this, with 96.1% of assets in the required condition at the end of 2019/20.<sup>18</sup>

The Environment Agency failed to achieve its target with 96.1% of assets in the required condition at the end of 2019/20.

The position continued to deteriorate in 2021, with 94.5% in the required condition by Q4 of 2020/2021.<sup>19</sup> The Agency reported that this was due to increased asset damage during multiple significant flood events in November 2019 and February 2020. COVID-19 restrictions also impacted the delivery of inspection, repair and maintenance work. The Government has provided £120 million of additional funding for asset repairs that are now in progress or planned in 2020/21.

The Policy Statement includes actions to review statutory powers and responsibilities to map, monitor, inspect, and maintain all defence assets by the end of 2021. By 2024, as part of the FCERM Strategy, the Environment Agency will also develop guidance setting out a common approach for inspecting and managing all flood and coastal defences to improve resilience, information sharing and collaboration.

Whilst the Government has committed to doubling capital investment in flood risk management, it must also ensure that long-term resource spending aligns with this and is available to the Environment Agency and local authorities to be able to effectively plan for and maintain existing flood and coastal defences (see flood introduction section for more detail).

\* The definition of 'high consequence' and the required condition, as well as the inspection process, is set out in Environment Agency (2014) Asset performance tools – asset inspection guidance.

## 3.2.2 Development in areas at risk of river or coastal flooding

Progress summary – Development in areas at risk of river or coastal flooding		
2019 score:	What has changed since 2019:	2021 score:
3	<p><b>Plan score – medium</b></p> <ul style="list-style-type: none"> <li>The plan score remains the same. National Planning Policy in England aims to steer development away from current flood risk areas and advises that future risk should be considered. However, there is a lack of resources in local authorities, and no clear policy for how local authorities should effectively account for future flood risk in plans and development decisions with a 2°C or 4°C rise in global temperature. It is positive to see some actions set out in the recent FCERM Strategy and Policy Statement that aim to ensure future development is safe from flooding. However, unclear proposals in the Government’s White Paper planning consultation may make adaptation more difficult to achieve if implemented.</li> </ul> <p><b>Risk management score – low</b></p> <ul style="list-style-type: none"> <li>The risk management score remains the same. The number of new homes granted planning permission against Environment Agency flood risk advice has increased; although in the vast majority of cases, the Agency’s advice is followed. Whilst limited building in Flood Zone 3 will not create a large present day increase in flood risk, it still increases exposure in the event of defence breaches and future climate and population changes. If building on the floodplain continues at the current level the funding required to maintain existing defences and build new ones will continue to rise.</li> </ul>	3
<p>Notes: See annex for full datasets            Key Indicators: Planning permissions not in line with Environment Agency advice, Development in Flood Zone 3, Nationally consistent future flood risk maps (not yet available).</p>		

### Summary of 2019 report score

**In our last report, development in areas at risk of river or coastal flooding scored a 3 (medium plan score, low risk management score).**

Our 2019 report highlighted that processes are in place to restrict development in areas of significant river or coastal flood risk, although advice from the Environment Agency on where to restrict development can be overruled. These processes do not consider the increased risk from climate change consistently, as there is no national map showing future flood risk that can be used for planning. On progress in managing risk, our previous report highlighted that exposure to flooding through new development is increasing.

Has the plan score changed?

**No, the score remains the same.**

**There are several new commitments in the new FCERM Policy Statement and updated FCERM Strategy on guiding the design and location of new development.** These include in the Environment Agency’s FCERM Strategy:

- Producing a National Flood Risk Assessment (NaFRA2) system to deliver a single, scalable assessment of flood risk that to be rolled out to in 2024.

When published, this should help places better plan and adapt to future risks from flooding from rivers, the sea and surface water.

- Environment Agency and coastal protection authorities advising planning authorities on how shoreline management plans can better inform planning policies for the coast, including designation of coastal change management areas.

In the Government's Policy Statement:

- Plans to review policy for building in areas of flood risk, to ensure that future development will be safe from flooding and assess whether current protections in the National Planning Policy Framework (NPPF) are adequate. A review and assessment of the NPPF has been undertaken by MHCLG but not yet published at the time of writing.
- Reviewing the effectiveness of existing planning policy on Coastal Change Management Areas (CMAs).
- Identifying what more could be done in cases where Environment Agency's advice on planning applications is not followed and considering ways to boost transparency, data collection, and reporting where Environment Agency or Lead Local Flood Authority advice is given.

**While national planning policy in England should steer development away from current flood risk areas and advises that future risk should be considered, at present there is no standard, national map of future flood risk and no clear policy for how local authorities should effectively account for flood risk with a 2°C or 4°C rise in global temperature in plans and development decisions.**

Planning applications that are subject to river and coastal flood risk have a series of logical tests applied to them. In 2021, MHCLG published a consultation to make some changes to the National Planning Policy Framework (NPPF).<sup>20</sup> The proposals include:

- Clarifying that all sources of flood risk should be accounted for in Local Plans.
- Strengthening the wording around opportunities provided by new developments (e.g. through use of green infrastructure and natural flood management).
- Moving the Flood Risk Vulnerability Classification from Planning Practice Guidance into the NPPF.

The consultation does not take the opportunity to make the significant changes to the approach to planning for flood risk that the Committee thinks are needed and does not take account of the Government's promised review of policy for building in areas at flood risk.

The Environment, Food and Rural Affairs (EFRA) Committee review of flooding in 2021 found that local planning authorities lack the knowledge and/or resources to effectively factor the impacts of climate change into their local plans and development decisions.<sup>21</sup> The EFRA Committee recommended that the Government must ensure that all local planning authorities have the powers, resources and information they need to perform this function, including properly trained, dedicated staff and funding.

As part of the 2021 Spending Review, the Government is considering the priorities for local government finance reform, including how to allocate funding to councils.<sup>22</sup> This should include flood and coastal erosion risk management functions. The 2021 FCERM action plan includes an action for the Environment Agency to work with the Town & Country Planning Association to develop online learning to help planners better account for flood risk and climate change.

**The 2020 Planning White Paper proposals set an aim to provide better quality homes and places that enhance the environment, health, and the character of local areas. However, the paper as published will not achieve this for climate resilience. More information is needed to understand the Government's intentions with the forthcoming Planning Bill.**

Planning reform provides an opportunity to improve the approach to planning for climate change and introduce greater clarity in planning policy and guidance. In August 2020 the Government consulted on a significant reform to planning in England.<sup>23</sup> The White Paper sets out three designated categories for land, with areas at risk of flooding excluded from the 'growth' area category, unless mitigation measures can be put in place. However, it is not clear what level of flood risk will trigger these protections, or what is included within the definition of 'mitigated flood risk'.

The White Paper proposes introducing legally binding housing targets for each local authority, set by Government. There is no detail on how these targets will take account of land constraints in each local authority area, outside of the green belt, including land that is at risk of flooding but also for land that is not suitable for development because it has very high biodiversity or amenity value.

The paper also proposes to roll all planning policy into the Local Plan, while making it shorter and quicker to produce. The Committee is supportive of looking at planning in a more integrated way but is concerned that capacity to consider complex issues such as climate change, will be materially reduced in a system aiming to prepare plans more quickly and making them shorter. Alongside this, removing the 'duty to cooperate' could make adaptation action across local authority areas more difficult to achieve. More information is needed on the plans for the forthcoming Planning Bill and how the proposals in the White Paper are to be achieved in practice. MHCLG, must therefore publish the policy recommendations from the internal review of planning policy for building in areas of flood risk, as soon as possible.

### Recommendation

Ensure that all types of current and future flood risk are included in policies to assess flood risk to new developments. Housing targets for local authorities should take account of flood risk, amongst other environmental issues. Assessments and management of flood risk in new developments must include as a minimum:

- Evidence that the development will be safe over its full lifetime, with a consideration of the downstream interactions and impacts of new developments i.e. not increase flooding in any other areas.
- An assessment of current and future flood risk under both a 2°C and 4°C global climate scenarios.
- Assess and manage the risk of flooding to local infrastructure as well as housing.
- A consideration of better preparedness as set out in the Government's recent FCERM Policy Statement.
- Ensure there are properly funded and trained staff in local authorities.

Department: MHCLG, Timing: 2022.

## Has the risk management score changed?

**No, the evidence available on managing risk remains the same as in 2019.**

**The number of new homes granted planning permission against Environment Agency flood risk advice has increased; although, in the vast majority of cases, the Agency's advice is followed.**

Whilst the Environment Agency is a statutory consultee on development proposed in proximity to a main river, in Flood Zones 2 or 3,<sup>\*</sup> or in areas with critical drainage problems, it is not a statutory consultee in relation to sources of flooding other than rivers and the sea. Nor is it a statutory consultee on development in Flood Zone 1<sup>†</sup> even when such areas are identified as being at future risk of flooding from rivers and the sea due to the predicted impacts of climate change.

Between April 2019 and March 2020, 866 homes (~2.4% of new homes proposed in planning applications) were granted permissions against Environment Agency advice.

Between 1 April 2019 and 31 March 2020, fewer than 5% of planning applications per year were approved against Environment Agency advice, which is comparable to previous years.<sup>24</sup> During this time, 866 homes (~2.4% of new homes proposed in planning applications) were granted permissions against Environment Agency advice. This is up from less than 1% of new homes proposed in 2018-19.<sup>25</sup> Where local authorities wish to grant permission for major development<sup>‡</sup> against Environment Agency advice, they are required to refer cases to the MHCLG Secretary of State. However, it is not clear if this process is always followed. Some of those developments built against Environment Agency advice could therefore be at significant risk now or in the future if advice to reduce flood risk has not been followed.

The Environment Agency publish a list of flood risk objections.<sup>26</sup> Local Planning Authorities also have an obligation under the Single Data List to report to Defra about planning permissions granted against Environment Agency advice.<sup>27</sup> In 2021, the Agency are planning to publish more information where local authorities have granted planning permission against their flood risk advice.<sup>28</sup>

**There is relatively limited building of new homes in Flood Zone 3. However, while it will not create a large present increase in flood risk, fundamentally, it still increases the exposure of people and buildings to current and future flooding in the event of a weakening of planning policy, defence breaches or fails, or future climate and population changes.**

In 2017-18, 9% of new residential addresses were built in Flood Zone 3, up from 7% in 2013-14.

Approximately 10% of land in England is classified as within Flood Zone 3 by the Environment Agency. In 2017-18, 9% (17,580) of new residential addresses were built in Flood Zone 3 (Figure 3.2), up from 7% in 2013-14.<sup>§ 29</sup>

Whilst there is relatively limited building of new homes in Flood Zone 3, the Environment Agency's Long Term Investment Scenarios calculate, based on population growth projections, and the resultant need for new homes, that England is likely to see almost double the number of properties in Flood Zone 3 - an increase from 2.4 million to 4.6 million - over the next 50 years.

<sup>\*</sup> Flood Zone 2 covers areas with between a 1:100-year risk (1% annual probability) and 1:1,000-year risk (0.1% annual probability) of river flooding or between a 1:200-year risk (0.5% annual probability) and 1:1,000-year risk (0.1% annual probability) of sea flooding. Flood Zone 3 covers areas with a greater than 1:100-year risk (1% annual probability) of river flooding or a greater than 1:200-year risk (0.5% annual probability) of flooding from the sea.

<sup>†</sup> Flood Zone 1 covers areas with a less than 1:1,000-year risk (0.1% annual probability) of river or sea flooding.

<sup>‡</sup> Major housing development is where 10 or more homes will be provided, or the site has an area of 0.5 hectares or more.

<sup>§</sup> The effect of flood defences is not considered in this calculation.

This work suggests that as long as local planning authorities implement national planning policy effectively, the increase in future property damages from flooding should be relatively modest at 4%, compared to a scenario where there is no new development on the flood plain. However, if national planning policy or its local implementation is weakened, the outlook could be very different, with property damages potentially increasing by over 30% during this period. In addition, if building on the floodplain continues at this level the funding required to maintain existing, and to build new defences will continue to rise (See Section 3.2.1 for cost estimates).

**There is also concern that a spatial shift in flood zones as a result of climate change will result in more homes built over the last decade ending up in higher flood zones over their lifetime without further action.**

Analysis of new homes in Flood Zone 3 found a greater proportion of new development on the floodplain takes place in the most socially vulnerable communities (~1.5% greater).<sup>30</sup>

One study has found that a disproportionately higher number of homes built in 'struggling or declining' neighbourhoods between 2008 and 2018 are expected to end up in areas at a high risk of flooding over their lifetime as a result of climate change.<sup>31</sup>

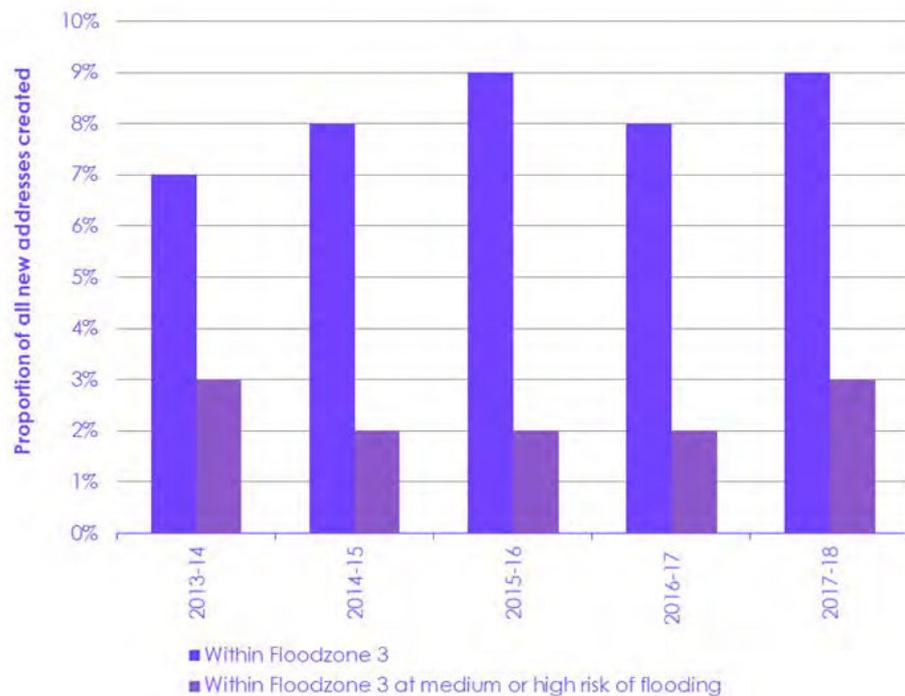

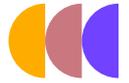

**Figures for new addresses in Flood Zone 3, taking account of flood defences and the condition they are in have been published for the first time for 2017-18 (Figure 3.2).\***

In 2017-18, 3% of all new residential addresses were built in areas at risk of medium or high flooding within Flood Zone 3.

In 2017-18, 3% (5,860) of all new residential addresses were built in areas at risk of medium or high flooding within Flood Zone 3. While the yearly rates of new homes in flood zones have increased only moderately on the national level, differences between regions exist. For a few regions, there is little land within the region that is not on a floodplain so local authorities have few options but to build there in order to meet housing targets. It is not known if these developments are being built with appropriate protection measures in place for current and future flood risk (for example at the property level – see Section 3.2.5).

\* Land assessed as having a chance of flooding from rivers and the sea presented in categories taking account of flood defences and the condition, they are in. High Risk: each year, there is a chance of flooding of greater than 1 in 30 (3.3%). Medium Risk: each year, there is a chance of flooding of between 1 in 30 (3.3%) and 1 in 100 (1%).

Figure 3.2 Proportion of new residential addresses created in National Flood Zone 3, 2013 – 2018

Source: MHCLG (2020) *Land Use Change Statistics (LUCS) residential address-based change table 2017-2018*.

**The high number of static caravans located along the eastern coastline of the UK are particularly vulnerable to current and future coastal flood risk.**

During 2020 there were applications to extend occupancy rights of caravan sites at high risk of coastal flooding, running the risk of creating permanent settlements in locations which would not normally receive planning permission. Any development will increase risk if it allows people to occupy caravans in high risk areas over winter months when coastal flooding is more likely:

- Updated flood projections for the third UK Climate Change Risk Assessment show that the expected annual damages from coastal flooding in eastern regions of England is projected to increase by 50% over the next 30 years, even with the benefit of current flood mitigation plans.\*<sup>32</sup>
- Static caravans are more vulnerable than permanent dwellings during a flood, not least because they provide no upper floor refuge, and are prone to movement, damage or even collapse in flood events.
- Static caravan owners or occupiers may be less familiar with an area if they are not permanent residents, and therefore they could be less aware of potential flood risks, flood mitigations or evacuation routes.

\* Assuming 4C scenario with low population and including direct and indirect damages.

## 3.2.3 Surface water flood alleviation

Progress summary – Surface water flood alleviation		
2019 score:	What has changed since 2019:	2021 score:

### Summary of 2019 report score

**In our last report, surface water flood alleviation scored a 2 (low plan score, medium risk management score).**

Our 2019 report highlighted that the systems for managing surface water flood risk are fragmented but plans and processes are coming together. However, climate change is missing from those plans. On progress in managing risk, our previous report highlighted that water companies are investing in retrofitting sustainable drainage systems (SuDS) for some existing homes. However, limited capacity in the sewer network means that the significant increase in surface water flood risk that is projected is unlikely to be managed adequately based on current action.

Has the plan score changed?

**Yes. The Committee's assessment suggests progress has been made in bringing together a long-term plan to support action on flood risk management, including surface water flood risk.**

The Government has produced a Policy Statement on FCERM supported by the Environment Agency's updated long-term FCERM Strategy (see chapter introduction). The FCERM Strategy puts in place measures that will allow for climate adaptation, seeking to better prepare for a 2°C rise in global temperature, as well as planning for higher scenarios, such as a 4°C rise in global temperatures.

The new FCERM Strategy has several commitments for the Environment Agency to work with Ofwat, water companies and other Risk Management Authorities to improve resilience to surface water and drainage flood risks and encourage long-term adaptive planning. In terms of surface water flooding, actions mostly draw on building up guidance and re-committing to previous actions, for example:

- The Environment Bill will require water companies to develop Drainage and Wastewater Management Plans<sup>33</sup> by end of 2022 to improve drainage and environmental water quality. Climate change should be a key component considered within water company drainage plans. The 21st Century Drainage Programme Capacity Assessment Framework sets out the need to use a range of climate scenarios.<sup>34</sup> The publication of these may improve the score for the 2023 Progress Report, although it is important that other Risk Management Authorities feed into the plans.
- Water companies will invest more than £1 billion between 2020 and 2025 to protect the environment, homes, business and drinking water from flooding, and have committed to reducing sewer flooding incidents.

The Policy Statement commits to taking forward the actions in the Surface Water Management Plan and publishing an update on progress made to implement the plan for spring 2021.<sup>35</sup> Actions include working with lead local flood authorities (LLFAs) to develop guidance to set out the best practice for local flood defence management and record keeping.

**An independent review of the arrangements for determining responsibility for surface water and drainage assets was published in May 2020.<sup>36</sup>**

The Government agreed to implement 12 of the recommendations in order to make responsibility for surface water and drainage assets more efficient, straightforward and effective which is a positive step, although it will be important to see these recommendations put into action. Recommendations include those which aim to improve clarity over roles and responsibilities, ensure flood investigation reports consider the views of residents and businesses and that lessons learned are shared widely. It also recommends that better advice is made available to homes and businesses at risk of surface water flooding to help them improve their own protection and resilience. The actions should build upon those in the FCERM Strategy and Policy Strategy and the Surface Water Management Action Plan.<sup>37</sup>

As reported in 2019, all LLFAs now have surface water flood management strategies published. However, there has still not been an assessment of the quality and consistency of those plans.

Has the risk management score changed?

**No. The evidence available on managing risk remains the same as in 2019.**

31% of the 176 schemes completed between April 2019 and March 2020 aimed to better protect people and homes from surface water flooding.

**Around 30% of FCERM schemes are focussed on surface water flood risk management and water companies are investing in reducing risk of sewer flooding to homes.**

The data linked with the Environment Agency's six-year FCERM programme show that 54 (31%) of the 176 schemes completed between April 2019 and March 2020 aimed to better protect people and homes from surface water flooding. This is up from April 2017 to March 2018 when 24% of schemes were for surface water flood management.<sup>38</sup> In April 2020, the Government announced changes to how the Government funding is allocated to flood projects including the introduction of a new risk category which will enable schemes that prevent surface water flooding to qualify for more funding.<sup>39</sup>

The Environment Agency publishes an annual report on the environmental performance of the nine water and sewerage companies operating mainly in England. Between 1 April 2019 and 31 March 2020, water companies invested:<sup>40</sup>

- £132 million to reduce the risk of sewer flooding to homes (down from £187 million in 2018-19).
- £300 million to maintain the public sewer system to prevent blockages and flooding (up from £288 million in 2018-19 and £111 million in 2017-18).
- £2 million in property-level measures to reduce the risk of sewer flooding in homes (down from £4.7 million in 2018-19).

**Money is being invested to improve forecasting and produce new maps of risk.**

The Surface Water Management Action Plan has invested £2 million since April 2019 to enable lead local flood authorities (LLFAs) to update their flood risk maps - covering over 1500km<sup>2</sup>, which includes just under 225,000 properties and 2.7 million people at risk of flooding. The FCERM Strategy says that by 2024 the Environment Agency will produce a new national assessment of flood risk that will help places better plan and adapt to future risks from flooding from rivers, the sea and surface water. This should help improve the ability to assess vulnerability changes.

£1.2 billion is also being invested to improve severe weather and climate forecasting which will help to more accurately predict storms that lead to flash flooding.<sup>41</sup> The release of higher resolution data as part of the latest update to the UK Climate Projections should also enable improvements to research on future changes in the frequency, intensity and spatial distribution of the severe storms that often drive surface water flooding.

**The updated flood risk project for the third CCRA highlighted that around 420,000 properties are currently at significant risk from surface water flooding in England.<sup>42</sup>**

Projections show that even under an extended adaptation scenario\* with low population rise, the number of properties at significant (1/30 year, or 3.3%) risk will increase by 59% by 2050, and 83% by 2080 under a scenario of a 2°C global temperature rise. This increases further under a 4°C scenario with an increase of 91% by 2050 and 137% by 2080s.

Research for the CCC found that across all flood risk levels, the south-east has a high percentage of properties at risk of surface water flooding, although all parts of the country are at risk (Figure 3.3).

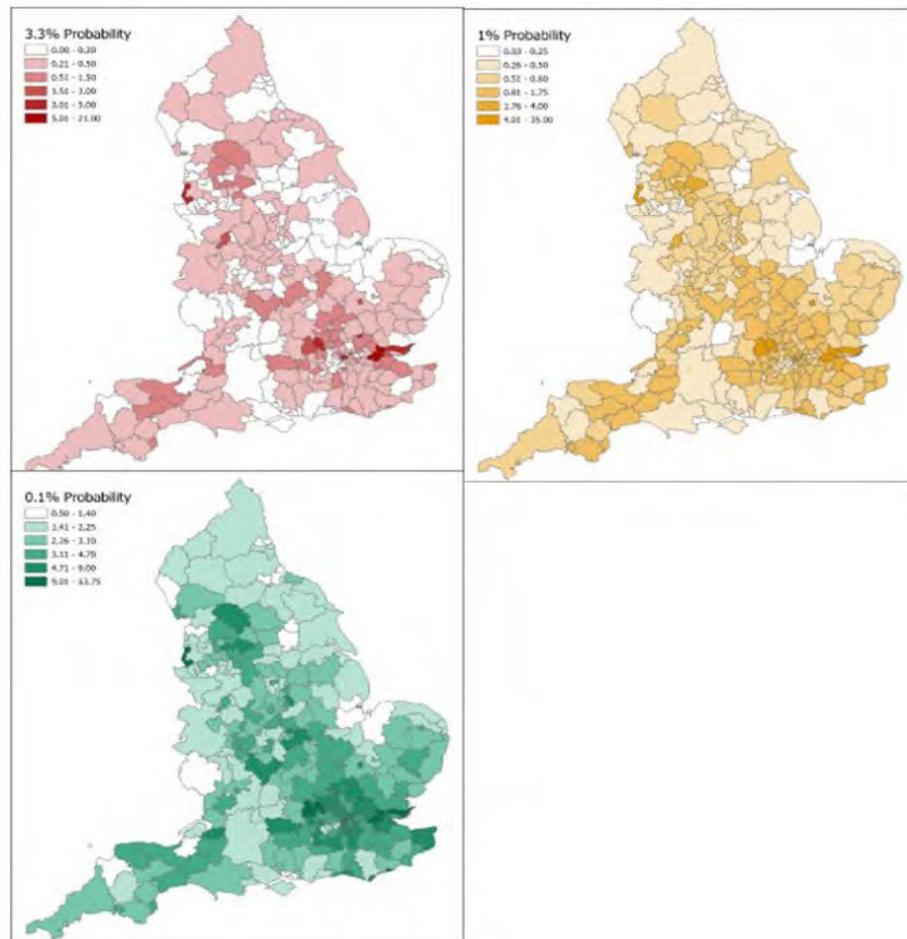

The number of properties at significant (1/30 year, or 3.3%) risk will increase by 59% by 2050, and 83% by 2080 under a scenario of a 2°C global temperature rise.

\* This 'current objectives+' scenario goes beyond the current implementation of policy (and recently introduced policy) to represent an enhanced whole system approach to adaptation (i.e. implementation is in-line with the higher level of ambition).

There remains a need for better data on sewer capacity, asset management and standards, SuDS and collection of information on surface water incidents.<sup>43</sup>

A co-ordinated approach to identifying, incentivising and managing opportunities for installing retrofit SuDS is also required. This should ensure they are not missed and that relevant parties fully understand how SuDS can help them to achieve their own objectives, for example by sharing the cost of the scheme or by qualifying for a reduction in sewerage charges.

**Figure 3.3** Percentage of properties in each Local Authority with a 3.3% (a), 1% (b) and 0.1% (c) probability of flooding from surface water in England.

## 3.2.4 Development and surface water flood risk

Progress summary – Development and surface water flood risk		
2019 score:	What has changed since 2019:	2021 score:
1	<p><b>Plan score - low</b></p> <ul style="list-style-type: none"> <li>The plan score remains the same. There is no plan to address development and surface water flood risk which takes into account a 2°C rise in global temperature, with consideration of 4°C. The planning system has inherent issues for dealing with surface water and ensuring that multi-beneficial SuDS are installed. Planning Practice Guidance and non-statutory SuDS standards have not yet been updated.</li> </ul> <p><b>Risk management score - low</b></p> <ul style="list-style-type: none"> <li>The risk management score remains the same. Surface water flooding remains a concern in new developments due to the rising level of risk in a changing climate. Homes are being built in areas at risk of surface water that may not have had any expert flood mitigation advice. The data that could show whether the planning system is reducing risk are not collected and there are no other indications that such a reduction is happening. The proportion of urban areas made up of impermeable surfacing, has increased since 2001, but remained stable since 2018.</li> </ul>	1
<p>Notes: See annex for full datasets            Key Indicators: Area of permeable and impermeable land within all urban areas in England, The number of properties built in areas of surface water flood risk (not yet available), Number, type and location of SuDS installations in new builds and retrofits (not yet available)</p>		

### Summary of 2019 report score

**In our last report, development and surface water flood risk management scored a 1 (low plan score, low risk management score).**

Our 2019 report found that there are no plans or processes that ensure new development in areas of surface water flood risk does not increase overall exposure or vulnerability. On progress in managing risk, our previous report highlighted that there is little evidence that 'green' sustainable drainage systems are deployed in new developments and that practitioners had little confidence that this was taking place.

Has the plan score changed?

**No, the score remains the same.**

**The planning system has inherent issues for dealing with surface water and ensuring that SuDS are installed. Although wording has been strengthened in the National Planning Policy Framework and the uptake of sustainable drainage systems has improved in recent years, the installation of high-quality SuDS that deliver multiple environmental benefits may still be insufficiently incentivised.**

In 2019, the Committee recommended that the National Planning Policy Framework (NPPF) and planning practice guidance (PPG) should be updated to ensure that Sustainable Drainage Systems (SuDS) installations maximise their impact in terms of flood risk reduction and their co-benefits, such as biodiversity and amenity value. This could be done by aligning the NPPF and PPG with the aims of

Schedule 3 of the Flood and Water Management Act (2010). \* In 2020 the Committee again made similar recommendations.<sup>44</sup>

In its response, the Government acknowledged the importance of encouraging natural flood management approaches, such as green sustainable drainage systems (SuDS), to ensure flood risk is managed effectively locally and nationally. MHCLG committed to publishing a revised PPG clarifying how green SuDS can reduce impacts of flooding and deliver additional benefits for biodiversity and the environment and set out how new drainage systems must comply with the Environment Agency's climate change allowances for rainfall intensity.<sup>45</sup> As yet, there have been no updates to the PPG, where issues of 'grey' vs 'green' SuDS, their adoption and wider benefits of green infrastructure could be dealt with more explicitly than in the NPPF. Also, Schedule 3 of the Flood and Water Management Act that sets out SuDS standards, an approval process, rules on adoption and changes to the right to connect to public sewers, was never enacted nor its requirements aligned with planning policy.

Several local authorities have produced their own guidance and standards to be followed, but nation-wide standards defining how to implement SuDS are currently non-statutory, only apply to developments of 10 or more properties and do not promote green SuDS. Defra has commissioned research to explore whether updating the Non-statutory Technical Standards for SuDS (NSTS) could help deliver SuDS that provide multiple benefits beyond managing surface water runoff, contributing to improved climate adaptation, health and wellbeing and better places and spaces.<sup>46</sup> The research also considers what the requirements to update the standards for the integration of high-quality multiple benefit SuDS might be.<sup>47</sup> The research report is due to be published in 2021.

The Government's Storm Overflows Taskforce, set up to eliminate harm from storm overflows, will consider a number of drainage issues, such as Sustainable Drainage Systems, including Schedule 3, and section 106 of the Water Industry Act 1991—right to connect to the public sewer. The taskforce will be reporting to Government in summer 2021.<sup>48</sup>

### Recommendation

To address the issue of increased risk of surface waterflooding in new developments, commit to ensuring that new developments do not put more water into the public sewers than what was there before, taking into account climate change. To incentivise this, end the automatic right to connect to the public sewer; planning reforms should enact Schedule 3 of the Flood and Water Management Act (2010); and technical SuDS standards should be made mandatory and be updated to deliver SuDS that provide multiple economic, social and environmental benefits.

Department: MHCLG, Timing: 2022.

**New rules (April 2020) mean that SuDS elements such as swales, basins, soakaways, and ponds, are officially recognised as 'surface water sewers' and can be adopted by water and sewage companies in England.<sup>49</sup>**

Sewers For Adoption will support water companies to take on responsibility for these types of measures. However, it doesn't cover all type of SuDS features and is confined by what is defined as a sewer (e.g. permeable paving is not covered).

\* Schedule 3 of the Flood and Water Management Act (2010), would require all new developments to include SuDS features that comply with national standards.

**There are a range of other plans and policies that provide an opportunity for surface water flood resilience and other wider benefits by improving and increasing green space and green infrastructure.**

It is not clear whether the steer in recent and upcoming policies to undertake more urban greening are being fully realised or taken up by developers yet.

- The Environment Bill: If enacted, will require developers to deliver at least a 10% improvement in biodiversity value (biodiversity net gain). This could be through a green roof or an on-site nature reserve, which could also act as a means of sustainable drainage, adjacent to a new housing development.
- Net Zero: Policies to reduce greenhouse gas emissions and improve air quality may also provide natural flood risk management in urban areas (see Chapter 2). For example, increased tree planting and green spaces for safer pedestrian and cycling access routes.
- Green Recovery: The Natural Capital Committee has highlighted the importance of access to green space. It can be beneficial to health and well-being, in terms of physical and mental health but also by reducing urban heat islands (see Section 3.5.1).<sup>50</sup>
- Sewage Inland Waters Bill: Proposed mitigation for sewage spills (such as nature-based solutions to manage water flow) could also lead to increased flood mitigation.

Has the risk management score changed?

**No. The evidence available on managing risk remains the same as in 2019.**

**The data that could show that the planning system is reducing risk are not collected and there are no other indications that such a reduction is happening.**

It remains unclear how much preference is being given to 'green' sustainable drainage systems (SuDS) in new developments. There is no readily available national dataset on the number of planning applications in areas at risk of surface water flooding, nor the impact of any advice given to developers and no monitoring of the uptake of SuDS. This means it is not possible to assess the effectiveness of current planning policy and whether 'green' SuDS are being installed.

**Recommendation**

To help improve the information on SuDS and surface water flood risk, urgently begin collecting data on sewer capacity and SuDS location, type and capacity. This would bring the level of information in line with that for river and coastal flood risk defences.

Department: MHCLG, Timing: 2021.

**Homes are being built in areas at risk of surface water that may not have had any expert flood mitigation advice. There remain no statutory consultees (such as the Environment Agency) for assessing major new developments in areas at risk of surface water flood risk.**

Between 2013 and 2018, around 23,000 new properties were built in areas at medium or greater risk of surface water flooding (1 in a 100 chance of flooding each year).<sup>51</sup> Environment Agency analysis added a 5m buffer around these at risk areas as an indication of likely increases in flood risk due to climate change, and to take account of errors in mapping.

Between 2013 and 2018, around 23,000 new properties were built in areas at medium or greater risk of surface water flooding (1 in a 100 chance of flooding each year)

Including the buffer, this increases the number of properties to around 67,800, approximately 6.7% of new addresses between 2013-2018.

Given the lack of a statutory planning consultee on development in areas at risk from surface water flooding, there is a high likelihood that a significant proportion of these homes will have been granted planning permission without appropriate expert advice, and may therefore not incorporate the flood mitigation measures needed to make the development safe and resilient over its lifetime.

#### Recommendation

The consultation process for surface water flood risk must be improved. This should be done by adding statutory consultees for all development type and sizes. Consultees must have the appropriate skills to provide advice on surface water flood mitigation. Ensure that local authorities fully justify planning decisions where applications can proceed either without or going against formal flood risk mitigation advice.

Department: MHCLG, Timing: 2022.

#### **The total area of impermeable surfaces in urban locations has increased since 2001.<sup>52</sup>**

The CCC's previous indicator showed an increase in impermeable areas from 477,000 hectares in 2001 to 621,000 hectares in 2018, remaining constant from then to 2020. The impermeable fraction of the total urban area increased from 37% in 2001 to 45% in 2020.

The CCC now has access to an improved indicator (which includes larger areas of greenspace within cities and towns, not captured in the original indicator). Data from this indicator is only available since 2016. The new indicator shows that:

- Impermeable surfaces have increased 1% between 2016 and 2020. This increase is made up of a 4% rise in manmade surfaces (making up 75% of total impermeable area in 2020) and a 7% fall in multiple surfaces that are impermeable, such as partially paved domestic gardens and road verges, for example (making up 25% of total impermeable area in 2020).
- Since 2018, the overall impermeable area fraction has remained stable at 40% of the total urban area.

Research for Yorkshire Water has assessed the impact of reducing impermeable areas in 10 catchment areas.<sup>53</sup> It found that reducing impermeable surfacing can help reduce future flood risk, but that other interventions will also be required.

## 3.2.5 Property-level flood resilience (PFR)

Progress summary – Property-level flood resilience (PFR)		
2019 score:	What has changed since 2019:	2021 score:
3	<p><b>Plan score - medium</b></p> <ul style="list-style-type: none"> <li>The plan score remains the same. There has been progress in planning for how to increase the uptake of PFR. New measures in the FCERM strategy and a new Code of Practice, and proposed amendments to the Flood Re Scheme if implemented should all have a positive impact on the uptake and effectiveness of PFR. However, there remains a need for targets for large-scale implementation of PFR measures, with effective monitoring and evaluation built in.</li> </ul> <p><b>Risk management score - low</b></p> <ul style="list-style-type: none"> <li>The risk management score remains the same. The current rate of PFR implementation remains low and could leave many homes vulnerable to flooding that would benefit from PFR.</li> </ul>	3
<p>Notes: See annex for full datasets Key Indicators: Number of homes that would benefit from PFR, Number of homes installing PFR per year.</p>		

### Summary of 2019 report score

**In our last report, property-level flood resilience (PFR) scored a 3 (medium plan score, low risk management score).**

Our 2019 report identified important aspirations outlined by Defra in their PFR Action Plan and work by Flood Re and others on approaches to encourage homeowners to put PFR in place, such as a Code of Practice and Certification Scheme. However, there were no clear plans for targets for large-scale implementation and PFR plans did not consider interventions in the context of climate changes of any magnitude.

The rate of PFR implementation was low when compared to indicative analysis from the Environment Agency's latest flood risk investment analysis.

### Has the plan score changed?

**No, the plan score for PFR remains medium. There has been positive progress, but to improve this score, targets for large-scale implementation of PFR need to be set out with effective monitoring and evaluation built in.**

**The Environment Agency's FCERM Strategy aims to mainstream PFR measures and encourage homes and businesses to build back better after flooding. An Action Plan published in May 2021 has provided further details on progress and planned action.**

The FCERM Strategy sets a strategic objective that between now and 2040, risk management authorities will work with the finance sector and other partners to mainstream property flood resilience measures and to 'build back better' after flooding.<sup>54</sup> This objective is supported by two measures. The first measure is that from 2021, risk management authorities will work with the finance sector, Flood Re and the property flood resilience industry to increase the uptake of property flood resilience measures in communities at highest risk.

The second measure is that by 2025 the Environment Agency will work with government and other partners to tackle the policy, financial and behavioural barriers to mainstreaming property flood resilience measures and ‘building back better’ after flooding.

Government is also investing £3 million to support three regional property flood resilience pathfinder projects to learn lessons which could be applied more widely. This is supporting new research initiatives, demonstration centres and advice portals that will help local communities in Yorkshire, the Oxfordshire to Cambridge Arc, and Devon and Cornwall, to learn about the benefits of installing property flood resilience measures in their homes.

In May 2021 the Environment Agency published an Action Plan which provided further detail on the progress made against measures in the FCERM Strategy as well as planned further action up to April 2022.

In May 2021 the Environment Agency published an Action Plan which provided further detail on the progress made against measures in the FCERM Strategy as well as planned further action up to April 2022.<sup>55</sup> The planned actions for PFR included:

- In July 2021, the Environment Agency will publish additional research to fill PFR knowledge gaps.
- By summer 2021, the Association of British Insurers (ABI), the British Insurance Brokers Association and Flood Re will publish a new specialist directory of brokers and insurers to support customers that are unable to get flood insurance cover.
- By November 2021, the Environment Agency will launch a new PFR Framework of suppliers.
- By December 2021, the Environment Agency and Chartered Institution of Water and Environmental Management (CIWEM) will support the PFR industry to develop a system of independent PFR training and accreditation.
- By March 2022, the National Flood Forum and the Environment Agency will publish lessons learnt on the measures needed to install property flood resilience.
- By April 2022, the Environment Agency will develop a bespoke tool for better valuing the economic benefits of PFR to local communities.

**The Government’s FCERM Policy Statement committed to several actions to improve the uptake of PFR among homes at high risk of flooding.**

The Government published a Policy Statement on Flood and Coastal Erosion Risk Management in July 2020.<sup>56</sup> This included a commitment to explore ways to provide greater clarity about the use and effectiveness of property flood resilience measures for homes and businesses at high risk of flooding, including how the benefits can be recorded. It stated that Government would build on the three regional pathfinder projects to boost uptake of PFR, including through Government’s new £200m innovative resilience fund. It also announced plans to consult on improvements to the efficiency and effectiveness of the Flood Re scheme to encourage greater uptake of PFR among households at high risk of flooding across the UK, which has since been published.

**The Government has consulted on changes to the Flood Re Scheme to increase the uptake of PFR. The current regulations underpinning the scheme are preventing Flood Re from creating incentives for an acceleration of uptake of PFR, which the consultation is aiming to rectify.**

Based on proposals in Flood Re's Quinquennial Review published in 2019, the Government published a consultation in 2021 on amendments to the Flood Re Scheme.<sup>57</sup> These proposals included:

- The ability for Flood Re to offer discounted premiums to households that have fitted property flood resilience measures, such as airbrick covers or non-return valves.
- Building an evidence base on the uptake and impact of PFR and, if suitable, using the data to stimulate the insurance industry to take account of reductions in damages due to PFR.
- The ability for Flood Re to reimburse insurers, and in turn property owners, up to £10,000 to build back better in order to reduce the future risk of the property flooding and/or the cost of repair.
- Enabling Flood Re to spend any surplus it accrues (beyond what it requires to operate and meet its regulatory requirements) on further activities to support the transition to a risk reflective home insurance market, including accelerating the uptake of PFR.
- Further reducing the cost of its cheapest premiums to ensure it is affordable for low income households.

New proposals from Government would help address some of the barriers that contribute to the low rate of PFR installation if implemented.

These proposals would allow better use of Flood Re's funds to address some of the barriers that contribute to the slow rate of PFR installation, detailed in the section below. A review of Flood Re's Quinquennial Review by the Government Actuary's Department (GAD) found that 'based on the modelling and wide range of scenarios, the financial elements of the QQR recommendations are affordable.'<sup>58</sup>

Defra has also published a call for evidence on local factors in managing flood and coastal erosion risk and Property Flood Resilience.<sup>59</sup> The consultation suggests that a number of enablers need to be made effective to increase the uptake of PFR. Respondents were asked to provide their views on enablers such as: financing and incentives, planning policy, building regulations and standards, training and technical expertise, evidence and data sharing and communication and understanding.

As a result of their 2020 'Bricks and Water' inquiry, Policy Connect and Westminster Sustainable Business Forum recommended that 'given the limited uptake of property flood resilience measures and continued development within the floodplain, Government should either extend the Flood Re scheme to cover residential buildings constructed after 1st January 2009, or put in place an alternative scheme. This should be evaluated as part of the ongoing Blanc review into flood insurance.' The Inquiry also recommended that performance targets should be included in the forthcoming Future Homes Standard.

The Blanc review of flood insurance in Doncaster (following the flooding that took place in November 2019) found some gaps in existing coverage.<sup>60</sup> The review found significant differences between owner-occupiers and tenants; with most tenants being poorly protected. In addition, 6% of buildings insurance and 6.5% of contents insurance for owner-occupiers did not cover flooding. The review made a series of recommendations including for Defra to carry out a larger survey of the

proportion of buildings and contents insurance policies that do not cover the risk of flooding. It is important that measures to address gaps in insurance coverage are consistent with achieving an increase in the uptake of PFR.

**A new Code of Practice and guidance for PFR has been published. A new report has also assessed that Flood Performance Certificates would help address barriers to PFR and help increase the rate of installation.**

A Code of Practice and guidance for property flood resilience was developed by Kelly et al. and published by the Construction Industry Research and Information Association (CIRIA) in 2020.<sup>61</sup> It contains six standards covering requirements for stages from hazard assessment to operation and maintenance, and acts as a PFR benchmark. The guidance notes that risks to the property may increase due to factors such as urbanisation and climate change, and that to ensure a level of protection for a property, PFR measures need to be operated and maintained following the guidance provided in a handover pack.

Policy Connect and Westminster Sustainable Business Forum also recommended in their 2020 'Bricks and Water' inquiry that Part C of the Building Regulations should be updated to require all properties at risk of flooding to include property flood resilience measures and that these measures should be specified and installed in accordance with the industry Code of Practice for property flood resilience.

Flood Performance Certificates for property owners could be made mandatory in the future to help increase PFR uptake.

Flood Re commissioned WPI Economics to produce a report on Flood Performance Certificates which was published in December 2020.<sup>62</sup> This is a document for the homeowner and any potential purchasers or renters of the property which sets out the severity of its flood risk and steps that could be taken to mitigate the risk. The report assesses that this would help address existing barriers and provide greater incentives for improving household resilience. It also suggested that following consultation and supporting legislation, a scheme could be opened in 2022 and made mandatory towards the end of the decade.

Research on applying behavioural insights to property flood resilience was published by the Environment Agency in September 2020 as part of the FCERM R&D Programme.<sup>63</sup> The project identified several factors such as adoption among peers, removing points of 'hassle' in the process and referencing social norms in messaging, which could be taken into account to help increase the uptake of PFR.

**The Government also extended its grant scheme in 2020 to help flood-hit homes and businesses make properties more resilient to future flooding.**

In September 2020 the Government also announced the extension of the £5,000 grant scheme available to those affected by flooding in the winter of 2019/20 to take into account delays to repair work and the additional pressures placed on local authorities by the COVID-19 pandemic.<sup>64</sup> The grants of up to £5,000 are a contribution towards making a property more resilient to future flooding, such as putting in flood doors and raising electrics from ground level. Flood-hit homes, businesses and charities in communities with over 25 properties flooded were eligible to apply. It remains at Government's discretion as to whether this or similar grant schemes are activated after future flooding events.

## Has the risk management score changed?

**No, the risk management score for PFR remains low. While the positive developments detailed in the 'Has the plan score changed?' section should increase the uptake of PFR, the most recent data on installation rates still suggest that many homes that could benefit from PFR would not have it installed for a long time. This rate needs to increase and be measured against an explicit target for the score to improve.**

The current rate of PFR installation is approximately 500 to 2,000 homes per year based on limited data.

The current rate of PFR installation is approximately 500 to 2,000 homes per year based on limited data. The estimate of 500 homes is based on data sourced from the Environment Agency's programme of PFR schemes for 2015/16 to 2020/21.<sup>65</sup> The estimate of 2,000 homes per year is based on a statement by Defra in its 2021 call for evidence that there have been around 23,000 publicly funded installations of PFR since 2008, which includes residential and non-residential properties.

It is difficult to get an accurate number of installations because: a) centrally funded schemes don't necessarily report how many properties are adapted; b) recovery grants issued following flood events may or may not be used for PFR; and c) individuals may install PFR measures independently of any Government funding scheme. Given that, according to the response to 2018 parliamentary question, over 11,000 recovery grants were approved in 2015/16 alone it is likely that the data sourced from the Environment Agency's programme of PFR schemes underestimates the current rate of PFR installation.<sup>66</sup> This highlights the need for better data collection in this area.

**Although the data are limited, the current rate of installation could leave many homes vulnerable to flooding that would benefit from PFR.**

In the FCERM strategy, the Environment Agency states that 'The long-term investment scenarios show the potential for an estimated 200,000 homes in England to be fitted with property flood resilience over the next 50 years.' The figure of 200,000 homes is an approximation and requires more robust information on flood depths to give a more accurate estimate of where PFR needs to be installed. However, it gives an idea of the scale of the challenge given the current rates of installation. There are a range of options which communities can consider to increase resilience, but PFR presents a significant opportunity to reduce the numbers of properties which are vulnerable to the impacts of flooding.

Alongside better data collection this highlights the need for targets for large-scale PFR implementation to assess whether actions are proving effective and to monitor progress. There is an opportunity for the updated long-term investment scenarios in 2025 to make use of the richer information in the new national flood risk assessment to provide better evidence about the potential for PFR installation. This evidence should be used to set smart targets with timescales.

**Recommendation**

Work with the Environment Agency to set out the measures being taken to improve the uptake of property-level flood resilience (PFR) following stakeholder responses to its PFR call for evidence and consultation. This should include improved data collection to monitor progress. Plans for the new national flood risk assessment and 2025 long-term investment scenarios must ensure that the evidence they provide can be used to identify the most effective locations for PFR, and smart targets for their installation with timescales.

Department: Defra, Timing: 2022.

## 3.2.6 Capacity to recover from flooding

Progress summary – Capacity of people and communities to recover from flooding		
2019 score:	What has changed since 2019:	2021 score:
5	<p><b>Plan score - medium</b></p> <ul style="list-style-type: none"> <li>The plan score remains the same. The FCERM Strategy sets a commitment for people to receive the information and support they need to prepare and respond to flooding and coastal change by 2030.</li> </ul> <p><b>Risk management score - medium</b></p> <ul style="list-style-type: none"> <li>The risk management score remains the same. The Government can provide financial assistance for homes which are flooded, and at-risk homes built before 2009 remain insurable through the Flood Re scheme. However, the time it takes to recover from flooding and return home is based on several complex factors and there can be significant impacts to health and well-being due to flooding. There remains no available national data that allow an assessment of risk or the proportion of homes or businesses that have insurance. Environment Agency figures show that the number of people signed up to the flood warning service in England has increased.</li> </ul>	5
<p>Notes: See annex for full datasets            Key Indicators: Number of flood warnings by type, Flood warning registrations, Mental health impacts from flooding, Number of homes installing PFR per year, Properties that have flood insurance (not yet available), Number of successful insurance claims within x time of flooding (not yet available), Uptake of/spending on flood recovery grants (not yet available), Length of time people are out of their homes following flooding (not yet available).</p>		

### Summary of 2019 report score

**In our last report, capacity of people and communities to recover from flooding scored a 5 (medium plan score, medium risk management score).**

Our 2019 report found that Local Resilience Forums have developed response and recovery plans for flooding based on present-day risk but did not consider how the risk from flooding might be changing now due to climate change. On progress in managing risk, our previous report highlighted that repair and renew grants are available from MHCLG for selected flood events. In severe flood events, insurance claims can take up to a year to settle which has a significant impact on recovery time and well-being of those affected, but more data was needed to understand rates of recovery.

Has the plan score changed?

**No, the score remains the same.**

**The FCERM Strategy (Box 3.1) sets a commitment for people to receive the information and support they need to prepare and respond to flooding and coastal change by 2030.**

This includes the following actions:

- From 2020 the Environment Agency will continue to work with Local Resilience Forums to develop flood plans that better coordinate preparing and responding to incidents.
- By 2022 the Environment Agency will have expanded its flood warning service to all places at high risk of flooding and coastal change from rivers and the sea.
- By 2023 the Environment Agency will work with partners to transport its warning and information services to better reach people living, working or travelling through flood risk areas.
- By 2025 risk management authorities will support people living in places at high risk of flooding and coastal change to set up flood groups, where they are wanted, and to develop and test local flood plans.

The Government's Policy Statement commits to supporting communities, including when flooding happens and during recovery afterwards. This includes undertaking a full review of the Flood Recovery Framework (at the time of writing this is underway) to improve its effectiveness, evaluating the most recent Property Flood Resilience Recovery Support Scheme, and supporting the voluntary sector to improve their capacity and capability to help local communities in the event of a flood.

Once implemented these steps should help towards improving future scores.

**Local Resilience Forums (LRFs) have developed response and recovery plans for flooding based on present-day risk, and there is now evidence that LRFs include climate change in local plans and risk registers. LRF's feel like they are better prepared for river and coastal flooding compared to surface water flooding.**

A survey of Local Resilience Forums found that most responders included climate change in Local Resilience Plans and/or Risk Registers to some extent (see Section 3.6).<sup>\*</sup> The survey also found that several LRFs felt like they were prepared for river and coastal flooding due to increased knowledge and experience of dealing with events previously and the availability of forecasts. Responders however, did not feel as prepared for surface water flooding events. The reasons provided included that surface water flooding is more difficult to forecast, and impacts can occur in areas not previously impacted or covered by flood warnings.

It is not known if local authorities have considered how they will manage the long-term recovery of people and communities who have been flooded. As recently recommended by the EFRA Committee, the Government needs to develop a properly resourced action plan with local partners for the long-term physical, economic, and psychological recovery of communities impacted by flooding.

Has the risk management score changed?

**No. The evidence available on managing risk remains the same as in 2019.**

<sup>\*</sup> Based on results of CCC survey of Local Resilience Forum. There are 38 LRFs in England. 17 LRFs responded to the survey, representing 45% of all LRFs in England.

The costs of flooding to health services have been estimated at £1,878 per adult per flood event with internal depths up to 30cm, rising to £4,136 with depths more than 1m.

### Impacts from flooding on health and well-being remain.

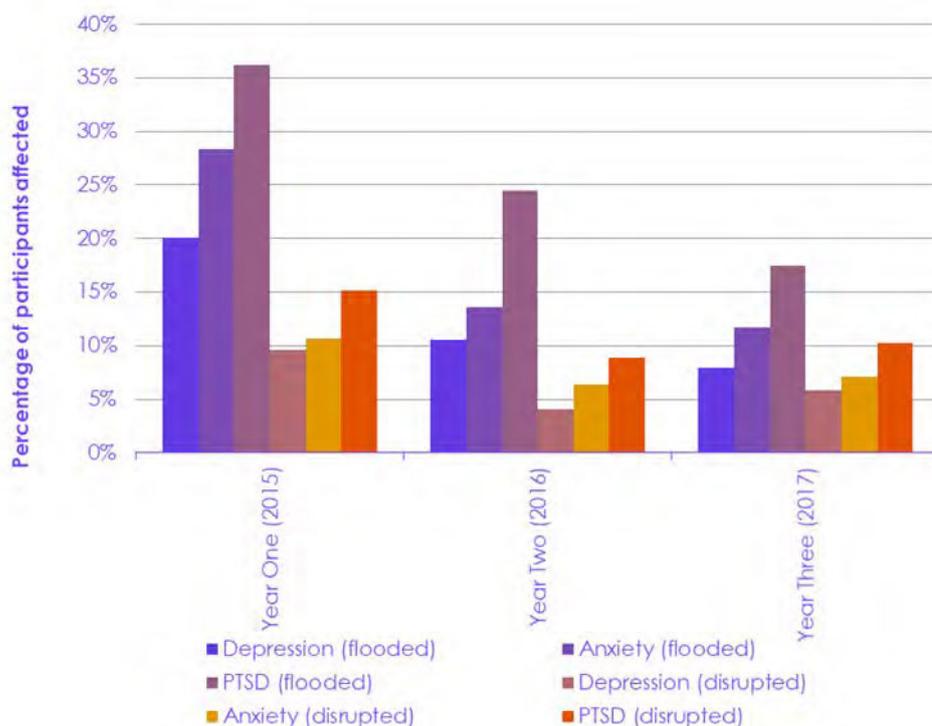

One of the greatest burdens of ill health from flooding is likely to be due to the impacts on mental health. Research has found that after one year following a flood, the prevalence of probable depression amongst homes flooded was 20.1%, anxiety 28.3% and PTSD 36.2% (Figure 3.4).<sup>67</sup> This compares with the general prevalence of depression amongst adults in Great Britain of 10% in 2019/20 (before the COVID-19 pandemic).<sup>68</sup> Three years after being flooded, mental health impacts still existed, although were reduced. Evacuation and displacement, particularly without warning, increases the risk of anxiety and post-traumatic stress disorder.

The COVID-19 pandemic may add to the already significant impacts for those displaced from their homes due to flooding in 2020 and 2021. Displacement from flooding combined with dealing with the impacts of the pandemic (e.g. potential illness, economic challenges and social isolation) are likely to be considerable. The staff needed to help support flooded households may also have reduced capacity whilst dealing with response to the pandemic.

The costs of flooding to health services were calculated in a recent study.<sup>69</sup> Costs were found to increase with depth of flood water inside the home. Costs increase from an average of £1,878 per adult per flood event with internal depths up to 30cm, to £4,136 where the depth is more than 1m deep.

In April 2020, the Government announced changes to its funding formula for flood defences, to include new evidence on the overall impacts of flooding, such as mental health and wellbeing.<sup>70</sup>

Figure 3.4 Mental health outcomes after flooding

Source: BMC Public Health (2020) *The English National Cohort Study of Flooding & Health: psychological morbidity at three years of follow up*; BMC Public Health (2018) *The English National Cohort Study of Flooding & Health: the changes in the prevalence of psychological morbidity at year two*; BMC Public Health (2017) *The English National Cohort Study of Flooding & Health: cross-sectional analysis of mental health outcomes at year one*.  
 Notes: The chart shows the prevalence of mental health outcomes after one, two- and three-years following flooding, for participants who either had their homes flooded, or were disrupted due to flooding.

**The time it takes to recover from flooding and return home is based on several complex factors.**

Recovery from flooding events is a combination of interacting factors, including: the depth of the flood water as well as duration of the flood; how contaminated the flood water is; the length of time it takes to dry out a property; having financial assistance, through insurance and grants, to repair and renew property; the availability of builders and other actors in the recovery process; having access to social support networks; and the medium- and long term strategies to return people to their homes and to manage the physical and mental health impacts.

Alongside these, other factors are discussed elsewhere in this report, such as being well-protected where appropriate (see Sections 3.2.1 on flood alleviation and 3.2.3 surface water flood alleviation); the effectiveness of the immediate emergency response (see Section 3.6); and having flood resilience measures in place to minimise impact (see Section 3.2.5).

**Further research and data collection are still required to understand the scale of this risk in terms of recovery time, how climate change will alter it, and what the most effective mix of social, economic and technical responses are to manage it in the future.**

Returning home from flooding can be a slow process, however monitoring is not routine or formalised (particularly in terms of contextual hazard data, such as depth and duration of flood), so the Committee cannot assess the differences between different flood events over time and whether recovery times are getting better or worse. It is important that monitoring begins to also identify the factors that cause the longest delays, so that future efforts to reduce recovery times can be implemented efficiently.

**The Government can provide financial assistance for homes which are flooded and Flood Re has allowed at-risk homes built before 2009 to be insurable. However, no data is available on how many homes have insurance that covers flood risk.**

Flood recovery grants continue to be made available following major flood events under the Flood Recovery Framework. Flood-hit households following Storm Denis and Ciara in 2020 were able to claim £500 and 100% council tax relief. Under the Bellwin scheme, local authorities dealing with the effects of the event can apply to have 100% of the eligible costs they incur above a threshold reimbursed by the Government.

There remains no available national data that allow an assessment of the proportion of homes or businesses that have insurance to cover flood risk. An independent review of the availability of flood insurance for homes and businesses flooded in Doncaster in 2019 found that 28% of owner-occupiers were not covered. If replicated across the country this could mean tens of thousands of vulnerable households who are unnecessarily unprotected against flooding and missing out on the support that has been set up to help them.

Flood Re has improved the ability of households built before 2009 that have previously been flooded to access affordable insurance. Defra has consulted on several changes to Flood Re which aim to improve its uptake, efficiency and effectiveness (see Section 3.2.5).

**Environment Agency figures show that the number of properties signed up to the flood warning service in England has increased (Figure 3.5).**

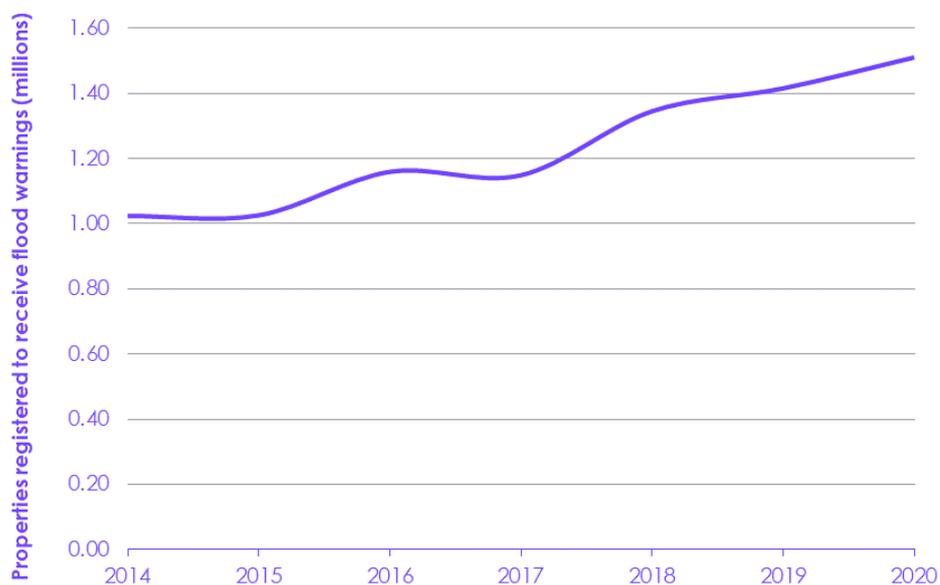

The ability to prepare for flooding in terms of keeping safe and minimising damage to property and possessions relies on high quality forecasts, which are received and acted upon. Between April 2019 and March 2020, the number of properties registered to received flood warnings rose by 7% from the previous year.

Between April 2019 and March 2020, the number of properties registered to receive flood warnings rose by 7% from the previous year.

An increasing number of users are accessing flood warning information through digital channels. In 2020, 6.2m users viewed over 65m pages, a more than threefold increase since 2018.

The FCERM Strategy commits the Environment Agency to expanding its flood warning service to all places at high risk of flooding from rivers and the sea. The Environment Agency's Expanding Flood Warnings project is working to provide all properties at high risk of flooding with warnings by 2022. By the end of 2022, the project aims to add 62,000 properties in England to the flood warning service.

## 3.3 Coastal erosion risk management

Progress summary – Coastal erosion risk management		
2019 score:	What has changed since 2019:	2021 score:
3	<p><b>Plan score - medium</b></p> <ul style="list-style-type: none"> <li>The plan score remains the same. Flood and Coastal Erosions Risk Management (FCERM) strategy indicates the Environment Agency is currently in the process of refreshing the evidence (including climate change projections) and technical guidance, which underpin Shoreline Management Plans (SMPs). The SMP Refresh is anticipated to initiate a new planned implementation cycle, however, it is not yet clear how this will change plan outcomes (including for both climate change responses and protecting habitats and species). Furthermore, the non-statutory status of SMPs limits their robustness as long-term plans as it is not clear if the measures outlined in them will be sufficiently funded.</li> </ul> <p><b>Risk management score - low</b></p> <ul style="list-style-type: none"> <li>The risk management score remains the same. It is not possible at present to conduct a robust assessment of progress in managing vulnerability. Information to track the rate of delivering SMP policies against SMP ambitions is not available. Furthermore, despite the irreversibility of properties lost to coastal erosion (in contrast to flooding), there is still no national dataset of properties lost, meaning it is not possible to assess the change in exposure, or the viability of the coastal local plans that use the SMPs.</li> </ul>	3
<p>Notes: See annex for full datasets Key Indicators: Grants for demolition and removal due to coastal erosion.</p>		

### Summary of 2019 report score

**In our last report, Coastal erosion risk management scored a 3 (low plan score, medium risk score).**

Our 2019 report highlighted that while Shoreline Management Plans (SMPs) had the potential to form a long-term, sustainable plan to address coastal erosion if they were implemented and sufficiently resourced, in practice, this was not the case. Existing plans did not include the full scale of future climate change risks from coastal erosion and thus could not plan long-term adaptation responses that could manage those risks. On progress in managing risk, we highlighted that the absence of a national dataset of properties lost to coastal erosion or data tracking the implementation of SMPs meant it was not possible to assess the change in exposure or the viability of the coastal local plans that use the SMPs as their evidence base.

### Has the plan score changed?

**No – the plan score is unchanged from 2019. Ongoing work to refresh the Shoreline Management Plans in England includes a requirement to assess SMPs against the latest climate evidence, however, it is not clear yet how this will be reflected in plan outcomes. In order for the score to increase the policy the Committee’s view is that SMPs must be made statutory.**

**More clarity is needed on how new evidence on climate change will be included in the process to refresh Shoreline Management Plans (SMPs) in England.**

SMPs remain the key mechanism for coastal defence management planning at both the regional and local level.<sup>71</sup> In England, there are 20 SMPs produced and updated by coastal groups in consultation with local communities and local partners.<sup>72</sup> The Environment Agency is currently working with coastal groups to refresh the SMPs in England. As specified in its FCERM strategy, the scope of the project includes the need to assess SMPs against the latest climate evidence, including impacts under a 2°C rise in global temperature, with consideration of 4°C.

It is understood the technical review phase of the SMP Refresh has been completed and outputs (Supplementary SMP Guidance covering UKCP18 and adaptation, plus individual 'health check' reports for each SMP) distributed to local authorities and Defra agencies. These will be discussed locally and SMP Action Plans updated with new priorities. However, details of how this will be factored into revised plan outcomes (including for both climate change responses and protecting habitats and species) is not currently clear. It is, therefore, not possible at present to determine how the SMP Refresh process will change existing SMP plans or their implementation in practice.

The Shoreline Management Plan Refresh is anticipated to kickstart a new planned implementation cycle.

**The SMP Refresh is anticipated to kickstart a new planned implementation cycle.**

SMPs outline preferred coastal management decisions in the short-term (0–20 years), medium-term (20–50 years) and long-term (50–100 years). These epochs are defined based on the start of the current (i.e. second-round) implementation cycle, which commenced over a decade ago (2009–11), rather than being incrementally updated; the current short-term epoch will end in the next few years. The SMP Refresh process is anticipated to initiate a rebasing of the implementation cycle to present day, which should help foster SMP policies based upon up-to-date data. However, SMPs remain advisory rather than statutory instruments meaning that in practice policy decisions are not necessarily funded or implemented.

Policy decisions within SMPs must be made statutory to ensure they are implemented.

**The Committee's view is that the policy decisions within SMPs must be made statutory to ensure they are implemented.**

The non-statutory status of SMPs severely undermines their effectiveness as the main vehicle that coastal authorities have to outline and implement their long-term strategy for coastal defence management.

**Defra has announced it will conduct a review of national policy for SMPs.**

Alongside the refresh of SMPs, Defra in its FCERM Policy Statement has committed to a review of the national policy for SMPs, which will focus on ensuring local plans are transparent, continuously evaluate outcomes and enable local authorities to make robust decisions for their areas.<sup>73</sup> The review will also assess current mechanisms and legal powers that Coastal Protection Authorities can use to manage the coast. This will include exploring the availability and role of financial products or services that can help people or businesses to achieve a managed transition away from areas at very high risk of coastal erosion.

**The Government has committed to increasing the use of nature-based solutions to address risks from coastal erosion.**

The FCERM Strategy and accompanying Policy Statement include a commitment to 'double the number of Government funded projects which include nature-based solutions to reduce flood and coastal erosion risk' (see also section 2.7). However, as yet no further information as to the scale or location of these projects is available.

**NAP2 includes an action to update the National Coastal Erosion Risk Map (NCERM) and ensure this remains freely available as open data online.**

The scope has been developed for a comprehensive NCERM update, with associated improvements to model architecture. The project will also revise assessments of property and infrastructure at risk in the future and explore combining NCERM within the national SMP Explorer being developed as part of phase 2 of the SMP Refresh.<sup>74</sup>

**The requirement for SMPs to underpin coastal development strategies in England has been removed from the 2018 revision of the National Planning Policy Framework (NPPF).**

Instead, the Planning Practice Guidance (PPG) now includes the requirement that local planners should use SMPs as the evidence base for their local plans, a move which may be considered to give it lesser importance.<sup>75</sup>

Has the risk score changed?

**No. The evidence available on managing risk remains the same as in 2019. It is not possible to assess robustly progress in managing coastal erosion risk in England due to a lack of baseline data on properties lost to coastal erosion and the implementation of SMP policy.**

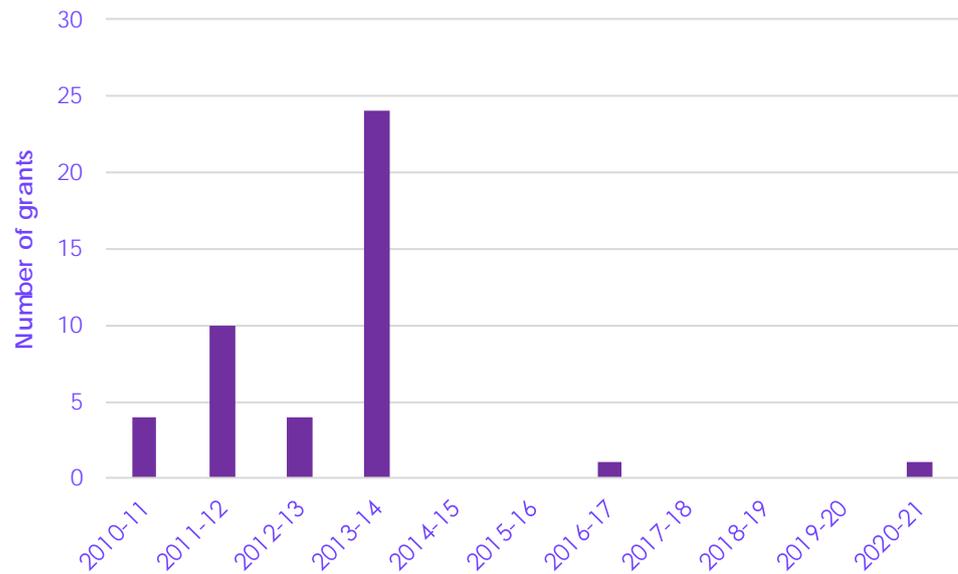

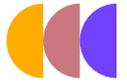

**The Government does not currently offer direct compensation for individual properties at risk from coastal change, and losses are generally uninsurable.**

The irreversibility of properties lost to coastal erosion means the potential risk impact for affected households is extreme, particularly as losses are uninsurable.

Defra's Coastal Erosion Assistance Grant (CAEG) provides £6,000 per property to assist local authorities with the demolition and removal costs associated with homes at imminent risk of loss from coastal erosion. Since 2010-11, 44 grants have been awarded with the majority of incidents concentrated around the east coast of England (e.g. Great Yarmouth and North Norfolk). Only two grants have been awarded since 2014-15. While it is not clear what has driven the drop, this could be a feature of the intermittency of coastal erosion events, such as cliff falls, or other factors linked to the administration or awareness of the grant scheme.<sup>76</sup>

Furthermore, while data suggests incidents are currently low, particularly relative to flooding, the irreversibility of properties lost to coastal erosion means the potential risk impact for affected households is extreme, particularly as losses are uninsurable.

Figure 3.6 Grants for demolition and removal due to coastal erosion

Source: Environment Agency

Notes: Number of successful applications for Coastal Erosion Assistance Grant, each representing one property

**The Environment Agency's new Flood and coastal resilience innovation programme will allocate £150 million across 25 local areas, funded by Government.**

The funding will target projects that demonstrate how practical innovative actions can work to improve resilience to flooding and coastal erosion. The aims of the programme are to:

- encourage local authorities, businesses and communities to test and demonstrate innovative practical resilience actions in their areas
- improve the resilience of 25 local areas, reducing the costs of future damage and disruption from flooding and coastal erosion
- improve evidence on the costs and benefits of the innovative resilience actions and demonstrate how different actions work together across geographical areas
- use the evidence and learning developed to inform future approaches to, and investments in, flood and coastal erosion risk management

**The absence of a national dataset of properties lost to coastal erosion or tracking of SMP policy implementation mean it is not possible to monitor progress in managing coastal erosion risk.**

It is vital that the Government allocates resources to the collection of these baseline data if the change in exposure or the viability of the coastal local plans that use the SMPs as their evidence base is to be assessed.

## 3.4 Water demand in the built environment

Progress summary – Water demand in the built environment		
2019 score:	What has changed since 2019:	2021 score:
8	<p><b>Plan score – high</b></p> <ul style="list-style-type: none"> <li>The plan score remains the same, with a number of positive developments since our last assessment. The Environment Agency National Framework strengthens planning with a move to strategic regional planning on drought resilience, reducing long term water use and reducing leakage. The latest water company plans set new targets for personal water consumption and metering. The Government consulted on measures to reduce personal water use in 2019 and is expected to announce a statutory target on overall demand for public water supply encompassing targets for leakage, personal consumption and non-household consumption in 2021. An updated water resources planning guideline has been published and the next set of company plans are expected to use UKCP18 climate projections.</li> </ul> <p><b>Risk management score – medium</b></p> <ul style="list-style-type: none"> <li>The risk management score remains the same. There remains a need for an increase in demand-side measures and stricter targets for reducing household water use. There has been no significant change in average household per capita consumption over the last 5 years. The percentage of homes with water meters continues to increase, however. The latest projections of future water availability show that current demand-side adaptation measures may not be sufficient to ensure risk is kept at least constant. The outcome of the consultation on measures to reduce personal water use and faster progress in actions to reduce demand will be crucial in determining whether risks of water availability are being managed.</li> </ul>	8
<p>Notes: See annex for full datasets            Key Indicators: Per capita consumption (l/h/d) – no significant change, Percentage of households with water meters – improving.</p>		

### Summary of 2019 report score

**In our last report, water demand in the built environment scored an 8 (high plan score, medium risk score).**

Water companies are required within their Water Resource Management Plans (WRMPs) to develop plans that are tied to their investment cycle for adapting to the risks of future water scarcity, including the effects climate change. This includes plans for demand management which is a critical aspect of ensuring resilient water supplies.

While a broad range of actions were being taken to reduce consumption, the Committee concluded that the level of progress in recent years and ambition in company plans may not be adequate to address future risks, particularly in the context of a 4°C global temperature rise scenario.

### Has the plan score changed?

**No, the plan score remains high - there have been a number of positive developments since our last assessment.**

The Environment Agency National Framework for Water Resources is being implemented. The framework looks at climate change pressures on public water supply using UK Climate Projections 2009 (UKCP09) datasets and sets an expectation for water company's regional plans to reduce demand to 110 litres per person per day by 2050.<sup>77</sup> The new National Infrastructure Strategy recognises that future requirements to increase resilience in water supplies and reduce the overall demand for water are key to better managing supply requirements.<sup>78</sup>

### **The latest water company plans set new targets for personal water consumption and metering.**

Water companies produce water resource management plans (WRMPs) every five years which look 25 years ahead. The Ofwat 2019 Price Review for 2020-25 requires water companies to help customers reduce personal consumption to 131 l/p/d by 2025 through their latest plans (WRMP19).<sup>79</sup> They also show that meter penetration will increase to 83% by 2045. WRMP19 plans use climate change projections from UKCP09. The latest plans show that, in the current regulatory environment, companies expect consumption to reduce to an average of 120 litres per person per day by 2045.<sup>80</sup> A further reduction to 110 litres per person per day will need to be achieved by 2050 to meet the expectations set out in the Environment Agency's National Framework for Water Resources.

Water companies expect consumption to reduce to an average of 120 litres per person per day by 2045. A further reduction to 110 litres per person per day is needed by 2050 to meet the expectations set out in the Environment Agency's National Framework for Water Resources.

### **The Government consulted on measures to reduce personal water use in 2019.**

The consultation on measures to reduce personal water use included consideration of demand-side measures including extending metering (including the use of smart meters), water efficiency labelling and amendments to building regulations.<sup>81</sup> An independent review by the Energy Savings Trust in 2019 of the costs and benefits of water labelling options in the UK recommended that the UK Government consider implementing a mandatory water labelling scheme linked to building regulations and minimum standards.<sup>82</sup> The Environment Bill policy targets paper proposed setting a statutory target on overall demand for public water supply encompassing targets for leakage, personal consumption and non-household consumption.<sup>83</sup> Choosing the right mix of acceptable measures will be vital to increasing the resilience of water supplies. The outcome of the consultation has been delayed due to departmental constraints imposed by COVID-19. Government is expected to announce its next steps to reduce per capita consumption in 2021.

### **An updated water resources planning guideline has been published and the next set of company plans are expected to use UKCP18 climate projections.**

Government consulted on the water resources planning guideline in 2020 and published the updated guideline in 2021.<sup>84</sup> In assessing the risk and possible impact of climate change, the guideline asks companies to consider the updated projections of future water availability produced for the third UK Climate Change Risk Assessment.<sup>85</sup> These projections are considered further below. Supplementary guidance on climate change is also being developed. Water companies are now developing cross company plans for 2024 using UKCP18 projections.

Has the risk management score changed?

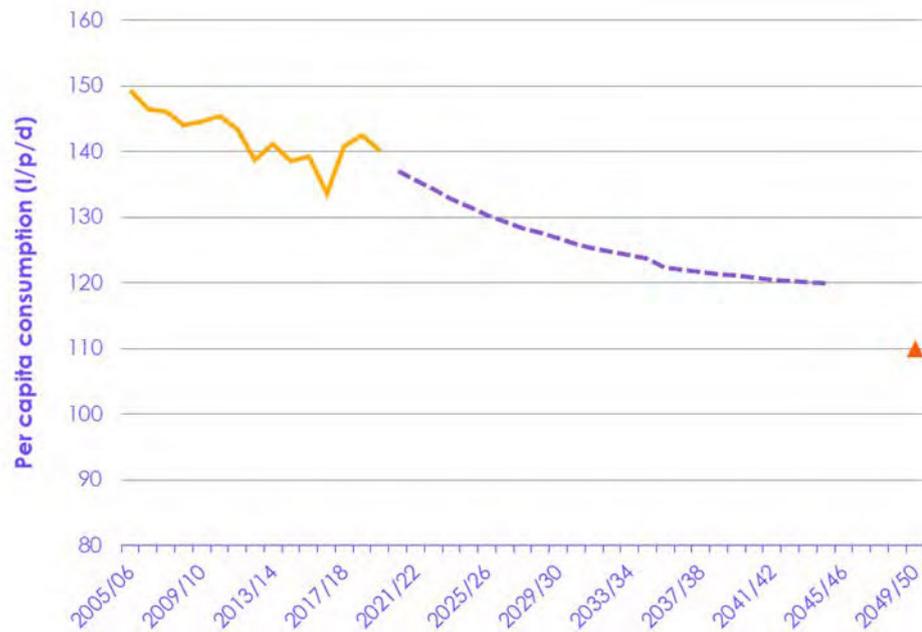

**No, the risk management score remains medium. Further action is needed to manage risks of future water shortages, through an increase in demand-side measures and stricter targets for reducing household water use.**

**There has been no significant change in average household per capita consumption over the last 5 years.**

Per capita consumption is a key measure for how efficiently we are using water. Weighted average\* per capita consumption per household in England was 140 l/h/d in 2019-20 (Figure 3.7). Consumption fell by 2% between 2018-19 and 2019-20. Overall, there has been little change in personal water use in the last 10 years although COVID-19 has reportedly influenced short term consumption patterns, with an increase in household consumption and a decrease in non-household consumption.<sup>86</sup>

There has been little change in personal water use in the last 10 years.

**Figure 3.7** Weighted average water consumption per capita for households in England 2005-2020 and forecast to 2044-45

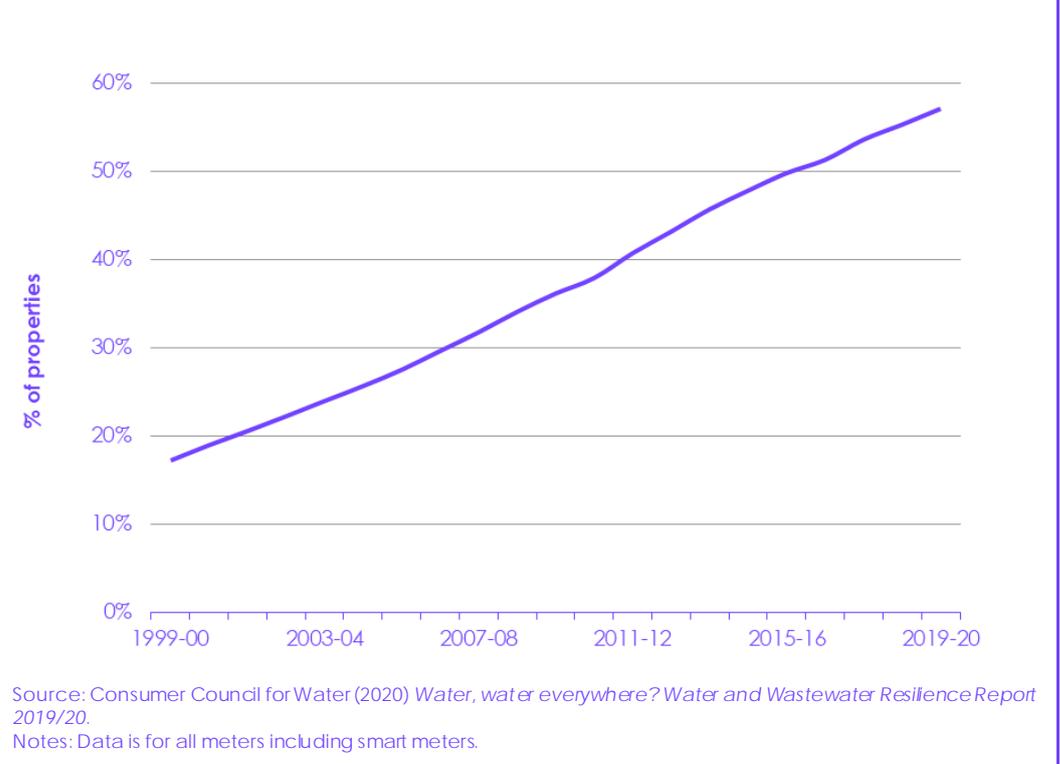

Source: Summary of actual and forecast data from Water Resource Management Plans (WRMP19) for all water companies in England. Data provided by the Environment Agency.  
 Notes: Forecast data to 2045 based on WRMP19. The target of 110 l/p/d represents the required level of per capita consumption by 2050 to meet the expectations set out in the Environment Agency's National Framework for Water Resources.

**The percentage of homes with water meters continues to increase.**

In 2019-20, 57% of households in England (and Wales) had water meters (Figure 3.8). This represents a 7% increase in metering since 2017/18. The latest water company plans show metering will increase to cover 83% of households by 2045. Over 2020-25, companies will invest £650 million in installing at least 2 million new water meters.<sup>87</sup> In the National Infrastructure Assessment, the National Infrastructure Commission recommended compulsory metering by the 2030s beyond water stressed areas, which could increase metering to 95% by 2050.

\* Weighted PCC is PCC weighted by water company population.

**Figure 3.8** Proportion of properties with water meters from 1999-00 to 2019-20

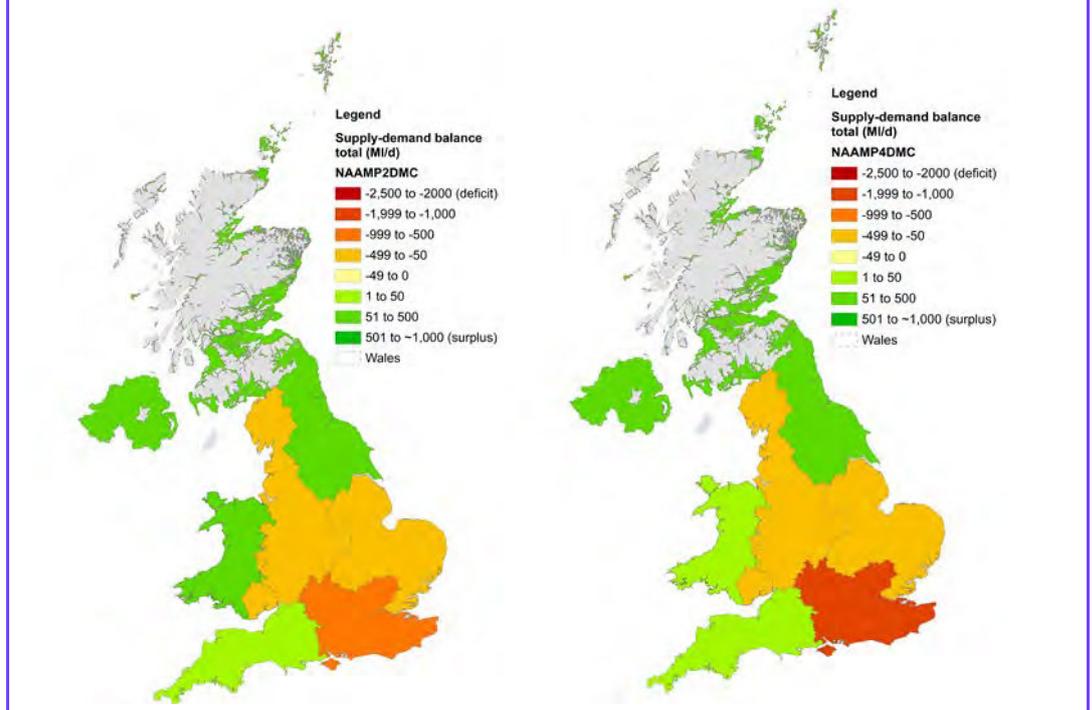

Recent analysis by Waterwise and Arqiva found that fitting one million smart water meters in the UK each year for the next 15 years could result in saving at least one billion litres of water a day (1,000 Ml/d) by the mid-2030s, as well as reducing the UK’s current greenhouse gas emissions by 0.5% (2.1MtCO<sub>2</sub>e).<sup>88</sup> Metering can also help with the management of water usage and supplies during peak demand, and help water companies identify and fix leaks.<sup>89</sup> The Government is expected to announce its approach to metering in 2021 as part of the new package of measures to reduce personal water use.

Although metering is a useful tool to help encourage lower water use by helping customers understand their usage, this may only occur if meters are visible to customers so they can track usage in real time. Meters are often placed out of sight, for instance underneath manhole covers in driveways. Metering also needs to be used in conjunction with other measures such as water labelling and messaging in order to achieve the reduction needed. Choosing the right mix of acceptable measures will be vital to increasing the resilience of water supplies.

**The latest projections of future water availability show that current demand-side adaptation measures may not be sufficient to ensure risk is kept at least constant.** The updated projections of future water availability produced for CCRA3 use the latest UKCP18 climate projections. In the current and announced adaptation scenario, reductions in demand and leakage are modelled in line with announced targets by government and the latest water resource management plans. Demand in England and Wales falls from around 140 to 118 l/h/d and leakage is reduced by around 50% by 2050. Under current and announced levels of adaptation, the latest projections of water availability indicate deficits in the Water Resources South East, Water Resources West and Water Resources East regions by the mid-century, in both 2°C and 4°C warming scenarios (Figure 3.9).\*

\* Under central population projection and assuming no additional adaptation action.

Figure 3.9 Mid-century supply-demand balance for UK Water Resource Regions

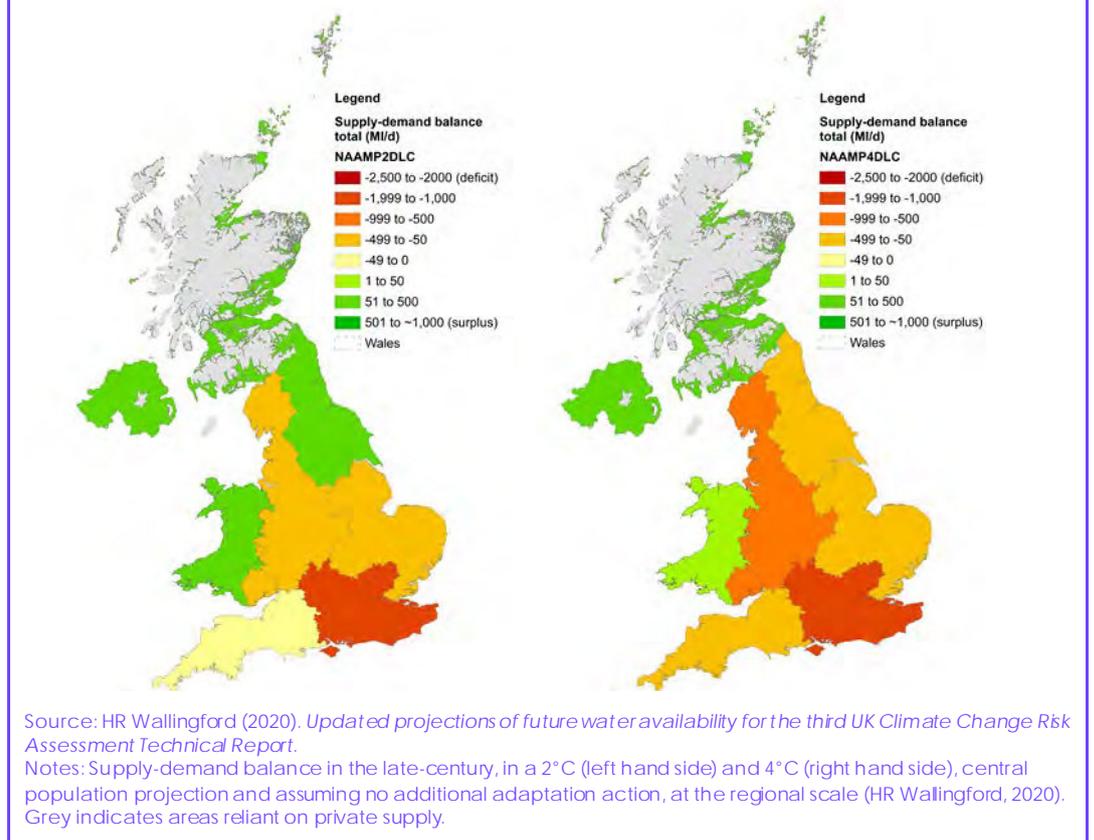

Source: HR Wallingford (2020). *Updated projections of future water availability for the third UK Climate Change Risk Assessment Technical Report.*

Notes: Supply-demand balance in the mid-century, in a 2°C (left hand side) and 4°C (right hand side), central population projection and assuming no additional adaptation action, at the regional scale (HR Wallingford, 2020). Grey indicates areas reliant on private supply.

By the late century, the projections show that in a 4°C world, all water resource regions in England are in deficit (Figure 3.10).

Figure 3.10 Late-century supply-demand balance for UK Water Resource Regions

**There remains a need for an increase in demand-side measures and stricter targets for reducing household water use.**

The outcome of the consultation and faster progress in indicators will be crucial in determining whether risks of water availability are being managed.

## 3.5 Public health and wellbeing

The impact of high temperatures poses a significant threat to people's health and wellbeing now and in the future. High temperatures affect a very wide range of health and social outcomes. The heatwaves in recent summers have caused thousands of excess all-cause deaths and disruptions to daily activities (including hospital services and education).

The impacts of heat from climate change will, to a significant degree, be determined by how well the built environment is adapted to the future climate. Lock-in is a key concern for capacity to adapt to future risks.<sup>\*</sup> Adaptation could be limited by housing and planning policies if they do not sufficiently consider climate change. This also has implications for the future delivery of health and social care as trends indicate a move to more home-based care. To tackle these issues requires cross-government coordination.

There are also more uncertain impacts on air pollution levels from changes in the climate (rather than changes in emissions which will have a very large effect) and threats from climate-sensitive infectious and non-infectious diseases. These changes are likely to alter the weather-related burden on human health and wellbeing in England.

The COVID-19 pandemic has shone light on resilience and capacity for action in Government departments, but particularly for those who deal with people, the built environment and business. The pandemic may have increased risks associated with high temperatures and poor indoor air quality as people have had to spend more time indoors during hot weather.<sup>90</sup> The impacts on health of both high temperatures and COVID-19 are disproportionately higher for vulnerable groups such as older persons, those with underlying conditions, and particularly people in residential care. Further work is required to explore how the concurrent risk of COVID-19 and heatwaves may have intersected to possibly amplify the number of deaths.

COVID-19 has also significantly affected the ability of health agencies to make progress in other areas of work, including climate change. Health bodies have seen a redeployment of staff and the unavailability of key stakeholders. Ongoing business as usual activities have been reoriented towards assessing and managing concurrent risks of COVID-19 and extreme weather events.<sup>91</sup>

<sup>\*</sup> Lock-in: Early actions or decisions that involve long lifetimes or path dependency, which will potentially increase future risk or vulnerability and that are difficult or costly to reverse later (quasi-irreversibility). This can be from an action or decision that is 'business-as-usual', from a lack of an action or decision, or from a mal-adaptative action or decision.

## 3.5.1 Health impacts from heat and cold

Progress summary – Health impacts from heat and cold		
2019 score:	What has changed since 2019:	2021 score:
2	<p><b>Plan score - low</b></p> <ul style="list-style-type: none"> <li>The plan score remains the same, but some progress has been made. MHCLG has proposed to introduce a new regulatory requirement for addressing overheating in new homes, alongside new statutory guidance. However, at the time of writing this is still part of a consultation and not yet policy. There remains no plan to understand overheating risk and adaptation needs in existing homes, nor action to retrofit existing buildings. There is also still no plan to address the lack of understanding of the extent of overheating risks in care facilities or how a move towards home-based care may alter the risks to patients and healthcare delivery from extreme weather. There has been some better planning for 2°C and 4°C scenarios in policies for schools and prisons.</li> </ul> <p><b>Risk management score - medium</b></p> <ul style="list-style-type: none"> <li>The risk management score remains the same. Cumulative excess all-cause mortality related to heatwaves in summer 2020 was higher than that observed in England during the 2003 pan-European heatwave and 2006 heatwave event. Research since 2019 has found further evidence of overheating occurring in homes. Better indicators would help to understand the extent of overheating in existing homes. While increasing heat is a major climate risk to health, cold related deaths will remain significant and mitigation action to improve the thermal comfort of homes in winter as well as summer remains urgently needed. There is increased evidence of overheating in hospitals and new research into the occurrence and cost of summertime overheating in care homes. The proportion of urban greenspace, which can lessen the urban heat island effect has fallen since 2016.</li> </ul>	2
<p>Notes: See annex for full datasets            Key Indicators: Area of urban greenspace, Number of heat and cold-related deaths per year, Number of hospitals/care homes/surgeries that experience overheating (not yet available for care homes and surgeries), Temperature and air quality monitoring in new and existing homes including the number of overheating exceedances and the number of homes currently adapted to overheating (not yet available), Number of / spending on passive cooling measures and air conditioning uptake in different building types (residential, care homes and healthcare facilities) (not yet available)</p>		

### Summary of 2019 report score

**In our last report, health impacts from heat and cold scored a 2 (low plan score, medium risk management score).**

Our 2019 report found that adaptation plans to mitigate the long-term risks of heat impacts on health were missing, despite CCRA2 highlighting the risks to health from heat as an urgent priority. Plans were in place to review the Building Regulations, but there had not been any significant shifts in policy to ensure that new buildings are being designed with the future climate in mind and no policies exist to help adapt existing buildings. On progress in managing risk, our previous report highlighted that actions are taking place; however, there was little evidence the risk was being managed. The Committee recommended that regulations be strengthened for overheating to prioritise passive cooling measures in existing and new buildings and a need for increased and improved data collection in healthcare facilities, as well as better indicators to monitor overheating in homes.

This priority includes subsections for: housing; schools and prisons; health and social care delivery; and greenspace. Whilst there are also potential heat impacts to people using public transport, these have not been included as it is not known what the national-level picture is for overheating on transport.

Has the plan score changed?

**No, the score remains the same although some progress has been made which could lead to an improved plan score in the next year or two.**

A key issue with tackling heat risk is that ownership of the issue is shared across Government departments. There is a lack of cross-departmental coordination in dealing with the multiple health outcomes from overheating and utilising the multiple adaptation options available for mitigating risk.

The following sections are therefore split roughly by policy/impact area.

### Buildings – Housing

**MHCLG has proposed to introduce a new regulatory requirement for overheating mitigation, alongside new statutory guidance, with the aim of reducing overheating risk in new-build residential buildings.**

The Committee have previously reported that high levels of energy efficiency installed in new and existing homes can increase the retention of heat and airtightness of the building. This can increase the risk of overheating and exposure to indoor air pollutants if appropriate adaptation and ventilation measures are not implemented at the same time. In 2019, the Committee therefore recommended that the Government needed to publish an integrated plan to reduce overheating risk in existing and new homes alongside decarbonising domestic heating and planning for at least 2°C increase in global temperature, with consideration of 4°C. The Government response supported the need for regulation on overheating but had not set out plans for an integrated plan.

In January 2021, MHCLG published the Future Buildings Standard consultation which included proposals for an overheating standard within Building Regulations. The consultation proposed to introduce a new regulatory requirement for overheating mitigation, alongside consideration of usability and new statutory guidance for occupiers, with the aim of reducing overheating risk in new-build residential buildings (including houses, flats, care homes and residential educational buildings). The methodologies proposed take account of climate change and use high emissions scenarios from UKCP09. The Committee have welcomed this consultation as a significant step forward in addressing one of the most urgent climate risks. The overheating requirement and the required guidance address previous CCC recommendations to have an overheating standard in place, to mitigate using passive adaptation measures and to ensure that developers consider energy, ventilation and overheating together.

If introduced, the overheating requirement will come into force at the same time as changes to Part L of the Building Regulations in June 2022.

However, the consultation does not propose to include retrofits of existing buildings or conversions from non-domestic to residential. On the latter, there is evidence that permitted development conversions seem to create a worse quality residential environment than conversions that occur through regular planning permission in relation to several factors widely linked to health, well-being and quality of life for future occupants (see risk section below).<sup>92 93</sup>

These are mainly related to the internal design aspects such as space standards, window arrangements and access to amenity space, and are worse for 'office to residential' conversions – with evidence that adaptation measures such as external shading are being discouraged in some instances.<sup>94</sup> The regulation should therefore be expanded to refurbishments of existing buildings and conversions of non-domestic buildings to residential.

### Recommendation

Implement a strong set of standards - with robust enforcement - that ensure both new and existing buildings are designed for a changing climate and deliver high levels of energy efficiency and low-carbon heat. Including:

- Publish robust definitions of the Future Homes Standard and Future Buildings Standard which are legislated in advance of 2023 and ensure no fossil fuels are burnt in new buildings. This must include coordination with DfE, MoJ, DHSC as well as BEIS and HMT.
- Regulate the overheating requirement as set out in the Future Buildings Standard consultation. Expand the requirement to cover refurbishments of existing buildings and conversions of non-domestic buildings to residential.
- Work with BEIS on the Heat and Buildings Strategy and use standards to set a clear direction for retrofit across the buildings stock.
- Ensure that the remit of the new building safety regulator covers climate change mitigation and adaptation, strengthened through an explicit responsibility for sustainability; and is fully equipped to monitor and enforce compliance with buildings standards.
- Work with HM Treasury to ensure that local authorities are properly funded to enforce buildings standards.
- Close loopholes allowing homes to be built which do not meet the current minimum standards for new dwellings. This includes provisions around the expiry of planning permission and permitted development rights relating to change of use. Make accurate performance testing and reporting widespread, committing developers to the standards they advertise.

Department: MHCLG, Timing: 2021.

### **It is not clear how much overheating risk for new developments is being considered within local planning of most local authorities.**

Local planning policies can reinforce the need for new developments to be planned and designed to manage internal temperatures (for example with regards to orientation, shading, building materials, window design, ventilation and green spaces).

The Greater London Authority (GLA) has made positive steps by requiring overheating mitigation, in accordance with a cooling hierarchy, through the London Plan for major developments.<sup>95</sup> This includes using dynamic overheating modelling to assess internal overheating, taking a design-led approach to mitigation (such as prioritising dual aspect dwellings to enable cross-sector ventilation), and avoiding overheating without reliance on energy intensive mechanical cooling systems.

However, analysis by the CCC has found that most local plans (outside of Greater London) which have been drafted or adopted since 2018 do not include similar requirements for managing overheating risk.

**Despite some progress on addressing risks in new build residential buildings, there remains no plan to increase understanding of overheating risk and adaptation needs in existing homes, nor action to retrofit existing buildings.**

Millions of people have worked from home, rather than offices in 2020.

The majority of homes in England that will be present in 2050 have already been built. The COVID-19 pandemic has increased the amount of time people spend in their homes as millions of people have worked from home, rather than offices.<sup>96</sup> For those people living in modern, urban flats these often have high glazing with little shading, limited natural ventilation, are single aspect, and many have no easy access to outdoor green space.<sup>97</sup>

The Government's plans for reducing emissions in existing homes also do not include climate adaptation as a key priority, which is a missed opportunity to include passive cooling in retrofit programmes, especially given the risk of increased energy efficiency standards potentially exacerbating the risk of overheating.\*

Further research is needed to gain a better understanding of the extent of overheating risk in existing homes (see risk section below), while overheating and ventilation should be considered alongside programmes for energy efficiency retrofit.

Various steps are also needed to enable and encourage the uptake of adaptation measures for overheating in existing homes (Box 3.2), particularly for vulnerable or lower-income groups or those living in homes where it is difficult to make modifications.

### Box 3.2

#### Encouraging the uptake of adaptation measures for overheating in existing homes

- High quality advice and information is critical for enabling measures:
  - Green Building Passports could provide holistic guidance to householders and unlock green finance at scale.
  - Home retrofit plans are a tailored approach which could also bring in wider dimensions of comfort, aesthetics, and affordability as well as adaptation needs.
  - Combining these with the opportunity of smart meter data in a digital Green Building passport could unlock green finance at scale by providing a robust, quality source of information to raise finance against, track progress and help make standards enforceable for both climate adaptation and mitigation.
- Finance and addressing upfront costs of adaptation measures. This could be achieved through a combination of private (including 'green') finance (such as via low cost 'green mortgage products, or grants) and public funding targeted at low-income households and to support the vulnerable, along with other priority areas such as public buildings and social housing.
- Skills remain a further critical enabling measure. The CITB (the industry training board for the construction sector) have identified pace of change as a key challenge, necessitating Government intervention. It is vital that the policy framework also scales up inspections and enforcement activity to ensure householders get what they have paid for.

\* For example, the Energy White Paper (2020) and Green Homes Grant (2020).

## Recommendation

Improve understanding of and support action on overheating in existing residential buildings and encourage retrofit of passive cooling measures. The Heat and Building Strategy must consider overheating risks. The following steps are needed:

- Further research to understand when overheating occurs in existing homes, including: ongoing monitoring of temperatures in the housing stock, monitoring of overheating exceedances in homes, and number of homes currently adapted.
- Guidance and information for homeowners with the steps that can be taken if their homes overheat. This should include an outline of behaviour options and the measures that can be installed to reduce internal temperatures. Green Building Passports and home retrofit plans could provide holistic guidance and help to unlock green finance.
- Overheating risk considered and mitigated against if necessary when doing energy efficiency retrofit programmes.
- Making finance available to install adaptation measures. This could be via grant schemes or green finance for private owners, with public funding targeted at low-income or vulnerable households alongside energy efficiency retrofit.

Department: BEIS and MHCLG, Timing: 2022.

### **The Government is working to reform building safety and regulation.**

Climate change is a building safety issue, both in terms of the health and safety of residents and users and because of the contribution buildings make to emissions and hence to the health and safety of the wider population.

The reforms in the Buildings Safety Bill create a framework to improve the efficacy of building regulations, including those relating to climate change mitigation and adaptation.<sup>98</sup> This should be strengthened through an explicit responsibility for sustainability alongside buildings safety and performance. It will be important to ensure the buildings safety regulator is sufficiently equipped to monitor and enforce compliance across all building regulations and to ensure that local authorities are properly funded for enforcement activities.

### **Buildings – schools and prisons**

#### **There has been better planning for 2°C and 4°C in schools and prisons.**

The general set of adaptation interventions for schools are similar to those for other buildings, although there are additional low regret options for behavioural responses and emergency plans. Adaptation measures are essential to avoid lock-in with building designs and adapt to the future risks of overheating, flooding and other climate hazards.\* The Department for Education (DfE), along with the GLA, provide guidance on climate change and aim to prioritise passive measure over mechanical cooling to mitigate overheating risk.<sup>99 100</sup>

DfE are in the process of revising design standards in 'Specification 21' to adapt to a 2°C global warming scenario and future proof to a 4°C scenario (as far as possible) on all new or refurbished projects. This update is being informed by research carried out by the Chartered Institute of Building Services Engineers (CIBSE) Schools Design Group which has modelled the two scenarios against the 'BB0101' adaptive thermal comfort overheating risk assessment which identified the severity of risk.<sup>101</sup>

\* Lock-in: Early actions or decisions that involve long lifetimes or path dependency, which will potentially increase future risk or vulnerability and that are difficult or costly to reverse later (quasi-irreversibility). This can be from an action or decision that is 'business-as-usual', from a lack of an action or decision, or from a mal-adaptive action or decision.

There has been better planning for 2°C and 4°C in schools and prisons.

In addition to this, the DFE have carried out further research on their resilient schools project and Gen Zero (Construction innovation Hub funded research project) and well as a number of pilots testing the scenarios with industry.

School-specific long-term climate adaptation plans could be useful for the health well-being and safety of students and staff, as well as to promote a more resilient, biodiverse and vibrant school environment. Having a school-specific climate adaptation plan could deliver multiple positive outcomes including reduced bills, increased learning opportunities, improved biodiversity and better air quality.

In relation to prisons, the recent Ministry of Justice's Adaptation Strategy requires that sites assess risks using UKCP18 and use this assessment to inform adaptation plans/actions. A set of measures are recommended, but there is no analysis of costs and benefits.<sup>102</sup> The strategy says that sites should:

- Build in more natural ventilation, solar shading and natural cooling.
- Improve Building Management System (BMS) controls.
- Have emergency plans in place that consider the likely intensity and frequency of heat.
- Deliver against objectives through an action plan to be used to monitor progress of initiatives and actively support the strategic objectives and continuous improvement throughout the estate.

Since 2019 it is a requisite for all newly built prisons to be awarded an Excellent BREEAM 2018\* rating with a costed option to be designed to the 'outstanding' level. Prison builds due to complete within the next year have been assessed against the BREEAM 2014 scheme and are currently on course to meet an Excellent rating. MoJ has included BRE's "designing for future thermal comfort" as a mandatory credit for new build programmes.

## Health and social care

**There is still no plan to assess the extent of current and future overheating risks in care facilities, or how a move towards home-based care may alter the risks to patients and healthcare delivery from extreme weather under current conditions and future projections.**

In 2019 the Committee recommended that DHSC produce a plan to address the risks of overheating in care homes and care facilities, including consideration of home-based care by 2021. The Government disagreed that a plan was needed, stating that current guidance and the Heatwave Plan for England are in place. However, a review of the Heatwave Plan found little evidence that it had helped reduce general summertime impacts of heat on health since it was introduced. Barriers to adaptation also remain, including access to long-term, strategic funding.<sup>†</sup>

CQC's #TempAware campaign raised awareness of the importance of ensuring people in care homes and healthcare facilities are appropriately monitored and their health supported during hot weather, and directs providers to resources such as PHE's 'Beat the Heat' materials and the Care Provider Alliance's guidance on 'Developing Contingency Plans for Adult Social Care Services'.

\* Building Research Establishment Environmental Assessment Methodology.

† As reported during stakeholder discussions.

The Department of Health and Social Care have promised to work with CQC and other relevant agencies to determine whether there is further guidance which can be highlighted.<sup>103</sup>

### Recommendation

Assess health sector vulnerability to existing and future climate risks, particularly, for care homes and home-based care. Following this, develop a cross-sector approach to address risks. This cross-sector approach should include input from CQC, PHE, NHS, MHCLG and local level public health bodies.

Department: DHSC, Timing: 2022.

**Health providers are required to have in place a Green Plan including adaptation, but the percentage of NHS Trusts completing a plan is low.<sup>104</sup> Greener NHS will release green plan guidance, which includes requirements for adaptation planning, and are due to report in the third round of the Adaptation Reporting Power.**

The third Health and Social Care Sector Adaptation Report should:

- Review progress on health and social care sector adaptation since the previous report.
- Identify the level of risk and readiness across the health and social care sector, building on the second UK Climate Change Risk Assessment (CCRA2-2017) and UKCP18 Climate Projections.
- Provide practical recommendations on local, national and systemic actions to mitigate these risks and build resilience.

**The heat and cold health alert systems/weather plans are being revised into a single year-round plan.**

While the current Heatwave Plan for England is central to the acute public health response to heatwaves, the number of heat-related deaths in recent years (see below) indicate more strategic prevention action is required from a range of actors.

Hot weather causes an increase in deaths and emergency hospital admissions. The current Heatwave and Cold Weather Plans for England provide guidance to health, social care and community practitioners and the public in order to protect vulnerable people in hot weather. They do not take a long-term view of risk although the new year-round all-weather plan is aiming to do this (See also Section 3.6 on emergency planning).

The Department of Health and Social Care (DHSC) commissioned an independent evaluation of the implementation and potential effects of the HWP in 2019 which is now published.<sup>105</sup> Our previous report discussed the findings in more detail in our 2019 Progress Report. The evaluation found that there is no evidence that general summertime relationships between temperature and mortality and between temperature and emergency hospital admissions have changed substantially in the years since the introduction of the first HWP in 2004. Evidence did suggest that the Heatwave Plan was good at protecting people during the alert periods (the hottest days), but not so good in hot weather where no alert was issued.

## Greenspace

**There are plans and policies which will provide an opportunity to increase and improve green space and therefore could lead to reduced outdoor temperatures (especially in urban areas).**

However, it is not clear whether the multiple benefits from individual policies are being fully realised and taken up by developers (see Section 3.2.3 above).

Has the risk management score changed?

**No. The evidence available on managing risk remains the same as in 2019.**

**The number of excess all-cause mortality associated with heatwave events in summer 2020 was higher than observed in England during the 2003 pan-European heatwave and 2006 heatwave event.**

PHE has reported that there were an estimated 2,556 all-cause excess deaths (excluding deaths from COVID-19) during episodes of heat across all ages during three heatwave periods in summer 2020 in England (Figure 3.11).<sup>\*</sup> This is the highest heatwave associated all-cause excess mortality observed in England since the introduction of the Heatwave Plan for England in 2004.

There were an estimated 2,556 all-cause excess deaths (excluding deaths from COVID-19) during episodes of heat across all ages during three heatwave periods in summer 2020 in England.

Whilst the third episode of a heatwave in the summer was prolonged, with very high temperatures recorded (day and night-time) (causing 1,734 total excess deaths, 68% of total heatwave excess mortality), the severity and intensity of the meteorological conditions alone does not fully explain the magnitude of the impacts observed. Epidemiological analysis conducted by PHE has found that:

- Notably, significant excess mortality was observed in the 45 to 64 years age group in the August heatwave, compared with previous years where, at a national level, significant excess deaths in younger age groups (<65) during heatwaves were not evident.
- Significant excess mortality was observed in deaths at homes and in care homes for the 65+ age group. Significant excess mortality in this age group was also seen in hospitals during two of the three heatwave periods observed in summer 2020.
- Deaths at home and in hospitals increased significantly in the <65 years group during the third heatwave period compared to non-heatwave days in 2020.
- The COVID-19 pandemic has been associated with a general shift in where deaths have been taking place, with more deaths at home when compared to previous years.
- Excess deaths due to circulatory and respiratory causes, Alzheimer's and Dementia all increased significantly across all three heatwave periods in the 65+ group.

The identification of place and cause of deaths is important for highlighting where to target interventions, particularly for those unable to adapt their indoor environment or their behaviours in response to heat and are reliant on others for their care. However, further work is required to explore how the concurrent risk of

<sup>\*</sup> Excess all-cause mortality was calculated by comparing the average number of all-cause deaths (corrected for delays in registration) on heatwave days with the average from the combination of the 7 non-heatwave days preceding and subsequent to the heatwave period, having subtracting the estimated number of deaths attributed to coronavirus (COVID-19) on those days.

COVID-19 and heatwaves may have intersected to possibly amplify the number of deaths.

Figure 3.11 Excess heat deaths during heatwaves

Source: PHE (2020) *Heatwave mortality monitoring reports 2016-2020*.

Notes: Data split by age range is not available for 2003 and 2006. 2020 data does not include COVID-19 related deaths.

## Buildings – Housing

### Since 2019, there is further evidence of overheating occurring in residential buildings.

Research for the Energy Follow Up Survey 2017 study, due to be published by BEIS in 2021, monitored temperatures in homes between October 2017 and April 2019.<sup>106</sup> The findings from the study were based on data collected from temperature loggers, interviews conducted during 2017 and 2018, and a mobile phone survey undertaken during a hot period in the summer of 2018. The study found that:

- Of the homes included, overheating occurred in 19% of bedrooms and 15% of living rooms during 2018 (the hottest English summer to date), with average temperatures reaching 26.9°C in bedrooms.\*
- The prevalence of monitored overheating was found to be significantly greater in homes occupied by those aged over 75 compared to those under 65. In contrast, those over 75 were significantly less likely to report overheating compared to those under 65.
- Households reported issues with building fabric, the weather, internal heat and ventilation as being the main reasons for overheating.

A recent study found overheating occurred in 19% of bedrooms and 15% of living rooms during 2018 (the hottest English summer to date).

\* The measured overheating assessment used temperatures monitored in the living room and main bedroom during summer 2018. Adaptive temperature thresholds (that recognise that people adapt to warmer temperatures), were used to calculate if overheating had occurred. The adaptive criteria method was expanded to enable the vulnerability of occupants to be taken into consideration by using a lower adaptive temperature threshold for vulnerable groups.

A study has found room temperatures reaching up to 47.5°C in a permitted development flat when no shading was present.

- An adaptive criteria approach to measuring overheating was found to be a credible approach to overheating assessment and could enable targeted approaches to mitigating overheating among the types of dwellings and households most at risk.

Research published in 2019 to evaluate passive mitigation methods for reducing the risk of overheating has found evidence of significant overheating occurring in a permitted development flat.<sup>107</sup> The study was conducted in a south-west facing, single aspect retrofit (office to residential conversion) apartment building in London between August and October 2016. The study found that when no shading was present room temperatures could reach up to 47.5°C.

### **Better indicators would help to understand the wider prevalence of overheating in existing homes.**

As well as target appropriate mitigation measures and allow progress in managing risks to be measured. Useful indicators include ongoing monitoring of temperatures in the housing stock; monitoring of overheating exceedances in homes; and number of homes currently adapted.

### **While increasing heat is a major climate risk to health, cold related deaths will remain significant and mitigation action to improve the thermal comfort of homes in winter as well as summer remains urgently needed.**

An integrated approach to housing and thermal comfort is required. A major programme to retrofit energy efficiency measures in homes needs to be delivered over the next 10-15 years in order to prepare homes for low-carbon heat, and improve comfort and health, particularly for the fuel poor. To ensure year-round comfort and health benefits are realised, retrofit programmes should include work to adapt properties to possible overheating and ventilation risks, as well as providing an opportunity to address flood risks and improve water efficiency.

### **Buildings – schools and prisons**

#### **There is limited evidence regarding the prevalence of high indoor temperatures in schools and educational buildings across the country. However, local studies and evidence from pupils and staff have identified some current serious issues:**

- Schools in London have reported that concentration levels of children had been affected as a result of high temperatures in recent years (GLA, 2020).
- A survey of teachers found that 90% reported taking additional measures to reduce classroom temperature, including purchasing portable air conditioners (Environmental Audit Committee, 2018a). The majority of respondents reported that high temperatures had an impact on student performance; with half reporting that the reduction in productivity was 'significant'.
- Some new student residences have experienced internal temperatures above 30°C, partly because window openings were inadequate.<sup>108</sup>

#### **Current research projects aim to provide refurbishment scenarios to assess the impact on overheating in the existing school stock: \* 109 110**

The GLA has also recently released some guidance to support schools and academies adapt to climate change.<sup>111</sup> The increase in research in COVID-19 aerosol transmission risk has meant that the role of ventilation design in schools is being reviewed by a number of groups from the risk perspective of the transmission of respiratory disease as well as for climate change adaptation risks, including the

\* Through UCL, ARID, NERC, ASPIRE, and EPSRC.

risks of overheating and poor indoor air quality as well as air quality from traffic and other pollution.

The policies set out above are positive steps towards managing overheating risk in the future, particularly for new and refurbished schools. More work is needed to understand the extent of overheating in existing school buildings and take appropriate mitigating action to reduce risk. It would also remain beneficial for schools to have their own adaptation plans.

### **UK prisons are vulnerable to high ambient temperatures.**

The CCRA3 Technical Report found that:<sup>112</sup>

- HM Inspectorate of Prisons' report included concerns from inmates during inspections which included difficulty of breathing, continuous heating, high ambient temperatures in cells and limited oxygen from poor ventilation.
- The Ministry of Justice (MoJ) received nearly 500 reports and complaints of overheating in 2016-17.
- Solutions such as air-cooling technologies have been suggested to be not acceptable for prison conditions.
- Currently, there is no systematic evidence monitoring the indoor temperatures inside prisons in the UK.

The Ministry of Justice received nearly 500 reports and complaints of overheating in 2016-17.

### **Health and social care**

#### **There is increased evidence of overheating in hospitals.**

Data on the number of NHS Trusts that experience overheating is now available for four years from the Estates Return Information Collection (ERIC).<sup>\*</sup> In 2019-20 there were 3,600 recorded instances of overheating down from 4,482 in 2018-19.<sup>113</sup>

As data is only collected on an annual basis it is difficult to identify seasonal trends. Greener NHS plan to collect overheating data informally on a quarterly basis.

In 2019, the Sustainable Development Unit commissioned a survey<sup>†</sup> in health care settings not covered by ERIC which found that in the last three years heatwaves have impacted other healthcare settings:

- 35% of homecare services
- 36% of primary care
- 45% of residential care

COVID-19 may have compounded risk in hospitals and care homes experiencing overheating. This would have a far more significant impact on staff in full PPE.

In 2019-20 there were 3,600 recorded instances of overheating across NHS Trusts.

<sup>\*</sup> Estates Return Information Collection, 2017-2020. ERIC is a mandatory collection for all NHS Trusts. The overheating item of the survey records where wards, for each of the 236 trusts, exceeded a daily maximum temperature of 26°C. The count provided in the survey includes each occupied ward or clinical area having a daily maximum of over 26°C as one incident. At any time of the year where temperatures are found to exceed 26°C, a risk assessment should be carried out and appropriate action taken to ensure the safety of vulnerable patients.

<sup>†</sup> Commissioned report by SDU, 2019. Questions covered years 2016-2019 and engagement was undertaken with stakeholders across the NHS and social care including frontline providers. 249 primary and social care providers engaged in the survey and while the response rate was low, the data provides an insight into providers' experience of and preparedness for extreme weather events. It should be noted that those who experienced the impacts of severe weather may be more likely to respond to a survey that addresses these issues.

### Box 3.3

#### Overheating studies in care studies

##### Care Homes Overheating Audit Pilot Project

The GLA piloted an audit process to produce evidence-based recommendations for reducing the occurrence of summertime indoor overheating and exposure to elevated temperatures in care settings by residents, as well as an easy-to-use Best Practice Overheating Checklist.

The audit results and findings aim to provide consideration by the Care Quality Commission (CQC) to include the risk of overheating due to the impact of climate change in their inspection assessment of care homes.

Care homes could benefit from simple measures incurring minimal or no costs (or possibly cost savings), such as switching off unnecessary heat sources, applying rules for window opening and use of curtains, to highly efficient albeit more complex and expensive solutions that could be implemented in the longer term. These include the application of external shading, high albedo finishing materials and green roofs. Key lessons learnt will be used to inform the establishment of a longer-term process that could be replicated in the future. These include:

- Data monitoring during the heating season can provide valuable insights when studying overheating, as heat exposure and heat related mortality can occur all year round, even when external temperatures are low.
- The all-round effectiveness of summertime overheating adaptation measures should always be considered, as improving one area may cause significant unintended consequences in other areas, including possible impacts on annual heating loads.
- Adaptation measures are best implemented at the design stage, however existing buildings can also benefit significantly from a variety of measures that can be implemented under varying timescales, budgets and other requirements.
- Occupant behaviour plays a significant role in overheating reduction and thus training care home residents and staff on how to best operate the building to keep cool is critical.

##### Mortality benefit of building adaptations:

Initial work has been undertaken to explore a cost-benefit evaluation of building adaptations designed to protect against heat risks to residents of care homes in England. The work found that various physical adaptations have the potential to be cost-effective and reduce heat risk and should therefore be considered as an important complement to operational responses. In one case study, external window shading was estimated to reduce mean indoor temperatures by 0.9 °C in a 'warm' summer and 0.6 °C in an 'average' summer. In this case, for a care home of 50 residents, over a 20-year time horizon and assuming an annual discount rate of 3.5%, the monetized benefit of reduced Years of Life Lost (YLL) would be between £44,000, and £230,000 depending on which life-expectancy assumption is used. Although this range represents appreciable uncertainty, it appears that modest cost adaptations to heat risk may be justified in conventional cost-benefit terms even under conservative assumptions about life expectancy.

Source: UCL, OBU and LSHTM (2021) ClimaCare project; Ibbetson, A. et al. (2021) Mortality benefit of building adaptations to protect care home residents against heat risks in the context of uncertainty over loss of life expectancy from heat.

## Greenspace

### **The proportion of urban greenspace has not changed in recent years.**<sup>114</sup>

The Urban Tree Challenge Fund £10 million fully committed to support the planting of 134,000 trees (above the target of 130,000 trees).<sup>115</sup> However, the proportion of urban greenspace is not increasing. The CCC's previous indicator showed a decrease of permeable urban areas (greenspace) from 821,000 hectares in 2001 to 763,000 hectares in 2020.<sup>116</sup> The permeable fraction of the total urban area has decreased from 63% in 2001 to 55% in 2020.

The CCC now has access to an improved indicator (which includes larger areas of greenspace within cities and towns, not captured in the original indicator). Data from this indicator is only available since 2016.

The new indicator shows that the total proportion of urban greenspace in England declined between 2016 and 2018 from 62% to 60%, with no change between 2018 and 2020. As well as concerns over the amount of urban greenspace, access to greenspace is not equal across the population.<sup>117</sup>

The total proportion of urban greenspace in England declined between 2016 and 2018 from 62% to 60% of urban areas.

### Recommendation

Introduce an urban greenspace target to reverse the decline and ensure towns and cities are adapted to more frequent heatwaves in the future and that the 25-Year goals are met.

Department: MHCLG, Timing: 2022.

## 3.5.2 Risks to people from pathogens

Progress summary – Risks to people from pathogens		
2019 score:	What has changed since 2019:	2021 score:
2	<p><b>Plan score - low</b></p> <ul style="list-style-type: none"> <li>The plan score remains the same. There is no coordinated plan in place which takes account of the impact of climate change on human pathogens. The new Health Security Agency provides an opportunity for climate change to be considered in the context of disease spread. Government are encouraging pro-environmental policies, such as maintaining or expanding urban green and blue space, to include a consideration of increased pathogen prevalence, but it is unclear what the take up of the guidance has been.</li> </ul> <p><b>Risk management score - medium</b></p> <ul style="list-style-type: none"> <li>The risk management score remains the same. Warmer weather is contributing to increases in tick abundance and the potential exposure of people to tick-borne diseases. Vector abundance of some mosquito species is increasing and spreading through Europe. There is a major risk of lock-in for vectors and pathogens, as once they are established, they are very difficult to eradicate. Resilience must be built proactively before new pathogens become established. While existing surveillance programmes, risk analysis and contingency planning are in place, the current level of surveillance of pathogens such as ticks and mosquitoes should be improved and expanded. This requires additional resources and investment from Government.</li> </ul>	2
<p>Notes: See annex for full datasets            Key Indicators: The distribution of ticks in the UK, The distribution of the Asian Tiger Mosquito in Europe, Geographical spread of other climate-sensitive pests and pathogens (not yet available), Funding for national surveillance mechanisms (not yet available).</p>		

### Summary of 2019 report score

**In our last report, risks to people from pathogens scored a 2 (low plan score, medium risk management score).**

Our 2019 report found that strategies to tackle invasive species – such as new mosquito species - do not consider human health and wellbeing. Other plans do not consider the long-term risks from climate change. On progress in managing risk, our previous report highlighted that existing surveillance programmes, risk analysis and contingency planning is in place, but the current level of surveillance could be improved. The report also found that more research was needed to quantify the impact climate change has on exposure to vector-borne-diseases compared to other influential factors.

Has the plan score changed?

**No, the score remains the same.**

**There is no coordinated plan in place which takes account of climate change scenarios and the impacts of health from pathogens.**

Since our report in 2019 the National contingency plan for invasive mosquitoes has been led by PHE. It highlights that the unprecedented change in status of vector-borne diseases (VBD) in Europe in recent decades is mainly due to increased globalisation and changes in climate and the environment acting on vector abundance.

This is likely to continue and therefore VBD risk in the UK is likely to increase. The plan sets out some actions for surveillance of invasive mosquitoes. However, it does not appear to include an assessment of how these actions relate to different climate change scenarios, although there are various papers published on climate change and pathogens.\*

As reported in 2019, other plans such as NAP2, the 25 YEP, the non-native species strategy, National Risk Register do not take account of the effects of future long-term climate change on human health and well-being due to VBDs.

**The multi-agency cross-government group on surveillance (Human Animal Infections and Risk Surveillance group – HAIRS), acts as a forum to identify and discuss infections with the potential for interspecies transfer.**

A system of horizon scanning is used to identify emerging zoonotic and vector-borne infections which may pose a threat to UK public health. Risk assessments have been done for tick-borne encephalitis, West Nile virus, Chikungunya virus, and Zika virus since 2017.

**Government are encouraging pro-environmental policies, such as maintaining or expanding urban green and blue space, to include a consideration of increased pathogen prevalence.**

Green and blue infrastructure and wetland areas (including in urban areas) that could reduce flood risk and urban heat islands, could potentially increase the risk of tick-borne infections or mosquito breeding grounds. PHE have published a wetland mosquito survey handbook on how to assess Wetlands.<sup>118</sup> To avoid local land-use conflicts, it aims to ensure that decision makers and those with day-to-day responsibilities for wetland management consider the public and veterinary health implications of mosquito populations. It is unclear what the take up of the guidance has been, including by local authorities.

**In 2021 it was announced that a new UK Health Security Agency will be set up to plan, prevent and respond to external threats to health.**

This provides an opportunity for climate change to be considered in the context of disease spread.

Has the risk management score changed?

**No. The score remains the same as in 2019.**

**Warmer weather is contributing to increases in tick abundance and the potential exposure of people to tick-borne diseases.**

The distribution of ticks has changed over time which may have contributed to an increased number of confirmed cases of Lyme disease in the UK and an increased risk of other tick-borne diseases. Climate change could be a cause of this change due to milder winters and warmer temperatures leading to increased tick-human contact patterns.

For example, since 2019 tick-borne encephalitis has been found to be present in Thetford Forest in the East of England and on the Hampshire/Dorset border.<sup>119</sup> Two probable cases of TBE infection have since been diagnosed due to tick-bites in the UK. Climate change models suggest a northern spread of TBE in Europe.<sup>120</sup>

Climate change models suggest a northern spread of TBE in Europe.

\* For example, Metelmann S et al. 2018.

As well as climate change, non-climate drivers such as agriculture, land use, tourism and wild animal populations could be a dominant influence on the incidence and distribution of ticks. Attribution of the different drivers, including climate change is not possible, and more research is needed to understand the links.

**There is a UK wide tick surveillance scheme, however it is constrained by a lack of resource.**

The UK's Tick Surveillance Scheme (TSS) began in 2005, run by PHE. Ticks are not routinely screened for pathogens and surveillance is constrained and would benefit from additional resources. The scheme still processes ~1,000 submissions per year and constitutes the best available data on UK ticks. Dedicated, local monitoring of tick activity would be useful to better understand how local weather conditions impact tick activity. This is currently being done in a small number of locations but could be rolled out and provide useful climate change indicator data.

**The Asian Tiger mosquito (*Aedes albopictus*) is spreading northwards across Europe (Figure 3.12).**

Since 2016, the Asian Tiger mosquito (*Aedes albopictus*) has been found (without confirmed establishment) in a few locations in Kent and west London.<sup>121</sup> This mosquito is an invasive species which can transmit dengue, chikungunya and zika virus, though there is no evidence that the mosquitoes found in the UK were capable of carrying disease (known as vector competence).

Responses to detection have been rapid and well-coordinated by PHE local health protection teams. However, the area where the mosquito is established in Europe has shifted northwards, across much of Italy and into mid and northern areas of France. Italy has experienced an epidemic of chikungunya in 2017 (Box 3.5). A recent study has found:<sup>122</sup>

- The local climate may be sufficient, in small pockets, around the Thames to sustain the Asian Tiger Mosquito currently.
- The area will spread in the future and within 50 years much of England and Wales may have a suitable climate.

Invasive mosquitos are likely to be found in increasingly challenging sites, such as urban areas. Recommendations have been made in a recent study around improving training of pest controllers and environmental health, incorporating PHE's mosquito surveillance schemes into routine local authority activities and developing local mosquito control plans.<sup>123</sup>

The suitable area for the Asian Tiger mosquito will spread in the future and within 50 years much of England and Wales may have a suitable climate.

**Box 3.5**

**Asian Tiger Mosquito (*Aedes albopictus*) in Europe**

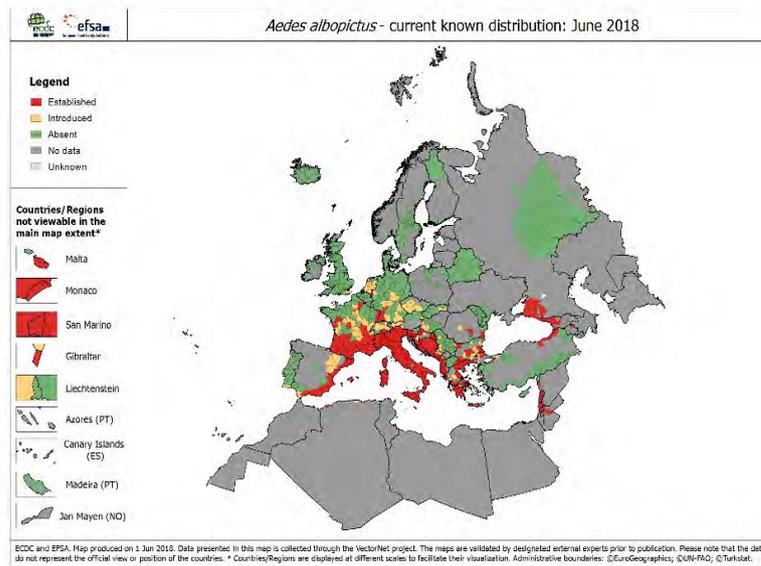

The Asian tiger mosquito (*Aedes albopictus*) has been reported in multiple European countries in recent decades. As a known vector of dengue and chikungunya, this species of mosquito is considered a serious health threat by the European Centre for Disease Prevention and Control. It has become established in most areas of Italy less than 600m above sea level. It is also prevalent in Southern France and Corsica and known to be spreading across Greece, Spain and the Balkan countries (Figure 3.12).

In France, following the establishment of *Aedes albopictus*, a national preparedness and response plan to prevent and control local transmission of chikungunya and dengue was developed in 2006 and is updated annually.

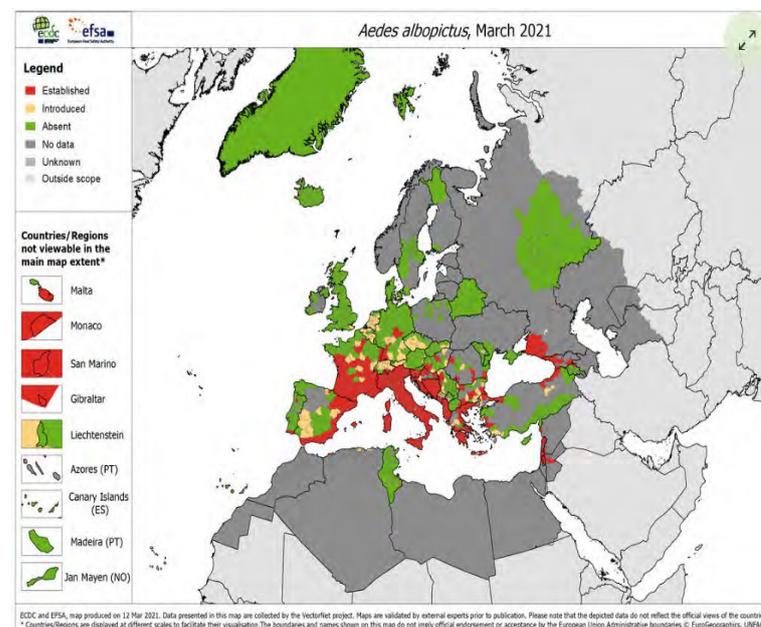

The plan focuses on entomological and epidemiological surveillance, with increased surveillance between May and November as well as increasing awareness among the population and health professionals of the risks. Since implementation, it has led to the detection and containment of several episodes of local transmission of chikungunya and dengue, including a small outbreak of autochthonous cases of Dengue in the city of Nimes in the South of France in 2015 and Chikungunya in Var, South-Eastern France in 2017.

Source: European Centre for Disease Prevention and Control, *Aedes Albopictus* Factsheet for Experts; European Centre for Disease Prevention and Control (2021) Seasonal active surveillance for invasive mosquitos over 2017-2019.; Succo, T. et al. Figure 3.12 Asian Tiger Mosquito distribution in Europe

June 2018

March 2021

Source: European Centre for Disease Prevention and Control (2020), *Mosquito maps*.  
Notes: June 2018 distribution compared to March 2021 distribution.

**Surveillance of invasive mosquitoes takes place across UK ports and in some motorway stations and truck stops (59 locations largely focussed on south-east England, where the risk of mosquitoes entering and establishing are greater). There is a major risk of lock-in for vectors and pathogens.\* Resilience must be built proactively before new pathogens become established.**

There is uncertainty around if or when pathogens will become established however, if introduced, it is extremely difficult for a zoonotic pathogen to be eradicated, as it will become established within the population in the native fauna. The pathogens can also become adapted to their new hosts. There is not only an impact on people's health but also a potentially large economic cost to local and central governments to monitor and control disease spread.

Climate change and vector-borne disease is an increasing problem, that must be fully addressed and invested in sufficiently. The new health agency provides an opportunity to expand surveillance across the UK, model and monitor species of concern and the mechanism by which invasive species arrive in the UK and provide suitable indicators to measure vector abundance. The Government must ensure such surveillance is appropriately funded.

#### Recommendation

Fund the strengthening and widening of vector and pathogen surveillance and early warning mechanisms, due to the increasing risk of disease spread as a result of climate change and other factors.

Department: DHSC, Timing: Now and ongoing.

\* Lock-in: Early actions or decisions that involve long lifetimes or path dependency, which will potentially increase future risk or vulnerability and that are difficult or costly to reverse later (quasi-irreversibility). This can be from an action or decision that is 'business-as-usual', from a lack of an action or decision, or from a mal-adaptative action or decision.

## 3.5.3 Air quality

Progress summary – Air quality		
2019 score:	What has changed since 2019:	2021 score:
3	<p><b>Plan score - medium</b></p> <ul style="list-style-type: none"> <li>The plan score remains the same. The Clean Air Strategy includes long-term targets to reduce the levels of some outdoor air pollutants and these should fall further as a result of the implementation of Net Zero policies. However, there is no consideration of the impact of climate change itself on air quality. Cleaner Air is one of Public Health England's (PHE's) top ten strategic priorities, as set out in PHE's Strategy 2020-2025. The benefits of additional adaptation (to target climate induced changes in outdoor air quality) are likely to be low, but more research is needed on pollution and health monitoring and modelling during different weather events. The Government proposed changes to Part F (ventilation) of Building Regulations in 2019-2021, to simplify and clarify guidance on ventilation in homes to ensure good indoor air quality and comfort to occupants.</li> </ul> <p><b>Risk management score - low</b></p> <ul style="list-style-type: none"> <li>The risk management score remains the same. Poor air quality causes significant harm to health. Vulnerability to outdoor air pollution, measures by the total number of people living with chronic respiratory conditions (COPD and asthma), has continued to increase. There is little evidence of monitoring of indoor air quality occurring in existing homes.</li> </ul>	3
<p>Notes: See annex for full datasets            Key Indicators: Number of people with chronic respiratory conditions, Instances of poor air quality in homes (not yet available), Number of installations of functional mechanical ventilation systems in buildings (not yet available).</p>		

### Summary of 2019 report score

**In our last report, health impacts from air quality scored a 3 (medium plan score, low risk management score).**

Our 2019 report found that plans and long-term targets are in place to reduce levels of air pollution, but these do not consider the impact of climate change of future air quality levels. On progress in managing risk, our previous report highlighted that research to address the CCRA2 research priority to understand the future impact of climate change on air quality was postponed, and vulnerability to air pollution has continued to increase.

Has the plan score changed?

**No, the score remains the same.**

**The Clean Air Strategy includes long-term targets to reduce the levels of some outdoor air pollutants and these will fall further with Net Zero policies. However, there is no consideration of the impact of climate change.**

As reported in 2019, targets and actions are in place to reduce air pollution within the Clean Air Strategy (CAS) and 25 Year Environment Plan. The Environment Bill delivers key parts of the Strategy and introduces a duty to set a legally binding target for fine particulate matter concentrations, and a duty to set a long-term air quality target. If met, future air pollution levels will be lower than now, and the marginal effect of climate change will act on a much lower baseline.<sup>124</sup>

Future levels of air pollution will fall even further with the implementation of virtually all changes proposed in the CCC's Net Zero pathways.\* There are several areas where the options adopted to meet Net Zero need to be carefully assessed to ensure the pathway is as beneficial as possible. For example, tree planting of certain species of tree and bioenergy crop may lead to increased production of ground level ozone and pollen that can aggravate asthma, hay-fever and other respiratory problems.<sup>125 126</sup>

**The benefits of additional adaptation to target climate induced changes in outdoor air quality are likely to be low.**

The most effective actions would be through the existing air quality policies and identified air quality improvement measures. These must ensure that climate risks are integrated into air quality policy and plans, taking account of both 2°C and 4°C warming scenarios. Further action might also be beneficial around improved early warning and response plans for extreme events, notably where there is an interaction between heat and air quality.

There is also a need for further research on pollution and health monitoring and modelling in different weather events.

**Cleaner Air is one of Public Health England's (PHE's) top ten strategic priorities, as set out in PHE's Strategy 2020-2025. They are considering physical and mental health co-benefits from reduced exposure to air pollution, including climate change.**

PHE is developing a five-year programme of work which aims to reduce the sources of air pollution and people's exposure to it, particularly for the most vulnerable groups. One priority is to understand opportunities and threats associated with air pollution and health, including climate change.<sup>127</sup>

**Fewer options are available to control pollen sources.**

The benefits of further action are mostly in further research and analysis of the linkages, and enhanced health advice and public warning systems. These are low-regret options.

**The Government has proposed changes to Part F (ventilation) of Building Regulations.**

These changes propose to simplify and clarify guidance on ventilation in new build homes to ensure good indoor air quality and comfort to occupants. Indoor air quality is determined by many factors including outdoor pollution, indoor pollutants and ventilation in buildings. Interventions to warm homes by reducing uncontrolled air leakage and prevent heat loss (e.g. through increased draught proofing and insulation) need to include adequate ventilation, otherwise they can worsen indoor air quality by concentrating pollutants generated indoors. This is an unintended consequence of high-performance retrofits, along with overheating, which can have negative impacts on respiratory conditions (including lung cancer), cardiovascular disease and allergic symptoms (e.g. atopic dermatitis, rhinitis, conjunctivitis and hay fever). These effects have major implications for building standards with respect to health.<sup>128</sup>

\* Major benefits to air quality are predicted from, for example, widespread electrification of transport and industry, where electricity supply is from 'clean' sources, and from reduced livestock in agriculture which reduces the emissions of ammonia that contribute to an important fraction of PM2.5. There are some actions where care is needed with respect to potential disbenefit on air quality; for example, the avoidance of high VOC (Volatile organic compounds) emitting species in increased forest and bioenergy cropland cover, which may lead to increased production of ozone. Biogenic VOCs from trees and shrubs contribute to formation of both ozone and particulate matter. Their emission is highly temperature-sensitive and hence climate change is liable to have adverse effects. Such effects would be exacerbated by tree planting programmes unless low-emitting species were selected.

In 2020, guidance from Public Health England on selected volatile organic compounds (VOCs) indoors and World Health Organisation (WHO) recommendations for indoor pollutant levels have allowed further flexibility to be introduced into Approved Document F by allowing designers to assess individual VOCs. In 2019 MHCLG reviewed Part F of Building Regulations (for ventilation) alongside Part L (for energy) in new homes to ensure the right level of ventilation is supplied that provides good indoor air quality. Natural ventilation, continuous extract (MEV systems) or supply and extract (including MVHR systems), are recognised as effective means of ventilating a modern property if designed, installed, used and maintained correctly. The revised Building Regulations guidance in Approved Document F is expected to improve compliance with the standards and therefore improve indoor air quality.

In 2021, MHCLG consulted on changes to the guidance in Approved Document F for existing homes.<sup>129</sup> These proposed changes recommend that extra ventilation is installed when installing common energy efficiency measures in existing properties, as well as when replacing windows, adding rooms, refurbishing kitchens or bathrooms (as is currently). The proposed changes aim to prevent homes becoming under-ventilated and less compliant with Part F as homes become more energy efficient.

A large proportion of homes simply do not comply with the current building regulations' requirements.

Despite positive changes proposed to regulations, the UK Government's 'Ventilation and indoor air quality in new homes' paper, has shown a large proportion of homes simply do not comply with the current building regulations' requirements, and poor indoor air quality has been observed in several sample homes tested.<sup>130</sup> There is a need for more accurate performance testing of new homes, committing developers to the standards they advertise.

The Health Protection Research Unit on Environmental Change (2016-20) has led to the development of a policy brief on the issue of housing energy efficiency and indoor air quality (specifically with regards to radon).

Has the risk management score changed?

**No. The evidence available on managing risk remains the same as in 2019.**

**Poor air quality causes significant harm to health.**

Poor air quality is associated with heart disease and stroke, as well as exacerbating respiratory conditions such as asthma, chronic obstructive pulmonary disease, lower respiratory tract infections and carcinomas of the respiratory tract. Particulates are estimated to contribute to around 29,000 deaths in the UK each year and up to 40,000 deaths when nitrogen dioxide exposure is also included.<sup>131</sup>

Long-term exposure to air pollution is associated with increased morbidity and mortality from chronic diseases, some of which have also been identified as increasing the risk of severe COVID-19 symptoms.

One study has estimated around 10-20 additional ozone related deaths per year in the UK due to climate change, although a reduced number of deaths from particulate matter.

In terms of future deaths from air quality that are attributable to climate change, there have been studies that model climate change impacts on air quality for Europe. One study estimated around 10-20 additional ozone related deaths per year in the UK, although a reduced number of deaths from particulate matter.<sup>132</sup>

**Vulnerability to air pollution, measured by the total number of people living with chronic respiratory conditions (COPD and asthma), has continued to increase.** Vulnerability to risks from air pollution can be monitored through assessing changes in the vulnerable population over time for air pollution related health impacts and deaths.

Although asthma and COPD cases can be viewed as an impact indicator (along with related deaths), in this context the Committee are treating them as vulnerability indicators; people with chronic respiratory conditions are more susceptible to periods of high air pollution:

- There has been a 20% increase in the number of patients receiving treatment for asthma in England, from 3.3 million patients in 2010-11 to 3.9 million patients in 2019-20.<sup>133</sup>
- The number of patients receiving treatment for COPD increased by 30% from 900,000 in 2010-11 to 1.2 million in 2019-20. Over this same period, the percentage of the total population receiving treatment for COPD increased from 1.6% to 1.9%.<sup>134</sup>
- London has the lowest percentage prevalence of both COPD and asthma, with the North of England having the highest percentage for COPD and the south west for asthma.
- Since 2001, deaths from asthma and COPD have increased by 24%.<sup>135</sup>
- Over 85s account for nearly 50% of deaths where asthma was the underlying cause compared to 23% in 2001.<sup>136</sup>

**There is little evidence of monitoring of indoor air quality occurring in existing homes.**

Apart from the MHCLG research mentioned above there is little evidence of monitoring of indoor air quality occurring in existing homes.

## 3.6 Effectiveness of the emergency planning system

Progress summary – Effectiveness of the emergency planning system		
2019 score:	What has changed since 2019:	2021 score:
5	<p><b>Plan score - medium</b></p> <ul style="list-style-type: none"> <li>The plan score remains the same. Climate change has now been recognised in the National Risk Register and is being included by some Local Resilience Forum in local resilience plans and risk registers. However, climate change is already altering the risk profile of some hazards and extreme events are possible in the current climate. It is unclear how this change in risk is being factored into current national risk assessments and legislation. Local Resilience Forum report being less prepared to respond to surface waterflooding, drought and heatwaves, compared to river or coastal flooding.</li> </ul> <p><b>Risk management score - medium</b></p> <ul style="list-style-type: none"> <li>The risk management score remains the same. Resilience Direct provides a platform for live multi-agency responses, resilience planning, exercising and recovery and has over 83,000 users. There are warnings in place for most climate hazards. However, climate risk is increasing, while the capacity to respond to incidents appears to be decreasing. This may lead to the available response capacity of some local areas becoming overwhelmed by future unprecedented events or series of events in parallel or quick succession. Improvements in resilience should be geographically targeted, with service vulnerability hotspots identified.</li> </ul>	5
<p>Notes: See annex for full datasets            Key Indicators: Environment Agency staff trained to respond to flood incidents, Number of emergency responders, Number of emergency planners and responders using Resilience Direct (not yet available), Time to coordinate responses to events (not yet available).</p>		

### Summary of 2019 report score

**In our last report, effectiveness of the emergency planning system scored a 5 (medium plan score, medium risk management score).**

Our 2019 report found that there are plans in place for the major climate-related emergencies today, but these do not include a consideration of the present-day change in risk from climate change. Weather and climate models have been increasing in the level of skill and granularity and can provide an improved baseline understanding of the current likelihood of extreme weather events. On progress in managing risk, our previous report highlighted that recent events have shown that the response system can be stretch and that capacity to respond in some areas is decreasing. These factors need to be properly assessed to ensure emergency planning is fit for the future climate.

Crisis response in the UK involves a diverse range of national and local organisations. National organisations and guidance clearly have a vital role to play in setting strategic direction. However, the responsibility for crisis planning and response at a local level in England lies with local resilience forums.

Has the plan score changed?

**No, the score remains the same.**

### **Climate change has now been recognised in the National Risk Register.**

In 2019 the Committee reported that the National Risk Register (NRR) (the public facing document of the National Security Risk Assessment, NSRA) did not acknowledge the projected changes in climate extremes that drive environmental hazards. The 2020 NRR now includes up front a section on climate change and recognises it as a significant crisis that the UK will need to face. There is a mismatch in the timescales considered by the NRR and CCRA which means that the NRR does not assess the impact and likelihood of climate trends, though it does now provide a link to the Climate Change Risk Assessment.

It is important that changing climate risk is also factored into the NSRA.

### **Climate change is already altering the risk profile of some hazards and extreme events are possible in the current climate.**

The CCRA3 Technical report reported that significant progress has been made in the attribution of extreme weather events since CCRA2, but this remains challenging because of the UK's highly variable weather and the fact that these events are, by definition, rare.<sup>137</sup> Recent extremes can be largely explained by the prevailing atmospheric circulation anomalies; however, these factors alone are not necessarily sufficient to explain the intensity of events, which may also have an underlying contribution from the warming UK climate.

A new methodology, known as UNSEEN (UNprecedented Simulation of Extremes with Ensembles) is providing a valuable tool for assessing current and near-term climate risks by providing better estimates of the tails of the observed distribution for the current climate and providing bounds on what is meteorologically plausible in terms of extreme events.

There is an 11% likelihood of any current year of summer temperatures exceeding those in 2018.

For example, it suggests that the severity of flooding of the Thames in 2014 should not be unexpected, even under present climate conditions, with even more extreme monthly rainfall totals possible. It has also been used to assess that there is an 11% likelihood of any current year of summer temperatures exceeding those in 2018 (where summer average temperatures were close to +2°C above the 1981–2010 average for a large swathe of southern and central England and Wales).

### **It is unclear how this change in risk is being factored into current national risk assessments and legislation.**

A study by the British Red Cross<sup>138</sup> recommended that there is a need for a future-proofed framework including a clearer role for the voluntary and community sector. Current legislation dates from 2004 and while the Government reviewed the Civil Contingencies Act in 2017, finding the legislation was working as intended, this was prior to some significant flood events of 2017. The Red Cross reports that since the legislation was introduced many in the crisis response sector have learnt important lessons from national crisis and are adapting to new threats such as the increased risk of climate related events. The Government should review regulations and guidance under the Civil Contingencies Act to ensure the legislation is fit for the changing nature of crisis response in the UK, including from the impacts of climate change.

### **Climate change is being included by some LRFs in plans and risk registers.**

An assessment of Local Resilience Plans by the British Red Cross<sup>139</sup> found that the emergency plans consistently prioritised short-term needs over longer-term support. Longer-term issues tended to be considered within the remit of other bodies such as local authorities or were featured in other specific plans such as the Recovery Plan, highlighting a potential lack of joining up between different strategies.

A survey of Local Resilience Forum by the CCC however found that most responders reported that they included climate change in Local Resilience Plans and/or Risk Registers.\* Survey responses said that climate change is usually derived from or embedded within assessments of risks in the National Security Risk Assessment (NSRA). All responders of the survey indicated that local risk assessments were updated once a year or more often and can incorporate changes to hazard likelihoods and impact.

**LRF's capability to respond varies depending on type of event.**

The survey also found that responders felt that their LRF's capability to respond to weather-related emergencies was either good or excellent. Drivers of capability to respond were mixed, although all LRF's surveyed said that one factor was experience of previous weather-related emergencies. Other key factors included the availability of resilience tools (such as Resilience Direct) and resources being made available to fund the LRF.

However, some LRFs felt they were not as prepared to deal with some hazards compared to others, a finding that is reflected in the Committee's earlier analysis of emergency planning from 2014. Whilst, responders of the survey felt that LRFs were prepared for river and coastal flooding, cold, and snow a number said that they were less prepared for heatwaves, drought and surface water flooding.

The Community Resilience Development Framework was published in September 2019 after consultation with representatives from UK Government Departments, statutory responders under the Civil Contingencies Act, the voluntary and community sector and academics.<sup>140</sup> The Framework provides a reference tool for the delivery of strategic approaches to community resilience development. Guidance on planning the coordination of spontaneous volunteers was also released, providing emergency responders with the guidance on how to plan, coordinate and manage spontaneous offers of support from the public during an emergency, including severe weather events.<sup>141</sup>

**England has Heatwave and Cold weather plans that provide guidance to health, social care and community practitioners and the public. However, these do not constitute a comprehensive long-term adaptation plan to reduce the risk of heat- and cold-related mortality and illness.**

The plans are due to be combined into one extreme weather plan, with an aim to move away from focusing on emergency response to longer-term resilience (see Section 3.5.1)

The 2021 Heatwave Plan has no significant changes but does include recognition that concurrent risk of heatwaves and COVID-19 pandemic could amplify risks to health.

Has the risk management score changed?

**No, the evidence available on managing risk remains the same as in 2019.**

\* There are 38 LRFs in England. 17 LRFs responded to the survey, representing 45% of all LRFs in England.

**The Resilience Direct platform is a tool for live multi-agency responses, resilience planning, exercising and recovery.**

The Resilience Direct (RD) service currently has over 83,500 users. Resilience Direct capability is assessed by the resilience community and enhanced accordingly.<sup>\*</sup> New RD mapping capability was launched in June 2020 which included new features to support RD users, such as Nowcasting.<sup>†</sup> Nowcasting allows responders to understand which access routes may be affected by surface water during high rainfall events and allows the emergency services to gain greater insight into the best routes during flooding, saving time in response.

**There are weather warnings in place for most climate hazards.**

There are well developed warning systems in place to alert the public and emergency responders to imminent threats of flooding, heavy rainfall, strong winds and heatwaves. The commissioning of year-round alerting system for heat and cold is complete.<sup>142</sup> The Met Office will issue a new Extreme Heat Warning service in June 2021, designed for extreme heat episodes and to work alongside PHE heat-Health Alert system. The warnings will focus on impacts to the general public.

The Cabinet Office continues to support the Met Office's year-round WeatherReady campaign.<sup>143</sup> The WeatherReady campaign encourages individuals, families and communities to think about preparations they can make to prepare for and cope with severe weather. It also provides resilience practitioners in local authorities, local emergency responders, and voluntary sector partners, with up-to-date expert guidance that can be used to communicate severe weather advice to individuals and communities.

**The capacity to respond to incidents appears to be decreasing, while risk is increasing.**

The effectiveness of the emergency response system is particularly sensitive to the expected impacts of future increases in extreme rainfall and flood risk. The numbers of Civil Category 1 responders, the response times of responders, the number of other responders (such as volunteers and charities) and the funding available for local authorities can impact how much capacity and ability an area has to be able to respond to extreme weather events.<sup>144</sup>

Category 1 responders are decreasing in number from the high point in 2009/10 which could impact the emergency services' ability to respond to any major situation, including floods or heatwaves:

- Fire service personnel have decreased by 23% since 2009.<sup>145</sup>
- Police service personnel have decreased by 8% since a peak in 2010, although numbers have risen since our 2019 report.<sup>146</sup>

Whilst the number of staff working for the Ambulance Service (full-time equivalent) increased by 24% between 2010 and 2019, this is mostly due to an increase in clinical support staff rather than ambulance staff which has remained constant.<sup>147</sup>

This decline may lead to the available response capacity of local areas becoming overwhelmed by future unprecedented events or series of events in parallel or quick succession.

<sup>\*</sup> Discussion with Cabinet Office (2021).

<sup>†</sup> The service is currently experimental and covers London, Birmingham, Manchester, Worcester and Leicester.

Other bodies are also available during emergencies. The armed forces have been used to support the response to natural disasters, for example during the response to Storm Dennis in 2020.<sup>148</sup> The British Red Cross is an auxiliary to Government and helps authorities respond to emergencies. The voluntary and community sector can be used to plan for and respond to emergencies.<sup>149</sup>

The number of Environment Agency staff who are trained and ready to respond to flood and environmental incidents is just above the target of 6,000.

The number of Environment Agency staff who are trained and ready to respond to flood and environmental incidents is just above the target of 6,000 (6,408).<sup>150</sup> Since the floods of winter 2015 to 2016, the Environment Agency has invested in new incident response kit including 40km of temporary flood barriers and 250 high volume pumps.

**Improvements in resilience should be geographically targeted, with service vulnerability hotspots identified before major events occur in areas where emergency services are already under strain.**

Emergency responders are required to reach urgent cases within mandatory timeframes, regardless of weather conditions. However, flooding of transport networks can add critical minutes to travel times between dispatch and arrival. A 2020 study found that vulnerable facilities with concentrations of elderly people, children and people with poor health, fall outside emergency service areas during flood events (even relatively low-magnitude coastal/fluvial (< 1-in-30 years) and surface water (1-in-30 years)). This indicates that for those populations who may need help during a flood (for example, evacuation), it is also much harder for emergency responders to gain access to those affected in good time.<sup>151</sup>

4.9 Local road network	229
4.10 Telecoms, digital and ICT infrastructure	231

## 4.1 Introduction

There have been a number of high-profile weather events causing damage to infrastructure in England since our last assessment.

**The functioning of our society and economies is heavily reliant on the services that infrastructure provides. Infrastructure systems in England are vulnerable to disruption and failure from extreme weather and a changing climate.**

Disruption to infrastructure networks from extreme weather can have significant implications not just for economic activity, but societal equity, health and well-being more generally. Networks are also vulnerable to increased degradation and reduced performance over time as a result of long-term changes in climate. There have been a number of high-profile weather events causing damage to infrastructure in England since our last assessment. 2019 was a particularly significant year with intense summer and autumn rainfall producing flash floods, notably impacting several stations on the London Underground. In the summer of 2019, temperatures exceeded 38°C (the hottest day ever recorded in the UK) which led to rail buckling and subsequent widespread damage and disruption on the rail network in England. A lightning strike in August that year caused a loss of power to one million customers including homes, businesses, one hospital and Newcastle Airport, and triggered disruption on the rail network. Winter flooding led to widespread disruption in South Yorkshire, quickly followed by the impacts of Storm Ciara and Dennis in early 2020.

**The UK Climate Risk Independent Assessment (CCRA3)<sup>1</sup> identifies increasing risks to infrastructure in England from high temperatures, flooding, drought, coastal erosion, and potentially wildfire in the coming decades.**

The CCRA3 Technical Report sets out the changes in climate that are expected over the coming decades; increasing average and extreme temperatures, changing rainfall patterns leading to flooding at certain times and water scarcity at others, and rising sea levels (see Chapter 1). An increasing frequency and severity of flooding from a range of sources represents the most significant climate change risk to UK infrastructure, including energy, transport, water, waste and digital communication. Assets and networks across all infrastructure sectors are already exposed to multiple sources of flooding, and the number of assets exposed could double under projected changes in climate by the 2080s. Projected extended periods of rainfall will increase the risk of slope and embankment failure - approximately 8% of the UK's transport and road network is at medium to high risk of landslide disruption.<sup>2</sup> Changes in rainfall, coupled with population growth, are projected to lead to supply-demand deficits in water resource zones across England and in some other parts of the UK by the 2050s, with widespread deficits projected by the 2080s. High temperatures can cause railway tracks to buckle, electricity cables to sag, signalling equipment to overheat and fail and road tarmac to soften and rut. Data centres are vulnerable to flood, high winds, wildfire and droughts as well as a loss of supporting power supply. While future projections remain uncertain, increases in maximum wind speeds experienced during storms would have significant implications for overhead power lines, data network cabling and the rail network, as well as for offshore infrastructure and wind turbines.

**Infrastructure assets can have very long lifetimes, in excess of 100 years, during which the English climate is expected to change considerably.**

Adaptation planning that considers long-term changes in the context of 2°C and 4°C global temperature scenarios is therefore particularly important for infrastructure.

Infrastructure can be built from the outset to be resilient to the anticipated range of future climatic conditions or designed to allow it to be upgraded cost-effectively as the climate changes, i.e. a managed adaptive approach.

**Whilst understanding of sectoral risks has improved over the last few years, the impacts of climate change could be amplified by interdependencies between infrastructure sectors, and these interactions are not well understood.**

No infrastructure network operates in isolation and a failure on one system can interact, and rapidly cascade into other sectors. System resilience to climate change goes beyond just the individual infrastructure network and can have far reaching consequences. All of the major climate hazards considered in CCRA3 could trigger a cascade effect from the power sector to other sectors; flooding, reduced water availability, increased temperatures and wildfire, as well as potential increases in storms. Interaction between climate hazards adds further complexity, for example combinations of drought followed by periods of intense rainfall can exacerbate bank stability issues.

**There have been a number of recent policy developments for national infrastructure and an increased focus on climate change adaptation is emerging.**

The UK Government has produced National Policy Statements which comprise the government's objectives for the development of nationally significant infrastructure and require climate change projections to be considered when developing new major infrastructure assets and projects. The first National Infrastructure Assessment was published in 2018, which included a number of climate change related recommendations such as national flood resilience standards and a plan to enable the water sector to meet changing supply and demand in 2050. A new National Infrastructure Strategy was published in 2020. The 2020 Spending Review committed £640 billion of gross capital investment in infrastructure before 2024-25.<sup>3</sup>

**Broader societal drivers will influence the need for resilient infrastructure.**

There will be significant implications for infrastructure resilience as a result of the transition to a Net Zero economy, for example a marked increase in reliance on electricity and the development of new energy infrastructure. This is explained further in Box 4.1.

#### **Box 4.1** Net Zero implications for infrastructure

The UK Government has adopted a Net Zero target through a revision to the 2008 Climate Act (such that the net UK carbon account for the year 2050 is at least 100% lower than the 1990 baseline). This will impact upon the type of infrastructure the UK will be reliant upon in 2050 as well its role within the wider economy and society. Changes in the energy, water supply and transport sectors will include:

- Increased reliance on electricity and ICT through extensive electrification, which amplifies the consequences of power outages and makes cascade failures to other networks more probable.
- Increased significance of offshore infrastructure to electricity supply.
- New infrastructure (e.g. hydrogen production, distribution and storage, electric vehicle charging points) with implications for scaling up investment in flood risk management.
- Increased requirements for water for CCS and Hydrogen production increases vulnerability to water shortages and, if facilities are sited on the coast, coastal erosion and sea level rise.

All proposed infrastructure investments will need to be critically evaluated through a Net Zero lens.

All of the major climate hazards considered in CCRA3 could trigger a cascade effect from the power sector to other sectors; flooding, reduced water availability, increased temperatures and wildfire, as well as potential increases in storms.

Energy supplies in particular will need to become increasingly resilient to climate change and interdependencies will need to be better understood and managed. Work is needed to understand the implications of water availability projections for the energy sector, in the context of Net Zero. The Government's new National Infrastructure Bank, announced as part of the National Infrastructure Strategy in 2020, will have a major role to play in supporting the transition of the UK's economy to Net Zero emissions by 2050.

*Source: CCC (2021) [The Third UK Climate Change Risk Assessment \(CCRA3\) - Advice to Government](#).*

In a recent White Paper, the Institution of Civil Engineers found that while the UK's long-term infrastructure drivers and challenges have not changed because of Covid-19, in the short to medium term the pandemic highlights the need to prioritise investments around digitalisation of new and existing infrastructure assets.<sup>4</sup>

In the sections below the Committee assess progress being made in accounting for and adapting to climate change for new infrastructure, existing infrastructure (broken down by sector) and with regard to infrastructure interdependencies.

## 4.2 Infrastructure interdependencies

Progress summary – Infrastructure interdependencies		
2019 score:	What has changed since 2019:	2021 score:
1	<p><b>Plan score – low</b></p> <ul style="list-style-type: none"> <li>The plan score has not improved, however there are promising developments through the new National Infrastructure Strategy (NIS) and the National Infrastructure Commission’s Resilience Study, which could lead to an improved plan score over the next two years. The new NIS is welcome and does acknowledge the increasingly important need to identify and limit cascading risks across infrastructure networks. However, there remains no systematic assessment of interdependency risk, or plan to improve resilience or address risks and opportunities from climate change. The Resilience Study develops a framework for the next National Infrastructure Assessment in 2023 and identifies climate change as one of three key challenges for resilient infrastructure.</li> </ul> <p><b>Risk management score – low</b></p> <ul style="list-style-type: none"> <li>The risk management score has not improved. Impacts caused by cascading failures from weather and climate related disruptions are still not recorded and monitored at a national scale. There remains a lack of data to assess whether actions by individual operators are reducing risk, and opportunities for data sharing across networks and Local Resilience Forums could be improved. Defra is promoting use of the UKCP18 climate projections through the Infrastructure Operators Adaptation Forum and the Adaptation Reporting Power. Defra has also been engaging reporting organisations to include better coverage of interdependent risks in ARP3 reports. However, the ARP3 reporting deadline exceeds the timeframe for this report therefore the Committee have been unable to assess the extent to which interdependent risks are being identified and managed. The transition to Net Zero and increased reliance on electricity for heating, transport and industrial processes will increase the potential impact of interacting risks.</li> </ul>	1
<p>Notes: See annex for full datasets Key Indicators: There remains a lack of data on interdependent risks and resilience actions by infrastructure providers.</p>		

### Summary of 2019 report score

**In our last report, infrastructure interdependencies scored a 1 (low plan score, low risk management score).**

In our last assessment the Committee found that there was no systematic national assessment of interdependency risk or plan to improve resilience, including addressing risks and opportunities from climate change. The report also highlighted issues around sharing of resilience data.

Strategic actions to reduce risk did not appear to be happening - there are NAP actions to share data, but these were not on track. Some research was underway and the Committee acknowledged the role of the NIA in beginning to address vulnerabilities. While many assets were being protected to the standard set out in the National Flood Resilience Review, it was not known whether risks were being fully managed.

Has the plan score changed?

**No, but there are promising developments. The new National Infrastructure Strategy acknowledges the increasing importance of managing cascading risks from climate change. However, there remains no systematic national assessment of interdependency risk or plan to improve resilience.**

The new National Infrastructure Strategy acknowledges that the increasingly interdependent nature of the UK's critical infrastructure means the need to identify and limit cascading risks is only becoming more important.<sup>5</sup> The Strategy is the Government's response to the National Infrastructure Commission (NIC) National Infrastructure Assessment (NIA) published in 2018. In its 2019 Resilience Study, the NIC sought feedback on cross-cutting resilience challenges facing the UK, especially those related to its economic infrastructure. In particular, the NIC focussed on the interconnected areas of digital, power, transport and water. The study identifies climate change, population growth and an increasing reliance on, and integration of, digital technologies as the top three challenges for resilient infrastructure in the UK.

In its final report on the Resilience Study, the NIC concludes that there is a need for a new framework for resilience which anticipates future shocks and stresses; improves actions to resist, absorb and recover from them by testing for vulnerabilities; values resilience properly; and drives adaptation. The Commission has made three recommendations to Government, which will help to deliver the framework for resilience:

- Government should publish a full set of resilience standards every five years, following advice from regulators, alongside an assessment of any changes needed to deliver them.
- Infrastructure operators should carry out regular and proportionate stress tests that consider vulnerabilities from interdependencies, overseen by regulators, to ensure their systems and services can meet government's resilience standards, and take actions to address any vulnerabilities.
- Infrastructure operators should develop and maintain long term resilience strategies, and regulators should ensure their determinations in future price reviews are consistent with meeting resilience standards in the short and long term.<sup>6</sup>

This framework will be applied to the next NIA in 2023. It is noted that the recommendations do not specifically include climate change considerations, and the report tends to focus more on resilience to one-off disruptions rather than resilience to a changing climate.

**Some NAP actions on cross-sectoral interdependencies are off-track and information sharing on interdependencies between Local Resilience Forums must be improved.**

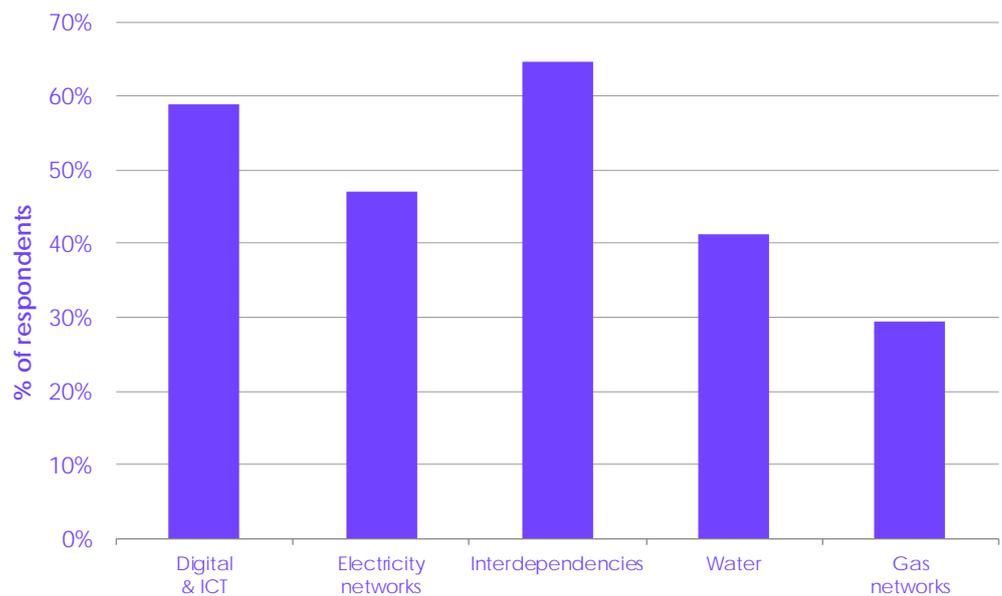

In our last assessment, the Committee highlighted concerns in the extent of actions to manage interdependent risks and data sharing arrangements:

"It remains unclear what action is being taken to reduce the climate risks related to infrastructure interdependencies. Cabinet Office should ensure that data sharing arrangements are in place between infrastructure providers and Local Resilience Forums and provide evidence to the CCC that this is happening".

Two thirds of Local Resilience Forums surveyed by the CCC stated that information on interdependencies between sectors could be improved in their area.

Local Resilience Forums (LRFs) play a key role in responding to and managing the impacts from extreme weather (see also Chapter 3, section 3.2.6 and 3.6). As in our last assessment, a biennial survey by the Cabinet Office of all local responders and LRFs in England has not been completed. In a survey of LRFs completed by the CCC for this report, when asked about the level of knowledge and information about the key risks to infrastructure in their area, two thirds of respondents stated that information on interdependencies between sectors could be improved (Figure 4.1). The majority of respondents also highlighted that better local information was needed on risks to Digital & ICT (59% of respondents) and electricity networks were also an area of concern (47% of respondents). LRFs typically felt that information on transport was sufficient\*; this may be because the location and key attributes of transport infrastructure assets are readily available.

Figure 4.1 LRF survey: Types of infrastructure for which local information could be improved

Source: CCC survey of Local Resilience Forums, conducted in March 2021.

Notes: There are 38 LRFs in England. 17 LRFs responded to the survey, representing 45% of all LRFs in England. Results for transport sectors are not shown in the chart – the % of respondents who said information could be improved for transport sectors is as follows: Railways 24%, Roads 18%, Airports 12% and Ports 12%.

To support the assessment of interdependent risks in the CCRA3 Technical Report, a project was commissioned to assess how climate change affects the interaction of risks across the infrastructure, built environment and natural environment sectors. Interruptions to power supply and disruptions to IT and communication services were identified as having the highest number of knock-on impacts across sectors.<sup>7</sup> It is particularly concerning that these are also the sectors which most LRFs identified in the survey as needing better information at a local level.

\* Transport includes railways, roads, airports and ports.

## Recommendation

Improve information sharing on climate risks to infrastructure interdependencies at a local level, especially for electricity, digital and ICT networks.

As reported in our previous assessment in 2019, NAP actions to enhance arrangements for information sharing between local infrastructure operators and improve understanding of critical risks arising from interdependencies have not been completed. Defra's link with Local Resilience Forums is key, and BEIS and DCMS should engage with utility companies to encourage standardised benchmarking and data sharing on climate risks to electricity networks, digital & ICT.

Department: Defra, BEIS and DCMS. Timing: Now and ongoing.

The Cabinet Office Civil Contingencies Secretariat is developing a standardised approach to support infrastructure owners and operators to understand the vulnerabilities across different critical sectors, with the goal of enhancing the information sharing of risks to infrastructure between Government departments and operators. The Cabinet Office reports that the scale of the response to the Covid-19 pandemic has led to some delays in delivery of this work. The Critical National Infrastructure Knowledge Base platform has been developed to better understand and manage the UK's critical national infrastructure and its supply chains. While this is a promising development, the extent to which climate risks will be included is not yet clear.

A sector-led forum of water companies and local authorities is being developed to define and develop a standardised methodology for benchmarking. The NAP references a National Infrastructure Resilience Council (NIRC) which was established to take a coordinated approach to flood resilience by utilities companies, however it is unclear whether any actions have yet been delivered under this body. These are positive developments for water and utilities sectors – the Department for Transport (DfT) and the Department for Digital, Culture, Media and Sport (DCMS) should seek to identify similar opportunities for better collaboration and data sharing with transport and digital sectors.

Has the risk management score changed?

**No. There is a continuing lack of data on the vulnerability of infrastructure to extreme weather and the progress that has been made in improving resilience.**

Impacts caused by cascading failures from weather and climate-related disruptions are still not systematically recorded and monitored. Whilst there is a lot of good research underway, there remains a lack of data on resilience actions by infrastructure providers, and especially on the fragility of infrastructure networks, including roads, rail, energy systems and ICT. The Infrastructure Operators Adaptation Forum is a cross-sector group which facilitates information sharing on interdependencies. Defra continues to engage with this group and to promote use of the latest climate projections by operators in their adaptation planning and reporting.

**Adaptation Reporting Power reports can go a long way towards providing this crucial information, however, ARP3 reports have not been available for this assessment.**

Awareness of, and planning for, interdependent climate risks and cascade failures by infrastructure operators seems to be increasing and Defra is encouraging increased focus on interdependencies under the Adaptation Reporting Power. There are two key objectives in Defra's strategy for the third round of reporting under the Adaptation Reporting power (ARP3):

- Support the ongoing integration of climate change risk management into the work of reporting organisations.
- Reports contribute to Government understanding of the level of preparedness of key sectors to climate change, at a sectoral and national level, and feed into the Adaptation Committee's reports to Parliament.<sup>8</sup>

When used effectively, the ARP can present updated risks and adaptation actions that allows for an assessment of preparedness of all infrastructure sectors and their interdependencies.

**When used effectively, the ARP can present updated risks and adaptation actions that allows for an assessment of preparedness of all infrastructure sectors and their interdependencies.**

In the CCC's review of ARP2<sup>9</sup> and our response to Defra's consultation on ARP3, the Committee recommended that reporting under the ARP should be mandatory and reports should be completed in time to inform CCRA3 and this Progress Report. Defra consulted on proposals for the third round of adaptation reporting in 2018 and concluded that the majority of respondents supported the continuation of voluntary reporting and there was support for the proposed timing and other circumstances in which the reporting power should be used.<sup>10</sup>

With a deadline of December 2021 however, only four\* ARP3 reports have been available for this assessment and based on the list of organisations who have confirmed they will report, there are expected to be gaps in coverage, particularly related to the resilience of canals and ports (see section 4.6 on ports).<sup>11</sup> These reports are intended to be a key feed-in to the development of the NAP and the CCRA. A recent policy paper by the Chartered Institute of Water and Environmental Management (CIWEM) also recommended the Government consider mandatory reporting and that the sequencing of reporting rounds should be modified so that reports can inform the CCRA.<sup>12</sup>

In 2020, the UK Government set out a roadmap towards mandatory climate risk reporting for large companies and financial institutions in the UK by 2025, aligned to the reporting requirements set out by the Financial Stability Board's Taskforce on Climate-related Financial Disclosures (TCFD). Using the Adaptation Reporting Power to the full extent set out in the Climate Change Act (2008) would send a very strong message on the UK's commitment to tackling climate risks across the economy.

**Recommendation**

Make changes ahead of the next round of reporting under the Adaptation Reporting Power (ARP). When used effectively, the ARP can present updated risks and adaptation actions that allows for an assessment of preparedness of all infrastructure sectors and their interdependencies. In particular:

- The next round of reporting must be mandatory.
- The deadline for reporting must allow sufficient time for consideration of all the reports in the fourth UK Climate Change Risk Assessment, and the CCC's statutory assessment of progress on adaptation.
- The list of organisations reporting should be expanded to ensure comprehensive coverage of critical infrastructure and services, such as canals and food supply chains, as recommended by the ARP3 consultation.

Department: Defra, Timing: 2023

\* Anglian Water, Energy Networks Association, Energy UK (due to be published 2021) and Port of London Authority

† The Committee notes that the Covid-19 pandemic may have been a contributing factor in fewer organisations submitting their ARP3 reports early.

## 4.3 Design and location of new infrastructure

Progress summary – Design and location of new infrastructure		
2019 score:	What has changed since 2019:	2021 score:
6	<p><b>Plan score – high</b></p> <ul style="list-style-type: none"> <li>The plan score remains high. The new National Infrastructure Strategy (2020) states that national infrastructure will be made resilient to future climate change, by ensuring that its expected effects are fully considered at the design stage and building in cost-effective mitigations over the whole life cycle of the asset. However, there is no explicit consideration of 2°C and 4°C warming scenarios. National Policy Statements require climate change projections to be considered when developing new major infrastructure assets and projects - they include broad consideration of 2°C and 4°C scenarios. New Green Book supplementary guidance on climate change recommends that projects with lifetimes beyond 2035 be assessed under a minimum of 2°C and 4°C scenarios. The Infrastructure and Projects Authority is working to build tests for climate resilience into assurance processes for all infrastructure projects on the Government’s Major Project Portfolio.</li> </ul> <p><b>Risk management score – low</b></p> <ul style="list-style-type: none"> <li>The risk management score remains low. Developments suggest it could improve in the next two years, though better data is required. The progress above, in relation to planning and assurance requirements for new major infrastructure projects, should lead to slower rates of increase in risk. However, there are no actions in the second National Adaptation Programme and no data to assess how the risk is being managed.</li> </ul>	6
<p>Notes: See annex for full datasets            Key Indicators: There remains a lack of data on the extent to which climate risks are being considered in the design and location of new infrastructure.</p>		

This section assesses the extent to which climate change is being considered in new major infrastructure in England.

### Summary of 2019 report score

**In our last report, design and location of new infrastructure scored a 6 (high plan score, low risk management score).**

In our last report, the Committee highlighted the role of The National Infrastructure Assessment (NIA) 2018 in setting out the new flood and water supply infrastructure needs by 2050, considering both 2°C and 4°C scenarios. The National Policy Statements require climate change projections to be taken into account when developing new major infrastructure assets and projects and include broad consideration of 2°C and 4°C scenarios. Nationally Significant Infrastructure Projects were continuing to take account of flooding, however it was more difficult to establish if other climate hazards were also being considered.

On progress in managing risk, there were no new actions in the second National Adaptation Programme (NAP2) for this priority and based on the evidence available, it was not possible to assess how well the risk was being managed.

### Has the plan score changed?

**No, the plan score remains high.**

**All new infrastructure is subject to a complex arrangement of planning and environmental regulations.**

The Planning Act 2008 sets out the development consent regime for nationally significant infrastructure projects in the fields of energy, transport, water, waste water, and waste. These projects are commonly referred to as major infrastructure projects. Climate change considerations are not fully integrated into planning legislation, though authorities are working to set out powers and duties related to adaptation.

**National Policy Statements require climate change projections to be considered when developing new major infrastructure assets and projects.**

They include broad consideration of 2°C and 4°C scenarios. Nationally Significant Infrastructure Projects are continuing to take account of flooding, though it is more difficult to establish if other climate hazards are being considered. The Infrastructure and Projects Authority (IPA) is working to build tests for climate resilience into assurance processes for all projects on the Government's Major Project Portfolio (GMPP), which will ensure that climate risks are assessed from the earliest stage of project development and require new projects to demonstrate how adaptation has been considered in project design.

**New supplementary Green Book guidance covers the consideration of climate change impacts in policy appraisal.**

The IPA work aligns closely with the new HM Treasury Green Book supplementary guidance on climate change, which supports analysts and policymakers to identify if and how their proposals could be affected by climate risks and challenges and to design adaptation measures in response.<sup>13</sup> The guidance recommends that projects with a lifetime to 2035 be appraised against a minimum of one scenario, consistent with a global temperature rise of 2°C, but for projects with longer time horizons, a minimum of at least two climate scenarios should be considered, consistent with 2°C and 4°C warming scenarios.

**The new National Infrastructure Strategy (2020) states that national infrastructure will be made resilient to future climate change.**

The strategy requires that expected effects of climate change are fully considered at the design stage for major projects, including impacts from higher temperatures, more extreme weather, and increased incidence of droughts, floods, and disease, and building in cost-effective climate risk reduction over the whole life cycle of the asset. In doing so, reference is made to the risks identified in the 2017 Climate Change Risk Assessment and the guidance for policy and programme makers set out in the Green Book supplementary guidance on climate change. The Government has committed to embedding environmental net gain\* in infrastructure in its 25 Year Environment Plan and is currently legislating for biodiversity net gain through the Environment Bill. This is discussed further in Chapter 2 (Natural Environment), though recent work of the NIC on natural capital and environmental net gain for infrastructure projects is discussed further in Box 4.2.

**Box 4.2**

**Infrastructure, Natural Capital and Environmental Net Gain**

The National Infrastructure Commission (NIC) provides the Government with impartial, expert advice on major long-term infrastructure challenges. In February 2021, the NIC released a discussion paper setting out its strategic position on Natural Capital and Environmental Net Gain.

\* An approach to development that leaves both biodiversity and the environment in a measurably better state than prior to development.

National Policy Statements require climate change projections to be considered when developing new major infrastructure assets and projects and include broad consideration of 2°C and 4°C scenarios.

The paper states that infrastructure developers should consider the impact of infrastructure development on natural capital assets and take the opportunities to contribute to the environment and biodiversity as part of development. Infrastructure projects should target environmental net gain, ensuring that infrastructure developers leave the environment in a measurably better state than they found it.

The Commission supports an environmental net gain approach across all infrastructure projects, including major infrastructure projects. This means that:

- infrastructure developers on all infrastructure projects should leave the environment in a measurably better state compared to the pre-development baseline;
- natural capital frameworks and analysis should be used in decision making for infrastructure; and
- infrastructure investors, developers, providers and operators should follow the mitigation hierarchy when delivering environmental net gain by:
  - avoiding impacts as far as possible;
  - minimising unavoidable impacts; and
  - as a last resort, compensating for unavoidable losses wherever the greatest benefits can be delivered, either locally or nationally, first considering compensating for losses within the development footprint.

However, the Commission recognises that there is further work that needs to be done and there are challenges that need to be addressed in order to support infrastructure projects to achieve this.

Source: National Infrastructure Commission (2021). [Natural Capital and Environmental Net Gain – A discussion paper](#).

## Has the risk management score changed?

**No, the risk management score remains low, though developments suggest it is improving and the score could increase in the next two years.**

There are no relevant actions in the second National Adaptation Programme. However, the developments above in relation to planning and assurance requirements for new major infrastructure projects should limit the increase in risk from new infrastructure.

**There remains a lack of data on the extent to which climate risks are being considered in the design and location of new infrastructure.**

Potential sources of this information could be data from the IPA on project approvals for GMPPs, or possibly the Nationally Significant Infrastructure Projects dataset, though it is not currently collected.

## 4.4 Energy generation, transmission and distribution

Progress summary – Energy generation, transmission and distribution		
2019 score:	What has changed since 2019:	2021 score:
8	<p><b>Plan score – high</b></p> <ul style="list-style-type: none"> <li>The plan score remains high. National Policy Statements for the energy industry, and new rules under the planning system and the Environmental Permitting Regime, require consideration of climate change impacts in the early stages of development for large installations or major upgrades of existing assets. The electricity transmission and distribution sector has cross-industry technical standards for managing current and future flood risk and a consistent approach to identifying critical assets at high levels of risk. The Energy Emergencies Executive (E3) and its Committee (E3C) monitors key risks to the sector and measures in place to ensure resilience of the system. Wind turbines and offshore energy infrastructure are heavily regulated.</li> </ul> <p><b>Risk management score – medium</b></p> <ul style="list-style-type: none"> <li>The risk management score remains medium. The energy generation and network sectors have published their ARP3 reports, collated by Energy UK and the Energy Networks Association. There has been only one significant loss of generating capacity due to weather since 2015, despite several episodes of extreme weather in that time. New analysis for CCRA3 shows an increased exposure to surface water flooding for power stations and electricity substations, even with additional adaptation, though substations serving one million customers were assessed as benefitting from flood protection measures from £172 million planned investment to 2023. The future planned increased reliance on electricity to power, transport, industry and heating increases the potential impact of any risk to the electricity system and work is needed to understand the implications of water availability projections for the energy sector, in the context of Net Zero.</li> </ul>	8
<p>Notes: See annex for full datasets            Key Indicators: Future flood projections from Sayers (2020) and limited data on assets benefitting from flood protection measures (substations only) have been used to assess the risk management score.</p>		

### Summary of 2019 report score

**In our 2019 report, energy generation, transmission and distribution scored an 8 (high plan score, medium risk management score).**

Plans were assessed as high, as the electricity sector has a well-developed understanding of risks faced by flooding which is supported by design guidelines for energy companies which include climate change and require companies to protect primary substations against flooding. Plans to manage risks to nuclear infrastructure include consideration of all relevant hazards.

On progress in managing risk, the Committee concluded that flood protection measures were being implemented by electricity supply, transmission and distribution companies and over 90% of sub-stations (550/589) deemed at risk of flooding should be resilient to a 1/1000 year flood event by 2021, reducing the exposure of customers at risk of interrupted supply. For other hazards and non-primary substations, it was less clear what steps were being taken. NAP2 and the ARP2 reports had highlighted actions and research needed to address CCRA2 gaps such as potential changes to wind speeds and the risk to gas networks crossing bridges.

Has the plan score changed?

**No, the plan score remains high.**

**National Policy Statements for the energy industry and new rules under the planning system and the Environmental Permitting Regime require consideration of climate change impacts in the early stages of development for large installations or major upgrades of existing assets.**

National Policy Statements for energy infrastructure set out how applicants and the Planning Inspectorate should take the effects of climate change into account when developing and consenting infrastructure. The Inspectorate should be satisfied that applicants for new energy infrastructure have taken into account the potential impacts of climate change using the latest UK Climate Projections available at the time the Environmental Statement was prepared. This should cover the estimated lifetime of the new infrastructure. The Environmental Impact Assessment (EIA) Regulations were updated in 2019, requiring energy infrastructure above a certain capacity to provide climate change risk assessments to the Planning Inspectorate as part of their planning application.

**The electricity transmission and distribution sector has cross-industry technical standards for managing current and future flood risk and a consistent approach to identifying critical assets at high levels of risk.**

Engineering Standard ETR138, updated in 2018, remains the industry standard for assessing and addressing asset risk from flooding. Planned actions by electricity supply, transmission and distribution companies are expected to see over 90% of substations deemed at risk of flooding become resilient to 1 in 1000-year flood events by 2021. This is in line with standard ETR138, which applies this requirement to primary substations with over 10,000 connections. This standard includes an assessment of the risks from flooding to all new and existing sites. It is not clear what actions are being taken for non-primary substations.

The Energy Emergencies Executive (E3) and its Committee (E3C) monitors key risks to the sector and measures in place to ensure resilience of the system. Energy distribution companies are including flood protection proposals in their ED2 stakeholder plans with the intention of continuing the retrospective protection of key sites vulnerable to flood risk. Engineering Standard ETR 132 requires Network Operators to fell a proportion of trees within falling distance of overhead lines. The ENA has commissioned a research report to understand impacts of changes in climate projected in UKCP18 on energy assets.

**Wind turbines and offshore energy infrastructure are heavily regulated in design and operation.**

Wind turbines are designed for specific climatic conditions in accordance with IEC 61400, an International Standard published by the International Electrotechnical Commission. The standard prescribes a set of design requirements to ensure that wind turbines are appropriately engineered to provide sufficient structural integrity against damage from all hazards within the planned lifetime of the asset. Design codes are evolving to include requirements to allow for future effects of climate change in the selection of environmental loads and other actions on offshore infrastructure. Any new offshore windfarms and transmission assets connected to the National Grid Transmission system will be subject to Ofgem connection requirements, including resilience to extreme disruptive weather.

Has the risk management score changed?

**No, the risk management score remains medium.**

Planned actions by electricity supply, transmission and distribution companies are expected to see over 90% of substations deemed at risk of flooding become resilient to 1 in 1000-year flood events by 2021.

**The energy generation and network sectors have published their ARP3 reports, collated by Energy UK and the Energy Networks Association (ENA).**

The scope of the Energy UK ARP3 report has been broadened compared to earlier ARP reports, from large (>100 MWe) thermal and hydroelectric power stations to include smaller (50 MWe to 100 MWe), distributed thermal plant and large (>100 MWe) wind turbine assets. The report is based on an assessment of risk under UKCP09 climate projections, however a review by the Joint Environmental Programme for the ARP3 report found that the conclusions of the previous assessment do not change under UKCP18 projections. All adaptation actions identified in the first adaptation report have been progressed and 73 of the 88 agreed actions have now been completed. All of the reporting companies assess climate risks as part of their corporate risk management processes and a number of Energy UK member companies are signed up to the Task Force for Climate-related Financial Disclosures.\* The report states that the sector is continuing to understand and address interdependencies through:

- Engagement with other infrastructure sectors, for example the Infrastructure Operators Adaptation Forum;
- Engagement with research, for example the interacting risks project commissioned for CCRA3;
- Responding to and learning from outages with widespread impacts, such as the 2019 lightning strike outage; and
- Working to support Black Start permit conditions†.

The ENA report<sup>14</sup> consolidates progress by gas and electricity network operators and highlights that interconnections between different industry sectors is a major source of risk for the energy network, with telecommunications and road transport thought to be the most important sources of risk. The report includes an updated risk assessment for energy networks and sets out the actions being taken to address those risks. Risk scores for 2050 have not been allocated in the report, which states there are too many variables that could affect the magnitude of climate change impacts, including Net Zero strategy.

**There has been only one significant loss of generating capacity due to weather since 2015, despite several episodes of extreme weather in that time. However, cascading impacts from a power outage across sectors can be significant.**

In February 2018, the 'Beast from the East' and Storm Emma weather events brought freezing temperatures, blizzards and high winds, prompting a Red alert from the Met Office. The summer of 2018 was exceptionally dry and warm weather – the second warmest June on record for the UK - and in February 2020 Storms Ciara and Dennis brought very strong winds and heavy rain in one of the wettest months ever recorded. Energy UK reports that electricity generation was not significantly affected in any of these instances.<sup>15</sup> A lightning strike in August 2019 caused a loss of power to one million customers including homes, businesses, one hospital and Newcastle Airport, and triggered disruption on the rail network (Box 4.3). In response to that event, the Energy Emergencies Executive Committee (E3C) (in which Energy UK participates) put forward a list of recommendations to enhance the security of the network, and to prevent and manage further power disruption events.

There has been only one significant loss of generating capacity due to weather since 2015, despite several episodes of extreme weather since 2015. However, cascading impacts from a power outage across sectors can be significant.

\* Including Centrica, Drax Power, EDF Energy UK, SSE and Uniper

† A Black Start Event is a significant partial or total failure of the electricity supply system across Great Britain.

The resulting actions, in alignment with those from Ofgem's independent investigation, are being taken forward through the E3C and its various Task Groups.<sup>16</sup>

### Box 4.3

#### Cascading impacts from 2019 power outages in England and Wales

All of the major climate hazards considered in the CCRA could trigger a cascade effect from the power sector to other sectors: flooding, reduced water availability, increased temperatures and wildfire, as well as potential increases in storms.

Power outages in England and Wales on the 9th of August 2019 demonstrate the potential for cascading infrastructure failure (Ofgem, 2020). The event was triggered by a lightning strike on the Eaton Socon-Wymondley circuit between Cambridgeshire and Hertfordshire, causing a routine fault on the national electricity transmission system and the disconnection of a number of small generators connected to the local distribution network. Simultaneously, two larger generators (Hornsea 1 Limited and Little Barford) experienced technical issues and were unable to provide power. The combined power losses exceeded the back-up power generation capacity of the Electricity System Operator (ESO), triggering a power outage.

A total of 892 megawatts (MW) of net demand was disconnected from local distribution networks. The electricity supply of over one million consumers was interrupted. The outage had significant knock-on impacts for the rail sector, with the Train Operating Company (TOC) Govia Thameslink Railway experiencing stranded trains, triggered by on-board automatic safety systems. This in turn caused knock-on delays across the rail network (Ofgem, 2020). Hornsea 1 Limited and RWE Generation UK plc (operators of Little Barford) each agreed to make voluntary payments of £4.5m to the Energy Industry Voluntary Redress Scheme.

Source: *The Third UK Climate Change Risk Assessment Technical Report, Chapter 4: Infrastructure.*

170 power stations and 463 electricity substations are currently exposed to significant risk of surface water flooding (1:30 or greater) in England. 53 power stations and 143 substations are currently exposed to significant risk of river flooding (1:75 or greater).

Under current and announced adaptation measures, energy assets in England will be well protected from river flooding - the number of power stations and electricity substations at risk are projected to decrease by at least 56% in a 4°C world by the 2080s.

#### **New future flood projections show an increased risk of surface water flooding for power stations and electricity substations, even with additional adaptation.**

New analysis for CCRA3 (Sayers et al., 2020) found that 170 power stations and 463 electricity substations are currently exposed to significant risk of surface water flooding (1:30 or greater) in England. 53 power stations and 143 substations are currently exposed to significant risk of river flooding (1:75 or greater). With current levels of adaptation, updated flood projections show that the risk of surface water flooding for power stations and electricity substations still increases compared to present day (Figure 4.2). The adaptation shortfall remains even under an enhanced adaptation scenario that goes over and above current planned adaptation action. By the 2080s in a 4°C world, the increase in risk is as high as 101% for electricity substations.<sup>17</sup>

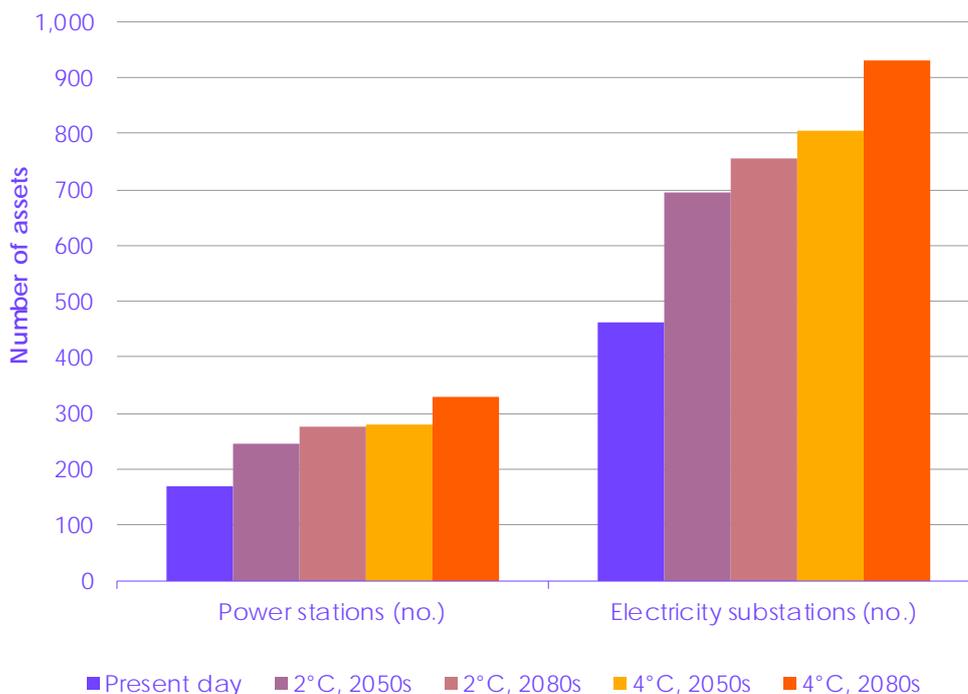

Conversely, Sayers et al (2020) project that under current and announced adaptation measures, energy assets in England will be well protected from river flooding. Under a low population and no additional adaptation scenario, the number of power stations and electricity substations at risk are projected to decrease by at least 56% in a 4°C world by the 2080s.

#### **There is evidence of continued investment from flood protection measures.**

Substations serving one million customers were assessed to benefit from flood protection measures from £172 million planned investment between 2011 and 2023.

There will be significant implications for energy infrastructure resilience and water abstraction as a result of the transition to a Net Zero economy.

**Figure 4.2** Number of electricity assets at significant risk of surface water flooding under a range of climate change scenarios

Source: Sayers et al (2020). *Third UK Climate Change Risk Assessment (CCRA) Future flood risk*.  
 Notes: Data extracted for the CCRA3 technical chapters from the results database available at [www.ukclimate.risk.org](http://www.ukclimate.risk.org). The climate scenarios presented above assume current levels of adaptation and low population growth in the mid and late century.

**Research is underway to better understand the implications of UKCP18 projections on energy networks.**

The Energy Networks Association (ENA) has engaged the Met Office to undertake research and provide a report on the impact of climate change factors on energy industry assets and operation using the revised UKCP18 data, including identifying regional differences. The report from this research has been used to assess the current risks to the energy network in the ARP3 report. Work is needed to understand the implications of CCRA3 water availability projections for the energy sector, in the context of Net Zero.

**There will be significant implications for energy infrastructure resilience and water abstraction as a result of the transition to a Net Zero economy.**

There will be significant implications for energy infrastructure resilience and water abstraction as a result of the transition to a Net Zero economy. The UK will become heavily dependent on electricity as our dominant energy source as we reduce our greenhouse gas emissions to Net Zero. While electricity provides about 15-20% of our energy today, by 2050 it could account for 55-65%, used for light, heat, communications, transport, industry and delivery of other critical services such as water.<sup>18</sup> This is alongside a potential increased reliance on renewables for electricity generation to 80% by 2050.<sup>19</sup> This will necessitate the development of new energy infrastructure, energy supplies will need to become increasingly resilient to climate change and interdependencies will need to be better understood and managed.

<sup>18</sup> Under the CCC's Balanced Pathway to Net Zero from the Sixth Carbon Budget Report.

In their ARP3 report, Energy UK notes that future access to sufficient and reliable freshwater supplies will remain a priority issue for the energy sector for the foreseeable future, given uncertainties around the future energy mix and the water-dependent nature of Carbon Capture Usage and Storage, Bioenergy with Carbon Capture and Storage, and hydrogen production.

## 4.5 Public water supply infrastructure

Progress summary – Public water supply infrastructure		
2019 score:	What has changed since 2019:	2021 score:
8	<p><b>Plan score – high</b></p> <ul style="list-style-type: none"> <li>The plan score remains high. The Draft National Policy Statement for Water Resources Infrastructure sets out how the applicant and the Secretary of State will consider the effects of climate change when developing and considering water resource NSIP applications, using the latest UK Climate Projections. Ofwat set out a £51 billion five-year investment package in its 2019 Price Review for the 2020-25 period, including requirements for water companies to cut leaks by 16% and reduce mains bursts by 12%. The water industry has committed to a 50% reduction in leakage by 2050.</li> </ul> <p><b>Risk management score – medium</b></p> <ul style="list-style-type: none"> <li>The risk management score remains medium. Total leakage for 2019/20 was 2950 ml/d - this represents a 7% reduction in leakage on 2017/18 levels. All but one water company in England met their leakage targets in 2019-20. Though there has been some progress in reducing leakage since our last assessment, the long-term trend is unclear and continued progress is required before the risk management score can be improved. The Consumer Council for Water reported in 2020 that though there has been a reduction in interruptions to supply (11% less than the previous year), performance over the last 5 years has remained static and consumers are still experiencing more interruptions than they should. In its initial assessment of water company plans for 2020-25, Ofwat stated that while all companies plan to improve the resilience of their services and systems, resilience in the round needs to be more firmly embedded across the whole of each water company's business.</li> </ul>	8
<p>Notes: See annex for full datasets Key Indicators: Total actual and forecast leakage for all water companies. Interruptions to supply.</p>		

This section considers progress in preparing for climate change in public water supply infrastructure, such as supply-side measures and structural improvements to water company networks, to reduce leakage and make water supply infrastructure resilient to extreme weather. Demand-side measures are typically lower regret and should be pursued first in balancing the supply and demand for water. Chapter 3 considers demand-side measures to reduce household water consumption and the use of water by businesses and industry is discussed in Chapter 5. Water in the natural environment is considered in Chapter 2.

### Summary of 2019 report score

**In our last report, public water supply infrastructure scored an 8 (high plan score, medium risk management score).**

The Water Resource Management Plans (WRMPs) set out how water companies have committed to more ambitious targets to reduce leakage and many had considered possible options for new water supply infrastructure and improving resilience to extreme weather.

On managing risk, progress in reducing leakage had slowed compared with during the 1990s. It was apparent that water companies were investing to improve resilience, but it was not clear if this investment would be adequate to address future risks from climate change.

Has the plan score changed?

**No, the plan score remains high. The National Policy Statement for water infrastructure will incorporate the latest climate projections and evidence from the third UK Climate Change Risk Assessment.**

The Planning Act requires the Secretary of State to have regard to the desirability of mitigating, and adapting to, climate change in designating a National Policy Statement (NPS). The Draft NPS for Water Resources Infrastructure sets out how the applicant and the Secretary of State will consider the effects of climate change when developing and considering water resource Nationally Significant Infrastructure Projects applications, using the latest UK Climate Projections. The draft NPS for water identifies areas where climate change adaptation should be incorporated into detailed design, such as flood risk and coastal change, biodiversity and nature conservation and water quality. Detailed consideration must be given to the range of potential impacts of climate change (for example, the 10th, 50th and 90th percentiles) using the latest UK Climate Projections available at the time, and to identify appropriate adaptation measures. This should cover the estimated lifetime of the new infrastructure.

Under the draft NPS, any adaptation measures should be based on the latest set of UK Climate Projections, the most recent UK Climate Change Risk Assessment, consultation with statutory consultation bodies, and any other appropriate climate projection data. The government consulted on the draft NPS for water resources in 2018/19. The final NPS was due to be laid in 2019 but has been delayed.

**Water companies continue to set targets to increase the resilience of water supplies.**

Ofwat set out a £51 billion five-year investment package in its 2019 Price Review for the 2020-25 period, including requirements for water companies to cut leaks by 16% and reduce mains bursts by 12% (both relative to 2017-18 levels by 2025).<sup>20</sup> In 2019 the water industry announced a new Public Interest Commitment<sup>21</sup> with a goal to triple the rate of leakage reduction by 2030 and the industry has committed to reducing leakage by 50% (on 2017-18 levels) by 2050 at the latest.<sup>22</sup> The 50% reduction was a recommendation from the National Infrastructure Commission.<sup>23</sup>

**The next round of water company plans will incorporate the latest UK climate projections and set stricter leakage targets.**

Current water company plans (WRMP19) use climate change data from UKCP09. WRMP24 is making use of UKCP18 and will include options to further reduce leakage. In 2019 the water industry announced a new Public Interest Commitment, which was created in response to dialogue with customers which revealed that they would like the water industry to do more, not just to improve services, but also to tackle wider social and environmental challenges. As part of the Public Interest Commitment, water companies have agreed to work together towards five challenging goals, one of which is to triple the rate of leakage reduction across the sector by 2030. A programme of work to help achieve each of the above goals will be led by a member of the Water UK board and an independent panel will be established to report annually on how well the sector is performing collectively.

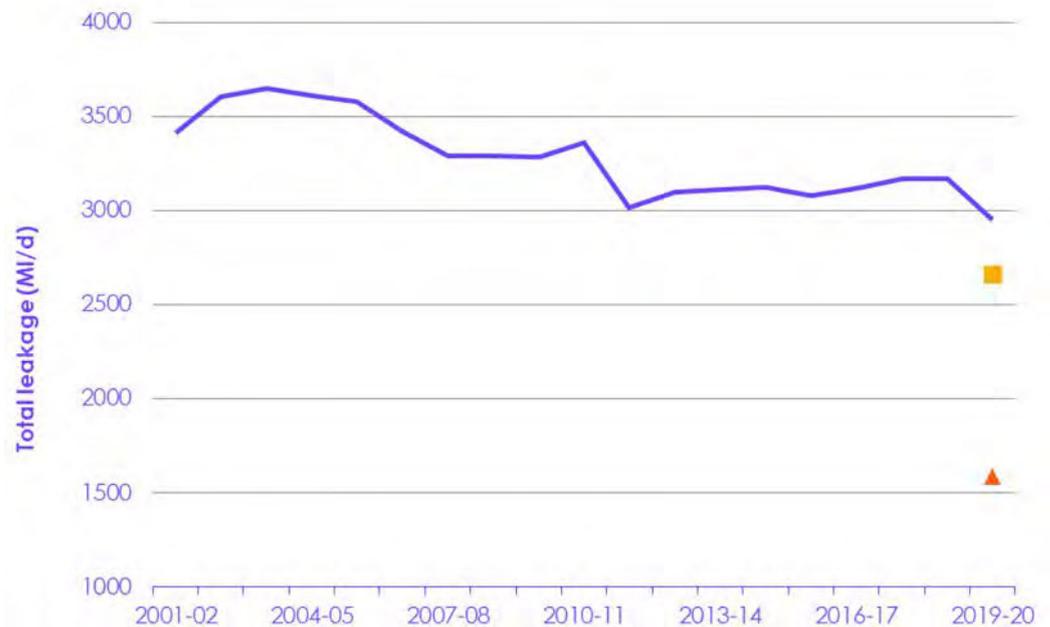

Has the risk management score changed?

**No, the risk management score remains medium. There has been some progress in reducing leakage since our last assessment, though continued progress is required before the risk management score can be improved.**

Total leakage for 2019/20 was 2,950 ml/d - this represents a 7% reduction in leakage on 2017/18 levels.

Total leakage for 2019/20 was 2,950 ml/d - this represents a 7% reduction in leakage on 2017/18 levels (Figure 4.3). Leakage has remained at a similar level since 2011/12 but is beginning to fall. All but one water company in England met their leakage targets in 2019-20.

**Figure 4.3** Total leakage for all water companies from 2000-01 to 2019-20 against future commitments

Source: Total leakage data from consumer Council for Water, Water & Wastewater Resilience Report 2019/20, Data Appendices. Ofwat 2025 commitment from 2019 Price Review for the 2020-25 period. Industry 2025 commitment from a letter from Water UK to the Secretary of State on 17/10/2018.

Notes: Purple line shows actual leakage for all water companies in England for the period 2001-02 to 2019-20. Yellow square shows the Ofwat performance commitment to reduce leakage by 16% (on 2017-18 levels) by 2025. Orange triangle shows industry commitment to reduce leakage by 50% (on 2017-18 levels) by 2050.

Ofwat have set performance commitments to cut leakage by 16% by 2025 (on 2017-18 levels) and the industry has committed to reducing leakage by 50% (on 2017-18 levels) by 2050 at the latest. The 50% reduction was a recommendation from the National Infrastructure Commission.

**Interruptions to water supply are reducing, though these are still considered to be higher than they should be.**

The Consumer Council for Water reported in 2020 that though there has been a reduction in interruptions to supply (11% less than the previous year), performance over the last 5 years has remained static and consumers are still experiencing more interruptions than they should.<sup>24</sup> Interruptions are not exclusively from extreme weather, though extreme weather is the predominant cause and the industry focus is on reducing weather-related interruptions.

In its initial assessment of water company plans for 2020-25, Ofwat stated that while all companies plan to improve the resilience of their services and systems, 'resilience in the round' needs to be more firmly embedded across the whole of each water company's business. Our assessment of progress in demand-side measures to improve the resilience of the public water supply, including analysis of trends in per capita consumption and the uptake of water metering, is set out in Chapter 3.

## 4.6 Ports and airports

In previous assessments, ports and airports have been combined into one adaptation priority. In this report, they have been given separate scores to reflect emerging differences in the publicly available information on the extent of planning for climate change across these two sectors, as well as the different climate hazards to which these sectors are vulnerable.

### Summary of 2019 report score

**In our last report, ports and airports scored a combined score of 5 (medium plan score, medium risk management score).**

Resilience standards and performance are, in general, left to individual port and airport operators to determine. Gatwick and Heathrow are required to produce resilience plans and incorporate resilience into businesses planning. Our last report reiterated that the Adaptation Reporting Power could present sector-wide reporting for ports and airports, however without making the Adaptation Reporting Power mandatory, the Government has no assurance that risk is being effectively managed completely in these sectors as not all operators had submitted a report in ARP2.

On progress in managing risk, the report highlighted that NAP2 actions are focused on developing a better understanding of risk, rather than reporting on changes in vulnerability. There had been progress at some ports in raising quay heights and assessing interdependencies, however actions at airports to improve flood resilience had been more reactive. There was limited data available to assess the frequency of disruptions to port and airport operations from extreme weather events, and how this might change in the future.

Progress summary – Ports		
2019 score:	What has changed since 2019:	2021 score:
5  (Ports and airports combined)	<p><b>Plan score – low</b></p> <ul style="list-style-type: none"> <li>Resilience standards for ports are left to individual operators and due to their commercial nature, there is limited information available on the extent of planning for climate change impacts. The Department for Transport report that they continue to liaise with ports and disseminate relevant climate risk information. Several port operators declined to participate in the second round of the Adaptation Reporting Power (ARP2) and expected participation in ARP3 is unclear. The Port of London Authority (PLA) has, however, submitted a third-round report ahead of the deadline.</li> </ul> <p><b>Risk management score – medium</b></p> <ul style="list-style-type: none"> <li>There is no new data available to assess the frequency of disruptions to port operations from extreme weather events, and how this might change in the future. The PLA ARP3 report acknowledges the benefits of adaptation reporting and identifies new risks from climate change. ARP3 reports may provide detail on adaptation actions to manage risk across the sector, however only the PLA report was available the time of assessment. There are limited actions in the NAP related to ports.</li> </ul>	2  (Ports)
<p>Notes: See annex for full datasets Key Indicators: There are no data available to assess the extent to which ports in England are resilient to climate change.</p>		

What is the plan score?<sup>\*</sup>

**The plan score is low.**

**There is limited information available on the extent of planning for climate change impacts by port operators.**

Ports are not subject to economic regulation and as a result there is a general lack of data regarding the overall resilience of ports compared to most other regulated sectors. Resilience standards for ports are left to individual operators and due to their commercial nature, there is limited information available on the extent of planning for climate change impacts. Since our last assessment, the implications of Brexit have been a key focus for the sector.

Internationally, there is non-mandatory guidance from the World Association for Waterborne Transport Infrastructure (PIANC, Working Group 178) regarding climate change adaptation for ports and inland waterways. It is not clear how many ports in England have implemented this guidance. The growing importance of and increased investment in freeports<sup>†</sup> presents an opportunity for early adaptation.

What is the risk management score?

**The risk management score is medium.**

**There is no new data available to assess the frequency of disruptions to port operations from extreme weather events, and how this might change in the future.**

ARP3 reports may provide detail on adaptation actions to manage risk, however only one ARP3 report from the ports sector, the Port of London Authority, was available at the time of assessment. Half of the UK's port capacity is located on the east coast, where the risk of damage from a tidal surge is greatest. Sea-level rise of around or beyond 50cm by 2080 is a particular concern, especially for some ageing port infrastructure, but flooding and physical damage to harbour infrastructure will also become an increasing threat.<sup>25</sup> It is also important to manage interdependencies with other infrastructure, particularly energy and the preparedness of the road and rail networks for climate change.

**The Port of London Authority ARP3 report acknowledges the benefits of adaptation reporting and identifies new risks from climate change.**

Following submission of the first ARP report in 2011, the Port of London Authority (PLA) has been reviewing climate risks regularly, undertaking adaptation measures, and collecting monitoring data the changes. PLA states that these actions have helped the PLA better understand the extent of the impacts and enable the evaluation of the action's effectiveness.

The report sets out new adaptation measures to address the following previously unidentified risks:

- Risks on the delivery of the Net Zero commitments of the organisation;
- An increased risk on port trade by climate change-induced disruption in the international supply chain; and

<sup>\*</sup> As the ports and airports adaptation priorities have been split out for the first time in this report, the assessment questions are slightly different. For all other adaptation priorities in this report the assessment questions are 'Has the plan score changed?' and 'Has the risk management score changed?'.

<sup>†</sup> An area that is exempt from customs duties and tariffs to enable added-value processes to take place.

- The increased chance of pandemics which affect port trade, inland freight and passenger transport;

PLA has been collaborating with the Environment Agency, including data sharing with regard to river flow level, monitoring the changes and managing the foreshores, liaising on the operation and maintenance of flood defences, engaging with the 10-year full review of the TE2100 plan, and the River Basin Management Plan for the Thames catchment.

**ARP reports could provide key information about the actions port operators are taking to identify and manage climate risks, but a sector-wide picture is not available.**

Six port operators submitted a report in round 2, while a number of operators invited to report declined to do so.<sup>26</sup> Only seven operators have indicated they will submit a report for round 3 in 2021.<sup>27</sup> Without making the Adaptation Reporting Power mandatory, the Government has no assurance that risk is being effectively managed in this sector. A more tailored approach for the ports sector may be appropriate, to ensure key information on climate risks and adaptation actions is being captured. Information that would enable an evidence-based assessment of the vulnerability could include time-series data on the number of disruptions caused by extreme weather events and the level of investment being made in improving standards of resilience.

Without making the Adaptation Reporting Power mandatory, the Government has no assurance that risk is being effectively managed in this sector.

**Recommendation**

Work with Port Operators and the British Ports Association to ensure the format of reporting under the Adaptation Reporting Power is appropriate for port operators and that the right operators are being asked to report. Defra should work with these organisations to identify what further support could be offered to enable more comprehensive reporting on adaptation by the ports sector.

Department: Defra, Timing: 2023

**There are limited actions in the NAP related to ports.**

The Department for Transport (DfT) continue to liaise with ports and disseminate relevant climate risk information. It is understood that there are individual projects to look at interruptions from extreme weather, but these are not industry wide. Shoreline Management Plans are in place for the full length of the English coastline and while they provide long-term considerations for all parts of the English coast, they cannot be relied upon as committed adaptation plans as they are non-statutory and unfunded.

## Progress summary – Airports

2019 score:	What has changed since 2019:	2021 score:
5  (Ports and airports combined)	<p><b>Plan score – medium.</b></p> <ul style="list-style-type: none"> <li>Resilience standards for most airports are left to individual operators, though Gatwick and Heathrow are required to produce resilience plans and incorporate resilience into business planning. Flood risk is assessed by airports with over five million passengers per year through their annual resilience plans. A new Aviation 2050 Strategy is expected - the draft strategy proposes that Government works with the aviation industry to improve resilience to weather but does not mention adapting to specific levels of future climate change such as 2°C or 4°C warming scenarios.</li> </ul> <p><b>Risk management score – medium.</b></p> <ul style="list-style-type: none"> <li>There are limited data available to assess the frequency of disruptions to airport operations from extreme weather events, and how this might change in the future, though actions being taken by individual airport operators should be lowering risk, in particular in relation to flooding. Defra expects all airports to submit an ARP3 report, however these were not available at the time of this assessment. Though the impacts of climate change on airports are expected to be lower than other transport modes (CCRA2), it is important to manage interdependencies with other infrastructure, particularly energy and the preparedness of the road and rail networks for climate change.</li> </ul>	5  (Airports)
<p>Notes: See annex for full datasets Key Indicators: There are no data available to assess the extent to which airports in England are resilient to climate change.</p>		

What is the plan score?\*

**The plan score is medium.**

**The two major airport operators in England must produce resilience plans under economic licence conditions and larger airports assess flood risk annually.**

The mandatory preparation of resilience plans for Gatwick and Heathrow airports continues to be governed by economic licence conditions. These require resilience plans to be incorporated into business plans. Other airport operators continue to be responsible for their own resilience planning and flood risk is assessed by airports with over five million passengers per year through their annual resilience plans. Heathrow airport has begun the planning process for the next regulatory period (2019-2023) which includes a climate change adaptation risk register and incorporating climate change adaptation into business planning processes.

**A new Aviation 2050 Strategy is expected.**

The draft strategy proposes Government works with the aviation industry to improve resilience to weather but does not mention 2°C or 4°C warming scenarios. The strategy was consulted on in 2019 but has not yet been published.

\* As the ports and airports adaptation priorities have been split out for the first time in this report, the assessment questions are slightly different. For all other adaptation priorities in this report the assessment questions are 'Has the plan score changed?' and 'Has the risk management score changed?'.

**As an industry, airport operators appear to be actively collaborating to improve resilience across the sector.**

The Industry Resilience Group - a collaboration between airports, airlines, air traffic control and regulators – was created in 2018 to ensure the activities and changes identified by the Voluntary Industry Resilience Group in its report to industry are delivered. The output will support a systemised approach to the way in which the UK's aviation network is planned and operated to enhance its day to day operating resilience. The Airport Operators Association convenes an adaptation working group with UK airports quarterly.

What is the risk management score?

**The risk management score is medium.**

**There are limited data available to assess the frequency of disruptions to airport operations from extreme weather events.**

While the impacts of climate change on UK aviation are expected to be the least significant of all transport modes, interdependencies with other infrastructure networks can be problematic, in particular power and ICT. The safety critical nature of airport operations means that even a small flood or power outage due to extreme weather can cause major disruption. Flooding of road and rail infrastructure can also affect passenger travel to and from airports. A widespread power cut due to extreme weather in 2019 affected two airports in England, and extreme weather caused widespread disruption at Gatwick airport on Christmas Eve 2013: unprecedented levels of river flooding led to the loss of three airfield electrical sub stations that serve the runway's lighting system; heavy rainfall caused the North Terminal basement to be flooded leading to the loss of electrical power and of some key systems; and local transport networks – both road and rail – were also severely impacted by the weather.

**There is only one action in the NAP for adaptation actions by airports.**

This is focused on improving the understanding of risk rather than reporting on reducing vulnerability or exposure. Birmingham, Gatwick, Glasgow, Heathrow, Manchester Group (including East Midlands), and Stansted Airports all reported for ARP2 and Defra states that all airports are expected to report in ARP3, however, participation is voluntary. The ARP3 reports will include climate risk assessments and steps to increasing resilience, however these were not available on time for this assessment.

While there is a lack of data to assess the risk for this report, the actions being taken by the industry set out above are promising. In particular, the Committee will be interested to see the new Aviation 2050 strategy and the outputs of the Industry Resilience Group.

While the impacts of climate change on UK aviation are expected to be the least significant of all transport modes, interdependencies with other infrastructure networks can be problematic, in particular power and ICT.

## 4.7 Rail network

Progress summary – Rail network		
2019 score:	What has changed since 2019:	2021 score:
8	<p><b>Plan score - high</b></p> <ul style="list-style-type: none"> <li>The plan score remains high. The rail sector continues to prepare for climate risks across a range of warming levels - Network Rail has now published Weather and Route Climate Change Adaptation plans for all routes, which includes consideration of warming scenarios exceeding 4°C. Network Rail has published its Environmental Sustainability Strategy to 2050 and Adaptation Roadmap, with defined outcomes to incorporate long-term adaptation planning and investment into business as usual by 2034.</li> </ul> <p><b>Risk management score - medium</b></p> <ul style="list-style-type: none"> <li>The risk management score remains medium. There are limited data on trends in vulnerability to climate risks, though weather-related delay data is relevant. Monitoring data from Network Rail's climate risk assessment is expected to provide better trend data in future. The rail sector remains at increasing risk of river and surface water flooding under a continuation of planned adaptation action, and increased heat risk causing rails to buckle, overhead cables to sag and signals to fail.</li> </ul>	8
<p>Notes: See annex for full datasets            Key Indicators: The total number of minutes delay per type of weather-related incident in England recorded by Network Rail between 2006-07 and 2020-21. Updated number of bridge sites at intolerable risk of bridge scour.</p>		

### Summary of 2019 report score

**In our last report, the rail network scored an 8 (high plan score, medium risk management score).**

Weather resilience and climate change adaptation plans were in place for each Network Rail route. The plans set out actions, timeframes, accountability and responsibilities in relation to implementing resilience measures under a medium emissions scenario. A climate change and weather resilience strategy was also in place, which is a good starting point for a framework to embed adaptation and resilience into policies, standards, decisions and investment.

The risk management score was assessed as medium. Though actions relating to rail infrastructure were associated with risk reduction and likely reducing vulnerability in some areas, the Committee did not have the evidence required to show this. The main indicators available for rail reliability were delay data and although of interest, they did not give a sense of how vulnerability to climate risk was changing.

Has the plan score changed?

**No, the plan score remains high. The rail sector continues to prepare for climate risks in a range of future warming scenarios, exceeding 4°C.**

The rail sector continues to prepare for climate risks in a range of future warming scenarios, exceeding 4°C.

Network Rail has now published updated Route Weather Resilience and Climate Change Adaptation (WRCCA) plans for all routes, which contain actions which prepare for warming scenarios exceeding 4°C.<sup>28</sup> According to the Control Period 6 WRCCA Plan Progress Report for 2019 – March 2021, the target of 80% of milestones completed has been met or exceeded for six of the eight plans.<sup>\*29</sup>

Network Rail also has a new Adaptation Roadmap with defined outcomes to incorporate long term adaptation planning and investment into business as usual by 2034 (Box 4.4).

#### Box 4.4

##### Network Rail Climate Change Adaptation Roadmap

Network Rail has set out an Adaptation Roadmap with defined outcomes to incorporate long term adaptation planning and investment into 'business as usual' operations by 2034.

Key milestones:

- Asset policies and standards updated to reflect long-term climate change projections by 2024.
- Review criticality and vulnerability mapping of all assets for climate change across the network by 2024.
- Agree level of service in extreme weather conditions with Government and regulators by 2027.
- Regions develop long-term adaptation pathway strategies and identify level of investment required for different scenarios by 2029.

Source: Network Rail Environmental Strategy (2020)

Regions are developing adaptation pathways strategies by the end of Control Period 7 (2029), which will include detailed adaptation pathway strategies for the entire network, and detail for areas with the highest level of risk or a need for transformational change.

Has the risk management score changed?

**No, however a large programme of work has been undertaken at Network Rail to enable better monitoring of how specific actions are managing climate risks.**

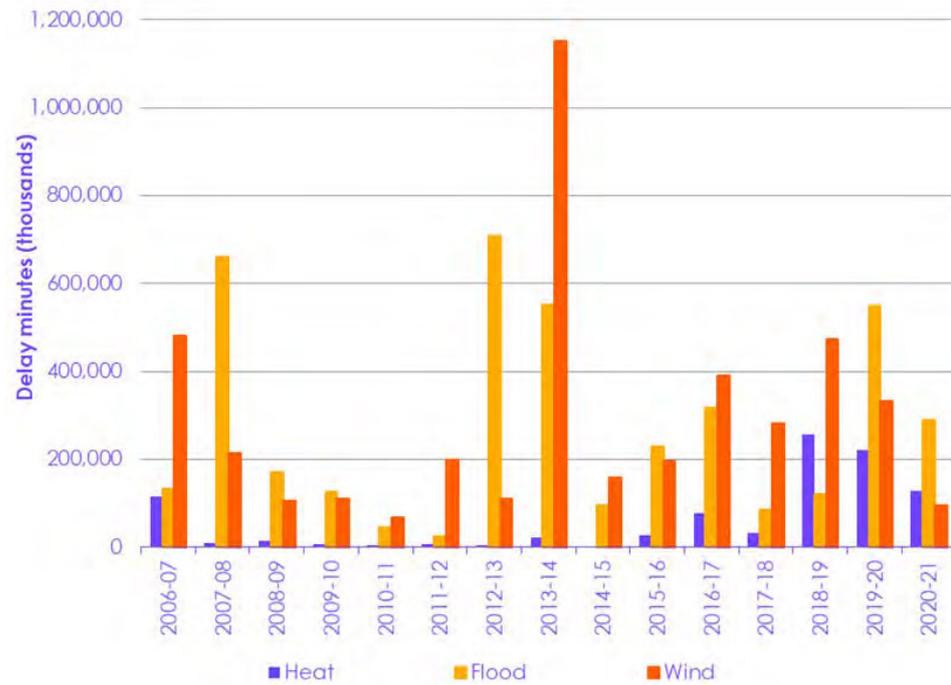

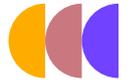

Network Rail has developed an Asset Function Risk Assessment which includes a full risk assessment including severity distribution of risks now and projections for the 2050s and 2080s. The risk assessment is supported by an Asset Function Action Plan which maps actions to risks.

**Network Rail continues to monitor weather-related delays to the network.**

Data on weather-related delays show how the network is being affected by weather, and the Committee is particularly interested in trends in heat, flood and wind impacts which are shown in Figure 4.4. Heat-related delays have been relatively consistent over the past 15 years, though these were significantly higher in 2018-19 and 2019-20 due to the summer heatwaves which are discussed further below. There is no clear trend in flood impacts and wind related delays.

\* Network Rail notes that due to some data reporting issues in using the milestones tracker for the first time, actual performance may be higher.

Figure 4.4 The total number of minutes delay per type of weather-related incident in England (2006/07 - 2020/21)

Source: Network Rail (unpublished).

Notes: Data doesn't include long-term closures as a result of extreme weather. While this is recorded, Network Rail report that the data collection is not consistent enough to give reliable data on longer term closures.

**There has been increased attention on the impacts of extreme weather on rail infrastructure since our last report.**

Recent hot summer weather in 2018 and 2019 has highlighted the effects that high temperatures can have on rail infrastructure and the potential for widespread impacts across sectors.

Recent hot summer weather in 2018 and 2019 has highlighted the effects that high temperatures can have on rail infrastructure and the potential for widespread impacts across sectors. On July 25th 2019, temperatures exceeded 38°C (the hottest day ever recorded in the UK) which led to rail buckling and subsequent widespread damage and disruption on the rail network in England.<sup>30</sup> VA Rail completed an independent review of Network Rail's response to the effects of the hot weather and found that there were good examples of widespread best practice, including lessons learnt from previous hot weather, a long-term asset resilience plan underway and hot weather plans being project-managed and delivered. However, future assets need to be designed and installed for greater resilience at higher temperatures and some standards were being misapplied or not living up to scrutiny. VA Rail made 18 recommendations in the following six categories:

- To ensure that an appropriate level of future resilience is designed into the infrastructure;
- To make the relevant standards & guidance notes fit-for-purpose;
- To reduce the number of unknown risk sites;
- To reduce the number of known risk sites;
- To make more predictable the industry response to hot weather;

- To identify, share and adopt industry best-practice.\*

Network Rail has begun work to address some of the recommendations, including updating operational weather management standards and implementing resilience measures on the network. A Seasonal Management Strategy is also under development, with the aim of supporting the transition between seasons and reducing repeat impacts from seasonal weather.

**Network Rail continues to manage bridge sites at intolerable risk of scour and there has been no notable change in the total number of sites at risk.**

Higher risk scour sites requiring remedial works are identified by Network Rail at the start of each year. While a programme of work is completed throughout the year to rectify those sites, new high-risk sites also emerge during the year. Over the past four years the number of sites rectified has been balanced out by the number of new sites identified, therefore the overall number of high risk sites remains unchanged. In 2019/20, 181 sites were identified as being at high risk at the start of the year, 45 sites were rectified and 43 new sites were identified.†

**Following a fatal train derailment in Scotland in August 2020, the Secretary of State requested a wider assessment of the impact of extreme weather on the resilience and safe performance of the rail network.**

Though the incident was in Scotland, the subsequent response will consider the resilience of the whole of the network, including England. Network Rail published the findings of two independent task forces - a Weather Advisory Task Force (WATF) and an Earthworks Management Task Force – in March 2021.‡ The key findings from the WATF are summarised in Box 4.5. Neither taskforce was tasked with assessing how Network Rail is responding to the challenge of future climate change, however implementation of the recommendations will address some of the challenges facing the railway.

**Box 4.5**

**Stonehaven derailment – Key findings of the independent Weather Advisory Task Force**

The major recommendations for Network Rail from the Weather Advisory Task Force include:

- Formal trial of the latest forecasting capabilities with the Met Office;
- Improvements in assessing the probability of earthwork failures, using forensic analysis of selected events to provide a complete picture of the context surrounding earthwork failures;
- Urgently transform the delivery of weather services, by considering the development of a new hazard and impact-based digital platform;
- A partnership-driven, integrated transport hub to provide 24/7 access to all operational services and expert advice, including flooding, and thus deliver an authoritative set of services across Network Rail routes and regions;
- Build its professional competencies in meteorology, hydrology and climate change so that staff can act as intelligent users of science and services across all its functions.

Source: Network Rail (2021). Weather Advisory Task Force, Final report, February 2021.

\* The report was provided by Network Rail for this assessment. It has been published internally at Network Rail and shared with the National Performance Board.

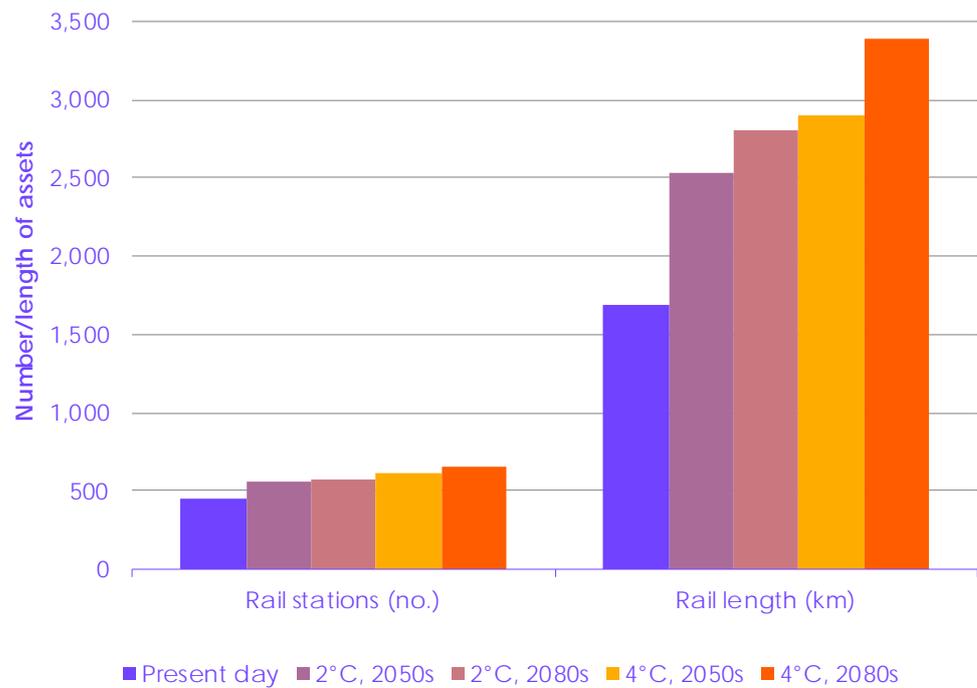

† Data provided by Network Rail (unpublished).

‡ The two taskforces were overseen by Dame Julia Slingo Lord Robert Mair, both of whom have authored and advised on the CCRA3 Technical Report.

**The rail sector remains at increasing risk of surface water and river flooding.**

New analysis for CCRA3 shows that, under current levels of adaptation, the rail sector remains at increasing risk of river and surface water flooding.<sup>31</sup> Sayers et al (2020) project that in England, under a low population and current levels of adaptation scenario, the risk of surface water flooding increases significantly in both the 2050s and 2080s. In a 4°C world by the 2080s, there is a projected 101% increase in length of railway track at risk and a 46% increase in railway stations at risk (Figure 4.5).

**Figure 4.5** Length of railway track and number of railway stations at significant risk of surface water flooding under a range of climate change scenarios

Source: Sayers et al (2020). *Third UK Climate Change Risk Assessment (CCRA) Future flood risk*.  
Notes: Data extracted for the CCRA3 technical chapters from the results database available at [www.ukclimaterisk.org](http://www.ukclimaterisk.org). The climate scenarios presented above assume current levels of adaptation and low population growth in the mid and late century.

For river flooding, risk also increases for all rail assets in both the 2050s and 2080s. By the 2080s in a 4°C world, there is an increase of up to 21% for length of railway track at risk and a 17% increase in stations at risk (under current levels of adaptation and a low population scenario).

## 4.8 Strategic road network

Progress summary – Strategic road network		
2019 score:	What has changed since 2019:	2021 score:
8	<p><b>Plan score - high</b></p> <ul style="list-style-type: none"> <li>The Road Investment Strategy 2 (2020 – 2025) includes a vision that the strategic road network is resilient to climate change and incidents, such as flooding, poor weather conditions and blockages on connecting transport networks. ### Summary of 2019 report score

**In our last report, strategic road networks scored an 8 (high plan score, medium risk management score).**

Highways England was embedding resilience and climate change into plans and investments, and taking action to safeguard against flooding on the road network as set out in their climate change risk assessment, which covers all climate hazards. Highways England published a Sustainable Development and Environment Strategy in 2017 which set out the high-level ambitions for the business.

On progress in managing risk, NAP2 actions were found to be relevant, focussed particularly around flood risk, slope stability and bridges. Highways England was meeting performance targets, for example, it met its 2018 target of at least 95% of the network in good condition. However, disruptive events remained a regular occurrence even in the current climate.

Has the plan score changed?

**No, it remains high.**

**Highways England continues to plan for a range of future climate scenarios.**

The Highways England Climate Adaptation Risk Assessment considers high emissions scenarios in identifying climate impacts and prioritising actions.

The Road Investment Strategy 2 (2020 – 2025) includes a vision that the strategic road network is resilient to climate change and incidents, such as flooding, poor weather conditions and blockages on connecting transport networks.<sup>32</sup> It includes performance indicators on structural, drainage and geotechnical condition. In May 2020, the Government announced a £1.7 billion Transport Infrastructure Investment Fund for local road and motorways (and railway).<sup>33</sup> It is not yet clear what proportion of this additional funding will go towards improving strategic road condition or increasing climate resilience more generally.

The Highways England Strategic Business Plan includes a performance outcome 'delivering better environmental outcomes' which states:

"We will monitor, assess and respond to the impacts of climate change on our network. We will work in partnership with organisations such as the Environment Agency, the Met Office and local authorities to improve the resilience of our network to more severe weather. We will focus on reducing flooding on our roads and minimising risks for local communities, retrofitting our assets to meet new environmental and drainage standards. We will also improve the resilience of our concrete pavements to prolonged high temperatures as part of our concrete maintenance and renewals programme, taking remedial action where necessary".

Highways England is developing a Geotechnical Climate Change Adaptation Plan as well as guidance for geotechnical design, construction and management. This will help to ensure that activities are identified to support the objective of making the network resilient to climate change and extreme weather events in the future.

#### **Highways England continues to embed climate change resilience and adaptation into standards.**

The Design Manual for Roads and Bridges sets standards for road design. Standard GG103 includes 12 sustainable development goals that design shall aspire to, including: 'be resilient to climate change'.<sup>34</sup> An accompanying National Application Annex for England includes a requirement that "resilience to future climatic conditions specific to the local and surrounding area shall be identified, assessed and incorporated into the design." Standard LA114 sets out the requirements for assessing and reporting the effects of climate on highways, as well as the effect on climate of greenhouse gas emissions from construction, operation and maintenance projects. It includes requirements for environmental assessments in relation to vulnerability to climate change including: scoping, study area, baseline scenario, data collection, significance criteria, evaluation of significance, and design and mitigation requirements.<sup>35</sup> Standards for drainage require flood risk assessments which apply the latest climate change allowances in accordance with relevant national legislation requirements.<sup>36</sup>

Has the risk management score changed?

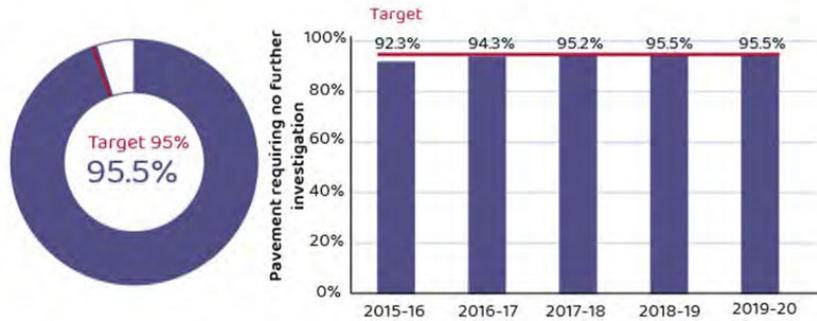

**No, it remains medium.**

#### **Highways England has met performance targets related to road condition.**

The Office of Road and Rail completes an annual assessment of Highways England's performance, which includes a key performance indicator that Highways England must maintain the pavement asset such that at least 95% of it does not require further investigation for possible maintenance. At the end of 2019-20, Highways England reported that 95.5% of its pavement (road surface) asset did not require further investigation for possible maintenance (Figure 4.6). This is above the target of 95% and is the same as the score recorded in 2018-19. Highways England has therefore returned the asset in a better condition than it started the road period with, as defined by the metric.

**Figure 4.6** Highways England performance against road condition KPI 2015-16 to 2019-20

Percentage of pavement not requiring further investigation for possible maintenance in 2019-20, and for individual years in RP1

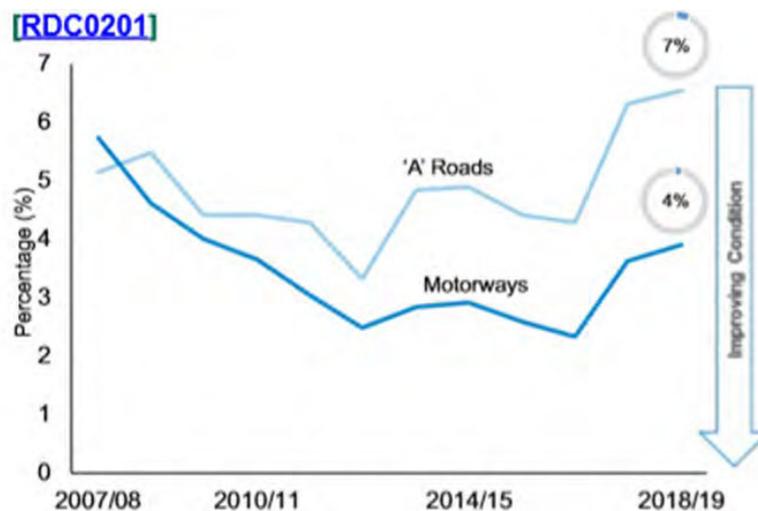

Source: ORR Annual Assessment of Highways England End of Road Period 1 2015-2020

The condition of strategic roads has worsened since our last assessment.

**However, the condition of strategic roads has worsened since our last assessment.** Roads in better condition should be better able to withstand extreme weather impacts. For Highways England managed motorways and 'A' roads, 4% and 7% respectively were categorised as red and should have been considered for maintenance in 2018/19 (Figure 4.7).<sup>\*</sup> The proportion broadly fell between 2007/08 and 2012/13 but has fluctuated thereafter with a peak in 2018/19. The relatively small size of the strategic road network could mean these figures are subject to fluctuation, as a change in the proportion denotes a relatively small change in the amount of road. Although the strategic road network is relatively small compared with the local road network, the impact of disruption on individual journeys and nationwide connectivity can be far greater.

**Figure 4.7** Proportion of the Highways England managed road network categorised as red\*, by road type, 2007/08 to 2018/19

Source: Department for Transport (2019). Road conditions in England to March 2019.

Notes: \*roads categorised as red should have been considered for maintenance (i.e. further investigation required).

<sup>\*</sup> Current measures of road condition are based on surface condition only and do not reflect the ability of the pavement structure to drain excess water or react to extreme temperatures.

**Targets to address flooding have changed since our last assessment.**

Highways England report that there were 118 flooding incidents in 2020.<sup>\*</sup> In Road Period 1 (2015–20) Highways England mitigated 248 flooding hotspots and 12 culverts considered to be at risk of flooding.<sup>37</sup> In Road Period 2 (2020-25), the flood resilience metric is ‘percentage of carriageway at low risk of flooding’, with an aspirational target for mitigation of 30 flooding hot spots per annum.

Flooding of transport networks can affect the provision of critical services, including emergency response. Recent research has found that even low magnitude floods can lead to a reduction in national level compliance with mandatory response times for ambulance and fire and rescue services in England.<sup>38</sup> As highlighted in the indicator wish-list published with this report, better indicators are needed that enable the assessment of impacts from disruption due to extreme weather on key infrastructure, including the impact of flooding events on roads.

<sup>\*</sup> Data provide by Highways England, from National Incident Liaison Officer (NILO) reports. The measure relates to flooding events closing sliproads and affecting 50% or more of carriageway, under the NILO criteria. A change in reporting criteria in 2020 may have affected the number of flooding incidents captured.

## 4.9 Local road network

Progress summary – Local road network		
2019 score:	What has changed since 2019:	2021 score:
5	<p><b>Plan score – medium</b></p> <ul style="list-style-type: none"> <li>The plan score remains medium. There have been no new, or updates to existing, strategies, plans or codes of practice for local roads since our last assessment. In May 2020, the Government announced a £1.7 billion Transport Infrastructure Investment Fund for local roads and motorways (and railways). It is not yet clear what proportion of this additional funding will go towards improving local road condition or increasing climate resilience more generally</li> </ul> <p><b>Risk management score – medium</b></p> <ul style="list-style-type: none"> <li>The risk management score remains medium. Road condition has remained the same over the most recent 3 years, following a period of gradual improvement from 2011/12. While it is positive that road condition has not become any worse, there remains a lack of data to assess the vulnerability of local roads to specific climate risks and to assess progress in managing the impact of climate risks on local roads.</li> </ul>	5
<p>Notes: See annex for full datasets            Key Indicators: Percentage of roads requiring maintenance in England by type (2007/08-2017/18).</p>		

### Summary of 2019 report score

**In our last report, local road networks scored 5 (medium plan score, medium risk management score).**

Our assessment in 2019 noted that local highway authorities have a duty under the Highways Act 1980 to ensure highways, and the assets associated with them such as lighting and bridges, are well maintained. A Highways Code of Practice asks local authorities to take account of climate change when maintaining the local road network. This includes applying the latest UK Climate Projections, ensuring infrastructure is resilient to climate change and determining actions to address risks. However, there was no statutory requirement for them to use this guidance and there had been no systemic assessment of the disruptions caused by flooding or extreme weather on local roads and the actions taken to reduce risk.

On progress in managing risk, the NAP sets out actions related to DfT sharing information with local highway authorities, however, it is the authorities' own responsibility to manage risks to the local road network. The Government allocates funding to local highway authorities to help improve local roads, including to increase resilience to weather, flooding and extreme heat.

### Has the plan score changed?

**No - there have been no new, or updates to existing, strategies, plans or codes of practice for local roads since our last assessment.**

In May 2020, the Government announced a £1.7 billion Transport Infrastructure Investment Fund for local roads and motorways (and railways). It is not yet clear what proportion of this additional funding will go towards reactive repair and what resources will be allocated to adaptation and increasing climate resilience. A

recent survey by the Asphalt Industry Alliance (AIA), found that, despite an increase in highway maintenance budgets, maintaining roads to target conditions is still out of reach for local authorities in England, with a reported shortfall in road carriageway budgets of £522.9m for 2021/21.<sup>39</sup>

A recent survey by the Asphalt Industry Alliance (AIA), found that, despite an increase in highway maintenance budgets, maintaining roads to target conditions is still out of reach for local authorities in England, with a reported shortfall in road carriageway budgets of £522.9m for 2021/21.

Has the risk management score changed?

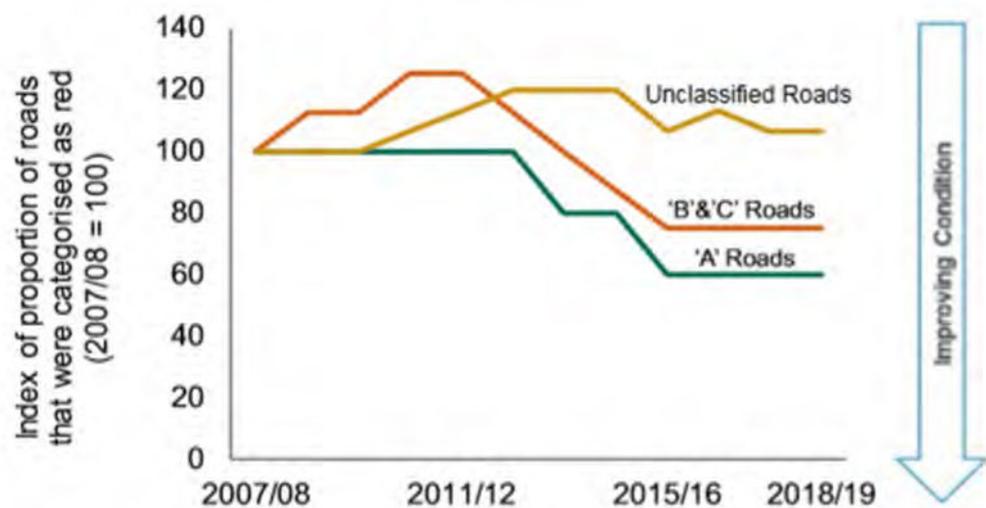

**No. There remains a lack of data to assess progress in managing the impact of climate risks on local roads.**

Data on road condition are a useful indicator of the potential vulnerability of roads to extreme weather, though information is not available on specific actions being taken to manage the impact of climate risks on local roads.

**Road condition has remained the same since our last assessment.**

The latest figures for local authority surface condition are broadly in line with the previous 3 years (Figure 4.8). Prior to this, 'A' roads, and 'B' and 'C' roads combined, had seen a period of gradual improvement since 2011/12 (i.e. fewer roads categorised as red). Unclassified roads had not seen the same improvement over this period.

**Figure 4.8** Trend in the proportion of local authority managed roads categorised as red, by road type, 2007/08 to 2018/19

Source: Department for Transport (2019) *Road conditions in England to March 2019*.

## 4.10 Telecoms, digital and ICT infrastructure

Progress summary – Telecoms, digital and ICT infrastructure		
2019 score:	What has changed since 2019:	2021 score:
2	<p><b>Plan score – low</b></p> <ul style="list-style-type: none"> <li>The plan score remains low, however there are signs of progress beginning to appear. Resilience planning in the data centre sector is conducted at corporate level by individual private operators, who compete on their ability to ensure business continuity for their customers. Resilience standards for the digital sector do not include requirements pertaining specifically to climate change risks. In its final report on the Resilience Study, the NIC recommended Government should introduce a statutory requirement by 2022 for clear, proportionate and realistic standards every five years for the resilience of digital (and other) services, with obligations on infrastructure operators to meet these resilience standards by 2023. These standards must include requirements pertaining to climate change risks.</li> </ul> <p><b>Risk management score – medium</b></p> <ul style="list-style-type: none"> <li>The risk management score remains medium. There is still a lack of data to assess how risks to telecoms, digital and ICT are changing. However, all major providers have flood defences compliant with the National Flood Resilience Review requirements and DCMS continues to engage with the EC-RRG on resilience and emergency response. ARP3 reports from the EC-RRG and TechUK should provide valuable information on steps the industry is taking to manage risks, however the reporting deadline exceeds the timeframe for this report. While data centres do not appear to have been affected by recent extreme weather events, CCRA3 has assessed the current climate risks to digital infrastructure as medium magnitude, increasing to ‘high’ under more extreme climate scenarios.</li> </ul>	2
<p>Notes: See annex for full datasets Key Indicators: There remains a lack of data on risks to and resilience actions by digital infrastructure operators.</p>		

### Summary of 2019 report score

**In our last report, telecoms, digital and ICT infrastructure scored a 2 (low plan score, medium risk management score).**

There was no visible clear plan or process by the industry or Government with actions to manage long-term climate risks to the sector. The Committee highlighted the opportunity to show a plan to manage risks through the Adaptation Reporting Power (ARP), however in the absence of reporting being mandatory there is no guarantee that organisations will continue to report. Recent Ofcom and industry guidance asks providers to maintain services during flooding incidents but does not include a consideration of climate change.

Data were not available to assess how the risk was changing. There had however been activity since the first NAP period, especially in relation to flooding, which should reduce the vulnerability of some assets.

Has the plan score changed?

**No, the plan score remains low, however there are signs of progress beginning to appear.**

Resilience planning in the data centre sector is conducted at corporate level by individual private operators, who compete on their ability to ensure business continuity for their customers. There remains no visible plan or process by the industry or Government with actions to manage long-term climate risks to the sector. The level of resilience offered by commercial providers and the standards they adhere to are set out in contractual SLAs (Service Level Agreements). A number of data centre facilities are designated Critical National Infrastructure. The EC-RRG\* Resilience Guidelines for Providers of Critical National Telecommunications Infrastructure do provide design considerations and operational processes for communications providers to build resilience to physical threats, including extreme weather, floods and lightning. However, there is no consideration of climate scenarios and how these may affect the prevalence or impact of such impacts. Ofcom's general conditions require communications providers to maintain uninterrupted access to emergency organisations "to the greatest extent possible", with significant fines for failures.

A standard for availability of service can to some extent be considered a proxy for the resilience of the infrastructure, however there remains a need for future climate risks to the sector to be reflected in industry standards.

**Resilience standards for the digital sector do not include requirements pertaining specifically to climate change risks.**

EN50600 is an availability standard which covers all aspects of data centre infrastructure including power, cooling and telecommunications. It also provides recommendations for operations and management, security and energy and sustainability. EN50600 is being harmonised with ISO and with the practices of the EU Code of Conduct for Data Centres. Provisional data from Tech UK† suggests that almost 80% of data centre sites are working towards practices compliant with EN50600 (representing 75% of sector activity) and over half of the sites in the UK conform to ISO50001 (representing around 70% of sector activity). ‡ Tech UK will report formally on the uptake of standards in their ARP3 report by the end of 2021.

**The NIC has recommended a statutory requirement for resilience standards for the sector by 2022 – these must include requirements pertaining to climate change risks.**

In May 2020, in its final report on the Resilience Study, the NIC recommended Government should introduce a statutory requirement by 2022 for clear, proportionate and realistic standards every five years for the resilience of digital (and other) services, with obligations on infrastructure operators to meet these resilience standards by 2023. This presents a real opportunity to incorporate consideration of climate change risks and adaptation actions into the standards.

**Recommendation**

Resilience standards for the digital sector must include requirements pertaining to climate change risks. In addressing the National Infrastructure Commission recommendations from the Resilience Study, Government should incorporate consideration of climate change risks and adaptation actions into any new standards being developed.

Standards for digital infrastructure operators should include requirements to:

- assess climate risks under both 2°C and 4°C global climate scenarios
- consider interdependencies with other critical infrastructure, and
- set out actions to reduce risk and monitor progress

Department: DCMS, Timing: 2022

\* EC-RRG is a cross government and telecoms industry forum whose aim is to ensure the telecoms sector remains resilient to threats and risks to services.

† Tech UK is the UK's technology trade association, whose remit is digital infrastructure, comprising communications networks and data centres.

‡ Provisional data collated by Tech UK in preparation of the ARP3 report.

Has the risk management score changed?

**No, the risk management score remains medium.**

**There remains a lack of data to assess how risks to telecoms, digital and ICT are changing.**

However, all major providers have flood defences compliant with the National Flood Resilience Review requirements and DCMS continues to engage with the EC-RRG on resilience and emergency response. ARP3 reports from the EC-RRG and TechUK should provide valuable information on steps the industry is taking to manage risks, however the reporting deadline exceeds the timeframe for this report.

**Data centres do not appear to have been affected by recent extreme weather events.**

The Data Centre Incident Reporting Network (DCIRN) does not currently collect quantitative data on climate change related outages to data centres, however there has been no publicly reported disruption from data centre outages as a result of recent extreme weather events (see introduction to this chapter). There are observations within the sector that older sites are more likely to be vulnerable to heatwaves than newer sites, especially if they are working to capacity, because their cooling systems will be challenged by sustained high temperatures.<sup>40</sup>

**CCRA3 has assessed the current climate risks to digital infrastructure as medium magnitude, increasing to 'high' under more extreme climate scenarios.**

While there is a general understanding of the interactions between ICT infrastructure and weather, quantitative projections assessing how climate change will affect the frequency and magnitude of these interruptions are lacking.

While there is a general understanding of the interactions between ICT infrastructure and weather, quantitative projections assessing how climate change will affect the frequency and magnitude of these interruptions are lacking.

However, there remains a lack of evidence. While there is a general understanding of the interactions between ICT infrastructure and weather, quantitative projections assessing how climate change will affect the frequency and magnitude of these interruptions are lacking. This is compounded by a lack of information in the public domain on the location or specification of assets for interests of security and commercial sensitivity. ICT is critical to the operation of wider infrastructure networks as well as underpinning business activities, access to key services and wider communication. Outages can therefore have significant effects on the locality and more broadly via interdependent infrastructure. Overall, CCRA3 concludes that further attention to the climate resilience of this sector and quantitative information on current and future risks under climate change is needed, to better assess its vulnerability and exposure to climate change.<sup>41</sup>

## Business

5.1 Introduction	238
5.2 Impact on business from extreme weather events	239
5.3 Supply chain interruptions	247
5.4 Water demand by industry	252
5.5 Business opportunities from climate change adaptation	256

## 5.1 Introduction

**Businesses that are better prepared for the impacts of climate change will be able to capitalise on opportunities and avoid future damages.**

Opportunities to businesses include those through an increase in demand for existing and new goods and services, which might specifically relate to adaptation. Businesses and industry in England face a number of opportunities and risks from climate change. Through international supply chains, distribution networks and global markets, businesses are exposed to risks from extreme weather, including flooding and water shortages around the world.

**Since our last report in 2019, the context for businesses in England and outlook for the immediate future has changed dramatically.**

The economic impacts of Covid-19 have been severe though varied among sectors and business types. It has highlighted the importance of business resilience and the reliability of key supply chains for people and the economy. The ways in which people work may change. Before the pandemic, around 5% of people in employment worked from home regularly.<sup>1</sup> As a result of the COVID-19 pandemic, levels of homeworking have risen substantially, with an average of around 30% of the workforce working exclusively from home each week during 2020.<sup>2</sup> Some businesses and workers may choose to adopt this style of working on a permanent basis.

Since 2019, the context for businesses in England has changed dramatically due to factors like the Covid-19 pandemic, the end of the EU exit transition period and the setting of the Net Zero target.

There is also change for many businesses who trade internationally following the end of the transition period after leaving the EU, who may reorganise their supply chains due to this and the impacts of Covid-19.

Many businesses have also responded positively to the UK's legislation of the Net Zero target and are undertaking long-term planning to ensure their operations align with the target. As demonstrated by the Government's plans for a green recovery, there are opportunities for industrial strategies and policies, and for businesses to do things differently to achieve key policy goals, including Net Zero. Helping businesses and industry prepare for the impacts of climate change should be among these goals.

**As in our 2019 report, the continuing growth of support for the Task Force on Climate-Related Financial Disclosures (TCFD) remains a key development for assessing businesses' preparedness for climate change.**

TCFD, and similar initiatives, such as the Taskforce on Nature-Related Financial Disclosures (TNFD), are relevant to all of the adaptation priorities within this chapter, though they are discussed primarily in the first 'Impact on business of extreme weather events.'

**It is critical to distinguish between different types of business in assessing preparedness and considering where further support may be required.**

It is important to note that the TCFD and other initiatives including compulsory reporting are primarily focussed on large, publicly listed organisations, with a focus on the financial sector. Small and Medium Enterprises (SMEs), as defined by the number of employees, account for 5.9 million or 99.9% of all UK private sector businesses, 61% of employment and 52% of turnover.<sup>3</sup> These businesses are a significant part of the UK economy and have fewer resources to adapt to the risks and opportunities arising from climate change than those targeted by TCFD and other initiatives.

It is important to distinguish between different types of business, particularly between larger businesses and SMEs, and between those who engage with climate change surveys and the general corporate sector.

The increasing growth of 'green' business practices and strategies may also mean that survey responses and other evidence better reflect this 'green' sector, rather than the general corporate sector.

## 5.2 Impact on business from extreme weather events

Progress summary – Impact on business from extreme weather events		
2019 score:	What has changed since 2019:	2021 score:
2	<p><b>Plan score - medium</b></p> <ul style="list-style-type: none"> <li>The plan score has increased from low to medium. Government has set out a roadmap for mandatory climate-related disclosures following legislation of the Net Zero target. This has been complemented by important work from other organisations to strengthen reporting of climate risks and adaptation through new standards and guidance. There remains a gap, where SMEs, the majority of businesses in England, are unlikely to benefit from most of these measures. A new SME Climate Hub is a welcome development, though the vast majority of its resources and promotion are focussed on Net Zero rather than adaptation.</li> </ul> <p><b>Risk management score - medium</b></p> <ul style="list-style-type: none"> <li>There is no change in the risk management score from 2019. The number of large businesses, particularly in the financial sector, aligning with TCFD and assessing climate risks continues to increase and mandatory reporting should lead to further improvements. However, there remain significant gaps, such as scenario analysis and reporting of adaptation measures, which will hinder the effectiveness of new reporting initiatives unless addressed.</li> </ul>	5
<p>Notes: See annex for full datasets            Key Indicators: TCFD disclosure (various surveys), Contingency planning for extreme weather, Economic impact of extreme weather events / Insurance losses due to extreme weather.</p>		

### Summary of 2019 report score

**In our last report, impact on business from extreme weather events scored a 2 (low plan score, medium risk management score).**

Our 2019 report found that while there were incentives for businesses to plan for how they might be impacted by climate change through initiatives such as the Task Force on Climate-related Financial Disclosures (TCFD), there was little evidence that planning was taking place for more than a 2°C increase in global temperature or that plans were in place to help smaller businesses prepare for climate change.

There was evidence of increasing action in response to climate change by businesses and the investment community. However, support for initiatives like TCFD had not yet led to better assessment and planning for climate change risks, particularly higher climate change scenarios relevant for adaptation.

### Has the plan score changed?

**Yes, the plan score has increased from low to medium. There have been significant steps to help businesses better prepare for the impacts of climate change, such as setting out a clear roadmap for making TCFD-aligned disclosures mandatory. To improve the score further, there need to be clear plans and support for smaller businesses and measures to ensure that approaches to considering physical risk continue to progress.**

100% of listed commercial companies could be covered by regulation or legislation regarding climate disclosures by the end of 2022.

### **Government has taken welcome steps over the past two years to improve consideration and reporting of the impacts of climate change by businesses and the finance sector.**

The UK announced its intention to make TCFD-aligned disclosures mandatory in 2020. A cross-Whitehall/cross-regulator UK Taskforce developed a roadmap that sets out an indicative path over the next five years for different categories of organisation.<sup>4</sup> For example, 100% of listed commercial companies could be covered by regulation or legislation regarding disclosures by the end of 2022, while for occupational pension schemes it could be 72% by the end of 2022, rising to 85% by the end of 2025, though this roadmap could be affected by consultations or other reviews.

Most action is planned to occur over the first three years, with the overall aim of providing comprehensive and high-quality information on how climate-related risks and opportunities are being managed across the UK economy. This will be achieved by incrementally increasing the coverage of supervisory expectations, disclosure rules or legislative requirements for seven categories of organisation: listed commercial companies; UK-registered companies; banks and building societies; insurance companies; asset managers; life insurers and Financial Conduct Authority (FCA)-regulated pension schemes; and occupational pension schemes.

Government has published several supporting consultations and will provide an update on progress in the 2022 refresh of the Green Finance Strategy.

The Government has already published related consultations. New pension regulations propose that trustees must establish and maintain oversight of the climate-related risks and opportunities which are relevant to their scheme, including publishing a report on a publicly available website free of charge.<sup>5</sup> It recently consulted on mandatory climate-related disclosures by certain UK publicly quoted companies, large private companies and Limited Liability Partnerships (LLPs) as well.<sup>6</sup>

Other consultations, such as on government procurement criteria which is discussed further in the following supply chains section, will also lead to greater consideration of climate change by affected businesses, if the proposed changes are implemented effectively. The Government will provide an update on progress in the 2022 refresh of the Green Finance Strategy. The Bank of England also confirmed the next step of its Climate Biennial Exploratory Scenario, after postponement due to the pandemic, would be published in June 2021.

### **The Government's steps have been complemented by the work of other climate-related reporting organisations which aim to improve the consistency and quality of information globally through new standards and guidance.**

The International Financial Reporting Standards (IFRS) published a consultation paper on sustainability reporting in 2020.<sup>7</sup> Feedback to this consultation identified an urgent need for better information about sustainability matters, including climate-related information. As a result, the IFRS confirmed its intention to produce a proposal by the end of September 2021, and possibly make an announcement on the establishment of a global sustainability standards board at COP26.

Five of the major organisations in sustainability disclosure; CDP, the Climate Disclosure Standards Board (CDSB), the Global Reporting Initiative (GRI), the International Integrated Reporting Council (IIRC) and the Sustainability Accounting Standards Board (SASB), proposed a vision for a global and comprehensive corporate reporting system.<sup>8</sup> This system would seek to reduce complexity in reporting and incorporate both financial accounting and sustainability disclosure, connected via integrated reporting.

In December 2020, these five organisations published a prototype climate-related financial disclosure standard for illustrative purposes to contribute to the IFRS' development of a sustainability standards board.<sup>9</sup> The work of the IFRS and these five organisations has received public support from the UK Taskforce and the Financial Reporting Council (FRC). The FRC has stated it plans to 'raise the bar' on climate change reporting and encouraged UK public interest entities to report in line with the TCFD recommended disclosures and make use of the SASB's metrics.<sup>10</sup>

The new Taskforce on Nature-related Financial Disclosures (TNFD) aims to complement TCFD and will provide a framework for corporates and financial institutions to assess, manage and report on their dependencies and impacts on nature, aiming to improve the appraisal of nature-related risk and redirect global financial flows away from 'nature-negative outcomes' and towards 'nature-positive outcomes.'

**The new Audit, Reporting and Governance Authority could oversee annual Resilience Statements which would include climate change, if proposals are implemented.**

BEIS published a consultation on 'Restoring trust in audit and corporate governance' which aims to respond to separate independent reviews of the audit system by Sir John Kingman, Sir Donald Brydon and the Competition and Markets Authority.<sup>11</sup> The proposals included establishing a strengthened regulator to replace the FRC, the Audit, Reporting and Governance Authority (ARGA) which would protect and promote the interests of investors, other users of corporate reporting, and the wider public interest. It is proposed that directors of public interest entities would need to publish an annual Resilience Statement setting out how directors are assessing the company's prospects and addressing challenges to its business model over the short, medium and long-term, including risks posed by climate change.

**These improvements in reporting could be undermined unless businesses are better supported when trying to assess physical risk and adaptation.**

As described in the section below, the evidence from reviews such as the latest TCFD status report suggest that there are aspects of reporting that organisations are struggling with.<sup>12</sup> This includes aspects that are critical for assessing physical risk and adaptation such as scenario analysis, the financial impacts of climate change and metrics and targets beyond those related to reducing emissions.

However, there are more examples of organisations considering higher climate change scenarios, such as a 4°C increase in global temperature, than at the time of our report two years ago. Unless this is addressed and regulators and auditors have the necessary expertise to monitor the quality of reporting, initiatives as described above will not be effective in ensuring businesses are prepared for the impacts of climate change.

**There are some good examples of work by organisations to address this, which could be further promoted and developed.**

There are some good examples of work by organisations in the past two years to address this. In 2020 Acclimatise et al. published a detailed set of questions to assist non-executive director oversight of physical climate change risk management.<sup>13</sup> The TCFD published further guidance on scenario analysis and consulted on forward looking financial metrics including metrics specifically for physical risk such as Climate Value at Risk (Climate VAR).<sup>14</sup> The Goal 13 Impact platform aims to help businesses collaborate on similar climate change initiatives and share best practice on aspects such as target setting, drivers of change and lessons learned.

More organisations are considering higher climate change scenarios, such as 4°C than two years ago, though reporting of physical risks and adaptation remains a concern.

There are also more examples of risk management and advisory firms offering services to help organisations assess their physical risk. These are all promising developments; however, progress needs to accelerate. Alongside effective enforcement of reporting requirements, organisations must be able to afford and access such information or services, otherwise preparation for physical risks will likely be ineffective. Without government support, there is likely to be a capacity barrier for SMEs in particular.

The BSI also has continued to work on adaptation-related standards which set out principles that organisations can follow, rather than set out an overly prescriptive approach. In addition to ISO 14090 *Adaptation to climate change – Principles, requirements and guidelines*, new adaptation-related standards have been published since 2019:

- *ISO 14091 Adaptation to climate change — Guidelines on vulnerability, impacts and risk assessment*
- *BS 8631:2021 Adaptation to climate change. Using adaptation pathways for decision making. Guide*
- *PD ISO/TS 14092:2020 Adaptation to climate change. Requirements and guidance on adaptation planning for local governments and communities*

There is ongoing work on standards focussing on financing local adaptation to climate change and reporting investments and financing activities related to climate change. Other standards on sustainable finance and natural capital accounting can also help organisations better plan for the impacts of climate change, such as PAS 7340 *Framework for embedding the principles of sustainable finance in financial services organizations*, published in January 2020, and BS 8632 *Natural Capital Accounting for Organizations*, published in June 2021.

**New reporting initiatives are less likely to influence smaller businesses, who make up the majority of businesses in England, and have fewer resources to adapt. The impacts of Covid-19 have hit these businesses particularly hard and has highlighted the importance of contingency planning for their resilience.**

The full impact of Covid-19 is still being understood but it and the resulting economic volatility has clearly had a significant effect on small businesses. Smaller firms were more likely than bigger ones to have had to temporarily close or pause trading during the pandemic, although this was not necessarily the same across all industries.<sup>15</sup> Analysis by the Bank of England in 2020 found that the pandemic reduced cash flows for many companies, with smaller companies 'more likely than larger companies to operate in sectors that have been most affected by the shock, such as accommodation and food, arts and recreation, and construction.'<sup>16</sup>

Previous research by the FSB in 2015 suggests the impacts of flooding and extreme weather can be severe for small businesses, but many do not have contingency plans for extreme weather, despite the benefits of doing so exceeding the costs.<sup>17</sup>

In the recovery from Covid-19 there will be many new small businesses established and some operating in different ways than before due to enforced changes from Covid-19. There is an opportunity to increase the level and effectiveness of contingency planning, including for extreme weather, by providing updated guidance and accessible information. Small businesses, including very small businesses working largely from home, will also benefit from investment in resilient digital infrastructure.

The impacts of flooding and extreme weather can be severe for small businesses, but many do not have contingency plans for extreme weather.

**A new SME Climate Hub offers several resources for physical risk and understanding climate impacts, though most of its promotion and resources focus on reducing emissions to Net Zero.**

A new SME Climate Hub was launched in December 2020 and is an initiative of the International Chamber of Commerce, the Exponential Roadmap Initiative, the We Mean Business coalition and the United Nations Race to Zero campaign. This is a welcome development as it aims to provide a 'one-stop-shop' for SMEs to make a climate commitment and access 'best-in-class' tools and resources, which was highlighted as something needed in the CCC's 2019 Adaptation Progress Report. It already offers several resources for physical risk and understanding climate impacts, though the vast majority of its promotion and resources focus on reducing emissions to Net Zero.

It will be important to monitor feedback for the SME Climate Hub and whether action from Government is required to develop resources accordingly to ensure the needs of different types of business and organisations are met. A NAP Action update reports that 'the Small Business Engagement campaign, led by Andrew Griffith MP, the UK's Net Zero Business Champion, will embed the need for adaptation and resilience to climate change in stakeholder-related activity.'

**Recommendation (Joint CCC 2021 Progress Report)**

Support businesses to play their full role in the Net Zero transition and in adapting to climate risks and opportunities, for example by extending and expanding the role of the Net Zero Business Champion beyond COP26, building on the Race to Zero and Race to Resilience campaigns and providing sufficient resources to fully support businesses of all sizes to engage in the transition, to input to policy development and to set their own robust Net Zero and adaptation action plans.

Department: BEIS, Timing: 2021-22.

**Even with the challenges of Covid-19, many businesses and investors have continued to demonstrate a desire for improved climate-related information and aligning their operations and portfolios to be consistent with the goals of achieving Net Zero and being prepared for the impacts of climate change.**

The Principles for Responsible Investment (PRI) report that climate change has remained a top priority for its signatories, particularly in advance of COP26. ShareAction proposed a Responsible Investment bill, stipulating in law that the 'best interests' of beneficiaries includes environmental and social considerations. Major asset management firms such as BlackRock have taken further steps to make consideration of climate change a central part of their investment decisions.

The UK Government set out plans for a green recovery in line with the majority preference of the UK Citizens' Assembly on climate change. Government can help further meet this demand by addressing the above weaknesses in planning for and supporting climate-positive behaviours by businesses and investors by providing clear signals about future policy and timescales.

**Has the risk management score changed?**

**No, the risk management score remains medium. New evidence published since 2019 suggests continued progress in some aspects of reporting, but others, which are particularly important for physical risk and adaptation, show very limited progress. The availability of indicators focussed on physical risk and adaptation for this priority remains limited and there is little new information on the economic impacts of extreme weather.**

The TCFD Status Report states that there have been improvements both in terms of the number of companies reporting and the quality of such reporting. The percentage of reviewed reports disclosing information aligning with a particular TCFD disclosure (for example, climate-related targets) increased on average by six percentage points between 2017 and 2019.

Only one in 15 companies reviewed by the TCFD disclosed information on the resilience of its strategy.

However, companies' disclosure of the potential financial impact of climate change on their businesses and strategies remains low. Only one in 15 companies reviewed disclosed information on the resilience of its strategy. The percentage of companies disclosing the resilience of their strategies, taking into consideration different climate-related scenarios, was significantly lower than that of any other recommended disclosure.

Some of the highlighted case studies demonstrated good approaches for assessing physical risk, such as use of a 4°C or higher scenario and the reporting by hazard in scenario analysis.<sup>18</sup> However, even those reports highlighted as best practice had some weaknesses related to assessing physical risk. Most of the reported physical risk metrics were related to water use. Physical and transition risks were often considered separately and only vague measures like the percentage of sites affected were reported with little information on the adaptation response.

#### Recommendation (Joint CCC 2021 Progress Report)

Develop further ways to embed Net Zero and climate risk in financial decisions by UK firms, building on the UK's Green Finance Strategy. This should include implementing mandatory climate disclosure, adoption of a robust green taxonomy with clear guidance on how it should be used, and considering the recommendations of the Committee's Finance Advisory Group, such as making Net Zero and adaptation plans mandatory for financial institutions and monitoring financial flows into climate action.

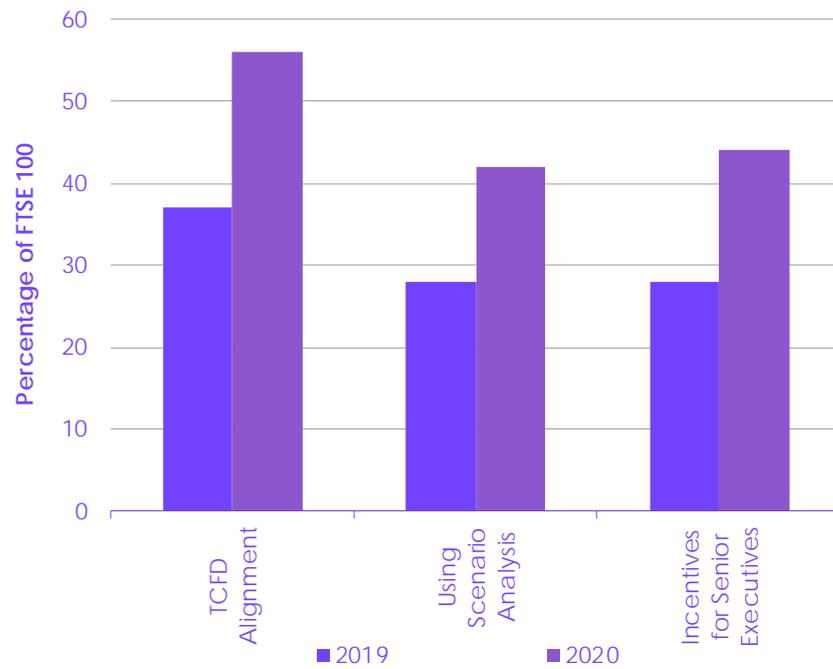

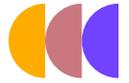

Department: BEIS and HM Treasury, Timing: 2021-25.

The proportion of companies reporting that they are planning for climate change is increasing but further progress is needed.

Figure 5.1 sets out responses from FTSE 100 companies to specific questions from Eco Act's most recent sustainability research. While there is improvement since the previous survey, the results still suggest a significant proportion of FTSE100 companies are not reporting in alignment with the TCFD recommendations, using scenario analysis, or taking steps like offering incentives for Senior Executives.

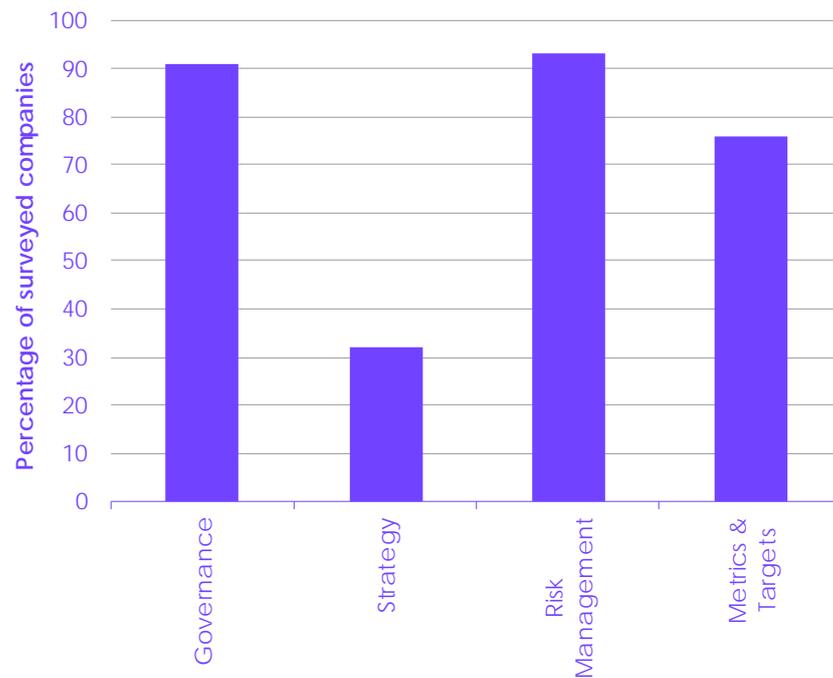

Figure 5.2 shows a survey by CDP which found a high proportion of respondents were providing information on three of the four thematic TCFD areas. However, two-thirds were not reporting under the strategy theme. This is largely because scenario analysis, which businesses have struggled with, is assessed under this theme. This suggests that many organisations are still unable to effectively assess the potential impacts of climate-related risks and opportunities on their businesses, strategy, and financial planning.

Figure 5.1 Survey responses from FTSE100 companies on climate risk

Source: The Sustainability Reporting Performance of the FTSE 100 (EcoAct, 2020)

Figure 5.2 Percentage of CDP respondents reporting under TCFD thematic areas

Source: Disclosure and the TCFD Recommendations: United Kingdom (CDP, 2020)

There are some initial estimates for the impact on businesses of the Autumn-Winter Floods 2019-20 based on insurance claim information from the ABI.<sup>19</sup>

- Of the estimated £110 million payouts, £45 million covered damaged homes and possessions; £58 million for business property and stock, with £7.5 million relating to damaged vehicles.
- The average household flood claim is likely to be around £31,000, and £70,000 for a flooded business. This compares to the average claim across all insured risks of £2,200 under a home insurance policy and an average claim of £11,500 on a commercial policy.

Sayers et al. for the CCC used the new UKCP18 climate projections to provide an updated assessment of future flood risk in 2020.<sup>20</sup> The results did not suggest a significant increase in risk for non-residential properties from flooding compared to their previous assessment in 2015 using UKCP09.

## 5.3 Supply chain interruptions

Progress summary – Supply chain interruptions		
2019 score:	What has changed since 2019:	2021 score:
2	<p><b>Plan score - medium</b></p> <ul style="list-style-type: none"> <li>The plan score has increased from low to medium. The first part of the National Food Strategy has been published and Government has made further commitments to report and better understand issues related to food supply chains, including climate change. There are also examples of private sector initiatives to inform supply chain planning for climate change and efforts by Government to revise its procurement rules. There still needs to be greater assurance for key supply chains and assessment of the impacts of climate change in new industrial and economic policies.</li> </ul> <p><b>Risk management score - low</b></p> <ul style="list-style-type: none"> <li>The risk management score has decreased from medium to low. The risks of supply chain interruptions are greater than in our last report. Action to respond to the risk is at roughly the same level as in 2019, with some surveys suggesting that businesses are increasingly prioritising resilience in their supply chain planning rather than speed and cost-efficiency, but others suggesting engagement with suppliers on climate change is still limited.</li> </ul>	3
<p>Notes: See annex for full datasets            Key Indicators: Supplier engagement on climate change (various surveys), Economic impact of supply chain interruptions.</p>		

### Summary of 2019 report score

**In our last report, supply chain interruptions scored a 2 (low plan score, medium risk management score).**

Our last report found that there were no stated goals or specific planning for adapting supply chains, and the UK Industrial Strategy did not make any references to helping supply chains become more resilient to the impacts of climate change. NAP2 did not address the risks that the UK faces from the international impacts of climate change.

The limited survey evidence available suggested some businesses were taking action but also suggests some did not engage with their suppliers on climate change.

### Has the plan score changed?

**Yes, the plan score has increased from low to medium. There are some promising new initiatives from Government and the private sector and surveys suggest that businesses are increasingly balancing the need for resilience in their supply chain planning alongside speed and cost-efficiency. To increase the score further there needs to be greater assurance for key supply chains, and plans for industry and the economy should incorporate the impacts of climate change on supply chain resilience.**

**Key supply chains such as food and medical supplies require stronger assurance about their resilience to future shocks, including the impacts of extreme weather.**

Covid-19 has highlighted the importance of having reliable and resilient supply chains, particularly for food and medicine. A report by the House of Commons International Trade Committee in July 2020 identified various adverse effects from the disruption caused by the pandemic, though also noted that UK supply chains for medicines and food had withstood many of the challenges at the time of writing.<sup>21</sup> In the Government's response to this report, it stated that the 'DEFEND programme, led by DIT, interrogates vulnerabilities in UK global supply chains for critical goods (excluding food) and develops strategies to strengthen supply chain resilience.'<sup>22</sup>

It is not clear to what extent extreme weather is currently considered alongside other current and future supply chain vulnerabilities. The CCRA3 Advice Report and CCRA3 Technical Report assessed that extreme weather is already causing supply chain disruption and that exposure to climate hazards is set to increase.<sup>23</sup> It also noted that there are 'opportunities to learn from the lessons on supply chain resilience during the COVID-19 pandemic' and that 'enhancing supply chain resilience should be a priority for post-COVID recovery planning and should also be a factor in the development of new trade agreements as trade patterns change following EU-Exit.'

**The Government is making progress with its work on food security and supply chains.**

The first part of the independent Dimpleby review of the new National Food Strategy was published in July 2020.<sup>24</sup> Part one focussed on the impacts of Covid-19 and the end of the EU exit transition. It assessed that the food supply chain proved resilient during Covid-19 but reminded us there is no room for complacency and that 'the fact that the food system didn't, in the end, break down is largely due to the nature of this particular crisis.'

On climate the Dimpleby review assessed that 'Climate change is currently the biggest threat to food security, perhaps the most serious the world has ever seen. The problems it creates are likely to be disruptions of supply rather than demand. One worst-case scenario would be the failure of multiple harvests worldwide. If that happened, there might not be enough food to go around. This is a food security issue on a grand scale.'

Part two of the review will assess the entire national food system, including the issues of climate change in more depth.

The UK Government committed in the Agriculture Act 2020 to publish a regular food security report, with the first report published before the end of 2021, and subsequent reports every 3 years.<sup>25</sup> The Food Standards Agency (FSA) has published its Areas of Research Interest (ARI), including considering climate change's influence on patterns of foodborne disease prevalence, the availability or need for new or novel foods, and its impact on international trade.<sup>26</sup>

**Recommendation**

Set out measures to ensure the resilience of the food supply chain, including to the risks of extreme weather in England and internationally, as part of its white paper responding to the independent review of the National Food Strategy for England.

Department: Defra, Timing: 2022.

The Dimpleby review assessed that climate change is currently the biggest threat to food security.

Government has committed to publishing a white paper six months after part two is published and has asked Henry Dimpleby to review progress six months after this.

## Recommendation

Ensure that adaptation is integrated into major upcoming policies in the next two years related to the eight priority risks identified in the Committee's advice on the third UK Climate Change Risk Assessment (CCRA3) for which BEIS has lead responsibility, coordinating work with other relevant departments as necessary:

- Risks to the supply of food, goods and vital services due to climate-related collapse of supply chains and distribution networks (with Defra and DIT)
- Risks to people and the economy from climate-related failure of the power system

In addition, for the coming five-year period 2023-2028, BEIS should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the other risks and opportunities in the CCRA for which it is the lead department (see Annex).

Department: BEIS, Timing: By 2023.

### **Government has consulted on changing its procurement processes to better take account of climate change. These are good proposals but require strengthening to really drive progress in planning.**

Public procurement accounts for around a third of all public expenditure at £290 billion according to a 2020 consultation by the Cabinet Office.<sup>27</sup> Government has consulted on ways to improve its public procurement process, including supporting national priorities such as the environment and tackling climate change.

Proposed changes would permit contracting authorities to assess how suppliers are operating across the whole of their business, not just criteria related to the delivery of the contract, for example a supplier's plans for achieving environmental targets across its operations. However, the proposals also state that this would only be allowed in a limited number of circumstances so as not to disadvantage small businesses.

Creating a level playing field for smaller businesses is important, however it is imperative that public procurement sends the right messages to suppliers by asking them to demonstrate their planning for and response to the impacts of climate change. In a previous consultation on social value in procurement, mitigating and adapting to climate change were listed as criteria that departments could use to assess a supplier's contribution to environmental policy objectives.<sup>28</sup>

Guidance should accompany any changes in procurement to ensure that suppliers are asked to provide useful qualitative and quantitative information on their contribution to environmental and climate change goals, and that these criteria are considered as widely as possible across contracts.

### **Government confirmed it is progressing the development of a new Greening Government Commitments (GGC) framework for 2021-25. There is an opportunity to increase the coverage of adaptation in GGC reports.**

In its NAP action update the Government confirmed it is progressing the development of a new Greening Government Commitments (GGC) framework for 2021-25. It is looking to include climate adaptation commitments as part of this framework and aims to publish new commitments in spring 2021. There is an opportunity to increase the coverage of adaptation in GGC reports, such as requesting more detailed information and highlighting best practice through case studies to help departments learn from one another. Reporting requirements for the most recent GGC report were reduced to the impact of Covid-19 on government departments.

Suppliers should provide evidence of their contribution to environmental and climate change goals, and these criteria should be considered as widely as possible across contracts.

**There are also examples from the private sector of greater consideration of the sustainability and resilience of their supply chains.**

HSBC and the Sustainability Consortium published a report in 2020 on improving supply chain resilience to manage climate change risks.<sup>29</sup> It discusses physical risk and why this may be different to other supply chain risks that organisations may face, as well as strategies to improve supply chain resilience.

There are other examples which do not currently focus on the risks from climate change specifically but have developed approaches which could be applied and learned from. WRAP's Sustainable Clothing Action Plan aims to reduce the environmental footprint of clothing by bringing together industry, government and the third sector. Industry includes both retailers and suppliers, as well as trade bodies. One of the working groups focuses specifically on metrics. The Courtauld Commitment 2025 has similar aims and processes to address sustainability issues in food and drink supply chains.

These and other approaches could help inform new industrial and economic strategies and policies, which must take into account the long-term impacts of climate change on supply chain resilience.

### Has the risk management score changed?

**Yes, the risk management score has decreased from medium to low. This is because of new evidence published since 2019 that points to a higher degree of underlying risk, while action has remained at roughly the same level, with mixed progress.**

**In addition to the impact of Covid-19, recent survey evidence from the Economist Intelligence Unit suggests high costs associated with supply chain disruption. It also suggests businesses are rethinking their approaches to supply chain management following Covid-19.**

In 2021 The Economist Intelligence Unit assessed the business costs of supply chain disruption across eight countries, including the UK.<sup>30</sup> In November and December 2020 it surveyed 400 senior supply-chain and procurement executives in five sectors (agriculture and food, industry, consumer goods and retail, healthcare and pharmaceuticals, and energy and utilities).

Its research found that disruptions have incurred substantial financial costs over the past three years, averaging 6 to 10% of annual revenues, as well as reputational costs, in terms of customer complaints and damage to brand reputation, as companies have struggled to maintain supplies of their goods. 54% of the executives surveyed said that organisations must make significant changes in order to effectively manage supply-chain disruptions in the next five years.

The report assesses that 'until now, companies have emphasised efficiency. But this is changing, with firms recognising a need to prioritise supply-chain resilience. Six in ten respondents agreed that redundancy and resilience in their company's supply chain are more important than speed and efficiency, with a third of respondents strongly agreeing. Climate-related risks and natural disasters are among the factors considered most likely to impact supply chains in the next five years, though geopolitical and pandemic-related risks were cited by a higher proportion of respondents.

A recent Economist Intelligence Unit survey suggests supply chain disruptions have incurred substantial financial costs over the past three years, averaging 6 to 10% of annual revenues, as well as reputational costs.

UK respondents to CDP reported \$2.2 billion of revenue at risk over the next five years due to physical and transition climate change risks, deforestation and water insecurity risks in their supply chains.

### **Other recent survey evidence suggests mixed progress for the responses of business to supply chain risks.**

In response to CDP's Supply Chain Survey in 2020, respondents from all countries expected total increased costs of \$120 billion in the next five years, caused by physical environmental impacts as well as addressing regulation and market changes, which could be passed on to buyers.<sup>31</sup> UK respondents reported \$2.2 billion of increased costs over the next five years due to climate change (including mitigation), deforestation and water insecurity risks in their supply chain.

Research by Eco Act in 2020 found that 64% of FTSE100 companies assessed value chain risks. It found businesses in the fast-moving consumer goods sector, a key sector for supply chain risks, generally performed better on its survey responses, though only half of respondents, across the FTSE100, DOW30, IBEX35 and CAC40 indexes, made use of scenario analysis. 89% of all FTSE 100 companies reported some engagement with their suppliers on climate change issues, though this includes mitigation as well as adaptation. The number of businesses disclosing to CDP in 2020 through its supply chain survey published in 2021 was nearly 8,100, more than double the amount in 2015.

## 5.4 Water demand by industry

Progress summary – Water demand by industry		
2019 score:	What has changed since 2019:	2021 score:
5	<p><b>Plan score - medium</b></p> <ul style="list-style-type: none"> <li>There is no change in the plan score from 2019. The Environment Agency's National Framework identifies key sectors for regional water groups to engage with and agree strategies for managing their water use. However, the Retailer Wholesaler Group (RWG) water efficiency sub-group, supported by the Environment Agency and Ofwat, has set out an action plan to improve this. There remains a lack of clear targets for the contribution of industry to managing water availability.</li> </ul> <p><b>Risk management score - medium</b></p> <ul style="list-style-type: none"> <li>There is no change in the risk management score from 2019. Non-household consumption of the public water supply is roughly the same as a decade ago. There is no more recent data on abstraction by industry than there was in 2019. Survey evidence published since 2019 suggests some sectors and businesses are reducing their water use. Additional data which take into account production levels are still required to assess genuine improvements in water efficiency in the future.</li> </ul>	5
<p>Notes: See annex for full datasets            Key Indicators: Abstraction by industry (Ml/d), Non-household consumption of the public water supply (Ml/d), Businesses reporting water use per unit of production.</p>		

### Summary of 2019 report score

**In our last report, water demand by industry scored a 5 (medium plan score, medium risk management score).**

Our last report found that there were some plans in place to reduce water use by businesses through abstraction reform, the water retail market and company initiatives and targets. However, there was no overarching plan or target and the effect of the water retail market on improving water efficiency was limited.

Direct abstraction from freshwater sources had fallen between 2012 and 2017 but consumption from the public water supply was the same as in 2012. There was good evidence that some businesses were reducing water use, for example reporting members of the Food and Drink Federation.

### Has the plan score changed?

**No, the plan score remains medium. There has been significant progress through the Environment Agency's National Framework and joint letter with Ofwat to improve uptake of water efficiency measures by business. There remains a lack of clear targets for the contribution of business to managing future water availability.**

**The Environment Agency's National Framework sets out how regional groups should work with local business sectors to help manage water availability in their regions.**

Based on the analysis for the National Framework for water resources in 2020, the Environment Agency identified key abstractors and water using sectors for regional groups to engage with:<sup>32</sup>

- Water Resources East should continue to engage with the agricultural sector (particularly spray irrigation), the food and drink industry, power sector and wider industry.
- Water Resources South East should engage with industry, particularly paper and pulp, and agriculture. This includes previously exempt abstractors using trickle irrigation for a range of purposes such as soft fruit growers.
- West Country Water Resources should engage with the minerals sector and agriculture (particularly the livestock subsector).
- Water Resources West should engage with navigation operators and industry, particularly the chemicals sector, as well as agriculture.
- Water Resources North should engage the power generation sector, industry and agriculture.

Reducing the demand for water from the non-household sector would have co-benefits such as improving the efficiency of business processes and reducing energy consumption.

The assessment identifies that reducing the demand for water from non-household sectors will play an important part in reducing demand overall and would have co-benefits such as improving the efficiency of business processes and reducing energy consumption. Regional groups' engagement is expected to include the approach to planning for water resources, managing droughts, reducing demand, and forecasting and monitoring non-household use of mains water. It will also consider a range of solutions such as re-using process water for other neighbouring businesses or large and business scale grey and rainwater harvesting.

**Ofwat's review of the retail market suggests it is still only having a limited impact on water efficiency. However, the Retailer Wholesaler Group (RWG) water efficiency sub-group, supported by the Environment Agency and Ofwat, has set out an action plan to improve this.**

Only around 6% of businesses who switched suppliers in 2019 received new water efficiency or leak detection devices as a result of switching.

Ofwat's third review of the impact of the water retail market for businesses in 2020 found that take-up of water efficiency services has increased but remains low.<sup>33</sup> Only around 6% of businesses who switched suppliers in the year preceding the report received new water efficiency or leak detection devices as a result of switching. Ofwat acknowledged this lack of progress in a joint open letter with the Environment Agency.<sup>34</sup>

The Retailer Wholesaler Group (RWG) water efficiency sub-group has since consulted and signed off a Headline Action Plan with a series of actions and milestones, mostly over the coming year, which Ofwat and the Environment Agency have publicly supported.<sup>35</sup> The plan has now been presented to the Senior Water Demand Steering Group (SWDSG), a new group established by Defra, as part of a new monitoring and reporting framework to report on progress on demand management.

As part of the environmental targets under the Environment Bill, it is being considered whether to set a target for the overall demand for water. By including non-household use, this would help to drive progress in conjunction with the retail market.<sup>36</sup>

## Recommendation

Work with the Environment Agency, Ofwat and other stakeholders to set out targets and supporting measures for reducing water use by business. This could be through ensuring that any water reduction targets linked to the Environment Bill include business as well as household water use, as well as responding to advice and recommendations from Defra's new Senior Water Demand Reduction Group.

Department: Defra, Timing: 2022.

### **There are examples of private sector initiatives which plan to reduce water at sector or company level.**

The Food and Drink Federation (FDF) and several member companies are supporters of the Courtauld 2025 Water Ambition. This commits signatory businesses to monitor water use in their own operations, improve efficiency and work collectively to improve the quality and availability of water in key sourcing areas by 2025. It includes a catchment project in the UK and going forward, the FDF and WRAP will look to develop a Water Roadmap for businesses.

### Has the risk management score changed?

**No. There is some evidence of positive action by industry to reduce water use. Additional data which take into account production levels are still required to assess genuine improvements in water efficiency in the future.**

### **Non-household consumption of the public water supply is at roughly the same level as a decade ago.**

Data from the Environment Agency suggest that non-household consumption of the public water supply was 2,700 MI/d in 2019/20.<sup>37</sup> This is the same as for our last report two years ago, but also the same as consumption in 2009/10. Due to the impacts of Covid-19 on resources for data collection, there are no updated data for abstraction. Additional data which take into account production levels are still required to assess genuine improvements in water efficiency.

### **Reports and survey data suggest positive action by businesses to address water efficiency, though this is not necessarily widespread across sectors.**

In CDP's most recent Global Water Report published in 2021, disclosures indicate that not addressing water risks is more costly than addressing them, though this includes flooding in addition to water availability.<sup>38</sup> The information submitted suggested the potential financial impact of global water risks to businesses is five times higher than the cost of addressing them. The sectors facing highest financial impacts are manufacturing, power generation, and food, beverage, and agriculture.

Since 2018, almost two-thirds of responding companies state they are reducing or at least maintaining their water withdrawals compared to the previous year. 27% of respondents reported adopting water efficiency, conservation, re-use and recycling measures and the proportion that factor water availability at a basin or catchment level into water risk assessments had increased from the previous year's survey from 48% to 65% of respondents.

CDP's Global Water Report also highlighted case studies of action by businesses. L'Oréal uses a 'waterloop' standard, where all process water is reused or recycled on site. It reports that the cost of equipping facilities with the water recycling technology required is lower than the potential financial impact of water-related risks. It aims to use this approach in all of its factories by 2030. Nissan uses rainwater

Non-household consumption of the public water supply was 2,700 MI/d in 2019/20. This is the same as for our last report two years ago, but also the same as consumption in 2009/10.

There are good examples of businesses developing processes to re-use or recycle water for which they report that the benefits exceed the costs.

harvesting and wastewater recycling at one its sites, allowing it to be independent of external water sources and save on water bills through reducing use.

Food and Drink Federation (FDF) members reporting in 2019 had reduced their absolute water consumption by 41.5% between 2007 and 2019 and the amount of water consumed per tonne of product was reduced by 44.5% over the same period.<sup>39</sup>

## 5.5 Business opportunities from climate change adaptation

Progress summary – Business opportunities from climate change adaptation		
2019 score:	What has changed since 2019:	2021 score:
2	<p><b>Plan score - low</b></p> <ul style="list-style-type: none"> <li>There is no change in the plan score from 2019. There has been progress in planning for a green recovery in response to the economic impacts from Covid-19, launching a race for resilience and some promising pilot schemes for adaptation. However, the business opportunities from climate change adaptation specifically are generally not considered in relevant national plans or strategies.</li> </ul> <p><b>Risk management score - medium</b></p> <ul style="list-style-type: none"> <li>There is no change in the risk management score from 2019. From the available data it is not possible to tell the extent to which UK businesses are planning for any direct opportunities from climate change (such as potentially longer growing seasons). There is some evidence published since 2019 suggesting businesses are considering opportunities from climate change adaptation.</li> </ul>	2
<p>Notes: See annex for full datasets            Key Indicators: Number of businesses reporting that they assess opportunities from climate change adaptation, Issues of resilience or other sustainability bonds to finance adaptation opportunities, Sales of adaptation goods and services.</p>		

### Summary of 2019 report score

**In our last report, business opportunities from climate change adaptation scored a 2 (low plan score, medium risk management score).**

Our last report found that there was no overarching plan and the Industrial Strategy did not mention climate change as a potential driver of business growth or city regeneration through adaptation-related technologies. There were no specific schemes from Innovate UK or use of the Industrial Strategy Challenge Fund to encourage climate-related adaptation opportunities.

Opportunities were identified for banking and green finance which had the potential to direct more finance towards adaptation and develop new adaptation products and services. The available data did not demonstrate the extent to which businesses were realising the opportunities from climate change.

### Has the plan score changed?

**No, the plan score remains low. There has been progress in planning for a green recovery in response to the economic impacts from Covid-19 and achieving Net Zero, and some promising pilot schemes for adaptation. However, to improve the score, there needs to be better plans at national level.**

**The Government has set out plans for transforming the financial system to better support environmental objectives. These plans reference the opportunities from climate change adaptation, though there is little detail at this stage.**

Shortly after our last report in 2019, the Government published its Green Finance Strategy.<sup>40</sup> The strategy specifically mentioned 'championing the resilience agenda' and exploring measures to unlock new revenue streams in areas such as natural capital and resilience.

It is due to conduct a formal review of progress against the ambitions and plans across all parts of the Green Finance Strategy in 2022.

A report by the London Stock Exchange Group in December 2020 highlighted examples of the use of new green finance products around the world, including for adaptation and resilience, such as green and sustainability bonds.<sup>41</sup> The review of the Green Finance Strategy should consider these and other new products and services. The review should also consider how the use of these or similar products and services could be increased and therefore create more opportunities for UK businesses from climate change adaptation.

The new sovereign green bond could help provide green and resilient infrastructure and create jobs.

In addition to announcing plans for making TCFD reporting mandatory, the UK Government announced a sovereign green bond in 2020. The Green Finance Institute assessed that this 'delivers on plans to move towards a resilient, Net Zero carbon economy,' it will 'bring a range of positive social benefits such as creating green collar jobs, skills and regional revitalisation,' and 'provide finance for green infrastructure, it will create green jobs and catalyse the sterling green bond market.'<sup>42</sup>

**The 2021 Dasgupta Review of the economics of biodiversity highlights the need for new standards, data and tools to help businesses and financial institutions integrate nature-related considerations into their decision-making.**

The 2021 Dasgupta Review of the economics of biodiversity identified the need for a financial system that channels financial investments – public and private – towards economic activities that enhance the stock of natural assets and encourages sustainable consumption and production activities.<sup>43</sup>

Much like for TCFD reporting and climate change, it sets out that 'what is ultimately required is a set of global standards underpinned by credible, decision-grade data, which businesses and financial institutions can use to fully integrate Nature-related considerations into their decision-making, and assess and disclose their use of, and impact on, Nature.'

Transforming the financial system to achieve this should incorporate the long-term impacts of climate change and consider the opportunities this transformation could create for business in the financial sector and more widely. Tools such as ENCORE (Exploring Natural Capital Opportunities, Risks and Exposure) could be promoted to help businesses become aware of new opportunities related to natural capital.

**A 'Race to Resilience' has been launched for COP26. This and other international initiatives can help to raise awareness of adaptation opportunities at the same time as improving resilience in the UK and other countries.**

The 'Race to Resilience' was announced in January 2021 and aims by 2030, to catalyse action by non-state actors\* that builds the resilience of 4 billion people from vulnerable groups and communities to climate risks.<sup>44</sup> The campaign will report back on progress annually starting at COP26. Mark Carney also announced a strategy for building a private finance system for Net Zero, with one of the four pillars being 'returns.' Similar principles could be used to consider the opportunities for adaptation.

**There could also be more opportunities for UK businesses if measures for a green recovery are able to better integrate adaptation and resilience.**

\* Non-state actors for the Race to Resilience could be individual companies, cities, regions, NGOs or organizations.

If more people work at home, there will be opportunities for new products and services which help people to be productive, including during periods of hot weather now and in the future.

In 2020, the Government has also announced a series of measures to help support a green recovery from the economic impacts of Covid-19, such as a ten-point plan for a green industrial revolution and a green jobs taskforce on skills, both currently focussed on Net Zero.<sup>45</sup> The Institute for Apprenticeships and Technical Education has also launched a green apprenticeships advisory panel.<sup>46</sup> Many of the areas under the ten-point plan will require consideration of mitigation and adaptation in parallel.

There could also be more opportunities for adaptation-related jobs and apprenticeships schemes particularly given possible changes in work and supply chains as a result of Covid-19 and the end of the transition period after leaving the EU. For example, if more people work at home, there will be opportunities for new products and services which help people to be productive, including during periods of hot weather now and in the future.

A report published by the Green Alliance in May 2021 considers the potential for creating new green jobs across Britain and found opportunities in seagrass planting, tree planting and wetlands restoration, peatland restoration initiatives and creating new green spaces.<sup>47</sup>

**There are examples of regional or project use of green finance which support adaptation and could be scaled up to provide greater opportunities for business.** The IGNITION project aims to increase investment in Greater Manchester's natural environment and build the city region's ability to adapt to the increasing impacts of climate change.

An example is the Greater Manchester IGNITION project which aims to develop innovative financing solutions for investment in Greater Manchester's natural environment and build the city region's ability to adapt to the increasing impacts of climate change.<sup>48</sup> It focuses on solutions such as rain gardens, street trees, green roofs and walls and development of green spaces. The aim is to develop a model that enables major investment in large-scale environmental projects which can increase climate resilience.<sup>49</sup>

From 12 February 2021, organisations can apply for a natural environment investment readiness fund (NEIRF) grant.<sup>50</sup> The NEIRF is a competitive grants scheme providing grants of between £10,000 and £100,000 to support environmental projects in England. Projects should have the ability to produce revenue from ecosystem services to attract and repay investment. Ecosystem services could include selling biodiversity units from a habitat bank or selling 'catchment services' such as improved water quality and natural flood management benefits resulting from natural environment improvements.

Has the opportunity score changed?

**No, the opportunity score remains medium. From the available data it is not possible to tell the extent to which UK businesses are realising the opportunities from climate change. There is some evidence published since 2019 suggesting businesses are considering opportunities from climate change adaptation.**

**There is some work being undertaken by government departments and agencies to create adaptation-related export opportunities for UK businesses.**

There are several NAP Action updates related to opportunities. UK Export Finance is undertaking work with the Environment Agency and OGDs on export opportunities related to 'flood control risk management,' with the aim of producing a 'prospectus' in 2021.

The Department for International Trade (DIT) carried out work to help businesses and the City of London demonstrate leadership in finance and insurance, including through the 2021 Global Resilience Summit. DIT is also undertaking work to link UK firms with international partners to help deliver resilient infrastructure in other countries.

**There is evidence of a growing demand for adaptation-related advisory services and data.**

In January 2020 a special issue of the journal 'Climate Services' summarised the findings of two EU-funded projects, called MARCO and EU MACS.<sup>51</sup> These projects aimed to characterise the current and untapped market for climate services in Europe and derive opportunities for market growth. For the UK they identified a range of case studies and examples for different types of services:

- adaptation and engineering solutions;
- risk assessments and reporting;
- climate models and scenario analyses
- climate finance;
- climate data;
- climate communications; and
- climate intelligence.

This demand for better business capability when it comes to assessing physical risk and adaptation can also be seen in recent corporate acquisitions; insurance broker Willis Towers Watson recently acquired adaptation consultancy Acclimatise, and McKinsey acquired consultancy Vivid Economics and climate analytics platform Planetrics.

**Survey evidence published since 2019 suggests there may be significant opportunities for businesses and that some are planning specifically for adaptation. However, much of this evidence is either for both mitigation and adaptation (making adaptation difficult to separate out) or for companies based outside the UK.**

Research by Eco Act in 2020 found that 70% of FTSE 100 companies assess the opportunities from climate change, though this is for both mitigation and adaptation. Data published by FTSE Russell in 2020 suggest that the green economy, and potentially related opportunities for climate change adaptation, is increasing in size. FTSE Russell's analysis found that the global green economy has grown from US\$2 trillion in 2009 to US\$4 trillion in 2018, an annualized growth rate of 8%.<sup>52</sup> However, it still remains a small proportion of all finance and the UK in particular has relatively low exposure to the green economy compared to other countries. In the 2020 TCFD Status Report, a case study from Pfizer stated that it was seizing the opportunities presented by climate change adaptation, particularly in terms of sustainable product development. It claims it is the first company in the pharmaceutical sector to issue a green bond.

Based on the responses of the 500 biggest companies by market capitalization that disclosed to CDP in 2018, \$236 billion of potential increased revenue through new solutions to adaptation needs was identified in a 2019 CDP report. The responses covered a range of sectors, though manufacturing businesses identified the most potential revenue of any sector.<sup>53</sup>

70% of FTSE 100 companies reported they assess the opportunities from climate change mitigation and adaptation.

# Departmental risk owners

This report assesses progress for 33 adaptation priorities representing different policy teams in the UK Government. In CCRA3, there are 61 risks and opportunities that should be included in the next iteration of the National Adaptation Programme. Table 1 below shows the departmental owners for the risks and opportunities in CCRA3, which are linked to the Committee's recommendations (see Executive Summary). It also shows a rough mapping to the priorities assessed in this report.

<b>Table A2</b> CCRA3 risks, departmental owners and adaptation priorities			
CCRA3 Risk or opportunity	Lead department	Secondary departments	Progress Report Adaptation Priority
N1 - Risks to terrestrial species and habitats from changing climatic conditions and extreme events	Defra		Terrestrial habitats and species Farmland habitats and species
N2 - Risks to terrestrial species and habitats from pests, pathogens and invasive species	Defra		Terrestrial habitats and species Farmland habitats and species
N3 - Opportunities from new species colonisations in terrestrial habitats	Defra		Terrestrial habitats and species Farmland habitats and species
N4 - Risk to soils from changing climatic conditions, including seasonal aridity and wetness.	Defra		Terrestrial habitats and species Agricultural productivity Commercial forestry
N5 - Risks to natural carbon stores and sequestration from changing climatic conditions, including temperature change and water scarcity.	Defra		Terrestrial habitats and species Agricultural productivity Commercial forestry
N6 - Risks to and opportunities for agricultural and forestry productivity from extreme events and changing climatic conditions	Defra		Agricultural productivity Commercial forestry Water management
N7 - Risks to agriculture from pests, pathogens and invasive species	Defra		Agricultural productivity
N8 - Risks to forestry from pests, pathogens and invasive species	Defra		Commercial forestry
N9 - Opportunities for agricultural and forestry productivity from new/alternative species becoming suitable.	Defra		Agricultural productivity Commercial forestry
N10 - Risks to aquifers and agricultural land from sea level rise, saltwater intrusion	Defra		Agricultural productivity
N11 - Risks to freshwater species and habitats from changing climatic conditions and extreme events	Defra		Freshwater habitats and species Water management

N12 - Risks to freshwater species and habitats from pests, pathogens and invasive species	Defra		Freshwater habitats and species
N13 - Opportunities to freshwater species and habitats from new species colonisations	Defra		Freshwater habitats and species
N14 - Risks to marine species, habitats and fisheries from changing climatic conditions, including ocean acidification and higher water temperatures.	Defra		Marine and coastal habitats and species Commercial fisheries and aquaculture
N15 - Opportunities to marine species, habitats and fisheries from changing climatic conditions	Defra		Marine and coastal habitats and species Commercial fisheries and aquaculture
N16 - Risks to marine species and habitats from pests, pathogens and invasive species	Defra		Marine and coastal habitats and species Commercial fisheries and aquaculture
N17 - Risks and opportunities to coastal species and habitats due to coastal flooding, erosion and climate factors	Defra		Marine and coastal habitats and species
N18 - Risks and opportunities from climate change to landscape character	Defra		N/A
I1 - Risks to infrastructure networks (water, energy, transport, ICT) from cascading failures	Cabinet Office	BEIS, DfT, MHCLG, DCMS	Infrastructure interdependencies Design/location of new infrastructure
I2 - Risks to infrastructure services from river, surface water and groundwater flooding	Defra	BEIS, DfT, MHCLG	River and coastal flood alleviation Surface water flood alleviation Development – surface water flooding Development – river or coastal flooding Energy sector Rail network Strategic road network Local road network Ports Airports Design/location of new infrastructure Telecoms, digital and ICT
I3 - Risks to infrastructure services from coastal flooding and erosion	Defra	BEIS, DfT, MHCLG	River and coastal flood alleviation Surface water flood alleviation Development – surface water flooding

			Development – river or coastal flooding Energy sector Rail network Strategic road network Local road network Ports Airports Telecoms, digital and ICT Design/location of new infrastructure
I4 - Risks to bridges and pipelines from flooding and erosion	Defra	DfT, BEIS, MHCLG	River and coastal flood alleviation Rail network Strategic road network Local road network Energy
I5 - Risks to transport networks from slope and embankment failure	DfT	MHCLG	Rail network Strategic Road Network Local road network
I6 - Risks to hydroelectric generation from low or high river flows	BEIS		Energy
I7 - Risks to subterranean and surface infrastructure from subsidence	Defra	BEIS, DfT, DCMS, MHCLG	Energy Telecoms, digital and ICT
I8 - Risks to public water supplies from reduced water availability	Defra		Public water supply infrastructure Water demand – built environment
I9 - Risks to energy generation from reduced water availability	BEIS		Energy
I10 - Risks to energy from high and low temperatures, high winds, lightning	BEIS		Energy
I11 - Risks to offshore infrastructure from storms and high waves	BEIS		Energy
I12 - Risks to transport from high and low temperatures, high winds, lightning	DfT	MHCLG	Rail network Strategic road network Local road network
I13 - Risks to digital from high and low temperatures, high winds, lightning	DCMS	MHCLG	Telecoms, digital and ICT
H1 - Risks to health and wellbeing from high temperatures	MHCLG	DHSC, BEIS	Health impacts from heat and cold
H2 - Opportunities for health and wellbeing from higher temperatures	DHSC		Health impacts from heat and cold

H3 - Risks to people, communities and buildings from flooding	Defra	MHCLG, Cabinet Office,	River and coastal flood alleviation Surface water flood alleviation Development – surface water flooding Recovery from flooding Property-level flood resilience
H4 - Risks to people, communities and buildings from sea level rise	Defra	MHCLG	River and coastal flood alleviation Recovery from flooding Coastal erosion risk management
H5 - Risks to building fabric	MHCLG	BEIS	N/A
H6 - Risks and opportunities from summer and winter household energy demand	BEIS		Energy
H7 - Risks to health and wellbeing from changes in air quality	Defra	DHSC	Air quality
H8 - Risks to health from vector-borne diseases	DHSC		Human pathogens
H9 - Risks to food safety and food security	Defra		Human pathogens
H10 - Risks to health from water quality and household water supply	Defra		N/A
H11 - Risks to cultural heritage	DCMS		N/A
H12 - Risks to health and social care delivery	DHSC	MHCLG	Emergency planning system Health impacts from heat and cold
H13 - Risks to education and prison services	MoJ and DfE		Health impacts from heat and cold
B1 - Risks to business sites from flooding	Defra	BEIS, MHCLG, DfT	Extreme weather impacts on business
B2 - Risks to business locations and infrastructure from coastal change from erosion, flooding and extreme weather events	Defra	BEIS, MHCLG, DfT	Extreme weather impacts on business
B3 - Risks to businesses from water scarcity	Defra	BEIS	Water demand by industry
B4 - Risks to finance, investment and insurance including access to capital for businesses	BEIS	DIT, DWP, HMT	N/A
B5 - Risks to business from reduced employee productivity due to infrastructure disruption and higher temperatures in working environments	BEIS	DHSC, DWP	Health impacts from heat and cold Extreme weather impacts on business

B6 - Risks to business from disruption to supply chains and distribution networks	BEIS	DfT, MHCLG, DIT	Supply chain interruptions
B7 - Opportunities for business from changes in demand for goods and services	BEIS	DIT	Business opportunities from adaptation
ID1 - Risks to UK food availability, safety, and quality from climate change overseas	Defra	FCDO, DIT	Supply chain interruptions
ID2 - Opportunities for UK food availability and exports from climate impacts overseas	Defra	FCDO, DIT	N/A
ID3 - Risks to the UK from climate-related international human mobility	FCDO	Home Office	N/A
ID 4 - Risks to the UK from international violent conflict resulting from climate change on the UK	FCDO	Home Office, MoD, Cabinet Office	N/A
ID5 - Risks to international law and governance from climate change overseas that will impact the UK	FCDO	MoD, Cabinet Office	N/A
ID6 - Opportunities from climate change (including arctic ice melt) on international trade routes	DIT	FCDO	N/A
ID7 - Risks from climate change on international trade routes	DIT		Supply chain interruptions
ID8 - Risk to the UK finance sector from climate change overseas	HM Treasury	DIT, FCDO	N/A
ID9 - Risk to UK public health from climate change overseas	DHSC	FCDO	Human pathogens
ID10 - Risk multiplication from the interactions and cascades of named risks across systems and geographies	Cabinet Office		N/A

# Joint Recommendations

## 2021 Report to Parliament

# Climate Change Committee Recommendations

---

## Central Government departments:

- **Table A1:** Cabinet Office and Number 10
- **Table A2:** COP Unit, the Foreign, Commonwealth and Development Office (FCDO) and the Department for International Trade (DIT)
- **Table A3:** HM Treasury (HMT)
- **Table A4:** Department for Business, Energy and Industrial Strategy (BEIS)
- **Table A5:** Department for Environment, Food and Rural Affairs (Defra)
- **Table A6:** Department for Transport (DfT)
- **Table A7:** Ministry of Housing, Communities and Local Government (MHCLG)
- **Table A8:** Department for Digital, Culture, Media and Sport (DCMS)
- **Table A9:** Department for Education (DfE)
- **Table A10:** Department for Work and Pensions (DWP)
- **Table A11:** Department of Health and Social Care (DHSC)
- **Table A12:** Home Office and the Ministry of Justice (MoJ)
- **Table A13:** Ministry of Defence (MoD)

## Regulators and the Office for National Statistics:

- **Table A14:** Office of Gas and Electricity Markets (Ofgem)
- **Table A15:** Water Services Regulation Authority (Ofwat)
- **Table A16:** Office for National Statistics (ONS)

## Devolved administrations:

- **Table A17:** The Scottish Government
- **Table A18:** The Welsh Government
- **Table A19:** The Northern Ireland Executive

**Table A1**  
Recommendations for Number 10 and Cabinet Office

Timing

Cross-cutting	Use the <b>Cabinet Committees</b> on Climate Strategy and Climate Action to drive home the need for more pace in policy development across Departments. Consider whether additional governance mechanisms such as independent delivery bodies are required in particular areas, such as heat decarbonisation.	2021-22 Priority recommendation
	Commit to a ' <b>Net Zero Test</b> ' to ensure that all Government decisions are compatible with the legislated emissions targets.	2021 Priority recommendation
	Develop (with BEIS) a <b>public engagement strategy</b> for Net Zero which builds on the findings of the UK Climate Assembly by involving people in decision-making, providing trusted information on decarbonisation choices and the need to reduce emissions and adapt to climate change. The strategy should also identify preferred policy options to empower people to contribute fully towards the path to Net Zero.	2021-22 Priority recommendation
	Support <b>local government</b> (with MHCLG) to play a full role in the Net Zero transition, including through increased resourcing, guidance, involvement in local area energy plans, statutory reporting on the emissions from their estate and reforming the planning framework to enable delivery of low-carbon and climate-resilient measures.  This is likely to require additional funding for staffing and resources for local delivery plans, alongside a 'duty to collaborate' to encourage authorities to work with local, regional and national partners to deliver their climate ambitions.	2021-23  (funding for local authorities at next Budget) Priority recommendation
	Cabinet Office should ensure that <b>adaptation</b> is integrated into major upcoming policies in the next two years related to the priority CCRA3 risk for which it has lead responsibility, coordinating work with other relevant departments as necessary:  <ul style="list-style-type: none"> <li>Multiple risks to the UK from climate change impacts overseas</li> </ul> In addition, for the coming five-year period (2023-2028), Cabinet Office should outline appropriate actions in the next <b>National Adaptation Programme</b> to address the adaptation gap identified for the other risks and opportunities in the CCRA3 for which it is the lead department (see Adaptation Report Annex).	By 2023  Priority recommendation
	Review <b>guidance documents</b> used in policy and business case development (e.g. the Green Book) and ensure these are consistent with the requirements of Net Zero and account for the impacts of climate change.	2022
	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing
	Cabinet Office should build a strong <b>climate resilience capability</b> for the UK, including making use of storyline or 'what-if' scenarios to assess risks, in addition to or instead of using 'reasonable worst-case' approaches. It should develop an early warning system for global climate shocks. It should consider how more allowance and flexibility can be built into policy making and policy implementation. This could include enhancing the ability of the Government to make fast decisions by bringing in technical advice and expertise quickly when needed, and both protecting, and enhancing, monitoring and surveillance systems to enable faster reactions as events unfold.	By 2023
	Develop and implement fully-funded plans towards making all <b>public buildings and vehicle fleets</b> zero-carbon in the long term. This must include a move to multi-year programmatic funding to deliver the stated ambitions of switching to ultra-low emission vehicles by 2030 and to halve emissions from public buildings by 2032, supported by cross-government strategy (including an ambitious new set of Greening the Government commitments) and capital funding levels in the order of £1 billion/year for buildings.	2021-22
	As the public sector, lead the shift to other positive behaviours that <b>reduce travel demand</b> , for example encouraging home-working.	2021
International (With BEIS and the COP Unit)	Work towards securing more <b>climate finance commitments</b> from developed countries to get back on track for mobilising \$100 billion a year in climate finance as soon as possible.	2021
	Work to bring forward additional <b>emissions reduction ambition</b> from countries that haven't yet strengthened commitments ahead of COP26.	H2 2021
	Place aligning <b>global COVID-19 recovery plans</b> with the goals of the Paris Agreement as a core goal of the UK's G7 and COP26 presidencies.	2021-22
	Ensure that any outcome on <b>international carbon markets</b> at COP26 has high integrity and genuinely supports global ambition to tackle climate change.	H2 2021
	Develop the option of applying either <b>border carbon tariffs or minimum standards to imports</b> of selected embedded-emission-intense industrial and agricultural products and fuels. This should include initiating development of carbon intensity measurement standards and fostering international consensus around trade policies through the G7 and COP presidencies.	2021 Priority recommendation

<b>Table A2</b> Recommendations for the COP Unit, the Foreign, Commonwealth and Development Office (FCDO) and the Department for International Trade (DIT)		Timing
Cross-cutting	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing
Action in the run-up to COP26	Work towards securing more <b>climate finance commitments</b> from developed countries to get back on track for mobilising \$100 billion a year in climate finance as soon as possible.	2021 (COP26)
	Work to bring forward additional <b>emissions reduction ambition</b> from countries that haven't yet strengthened commitments ahead of COP26.	H2 2021
	Provide a clear commitment prior to COP26 regarding the timescale by which the <b>UK's official development assistance (ODA) contribution</b> will return to 0.7% of GNI given the UK's commitment to align its ODA spend with Paris Agreement requirements and the need for increased finance to achieve the Paris Agreement.	H2 2021
	Place aligning <b>global COVID-19 recovery</b> plans with the goals of the Paris Agreement as a core goal of the UK's G7 and COP26 presidencies.	2021-22
	Ensure that any outcome on <b>international carbon markets</b> at COP26 has high integrity and genuinely supports global ambition to tackle climate change.	H2 2021
	Develop the option of applying either <b>border carbon tariffs or minimum standards to imports</b> of selected embedded-emission-intense industrial and agricultural products and fuels. This should include initiating development of carbon intensity measurement standards and fostering international consensus around trade policies through the G7 and COP presidencies.	2021 Priority recommendation
Ongoing climate action	For the coming five-year period (2023-2028), FCDO should outline appropriate actions in the next <b>National Adaptation Programme</b> to address the adaptation gap identified for the risks in the CCRA for which it is the lead department (see Adaptation Report Annex).	2023 Priority recommendation
	Publish a new strategy for the UK's <b>international climate policy</b> for after COP26 - ensuring that the initiatives for the COP26 presidency have long-term benefits for global emissions over the coming decade and supports the implementation of policies to deliver on strengthened national targets.	H1 2022
	For the coming five-year period (2023-2028), DIT should outline appropriate actions in the next <b>National Adaptation Programme</b> to address the adaptation gap identified for the risks and opportunities in the CCRA3 for which it is the lead department (see Adaptation Report Annex).	2023
	DIT should use trade policy to <b>encourage increased ambition</b> on both climate change mitigation and adaptation in other countries, including considering the role for border carbon adjustments and standards to <b>prevent carbon leakage</b> .	Spring 2022

Table A3 Recommendations for the HM Treasury (HMT)		Timing
	Complete the overdue <b>Net Zero Review</b> , which should: <ul style="list-style-type: none"> <li>Develop a plan for funding decarbonisation fairly, reviewing the distribution of costs for businesses, households and the Exchequer.</li> <li>Set approach to near-term and long-term decarbonisation funding needs.</li> <li>Consider policy implications for a just transition.</li> </ul>	2021 Priority recommendation
	The <b>spending review(s)</b> should ensure departments are fully equipped to deliver the necessary actions across climate change mitigation and adaptation, during the rest of this Parliament and beyond.	2021 Priority recommendation
	For the coming five-year period (2023-2028), outline appropriate actions in the next <b>National Adaptation Programme</b> to address the adaptation gap identified for the risks in the CCRA for which it is the lead department (see Adaptation Report Annex).	2023 Priority recommendation
	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing
Funding	Increase resources for <b>local government</b> to play a full role in the Net Zero transition.	2021-23 (funding for LAs at next budget) Priority recommendation
	Fund plans towards making all <b>public buildings and vehicle fleets</b> zero-carbon in the long term. This must include a move to multi-year programmatic funding to deliver the stated ambitions of switching to ultra-low emission vehicles by 2030 and halving emissions from public buildings by 2032, supported by cross-government strategy (including an updated set of Greening the Government commitments) and capital funding levels in the order of £1 billion/year for buildings.	2021-22
	Provide a clear commitment prior to COP26 regarding the timescale by which the <b>UK's official development assistance (ODA) contribution</b> will return to 0.7% of GNI given the UK's commitment to align its ODA spend with Paris Agreement requirements and the need for increased finance to achieve the Paris Agreement.	H2 2021
	Establish mechanisms (with BEIS) to close the substantial funding gap for <b>heat networks</b> , with a multi-year funding programme needed of sufficient scale to deliver the growth in network deployment, and transition to low-carbon heat sources.	2022
Taxation, carbon and energy pricing	Work with BEIS on the <b>Heat and Buildings Strategy</b> : to ensure that relative prices favour a shift to low-carbon technologies, consulting widely including with the Committee on Fuel Poverty; to ensure that sufficient funding is available; and to consider the role of tax incentives (e.g. Stamp Duty differentials). Work with MHCLG and the new buildings safety regulator to ensure that local authorities are properly funded to enforce buildings standards.	2021 Priority recommendation
	Consult on <b>reforms to electricity pricing</b> to remove disincentives to electrification, based on consideration of the strategic and fair allocation of legacy policy costs associated with the past deployment of less-mature low-carbon electricity generation. Also consider the balance of existing taxes, such as the Climate Change Levy, on different energy sources. These reforms in combination with wider sectoral incentives, standards and carbon pricing should remove price barriers to electrification.	H1 2022
	Consult (with BEIS) on the introduction of a <b>carbon tax</b> (either as part of the UK ETS or a separate instrument) aimed at curbing rising emissions from Energy from Waste.	2022
	Reform <b>Vehicle Excise Duty</b> , with larger differentials across all vehicle types, to provide stronger incentives to purchase zero-emission vehicles and reverse the shift towards cars that have higher lifecycle emissions. The reforms should consider the impact and design of second and subsequent year rates, to ensure they encourage the purchase of zero-emission vehicles in the second-hand market.	H1 2022
	<b>Aviation tax reform</b> should seek to address price imbalances between aviation and surface transport, encouraging the low-carbon alternative (e.g. rail) for journeys where one exists. Taxation should also be used, alongside improvements in broadband, to embed positive behaviours that have arisen during the pandemic (e.g. replacing business travel with videoconferencing and online collaboration).	2021-22
	Create a clear incentive for manufacturing facilities not currently covered by the UK ETS to switch to low-carbon energy sources by reforming the suite of energy and carbon policies, which could include rebalancing the <b>Climate Change Levy</b> rates for electricity and gas.	2023
	Set out a clear plan for ensuring that carbon prices and taxes on manufacturers, energy producers and aviation encourage emissions reductions in line with the CCC Pathway, planning for revised (and likely higher) carbon prices from 2023. This should include setting out a <b>cap for the UK ETS</b> consistent with a credible path to the Sixth Carbon Budget for consultation by Q3 2021.	2021
	Develop (with DIT) the option of applying either <b>border carbon tariffs or minimum standards to imports</b> of selected embedded-emission-intense industrial and agricultural products and fuels. This should include initiating development of carbon intensity measurement standards and fostering international consensus around trade policies through the G7 and COP presidencies.	2021 Priority recommendation

Table A3 Recommendations for the HM Treasury (HMT)		Timing
Green finance	Develop further ways to embed Net Zero and climate risk in <b>financial decisions</b> by UK firms, building on the UK's Green Finance Strategy. This should include implementing mandatory climate disclosure, adoption of a robust green taxonomy with clear guidance on how it should be used. It should also consider the recommendations of the Committee's Finance Advisory Group, such as making Net Zero and adaptation plans mandatory for financial institutions and monitoring financial flows into climate action.	2021-25
	In the <b>green gilt framework</b> , setting out the rules on what spending green sovereign bonds can be used for, ensure that revenue is used to fund expenditure that will genuinely contribute to Net Zero and improved climate resilience.	2021

Table A4 Recommendations for the Department for Business, Energy and Industrial Strategy (BEIS)		Timing
Cross-cutting	<p>Publish the overall <b>Net Zero Strategy</b>. It should:</p> <ul style="list-style-type: none"> <li>• Provide a comprehensive plan for achieving Net Zero, the 2030 NDC and the carbon budgets, setting out ambition for sectors and key technologies and behaviours that together will meet the challenge.</li> <li>• Set out the approach to the key cross-cutting challenges of fair funding, just transition, skills, public engagement, local delivery, governance.</li> <li>• Set timelines for how policies will start to deliver decarbonisation with the required urgency, and ensure that wider policy development is consistent with the UK's climate goals.</li> <li>• Ensure adaptation is properly integrated in the plan, maximising synergies and minimising trade-offs, while recognising the risks and impacts from climate change (see Adaptation Progress Report for more details).</li> <li>• Introduce processes for monitoring progress and mechanisms to course-correct over time.</li> </ul>	2021 Priority recommendation
	<p>Ensure that <b>adaptation is integrated</b> into major upcoming policies in the next two years related to the eight priority risks identified in the Committee's advice on the third UK Climate Change Risk Assessment (CCRA3) for which BEIS has lead responsibility, coordinating work with other relevant departments as necessary:</p> <ul style="list-style-type: none"> <li>• Risks to the supply of food, goods and vital services due to climate-related collapse of supply chains and distribution networks (with Defra and DIT).</li> <li>• Risks to people and the economy from climate-related failure of the power system.</li> </ul> <p>In addition, for the coming five-year period (2023-2028), BEIS should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the other risks and opportunities in the CCRA for which it is the lead department (see Adaptation Report Annex).</p>	By 2023 Priority recommendation
	<p>Develop a <b>public engagement</b> strategy for Net Zero which builds on the findings of the UK Climate Assembly by involving people in decision-making, providing trusted information on decarbonisation choices and the need to reduce emissions. The strategy should link to engagement on adaptation and identify preferred policy options to empower people to contribute fully towards the path to Net Zero.</p>	2021-22 Priority recommendation
	<p>Ensure <b>all departmental policy decisions</b>, and procurement decisions, are consistent with the Net Zero goal and reflect the latest understanding of climate risks.</p>	Now and ongoing
International	<p>Update the UK's long-term <b>low greenhouse gas emission development strategy with the UNFCCC</b> to reflect a formulated economy-wide plan to achieve Net Zero by 2050 (expected to be the Net Zero Strategy).</p>	H2 2021
	<p>Place aligning <b>global COVID-19 recovery plans</b> with the goals of the Paris Agreement as a core goal of the UK's G7 and COP26 presidencies.</p>	H2 2022
	<p>Publish a new strategy for the UK's <b>international climate policy for after COP26</b> - ensuring that the initiatives for the COP26 presidency have long-term benefits for global emissions over the coming decade and support the implementation of policies to deliver on strengthened national targets.</p>	H1 2022
Jobs and skills	<p>Working with DWP, DfE, the Home Office and MHCLG, develop a strategy for a <b>Net Zero workforce</b> that ensures a just transition for workers transitioning from high-carbon to low-carbon and climate-resilient jobs, integrates relevant skills into the UK's education framework and actively monitors the risks and opportunities arising from the transition. This strategy should include the development and roll-out of plans for training and skills, with buildings and manufacturing being priority areas.</p>	2021 Priority recommendation
	<p>Design industrial decarbonisation policies to <b>support and create jobs</b>, especially in regions with reliance on industrial jobs.</p>	Now and ongoing

Table A4 Recommendations for the Department for Business, Energy and Industrial Strategy (BEIS)		Timing
Supporting business action	<b>Support businesses</b> to play their full role in the Net Zero transition and in adapting to climate risks and opportunities, for example by extending and expanding the role of the Net Zero Business Champion beyond COP26, building on the Race to Zero and Race to Resilience campaigns and providing sufficient resources to fully support businesses of all sizes to engage in the transition, to input to policy development and to set their own robust Net Zero and adaptation action plans.	2021-22
	Develop further ways to embed Net Zero and climate risk in <b>financial decisions</b> by UK firms, building on the UK's Green Finance Strategy. This should include implementing mandatory climate disclosure, adoption of a robust green taxonomy with clear guidance on how it should be used. It should also consider the recommendations of the Committee's Finance Advisory Group, such as making Net Zero and adaptation plans mandatory for financial institutions and monitoring financial flows into climate action.	2021-25
	Determine appropriate regulatory arrangements, rules and guidance for the use of <b>carbon offsetting by UK corporates</b> within their Net Zero strategies, recognising the growing demand for offsetting markets, the interactions with the UK ETS and currently accredited schemes (i.e. the Woodland Carbon Code and the Peatland Code), and the need to avoid double-counting or negative outcomes for non-carbon objectives.	2021-22
Research and data	Drawing on the Energy Innovation Needs Assessments ensure <b>innovation funding</b> (e.g. through UKRI, Catapults, the Industrial Strategy Challenge Funding, BEIS Innovation Programme and the Net Zero Innovation Portfolio) drives forward an extensive research and innovation package for delivering a Net Zero, climate-resilient future.	Now and ongoing
	<b>Make monitoring and data analysis</b> of climate risks more accessible, alongside better digitisation of past records. Further efforts should be taken to make the evidence on climate risks more usable for decision makers through co-design of research programmes with end users, where the user drives the research question from the beginning of the process. A major gap is the lack of projections of impacts in 2°C and 4°C scenarios; this needs addressing as an urgent priority ahead of CCRA4.	2022
	Review plan for improving <b>data collection</b> and statistical reporting for the purposes of monitoring and informing the low-carbon transition, as part of the broader work the ONS are already undertaking to improve the collection of climate-related data.	2022
	Work with ONS to put in place plans to <b>collect and report data</b> annually on low-carbon heat networks, specifically the amount of heat delivered (split by DUKES consumption sector, i.e. Residential/Public/Commercial/Industry, and where possible, by source of heat supply). This should be part of a plan for improving data collection and statistical reporting for the purposes of monitoring and informing the low-carbon transition.	2022
	Improve the collection and reporting of <b>industrial decarbonisation data</b> to allow for progress to be monitored more effectively, particularly on energy and resource efficiency.	2022
	Set out a clear plan (with HMT) for ensuring that carbon prices and taxes on manufacturers, energy producers and aviation encourage emissions reductions in line with the CCC Pathway, planning for revised (and likely higher) carbon prices from 2023. This should include setting out a <b>cap for the UK ETS</b> consistent with a credible path to the Sixth Carbon Budget for consultation by Q3 2021.	2021
Energy / carbon pricing and emissions trading	Consult (with HMT) on <b>reforms to electricity pricing</b> to remove disincentives to electrification, based on consideration of the strategic and fair allocation of legacy policy costs associated with the past deployment of less-mature low-carbon electricity generation. It should also consider the balance of existing taxes, such as the Climate Change Levy, on different energy sources. These reforms in combination with wider sectoral incentives, standards and carbon pricing should remove price barriers to electrification.	H1 2022
	Consult (with HMT) on the introduction of a <b>carbon tax</b> (either as part of the UK ETS or a separate instrument) aimed at curbing rising emissions from Energy from Waste.	2022
	Commit (with DfT) not to use credits from the <b>Carbon Offsetting and Reduction Scheme for International Aviation</b> (CORSIA) for flights covered by the UK ETS unless and until they can satisfy strict eligibility criteria (equivalence, additionality, permanence, sustainability).	2021-22
	Develop (with DfT) the option of applying either <b>border carbon tariffs</b> or <b>minimum standards to imports</b> of selected embedded-emission-intense industrial and agricultural products and fuels. This should include initiating development of carbon intensity measurement standards and fostering international consensus around trade policies through the G7 and COP presidencies.	2021 Priority recommendation

Table A4 Recommendations for the Department for Business, Energy and Industrial Strategy (BEIS)		Timing
Buildings	Produce a robust, equitable and ambitious <b>heat strategy</b> to eliminate emissions from buildings through a clear direction for the next 30 years. This must include: <ul style="list-style-type: none"> <li>Standards covering all segments of the building stock, with support for consumers through the transition.</li> <li>Plans to rebalance policy costs - in consultation with the Committee on Fuel Poverty and wider stakeholders - while making low-carbon solutions more financially attractive.</li> <li>Plans to introduce Green Building Passports.</li> <li>Formalisation of a governance framework to drive decisions on heat infrastructure including a role for area-based energy plans and zoning of heat networks.</li> </ul>	2021 Priority recommendation
	Provide a stable long-term policy framework to support sustained <b>energy efficiency and heat pump</b> growth at sufficient scale (i.e. 600,000 heat pumps per year in existing homes by 2028). This must include a replacement for the Green Homes Grant voucher scheme which works, backed by standards and support for non-residential heat pump installations. Create a level-playing field for hybrid heat pumps off the gas grid and ensure hybrid heat pumps are an integral part of PAS2035 retrofit coordinator advice.	2021 Priority recommendation
	Establish mechanisms to close the substantial funding gap for <b>heat networks</b> , with a multi-year funding programme of sufficient scale to deliver the growth in network deployment, and transition to low-carbon heat sources, needed. Finalise policy on the future market framework for heat networks, including requiring new district heat schemes to utilise low-carbon sources from 2025 at the latest and setting regulations for the conversion of legacy fossil fuel schemes to low-carbon sources.	2022
	Publish proposals for standards to phase out the installation of <b>new liquid and solid fossil fuel heating</b> by 2028 at the latest. Send clear signals on the phase-out of gas heating, including the roles for area-based planning and standards in phasing out gas installations (as in Scotland).	2021
	Move to <b>multi-year programmatic funding</b> to deliver the stated ambition of halving emissions from public buildings by 2032. This must be supported with cross-government strategy (either independent or integrated with the Net Zero or Buildings Strategies) and funding levels in the order of £1 billion/year. Support mechanisms must be designed so that smaller public bodies can access them.	2022
	Set requirements for all <b>new gas boilers to be hydrogen-ready</b> by 2025 at the latest, while ensuring that all new boilers outperform current and expected future air quality standards.	2021
	Implement improvements to the <b>Energy Performance Certificate (EPC) and Standard Assessment Procedure (SAP)</b> framework, including: <ul style="list-style-type: none"> <li>Ensuring EPCs drive deployment of the necessary energy efficiency measures and do so on a holistic basis to address overheating, ventilation, and moisture-risk.</li> <li>Supporting delivery objectives across both energy efficiency and low-carbon heat, and valuing properly the benefits of low-carbon and flexible technologies.</li> <li>Formally integrating a forward trajectory for declining grid carbon-intensity, in line with Government projections.</li> <li>Addressing wider issues of quality/robustness, with a commitment to integrate in-use performance metrics from 2023.</li> <li>Plans for the future role of Green Building Passports.</li> </ul>	2022
	Improve understanding of and support action on <b>overheating in existing residential buildings</b> and encourage retrofit of passive cooling measures. The Heat and Building Strategy must consider overheating risks. The following steps are needed: <ul style="list-style-type: none"> <li>Further research to understand when overheating occurs in existing homes, including ongoing monitoring of temperatures in the housing stock, monitoring of overheating exceedances in homes, and the number of homes currently adapted.</li> <li>Guidance and information for homeowners with the steps that can be taken if their homes overheat. This should include an outline of behavioural options and the measures that can be installed to reduce internal temperatures. Green Building Passports and home retrofit plans could provide holistic guidance and help to unlock green finance.</li> <li>Overheating risk considered and mitigated against if necessary when doing energy efficiency retrofit programmes.</li> <li>Making finance available to install adaptation measures. This could be via grant schemes or green finance for private owners, with public funding targeted at low-income or vulnerable households alongside energy efficiency retrofit.</li> </ul>	2022
	Bring forward the date to reach EPC C in <b>social homes</b> to 2028, in line with the Private Rented Sector (PRS) proposals and finalise the delivery mechanism. Implement ambitious <b>PRS standards</b> for homes which drive fabric efficiency, while valuing deployment of cost-effective low-carbon heat alongside this. Implement the EPC B target for <b>PRS non-domestic buildings</b> in line with new proposals. Consult on options to cover the regulatory policy gap for <b>owner-occupied homes</b> .	2021

Table A4 Recommendations for the Department for Business, Energy and Industrial Strategy (BEIS)		Timing
Power	Publish a plan for reaching an emissions intensity of 50 gCO <sub>2</sub> /kWh by 2030, with a total of around 350 TWh of low-carbon generation. Set out a schedule for regular auctions to procure <b>low-carbon generation</b> , with a clear pathway of volumes to be procured and robust contingency for uncertainties in demand and delivery. Address potential barriers to deploying and using low-carbon generation at scale (e.g. the planning and consenting regime for renewables and networks, exposure to climate risks) and, with Ofgem, develop a framework under which sufficient supply resilience can be ensured.	2022 Priority recommendation
	Commit to phasing out <b>unabated gas generation</b> by 2035, subject to ensuring security of supply.	2021 Priority recommendation
	Publish a comprehensive long-term strategy for <b>unabated gas phase-out</b> , including ensuring new gas plant are properly CCS- and/or hydrogen-ready as soon as possible and by 2025 at the latest.	By Spring 2022 Priority recommendation
	Develop a strategy as soon as possible on <b>market design</b> for the medium to long term for a fully decarbonised, resilient electricity system in the 2030s and onwards.	2023
	Develop mechanisms for strategic investment in coordination with Ofgem to ensure that <b>electricity networks</b> can accommodate increased future demand levels, including large localised demand increases associated with electrification in manufacturing, transport and buildings, and that lack of network capacity does not cause delays in emissions reduction.	2023
	Develop a strategy to coordinate the development of <b>interconnectors</b> , connections for offshore wind farms and the enhancement of inter-area transfer capacity for the onshore network, ensuring cost-effective, timely delivery, bringing forward any legislation necessary to enable it.	H1 2022
	Work in partnership with Ofgem to publish and implement a new <b>Smart System Plan and Energy Data and Digitalisation Strategy</b> , including working with DCMS on cyber-security, in order to continue to unlock the full benefits of electricity system flexibility. Ensure that, alongside smart standards for heating, all electricity users have access to half-hourly metering and the option of tariffs that encourage flexibility in use of electric heat and electric vehicle charging.	2021
	Improve information sharing on climate risks to infrastructure interdependencies at a local level, especially for <b>electricity, digital and ICT networks</b> . As reported in our previous assessment in 2019, NAP actions to enhance arrangements for information sharing between local infrastructure operators and improve understanding of critical risks arising from interdependencies have not been completed. Defra's link with Local Resilience Forums is key, and BEIS and DCMS should engage with utility companies to encourage standardised benchmarking and data sharing on climate risks to electricity networks, digital & ICT.	Now and ongoing
Waste	Set out capacity and usage requirements for <b>Energy from Waste</b> consistent with plans to improve recycling and waste prevention. Issue guidance to align local authority waste contracts and planning policy to these targets.	2021 Priority recommendation
	Introduce the necessary planning guidance and policy to ensure any <b>new Energy from Waste</b> plants (including incineration, gasification & pyrolysis facilities) are built with carbon capture usage and storage (CCUS) or are 'CCUS-ready'.	Spring 2022 Priority recommendation
	Set out how <b>existing Energy from Waste</b> plants will be supported to be retrofitted with CCUS from late 2020s onwards, with 2050 a backstop date for full CCUS coverage.	2022

Table A4 Recommendations for the Department for Business, Energy and Industrial Strategy (BEIS)		Timing
Manufacturing and construction	Establish funding mechanism(s) to support operational and capital costs of both <b>electrification and hydrogen-use in manufacturing</b> , as soon as possible, with the aim of awarding funding in 2022. There must be mechanisms for both options, not only hydrogen, and the mechanism(s) should be designed to ensure that, in the medium term, hydrogen-use and electrification compete on a level playing field, to ensure the best value for consumers and taxpayers. Support for electrification may be combined with reforms to electricity pricing.	2022 Priority recommendation
	Continue to support <b>innovation</b> and demonstration of fuel switching and CCS technologies for decarbonising manufacturing and construction. Ensure that a full range of options is developed, filling previous gaps in support, such as encouraging electrification projects to come forward.	Spring 2022
	Set out which policies will deliver the pathway to 4 MtCO <sub>2</sub> e of <b>industrial energy efficiency</b> abatement set out in the Industrial Decarbonisation Strategy and quantify how much abatement will come from each policy: <ul style="list-style-type: none"> <li>Set out the future role of Climate Change Agreements (CCAs) and any required CCA reforms.</li> <li>Consult on mandating the use of Energy Management Systems and on Government support and incentives for implementing energy management standards.</li> <li>Set out the role of energy efficiency standards and audit programmes.</li> <li>Develop resources such as direct advice and training to address capacity and expertise gaps, and highlight available energy efficiency solutions, particularly for SMEs.</li> </ul>	Spring 2022
	Ensure the policy package for decarbonising manufacturing addresses manufacturers' low appetite for investments with long <b>payback times</b> , either using grants or favourable loans, particularly for energy efficiency.	2022
	Work with the minerals industries to develop a detailed joint plan for <b>CO<sub>2</sub> transport from dispersed sites</b> .	Spring 2022
	Commit to <b>targets</b> for ore-based steelmaking and cement production in the UK to reach near-zero emissions by 2035 and 2040, respectively.	2021
	Deliver industrial <b>carbon capture contracts (ICC)</b> to enable final investment decisions on the first ICC projects by mid-2022.	H1 2022
	Deliver the proposed <b>CCS transport and storage</b> regulatory investment model to enable final investment decisions by mid-2022 that are consistent with establishing at least two CCS transport and storage clusters in the mid-2020s.	H1 2022
	Create a clear incentive for <b>manufacturing facilities not currently covered by the UK ETS</b> to switch to low-carbon energy sources by reforming the suite of energy and carbon policies, which could include rebalancing the Climate Change Levy rates for electricity and gas.	2023
	Set out a strategy for decarbonisation of <b>off-road mobile machinery</b> and work with industry to identify potential policies to increase uptake of low-carbon off-road mobile machinery. This will require work across BEIS, MHCLG, DfT and Defra.	2021

Table A4 Recommendations for the Department for Business, Energy and Industrial Strategy (BEIS)		Timing
Resource efficiency in manufacturing and construction	<p>Step up efforts (with Defra) to deliver the <b>waste prevention and resource efficiency</b> improvements required as part of the pathway to Net Zero, including by:</p> <ul style="list-style-type: none"> <li>Accelerating delivery of the Waste Prevention Programme so that key policies, such as Extended Producer Responsibility and new product standards, are on track to be in place well before 2025.</li> <li>Setting out how levels of resource efficiency improvements identified within the Industrial Decarbonisation Strategy will be delivered.</li> <li>Beginning to develop and implement any additional policies needed to deliver these resource efficiency improvements, by the end of 2022.</li> <li>Ensure cross-departmental working, potentially through new cross-Whitehall governance focused on resource efficiency.</li> </ul>	<p>Spring 2022 <b>Priority recommendation</b></p> <p>(end 2022 for additional policies)</p>
	<p>Develop policies (with MHCLG, Defra and DfT) to drive more <b>resource-efficient construction</b> and use of existing low-carbon materials, including a substantial increase in the use of <b>wood in construction</b>. Policies should include:</p> <ul style="list-style-type: none"> <li>Reviewing and clarifying the position of structural timber in the ban on combustible materials, underpinned by further research and testing where necessary, and ensuring there are no barriers to the safe use of timber in buildings. The buildings safety regulator to play a role in overseeing this on an ongoing basis.</li> <li>The development of a fully-funded policy roadmap on the use of timber, including policies to support the development of UK wood supply chains.</li> <li>Finalising the reporting methodology for whole-life carbon standards.</li> <li>Setting out a plan for phasing in mandatory whole-life reporting followed by minimum whole-life standards for all buildings, roads and infrastructure by 2025, with differentiated targets by function, scale, and public/private construction.</li> </ul>	Spring 2022
	<p>Consult on detailed proposals (with Defra) for <b>product standards and extended producer responsibility</b> to improve the resource efficiency of consumer goods' lifecycles. The proposals should include all consumer goods with high environmental impact and cover how products are made, through indicators such as the level of recycled content and critical material content, and the reparability, durability and upgradability of a product.</p>	Spring 2022
	<p>Work with business to encourage and <b>enable consumers to share</b>, lease and use products for longer while discouraging 'disposable' business models.</p>	Spring 2022
Transport	<p>Continue to support (with DfT and Ofgem) widespread deployment of <b>EV charging infrastructure</b>:</p> <ul style="list-style-type: none"> <li>This should ensure it can support high EV uptake levels. Project Rapid has the right ambition for the strategic road network and should be developed into a full strategy for the 2020s and beyond.</li> <li>Further investment is needed to support on-street and other urban charging solutions for those without off-street parking and destination charging.</li> <li>Government should aim for there to be around 150,000 public charge points operating by 2025. These should be widely available across all regions of the UK.</li> <li>Implement the recommendations of the EV Energy Taskforce, in particular improving the consumer charging experience and making smart-charging accessible, appealing and cost-effective for as many EV users as possible.</li> </ul>	Now and ongoing <b>Priority recommendation</b>
	<p>Produce a clear assessment (with DfT) of how best to re-use and <b>recycle EV batteries</b> and fund development of competitive, large-scale battery recycling facilities in the UK.</p>	2021-22
	<p>Continue innovation and demonstration support (with DfT) for <b>zero-carbon fuel technologies</b> and their use in shipping, and ship efficiency measures. Develop incentives for zero-carbon ammonia and hydrogen supply chains.</p>	Early 2020s

Table A4 Recommendations for the Department for Business, Energy and Industrial Strategy (BEIS)		Timing
Greenhouse gas removals (GGRs)	The overall Net Zero Strategy should place <b>GGRs in context</b> of a wider strategic approach to reaching Net Zero, setting out a plan for development and deployment of removals, but also for actions elsewhere to limit the need for them.	2021 Priority recommendation
	Building on the Greenhouse Gas Removals (GGR) call for evidence, launch consultation on Government's preferred <b>GGR strategy</b> and long-term expected requirement for GHG removals, including a proposed market design, a set of governance principles and proposals that recognise the need for a long-term price signal.	H1 2022 Priority recommendation
	Support the <b>demonstration of engineered GGR</b> at scale in the 2020s, either through amending existing policies or introducing new support mechanisms.	2022 Priority recommendation
	Build on the recently commenced <b>innovation programmes</b> , the Direct Air Capture and other Greenhouse Gas Removals Competition and UK Greenhouse Gas Removal Demonstration Programme, to support both the demonstration and commercialisation of more advanced greenhouse gas removal technologies (taking these from technology readiness level 5 to 8), and alongside undertake research and development into less advanced removal approaches including through pilots and field experiments.	Now and ongoing
	Ensure that a <b>public engagement strategy</b> for Net Zero includes national, regional, and local communities to improve the public's understanding of GGR approaches and both the local and system-wide implications of different options - awareness is currently very low, and support is mixed or uncertain.	2021-22
	Align with adaptation policies to ensure long-term <b>resilience and effectiveness of GGRs</b> in the face of climate impacts and exploit potential for co-benefits (e.g. choice of tree species, protecting new infrastructure from flood risks).	Before 2025
Fuel supply	Develop a <b>Hydrogen Strategy</b> out to 2035 that determines plans and sets out pathways to appropriate hydrogen use across power, industry, transport, and buildings; low-carbon hydrogen production options; and the associated infrastructure. Ensure that large-scale hydrogen trials begin in the early 2020s.	2021 Priority recommendation
	Deliver a <b>Biomass Strategy</b> that is aligned to the UK's path to Net Zero, and which reflects recommendations on governance, monitoring and best-use from the Committee's 2018 Biomass report and 2020 Land Use report. The UK should also continue to take a global lead on further developing and improving UK and international biomass governance and sustainability criteria.	2022 Priority recommendation
	Set new requirements for CCS-readiness at <b>biofuel conversion facilities</b> of all scales. This should include dates beyond which new facilities should be built with CCS, and dates for when CCS will need to be retrofitted to biofuel facilities already in operation.	2022
	Set out policies to reduce <b>upstream emissions from oil and gas</b> production by 68% by 2030, relative to 2018 levels: <ul style="list-style-type: none"> <li>Develop policies to reduce emissions from existing oil and gas platforms, including developing carbon-intensity measurement standards for gas and oil.</li> <li>Set a requirement for new plans for offshore oil and gas platforms and associated installations to use low-carbon energy for their operations, aligning to zero direct emissions from operational energy use by 2027.</li> <li>Make plans to ensure flaring and venting is only permitted for safety reasons from 2025.</li> </ul>	2021
	Work with Ofgem to make explicit how current and future policies will reduce emissions associated with <b>methane leakage</b> from the gas networks in a way that is consistent with the Sixth Carbon Budget.	2021
	Formalise the process, governance framework and timeline for decisions on the <b>conversion to hydrogen</b> of appropriate parts of the gas pipeline networks. This should include starting a programme of research with Ofgem to identify areas which are unlikely to be suitable (such that electrification and alternatives can be prioritised), alongside priority candidate areas for hydrogen.	2021

Table A5 Recommendations for the Department for Environment, Food and Rural Affairs (Defra)		Timing
Cross-cutting	<p>The next <b>National Adaptation Programme</b>, due in 2023, should ramp up adaptation ambition, implementation and evaluation. It should:</p> <ul style="list-style-type: none"> <li>• Set out the Government's vision for a well-adapted UK, alongside the measurable outcomes that the Government is aiming to achieve by the end of the next NAP period (2023 – 2028).</li> <li>• Include a detailed monitoring and evaluation framework, including which indicators will be used to monitor progress in reducing risk and showing the effectiveness of different adaptation responses for each risk in CCRA3.</li> <li>• Report how departments have addressed the top eight priority risks set out in the CCRA3 Advice Report for urgent action between 2021 and 2023.</li> <li>• Set out how adaptation is being integrated into policy, and the measurable actions by department for adaptation across each of the 61 risks and opportunities set out in the CCRA3 Technical for the period 2023-2028.</li> <li>• Ensure the adaptation actions and the programme as a whole are framed around the principles for good adaptation outlined in the CCRA3 Advice Report: <ul style="list-style-type: none"> <li>– Adapt to 2°C warming, assess the risks for 4°C</li> <li>– Prepare for unpredictable extremes</li> <li>– Assess interdependencies</li> <li>– Understand threshold effects</li> <li>– Integrate adaptation into relevant policies</li> <li>– Ensure adaptation is sufficiently financed</li> <li>– Avoid lock-in</li> <li>– Address inequalities</li> <li>– Consider opportunities from climate change</li> </ul> </li> <li>• Specific actions to manage international climate risks should be included, setting out the direct response to the risks identified in CCRA3.</li> </ul>	2023 onwards Priority recommendation
	<p>Ensure that <b>adaptation is integrated</b> into major upcoming policies in the next two years related to the priority CCRA3 risks for which Defra has lead responsibility, coordinating work with other relevant departments as necessary:</p> <ul style="list-style-type: none"> <li>• Risks to the viability and diversity of terrestrial and freshwater habitats and species from multiple hazards.</li> <li>• Risks to soil health from increased flooding and drought.</li> <li>• Risks to natural carbon stores and sequestration (trees, soils and wetlands) from multiple hazards.</li> <li>• Risks to crops, livestock, and commercial trees from multiple hazards.</li> </ul> <p>In addition, for the coming five-year period (2023-2028), Defra should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the other risks and opportunities in the CCRA for which it is the lead department (see Adaptation Report Annex).</p>	By 2023 Priority recommendation
	<p>Implement a <b>public engagement programme about national adaptation objectives</b>, acceptable levels of risk, desired resilience standards, how to address inequalities, and responsibilities across society. The findings from the programme should feed into the vision and desired outcomes of the next National Adaptation Programme.</p>	2021 Priority recommendation
	<p>Implement measures to address <b>non-financial barriers to tackling emissions from land use and agriculture</b>, including awareness and improving skills in sustainable forestry and peatland management; scaling up supply chains; streamlining application processes and addressing contractual and tax issues where they are acting as barriers. Delivery plans should also set out measures to:</p> <ul style="list-style-type: none"> <li>• Improve knowledge exchange of low-carbon farming practices to provide confidence to farmers to take up measures to reduce on-farm GHGs.</li> <li>• Improve the science and evidence base for woodlands and peatlands, to deliver GHG reductions and multiple other benefits, ensure the right tree is planted in the right place and that they are resilient to future climate impacts.</li> </ul>	2021-25 Priority recommendation

Table A5 Recommendations for the Department for Environment, Food and Rural Affairs (Defra)		Timing
Cross-cutting	Legislate the <b>Environment Bill</b> this year, using it to strengthen commitments on waste, resource efficiency, agriculture and land-use.	2021
	Develop (with DIT) the option of applying either <b>border carbon tariffs or minimum standards to imports</b> of selected embedded-emission-intense industrial and agricultural products and fuels. This should include initiating development of carbon intensity measurement standards and fostering international consensus around trade policies through the G7 and COP presidencies.	2021 Priority recommendation
	Ensure <b>all departmental policy decisions</b> , and procurement decisions, are consistent with the Net Zero goal and reflect the latest understanding of climate risks.	Now and ongoing
Research and data	Fund a programme of work to design and populate the appropriate new <b>priority adaptation indicators</b> for England. These should complement other environmental and social indicators collated by Government. The CCC could be tasked to coordinate this activity in partnership with other relevant organisations such as the Office for Environmental Protection and Environment Agency.	2021
	Continue to monitor <b>consumption emissions</b> . These are important to ensure that action to decarbonise UK-based activities does not result in emissions moving offshore, and to track progress in decarbonisation of imports to the UK, which in turn can inform future policy (e.g. border carbon adjustments).	Now and ongoing
	Improve the collection and reporting of <b>industrial decarbonisation data</b> to allow for progress to be monitored more effectively, particularly on energy and resource efficiency.	2022
Nature and land use	Extend current ambition set out by the UK government and the devolved administrations to implement a comprehensive delivery mechanism to address <b>degraded peatland</b> : <ul style="list-style-type: none"> <li>17% of upland peat is restored, equivalent to 200,000 hectares (and where this is not possible, stabilise the peat) by 2025; 58% by 2035 (700,000 hectares) and the remaining area by 2045.</li> <li>Rewet and sustainably manage 12% of lowland peat used for crops by 2025 (24,000 hectares), rising to 38% by 2035 (72,000 hectares).</li> <li>Rewet 8% of lowland grassland area by 2025 (18,000 hectares), rising to 25% by 2035 (54,000 hectares).</li> <li>Remove all low-productive trees (i.e. less than YC8) from peatland (equivalent to 16,000 hectares by 2025), and restore all peat extraction sites by 2035 (equivalent to 50,000 hectares by 2025).</li> </ul>	2021-25 Priority recommendation
	Extend current ambition set out by the UK government and the devolved administrations to implement a comprehensive <b>delivery mechanism for new woodland</b> to create at least 30,000 hectares per year across the UK by 2025 (in line with the Government's commitment) and an average of 40,000 hectares per year in the 2030s.	2021-25 Priority recommendation
	Introduce legislation to: <ul style="list-style-type: none"> <li>Extend the <b>ban on rotational burning of peat</b> from certain protected upland bog sites to all peatland before the start of the burn season in 2021</li> <li>End peat extraction, and ban its sale for all horticultural uses including in the professional sectors and apply this to imports by 2023.</li> <li>Mandate water companies to restore peatland under their ownership.</li> <li>Ensure lowland peat soils are not left bare.</li> </ul>	2021-23 Priority recommendation
	Publish an overarching strategy that clearly outlines the relationships and <b>interactions between the multiple action plans</b> in development for the natural environment, including those for peat, trees, nature and plant biosecurity. This must clearly outline how the different strategies will combine to support the Government's climate change goals on both Net Zero and adaptation, along with the wider environment and other goals.	2021
	Make <b>long-term targets for biodiversity</b> , set out under the Environment Bill, and associated timeframes outcome-based and linked directly to the goals set out in the Government's 25-Year Environment Plan.	H1 2022
	Make <b>interim targets for biodiversity</b> statutory and link them clearly to the long-term targets set out in the Environment Bill.	H1 2022
	The commitment in the 25 Year Environment Plan to achieve 75% <b>restoration for terrestrial and freshwater</b> protected sites should be extended to include all priority habitat sites.	2021
	Set out a clear mechanism to account for the consequences of <b>higher water temperatures and low flows</b> (including drying up) in water bodies for freshwater habitats and species, and for meeting the Water Framework Directive (WFD) targets. This is lacking in current plans to revise the River Basin Management Plans (RBMPs).	H1 2022
	Extend the statutory requirements of <b>marine plan policies</b> to the decisions of public and private organisations. At present only public authorities are duty bound under law to apply the plan policies to their decisions meaning there is a significant gap in the protections they are designed to provide.	Now

Table A5 Recommendations for the Department for Environment, Food and Rural Affairs (Defra)		Timing
Agriculture and food	<p>Provide <b>incentives and address non-financial barriers</b> across all of the UK to:</p> <ul style="list-style-type: none"> <li>Plant <b>trees</b> on 2% of farmland by 2025 while maintaining their primary use, rising to 5% by 2035.</li> <li>Extend <b>hedgerows</b> by 20% by 2035 and better manage existing hedgerows.</li> <li>Increase the area growing <b>energy crops</b> across the UK to 6,000 hectares per year by 2025, and 30,000 hectares per year by 2035.</li> </ul>	2021-25 Priority recommendation
	<p>Implement measures to encourage consumers to <b>shift diets and reduce food waste</b> across the supply chain, including:</p> <ul style="list-style-type: none"> <li>Low-cost, low-regret actions to encourage a 20% shift away from all meat by 2030, rising to 35% by 2050, and a 20% shift from dairy products by 2030. Develop an evidence-based strategy to establish options for successful behaviour shifts and demonstrate public sector leadership.</li> <li>Policy to reduce food waste by 50% by 2030 and 60% by 2050, with the public sector taking a lead through measures such as target setting and effective product labelling.</li> </ul>	Start now and review mid-2020s for diet change Priority recommendation
	<p>Introduce a strong <b>post-CAP regulatory baseline</b>, and adopt and retain existing EU rules that benefit GHG mitigation into UK legislation. These include low-cost, low-regret on-farm measures to reduce emissions; extending coverage of Nitrate Vulnerable Zones across all of the UK; including measures that reduce enteric methane emissions in the Clean Air Strategy, specifically under the proposal to extend environmental permitting to the dairy and intensive beef sectors; and mandating UK feed producers to incorporate methane inhibiting additives in compound feed and mineral supplements.</p>	2021-23
	<p>Set out measures to ensure the resilience of the <b>food supply chain</b>, including to the risks of extreme weather in England and internationally, as part of its white paper responding to the independent review of the National Food Strategy for England.</p>	2022
	<p>Introduce a comprehensive plan and incentives to deliver <b>emissions reduction across all UK farms</b> through:</p> <ul style="list-style-type: none"> <li>High take-up of low-carbon agricultural measures (60-75% by 2050) covering livestock (diets, breeding, and health), soils (cover crops and grass-legume mix) &amp; waste management (anaerobic digestion and slurry covers).</li> <li>Measures to incentivise the take-up of near-zero-emissions options for agricultural machinery and vehicles from the mid-2020s, and develop options where they are not currently available.</li> </ul>	2021-25
	<p>The landscape-level and on-farm measures set out above should:</p> <ul style="list-style-type: none"> <li><b>Leverage private and public finance</b> (e.g. a trading scheme or auctioned contracts). New and existing funding streams should continue during the transition period to this system to avoid a hiatus in deployment.</li> <li>Be accompanied by a strong <b>monitoring, reporting and verification</b> system that uses the latest monitoring tools and technologies to create a strong institutional framework to verify actions across the UK.</li> </ul>	2021-25
	<p>Set out a strategy for decarbonisation of <b>off-road mobile machinery</b> and work with industry to identify potential policies to increase uptake of low-carbon off-road mobile machinery. This will require work across BEIS, MHCLG, DfT and Defra.</p>	2021

Table A5 Recommendations for the Department for Environment, Food and Rural Affairs (Defra)		Timing
Waste	Introduce the necessary planning guidance and policy to ensure any new <b>Energy from Waste</b> plants (including incineration, gasification & pyrolysis facilities) are built with carbon capture usage and storage (CCUS) or are 'CCUS ready'.	Spring 2022 Priority recommendation
	Set out how existing <b>Energy from Waste</b> plants will be supported to be retrofitted with CCUS from late 2020s onwards, with 2050 a backstop date for full CCUS coverage.	2022 Priority recommendation
	Set out capacity and usage requirements for <b>Energy from Waste</b> consistent with plans to improve recycling and waste prevention. Issue guidance to align local authority waste contracts and planning policy to these targets.	2021 Priority recommendation
	Set out <b>funding arrangements for local authorities</b> to provide the recycling, composting and waste management services and infrastructure required to deliver at least the commitments in the Environment Bill, Waste Prevention Programme and Resources and Waste Strategy, by 2022.	2022-25
	Consult on the introduction of a <b>carbon tax</b> (either as part of the UK ETS or a separate instrument) aimed at curbing rising emissions from Energy from Waste.	2022
	Set a target for a 68% <b>recycling rate</b> by 2030 covering all wastes in England via the Environment Bill and announce new policies to meet this target. Northern Ireland to set a 70% target for 2030. Scotland and Wales to set new targets for 2030 that go beyond their 70% targets for 2025.	2021
	<b>Composting facilities</b> should be incentivised to install forced aeration as a method of reducing on-site emissions.	From 2022
	Mandatory <b>business food waste</b> reporting to be introduced by 2022, building on WRAP's existing voluntary scheme.	2022
	Legislate for (in England via the Environment Bill, and in Wales, Scotland, and Northern Ireland via new legislation) and implement a <b>ban on landfilling of the main biodegradable waste</b> streams from 2025 (both municipal and non-municipal). There must be sufficient recycling/composting/AD treatment capacity made available before the ban comes into force, so that significant increases in energy-from-waste are avoided.	2021
	Long-term plans should be announced for eventual <b>diversion of all wastes from landfill</b> (except for where no alternative treatment or disposal method exists) but with a date conditional on sufficient action on reduction, re-use and recycling, and installation of CCS at energy-from-waste plants, to avoid a surge in fossil emissions when the ban comes into force.	Mid-2020s
	Introduce policies and funding for increased <b>methane capture and oxidation at landfill sites</b> , to decrease fugitive landfill methane emissions significantly.	2022
Phase out <b>exports of waste</b> by 2030 at the latest, through improvements in waste prevention and domestic recycling and recovery, while strengthening tracking and enforcement to ensure that any exports intended for recycling are being treated appropriately.	2020s	
Greenhouse gas removals and offsets	Build on the recently commenced innovation programmes (with BEIS), the Direct Air Capture and other Greenhouse Gas Removals Competition and UK Greenhouse Gas Removal Demonstration Programme, to support both the <b>demonstration and commercialisation of more advanced greenhouse gas removal</b> technologies (taking these from technology readiness level 5 to 8), and alongside undertake research and development into less advanced removal approaches including through pilots and field experiments.	Now and ongoing
	Align with adaptation policies to ensure long-term <b>resilience and effectiveness of GGRs</b> in the face of climate impacts and exploit potential for co-benefits (e.g. choice of tree species, protecting new infrastructure from flood risks).	Before 2025
	Consider (with BEIS) the appropriate regulatory arrangements, rules and guidance for the use of <b>carbon offsetting by UK corporates</b> within their Net Zero strategies, recognising the growing demand for offsetting markets, the interactions with the UK ETS and currently accredited schemes (i.e. the Woodland Carbon Code and the Peatland Code), and the need to avoid double-counting or negative outcomes for non-carbon objectives.	2021-22

Table A5 Recommendations for the Department for Environment, Food and Rural Affairs (Defra)		Timing
Resource efficiency	<p>Step up efforts to deliver the <b>waste prevention and resource efficiency</b> improvements required as part of the pathway to Net Zero, including by:*</p> <ul style="list-style-type: none"> <li>Accelerating delivery of the Waste Prevention Programme so that key policies, such as Extended Producer Responsibility and new product standards, are on track to be in place well before 2025.</li> <li>Setting out how levels of resource efficiency improvements identified within the Industrial Decarbonisation Strategy will be delivered.</li> <li>Beginning to develop and implement any additional policies needed to deliver these resource efficiency improvements, by the end of 2022.</li> <li>Ensure cross-departmental working, potentially through new cross-Whitehall governance focused on resource efficiency.</li> </ul>	<p>Spring 2022 Priority recommendation</p> <p>(end 2022 for additional policies)</p>
	<p>Consult on detailed proposals for <b>product standards and extended producer responsibility</b> to improve the resource efficiency of consumer goods' lifecycles. The proposals should include all consumer goods with high environmental impact and cover how products are made, through indicators such as the level of recycled content and critical material content, and the reparability, durability and upgradability of a product.</p>	Spring 2022
	<p>Develop policies (with BEIS, MHCLG and DfT) to drive more <b>resource-efficient construction</b> and use of existing low-carbon materials, including a substantial increase in the use of <b>wood in construction</b>. Policies should include:</p> <ul style="list-style-type: none"> <li>Reviewing and clarifying the position of structural timber in the ban on combustible materials, underpinned by further research and testing where necessary, and ensuring there are no barriers to the safe use of timber in buildings. Buildings safety regulator to play a role in overseeing this on an ongoing basis.</li> <li>The development of a fully funded policy roadmap on the use of timber, including policies to support the development of UK wood supply chains.</li> <li>Finalising the reporting methodology for whole-life carbon standards.</li> <li>Setting out a plan for phasing in mandatory whole-life reporting followed by minimum whole-life standards for all buildings, roads and infrastructure by 2025, with differentiated targets by function, scale, and public/private construction.</li> </ul>	Spring 2022
	<p>Work with business to encourage and enable consumers to share, lease and use products for longer whilst <b>discouraging 'disposable' business models</b>.</p>	Spring 2022
Buildings and infrastructure	<p>Make changes ahead of the next round of reporting under the <b>Adaptation Reporting Power (ARP)</b>. When used effectively, the ARP can present updated risks and adaptation actions that allows for an assessment of preparedness of all infrastructure sectors and their interdependencies. In particular:</p> <ul style="list-style-type: none"> <li>The next round of reporting must be mandatory.</li> <li>The deadline for reporting must allow sufficient time for consideration of all the reports in the fourth UK Climate Change Risk Assessment, and the CCC's statutory assessment of progress on adaptation.</li> <li>The list of organisations reporting should be expanded to ensure comprehensive coverage of critical infrastructure and services, such as canals and food supply chains, as recommended by the ARP3 consultation.</li> </ul>	2023
	<p>Work with the Environment Agency to set out the measures being taken to improve the uptake of <b>property-level flood resilience (PFR)</b> following stakeholder responses to its PFR call for evidence and consultation. This should include improved data collection to monitor progress. Plans for the new national flood risk assessment and 2025 long-term investment scenarios must ensure that the evidence they provide can be used to identify the most effective locations for PFR, and smart targets for their installation with timescales.</p>	2022
	<p>Work with <b>Port Operators and the British Ports Association</b> to ensure the format of reporting under the Adaptation Reporting Power is appropriate for port operators and that the right operators are being asked to report, as well as to identify what further support could be offered to enable more comprehensive reporting on adaptation by the ports sector.</p>	2023
	<p>Improve information sharing on climate risks to infrastructure interdependencies at a local level, especially for <b>electricity, digital and ICT networks</b>. As reported in our previous assessment in 2019, NAP actions to enhance arrangements for information sharing between local infrastructure operators and improve understanding of critical risks arising from interdependencies have not been completed. Defra's link with Local Resilience Forums is key, and BEIS and DCMS should engage with utility companies to encourage standardised benchmarking and data sharing on climate risks to electricity networks, digital &amp; ICT.</p>	Now and ongoing

**Table A5**

Recommendations for the Department for Environment, Food and Rural Affairs (Defra)

Timing

Waste and  
wastewater

Work with the Environment Agency, Ofwat and other stakeholders to set out targets and supporting measures for **reducing water use by business**. This could be through ensuring that any water reduction targets linked to the Environment Bill include business as well as household water use, and responding to advice and recommendations from Defra's new Senior Water Demand Reduction Group.

2022

Commit innovation funding to development and demonstration of novel **wastewater treatment** process that achieve a step change improvement in direct process emissions.

2022

Outside of the municipal wastewater sector, incentivise **industrial wastewater plants** to reduce their process emissions.

From 2022

Table A6 Recommendations for the Department for Transport (DfT)		Timing
Cross-cutting	For the coming five-year period (2023–2028), DfT should outline appropriate actions in the next <b>National Adaptation Programme</b> to address the adaptation gap identified for the risks and opportunities in the CCRA for which it is the lead department (see Adaptation Report Annex).	2023 Priority recommendation
	Decisions on <b>investment in roads</b> should be contingent on analysis justifying how they contribute to the UK's pathway to Net Zero. This analysis should demonstrate that the proposals would not lead to increases in overall emissions. Wherever possible, investment in roads should be accompanied by proportionate investment in EV charging infrastructure and in active travel and public transport.	2021-22
	Develop policies (with BEIS, Defra and MHCLG) to drive more <b>resource-efficient construction</b> and use of existing low-carbon materials. DfT's focus should be on: <ul style="list-style-type: none"> <li>Finalising the reporting methodology for whole-life carbon standards</li> <li>Contributing to a plan for phasing in mandatory whole-life reporting followed by minimum whole-life standards for all roads and infrastructure by 2025, with differentiated targets by function, scale, and public/private construction.</li> </ul>	Spring 2022
	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing
Electric vehicles	Develop a comprehensive policy package to <b>support the supply and uptake of EVs</b> to enable delivery of the 2030 phase-out of new petrol and diesel cars and vans. This will require: <ul style="list-style-type: none"> <li>Strong consumer incentives to purchase zero-emission vehicles, whether in the form of purchase subsidies or preferential tax rates and duties. These should be fair across consumer groups and scaled back as costs of EVs fall.</li> <li>Introducing a zero-emission vehicle mandate requiring car manufacturers to sell a rising proportion of zero-emission vehicles (specifically, fully battery-electric vehicles), reaching nearly 50% by 2025 and 100% by 2030, with only a very small proportion of hybrids allowed alongside until 2035. This will benefit air quality and consumers, as well as greenhouse gas emissions.</li> <li>Setting out ambitious UK regulations on new car and van CO<sub>2</sub> intensities to 2030, with more regular intervals than the EU's five years, requiring around a 55% reduction by 2025 and 97% by 2030.</li> </ul>	Policy package: 2021 Support: Now and ongoing  Priority recommendation
	Continue to support widespread deployment of <b>EV charging infrastructure</b> : <ul style="list-style-type: none"> <li>This should ensure it can support high EV uptake levels. Project Rapid has the right ambition for the strategic road network and should be developed into a full strategy for the 2020s and beyond.</li> <li>Further investment is needed to support on-street and other urban charging solutions for those without off-street parking and destination charging.</li> <li>Government should aim for there to be around 150,000 public charge points operating by 2025. These should be widely available across all regions of the UK.</li> <li>Implement the recommendations of the EV Energy Taskforce, in particular improving the consumer charging experience and making smart-charging accessible, appealing and cost-effective for as many EV users as possible.</li> </ul>	Now and ongoing Priority recommendation
	Produce a clear assessment of how best to re-use and <b>recycle EV batteries</b> and fund development of competitive, large-scale battery recycling facilities in the UK.	2021-22

Table A6 Recommendations for the Department for Transport (DfT)		Timing
Public transport and active travel	Strengthen support for, and provision of, schemes to support <b>walking, cycling and public transport</b> to reduce demand for higher-carbon travel: <ul style="list-style-type: none"> <li>Provision of infrastructure for active travel and other support schemes, as well as measures to make it less attractive to drive, are needed.</li> <li>This should include maintaining positive behaviour shifts and addressing risks resulting from the COVID-19 pandemic.</li> <li>Working across delivery bodies (e.g. local authorities) is critical.</li> </ul>	2021-22 Priority recommendation
	Government should support the <b>public transport and shared mobility</b> sectors to recover from the COVID-19 pandemic: <ul style="list-style-type: none"> <li>Positive communications and messaging will be required to rebuild public confidence in the safety of public transport.</li> <li>Financial support for the sector should be maintained while confidence and demand are rebuilt, to avoid the risk of operators cutting service provision.</li> <li>Government should seek to reverse the increasing relative price advantage of car travel over public transport.</li> </ul>	2021-22
	Set out a clear vision to deliver Net Zero in <b>rail</b> , and support Network Rail and other bodies in delivering the target to remove all passenger diesel trains by 2040. This should cover a mix of zero-emission technologies (e.g. track electrification, battery-electric, hydrogen and hybrid trains). The strategy should be published by 2021 as recommended by the National Infrastructure Commission.	2021
	Mandate a <b>phase-out</b> of new sales of all <b>diesel buses and coaches</b> by 2040 at the latest. <ul style="list-style-type: none"> <li>This should include a requirement for new sales of diesel vehicles operating on shorter, urban routes to end considerably sooner.</li> <li>Local authorities should be empowered to continue driving zero-emission bus take-up and to deliver improvements to bus services.</li> </ul>	2021-22
	Implement large-scale <b>trials of zero-emission HGVs</b> in the early-2020s to demonstrate the commercial feasibility of these technologies and establish the most suitable and cost-effective technology mix.	Early 2020s
Freight and off-road mobile machinery	Set out and implement a <b>strategy to transition to zero-carbon freight</b> , including: <ul style="list-style-type: none"> <li>Ending sales of new diesel HGVs by 2040 at the latest.</li> <li>Stronger purchase and other incentives for zero-emission HGVs.</li> <li>Infrastructure plans and support (e.g. ultra-rapid chargers for battery-electric HGVs and hydrogen refuelling stations for hydrogen HGVs).</li> <li>Clean air zones.</li> </ul>	2021
	Implement schemes to <b>reduce HGV and van use</b> in urban areas (e.g. e-cargo bikes and use of urban consolidation centres), to reduce traffic and improve the safety of active travel.	2021
	Set out a strategy for decarbonisation of <b>off-road mobile machinery</b> and work with industry to identify potential policies to increase uptake of low-carbon off-road mobile machinery. This will require work across BEIS, MHCLG, DfT and Defra.	2021
	Build on the <b>Clean Maritime Plan</b> and formal inclusion of international shipping in CB6 and Net Zero to set a Net Zero 2050 goal for UK shipping (including international shipping) and a pathway to get there.	2021
Shipping	Take a leadership role in working with the <b>International Maritime Organisation (IMO)</b> and other willing partners on global shipping policies, research funding, tighter efficiency targets and other initiatives to reduce shipping emissions. Work to strengthen the IMO 2050 global target.	2021-22
	Commit to the UK's first <b>clean maritime cluster(s)</b> operating at commercial scale (supplying at least 2 TWh/year of zero-carbon fuels) by 2030 at the latest, with zero-carbon fuels expanding to 33% of UK shipping fuel use by 2035.	2021-22
	Continue <b>innovation and demonstration support for zero-carbon fuel</b> technologies and their use in shipping, and ship efficiency measures. Develop incentives for zero-carbon ammonia and hydrogen supply chains.	Early 2020s
	Provide support for ports' investment in <b>shore power</b> and electric recharging infrastructure.	Early 2020s
	Start monitoring <b>non-CO<sub>2</sub> effects</b> of shipping and decide on how best to tackle them alongside UK climate targets.	2021

Table A6 Recommendations for the Department for Transport (DfT)		Timing
Aviation	Commit to a Net Zero goal and pathway for UK aviation as part of the forthcoming <b>Aviation Decarbonisation Strategy</b> , with UK international aviation reaching Net Zero emissions by 2050 at the latest, and domestic aviation potentially earlier. Plan for residual emissions (after efficiency, low-carbon fuels, and demand-side measures) to be offset by verifiable greenhouse gas removals, on a sector net emissions trajectory to Net Zero.	2021 Priority recommendation
	Assess the Government's <b>airport capacity strategy</b> in the context of Net Zero and any lasting impacts on demand from COVID-19, as part of the aviation strategy. There should be no net expansion of UK airport capacity unless the sector is on track to sufficiently outperform its net emissions trajectory and can accommodate the additional demand. A demand management framework will need to be developed (by 2022) and be in place by the mid-2020s to annually assess and, if required, control sector GHG emissions and non-CO <sub>2</sub> effects.	2021-22 Priority recommendation
	Take a leadership role within the <b>International Civil Aviation Organisation (ICAO)</b> , and work with other high-ambition nations, to set a long-term goal for aviation consistent with the Paris Agreement, strengthen the CORSIA scheme and align CORSIA to this long-term goal.	2021-22
	Continue innovation and demonstration support for <b>sustainable aviation fuel (SAF)</b> technologies, aircraft efficiency measures, hybrid, full electric and hydrogen aircraft development and airspace modernisation. Set out a policy package for supporting the near-term deployment of commercial SAF facilities in the UK (with carbon capture and storage where applicable).  Longer-term, support for SAF should transition to a more bespoke, enduring policy to drive uptake.	Now and ongoing Policy package in 2021
	Use <b>aviation tax reform</b> to address price imbalances between aviation and surface transport, encouraging the low-carbon alternative (e.g. rail) for journeys where one exists. Taxation should also be used, alongside improvements in broadband, to embed positive behaviours that have arisen during the pandemic (e.g. replacing business travel with online networking).	2021-22
	Commit to not use credits from the <b>Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA)</b> for flights covered by the UK ETS unless and until they can satisfy strict eligibility criteria (equivalence, additionality, permanence, sustainability).	2021-22
	Start monitoring <b>non-CO<sub>2</sub> effects</b> of aviation (including through CORSIA for eligible aeroplane operators), set a minimum goal of no further warming after 2050, research mitigation options, and consider how best to tackle non-CO <sub>2</sub> effects alongside UK climate targets without increasing CO <sub>2</sub> emissions.	2021-22

Table A7 Recommendations for the Ministry of Housing, Communities and Local Government (MHCLG)		Timing
Cross-cutting	<p>Support <b>local government</b> to play a full role in the Net Zero transition, including through increased resourcing, guidance, involvement in local area energy plans, statutory reporting on the emissions from their estate and reforming the planning framework to enable delivery of low-carbon and climate resilient measures.</p> <p>This is likely to require additional funding for staffing and resources for local delivery plans, alongside a 'duty to collaborate' to encourage authorities to work with local, regional and national partners to deliver their climate ambitions.</p>	<p>2021-23 <b>Priority recommendation</b></p> <p>(funding for local areas at next budget)</p>
	<p>Ensure that <b>adaptation is integrated</b> into major upcoming policies in the next two years related to the priority CCRA3 risks for which MHCLG has lead responsibility, coordinating work with other relevant departments as necessary:</p> <ul style="list-style-type: none"> <li>Risks to human health, wellbeing and productivity from increased exposure to heat in homes and buildings (with DHSC).</li> <li>In addition, for the coming five-year period (2023-2028), MHCLG should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the risks and opportunities in the CCRA for which it is the lead department (see Adaptation Report Annex).</li> </ul>	<p>By 2023 <b>Priority recommendation</b></p>
	<p>Working with BEIS, DWP, DfE and the Home Office, develop a strategy for a <b>Net Zero workforce</b> that ensures a just transition for workers transitioning from high-carbon to low-carbon and climate-resilient jobs, integrates relevant skills into the UK's education framework and actively monitors the risks and opportunities arising from the transition. This strategy should include the development and roll-out of plans for training and skills, with buildings and manufacturing being priority areas.</p>	<p>2021 <b>Priority recommendation</b></p>
	<p>Ensure that developments and infrastructure are compliant with <b>Net Zero</b> and appropriately <b>resilient to climate change</b> through proposed amendments to the Planning Bill.</p>	<p>2021-22</p>
	<p>Introduce an <b>urban greenspace</b> target to reverse the decline and ensure towns and cities are adapted to more frequent heatwaves in the future and that the 25-Year Plan goals are met.</p>	<p>2022</p>
	<p>Ensure all departmental policy decisions, planning decisions and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b>.</p>	<p>Now and ongoing</p>
Flooding	<p>Ensure that all types of current and future <b>flood risk</b> are included in policies to assess flood risk to new developments. Housing targets for local authorities should take account of flood risk, amongst other environmental issues. Assessments and management of flood risk in new developments must as a minimum:</p> <ul style="list-style-type: none"> <li>Include evidence that the development will be safe over its full lifetime, with a consideration of the downstream interactions and impacts of new developments (i.e. it should not increase flooding in other areas).</li> <li>Include an assessment of current and future flood risk under both 2°C and 4°C global climate scenarios.</li> <li>Assess and manage the risk of flooding to local infrastructure as well as housing.</li> <li>Include a consideration of better preparedness as set out in the Government's recent FCERM Policy Statement.</li> <li>Ensure there are properly funded and trained staff in local authorities.</li> </ul>	<p>2022</p>
	<p>To help improve the <b>information on SuDS and surface water flood risk</b>, urgently begin collecting data on sewer capacity and SuDS location, type and capacity. This would bring the level of information in line with that for river and coastal flood risk defences.</p>	<p>2021</p>
	<p>To address the issue of increased risk of <b>surface water flooding</b> in new developments, commit to ensuring that new developments do not put more water into the public sewers than what was there before, taking into account climate change. To incentivise this, end the automatic right to connect to the public sewer; planning reforms should enact Schedule 3 of the Flood and Water Management Act (2010); and technical SuDS standards should be made mandatory and be updated to deliver SuDS that provide multiple economic, social and environmental benefits.</p>	<p>2022</p>
	<p>The <b>consultation process for surface water flood risk</b> must be improved. This should be done by adding statutory consultees for all development type and sizes. Consultees must have the appropriate skills to provide advice on surface water flood mitigation. Ensure that Local Authorities fully justify planning decisions where applications can proceed either without or going against formal flood risk mitigation advice.</p>	<p>2022</p>

Table A7 Recommendations for the Ministry of Housing, Communities and Local Government (MHCLG)		Timing
Buildings	<p>Implement a <b>strong set of standards – with robust enforcement</b> – that ensure both new and existing buildings are designed for a changing climate and deliver high levels of energy efficiency and low-carbon heat. Including:</p> <ul style="list-style-type: none"> <li>Publish robust definitions of the Future Homes Standard and Future Buildings Standard which are legislated in advance of 2023 and ensure no fossil fuels are burnt in new buildings. This must include coordination with DfE, MoJ, DHSC as well as BEIS and HMT.</li> <li>Regulate the overheating requirement as set out in the Future Buildings Standard consultation. Expand the requirement to cover refurbishments of existing buildings and conversions of non-residential buildings to residential.</li> <li>Work with BEIS on the Heat and Buildings Strategy and use standards to set a clear direction for retrofit across the buildings stock.</li> <li>Ensure that the remit of the new buildings safety regulator covers climate change mitigation and adaptation, strengthened through an explicit responsibility for sustainability; and is fully equipped to monitor and enforce compliance with buildings standards.</li> <li>Work with HM Treasury to ensure that local authorities are properly funded to enforce buildings standards.</li> <li>Close loopholes allowing homes to be built which do not meet the current minimum standards for new dwellings. This includes provisions around the expiry of planning permission and permitted development rights relating to change of use. Make accurate performance testing and reporting widespread, committing developers to the standards they advertise.</li> </ul>	2021-22 <b>Priority recommendation</b>
	<p>Develop and implement plans to make all <b>public-sector buildings and vehicle fleets</b> within the department's remit zero-carbon in the long term, switching to ultra-low emission vehicles by 2030 and halving emissions from public buildings by 2032. This must be part of a coherent cross-government strategy including an updated set of Greening the Government commitments, multi-year spending commitments and annual reporting.</p>	2021-22
	<p>Implement improvements to the <b>Energy Performance Certificate (EPC) and Standard Assessment Procedure (SAP)</b> framework, including:</p> <ul style="list-style-type: none"> <li>Ensuring EPCs drive deployment of the necessary energy efficiency measures and do so on a holistic basis to address overheating, ventilation, and moisture-risk.</li> <li>Supporting delivery objectives across both energy efficiency and low-carbon heat, and valuing properly the benefits of low-carbon and flexible technologies.</li> <li>Formally integrating a forward trajectory for declining grid carbon-intensity, in line with Government projections.</li> <li>Addressing wider issues of quality/robustness, with a commitment to integrate in-use performance metrics from 2023.</li> <li>Plans for the future role of Green Building Passports.</li> </ul>	2022
Construction	<p>Step up efforts to deliver the <b>waste prevention and resource efficiency</b> improvements required as part of the pathway to Net Zero, including by:</p> <ul style="list-style-type: none"> <li>Setting out how levels of resource efficiency improvements in construction identified within the Industrial Decarbonisation Strategy will be delivered.</li> <li>Beginning to develop and implement any additional policies needed to deliver these resource efficiency improvements, by the end of 2022.</li> <li>Ensure cross-departmental working, potentially through new cross-Whitehall governance focused on resource efficiency.</li> </ul>	Spring 2022 <b>Priority recommendation</b>  (end 2022 for additional policies)
	<p>Develop policies (with BEIS, Defra and DfT) to drive more <b>resource-efficient construction</b> and use of existing low-carbon materials, including a substantial increase in the use of <b>wood in construction</b>. Policies should include:</p> <ul style="list-style-type: none"> <li>Reviewing and clarifying the position of structural timber in the ban on combustible materials, underpinned by further research and testing where necessary, and ensuring there are no barriers to the safe use of timber in buildings. Buildings safety regulator to play a role in overseeing this on an ongoing basis.</li> <li>The development of a fully funded policy roadmap on the use of timber, including policies to support the development of UK wood supply chains.</li> <li>Finalising the reporting methodology for whole-life carbon standards.</li> <li>Setting out a plan for phasing in mandatory whole-life reporting followed by minimum whole-life standards for all buildings, roads and infrastructure by 2025, with differentiated targets by function, scale, and public/private construction.</li> </ul>	Spring 2022
	<p>Set out a strategy for decarbonisation of <b>off-road mobile machinery</b> and work with industry to identify potential policies to increase uptake of low-carbon off-road mobile machinery. This will require work across BEIS, MHCLG, DfT and Defra.</p>	2021

Table A8 Recommendations for the Department for Digital, Culture, Media and Sport (DCMS)		Timing
Cross-cutting	Support BEIS in developing a <b>public engagement strategy</b> for Net Zero which builds on the findings of the UK Climate Assembly by involving people in decision-making, providing trusted information on decarbonisation choices and the need to reduce emissions and adapt to climate change. The strategy should also identify preferred policy options to empower people to contribute fully towards the path to Net Zero.	2021-22 Priority recommendation
	For the coming five-year period (2023-2028), outline appropriate actions in the next <b>National Adaptation Programme</b> to address the adaptation gap identified for the risks and opportunities in the CCRA for which it is the lead department (see Adaptation Report Annex).	2023 Priority recommendation
	Work in partnership with Ofgem to publish and implement a new <b>Smart System Plan and Energy Data and Digitalisation Strategy</b> , including on cyber-security, in order to continue to unlock the full benefits of electricity system flexibility. Ensure that, alongside smart standards for heating, all electricity users have access to half-hourly metering and the option of tariffs that encourage flexibility in use of electric heat and electric vehicle charging.	2021
	Ensure <b>sport and culture strategies</b> align to other departments' plans for lower-carbon buildings, more active travel and improved public health.	2021
	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing
Digital infrastructure	Ensure plans for a <b>digital transition and fibre roll-out</b> can complement changing work patterns and travel behaviours, leading to lower-carbon working. Co-ordinate with DfT to invest in digital infrastructure to lock in positive behaviours that reduce travel demand (e.g. home-working).	2021
	<b>Resilience standards for the digital sector</b> must include requirements pertaining to climate change risks. In addressing the National Infrastructure Commission recommendations from the Resilience Study, Government should incorporate consideration of climate change risks and adaptation actions into any new standards being developed. Standards for digital infrastructure operators should include requirements to: <ul style="list-style-type: none"> <li>Assess climate risks under both 2°C and 4°C global climate scenarios.</li> <li>Consider interdependencies with other critical infrastructure, and</li> <li>Set out actions to reduce risk and monitor progress.</li> </ul>	2022
	Improve information sharing on climate risks to infrastructure interdependencies at a local level, especially for <b>electricity, digital and ICT networks</b> . As reported in our previous assessment in 2019, NAP actions to enhance arrangements for information sharing between local infrastructure operators and improve understanding of critical risks arising from interdependencies have not been completed. Defra's link with Local Resilience Forums is key, and BEIS and DCMS should engage with utility companies to encourage standardised benchmarking and data sharing on climate risks to electricity networks, digital & ICT.	Now and ongoing

Table A9 Recommendations for the Department for Education (DfE)		Timing
	Working with BEIS, DWP, MHCLG and the Home Office, develop a strategy for a <b>Net Zero workforce</b> that ensures a just transition for workers transitioning from high-carbon to low-carbon and climate-resilient jobs, integrates relevant skills into the UK's education framework and actively monitors the risks and opportunities arising from the transition. This strategy should include the development and roll-out of plans for training and skills, with buildings and manufacturing being priority areas.	2021 Priority recommendation
	Support BEIS in developing a <b>public engagement strategy</b> for Net Zero which builds on the findings of the UK Climate Assembly by involving people in decision-making, providing trusted information on decarbonisation choices and the need to reduce emissions and adapt to climate change. The strategy should also identify preferred policy options to empower people to contribute fully towards the path to Net Zero.	2021-22 Priority recommendation
	For the coming five-year period (2023-2028), DfE should outline appropriate actions in the next <b>National Adaptation Programme</b> to address the adaptation gap identified for the one risk in the CCRA for which it is the lead department (see Adaptation Report Annex).	2023 Priority recommendation
	Develop and implement plans to make all <b>public-sector buildings and vehicle fleets</b> within the department's remit zero-carbon in the long term, switching to ultra-low emission vehicles by 2030 and halving emissions from public buildings by 2032. This must be part of a coherent cross-government strategy including an updated set of Greening the Government commitments, multi-year spending commitments and annual reporting.	2021-22
	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing

Table A10 Recommendations for the Department for Work and Pensions (DWP)		Timing
	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing
	Working with BEIS, DfE, MHCLG and the Home Office, develop a strategy for a <b>Net Zero workforce</b> that ensures a just transition for workers transitioning from high-carbon to low-carbon and climate-resilient jobs, integrates relevant skills into the UK's education framework and actively monitors the risks and opportunities arising from the transition. This strategy should include the development and roll-out of plans for training and skills, with buildings and manufacturing being priority areas.	2021 Priority recommendation
	Design industrial decarbonisation policies to <b>support and create jobs</b> , especially in regions with reliance on industrial jobs.	Now and ongoing
	Develop and implement plans to make all <b>public-sector buildings and vehicle fleets</b> within the department's remit zero-carbon in the long term, switching to ultra-low emission vehicles by 2030 and halving emissions from public buildings by 2032. This must be part of a coherent cross-government strategy including an updated set of Greening the Government commitments, multi-year spending commitments and annual reporting.	2021-22

Table A11 Recommendations for the Department of Health and Social Care (DHSC)		Timing
	For the coming five-year period (2023–2028), DHSC should outline appropriate actions in the next National Adaptation Programme to address the adaptation gap identified for the risks and opportunities in the CCRA for which it is the lead department (see Adaptation Report Annex).	2023 Priority recommendation
	Assess <b>health sector vulnerability</b> to existing and future climate risks, particularly for care homes and home-based care. Following this, develop a cross-sector approach to address risks. This cross-sector approach should include input from DHSC, CQC, PHE, NHS, MHCLG and local level public health bodies.	2022
	Fund the strengthening and widening of vector and pathogen surveillance and early-warning mechanisms, due to the increasing risk of <b>disease spread</b> as a result of climate change and other factors.	Now and ongoing
	Develop and implement plans to make all <b>public-sector buildings and vehicle fleets</b> within the department's remit zero-carbon in the long term, switching to ultra-low emission vehicles by 2030 and halving emissions from public buildings by 2032. This must be part of a coherent cross-government strategy including an updated set of Greening the Government commitments, multi-year spending commitments and annual reporting.	Now and ongoing
	Support the NHS in delivering on its Net Zero plan.	Now and ongoing
	Take an active role in climate policy development that also has <b>health benefits</b> , such as active travel, access to green space, air quality, better buildings and healthier diets.	Now and ongoing
	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing

Table A12 Recommendations for the Home Office and the Ministry of Justice (MoJ)		Timing
	For the coming five-year period (2023–2028), MoJ should outline appropriate actions in the next <b>National Adaptation Programme</b> to address the adaptation gap identified for the risks in the CCRA for which it is the lead department (see Adaptation Report Annex).	2023 Priority recommendation
	Home Office, BEIS, DWP, DfE and MHCLG, should develop a strategy for a <b>Net Zero workforce</b> that ensures a just transition for workers transitioning from high-carbon to low-carbon and climate-resilient jobs, integrates relevant skills into the UK's education framework and actively monitors the risks and opportunities arising from the transition. This strategy should include the development and roll-out of plans for training and skills, with buildings and manufacturing being priority areas.	2021 Priority recommendation
	Develop and implement plans to make all <b>public-sector buildings and vehicle fleets</b> within the department's remit zero-carbon in the long term, switching to ultra-low emission vehicles by 2030 and halving emissions from public buildings by 2032. This must be part of a coherent cross-government strategy including an updated set of Greening the Government commitments, multi-year spending commitments and annual reporting.	2021-22
	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing

Table A13 Recommendations for the Ministry of Defence (MoD)		Timing
	Ensure all departmental policy decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing
	Develop and implement plans to make all <b>public-sector buildings and vehicle fleets</b> within the department's remit zero-carbon in the long term, switching to ultra-low emission vehicles by 2030 and halving emissions from public buildings by 2032. This must be part of a coherent cross-government strategy including an updated set of Greening the Government commitments, multi-year spending commitments and annual reporting.	2021-22
	Assess the potential for <b>alternative fuels</b> (such as low-carbon electricity, hydrogen or bioenergy) to be used for land vehicles, ships and aircraft, and consider opportunities to support wider use of low-carbon technologies in civil applications (e.g. through research or demonstration).	Now and ongoing

Table A14 Recommendations for the Office of Gas and Electricity Markets (Ofgem)		Timing
	Continue to support widespread deployment of <b>EV charging infrastructure</b> : <ul style="list-style-type: none"> <li>This should ensure it can support high EV uptake levels. Project Rapid has the right ambition for the strategic road network and should be developed into a full strategy for the 2020s and beyond.</li> <li>Further investment is needed to support on-street and other urban charging solutions for those without off-street parking and destination charging.</li> <li>Around 150,000 public charge points will need to be operating by 2025. These should be widely available across all regions of the UK.</li> <li>Implement the recommendations of the EV Energy Taskforce, in particular improving the consumer charging experience and making smart-charging accessible, appealing and cost-effective for as many EV users as possible.</li> </ul>	Now and ongoing <b>Priority recommendation</b>
	Ensure all regulatory decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing
	Develop mechanisms for strategic investment in coordination with BEIS to ensure that <b>electricity networks</b> can accommodate increased future demand levels, including large localised demand increases associated with electrification in manufacturing, transport and buildings, and that lack of network capacity does not cause delays in emissions reduction.	2023
	Start a programme of research with BEIS to identify <b>areas which are unlikely to be suitable for hydrogen</b> (such that electrification and alternatives can be prioritised), <b>alongside priority candidate areas for hydrogen</b> . Distribution Network Operators should gather and share detailed information on network capacity (at least to substation level) to feed into this.	2021
	Set out reforms to encourage the <b>utilisation of existing network capacity</b> and ensure that costs of local network upgrades are shared fairly and do not disincentivise the roll-out of low-carbon technologies.	2021
	Work in partnership with BEIS to publish and implement a new <b>Smart System Plan and Energy Data and Digitalisation Strategy</b> , including working with DCMS on cyber-security, in order to continue to unlock the full benefits of electricity system flexibility. Ensure that, alongside smart standards for heating, all electricity users have access to half-hourly metering and the option of tariffs that encourage flexibility in use of electric heat and electric vehicle charging.	2021
	Develop (with BEIS) a strategy to coordinate the development of <b>interconnectors</b> , connections for offshore wind farms and the enhancement of inter-area transfer capacity for the onshore network, ensuring cost-effective, timely delivery, bringing forward any legislation necessary to enable it.	H1 2022
	Work with BEIS to make explicit how current and future policies will reduce emissions associated with <b>methane leakage</b> from the gas networks in a way that is consistent with the Sixth Carbon Budget.	2021

Table A15 Recommendations for the Water Services Regulation Authority (Ofwat)		Timing
	Ensure all regulatory decisions, and procurement decisions, are consistent with the <b>Net Zero goal</b> and reflect the latest understanding of <b>climate risks</b> .	Now and ongoing
	Include <b>decarbonisation</b> as one of Ofwat's core principles, to assist the water industry's goal of decarbonising by 2030, and the need to roll out advanced anaerobic digestion systems.	2021
	Work with Defra, the Environment Agency and other stakeholders to set out targets and supporting measures for <b>reducing water use by business</b> . This could be through ensuring that any water reduction targets linked to the Environment Bill include business as well as household water use as well as responding to advice and recommendations from Defra's new Senior Water Demand Reduction Group.	2022

Table A16 Recommendations for the Office for National Statistics (ONS)		Timing
	Review plan for improving <b>data collection</b> and statistical reporting for the purposes of monitoring and informing the low-carbon transition, as part of the broader work the ONS are already undertaking to improve the collection of climate-related data.	2022
	Work with BEIS to put in place plans to collect and report data annually on <b>low-carbon heat networks</b> , specifically, the amount of heat delivered (split by DUKES consumption sector, i.e. Residential/Public/Commercial/Industry, and where possible, by source of heat supply).	2022
	Improve the collection and reporting of <b>industrial decarbonisation data</b> to allow for progress to be monitored more effectively, particularly on energy and resource efficiency.	2022

**Table A17**  
Recommendations for the Scottish Government

Timing

Scale up delivery across all sectors in line with the ambition set out in the recent <b>Climate Change Plan Update</b> .	Now and ongoing
<p>Publish the finalised <b>Heat in Buildings strategy</b>.</p> <ul style="list-style-type: none"> <li>• This must include finalising the regulatory framework and role of different trigger points (including area-based plans), and setting in train the legislation needed to underpin these.</li> <li>• Consult on the trajectory of reform for metrics such as EPCs, to ensure they are robust and enforceable, fit for purpose to deliver the measures needed on a holistic basis, do not disincentivise low-carbon heat, integrate in-use performance metrics from 2023, and include plans for the future role of Green Building Passports.</li> <li>• Provide further detail on the ambition for heat networks and heat pumps over the coming decade, and determine how funding for energy efficiency and low-carbon heat will be allocated to meet strategic priorities.</li> </ul>	2021
Proposals in Scotland's Updated Climate Change Plan 2018-32 to set out a <b>route map for agricultural transformation</b> should be scaled up, with the development of environmental conditionality that incentivises emission reduction and carbon sequestration measures in the land sector that build towards Scotland's climate goals. It is essential that appropriate incentives are in place to drive early action, given the time (often decadal) needed for some measures to reduce and sequester carbon (e.g. afforestation and peat restoration).	2021
<p>Renew efforts to improve <b>recycling and resource efficiency</b>, including by:</p> <p>Bringing forward the planned circular economy package for legislating within the forthcoming Programme for Government.</p> <p>Putting in place the policy and support to ensure the 2025 targets (including the 70% recycling target) within the package are delivered, and setting new ambitious targets for 2030.</p> <p>Legislating to ban key biodegradable waste streams going to landfill from 2025, and ensuring this is delivered through increased resource efficiency and recycling.</p>	2021
<p>Publish a strategy setting out how the Scottish Government will achieve a 20% reduction in <b>car-kilometres</b> by 2030 and deliver 20-minute neighbourhoods. This should be supported by:</p> <p>Continuing to strengthen schemes to support walking, cycling, and public transport.</p> <p>Investment in infrastructure connectivity to lock in positive behavioural changes that reduce travel demand (e.g. home-working).</p> <p>Supporting the public transport and shared mobility sectors to recover from the COVID-19 pandemic, including through recovery funding and positive communication and messaging.</p>	2021
Continue to support the expansion of Scotland's <b>public EV charge point network</b> , to ensure the EV transition works for all road users in Scotland.	Now and ongoing
Maintain the provision of <b>interest-free loans</b> for EVs (now including second-hand EVs) on top of existing UK government grants. Plan for a transition to fiscally-neutral incentives as EV costs fall.	2021-22
Taxation should be used, alongside improvements in broadband, to <b>embed positive behaviours</b> that have arisen during the pandemic, replacing business travel with videoconferencing and online collaboration.	2021-22
Seek to address price imbalances between aviation and surface transport, once <b>aviation taxation</b> is devolved to Scotland, encouraging the low-carbon alternative (e.g. rail) for journeys where one exists.	2021-22
Play a leading role in decarbonising the <b>shipping</b> sector by exploring opportunities to transition ferries operated by Transport Scotland to low-carbon energy and establishing appropriate business models to encourage their adoption.	Now and ongoing

Table A18 Recommendations for the Welsh Government	Timing
Publish a new <b>Net Zero Delivery Plan</b> that sets out a long-term vision for meeting the Net Zero goal in 2050, with a particular focus on the Third Carbon Budget and beyond.	2021
Publish a coherent, <b>long-term strategy for heat and energy</b> efficiency in Welsh homes and other buildings, setting a framework for progress in areas of devolved responsibility.  As part of this, energy efficiency policy should be designed so as to ensure that funds go as far as possible in reducing the fuel poverty gap and improving the energy efficiency of homes, by focusing on the most cost-effective interventions (including upgrading homes to EPC B and EPC C where applicable).	2021
Deliver on the priorities set out in Llbwyr Newydd to <b>reduce demand for higher-carbon travel</b> . This includes: <ul style="list-style-type: none"> <li>• Delivering a better, more integrated, decarbonised bus system.</li> <li>• Developing a network of connected local routes for walking and cycling.</li> <li>• Investing in infrastructure connectivity to enable delivery of the ambition for 30% of the workforce to work remotely on a regular basis.</li> <li>• Supporting the public transport and shared mobility sectors to recover from the COVID-19 pandemic, including through recovery funding and positive communication and messaging.</li> </ul>	2021-22
Support delivery of a <b>charging network</b> that meets the ambition set out in the Electric Vehicle Charging Strategy, to ensure the EV transition works for all road users in Wales.	Now and ongoing
The Welsh Government's second statutory decarbonisation plan (LCDP2), due out later this year, should set out policies to <b>accelerate afforestation rates</b> to deliver its share of the UK target to plant 30,000 hectares in 2025.	2021
Build on strong progress made on <b>recycling and resource efficiency</b> , including by: <ul style="list-style-type: none"> <li>• Implementing the policies set out in the recent 'Beyond Recycling' strategy.</li> <li>• Legislating and progressing towards the existing 70% recycling target, and set new ambitious targets for 2030.</li> <li>• Legislating to ban key biodegradable waste streams going to landfill from 2025, and ensuring this is delivered through increased resource efficiency and recycling.</li> </ul>	2021

**Table A19**  
Recommendations for the Northern Ireland Executive

Timing

<p>Legislate a credible <b>long-term emissions reduction target</b> that is backed up by evidence on its deliverability and a clear plan for how it can be achieved in a way that is fair for Northern Ireland's citizens – the Committee previously advised that an 82% reduction on 1990 levels by 2050 is Northern Ireland's appropriate contribution to the Paris Agreement and the UK Net Zero goal.</p>	<p>2021-22</p>
<p>Publish a final energy strategy that sets out how Northern Ireland will achieve a <b>net-zero-carbon energy system</b> by 2050, in line with the pathways recommended in our December 2020 advice.</p>	<p>2021</p>
<p>Publish a coherent, <b>long-term strategy for heat and energy efficiency</b> in Northern Ireland's homes and other buildings; encompassing regulatory, policy and funding commitments to facilitate delivery.</p> <ul style="list-style-type: none"> <li>• The strategy should include a trajectory of regulatory standards for energy efficiency, supported by reforms to relevant metrics (such as EPCs) to ensure they drive the measures needed on a holistic basis and do not disincentivise low-carbon heat. Reforms should ensure metrics are robust and enforceable such that standards targeted are achieved in practice.</li> <li>• Publish proposals on the phase-out of fossil fuel heating, including standards to phase out the installation of new liquid and solid fossil fuel heating. Proposals should recognise the critical role of heat pumps and hybrid heat pumps in these homes, minimising the use of biofuels to reflect economy-wide needs.</li> </ul>	<p>2022</p>
<p>Consult on an ambitious trajectory of <b>new-build standards</b> uplifts, including ensuring all new homes are designed for a changing climate, are ultra-efficient and use low-carbon heating from 2025.</p>	<p>2021</p>
<p>Set out provisions to integrate a <b>post-CAP framework</b> that helps the land sector contribute to Northern Ireland's climate goals as soon as the climate legislation is introduced. This should include providing incentives for landowners and tenants to deliver low-carbon farming practices and change the use of land to reduce emissions and increase carbon sequestration.</p>	<p>2022</p>
<p>The Northern Ireland Executive should bring forward a <b>resource efficiency package</b> which matches the ambition of Wales and Scotland, including by:</p> <ul style="list-style-type: none"> <li>• Setting a target for 70% recycling across all wastes by 2030.</li> <li>• Policies to deliver such a target, as well as improving waste prevention and re-use.</li> <li>• Legislating to ban key biodegradable waste streams going to landfill from 2025, and ensuring this is delivered through increased resource efficiency and recycling.</li> </ul>	<p>2022</p>
<p>Strengthen support for and provision of schemes to support <b>walking, cycling and public transport</b> to reduce Northern Ireland's high levels of car-dependence:</p> <ul style="list-style-type: none"> <li>• Strengthen schemes to ensure access to local amenities without dependency on cars.</li> <li>• Invest in infrastructure connectivity to lock in positive behavioural changes that reduce travel demand, e.g. home-working.</li> <li>• Support the public transport and shared mobility sectors to recover from the COVID-19 pandemic, including through recovery funding and positive communication and messaging.</li> </ul>	<p>2021-22</p>
<p>Support the deployment of <b>public charge points</b> across Northern Ireland, to address the issue that Northern Ireland currently has the fewest EV charge points per capita of any of the UK nations.</p>	<p>Now and ongoing</p>
<p>Resume collecting and publishing <b>data on vehicle-kilometres</b> travelled by mode in Northern Ireland. This will help identify which actions are effective in encouraging modal shift away from car travel.</p>	<p>2021-22</p>
<p><b>Long-haul air passenger duty</b>, which is devolved to Northern Ireland, should be increased at least in line with UK-wide long-distance APD, to better reflect the climate change impact of flying.</p>	<p>2021-22</p>

## The Commission's remit

The Commission provides the government with impartial, expert advice on major long term infrastructure challenges. Its remit covers all sectors of economic infrastructure: energy, transport, water and wastewater (drainage and sewerage), waste, flood risk management and digital communications. While the Commission considers the potential interactions between its infrastructure recommendations and housing supply, housing itself is not in its remit. Also out of the scope of the Commission are social infrastructure, such as schools, hospitals or prisons, agriculture, and land use

The Commission's objectives are to support sustainable economic growth across all regions of the UK, improve competitiveness, and improve quality of life.

The Commission delivers the following core pieces of work:

- a National Infrastructure Assessment once in every Parliament, setting out the Commission's assessment of long term infrastructure needs with recommendations to the government
- specific studies on pressing infrastructure challenges as set by the government, taking into account the views of the Commission and stakeholders, including recommendations to government
- an Annual Monitoring Report, taking stock of the government's progress in areas where it has committed to taking forward recommendations of the Commission.

The Commission's binding fiscal remit requires it to demonstrate that all its recommendations for economic infrastructure are consistent with, and set out how they can be accommodated within, gross public investment in economic infrastructure of between 1.0% and 1.2% of GDP each year between 2020 and 2050. The Commission's reports must also include a transparent assessment of the impact on costs to businesses, consumers, government, public bodies and other end users of infrastructure that would arise from implementing the recommendations.

When making its recommendations, the Commission is required to take into account both the role of the economic regulators in regulating infrastructure providers, and the government's legal obligations, such as carbon reduction targets or making assessments of environmental impacts. The Commission's remit letter also states that the Commission must ensure its recommendations do not reopen decision making processes where programmes and work have been decided by the government or will be decided in the immediate future.

The Commission's remit extends to economic infrastructure within the UK government's competence and will evolve in line with devolution settlements. This means the Commission has a role in relation to non-devolved UK government infrastructure responsibilities in Scotland, Wales and Northern Ireland (and all sectors in England).

The Infrastructure and Projects Authority (IPA), a separate body, is responsible for ensuring the long term planning carried out by the Commission is translated into successful project delivery, once the plans have been endorsed by government.

## The Commission's members

**Sir John Armitt CBE (Chair)** published an independent review on long term infrastructure planning in the UK in September 2013, which resulted in the National Infrastructure Commission. Sir John is the Chair of National Express Group and the City & Guilds Group. He also sits on the boards of the Berkeley Group and Expo 2020.

**Dame Kate Barker** sits on the boards of Taylor Wimpey plc and Man Group plc. She also chairs the Jersey Fiscal Policy Panel, is the Chairman of Trustees at the British Coal Staff Superannuation Scheme, and a member of the Geospatial Commission. She was an external member of the Bank of England's Monetary Policy Committee from 2001 to 2010. In April 2020, she will become Chair-elect of the Universities Superannuation Scheme.

**Professor Sir Tim Besley CBE** is School Professor of Economics and Political Science and W. Arthur Lewis Professor of Development Economics at the LSE. He served as an external member of the Bank of England Monetary Policy Committee from 2006 to 2009.

**Professor David Fisk CB** is the Director of the Laing O'Rourke Centre for Systems Engineering and Innovation Research at Imperial College London. He has served as Chief Scientist across several government departments including those for environment and transport, and as a member of the Gas and Electricity Markets Authority.

**Andy Green CBE** holds several Chair, Non-Executive Director and advisory roles, linked by his passion for how technology transforms business and our daily lives. He chairs Lowell, a major European credit management company and has served as Chair of the Digital Catapult, an initiative to help grow the UK's digital economy.

**Bridget Rosewell CBE** is a director, policy maker and economist. She served as Chief Economic Adviser to the Greater London Authority from 2002 to 2012 and worked extensively on infrastructure business cases. She is a Non-executive Director at Network Rail, Chair of the Atom Bank and Non-executive Chair of the Driver and Vehicle Standards Agency.

**Professor Sadie Morgan OBE** is a founding director of the Stirling Prize winning architectural practice dRMM. She is also Chair of the Independent Design Panel for High Speed Two and one of the Mayor of London's Design Advocates. She sits on the boards of the Major Projects Association and Homes England.

**Julia Prescott** is a co-founder and Chief Strategy Officer of Meridiam and sits on the Executive Committee of Meridiam SAS. She has been involved in long term infrastructure development and investment in the UK, Europe, North America and Africa. Since 2019 she has sat on the board of the Port of Tyne.

# Executive summary

---

## **Putting the UK on the pathway to a highly renewable electricity system is the best way to deliver low cost low carbon electricity for the UK.**

**The net zero target makes this more urgent than ever.**

In June 2019 the government raised the UK's ambition on tackling climate change by legislating for a net zero greenhouse gas emissions target for the whole economy by 2050.<sup>1</sup> Decarbonising the power sector is integral to achieving this goal. Good progress has been made. Power sector emissions have fallen by around 53 per cent in the past decade,<sup>2</sup> and government has played a central role in supporting this reduction. The government's ambition to deploy 40 GW of offshore wind by 2030 is another welcome step. This positive progress must continue.

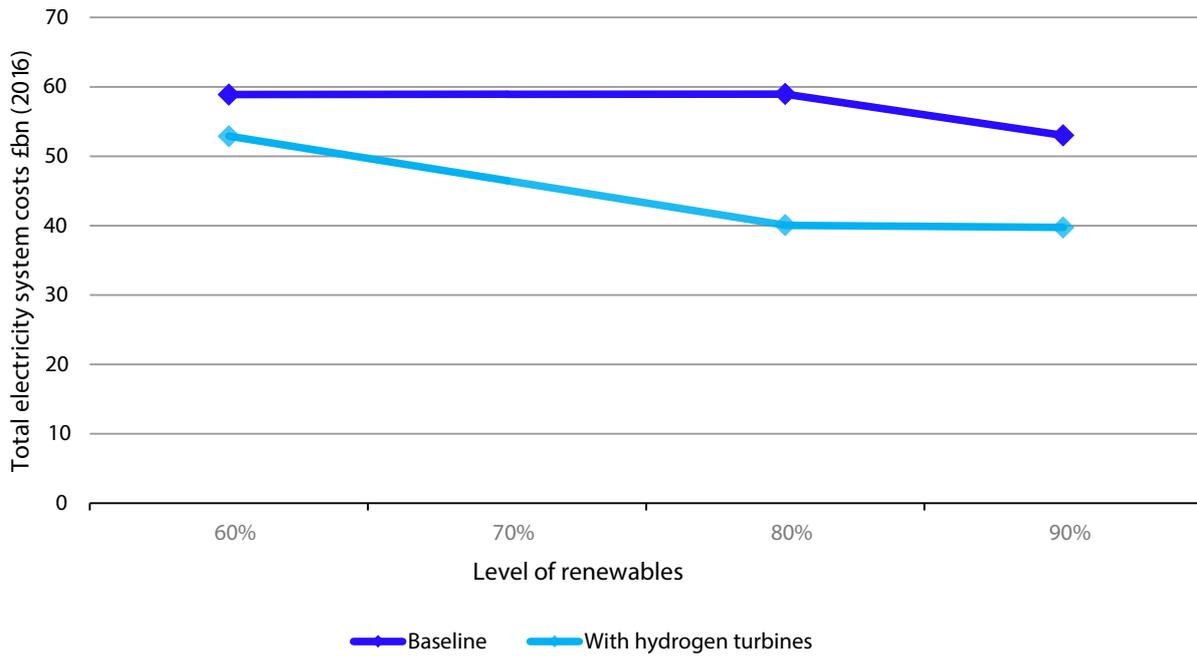

Delivering low carbon electricity while keeping costs affordable to consumers is key. Currently the average energy bill is around £1,200 per year<sup>3</sup>, with electricity making up around £600 of this,<sup>4</sup> and energy bills make up on average 4 per cent of household expenditure.<sup>5</sup> For households in the bottom 10 per cent of the income distribution this increases to 8 per cent.<sup>6</sup>

Clearly, there is a lot of uncertainty when considering the UK in 2050. Accurately knowing how people are going to heat their homes or move around cities and towns 30 years from now is an unachievable task. But uncertainty is not an excuse for inaction. It simply underlines the need to maintain optionality and flexibility in how the UK power system evolves.

That is why, in the *National Infrastructure Assessment*, the Commission set out clear, robust and achievable actions for government to take in the near term to support the decarbonisation of the power sector. These actions focused on setting the UK on the pathway to a highly renewable system. This is the best way to reduce emissions, keep costs low, and maintain optionality in a rapidly changing sector.

Modelling of the total cost of the power system in a net zero economy, carried out for the Commission by Aurora Energy Research,<sup>7</sup> demonstrates that increasing the proportion of renewables on the system does not materially impact the cost of the system. Future system costs may even be lower if action is taken to test the feasibility of deploying hydrogen turbines, an emerging technology for the power sector.

Figure 1: Costs of net zero power systems (average annual costs from 2030 to 2050)

Note: the costs at 70% renewables have been estimated and not modelled.

Table 1: Scenarios, cost and level of nuclear deployment

Level of renewable penetration in 2050	Total system costs (£2016)	Nuclear capacity deployed in addition to already contracted capacity
60 per cent	£59bn	24 GW, approximately 7 Hinkley Point C sized plants.
80 per cent	£59bn	7 GW, approximately 2 Hinkley Point C sized plants.
90 per cent	£53bn	3 GW, approximately, 1 Hinkley Point C sized plant.

## Recommendations from the National Infrastructure Assessment

The analysis and insights summarised in this paper reaffirm the case for the Commission’s recommendation to deliver at least 50 per cent renewable generation by 2030, as part of the transition to a highly renewable generation mix. Since the *National Infrastructure Assessment*, reductions in the cost of renewables have outstripped forecasts.

The latest modelling results also show that a highly renewable power system, combined with flexible technologies including hydrogen powered generation, could be substantially cheaper than alternatives that rely heavily on a fleet of nuclear power plants. There is considerable uncertainty around modelling over such a long time period and in a sector with so much technological change. It does not make sense to fully commit now to a system dominated by one technology, whether that is nuclear, offshore wind or another. Making such decisions now, for example by committing to a fleet of nuclear power plants, rules out a more diverse future generation mix and the potential this has to reduce costs to consumers.

That is why the Commission recommends that the government take action to ensure the UK is running on at least 50 per cent renewable generation by 2030, as part of the transition to a highly renewable system. A renewables based system looks like a safer bet at present than constructing multiple new nuclear plants. But a large amount of uncertainty does remain. Cancelling the nuclear programme entirely risks a 'stop start' approach which is likely to be highly inefficient. Agreeing support for no more than one more nuclear plant before 2025 allows the UK to pursue a highly renewable mix without closing off the nuclear alternative.

## Modelling approach

The work carried out for the Commission analyses the total electricity system costs of delivering a net zero compatible electricity system out to 2050. This involves modelling an electricity system that balances supply and demand for every half hour of the year. The costs presented include the costs of building, connecting and operating generation technology.

There are two different electricity demand scenarios assumed. One scenario assumes electrification of heating and the other assumes hydrogen for heating ('Greener Gas'). The modelling compares electricity systems with upwards of 50 per cent renewable generation beyond 2030 given current government commitments and the previous recommendation of the Commission.

Additionally, this work considers the impact that either hydrogen or bioenergy with carbon capture and storage could have if deployed in the power sector. Natural gas, which is used for producing hydrogen in some scenarios, is assumed to be available at current forecast prices.

## Net zero power systems with electrification of heat

Highly renewable systems are still a low cost option in a net zero world. The analysis once again finds that electricity system costs are broadly flat across a range of different levels of renewable penetrations. If hydrogen is deployed, providing low carbon and flexible generation, it could further reduce the costs of highly renewable systems, by up to 30 per cent in some scenarios modelled here.

If bioenergy with carbon capture and storage is deployed in the power sector, it is likely to be used to generate baseload. This leads to lower levels of nuclear, further highlighting the risks of committing to an extensive new nuclear fleet now.

## Net zero power systems with Greener Gas

The conclusions also hold in a lower demand scenario where heating has been decarbonised using hydrogen. This demonstrates that the Commission's analysis, and recommendations, are robust to uncertainty.

# Recommendations from the National Infrastructure Assessment

---

The Commission considers that the UK electricity system should be running on at least 50 per cent renewable generation by 2030, as part of the transition to a highly renewable electricity supply. To achieve this, the government should set out a pipeline of Contracts for Difference auctions to deliver the needed generation. Recent analysis for the Commission also highlights the potential for hydrogen technology in the power sector, which further supports the case for pursuing a highly renewable system.

The government's ambition to deploy 40 GW of offshore wind will go a long way to delivering at least 50 per cent renewable generation by 2030. This positive progress needs to continue. Delivering the Commission's recommendations would allow government to take the needed concrete action in the near term, whilst not closing down options for the future.

## The Commission's recommendations deliver a 21st century power system

In the National Infrastructure Assessment the Commission recommended that government:

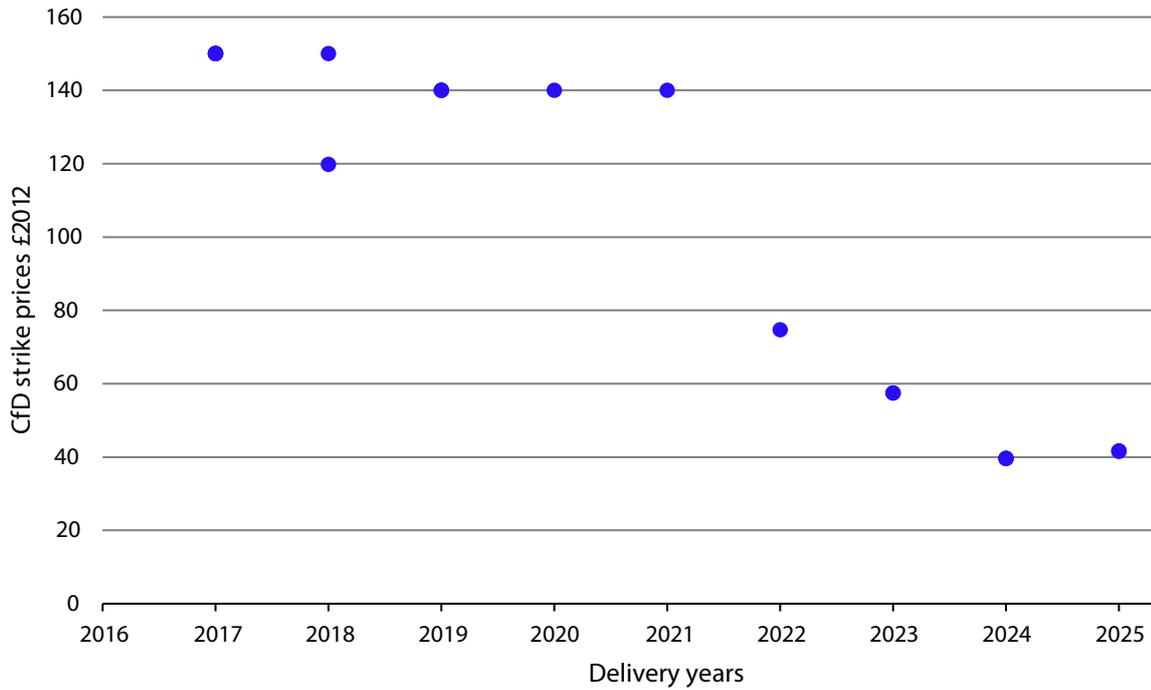

- set out a pipeline of pot 1 Contracts for Difference auctions, to deliver at least 50 per cent renewable generation by 2030, as part of the transition to a highly renewable generation mix
- move technologies that have recently become cost competitive, such as offshore wind, to pot 1 following the next Contracts for Difference auction in Spring 2019. Pot 1 should be used for the overwhelming majority of the increase in renewable capacity required
- publish indicative auction dates and budgets for the next decade by 2020
- over time take whole systems costs into account in Contracts for Difference auctions, as far as possible
- consider whether there is a case for a small-scale, pot 2 auction in the 2020s, if there are technologies which are serious contenders for future pot 1 auctions
- not agree support for more than one nuclear power station beyond Hinkley Point C, before 2025.

The considerations underpinning these recommendations are:

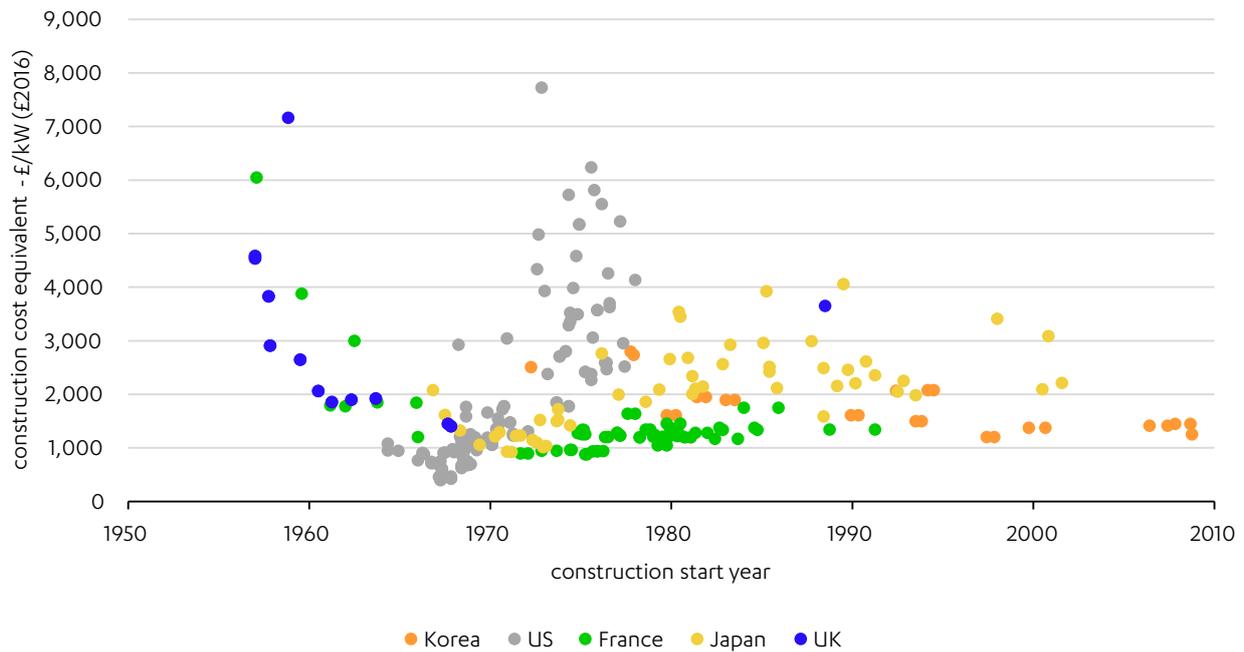

- **The analysis carried out for the Commission of future electricity system costs finds that systems with high penetrations of renewables are as cost effective as other systems** (Figure 1). This was true under the previous 2050 emissions target and it is still true with the new, more ambitious, net zero target. While there are uncertainties in any modelling, it is clear that ruling out the highest penetrations of renewables now would be counterproductive.
- **Renewable costs have consistently fallen faster than forecast.** The analysis summarised above uses informed and expert forecast of future technology costs, capturing a central view of how these costs could evolve. However, over the past decade renewables costs have consistently fallen faster than forecast. The latest Contracts for Difference auction once again demonstrated the rapid cost reductions in renewables (Figure 2), as the Commission suggested it might in its Assessment. Whilst this does not mean the Commission expects this to continue to happen, this presents an upside risk that renewables are even cheaper than currently expected. Other technologies that are key to low cost highly renewable systems, such as short term batteries, have also seen significant cost reductions over the past decade.<sup>8</sup>
- **In contrast, nuclear plants have not yet demonstrated consistent cost reduction.** Figure 3 shows the construction costs of nuclear power stations in various countries, by construction start date. With many decades of experience this data still shows no discernible trend in construction costs over time. This is true even for countries, such as France, that have built fleets of similarly designed reactors.
- **Emerging technologies, such as hydrogen, could further reduce the costs of highly renewable systems.** The Commission's latest analysis demonstrates that, if deployed, hydrogen, either generated from electrolyzers using curtailed generation or gas reforming with carbon capture and storage (CCS), has the potential to materially reduce the cost of highly renewable electricity mixes. In some scenarios costs are reduced by up to 30 per cent.
- **If bioenergy with carbon capture and storage (BECCS) is deployed in the power sector, it will likely displace other baseload technologies such as nuclear.** The Committee on Climate Change have set out that BECCS will likely be needed to generate negative emissions. If deployed in the power sector the Commission's analysis finds it will likely generate baseload and therefore displaces some nuclear capacity.
- **Keeping options open in a rapidly evolving sector is important and putting the UK on the pathway to a highly renewable system does just this.** Costs and operability of different technologies will continue to change rapidly, and the UK must be responsive to this. Policy decisions that lock the UK consumer into paying for large scale programmes with long construction times risk missing opportunities that may emerge. In contrast to other technologies renewables have short construction timelines. Therefore, if action is taken to put the UK power system on a highly renewable pathway, and evidence emerges that makes the case for alternative technologies, it will be possible to change course. The potential cost savings from hydrogen in the power sector is one example that underlines the importance of this.

- New low carbon capacity is needed over the next decade and renewables can deliver this.** As the Commission argued in the first Assessment, due to current plant retirements, in the 2020s there will be a gap in electricity generating capacity, that needs to be filled.<sup>9</sup> It must be the case that low carbon generation fills this gap. Given their short lead times, renewables are ideally placed to do this. With the exception of Hinkley Point C, nuclear power stations would likely only be able to deliver new capacity in the early 2030s. It therefore makes sense for government to take action to deploy renewables now.

**Figure 2: Price reductions in offshore wind in the UK<sup>10</sup>**

Note: Similar cost trajectories have been demonstrated for both onshore wind and solar. For example, *An analysis of the potential outcome of further ‘Pot 1’ CfD auction in GB estimated the price of onshore wind at around £45/MWh in £2012.*<sup>11</sup> However, this chart only covers prices agreed in signed Contracts for Difference in the UK. This trend is not just UK based, with cost reductions in onshore wind, offshore wind, and solar evidenced around the globe.<sup>12</sup>

Figure 3: Construction costs of nuclear power stations over time<sup>13</sup>

## The Commission's recommendations are robust to future change and uncertainty

The analysis presented in this paper makes estimates of the behavior of complex systems over long periods of time and in the context of rapid technological change. These estimates are inevitably uncertain. It is important to consider this uncertainty when drawing conclusions from any such modelling. Small differences in total costs in 2050 should not be used to justify the case for individual technologies, and significant policy decisions should not be taken on the basis of marginal differences in costs over the long term.

The Commission's recommendations are robust to this type of uncertainty. By focusing on high-level trends, and not on individual numbers or small cost differences, the Commission has accounted for the level of uncertainty to 2050. Moreover, the actions that the Commission recommends government take do maintain optionality and avoid excessive technological lock-in, allowing the UK to be reactive to future change.

### **Box 1: A level playing field for onshore wind**

The Commission recommended in the Assessment that cost competitive technologies such as offshore wind should be moved to pot 1 in the Contracts for Difference (CfD) auctions. A pipeline of pot 1 auctions should then be set out to deliver at least 50 per cent renewable generation by 2030, as part of the transition to a highly renewable generation mix. This would provide a genuine route to market for onshore wind and support the UK to deploy a low cost renewable generation mix.

Recently, the government has announced that it will once again run pot 1 auctions, giving onshore wind and solar a pathway to at scale deployment in the UK. This is positive progress towards meeting the Commission's recommendations on the power sector and is very welcome.

The additional challenge of a net zero target makes it even more crucial that government levels the playing field to enable all cost competitive renewable technologies to come forward. The modelling discussed in this paper shows that a significant increase in onshore capacity would support the least cost generation mix.

For each of the scenarios, there is a significant increase in onshore capacity by 2030 of between 2.8 – 4.3 GW, increasing from a 2020 baseline of 12.6 GW.

This is supported by a range of other analyses: Cornwall Insight's long-term power market model shows that the onshore wind capacity likely to be needed is between 16GW and 22GW by 2030 for net zero scenarios,<sup>14</sup> and the central scenario analysis commissioned for the Committee on Climate Change's net zero report from Vivid Economics shows 20GW onshore wind by 2025.<sup>15</sup>

With government support this is achievable. The government's Renewable Energy Planning Database, tracking renewable electricity projects, shows that there is 4.7 GW of onshore wind capacity awaiting construction having had planning permission granted.<sup>16</sup> The appropriate policy support would create a route to market for these projects that are ready to build in the 2020s.

# Modelling approach

The electricity system modelling carried out for the National Infrastructure Assessment has been updated to account for the net zero emissions target. The Commission has also used this updated modelling to investigate the impact that some emerging technologies could have if deployed in the power sector.

Aurora Energy Research was commissioned to carry out updated electricity system modelling. The approach taken is the same as was taken for the *National Infrastructure Assessment*. The modelling analyses the costs of delivering a net zero compatible electricity system with different levels of renewable generation.

The net zero target requires emissions, after accounting for greenhouse gas (GHG) removals, to be zero by 2050. It does not require each sector in and of itself to produce zero emissions. In its indicative net zero consistent scenario the Committee on Climate Change (CCC) allowed for 2.9 MtCO<sub>2</sub> (4.5gCO<sub>2</sub>/kWh) of emissions from the power sector.<sup>17</sup> This is used as a benchmark for the power sector in the analysis presented in this paper. Whilst there may be debate about the exact level of decarbonisation required in the power sector, the Commission considers that this accurately represents a very low emissions electricity system.

The Commission has investigated the cost of running an electricity system with different proportions of renewable generation. The modelling considered systems with 60, 80 and 90 per cent renewable penetrations in 2050. The least cost mix of renewables, between onshore wind, offshore wind and solar, is analysed in the modelling. The remaining generation is optimised economically based on profit maximisation, within the limits of emissions and operability constraints assumed. This modelling work involves analysing the electricity system for every half hour of the year and aggregating costs for meeting demand throughout.

The Commission has only considered renewable mixes above 50 per cent in this latest work. This approach is taken in light of recent government announcements on delivering 40 GW of offshore wind capacity and the Commission's recommendations to government that the UK should be running on at least 50 per cent renewable by 2030.

The modelling provides the following outputs for each scenario:

- total costs in £2016 of constructing and running the electricity systems, averaged over the years 2030 to 2050.
- capacity and generation for each type of technology.

The electricity system costs are further broken down into the following five categories:

- **Wholesale market costs:** The costs of electricity generation, including a carbon price. The carbon price is set at the value required to meet the emissions constraint under each scenario.

- **Capacity market costs:** Costs of procuring enough capacity to meet assumed security of supply constraints.
- **Balancing market costs:** These costs cover the actions required to ensure that the electricity system always balances supply and demand.
- **Network costs:** The cost of building new network cables to connect and support additional generation capacity.
- **Subsidy costs:** Any additional cost on top of the above four categories required to deploy the set amount of renewable capacity.

A more detailed overview of the modelling approach used by Aurora Energy Research is outlined in *Net zero electricity systems modelling* with the full data and assumptions from this analysis.<sup>18</sup> A table of key assumptions is set out in Annex 1.

## Demand scenarios

The future pathway for decarbonised heat in the UK is not yet set but it will have a significant impact on the demands on the power system. Uncertainties around cost, technology, and consumer behavior means that it is difficult to decide the cheapest way to replace natural gas to meet future climate targets now. But uncertainty is not an excuse for inaction in the near term. The Commission has previously made a number of recommendations for developing the evidence base on low carbon heating options. Doing so will give the government, industry, and others the confidence to invest in the best solution at the right time.

In the absence of a single pathway, the Commission's power sector analysis considers two heating pathways:

- **Electrification:** represents a future in which most of the heating sector has been decarbonised largely by using heat pumps.
- **Greener gas:** represents a future in which heat is primarily provided by low carbon hydrogen.

The approach used in this updated analysis is similar to the one used for the analysis underpinning the Assessment. The assumptions for the heating demand scenarios are based on *Cost analysis of future heat infrastructure options*.<sup>19</sup> The results for each scenario are presented separately in the following chapters.

## Emerging technologies for 21st century power systems

The net zero target will impact not just the electricity sector but the whole economy, changing which technologies are available and economic to use in the power sector. As the Committee on Climate Change set out in their report *Net zero: the UK's contribution to stopping global warming*,<sup>20</sup> action across all sectors is needed for the UK economy to fully decarbonise.

Hydrogen, a zero carbon energy carrier, could be used to decarbonise areas of transport, heating, industry and potentially aviation and shipping. The CCC have stated that "By 2050, a new low carbon industry is needed with UK hydrogen production capacity of comparable size to the UK's current fleet of gas-fired power stations".<sup>21</sup>

Similarly, bioenergy with carbon capture and storage (BECCS), with its ability to generate negative emissions, will also be needed to meet the net zero target. The CCC have argued that BECCS will be needed “whether for power generation, hydrogen production or production of biofuels for areas that cannot move away from hydrocarbon fuels (e.g. aviation)”.<sup>22</sup>

Given this, the Commission has now undertaken analysis of the impact that these two technologies could have if deployed in the power sector. This paper sets out that work. However, the paper does not consider the wider impact these technologies would have across the economy. Nor does it consider the case for using these technologies in the power sector compared to other sectors in the economy. It is only analysing the impact these technologies would have if deployed for electricity generation.

## Hydrogen technology in the power sector

The Commission has previously made recommendations on hydrogen for heating and use in fuel cells for heavy goods vehicles.<sup>23,24</sup> But the heightened ambition of moving to a net zero economy may mean that hydrogen is used in other sectors as well. The CCC included 270 TWh of low carbon hydrogen in its indicative net zero pathway.<sup>25</sup>

This paper uses two scenarios to analyse the impact that hydrogen could have if deployed in the power sector:

- **A flexible source of low carbon electricity to complement renewables:** hydrogen, generated from gas reforming with CCS, burning in hydrogen turbines where this lowers the costs of the electricity system.
- **Electrolysis in the power system:** hydrogen produced from electrolyzers using curtailed generation, which is then burned for electricity at a later date.

This analysis has not considered the impacts or costs of the transmission or storage of hydrogen gas. More detail on the approach is set out in Annex 2.

## Bioenergy with carbon capture and storage

Burning biomass combined with CCS technology has the potential to generate both electricity and negative emissions (see box 5). But due to the high capital and fuel costs this technology is unlikely to be cost-effective in the power sector unless it receives revenue for the negative emissions it generates or provides value to the system by running flexibly.<sup>26</sup>

This analysis considers the impact of deploying BECCS in the power sector. This analysis is separate from the hydrogen scenarios described above. The quantity of BECCS assumed is based on estimates of the required amount of negative emissions in the economy by 2050.<sup>27</sup> In the scenarios presented here around 50 MtCO<sub>2</sub> is captured by BECCS in power.\* This is equivalent to around 135 TWh primary of biomass feedstock – well within current estimates for available supply.<sup>28</sup>

More detail on the approach is set out in Annex 2.

\*This is not the full total of negative emissions that the CCC, and others, suggest the UK will need to generate. Additional negative emissions could be generated from other sources (see box 5).

# Net zero power systems with electrification of heat

---

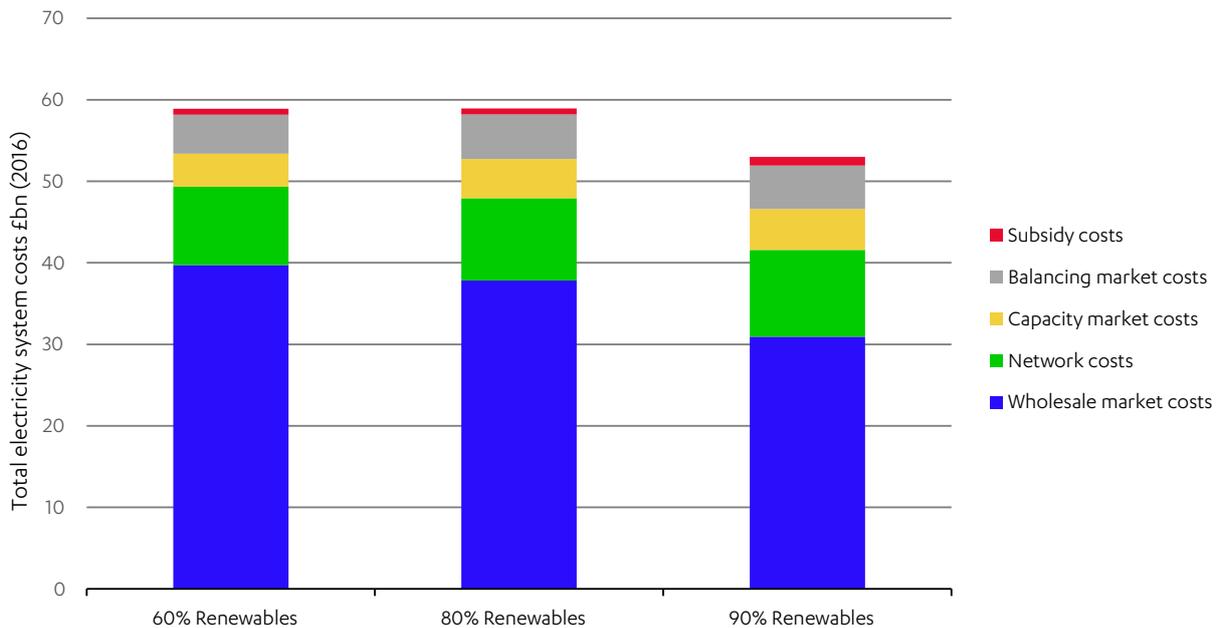

**This chapter presents the results of the power sector analysis with the electrification of heat demand scenario.**

## **Highly renewable systems are still a low cost option in a net zero world**

The modelled electricity system costs are lowest in the highest renewables scenarios (Figure 4). However, the cost difference is less than 10 per cent of total costs. This variability is well within reasonable tolerance levels given the uncertainty inherent in modelling out to 2050. The Commission has taken a prudent and sensible approach to uncertainty, not overly fixating on small 2050 cost differentials. Therefore the overall electricity system costs across the scenarios should be considered as broadly flat across the 60, 80 and 90 per cent scenarios. These estimates are similar to others in the literature.<sup>29</sup>

Scenarios with higher renewable deployment have lower wholesale market costs but this is largely offset through increases in other cost categories (Figure 4). As the renewables considered here are close to zero marginal cost, they significantly depress wholesale market prices, but some of this cost is shifted to increased subsidy levels. Higher balancing mechanism and network costs also occur. This is due to the inherent variability of renewables increasing the costs of balancing supply and demand, and the need for increased network capacity to connect more renewables.

Figure 4: Costs of net zero power systems

### Box 2: Intermittency cost estimates

Variable renewables, specifically wind and solar, are a low-cost technology option for supplying electricity. Indeed, the Commission believes that a highly renewable mix could be the lowest cost electricity system for meeting consumers' needs from 2030 onwards. However, each of these technologies relies on variable weather patterns, driving up uncertainty and placing additional strain on the electricity system.

This cost has often been calculated as the "intermittency cost" in the literature.<sup>30</sup> This cost can be broken down into components in several different ways. For example, the Committee on Climate Change have suggested that it can be understood as the interaction of the following four, albeit overlapping, components:<sup>31</sup>

- **Meeting peak demand:** costs of procuring back-up capacity for periods of peak demand and low renewable output.
- **Balancing requirements:** costs of paying for flexible technologies to be on the system that can ramp quickly to meet short-term electricity shortfalls.
- **Additional network costs:** costs of constructing additional transmission and distribution networks to connect renewable generation to demand.
- **Curtailment:** costs of generation that must be constrained due to too much surplus electricity. This should be distinguished from curtailment due to network constraints, which is not considered here.

The full system cost of intermittent generation will vary depending on the penetration of renewables on the system. Estimates range between £5/MWh to £50/MWh for renewable penetration up to around 65 per cent.<sup>32</sup> From this latest analysis the Commission can estimate the cost of renewable integration at 90 per cent penetration levels. This is set out in table 2 below.

The Commission's analysis does not find that these costs increase substantially with higher levels of renewable penetration. This is in line with the conclusion that highly renewable systems are at least as cost effective as those with lower proportions of renewables for providing the UK's long term electricity supply. As with all estimates for 2050 electricity systems, these are uncertain. As more renewables are deployed on the electricity system these costs will become more certain.

It is also the case that inflexible technologies, such as nuclear, or particularly large assets, such as interconnectors, may impose separate costs on the electricity system. These should also be considered.

**Table 2: Intermittency cost calculations**

Category	Methodology	Intermittency cost when moving from 60% to 90% renewables
Meeting peak demand	Calculated as the additional capacity market costs	£6/MWh
Balancing requirements	Calculated as the additional costs in the balancing mechanism	£3/MWh
Additional network costs	Calculated as the additional network costs	£6/MWh
Curtailment	Calculated as the total percentage of curtailed renewable generation. This should be applied as a cost uplift after other costs have been added to the baseline costs.	17% cost uplift, £9/MWh using the example of an offshore wind farm at £40/MWh
<b>Total</b>		<b>£24/MWh</b>

## Technology mixes in net zero power systems

The Commission's analysis of 2050 generation and capacity mixes has not significantly changed in light of the net zero target. The same technologies, in broadly similar quantities, are still likely to be needed in the long term (Figure 5, Figure 6). Across all scenarios, significant solar, onshore wind, and offshore wind capacity is needed:

- Between 129 – 237 GW of renewable capacity is in operation by 2050, generating between 360 – 530 TWh of electricity across the scenarios modelled. This includes 56 – 121 GW of solar, 18 – 27 GW of onshore wind, and 54 – 86 GW of offshore wind.
- To ensure security of supply there is still a significant capacity of unabated thermal plant on the system by 2050 (between 45 - 54 GW). However, this only provides around 3 – 4 TWh of annual generation as it is primarily deployed as back up capacity.
- At least 18 GW of gas CCS capacity is needed by 2050 across all scenarios, generating upwards of 23 TWh of electricity. By 2050 it is primarily playing a peaking role in the electricity system, with annual load factors of between 14 – 16 per cent. The residual emissions from not capturing 100 per cent of the CO<sub>2</sub> is likely to limit its role in providing bulk baseload generation in a net zero power system, unless higher capture rates are achieved.

- As little as 8 GW of nuclear capacity has been deployed in some scenarios, suggesting that it is possible to meet demand in electricity systems without significant capacity of inflexible baseload generation in the long-term. This is broadly equivalent to one additional nuclear plant beyond Hinkley Point C, in line with the Commission’s recommendation.
- All technologies deployed here fall within the maximum potential capacity deployable in the UK. This is further discussed in Annex 3.

Figure 5: Capacity mix of modelled scenarios in 2050

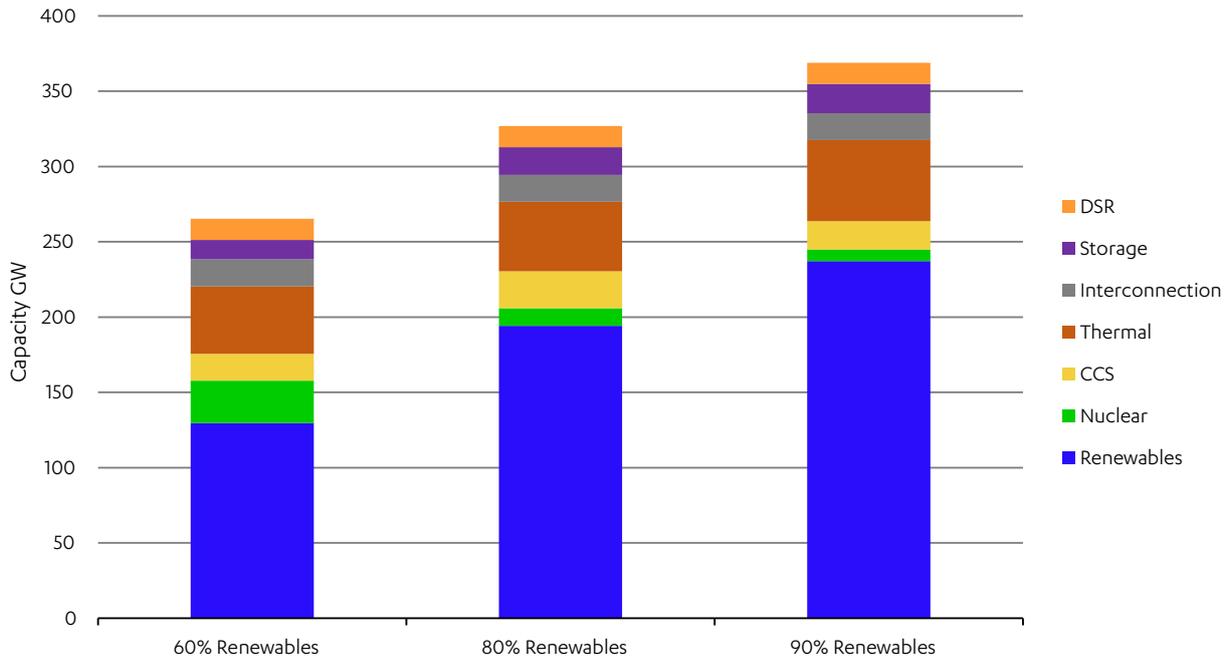

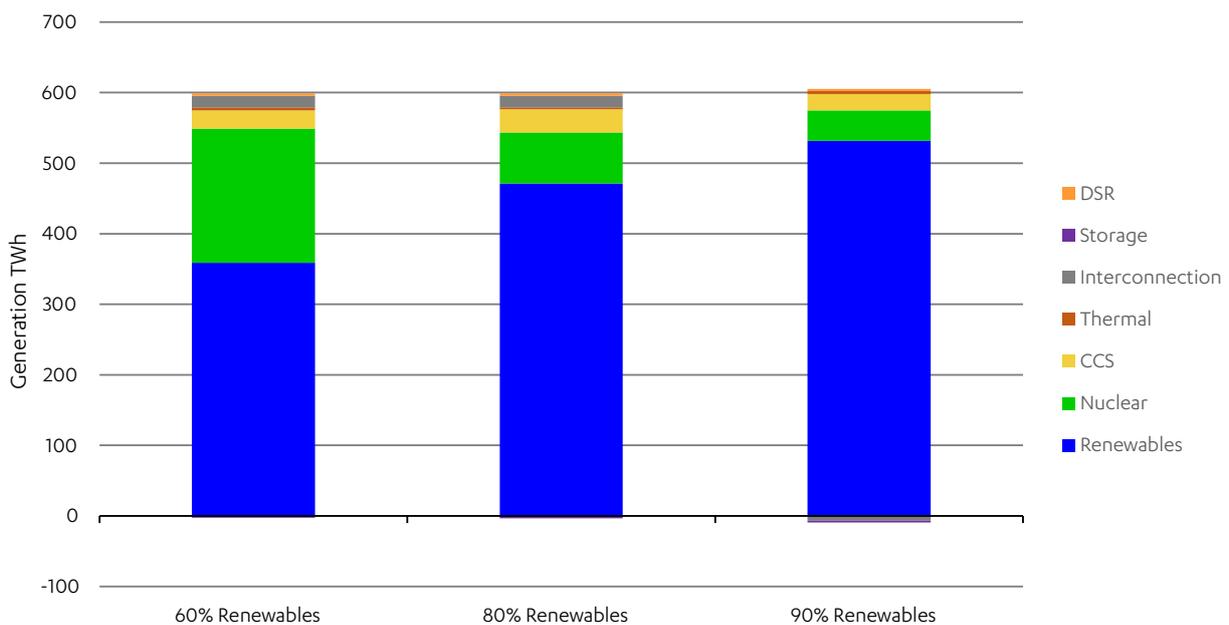

Figure 6: Generation mix of modelled scenarios in 2050

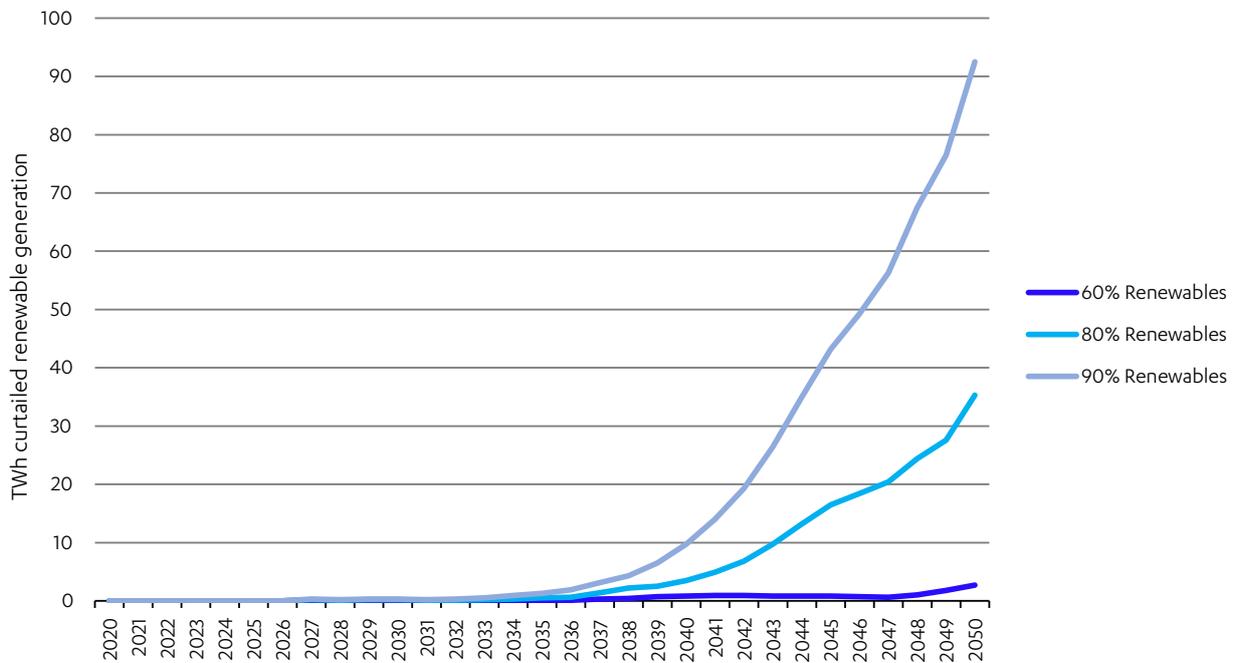

## Curtailment in highly renewable power systems

Increasing deployment of renewables is likely to result in more curtailment, but this does not stop highly renewable systems from being a low cost option. Due to their reliance on weather patterns renewables may generate at times when the electricity system already has enough electricity to meet demand. When this happens, the excess generation may need to be curtailed. This curtailment is different from curtailment in the current system which happens largely due to constraints on the transmission or distribution grid. The maximum level of curtailment in the scenarios modelled here is around 90 TWh (Figure 7). However, whilst this does increase the unit costs of renewables, capital and operating cost estimates are now low enough that highly renewable systems are still low cost.

It is unlikely that significant volumes of curtailed generation would go unused in the long run. New technologies or business models that will be able to make economic use of this curtailment are likely to be deployed. Therefore, it is better to see this curtailment not as a cost to the system but an opportunity. One technology that could take advantage of this opportunity is hydrogen production.

**Figure 7: Curtailment of renewables across modelled scenarios**

### Box 3: The role of system flexibility

Flexible technologies, those that can help balance supply and demand, will be integral to providing the UK with a power system fit for the 21st Century and securing low cost, low carbon electricity for UK consumers. The Commission recognised this in *Smart Power* published in 2016.<sup>33</sup> *Smart Power* set out a range of actions for government and regulators to take to position the UK as a world leader in electricity system flexibility. Analysis carried out for the Commission estimated that achieving a highly flexible electricity system could save UK consumers up to £8bn by 2030.<sup>34</sup> Subsequent analysis has reinforced this and argued that this saving is likely to be even higher by 2050.<sup>35</sup> The analysis presented in this paper further bolsters this case.

Specifically, the Smart Power report called for the UK to become a world leader in electricity storage systems, interconnection and demand side response. A significant capacity of these three technologies are deployed in the analysis presented here, highlighting their importance to the system:<sup>36</sup>

- Across all scenarios 17.9 GW of interconnection comes online, performing a key role in balancing the system, especially in periods of low renewable output. This is in line with the pipeline of interconnectors that are either in operation, under construction, or have been given regulatory approval from Ofgem.<sup>37</sup>
- Large volumes of storage, primarily lithium-ion batteries, and demand side response are included in the mix based on being able to make sufficient economic returns.

One key challenge for future electricity systems is the ability to meet peak demands, especially through the winter months. In the 60 per cent renewables scenario the higher capacity of baseload generation, in the form of nuclear and gas CCS, make these peaks relatively straightforward to meet (Figure 8). But a very highly renewables system can also meet these peaks. Figure 9 demonstrates how the peaks are met during the modelled 2050 January. With 90 per cent of annual generation coming from renewables they contribute the majority of this. However, when renewable output is low, nuclear, gas CCS, storage, interconnection and demand side response all stack up to meet the majority of these peaks. Some small amount of gas CCGT generation is still occasionally required but this only makes up around 4TWh of annual generation using 2MtCO<sub>2</sub><sup>38</sup> of 2.9MtCO<sub>2</sub> emissions constraint.

All future electricity systems need to be robust to extreme weather conditions, especially in a changing climate. The Commission recognised the importance of fully understanding weather impacts on electricity systems and has commissioned the Met Office to undertake research on this. An initial literature review conducted by the Met Office suggested that there are four key areas of uncertainty:<sup>39</sup>

**Peak winter residual demand:** a combination of low temperatures in winter driving high energy demands, combined with low windspeeds leading to low renewable wind energy, and potential limits on solar generation.

**Summer wind drought:** high pressure heatwaves in summer which could lead to a drought of wind supply, exacerbated by possible very low wind speeds, increasing the reliance on solar generation.

**Surplus solar:** combination of low demand and high solar generation output, leading to residual demand frequently dropping below zero and leading to surplus generating supply.

**Wind and solar ramping:** major changes in wind speed or solar irradiance over short time periods, both of which could lead to short term surplus and a requirement to curtail supply.

The review also highlighted the benefits of the UK having a diverse mix of renewables to help manage variable meteorological conditions. Additionally, ensuring that the UK's renewable generators are spread across the country to take advantage of complementary weather patterns could also be key.

The Commission will look to work with the Met Office, and others, to further build this evidence base in the coming years.

Figure 8: Model outputs for generation mix of January 2050 in 60% renewables electrification scenarios

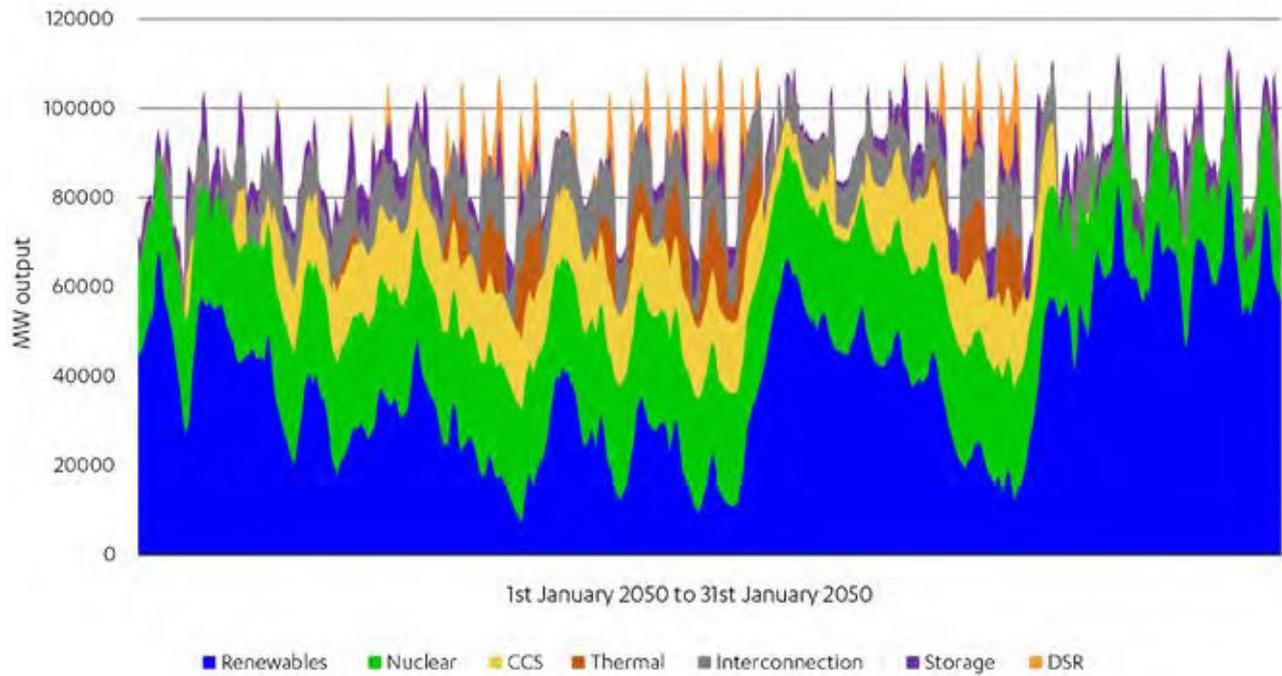

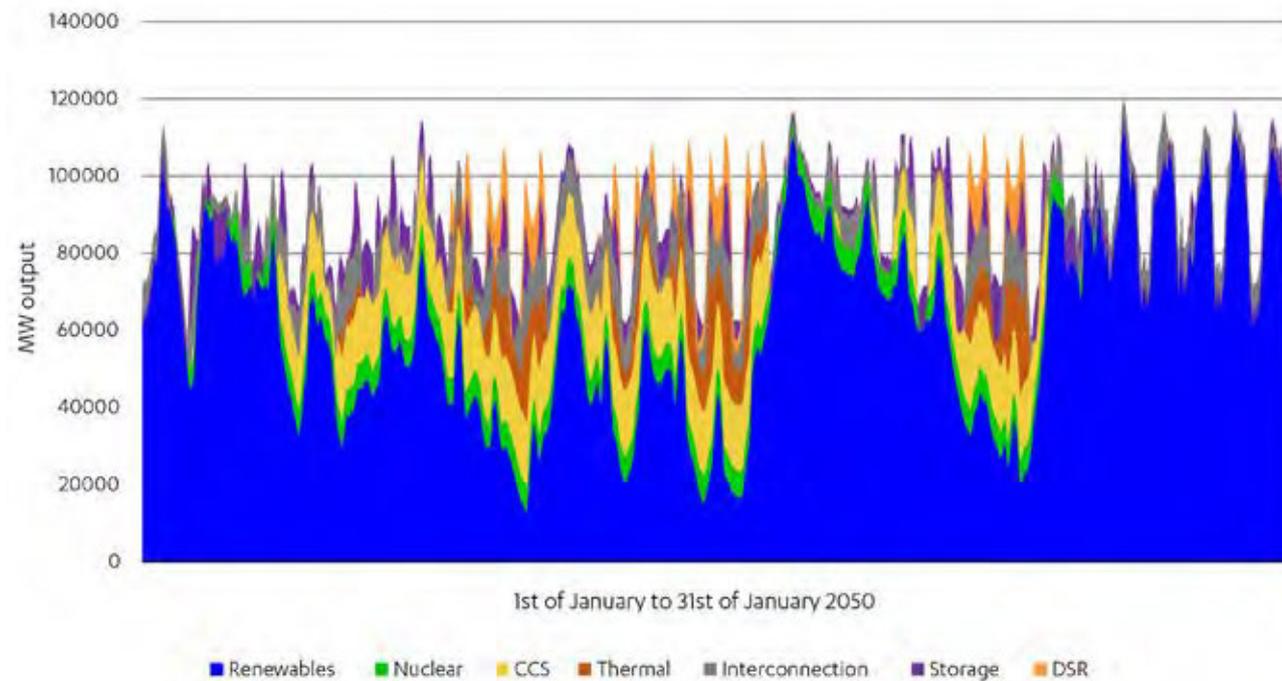

Figure 9: Model outputs for generation mix of January 2050 in 90% renewables electrification scenarios

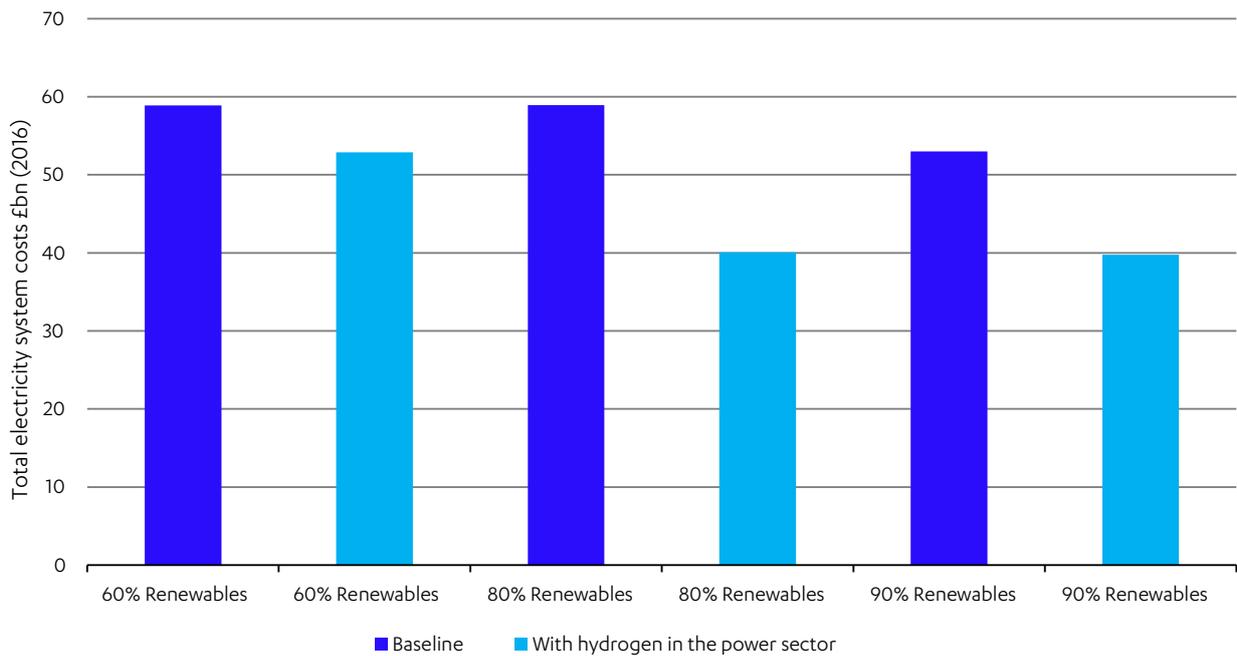

Note: the demand profiles differ across Figure 8 and Figure 9 due to when storage, interconnection and DSR are importing electricity from the system alongside different electric vehicle charging profiles.

## A flexible source of low carbon electricity to complement renewables

Deploying hydrogen turbines at scale, as a complement to renewable technologies, significantly reduces overall systems costs. Across the three different levels of renewable penetration, savings of between 10–30 per cent are seen (Figure 10). It is still the case that the higher penetration renewable scenarios are the cheapest, suggesting that a highly renewable mix is still likely to be at least as cost effective as those with higher baseload capacity. But deploying hydrogen turbines at scale could further lower costs.

**Figure 10: Electricity system costs with hydrogen from gas reforming in the power sector**

**The hydrogen turbines displace many other non-renewable forms of generation and flexibility, reducing the capacity of these technologies needed, and hence system costs** (Figure 11 and Figure 12). Specifically, hydrogen gas turbines:

- Displace nuclear by providing cheaper baseload generation. Nuclear capacity decreases by up to 11 GW with a low of around 5 GW across the scenarios.
- Completely displace all gas CCS from the scenarios. Hydrogen turbines provide both baseload generation and flexible supply at lower cost than gas CCS, completely replacing it in the modelling.
- Significantly decrease the amount of thermal back up capacity needed. As outlined earlier, the scenarios have a large capacity of traditional thermal generation which is needed for security of supply but very rarely runs. As hydrogen turbines also provide firm power, they replace much of this thermal plant. Capacity of thermal plant falls by between 13 – 16 GW across the scenarios.
- Decrease the amount of electricity that is imported from connected EU markets during high price periods. Net imported generation falls by up to 20 TWh across all scenarios.

- The hydrogen turbines provide low carbon baseload generation, low carbon flexibility and firm power, which are normally provided in the modelling by a range of different technologies. By combining all of these services in one technology, this significantly lowers the amount of capacity needed and therefore the capital investments required. This lowers overall system costs.

Figure 11: Capacity mix with hydrogen from gas reforming in the power sector in 2050

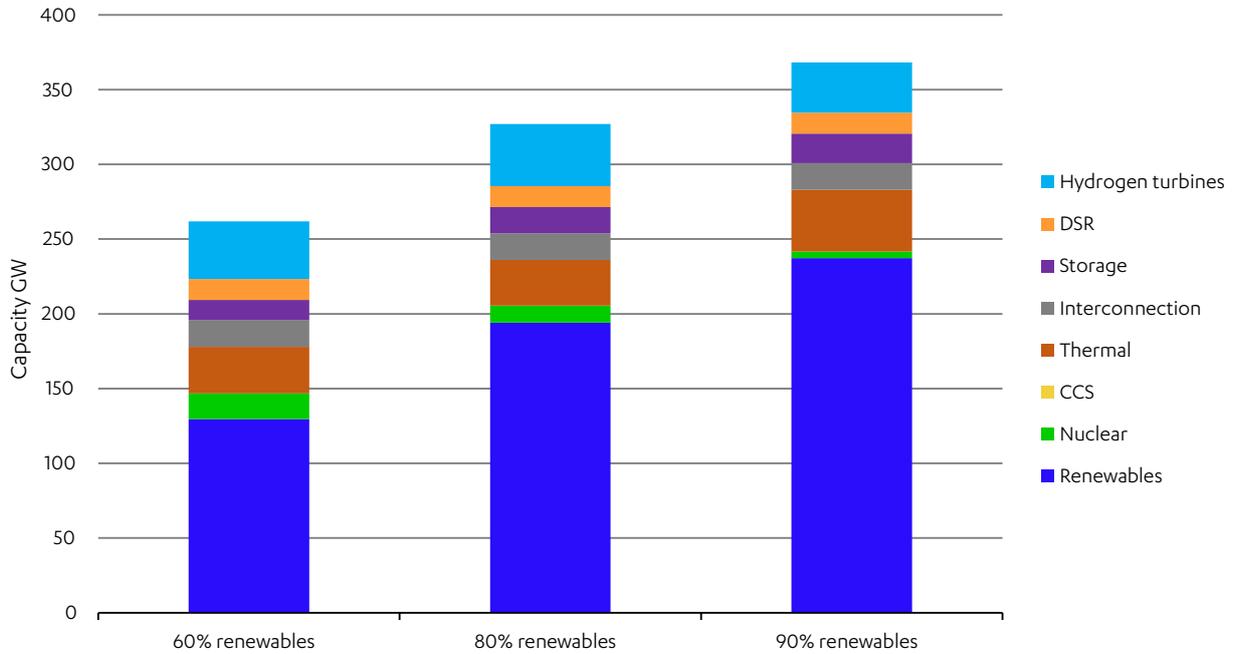

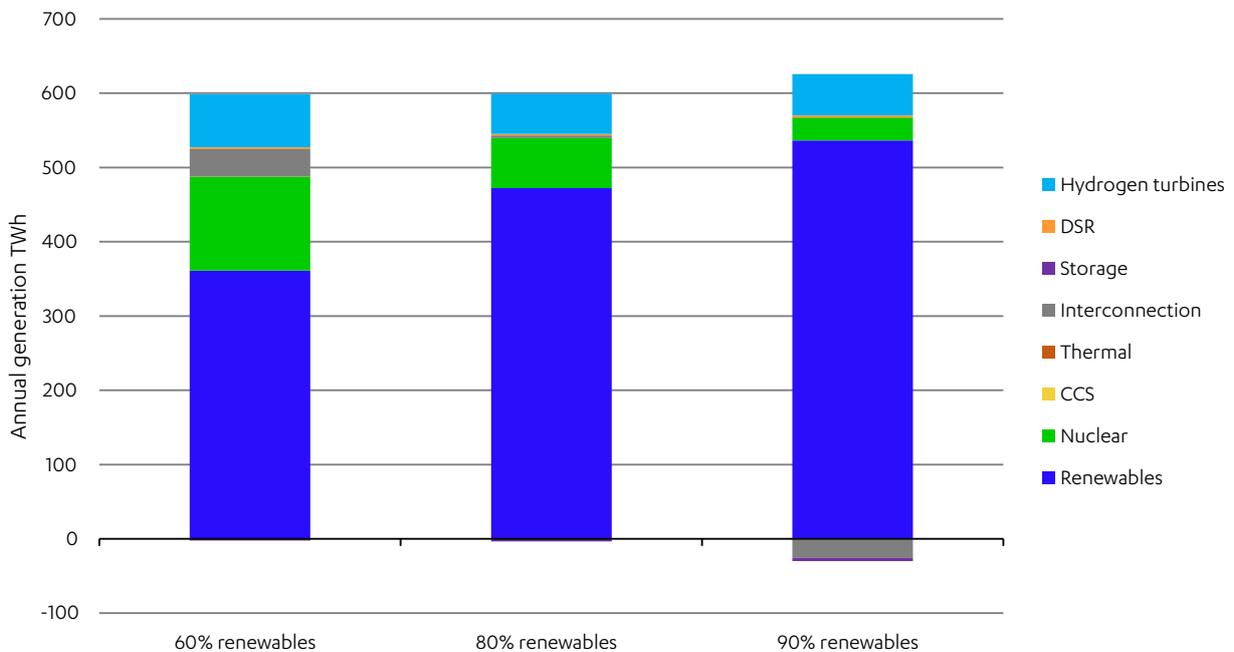

Figure 12: Generation mix with hydrogen from gas reforming in the power sector in 2050

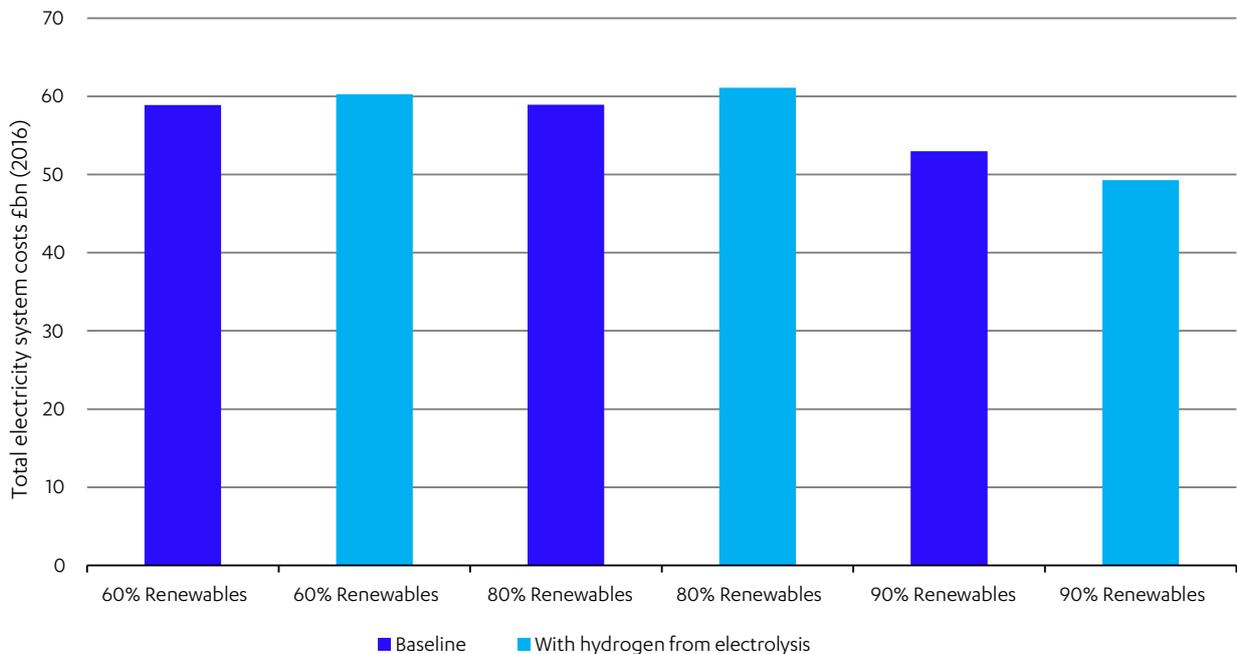

Note: If the UK is net exporting electricity this appears on the chart as a negative figure below the x-axis.

## Electrolysis in the power sector

The Commission's analysis finds that some electrolyser capacity does have the potential to reduce system cost, by up to 7 per cent (Figure 13), through using curtailed renewable generation. This is most likely in systems with higher renewables deployment and hence higher levels of curtailment, as this allows the electrolysers to achieve higher load factors.

**Figure 13: Electricity system costs with electrolysis in the power sector**

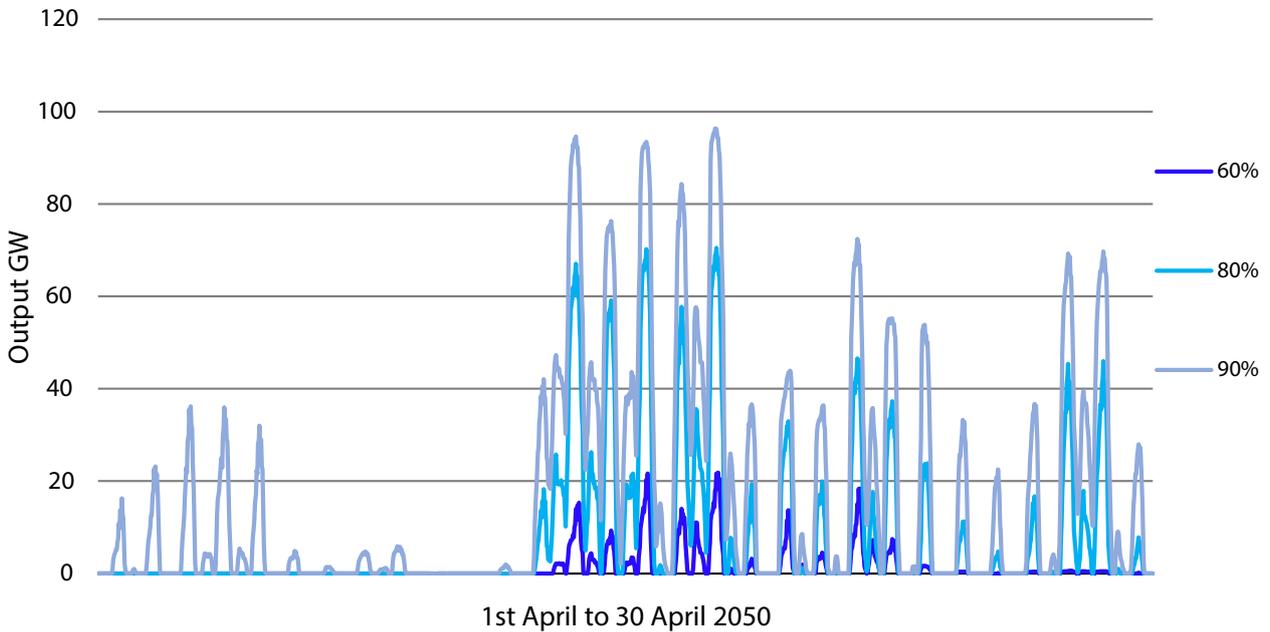

Electrolysers in this analysis capture 90 per cent of the curtailed renewable generation. In lower renewable penetration scenarios deployment of electrolysers is found to marginally increase costs as there is not enough curtailed generation to cover the capital investment required to build the electrolysers.

- The utilisation rate of the electrolysers has a significant impact on how cost-effective they are. Curtailment of renewables varies dramatically throughout the year (Figure 14). To capture all curtailed generation, including the largest of these peaks, would require around 95 GW capacity of electrolysers. But these would be achieving a utilisation rate of less than 1 per cent and would therefore be uneconomic. In this analysis, electrolysers are sized to capture 90 per cent of curtailed generation, leading to annual utilisation rates of around 15 per cent.
- The hydrogen produced from these electrolysers is burned in hydrogen compatible gas turbines. These hydrogen gas turbines then primarily displace nuclear and gas CCS generation.

This work only highlights one potential use of curtailed generation. Other technologies, for example inter-seasonal storage such as compressed air storage,<sup>40</sup> may find an economic use for curtailed generation. The value proposition for electrolytic hydrogen outside the power sector, such as for use in heavy goods vehicles, also needs to be fully understood. But this analysis highlights that curtailed generation should not be considered as a cost in isolation as it is highly likely that economic uses of it will emerge.

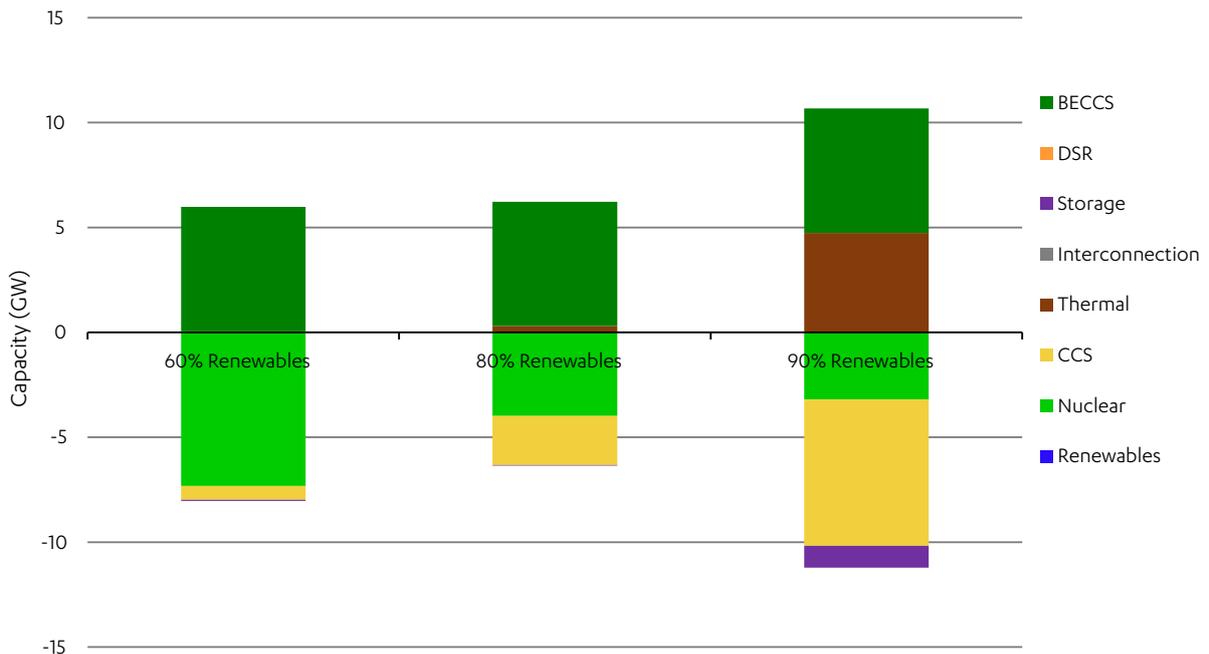

Figure 14: Profile of curtailed renewable generation in modelled April 2050

## Bioenergy with carbon capture and storage in power

The analysis concludes that deploying bioenergy with carbon capture and storage in the power sector has little impact on total electricity system costs, but that it would likely weaken the case for a large nuclear fleet in the long term.(Figure 15).

Figure 15: Change in capacity in 2050 when introducing BECCS into the electricity system

The modelling finds that BECCS will likely run baseload – meaning it would aim to generate constant output rather than flex to meet demand. As a result, it displaces other inflexible technologies such as nuclear that compete for baseload. Whilst BECCS has the technical capability of providing some system flexibility, the costs of building additional capacity outweigh the potential revenue from capturing peak prices. The Commission has not considered whether BECCS should be deployed in the power sector but sought to understand the impacts if it was:

- The BECCS deployed runs baseload in all scenarios. The analysis finds that the cost of building extra BECCS capacity to allow a plant to run flexibly, by ramping up and down to meet demand, exceeds any revenue gained from capturing peak prices. This is compounded as BECCS is unlikely to be as flexible as other technologies such as traditional CCS plants.<sup>41</sup>
- As a result, introducing BECCS into the generation mix reduces the capacity of nuclear by 3 – 7 GW across all scenarios, and reduces the capacity of gas CCS by up to 7 GW across all scenarios.
- There could be other sectors that BECCS may have more value in. Similar in depth analysis needs to be conducted on a sector by sector basis to provide insight into where BECCS has the highest value across the whole economy.

## Conclusions

**Highly renewable electricity systems are at least as cost effective as those with lower proportions of renewables.** This conclusion is unchanged from the analysis conducted for the Assessment. As is expected when carrying out modelling exercises there have been some changes at the margins, with capacity mixes and deployment timelines of various technologies changing slightly. But these have not affected the overall conclusion used to inform the Commission’s recommendations.

**The modelling also finds that there could be a role for either hydrogen or BECCS in the power system, with hydrogen offering the potential to lower electricity system costs:**

- Hydrogen gas turbines, with a plentiful supply of cheap low carbon hydrogen could play a major role in future power systems. They can act as a natural complement to renewables, helping to reduce whole system costs, but further action is required to demonstrate the technology at scale.
- Electrolysis, producing hydrogen from curtailed electricity, could help to reduce system costs in highly renewable mixes. However, it will be challenging to absorb all curtailed renewable generation at low cost due to the volatility of its production.
- Deploying BECCS in the power sector has little impact on costs, but it would likely displace other baseload generation such as nuclear.

# Net power systems with decarbonised gas heating

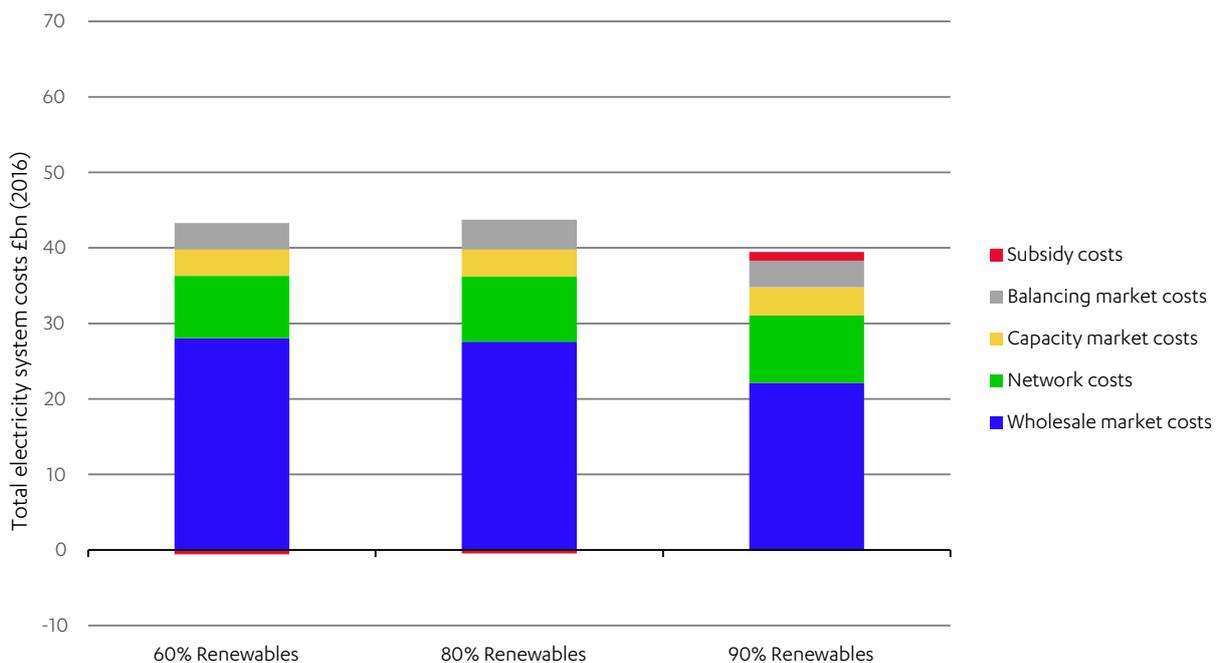

This chapter summarises the results from the power sector analysis with the Greener Gas demand scenario. As set out in table 1, the two primary changes are lower demand, at around 465 TWh, and a corresponding tighter emissions constraint of 1 MtCO<sub>2</sub>. All other assumptions, including technology costs, are held the same. The results in this section are similar to the results for the electrification of heat demand scenarios and therefore only the key results are presented.

## Power system in the Greener Gas scenario

The modelling finds that the costs of low carbon electricity systems, averaged between 2030 and 2050, are again broadly flat across the 60, 80 and 90 per cent renewables penetration scenarios (Figure 16).

- The overall system costs of the electrification of heat and greener gas scenarios should not be directly compared. The costs of providing low carbon electricity for heat are included in the electrification of heat analysis (Figure 4) but the costs of generating low carbon hydrogen for heating are not included in the greener gas scenario (Figure 16).

Figure 16: Costs of net zero power systems

The generation (Figure 18) and capacity (Figure 17) mixes in the Greener Gas scenario have similar proportions of technologies to the electrification of heat scenarios but lower overall levels. As the demand for electricity in these scenarios is lower, less capacity is built out to meet it:

- Across the three scenarios 57 – 124 GW of solar, 15 – 22 GW of onshore wind, and 41 – 62 GW of offshore wind are deployed by 2050.
- To ensure security of supply there is still a significant capacity of unabated thermal plants on the system by 2050. However, this only provides up to 2 TWh of annual generation as it is primarily deployed as back up capacity.
- At least 5 GW of gas CCS capacity is needed by 2050 across all scenarios. Similarly to the electrification scenarios this is primarily playing a peaking role by 2050 due to the residual emissions of generating baseload.
- Between 5 – 21 GW of nuclear capacity is deployed by 2050 across the three scenarios.
- The capacity of all technologies is lower in the Greener Gas scenarios than in the electrification of heat. The capacities therefore fall within the resource constraints discussed in Annex 3.

With a significantly smaller power sector there is less overall curtailed generation (Figure 19). However, there is little difference in the percentage levels of curtailed renewables. In the electrification of heat scenarios between 1 – 17 per cent of renewable generation is curtailed. In the Greener Gas scenario this is around 0 – 14 per cent.

**Figure 17: Capacity mix in 2050 of modelled scenarios**

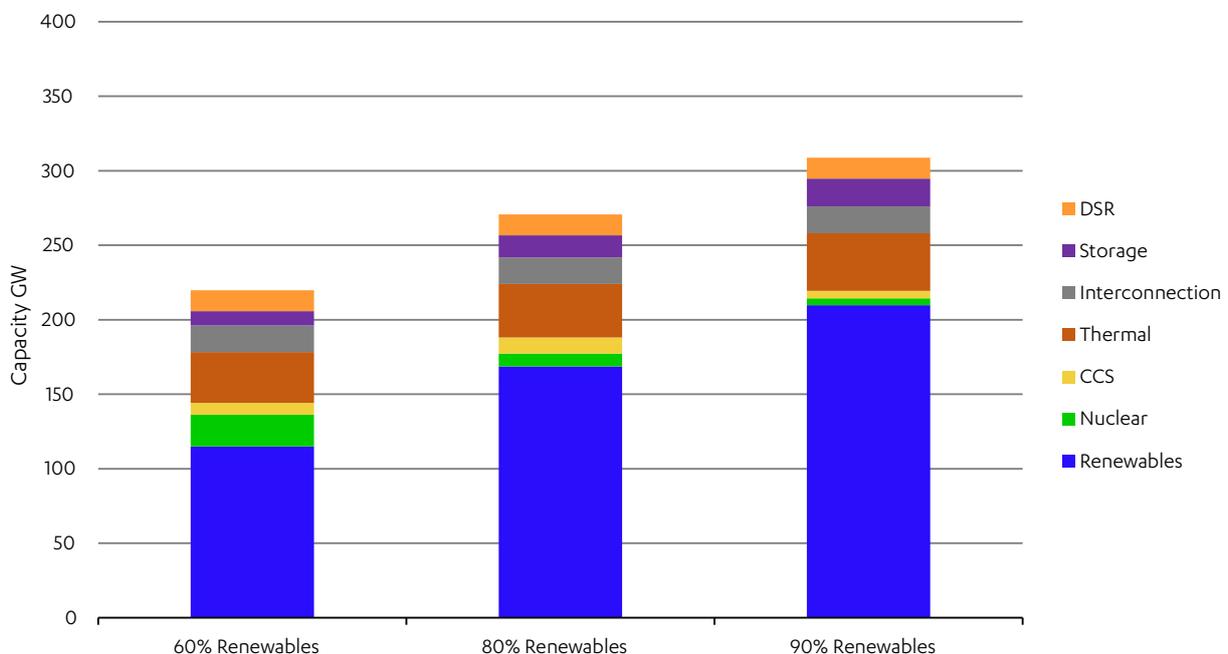

Figure 18: Generation mix in 2050 of modelled scenarios

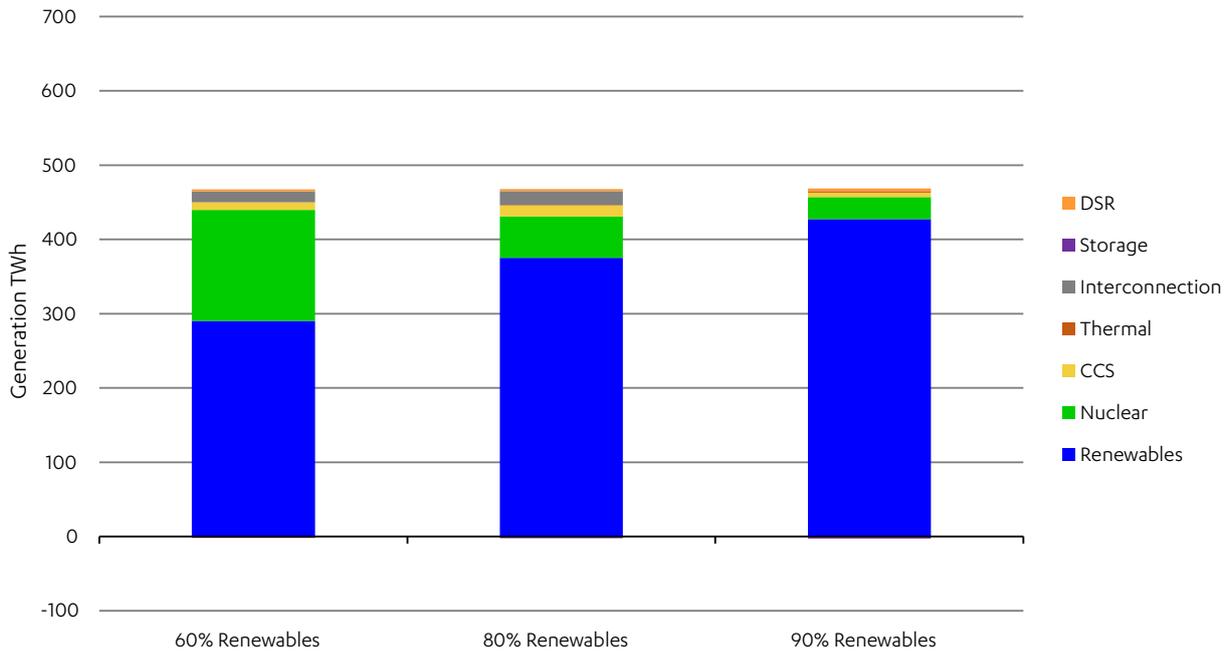

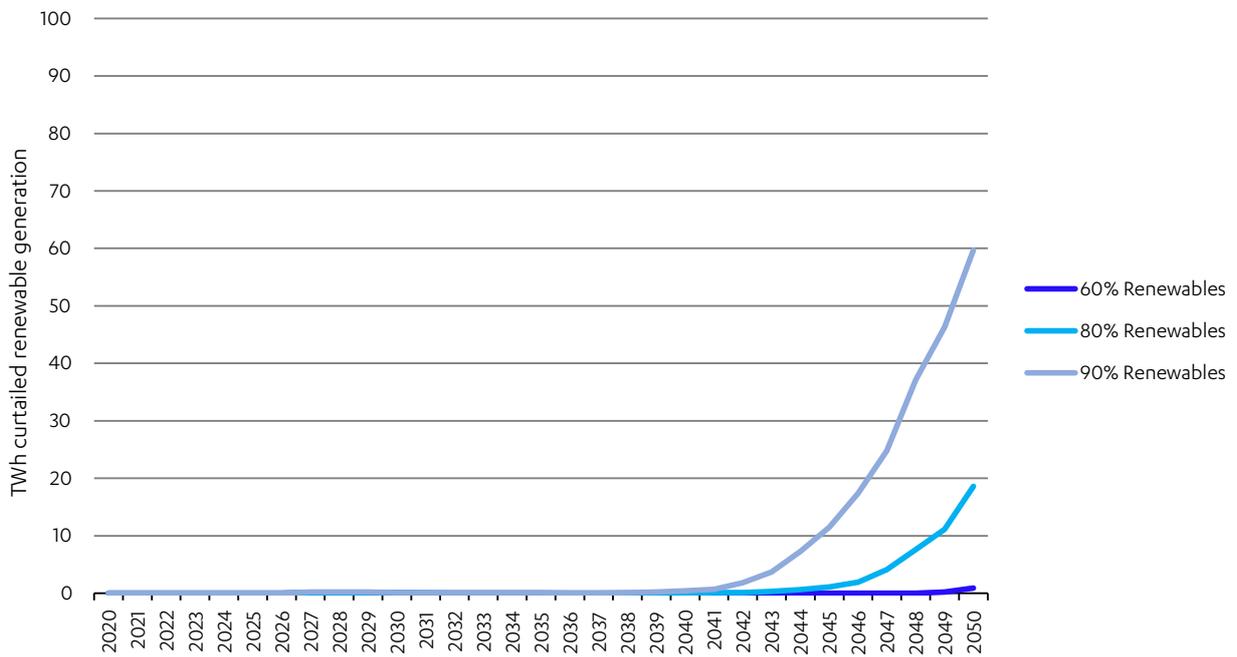

Figure 19: Curtailment of renewables across modelled scenarios

## Hydrogen technology in the power sector

Hydrogen technologies are once again found to have the potential to materially reduce overall electricity system costs:

- Gas reforming can significantly reduce costs by 21 – 28 per cent (Figure 20). However, costs still reduce with higher levels of renewables suggesting that at scale hydrogen is a complement to rather than replacement for renewables.
- Electrolysis reduces costs marginally at the highest levels of renewable deployment, by around 2 per cent, but at lower penetrations there is not enough curtailment to make it economic (Figure 21).
- The hydrogen generation displaces many other forms of non renewable generation and capacity (Figure 22, Figure 23). Up to 8 GW of nuclear capacity is displaced and all gas CCS capacity is replaced by hydrogen gas turbines.

**Figure 20: Electricity system costs with hydrogen from gas reforming in the power sector**

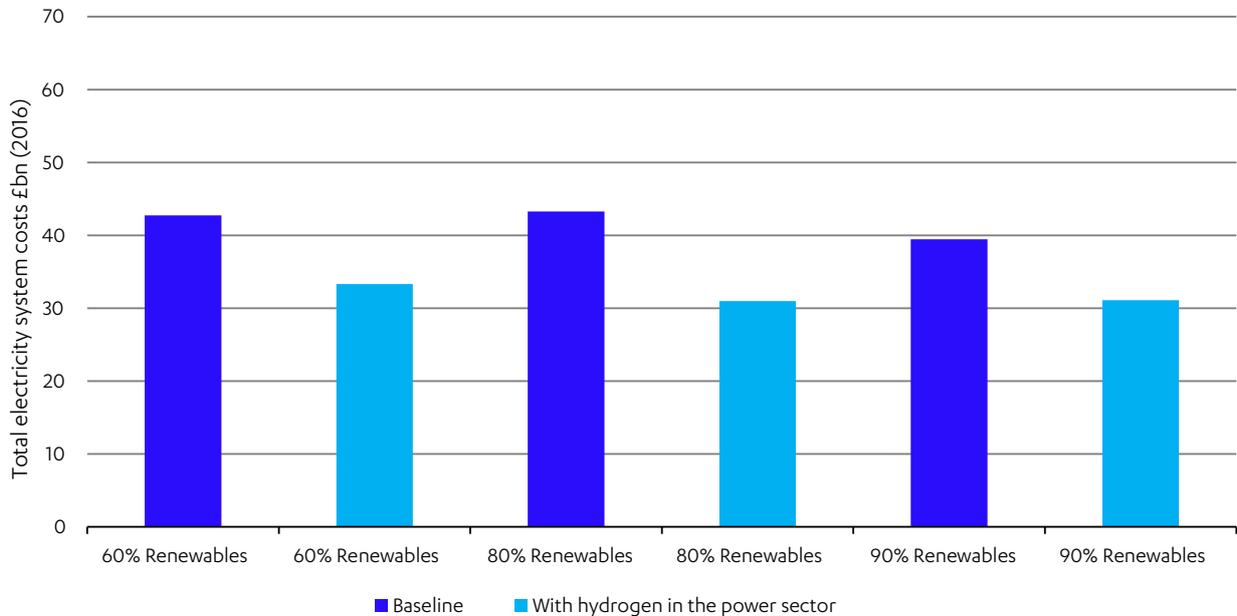

Figure 21: Electricity system costs with electrolysis in the power sector

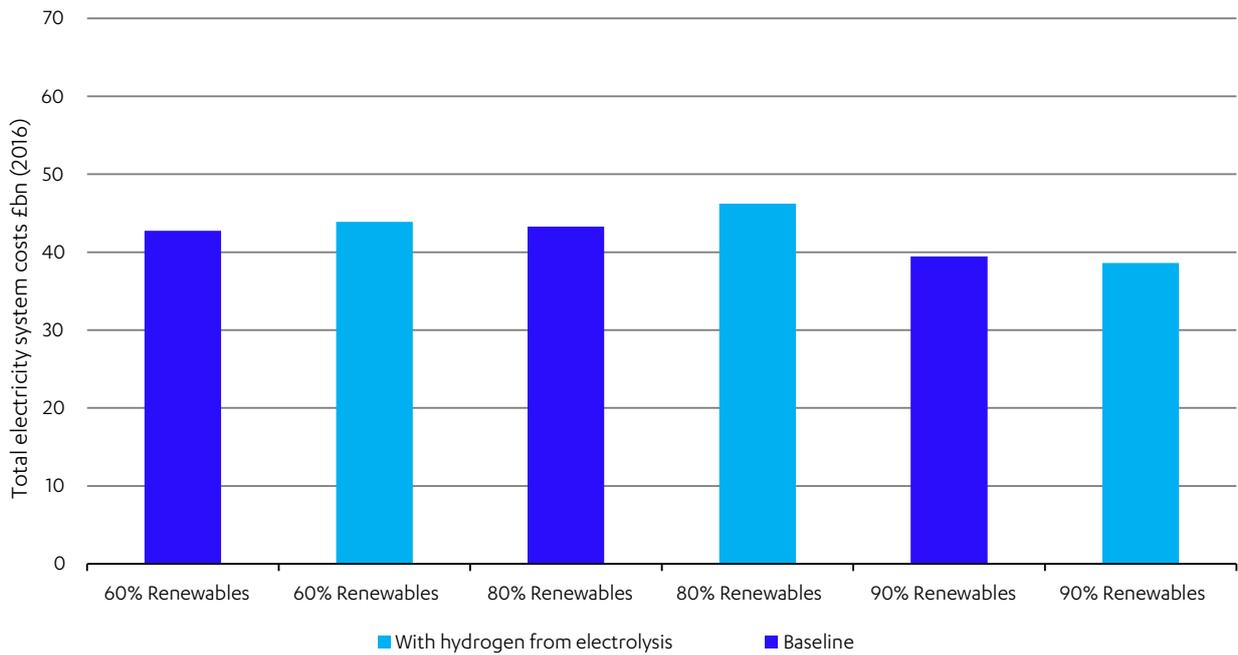

Figure 22: Capacity mix with hydrogen from gas reforming in the power sector in 2050

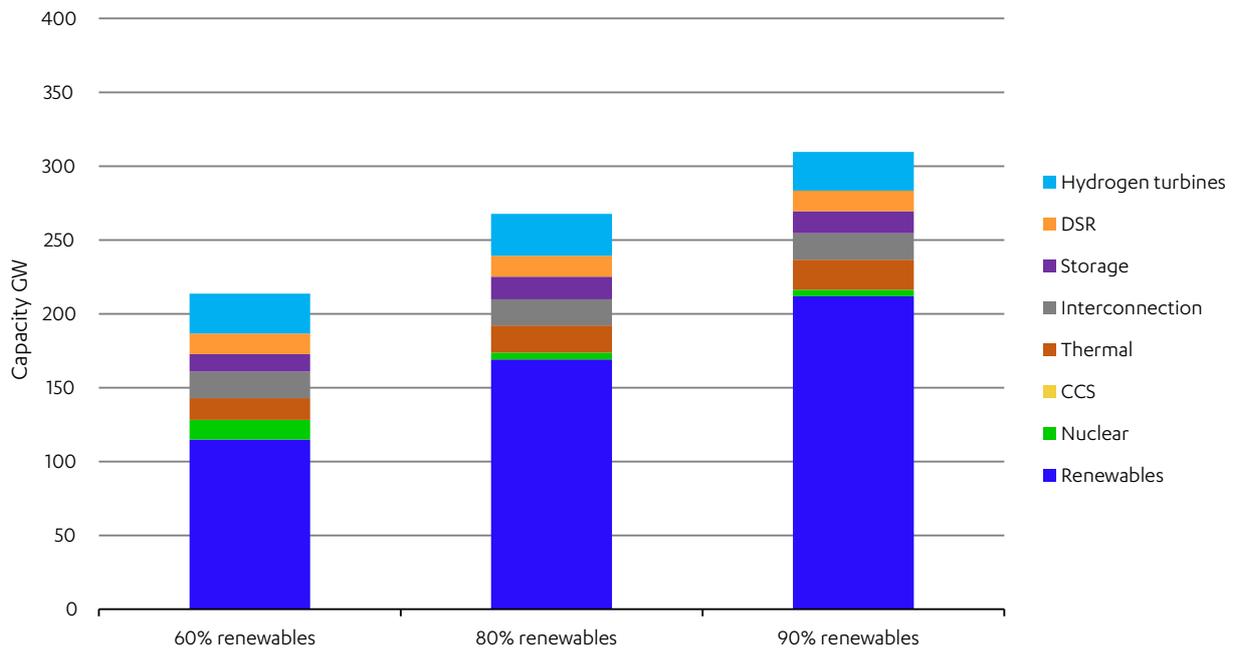

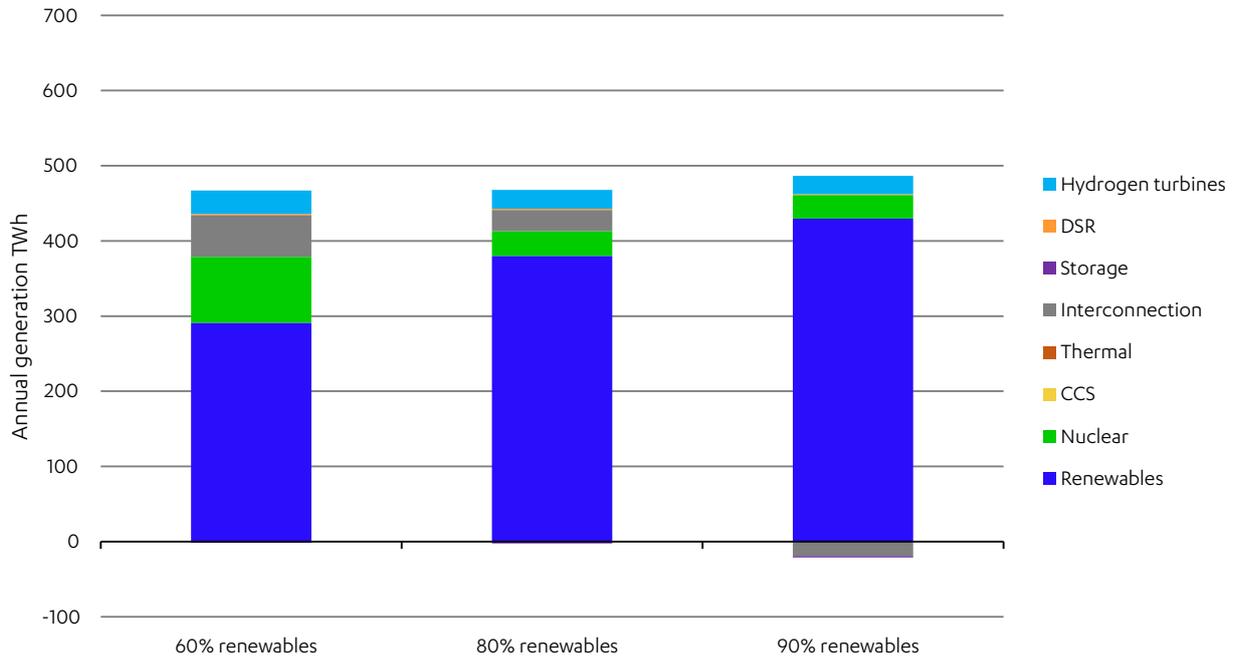

Figure 23: Generation mix with hydrogen from gas reforming in the power sector in 2050

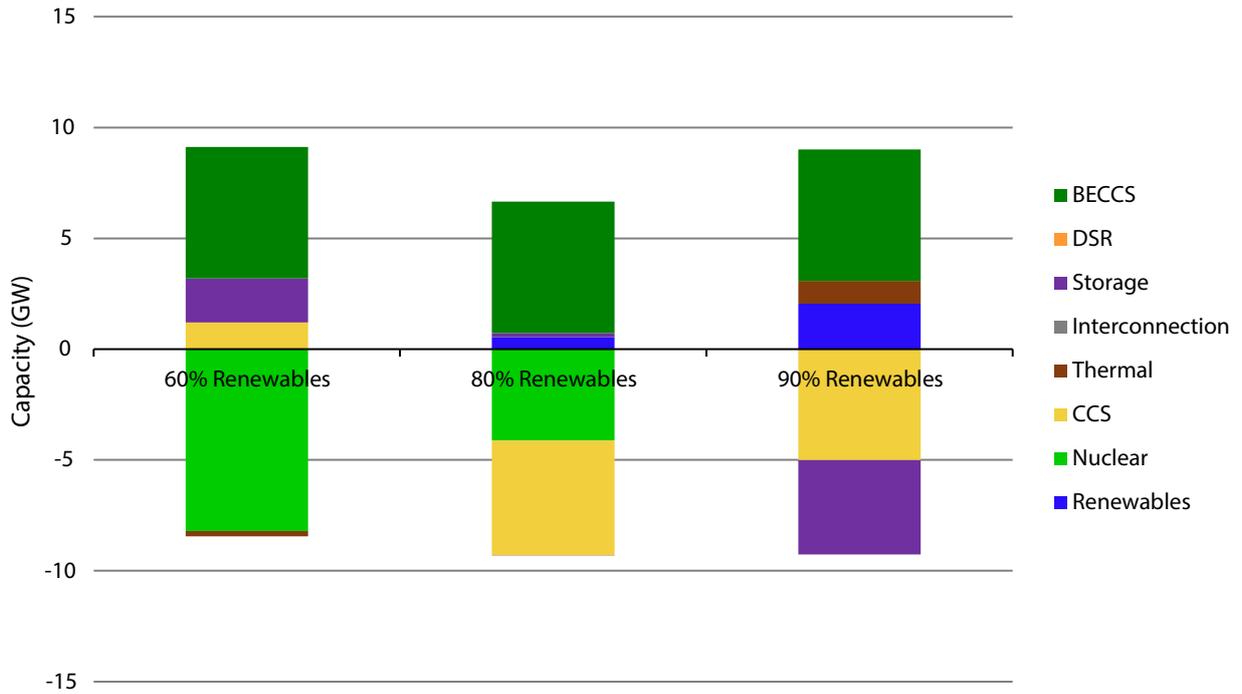

Note: If the UK is net exporting electricity this appears on the chart as a negative figure below the x-axis.

## Bioenergy with Carbon Capture and Storage in the Power Sector

The analysis finds that deploying BECCS in power will marginally increase overall power systems cost due to the relatively higher capital costs and again displaces nuclear capacity (Figure 24). Similarly to the electrification of heat scenarios, the BECCS capacity runs baseload in all scenarios.

Figure 24: Change in capacity in 2050 when introducing BECCS into the electricity system

## Annex 1: Key assumptions

Table 1: Key assumptions for the electrification scenario

Parameter/Scenario	Assumptions for electrification	Assumptions for Greener Gas	Comments
Annual generation (TWh)	595	465	These total demand scenarios are comparable to the demand in the CCC indicative net zero scenario (650 TWh) <sup>42</sup> and the National Grid ESO Future Energy Scenarios 2019 (400 – 450 TWh) <sup>43</sup>
Emissions constraint (MtCO <sub>2</sub> )	2.9	1	In the electrification scenarios as demand is similar to that in the CCC indicative net zero pathway a 2.9 MtCO <sub>2</sub> constraint is used, as the Greener Gas scenario has a smaller power sector a lower emissions constraint of 1 MtCO <sub>2</sub> is used.
Electric vehicle deployment	Assumed 100% new sales are EVs by 2030	Assumed 100% new sales are EVs by 2030	In line with recommendations made in the Assessment by 2030 100 per cent of new car sales are electric vehicles.
Number of heatpumps	33 million 4kW heatpumps are installed in homes	N/A	These assumptions are based on Cost analysis of future heat infrastructure option <sup>44</sup>
Energy efficiency measures	Heat demand is lowered by around 100 TWh against the counterfactual from energy efficiency measures.		These assumptions are based on Cost analysis of future heat infrastructure options <sup>45</sup>
Gas prices	BEIS central gas prices are assumed, reaching 63p/therm by 2050.		BEIS fossil fuel price assumptions <sup>46</sup>
Interconnector capacity assumed	17.9 GW	17.9 GW	This is based on the capacity of interconnectors either already in operation, under construction or with regulatory approval from Ofgem <sup>47</sup>
Baseline level of nuclear to 2050	4.6 GW	4.6 GW	Assuming Sizewell B and Hinkley Point C are both online in 2050

## Annex 2: Hydrogen and BECCS

### Hydrogen assumptions and methodology

In each of the two scenarios modelled the hydrogen generated is burned in a 100 per cent hydrogen compatible gas turbine to generate electricity. Gas turbines, specifically combined cycle gas turbines (CCGT), are a mature technology which generate a significant amount of the UK's electricity.<sup>48</sup> These plants burn natural gas to generate electricity. However, engineering assessments have suggested that natural gas could be replaced with up to 100 per cent hydrogen at little additional cost.<sup>49</sup> Whilst this may result in high NOx emissions, which have significant air quality impacts, NOx capture facilities or diluted fuels could likely be used to mitigate this impact.<sup>50</sup> A number of organisations have made public commitments to developing hydrogen turbines in the 2020s.<sup>51</sup> Siemens have already developed a prototype turbine capable of running on 100 per cent hydrogen.<sup>52</sup>

Given the lack of technical maturity of this technology similar costs and running parameters to a traditional CCGT plant are assumed in this analysis (Table 4). Further research, development and deployment is needed to increase confidence and certainty in the technical capability of this technology. The UK has the opportunity to be at the leading edge of this.

**Table 4: H2 CCGT running parameters in 2050**

Parameter	Value
Capital costs	£700/kW
Fixed operating costs	£25/kW
Variable operating costs	£1/MWh
Efficiency	50%

The costs and running parameters of low carbon hydrogen technology are highly uncertain. There is currently little hydrogen produced from gas reforming with CCS globally (see Box 4),<sup>53</sup> and no at scale deployment of 100 per cent hydrogen combusting gas turbines.<sup>54</sup> To fully assess the viability of a future power system with a significant role for hydrogen, and the cost savings it can bring, this must change. With near-term action the UK can be at the leading edge of proving the viability of this technology.

In the Assessment the Commission recommended that government support the development of a hydrogen production plant using gas reforming with carbon capture and storage by 2023, as part of a large scale trial to supply hydrogen for heating to at least 10,000 homes. Successful delivery of such a plant would significantly reduce levels of uncertainty and build confidence that future systems with hydrogen used at scale are realisable.

### A flexible source of low carbon electricity to complement renewables

Flexible low carbon generation is the ideal complement to renewable generation as it can respond to changing weather and demand patterns – hydrogen burning gas turbines could play this role. Baseload technologies, those that run at a near constant output throughout the year, are not as flexible.

The Commission has modelled a power sector which has both low carbon hydrogen available and hydrogen compatible gas turbines to burn this hydrogen. The work assumes that hydrogen is produced from gas reforming with CCS, as this is currently likely to be the cheapest source of hydrogen. To ensure this is consistent with economy wide decarbonisation, the emissions from producing the hydrogen used to generate electricity are accounted for in the power sector while maintaining net zero compliant emissions in the power sector.

### **Electrolysis in the power system**

Curtailed renewable generation could be used by electrolyzers to generate zero carbon hydrogen. At periods where generation significantly exceeds demand the surplus electricity can be absorbed by electrolyzers and turned into hydrogen for combustion in the power sector at a later date. Not only could this help to reduce wasted electricity, and hence costs, but it may also provide an effective long-term storage option for the power sector.

**Box 4: Producing low carbon hydrogen**

Hydrogen is a zero carbon gas capable of replacing natural gas, and other energy carriers, in a range of different processes. There is currently around 2000 TWh of hydrogen produced globally,<sup>55</sup> but this is largely made through high carbon emissions processes. There are two primary routes through which low carbon hydrogen can be produced:

- **Gas Reforming with CCS:** combines natural gas and water and converts these to hydrogen and carbon dioxide. Gas reformation is currently significantly cheaper than any other method of hydrogen production and is the most widely used method today. This production method needs to be paired with carbon capture and storage, otherwise it still emits significant amounts of carbon dioxide. Additionally, if the future costs assumptions used in this analysis are to be realised it is likely that novel reforming methods, such as Auto Thermal Reforming, would need to be developed and deployed at scale.<sup>56</sup>
- **Electrolysis:** uses an electric current to split water into hydrogen and oxygen. Provided that the electricity is from a low carbon source electrolysis has the potential to produce hydrogen with minimal carbon emissions. However, this is a more expensive and energy intensive method of hydrogen production than gas reformation.<sup>57</sup>

These assumptions for hydrogen production technologies are based on *Hydrogen Supply Chain Evidence Base*<sup>58</sup> and are similar to those used in other analysis.<sup>59</sup> Throughout, this analysis has, in order to better demonstrate the potential benefits of hydrogen in the power sector at scale, used ambitious cost assumptions for hydrogen technologies.

The overall cost of hydrogen production will also depend on gas prices, a globally traded commodity. If prices significant diverge from those assumed here, this could materially impact the conclusions of the analysis.

**Table 5: Assumptions for advanced gas reforming with CCS in 2050**

Parameter	Value
Capital costs	£338/kW
Fixed operating costs	£24/kW
Variable operating costs	£0/MWh, excluding the electricity price
Efficiency	84%
Gas price	63p/therm
Capture rate	90%

**Table 6: Assumptions for electrolysis in 2050**

Parameter	Value
Capital costs	£455/kW
Fixed operating costs	£49/kW
Variable operating costs	£0/MWh, excluding the electricity price
Efficiency	74%

## Bioenergy with carbon capture and storage methodology

Double counting negative emissions generated from biomass is a risk in a sector specific approach. It is likely that, if there is a limited supply of negative emissions, these will be needed to offset emissions in sectors other than power – some of which are outside the Commission’s remit. Therefore, the same net zero compliant emissions target for the power sector, used elsewhere in this analysis, is assumed. The negative emissions and any associated revenue streams are not included in this work. The implicit assumption is that the negative emissions are accounted for, and remunerated, elsewhere in the economy. Based on this, the modelling captures the lowest cost way to capture 50 MtCO<sub>2</sub> emission from BECCS used in the power system in 2050

### Box 5: Biomass with carbon capture and storage technology

Biomass, when considered in the context of generating energy, primarily refers to: crops grown specifically for energy, forest and agricultural residues, and organic wastes.<sup>60</sup> It can be used to generate electricity through combusting in a power plant. In 2018 biomass plants generated around 35 TWh of electricity in the UK.<sup>61</sup>

Carbon capture and storage is the process of capturing carbon from high carbon processes and storing it underground, instead of allowing it to be released into the atmosphere.

When combined with biomass, CCS technology can produce negative emissions, drawing down carbon from the atmosphere and storing it underground. Detailed consideration and lifecycle assessments would need to be made to ensure that this is creating a genuine carbon reduction – this is not the topic of this paper.

A key parameter when considering CCS technology is the capture rate, the amount of carbon dioxide that would have otherwise been released that is captured. This has a significant impact on the role that various CCS technologies could play in a net zero economy. For this analysis a 90 per cent capture rate is assumed – this is consistent with the range of current estimates.<sup>62</sup>

There are many other sources of generating negative emissions, including afforestation and reforestation, soil carbon sequestration, enhanced terrestrial weathering, and direct air capture.<sup>63</sup> However, these do not directly relate to the power sector and are therefore not the subject of this paper.

## Annex 3: Resource constraints

There will be an upper limit on the amount of each technology that can be deployed in the UK. For example, land or seabed availability will limit the amount of capacity of some technologies in the UK. The modelled levels of capacity fall within the current theoretical estimates of the total capacity of each technology that can be deployed in the UK. However, barriers may emerge in practice that need to be better understood going forward:

- A range of factors must be accounted for when considering resource constraints for renewables, these include land and seabed availability, solar irradiance, wind speeds, and water depths. The capacity of onshore wind, offshore wind and solar built across the full range of scenarios considered here fall well within current resource estimates.<sup>64</sup> However, in practice, more granular constraints may emerge. A better understanding of competing uses of the seabed and visual impacts of renewables will be needed to reach the upper end of capacity deployed in these scenarios.
- There are a range of different factors and constraints that need to be considered when assessing whether a specific location is viable and safe for a large scale nuclear plant to be deployed.<sup>65</sup> This limits the number of plants that could theoretically be constructed in the UK. Estimates suggest that currently identified nuclear sites could support up to 35 GW of nuclear capacity by 2050.<sup>66</sup> Nuclear capacity in all scenarios presented here falls within this limit.
- The primary resource constraint on deploying CCS in the UK is likely to be the capacity of CO<sub>2</sub> storage. CO<sub>2</sub> is likely to be stored offshore in depleted oil and gas fields or saline aquifers. Current estimates suggest the UK has between 1.5 – 78 GtCO<sub>2</sub> storage capacity<sup>67</sup> – significantly more than the upper limit of 7 MtCO<sub>2</sub> annually captured in any scenarios presented here.

Amendments to the version laid before Parliament in October 2017

The following corrections have been made:

p122, p142: The unit label for the metric “Biodegradable waste sent to landfill” has been corrected to read “Million Tonnes”.

p156: The text “(in real 2016 prices)” has been removed.

p156: Three values in table 11 have been corrected.

A few other minor typographic errors have also been corrected.

# Foreword from the Prime Minister

**This Government is determined to leave our natural environment in a better condition than we found it. Clean growth is not an option, but a duty we owe to the next generation, and economic growth has to go hand-in-hand with greater protection for our forests and beaches, clean air and places of outstanding natural beauty.**

There is no conflict between this aspiration and our plan to create an economy that works for everyone. But to do this we need a clear strategy that brings Government, business and society together. This Strategy sets out the action we will take to cut emissions, increase efficiency, and help lower the amount consumers and businesses spend on energy across the country.

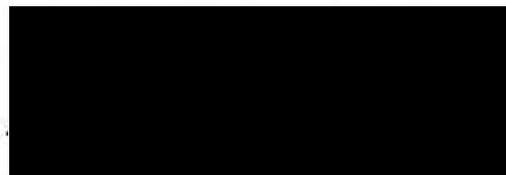

The United Kingdom has a proud record in this field. Britain was one of the first countries to recognise the challenge posed by climate change and we have led the world in taking action to reduce carbon emissions. Our investment in green energy has seen Britain produce record amounts of renewably-generated electricity. On the world stage, we were instrumental in driving through the landmark Paris Agreement.

Protecting our environment for the next generation also benefits our wider economic prosperity. The UK has helped new green industries to develop which have brought jobs and growth, even as we have taken decisive action to protect the world around us.

In this document, we set out the actions we are taking to put clean growth at the centre of our modern Industrial Strategy: changing the way we heat our homes, power our cars, and run our electricity grid. But we cannot achieve this through Government action alone. We must harness the ingenuity and determination of all our people and businesses across the country if we are to build a better, greener Britain. The Government will help British businesses and entrepreneurs to seize the opportunities which the global low carbon economy presents, from electric vehicles to offshore wind.

Success in this mission will improve our quality of life and increase our economic prosperity. It will mean cleaner air, lower energy bills, greater economic security and a natural environment protected and enhanced for the future.

## Seizing the clean growth opportunity

The move to cleaner economic growth is one of the greatest industrial opportunities of our time. This Strategy will ensure Britain is ready to seize that opportunity.

Our modern Industrial Strategy is about increasing the earning power of people in every part of the country. We need to do that while not just protecting, but improving the environment on which our economic success depends. In short, we need higher growth with lower carbon emissions. This approach is at the heart of our Strategy for clean growth.

The opportunity for people and business across the country is huge. The low carbon economy could grow 11 per cent per year between 2015 and 2030, four times faster than the projected growth of the economy as a whole.

This is spread across a large number of sectors: from low cost, low carbon power generators to more efficient farms; from innovators creating better batteries to the factories putting them in less polluting cars; from builders improving our homes so they are cheaper to run to helping businesses become more productive.

This growth will not just be seen in the UK. Following the success of the Paris Agreement, where Britain played such an important role in securing the landmark deal, the transition to a global low carbon economy is gathering momentum. We want the UK to capture every economic opportunity it can from this global shift in technologies and services.

### Greg Clark

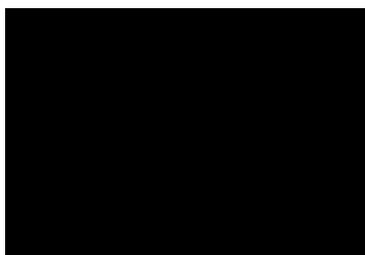

Secretary of State  
for Business, Energy  
and Industrial Strategy

Our approach to clean growth is an important element of our modern Industrial Strategy: building on the UK's strengths; improving productivity across the country; and ensuring we are the best place for innovators and new businesses to start up and grow.

A good example of this is offshore wind, where costs have halved in just a few years. A combination of sustained commitment – across different Governments – and targeted public sector innovation support, harnessing the expertise of UK engineers working in offshore conditions and private sector ingenuity, has created the conditions for a new industry to flourish, while cutting emissions. We need to replicate this success in sectors across our economy.

This Strategy delivers on the challenge that Britain embraced when Parliament passed the Climate Change Act. If we get it right, we will not just deliver reduced emissions, but also cleaner air, lower energy bills for households and businesses, an enhanced natural environment, good jobs and industrial opportunity. It is an opportunity we will seize.

# Executive Summary

Clean growth means growing our national income while cutting greenhouse gas emissions<sup>1</sup>. Achieving clean growth, while ensuring an affordable energy supply for businesses and consumers, is at the heart of the UK's Industrial Strategy. It will increase our productivity, create good jobs, boost earning power for people right across the country, and help protect the climate and environment upon which we and future generations depend.

## UK Leadership and Progress

Our Strategy for clean growth starts from a position of strength.

The UK was one of the first countries to recognise and act on the economic and security threats of climate change. The Climate Change Act, passed in 2008, committed the UK to reducing greenhouse gas emissions by

at least 80 per cent by 2050 when compared to 1990 levels, through a process of setting five year caps on greenhouse gas emissions termed 'Carbon Budgets'. This approach has now been used as a model for action across the world, and is mirrored by the United Nations' Paris Agreement.

We have been among the most successful countries in the developed world in growing our economy while reducing emissions. Since 1990, we have cut emissions by 42 per cent<sup>2</sup> while our economy has grown by two thirds<sup>3</sup>. This means that we have reduced emissions faster than any other G7 nation, while leading the G7 group of countries in growth in national income over this period<sup>4</sup>.

This progress has meant that we have outperformed the target emissions reductions of our first carbon budget (2008 to 2012) by one per cent<sup>5</sup> and we project that we will outperform against our second and third budgets, covering the years 2013 to 2022, by almost five per cent and four per cent respectively<sup>6</sup>. Our economy is expected to grow by 12 per cent over that time<sup>7</sup>. This will be a significant achievement.

We have made progress across every sector of our economy.

<sup>1</sup> There are several greenhouse gases (GHGs) that contribute to climate change, the most abundant of which is carbon dioxide. Because of this, we measure emissions of GHGs in terms of millions of tonnes of carbon dioxide equivalent (Mt). One tonne of carbon dioxide fills roughly the same space as a small house.

**Figure 1: UK and G7 economic growth and emissions reductions<sup>8</sup>**

- In 2016, 47 per cent of our electricity came from low carbon sources, around double the level in 2010<sup>9</sup>, and we now have the largest installed offshore wind capacity in the world. Our homes and commercial buildings have become more efficient in the way they use energy which helps to reduce emissions and also cut energy bills, for example average household energy consumption

has fallen by 17 per cent since 1990<sup>10</sup>. Automotive engine technology has helped drive down emissions per kilometre driven by up to 16 per cent and driving a new car bought in 2015 will save car owners up to £200 on their annual fuel bill, compared to a car bought new in 2000<sup>11</sup>. England also recycles nearly four times more than it did in 2000<sup>12</sup>.

<sup>9</sup> BEIS (2017); Digest of UK Energy Statistics 2017 <https://www.gov.uk/government/statistics/energy-chapter-1-digest-of-united-kingdom-energy-statistics-dukes>

<sup>10</sup> BEIS (2017) Energy Consumption in the UK <https://www.gov.uk/government/statistics/energy-consumption-in-the-uk> Change in average consumption per household 1990-2016

<sup>11</sup> Annual average household saving from driving a car purchased new in 2015 (the latest year for which data is available) compared to driving a car purchased new in 2000. Fuel savings valued using 2015 prices. DfT (2017) National Travel Survey; DfT (2017) Vehicles Statistics; ICCT (2015) From Laboratory to Road; BEIS (2016) Green Book supplementary appraisal guidance

<sup>12</sup> Defra (2016) ENV18 - Local authority collected waste: annual results tables: <https://www.gov.uk/government/statistical-data-sets/env18-local-authority-collected-waste-annual-results-tables>

- This progress has been aided by the falling costs of many low carbon technologies: renewable power sources like solar and wind are comparable in cost to coal and gas in many countries<sup>13</sup>; energy efficient light bulbs are over 80 per cent cheaper today than in 2010<sup>14</sup>; and the cost of electric vehicle battery packs has tumbled by over 70 per cent in this time<sup>15</sup>.
- As a result of this technological innovation, new high value jobs, industries and companies have been created. And this is driving a new, technologically innovative, high growth and high value “low carbon” sector of the UK economy. Not only are we rapidly decarbonising parts of the domestic economy, but thanks to our world leading expertise in technologies such as offshore wind, power electronics for low carbon vehicles and electric motors, and global leadership in green finance, we are successfully exporting goods and services around the world – for example, one in every five electric vehicles driven in Europe is made in the UK<sup>16</sup>. This progress now means there are more than 430,000 jobs in low carbon businesses and their supply chains, employing people in locations right across the country<sup>17</sup>.

This progress has altered the way that we see many of the trade-offs between investing in low carbon technologies that help secure our future but that might incur costs today. It is clear that actions to cut our emissions can be a win-win: cutting consumer bills, driving economic growth, creating high value jobs and helping to improve our quality of life.

Of course, greenhouse gas emissions are a global problem and action is needed from all countries. The UK has played a key role in demonstrating international leadership on tackling climate change through its domestic action, climate diplomacy and financial support. The UK was among the first to recognise climate change as an economic and political issue as opposed to solely an environmental one and has used its world leading economic, science and technical skills to shape the global debate around climate change, for instance making the economic case for climate action in the landmark Stern Report in 2006<sup>18</sup>. The UK has also used its influence and resources to help developing countries with their own clean growth – and our actions to date are expected to save almost 500 million tonnes of carbon dioxide over the lifetime of the projects<sup>19</sup>, more than the entire annual emissions of France<sup>20</sup>. While we do not count these results against our domestic targets, we can be proud of the impact of the UK’s commitment to global climate action.

## The Opportunities and Challenges

The UK played a central role in securing the 2015 Paris Agreement in which, for the first time, 195 countries (representing over 90 per cent of global economic activity<sup>21</sup>) agreed stretching national targets to keep the global temperature rise below two degrees. The actions and investments that will be needed to meet the Paris commitments will ensure the shift to clean growth will be at the forefront of policy and economic decisions made by governments and businesses in the coming decades. This creates enormous potential economic opportunity — an estimated \$13.5 trillion of public and private investment in the global energy sector alone will be required between 2015 and 2030 if the signatories to the Paris Agreement are to meet their national targets<sup>22</sup>. The decision by the US to withdraw from the Paris Agreement served to bring together and bolster action internationally on climate change with many countries underlining their commitment to the Paris Agreement in the days and weeks that followed.

The UK is well placed to take advantage of this economic opportunity. Our early action on clean growth means that we have nurtured a broad range of low carbon industries, including some sectors in which we have world leading positions. This success is built upon wider strengths – our scientific research base<sup>23</sup>, expertise in high-value service and financial industries<sup>24</sup>, and a regulatory framework that provides long-term direction and support for innovation and excellence in the design and manufacturing of leading edge technology.

Capturing part of the global opportunity while continuing to drive down carbon emissions from our own activities could provide a real national economic boost. The UK low carbon economy could grow by an estimated 11 per cent per year between 2015 and 2030 – four times faster than the rest of the economy<sup>25</sup> – and could deliver between £60 billion and £170 billion of export sales of goods and services by 2030<sup>26</sup>. This means that clean growth can play a central part in our Industrial Strategy – building on our strengths to drive economic growth and boost earning power across the country.

Action to deliver clean growth can also have wider benefits. For example, the co-benefit of cutting transport emissions is cleaner air, which has an important effect on public health, the economy, and the environment.

But hitting our carbon budgets and expanding the low carbon economy will not be easy. We have achieved significant results in the power and waste sectors and now need to replicate this success across the economy, particularly in the transport, business and industrial sectors. We also need to reduce the emissions created by heating our homes and businesses, which account for almost a third of UK emissions. If done in the right way, cutting emissions in these areas can benefit us all through reduced energy bills, which will help improve the UK's productivity, and improved air quality, while the innovation and investment required to drive these emissions down can create more jobs and more export opportunities.

<sup>26</sup> Ricardo Energy and Environment for the Committee on Climate Change (2017) UK business opportunities of moving to a low-carbon economy (supporting data tables) <https://www.theccc.org.uk/publication/uk-energy-prices-and-bills-2017-report-supporting-research/>

Figure 2: UK emissions by sector, 2015<sup>27</sup>

In order to meet the fourth and fifth carbon budgets (covering the periods 2023-2027 and 2028-2032) we will need to drive a significant acceleration in the pace of decarbonisation and in this Strategy we have set out stretching domestic policies that keep us on track to meet

our carbon budgets. However, we are prepared to use the flexibilities available to us to meet carbon budgets, subject to the requirements set out in the Climate Change Act, if this presents better value for UK taxpayers, businesses and domestic consumers.

<sup>27</sup> BEIS (2017) UK Greenhouse Gas Inventory Statistics (1990-2015) <https://www.gov.uk/government/collections/final-uk-greenhouse-gas-emissions-national-statistics>; BEIS analysis

Every action that we take to cut emissions must be done while ensuring our economy remains competitive. As we set out in our Industrial Strategy Green Paper, we attach great importance to making sure our energy is affordable<sup>28</sup>. This is why the Government has commissioned an independent review into the cost of energy led by Professor Dieter Helm CBE. This review will recommend ways to deliver the Government's carbon targets and ensure security of supply at minimum cost to both industry and domestic consumers. Once Ministers have had the opportunity to consider the review's proposals, the Government will incorporate its recommendations into the further development of the Clean Growth Strategy as appropriate.

Another imminent challenge is to manage any impact of leaving the European Union as the Government fulfils its commitment to the British people. Leaving the EU will not affect our statutory commitments under our own domestic Climate Change Act and indeed our domestic binding emissions reduction targets are more ambitious than those set by EU legislation. The exact nature of the UK's future relationship with the EU and the long-term shape of our involvement in areas like the EU Emissions Trading System are still to be determined. There are also emerging opportunities to drive more action – for example by putting emission reductions and land stewardship at the heart of a post EU agricultural support policy. We will therefore carefully examine each area of common interest with our EU partners and work to deliver policies and programmes that are at least as beneficial as the current arrangements.

## Our Clean Growth Strategy

This Strategy sets out a comprehensive set of policies and proposals that aim to accelerate the pace of “clean growth”, i.e. deliver **increased** economic growth and **decreased** emissions.

### Our Approach

In the context of the UK's legal requirements under the Climate Change Act, the UK's approach to reducing emissions has two guiding objectives:

1. To meet our domestic commitments at the lowest possible net cost to UK taxpayers, consumers and businesses; and,
2. To maximise the social and economic benefits for the UK from this transition.

In order to meet these objectives, the UK will need to nurture low carbon technologies, processes and systems that are as cheap as possible.

We need to do this for several reasons. First, we need to protect our businesses and households from high energy costs. Second, if we can develop low cost, low carbon technologies in the UK, we can secure the most industrial and economic advantage from the global transition to a low carbon economy. Third, if we want to see other countries, particularly developing countries, follow our example, we need low carbon technologies to be cheaper and to offer more value than high carbon ones.

We cannot predict every technological breakthrough that will help us meet our targets. Instead, we must create the best possible

<sup>28</sup> BEIS (2017) Building our Industrial Strategy <https://www.gov.uk/government/consultations/building-our-industrial-strategy>

environment for the private sector to innovate and invest. Our approach will maintain that of our Industrial Strategy: building on the UK's strengths, improving productivity across the UK and ensuring we are the best place for innovators and new business to start-up and grow. We are clear about the need to design competitive markets and smart regulation to support entrepreneurs and investors who will develop the new technologies at the scale we need. This will help our wider aim of improving the UK's earning power.

It is only through innovation – nurturing better products, processes and systems – that we will see the cost of clean technologies come down. That is why this Strategy sets out for the first time how over £2.5 billion will be invested by the Government to support low carbon innovation from 2015 to 2021. More broadly, the National Productivity Investment Fund will provide an additional £4.7 billion, with an extra £2 billion a year by 2020-21, representing the largest increase in public spending on UK science, research and innovation since 1979<sup>29</sup>. The UK is also working collaboratively as a core member of “Mission Innovation”<sup>30</sup>, a group of leading countries which aims to drive forward clean energy innovation on a global scale.

In addition to supporting innovation, we are focused on policies that deliver social and economic benefits beyond the imperative to reduce emissions. Higher quality, more energy efficient buildings are healthier places to live and work. Reducing the amount of heat we waste will reduce bills. Accelerating the rollout of low emission vehicles contains a triple win for the UK in terms of industrial opportunity, cleaner air and lower greenhouse gas emissions. And crucially, many of the actions in the Clean Growth Strategy will enhance the UK's energy security by delivering a more diverse and reliable energy mix.

Actions taken by the Government on clean growth will be consistent with broader Government priorities, such as delivering clean air. All parts of the UK have a major role to play in delivering our ambitions on clean growth, and the Devolved Administrations have a range of plans and policies in place to deliver emission reductions. We will work closely with them, and with local leaders across the UK, as we develop the policies and proposals set out in this Strategy.

The changes to our infrastructure and the pace of innovation will require significant investment from the private sector. The first steps to support the growth of the green finance sector in the UK are set out in this Strategy. We are building on a position of global leadership in finance and investment. These steps will be followed by ambitious policy proposals to further accelerate investments to deliver our Clean Growth Strategy. To help develop this longer-term work, the Government has set up a new Green Finance Taskforce, comprising senior representatives from the finance industry and Government.

### **Key Policies and Proposals**

The key actions that this Government will take as part of our Strategy are set out below. While these policies and proposals will drive emissions down throughout the next decade, our focus is on the areas where we need to do more to achieve the fifth carbon budget through domestic action in the UK.

Through preparing this Strategy, we have identified areas where we will need to see the greatest progress, both through technological breakthroughs and large-scale deployment, if we are to meet the fifth carbon budget through domestic action.

<sup>29</sup> HM Treasury (2016) Autumn Statement 2016 <https://www.gov.uk/government/topical-events/autumn-statement-2016>

<sup>30</sup> Mission Innovation <http://mission-innovation.net/>

## Key Policies and Proposals in the Strategy

### Accelerating Clean Growth

1. Develop world leading **Green Finance** capabilities, including by:
  - Setting up a **Green Finance Taskforce** to provide recommendations for delivery of the public and private investment we need to meet our carbon budgets and maximise the UK's share of the global green finance market
  - Working with the British Standards Institution to develop a set of **voluntary green and sustainable finance management standards**
  - Providing up to £20 million to support a new **clean technology early stage investment fund**
  - Working with mortgage lenders to develop **green mortgage** products that take account of the lower lending risk and enhanced repayment associated with more energy efficient properties

### Improving Business and Industry Efficiency – 25% of UK Emissions

2. Develop a package of measures to **support businesses to improve their energy productivity**, by at least 20 per cent by 2030, including by:
  - Following the outcome of the independent review of Building Regulations and fire safety, and subject to its conclusions, we intend to consult on **improving the energy efficiency of new and existing commercial buildings**
  - Consulting on raising minimum standards of energy efficiency for **rented commercial buildings**
  - Exploring how **voluntary building standards** can support improvements in the energy efficiency performance of business buildings, and how we can improve the provision of information and advice on energy efficiency to SMEs
  - Simplifying the requirements for businesses to **measure and report on energy use**, to help them identify where they can cut bills
3. Establish an **Industrial Energy Efficiency scheme** to help large companies install measures to cut their energy use and bills
4. Publish **joint industrial decarbonisation and energy efficiency action plans** with seven of the most energy intensive industrial sectors
5. Demonstrate **international leadership in carbon capture usage and storage (CCUS)**, by collaborating with our global partners and investing up to £100 million in leading edge CCUS and industrial innovation to drive down costs
6. Work in partnership with industry, through a new CCUS Council, to put us on a path to meet our ambition of having the option of **deploying CCUS at scale in the UK**, and to maximise its industrial opportunity

7. Develop our strategic approach to **greenhouse gas removal technologies**, building on the Government's programme of research and development and addressing the barriers to their long term deployment
8. Phase out the installation of high carbon forms of fossil fuel heating in new and existing businesses **off the gas grid** during the 2020s, starting with new build
9. Support the **recycling of heat** produced in industrial processes, to reduce business energy bills and benefit local communities
10. **Innovation:**
  - Invest around £162 million of public funds in research and innovation in **Energy, Resource and Process efficiency**, including up to £20 million to encourage switching to lower carbon fuels
  - Support innovative energy technologies and processes with £14 million of further investment through the **Energy Entrepreneurs Fund**

### Improving Our Homes – 13% of UK Emissions

#### *Improving the energy efficiency of our homes*

11. Support around £3.6 billion of investment to **upgrade around a million homes** through the Energy Company Obligation (ECO), and extend support for home energy efficiency improvements until 2028 at the current level of ECO funding
12. We want all fuel poor homes to be upgraded to Energy Performance Certificate (EPC) Band C by 2030 and our **aspiration is for as many homes as possible to be EPC Band C by 2035** where practical, cost-effective and affordable
13. Develop a long term trajectory to improve the **energy performance standards of privately-rented homes**, with the aim of upgrading as many as possible to EPC Band C by 2030 where practical, cost-effective and affordable
14. Consult on how **social housing** can meet similar standards over this period
15. Following the outcome of the independent review of Building Regulations and fire safety, and subject to its conclusions, we intend to consult on **strengthening energy performance standards for new and existing homes** under Building Regulations, including futureproofing new homes for low carbon heating systems
16. Offer all households the opportunity to have a **smart meter** to help them save energy by the end of 2020

#### *Rolling out low carbon heating*

17. Build and extend **heat networks** across the country, underpinned with public funding (allocated in the Spending Review 2015) out to 2021
18. Phase out the installation of high carbon fossil fuel heating in new and existing **homes currently off the gas grid** during the 2020s, starting with new homes

***Rolling out low carbon heating (continued)***

- 19. **Improve standards** on the 1.2 million **new boilers** installed every year in England and require installations of control devices to help people save energy
- 20. Invest in **low carbon heating** by reforming the **Renewable Heat Incentive**, spending £4.5 billion to support innovative low carbon heat technologies in homes and businesses between 2016 and 2021
- 21. **Innovation:** Invest around £184 million of public funds, including two new £10 million innovation programmes to develop new energy efficiency and heating technologies to enable lower cost low carbon homes

**Accelerating the Shift to Low Carbon Transport – 24% of UK Emissions**

- 22. **End the sale** of new conventional petrol and diesel cars and vans by 2040
- 23. Spend £1 billion supporting the take-up of **ultra low emission vehicles (ULEV)**, including helping consumers to overcome the upfront cost of an electric car
- 24. Develop one of the best electric vehicle charging networks in the world by:
  - Investing an additional £80 million, alongside £15 million from Highways England, to support **charging infrastructure deployment**
  - Taking new powers under the **Automated and Electric Vehicles Bill**, allowing the Government to set requirements for the provision of charging points
- 25. Accelerate the uptake of low emission **taxis and buses** by:
  - Providing £50 million for the **Plug-in Taxi programme**, which gives taxi drivers up to £7,500 off the purchase price of a new ULEV taxi, alongside £14 million to support 10 local areas to deliver dedicated charge points for taxis
  - Providing £100 million for a national programme of **support for retrofitting and new low emission buses** in England and Wales
- 26. Work with industry as they develop an **Automotive Sector Deal** to accelerate the transition to zero emission vehicles
- 27. Announce plans for the **public sector** to lead the way in transitioning to zero emissions vehicles
- 28. Invest £1.2 billion **to make cycling and walking** the natural choice for shorter journeys
- 29. Work to enable cost-effective options for shifting more freight from **road to rail**, including using low emission rail freight for deliveries into urban areas, with zero emission last mile deliveries
- 30. Position the UK at the forefront of research, development and demonstration of **Connected and Autonomous Vehicle technologies**, including through the establishment of the Centre for Connected and Autonomous Vehicles and investment of over £250 million, matched by industry

31. **Innovation:** Invest around £841 million of public funds in innovation in low carbon transport technology and fuels including:

- Ensuring the UK builds on its strengths and leads the world in the design, development and manufacture of **electric batteries through investment of up to £246 million in the Faraday Challenge**
- Delivering trials of **Heavy Goods Vehicle (HGV) platoons**, which could deliver significant fuel and emissions savings

### Delivering Clean, Smart, Flexible Power – 21% of UK Emissions

32. **Reduce power costs for households and businesses by:**

- Implementing the **smart systems plan**, which will help consumers to use energy more flexibly and could unlock savings of up to £40 billion to 2050
- Working with Ofgem and National Grid to create a more **independent system operator** to keep bills low through greater competition, coordination and innovation across the system
- Responding to the forthcoming **independent review into the cost of energy** led by Professor Dieter Helm CBE
- Publishing a draft bill to require Ofgem to **impose a cap** on standard variable and default tariffs across the whole market

33. **Phase out the use of unabated coal** to produce electricity by 2025

34. Deliver **new nuclear power** through Hinkley Point C and progress discussions with developers to secure a competitive price for future projects in the pipeline

35. Improve the route to market for **renewable technologies** such as offshore wind through:

- **Up to £557 million for further Pot 2 Contract for Difference auctions**, with the next one planned for spring 2019
- Working with industry as they develop an ambitious **Sector Deal for offshore wind**, which could result in 10 gigawatts of new capacity, with the opportunity for additional deployment if this is cost effective, built in the 2020s

36. Target a total **carbon price** in the power sector which will give businesses greater clarity on the total price they will pay for each tonne of emissions. Further details on carbon prices for the 2020s will be set out in the Autumn 2017 Budget

37. **Innovation:** Invest around £900 million of public funds, including around:

- **£265 million** in smart systems to reduce the cost of electricity storage, advance innovative demand response technologies and develop new ways of balancing the grid
- **£460 million** in nuclear to support work in areas including future nuclear fuels, new nuclear manufacturing techniques, recycling and reprocessing, and advanced reactor design
- **£177 million** to further reduce the cost of renewables, including innovation in offshore wind turbine blade technology and foundations

### Enhancing the Benefits and Value of Our Natural Resources – 15% of UK Emissions

38. As we leave the EU, design a new system of **future agricultural support** to focus on delivering better environmental outcomes, including addressing climate change more directly
39. Establish a **new network of forests** in England including new woodland on farmland, and fund larger-scale woodland and forest creation, in support of our commitment to plant 11 million trees, and increase the amount of **UK timber** used in construction
40. Work towards our ambition for **zero avoidable waste** by 2050, maximising the value we extract from our resources, and minimising the negative environmental and carbon impacts associated with their extraction, use and disposal
41. Publish a new **Resources and Waste Strategy** to make the UK a world leader in terms of competitiveness, resource productivity and resource efficiency
42. Explore new and innovative ways to manage **emissions from landfill**
43. Support **peatland** through a £10 million capital grant scheme for peat restoration
44. **Innovation:** Invest £99 million in innovative technology and research for agri-tech, land use, greenhouse gas removal technologies, waste and resource efficiency

### Leading in the Public Sector – 2% of UK Emissions

45. Agree **tighter targets for 2020 for central government** and actions to further reduce greenhouse gas emissions beyond this date
46. Introduce a **voluntary public sector target of a 30 per cent** reduction in carbon emissions by 2020-21 for the wider public sector
47. Provide £255 million of funding for **energy efficiency improvements** in England and help public bodies access sources of funding

### Government Leadership in Driving Clean Growth

48. Work with businesses and civil society to introduce a **“Green Great Britain”** week to promote clean growth
49. Reinststate a regular **Clean Growth Inter-Ministerial Group** responsible for monitoring the implementation of this Strategy and driving ambitious clean growth policies
50. Report annually on our performance in delivering GDP growth and reduced emissions through an **“Emissions Intensity Ratio”**

# INVESTMENT IN INNOVATION FOR CLEAN GROWTH

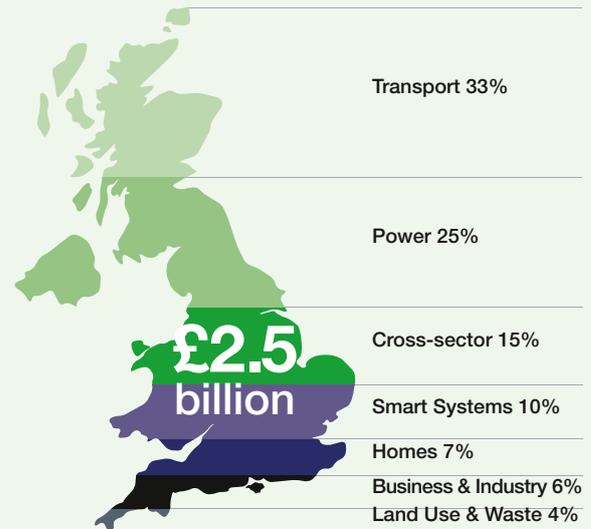

To achieve the clean growth we want, the UK will need to nurture low carbon technologies, processes and systems that are as cheap as possible.

It is only through innovation that we will see new technologies developed and the cost of clean technologies come down.

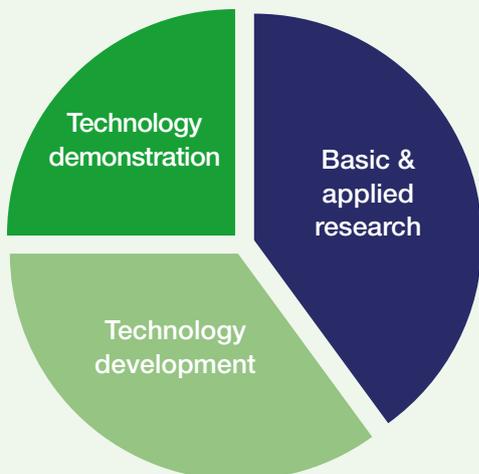

Government has significantly increased its investment in low carbon innovation

This strategy sets out, for the first time, where Government funding is targeted

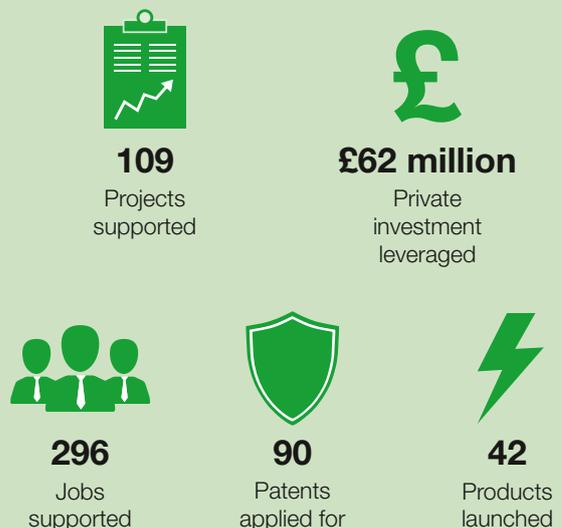

Investment will be made at all stages of technology development: from basic research to pre-commercial trials

Innovation creates jobs and helps companies grow

The Energy Entrepreneurs Fund is a competitive funding scheme to support the development and demonstration of state of the art technologies, products and processes.

The impact of Phases 1-5 is:

## Tracking Our Progress

We want to deliver increased economic growth and reduced emissions. We have developed an Emissions Intensity Ratio (EIR) to measure our clean growth performance which we will publish each year so we can track progress. To reach our 2032 targets we will need to drive the emissions intensity of the economy down by an average of five per cent per year to 2032, an acceleration in the four per cent annual fall since 1990<sup>31</sup>.

### The Emissions Intensity Ratio (EIR)

This measures the amount of greenhouse gases (tonnes of carbon dioxide equivalent) produced for each unit of Gross Domestic Product (GDP) created. Currently the EIR is 270 tonnes/£ million and it was 720 tonnes/£ million in 1990. By 2032, we expect the EIR will need to be nearly as low as 100 tonnes/£ million to meet our ambitions.

## Next Steps

This Strategy is not the end of the process. While this is an important milestone in our work to decarbonise the UK while growing our economy, our approach will develop and adapt to changing circumstances. We will update key elements of the Strategy in line with our annual statutory responses to the Committee on Climate Change's reports on progress, ahead of setting the sixth carbon budget by 30 June 2021.

We will also launch the following Government consultations during 2017 and 2018 on:

- The design of a new industrial heat recovery programme
- Making the private rented sector energy efficiency regulations more effective, and setting longer term energy performance standards across both the domestic private and social rented sectors
- A streamlined and more effective energy and carbon reporting framework for UK businesses to help them identify where they can cut bills
- A package of measures to support businesses to improve how productively they use energy
- Our strategic approach to the aviation sector in a series of consultations over the next 18 months.

A full list of the actions and milestones arising from this Strategy is set out at Annex B.

Many of the future actions the Government will be taking, expanding on the proposals above, will be set out in the 25 Year Environment Plan, which will be designed to be a sister document to this Strategy, and in a long term strategy for the UK's transition to zero road vehicle emissions. Taken together, these set out the Government's approach to fulfilling its commitment to leave the environment in a better state than it inherited. Along with the Industrial Strategy White Paper, to be published later in 2017, these will form a critical part of our future progress.

<sup>31</sup> BEIS analysis; ONS (2016) Quarterly National Accounts; BEIS (2017) UK Greenhouse Gas Inventory Statistics (1990-2015); OBR (March 2017) Economic and Fiscal Outlook; OBR (January 2017) Fiscal Sustainability Report

The Government cannot achieve the changes needed to our economy by itself. Outside action on public sector emissions, the Government's key role is to set the framework for action across the economy. Beyond that, clean growth has to be a shared endeavour between Government, business, civil society and the British people. Creating this supportive environment will help attract the domestic and international investment the UK wants. Therefore from 2018 we will work with private partners and NGOs to introduce a **Green Great Britain Week**.

We welcome views and comments on our approach and these should be sent to [CleanGrowthStrategy@beis.gov.uk](mailto:CleanGrowthStrategy@beis.gov.uk) by 31 December 2017. Views received in response to both this Strategy and the detailed policy proposals which will follow it, will be considered as we update key elements of our Strategy before setting the sixth carbon budget by 30 June 2021.

### Green Great Britain Week

An annual event to:

- Focus on climate and air quality issues across the UK
- Demonstrate our progress and successes on climate action
- Share the latest climate science
- Highlight and promote economic opportunities arising from clean growth especially to international investors.

# Chapter 1:

## UK Leadership and Progress

Our strategy for clean growth starts from a position of strength. The UK was one of the first countries to recognise and act on the threat of climate change and continues to play an important leadership role today.

In 2008, we became the first country to set a legally binding emissions reduction target through the Climate Change Act.

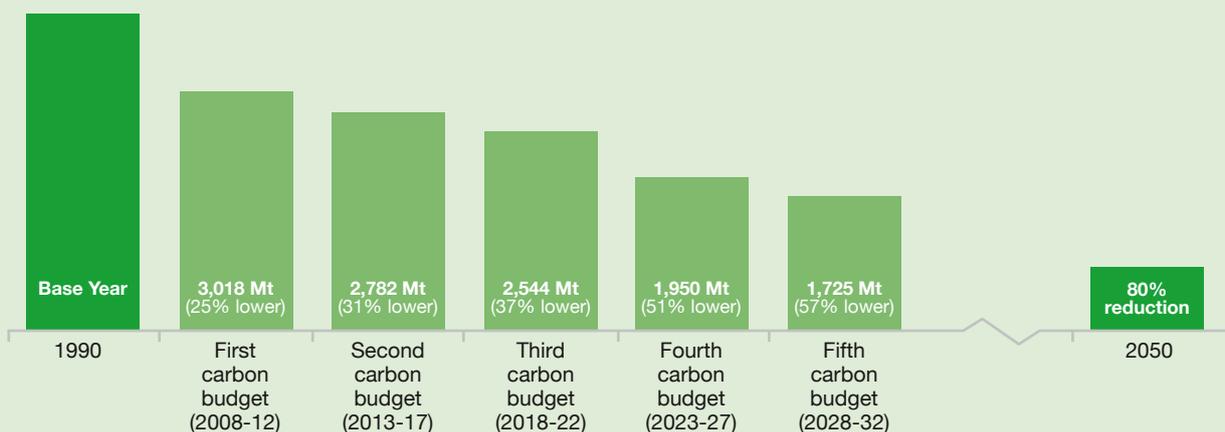

This has driven significant progress in cutting emissions. In 2016 alone UK emissions fell by six per cent compared to the year before<sup>32</sup>. Overall, between 1990 and 2016, the UK reduced emissions by 42 per cent<sup>33</sup>. Today, the Climate Action Network ranks the UK third in the world for action on climate change<sup>34</sup>.

### What the Climate Change Act Requires

The Climate Change Act requires the UK to reduce its emissions by at least 80 per cent by 2050<sup>35</sup>. This means greenhouse gas emissions falling from around 14 tonnes per person in 1990 to around 2 tonnes per person in 2050. To ensure steady progress towards our 2050 goal, the Climate Change Act requires the Government to set intermediate targets – ‘carbon budgets’. These are caps

on the greenhouse gas emissions that can be emitted across the UK during a five-year period. Five carbon budgets have been set to date, putting in place caps on greenhouse gas emissions from 2008 out to 2032. In July 2016, we set the fifth carbon budget, which requires a 57 per cent average reduction in emissions over 2028-32 across the UK compared to a 1990 baseline.

Figure 3: UK carbon budgets and 2050 target<sup>35</sup>

Source: UK legislation; BEIS

<sup>32</sup> BEIS (2017) Provisional UK greenhouse gas emissions national statistics 2016 <https://www.gov.uk/government/statistics/provisional-uk-greenhouse-gas-emissions-national-statistics-2016>

<sup>33</sup> Ibid

<sup>34</sup> Climate Action Network (2017) Climate Change Performance Index Results 2017 <http://www.caneurope.org/docman/climate-energy-targets/3015-climate-change-performance-index-2017/file>

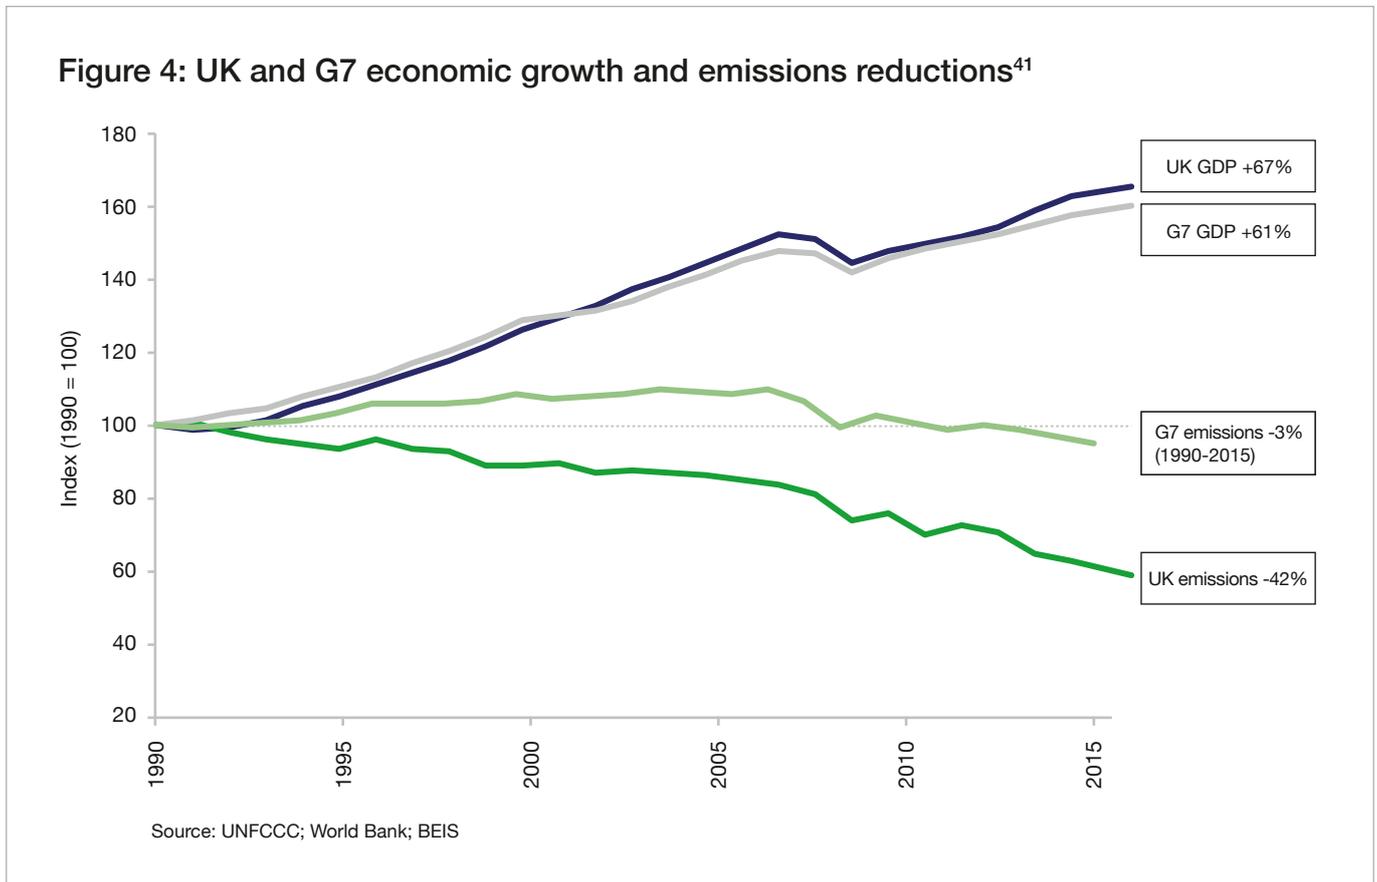

<sup>35</sup> On 1990 levels

<sup>36</sup> 1990 base year emissions 803 Mt, equivalent to 4,013 Mt over a 5-year period, BEIS (2017) UK Greenhouse Gas Inventory Statistics (1990-2015) <https://www.gov.uk/government/collections/final-uk-greenhouse-gas-emissions-national-statistics>

This progress has not come at the expense of the economic growth we need to support our public services and invest in our future. Between 1990 and 2016, while the UK reduced its emissions by 42 per cent<sup>37</sup> the economy grew by 67 per cent<sup>38</sup>. The UK has reduced emissions per person faster than any other G7 nation (and indeed more than any other G20 nation<sup>39</sup>) while at the same time leading the G7 in GDP growth per capita since 1990<sup>40</sup>. PwC’s Low Carbon Economy Index shows that the UK was the fastest of any country in the G20 to decarbonise in 2016<sup>41</sup>.

### Progress Has Been Made Across the UK Economy

Some of the largest falls in emissions since 1990 have been seen in the power sector, where emissions have fallen by almost half<sup>43</sup> as the UK has switched away from coal and increased the share of renewables and gas in electricity generation. In 2016 nearly one quarter of the UK’s electricity generation was provided by renewables<sup>44</sup> and on 7 June this year renewable energy sources supplied over 50 per cent of UK electricity for the first time in history<sup>45</sup>.

**Table 1: Greenhouse gas emissions by sector, 1990-2015<sup>46</sup>**

Sector	Emissions (Mt)		Percentage change 1990-2015
	1990 base year <sup>47</sup>	2015	
Business and industry	231	123	-47%
Transport	122	120	-2%
Power	204	104	-49%
Natural resources	152	77	-50%
Homes	80	64	-20%
Public sector	13	8	-40%
<b>Total</b>	<b>803</b>	<b>496</b>	<b>-38%<sup>48</sup></b>

Source: BEIS

There have also been significant falls in emissions from waste and industry – driven partly by a change in the UK’s economic structure from manufacturing to services but also by a large reduction in waste being sent to landfill. This has been driven by initiatives like the Landfill Tax which helped reduce the amount of taxable waste sent to landfill by 76 per cent between 1997 and 2016<sup>49</sup>.

We have made progress in other sectors, including transport, where tighter regulations have helped drive down the average car’s carbon emissions per kilometre by up to 16 per cent since 2000<sup>50</sup> while hybrid and ultra low emission vehicles (ULEVs), such as electric and hydrogen fuel cell cars, accounted for a record

5.5 per cent of sales in July 2017<sup>51</sup>. In our homes, average household energy consumption has fallen by over 17 per cent since 1990, in part due to tighter standards and obligations on energy suppliers to improve energy efficiency<sup>52</sup>.

### Falling Costs and Rapid Technology Uptake

This progress has been aided by the falling costs of many low carbon technologies globally, coupled with accelerating momentum in the deployment of the technologies we need to reduce emissions, as a result of early policy action by the UK, other governments and substantial public and private sector investment.

<sup>46</sup> BEIS (2017) UK Greenhouse Gas Inventory Provisional Statistics (1990-2016) <https://www.gov.uk/government/statistics/provisional-uk-greenhouse-gas-emissions-national-statistics-2016>

<sup>47</sup> In line with the Climate Change Act the base year is comprised of 1990 for carbon dioxide, methane and nitrous oxide, and 1995 for fluorinated compounds

<sup>48</sup> Provisional 2016 estimate: -42 change 1990-2016. BEIS (2017) UK Greenhouse Gas Inventory Statistics (1990-2015) <https://www.gov.uk/government/collections/final-uk-greenhouse-gas-emissions-national-statistics>

<sup>52</sup> BEIS (2017) Energy Consumption in the UK <https://www.gov.uk/government/statistics/energy-consumption-in-the-uk> Change in average consumption per household 1990-2016

For example, the power sector has seen dramatic falls in the price of renewable energy due to government policies, with global investment estimated at \$2.8 trillion since 2007<sup>53</sup>. This has driven down the cost of solar cells by 80 per cent since 2008<sup>54</sup>, meaning we are now beginning to see solar deploying in the UK without government support, and onshore

wind power by 50 per cent since 2009<sup>55</sup>. The cost of offshore wind is falling even faster; in the UK, government investment has helped to deliver a 50 per cent drop in costs over just the last two years<sup>56</sup>. This means that wind and solar energy are increasingly cost competitive with coal and gas in many countries<sup>57</sup>.

<sup>56</sup> Gov.uk (2017) New clean energy projects set to power 36 million homes <https://www.gov.uk/government/news/new-clean-energy-projects-set-to-power-36-million-homes>

<sup>57</sup> New Climate Economy (2014) Better Growth, Better Climate <http://newclimateeconomy.report/2014/>

<sup>58</sup> Bloomberg New Energy Finance (2016), H2 2016 Global Levelised Cost of Electricity Update <https://about.newenergyfinance.com/about/blog/h2-2016-lcoe-giant-fall-generating-costs-offshore-wind/>

Global investment in energy efficiency is also growing, having already reached \$221 billion in 2015, an increase of six per cent on the year before<sup>59</sup>. This included \$12 billion of investment in improving the efficiency of appliances and has led to an improvement in the average efficiency of major appliance categories<sup>60</sup> of more than 16 per cent between 2005 and 2015<sup>61</sup>.

The transport sector is seeing the beginnings of a rapid shift to clean technology. Between 2011 and 2016, the number of electric vehicles on the road globally increased thirtyfold<sup>62</sup>. This has been aided by the falling costs of the battery packs that power electric vehicles, which have come down by nearly 80 per cent since 2010<sup>63</sup>. In the future, the cost of electric vehicles is now forecast to fall below that of conventional vehicles in the early to mid-2020s<sup>64</sup>.

## A High Growth Low Carbon Economy

As a result of this technological innovation and investment, new high value jobs, industries and companies have been created. The UK low carbon economy – encompassing activities such as the design and building of low carbon power and heat projects, the manufacture of electric vehicles, the development of energy efficient products and systems for buildings, and green finance – already supports over 430,000 jobs directly and through supply chains<sup>65</sup>. We have developed world leading expertise in technologies such as offshore wind and power electronics for low carbon vehicles and electric motors, and we are a global leader in green finance.

This progress has altered the way that we see many of the trade-offs between investing in low carbon technologies that help secure our future but that might incur costs today. Actions to cut our emissions can be a win-win: cutting consumer bills, driving economic growth, creating high value jobs and helping to improve our quality of life.

## The UK's Low Carbon Economy: Driving Regional Growth

The growth in the UK's low carbon economy has taken place across the country, with centres of excellence in many parts of the UK.

**Scotland:** Turnover of the low carbon economy was £5.5 billion in 2015, supporting 31,000 jobs and 20,000 businesses

**Northern Ireland:** Turnover was almost £1 billion, supporting 5,000 jobs and 4,000 businesses

**Midlands:** Leading region for the design and manufacture of low carbon vehicles, with more than £1.5 billion (more than 60 per cent) of UK automotive R&D carried out in the region

**Wales:** Turnover was £1.7 billion in 2015 with 11,000 jobs and 4,500 businesses

**South West:** The low carbon sector in Bristol employs over 9,000 people and over 19,000 in the whole of the West of England, generating £2.4 billion

**North:** Low carbon investment has encouraged innovation and generation of clean energy, and developed local supply chains, all of which has helped drive regeneration

**North East:** The Siemens offshore wind blade factory at Alexandra Dock in Hull directly supports 1,000 jobs with £310 million investment

**South East:** The low carbon economy in Oxfordshire has a turnover of £1.15 billion supporting 8,800 jobs, and is 7 per cent of the local economy

## The UK's International Leadership and Actions to Reduce Emissions Overseas

Climate change is a global challenge requiring action from all countries. The UK has played a key role in demonstrating international leadership on reducing emissions and supporting other countries to do the same.

The UK was the first country in the world to introduce legally binding emissions reduction targets under the Climate Change Act, which has been used as a model around the world, including in France, Denmark, Sweden and Mexico. The UK was among the first to recognize that climate change is an economic and political issue not just an environmental one, and to put serious climate expertise in our embassies to influence and help countries to act.

We have used our world leading economic, science and technical skills to shape the debate around climate change and have been at the forefront of the debate through our world leading scientists at the Met Office, the landmark 2006 Stern Report<sup>66</sup> and the more recent New Climate Economy project<sup>67</sup>, having one of the first Foreign Secretary Special Representatives on

climate and arranging the first discussion of climate change in the UN Security Council.

We also played a critical role in securing the 2015 Paris Agreement, the first ever international climate change agreement where 195 countries (representing over 90 per cent of global economic activity<sup>68</sup>) made a commitment to reduce emissions with the long-term goal of limiting global temperature increases to “well below 2 degrees”, and to review progress every five years, mirroring the UK's ground-breaking processes.

The Agreement puts pressure on all countries to bring forward long-term emissions reduction strategies by 2020. The Clean Growth Strategy, as the UK's long-term emissions reduction strategy, shows the UK is leading the world in response to this important step. The UK also led the way in pledging to phase down the use of hydrofluorocarbons (HFCs) by 79 per cent by 2030, and following this lead 197 countries agreed a global phase down of HFCs – delivering an 85 per cent phase down by 2036 - under the United Nations Montreal Protocol in October 2016.

### The UK's International Leadership and Actions to Reduce Emissions Overseas (continued)

The UK is among the largest contributors of climate finance, committing to provide at least £5.8 billion from 2016 to 2020, to help developing countries mitigate and adapt to the impacts of climate change, reduce deforestation and support cleaner economic growth. From 2011 we have used our International Climate Finance to install more than 400 megawatts of clean energy capacity, mobilised £2.7 billion of additional public and private finance, supported more than 34 million people in adapting to the impacts of climate change and helped resilient economic development in over 70 countries<sup>69</sup>.

This support takes many forms, for instance investment in the Climate Investment Funds, through which the UK has helped support renewable energy, climate resilience and forestry projects in 72 countries<sup>70</sup>. The UK has also been at the forefront of global action to halt deforestation – helping negotiate

international frameworks and mobilising partnerships to deliver on them – to meet shared goals such as ending forest loss by 2030, and eliminating deforestation from the production of key agricultural commodities by 2020. Together with Germany and Norway, we have collectively pledged \$5 billion between 2015 and 2020 to incentivise ambitious governments, companies and communities to protect our largest natural global carbon sinks. This includes supporting a 30 per cent reduction in deforestation in Colombia's Amazon, improving livelihoods in conflict-affected areas<sup>71</sup>.

Our actions to date are expected to save nearly 500 Mt over the lifetime of the projects<sup>72</sup>, more than the entire annual emissions of France<sup>73</sup>. And while we do not count these results against our domestic budgets, we can be proud of the impact of the UK's commitment to global climate action.

<sup>73</sup> UNFCCC (retrieved September 2017) [http://di.unfccc.int/time\\_series](http://di.unfccc.int/time_series), 2015 data

*The Renewable Energy Performance Platform supports small to medium-sized renewable energy projects throughout sub-Saharan Africa. In West Kenya, two mini-hydro power plants will provide electrification to local rural communities, helping to stimulate rural economic growth. Importantly, after 20 years of operation the project will be fully transferred to the local community.*

# Chapter 2:

## The Opportunities and Challenges

## The Size of the Clean Growth Opportunity

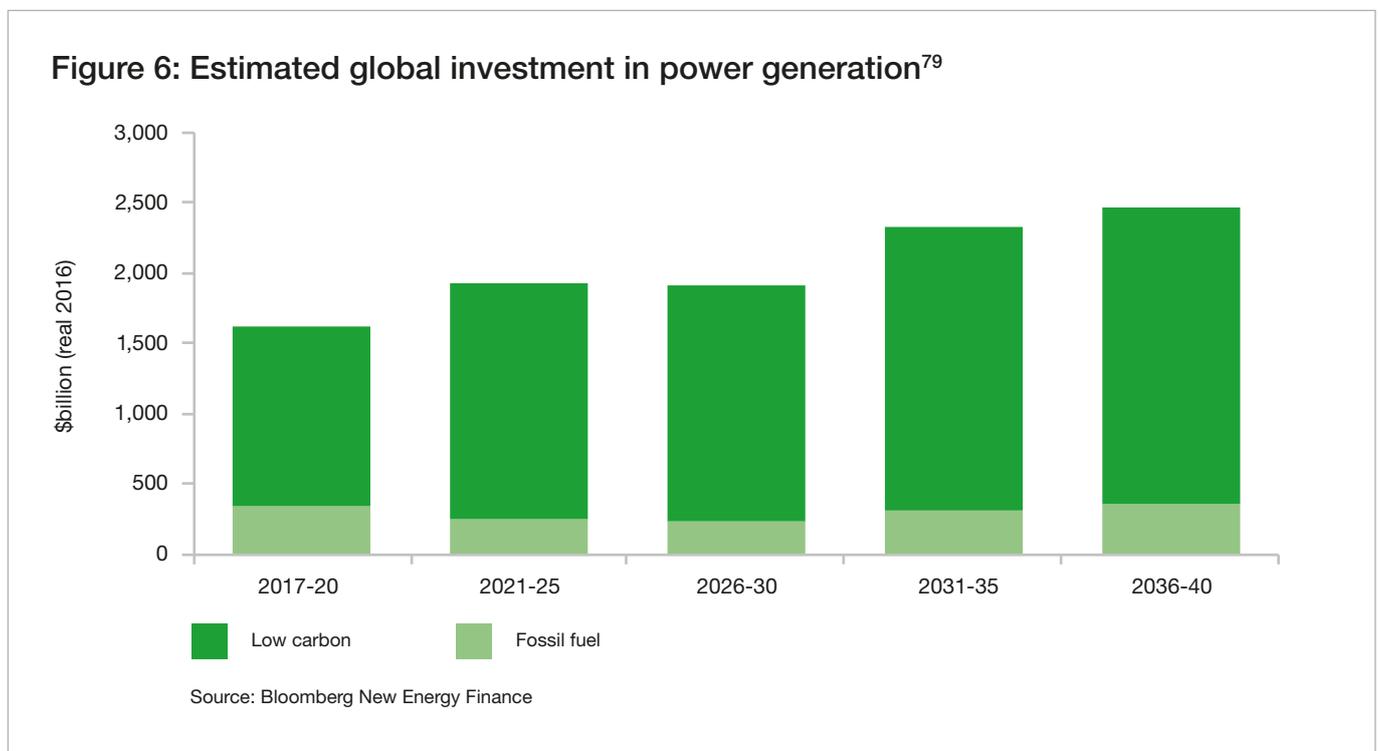

The commitments made in the Paris Agreement – shifting to cleaner, low carbon technologies in power, transport, heating and cooling, industrial processes and agriculture – will require enormous investment of public and private capital. An estimated \$13.5 trillion of public and private investment will be required in the energy sector alone<sup>74</sup>.

We have a high degree of confidence that these investments will be made given the scale of political support and the transformational impact of investment to date – indeed decarbonisation is cited as one of the ‘megatrends’ that will reshape the global economy over the years to come<sup>75</sup>.

We are determined to ensure that this trend works to the advantage of the UK economy and that we embed it at the core of our Industrial Strategy.

Looking across sectors, to assess the size of the opportunity, highlights several key areas.

The **power sector** has seen some of the most significant early action on climate change, given its status as the largest source of emissions in most countries. Annual new global investment in renewable electricity grew more than threefold since 2005, reaching over \$240 billion in 2016<sup>76</sup>. This trend is happening everywhere. In Europe, over 80 per cent of new power generating capacity built in 2016 was from renewables<sup>77</sup>. Globally, clean energy technologies are estimated to account for over 85 per cent of the \$10.2 trillion investment in power generation projected between now and 2040<sup>78</sup>.

## Clean Growth in China and India

Both China and India are driving the global transition to the low carbon economy, supported by political will<sup>80,81</sup>, falling technology costs<sup>82</sup> and a desire to seize the economic opportunity<sup>83,84</sup>.

China has put 'Green Development' at the heart of its current five year economic strategy<sup>85</sup> and committed to reduce its level of carbon emissions per unit of economic activity by 60 per cent to 65 per cent by 2030 compared to 2005.

India's targets commit to reducing emissions by 33 to 35 per cent over the same period, and Prime Minister Modi has plans to make India a leader in solar and renewable energy<sup>86</sup>.

These ambitions have translated into impressive plans. India plans to increase its renewable power fivefold to 175 gigawatts by 2022<sup>87</sup>, including 60 gigawatts of wind and 100 gigawatts of solar; and China has committed to invest \$360 billion in low carbon power by 2020<sup>88</sup>, increasing its renewable energy capacity by around 40 per cent.

This ambition extends to the transport sector. China currently has an electric car market share close to 1.5 per cent<sup>89</sup> and is aiming for ten per cent of its manufacturing output in the country to be either low or zero emission from 2019, rising to 12 per cent in 2020. India has stated an aspiration for all new cars sold to be electric by 2030<sup>90</sup>.

The **transport sector** is also seeing the acceleration of a rapid shift to clean technology supported by government leadership and global investment.

Between 2011 and 2016, the number of electric vehicles (EVs) on the road globally increased thirtyfold<sup>91</sup> and governments are announcing increasingly ambitious targets that are driving even more rapid changes. The Government has announced an end to the sale of all new conventional petrol and diesel cars and vans by 2040<sup>92</sup>. France has also announced the end of

petrol and diesel car sales by 2040<sup>93</sup>, Norway is aiming for 100 per cent ultra low emissions vehicle sales by 2025<sup>94</sup>, and China has recently announced a requirement for at least 10 per cent of auto manufacturers' output in the country to be either low or zero emission from 2019, rising to 12 per cent in 2020<sup>95</sup>.

Meanwhile auto manufacturers are rapidly expanding their plans for new ultra low emission vehicle models, from just ten in 2010 to more than 200 in 2020<sup>96</sup>.

<sup>96</sup> Bloomberg New Energy Finance (2017) Global EV and charging policy support database

Figure 7: Global deployment forecasts for electric vehicles have been improving over time<sup>97</sup>

Globally, sales of EVs are expected to be five times higher in 2020 compared to 2015<sup>98</sup> and to take a rapidly increasing share of the market in an industry whose revenue in 2016 was more than \$2 trillion<sup>99</sup>.

The global **construction** sector will also be boosted by investment in sustainable infrastructure to meet decarbonisation goals.

Global markets for energy efficient buildings, and for low carbon heating and cooling, are already growing and the market for investment in buildings that reduce emissions and are resilient to climate change in just six key emerging economies in Asia has been estimated at more than \$15 trillion up to 2030<sup>100</sup>.

There is also a significant expansion in the use of innovative **green finance** to support the investment needed to realise these opportunities with the global markets for green bonds growing rapidly from \$7.2 billion in 2012 to over \$80 billion in 2016 and expected to break these records in 2017<sup>101</sup>.

## Opportunities for the UK

Just as the UK has led the world diplomatically in addressing climate change, we are also well-placed to take advantage of the global shift to a clean energy economy as we benefit from significant economic competitive advantages, including:

- The most productive science base<sup>102</sup> of the G7 countries – a critical asset, given the extensive innovation required for decarbonisation in many sectors;
- World leading expertise in high-value services<sup>103</sup>, with strengths in areas such as finance, law, consultancy, software and data services – all important to enabling the low carbon transition;
- Excellence in the design and manufacture of products based on advanced technologies as in the automotive and aerospace sectors<sup>104</sup>; and

- A policy and regulatory environment that provides long-term direction and supports innovation, with some of the most liberalised gas and electricity markets; a long-term policy framework set by the Climate Change Act and carbon budgets; and an energy regulator which is pioneering in its approach to encouraging companies to innovate<sup>105</sup> with programmes like the ‘regulatory sandbox’<sup>106</sup>.

We have already capitalised on these strengths to take a leadership position in some important emerging low carbon sectors:

- **Power:** The UK has the most offshore wind generation built anywhere in the world, with around 40 per cent of the global installed capacity<sup>107</sup>. British companies are now benefiting from exports in areas such as cable installation, repairing equipment, construction work and consulting<sup>108</sup>.
- **Electric vehicles:** In 2016, one in five battery electric cars driven in Europe was built in the UK<sup>109</sup> and low emission vehicle exports were estimated to be worth nearly £2.5 billion in 2015<sup>110</sup>.

- Low carbon financial and professional services:** London is emerging as a leader in low carbon finance, the centre of global carbon trading, and with 50 green bonds listed on the London Stock Exchange, raising a combined \$14.8 billion<sup>111</sup> across seven currencies. It has been estimated that UK legal and finance advice was

behind a third of new clean energy projects globally between 2007 and 2012<sup>112</sup>. The UK is home to the largest speciality insurance market in the world<sup>113</sup>, and is a leading provider of insurance cover for climate-related risks and for large-scale low carbon infrastructure projects.

<sup>114</sup> IRENA (retrieved September 2017) <http://www.irena.org/home/index.aspx>

Analysis for the Committee on Climate Change has suggested that if we continue to develop and build on our strengths we can capture significant economic benefits from these decarbonising trends. The UK’s low carbon economy could grow at around 11 per cent a year between 2015 and 2030, some four times faster than the average growth rate for the UK

economy overall which would mean the low carbon economy would increase from around two per cent of the UK’s total output at present to around eight per cent by 2030<sup>114</sup>. The same study estimates that UK exports of low carbon goods and services could be worth between £60 billion and £170 billion by 2030.

## Clean Growth and the UK Industrial Strategy

As we form our Industrial Strategy, we will aim to maximise the UK industrial advantages from the global shift to a low carbon economy. We will build and link together the strengths we already have, while nurturing new ones, so that our whole economy can seize the opportunities presented by this global economic trend.

We have already committed to the **largest increase in public spending for investment in science, research and innovation** in almost 40 years<sup>117</sup>. We will ensure that this is invested to catalyse low carbon innovation across multiple sectors of the economy.

We have also committed to **upgrading our digital, energy, transport, housing, water and flood defence infrastructure**, including through investment in the National Productivity Investment Fund, with annual central government infrastructure investment rising each year from around £2 billion in 2016/17 to over £5 billion in 2020/21<sup>118</sup>. We will ensure that these investments strengthen market demand for the innovative new clean energy technologies and services that our businesses are creating.

We have announced **significant reforms to technical education**, with the creation of new qualifications (T-levels), high-quality work

placements, and Institutes of Technology to deliver higher education in STEM subjects. We will ensure that these reforms help train our innovators of the future and provide businesses with the skilled professionals they need to thrive in the clean energy economy<sup>119</sup>.

We have welcomed early work on **sector deals** in nuclear, auto manufacturing and industrial digitalisation, all of which are central to productivity in the low carbon economy, and we will challenge businesses in all sectors to increase their competitiveness in relation to the shift to clean energy.

In return, and to maximise the domestic and international opportunities for the UK, we will **strengthen our support for businesses** as part of the transition to the low carbon economy. We have added billions of pounds in potential support for UK exporters, doubling the capacity of UK Export Finance and increasing available cover for individual markets by up to 100 per cent<sup>120</sup>, and will dedicate resources within the Department for International Trade to promote investment into the UK renewable energy landscape, develop this supply chain further and support UK exports. So far this has helped to secure investments across the country: into a turbine blade manufacturing plant in Hull<sup>121</sup>, a transition pieces yard in Teesside<sup>122</sup> and an MHI Vestas investment into the Isle of Wight<sup>123</sup>, which collectively support over 1,400 new jobs.

<sup>123</sup> MHI Vestas Offshore Wind commences hiring for over 200 jobs on the Isle of Wight, UK <http://tinyurl.com/l5nrs25>

We are committed to **making the most of the diverse strengths of all of Britain's cities and regions**, to grasp the opportunities that could drive faster growth and increased earning power in each of them. To support this, we have allocated an additional £1.8 billion from the Local Growth Fund for a new set of Growth Deals between Government and Local Enterprise Partnerships (LEPs)<sup>124</sup>. Each region of the UK differs in its local energy resources, its industrial and domestic energy needs, and its expertise. We will ensure that local communities and LEPs are empowered to make the best

use of their local skills and resources, so that through the clean energy economy they can drive productivity, job creation and growth.

And we will set out our plans to build on this progress in the Industrial Strategy White Paper, to be published later in 2017, positioning the UK as a leader in the low carbon economy, investing in the foundations required for economic success and ensuring our industries succeed in an economic transition that we are helping to shape and lead.

<sup>124</sup> HM Government (2016) Autumn Statement 2016 <https://www.gov.uk/government/publications/autumn-statement-2016-documents/autumn-statement-2016>

## The Challenges to Delivering Clean Growth

We have high aspirations and are committed to delivering clean growth. But we face three significant challenges that we must overcome if we are to continue progress: ensuring we deliver affordable energy for households and businesses; decarbonising “harder to reach” parts of the UK economy; and establishing a post-EU emissions and environmental framework that is at least as beneficial as current arrangements.

### Decarbonising Harder to Reach Sectors and the Use of Flexibilities

As a result of our actions so far we have already driven emissions per head down by nearly half since 1990. This progress meant that we exceeded the target emissions reductions of our first carbon budget (2008 to 2012) by one per cent<sup>125</sup> and we project that we will outperform against our second and third budgets covering the years 2013 to 2022 by almost five per cent and four per cent respectively<sup>126</sup>. This will be a significant achievement.

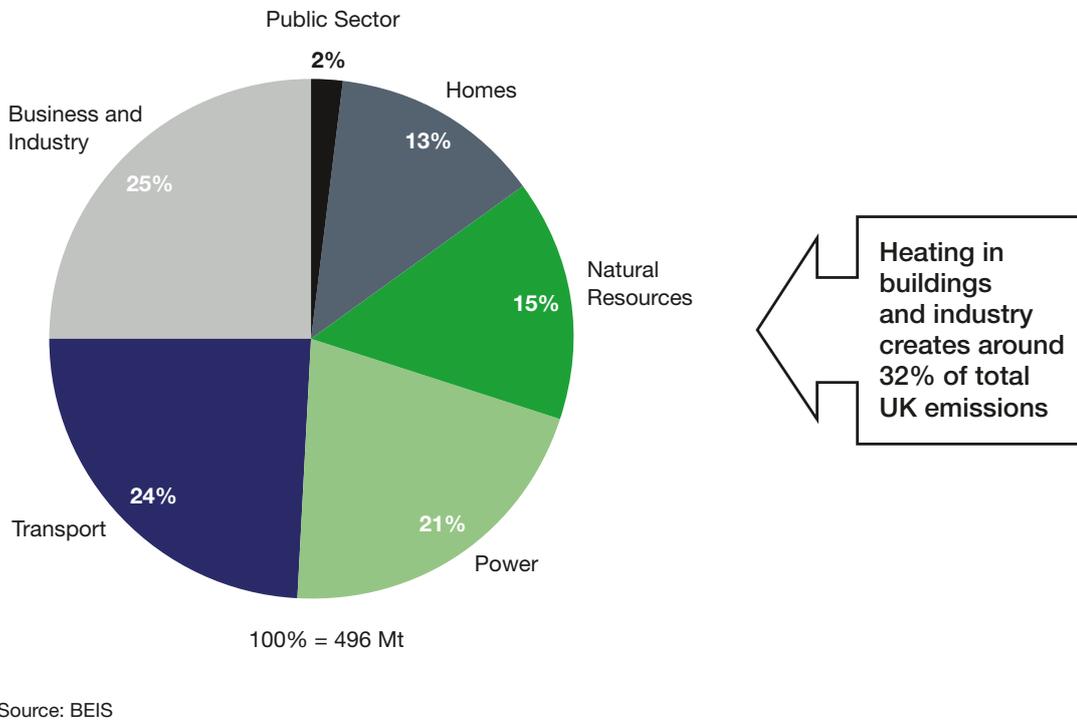

Our achievements to date have been substantially driven by significant decarbonisation of the power and waste sectors and we now need to replicate this success across the economy, particularly in the transport, business and industry sectors which account for almost half of current emissions. And we need further action on heating across key sectors, which is responsible for around a third of emissions.

These are the “harder to reach” parts of the economy requiring more investment, concerted joined up working between government, industry and consumers, or big technological breakthroughs to drive substantial shifts down in carbon emissions. This Strategy sets out how we plan to address some of these difficulties, including how we will target our innovation investment. Cutting emissions in these areas can benefit us all through cleaner air and reduced energy bills which will help improve the UK’s productivity. In addition, the innovation and investment required to drive these emissions down can create more jobs and more export opportunities.

<sup>125</sup> DECC (2014) Final statement for the first carbon budget period <https://www.gov.uk/government/statistics/final-statement-for-the-first-carbon-budget-period>

<sup>126</sup> BEIS (2017) Energy and Emissions Projections 2016 <https://www.gov.uk/government/publications/updated-energy-and-emissions-projections-2016>

**Figure 10: UK emissions by sector, 2015<sup>127</sup>**

Our approach is pragmatic. Given how much uncertainty underlies projections, we need an approach that is flexible in response to shifting evidence, not least about the impact of policies. It is also right, in our economic circumstances, to be rigorous in examining the costs and benefits of action to reduce emissions, and the right pace of change. The Climate Change Act permits us to use “flexibilities”, such as surplus from previous carbon budgets or the purchase of good quality international carbon credits<sup>128</sup>, to meet carbon budgets. We are prepared to use the flexibilities available to us to meet carbon budgets, subject to the requirements set out in the Climate Change Act, if this presents better value for UK taxpayers, businesses and domestic consumers.

Our current estimated projection for the fourth and fifth carbon budgets suggests that we could deliver 94 per cent and 93 per cent of our required performance against 1990 levels – for carbon budgets which will end in ten and fifteen years’ time respectively<sup>129</sup>. While we have the option to use flexibilities to fully meet our carbon budgets, the ambitious policies and proposals set out in this Strategy, and the rapid progress and accelerating pace of changes in low carbon technologies so far, suggest that we may not need to use this option. We will decide whether to use flexibilities following consultation with the Devolved Administrations, and having obtained and taken into account advice from the Committee on Climate Change.

<sup>127</sup> BEIS (2017) UK Greenhouse Gas Inventory Statistics (1990-2015) <https://www.gov.uk/government/collections/final-uk-greenhouse-gas-emissions-national-statistics>; BEIS analysis

<sup>128</sup> A good quality carbon credit is one with its emission reduction and sustainability credentials assured.

<sup>129</sup> This includes an initial estimate of 30 Mt and 80 Mt of additional savings in the fourth and fifth carbon budgets respectively from the more advanced policies and proposals in the Clean Growth Strategy. As we move forward and develop the full range of policies and proposals, we will publish individual impact assessments as appropriate with updated analysis.

**Table 2: Performance against carbon budgets<sup>130</sup>**

		Carbon Budget				
		1 2008-12	2 2013-17	3 2018-22	4 2023-27	5 2028-32
Budget, cumulative emissions, Mt		3,018	2,782	2,544	1,950	1,725
Average reduction vs 1990 emissions, %		-25%	-31%	-37%	-51%	-57%
Existing policies	Projected emissions, cumulative emissions, Mt	2,982 actual	2,650 E	2,453 E	2,096 E	1,972 E
	Result vs. Budget, %	-1.2%	-4.7%	-3.6%	+7.5%	+14.3%
Existing and new policies and proposals <sup>131</sup>	Projected emissions, cumulative emissions, Mt	2,982 actual	2,650 E	2,453 E	2,066 E	1,892 E
	Result vs. Budget, cumulative emissions, Mt	-36	-132	-91	+116	+167
	Result vs. Budget, %	-1.2%	-4.7%	-3.6%	+6.0%	+9.7%
	Cumulative surplus (+) or deficit (-), Mt		+132	+223	+107	-60

### The Climate Change Act 2008<sup>132</sup>

The Act allows Government some flexibility on when and how to reduce UK emissions on route to 2050 but before doing so the Government must obtain and take into account the advice of the Committee on Climate Change and consult the Devolved Administrations. There are three options:

**1. Carry forward over-achievement from earlier budgets:** The Act allows for Government to carry forward over-achievement from one carbon budget to the next, so that early action to reduce emissions increases the following budget<sup>133</sup>.

**2. Carry back from later carbon budgets:** The Act allows for the Government to increase the carbon budget in one period with a corresponding tightening of the next carbon budget. This ‘borrowing’ is limited to one per cent of the later carbon budget.

**3. Use international carbon credits:** The Act allows for the purchase of good quality international carbon credits to contribute to meeting carbon budgets but with a limit on the use of these credits set 18 months in advance of the relevant carbon budget.

<sup>130</sup> BEIS (2017) Energy and Emissions Projections 2016 <https://www.gov.uk/government/publications/updated-energy-and-emissions-projections-2016>

<sup>131</sup> BEIS initial estimates of a subset of new early stage policies and proposals show an additional potential reduction of up to 30 Mt and 80 Mt over the fourth and fifth carbon budget periods respectively; these and other policies will be developed building on the proposals outlined in the Strategy.

<sup>132</sup> The Act sets out specific requirements to follow before deciding to use a particular flexibility (such as seeking advice from the Committee on Climate Change before banking) or when creating a framework for a decision to be taken within (such as setting a limit on the amount of carbon units which can be used to meet carbon budgets). Any use of flexibilities needs to be consistent with keeping the UK on track to meet its long term target in 2050 having regard to domestic action.

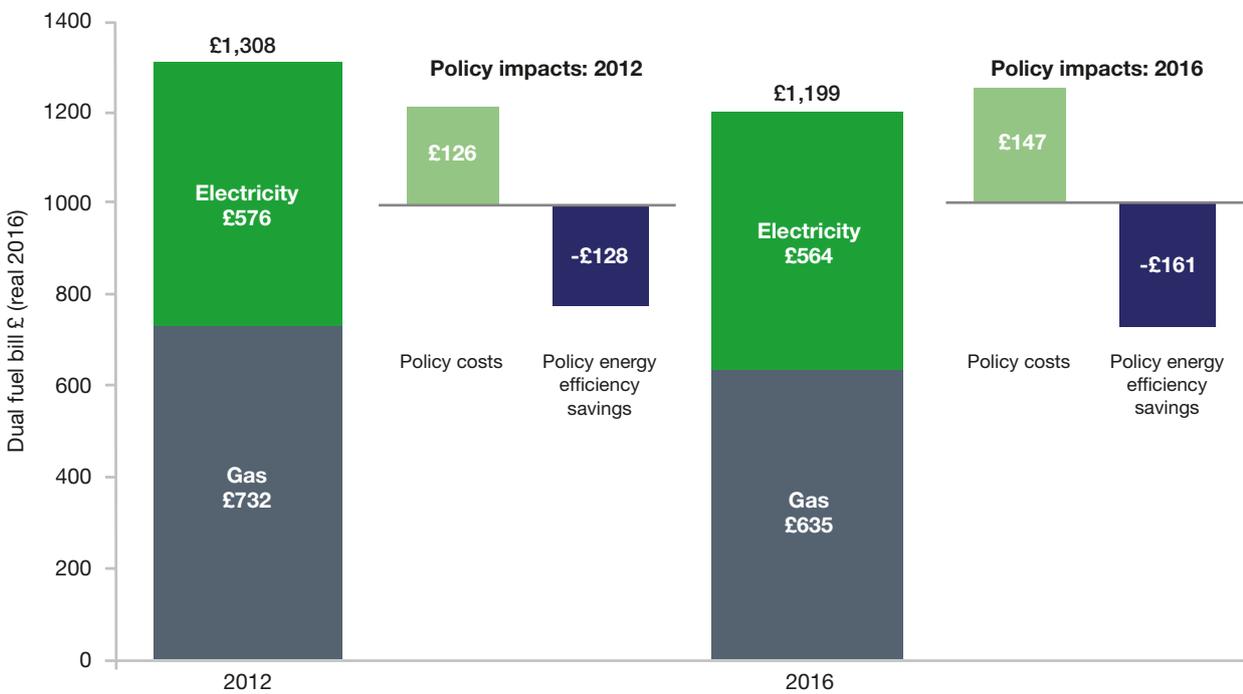

<sup>133</sup> Government will take a decision on whether to bank any surplus from the second to third carbon budget by May 2019 and from the third to the fourth carbon budgets in May 2024. The decision will be made after taking into account advice from the Committee on Climate Change and consulting with the Devolved Administrations.

### Delivering Affordable Energy

Actions taken to tackle emissions have helped to reduce average energy bills for households as efficiency savings have more than offset the cost of financial support provided for developing low carbon technologies. The cost of policies delivering cleaner energy, support for vulnerable

households and investing in upgrading our buildings accounts for around 12 per cent of an average gas and electricity bill. However, these costs are on average more than offset by savings from improvements to the energy efficiency of people’s homes, delivering a saving of £14 on average in 2016 (see figure 11).

**Figure 11: Average annual household dual fuel bill, 2012 and 2016**

Source: BEIS

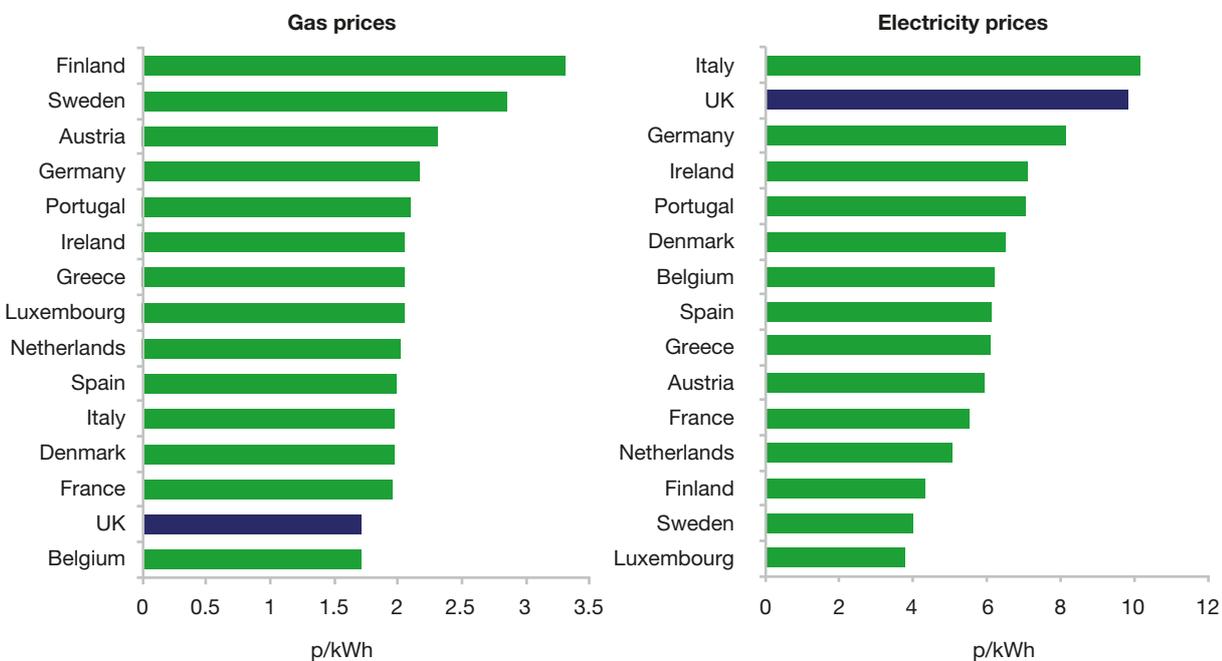

Going forward, our efforts to decarbonise will require increased investment across the energy system. However, our focus on innovation will ensure we minimise the costs of this investment as much as possible and further improvements in energy efficiency will continue to drive down bills. We have already seen the costs of offshore wind projects fall 50 per cent since 2015 and we are now seeing investment in solar without government support. We will also make sure that those least able to pay are protected through our work on fuel poverty, and are publishing a draft bill to require Ofgem to impose a cap on standard variable and default tariffs across the whole market.

On industrial energy, there is more to be done. The UK has some of the lowest gas prices in the EU, including for industry. However, our

electricity prices are less competitive for large industrial users.

Every action to cut emissions must be taken while ensuring our economy remains competitive. As we have set out in our Industrial Strategy Green Paper, we attach great importance to making sure our energy is affordable. The Government has already supported UK businesses to help them with energy costs through various programmes. For instance the Government has taken steps to reduce the cumulative impact of energy and climate change policies on industrial electricity prices for key Energy Intensive Industries (EII) in sectors such as steel, plastics, cement and chemicals. This includes a package of relief for EIIs worth £260 million in 2016 and over £500 million since 2013<sup>134</sup>.

**Figure 12: Industrial electricity and gas prices for large consumers in the EU15 in 2016, including taxes<sup>135</sup>**

Source: BEIS

<sup>134</sup> BEIS analysis. Figure includes compensation for indirect costs from EU Emissions Trading System, Carbon Price Support, Renewables Obligation, and Feed in Tariffs

<sup>135</sup> BEIS (2017) Quarterly Energy Prices <https://www.gov.uk/government/collections/quarterly-energy-prices>. Notes: Large gas consumers are those consuming 27,778 - 277,777 MWh per annum; large electricity consumers are those consuming 20,000 - 69,999 MWh per annum.

But we want to continue to do everything we can to ensure our energy prices are competitive. This is why the Government has commissioned an independent review into the cost of energy led by Professor Dieter Helm CBE which will recommend ways to deliver the Government's carbon targets and ensure security of supply at minimum cost to both industry and domestic consumers. The review will report on the full supply chain of electricity generation, transmission, distribution and supply, and consider the opportunities to reduce costs in each part. It will set out options for a long term roadmap for the power sector. Once Ministers have considered the review's proposals, the Government will incorporate its recommendations into the further development of the Clean Growth Strategy as appropriate.

## Leaving the EU

The British people have voted to leave the European Union and the Government is working to get the best deal for the UK. Leaving the EU offers a unique opportunity to shape our environment and economy for the benefit of all – to have the freedom to make our own decisions on a whole host of matters.

And whatever our future relationship with the EU, the UK's commitment and leadership role in tackling climate change remains undimmed and working closely with the EU on this global challenge will remain important. Leaving the EU will not change any of our statutory commitments to reduce our emissions according to our Climate Change Act – indeed those targets are more ambitious and challenging than those set by EU legislation. There is also no need to change our domestic targets under the Act as a result of leaving the EU, as these targets are rooted in climate science. The UK remains strongly committed to the Paris Agreement and whatever the form of our future partnership with the EU we will satisfy our international obligations under the Agreement.

But there are extremely important current arrangements between the UK and the EU that bring material benefits for all the countries involved and it is critical that we get the detail of our exit negotiations right.

There are four main areas where the UK's current emissions policies rely on EU mechanisms:

- The EU Emissions Trading System (EU ETS) covering the “traded sector” (power, heavy industry and intra EEA aviation) which collectively account for around 40 per cent of UK emissions under carbon budgets. We remain committed to reducing emissions in these sectors and the UK already has a range of domestic policies in place to support this. We will seek to ensure that our future approach is at least as ambitious as the existing scheme and provide a smooth transition for the relevant sectors.
- For sectors not covered by the EU ETS, two sector policies operate at EU rather than UK level and are particularly important for driving emissions reductions – new car and van CO<sub>2</sub> regulations, and EU fluorinated gas quotas. We remain committed to reducing emissions in these areas and will offer certainty to industry as soon as possible on our future relationship with the EU. We will seek to ensure our future approach is at least as ambitious as the current arrangements.
- EU products policy which sets minimum standards for a range of products such as white goods and lighting, which improve energy efficiency. We continue to support these policy measures, which cut energy bills, increase energy security, reduce emissions and help customers make informed choices, and we will keep step with equivalent standards wherever possible and appropriate, or even exceed them where it is in the UK's interest to do so. This may include products not yet covered by European legislation, such as smart appliances.

- Non-energy and climate EU frameworks and policies which affect the UK, such as the Common Agricultural Policy. For instance, we will take the opportunity of leaving the Common Agricultural Policy to address climate change more directly by designing a new system to support the future of farming and the countryside, with a strong focus on delivering better environmental outcomes, including tackling climate change.

Detailed future policies will emerge as we negotiate the exact form of the UK's exit from the EU but while the UK is a member of the European Union, existing rules still apply and we will continue to engage constructively on new and existing EU legislation. Our Clean Growth Strategy therefore uses existing policy as the basis for the UK's emissions projections.

### Carbon Pricing and Emissions Trading

Pricing emissions provides a cost-effective and technology neutral way of reducing carbon emissions and mobilising the private sector and in the UK pricing policies like Carbon Price Support (CPS), and the EU Emissions Trading System (EU ETS) have already helped to drive a switch from coal to gas generation in the power sector.

The UK is a pioneer in developing carbon pricing. In 2002 the UK launched the UK ETS, which served as a pilot for the EU ETS, giving businesses early experience of emissions trading and establishing London as its global centre.

The EU ETS is the largest cap-and-trade system for carbon emissions in the world. Each year, every participant must surrender one allowance for each tonne of carbon dioxide (or equivalent) emitted, and allowances are auctioned or allocated between participants. The cap on allowances is reduced annually in line with the EU's climate ambition.

However, a surplus of allowances in the EU ETS has caused the price to fall and it currently provides little incentive for low carbon investment. As a result the UK introduced CPS in April 2013 which acts as a top up to the EU ETS price in the power sector. The UK also supports measures to strengthen the EU ETS, with notable success in recent negotiations. We will continue to drive for ambitious reform for the next phase of the system.

The Government is considering the UK's future participation in the EU ETS after our exit from the EU and we remain firmly committed to carbon pricing as an emissions reduction tool whilst ensuring energy and trade intensive businesses are appropriately protected from any detrimental impacts on competitiveness.

Specifically in relation to the power sector and CPS, starting in 2021/2022, the Government will target a total carbon price which will give businesses greater clarity on the total price they will pay for each tonne of emissions, and we will set out more detail on carbon prices for the 2020s in the 2017 Autumn Budget.

# Chapter 3:

## Our Clean Growth Strategy

## Our Approach

In the context of the UK's legal requirements under the Climate Change Act, our approach to reducing emissions has two guiding objectives:

1. To meet our domestic commitments at the lowest possible net cost to UK taxpayers, consumers and businesses.
2. To maximise the social and economic benefits for the UK from this transition.

In order to meet these objectives, the UK will need to nurture low carbon technologies, processes and systems that are as cheap as possible. We need to do this for several reasons. First, we need to protect our businesses and households from high energy costs. Second, if we can develop the low cost, low carbon technologies in the UK, we can secure the most industrial and economic advantage from the global transition to a low carbon economy. Third, if we want to see other countries, particularly developing countries, follow our example, we need low carbon technologies to be cheaper and to offer more value than high carbon ones.

We cannot predict every technological breakthrough that will help us meet our targets. Instead, we must create the best possible environment for the private sector to innovate and invest. Our approach will mirror that of our Industrial Strategy: building on the UK's strengths (see Chapter 2 and below on green finance); improving productivity across the UK; and ensuring we are the best place for innovators and new business to start up and grow. We are clear about the need to design competitive markets and smart regulation to

support entrepreneurs and investors who will develop the new technologies at the scale we need. It is only through innovation – nurturing better products, processes and systems – that we will see the cost of clean technologies come down. This Strategy sets out how more than £2.5 billion will be invested by the Government to support low carbon energy innovation from 2015-2021. These actions will help our wider aim of improving the UK's earning power.

In addition to supporting innovation, we are focused on policies that deliver social, environmental and economic benefits beyond the imperative to reduce emissions. Better buildings are healthier places to live and work. Reducing the amount of heat we waste will reduce bills. High ambition on electric cars and other low emission vehicles contains a triple win for the UK in terms of industrial opportunity, cleaner air and lower greenhouse gas emissions. Crucially, many of the actions included here will enhance the UK's energy security.

Alongside these actions, we are laying the groundwork for major decisions in the areas where we face greatest uncertainty and challenge: in how we reduce the emissions that result from heating our homes and businesses; how we decarbonise our transport system; and how we work with industry to make carbon capture, usage and storage (CCUS) a viable future option. This has been shaped by our analysis of plausible pathways out to 2050, reflecting the huge uncertainties. In every section of the Strategy, we also explore the opportunity to shape new commercial opportunities for the UK that can help improve skills and create good jobs.

## Building on the UK's Strengths: Green Finance

Private sector investment in low carbon technology and infrastructure will be key to meeting our carbon budgets and realising the economic opportunities from the low carbon transition. Around £180 billion of investment is already in the pipeline to build the power stations needed in the UK to produce clean and secure supplies of electricity and the networks to deliver this to homes and businesses<sup>136</sup>.

To meet our decarbonisation challenge we will need to mobilise more private capital in sustainable projects and develop more innovative risk sharing financial structures for investment in domestic and commercial low carbon technology. This is a major business and export opportunity for the UK and could cement the UK's position as the leading hub for global low carbon investment.

### UK Leadership in Green Finance

We already demonstrate global leadership on green finance around the world through initiatives like the G20 Green Finance Study Group, which we co-chair; the Green Finance Initiative, a partnership between the financial and professional services sector, academics and civil society, which promotes the UK as a leading global centre for green finance; and through participation in senior global multilateral fora such as the Financial Stability Board's Task Force on Climate-related Financial Disclosures (TCFD), which recently published its final recommendations.

The first offshore green bond issued by an Indian entity and the first green bond issued by a Chinese bank were listed on the London Stock Exchange and 50 green bonds denominated in seven currencies with a value of \$14.8 billion are now listed in the UK<sup>137</sup>.

On 31<sup>st</sup> July 2017, Anglian Water released the first ever public utility Sterling Green Bond on the London Stock Exchange.

Improving the energy performance of homes is vital in decarbonising our economy. Mortgage lenders have a significant financial stake in these properties, their future value, and their customers' ability to make their repayments. This is why the Government supported the LENDERS<sup>138</sup> project with funding from Innovate UK. We want to see the project recommendations implemented, including improving mortgage affordability assessments on energy bills, and lenders to develop a range of innovative new "green mortgage" products to encourage consumers to purchase more efficient homes, or improve their efficiency.

<sup>136</sup> Figure is total for electricity generation, electricity distribution and electricity transmission. Real 2015/16 prices. Gov.uk (2016) National Infrastructure and Construction Pipeline <https://www.gov.uk/government/publications/national-infrastructure-and-construction-pipeline-2016>

<sup>137</sup> London Stock Exchange 2017

<sup>138</sup> UKGBC (2017) Lenders core report <https://www.ukgbc.org/ukgbc-work/lenders-core-report/>

To capture and exploit this opportunity we need to go further. This is why we have set out in this Strategy a series of policies and proposals to develop our expertise in, as well as the opportunity from, new green finance solutions. These include:

- Setting up a Green Finance Taskforce<sup>139</sup>, comprising senior representatives from the finance industry and Government, to develop ambitious policy proposals which could further accelerate private sector investments to deliver our Clean Growth Strategy.
- Endorsing the recommendations put forward by the Financial Stability Board's Task Force on Climate-related Financial Disclosures and encouraging publicly-listed companies to implement these recommendations.
- Working with the British Standards Institution (BSI) to develop a set of voluntary green and sustainable finance management standards to promote responsible investment practices globally. The BSI will have completed the necessary standards scoping exercises and have the first standard in production by the first half of 2018.
- Providing up to £20 million of new investment to support clean technology early stage funding, alongside creating an online platform to showcase UK businesses which have received innovation support from the Government. This will make this information easily accessible for early stage investors to help increase the flow of investment into innovative businesses in the UK.
- Working with mortgage lenders to develop green mortgage products that take account of the lower lending risk associated with more efficient properties and the reduced outgoings for customers living in more efficient homes.

## Ensuring the UK is the Best Place for Low Carbon Innovators

Our Industrial Strategy Green Paper made clear that, for the UK economy to flourish, it must do things other advanced economies cannot do, or do them in better ways. This is the essence of innovation. This is a core part of our approach to decarbonising the UK's economy where investment in innovation will help us to:

- Drive down the cost of key technologies, systems and processes and increase the value they deliver to consumers (such as with batteries and electric vehicles);
- Lay the groundwork for decisions where the right technology choices are currently less clear (such as how we will heat our homes and businesses in the future); and
- Nurture technologies and businesses where the UK is a global leader, leveraging private sector investment and building international partnerships to create export opportunities.

Innovation involves incremental improvements, cross-sector knowledge sharing, and "breakthroughs". It results from competition within the private sector and from collaboration between the private sector and Government, as well as other organisations; each has a role in producing, spreading and adopting novel technologies and approaches. The Government is often more active at earlier stages of innovation, through investment in research, education and skills. Later on, private firms play a bigger role, bringing new technologies to market. However, there is no single, linear route for innovations to progress from concept to commercialisation and often innovation in one area has applications in others.

We want to use the power of Government to support innovation in a low carbon economy using all the tools available to us, including market design, taxation and regulation, as well as investment in our education system, our

<sup>139</sup> The list of members can be found at <https://www.gov.uk/guidance/green-finance>

science base and innovative companies. Our aim is to become one of the best places in the world for low carbon innovation. We understand the need for Government funding that is accessible to private, public and community sector organisations with all playing key roles in supporting and harnessing innovation.

Government funding can be key to stimulating private sector investment from the UK and overseas, both through direct leverage and by creating confidence in the potential to attract follow-on investment for particular innovations. Public investment brings in around 30 per cent additional private funding over the short term, with this increasing in the longer term<sup>140</sup>.

The Government has significantly increased its investment in low carbon innovation. Between 2015 and 2021 we expect to invest more than £2.5 billion in research, development and demonstration of low carbon energy, transport, agriculture and waste. This includes:

- Up to £505 million from BEIS's Energy Innovation Programme<sup>141</sup>, which aims to accelerate the commercialisation of innovative clean energy technologies and processes.

- Up to £1.2 billion of funding from the combination of UK Research Councils and Innovate UK – now being brought into one organisation with the creation of UK Research and Innovation. These investments include funding for the Energy Systems Catapult and the Offshore Renewable Energy Catapult.
- Up to £246 million for the Faraday Challenge, which will ensure the UK builds on its strengths and leads the world in the design, development and manufacture of electric batteries<sup>142</sup>.
- Up to £620 million from a range of Departments, including BEIS, DfT, DfID and Defra and additional Industrial Strategy Challenge Fund (ISCF) support.

In addition to this Government funding, Ofgem is making up to £720 million of regulated expenditure available to gas and electricity network companies in Great Britain, to support smarter, more flexible, efficient, and resilient networks. The Government is also stimulating industry-academia collaboration, for example through the Agri-tech catalyst, which will help improve agricultural productivity and contribute to more environmentally sustainable agricultural systems.

### BEIS Energy Innovation Programme

New projects announced as part of the BEIS Energy Innovation Programme in the Clean Growth Strategy include:

- Up to £10 million for innovations that provide low carbon heat in domestic and commercial buildings
- Up to £10 million for innovations that improve the energy efficiency of existing buildings
- An extra £14 million for the Energy Entrepreneurs Fund, including a new sixth fund
- Up to £20 million in a carbon capture and utilisation demonstration programme
- Up to £20 million to demonstrate the viability of switching to low carbon fuels for industry
- Up to £7 million to develop further the capability of nuclear regulators who support and assess advanced nuclear technologies
- Up to £20 million to support clean technology early stage funding

<sup>140</sup> BIS (2014) Analysis Paper 04 Estimating the effect of UK direct public support for innovation <https://www.gov.uk/government/publications/innovation-effect-of-public-support>

<sup>141</sup> The £505 million BEIS Energy Innovation Programme will invest around £70 million in smart systems, around £90 million in the built environment (energy efficiency and heating), £100 million in industrial decarbonisation and carbon capture, usage and storage (CCUS), around £180 million in nuclear innovation, around £15 million in renewables innovation, and around £50 million in support for energy entrepreneurs and green financing.

<sup>142</sup> BEIS press release (2017) <https://www.gov.uk/government/news/business-secretary-to-establish-uk-as-world-leader-in-battery-technology-as-part-of-modern-industrial-strategy>

Last November, the Prime Minister announced £4.7 billion of additional research and development funding<sup>143</sup> – a bigger increase than in any Parliament since 1979. This funding aims to kick start the development of disruptive technologies, including low carbon technologies, that have the potential to transform the UK economy<sup>144</sup>. It includes the Faraday Challenge and £93 million for Robotics and Autonomous Systems, and we are exploring the scope to fund further clean growth innovation challenges.

Internationally, governments around the world are investing around \$15 billion a year in low carbon innovation, and this figure is set to rise significantly<sup>145</sup>. A key component of our innovation strategy is identifying opportunities for global partnership. In particular, the UK is committed to clean energy innovation as a member of ‘Mission Innovation’. This initiative

aims to reinvigorate and accelerate global clean energy innovation and to make clean energy widely affordable. As part of our commitment within Mission Innovation, the UK will invest at least £100 million in 2020-21 on projects that will help to address the clean energy needs of developing countries<sup>146</sup>.

How we spend money is just as important as how much we spend. To ensure a strategic approach, a new Energy Innovation Board was launched in 2016<sup>147</sup>, to bring together senior representatives from across the Government, Innovate UK, Research Councils, and Ofgem, to align public investments in low carbon innovation. The Board aims to co-ordinate the UK’s domestic and international clean energy and low carbon innovation activities to maximise their impact, and to ensure that those investments leverage increased private sector investment.

### Energy Entrepreneurs Fund

The Government is also launching a sixth round of the Energy Entrepreneurs Fund, which has been running since 2012, and aims to support, through capital grants, the development and demonstration of innovative energy technologies and processes, with a particular focus on assisting small and medium sized enterprises. This sixth round will offer up to £10 million in funding. Alongside this, a further £4 million has been offered to companies who applied for the fifth funding round, bringing the total to £14 million across the projects supported<sup>148</sup>.

Over phases one to five of the Energy Entrepreneurs Fund, we have invested £47.2

million in 102 companies, which leveraged a further £35 million from the private sector. For those companies that have completed their projects, over £63 million in follow-on private investment has been secured.

For instance Vantage Power in West London retrofit buses to a low carbon standard. This is done at a fraction of the cost of purchasing new hybrid buses, and means that operators can reduce their fuel consumption and emissions. Vantage Power were beneficiaries of the Energy Entrepreneurs Fund, and the buses they have retrofitted have reported up to 40 per cent lower fuel consumption and 92 per cent lower emissions of nitrogen oxides.

<sup>148</sup> The Energy Entrepreneurs Fund is funded through the £505 million BEIS Energy Innovation Programme

**Table 3: Government investments in clean growth technology 2015-2021<sup>149</sup>**

	Forecast Clean Technology Innovation Spend £ million (across Innovate UK, Research Councils, BEIS, DfT, DfID, Defra)			
	Basic & Applied Research	Technology Development	Technology Demonstration	Total
Innovation in Smart Systems (including energy storage)	175	43	47	265
Innovation in the Power Sector (including renewables)	209	276	154	638
Innovation in Homes (including heat and energy efficiency)	100	31	53	184
Innovation in the Transport Sector (including electric vehicles and batteries)	296	413	132	841
Innovation for Business and Industry, including carbon capture, usage and storage (CCUS)	57	47	58	162
Innovation in Natural Resources	69	30	0	99
Cross-sector Clean Tech Innovation (including for entrepreneurs)	234	62	91	387
<b>Total (£ million)</b>	<b>1,140</b>	<b>902</b>	<b>534</b>	<b>2,576</b>

NB All figures are indicative and are subject to competitive bidding processes across sectors and value for money tests.

<sup>149</sup> Final spending commitments are subject to competitive bidding processes across sectors and value for money tests. Excludes £720 million of regulated expenditure being made available by Ofgem to support innovation in gas and electricity networks.

## Clean Growth Innovation Challenges

To get the clean growth we want, we need breakthroughs in clean technologies. Government funding and innovations in universities are crucial, but such breakthroughs also need the creativity and energy of the private sector. We have identified the key challenges we believe need to be overcome if we are to meet future carbon budgets:

### Hydrogen and bioenergy

Clean fuels such as hydrogen and bioenergy could be used for transport, industry, and to heat our homes and businesses. We need to test how they work in the existing gas network, whether they can fire industrial processes, and how they could be used in domestic appliances. These options need to work as well and as cheaply as current technologies.

### Homes

We need energy efficiency and heat technologies that are less costly and easier to install, and commercial innovation to ensure retrofits are attractive for homeowners. To build lower cost, lower carbon homes, we need to use innovative construction methods including factory production and off-site manufacturing.

### Batteries

To rapidly decarbonise transport, including rail and EVs, we need innovation in batteries: to extend their range and lifetime, bring down their cost, and ensure they can be disposed of sustainably. New methods for charging are needed to make electric vehicles easier to use, including super-fast charge points, wireless charging and dynamic charging.

### Smart energy system

Clean technologies such as electric vehicles, batteries, fuel cells and renewable energy are all falling in cost. We need to ensure

these technologies can integrate smoothly in the energy system, including finding local solutions, so that consumers benefit from lower energy and transport costs.

### Power

We need to bring down the costs of nuclear power through developing new materials and manufacturing processes, and exploring the opportunities of new fuels and reactor designs. To further reduce the cost of offshore wind, we need to deliver larger turbines, extend existing asset life, optimise performance and reduce operational maintenance.

### Industry

We need to find alternatives to industrial fuels which are energy intensive to produce, without increasing cost or reducing performance. The cost of CCUS technologies will need to fall.

### Waste

We need to minimise the impacts of anaerobic digestion, particularly in relation to air quality. This includes developing improved digestion and ammonia and phosphate extraction technologies and reducing methane emissions. Innovative techniques are also needed to reduce the impact of landfills at the end of their use.

### Land use

To support greater productivity of agricultural land, we need to: increase carbon storage through fertilising crops more effectively, develop new animal and plant breeding technologies, use precision farming technologies on smaller scale farms, and develop robotics and new sensor technologies. We also need to reduce plant and tree disease and investigate methods to improve soil health and carbon stocks.

## Getting to 2032

We cannot predict the exact technological changes that will help us deliver on the fourth and fifth carbon budgets (and beyond). Some technologies will develop faster than expected, making it easier to reduce emissions in particular sectors. Some technologies may develop less quickly than we hope.

To explore this uncertainty, we test different potential versions of the future based on current knowledge. These are not firm predictions of the future and should not be taken as sectoral targets. However, they allow us to identify areas where progress is most needed to meet our future carbon budgets, especially the fifth carbon budget, and where action now is unlikely to be wasted. The policies and proposals set out in this Strategy reflect that understanding.

Our Clean Growth Strategy sets out in detail a possible pathway for meeting the fifth carbon budget through domestic action, including many of the policies and proposals set out here. The route we ultimately take to meeting our targets will depend on a range of factors, in particular ensuring we are mindful of any impact on energy costs for households and businesses, and changes in costs as a result of innovation.

The approach could involve<sup>150</sup>:

- Emissions from business and the public sector falling by 30 per cent on today's levels, through significant improvements in energy efficiency, reducing energy use per unit of output as well as reducing the carbon content of industrial energy use by at least 14 per cent through switching to cleaner fuels. Our proposals will contribute to this, for example improving business energy efficiency and standards for commercial buildings, and agreeing tighter targets to reduce central government emissions.
- Emissions from homes falling by 19 per cent from today, with household energy use falling nine per cent, through a combination of switching low-carbon heating and greater energy efficiency which in turn will help to reduce bills. We will also need to bring down the cost of low carbon alternatives to the gas boiler. This is supported by the proposals set out in this Strategy, including investments in upgrading homes and proposals to improve energy performance standards across the housing sector.
- Emissions from transport falling by 29 per cent from today, largely achieved by accelerating the shift to electric and other low emission vehicles. This transition could involve reducing the energy and emissions intensity of road transport<sup>151</sup> by 30 per cent and 44 per cent respectively. Our proposals, such as those to encourage uptake of ULEVs, will contribute to this.
- Emissions from power falling by 80 per cent on today's levels, by increasing the share of clean electricity generation to over 80 per cent of demand and moving to a smarter, more flexible system and reducing demand by improving the efficiency of appliances. The proposals set out in this Strategy, for example providing further funding for Contract for Difference auctions for renewable technologies, will help to deliver this.
- Emissions from land use and agriculture falling by 26 per cent on today's levels. This could mean that woodland cover increases by up to 16 per cent and the emissions intensity of agricultural outputs could improve by 27 per cent. Emissions from waste and F-gases fall to around 14 Mt by 2032, 53 per cent lower than today. This could mean that the amount of biodegradable waste sent to landfill in 2032 is around 45 per cent lower than that seen in 2015. This is supported by the proposals in this Strategy, such as those to reduce emissions from waste and to establish a new network of forests.

<sup>150</sup> Total sector emissions reductions are compared against estimated 2017 levels. Supplementary metrics, where relevant, compared the 2032 pathway with 2015 official statistics. See Table 4 in Annex D, and Table 6 in the Technical Annex for details.

<sup>151</sup> Covering cars, van and freight

## BBOXX

BBOXX was formed by students at Imperial College London in 2010. In addition to \$2 million in private funding, since 2013 BBOXX received £1.2 million, including from the EPSRC and DfID, to tackle the challenges and opportunities arising from unreliable electrical supplies in rural Africa. By providing households with off-grid electric lighting, children can do their homework and families can run a business without incurring threats to their health from paraffin smoke. Since 2006, BBOXX has created a sustainable non-subsidised business model. Rapidly expanding from three founders to a global staff of 140, BBOXX products have already saved energy worth over \$2 million and offset over 40,000 tonnes of CO<sub>2</sub>. BBOXX aims to provide up to 20 million people with electricity by 2020.

Innovation can deliver dramatic results, as we have seen with the rapid falls in the costs of some clean technologies over the past ten years, and this Strategy sets out ambitious proposals on funding innovation to further reduce costs. We take a cautious approach towards quantifying the contribution of current and future innovation to emissions savings. As we cannot say precisely how our investments today will impact on the UK's emissions in the future, we have omitted any estimates from this analysis.

We estimate the combination of existing policies and new measures in this Strategy that can be quantified could deliver 93 per cent of the required level of emissions savings for the fifth carbon budget, against our 1990 baseline. As well as setting out policies within this Strategy, we identify areas where we will need to drive further progress through future consultations, innovation spend and policy design. This is set out in more detail at Annex A.

## Beyond the Fifth Carbon Budget, Towards 2050

There is even greater uncertainty about which technologies will help us reduce emissions by at least 80 per cent by 2050<sup>152</sup>. It is even more challenging to predict what the UK economy will look like in 2050 than in 2032. However, exploring the plausible potential pathways to 2050 helps us to identify low-regrets steps we can take in the next few years common to many versions of the future, as well as key technologies and uncertainties. To demonstrate this, we present three illustrative long-term pathways in this Strategy:

<sup>152</sup> On a 1990 baseline.

- **Electricity pathway:** Under this pathway, electricity is the main source of energy in 2050. There are many more electric vehicles (EVs), we replace our gas boilers with electric heating and industry moves to cleaner fuels. Altogether this means we use around 80 per cent more electricity than today, and virtually all of it comes from clean sources (renewables and nuclear). In this pathway, CCUS is not used in the UK by 2050.
- **Hydrogen pathway:** Under this pathway, we use hydrogen to heat our homes and buildings, as well as to fuel many of the vehicles we drive in 2050 and power the UK's industry. We adapt existing gas infrastructure to deliver hydrogen for heating and a national network of hydrogen fuelling stations supports the use of hydrogen vehicles. A large new industry supports hydrogen production using natural gas and capturing the emissions with CCUS.
- **Emissions removal pathway:** Under this pathway, sustainable biomass power stations are used in tandem with CCUS technology. Carbon is removed from the atmosphere by plants (biomass) as they grow and, when the biomass is used to generate electricity, emissions are captured and stored instead of returning to the atmosphere. There is still a significant clean transition in other sectors but successful innovation in emissions removal allows more time for some of these changes.

These illustrative pathways should not be seen as predictions, as we are continuing to build our understanding of the best approach. The ultimate way forward might in fact be some combination of these, or another approach

that builds on further innovation. This approach will also be consistent with Government's commitments on clean air out to 2050.

The purpose of these illustrations is to demonstrate a range of practical ways in which emission reduction aims can be delivered with technology known today, and to underline some of the steps common to all. These include:

- making our homes and commercial buildings more energy efficient;
- shifting to low carbon sources of heating, such as through more district heating;
- continuing to decarbonise electricity;
- ensuring our electricity system is smart and flexible to respond to changes in demand and decarbonise at least cost;
- increasing the number of ultra low emission vehicles in the UK; and
- working with industry on how to improve efficiency and transition to clean fuels.

### Greenhouse Gas Removal Technologies

As the UK approaches 2050, its remaining emissions will likely be in the sectors where it is the most difficult to cut them – in industry, agriculture, aviation and shipping. Under the Paris Agreement, as well as seeking to limit warming to well below 2 degrees, and to pursue 1.5 degrees, the UK is committed to working with other countries to achieve global net zero emissions in the second half of the century<sup>153</sup>. This will require a step change in action to tackle climate change and has strong links to how the Sustainable Development Goals will be achieved.

<sup>153</sup> This means that global GHG emissions will not be greater than the amount of GHGs which are absorbed through natural processes or technology.

As highlighted by the Committee on Climate Change<sup>154</sup>, greenhouse gas removal (GGR) technologies are likely to have an important role to play in offsetting difficult-to-cut emissions, by removing greenhouse gases from the air. As we learn more about how GGRs could be developed and deployed, we want the UK's entrepreneurs, universities and engineering industries to be well placed to exploit the advantages of global demand for these new technologies.

There is a diverse set of GGR technologies with varying potential scale and at varying stages of development. These include afforestation, bio-energy with carbon capture and storage (BECCS), direct air capture (capturing carbon dioxide from the air and storing it), enhanced weathering (crushing suitable rocks that react with carbon dioxide and spreading over land), and methods for storing carbon in the oceans, such as ocean liming.

We are therefore taking active steps to strengthen our understanding of these technologies and, where appropriate, move forward with deployment. The Government's strategic approach to GGR has two main elements:

- A Government programme of research and development**, which aims to improve our understanding of GGR technologies, to help overcome the uncertainties around their costs, deployment potential, and impacts on the environment. We have been working with the Research Councils, who launched a new £8.6 million research programme looking at all GGR technologies in April 2017. We will also develop robust estimates of sustainable biomass resource available to the UK, reporting during 2018, and consider Royal Society scientific views on GGR.
- The Government will consider the scope for removing barriers and strengthening incentives to support the deployment of GGR**, to position the UK at the leading edge of GGR development. This includes, for example, considering options for developing a carbon offset market and exploring how UK timber could be used in construction. We are also considering how best to take forward CCUS, as set out in 'Improving Business and Industry Efficiency and Supporting Clean Growth'. We will conduct a study on how GGR activity can be incentivised, in the UK and in other countries, which will help us develop policy and accounting frameworks fit for the future. And we will also consider how legal, financial and regulatory frameworks could support the rollout of GGR technologies at scale.

We will develop our strategic approach for GGR technologies, including consideration of whether to reprioritise existing innovation spend, in light of these pieces of work.

### Global Net Zero Emissions

As well as seeking to limit warming to well below 2 degrees, and to pursue 1.5 degrees, the Paris Agreement includes an aim of achieving net zero global greenhouse gas emissions in the second half of the century. Our obligations under the Climate Change Act only take us to 2050, and the Government agrees with the Committee on Climate Change that now is not the right time to set a post-2050 net zero goal. We need to understand more about the global path to net zero emissions, and believe that our focus should be on meeting our existing targets. However, the Government believes the UK will need to legislate for a net zero emissions target at an appropriate point in the future, to provide legal certainty on where the UK is heading.

<sup>154</sup> Committee on Climate Change (2016) UK climate action following the Paris agreement: <https://www.theccc.org.uk/publication/uk-action-following-paris/>

### Measuring the Delivery of the Clean Growth Strategy

This Strategy sets out a comprehensive set of policies and proposals that will allow us to accelerate the pace of clean growth. We want to continue the UK’s strong economic growth while achieving that growth in a way that sees emissions fall. Between 1990 and 2016 emissions fell by 42 per cent whilst GDP grew by 67 per cent which meant that the “emissions intensity” of our economy – the

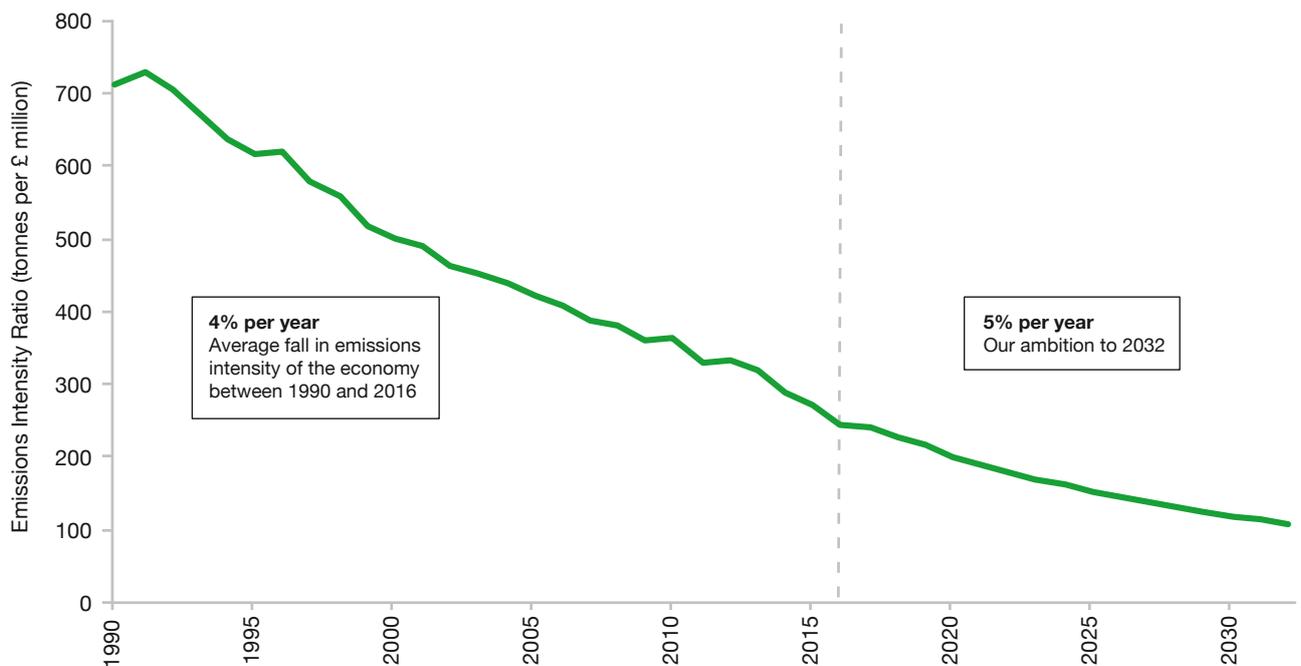

amount of carbon emitted for each pound of national income generated - fell by four per cent per year on average. We want to build on this success and accelerate clean growth. To reach our targets, the emissions intensity will have to fall by an average five per cent per year to 2032. We will therefore introduce a new measure of progress, the Emissions Intensity Ratio (see below) and publish our performance against this intensity ratio on an annual basis.

### The Emissions Intensity Ratio (EIR)

This will measure the amount of greenhouse gases (tonnes of carbon dioxide equivalent) produced for each unit of Gross Domestic Product (GDP) created. Currently the EIR is

270 tonnes/£ million and it was 720 tonnes/£ million in 1990. By 2032, we expect the EIR will need to be nearly as low as 100 tonnes/£ million to meet our ambitions.

**Figure 13: Historic and projected Emissions Intensity Ratio (EIR)**

Source: BEIS

## Government Leadership

To maintain cross-Government progress on clean growth, we will reinstate a regular Clean Growth Inter-Ministerial Group, which will be responsible for monitoring the implementation of this Strategy and driving ambitious clean growth policies.

The Government cannot achieve the changes needed to our economy by itself. Outside action on public sector emissions, the Government's key role is to set the framework for action across the economy. Beyond that, clean growth has to be a shared endeavour between Government, business, civil society and the British people.

Creating this supportive environment will help attract the domestic and international investment the UK wants. Therefore, from 2018, we will work with private partners and NGOs to introduce a **Green Great Britain Week**, to engage as many people as possible in the importance of tackling climate change and improving air quality. A week of high profile activity, this will be an opportunity to both celebrate UK leadership on climate change and look ahead to explore how we can continue to drive ambitious action in the future. This annual event will be an important moment to bring together all parts of society, from business through to the general public, to better understand the different ways the UK can further harness clean growth to boost economic performance, reduce emissions and create a cleaner environment.

### Green Great Britain Week

An annual event to:

- Focus on climate and air quality issues across the UK, demonstrating how all parts of the country and sectors of the economy are working towards a cleaner future.
- Demonstrate our progress and successes by showcasing how taking action on climate change and air quality can provide opportunities for UK businesses and citizens.
- Share the latest climate science, providing a platform for the latest research on the impacts of climate change and the importance of taking ambitious action.
- Promote UK leadership on tackling climate change and air quality across our economy, and how we are driving forward innovation to create economic opportunities from reducing emissions, especially to international investors.

# Chapter 4: Sectors

# Improving Business and Industry Efficiency and Supporting Clean Growth

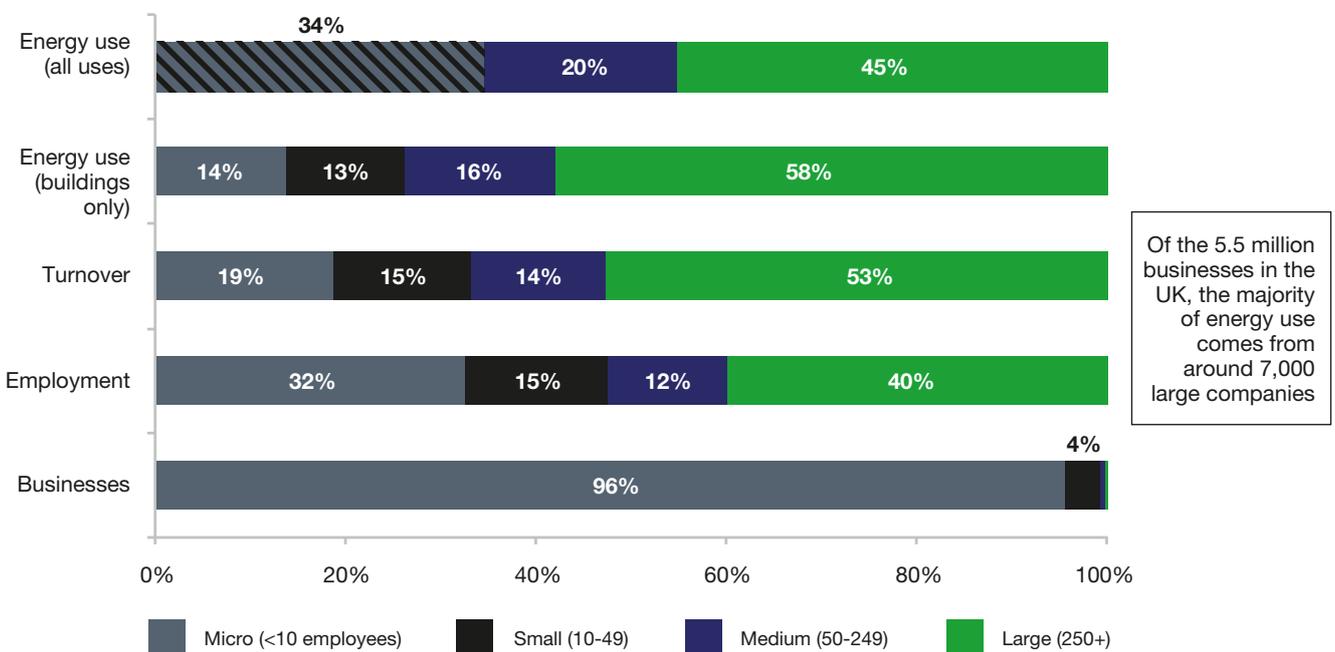

## Progress

Since 1990, emissions from business and industry have almost halved, mainly due to efficiency gains and a shift in manufacturing to cleaner fuels, as well as changes to the industrial structure of the UK economy. Much of this reduction has taken place in the most energy intensive industries. For instance, each tonne

of steel produced in the UK requires 40 per cent less energy to produce than 40 years ago<sup>155</sup>.

In addition, we have also improved the energy efficiency of non-domestic buildings since 1990 with emissions 18 per cent lower in 2015<sup>156</sup>. The number of properties registering as having the lowest Energy Performance Certificates (EPC Bands F and G) has dropped from 19 per cent to 13 per cent between 2010 and 2016<sup>157</sup>.

**Figure 14: Distribution of energy use, turnover, and employment by business size (2016)<sup>158</sup>**

Of the 5.5 million businesses in the UK, the majority of energy use comes from around 7,000 large companies

Source: Derived from Business population estimates, Non-Domestic National Energy Efficiency Data-Framework and Business Energy Efficiency Survey

<sup>155</sup> WSP and Parsons Brinckerhoff & DNV GL (2015) Report prepared for DECC & BIS: Industrial Decarbonisation & Energy Efficiency Roadmaps to 2050 <https://www.gov.uk/government/publications/industrial-decarbonisation-and-energy-efficiency-roadmaps-to-2050>

<sup>156</sup> BEIS (2017) Final UK greenhouse gas emissions national statistics: 1990-2015 <https://www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-2015>

<sup>157</sup> DCLG (2017) Live tables on Energy Performance of Buildings Certificates <https://www.gov.uk/government/statistical-data-sets/live-tables-on-energy-performance-of-buildings-certificates>

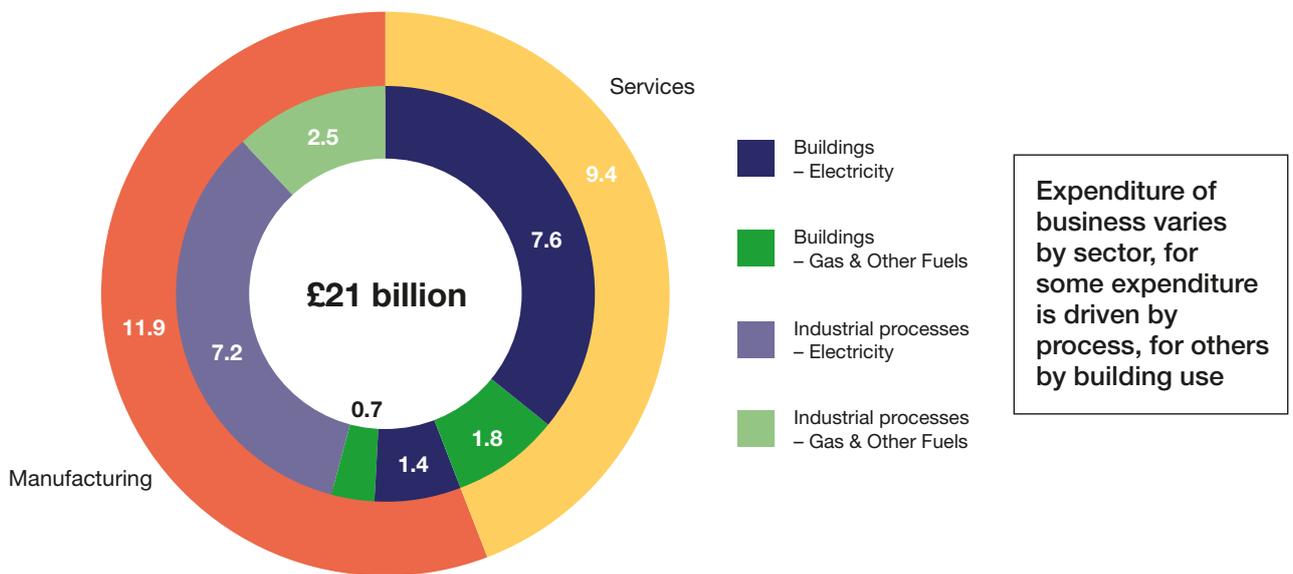

<sup>158</sup> BEIS (2016) Business population estimates 2016 <https://www.gov.uk/government/statistics/business-population-estimates-2016>; BEIS (2014) Non-domestic National Energy Efficiency Data-Framework (ND-NEED) <https://www.gov.uk/government/statistics/non-domestic-national-energy-efficiency-data-framework-energy-statistics-2006-12>

Overall, business and industry now account for approximately 25 per cent of the UK’s emissions (excluding fluorinated gases or F-gases)<sup>159</sup>, with around two thirds of industrial emissions coming from a small number of energy intensive sectors (for example chemicals, iron and steel)<sup>160</sup>. Businesses and industry are also major users of electricity, accounting for over 50 per cent of electricity use<sup>161</sup>.

We now have a much greater understanding of the potential for cost-effective energy efficiency in the commercial and industrial sector. Our analysis says that up to £6 billion<sup>162</sup> could be saved in 2030 through investment in

cost-effective energy efficiency technologies. Roughly half of these savings are available through improving the efficiency of buildings and processes, including by fitting better insulation and smarter energy controls. The other half can be realised through eliminating electricity waste in business for example using better lighting and energy management systems. This is consistent with research from EEF, the manufacturers’ trade association, which found that a 14 per cent reduction in electricity consumption could be made across the manufacturing sector, equivalent to over £1 billion a year in savings<sup>163</sup>.

**Figure 15: 2015 final energy expenditure<sup>164</sup> on energy by end use and fuel, £ billion, 2016 prices.**

**Expenditure of business varies by sector, for some expenditure is driven by process, for others by building use**

<sup>164</sup> Excluding expenditure on energy used for raw material extraction or transformation to other fuels (e.g. oil extraction and refining) and excluding energy used for transportation

## CRESS Systems

CRESS Systems, based in Darlington, have developed a flywheel to reduce the energy required to drive cranes at shipping ports. They received Energy Entrepreneurs Fund grants of £800,000 to build and test the first system at the Port of Felixstowe. Since then, they have secured investment from Enterprise Ventures' Northern Powerhouse Investment Fund and private investors to finalise the product and make first sales into the port market world-wide.

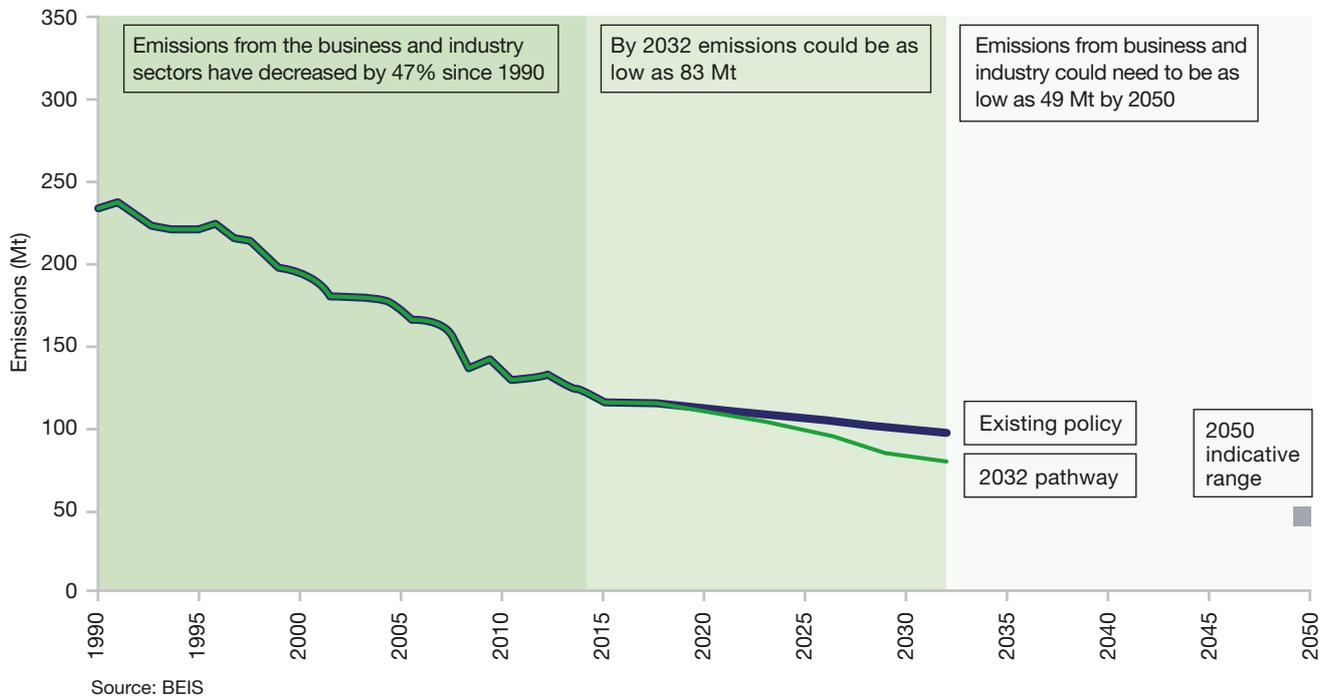

## Ambition

The Government is determined to help businesses improve their productivity and competitiveness as part of our Industrial Strategy. This includes working together to unlock any potential energy savings to help keep bills as low as possible.

Our goal is to enable businesses and industry to improve energy efficiency by at least 20 per

cent by 2030. This will contribute to overall economic growth by reducing the amount of energy required per unit of output. We will take a final decision on the level of this goal and how best to measure progress toward it in 2018, taking into account the recommendations of the independent review into the cost of energy, led by Professor Dieter Helm CBE.

**Figure 16: Actual and projected emissions in business and industry, taking into account the clean growth pathway, 1990-2050**

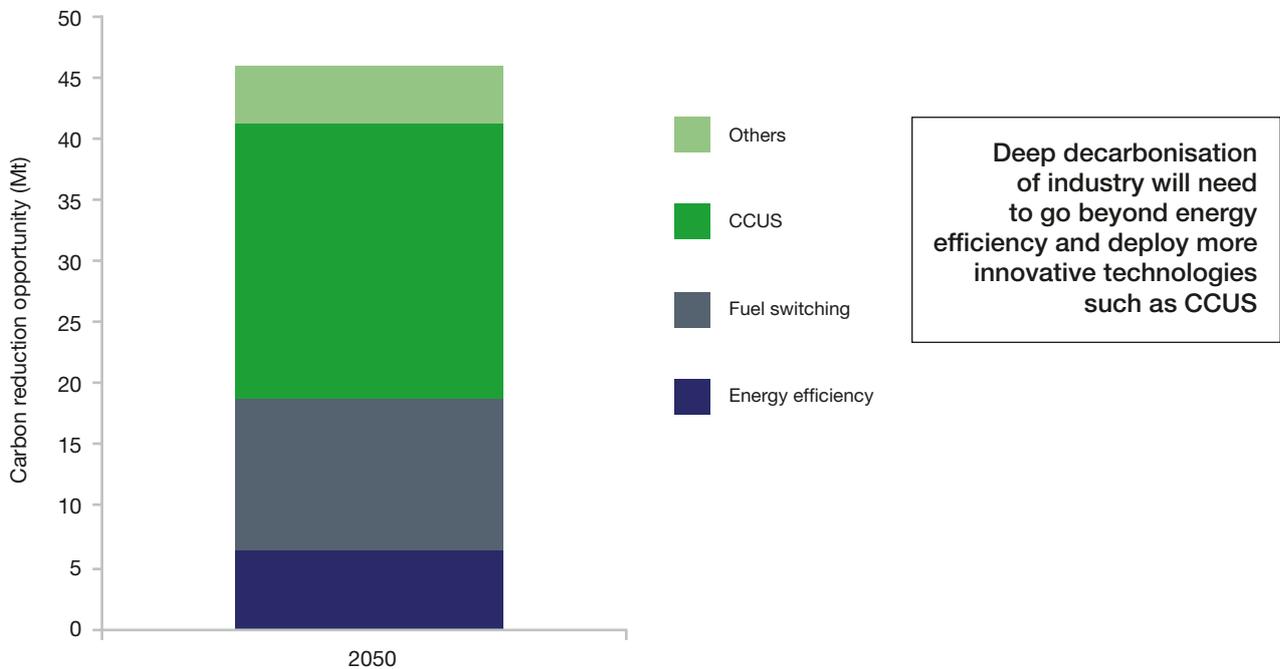

The Government will put in place a simpler, more ambitious and long-term policy and regulatory framework. This will:

- Make it easier for businesses to identify where they can save energy by simplifying the energy and carbon reporting framework.
- Ensure that those who lease premises to businesses, including in the service sector, continue to refurbish and improve the performance of their buildings. In parallel, all new commercial and industrial buildings should be more energy efficient.
- Help to understand how we can encourage greater investment in energy efficiency measures and technologies, including establishing an Industrial Energy Efficiency scheme to help large companies install measures to cut their energy use, and working with the financial sector to identify how such measures can be taken forward.

Energy intensive industries will require steps beyond energy efficiency. Out to 2030, this will require industry to make progress in switching from fossil fuel use to low carbon fuels such as sustainable biomass, in line with broader Government priorities on delivering clean air, and clean electricity. Beyond 2030, this switching will need to substantially increase in scale and be coupled with the deployment of new technologies, for example carbon capture, usage and storage (CCUS). Over the course of this Parliament, we will therefore also develop a framework to support the decarbonisation of heavy industry. Overall, one possible pathway to 2032 could involve emissions from business and industry falling by around 30 per cent on today's levels to as low as 83 Mt by 2032.

**Figure 17: Carbon reduction opportunities across industry (2050)<sup>165</sup>**

Source: 2050 Roadmaps Cross-Sector Summary report (2015). This illustrates the technical potential for emissions savings in the report's 'MAX TECH' pathway.

### Opportunities

The UK energy efficiency sector already turns over £20.3 billion, employs 144,000 people and sells exports worth over £1 billion<sup>166</sup>. We know the potential for further energy efficiency in businesses and industry is significant - up to £6 billion could be saved by 2030 through investment in cost-effective energy efficiency technologies in buildings and industrial processes. As well as reducing bills across

the UK, building the energy efficiency market would place UK businesses and industry in a prime position to further increase the export of knowledge, skills and products to other countries. It would also involve greater flows of external finance, a sector where the UK is already a market leader. For example, the UK energy services market is estimated to have a potential annual size of €1 billion per year and would require significantly more third party finance than we see currently<sup>167</sup>.

<sup>165</sup> BIS, DECC (2017) Industrial Decarbonisation and Energy Efficiency Roadmaps to 2050 <https://www.gov.uk/government/publications/industrial-decarbonisation-and-energy-efficiency-roadmaps-to-2050> 'Fuel switching' includes a small amount of bioenergy used for feedstock

<sup>167</sup> EC (2014) The European ESCO Market Report 2013 <https://ec.europa.eu/jrc/en/publication/eur-scientific-and-technical-research-reports/european-esco-market-report-2013>

## Policies and Proposals

### Unlocking Business Energy Efficiency

1. The Government will develop a package of measures to support businesses to improve how productively they use energy and will consult on this in 2018, with the aim of improving energy efficiency by at least 20 per cent by 2030.
2. The Government will ensure incentives for investment in energy efficiency are regularly reviewed, for instance the list of products that qualify for enhanced capital allowances tax relief.
3. We will continue with plans to close the CRC Energy Efficiency Scheme following the 2018-19 compliance year. We will drive energy efficiency by implementing the previously announced increase to the main rates of the Climate Change Levy from 2019.
4. We will undertake an evaluation of the Climate Change Agreements to inform any successor scheme from 2023.
5. The Government will build on existing schemes such as the Energy Savings Opportunity Scheme (ESOS), undertaking a comprehensive assessment of its effectiveness and consider any future reforms.
6. The Government will work with stakeholders to improve the market for energy services, building confidence across commercial and industrial customers.
7. Alongside this Strategy, we are consulting on a new and streamlined energy and carbon reporting framework to replace some existing schemes, such as the reporting element of the CRC Energy Efficiency Scheme, and align with mandatory annual greenhouse gas reporting by UK quoted companies. This will improve the way in which businesses report their energy use, and provide businesses with the information needed to identify how they can reduce energy bills.
8. The Government will establish an Industrial Energy Efficiency scheme to help large companies install measures to cut their energy use and their bills.
9. We are consulting on the design of a new industrial heat recovery programme. This £18 million fund will encourage investment by manufacturers to recover and reuse heat from industrial processes that would otherwise be wasted.
10. The Government will explore with stakeholders how we can improve the provision of information and advice to SMEs to encourage the uptake of energy efficiency technologies.

## Anglian Water

Anglian Water's 'Love Every Drop' campaign aims to significantly reduce carbon emissions, including in their supply chain, and encourage customers to be more resource efficient and cut down their carbon emissions. Their manifesto, published in 2015, aims to raise awareness about how essential water is to life, to people and the environment, and to a vibrant and growing economy too. This helped to save £2.5 million in energy costs in 2016. They have also issued the first ever public utility green bond this year, raising £250 million to finance a range of sustainable projects and support the company's vision of sustainability, carbon reduction, water efficiency and environmental stewardship.

### More Energy Efficient Commercial and Industrial Buildings

11. The Government has commissioned an independent review of Building Regulations and fire safety, being led by Dame Judith Hackitt. The review will report in spring 2018. Subject to the conclusions of that review, the Government intends to consult on making improvements to Building Regulations requirements for new and existing commercial buildings where there are cost-effective and affordable opportunities, and it is safe and practical to do so. This will look to promote low carbon and higher energy efficiency heating, ventilation and air conditioning systems in new commercial buildings.

12. 42 per cent of business buildings' energy use is in the private rented sector<sup>168</sup>. We will consult in 2018 on how best to improve the energy performance of these buildings through tighter minimum energy standards.

13. The Government will explore how voluntary building standards can support future improvements in business building performance.

14. As we work to understand different options for the long term decarbonisation of heat, we will need to tackle the challenge of those business properties off the gas grid, particularly those heated by oil boilers and facing volatile costs. Beyond support through the Renewable Heat Incentive (RHI), our ambition is to phase out the installation of high carbon fossil fuel heating in new and existing business buildings off the gas grid during the 2020s, starting with new buildings as these lend themselves more readily to other forms of low carbon heating. We will involve businesses and industry in developing our new policy, in line with broader Government priorities on delivering clean air.

<sup>168</sup> BEIS (2016) Building Energy Efficiency Survey (BEES) <https://www.gov.uk/government/publications/building-energy-efficiency-survey-bees>

## Transforming Manufacturing and Heavy Industry

15. Alongside this Strategy, we have published joint industrial decarbonisation and energy efficiency action plans with seven of the most energy intensive industrial sectors, building on three years of joint industry-Government co-operation. These action plans identify steps by industry and Government that can be taken now to support long term low carbon growth, energy efficiency and emissions reductions on a sector by sector basis. These include the sharing of best practice and innovation opportunities, including through a new online portal, facilitating dialogue to improve access to finance and cross-sector consideration of the best uses of biomass across industry.
16. The Government remains committed to using carbon pricing as an emissions reduction tool and will ensure that a clear price signal continues to incentivise industrial emissions reduction.
17. We will develop a framework to support the long term low carbon development of energy intensive industrial processes, such as CCUS and electrification.

## Government Innovation Investment

The Government expects to invest around £162 million<sup>169</sup> of innovation funding out to 2021, in research, development and demonstration of energy, resource and process efficiency alongside better low carbon fuels and CCUS. This includes:

- **Energy efficiency:** We need to drive down the cost of new technologies to integrate them into existing processes and improve performance without affecting reliability. The Government is providing £9.2 million for an Industrial Energy Efficiency Accelerator, to help reduce the emissions from UK industry by increasing the commercially viable options available.
- **Processes, resource and material efficiency:** Over time we will need to replace materials which are energy intensive to produce with lower carbon ones at competitive prices, known as “advanced materials”. Government will work through Industrial Strategy sector deals and the Industrial Strategy Challenge Fund to stimulate innovation in advanced materials. We will also need to encourage more resource efficient business models, extend product life and reduce waste volumes. The Industrial Digitalisation Review will investigate how the design, development and deployment of digital technologies can drive increased national productivity.

<sup>169</sup> All figures are indicative and are subject to competitive bidding processes across sectors and value for money tests

- **Fuel Switching:** Firing industrial processes with low carbon fuels (such as hydrogen) is currently viewed as prohibitively expensive and disruptive. Innovation can prove the viability of these fuels without impacting

operations. Government will invest up to £20 million in competitions from 2018, initially for research followed by competitions for demonstrator projects across industry.

## Carbon Capture, Usage and Storage

There is a broad international consensus that carbon capture, usage and storage (CCUS) has a vital future role in reducing emissions. This could be across a wide range of activities such as producing lower-emission power, decarbonising industry where fossil fuels are used and/or industrial processes as well as providing a decarbonised production method for hydrogen which can be used in heating and transport. This makes CCUS a potentially large global economic opportunity for the UK. The International Energy Agency estimates there will be a global CCUS market worth over £100 billion - with even a modest share of this global market, UK GVA could increase to between £5 billion and £9 billion per year by 2030<sup>170</sup>.

However, the current technology is expensive and there are only 21 large-scale plants operating, or in construction, across the world – of which 16 rely on revenue from providing carbon dioxide for enhanced oil recovery<sup>171</sup>.

Our Clean Growth Strategy is underpinned by three commitments: to reduce our emissions in the most cost-effective way; to maximise innovation to develop world leading

technologies and to seek the maximum possible benefits from investment for improving the productivity of the UK economy. While we have explored ways to deploy CCUS at scale in the UK since 2007, the lack of a technological breakthrough to reduce the cost of CCUS and the cost structures and risk sharing that potential large-scale projects have demanded has been too high a price for consumers and taxpayers. It is clear from the relative lack of deployment of the technology that other governments have reached a similar conclusion.

However, we have continued to invest in innovation and technology development both in the UK and overseas. To date we have invested over £130 million in R&D and innovation support to develop CCUS in the UK, supporting the development of technologies including NET Power's Allam cycle, Carbon Clean Solutions and C-Capture. We are also one of the leaders in providing aid support to CCUS internationally through our support to CCUS pilot projects in countries with a fossil fuel-intensive energy sector, such as Mexico, South Africa, and Indonesia.

<sup>170</sup> CCSA & TUC (2014) The economic benefits of carbon capture and storage in the UK <http://www.ccsassociation.org/press-centre/reports-and-publications/>

<sup>171</sup> Large-scale CCS facilities <http://www.globalccsinstitute.com/projects/large-scale-ccs-projects>

## Carbon Capture, Usage and Storage (continued)

### **Investing in cutting edge technology to achieve global cost reductions in CCUS**

*As a global leader in supporting the development of cutting edge technologies, the Government provided £7.5 million for the early development support to the UK invented Allam cycle technology used by NET Power. This technology has the potential to capture 100 per cent of the carbon dioxide emitted at a cost similar to that of an unabated Combined Cycle Gas Turbine (CCGT).*

*This early support from the Government in a cutting edge technology has been critical to developing the technology and for the 8 Rivers NET Power project to reach demonstration scale. In March 2016, construction began on the NET Power pilot project, a 50 MWth first-of-its-kind natural gas-fired power plant located in Texas and the plant is expected to start operations in late 2017. The pilot project also includes significant UK content with two UK companies – Goodwins Steel Castings Ltd and Heatric involved in the project.*

We now see a new opportunity for the UK to become the global technology leader for CCUS, working internationally with industry and governments to bring about global cost reductions. We will do this through:

#### Re-affirming our commitment to deploying CCUS in the UK subject to cost reduction:

We will build on the success of the Offshore Wind Cost Reduction Taskforce<sup>172</sup> and convene a CCUS Cost Challenge Taskforce to deliver a plan to reduce the cost of deploying CCUS. This will then underpin

a deployment pathway for CCUS in 2018, setting out the steps needed to meet our ambition of deploying CCUS at scale during the 2030s, subject to costs coming down sufficiently. This will include looking at the options for permanent storage of carbon dioxide domestically as well as elsewhere via international shipping.

Following the advice from the Parliamentary Advisory Group on CCUS the Government will review the delivery and investment models for CCUS in the UK to understand how the barriers to deployment can be reduced, and how the private and public sectors can work together to deliver the Government's ambition for CCUS.

We will work with the ongoing initiatives in Teesside, Merseyside, South Wales and Grangemouth to test the potential for development of CCUS industrial decarbonisation clusters.

We will set up a new Ministerial-led CCUS Council with industry to review our progress and priorities. Through the CCUS Council we will also monitor costs and deployment potential with the option of revising our deployment path accordingly.

<sup>172</sup> Offshore Wind Cost Reduction Taskforce <https://www.gov.uk/government/groups/offshore-wind-cost-reduction-task-force>

International collaboration: The Government will convene and lead a new international working group to drive down the cost and accelerate deployment of CCUS, including by:

- Participating in Mission Innovation and its Carbon Capture Challenge and working closely with private-sector led initiatives such as the Oil and Gas Climate Initiative;
- Developing closer collaborative working with countries such as Norway, the United States, Canada and Australia including joint working on innovation and carbon dioxide transport and storage solutions and working multi-laterally through the Carbon Sequestration Leadership Forum and North Sea Basin Task Force;
- Continuing to be a global leader in CCUS investments through the UK's £60 million international CCS programme which has been running since 2012, by investing a further £10 million in the programme. This will further strengthen international action on CCUS and draw on UK technical and commercial expertise; and
- Organising an international Global Carbon Capture Usage and Storage Conference in 2018 with international partners.

Innovation: The Government will spend up to £100 million from the BEIS Energy Innovation Programme to support Industry and CCUS innovation and deployment in the UK including £20 million of funding available for a carbon capture and utilisation demonstration programme to invest in new innovative technologies that capture and utilise carbon

dioxide. The programme will also support next generation capture technologies, with an aim to lower the cost of capture compared to the current best performing technologies; and small-scale industrial capture demonstrations to reduce the risks associated with carbon capture on an industrial site. We also intend to support the application of CCUS in low carbon hydrogen production; develop our understanding of the role of GGR technologies, including bio-energy with carbon capture and storage; and support innovations that reduce the cost of transporting and storing carbon dioxide. The Government intends to set out further detail in 2018.

#### ***Investing in supporting new UK CCUS technologies and companies***

*The Government has provided over £4 million to support Carbon Clean Solutions Ltd, a UK headquartered company. This has supported the research, development and deployment of their novel carbon capture solvent technologies contributing to cost reductions in both the capital and operating costs of the technologies.*

*In early 2017, building on this early support from the UK Government, Carbon Clean Solutions launched an innovative carbon capture and utilisation project in India. In March 2017 Carbon Clean Solutions signed a partnership agreement with the global resource management company, Veolia, for a large-scale rollout of Carbon Clean Solution's carbon capture technology in a number of industrial processes.*

# Improving Our Homes

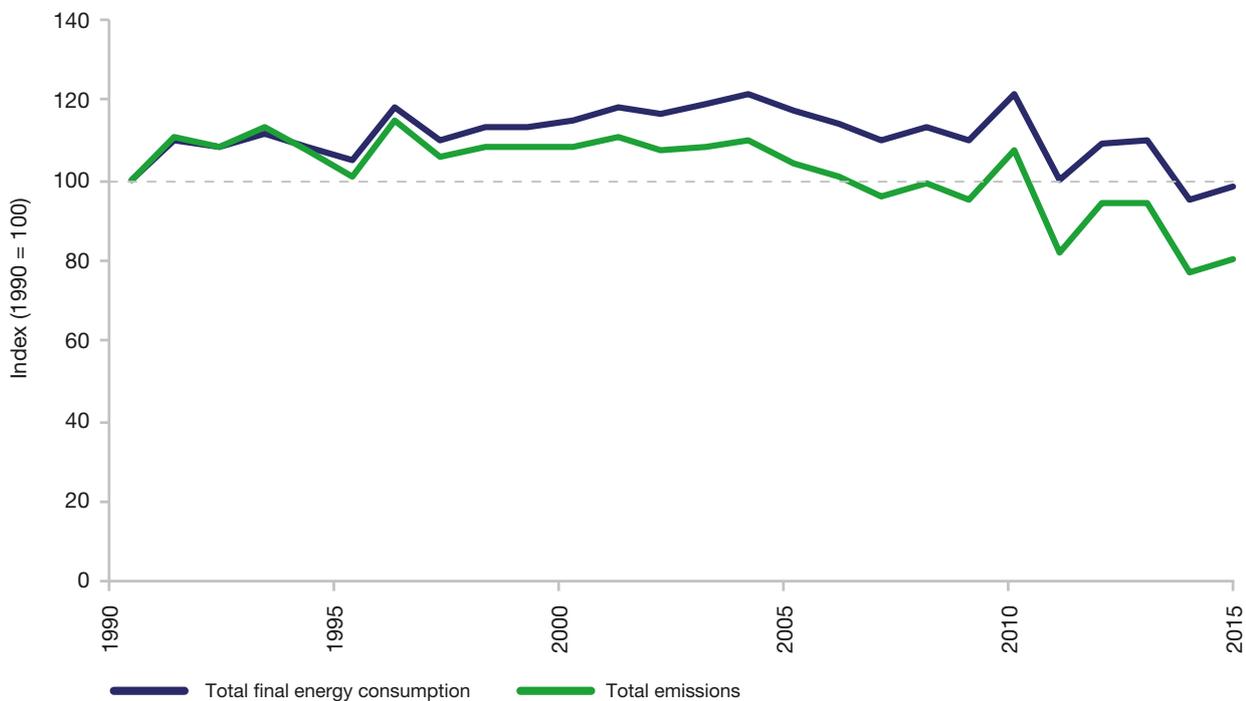

## Progress

Homes now account for 13 per cent<sup>173</sup> of the UK’s emissions (rising to 22 per cent once electricity use is taken into account<sup>174</sup>). The average household’s energy consumption has fallen by over 17 per cent since 1990<sup>175</sup>. This has been driven by a combination of: tighter building and products standards, in particular

better boilers; the uptake of insulation and other energy efficiency measures, mainly delivered through obligations on energy suppliers; and greater awareness of potential energy savings.

While there are now approximately a quarter more homes than in 1990, the overall total of emissions from the sector has reduced by about a fifth over this period<sup>176</sup>.

**Figure 18: Total energy consumption and emissions of UK homes, 1990-2015**

Source: BEIS Energy Consumption in the UK, 2017

<sup>173</sup> BEIS (2017) UK Greenhouse Gas Emissions <https://www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-2015>

<sup>174</sup> BEIS (2017) Annex 1990 – 2015 Final emissions by end user and fuel type [https://www.gov.uk/government/uploads/system/uploads/attachment\\_data/file/604354/Annex\\_1990-2015\\_Final\\_emissions\\_by\\_end\\_user\\_and\\_fuel\\_type.pdf](https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/604354/Annex_1990-2015_Final_emissions_by_end_user_and_fuel_type.pdf) A minor adjustment for fluorinated gases has been made, which are accounted with the Natural Resources sector

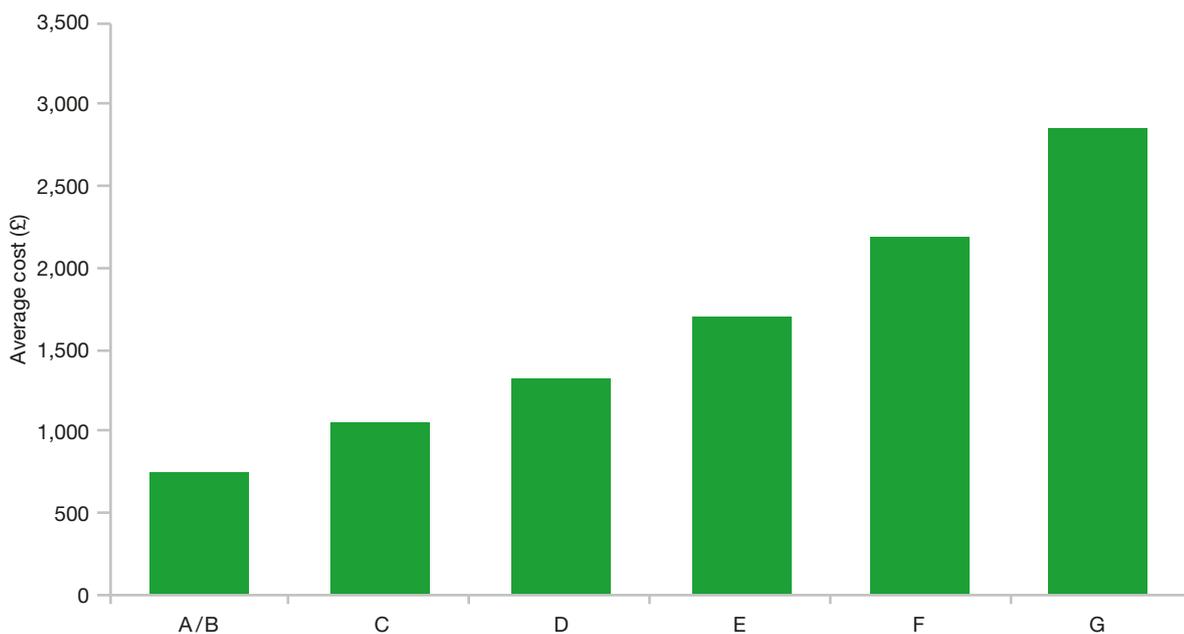

<sup>175</sup> BEIS (2017) Energy Consumption in the UK <https://www.gov.uk/government/statistics/energy-consumption-in-the-uk> Change in average consumption per household 1990-2016.

<sup>176</sup> BEIS (2017) UK Greenhouse Gas Emissions <https://www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-2015>

Reducing emissions through the measures listed above not only creates better quality homes but cuts the costs of heating them. Almost 79 per cent of homes in England in 2015 had an Energy Performance Certificate (EPC) rating of Band D or better compared to 39 per cent in 2005<sup>177</sup>. Upgrading energy efficiency from an EPC Band E to an EPC Band D reduces energy costs by £380 per year on average. For example, the annual running cost of a Band C rated home are £270 lower than the average Band D rated home and £650 less than the average Band E rated home<sup>178</sup>.

Improved energy efficiency also offers substantial health benefits. There is a clear link between cold homes and ill-health, where existing conditions (such as respiratory illnesses or mental health conditions) are exacerbated. The Building Research Establishment (BRE) has estimated, conservatively, that the cost of cold and damp homes to the NHS is approximately £760 million per year<sup>179</sup>. Increasing resilience to rising temperatures is also a potentially significant climate change challenge and we are undertaking research into whether further measures on overheating are necessary for new homes.

**Figure 19: Average annual cost of energy in homes by energy efficiency rating, 2014<sup>180</sup>**

Source: DCLG

<sup>177</sup> DCLG (2017) English Housing Survey 2015 to 2016

<sup>178</sup> BEIS analysis based on English Housing Survey data

<sup>179</sup> Building Research Establishment (2011) The cost of poor housing to the NHS BEIS analysis based on English Housing Survey data

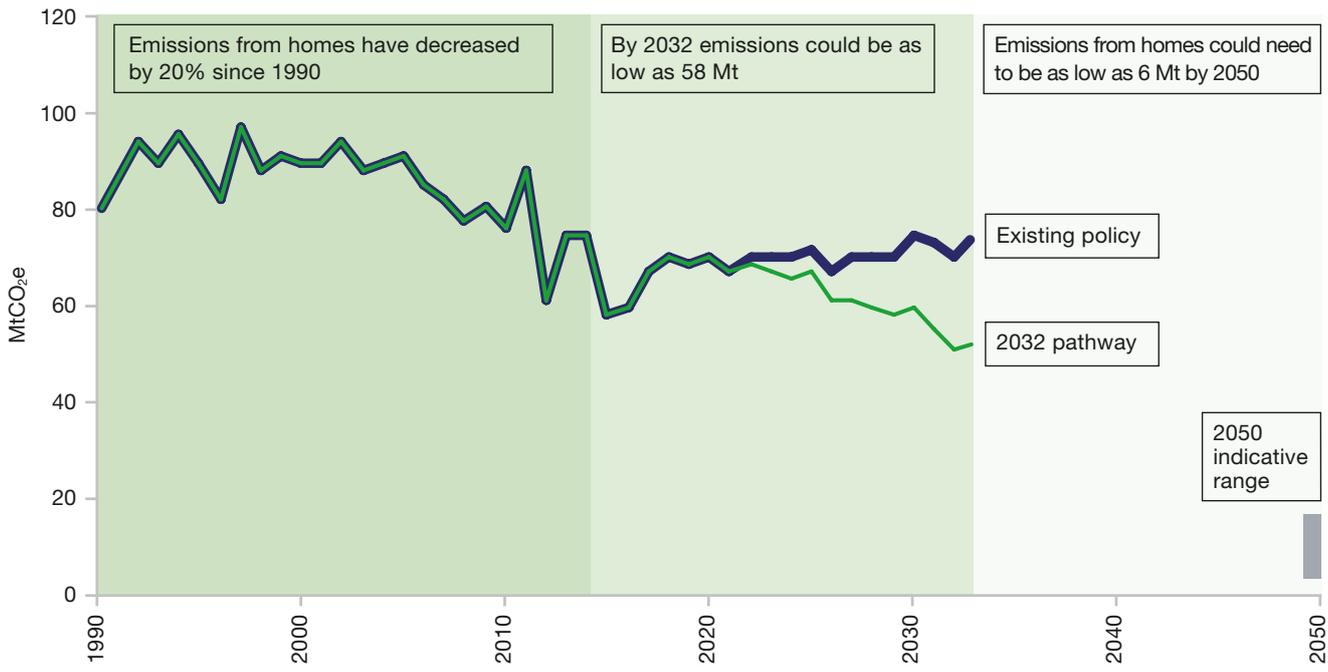

<sup>180</sup> BEIS analysis based on English Housing Survey data

Obligations on energy suppliers such as the Energy Company Obligation (ECO) are estimated to have reduced dual fuel customers' bills by over £800 million across the UK in 2016<sup>181</sup>. Since 2013, ECO has driven the installation of 2.1 million energy efficiency measures in 1.7 million properties<sup>182</sup>. Separately, the Domestic Renewable Heat Incentive has enabled householders to install over 55,000 low carbon heating technologies such as heat pumps, biomass boilers and solar water heating<sup>183</sup>.

In particular, progress has been made to upgrade the homes of those living in fuel poverty: the number of fuel poor households in England living in homes at energy efficiency rating E or below reduced from 1.8 million in 2010 to 920,000 in 2015<sup>184</sup>.

In parallel, the roll-out of smart meters is helping to give households more control over their energy use, based on near real-time information. As of June 2017, 7.7 million smart and advanced meters were operating in homes and small business sites across the country<sup>185</sup>.

## Ambition

We want to further reduce emissions from homes while ensuring that everyone has a home that is comfortable, healthy and affordable to run. Our objective is to ensure our policies will encourage people to improve their homes where it is cost effective and affordable for them to do so. One possible pathway to 2032 could involve emissions from homes falling by almost one fifth compared to today, to around 58 Mt by 2032.

To achieve this 2032 pathway, we will need to ensure existing buildings waste even less energy. This pathway could see a further six to nine million properties insulated, especially focusing on those in fuel poverty where we are aiming to have the 2.5 million fuel poor homes in England improved to energy efficiency rating C or better by 2030<sup>186</sup>. More broadly, our aspiration is that as many homes as possible are improved to EPC Band C by 2035, where practical, cost-effective and affordable.

Reducing demand for energy will not be enough on its own to meet our ambitions for homes. By 2050, we will also likely need to fully decarbonise how we heat our homes. There are a number of low carbon heating technologies with the potential to support the scale of change needed, including heat pumps,

using low carbon gases (such as hydrogen) in our existing gas grid and district heat networks. However, at present it is not certain which approaches or combination of them will work best at scale and offers the most cost-effective long-term answer. Decarbonising heat is our most difficult policy and technology challenge to meet our carbon targets.

We will therefore need to lay the groundwork this Parliament so we are ready to make decisions in the first half of the next decade about the long term future of how we heat our homes, including the future of the gas grid (please see box below on the Future of Heat Decarbonisation). This includes support for innovation to test and bring down the cost of low carbon heating technologies, many of which are currently too expensive.

Ahead of these decisions, we can take further action to reduce emissions from heating the 850,000 homes<sup>187</sup> currently not connected to the gas grid in England and that use oil for heating. We also need to avoid new homes needing to be retrofitted later and ensure that they can all accommodate low carbon heating. This could involve all new homes off the gas grid from the mid-2020s being heated by a low carbon system, such as a heat pump.

<sup>186</sup> Conservatives (2017) <https://www.conservatives.com/manifesto>

<sup>187</sup> BEIS analysis based on English Housing Survey data

## Opportunities

The energy efficiency industry already contributes substantially to the low carbon economy, supporting 144,000 direct employees<sup>187</sup>. In 2016, investment in energy efficiency globally grew by nine per cent with substantial levels of global investment in energy efficiency predicted to deliver on the Paris Agreement. This is coupled with a potentially substantial domestic market of 27 million homes. The UK, therefore, has

the opportunity to become a trusted leader in the quality, service and installation of low carbon and energy efficiency products and an exporter of knowledge, skills and products to other countries. These markets can build on the success of the UK gas boiler market – the biggest boiler market in the world, in terms of value and volume (the annual market value for boilers in the UK is around £2.5-£3 billion<sup>188</sup>) with some of the most experienced manufacturers and installers.

### Exeter Road Project

Enfield's award-winning Exeter Road Project combined energy efficiency measures with the installation of a ground source heat pump system to provide a new heating and hot water system to 185 flats. The new heating system is estimated to reduce fuel costs

by 80 per cent per flat, saving residents as much as £500 a year. Exeter Road resident **Ms Adeleke** says: "I am very happy with the heating, it keeps my home warm all of the time. My old heating didn't work properly all day and wasn't in every room. It is cheaper to run than the other heating so far this winter."

<sup>187</sup> ONS (2017) Low Carbon and Renewable Energy Economy Survey, final estimates: 2015 <https://www.ons.gov.uk/economy/environmentalaccounts/bulletins/finalestimates/2015results>

<sup>188</sup> Delta Energy & Environment (2016) Heat Insight Service, August 2016 Briefing note

## Policies and Proposals

### Improving People's Homes and Reducing Bills

1. ECO will upgrade around a million homes, supporting £3.6 billion of investment. We have changed the scheme so it is more focused on households with low incomes. We will extend support for home energy efficiency out to 2028 at least at the current level of ECO funding. We will review the best form of support beyond 2022 recognising the need to both save carbon and meet the Government's commitment to upgrade all fuel poor homes to EPC Band C by 2030.
2. For privately rented homes, we have legislated so that from April 2018, landlords of the worst performing properties will need to improve those properties to a minimum of EPC Band E before they can be let, lowering bills for some of the most vulnerable private tenants while ensuring costs of improvements are reasonable and affordable. We will consult shortly on steps to make these regulations more effective.
3. The Government will look at a long term trajectory for energy performance standards across the private rented sector, with the aim of as many private rented homes as possible being upgraded to EPC Band C by 2030, where practical, cost-effective and affordable. We will consider options with a view to consulting in 2018. In addition, the Government will also look at how social housing can meet similar standards on the same timetable. When looking at this we will need to take account of the findings of the independent public inquiry into the fire at Grenfell Tower<sup>189</sup> and the Government's separate work looking at wider social housing policy issues<sup>190</sup>.
4. We want all fuel poor homes to be upgraded to EPC Band C by 2030, and our aspiration is that, across the whole housing stock, as many homes as possible reach a similar standard by 2035, where practical, cost-effective and affordable.
5. To build the market for energy efficiency, we need to make it as easy as possible for people to pay for and make home energy efficiency improvements. We are publishing a call for evidence on additional measures to encourage energy performance improvements, including a focus on:
  - Working with mortgage lenders to incorporate energy efficiency into their lending decisions, alongside developing innovative "green mortgage" products. The Government is now exploring ways that it could support the launch of more products, and further details are included in our call for evidence.
  - Looking at incentives and other levers that could encourage homeowners to invest in energy efficiency improvements.

<sup>189</sup> Grenfell Tower Inquiry (2017) Terms of Reference <https://www.grenfelltowerinquiry.org.uk/news/prime-minister-announces-inquiry-terms-reference/>

<sup>190</sup> Prime Minister's response of 15th August 2017 <https://www.grenfelltowerinquiry.org.uk/key-documents/>

6. We will work with industry to implement the independent, industry-led *Each Home Counts*<sup>191</sup> review to improve quality and standards for all retrofit energy efficiency and renewable energy installations.
7. We will replace the existing, telephone-only Energy Saving Advice Service with a digitally-led service by spring 2018, working closely with the *Each Home Counts* implementation, offering tailored advice on improving the energy performance of people's homes.
8. Homeowners expect building work that improves the energy efficiency of a property to be high quality, helping them reduce energy bills and making their homes more comfortable. The Government has commissioned an independent review of Building Regulations and fire safety, being led by Dame Judith Hackitt. The review will report in spring 2018. Subject to the conclusions of that review, the Government intends to consult on making improvements to Building Regulations requirements, so that any new work (i.e. extensions to a property and other building work) to existing properties meets a high standard of energy efficiency, where the evidence shows there are cost-effective and affordable opportunities and that it is safe and practical to do so. Any improvements would focus on the standards of the work carried out on properties itself, and would not include any wider "consequential" improvements to other parts of the property.
9. Following the sale of the Green Deal Finance Company, the Government is publishing a call for evidence on how to reform and streamline the Green Deal framework to make the "Pay as You Save" system more accessible to businesses, while ensuring adequate protection for consumers.
10. It could be possible to extend EPCs to other trigger points and we will issue a Call for Evidence by spring 2018 seeking views in this area, as well as wider views on how EPCs could be further improved, in light of new sources of data and capabilities. As the EPC requirements derive from the Energy Performance of Buildings Directive, any future changes will need to be considered in the context of leaving the European Union.
11. Energy performance improvements installed in both new build and existing properties can fall short of expectations. The Government has commissioned an independent review of Building Regulations and fire safety, being led by Dame Judith Hackitt<sup>192</sup>. The review will report in spring 2018. Following the outcome of this review and subject to its conclusions we will look at the potential for any further action on compliance and enforcement related to energy performance. We will also continue to explore innovative solutions to this problem, such as measuring actual building performance using data from smart meters, and working with the industry to develop a 'quality mark' to drive up standards.

<sup>191</sup> DCLG (2016) *Each Home Counts: Review of Consumer Advice, Protection, Standards, and Enforcement for Energy Efficiency and Renewable Energy* <https://www.gov.uk/government/publications/each-home-counts-review-of-consumer-advice-protection-standards-and-enforcement-for-energy-efficiency-and-renewable-energy>

<sup>192</sup> Grenfell Tower Inquiry (2017) Terms of Reference <https://www.gov.uk/government/news/independent-review-of-building-regulations-and-fire-safety-publication-of-terms-of-reference>

12. We will ensure every home is offered a smart meter by the end of 2020 and we expect energy suppliers to make every effort to provide smart meters to all their customers. We will:

- Continue to work with suppliers to ensure that people are provided with tailored advice when a smart meter is installed;
- Trial the provision of regular information about their energy use to encourage long-term energy savings; and
- Explore how the data available through the national smart metering platform can, with customers' consent, support personalised recommendations for saving energy, more targeted policy interventions and help businesses develop energy saving offers.

13. Alongside this Strategy, the Government has published *Boiler Plus*, improving standards for the 1.2 million new boilers<sup>193</sup> installed in England every year and ensuring control devices are included with every installation so people can more easily control comfort in their own homes for less fuel from April 2018.

### Encouraging the Take-up of Cleaner Heating Systems

14. Through the Renewable Heat Incentive (RHI), we are spending £4.5 billion between 2016 and 2021 to support innovative low carbon heat technologies in homes and businesses, such as heat pumps, biomass boilers and solar water heaters. We are also reforming the RHI to focus the scheme towards long-term decarbonisation through greater uptake of technologies such as heat pumps and bio methane (biogas to grid)<sup>194</sup>.

15. Beyond the RHI, our ambition is to phase out the installation of high carbon fossil fuel heating in new and existing off gas grid residential buildings (which are mostly in rural areas) during the 2020s, starting with new homes as these lend themselves more readily to other forms of low carbon heating. In line with broader Government priorities on delivering clean air, we are considering a range of policy options to support this, and are investing £10 million in an innovation challenge fund to support low carbon heating systems. We will involve consumers and industry in developing our new policy so that it is straightforward for people to get new technologies installed. The Government will also explore the use of the £200 million package of Growth Programme and Countryside Productivity offers to support renewable energy projects in rural areas<sup>195</sup>.

16. In the Spending Review 2015, we allocated funding out to 2021 to grow the UK heat networks market so it is self-sustaining in the longer term. This could support significant investment of private and other capital by 2021. This will enable the construction of heat networks in areas of high heat demand density such as urban centres, campuses and business parks, including in rural locations. Following recommendations from an industry taskforce, we will also examine the measures necessary to create an effective long-term market framework for the sector beyond 2020.

<sup>193</sup> BEIS (2017) Boiler Standards IA <https://www.gov.uk/government/consultations/heat-in-buildings-the-future-of-heat>

<sup>194</sup> BEIS (2016) The Renewable Heat Incentive: A reformed and refocused scheme <https://www.gov.uk/government/consultations/the-renewable-heat-incentive-a-reformed-and-refocused-scheme>

<sup>195</sup> Defra (2017) £200 million boost for rural England <https://www.gov.uk/government/news/200-million-boost-for-rural-england>

17. The Government has commissioned an independent review of Building Regulations and fire safety, being led by Dame Judith Hackitt. The review will report in Spring 2018. Following the outcome of the independent review, and subject to its conclusions, the Government intends to consult on improving requirements for new homes where the evidence suggests that there are cost-effective and affordable opportunities, and it is safe and practical to do so. This will look to ensure that new homes are future-proofed for the installation of lower carbon heating systems where this is cost-effective and affordable. This will help to phase out high carbon fossil fuels in the future, starting with homes off the gas grid.

### Government Innovation Investment

The Government expects to invest £184 million<sup>196</sup> out to 2021 in research, development and deployment of innovative energy efficiency and heating technologies, and the gas network. These will address the key innovation challenges to meet our long-term goals, including:

- **Developing better energy efficiency and heating technologies.** We need innovation in products, supply chain capacity and skills, and new business models to reduce the expense and challenge of retrofit solutions. To deliver this the Research Councils

are investing over £70 million in energy efficiency, including £22 million in buildings research. In addition, we will run:

- A new £10 million grant fund for the innovation of new insulation materials, installation methods and business models for existing buildings.
- A further £10 million grant fund will focus on making low carbon heating technologies more affordable, better performing, and attractive to the consumer.
- We also need to ensure that existing regulation does not impede the development of new low cost energy efficiency technologies. This will be considered as part of our call for evidence on additional measures to encourage energy improvements alongside this Strategy.
- **Building lower cost, low carbon homes.** New methods in construction including factory production and off-site manufacturing may help us build new energy efficient homes more quickly and more cheaply. The Government is currently tendering a £1.4 million three-year research project to address the drivers, barriers, and challenges of new low carbon homes.

<sup>196</sup> All figures are indicative and are subject to competitive bidding processes across sectors and value for money tests.

## Econovate

Econovate, based in Hemel Hempstead produce construction ‘blocks’ made from recycled waste which might otherwise end up in landfill. They received an Energy Entrepreneurs Fund grant of £800,000, and their product is now fully certified for use. Econovate have subsequently raised over £645,000 capital funding to grow the manufacturing of their award winning product which has a high level of performance, saving more than 300kg of CO<sub>2</sub> per cubic metre compared to standard concrete, and which is four times stronger than current blocks.

- **Behaviour change.** Innovation can help overcome non-financial barriers, in particular behavioural barriers, to energy efficiency. Research Councils are planning to invest around £19 million to research how people’s energy choices can help them stop wasting as much energy. Government is investing in smart ways of developing heating services, with work led by the Energy Systems Catapult.
- **Network solutions.** To inform the decisions that will be needed on our long term approach to decarbonising heat (please see box below on the Future of Heat Decarbonisation), we will run a £25 million project on using hydrogen as an alternative to natural gas<sup>197</sup>, including looking at regulatory standards and the development of appliances.
- **Supporting innovation through policy instruments.** We recognise that the way in which Government policies are designed can have an impact on the rate of deployment of new, innovative low carbon and energy efficient technologies. As such, we will explore ways in which we could make it easier for innovative approaches or products to be installed under our consumer-facing schemes such as ECO – potentially reducing costs, improving the overall performance of the technologies, and building a stronger evidence base on the savings they deliver.
- Ofgem is making available up to £195 million for gas network companies in Great Britain to develop and demonstrate new technologies as well as new operating and commercial arrangements.

<sup>197</sup> BEIS (July 2017) Funding for innovative approaches to a low carbon built environment <https://www.gov.uk/government/publications/funding-for-innovative-approaches-to-using-hydrogen-gas-for-heating>

## The Future of Heat Decarbonisation

Heating our homes, businesses and industry accounts for nearly half of all energy use in the UK and a third of our carbon emissions. Nearly 70 per cent of our heat is produced from natural gas. Meeting our target of reducing emissions by at least 80 per cent by 2050 implies decarbonising nearly all heat in buildings and most industrial processes. Reducing the demand for heat through improved energy efficiency will have an important role to play but will not by itself suffice to meet our 2050 target.

We need to lay the groundwork in this Parliament to set up decisions in the first half of the next decade about the long term future of heat. The demands on our energy infrastructure will change as low carbon heating technologies take over from fossil fuels, with a greater dependence on electricity and potentially new infrastructure needed for system balancing and the generation of low carbon gases. Supply chains will need time to grow to provide products and services consumers across the country will need.

There is a range of low carbon heating technologies with the potential to support the scale of change needed. These include the electrification of heating with households moving away from gas or oil boilers, to electric

heat pumps; decarbonising the gas grid by substituting natural gas with low carbon gases like biogas and hydrogen; and heat networks (which are likely to be particularly effective in dense urban areas). At present, it is not clear which approach will work best at scale and offer the most cost-effective, long term answer. We will work with industry, network operators, manufacturers, and consumers to achieve a clear and shared understanding of the potential as well as the costs and benefits and implications of different pathways for the long term decarbonisation of heat. This includes modelling the costs and benefits of different approaches, establishing the likely level of change for households and demands on the electricity grid building on the work of others in this field.

Government has commissioned research into different heat demand scenarios, the use of hydrogen, what changes might be needed to the electricity grid in response to large scale uptake of heat pumps, the role that bioenergy might play in decarbonising heat and international activity. We plan to publish initial findings from a number of studies later this year, and a full report on our review of the evidence by summer 2018.

# Accelerating the Shift to Low Carbon Transport

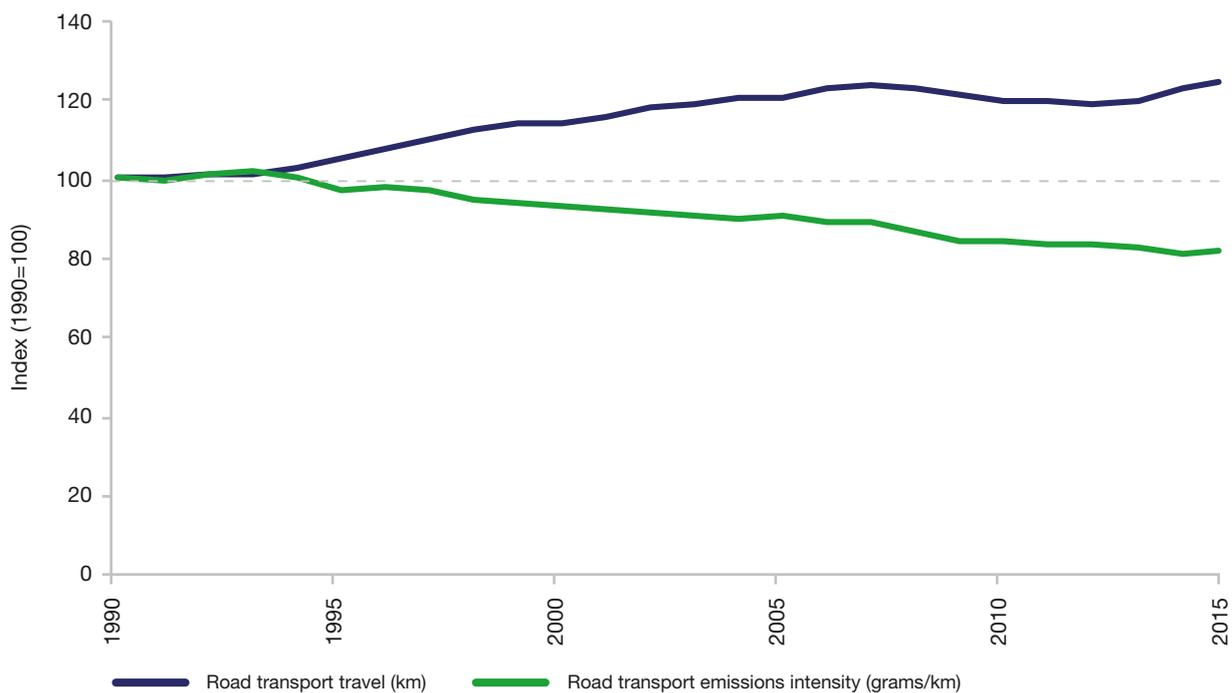

## Progress

Transport emissions in 2015 were down two per cent compared to 1990<sup>198,199</sup>. While new cars in the UK are up to 16 per cent more efficient than they were in 2000<sup>200</sup>, this improvement has

been largely offset by a nine per cent increase in road traffic to 2015<sup>201</sup>, with the number of registered vehicles increasing over the same period from 28.9 million to 36.5 million<sup>202</sup>. The transport sector now accounts for 24 per cent of the UK's emissions<sup>203</sup>.

**Figure 21: Emissions intensity of road transport (cars, vans and HGVs) 1990-2015**

Source: DfT, BEIS

<sup>198</sup> BEIS (2017) Final UK greenhouse gas emissions statistics 1990-2015 <https://www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-2015>

<sup>199</sup> Provisional statistics suggest that GHG emissions from transport may show an increase 1990-2016. BEIS (2017) Provisional UK greenhouse gas emissions statistics 2016 <https://www.gov.uk/government/statistics/provisional-uk-greenhouse-gas-emissions-national-statistics-2016>

<sup>200</sup> Fuel efficiencies are from DfT modelling using DfT (2017) Vehicle statistics; ICCT (2015) From Laboratory to Road: A 2015 update <http://www.theicct.org/laboratory-road-2015-update>

<sup>201</sup> DfT (2016) Road traffic estimates in Great Britain: 2015 <https://www.gov.uk/government/statistics/road-traffic-estimates-in-great-britain-2015>. Measured in 'vehicle miles' which combines the number of vehicles on the road and how far they drive.

<sup>202</sup> DfT (2017) Licensed vehicles and new registration tables <https://www.gov.uk/government/statistical-data-sets/all-vehicles-veh01> VEH0102

<sup>203</sup> BEIS (2017) Final UK greenhouse gas emissions statistics 1990-2015 <https://www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-2015>

Improvements by manufacturers in the fuel efficiency of vehicles have largely been driven by tighter regulation, mainly set at EU level<sup>204</sup>. Driving a new car bought in 2015 would have saved car owners up to £200 on their annual fuel bill, compared to a car bought new in the year 2000<sup>205</sup>.

The fuel we use in our cars is also lower carbon, with the Renewable Transport Fuel Obligation (RTFO) driving the greater use of biofuels. Biofuels now account for around three per cent of fuel sales, with around half of that derived from wastes<sup>206</sup>. Average greenhouse gas savings from biofuels are around 70 per cent compared to petrol and diesel<sup>207</sup>. The RTFO has stimulated around £1 billion of investment in UK production facilities<sup>208</sup> including, for instance, Argent Energy's £75 million production plant in Cheshire which is using innovative technology to turn sewage waste into biodiesel<sup>209</sup>.

We are now seeing greater innovation from carmakers, beyond the internal combustion engine, as the world accelerates towards mass adoption of zero emission vehicles. The UK now has over 115,000 ULEVs on the road<sup>210</sup>. ULEV uptake has been driven through a combination of grants, which reduce the upfront costs of ultra low emission cars by up to £4,500<sup>211</sup>, together with improved charging infrastructure<sup>212</sup> and new approaches like the £40 million Go Ultra Low Cities scheme, through which eight local authority areas are trialling local initiatives including city centre charge point hubs, free parking and access to bus lanes for ULEVs<sup>213</sup>.

On public transport, Government has invested £37 billion in the public transport system between 2011 and 2016<sup>214</sup>. Rail passenger journeys are now at their highest level since the 1920s<sup>215</sup>.

<sup>204</sup> With a target of 95g/km for cars in 2021 (down from 146g/km in 2009) - Reducing CO<sub>2</sub> Emissions from passenger cars, [https://ec.europa.eu/clima/policies/transport/vehicles/cars\\_en](https://ec.europa.eu/clima/policies/transport/vehicles/cars_en)

<sup>205</sup> Annual average household saving from driving a car purchased new in 2015 (the latest year for which data is available) compared to driving a car purchased new in 2000. ### Ambition

We want a more modern transport system – one that is clean, affordable and easy to use. That means cutting our carbon dioxide emissions, and improving our air quality – clean air is one of the most basic requirements of a healthy environment for us all to live, work and bring up families.

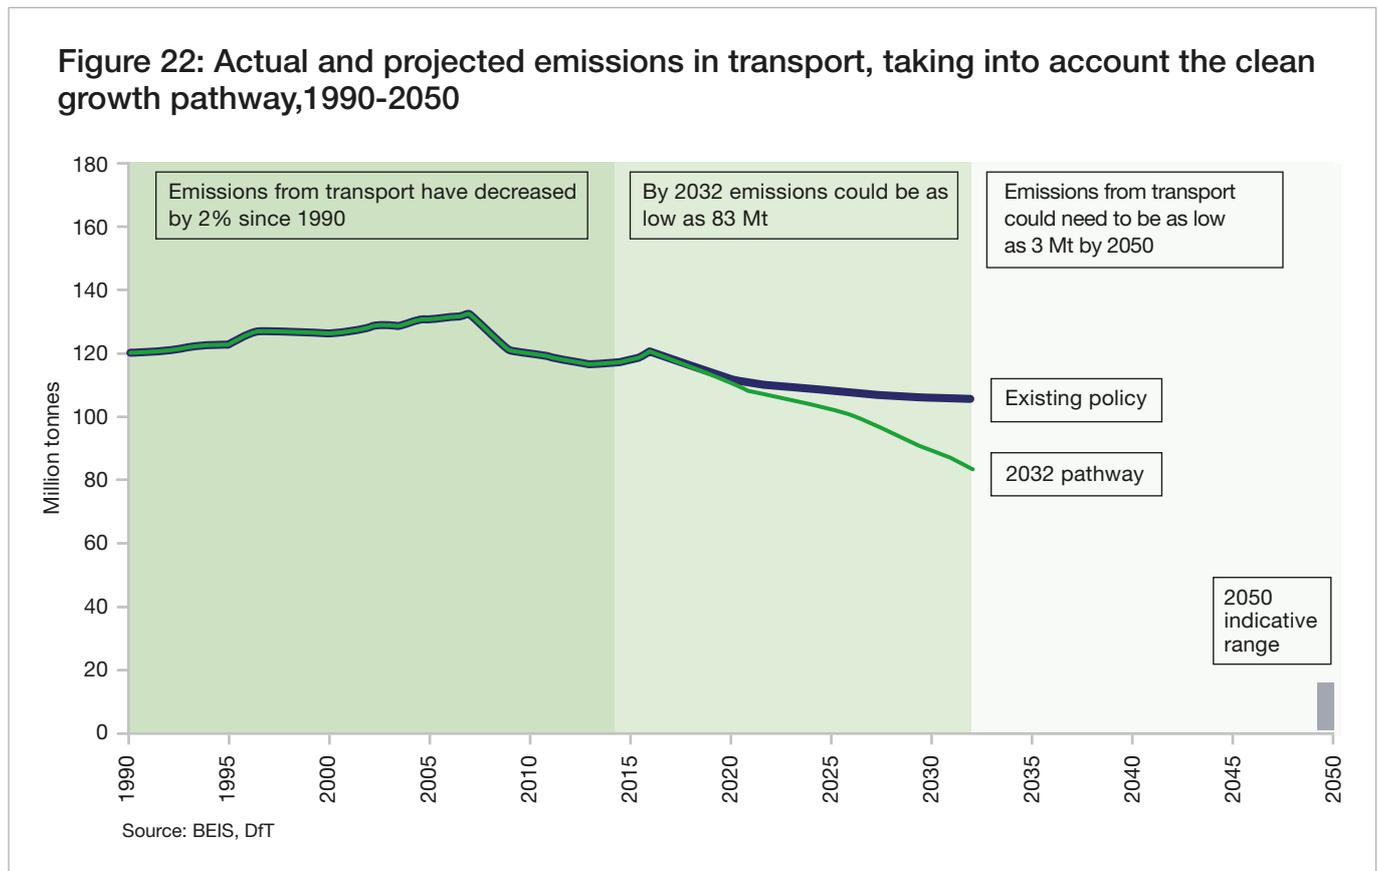

To meet our 2050 target, almost every car and van will need to be zero emission by 2050. The Government has announced an end to the sale of all new conventional petrol and diesel cars and vans by 2040.

Emissions from heavy goods vehicles (HGVs) will also need to reduce significantly to make a meaningful contribution towards meeting the

UK’s overall 2050 target. Walking and cycling will be made easier for many shorter journeys. By 2040, we want cycling and walking to be the natural choices for shorter journeys, or as part of a longer journey.

We will continue to modernise our aviation and shipping sectors, both through international action, such as standards and offsetting schemes, and domestically, for example through support for sustainable alternative fuels, improved efficiency and new technologies<sup>216</sup>.

One possible pathway to 2032 could involve emissions from transport falling by almost 30 per cent compared to today (to around 83 Mt by 2032).

<sup>216</sup> Although emissions from international aviation and shipping are not currently included in the UK’s targets under the Climate Change Act, our carbon budgets put the UK on a trajectory consistent with a 2050 target that includes these emissions. The Government has not reached a final view on the appropriate level of aviation emissions in 2050. For details on modelling assumptions, please see the technical annex.

To achieve this 2032 pathway, we need to further upgrade our transport system:

- ULEVs on the market today are already an attractive proposition for a significant proportion of motorists given the significantly lower running costs, but we can do more to accelerate ULEV development and uptake. ULEVs should become progressively more affordable as economies of scale are realised and they could provide savings for consumers compared to equivalent internal combustion engine cars by the mid-2020s or sooner<sup>217</sup>. As a result, at least 30 per cent of new car sales are expected to be ULEVs by 2030, and possibly as many as 70 per cent. For new vans, up to 40 per cent of sales could be ULEVs by 2030.
- There needs to be significant improvement in the efficiency of HGVs, with new HGVs needing to be up to 15 per cent more efficient by 2030. We also need to take steps to encourage the industry in moving towards low emission technologies.
- We need a cleaner public transport system. Low emission buses now represent 13 per cent of all buses in the UK<sup>218,219</sup>, but we want to go well beyond this to achieve significant uptake of ultra low and zero

emission buses. We will seek more use of electric, bi-mode (electric and diesel hybrid) and alternative fuel traction on the railway, and will continue to invest in route electrification where it benefits passengers<sup>220</sup>.

- It will be important to reduce the number of shorter journeys made by car, by supporting people to use alternative forms of transport for these trips such as cycling and walking.
- We want to see a near doubling of sustainable bioenergy used in the transport sector.

## Opportunities

The UK already has a thriving automotive sector, producing 1.7 million cars annually, employing over 160,000 people and generating £40 billion in exports<sup>221</sup>. The sector's skilled workforce, established manufacturing bases and high productivity ideally place it to be a world leader in the low emission vehicle market. In 2015, low emission vehicle exports were already estimated to be worth £2.5 billion to the UK economy<sup>222</sup>. With 80 per cent of UK produced vehicles already exported across the world<sup>223</sup> and increasing global demand for low emission vehicles the UK industry has real opportunity to further expand.

<sup>217</sup> This is based on the whole-life cost of electric vehicles. The up-front cost of these vehicles is expected to fall below that of conventional vehicles in the second half of the 2020s. Bloomberg New Energy Finance (2015) Are the economics of EVs competitive with conventional cars?; Element Energy (2016) Low carbon cars in the 2020s; International Council on Clean Transportation (2016) Evolution of incentives to sustain the transition to a global electric vehicle fleet.

## Health Benefits

The Government has pledged to be the first generation to leave the environment in a better state than it inherited. As well as significantly reducing greenhouse gas emissions, wide-scale adoption of ULEVs will improve our health and quality of life by making the air cleaner in our towns and cities.

While air quality in the UK has been improving in recent decades and will continue to do so due to Government action and investment of over £3 billion in air quality and cleaner transport, there are some parts of the country where there are unacceptable levels of air pollution. Poor air quality remains the largest environmental risk to public health in the UK.

The most immediate challenge is the problem of nitrogen dioxide concentrations around some roads, due mainly to conventional road vehicles, and the Government has published a plan to address this<sup>224</sup>. As part of this plan, the Government announced a £255 million Implementation Fund to help local authorities develop and deliver targeted action to improve air quality, and committed to establishing a new Clean Air Fund.

In 2018, the Government will also publish a wider Clean Air Strategy, setting out how it will significantly reduce the emissions of five damaging air pollutants by 2020 and 2030.

## Policies and Proposals

### Accelerating Take up of Ultra Low Emission Vehicles

1. The Government has announced an end to the sale of all new conventional petrol and diesel cars and vans by 2040.
2. We are spending £1 billion to drive the uptake of ULEVs. If battery prices continue to fall there will be less need for Government subsidies for new vehicles in the future. We will provide support for ULEVs to help the development of a mature and self-sufficient market.
3. We will encourage ULEV uptake through schemes that build on our experience in delivering initiatives - for example the £40 million 'Go Ultra Low Cities' scheme.
4. We want to have one of the best electric vehicle (EV) charging networks in the world. We will set out our strategy to achieve this using regulation, funding and private investment. To support this:
  - In addition to workplace and residential charging support, the Government has also allocated an additional £80 million to support charging infrastructure deployment, alongside £15 million from Highways England to ensure rapid charge points every 20 miles across 95 per cent of England's Strategic Road Network<sup>225</sup>.
  - New powers under the Automated and Electric Vehicles Bill<sup>226</sup> will allow the Government to set specific requirements for the provision of EV charge points or hydrogen refuelling infrastructure at motorway service stations and large fuel retailers, as well as ensuring that charge points are convenient to access and work seamlessly right across the UK.

<sup>224</sup> DEFRA (2017) UK plan for tackling roadside nitrogen dioxide concentration: Detailed plan. <sup>226</sup> Cabinet Office (2017) Queen's Speech Background Briefing Notes 2017 [https://www.gov.uk/government/uploads/system/uploads/attachment\\_data/file/620838/Queens\\_speech\\_2017\\_background\\_notes.pdf](https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/620838/Queens_speech_2017_background_notes.pdf)

## Electric Cars

**Sue Bentley from Runcorn, Cheshire:** “When I purchased an electric car I was the only one in my neighbourhood at that time. I believe electric vehicles are the way forward, they’re easy to run, reliable and good for the planet. Now seven people in my neighbourhood have one and they love them!”.

- The Bill will also allow the Government to require all new charge points sold or installed in the UK to be ‘smart’ enabled. This will help shift charging away from peak times of the day, reducing demand on the electricity system and keeping costs lower for everyone.
  - We will consider the role of regulation to accelerate the UK’s transition to widespread provision of ULEV infrastructure.
5. The Government has provided £4.8 million through the Hydrogen for Transport Advancement Programme to create a network of 12 hydrogen refuelling stations, and £2 million through the Fuel Cell Electric Vehicle Fleet Support Scheme to increase uptake of hydrogen fuel cell cars and vans in the public and private sector. A new £23 million fund was recently announced to boost the creation of hydrogen fuel infrastructure and encourage roll-out of hydrogen vehicles<sup>227</sup>.
  6. We will announce plans for the public sector to lead the way in transitioning to zero emission vehicles, with an ambitious uptake requirement for central government and new Buying Standards to encourage procurers to choose the cleanest, low emission vehicle.
  7. We will support the uptake of low emission taxis:
    - The Government will provide £50 million for the Plug-in Taxi programme, which gives taxi drivers up to £7,500 off the purchase price of a new ULEV taxi, alongside £14 million to support ten local areas to deliver dedicated charge points for taxis<sup>228</sup>.
    - We will consider whether our revised best practice guidance to local taxi and private hire vehicle (PHV) licensing authorities in England should recommend zero emission capability in urban areas by 2032. In considering the Law Commission’s recommendation for national taxi and PHV standards in England, we will examine the potential for Government to make this target mandatory.

<sup>227</sup> DfT (2017) £23 million boost for hydrogen-powered vehicles and infrastructure <https://www.gov.uk/government/news/23-million-boost-for-hydrogen-powered-vehicles-and-infrastructure>

<sup>228</sup> BEIS, DfT (2017) 1,000 jobs created at new £325 million factory for electric taxis <https://www.gov.uk/government/news/1000-jobs-created-at-new-300-million-factory-for-electric-taxis>

8. 'Go Ultra Low'<sup>229</sup> brings the Government and leading vehicle manufacturers together to explain the benefits of ULEVs to motorists and businesses, and its success has been internationally recognised. We will continue to work with industry on consumer communications on ULEVs until at least 2020.
9. The Government will set out further detail on a long term strategy for the UK's transition to zero road vehicle emissions by March 2018.

### **Enabling our Automotive Industry to Become a World Leader in Zero Emission Technologies**

10. The Automotive Council is now developing an Industrial Strategy Sector Deal, building on the £1 billion Advanced Propulsion Centre, which is seeking to establish the UK as a world leader in zero emission vehicle technologies<sup>230</sup>. The Sector Deal will aim to accelerate the transition to zero emission vehicles, complemented by Automotive Council research to determine UK priorities for the EV supply chain.

### **Developing a More Efficient and Low Carbon Freight System**

11. Low emission vans and HGVs between 3.5 and 44 tonnes have been eligible since late 2016 for plug-in grants worth up to £20,000 for the first 200 vehicles bought using the grant<sup>231</sup>.

12. We are consulting on proposals to allow category B (car) licence holders to drive slightly heavier vans if they are powered by a low emission technology, effectively offsetting the additional weight of the powertrain<sup>232</sup>. This will encourage further uptake of cleaner goods vehicles.

13. The Government's Freight Carbon Review<sup>233</sup>, published in February 2017, identified a range of measures to help fleet operators reduce their emissions, including through improved fuel efficiency. The Energy Saving Trust is piloting a scheme to advise HGV fleet operators on reducing fuel consumption. The Government will set out further measures to support the pathway to low emission freight by March 2018, as part of a long term strategy for the UK's transition to zero vehicle emissions.

14. Our 2016 Rail Freight Strategy<sup>234</sup> highlighted the potential to reduce emissions by growing rail freight and reducing HGV journeys. We will accelerate our activity to enable cost-effective options for shifting more freight from road to rail, including using low emission rail freight for deliveries into urban areas, with zero emission last mile deliveries.

<sup>234</sup> DfT (2016) Rail Freight Strategy: Moving Britain Ahead [https://www.gov.uk/government/uploads/system/uploads/attachment\\_data/file/552492/rail-freight-strategy.pdf](https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/552492/rail-freight-strategy.pdf)

### University of Cambridge – Centre for Sustainable Road Freight

The Centre for Sustainable Road Freight at the University of Cambridge has developed a new trailer design for articulated vehicles that makes the vehicle more aerodynamic. They were awarded £4.4 million in funding from the Engineering and Physical Sciences Research Council and £1.4 million in joint funding from an industrial consortium comprising freight operators such as DHL, John Lewis Partnership, Tesco and Wincanton, as well as vehicle industry partners including Firestone, Goodyear, Haldex and Volvo. Their innovation cuts fuel consumption and pollution by articulated vehicles by around seven per cent. Waitrose has already added 36 of the modified trucks to its fleet and Warburtons will use the new design for all future fleet purchases.

### Encouraging Low Carbon Alternatives to Car Journeys

- 15. We will continue to invest in our public transport network, and help people to cycle, walk or travel by bus or train.
- 16. Our Cycling and Walking Investment Strategy<sup>235</sup> identifies £1.2 billion which may be invested in cycling and walking from 2016-21. Under this new strategic approach, Local Cycling and Walking Infrastructure Plans identify improvements required at the local level, and enable a long-term approach to developing local cycling and walking networks, ideally over a ten year period.
- 17. As announced in the 2016 Autumn Statement, the Government will provide £100 million for a national programme of support for retrofitting and new low emission buses in England and Wales, including hundreds of new low emission buses and retrofitting of thousands of older buses.

- 18. The Government will seek more use of electric, bi-mode (electric and diesel hybrid) and alternative fuel traction on the railway. We will continue to invest in route electrification where it provides benefits to passengers. The industry is also developing trains powered by alternative fuels, for example using battery and hydrogen power.

### More Efficient Vehicles and Driving Behaviour

- 19. As we leave the EU, we want the UK to continue to be a world leader in low carbon transport, and we will look for opportunities to strengthen further the controls on vehicle CO<sub>2</sub> emissions. We will pursue an approach which offers certainty to industry, and is at least as ambitious as current arrangements.

<sup>235</sup> DfT (2017) Cycling and Walking Investment Strategy [https://www.gov.uk/government/uploads/system/uploads/attachment\\_data/file/603527/cycling-walking-investment-strategy.pdf](https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/603527/cycling-walking-investment-strategy.pdf)

20. We will continue to help promote and support efficient driving behaviours amongst fleets and private drivers, seeking to maximise the potential of new technologies including early adoption in public sector fleets and close working with other programmes to improve driver standards.

### Lower Carbon Fuels

21. We will promote sustainable alternative fuels, which reduce the carbon emissions from petrol and diesel vehicles, and we will set targets to support development of advanced fuels suitable for HGVs and aviation.

22. We have recently relaunched the Future Fuels for Flight and Freight Competition – a £22 million industry competition to encourage development and deployment of low carbon HGV and aviation fuels.

### Modernising the Domestic Aviation and Shipping Sectors

23. We will set out our strategic approach to the aviation sector in a series of consultations over the next 18 months<sup>236</sup>, including a paper on how to support growth while tackling the environmental impacts of aviation. This will culminate in the publication of a new Aviation Strategy for the UK by the end of 2018.

24. Industry and the Government have made a joint £3.9 billion commitment between 2013 and 2026 to the development of new aircraft technology with the Aerospace Technology Institute<sup>237</sup>. We have announced that we will extend the RTFO to include incentives to use biofuels in aviation.

25. On domestic shipping, the Government will continue to work with industry to develop improved fuel efficiency technologies, including new propulsion systems, hull design and aerodynamic structures.

26. We will work with ship owners and ports to identify the barriers faced in supplying and using sustainable alternative fuels and cleaner emissions technologies, to explore possible solutions. In addition, we expect operational improvements to play a role, including better use of ship capacity.

### Government Innovation Investment

The Government expects to invest around £841 million out to 2021 in innovation in low carbon transport technology and fuels, primarily through programmes run by DfT, OLEV, the Research Councils, Innovate UK, and BEIS<sup>238</sup>.

The Government will build on this investment to make the UK one of the world's leading innovators in new low carbon technologies. Investments include:

- **Electric vehicle and battery technology.** Government investment will help bring down the cost of EVs and increase their range. Through the Industrial Strategy Challenge Fund (ISCF), we will invest £246 million over four years in the design, development and manufacture of batteries for the electrification of vehicles, as part of the 'Faraday Challenge'<sup>239</sup>. The Government has also awarded £10 million to build UK capability in the development and commercialisation of automotive battery packs.

<sup>236</sup> HM Government (2017) Beyond the Horizon: The future of UK aviation – a call for evidence on a new strategy <https://www.gov.uk/government/consultations/a-new-aviation-strategy-for-the-uk-call-for-evidence>

<sup>237</sup> Aerospace Technology Institute <http://www.ati.org.uk/>

<sup>238</sup> All figures are indicative and are subject to competitive bidding processes across sectors and value for money tests.

<sup>239</sup> BEIS (2017) Business Secretary announces Industrial Strategy Challenge Fund investments <https://www.gov.uk/government/news/business-secretary-announces-industrial-strategy-challenge-fund-investments>

- **Charging and grid support.** We will provide at least £70 million over the next five years to support innovation in energy storage, demand side response and other smart energy technologies, including up to £20 million for vehicle-to-grid products and services<sup>240</sup>. This is focused on how an expanded fleet of EVs could provide network flexibility and system balancing while potentially offering benefits to bill payers.
- **Advanced fuels.** There are fewer options for reducing emissions in the freight and aviation sectors, and here innovation in fuel technology can play an important role. We are providing £40 million out to 2021, to fund the development of advanced low carbon fuels derived from wastes or industrial and agricultural by-products. In August 2017 we relaunched the Future Fuels for Flight and Freight Competition - a £22 million industry competition to encourage development and deployment of low carbon HGV and aviation fuels.
- **Zero emission HGVs.** In January 2017, we announced the winners of over £20 million for the Low Emission Freight and Logistics Trial<sup>241</sup>. Twenty different projects are receiving funding to demonstrate and trial low and zero emission vehicles in UK fleets, for example using hydrogen, electric and biogas technologies. In the longer term, there is an opportunity to take forward projects to support innovative technologies such as 'dynamic charging' as a potential solution to decarbonising freight.
- **HGV platoons.** HGV platooning, using advanced vehicle technologies, enables lorries to move in a group and could deliver significant fuel and emissions savings. We will be delivering trials of HGV platoons, with joint funding from Highways England, to assess the feasibility and potential costs and benefits of this technology on UK roads. In August 2017, we announced a trial of HGV platoons, jointly funded with Highways England, which will see up to three HGVs travelling in convoy, with acceleration and braking controlled by the lead vehicle, and with a driver ready to take control at any time in all the HGVs. Platooning trials have been conducted across Europe and the USA, and these trials will assess whether the technology is appropriate and beneficial on UK roads.

Government has also established the Centre for Connected and Autonomous Vehicles (CCAV) and invested over £250 million, matched by industry, to position the UK at the forefront of research, development, and demonstration. These technologies have the potential to smooth traffic flows and increase efficiency of road transport. CCAV is also coordinating engagement with the wider research base and industry, identifying and reducing barriers to innovation or business expansion.

<sup>240</sup> BEIS (2017) Funding for innovative smart energy systems <https://www.gov.uk/guidance/funding-for-innovative-smart-energy-systems>

# Delivering Clean, Smart, Flexible Power

## Progress

Power sector emissions have fallen 49 per cent since 1990 as we have switched from coal to gas and renewable power such as wind and solar, with biomass conversions also playing an important transitional role, alongside improvements in the efficiency of

our economy<sup>242</sup>. Last year, 47 per cent of our electricity came from low carbon sources, with the rest mainly coming from coal and gas<sup>243</sup>. Coal use fell to record low levels last year, and on 21 April 2017, for the first time since 1882, we did not use any coal for a 24-hour period<sup>244</sup>. At the same time, we have ensured a secure supply of electricity.

**Figure 23: UK electricity generation by fuel type, 2000-2016<sup>245</sup>**

Source: BEIS

<sup>242</sup> BEIS (2017) Final UK greenhouse gas emissions national statistics: 1990-2015 <https://www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-2015>

<sup>243</sup> BEIS (2017): Digest of UK Energy Statistics 2017 <https://www.gov.uk/government/statistics/energy-chapter-1-digest-of-united-kingdom-energy-statistics-dukes>

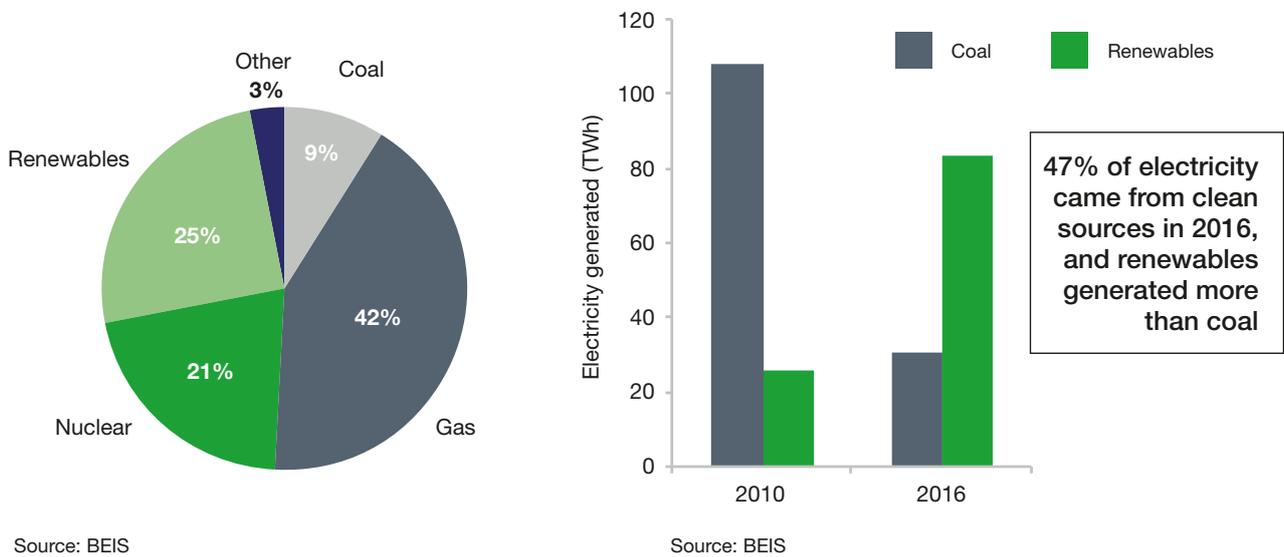

<sup>244</sup> Financial Times (2017) Britain passes historic milestone with first days of coal-free power <https://www.ft.com/content/fc2c8d12-191d-11e6-bb7d-ee563a5a1cc1>

<sup>245</sup> BEIS (2017) Energy Trends June 2017 <https://www.gov.uk/government/collections/energy-trends>

The costs of low carbon and more efficient technologies have fallen significantly since 2010 through a series of innovations and growth in deployment. Solar photovoltaic modules are now almost 80 per cent cheaper<sup>246</sup>, LED lightbulbs over 80 per cent cheaper<sup>247</sup>, and batteries for electric vehicles (EVs) over 70 per cent cheaper<sup>248</sup>. Average household electricity

bills in 2016 were around 10 per cent lower than in 2008, when the Climate Change Act was introduced<sup>249</sup>. While policy costs on bills have increased over this period, this has been more than offset by reduced electricity use, thanks in part to tightening standards on electrical products.

**Figure 24: UK electricity generation mix, 2016 (left) and UK electricity generation from coal and renewables 2010-16 (right)**<sup>250</sup>

<sup>250</sup> BEIS (2017) Energy Trends <https://www.gov.uk/government/collections/energy-trends>

### Ambition

We want a diverse electricity system that supplies our homes and businesses with secure, affordable and clean power. That means developing low carbon sources of electricity that are both cheap and clean, taking into account wider system impacts for all sources of generation. It also means upgrading our electricity system so it is smarter (using data to provide greater control), more flexible (providing energy when it is needed) and takes advantage of rapidly developing technologies such as energy storage.

By 2050, we anticipate that emissions from the power sector could need to be close to zero<sup>251</sup>. Indeed, we may even see negative emissions – that is, greenhouse gases being removed from the atmosphere – from the sector if sustainable bio-energy and carbon capture and storage are used together. At the same time, many more people are expected to drive EVs, many homes and offices may have efficient electric heating and cooling, and more industrial sites could be powered by clean electricity. There are however alternatives to electrification, such as hydrogen, which could mean that electricity demand is more similar to today.

**Figure 25: Actual and projected power sector emissions, taking into account the clean growth pathway, 1990-2050**

Source: BEIS

<sup>251</sup> BEIS internal analysis of 2050 pathways

One possible pathway to 2032 could see power emissions fall by 80 per cent compared to today, to around 16 Mt<sup>252</sup>. This could be achieved by:

- Growing low carbon sources such as renewables and nuclear to over 80 per cent of electricity generation, and phasing out unabated coal power.
- Enabling a smarter, more flexible system, unlocking significant expansion of interconnection, electricity storage, and demand side response, the first steps of which are set out in the Smart Systems and Flexibility Plan<sup>253</sup>. For consumers, this could mean smart appliances and smart tariffs which help balance the grid in return for lower bills.

- Keeping costs down for consumers by reducing any wasted energy, including more efficient electrical products.

To achieve this we need to continue bringing down the costs of low carbon generation from renewables and nuclear power, and ensure that the UK can deploy CCUS at scale during the 2030s, subject to costs coming down sufficiently. We also need to remove barriers and improve price signals for smart energy innovations which improve the efficiency and flexibility of the system.

### Oxis Energy

OXIS energy, based in Oxfordshire has developed a high performing rechargeable battery which is lighter, more efficient and cheaper than competitor products. The company has received £2.7m in funding from Innovate UK and has grown to employ 60 staff. Their most recent grant is supporting them to produce a revolutionary electric vehicle battery.

<sup>252</sup> BEIS internal analysis of 2032 pathway

<sup>253</sup> BEIS and Ofgem (2017) Upgrading our energy system: smart systems and flexibility plan <https://www.gov.uk/government/publications/upgrading-our-energy-system-smart-systems-and-flexibility-plan>

### Powering Electric Vehicles and Heating

Electric vehicles, electric heating and energy efficiency are key options for reducing emissions in transport and buildings. The impacts of these measures on the power sector are taken into account in our 2032 pathway and summarised below. It shows a net increase of around 3 per cent in the electricity

demand and around 4 per cent in peak demand in 2032, and how this can be met through a mix of technologies. In practice, we do not yet know exactly how quickly costs will fall and take-up will increase for electric vehicles, or the role that electrification could play in the long-term decarbonisation of heat.

	Generation (2032)	Capacity (2032)
Impact of the 2032 pathway (compared to BEIS reference case)	Extra demand: 10 TWh (+3%)	Extra peak demand: 2.8 GW (+4%)
	Extra supply: Clean generators 3 TWh Interconnection 4 TWh Fossil fuels 4 TWh	Extra capacity and flexibility: Demand-side response 4.9 GW Storage 0.3 GW Clean generators 0.5 GW Fossil fuels 1.2 GW

Source: BEIS internal analysis of GB power system

Note: The impact of the 2032 pathway is assessed against an updated version of the published BEIS 2016 reference case<sup>254</sup>. Not all extra capacity and flexibility is available to help meet peak demand. Numbers may not sum due to rounding.

For this analysis, we took into account the potential for smart charging of electric vehicles and smart use of heat pumps. For example, we assumed potential to shift charging of most electric vehicles to overnight, which could reduce bills for consumers on a smart

tariff<sup>255</sup>. This ‘demand-side response’ – adjusting energy consumption to when it is plentiful and cheap – would help to balance the grid and reduce peak demand. Our Smart Systems and Flexibility Plan is about unlocking this potential<sup>256</sup>.

<sup>254</sup> BEIS (2017) Energy and Emissions Projections 2016 <https://www.gov.uk/government/publications/updated-energy-and-emissions-projections-2016> A number of model updates and improvements have been made regarding the electricity demand profiles of key technologies and how this demand might be shifted, the availability of electricity storage technologies, and assumed system operability requirements.

<sup>255</sup> Fisher, J., Gammon, R. and Irvine, K.N. (2015) My Electric Avenue <https://www.dora.dmu.ac.uk/xmlui/handle/2086/12180> There is considerable uncertainty on the extent to which customers will change their behaviours and we will be monitoring the evidence here.

<sup>256</sup> BEIS and Ofgem (2017) Upgrading our energy system: smart systems and flexibility plan <https://www.gov.uk/government/publications/upgrading-our-energy-system-smart-systems-and-flexibility-plan>

## Opportunities

The UK is well placed to benefit from the transition to a cleaner, smarter power sector and we already see jobs, regional investment and export sales flowing from UK supply chains for clean power technologies. In 2015, the low carbon electricity sector generated over £12 billion in turnover and directly supported 47,000 jobs, with more in supply chains<sup>257</sup>.

There is an opportunity for the UK to become one of the most advanced economies for smart energy and technologies, which is a core component of our Industrial Strategy, while upgrading our power infrastructure will improve energy security and air quality. Consumers will benefit from a smarter, more flexible power system to keep down costs, and will have more control of their energy through smart meters, with near real-time information on energy use and cost.

### Clayhill solar farm

Clayhill solar farm and energy storage facility is the first in the UK to be built without subsidy. Consisting of over 30,000 solar panels, it can generate enough power for 2,500 homes. Five onsite batteries allow electricity to be stored and utilised when needed, providing services for the electricity grid, such as frequency response. Co-locating storage at new renewable sites, combined with significant reductions in generation and storage technology costs, may allow more subsidy free sites to be built – providing services that help to maintain the reliability of the grid and clean electricity at low cost.

<sup>257</sup> ONS (2016) Low Carbon Economy and Renewable Energy Economy Survey <https://www.ons.gov.uk/economy/environmentalaccounts/bulletins/finalestimates/2015results>

## Policies and Proposals

### Growing Low Carbon Sources of Electricity

1. We confirm the Government's intention to phase out unabated coal generation by 2025, and we will shortly publish the Government's detailed response to the consultation.
2. We are delivering new nuclear capacity through the final investment decision on Hinkley Point C, and will progress discussions with developers to secure a competitive price for future projects in the pipeline.
3. We will work with industry as they develop an ambitious Sector Deal for offshore wind. Provided costs continue to fall, this could result in 10 gigawatts of new capacity built in the 2020s, with the potential to support high value jobs and a sustainable UK industry exporting goods and services around the world. We will also consider whether there could be opportunities for additional offshore wind deployment in the 2020s, if this is cost-effective and deliverable. This would mean up to £557 million for further Pot 2 Contract for Difference auctions, with the next one planned for spring 2019. We will work with the Crown Estate and the Crown Estate (Scotland) to understand the potential for deployment of offshore wind in the late 2020s and beyond and it is our current intention that wind projects on the remote islands of Scotland that directly benefit local communities will be eligible for the next Pot 2 auction, subject to obtaining State aid approval.

4. We want to see more people investing in solar without government support and are currently considering options for our approach to small scale low carbon generation beyond 2019, and will provide an update later this year. More nascent technologies such as wave, tidal stream and tidal range, could also have a role in the long-term decarbonisation of the UK, but they will need to demonstrate how they can compete with other forms of generation.
5. We remain committed to carbon pricing to help reduce emissions in the power sector. Further details on carbon prices for the 2020s will be set out in the autumn 2017 Budget.

### Delivering Smarter, More Efficient Energy

6. The Government will ensure that every household is offered a smart meter by their energy supplier by the end of 2020, and we expect energy suppliers to make every effort to provide smart meters to all their customers.
7. The Government, Ofgem and industry will implement the 29 actions set out in the Smart Systems and Flexibility Plan published on 24 July. These will enable technologies such as energy storage and demand side response to compete effectively within the energy market, help integrate more low carbon generation such as solar into our energy system, and deliver secure, smart appliances and smart tariffs to allow consumers to benefit from using energy at times when it is cheaper. Innovations and other steps to increase flexibility could unlock up to £40 billion in energy cost savings up to 2050<sup>258</sup>.

<sup>258</sup> BEIS and Ofgem (2017) Upgrading our energy system: smart systems and flexibility plan <https://www.gov.uk/government/publications/upgrading-our-energy-system-smart-systems-and-flexibility-plan>

8. We will continue to work with Ofgem and the National Grid to create a more independent system operator which will help to keep household bills low through greater competition, coordination and innovation across the system.
9. We will work with Ofgem to ensure the necessary regulatory and market arrangements evolve to support the development of a clean, smart and flexible energy system as outlined in their strategy for regulating the future energy system<sup>259</sup>.
10. We will work to ensure significant private investment in new electricity interconnectors, which will help keep prices low for consumers, ensure a more secure grid and help integrate clean generation. Project assessments indicate the potential for at least 9.5 gigawatts more interconnection by the early-to-mid 2020s, in addition to the 4 gigawatts today and the 4.4 gigawatts under construction<sup>260,261</sup>.
11. Ofgem's price control regime will enable up to £26 billion of investment in upgrading and operating our electricity distribution networks from 2015-23<sup>262</sup> and we will work closely with industry to capitalise on the opportunities for smart integration of electric vehicles into the electricity system.
12. We confirm that when an installer installs solar panels with a battery in residential accommodation, this can attract a reduced VAT rate of 5 per cent if the installation conditions are met<sup>263</sup>. We will keep the tax treatment of technologies such as solar, storage and heat networks under review.

## Keeping Energy Costs Down for Businesses and Households

13. The Government has commissioned an independent review into the cost of energy led by Professor Dieter Helm CBE which will recommend ways to deliver the Government's carbon targets and ensure security of supply at minimum cost to both industry and domestic consumers. Once Ministers have had the opportunity to consider the Helm review's proposals, the Clean Growth Strategy will incorporate its recommendations into our further policy development as appropriate.
14. We are publishing a draft bill to require Ofgem to impose a cap on standard variable and default tariffs across the whole market.
15. The existing Levy Control Framework will be replaced by a new set of controls beyond 2020/21. These will be set out later this year.
16. We are evaluating the results of the Electricity Demand Reduction Pilot, which has offered organisations £5.4 million of funding for projects that could reduce bills and improve security of supply through making energy savings at peak times.

## Government Innovation Investment

The Government expects to invest around £900 million<sup>264</sup> of public funds between 2015 and 2021 in research and innovation in the power sector.

- **Power and smart systems:** Ensuring that the power system is smart and resilient to new demands and new sources of supply

<sup>259</sup> Ofgem (2017) Our strategy for regulating the future energy system <https://www.ofgem.gov.uk/publications-and-updates/our-strategy-regulating-future-energy-system>

<sup>260</sup> Ofgem <https://www.ofgem.gov.uk/electricity/transmission-networks/electricity-interconnectors>

<sup>261</sup> Ofgem (2017) Cap and floor regime: Initial Project Assessment of the GridLink, NeuConnect and NorthConnect Interconnectors <https://www.ofgem.gov.uk/publications-and-updates/cap-and-floor-regime-initial-project-assessment-gridlink-neuconnect-and-northconnect-interconnectors>

<sup>262</sup> Ofgem (2017) RIIO ED1 Annual Report 2015-16 <https://www.ofgem.gov.uk/publications-and-updates/riio-electricity-distribution-annual-report-2015-16>

<sup>263</sup> Each case will be considered on the specific facts. If batteries are sold separately and retrofitted to existing solar systems, VAT will be charged at the standard rate of 20%.

<sup>264</sup> All figures are indicative and are subject to competitive bidding processes across sectors and value for money tests. Numbers may not sum due to rounding.

will be important for energy security, cost and industrial opportunities. The Government, in partnership with the Research Councils and Innovate UK, expects to invest around £265 million in research, development and deployment in this area which will help to reduce the cost of electricity storage, advance innovative demand response technologies and develop new ways of balancing the grid, for example using EVs.

- **Nuclear:** We need to bring down the costs of nuclear power while maintaining safety by investing in innovation that will help plants to be built to time and budget. The Government, in partnership with the Research Councils and Innovate UK, expects to invest around £460 million to support work in areas including future nuclear fuels, new nuclear manufacturing techniques, recycling and reprocessing, and advanced reactor design. The Government has asked the Nuclear Innovation and Research Office (NIRO) to convene a new advisory Board, building on the success of the Nuclear Innovation and Research Advisory Board (NIRAB). The Board will provide independent expertise and advice to support and inform the Government's Nuclear Innovation Programme. The Government is also announcing that it will invest £7 million to further develop the capability and capacity of the nuclear regulators to support the development of advanced technologies. Industry is developing a potential nuclear sector deal as part of the Government's Industrial Strategy, co-ordinated around the objective of achieving cost reductions.
- **Renewables:** The UK already has a world leading offshore wind sector and is well placed to benefit from further investment in renewables innovation to accelerate cost reduction. The Government, in partnership with the Research Councils and Innovate UK, expects to invest around £177 million to further reduce the cost of renewables, including innovation in offshore wind turbine blade technology and foundations. New innovation opportunities are likely to arise in a number of areas, including floating offshore wind platforms, and advanced solar PV technologies.
- **Carbon capture, usage and storage:** CCUS could reduce the cost of meeting our 2050 target by supporting emissions reductions in industry, power, heating and transport<sup>265</sup>. Our new approach to CCUS is set out in the Business chapter.
- Ofgem is making available to GB electricity network companies up to £525 million of regulated expenditure between 2016 and 2021<sup>266</sup>. The goal is to support smarter, flexible networks, from enabling the integration of clean generation through to customer-focussed energy efficiency measures. This builds on previous network company innovation which delivered 4.5 – 6.5 times more benefits for consumers than it cost<sup>267</sup>.

<sup>265</sup> BEIS internal analysis of 2050 pathways

<sup>266</sup> Ofgem internal analysis

<sup>267</sup> Poyry and Ricardo Energy & Environment (2016) An independent evaluation of the LCNF [https://www.ofgem.gov.uk/system/files/docs/2016/11/evaluation\\_of\\_the\\_lcnf\\_0.pdf](https://www.ofgem.gov.uk/system/files/docs/2016/11/evaluation_of_the_lcnf_0.pdf)

## Enhancing the Benefits and Value of Our Natural Resources

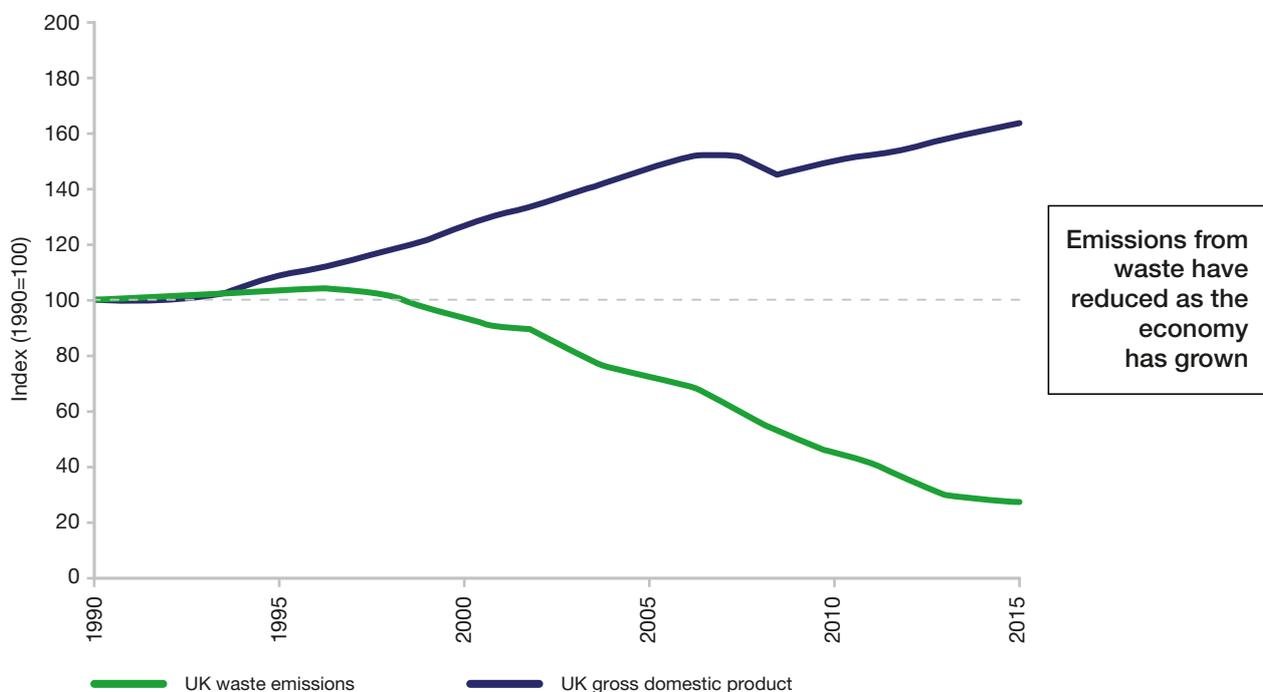

### Progress

The UK is generating more value from the use of our natural resources (covering livestock, crops, trees, land use and waste) while also cutting emissions. We have halved our emissions from these sectors since 1990 and they now only account for 15 per cent of total UK emissions<sup>268</sup>.

During this time emissions from the waste sector have decreased by 73 per cent. This

has been driven by taxing waste to landfill, increased recycling and more and better waste infrastructure. We have seen household recycling rates increase from 11 per cent to 44 per cent between 2000/1 and 2015/16<sup>269</sup>. At the same time, the UK waste sector has become an important contributor to electricity generation. Waste helped to generate 14 per cent of UK renewable electricity in 2015, enough to power 2.3 million homes<sup>270</sup>.

**Figure 26: Changes in emissions from waste and economic growth, 1990-2015**

Source: ONS, BEIS

Emissions from waste have reduced as the economy has grown

<sup>268</sup> BEIS (2017) Final UK greenhouse gas emissions national statistics: 1990-2015 <https://www.gov.uk/government/collections/final-uk-greenhouse-gas-emissions-national-statistics>

<sup>269</sup> Defra (2016) ENV18 - Local authority collected waste: annual results tables <https://www.gov.uk/government/statistical-data-sets/env18-local-authority-collected-waste-annual-results-tables>

<sup>270</sup> BEIS (2017) Energy Trends: Renewables <https://www.gov.uk/government/statistics/energy-trends-section-6-renewables>

This shift in resource efficiency has also been seen in agriculture – since 1990 emissions from producing a kilogram of pork have decreased by 30 per cent and by 16 per cent for a litre of milk. Many of our farms are using more efficient agricultural practices, for example improving crop nutrient and crop health management.

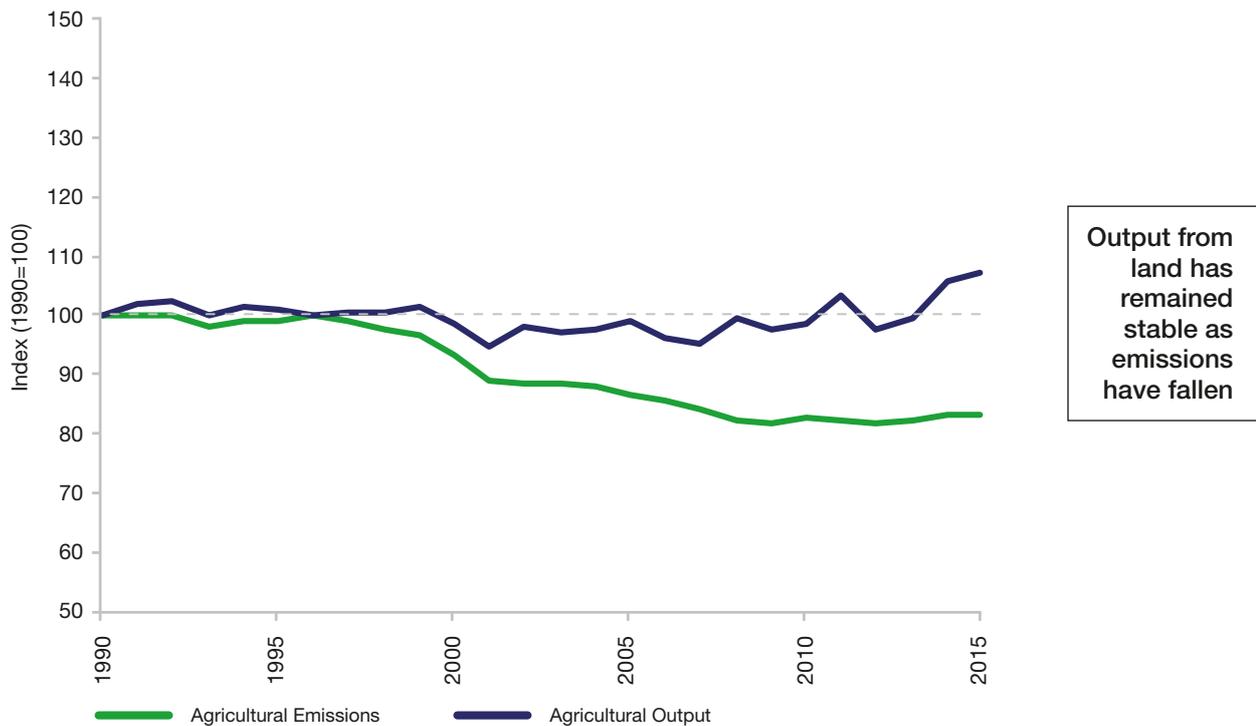

**Ambition**

We want low emission, highly productive land while ensuring we hand our environment on to the next generation in a better state than we found it. As part of this, we want the UK to become a world leader in terms of competitiveness, resource productivity and resource efficiency: maximising the value we extract from our resources, and minimising the negative environmental and carbon impacts associated with their extraction, use and disposal. We will work toward achieving zero avoidable waste by 2050.

Reducing emissions from natural resources will be important for meeting the 2050 target cost-effectively. Emissions from natural resources could fall by 30 per cent, with tree cover in England increasing by 180,000 hectares from 9.8 per cent to 11 per cent, as they are nurtured from saplings into maturity, providing essential spaces for our communities and enhancing our carbon sink.

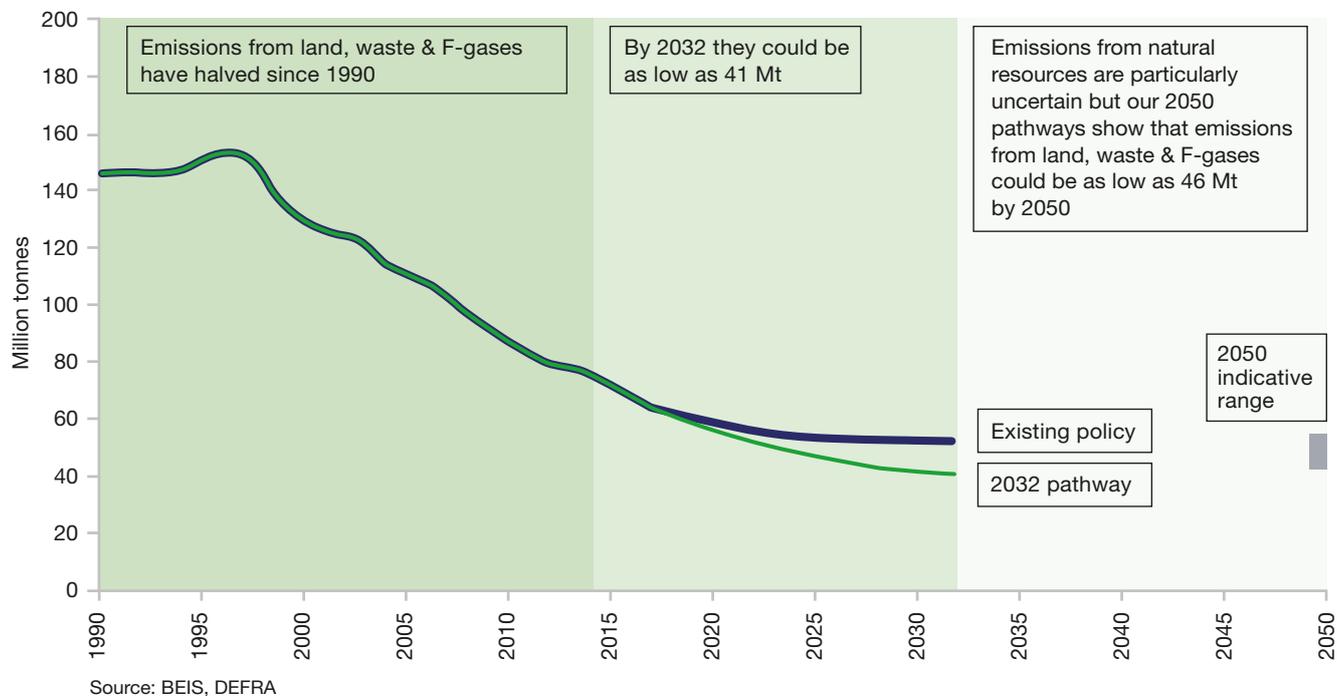

One possible pathway to 2032 could involve emissions from our natural resources falling by almost two fifths compared to today, and is consistent with meeting the Government's 2060 aspiration, to increase England's woodland cover from 10 per cent to 12 per cent. The pathway ramps-up planting in the 2020s recognising the significant contribution trees make to later carbon budget periods.

**Figure 27: Changes in emissions from agriculture and agricultural outputs, 1990-2015<sup>271</sup>**

<sup>271</sup> ONS (2016) Annual and quarterly low level aggregates of UK output gross value added (GVA), <https://www.ons.gov.uk/economy/grossdomesticproductgdp/datasets/ukgdpolowlevelaggregates/current>

**Figure 28: Actual and projected emissions in natural resources, taking into account the clean growth pathway, 1990-2050**

To achieve this 2032 pathway, we need to ensure that our farmers and land managers have the right incentives to promote environmental improvement while encouraging consumers, businesses and industry to further reduce waste and improve their resource efficiency, resulting in reduced bills. This means:

- Leaving the Common Agricultural Policy and designing a new system of future agricultural

support will give us the opportunity to address climate change more directly. We will design a new system to support the future of farming and the countryside, with a strong focus on delivering better environmental outcomes, including tackling climate change. An Agriculture Bill was announced in the Queen’s Speech following the 2017 general election, the details of which will be announced shortly.

- Our indicative pathway could involve planting up to 130,000 hectares of new woodland and implement plans for farmers to plant more trees across England, providing not just carbon reduction but recreational space for our growing communities and timber for our bioeconomy.
- We will develop new ambitious plans for the sustainable management of our natural environment including capturing more carbon by our plants and soil.
- Action to divert more food waste than ever before from landfill, to support resource productivity and avoid further emissions by preventing food waste in the first place.

## Opportunities

The UK has some of the most dynamic and innovative businesses working on using our natural resources more efficiently. Government will work with them to deliver smart and ambitious regulation and targets to help us meet new environmental demands while also driving growth from these sectors.

There are clear economic benefits to be gained from driving resource productivity, a more efficient farming sector and developing the UK's land use sector. Forestry is a growth sector, with forestry and wood processing providing 43,000 jobs in the UK and contributing £2 billion to the economy<sup>272</sup>. This, in turn, provides an important carbon sink – the doubling of woodland cover over the past century means UK forests currently absorb 20 million tonnes of carbon dioxide a year.

Analysis from the Waste and Resources Action Programme (WRAP) suggests progress to a more resource efficient economy has the potential to create up to 205,000 jobs<sup>273</sup>. Some 54,000 of these jobs could be created in regions and at pay grades where there is spare capacity, making a net contribution to UK employment.

## Manchester City of Trees

Manchester City of Trees is an urban community partnership focussed on tree planting, woodland management and re-connecting communities to green spaces. The goals of the project are 3 million trees planted, one for every man, woman and child across Greater Manchester, 2,000 hectares of unmanaged woodland brought back into a productive state, and to connect people to the trees and woods around them.

<sup>272</sup> Forestry Commission (2016) Forestry Statistics 2016 [https://www.forestry.gov.uk/pdf/Ch8\\_Finance\\_FS2016.pdf/\\$FILE/Ch8\\_Finance\\_FS2016.pdf](https://www.forestry.gov.uk/pdf/Ch8_Finance_FS2016.pdf/$FILE/Ch8_Finance_FS2016.pdf); [https://www.forestry.gov.uk/pdf/Ch7\\_Employment\\_FS2016.pdf/\\$FILE/Ch7\\_Employment\\_FS2016.pdf](https://www.forestry.gov.uk/pdf/Ch7_Employment_FS2016.pdf/$FILE/Ch7_Employment_FS2016.pdf) Estimate of economic value and jobs relates to forestry and primary wood processing; National Atmospheric Emissions Inventory (2017) Projections of emissions and removals from the LULUCF sector to 2050 [http://naei.beis.gov.uk/reports/reports?report\\_id=927](http://naei.beis.gov.uk/reports/reports?report_id=927)

<sup>273</sup> Waste and Resources Action Programme (2015) Employment and the Circular Economy <http://www.wrap.org.uk/content/employment-and-circular-economy>

## Policies and Proposals

The Government's 25 Year Environment Plan will set out the Government's approach to improving our natural environment, including reducing both carbon emissions and other dangerous pollutants. In meeting carbon budgets we are committed to policy development that enhances our natural assets, helps prepare for the impacts of climate change and supports our commitments on clean air.

### Farmers and Rural Businesses Benefit from Clean Growth Opportunities

We want our land and agriculture sectors to play a significant role in low carbon growth, supported through a system of incentives to improve efficiency and improve our natural environment:

1. The Government will introduce a new agri-environment system to support the future of farming and the countryside, with a strong focus on delivering better environmental outcomes, including mitigation of and adaptation to climate change.
2. We aim to support industry in strengthening farm biosecurity to improve productivity, reduce reliance on veterinary medicines and reduce emissions. To begin this, we are developing a scheme to directly tackle endemic diseases in beef and dairy herds.
3. We will work with industry to encourage the use of low-emissions fertiliser. We will review the levels of take up over the next five years using data from the British Fertiliser Practice Survey. This will provide evidence to shape our future policies.
4. We will work with industry to produce a UK Bioeconomy Strategy that will bring together biological industries, academia and innovators, linking up farmers and land managers with high tech industries. Through a thriving innovation-based bioeconomy, we will develop less carbon intensive products such as bio-based chemicals, plastics and other materials.
5. We will develop a new incentive structure to harness the potential for growth in forestry and renewables being supplied from within the UK, including on bioenergy, as part of our ambitions for strengthening the rural economy and encouraging diversification of farm businesses.
6. Funding from the £200 million package of Rural Development Plan for England (RDPE)<sup>274</sup> Growth Programme and Countryside Productivity Offers, announced in July 2017, could be used to support renewable energy projects, such as solar panels or small wind turbines linked to battery storage.

<sup>274</sup> Rural Development Programme for England (RDPE), which works to make England's agriculture and forestry sectors more competitive, to improve the quality of life in rural areas and to diversify rural economies.

## Natural Capital

**What is natural capital?** Natural capital enables us to think about our natural environment and the countryside as a set of valuable assets (for example, forests, clean air, soils, species, freshwaters, oceans and minerals). Like any asset, natural capital, if maintained and invested in, provides flows of services to the economy and society. These include food, energy, carbon sequestration, pollutant removal, flood risk reduction, recreational and educational opportunities, health benefits and many others. Many of these benefits do not have a direct market value.

**Why is natural capital relevant for reducing carbon emissions?** The Climate Change Act requires that our plan for reducing emissions contribute to sustainability. As part of this work we have looked at how measures and policies could have impacts on our natural assets, including the impact of reducing carbon emissions. Natural capital can also contribute significantly to reducing levels of greenhouse gases through land use and land use change. This is described in the Technical Annex. The Government's wider work on natural capital will be set out in the 25 Year Environment Plan.

### Making Sure Our Land Plays a Central Role in Capturing Carbon and Enhancing Natural Capital

7. During the 2020s we need to accelerate the rate of tree planting, working towards our 12 per cent tree cover aspiration by 2060. To do this will require investment by the private and charitable sectors, not just government. A number of our policy proposals will create the conditions for that investment to come forward. We will need new skills in forest design, a reliable supply of resilient planting stock, new opportunities for domestic timber, and a new generation of skilled people helping to enhance our towns, cities and countryside. Recently published natural capital accounts by the Office for National Statistics show that Britain's woodlands provide services of £2.3 billion per year to the economy in terms of recreation, carbon sequestration, timber and air pollutant removal<sup>275</sup>.
8. We will develop a new network of English forests with the right incentives and rules to establish and support new regional and national community woodlands to help reach 12 per cent woodland cover in England by 2060. We have allocated funding to woodland planting to support our commitment to plant 11 million trees<sup>276</sup>.
9. We will set up a stronger and more attractive domestic carbon offset market that will encourage more businesses to support cost-effective emissions reductions, such as through planting trees. We will also explore how we could extend this market to include other land activities.
10. We will unlock private finance to invest in forestry by establishing forestry investment zones to offer investors streamlined decision making and more certainty, within shorter timelines.
11. We will fund larger-scale woodland and

<sup>275</sup> ONS (2017) UK natural capital: ecosystem accounts for freshwater, farmland and woodland <https://www.ons.gov.uk/economy/environmentalaccounts/bulletins/uknaturalcapital/landandhabitatecosystemaccounts>

<sup>276</sup> Forestry Commission and Natural England (2017) Countryside Stewardship opens for 2017 <https://www.gov.uk/government/news/countryside-stewardship-opens-for-2017>

forest creation, and we will design woodland creation incentives that attract more landowners and farmers to plant on marginal land, including through agroforestry and bioenergy production, to help diversify land-based businesses and enhance the farmed environment.

12. Peatland, like woodland, forms a key part of the UK's natural capital, but is widely degraded. We launched a £10 million capital grant scheme for peat restoration in July 2017 to target peatlands in England. Funds are available from April 2018 for three years<sup>277</sup>.
13. We will work with industry to increase the amount of UK timber used in construction, creating a conveyor belt of locked-in carbon in our homes and buildings.

### **The UK will work towards being a Zero Avoidable Waste economy by 2050**

14. Zero avoidable waste equates to eliminating all waste where it is technologically, environmentally and economically practicable to do so and working to support innovation in new materials, products and processes that extend the range of materials covered by this categorisation.
15. Working in partnership with business and civil society toward our shared zero avoidable waste ambition, we will support the transition to a highly productive and competitive economy where we unlock the environmental and economic benefits associated with greater resource productivity without imposing negative costs on business or society.
16. By working in partnership with industry, we will be able to seek out opportunities to achieve even greater levels of recycling, improve the utilisation of our food and bio-waste and incentivise activities such as reuse, repair and remanufacturing – protecting our environment and strengthening our economy in the long-term.
17. We will work towards no food waste entering landfill by 2030. Many local authorities have introduced separate collection of food waste and we will work to support more so that the amount of food waste sent to landfill continues to decline.
18. We will set out a new Resources and Waste strategy which seeks to maximise resource productivity, reduce waste in our energy and resource systems, promote well-functioning markets for secondary materials and incentivise producers to design better products. The strategy will focus on three key areas:
- Maximising resource productivity - through more efficient manufacturing processes
  - Maximising the value we get from resources throughout their lifetimes - by designing products more smartly to increase longevity and enable recyclability
  - Managing materials at end of life – by targeting environmental impacts

<sup>277</sup> Defra press release (2017) New £10 million fund to restore peatland <https://www.gov.uk/government/news/new-10-million-fund-to-restore-peatland>

19. We will explore how data can support the development of a network of resource efficiency clusters led by Local Enterprise Partnerships (LEPs), whereby LEPs would develop local level strategies to drive greater resource efficiency, supporting processes such as industrial symbiosis and the development of new disruptive business models that challenge inefficient practice.
20. We will explore how we can better incentivise producers to manage resources more efficiently through producer responsibility schemes.
21. We will take action through the Courtauld 2025 Agreement to reduce the amount of food that is wasted in the UK. This could deliver up to £20 billion worth of savings to the UK economy between 2015 and 2025<sup>278</sup>. We will also divert more food from landfill to support resource productivity and avoid further emissions.

22. We will explore new and innovative ways to manage emissions from landfill, undertaking research and analysis to support new approaches such as optimising surface methane oxidation. We will also investigate accelerating the breakdown of waste in landfill to improve the quantity and quality of landfill gas captured. This research should identify innovation to bring down the costs of low carbon technologies and lay the groundwork for future decisions.

### Government Innovation Investment

The Government expects to invest £99 million out to 2021 on innovation in natural resources. The Government wants the UK to be at the forefront of land-based innovation – ensuring our industry remains at the cutting edge of agricultural and bio-based technology development through the forthcoming bioeconomy strategy and through the existing £160 million Agri-Tech Strategy<sup>279</sup>:

### Recycling Technologies

Recycling Technologies, based in Swindon, has developed a new process that can recycle mixed plastic waste, which normally goes to landfill or is incinerated, into a clean fuel. With the support of an Energy Entrepreneurs Fund grant of around £700,000, testing has shown that this product can be used in industrial burners or marine engines. As an alternative, the product could be distilled and used as feedstock to make more new plastics, paints, polishes or lubricants. Recycling Technologies recently raised £5 million in private investment and are now actively on the lookout for further manufacturing sites.

<sup>278</sup> WRAP (2016) The Courtauld Commitment 2025 to transform UK food and drink <http://www.wrap.org.uk/content/courtauld-commitment-2025-transform-uk-food-and-drink>

<sup>279</sup> Defra (2015) Agricultural technologies (agri-tech) strategy <https://www.gov.uk/government/collections/agricultural-technologies-agri-tech-strategy>

- **Innovative technology:** The Government has supported research on innovative technologies in agriculture via the Agri-Tech Catalyst, to accelerate the translation of research into practical solutions to improve agricultural productivity, whilst reducing the environmental impact of agricultural production, some of which has additional low carbon benefits.
- **Centres for Agri-tech Innovation:** Four centres have been funded in partnership with industry, academia and Government:
  - **Agrimetrics** - £11.8 million for a ‘big-data’ centre of excellence for Agrimetrics to utilise data science and modelling to build a more productive, sustainable and efficient food system.
  - **Agricultural Engineering Precision Innovation Centre (Agri-EPI)** - £17.7 million on precision agriculture to help the UK’s agri-food sector develop more productive and sustainable UK agriculture and export markets.
  - **Centre for Crop Health and Protection (CHAP)** - £21.3 million to revolutionise how farmers manage crop threats including pests and disease, both in the UK and overseas.
  - **Centre for Innovation Excellence in Livestock (CIEL)** - £29.1 million to create new livestock technology and products to boost the profitability and productivity of livestock farming.

To complement this early action on innovation, the Government believes there are further opportunities for innovation linked to natural resources. In determining these we have focused where the Government can add the most value and develop UK opportunities. The main innovation challenges that could be unlocked are below, with detail on opportunities for UK investment.

## Land

Improving productivity and management skills on farms, coupled with technological innovation, will provide the tools for achieving a step change in the level of carbon savings.

- **Fertiliser:** We will develop affordable low carbon fertiliser products to reduce and replace fertilisers; explore the potential for bio-stimulants to improve nutrient use efficiency; and explore the viability of fertiliser production by recovering nutrients from wastes and other organic materials.
- **Soil health:** We will aim to target new sustainable land management techniques to overcome the decline in soil quality in the UK and the impact on productivity. We are already funding UK research into soils to deliver greenhouse gas removals (GGR) and abatement technologies as part of the £8.6 million research on GGRs<sup>280</sup>.
- **Crops and livestock genetics:** We will explore the mitigation potential of new breeding technologies and any barriers to their deployment to improve agricultural and forestry productivity and resilience.

<sup>280</sup> The National Environment Research Council (2017) £8.6 million UK research programme on greenhouse gas removal <http://www.nerc.ac.uk/press/releases/2017/09-greenhousegas/>

- **Low emission farming techniques:** We will reduce the costs of resource use in crop and livestock production by: improving our understanding of crop soil interactions; explore the potential of robotics and the latest sensor technologies; precision farming technologies more viable on smaller scale farms, investigate the potential of improving soil health and carbon stocks.
- **Forestry innovation:** We need to improve the resilience and productivity of our forests such as through greater understanding of how tree genetics can contribute to GGRs, especially as we approach 2050.
- **Resource efficiency.** We will encourage the development of business models which encourage resource efficiency, extend product life, conserve resources, and prevent material from becoming waste. Innovate UK's £15 million Manufacturing and Materials Competition will support the development of more flexible and efficient processes and materials.
- **Energy recovery processes.** We will work with the waste sector to ensure that different waste materials going into energy recovery processes are treated in the best possible way, to minimise environmental impact and maximise their potential as a resource. The National Infrastructure Commission's work on different pathways for the treatment of waste will feed into this. We will also work with businesses to explore the use of bio-based materials and to promote recyclable packaging so that more is recycled.

Innovate UK will also ensure that future rounds of its health and life science calls encourage bids which directly or indirectly support practices that may have a positive impact on climate change.

## **Waste**

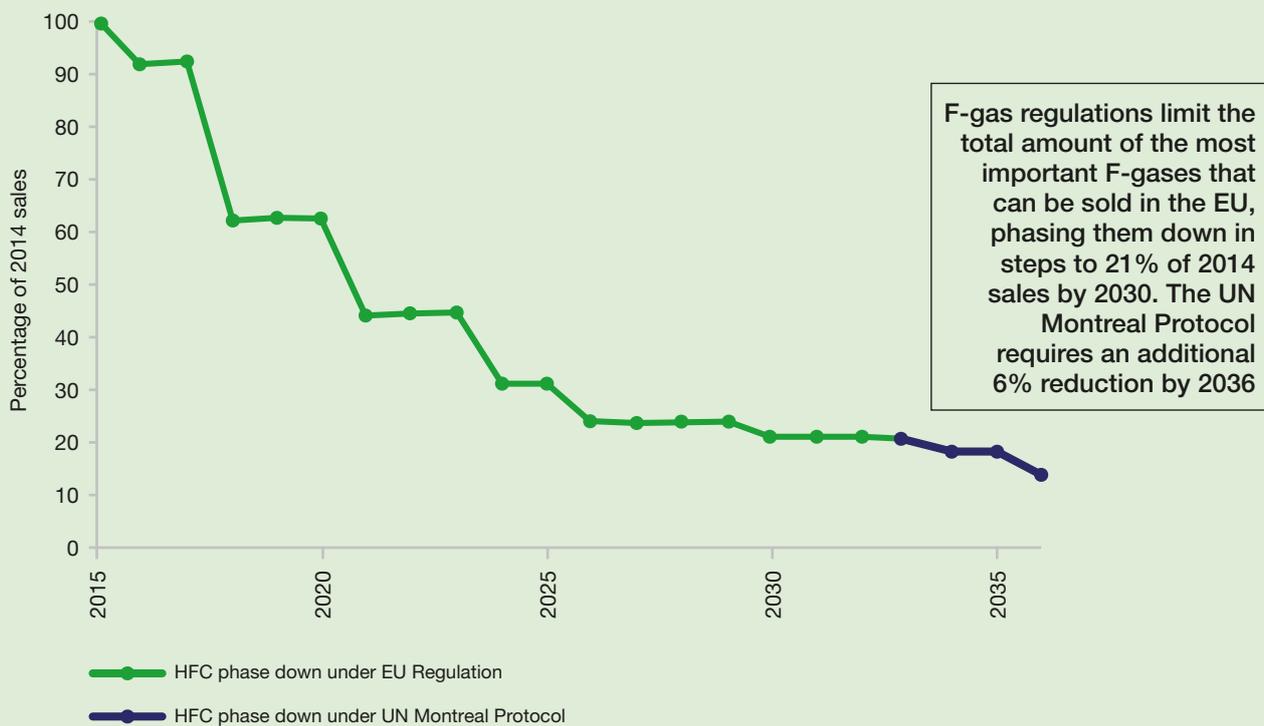

- **Anaerobic Digestion.** We need to ensure the sector continues to support our carbon and air quality goals, and that best practice is followed when digestate is spread to land to minimise ammonia release and air quality and pollutant impacts. This includes development of improved digestion and ammonia and phosphate extraction technologies while working with the sector to focus on reducing methane emissions.
- **Landfill gas capture and management.** There is an opportunity to undertake further research to accelerate methane production in the early life of a landfill site to reduce the length of aftercare required. This could help to reduce emissions from landfill further and in a sustainable way.

### Fluorinated Gases

Fluorinated gases (F-gases) are powerful greenhouse gases with a climate change effect up to 23,000 times greater than carbon dioxide<sup>281</sup>. Often used as refrigerants, the reduction in F-gas emissions has been a major success story as we decarbonise the economy. UK emissions decreased by 20 per cent between 1995 and 2015. Our current policies will cut UK F-gas emissions from 17 MtCO<sub>2</sub>e in 2015 (about 3 per cent of total UK emissions) to 9.3 MtCO<sub>2</sub>e by 2023, 6.6 MtCO<sub>2</sub>e by 2027 and 3.2 MtCO<sub>2</sub>e by 2035, representing an 81 per cent cut from 2015 levels<sup>282</sup>.

The UK led the way in pledging to phase down use of hydrofluorocarbons (HFCs) by 79 per cent by 2030. Following the UK lead, 197 countries agreed under the United Nations Montreal Protocol to a global phase down of HFCs which will see the UK and other developed countries go even further by delivering an 85 per cent phase down by 2036. It is estimated that this deal will reduce emissions equating to 0.5°C of avoided temperature change<sup>283</sup> by 2100, making a major contribution to the Paris Agreement on climate change and the goal of keeping the global temperature increase well below 2 degrees.

## Leading in the Public Sector

### Progress

Since 1990, the public sector – including central and local government, health, education and emergency services – has reduced its emissions by 40 per cent<sup>285</sup> as a result of energy efficiency and rationalisation of the central government estate.

Central government and its agencies have led by example through the Greening Government Commitments (GGC), which include a greenhouse gas reduction target. As of 2015/16, we have succeeded in meeting the target by delivering a 27 per cent emissions reduction and £127 million of savings against 2009/10 levels<sup>286</sup>. The original target was a 25 per cent reduction compared to the 2009/10

baseline so new targets were set in January 2017, with the aim of achieving a 32 per cent reduction by 2019/20.

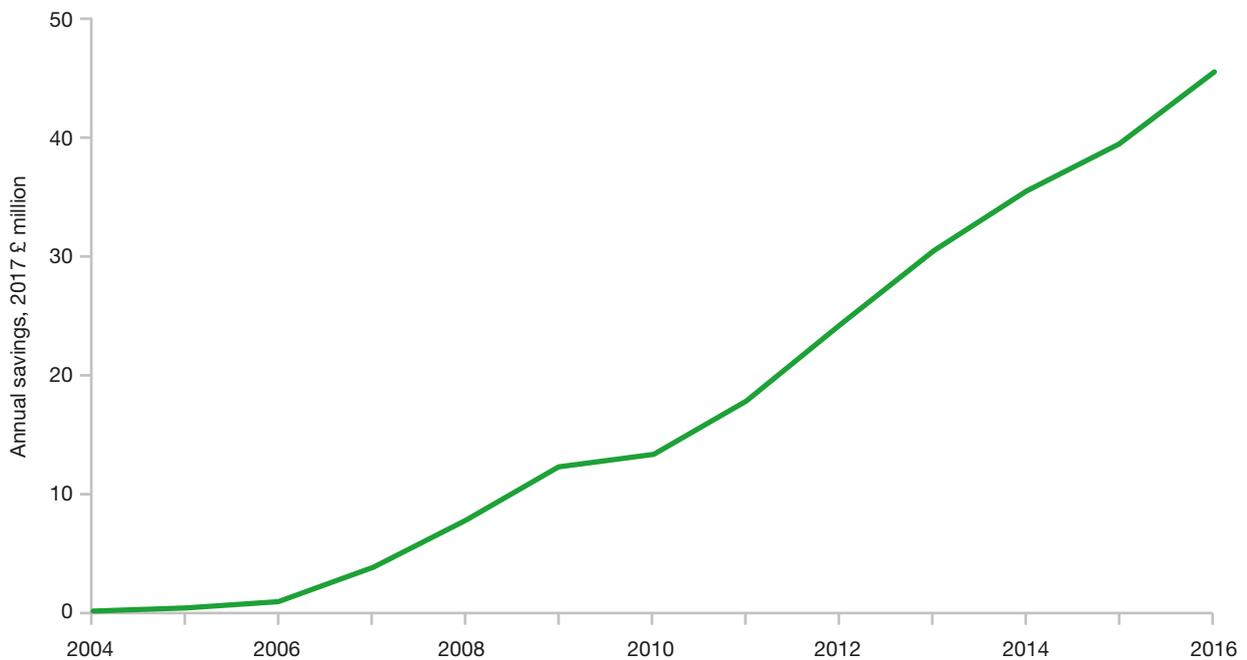

Outside central government, energy efficiency has been supported by an interest-free loan scheme, managed by Salix Finance. To date, the loan scheme has funded over 16,000 projects, improving public sector and higher education buildings for its users and is projected to save the sector around £55 million on energy bills this year<sup>287</sup>. In addition, the Re:Fit programme, managed by Local Partnerships, has helped public sector organisations invest in energy efficiency and energy generation projects by helping them to establish energy service contracts.

<sup>285</sup> Compared to 2015 levels. Sustainable Development Unit (2016) Sustainable Development in Health and Care Report – Health Check 2016 <http://www.sduhealth.org.uk/policy-strategy/reporting/sustainable-development-in-health-and-care-report-2016.aspx>

<sup>286</sup> Defra (2017) Greening Government Commitments 2015-2016 Annual Report <https://www.gov.uk/government/publications/greening-government-commitments-2015-to-2016-annual-report> This includes all end use emissions

<sup>287</sup> Salix Finance: Public Sector Loan Scheme <https://www.salixfinance.co.uk/>

**Figure 30: Annual energy bill savings from public sector Energy Efficiency Loans**

Source: Public Sector Energy Efficiency Loan Scheme BEIS model

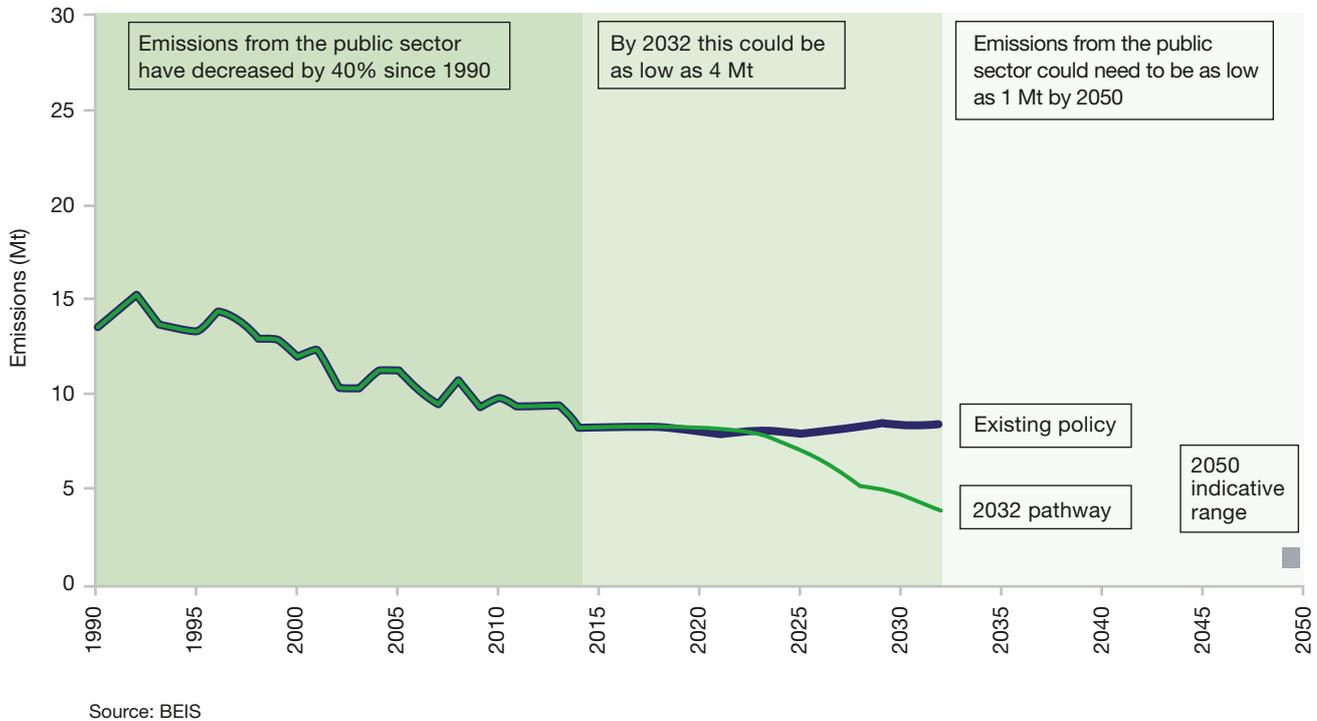

### Ambition

We want the public sector to be a leader in reducing carbon emissions; an approach that will also save organisations significant amounts of money. While central government has shown what is possible, we now want the wider public sector to reap the benefits of this approach. The annual energy bill across all public sector

buildings in England and Wales is estimated to be around £2 billion<sup>288</sup> and this could be reduced significantly, releasing funds for front line services. The public sector also has a key role to play in demonstrating best practice, promoting transparency over emissions reporting and catalysing markets in energy efficiency by implementing measures at scale.

<sup>288</sup> BEIS (2016) Building Energy and Efficiency Survey <https://www.gov.uk/government/publications/building-energy-efficiency-survey-bees>

**Figure 31: Actual and projected emissions in the public sector, taking into account the clean growth pathway, 1990-2050**

To meet the UK's 2050 target, emissions from the buildings and activities of the public sector will need to be near zero. As with homes and commercial property, this means improving energy efficiency and energy management, and decarbonising the heating and cooling of buildings as far as possible.

Our pathway to 2032 sees emissions from the public sector falling by around 50 per cent compared to today. To achieve this, the Government will need to:

- Set longer term emissions reduction targets across the public sector, and encourage transparent reporting on these.

- Address barriers to energy efficiency and low carbon investment, such as supporting organisations to access finance, and make the case for action internally.

### Opportunities

Ambitious action in the public sector will catalyse further innovation in low carbon products and services, generating new business and employment opportunities, and acting as a springboard for the wider low carbon market in the UK and internationally.

## Spotlight: NHS

The NHS is responsible for around a third<sup>289</sup> of public sector carbon emissions and in 2015/16 around £570 million was spent by the NHS Trust on energy<sup>290</sup>. Emissions from energy and travel alone have an annual carbon footprint of 7.4 million tonnes<sup>291</sup> demonstrating the important role of the NHS and the health supply chain in reducing the UK's emissions. Despite the challenges in the sector, over the last ten years the health system has reduced its annual carbon emissions by 3.6 million tonnes and saved almost £2 billion in energy costs<sup>292</sup>. Health organisations have in place mandatory Sustainable Development Management Plans which include recommendations

on reducing carbon emissions, improving energy efficiency, increasing local energy generation and understanding the health and financial impacts of travel<sup>293</sup>. NHS organisations are expected to report annually on carbon reduction with 69 per cent of providers and Clinical Commissioning Groups meeting minimum standards. Health organisations are also strongly encouraged to adopt and report on progress against a carbon reduction target of 34 per cent in line with the Climate Change Act with an NHS baseline of 2007/08<sup>294</sup>. Forty one per cent<sup>295</sup> of trusts already report they are on track to meet the 34 per cent target by 2020/21.

## Dryden School

Dryden School is a secondary special school in Gateshead. They cut their energy bill using a 100 per cent interest free loan of almost £80,000, funded by the Government's Salix scheme. By installing LED lighting, pipework insulation and improving the Building Energy Management System and hydrotherapy pool ventilation system they cut their bill by £17,000 a year – saving over £342 per pupil, and meaning their loan pays back in just over four years.

## Policies and Proposals

### Setting Targets and Reporting Against Them

1. Outside central government, some parts of the wider public and higher education sectors have already set emission reduction targets to encourage organisations to focus on cutting carbon and energy bills. However there is no common target that covers the whole sector. Therefore, the Government will introduce a voluntary wider public and higher education sector target of a 30 per cent reduction in greenhouse gases by 2020/21, against a 2009/10 baseline, and will publish a Call for Evidence alongside this document to gain views from the sector on the target and a proportionate reporting framework to underpin this, as well as further policies to realise carbon and cost saving potential. We will review progress against this voluntary target by 2020, with a view to moving to a more ambitious target during the 2020s (such as a 50 per cent reduction by 2030). Once a reporting framework is in place, and there is clear evidence of the impact of voluntary action, a mandatory target could also be considered.
2. For central government, the Greening Government Commitments (GGCs) have already produced significant emissions savings across departments and agencies. We are currently working with departments to agree higher targets for 2020 and actions to further reduce greenhouse gas emissions beyond this date. We will publish the new targets in due course.

### Supporting Access To Finance

3. In the 2015 Spending Review, the Government announced £295 million of new funding for public sector energy efficiency across the UK. In England, this increased funding is invested in the existing public sector energy efficiency loan scheme, which is available to the wider public and higher education sectors. The loan scheme administrator currently manages £210 million, and this will rise to some £385 million by 2020. This revolving loan scheme will continue to be recycled to at least 2025. Similar schemes run in Scotland and Wales received £40 million of the 2015 spending review award.
4. An Energy Performance Contract provides finance to organisations so that they can invest in cost-effective energy conservation measures, without incurring any upfront capital costs. The Government will continue to support their expansion in the public sector, as they offer a new route to improve energy efficiency, while producing guaranteed savings. To underpin this approach we are continuing support to the RE: FIT programme in 2017/18, alongside Local Partnerships.

## Local Leadership

Moving to a productive low carbon economy cannot be achieved by central government alone; it is a shared responsibility across the country. Local areas are best placed to drive emission reductions through their unique position of managing policy on land, buildings, water, waste and transport. They can embed low carbon measures in strategic plans across areas such as health and social care, transport, and housing.

The Government recognises the importance of anchoring economic growth in the strengths of local areas. Indeed, each local area will be responsible for coordinating its own local industrial strategy in alignment with the national Industrial Strategy<sup>296</sup>.

Local leaders are already rising to the challenge and putting local carbon targets and strategies in place. Nearly 70 local authorities are signed up to using 100 per cent clean energy by 2050 as part of the UK100 network<sup>297</sup>, reflecting the leadership shown by mayors globally on climate change and clean energy. Partnerships across public, private and community sector organisations can unlock powerful integrated local energy solutions.

The Government is committed to supporting local leadership and has already given additional powers and responsibilities through the Cities and Local Government Devolution Act 2016; many of the Local Devolution deals agreed to date include energy commitments. We work with local areas to support delivery, develop partnerships, and enable access to low carbon procurement frameworks.

In 2017, in England we funded 13 Local Enterprise Partnerships (LEPs) to develop local energy strategies and will support the remaining 25 LEPs to produce their own later this year. We will also launch a new Local Energy programme to support local areas in England to play a greater role in decarbonisation. This will increase local capacity and capability across England and provide on the ground practical support and expertise to unlock local energy opportunities.

The programme will start to support delivery of the Industrial Strategy and Smart Systems Plan, working with local areas to demonstrate that deep decarbonisation can be achieved through local system change in a way that keeps costs down and maximises economic benefit.

Innovation at the local level is also vital. The Energy Innovation Board will ensure that all relevant clean technology innovation funds are accessible to local actors including local authorities, Local Enterprise Partnerships, community sector organisations and others, as appropriate.

Government will continue to work with and support local leaders. We will establish a Local Energy Contact Group, building on the valuable work of the previous Community Energy Contact Group, to continue the crucial dialogue between local stakeholders and Ministers.

### *Local Leadership: Cornwall*

*Cornwall hosts a wealth of renewable energy resources including wind, solar, geothermal and marine energy. Cornwall now contributes more than 768 MW of sustainable energy generation to the UK energy mix<sup>296</sup>, with approximately 25 per cent in local ownership, including 8 MW of Council-owned solar PV and more than 1MW owned by community groups supported by England's first community energy revolving fund with £2.5 million council funds<sup>297</sup>.*

<sup>296</sup> Regen (2016) Renewable Energy: a local progress report for England <https://www.regensw.co.uk/renewable-energy-progress-reports>

<sup>297</sup> Cornwall Council press release (2017) <https://www.cornwall.gov.uk/council-and-democracy/council-news-room/media-releases/news-from-2017/news-from-march-2017/community-energy-remains-at-the-heart-of-cornwall-council-s-energy-agenda/>

# Chapter 5: Next Steps

This Strategy sets out our plan to meet our future carbon budgets. Chapter 4 sets out the potential to reduce emissions across each sector and our policies and proposals to unlock the further savings needed. The timeframes for these actions are set out in full in annexes A and B.

In addition to the Emissions Intensity Ratio, we have also developed a set of metrics which will help us assess and understand progress. These metrics are summarised below and set out in Annex D.

This Strategy is not the end of the process. Our policies and proposals will evolve as we respond to costs coming down, to lessons about what does and does not work, to improved evidence, and to wider trends in the economy, society, technology and innovation. To keep track of this moving picture and our progress towards carbon budgets, we will be monitoring and reporting against each element of this Strategy.

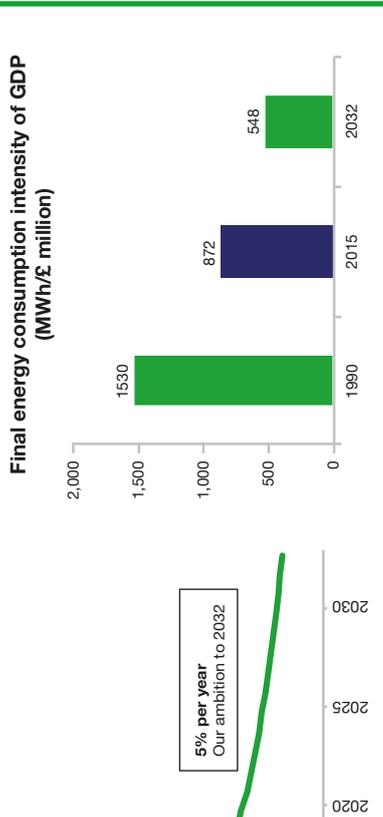

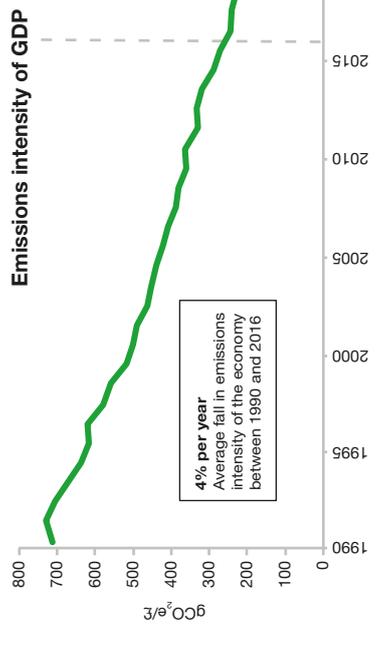

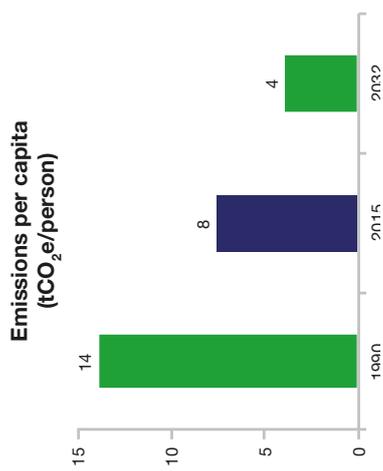

From 2018, we will use the Government's response to the Committee on Climate Change's annual progress report to bring together reporting against this strategy on the emission intensity ratio, metrics and actions. We will publish our performance against the Emissions Intensity Ratio on an annual basis. We will also update key elements of the Strategy in line with our annual statutory responses to the Committee on Climate Change's reports on progress, ahead of setting the sixth carbon budget by 30 June 2021.

We welcome views on this Strategy. Comments and suggestions should be sent to [CleanGrowthStrategy@beis.gov.uk](mailto:CleanGrowthStrategy@beis.gov.uk) by the end of December 2017. Government intends that the individual departmental policies and proposals contained within the plan will be consulted on separately, where such consultation has not already taken place. Views received in response to both this Strategy and the detailed policy proposals which will follow it will be considered as we update key elements of our strategy before setting the sixth carbon budget by 30 June 2021.

The Government will also launch an annual week focusing on climate issues across the UK, to showcase our progress and successes on climate action, share the latest climate science, and highlight and promote economic opportunities arising from clean growth around the country.

# Whole economy

We will report progress against this framework of economy-wide and sector-level metrics annually. Details of each metric are set out in Annex D

## Homes

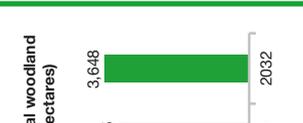

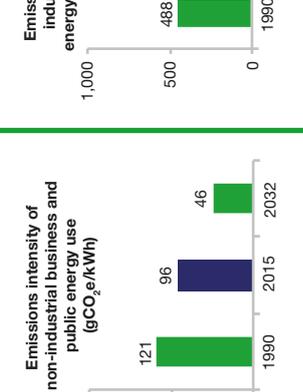

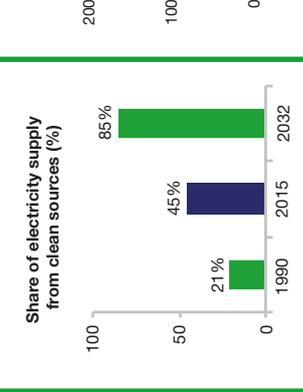

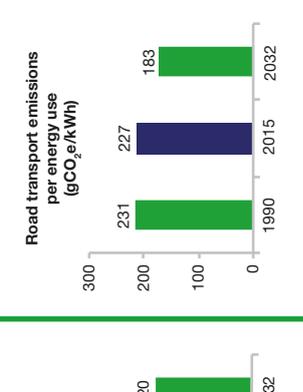

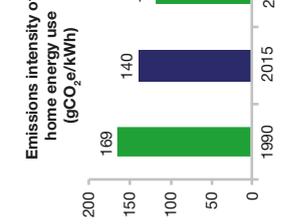

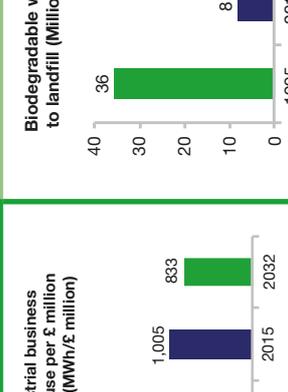

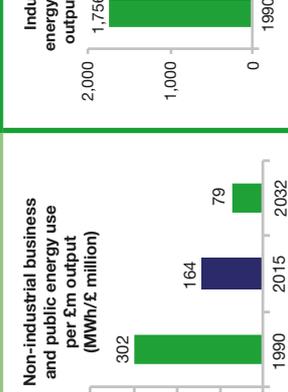

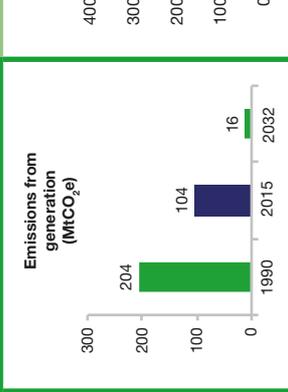

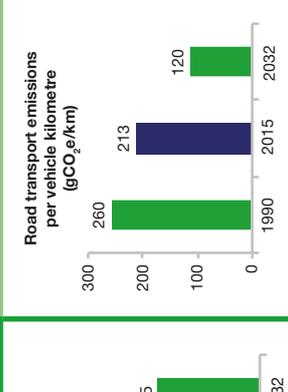

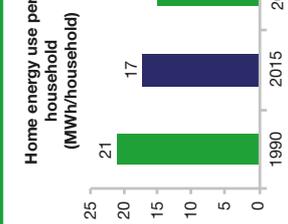

## Power

## Non-industrial business & public sector

## Land & environment

# Annexes

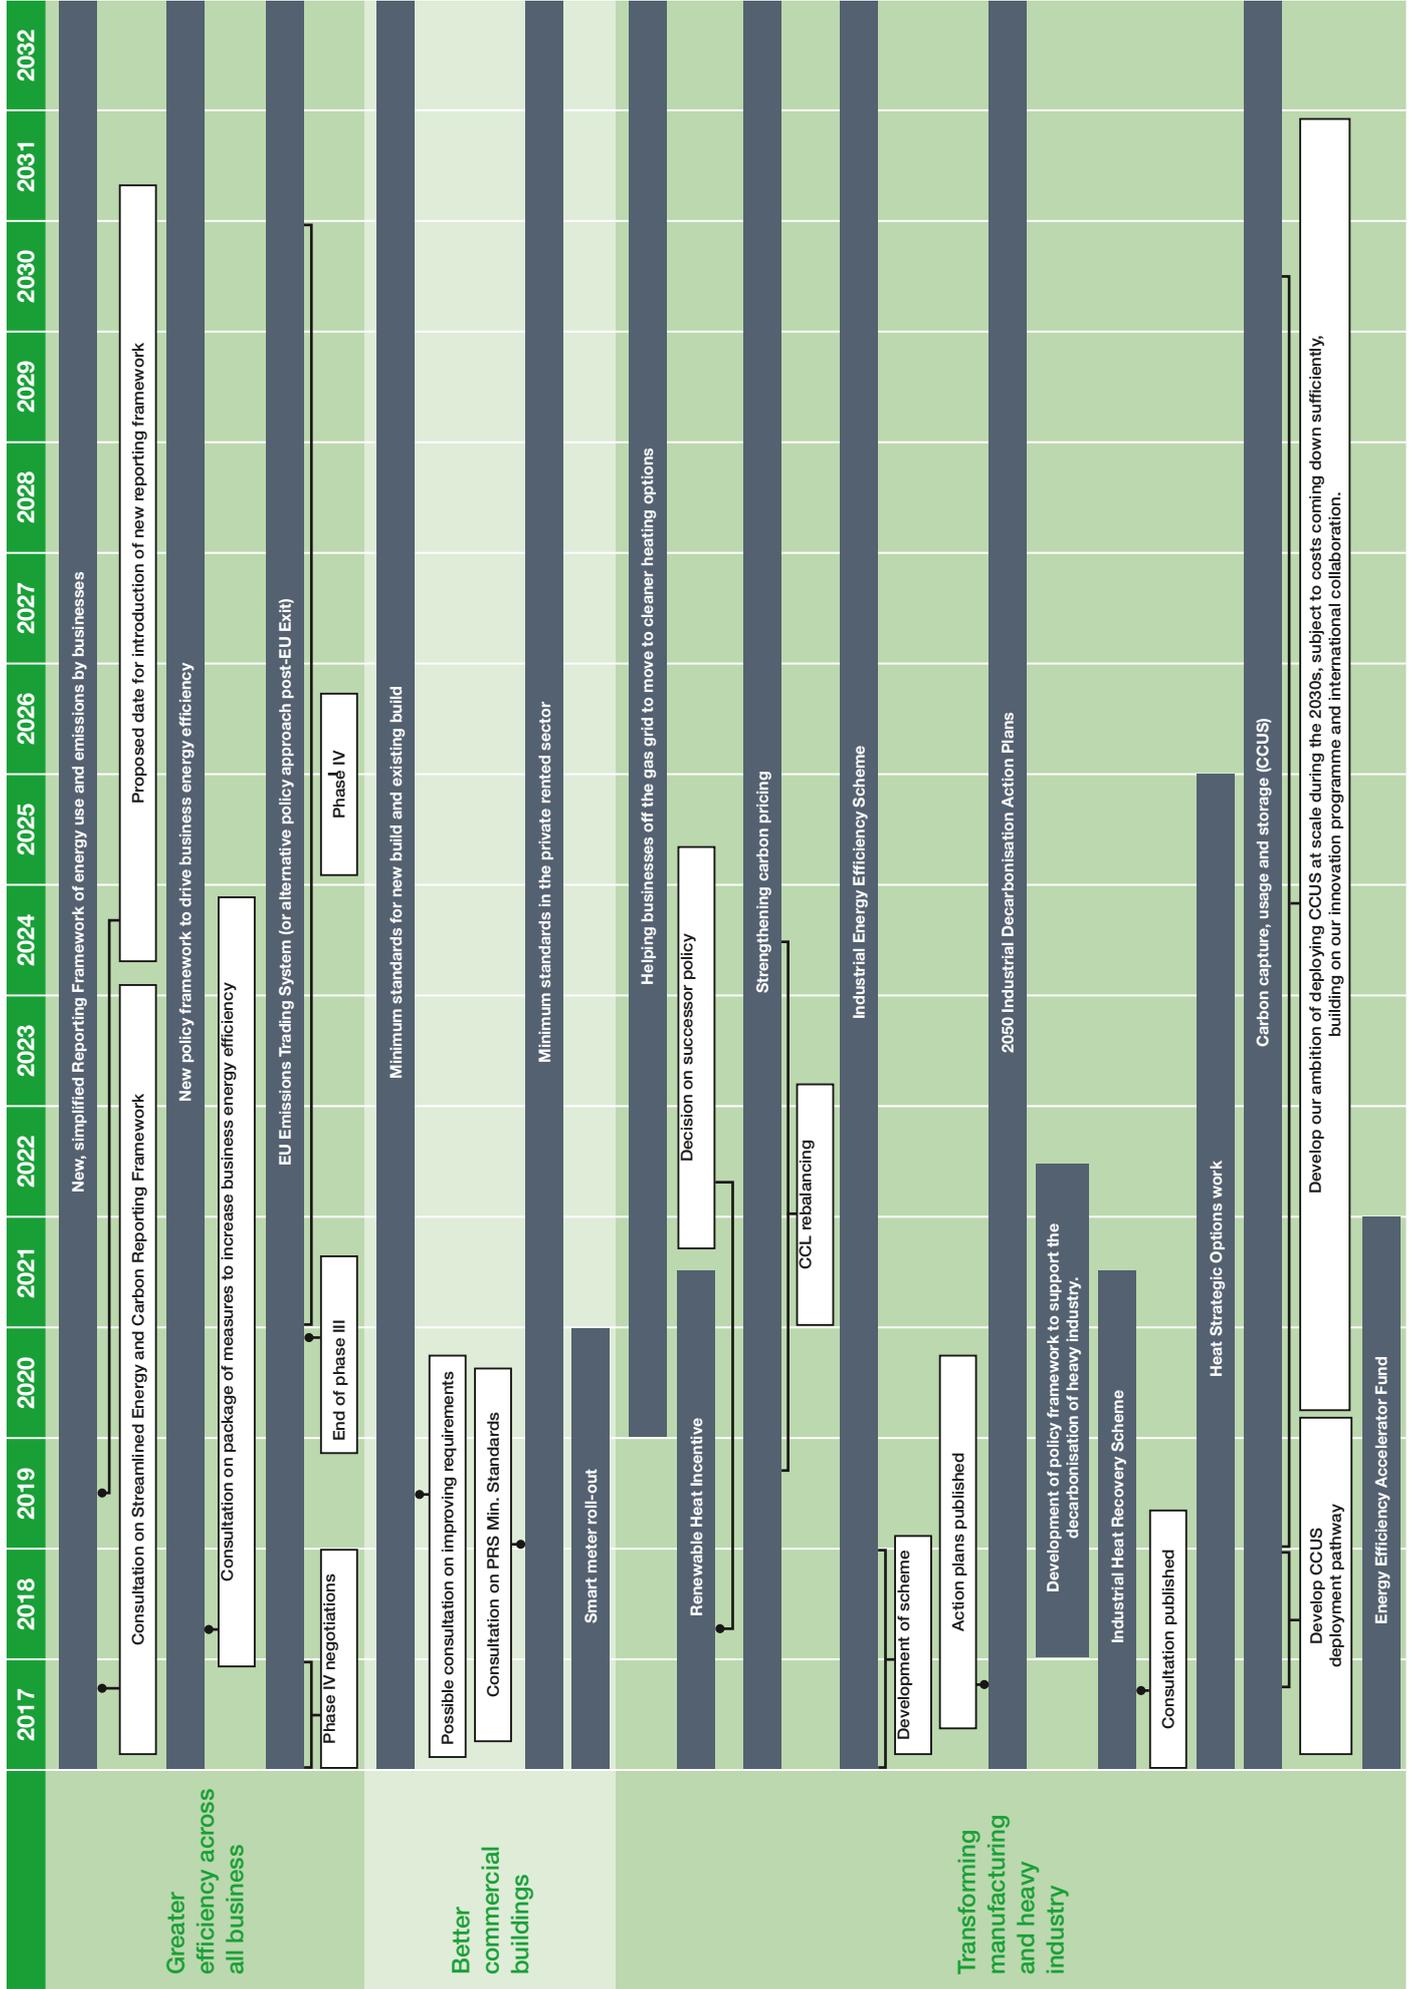

## Annex A:

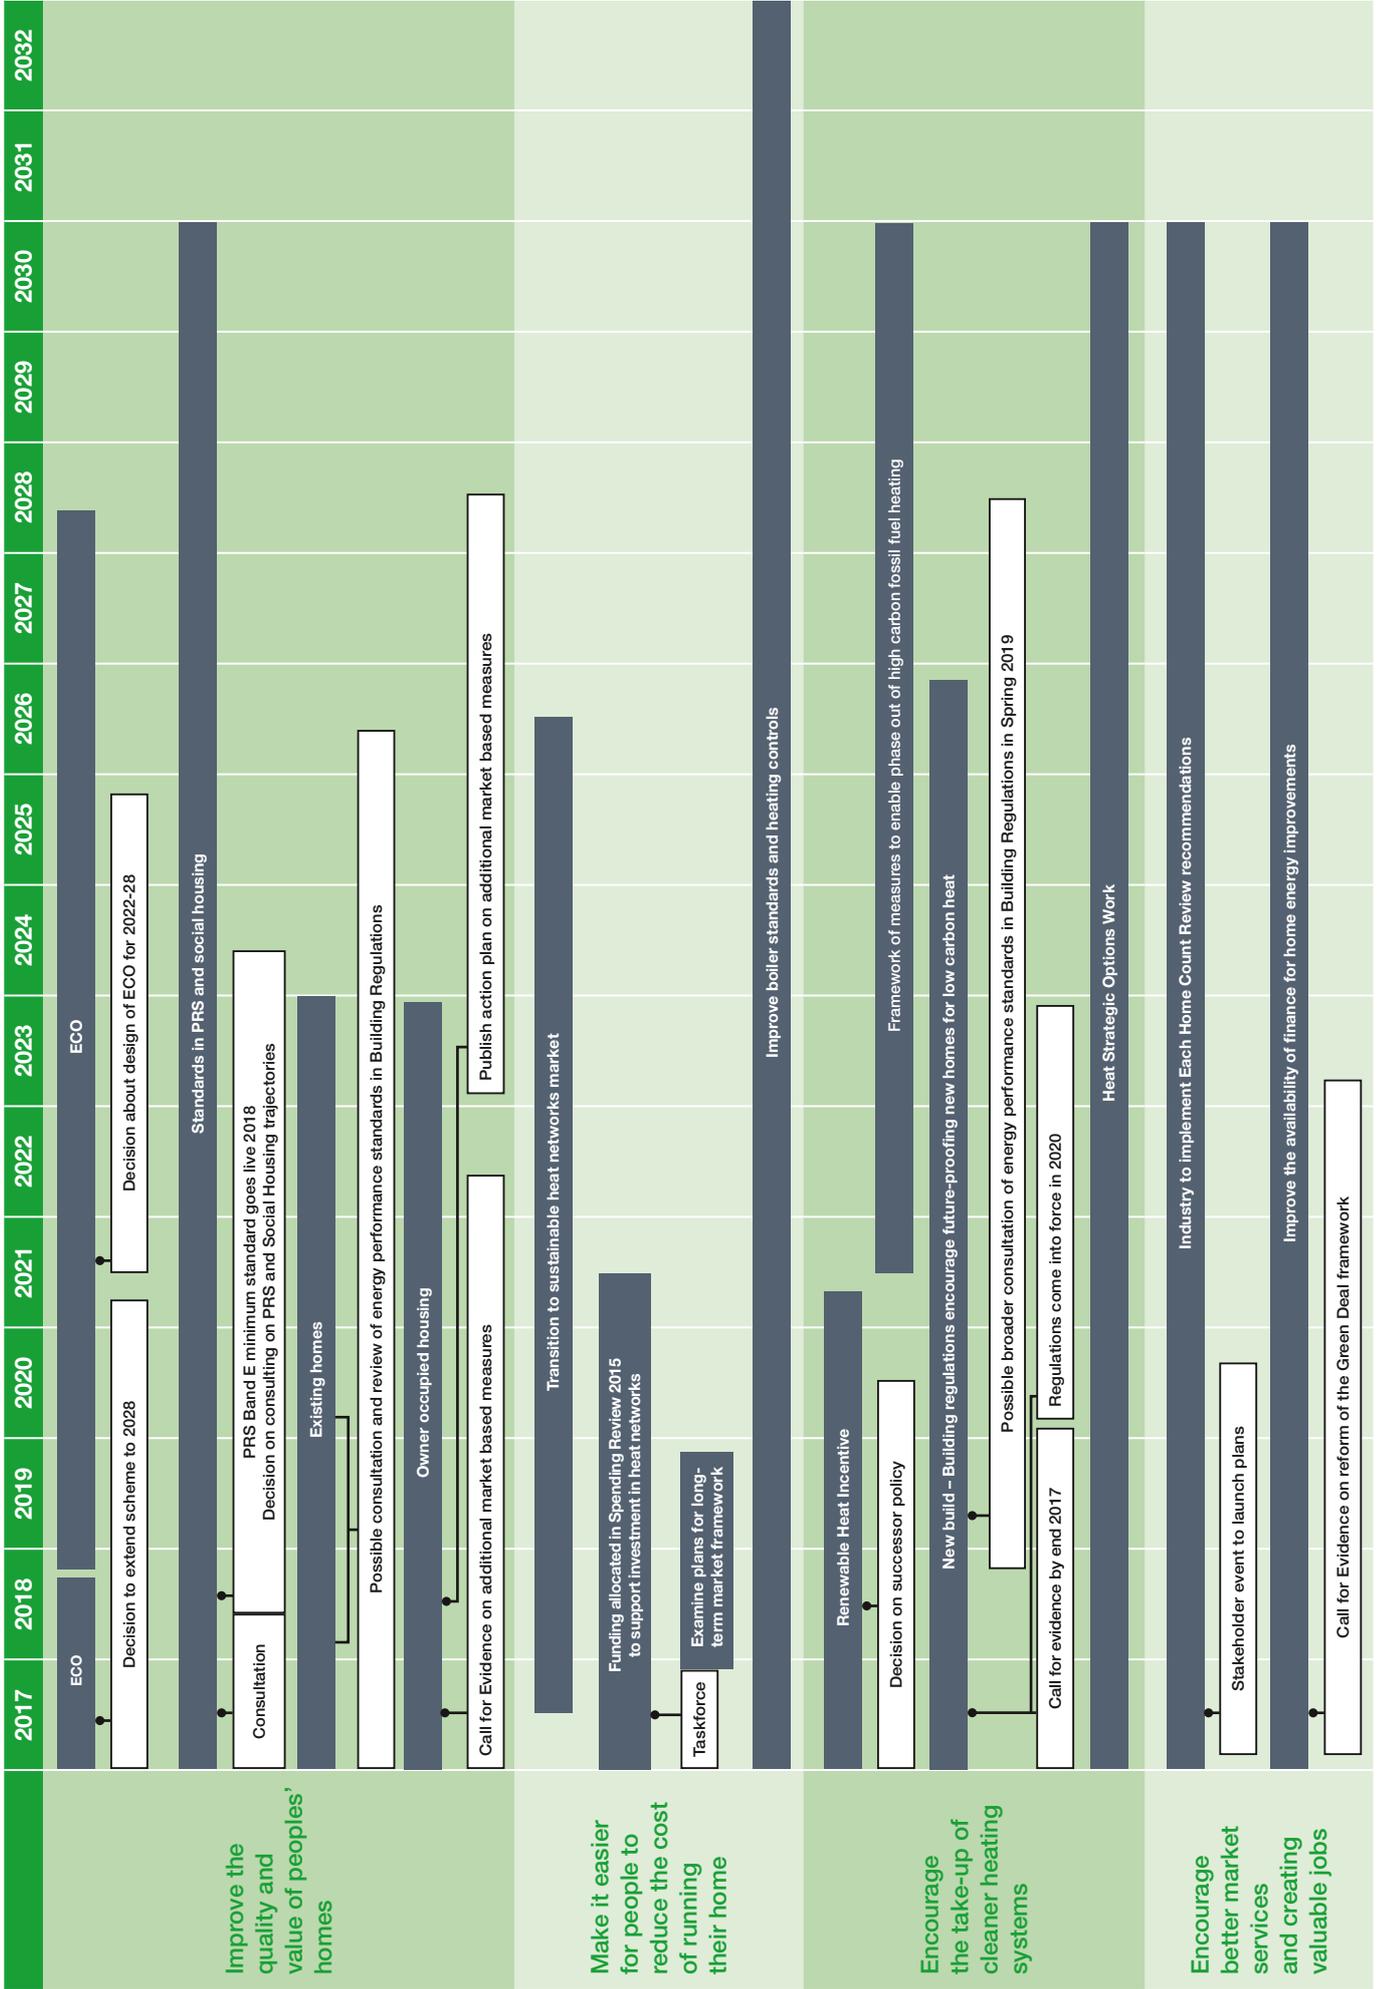

### Decision pathways

These following decision pathways give an overview of how the policies and proposals set out in this Strategy map over time. They include future policy development such as publications, key decisions, reviews and consultations, which aim to unlock further carbon savings. Some Government programmes, such as the Industrial Strategy, cut across several sectors and so are not reflected below.

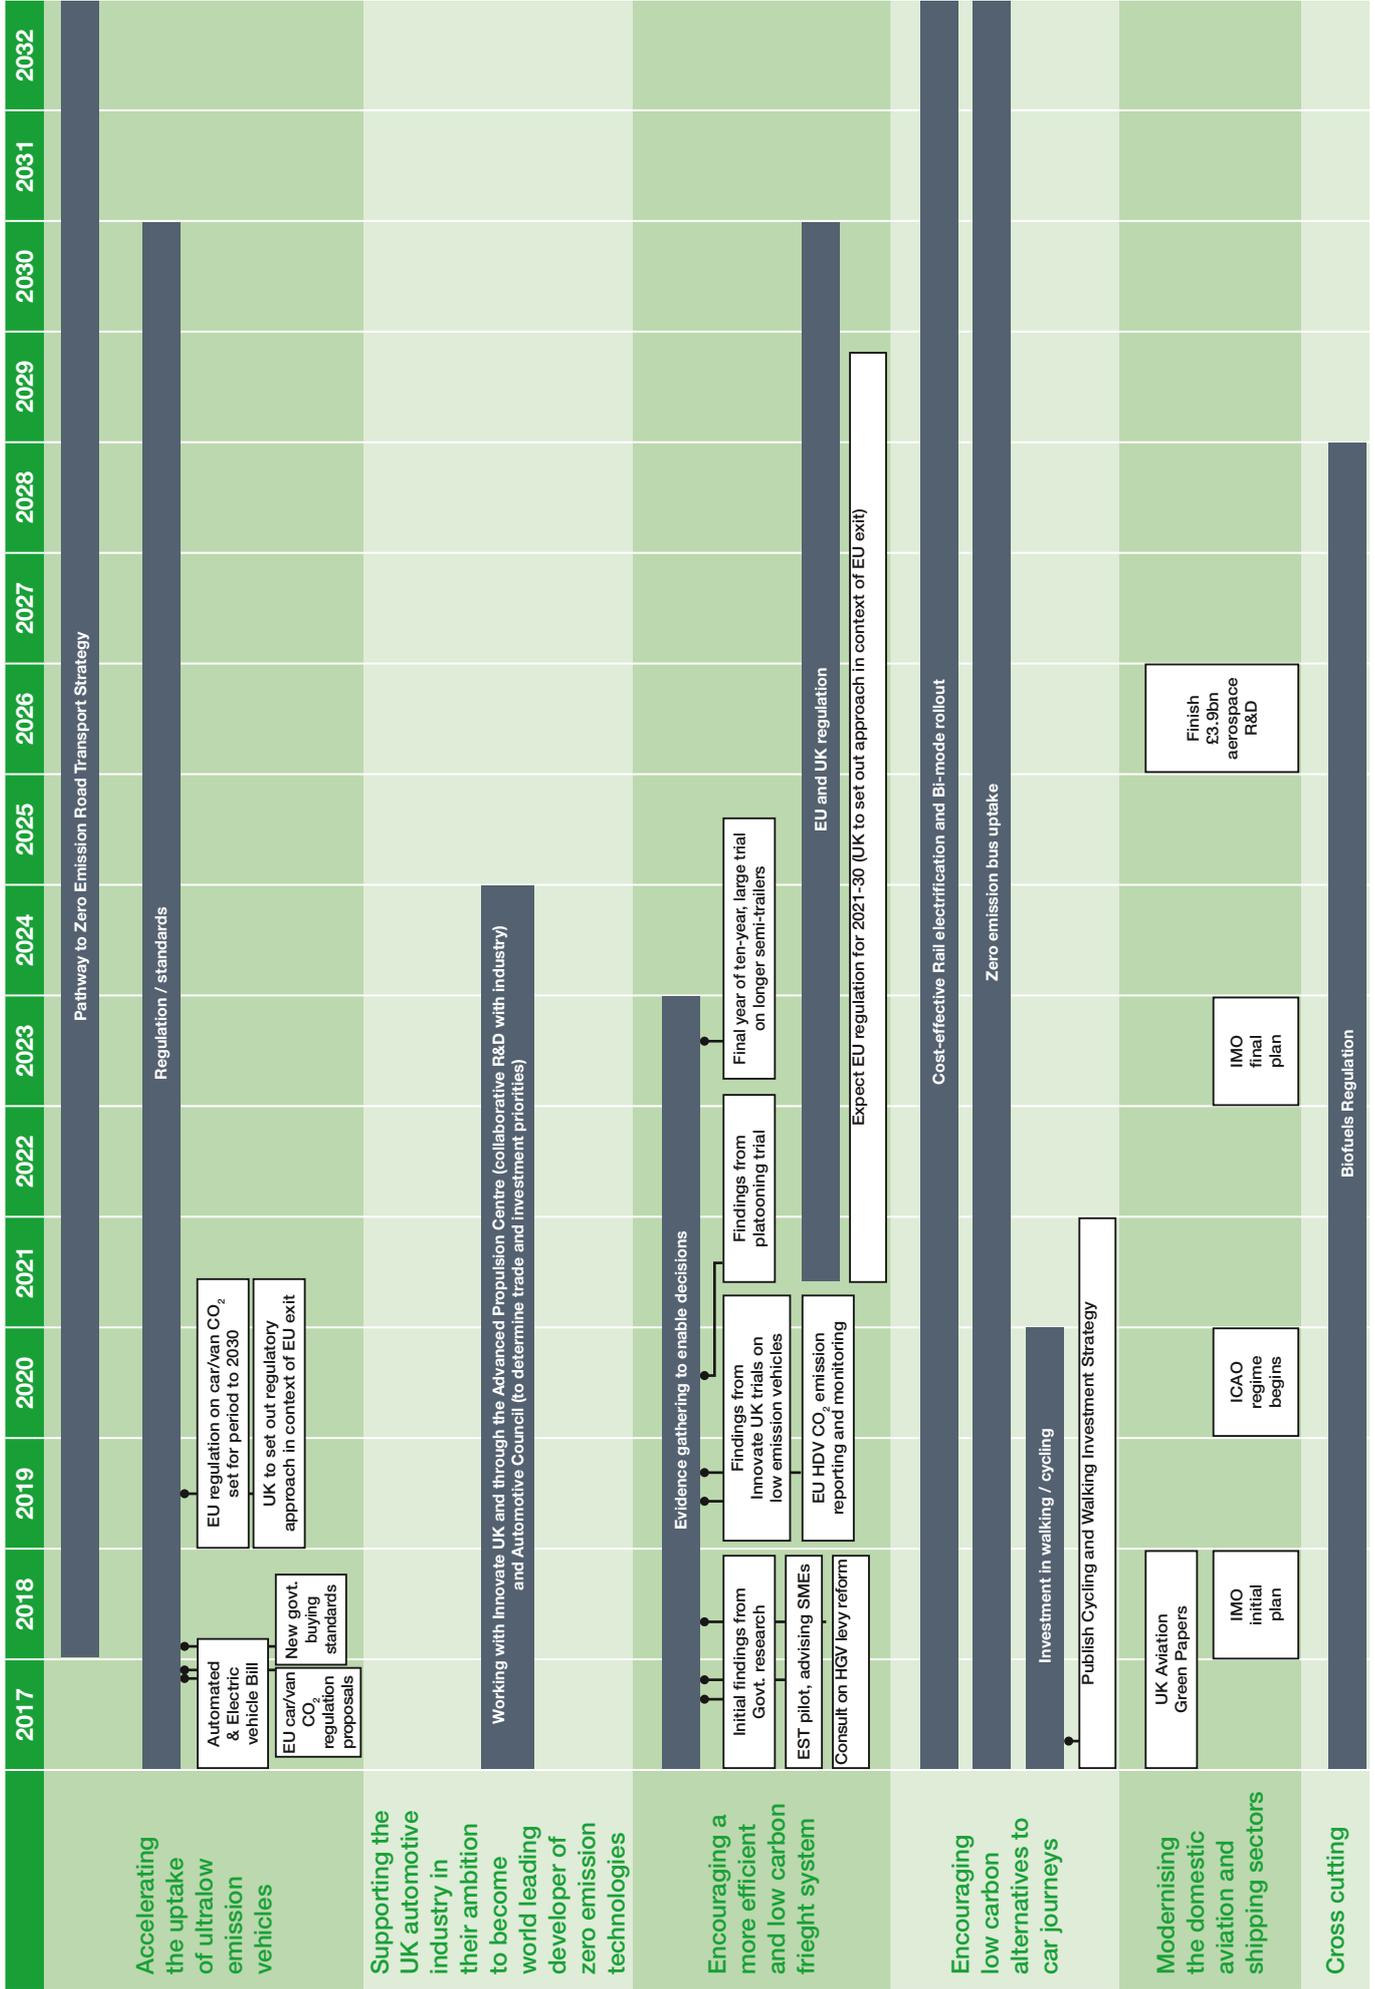

Business and Industry

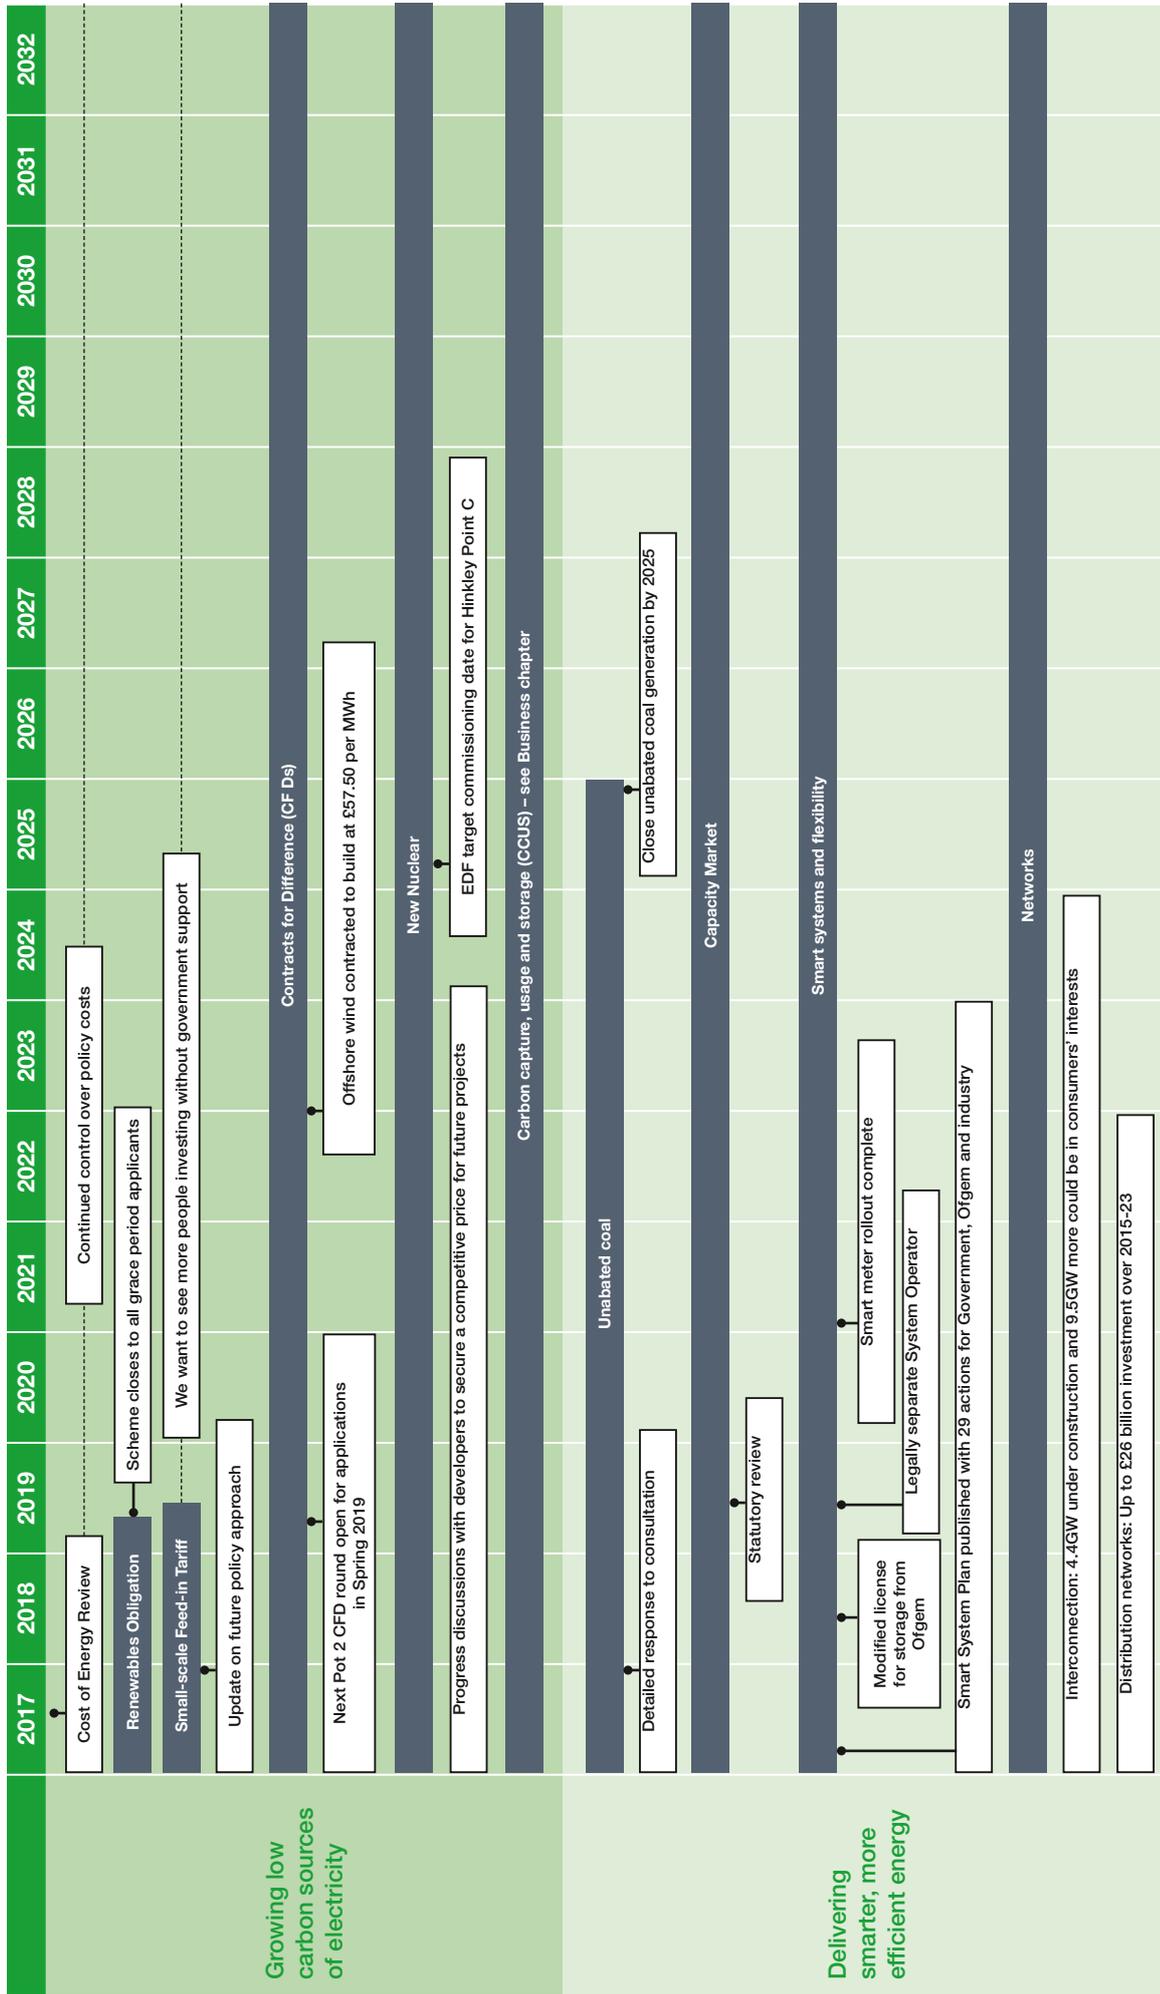

Homes

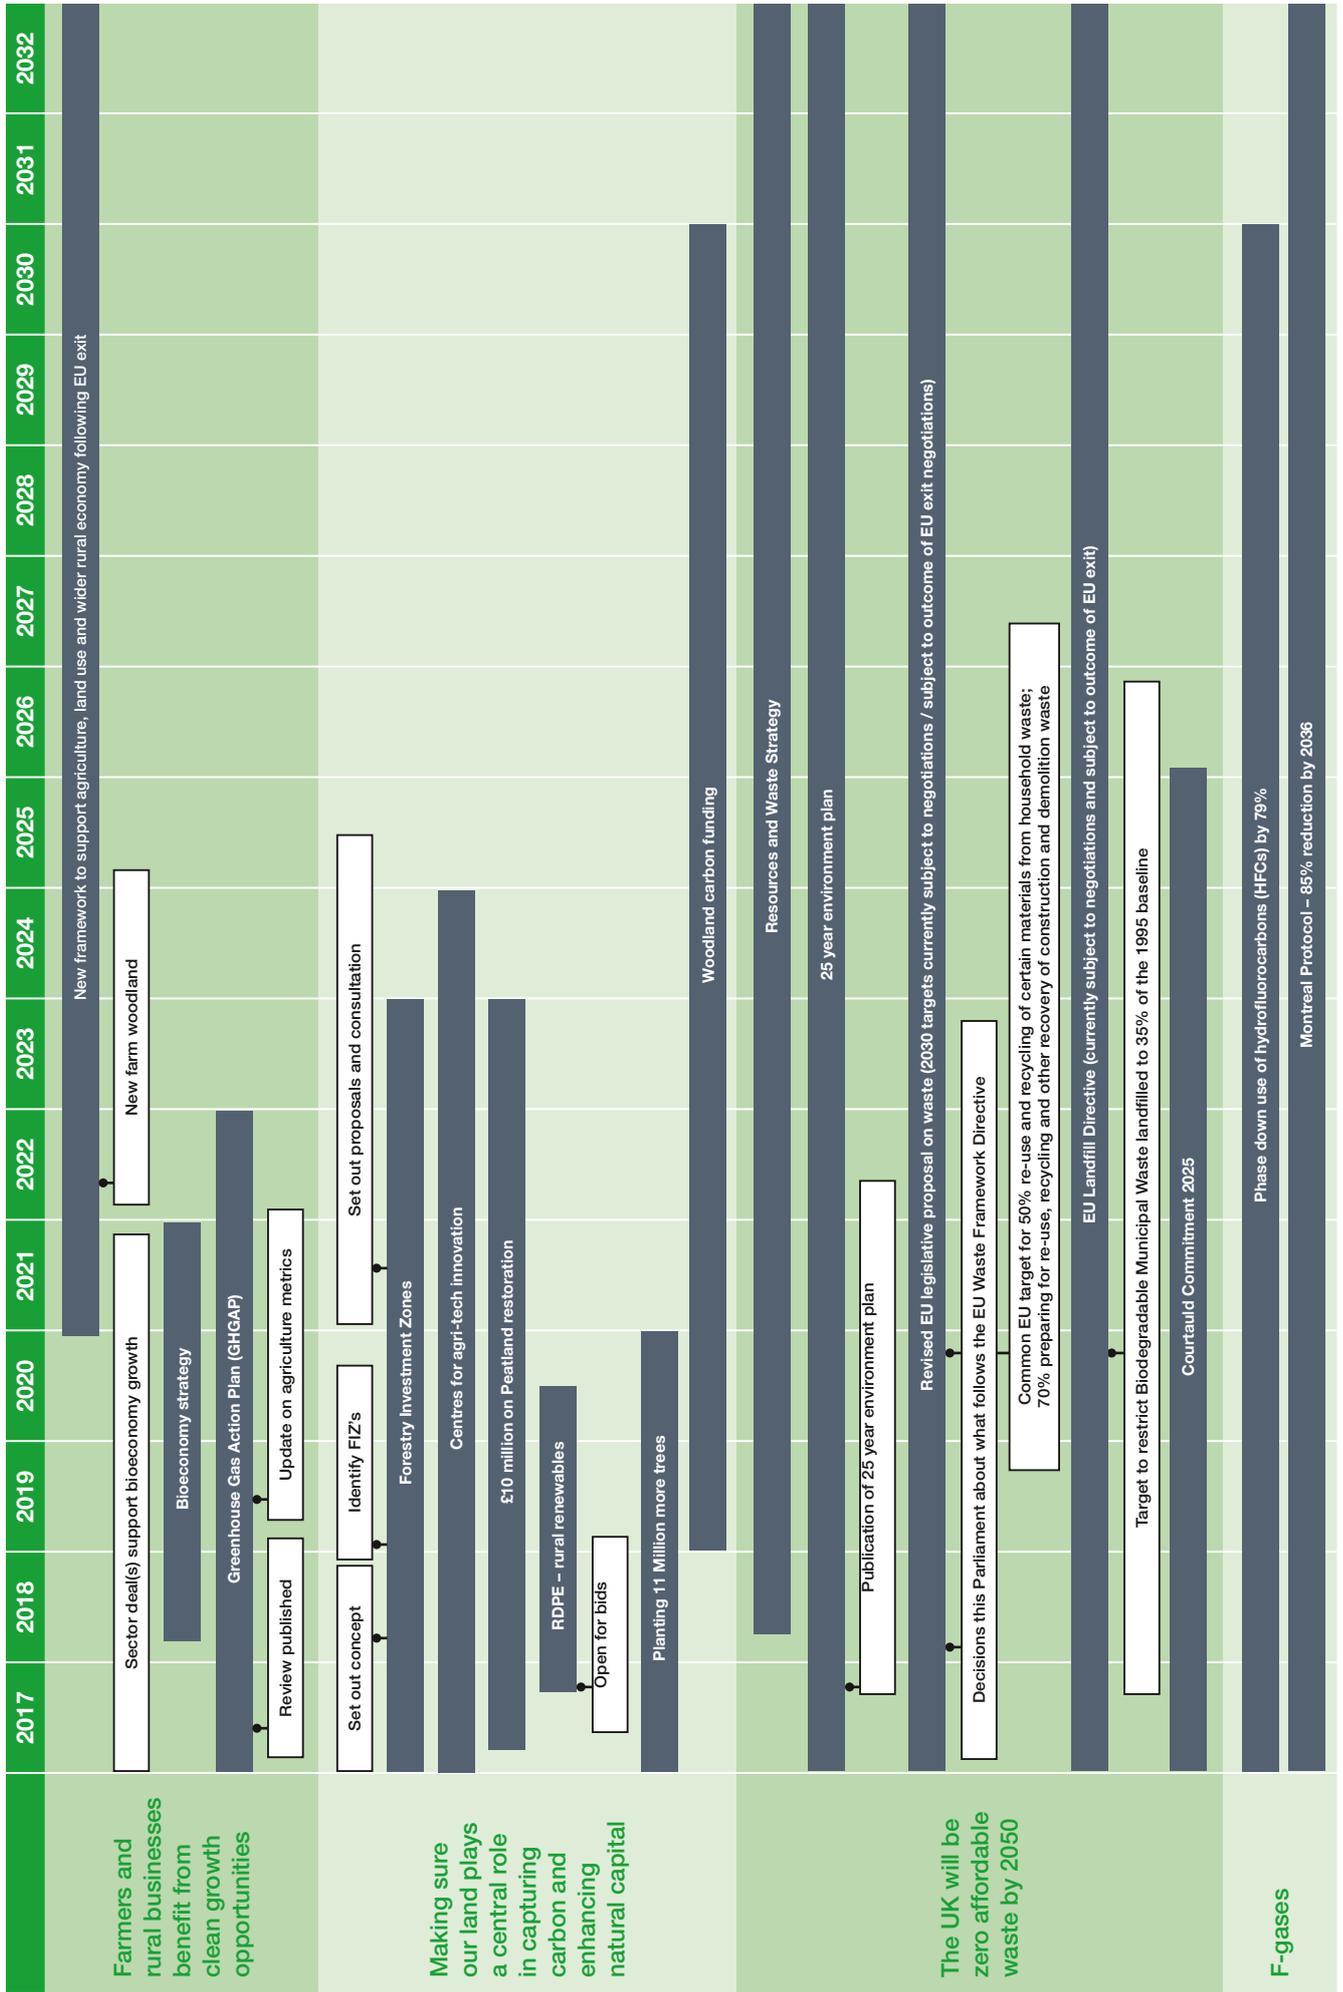

Transport

Power

Natural resources

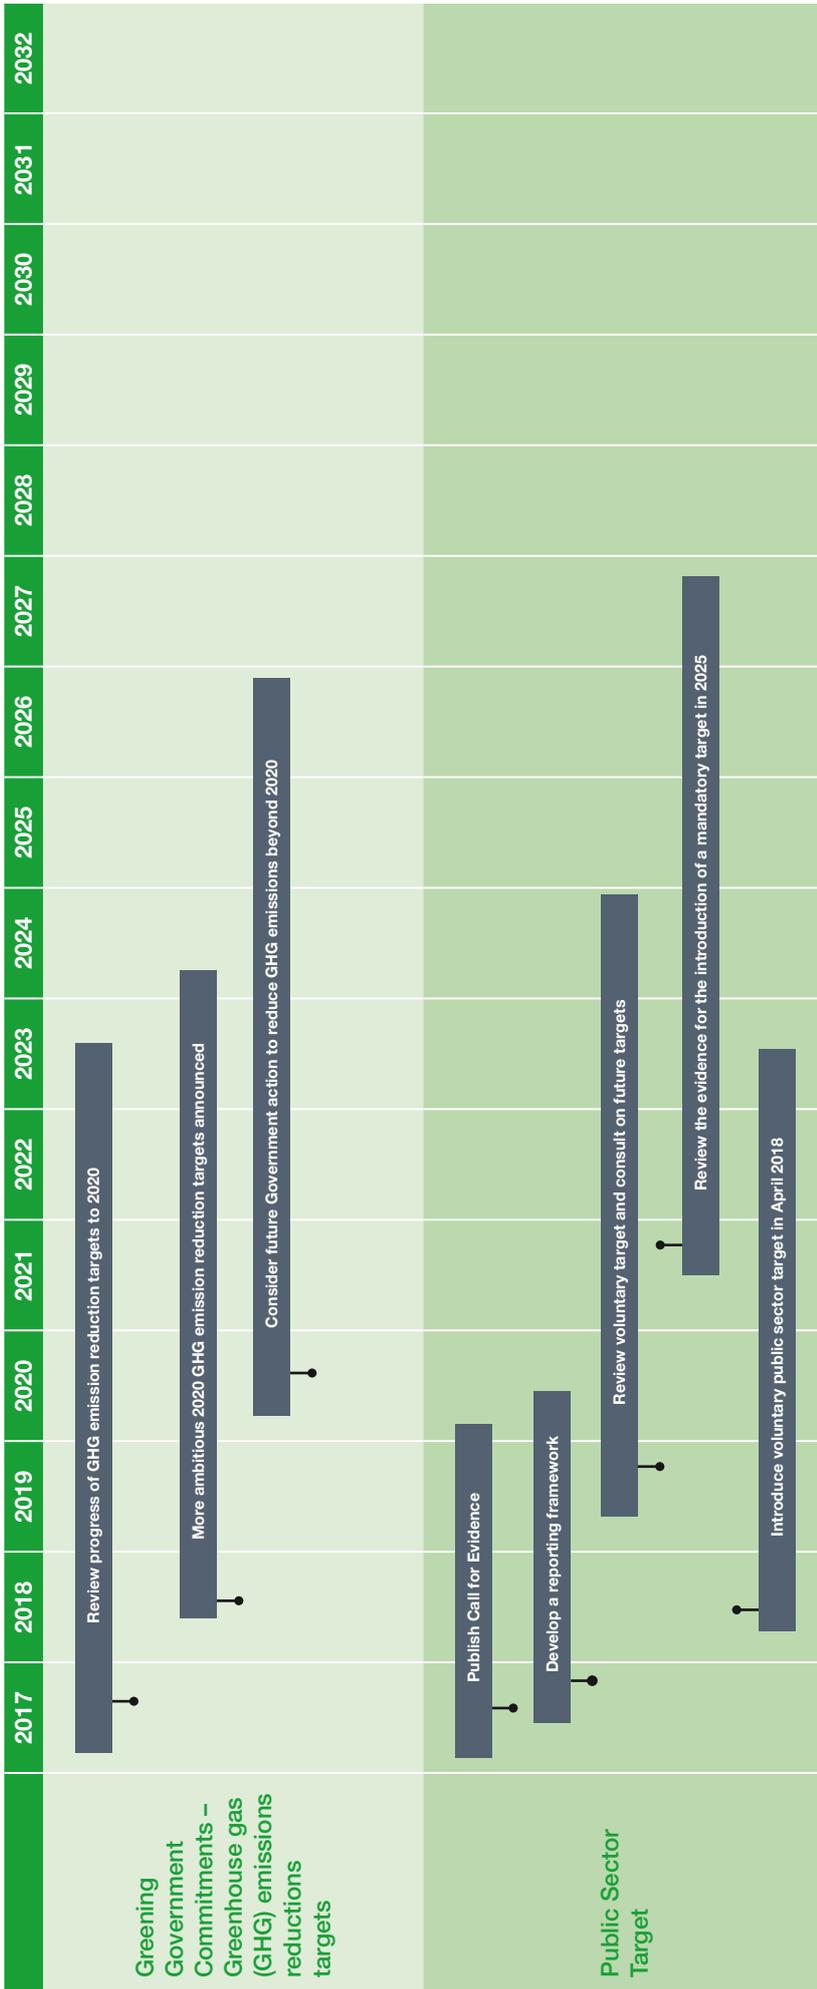

Farmers and rural businesses benefit from clean growth opportunities

Making sure our land plays a central role in capturing carbon and enhancing natural capital

The UK will be zero affordable waste by 2050

F-gases

Public sector

## Annex B:

# Actions and milestones

This annex sets out actions and milestones that the Government is committing to in this plan, and related publications. Actions will be updated and progress reported through

the Government's response to the Committee on Climate Change's annual progress report. Details of the Government's Innovation Investment are set out in Chapter 4.

Lead department	Description	Timing
<b>Improving Business and Industry Efficiency and Supporting Clean Growth</b>		
BEIS	Consult on new and streamlined energy and carbon reporting framework. This will replace some existing schemes, such as the reporting element of the CRC Energy Efficiency Scheme, and align with mandatory annual greenhouse gas reporting by UK quoted companies.	Published alongside this Strategy, with proposed introduction of new framework by 2019
BEIS	Consult on the design of a new £18 million industrial heat recovery programme.	Published alongside this Strategy
BEIS	Publish joint industrial decarbonisation and energy efficiency action plans with seven of the most energy intensive industrial sectors, building on three years of joint industry-Government cooperation.	Published alongside this Strategy
BEIS	New Ministerial-led CCUS Council with industry established.	From 2017
BEIS	CCUS Cost Challenge Taskforce established to deliver a plan to reduce the cost of deploying CCUS.	From 2017
BEIS	Establish an Industrial Energy Efficiency scheme.	From 2017
BEIS/DCLG	Consult on how best to improve the performance of the commercial and private rented sector, through tighter minimum building standards in the Private Rented Sector.	2018
BEIS	Deployment pathway for CCUS produced.	2018
BEIS	Work with industrial clusters to identify the most appropriate way forward to test the potential for development of CCUS industrial decarbonisation clusters.	2018
BEIS	Organise an international CCUS event with international partners.	2018
BEIS	Commit to provide further details on CCUS innovation spend.	2018
BEIS	Develop and consult on a package of measures to support businesses to improve how productively they use energy.	From 2018
BEIS/HMT	Ensure incentives for investment in energy efficiency are regularly reviewed, for instance the list of products that qualify for enhanced capital allowances tax relief.	On-going
BEIS	Undertake an evaluation of the Climate Change Agreements to inform any successor scheme from 2023.	Expected to commence in 2018

Lead department	Description	Timing
DCLG	Following the outcome of the independent review of Building Regulations and fire safety, and subject to its conclusions, the Government intends to consult on improving the energy efficiency of new and existing commercial buildings.	2018
BEIS	Beyond support through the RHI, ambition to phase out high fossil fuel heating in businesses off the gas grid during the 2020s. Businesses and industry will be involved in developing the new policy.	During the 2020s
BEIS	Develop a clear policy framework to support decarbonisation in energy intensive industries.	By 2022

Improving our Homes		
BEIS	Publish a call for evidence on additional measures to encourage energy performance, particularly amongst owner occupiers.	Published alongside this Strategy
BEIS	Publish a call for evidence on how to reform and streamline the Green Deal framework to make the “Pay as You Save” system more accessible to businesses, while ensuring adequate protection for consumers.	Published alongside this Strategy
BEIS	Work with industry to implement the independent industry led <i>Each Home Counts review</i> to improve quality and standards for all retrofit energy efficiency and renewable energy installations.	2017
BEIS/HMT	Work with mortgage lenders to incorporate energy efficiency into their lending decisions, and look at incentives and other levers that could encourage home-owners to invest in energy efficiency improvements.	2017
BEIS	Explore ways in which we could make it easier for innovative approaches or products to be installed under our consumer-facing schemes such as the Energy Company Obligation.	2017
BEIS	For privately rented homes, from April 2018, landlords of the worst performing properties will need to improve those properties to a minimum of EPC E before they can be let; lowering bills for some of the most vulnerable private tenants. We will consult shortly on steps to make these regulations more effective.	2017
BEIS	Consult on ECO's operation through to 2022.	2018
BEIS	Reform the RHI to focus the scheme towards long-term decarbonisation through greater uptake of technologies such as heat pumps and bio methane (biogas to grid).	2017
BEIS	Continue to work with suppliers to ensure that people are provided with tailored advice when a smart meter is installed.	2017
BEIS	Alongside this Strategy, the Government has published <i>Boiler Plus</i> , improving standards for the 1.2 million new boilers installed in England every year and ensuring control devices are included with every installation so people can control comfort in their own homes for less from April 2018.	Spring 2018
BEIS	Replace the existing, telephone-only Energy Saving Advice Service with a digitally led-service working closely with the Each Home Counts implementation, offering tailored advice on improving the energy performance of people's homes.	Spring 2018
BEIS/DCLG	Issue a Call for Evidence seeking views on further triggers points for Energy Performance Certificates (EPCs) to be updated, as well as wider views on how EPCs could be further improved, in light of new sources of data and capabilities	Spring 2018

Lead department	Description	Timing
BEIS/DCLG	The Government will look at a long term trajectory for energy performance standards across the private rented sector, with the aim of as many private rented homes as possible being upgraded to EPC C by 2030 where practical, cost-effective and affordable.	2018
BEIS/DCLG	The Government will also look at introducing similar energy performance standards across the social housing sector, where practical, cost-effective and affordable. This will need to take account of the findings of the independent public inquiry into the fire at Grenfell Tower and the Government's separate work looking at wider social housing policy issues.	2018
BEIS/DCLG	Following recommendations from the review of Building Regulations and fire safety currently underway explore innovative solutions to energy performance improvements not performing as well as predicted, including potential actions on compliance and enforcement of energy performance.	By 2019
BEIS	Continue smart meter roll out.	Roll out complete by end of 2020
BEIS	Funding allocated in the Spending Review 2015 to grow the UK's heat networks market.	By 2021
BEIS	Beyond support through the RHI, ambition to phase out high fossil fuel heating in homes off the gas grid during the 2020s. Consumers and industry will be involved in developing the new policy.	During the 2020s

Accelerating the Shift to Low Carbon Transport		
DfT	Series of consultation papers setting out the Government's strategic approach to aviation, including how to support growth whilst tackling environmental impacts.	2017-2018
DfT	Regulation to improve EV charge point provision and consumer access under the Automated and Electric Vehicle Bill.	2017
DfT	Deployment of £80 million ULEV infrastructure funding announced in Autumn Statement 2016.	2017-2021
DfT	Consider outcome and next steps in light of SME HGV fleet review pilot.	2017
DfT	Pathway to Zero Emission Road Transport Strategy Document.	By early March 2018
DfT/Defra	Updating Government vehicle buying standards.	End 2018
DfT	EU HGV CO <sub>2</sub> emission reporting and monitoring starts.	January 2019
HMT	Decision(s) on future fiscal support/tax incentives for ULEVs.	Ongoing

Lead department	Description	Timing
DfT	Report from Low Emission Freight and Logistics Trial.	2019
DfT	Decision on domestic regulatory regime for car/van CO <sub>2</sub> regulations in context of EU exit.	2019
HMT	Decisions on support for cycling and walking following end of current funding period (to 2019/20).	2020
DfT	Decision on next steps in light of platooning and longer semi-trailer trials.	2020 onwards
DfT	Decision on domestic regulatory regime for freight CO <sub>2</sub> regulations in context of EU exit.	Mid 2020s
DfT	Active participation in the IMO to address GHG emissions from shipping.	Ongoing

Clean, Smart, Flexible Power		
BEIS	Publish a full response to the consultation on ending unabated coal generation in Great Britain.	Shortly
BEIS	Publish independent Cost of Energy Review, undertaken by Professor Dieter Helm CBE.	Autumn 2017
HMT	Set out further details on carbon prices beyond 2020/21.	Autumn 2017
BEIS	Work with industry to develop a nuclear Sector Deal as part of the Industrial Strategy, looking at boosting competitiveness and skills across the sector.	Autumn 2017
BEIS/HMT	Set out new controls to replace the Levy Control Framework beyond 2020/21.	End 2017
BEIS	Provide an update on our approach for small scale low carbon generation beyond 2019.	End 2017
Ofgem	Introduce a modified generation license for storage to improve regulatory clarity.	Summer 2018
BEIS	Continue to work with nuclear developers on their new build proposals, including on financing plans.	2018
Ofgem/National Grid	Create a legally separate system operator.	April 2019
BEIS	Planned Pot 2 Contract for Difference auction.	Spring 2019
BEIS	Continue to work with Ofgem and industry to implement the 29 actions in the Smart Systems and Flexibility Plan.	2020

Lead department	Description	Timing
<b>Enhancing the Benefits and Value of our Natural Resources</b>		
BEIS	Set out approach to bring together biological industries, academia and innovators, linking up farmers and land managers with high tech industries to make the most of existing resources and develop advance feed stocks that are essential for the future low carbon economy.	By end of 2017
BEIS	New Bioeconomy Strategy.	By end of 2017
Defra & BEIS	Set up a stronger and more attractive domestic carbon offset market that will encourage more businesses to support cost-effective emissions reductions such as through planting trees. We will also explore how we could extend this market to include other land activities.	2017 onwards
Defra	Establish forestry investment zones.	2017 onwards
Defra	Set out 25 Year Environment Plan.	2017 onwards
Defra	Government to publish a new Resources and Waste Strategy.	2018
Defra	Publish a Clean Air Strategy.	2018
Defra	£10 million capital grant scheme for peat restoration.	Funds available from April 2018 for 3 years
Defra	Continue working with the Organisation for Economic Co-operation and Development (OECD) on their project to improve the modelling of macroeconomic effects of the transition to a circular economy.	Project concludes end of 2018
Defra	Commit to make available up to £200 million to support rural communities over the next two years and set out agroforestry decisions.	By end of 2019
Defra	Allocated funding to woodland planting to plant 11 million trees.	2020
Defra	EU target of at least 50% of household waste being recycled by 2020.	2020
Defra	Woodland Carbon Fund: £19.2 million to fund larger-scale woodland and forest creation.	By 2021
Defra	Work with industry to encourage the use of low-emissions fertiliser, and review the levels of take up using data from the British Fertiliser Practice Survey.	Over next 5 years
Defra	Targets of a 20% reduction in food and drink waste arising in the UK, a 20% reduction in the greenhouse gas intensity of food and drink consumed in the UK, and a reduction in impact associated with water use in the supply chain through delivery of the Courtauld Commitment 2025.	Concludes in 2025, with an on-going review of progress
Defra	Work towards no food waste entering landfill by 2030.	2030
Defra	UK to phase down use of hydrofluorocarbons (HFCs) by 79% by 2030.	2030
Defra	UK to phase down use of HFCs by 85% by 2036 under the United Nations Montreal Protocol.	2036
Defra	Ambition for the UK to be zero avoidable waste economy by 2050.	2050

Lead department	Description	Timing
<b>Leading in the Public Sector</b>		
BEIS	Continue to fund further improvements in the wider public sector with £295 million of funding allocated to the public sector energy efficiency loan scheme, across the UK, in the 2015 Spending Review.	On going
BEIS	Introduce a voluntary wider public and higher education sector target of 30% reduction in greenhouse gases by 2020/21, against a 2009/10 baseline, and will publish a Call for Evidence. We will review progress against this voluntary target by 2020, with a view to moving to a more ambitious target during the 2020s (e.g. 50% reduction by 2030). Once a reporting framework is in place, and there is clear evidence of the impact of voluntary action, a mandatory target could be considered.	2018
BEIS	Review existing carbon saving policies impacting the public sector to assess whether changes or new policies are needed to realise the carbon and costs savings potential. We will explore this further through a Call for Evidence.	2017
BEIS	Currently assessing how much the current 2020 greenhouse gas emission reduction target under the GGCs could be stretched to be more ambitious yet achievable. We also aim to set an appropriate level of ambition beyond 2020.	2018
BEIS	Continue to support the expansion of Energy Performance Contracts in the public sector which can offer a new route for investment in energy efficiency alongside guaranteed savings.	We are providing continuing support in 2017/18

## Annex C:

### Climate science

UK and international climate action is underpinned by a robust evidence base on the science of climate change. In this annex we summarise (i) the scientific evidence that reinforces the need for ambitious action to reduce

emissions; (ii) the scientific rationale behind the internationally-agreed global temperature goals; (iii) UK climate action; and (iv) future scientific priorities from a UK government perspective.

#### 1: Why we are committed to ambitious action on climate change

We are already seeing the impacts of climate change. The global average temperature of the Earth's surface has risen around 1°C since pre-industrial times<sup>298</sup>. All but one of the top sixteen warmest years on record have occurred since 2000<sup>299</sup>, and each of the last three decades has been successively warmer at the Earth's surface than any preceding decades since 1850<sup>300</sup>. 2015 and 2016 were the warmest years on record by quite some margin<sup>301</sup> -albeit enhanced by the El Niño effect- and the impacts of climate change are already widespread and are affecting many sectors of society<sup>302</sup>. Arctic sea ice extent has declined by about 4 per cent every decade since

records began in 1979 and sea level has risen by about 3 mm a year since the early 1990s<sup>303</sup>. In addition, increased uptake of carbon dioxide by the oceans has caused the pH of ocean surface water to decrease by 0.1 units since the beginning of the industrial era, corresponding to a 26 per cent increase in acidity<sup>304</sup>. Without action to reduce the level of greenhouse gases we emit globally, climate change is set to continue with increasing temperatures on the land and in our oceans. This will result in further increases in sea levels, more frequent and more severe heat waves and a changing rainfall pattern leading to more droughts and floods in some regions; and disruption to some ecosystems<sup>305</sup>. Without significant reductions in emissions, the world is likely to be on course for

<sup>306</sup> IPCC (2014) Climate Change 2014: Synthesis Report <https://www.ipcc.ch/report/ar5/syr/> Contribution of Working Groups I, II and III to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change

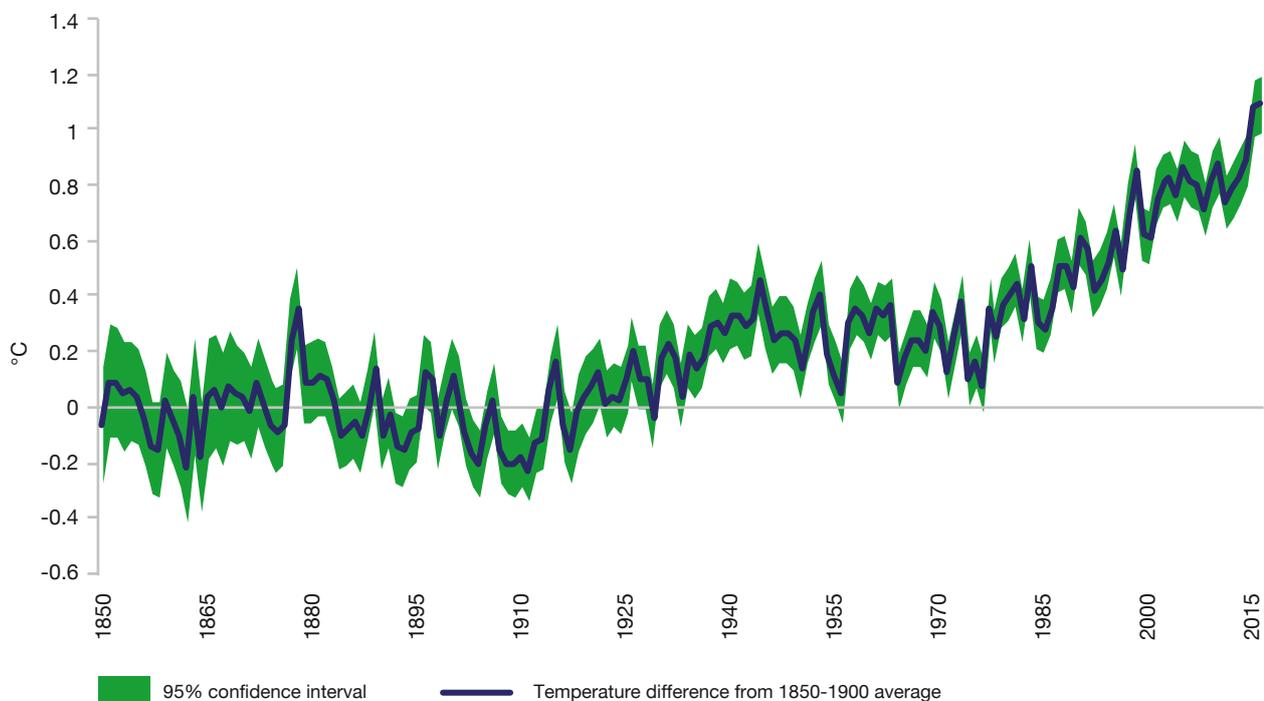

average temperature rise in excess of 2°C above pre-industrial levels, and possibly as much as 5°C for the highest emissions scenarios, by the end of this century<sup>306</sup>. Additionally, continuing acidification of the oceans will pose substantial risks to marine ecosystems.

This growing level of global climate instability poses great risks to natural ecosystems, global food production, supply chains and economic development. It is likely to lead to the displacement of vulnerable people and migration, impact water availability globally, and result in greater human, animal and plant disease. Climate change can indirectly increase the risks of violent conflicts by amplifying drivers of conflicts such as poverty and economic shocks. For this reason the

UN, Pentagon and UK's National Security and Strategic Defence Reviews cite climate change as a stress multiplier.

The UK is likely to feel the impact of climate change both directly and through impacts in other parts of the world which will affect our food and materials prices, trade, investments and security. In its recent UK Climate Change Risk Assessment<sup>307</sup> the Government endorsed the six key climate change risks for the UK identified in an independent review by the Adaptation Sub-Committee<sup>308</sup>: flooding and coastal change; shortages in public water supply; risks to health, wellbeing and productivity from high temperatures; risks to natural capital and our ecosystems; risks to food security and trade; and new pests and diseases.

## 2: Global temperature goals and our progress towards them

Scientific evidence shows that increasing magnitudes of warming increase the likelihood of severe, pervasive and irreversible impacts on people and ecosystems<sup>309</sup>. These climate change risks increase rapidly above 2°C but some risks are considerable below 2°C. This is why, as part of the Paris Agreement in 2015, 195 countries committed to hold “the increase in the global average temperature to well below 2°C above pre-industrial levels and to pursue efforts to limit the temperature increase to 1.5°C above pre-industrial levels, recognising that this would significantly reduce the risks and impacts of climate change”. The Agreement recognised that in order to achieve this goal, global emissions of greenhouse gases would need to peak as soon as possible, reduce rapidly thereafter and reach a net zero level in the second half of this century.

As part of the Paris Agreement countries also committed to reduce or limit their greenhouse gas emissions. These are contained in their ‘Nationally Determined Contributions’ (NDCs). A number of studies<sup>310</sup> consider how close these commitments bring us to staying below 2°C, and estimate that if they were met we would be on a path to a global temperature rise of 2.7 to 3.7 °C above pre-industrial levels by 2100. It is worth noting that these assessments have different assumptions regarding both the extent to which countries meet their NDCs and, crucially, the actions that will be taken by countries to reduce their emissions after 2030,

which will be a key determinant of whether the world will meet the long-term global temperature goal.

These assessments show that NDCs represent a significant deviation from the 4 to 5°C temperature rise projected if there were no further policies to reduce emissions beyond those in place or planned today. Action would also provide other co-benefits such as limiting the rate of ocean acidification and improving air quality. Nevertheless it is clear that greater action is needed from all countries if we are to limit global temperature increases to well below 2°C.

## 3: UK climate action

The UK's current target is to reduce its greenhouse gas emissions by at least 80 per cent by the year 2050, relative to 1990 levels. This 2050 target was set to be consistent with keeping the global average temperature to around 2°C above pre-industrial levels with a 50 per cent likelihood. In October 2016 the Committee on Climate Change (CCC) said<sup>311</sup> that the Paris Agreement target “is more ambitious than both the ambition underpinning the UK 2050 target and previous international agreements”, but that the UK should not set new UK emissions targets now, as it already has stretching targets and achieving them will be a positive contribution to global climate action. The CCC advised that the UK's fair contribution to the Paris Agreement should include measures to maintain flexibility to go further on UK targets, the development of options to remove greenhouse gases from the air, and that its targets should be kept under review.

<sup>309</sup> IPCC (2014) Climate Change (2014) Impacts, Adaptation, and Vulnerability, Summary for policymakers <http://www.ipcc.ch/report/ar5/wg2/> Part A: Global and Sectoral Aspects. Contribution of Working Group II to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change

<sup>310</sup> For example: UNEP (2016) The Emissions Gap Report 2016 <http://www.unep.org/emissionsgap/>

<sup>311</sup> CCC press release (2016) <https://www.theccc.org.uk/2016/10/13/concrete-action-needed-to-meet-uk-climate-commitments-following-paris-agreement-and-brexite-vote/>

There will be an unavoidable level of climate change, regardless of future global emissions, because of the existing accumulation of greenhouse gases in the atmosphere. As a consequence, some level of adaptation will be necessary in the UK. To this end, the UK is already considering climate risks and what actions will be required through its five-yearly policy cycle of a Climate Change Risk Assessment followed by a National Adaptation Programme<sup>312</sup>. The scale of the potential investments, the risks associated with failure, and the long lifetimes and lead-times of the infrastructure, together mean that future investments are likely to be highly sensitive to how climate change evolves over the next two to three decades.

Actions to mitigate climate change can have wider positive impacts on the economy and the environment, beyond the direct benefits of avoided climate change<sup>313</sup>. There is strong evidence that well-designed climate mitigation action can provide substantial co-benefits while minimising any possible adverse side-effects<sup>314</sup>. For example, co-benefits can include substantial air quality improvements from avoided fuel combustion and health and wellbeing benefits of active travel.

#### **4: Future scientific priorities and UK leadership**

In recent years the debate and focus of scientific research has shifted from whether climate change is happening and/or is being caused by

human activity, to the severity of the expected impacts and the level of action required to address climate change through a combination of adaptation and mitigation. Our knowledge has increased significantly but many key research priorities remain. As developed and agreed by the Government Chief Scientific Advisers (CSAs) our current science priorities are:

1. Present weather and climate risks globally and within the UK;
2. Future climate over this century under different emissions scenarios globally and within the UK, including extreme weather events<sup>315</sup>;
3. Climate risks and impacts from future climate variability and change;
4. Emission pathways compatible with different levels of warming including timing and a consideration of technologies to achieve net zero emissions;
5. Impacts and opportunities of mitigation and adaptation; and
6. The case for early action: implications of delaying mitigation actions.

The UK is a global leader in climate science and will play a key role in addressing these research needs.

<sup>312</sup> The second UK Climate Change Risk Assessment was completed in 2017 and this is being used to inform the second National Adaptation Programme due for completion in 2018. The third Climate Change Risk Assessment will be delivered in 2022

<sup>313</sup> Royal Commission on Environmental Pollution (2007) The Urban Environment <http://www.rcep.org.uk/reports/26-urban/26-urban.htm>

<sup>314</sup> IPCC (2014) In: Climate Change 2014: Mitigation of Climate Change, Summary for Policymakers <http://ipcc.ch/report/ar5/wg3/> Contribution of Working Group III to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change

<sup>315</sup> For example, this includes a better understanding of climate sensitivity and cloud processes, and improving the ability of global climate models to represent regional climate and extremes.

## Annex D:

# Changes that illustrate how our pathway could be delivered<sup>316</sup>

This table illustrates key changes in each sector that could lead to the emissions reductions set out in our

2032 pathway. It is possible that equivalent emissions savings could be achieved in different ways.

**Table 4: Key historic and future changes by sector**

		1990	2015	2032
Overall	Emissions per capita (tCO <sub>2</sub> e/person)	14	8	4
	Emissions Intensity Ratio, EIR (tCO <sub>2</sub> e/£ million of GDP)	717	271	107
	Final energy consumption intensity of GDP (MWh/£ million)	1,530	872	548
Business and public sector	Non-industrial business and public energy use per £ million output (MWh/£ million)	302	164	79
	Emissions intensity of non-industrial business and public energy use (gCO <sub>2</sub> e/kWh)	121	96	46
	Industrial business energy use per £ million output (MWh/£ million)	1,756	1,005	833
	Emissions intensity of industrial business energy use (gCO <sub>2</sub> e/kWh)	488	403	345
Homes	Home energy use per household (MWh/household)	21	17	15
	Emissions intensity of home energy use (gCO <sub>2</sub> e/kWh)	169	140	120
Transport	Road transport energy use per 1,000 vehicle kilometres (kWh/km)	1,127	941	655
	Road transport emissions per vehicle kilometre (gCO <sub>2</sub> e/km)	260	213	120
	Road transport emissions per energy use (gCO <sub>2</sub> e/kWh)	231	227	183
Power	Emissions from generation (MtCO <sub>2</sub> e)	204	104	16
	Share of electricity supply from clean sources (%)	21%	45%	85%
Natural Resources	Total UK conventional woodland area (thousand hectares)	2,778	3,155	3,648
	Emissions intensity per £m agricultural output (tCO <sub>2</sub> e/£ million)	5,354	3,841	2,817
	Biodegradable waste sent to landfill (Million Tonnes)	36 <sup>317</sup>	8	4
	Greenhouse gas emissions from landfill (MtCO <sub>2</sub> e)	60	12	7

<sup>316</sup> Based upon BEIS, Defra, DfT and DCLG analysis. Further information on sources is made available in the technical annex.

<sup>317</sup> Covers the period 1995 as the earliest data available

# Technical Annex

## UK Carbon Budgets Explained

### Framework

Parliament passed the Climate Change Act (the Act) in 2008, establishing the UK's 2050 target and the supporting framework of carbon budgets. Under the Act, the UK is legally required to reduce greenhouse gas emissions by at least 80 per cent by 2050 on 1990 levels<sup>318</sup>. In order to put the UK on a pathway to achieving the 2050 target, the Government is obliged to set legally binding five-year caps on emissions – ‘carbon budgets’ – twelve years in advance and then to publish a report setting out the policies and proposals to meet that budget and those budgets previously set.

### The Committee on Climate Change

The Act also established the Committee on Climate Change (CCC), an independent statutory body, to advise the Government and the Devolved Administrations on setting and meeting carbon budgets. The CCC advises on the level of each budget, the respective contributions that different sectors could make and the extent to which carbon budgets could be met through the use of flexibilities.

## Legislated carbon budgets

Five carbon budgets have been set to date, covering 2008 to 2032<sup>319</sup>. The fourth carbon budget (covering 2023 to 2027) was set in June 2011<sup>320</sup>. The fifth carbon budget (covering 2028 to 2032) was set in July 2016<sup>321</sup>.

### Accounting for emissions

The UK's performance against its 2050 target and carbon budgets is assessed through the UK's net carbon account, measured in tonnes of carbon dioxide equivalent (tCO<sub>2</sub>e)<sup>322</sup>.

The net carbon account<sup>323</sup> comprises greenhouse gas emissions from the UK, emissions which are captured and stored from land use, land-use change and forestry (LULUCF) and net purchases of international carbon units. Carbon units include allowances issued under cap and trade systems, such as the EU Emissions Trading System (EU ETS) and international carbon credits issued under international schemes, such as the Clean Development Mechanism<sup>324</sup>.

<sup>318</sup> The target covers a selection of greenhouse gases in addition to carbon dioxide, namely methane, nitrous oxide, and a range of fluorinated gases (F-gases), specifically hydrofluorocarbons, perfluorocarbons, and sulphur hexafluoride. The 1990 baseline consists of emissions in 1990 for all greenhouse gases except for the F-gases, for which the baseline is 1995. The baseline is revised annually in line with updates made to the UK's greenhouse gas inventory (the official record of UK greenhouse gas emissions). BEIS (2017) Final greenhouse gas emissions inventory statistics 1990-2015 <https://www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-2015>

<sup>319</sup> UK Legislation (2009) The Carbon Budgets 2009 <http://www.legislation.gov.uk/ukxi/2009/1259/article/2/made> Covering first three carbon budgets

<sup>320</sup> UK Legislation (2011) The Carbon Budget Order 2011 <http://www.legislation.gov.uk/ukxi/2011/1603/made>

<sup>321</sup> UK Legislation (2016) The Carbon Budget Order 2016 <http://www.legislation.gov.uk/ukxi/2016/785/made>

<sup>322</sup> Given the size of the UK economy, we typically describe targets in terms of millions of tonnes of carbon dioxide equivalent (MtCO<sub>2</sub>e) – so the fifth carbon budget limits UK emissions to 1,725 MtCO<sub>2</sub>e or 1,725,000,000 tCO<sub>2</sub>e

<sup>323</sup> The Annual Statement of Emissions sets out the net carbon account. BEIS (2017) <https://www.gov.uk/government/collections/annual-statements-of-emissions>

<sup>324</sup> Clean Development Mechanism: <https://cdm.unfccc.int/>

The net carbon account for each budget is calculated according to rules set out in Carbon Accounting Regulations<sup>325</sup>. Under current regulations, the net carbon account reflects the UK's share of the EU ETS for power, heavy industry and domestic aviation. The EU ETS sets a total cap on the amount of greenhouse gases that can be emitted by heavy industry and power plants in the participating countries. For the "non-traded" sectors which fall outside the EU ETS, the net carbon account reflects the UK's reported emissions under the United Nations Framework Convention.

The UK's 2050 target and carbon budgets currently exclude emissions from international aviation and international shipping, but the Act states that in setting carbon budgets, the Government must take these emissions into account<sup>326</sup>. The CCC advises that the UK should plan for international aviation and shipping emissions of around 41 MtCO<sub>2</sub>e in 2050 – this has been incorporated into our scenarios and will be kept under review. Further information is set out in the 2050 pathways section of this technical annex.

### International actions

The 2015 Paris Agreement under the UN established the goal of keeping the global mean temperature rise to well below two degrees, whilst pursuing efforts to limit the rise to under 1.5°C. The UK is already playing its part,

with the CCC confirming that there is presently no need for the UK to change its targets in light of the Paris Agreement (see Annex C on Climate Science).

As well as our obligations under Paris, as a current member of the EU, the UK has EU-level targets to 2020. In October 2014, the European Council agreed an EU level target of at least a 40 per cent reduction in EU domestic emissions from 1990 levels by 2030. This target will be split into an EU-wide target for the traded sector, governed by the EU ETS, and member state-level targets for the non-traded sector, set via the Effort Sharing Regulation (ESR). A separate Land Use, Land Use Change and Forestry Regulation will cover emissions from those activities. The EU ETS, ESR and the LULUCF Regulation for the period 2021-2030 are still under negotiation in Brussels, though we anticipate that the emissions reductions under the UK's domestic Climate Change Act will be more ambitious and challenging than those set by the EU. The EU legislation on greenhouse gas emissions is among the important current arrangements between the UK and EU that will be addressed as part of the UK's EU exit negotiations. However, whatever the form of the UK's partnership with the EU, working closely together to address the global challenge of climate change will remain important.

<sup>325</sup> For each carbon budget the Government proposes accounting rules for Parliament to agree. Carbon accounting rules for the first and second carbon budget can be found here: <https://www.gov.uk/government/publications/2010-to-2015-government-policy-greenhouse-gas-emissions/2010-to-2015-government-policy-greenhouse-gas-emissions#appendix-4-carbon-budgets>

<sup>326</sup> Climate Change Act: Section 30 <http://www.legislation.gov.uk/ukpga/2008/27/section/30>

## The Role of Carbon Markets

Since establishing the first multi-industry carbon trading scheme in the world in 2002 - the voluntary UK ETS - the UK has had an influential role in establishing the EU Emissions Trading System (EU ETS), the first and largest carbon trading scheme. According to the Institute for Public Policy Research, 93.5 per cent of the global market in carbon exchanges is in London, making it the carbon trading capital of the world<sup>327</sup>.

Putting a price on carbon is set to play an increasing role in moving to a global low carbon economy. Carbon markets can help reduce the cost of reducing emissions by enabling the reductions to occur where it is least cost to do so<sup>328</sup>. Already 40 national jurisdictions and over 20 cities, states and regions put a price on carbon amounting to 13 per cent of global greenhouse gas emissions<sup>329</sup>. With China implementing a national emissions scheme this year, this will rise substantially.

The UK supports a number of initiatives to encourage development of carbon markets, such as the Carbon Initiative for Development and the Forest Carbon Partnership Facility Carbon Fund. These deliver development benefits while incentivising high quality, high volume supplies of carbon credits.

Looking beyond 2020, the Paris Agreement provides an opportunity to stimulate international co-operation. The agreement includes a framework for carbon trading, currently under development through international negotiations. It also provides incentives to engage the private sector to get more actively involved in the transition to a low carbon future. The opportunity to develop a trade in good quality carbon units is at the heart of the UK Government's vision for an efficient global carbon market.

## Projections of UK energy and emissions

The Government projects what our energy demand, fuel mix and emissions might look like as a result of our existing policies. These Energy and Emissions Projections (EEP) give us a sense of whether we are on track to meet our carbon budgets. The latest projections were published on 15 March 2017. We are continually working to improve our projections. In 2018 we will share more details of the methodology, enabling further understanding.

Our latest projections show the trend of falling emissions while growing our economy is set

to continue. They estimate that between 2015 and 2020 we will reduce emissions by 17 per cent, while the OBR forecasts the economy is set to grow by nine per cent (in real terms) over this period<sup>330</sup>.

We have met our first carbon budget and current central projections show us exceeding requirements for both the second and third carbon budgets<sup>331</sup>. Emissions are projected to continue to fall through the 2020s, but there is an estimated shortfall against the fourth and fifth carbon budgets, based on estimates of emissions reductions from existing policies.

<sup>330</sup> OBR (2017) Economic and fiscal outlook – March 2017 <http://budgetresponsibility.org.uk/efo/economic-fiscal-outlook-march-2017/>

<sup>331</sup> BEIS (2017) Energy and Emissions Projections 2016 <https://www.gov.uk/government/publications/updated-energy-and-emissions-projections-2016>

**Table 5: Performance against carbon budgets<sup>332</sup>**

		Carbon Budget				
		1 2008-12	2 2013-17	3 2018-22	4 2023-27	5 2028-32
Budget, cumulative emissions, MtCO <sub>2</sub> e		3,018	2,782	2,544	1,950	1,725
Average reduction vs 1990 emissions, %		-25%	-31%	-37%	-51%	-57%
Existing policies	Projected emissions, cumulative emissions, MtCO <sub>2</sub> e	2,982 actual	2,650 E	2,453 E	2,096 E	1,972 E
	Result vs. Budget, %	-1.2%	-4.7%	-3.6%	+7.5%	+14.3%
Existing and new policies and proposals <sup>333</sup>	Projected emissions, cumulative emissions, MtCO <sub>2</sub> e	2,982 actual	2,650 E	2,453 E	2,066 E	1,892 E
	Result vs. Budget, cumulative emissions, MtCO <sub>2</sub> e	-36	-132	-91	+116	+167
	Result vs. Budget, %	-1.2%	-4.7%	-3.6%	+6.0%	+9.7%
	Cumulative surplus (+) or deficit (-), MtCO <sub>2</sub> e		+132	+223	+107	-60

We expect our shortfall against the fifth carbon budget to reduce significantly based on the policies and proposals set out in this Strategy. Initial estimates of these new early stage policies and proposals show an additional potential reduction of up to 30 MtCO<sub>2</sub>e and 80 MtCO<sub>2</sub>e over the fourth and fifth carbon budget periods respectively<sup>334</sup>; these and other policies will be developed building on the proposals outlined in the Strategy.

The Climate Change Act permits the Secretary of State, at certain points in budgetary cycles, to decide to “carry forward” our over achievements from previous budgetary periods or credit carbon units to the net carbon account. These flexibilities may be utilised to meet any shortfalls that crystallised<sup>335</sup>. As is evident from the above table, there is currently sufficient projected surplus available to carry forward to meet the fourth carbon budget and some of the fifth carbon budget; any shortfall that persists following any carry forward may be met through the purchase of international credits, subject to the requirements of the Climate Change Act.

The current projections are subject to significant uncertainty. For example, we cannot predict exactly what type and scale of global technical innovation

will develop over the next decade. Indeed as the past few years have shown we cannot predict our future energy mix since global action can transform the cost and installation of different technologies, driving very different outcomes to those expected.

Other uncertainties include:

**Macroeconomic factors:** such as population, public employment, and gas prices.

**Policy impacts:** How society will respond to incentives such as taxes or regulation.

**Evidence base:** Scientific knowledge evolves over time, as does our knowledge of technology performance.

**Changing behaviours:** Consumer and business behaviour will evolve over time as new priorities change and fashions develop.

This is why we have used “pathways” for each sector rather than specific estimates of emissions reductions from individual policies, to make sure we take an approach that is robust to these uncertainties.

<sup>332</sup> BEIS (2017) Energy and Emissions Projections 2016 <https://www.gov.uk/government/publications/updated-energy-and-emissions-projections-2016>

<sup>333</sup> BEIS initial estimates of a subset of new early stage policies and proposals show an additional potential reduction of up to 30 Mt and 80 Mt over the fourth and fifth carbon budget periods respectively; these and other policies will be developed building on the proposals outlined in the Strategy.

<sup>334</sup> BEIS initial estimates

<sup>335</sup> Chapter 2 sets out more detail on the Climate Change Act requirements Government will need to follow when taking any decisions on use of flexibilities to meet carbon budgets.

### The 2032 pathway

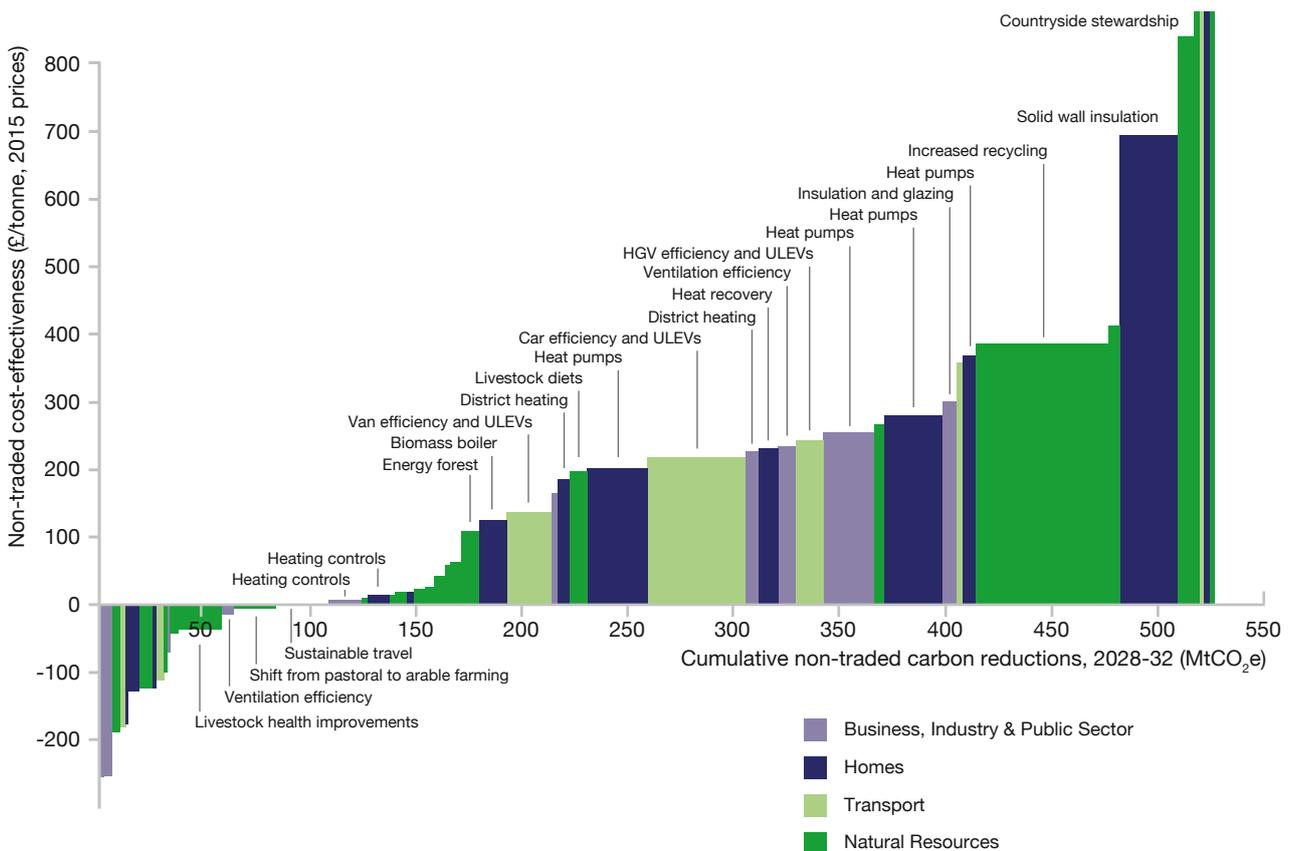

This section provides further details on the impact of the economy-wide pathway presented in Chapter 4 on UK emissions over the period to 2032. Our latest energy and emissions projections provide the starting point for developing the 2032 pathway set out in Chapter 3, and are based on our existing policies.

Emissions reductions beyond our existing policies are then based on the maximum theoretical potential for further abatement identified in the Impact Assessment for the

level of the fifth carbon budget<sup>336</sup>. In doing so, a marginal abatement cost curve (MACC) was estimated, indicating the extent, cost, and type of potential for available emissions reductions opportunities. This is shown in Figure 33.

Table 6 on the following page compares GHG emissions in 2017, 2032 and over the fifth carbon budget period based on a) projected emissions under existing (and past) policies, and b) the 2032 pathway for meeting the fifth carbon budget set out in Chapter 4.

<sup>337</sup> Direct emissions are those produced immediately within the housing sector, and exclude for example emissions from electricity generation.<sup>338</sup> Figures may not sum due to rounding<sup>339</sup> Beyond 2020, the emissions scenario for the power sector provides an illustration only.<sup>340</sup> Increase due to large-scale heat networks<sup>341</sup> Analysis of the power sector 2032 pathway is based on the BEIS (2017) Energy and Emissions Projections Reference scenario, 2016 <https://www.gov.uk/government/publications/updated-energy-and-emissions-projections-2016>. The analysis additionally takes into account changes in electricity demand resulting from actions outlined in the 2032 pathway in energy-consuming sectors (e.g. transport, homes, industry). Furthermore, a number of model updates and improvements have been made regarding the electricity demand profiles of key technologies and how this demand might be shifted, the availability of electricity storage technologies, and assumed system operability requirements.<sup>342</sup> The UK Net Carbon Account is defined by UK Carbon Accounting Regulations. Current regulations require that emissions covered by the EU Emissions Trading System (Traded emissions) are included as being equal to the UK's allocation of permits under the System, rather than actual UK territorial emissions. When setting the fifth carbon budget, this allocation was estimated to be 590 MtCO<sub>2</sub>e during the fifth carbon budget period.<sup>343</sup> Net carbon account as published in the BEIS (2016) Energy and Emissions Projections Reference Scenario prior to the additional analysis made on the power sector (see note above).

**Table 7: Non-traded emissions reductions during 2028-2032: Maximum theoretical potential, and the 2032 pathway<sup>344</sup>**

<i>MtCO<sub>2</sub>e</i>	Maximum theoretical potential for reducing non-traded emissions during 2028-2032	Non-traded sector emissions reductions resulting from the 2032 pathway
Business, Industry and public buildings	82	53
Homes	145	65
Transport	107	80
Natural resources	193	50
<b>Total</b>	<b>527</b>	<b>248</b>

Source: DECC, BEIS

This evidence was combined with judgements about the barriers to delivering emissions reductions, the rate at which low carbon options could be adopted and the timescales of key decisions set out in the Decision Pathways annex. The pathway is based on our current expectations of the availability and performance of low carbon options, but there is considerable uncertainty about how these will develop, and this is only one of several plausible pathways.

The maximum theoretical potential for emissions abatement across the UK economy is compared with the emissions reductions in the 2032 pathway (relative to the central emissions projection) in Table 7.

### Indicative annual range

Section 12 of the Climate Change Act 2008 requires the Government to publish an indicative annual range for the net UK carbon account for each year over which the levels of carbon budgets are set. An indicative annual range is a range within which the Secretary of State expects the amount of the net UK carbon account for the year to fall. Table 8 shows these ranges for the fifth carbon budget, taking account of the emissions savings implied by the 2032 pathway. The range reflects uncertainty in emissions projections under existing policies.

**Table 8: Indicative annual range for the net UK carbon account, 2028-2032 (MtCO<sub>2</sub>e)**

Indicative net UK carbon account	Carbon Budget 5 2028-2032				
	2028	2029	2030	2031	2032
Upper Bound	382	381	372	363	358
Central	357	354	345	336	331
Lower Bound	343	341	331	324	319

Source: BEIS, DfT, Defra and DCLG analysis

<sup>344</sup> DECC (2016) Impact Assessment for the level of the fifth carbon budget <http://www.legislation.gov.uk/uksi/2016/785/impacts> Section 3.3.4

**Table 9: Costs and benefits of the 2032 pathway**

<b>Capital and operating costs</b>	The incremental costs of installing and running low carbon technologies
<b>Finance costs</b>	The real social cost of providing finance for capital investments, which varies between sectors
<b>Energy savings</b>	The value of lower energy use due to improved efficiency of energy consumption, or switching from fossil fuels to low carbon alternatives
<b>Greenhouse Gas emissions impacts</b>	The benefits associated with reduced emissions. Where emissions are covered by the EU ETS, this benefit will be the avoided financial cost of purchasing EU emissions allowances. Reductions in non-traded emissions are valued using the Government's non-traded carbon values
<b>Impacts on air quality</b>	The benefits associated with lower emissions of NO <sub>x</sub> , PM <sub>2.5</sub> and other air pollutants detrimental to the health of individuals
<b>Other cost and benefits</b>	These include the hassle cost to households for installing measures, benefits of shorter journey times due to lower congestion, less noise pollution and warmer homes from energy efficiency improvements

### Positive economic value

Delivering the 2032 pathway described in this Strategy would result in a wide range of costs and benefits as described in Table 9. These costs and benefits can vary significantly. In particular they will depend on a wide range of social and economic factors such as growth in population and gross domestic product; they will depend on how innovation results in new and lower cost low carbon technologies; and importantly the costs and benefits will also depend on the precise actions that are taken as a result of the Strategy.

The extent of these costs and benefits is not fully known at this point in time because they will depend on the final design of the policies and proposals to meet carbon budgets. When setting the fifth carbon budget an indicative set of costs and benefits were estimated and set out in the accompanying impact assessment<sup>345</sup>. Overall, it was estimated that meeting the fifth carbon budget through domestic action alone could be achieved with a net benefit to the UK of up to £5.5 billion over the fifth carbon budget period.

The impact assessment also set out the sensitivity of these estimates to a range of underlying social and economic factors. These factors in particular included uncertainty around technology costs, energy prices, underlying drivers of UK emissions, and non-cost barriers to delivery.

As noted, these estimates only provide an illustration of the potential scale of impacts. The 2032 pathway shows what is considered possible through domestic action, although this is only one of several plausible pathways. As Government delivers its Clean Growth Strategy and finalises policies, these will be accompanied with their own impact assessments where appropriate, which will set out the specific costs and benefits of the proposals.

<sup>345</sup> DECC (2016) Impact Assessment for the level of the fifth carbon budget <http://www.legislation.gov.uk/uksi/2016/785/impacts> Section 4.1

## 2050 pathways

### Developing our illustrative 2050 pathways

To explore the range of opportunities for the UK out to 2050 we have used UK TIMES, a model of the whole UK energy and greenhouse gas system (see further detail below). The model allows us to explore different possible outcomes by considering the availability, performance, feasible build rates, and costs of existing and new technologies, as well as how the future economy might differ from today. This model has been developed by the Government in partnership with University College London (UCL) over a number of years, in consultation with many partners.

There are many ways the 2050 target could be met. To illustrate key potential technologies and uncertainties we investigated three pathways in depth. These three have all been deliberately selected to illustrate a wide range of possible pathways; for example, from 100 per cent battery electric cars to 100 per cent hydrogen fuel cell cars. However, different pathways within this range, and beyond this range, are also possible. All three 2050 pathways are consistent with the sector emissions levels in the 2032 pathway presented in this Strategy. They do not represent the most likely or preferred pathways to meeting the 2050 target, but show that the 2032 pathway would leave open a wide range of options for 2050.

A detailed overview of the three pathways is given below, together with an explanation of the methodology used to develop these pathways.

### Details of the three 2050 pathways

#### Pathway 1: Electricity

This pathway sees UK electricity generation increasing to around 650 TWh in 2050. All cars and vans are electric and four in five buildings use electric heating. Electricity is also the main low carbon energy source to the

industry sector, making up around one-third of fuel demand. Around one in five buildings use a largely low carbon district heat network. In this pathway carbon capture, usage and storage (CCUS) technologies are not available, which means there are no negative emissions. Hydrogen production is very low and industry sector emissions are higher than in the other two pathways.

#### Pathway 2: Hydrogen

This pathway sees a key role for low carbon hydrogen in decarbonising our vehicles and buildings. All cars and vans are fuelled by hydrogen and the majority of buildings use a hydrogen grid. Electricity and district heat still play a role in both residential and commercial/public buildings. Overall hydrogen production is around 700 TWh in 2050, with Steam Methane Reforming and CCUS being the primary generation method. The role for CCUS in this pathway is greater than the other pathways with over 170 MtCO<sub>2</sub>e being captured and stored in 2050. Because hydrogen is the main energy source for heating and transport, electricity demand and therefore generation is lower than the other pathways at around 340 TWh (around the same level as today).

#### Pathway 3: Emissions removal

This pathway illustrates the role that a negative emissions technology (in this case bio-energy with carbon capture and storage) could play in meeting the 2050 target. Here negative emissions in the electricity sector of around 20 MtCO<sub>2</sub>e create “headroom” for other sectors such as transport, buildings and agriculture to decarbonise more slowly. In this pathway total electricity generation is around 570 TWh. Around four of every five cars and vans on our roads are electric and three in every five buildings are heated by low carbon electricity. Around one in every five buildings uses a largely low carbon district heat network.

Table 10: Characteristics of the 2050 pathways in 2050

		Pathway 1: Electricity	Pathway 2: Hydrogen	Pathway 3: Emissions removal
Non-industrial business and public sector	Emissions (MtCO <sub>2</sub> e)	3	1	1
	Share of district heat use in heating (per cent)	17%	24%	18%
	Share of electricity use heating (per cent)	83%	13%	80%
	Share of hydrogen use in heating (per cent)	0%	56%	0%
Industrial business	Emissions (MtCO <sub>2</sub> e)	58	59	48
	Share of electricity use (per cent)	33%	23%	30%
	Share of hydrogen use (per cent)	0%	32%	28%
	Share of bioenergy use (per cent)	20%	15%	9%
	Captured emissions from industrial businesses (MtCO <sub>2</sub> e)	0	165	37
Homes	Emissions (MtCO <sub>2</sub> e)	8	6	19
	Share of district heat use in heating (per cent)	17%	17%	17%
	Share of electricity use in heating (per cent)	76%	14%	60%
	Share of hydrogen use in heating (per cent)	0%	62%	0%
Transport	Emissions (MtCO <sub>2</sub> e)	3	5	15
	Share of car and van km in battery electric vehicles (per cent)	100%	0%	85%
	Share of car and van km in hydrogen fuel cell electric vehicles (per cent)	0%	100%	0%
	Share of HGV km in zero emission vehicles (per cent)	55%	19%	93%
Power	Emissions (MtCO <sub>2</sub> e)	4	3	-22
	Electricity generation (TWh)	647	339	572
	Share of clean electricity generation (per cent)	99%	99%	99%
Natural resources	Emissions (MtCO <sub>2</sub> e)	46	46	60
Aviation and shipping <sup>346</sup>	Emissions (MtCO <sub>2</sub> e)	44	44	44
Total	Emissions (MtCO <sub>2</sub> e)	165	165	165

<sup>346</sup> Includes domestic and international aviation and shipping, in line with advice from the Committee on Climate Change. CCC (2015) Sectoral scenarios for the fifth carbon budget <https://www.theccc.org.uk/publication/sectoral-scenarios-for-the-fifth-carbon-budget-technical-report/>

## Overview of the methodology used to develop 2050 pathways

The 2050 analysis uses UK TIMES, a model of the whole UK energy and greenhouse gas system covering the period 2010 to 2060<sup>347</sup>. The model identifies the least cost technology pathway capable of both producing an assumed set of outputs (e.g. industrial output, space heating, and passenger distances travelled) and an emissions reduction profile. The technology pathway identified by the model will vary according to the input assumptions for technology and resource performance, cost and availability. The model can also be set up to roll out specific technologies in line with a given deployment profile. When the model is used in this way it will take account of the deployment profiles for specific technologies, and identify the least cost mix of remaining options.

The 2050 pathways analysis has two primary objectives.

First, it examines three substantially different “pathways” of economy-wide decarbonisation to understand the range of possible long-term outcomes.

Through previous modelling, research and external engagement, BEIS has identified the three areas of technology and resource uncertainty likely to have a big impact on the 2050 energy system. The pathways were then developed in consultation with internal sector experts to illustrate potential futures based on contrasting roles for these factors:

- The role of electrification;
- The role of hydrogen;
- The role of bioenergy production with CCUS to produce ‘negative emissions’.

Second, it confirms all of the pathways are consistent with meeting the 2050 and fifth carbon budget emissions reduction targets.

The modelled pathways were constructed in UK TIMES by varying input assumptions for:

- Availability of technologies. For example, CCUS is not available in pathway 1 and negative emissions technologies are only available in pathway 3.
- The extent or speed at which technologies can be rolled out e.g. faster growth in hydrogen production is allowed in pathway 2, whilst expansion of electric heating is more restricted.
- Entering fixed deployment profiles for some technologies e.g. 100 per cent of cars and vans are set to be powered by electricity or hydrogen in pathways 1 and 2 respectively.

Other assumptions were kept the same across the pathways. For instance the consumption and output projection assumptions are consistent with current official economic growth and population projections and were the same for each of the modelled 2050 pathways. Technology and resource costs and performance assumptions were also kept the same and sector emissions were aligned to those in the 2032 pathway described in this Strategy.

## Impact of international aviation and shipping on 2050 emissions

International aviation and shipping emissions are not currently included within the UK’s targets under the Climate Change Act. However, carbon budgets have been set in a way that takes these emissions into account – the UK is on a trajectory that could be consistent with a 2050 target that includes emissions from international aviation and shipping.

<sup>347</sup> For this analysis, model version v1.2.3\_d0.6.0\_DNP has been used.

The Government has not reached a final view on the appropriate level of international aviation and shipping emissions in 2050. The CCC in their advice on the fifth carbon budget advised leaving space in the 2050 target of around 41 MtCO<sub>2</sub>e. This has been the modelling assumption used throughout this Strategy<sup>348</sup>.

We have undertaken sensitivity analysis to test the potential impact of higher or lower aviation emissions on how the UK could meet its 2050 target (focusing on aviation emissions as they are greater than shipping emissions).

There are a number of policy measures available, both at the domestic and international levels, to address aviation emissions. It is likely that a combination of approaches and policy measures will be required. Examples of action available to countries include: international level action to tackle aviation emissions (such as through international standards and offsetting schemes) and domestic action to tackle aviation emissions (such as through support for sustainable alternative fuel uptake in aviation or improved operational efficiency).

We have explored the feasibility of taking domestic policy action to offset aviation emissions to 2050 above the CCC planning assumption. We have analysed a scenario from the Airports Commission's (AC) work on aviation capacity. For the case of expansion at Heathrow (a new northwest runway), the AC estimated UK gross aviation emissions in its "carbon traded" scenario to be around 44 MtCO<sub>2</sub>e in 2050<sup>349</sup>.

This scenario for gross UK aviation emissions above the CCC planning assumption provides a useful basis for a sensitivity test. Our analysis shows that it is possible to meet the 2050 target under the Climate Change Act domestically if aviation emissions are 44 MtCO<sub>2</sub>e<sup>350</sup> – this is the case for our three pathways to 2050. Further action could be taken after the fifth carbon budget in order to offset these higher aviation emissions through action elsewhere in the UK. The action taken in the remaining UK sectors depends on the wider pathway to 2050.

### Consideration of wider circumstances

The Climate Change Act requires the Government to take into account a range of factors in developing its plan for meeting carbon budgets. These factors are discussed throughout the Strategy and its annexes. For a number of these factors it is not currently possible to know the full impacts as these will depend on the detailed design of the individual policies that will be developed in the coming years as the Strategy is delivered.

Nevertheless, it is possible to estimate the nature of potential impacts and the considerations that will need to be made as policies are developed. In delivering the Strategy, the Government will undertake analysis to inform policy development. Where appropriate, impact assessments supporting the policy design will be produced.

<sup>348</sup> CCC (2015) Sectoral scenarios for the fifth carbon budget <https://www.theccc.org.uk/publication/sectoral-scenarios-for-the-fifth-carbon-budget-technical-report/>. The CCC's central scenario allows 37.5 MtCO<sub>2</sub>e for aviation emissions in 2050, of which 36.2 MtCO<sub>2</sub>e

<sup>349</sup> The AC used two scenarios – one called "carbon capped", and one called "carbon-traded". In the "carbon-capped" scenario, the AC's analysis showed that policies are available to limit UK aviation emissions to the CCC planning assumption of 37.5 MtCO<sub>2</sub>e in 2050 (domestic and international). In the "carbon traded" scenario, there is a global carbon market allowing reductions to be made where they are most efficient across the global economy resulting in UK aviation emissions of 44 MtCO<sub>2</sub>e (domestic and international).

<sup>350</sup> 47 MtCO<sub>2</sub>e total international aviation and shipping emission assumed in this scenario

## Economic circumstances

Impacts on growth and competitiveness of the UK economy can arise through a number of channels, as a result of actions taken to deliver the Strategy. These arise due to:

- Impacts on the timing and scale of investment spending;
- Impacts on business output resulting from improvements in energy efficiency, and changes in expenditure on capital assets;
- Reorientation of consumption patterns away from emissions-intensive products and towards more energy-efficient products;
- Impacts from changes to energy prices as a result of energy demand changes, and any changes in the costs of policy delivery mechanisms included in energy bills;
- Long-term benefits from innovation, including the development of nascent industries, associated spillover benefits into other sectors, and the increase in exports of knowledge and new technologies;
- Indirect effects on growth through changes in exposure to energy price volatility and supply disruptions;
- Transition costs that could materialise, for example the potential impact of stranded assets and any transitional unemployment; and
- Multiplier effects associated with the above impacts, including any impacts on employment.

The Government has undertaken analysis to assess the likely range of impacts from meeting the range of budgets. This analysis was undertaken in order to inform the setting of the fifth carbon budget and is set out in section 4.1 of the impact assessment.

## Fiscal circumstances

Impacts on taxation, public spending, and public borrowing can arise for a number of reasons:

- The Government currently provides financial support for the take-up of low carbon technologies. Changes to existing policies or new policies may affect this expenditure;
- Impacts on GDP, for the reasons set out above, can affect tax revenues;
- Behaviour change can affect revenues relating to environmental taxes (e.g. landfill tax);
- Decisions may be taken in the future with regards to the wider tax system to take account of the broader fiscal position.

## Social circumstances

Delivering the Strategy may have impacts on fuel poverty in the UK and its nations. The UK Government has a statutory target to raise as many English fuel poor homes as is reasonably practicable to energy efficiency Band C by 2030, with milestones of Band E by 2020 and Band D by 2025. The Devolved Administrations in Scotland and Wales have separate legal fuel poverty targets.

The pathway set out in the Strategy could affect fuel poverty through a number of channels. These include impacts on energy prices, impacts on the energy needs of households through improved building fabric, and changes in the way heat is supplied. We will assess the impact on fuel poverty as part of the implementation of the individual policies outlined in the Strategy.

## Energy policy and energy supplies

Energy security is about ensuring secure, reliable, uninterrupted supplies to consumers, and having a system that can effectively and efficiently respond and adapt to changes and shocks. It is made up of three characteristics: flexibility, adequacy and resilience. The Government is committed to ensuring there are secure supplies for consumers whatever the energy mix.

The energy intensity of the UK economy has fallen significantly since 1990 and this trend is expected to continue. The energy intensity of the UK economy in 1990, as measured through final energy demand, was 1,530 MWh of energy per million pounds of GDP. In comparison, the energy intensity of the UK economy is projected to be around 630 MWh

per million pounds of GDP in 2032, under the EEP 2016 reference emissions scenario based on existing policies. In the 2032 pathway, energy intensity could be as low as 548 MWh per million pounds of GDP by 2032.

Delivering the 2032 pathway would result in changes in fuel consumption across the whole economy, with estimated impacts set out in Table 11. In total, the 2032 pathway would reduce final consumption by around 13 per cent in 2032 relative to projected energy consumption under existing policies, as a result of further improvements in fuel efficiency. The reduction in fossil fuel consumption will help improve energy security but the pathway is also characterised by a shift from end-user fossil fuel consumption towards biomass and electricity.

**Table 11: Change in annual final energy consumption in 2032, relative to the existing policies scenario**

	Potential saving (-) or additional consumption (+) in 2032 (TWh/year)	Percentage impact relative to existing policies
Electricity	+14	+4%
Gas	-124	-23%
Coal	-6	-38%
Oil	-126	-25%
Bioenergy	+28	+29%
<b>Total</b>	<b>-215</b>	<b>-14%</b>

The capacity mechanism will use competition to find the most cost-effective mix of technologies to ensure we have sufficient reliable capacity to meet electricity demand.

The power sector's response to these changes in demand has been modelled using BEIS's Dynamic Dispatch Model (DDM)<sup>351</sup>. All other things being equal increased electricity consumption results in overall increases in the marginal costs of power supply, due to the need to dispatch more expensive generating technologies to meet consumption. The precise impacts depend on a range of factors, including the technology mix, technology costs, and fossil fuel and carbon prices.

While electricity consumption is lower than the reference case projections (existing policies) in the early 2020s, over the fifth carbon budget as a whole 1.5 per cent more electricity is used. This is met through additional supply from clean generation, gas generation and interconnection.

A smarter electricity system reduces the additional capacity and costs from higher electrification of transport and heat through deploying energy storage technologies, and shifting electric vehicle charging and heat pump demand. Smart flexibility and technologies have the effect of reducing electricity consumption at peak times and shifting consumption to times when overall consumption is lower and more low-cost electricity generation capacity is available.

### Sustainability (including the impact on natural capital)

Section 13(3) of the Climate Change Act 2008 states that proposals and policies for meeting carbon budgets must, when taken as a whole, '*be such as to contribute to sustainable development*'. Tackling climate change is essential for maintaining a healthy, resilient natural environment, and the Government is committed to ensuring that the value of nature is appropriately reflected in all relevant policy decisions.

Actions taken to meet our carbon budgets can create both risks and opportunities relating to the quality of our environment. We refer to the stocks of natural assets (e.g., forests, clean air, soils, species, freshwaters, oceans and minerals) that provide flows of natural resource inputs and ecosystem services as natural capital. Government set up the Natural Capital Committee (NCC) in 2012 to advise it on the sustainable use of natural capital, and how the services provided by, and risks to, natural assets can be better accounted for and valued in decision-making. This thinking is informing revisions to the HM Treasury Green Book to ensure a structured and consistent approach to assessing impacts on natural capital in policy appraisal.

To produce an assessment of natural capital impacts for the Strategy, a screening exercise was conducted to identify which policies and proposals might be expected to have natural capital impacts. For these an assessment framework was designed to ensure that potential impacts on natural capital assets and their services were considered in a consistent way. Assessments prompted consideration of the spatial effects of each measure, the timeframe of these effects and a range of environmental assets that could be affected.

<sup>351</sup> DECC (2014) Dynamic Dispatch Model <https://www.gov.uk/government/publications/dynamic-dispatch-model-ddm>

The detail of the assessments showed that impacts can vary depending on the context and policy approach which is important to consider when developing policy.

Important risks and opportunities identified included:

- Increasing forestry cover can have a number of benefits to natural capital including creating new habitats for animals and reducing flood risk. Likewise changes to farming practices can reduce the demands placed on natural resources and aid biodiversity. However, context is very important when changing land use. For example, benefits vary by species of tree planted, or the previous use of land converted to produce less emission intensive crops.
- Transport sector measures such as the deployment of ULEVs may provide significant opportunities to reduce emissions of harmful air pollutants including Particulate Matter (PM) and nitrous oxides. There are also potential benefits in less pollution running off from road and reduced noise levels.
- Burning biomass for heat or power and biofuels for transport can create some harmful emission including Particulate Matter (PM) and Volatile Organic Compounds (VOCs). More broadly, while there are some risks, there are significant opportunities to both reduce greenhouse gas emissions while also reducing harmful air pollutants.

The work also highlighted the need to consider natural capital impacts across groups of policies. These considerations will be taken forward as specific measures are designed and appraised in detail in accordance with Green Book guidance.

### Assumptions and evidence base

The analysis of the 2032 and 2050 pathways are underpinned by a common set of assumptions about future economic and demographic trends, which align with those used for the 2016 Energy and Emissions Projections<sup>352</sup>. The EEP 2016 Reference scenario, representing future emissions under the UK's current suite of climate policies, is also used as the reference for GHG emissions and energy consumption in each sector. The analysis uses assumptions about future energy prices, published as part of supplementary Green Book appraisal guidance.

Wherever possible technical assumptions on costs, performance and availability of technologies have been aligned between the UK TIMES model used for the 2050 pathways analysis and the models used to for the 2032 pathway analysis, although due to differences in modelling approaches there are some minor differences.

<sup>352</sup> BEIS (2017) Updated energy and emissions projections 2016 <https://www.gov.uk/government/publications/updated-energy-and-emissions-projections-2016>

## Evidence base

**Commercial and public buildings:** 2032 pathway analysis was based on the BEIS Non-domestic Building model using evidence from the Digest of UK Energy Statistics, Energy and Emissions Projections, ECUK and the Building Energy Efficiency Survey (BEES) to estimate heating, cooling and ventilation demand to 2032. Technology evidence was taken from BEES; RHI statistics and an interim heat pump performance report; an AECOM report on heat network costs and performance; and cost data from Heat Networks Delivery Unit (HNDU) sponsored projects. The Products Policy model was used for ventilation scenarios. For the 2050 pathways additional assumptions were taken from Carbon Trust; Valuations Office Agency and Poyry.

**Industry:** The 2032 pathway was developed using BEIS Industry Pathways Models, split into eight industry sectors. A capital cost uplift of 10 per cent has been applied in the 2032 analysis to reflect potential hidden costs of delivering measures. For iron and steel, paper, cement and a part of chemicals actual production steps are modelled, using evidence from the Usable Energy Database<sup>353</sup>. The remaining sectors (other chemicals, non-metallic minerals, non-ferrous metals, food and drink and 'other' industry) are split into the different energy service demand categories (e.g. high temperature heat, low temperature heat) and generic technologies that produce these types of energy are modelled. Assumptions for these sectors are mainly based on UK MARKAL. Evidence from the Government's 2050 Industrial Decarbonisation and Energy Efficiency Roadmaps, published in 2015, was incorporated into the modelling; in particular, the timing and extent of technologies deployed in the 2032 pathway analysis.

**Transport:** The 2032 pathway was developed using the Department of Transport's National Transport Model (NTM)<sup>354</sup> for road measures and the Rail Emissions Model for rail measures. The NTM forecasts emissions and traffic accounting for impacts on vehicle fuel efficiency and fuel mix. The ECCo model was used to develop uptake scenarios for Ultra Low Emissions Vehicles. Impacts of sustainable travel measures were based on evidence from the evaluation of the Sustainable Travel Towns<sup>355</sup>. The NTM covers Great Britain, so an uplift has been applied to account for transport emissions from Northern Ireland. This is the standard approach taken by DfT. For 2050 pathways analysis, nine vehicle groups are represented (e.g. car, bus, lorry), each with different types of vehicle choice (e.g. electric or hydrogen). Car and LGV assumptions were based on Element Energy's ECCo Cost and Performance Database; HGV assumptions from a Ricardo report to the CCC (A review of the efficiency and cost assumptions for road transport vehicles to 2050); and maximum growth and delivery rate assumptions from DfT/ University College London (UCL).

<sup>353</sup> UKERC Energy Data Centre, Industrial Energy use: <http://tinyurl.com/k8nohc7>

<sup>354</sup> DfT (2012) Transport appraisal and modelling tools <https://www.gov.uk/government/collections/transport-appraisal-and-modelling-tools>

<sup>355</sup> Sloman et al. (2010) The effects of smarter choice programmes in the sustainable travel towns: research report <https://www.gov.uk/government/publications/the-effects-of-smarter-choice-programmes-in-the-sustainable-travel-towns-full-report>

**Domestic buildings:** The 2032 pathway for existing buildings covers energy efficiency, heating technologies, heat networks, and behaviour change. The pathway was developed through the BEIS Domestic Buildings Scenario Model. Cost and performance assumptions for energy efficiency and heat measures is based on published analysis for the Renewable Heat Incentive (RHI) and Energy Company Obligation. For new homes, build rate assumptions were taken from the 2015 Housing Standards Review Impact Assessment, and impacts of low carbon heat measures was based on analysis conducted by an AECOM-led consortium. Additional assumptions for the 2050 pathways analysis are taken from UCL, Office of National Statistics (ONS) and Energy Consumption in the UK (ECUK).

**Power:** The power sector's response to the changes in demand under the 2032 pathway has been modelled using BEIS's Dynamic Dispatch Model<sup>356</sup>. The DDM is a comprehensive fully-integrated power market model covering the market in Great Britain over the medium to long-term. The model enables analysis of electricity dispatch from GB power generators and investment decisions in generating capacity from 2010 through to 2050. It considers electricity demand and supply on a half-hourly basis for sample days. Investment decisions are based on projected revenue and cash flows taking into account policy impacts and changes in the generation mix. The full lifecycle of power generated plant is modelled, from planning through to decommissioning. The modelling accounts for risk and uncertainty involved in investment decisions. UK TIMES 2050 modelling uses the same technology assumptions as the DDM where possible, and also includes additional evidence from UCL, National Grid, EPRI and Carbon Trust.

**Agriculture and land use:** Agriculture: Evidence has been scaled from England to cover all of the UK Greenhouse Gas Emissions Inventory for England, Scotland, Wales and Northern Ireland (1990-2015). The scaling factor is based on a five-year average of the national contributions to overall agricultural emissions from the national inventory report (the 2014 common reporting format tables). From that data the average English contribution to agricultural GHGs is 63 per cent and estimates are scaled up on this basis.

**Forestry:** Emissions reductions are projected using an off-line version of the CARBINE carbon accounting model with policy specific mixes of woodland types. Biomass supply from relevant harvest fractions are included in the scenario analysis, but carbon storage and emissions reductions associated with the use of harvested wood products are not. This evidence has been scaled from England to cover all of the UK, based on both the share of current and historical activity<sup>357</sup> and afforestation scenarios developed with DA forestry leads through the LULUCF GHG inventory and projections project funded by the BEIS Science team.

**Soils:** The 2032 pathway analysis for England uses analysis of the potential GHG savings from different types of peatland restoration. Emission reductions are estimated using preliminary findings from an forthcoming BEIS-funded research project combined with cost data from the peatland code, agri-environment payments and reports for the CCC Adaptation sub-Committee. In order to cover the UK as a whole the England-only data has been scaled based on estimates of total UK peatland area. Agriculture and land use is represented in the 2050 pathway analysis by applying a fixed emissions profile with a series of mitigation options available. This profile combines components from land use, crops and livestock.

<sup>356</sup> DECC (2014) Dynamic Dispatch Model <https://www.gov.uk/government/publications/dynamic-dispatch-model-ddm>

<sup>357</sup> Forestry Commission (2017) Forestry Statistics <https://www.forestry.gov.uk/forestry/infd-7aqqdc>

**Waste:** The emission saving from waste in the 2032 pathway has been informed by a variety of sources. Food waste prevention savings are based on WRAP analysis associated with the Courtauld Commitment 2025. Landfill diversion was based on Defra's Routemap. Projections of waste arising are a key input to the model. Landfill gas capture and oxidation assumptions were developed in an expert elicitation exercise with the Environment Agency. Cover the UK as a whole, the England only data has been scaled based on the Greenhouse Gas Emissions Inventory for England, Scotland, Wales and Northern Ireland (1990-2015).

**Economic growth and demographic changes:** The 2032 pathway analysis used the same growth assumptions as the 2016 Energy and Emissions projections. In the UK TIMES model used for 2050 pathway analysis, there are 60-plus growth drivers which are exogenous to the model and based on a variety of assumptions including: BEIS Energy Demand Model outputs, GDP growth assumption, ONS population growth, Department for Communities and Local Government (DCLG) household projections and Department for Transport (DfT) transport driver estimates.

**Fossil fuel prices:** Fossil fuel prices assumptions are based on the BEIS Fossil Fuel Price Assumptions 2016<sup>358</sup>.

**Carbon Values:** The Government's current approach to carbon valuation was adopted in 2009 based on a "target-consistent" methodology. This is set out here <https://www.gov.uk/government/collections/carbon-valuation--2>.

**Aviation and Shipping (A&S):** The CCC planning assumption is used to set the aviation and shipping "headroom" level in 2050. Domestic aviation and shipping is modelled as part of carbon budgets leading up to 2050.

**Bioresource:** Bioresource availability is based on the Bioenergy Feedstock Availability Model<sup>359</sup>. The assumed land area available for energy crops has been limited by excluding a wide range of sensitive sites on both landscape and biodiversity grounds. Domestic and imported bioresource costs are from a range of sources including CCC, E4tech, Carbon Trust and Nix Farm Management.

**Air quality:** Air quality emissions factors are provided by the National Atmospheric Emissions Inventory and Aether. Air quality damage costs are consistent with COMEAP guidance on air pollution.

**Hydrogen:** Hydrogen assumptions were developed by University College London<sup>360</sup>. The costs are based on the assumption that a new network would need to be built to allow heating to be supplied by hydrogen.

**EU ETS:** Assumptions for the UK's share of EU ETS allowances are aligned with the levels assumed at the time of setting the respective budgets. These are 1,078 MtCO<sub>2</sub>e (second carbon budget); 985 MtCO<sub>2</sub>e (third); 690 MtCO<sub>2</sub>e (fourth); and 590 MtCO<sub>2</sub>e (fifth).

## Source information for metrics see Annex D: Changes that illustrate how our pathway could be delivered

**Overarching:** Emissions estimates for these metrics are taken from the BEIS (2017) GHG emissions statistics<sup>361</sup> and 2032 pathway analysis. Population data (historical and projected) are sourced from the Office for National statistics (2017)<sup>362</sup>. Energy data are taken from the BEIS (2016) Digest of UK Energy Statistics (DUKES)<sup>363</sup> and 2032 pathway analysis. Gross Domestic Product (GDP) estimates to 2015 are taken from the Office for National Statistics<sup>364</sup>. Emissions and energy use projections are based upon BEIS (2017) Energy and Emissions Projections 2016<sup>365</sup>. GDP projections are taken from the Office for Budget Responsibility (OBR) Economic and Fiscal Outlook November 2016.

**Business and public sector:** Emissions estimates for these metrics are taken from the BEIS (2017) GHG emissions statistics and 2032 pathway analysis. Energy data are taken from the BEIS (2016) Digest of UK Energy Statistics and 2032 pathway analysis. Output gross value added (GVA) estimates for services and industry are sourced from the Office for National Statistics on a constant price basis<sup>366</sup>. There are no official projections of output GVA; estimated trends have been made consistent with assumptions used in BEIS (2017) Energy and Emissions Projections.

**Homes:** Emissions estimates for these metrics are taken from the BEIS (2017) GHG emissions statistics and 2032 pathway analysis. Energy data are taken from the BEIS (2016) Digest of UK Energy Statistics and 2032 pathway analysis. UK Household historical estimates have been taken from BEIS (2017) Energy Consumption in the UK<sup>367</sup> with projections sourced from BEIS (2017) Energy and Emissions Projections 2016, both of which are consistent with DCLG household modelling.

**Transport:** The road transport metrics cover cars, vans and freight only. Emissions estimates for these metrics are taken from the BEIS (2017) GHG emissions statistics and 2032 pathway analysis. Energy data for road transport are taken from BEIS (2016) Energy Consumption in the UK, consistent with DUKES. Projected energy estimates are taken from the 2032 pathway analysis. Road transport demand estimates (in vehicle kilometres) are taken from DfT (2017) Road Traffic statistics<sup>368</sup> (Table TRA0201) and 2032 pathway analysis.

<sup>361</sup> BEIS (2017) Final GHG Emissions Inventory Statistics, <https://www.gov.uk/government/statistics/final-uk-greenhouse-gas-emissions-national-statistics-1990-2015>

<sup>368</sup> DfT (2017) Road Traffic Statistics, [www.gov.uk/government/organisations/department-for-transport/series/road-traffic-statistics](http://www.gov.uk/government/organisations/department-for-transport/series/road-traffic-statistics)

**Power:** Emissions estimates for these metrics are taken from the BEIS (2017) GHG emissions statistics and 2032 pathway analysis. Low carbon generation data are taken from BEIS (2016) Digest of UK Energy statistics, chapter 5, with projections sourced from 2032 pathway analysis.

**Natural Resources:** Emissions estimates for these metrics are taken from the BEIS (2017) GHG emissions statistics and 2032 pathway analysis. Estimates of biodegradable waste to landfill are taken from the Defra (2017) Digest of Waste and Resource statistics<sup>369</sup> and 2032 pathway analysis. Estimates of total conventional woodland cover are sourced from the Forestry Commission's (2017) Forestry statistics<sup>370</sup> and 2032 pathway analysis. Output gross value added (GVA) estimates for agriculture are sourced from the Office for National Statistics on a constant price basis. There are no official projections of output GVA; Defra analysts have estimated future GVA based on historic trends.

## 2 The Ten Point Plan for a Green Industrial Revolution

# Foreword from the Prime Minister

This year has taken a very different path from any we expected, but I have not lost sight of our ambitious plans to unite and level up our country.

Just as science will enable humanity to rout Coronavirus, so we will use the UK's extraordinary powers of invention to repair the economic damage and build back better. Now is the time to plan for a green recovery – with high-skilled high-paid jobs that offer the extra satisfaction of helping to make our nation cleaner, greener and more beautiful.

Imagine how our Green Industrial Revolution could transform life across our United Kingdom. You cook your breakfast using hydrogen power before getting in your electric car, having charged it overnight from batteries made in the Midlands. Around you the air is cleaner, and the trucks and trains, ships and planes are running on hydrogen or a synthetic fuel. British towns and regions — Teesside, Port Talbot, Merseyside and Mansfield — have become synonymous with green technology and the jobs they bring. This is where Britain's ability to make hydrogen and capture carbon pioneered the decarbonisation of transport, industry and power.

This Ten Point Plan to get there will mobilise £12 billion of government investment, and potentially three times as much from the private sector, to create and support up to 250,000 green jobs. There will be electric vehicle technicians in the Midlands, construction and installation workers in the North East and Wales, specialists in advanced fuels in the North West, agroforestry practitioners in Scotland, and grid system installers everywhere. And we will help people train for these new green jobs through our Lifetime Skills Guarantee.

We will turn the UK into the world's number one centre for green technology and finance, laying the foundations for decades of economic growth by delivering net zero emissions in a way that creates jobs and allows us to carry on living our lives. And we will harness Mother Nature's ability to absorb carbon by planting 30,000 hectares of trees a year by 2025, and restore the abundance of nature by rewilding 30,000 football pitches worth of countryside.

The UK was the first major economy to embrace a legal obligation to achieve net zero carbon emissions by 2050. I will establish Task Force Net Zero to take forward this national priority, and through next year's COP26 Summit, we will urge countries and companies around the world to join us in delivering net zero globally.

We long ago proved that green and growth can go hand-in-hand. So let us meet the most enduring threat to our planet with one of the most innovative and ambitious programmes of job-creation we have known

**The Rt Hon Boris Johnson MP**

Prime Minister

# Foreword from the Secretary of State for Business, Energy & Industrial Strategy

As the world looks to recover from the impact of coronavirus on our lives, livelihoods and economies, we have the chance to build back better: to invest in making the UK a global leader in green technologies.

If we apply the same zeal and ingenuity to stopping climate change as we have to tackling coronavirus, we can do so while transforming our economy, delivering jobs and growth across the country.

Our Ten Point Plan sets the firm foundations to do just that. The plan brings together ambitious policies and significant new public investment, while seeking to mobilise private investment. This has the potential to deliver up to an estimated £42 billion of private investment by 2030 across energy, buildings, transport, innovation and the natural environment. In doing so, we will position the UK to take advantage of export opportunities presented by low carbon technologies and services into new, global emerging markets – providing jobs and reinvigorating our industrial heartlands.

The Ten Point Plan demonstrates the UK's significant and continuing commitment to tackling greenhouse gas emissions. We have led the G7 countries in cutting emissions since 1990. As President-Designate for the United Nations Framework Convention on Climate Change Conference of the Parties 26 (COP26), I am committed to ensuring we also use our leadership role so that all countries, businesses, cities and investors adopt a greener, more resilient, sustainable path for the future.

This will build on a Conservative track record of addressing the climate challenge. From helping to secure the Paris Agreement, to legislating for net zero, and setting out the greenest manifesto in the UK's history, this plan delivers on our commitments to present a vision for the UK that is greener, more prosperous and at the forefront of global industry. We will continue to build on this plan.

Over the next year we will bring forward ambitious proposals across the economy to cut emissions and secure long-term growth for the whole country, starting with the Energy White Paper before the end of the year. I look forward to working with businesses, organisations representing the interests of UK citizens, the Devolved Administrations and Governments across the world to make this a reality.

**The Rt Hon Alok Sharma MP**

Secretary of State for Business, Energy and Industrial Strategy, President COP 26

# Introduction

Two centuries ago the UK led the world's first Industrial Revolution. Powered by innovation and private investment, this transformation gave birth to many of our great cities and effectively created the modern world. Today we will mobilise the same forces to level up our country and enable our proud industrial heartlands to forge the future once again. By investing in clean technologies – wind, carbon capture, hydrogen and many others – Britain will lead the world into a new Green Industrial Revolution.

As the world begins to recover from the devastating impact of the coronavirus on lives and livelihoods, a broader transformation is taking shape. We will create hundreds of thousands of new jobs by investing in pioneering British industries while simultaneously protecting future generations from climate change and the remorseless destruction of habitats.

Britain is already leading the way. Over the last 30 years, we have shown that economic success and environmental responsibility go hand in hand. We expanded our GDP by 75 per cent while cutting emissions by 43 per cent. Our low-carbon industries already support over 460,000 jobs,<sup>1</sup> from electric vehicle manufacturing in the Midlands and the North East to our thriving offshore wind industry centred on the Humber and the Tees. In 2019, we became the first major economy to adopt a legally binding obligation to reach net zero greenhouse gas emissions by 2050.

This year, our Ten Point Plan will lay the foundations for a Green Industrial Revolution. We will start by supporting 90,000 jobs across the UK within this Parliament, and up to 250,000 by 2030. Engineers, fitters, construction workers and many others will be engaged in harnessing British science and technology to create and use clean energy and forge great new industries that export to new markets around the world. Our Lifetime Skills Guarantee will equip people with the training they need to take advantage of these opportunities.

The government has announced over £5 billion to support a green recovery. This plan mobilises £12 billion – and potentially more than three times as much from the private sector – to place green jobs at the heart of our economic revival.

As the world goes green, we will seek to put the UK at the forefront of global markets for clean technology. One measure of the opportunity is that 83 per cent of the \$13.3 trillion of global investment in electricity systems by 2050 could be in zero-carbon technologies.<sup>2</sup>

We will generate new clean power with offshore wind farms, nuclear plants and by investing up to half a billion pounds in new hydrogen technologies. We will use this energy to carry on living our lives, running our cars, buses, trucks and trains, ships and planes, and heating our homes while keeping bills low. And to the extent that we still emit carbon,

<sup>1</sup> <https://www.ons.gov.uk/economy/environmentalaccounts/methodologies/lowcarbonandrenewableenergyeconomy/creesurveyqmi>

<sup>2</sup> <https://about.bnef.com/new-energy-outlook/>

we will pioneer a new British industry dedicated to its capture and return to under the North Sea. Together these measures will reinvigorate our industrial heartlands, creating jobs and growth, and pioneering world-leading SuperPlaces that unite clean industry with transport and power. All of these ambitions will be propelled by doubling down on Britain's world-leading expertise in green finance and innovation.

Finally, we will harness nature's ability to absorb carbon by establishing new National Parks and Areas of Outstanding Natural Beauty, and making them even greater havens of biodiversity, with the aim of protecting 30% of England's countryside by 2030. We will use the freedoms we regain by leaving the EU to support Britain's farmers so that, alongside producing high-quality food, we ensure healthy soils which will also retain and – over time – capture carbon. We will restore our peatlands and woodlands, create the Nature Recovery Network and wilder landscapes, generating new jobs in nature and land management. And we will better adapt and protect our communities from the already visible effects of climate change by investing in flood defences and using nature-based solutions to increase flood resilience.

The cumulative effect of this plan will be to reduce UK emissions by 180 million tonnes of carbon dioxide equivalent (Mt CO<sub>2</sub> e) between 2023 and 2032, equal to taking all of today's cars off the road for around two years. But this is only the start. Over the next year we will work with industry to devise further sectoral plans and meet our carbon budgets and target of net zero by 2050. To drive our progress towards this national priority, the Prime Minister will establish a new Task Force Net Zero, putting a systems approach at the heart of our thinking.

But action by the UK alone will not be sufficient to avoid catastrophic climate change. Our Ten Point Plan strengthens our ability to bring other countries with us and positions Britain as a leader in the green technologies we all need to employ. Through our Presidency of the United Nations Framework Convention on Climate Change (UNFCCC) Conference of the Parties 26 (COP26) in Glasgow, the UK will urge ambitious action from countries, businesses, cities, and investors alike. Together we will deliver the promises of the 2015 Paris Agreement and drive progress towards global net zero. And next month, alongside the UN and France, the UK will host a Climate Ambition Summit five years after COP21 in Paris to rally the world behind the goal of a greener, more resilient and sustainable future.

# The Ten Point Plan for a Green Industrial Revolution

**Point 1**  
Advancing Offshore Wind

**Point 2**  
Driving the Growth of Low Carbon Hydrogen

**Point 3**  
Delivering New and Advanced Nuclear Power

**Point 4**  
Accelerating the Shift to Zero Emission Vehicles

**Point 5**  
Green Public Transport, Cycling and Walking

**Point 6**  
Jet Zero and Green Ships

**Point 7**  
Greener Buildings

**Point 8**  
Investing in Carbon Capture, Usage and Storage

**Point 9**  
Protecting Our Natural Environment

**Point 10**  
Green Finance and Innovation

## Point 1: Advancing Offshore Wind

Offshore wind is a critical source of renewable energy for our growing economy, with the UK already leading the world. By 2030 we plan to quadruple our offshore wind capacity so as to generate more power than all our homes use today, backing new innovations to make the most of this proven technology and investing to bring new jobs and growth to our ports and coastal regions.

The UK already generates more electricity from offshore wind than any other country, harnessing the wind power our seas are well placed to produce. Government support to unleash the potential of this industry has seen the cost of offshore wind fall by two thirds in the last five years. To offer further commitment to the industry and help further reduce costs, next year, we will aim to deliver up to double the amount of renewables we procure through our next Contract for Difference auction. And by **2030, we aim to produce 40GW of offshore wind**, including **1GW of innovative floating offshore wind** in the windiest parts of our seas. The UK is home to the world's first two floating offshore windfarms and by 2030 we intend to have scaled this twelvefold. Our target could encourage £20 billion of private investment into the UK and could double jobs in the sector over the next decade, ranging from construction workers to top-end engineers.

With a single turn of their blades, the latest wind turbines generate enough electricity to power a house for more than 24 hours. We will put ourselves at the forefront of manufacturing as we see wind turbines grow in size. To support this enlarging industry, we will invest **£160 million into modern ports and manufacturing infrastructure**, providing high quality employment in coastal regions. We will also enable the **delivery of 60% UK content in offshore wind projects**, as set out by the industry, through more stringent requirements for supply chains in the Contract for Difference auctions. This will help attract inward investment into manufacturing in the UK and increase our global competitiveness and expertise.

To integrate clean technologies like offshore wind, we must transform our energy system, building more network infrastructure and utilising smart technologies like energy storage. **Our Offshore Transmission Network Review** will set out our strategy to connect offshore wind in a clean and cost-effective way, and we will outline our plans for smart systems and introducing competition in onshore networks in the forthcoming Energy White Paper.

Advancing offshore wind could deliver...		
Support for up to <b>60,000 jobs</b> in 2030	Around <b>£20bn</b> of private investment by 2030	Savings of <b>21MtCO<sub>2</sub>e</b> between 2023 and 2032, or <b>5%</b> of 2018 UK emissions

### Policy impacts

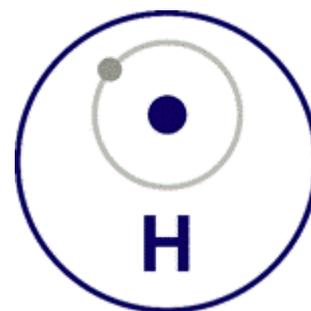

- Our commitment to a 40GW offshore wind target could help bring forth around £20bn of private investment in renewable energy.
- Co-ordinated offshore wind connection could deliver up to £6bn in consumer savings by 2050, significantly reducing environmental and social impacts on coastal communities.
- An estimated 60% of spending on UK offshore wind will be invested back into the economy by 2030.

### Target Milestones

<b>2020</b>	Competitive process launched to support modern, integrated portside infrastructure
<b>2021</b>	Consult on the introduction of more stringent supply chain plan requirements, and support up to twice the capacity of renewable generation in the next CfD round, with onshore wind and solar projects eligible to bid for CfD contracts
<b>2021</b>	The Offshore Transmission Network Review will publish an update by the end of the year, with a view to providing clarity for an enduring approach in 2021

## Point 2: Driving the Growth of Low Carbon Hydrogen

Hydrogen is the lightest, simplest and most abundant chemical element in the universe. It could provide a clean source of fuel and heat for our homes, transport and industry. The UK already has world-leading electrolyser companies, and unparalleled carbon capture and storage sites that we can maximise. Working with industry the UK is aiming for 5GW of low carbon hydrogen production capacity by 2030. Hubs where renewable energy, CCUS and hydrogen congregate will put our industrial ‘SuperPlaces’ at the forefront of technological development. We are also pioneering hydrogen heating trials, starting with a Hydrogen Neighbourhood and scaling up to a potential Hydrogen Town before the end of this decade.

Working **alongside partners in industry, our aim is for the UK to develop 5GW of low carbon hydrogen production capacity by 2030** that could see the UK benefit from around 8,000 jobs across our industrial heartlands and beyond. This will be supported by a range of measures, including a **£240 million Net Zero Hydrogen Fund**, and setting out next year, our hydrogen business models and a revenue mechanism for them to bring through private sector investment.

The UK is already a world leader in investigating the use of hydrogen for heating, replacing fossil fuels like natural gas with hydrogen and hydrogen blends. We are keen to accelerate this work and support industry. For example, Ofgem will publish details later this month on the proposed **network demonstration** in the Levenmouth area of Fife, intended to provide hydrogen to 300 homes over a four-year period. Simultaneously, we are scaling-up the electric heat pump market, ensuring we can exploit a range of low carbon heating options available for UK consumers.

Producing low carbon hydrogen at scale will be made possible by carbon capture and storage infrastructure, and we plan to grow both of these new British industries side by side so our industrial ‘**SuperPlaces**’ are envied around the world. We will also build on our success in offshore wind and other renewables, to bring forward the zero-carbon hydrogen of the future. Together this will develop resilient supply chains, support jobs and position UK companies at the forefront of an exciting growing global market, as well help things like industrial processes, industrial heat, power, shipping and trucking to make the shift to net zero.

### Driving the growth of low carbon hydrogen could deliver...

<p>Support for up to <b>8,000 jobs</b> by 2030, potentially unlocking up to <b>100,000 jobs</b> by 2050 in a high hydrogen net zero scenario</p>	<p>Over <b>£4bn</b> of private investment in the period up to 2030</p>	<p>Savings of <b>41MtCO<sub>2</sub>e</b> between 2023 and 2032, or <b>9%</b> of 2018 UK emissions</p>
--	--	---

### Policy impacts

- Aiming for 5GW Hydrogen production capacity by 2030 in partnership with industry.
- Lower carbon heating and cooking with no change in experience for domestic consumers through hydrogen blends and reducing the emissions of the gas used by up to 7%.

### Target Milestones

<b>2021</b>	Publish our Hydrogen Strategy and begin consultation on Government's preferred business models for hydrogen
<b>2022</b>	Finalise hydrogen business models
<b>2023</b>	Work with industry to complete testing necessary to allow up to 20% blending of hydrogen into the gas distribution grid for all homes on the gas grid
<b>2023</b>	By 2023 we will support industry to begin hydrogen heating trials in a local neighbourhood
<b>2025</b>	We hope to see 1 GW of Hydrogen production capacity
<b>2025</b>	Will support industry to begin a large village hydrogen heating trial, and set out plans for a possible pilot hydrogen town before the end of the decade

### Case study: ITM POWER

ITM Power is a manufacturer of PEM (proton exchange membrane) electrolyzers, a technology which enables the generation of hydrogen from water and are active in projects in the UK and throughout Europe. The company is based in Sheffield. Coupled with a renewable energy supply, this production method is capable of producing zero carbon hydrogen. The Gigastack project explores the potential to scale up electrolyser size and integrate those units with offshore wind facilities. BEIS is currently supporting a consortium led by ITM Power along with Orsted, Phillips 66, and Element Energy through its Low Carbon Hydrogen Supply Programme.

## Point 3: Delivering New and Advanced Nuclear Power

Our electricity system will grow and could double in size by 2050 as demand for low-carbon electricity in sectors like heat and transport rises. Nuclear power provides a reliable source of low-carbon electricity. We are pursuing large-scale nuclear, whilst also looking to the future of nuclear power in the UK through further investment in Small Modular Reactors and Advanced Modular Reactors.

The UK was home to the world’s first full-scale civil nuclear power station more than sixty years ago, and this industry now employs around 60,000 people in the UK. We see the ongoing potential of this technology. Whether a large-scale power plant, or next generation technologies such as Small and Advanced Modular Reactors, new nuclear will both produce low carbon power and create jobs and growth across the UK. We are pursuing **large-scale new nuclear projects**, subject to value-for-money. To support this, we will provide development funding.

Alongside this, we are also looking to invest further in the next generation of nuclear technology. Subject to value-for-money and future spending rounds, we are announcing **up to £385 million in an Advanced Nuclear Fund**. This will enable investment of up to **£215 million into Small Modular Reactors** to develop a domestic smaller-scale power plant technology design that could potentially be built in factories and then assembled on site. It will unlock up to £300 million private sector match-funding.

We are also committing **up to £170 million for a research and development programme on Advanced Modular Reactors**. These reactors could operate at over 800°C and the high-grade heat could unlock efficient production of hydrogen and synthetic fuels, complementing our investments in carbon capture, utilisation and storage (CCUS), hydrogen and offshore wind. Our aim is to build a demonstrator by the early 2030s at the latest to prove the potential of this technology and put the UK at the cutting edge against international competitors.

To help bring these technologies to market, we will invest an additional **£40 million in developing the regulatory frameworks and supporting UK supply chains**.

New and advanced nuclear power could deliver...		
A large-scale nuclear power plant will support a peak of around <b>10,000 jobs</b> during construction	Government support could unlock significant private investment, up to <b>£300m</b> for development of small modular reactors alone	Each GW of nuclear power generation is enough to power <b>2 million homes</b> with clean electricity

## Policy impacts

- Key role for nuclear in delivering deep decarbonisation of our electricity system, alongside renewables and other technologies.
- High-skilled jobs created and sustained across the UK.
- Likely role for AMRs in decarbonising industry, heat and transport.

## Target Milestones

<b>2020</b>	Publication of the Energy White Paper
<b>2021</b>	Proposed launch of Phase 2 of UK SMR design development
<b>Mid 2020s</b>	Hinkley Point C comes online
<b>Early 2030s</b>	First SMRs and AMR demonstrator deployed in the UK

## Case study: Hinkley Point C

The main construction for Hinkley Point C in Somerset started in 2016. It is one of the largest and most complex construction projects in the UK and is expected to take approximately ten years. The project will create around 25,000 employment opportunities during construction and 900 jobs throughout 60 years that it will be operational.

The developer originally predicted that during construction, the South West economy would receive a boost of £1.5 billion, while during operation, a contribution of £40 million a year will be made. In May 2020, the developer reported that £1.67 billion had already been spent with companies in the South West.

## Point 4: Accelerating the Shift to Zero Emission Vehicles

Zero emission vehicles can be our most visible incarnation of our ability to simultaneously create jobs, strengthen British industry, cut emissions, and continue travelling. From 2030 we will end the sale of new petrol and diesel cars and vans, 10 years earlier than planned. However, we will allow the sale of hybrid cars and vans that can drive a significant distance with no carbon coming out of the tailpipe until 2035. The accompanying support package of £2.8 billion demonstrates our continued faith in British car manufacturing as the backbone of UK industry in the West Midlands, Wales and the North, bringing jobs and investment back into the UK whilst simultaneously reducing greenhouse gas emissions and improving the air we breathe.

The UK is a leading a manufacturer of Electric Vehicles. The Nissan Leaf, produced in the UK, was the third highest selling EV in Europe in 2019. There are over 100 models of EVs on the market, and by 2025 nearly as many models as with conventional petrol and diesel vehicles are expected. With cars and vans making up nearly a fifth of emissions, **we are taking decisive action to end the sale of new petrol and diesel cars and vans by 2030, with all vehicles being required to have a significant zero emissions capability (e.g. plug-in and full hybrids) from 2030 and be 100% zero emissions from 2035.** We will work with industry to make the transition to ensure it remains one of Britain's success stories. Alongside this new phase-out date, we will **publish a Green Paper next year on the UK's post-EU emissions regulations.** As we move forward with this transition, we will need to ensure that the tax system encourages the uptake of EVs and that revenue from motoring taxes keeps pace with this change, to ensure we can continue to fund the first-class public services and infrastructure that people and families across the UK expect.

We must take advantage of the once in a generation opportunity to build a world-leading EV supply chain here in the UK and improve air quality in our towns and cities. We have committed up to **£1 billion to support the electrification of UK vehicles and their supply chains, including developing "Gigafactories" in the UK** to produce the batteries needed at scale. A single factory could employ around 2,000 people in highly skilled jobs. We are **announcing the first £500 million of investment this Parliament** to drive the electrification of the UK automotive sector, protect existing jobs including in the West Midlands, Wales and the North and support thousands of high-quality jobs across the UK.

We will invest **£1.3 billion to accelerate the roll out of charging infrastructure**, targeting support on rapid charge points on motorways and major roads to dash any anxiety around long journeys, and installing more on-street charge points near homes and workplaces to make charging as easy as refuelling a petrol or diesel car. And whilst the costs of EVs are already falling, we will provide **£582 million to extend the Plug-in Car, Van, Taxi and Motorcycle grants to 2022–23** to reduce their sticker price for the consumer.

We will also **consult on a date for phasing out the sale of new diesel heavy goods vehicles** (HGVs). We will invest **£20 million next year in freight trials** to pioneer hydrogen and other zero emission lorries, to support industry to develop cost-effective, zero-emission HGVs in the UK.

### Accelerating the shift to zero emission vehicles could deliver...

Support for around <b>40,000</b> <b>new jobs</b> in 2030	Around <b>£3bn</b> of private investment by 2026	Savings of around <b>5MtCO<sub>2</sub>e</b> to 2032 and <b>300MtCO<sub>2</sub>e</b> to 2050
--	---	---

### Policy impacts

- Realising carbon savings of around 300 Mt CO<sub>2</sub> e to 2050.
- Thousands more ultra-low and zero-emission cars and vans on UK roads, supported by additional funding for plug in vehicle grants.
- Thousands more charge points in homes, workplaces, in residential streets and along motorways and major A roads.

### Target Milestones

<b>2021</b>	We will publish a Delivery Plan setting out key milestones to deliver the new phase out dates
<b>2021</b>	We will publish a Green Paper on the UK's post EU emissions regulations and the car and van phase out dates, as well as launch a consultation on the phase out of new diesel HGVs
<b>2030</b>	We expect the network of charge points on England's motorways and major A road to be extensive with more than 2,500 high powered charge points that can charge your car so it can drive over 100 miles, all in the time it takes to have a cup of coffee
<b>2030</b>	End of sales of new petrol and diesel cars and vans
<b>2035</b>	All new cars and vans will be zero-emission from the tailpipe leading to cleaner, greener vehicles on UK roads. England's motorways and major A roads will have around 6,000 high powered charge points

## Point 5: Green Public Transport, Cycling and Walking

As well as decarbonising private vehicles, we must increase the share of journeys taken by public transport, cycling and walking. We will therefore accelerate the transition to more active and sustainable transport by investing in rail and bus services, and in measures to help pedestrians and cyclists. We will fund thousands of zero-emission buses and give our towns and cities cycle lanes worthy of Holland. This will improve the air we breathe and increase both mental and physical health, as well as reduce emissions.

We will invest tens of **billions of pounds in enhancements and renewals of the rail network, £4.2 billion in city public transport and £5 billion on buses**, cycling and walking, as announced by the Prime Minister in February. We will **electrify more railway lines**; end the complicated franchising model and create a simpler, more effective system; and create integrated bus and train networks in more places, with smart ticketing, more frequent services, and bus lanes to speed journeys. We will **invest £120 million next year to begin the introduction of at least 4,000 more British built zero emission buses**. Early next year, we will publish the first-ever **National Bus Strategy**, funded through the £5 billion of new money for buses and cycling announced by the Prime Minister, including more frequent and cheaper "superbus" networks and integrated ticketing between operators and modes. We will fund at least two **all-electric bus towns, beginning this financial year, as well as developing the first fully zero-emission city centre**.

We will expand rail routes around our big regional cities, including Manchester and Birmingham. As set out in the manifesto, our long-term aim is to improve public transport in city regions to make it as good as London's, which would save thousands of tonnes of carbon. In smaller places, we will improve buses, introduce more rural on-demand services, and restore many of the rail links removed in the Beeching era to give people the choice not to drive. We will progress the **Midlands Rail Hub** scheme in Birmingham and improvements in Manchester and Leeds, alongside Northern Powerhouse Rail to improve east-west links across the Pennines.

We will build first hundreds, then thousands, of miles of **segregated cycle lane and create more low-traffic neighbourhoods** to stop rat-running and allow people to walk and cycle. We will expand school streets, which have caused dramatic falls in traffic and pollution around schools. We have already started this transformation with £250 million spending this year as part of the PM's announcement that we will spend £2 billion over this Parliament. A new body, **Active Travel England**, will hold the budget, inspect schemes, and assess local authorities for their performance on active travel. We will also launch a national programme of support to increase uptake of electric bikes.

Decarbonising our public transport could deliver...		
Up to <b>3,000</b> jobs by 2025	Government investment of <b>£5bn</b> in buses, cycling and walking this parliament	Savings of around <b>2MtCO<sub>2</sub>e</b> from green buses, cycling and walking between 2023 and 2032

### Policy impacts

- We will bring 4,000 zero emission buses onto our roads, representing 12% of the local operator bus fleet in England.
- We will further electrify regional and other rail routes.
- We will launch the first-ever National Bus Strategy, as part of the PM’s £5 billion funding, integrated ticketing between operators and modes and more bus lanes, making services faster, more attractive and cheaper to operate.
- We will spend £500 million reopening lines and stations closed under the Beeching cuts.
- Over 1,000 miles of safe and direct cycling and walking networks delivered by 2025 with network plans developed and being built out in every town and city in England.

### Target Milestones

<b>Early 2021</b>	National Bus Strategy and first electric bus town
<b>2021</b>	First of 4,000 new zero-emission buses delivered
<b>2023–2024</b>	First rail lines reopened
<b>2025</b>	Cycle training available to every school child and adult who wants it
<b>By 2025</b>	We will double cycling rates from 2013 levels to 1.6 billion stages per year

## Point 6: Jet Zero and Green Ships

We will position the UK at the forefront of aviation and maritime technology to push forward low carbon travel and build on UK strengths. By taking immediate steps to drive the uptake of sustainable aviation fuels, investments in R&D to develop zero-emission aircraft and developing the infrastructure of the future at our airports and seaports – we will make the UK the home of green ships and planes. Internationally, we will continue to lead efforts to find solutions to global aviation and maritime emissions, including using our COP Presidency to develop a sector-led goal.

A century ago, a Mancunian and a Glaswegian completed the first non-stop transatlantic flight and created civil aviation. Fast-forward to September 2020 when the first commercial aircraft powered by a hydrogen fuel cell took off in Cranfield. British innovation will unlock the world of sustainable fuels, turning these fossil fuel intensive journeys into lower carbon routes of transportation that allow the opportunity of global travel whilst also safeguarding our planet. To achieve this, we have established the **Jet Zero Council** as a sector-wide partnership to accelerate the development and adoption of new technologies to help develop our strategy to reach net zero aviation, which we will set out next year. We are investing **£15 million into FlyZero** – a 12-month study, delivered through the Aerospace Technology Institute (ATI), into the strategic, technical and commercial issues in designing and developing zero-emission aircraft that could enter service in 2030.

Moving to sustainable fuels is one of the key steps to success that we can unlock. We will run a £15 million competition to support the production of **Sustainable Aviation Fuels (SAF)** in the UK, building on the success of the Future, Fuels for Freight and Flight Competition. We will establish a SAF clearing house, the first of its kind in Europe, to enable the UK to certify new fuels, driving innovation in this space. Alongside this, we intend to **consult on a Sustainable Aviation Fuel mandate** to blend greener fuels into kerosene, which will create a market-led demand for these alternative fuels. To support the emergence of a market in zero emission aircraft we will invest in R&D into the infrastructure upgrades required at UK airports to move to battery and hydrogen aircrafts.

The UK has a strong history in shipbuilding, with the maritime sector employing 185,000 people. To complement our work on aviation, we will invest **£20 million into the Clean Maritime Demonstration Programme** to develop clean maritime technology. We are already running hydrogen ferry trials in Orkney and due to launch a hydrogen refuelling port in Teesside, as we seek to revitalise our ports and coastal communities.

Taking action on net zero aviation and green ships could deliver...		
<p>Up to <b>5,200 jobs</b> supported by a domestic SAF industry</p>	<p>Future proofing the aerospace industry which is worth <b>£12bn</b> to the economy</p>	<p>Savings of up to <b>1MtCO<sub>2</sub>e</b> by 2032 from clean maritime and nearly <b>15MtCO<sub>2</sub>e</b> by 2050 from SAF</p>

### Policy impacts

- These measures will enable the production of sustainable aviation fuels in the UK, supporting industry and driving fuel uptake.
- Our action will cement our position as a global leader in aerospace, (worth £12 billion to the UK economy), and position the UK at the forefront of the zero-emission aircraft revolution.

### Target Milestones

- |             |  |
|-------------|--|
| <b>2021</b> | We will consult on the Aviation Decarbonisation Strategy   |
| <b>2025</b> | We will consult on a SAF mandate and run a £15 million competition for fuel plants in 2021, with a mandate possibly starting in 2025 |

## Point 7: Greener Buildings

We will put our homes, workplaces, schools and hospitals at the heart of our green economic recovery, supporting 50,000 jobs and building new supply chains and factories in the UK. Making our buildings more energy efficient and moving away from fossil fuel boilers will help make people's homes warm and comfortable, whilst keeping bills low. We will go with the grain of behaviour, and set a clear path that sees the gradual move away from fossil fuel boilers over the next fifteen years as individuals replace their appliances and are offered a lower carbon, more efficient alternative.

Action on buildings can rapidly support jobs and level-up across the country. In addition to supporting around 50,000 jobs by 2030, today's announcements provide an opportunity to develop the growing UK heat pump manufacturing base and expand supply chains for building efficiency. Funding and regulatory measures, delivered in partnership with industry, will stimulate near-term investment whilst supporting the most vulnerable.

To future-proof new buildings and avoid the need for costly retrofit, we will seek to **implement the Future Home Standard in the shortest possible timeline, and consult shortly on increased standards for non-domestic buildings** so that new buildings have high levels of energy efficiency and low carbon heating. As is the common theme across this plan, we want to stimulate investment and manufacturing in the UK. **We will aim for 600,000 heat pump installations per year by 2028**, creating a market led incentive framework to drive growth, and will bring forward regulations to support this especially in off gas grid properties. This ambition still leaves open the choice as to whether we ultimately pursue hydrogen heating, an electrified heating system, or a mixture of both, whilst we continue to pilot the options.

We are providing **£1 billion** to extend the schemes announced by the Chancellor earlier in the year to further kickstart this market. We will extend the **Green Homes Grant** for another year to improve the energy efficiency of homes and replace fossil fuel heating. We will reduce emissions in schools, hospitals and public buildings by further funding for **Public Sector Decarbonisation Scheme**. We will transform the lives of more homeowners who live off the gas grid, particularly in rural areas, with upgrades to their heating systems through the **Homes Upgrade Grant**. And we will commit to further funding for the **Social Housing Decarbonisation Fund** to continue upgrading the least efficient social housing.

Private renters too will benefit, as we **strengthen energy efficiency requirements for private sector landlords**. To support those least able-to-pay, we will **extend the Energy Company Obligation to 2026**, so suppliers can help improve the draughtiest and coldest homes.

To go with the grain of consumer habits, we will improve energy efficiency standards of household products so they use less energy and materials, helping households and

businesses reduce their bills with minimal effort, including by launching an **improved Energy Technology List website**. And we will kickstart the green home finance market by **consulting on introducing mandatory disclosure requirements for lenders on the energy performance of homes** on which they lend and setting voluntary improvement targets.

Developing greener buildings could deliver...		
Support for around <b>50,000 jobs</b> in 2030	Around <b>£11bn</b> Of private investment in the 2020s	Savings of <b>71MtCO<sub>2</sub>e</b> between 2023 and 2032, or <b>16%</b> of 2018 UK emissions

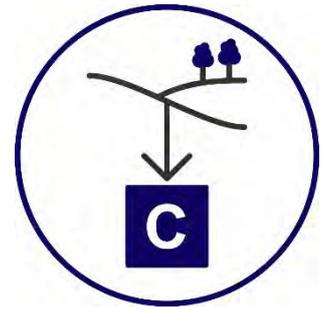

### Policy impacts

- We are setting an ambition of 600,000 heat pumps installations per year by 2028.
- Homes built to the Future Homes Standard will be ‘zero carbon ready’ and have 75–80% lower carbon dioxide emissions than those built to current standards.
- Our green home finance initiatives could help to improve the energy efficiency of around 2.8 million homes, improving around 1.5 million to EPC C standard by 2030.

### Target Milestones

<b>2021</b>	Set out our Heat and Buildings Strategy
<b>2021</b>	Launch a world class energy related products policy framework. We will push for products to use less energy, resources, and materials, saving carbon and helping households and businesses to reduce their energy bills with minimum effort
<b>By 2032</b>	Ensure that the public sector has reduced its direct emissions by 50% compared to a 2017 baseline

## Point 8: Investing in Carbon Capture, Usage and Storage

Carbon Capture, Usage & Storage (CCUS) will be an exciting new industry to capture the carbon we continue to emit and revitalise the birthplaces of the first Industrial Revolution. Our ambition is to capture 10Mt of carbon dioxide a year by 2030, the equivalent of four million cars' worth of annual emissions. We will invest up to £1 billion to support the establishment of CCUS in four industrial clusters, creating 'SuperPlaces' in areas such as the North East, the Humber, North West, Scotland and Wales. We will bring forward details in 2021 of a revenue mechanism to bring through private sector investment into industrial carbon capture and hydrogen projects via our new business models to support these projects.

CCUS technology captures carbon dioxide from power generation, low carbon hydrogen production and industrial processes, storing it deep underground where it cannot enter the atmosphere. This technology will be globally necessary, but no one country has yet captured the market. The UK has an unrivalled asset – our North Sea, that can be used to store captured carbon under the seabed. Developing CCUS infrastructure will contribute to the economic transformation of the UK's industrial regions, enhancing the long-term competitiveness of UK industry in a global net zero economy. It will help decarbonise our most challenging sectors, provide low carbon power and a pathway to negative emissions.

**We will establish CCUS in two industrial clusters by mid 2020s, and aim for four of these sites by 2030, capturing up to 10 Mt of carbon dioxide per year.** Developed alongside hydrogen, we can create these transformative “**SuperPlaces**” in areas such as the heart of the North East, the Humber, North West and in Scotland and Wales. **Our £1 billion CCUS Infrastructure Fund** will provide industry with the certainty required to deploy CCUS at pace and at scale. These clusters will be the starting point for a new carbon capture industry, which could support up to 50,000 jobs in the UK by 2030, including a sizeable export potential. Alongside this, we will bring forward details in 2021 of a revenue mechanism to bring through private sector investment in industrial carbon capture and hydrogen projects, to provide the certainty investors require.

## Investing in carbon capture usage and storage could potentially deliver...

<p>Support for around <b>50,000 jobs</b> by 2030<sup>3</sup></p>	<p>Up to <b>£1.bn</b> of public investment by 2025</p>	<p>Savings of around <b>40MtCO<sub>2</sub>e</b> between 2023 and 2032, or <b>9%</b> of 2018 UK emissions</p>
--	--	--

### Policy impacts

- Ambition to capture and store 10Mt of CO<sub>2</sub> per year by 2030 – the equivalent of all the industrial emissions in the Humber or taking around 4 million cars off the road.
- We will facilitate the deployment of CCUS in four clusters by 2030.

### Target Milestones

<b>2021</b>	Execute a process for CCUS deployment, working in collaboration with industry and set out further details of a revenue mechanism for industrial carbon capture and hydrogen projects
<b>2022</b>	New CCUS business models finalised
<b>2030</b>	Two clusters operational by the mid 2020s, subject to relevant value for money and affordability considerations and a further two clusters operational by 2030

### Case study: Tata CCUS

Tata Chemicals Europe (TCE) are constructing, with the support of a £4.2 million grant from BEIS, the UK's first industrial-scale Carbon Capture & Utilisation (CCU) demonstration plant at their site in Northwich, for the manufacture of high purity sodium bicarbonate. The plant will be commissioned in 2021 and is capable of capturing up to 40,000 tons per year of carbon dioxide and will reduce carbon emissions at the plant by 11 per cent. TCE exports 60% of its sodium bicarbonate production in the UK to over 60 countries across the globe. The CCU project will be a springboard for TCE to unlock further expansion into its export markets.

<sup>3</sup> BEIS internal analysis using Energy Innovation Needs Assessment calculators.

## Point 9: Protecting Our Natural Environment

The natural environment is one of the most important and effective solutions we have for capturing and sequestering carbon long-term. We will safeguard our cherished landscapes, restore habitats for wildlife in order to combat biodiversity loss and adapt to climate change, all whilst creating green jobs.

We will protect our natural environment through the creation of **new National Parks and Areas of Outstanding Natural Beauty (AONB)**. We will start the process for designating more of England's beautiful and iconic landscapes as National Parks and AONBs, safeguarding these areas for future generations and bringing more people within closer reach of nature. These new National Landscapes will play a key role in meeting the Government's commitment to protect and improve 30% of UK land by 2030.

We will immediately create more green jobs with a **£40 million second round of the Green Recovery Challenge Fund**. This fund will help create and retain thousands of jobs to work on nature conservation and restoration projects across England helping to improve biodiversity and tackle climate change.

We are acting now to protect our precious landscapes and create nature restoration jobs. We will also accelerate the vital work needed to restore our natural ecosystems with the establishment of 10 long-term Landscape Recovery projects over the next four years. These Landscape Recovery projects will pilot land use change to restore wilder landscapes in England helping to sequester carbon and establish a Nature Recovery Network. And as we leave the EU, our new **Environmental Land Management** scheme will be a key vehicle in our efforts to combat climate change whilst also delivering other environmental benefits, by incentivising land management actions such as tree planting and peatland restoration. We will **launch Environmental Land Management pilots next year** as we move away from the Common Agricultural Policy, alongside Productivity Grants for farmers to invest in modern technology to make their businesses more efficient and more profitable, while reducing their emissions.

Investment in flood defences will protect our homes, businesses, and communities from the risk of flooding, whilst also safeguarding our natural environment and helping us adapt to our changing climate. We will **invest £5.2 billion in a six-year programme for flood and coastal defences** including new innovative approaches to work with the power of nature to not only reduce flood risk, but deliver benefits for the environment, nature and communities.

### Protecting our natural environment could deliver...

<p>Up to <b>20,000 jobs</b> from improving flood defences by 2027</p>	<p>Up to <b>£5.2bn</b> of investment for flood defences</p>	<p><b>Climate and biodiversity benefits</b> from protecting our national landscapes</p>
---	---	---

### Policy impacts

- Increasing the Green Recovery Challenge Fund to £80 million will mean that over 100 nature projects are delivered on the ground over the next 2 years.
- New National Parks, AONB designations and Landscape Recovery projects will protect up to an additional 1.5% of natural land in England, contributing to our target of protecting 30% of UK land by 2030.
- Establishing 10 Landscape Recovery projects could create the equivalent of well over 30,000 football pitches of wildlife rich habitat.
- Investment in flood defences will support 2,000 flood schemes across every region of England and will better protect over 336,000 properties from risk of flooding.

### Target Milestones

<b>2020–2021</b>	From the end of 2020 we will award the first £40 million in a range of nature projects across England through the Green Recovery Challenge Fund, with a second-round worth up to a further £40 million in 2021
<b>2021</b>	In 2021 we aim to start the process for designating new National Parks and AONBs
<b>2021</b>	Starting in 2021, we will invest £5.2 billion in a six-year capital investment programme for flood and coastal defences
<b>2022–2024</b>	Between 2022 and 2024 we aim to initiate 10 long-term Landscape Recovery projects

## Point 10: Green Finance and Innovation

Unleashing innovation and developing new sources of finance are fundamental for further developing the green technologies for net zero. We have committed to raising total R&D investment to 2.4% of GDP by 2027 and in July 2020 published the UK Research and Development Roadmap. The next phase of green innovation will help bring down the cost of the net zero transition, nurture the development of better products and new business models, and influence consumer behaviour.

Our vision is for the UK to be a global leader in the technologies needed to decarbonise our economies and transition to net zero. Through our world class innovators, entrepreneurs and finance institutions we will focus progress on the key technologies of the future. Alongside specific green policies, this will also be backed by the record increase in public investment in research and development and the new agency designed to fund our scientists to pursue high risk, high reward work that might create a step change in the world's path to net zero.

To accelerate the commercialisation of innovative low-carbon technologies, systems and processes in the power, buildings, and industrial sectors, we will launch the **£1 billion Net Zero Innovation Portfolio**. The portfolio will focus on ten priority areas that correspond with this Ten Point Plan, including: floating offshore wind; nuclear advanced modular reactors; energy storage and flexibility; bioenergy; hydrogen; homes; direct air capture and advanced CCUS; industrial fuel switching; and disruptive technologies such as artificial intelligence for energy. We have already launched the first phase of a **£100 million investment in brand-new Greenhouse Gas Removals including Direct Air Capture** in November 2020, which captures carbon dioxide emissions directly from the air. We will **provide £100 million for Energy Storage and Flexibility innovation challenges** – essential technology as we move towards an increasingly renewables-heavy system to allow us to store energy over hours, days and even months.

We are doubling down on our ambition to be the first country in the world to **commercialise fusion energy technology**, enabling low carbon and continuous power generation. We are already providing £222 million for the visionary STEP programme (Spherical Tokamak for Energy Production), which aims to build the world's first commercially viable fusion power plant in the UK by 2040, and £184 million for new fusion facilities, infrastructure and apprenticeships to lay the foundations of a global hub for fusion innovation in the UK.

Across land and sea, we will invest in transport innovation to trial and deploy new technologies, building on the world leading expertise of UK businesses and by investing **£3 million in the Tees Valley Hydrogen Transport Hub**. On roads, the Government will invest **£20 million across trials of zero emission heavy goods vehicles**, testing technologies at scale. We will also continue to support climate ambition internationally and

grow global markets for clean technologies through our International Climate Finance programmes. Since June 2020, we have already committed £170 million to support green recovery across Latin America, Africa and Asia.

Delivering clean investment at the scale and pace required will mean taking bold steps. That is why we will **issue the UK's first Sovereign Green Bond in 2021** subject to market conditions – and intend to follow up with a series of further issuances to meet growing investor demand for these instruments. These bonds will help finance sustainable projects, finance much-needed infrastructure investment and create green jobs across the country.

We will harness the international reputation of the UK's world leading financial sector to encourage private investment into supporting innovation and manage climate financial risk. In line with the recommendations of the Taskforce on Climate-related Financial Disclosures (TCFD), we intend to introduce **mandatory reporting of climate-related financial information across the economy by 2025, with a significant portion of mandatory requirements in place by 2023**. We will position the UK, and the City of London, as a leader in the global voluntary carbon markets, including in response to the recommendations of the independent Taskforce on Scaling Voluntary Carbon Markets. Furthermore, we will implement a **green taxonomy** that defines which economic activities tackle climate change and environmental degradation to help better guide investors. Combined, these measures will provide investors with clarity and a clear framework to deliver the low carbon finance needed for a net -zero economy by 2050. We recognise that these signals are powerful long-term markers for investments, alongside other tools – such as a clear carbon price as we leave the EU Emissions Trading System. HMT's Net Zero

Review will consider the choices across our tax, spend, regulatory and other levers to maximise growth opportunities and ensure an equitable balance of contributions across society.

To ensure we have the skilled workforce to deliver net zero, we have launched **the Green Jobs Taskforce**, working in partnership with business, skills providers and unions, to help us develop plans for new long-term good quality, green jobs by 2030 and advise what support is needed for people in transitioning industries. The taskforce will conclude its work in spring 2021, with the actions feeding into our Net Zero Strategy to be published later in the year.

Enhancing green finance and innovation could deliver...		
<p>The potential for <b>hundreds of thousands</b> of jobs by 2030</p>	<p><b>£1bn</b> of government funding in net zero innovation with <b>£1bn</b> of matched funding and potentially <b>£2.5bn</b> of follow on funding from the private sector</p>	<p>Enables <b>carbon savings</b> across low carbon sectors</p>

### Policy impacts

- By 2030, unlock the potential for 300,000 jobs in exports and domestic industry through new commercial opportunities across low carbon sectors.
- Enables savings across low carbon sectors.

### Target Milestones

<b>2020</b>	Publish priorities within the Net Zero Innovation Portfolio
<b>2021</b>	Remaining priority innovation challenges within the Net Zero Innovation Portfolio launched
<b>2022</b>	Start vessel trials in Orkney, work towards a hydrogen port in Tees Valley, and launch feasibility studies for several clean maritime clusters across the UK
<b>2022</b>	Announce the site for UK fusion power plant demonstrator

### **Case study: The Green Finance Institute – building partnerships to accelerate green finance**

The Green Finance Institute, launched in July 2019 is led by Chair, Sir Roger Gifford, senior banker at SEB and former Lord Mayor of the City of London, and CEO, Dr Rhian-Mari Thomas OBE, former Barclays executive.

Seed funded by the UK Government and the City of London Corporation, the Institute champions the UK's green finance brand internationally and brings together global experts and practitioners to co-design sector-specific solutions that channel capital towards a clean, resilient and environmentally sustainable economy.

The Institute's early successes have included establishing a Coalition for the Energy Efficiency of Buildings and subsequent Zero Carbon Heating Taskforce of over 200 expert members, launching a Green Finance Education Charter, developing the case for the UK's first Green Sovereign Bond from investors with more than \$10 trillion assets under management and co-hosting the Green Horizons Summit, which featured global leaders from the public and private sector and attracted over 300,000 viewers across 90 countries.

## Look Ahead: The Race to Zero

The Ten Point Plan ensures that our recovery from coronavirus will be green, generate jobs and bolster the economy, whilst continuing to drive down emissions both now and in the future. There is however more to be done to achieve net zero by 2050, and the Ten Point Plan represents one more step on the path to ending the UK's contribution to global emissions once and for all. In the coming year, we will set out further plans for reducing emissions across all the UK's major economic sectors as outlined below, including our overall Net Zero Strategy, which will clearly set out our pathway to achieving net zero emissions by 2050. These efforts need to be undertaken in parallel with adaptation action, building resilience to the effects of climate change we are already experiencing.

Climate change is a global issue, and the UK must use our own net zero ambition to encourage other nations to adopt similar targets. In November 2021, the UK will host the United Nations Framework Convention on Climate Change, Conference of the Parties (COP26), bringing together world leaders, climate experts, business leaders and citizens to agree ambitious action to tackle climate change. This December, the UK, along with the UN and France, will host a virtual leader-level Climate Ambition Summit to demonstrate the urgency of action and provide an important moment for international leaders to show they are committed to a greener, more resilient, sustainable path for the future.

In 2015 at COP21, the UK played a leading role in securing the agreement of 195 parties to sign up to the historic Paris Climate Agreement, setting a goal of limiting global temperature increases to well below 2°C (vs pre-industrial levels) and to pursue efforts towards a 1.5°C goal. Whilst progress has been made through the Paris Agreement, current commitments will not achieve the temperature goals that were set, instead implying a devastating rise of around 3°C of warming by 2100. Increased action at COP26 is therefore vital, and we will use our COP26 Presidency role to work through five priority areas – Adaptation and Resilience, Zero Emission Vehicles, Energy Transition, Nature, and Finance. We are also considering the UK's revised Nationally Determined Contribution (NDC), itself an embodiment of our efforts to reduce national emissions, and we will set this out by the Climate Ambition Summit. Our roadmap below of forthcoming announcements will demonstrate the UK's commitment and action in delivering on our net zero target, encouraging similar levels of ambition from businesses, organizations and nations around the world.

# Look Ahead

<p><b>Energy White Paper</b> </p> <p>The White Paper will set out how the transformation of our energy system can drive economic growth and jobs, all whilst reducing emissions, consistent with our 2050 net zero target, and keeping bills affordable. It signals the transition away from unabated fossil fuels to clean energy solution; setting out actions that build on our success in power generation, look forward to challenges in heat and industry, and provide support to our vital oil and gas sector as it adapts to a net zero world. As we undergo this change, our energy system will evolve, becoming more integrated, more dynamic and more decentralised. Our strategy enables us to exploit smart, digital-enabled technologies to drive competition and harness innovation for the benefit of consumers.</p>	<p><b>Transport Decarbonisation Plan</b> </p> <p>The Transport Decarbonisation Plan will set out how we will move further and faster to decarbonise the entire UK transport system. The bold and ambitious plan will take a holistic and cross-modal approach to put us on a pathway to net zero by 2050. Alongside delivering the technical measures required, the Transport Decarbonisation Plan will seek to maximise the benefits of decarbonisation through place-based solutions and developing the UK as a green transport leader.</p>	<p><b>Heat &amp; Buildings Strategy</b> </p> <p>The Heat &amp; Buildings Strategy will set out the immediate actions we will take for reducing emissions from buildings. These actions include the deployment of energy efficiency measures and low carbon heating as part of an ambitious programme of work required to enable key strategic decisions on how we achieve the mass transition to low-carbon heat and set us on a path to decarbonising all homes and buildings.</p>
<p><b>National Infrastructure Strategy</b> </p> <p>The government will publish the National Infrastructure Strategy, setting out how infrastructure can support the economic recovery and deliver our long term growth ambitions. The NIS will focus on decarbonising our infrastructure networks and levelling up the economy, as well as supporting private finance and accelerating infrastructure delivery through project Speed.</p>	<p><b>Industrial Decarbonisation Strategy</b> </p> <p>This strategy will set out the Government's vision for a prosperous, low carbon UK industrial sector in 2050. Working closely with the Devolved Administration partners, we will set out how the low carbon transition can support industrial competitiveness and the green recovery across the UK, including identifying opportunities for new markets and sectors to develop.</p>	<p><b>Hydrogen Strategy</b> </p> <p>The strategy will outline government's ambitions for a UK hydrogen economy, and set out the near-term actions that need to be taken to ensure low carbon hydrogen can play a vital role in decarbonising industry, heat and heavy transport, whilst also providing system value through grid balancing and integration of increasing levels of intermittent renewable electricity.</p>
<p><b>England Tree Strategy</b> </p> <p>The Tree Strategy will set out our long-term vision for trees, woodlands and forestry in England, and the role we expect them to play in tackling climate change and biodiversity loss. It will set out actions we will take over the coming years to move towards this vision and meet our manifesto commitment to increase planting to 30,000 hectares per year, building on the announcement of the £640m Nature for Climate Fund to support tree planting and peatland restoration.</p>	<p><b>Net Zero Strategy</b> </p> <p>This strategy will set out the Government's pathway for transitioning to a net zero economy, making the most of new growth and employment opportunities across the UK. Building on the sectoral plans we will bring forward in 2020/21, we will develop a comprehensive net zero strategy building on the 10 Point Plan. The strategy will also consider what is needed to enable change at scale over the next 30 years – the skills we need in the economy, the shifts to our energy systems, finance flows and behaviours at individual, local and national level required to fully decarbonise our economy, recognising the complex interactions between energy systems, land and individuals in a net zero world.</p>	<p><b>HMT Net Zero Review</b> </p> <p>The Net Zero Review will consider how the transition to net zero will be funded and where the costs will fall, helping ensure an equitable balance of contributions between households, businesses and taxpayers.</p>
<p><b>England Tree Strategy</b> </p> <p>The Tree Strategy will set out our long-term vision for trees, woodlands and forestry in England, and the role we expect them to play in tackling climate change and biodiversity loss. It will set out actions we will take over the coming years to move towards this vision and meet our manifesto commitment to increase planting to 30,000 hectares per year, building on the announcement of the £640m Nature for Climate Fund to support tree planting and peatland restoration.</p>	<p><b>Net Zero Strategy</b> </p> <p>This strategy will set out the Government's pathway for transitioning to a net zero economy, making the most of new growth and employment opportunities across the UK. Building on the sectoral plans we will bring forward in 2020/21, we will develop a comprehensive net zero strategy building on the 10 Point Plan. The strategy will also consider what is needed to enable change at scale over the next 30 years – the skills we need in the economy, the shifts to our energy systems, finance flows and behaviours at individual, local and national level required to fully decarbonise our economy, recognising the complex interactions between energy systems, land and individuals in a net zero world.</p>	<p><b>Nature Strategy</b> </p> <p>Our new strategy for nature will set our ambition to conserve and enhance England's biodiversity, delivering on our global targets under the Convention on Biological Diversity and the goals set out under our 25YEP. The Nature Strategy will be clearly linked to other strategies, including those for Trees, Peat and Pollinators. We plan to publish in 2021 but are already implementing key commitments such as the Nature Recovery Network.</p>

## Notes on figures

Any figures or values displayed without reference to a direct or external source have been calculated in accordance with standard HMG analysis procedure. Aggregate figures rely on simplifying assumptions without presuming macroeconomic market conditions and are subject to further consideration in upcoming sectoral strategies. For further guidance on methodology, see below.

**Emissions savings:** The figures estimate the amount of greenhouse gas emissions (in million tonnes of carbon dioxide equivalent or MtCO<sub>2</sub>e) saved in total over the period 2023–2032. This corresponds to the period of the UK's 4th and 5th Carbon Budgets and savings are relative to HMG's 2019 Energy and Emissions Projections (<https://www.gov.uk/government/publications/updated-energy-and-emissions-projections-2019>). Central estimates are presented based on HMG modelling and analysis.

**Jobs impacts:** The figures estimate the impact on jobs in the relevant low carbon sector and its supply chain in 2030. In most cases estimates are based on the number of full-time equivalent jobs and sustained HMG support required to deliver the deployment levels of low carbon technologies set out in the plan. Also accounted for are wider technology market opportunities. Central estimates are presented based on HMG analysis, drawing on sources such as the Energy Innovation Needs Assessment (<https://www.gov.uk/government/publications/energy-innovation-needs-assessments>).

**Investment:** The figures estimate the amount of public (directly HMG funded) and private sector expenditure on capital (i.e., physical assets such as property, technology, buildings, infrastructure, and equipment) over the period to 2030 unless specified otherwise.

Chapter 16 Top 40 priority infrastructure investments	131

# OVERALL

## Progress since 2010

55

major roads and local transport projects completed

King's Cross completed, along with improvements to over 400 other stations

Construction started on transformational projects like Mersey Gateway and the Northern Hub rail upgrade

More than 500 flood and coastal erosion defence improvement schemes completed

Roads Investment Strategy to treble spending on strategic roads investing a further £15 billion in over 100 schemes

£38bn

of spend on our railways in Network Rail Control Period 5

Hinkley Point C, High Speed 2 and Thames Tideway Tunnel due to start construction

Start of construction expected on more than 1,400 flood schemes, with £2.3 billion capital investment

## Plan to 2020-21

# OVER 2500 PROJECTS COMPLETED SINCE 2010

- Opening of new Heathrow Terminal 2 and Birmingham runway extension

Over  
1.5m

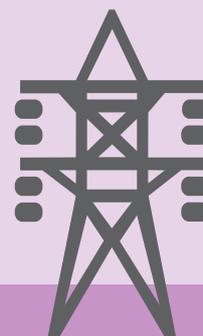

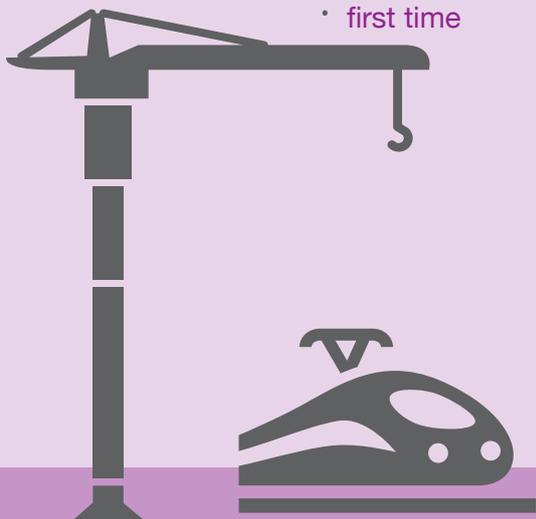

- homes and businesses with access to superfast broadband for the first time

£22bn

- of private-sector investment in water and waste water assets

Nearly  
20GW

- of new electricity generation capacity created – enough to power around 23 million homes

£46bn

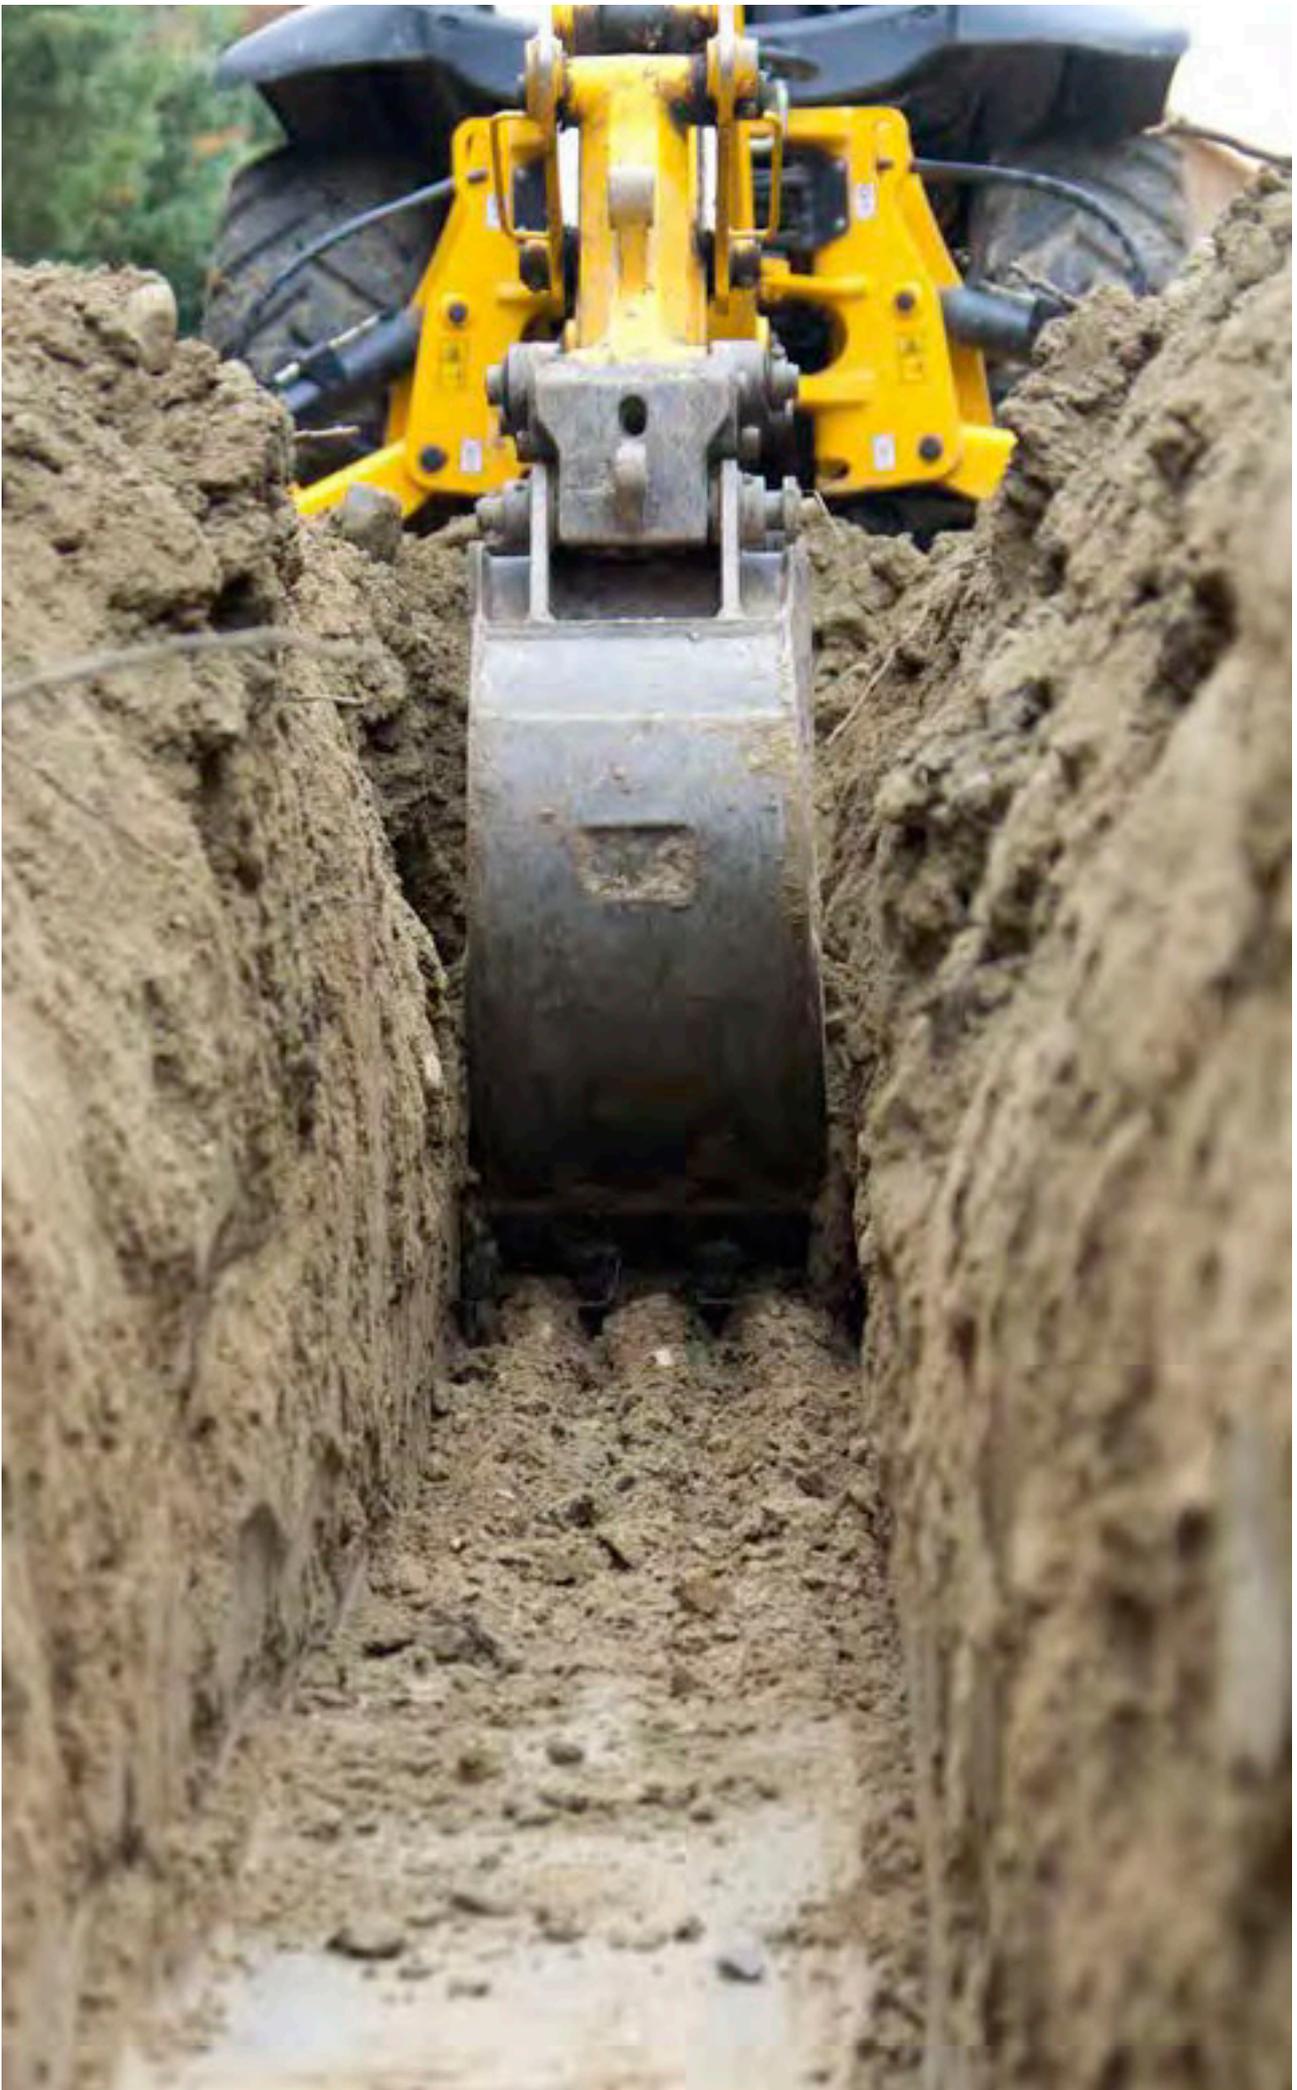

- of investment in gas and electricity networks in the pipeline

- Results of first Capacity Market auction and Contracts for Difference allocations due in 2015

- Francis Crick Institute due to be fully operational in 2016

- Final Airports Commission report to be published in summer 2015

**OVERALL INFRASTRUCTURE PIPELINE £466BN**  
**In construction £277bn**  
**Future investment £189bn**

# Executive summary

Improving the UK's productivity is a vital element of the government's Long-Term Economic Plan. High-quality infrastructure boosts productivity and competitiveness, allowing businesses to grow and enabling them to reach suppliers, deepen labour and product markets, collaborate and innovate and attract inward investment.

The choices that we make about infrastructure enable us to shape the type of economy and society that we want for the future. Infrastructure has the capacity to unlock economic potential in individual regions and ensure that growth and opportunities are distributed across the country, while also creating networks which bind together the different parts of the UK. Investment in infrastructure also helps the government to deliver new housing and business development where it is most needed.

The National Infrastructure Plan 2014 (NIP 14) sets out an ambitious infrastructure vision for the next parliament and beyond, reinforcing the government's commitment to investing in infrastructure and improving its quality and performance. It is underpinned by a pipeline of over £460 billion of planned public and private investment.<sup>1</sup>

The government is prioritising the public funding of infrastructure, putting in place the right policy framework to give investors the confidence to commit to long-term projects, and ensuring the supply chain has the certainty and tools it needs to deliver effectively. It recognises the importance of getting the fundamentals right – delivering our key projects and programmes on time and on budget – while also addressing longer-term challenges: integration, resilience, skills, and sustainability.

## Progress since 2010

Public and private infrastructure investment has increased in recent years. A top down analysis of average annual infrastructure investment between 2011 and 2014 has been refreshed for NIP 14. **HM Treasury estimates now indicate that average annual infrastructure investment is 15% higher in this parliament than it was in the previous parliament.**<sup>2</sup>

Of course, levels of investment are only meaningful if they translate to successful delivery. **Since 2010, over 2,500 different infrastructure projects or schemes have been completed.**

---

<sup>1</sup> This includes oil and gas investment for the first time.

<sup>2</sup> £47 billion in 2010-11 to 2013-14, compared with £41 billion in 2005-06 to 2009-10 (in 2013-14 prices). HM Treasury estimates, based on published sources. These figures are not comparable to pipeline data presented in this document, which is a forward-looking bottom-up assessment of planned infrastructure investment. Please refer to 'Methodology and Sources for National Infrastructure Plan 2014' for further information on how these estimates are calculated.

Some of these such as the King's Cross redevelopment are long-term projects which have been undertaken over a number of years – just as some of the projects to which the government is now committing will yield benefits in decades to come. Others are smaller in-year schemes which can have an immediate impact at a local level, for example, Highways Agency pinchpoint schemes which have been planned, constructed and completed within this parliament. All are crucial to meeting the UK's infrastructure needs.

A comprehensive update on delivery since 2010 is published as an annex to this document. Key highlights include:

- 55 major roads and local transport projects completed
- start of construction on transformational transport projects such as Mersey Gateway Bridge and Northern Hub
- completion of King's Cross, along with improvements to 400 other stations
- significant progress on Crossrail, the biggest construction project in Europe, which is on time and on budget, with almost 90% of tunnelling complete and flagship stations in construction
- completion of more than 500 flood and coastal erosion defence improvement schemes, improving the standard of protection to over 160,000 homes
- nearly 20GW of new electricity generation capacity created – enough to power around 23 million homes
- over 1.5 million homes and businesses with access to superfast broadband for the first time
- completion of Heathrow Terminal 2 and a runway extension at Birmingham Airport
- increase in container ports capacity of more than 3 million TEU,<sup>3</sup> including completion of the London Gateway port and logistics park

The government has also made significant progress in laying the foundations for long-term investment in key projects and programmes:

- the High Speed Rail Preparation Act received Royal Assent, a vital step forward in the delivery of HS2
- the Energy Act has provided the legislative basis for Electricity Market Reform, with the first 8 investment contracts for renewable projects awarded in Spring 2014, unlocking up to £12 billion of investment
- key commercial terms for Hinkley Point C have been agreed, and the project has now secured state aid approval from the European Commission
- the Airports Commission published its interim report in 2013 and is now consulting on shortlisted options
- Thames Tideway Tunnel received development consent and the tender process for construction of the tunnel is underway
- following a consultation on the location options for the lower Thames Crossing, one option has been dropped and work to develop the remaining two options continues to progress well

---

<sup>3</sup> Twenty-foot Equivalent Unit – a measure of container handling capacity

The government has also taken cross-cutting action to support long-term infrastructure investment and drive delivery:

- publishing the **first ever National Infrastructure Plan** bringing together for the first time its vision and approach for the key economic infrastructure sectors, supported by a robust and detailed infrastructure pipeline
- establishing the **UK Guarantees Scheme**, which has now approved support for projects worth around £4 billion
- **streamlining the planning regime** to ensure that decisions get made as quickly as possible
- **strengthening government delivery capability** and creating a Major Infrastructure Tracking unit within Infrastructure UK to monitor progress and address obstacles to delivery

## Infrastructure to 2020 and beyond

NIP 2014 builds on this progress by providing a clear forward-looking delivery plan for each of the economic infrastructure sectors.

The tough choices the government has made on day-to-day spending have enabled it to prioritise public investment in vital infrastructure. **This has enabled it to establish long-term funding certainty for the key areas where infrastructure is publicly funded – roads, rail, flood defences and science. All of the publicly funded elements of the infrastructure pipeline now represent a firm and specific government commitment.** This is vital in allowing us to take a strategic approach to investment and delivery and unlocking crucial efficiencies. It also gives the supply chain the confidence in the level of forthcoming infrastructure activity that is fundamental to investment decisions.

NIP 2014 builds on these commitments by setting out clear and fully funded delivery plans for the next parliament (including details of specific projects and programmes). Highlights include:

- **£15 billion of investment in the Strategic Road Network** as part of a new Road Investment Strategy which will include undertaking over 100 major schemes to 2020-21, including transformational projects for the A303 and A1 north of Newcastle
- **a £2.3 billion programme of flood investment investing in over 1,400 schemes to protect at least 300,000 homes;** underpinned by a detailed pipeline of individual schemes including at Oxford, Lowestoft, Yalding, River Thames and the Humber
- **a £38 billion Network Rail delivery programme,** including electrification of key lines, as well as commitments to transformational projects such as Crossrail, phase 1 of which is due to complete in 2018, and HS2, phase 1 of which is due to start construction in 2017
- continued support for digital infrastructure which will ensure that 95% of premises have access to superfast broadband by 2017
- an ambitious programme of investment in science infrastructure, including ground-breaking projects such as a new polar research ship and Met Office supercomputer

The majority of the infrastructure pipeline is expected to be privately funded and financed, and the NIP also includes plans for energy, water, waste, aviation and ports where most or all of the investment comes from the private sector. The government will continue to make sure that the conditions are right for such investment to come forward by upholding a competitive tax system and world-class regulatory regime. **NIP 14 sets out some key policy milestones to 2020-21 in these sectors, including:**

- **implementation of the final stages of Electricity Market Reform** to support long-term investment in electricity generation, with the first Capacity Market auction taking place in December 2014 and the first Contracts for Difference being allocated under the enduring regime in early 2015
- **publication of the Airports Commission's final report on airport capacity** in the South East in summer 2015

**This year's National Infrastructure Plan also includes detailed analysis of how the private-sector element of the pipeline will be funded and financed.** Since 2010, the government has implemented a number of initiatives to incentivise private investment, in particular the £40 billion UK Guarantees Scheme. Our world-class system of independent regulation continues to attract investment into sectors such as water, electricity and gas networks and telecommunications. Around a further £80 billion of project-specific finance (primarily in non-regulated sectors) is likely to be required between now and 2020. NIP 14 provides more detail than ever before on where these opportunities are expected to lie, providing transparency and clarity for investors, and setting out the action the government is taking to ensure that such investment comes forward.

To ensure value for money for taxpayers and consumers, the government's infrastructure plan must continue to be underpinned by a relentless focus on successful infrastructure delivery and performance. **NIP 14 sets out the action the government is taking to ensure effective delivery of its key projects, identify and address drivers of high costs and to address future delivery challenges,** focusing on issues such as skills, asset management, further improvements to streamline the planning system, and the integration and resilience of our key networks. The government has also refreshed its Top 40 priority investments to reflect changes in project status and ensure that they continue to reflect the government's priorities in each infrastructure sector. This is essential if it is to remain an effective tool for monitoring and supporting progress in infrastructure delivery. Annexes providing a detailed update on delivery since 2010, the top 40, and more detailed performance indicators for individual sectors are provided online.<sup>4</sup>

In addition to setting out detailed plans to the end of the decade, **NIP 14 sets the direction and ambition for the government's longer-term approach to infrastructure in each of the sectors that it covers.** While these plans are less detailed, the government is taking action now to ensure that it is well placed to meet the infrastructure challenges facing the UK in the 2020s and beyond.

<sup>4</sup> [www.gov.uk/government/collections/national-infrastructure-plan](http://www.gov.uk/government/collections/national-infrastructure-plan)

## Infrastructure pipeline

The NIP is underpinned by the infrastructure pipeline, which is a forward-looking, bottom-up assessment of planned public and private infrastructure investment in the UK.<sup>5</sup> The pipeline enhances visibility and certainty for investors and the supply chain and allows government to work more effectively to ensure that the UK's infrastructure needs are met.

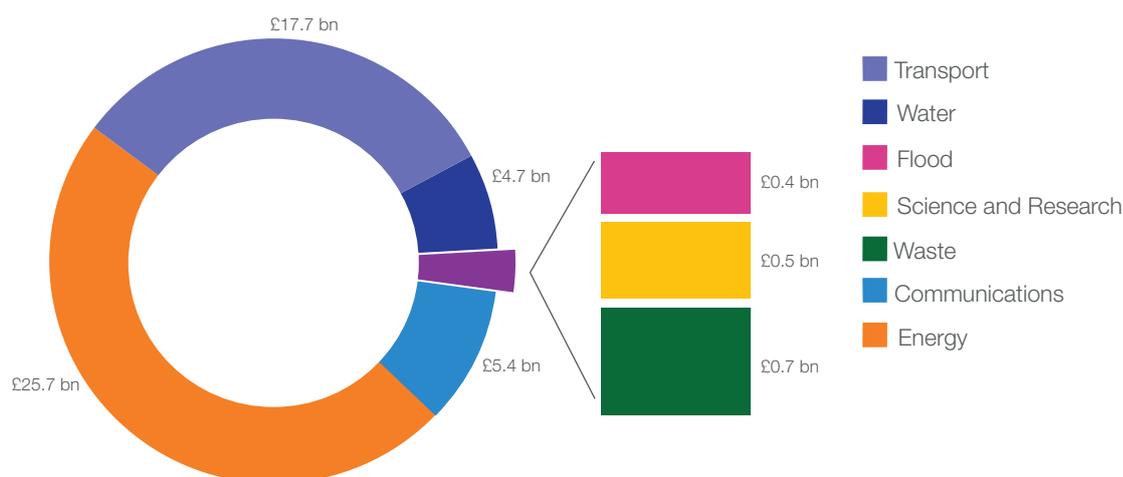

The refreshed infrastructure pipeline sets out over £460 billion of planned public and private investment to the end of the decade and beyond across the key infrastructure sectors. This includes upstream oil and gas investment for the first time – without oil and gas, the pipeline is £413 billion (this compares with £383 billion in NIP 2013<sup>6</sup>).

**Table ES.1: 2014 Infrastructure pipeline, by sector, 2014-15 onwards**

Sector	No of Projects	No of Programmes	Pipeline Value (£ bn)
Communications	1	5	11.0
Energy	77	70	274.9
<i>(of which Oil&amp;Gas)</i>	<i>0</i>	<i>1</i>	<i>53.0</i>
Flood	5	21	3.7
Science and Research	18	4	1.4
Transport	141	129	142.3
Waste	20	0	2.0
Water	1	59	30.9
<b>Total</b>	<b>263</b>	<b>288</b>	<b>£466</b>
<i>(excluding Oil&amp;Gas)</i>	<i>263</i>	<i>287</i>	<i>£413</i>

£55 billion of investment (including £12 billion oil and gas) is planned for 2015-16 alone and over £320 billion (including £53 billion oil and gas) up to 2020-21.

**Chart ES.1: 2014 infrastructure pipeline, by sector, spend in 2015-16**

Source: HM Treasury, Major Infrastructure Tracking Unit

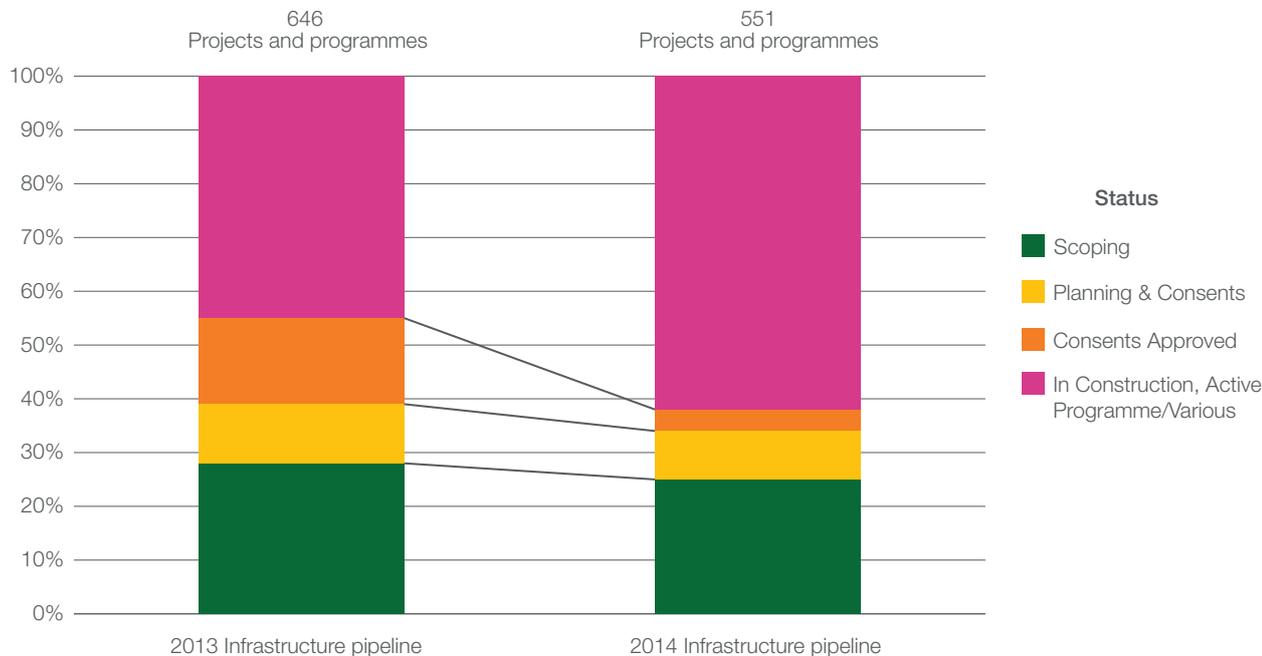

Note: Spend on energy in 2015-16 includes oil and gas of £12 billion

<sup>5</sup> The infrastructure pipeline includes projects and programmes with a capital value of c.£50 million and over.

<sup>6</sup> All pipeline figures are in 2013-14 prices. The pipeline published at NIP 2013 was £377 billion in 2012-13 prices

As is to be expected for a pipeline stretching well into the next decade, projects and programmes are at different stages of development. However, with government support, projects in the pipeline are making the crucial transition from scoping and planning into delivery and towards completion. Over 60% of the projects and programmes in the pipeline (excluding oil and gas) are now in construction or part of an active programme (compared with 45% in 2013).

**Chart ES.2: Projects and programmes in infrastructure pipeline, by status**

Source: HM Treasury, Major Infrastructure Tracking Unit

Note: Some smaller projects that were individually listed in the 2013 pipeline have been grouped into larger programmes this year. This does not affect overall investment assumptions. Projects and programmes that have been completed since NIP 13 have also been removed from the pipeline

Further details on the pipeline can be found at:

[www.gov.uk/government/collections/national-infrastructure-plan#national-infrastructure-pipeline](http://www.gov.uk/government/collections/national-infrastructure-plan#national-infrastructure-pipeline)

## Table ES.2: Announcements in NIP 2014

**Roads Investment Strategy** – the government is committing £15 billion between 2015-16 and 2020-21 to continue the transformation of the Strategic Road Network, including major projects for the A303, A1, A47 and A27

**Flood defences** – the government has published its 6-year programme of investment in flood defences, allocating the £2.3 billion capital funding provided at the 2013 Spending Round

**Interconnectors** – the government will ensure that interconnectors can participate in the 2015 capacity auction; it will estimate the eligible capacity of each interconnector on a case-by-case basis

**Swansea Tidal Lagoon** – the government will start closer discussions with Tidal Lagoon Power Ltd to establish whether a potential tidal lagoon project at Swansea Bay is affordable and value for money for consumers (without prejudice to the planning decision on the project)

**Moorside** – HM Treasury has reached a cooperation agreement with Toshiba, GDF Suez and NuGen with the aim of issuing a statement of intent to provide a guarantee to assist the financing of a new nuclear power plant at Moorside, subject to due diligence and ministerial approval

**Broadband connection vouchers** – the government will provide up to £40m to extend the SME connection voucher scheme to March 2016 and to more cities; vouchers will be available on a first come, first served basis

**700MHz spectrum change of use** – further details of the clearance process for high-value spectrum will be set out in 2015 ahead of a further auction of mobile broadband spectrum, subject to the development of delivery options by DCMS and Ofcom

**Barking Riverside** – the government will agree a principal heads of terms agreement for a loan of £55 million to support the extension of the London Overground to Barking Riverside, to unlock the delivery of 11,000 homes

**Brent Cross** – the government supports the London Borough of Barnet and GLA plans for the regeneration of Brent Cross which could deliver 7,500 homes, subject to a full business case

**Ebbsfleet** – the government is making the first £100m available to fund infrastructure and land remediation at Ebbsfleet, taking forward its commitment to build the first new garden city for almost 100 years, which will deliver up to 15,000 new homes

**Access to Ebbsfleet** – the government will undertake a review of transport provision for the Ebbsfleet area, including Crossrail, High Speed 1, Southern and Southeastern rail services

**Queen Elizabeth Olympic Park redevelopment (Olympicopolis)** – the government will invest £141m to support the London Legacy Development Corporation and Mayor of London's plans to build a new higher education and cultural quarter at the Queen Elizabeth Olympic Park

**Northstowe** – the government will take forward development at Northstowe, to support accelerated delivery of up to 10,000 homes, and evaluate the feasibility and economic impact of using this model at a wider scale to support and accelerate housing supply

**Crossrail 2** – the government will provide £2 million between 2014-15 and 2015-16 to support the development of a comprehensive business case produced jointly by the Department for Transport and Transport for London, to complete ahead of the next Spending Review; this will be combined with a full options appraisal of all potential major transport projects in London, including an extension of the Bakerloo Line to improve connectivity in South East London, and the devolution of South Eastern rail services to London

**Ultra-low emission vehicle research and development** – the government is announcing up to £50 million between 2017-18 and 2019-20, to support innovation in manufacturing of ultra-low emission vehicles in the UK, based on a government contribution of £25 million for which it will seek match-funding from industry.

**Ultra-low emission vehicles in London** – the government will provide an additional £10 million between 2017-18 and 2019-20 to increase ultra-low emission vehicles in London, in support of the ambition to introduce an Ultra-Low Emission Zone by 2025

---

**Support for ultra-low emission vehicles** – the Roads Investment Strategy sets aside £15 million between 2015-16 and 2020-21 for a national network of chargepoints for ultra-low emission vehicles on the Strategic Road Network; the government is also announcing further detail of three funds totalling £85 million to support ultra-low emission taxis, buses and cities

---

**Local highways maintenance grant** – the government has already announced that local highways maintenance funding will be increased, totalling £5.8 billion over the next six years, and can now announce how the formula grant will be broken down by region

---

**Clean Vehicle Technology fund** – the government will provide up to £4 million to extend the Clean Vehicle Technology fund in 2014-15 which funds road vehicle modification by local authorities in order to reduce air pollution

---

**Chesterton Rail Station** – as announced by the Prime Minister and Deputy Prime Minister the government will provide £44 million between 2014-15 and 2016-17 to build a new rail station at Chesterton, linked to Cambridge Science Park

---

**Cycle City Ambition grants** – as announced by the Deputy Prime Minister on 27 November, the government will provide £114 million between 2015-16 and 2017-18 to enable the continuation of the Cycle City Ambition scheme in the eight cities it already covers; this will provide capital funding for better cycle infrastructure such as segregated lanes and improved junctions

---

**Access for all** – the government will increase the funding for the Access for All scheme by £60 million between 2015-16 and 2018-19, improving platform access at around 20 stations

---

**Norwich in Ninety** – the government supports the key recommendations of the Great Eastern Main Line Task Force, including upgraded infrastructure and the latest Rolling Stock. Bidders for the next Anglia Franchise, which will start in October 2016, will be incentivised to submit plans for achieving these recommendations for services to Norwich in 90 minutes and associated benefits along the Great Eastern Mainline

---

**East West Rail** – the government will consider the outputs of the Network Rail study into the East West Rail central section (Bedford to Cambridge) as part of the planning for Control Period 6 (2019-2024)

---

**Dawlish rail services** – the government will support Network Rail in its work to improve the resilience of the railway at Dawlish; additionally, it will ask Network Rail to examine wider issues surrounding connectivity to and within the South West peninsula; specifically, Network Rail will consider alternatives to the current mainline route to the South West via Dawlish, including an alternative route via the north side of Dartmoor through Okehampton; this work will feed into Network Rail's Initial Industry Plan for Control Period 6 (2019-2024)

---

**Bath City Centre Congestion Relief** – the government welcomes the strategy put forward by Bath and North East Somerset Council and the West of England LEP to improve transport capacity East of Bath and reduce city centre congestion; the government will consider a business case, which will be developed by Bath and North East Somerset Council that assesses the viability of proposals including a park and ride, as well as a park and rail service, located to the East of Bath

---

**Compulsory Purchase Reforms** – proposals will be published for consultation at Budget 2015 to make processes clearer, faster and fairer, with the aim of bringing forward more brownfield land for development

---

**National Transport Policy** – the government plans to lay the National Networks National Policy Statement before Parliament this month for consideration and a formal vote

---

**Planning: establishing the principle of development** – the government will take forward measures to ensure that the principle of development need only be established once

---

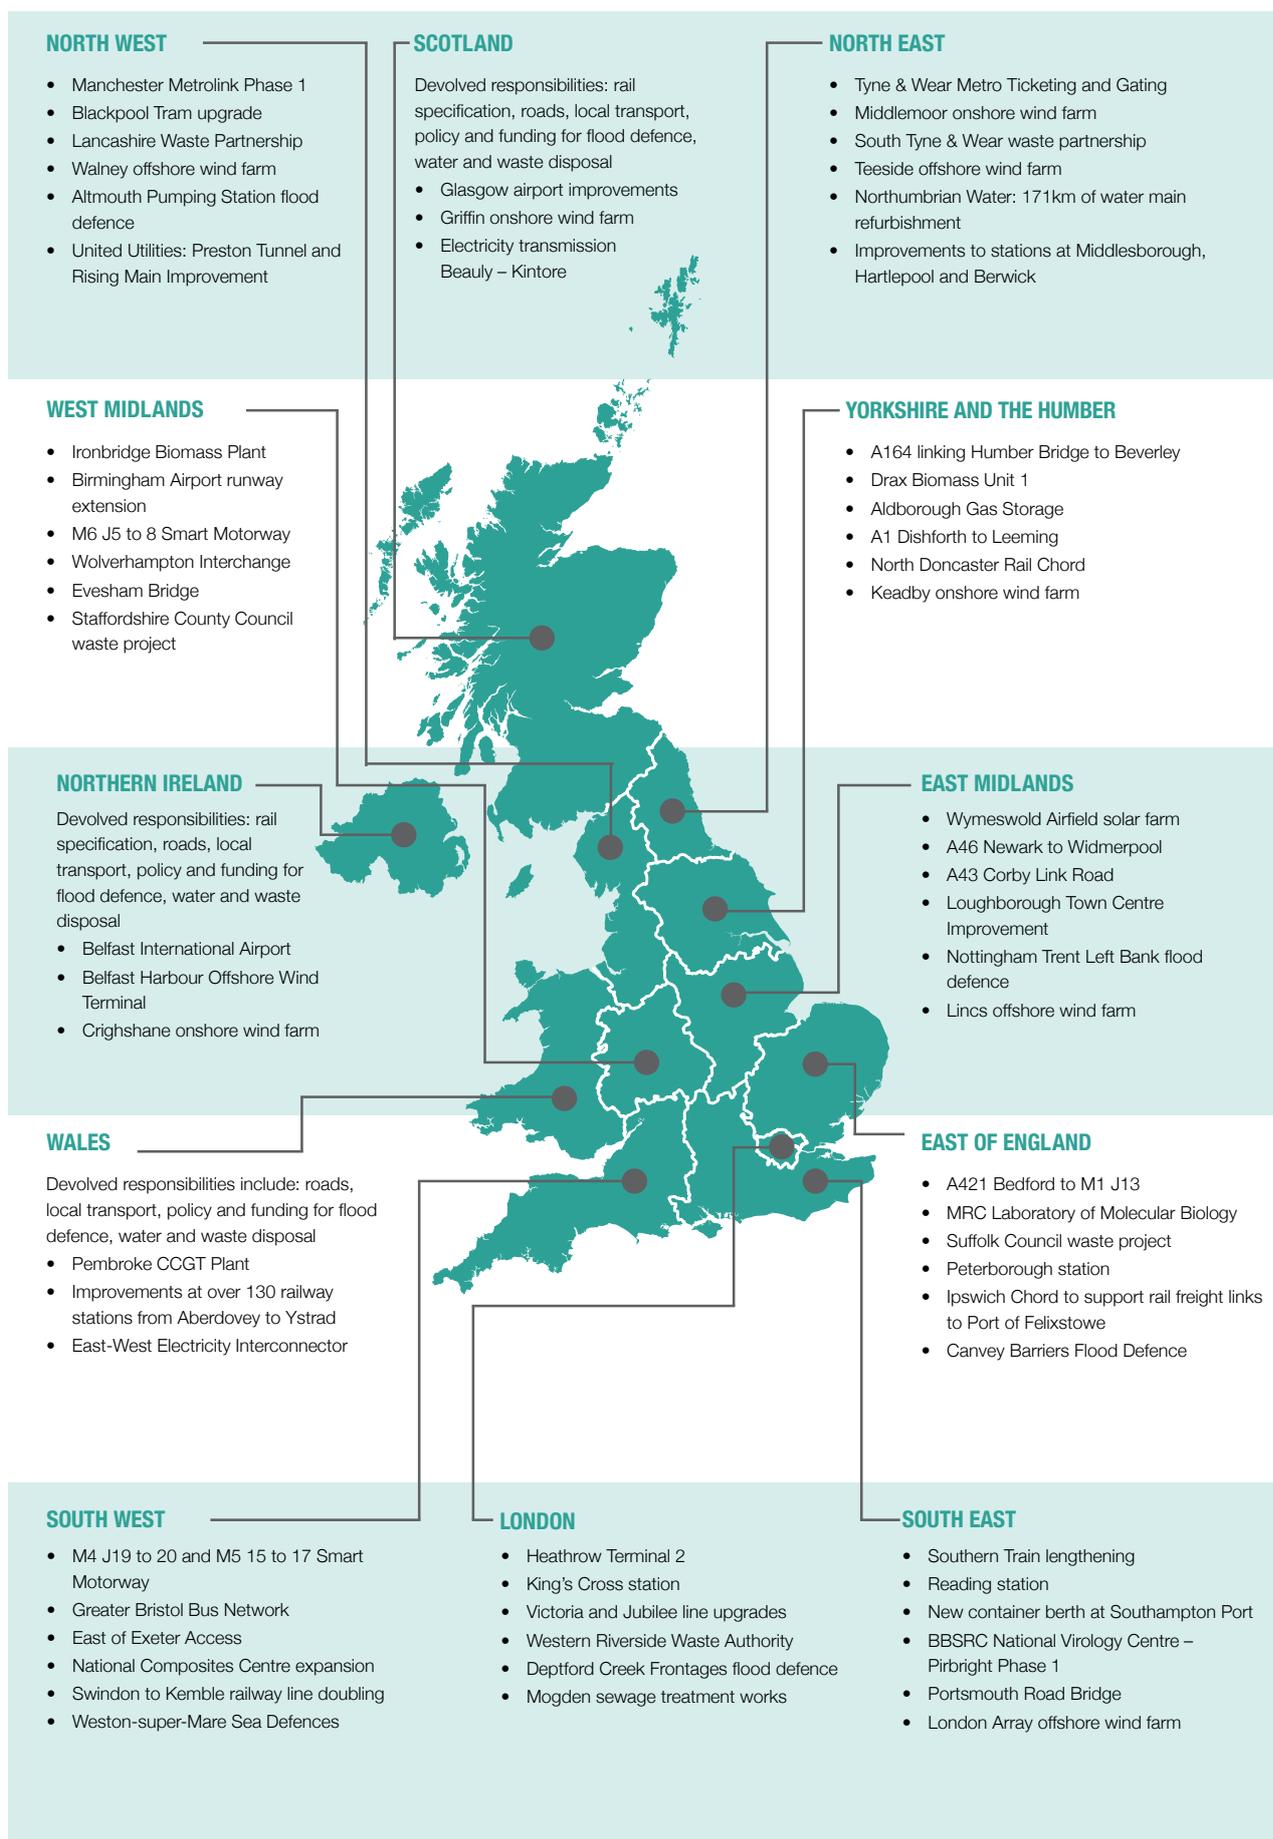

**Planning: section 106 negotiations** – the government will take steps to speed up section 106 negotiations, to reduce delays to the planning process

---

**Planning: speed of decisions** – the government will keep the speed of major decisions under review, with minimum performance thresholds increasing to 50% of major decisions made on time as performance improves

---

# PROJECTS COMPLETED SINCE 2010

# ECONOMIC IMPACT OF INFRASTRUCTURE INVESTMENT

Infrastructure investment could support 5,000 construction jobs for every £1 billion spent, as well as many more indirectly in design, engineering and planning

For every £1 the government is investing in broadband, the UK economy will benefit by £20

£266 million of transport pinch point funding means local transport improvements of over £511 million, with the potential to support over 200,000 jobs and around 150,000 new homes

62% of suppliers winning work for Crossrail are outside London; 58% are SMEs

Increase in overall economic activity of £2.84 for every £1 spent on infrastructure construction

## Sources:

Construction jobs/£: ONS data, DfT calculations

Broadband: SQW – UK Broadband Impact Study – Nov 2013

Pinch points: Press release – Road and rail projects to boost local and regional transport – Dec 2013

Crossrail: Crossrail calculations (<http://crossrail.co.uk/news/articles/new-figures-show-impact-of-crossrail-on-jobs-and-growth-around-the-uk>)

Overall economic activity (£2.84): CECA – Securing our economy: The case for infrastructure – May 2013

# Chapter 1:

# The government's strategy for UK infrastructure

## The government's infrastructure strategy

- 1.1 There is a strong economic case for infrastructure investment. A majority of economic studies report that infrastructure has a significant positive effect on output, productivity, and growth rates, and is a key driver of jobs throughout the economy. As such, it is a key element of the government's long-term economic plan.
- 1.2 Prior to 2010, many areas of UK infrastructure had suffered from historic under-investment. By prioritising vital capital investment in infrastructure, the government has been able to provide long-term funding certainty for the key areas where infrastructure is publicly funded – roads, rail, flood defences and science. This means that all of the publicly funded elements of the infrastructure pipeline now represent a firm and specific government commitment.
- 1.3 The UK's mixed model of infrastructure investment enables the government to prioritise public investment in the areas where it provides greatest value for money. In other areas, it harnesses the efficiencies created by a competitive market and commercial incentives. The action the government has taken to stabilise the public finances has been vital to ensuring the private sector has the confidence to invest.
- 1.4 The UK's competitive tax system and world-class regulatory regime, which provides the basis for significant investment in areas such as water, telecoms, and electricity and gas networks, are crucial to providing the right conditions for investment in private-sector infrastructure. So too is the targeted intervention the government has made in individual sectors (e.g. electricity and broadband) and the dedicated support it provides for private-sector finance for individual projects.
- 1.5 The final element of the government's infrastructure strategy has been a relentless focus on successful delivery – this means projects delivered faster, better and more cost-effectively. A key priority has been ensuring that the conditions for successful delivery are right across both the public and private sectors: streamlining the planning regime; developing a robust and transparent pipeline of projects and programmes; ensuring the right skills and capacity are in place; reducing infrastructure costs; adopting a more intelligent approach to procurement; and developing best practice to inform how infrastructure projects are managed and run.

- 1.6 The government is leading by example by strengthening its own approach to delivery. For example, through its Top 40 priority investments it has introduced a clear and consistent approach to project prioritisation. There has also been a step-change in the government's own delivery capability, overseen by Lord Deighton, the Commercial Secretary to the Treasury; and the introduction of mechanisms that allow the government to identify and address risks early and effectively. This includes a dedicated programme management function within Infrastructure UK and an infrastructure-focused Cabinet committee chaired by the Chief Secretary to the Treasury.

## The role of the National Infrastructure Plan

- 1.7 The government published the first National Infrastructure Plan (NIP) in 2010, bringing together for the first time its vision and approach for the key economic infrastructure sectors – transport, energy, flood defences, water, waste, communications and science. Since then, the government has continued to develop and refine its approach in response to feedback from investors and the supply chain to ensure the NIP is a maturing, integrated plan for UK infrastructure. The NIP is underpinned by the infrastructure pipeline, which sets out details of planned public and private investment to 2020 and beyond.
- 1.8 The NIP ensures that the government's approach in individual sectors is transparent and coordinated, providing a single point of reference for potential investors and the supply chain in setting out how the infrastructure needs of the economy are expected to be met.
- 1.9 This enables the government to maximise value for taxpayers and consumers by taking a holistic view of issues that cut across a number of different areas of infrastructure – such as the availability and cost of finance, infrastructure skills, planning and permitting, and network resilience. The NIP also allows for a more integrated approach to infrastructure planning, and supports initiatives to develop and share best practice on issues such as reducing construction costs and improving asset management and sustainability.
- 1.10 The NIP also means that the government can address infrastructure delivery in a focused and joined-up way. It sets out the government's priority projects and programmes, and acts as a tool for driving and monitoring progress across sectors – including addressing any obstacles which emerge.
- 1.11 The NIP is produced by Infrastructure UK (IUK), a unit within HM Treasury which is dedicated to infrastructure planning, financing and delivery.

## National Infrastructure Plan 2014

- 1.12 In NIP 14, the government seeks to consolidate and build on the progress already made in this parliament, and to provide the clarity and visibility that industry and investors need on its direction and commitments for infrastructure in future.
- 1.13 Having previously set out long-term capital commitments for key publicly-funded sectors, the government is now in a position to set out a clear delivery plan for each of the key infrastructure sectors for the next five years. This includes providing details of specific publicly-funded capital projects and programmes being taken forward as a result of the commitments made at Spending Round 2013.
- 1.14 NIP 14 also sets out a detailed, cross-cutting approach to infrastructure finance and delivery. In addition, the document starts to address some of the longer-term challenges that UK infrastructure will have to address in the 2020s and beyond.

1.15 The structure of the document is as follows:

- Chapter 1 (this chapter) outlines the government's overall strategy for UK infrastructure
- Chapter 2 sets out the government's plan to support and promote infrastructure development at a local and regional level across the UK, as well as in Scotland, Wales and Northern Ireland
- Chapters 3-13 set out the detailed sector plans; these include the government's objectives, an evidence-based needs analysis, a clear strategy for each sector, a detailed plan for the next five years, and a broader sense of direction over the longer term; they also identify the government's priority projects and programmes for each sector
- Chapter 14 highlights the government's approach to infrastructure funding and finance, including its most detailed assessment yet of the potential finance opportunities in infrastructure; for the first time, this also includes a robust analysis of the potential market for infrastructure finance
- Chapter 15 summarises the action the government is taking to improve infrastructure planning, delivery and performance, including the work it is doing with industry to build on the achievements of the Infrastructure Cost Review
- Chapter 16 sets out the government's approach to its 'Top 40' priority investments
- there are also three online-only annexes to the document, which provide more details on infrastructure delivery since 2010, a delivery update on the 'Top 40', and performance indicators for key sectors

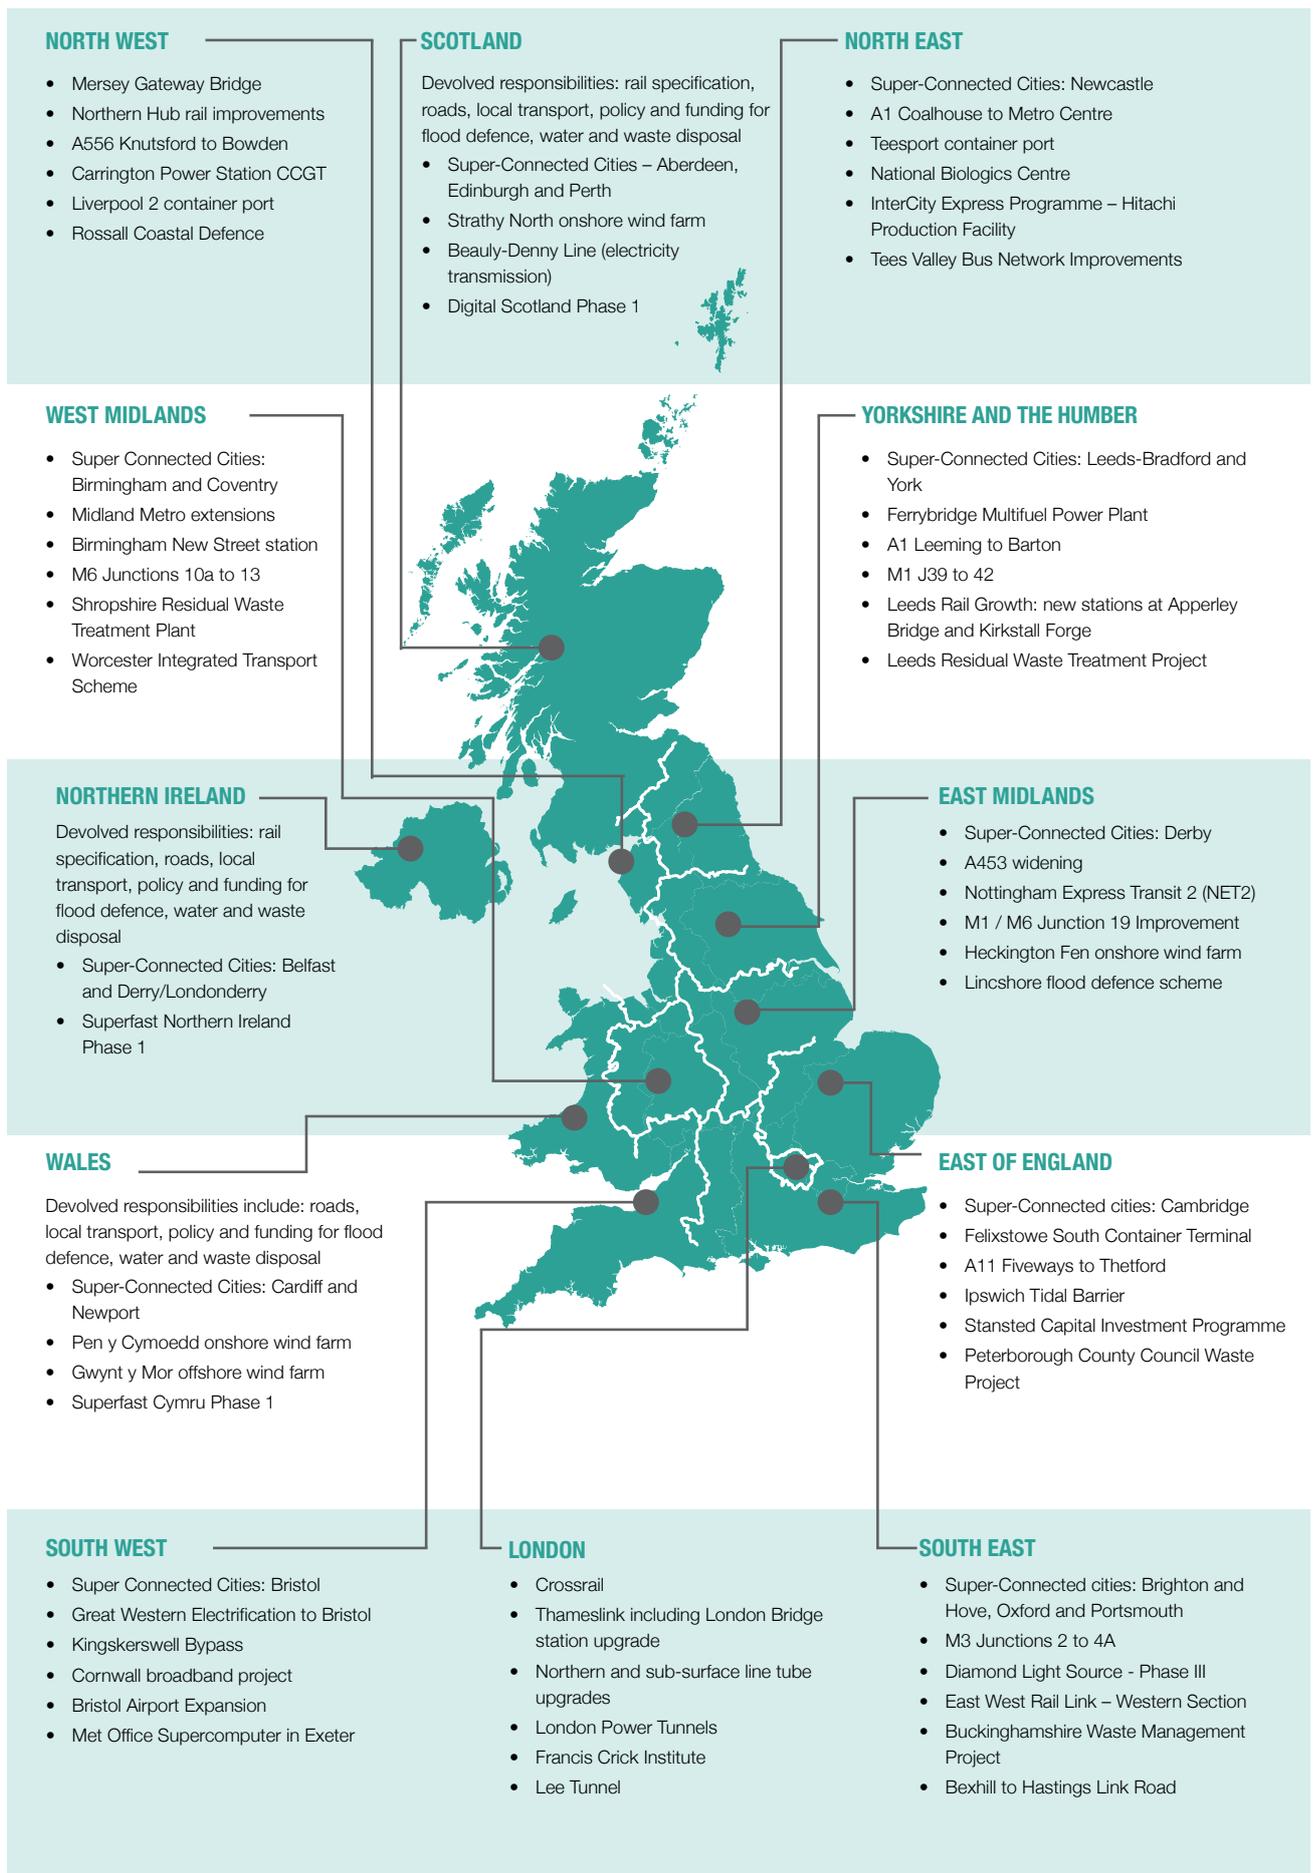

## Meeting the longer-term challenges

- 1.16 NIP 14 is published alongside a refreshed infrastructure pipeline which provides details of over £460 billion of planned investment across both the public and private sectors (this includes upstream oil and gas investment for the first time). Many of the infrastructure assets and networks delivered as a result of these plans are expected to be used for decades to come.
- 1.17 Of course, the government's role is to plan not just for the infrastructure we need now, but also for what we will need in the future – and to provide industry with the visibility and stability that it needs to do the same.
- 1.18 Predicting those long-term requirements is far from straightforward, and it is important that future governments retain the flexibility to adapt their approach as new opportunities or pressures emerge. However, there are some long-term challenges that we can be relatively confident our infrastructure will need to be able to meet.
- 1.19 One such challenge is changes to the social landscape. The UK population is growing, and growth is projected to continue throughout this century in most forecasts. The ONS central projections and research by the Infrastructure Transitions Research Consortium (ITRC) show that the UK population will grow by around 25 million people (to 90 million) by the end of the century, with a greater number than ever before over the age of 65. Population increase puts upward pressure on demand for infrastructure services like energy, water and transport.<sup>1</sup>

<sup>1</sup> ITRC, 'National infrastructure assessment: Analysis of options for infrastructure provision in GB', ITRC, January 2014

- 1.20 Climate change will also shape the future of UK infrastructure, testing the sustainability and resilience of our networks and assets and strengthening the imperative to make our transport and energy systems greener.
- 1.21 We know too that technological advances will change both our infrastructure needs and the way in which those needs are met – through the development of new types of infrastructure, or the opportunity to deliver or use existing mechanisms in new ways. For example, the increasing requirement for digital connectivity and innovative approaches such as driverless cars are already influencing the choices we make in developing our communication and transport systems. Likewise, we are adapting the way in which we deliver our projects and programmes through breakthroughs in off-site manufacturing. While the nature of innovation makes it inherently difficult to predict, our infrastructure systems will need to be nimble enough to adapt to, and take advantage of, future advances.
- 1.22 The government is taking steps to ensure that the UK is as well placed as possible to meet those challenges when they emerge. Setting out clear and comprehensive plans for the next five years in each of its key infrastructure sectors is key to that, as is the action it is taking to drive forward transformative long-term projects such as HS2, Crossrail and Hinkley Point C.
- 1.23 In addition to setting out clear plans to the end of the decade, NIP 14 gives an initial sense of direction and ambition for the government's longer-term approach to infrastructure in each of the sectors that it covers. By their very nature, these plans are less detailed. However, the government is taking action now to ensure that it has the right organisational and institutional structures in place to develop and take them forward. That means a National Infrastructure Plan that allows it to develop a coherent and credible approach to infrastructure investment and delivery; mechanisms to ensure long-term funding and finance in both the public and private sectors; governance structures that allow every region in the UK to maximise its economic potential, and a conducive delivery environment.
- 1.24 With that framework in place, and with a strong dialogue with industry and the supply chain, the government is confident that UK infrastructure is well placed to meet the challenges that it will face in the next few decades and beyond.

# PROJECTS IN CONSTRUCTION AS OF 2014-15

# Chapter 2:

## Infrastructure across the UK

- 2.1 As set out in the previous chapter, ensuring we have the right infrastructure in the right places is vital to allow our society and economy to function effectively. It is also a crucial tool in driving growth and regeneration across the UK and creating strong and prosperous communities in which people want to live and work.
- 2.2 The government is committed to giving local areas the tools they need to ensure they have the infrastructure that is right for them. That means not taking a one-size-fits-all approach, but giving local authorities, cities and regions the autonomy to determine what is delivered locally, and ensuring they have the ability to influence the regional and national infrastructure that will shape their areas.

### **The infrastructure pipeline in the regions**

- 2.3 The infrastructure pipeline, published alongside the National Infrastructure Plan 2014, gives an indication of the breadth of infrastructure investment being undertaken across the UK. While 38% of the investment in the pipeline is presented on a regional basis, this does not include cross-regional and UK-wide projects or programmes which will have a transformative effect in individual areas – such as the roll-out of superfast broadband (£1.7 billion), the £20 billion of works maintaining the country's gas and electricity networks which straddle more than one region, and major multi-regional projects such as HS2.

### Box 2.A: Case study: the infrastructure pipeline in the South West

- Improvements to the strategic and local road networks including the A303, the Kingskerswell Bypass (A380) and 30 pinchpoint schemes
- Electrification of the Great Western Mainline and improvements to Bristol Temple Meads station
- Expansion of Bristol Airport
- The Cornwall Broadband project, worth £132 million, which is deploying 130,000km of fibre optic cable throughout the area
- Government funding of over £54 million to enable the delivery of superfast broadband across Devon and Somerset
- Western Power's plans to spend over £1.5 billion on electricity distribution networks across spending control periods
- Investment in water and sewerage networks of over £2 billion, and in waste of £228 million
- Approximately £136 million Grant in Aid (GIA) from the 6-year floods and coastal erosion management programme is supporting at least 240 projects in this region<sup>1</sup>
- A 3.3GW Nuclear Power Plant at Hinkley Point C worth £16 billion

Source: HM Treasury Major Infrastructure Tracking unit

2.4 The maps on pages 15, 21 and 31 further highlight the diverse range of projects that the government has completed and set out plans to take forward across the UK.

## Empowering local areas

- 2.5 The government has established Local Enterprise Partnerships (LEPs) between local government and business in functional economic areas, giving them the opportunity to decide what the priorities should be for investment in roads, buildings and facilities in the area. The 39 LEPs have made Strategic Economic Plans, which bring together priorities across local areas and sectors. These documents clearly present the direction the local economy is taking, and highlight important local infrastructure development and delivery opportunities. As such, they act as the starting point for a dialogue on the priorities for spending.
- 2.6 At a regional level, the government encourages LEPs, local authorities and cities to come together and work with central government to shape the infrastructure that they need in their own areas.

### Box 2.B: Northern Powerhouse

The government has been clear on the need to rebalance the economy in order to restore economic growth in this country. An important aspect of such rebalancing is to ensure that all areas of the country are able to realise their full economic potential and prosperous cities in the north can complement prosperous cities in the South. The Chancellor has set out plans to create a Northern Powerhouse, through provision of modern transport connections, support for science and universities and more power and control to civic government to maximise the potential of the North of England and reduce the decades-old gap between London and other cities. The government has also listened to the ideas that have come forward through the Deputy Prime Minister's Northern Futures project.

<sup>1</sup> The level of GIA may vary across the programme regions as detailed project planning proceeds

- 2.7 The government has also introduced a range of wider mechanisms for devolving governance and funding to enable local areas to take responsibility for driving economic growth in their own areas.

### Box 2.C: London

London has established itself as an incredibly successful thriving global capital, with a population of over 8 million. It is a standout example of how an empowered and ambitious city can help drive the country's economy forward.

London has an elected mayor who sets an overall vision for London and has a duty to create plans and policies for the capital covering a range of issues including transport, planning and regeneration.

Transport for London (TfL) is the public body with standalone responsibility for the majority of transport services in London. It receives over £12 billion of funding from the government over the current Mayor of London's 4 year term. This has enabled it to pursue major programmes of investments such as upgrades to the Northern and Victoria tube lines and expansion of the London Overground network, the rollout of electric and hybrid bus fleets, and the improvement of cycle infrastructure including Cycle Superhighways and segregated cycle lanes. This is in addition to a significant rolling programme of maintenance and renewal. It also undertakes one-off major infrastructure projects such as Crossrail, which is a joint venture with the Department for Transport.

Infrastructure investment in London has ripple effects across the whole country. 43% of businesses that won Crossrail work for example are based outside London and the southeast, with 62% based outside the capital itself.<sup>2</sup>

### City Deals

- 2.8 City Deals are agreements between government and a city that give the city control over decisions that affect their area and how public money should be spent in order to help businesses grow and create economic growth. A total of 28 City Deals have been concluded over this Parliament; 27 in England and one in Scotland (Glasgow and Clyde Valley).
- 2.9 A key element of several City Deals has been the establishment or strengthening of economically prioritised infrastructure spending programmes – notably in Greater Manchester, Glasgow and Clyde Valley, and Greater Cambridge which will see a combined investment from central and local government along with private sector partners of over £3.5 billion.

“[The Greater Cambridge City Deal] is a very significant step towards providing the City with the economic means to shape our future and that of those who live and work in this unique place. It is a great example of what can be achieved when local authorities and others collaborate as they did here”

Jane Paterson-Todd, Chief Executive for Cambridge Ahead

<sup>2</sup> <http://www.crossrail.co.uk/news/articles/55bn-of-crossrail-contracts-creating-jobs-and-business-opportunities-around-the-uk>

## Growth Deals

- 2.10 Building on the success of City Deals, the government has introduced Growth Deals which provide LEPs with money from the Local Growth Fund (LGF) for projects that benefit the local area and economy. Growth Deals have provided the opportunity to bring together LEP, local authority and private sector resources behind the key priorities of the local economy as set out in the strategic economic plans.
- 2.11 The LGF was created in response to Lord Heseltine's report *No Stone Unturned*<sup>3</sup> and combines £12 billion of spending allocations across transport, housing and skills over the six year period to 2020-21. Allocations are made on the basis of a competitive process. The first round of deals were agreed in July 2014, in which £6 billion was allocated across 39 LEPs.<sup>4</sup> Details of some of the projects that received funding through these deals are set out in Chapter 5.
- 2.12 These Growth Deals are crucial in supporting local infrastructure. Firstly LEPs can now plan a significant amount of capital spending over the medium term to 2020-21; this increased certainty is vital for effective infrastructure planning and delivery. They also give LEPs greater autonomy. Of the 332 transport schemes partially or fully funded through the LGF, approximately 90% will be free from any further central government approval. Under the previous approvals system, only around half of the schemes would have enjoyed this freedom. The government has retained an appropriate degree of control for those projects it assesses to be the most complex, contain the greatest degree of risk, or which have significant strategic linkages to other major schemes. The government is also facilitating the sharing of good practice between local authorities, in order to embed consistently high standards of delivery right across the country.

## Supporting the funding and financing of local infrastructure

- 2.13 In addition to giving local areas control over infrastructure investment through the mechanisms outlined above, the government has put in place some specific sources of funding to help unlock local investment in infrastructure and other growth projects:
- The Growing Places Fund (GPF) provides up-front capital to help local authorities and developers take infrastructure projects forward where relatively small amounts of funding can help to unlock further development. The GPF is supporting 323 projects across the country.
  - The Regional Growth Fund (RGF) is a £3.2 billion fund helping companies throughout England to create jobs between now and the mid-2020s. Over £168 million has been used for local transport and utilities development, helping local areas realise their economic potential by making essential improvements to road, rail and port infrastructure and over £78 million for energy schemes, including low carbon technology. A further round of successful bidders is to be announced in spring 2015.
  - The Community Infrastructure Levy (CIL) is a levy that local authorities in England and Wales can choose to charge on new developments in their area. The money is being used to support development by funding infrastructure that the council, local community and neighbourhoods want.

<sup>3</sup> 'No stone unturned: in pursuit of growth', The Rt Hon the Lord Heseltine of Thenford CH, October 2012

<sup>4</sup> Interactive map of Local Enterprise Partnerships [http://www.tripline.net/trip/Local\\_Growth\\_Deals\\_2014-60344703535410079317EC660AA1B3AF](http://www.tripline.net/trip/Local_Growth_Deals_2014-60344703535410079317EC660AA1B3AF)

**Box 2.D: Case study: Growing Places Fund**

Greater Lincolnshire LEP used £2.9 million of Growing Places Fund funding to provide for the upfront infrastructure costs necessary to allow the Mablethorpe development to proceed. This will include the delivery of 180 homes (of which 120 are affordable), a new supermarket, a sports field and improved access to the local junior school. Overall the scheme will create 530 jobs, and bring in a further £6.5 million private sector investment.

**Using infrastructure to support and stimulate regeneration****Box 2.E: Regeneration announcements**

- **Barking Riverside** – the government will agree a principal heads of terms agreement for a loan of £55 million to support the extension of the London Overground to Barking Riverside, to unlock the delivery of 11,000 homes
- **Brent Cross** – the government supports the London Borough of Barnet and GLA plans for the regeneration of Brent Cross which could deliver 7,500 homes, subject to a full business case
- **Ebbsfleet** – the government is making the first £100 million available to fund infrastructure and land remediation at Ebbsfleet, taking forward its commitment to build the first new garden city for almost 100 years, which will deliver up to 15,000 new homes
- the government will undertake a review of **transport provision for the Ebbsfleet** area, including Crossrail, High Speed 1, Southern and Southeastern rail services
- **Queen Elizabeth Olympic Park redevelopment (Olympicopolis)** – the government will invest £141 million to support the London Legacy Development Corporation and Mayor of London's plans to build a new higher education and cultural quarter at the Queen Elizabeth Olympic Park
- **Northstowe** – the government will take forward development at Northstowe, to support accelerated delivery of up to 10,000 homes, and evaluate the feasibility and economic impact of using this model at a wider scale to support and accelerate housing supply

- 2.14 The government also recognises that key national infrastructure schemes can be instrumental in unlocking regeneration or housing projects in local areas. For example, an improved A14 will support further growth in the region as the east coast Haven ports at Ipswich, Harwich and Felixstowe expand, as well as major developments such as Northstowe, the Alconbury Enterprise Zone, and expansion on the northern and eastern fringes of Cambridge.
- 2.15 The High Speed 2 (HS2) Growth Taskforce, which reported in March 2014, made a number of recommendations to maximise the potential of HS2. This includes helping the UK's cities and businesses grow, to generate more jobs, to breathe new life into areas in need of regeneration and to create opportunities for businesses to compete for HS2 contracts. Responding to the recommendations in this report, Phase 1 places are due to finalise their HS2 local growth strategies in spring 2015 and will set up local delivery bodies by summer 2015. The government will also continue to consider proposals for a central HS2 regeneration and development company.

2.16 The government has made significant progress on its commitment to specific housing and regeneration projects, including:

- agreeing principal heads of terms for a loan of £55 million to support the extension of the London Overground to Barking Riverside to unlock the delivery of 11,000 homes
- supporting the London Borough of Barnet and GLA plans for the regeneration of Brent Cross which could deliver 7,500 homes, subject to a full business case
- taking forward the commitment to build the first new garden city for almost 100 years at Ebbsfleet, which will deliver up to 15,000 new homes; the A2 Bean and Ebbsfleet Junction improvements will be delivered as part of the Highways Agency programme; the Chairman Designate of the proposed Urban Development Corporation is now in place and the government has reached agreement with the key landowners on the site on a collaborative approach to the delivery of development; the government will make the first £100 million available to fund infrastructure and land remediation to kick start development, subject to due diligence
- the government will undertake a review of transport provision for the Ebbsfleet area, including Crossrail, High Speed 1, Southern and Southeastern rail services
- the government will invest £141 million in order to support the London Legacy Development Corporation and Mayor of London's Olympicopolis project to redevelop the Queen Elizabeth Olympic Park; this will support the construction of a new higher education and cultural quarter carried out in partnership with University College London, the Victoria and Albert Museum, University of the Arts London and Sadler's Wells, driving innovation and growth and ensuring that this opportunity builds on the success of London 2012
- the government will take forward development of Northstowe; the government will trial a new delivery model on the site, with the Homes and Communities Agency taking the lead on delivering the site, including through master-planning and commissioning; this will support the construction of up to 10,000 new homes on the site, up to twice as fast as conventional development routes; the government will report by Budget on the delivery vehicle, governance and investment in the site; the government will undertake an evaluation of the Northstowe development, and of the feasibility and economic impacts of pursuing this model at a wider scale

## Infrastructure investment in Northern Ireland, Scotland and Wales

2.17 In Northern Ireland, Scotland and Wales, the split between the responsibility of the UK government and each of the devolved administrations for infrastructure policy and funding varies according to the distinct devolution settlement in place for each administration. For example:

- responsibility for investment in roads infrastructure is fully devolved to the Northern Ireland Executive, Scottish Government and Welsh Government
- rail specification is devolved in Northern Ireland and Scotland, but not devolved in Wales
- decisions on public sector support for infrastructure in or around airports and ports is generally devolved, whilst regulation of aviation and air transport is dealt with at the UK government level

- similarly, energy policy is devolved in Northern Ireland (aside from some UK government responsibilities in relation to nuclear energy), whereas in Scotland and Wales responsibility for investment in infrastructure has largely remained a reserved matter for the UK government; regulation is conducted by Ofgem in Wales and Scotland but by the Utilities Regulator in Northern Ireland, reflecting the more extensive level of devolution in place there
- both environmental infrastructure and regulation are the responsibility of the three devolved administrations, including policy and funding responsibility for flood defences, water infrastructure, and sewage and waste disposal
- infrastructure relating to broadcasting and telecommunications remains largely a non-devolved matter, although the devolved administrations may support businesses involved in those sectors as part of their general role in promoting economic development

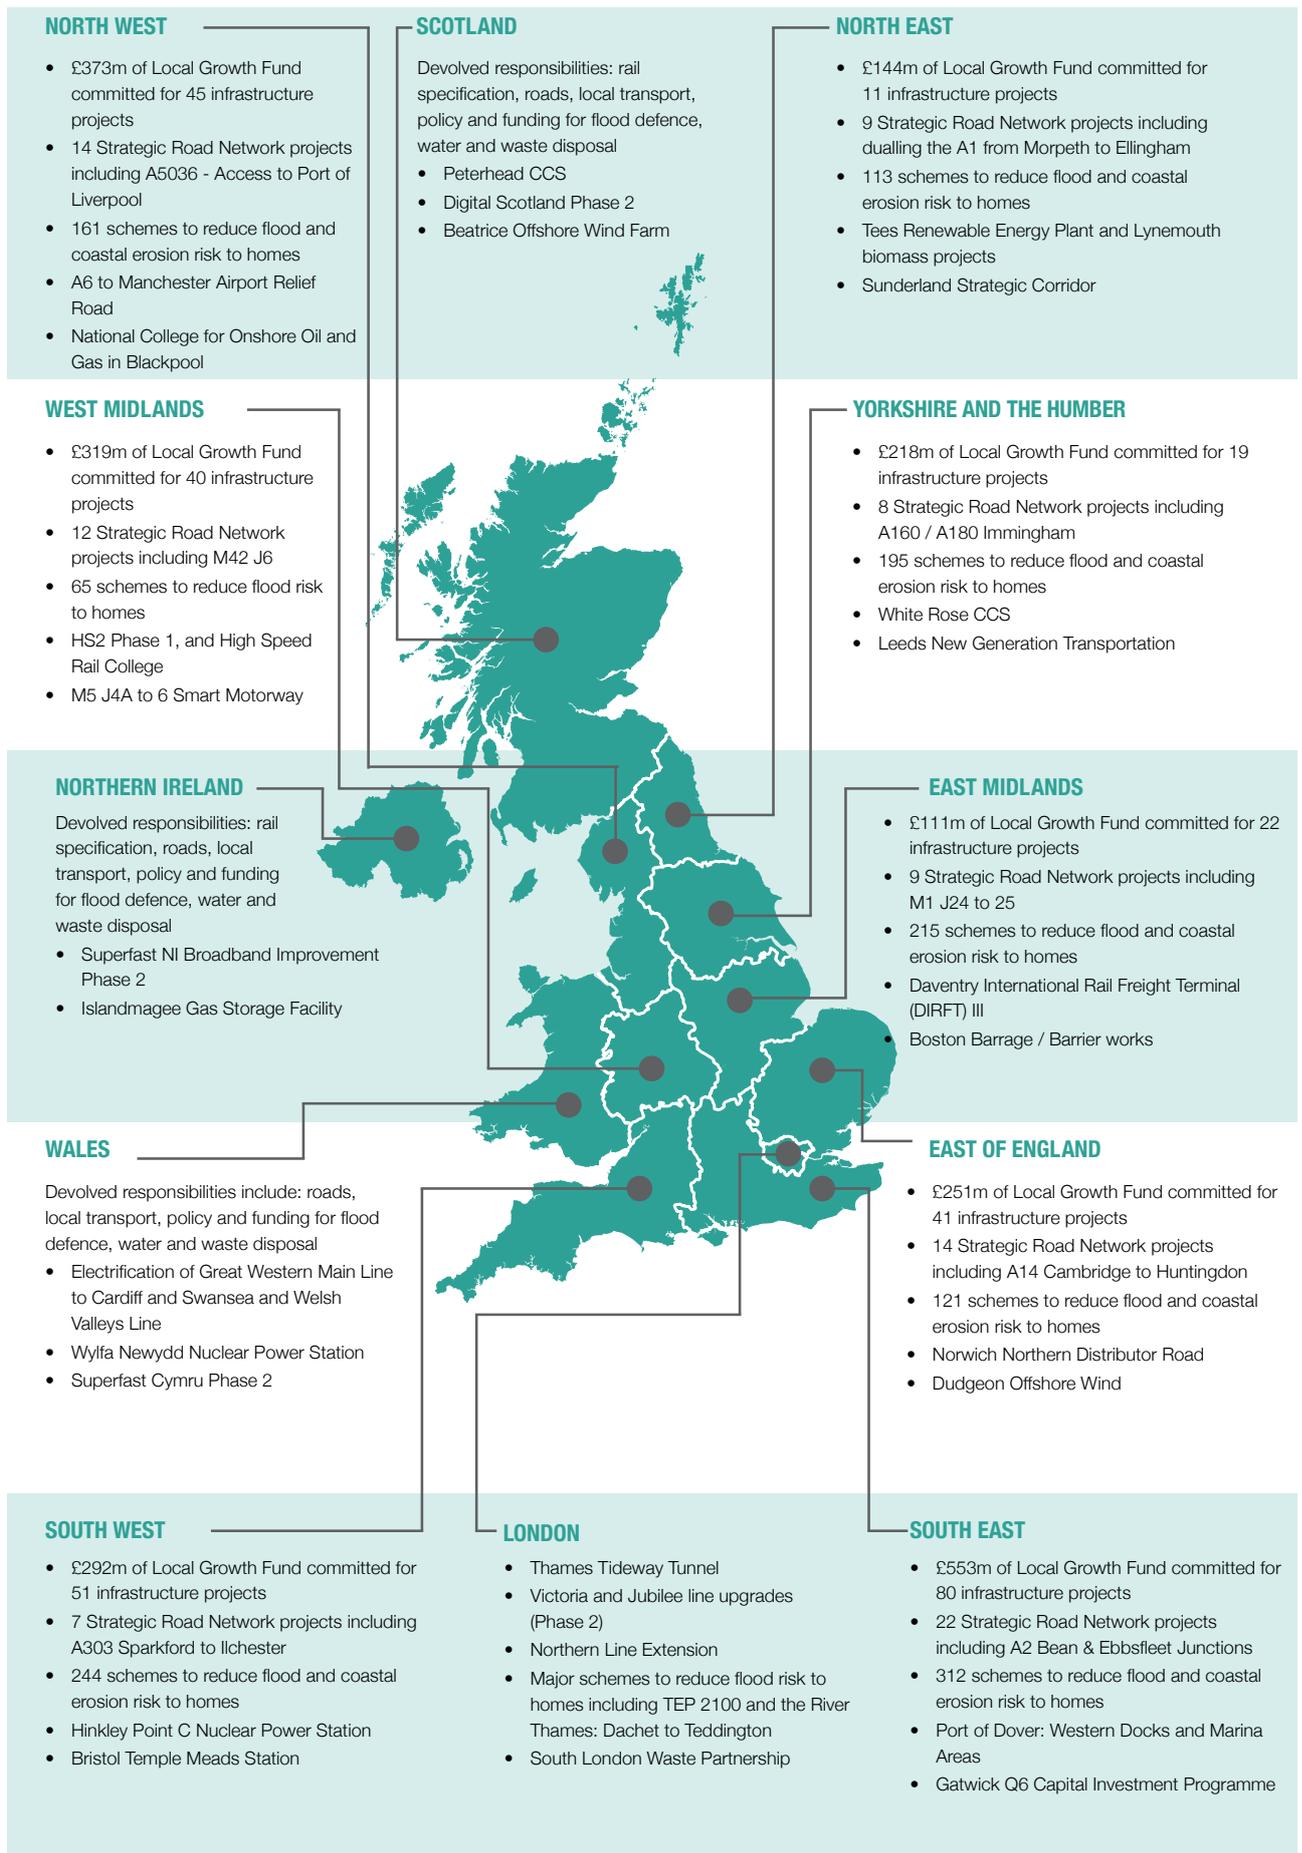

### **Box 2.F: UK government investment in Northern Ireland, Scotland and Wales**

The government remains committed to supporting investment in Northern Ireland, Scotland and Wales in areas where policy responsibility is non-devolved. For example:

- funding of £122 million has been granted to Scotland (including Highlands and Islands), £69 million to Wales and £12 million to Northern Ireland for funding in superfast broadband; Cardiff and Newport in Wales, and Aberdeen, Edinburgh and Perth in Scotland and Belfast and Derry/Londonderry in Northern Ireland are also super-connected cities
- as part of its commitment to the development of marine energy, the government has provided £10 million of grant funding to the MeyGen project in the Pentland Firth Inner Sound in Scotland and the SeaGeneration Wales Limited project in Anglesey
- the UK government is investing £50 million in an offshore renewable energy catapult in Glasgow, designed to accelerate the design, deployment and commercialisation of renewable energy technology innovation
- the government has announced UK Guarantees for the Grangemouth petrochemical plant and the Countesswells development in Aberdeen, which will finance a new development of 3,000 homes; it has also signed a cooperation agreement with Hitachi and Horizon with the aim of being able to agree an in-principle guarantee by the end of 2016 to support the financing of a new nuclear power plant at Wylfa, subject to final due diligence and ministerial approval
- the UK government agreed a funding package with the Welsh government to electrify the Valley Lines; the UK government will also cover the full costs of electrifying the Great Western Main Line to Swansea and devolve the Wales and Borders rail franchise, so that the Welsh government will decide the new franchise in 2018; in order to make this deal happen, the UK government will take over sponsorship and fund the delivery of the Cardiff-Bridgend section of the Main Line electrification scheme to Swansea – worth £105 million, and contribute £125 million towards the costs of the wider Valley Lines electrification scheme; the Welsh government will take over sponsorship and delivery of the Valley Lines project
- the government also provides support for private-sector energy investment in Scotland, and the Beatrice offshore wind farm was one of 8 UK projects to receive an early Investment Contract as part of the Final Investment Decision Enabling for Renewables allocation in spring 2014

- 2.18 Except for those areas which are non-devolved responsibilities, Northern Ireland, Scotland and Wales are responsible for prioritising and delivering infrastructure investment, supported by the funding they receive from the government through their 'block grant' allocations.
- 2.19 The UK government has also allowed local authorities in Scotland and Wales to access the cheaper Project Works Loan Board 'project rate' in relation to borrowing in support of key infrastructure projects. A total of £400 million of borrowing has been made available through to the end of 2015-16. The Scottish and Welsh Governments have now established arrangements for accessing the project rate with local authorities in their own jurisdictions.
- 2.20 The Scottish government published an Infrastructure Investment Plan in 2011 setting out a pipeline of public investment in both economic and social infrastructure through to 2030. A report on progress against the Plan is published annually. The investment pipeline was updated further in August 2014, and now provides information on 30 major programmes and over 100 individual projects. The Scottish 'Infrastructure Investment Plan' and related documents are available at: [www.scotland.gov.uk/Topics/Government/Finance/18232/IIP/](http://www.scotland.gov.uk/Topics/Government/Finance/18232/IIP/)
- 2.21 The Northern Ireland Executive published its latest 'Investment Strategy for Northern Ireland 2011-21' (ISNI) in October 2012. The ISNI sets out the Executive's renewed priorities for capital investment in social, economic and environmental infrastructure projects – with schemes valued at over £13 billion in total to be delivered in the period up to 2021. The 'Investment Strategy for Northern Ireland' is available at: [www.sibni.org/investment\\_strategy\\_for\\_northern\\_ireland\\_2011\\_-\\_2021.pdf](http://www.sibni.org/investment_strategy_for_northern_ireland_2011_-_2021.pdf)
- 2.22 The Welsh Government set out its approach to identifying, prioritising and delivering the social and economic infrastructure needs of Wales in the 'Wales Infrastructure Investment Plan' (published in 2012). Together with the infrastructure investment pipeline, which provides details of priority infrastructure investments in Wales – incorporating over 320 investments worth over £34 billion across both public and private sectors, including in the non-devolved areas of rail and energy – these documents provide a clear picture of how the Welsh Government is delivering its strategic investment priorities, as well as providing an overview of sectoral investment plans. The Wales Infrastructure Investment Plan is available at: <http://wales.gov.uk/funding/wiipindex/?lang=en>

# FORTHCOMING PROJECTS TO 2020-21

# ROADS

## Progress since 2010

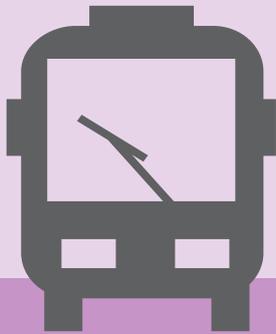

14

major roads projects completed and 14 more in construction

Over  
200

smaller improvements delivered around the country

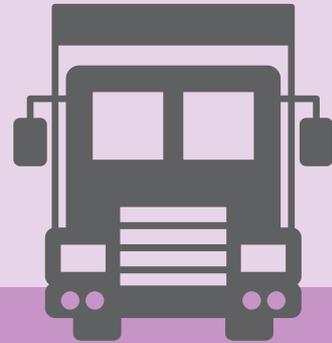

New Smart Motorway lanes opened including on the M1, M6 and M25

£400m

invested in development of Ultra Low Emission Vehicles

Creation of a new national Strategic Highways Company

Over  
£15bn

to undertake over 100 strategic road schemes

Investing in new 'expressways' to link under-served areas including A303 and A1 north of Newcastle

Resurfacing up to 80% of the Strategic Road Network

Plan to 2020-21

**INFRASTRUCTURE PIPELINE FOR ROADS £15.9BN**

**In construction £2.5bn**

**Future investment £13.4bn**

# Chapter 3:

## Roads

### Box 3.A: Announcements on roads

- **Roads Investment Strategy** – the government is committing £15 billion between 2015-16 and 2020-21 to continue the transformation of the Strategic Road Network; this will be the biggest programme of road investment since the 1970s, with investment tripling from current levels by the end of the decade and over 100 schemes to take place over the next Parliament; major projects are taking place in every region, with at least £1.8 billion invested in every area; the schemes being taken forward include substantial projects to upgrade the A303 in the South West, A1 in Gateshead and north of Newcastle, A47 in the East of England, and the A27 along the south coast
- **Support for ultra-low emission vehicles (ULEVs)** – the government is announcing up to £50 million between 2017-18 and 2019-20 to support innovation in manufacturing of ultra-low emission vehicles in the UK, based on a government contribution of £25 million for which it will seek match-funding from industry. The Roads Investment Strategy sets aside a further £15 million between 2015-16 and 2020-21 for a national network of chargepoints for ULEVs on the Strategic Road Network. The government is also providing £10 million support for ULEV measures in London, as well as further detail of three funds totalling £85 million to support ultra-low emission taxis, buses and cities

### Objectives

- 3.1 The government's aim is to create a national road network fit for the 21st century, which improves economic productivity and supports jobs and growth across the country. It seeks to increase capacity, tackle congestion, support development, strengthen connectivity, improve reliability and resilience, and ensure a road network of the best possible quality.

### Needs

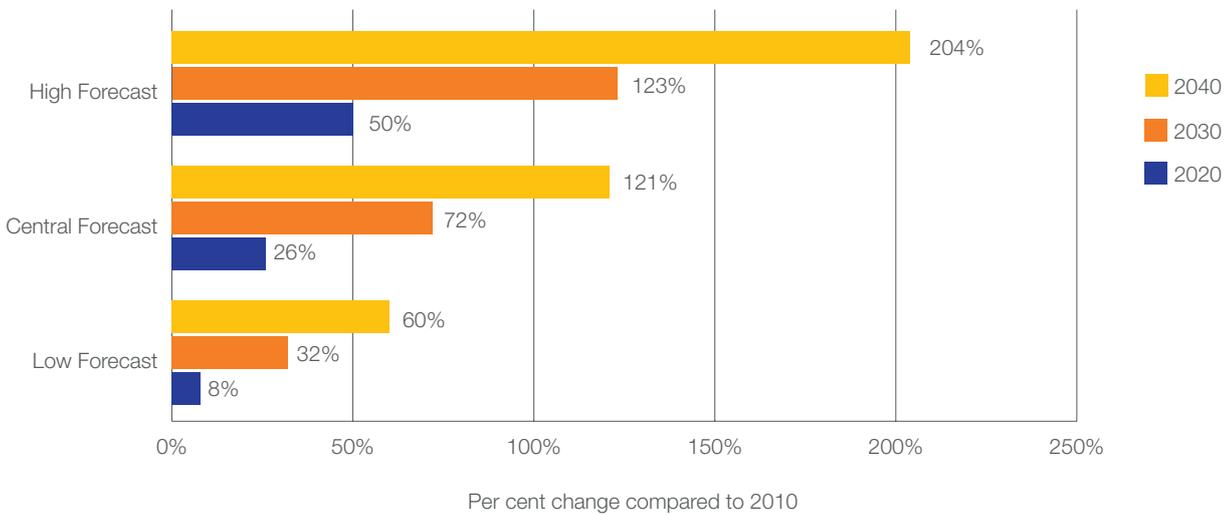

- 3.2 The road network is vital to the economic sustainability of the UK. Well-connected road infrastructure enables people to travel for work and leisure and businesses to move goods. Over 65% of freight movements and 90% of passenger miles are made by road.<sup>1</sup> The long-term trend is of growing road traffic with vehicle miles travelled per year increasing from 28.9 billion in 1949 to 303.7 billion vehicle miles in 2013.<sup>2</sup>

<sup>1</sup> National Policy Statement for National Networks, Department for Transport, (forthcoming)

<sup>2</sup> Annual Road Traffic Estimates – Great Britain 2013, Department for Transport, June 2014

- 3.3 With GDP and population expected to rise, demand for travel on the UK’s Strategic Road Network will increase further. DfT analysis estimates that by 2040 traffic in England will be between 27% and 57% higher than 2013 levels based on a range of forecasts of economic growth, motoring costs and the trend in individual travel behaviour.<sup>3</sup> This growth, unaccompanied by the required level of investment or appropriate policies to encourage mode shift, is likely to have a significant impact on levels of congestion.
- 3.4 The Strategic Road Network (SRN) is a crucial element of our road infrastructure; in 2013, while it only accounted for 2.4% of the total road network in England, it carried 32.9% of all motor vehicle traffic and 65.6% of all HGV traffic.<sup>4</sup> Chart 3A identifies a range of scenarios for congestion levels on the Strategic Road Network in England between 2010 and 2040.<sup>5</sup>

**Chart 3.A: Forecast of congestion on the strategic road network in England<sup>6</sup>**

Source: Road Traffic Forecasts, Department for Transport, (forthcoming)

- 3.5 Greater congestion will lead to greater delays and uncertainty about journeys for commuters and businesses, potentially incurring significant economic costs. DfT estimates indicate that congestion on the SRN already costs over £2 billion per year in value of time and could rise to nearly £10 billion per year by 2040 unless action is taken.<sup>7</sup>

## Strategy

- 3.6 The vast majority of UK roads investment is publicly funded. The government directly funds the maintenance and development of the SRN through the Highways Agency. Local roads remain the responsibility of local authorities, with funding support from the government, and are covered in the Local Transport section.

<sup>3</sup> Road Traffic Forecasts, Department for Transport, (forthcoming)

<sup>4</sup> Annual Road Traffic Estimates: Great Britain 2013, Department for Transport, June 2014

<sup>5</sup> Investment assumptions do not take account of announcements made in Investing in *Britain’s Future* in June 2013

<sup>6</sup> Data based on forecast scenario 1 and high/low demand variants from Road Traffic Forecasts – (forthcoming)

<sup>7</sup> National Policy Statement for National Networks, Department for Transport, (forthcoming)

- 3.7 The government is taking action across the SRN to address growing demand and the resulting pressures on the network. This includes:
- the biggest programme of roads investment since the 1970s, focusing on developing and maintaining the existing network to a high standard
  - the creation of a new publicly-owned Strategic Highways Company, freed from government red-tape, and supported by long-term funding certainty and a clear Road Investment Strategy
  - making the best use of road capacity – including through ‘Smart Motorways’, making extra lanes available at key times on more of the busiest routes by opening up the hard shoulder, and using innovative technology to keep traffic moving
  - taking advantage of technological change to improve the experiences and choices of travellers and developing new techniques for the performance and operation of vehicles and the management of transport systems

## Delivery plan

- 3.8 The government is taking steps to revolutionise the way that it plans and delivers roads investment, including:
- publishing the first-ever Road Investment Strategy (RIS1) spanning 2015-16 to 2019-20, to set out the national priorities and plans for our Strategic Road Network
  - replacing the Highways Agency with a new strategic highways company, and transforming it into a world-class infrastructure company
  - creating a new highways monitor, charged with ensuring that taxpayers’ money is well spent and the highways authority is delivering efficiencies during RIS 1 and for the future.

3.9 These changes will be underpinned in legislation, through the Infrastructure Bill currently before Parliament.

### Key actions to 2020-21

3.10 RIS1 provides details of the government's commitment to treble spending on strategic road enhancements, investing a further £15.2 billion in over 100 major schemes by 2021. This will include:

- to improve the condition of our strategic roads: £6 billion to resurface up to 80% of the Strategic Road Network by the end of the decade
- to improve connectivity and support the growth of regional economies, a package of transformational developments:
  - £2 billion of improvements to the A303/A30/A358 corridor, transforming connectivity to the South West with a new expressway, including a tunnel of at least 1.8 miles at Stonehenge
  - £640 million to further improve the A1 to the west and north of Newcastle, with a particular focus on tackling congestion by further widening sections of the Western-Bypass and dualling north to Ellingham
  - £350 million to upgrade the A47 in the East of England, including continuous dual carriageway around Norwich
  - £350 million to upgrade the A27 on the south coast, including a dual carriageway bypass for Arundel
  - £170 million to improve connections on trans-Pennine roads including improvements to the A61 and A628
  - £1.5 billion of investment in the A14 Cambridge to Huntingdon which improves freight access to Felixstowe, one of the country's major shipping ports, tackling the congestion in the East of England and unlocking a major housing development at Northstowe
- to extend the capacity of the existing network and address the very worst congestion that is holding back the economy:
  - tripling the level of investment in enhancements to the Strategic Road Network – rising from recent levels of £1 billion per year to £3 billion per year by the end of the decade – allowing for sustained investment in improvements to the strategic road network in every region of the country
  - 1,300 lane miles of extra capacity, including a 'smart spine' of Smart Motorways linking London, Birmingham and the North West, providing additional capacity to some of the busiest routes on the network
  - £9 billion to invest in over 100 major projects on the Strategic Road Network by the end of the decade
  - upgrading the country's most important A roads to 'Expressways' – with many similar standards and similar safety levels to our motorways, expected to deliver mile a minute speeds for most journeys; Expressways would generally be dual-lane, with grade separated junctions and technology used to control and inform traffic

- 3.11 RIS1 will also establish 5 designated funds worth £900 million to address a range of specific issues over and above the traditional focus of road investment and ensure the new Strategic Highways Company is at the cutting edge of innovation in road construction and network management. The funds are:
- Environment
  - Cycling, Safety and Integration
  - Innovation
  - Air Quality
  - Growth & Housing
- 3.12 In order to support its ambitious investment programme, in November 2014 the Highways Agency appointed 26 companies to the largest ever Collaborative Delivery Framework worth £5 billion over the next 5 years.
- 3.13 The government will also provide over £500 million of additional capital investment by the end of the decade to support the further uptake of ultra-low emission vehicles (ULEVs). This includes a £32 million fund for charging infrastructure, on top of which the Road Investment Strategy includes £15 million for a network of chargepoints which will ensure access to a chargepoint every 20 miles on 95% of the Strategic Road Network. This infrastructure investment will ensure that ULEV drivers can easily find a rapid charge point to help undertake any journey they choose. A further £11m of joint government and industry funding will help establish an initial network of up to 15 hydrogen refuelling stations by the end of 2015.

### **Priority investments (Top 40)**

- 3.14 To support delivery of its objectives for the roads sector, the government has included the following within its Top 40 priority infrastructure investments:
- Accelerated Road Schemes
  - Strategic Roads New Capacity
  - Smart Motorways
  - A14
  - Lower Thames Crossing
  - A303 / A30 / A358 Corridor
  - A1 (North East)
- 3.15 For full details on the Top 40 selection criteria and how the government tracks and supports progress, please see Chapter 16, which also sets out the key projects and programmes within individual investments.

### **Longer term**

- 3.16 The government's vision is nothing short of a transformation of the nation's road network over the next quarter of a century, with the aim of putting the nation's Strategic Road Network back in the top ten globally.

3.17 As part of RIS1, the government has also asked the new Strategic Highways Company to explore the feasibility of further transformational investments including:

- consideration of further improvements for trans-pennine connectivity from Manchester to Sheffield, raising the level of future ambition and determining if there is an historic opportunity to link two of our great northern cities; this work will be taken forward with Transport for the North as part of the development of the wider Northern transport strategy
- an Oxford to Cambridge Expressway – a new east-west connection linking Cambridge, Bedford, Milton Keynes, and Oxford, connecting a number of high-growth areas, and creating a much better direct east-west connection between some of our most important scientific and technical centres of excellence
- M25 South West quadrant improvements – exploring options for tackling the extremely serious levels of congestion on the busiest road in Britain, making best use of all transport modes

3.18 Transforming our road network is the work of a generation and more detailed future plans will be laid out in subsequent Road Investment Strategies. Alongside the results on future feasibility study work this may well include further improvements to our major trunk roads, such as the A1 between London and Scotland.

**Further information**

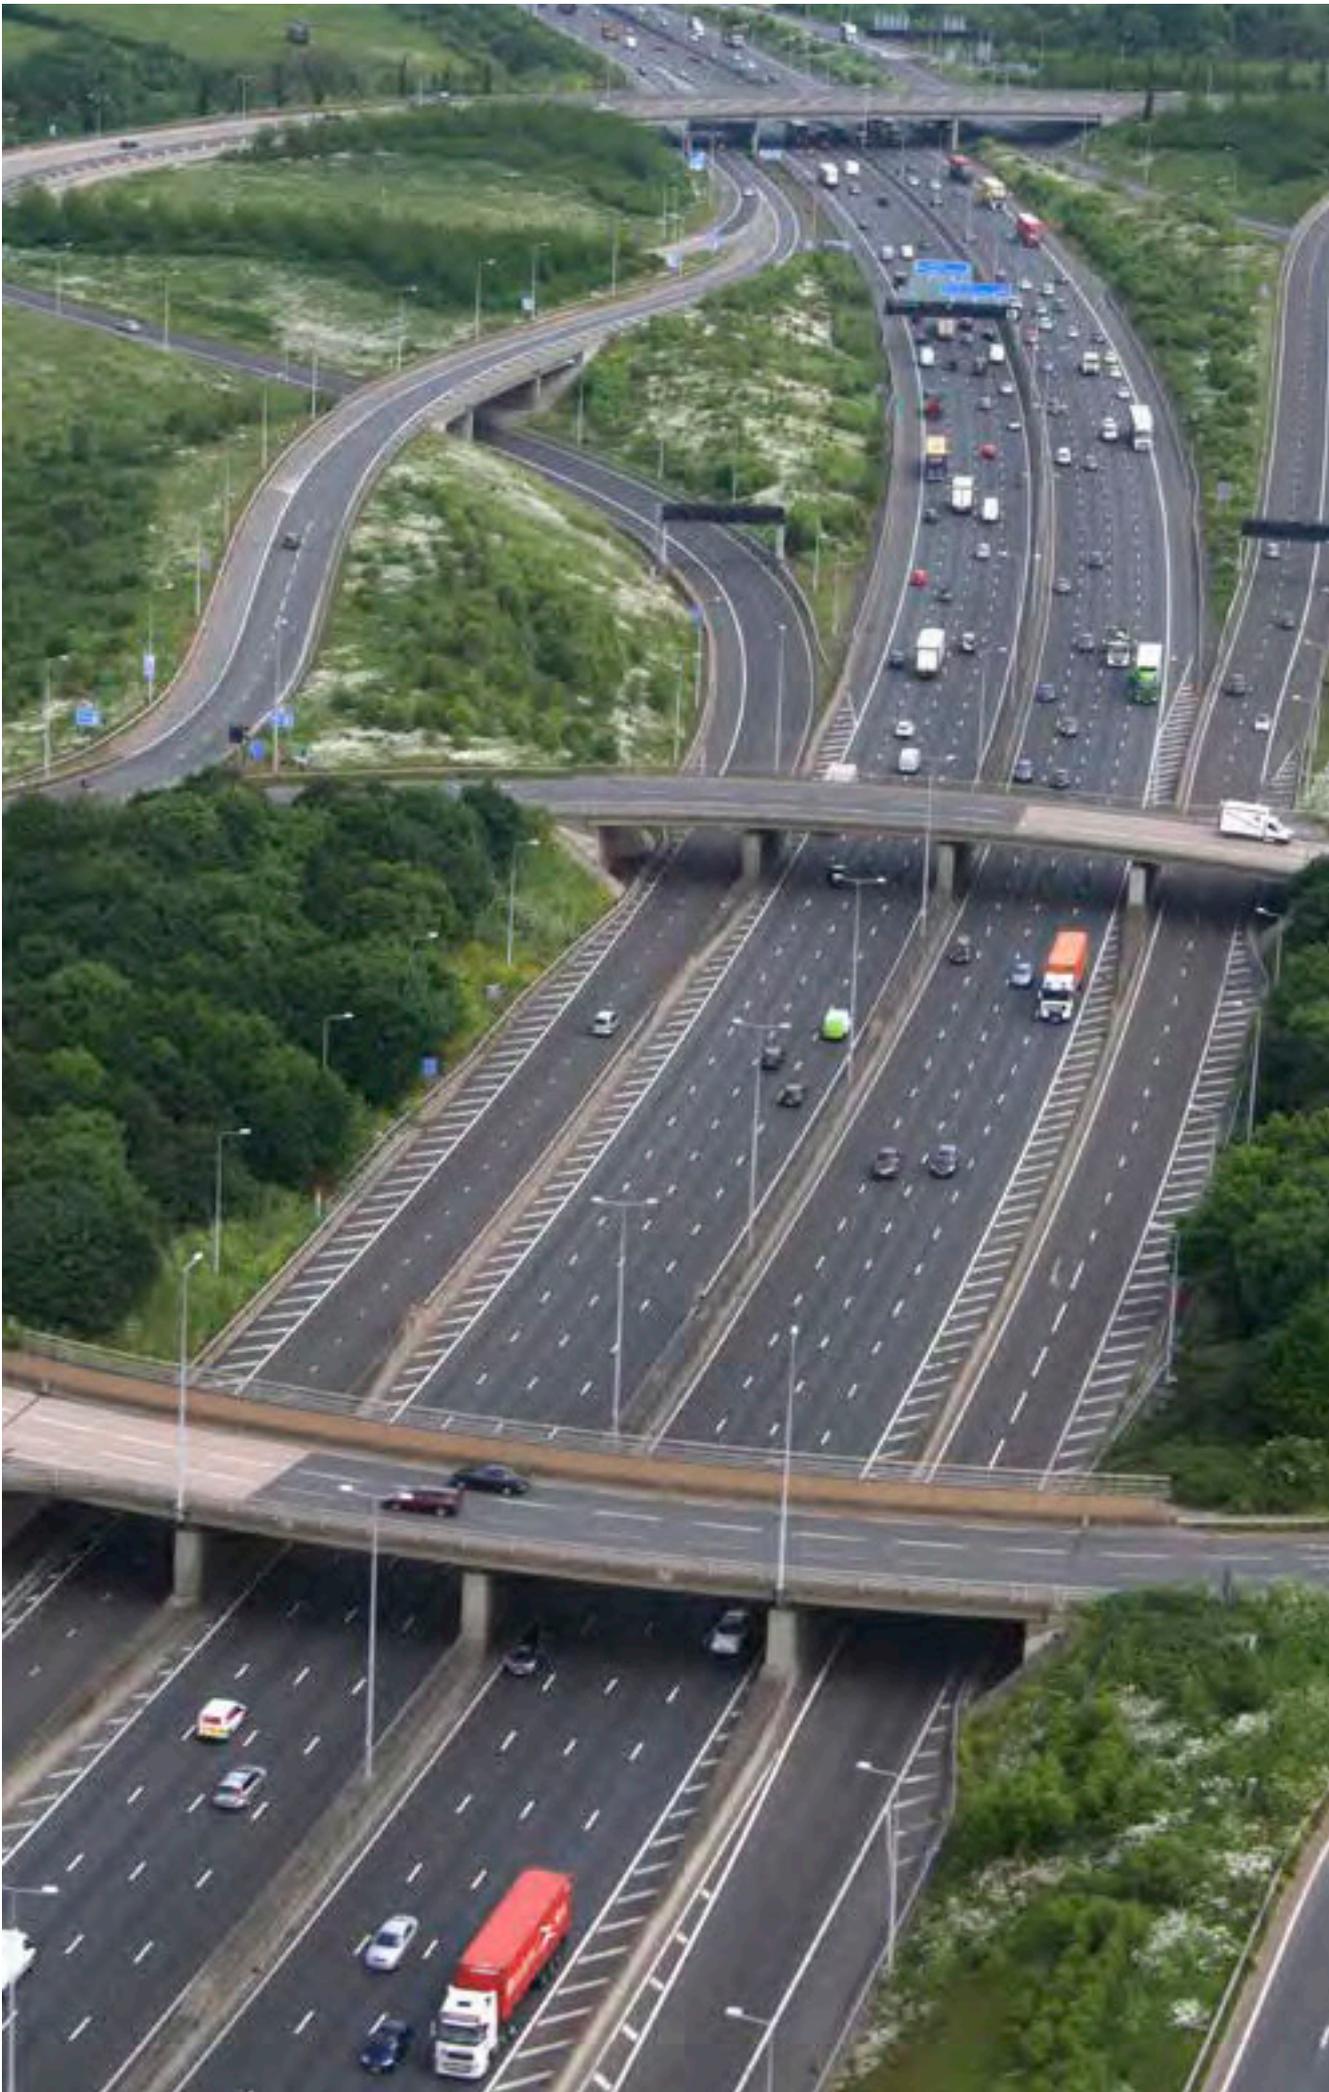

3.19 The infrastructure pipeline sets out details of major planned projects and programmes within the roads sector, including current status, projected construction start/completion dates and cost profiles (where available).

3.20 The full Road Investment Strategy 1 can be found on the gov.uk website.

**Key policy and delivery milestones**

	2015-16	<p><b>Top 40 key project starts due:</b> A160/A180 Immingham (all accelerated roads now in construction)</p> <p><b>Top 40 key project completions due:</b> M1 J28 to 31 and J39 to 42, M6 J10 to 13, A453 Widening</p> <p>Consultation on detailed route options for the Lower Thames Crossing</p>
	2016-17	<p><b>Top 40 key project starts due:</b> A14 (Cambridge to Huntingdon)</p> <p><b>Top 40 key project completions due:</b> M3 J2 to 4A, A556 Knutsford to Bowden, Manchester Smart Motorways, M1/M6 J19, A160/A180 Immingham, A1 Coal House to Metro Centre</p>
	2017-18	<p><b>Top 40 key project completions due:</b> A5-M1 Link Road, A1 Leeming to Barton</p>

	2020-21	<p>Start of RIS2 period</p>

Project-specific dates are based on the infrastructure pipeline and are indicative of current plans. Some projects may be subject to finalisation of statutory processes. Final decisions on private-sector led projects will be taken by the project developer.

# RAIL

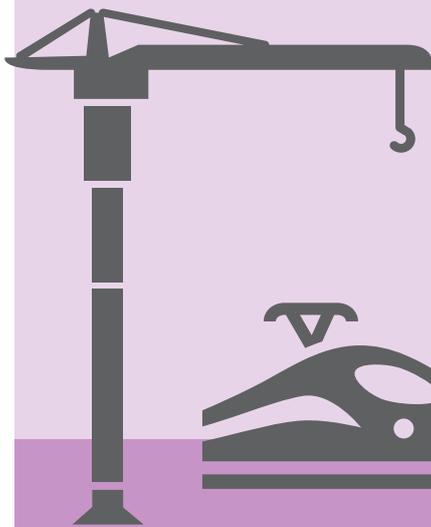

## Progress since 2010

- Major upgrade of King's Cross Station, unlocking 2,000 new homes

- Improvements to over 400 other stations around the country

- Crossrail tunnelling nearly 90% complete and flagship stations in construction

- Construction started on the transformational Northern Hub rail upgrade

£38bn

- Network Rail delivery plan, including electrification of key lines

- Crossrail due to be fully operational by 2019

- HS2 phase 1 due to start construction in 2017

- Plans to reduce industry costs by up to £3.5 billion by 2019

Plan to 2020-21

**INFRASTRUCTURE PIPELINE FOR RAIL £86.9BN**

**In construction £34.8bn**

**Future investment £52.1bn**

# Chapter 4:

# Rail

## Box 4.A: Announcements in the rail sector

- **Crossrail 2** – see Chapter 5 (Local Transport)
- **Norwich in Ninety** – the government supports the key recommendations of the Great Eastern Main Line Task Force, including upgraded infrastructure and the latest Rolling Stock. Bidders for the next Anglia Franchise, which will start in October 2016, will be incentivised to submit plans for achieving these recommendations for services to Norwich in 90 minutes and associated benefits along the Great Eastern Mainline
- **East West Rail** – the government will consider the outputs of the Network Rail study into the East West Rail central section (Bedford to Cambridge) as part of the planning for Control Period 6 (2019-2024)
- **Dawlish rail services** – the government will support Network Rail in its work to improve the resilience of the railway at Dawlish. Additionally, it will ask Network Rail to examine wider issues surrounding connectivity to and within the South West peninsula. Specifically, Network Rail will consider alternatives to the current mainline route to the South West via Dawlish, including an alternative route via the north side of Dartmoor through Okehampton. This work will feed into Network Rail's Initial Industry Plan for Control Period 6 (2019-2024)
- **Access for all** – the government will increase the funding for the Access for All scheme by £60 million between 2015-16 and 2018-19, improving platform access at around 20 stations
- **Chesterton Rail Station** – as announced by the Prime Minister and Deputy Prime Minister the government will provide £44 million between 2014-15 and 2016-17 to build a new rail station at Chesterton, linked to Cambridge Science Park

## Objectives

- 4.1 The government's objectives for the rail network are to:
- increase rail capacity, particularly into major cities
  - reduce journey times
  - strengthen connectivity
  - improve reliability, safety and the passenger experience

- 4.2 The government's rail strategy supports overall decarbonisation of the transport system by providing a greener alternative to roads and aviation.

## Needs

- 4.3 Rail is vital to the UK's economic prosperity. If rail services are inefficient and do not meet people's needs for routing or frequency, business and jobs suffer. Since privatisation in the mid-1990s, there has been sustained growth in rail passenger demand. Over 4.3 million journeys are now made by rail every day. Over the last 10 years, passenger journeys in Great Britain have increased by 57%. Demand for long distance rail travel has also increased with 129 million long distance journeys made in 2013/14.<sup>1</sup>
- 4.4 Demand for rail freight has also grown, with freight volumes increasing by over 60% since 1995.<sup>2</sup> In the year to March 2014 alone, the volume of freight moved by rail has grown by 5.8%.<sup>3</sup> Economic impact analysis suggests that the transport of over 100 million tonnes of goods annually by the rail freight industry, worth around £30 billion, directly contributes £870 million to the economy.<sup>4</sup> Rail freight produces 76% less carbon dioxide than road freight per tonne, with each freight train estimated to remove between 43 and 77 HGVs from the roads.<sup>5</sup>
- 4.5 Rising commuter satisfaction and improved service provision, as well as population growth and capacity constraints on other transport modes, mean both passenger and freight demand are predicted to increase further. An upper estimate of forecast growth in passenger rail journeys (passenger-miles) can be seen in Chart 4.A below.

<sup>1</sup> Passenger Journey by Sector, National Rail Trends Portal, ORR

<sup>2</sup> Value and Importance of Rail Freight, Network Rail, April 2013

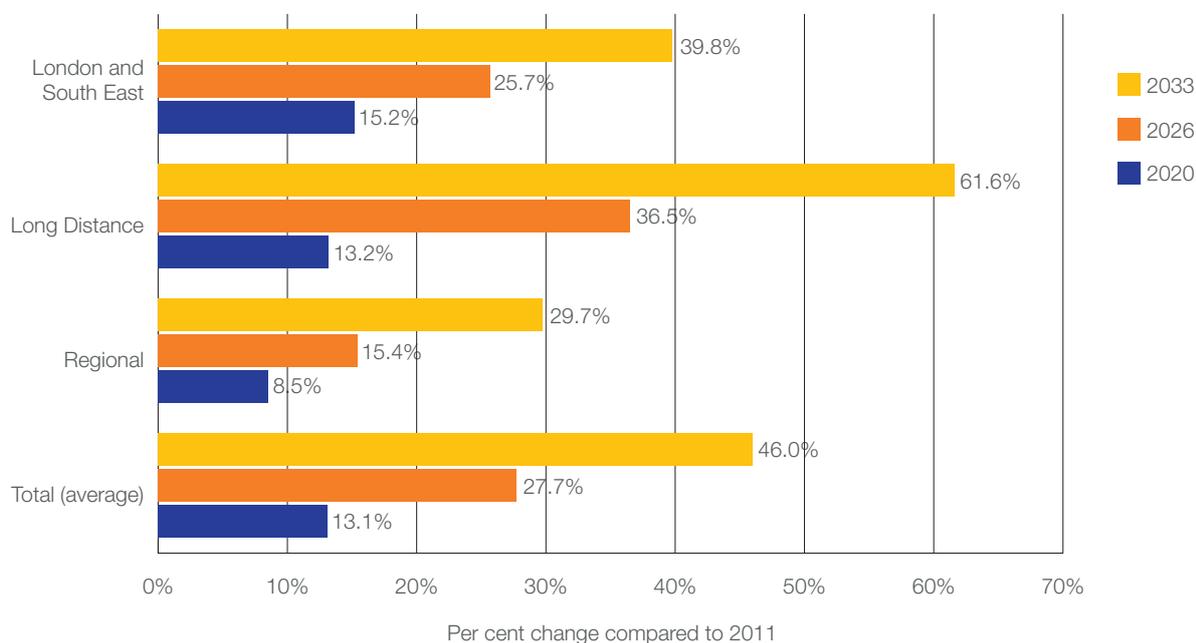

<sup>3</sup> Freight Rail Usage, ORR, May 2014

<sup>4</sup> Value and Importance of Rail Freight, Network Rail, April 2013

<sup>5</sup> *ibid*

4.6 Total freight traffic, in terms of tonne kilometres moved, is forecast to increase at an average of 2.9% per annum through to 2043.<sup>6</sup>

**Chart 4.A: Forecast of passenger miles on the rail network in Great Britain<sup>7</sup>**

Source: National Policy Statement for National Networks, Department for Transport, (forthcoming)

## Strategy

4.7 The government provides strategic direction and funding to the railways and procures franchises, key projects and in exceptional cases some targeted rolling stock. The majority of rail infrastructure investment is publicly funded (supplemented by access revenue from train and freight operating companies). It also takes targeted action on rail fares to ease the burden on consumers while ensuring that the railway remains financially sustainable.

4.8 The government's approach to the rail sector involves:

- investing in improving capacity and connectivity on the rail network and enhancing passenger experience by:
  - building new lines and making improvements to existing lines, including a rolling programme of electrification and the introduction of better signalling, to provide faster, more frequent journeys
  - enhancing and redeveloping stations
  - enabling a franchise-led programme of progressive investment in rolling stock
  - supporting growth in rail freight by strengthening the Strategic Rail Freight Network
- investing in High Speed 2, the biggest transport project for a generation, which will result in new capacity, better connectivity and quicker journeys; HS2 will link 8 of Britain's 10 largest cities, serving one in five of the UK population; it will allow more passengers to use trains and more freight operators to use rail rather than road; it will also be an engine for economic growth, generating jobs and helping to rebalance the economy between north and south

<sup>6</sup> The Freight Market Study, Network Rail, October 2013

<sup>7</sup> Estimates for demand growth by 2030, based on current GDP trend forecasts and fares policy

- investing in other major projects such as Crossrail, which will change the way that people travel around London, improving journey times across the capital, easing congestion and offering better connections; Crossrail will, for the first time, deliver a direct connection between all of London's main employment centres – linking Heathrow with Paddington, the West End, the City and Canary Wharf

## Delivery plan

- 4.9 Network Rail is the company responsible for owning, operating and managing Britain's railway network, operating under a licence enforced by the Office for Rail Regulation. In December 2013, the Office for National Statistics (ONS) announced that, following implementation of the European System of Accounts 2010 (ESA10), Network Rail Limited with all of its subsidiaries would be reclassified as a central government body. That decision took effect on 1 September 2014 and Network Rail is now a public-sector arms-length body of the Department for Transport.
- 4.10 HS2 Ltd is the company responsible for developing and promoting the UK's new high speed rail network and is wholly owned by the government.
- 4.11 Responsibility for the delivery of Crossrail belongs to Crossrail Ltd, a fully-owned subsidiary of Transport for London, which is sponsored by the Department for Transport.

## Key actions to 2020

- 4.12 The government is undertaking the largest modernisation programme for over a century.
- 4.13 Over the next 5 years it is committed to:
- overseeing £38 billion of expenditure by Network Rail in Control Period 5 (2014 – 2019) including the following enhancement projects:
    - the start of a major electrification programme including key routes such as the Great Western Line, Trans-Pennine and Midland Main Line
    - redevelopment of key stations in Birmingham, Bristol and Manchester
    - capacity improvements at key routes such as the South West and through the Northern Hub
    - beginning implementation of the European Rail Traffic Management System to improve line capacity
    - further development of the Strategic Rail Freight Network
  - ensuring Crossrail is completed on time and on budget; for further detail on Crossrail 2, see Chapter 5
  - completion of the Thameslink upgrade programme, including the redevelopment of London Bridge station and a new direct interchange with Crossrail at Farringdon
  - provision of 3,400 new rail vehicles; this includes around 2,500 for 3 major projects – new trains for the Intercity Express Programme, Thameslink and Crossrail – which are being procured by the public sector
- 4.14 The HS2 Hybrid Bill is currently going through Parliament, and has now passed Second Reading, with Royal Assent expected by the end of 2016. Phase 1 is due to start construction in 2017. This will coincide with the opening of the new National College for High Speed Rail, which will provide up to 2,000 apprentices and will be crucial in supporting the leading edge supply chain provision needed for HS2. The government will also confirm next steps on how to take forward Phase 2 in 2015.

- 4.15 A detailed timetable for all rail franchise competitions over the next 8 years has now been published by the government, and will be refreshed annually, to provide long-term certainty to the market and support major investments in the network. This can be accessed at the following address: <https://www.gov.uk/government/publications/rail-franchise-schedule>
- 4.16 In its 2012 Command Paper “Reforming our Railways, Putting the Customer First”, the Government challenged the Rail Industry to deliver savings of up to £3.5 billion by 2019 to bring it alongside its very best overseas comparators. In its Final Determination for the next Control Period (covering the years 2014 to 2019) the Office of Rail Regulation has set Network Rail the detailed efficiency targets that will achieve this. In parallel, through its franchising programme, the Department for Transport is incentivising Train Operators to deliver operational efficiencies and help drive down industry’s costs.

### Priority investments (Top 40)

- 4.17 To support delivery of its objectives for the rail sector, the government has included the following within its Top 40 priority infrastructure investments:
- Intercity Express Programme
  - European Rail Traffic Management System
  - High Speed 2
  - Strategic Freight
  - Crossrail
  - Thameslink
  - Rail Investment Strategy route programmes
  - Major Stations
- 4.18 For full details on the Top 40 selection criteria and how the government tracks and supports progress, please see Chapter 16, which also sets out the key projects and programmes within individual investments.

### Longer term

- 4.19 Network Rail Control Period 6 will run from 2019 to 2024. It is likely that the initial industry plan will be released in Autumn 2016, with a view to a final determination by the ORR in 2018, though final timings will be confirmed in due course.
- 4.20 Phase 1 of High Speed 2 is due to open in 2026, with Phase 2 currently scheduled to complete in 2033.
- 4.21 To improve connectivity in the Midlands and the North, Sir David Higgins, Chairman of HS2 Ltd has recommended that decision making on HS2 be integrated with Network Rail’s decision making for improvements to the existing network during control period 6. The Secretary of State for Transport has commissioned HS2 Ltd and Network Rail to make recommendations before the government’s response to the Phase Two consultation. The government is also working on ways to accelerate delivery of the Phase 2 section to Crewe, pending a decision on the route in 2015.

- 4.22 The government will support the railway industry study, due to report in February 2015, which is considering the case for including electrification of the following eight routes in Network Rail's Control Period 6: Leeds – Harrogate – York, Selby – Hull, Sheffield – Leeds, Sheffield – Doncaster, East Coast Main Line – Middlesbrough, Sheffield – Manchester (including the Hope Valley Line), Warrington – Chester, Crewe – Chester.
- 4.23 The government has also given its backing to develop proposals for a new High Speed 3 rail connection for cities in the north, which could significantly reduce journey times across the region. In response to recommendations from Sir David Higgins, the government has announced the creation of a new body called Transport for the North made up of the main northern city regions. This body will work together with other authorities and stakeholders and allow the north to speak with one voice on the big decisions to benefit the region as a whole.
- 4.24 The government, working with Transport for the North, will now produce a comprehensive transport strategy for the region. This will include options, costs and a delivery timetable for a HS3 east-west rail connection. An interim report will be produced in March 2015.

### Further information

- 4.25 The infrastructure pipeline sets out details of major planned projects and programmes within the rail sector, including current status, projected construction start/completion dates and cost profiles (where available).
- 4.26 The full Network Rail Control Period 5 Delivery Plan is available at: [www.networkrail.co.uk/publications/delivery-plans/control-period-5/cp5-delivery-plan/](http://www.networkrail.co.uk/publications/delivery-plans/control-period-5/cp5-delivery-plan/)
- 4.27 Further details on delivery of HS2 and Crossrail can be found on the relevant project websites.

### Key policy and delivery milestones

2015	Manchester Victoria and Birmingham New Street station works due to be completed
	New Intercity Express Programme (IEP) plant due to be fully operational
	HS2 Phase One construction contracts due to be put out to tender and phase 1 locations due to finalise growth strategies
	Northern Electrification Taskforce Report due to be published
2016	Initial Industry Plan for Control Period 6 due to be published
	Royal Assent due to be granted for HS2 Hybrid Bill
2017	Control Period 6 High Level Output Specification due to be published
	HS2 Phase 1 construction due to start
	Crossrail tunnel and station fit-outs due to be completed and first rolling stock in use
2018	London Bridge works (Thameslink programme) due to be completed
	First InterCity Express Programme trains due to be in service on East Coast Main Line
	Office of Rail Regulation final determination on Control Period 6 due to be published
	First Crossrail services due through Central London tunnelled sections
2019	Network Rail Control Period 6 Delivery Plan due to be published and start of works
	Full Crossrail services due to be operating from Heathrow & Reading to Abbey Wood & Shenfield.

Project-specific dates are based on the infrastructure pipeline and are indicative of current plans. Some projects may be subject to finalisation of statutory processes. Final decisions on private-sector led projects will be taken by the project developer.

# LOCAL TRANSPORT

## Progress since 2010

Over

£1bn

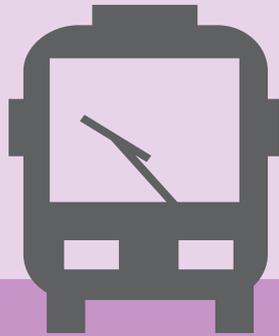

allocated to local sustainable transport projects

41

major local transport projects completed and 28 more under construction

Mersey Gateway Bridge started construction in spring 2014

Completion of the London orbital rail route, Victoria line upgrade and new trains on Circle and Hammersmith and City tube lines

Over

330

transport improvements to be supported through £3.1 billion of Local Growth Funding

41

major transport schemes to be delivered including in Nottingham, Bristol and Leeds

Mersey Gateway Bridge due to open to traffic in autumn 2017

Northern Line Extension due to start construction in 2015

## Plan to 2020-21

**INFRASTRUCTURE PIPELINE FOR LOCAL TRANSPORT £32.3BN**

**In construction £19.8bn**

**Future investment £12.5bn**

# Chapter 5:

## Local transport

### Box 5.A: Local transport announcements

- **Crossrail 2** – the government will provide £2 million between 2014-15 and 2015-16 to support the development of a comprehensive business case produced jointly by the Department for Transport and Transport for London, to complete ahead of the next Spending Review this will be combined with a full options appraisal of all potential major transport projects in London, including an extension of the Bakerloo Line to improve connectivity in South East London, and the devolution of South Eastern rail services to London
- **Cycle City Ambition grants** – as announced by the Deputy Prime Minister on 27 November, the government will provide £114 million between 2015-16 and 2017-18 to enable the continuation of the Cycle City Ambition scheme in the eight cities it already covers; this will provide capital funding for better cycle infrastructure such as segregated lanes and improved junctions
- **Clean Vehicle Technology Fund** – the government will provide up to £4 million to extend the Clean Vehicle Technology fund in 2014-15 which funds road vehicle modification by Local Authorities in order to reduce air pollution
- **Local highways maintenance grant** – the government has already announced that local highways maintenance funding will be increased, totalling £5.8 billion over the next six years, and can now announce how the formula grant will be broken down by region
- **Bath City Centre Congestion Relief** – the government welcomes the strategy put forward by Bath and North East Somerset Council and the West of England LEP to improve transport capacity East of Bath and reduce city centre congestion; the government will consider a business case, which will be developed by Bath and North East Somerset Council that assesses the viability of proposals including a park and ride, as well as a park and rail service, located to the East of Bath

### Objective

- 5.1 The government is committed to ensuring that local transport systems are tailored to the needs of local communities, allowing them to travel freely and easily and supporting jobs and growth.

## Strategy

- 5.2 Local roads, which are not part of the Strategic Road Network, are a crucial element of the overall transport system and carry the majority of non-freight road traffic. Local authorities have responsibility for managing, maintaining and making improvements to local roads in a way that best meets local needs. The government provides supporting funding for many larger enhancement and maintenance schemes.
- 5.3 In addition to this the government will be providing local authorities (in England) with £5.8 billion over the next six years for maintenance of local highways. At around £400 billion the local road network is one of the UK's most valuable infrastructure assets, and this investment will ensure that is kept in good order, preventing potholes and making journeys safer.
- 5.4 The government is now able to announce that of this funding £4.7 billion will be allocated according to a needs-based formula, with £580 million to incentivise good asset management and efficiencies, and £575 million reserved to a challenge fund for large one-off maintenance and renewal projects. Funding from the needs-based formula, before including incentive and challenge funding, will indicatively be allocated regionally as follows:
- North East – £270 million
  - North West – £630 million
  - Yorkshire and the Humber – £490 million
  - East Midlands – £540 million
  - West Midlands – £510 million
  - East of England – £640 million
  - South East – £780 million
  - South West – £850 million
- 5.5 55% of car journeys are under five miles, and many of these local trips could be made by public transport, cycling or walking. The government works with local authorities to encourage people to use these options as an alternative to cars to ease congestion whilst cutting carbon, and also provides supporting funding for larger improvements (bus stations, tram schemes). Some funding is also provided for ongoing services, including buses.

## Delivery plan

- 5.6 As set out in Chapter 2, a significant proportion of future local transport funding (including the capital element of the Local Sustainable Transport Fund) has now been incorporated into the Local Growth Fund (LGF).
- 5.7 LGF spending has been devolved to 39 Local Enterprise Partnerships (LEPs) between local authorities and businesses. The LEPs are responsible for determining local priorities, with responsibility for delivery of projects remaining primarily with local authorities.

## Key actions to 2020

- 5.8 The government has already agreed the first £6 billion of local projects through a wave of Growth Deals with LEPs. This includes the complete allocation of £2 billion from the

LGF for 2015-2016. LGF projects are expected to be matched by local investments worth around twice the contribution from the government. 332 transport improvements will be supported including:

- £44 million for the Metrolink transport system in Manchester, which will include 12 new trams, as part of a £448 million transport package in Greater Manchester including revamped stations and improved bus services
- £23 million for a new road crossing of the M4 linking Swindon to nearby Wichelstowe, creating thousands of jobs and opening up a new site for thousands of homes
- funding for Birmingham to help the city make the most of HS2 – including improving connection to the Birmingham Curzon Street station
- more than £600 million for local sustainable transport schemes

- 5.9 In addition, there are over 100 local authority major (over £5 million) transport projects where funding has been incorporated into the LGF, which are expected to be complete by 2020.
- 5.10 The government will provide support to LEPs and local authorities to improve their delivery capability through the Transport Delivery Excellence programme.
- 5.11 The government has recently consulted on a draft Cycling Delivery Plan. The plan includes a number of specific actions for the next 10 years focusing on infrastructure developments such as cycle-proofing our roads and promoting cycling and walking as alternative sustainable travel choices. The government will respond to the consultation in the new year.

## London

- 5.12 Transport for London (TfL) is the public body with standalone responsibility for the majority of the capital's transport services.
- 5.13 It has a number of major infrastructure upgrades planned, including:
- completion of major projects to rebuild Tottenham Court Road, Victoria and Bond Street stations, increasing capacity and adding step-free access
  - further projects to modernise some of the underground's busiest stations are planned for Bank, Holborn and Camden Town
  - increasing the number of trains on the Jubilee and Victoria lines up to 36 trains per hour (a train every 100 seconds) in the peak hours over the next six years
  - £4 billion investment to improve London's roads, including 17 major roads schemes and 33 junction improvements
- 5.14 The government welcomes the Crossrail 2 Funding and Financing report, completed by PWC, which was published on 27 November 2014. The proposal to build a second Crossrail line could support regeneration and help London's transport network to support long term growth by addressing crowding and offering more direct, fast, frequent services that are not available at present. The Funding and Financing report shows that a significant local contribution to the costs of Crossrail 2 is possible, although genuinely private sources of funding are limited. As with all government spending, the government would need to consider affordability and a business case for Crossrail 2 before making a decision to proceed. In response to the report, the government will provide £2 million between 2014-15 and 2015-16 to support the development of a comprehensive business case produced jointly by the Department for Transport and Transport for London, to complete ahead of the next Spending Review. This will be combined with a full options appraisal of potential major transport projects in London, including an extension of the Bakerloo line and the devolution of South Eastern rail services to London.
- 5.15 Construction of the Northern Line Extension to Battersea is due to start construction in 2015. The extension will improve transport links and public spaces in the area and is essential to support the transformation of Vauxhall, Nine Elms and Battersea, a designated regeneration area on the South Bank. The project could support up to 25,000 jobs and creation of 16,000 new homes.
- 5.16 TfL has consulted recently on options for a new river crossing in East London, with options including crossings at Woolwich, Gallions Reach and Belvedere. An interesting proposal made by Sustrans, and worth looking at in more detail, would be a new pedestrian and cycle bridge from Rotherhithe to Canary Wharf – which could be called the Brunel Bridge in tribute to one of the great figures in the history of UK infrastructure

## Priority investments (Top 40)

- 5.17 To support delivery of its objectives for the local transport sector, the government has included the following within its Top 40 priority infrastructure investments:
- Local Transport Major Schemes
  - Mersey Gateway Bridge
  - Transport for London Major Schemes
  - Northern Line Extension

5.18 For full details on the Top 40 selection criteria and how the government tracks and supports progress, please see Chapter 16, which also sets out the key projects and programmes within individual investments.

### Longer term

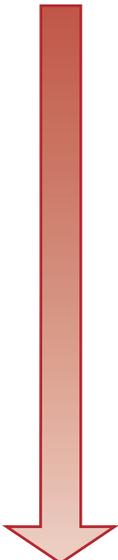

5.19 The government has confirmed availability of a Local Growth Fund of at least £12 billion until 2020-21. It remains committed to the localism agenda and will continue to consider ways in which it can give local areas more control to influence the local growth and infrastructure funding that affects them.

### Further Information

5.20 The infrastructure pipeline sets out details of major planned projects and programmes within the local transport sector, including current status, projected construction start / completion dates and cost profiles (where available).

5.21 Further details of projects funded through Growth Deals can be found here: <http://maps.dft.gov.uk/local-growth-deals/>

### Key policy and delivery milestones

	2015	<p><b>Top 40 key project starts due:</b> Norwich Northern Distributor Road, Sunderland Strategic Corridor (New Wear Crossing). Northern Line Extension also due to start</p> <p><b>Top 40 key project completions due:</b> Nottingham NET2, Midland Metro, Kingskerswell Bypass</p> <p>Start of Local Growth Fund projects</p>
	2016	<p><b>Top 40 key project completions due:</b> Heysham to M6 Link Road</p>
	2017	<p><b>Top 40 key project starts due:</b> Leeds New Generation Transport</p> <p><b>Top 40 key project completions due:</b> Norwich Northern Distributor Road and Sunderland Strategic Corridor (New Wear Crossing). Mersey Gateway Bridge open to traffic</p>
	2018	
	2019	
	2020	<p><b>Top 40 key project completions due:</b> Leeds New Generation Transport. Northern Line Extension also due to complete</p>

Project-specific dates are based on the infrastructure pipeline and are indicative of current plans. Some projects may be subject to finalisation of statutory processes. Final decisions on private-sector led projects will be taken by the project developer.

# AVIATION

## Progress since 2010

- Opening of new Heathrow Terminal 2
- 
- 
- 

- First planes took off from extended runway at Birmingham Airport
- 
- 
- 

Completion of

£164m

- programme to replace the NATS en-route radar network
- 
- 

- Final Airports Commission report due in summer 2015
- 
- 
- 

£6.1bn

- of private-sector aviation investment in the pipeline
- 
- 

- Better road links to support airports including the M42 in Birmingham and A6 in Manchester
- 
- 

Plan to 2020-21

**INFRASTRUCTURE PIPELINE FOR AVIATION £6.1BN**

**In construction £5.7bn**

**Future investment £0.4bn**

# Chapter 6:

# Aviation

## Objectives

6.1 The government seeks to ensure that the UK:

- has sufficient airport capacity to meet current and forecast need
- remains one of the best connected countries in the world via its air links
- maintains its aviation hub capability

## Needs

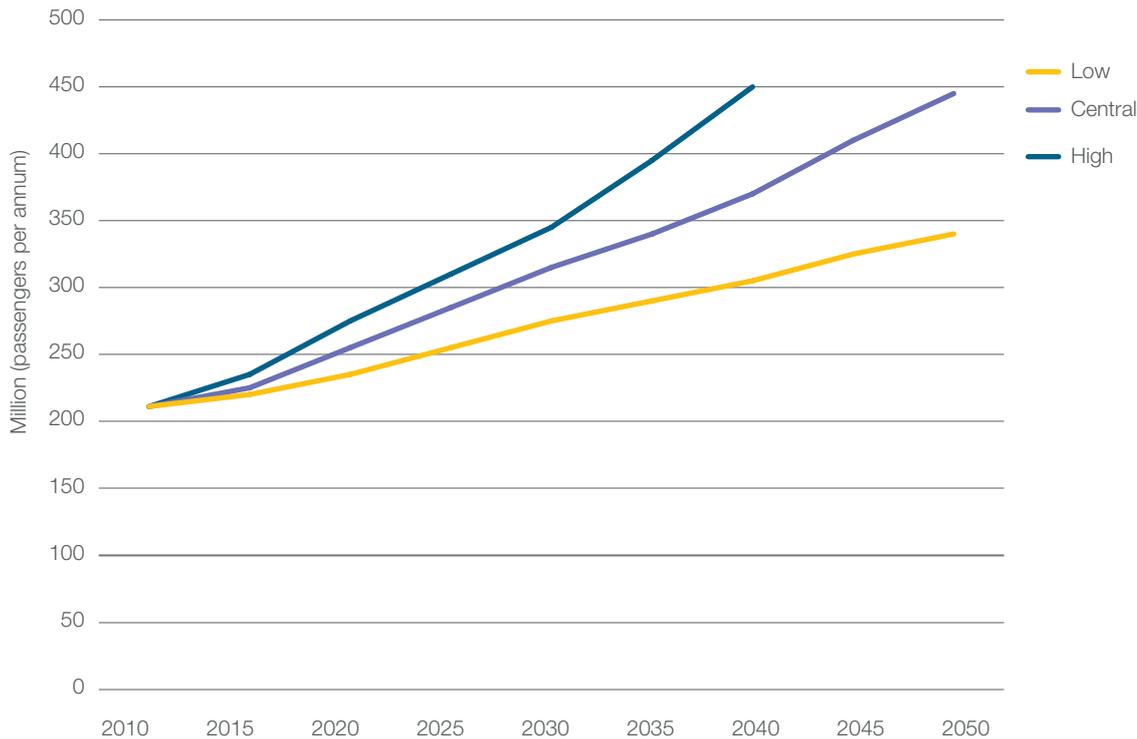

6.2 Air transport has a key role in supporting long-term economic growth, with the aviation sector contributing around £18 billion per annum of economic output to the economy and employing 220,000 people directly.<sup>1</sup> During 2013, UK airports handled 228 million passengers providing access to over 360 destinations worldwide.<sup>2,3</sup>

<sup>1</sup> Aviation Policy Framework, Department for Transport, March 2013

<sup>2</sup> Civil Aviation Authority statistics, March 2014

<sup>3</sup> Aviation Policy Framework, Department for Transport, March 2013

**Chart 6.A: Forecast of terminal passengers at UK airports, 'max use' capacity scenario**

Source: DfT, UK Aviation Forecast, Jan 2013

- 6.3 Demand for air travel is forecast to increase within the range of 1% to 3% a year up to 2050.<sup>4</sup> Low, central and high forecasts for passenger numbers at UK airports, taking into account the impact of capacity constraints, are shown in Chart 6.A.
- 6.4 With rising demand for air travel, the UK's airports face a capacity and connectivity challenge. Heathrow Airport – one of the busiest airports in the world – has operated at almost 98% capacity in 6 of the last 10 years and other major South East airports are forecast to reach full capacity between 2025 and 2030 under certain scenarios.<sup>5</sup>

## Strategy

- 6.5 Aviation in the UK is largely privately owned and managed, and the government believes that a competitive aviation market is the most effective way to meet the interests of air passengers and other users. The government's role is primarily to uphold a strong international and domestic regulatory framework which ensures a level playing field and the maintenance of high standards of safety and security. Within this framework the Civil Aviation Authority is responsible for regulating airports which pass a market power test under the Civil Aviation Act 2012 (currently Heathrow and Gatwick).
- 6.6 In order to ensure that the UK is well placed to maintain its aviation hub capability, the government has appointed an independent Airports Commission to examine the scale and timing of airport capacity needs in the South East and to identify how they should be met. The Commission has been asked to assess the options for meeting the UK's international connectivity needs, and recommend the optimum approach to meet those needs.
- 6.7 The government also recognises the importance of maximising the capacity and connectivity of existing airport infrastructure. This includes:

<sup>4</sup> UK Aviation Forecasts, Department for Transport, January 2013

<sup>5</sup> Airports Commission: Interim Report, Airports Commission, December 2013

- encouraging ongoing programmes of private investment at airports across the UK
  - optimising existing capacity through the adoption of innovative operational approaches and new technology
  - taking action to improve the quality of surface transport links to existing airports
- 6.8 The government is also taking action to maintain regional air access to London where there is the probability that an existing service would be lost, and to allow start-up aid for new routes from UK regional airports handling fewer than 5 million passengers per annum, in order to underpin the role of aviation in promoting local growth and connectivity.
- 6.9 Across all these measures, the government's policy is to manage the environmental impact of aviation including limiting and, where possible, reducing the number of people in the UK significantly affected by aircraft noise.

## Delivery plan

- 6.10 There is significant private-sector investment planned to improve capacity at airports across the UK between now and 2020. The government will also be taking action to support better use of existing airport capacity and, through the Airports Commission, to ensure future needs are met.

### Key actions to 2020

- 6.11 The Airports Commission has now published its interim report and is currently consulting on its assessment of proposals for additional runway capacity at Gatwick and Heathrow airports. The Commission will publish its final report in summer 2015. The Commission's analysis will be used to inform government decisions in summer 2015 on future airport capacity in the South East which will include how powers for any new runway could be delivered.
- 6.12 The government will continue to take action to make better use of existing airport capacity, including through a package of surface access measures for international gateways:
- the new Roads Investment Strategy includes plans for a comprehensive upgrade of the M42 Junction 6 near Birmingham airport, allowing better movement of traffic on and off the A45, supporting access to the airport and preparing capacity for the new HS2 station
  - Western Rail Access to Heathrow, to provide a direct service from Reading, will commence enabling works in 2017, subject to feasibility
  - Network Rail is producing a feasibility study into options on Southern Rail Access to Heathrow, to report its findings in 2015
  - Network Rail is consulting on extending the scope of the East Anglian Mainline study to include access to Stansted and will report findings in 2015
  - Network Rail is looking at capacity on the Brighton Mainline as part of the Route Study for Sussex on which it is currently consulting
- 6.13 In total, there is £6.1 billion of planned investment in UK airports and air traffic control in the pipeline between now and the end of the decade. Both Heathrow and Gatwick, regulated by the Civil Aviation Authority, have significant investment plans as part of the sixth quinquennium regulatory period which started on 1 April 2014 for both airports, and will run until 31 December 2018 for Heathrow and until 31 March 2021 for Gatwick.

A number of other privately-owned airports are also expected to bring forth investments to improve capacity on a commercial basis.

**Priority investments (Top 40)**

6.14 To support delivery of its objectives for the aviation sector, the government has included the following within its Top 40 priority infrastructure investments:

- Airport Infrastructure Improvements
- Airport Connectivity (see also ports)

6.15 For full details on the Top 40 selection criteria and how the government tracks and supports progress, please see Chapter 16, which also sets out the key projects and programmes within individual investments.

**Longer term**

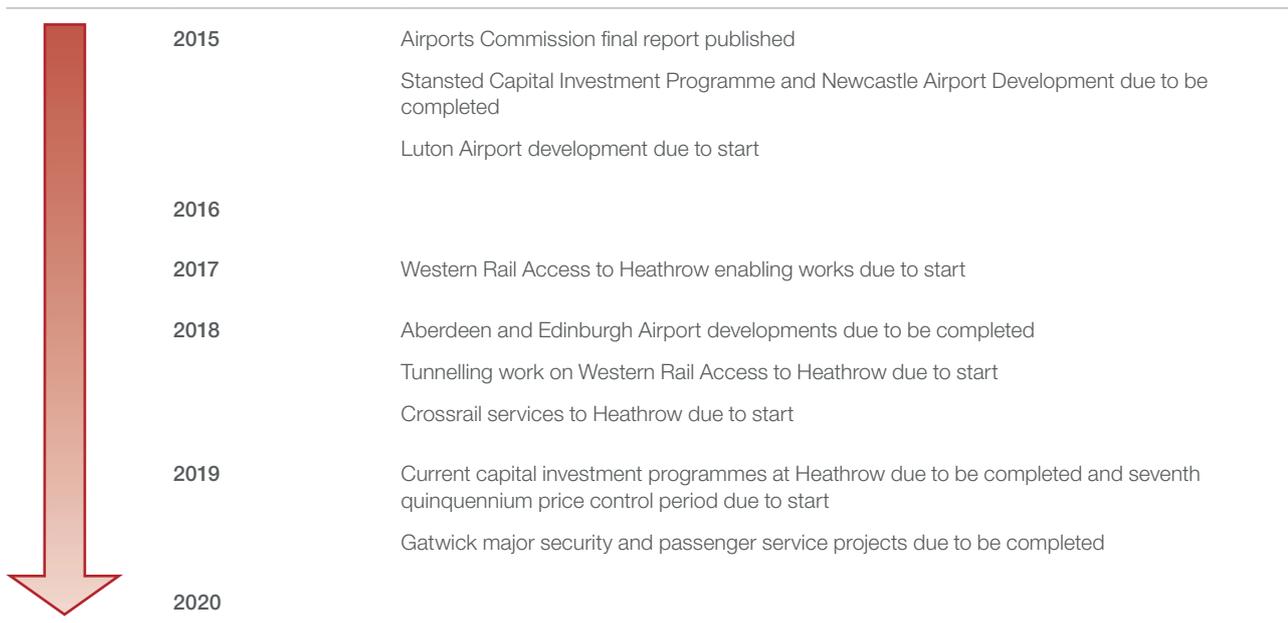

6.16 The Airports Commission has focused primarily on recommendations to meet capacity constraints that are forecast to emerge by 2030. However, the Airports Commission has also indicated that there is likely to be a demand case for a second additional runway in operation by 2050 or, in some scenarios, earlier. It is currently carrying out further analysis on this issue in the second phase of its work programme, including looking at the implications for any future capacity. This will enable it to make recommendations to government in its final report as to when, how and by whom the case for a second new runway should be considered.

**Further information**

6.17 The infrastructure pipeline contains details of major planned projects and programmes within the aviation sector, including current status, projected construction start/completion dates and cost profiles (where available).

6.18 Further details on the work of the Airports Commission can be found at: [www.gov.uk/government/organisations/airports-commission](http://www.gov.uk/government/organisations/airports-commission)

**Key policy and delivery milestones**

Project-specific dates are based on the infrastructure pipeline and are indicative of current plans. Some projects may be subject to finalisation of statutory processes. Final decisions on private-sector led projects will be taken by the project developer.

# PORTS

## Progress since 2010

**In construction £1bn**

**Future investment £0.2bn**

# Chapter 7:

## Ports

### Objectives

- 7.1 The government seeks to ensure sustainable port development that will cater for long-term forecast growth in volumes of imports and exports by sea.

### Needs

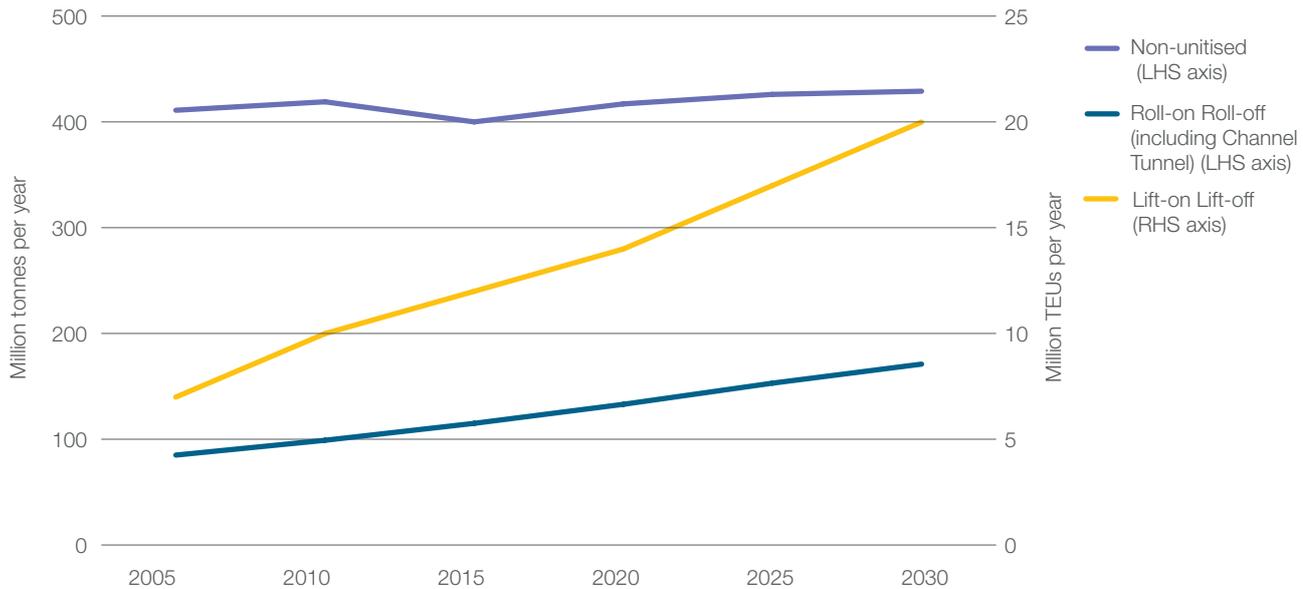

- 7.2 As an island economy, shipping provides the most effective way to move the vast majority of freight and bulk commodities in and out of the UK. The provision of sufficient port capacity will remain an essential element in ensuring sustainable growth in the UK economy.
- 7.3 There are approximately 120 commercial ports in the UK<sup>1</sup> and the UK handles the largest amount of freight in Europe in terms of tonnage. Ports in England and Wales handle around 95% of all goods in and out of the UK by volume. Freight traffic through UK ports has increased by three-quarters in the last 40 years.<sup>2</sup> Estimates suggest that the ports sector contributed approximately £7.9 billion to UK GDP in 2011.<sup>3</sup>
- 7.4 Future need for port infrastructure depends on overall demand for port capacity. In 2007 the Department for Transport published demand forecasts up to 2030. The results are shown in Chart 7.A.

---

<sup>1</sup> UK Major Ports Group

<sup>2</sup> National Policy Statement for Ports, Department for Transport, February 2012

<sup>3</sup> The economic impact of the UK Maritime Services Sector: Ports, Oxford Economics, February 2013

**Chart 7.A: Forecast of port traffic in Great Britain**

Source: MDS Transmodal Ltd., Update of UK Port Demand Forecasts to 2030 & Economic Value of Transshipment Study, July 2007  
TEUs stands for Twenty-foot Equivalent Unit – a standard measure for container handling capacity

- 7.5 The department has commissioned fresh forecasts which will reflect changes in port freight demand following the global financial crisis and a further update is expected in spring 2015.
- 7.6 Ports also have an important part to play in the import and export of energy supplies, including coal, oil, liquefied natural and petroleum gas, and biomass. In particular, ports will have a crucial role in supporting the installation, operation and maintenance of offshore wind facilities.

## Strategy

- 7.7 The ports sector consists of a mixture of company, trust and municipal ports, which operate independently of government, on commercial principles. The government believes that the best way to achieve its objectives is to facilitate a competitive and efficient port industry, allowing judgements about when and where new developments are proposed to be made on the basis of commercial factors. However, the government has established a strategic partnership with the ports industry to provide a cohesive platform for future development. This includes taking action to improve surface access to and from ports where appropriate.

## Delivery plan

7.8 The private sector operates 15 of the largest 20 ports by tonnage and around two-thirds of the UK ports' traffic. Development of capacity will therefore be driven largely by private investment.

### Key action to 2020

- 7.9 The pipeline includes £1.2 billion of planned investment in major ports projects, from renewals to expansions between now and the end of the decade. For example:
- the Port of Felixstowe is on target to deliver a container handling capacity of 6 million TEUs a year by 2020 (and could deliver an additional 2 million TEUs<sup>4</sup> in the Harwich Haven by 2030)
  - Green Port Hull is planned to be operational in early 2016. The start of production at the blade factory is scheduled to be in the middle of 2016 with full production levels reached from mid-2017 onwards
  - Dover Port redevelopment of the Western docks
  - a programme of capital investment by Associated British Ports across its portfolio
- 7.10 The government will continue to support the development of international gateways by improving connectivity through measures on surface access. These include the A503 development to improve access to the Port of Liverpool, the A63 (Castle-street) at Hull, the A14 serving Felixstowe, and various rail gauge clearance and path improvements.
- 7.11 Infrastructure UK is working with Atlantic Gateway to facilitate the delivery of critical infrastructure projects in the North West.

### Priority investments (Top 40)

- 7.12 To support delivery of its objectives for the ports sector, the government has included the following within its Top 40 priority infrastructure investments:
- Container Port Capacity
  - Ports Connectivity (see also airports)
- 7.13 For full details on the Top 40 selection criteria and how the government tracks and supports progress, please see Chapter 16, which also sets out the key projects and programmes within individual investments.

### Longer term

- 7.14 If completed as planned, the private-sector container terminal projects already granted development consent since 2005 would together provide sufficient aggregate container capacity to meet forecast demand at national level for at least the next 20 years.
- 7.15 The government has also left open the possibility for other developers to bring forward proposals for additional developments that satisfy demand that these consented developments are not meeting, as well as a continuing requirement for further new container capacity to meet expected longer term growth.

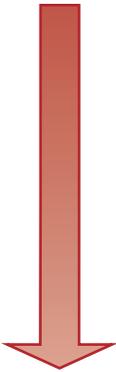

---

<sup>4</sup> Twenty-foot Equivalent Unit

## Further information

7.16 The infrastructure pipeline contains details of major planned projects and programmes within the ports sector, including current status, projected construction start/completion dates and cost profiles (where available).

## Key policy and delivery milestones

	2015	New DfT forecasts on freight demand for ports due to be published Liverpool 2 development due to be completed Port of Dover Western Docks development due to start construction Felixstowe South development due to be completed
	2016	
	2017	Teesport development due to be completed Green Port Hull wind turbine manufacturing site due to be completed
	2018	
	2019	
	2020	Port of Dover Western Docks development due to be completed

Project-specific dates are based on the infrastructure pipeline and are indicative of current plans. Some projects may be subject to finalisation of statutory processes. Final decisions on private-sector led projects will be taken by the project developer.

# ENERGY

## Progress since 2010

Plan to 2020-21

**INFRASTRUCTURE PIPELINE FOR ENERGY £274.9BN**

**In construction £194.7bn**

**Future investment £80.2bn**

# Chapter 8:

## Energy

### Box 8.A: Announcements in energy

- **Interconnectors** – the government will ensure that interconnectors can participate in the 2015 capacity auction, estimating the eligible capacity of each interconnector on a case-by-case basis
- **Swansea Tidal Lagoon** – the government remains committed to achieving its low carbon energy goals through the deployment of a range of technologies; it believes there may be significant tidal lagoon potential in the UK which is why DECC has started to explore the potential for a future lagoon programme; the government will start closer discussions with Tidal Lagoon Power Ltd to establish whether a potential tidal lagoon project at Swansea Bay is affordable and value for money for consumers (without prejudice to the planning decision on the project); if the project were to progress it could become the first tidal lagoon project in the world
- **Moorside** – HM Treasury has reached a cooperation agreement with Toshiba, GDF Suez and NuGen with the aim of issuing a statement of intent to provide a guarantee to assist the financing of a new nuclear power plant at Moorside, subject to due diligence and ministerial approval

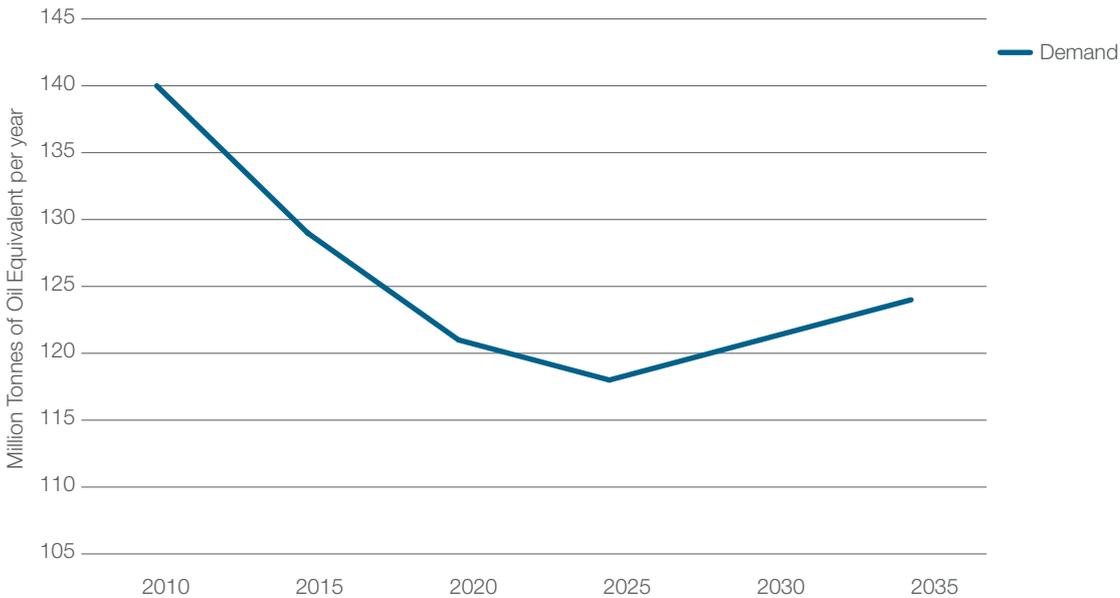

### Objectives

- 8.1 The government seeks to support the level and type of energy infrastructure investment and behavioural change required to:
- ensure power, heat and transport are affordable for households and businesses
  - provide energy security to facilitate day-to-day activities and support economic growth
  - reduce carbon emissions in order to mitigate climate change and meet its legally-binding targets

## Needs

8.2 Energy underpins the operation of a successful economy and allows other infrastructure networks to function, generating further economic growth. Overall energy demand, while difficult to predict, is expected to continue its general downward trend up until 2025. After this, demand is forecast to rise as the impact of existing policies declines. This is because, in the absence of policy intervention, trend improvements in energy efficiency and the impact of fossil fuel prices are insufficient to offset the impact of economic and population growth.<sup>1</sup> Projected final energy demand is shown in Chart 8.A.

**Chart 8.A: Energy demand by final users, UK**

Source: Updated energy and emissions projections 2014, DECC, September 2014  
Excludes international aviation

- 8.3 Large-scale investment in gas and low-carbon electricity generation is vital in order to replace ageing energy infrastructure, maintain secure energy supplies and meet legally-binding environmental targets. Around £100 billion of investment is estimated to be required in electricity generation and networks by 2020.<sup>2</sup>
- 8.4 National Grid and Ofgem project that current electricity generation capacity will reduce until the middle of the current decade.<sup>3</sup> In total, a fifth of our existing power stations are scheduled to close by 2020 because they are old, inefficient or polluting.
- 8.5 As legacy coal, gas and nuclear power stations come off line, they will increasingly be replaced with a combination of renewable energy, new nuclear power and fossil fuel power stations fitted with Carbon Capture and Storage (CCS) technology. New gas plant is also needed as a vital backup for less flexible renewable generation and to ensure that the system can meet peak electricity demand. Demand for gas to supply heat to homes and businesses will also remain significant for some time to come.

<sup>1</sup> Updated energy and emissions projections 2014, DECC, September 2014

<sup>2</sup> Implementing Electricity Market Reform, DECC, June 2014

<sup>3</sup> Electricity Capacity Assessment, Ofgem, June 2014

8.6 There is also significant opportunity for greater energy efficiency in the UK. Analysis suggests that there may be potential for up to 32 terawatt hours of electricity savings in 2030 (or around 9 % of estimated total demand).<sup>4</sup>

## Strategy

- 8.7 There are three key elements to UK energy infrastructure: oil and gas production; electricity generation; and transmission and distribution through gas and electricity networks. In addition, the government is committed to investment in improved energy efficiency to reduce demand. In all these areas, investment is primarily planned and delivered by the private sector.
- 8.8 In the case of gas and electricity transmission and distribution, independent economic regulation ensures value for money for consumers. Ofgem sets the levels of return which the monopoly network companies can make through a price control process. For electricity transmission, the government and Ofgem have introduced a competitive tender process for the delivery of offshore connections, and Ofgem has recently consulted on proposals to extend a similar approach to certain onshore assets. By upholding a robust system of economic regulation, the government provides companies with the confidence they need to invest in maintaining and developing the country's networks.
- 8.9 In other areas, the government believes that the best way to ensure value for consumers and taxpayers is through the operation of a liberalised energy market. However, within this framework, the government recognises the value of targeted intervention where necessary to achieve the scale and pace of change required to meet overall energy objectives. The government has therefore taken targeted action in the following areas:
- introducing a Levy Control Framework, which sets the aggregate amount that can be levied from consumers by energy suppliers to implement government policy, supporting investment and ensuring bill payers are protected; the government is also committed to being transparent about the costs of levies on bills and publishes an annual report showing their impact on household and business energy bills
  - legislating for Electricity Market Reform, which is designed to minimise costs while also delivering investment, key elements of which include:
    - the Capacity Market, which provides steady payments to providers (both demand and supply side) in return for the delivery of capacity when needed
    - Contracts for Difference (CfDs), which are long-term, legally-binding agreements to stabilise prices for low-carbon plant, providing the policy certainty required to underpin investment and making renewable energy cheaper for consumers by delivering that investment at a lower cost of capital
  - taking steps to support the maximum economic production of remaining reserves in the UK Continental Shelf (UKCS) and exploit new opportunities for shale gas production
  - actively pursuing a significant increase in electricity interconnection capacity to ensure the UK has access to the imports it needs

---

<sup>4</sup> Implementing Electricity Market Reform, DECC, June 2014

- 8.10 The government is also taking measures to ensure energy markets are competitive, including through an annual assessment of the state of competition in energy markets. Following the first of these, the energy market has been referred to the Competition and Markets Authority (CMA) for investigation.
- 8.11 The government is committed to minimising the UK's energy needs through the introduction of measures to improve energy efficiency and reduce demand. As set out in the government's Energy Efficiency Strategy, this includes:
- expanding choice and support for households through the introduction of the Green Deal and Energy Company Obligation (ECO)
  - requiring suppliers to roll out smart electricity and gas meters to all households and small non domestic sites by the end of 2020 to put consumers in control of their energy consumption
  - ensuring that both UK businesses and the public sector have access to the support and information they need to install cost-effective energy efficiency measures
  - mobilising investment in the green economy through the Green Investment Bank, which has energy efficiency as one of its key priorities

## Delivery plan

- 8.12 The government's plan for energy infrastructure will be delivered through private-sector investment, supported by government in line with the policy framework set out above.

### Key action to 2020

#### Electricity generation

- 8.13 Annual levy caps for the total projected costs of schemes within the Levy Control Framework (LCF) have been set to 2020-21.

**Table 8.1: Levy Control Framework annual limits (£ million, 2011-12 prices)**

2015/16	2016/17	2017/18	2018/19	2019/20	2020/21
4,300	4,900	5,600	6,450	7,000	7,600

Source: HM Treasury

- 8.14 The infrastructure pipeline includes a total of £65 billion of mixed energy generation investment by the private sector between now and 2020-21. The overall investment assumptions around low-carbon technologies in the pipeline take into account the LCF limits set out above.
- 8.15 Investment Contracts (an early form of Contract for Difference) have been awarded under the Final Investment Decision Enabling for Renewables process, which is expected to unlock up to £12 billion of investment backed and over 4.5GW of renewables generation capacity.
- 8.16 The contract allocation process under the enduring CfD regime is currently underway, and successful applicants will be notified that they have been awarded contracts early in 2015. The budget for the first CfD allocation round is now £300 million, to be allocated via a competitive auction process to drive value for consumers. The government has held back a significant part of the budget for future allocations within the Levy Control Framework cap.

- 8.17 The government has confirmed that it will seek to procure 48.6GW in the capacity market auction in December 2014. All capacity has to be available from October 2018 for one year, with further auctions held for future delivery years on a rolling basis.
- 8.18 In the nuclear sector, the government and EDF are working together to finalise the Hinkley Point C plant, including the full CfD terms and financing arrangements for the project, which includes support from a UK Guarantee. Progress on Wylfa Newydd continues as the advanced boiling water reactor which Hitachi and Horizon have proposed for this site moves through the Generic Design Assessment, with completion of the process expected in 2017. HM Treasury has also reached a cooperation agreement with Toshiba, GDF Suez and NuGen with the aim of issuing a statement of intent to provide a guarantee to assist the financing of a new nuclear power plant at Moorside, subject to due diligence and ministerial approval.
- 8.19 The government is actively pursuing a significant increase in electricity interconnection to support security of supply, and a robust pipeline of projects is in place which could more than double our capacity by the 2020s.
- 8.20 In recognition of their contribution to security of supply and affordability, the government will ensure that interconnectors can participate in the 2015 capacity auction. This will enable the widest possible range of resources to compete to deliver the capacity we need to ensure the security of our electricity supply in future. It should strengthen the case for the development of further interconnectors linking Great Britain with other electricity markets and could contribute to around £5 billion of private sector investment to 2020,

with savings to consumers of up to £9 billion over the longer term.<sup>5</sup> Interconnectors will participate on the basis of a calculation of de-rated capacity which reflects the individual circumstances of each interconnector, based on an assessment of likely future direction of electricity flows between interconnected markets, and technical reliability, at times of system stress. The government will provide a full response to the policy consultation in January 2015 which will set out the details of the methodology to be used for de-rating.

- 8.21 Ofgem has introduced a new ‘cap and floor’ regulatory regime to bring forward interconnector investment and 5 projects are already being assessed. This is in addition to the NEMO interconnector to Belgium which piloted the regime, and the ElecLink interconnector to France which received regulatory approval to proceed as a merchant project this summer. Subject to progress with the regulatory settlement between Ofgem and the developers (Statnett and National Grid), a final investment decision on the NSN electricity interconnector project, is also expected in early 2015. The project, which would link the UK and Norway, would be the longest sub-sea electricity interconnector in the world.

### Oil and gas

- 8.22 The pipeline includes £53 billion of planned investment within the oil & gas sector between now and 2018-19.
- 8.23 The government is committed to ensuring that the UK Continental Shelf attracts the right investment and has the right infrastructure in place to maximise economic recovery as the basin matures. The UKCS has recently seen record investment of £14.4 billion in 2013, £7 billion of which was directly incentivised by the government’s field allowances. Building on Sir Ian Wood’s ‘UKCS Maximising Recovery Review’, the government has been considering interactions between the tax system and strong asset stewardship as part of the review of the oil and gas fiscal regime to ensure we maximise the benefits of our existing infrastructure. The initial conclusions of the review will be published at Autumn Statement.

### Electricity and gas transmission and distribution

- 8.24 RIIO (Revenue = Incentives + Innovation + Outputs) is Ofgem’s new performance-based model for setting network company price controls, lasting for eight years. Ofgem completed the first price control reviews to use the RIIO framework in early 2013: RIIO-T1 for gas and electricity transmission and RIIO-GD1 for gas distribution. The final determination for the RIIO-ED1 price control for electricity distribution was published in November 2014. This will set expenditure to 2022-23.
- 8.25 The pipeline includes £8 billion of planned capital investment in gas transmission and distribution and £38 billion in electricity transmission and distribution to 2020-21 including offshore transmission and interconnectors. This is consistent with the final determinations for RIIO-ET1, RIIO-GD1, RIIO-GT1 and the draft determination for RIIO-ED1 and adjusted for current DECC modelling on network requirements.

### Energy efficiency

- 8.26 Energy suppliers will be responsible for replacing over 53 million gas and electricity meters with Smart Meters by 2020. This will involve visits to 30 million homes and small businesses.

<sup>5</sup> According to analysis carried out on behalf of the Department of Energy and Climate Change: [https://www.gov.uk/government/uploads/system/uploads/attachment\\_data/file/266307/DECC\\_Impacts\\_of\\_further\\_electricity\\_interconnection\\_for\\_GB\\_Redpoint\\_Report\\_Final.pdf](https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/266307/DECC_Impacts_of_further_electricity_interconnection_for_GB_Redpoint_Report_Final.pdf)

8.27 The government is also testing whether projects that deliver lasting electricity savings at peak times, for example by replacing old bulbs with LEDs or improving motors and pumps, could in future compete in Capacity Market auctions. The first Electricity Demand Reduction Pilot auction is for up to £10 million and is being held in January 2015. Subject to the outcome a further auction may follow. The total budget for the EDR Pilot is at least £20 million.

### Priority investments (Top 40)

8.28 To support delivery of its objectives for the energy sector, the government has included the following within its Top 40 priority infrastructure investments:

- electricity generation – nuclear (including Hinkley Point C)
- electricity generation – gas
- electricity generation – wind
- electricity generation – other renewables (biomass, solar, marine)
- electricity interconnection
- Carbon Capture and Storage
- energy transmission and distribution
- oil and gas production (including shale gas)
- Smart Meters

8.29 For full details on the Top 40 selection criteria and how the government tracks and supports progress, please see Chapter 16, which also sets out the key projects and programmes within individual investments.

### Longer term

8.30 £80 billion of the energy generation investment in the pipeline is planned for beyond 2020-21. While there remains ongoing demand to build new power generating capacity up to 2030 and beyond to meet our energy needs, the exact technology mix will depend on a number of factors including demand, affordability and progress towards our decarbonisation targets.

8.31 Within that context, the government has secured an ambitious but flexible deal on European Union emissions targets which will cut greenhouse gas emissions by at least 40% within the EU by 2030. This will allow the UK to decide how to decarbonise at least cost to consumers, while also improving energy security by reducing EU reliance on imported energy.

8.32 In the long term, the government's strategy for the electricity market envisages a transition to a market where low carbon technologies can compete fairly on price, with a decreasing role for the Government over time. The government is taking steps now to support the development of less mature low-carbon technologies, which are expected to play a bigger role post 2020. For example:

- to help develop and commercialise wave and tidal technologies, the UK has put in place the most comprehensive marine energy support programme in the world, including protecting revenue support for 100MW of wave and tidal stream projects

- the government will also start closer discussions with Tidal Lagoon Power Ltd to establish whether a potential tidal lagoon project at Swansea Bay is affordable and value for money for consumers (without prejudice to the planning decision on the project); if the project were to progress it could become the first tidal lagoon project in the world
- supporting the development of Carbon Capture and Storage (CCS) through the ongoing £1 billion commercialisation competition and a £125 million 4-year co-ordinated research, development and innovation programme; the government is also now seeking views on phase 2 of CCS

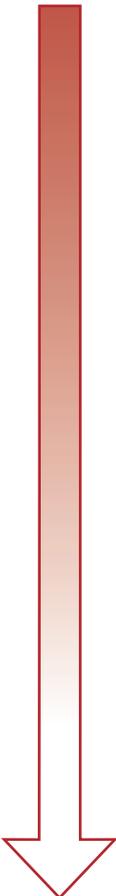

8.33 The government also anticipates significant deployment of new nuclear power through the 2020s with Nuclear New Build (NNB) Generation Company, Horizon and NuGen setting out plans to develop around 16GW of new capacity.

### Further information

8.34 The infrastructure pipeline sets out details of major planned projects and programmes within the energy sector, including current status, projected construction start/completion dates and cost profiles (where available).

8.35 Further details on the delivery plan for Electricity Market Reform can be found at <https://www.gov.uk/government/policies/maintaining-uk-energy-security--2/supporting-pages/electricity-market-reform>

### Key policy and delivery milestones

	2015	Results of first enduring CfD regime allocation round and Capacity Market Auction due Beaulieu-Denny Line (electricity transmission) due to be completed Nemo, NSN and ElecLink interconnector project final investment decisions due Smart Meter installation phase and 8-year RIIO-ED1 electricity distribution price control due to start
	2016	Hinkley Point C due to start construction Dudgeon (offshore wind) and Burbo Bank Extension (offshore wind) due to start construction Carrington (CCGT) and Ferrybridge (Biomass) projects due to be completed Westernmost Rough and Humber Gateway OFTOs due to be in operation
	2017	Further (T-I) Capacity Market Auction for 2018-19 capacity Western Coast Link (electricity transmission) due to be completed Pen Y Comoedd (onshore wind) and Drax (Biomass conversion) due to be completed
	2018	Capacity from first Capacity Market auction to be available for at least one year from October Beatrice (offshore wind) and Walney projects (offshore wind) due to start construction Dudgeon (offshore wind) and Burbo Bank Extension (offshore wind) due to be completed Horizon Wylfa (nuclear) final investment decision due NuGen Moorside (nuclear) final investment decision due
	2019	Hornsea (offshore wind) due to start construction Tees Renewable Energy Plant (Biomass) due to be completed NEMO interconnector (subject to final investment decision) due to be completed
	2020	Smart Meter rollout to over 30 million premises due to be completed

Project-specific dates are based on the infrastructure pipeline and are indicative of current plans. Some projects may be subject to finalisation of statutory processes. Final decisions on private-sector led projects will be taken by the project developer.

# FLOODS

## Progress since 2010

More than

500

flood and coastal erosion defence improvement projects completed

Major flood schemes completed in Essex, Lincolnshire, Weston-super-Mare, and Nottingham

Nearly

160,000

homes protected to date...

...and on track to deliver target of 165,000 by the end of the Parliament

£2.3bn

capital investment committed helping to avoid more than £30 billion in economic damages

Improved protection for at least 300,000 homes

Investment in more than

1,400

schemes

10%

efficiency savings planned across the investment period

Plan to 2020-21

**INFRASTRUCTURE PIPELINE FOR FLOODS £3.7BN**

**In construction £1.9bn**

**Future investment £1.8bn**

# Chapter 9:

## Floods and coastal erosion

### Box 9.A: Announcements on flooding and coastal erosion

- The government has published its 6-year programme of investment in flood defences, allocating the £2.3 billion capital funding provided at the 2013 Spending Round

### Objectives

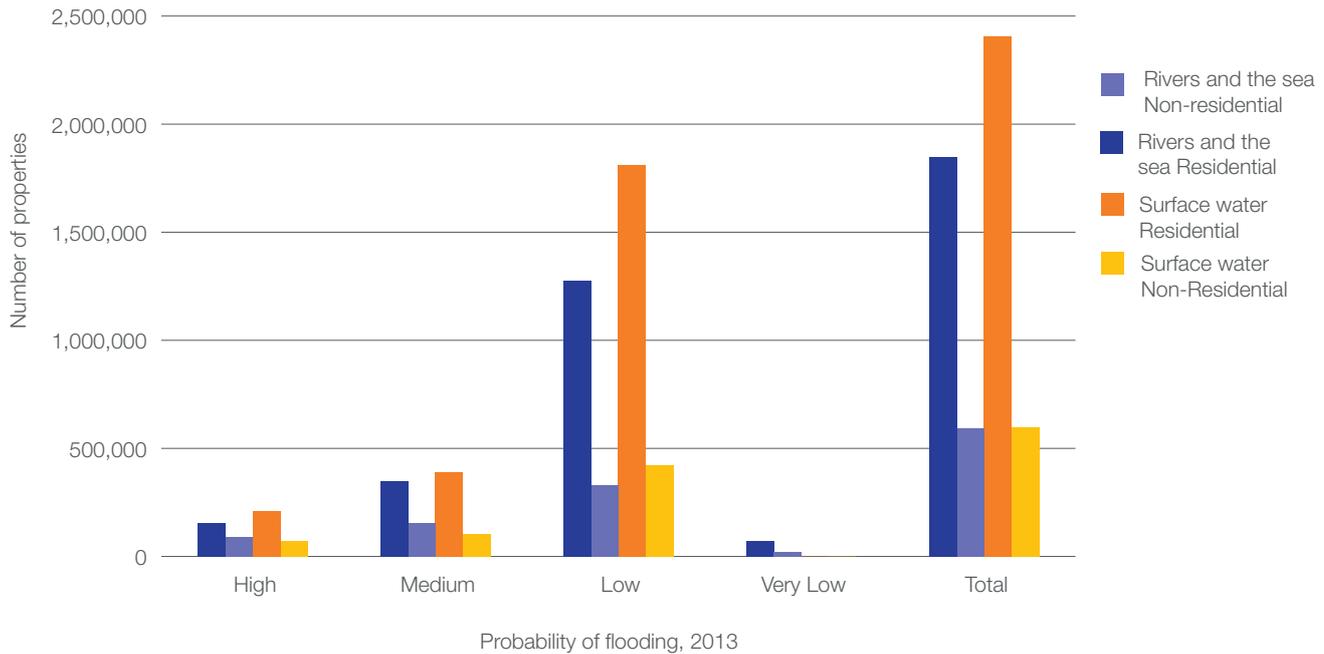

- 9.1 The government's priority is to reduce the risks of flooding and coastal erosion and the consequences for people, the economy, environment and society.

### Needs

- 9.2 The flooding in recent years demonstrates the impact flooding and coastal erosion can have on households, businesses and communities. The Environment Agency's Long-Term Investment Scenarios (LTIS) report,<sup>1</sup> published today, is an economic assessment of future flood and coastal erosion risk management looking ahead over a 50-year horizon. The number of properties at risk of flood from both surface water and from the rivers and sea is shown in Chart 9.A.

<sup>1</sup> Long Term Investment Scenarios, Environment Agency, December 2014

**Chart 9.A: Properties at risk from flooding, by type of property and source of risk**

Source: Environment Agency, Long-Term Investment Scenarios, Dec 2014

## Strategy

9.3 The government's flood and coastal erosion risk management strategy comprises:

- promoting a nationally consistent approach to assessing and managing flood and coastal erosion risk
- achieving greatest value for the taxpayer in managing investment in new and improved defences
- taking a risk-based management approach that targets resources to those areas where they have the greatest effect; the government offers access to public funding for all worthwhile schemes and prioritises its investment to achieve the greatest reduction in risk possible
- facilitating and securing alternative sources of funding where possible to maximise overall reduction in risk and encourage greater local choice with local beneficiaries having a greater stake

9.4 The government is the largest funder of risk management of flooding and coastal erosion from main rivers and the sea. In making decisions about where to prioritise resources, the government takes into account the overall economic damages avoided and the number of households benefiting.

## Delivery plan

9.5 For the first time, this government has set out a specific long-term funding settlement for flood and coastal erosion risk management. This government will invest £2.3 billion in total across the six year period, representing a real terms increase of 9% compared with the spending review 2010 period. This ensures a major long-term commitment, and is consistent with the recommendations put forward by the Environment Agency in the Long-term Investment Scenarios.

### Key action to 2020

9.6 The 6-year capital investment plan will:

- deliver improved protection to at least 300,000 homes and help avoid more than £30 billion in economic damages, including a £1.5 billion reduction in potential losses for the farming sector
- provide for investment in more than 1,400 schemes
- benefit homes and businesses right across England, including replacing seawalls at Fleetwood; building a barrage at Boston; refreshing tidal defences at the Thames Estuary; and undertaking schemes at Oxford, Lowestoft, Yalding and the Humber
- attract approximately £600 million of additional local contributions through partnership funding
- reduce overall flood risk by 5% compared to current levels by 2021

9.7 Also set out are the Environment Agency's commitments to improving how the programme will be managed and delivered, to ensure the benefits of long-term funding certainty are maximised. This includes:

- developing a clear high level statement of outputs and KPIs that aligns and incentivises delivery and performance at all levels, learning from similar approaches in the private and regulated sectors
- delivering further efficiencies from longer-term funding certainty by building on the process of grouping projects into larger 'packages' and programmes of work and exploring the opportunities for a more flexible 'whole-life' approach
- the adoption of new collaborative approaches to delivery building on the recent successful procurement of the TEP1 alliancing initiative (phase 1 of TEP 2100)
- continued investment in improved asset management and programme management datasets and tools
- a strengthened programme management function with the capacity and capability to monitor and intervene early on any obstacles that pose a risk to successful delivery of the programme
- targeted Environment Agency support for local area and local authority led schemes delivery capability

9.8 The plan commits the Agency to developing an integrated approach to deliver these enhancements by spring 2015. This will help deliver the commitment to increase capital efficiency by at least 10% across the investment period compared to a 2014-15 baseline, and is also expected to allow targeting of further efficiency within the maintenance programme.

## Priority investments (Top 40)

- 9.9 To support delivery of its objectives for the floods and coastal erosion sector, the government has included the Flood and Coastal Erosion Risk Management Programme within its Top 40 priority infrastructure investments.
- 9.10 For full details on the Top 40 selection criteria and how the government tracks and supports progress, please see Chapter 16, which also sets out the key projects and programmes within individual investments.

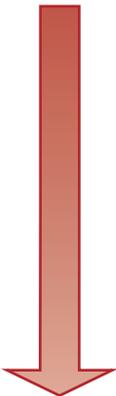

## Longer term

- 9.11 Government's current investment plans to 2020-21, supplemented by forecast local contributions and 10% efficiencies, are consistent with the profiles for investment demand currently modelled in the LTIS. It is projected that those investment profiles would deliver a 12% reduction in expected flood damages compared to current levels over the next 50 years.
- 9.12 A number of factors will influence future investment needs, including changes in climate change, development in areas of risk and the costs of protection. The government's approach to flood risk management therefore allows for an adaptive investment strategy to tackle these challenges in the longer term.

## Further information

- 9.13 The infrastructure pipeline sets out details of major planned projects and programmes within the floods and coastal erosion sector, including current status, projected construction start/completion dates and cost profiles (where available).
- 9.14 Further details on the floods vision and Long Term Investment Scenarios are available on the gov.uk website.

## Key policy and delivery milestones

	2015-16	Start of 6-year flood capital investment plan Thames Estuary 2100 Programme Phase 1 due to start construction
	2016-17	Rossall Coastal Defence scheme due to be completed Lincshore scheme due to be completed
	2017-18	Boston Barrage / Barrier Works due to start construction
	2018-19	Oxford Western conveyance scheme due to start construction
	2019-20	River Thames Scheme: Datchet to Teddington due to start construction Boston Barrage / Barrier Works due to be completed

Project-specific dates are based on the infrastructure pipeline and are indicative of current plans. Some projects may be subject to finalisation of statutory processes and necessary partnership funding. Final decisions on private-sector led projects will be taken by the project developer.

# COMMUNICATIONS

Progress since 2010

80%

of the UK now has superfast broadband coverage with over 1.5 million homes and businesses having access for the first time

Over

25,000km

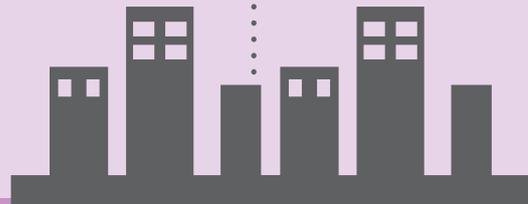

of fibre-optic cabling rolled out – 25 times the distance from Land's End to John O'Groats

22

Super-Connected Cities created across the UK

4G

services rolled out to over 300 towns and cities

95%

of the UK will have access to superfast broadband by 2017 and 8 pilot schemes will explore how to reach the final 5%

70%

of rail passengers to benefit from high-speed broadband on trains by 2019

4G

to reach 98% of premises by 2017

Digital Communications Infrastructure Strategy response to be published in 2015

Plan to 2020-21

**INFRASTRUCTURE PIPELINE FOR COMMUNICATIONS £11.0BN**

**In construction and future investment £11.0bn**

# Chapter 10:

# Communications

## Box 10.A: Announcements in the communications sector

- **Broadband connection vouchers** – the government will provide up to £40 million to extend the SME connection voucher scheme to March 2016 and to more cities; vouchers will be available on a first come, first served basis
- **700MHz spectrum change of use** – further details of the clearance process for high-value spectrum will be set out in 2015 ahead of a further auction of mobile broadband spectrum, subject to the development of delivery options by DCMS and Ofcom

## Objectives

10.1 The government is committed to ensuring that the UK has the right digital communications infrastructure to drive economic growth and innovation, enhance our national competitiveness and build a digital society.

## Needs

10.2 Digital infrastructure influences people's ability to access information and services, and to connect with the wider world. The economic impact of the internet is expected to keep growing and is predicted to reach £221 billion by 2016, an 11% rise each year. By this time it will account for 12.4% of the UK's GDP, a significant increase from 8.3% in 2010 and almost double the developed market average including Germany, Japan, the US and France.<sup>1</sup>

10.3 As the number of internet users and global connected devices increase, estimates suggest that the availability and take-up of faster broadband speeds will add about £17 billion to the UK's Gross Value Added by 2024, as a result of enhanced productivity, more uptake in the labour force and flexibility in working practices such as the ability to telework.<sup>2</sup> Faster broadband could also reduce commuting costs and lead to total household savings of £270 million per annum by 2024.<sup>3</sup>

10.4 Forecasting future needs in the communications space is challenging, but there is a level of consensus that the future will see continued rapid technological change. More

---

<sup>1</sup> The Internet Economy in the G20, Boston Consulting Group, March 2012

<sup>2</sup> UK Broadband Impact Study: Impact Report, SQW, November 2013

<sup>3</sup> *ibid*

bandwidth will be needed as the traffic over fixed and wireless networks continues to rise, fuelled by the increased take up of smartphones, together with a rise in the availability and use of applications. The scale, availability and capacity of WiFi networks will become increasingly critical. The number of consumers will also remain on the rise (particularly in the older age group) and there will be more focus on reliability, in addition to speed.

- 10.5 Given these factors, and the enduring importance of a world-class digital infrastructure in supporting international competitiveness, the UK will need to continue to prioritise to ensure its communications compare favourably with those of other leading nations.

## Strategy

- 10.6 The UK telecoms market is one of the most open and competitive in the world. Effective deregulation has set industry free to create new services and set international standards. The government will always look to the market to deliver communications infrastructure but will also take action where necessary to support innovation and growth, ensure fairness, and protect consumers and other citizens.
- 10.7 To make sure everyone in the UK has access to fast, reliable broadband, the government has set out a vision for a superfast broadband network in the UK of over 24 Megabits per second (Mbps), to reach 95% of the population by 2017. Significant public funding has been committed to enable the rollout to areas where investment would otherwise not be commercially viable.
- 10.8 Some areas of the UK do not get good quality mobile coverage, or do not get any coverage at all. Good mobile coverage helps businesses to grow and people to stay in touch, which can be very important for people who are vulnerable or isolated. The government is therefore investing to improve the quality and coverage of mobile phone voice and data services.
- 10.9 Alongside this direct investment, the government continues to ensure that the policy and regulatory environment is conducive to delivering significant private sector investment in both fixed and wireless technologies, responding to demand and competitive pressures. That includes facilitating the use of spectrum.

## Delivery plan

10.10 The Department for Culture, Media and Sport leads on digital communications infrastructure policy, with a dedicated unit, Broadband Delivery UK (BDUK), which has responsibility for managing the government's broadband delivery.

### Key actions to 2020

- 10.11 90% of the UK will have access to superfast broadband by early 2016, supported by public investment of over £1.2 billion through the government's superfast broadband programme. An additional £500 million has been allocated with the aim of providing coverage to 95% of UK premises by the end of 2017.
- 10.12 Alongside government funded programmes, the private sector is also investing in excess of £5 billion in commercial programmes to upgrade the UK's digital communications infrastructure: BT's superfast broadband roll-out to two thirds of the UK is almost complete and mobile network operators are rolling out 4G technology at pace, following government's auction of 4G spectrum in 2013.
- 10.13 Over 5000 SMEs across 22 cities have benefitted from the government's connection voucher scheme, with new broadband connections on average six times faster than before. In order for more businesses to benefit, the government is allocating up to £40 million to extend the scheme to March 2016 and to more cities. Vouchers will be available in the new cities from April 2015, and will be available on a first come, first served basis.
- 10.14 The government is also planning to roll out a high speed (50 Mbps) broadband network on the busiest 30% of Britain's railways. Noticeable improvements will start during 2015, with 70% of passengers benefitting from the new technology by 2019. The programme will tackle a series of 'not-spots' – areas along rail corridors with intermittent or poor mobile phone signal coverage – delivering a consistent and reliable service on key routes.
- 10.15 Government's Mobile Infrastructure Programme is a unique model for extending mobile coverage to areas where it will have significant social benefits, and is delivering where the commercial sector alone will not. To ensure benefits of the programme are maximised, it has been extended to 2016.

### Priority investments (Top 40)

- 10.16 To support delivery of its objectives for the digital communications sector, the government has included the following programmes within its Top 40 priority infrastructure investments:
- Superfast broadband
  - Super-Connected Cities
  - Mobile Infrastructure Project
  - Commercial 4G rollout
- 10.17 For full details on the Top 40 selection criteria and how the government tracks and supports progress, please see Chapter 16, which also sets out the key projects and programmes within individual investments.

### Longer term

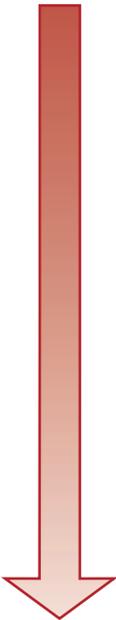

10.18 To achieve the government's ambition to have the right digital communications infrastructure to drive economic growth and innovation we need infrastructure that will allow people to access services when they want, where they want.

- 10.19 The government's current investment plans for digital communications infrastructure are expected to have achieved their objectives by the end of the decade. The government therefore recognises the need for a strategy that goes beyond 2020.
- 10.20 To meet this goal, the government published its consultation on a Digital Communications Infrastructure Strategy in August 2014, which considers different scenarios for future demand and looks at what should follow delivery of superfast broadband and address the rapid convergence of the broadband and telecommunications markets. The government will publish its response to the consultation and its long-term strategy in 2015.
- 10.21 The UK Spectrum Strategy sets out a framework up to 2025 and beyond. In this time, the value of spectrum is expected to double to reach £100 billion. Government's Strategy aims to support this growth and offer business the access it needs to innovate and grow, and everyone in the UK the services they need to live their lives to the full.
- 10.22 As part of this, the government supports Ofcom's work on the change of use of 700MHz spectrum, which it estimates will bring in quantified benefits of between £900 million and £1.3 billion in network cost savings as well as significant unquantified benefits such as improved coverage, capacity and speed in rural areas. Allocating the 700MHz band for mobile broadband will support the growth in demand for mobile services by providing greater capacity in the 4G networks as well as potentially preparing for 5G services. Subject to the development of delivery options by DCMS and Ofcom, further details of the clearance process for this high-value spectrum will be set out in 2015.

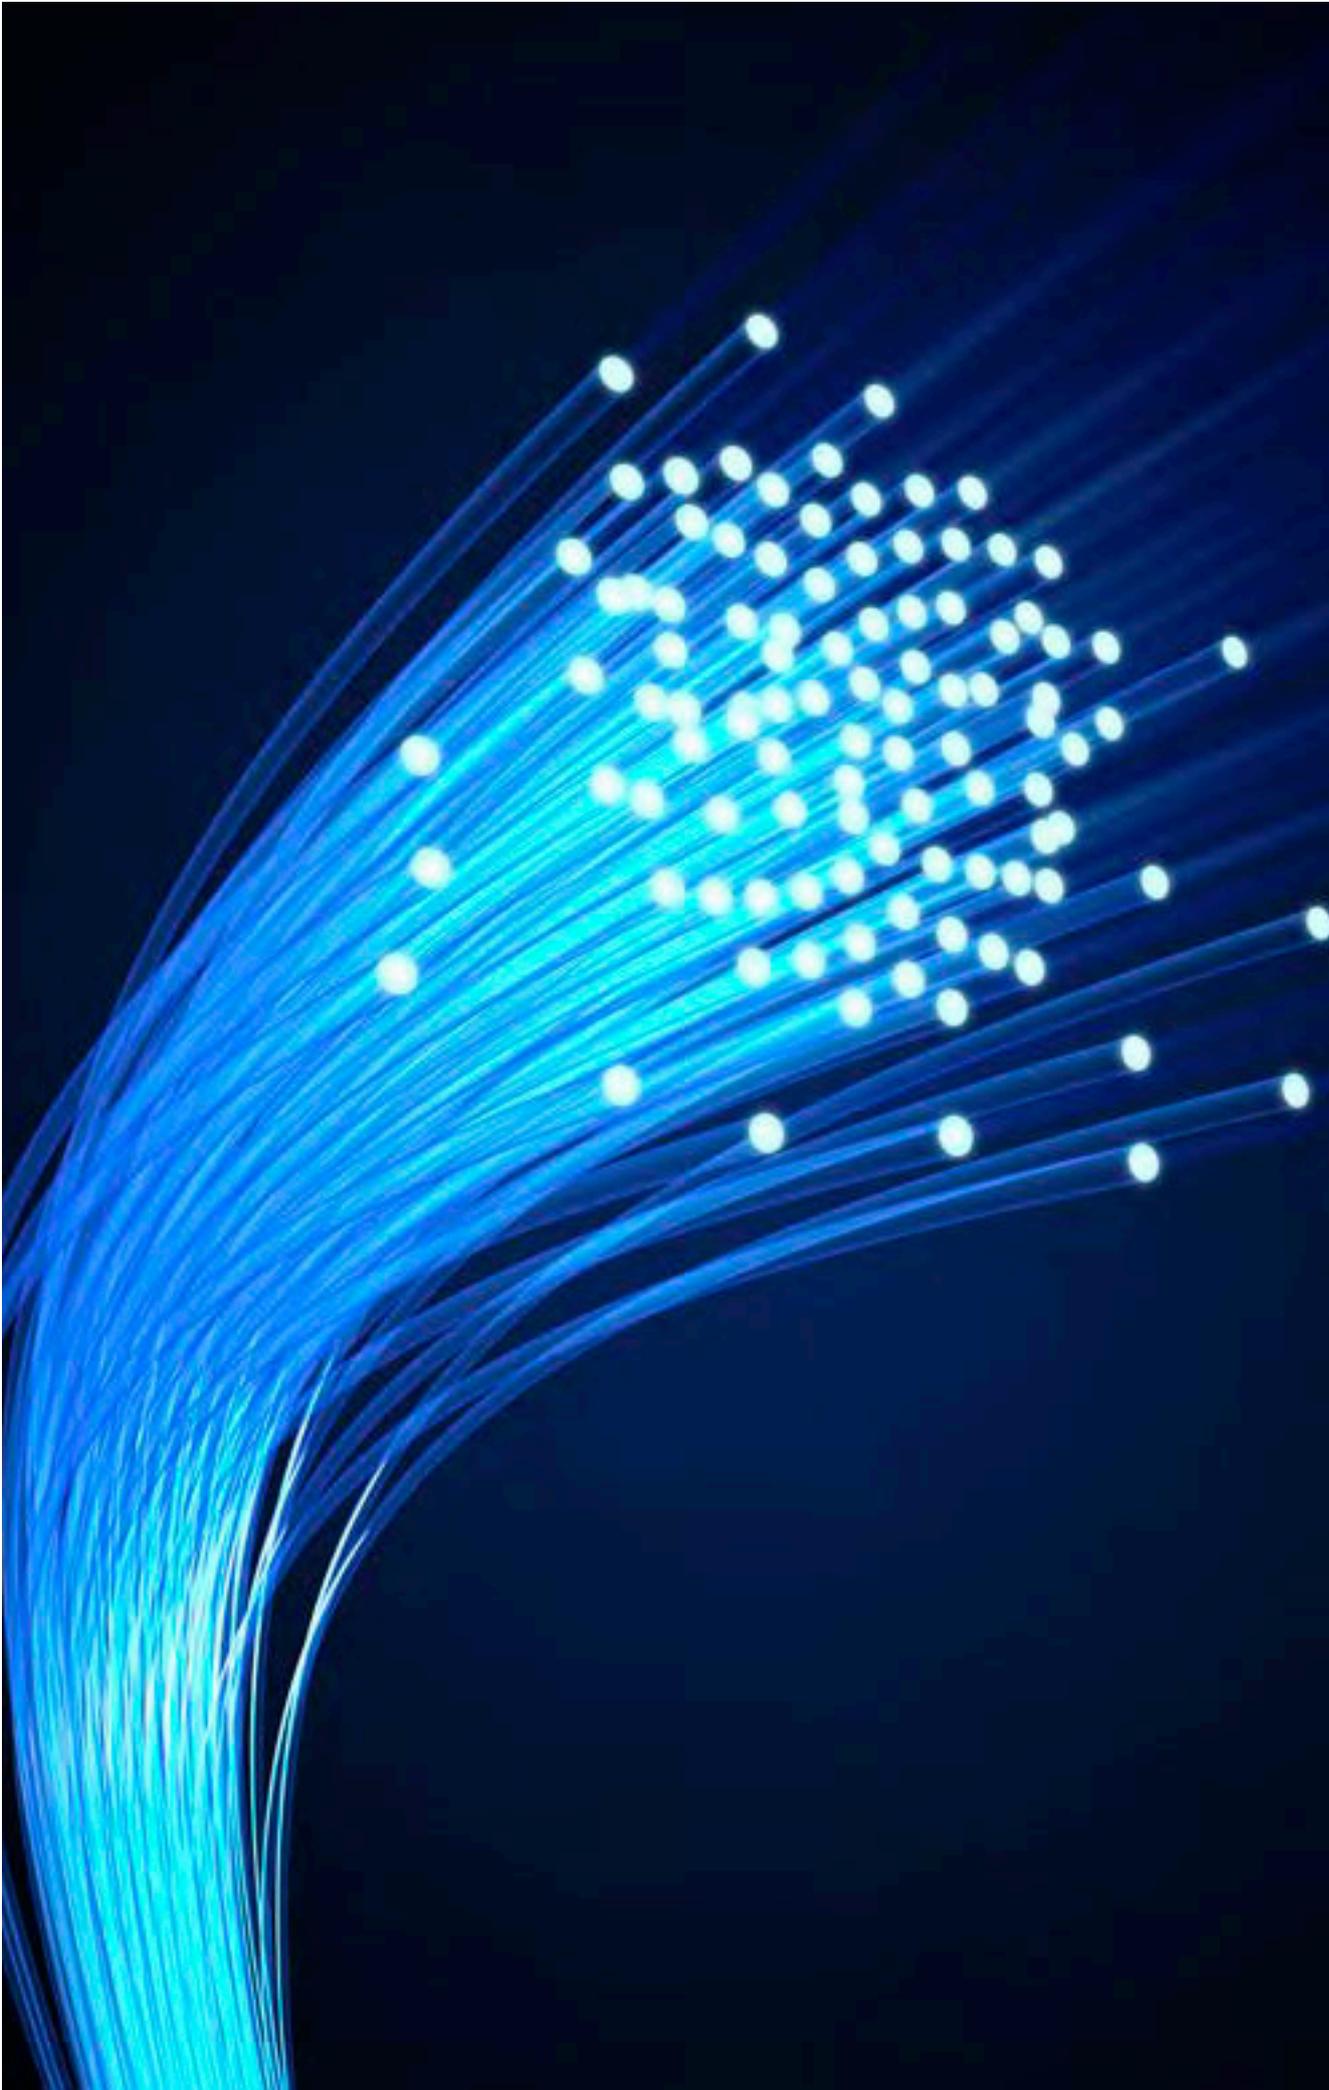

### Further information

- 10.23 The infrastructure pipeline sets out details of major planned projects and programmes within the digital communications sector, including current status, projected construction start/completion dates and cost profiles (where available).
- 10.24 Further information on the roll-out of superfast broadband can be found at:  
[www.google.com/maps/d/viewer?mid=zwLLqmDnfnjA.khRmsBv2kR70&msa=0&ll=53.709714,-2.768555&spn=7.417298,14.0625&dg=feature](http://www.google.com/maps/d/viewer?mid=zwLLqmDnfnjA.khRmsBv2kR70&msa=0&ll=53.709714,-2.768555&spn=7.417298,14.0625&dg=feature)

### Key policy and delivery milestones

	2015	Digital Communications Infrastructure Strategy due to be published 1,000 public buildings, over 100 trains and 1,300 buses due to have been fitted with free Wi-Fi and 10,000 businesses connected to superfast broadband as part of the Super-Connected Cities programme Further details of the clearance process for high-value spectrum due to be set out, subject to development of delivery options by DCMS and Ofcom
	2016	Superfast Broadband Phase 1 due to be completed – 90% UK coverage Mobile Infrastructure Project due to be completed Connection voucher scheme now extended to 2016
	2017	Commercial 4G services due to be fully rolled out Superfast Broadband Phase 2 due to be completed – 95% UK coverage
	2018	
	2019	70% of rail passengers due to benefit from high-speed broadband on trains
	2020	Deadline for the release of 500 MHz of public sector spectrum below 5 GHz

Project-specific dates are based on the infrastructure pipeline and are indicative of current plans. Some projects may be subject to finalisation of statutory processes. Final decisions on private-sector led projects will be taken by the project developer.

# WATER

## Progress since 2010

£22bn

of private-sector investment in water and waste water assets

Improvements at almost 500 sewage works since 2010, reducing phosphate and ammonia pollution

Environmental quality of 3,290 km of rivers protected or improved ...

... and cleaner beaches with a record 99.5% of England's bathing waters passing EU standards

£30.9bn

of water and waste water asset investment in the pipeline

2014 Water Act to give all business, charity and public sector customers in England the freedom to switch supplier from 2017

Thames Tideway Tunnel expected to start construction in 2016

Plan to 2020-21

**INFRASTRUCTURE PIPELINE FOR WATER £30.9BN**

**In construction £4.1bn**

**Future investment £26.8bn**

# Chapter 11:

# Water

## Objectives

11.1 The government's objectives for the water sector are to secure a fair deal for customers while enabling water companies to continue to attract low-cost investment needed to provide the high quality, resilient water services customers want.

## Needs

11.2 The country's existing water and wastewater infrastructure is of varied age and condition, and some of it is well over a century old. There are three main factors influencing future water needs: changing demand, demographic changes and the impact of climate change:

- household demand has been increasing since the 1950s, and although water companies forecast that average personal consumption will drop from 146 litres per day in 2010-11 to 132 in 2030-31, population growth will offset this fall;<sup>1</sup> Industrial water use has been declining as the economy moves away from heavy industry; however, a drive to reduce carbon emissions, e.g. through carbon capture and storage at power stations, could increase water usage
- with population growth likely to be concentrated in the most water-stressed parts of the country, combined with a trend towards smaller households, total household consumption is forecast to increase by 3%, while total water demand (for all purposes) may rise by 5% by 2020. Some extreme scenarios suggest water demand could rise by as much as 49% by 2050<sup>2</sup>
- a Met Office study suggests a worst case scenario of 10 times as many significant droughts by 2100;<sup>3</sup> while water companies are better prepared for such events, sustained investment is likely to be required for a changing climate; demand is likely to increase too, with more water used in hotter weather and potential for greater irrigation<sup>4</sup>

---

<sup>1</sup> Aggregate of final company water resource management plans (2015-2040). Figures are for England only.

<sup>2</sup> Water for life, DEFRA, 2011

<sup>3</sup> An extreme value analysis of UK drought and projections of change in the future, Met Office, 2010

<sup>4</sup> Water for life, DEFRA, 2011

- 11.3 Waste water treatment infrastructure is also essential for a clean environment and public health. Every day in England and Wales the sewerage system collects approximately 10 billion litres of waste water from households and industry.<sup>5</sup> Demand for new and improved waste water infrastructure is expected to increase as a result of statutory requirements to protect the environment and water quality, population growth, urbanisation and adaptation to climate change.
- 11.4 New infrastructure is not the only solution to the above issues. However, a sustained and significant programme of maintenance, renovation and replacement in water infrastructure will also be necessary in order to reduce leakages and ensure a high level of service for customers both now and in the future.

## Strategy

- 11.5 The government sets the strategic policy framework for a privatised water industry to ensure sufficient supplies of secure and sustainable water – including a requirement to plan to balance supply and demand over the long term. In doing so, it seeks to set the conditions for a water sector that is as innovative, efficient and customer-focused as possible.
- 11.6 An independent economic regulator (Ofwat), sets the framework within which individual companies make their commercial decisions, ensuring that consumers receive high standards of service at a fair price. In doing so, it must take into account the government's stated policy priorities including considering the impact on investment, innovation, resilience, sustainable development and the need to prepare for longer-term challenges.
- 11.7 Water companies are regulated by the Drinking Water Inspectorate to ensure water supplies in England and Wales are safe and drinking water quality is acceptable to consumers. The Environment Agency regulates environmental impacts, abstractions and discharges.
- 11.8 The government also takes targeted action where appropriate to ensure that water companies support vulnerable customers, and when necessary, to facilitate investment in projects of exceptional size and complexity such as Thames Tideway Tunnel.

## Delivery plan

- 11.9 Privately-owned water and sewerage companies are responsible for running, maintaining and, where necessary, upgrading the UK's water infrastructure.

### Key action to 2020

- 11.10 The Thames Tideway Tunnel is a key element of the programme to modernise London's aging sewerage network and the project received development consent in September 2014. Following the government's decision to specify the project under the Water Industry Act it will be designed, financed and operated by a separately regulated Independent Infrastructure Provider. Thames Water is currently procuring through competition both the Infrastructure Provider and the main contractors for the construction. Contract negotiations should be completed in mid-2015 with construction due to start in 2016.

<sup>5</sup> National Policy Statement for Waste Water, DEFRA, March 2012

- 11.11 The water industry operates on five-yearly cycles called asset management periods. Ofwat has now published draft determinations setting the price, investment and service package that water companies should provide for the next asset management period (AMP6), which will begin on 1 April 2015. Ofwat's final determinations will be published on 12 December 2014.
- 11.12 Based on its draft determination proposals for AMP6, Ofwat projects that by 2020:
- there will be £43 billion of total investment on delivering, maintaining and improving services; the pipeline captures a projection of the capital element of this<sup>6</sup>
  - average bills will fall by about 5% in real terms
  - more than 340 million litres of water a day will be saved by tackling leakage and promoting water efficiency
  - there will be on average a 40% reduction in the time lost due to supply interruptions
- 11.13 Major projects and programmes due for delivery in AMP6 will be confirmed in companies business plans once the final determination has been published.
- 11.14 The Water Act will, for the first time, mean all businesses, charities and public sector customers in England will have the freedom to switch supplier from 2017.

### Priority investments (Top 40)

- 11.15 To support delivery of its objectives for the water sector, the government has included the following within its Top 40 Priority Infrastructure Investments:
- Water Supply and Sewerage Networks
  - Thames Tideway Tunnel
- 11.16 For full details on the Top 40 selection criteria and how the government tracks and supports progress, please see Chapter 16, which also sets out the key projects and programmes within individual investments.

### Longer term

- 11.17 Following AMP6, Asset Management Period 7 will run from 2020 to 2025. The price review process for AMP7 is expected to involve a similar total expenditure (TOTEX) and output-based approach to that taken in PR14.
- 11.18 Companies produce Water Resources Management Plans which set out how they will balance the demand and supply of water over the long-term, taking account of factors such as population growth, economic growth and climate change. Companies consider options from managing demand as well as options for developing new sources of supply, for example reservoirs. The plans are subject to public consultation and the Environment Agency provides technical advice to the Secretary of State, who decides whether each company should publish its proposals as a final plan.
- 11.19 Most water companies have now published the final version of their latest plans (covering 2015 to 2040). The companies will begin consulting on their next plans in 2018.

<sup>6</sup> For the AMP6 period (2015-20), Ofwat is moving to a total expenditure approach in which capital investment and operating expenditure are assessed together. Of the £43 billion of totex in AMP6, an estimated £22 billion represents expenditure which would have been traditionally reported as capex.

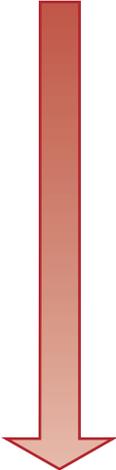

### Further information

11.20 The infrastructure pipeline sets out details of major planned projects and programmes within the water sector, including current status, projected construction start/completion dates and cost profiles (where available).

11.21 Further details on the price review process for AMP6 is available on Ofwat’s website.

### Key policy and delivery milestones

---

	<b>2015</b>	Start of Asset Management Period 6 (AMP6) with £43 billion of anticipated investment to deliver, maintain and improve water services  Thames Tideway Tunnel contract awarded to Infrastructure Provider  Lee Tunnel due to be completed
	<b>2016</b>	Thames Tideway Tunnel due to start construction
	<b>2017</b>	All businesses, charities and public sector customers will have the freedom to switch supplier under the 2014 Water Act
	<b>2018</b>	
	<b>2019</b>	Ofwat final determinations on AMP7 due to be published
	<b>2020</b>	End of AMP6 and start of AMP7

Project-specific dates are based on the infrastructure pipeline and are indicative of current plans. Some projects may be subject to finalisation of statutory processes. Final decisions on private-sector led projects will be taken by the project developer.

# WASTE

Progress since 2010

£3.2bn

in funding allocated to support 27 new local authority waste projects

19

projects completed including in Cumbria, Staffordshire and Exeter

4.6m

tonnes of extra processing capacity per year

20

waste projects worth more than £2 billion in the pipeline

England on track to meet EU targets for reducing waste sent to landfill

Negotiation on EU review of resource and waste management expected to be concluded by 2018

Plan to 2020-21

**INFRASTRUCTURE PIPELINE FOR WASTE £2.0BN**

**In construction £1bn**

**Future investment £1bn**

# Chapter 12:

## Waste

### Objectives

- 12.1 The government's ambition is to move towards a 'circular economy' where material resources are valued and kept in circulation. This means that we make the best use of materials and resource, prevent and deal with waste, and recycle properly. This is essential for our future growth, increased resilience and environmental and human health.

### Needs

- 12.2 Waste and resource management is critical to the UK. England produced approximately 42 million tonnes of Municipal Solid Waste (including 19.1 million tonnes of Commercial and Industrial waste similar in nature to household waste in 2012), 16.2 million tonnes of which went to landfill.<sup>1</sup> As well as being damaging to the environment this is a loss of a valuable resource.
- 12.3 The UK also needs sufficient waste infrastructure capacity to be in place to meet the requirements of the EU Landfill Directive targets for biodegradable municipal waste (BMW). The current target requires that the amount of BMW sent to landfill in England by 2020 decreases to 35% of 1995 levels (to 10.2 million tonnes).<sup>2</sup> England met its contribution to the UK BMW target for 2010 and the latest data, for 2012, shows BMW to landfill already within the requirements of the 2013 and 2020 targets. Based on the latest assumptions, levels of BMW to landfill in England are expected to be around 3.5 million tonnes in 2020.<sup>3 4</sup>

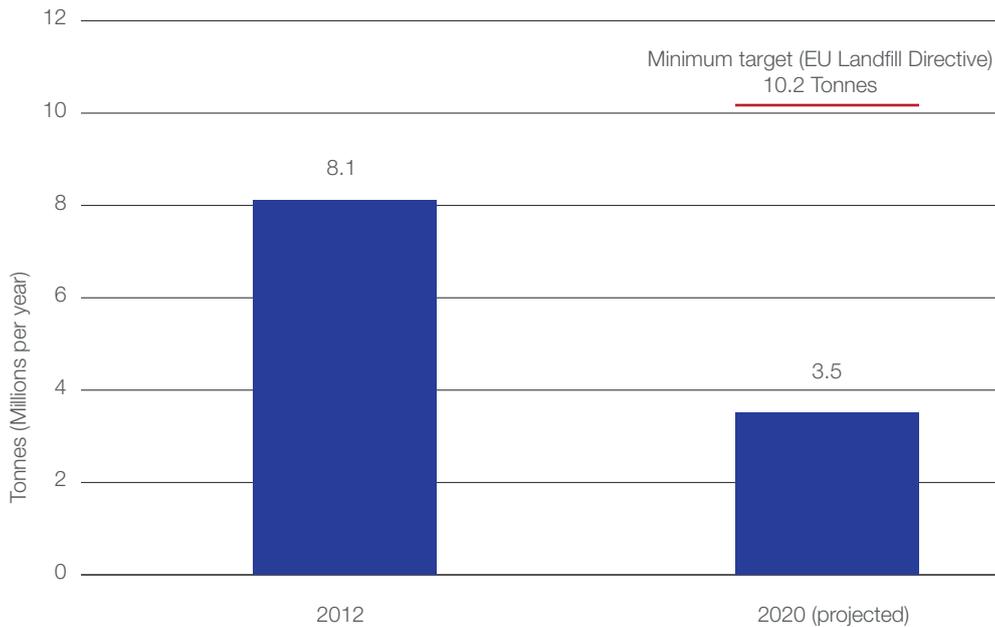

---

<sup>1</sup> Estimate includes household waste and similar waste from commercial and industrial sources. Source: Wastedataflow and Forecasting 2020 Waste Arisings and Treatment Capacity, Defra, October 2014

<sup>2</sup> Defra – UK statistics on waste – 2010 to 2012, Defra, September 2014

<sup>3</sup> *ibid*

<sup>4</sup> Forecasting 2020 Waste Arisings and Treatment Capacity, Defra, October 2014

**Chart 12.A: Forecast of biodegradable municipal waste sent to landfill in England**

Source: UK statistics on waste, 2010 to 2012, Defra, Sep 2014;  
Forecasting 2020 waste arisings and treatment capacity, Defra, Oct 2014

## Strategy

- 12.4 The government seeks to ensure the best use of materials and resources, and that waste in England is dealt with as efficiently as possible, in a way that meets EU targets. It also believes that the efficient use of resources should primarily be driven by the market, operating within a policy and regulatory structure that provides the right economic incentives. This includes using the tax system to influence behavioural change where appropriate (e.g. through the landfill tax).
- 12.5 Private sector suppliers build and run waste plants that treat waste and divert biodegradable municipal waste from landfill. To ensure that it will meet its EU obligations, the government provides financial support to help local authorities part-fund residual waste infrastructure contracts with private sector suppliers. The government also provides technical and commercial expertise to PFI/PPP waste projects, including helping local authorities identify and secure substantial efficiency savings.

## Delivery plan

- 12.6 The government routinely monitors progress against its requirements under the EU Landfill Directive and, as set out above, England is currently on track to meet the existing 2020 targets. All grant funding has now been allocated to waste infrastructure and the government is not currently planning to fund any new projects through Waste Infrastructure Credits.

### Key action to 2020-21

- 12.7 There are some 20 existing waste PFI and PPP projects representing almost £2 billion of investment between now and 2020-21 in the infrastructure pipeline, 11 of which are already in construction.
- 12.8 In July 2014, the European Commission published proposals as part of a review of resource and waste management policy and legislation, including key targets in EU waste legislation. The government is committed to the negotiation and implementation of proportionate EU agreements, and has made clear that it would not support new targets at an EU-level unless there is a clear economic and environmental case to do so.
- 12.9 There will now be a period of negotiation on the European Commission proposals which is expected to conclude between 2016 and 2018.
- 12.10 It is only once these negotiations have substantively concluded that the government expects to have sufficient clarity to decide what further action, including on infrastructure, will be necessary to meet any revision of the targets.

### Longer term

- 12.11 In the longer term, the government wants to see businesses leading the way in resource use and management, increasingly realising the economic and commercial opportunities that arise from resource efficiency and tackling environmental challenge.
- 12.12 The government will continue to have a role to play. It will continue to work with local authorities, industry and other stakeholders to promote good practice and ensure businesses have the tools and the freedom to realise the benefits of moving towards a more circular economy

### Further information

- 12.13 The infrastructure pipeline sets out details of major planned projects and programmes within the waste sector, including current status, projected construction start/completion dates and cost profiles (where available).
- 12.14 Details of individual PFI and PPP projects are available on local authority websites.

### Key policy and delivery milestones

2015	3 waste projects in London, Surrey and Gloucestershire due to start construction
	4 waste projects due to be completed including in Shropshire, Barnsley and Wakefield
2016	8 waste projects due to be completed including in Merseyside, Buckinghamshire and Cornwall
2017	3 waste projects in North Yorkshire, North Lincolnshire and Derby due to be completed
2018	EU negotiations on new waste targets due to have concluded
	South London waste project due to be completed
2019	
2020	Deadline for meeting existing EU Landfill Directive targets

Project-specific dates are based on the infrastructure pipeline and are indicative of current plans. Some projects may be subject to finalisation of statutory processes. Final decisions on private-sector led projects will be taken by the project developer.

Plan to 2020-21

**INFRASTRUCTURE PIPELINE FOR SCIENCE £1.4BN**

**In construction £1bn**

**Future investment £0.4bn**

# Chapter 13:

## Science and research

### Objectives

- 13.1 The government aims to make the UK the best place in the world to do science and research.

### Needs

- 13.2 Science is a crucial driver of productivity growth. The UK's ability to develop and commercialise new ideas, products and services will be critical to its economic success.
- 13.3 Yet the science and innovation landscape is changing. The scale of science is increasing, meaning long-term strategic investment by government and business is required. Sophisticated infrastructure and kit means that national, or in some cases international, facilities are often the only realistic solution. The global pace of research is increasing, meaning the UK needs to work harder to remain at the cutting edge. Science – and the way it is conducted - is also becoming more open, working across organisational, disciplinary and geographic boundaries and requiring greater collaboration between business, research and academic institutions, and government.
- 13.4 All this poses new challenges for the way we approach science infrastructure. Sustained and efficient future investment in scientific and research infrastructure is essential to ensure that UK research is able to remain internationally competitive.

### Strategy

- 13.5 Recognising its importance, the government has taken tough decisions this parliament to increase spending on science at a time of falling budgets. This has delivered major programmes spanning both blue skies and applied science, and across the eight great technologies.
- 13.6 In addition to directly funding capital projects, the government continues to enhance funding at institutional and project level through Research Councils UK (RCUK) and the Higher Education Funding Council for England (HEFCE) to ensure a joined-up network of science infrastructure.
- 13.7 It also uses funding mechanisms and incentives to encourage greater collaboration between the research community, business and government. For example, the Research Partnership Investment Fund (RPIF) which gives awards to large-scale projects and can attract at least double public investment from private or charitable sources. Likewise,

Catapults are a network of widely-supported technology and innovation centres which aim to boost the UK's innovation capability in areas that have a large global market potential, bringing together public and private sector actors through a risk sharing model. Many of the Catapults support research into areas with direct implications for economic infrastructure sectors, including in future cities, offshore renewable energy, transport systems and digital communications.

## Delivery plan

### Key actions to 2020-21

- 13.8 The government has increased capital funding for science and research in real terms to £1.1 billion in 2015-16, and provided a long-term commitment which sees it growing in line with inflation each year to 2020-21.
- 13.9 The government recently consulted on proposals for long-term capital investment to 2020-21. In doing so, it set criteria for the prioritisation of publicly funded capital projects: affordability (including revenue costs), excellence, impact, skills development, and efficiency and leverage of other funding sources. Projects are also required to support the government's wider priorities: the 'eight great technologies', the industrial strategy and developing collaboration across disciplines and boundaries.
- 13.10 At Autumn Statement 2014, the government will announce which large projects have been selected in the first round of funding as part of this consultation. Shortly afterwards, it will publish its Science and Innovation Strategy, and full response to the capital consultation. These will build on the feedback received and set out how the long-term funding settlement for the sector will be used to support key priorities and projects.
- 13.11 The government will also continue to focus on delivery of its existing infrastructure commitments, including major science projects such as Diamond Phase III, the Pirbright Institute Development Phase 2 and the Francis Crick Institute.

### Longer-term

- 13.12 The government's forthcoming Science and Innovation Strategy will set out the government's long-term objectives for the sector.

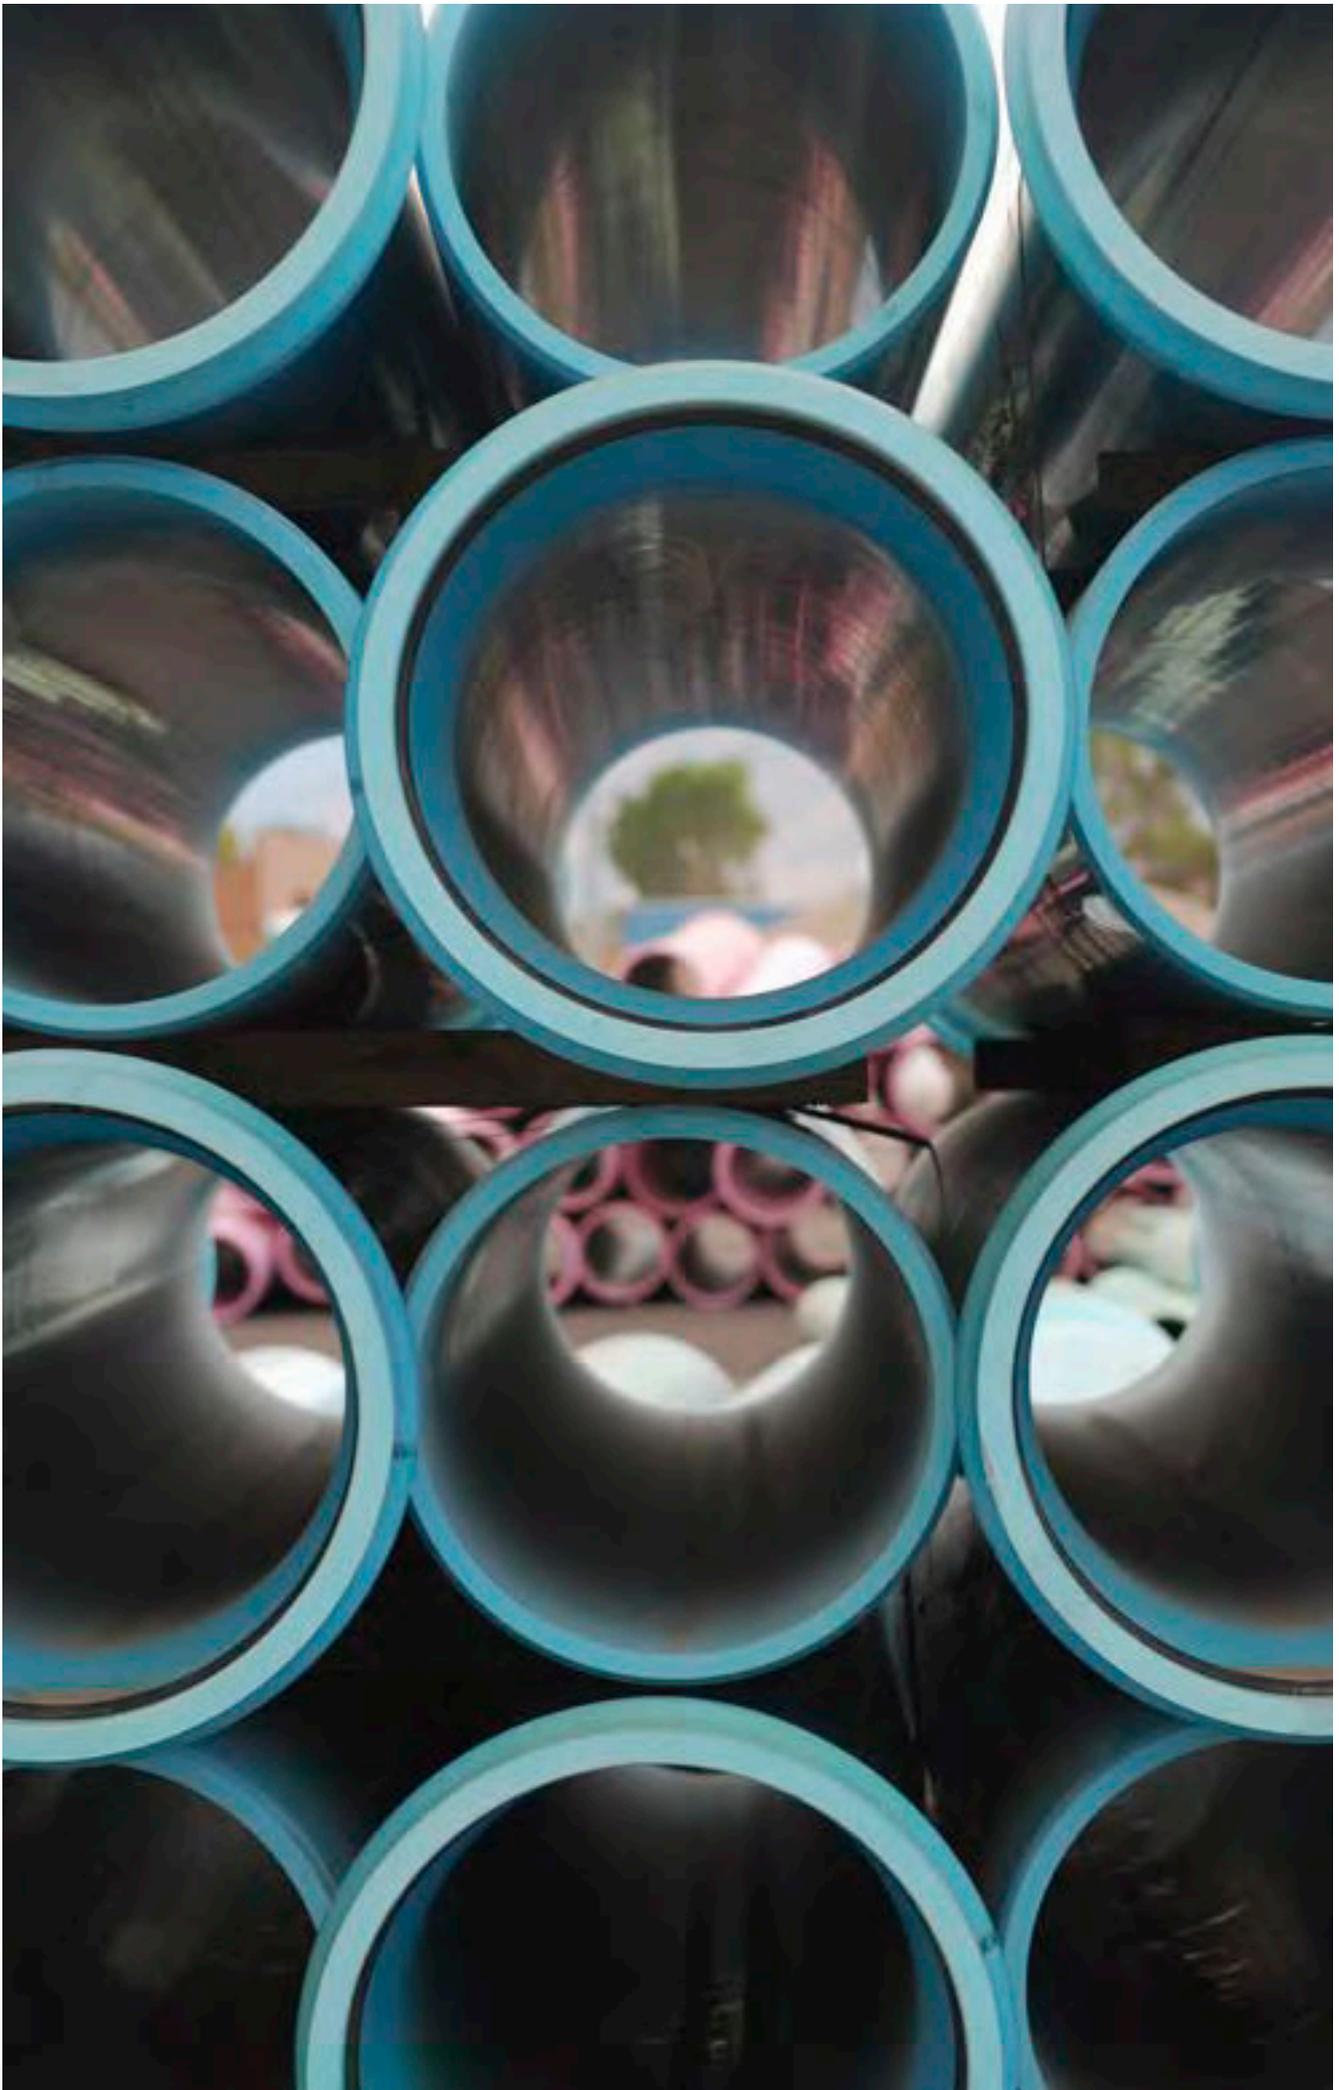

### Priority projects

- 13.13 To support delivery of its objectives for the science and research sector, the government has included the following within its Top 40 priority infrastructure investments:
- Science Major Projects – focusing on the largest projects by capital value
  - Science and Innovation Catapults – focusing on physical infrastructure elements
- 13.14 For full details on the Top 40 selection criteria and how the government tracks and supports progress, please see Chapter 16, which also sets out the key projects and programmes within individual investments.

### Further information

- 13.15 The infrastructure pipeline contains details of major planned projects and programmes within science and research infrastructure, including current status, projected construction start/completion dates and cost profiles (where available).

# Chapter 14:

## Financing UK infrastructure

- 14.1 Securing the right funding and financing is critical to delivering UK infrastructure effectively and efficiently. Overall, analysis of investment trends show that investment in UK infrastructure has been increasing, from an average annual investment of £41 billion between 2005-6 and 2009-10 to an average annual investment of £47 billion between 2010-11 and 2013-14.<sup>1</sup>
- 14.2 The infrastructure pipeline sets out details of around £327 billion of planned investment across the public and private sectors to 2020-21. This chapter sets out the details of how this investment will be delivered, and the opportunities for private investment in the 2014 infrastructure pipeline.

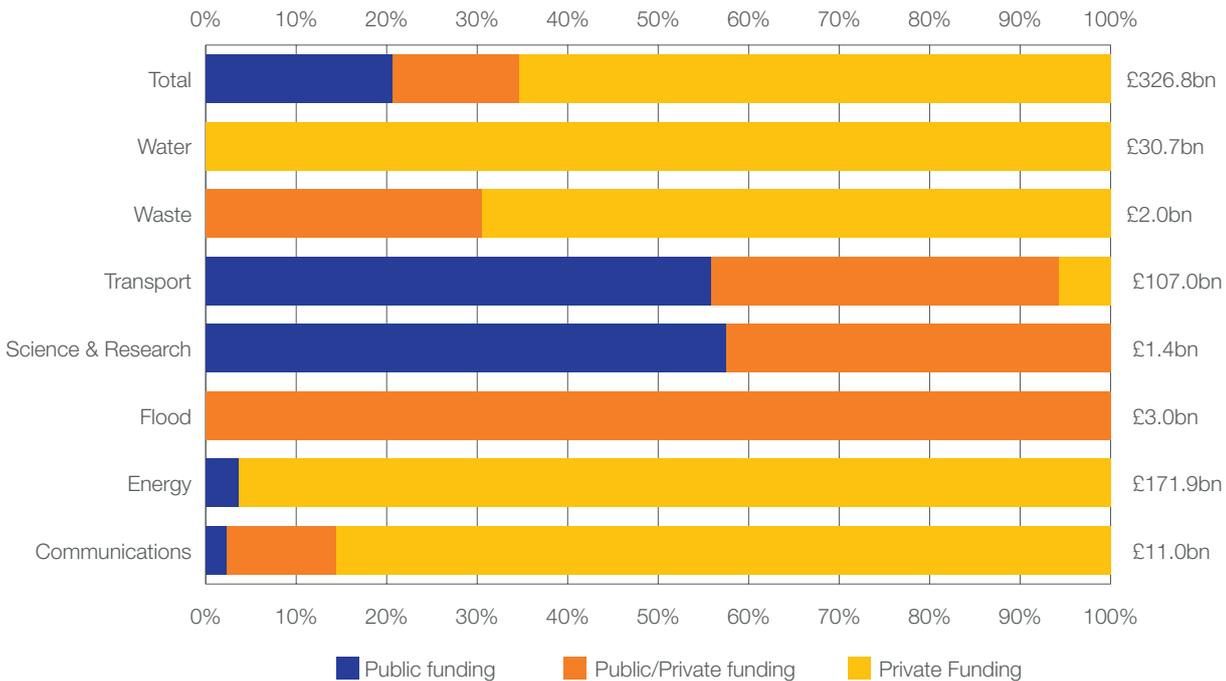

### Funding infrastructure

- 14.3 Underpinning investment in UK infrastructure is the funding source which will ultimately pay for the asset. Funding is paid for in three main ways: from consumers through bills and user charging, through public spending raised from general taxation, or a combination of the two.
- 14.4 Chart 14.A below shows the proportion of public and private funding for infrastructure investment in the 2014 infrastructure pipeline.

---

<sup>1</sup> 2013-14 prices. HM Treasury estimates, based on published sources. These figures are not comparable to pipeline data presented in this document, which is a forward-looking bottom-up assessment of planned infrastructure investment. Please refer to 'Methodology and Sources for National Infrastructure Plan 2014' for further information on how these estimates are calculated

**Chart 14.A: Funding mix of 2014 infrastructure pipeline, 2014-15 to 2020-21, by sector**

Source: HM Treasury, Major Infrastructure Tracking Unit

- 14.5 The UK has been at the forefront of developing a model of infrastructure investment whereby responsibility for funding, financing and delivery is split between the public and private sectors. This means that 20.6% (£67.5 billion) of the planned investment in the infrastructure pipeline is entirely public investment, with a further 13.8% (£45 billion) representing a mix of public and private sources, and 65.6% (£214.4 billion) will be purely private investment.
- 14.6 The approach to delivering investment depends on the sector concerned, the nature of the asset, for example whether there are a defined set of users who will benefit and could reasonably be charged for usage, and takes into account the relative efficiency and fairness of different approaches to funding. The government’s objective is to ensure an open market for investment in UK infrastructure to maximise competition for investment and ultimately drive down the costs of delivering infrastructure. The model also seeks to allocate risk appropriately between the public and private sectors to ensure value for money is delivered for the taxpayer.
- 14.7 For example, the partnership funding policy for the floods programme prioritises investment on a transparent and objective basis. It increases certainty, local ownership and choice, and incentivises communities to reduce costs and maximise benefits. Alongside the £2.3 billion of government capital expenditure, the government expects to attract contributions from other sources, including the private sector, of around £600 million for the schemes within the 6 year programme.

## Financing infrastructure

- 14.8 While the funding model determines the revenue stream that will ultimately pay for an asset, financing is the method of securing upfront capital investment which will get a project started and support associated jobs and economic growth. Predictability in the revenue stream enables finance to be made available to developers of an asset, so that the project can get underway.

## Public financing

- 14.9 Where projects are publicly funded, this means that they are financed (in their entirety or in part) directly out of the agreed capital budgets of the relevant government department, local authority or arms-length delivery body.
- 14.10 Of the current UK infrastructure pipeline to 2020-21, £67.5 billion will come from public investment with a further £45 billion from a mix of public and private sources. All publicly funded elements of the infrastructure pipeline now represent a firm and specific government commitment. Details of new government funding commitments are set out in the previous sector chapters of this document.

## Investment in the regulated sectors

- 14.11 A significant proportion of private investment in the infrastructure pipeline is in regulated sectors. The UK has pioneered a system of independent regulation for the following sectors of the economy: electricity and gas transmission and distribution; water; telecommunications; airports; and rail. While the specific approach varies between sectors, regulation is structured in a way that protects consumers, rewards efficiency and innovation, and gives investors the confidence to privately finance the infrastructure the UK economy needs.
- 14.12 Regulated companies will continue to require investment in order to both maintain existing infrastructure and construct large new assets, such as the Thames Tideway Tunnel. The infrastructure pipeline to 2020-21 includes £113.5 billion of investment in the regulated sectors.
- 14.13 The essential nature of network infrastructure means that demand for services is strong and expected to grow over time. Price controls and licence conditions are set by independent economic regulators and provide investors with a high degree of predictability about the extent of future profitability in the sector, which is free from political interference. This system of independent regulation has proved particularly attractive to traditionally long-term investors, such as pension funds.
- 14.14 Equity investment in the regulated sectors is made either directly in large publicly-listed regulated companies, or through share-holdings in the groups or investment funds that own regulated companies as part of their portfolio.
- 14.15 The capital-intensive nature of regulated industries, as well as the make-up of regulatory settlements, creates considerable opportunities for debt investment. Regulated companies commonly issue debt as fixed term interest-bearing bonds, or bonds linked to RPI as inflation is included in the regulatory settlement. Other forms of debt investment are also generally available including short-term debt such as commercial paper, and other financial instruments designed to match the company's future interest payments to the levels allowed in the price control settlement.
- 14.16 Moody's Investors Service (a credit rating agency) regards the regulatory regime for electricity and gas networks and water companies in Great Britain as amongst the most stable and predictable in the world, assigning the highest score (Aaa) for the relevant factor under its methodologies for the two sectors.

14.17 Developments in regulatory settlements continue to make regulated infrastructure networks an even more attractive place to invest. For example:

- in regulated energy networks, the length of regulatory settlements has extended from five to eight years; in addition, there is a mechanism to update this settlement annually with movements in the cost of debt and to set allowances for major projects agreed during the price control period; this removes the need to 'log-up' capital investments until the next price review period
- Ofwat and Ofgem have introduced new mechanisms to award 'enhanced status' (water) or 'fast-track' status (energy) to companies whose business plans are high-quality, ambitious, fully engaged with their customers and well justified; network companies that achieve this status are then subject to only a 'light-touch' regulatory review; this new mechanism reduces the 'regulatory burden' and reduces uncertainty for the companies demonstrating outstanding business plans and frees them to focus on delivering their business plans

14.18 The government is fully committed to the system of independent regulation for delivering the required infrastructure investment in the regulated sectors, while protecting consumers' interests. The stability of the UK economic regulation systems means that companies operating regulated networks in the UK are consistently regarded as stable and relatively low-risk. There should therefore be continued competition to invest in the regulated sectors, reducing the cost of capital, which is a positive outcome for consumers.

### **Private investment**

14.19 As well as corporate investment in the regulated sectors, there is a further £130 billion of private investment in the non-regulated sectors of the infrastructure pipeline to 2020-21. For several sectors, in particular waste, ports, and oil and gas, financing is likely to be almost entirely provided by project developers on balance sheet – where investment is financed from the companies' own resources.

14.20 For other sectors, primarily in energy generation, balance sheet financing is also important. However, many developers in these sectors – particularly the large utilities – have had limited headroom for investment on balance sheet for some time. The opportunity for project financing is therefore likely to grow and involves raising long-term financing in the form of debt and equity to be repaid from the cash flows generated by the project once operational.

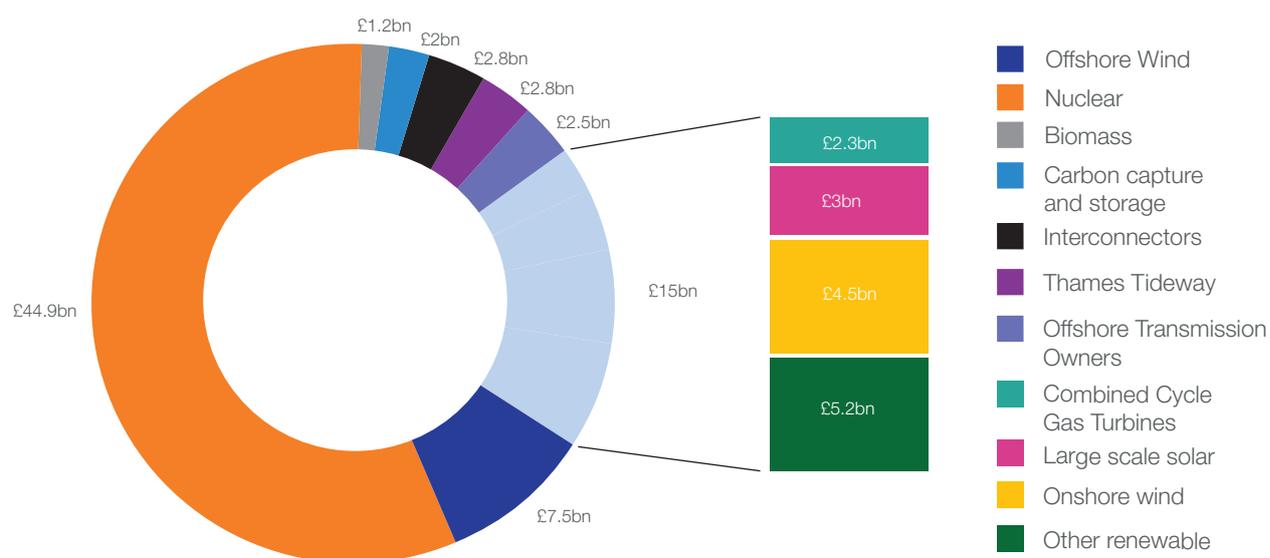

## Breakdown of project specific finance opportunities to 2020-21

14.21 In sectors where some or all investment will be off balance sheet, there are potential investment opportunities in project finance. This includes energy generation, interconnection, offshore transmission, as well as one-off large scale projects like the Thames Tideway Tunnel.

14.22 In the finance update to NIP 2013, published in March 2014, the government set out a total of £125 billion of potential finance opportunities, including £52 billion in projects to 2019-20, and £73 billion beyond 2020. This assessment was based on the capital expenditure required for projects over the course of construction, often extending beyond 2020. For NIP 2014, the methodology has been updated, extending to include the 2020-21 financial year and to reflect the need for projects to have finance committed upfront. This means the full capital expenditure (capex value) of a project is allocated in the year that a final investment decision is expected, where this falls in or before 2020-21. This better reflects when investment will actually need to be committed by the market.

14.23 The stated value of the potential project finance opportunity to 2020-21 has therefore increased, as £31 billion has been brought forward from the post-2020 period into the current decade. This is due to the full capex value for 3 nuclear projects falling within the pre-2021 financing window. Taking into account our expectations on the use of corporate balance sheets in the sectors included, the total project financing opportunity to 2020-21 is therefore £79 billion, based on the updated methodology.<sup>2</sup> It should be noted that it is not the government's policy to pick the electricity mix. Ultimately the amount of investment in the various technologies will be driven by how each can meet our security of supply and low carbon ambitions at least cost to consumers. Furthermore, exact finance structures will ultimately be determined by the project sponsor in any given deal. The assessment provided in Table 14.1 of project finance opportunities, and structures is based on data in the 2014 UK infrastructure pipeline and engagement with developers.

<sup>2</sup> HM Treasury estimates. Please refer to 'Methodology and Sources for National Infrastructure Plan 2014' for further information

**Table 14.1: Breakdown of project finance investment opportunities in UK infrastructure to 2020-21**

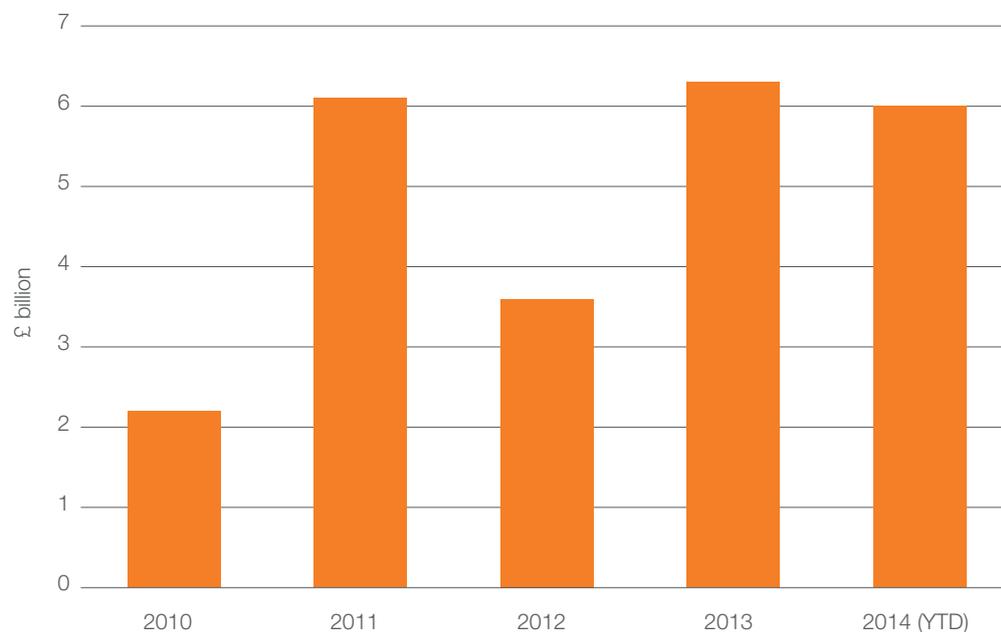

Nuclear	Investment to 2020-21: £45bn Investment opportunity: Up to £45bn Estimated Debt/Equity value: £22.5/£22.5bn	Specific projects:	Hinkley Point C – a 3.2GW facility in Somerset developed by NNB GenCo Moorside – a 3.6GW facility in Cumbria developed by NuGen Wylfa Newydd – a 2.7GW facility in Anglesey developed by Horizon Nuclear Power.
Offshore wind	Investment to 2020-21: £10.1bn Investment opportunity: Up to £7.5bn Estimated Debt/Equity value: £5.7/£1.9bn	Specific projects:	Beatrice – 664MW, Outer Moray Firth, SSE Renewables/Repsol Nuevas Energias Burbo Bank Extension – 258MW, Liverpool Bay, DONG Energy Dudgeon – 402MW, Norfolk coast, Statkraft/Statoil Hornsea – 1.2 GW, Yorkshire coast, DONG Energy Walney Extension – 660MW, Cumbrian Coast, DONG Energy
Carbon capture and storage (CCS)	Investment to 2020-21: ~ £3bn, including up to £1bn of government funding available. Investment opportunity: ~ £2bn	Specific projects:	Peterhead – a post combustion gas fired retro-fit CCS power station capable of capturing 1mt CO2 per year, Aberdeenshire, Shell with SSE Generation White Rose – a new 426MW oxy-fuel coal power station with CCS, capable of capturing 2mt CO2 per year, Yorkshire, Capture Power
Biomass	Investment to 2020-21: £1.2bn Investment opportunity: Up to £1.2bn Estimated Debt/Equity value: £0.7/£0.5bn	Specific projects:	Tees Renewable Energy Plant – 299MW biomass plant, Teeside, developed by MGT Teeside Lynemouth Biomass conversion – 420MW coal to biomass conversion, Northumberland, Lynemouth Power (RWE Npower)
Interconnectors	Investment to 2020-21: £5.3bn Investment opportunity: £2.8bn Estimated Debt/Equity value: £1.6/£1.2bn	Specific projects:	ElecLink – 1GW UK-France, Groupe Eurotunnel/Star Capital Partners FAB –1.4GW France-Alderney-Britain, RTE/Alderney RE/Transmission Investment Greenlink –0.5GW GB-Ireland interconnector, Element Power IFA2 – 1GW UK-France, National Grid and RTE NEMOLink – 1GW UK-Belgium interconnector, National Grid and Elia NSN –1.4GW UK-Norway interconnector, National Grid and Statnett. Viking Link – 0.7-1.4GW UK-Denmark, National Grid and Energinet.dk
Thames Tideway Tunnel	Investment to 2020-21: £4.2bn Investment opportunity: Up to £2.8bn Estimated Debt/Equity value: Up to £1.8bn/Up to £1bn	Specific projects:	Thames Tideway Tunnel – a 25km sewer under the Thames in London being developed by Thames Water
Other energy investment	Investment to 2020-21: Up to £18bn Investment opportunity: Up to £18bn Estimated Debt/Equity value: £13bn/£5bn	Specific sectors:	Offshore Transmission of up to £2.5bn (est. £2.25bn debt/£0.25bn equity) Large scale solar of up to £3bn (est.£2.4bn debt/£0.6bn equity) Onshore wind of up to £4.5bn (est. £3.6bn debt/£0.9bn equity) Gas generation of up to £2.3bn (est. £1.2bn debt/£1.2bn equity) Other renewable generation of up to £5.2bn (est. £3.1bn debt/£2.1bn equity)

Note: Values may not sum exactly due to rounding

## Sources of private finance for the 2014 infrastructure pipeline

14.24 The UK continues to be an attractive place to invest. Nabarro LLP's 2013 infrastructure index assessed the UK as number one for attracting investment. Recent trends suggest both debt and equity markets are increasingly willing and able to invest in UK infrastructure.

### Chart 14.C: Value of private sector investment transactions in UK infrastructure

Source: HM Treasury analysis, using InfraDeals Transactions Database

Please refer to 'Methodology and Sources for National Infrastructure Plan 2014' for further information

## Equity

14.25 Around £33 billion of project investment opportunity is estimated to be equity investment. Equity in UK infrastructure is provided by a range of entities in the market: developers, institutional investors and funds, as well as the supply chain.

14.26 The government expects **developers** to continue to be significant providers of a project's equity. However, large utilities remain balance sheet constrained as many are still highly leveraged, which restricts their capacity to make large-scale greenfield investment.

14.27 Therefore, **institutional investors** such as pension funds and insurance companies are also a potential source of equity investment, investing either directly or through equity funds. Institutional investors are particularly relevant for infrastructure as they are looking for longer-term investments to match defined liabilities that are realised when claims are made for pension or insurance purposes, and government bonds are less attractive as yields are currently low.

14.28 **Equity funds** are playing an important role in allowing developers to recycle their capital by taking stakes in projects. For example, in 2014 Greencoat and Swiss Life acquired developer AES's UK onshore wind portfolio for £175 million, and Equitix acquired a 50% stake in GDF Suez's 70MW UK wind portfolio. The new €150 million Allianz Renewable Energy Fund, managed by Allianz Global Investors, recently made its first investment in a solar farm north-east of London.<sup>3</sup> However this investor class still tend to invest in sectors where there is low regulatory, construction and technology risk.

14.29 There is also equity provision in UK infrastructure from the **supply chain**. Recent examples include equipment manufacturers such as Siemens, where Siemens Project Ventures will invest in a project if there is a strategic reason to do so, ie where it benefits from a supply contract. On the basis of this strategy, Siemens invested in both Gwynt-y-Mor and Lincs offshore wind farms.<sup>4</sup>

14.30 Equity investment in UK infrastructure is unlikely to be delivered by UK institutional investors, existing commercial banks and funds alone: **overseas investors** have a role to play. This is about ensuring deliverability, driving down the cost of capital by broadening the appetite for UK infrastructure, opening up our funding markets, and liberalising our energy markets.

14.31 The UK has attracted over £18 billion of large-scale equity investments in UK infrastructure projects since May 2010.<sup>5</sup> Recent examples are shown in Table 14.2.

**Table 14.2: Examples of foreign investment in UK infrastructure**

Date	Investor	Country	Investment (% stake in project)
Jun '14	Antin IP	France	Central Area Transmission System (Cats) (63%)
Aug '14	Marubeni	Japan	Westermost Rough Offshore Wind (25%)
Sep '14	Ontario Teachers' Pension Plan (OTPP)	Canada	Bristol Airport (49%)
	Abu Dhabi Future Energy Company (Masdar)	UAE	Dudgeon Offshore Wind (35%)
Oct '14	Ferrovial	Spain	Aberdeen/Glasgow/Southampton Airports (50%)
Nov '14	Copenhagen Infrastructure Partners	Denmark	Beatrice Offshore Wind (25%)

14.32 The UK reached a total of \$1,606 billion (£975 billion) last year in Foreign Direct Investment (FDI) stock, which is almost \$500 billion more than any other European country. Over half of the £975 billion FDI in the UK in 2013-14 is in energy or other infrastructure schemes, also creating 31,261 jobs.<sup>6</sup>

<sup>6</sup> UNCTAD World Investment Report 2014.

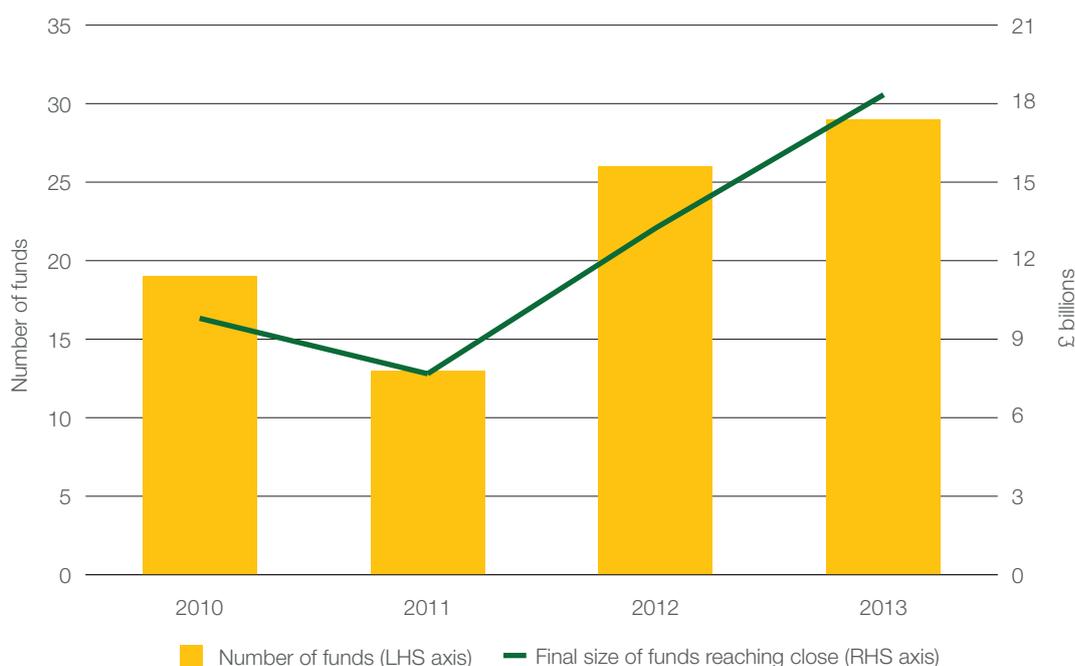

## Debt

14.33 Around £45 billion of the project investment opportunity is estimated to be debt financed. Despite contraction in lending activity as a result of the financial crisis, **commercial banks** are still significant players in infrastructure finance, and are again reporting increasing capacity to provide the longer-term lending required for infrastructure. According to the Deloitte Infrastructure Investors Survey 2013, many investors expect the terms and availability of debt financing for infrastructure to continue to improve over the next two years.<sup>7</sup> There is increasing liquidity in the debt market for new build assets provided that the investment proposition is well structured and the risk profile is appropriate. In the sectors that are more established such as onshore wind and solar, there is debt financing available for UK infrastructure projects in both construction and operational phases. Tenors available are also improving with Japanese banks in particular offering up to 30 years.<sup>8</sup> This is also reflected in debt terms that are again very favourable for investors.

14.34 Recent activity in sectors perceived as more risky, such as offshore wind, has shown some appetite for lending with longer tenors (particularly non-UK lenders) and lower margins. The syndication market has also returned where the project finance debt requirement is underwritten by a small number of lead banks who subsequently pass on some of their exposure to a second tier of banks. Since the financial crisis this market had been largely close and only club deals where the lead banks take and hold their respective commitment had been possible. An example of a recent syndication is the c.£290 million of senior debt raising by Antin to help fund its acquisition of a stake in the Central Area Transmission System (CATS) gas transmission network for the North Sea.

14.35 There are an increasing number of infrastructure debt funds either currently active or being set up. In 2013, ten unlisted infrastructure debt funds reached a final close, raising a record \$8.1 billion<sup>9</sup> globally.

**Chart 14.D: Unlisted infrastructure equity and debt funds with potential to invest in the UK**

Source: HM Treasury analysis, using Preqin data

Note: Please refer to 'Methodology and Sources for National Infrastructure Plan 2014' for further information

<sup>7</sup> Infrastructure Investors Survey, Deloitte, 2013

<sup>8</sup> HM Treasury market engagement, 2014

<sup>9</sup> The Importance of Infrastructure Debt, Preqin, May 2014

- 14.36 As show in Chart 14.D, the scale of equity and debt infrastructure funds with the potential to invest in the UK is increasing. However, appetite in both the debt and equity markets is strongest in established lower risk sectors where assets are operational, and evidence suggests that banks will take construction risk in more established sectors like solar and onshore wind. In general, appetite for less established sectors such as offshore wind is currently confined to around six to eight lenders which limits the size of deals that can be comfortably funded by banks.
- 14.37 However the 600MW Gemini offshore wind project in the Netherlands shows that significant finance can be raised, delivering €2 billion of senior debt with €800 million at risk, from 12 commercial banks and the **European Investment Bank (EIB)**, involving the support of three **export credit agencies (ECA)**.<sup>10</sup> Large deals in sectors such as this, particularly greenfield ones, broadly all involve some public backing either by EIB or ECAs or both. For the most risky and large-scale projects such as nuclear these are unlikely to be financed currently without government support measures such as the UK Guarantee Scheme.
- 14.38 To enable projects to be financed, there has been an emergence of alternative financing structures for infrastructure projects in the form of incorporated or unincorporated joint ventures. For example, in the UK offshore wind sector, DONG Energy – who is the developer for 4 offshore wind projects in the UK – aims to bring in a 50% joint venture partner within 12 months of the final investment decision, ie still during the construction period. The joint venture partner may decide to project finance their part of the investment and would normally aim to raise this finance as soon as practicable after entering the joint venture. In these structures DONG Energy has taken a flexible approach to construction risk. This together with the ability of the joint venture partner to borrow against its share of the project revenues creates a viable structure for attracting project finance in a relatively higher risk/return sector. A recent example of an incorporated joint venture structure is the offshore wind farm Westermost Rough (see Box 14.A).

#### **Box 14.A: Securing project financing: The Westermost Rough Example**

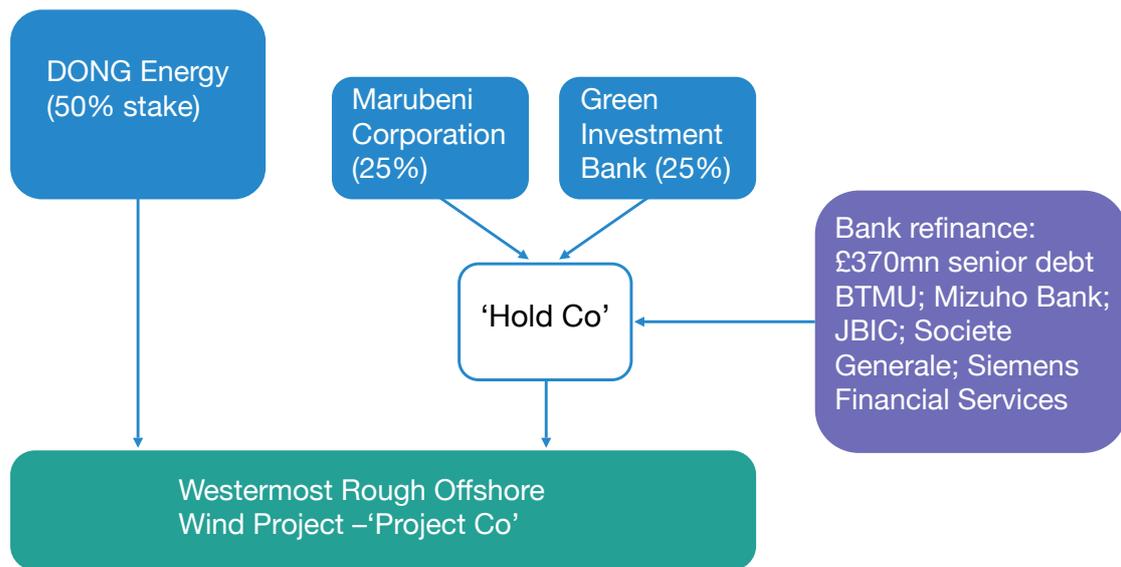

Westermost Rough is a 210MW wind farm off the coast of Yorkshire which was part of the Round 2 offshore wind farm tendering process. In 2007, DONG Energy became the developer of the project and in March 2014, after construction had started, sold a 50% stake to the Green Investment Bank (GIB) and Marubeni Corporation. In August 2014, GIB and Marubeni corporation refinanced most of their investment on the basis of its share of the project revenues by signing an agreement with banks for £370 million of senior debt.

GIB and Marubeni obtained debt financing from lenders including BTMU, Mizuho Bank, Japan Bank for International Cooperation, Societe Generale and Siemens Financial Services as shown in Chart 14.E.<sup>11</sup>

<sup>10</sup> InfraDeals

<sup>11</sup> InfraDeals

**Chart 14.E: Incorporated joint venture structure for Westermost Rough**

## Refinancing

- 14.39 Improvements in the market are also evidenced by the refinancing market. For example, DfT has issued refinancing notices on two significant transport projects: Intercity Express Programme Great Western Rolling Stock (c.£1 billion of commercial debt) and Thameslink rolling stock (c.£1.2 billion of commercial debt) and is actively considering opportunities to refinance and deliver value for the taxpayer on other projects. This reflects the reducing price of credit in the market making refinancing attractive for some infrastructure projects. There has also been significant debt refinancing activity in renewable energy. In addition to developers' equity being recycled by equity funds, developers are also taking out their equity by issuing debt as in the Westernmost Rough example mentioned above. Another example is Lightsource Renewable Energy, one of the UK's biggest solar developers, which has secured almost £200 million in project finance in the last year to support the refinancing of operational solar parks.<sup>12</sup>
- 14.40 With some positive trends in commercial bank lending, debt and equity fundraising and refinancing, as set out above, the government expects appetite for private investment in UK infrastructure to continue to improve, and financing for the infrastructure pipeline to be available. However the government recognises the challenges to securing finance and has put in place a number of policy measures and finance initiatives to promote private investment in UK infrastructure.

<sup>12</sup> InfraDeals

## Action to support private investment

### Box 14.B: Policy measures to support energy investment

New legally-binding Contracts for Difference (CfDs) are supporting investment in low-carbon energy generation. Under a CfD, the electricity generator is paid the difference between the ‘strike price’ – a price for electricity reflecting the cost of investing in a particular low-carbon technology – and the ‘reference price’ – a measure of the average market price for electricity in the GB market. It gives greater certainty and stability of revenues to electricity generators by reducing their exposure to volatile wholesale prices, whilst protecting consumers from paying for higher support costs when the market electricity prices are high. In April 2014, the government awarded investment contracts (early Contracts for Difference) to eight major renewable electricity projects. The first full CfD contract allocation round is due to conclude in early 2015. The budget for the first CfD allocation round is now £300m. The government has held back a significant part of the budget for future allocations within the Levy Control Framework cap. CfDs are available to a range of low-carbon energy generation including nuclear, offshore wind, and biomass.

The government is providing £1 billion of public funding for carbon capture and storage (CCS) technology through a commercialisation competition. £100 million has been set aside for the Peterhead and White Rose CCS projects to undertake FEED (Front End Engineering and Design) studies. In late 2015 the companies will take final investment decisions with the government taking decisions shortly afterwards.

The government recognises that investment in new gas plant capacity will be needed as back-up for less flexible renewable electricity generation to meet demand. The government is supporting investment in these assets via the Capacity Market, providing payment beginning in 2018-19 for reliable sources of capacity, alongside their electricity revenues, to ensure they deliver energy when needed.

Development of offshore projects requires development of offshore transmission infrastructure. Ofgem has introduced a stable and attractive regulatory regime for offshore transmission to secure revenues for Offshore Transmission Owner Assets (OFTOs), which has already secured financing from a wide range of investors in these assets. Ofgem grants licences to operate new offshore transmission assets via a competitive tender process, driving down costs. This innovative, competitive approach has saved generators and consumers £200-£400 million over the first tranche of projects.<sup>13</sup>

Increasing interconnection can reduce bills for consumers. For interconnectors between the UK and other countries, the UK has historically relied on merchant interconnectors, where private developers decide where to build interconnection (and how much to build) and recover their capital and returns by exploiting the price differences between interconnected markets. To support interconnection, Ofgem has launched a new “cap and floor” regulatory regime. Private developers still decide the location and capacity of interconnectors, but consumers guarantee a floor to the developer’s revenues in downside scenarios, in exchange for a cap on the revenues in upside cases. In addition, today the government is announcing that interconnectors will have access to the capacity market from 2015 to provide clarity and confidence to investors.

<sup>13</sup> <https://www.ofgem.gov.uk/publications-and-updates/consultation-cepabdo-evaluation-offshore-transmission-tender-round-1-benefits>

### Finance initiatives

14.42 While the trends in investment are showing signs of improvement and the government has introduced policy to support investment in energy generation and transmission, there are still challenges in securing finance, particularly given the large scale and perceived risks of some types of infrastructure. The government has therefore taken a number of steps to stimulate a range of different types of private investment in UK infrastructure.

14.43 The UK Guarantees Scheme (UKGS) was launched in 2012 to support investment in UK infrastructure. The government will engage with industry on the future of the UKGS, which is currently due to close in 2016.

#### Box 14.C: The UK Guarantees Scheme

UK flagship vehicle, with £40 billion worth of guarantees, to provide certainty to investors.

Government is using the strength of its credit rating to facilitate the provision of debt.

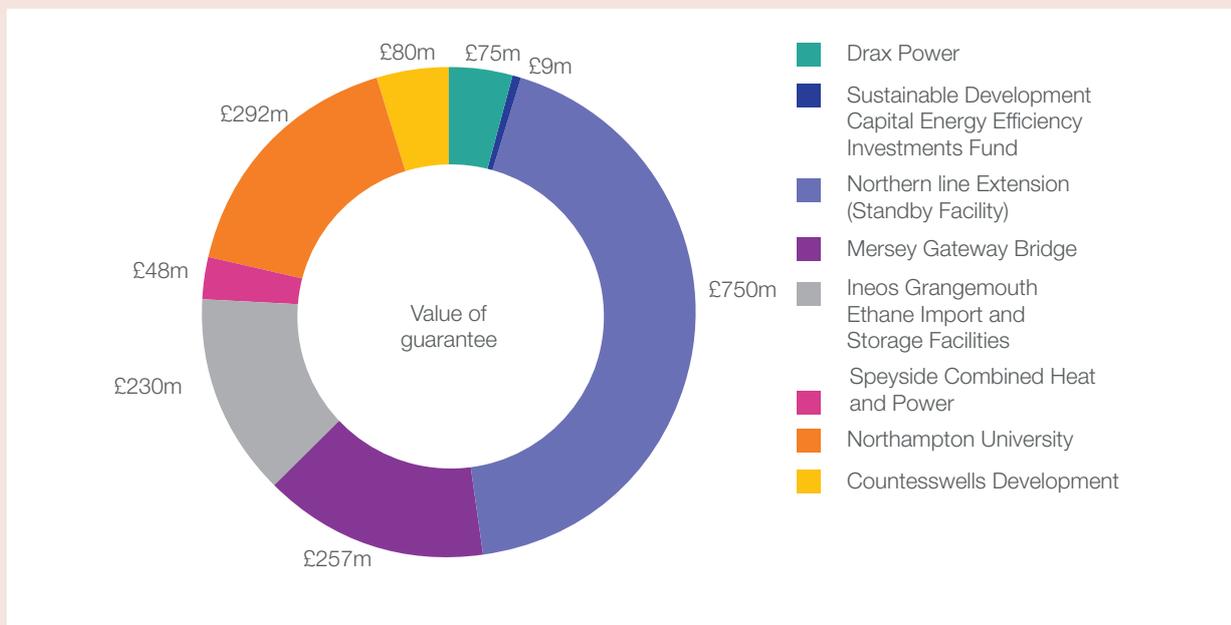

39 projects with a total capital value of £34 billion pre-qualified for the scheme.

7 guarantees and 1 standby facility signed or approved to date with a value of over £1.7 billion, supporting projects worth almost £4 billion.

In 2014, UKGS has underwritten £827 million of senior debt for greenfield projects in the UK – more than any other commercial lender (InfraDeals).

During 2014, over 50 institutional investors have funded infrastructure projects as result of UKGS.

#### Chart 14.F Guarantees and facilities signed or approved under the UK Guarantees Scheme to date

Source: HM Treasury

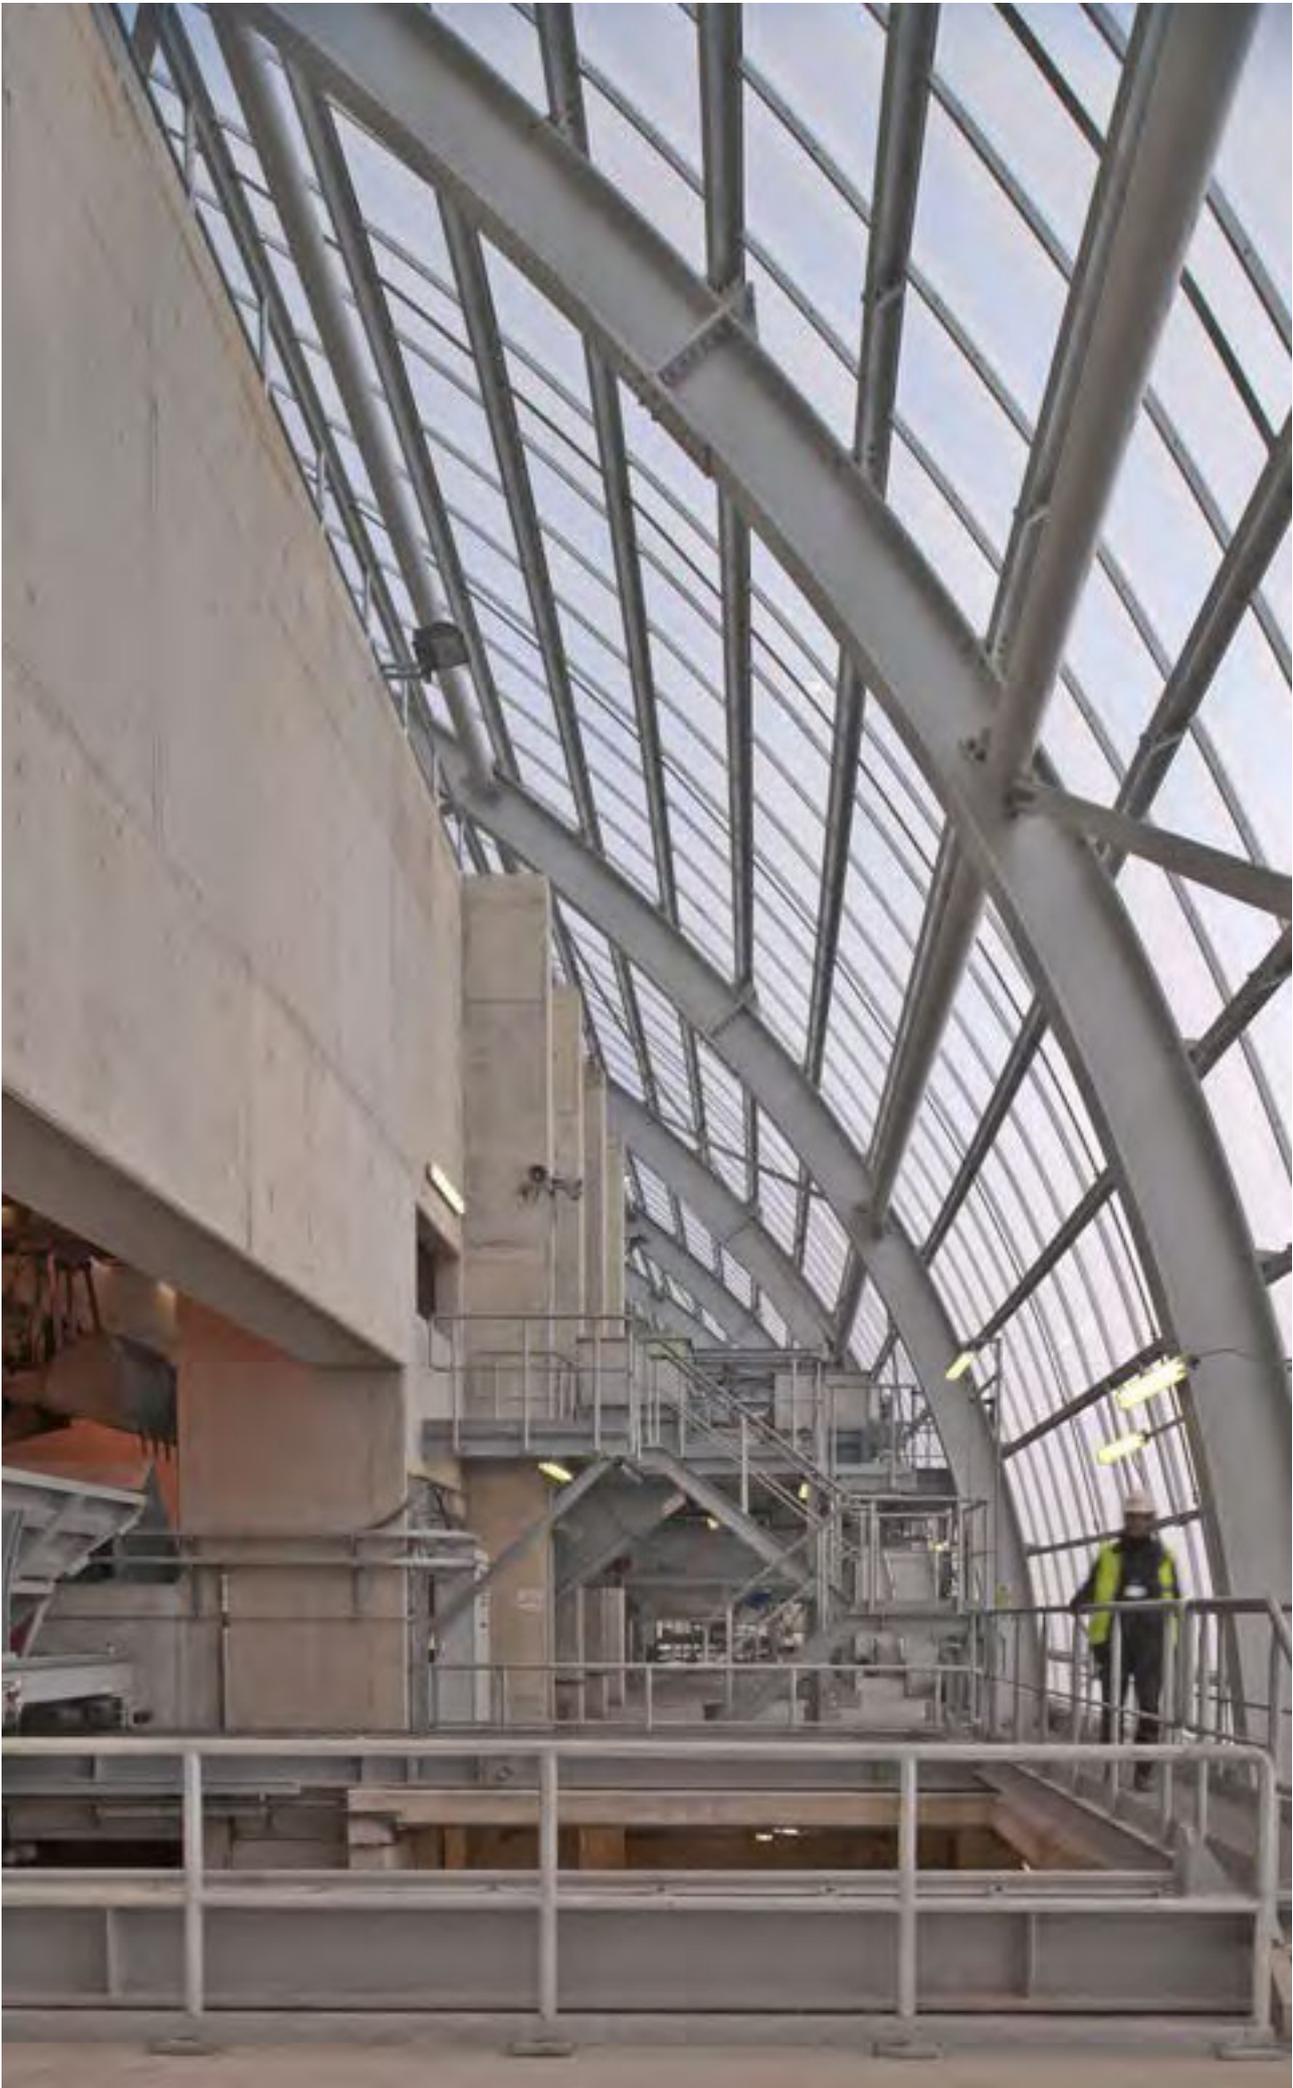

Please refer to 'Methodology and Sources for National Infrastructure Plan 2014' for further information

- 14.44 **The Green Investment Bank (GIB)** is the world's first investment bank dedicated to accelerating the transition to a green economy. With committed funding of £3.8 billion, the GIB is providing debt solutions to innovative, environmentally friendly sectors where the risk profile, particularly in innovative technologies, means there is currently a lack of sufficient support from private markets. The GIB has invested more than £1.4 billion in over 35 projects in over 200 communities across the UK, working with over 70 co-investors. In June 2014 the GIB announced plans to launch a £1 billion fund to acquire equity stakes in operational offshore wind projects in the UK. Equity investments in operational wind farms can offer a compelling opportunity for investors seeking long-term, inflation-linked returns and the GIB is now seeking a suitable group of strategic, long-term co-investors to participate in this innovative capital raising exercise.
- 14.45 The government is also encouraging greater involvement of institutional investors in UK infrastructure.
- 14.46 The government set up the **Insurers' Infrastructure Investment Forum** to give members of the Association of British Insurers (ABI) a direct communication link to government, exploring ways to maximise opportunities for insurance fund managers to invest in UK infrastructure debt instruments via the capital markets. In December 2013, and as a result of the new certainty over Solvency II, six insurers – Aviva, Friends Life, Legal & General, Prudential, Scottish Widows and Standard Life – said they will work alongside partners with the aim of delivering £25 billion of investment in UK infrastructure in the next five years.

- 14.47 As part of the **PF2 Priority Schools Building Programme** the Education Funding Agency (EFA) has developed and procured an innovative senior debt finance vehicle which will fund all five batches of schools under the programme. One of the key features of the **debt aggregator** is the ability to aggregate total financing requirements across all of the batches but without common ownership of equity at the project level. By aggregating the funding requirements, the EFA has been able to access cheaper sources of finance, and streamline its procurement by using standardised finance documents for each batch of schools. EFA has now signed a Funding Procurement Agreement with the aggregator which is a wholly owned subsidiary of International Public Partnerships Limited, with services provided by Amber Infrastructure Limited, and senior funding provided by Aviva and the European Investment Bank. PF2 is a public private partnership model that is used primarily for social infrastructure projects and where government invests equity alongside the private sector to promote closer partnership working.
- 14.48 The **Pensions Infrastructure Platform (PiP)** was announced in 2011 to help make infrastructure investment more accessible to UK pension schemes. HM Treasury signed a memorandum of understanding with the National Association of Pension Funds (NAPF) and the Pension Protection Fund (PPF) to assume an advisory role in establishing the PiP. In February this year, the PPP Equity PIP LP fund was launched. This first PIP fund invests in UK PPP/PFI project equity and is being managed by Dalmore Capital. It has a hard cap of £600 million and currently has commitments of £348 million. Two thirds of this has already been invested into 41 separate projects. In September, PiP appointed its first Chief Executive to accelerate development of the organisation and to promote it to all UK pension schemes. Additional investment funds and co-investment opportunities are being worked on with the support of the PiP's UK Founding Investor pension schemes. PiP retains its original £2 billion target for investment into UK infrastructure by UK pension schemes.
- 14.49 At the European level, the **European Investment Bank (EIB)** is another source of finance for infrastructure projects in the UK. In recent years the EIB has significantly increased its support for long-term investment across a range of sectors in the UK. Record lending last year provided nearly £5 billion for investment in water and energy infrastructure, support for improved rail and port facilities, loans to support new hospitals, housing and development of higher and further education across the country. The EIB has just agreed its largest ever single loan for any project in Europe, £1.5 billion for investment in energy infrastructure by National Grid. The National Grid loan is for a range of capital investments, including the Western Link and London Power tunnels, as well as upgrading transmission infrastructure across the country. Under the EU's recently announced Investment Plan for Europe, further work is underway to use EU resources and institutions to facilitate €315 billion of investment across Member States. The infrastructure pipeline has enabled the UK to be on the front foot in proposing up to £60 billion of investment that could be eligible for support from the proposed €315 billion EU Investment Plan. The UK's approach of producing a clear, rigorous pipeline across all infrastructure sectors is seen as an exemplar for other EU countries looking to identify planned investment and engage the private sector.

# Chapter 15:

## Planning, performance and delivery

### Box 15.A: Announcements on planning, performance and delivery

- **Compulsory Purchase Reforms** – proposals will be published for consultation at Budget 2015 to make processes clearer, faster and fairer, with the aim of bringing forward more brownfield land for development
- **National Transport Policy** – the government plans to lay the National Networks National Policy Statement before Parliament this month for consideration and a formal vote
- **Establishing the principle of development** – the government will take forward measures to ensure that the principle of development need only be established once
- **Section 106 negotiations** – the government will take steps to speed up section 106 negotiations, to reduce delays to the planning process
- **Speed of decisions (DCLG)** – the government will keep the speed of major decisions under review, with minimum performance thresholds increasing to 50% of major decisions made on time as performance improves

15.1 Since 2010 Infrastructure UK has worked closely with other government departments and agencies, the construction industry, regulators, clients and promoters of projects to drive improved infrastructure delivery and performance across both the public and private sectors. Its focus now is to build on this success, and the success of major projects like the Olympics and Crossrail, in addressing the next phase of delivery challenges.

### Improving government client-side capability

15.2 Since 2010, the government has successfully transformed its approach to planning, tracking and delivering its infrastructure programme. This includes:

- using the NIP as a tool for driving delivery of the government's infrastructure agenda, including through the development of a clear set of priority investments (the 'Top 40') with a strong link to the government's overall strategy and objectives in those sectors
- establishing a new Major Infrastructure Tracking (MIT) team within Infrastructure UK to professionalise its approach to programme managing delivery of the government's infrastructure priorities; this includes a more robust and reliable pipeline and much improved monitoring of delivery progress and risks across the different infrastructure sectors, and an enhanced ability to identify where strategic interventions may be required

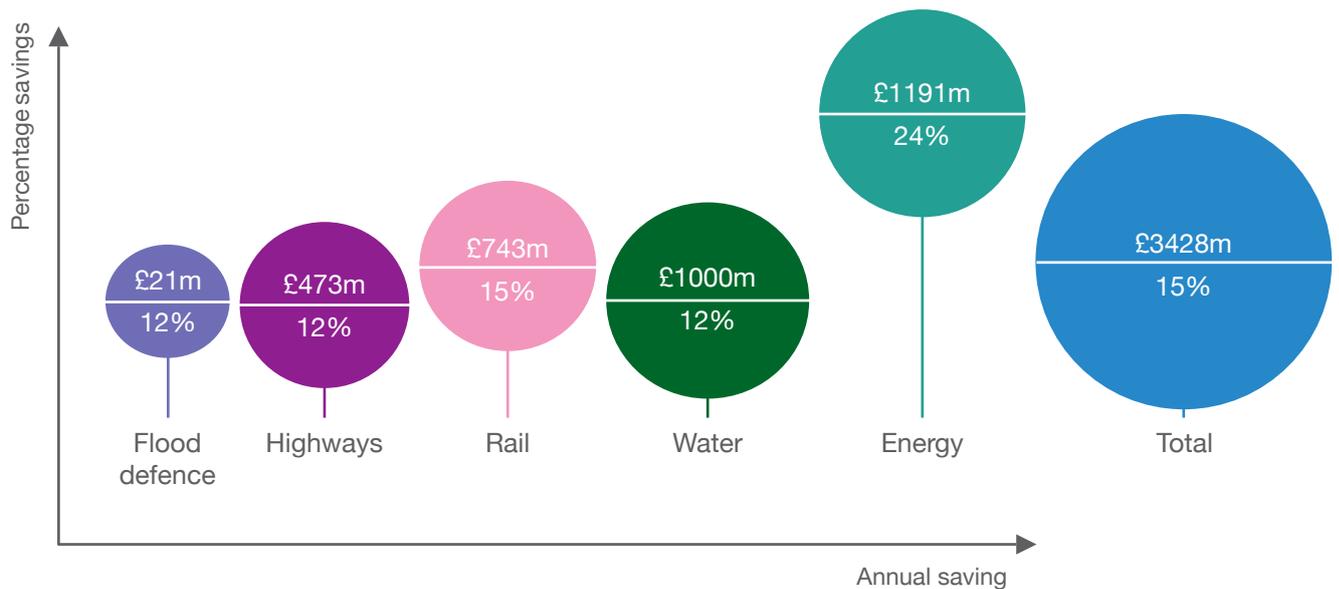

- deploying commercial specialists from IUK alongside government departments to help secure the contractual arrangements for delivery of critical infrastructure projects, including: Mersey Gateway Bridge, the Northern Line Extension to Battersea, rural broadband, Thames Estuary (phase 1), and ongoing negotiations for Hinkley Point C, Thames Tideway Tunnel, Ebbsfleet Garden City and High Speed Two
- creating a dedicated Cabinet Committee for infrastructure, chaired by the Chief Secretary to the Treasury and including Ministers from all the key infrastructure Departments, which oversees progress on the infrastructure programme and agrees early actions to address any obstacles to delivery
- utilising the expertise of key industry stakeholders to help deliver the NIP through the creation of the National Infrastructure Plan Strategic Engagement Forum (NIPSEF); through NIPSEF, the government has developed a strategic dialogue with the finance, asset owner, supply chain and business communities, allowing it to understand industry views, take advice on barriers to delivery and better communicate actions the government is taking
- improving the commercial capability of key infrastructure departments (DFT, DECC, DEFRA and DCMS), through Lord Deighton's work on Infrastructure Capacity Plans and the introduction of a new presumption that significant economic infrastructure projects and programmes should be supported by specialist delivery units with the appropriate commercial expertise

15.3 The government will continue to embed these changes, and ensuring that the right capability and systems are in place for successful delivery will remain a key focus at all levels of government.

## Working with industry to reduce costs and drive performance

### Progress to date

- 15.4 In 2010, Infrastructure UK launched the Infrastructure Cost Review, an investigation into the drivers of higher costs and poor delivery outcomes in the UK. The investigation led to a three-year joint programme with industry to improve infrastructure delivery in the UK. The programme sought to improve pipeline certainty, promote collaborative behaviours and innovation and reduce the costs of delivery by around 15%.
- 15.5 Working with the Infrastructure Client Group (ICG), a group of leading clients from across sectors, the programme has reported annual savings of over £3 billion (as set out in Chart 15.A) and set in place a number of improvements that are helping to improve delivery of our key infrastructure projects.
- 15.6 In 2011, the government published the first infrastructure investment pipeline, setting out in one place the investment plans of infrastructure clients from the public, private and regulated sectors, providing a holistic view of the demand for infrastructure investment across sectors and regions. This allows industry to match their business planning with projections of future demand, enabling industry to invest strategically for the market, rather than simply tactically for a project. The breadth and depth of the pipeline, which is now published twice annually, has increased year-on-year and the government is committed to improving its utility to industry.

**Chart 15.A: Savings as measured in the Cost Review**

Source: HM Treasury

15.7 The Cost Review<sup>1</sup> was one of a number of studies to identify the need for a greater focus on the early stages of projects to ensure that they are set up to succeed. The government has worked with industry to develop a “Project Initiation Routemap”. It provides a framework to help identify and address many common and recurring problems during the early stages of projects. Following an industry-wide consultation in 2013, the government published in July 2014 a refreshed and improved version of the Routemap tools and modules.

15.8 Eleven Routemap assessments have been undertaken for nine different clients in five sectors, helping to support successful project delivery on major infrastructure projects worth over £60 billion.

“Using the Routemap is like holding a mirror up to yourself. It helps you to understand the environment you have and create the one you need”

Andy Mitchell, CEO Thames Tideway Tunnel

15.9 The Cost Review study also set out opportunities to improve procurement outcomes through earlier engagement with supply chains and a more collaborative approach. In October 2014 new guidance was published through the ICG providing support to those wishing to use more collaborative supply chain engagement through alliancing.

15.10 As a result of increasing levels of investment in infrastructure across the public, private and regulated sectors, there is a growing pressure on input costs and demand for skilled workers.

15.11 The Construction Skills Network forecasts overall construction employment rising from 2.54 million in 2014 to 2.73 million in 2019. At the same time, a high proportion of those currently employed in key sectors of the industry will soon retire.<sup>2</sup> These factors suggest that, without appropriate action, the industry could face a skills shortage.

<sup>1</sup> Infrastructure UK Cost Review Report, HM Treasury, 2010

<sup>2</sup> In the power sector, an estimated 50% of current employees are set to leave the sector by 2023, and in rail, 20% of the workforce is over 55

15.12 The government and industry are undertaking a number of initiatives to address skills supply issues that are already well evidenced. These include:

- EngTechNow scheme, aiming to increase “Engineering Technician” professional registrations
- support through BIS competitive funds and the National Colleges programme to develop skills capacity
- £30m fund established by BIS which seeks to increase the supply of engineers, especially female engineers
- individual client led programmes and Joint Ventures – mainly specialist colleges such as the Tunnelling Academy and similar initiatives in highways, power, and flood defence

15.13 The Infrastructure Carbon Review<sup>3</sup> recognised the potential benefits of considering whole life carbon as a driver of lower lifetime costs. The government, infrastructure clients, and suppliers have agreed to incorporate carbon reduction objectives within their infrastructure projects and programmes by 2016. The government will also work alongside the Green Construction Board to develop a new carbon standard.

### Key actions to 2020

15.14 Feedback from industry – both clients and suppliers – suggests that there are further opportunities for improvement. The next stage of the Infrastructure Cost programme was launched in October 2014. The refreshed programme embeds further government’s partnership with industry through the Infrastructure Client Group and will focus on the following areas:

- **improving pipeline visibility and certainty:** the pipeline will only maximise its effectiveness if it gives the supply chain the confidence to invest; the government will continue to develop the pipeline and how it is used to monitor performance, and will work with delivery bodies and clients to ensure that the investment pipeline flows through to the supply chain in work packages; it will also continue to promote the development of more granular local pipelines and delivery plans such as those already being developed in the North West, West Midlands and London
- **whole life planning and cost control:** the roads and flood defence programmes are already building on the benefits of long-term funding, by adopting best practice from private and regulated sectors; IUK will continue to work with departments and industry to support the adoption of improved asset management and whole-life principles alongside the ongoing ICG work on carbon reduction, risk management and standards
- **improving project initiation:** the government will continue to extend the implementation of the Routemap across the Top 40 projects and will incorporate it into the Major Project Authority’s assurance and approval processes; it will also make it a tool available to LEPs in implementing their Strategic Economic Plans
- **improving procurement:** building on work of the Infrastructure Alliancing Group, an overarching set of objectives and principles is being developed to drive smarter, faster and more effective risk allocation in procurements; these objectives will be underpinned by measures to embed alliancing best practice and collaborative working; consideration will also be given to how procurement can be used appropriately to encourage

<sup>3</sup> Infrastructure Carbon Review, HM Treasury, November 2013

investment in innovation and skills and to developing a standardised approach to measuring and sharing information on supplier performance

- **supply chain productivity and skills:** the government is investing to deliver the key skills required to meet the requirements of the infrastructure pipeline and improve delivery productivity; the government will shortly set out more details around the National Colleges programme which will create high status technical training institutions, targeting critical skills gaps; the government has announced its intention to create a National College for High Speed Rail, a college for onshore oil and gas to support the Shale industry and a National Nuclear College; further national colleges are expected to be forthcoming in response to the recent call for engagement; to support further action and coordination across the infrastructure sector and training providers, IUK is using the infrastructure pipeline to build a stronger evidence base of expected demand and the potential skills gaps; the result of this work will be published in spring 2015

15.15 The Infrastructure Cost programme will continue to be coordinated alongside the government's wider ambitions for the construction sector as set out in the Industrial Strategy for Construction, Construction 2025.

### **Box 15.B: Case Study: Rail skills**

The new academy for rail, jointly funded by the government and the rail industry, will give a new generation of young people the skills to succeed.

Opening in autumn 2015, the academy will boost the UK's expertise and skills level in rail engineering, plugging the skills gap that could otherwise become a barrier to growth. Thousands of young people will gain vital training in specialist traction and rolling stock and many others will learn the skills they need to respond to new technology in the UK rail industry.

The Department for Transport, the Department for Business, Innovation & Skills and the National Skills Academy for Rail Engineering have provided £3.5 million for the National Training Academy for Rail (NTAR), with industry partner Siemens contributing the rest.

## **Streamlining the planning and consenting systems**

15.16 Improving the efficiency and speed of the planning process, particularly for infrastructure delivery, is a crucial part of creating the right conditions for sustainable growth.

### **Progress to date**

15.17 The government has taken a number of steps to improve the planning system over this Parliament, including:

- introducing a presumption in favour of sustainable development in the National Planning Policy Framework
- establishing the Major Infrastructure Unit in the Planning Inspectorate to speed up the application process for major infrastructure projects
- establishing a new Planning Court to speed up the judicial review process
- radically streamlining planning policy and guidance
- making changes to the Nationally Significant Infrastructure Planning (NSIP) regime in response to a 2014 review:

- publishing a prospectus to help with the pre-application process, including arrangements for handling early advice provided to the Planning Inspectorate by developers
- improving training and practice to ensure greater consistency of examination hearings
- ensuring applications are published without delay, allowing more time to study documents without lengthening the overall timetable

15.18 These reforms are working. The NSIP regime has bedded in well and 97% of all applications have been approved, with all but one of the decisions made within the prescribed deadlines. The latest figures show that local planning authority approval rates are at a 10-year high, with authorities granting 350,000 permissions (including approvals for 230,000 new homes) in the year to June. 80% of local planning authorities now have at least a published Local Plan (compared to less than a third in 2010), and nearly 60% have an adopted plan in place.<sup>4</sup>

15.19 Early outcomes from the government's new Planning Court show a significant reduction in the time taken to deal with Judicial Review cases. The important early stage of deciding whether a case has the merit to proceed to a hearing has fallen by around 40% from 15 weeks (in the 12 months to April 2013) to 9 weeks (in the 12 months to September 2014). Furthermore, the time taken from lodging a claim to reaching a decision at a final hearing has fallen by around 30% from 54 weeks (in the 12 months to April 2013) to 39 weeks (in the 12 months to September 2014).<sup>5</sup>

### Key actions to 2020

15.20 The Government believes that the compulsory purchase regime would benefit from streamlining and updating. Proposals will be published for consultation at Budget 2015 to make processes clearer, faster and fairer, with the aim of bringing forward more brownfield land for development.

15.21 The government is also continuing to make practical improvements to the Nationally Significant Infrastructure Planning regime and will take forward work to:

- bring more non-planning consents into the Development Consent Order regime, starting with three consents covering water discharge and trade effluent during this Parliament; the European Protected Species licence will be brought into the regime early in the new Parliament, once a legislative vehicle is identified, in a way that ensures robust decision making; the government is currently working towards bringing flood defence consents into the environmental permitting framework next year, followed by water abstraction and impoundment licenses as soon as possible after that.
- consult on options in 2015 for combining the two-stage process of making written and relevant representations into a single longer stage; this could make it easier for communities and others to engage with the regime and reduce the scope for duplication of effort
- create a more proportionate process for handling changes to Development Consent Orders, post consent, (through the Infrastructure Bill)

<sup>4</sup> Department for Communities and Local Government

<sup>5</sup> Ministry of Justice

- allow two inspectors for examinations instead of the current stipulation for one or three, which could save small schemes around £100,000 per application, (through the Infrastructure Bill)
- allow for the appointment of the Examining Authority as soon as an application has been accepted, to make process more efficient, (through the Infrastructure Bill)
- clarify guidance on the expectations for Preliminary Environmental Information and how to make changes to proposals during examinations
- lay the National Networks National Policy Statement before Parliament in December

15.22 The government will continue to improve the planning system for infrastructure outside of the NSIP regime. Autumn Statement 2013 announced a comprehensive package of measures to speed up planning decisions. This included ‘deemed discharge’ of planning conditions and reducing unnecessary statutory consultation, which have been taken forward through the Infrastructure Bill and new regulations.

15.23 Building on this progress, the government will take further measures to speed up the end-to-end planning process, including:

- taking forward measures to ensure that the principle of development need only be established once, to give greater certainty and allow locally-supported development to proceed more quickly
- taking steps to speed up section 106 negotiations, including revised guidance, consulting on a faster process for reaching agreement, and considering how timescales for agreement could be introduced, and improving transparency on the use of section 106 funds
- keeping the speed of decisions on major applications under review, with the minimum performance threshold increasing to 50% of major decisions on time as performance continues to improve

## Infrastructure interdependence, resilience and cross-sectoral working

15.24 The UK infrastructure system is a highly complex, interdependent set of networks and assets that rely on each other to work effectively. The government is working with academia, regulators and industry to develop a more strategic, coordinated and efficient approach to future infrastructure development and delivery, with the aim of saving costs and increasing value – ensuring that we get right what we build, as well as where and how we build it.

15.25 It is also vital that these assets are sufficiently resilient to absorb, adapt to or rapidly recover from a disruptive event whether that be adverse weather, terrorist or cyber-attacks, industrial action or simply degradation over time. Across the UK, some elements of our national infrastructure are designated by government as Critical National Infrastructure (CNI). The concept of CNI exists to enable government, regulators, and industry to prioritise efforts to harden and protect assets essential to daily life, to ensure continuity of service to the public. With an agreed and prioritised list of assets, resources can be deployed as effectively as possible to protect the infrastructure that is deemed most critical. Protecting the UK’s CNI relies upon close co-operation and collaboration between industry and government.

15.26 Departments responsible for CNI have submitted their Sector Resilience Plans (SRPs) to the Cabinet Office. A summary of the SRPs setting out the current level of resilience to risks of UK infrastructure was published in November.<sup>6</sup>

### Progress since 2010

15.27 The UK Regulators Network (UKRN) was formed in March 2014 with the purpose of ensuring effective cooperation between sectors. It will explain and take account of the differences between sectors, while maximising coherence and shared approaches in the interests of consumers and the economy. The UKRN's work programme consists of 8 projects and 6 objectives, including specific workstreams on efficient multi-sector infrastructure investment projects, affordability and cross sector resilience<sup>7</sup>.

15.28 The government initiated the development of a new methodology to assist with the planning and management of interdependencies. The Interdependency Planning and Management Framework (IPMF)<sup>8</sup>, published in November, enables the identification and appraisal of cross-sectoral delivery benefits and facilitates engagement between stakeholders. It was developed in a joint research programme between the University of Bristol and University College London.

15.29 The IPMF is currently being incorporated into Green Book supplementary guidance on valuing infrastructure spend, which is due to be available in early 2015. This work will ensure that interdependencies can be properly identified, valued and the associated impacts realised from the inception of major government-funded infrastructure investments.

15.30 The government is taking advantage of opportunities for synchronised or co-located investment to 'future-proof' our networks and systems. This is considerably cheaper and less disruptive overall in the long term than creating new networks separately at a later date. For example, the HS2 Hybrid Bill includes clauses allowing the inclusion of telecommunications equipment in the future along the route of HS2 Phase One (from London to Birmingham) based on evidence of a projected increase in data capacity requirements. The proposal to allow other types of infrastructure to use the route has also been incorporated into the consultation document for HS2 Phase Two.

15.31 The understanding of interdependence is also being improved by two multi-disciplinary research centres (iBUILD<sup>9</sup> and the International Centre for Infrastructure Futures<sup>10</sup>). These were launched in 2013 to investigate innovative infrastructure business models, and bring together expertise in fields such as economics, engineering and social sciences.

### Key actions to 2020

15.32 The government has recently held a consultation on whether further measures would support and embed the work of the UKRN, and will respond in due course. The UKRN will also publish further reports as part of its work programme, including work on cross-sectoral resilience.

<sup>6</sup> [www.gov.uk/government/publications/sector-resilience-plan-2014](http://www.gov.uk/government/publications/sector-resilience-plan-2014)

<sup>9</sup> <https://research.ncl.ac.uk/ibuild/>

<sup>10</sup> <http://www.icif.ac.uk/index.html>

- 15.33 Organisations across government and the regulated sectors have been working together to investigate how utility connections can be achieved more effectively, to help the development of housing and economic activity. This work covers the co-ordination of new connections and improving the understanding of capacity requirements going forwards. In December, the government will produce a document which will provide a single point of reference for developers on the most up to date roles, responsibilities and expectations of different parties involved in the process of delivering utilities connections.
- 15.34 IUK will explore the technical, commercial and legislative feasibility of using the fibre cabling that supports wind farms for commercial communications services including broadband for rural communities.

#### **Box 15.C: Case Study: Flood defences: resilience and cross-sectoral working**

Coastal flood defences can bring combined benefits of greater resilience and economic growth across a number of sectors. As an example, Mounts Bay in Penzance is currently considering how best it can address the risk of coastal flooding for its community. A breakwater could strengthen flood defences, but also bring much wider benefits such as enabling more local and visiting boats to safely harbour, protecting vulnerable local infrastructure and attracting possible private investment in a marina. Working alongside Cornwall Council and Penzance Town Council, government has now made funding available for a study to appraise the best options going forward. The results will have impact across the community and help this area grow and thrive.

Multiple organisations will also have a role to play in a 20 year action plan to reduce the risk of flooding in Somerset. The plan, developed in March 2014, contains key objectives which go beyond simply reducing the frequency, depth and duration of flooding. It also includes maintaining access for communities and businesses, ensuring strategic transport connectivity, and promoting business confidence and local resilience. Immediate delivery of the Action Plan is being overseen by an Implementation Group, led by Somerset County Council and also consisting of local and national partners. Central government is supporting the delivery of the plan with a £20.5 million contribution, announced in March 2014.

# Chapter 16:

## Top 40 priority infrastructure investments

### Introduction

- 16.1 To support delivery of its objectives in each sector, since 2011 the government has set out its 'Top 40 priority infrastructure investments'. This allows the government to focus on the delivery of those investments which either make the most significant contribution towards achieving a particular objective or carry the most risk should they fail, both strategically and in value for money terms.
- 16.2 As set out in the previous chapter, the government monitors delivery against the Top 40 priority investments, and key projects and programmes within them, through the Major Infrastructure Tracking Unit within Infrastructure UK. A Cabinet Sub-Committee, chaired by the Chief Secretary to the Treasury, meets regularly to scrutinise progress and support as appropriate in tackling specific delivery challenges and cross-cutting issues.
- 16.3 The government has also identified other levers that it can use to support effective delivery of these priority investments. These include operating a presumption in favour of prequalification for the UK Guarantees Scheme for any project that is part of a 'Top 40' priority investment, subject to the Scheme's criteria. The government will also ensure that it gives regard to the 'Top 40' designation when considering applications for the Nationally Significant Infrastructure Planning Regime.

### Selection of Top 40 priority infrastructure investments

- 16.4 Given the scale of the government's infrastructure commitments, the Top 40 is necessarily diverse and spans both the public and private sectors, and includes projects both currently in construction and some which are still in the scoping stages, with delivery milestones stretching beyond 2020. The current full list of Top 40 priority infrastructure investments, including key projects and programmes, is set out in Table 16.1 at the end of this chapter.
- 16.5 Top 40 priority investments, are selected on the basis of three main criteria:
- potential contribution to economic growth
  - nationally significant investment that delivers substantial new or replacement infrastructure with enhanced quality, sustainability and capacity
  - projects that attract or unlock significant private investment

16.6 Priority investments are grouped by sector and are not listed in order of importance. Whilst some individual projects are large or significant enough to be included within the Top 40 in their own right, in many cases the priority investment will be a wider programme, with key projects from within that programme identified for closer scrutiny. Key projects are chosen based on one or more of the following criteria:

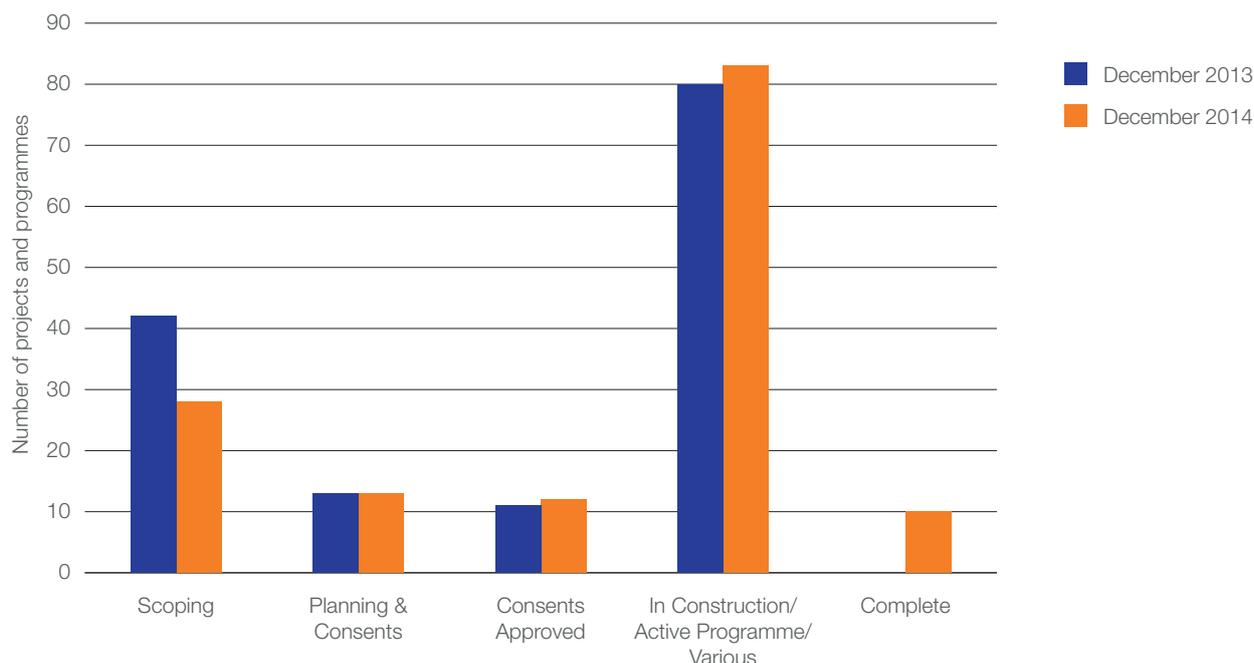

- Strategic importance (SI): project delivers a significant contribution towards an objective
- Capital value (CV): project of significant capital value
- Regional priority (RP): project of high strategic importance or capital value in a region
- Demonstrator (D): project is innovative or novel and could improve future delivery
- Unlocking investment (UI): project enables significant private sector investment

### **Progress on the government's Top 40 investments since NIP 2013**

16.7 Chart 16.A highlights progress on the government's Top 40 priority investments since NIP 13. It demonstrates that, with government support, key projects and programmes are moving from the early stages of delivery (scoping, planning and consents) into construction and completion.

16.8 The chart shows that a number of the key projects within the Top 40 priority investments highlighted in NIP 13 have been successfully delivered during the past year. These are listed below:

- M25 Junctions 5 to 6/7 and Junctions 23 to 27 (Smart Motorways)
- Network Rail Control Period 4 key projects: Southern Train Lengthening, West Coast Main Line and East Coast Main Line (Line Capacity Improvements)
- Peterborough and Reading stations (Major Station Improvements)
- Birmingham runway extension (Regional Airports)
- Heathrow and Gatwick Quinquennial 5 capital investment, including Heathrow Terminal 2 (South East Airports)
- National Composites Centre Expansion (Science and Innovation Catapults)
- Manchester Metrolink Extension (Local Authority Major Transport Schemes)

**Chart 16.A: Status of NIP 2013 Top 40 projects and programmes**

Source: HM Treasury, Major Infrastructure Tracking Unit

## Changes to the Top 40 since NIP 13

- 16.9 The Top 40 is not a static list, but is refreshed on an annual basis to reflect changes in project status and ensure that it continues to reflect the government's priorities in each infrastructure sector. This is essential if it is to remain an effective tool for monitoring and supporting progress in infrastructure delivery. The government particularly focuses on adding new projects that are at an early stage of development, as this is where it can often have most influence in driving progress.
- 16.10 To reflect the progress highlighted above, completed projects have now been removed from the list.
- 16.11 The government has also decided to remove two funding categories from the Top 40, containing three separate infrastructure funds; the Research Partnerships Investment Fund and Local Infrastructure Funding (Regional Growth Fund and Growing Places Fund). This decision reflects that the current phases of these funds have now been fully allocated to a large number of relatively small projects, which are not being delivered directly by central government.
- 16.12 In the rail sector, the government has reorganised the way it categorises investment by introducing a new Rail Investment Strategy priority investment (replacing the previous categories for Electrification, Line Capacity Improvements and Northern Connectivity). This is to better align with reporting structures and public understanding of how this investment is delivered. This includes a number of regional enhancements as key programmes, ensuring that the Great Western Programme, Northern Hub and East-West Rail, amongst others, continue to be effectively monitored and driven forward. A new priority investment, the European Rail Traffic Management System has also been added.

16.13 In the aviation sector the decision has been taken to move away from a geographic split (South East and Regional Airports) to priority investments which address objectives more directly (Airport Infrastructure Improvements and Airport Connectivity). Port Connectivity is also included in the latter category as this supports the government's overall strategic objectives in a similar way.

16.14 In the roads, flood defence and science sectors, the publication of new strategies and more detailed capital investment plans has inevitably required a considered reprioritisation of key projects. This means the A303/A30/A358 Corridor and A1 (North East) road programmes become priority investments in their own right given their significant capital value, strategic and regional importance. The Highways Agency New Capacity category has been renamed as Strategic Road Network Capacity. The A1 Leeming to Barton key project will now be monitored as part of the wider A1 priority investment.

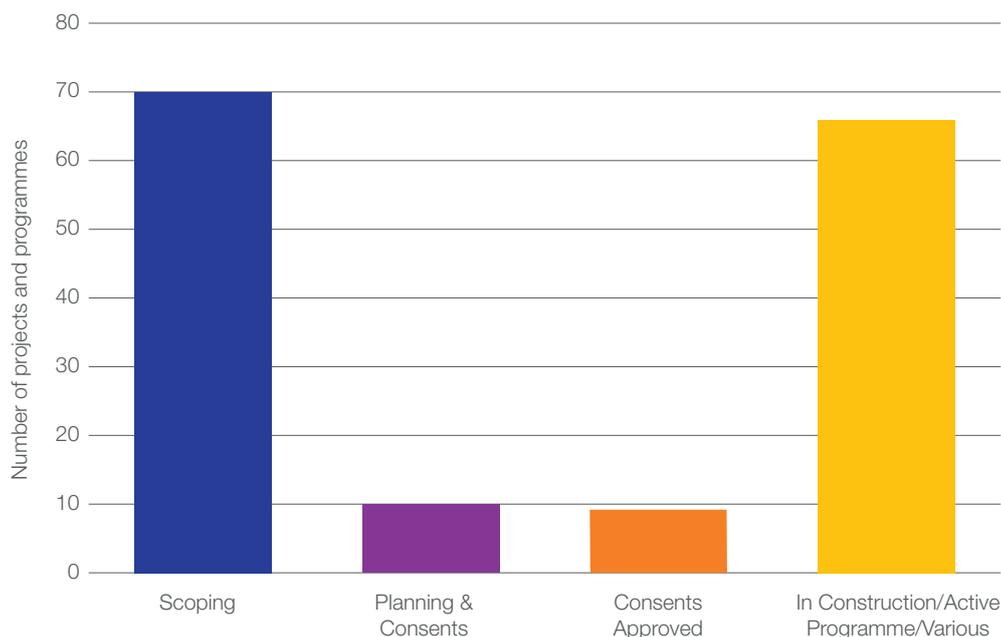

16.15 The government has identified six new flood defence key projects which were included in the Top 40 in NIP 13 combined will cost more than £700 million. Given that all nine flood growth schemes are expected to be under construction by the end of 2014-15, these will no longer be tracked as individual key projects but will still be monitored as part of the wider programme.

16.16 Similarly, the key projects in the Science Majors priority investment were selected based on the capital value of the investment at stake. Reflecting decisions taken since NIP 13, the government is introducing the new Polar Research Ship to its list of Science Majors. Further projects may be added in line with the priorities set out in the forthcoming Science and Innovation Strategy.

16.17 In the energy sector, the government's commitment to increase electricity interconnection is reflected in a new priority investment.

16.18 The delivery status of the new Top 40 is shown in Chart 16.B. As would be expected, there are a higher number of projects in the new Top 40 which are in scoping, reflecting the government's continuing commitment to supporting the development of new infrastructure projects and programmes, particularly in their early stages.

**Table 16.1: Full list of Top 40 priority infrastructure investments in NIP 2014 (including selection criteria)**

Priority investment	Key projects/programmes	Selection criteria
<b>Roads</b>		
1 Accelerated Roads	M3 Junctions 2 to 4a	D
	M6 Junctions 10a to 13	D
	M1 Junctions 28 to 31	D
	A160 / A180 Immingham	D
2 Strategic Road Network Capacity	M1 / M6 Junction 19 Improvement	CV
	A556 Knutsford to Bowdon	CV
	A453 Widening	CV
	A5-M1 Link Road	CV
	A2 Bean and Ebbsfleet	CV
3 Smart Motorways	Manchester Smart Motorways	CV
	M1 Junctions 39 to 42	CV
	M4 Junctions 3 to 12	CV
4 A14		SI CV RP UI
5 Lower Thames Crossing		SI RP UI
6 A303/A30/A358 Corridor		SI RP
7 A1 (North East)		SI RP
<b>Rail</b>		
8 Intercity Express Programme		SI CV
9 HS2		SI CV RP UI
10 European Rail Traffic Management System		SI
11 Strategic Rail Freight	Felixstowe to Nuneaton	SI
	Strategic Rail Freight Interchanges	SI UI
12 Crossrail		SI CV RP
13 Thameslink		SI CV RP
14 Rail Investment Strategy	North of England Programme (including Northern Hub)	SI CV RP
	Great Western Programme	CV RP
	South West Route Capacity Programme	CV RP
	Midland Main Line Programme	CV RP
	East-West Rail and Electric Spine	CV RP
	East Coast Main Line	CV RP
15 Major Stations	Manchester Victoria	SI RP
	Bristol Temple Meads	SI RP
	Birmingham New Street	SI RP

Priority investment		Key projects/programmes	Selection criteria
<b>International Gateways</b>			
16	Airport Infrastructure Improvements	Heathrow Q6	SI CV
		Gatwick Q6	SI CV
17	Port Capacity		SI
18	Airport / Port Connectivity	A6 to Manchester Airport Relief Road	SI CV RP
		M42 Junction 6	SI CV RP
		A5036 to Port of Liverpool	SI CV RP
<b>Local Transport</b>			
19	Transport for London	Sub-surface upgrade	CV RP
		Northern Line upgrade	CV RP
		Bank station upgrade	CV RP
		Victoria and Jubilee Lines (Phase 2)	CV RP
20	Northern Line Extension		CV RP UI
21	Mersey Gateway Bridge		CV RP UI
22	Local Transport Major Schemes	Heysham – M6 Link Road	RP
		Nottingham NET2	RP
		Leeds New Generation Transport	RP
		Norwich NDR	RP
		Sunderland Strategic Corridor	RP
		Kingskerswell Bypass (A380)	RP
		Croxley Rail Link	RP
		Midland Metro	RP
<b>Energy</b>			
23	Electricity Generation – Nuclear	Hinkley Point C	SI CV
		Wylfa Newydd	SI CV
		Moorside	SI CV
24	Electricity Generation – Gas (to 2020-21)		SI
25	Electricity Generation – Wind (to 2020-21)	Onshore	SI
		Offshore	SI CV
26	Electricity Generation – Other Renewables (to 2020-21)	Biomass	SI
		Solar PV	SI
		Marine	SI
27	Carbon Capture & Storage (CCS)	Peterhead CCS project	SI
		White Rose CCS project	SI
28	Electricity Interconnection		SI
29	Energy Transmission & Distribution	Western HVDC Link	SI CV
		Beaulieu-Denny 400kv Line	SI CV
		London Power Tunnels	SI CV

30	Oil & Gas Production	Shale Gas	SI
31	Smart Meters		SI CV

Priority investment	Key projects/programmes	Selection criteria
---------------------	-------------------------	--------------------

### Communications

32	Superfast Broadband		SI CV RP
33	Super-Connected Cities		SI CV RP
34	Mobile Infrastructure Project		SI RP
35	4G Rollout		SI RP

### Water

36	Water Supply & Sewerage (AMP6)		SI CV
37	Thames Tideway Tunnel		SI CV RP

### Flood Defence

38	Flood and Coastal Erosion Risk Management Programme	Lincshore	SI RP
		Thames Estuary Phase 1	SI CV RP D
		River Thames Scheme (Datchet to Teddington)	SI CV RP
		Boston Barrage/Barrier Works	SI RP
		Rossall Coastal Defence Improvement Scheme	SI RP
		Oxford – Western Conveyance	SI RP

### Science & Research

39	Science Majors	Francis Crick Institute	SI
		Polar Research Ship	SI
		Diamond Light Source Phase III	SI
		Pirbright Development Phase II	SI
40	Science & Innovation Catapults	Cell Therapy Manufacturing Centre	SI
		National Biologics Manufacturing Centre	SI

# The Commission

---

The National Infrastructure Commission was established in 2015 to provide independent, impartial advice on the UK's long term infrastructure needs.

As of July 2018, the Commission's members are:

**Sir John Armitt CBE (Chair)** published an independent review on long-term infrastructure planning in the UK in September 2013, which resulted in the National Infrastructure Commission. Sir John is chairman of the National Express Group and the City & Guilds Group and sits on the boards of the Berkeley Group and Expo 2020.

**Dame Kate Barker** sits on the boards of Taylor Wimpey plc and Man Group plc. She is also chair of trustees for the British Coal Staff Superannuation Scheme. She has previously served as an external member of the Bank of England's Monetary Policy Committee (2001-2010).

**Professor Sir Tim Besley CBE** is School Professor of Economics and Political Science and W. Arthur Lewis Professor of Development Economics at the LSE. He has previously served as an external member of the Bank of England Monetary Policy Committee (2006-2009).

**Professor David Fisk CB** is Emeritus Professor at the Centre for Systems Engineering and Innovation at Imperial College London. He has served as Chief Scientist across several Government departments including Environment and Transport, and as a member of the Gas and Electricity Markets Authority.

**Andy Green** holds several Chairman, Non-Executive Director and advisory roles, linked by his passion for how technology transforms business and people's daily lives. This includes chairing IG Group, a global leader in online trading and Digital Catapult, an initiative to help grow the UK digital economy.

**Professor Sadie Morgan** is a founding director of the Stirling Prize winning architecture practice dRMM. She is also chair of the Independent Design Panel for High Speed Two, is deputy chair of the Thames Estuary 2050 Growth Commission and a Mayor's design advocate for the Greater London Authority.

**Julia Prescott** is co founder and Chief Strategy Officer of Meridiam, and sits on the Executive Committee of Meridiam SAS. She has been involved in long term infrastructure development and investment in the UK, Europe, North America and Africa.

**Bridget Rosewell OBE** is a director, policy maker and economist. She has served as Chief Economic Adviser to the Greater London Authority (2002-2012) and worked extensively on infrastructure business cases. She is a director of Network Rail.

# Foreword

---

The infrastructure we have now, and the infrastructure we plan to build, will support and sustain us for decades to come. Our quality of life, and our success as an economy in the future, will depend on our infrastructure's ability to respond to future challenges. This will rely on decisions taken now.

Providing the right infrastructure for the future does not just entail delivering the running water, roads and rail that traditionally spring to mind, although these are important. The UK needs fast, reliable internet connections. It needs low cost energy and transport that doesn't harm the planet. It needs to make cities liveable for the growing urban population. It needs to reduce the plastic waste that can end up in our oceans. It needs water supply and flood defences that can respond to the risk of extreme floods and drought. All this needs to be done in a way that is well designed, and affordable for the government and the public.

Over the last 50 years, the UK has seen an endless cycle of delays, prevarication and uncertainty. These have been driven in part by short term considerations, and the lack of a cross-sectoral approach to infrastructure. This approach has limited growth, undermined job certainty, and restricted innovation. And too often the UK has ended up playing catch up. This will not do for the challenges ahead.

In the National Infrastructure Assessment, the first of its kind, the Commission has been able to look across infrastructure sectors, and come to independent conclusions based on the best available evidence. The Assessment sets out a clear, long term strategy for the UK's economic infrastructure from 2020 to 2050, providing long term clarity for industry and the supply chain.

The Commission's interim report, published in October 2017, identified three headline challenges for the UK's infrastructure: congestion, capacity and carbon. The Assessment's recommendations to government tackle congestion by prioritising devolved, stable, long-term funding for urban infrastructure in cities. The recommendations will improve the capacity of our water supply and digital infrastructure. And they will reduce our carbon emissions by leading the move to an energy system that is powered mainly by renewable energy sources such as solar and wind.

However, this is not all: the recommendations will also improve our quality of life by reducing air pollution, protecting our homes from floods, and making cities better places to live. The cost of driving will fall substantially if people can switch to electric vehicles. And they will help the environment by reducing waste that ends up in our landfills, incinerators and oceans.

Over the course of preparing this Assessment, the Commission has consulted and listened to the public, industry, academics, local and national government. Our analysis and proposals will not satisfy everyone. But the recommendations represent our considered view of how we can best create infrastructure which enables a fair, productive and green society for the whole country.

Ensuring that the Commission's recommendations can deliver the benefits we think they can, will require politicians across all parties to build a consensus. We welcome the funding guidelines that government has set for the Commission's recommendations, and have made our recommendations in line with it. We have also taken into account existing government commitments for road, rail and aviation, as well as all of our previous recommendations. We look forward to the government adopting our programme of recommendations as policy, and committing to invest in our infrastructure over the coming years.

I would like to take this opportunity to thank my fellow Commissioners and the excellent team at the Commission secretariat, in particular its Chief Economist, James Richardson, who has led the development of this Assessment from start to finish. I would also like to thank everyone who has contributed to our work over the last two years. We look forward to the response from government and the wider community.

**Sir John Armitt CBE**  
Chair, National Infrastructure Commission

# In brief

---

**The first National Infrastructure Assessment sets out the Commission's plan of action for the country's infrastructure over the next 10-30 years. Infrastructure can inspire confidence and growth. But long term projects require a long-term vision, lasting plans, and stable funding. The UK must take decisive action.**

The Commission's recommendations represent a significant programme of upgrades to the nation's infrastructure. But they are not an unaffordable wish list. They have been costed in line with the government's guideline for investment in infrastructure. And they are affordable for households and businesses.

The Commission was set up to address the lack of a long term infrastructure strategy, siloed decision making in infrastructure sectors, fragile political consensus and short termism. The Commission has addressed these issues by taking a long term, cross-sectoral approach, with in-depth analysis and wide consultation.

The government has committed to respond to the Commission's recommendations and to adopt agreed recommendations as government policy.

The recommendations set out a pathway for the UK's economic infrastructure:

- nationwide full fibre broadband by 2033
- half of the UK's power provided by renewables by 2030
- three quarters of plastic packaging recycled by 2030
- £43 billion of stable long term transport funding for regional cities
- preparing for 100 per cent electric vehicle sales by 2030
- ensuring resilience to extreme drought
- a national standard of flood resilience for all communities by 2050.

Alongside these, better design and more efficient funding and financing can save money, reduce risk, add value and create a legacy that looks good and works well.

**These recommendations will equip the UK with the infrastructure it most needs. The Commission will continue to work to build consensus. It will hold government to account for the implementation of its recommendations. And it will continue to work on the nation's most pressing infrastructure issues.**

# Executive summary

---

**The UK must take decisive action to have world leading infrastructure. Infrastructure can inspire confidence and growth. But long term projects require a long term vision, lasting plans, and stable funding.**

Too often, the delivery of the UK's major infrastructure projects has been slow and uncertain. Airport expansion in the south east is the best known, but not the only, example. The Mersey Gateway Bridge, which opened in October 2017, was proposed in 1994. Crossrail, due to open this year, was originally proposed in 1974. Consequently, much of the country's infrastructure has not kept pace with population growth, demand and advances in technology. The UK must stop running to stand still.

The National Infrastructure Commission was set up to address the problems with long term infrastructure planning in the UK. This first National Infrastructure Assessment builds on the analysis in the Commission's interim report, *Congestion, Capacity, Carbon: Priorities for national infrastructure*, to set out a long term vision for high quality, good value, sustainable economic infrastructure for the UK, and a clear plan to achieve it.

Its core proposals include:

- nationwide full fibre broadband by 2033
- half of the UK's power provided by renewables by 2030
- three quarters of plastic packaging recycled by 2030
- £43 billion of stable long term transport funding for regional cities
- preparing for 100 per cent electric vehicle sales by 2030
- ensuring resilience to extreme drought through additional supply and demand reduction
- a national standard of flood resilience for all communities by 2050.

It also highlights the most important future challenges. Heating must no longer be provided by natural gas, a fossil fuel. The UK must prepare for connected and autonomous vehicles. These need more time for evidence or technology to develop. The Assessment sets out the actions needed to enable robust decisions to be taken in future.

## The National Infrastructure Assessment

The Commission is required to carry out an overall assessment of the UK's infrastructure requirements once every 5 years. This is the first of those assessments. It covers all the key sectors of economic infrastructure, setting out recommendations for transport, energy, water and waste water, flood resilience, digital connectivity, and solid waste, from now until 2050. The Commission's remit also includes the potential interactions between its infrastructure recommendations and housing, but not housing supply in general. The Assessment is guided by the Commission's objectives to support sustainable economic growth across all regions of the UK, improve competitiveness and improve quality of life. More information can be found in the Commission's **framework document**.

### Thinking long term

By 2050, the UK's population and economy will have grown significantly. This will place substantial pressures on infrastructure. And meeting the challenge of climate change will require a transformation in energy, waste and transport by 2050. Even so, the effects of climate change will still be felt, with higher average temperatures and increased risk of drought and flooding. The UK's infrastructure will need to adapt to these pressures. The Assessment provides a long term strategy for how to do this. More information can be found in the Commission's four papers on **the environment and climate change, economic growth, population change and demography, and technological change**.

### How has the Commission come to these conclusions?

The strategies have been developed considering the responses to the Commission's consultation in **Congestion, Capacity, Carbon: Priorities for national infrastructure**, working closely with experts and other independent organisations, seeking diverse views across sectors and regions, asking the public for their views (via a social research programme), and through the Commission's own internal analysis and modelling. More information and consultants' reports can be found on the Commission's **website**.

### How much will this all cost?

Government has given the Commission a long term funding guideline for its recommendations (the 'fiscal remit'). Where infrastructure is funded by the private sector, and the costs of any recommendations will ultimately be met by consumers, the Commission is also required to provide a transparent assessment of the overall impact on bills. These are set out in Chapter 7. More information on the Commission's fiscal and economic remit can be found in the Commission's **remit letter**.

The Commission's recommendations represent a major long term programme of investment in the UK's infrastructure. The programme includes substantial funding for major schemes such as Crossrail 2 and Northern Powerhouse Rail, as well as to support the delivery of enhanced digital networks and flood protection. The Assessment has been made in the light of existing infrastructure plans and investment. However, this is not an unaffordable wish list, but has been carefully designed to be consistent with the government's long term funding guideline for public investment in infrastructure. Where infrastructure is funded by the private sector, a transparent assessment is provided of costs and savings for each recommendation to ensure that consumer costs are manageable and proportionate to the benefits the infrastructure provides.

The recommendations in this Assessment have all been guided by the objectives set for the Commission by government to: support sustainable economic growth across all regions of the UK; improve competitiveness; and improve quality of life. They have been designed to stand the test of time, and to be robust to a variety of scenarios. Together they comprise an ambitious plan to modernise and enhance the UK's economic infrastructure.

The Assessment's recommendations do not simply comprise a list of projects for the government to build; good infrastructure requires long term planning, stable funding structures and good design. The Commission has also been able to consider interdependencies between sectors: urban infrastructure planning needs to be integrated with housing; the energy system needs to be prepared for an increase in electric vehicle ownership; and digital connectivity on the roads could be necessary for connected and autonomous vehicles.

Further detail on the Commission's analysis is set out in the technical annexes published alongside this report, the Commission's interim report and background papers, and the 31 reports commissioned for the Assessment, available on the Commission's website. Annex C sets out a list of these supplementary documents.

Good infrastructure is essential to the country's future growth and prosperity. Infrastructure is a key pillar of the government's Industrial Strategy. Now is the time to deliver. This Assessment is the plan of action.

## **Building a digital society**

Data and digital connectivity will increasingly drive the country's economic growth, competitiveness, and quality of life. Digital communication makes it easier for customers and suppliers to find each other and exchange goods and services. In future, innovations such as artificial intelligence and the internet of things will bring new applications that rely on digital connectivity, from driverless cars to increased use of virtual reality. Some health services are already moving online, providing better access to specialist services, and reducing the need for patients to sit in waiting rooms where they risk further infection.

The UK already has a strong digital economy underpinned by an extensive broadband network. But the superfast broadband programme that delivered this is coming to an end. While current digital connectivity is enough for current needs, demand for data is rapidly increasing; superfast broadband may not be sufficient for the future.

The Commission's judgement is that the government should act now to deliver full fibre across the country; in the Commission's social research, 86 per cent of people agreed that all parts of the UK should have equal access to broadband. Full fibre broadband is the likely next step in digital connectivity. It is more reliable and cheaper to maintain than today's part copper, part fibre broadband connections. But it will take at least a decade to build nationally. Government needs to make a decision on full fibre now to avoid the risk of the UK being left behind in years to come. Full fibre will deliver benefits compared to current broadband even if the expected demand growth does not materialise. Enhanced digital connectivity will also facilitate the development of smart infrastructure: infrastructure with digital connections, enabling more efficient management and maintenance.

To encourage full fibre rollout, the government should put in place a national broadband plan by the end of 2018. Ofcom should provide certainty to commercial investors and encourage further private sector delivery of full fibre. With this certainty from government and Ofcom, most urban areas are likely to receive full fibre just through the promotion of market competition. However, full fibre will still need to be subsidised in some areas where commercial players are unlikely to deliver it. This should begin with the locations least likely to receive broadband commercially. With these plans in place, nationwide full fibre connectivity should be available no later than 2033.

## Low cost, low carbon

The UK can and should have low cost and low carbon electricity, heat and waste. Ten years ago, it seemed almost impossible that the UK would be able to be powered mainly by renewable energy in an affordable and reliable way. But there has been a quiet revolution going on in this area. There is ample scope to build on this success in years to come. Highly renewable, clean, and low cost energy and waste systems increasingly appear to be achievable.

Furthermore, such a system need not lead to higher bills. Today, consumers pay an average of £1,850 per year for the energy they use, including fuel and equipment for heating and hot water, electricity and transport fuel costs. The same services could be delivered at the same cost (in today's prices) in 2050 by a low carbon energy system. But this will only be possible if the right decisions are taken now.

Sustaining progress on reducing emissions requires government to show ambition. The crucial first step is to enable an increasing deployment of renewables. The Commission's modelling has shown that a highly renewable generation mix is a low cost option for the energy system. The cost would be comparable to building further nuclear power plants after Hinkley Point C, and cheaper than implementing carbon

capture and storage with the existing system. The electricity system should be running off at least 50 per cent renewable generation by 2030, as part of a transition to a highly renewable generation mix. Government should not agree support for more than one nuclear power station beyond Hinkley Point C before 2025.

But there are some changes that will need to be made to enable the increase in renewables. It will require increased system flexibility, in line with the recommendations in the Commission's *Smart Power* report. The Commission favours the use of existing market mechanisms – contracts for difference and the capacity market – where possible, to avoid creating more uncertainty, but incremental improvements could be made. All renewables should be able to compete; there is no longer a case for any bilateral deals, including for tidal.

Even with emissions almost eliminated from power generation, the UK cannot achieve its emissions targets while relying on natural gas, a fossil fuel, for heating. Delivering a low cost, low carbon heating system is the major outstanding challenge. But the electricity system represented just such a challenge ten years ago. There are actions that the UK can and should take now.

As a first step, improving the energy efficiency of the UK's buildings will mitigate some of the emissions from heat. In the meantime, the evidence base must be built up to make decisions on heat in future. The safety case for using hydrogen as a replacement for natural gas should be established, followed by trials for hydrogen at a community scale and alongside carbon capture and storage. At the same time, further data on the performance of heat pumps in the UK should be collected and used to support decisions.

In the waste sector, too, there are lower cost, lower carbon options especially for food waste and plastics. There is public support for greater recycling, but frustration with the complexity of the process.

It is cheaper to collect food waste separately and process it in anaerobic digesters, rather than send it to energy from waste plants (incinerators). Seventy nine per cent of people who do not currently use a food waste bin would be prepared to use one if it were provided by their local council. More plastics should be recycled, including by restricting the use of hard-to-recycle plastic packaging by 2025. Better packaging design, clearer labelling, fewer hard to recycle plastics, and tougher recycling targets (of 65 per cent of municipal waste and 75 per cent of plastic packaging by 2030) could all reduce residual waste and mitigate the need to build additional infrastructure.

## Revolutionising road transport

By 2050, road transport will be unrecognizable from today. Cars and vans will be electric, and increasingly autonomous. Electric, connected and autonomous vehicles will change the nature of the transport debate in the UK.

Electric vehicles are easier to drive, quieter and less polluting than conventional cars and will soon have the same range and be cheaper to buy and maintain. Once

this happens, their take up could increase rapidly. Given their benefits for the environment, this is something government should encourage. A key way to do this is by ensuring that charging an electric vehicle is as easy as refilling a conventional vehicle, or even easier.

The government needs to provide the right environment to support and encourage the switch to electric vehicles. To catalyse this, consumers need to feel confident that they can charge their electric vehicles en route across the country. A core network of fast or rapid chargers should be installed in visible locations across the UK. Government should subsidise charger installation where the private sector will not build them, starting in the locations least likely to be delivered commercially. However, the majority should be built by the private sector. Government should enable commercial investors to build charge points throughout the country, including by requiring local authorities to free up 5 per cent of their parking spaces for electric vehicle charge points by 2020, and 25 per cent by 2025.

The energy system will also need to be prepared for an increase in demand for electricity as the transition to electric vehicles gains traction. Whilst fast and rapid chargers will be needed to tackle range anxiety, most charging should be slow and smart. Done in the right way, using smart charging, electric vehicles can lower electricity system costs: the system will be able to operate closer to full capacity over the course of the day, as electric vehicles can charge primarily at night, increasing network efficiency. And with electric vehicles providing a source of flexible demand, the need for other kinds of flexibility such as battery storage or fossil fuels will be reduced.

In the longer term, connected and autonomous vehicles will bring even greater changes to the UK's roads. They will improve safety, and could allow more people to use personal transport and free up driving time for work or leisure. They may even encourage a shift towards increased vehicle sharing and reduced car ownership. Traffic lights and stop signs may become unnecessary, speed limits could be higher, and the use of road space could be automatically and constantly changing according to need. But, with road and rail projects lasting for decades, government needs to start taking the potential future impacts into account now as it makes investment plans.

A framework should be developed to assess potential impacts, even though these are inevitably uncertain. An initial framework should be put together before the next five year planning cycle for rail and major roads begins in the early 2020s.

## Transport and housing for thriving city regions

Cities can be great places to live, with excellent public transport systems, well-designed public spaces for leisure and social activities, and flourishing, well-connected businesses. They are also engines of economic growth. However, as urban populations increase, many cities are becoming full and congested, and this is inhibiting economic development and reducing quality of life.

The UK has a programme of major strategic transport projects in the pipeline, including a large programme to improve major roads, HS2 and Northern Powerhouse Rail. In planning for the next wave of major investment, attention must be turned to cities. The UK is unusual in that many of its large cities outside of the capital are less productive than the national average. Transport alone cannot drive growth, but the UK should make sure that urban transport enables it.

For all their benefits, neither electric nor connected and autonomous vehicles will solve the problems of urban transport; rather they are likely to increase the number of drivers on the roads. Government and cities need to act now to ensure that space in cities is used effectively, with room allocated for fast, frequent public transport systems, well-connected and affordable housing, and pleasant public spaces. This will require a new approach to governance, strategy and funding.

To deliver thriving cities, metro mayors and other city leaders should develop integrated strategies for transport, employment and housing. Housing and infrastructure should be planned together: new housing requires new infrastructure. These integrated strategies should be backed up by stable, substantial, devolved funding. And for the cities that face the most severe capacity constraints, and with the most potential for growth, there should be additional funding to support major upgrade programmes, which would be agreed between the cities and central government.

Development of regional cities should be in addition to, rather than instead of, continuing to invest in London, whose growth brings benefits across the UK. The Commission will continue to work with government and cities to develop the next wave of infrastructure upgrades across the country.

## Reducing the risks of drought and flooding

Climate change will continue to make extreme weather events such as floods and drought more likely in future years, and cities, towns and villages must be resilient. Decisive policy action is needed to mitigate these risks.

About 5 million properties in the UK are currently at risk of flooding. Protection from floods in the UK over the past years has too often been reactive rather than proactive. Ideally, no one should be exposed to flooding. Flooding has severe impacts on quality of life, particularly mental health.

A long term strategy for flood protection would allow a nationwide standard of resilience to flooding, with catchment based plans. These plans should evaluate the full range of options including traditional flood defences, 'green infrastructure' (whether natural flood management or sustainable drainage systems), individual property measures and spatial planning. In the Commission's social research, 59 per cent of people agreed that everyone should have the same standard of flood resilience, even though some properties cost more to protect.

The Commission believe that a national standard should be set for resilience to flooding with an annual likelihood of 0.5 per cent by 2050, where feasible. Over

longer time periods, higher standards might be achievable. Densely populated areas, where the consequences of flooding are potentially much more serious, should be resilient to flooding with a likelihood of only 0.1 per cent a year by 2050. The Environment Agency should update plans for all catchments and coastal cells in England before the end of 2023.

A reliable water supply is usually taken for granted in UK. But despite its reputation for rain, the country faces a real and growing risk of water shortages, especially in the south east of England. Action is needed to address these challenges, but conflicting incentives, limited cooperation between water companies and a short term focus mean that insufficient progress has been made. In the event of a serious drought, the nation faces an unacceptably high risk of severe supply limitations; homes and businesses could even be completely cut off.

The Commission has published a standalone report, *Preparing for a drier future: England's water infrastructure needs*, which sets out a twin-track approach to manage water supply and demand. The government, working with Ofwat and water companies, needs to ensure the capacity of the water supply system in England is increased to boost the country's resilience to drought whilst also managing demand and reducing leakage. This can be achieved through: delivering a national water transfer network and additional water supply (for example reservoirs or water re use) by the 2030s; and halving leakage by 2050, together with greater smart metering.

## Choosing and designing infrastructure

For government and relevant industries to take decisive action on their infrastructure projects, they need to have confidence that their decision making is as good as possible. Long term decisions inevitably carry risk, but these risks need to be taken, and uncertainty managed as much as possible. Decision making can be improved through robust analysis of the performance of existing infrastructure and recognising the value of good design in infrastructure.

Not everything can be reduced to numbers, but there should be an effective methodology to measure the quality of the UK's current infrastructure to reliably inform assessments of future needs. The assessment of the potential value of new projects could be more effective if there were better data on how past projects have performed. All government departments and agencies should therefore collect and publish costs and benefits estimates and outturns for major infrastructure projects. This would lead to increased scrutiny of costs and benefits estimates, improving quality.

Good design can save money, reduce risks, add value, deliver more projects on time and create infrastructure that looks good and works well for everyone. All nationally significant infrastructure projects should have a board level design champion, and use a design panel to maximise the value provided by the infrastructure. The Commission, advised by a national infrastructure design group, will publish a set of design principles to inform this.

## Funding and financing

While the Commission's recommendations comprise an ambitious programme of investment, this is not an unaffordable wish list. A crucial factor in the development of this Assessment has been the fiscal remit set by government. This provides a long term funding guideline for public investment in infrastructure of 1.0 to 1.2 per cent of GDP, including existing government funding commitments such as HS2.

Where infrastructure is funded by the private sector, and the costs of any recommendations will ultimately be met directly by consumers, the Commission has also provided a transparent assessment of the overall impact on bills. Where recommendations have net costs, the Commission believes that these are manageable and good value relative to the benefits the infrastructure provides.

The recommendations in this Assessment, and the implications for public expenditure and for bills, reflect the judgement of the Commission. In reaching its conclusions, the Commission has drawn on a wide range of evidence. Uncertainty is inevitable given the timescales for infrastructure investment, and so the Commission has also sought to understand how robust its decisions are to uncertainty, seeking solutions that will stand the test of time.

The recommendations are an affordable and deliverable strategy to modernise and strengthen the UK's infrastructure networks. Nevertheless, it is important that these recommendations are paid for at least cost. Part of this comes from improvements in design and delivery. Part comes from ensuring that infrastructure is financed in the best way possible.

These recommendations will require a combination of public and private financing. Financing itself is not in short supply. However, state financing institutions can help to encourage private investment and catalyse activity in new markets. The European Investment Bank does some of this, but there is a risk that access may be lost following the UK's exit from the EU. A UK infrastructure finance institution, focussed on specific objectives, should be established if access to the European Investment Bank ceases after the UK exits the EU.

There is also a need for a better understanding of the costs and benefits of private financing and traditional procurement in the delivery of publicly funded infrastructure. The Commission has developed an analytical framework to be used in the evaluation of the costs and benefits of financing options for new and existing projects, which will enable greater certainty about the costs and benefits of the use of private financing for public sector projects.

Over the Assessment's timeframe, changes to the way road users pay to use roads are inevitable. In particular, fuel duty revenues will continue to decline with the impending shift to electric vehicles. This presents a huge opportunity to design a system that improves on current road taxation by being fairer, more sustainable, more effective at reducing the negative impacts of driving, and attracting greater public support. For years, experts have proposed road pricing, only for it to be opposed by the public. The Commission intends to engage stakeholders and the

public on this topic to identify a new approach that works for the future of transport. Reforming how road use is paid for has been discussed for decades, but the issue is becoming more and more pressing and cannot be avoided forever.

Local funding mechanisms can help to ensure that local infrastructure is funded in a way that is fair, efficient and sufficient to meet local needs. The current system for gathering contributions from developers is complex, but raises more revenue than previous attempts. But the system could be improved still further. More funding mechanisms should also be made available to Local Authorities to enable them to capture a greater share of the uplift in land value that can occur with infrastructure investment. This should include making it easier to raise business rate supplements for up to one third of scheme costs, and giving local authorities powers to levy zonal precepts on council tax where public investments in infrastructure drive up surrounding property values.

## Next steps

The Commission has outlined an ambitious set of recommendations. As the first Assessment, it could never solve everything. The Commission has therefore focused on key priorities to equip the UK with the infrastructure it needs. These recommendations will enable the UK to have a thriving digital economy, a low cost, low carbon energy and waste network, clean air, successful cities, and resilience to extreme weather. But the Commission cannot achieve this alone. Government, regulators, industry, citizens and others will all need to contribute to making this vision a reality. Over the coming months, the Commission will work to build consensus around its recommendations.

Infrastructure delivery depends on the availability of the right skills, the approach to construction and project management, the depth of the supply base, and the capability of government and other infrastructure owners and operators to act as an intelligent client. These are the responsibility of the Infrastructure and Projects Authority which advises on infrastructure delivery. The UK's exit from the EU will impact the UK's skills base and supply chain. There should be a strategic approach to manage this.

As its initial next step, the government has committed to lay the Assessment before Parliament, and to respond to the Assessment within six months (with a final deadline of a year). Its response will set out which recommendations it has agreed to, any further work required to take forward the recommendations, and alternative proposals for any recommendations it has not agreed.

The Commission will monitor progress in delivering government endorsed recommendations, and will report on this in its Annual Monitoring Reports.

The second Assessment, expected around 2023, will build on the recommendations in this report, as well as covering new ground.

## Northern Ireland, Scotland and Wales

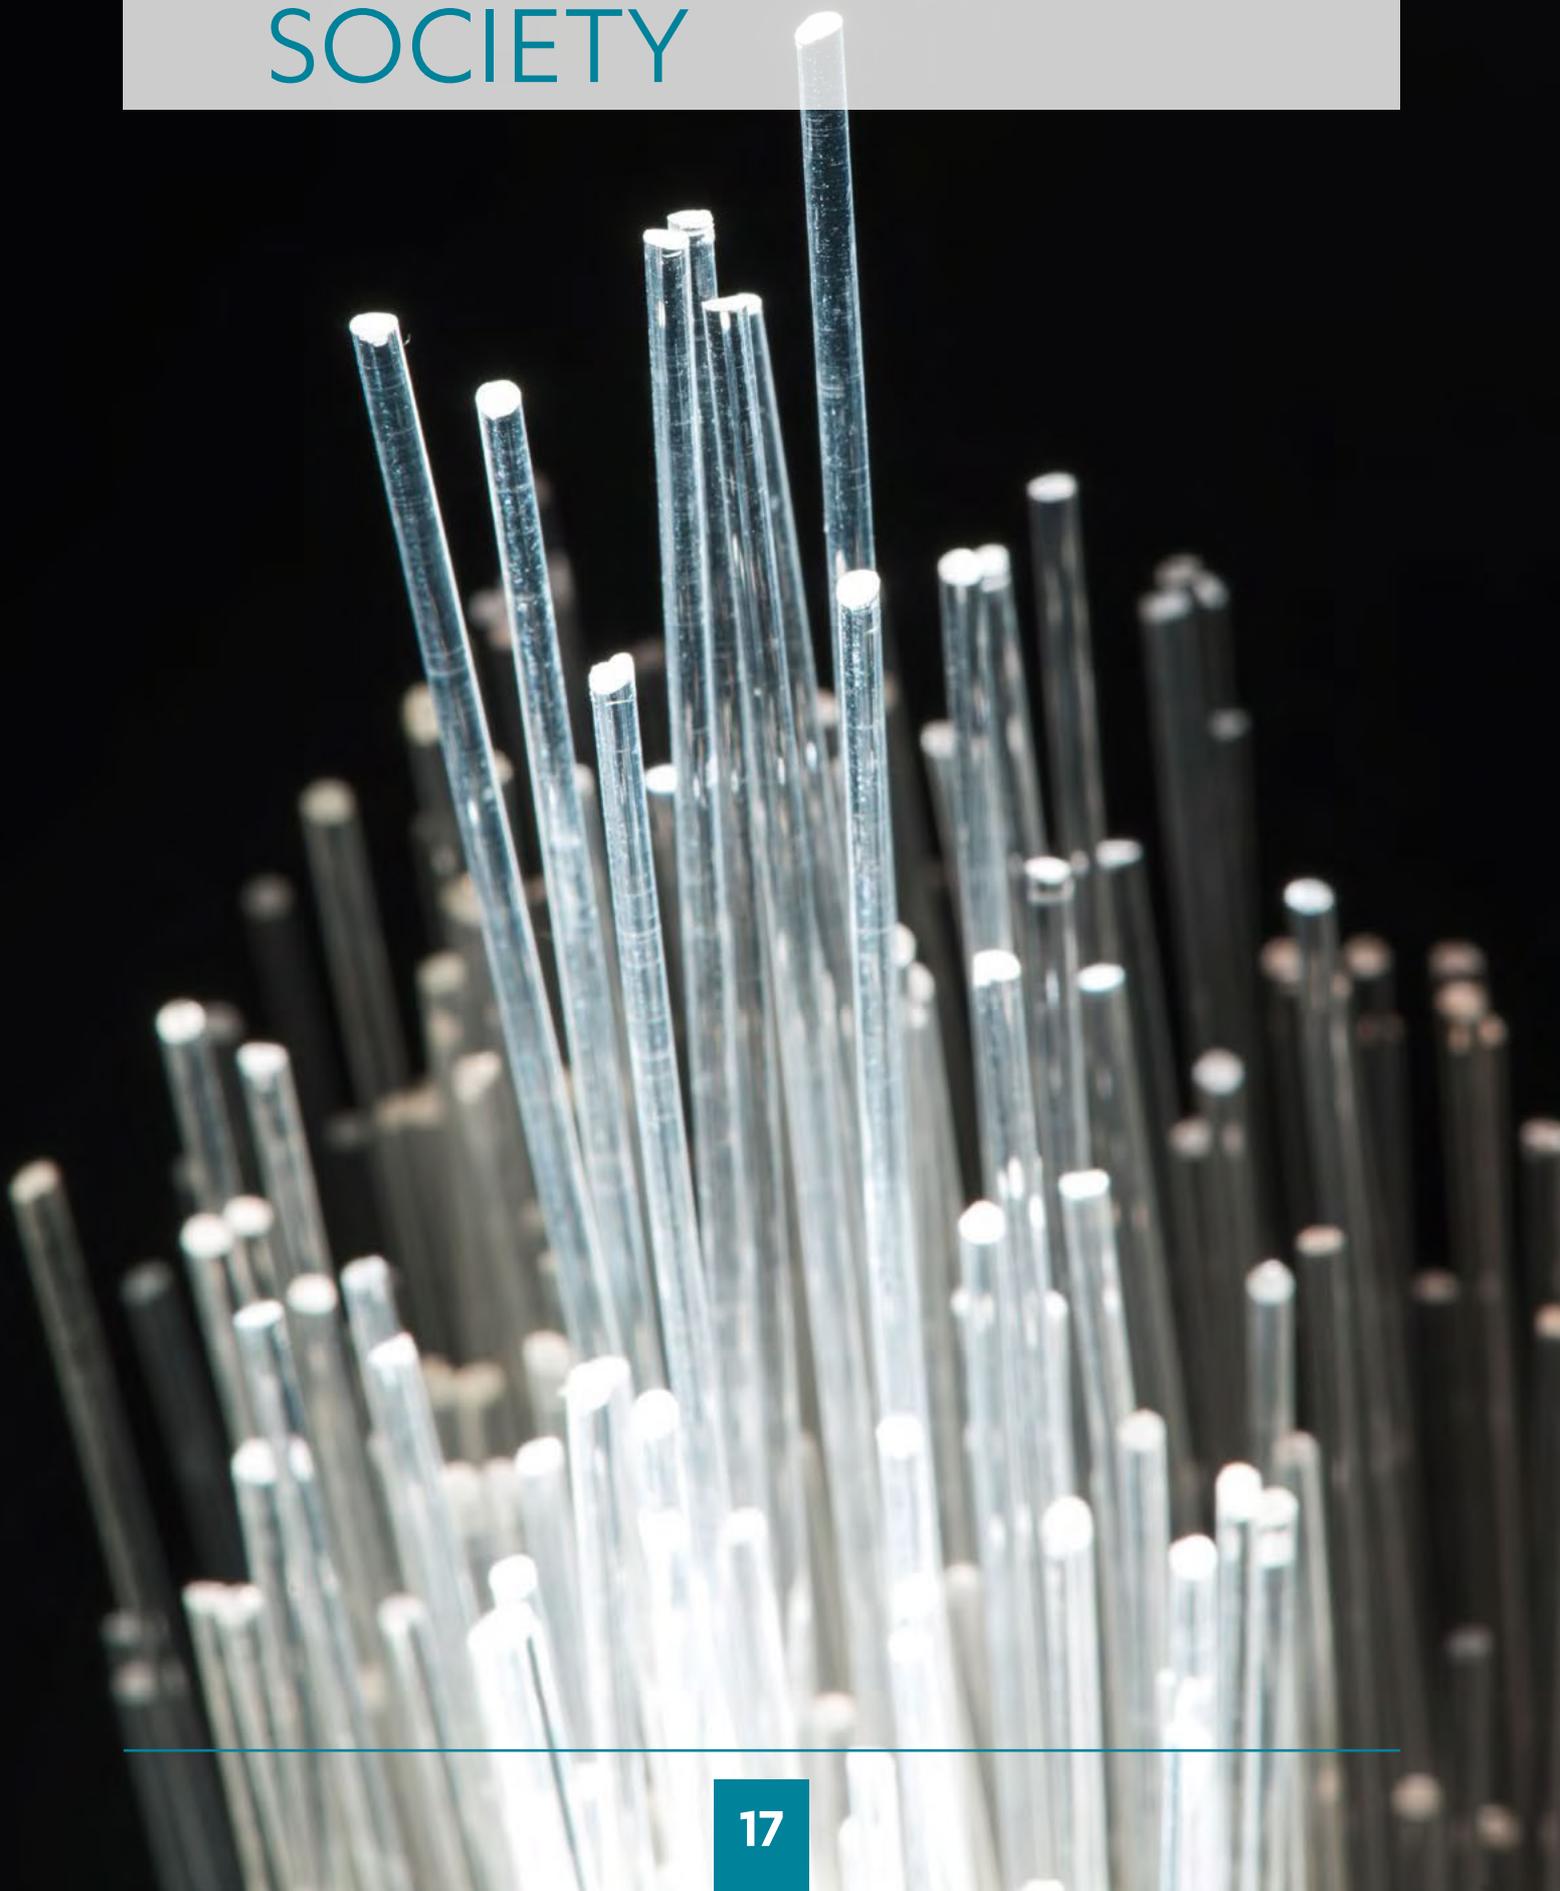

The Commission's remit covers six infrastructure sectors. As summarised in the table below, in four of six sectors covered by the Commission, there is substantial devolution to the devolved governments. Only energy in Great Britain and digital communications in the UK do not entail significant devolution.

The Commission's role is to advise the UK government. But the Commission works with both the UK government and the devolved administrations where responsibilities interact.

Sector covered by the Commission	Devolved administration responsibility		
	Scotland	Northern Ireland	Wales
<b>Transport</b>	Largely devolved	Devolved responsibility	Devolved, aside from rail
<b>Energy</b>	Not devolved, aside from energy efficiency	Devolved, aside from nuclear	Not devolved aside from energy efficiency
<b>Water and sewerage</b>	Devolved responsibility	Devolved responsibility	Devolved responsibility
<b>Flood risk</b>	Devolved responsibility	Devolved responsibility	Devolved responsibility
<b>Digital</b>	Not devolved	Not devolved	Not devolved
<b>Waste</b>	Devolved responsibility	Devolved responsibility	Devolved responsibility

**Table 1: Devolved administration responsibilities, by infrastructure sector**

# 1. BUILDING A DIGITAL SOCIETY

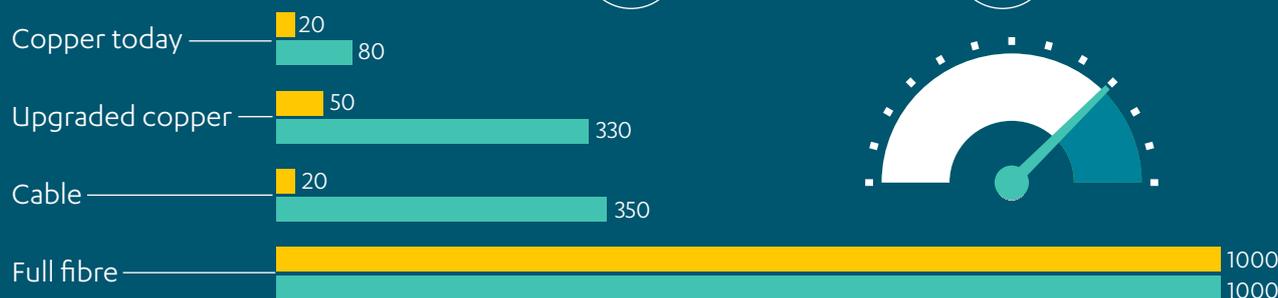

# A FULL FIBRE FUTURE

Digital services are increasingly important for growth, infrastructure, and quality of life.

The superfast broadband programme is coming to an end and full fibre is the next step

## Faster:

offering as much as 1,000 mbps

Upload speeds (mbps)

Download speeds (mbps)

## More reliable:

fibre has 5 times fewer faults than copper connections

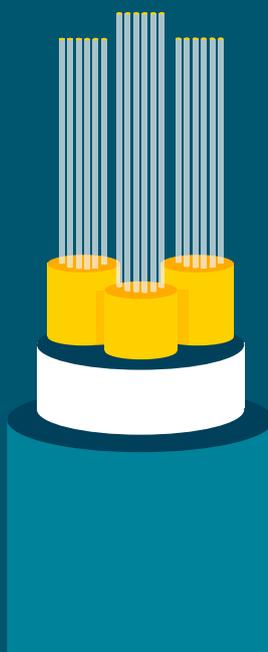

## Cheaper to run:

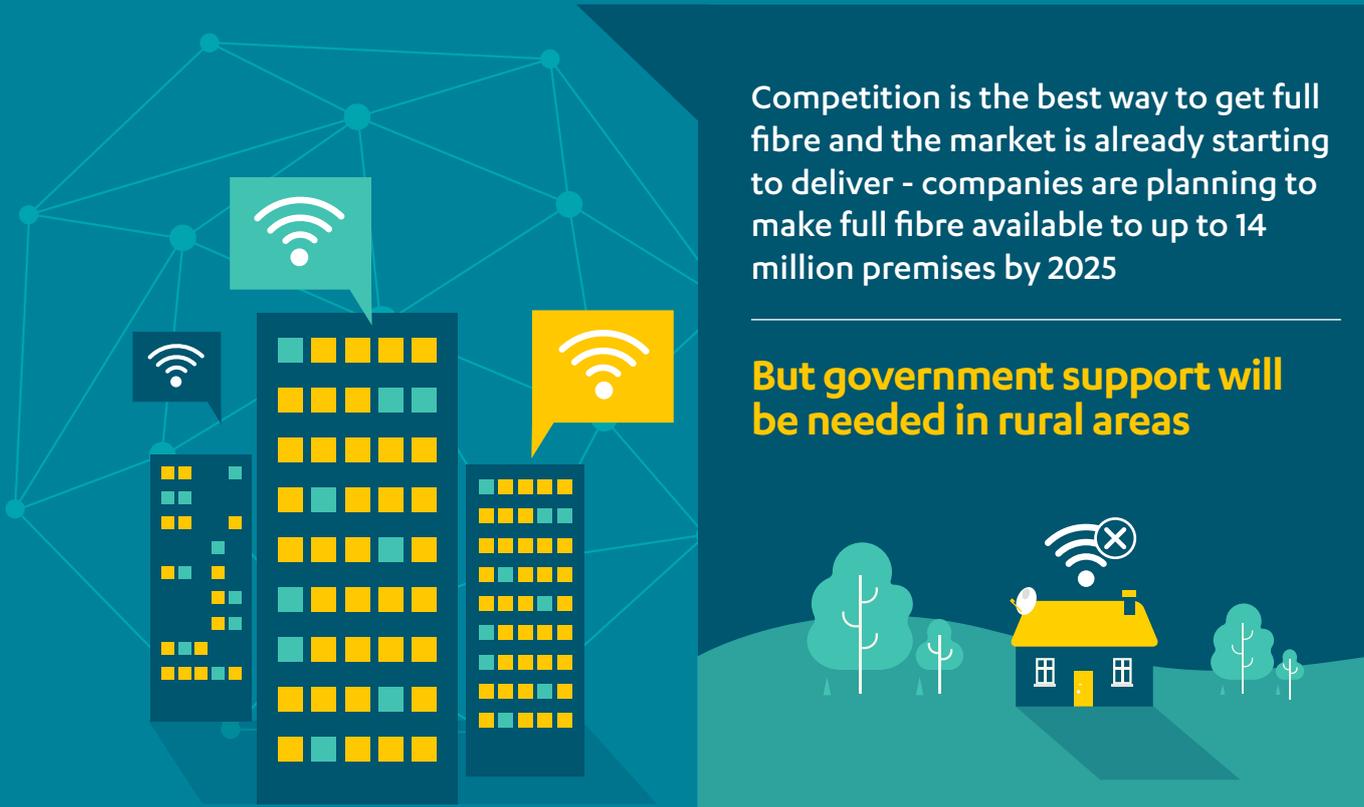

Fibre would save up to £5bn in operating costs over 30 years

The benefits will take time, as full fibre speeds are not yet needed, but delivery will take 10-20 years

## Investment must start now

to avoid being left behind

Competition is the best way to get full fibre and the market is already starting to deliver - companies are planning to make full fibre available to up to 14 million premises by 2025

**But government support will be needed in rural areas**

**THE COMMISSION RECOMMENDS:**

A government strategy to deliver nationwide full fibre by 2033

Ofcom should promote network competition to drive the commercial roll-out of full fibre

Government support in rural areas starting by 2020

Measures aimed at cutting the costs of delivery

Allow for copper switch off by 2025

Sources: DCMS, Ofcom, Prism and Tactis, Frontier Economics

**Digital connectivity is now an essential utility, as central to the UK's society and economy as electricity or water supply. Demand for data, and therefore the speed, reliability and capacity of broadband connections, is growing rapidly. Demand is likely to continue to increase as businesses, homes and infrastructure become smarter. So it is important that quality broadband is available throughout the country. Full fibre can provide this for the future.**

The UK already has a strong digital economy underpinned by an extensive superfast broadband network.<sup>1</sup> There is room for improvement on mobile coverage and rural connectivity but, in general, the UK's digital connectivity meets the needs of today's consumers.<sup>2</sup> The UK compares well internationally for superfast broadband availability, but trails behind other countries such as Spain and Sweden for full fibre availability.<sup>3</sup>

The UK must now prepare for the future. The superfast broadband programme is coming to an end, with 98 per cent of UK premises on track to receive superfast broadband.<sup>4</sup> A guaranteed minimum broadband service will be available to remaining premises by 2020 but provides only a basic service for today's needs.<sup>5</sup>

The Commission's judgement is that a national full fibre rollout programme should be put in place. This will provide fast, reliable broadband, improve connectivity in rural areas, and support 4G and 5G mobile coverage. However, it will take at least a decade to build.<sup>6</sup>

The successful delivery of full fibre will require:

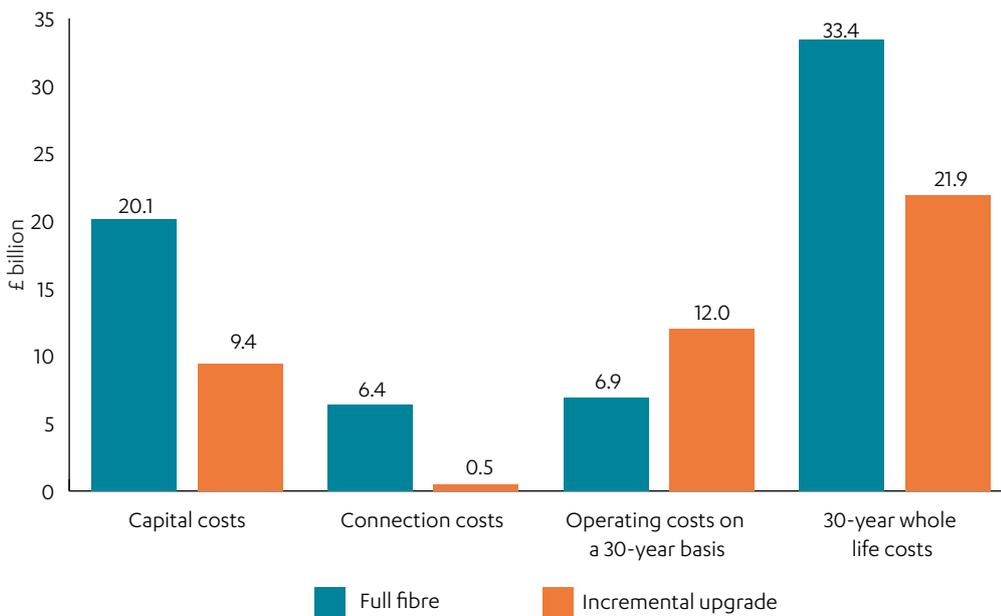

- a nationwide plan to deliver full fibre to all businesses and homes by 2033, with approaches tailored to the needs of different areas
- making the most of fibre deployment to support improved mobile coverage
- allowing for copper switch-off
- tackling the barriers that delay deployment and increase costs.

The Commission has previously examined the infrastructure needed to support 5G mobile in its report *Connected Future*<sup>7</sup> and the Assessment does not re-examine this. The Commission is also carrying out a review of economic regulation, which will report in spring 2019.

## Full fibre for the future

The UK faces a choice between continuing to upgrade the existing copper network, or replacing what is left of it with fibre optics. Full fibre, a connection without any copper, is the best available broadband technology on the horizon. It can provide consistent, gigabit speeds, which are less affected by rain and flooding, uses less energy, costs less to maintain and has no long term foreseeable capacity constraints.<sup>8,9,10,11</sup> Nationwide full fibre would also provide the foundation for 5G mobile connectivity and could improve 4G coverage in harder to reach places.<sup>12</sup>

Choosing to make this investment is not a risk-free decision. In countries with widespread full fibre, take-up of higher bandwidth services is often low.<sup>13</sup> Analysis produced for the Commission estimates that, over a 30 year period, building and maintaining a full fibre network would cost £33.4 billion.<sup>14</sup> This is estimated to be approximately £11.5 billion more than incrementally upgrading the existing infrastructure.<sup>15</sup> But a further incremental upgrade now may still require full fibre in the long term. Figure 1.1 shows the breakdown of costs.

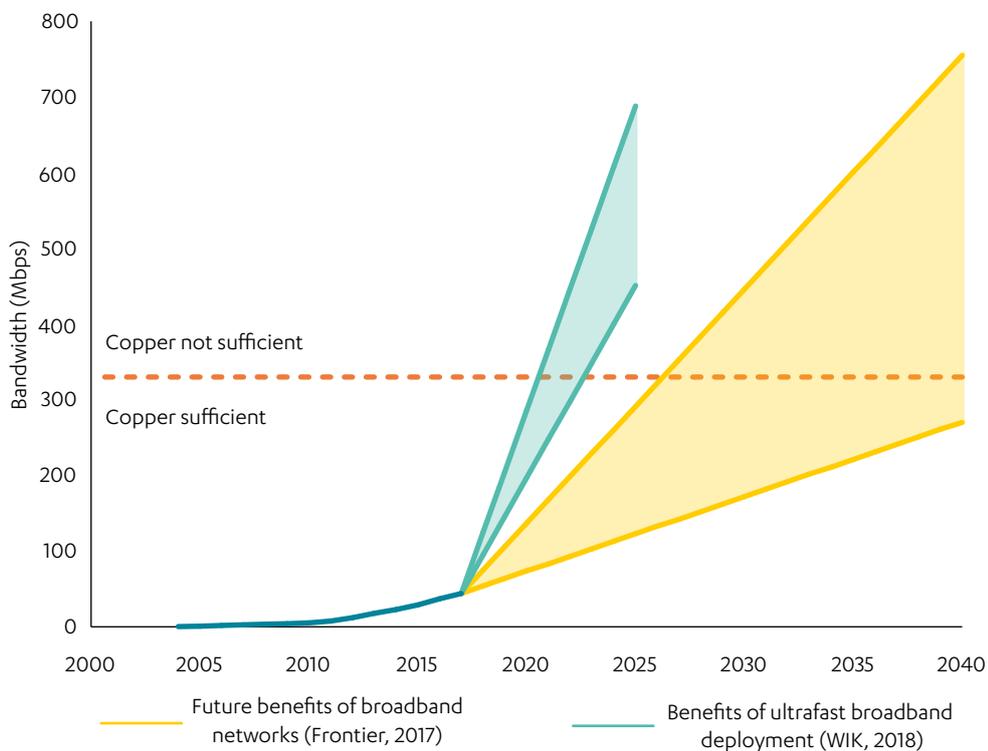

Note: present value in 2020

**Figure 1.1: Estimated costs of deploying full fibre versus upgrading the existing copper/cable infrastructure<sup>16</sup>**

The two alternatives to fibre are G.fast (a copper based technology), and cable (which uses shielding to reduce the electromagnetic interference that affects copper). G.fast might be an appropriate interim solution in some areas, but it is ultimately subject to many of the same limitations as copper. Unlike fibre, speeds on copper lines drop significantly over longer distances.<sup>17</sup> Existing cable networks can be upgraded to compete more effectively with fibre over the long term.<sup>18</sup> But Virgin Media, the UK's main cable provider, is increasingly rolling out fibre as it expands its network into new areas, partly because deploying and maintaining

new cable is more expensive than full fibre.<sup>19</sup> Full fibre also has the potential to deliver much higher upload and download speeds.<sup>20</sup>

Total data demand, based on the time spent on the internet, has risen drastically over the last few years.<sup>21</sup> This is because people are online for more of the day and because the amount of data used at any one time is increasing, requiring higher bandwidth. Figure 1.2 compares projections of bandwidth demand, produced for the Commission and for Ofcom, the regulator, and the level at which a copper network becomes insufficient to meet demand. It is not clear when, or if, bandwidth demand will outstrip the capacity of the existing copper network. But it is possible that bandwidth demand could exceed the capabilities of a copper network within the 10-20 year horizon required to roll out a full fibre network.

Note: the dotted line is the theoretical maximum 'up to speed' on a copper upgrade.

**Figure 1.2: Historic average UK broadband bandwidth and forecasted future bandwidth demand<sup>22</sup>**

However, despite the possibility that demand does not materialise, the Commission's judgement is that investment in full fibre is a risk worth taking. Past investments in digital infrastructure have supported significant economic growth. The rollout of broadband infrastructure in OECD countries from 1997 to 2007 increased annual per capita growth by 0.9 to 1.5 percentage points for a 10 percentage point increase in broadband penetration.<sup>23</sup>

## Potential drivers of future bandwidth demand

**Demand increases to meet supply:** History shows that as consumers' bandwidth increases, sites and applications adapt to make use of faster speeds. Video is the main driver of bandwidth demand. When BBC iPlayer launched in 2007 it required 0.5 megabits per second (Mbps) to watch programmes on demand.<sup>24</sup> Today, the minimum is the same, but iPlayer now offers a range of more sophisticated services that require much faster speeds, including 20 Mbps for Ultra HD programmes such as Blue Planet, and 36 Mbps for live events such as the World Cup.<sup>25</sup>

**Virtual reality:** If the use of virtual (and/or augmented) reality increases for entertainment, simulations, or communication, this will require better, faster broadband connections.<sup>26</sup>

**Internet of things:** Innovations in the network of infrastructure and appliances with digital connections will continue to increase the amount of data being transferred regularly through both the broadband and mobile networks.<sup>27</sup>

**Connected and autonomous vehicles:** Connected vehicles are expected to transmit large amounts of data at high speeds to other connected vehicles and/or road infrastructure. This is likely to require reliable 5G connectivity on roads, which will need to be underpinned by fibre.<sup>28</sup>

Furthermore, a full fibre network still provides several benefits relative to a copper network upgrade. These include operational savings, which would start being realised straight away and could amount to £5.1 billion between 2020 and 2050 (see figure 1.1). Full fibre suffers five times fewer faults than copper-based networks.<sup>29</sup> While not large enough to justify the investment in itself, these savings will continue beyond this timeframe.

## A long term strategy for nationwide full fibre

Network operators are beginning to build new full fibre networks across the UK. However, only 4 per cent of UK premises have access to full fibre.<sup>30</sup>

Delivering a new national full fibre infrastructure network will take at least a decade.<sup>31</sup> Other estimates suggest the programme could be closer to 20 years.<sup>32</sup> If the UK wants to avoid the risk of not having the infrastructure needed to support an increasing demand for data in the future, it will need to start investing soon, even if this is ahead of demand at present.

Transitioning to full fibre from copper is a substantial infrastructure upgrade, and it will be difficult for the market to deliver in the absence of a clear government strategy. Commercial investors will need clarity on government's decision to back full fibre to give them the confidence to invest.

Government must therefore define and deliver the country's full fibre broadband strategy. It should be responsible for the plan, and ensure that Ofcom has the necessary powers to implement and deliver it.

## A nationwide strategy

Recent announcements by network operators already total 14 million premises expected to receive a full fibre connection by 2025,<sup>33</sup> but in reality this number will be lower as the networks will overlap. Therefore, while some areas will receive multiple full fibre networks on a commercial basis, many homes and businesses, particularly in rural areas, will not receive full fibre at all. The government has set a target date of 2033 for national coverage, but should now set out a clear strategy to achieve this, giving commercial investors the confidence they need.

A nationwide broadband plan must reflect the differing economics of delivering full fibre in different areas of the country. Government should promote competition in areas where it is commercially viable for multiple network operators to build and operate full fibre networks. However, some geographic areas are not commercially viable at all, and in others there is only likely to be a commercial case for one network (for example smaller towns and villages). A key part of government's plan must be to ensure that the places that would not otherwise receive full fibre get the connectivity they need.

## Incentivising competition

Competing fibre networks should be encouraged wherever they are feasible. Without infrastructure competition, the existing provider has poor incentives to build new fibre networks, as this undermines its existing copper based services. New entrants do not have existing customers to lose, so they have greater incentives to build. Competition will force the incumbent to build new networks commercially and at a competitive price.<sup>34</sup>

Infrastructure competition has been shown to drive investment in both new and existing broadband networks.<sup>35,36</sup> It has been a key driver of widespread fibre rollout in South Korea and Japan, which have over 95 per cent full fibre availability.<sup>37</sup> There is a strong correlation between cable coverage and full fibre availability internationally.<sup>38</sup>

The UK should therefore stick to a competitive model for commercial investors to deliver full fibre. This will require significant financing and it is essential that investors have confidence that if their business plans are successful, they will be able to make a fair return without the government reneging after the fact. The market must have the freedom to set the price for new services, subject, as now, to regulation of the basic service level. Within a competitive model consumers will have a choice of whether to pay any premium for full fibre. The market will drive full fibre deployment, and government should not intervene by restricting overbuild of new or existing networks, unless it constitutes anticompetitive behaviour.

This requires:

- a clear commitment from government and Ofcom to promote a competitive market wherever possible, with a stable regulatory regime

- a commitment to deregulate in geographic areas where competition is effective
- a commitment to ensuring telecoms providers can make a 'fair bet' for the risks they are taking in building new infrastructure, recognising the long term benefits of the infrastructure
- Ofcom continuing to ensure all providers can access Openreach's ducts and poles on a fair and efficient basis.<sup>39</sup>

## Reaching rural and remote areas

The Commission has concluded that nowhere should miss out on the benefits of full fibre. The Commission's social research found that 86 per cent of people agreed that all parts of the UK should have equal access to broadband.<sup>40</sup> In the past, the UK had the ambition and foresight to connect the whole country to electricity, water and transport networks. The benefits today are obvious. The same ambition is needed now for digital infrastructure.

The capacity constraint of the existing copper network is a particularly critical issue for rural areas with long copper lines. The performance of copper is severely affected by distance, and cannot be upgraded without replacing large parts with fibre, effectively rendering full fibre as the only viable infrastructure upgrade option for most rural areas.<sup>41</sup> In the most remote areas, alternative technologies such as the use of mobile connectivity, fixed wireless or satellite might be more cost effective. Full fibre could also help to improve mobile coverage in hard to reach areas. Mobile 'cells', which transmit and receive data to and from mobile devices, connect to fixed fibre through which they are linked to the global internet.

Without full fibre, rural areas and some deprived communities where full fibre may not be commercially viable will risk falling behind. But everyone stands to gain from ubiquitous connectivity if it enables public services to use digital technology to become more efficient. For example, some health services are already moving online, which can provide better access to specialist services, reduce the need for patients to sit in waiting rooms where they risk further infection, and reduce costs for the NHS.<sup>42</sup> Savings from online provision in rural areas are likely to be particularly large, where the costs of providing traditional services are higher in sparsely populated areas.

The Commission recommends a taxpayer-subsidised infrastructure delivery scheme to uncommercial areas, along the lines of the successful Broadband Delivery UK programme, which directly subsidised up to 50 per cent of the capital expenditure for installing superfast broadband in rural areas. A taxpayer subsidy can take advantage of competitive dynamics, with different companies bidding for tenders. In the short term, this can have positive implications for how quickly and cheaply the infrastructure is deployed. In the longer term, it also enables the costs and performance of subsidised delivery in one region to be measured against others.

Unlike the 'Broadband Delivery UK' programme, government should focus initially on the areas least likely to receive full fibre broadband commercially, and which are also most likely to experience unreliable broadband through long distances of copper cables. Communities within these areas should be eligible to get their full fibre sooner if they volunteer to help build their network at community level, as for example Broadband for the Rural North have done.<sup>43</sup>

However, a reasonable cost threshold will be necessary: the most expensive premises can cost above £45,000.<sup>44</sup> This threshold should be high enough for the programme to cover the vast majority of premises. The few premises which are above the cost threshold should be able to use the subsidy to fund their own solution. The guaranteed minimum broadband service will act as a safety net.<sup>45</sup>

## Completing a nationwide rollout

In some areas of the country, only one fibre operator is commercially viable. It is uncertain whether fibre operators will rush to invest with the aim of becoming the monopoly provider or choose to avoid areas that cannot support multiple networks. In these areas, there is a choice between a targeted solution or relying on the combination of competition and eventual direct government support where the private sector doesn't deliver.

A targeted solution might meet the particular challenge, but would require the government to identify and define the boundaries of these areas upfront. This would rely upon uncertain and evolving assumptions. Changes in the cost of deployment and consumer demand could extend the area where competition is commercially viable, rendering any targeted solution out of date and potentially costly.

Given the pace of innovation in the industry, the potential for significant changes in consumer demand, and the long timescales over which any targeted solution would have to operate, the Commission believes that the boundaries should be allowed to reveal themselves over time. Providing government support for the hardest to reach areas first will allow the market to drive investment in the first instance. The part-subsidy scheme can then be extended in phases to areas that remain unserved, meeting market driven rollout 'in the middle'. If this results in support for provision in areas that are commercially viable, but for only one provider, the taxpayer contribution can be reinvested or refunded through clawback mechanisms.

## Improving mobile connectivity

The Commission was asked in March 2016 to advise government on the steps the UK should take to become a world leader in the deployment of 5G mobile networks, and take early advantage of the applications 5G could enable. The Commission published its report, *Connected Future*, in December 2016.

The Commission's central finding was that mobile connectivity has become a necessity. It recommended that government ensures services are available

wherever people live, work and travel, and that the UK's roads, railways and city centres are ready for 5G.

The government and Ofcom have made some progress; the Department for Digital, Culture, Media and Sport has bolstered its telecoms capabilities and Ofcom has improved its coverage metrics to reflect actual user experience. Ofcom is also currently consulting on new coverage obligations, tied to the 700 MHz spectrum auction, to improve geographic coverage, particularly in rural areas.<sup>46</sup> However, government has made particularly poor progress on road and rail connectivity. It must accelerate its work to ensure 5G-ready infrastructure is available across the UK's motorways and major rail lines by 2025 at the latest.

The Assessment does not reopen the Commission's earlier mobile recommendations. The focus of the Assessment has been on fibre deployment for both fixed and mobile connectivity. Fibre is the necessary underpinning infrastructure for mobile connectivity. Full fibre policies have the potential to improve 4G coverage in hard to reach towns, villages and hamlets. It could also help deliver 5G further, more quickly and cheaply.

Mobile coverage is particularly poor in rural areas; 15 per cent of rural geographic areas cannot receive 4G coverage by any operator, compared to less than 1 per cent of urban areas. The Church of England recently agreed to using its church spires to improve mobile coverage. Two thirds of Anglican churches are in rural areas, situated in the heart of villages with tall spires, ideal for mobile cells. A full fibre connection to the highest point in a local village, whether or not that is the church, could allow mobile cells to be easily installed, improving connectivity in that local area.

Looking ahead, there is an option to preempt where 5G cells might need fibre. Subsidised full fibre rollout could include these locations. This includes lampposts and public buildings. Lampposts could be ideal sites for 5G cells, as well as WiFi and 4G cells today. They have access to power, are high up and evenly spaced out. But they do not automatically have fibre and will not receive it without coordination.

5G is a certain part of the future but what the 5G network will look like is uncertain. It is therefore a gamble to modify full fibre deployment based on any current 5G assumptions. Further evidence is needed to decide whether 5G obligations should be included with full fibre subsidies. The onus should be on wireless infrastructure operators to supply evidence and recommendations to the government.

### **Allowing for copper switch-off**

Copper switch-off should be a key part of the long term national full fibre plan. Running a copper network adjacent to a fibre network will add significantly to overall costs. Switching off the copper network is ultimately a commercial decision for Openreach, the existing operator, but does require some government intervention to allow them to make the decision.

The transition plan will need to include protection for potentially vulnerable consumers. Some consumers will not want fibre but will receive it anyway. Openreach should not be able to charge customers extra that had no need for the upgrade.

## Removing policy barriers

Tackling the barriers that delay deployment and increase costs must be an integral part of the UK's national full fibre broadband plan. Government has set up a Barriers Busting Task Force. This is a good first step and should continue to be prioritised. The Commission has identified four key objectives.

**Give digital infrastructure operators the same rights as utilities:** The process for obtaining rights of way on private land, known as 'wayleaves', should be simplified and standardised, through a notification regime similar to those used for other utilities. All new developments should have full fibre and telecoms duct capacity from the outset, as for other utilities such as electricity and water.

**Prioritise digital connectivity at a local level:** As recommended in *Connected Future*, local government should designate an individual 'digital champion' with responsibility for engaging with telecoms providers. The digital champion in each local planning authority should be responsible for coordinating and facilitating digital infrastructure deployment in their area, acting as the single point of contact for all telecoms providers, and assisting them in delivering better connectivity for the local area. Digital champions should prioritise:

- reforming and streamlining the process around permissions for street works, reducing the variability across the country and removing inefficient delays
- improving the accessibility of their publicly owned assets, making it easier and cheaper for operators to deploy digital infrastructure in the local area.

**Increase infrastructure sharing to push full fibre rollout further:** Access to Openreach's ducts and poles allows alternative operators to deploy fibre more quickly and cheaply. They no longer need to dig their own trenches, which can make up to 60 per cent of total deployment costs.<sup>47</sup> This increases the areas of the country where full fibre can be rolled out commercially. The success of this policy should be monitored by levels of usage to ensure that Openreach's infrastructure is accessible in practice. There may not be benefits from duplicating in-building fibre connections, which are costly and disruptive to install. Countries such as Spain, Portugal and France mandate that in-building fibre is accessible to all operators.<sup>48</sup> Ofcom should consider whether such policies should be applied in the UK.

Making use of other existing infrastructure can also reduce deployment costs. For example, using aerial fibre along existing electricity poles may push some

premises below a reasonable cost threshold in rural areas. Infrastructure re-use should therefore be explored before premises are ruled out for being too costly.

**Ensuring planning is fit for 5G deployment.** The next generation of mobile will require a large number of small cells raising planning issues such as access to street furniture (eg lampposts). This will require collaboration between network operators and local authorities to ensure planning and other permissions are handled swiftly and in a coordinated way. The UK will not get the mobile infrastructure it needs if each individual cell requires separate planning permission. Planning policy, legislation for code powers, and guidelines for deployment at street level will need to be addressed before dense site deployment can take place. The Commission made recommendations on 5G in *Connected Future*.<sup>49</sup>

**The Commission recommends that government should set out a nationwide full fibre connectivity plan by spring 2019, including proposals for connecting rural and remote communities. This should ensure that full fibre connectivity is available to 15 million homes and businesses by 2025, 25 million by 2030 with full coverage by 2033. To achieve these targets:**

- Ofcom should promote network competition to drive the commercial rollout of full fibre, by deregulating where competition is effective and guaranteeing a fair bet on risky investments before regulating any uncompetitive areas.
- Government should part subsidise rollout to rural and remote communities, beginning by 2020, starting with the hardest to reach areas and community self-build.
- Government and Ofcom should allow for copper switch-off by 2025.
- Government and Ofcom should take action to cut the cost of full fibre deployment including:
  - Government should ensure the processes for obtaining wayleaves and connecting new builds are the same for digital infrastructure as other utilities by 2019.
  - Local government should designate ‘digital champions’ to improve telecoms processes such as street work permissions and access to publicly owned assets.
  - Ofcom should monitor the accessibility of Openreach’s duct and pole infrastructure by levels of usage.

## 2. LOW COST, LOW CARBON

# LOW CARBON INFRASTRUCTURE AT NO EXTRA COST

Reducing emissions has often appeared costly and difficult, but this is no longer the case, if the right decisions are taken now

Today, consumers pay an average of

# £1,850

per year for electricity, heating, hot water and petrol or diesel

The same services could be delivered at the same cost in 2050 by a low carbon energy system

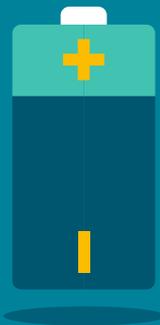

The Commission estimates that an electricity system powered mainly by renewables would cost no more than relying on new nuclear power plants

Renewables need more flexibility to balance variations in weather, but are cheaper to build

Sources of flexibility are getting cheaper: battery prices have fallen

# 80%

since 2010

Burning natural gas for heating and hot water is not a long-term option:

# 22%

of UK's greenhouse gas emissions come from heating

## THE COMMISSION RECOMMENDS:

At least 50% renewable electricity generation by 2030

No more than 1 more contract for new nuclear before 2025

Pilots to test hydrogen and heat pumps as low carbon heating options

Buildings which require less energy to heat

# INCINERATING LESS, RECYCLING MORE

England needs to do as well as Wales – a world leader – at recycling

## PEOPLE ARE WILLING TO DO THEIR BIT:

50%

would pay £30 a year for more recyclable packaging

79%

of people would be willing to separate their food waste

## BUT THEY FIND THE CURRENT SYSTEM TOO COMPLICATED

Higher recycling, especially of plastics, could:

Save £6.2 billion from 2020 to 2050

Avoid the need to build 20 additional incinerators

Reduce greenhouse gas emissions

## THE COMMISSION RECOMMENDS:

Recycling targets: 65% of all waste, 75% of plastic packaging, by 2030

Clearer labelling: recyclable or not recyclable

Restricting use of hard to recycle plastics, by 2025

Separate food waste collection, by 2025

**The UK can have low cost, low carbon electricity, heat and waste. Ten years ago, it seemed almost impossible for the UK to transition to being powered mainly by renewable energy sources such as solar and wind power in an affordable and secure way. Now the same focus needs to be applied to deliver a value for money approach to reducing emissions from heat. Low cost, low carbon energy and waste systems are now possible, and should be delivered.**

The UK is legally bound to reduce its greenhouse gas emissions by at least 80 per cent from 1990 levels by 2050. Today, around 70 per cent of emissions come from electricity, buildings, travel and waste.<sup>1</sup>

Reducing emissions has often appeared costly and difficult, but this is no longer the case. Today consumers pay an average of £1,850 per year for the energy they use, including electricity, transport fuel, and fuel and equipment for heating and hot water.<sup>2</sup> The Commission's analysis shows that the same services could be delivered at the same cost (in today's prices) in 2050 by a low carbon energy system.<sup>3</sup> But this will only be possible if the right decisions are taken now.

The Commission's modelling has shown that delivering a low carbon electricity system for 2050 powered mainly by renewables is a low cost option, cost comparable to building further nuclear power plants after Hinkley Point C. The Commission's modelling also shows that continuing to use fossil fuels with the addition of carbon capture and storage is unlikely to form part of a cost competitive generation mix.

Reducing the waste sent to energy from waste plants (incinerators) by recycling more plastic and converting more food waste into biogas can also help reduce overall emissions. But even with emissions almost eliminated from power generation and waste, the UK cannot achieve its emissions targets without transitioning away from using natural gas, a fossil fuel, for heating. The UK must now address this problem. In the short term, improving the energy efficiency of the UK's buildings will reduce demand for heat and mitigate some of the emissions. In the longer term, it will also reduce the costs associated with delivering low carbon heat infrastructure.

The successful delivery of a low cost, low carbon energy and waste system requires:

- a flexible electricity system and new generation, primarily through renewables
- determining the best way to deliver low carbon heat in the UK

- buildings which require less energy to heat
- encouraging more recycling, and less waste incineration.

## A lower cost, low carbon energy system

Reducing carbon dioxide emissions from the power sector no longer needs to be considered expensive. The Commission's analysis suggests that, across electricity, heat and transport, switching to and using low carbon alternatives does not need to lead to higher costs for consumers in the long term. The need to replace fossil fuels is driving a shift away from technologies, many over 100 years old, that society has become locked into, but which are now beginning to be replaced by more efficient alternatives.

Today, consumers pay an average of £1,850 per year for the energy they use, including electricity, transport fuel, and fuel and equipment for heating and hot water.<sup>4</sup> The Commission's analysis shows that the same services could be delivered at the same cost (in today's prices) in 2050 by a low carbon energy system.<sup>5</sup>

Heating is currently predominantly fuelled by natural gas, a fossil fuel. Transitioning to a low carbon alternative (the two main options are electrified heat, using heat pumps; and hydrogen fuelled heat) will add to household bills. But these extra costs can be outweighed by switching to use electricity rather than petrol or diesel for transport. The cost of supplying low carbon electricity is falling.

These estimates are inevitably uncertain. Savings will only be possible if the right decisions are taken. In particular, these estimates assume investment in cost-effective energy efficiency measures.

The Commission's cost estimates:

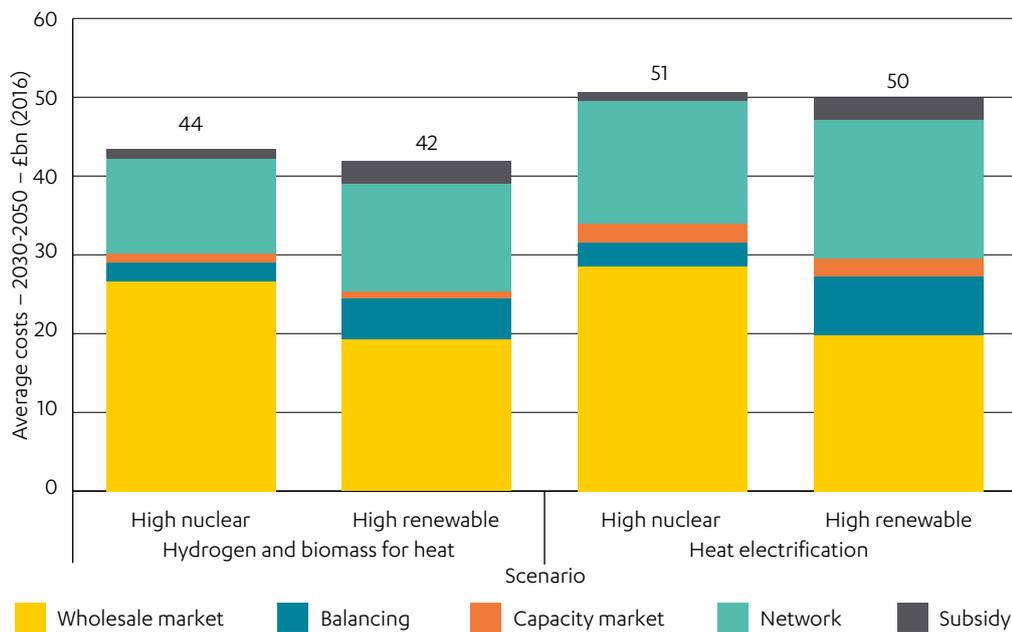

- assume a typical household, consuming the same quantities of energy services today and in 2050
- include the costs of electric vehicle charging infrastructure and home heating appliances (boilers, heat pumps) as well as the costs of energy and fuel
- exclude potential savings on the cost of cars and car maintenance from the switch to electric vehicles, and the one-off costs of energy efficiency measures
- exclude tax – there would be further savings for households from today's tax system (since petrol and diesel are heavily taxed) but these savings would have to be made up elsewhere by the Exchequer
- average the projected costs of predominantly hydrogen and predominantly heat pump scenarios for low carbon heat

- assume continued technology development for existing technologies (eg battery storage) but do not take into account potential new technologies.

Full details are set out in the technical annex: *Energy and fuel bills today and in 2050*.

## Renewables have become cost competitive

It is now possible to conceive of a low cost electricity system that is principally powered by renewable energy sources. The Commission’s analysis has shown that the estimated average cost of the electricity system as a whole between 2030 and 2050 is broadly comparable between investing heavily in nuclear power stations or investing heavily in renewables (there is very little prospect of new nuclear, beyond Hinkley Point C, coming on system before 2030). Figure 2.1 shows slightly lower average costs for a scenario with 90 per cent renewable and less than 10 per cent nuclear compared to a scenario with 40 per cent renewable and around 40 per cent nuclear, regardless of whether heat is predominantly electrified using heat pumps or provided through low carbon hydrogen in the future. The higher cost of managing the variable nature of many renewables (‘balancing’) is offset by the lower capital cost, which translates into lower costs in the wholesale market.

**Figure 2.1: Average cost of the electricity system per year for different proportions of renewables/nuclear and heat decarbonisation pathways<sup>6</sup>**

Estimates over such a long time period, and with considerable technological change, are inevitably uncertain. Specific figures should not be given undue weight. However, the broad conclusion of the analysis implies that an electricity system with no further nuclear plants after Hinkley Point C is likely to be cost comparable with a system which accommodates a new fleet of nuclear reactors.

These estimates assume continued reductions in the costs of renewable technologies. However, in recent years actual cost reductions have exceeded expected reductions.<sup>7</sup> If the trend were to continue, and reductions were to exceed those assumed here, then the case for renewables would be stronger still. Further reductions could arise, for example, from new, cost effective, technologies for energy storage: the modelling does not assume untried technologies.

Historical evidence suggests it is much less likely that nuclear costs will fall. Figure 2.2 shows the construction costs of nuclear power stations in various countries, by construction start date. This shows no discernible trend in construction costs over time. This is true even for countries, such as France, that have built fleets of similarly designed reactors. The issue of long term disposal for nuclear waste is also still unresolved in the UK.

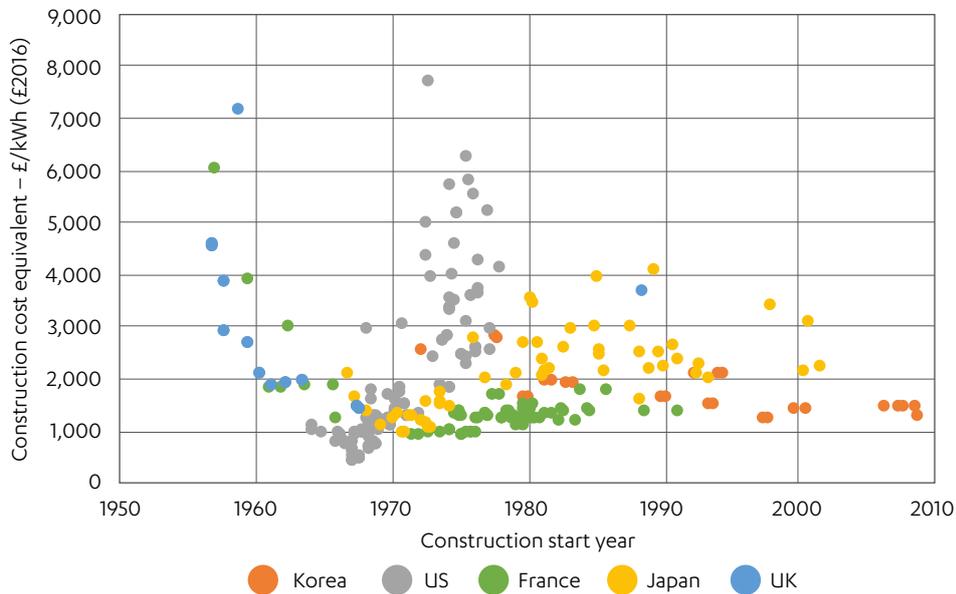

Figure 2.2: Construction costs of nuclear power stations over time<sup>8</sup>

## Paying for nuclear and carbon capture and storage

New nuclear power plants and carbon capture and storage infrastructure will not be built by the private sector without some form of government support. This can come in a variety of forms. Expenditure will be treated as either 'on' or 'off' the public balance sheet (the account of government's assets and liabilities) depending on an assessment by the Office for National Statistics of where the risks and rewards sit.

Off public balance sheet deals, such as the package for Hinkley Point C, leave risks predominantly with the private sector. The National Audit Office found that this procurement model for Hinkley Point C did not provide best value for money for consumers.<sup>9</sup> It is also questionable whether a further deal on this basis could be agreed, given the scale of risk that the private sector is required to hold.

A commonly discussed alternative 'regulated asset base' model, as used for the Thames Tideway Tunnel, could also be classified as off the government balance sheet. In this case, however, consumers hold both some risks and some elements of financing. The Thames Tideway model requires consumers to pay for infrastructure in advance. This makes projects appear cheaper as consumers are effectively financing the projects at zero interest. At least some of the risk associated with construction costs also sit with consumers, a further hidden cost, since consumers are not paid to hold these risks in the way investors would be.

Funding nuclear power stations or carbon capture and storage on the public balance sheet represents a transfer of risk from the private to the public sector. Cost overruns would ultimately be paid for by taxpayers, at least in part. These risks are not reflected in the government's cost of borrowing, since it is taxpayers, rather than the holders of debt, who bear the risk. But this does not mean the risk, and its associated costs, have been avoided. The apparently lower financing costs represent a transfer, rather than a reduction, in risk.

On balance sheet options would need to compete with alternative uses of the government's balance sheet. Chapter 7 sets out the Commission's choices within the resources government have set out (the 'fiscal remit'). The Commission have not assumed any on balance sheet nuclear power stations in making these choices.

It is not clear what the best model for either type of project would be, since this would depend on the commercial terms available and where risk can best be managed. Past experience of on balance sheet nuclear construction in the UK has been mixed. There is limited experience of using the regulated asset base model for anything as complex and risky as nuclear. However, any assessment needs to recognise the full costs and risks. It should not be distorted by hidden costs or used to present costs as artificially lower.

Given the balance of cost and risk, a renewables based system looks like a safer bet at present than constructing multiple new nuclear power plants. But a large amount of uncertainty does remain. No country has yet built an electricity system with very high levels of variable renewables. It will be important to develop a better understanding of how such a system performs under adverse weather conditions, particularly given that climate change itself makes such conditions

harder to predict. The risk is that the extra services required to accommodate large amounts of renewables may be harder, or more expensive, to source than envisaged. But given that some technologies which provide flexibility are still fairly immature, the costs could also be lower than the analysis suggests.

Given these uncertainties, the Commission is recommending a 'one by one' approach to new nuclear plants, as opposed to the current government policy to develop a large fleet. This is preferable to a 'stop start' approach, in which the nuclear programme is cancelled only to be restarted at a later date. It will allow the UK to maintain, but not expand, a skills base and supply chain. This allows the UK to pursue a high renewables mix, which is most likely to be the preferred option, without closing off the nuclear alternative.

The Government should also seek to ensure continuity with current Euratom arrangements as the UK leaves the EU, to ensure that on 29 March 2019 the UK has the necessary measures in place for the nuclear industry to continue to operate.

## A more flexible power system

Matching energy supply and demand means the electricity system needs 'flexibility', both within days and across seasons. This can be provided by a combination of flexible supply (energy that can be generated on demand); energy storage; and flexible demand (demand that can be moved to a time of day when there is more supply).

To date, carbon intensive fossil fuels have met some of this need by providing plenty of flexible supply. But as they come off the system in favour of (mostly variable) renewable energy, flexibility will need to be maintained in other ways. The Commission's analysis takes into account the cost of providing additional flexibility, as well as wider system costs such as the transmission and distribution of electricity. More renewables do lead to more money being spent to match supply and demand: a system with 90 per cent renewables is estimated to cost up to £4.5 billion more per year to balance. But cheaper capital costs are estimated to offset this within the costs for the overall system.<sup>10</sup>

In all scenarios, extra flexibility, which includes technologies such as storage, interconnection and demand side response, is a low regrets investment which reduces estimated total energy system costs by between £1-7 billion per year on average between 2030 and 2050.<sup>11</sup> This finding echoes the conclusions of the Commission's *Smart Power* report.<sup>12</sup> Extended periods of low sun and wind in the winter can be met by a range of flexible technologies or, in the extreme case, by using limited amounts of fossil fuels. These events are rare, so the impact on emissions would remain small.<sup>13</sup>

The Commission's analysis demonstrates that a rapid uptake of electric vehicles in the 2020s (see Chapter 3) can not only be accommodated, but that the batteries in electric vehicles could be a valuable and low cost source of flexibility for the electricity system in future. Provided smart charging is implemented, electric

vehicles can provide demand when it is otherwise low and potentially return power, stored in car batteries, to the grid at peak times ('vehicle to grid').<sup>14</sup>

## A level playing field for different renewables

The existing mechanism for supporting low carbon generation technologies is called 'Contracts for Difference'. To reduce generators' exposure to volatile wholesale electricity prices, Contracts for Difference require generators to sell energy to the market as usual, but contract government to pay generators any difference between the market price and a pre agreed 'strike price', which is usually valid for 15 years. At times of high market prices these payments reverse and the generator is required to pay government back the difference between the market price and strike price.<sup>15</sup>

The Commission favours the use of existing market mechanisms – Contracts for Difference and the capacity market – where possible, to avoid creating more uncertainty, but incremental improvements could be made. The Contracts for Difference mechanism can provide both certainty for generators and a subsidy (depending on the agreed 'strike price'). Low carbon generation technologies have so far not been cost competitive, bringing both of these into play.

Since the introduction of Contracts for Difference, there have been significant reductions in the costs of renewables to consumers, through the competitive allocation of support. For each Contracts for Difference auction, technologies at similar stages of development are grouped together in different 'pots'. Pot 1 was set up for 'established' technologies, including onshore wind and solar, and pot 2 (for 'less established' technologies) contains, amongst other technologies, offshore wind. Only one pot 1 auction has been run to date.

Revising the distribution of technologies between pots and reinstating a pipeline of pot 1 auctions would enable the lowest cost renewable generation mix to be brought forward in the 2020s. Onshore wind, which enjoys strong public support overall,<sup>16</sup> but has been controversial in some communities, would still be subject to planning restrictions in England. Projects in Wales and Scotland would no longer be held back. Pot 2 auctions could be used to allocate small amounts of support to emerging technologies, especially where they are likely to be able to contribute to the reduction of system costs in future.

Low carbon generation technologies should benefit from the support from Contracts for Difference. However, as set out in the Commission's interim National Infrastructure Assessment, it is also important that generators are responsible for costs and benefits they impose on the system, such as those related to where they situate. Some sites impose costs, for example due to the need for new transmission infrastructure, or benefits, for example if local weather conditions complement those elsewhere.

Over time, the different costs and benefits of new generation should increasingly be reflected in the auction process, allowing the lowest cost system to be developed. However, calculating these impacts is very complex, and in practice

a mixture of pricing and other mechanisms will need to be used to ensure total system costs are reflected in the bid price. As the generation mix evolves, it will be essential that both technological and spatial diversity are maintained across the system. This may involve making use of administrative limits for each technology within auctions.

As the prices of low carbon technologies continue to fall, the need to subsidise low carbon generation through Contracts for Difference will reduce and, particularly in later years, the mechanism may require payments from generators. This could result in contracts that provide the certainty required for low cost investment, but which are low cost or cost neutral for consumers over their duration. This may be important, as no one knows what the electricity markets will look like in the long term, or what factors will drive the electricity price. However, contract lengths will also need to reflect the need to retain flexibility in the future development of the electricity market.

## Tidal power

The Commission's analysis suggests that tidal lagoon power will remain an expensive technology in the future. The extra benefits which arise from its predictability are not enough to offset its higher capital costs.<sup>17</sup> And it will never be a large-scale solution: an entire fleet of tidal lagoons would only meet up to 10 per cent of current electricity demand in the UK.<sup>18</sup> This also limits the scope for cost reductions through the kinds of learning and scale economies that have been achieved with wind and solar power. Further details are set out in technical annex: *Tidal power*. Given the broad portfolio of readily available lower cost, low carbon technologies, special treatment for tidal lagoons in the form of bilaterally agreed contracts is not justified. However, tidal should be allowed to compete on an equal basis with other technologies for Contracts for Difference.

## The near term: 2020 – 2030

Increasing population and electric vehicle uptake means that energy demand could increase by 9-26 per cent from today to 2030.<sup>19</sup> And over this period, up to 40 GW of older power stations will come offline.<sup>20</sup> This creates a large opportunity to continue to reduce emissions from the electricity system throughout the 2020s without stranding assets.

New nuclear power stations are unlikely to be an additional source of electricity in the 2020s, with the possible exception of Hinkley Point C. Large scale projects have long construction timelines and often face delays. Smaller reactors are still at an early stage of development and their benefits remain speculative. It is estimated that the end-to-end deployment process will take 12-14 years for the first small modular reactor.<sup>21</sup>

Since a system with a high proportion of renewable generation looks cost effective in the long term, and adding more nuclear to the system in this timeframe is unlikely, it makes sense to continue to add more renewables to the system in the 2020s.

However, not all new sources of supply in the 2020s need be renewable. Interconnectors, of which there is a large pipeline of projects, are likely to become of increasing importance throughout this period, and the Government should ensure that the current pipeline is not affected by the UK's exit from the EU. It may also be cost-effective to deploy a limited amount of new gas power stations, provided they can be accommodated within the carbon budgets, and recognising that load factors are likely to be on a reducing path.<sup>22</sup>

The Commission recommends that in order to keep the option of a highly renewable system in 2050 open, at least 50 per cent of generation (in TWh) should be renewable by 2030. This would be equivalent to between 12 and 19 GW of offshore wind being deployed, in addition to the current pipeline.<sup>23</sup> The Commission's analysis suggests that the budget of £557 million that the government has set aside for future Contracts for Difference auctions may be sufficient to achieve this, depending on the future wholesale price of electricity.<sup>24</sup> However, if interconnectors do not deliver expected benefits, up to 65 per cent of generation may need to be renewable to meet 2030 carbon targets.

**The Commission recommends that government should set out a pipeline of pot 1 Contracts for Difference auctions, to deliver at least 50 per cent renewable generation by 2030, as part of the transition to a highly renewable generation mix. Government should:**

- Move technologies that have recently become cost competitive, such as offshore wind, to pot 1 following the next Contracts for Difference auction in Spring 2019. Pot 1 should be used for the overwhelming majority of the increase in renewable capacity required.
- Publish indicative auction dates and budgets for the next decade by 2020.
- Over time take whole systems costs into account in Contracts for Difference auctions, as far as possible.
- Consider whether there is a case for a small-scale, pot 2 auction in the 2020s, if there are technologies which are serious contenders for future pot 1 auctions.
- Not agree support for more than one nuclear power station beyond Hinkley Point C, before 2025.

## Carbon capture and storage

The Commission's analysis included carbon capture and storage (CCS) as a potential option for the electricity system. Carbon capture and storage would allow the continued use of fossil fuels. However, the Commission's analysis showed that it rarely appeared to be a cost effective option for reducing power sector emissions. In scenarios where small amounts were cost effective, this was in the 2040s. This finding held even when carbon dioxide transport and storage costs were assumed to be very low, indicating the outcome if carbon capture and storage had already been built for other purposes. This shows it does not make sense for electricity consumers to subsidise the development of carbon capture and storage, since it will not benefit them in future.

Generation scenario	Heat decarbonisation scenario	CCS cost assumption	Percentage of CCS in the 2050 generation mix
40% renewable	Hydrogen and biomass	Central	1%
		Low	5%
	Electrification	Central	4%
		Low	8%
90% renewable	Hydrogen and biomass	Central	0%
		Low	0%
	Electrification	Central	0%
		Low	0%

**Figure 2.3: Percentage of generation from fossil fuelled power stations equipped with carbon capture and storage in 2050 under different scenarios for generation mix, heat decarbonisation pathways and carbon capture and storage costs**

There are several other potential uses for carbon capture and storage, including the reduction of emissions from industrial processes and combining it with biomass combustion to create negative emissions. However, the most pressing reason to develop it at scale is likely to be for the manufacture of low carbon hydrogen. This will be required if the UK chooses to remove carbon emissions from heat through diluting or replacing natural gas with hydrogen, especially in the absence of a global hydrogen market. Removing and storing the carbon from natural gas as part of producing hydrogen is a simpler process than capturing it as it is burnt in a power station.<sup>25</sup>

## Informing future decisions on heat

Reducing emissions from heating in an affordable way is the next challenge. Currently 69 per cent of heat is produced through burning natural gas, a fossil fuel.<sup>26</sup> This must be radically reduced. Uncertainties around cost, technology, and consumer behaviour means that it is difficult to decide the cheapest way to replace natural gas to meet future Climate Change Act targets now. However, this uncertainty is not an excuse for inaction in the near term. Low carbon heat at lowest cost will benefit the environment and improve many people's lives.

There are two potential large scale solutions for low carbon heat, and a range of smaller solutions which may complement one of them. The first option is electrification, using heat pumps to increase the efficiency of using electricity for heating. Alternatively, hydrogen from a zero carbon source (which creates only water vapour when burnt) could be used as a direct replacement for natural gas, fuelling boilers and appliances.

Whilst there are incremental steps that can be taken to address some aspects of the challenge, an incremental approach on its own will not be enough. In the 2020s, decisions will be required on whether the gas network should be maintained and converted, or phased out.

The Commission's analysis shows that currently all routes to low carbon heat are more expensive than maintaining the status quo, although the cost of heating as a proportion of GDP in 2050 is estimated to reduce.<sup>27</sup> The impacts of this cost will also be offset by switching to cheaper forms of energy in other areas, particularly transport.<sup>28</sup> Central estimates indicate an average annual cost between now and 2050 of £13 – 16 billion above the current system cost of £24 billion.<sup>29</sup> These figures are highly uncertain. Finding ways to reduce both the uncertainty and magnitude of them must be a priority.

For government to make choices about the decarbonisation of heat in the 2020s, there needs to be a coherent programme to ensure that the evidence to do so is in place. This should include collaborating internationally on research and development, to give government the confidence to invest in the best solution when the time is right. The Commission plans to provide further advice to government on this issue in the next National Infrastructure Assessment, taking into account parallel strategies in Scotland and Wales.

**The Commission recommends that government needs to make progress towards zero carbon heat:**

- **Establishing the safety case for using hydrogen as a replacement for natural gas, followed by trialling hydrogen at community scale by 2021.**
- **Subject to the success of community trials, launching a trial to supply hydrogen to at least 10,000 homes by 2023, including hydrogen production with carbon capture and storage.**
- **By 2021, government should establish an up to date evidence base on the performance of heat pumps within the UK building stock and the scope for future reductions in the cost of installation.**

## **Buildings which require less energy to heat**

Improving the insulation of buildings makes sense both now and in a low carbon future. The Commission's analysis suggests that there are over 21 million individual improvements to buildings in England that together could save billions of pounds. This includes insulating 10 million lofts, 6 million floors and almost

5 million walls. This is equivalent to 21,000 improvements being installed every week between now and 2035.<sup>30</sup> The current rate of progress is around 9,000 improvements installed per week.<sup>31</sup>

Delivering these improvements alone represents a major challenge. Driving widespread improvements in energy efficiency is notoriously difficult. Different interventions to stimulate uptake will be required across different segments of the building stock.

However, an even more ambitious approach may ultimately be required. The optimum level of energy efficiency is partly linked to the choice of heat technology: in particular, heat pumps work best in buildings with reasonably high insulation standards because they provide constant, but low temperature levels of heat.

A range of different initiatives will need to be trialled and fully evaluated, learning from international experience, and progress regularly reviewed. The government will need to prepare for the fact that it is likely that some future energy efficiency initiatives may fail. But this should not lead to a loss of momentum or enthusiasm for energy efficiency. Alongside this, innovation in energy efficiency products and processes should also continue to be supported, particularly for solid walls. An immediate priority is the social rented sector. Under any approach, government will inevitably bear most of the cost of improving energy efficiency either through direct grants, support to social landlords or rental payments via Housing Benefit. The Commission estimates that cost effective improvements to existing socially rented properties would cost £3.8 billion. A ten year programme would meet government's own stated ambition of ensuring social rented properties reach at least Energy Performance Certificate level C by 2030.<sup>32</sup>

**The Commission recommends that government should set a target for the rate of installations of energy efficiency measures in the building stock of 21,000 measures a week by 2020, maintained at this level until a decision on future heat infrastructure is taken. Policies to deliver this should include:**

- Allocating £3.8 billion between now and 2030 to deliver energy efficiency improvements in social housing.
- Government continuing to trial innovative approaches for driving energy efficiency within the owner occupier market.
- Government setting out, by the end of 2018, how regulations in the private rented sector will be tightened and enforced over time.

## Incinerating less, recycling more

Low cost, low carbon waste is also necessary and achievable in the near term. The Commission's remit on waste covers England only, where waste generation is expected to rise as the population grows. Energy from waste plants (incinerators) facilitated the move away from landfill, and make sense when the alternative is

energy from fossil fuels. They incinerate 'black bag' waste and other wastes that cannot be recycled, producing electricity and providing heat where there is a source of demand nearby.

However, lower cost, lower carbon options exist for some types of waste, in particular food waste and plastics. In these areas, England should not settle for the minimum standards set out in EU legislation but should seek to be amongst the best performers, learning from the example set by Wales.

## Separating food waste

As an alternative to incineration, food waste can be treated in 'anaerobic digesters'. Anaerobic digesters break down biodegradable waste in the absence of oxygen, producing biogas and a low grade fertiliser ('digestate') at a fraction of the capital cost of incinerators.<sup>33</sup> In future, technologies such as pyrolysis or gasification, may also become available commercially.<sup>34</sup>

Biogas can be used as a low carbon substitute for natural gas. It can also be converted to a range of biofuels, which may prove especially valuable in sectors where fossil fuels are hardest to replace, such as aviation. Besides treatment, there are benefits to collecting food waste separately, such as preventing the contamination of other recyclable materials.

Using anaerobic digestors requires the separate collection of food waste, which is typically collected weekly in household 'caddies' designed for the purpose. In 2014-15, only 26 per cent of English households had separate food collection.<sup>35</sup> The Commission's analysis shows universal food waste collection would avoid the need to build between 1 and 3 energy from waste plants between now and 2050. It would save up to £400m in capital costs and £1.1bn in operational costs for local authorities in total between 2020 and 2050.<sup>36 37</sup> This includes the cost of weekly collections.

In the Commission's social research, 79 per cent of participants without caddies said they would be willing to use one.<sup>38</sup> A higher recycling rate more generally reduces the demand for residual waste infrastructure. By 2035, a 65 per cent recycling rate, with separate food waste collection, would mean that 7 million tonnes less residual capacity is needed, equivalent to 20 energy from waste facilities.<sup>39</sup>

**The Commission recommends that government should establish separate food waste collection for households and businesses (to enable production of biogas) by 2025.**

## Wales: a world leader in recycling

In 2008, Wales had a similar recycling rate to England (approximately 40 per cent). Today, Wales has the third highest municipal recycling rate in the world (64 per cent).<sup>40</sup>

Wales achieved this through its 'towards zero waste' strategy. The strategy established ambitious recycling targets for local authorities, mandated the separate collection of food waste and provided a blueprint for standardised collection of other materials.<sup>41</sup>

To ensure local authorities had the capacity to deliver effective recycling collection systems, the Welsh Government provided £68 million in capital support for recycling infrastructure.<sup>42</sup> Additionally, the ability to fine local authorities that missed their recycling targets was introduced.<sup>43</sup> In practice, only one local authority has been fined; all that missed the targets were referred to a support program. Communication campaigns were conducted to raise awareness of what could be recycled.

By becoming a leader in recycling, Wales saw the total cost of collection for local authorities fall. In the process, it avoided 105,000 tonnes of carbon dioxide emissions.

## Reducing plastic waste

A more circular economy, with a higher recycling rate that keeps materials in use for longer, could save local authorities a total of £6.2bn between 2020 and 2050.<sup>44</sup> Targeting plastics is particularly important. Increasing the plastic recycling rate will also reduce emissions generated from burning plastics (effectively a fossil fuel) and reduce leachates that can contaminate local water systems when plastic is landfilled.

Despite this, the UK's plastic recycling rate is just 30 per cent.<sup>45</sup> This is due to both household behaviour, and product design. In England, 53 per cent of households throw away items that could be recycled.<sup>46</sup> This appears, at least in part, to be due to a lack of clarity on recycling; the Commission's social research suggests many people would like to recycle more but find it complex and confusing.<sup>47,48</sup>

The first priority should be to reduce unnecessary packaging and other single use plastics. The government have launched a range of consultations in this area. It is important that these lead to action. Thereafter, it is important to target hard-to-recycle materials. The way packaging is designed can alter the cost and viability of recycling. To date, incentives in the waste system have been focused on weight. The government is currently reviewing this approach, as reductions in weight may have reached their limit. Setting incentives to improve product design could help reduce the cost of recycling.

Some materials are particularly problematic. PVC can compromise recycling of PET, which is otherwise widely recycled.<sup>49</sup> Polystyrene is almost never economical to recycle and particularly dangerous to marine life.<sup>50</sup> In the long run, these materials need to be replaced if packaging is to be sustainable. A clear timetable

by which these products would be phased out would allow industry to develop sustainable alternatives.

A package of measures to improve supply of recyclable material, standardise collection regimes and clarify labelling is needed to push recycling rates upwards. Government initiatives and incentives to target specific products such as the Deposit Return Scheme or recent proposals on packaging reform are important steps forward, but they need to work alongside ambitious headline targets.<sup>51</sup>

**The Commission recommends that government should set a target for recycling 65 per cent of municipal waste and 75 per cent of plastic packaging by 2030. Government should set individual targets for all local authorities and provide financial support for transitional costs.**

The government should establish:

- Clear two symbol labelling (recyclable or not recyclable) across the UK by 2022.
- A consistent national standard of recycling for households and businesses by 2025.
- Restrictions on the use of hard-to-recycle plastic packaging (PVC and polystyrene) by 2025.
- Incentives to reduce packaging and for product design that is more easily recyclable by 2022.
- A common data reporting framework for businesses handling commercial and industrial waste by the end of 2019, ideally through voluntary reporting but if necessary by legislation.

# 3. REVOLUTIONISING ROAD TRANSPORT

# GETTING READY FOR THE ROADS REVOLUTION

Vehicles of the future will be cheaper, cleaner, quieter and safer.

As prices fall and range increases, take up of electric vehicles could accelerate rapidly

## ELECTRIC VEHICLES MEAN:

### 1 Cleaner air

vehicles contribute to 80% of air pollution breaches and 34% of greenhouse gas emissions

### 2 Lower costs

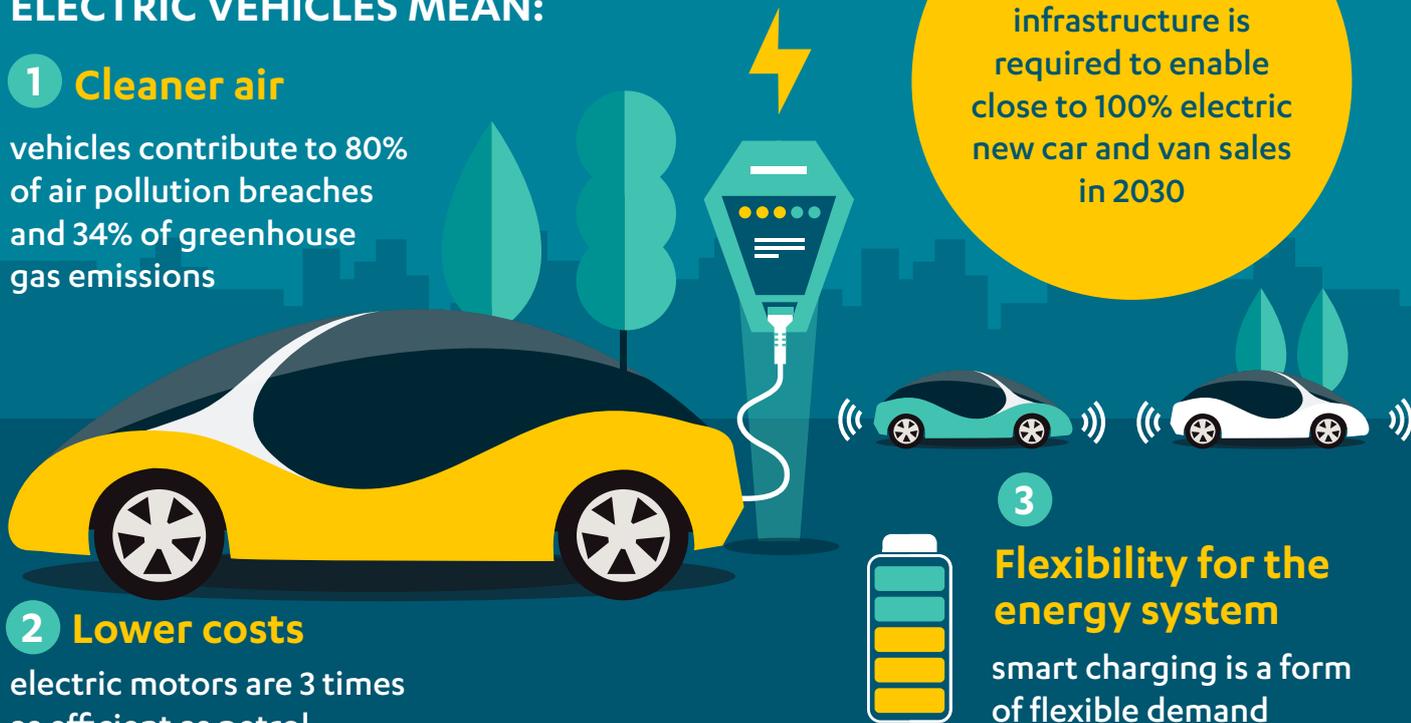

electric motors are 3 times as efficient as petrol

Charge point infrastructure is required to enable close to 100% electric new car and van sales in 2030

### 3

### Flexibility for the energy system

smart charging is a form of flexible demand

## CONNECTED, AUTONOMOUS VEHICLES WILL MEAN:

### Safer roads

over 1,700 people are killed on the roads per year

### Accessibility

more people can travel by car

### Time freed up

driving takes an average of 140 hours per year

## BUT ROADS WILL NEED TO CHANGE. SOME IDEAS ARE:

**1** Connecting cars and traffic signals, instead of waiting at the lights

**2** Flexible curbs changing use through the day, instead of yellow lines

**3** Separate lanes, instead of mixing different types of vehicle

**4** Variable speed limits, smoothing the flow of traffic

**5** Automatic re-routing of journeys, instead of traffic jams

**80** ↑

## THE COMMISSION RECOMMENDS:

Making it easier to convert parking spaces and provide charge points on the street

Investing in the electricity network to achieve the benefits of electric vehicles

Future road and rail investment plans need to reflect the impact of connected and autonomous vehicles

Government support for rural charge points

**Most journeys in the UK are made by road. After 100 years of incremental change, road transport is about to undergo a revolution. More electric cars and vans are being built and sold, and autonomous vehicles could soon be on the roads too. These vehicles will change the nature of the transport debate in the UK. Conventional vehicles bring pollution, noise and accidents; electric vehicles are cleaner and quieter, and connected and autonomous vehicles could make roads safer.**

The UK is one of the top European countries in terms of electric vehicle sales,<sup>1</sup> and government already supports the move to electric vehicles.<sup>2</sup> But the UK should speed up its preparations; electric vehicles are fast becoming cheaper and better, and take up could accelerate. With the right conditions, including a national network of electric vehicle charge points, the UK could become a world leader in electric vehicles.

There is also potential for the UK to become a world leader in connected and autonomous vehicles. KPMG has ranked the UK fifth in the world in terms of readiness for connected and autonomous vehicles,<sup>3</sup> and the UK is home to many companies developing this technology. The Commission has launched an innovation competition for ideas on how to deliver world-class roads ready for this revolution: 'Roads for the Future.'

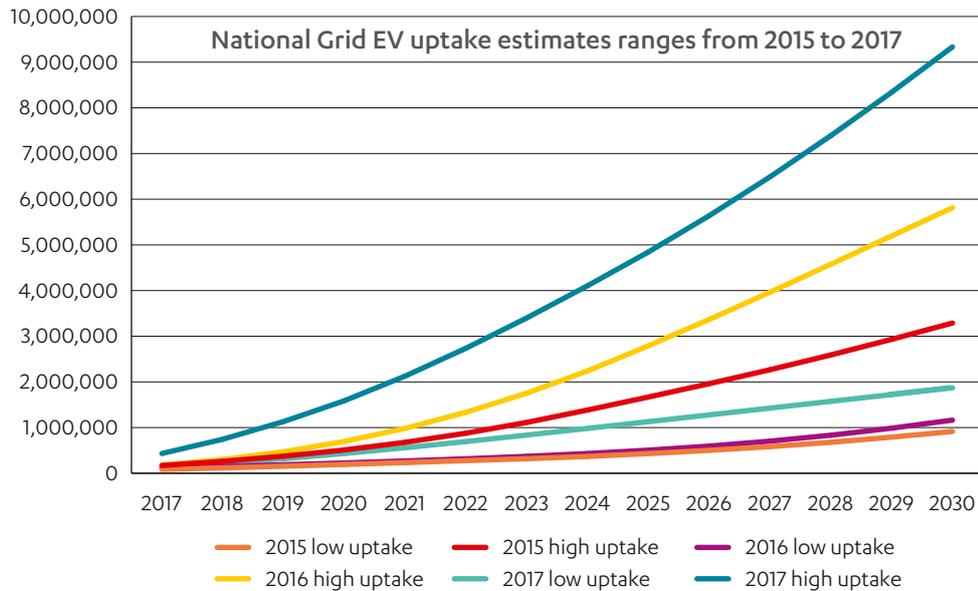

Government must set a clear policy direction to encourage private sector investment in charging infrastructure for electric vehicles, and to prioritise research and innovation for connected and autonomous vehicles in the longer term. This will require:

- enabling electric vehicles to provide additional flexibility to the energy network
- enabling commercial charge point provision, with support in rural areas
- putting connected and autonomous vehicles at the heart of government planning
- preparing roads for connected and autonomous vehicles.

## Electric vehicle uptake predictions

Electric cars and vans could become widespread ahead of most predictions, as prices continue to fall. Price falls are being driven by reductions in the cost of batteries, the most expensive component of an electric vehicle. Battery prices fell by 80 per cent between 2010 and 2016.<sup>4</sup> This initially meant that the range of electric vehicles could be extended: some cars can now travel up to 300 miles

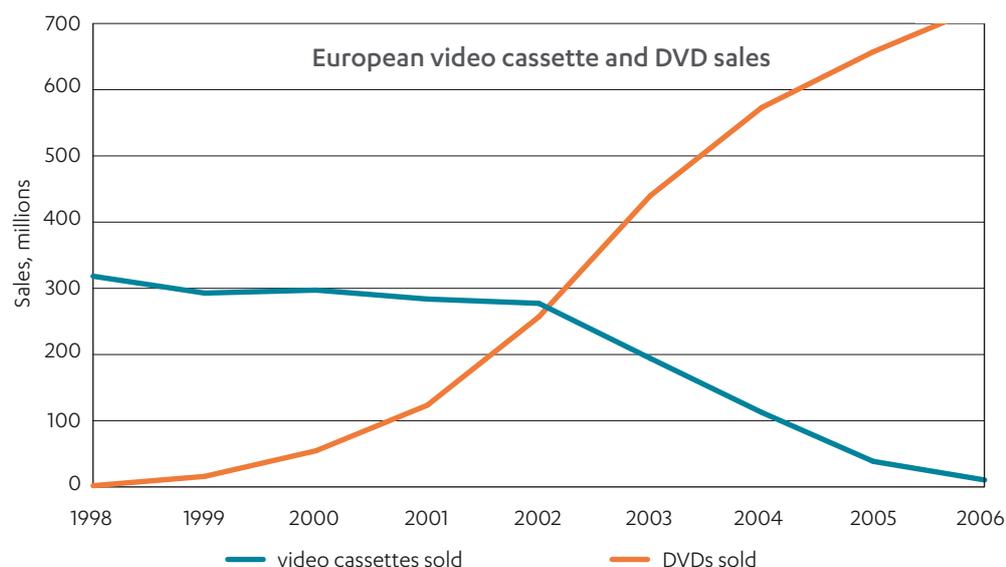

on a single charge.<sup>5</sup> Once ranges are sufficient, further falls in battery prices can translate directly into falls in the prices of the vehicles.<sup>6</sup> Upfront cost parity between electric and conventional vehicles is now expected by the mid-2020s.<sup>7</sup> And as purchase prices become comparable, fully electric vehicles will look increasingly attractive, as they are cheaper to run.<sup>8</sup> As these facts emerge, projections are evolving to reflect them: figure 3.1 shows how National Grid's electric vehicle uptake estimates have increased over the past three years.

**Figure 3.1: Range of battery electric and plug-in hybrid vehicle uptake estimates from National Grid's Future Energy Scenarios<sup>9</sup>**

Given current industry momentum and falling costs, it looks like electric vehicles, rather than alternatives such as hydrogen, will capture the market for low emission cars and vans in the short to medium term. It is too early to know if electric vehicles are the future for larger vehicles. The Commission's study on the future of the freight system, due to report in Spring 2019, will consider how to reduce emissions and congestion from road freight.

New technologies typically follow an s-shaped diffusion curve, which starts to accelerate as uptake moves into the 'take-off' period. This can start when they have reached 5 per cent of their potential market.<sup>10</sup> Figure 3.2 demonstrates how sales of videos declined as consumers switched to purchasing DVDs.

**Figure 3.2: Sales of video cassettes and DVDs in Europe over time showing a typical s-shaped technology diffusion curve.<sup>11</sup>**

In 2017, electric and hybrid vehicles represented 1.8 per cent of all new registrations, up 27 per cent on the previous year.<sup>12</sup> Electric vehicles could therefore soon enter the ‘take-off’ stage in the UK. Some projections suggest that the UK could even see 100 per cent sales of electric vehicles by 2027, and 100 per cent stock by 2042.<sup>13</sup>

A 2016 Department for Transport survey showed concern about recharging was the most significant factor preventing consumers buying an electric vehicle (45 per cent), followed by the distance travelled by one charge (39 per cent).<sup>14</sup> But aside from the need for a charging network, electric vehicles are likely to become increasingly attractive to consumers.

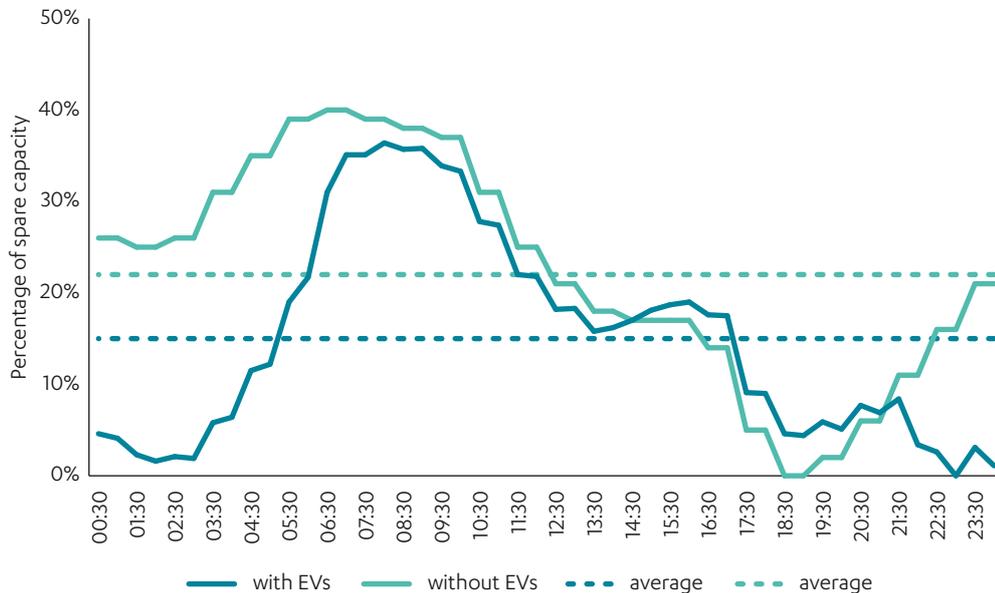

The uptake of electric vehicles will also depend on supply. Car manufacturers are beginning to ramp up electric vehicle production. Ford, the best selling car maker in the UK today, plans to have 40 fully electric or hybrid models in its global line-up by 2022, while Volkswagen, the second best selling car maker, is targeting 80 fully electric or hybrid models by 2025.<sup>15</sup> At Nissan’s factory in Sunderland, electric vehicles roll off the same production line as petrol and diesel vehicles.

A rapid increase in uptake of electric vehicles is not certain. But it is certain that electric vehicles reduce the cost of driving, lower air pollution, and reduce emissions, in addition to supporting a highly renewable energy system. Therefore, government should encourage and facilitate the swiftest possible uptake of electric vehicles.

**The Commission recommends that government, Ofgem and local authorities should enable the roll out of charging infrastructure sufficient to allow consumer demand to reach close to 100 per cent electric new car and van sales by 2030.**

## Electric vehicles and the energy system

The transition to electric vehicles will provide additional, low cost flexibility for the energy system.<sup>16</sup> When electric vehicles are able to follow price signals and charge when demand is low ('smart' charging), they help to smooth out daily electricity demand. As shown in figure 3.3, the daily demand profile with electric vehicles leads to a lower proportion of capacity being spare throughout the day than without electric vehicles. This means that electricity networks are used more efficiently and reduces the need for other types of flexibility, such as small gas engines and batteries. Overall system costs are reduced.<sup>17</sup> Furthermore, batteries considered at the end of their useful life in an electric vehicle may still retain up to 80 per cent of their original capacity.<sup>18</sup> These batteries can provide a source of storage for the grid, reducing the need for further investment (and supporting the price of second-hand electric vehicles).

**Figure 3.3: Percentage of spare generation capacity throughout the day with electric vehicles and without<sup>19</sup>**

The Commission's analysis suggests that a 100 per cent uptake of electric cars and vans could increase total annual electricity demand by 26 per cent by 2050.<sup>20</sup> However, as electric engines are more efficient than petrol or diesel, each car would use less energy overall,<sup>21</sup> and as electricity becomes increasingly low carbon, emissions would reduce. Chapter 2 sets out how the UK can achieve a low cost, low carbon energy system, whilst accommodating an increase in electric vehicles.

### Smart charging

Smart charging is essential for reducing the overall cost of the energy system as the number of electric vehicles increases. Not putting in place the necessary policy incentives could increase power system costs by £2 billion per year on

average (2030-50), adding up to £30 per year on average to consumer bills (2030-50).<sup>22</sup> This would primarily be driven by increased power prices and electricity network reinforcement costs.<sup>23</sup> Smart charging will be much cheaper for the consumer than on-demand, rapid charging, as prices are likely to be lower when there is less demand on the electricity network.

Smart charging should therefore be the default option for home charging. There is likely to be an overall consumer preference for smart and slow charging.<sup>24</sup> But this is not certain. It is slightly less convenient, and carries some risk if a car is needed for a long journey earlier than expected.

## Regulation

The Office for Low Emission Vehicles works to support the early market, and the Automated and Electric Vehicles Bill, which is currently before Parliament, will give government powers to make regulations on the specification of charge points (including requiring all charge points to be smart and interoperable).<sup>25</sup>

Given the importance of managing the interaction between charging and the energy system, it makes sense for Ofgem to take on the role of ensuring that there are arrangements to optimise use of chargers within the energy system. Ofgem should also consider whether there is a need to protect consumers from spikes in energy prices which could make rapid charging prohibitively expensive. Consumers should be able to refuel their car in an emergency without having to pay over the odds.

Government, industry and Ofgem should work together with the Office for Product Safety and Standards, the Institute of Engineering and Technology and the International Standards Organisation to ensure interoperability and the development of minimum standards for charge points.

**The Commission recommends that Ofgem should take on the role of regulating the interaction between electric vehicle charge points and the electricity network immediately, ensuring that electric vehicle charging and vehicle to grid services contribute to the optimisation of the energy system. Government, industry and Ofgem should work together to set minimum standards for a network of interoperable, smart charge points.**

## A national network of charge points

Developing a nationwide, electric vehicle charging network offers the chance for the UK to get ahead. Too often in the past, short-term interests, a lack of coordination, and a tendency to endlessly debate difficult issues and delay difficult decisions have meant the UK has been slower to adopt new infrastructures than other countries. This time can be different.

Government funding is already available in the form of grants for home, workplace and on-street residential charge points. The Autumn Budget 2017 announced a new £400 million Charging Infrastructure Investment Fund,

including £200 million of investment from the private sector.<sup>26</sup> However, so far, no private sector partner has been procured.<sup>27</sup>

## Supporting charge point installation

Building electric vehicle charge points represents a big opportunity for the private sector. Demand for charge points is likely to grow.

Charge points are already being built across the country, growing from a total of 2,880 points in 2012 to 14,160 points in 2017.<sup>28</sup> Chargemaster plc plans to expand its POLAR charging network to 25,000 chargers by 2020.<sup>29</sup> A UK-based energy company, Pivot Power, is working with National Grid to build 45 new charging sites, each with up to 100 charge points, across the country, investing £1.6 billion.<sup>30</sup> And some petrol companies, such as Shell, have already begun installing electric vehicle charge points at their petrol forecourts.<sup>31</sup>

However, some potential charge point providers may be put off by the uncertain cost of connecting new charging infrastructure to the electricity network. New connections can trigger the need for network reinforcement, which the customer pays a proportion of as a connection charge.<sup>32</sup> Ofgem aims to avoid imposing general charges for reinforcement costs, preferring to link them to a customer's own network usage. However, this needs to take into account the indirect system benefits from both rapid and smart chargers.

Rapid charge points are more likely to trigger reinforcements than slow, smart chargers. They do not directly benefit the energy system in the way that smart chargers do. However, at present rapid chargers also provide an indirect benefit to the electricity network by reducing range anxiety, incentivising uptake and therefore incentivising the spread of smart charging.

Passing reinforcement costs on to public charge point providers risks reducing the amount of charge points installed and ultimately ignores the benefits that network users gain from an electric vehicle fleet. Ofgem's recent process to look into whether extra investment was required concluded that given the current pace of change it was unlikely to be needed before 2023. However, this was only done in consultation with network owners and not with the aim of facilitating a rapid uptake of electric vehicles.<sup>33</sup>

The Commission believes that this represents a missed opportunity. Ofgem should take a more proactive approach to preparing for future reinforcement needs for charging points; electricity networks should work with charge point providers to identify likely future reinforcements and invest ahead of time.

**The Commission recommends that Ofgem should commission electricity network operators to work with charge point providers to identify potential anticipatory investments required to accommodate public charging infrastructure. Opportunities for investment within the current price control period should be identified by Summer 2019.**

Furthermore, engagement with local authorities should not hold up the process of delivering charge points. Local authorities should work with commercial investors, make it easy for charge points to be built on their land, require charge points to be built as part of new developments, and free up parking spaces to be used for electric vehicle charging.

If travel patterns and car ownership models are fundamentally disrupted, vehicles may park and charge in different locations to today. But in the short term ensuring that charge points are installed and accessible for electric vehicles, and that this rollout is balanced against the needs of drivers of internal combustion engine vehicles, must be a priority.

On-street charge points for electric vehicles will be particularly important in dense urban areas where access to home off-street parking is limited, but these are the same areas where parking spaces in general will be at a premium. Local authorities will need to work with private sector providers and electricity network owners to identify where demand for charge points is likely to be highest, and ensure that there are sufficient parking spaces available for charge point installation as demand materialises.

**The Commission recommends that government should place a requirement on local authorities to work with charge point providers to allocate 5 per cent of their parking spaces (including on-street) by 2020 and 20 per cent by 2025 which may be converted to electric vehicle charge points.**

## **A visible core network**

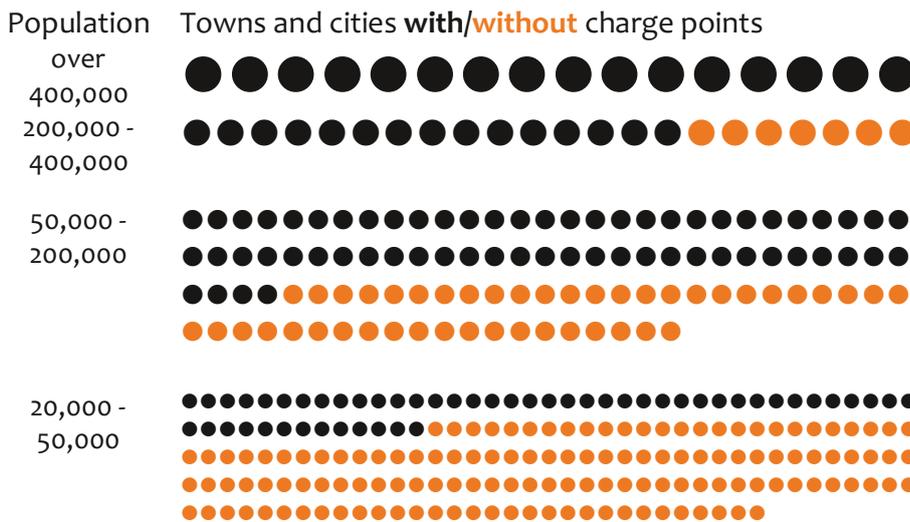

Although the majority of charge points are likely to be slow and smart, having a core network of visible, rapid chargers in place could significantly increase the pace of uptake. This network should provide both sufficient coverage, so that it is possible to find a charge point within a reasonable distance throughout most of the country, and enough power to fully recharge an electric vehicle within a reasonable timescale (for example within 1 hour). To enable close to 100 per cent of new car and van sales to be electric by 2030, the core network would need to be in place in the early 2020s to avoid inhibiting electric vehicle uptake.

The charge point network is often compared to the petrol station network but differs in two respects. Firstly, drivers of petrol and diesel vehicles do not suffer from range anxiety. Consumer confidence already exists in the petrol station network. Visible charge points in more places will combat this issue for potential electric vehicle drivers, and allay their concerns about being able to travel anywhere in the UK.

Secondly, the shape of the charging network is likely to be different to the petrol station network. Electric vehicle owners are more likely to recharge in towns and places where they can undertake other activities, than stop en-route. And petrol stations need to be accessible for fuel deliveries, which is not a consideration for charge points.

The pattern of private sector provision of charge points in the early stages of the electric vehicle market is likely to be similar to mobile and fixed broadband, where provision is strong in densely populated areas, but rural areas are initially underserved. Charge points in rural locations, which benefit users and society by contributing to a complete network providing coverage across the country, will not be as profitable as those in urban centres and main arterial routes, and many of the benefits from providing this network will go to electric vehicle purchasers and manufacturers rather than charge point providers. Therefore, commercial investors are less likely to build charge points in rural areas before electric vehicles become the mainstream choice.

This means there is a case for government support to build charge points in rural areas, to deliver a core national network in the short term, before relying entirely on the private sector to take forward the delivery of the network at scale as the pace of uptake increases. There are 332 'built-up' areas<sup>34</sup> in the UK with populations above 20,000. 187 of these are not served by a rapid charger. There are 145 built-up areas with populations above 50,000, 52 of which are not served by a rapid charger (shown in figure 3.4).

**Figure 3.4: Proportion of built-up areas with at least one rapid charge point in June 2018 (by population)<sup>35</sup>**

At least one rapid charger in each of those places would represent a reasonable core network. The cost of installing a rapid charger is around £50,000, so the costs of installing chargers at 200 currently unserved locations would be around £10 million. Government does not need to directly own or operate these charge points.

**The Commission recommends that government should subsidise, by 2022, the provision of rapid charge points in rural and remote areas, where the market will not deliver in the short term.**

## Preparing for connected and autonomous vehicles

Whilst electric vehicles represent a revolution in how vehicles are powered, the changes delivered by connected and autonomous vehicles could be more profound still. Connected and autonomous vehicles could have implications for the roads themselves, as well as the way people travel.

Connected vehicles can communicate with other vehicles or infrastructure on the road network, to assist with safer and better informed driving. Autonomous vehicles use a range of technologies to reduce the need for human involvement for navigating the road. These vehicles will have impacts on infrastructure design, capacity, demand, travel patterns, land use, and interactions between transport modes. All this is not yet understood. Government should start planning for these changes now.

Connected and autonomous vehicles will create new travel opportunities, free up time focused on driving, and could improve safety. They could also increase road capacity, enable higher speed limits and shorter journey times, encourage vehicle sharing, and release street space currently used for parking. Traffic lights and stop signs may become unnecessary. And the use of road space could be automatically and constantly changing according to need.

It is uncertain when fully autonomous vehicles will be a reality on the roads. Existing technology can already control the vehicle in a wide range of circumstances and is increasingly being deployed within cars on the market today.<sup>36</sup> Some estimates suggest that self-driving cars could be on the road by the 2020s,<sup>37</sup> although others predict this will take much longer. But despite uncertainty about the timetable and extent of change, it is no longer reasonable to assume existing patterns of road use will remain unchanged in future.

Government must first act decisively on the Commission's recommendation in *Connected Future* to roll out digital connectivity across the road network, starting with the strategic roads network by 2025.<sup>38</sup> Research indicates that improved connectivity, either 5G or in other forms, could enhance the road capacity benefits of automation by improving vehicle-to-vehicle and vehicle-to-infrastructure communication.<sup>39</sup>

The potential impacts and benefits of connected and autonomous vehicles vary in different places and on the level of automation. For example, in urban areas, although careful management will be needed to avoid adding to congestion, automated on-demand public transport options could provide more convenience than buses or trams. Road transport is unlikely to supplant rail in its core markets: commuting into city centre (where physical space is a key limitation) and long distance city centre to city centre travel (where rail has a speed advantage). However, overall, connected and autonomous vehicles could have a significant positive impact on interurban connectivity.

## Building the evidence base

Government has made a good start in positioning the UK as a centre of excellence for connected and autonomous vehicles. It has created a conducive environment for trialling, stimulated private sector innovation through various funding initiatives, and launched an extensive review of the regulatory environment. It has also begun to think strategically about the longer-term implications for transport through programmes such as the Industrial Strategy's Grand Challenge on the Future of Mobility.

These key steps are welcomed by the Commission. But the research programme now needs to evolve to ensure that connected and autonomous vehicles are central to transport policy and investment decision-making in future. In October 2017, government was funding at least 53 separate research projects, but the evidence on the impact of connected and autonomous vehicles has so far not been sufficient to influence the latest plans for road and rail (the second Road Investment Strategy and Network Rail's Control Period 6).

Planning for the 2025-2030 investment period, when highly autonomous vehicles are predicted by some to be on sale, will begin in the early 2020s. Government should aim for evidence on the impact of connected and autonomous vehicles to be sufficiently robust to start to factor in policy making for both planning processes.

**The Commission recommends that government should address the implications of technological innovation in long term transport planning processes, including the next rail control period and road investment strategy.**

## A research framework

A research framework is required, focussing on four key areas: technology; legislation and regulation; people; and infrastructure. Extensive work is already being undertaken on the first two areas. Therefore, the priority for new research within the framework should be to focus on people and infrastructure, where research is less advanced. These two areas are fundamentally linked; how roads are changed to accommodate connected and autonomous vehicles will reflect and impact how, where, when and why people choose to use them and other forms of transport.

To assess people's behaviour patterns, trials will need to ensure that the information gathered is useful and reflects a wide cross-section of the public. While reliable forecasts of the take up and use of connected and autonomous vehicles are not likely to be developed until highly autonomous cars are on sale, government should focus on improving existing analytical tools to prepare as far as possible.

In terms of infrastructure, the government will ultimately need to determine changes in the way roads are planned, designed and operated to maximise the potential benefits of connected and autonomous vehicles. A key question will be

how acceptable it is for individual drivers to give up a degree of control, at least on parts of the road network, to improve the outcome for road users. Despite the uncertainty, the process of thinking about how roads should adapt must start now, and take a flexible approach.

## Roads for the future

The Commission launched 'Roads for the Future' in January 2018: an innovation competition on how roads should be designed, managed and used to maximise the benefits of connected and autonomous vehicles. An overall winner will be announced in September. The shortlisted entries are:

**Smart signals, AECOM, York:** Examining how smart signals could alert drivers and vehicles to the speed they should drive at so they arrive at the next set of traffic lights just as they turn green, cutting congestion and ending polluting 'stop-go' driving.

**Active traffic management, Leeds City Council, Leeds:** Examining how the data generated from digitally connected cars could be used to improve traffic light systems, allowing highway authorities to better manage traffic on their roads.

**FlexKerbs, Arup, London:** Looking at how kerbsides with fixed features such as double yellow lines, parking bays and bus stops could become more flexible, changing their use according to the time of day and levels of demand.

**AI short term traffic prediction, Immense Simulations, Oxford:** Using AI to help sat-nav systems to 'learn' better routes to improve the directions given, so that both driven and driverless cars could change course to avoid congestion.

**Segregated connected and autonomous vehicle zones, City Science, Exeter:** Examining how sections of existing roads could be dedicated to driverless cars, making it easier for highways authorities to manage risks, integrate connected and autonomous vehicles into the existing transport network, and encourage take-up.

To ensure that the framework is delivered and connected and autonomous vehicles are fully embedded in long-term transport planning processes the right structures need to be in place within government. At present, there is no single long-term home within government for research and analysis into future disruptive transport technologies.

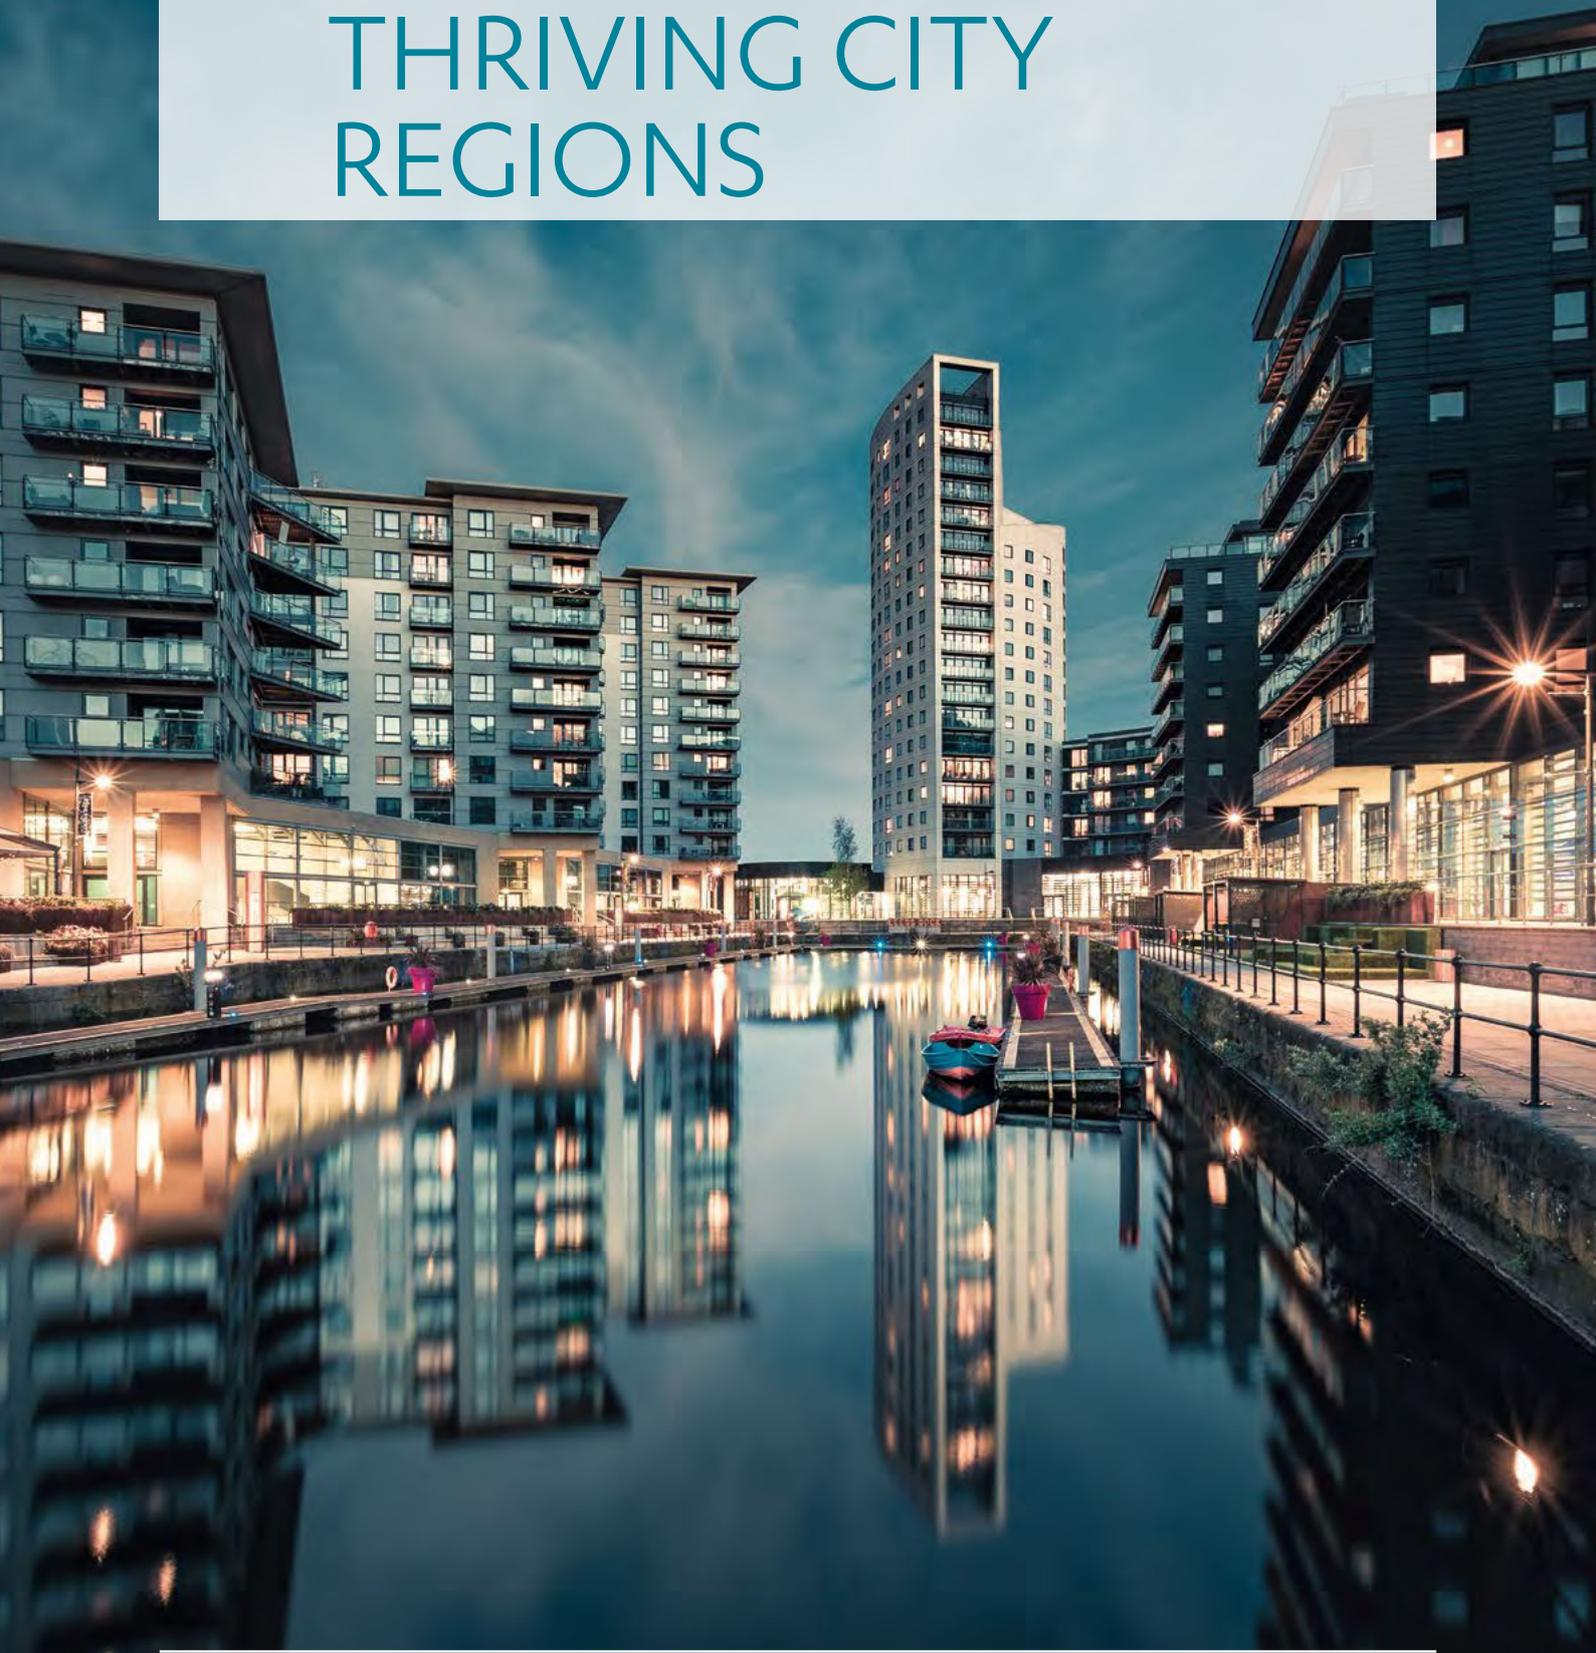

The Commission therefore believes that a new body should be created, subsuming the Centre for Connected and Autonomous Vehicles' current functions but with a wider policy remit and a more influential role in the Department for Transport's long-term transport planning processes. Amongst its responsibilities should be the Commission's proposed connected and autonomous vehicles framework. However, its core focus should be on ensuring that technological innovation is fully embedded in the planning processes for the third Road Investment Strategy and the next rail investment cycle, Control Period 7.

The Commission recommends that government should establish a centre for advanced transport technology in the Department for Transport to bring together work on technological innovation and ensure its implications are central to future investment proposals. This should include developing and overseeing the Commission's proposed connected and autonomous vehicles framework.

# 4. TRANSPORT AND HOUSING FOR THRIVING CITY REGIONS

# CITIES ARE THE PRIORITY FOR FUTURE TRANSPORT INVESTMENT

Investing in urban transport can support productivity and quality of life

Intercity transport is getting the investment it needs

Highways England  
**4 billion**  
per year (2020-25)

Network Rail  
**6 billion**  
per year (2019-24)

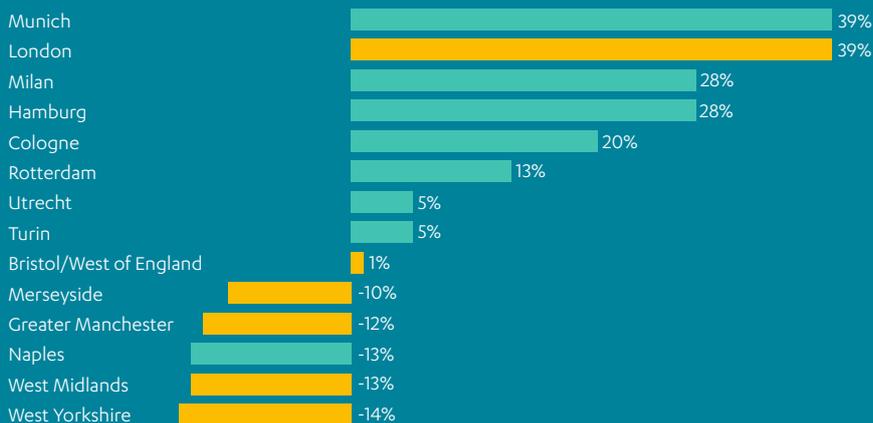

High Speed 2  
**4 billion**  
per year (2020-30)

**BUT:**

productivity is low in too many UK cities, unlike in Europe

GVA per capita relative to national average for relevant country

Transport networks are close to capacity in many UK cities

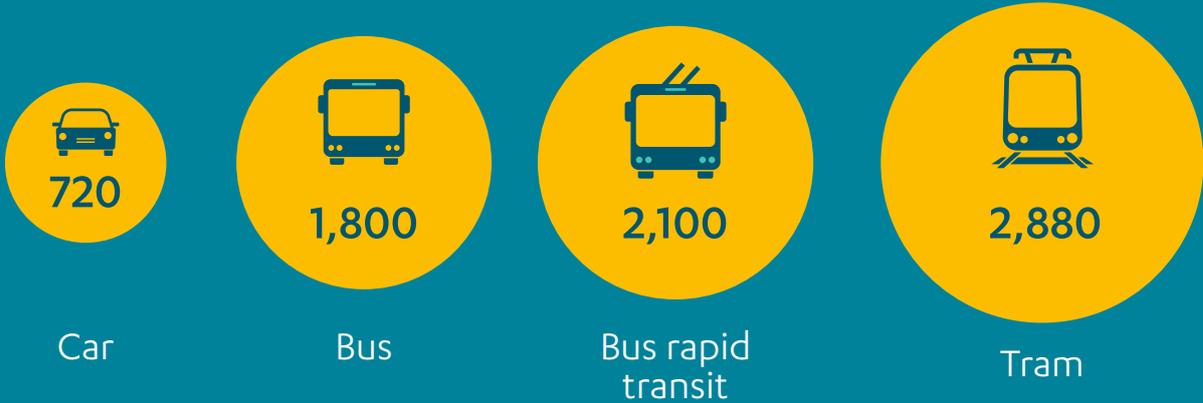

In cities, better cars can't solve the problem as there isn't enough space

## Mass rapid transport is needed to increase accessibility

Typical maximum capacity per lane (inbound passengers per hour)

But transport alone isn't enough – cities need skills, green space, cultural and leisure activities

### THE COMMISSION RECOMMENDS:

City-led plans for transport to connect housing and jobs

Devolved, long-term funding to give certainty to all cities

Major projects in the fastest growing, most congested cities

Sources: HM Treasury, Network Rail, Department for Transport, Eurostat, ONS, Steer Davies Gleave

**Cities can and should be great places to live and work. But their increasing popularity means they are becoming full and congested, and this risks inhibiting growth and undermining quality of life. Space in cities should be used effectively, with room allocated for fast, frequent public transport systems, well connected and affordable housing, and pleasant public spaces. This will require a new approach to governance, strategy and funding for urban transport.**

In recent years, government has prioritised major upgrades to transport between cities. The next wave of major upgrades should increase the focus on transport within cities. Infrastructure cannot drive growth alone; other factors, especially skills, are essential. But lack of infrastructure can inhibit growth.

The UK is unusual in that most large cities outside of the capital are less productive than the national average; cities such as Birmingham and Leeds should have the potential to be as successful as major cities elsewhere in Europe which boost their countries' productivity.<sup>1</sup> But this will require vision and planning. London, and to some extent Manchester, have benefitted from having a mandate to transform their cities' transport infrastructure. Other cities, large and small, need to be able to take the same approach.

Unlocking growth in cities requires:

- developing integrated strategies for housing, employment and transport, to allow cities to grow and people to live and work where they want
- devolving planning and funding for urban infrastructure to all cities
- prioritising major upgrades for cities with the most growth potential and capacity constraints
- £43 billion of additional investment in urban transport by 2040

## Cities as social and economic hubs

Cities<sup>2</sup> are increasingly critical to the UK's economy and international competitiveness. The benefits of firms in knowledge based services clustering together in close proximity has made city centres attractive places for firms to locate, leading to a revival in many cities' fortunes.<sup>3</sup> They are hubs for high value industries and employment; 60 per cent of all jobs and 71 per cent of knowledge intensive business service jobs are in cities.<sup>4</sup> Supporting growth in city-regions is essential to providing balanced growth across the UK, as cities provide employment and a range of specialist services across a whole region.

Cities have also become more attractive places to live as they have attracted highly skilled workers and cultural and leisure amenities have grown.<sup>5</sup> More than half of the UK's population live in cities, and as the UK economy has become more city focused, the popularity of cities has grown.<sup>6</sup> London's population fell from 8.6 million in 1939 to 6.7 million in 1988, but this huge shift has since reversed, with London growing 30 per cent to 8.8 million in 2016.<sup>7</sup> In other major cities, recovery started later, but in almost all cases population growth was stronger in the 2000s than in the 1990s and has accelerated in the current decade.<sup>8</sup>

## Unlocking growth

Enabling people to work and live in or around cities is a key way in which infrastructure investment can support growth in every region. There are fast growing, infrastructure constrained cities spread across the regions of the UK,<sup>9</sup> and addressing these constraints is the greatest opportunity for infrastructure to help each region to do better.

Most major UK cities lag behind national productivity levels. This contrasts with large cities in many other European countries, which add to their countries' productivity.<sup>10</sup> Infrastructure cannot drive growth alone; other factors, especially skills, are essential. But lack of infrastructure can inhibit growth. To sustain future growth, transport policy must reflect the economic and structural changes that are shaping the UK's transport needs.

The priorities for transport investment should be growing and congested urban areas and their catchments, the key interurban corridors, and the key international gateways.<sup>11</sup> There has been welcome progress on the latter two areas in recent years. After years of delays, decisions on aviation capacity are being made following the report of the independent Airports Commission.<sup>12</sup> Investment in interurban corridors has increased sharply and is planned to increase further in the 2020s. Chapter 7 sets out the Commission's proposals for future investment in the strategic road and rail networks, with substantial continued investment. Chapter 3 sets out the need for future plans to respond to the opportunities from connected and autonomous vehicles.

However, investment in urban transport outside of London continues to lag behind.<sup>13</sup> Urban transport networks underpin commuter journeys that create deep labour markets, and enable people to access cultural and leisure activities. Most urban journeys are short, relying predominantly on urban transport networks. The average trip length for people who live in cities and towns is under 10 miles, with fewer than 5 per cent of journeys over 25 miles.<sup>14</sup> Rail journeys tend to be longer, but most start or end in cities.<sup>15</sup> Infrastructure to support public transport in growing and congested cities offers some of the highest returns for transport investment.<sup>16</sup>

## Investment in local and strategic transport

### Intercity networks

Investment in national road and rail has been increasing, with further investment forthcoming to improve interurban transport. Highways England is proposing to spend more than £4 billion per year from 2020 to 2025; the government has committed around £6 billion per year for Network Rail between 2019 and 2024; in addition, HS2 is expected to cost around £4 billion per year on average throughout the 2020s.<sup>17</sup> Northern Powerhouse Rail will deliver long overdue improvements in travel times between the major cities of the North of England.

Continued focus is needed to deliver these major commitments. Sub-national transport bodies will need to work with government on the development and delivery of these programmes and will play an important role in ensuring that they are integrated with regional and local networks.

### Local road maintenance

In recent years, insufficient funding has led to poor conditions on local roads, affecting road users throughout the country. Six per cent of urban local A roads are considered to be in poor or very poor condition, and 3 per cent of rural A roads.<sup>18</sup> This creates hazards for road users, and also increases the long term cost of maintenance. The economic case for maintenance is very strong, since inadequate upkeep creates a risk that roads may need to be closed for emergency repairs.<sup>19</sup>

The major funding decisions for transport in the first half of the 2020s – Road Investment Strategy 2 for Highways England, Control Period 6 for Network Rail and major projects such as HS2 – have already been made or are shortly to be decided. They therefore fall outside the scope of the Assessment, since the Commission’s remit states that the Commission “will not reopen decision making processes where programmes and work have been decided (or are due to be decided immediately after a [Commission] report is published)”.<sup>20</sup>

It is for the Department for Transport to prioritise in the early 2020s between providing the funding needed to maintain the existing road network or to deliver the full programme of enhancements. In the later 2020s, the Commission believes that £500 million a year of funding should be made available for local highways authorities to address the local road maintenance backlog probably through to the early/mid 2030s.

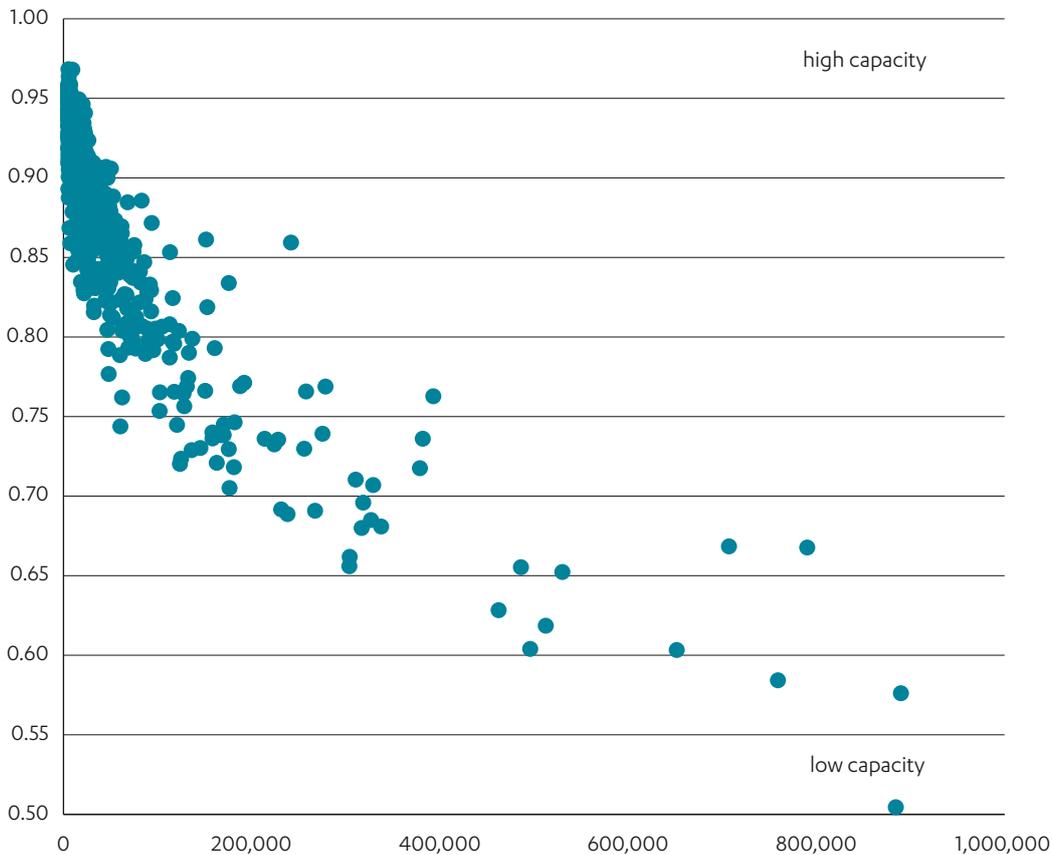

**The Commission recommends that government should make £500 million a year of funding available from 2025/26 to 2034/35 for local highways authorities to address the local road maintenance backlog.**

### Urban transport

In growing urban areas, transport networks are coming under increasing pressure. Cars and buses in central Manchester or Bristol experience delays of more than 100 seconds per mile travelled.<sup>21</sup> This compares to an average of 78 seconds on all urban A roads, 22 seconds on rural A roads and 9 seconds on

the intercity road network.<sup>22</sup> Crowding on the railway is also focused on cities, particularly London, Manchester, Birmingham and Leeds.<sup>23</sup>

Figure 4.1 shows that the capacity of road networks to deal with peak traffic falls with increases in the size of towns and cities, particularly in areas with populations above 100,000. The chart uses the Commission's newly developed measure of how quickly people can travel from where they live in a town or city (using the Office for National Statistics' 'built up areas' definitions) to that town or city's centre of employment. The dataset and technical details are available on the Commission's website. The chart uses the ratio of peak to off-peak connectivity for towns and cities to assess capacity constraints. A value of 1 implies that the connectivity is the same at peak and off-peak times. Lower values imply constraints at peak times. As settlement size increases, road networks become increasingly less effective at managing peak demands.<sup>24</sup>

**Figure 4.1: Built up area population and ratio of peak to off-peak connectivity for built up areas with population under 1 million<sup>25</sup>**

### Making best use of limited space

More investment in public transport, alongside the promotion of safe cycling and walking, is the only way that cities can increase their infrastructure capacity to support growth. Connected and autonomous vehicles could have a positive impact on intercity transport, but they will never be an effective replacement

for high capacity public transport in dense city centres and may simply increase pressures on road space.<sup>26</sup>

New forms of public transport – from dockless cycle or even electric scooter hire to autonomous buses – are emerging. City leaders need to consider how to manage the impacts of changing travel patterns in their transport planning. But the basic challenge of urban transport is still the same: there is simply not enough space in cities for everyone to travel by car.

Typically new roads lead to new journeys, filling up the additional space.<sup>27</sup> But, as shown in figure 4.2, it is possible to increase capacity by investing in high capacity public transport.

Transport mode	Typical maximum capacity per lane (inbound passengers per hour)
Car (1.2 people – current commuter average)	720
Bus	1,800
Bus rapid transit	2,100
Tram	2,880

**Figure 4.2: Maximum system capacity for different modes of transport<sup>28</sup>**

A less car focused approach to urban transport can also bring other benefits, including:

- the opportunity to build well designed city centres focused on people's needs
- reallocating space from roads and parking to pedestrianised areas, leisure amenities and green space
- better, safer provision for cycling and walking
- improved transport networks that are more accessible for older and disabled people
- infrastructure aligned with schemes to bring brownfield land back into use, which can help regenerate inner cities.<sup>29</sup>

Poor air quality is also a significant cost of cities dominated by petrol and diesel cars, and has a damaging impact on health. However, in the long term widespread adoption of electric vehicles will reduce the harm caused by this, so it is important that cities help to facilitate the rapid uptake of electric vehicles, as set out in Chapter 3.

## Improving transport in every city

Government should make sure all cities are able to deliver the appropriate transport infrastructure in their area. This requires changes in strategy development, funding and governance for urban infrastructure in cities outside London.

### Strategy development

Transport policy should not be about schemes. Investment needs to enable the journeys that allow people to live and work where they want to, and to connect people to wider services. Decision makers need to understand all the characteristics of the local economy, environment and geography. Transport policy needs to be integrated with a clear strategy for where housing growth can be accommodated in and around cities, and where employment growth is likely to occur. Linking transport enhancements to housing growth is essential to get the most value from investment.

City leaders should implement long term plans for their city-region reflecting their own economic and social priorities, based on their own local knowledge and accountability. These need to integrate transport, housing and employment. Other urban infrastructure, such as digital (see Chapter 1), electric vehicle charging (see Chapter 3) and flood resilience (see Chapter 5) also needs to be considered.

Recent government policy on devolution has meant cities increasingly have the right powers and governance to tackle these issues, particularly in cities with mayors. However, integration of strategies for transport and housing requires integration of decision making. Currently, leaders in large cities need unanimous approval from individual districts to all aspects of any integrated development plan, limiting the level of ambition. This needs to be addressed to maximise the value from new urban transport infrastructure.

Beyond this, a lack of long term funding means that, outside of London and Manchester, few cities have developed integrated strategies, since there has been no realistic prospect of being able to implement them. In some cities, this has also led to a lack of strategic capacity.

### Funding

Local leaders making long term plans for their cities need long term certainty on funding. There is a lack of long term, stable and certain funding structures to support investment in urban transport outside London. City and local leaders have to bid to many different government competitions, which provide an unpredictable and short term funding stream and place a significant strain on the limited revenue funding available for transport planning.<sup>30</sup> The government's recently created Transforming Cities Fund improves on previous funding arrangements by giving mayors more flexibility over their funding allocations,

and simplifying requirements before funding decisions can be made. But more progress is needed.

Local transport authorities outside London should have stable, devolved infrastructure budgets, as Highways England and Network Rail have. The devolved budget should comprise of five year settlements, with fixed annual budgets set at least two years before the start of the five year period. This budget should be sufficient to cover all maintenance, small to medium enhancement projects and programmes to deploy or pilot new smart infrastructure technologies.

Devolved infrastructure budgets will be a replacement for Department for Transport and Local Growth Fund grants for local infrastructure, and they will be complementary to the funding that authorities can raise locally through fare income and other local revenue sources.

Maintenance allocations should be determined according to the cost of keeping the relevant infrastructure assets held by the authority in working order. Funding for small to medium enhancement projects in cities should be allocated according to the size of the city, the city's density, and evidence that the city's projected growth will outstrip its existing infrastructure capacity.

Increased funding for cities should be available to all cities with a population over about 100,000 to reflect the higher infrastructure needs of denser urban areas. This broadly matches the definition of 'primary urban areas' (54 cities in England outside London).<sup>31</sup> Whilst there is no perfect boundary, a population of around 100,000, as shown in figure 4.1, is the point at which capacity constraints become most serious.

The level of funding for devolved infrastructure budgets in cities should ensure their spending power increases by around 10 per cent during the 2020s compared to current urban transport investment, an increase of approximately £300 million per year, and increases by around 30 per cent or over £1 billion per year by the mid 2030s. This totals around £12 billion from 2020 to 2040. Chapter 7 sets out the choices that the Commission has made within the resources set out by the government. With large existing commitments, such as HS2, in the 2020s, new funding for cities has to build up gradually. Funding for authorities outside cities should remain broadly at current levels.

To ensure the long term stability of funding for cities and local authorities, government should legislate for an obligation to publish infrastructure allocations in advance. In the future, government should also consider whether local tax raising may be more appropriate than central government grants.

As well as increased funding for investment, it is important that local infrastructure authorities have the resources they need to increase their transport capacity. Government should therefore ensure sufficient revenue funding is available for local project development, network management and bus operations, especially in cities.

## Governance

The appropriate authority to make decisions on how to invest devolved urban infrastructure funding will usually be one that already exists: a mayoral combined authority, combined authority or unitary authority. But some cities have no urban infrastructure authority of their own and are served by a county council. In these cases government should ensure that arrangements are put in place for an appropriate urban infrastructure authority.

Once funding is devolved to local authorities, central government should not have powers over how it is spent. Cities will need to coordinate with Highways England and Network Rail and may, in some cases, choose to use some of their resources for enhancements to the strategic networks in partnership with them. Local authorities should be expected to make evidence based decisions, evaluate performance of their investments and publish information enabling them to be held to account by local people on how they have invested in infrastructure. Chapter 6 sets out the Commission's proposals on how to use better data to improve the appraisal and selection of projects. In cases of serious failure, government could withdraw funding devolution.

**The Commission recommends that cities should have the powers and funding they need to pursue ambitious, integrated strategies for transport, employment and housing.**

- **By 2021, metro mayors and city leaders should develop and implement long term integrated strategies for transport, employment and housing that will support growth in their cities.**
- **By 2021, government should ensure city leaders have the right powers to deliver these integrated strategies, including the power for metro mayors to make decisions on major housing development sites.**
- **Government should set out devolved infrastructure budgets for individual cities for locally determined urban transport priorities in line with the funding profile set out by the Commission. Budgets for 2021-2026 should be confirmed by mid 2019. Government should pass legislation, by 2020, requiring cities to be given regular five year infrastructure budgets.**

## Infrastructure to support housing

Infrastructure needs to promote new housing and new communities in areas where they are needed. Infrastructure alone will not solve the UK's housing challenges, but better coordination of infrastructure with new developments is vital if infrastructure is to be deployed effectively.

Siloed planning and delivery of utilities infrastructure and housing means that providing utilities to new housing developments can often be a cause of delay to construction. Consultation responses to *Congestion, Capacity, Carbon: priorities for national infrastructure* identified three causes.

Firstly, there is a tension between the requirements on regulators to protect consumers from price rises and to invest in future infrastructure provision, which can generate perverse outcomes for the delivery of timely infrastructure. In particular there is a lack of incentive for utility companies to develop increased capacity in advance of development, putting these costs on housebuilders. This can create coordination failures where upgrades are large and exceed the needs of any individual development.

Secondly, the diversity of organisations (the Distribution Network Operators, the industry regulators, local planning authorities) involved in the planning, design and delivery of utilities infrastructure in England leads to division and poor communication. And thirdly, there is a lack of mechanisms to improve coordination between housing and infrastructure for smaller scale housing developments.

The Commission will conduct more detailed analysis on the role of utilities in the delivery of housing, working with stakeholders and liaising with ongoing studies.

## The next wave of infrastructure upgrades

Substantial funding must be set aside for major upgrade programmes in the city-regions that need them the most, in addition to the devolved funding for small to medium enhancements. London has had the advantage of receiving exceptional funding for upgrades to capacity such as Crossrail. Other cities should have this benefit too. This could provide cities in the UK with major capacity upgrades such as metros or bus rapid transit.

Major upgrade programmes require higher levels of funding to be concentrated in a few areas temporarily, and even fast growing cities do not require transformative upgrades on a continuous basis, meaning that a process of prioritisation is required. Funding should be agreed for major new capacity programmes in cities where infrastructure is the most significant constraint on growth. Identifying programmes will take time; most cities have not developed plans at this scale because they have lacked funding streams that could realistically deliver them. In some cities, it will be important to build capability in strategy, procurement and delivery before launching major investment programmes.

Before funding is agreed, cities should commit to additional housing development alongside new transport, linking employment growth to new homes. They should also be able to demonstrate that they can provide a local contribution to project costs, as for Crossrail 2, although the proportion may need to vary to reflect regional circumstances.<sup>32</sup> This contribution should include local fundraising, potentially through fares or local taxes.

Central government should work closely with cities before making final commitments to funding. Not everywhere will need major investment. The initial phase should identify priority cities. Figure 4.3 illustrates how capacity constraints and expected employment growth vary considerably between cities. This uses the Commission's new measure of transport connectivity (see figure 4.1)<sup>33</sup> and employment growth estimates<sup>34</sup> derived from Office for National Statistics' population projections (which roll forward data from the recent past, adjusting for demographics, and are not forecasts).

Having identified priority cities for the first wave, government should work with them as they develop specific project proposals to support growth. When final proposals are submitted to government, they should also be reviewed by the Commission. The government should then make final decisions on major upgrade programmes and allocate funding, making long term commitments into future spending review periods where necessary.

**Figure 4.3: Capacity constraints on the roads and employment growth projections for 2018-50 within city centres outside London, based on Commission analysis.**

Note: The 25 largest cities by employment are shown in orange, with smaller cities in grey. Cities further to the right are projected to grow faster in their city centre, while cities nearer to the top have greater capacity constraints into the city centre.<sup>35</sup>

Not all cities will need large scale investments. In some, existing capacity and incremental enhancements will be sufficient. Others that are not included in the first wave should be considered for inclusion in future rounds of funding, especially where lower cost interventions, such as bus schemes, have identified demand in key transport corridors. Given the long term funding being proposed

(major capacity programmes could easily need to be funded for 5-10 years) future rounds should take place no more than once or twice per parliament. It is essential that the process makes choices about the most important investments rather than giving many small funding grants. Around £31 billion is required by 2040 for major urban transport capacity programmes, delivering on growth needs over that period and preparing for future growth.

**The Commission recommends that government should allocate significant long term funding for major capacity upgrades in selected growth priority cities, in line with the funding profile set out by the Commission. Cities benefiting from major projects should make commitments on housing delivery and provide at least 25 per cent of funding. Priority cities should be identified by mid 2019, with long term investment commitments agreed by 2020. Future rounds should take place no more than twice a parliament.**

## London

Development of regional cities should be in addition to and not instead of continuing to invest in London. The UK's highest value jobs continue to be in London and it is projected to grow faster than anywhere else, with employment growing 18 per cent to 6.7 million by 2041.<sup>36</sup> Taxes paid in London and its surrounding regions fund infrastructure and other services in other regions of the UK, contributing £3,070 per person to the rest of the UK in 2016.<sup>37,38</sup> And it is an internationally competitive city; infrastructure constraints on London's growth are as likely to cause displacement overseas as they are to elsewhere in the UK.

London's transport networks are already more congested and overcrowded than anywhere else in the country. Future growth will not be possible without substantial increases in capacity. The Commission has already recommended that Crossrail 2 should go ahead to increase capacity into central London. The Mayor's Transport Strategy sets out a wider range of interventions that will be needed, including improvements to bus networks, cycling infrastructure, the Underground and suburban rail lines.<sup>39</sup>

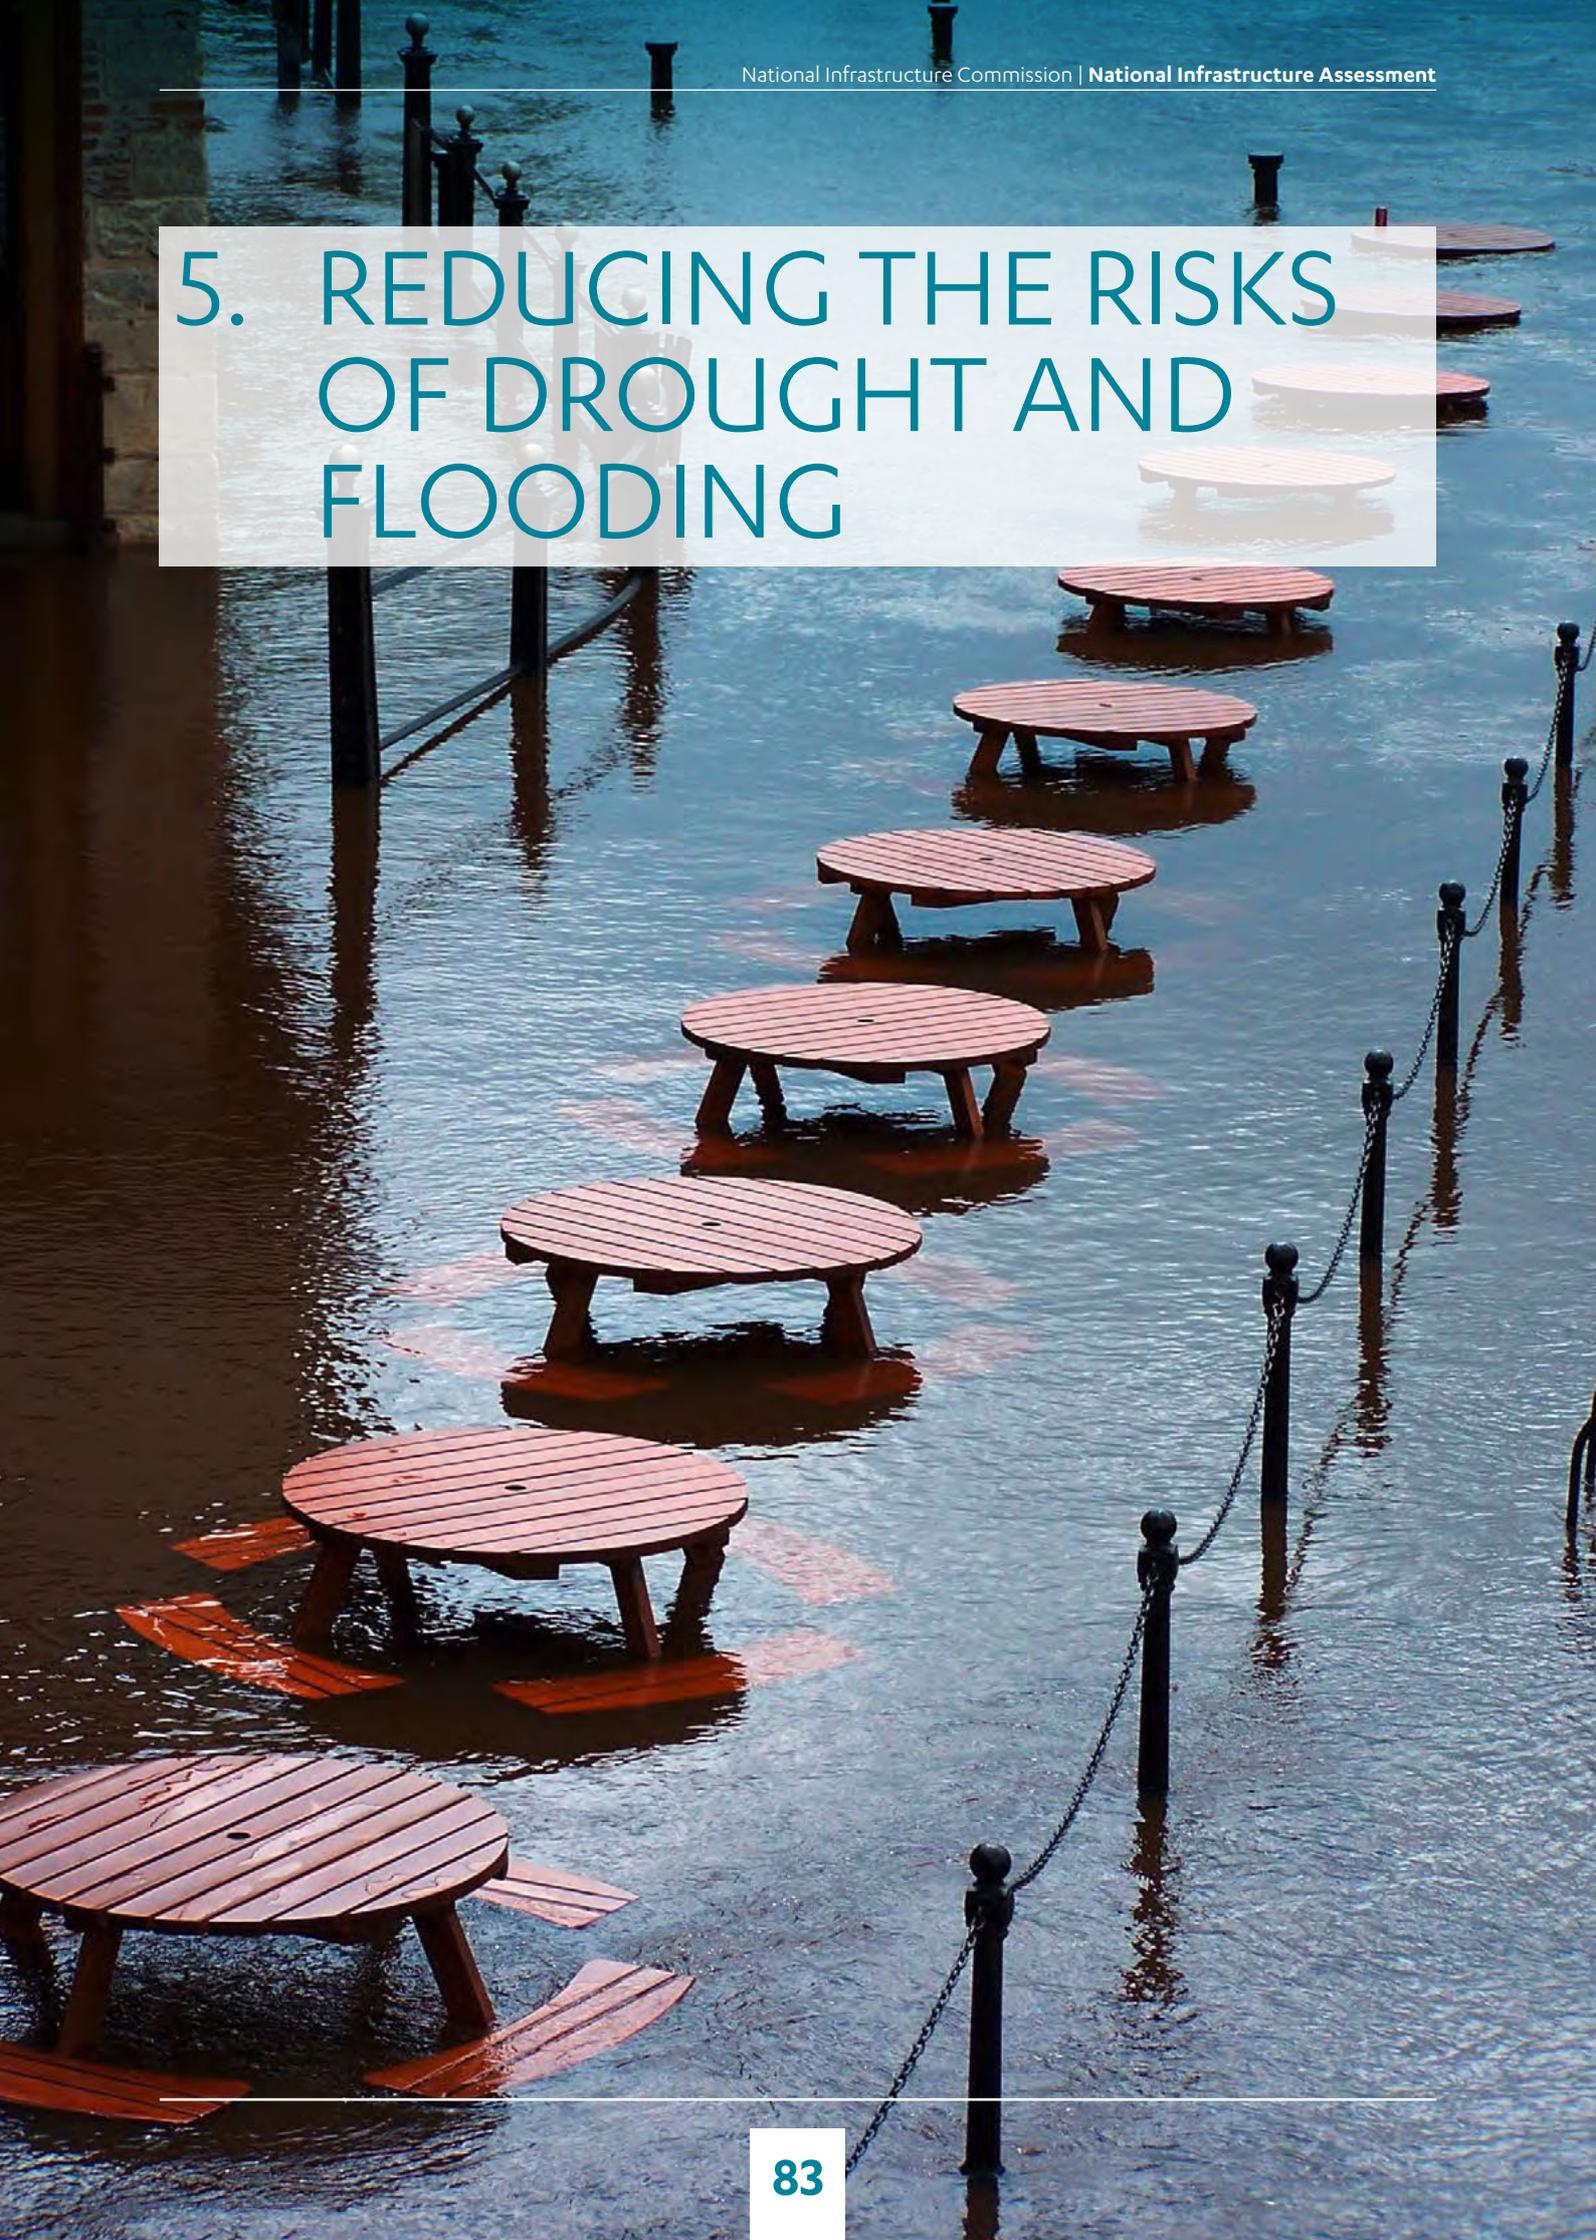

Most of the proposals contained in the Mayor's Transport Strategy would be delivered by Transport for London. Transport for London plans to cover all its operational expenditure through its own operational income in future, but it will still need support for investment, which should be sustained at current levels. The government should continue to work with the Mayor to fund Crossrail 2 as recommended by the Commission.

# 5. REDUCING THE RISKS OF DROUGHT AND FLOODING

# BEING RESILIENT TO EXTREME WEATHER

Climate change increases the risk of both flooding and drought in England

This is already having an impact, and will do in the future:

**High flood risk:**

**1 million**

homes have more than 1% chance of flooding in any given year

**But also a strong risk of drought:**

**1 in 4**

chance of a severe drought between now and 2050

## RESILIENCE SAVES PEOPLE FROM THE TRAUMA OF FLOODING AND THE COSTS OF DAMAGE AND INSURANCE

The Commission have proposed a national standard so that by 2050 communities will be resilient to flooding

**99.5%**

of the time wherever feasible

This means that someone living in a house at risk of flooding for 20 years would face only a 1 in 10 chance of flooding over that time

## BUT WE ALSO NEED TO BE MORE RESILIENT TO DROUGHT

Relying on emergency measures would cost an estimated

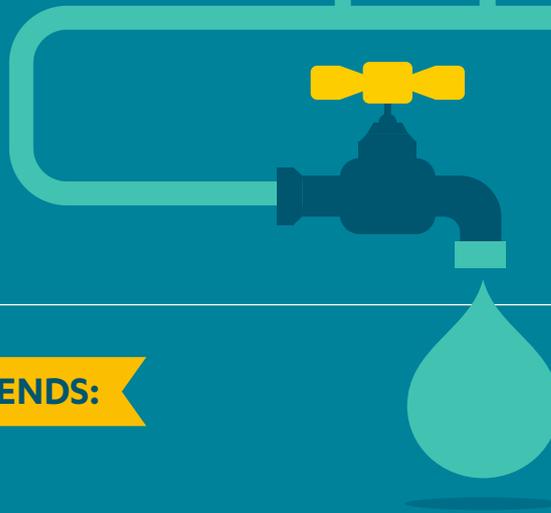

# £40 billion

Over the next 30 years – being resilient would cost only £21 billion

The UK needs an extra

# 4,000MI

of water a day to assure long-term supply

### THE COMMISSION RECOMMENDS:

A national standard of flood resilience with a higher standard in major urban areas

A national water transfer network and new water supply, such as reservoirs

Nationwide, catchment-based plans combining green and grey infrastructure

Halving leakage by 2050 and reducing demand through efficiency and smart metering

Sources: Commission calculation using inputs from Atkins, Environment Agency, ITRC and Regulatory Economics

## Climate change will increase the risk of both flooding and drought. Despite several significant incidents over recent years, the risks continue to rise, and planning has been disjointed. Action is needed now to make communities resilient for the future, rather than waiting until the situation gets worse.

About 5 million properties in England are currently identified to be at risk of flooding. Of these, about 600,000 homes have more than a 1 per cent chance each year of being flooded by rivers and the sea.<sup>1</sup> A similar number have more than a 1 per cent chance each year of flooding from surface water.<sup>2</sup> Floods affect people's lives and health as well as causing economic damage.

While it will never be possible to prevent all flooding, the current approach is too piecemeal and too reactive. Government should ensure that all communities are resilient, so they are able to cope with, and recover from, flooding. There should be a long term national programme: resilience cannot be increased everywhere overnight and the extra funding needed will only become available gradually. But a long term strategy, with long term funding, can deliver a national standard by 2050.

At the same time, households and businesses in large and densely populated parts of England face significant risk of having their water supplies rationed because of drought. While water companies' plans show some progress in addressing this risk, they fall short of what is needed. The Commission's 2018 report *Preparing for a drier future: England's water infrastructure needs*<sup>3</sup> set out the action needed for drought resilience.

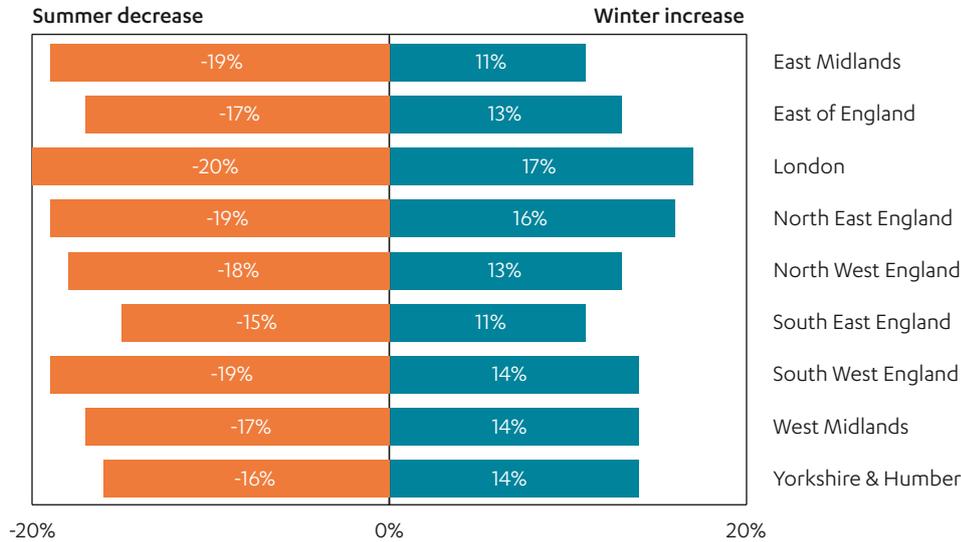

To minimise the impact of severe weather and climate change, England requires:

- a long term strategy to ensure that all communities are resilient to severe flood events by 2050, with higher standards for the most densely populated areas
- increased resilience to drought through a national water network, halving the water lost through leaks, and reducing demand through smart metering

A lack of reliable data has meant that it has not been possible to consider surface or waste water in detail for this Assessment. Surface water flooding is significant<sup>4</sup> and there has been little progress in the decade since the Pitt review.<sup>5</sup> Further work is needed urgently.

## The risk of flooding

Climate change is expected to both increase rainfall in winter and decrease it in summer, as shown in figure 5.1. Together with population growth, this will lead to greater risks of both flooding and drought.

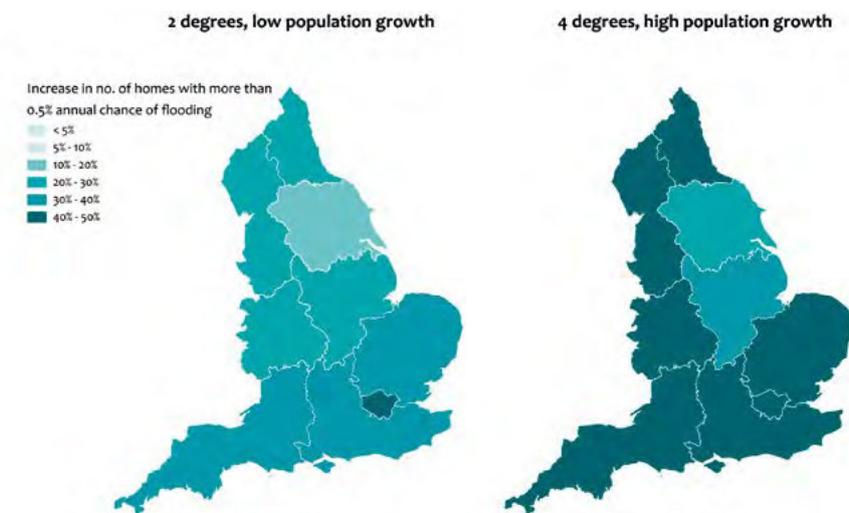

**Figure 5.1 Projected changes in summer and winter precipitation by 2050<sup>6</sup>**

Note: changes for 50% probability in the 2050s assuming medium emission scenario.

The likelihood of drought and flooding is expressed as an annual probability. For example, a 1 per cent annual probability of flooding corresponds to a 1 in 100 chance of a particular area being affected each year. As there are many areas at risk of flooding across England, there is a high chance that at least one will be flooded by a 1 per cent event in any year. Probabilities can only be an estimate: in particular, the uncertain impacts of climate change limit the ability to forecast future risk precisely. Care should be taken in interpreting specific figures, but scenarios allow a broad assessment of plausible future flood risk. Further details and references to the assumptions and analysis are in the technical annexes: *Flood modelling and Analysis of drought resilience*.

Increasing numbers of households across England are at risk of flooding in severe events (shown in figure 5.2), but long term objectives for flood risk management are unclear. Levels of risk and investments vary widely across otherwise similar places and there is no certainty of whether or when preventative action will be taken.

**Figure 5.2 Percentage increase in homes at 0.5 per cent or greater annual chance of flooding in future population and climate change scenarios<sup>7</sup>**

Flooding has significant impacts on the local community including disruption, loss of employment, and mental ill health as well as direct impacts on buildings and property.<sup>8</sup> Insurance can help, and is currently subsidised for homes at most risk, but only covers some of the impacts.

## A national standard of flood resilience

Management of flood risk over recent years has too often been short term and reactive. In the past, government budgets for flood risk management have been reduced, only to be increased again after floods: budgets were reduced in 2006/7 and 2007/8 but then increased following floods in 2007, and cut again in 2011/12 with a large increase following floods in the winter of 2013/14.<sup>9</sup> It would clearly be better to build flood resilience before it is needed. The six year capital programme agreed for 2015/16 – 2020/21 provides greater certainty and should result in more efficient planning. However, there is no clear long term objective for the level of flood resilience that the government is seeking to achieve.

Decisions about capital investment in flood risk management have generally been made on the basis of cost benefit analysis. Essentially, this involves an assessment of whether it is ‘worth’ protecting particular homes and commercial properties. This is not a sustainable basis for decision making. Properties at risk of flooding are seldom abandoned or adapted to cope with the risk, so people are left to live with the risk. Subsidised insurance can incentivise homeowners in flood risk areas not to take any action. Without a clear objective, it is harder for the Environment Agency to take a strategic view across a whole catchment, although some catchment based plans have been made.

A better approach would be to set a nationwide objective for a minimum level of resilience wherever feasible. This has public support: the Commission’s social research showed that 59 per cent of people thought everyone should receive the

same level of protection, even though in some areas it would cost more, with only 16 per cent against.<sup>10</sup> However, a national standard should not be statutory or imply a right to compensation if not achieved.

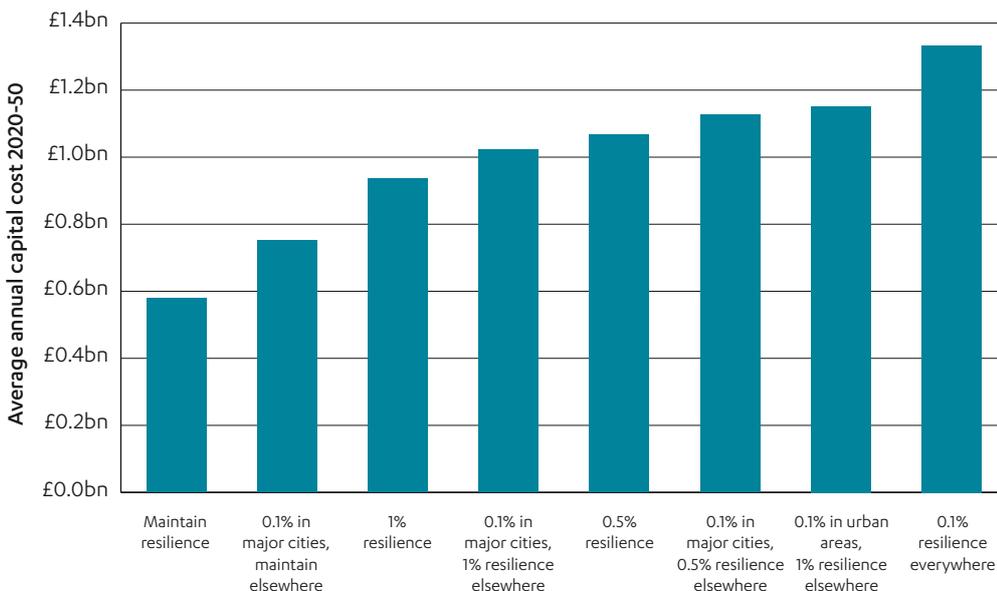

## Setting a standard

There is no absolute way of setting the right standard. What is affordable and achievable will vary over time. The Commission has considered what standards would be reasonable by 2050. Over longer time periods, higher standards might be achievable.

The Commission has analysed the investment that would be required to provide a range of resilience standards across different settlement types for river and sea flooding. Average annual capital costs between 2020 and 2050 are shown in figure 5.3, based on a climate change scenario equivalent to a 2°C increase in global mean temperatures.

The costs were estimated using recent Environment Agency data on flood risk management activities. The modelled cost per property varies depending on the property's current and future risk, whether it benefits from existing flood defences, property density and source of flooding.<sup>11</sup> The baseline assumes that current resilience is maintained, broadly following the Environment Agency's Long Term Investment Scenarios.<sup>12</sup> Further details are in the technical annex: *Flood modelling*.

The modelling produces estimates of the costs of a national standard of resilience to flooding with 1 per cent, 0.5 per cent or 0.1 per cent annual probability, and additional costs for providing higher standards in the most densely populated areas.

**Figure 5.3 Estimated average annual public capital costs for different standards of resilience to flooding from rivers and the sea, 2°C increase in global mean temperatures climate scenario, 2017 prices, in England**

The annual ongoing cost of a particular standard can be compared to the estimated avoided damage, including property damages, emergency response costs, risk to life and physical injury, mental health effects and impacts on infrastructure, transport, schools and leisure. Setting a national standard will ensure that society as a whole is better off, but without requiring that each home or commercial property justifies its level of flood resilience.

Whilst the estimated costs of nationwide flood resilience are up to three times current investment, the benefits (reduced damages) exceed costs for the range of standards. Estimates are inevitably uncertain; climate change means weather patterns, and therefore the scale of impacts, may fall outside the range of available data.

The Commission's judgement is that all properties, wherever feasible, should be resilient to severe flooding, with a 0.5 per cent annual probability, by 2050. This is consistent with the advice provided to government by the Natural Capital Committee for the 25 year Environment Plan.<sup>13</sup> Under this standard, someone living in a house at risk of flooding for 20 years would face less than a 1 in 10 residual chance of being flooded.

### **Densely populated areas**

A higher standard should be provided for the largest cities, with populations over half a million. This reflects the lower cost per property for protecting densely populated areas<sup>14</sup> and the potential for natural disasters in cities to result in cascading failures, putting severe pressures on disaster response. The largest cities provide a range of economic and social services to their region as a whole, not just to those who live within them, so the potential impact of flooding is greater.

Precise estimates of probability for extreme events are hard to obtain. Economically important locations should be stress tested against a range of plausible extreme events. The Thames Barrier was designed for sea levels with an annual probability of 0.1 per cent. The Commission's analysis has assumed the same standard for the largest cities.

### **Climate change scenarios**

The Commission undertook similar analysis for a climate change scenario equivalent to a 4°C increase in global mean temperatures. The costs of achieving each resilience standard in a 4°C world are much higher than for the same standard in a 2°C world, but so are the benefits.

This might suggest a precautionary approach of building resilience against higher climate change. However, flood resilience can be designed to be enhanced incrementally. Measures that provide resilience in a 2°C world can be upgraded if it becomes apparent that a 4°C world is more likely. This 'adaptive management' is consistent with catchment based approaches using a range of interventions, rather than just conventional flood defences. This is the most appropriate

approach until there is more certainty on climate change impacts, allowing resilience standards to be increased over time.

**The Commission recommends that government should set out a strategy to deliver a nationwide standard of resilience to flooding with an annual likelihood of 0.5 per cent by 2050 where this is feasible. A higher standard of 0.1 per cent should be provided for densely populated areas where the costs per household are lower.**

## A long term strategy for flood resilience

A clear objective will allow for a long term, national strategy for flood resilience. The Environment Agency are due to update their National Flood and Coastal Erosion Risk Management Strategy in 2019. This should expand on the 25 Year Environment Plan to set out how these standards of flood resilience can be achieved by 2050.

Delivering the strategy will require action on long term funding, updated catchment and shoreline management plans, surface water management and development control. Environment Agency monitoring of the strategy should include data on the number, locations and resilience of properties flooded from different sources and events each year.<sup>15</sup>

The strategy should set out a clear plan to deliver the proposed resilience by 2050, as well as ensuring that different aspects of flood management are joined up. It should make clear what is expected of different stakeholders and maximise the opportunities for partnership working. This should be backed up by a long term funding commitment, building on the existing six year capital programme, enabling efficient planning and delivery of projects to address the risk from all sources of flooding.

### Catchment and shoreline plans

Existing Catchment Flood Management Plans and Shoreline Management Plans should be updated to take account of the new standard and set out long term plans for flood risk management across catchments and coastal cells. These plans should use the latest evidence to evaluate the full range of options to achieve the proposed resilience standard including traditional flood defences, 'green infrastructure' (whether natural flood management or sustainable drainage systems), individual property measures, spatial planning and coastal realignment or 'managed retreat.' They will need to take account of the replacement of the Common Agricultural Policy following the UK's exit from the EU which should support natural flood management. As risk can never be eliminated, flood warning, response and recovery will also continue to be important.

The plans will need to show how risk can be managed for all plausible climate futures. They should ensure interventions are adaptable to different futures and that climate change is factored into the design and construction of all

infrastructure. This should be undertaken in such a way that the plans can be updated to reflect new information on climate change with the minimum of effort.

## Surface water management

The data needed to robustly assess the costs and benefits of different resilience standards for surface water flooding is currently unavailable. All relevant organisations should ensure data is available in good time for the next Assessment. Water companies are developing Drainage and Wastewater Management Plans. Water companies and local authorities should work together to build on their existing plans and take action on local flood risk where this is possible. This should include identifying communities at greatest risk from severe surface water flooding and developing joint plans, including investment requirements, to ensure resilience. These plans should inform the next Price Review and Assessment.

## Development control

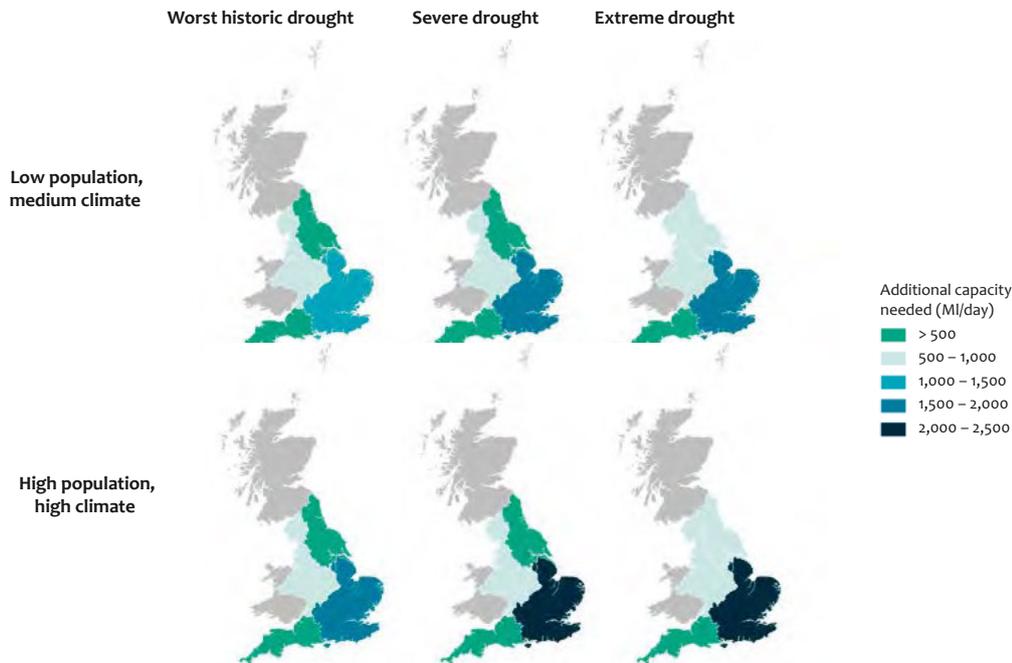

Preventing inappropriate housing development is essential for effective long term flood risk management. In 2016/17, 11 per cent of new homes were built in the floodplain<sup>16</sup> and while many will have been designed to minimise the risk, long term sustainability and compliance is difficult to demonstrate. Consideration should also be given to development outside the floodplain which could increase risk, for example through increased surface water runoff.

**The Commission recommends that, to deliver the strategy:**

- **By the end of 2019, government should put in place a rolling 6 year funding programme in line with the funding profile set out by the Commission. This should enable efficient planning and delivery of projects and address the risks from all sources of flooding.**
- **The Environment Agency should update plans for all catchments and coastal cells in England before the end of 2023. These should identify how risk can be managed most effectively using a combination of measures including green and grey infrastructure, spatial planning and property level measures.**
- **Water companies and local authorities should work together to publish joint plans to manage surface water flood risk by 2022.**
- **The Ministry of Housing, Communities and Local Government and planning authorities should ensure that from 2019 all new development is resilient to flooding with an annual likelihood of 0.5 per cent for its lifetime and does not increase risk elsewhere.**

## Drought resilience

A reliable water supply is usually taken for granted in the UK. But the country faces a real and growing risk of water shortages, especially in the south east of England. Climate change, an increasing population, and the need to protect the environment are bringing further challenges for an already strained system. And the pressure will only rise over the coming decades as shown in figure 5.4.

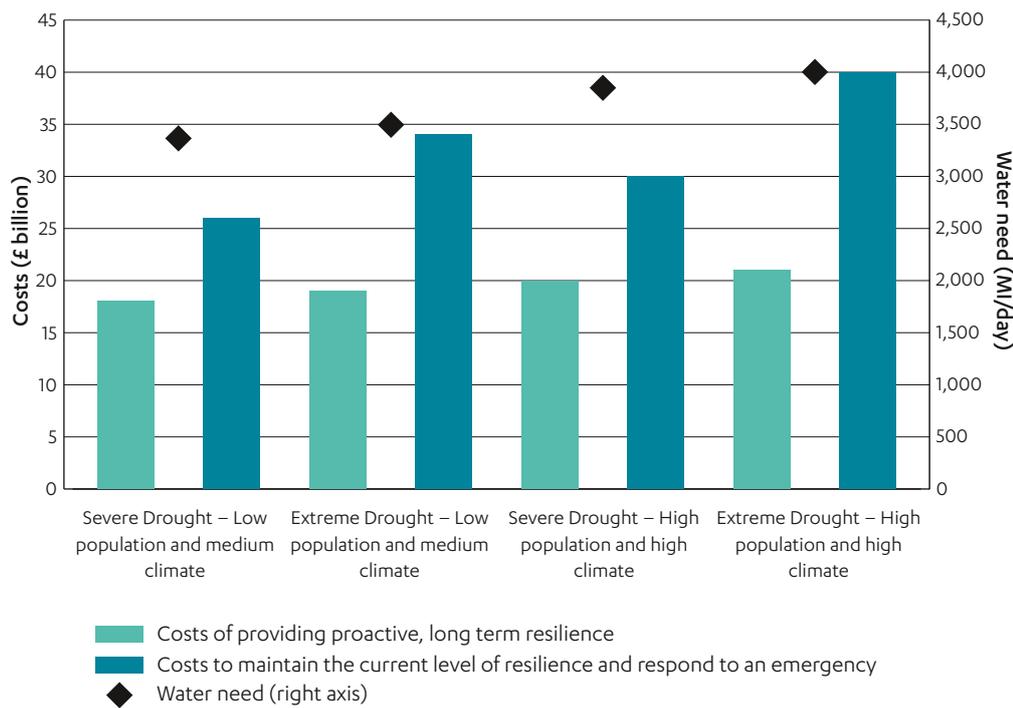

**Figure 5.4 Additional water capacity for droughts with different population and climate scenarios<sup>17</sup>**

Note: medium climate refers to an average medium emission scenario, high climate refers to a drier, medium emissions scenario with less water in the south east.

The full analysis is shown in the Commission's report *Preparing for a drier future* and the technical annex: *Analysis of drought resilience*. Conflicting incentives, limited cooperation between water companies and a short term focus have constrained action. As a result a serious drought would lead to an unacceptably high risk of severe supply limitations; homes and businesses could even be completely cut off.

Maintaining current levels of resilience until 2050 in the face of rising population, environmental and climate pressures, would require additional capacity of about 2,700-3,000 million litres per day (Ml/day) in England.<sup>18</sup> Additional capacity required to protect the UK from extreme drought (0.2 per cent annual chance) is between 3,500 and 4,000Ml/day as shown in figure 5.5.<sup>19</sup> The Commission's analysis shows that the costs of providing proactive long term resilience are less than those for relying on emergency response.

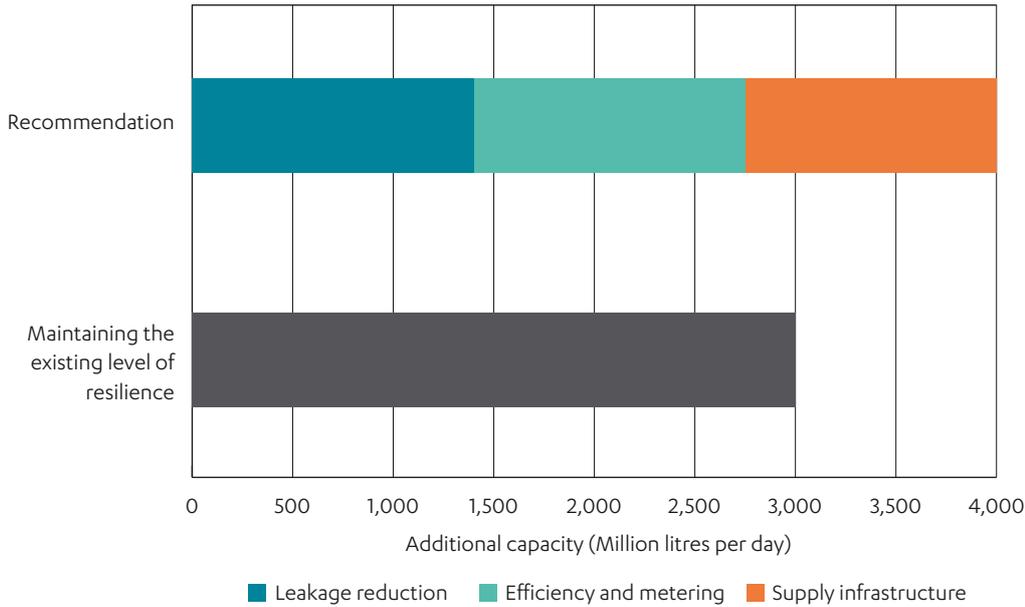

The Commission therefore believes that additional supply and demand reduction totalling 4,000Ml/day should be delivered by 2050.

**Figure 5.5 Costs of providing proactive, long term resilience and relying on emergency response for droughts beyond current resilience levels<sup>20</sup>**

Note: Costs are expected present values to 2050 (in 2018 prices) and include maintaining 1 per cent resilience, which is considered to be ‘business as usual’.

A ‘twin-track’ approach of reducing demand and increasing supply is the lowest cost and most sustainable way to increase resilience. And more ambitious long term plans are needed, as shown in figure 5.6. These should address leakage, enable water companies to undertake more comprehensive water metering and demand management, and ensure the delivery of a national water network, and other options for additional supply infrastructure.

**Figure 5.6 Twin-track approach addressing demand and supply<sup>21</sup>**

## Supply

Even with ambitious action to reduce demand, more supply infrastructure will be needed. Aiming for additional capacity of 4,000ML/day will require a minimum of 1,300ML/day additional supply infrastructure.<sup>22</sup> Different options are available, including transfers, reservoirs, reuse and desalination. A range of studies have all found a positive cost benefit case for greater transfers and water trading.<sup>23</sup> A network of strategic water transfers, which can move water from areas with a surplus to those where it is needed, could provide about 700ML/day more capacity at comparable cost to other options and with increased adaptability of the overall system.<sup>24</sup> The remaining capacity should be provided by the most cost effective combination of supply infrastructure.

The scale of this infrastructure goes well beyond that seen in the draft plans proposed by water companies. It is likely to need strengthened regional approaches and an independent national framework. Ofwat has developed a 'direct procurement' mechanism for large infrastructure projects which could form the basis of open and transparent competition ensuring all options for significant additional supply capacity can be considered.

## Demand

Demand reduction, including addressing leakage, can deliver the remaining 2,700ML/day needed. Today, around 2,900ML/day (20 per cent) of water put into the public supply is lost through leakage.<sup>25</sup> An ambitious long term strategy to reduce leakage would encourage action by customers and incentivise technological innovation, which should drive down the costs of managing leaks. Halving leakage should save over 1,400ML/day by 2050.

Conventional metering can reduce demand by around 15 per cent and smart meters are expected to reduce this further (to about 17 per cent) and help identify leaks.<sup>26</sup> Water companies can introduce compulsory water metering in water stressed areas. About 50 per cent of homes in England are currently metered and this is expected to reach around 80 per cent by 2050, saving around 400ML/day. Bringing forward metering more quickly would result in a further 400ML/day reduction in demand by 2050. In addition, efficiency improvements (as washing machines and toilets use less water, for example) are expected to reduce demand by around 600ML/day. There might be potential to go further in increasing efficiency, for example through local reuse schemes or labelling appliances, and companies should be more ambitious and show what can be achieved.

**The Commission recommends that government should ensure that plans are in place to deliver additional supply and demand reduction of at least 4,000ML/day. Action to deliver this twin-track approach should start immediately:**

- **Ofwat should launch a competitive process by the end of 2019, complementing the Price Review, so that at least 1,300ML/day is provided through (i) a national water network and (ii) additional supply infrastructure by the 2030s.**
- **The Department for Environment, Food and Rural Affairs should set an objective for the water industry to halve leakage by 2050, with Ofwat agreeing 5 year commitments for each company (as part of the regulatory cycle) and reporting on progress.**
- **The Department for Environment, Food and Rural Affairs should enable companies to implement compulsory metering by the 2030s beyond water stressed areas, by amending regulations before the end of 2019 and requiring all companies to consider systematic roll out of smart meters as a first step in a concerted campaign to improve water efficiency.**

## Joining up flood and water management

A healthy aquatic environment is important for water supply and flood management as well as for biodiversity. Interventions to improve flood and drought resilience should consider the range of interactions that water has with people and the environment. There are opportunities for green infrastructure approaches that deliver multiple benefits including groundwater recharge, water quality and flood risk management.

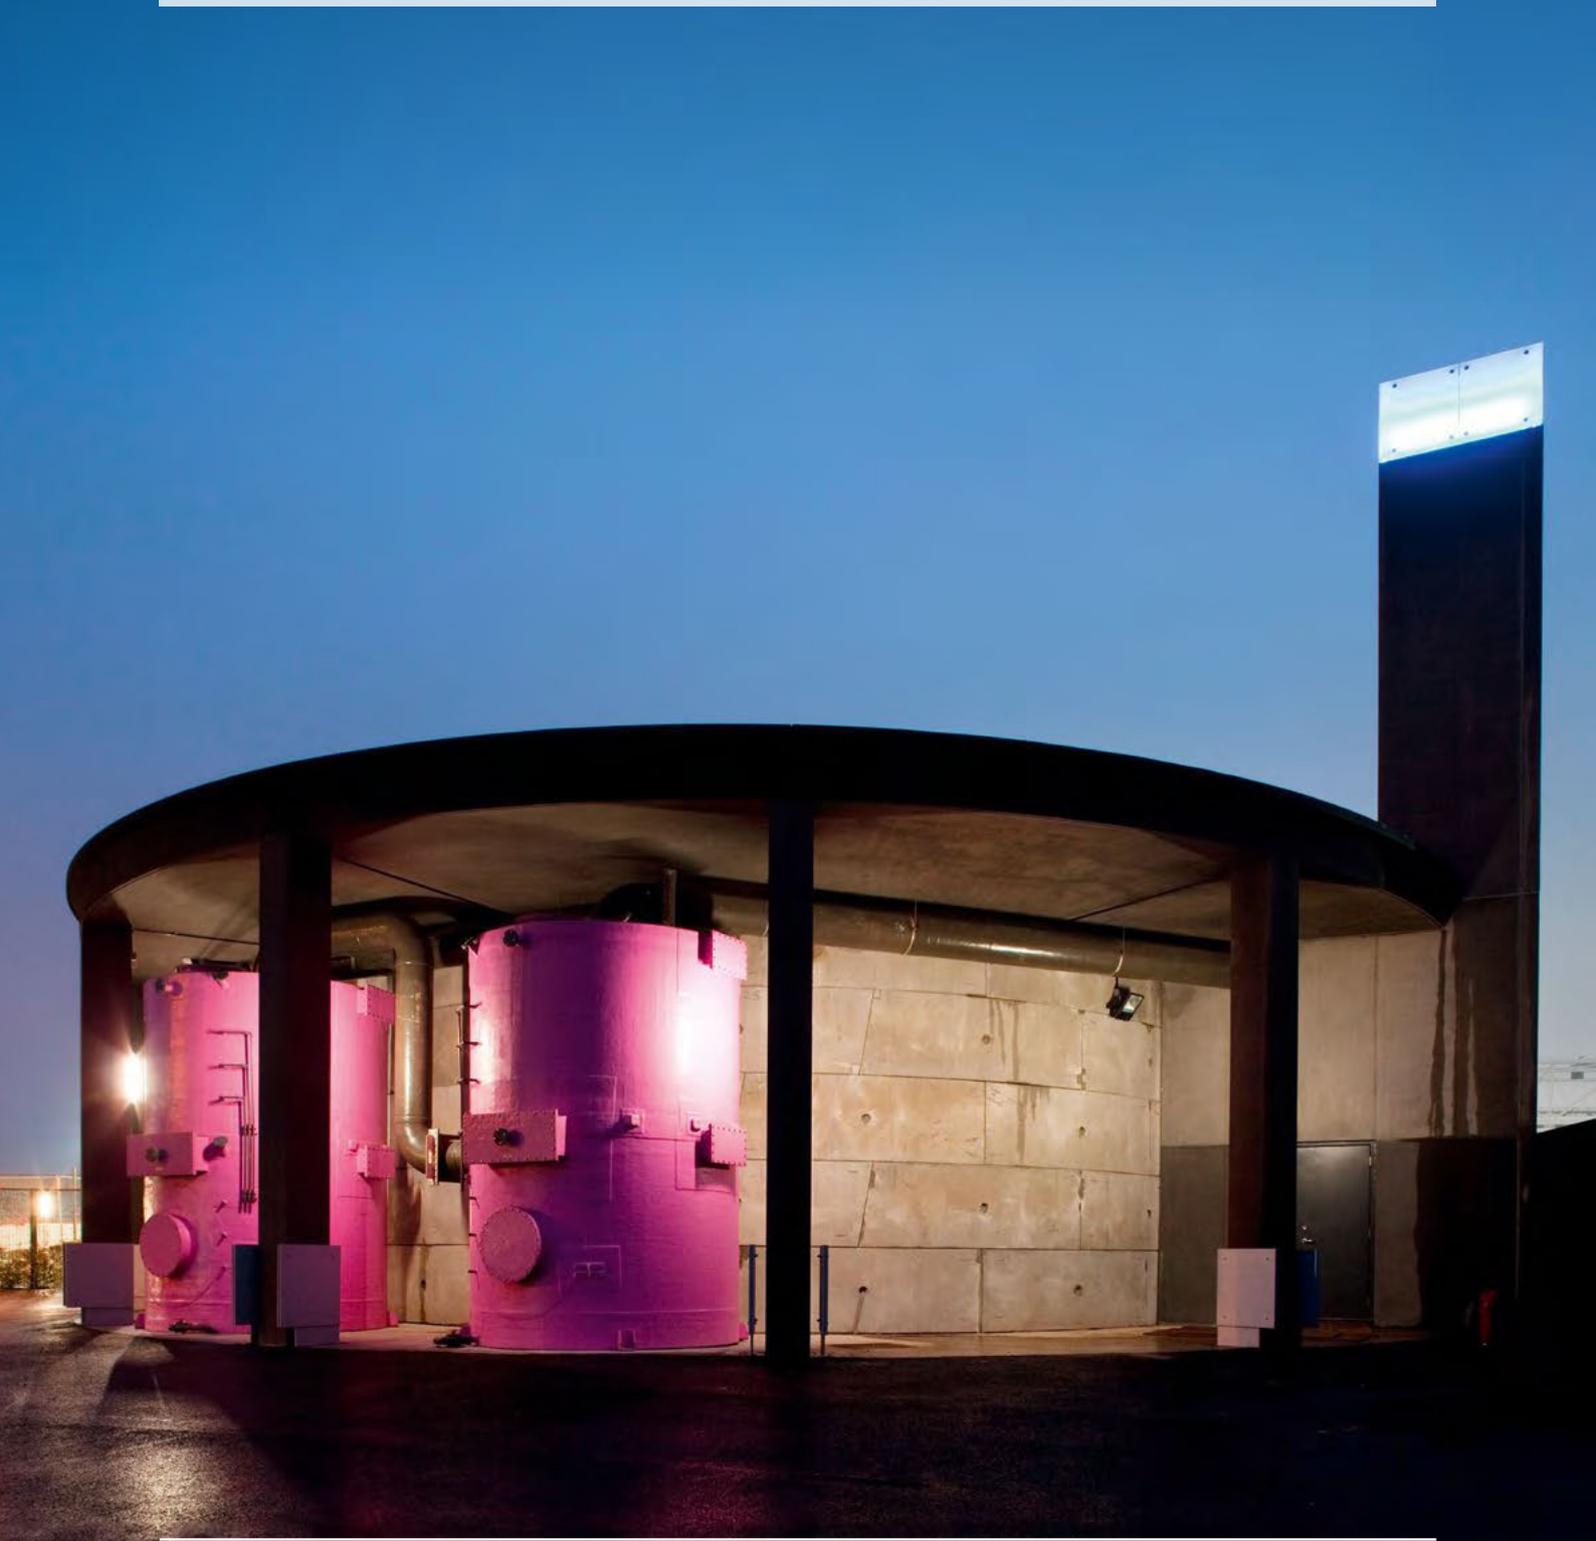

The Environment Agency, local authorities and water companies should all work together to better coordinate their plans. The Environment Agency has a key role through its strategic overview for all flood and coastal erosion risk management as well as regulatory responsibility for water quality and abstraction. Appraisal and funding should encourage interventions that improve both drought and flood

resilience. Decisions on flood and water infrastructure should take into account the full range of potential benefits as well as wider impacts to ensure that all objectives can be delivered effectively.

# 6. CHOOSING AND DESIGNING INFRASTRUCTURE

## The UK needs to have confidence in its decision making and its ability to deliver innovative, world-leading, well designed infrastructure projects. It must make effective and timely decisions, and prioritise getting the best value out of its infrastructure projects over their lifetime.

The Commission was established to address many serious weaknesses in infrastructure decision-making. Policy uncertainty, reversals and prevarication have driven up costs and hampered delivery, with short term considerations often leading to decisions on controversial projects being postponed or, alternatively, taken in a rush without considering the evidence.

Better decisions can be taken. Part of this is to improve the processes by which individual projects are assessed and designed. This requires:

- improving project appraisal by collecting better data on outturn costs and benefits of major infrastructure projects
- ensuring quality design in future nationally significant infrastructure projects
- developing a clear framework for measuring infrastructure performance.

Delivery of high quality infrastructure also depends on the availability of the right skills, the approach to construction and project management, the depth of the supply base, and the capability of government and other infrastructure owners and operators to procure and act as an intelligent client for infrastructure. The UK's exit from the EU will impact the UK's skills base and supply chain; there should be a strategic approach to manage this. These areas are the remit of the Infrastructure and Projects Authority, rather than the Commission. Therefore, they are not covered in this chapter, but they remain critical.

## Choosing projects

Government needs a robust approach to assessing the costs and benefits of infrastructure projects. Cost benefit analysis (also known as economic appraisal) is widely used to assist in deciding between infrastructure projects in the public sector, especially for transport projects. The UK is generally thought to be a leader in cost benefit analysis.<sup>1</sup> The Commission has engaged with a range of experts and interested stakeholders over the past year to better understand the limitations of existing methods and assess where improvements could be made.<sup>2</sup> Issues include:

- capturing system wide effects, rather than simply the marginal impact of individual projects

- the treatment of uncertainty – too often a single number is presented which does not reflect the range of possible outcomes
- ensuring the process does not become overly precise and focused on a preferred option at too early a stage.

## Improving data

These are not straightforward issues to address. The Commission intends to continue working with experts and interested parties to find solutions. One key area where immediate progress could be made is in addressing the lack of consistent and publicly available outturn data on the costs and performance of infrastructure projects. In many cases, considerable time and energy is devoted to estimating expected costs and benefits but very little on establishing actual costs and benefits when projects are built.

Better data would allow:

- decision makers to understand the range of uncertainty in project appraisals by showing how outcomes have varied for similar projects, mitigating the natural tendency to optimism in assessing costs and benefits<sup>3</sup>
- consideration of a wider range of approaches at an early stage, by highlighting historic examples of successful alternatives to decision makers
- simplification of the early stages of appraisal, basing initial estimates on results from comparable projects
- greater scrutiny of proposals, at a stage when decisions are still open
- a more balanced understanding of past success and failure, in place of an excessive focus on the best or worst cases
- a better understanding of how different procurement and financing models affect outcomes (see Chapter 7).

The Commission's technology study, *Data for the public good*, identified the potential economic benefits from collecting and sharing infrastructure data. It recommended that the Infrastructure Client Group should cultivate a shift towards minimum levels of commercial confidentiality in the infrastructure industry.

Highways England routinely publish outturn project evaluations of major investments. This system has led to more accurate estimates of the likely costs of future projects, reducing the average error in forecast costs by 20 per cent between 2000 and 2009.<sup>4</sup> Other public bodies could adopt a similar approach.

Historic outturn costs and performance data from major projects, which are appraised individually to a high level of detail, will be of greatest value. The

inclusion of historic data is vital to ensure that these datasets can inform decision making. Data should be reported on at least projects with a whole life cost above:

- £10 million for flood management
- £100 million for roads
- £500 million for rail

Cost data should be routinely comparable between initial estimates and actual outturns. Similarly, direct measures of benefit, such as whether passenger numbers meet expectations, should be straightforward to compare. More complex impacts, such as those on GDP or natural capital, can be hard to separate out from other background changes. But this should not be an excuse for failing to publish simpler measures.

Commercial considerations are sometimes stated as a reason for non disclosure but these can be overblown: projects which go wrong are scrutinised in public, so it is only success stories which are not available.

Full evaluation should more often be undertaken to estimate impacts. In many areas, very few robust evaluations exist. For example, the What Works Centre for Local Economic Growth has only identified two high quality evaluations worldwide of the economic impacts of high speed rail and none for trams or cycling schemes.<sup>5</sup>

**The Commission recommends that government should publish good quality data on infrastructure costs and performance. All public bodies taking decisions on strategic economic infrastructure should publish the forecast costs and benefits of their major infrastructure projects at each appraisal stage and at a suitable point after completion, by the end of 2019. The Infrastructure and Projects Authority should work with departments to ensure that costs are comparable between sectors.**

## The value of good design

Once a decision is taken, infrastructure needs to be designed and built well. This Assessment demonstrates the need for investment in the nation's infrastructure, and the Commission is committed to ensuring this is of the highest quality. Now is the time to embed design into the culture of infrastructure planning, saving money, reducing risk, adding value, supporting environmental net gain and creating a legacy that looks good and works well.

### Design Task Force

In February 2018, the Commission announced a Design Task Force chaired by Commissioner Professor Sadie Morgan, to advise on how best to ensure quality design in future major infrastructure.<sup>6</sup>

The Task Force has concluded that achieving the Commission's design ambitions requires two things: advocacy for design at the highest level within projects and access to design expertise. Major projects, including HS2 and Crossrail already do this, embedding design in the procurement and delivery process. This approach should be adopted for all Nationally Significant Infrastructure Projects (as defined within the Planning Act 2008) and those which require Parliamentary approval. Similar arrangements should be encouraged for all other infrastructure projects. The approach could also be amplified in the Government's National Policy Statements for infrastructure.

A new independent National Infrastructure Design Group, to be established by the Commission, will develop infrastructure design principles to guide design panels, which will be published in 2019. This group will also act as a champion of design quality in the nation's infrastructure, by:

- promoting new national infrastructure design principles
- commissioning and publishing research to promote continuous improvement in infrastructure design quality
- providing inspiration and intelligence on good infrastructure design
- promoting and supporting public debate on infrastructure design.

**The Commission recommends that government should be embedded into the culture of infrastructure planning, to save money, reduce risk, add value, support environmental net gain and create a legacy that looks good and works well, by:**

- **Government ensuring that all Nationally Significant Infrastructure Projects, including those authorised through hybrid parliamentary bills, have a board level design champion and use a design panel to maximise the value provided by the infrastructure.**
- **Design panels for nationally significant infrastructure projects having regard to design principles to be published by the National Infrastructure Commission based on advice received from the national infrastructure design group.**

## **Smart, resilient design**

Smart capability and resilience should form an important part of the infrastructure design process.

New data capture and processing technologies such as sensors, artificial intelligence and digital twins can generate better quality data about infrastructure, and be used to improve the way that infrastructure is planned and maintained. They can help to optimise networks, prevent failures, and better target maintenance and renewals. The Commission set out recommendations in

*Data for the public good* to support infrastructure becoming increasingly smart. All new projects should consider data collection and use at the design stages.

Resilience is also a key dimension in the design and management of infrastructure, including adaptation to climate change. Resilience needs to be considered both at the level of individual projects and at the level of wider systems. Individually small scale failures can multiply up in complex systems to far more serious impacts.<sup>7</sup>

The Commission recognised in its initial consultation on process and methodology that, given the breadth and complexity of resilience, it would not be possible to consider the issue fully in this first Assessment.<sup>8</sup> The Commission intends to carry out a more in-depth analysis of resilience as a theme, working with key stakeholders, to inform a future approach ahead of the next Assessment.

## Measuring infrastructure performance

Measuring the quality of the UK's current infrastructure systems can reliably inform the assessment of the UK's future infrastructure needs, and in turn enable the delivery of high quality infrastructure. Currently, the assessment of how well infrastructure is doing too often focuses on the amount of money being spent.<sup>9</sup> But infrastructure has a long lifetime, and so its performance should consider the quality of service delivered by the whole infrastructure system, including its impact on natural capital. Understanding how the performance of each system changes over time could form a crucial part of the Commission's decision making in future.

The Commission intends to measure the quality of the UK's current infrastructure systems based on the framework presented in table 6.1 below. The measures in the framework work across most sectors, allowing the Commission to compare different infrastructure systems. They have also been designed to measure the performance of infrastructure against the Commission's objectives. These measures were developed following consultation on an earlier set published in the Commission's interim report, *Congestion, Capacity, Carbon: Priorities for national infrastructure*.

Table 6.1 – Performance measures

Domain	Sub-domain	Transport	Energy	Waste	Water and wastewater	Flood risk	Digital communications	
Volume	Volume of consumption	Passenger/tonne km travelled (e)	Energy consumed (e)	Total waste generated (e)	Water consumed (e)	N/A	Gigabytes of data consumed (fixed and mobile) (e)	
		Number of trips (e)		Residual waste generated (e)	Wastewater produced (n)		Voice minutes (fixed and mobile) (e)	
Resilience	Resilience to large shocks	Stress test (n)	Stress test (n)	Stress test (n)	Security of supply index (e)	Risk of flooding and coastal erosion (e)	Stress test (n)	
			Capacity margin (e)		Probability of drought (n)	Standard of protection (n)		
			Expected loss of load (e)					
	Everyday resilience	Travel time reliability (n)	Time that properties lose access to energy (e)	N/A	Time that properties lose access to water (e)	Number of properties flooded (n)	Number of serious incidents reported to Ofcom (e)	
Quality	Service quality	Connectivity (n)	N/A	Gross value added from waste material recovery (e)	Number of water quality incidents (e)	N/A	Coverage by technology (e)	
				Recycling rates (e)			Actual speed at peak time (n)	
	Quality of user experience	Satisfaction derived from survey (e)	Satisfaction derived from survey (c)	Design quality (n)	Satisfaction derived from survey (e)	Design quality (n)	Satisfaction derived from survey (e)	Design quality (n)
		Design quality (n)	Design quality (n)		Design quality (n)		Percentage of all 90-second calls completed without interruption (e)	Percentage of mobile data connections which deliver a speed of at least 2 Megabits per second (e)

Note: (e) denotes existing measures; (n) denotes new measures; and (c) denotes measures constructed by the Commission using existing measures

Domain	Sub-domain	Transport	Energy	Waste	Water and wastewater	Flood risk	Digital communications	
Cost	Cost	Cost per passenger/tonne km (c)	Cost per kilowatt hour of energy (c) Average annual energy bill (e)	Cost per tonne of waste collected and disposed/treated (c)	Cost of water per litre (c) Cost of wastewater treated per population equivalent (c) Average annual water and sewerage bill (e)	Cost per property protected (c) Cost incurred on flood risk insurance claims (e)	Cost per gigabyte of data (fixed and mobile) (e) Average monthly bill (fixed and mobile) (e)	
		CO2e emissions per passenger/tonne km (e)(c)	CO2e emissions per kilowatt hour used (c)	CO2e emissions per tonne of waste produced (c)	CO2e emissions per litre of water consumed (e) Total CO2e emission from water and wastewater (e)	N/A	CO2e emissions per gigabyte of traffic used (n) Total CO2e emissions from digital comms (n)	
Environment	Emissions	Total CO2e emissions from transport (e)	Total CO2e emissions from energy (e)	Total CO2e emissions from waste (e)	Total CO2e emission from water and wastewater (e)	Measure of habitat improved or created (e)	N/A	
		Air quality (e)	Air quality (e)	Waste generated per capita (e)	Number of serious pollution incidents caused by water companies (e) Percentage of water bodies with unsustainable levels of abstraction (e) Average concentration of reactive phosphorus in rivers (e)			
	Environmental externalities	Noise (e)	Ground pollution from waste (n)	To be developed	Value of water services provided by natural environment (e) Cost that energy services impose on the natural environment (e)	Value of water services provided by natural environment (e)	To be developed	To be developed
		Value of energy services provided by natural environment (e) Cost that energy services impose on the natural environment (e)						
Efficiency	System efficiency	Congestion (e)	Energy efficiency of buildings (e) Transmission/distribution losses (e) Ratio of average to peak demand (c)	Reject rates from sorting facilities (e) Capture rate of recyclable materials (e)	Leakage (e)	N/A	N/A	

Note: (e) denotes existing measures; (n) denotes new measures; and (c) denotes measures constructed by the Commission using existing measures

Details on responses to the consultation and how these informed the framework and the measures will be provided in a separate technical annex, to be published after this Assessment. The annex will also set out how the Commission intends to further develop performance measures that do not yet exist, including measures linked to natural capital (working with the Natural Capital Committee), design quality and stress tests. The measures in the framework are a work in progress and the Commission expects to update them as new measures are developed or better data becomes available.

The Commission has gathered data on many of these measures, which will also be published on the Commission's website in September 2018. This data gathering process has highlighted two significant gaps so far:

- commercial and industrial waste, where government has launched a competition to develop a new digital solution to track waste.<sup>10</sup>
- the number of properties that are flooded where data recorded by local authorities is not aggregated and published centrally.<sup>11</sup>

Recommendations on filling these gaps have been set out in earlier chapters of the report.

# 7. FUNDING AND FINANCING

**The recommendations set out in this Assessment are not simply a wish list. The recommendations are affordable within the resources set out by the government and provide a fully costed plan for infrastructure spending without significant additional costs to billpayers.**

The recommendations in the Assessment have all been carefully considered by the Commission bearing in mind its objectives. The implications of the recommendations for public expenditure and for bills have been weighed up. The Commission has made judgements on priorities for expenditure within the government's infrastructure funding guidelines. In reaching its conclusions, the Commission has drawn on a wide range of evidence and considered the outcomes of its recommendations under a range of scenarios.

The cost of infrastructure services affects business competitiveness and households' quality of life. The Assessment therefore sets out recommendations to ensure that infrastructure projects are paid for at the lowest whole life cost. Efficient delivery and management of assets and good design have a part to play in this. But it also requires improvements in funding and financing arrangements:

- A UK infrastructure finance institution if the UK loses access to the European Investment Bank
- Improving the analysis of costs and benefits of private financing and traditional procurement
- Engaging stakeholders and the public on paying for road use, recognising that the existing approach is unsustainable
- Expanding and strengthening the range of mechanisms for capturing a share of increases in land value associated with infrastructure.

## Paying for infrastructure

The costs of the Commission's recommendations and who will pay are included in the tables below. These set out planned infrastructure spending in the period from 2020 to 2050.

Households ultimately fund all new infrastructure. This occurs through a variety of channels. Government funded infrastructure is paid for via tax. Infrastructure paid for in this way is covered in the 'fiscal remit' table. Infrastructure funded by the private sector is paid for through bills and charges paid by households, businesses, and the public sector (for example water and gas bills). Higher costs to businesses ultimately feed through to households via the costs of goods and services. Infrastructure paid for in this way is covered in the bills table.

## Fiscal remit

The government has given the Commission a long term funding guideline for public capital expenditure, the ‘fiscal remit’. The Commission “must be able to demonstrate that its recommendations for economic infrastructure are consistent with, and set out how they can be accommodated within, gross public investment in economic infrastructure of between 1.0% and 1.2% of GDP in each year between 2020 and 2050.”<sup>1</sup>

The fiscal remit covers capital expenditure by the public sector, including both local and national expenditure. It does not include spending by the devolved administrations, nor does it include day to day spending (‘resource’ spending).<sup>2</sup>

The fiscal remit does not only cover new projects. Existing commitments and ongoing investment in maintenance and renewals must also be accommodated alongside the Commission’s recommendations. The Commission’s remit specifically excludes consideration of decisions that have already been made, and spending that has already been committed, such as HS2. Committed spending, such as HS2; Crossrail 2 and Northern Powerhouse Rail; and maintaining current assets together add to 1.1 per cent of GDP from 2020-2025 and 0.9 per cent from 2025-2030.

Table 7.1 sets out the Commission’s proposals for the fiscal remit.

**The Commission recommends that government should deliver long term certainty over infrastructure funding by adopting the funding profile set out in the ‘fiscal remit’ table in Spending Review 2019 and other future spending plans.**

## Bills

Households typically pay for infrastructure via bills where consumers can choose how much, or what level, of a service to purchase. For example, linking households’ energy bills to their usage helps to keep total consumption at an efficient and sustainable level.

The Commission is required to provide “a transparent assessment of the overall impact on costs to businesses, consumers, public bodies and other end users of infrastructure.”<sup>3</sup> Table 7.2 sets out these impacts. Detailed analysis of this is included in *National Infrastructure Assessment impact and costings notes*.

Where recommendations have net costs, the Commission believes that these are manageable and good value relative to the benefits the infrastructure provides.

Table 7.1: The fiscal remit

Average annual expenditure (£ million, 2018/19 prices)	2020-2025	2025-2030	2030-2035	2035-2040	2040- 2045	2045-2050
<b>Transport</b>

Table 7.2: The impact on bills

Average annual aggregate impact (£ million, 2018/19 prices)	2020-2025	2025-2030	2030-2035	2035-2040	2040-2045	2045-2050
Heat trials and energy efficiency	+110	+270	+190	+180	+180	+180
Waste	+140	+110	+50	-10	-30	-60
Flood risk – lower insurance costs	-60	-240	-420	-610	-790	-980
Water – resilience to drought	+310	+640	+280	+280	+280	+280
<b>Total impact on households, businesses and public sector</b>	+510	+780	+100	-150	-370	-580
<b>Total impact on households</b>	+440	+650	+120	-60	-240	-420
<b>Average impact per household (£/year)</b>	<b>+£20</b>	<b>+£20</b>	<b>£0</b>	<b>£0</b>	<b>-£10</b>	<b>-£10</b>
<b>Total impact on businesses</b>	+50	+90	-20	-70	-100	-130
<b>Total impact on public sector resource spending</b>	+20	+40	0	-20	-30	-30

Impacts are shown relative to a baseline without the recommendation. This is different to the energy bills impacts described in the *Low Cost, Low Carbon* chapter which compare 2050 to today. Negative figures denote savings. Columns may not sum to totals due to rounding

## The Commission's choices

The recommendations in this Assessment, and the implications for public expenditure and for bills, reflect the judgement of the Commissioners. In reaching its conclusions, the Commission has drawn on a wide range of evidence, including scenario based modelling, stakeholder expertise and opinions, social research, and specially commissioned studies (which are available on the Commission's website). Further details on the Commission's approach are set out in *The National Infrastructure Assessment: process and methodology* and the interim report *Congestion, capacity, carbon: priorities for national infrastructure*.

### Meeting the Commission's objectives

These recommendations reflect the Commission's objectives: to support sustainable economic growth in every region; improve competitiveness; and improve quality of life.

**Sustainable economic growth in every region:** Full fibre digital infrastructure and urban transport networks lower the costs of connecting firms, workers and consumers; capture the benefits of higher productivity in dense clusters of firms; and enable innovation.

**International competitiveness:** Low cost energy supports international competitiveness as an input to all economic activity. Promoting electric, connected and autonomous vehicle infrastructure supports the UK motor industry to stay at the forefront of innovation.

**Quality of life:** Better air quality from electric vehicles, warmer homes from energy efficiency and a better designed public realm can improve people's quality of life. Resilience to floods and droughts protects people against natural disasters.

## **Prioritising within the fiscal remit**

Resources are inevitably limited. This has required the Commission to prioritise between available options in some areas.

### **Prioritise support for new infrastructure networks in the short term:**

Broadband and electric vehicle charging have been prioritised in the short term, when resources are most constrained. These new technologies represent major opportunities for growth and are particularly time critical if the UK is to remain internationally competitive.

**Prioritise urban transport over intercity networks in the 2030s:** Most spending on major upgrades to urban infrastructure, recommended in Chapter 4, will come in the late 2020s and especially in the 2030s. This profile reflects the overall availability of resources, as well as the need for local capability and for proposals to be developed by cities. In later years, urban spending will be balanced by reduced spending on major enhancements on the intercity networks, which will have seen at least a decade of sustained high investment.

**Focusing on low regret options on the motorway and major road network while the impact of new technology is uncertain:** Figure 7.1 sets out the enhancement budget for Road Investment Strategies 1 to 3, together with historic estimates of equivalent spending in the past. For future Road Investment Strategies, maintenance, renewals and incremental enhancements should be prioritised over 'mega projects' given the increased uncertainty that new technology creates for projects with very long payback periods. Large road and rail projects should compete for the same funding, as indicated in the fiscal remit table, to ensure the most beneficial projects are taken forward regardless of mode. An additional £500m a year should be spent on basic maintenance for local roads between 2025-2035.

### **Balance increased rail expenditure in the late 2020s with other priorities:**

There is a major increase in rail expenditure in the 2020s from HS2, Northern Powerhouse Rail and Crossrail 2, as shown in figure 7.2. Continuous change is not sustainable for the rail network and there are other priorities; sums for further enhancements in Network Rail in the late 2020s ('Control Period 7') should be correspondingly lower, although funding for maintenance and renewals should be protected.

**Provide an indicative budget for Northern Powerhouse Rail of £24 billion from 2023-24 to 2039-40:** The business case for Northern Powerhouse Rail remains under development. It is important that Transport for the North sets its priorities for the region and a clear budget will allow that to happen. However, city leaders in the region should have the freedom to shift additional funding from urban budgets to Northern Powerhouse Rail if they choose.

**Provide an indicative budget for Crossrail 2 of £27.7 billion from 2023-24 to 2035-36:** In line with *Transport for a world city*,<sup>4</sup> this reflects the need for Transport for London to reduce and phase the costs of the scheme. London should contribute at least half of the scheme costs.

**Provide a gradual increase in the budget for flood protection:** This reflects the long term strategy proposed in Chapter 5. Spending is weighted towards later years due to other priorities in the 2020s and the time needed for the development of robust plans to achieve the required level of protection.

**Apply efficiency savings to renewals spending:** These are in line with the government's *Transforming Infrastructure Performance*<sup>5</sup> productivity programme.

**Maintain the Housing Infrastructure Fund outside cities:** Within cities, this funding should be merged into wider devolved funding for strategic transport and housing strategies.

**Leave headroom in the later period:** Some recommendations, such as flood protection, involve spending to 2050. But overall there is considerable space in later years. This will be needed for future priorities such as zero carbon heat, surface water flooding or even completely new infrastructure that may be needed in decades to come.

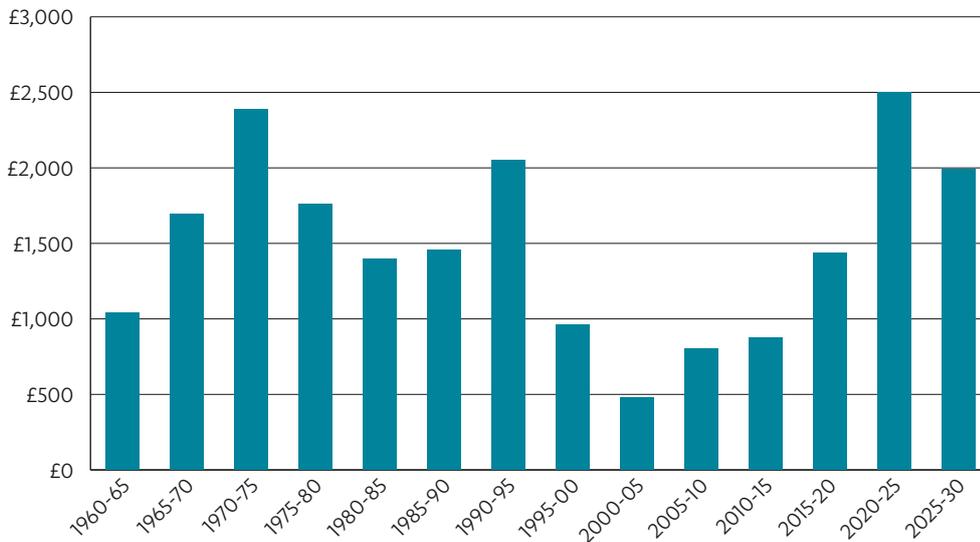

Figure 7.1: Historic and planned enhancement spending on strategic roads<sup>6</sup>

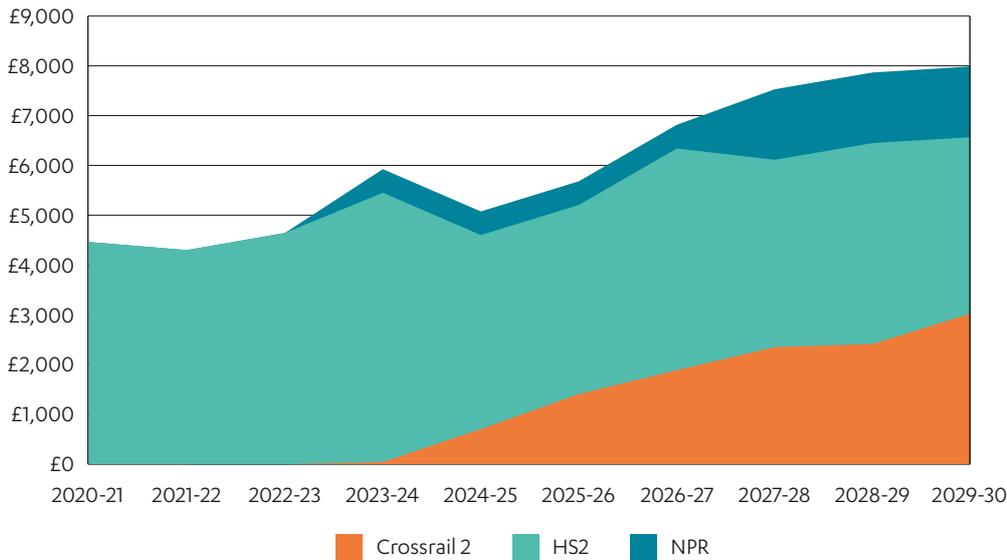

Figure 7.2: Capital Investment in rail 'mega projects' (£m, 2018/19 prices)

## Managing uncertainty

The Commission has also considered how the impact of its recommendations may be affected by uncertainty, focusing particularly on technology, population, economic growth and climate change.<sup>7</sup> The Commission has sought to understand how robust its decisions would be to uncertainty, seeking solutions that will stand the test of time, but recognising that some uncertainty is unavoidable given the timescales for infrastructure investment.

**Balancing the risks of major investments:** For full fibre and water, the potential costs of inaction are much higher than those of action. For flood protection, a more 'adaptive' approach can be taken because defences can be added to incrementally if risks turn out higher. For energy, the Commission's judgement is that the supply chain for nuclear power should be maintained by agreeing a further plant beyond Hinkley Point C, even though renewables look like an increasingly viable alternative, as the costs of re-establishing the nuclear supply chain would be very high.

**Making complementary recommendations:** Investing in both urban transport and rural fibre mitigates uncertainty about the future location of economic activity. Electric vehicle charging helps reduce the cost of more renewables intensive electricity generation by providing more flexible demand and potentially lowering the cost of storage.

**Planning for future decisions:** Investing in renewables in the 2020s will improve understanding of system balancing costs for the 2030s and 2040s. Separation of food waste is good value for money today, but also maximises the availability of biogas. Biogas has a range of potentially high value uses replacing hard to substitute fossil fuels in future. Assessing the potential impact of connected, autonomous vehicles on road and rail investment could reduce the risk of costly long term investments being overtaken by technology.

## Strategic use of public and private financing

Infrastructure typically requires large up front investment ('financing') followed by a long period in which these costs, plus on going maintenance and operational costs, are repaid by users or taxpayers ('funding'). The Commission's recommendations will require a combination of public and private financing mechanisms and these arrangements should be as efficient and as cost effective as possible.

Finance itself is not in short supply.<sup>8</sup> However, in some cases public sector support can ease constraints on the financing of projects in the private sector. In other cases, private finance could increase the efficiency of projects in the public sector and share risks.

### UK infrastructure finance institution

The UK has a high proportion of privately owned, operated and financed infrastructure.<sup>9</sup> Almost half of the planned pipeline of infrastructure projects to 2020/21 will be delivered and funded privately.<sup>10</sup> It has well developed capital markets which generally help to facilitate this private finance. And there is an appetite on the part of institutional investors to increase both the scope and scale of their investment in infrastructure projects.<sup>11</sup>

Both government and arms length independent state institutions can help to support this investment, by absorbing risk that the market finds hard to manage and supporting due diligence functions for innovative projects. The government already has some established mechanisms to support private investment such as the UK Guarantee Scheme.

There is an ongoing market failure around innovation in the infrastructure sector; the risks associated with innovative technologies, techniques and financial products can be too high for the private sector without government support.<sup>12</sup> For example there is strong evidence that the Green Investment Bank helped to catalyse private investment in offshore wind.<sup>13</sup> And there is a role for government in easing liquidity constraints in the infrastructure market during times of crisis.<sup>14</sup>

Independent financing institutions can mitigate some of the risks involved in public sector support for private investment. Independent institutions can provide policy stability in areas which exist outside of the short term political cycle. They can also develop expertise and credibility, which can be used to build the understanding and capabilities of both private investors and local government.<sup>15</sup> A portfolio of investments allows an institution to take risk without imposing an overall cost on the public purse.

In the past, the European Investment Bank and the recently privatised Green Investment Bank have provided this kind of function in the UK.<sup>16</sup> The government has indicated that it may be mutually beneficial to maintain a relationship between the UK and the European Investment Bank<sup>17</sup>, and the Commission

has heard from a wide range of stakeholders that this would be their preferred outcome. However, it may not be possible: a contingency plan is needed.

Any new domestic institution would not score within the Commission's fiscal remit, since its activities would score as 'financial transactions' rather than as capital expenditure. However, unlike the European Investment Bank, lending by any domestic institution would score within the government's main debt measure, Public Sector Net Debt.<sup>18</sup> A new institution would therefore need a clear remit, and robust processes, to ensure additionality and 'sound banking' (measuring project returns in terms of risk adjusted interest rates and lending at market rates).<sup>19</sup>

**The Commission recommends that government should maintain access to the European Investment Bank if possible. If access is lost, a new, operationally independent, UK infrastructure finance institution should be established by 2021. To enable this, government should consult on a proposed design of the new institution by Spring 2019. The consultation should cover:**

- **Functions, including provision of finance to economic infrastructure projects in cases of market and coordination failures; catalysing innovation; and acting as a centre of excellence on infrastructure project development, procurement and delivery**
- **A clear mandate, including sound banking, additionality and having a wider economic and social impact**
- **Governance to safeguard the operational independence of the institution.**

## **Evaluating the performance of private financing and traditional procurement**

As well as the public sector supporting private financing, private finance can support public sector projects. The introduction of private financing into public infrastructure delivery came following a poor record of public sector delivery.<sup>20</sup> It has led to quicker delivery of projects, enabling society to access infrastructure services earlier, and contributed to better public sector commercial capability.<sup>21,22</sup>

Private financing, in comparison to traditional procurement, encourages a whole life approach to project design. The transfer of risk to the private partner incentivises efficiency in delivery over the project lifecycle but can sometimes create challenges where requirements change during the project lifetime. There is a residual level of risk that can never be transferred, since in extreme circumstances projects can return to the public sector where private providers go bankrupt.

There has been a slowdown in the use of private financing in recent years due to uncertainties about its cost effectiveness and the rationale for its use.<sup>23</sup> The overall performance of private finance has not been robustly evaluated.<sup>24</sup>

The Commission proposes an analytical framework for whole life analysis of the costs and benefits of private financing and traditional procurement, set out in the technical annex *Proposed analytical framework for evaluating the performance of private financing and traditional procurement*. It builds on past studies considering performance and costs during construction by covering the whole lifespan of projects and a wider range of potential benefits.

Consultation has found a wide consensus on the dimensions in the framework. The immediate next steps are for the framework to be piloted to develop insights on its practical application and identify where it needs to be revised.

Following the pilot, the Commission aims to develop a consistent evidence base of costs and benefits of financing models through more detailed analysis. This independent source of evidence should lead to the more strategic use of private financing and traditional procurement, and improve the design of existing models to build more collaborative long term approaches.

## Additional funding mechanisms

### Paying for road use

Road use is a notable exception to the general principle that infrastructure is paid for through bills where consumers can choose their level of usage.

Over the Assessment's timeframe changes to the way drivers pay as they use roads are inevitable. Fuel duty revenues will decline with the impending shift to electric vehicles.<sup>25</sup> Technological change has the potential to radically change driving patterns and vehicle ownership. The current system of road taxation is not sustainable.

One option might be to introduce a 'road pricing' scheme to charge drivers according to where and when they drive, which could deliver valuable benefits. Road pricing can:

- Pay for new and better road infrastructure; creating a revenue stream from roads can attract private investment, as with some toll roads
- Reduce congestion; congestion is estimated to cost the economy over £35 billion a year, and pricing congestion has been shown to reduce traffic volumes<sup>26,27</sup>
- Protect tax revenue; fuel duty will decline and road pricing is a sustainable alternative

The changing use of roads presents an opportunity to design a road pricing scheme that improves on current road taxation by being fairer, more sustainable and more effective at reducing the negative impacts of driving. Developments in technology provide new ways to implement road pricing that have previously been too expensive or impractical. Some possible changes, such as 'mobility

as a service', where people pay for journeys rather than car ownership, would naturally fit with alternative forms of road pricing.

There has often been a disconnect between theoretically perfect road pricing systems suggested by policymakers and the perceived fairness and practicality of those systems by the public.<sup>28</sup> Rather than propose a further technocratic recommendation the Commission will explore new ways to engage stakeholders and the public on this topic, looking at a full range of potential options in light of the major changes in road use and taxation that are inevitable. Reforming how road use is paid for has been discussed for decades,<sup>29</sup> but the issue is becoming more and more pressing and cannot be avoided forever.

## Land value capture

Local funding for infrastructure can strengthen local accountability, sharpen the incentives for scheme designers to maximise local benefits, and improve the fairness of the funding regime as local beneficiaries contribute to the scheme costs. One approach to raising funding locally is to capture part of any increase in land values from infrastructure development or planning permission for new developments. But the Commission's analysis suggests this is not the silver bullet for funding local infrastructure.<sup>30</sup>

Whilst the current system, comprising Section 106 contributions from developers and the Community Infrastructure Levy, is complex, it is more successful at raising funding than previous approaches.<sup>31</sup> Other parts of the tax system, such as Capital Gains Tax and Stamp Duty, also capture a proportion of land value increases, although there are no reliable measures of how much. Some have argued for radical reform of local funding.<sup>32</sup> However, without a full picture of existing receipts it is unclear this would increase total revenues, and the history of previous reforms argues for caution.<sup>33</sup> Reform would undoubtedly lead to costs and delays in the short term as land owners and developers sought to understand new liabilities before making major decisions.

The sums potentially available would vary significantly across the country. Analysis undertaken for the Commission indicates that roads investment which reduces travel times by 10 per cent in the Cambridge – Milton Keynes – Oxford Growth Arc is associated with higher average property values of over £3,000 per property; a similar scheme in the East Midlands is associated with higher values on average of £2,000 per property and in Yorkshire of £1000 per property.<sup>34</sup>

The Commission's remit covers the interaction between infrastructure and housing, but not housing itself. The Commission has therefore looked at local funding mechanisms from the perspective of infrastructure funding and has concluded that the existing system should be improved rather than replaced, identifying three policies to help raise local revenues.

## Business rates and council tax

London used a business rate supplement to help fund Crossrail 1.<sup>35</sup> This supplement, charged at 2p for every £1 paid by businesses above a certain threshold, will eventually provide nearly one third of Crossrail 1's costs. Applying a small charge to a large base of rate payers is a simple way to gather a contribution to scheme costs. The same approach could be applied to council tax, where a precept could be applied to reflect part of the increase in property values that result from new transport infrastructure.<sup>36</sup> To protect existing residents, the precept could be applied only to new residents that move into the area. To ensure the precept is genuinely related to project costs, it could be time-limited.

Changes in the 2011 Localism Act now require a majority of business rate payers to agree to the supplement, both in number of rate payers and by the value of the rates paid.<sup>37</sup> This is difficult to coordinate; introducing a threshold of one third of scheme costs before ballots are used would make the funding tool simpler to use while retaining safeguards. In this way, future infrastructure projects could benefit from Crossrail 1's innovative funding structure.

## Community Infrastructure Levy

The government are currently consulting on changes to improve the Community Infrastructure Levy. Pooling section 106 agreements across several projects was an important means for local authorities to develop bespoke funding solutions such as the Milton Keynes Tariff. However local authorities are currently not allowed to do this.<sup>38</sup> The government's proposals would remove pooling restrictions in some but not all cases, which would create further complexity and limit flexibility. A simpler approach would be to remove all pooling restrictions which would allow local authorities to use section 106 more effectively.

## Compulsory purchase regime

The compulsory purchase regime, whereby local authorities can buy land as a last resort, could be strengthened. The current regime is costly, time consuming and uncertain.<sup>39</sup> Conducting an independent assessment of site value at the start of the process could save money and provide more certainty for the parties involved in a compulsory purchase order.

**The Commission recommends that local authorities should be given further powers to capture a fair proportion of increases in the value of land from planning and infrastructure provision. To enable this, government should:**

- Remove pooling restrictions on Section 106 in all circumstances, through forthcoming secondary legislation by 2020
- Remove the ballot requirement for upper tier authorities' powers to levy a business rate supplement of 2p or less in the pound for infrastructure, except where the supplement exceeds one third of scheme costs by 2021

- Give local authorities powers to levy zonal precepts on council tax, where public investments in infrastructure drive up surrounding property values by 2021
- Provide greater certainty in compulsory purchase compensation negotiations by including independent valuations early in the process to be paid for by the acquiring authority by 2021.

# 8. NEXT STEPS

**This is the Commission's first Assessment of the UK's economic infrastructure. Since its establishment, the Commission has been working to identify the key priorities for the nation's infrastructure, culminating in the recommendations set out in this Assessment. But the work does not stop here. These recommendations need to be implemented. Government, regulators, industry and others will all need to contribute to making this a reality. The Commission will report on progress in its Annual Monitoring Report. And the second Assessment, expected in around 5 years' time, will develop on these themes and identify future priorities for the UK's infrastructure.**

Over the coming months and years, the Commission will:

- seek consensus on its recommendations
- work with government to establish its recommendations as government policy
- monitor the implementation of the recommendations set out in the Assessment alongside those in its earlier studies
- carry out further work on some of the areas outlined in this Assessment, including housing, design and economic regulation
- begin work on the second National Infrastructure Assessment, expected around 2023.

## Consensus building

Too often in the past, a lack of political consensus has led to delays and extra costs in infrastructure. The Commission was established to provide independent advice and analysis and to move away from a position where the main promoters of infrastructure are either politicians or scheme developers, whose arguments, however well made, are often treated with scepticism. Ultimately, it is for government to decide on the Commission's recommendations. However, over the coming months, the Commission will endeavour to build consensus around its recommendations and engage across parties and with the public, policy makers, infrastructure experts and relevant bodies, as set out in its framework document.

As set out in the Executive summary, the Commission's remit extends to economic infrastructure within the UK government's competence, and will

evolve in line with devolution settlements. This means the Commission's recommendations will apply to non devolved UK government infrastructure responsibilities in Scotland, Wales and Northern Ireland (and all sectors in England). The Commission will continue to engage closely with devolved administrations and bodies under their jurisdictions as appropriate, particularly on matters where the respective infrastructure policy responsibilities of the UK government and devolved administrations interact.

## Government response

The Commission's framework document states that:

"The government will lay the [Commission's] reports before Parliament, and will respond to the [Commission's] national infrastructure assessment and specific studies. The government will respond as soon as practicable; it will endeavour to respond within 6 months, and not longer than a year. The response will set out clearly any further work required to take forward the recommendations. Recommendations the government agrees should be taken forward will become known as 'endorsed recommendations'. Where the government does not agree with a Commission recommendation, it may put forward an alternative proposal.

"Where the government is responsible for delivering endorsed recommendations, the government's endorsement will be a statement of government policy. Where recommendations have wider implications for the planning regimes, the government will highlight any further steps needed to confirm the endorsed recommendation as planning policy. The government will use the levers at its disposal to deliver endorsed recommendations – whether through spending, regulation, deregulation, market stimulation, or by setting strategic priorities for regulators as appropriate. In some cases, endorsed recommendations will not be directly taken forward by the government, but may be relevant for decisions made by other bodies such as economic regulators."

The Commission will provide support to government as it makes its decisions on the Assessment's recommendations, including as it prepares for the forthcoming Budget and Spending Review, to ensure that the analysis and conclusions in the Assessment are fully understood and any questions are answered accurately.

## Monitoring

The Commission has been established as a permanent, independent body, and so has a role in holding the government to account for implementing its recommendations, where they have been agreed. The Commission's framework document states that "the [Commission] will hold the government to account for delivering [Commission] recommendations that the government has endorsed and agreed to take forward."

The Commission will monitor the government's progress in delivering endorsed recommendations, and will comment on this in its Annual Monitoring Report.

Where the recommendations have implications for other bodies, such as economic regulators, the Commission will also comment on the progress made by the relevant bodies.

## Further work

The Commission has set out an ambitious set of recommendations in this Assessment. However, in some areas there is still further work to do. Alongside its study programme, which is currently focusing on the future of the UK's freight network, the Commission has identified the following priorities for further work:

- developing the Commission's work on the link between infrastructure and housing
- developing further the work of the design task force to champion design quality in the nation's infrastructure
- addressing the evolution of the regulatory framework and its adaptability to different models of utility service provision
- continuing development of the ideas generated by the Commission's 'Roads for the Future' innovation competition, which concludes in September
- continuing to develop the Commission's performance measures, both by filling gaps – including establishing measures linked to natural capital, design quality and resilience – and by progressively updating the measures set out in Chapter 6 as new approaches are developed or better data becomes available
- continuing work on cost benefit analysis, including developing alternative approaches where current methods perform less well
- developing the analytical framework for the performance evaluation of public private partnership projects.

The Commission also intends to work with a small number of urban authorities to explore how the national strategies set out in this Assessment could inform long term infrastructure planning for cities and city regions.

## The second National Infrastructure Assessment

The Commission publishes an Assessment once every five years. Work on the next Assessment will begin as soon as the first is published.

Given that this kind of cross-sector assessment has not been undertaken at a national level before in the UK, as a first step the Commission will carry out a 'lessons learnt' review shortly after the publication of the Assessment, informed by stakeholder views.

Drawing upon the outputs from this review, the Commission will prepare the process and methodology for the next iteration of the Assessment, on which it expects to engage with stakeholders before carrying out a public consultation. Alongside this, it will develop its evidence base and identify the key areas for further research and analysis.

An important priority will be to undertake more in-depth analysis of infrastructure resilience, as previously indicated in the Commission's Process and Methodology consultation.<sup>1</sup> In addition, a number of other areas have been identified, which the Commission will return to in its next Assessment, in the light of developing evidence and technology. They include: the future of heat, as set out in Chapter 2; a national transport strategy that considers the potential changes to travel patterns by road and rail as connected and autonomous vehicles become more widespread, discussed in Chapter 3; the use of data in improving the performance and planning of infrastructure as data is becoming part of infrastructure; surface water, building on the joint plans to manage surface water flood risk to be developed by local authorities and water companies, covered in Chapter 5; and paying for road use, where the Commission will explore new approaches to public engagement to identify options which are fair, sustainable and reduce the negative impacts of driving, covered in Chapter 7.

The second Assessment is expected to be published around 2023.

## Endnotes

<sup>1</sup> National Infrastructure Commission (2016), National Infrastructure Assessment: Process and methodology consultation

# Annex A: Glossary

Term	Meaning
<b>1. Building a digital society</b>	
4G	Fourth generation of mobile systems. 4G provides faster data speeds than previous generations.
5G	The fifth generation of wireless networks beyond 4G mobile networks. 5G is expected to deliver even faster data rates and better user experience, although international standards have not yet been set.
Anti-competitive behaviour	Strategies designed to limit and prevent fair competition, for example predatory pricing and collusion.
Augmented reality	Augmented reality is a technology that overlays computer generated enhancements on the real world.
Broadband	A type of high speed internet connection.
Capital costs or expenditure	Fixed one-time expenses that are incurred upfront, usually when paying for assets such as buildings, construction or equipment (ongoing costs are usually referred to as operational costs).
Clawback mechanism	A special contractual clause which allows money that has already been spent to be paid back under certain conditions.
Connected and autonomous vehicles (CAV)	Connected vehicles can communicate with their surrounding environment. Autonomous vehicles can operate with little or no human input (be driverless) for some, or all, of the journey. Connected and autonomous vehicles can do both.
Deregulation	Deregulation is the removal of regulation, usually with the aim of increasing competition and innovation.
Digital economy	The digital economy refers to the economic activity that is based around digital technologies.
Ducts	A tube or passageway to hold cables, usually underground.
Economic regulation	Economic regulation applies the principles of competitive markets to network industries to achieve greater efficiency and to move away from monopolistic outcomes.
Fair bet	This is a regulatory principle which recognises that an investing firm needs to benefit from sufficient upside potential from any investment to offset the downside risk of failure. The regulator should only impose regulation once a 'fair' return has been made.

Term	Meaning
Gigabit speeds	Download speeds above 1000 megabits per second. 1 gigabit is 1,000 megabits.
Megabits per second (Mbps)	A measure of the rate at which data can be transmitted. One megabit per second is 1 million bits per second (bps). One bit is a single binary digit: 1 or 0
Mobile coverage	The geographic area covered by mobile services.
Openreach	Openreach is the UK's telecoms incumbent network operator. It owns, operates and maintains the UK's main broadband and landline network.
Operating costs or expenditure	Day-to-day spending on running services and maintenance.
Reasonable cost threshold	A reasonable cost threshold is the cost limit at which government will subsidise up to. The costs above this threshold are not deemed reasonable or fair to impose upon taxpayers or billpayers.
Superfast broadband	Broadband services that deliver download speeds of at least 30 megabits per second (mbps).
Ubiquitous connectivity	Digital connectivity everywhere.
Virtual reality	Virtual reality (VR) is an artificial, computer-generated and immersive simulation usually through a headset.
WiFi	A wireless connection which allows devices to connect to the internet.

## 2. Low cost, low carbon

Balancing	The processes and systems required to balance supply with demand in the electricity system. A range of technologies can provide balancing services.
Biogas	A gas produced by breaking down organic matter in the absence of oxygen. This gas can be used in a similar manner to natural gas to produce heat or electricity but unlike natural gas, biogas from sustainable sources is a renewable fuel.
Biomass	A renewable fuel of organic material, such as wood, plants or other waste. Biomass can be burned directly or processed into biofuels such as ethanol and methane.
Black bag waste	Black bag waste is household items which cannot be recycled.
Capacity market	In the capacity market the government determines what level of system security is required for four years ahead and then commissions National Grid to calculate the amount of generating capacity that would deliver this. National Grid then runs an auction to procure this capacity at the lowest price.
Carbon capture and storage (CCS)	A process to capture, transport and store carbon dioxide emissions from fossil fuel use. It prevents the carbon dioxide from entering the atmosphere, usually by storing it underground.

Term	Meaning
Climate Change Act	The Climate Change Act, established in 2008, sets legally binding targets to reduce carbon dioxide emissions in the UK by at least 80% by 2050, from 1990 levels.
Decarbonisation	Decarbonisation refers to the removal or reduction of carbon dioxide (a greenhouse gas) from energy sources with the purpose of reducing the impact of climate change.
Deposit Return Scheme	Consumers pay a deposit for an item, such as a single use drink container, which is redeemed on return of the item.
Digestate	Digestate is the solid residue left over from anaerobic digestion which can be used as fertilizer.
Distribution of electricity	The lower voltage (as compared with the transmission of electricity), local, electricity network which is used to deliver electricity to most customers.
Electric vehicle	For the purposes of this report, 'electric vehicles' refers to fully electrified plug-in vehicles that run entirely from an electric battery that must be recharged. This is distinct from hybrid and plug in hybrid vehicles which have both a conventional and an electric motor.
Energy Performance Certificate level C	An Energy Performance Certificate is required for properties when constructed, sold or let. It provides details on the energy performance of the property and what can be done to improve it. The levels range from A-G, A is the most energy efficient whilst G is the least energy efficient.
Energy system	The energy system is the combination and interaction of supply and demand for energy. Energy is used for a range of different activities, such as: transport, heating and powering homes and in industrial processes. Energy is created from a variety of sources including renewables, fossil fuels and nuclear.
Fossil fuel	Fossil fuels are hydrocarbons formed in the earth from biological origin such as coal, oil and natural gas. They are non-renewable and produce greenhouse gases when burnt for energy which cause global warming.
Gasification	Gasification is a process of converting biomass and waste into fuel. It uses little or no oxygen to convert carbon-based materials into synthetic gas which can be used to generate electricity or in place of natural gas.
Greenhouse gas emissions	Greenhouse gases trap heat in the atmosphere which leads to global warming and climate change. Carbon dioxide is the most prevalent of the greenhouse gases and is emitted from activities such as burning fossil fuels.
MW, GW, TW	A watt is a unit of power, which quantifies the rate of energy transfer. A megawatt (MW) is 1,000,000 watts, a gigawatt (GW) is 1,000 megawatts and a terawatt (TW) is 1,000 gigawatts.

Term	Meaning
MWh, GWh, TWh	A watt hour is a measure of energy. It is equal to the total energy delivered by a rate of energy transfer of one watt, provided for one hour. A megawatt hour (MWh) is 1,000,000 watt hours. A gigawatt hour is 1,000 MWh and a terawatt hour is 1,000 gigawatt hours (GWh).
Incinerators	Facilities in which waste is burned in a controlled fashion, either to reduce its volume or its toxicity. Energy from waste plants use incineration of waste to generate electricity, and in some cases heat for domestic or industrial heating.
Interconnector	Electricity interconnectors are physical links which allow the transfer of electricity across country borders. Britain's electricity market currently has links with France, the Netherlands, Northern Ireland and the Republic of Ireland.
Landfill	Area of land where waste is disposed of, either on top or buried.
Load factors	The load factor is the ratio of total energy used in a period to the maximum possible energy use in that period.
Natural gas	Natural gas is a fossil fuel used as a source of energy for heating, cooking, and electricity generation. It is mainly composed of methane, which burns to give carbon dioxide and water vapour.
Nuclear power plant	Power plants make electricity. A nuclear power plant does this through nuclear reactions relying upon uranium (a non-renewable energy source). Nuclear power plants do not emit greenhouse gases but they do produce radioactive waste.
PET	PET (polyethylene terephthalate) is a very common plastic widely used for packaging food and drinks.
Power generation	Power generation refers to the creation of electricity.
Power station	A power station is where electricity is generated.
PVC	PVC (polyvinyl chloride) is a very common plastic used in packaging.
Pyrolysis	The burning of waste in a controlled (oxygen-depleted) environment to generate a combustible gas (syngas).
Recycling	The process of converting waste into reusable material.
Renewable energy	Renewable energy is generated from natural resources, such as sunshine and wind.
Small modular reactor	Small modular reactors generate electricity by a nuclear reaction. These reactors are smaller than conventional nuclear reactors, with power outputs of around 300 MW compared to around 1000 MW or more. No small modular reactors are currently in commercial operation.
Tidal lagoon	A tidal lagoon is a power station which generates tidal power. It is an enclosed area of coastline with a high tidal range which drives turbines and generates electricity.

Term	Meaning
Tidal power	Tidal power is the production of electricity using the ocean's tide. It is a renewable and predictable source of energy.
Transmission of electricity	The high voltage electricity network, used to move electricity long distances across the country.
Wholesale market	Great Britain has a liberalised electricity wholesale market where prices are not set by a regulator. The wholesale market is where retail suppliers, traders and large consumers purchase energy in bulk from those that generate energy.

### 3. Revolutionising road transport

Centre for Connected and Autonomous Vehicles (CCAV)	The organisation which works across government to support the market for connected and autonomous vehicles.
Charge point	A charge point is the infrastructure which supplies the electricity to recharge electric vehicles.
Control Period 6/7	Network Rail, which owns and operates the railway infrastructure in England, Wales and Scotland, has 5-year 'control periods' to decide investment priorities. Control Period 6 and 7 refer to the periods 2019/20-2023/24 and 2024/25-2028/29 respectively.
Freight	Freight is the term used to define the transportation of goods rather than people.
Hybrid vehicle	A hybrid vehicle is one which uses two different energy sources, such as petrol or diesel with electricity.
Internal combustion engine vehicle	An internal combustion engine vehicle is a conventional vehicle which runs by burning a fuel, usually petrol or diesel, inside the engine.
Interoperable	Interoperability refers to the ability of a product or system to operate with other products or systems without any restrictions.
National Grid	A British multinational electricity and gas utility company whose operations include owning and operating electricity transmission network assets and part of the national gas grid
Rapid chargers	Rapid charge points, of 43kW or above, can charge an electric vehicle battery in 20-30 minutes. Some 'fast' chargers, of 22kW, can charge current models of electric vehicle in about an hour.
Road investment strategy (RIS)	The government's investment plans for 5 year periods for the Strategic Road Network of 4,400 miles of motorways and major 'A' roads managed by Highways England. Road investment strategy 1 covers 2015/16-2019/20; Road investment strategy 2 will cover 2020/21 to 2024/25.

Term	Meaning
S-shaped diffusion curve	The diffusion of an innovation is said to follow an S-shaped curve. This involves three phases: slow initial uptake by a few early adopters; uptake rapidly increases as the innovation gains popularity and finally; uptake slows down and levels off as the innovation reaches maturity.
Vehicle to grid	Vehicle to grid systems involve electric vehicles returning power, stored in car batteries, to the electricity grid at peak times.
<b>4. Transport and housing for thriving city-regions</b>	
Brownfield	Brownfield land refers to urban sites that have had previous developments on them but are now vacant, derelict or contaminated.
City	Cities are large urban areas. There is no single definition in use in the UK. Generally, the Assessment uses the 'primary urban area' definition originally established for the State of the English Cities report. Under this definition, there are 63 cities in the UK. This equates to cities with a population of around 110,000 or larger. 'Major cities' refers to the largest UK cities, with a population of around 500,000 or larger (Birmingham, Bristol, Glasgow, Liverpool, Leeds, London, Manchester, Newcastle, Nottingham and Sheffield on a primary urban area definition). However, note that in figure 5.3, the definition of major cities relies on Office for National Statistics rural-urban classification data for 'major' and 'minor' conurbations, which excludes Bristol.
Combined authority	Combined authorities are corporate bodies formed of two or more local government areas.
County council	Many areas in England have two tiers of local government: (1) county councils and (2) district, borough or city councils. County councils cover the whole county and are responsible for services which include transport, education and social care.
Crossrail	Crossrail, also known as the Elizabeth Line, is a new railway running for more than 60 miles from Reading and Heathrow in the west, underneath London and out to Shenfield and Abbey Wood in the east. Crossrail is expected to open at the end of 2018.
Crossrail 2	Crossrail 2 is a proposed new rail line which would run from the south-west to the north-east of London. Construction is expected to start in the early 2020s with the line opening in the early 2030s.
District council	Many areas in England have two tiers of local government: (1) county councils and (2) district, borough or city councils. District councils cover areas within county councils and are responsible for services which include housing and planning applications.
Dockless cycle	Dockless cycle is a service in which bikes can be located, hired and unlocked using a smartphone app and does not require a docking station.
Highways England	The publicly owned organisation which operates, maintains and improves England's 4,400 miles of motorways and major A roads.

Term	Meaning
HS2	High Speed 2 is a planned new high-speed rail network linking London, the West Midlands, Leeds and Manchester. The project is expected to be completed by 2033.
Integrated development plan	A single plan for urban development covering transport, housing and related infrastructure.
Interurban transport	Transport between cities.
Mayoral combined authority	Mayoral combined authorities are corporate bodies formed of two or more local government areas with an elected mayor. There are currently 7 mayoral combined authorities in the UK.
Metro mayor	A metro mayor is a person elected to chair a combined authority with powers to make decisions across the whole city region. There are currently 7 metro mayors in the UK.
Network Rail	Network Rail is the publicly owned organisation which owns and operates the railway infrastructure in England, Wales and Scotland.
Northern Powerhouse Rail	Northern Powerhouse Rail, also known as High Speed 3 (HS3) or Crossrail for the North, is a proposed strategic rail programme to connect the major cities in the North of England.
Transport for London (TfL)	Transport for London is the authority responsible for the transport system in London.
Unitary authority	In some parts of the country, one tier of local government provides all the local services, these are known as unitary authorities.
Urban transport	Transport within cities.

## 5. Reducing the risks of drought and flooding

Catchment Flood Management Plans	Catchment Flood Management Plans assess all types of inland flooding from rivers, groundwater, surface water and tidal flooding. Their purpose is to help the Environment Agency and their partners to plan and agree the most effective way to manage flood risk.
Common Agricultural Policy	The Common Agricultural Policy is a European Union system of subsidies and support programmes for agriculture.
Desalination	Desalination is the process of removing salt and other minerals from water.
Drainage and Wastewater Management Plans	Drainage and Wastewater Management Plans are long term plans for drainage and wastewater services. The framework for developing these plans is currently being defined by the 21st Century Drainage Programme.

Term	Meaning
Drought	<p>Drought is defined for this report as a period of such low rainfall that companies have to impose restrictions on households' water supply, by providing water only at certain times of the day or through temporary taps (standpipes) in the streets. The likelihood of a drought occurring is measured by its annual probability. Typically, the lower the chance of a drought occurring, the worse the drought is likely to be. The probabilities mentioned in this report are:</p> <p>1 per cent annual probability: approximately a 1 in 4 chance of drought by 2050; this is used as a proxy for the worst recorded drought in recent history</p> <p>0.5 per cent annual probability: approximately a 1 in 7 chance of drought by 2050</p> <p>0.2 per cent annual probability: approximately a 1 in 17 chance of drought by 2050.</p>
Grey / green infrastructure	Grey infrastructure refers to man-made, constructed assets such as pipes, sewers and dams. Green infrastructure makes use of natural processes to provide infrastructure services, such as wetlands, which can provide flood resilience and wider benefits such as enhancing biodiversity.
Managed retreat	Managed retreat is also known as coastal or defence realignment. It refers to the controlled flooding of a defined area to manage the risk of flooding or coastal erosion in the wider area.
Megalitre per day (Ml/day)	One Megalitre is equal to 1000 cubic metres or 1 million litres.
National water network	Coordinated and strategic transfers to move water between water companies and regions based on their needs.
Price Review	The process undertaken every five years by Ofwat to determine water company price controls for the next five years.
Shoreline Management Plans	Shoreline Management Plans identify the most sustainable approach to managing the flood and coastal erosion risks to the coastline looking up to 100 years ahead.
Surface water	Surface water is rain water that collects on the earth's surface. Surface water flooding occurs when intense rainfall overwhelms the capacity of local drainage systems.
Waste water	Water that has been affected by human use such as flushing and washing.
Water supply	The source, means and process of supplying water for people to use.
Water transfer	Water transfers involve water supply infrastructure to move water from one place to another. They can be made of man-made structures such as pipes and canals or a combination of such structures with rivers or other existing water courses.

Term	Meaning
<b>6. Choosing and designing infrastructure</b>	
Artificial intelligence	The development of machines that can perform tasks normally requiring human intelligence.
Digital twin	A digital model of infrastructure which will be able both to monitor infrastructure in real-time and to simulate the impacts of possible events such as a natural disaster or a new train line.
Hybrid bill	A hybrid bill is a set of proposals for introducing new laws, or changing existing ones. They are generally used to secure powers to construct and operate major infrastructure projects of national importance. Hybrid bills address both public and private matters.
Infrastructure and Projects Authority	The IPA is the government body responsible for supporting the delivery of infrastructure and other major projects, reporting to Cabinet Office and HM Treasury.
Infrastructure Client Group	The Infrastructure Client Group supports the development and exchange of best practice to improve the efficiency of the construction sector and help deliver major cost savings. It is made up of government and industry representatives from the major infrastructure clients.
National Policy Statements	National Policy Statements were established under the Planning Act 2008. They set out national policy for a sector in one place and are intended to provide greater clarity and certainty for the planning process to deliver Nationally Significant Infrastructure Projects.
Nationally Significant Infrastructure Projects	Nationally Significant Infrastructure Projects are large scale developments relating to energy, transport, water, or waste. They require only a single type of planning consent, known as a Development Consent Order, which is designed to be a much quicker process than applying for several individual planning consents separately. This was established under the Planning Act 2008 and amended by the Localism Act 2011.
Natural capital	Natural capital is the 'stock' of natural assets. These include: waters, land, air, species, minerals and oceans
Resilience	The United Nations defines resilience as the ability of a system, community or society exposed to hazards to resist, absorb, accommodate, adapt to, transform and recover from the effects of a hazard in a timely and efficient manner.
What Works Centre for Local Economic Growth	The What Works Centre for Local Economic Growth was set up in 2013 to analyse which policies are most effective in supporting and increasing local economic growth. It is an independent organisation funded by the Economic and Social Research Council and government.

Term	Meaning
<b>7. Funding and financing</b>	
Capital Gains Tax	Capital Gains Tax is a tax on the profit of the sale of an asset that has increased in value.
Capital markets	The part of the financial system involved in raising long term financing to support investment. It involves the issue and trading of equity (company shares), debt (corporate and government bonds), and other long term financial instruments.
Community Infrastructure Levy (CIL)	A fixed charge based on the development of new floor space. The money can be used to fund infrastructure that is needed as a result of development. It came into force in April 2010.
Economic infrastructure	Economic infrastructure refers to assets which facilitate economic activity such as: transport, energy, digital communications, water supply, waste management and flood risk management.
European Investment Bank (EIB)	The European Investment Bank is the European Union's bank for providing finance and expertise for sustainable investment projects that contribute to EU policy objectives.
Fuel duty	Fuel duty is a tax on petrol, diesel and other fuels used in vehicles or for heating.
Green Investment Bank (GIB)	The UK Green Investment Bank (now the Green Investment Group) was publicly owned, but is now an independent organisation owned by Macquarie Group Limited. The GIB was established in 2010 to increase the UK's ability to meet its environmental targets and commitments by getting green infrastructure projects financed more quickly than would otherwise have been the case.
Housing Infrastructure Fund	The Housing Infrastructure Fund is a government capital grant programme to help unlock new homes in areas with the greatest housing demand. The fund is £5 billion and funds the local infrastructure necessary before homes can be built.
Localism Act 2011	An Act of Parliament which amended powers for local authorities, including housing and planning.
Pooling restrictions	Limits on the number of number of Section 106 agreements which can be used to fund projects or types of infrastructure. According to Regulation 123 of the Community Infrastructure Levy regulations, they must be five or fewer.
Precept	A precept is an additional levy within Council Tax

Term	Meaning
Private finance Initiative (PFI)	The Private finance initiative is a method for the private sector to finance public infrastructure. In the UK, the original private finance initiative has been replaced by 'Private Finance 2'. The private partners invest equity, and take on significant levels of borrowing to finance the upfront costs of infrastructure projects. The project is then leased back to the relevant government body which makes regular payments to the project company, typically over 25 years. More generically, the term 'public private partnership' is used to cover a range of cooperative arrangements between public and private sector bodies, including private finance initiative type arrangements.
Risk-adjusted interest rates	The risk-adjusted interest rate refers to the rate of interest on debt financing that is adjusted to reflect project specific risks, adding a premium to the cost of debt financing.
Section 106 agreements	Legal agreements between local authorities and developers to mitigate the impact of new developments through contributions towards site-specific infrastructure, including affordable housing. They arise from section 106 of the Town and Country Planning Act 1990.
Spending Review 2019	Spending Reviews set out the government's spending plans. The next Spending Review will take place in 2019.
Stamp Duty	Stamp Duty is a tax paid when purchasing a property. It is calculated based on the purchase price of the property.
Whole life cost	The whole life cost is the amount that a product or service costs over its lifetime. It includes the initial capital cost, the costs to run, maintain, repair and upgrade, as well as the eventual disposal costs.

# Annex B: Acknowledgements

---

The Commission is grateful to everyone who has engaged with the National Infrastructure Assessment process. The list below sets out organisations that have engaged with the Commission since publication of its interim report *Congestion, Capacity, Carbon: Priorities for National Infrastructure* through at least one of the following means:

- submitting consultation responses to the interim report
- participating in roundtables
- attending meetings with members of the Commission Secretariat.

Former Commissioners Lord Adonis, Demis Hassabis, Lord Heseltine and Sir Paul Ruddock were all members of the Commission at earlier stages of the Assessment process and contributed to it throughout their tenure.

The Commission would like to thank everyone who responded to earlier consultations (on the Process and Methodology for the Assessment, and the Call for Evidence on the Assessment), commented on the driver papers, and participated in initial workshops and roundtables. The Commission acknowledges the contribution of its expert advisory groups for their input throughout the Assessment process, the Infrastructure Transitions Research Consortium for support with modelling, and the consultants that have been engaged by the Commission and contributed to developing its evidence base.

The Commission is also grateful to those who have engaged with the Assessment in an individual capacity, to officials from across government and to those members of the public that took part in social research workshops and polling.

The Commission would like to acknowledge members of the Secretariat who worked in the Assessment team: Ioannis Andreadis, Matthew Behull, Katie Black, Tom Bousfield, Tom Bradbury, Alexa Bruce, Peter Burnill, Anesu Bwawa, Nathaniel Cowton, Matt Crossman, Manuela Di Mauro, Samuel Downes, Awaritoma Efejuku, Francesca Fabbri, Jonathan Hale, Ted Hayden, Sarah Hayes, Catherine Jones, Jack Large, Faraz Latif, Bianca Letti, Donna Leong, Greg McClymont, Sharmila Meadows, Chris Newitt, Federica Odifreddi, Sarah Rae, James Richardson, Eric Salem, Dörte Schneemann, Andrea Silberman, Alwyn Spencer, Olivia Stevens, Michael Tran, Siddharth Varma, Tom Wickersham, Stephanie Williams and Ruth Xue.

The Commission has produced or commissioned the reports listed below as part of the analysis supporting the National Infrastructure Assessment. All reports are available on the Commission's website or will be when published.

## National Infrastructure Commission reports

National Infrastructure Assessment impact and costings notes, July 2018

Technical annex: Analysis of drought resilience, July 2018

Technical annex: Flood modelling, July 2018

Technical annex: Energy and fuel bills today and in 2050, July 2018

Technical annex: Tidal power, July 2018

Technical annex: Power system effects of electric vehicles, July 2018

Technical annex: Proposed analytical framework for evaluating the performance of private financing and traditional procurement, July 2018

Preparing for a drier future: England's water infrastructure needs, April 2018

Congestion, Capacity, Carbon – Priorities for National Infrastructure, October 2017

    Congestion, Capacity, Carbon – Modelling annex, October 2017

    Congestion, Capacity, Carbon – Modelling annex data, October 2017

The impact of the environment and climate change on future infrastructure supply and demand, June 2017

Economic growth and demand for infrastructure services, March 2017

The impact of population change and demography on future infrastructure demand, December 2016

The impact of technological change on future infrastructure supply and demand, December 2016

National Infrastructure Assessment: Call for evidence, October 2016

The National Infrastructure Assessment process and methodology: Consultation response, October 2016

Annex: Responses to National Infrastructure Assessment process and methodology consultation overview, October 2016

National Infrastructure Assessment process and methodology: a consultation, May 2016

International Transport Forum (March 2017), Strategic infrastructure planning; international best practice

# Annex D: Recommendations

---

## 1. Building a digital society

The Commission recommends that government should set out a nationwide full fibre connectivity plan by spring 2019, including proposals for connecting rural and remote communities. This should ensure that full fibre connectivity is available to 15 million homes and businesses by 2025, 25 million by 2030 with full coverage by 2033. To achieve these targets:

- Ofcom should promote network competition to drive the commercial rollout of full fibre, by deregulating where competition is effective and guaranteeing a fair bet on risky investments before regulating any uncompetitive areas.
- Government should part subsidise rollout to rural and remote communities, beginning by 2020, starting with the hardest to reach areas and community self-build.
- Government and Ofcom should allow for copper switch-off by 2025.
- Government and Ofcom should take action to cut the cost of full fibre deployment including:
  - Government should ensure the processes for obtaining wayleaves and connecting new builds are the same for digital infrastructure as other utilities by 2019.
  - Local government should designate ‘digital champions’ to improve telecoms processes such as street work permissions and access to publicly owned assets.
  - Ofcom should monitor the accessibility of Openreach’s duct and pole infrastructure by levels of usage.

## 2. Low cost, low carbon

The Commission recommends that government should set out a pipeline of pot 1 Contracts for Difference auctions, to deliver at least 50 per cent renewable generation by 2030, as part of the transition to a highly renewable generation mix. Government should:

- Move technologies that have recently become cost competitive, such as offshore wind, to pot 1 following the next Contracts for Difference auction in Spring 2019. Pot 1 should be used for the overwhelming majority of the increase in renewable capacity required.

- Publish indicative auction dates and budgets for the next decade by 2020.
- Over time take whole systems costs into account in Contracts for Difference auctions, as far as possible.
- Consider whether there is a case for a small-scale, pot 2 auction in the 2020s, if there are technologies which are serious contenders for future pot 1 auctions.
- Not agree support for more than one nuclear power station beyond Hinkley Point C, before 2025.

The Commission recommends that government needs to make progress towards zero carbon heat:

- Establishing the safety case for using hydrogen as a replacement for natural gas, followed by trialling hydrogen at community scale by 2021.
- Subject to the success of community trials, launching a trial to supply hydrogen to at least 10,000 homes by 2023, including hydrogen production with carbon capture and storage.
- By 2021, government should establish an up to date evidence base on the performance of heat pumps within the UK building stock and the scope for future reductions in the cost of installation.
- Set a target for the rate of installations of energy efficiency measures in the building stock of 21,000 measures a week by 2020, maintained at this level until a decision on future heat infrastructure is taken. Policies to deliver this should include:
  - Allocating £3.8 billion between now and 2030 to deliver energy efficiency improvements in social housing.
  - Government continuing to trial innovative approaches for driving energy efficiency within the owner occupier market.
  - Government setting out, by the end of 2018, how regulations in the private rented sector will be tightened and enforced over time.

The Commission recommends that government should set a target for recycling 65 per cent of municipal waste and 75 per cent of plastic packaging by 2030. Government should set individual targets for all local authorities and provide financial support for transitional costs. The government should establish:

- Separate food waste collection for households and businesses (to enable production of biogas) by 2025.
- Clear two symbol labelling (recyclable or not recyclable) across the UK by 2022.
- A consistent national standard of recycling for households and businesses by 2025.

- Restrictions on the use of hard-to-recycle plastic packaging (PVC and polystyrene) by 2025.
- Incentives to reduce packaging and for product design that is more easily recyclable by 2022.
- A common data reporting framework for businesses handling commercial and industrial waste by the end of 2019, ideally through voluntary reporting but if necessary by legislation.

### 3. Revolutionising road transport

The Commission recommends that government, Ofgem and local authorities should enable the roll out of charging infrastructure sufficient to allow consumer demand to reach close to 100 per cent electric new car and van sales by 2030. Government should address the implications of technological innovation in long term transport planning processes, including the next rail control period and road investment strategy.

- Ofgem should take on the role of regulating the interaction between electric vehicle charge points and the electricity network immediately, ensuring that electric vehicle charging and vehicle to grid services contribute to the optimisation of the energy system. Government, industry and Ofgem should work together to set minimum standards for a network of interoperable, smart charge points.
- Ofgem should commission electricity network operators to work with charge point providers to identify potential anticipatory investments required to accommodate public charging infrastructure. Opportunities for investment within the current price control period should be identified by Summer 2019.
- Government should place a requirement on local authorities to work with charge point providers to allocate 5 per cent of their parking spaces (including on-street) by 2020 and 20 per cent by 2025 which may be converted to electric vehicle charge points.
- Government should subsidise, by 2022, the provision of rapid charge points in rural and remote areas, where the market will not deliver in the short term.
- Government should establish a centre for advanced transport technology in the Department for Transport to bring together work on technological innovation and ensure its implications are central to future investment proposals. This should include developing and overseeing the Commission's proposed connected and autonomous vehicles framework.

## 4. Transport and housing for thriving city regions

The Commission recommends that government should make £500 million a year of funding available from 2025/26 to 2034/35 for local highways authorities to address the local road maintenance backlog.

The Commission recommends that cities should have the powers and funding they need to pursue ambitious, integrated strategies for transport, employment and housing.

- By 2021, metro mayors and city leaders should develop and implement long term integrated strategies for transport, employment and housing that will support growth in their cities.
- By 2021, government should ensure city leaders have the right powers to deliver these integrated strategies, including the power for metro mayors to make decisions on major housing development sites.
- Government should set out devolved infrastructure budgets for individual cities for locally determined urban transport priorities in line with the funding profile set out by the Commission. Budgets for 2021-2026 should be confirmed by mid 2019. Government should pass legislation, by 2020, requiring cities to be given regular five year infrastructure budgets.
- Government should allocate significant long term funding for major capacity upgrades in selected growth priority cities, in line with the funding profile set out by the Commission. Cities benefiting from major projects should make commitments on housing delivery and provide at least 25 per cent of funding. Priority cities should be identified by mid 2019, with long term investment commitments agreed by 2020. Future rounds should take place no more than twice a parliament.

## 5. Reducing the risks of drought and flooding

The Commission recommends that government should set out a strategy to deliver a nationwide standard of resilience to flooding with an annual likelihood of 0.5 per cent by 2050 where this is feasible. A higher standard of 0.1 per cent should be provided for densely populated areas where the costs per household are lower. To deliver the strategy:

- By the end of 2019, government should put in place a rolling 6 year funding programme in line with the funding profile set out by the Commission. This should enable efficient planning and delivery of projects and address the risks from all sources of flooding.
- The Environment Agency should update plans for all catchments and coastal cells in England before the end of 2023. These should identify how risk can be managed most effectively using a combination of measures

including green and grey infrastructure, spatial planning and property level measures.

- Water companies and local authorities should work together to publish joint plans to manage surface water flood risk by 2022.
- The Ministry of Housing, Communities and Local Government and planning authorities should ensure that from 2019 all new development is resilient to flooding with an annual likelihood of 0.5 per cent for its lifetime and does not increase risk elsewhere.

The Commission recommends that government should ensure that plans are in place to deliver additional supply and demand reduction of at least 4,000 MI/day. Action to deliver this twin-track approach should start immediately:

- Ofwat should launch a competitive process by the end of 2019, complementing the Price Review, so that at least 1,300 MI/day is provided through (i) a national water network and (ii) additional supply infrastructure by the 2030s.
- The Department for Environment, Food and Rural Affairs should set an objective for the water industry to halve leakage by 2050, with Ofwat agreeing 5 year commitments for each company (as part of the regulatory cycle) and reporting on progress.
- The Department for Environment, Food and Rural Affairs should enable companies to implement compulsory metering by the 2030s beyond water stressed areas, by amending regulations before the end of 2019 and requiring all companies to consider systematic roll out of smart meters as a first step in a concerted campaign to improve water efficiency.

## 6. Choosing and designing infrastructure

The Commission recommends that government should publish good quality data on infrastructure costs and performance. All public bodies taking decisions on strategic economic infrastructure should publish the forecast costs and benefits of their major infrastructure projects at each appraisal stage and at a suitable point after completion, by the end of 2019. The Infrastructure and Projects Authority should work with departments to ensure that costs are comparable between sectors.

The Commission recommends that design should be embedded into the culture of infrastructure planning, to save money, reduce risk, add value, support environmental net gain and create a legacy that looks good and works well, by:

- Government ensuring that all Nationally Significant Infrastructure Projects, including those authorised through hybrid parliamentary bills, have a board level design champion and use a design panel to maximise the value provided by the infrastructure.

- Design panels for nationally significant infrastructure projects having regard to design principles to be published by the National Infrastructure Commission based on advice received from the national infrastructure design group.

## 7. Funding and financing

The Commission recommends that government should deliver long term certainty over infrastructure funding by adopting the funding profile set out in the ‘fiscal remit’ table in Spending Review 2019 and other future spending plans.

The Commission recommends that government should maintain access to the European Investment Bank if possible. If access is lost, a new, operationally independent, UK infrastructure finance institution should be established by 2021. To enable this, government should consult on a proposed design of the new institution by Spring 2019. The consultation should cover:

- Functions, including provision of finance to economic infrastructure projects in cases of market and coordination failures; catalysing innovation; and acting as a centre of excellence on infrastructure project development, procurement and delivery.
- A clear mandate, including sound banking, additionality and having a wider economic and social impact.
- Governance to safeguard the operational independence of the institution.

The Commission recommends that local authorities should be given further powers to capture a fair proportion of increases in the value of land from planning and infrastructure provision. To enable this, government should:

- Remove pooling restrictions on Section 106 in all circumstances, through forthcoming secondary legislation by 2020.
- Remove the ballot requirement for upper tier authorities’ powers to levy a business rate supplement of 2p or less in the pound for infrastructure, except where the supplement exceeds one third of scheme costs by 2021.
- Give local authorities powers to levy zonal precepts on council tax, where public investments in infrastructure drive up surrounding property values by 2021.
- Provide greater certainty in compulsory purchase compensation negotiations by including independent valuations early in the process to be paid for by the acquiring authority by 2021.

# Foreword

## Fairer, faster, greener

For decade after decade, governments of every political stripe have failed to invest enough in the UK's regions and nations. It is one of the reasons why the quality of our national infrastructure has fallen behind that of other countries. This Strategy will change that.

In almost my first words as Prime Minister, I promised to unite our country by physically and literally renewing the ties that bind us together. I promised to unleash the productive power not just of London and the South East, but of every corner of England, Scotland, Wales and Northern Ireland. I want to bring hope and opportunity for each part of the UK. Levelling up is my government's core purpose.

Our roads and our railways and our full-fibre cables join us together as one nation - the thigh bone connected to the hip bone, connected to the back bone, connected to the shoulder bone - but our national anatomy is creaking. Some of our organs, the cities, are congested and need relief. Some of our towns and villages, the largest part of the national body, are neglected and need attention. Some of our spine, the inter-city road and rail network, is old and needs renewal.

This document sets out our plan for a renaissance, backed by hundreds of billions of pounds of public and private investment. It is a response to the outstanding work done by the National Infrastructure Commission in assessing what the country needs. We will build that infrastructure, and redress long-standing inequalities, particularly in transport, between different parts of the UK. In recent years, we have spent heavily on the rail and road networks of London and the south-east, whose prosperity benefits us all. The fruits of that investment - Thameslink, Crossrail, new trains on the Underground, the future Lower Thames Crossing to relieve the M25 - will serve our economic engine well for many years.

But in the period covered by this strategy, we will significantly shift spending to the regions and nations of the UK. On our major A roads and motorways, two-thirds of our upgrades are outside south-eastern England, including dualling the A303 to the south-west and completing the first trans-Pennine dual carriageway in fifty years.

In public transport, all but one of the major new capital projects in the next few years will be outside the south-east. Northern Powerhouse Rail will connect Leeds and Manchester, and we will help make bus and rail networks in those and other city regions as good as Greater London's.

I know, too, that a multitude of smaller, local projects - better buses, and bypasses, and new stations, and cycle lanes - will do at least as much good as the megaschemes, and help more people. This strategy funds them too. We will restore many of the rail services lost in the Beeching cuts, pump money into local roads, and are providing £5 billion of extra funding to improve buses and cycling across the country, again on the model of London.

The Union Connectivity Review will examine new ways to bind together our United Kingdom, improving the links between our four nations. We have changed the Green Book, the government's guidance on how to assess potential investments, to help us address regional and Union imbalances.

And our environmental agenda, set out in our recent ten-point plan, is fully reflected in this Strategy, with ambitious commitments on energy, decarbonisation and clean economic growth driving us towards net zero in 2050. Our new industrial revolution will create and support up to 250,000 green jobs.

About half of all infrastructure spending is private, especially in energy, water and telecoms. We will reduce policy uncertainty that holds back investment and create a new national infrastructure bank to co-invest with private-sector partners. It will be available to metro mayors and local authorities. And it will be headquartered in the North of England: the place where the first infrastructure revolution, and arguably the modern world, was born.

The projects in this strategy, including £27 billion of public funding next year, will create wealth and thousands of jobs to repair some of the scars from the pandemic. We must build back better, not the same as before.

So we also start to ask how we should answer the new challenges caused by COVID-19, such as increased demand for roads; and how we can use the new levers the crisis has given us. We have learned, since March, that we can build new hospitals and testing labs more quickly than we ever imagined. We will use that experience to deliver motorway junctions, railways, and power stations more quickly too. We are in the buyer's market of a lifetime; we will use our weight as a major client to drive best practice in procurement.

In a world likely to be working less from the office, our massive gigabit-capable broadband programme looks more important than ever. It has enormous potential for levelling-up: with cheaper property, more relaxed lifestyles and superb internet connections, previously left-behind towns could become homeworking hubs.

Yet I also deeply believe in the future of cities and of other places where people can meet each other, challenge each other, spark off other people and create those magical flashes of creativity and invention. After months trapped on endless flickering video-conferences, we will want face-to-face contact more than ever. Some of our infrastructure needs will change because of COVID-19. Many will not.

Infrastructure will not, of course, level up Britain on its own. We must work on skills, on research and on innovation to create new, wealth-generating clusters - new Cambridges, new Thames Valleys - across the country. But this Strategy will put the calcium in our national bone structure and the collagen in our national skin tissue.

**Boris Johnson**  
Prime Minister

# Executive Summary

Infrastructure underpins the economy. Transport, digital, energy and utility networks are vital for jobs, businesses and economic growth. But they also have a profound impact on people's daily lives.

The government wants to deliver an infrastructure revolution: a radical improvement in the quality of the UK's infrastructure to help level up the country, strengthen the Union, and put the UK on the path to net zero emissions by 2050.

This Strategy sets out the government's plans to deliver on this ambition. It is the first of its kind: **rooted in the expert advice of the highly respected National Infrastructure Commission (NIC) and responding to its ground-breaking 2018 assessment of the country's infrastructure needs.**

**Infrastructure is long-term.** Decisions taken today on new rail lines, power plants, or road upgrades, will affect lives and livelihoods for decades to come. But infrastructure investment also has an important short-term role to help support jobs and stimulate the economy. This Strategy brings together the government's long-term goals with the short-term imperative to rebuild the economy following the COVID-19 pandemic.

COVID-19 continues to pose a huge challenge to the UK, as it does with every other major global economy. **The government will do whatever it takes to ensure the economy recovers as swiftly as possible.** In the summer, the government brought forward £8.6 billion of investment to support jobs during the pandemic. This Strategy sets out the government's plans to go further, to drive a strong and jobs-rich recovery.

**As the government helps the economy to recover it will also seek to address the long-term issues that have held back UK infrastructure.** These issues include 'stop-start' public investment, insufficient funding for regions outside of London, slow adoption of new technology, policy uncertainty that undermines private investment, and project delivery plagued by delays and cost overruns.

This Strategy sets out how the government will address these issues and do things differently: how it will build back fairer, faster and greener. It describes how the government will:

- **Boost growth and productivity across the whole of the UK, levelling up and strengthening the Union:** the government wants to level up communities and nations across the UK through investment in rural areas, towns and cities, from major national projects to local priorities;
- **Put the UK on the path to meeting its net zero emissions target by 2050:** bold action is needed to transform the UK's infrastructure to meet net zero and climate change commitments. The government will continue to decarbonise the UK's power, heat and transport networks – which together account for over two-thirds of UK emissions - and take steps to adapt to the risks posed by climate change;
- **Support private investment:** the UK has a proud record of attracting private investment into its infrastructure. But the government recognises investors have faced uncertainty in the past few years. This Strategy – and *the Energy White Paper* which will follow shortly – are aimed at providing

investors with clarity over the government's plans, so they can look to the UK with confidence and help deliver the upgrades and projects needed across the country; and

- **Accelerate and improve delivery:** the government wants to transform the way infrastructure projects are delivered in the UK. This will be achieved through wide-ranging reforms from speeding up the planning system, to improving the way projects are chosen, procured and delivered, and greater use of cutting-edge construction technology.

This approach is underpinned by high levels of government investment, with record levels of investment for the railways, strategic roads, broadband networks and flood defences.

**This Strategy also puts innovation and new technology at the heart of the government's approach.**

Every infrastructure sector could face transformative technological change over the next twenty years. From electric vehicles, to hydrogen heating systems, to 5G and its successors, new technologies have enormous potential to improve the environment and the daily lives of people across the UK. This Strategy will ensure the UK is at the forefront of this technological revolution.

**The whole of the UK will benefit from this Strategy.**

Where policy is reserved for the UK government, this Strategy includes measures which will benefit every nation, such as a radical improvement in mobile coverage in rural areas. Where policy sits with the devolved administrations, Scotland, Wales and Northern Ireland will receive commensurate funding through the Barnett formula.

# Driving recovery and rebuilding the economy

The COVID-19 pandemic has caused hardship for individuals, families and businesses across the UK. The health emergency has been accompanied by an economic shock of historic proportions. The government has responded with an unprecedented economic support package, and will do whatever it takes to ensure the economic recovery from COVID-19 is as swift and strong as possible.

Infrastructure investment will have a key role to play in the recovery, both by maintaining jobs in the short term, and creating the conditions for long-term sustainable growth. In the summer, the government brought forward £8.6 billion of capital investment in infrastructure, decarbonisation and maintenance projects, supporting thousands of jobs.

Now the government is going further. To support the recovery, government investment in economic infrastructure will be £27 billion in 2021-22. The government is also setting out longer-term settlements for key infrastructure programmes, with record levels of investment in strategic roads, rail, broadband and flood defences. Economic infrastructure is one part of overall public investment, which also includes other areas such as schools, hospitals, and defence. Spending Review 2020 delivers £100 billion total investment in 2021-22 to support the recovery.

This decision to press on with high levels of investment, despite the fiscal pressures COVID-19 presents, marks the government's commitment to end the stop-start pattern of investment that has been common in the UK in the past. Next year the government will review the fiscal remit for the National Infrastructure Commission, to ensure it reflects the government's long-term ambitions.

Public investment is only part of the story. Private infrastructure investment will be crucial for the UK's economic recovery from the pandemic. This Strategy sets out how the government will support private sector investment, including through a new infrastructure bank for the UK which will co-invest with the private sector, and through the Prime Minister's Ten Point Plan for a Green Industrial Revolution, which will mobilise tens of billions of pounds of private investment.

Finally, the pandemic has had a profound impact on the way people use infrastructure. Many of these changes will be temporary: aided by government, city centres will bounce back; aviation will return. But in some areas changes could endure: more home working is likely in future, and the surge in cycling seen in the past six months could continue. The government will work closely with the NIC and industry to understand the longer-term effects COVID-19 may have on UK infrastructure, and the implications for policy.

# Levelling up and strengthening the Union

The government wants to use infrastructure to unite and level up the UK, delivering a stronger Union, thriving regions, cities living up to their full potential and revitalised towns and communities. To deliver this, the government is investing across the country, prioritising those areas that have received less support in the past.

## Leaving no community or business behind

- £5 billion to support UK-wide gigabit broadband roll-out, a Shared Rural Network extending 4G mobile coverage to 95% of the UK, and £250 million to ensure resilient and secure digital networks;
- £5 billion over this parliament for buses and cycling; and
- A new £4 billion cross-departmental Levelling Up Fund that will invest in local infrastructure in England (which will attract funding for Scotland, Wales and Northern Ireland in the usual way).

## Creating regional powerhouses, making cities the engines of growth and revitalising towns

- Supporting the largest city regions outside of London with £4.2 billion intra-city transport settlements;
- Backing new green growth clusters in traditional industrial areas, with carbon capture and storage, offshore wind, port infrastructure and low carbon hydrogen;
- Bringing jobs, investment and prosperity to some of the most deprived communities across the UK through the freeports programme;
- Revitalising over 100 town centres and high streets through the Towns Fund; and
- Restoring many of the rail services lost through the Beeching cuts of the 1960s.

## Connecting the regions and nations of the UK, and creating a united and global Britain

- Backing HS2 to deliver essential North-South connectivity, with an Integrated Rail Plan to deliver transformational improvements in the Midlands and the North;
- Record investment in strategic roads (over £27 billion), including the A66 between Penrith and Scotch Corner, Lower Thames Crossing, and the A303 Stonehenge; and
- Delivering a Union Connectivity Review reviewing options to improve transport links across the four nations of the UK.

## And changing how decisions are taken:

- Increasing the UK government's ability to invest directly in Scotland, Wales and Northern Ireland through the UK Internal Market Bill;
- Changing the way projects are appraised to support levelling up through the Green Book Review;
- Expanding devolution within England, and implementing the devolution deal in West Yorkshire;
- Relocating 22,000 civil servants out of London and the South East by 2030.

# Decarbonising the economy and adapting to climate change

As set out in the Prime Minister's Ten Point Plan for a Green Industrial Revolution, infrastructure investment is fundamental to delivering net zero emissions by 2050. The government will unlock private sector investment to accelerate the deployment of existing technology, such as retrofitting the UK's building stock and electrification of vehicles, while advancing newer technologies such as carbon capture and low-carbon hydrogen. The government's approach will create jobs to support the recovery from COVID-19, and support the government's levelling up agenda by ensuring key industrial areas are at the heart of the transition to net zero. The UK is already decarbonising faster than any other G20 country. As hosts of the UN Climate Change Conference COP 26 next year, the UK will go even further to promote the importance of low-carbon infrastructure and support its commitment to the Paris Agreement. Key measures include:

- Significant investment in offshore wind and into modern ports and manufacturing infrastructure to expand the share of energy generation from renewables;
- Providing up to £525 million to bring forward large-scale nuclear and invest in the development of advanced nuclear technologies;
- £1 billion to support the establishment of carbon capture and storage in four industrial clusters;
- Investing in hydrogen to scale up the UK's capacity to produce both 'blue' and 'green' hydrogen;
- Investing £1.3 billion in charging infrastructure to accelerate the mass adoption of electric vehicles ahead of ending the sale of new petrol and diesel cars by 2030;
- Enabling heat decarbonisation by supporting the roll-out of existing technologies like heat pumps and development of emerging technologies like hydrogen;
- Funding to help England to meet its share of the Climate Change Committee's recommendations to plant 30,000 hectares of trees a year in the UK; and
- Investing £5.2 billion by 2027 to better protect 336,000 properties and boost resilience of communities to the increased risk of flooding and coastal erosion resulting from climate change.

## Supporting private investment in infrastructure

Private investment has delivered major benefits for UK infrastructure and will be critical over the coming decades as the UK moves towards meeting net zero in 2050. The government is committed to supporting private investment and is taking action across the following areas:

- The government is setting up a new UK infrastructure bank, to co-invest alongside the private sector in infrastructure projects;
- The bank will operate UK-wide, be based in the North of England, and support the government's ambitions on levelling up and net zero;
- The bank will also be able to lend to local and mayoral authorities for key infrastructure projects, and provide them with advice on developing and financing infrastructure;

- The government is committed to the model of independent economic regulation, but will refine it to ensure it provides a clear and enduring framework for investors and businesses and delivers the major investment needed in decades to come, while continuing to deliver fair outcomes for consumers;
- The government will produce an overarching policy paper on economic regulation in 2021, which will consider regulator duties, how to inject more competition into strategic investments and the benefits of a cross-sectoral Strategic Policy Statement; and
- The government will continue to develop new revenue support models and consider how existing models – such as the Regulated Asset Base model and Contracts for Difference – can be applied in new areas, and remains open to new ideas from the market. The government will not reintroduce the private finance initiative model (PFI/PF2).

# Accelerating and improving delivery

The government wants to deliver infrastructure projects better, greener and faster. That means addressing longstanding challenges such as complex planning processes, slow decision-making, and low productivity in the construction sector. It also means learning lessons from the COVID-19 pandemic, for instance from the approaches that built Nightingale Hospitals in record time, and saw the UK move swiftly to secure access to a range of promising vaccines. Further, there is a clear opportunity with EU exit to change how this government delivers projects, using the flexibility the UK has as a sovereign country to do things differently.

The government set up Project Speed in the summer, to review every part of the infrastructure project lifecycle and identify where improvements could be made. Project Speed has developed a comprehensive package of reforms, including:

- Reform of environmental regulations to deliver a quicker and simpler framework for assessing environmental impacts and secure better outcomes for the environment;
- Landmark reform of the planning system including consulting on amending permitted development rights, to let schools and hospitals be expanded quickly;
- Transforming the construction sector to enable it to become more productive, more sustainable and more internationally competitive, with better use of data and modern methods of construction;
- Ensuring more effective decision making with streamlined approval processes, more emphasis on quality design, and better monitoring and evaluation;
- Embedding good design in all infrastructure projects through planning reforms; and

- Bringing about a step change in capability and leadership, accelerating investment in major project expertise and delivery skills and improving the skills base across the country to ensure every area can deliver the infrastructure it needs.

These reforms have already driven substantial progress, and in future mean the UK's vital infrastructure like schools, hospitals, transport and other networks will be delivered better, greener and faster:

- Better, because the process of assessing infrastructure projects under the revised methodology will ensure the government is valuing the wider economic, social and environmental benefits of a project. The government will set projects up to succeed by strengthening the assurance and decision-making regime.
- Greener, because the requirements of the net zero commitment will be considered in every stage of the project lifecycle and underpin decisions on the technical solutions chosen to achieve the required outcomes.
- Faster, by simplifying and shortening the processes through which projects secure the consents they need to proceed, procure contracts and deliver; while using modern methods of construction, new skills and a strategic relationship with industry which will improve productivity.

# Conclusion and next steps

This Strategy clearly sets out the government's long-term infrastructure ambitions:

- **It provides a long-term perspective** without ignoring shorter-term imperatives;
- **It sets out clear goals and plans to achieve them**, with more detail to come in some areas over the coming weeks and months;
- **It announces multi-year funding commitments** for many key infrastructure programmes; and
- **It confirms the government's commitment to fundamentally change** the way it considers and delivers infrastructure across the whole of the UK.

However, this isn't the final word on the government's infrastructure plans – it instead represents the first step of a multi-year process to transform the UK's infrastructure networks. This Strategy will also be followed by a series of detailed publications setting out further details on key areas of infrastructure policy, including the Construction Playbook, Energy White Paper, English Devolution and Local Recovery White Paper, a refreshed Industrial Strategy, Union Connectivity Review and an updated National Infrastructure and Construction Pipeline.

The government is also setting out new priorities for the National Infrastructure Commission, including commissioning a new study on greenhouse gas removal technologies, and preparing to appoint additional Commissioners.

# Introduction

This National Infrastructure Strategy comes at an historic time. COVID-19 has caused a significant health and economic shock. The UK has left the European Union and is fully independent and self-governing for the first time in 45 years, creating new opportunities to do things differently. **This is the moment to build back better, to create world-class infrastructure across the whole UK, and to transform people's lives for decades to come.**

Infrastructure is the backbone of the economy – vital to jobs, economic growth and quality of life for people across the UK. It affects everybody's daily lives in profound ways. The government's commitment to unite and level up the UK is more urgent than ever, and infrastructure will be crucial in renewing the fabric of the country.

The UK has a proud history of building infrastructure – from the railways that brought forth the industrial revolution to the Thames Barrier that protects millions from flooding each year. **But there are long-standing challenges that have held back the UK's infrastructure:** insufficient and costly 'stop-start' public investment; a lack of focus on the potential of great urban centres; slow adoption of new technology; policy uncertainty undermining private investment; and sluggish delivery, with projects too often delayed.

**This National Infrastructure Strategy tackles these challenges.** Rooted in the authoritative and impartial advice of the National Infrastructure Commission (NIC), it sets out how infrastructure can support the immediate economic recovery and the government's ambition to transform the UK's infrastructure networks over the next decade and beyond.

This Strategy marks the first decisive step change in the nation's infrastructure ambitions. The government's vision is for:

- **A united UK with thriving communities, cities, regions and nations,** with quality infrastructure giving everyone, everywhere opportunities to succeed. Communities will be brought together, broadband connectivity will be better, commutes will be shorter and delays will be fewer;
- **Greener and more beautiful places,** with cleaner air, more green spaces, green buses, more cycling, low-carbon and energy efficient homes, and better high streets for UK towns;
- **The UK to be a world leader in new technologies,** including wind power, hydrogen production carbon capture and storage, nuclear power, electric vehicles and zero emission planes; and
- **A stable and robust regulatory and delivery system,** leading to sustained public and private investment to support innovation, delivering projects better, faster and greener.

## Addressing long-standing challenges

The COVID-19 pandemic has introduced enormous short-term disruption, and may have long-term effects on the way people live, for instance with less daily commuting. However, this does not undermine the long-term arguments for infrastructure: the UK still needs to invest in digital, transport and utilities networks to underpin economic recovery and growth. It does mean that the government will have to continue to refine its approach to infrastructure investment in response to the impacts of COVID-19 in the years to come.

**Chapter 1 of this Strategy focuses on how infrastructure can boost short term economic growth and drive the recovery from COVID-19.** It sets out how *Spending Review 2020* delivers high levels of investment to support the economic recovery, with long-term settlements for key infrastructure programmes.

**Chapter 2 focuses on levelling up the economy.**

The UK's major cities and regions are not as productive as international comparators. Towns and regions are held back by inadequate and out of date infrastructure, making it hard for people to get to work, run businesses and attract international investment. The UK's transport networks are ageing and congested and UK gigabit broadband coverage lags behind many competitor countries. There are also problems with poor infrastructure connecting the four nations of the UK. **This strategy announces an ambitious package of plans to level up the nations, regions, cities and towns of the UK and strengthen the Union** – with vastly improved broadband, road and rail networks connecting up the country, investments to boost cities, towns and communities, and getting the basics right everywhere with better roads, buses and cycling infrastructure. This is underpinned by changes in how and where decisions are made, to better reflect local and national needs.

The UK has made substantial progress in reducing carbon emissions from its power networks and the cost of renewables has fallen sharply – **but bold action is now needed to transform the UK's infrastructure to meet net zero and climate change commitments** as one of the world's leading, modern, sustainable economies.

In line with the Prime Minister's *Ten Point Plan for a Green Industrial Revolution*, **Chapter 3 sets out the government's plans to decarbonise power, heat, heavy industry and transport networks** - which together account for over 80% of UK emissions - and how to adapt to the risks posed by climate change.<sup>1</sup>

The UK has a proud record of attracting private investment into its infrastructure, and this will be even more vital in delivering on its net zero targets. But the government recognises that investors have faced some uncertainty in the past few years. **Chapter 4 of this Strategy sets out the government's plans to support private investment in infrastructure**, including by establishing a **new UK infrastructure bank**, to harness private capital investment.

**Finally, infrastructure delivery in the UK has been too slow for too long.** The COVID-19 pandemic has shown that this doesn't have to be the case; for instance the Nightingale hospitals were assembled in record timescales. **Chapter 5 sets out the steps the government is taking to accelerate and improve infrastructure delivery.** This will be achieved through wide-ranging reforms coming out of the Project Speed taskforce, from speeding up the planning system, to improving the way projects are chosen and run, reforming the way the government procures, and using cutting edge construction technology.

**The whole of the UK will benefit from this Strategy.**

Where policy is reserved for the UK government, this Strategy includes measures which will benefit every nation of the UK, such as a radical improvement in mobile coverage in rural areas. Where policy sits with the devolved administrations, those governments will receive funding through the Barnett formula for the benefit of Scotland, Wales and Northern Ireland.

**The journey doesn't stop here.** Successful delivery of this plan will require collaboration across all parts of government, industry and civil society. The government will be following up this Strategy with further detail on a number of areas – including the English Devolution and Local Recovery White Paper and the Energy White Paper. The final chapter of this strategy sets out what the government will do next to deliver on its ambitions.

# The case for infrastructure investment

High quality infrastructure is crucial for economic growth, boosting productivity and competitiveness. It helps connect people to each other, people to businesses, and businesses to markets, forming a foundation for economic activity. Infrastructure acts as a direct 'input' for businesses, which rely on energy, transport and waste collection to operate. Well-developed transport and digital networks allow businesses to grow and expand, enabling them to extend supply chains, deepen labour and product markets, collaborate, innovate and attract inward investment. These 'agglomeration' effects are particularly powerful in city regions, where high quality infrastructure can play a substantial role in boosting productivity. But they also apply more broadly.

Infrastructure can also support other government policy objectives. For instance, it can improve skills and education through investment in digital technology and buildings. It is a key factor in determining where firms choose to locate and grow, and people's ability to access resources.

However, the size of the UK's capital stock (a measurement of the value of the UK's current infrastructure networks) is generally considered to be smaller than comparable economies.<sup>2</sup>

In 2019 the World Economic Forum (WEF) ranked UK infrastructure 11th in the world, behind comparable European economies such as France, Germany and the Netherlands.<sup>3</sup> The UK also falls well behind other countries on a sector-by-sector basis. For instance, WEF rank the UK 36th for the quality of its road infrastructure, and 79th on fibre internet subscriptions.

Businesses and communities also need consistency and certainty about planned infrastructure. For a long time, investment in UK infrastructure has been volatile and stop start. Previous governments have increased investment and then cut back. This has created a fractured supply chain, exposed to significant vulnerability, and is part of the reason why the UK has a lower infrastructure stock than in many other countries.

This means that increasing both public and private investment, whether in order to reduce some of the highest levels of road congestion in Europe,<sup>4</sup> or increasing gigabit-capable broadband access to continue to catch up to international competitors,<sup>5</sup> would have a relatively larger impact on growth and living standards in the UK.<sup>6</sup>

# The National Infrastructure Commission

The government set up the NIC in 2015, with the aim of providing impartial, expert advice on major long-term infrastructure priorities. The NIC published its first *National Infrastructure Assessment* in July 2018.<sup>7</sup> This comprehensive report set out the Commission's assessment of the UK's infrastructure needs over the next 30 years, and made a series of recommendations to the government across all areas of economic infrastructure: energy, transport, water and wastewater (drainage and sewerage), waste, flood risk management and digital communications.

**The NIC recommendations have already substantially influenced the government's infrastructure agenda** and provided the foundations for many of the measures announced in this Strategy and at previous fiscal events. This Strategy provides the government's formal response to the NIC's recommendations. But it also goes further, setting out the next steps in the government's plans for a step change in UK infrastructure policy. A detailed response to each NIC recommendation is provided alongside this Strategy in *Response to the National Infrastructure Assessment*.

This is the first time the government has responded to such a comprehensive assessment of the UK's infrastructure needs: the government intends to undertake a similar exercise and update this Strategy every five years, in response to future National Infrastructure Assessments.

**In line with the NIC's remit, this Strategy focuses on economic or networked infrastructure:** energy, transport, water, waste, flood risk management and digital communications. However, the reforms to project delivery will clearly benefit all forms of capital projects, including social infrastructure such as schools, hospitals and prisons. Further detail on the government's plans for social infrastructure investment are set out in *Spending Review 2020*.

# Recovery and rebuilding the economy

## At a glance

The COVID-19 pandemic has caused hardship for individuals, families and businesses across the UK. The health emergency has been accompanied by an economic shock of historic proportions. The government has responded with an unprecedented economic support package, and will do whatever it takes to ensure the economic recovery from COVID-19 is as swift and strong as possible.

Infrastructure investment will have a key role to play in the recovery, both by maintaining jobs in the short term, and creating the conditions for long-term sustainable growth. In the summer, the government brought forward £8.6 billion of capital investment in infrastructure, decarbonisation and maintenance projects, supporting thousands of jobs.

Now the government is going further. To support the recovery, government investment in economic infrastructure will be £27 billion in 2021-22. The government is also setting out longer-term settlements for key infrastructure programmes, with record levels of investment in strategic roads, rail, broadband and flood defences. Economic infrastructure is one part of overall public investment, which also includes other areas such as schools, hospitals, and defence. Spending Review 2020 delivers £100 billion total investment in 2021-22 to support the recovery.

This decision to press on with high levels of investment, despite the fiscal pressures COVID-19 presents, marks the government's commitment to end the stop-start pattern of investment that has been common in the UK in the past. Next year the government will review the fiscal remit for the National Infrastructure Commission, to ensure it reflects the government's long-term ambitions.

Public investment is only part of the story. Private infrastructure investment will be crucial for the UK's economic recovery from the pandemic. This Strategy sets out how the government will support private sector investment, including through a new infrastructure bank for the UK, which will co-invest with the private sector, and through the Prime Minister's Ten Point Plan for a Green Industrial Revolution, which will mobilise tens of billions of pounds of private investment.

Finally, the pandemic has had a profound impact on the way people use infrastructure. Many of these changes will be temporary: aided by government, city centres will bounce back; aviation will return. But in some areas changes could endure: more home working is likely in future, and the surge in cycling seen in the past six months could continue. The government will work closely with the NIC and industry to understand the longer-term effects COVID-19 may have on UK infrastructure, and the implications for policy.

The UK is experiencing a health and economic shock of historic proportions. The threat posed by COVID-19 has forced governments around the world to restrict activity to control the virus. The government fully recognises what a challenging period this is for the British people and for businesses across the economy, and will do whatever it takes to ensure the UK recovers as quickly and strongly as possible.

The government has responded with an unprecedented set of economic support measures, including the Coronavirus Job Retention Scheme (CJRS) which has supported millions of jobs across the economy, and further tax cuts and deferrals, grants and loans for businesses.

**The pandemic has also profoundly affected the way people use infrastructure** – planes have been grounded, trains left empty. Digital infrastructure has been crucial in keeping people connected. The number of people cycling has surged. There has been additional pressure on parts of the road network.

Within infrastructure, the transport sector has been the most heavily impacted, with dramatic falls in demand across many modes. Over the period, the government has responded with a series of targeted aid packages:

- The government is supporting the aerospace sector and its aviation customers with over £9 billion support through the Bank of England's COVID-19 Corporate Financing Facility, grants for research and development, loan guarantees and support for aerospace exports. In addition, the government has provided £5.7 million funding to air passenger services between Great Britain and Northern Ireland to ensure those who needed to travel could continue to do so;
- The government is safeguarding vital transport links to the mainland for people living on the Isle of Wight and the Isles of Scilly, including an emergency package of up to £10.5 million for lifeline ferry services;

- The government has provided more than £3 billion to support local light rail and bus networks, across the country to keep cities moving, including London, and maintain connectivity; and
- The government has stepped in to keep train services running in spite of severely reduced passenger demand. While these temporary arrangements are in place, the government will make an early start on key reforms and ensure a new and better type of rail network emerges following the pandemic.

The breakthroughs that have been achieved in vaccine development shows that an end to the pandemic is in sight. But some of the behavioural changes seen through this period are likely to endure. For instance, people are likely to spend more time working from home in future, making the government's plans to deliver gigabit broadband across the country even more important. Many people who have started cycling to work will continue to do so.

But in other areas, the economy may return to similar patterns to before the pandemic. For instance, cities will still be key engines of growth, with people and businesses clustering to drive and benefit from innovation. The government's plans for greater funding for city-regions will be key.

All of this creates questions for the government, such as how to address increased demand for space on the roads? And how to rebuild confidence in public transport as the pandemic eases? The government will work closely with industry, consumers and the NIC to address these questions.

It is also clear that COVID-19 has had a particularly harsh impact on the North of England, making the government's levelling up agenda even more pressing than before.

**The government's immediate focus now is on ensuring infrastructure investment and policy support the recovery.** Infrastructure investment can boost jobs, while also increasing growth and productivity. That is the government's aim through *Spending Review 2020*.

# Infrastructure and public health

As well as being vital for the economy and productivity growth, infrastructure is also a key driver of public health outcomes.

The pandemic has proven that taking steps now to increase overall public health – by improving air quality and encouraging cycling and walking to fight obesity – will pay dividends over the longer-term as the UK focuses on economic and physical recovery. The government is reflecting this priority in its approach to infrastructure investment.

The COVID-19 pandemic has shown that many people need to think harder about their health, and the lifestyle changes which might help them be more active and stay fit. Investment in active travel is critical to this. Government support for cycling and walking helps tackle obesity by providing ways for people to exercise as well as get from A to B, while measures to decarbonise the economy and reduce congestion will help improve air quality – and therefore health – across the UK.

This year has also highlighted the benefits of having truly local green space for mental and physical health and wellbeing, as well as highlighting the deficit in accessible green space for some communities and in deprived areas. The government is developing a National Framework of Green Infrastructure Standards for England that will show what good green infrastructure looks like, and help local authorities, developers and communities to improve provision in their area.

# Infrastructure and the recovery: the 2020 Spending Review

As well as setting budgets for next year, the Spending Review announces longer-term budgets for key capital programmes and projects. This includes funding for HS2 – the biggest infrastructure project in Europe – and record levels of investment in programmes for strategic roads, flood defences and broadband. Further details are set out in *Spending Review 2020*.

**Taken together, these spending commitments mark a clear step change in the UK’s approach to infrastructure investment.** Too often in the past, governments have invested too little in infrastructure, or investment has been done on a stop-start basis. This government is committed to end that, recognising that climate change, regional inequality and low productivity are long-term challenges that require a sustained commitment.

**The government is committed to major investment, not just in the infrastructure sectors covered in this document, but also in other sectors including health, education, science and defence. Spending Review 2020 delivers £100 billion total investment in 2021-22 to support the recovery.** This is part of the government’s plans to invest over £600 billion over the next five years, delivering the highest sustained levels of public sector net investment as a proportion of GDP since the late 1970s.

The economic infrastructure sectors covered in this document, such as transport, energy and digital communications form a key part of these plans. **Next year the government will spend £27 billion in these sectors.<sup>8</sup>**

Public investment is only part of the story. Much of the UK’s infrastructure is financed by the private sector, and **private investment will be crucial for the UK’s economic recovery from the pandemic.** This Strategy sets out how the government will support private sector investment. This includes the introduction of a major new national infrastructure bank to catalyse investment in infrastructure projects. And this Strategy delivers on the Prime Minister’s *Ten Point Plan for a Green Industrial Revolution*, which is intended to mobilise tens of billions of pounds of private investment.

Public sector net investment since 1984-85 to 2025-26

Source: OBR. Sharp increase in 2020-21 is driven by the upfront cost of expected future calls on government guaranteed loans and a fall in GDP

# The National Infrastructure Commission's fiscal remit

The National Infrastructure Commission's (NIC's) Charter commits the government to setting a binding fiscal remit to ensure that the NIC's recommendations remain affordable. While the need for infrastructure investment is clear, the government remains committed to fiscal sustainability, and is mindful of the significant fiscal pressures that exist over the short- and medium-term. The fiscal remit aims to strike an appropriate balance.

The fiscal remit refers to investment in those sectors covered by the NIC: transport, energy, flood risk management, digital communications, water, and waste. The fiscal remit is designed to ensure that the NIC clearly prioritise their recommendations and explain which they consider are most critical in addressing the country's long-term infrastructure needs.

In 2016 the government set the NIC's fiscal remit at between 1-1.2% of GDP. This means that the NIC must be able to demonstrate that its recommendations are consistent with gross public investment in economic infrastructure of between 1% and 1.2% of GDP in each year between 2020 and 2050. This remit applies to both the National Infrastructure Assessment and specific studies.

The government is committed to increasing infrastructure investment to drive the economic recovery and make progress against its longer-term plans, and it is important that the NIC's fiscal remit reflects these ambitions. However, given current economic uncertainty, now is not the right time to definitively update the remit. Instead, the government will review the NIC's fiscal remit in detail next year, to ensure it continues to reflect the government's ambitions as the NIC prepare to publish their second National Infrastructure Assessment. In the meantime, the government will maintain the NIC's fiscal remit at a minimum of 1-1.2% of GDP.

# Delivering on these commitments

The construction industry is essential to maintaining and delivering vital infrastructure services, including transport and utilities networks, and ensuring public safety by delivering critical public health facilities and remediating unsafe buildings. But the sector also faces long-term challenges. It is fragmented when compared to those in other countries; struggles to raise investment for innovation; and in the UK has had to manage significant cycles of public investment increases and cuts.

The construction sector has responded well to the pandemic, working closely with government and key stakeholders to ensure sites can remain open and activity can continue safely. But the government recognises the challenges the sector is still facing now, with uncertainty weighing on private investment. While the majority of construction sites have now reopened, the sector still faces significant challenges as a result of reduced private sector demand and the knock-on impact this has for job retention and financial health.

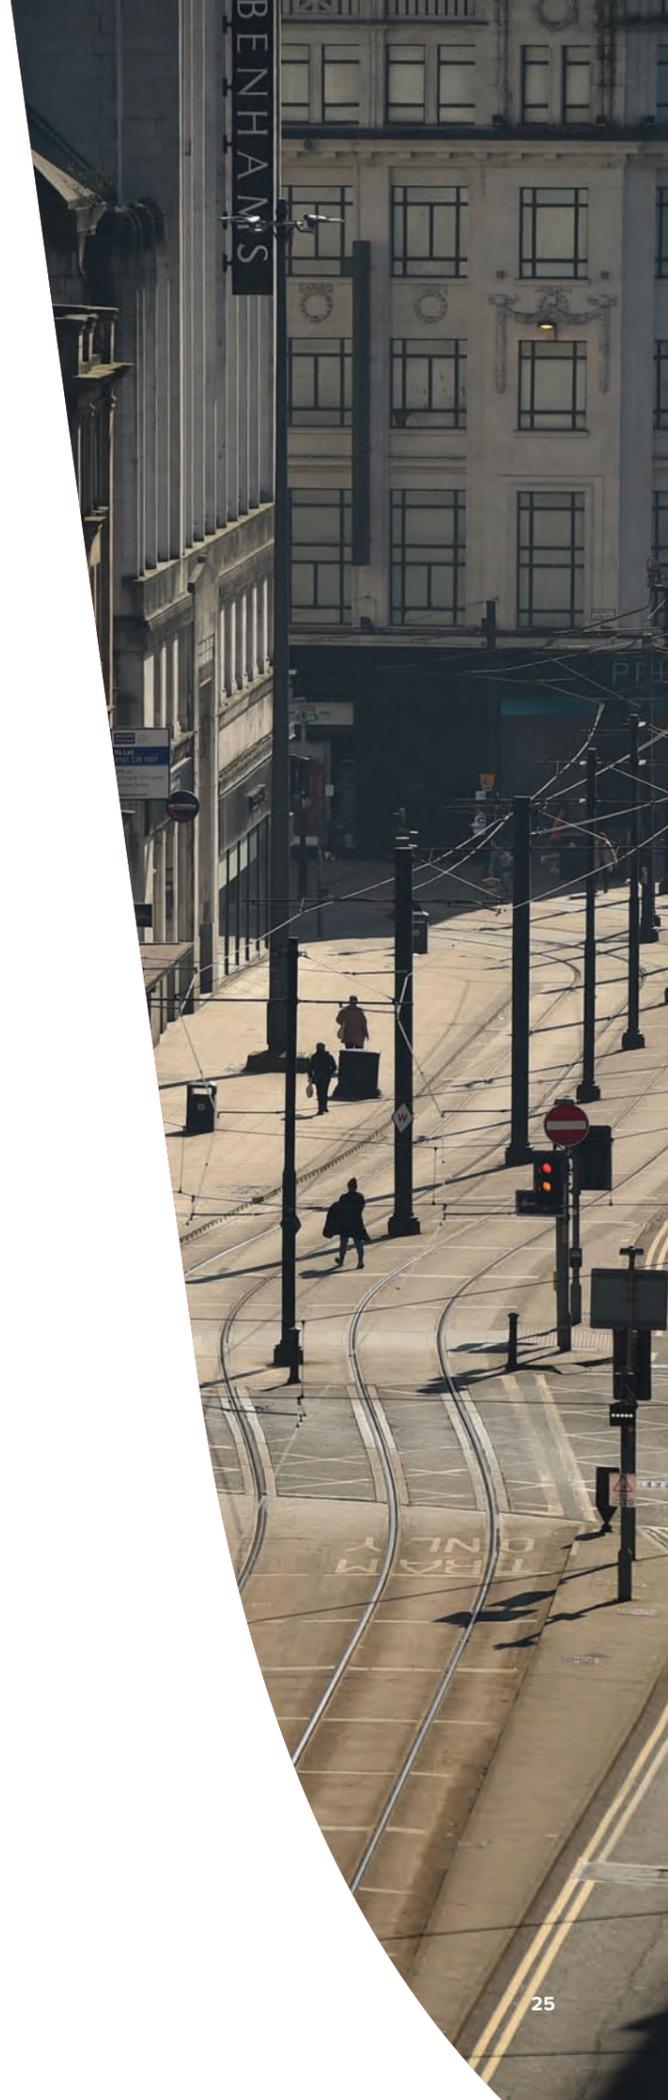

Continuing to progress the UK's ambitious infrastructure plans in all parts of the country is vital to the recovery of the construction sector, and the economy as a whole. The government is continuing to do everything it can to ensure that construction sites are able to remain open and operate safely, so that the industry emerges from the pandemic with the capability and capacity to deliver this Strategy.

By ramping up investment progressively in a structured way, the government's ambition is to eliminate the peaks and troughs that have proved destabilising for the supply chain in the past. The government has taken a balanced approach between new and existing assets, as well as delivering more local and regional enhancements to create a varied pipeline in terms of the size and location of projects. This will result in commercial opportunities to small and medium-sized enterprises as well as large contractors.

Alongside ongoing major projects such as HS2, in the immediate-term new investment will be targeted at smaller local schemes to upgrade existing infrastructure. These projects can be taken through planning and development quickly to provide employment opportunities in the UK construction sector that would otherwise be affected by COVID-19 and decreasing private sector demand.

HM Treasury is strongly encouraging all government departments and their agencies to progress approved and funded projects into procurement and contract without delay (subject to good project discipline). This includes continuing to publish a comprehensive *National Infrastructure and Construction Pipeline*, with the next update in Spring 2021.

The government is also urging local authorities to take steps to preserve construction jobs in their areas by progressing funded projects as soon as practicable. Finally, the government will use its weight as a major construction client to transform and modernise the industry, through the publication and implementation of the *Construction Playbook*.

# Levelling up the whole of the UK

## At a glance

The government wants to use infrastructure to unite and level up the UK, unleashing the potential of the Union, thriving regions, cities living up to their full potential and revitalised towns and communities. To deliver this, the government is delivering major investment across the country, prioritising those areas that have received less support in the past.

### Leaving no community or business behind

- £5 billion to support UK-wide gigabit broadband roll-out, a Shared Rural Network extending 4G mobile coverage to 95% of the UK, and £250 million to ensure resilient and secure 5G networks;
- £5 billion over this parliament to transform bus services and cycling infrastructure;
- A new £4 billion cross-departmental Levelling Up Fund that will invest in local infrastructure in England (which will attract funding for Scotland, Wales and Northern Ireland in the usual way); and
- £5.2 billion by 2027 to better protect communities from flooding and coastal erosion.

### Creating regional powerhouses, making cities the engines of growth and revitalising towns

- Supporting the largest city regions outside of London with £4.2 billion intra-city transport settlements;
- Backing new green growth clusters in traditional industrial areas, with carbon capture and storage, offshore wind, port infrastructure and low carbon hydrogen;
- Bringing jobs, investment and prosperity to some of the most deprived communities across the four nations of the UK through the freeports programme;
- Revitalising over 100 town centres and high streets through the Towns Fund; and
- Restoring many of the rail services lost through the Beeching cuts of the 1960s.

### Connecting the regions and nations of the UK, and creating a united and global Britain

- Backing HS2 to deliver essential North-South connectivity, with the Integrated Rail Plan delivering transformational improvements in the Midlands and the North;
- Record investment in strategic roads (over £27 billion), including the A66 between Penrith and Scotch Corner, Lower Thames Crossing, and the A303 Stonehenge; and
- Delivering a Union Connectivity Review identifying options to improve transport links across the four nations of the UK.

### And changing how decisions are taken

- Increasing the UK government's ability to invest directly in Scotland, Wales and Northern Ireland through the UK Internal Market Bill;
- Changing the way projects are appraised to support levelling up through the Green Book Review;
- Expanding devolution within England, and implementing the devolution deal in West Yorkshire; and
- Relocating 22,000 civil servants out of London and the South East by 2030.

The government's vision is to level up the whole of the UK and deliver a stronger Union between Scotland, Wales, Northern Ireland and England. The growth of every region and nation in the UK is vital, not just to boost economic growth and productivity, but to create a stronger, fairer and more inclusive society.

Great nations, where opportunity and talent are spread evenly, depend on great infrastructure. Although not the only factor – skills, local leadership and business environment are also fundamental – infrastructure plays a crucial role in resolving disparities between places. Better infrastructure networks can have a transformative effect on economic and social outcomes as they connect people, either physically or digitally, to opportunities.

Some parts of the UK lead the world as great places to live, work and do business, in part due to excellent infrastructure. The government will draw on its experience in these places to **create a new infrastructure anatomy that unites and levels up the whole of the UK.**

First, **the government will ensure that no citizen, community or business is left behind**, by connecting them to the next stage of the digital revolution and ensuring that they can get around their local community with well-maintained local roads. The government is also improving the essential, everyday features of peoples' lives; faster and greener buses that markedly improve the commute, and high quality, well integrated cycling infrastructure that sparks a gear change in the way people ride.

Second, **re-balancing the UK relies on boosting the cities and towns** most in need. Cities are the anchors of successful regions across the world; they are engines of growth. To drive economic growth across all regions of the UK, the government is investing in growth in cities. But over half the UK's population live in towns, many of which have suffered economic and social decline over decades. The government is investing in infrastructure to revitalise towns, as well as to drive their economic regeneration.

Third, the government will **connect the nations and regions of the UK**, building infrastructure networks that bring together the whole of the UK. To level up and unite the country, cities across the UK must also be accessible to each other, to support trade across regions and spread growth from south to north, east to west and back again. The government is investing in national transport and pivoting investment away from London, ensuring every region has great connectivity.

Fourth, **maintaining the UK's position as a global trading nation** also requires infrastructure that connects the country to its international partners - linking businesses to valuable markets and to support trade and investment. The government is supporting private sector investment to improve infrastructure for international freight and aviation.

Finally, **this will require doing things differently**, including changing how investment and policy decisions are made. This means ensuring that decisions are not just made in Whitehall but reflect the diversity of this country, empowering local areas and leaders, but also ensuring decisions can be made for the UK as a whole where appropriate. It is vital that decision-making frameworks such as the Green Book also reflect the government's levelling up agenda.

### Infrastructure across the Union

As responsibility for much infrastructure is devolved, the devolved administrations receive funding through the application of the Barnett formula in line with investment decisions taken by the UK government. This funding ensures the devolved administrations have the means to invest in infrastructure to support people and businesses in Scotland, Wales and Northern Ireland.

Infrastructure sector	Devolved Administration responsibility		
	Scotland	Wales	Northern Ireland
Transport	Largely devolved	Largely devolved, aside from rail and aviation	Devolved
Energy	Not devolved, aside from energy efficiency	Not devolved, aside from energy efficiency	Devolved, aside from nuclear
Digital	Not devolved	Not devolved	Not devolved
Waste and sewage	Devolved	Devolved	Devolved
Flood risk	Devolved	Devolved	Devolved
Waste	Devolved	Devolved	Devolved

Source: National Infrastructure Commission

## Leaving no community or business behind

From Teeside to Tonbridge, from Bury to Bristol, from Lewis to Lewes, and from Portadown to Penzance, the government is determined to level up the opportunities available everywhere, boosting jobs, wages and prospects for all communities. The economic opportunities available to many people depend on where they were born, grew up and still live – around 40% of the UK population live within the local area where they were born.<sup>9</sup> These economic opportunities are therefore dictated in practice by the nature of their local economy.

**This is why the government is also taking action to deliver** local roads, buses, cycling, better digital connectivity and flood defences across the country. Where policy is devolved the devolved administrations will receive funding through the application of the Barnett formula in line with the decisions taken by the UK government. Where policy is reserved - for example digital infrastructure - the UK government is focused on improving connectivity for the whole of the UK.

**Rural communities in particular rely on strong infrastructure networks to support their local economies**, and these must be well-thought through and maintained. The government's long-term ambition is for people and businesses in rural areas to be able to easily access and unlock opportunity, as in other parts of the UK by improving connectivity.

### Investing in local priorities

The government is creating a new £4 billion Levelling Up Fund that will invest in local infrastructure that has a visible impact on people and their communities and will support economic recovery. Moving away from a fragmented landscape with multiple funding streams,

this new cross-departmental fund for England will invest in a broad range of high value local projects up to £20 million, or more by exception, including bypasses and other local road schemes, bus lanes, railway station upgrades, regenerating eyesores, upgrading town centres and community infrastructure, and local arts and culture. It will be open to all areas in England and prioritise bids to drive growth and regeneration in places in need, those facing particular challenges, and in areas that have received less government investment in recent years. This fund will attract funding for Scotland, Wales and Northern Ireland in the usual way.

### Local roads

This Strategy, will transform the journeys people make every day. Local roads make up 98% of the network and are used in almost every journey. They are estimated to be worth £400 billion – one of the UK's most valuable public assets.<sup>10</sup> Well-maintained local roads allow for faster and more reliable journeys, boosting local businesses and serving all road users. High quality local roads are also central to the future of transport, playing an important role in the take-up of autonomous vehicles and greener forms of transport such as cycling and buses.

**The Spending Review commits £1.125 billion of local roads maintenance funding in 2021-22**, including £500 million for the Potholes Fund to fix potholes and resurface roads. **This will be supported by £260 million allocated to Local Authorities in 2021-22 for shovel-ready local transport schemes** through the Integrated Transport Block, including public transport and active travel upgrades.

**The government is also investing £310 million in 2021-22 in upgrading the road network**, reducing congestion and making it better able to cope with demand by adding capacity. This will support investment in over 50 schemes in this Parliament such as North Hykeham relief road and crossings in both Lake Lothing and Great Yarmouth due to start construction shortly. **Altogether, this means the government is investing £1.7 billion in local roads in 2021-22.**

**Buses and active travel**

Road-building alone cannot solve congestion: the UK also needs to use limited road space more efficiently. **This forms part of the government’s broader agenda for driving improvements in local transport across the country through £5 billion for buses and cycling over this Parliament.** Increasing cycling and walking can help tackle some of the most challenging issues facing UK society: improving air quality, combatting climate change, improving health and wellbeing, addressing inequalities and tackling congestion on the roads. There has already been progress in this space – despite fewer people travelling overall during the pandemic, in the summer there was around a 100% increase in weekday cycling, and on some weekends the increase has been around 200%, compared to early March, prior to the lockdown.<sup>11</sup>

**In May, the government announced a £2 billion active travel package in order to make it easier and safer for people to walk and cycle.** This investment will support the delivery of the priorities set out in Gear Change, the government’s new long-term walking and cycling strategy,<sup>12</sup> which will ensure high design standards, and help integrate new cycling infrastructure into cities, alongside other road users, with thousands of miles of safe, continuous and direct cycling routes. **This funding included £225 million in emergency funding in 2020-21 for local authorities to help them create cycle lanes and more space for pedestrians.**

Buses are the workhorses of public transport, accounting for over 50% of journeys.<sup>13</sup> Yet domestic bus use has been in decline, falling by over 10% since 2009-10 outside London.<sup>14</sup> The government is investing to build back better by supporting local authorities and operators to work together to coordinate timetables and ticketing to meet shifting patterns of demand, deliver bus priority measures that tackle congestion, and employ open data and demand-responsive technologies to improve the customer experience. **The Spending Review commits £300 million in 2021-22 to drive transformation, maintain essential services as long as necessary, and support the industry through the COVID-19 recovery.** This combination of measures will make trips smoother and faster than ever before.

**Digital connectivity**

The UK is a nation that thrives on digital connectivity, with some of the highest rates of digital adoption in the world. The UK has the fifth largest number of broadband and mobile subscriptions in the OECD,<sup>15</sup> and more people in the UK shop online than in any EU member state.<sup>16</sup> The government wants to deliver high quality, reliable digital infrastructure that works across the UK, so that mobile calls do not drop, video calls don’t freeze, and people working from home can do their jobs and run their businesses with ease.

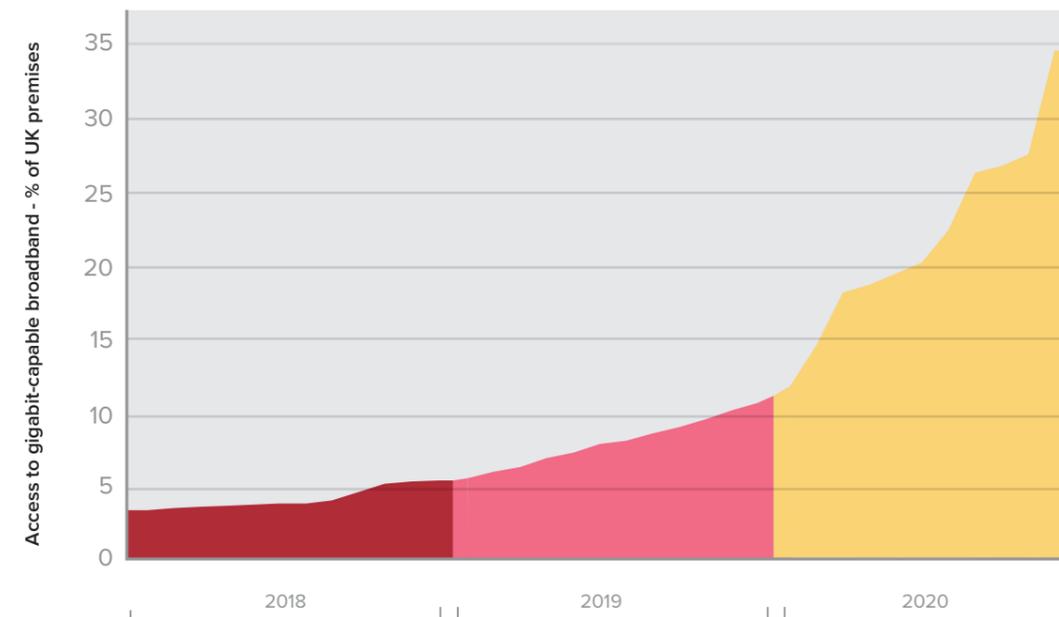

**Fast, reliable digital connectivity can deliver economic, social and well-being benefits for the whole of the UK.** Never has this been more important than as the country deals with the impact of COVID-19, when digital infrastructure has enabled home working, home learning, and kept families in touch with each other in extraordinary circumstances.

**Digital infrastructure is particularly important for the UK’s rural communities in all four nations.** Greater connectivity can help rural businesses innovate, grow, and create jobs. In doing so, it can help rural areas attract and retain young people and families, supporting thriving rural societies.

Gigabit-capable broadband, such as full fibre, can provide speeds of over 1,000Mbps, over forty times faster than standard superfast broadband and fast enough to download an HD film in seconds. These speeds provide new opportunities across the UK, for consumers and businesses alike, and enable 5G technology.

**The government’s programme for gigabit-capable broadband has made dramatic progress.** More than a third of UK premises now have access to gigabit-capable connections, up from 9% when the government took office in July 2019. By next year, more than half of all premises will have access. During the COVID-19 pandemic, operators have rightly focused on network resilience at a time of unprecedented need for good connectivity. The government has also announced restrictions on the use of Huawei equipment. The government is working with industry to target a minimum of 85% gigabit capable coverage by 2025, but will seek to accelerate roll-out further to get as close to 100% as possible. The government will continue to implement an ambitious programme of work to remove barriers to broadband deployment and maximise coverage in the hardest to reach areas of the country.

**Gigabit-capable broadband coverage in the UK**

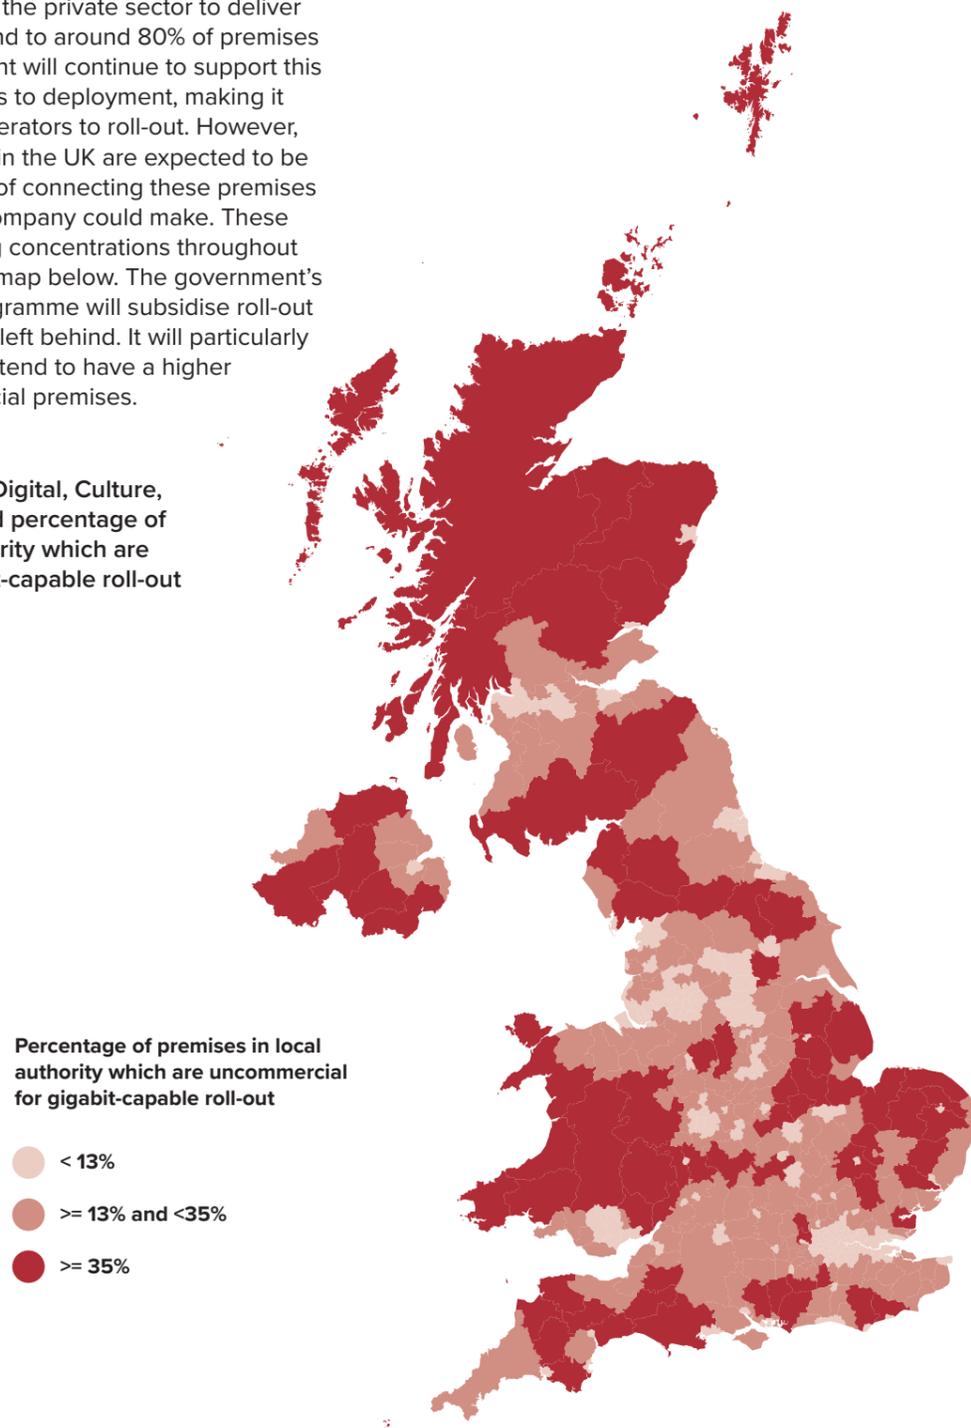

Source: Graph compiled using UK gigabit coverage data from thinkbroadband. UK gigabit coverage defined as percentage of UK premises with access to FTTP and/or DOCSIS 3.1. Data as of 10 November 2020.

**The strategy for UK-wide gigabit-capable broadband**

The government expects the private sector to deliver gigabit-capable broadband to around 80% of premises in the UK. The government will continue to support this through removing barriers to deployment, making it quicker and easier for operators to roll-out. However, around 20% of premises in the UK are expected to be uncommercial: the costs of connecting these premises outweigh the returns a company could make. These premises occur in varying concentrations throughout the UK, as shown by the map below. The government's £5 billion UK Gigabit Programme will subsidise roll-out to ensure no area will be left behind. It will particularly benefit rural areas which tend to have a higher proportion of uncommercial premises.

Source: Department for Digital, Culture, Media & Sport. Estimated percentage of premises in a local authority which are uncommercial for gigabit-capable roll-out

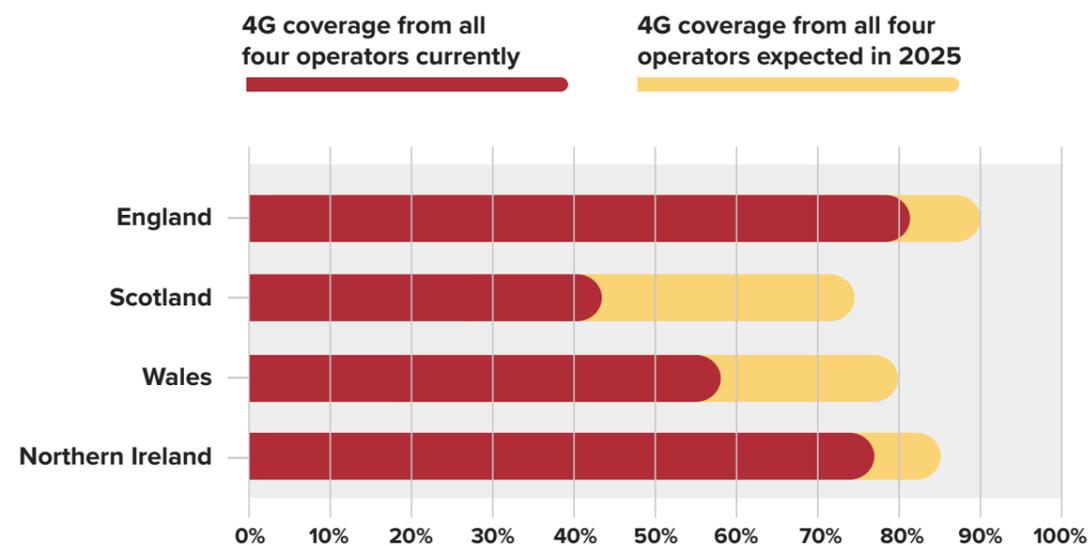

UK-wide roll-out is a major civil engineering project, requiring enough cabling to go around the Earth more than ten times.<sup>17</sup> The total level of investment required is in the region of £30 billion. Through the government's ambitious strategy, rapid increases in the rate of digital infrastructure deployment are already being seen and the UK is expected to see record speeds of deployment in the coming years. Current market data suggests that operators are on track to deliver new full fibre coverage to 2.5 million premises in 2020, up from around 750,000 in 2018.<sup>18</sup> The government expects this build rate to increase even further, creating thousands of new jobs.

Mobile connectivity is also crucial to allowing people to stay connected on the move. That is why the government is investing £500 million, matched by industry, to deliver high-quality 4G mobile coverage from at least one operator across 95% of the UK by 2025, through the Shared Rural Network. Through this ground-breaking partnership between government and industry, each operator has individually committed to reach 90% of the UK's landmass by 2026, and collectively the Shared Rural Network will provide additional coverage to 280,000 premises and 16,000 kilometres of roads by 2026. This will have major benefits in rural areas, and for Scotland, Wales and Northern Ireland nations in particular.

The Shared Rural Network will not only improve coverage, but also increase consumer choice. Currently, only 67% of the UK has good quality coverage from all four operators, and that will improve to 84% by the end of the programme.<sup>19</sup> This will mean far fewer people in rural areas will find themselves locked-in to the only mobile network with good coverage of their area.

The government will continue its pioneering 5G Testbeds and Trials Programme, with £50 million in 2021-22 to support demonstration projects across rural, urban and industrial settings. These projects show the exciting potential for 5G to transform the lives of consumers and businesses, and are a key part of ensuring the benefits of 5G can be felt in every nation of the UK by the mid-2020s.

It is also vital that digital infrastructure networks are secure and resilient. That is why the government is introducing the Telecommunications (Security) Bill which sets out a new regulatory regime for telecoms security. The government will also publish the 5G Supply Chain Diversification Strategy to ensure the UK's 5G networks are not over reliant on a single supplier, committing £250 million to start this journey. The strategy will set out a clear and ambitious plan to grow the telecoms supply chain and ensure it is resilient to future trends, to shape global standards, and to make significant investments in research and development to bring through new technology. The government will seek the advice of the Telecoms Diversification Task Force in developing specific programmes under this strategy.

### Flooding

Expanding economic opportunity means little for a place – and the people who live and work there – if the infrastructure supporting it is not resilient to potential hazards. Many rural communities and economies across the UK have experienced the devastating impacts of flooding, which can cause significant damage to homes and businesses lasting much longer than the floods themselves. The government is committed to harnessing the opportunities of rural landscapes to increase the resilience of rural communities to flooding. **The government will do this by maximising good land management and implementing nature-based solutions through the next £5.2 billion flood and coastal defence programme starting in 2021, a doubling of the current programme.** Further details are set out in Chapter 3.

## Boosting the UK’s cities and towns

The government recognises that different places across the UK have different challenges:

- **Regional cities** are not as productive or as connected, as they should be. The government’s long-term ambition is for UK cities to be globally competitive. The government will support them to improve their productivity through strengthened infrastructure; and
- **Many towns have lost out from structural changes** – facing economic and social deprivation. The government’s long-term ambition is for every town to be an excellent place to live and work – offering opportunity to those who live there. The government will drive the regeneration of towns, including through investing in infrastructure.

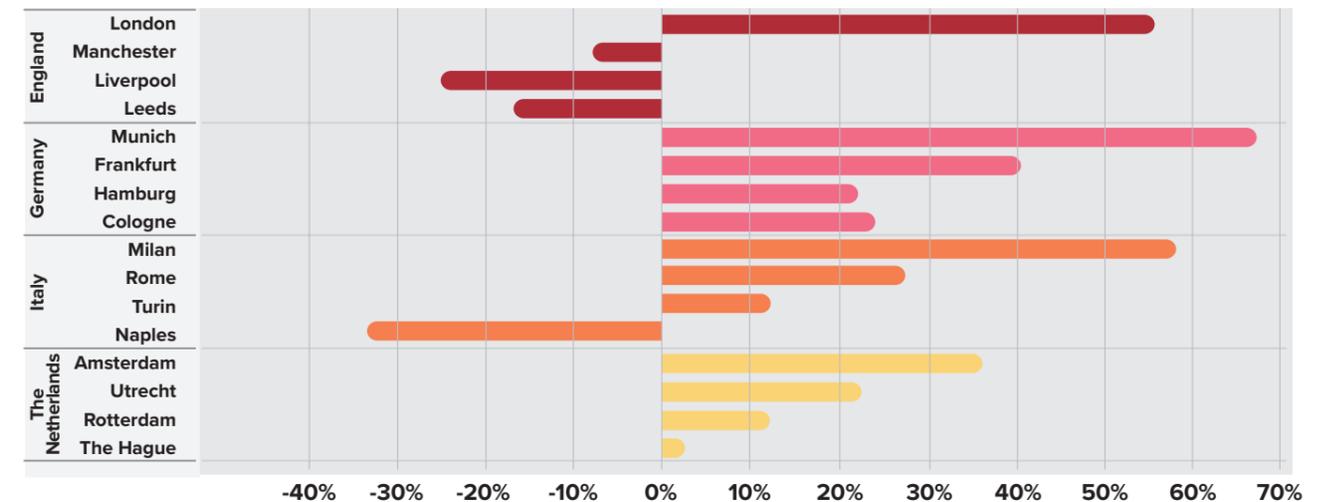

### Making cities the engines of future growth

The government shares the National Infrastructure Commission’s (NIC’s) view on the importance of strong regional cities; the vital organs of the UK economy. Cities drive economic growth through agglomeration effects; they encourage specialisation, drive competition and spread ideas and innovation faster than other places. London is one of the most productive cities in the world, and many other UK regional cities can also play a similarly important role in the UK economy.

However, the NIC noted that many of the UK’s largest cities have below average productivity relative to their size and population, in part due to high congestion and poor local transport links. They are not producing agglomeration economies to the degree that they could. This in turn has an impact on the success of nearby towns, as strong cities can act as an anchor for growth across a wider region.

A well-designed public-transport network is fundamental to the operation of any city. London is the only city in Europe where you can access more local services by public transport than by car.<sup>20</sup> But the story is different in regional cities, where access to those same services by public transport lags behind continental peers. **This is why the government will invest in the North, Midlands and South West to help rebalance the UK economy, and devolved administrations will receive funding to enable public transport investment in Scotland, Wales and Northern Ireland.** Levelling up the rest of the UK does not mean levelling London down. The government is continuing to address capacity issues in the capital, by financing the completion of Crossrail, but has agreed that Transport for London will stop development on Crossrail 2. This frees up investment to raise the performance of public transport networks in the regional cities towards London’s gold standard.

Productivity in selected major cities in England and comparable countries.  
Calculated using GDP per capita in the metropolitan area as share of the national value

Source: National Infrastructure Commission calculations using OECD Statistics. Functional Urban Areas and National level, 2018 (except France where latest urban productivity data is 2016). Productivity in English cities has been calculated as a percentage of the UK average

The government agrees with the NIC that long-term and locally led investment in large cities' transport networks is critical to driving future economic growth and competitiveness. This is central to the government's ambition of levelling up the UK.

The Transforming Cities Fund was launched at Autumn Budget 2017 to improve public transport, boost connectivity and reduce congestion through packages of interlinked schemes such as light rail, new bus corridors, cycling and walking infrastructure. The government has now allocated nine city regions a share of over £1.2 billion for a range of shovel-ready public and sustainable transport schemes – in addition to the over £1 billion already devolved to six Mayoral Combined Authorities. In line with the NIC recommendation, this will drive up productivity and spread prosperity through investment in public transport in MCAs.

Alongside the Transforming Cities Fund and a share of the £5 billion announced for buses and cycling over this Parliament, **eight City regions will also benefit from £4.2 billion government investment in five-year funding settlements for local transport starting in 2022-23**, and £50 million in 21/22 to support preparations for settlements. Following the approach that has worked for London, these settlements will be agreed with elected Mayors and published, providing transparency and accountability while giving Mayors the flexibility and certainty to deliver their plans. The city regions that will receive settlements, subject to appropriate governance, include Greater Manchester, Liverpool City Region, West Midlands, West Yorkshire, Sheffield City Region, Tyne and Wear, West of England and Tees Valley. This will deliver the NIC's recommendation to provide settlements that enable long-term and locally-led investment in large cities transport networks, devolving decisions on local transport to those that understand those systems best.

Transport needs to work hand in glove with skills, education, housing, culture and environment policies to deliver the step change in quality of life and economic performance the government wants to see. Alongside transport, the government is therefore taking steps to improve local infrastructure more broadly, working in conjunction with local areas to ensure investment is in line with local priorities. The government has agreed City and Growth Deals across the UK, to provide local areas with the powers and funding they need to drive forward local economic priorities. The government is investing in Scotland, Wales and Northern Ireland's cities, towns and rural areas through City and Growth Deals. There are 20 City and Growth Deals in Scotland, Wales and Northern Ireland either agreed or in negotiation, committing almost £3 billion of UK Government investment. This means every part of Scotland, Wales and Northern Ireland is supported by a City and Growth deal.

The government also continues to support pan-regional partnerships; the Northern Powerhouse, Midlands Engine, Western Gateway - and recognises the role they play in championing investment and opportunity in their geographies.

Spending Review 2020 also confirms that, in addition to the Brownfield Housing Fund announced at March Budget 2020 for Mayoral Combined Authorities to unlock up to 26,000 high quality homes, **the government will provide an additional £100 million in 21/22 to support housing delivery and regeneration**, including unlocking brownfield sites, regenerating estates and releasing serviced plots on public sector land.

These plans form part of the £7.1 billion National Home Building Fund which will help deliver up to 860,000 homes across the country, in large part through investment in infrastructure to unlock housing – including roads, community facilities and utilities. This will ensure that more homes mean better, not more stretched, local infrastructure and community facilities.

### **Regenerating towns and communities**

Towns in the UK are hubs of economic activity and provide homes to the majority of the population in the UK. While some towns have prospered, either in their own right or through their links to growing cities, many struggling towns do not always have the fundamental building blocks for a strong local economy in place.

Some towns face specific disadvantages that reduce growth and productivity. This can be a mix of economic deprivation, characterised by high concentrations of low-skilled workers, social deprivation, poor employment and low health outcomes. This can be exacerbated by poor transport and digital connectivity. Places that face these challenges need targeted support to help boost their local economies, support local leadership and maximise their potential.

**The government will, therefore, invest in infrastructure to support economic regeneration and create new employment opportunities in the towns across the UK** which are most in need, to make them excellent places to live and work.

Through the Towns Fund, the government is galvanising the local economies of over 100 struggling towns across England to support their long-term economic and social regeneration as well as their immediate recovery from the impacts of COVID-19. The first seven Town Deals were agreed in October 2020. Further successful towns will be announced over the coming months.

The government is taking steps through national programmes to support local economies, in towns across the UK. **Through its ambitious Freeports programme the UK government will bring jobs, investment and prosperity to some of the most deprived communities across the four nations of the UK.** Freeports will enjoy a combination of tariff benefits, tax incentives, and regeneration funding. The programme aims to establish Freeports as national hubs for global trade and investment across the UK, promote regeneration and job creation, and create hotbeds for innovation. A minimum of 10 Freeports will be delivered. Successful bidders will be announced in Spring 2021 and the first Freeports will be designated in late 2021.

Supporting jobs and growth across the UK, in particular in post-industrial and coastal towns, the government's decarbonisation agenda will build the UK's capability in new green industries. Infrastructure investment in offshore wind capacity (40GW by 2030) and port infrastructure will create jobs in coastal communities. Further investment in Carbon Capture and Storage and in low carbon hydrogen will drive economic activity in post-industrial towns.

# Infrastructure investment across the UK

Where policy is reserved for the UK government – for example digital infrastructure – it is taking action to improve infrastructure across the whole of the UK. Where policy is devolved – for example substantial areas of transport – the UK government allocates funding to the devolved administrations through the Barnett formula.

The map shows how investment by the UK government in a number of local infrastructure programmes will benefit different regions.

In addition, the government is making key transport investments in England, including:

## 1 North East

- **Tyne and Wear** and **Tees Valley** will benefit from intra-city transport settlements starting from 22/23.
- Providing £209m to the North East including £16m to redevelop **Sunderland Central Station**.

## 2 North West

- **Greater Manchester** and **Liverpool City Region** will benefit from intra-city transport settlements starting from 22/23.
- Providing £40m to **Preston City Region** including funding for a next generation Urban Traffic Management and Control system.
- Providing an additional £146m to halve the construction time of dualling the A66 across the Pennines.

## 3 Yorkshire and Humber

- **Sheffield** and **Leeds City Regions** will benefit from intra-city transport settlements starting from 22/23.
- Providing £319m to **West Yorkshire Combined Authority** including £30m for active and sustainable travel across **Bradford**, and £171m to **Sheffield City Region** including for a new bus rapid transit link.

- Developing schemes including the A1 from **Doncaster to Darrington**.

## 4 West Midlands

- **West Midlands Combined Authority** will benefit from intra-city transport settlements starting from 22/23.
- The Transforming Cities Fund provides £321m to **West Midlands Combined Authority** to invest in public transport schemes.

## 5 East Midlands

- Upgrading the A46 Coventry Junctions.
- Providing £169m to **Derby & Nottingham** including £25m for bus rapid transit in Derby, and £40m to **Leicester**.
- Progressing the North Hykeham Relief Road in Lincolnshire.

## 6 East of England

- Providing £39m to **Norwich** including a mobility hub at Norwich station, and £95m to **Cambridgeshire** and **Peterborough** to invest in public transport schemes.
- Building the Great Yarmouth Third River Crossing in **Norfolk** and Lake Lothing Third Crossing in **Suffolk**.

## 7 London & South East

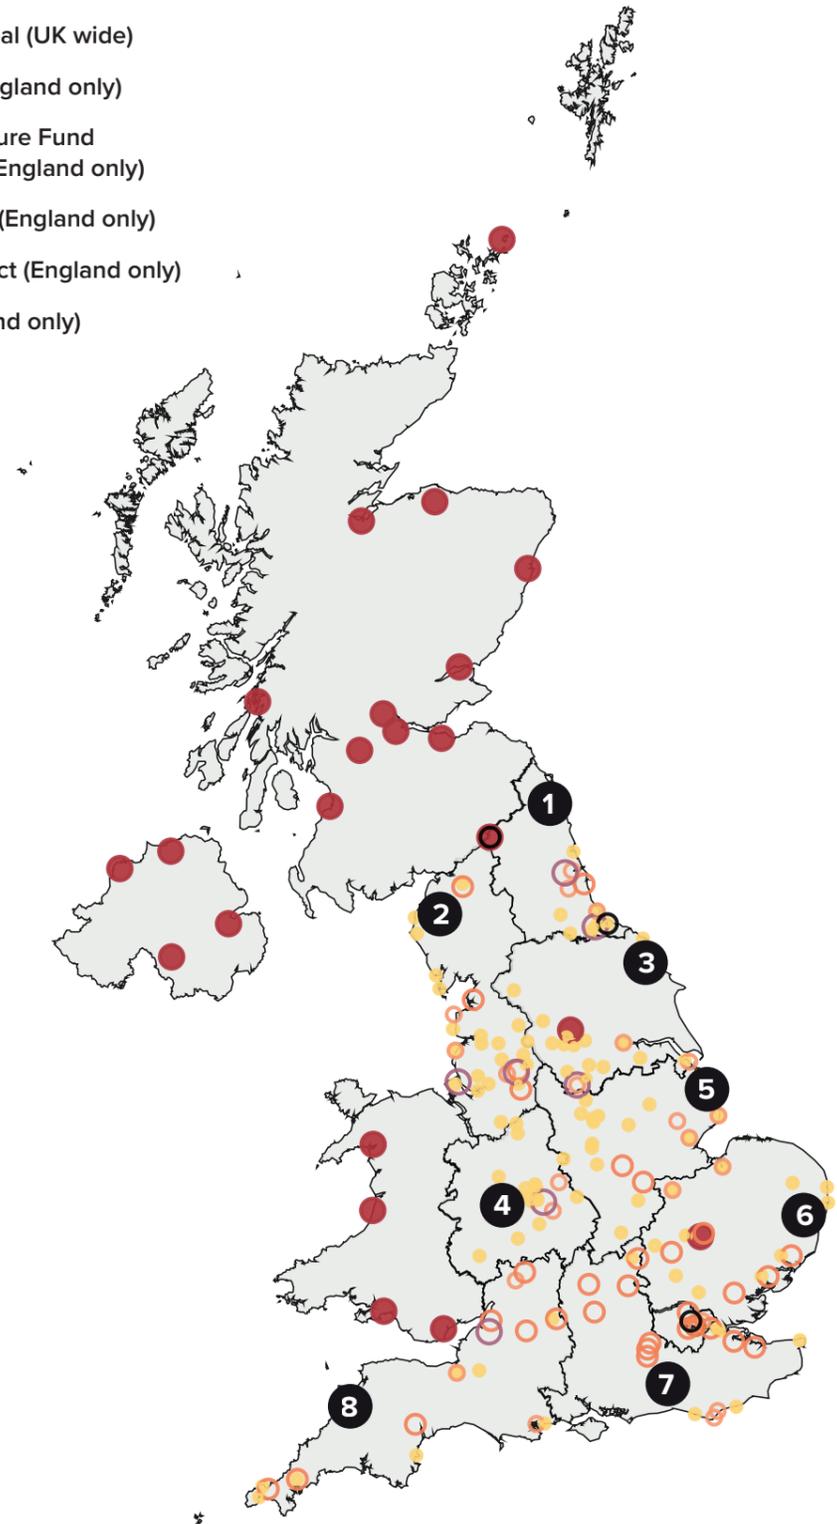

- Providing £60m to **Portsmouth** and **South East Hampshire** including the relocation of Gosport bus station and taxi rank, and £63m to **Southampton** including new rapid bus links.
- Investing in the Lower Thames Crossing and financing the completion of Crossrail.

## 8 South West

- The **West of England Combined Authority** will benefit from intra-city transport settlements starting from 22/23.
- Providing £59m to **Plymouth** including £12m to improve walking and cycling, and £79m to **Bournemouth, Christchurch & Poole**.
- Investing in the A303 Stonehenge scheme, and in MetroWest to improve rail services across **Bristol** and the surrounding region.

### Local infrastructure schemes

- City and Growth Deal (UK wide)
- Flood Defences (England only)
- Housing Infrastructure Fund - Forward funding (England only)
- Mayoral Gainshare (England only)
- Regeneration Project (England only)
- Towns Fund (England only)

# Connecting nations and regions

HS2 is this government's flagship national transport project, forming the spine of the UK's transport network by delivering essential North-South connectivity between some of the UK's biggest and most productive cities. High-speed rail does not just affect those who ride it, but also releases capacity on the classic rail network, meaning better local train connections into the UK's great cities. Construction for Phase 1 from London to the West Midlands started earlier in 2020, and the Hybrid Bill for Phase 2a from the West Midlands to Crewe is expected to receive Royal Assent later this year.

This government is committed to building back better. In line with the recommendations of Douglas Oakervee's review, **the government has strengthened HS2 governance, including through a new ministerial taskforce.** This is providing greater oversight and control of delivery performance, ensuring that HS2 will be delivered on time and on budget, and supporting realisation of the benefits of the scheme.

**Through the Union Connectivity Review announced by the Prime Minister the government will bring its four great nations closer together by assessing options to improve transport links.** The review will be chaired by Sir Peter Hendy and report by summer 2021. It will involve extensive consultation with the devolved administrations and consider the quality and reliability of existing connections; long-term trends in demand and technological developments; the environmental impact of both the existing and proposed transport links; and how connectivity can support economic growth as the UK recovers from COVID-19. The report will provide recommendations on whether and how best to improve connections, and whether that should include additional infrastructure investment by the UK government.

The government will also revitalise the arteries as well as the spine of the country's transport network, recognising that regional, as well as national, connectivity is vital to uniting the UK. **The government will make the largest ever investment in England's strategic roads - £27.5 billion over this Parliament, a 60% increase on spending in the last five years.** This major investment will ensure that these national traffic corridors are well designed, delivered, maintained, and continue to serve all road users into the future.

New upgrades will include: dualling the A66 between Penrith and Scotch Corner and halving the construction time as part of Project Speed; upgrading the A46 Newark bypass in the East Midlands; building a new Lower Thames Crossing; and building a two-mile tunnel on the A303 at Stonehenge to speed up journeys and enhance the World Heritage Site. The second Road Investment Strategy is focussed not just on road users, but on fulfilling the government's obligations to communities living close to major routes and towards the natural, built and historic environments. All of this money will generate Barnett payments to the Scottish Government, Welsh Government and Northern Ireland Executive, so that they can follow suit.

The railways helped to build modern Britain, so as well as building HS2, the government is also boosting the classic rail network. **Over the remainder of Network Rail's 5 year settlement – Control Period 6 – the government will invest £17.5 billion to renew and upgrade the railway system, improving passenger journeys across the UK.** This will deliver on the NIC's recommendations by progressing the East West Railway.

In 2017, the National Infrastructure Commission outlined the transformational economic potential of the Oxford-Cambridge Arc in its report 'Partnering for Prosperity'. At Spending Review 2020 the government has reaffirmed its commitment to the area, including additional funding to support the Budget 2020 commitments to develop a Spatial Framework to plan for long-term economic and housing growth and to explore the case for up to four Development Corporations along the route of East West Rail. This will help to deliver sustainable economic and housing growth, supported by infrastructure, that meets the needs of local people.

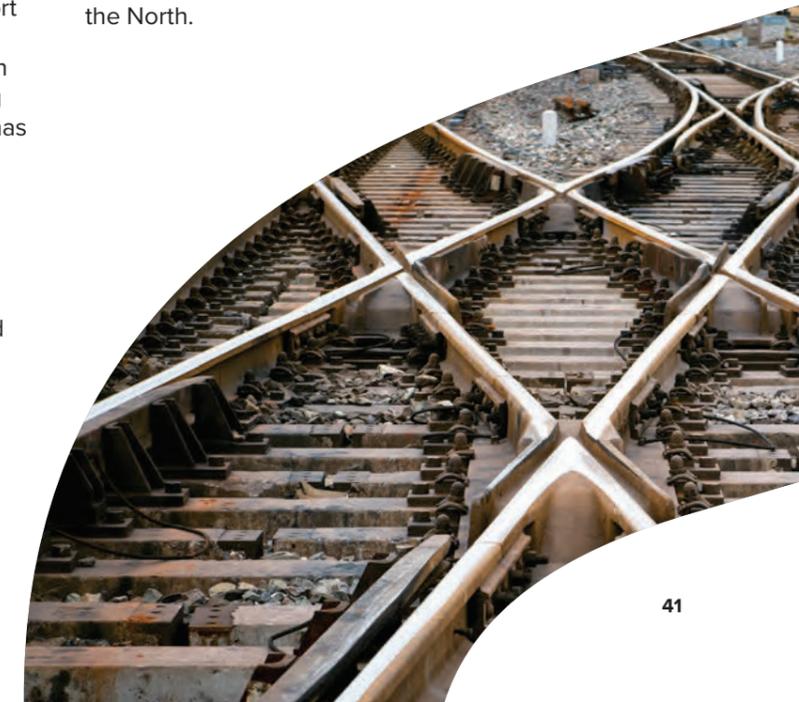

The government will also deliver on its manifesto commitment to spend £500 million to restore transport services previously lost in the Beeching cuts of the 1960s, including reopening the Ashington-Blyth line in Northumberland to passenger services, and restoring rail links to Okehampton in Devon. The government has also launched a New Ideas Fund to pay for feasibility work on proposals for new lines and stations.

Feasibility funding for the first ten schemes has been announced, which will provide a basis for decisions on further development: re-opening Meir Station in Stoke-on-Trent; the Barrow Hill line between Sheffield and Chesterfield; the Ivanhoe line between Leicester and Burton on Trent; branch lines on the Isle of Wight (Shanklin-Ventnor and Wootton-Newport); the Abbey line between St Albans Abbey and Watford Junction;

Reopening Wellington and Cullompton railway stations; Bury-Heywood-Rochdale lines; Clitheroe to Hellfield railway line; reinstatement of rail access to Devizes via a new railway station at Lydeaway; and the Waterside line (Hythe-Totton). The government will provide further feasibility funding for an additional fifteen proposals to inform decisions on further development: reopening Beeston Castle and Tarporley station in Cheshire, St. Anne's Park station in Bristol, and Ferryhill station in County Durham; reinstating links between Bolton, Radcliffe, and Bury; the Stratford-upon-Avon to Honeybourne/Worcester/Oxford line; new stations at Waverley in South Yorkshire and a station in the Langport/Somerton area of Somerset; improved services from Melton Mowbray and Falmouth; upgrading the South Fylde Line; the Maid Marian line between Nottinghamshire and Derbyshire; reinstating rail access to Cirencester; restoring services between Swanage and Wareham; the South Humber rail link; and a new link between Consett and Newcastle.

The government is also expanding the third round of the New Stations Fund to £32 million. This will fund the opening of railway stations at Edginswell and Thanet Parkway in Kent; and St Clears in Carmarthenshire. It will also provide funding to further develop proposals for stations at Haxby in York and Deeside in Flintshire.

The government is fully committed to improving connectivity between northern cities. Over the course of this year, the government has been drawing up an Integrated Rail Plan for the Midlands and the North of England, which will be published shortly. In line with the terms of reference, the Plan will ensure that Phase 2b of HS2, Northern Powerhouse Rail and other planned rail investments in the North and Midlands are scoped and delivered in an integrated way. This will bring transformational rail improvements more quickly and to more places, and will be informed by the NIC's assessment of the rail needs of the Midlands and the North.

# Connectivity for a trading nation

International connectivity is important for linking businesses to valuable markets, and to support trade and investment.<sup>21</sup> The UK has the third largest aviation network in the world. Flights into UK hub airports connect the regions and nations of the UK to the world, enabling a more global Britain. Air connectivity also brings together the nations of the UK, and in 2019 over 19 million passengers flew on routes between England, Scotland, Wales and Northern Ireland.<sup>22</sup>

The government last month launched the **Global Travel Taskforce** to consider how the international travel sector could be supported through the specific challenges caused by the COVID-19 pandemic. It has since considered what steps we can take to facilitate business and tourist travel on a bilateral and global basis, through innovative testing models and other non-testing means, and more broadly what steps we can take to increase consumer confidence and reduce the barriers to a safe and sustainable recovery of international travel. This is alongside the already unprecedented package of measures announced by the Chancellor and available to the travel sector, including schemes to raise capital, flexibilities with tax bills and the extended furlough scheme.

The UK's freight system is one of the most efficient in the world, providing seamless transportation of goods into, out of and across the country, boosting economic growth. The government has announced that it will provide a full response to the NIC's *Better Delivery: The Challenge for Freight* report through the publication of a comprehensive cross-modal freight strategy in 2021. This will also consider the impacts on the freight system of the end of the transition period and the COVID-19 pandemic.

In preparation for the end of the transition period, the government has provided critical support to key ports around the UK through their surrounding Local Resilience Forums to mitigate any potential disruption and ensure continued seamless transit of freight in and out of the country. This has included development and implementation of essential traffic management plans, particularly around the Port of Dover and the Channel Tunnel, as well as upstream intervention to support and improve haulier preparedness ahead of the end of the Transition Period. The government has also allocated £200 million towards the Port Infrastructure Fund to ensure that ports across the UK have the necessary infrastructure in place for freight to continue to flow smoothly in and out of the UK.

## Doing things differently

The government is taking steps to reform how it invests in places, as well as what it invests in, to embed long-term change in policy making to level up and unleash the potential of the Union.

**Major policy interventions will be considered UK-wide.** The UK Internal Market (UKIM) Bill changes the government's powers to act in Scotland, Wales, and Northern Ireland. If passed, the UK Government will have concurrent powers to invest in infrastructure and economic development.

The government supports English devolution to strengthen local institutional structures and bring decision-making closer to the places impacted by those decisions. Nearly 40% of people in England now live in an area where devolution has transferred powers and funding from Whitehall to a directly-elected city region mayor.<sup>23</sup> The government will set out expanded devolution arrangements in the English Devolution and Local Recovery White Paper, building on the success of the directly-elected mayors who are driving economic growth across their functional economic areas, by ensuring mayors have the powers and responsibilities they need to shape their local area.

**The government is also taking steps to ensure national policy making is sensitive to local needs.**

Through the government's Places for Growth programme, 22,000 civil service roles will be relocated from Whitehall by 2030 to address the regional imbalance in the civil service. The new National Infrastructure Bank will also be based in the north of England. In addition, the UK government will invest £210 million in 2021-22 in the Places for Growth and Government Property Agency hubs programmes, establishing more UK government hubs around the UK, enabling departments to further relocate out of London. The government will deliver on its commitment at *Budget 2020* for an economic campus in the North of England.

To ensure the impact of policies on places is taken into account when choices are made, the government conducted a review into its guidance on appraising proposals regarding government spending, taxation and regulations (*the Green Book*). This will better link policies to government objectives, including levelling up.

# The Green Book Review

As announced at Budget 2020, the government has undertaken a review of the Green Book, to ensure that investment spreads opportunity across the UK. The Green Book is the government's guidance on best-practice appraisal and is therefore a vital tool for ensuring value for money for taxpayers.

A central finding of the review is that the appraisal process often fails to properly consider how a proposal will deliver the government's policy ambitions, including levelling up. This leads to appraisals being focused on a benefit cost ratio (BCR) that does not reflect social policy objectives or give ministers the information they need about where costs and benefits fall.

HM Treasury has therefore updated the Green Book to end the dominance of the BCR in decision making, starting with this Spending Review. Appraisals must give a comprehensive picture of cost and benefits, including non-monetisable, non-economic impacts. In particular, options will be assessed first and foremost on whether they deliver relevant policy objectives (for instance, the regeneration of a particular place). Any option which fails to do so cannot be considered value for money and will not progress to shortlisting stage.

The government is also changing the guidance so it will no longer be acceptable for proposals to be 'place blind'. Business cases should be developed to align with relevant local strategies and major interventions in the area. And for the first time, business cases for all proposals will have to set out how they will impact different places on a comply or explain basis.

These changes will be crucial to levelling up. They will mean that appraisals and advice to ministers should include much better analysis on how options deliver their policy goals, as well as which parts of the country look to gain most from them, supporting better-informed decisions.

These updates will feed into future Spending Reviews and HM Treasury will also roll out a tailored programme of training across Whitehall and beyond to ensure that the new Green Book guidance is fully embedded in future appraisals.

# Decarbonising the economy and adapting to climate change

## At a glance

As set out in the Prime Minister's *Ten Point Plan for a Green Industrial Revolution*, infrastructure investment is fundamental to delivering net zero emissions by 2050. The government will unlock private sector investment to accelerate the deployment of existing technology, such as retrofitting the UK's building stock and electrification of vehicles, while advancing newer technologies such as carbon capture and low-carbon hydrogen. The government's approach will create jobs to support the recovery from COVID-19, and support the government's levelling up agenda by ensuring key industrial areas are at the heart of the transition to net zero. The UK is already decarbonising faster than any other G20 country.<sup>24</sup> As hosts of the UN Climate Change Conference COP 26 next year, the UK will go even further to promote the importance of low-carbon infrastructure and support its commitment to the Paris Agreement.

### Key measures include:

- Making significant investment in offshore wind and modern ports and manufacturing infrastructure to expand the share of generation from renewables;
- Providing up to £525 million to bring forward both large-scale nuclear and invest in the development of advanced nuclear technologies;
- £1 billion to support the establishment of carbon capture and storage in four industrial clusters;
- Investing £1.3 billion in charging infrastructure to accelerate the mass adoption of electric vehicles (EVs) ahead of ending the sale of new petrol and diesel cars by 2030;
- Promoting private investment and setting an enduring regulatory environment to promote energy efficiency;
- Enabling heat decarbonisation by supporting the roll-out of existing technologies like heat pumps and development of emerging technologies like hydrogen;
- Funding to help England to meet its share of the Climate Change Committee's recommendations to plant 30,000 hectares of trees a year in the UK; and
- Investing £5.2 billion by 2027 to better protect 336,000 properties and boost resilience of communities to the increased risk of flooding and coastal erosion resulting from climate change

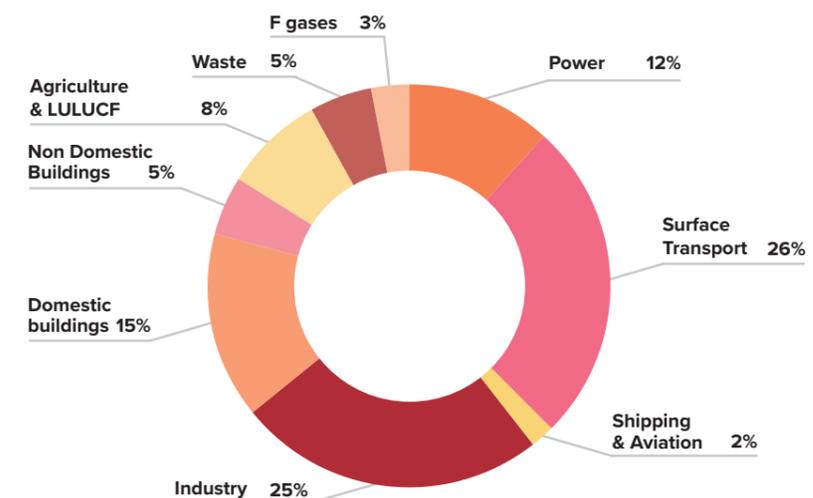

In June 2019 the UK became the first major economy in the world to legislate to end its contribution to global warming by 2050, in line with the UK's commitment to global climate action under the Paris Agreement.

**The UK's commitment to achieving net zero emissions by 2050 will require profound changes that will provide huge opportunities for the UK to build back better from COVID-19.** The UK will need strong, consistent and deliberate policy action to support the technologies that will reduce emissions.<sup>25</sup>

These changes will be economy-wide, and HM Treasury is currently undertaking a review into how the transition could be funded and where the costs could fall. An interim report will be published shortly and the final report in spring 2021.

The majority (over 80%) of the UK's emissions come from infrastructure sectors, and so action on infrastructure will be crucial for meeting the UK's Carbon Budgets and continuing progress towards the net zero target.<sup>26</sup>

### UK production emissions by sector (2019)

Source: Department for Business, Energy & Industrial Strategy provisional UK emissions 2019, on a by source basis - mapped to Climate Change Committee sectors

The UK has already made considerable progress, reducing emissions by 45% since 1990 while growing the economy by almost 80% (as of 2019).<sup>27</sup> This has been achieved while minimising costs, causing a net reduction in household bills.<sup>28</sup>

The majority of contributions and investment so far has come from the power sector, where emissions have fallen almost 70% since 2008.<sup>29</sup> This has been driven through coordinated action by the private sector working closely with the government: regulated efficiency measures have reduced electricity consumption by 14%;<sup>30</sup> coal power generation has fallen from 30% to below 1% since 2014,<sup>31</sup> and the price of off-shore wind has fallen by 55%.<sup>32</sup>

To go further, the UK will need to improve other aspects of its infrastructure in a way that more visibly alters people's lives, including how people heat their homes and travel around the country. **This Strategy sets out early actions that the government will take to build the infrastructure needed to achieve net zero, improve air quality, create a greener urban environment, and minimise the impact of flooding.** This includes significant progress on: carbon capture and storage, low-carbon hydrogen production, charging infrastructure for electric vehicles, offshore wind, and energy performance improvements in buildings.

In many cases the solutions needed are known and action needs to be taken immediately. Further progress will be made by accelerating the deployment of existing technology in the near-term, such as increasing wind generation or driving retrofit in the UK's building stock. These tasks will enable rapidly growing industries, creating jobs across the economy and boosting productivity.

For other areas, **new technologies and skills will need to be developed to continue decarbonising.** Since 2016, the government has made historic increases to public support for science. The UK's world-class institutions are already amplifying this scientific progress through curiosity-driven research and support for technologies. Looking ahead, the government will need to build on these strengths to drive both the development and deployment of new technologies, including:

- Low carbon hydrogen as a potential alternative to fossil fuel heating in industry and buildings, to store energy, a source of power, and for some modes of transport;
- Carbon Capture and Storage to remove up to 90% of the carbon dioxide emissions from gas-fired power stations and industrial factories, including those making hydrogen, as well as to support greenhouse gas removal technologies to offset some emissions from the hardest to decarbonise sectors;
- Technologies to remove carbon dioxide from the air, using 'direct air capture' or biomass, so that it can be used as an input to other processes, or stored; and
- Floating offshore wind to allow the harnessing of wind power across a greater proportion of the seabed.

Investment in these areas, where the UK has competitive advantage, can create the knowledge and skills needed for a green industrial revolution, driving leadership in the industries of the future, reducing national and global emissions, as well as providing the platform for significant economic growth. Where these investments are brought together to create place-based industrial clusters they can transform local economies, creating productive jobs, developing specialist skillsets, and attracting private investment. For example, the North East of England could become a home of choice for companies delivering carbon capture and storage; making hydrogen power a part of daily life; and designing, building and maintaining offshore wind turbines.

At the same time, **the country must adapt to the risks posed by climate change.** National infrastructure will be made resilient to future climate change by ensuring that its expected effects are fully considered at the design stage. This means addressing the likely impacts of higher temperatures, more extreme weather, and increased incidence of droughts, floods, and disease, and building in cost-effective mitigations over the whole life cycle of the asset now

## The government's approach

**Reducing emissions across whole sectors of the economy must be done in a sustainable way that minimises cost.** The benefits, opportunities and costs need to be shared across society and the economy must grow to enable the transition to be sustained, particularly as it recovers from the COVID-19 pandemic. **In November 2020, the Prime Minister laid out his Ten Point Plan for a Green Industrial Revolution. This strategy sets out how it will be delivered.**

The government cannot tackle this challenge alone. **Instead, the government will look to work closely with investors, industry and households.** This strategy sets out clear objectives and ambitions, to provide policy and regulatory certainty for project sponsors and investors to harness the transformational benefits that can be delivered by long-term private capital investment. The energy transition will be underpinned by harnessing private investment and innovation as new technologies become available, new markets are established and opportunities are created across the economy.

However, the full suite of policy levers will need to be deployed to encourage this private sector investment and create the appropriate market incentives to encourage competition and drive down costs, and to ensure that decarbonisation is achieved at the best possible value for money, with the right distributional balance of costs across consumers, taxpayers and the private sector.

**In the short-term, public financing will help to overcome barriers to investment in new technologies and ensure the costs are borne fairly across society, for example:**

- By using the government's unique position to support those risks where the private sector simply cannot, including in the development of financing and delivery models for complex and novel major infrastructure;
- By supporting trade exposed industries at risk of offshoring due to higher operational costs associated with decarbonisation technologies;
- By investing in fuel poor households and social housing to reduce bills for the poorest in society and protect the less able to pay; and
- By supporting the transition from R&D to deployment, driving forward innovation and encouraging UK companies to stay at the cutting edge.

**Now and in the longer term, creating the right regulation and tax measures will be imperative in driving competition and opening up new markets.** This will influence behaviour to address market failures, with a view to any government subsidies reducing over time as risks which once could not be borne by the private sector are mitigated. The Net Zero Review will analyse the range of choices for how households, businesses and the taxpayer could contribute towards the transition and evaluate the trade-offs between cost, competitiveness, effects on consumers and impacts on the taxpayer.

This chapter sets out the government's progress on this vision to date, across low carbon energy, industry, transport, buildings, resilience to climate change, and developing new and innovative technologies, as well as the strategy for moving forward.

# Power

The decarbonisation of the power sector is a major success story from the past decade. It accounted for just 12% of emissions in 2019, down from 27% in 2008, mainly due to the growth of renewables and reductions in the use of coal in power stations.<sup>33</sup> Throughout this period, private investment has also underpinned substantial progress in reducing the cost of clean electricity and maintaining secure supplies.

The steady increase in renewable investments has been driven through a number of successful subsidy schemes and market reforms. Competitive auctions through the Contracts for Difference scheme have led to a dramatic reduction in the costs of offshore wind from £120/MWh in the first auction in 2015 to just £40/MWh in 2019.

While the total cost to consumers from low carbon levies has been significant, rising to around £10 billion a year in 2020, these have secured significant reductions in the cost of clean electricity and also put downward pressure on wholesale prices. Further deployment of renewables can be done in a more sustainable fashion without significantly higher costs to consumers.

Progress on decarbonisation in the power sector has also been driven by a consistent carbon price signal that has reduced the UK's reliance on coal generation from 30% to below 1% since 2014.<sup>34</sup> **The UK has committed to ending coal electricity generation no later than 2025** and is encouraging other countries to follow suit. The carbon price remains one of several efficient tools in driving decarbonisation.

The government has also ensured that security of electricity supplies remains paramount as the country decarbonises. Since it was established in 2014, the Capacity Market has helped maintain sufficient supply of electricity generation, providing generators with competitively auctioned contracts to be available at periods of peak demand. The UK is also building the first nuclear power station in a generation, at Hinkley Point, which will provide reliable low carbon electricity to power the equivalent of around six million homes a year once it is operational later this decade.

The 2050 net zero goal provides the trajectory within which the government will continue to decarbonise the power sector, while ensuring that the right balance is struck between reducing power sector emissions, maintaining the security of the system and ensuring electricity remains affordable for households and businesses.

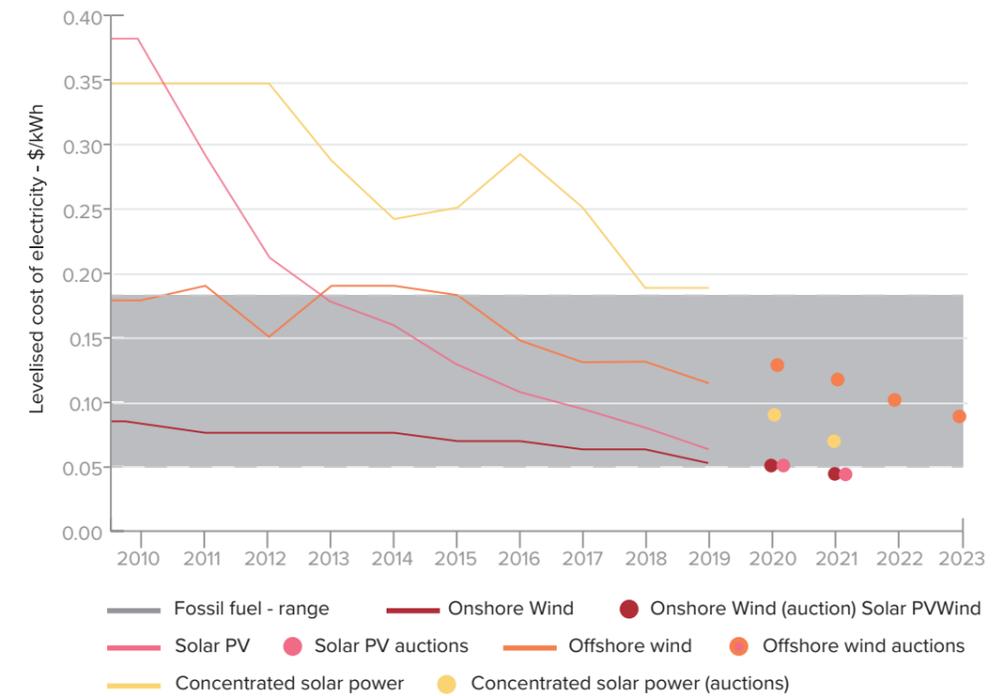

To achieve net zero by 2050, the power system will need to be virtually carbon free and significantly larger to cope with the additional demand from electrification in transport, heating and some industrial processes. This expanded system will require increased investments in network infrastructure, sources of flexibility, such as interconnection, demand response and storage and enough low carbon generation capacity to provide the vast majority of the UK's electricity needs.<sup>35</sup>

The bulk of this generation needed by 2050 will likely be provided by low cost renewables. However, given their intermittent nature there will also be a requirement for more reliable sources of power in the future energy provision of the UK. In particular, power generated from nuclear or power stations that burn hydrogen, or gas with carbon capture and storage. The government will therefore ensure private capital investment is able to continue to finance the energy transition and allow these technologies and network investments to come forward.

There will be decisions on how quickly capital-intensive energy infrastructure is deployed, where the government will ensure costs are minimised and distributed fairly across different groups. The Net Zero Review will look at these questions in more detail, and in spring 2021 will set out how the government will approach such distributional issues and ensure the UK benefits from the opportunities, as well as who bears the costs of the transition.

## Price of renewables globally

Source: Climate Change Committee Progress Report 2020

Around £20 billion a year is invested in the energy sector,<sup>36</sup> and there continues to be strong appetite for investment in sustainable energy projects with good environmental, social and governance credentials. The government has played a critical role in bringing technologies to market and reducing the cost of capital through the Contracts for Difference scheme. This competitive support mechanism is now well established and will help support the deployment of renewables as well as other forms of low carbon power.

Other financing models will also be vital to power sector decarbonisation. The Regulated Asset Base (RAB) model has played an important role in encouraging investment into complex infrastructure projects and the government is considering its replicability for energy projects such as nuclear power and carbon dioxide transport and storage.

## Renewables

To deliver net zero, the share of generation from renewables needs to dramatically increase. While the UK leads the world in the deployment of offshore wind, greater generation capacity will need to come from onshore wind and solar as well. As recommended by the National Infrastructure Commission (NIC), the next auction round for Contracts for Difference in

## 2021 will include technologies such as onshore wind and solar PV.

The government has also set out an increased ambition to achieve 40GW of offshore wind by 2030. To begin on this path and to increase the amount of renewable capacity needed to further decarbonise power, the government has announced an ambition for the 2021 Contracts for Difference Auction to support up to double the renewable capacity procured in the 2019 round, subject to maintaining competitive tension in the auction.

**The government will continue to support the deployment of renewables through competitive Contracts for Difference auctions every two years, with the next due in 2021.** Contracts for Difference have proven successful in reducing the cost of capital for renewable technologies, but this has insulated generators from price signals, potentially failing to incorporate the total system costs of intermittent renewables. As the NIC recommended, **the government will ensure that total system costs are considered in designing future Contracts for Difference rounds as far as possible and will publish a call for evidence on the evolution of the Contracts for Difference regime to explore these issues further.**

As renewables deploy at greater volumes it is likely that investors will look to the post-contract market revenues available and will wish to understand what the power market could look like with increasing zero marginal costs generation on the system. The government will continue to ensure that support mechanisms evolve to consider the total system benefits provided by competing generation technologies and flexibility solutions.

Building the sector has required considerable consumer-funded subsidies, which are forecast to reach over £10 billion annually by the end of the year. Following the 2019 auction, however, the latest offshore wind contracts are expected to deliver clean electricity at very low costs, and could even begin generating at below market prices when they start operating in the mid-2020s, meaning a better deal for consumers.

Consistent with the target of 40GW offshore wind by 2030, the government expects around 65% of electricity generated in Great Britain to come from renewable sources by 2030. However, the need to ensure that generation can be brought forward sustainably and at least cost to consumers, and that the sector contributes appropriately to the UK's overall climate goals, means that this is not a strict renewables target.

In partnership with industry, the government will enable the UK to harness more of the economic benefit from the accelerated deployment of renewables technologies, alongside the clean electricity it produces. The Offshore Wind Sector Deal with the renewables sector continues to support these efforts.

As a greater number of offshore wind farms are deployed off the British Isles, there will be many jobs created across the UK. To harness the potential of this new industry **the government has announced £160 million to upgrade UK ports and manufacturing facilities.** This infrastructure funding could help the sector support up to 60,000 direct and indirect jobs by 2030. The offshore wind industry has set a target in its Sector Deal, to secure 60% UK content for the offshore wind supply chain. The government will consult on the introduction of more stringent supply chain plan requirements in future Contract for Difference, including consequences for non-delivery.

**The government has also committed to support the development of floating offshore wind,** setting a target of 1GW deployment by 2030 to ensure the UK establishes a leadership position in the next generation of offshore wind technology.

### Nuclear

Nuclear power has long played an important role in UK power generation and will continue to do so provided it can be delivered to time and budget. Hinkley Point C will be the UK's first new nuclear plant in a generation, and has continued construction throughout the pandemic by adapting to new working environments.

Nuclear is a proven, value-for-money source of reliable low carbon power which can complement renewables. **The government is pursuing large-scale nuclear projects,** subject to clear value for money for both consumers and taxpayers and all relevant approvals, with further details to follow in the *Energy White Paper*.

As outlined in the *Ten Point Plan for a Green Industrial Revolution*, **the government will provide up to £525 million to bring forward large-scale nuclear and invest in the development of advanced nuclear research and development (R&D),** including up to £385 million in an Advanced Nuclear Fund for small modular reactors and advanced modular reactors. This is alongside £220 million for nuclear fusion.

Last year, the government consulted on a nuclear Regulated Asset Base (RAB). The government is considering the responses to this consultation and expects to publish a response in due course. Alongside considering the RAB model the government will also continue to consider the potential role of government finance during construction, provided there is clear value for money for consumers and taxpayers.

### Carbon capture and storage

Carbon capture and storage (CCS) will be essential for net zero. Power stations with CCS technologies could provide valuable low carbon electricity when renewables are not generating by capturing the emissions from biomass or gas-powered power generation. CCS will also be essential to decarbonising large parts of industry, producing low emissions hydrogen and in delivering greenhouse gas removal technologies, permanently locking away carbon dioxide.

However, the technology has not been delivered at scale and significant risks remain. Therefore, the government will play a central role in bringing forward this complex infrastructure in partnership with industry over the next decade. The CCS Action Plan sets out the ambition to deploy CCS at scale in the 2030s.<sup>37</sup>

To help deliver on the government's ambitions, Budget 2020 announced that the government will establish CCS in at least two UK sites, along with at least one CCS power station, using consumer subsidies.

The government is now increasing that ambition, and will:

- **Invest £1 billion to bring forward four CCS clusters by the end of the decade, with two to begin construction by the mid 2020s;**
- **Set an ambition to capture 10 megatons of carbon dioxide per year by 2030;** and
- **Outline further details in 2021 on a revenue mechanism to bring through private sector investment** into transport and storage, power and industry CCS and hydrogen projects via new business models to support these projects.

## Hydrogen

Hydrogen is a flexible energy carrier that can be burnt as a gas or used in a fuel cell to generate heat or power. It is a leading technology option for decarbonising heavy industry, and could be used to reduce emissions in hard-to-abate modes of transportation, such as heavy goods vehicles or shipping. Almost none of the hydrogen used in the UK today is low carbon, and it is mostly used in the petrochemical sector.

In order to realise the potential of hydrogen the government is establishing a **£240 million Net Zero Hydrogen Fund**. This will provide capital funding to support deployment of low-carbon hydrogen production in the UK, and will support both methane reformation with CCS ('blue' hydrogen), and electrolysis using renewable electricity ('green' hydrogen). Working alongside partners in industry, the government's aim is for the UK to develop 5GW of low carbon hydrogen production capacity by 2030, with a mixture of 'blue' and 'green' hydrogen.

Next year, the government will set out its approach to growing the hydrogen economy, through a **UK Hydrogen Strategy**. The strategy will consider how to continue support for the scale up of low carbon hydrogen production, as well as the interaction with storage, distribution and potential end use demand. It will set out how the UK can capture economic benefits from building a resilient domestic supply chain.

This will include details of hydrogen business models and a revenue mechanism for bringing through private sector investment, to ensure low carbon hydrogen can play a key role in the UK's economic recovery and achieving net zero. It will also set out how the government will support the hydrogen and CCS industries side by side, in conjunction with support for the demand side such as heating trials and support for hydrogen in shipping.

## Network reform

As the 2017 Cost of Energy Review and the NIC have pointed out, there is scope for greater competition in delivering the onshore network infrastructure upgrades the UK will require as the energy system decarbonises. Network operators will therefore be required to make investment decisions that are best for the operation of the whole system rather than their own network. The government will outline plans on onshore networks in the forthcoming *Energy White Paper*, including plans to legislate to introduce competition.

The government has already worked with National Grid and Ofgem to give more independence to the transmission system operator for electricity, and expects to see distribution networks take a more active role in system operation. **The government will review the right long-term role and organisational structure for the Electricity System Operator**, in light of the reforms to the System Operator instituted in April 2019. It is possible that there will need to be greater independence from the current ownership structure, should it be appropriate to confer additional roles on the System Operator.

As the power system evolves, the government will need to consider how its own role, as well as the roles of the regulator, the Electricity System Operator, network operators and other energy market participants will change over time. **The Energy White Paper will set out the government's approach on the overall governance of the system.**

The evolution of the power system will also require the evolution of the networks to deliver power to people's homes and businesses and to ensure this infrastructure does not hold back the transition to electric vehicles, cleaner sources of heat or greater renewables on the grid. To enable this, government and the regulator will continue to ensure there is a common understanding of the future strategic direction to align policy objectives while maintaining the regulators' independence. If achieved, this approach could provide investors with greater certainty over longer-term investment decisions and support the transition of the energy network.

## Industry

Industry accounted for 25% of emissions in 2019.<sup>38</sup> Since 1990, emissions have more than halved due to reductions across all parts of industry, including manufacturing, construction and fossil fuel supply.<sup>39</sup> In the manufacturing sector, greenhouse gas emissions fell by 25% between 2009 and 2017. Analysis from the Climate Change Committee (CCC) suggests this is due to the changing structure of the UK's manufacturing sector, as well as improved energy efficiency and a shift to low carbon fuels.<sup>40</sup>

A mix of technologies will be needed to fully decarbonise industry, because there is a wide variety of sources of emissions across sectors. Options include CCS, electrification of heating, and using hydrogen as a low carbon fuel. These will be considered in the context of changes in the energy sector.

Around half of manufacturing sector emissions in the UK come from major industrial clusters, and targeted public investment in shared infrastructure will help turn these areas into world-leading centres of low-carbon manufacturing, creating jobs and export opportunities.<sup>41</sup> Alongside this, firms will also need to make their processes more energy efficient. **The £315 million Industrial Energy Transformation Fund will support early adoption of energy efficiency and deep decarbonisation projects in energy intensive industries.**

Most energy intensive industries currently receive free allowances under the EU Emissions Trading System (ETS). When the UK leaves the EU, the UK will adopt a replacement carbon pricing system, which will include similar mechanisms to free allocation.

Many of the sectors that receive free allowances are particularly exposed to international trade, and bearing all the costs of decarbonising could be a risk to their competitiveness. As part of the *Industrial Decarbonisation Strategy*, to be published in spring 2021, the government will consider what demand-side policies can drive emissions reductions in industry. These could include developing the market for low carbon industrial products, for example through introducing new product standards to drive demand.

**The government will also consider what role fiscal measures should play in supporting industry.** As well as up-front capital support for CCS and low-carbon hydrogen production, **the government will set out new business models for industry carbon capture and hydrogen to enable private sector capital investment and support firms' longer-term operating costs.** The government's role will evolve over time, with subsidy reducing as technology matures, supported through an increasing carbon price. The government will consider what trade and diplomatic levers could be used to protect the competitiveness of UK industries as they decarbonise.

## Transport

Transport is the highest emitting sector of the UK economy, accounting for 28% of domestic emissions in 2019.<sup>42</sup> Reducing emissions from all modes of transport will therefore be key to achieving the UK's net zero target in 2050. The government is committed to going further and faster to tackle climate change, which is why **the Department for Transport is developing a bold and ambitious Transport Decarbonisation Plan to achieve net zero emissions across all modes of transport.** This Plan will be the biggest piece of work the government has ever done to tackle greenhouse gas emissions from transport. The holistic and cross-modal approach to decarbonising the entire transport system will set out a credible and ambitious pathway to deliver transport's contribution to carbon budgets and meet net zero by 2050.

Road transport is responsible for over 90% of domestic transport emissions and is also one of the biggest contributors to poor air quality in the UK's towns and cities.<sup>43</sup> Decarbonising road transport is therefore particularly important for meeting the interim carbon budgets, as well as cleaning up the UK's air.

To help achieve this, **the Prime Minister has announced that new petrol and diesel cars and vans will not be sold after 2030.** Between 2030 and 2035, any new cars and vans sold with tailpipe emissions should be capable of driving a significant distance with no carbon emissions from the tailpipe. All cars and vans sold after 2035 will be fully zero emissions at the tailpipe. The government will increase the uptake of zero emission vehicles with a package of regulation, incentives and investment in electric vehicle (EV) charging infrastructure, delivered in partnership with the auto sector, consumers and the growing chargepoint industry. As set out by the Prime Minister, in moving forward with this transition the tax system will need to encourage the uptake of EVs and that revenue from motoring taxes keeps pace with this change, to ensure the government can continue to fund first-class public services and infrastructure.

The EV charging ecosystem will be one of the UK's green industries of the future, and the government wants to maximise private sector investment in the delivery of charging infrastructure. However, recognising that it is a new market and that availability of charging infrastructure is a barrier for two thirds of drivers considering the switch to EVs, **the government will kickstart the delivery of a core rapid charging network across motorway and key A road service stations.** By 2023 the government expects to see a high-powered charging hub at every motorway service area, installed by the private sector.

To ensure the private sector can continue to expand the charging network at pace in the 2020s, **the government will invest £950 million in future proofing grid capacity along motorways and key A roads** to prepare for 100% uptake of zero emission cars and vans ahead of need.

**The government will also extend support for chargepoint installation at homes, workplaces and on-street locations,** but reform these schemes so that they target difficult parts of the market such as leaseholders and Small and Medium Enterprises (SMEs). **Finally, the government has committed £90 million to fund local EV charging infrastructure** to support the roll out of larger, on-street-charging schemes and rapid hubs in England.

Alongside this investment, the government will be consulting on regulations to improve the consumer experience at public chargepoints later in 2020. There are four core areas in the consultation, including payment methods and payment roaming, opening up chargepoint data, increasing the reliability of the charging infrastructure and ensuring pricing transparency. In 2019 the government consulted on proposals to require all newbuild residential properties with associated parking (including a block of flats with an associated car park) to have an EV chargepoint. The government also consulted on requiring all new non-residential properties, with more than 10 parking spaces, to have at least one chargepoint and cable routes for a further one in five spaces. The government will respond to the consultation soon, with regulations being laid in 2021.

At the start of this year, before the COVID-19 pandemic, EV market share had tripled compared to last year, and has held up through the course of the year. To further incentivise drivers to make the switch to an EV, the government uses the tax system to encourage the uptake of cars with low carbon dioxide emissions, which is why users of zero and ultra-low emission cars have beneficial Vehicle Excise Duty (VED) and company car tax rates (CCT) in comparison to conventionally fuelled vehicles. Following Budget, from April 2020, zero emission cars pay no VED at first registration or subsequently. **The Spending Review confirms the government will continue the Plug-in Car, Van, Taxi and Motorcycle Grants until 2022-23,** increasing funding by over £200 million compared to budget 2020, to £582 million in total.

As well as decarbonising private vehicles, the government wants to increase the share of journeys taken by public transport, cycling and walking, and decarbonise buses and trains. Supporting greener buses is another key part of the government's agenda for achieving net zero and tackling air pollution. London now has the largest fleet of electric buses in Europe,<sup>44</sup>

and the UK is one of the world's leading designers and exporters of buses. The Prime Minister announced in February that the government would deliver a further 4,000 zero emission buses. **The Spending Review confirms £120 million to deliver an additional 500 zero emission buses in 2021-22.** This builds on up to £50 million investment in the first All Electric Bus Town, which will be announced early next year and is expected to deliver around 300 zero emission buses, supporting greener and cleaner journeys.

Where it is less certain what technology will provide the most effective route to decarbonisation or where it is unclear how the technology can be scaled commercially, the government will fund R&D programmes to support innovation.

Innovation will play a crucial role in decarbonising domestic shipping, for which emissions are likely to be reduced mainly through the scale adoption of alternative fuel systems like hydrogen and ammonia. **The government will provide £20 million in 2021-22 to enable a UK network of technology demonstrations in alternative marine fuels and green shipbuilding,** including hydrogen vessels trials in Orkney and groundworks for a hydrogen port in Teesside. In parallel, the government will consider whether and how the Renewable Transport Fuel Obligation could be used to encourage the uptake of low carbon fuels in maritime, taking the availability of sustainable resources, competing uses and the international character of the maritime sector into consideration.

**£21 million will also be provided for the decarbonisation of aviation**, through supporting sustainable aviation fuels and zero emission flight infrastructure. This work will be overseen by the recently established Jet Zero Council, a partnership between government and industry to drive the delivery of new technologies and innovative ways to cut aviation emissions. This will fund a one-year competition to support the development of a Sustainable Aviation Fuel (SAF) Demonstration and first-of-a-kind commercial plants. This funding will also kickstart the establishment of a clearing house for SAF, the first of its kind in Europe, to certify new fuels and develop UK expertise. The government will also consult on introducing a SAF mandate. Funding for the Aerospace Technology Institute, which provides match-funding to stimulate the development of innovative and more efficient aircraft technologies, has also been extended.

The UK's airspace is an essential, but invisible, part of its national transport infrastructure. **The government is therefore committed to modernising UK airspace, which will deliver quicker, quieter and cleaner journeys and more capacity** for the benefit of those who use and are affected by UK airspace. The government will continue to co-sponsor the airspace modernisation programme with the Civil Aviation Authority. This will ensure that carbon savings for aviation can be realised through proven technology this decade.

Freight also contributes to pollution and congestion in the UK's urban areas which, left unchecked, will only get worse. The government supports the NIC's recommendations in this area, and believes that through the adoption of new technologies and better recognition of freight's needs in the planning system, it is possible to decarbonise freight by 2050 and manage its contribution to congestion.

Unlike lighter goods vehicles, such as passenger cars and vans, there is currently not a commercially viable path to decarbonise heavy goods vehicles (HGVs) which contribute 17% of UK transport emissions.<sup>45</sup> To support the sector to make the transition to zero emission vehicles, the government will invest £20 million in 2021-22 to establish zero emission road freight trials. These will assess the most effective and commercial path to decarbonising HGVs. The government will also consult on a phase out date for the sale of diesel HGVs.

The government has announced that it will provide a full response to the NIC's Better Delivery: *The Challenge for Freight report*, through the publication of a comprehensive cross-modal freight strategy. This strategy will be published in 2021 and will consider the impacts on the freight system of the end of the

transition period as the UK leaves the European Union and the COVID-19 pandemic. Since the publication of *Better Delivery* in April 2019, progress has been made against the recommendations in the report, including on:

- **Better land use planning:** through provision of guidance on how local authorities can assess need and allocate space for logistics in the *Housing and economic needs assessment*, July 2019; and
- **Data and analysis:** through the ongoing development of a freight mapping tool to enable the UK's freight networks to meet growing demands for faster deliveries while reducing its impact on congestion and the environment. The discovery phase of this project will conclude in December, with further work planned for 2021.

The government has also recently established a Freight Council to provide a forum for discussion with industry stakeholders from all parts of the freight sector. The forum met frequently in the first half of 2020 and will meet quarterly going forward, with a focus on long-term strategic issues for the freight sector.

## Buildings

Emissions from UK buildings have declined steadily over the past 20 years, falling 25% since their peak in 2001 due to a range of government interventions and actions by the private sector, many of which have also reduced energy bills.<sup>46</sup>

### These include:

- Improving the energy performance of homes through the Energy Company Obligation and public sector buildings through the Public Sector Energy Efficiency Scheme;
- Supporting the roll-out of low carbon heat through the Renewable Heat Incentive;
- Kickstarting the heat networks market through the £320 million Heat Networks Investment Project;
- Setting stretching efficiency standards for new gas boilers;
- Raising minimum standards for both new and existing buildings, and energy related products;
- Introducing minimum energy performance standards for domestic and non-domestic private rented properties and;

- Requiring large businesses to carry out audits every 4 years under the Energy Saving Opportunity Scheme (ESOS), covering buildings, industrial processes and transport, to identify cost-effective energy saving measures.

This year so far, the government has announced further measures to continue this progress, including:

- **Over £3 billion to make homes and buildings greener and more energy efficient** through the Green Homes Grant, Public Sector Decarbonisation Scheme and Social Housing Decarbonisation Fund demonstrator;
- **The introduction of a Future Homes Standard**, in the shortest possible timeframe before 2025, which will ensure new build homes are future proofed with low carbon heat and world leading levels of energy efficiency and consult shortly on increased standards for non-domestic buildings;
- **A new Green Gas Support Scheme** to support the production and injection of green gas (biomethane) into the grid, funded through a Green Gas Levy, and a £270 million Green Heat Networks Scheme, enabling new and existing heat networks to be low carbon and connect to waste heat that would otherwise be released into the atmosphere; and
- **Support for households and small businesses to invest in heat pumps** through a Clean Heat Grant scheme, backed by £100 million of funding.

These policies are driving growth in the energy efficient and low carbon heat sector, with the Office for National Statistics (ONS) estimating 114,000 were employed in the sector in 2018, an increase of 59% since 2015 with a turnover of £16.7 billion<sup>47</sup>

However, the UK continues to have some of the oldest and least energy efficient homes in Europe, and the sector continues to make up 23% of total UK emissions meaning that more ambitious and urgent action is required in this Parliament.<sup>48</sup>

To meet the UK's climate goals, the pace of heat decarbonisation and energy efficiency improvement needs to accelerate. 85% of homes are currently on the gas grid, but to get to net zero, the vast majority will need to stop burning natural gas.<sup>49</sup> This will require further improvements in the energy efficiency of buildings, repurposing the grid to green gases

(biomethane or hydrogen), moving to non-grid low carbon heat sources (primarily heat pumps), or to hybrid systems that combine the two. It is not yet clear which of these routes will be best, and it is possible that a variety of solutions will be required for different properties, or in different areas of the country. Making the decision too quickly may lead to inefficient investments and sub-optimal path dependency while uncertainty remains high.

However, with boilers lasting roughly 15 years on average, 2050 is only two heating system replacements away. **Therefore, by the early 2030s the UK needs to be in a position to ensure that the estimated 1.7 million new heating systems being installed each year are ready for net zero. Today, that number is nearer 30,000.** It is therefore necessary to take the steps now to inform decisions about what kind of installation must be made.

In relation to hydrogen, that means supporting activity to determine its safety and feasibility. This includes delivering hydrogen heating trials, where the government is investing £81 million with the goal of beginning a neighbourhood trial by 2023 and a large village trial by 2025. For heat pumps, it means taking large scale 'no regrets' actions which are necessary in all scenarios and can lead to lower consumer bills, reduced fuel poverty and a thriving industry. This includes ramping up the domestic heat pump market to 600,000 installations by 2028, growing heat networks, and improving the energy efficiency of the UK building stock. This will require strong regulation to drive behaviour change and investment from those able to pay, while ensuring that the government supports those who need it.

Action will also be required in the non-domestic sectors. Through the Public Sector Decarbonisation Fund, **the government will continue to take the necessary steps to improve schools, hospitals, prisons and other public buildings.** The government will consult on future building standards and in-use energy performance requirements for non-domestic buildings, and publish a response on non-domestic private rental sector buildings regulation.

More detail on how the government plans to use a combination of regulation and targeted spending to stimulate the energy efficiency market over the next decade, and encourage greater use of clean heat, will be set out in the forthcoming *Energy White Paper*, *Hydrogen Strategy*, and *Heat and Building Strategy*.

## Climate change adaptation

Infrastructure for energy, water, transport and communications underpins activities across society and the economy, yet may be directly or indirectly vulnerable to climate change risks. The second *Climate Change Risk Assessment (CCRA)*, published in 2017 identifies the key climate risks to infrastructure, including from groundwater flooding, coastal flooding and erosion, embankment failure, high winds, lightning as well as cascading failures from infrastructure interdependencies.

In the second National Adaptation Programme, the government set out a vision to develop an infrastructure network that is resilient to today's natural hazards and prepared for the future changing climate. The government engages with the Infrastructure Operators Adaptation Forum, a network coordinated by the Environment Agency, Climate Change Committee and National Infrastructure Commission. The Forum enables learning and the sharing of best practice on actions to reduce vulnerability and realise opportunities around interdependencies between infrastructure systems. In addition the government supports and builds capability of organisations reporting under the third cycle of the Adaptation Reporting Power, which opened in January 2019 and runs until Jan 2021. Over 90 organisations have confirmed their participation in this reporting round, including infrastructure operators responsible for energy, water, telecoms, road, rail and ports.

In the 25 Year Environment Plan, the government committed to ensure that all policies, programmes and investment decisions consider the possible extent of climate change this century. As part of ensuring this approach is embedded in policy and programme decisions, the government has revised the *Green Book Supplementary Guidance on Accounting for the Effects of Climate Change* to include updated information on climate evidence and assessments.<sup>50</sup> This guidance is an important tool in supporting departments to meet the Green Book requirement to consider climate risks in policy, programme and investment decisions where appropriate.

The increasingly interdependent nature of the UK's critical infrastructure means that the need to identify and limit cascading risks is only becoming more important. Climate change impacts may result in risks within and between critical national infrastructure sectors.

## Nature-based solutions and waste

Climate change has severe implications for natural habitats and biodiversity loss, and it is essential that these twin threats are tackled in parallel. The Review into the Economics of Biodiversity is considering the question of how economic prosperity can go hand in hand with addressing biodiversity loss in a global context. Domestically, nature-based solutions have an essential role to play both in climate mitigation and adaptation. Healthy and restored ecosystems lock away more carbon in plants and soils than degraded ones, while also supporting a more diverse and abundant range of flora and fauna.

**The government's Nature for Climate Fund (NCF) will help England to meet its share of the CCC's recommendations to plant 30,000 hectares of trees a year in the UK.** Woodlands and urban trees are vital green infrastructure which offer carbon capture as well as a wide range of natural capital and public amenity benefits such as clean water, natural flood alleviation, biodiversity, and urban cooling. **The government will**

**extend the Urban Trees Challenge Fund and invest in Community Forests.** The NCF will also help to restore more peatlands, locking in carbon while providing wider benefits for biodiversity and water. Further detail will be set out in the England Tree Strategy and England Peat Strategy next year.

The UK also needs to go further in increasing its resource-use efficiency, to reduce the burden placed on the natural world through the supply of raw materials and absorbing waste. **The Environment Bill is legislating wide-reaching waste reforms** – including extended producer responsibility (EPR), a deposit return scheme, and consistent collection of food waste and recycling - which will increase resource-use efficiency and cut greenhouse gas emissions from their implementation in 2024. EPR will ensure that the costs of processing packaging waste are transferred from local authorities to manufacturers and sellers. This will encourage innovation in packaging design, leading to a more sustainable use of resources.

In order to prevent the build-up of waste, it is important to be able to follow its journey through supply chains. New waste tracking technology in the UK is the future of a high-tech circular economy underpinned by world class digital infrastructure, and will ensure that all waste movements across the economy can be tracked, supporting resource efficiency as well as informing sustainable future infrastructure investment.

## Water and flood risk management

Climate change will continue to increase the risk that there is too much or too little water in the environment – leading to a higher frequency of flooding and drought. Both extremes in weather can cause significant damage and disruption to communities, homes, land and infrastructure.

While it will never be possible to prevent all flooding, taking clear action now to boost nationwide resilience will ensure the impacts from flood events can be minimised and communities can recover more quickly when they do happen. In July 2020, the Secretary of State for the Environment published the government's long-term Policy Statement on flood and coastal erosion risk management.<sup>51</sup> The Policy Statement outlines five ambitious policies and over 40 supporting actions to better protect and prepare the country against flooding and coastal erosion. Alongside the government's policy statement, the Environment Agency published their updated National Flood and Coastal Erosion Risk Management Strategy for England.

At the heart of the government's strategy is its flood and coastal defence investment programme, which provides longer-term certainty of funding, unlocking even greater efficiency in infrastructure investment. Devolved administrations receive funding in-line with the investment. **The March 2020 Budget announced that, from 2021, the amount invested in the flood and coastal defence programme in England will double to £5.2 billion, delivering 2,000 new defence schemes to better protect 336,000 properties over six years.**

This investment will reduce national flood risk by up to 11% by 2027 helping to avoid £32 billion of wider economic damages – benefitting every region of the country. This exceeds the level of investment recommended by the NIC, underlining this government's commitment to ensuring homes and businesses across the country are better protected from the devastating impacts of flooding.

Alongside this commitment, **the government announced a transformative £200 million Flood and Coastal Resilience Innovation Programme.** Through this new programme, managed by the Environment Agency, over 25 local areas in England – urban, rural and coastal, from the North, the Midlands and the South – will be selected to take forward wider innovative actions that improve their resilience to flooding and coastal erosion.

The government agrees with the NIC that there must be a twin track approach to delivering additional water supply and demand reduction to increase the resilience of water supplies. Water companies are responsible for planning to meet future supply requirements through the production of water resource management plans. For the next round of plans due in 2024, **the government will require the water industry to plan to deliver resilience to a one in 500-year drought.**

The Environment Agency published a National Framework for water resources in March 2020, and will support water companies to plan regionally and with other sectors to achieve the right balance of measures to increase resilience. At Price Review 2019, Ofwat agreed up to £469 million of funding for water companies between 2020 and 2025 to progress work on new strategic water resource and transfer infrastructure, as identified in company Water Resources Management Plans. Ofwat has established the Regulators' Alliance for Progressing Infrastructure Development (RAPID) to support this process and overcome barriers which might hamper the development of these strategic schemes.

As well as new infrastructure, the government recognises that demand on water supply must be tackled through reducing the amount of water lost through leaks and reducing the volume consumed by customers. **The government is exploring the possibility of a statutory target to reduce water demand using powers in the Environment Bill.** This would be on the volume of water distributed or abstracted by water companies, encompassing household use, non-household use and leakage. In line with the NIC's recommendations, the water industry has also committed to reduce leaks by 50% by 2050.

## Innovative technologies

Since 2016 the government has increased public investment in science and innovation to historic levels. These investments have enhanced understanding of the social, environmental and economic implications of future energy options, helping to create a whole system approach to net zero. This support is helping to bring

new innovations to the market. For example, cheaper and more efficient fuel cells and new sustainable biofuels, underpinning the net zero transformation.

**At the Spring Budget, the government committed to at least doubling the size of the Energy Innovation Programme.** The Energy Innovation Portfolio (now the Net Zero Innovation Portfolio) is designed to reduce the costs of decarbonisation by developing and accelerating near-to market low-carbon energy technologies that will be necessary to achieve net zero emissions by 2050. The portfolio is targeted at the development and demonstration end of the R&D spectrum to bolster technologies such as floating offshore wind, hydrogen and advanced modular nuclear reactors and stimulate private sector investment.

**The government is making £200 million of this funding available in 2020-21.** Through this programme the government expects to bring down the costs of deploying innovative near-to-market technologies, such as hydrogen. It will also support the commercialisation of new types of firm low carbon power to become available in the 2030s and 2040s, such as inter-seasonal storage, and less intermittent forms of renewables, such as floating offshore wind.

This investment will support leading researchers and innovators from all four nations to discover and create the industries of the future. This funding will boost R&D activity from discovery research to demonstration. Supporting the UK to seize the opportunity of scientific progress to deliver new transformative technologies, enhance the efficiency of existing approaches and support the adoption of emerging technologies across the country.

**At the Summer Economic Update the government dedicated £100 million towards Direct Air Capture technologies** – as a type of Greenhouse Gas Removal technologies – in order to help achieve net zero by 2050. In October, the Prime Minister also committed to support the development of floating offshore wind, setting a deployment target of 1GW by 2030.

**The government is also commissioning the NIC to undertake a new study looking at Greenhouse Gas Removal technologies.** This study will report in summer 2021, and the Terms of Reference have been published alongside this Strategy.

## Looking to the future

The government will continue to report reductions in the UK's carbon emissions in line with carbon budgets. The government will also monitor air quality, efforts to reduce the impact of climate change (including drought and flooding), progress against statutory fuel poverty targets, progress against the ambition for two million green jobs by 2030 across the UK, and steps to deliver an average building EPC rating of C. And, as the key pathways towards net zero become more well established, the government will track and use real time data, such as EV uptake and heat pump installation, to ensure the fundamental changes in the economy needed to deliver net zero are being delivered.

**This Strategy is central to the UK's efforts to achieve net zero emissions by 2050 and delivering the Prime Minister's *Ten Point Plan for a Green Industrial Revolution*.** By unlocking private sector investment, the government will accelerate the deployment of existing technologies, and advance innovation in new ones. In doing so, the government will lead the UK through a just transition to net zero, that supports the short-term recovery from COVID-19, and levels up and unites the nations, by providing long-term sustainable jobs in the future net zero economy.

# Supporting private investment

## At a glance

Private investment has delivered major benefits for UK infrastructure and will be vital over the coming decades as the UK moves towards meeting net zero in 2050. The government is committed to supporting private investment and is taking action across the following areas:

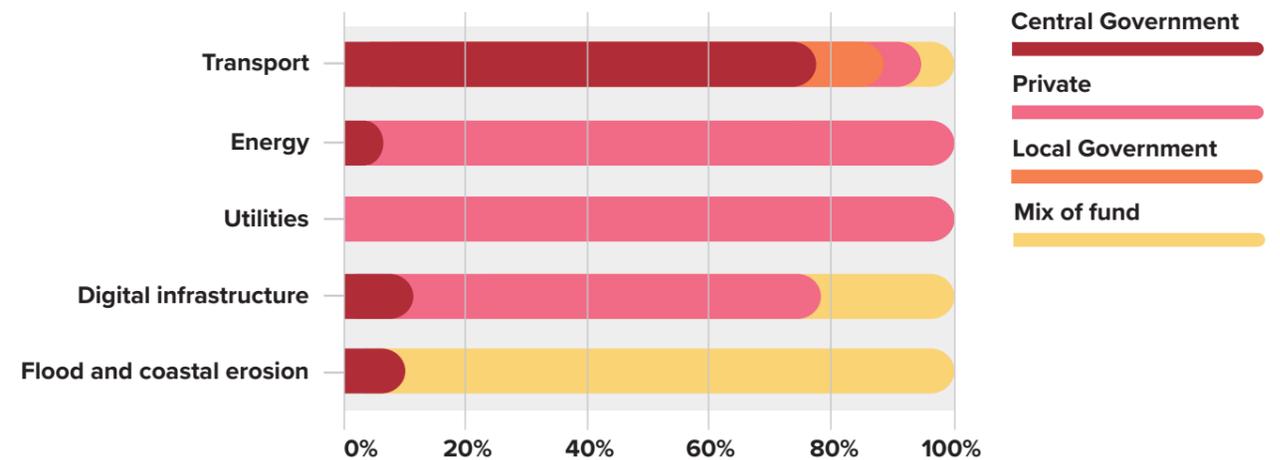

- **The government is setting up a UK infrastructure bank**, to co-invest alongside the private sector in infrastructure projects;
- The bank will operate UK-wide, be based in the north of England, and support the government's ambitions on levelling up and net zero;
- The bank will also be able to lend to local and mayoral authorities for key infrastructure projects, and provide them with advice on developing and financing infrastructure;
- **The government is committed to the model of independent economic regulation**, but will refine it to ensure it provides a clear and enduring framework for investors and businesses and delivers the major investment needed in decades to come, while continuing to deliver fair outcomes for consumers;

- **The government will produce an overarching policy paper on economic regulation in 2021**, which will consider regulator duties, injecting more competition into strategic investments, and the benefits of a cross-sectoral Strategic Policy statement; and
- **The government will continue to develop new revenue support models and consider how existing models - such as the Regulated Asset Base model and Contracts for Difference - can be applied in new areas and remains open to new ideas from the market. The government will not reintroduce the private finance initiative model (PFI/PF2).**

The private sector plays a vital role in achieving the UK's infrastructure ambitions. Much of UK's economic infrastructure is privately owned, with almost half of the UK's future infrastructure pipeline forecast to be privately financed.<sup>53</sup>

The UK has long been an attractive destination for private investment, underpinned by a sophisticated system of independent regulation, strong legal framework and expertise, and leading professional and financial services sectors. This has drawn investment from both UK and international investors across various sectors including transport, digital infrastructure, and utilities.

Funding mix of UK investment between 2018/19 and 2020/21 by sector

Source: 2018 National Infrastructure and Construction Pipeline

Private investment has delivered major benefits for UK infrastructure. Over the past decade alone, over £200 billion has been invested in the water and energy sectors.<sup>53</sup>

Over the past three decades, this investment has delivered significantly higher service quality for consumers. The number and length of power cuts has more than halved since 2002.<sup>54</sup> From 1990 to 2019, emissions fell 41% while the economy grew 78%,<sup>55</sup> water leaks are down by a third since the mid-1990s<sup>56</sup> and over 96% of premises in the UK have access to superfast broadband (speeds of 24Mbps or more).<sup>57</sup>

Historic levels of investment will be required in UK infrastructure in the coming years, to maintain and upgrade networks to meet the government's objectives for economic growth and decarbonisation. For example:

- Water companies in England and Wales will be investing at least £51 billion between 2020 and 2025;<sup>58</sup>
- The total level of investment required to upgrade the nation's broadband networks to be gigabit-capable speeds is in the region of £30 billion; the vast majority of this is expected to come from the private sector;<sup>59</sup>
- Total annual investment in the energy sector was £19 billion in 2019 and this is expected to increase in the years to come in order to transform energy networks to achieve net zero;<sup>60</sup>
- The Prime Minister's '10 Point Plan for a Green Industrial Revolution' will mobilise £12 billion of public investment and potentially three times more from the private sector.

The government remains strongly committed to supporting private investment and maintaining the UK's status as a leading global destination for private investment. That is why the government conducted an in-depth review – the 'Infrastructure Finance Review' (IFR) – of private investment in infrastructure and asked the National Infrastructure Commission (NIC) to undertake a review of UK's system of economic regulation. **This Strategy marks the government's conclusion to the IFR and response to the NIC study.**

The IFR was launched in Spring 2019, and consulted a broad range of financial and infrastructure experts on: the current state of the UK's infrastructure finance market and the role of the European Investment Bank; the ways in which the government and independent regulators can help facilitate investment; the potential future challenges for infrastructure financing; and the performance and possible improvements to the UK's institutional framework to support infrastructure finance. Further information on the IFR is set out in the government's formal response to the consultation, published alongside this strategy.

The government has heard from the market on the challenges facing UK infrastructure in the coming decades. The IFR found that the UK continues to have fundamental strengths, and the market appetite for investing in UK infrastructure is strong, especially for long-term investments with well-understood risk profiles. But the UK will face new challenges as it seeks to decarbonise the economy and ensure access to high-quality infrastructure across the country. The government needs to do more to attract private investment to deliver the investment needed in this period.

Following the IFR, the government's approach to private investment is built on three key principles:

- **The government will provide investors with long term policy certainty** including where appropriate, directly coinvesting alongside the private sector and acting as a cornerstone investor on key projects through a national infrastructure bank;
- **The government will maintain a strong and enduring system of independent economic regulation**, helping deliver the investment levels the country needs and fair outcomes for consumers of today and the future; and
- **The government will continue to use a range of policy tools and innovative funding mechanisms to embrace opportunities** from new technologies and decarbonise and level up the economy.

## A new infrastructure bank for the UK

To underpin this infrastructure revolution and catalyse the private investment the UK needs, **the government is setting up a new infrastructure bank for the UK.** The bank will play a leadership role in supporting private infrastructure projects to help meet the government's objectives on economic growth, levelling up, and transitioning to net zero.

**The bank will be headquartered in the north of England,** and will operate UK-wide, supporting investment in projects and programmes across the whole of the UK.

In line with the NIC's recommendation, the new bank will operate within a mandate set by government and have a high degree of operational independence. It will be a world-class, expert institution. The bank will play an important role in supporting new infrastructure technologies.

**The bank will co-invest alongside private sector investors** including banks, institutional investors, sovereign wealth funds, pension funds and global infrastructure investors. It will use a range of tools to support private projects: as well as offering guarantees through the existing UK Guarantees scheme, it will be able to offer debt, equity, and hybrid products.

**The bank will be able to lend to local and mayoral authorities for key regional infrastructure projects.** It will also be able to provide advice and support to these authorities on developing and financing projects.

The new bank will replace some of the activities of the European Investment Bank (EIB), following the UK's departure from the European Union. However, the bank will provide more targeted support than the EIB, and will be better aligned with the UK government's objectives.

**At Budget 2021, the Chancellor will set out comprehensive details regarding the operations, mandate and scale of the bank.** The government intends for the bank to be operational in an interim form, from spring 2021, so it can play a role in supporting the UK's economic recovery from the COVID-19 pandemic. The government will legislate for the bank at the earliest opportunity, to put it on a statutory footing.

## The role of pension funds

**There is a huge opportunity for pension funds to support the UK's infrastructure investment ambitions.** The industry anticipates that pension funds and insurers will be able to invest between £150 billion and £190 billion in infrastructure over the next ten years.<sup>61</sup>

Pension funds invest for the long-term and their objectives and investment profiles are well matched to infrastructure investment, particularly in regulated sectors.

The government wants the National Infrastructure Bank to work closely with pension fund and institutional investor market to explore opportunities for a further expansion of pension fund investment in UK infrastructure.

Already this year the government has made changes to make it easier for pension funds to invest in infrastructure. In March this year the Financial Conduct Authority (FCA) made changes to their 'permitted links' rules to allow unit linked pension funds, which are widely used for contract-based pensions investments, to invest in a wider range of illiquid assets.<sup>62</sup>

Furthermore, the recently published Solvency II Review Call for Evidence seeks views from stakeholders on potential areas in which Solvency II could be reformed to better incentivise insurers, who run contract-based schemes, to invest in infrastructure and other long-term productive assets.

The Department for Work and Pensions are considering a number of changes to remove barriers to infrastructure investment including:

- A consultation on changes to the calculation of the default fund charge cap for automatic enrolment schemes to allow greater flexibility for performance-based fee structures and thereby remove a barrier to investment in longer term assets like infrastructure.
- Changes to allow consolidation of smaller pension funds so they may more easily invest in infrastructure.

# Economic regulation

The economic regulatory framework is central to the provision of infrastructure, with Ofcom, Ofgem and Ofwat monitoring and refereeing how infrastructure is funded, delivered and operated within their respective sectors.

The UK's framework of strong, independent economic regulation has delivered significant benefits in the utilities sectors. The regulatory model has been integral to attracting over £200 billion of private sector investment in the UK's infrastructure networks and driving higher standards for consumers. The system has also played an important role during the COVID-19 pandemic, helping to ensure that financial assistance has been provided to vulnerable customers and enabling the continuity of vital services.

The government is committed to maintaining this system of independent economic regulation. But it is vital the system can rise challenges of the 21st century, notably the need to decarbonise infrastructure across all networks, adapt to climate change, capitalise on new innovative technologies and take advantage of opportunities arising from leaving the EU.

That is why, in 2018, the government asked the NIC to carry out a study on the regulatory model for water, energy and telecoms sectors. The aim of this study was to assess what changes might be necessary to the existing regulatory framework to facilitate future investment needs, promote greater competition and increase innovation, and meet the needs of both current and future consumers.

The NIC published their report – *'Strategic Investment and public confidence'* – in October 2019, setting recommendations for updating the regulatory model to incentivise long term investment and rebuild public confidence. The government thanks the NIC for their work, and at Budget 2020 the Government announced that it agrees with the NIC's primary finding that the UK's system of economic regulation is working well but needs updating in some areas to address 21<sup>st</sup> century challenges.

The government is committed to taking a long-term approach to investment to provide predictability and the required stability, as well as appropriate incentives to investors. This should also balance the needs of current consumers with those of future consumers. A detailed response to each of the NIC recommendations on economic regulation is set out in *'Response to the Regulation Study - Strategic investment and public confidence'*. The government's position will be expanded further in an overarching policy statement in 2021.

## Clear strategic direction

The government is mindful of the uncertainties currently faced by investors in a rapidly changing domestic and international context, and recognises the importance of integrity and consistency within the system to help provide certainty to investors and build consumer confidence.

The NIC stressed the importance of a more transparent strategic framework to help regulators support investments, balancing the long-term priorities with the current needs of consumers.

The government uses strategic policy statements as a formal mechanism to set long-term priorities for the regulated sectors, such as those already issued for Ofwat and Ofcom.

At Budget 2018 HM Treasury and the Department for Business, Energy and Industrial Strategy (BEIS) launched a review of strategic policy statements, concluding in 2019. The government considers that strategic statements have been successful in setting long-term priorities, but also recognises the benefits of having an additional overarching set of strategic priorities to complement and bring focus to sectoral specific strategic policy statements and reflect common challenges faced by regulators, such as data sharing and protection, as well as broader investment priorities such as the net zero and levelling up agendas.

The government supports the NIC's recommendation to create a more transparent strategic framework and commits to producing an overarching policy paper in 2021. This will set out further details on key areas, including commitments to consider regulator duties, inject more competition into strategic investments, and explore the benefits of cross-sectoral strategic policy statements in order to provide greater clarity for regulators, investors and consumers.

## Coherent duties to reflect new challenges

Regulators currently have a number of additional duties, beyond their primary duties, which they must consider in carrying out their core functions. For instance, Ofwat has a duty to contribute to the achievement of sustainable development, whilst Ofcom has a duty to consider innovation.

While existing duties vary between regulators, and further consideration should be given to how these are prioritised, the government supports the adoption of a coherent approach to price, quality, resilience and environment in order to meet 21st century challenges and promote innovation and growth. In particular, the government supports the NIC's recommendation that, where relevant, regulators should have duties to support net zero targets. **The government will continue to review the most appropriate measures, including a net zero duty, to ensure that regulators make the necessary contributions to achieve these targets.**

The government also recognises the opportunity for greater collaboration between regulators approaching similar challenges, building on the work of recent years. **The government supports the NIC's recommendation for the UK Regulators Network to have a stronger role, and commits to increasing collaboration, including by reviewing data sharing powers between regulators, with a view to considering how best to encourage regulators to develop joint data sets for 'whole customer' analysis.**

### Greater use of competition

To ensure that new infrastructure is delivered in the most efficient and appropriate way, the government supports the NIC's assessment that the use of competition should be harnessed as the most reliable means of supporting innovation and providing enhancements to economic infrastructure.

Competition in investment is already used successfully in economic infrastructure to drive transformational change. For example, competition has driven rapid innovation in mobile networks, seeing mobile data per connection being over six times higher than five years ago. The government will outline plans on electricity onshore networks, including introducing competition, in the forthcoming *Energy White Paper*. The government will also review whether regulators need further powers to promote competition as part of the forthcoming policy paper.

### Building public confidence

**The government recognises the importance of building public confidence in companies, regulators and investors, to the long-term success of utility provision.**

This includes ensuring companies take the needs of the communities they serve into account. To this end, the regulatory framework should be updated to reflect the government's priorities for levelling up and devolution of powers within the UK. **The government agrees with the NIC's proposals for regulators to ensure that devolved administrations, local authorities and metro mayors have sufficient opportunity to contribute to consultations as part of the price control process.**

The government also agrees with the NIC that regulators should be proactive in ensuring that rewards for investors reflect performance. Above all, customers must be confident that companies are well run and governed. Regulators need to deliver this confidence whilst also enabling sectors to be adequately financed so they may perform well for present and future generations. Regulators currently have a range of powers and tools to ensure that the rewards for investors reflect performance, and the government supports their role in driving improvements in this area.

Overall, as the NIC's report demonstrates, updating the UK's regulatory model to further long-term investment and build public confidence will be a vital task over the next few years. These efforts take on even greater significance in the context of the COVID-19 pandemic, where an effective and updated system of independent economic regulation will be crucial to efforts to build back better.

## Funding support mechanisms

The UK has a long history of harnessing the innovation and capacity of the private sector to help deliver infrastructure. Meeting the challenge of net zero will require a host of new technologies and a partnership in different forms between the private sector and government to pull them through into commercialisation.

The government has already developed a range of tools to attract investment and will continue to apply these in new areas and develop further innovative models to meet specific challenges. This includes setting revenues and prices on a competitive basis, for example through Contracts for Difference (CfD) in renewable energy; subsidising delivery in uncommercial areas like gigabit broadband rollout; or bespoke mechanisms for new investments such as the Regulated Asset Base (RAB) model for Thames Tideway Tunnel.

The government continues to consider new models and how existing models can be applied in new areas and is open to ideas from the market. Examples include:

- **New support mechanisms:** In 2019, the government consulted on using the RAB model for new nuclear power stations and other energy sources. It has also published a response on business models for carbon capture, and storage (CCS), where it is developing new support mechanisms and markets for industrial emissions technologies, hydrogen production and power plants with CCS technology in order to create innovative solutions to a complex set of incentives. These business models will require careful design to ensure new markets can be established and private investment can be sustained;
- **Opening up existing mechanisms to new areas:** In March 2020, the Government announced that onshore wind and solar PV would be included in the next round of CfD auctions. Since 2009, awarding the ownership and operation of offshore wind network connections through a competitive tender process is estimated to have saved consumers in excess of £700 million.<sup>63</sup> The government will outline onshore network in the forthcoming *Energy White Paper*, including plans to legislate to introduce competition; and

- **Incubating new ideas:** Since 2016, the Government has made the largest increases to public support for research and development (R&D) on record. This investment will support a range of sectors including new opportunities and emerging technologies for infrastructure, construction and manufacture, for example digital manufacturing, robotics and modular methods of construction.

In 2018, the government retired PFI/PF2 for new schemes because of their fiscal risk, inflexibility and complexity. As part of the IFR, alternatives to the PFI and PF2 model were explored and assessed against the government's test for any new private finance model: its benefits must outweigh the additional costs of private finance. No new models were found through this process, and so **the government** will not reintroduce PFI, PF2 or similar models of private finance.

The government still makes payments of nearly £10 billion a year on existing PFI, PF2 and other associated contracts which were entered into by previous administrations. **The government is funding a programme of work to review PFI contracts, to ensure they are well managed.** This includes providing support for authorities taking back PFI assets as contracts expire and delivering extensive contract management training across the public sector.

# Accelerating and improving delivery

## At a glance

The government wants to deliver infrastructure projects better, greener and faster. That means addressing longstanding challenges such as complex planning processes, slow decision-making, and low productivity in the construction sector. It also means learning lessons from the COVID-19 pandemic, for instance from the approaches that built Nightingale Hospitals in record time, and saw the UK move swiftly to secure access to a range of promising vaccines. Further, there is a clear opportunity with EU exit to change how this government delivers projects, using the flexibility the UK has as a sovereign country to do things differently.

The government set up Project Speed in the summer, to review every part of the infrastructure project life cycle and identify where improvements could be made. Project Speed has developed a comprehensive package of reforms, including:

- **Reform of environmental regulations** to deliver a quicker and simpler framework for assessing environmental impacts and secure better outcomes for the environment;
- **Landmark reform of the planning system** including consulting on amending permitted development rights, to let schools and hospitals be expanded quickly;
- **Transforming the construction sector** to enable it to become more productive, more sustainable and more internationally competitive, with better use of data and modern methods of construction;
- **Ensuring more effective decision making** with streamlined approval processes, more emphasis on quality design, and better monitoring and evaluation;

- **Embedding good design in all infrastructure projects** through planning reforms; and
- **Bringing about a step change in capability and leadership**, accelerating investment in major project expertise and delivery skills and improving the skills base across the country to ensure every area can deliver the infrastructure it needs.

These reforms have already driven substantial progress, and in future mean the UK's vital infrastructure like schools, hospitals, transport and other networks will be delivered better, greener and faster:

- **Better**, because the process of assessing infrastructure projects under the revised methodology will ensure the government is valuing the wider economic, social and environmental benefits of a project. The government will set projects up to succeed by strengthening the assurance and decision-making regime;
- **Greener**, because the requirements of the net zero commitment will be embedded in every stage of the project life cycle and underpin decisions on the technical solutions chosen to achieve the required outcomes; and
- **Faster**, by simplifying and shortening the processes through which projects secure the consents they need to proceed, procure contracts and deliver; while using modern methods of construction, new skills and a strategic relationship with industry which will improve productivity.

**The effective delivery of infrastructure is critical to the success of this Strategy.** The government and industry must work together in new ways to accelerate the delivery of the government's ambitious infrastructure portfolio, whilst delivering better environmental and biodiversity outcomes in line with the UK's 25 year Environmental Plan.

The UK has proved that it can deliver safe, world-class and innovative infrastructure, such as the A14 upgrade which was delivered eight months early and on budget using innovative procurement and construction methods. However, the project took years to enter construction, and illustrates the well-known and longstanding challenges that government and industry face. The end-to-end delivery process is complex and takes a long time, with some of the most critical projects taking over a decade to move from conception to reality.

Government decision making can be slow and duplicative, as can planning and development regimes. Productivity growth in the UK construction sector remains one of the lowest of all sectors of the economy, in part because the industry has lacked the confidence to invest in innovation and developing capability. The government has too few project delivery professionals equipped with the right skills, and projects are often not set up and managed well enough to anticipate and prevent delays and cost increases.

The COVID-19 pandemic has shown that this does not need to be the case. The government has assembled Nightingale hospitals in lightning quick time. Through the ventilator challenge, government and industry worked together to design, build and procure ventilators at record time and scale. It is time to take these learnings and apply them to infrastructure.

Combined with EU exit, **this provides opportunities to build back better by designing planning and procurement regimes that are tailored to the UK, putting outcomes ahead of process whilst protecting the environment and the nation's biodiversity.** It will also allow the UK to prioritise its own interests when procuring and working with industry, ensuring

money spent on infrastructure projects delivers transformational economic, social and environmental outcomes for citizens.

**The Prime Minister launched the Project Speed taskforce in summer 2020, which aims to accelerate and improve the delivery of the government's infrastructure portfolio.** Project Speed has reviewed the end-to-end delivery process working closely with experts - applying learnings across a number of case study projects to test and iterate a comprehensive package of reforms. On some of these projects, the taskforce has already found potentially significant time savings through more efficient and focused decision making, and will be accelerated further over the course of this Parliament.

## A66

The A66 is a critical freight and regional transport route, connecting the North East and North West. This major upgrade programme will dual the six remaining sections of single carriageway between Scotch Corner and Penrith.

The project was programmed to take over fifteen years, including four more years of development and ten years of construction.

The Project Speed review identified ways to save up to 50% of time in the planned construction process, cutting this down from 10 to 5 years through innovative solutions such as standardised, modular and offsite design and construction, alongside more intensive and concurrent delivery.

In aggregate, these interventions could accelerate delivery by around one third, enabling users to benefit from the improved road over five years earlier. Through reviewing the end-to-end delivery schedule of the A66, Project Speed was able to identify, test and iterate reform options to the decision making, planning and construction processes. These reforms will now be rolled out across the government's portfolio, dramatically cutting delivery times and providing benefits to users earlier.

**Project Speed represents a revolution in the government's approach to delivering infrastructure projects better, greener, and faster.** Embedding these reforms will require strong drive from government, legislative reform and strengthening working relationships with industry.

This package of reforms cuts across four areas:

- **Reforming infrastructure planning and better environmental regulations:** accelerating planning permission by removing blockers and inefficiencies in current planning regimes, allowing more dynamic project development whilst ensuring better environmental outcomes after EU exit;
- **Simplifying procurement regulations and modernising the construction sector:** designing more streamlined procurement regulations after EU exit, enabling government to use its weight as a customer to support the construction industry in adopting modern, highly productive practices;
- **More effective decision making:** front-loading decision making – stopping or progressing schemes earlier; streamlining and condensing governance, with assurance and approval milestones planned upfront and bringing in functional expertise earlier; and monitoring and evaluating projects using better data to support continuous improvement and policy reform; and
- **A step change in capability and leadership:** accelerating investment in major project expertise and delivery skills; and recruiting expert leadership and improving the skills base across the country to ensure every area can deliver the infrastructure it needs.

This is a major reform package and the prize is substantial - in aggregate, these reforms could accelerate delivery of infrastructure projects by up to a third. Much of the reform package relates to reserved policy and will apply to England. The UK government will work in partnership with the devolved administrations to ensure learnings and benefits are shared across the four nations.

## Reforming planning and environmental regulations

The planning system governs the regulation of land use and development. It is central to addressing the UK's infrastructure priorities, unlocking land to deliver new infrastructure whilst ensuring citizens are empowered to shape their local communities and achieving the best environmental outcomes.

Part of the current planning system can be complex and burdensome, slowing project development and adding costs to construction. They need to be refreshed to address 21<sup>st</sup> century challenges, as the UK builds back better, greener and faster.

Combined with EU exit, this is a historic opportunity to design more nimble frameworks that speed up the delivery of critical infrastructure while protecting and enhancing England's unique ecosystems. Reforming the planning system is not a task this government undertakes lightly, but it is both an overdue and a necessary reform.

### Planning regime for infrastructure

Whilst planning for the UK's largest schemes such as HS2 might require an Act of Parliament, or a special consent under the Transport and Works Act, the majority of infrastructure projects that require consents will use one of two main routes. The Town and Country Planning Act 1947 (TCPA), supported by the National Planning Policy Framework, allows local authorities to make planning decisions for development and infrastructure within their local areas. The Nationally Significant Infrastructure Projects (NSIP) regime is used for projects such as large strategic road schemes and power stations. The NSIP regime is well-respected but is currently not being implemented as effectively as possible, leading to slower delivery times and more uncertainty.

**In August 2020, the government published its *Planning for the Future***, which closed for consultation on 29 October 2020, proposing a wide range of reforms to bring England's planning system under the TCPA into the 21<sup>st</sup> century.<sup>64</sup> The reforms seek to support the redevelopment of town and city centres for housing and local infrastructure through a simpler and more certain system and unlock the growth potential of areas across the country.

In addition to these reforms, **the government is making it easier and faster to build social infrastructure**, responding to the needs of local communities, such as for schools and hospitals, by consulting on:

- **Amending Permitted Development Rights (PDRs)** through secondary legislation, which will allow for the easier expansion of schools, hospitals and prisons. PDRs accelerate specified types of development through the planning system by allowing development to take place without requiring full planning permission from the local planning authority. This change will enable the extension of the footprint of facilities by 25% or 250 square metres, whichever is larger; and
- **Introducing a faster planning application process** for more substantial school, further education college, hospital and prison developments, through secondary legislation to encourage greater prioritisation of applications by local planning authorities, including a shorter timescale of 10 weeks for determination.

## School Rebuilding Programme

The School Rebuilding Programme commits to a 10-year pipeline of 50 schools a year. This long-term pipeline will enable industry to invest in itself, building the capacity to deliver high quality, greener buildings that support the government's 2050 net zero target faster through application of modern methods of construction.

The proposed planning reforms in this Strategy will help to increase the use of permitted development rights to replace buildings on existing school sites, where the development is not on playing field land and does not exceed six metres in height. Many schemes are expected to be eligible for the enhanced PDR, potentially taking months off the planning permissions process for each of those projects.

# ve

Major energy, transport, water, waste and commercial projects are consented through the NSIP regime. The regime has a strong track record for delivering robust consents. However, Project Speed has identified risks to the timeliness of ministerial decision making, inefficiencies in the ways in which different public bodies interact with the regime, and scope for improvement including through adoption of digital working practices. Therefore, **the government is establishing a National Infrastructure Planning Reform Programme** to refresh how the NSIP regime operates, making it more effective and bringing government departments together to deliver more certainty in the process and better and faster outcomes. This will:

- Set an ambition to cut timescales by up to 50% for some projects entering the system from September 2023;
- Establish a project “acceleration team” of planning experts to accelerate infrastructure projects through the system, identifying innovative ways to deliver faster planning consents; and
- Monitor the performance of the NSIP regime, coordinate with relevant departments on the need for a review of their National Policy Statements and ensure effective engagement with infrastructure departments, statutory consultees and the Planning Inspectorate and industry.

### Environmental regulations

**Delivering vital infrastructure whilst protecting and improving the environment is a top government priority.** EU exit provides a historic opportunity to design a quicker, simpler framework for assessing environmental impacts and enhancement opportunities, that speeds up the process while protecting and enhancing England’s unique ecosystems. This new system for environmental assessment will be tailored to the country’s needs, outcomes rather than process-focused, respectful of local democratic processes, and support net gains for biodiversity wherever possible. These reforms include:

- **A new system of environmental assessment (including Strategic Environmental Assessments and Environmental Impacts Assessments)** – to deliver a new framework that provides clarity, removes duplication, and ensures environmental considerations are embedded effectively in decision making at an early stage; and
- **Strategic approaches to the protection of habitats and species**, allowing more dynamic and pragmatic planning, including placing schemes like district level licensing on a statutory footing and developing strategic habitat mitigation and compensation schemes like the Solent nitrate trading platform.<sup>65</sup> This will help unlock development and reduce delays now, while respecting and improving the environment, without requiring wider reforms of the planning system to be in place.

### Designing high-performing and beautiful infrastructure

The government wants the planning process to stimulate proposals that are well-designed and will enhance the environment, health and character of local areas. As outlined in *Planning for the Future*, the government wants to better incentivise good design and high-quality homes and infrastructure, which should be a central tenet of the planning system and planning decisions.

**Good design is also an essential element in securing high performance of infrastructure from the start.**

In line with the design principles set out by the National Infrastructure Commission (NIC), **the government is committed to embedding good design in all infrastructure projects through:**

- Local plans which set clear rules rather than general policies for development, so that quality cannot be negotiated away nor can the lived experience of the consumer be ignored too readily;
- A reformed planning system which brings forward a new focus on design and sustainability in national policy and practice, building on the *National Design Guide* published in October last year, with a consultation on the proposed *National Model Design Code* later in 2020; and
- Requiring all infrastructure projects to have a board level design champion in place by the end of 2021 at either the project, programme or organisational level, supported where appropriate by design panels.

# Simplifying procurement and modernising construction

Up to £37 billion of contracts across economic and social infrastructure will be brought to market over the next year.<sup>66</sup> But current procurement regulations are burdensome, slow and do not do enough to ensure public money delivers high-quality, innovative outcomes.

The COVID-19 pandemic has required a step change in the scale of public procurement, whether it be designing and manufacturing ventilators or building Nightingale hospitals in record time. Combined with EU exit, this is a historic opportunity to improve the UK’s regulatory model, building on the lessons from COVID-19 and ensuring greater transparency, fair and open competition. **With a more effective procurement regime in place, government can use its weight as a major buyer to modernise the construction industry and drive better outcomes across the country.**

### A simplified procurement regime

Exiting the EU provides the opportunity to streamline regulations, reduce waste and create a simpler, fairer, more flexible and innovative regime for public procurers and for suppliers to government. The government will publish a green paper in due course which will propose radical reform of the procurement rules. These reforms include:

- **Reducing and simplifying the current procurement procedures** which cause unnecessary bureaucracy and confusion for suppliers;
- **Embedding transparency** by default throughout the commercial life cycle so that procurement and contract data can be more easily scrutinised; and
- **Improving the way commercial tools operate**, such as framework agreements, to improve open competition and avoid a situation where potential suppliers are locked out of government business; and

- **Improving the way in which procurement challenges operate** to reduce costs for both the public and private sectors, deterring spurious challenges whilst ensuring that genuine grievances are dealt with efficiently.

With a simpler, fairer and more effective regime in place, the government can use public procurement to drive better economic outcomes across the country – including supporting a more productive, modern construction industry.

### Transforming the construction sector

Currently, the UK's construction industry is not living up to its full potential. It contributed £117 billion to the UK economy in 2018 and supports over two million jobs, but is one of the nation's least productive industries, and the built environment is a major contributor to greenhouse gas emissions.<sup>67 68</sup>

The government can use its weight as a major construction client to transform and modernise the industry. The publication of The *Construction Playbook* in winter 2020 will improve how government assesses, procures and delivers public works. The *Construction Playbook* will set out policies and principles developed with the private sector and drawing on best practice across the public sector. A multi-year implementation programme will embed The *Construction Playbook* to:

- **Incentivise industry to innovate** by setting clear and appropriate outcome-based contract specifications, rather than defining upfront how infrastructure should be delivered;
- **Support industry to invest in itself** by providing greater certainty of demand with longer term contracting across portfolios. This includes continuing to publish a comprehensive National Infrastructure and Construction Pipeline with the next update in Spring 2021;
- **Facilitate the adoption of Modern Methods of Construction (MMC)**, off-site manufacturing by standardising components, designs and interfaces;
- **Further embed digital technologies** to standardise the approach to generating and classifying data, data security and data exchange, and to support the adoption of the Information Management Framework and the creation of the National Digital Twin; and
- **Develop a consistent and mutually beneficial relationship with industry** to move away from a confrontational approach, towards stronger relationship and contract management which will deliver continuous improvement over time.

The Infrastructure and Projects Authority (IPA) will publish *Transforming Infrastructure Performance 2021* next year, providing more detail to industry and partners on the government's shared vision for the future of infrastructure and the roadmap for delivering it, building upon the measures outlined in this Strategy and the *Construction Playbook*.

# Health Infrastructure Plan

The Health Infrastructure Plan sets out the Department of Health and Social Care's strategy for investment in NHS Infrastructure, and was taken further in the manifesto commitment to have 40 hospitals built by 2030. Application of the Construction Playbook principles, including a pipeline approach and commercial and procurement strategy which generates market appetite, will incentivise performance improvements over the life of the programme. This will involve the application of MMC and new technologies to facilitate, drive and enable the delivery of this investment in capital infrastructure within the challenging timeframe.

Building a stronger, more diverse and sustainable construction industry will require long-term investment in skills to increase recruitment, improve retention rates and support the industry to adopt new technologies and techniques – particularly in green and digital construction. The government has recognised the importance of investing in skills and training as part of its economic response to COVID-19, and the Prime Minister recently set out his commitment to skills and lifelong learning. Government is taking forward reforms to:

- **Support industry through sustained public investment**, by bringing forward £8.6 billion of decarbonisation, infrastructure and maintenance projects in the summer, and by increasing capital spending next year;
- **Leverage public contracts to boost opportunities** for construction apprentices, traineeships and T levels in the construction sector, and to recruit a more diverse workforce;
- **Improve apprenticeships for employers** across the economy, which the construction industry will especially benefit from, allowing them to transfer more of their unspent levy funds before they expire and use more intensive apprenticeships training options;
- **Introduce construction sector traineeships** to bridge the gap between further education courses and entry to employment; and
- **Allocate funding for adult learners** to access short training modules (4-16 weeks) for upskilling and reskilling via the National Skills Fund investment.

## More effective decision making

The government has a long-standing and robust decision-making process in place, supported by the frameworks of the *Green Book* and *Managing Public Money* guidance, HM Treasury and Cabinet Office approvals processes, and internal departmental investment committees. The UK is a world leader in its frameworks for decision making, and models such as the Green Book are followed by many other countries.

However, UK decision making could be faster and more effective. Low investment in regional infrastructure projects has left some parts of the UK behind, and decisions do not always fully capture the government's priority outcomes. Decision making is not always driven by the best data and the process can often be slow and duplicative. Finally, projects don't focus enough on monitoring and evaluation processes that would identify best practice for future decision making.

### Reflecting priority outcomes

If the government is to deliver on its ambitions to level up and decarbonise the economy, decision making will need to be more focused on supporting the government's priority outcomes. This means that, for example, projects which significantly reduce regional disparities and carbon emissions should be given greater consideration. **The government is taking forward work in a number of areas to ensure that decision making reflects priority outcomes**, including:

- **The 2020 Spending Review has already started the process**, introducing the new Public Value Framework which establishes a clear link between departments' spending proposals and intended outcomes, thereby supporting the selection of the most effective and impactful projects;
- **The government has launched the trial of a new Project Scorecard** to identify from the outset how projects will contribute to government's priority outcomes. This will give decision-makers better information about the extent to which different investment options deliver their objectives; and
- **The government has also published an updated *Green Book*** following a comprehensive review process. This seeks to rebalance an appraisal process that has frequently relied too heavily on the benefit-cost ratio, to the exclusion of the development of a robust and well-evidenced strategic case. It will also introduce new guidance on analysing place-based and transformational impacts. Together this will support and enable the levelling up agenda.
- **Developing a National Underground Assets Register**. The UK does not have an efficient process for utility asset owners to share their data. This means in order to plan or carry out infrastructure works, planners and excavators must contact all asset-owning organisations in the area, wait for each to respond, then compile information so it can be read and understood by workers. This process is slow, inefficient and limits the speed at which works can be carried out; a comprehensive register of underground assets would help address this. It will also help prevent accidental damage to underground pipes and cables which currently costs the UK economy £1.2 billion per annum and will improve worker safety.<sup>69</sup>

### Streamlining processes

The government can further improve the quality and the speed of those decisions, making them well and only once, rather than regularly re-opening and prolonging the process. Project Speed has developed the following reforms to do this:

### Better use of data

Good decision making is underpinned by clear and accessible data – both on the nature of the problems that infrastructure is trying to solve, and on the performance of existing infrastructure systems. The NIC's 2018 study *Data for the Public Good* identified that there is currently limited understanding of how the UK's infrastructure works as a system and that use of new technology like sensors, digitalisation, digital twins, the internet of things, big data, and artificial intelligence is piecemeal and not done in a coordinated way. The government will address this by:

- **Launching a new cost benchmarking hub and data platform**, supported by cost estimating best practice guidance to ensure project assumptions are realistic and achievable at the outset, enabling more robust decisions at an earlier stage;
- **Developing a "national digital twin" of the UK's infrastructure systems and built environment**. Smart infrastructure is capable of collecting data about itself as it operates, which can then be used to inform real-world decisions. This is known as a "digital twin". Although many infrastructure owners across energy, waste, transport and water have "digital twins" of their assets, the exchange of data between these systems is often ineffective, making it harder to tackle cross-cutting infrastructure issues such as climate change; and
- **Streamlining and condensing governance** – seeking to remove duplication and speeding up investment approvals at the centre of government by combining HM Treasury and Cabinet Office approvals processes for priority projects;
- **Bringing in specialists and ministers into the process earlier** – to offer expertise, support and provide key decisions early on - progressing or stopping projects at the right time; and
- **Front-end loading planning and decision making** – ensuring all major projects that are complex or novel use the Routemap methodology, a project initiation tool developed by industry and the IPA. A new Project Delivery Framework will be introduced in early 2021, including setting clear standards that must be met at each stage for a project to proceed.

### Monitoring and evaluation

**Good decision making does not stop with project approval.** To ensure the UK is getting the maximum value out of reforms and taxpayer money, the government needs to robustly monitor and evaluate projects during and after delivery. Changes to how the government monitors and evaluates project outcomes will improve how institutions like the NIC and National Audit Office (NAO) hold the government to account.

At the heart of the government's monitoring and evaluation framework is the IPA's oversight of the Government Major Projects Portfolio (GMPP). This ensures robust oversight of government's most complex and strategically significant projects and programmes. **The government is taking action by updating the GMPP to ensure the most critical and complex projects receive robust scrutiny and oversight.** The portfolio has recently been updated, increasing in size by 50% to reflect the full range of major projects delivering government priorities. Further, from April 2021 government departments will be required to collect and report improved project performance data including on; productivity, sustainability, levelling up and innovation to the IPA.

**From April 2021, all major infrastructure projects on the GMPP will be required to publish a summary business case following final approval, a close out report following completion and a long-term evaluation five to ten years into operation.** Over time this will create an evidence base to support continuous improvement and further policy reform.

## A step change in capability and leadership

Strong and accountable leadership is vital to the success of the government's infrastructure agenda and essential for successful delivery across every stage of the infrastructure lifecycle. The government is already investing in building the capability of its leaders through the Major Projects Leadership Academy and associated programmes.

**But to build better, greener and faster, the government needs to drive a step change in capability, culture and behaviour.** The government needs to equip those accountable for the success of projects – Senior Responsible Owners (SROs), Accounting Officers and Ministers – with the skills and tools they need, and ensure clear accountability, both for project delivery and successful outcomes.

The government is accelerating investment in major project expertise and leadership skills by:

- **Recruiting a pool of major projects experts,** deployed directly into departments, to boost leadership capacity and capability in government major projects, and filling critical gaps in professional delivery roles across the government's major project portfolio;
- **Creating a better deal for major project SROs** to boost capability and capacity across government, by taking forward work to reform selection, remuneration arrangements, grade structures and support, which will attract and retain top talent; and
- **Setting a requirement for projects to demonstrate SRO capability and capacity** through approvals gates, to ensure projects are resourced with leaders with the right level of experience and time to focus on effective delivery.

To complement these reforms, the government is putting in place a new rigorous approach to standards and professional accreditation to build a sustainable skills base by:

- **Establishing a new Government Projects Academy** to set professional standards and equip people across government with the expert skills needed to deliver major projects successfully, putting world class delivery, modern methods and sustainable practices at the heart of training practices. This would be open to project leaders from across the public sector and local government including **making new scholarships available to project leaders in local government;**

- Introducing a rigorous new approach to developing and accrediting project professionals at all levels, from foundation to mastery, starting in 2021, with standards set by the new Government Projects Academy; and
- Establishing training on major project delivery as a core expectation for Ministers and senior officials as senior sponsors of infrastructure projects, to build understanding of how best to support and challenge major projects to help them succeed.

## Looking to the future

This package of reforms will revolutionise the way government operates and transform the way infrastructure projects are delivered, leading to a step-change in delivery speed and quality.

**Project Speed has been an effective tool for galvanising Whitehall and industry, challenging the status quo and driving change.** However, the job is not yet complete. The taskforce will continue to remove obstacles in the process of delivering infrastructure, challenge assumptions, and develop, test and iterate reforms on case study projects. The reforms will be rolled out across the breadth of the government's infrastructure portfolio through the settlements agreed at Spending Review 2020 and future events.

**The government will remain committed to effective infrastructure delivery, implementing reforms at pace, removing barriers to delivery and continuing to test current assumptions.** This will ensure that the government's ambitious infrastructure pipeline is delivered better, greener and faster.

# Conclusion and next steps

This Strategy sets out the government's plans to transform its approach to infrastructure policy and delivery, to meet both the short- and long-term challenges facing the UK. This Strategy:

- **Provides a long-term perspective without ignoring shorter-term imperatives:** the Strategy puts recent spending announcements in context, emphasises the value of infrastructure investment to support the economic recovery, but also looks beyond the Spending Review to the government's longer-term ambitions.
- **Sets out clear goals and plans to achieve them:** the government has set out clear ambitions across all economic infrastructure sectors, focused on recovery, levelling up and decarbonisation. These ambitions are underpinned by clear actions, with more detail to come in some areas over the coming weeks and months, with more detail to come in some areas over the coming weeks and months.
- **Announces, multi-year funding commitments for key infrastructure programmes** to back up its ambitions, with more details to come at the next Spending Review in 2021. It makes clear that where policy is devolved, the devolved administrations benefit from funding, through the Barnett formula, enabling their investment to support people and business in Scotland, Wales and Northern Ireland. The Strategy also sets out the government's plans to review the National Infrastructure Commission's (NIC's) fiscal remit.
- **Confirms the government's commitment to fundamentally change the way it considers and delivers infrastructure** across the whole of the UK. It matches the spirit and ambition of the NIC's *National Infrastructure Assessment*, in many places exceeding their recommendations.

However, this Strategy isn't the final word on the government's infrastructure plans – it instead represents the first step of a multi-year process to transform the UK's infrastructure networks. The ambitions set out here will be further strengthened by the next Spending Review in 2021. This Strategy will also be enhanced by a series of related publications over the next 12 months, setting out further details on key areas of infrastructure policy, including:

#### In the next three months:

- *The Union Connectivity Review*
- *The Construction Playbook*
- *The Integrated Rail Plan*
- *The Energy White Paper*

#### In the next six months:

- *The Net Zero Review* final report
- *The National Infrastructure and Construction Pipeline*
- *Transforming Infrastructure Performance 2021*
- A transport decarbonisation plan

#### In the next twelve months:

- *The English Devolution and Local Recovery White Paper*
- An electric vehicle charging infrastructure strategy
- A heat and buildings strategy
- A hydrogen strategy
- An industrial decarbonisation strategy
- A refreshed *Industrial Strategy*

Taken together, these documents will set out the full scope and scale of the government's ambitions to level up and unite the country, decarbonise the economy, and revolutionise how the UK funds and delivers infrastructure.

#### Inclusive infrastructure

Much of the UK's infrastructure was built at a time when the needs of disabled people were not sufficiently prioritised. The consequence has been decades of retrofitted solutions – often expensive, unattractive, and achieving only 'accessibility'. It is vital that the UK's future infrastructure is fully inclusive of everyone, including Britain's 14.1 million disabled people.

The government is determined to transform the lives of disabled people, who for far too long have encountered barriers to enjoying the day to day activities and opportunities that others can take for granted. Infrastructure is a key part of this, and **in Spring 2021 the government will publish a *National Strategy for Disabled People***, expanding on the ways that the government will pursue inclusion and extend opportunities for disabled people across all aspects of life.

# The future of the National Infrastructure Commission

The NIC's exceptional analysis underpins many of the measures announced in this Strategy, and their National Infrastructure Assessment has influenced government decision making since its publication in 2018.

Looking forward, the NIC will now begin preparations for the second 'National Infrastructure Assessment' due for publication in 2023. This new, comprehensive review of the UK's evolving infrastructure priorities will have to take the ambitions and plans set out in this Strategy into account. It will also have to assess the longer-term impact of COVID-19 on economic infrastructure sectors, including any behaviour and technological changes catalysed by the pandemic.

In the meantime, the government has identified new priorities for the NIC for 2021, and is commissioning a new study on greenhouse gas removal technologies which will report next summer. The NIC will provide recommendations to government on:

- the technologies that should be deployed to deliver negative emissions;
- the policies needed to incentivise the rollout of these technologies; and
- the timeline of decisions needed by government to enable the UK to use negative emission technologies to achieve net zero.

The term of reference for this work have been published alongside this Strategy.

The government is also committed to ensuring the NIC maintains its reputation as an impartial, expert body. Building on the new and re-appointments announced earlier this year,<sup>70</sup> the government will shortly launch a competition to appoint several additional Commissioners. This will help strengthen the NIC's expertise in key areas – including local government and environmental issues – and increase the diversity of the Commission.

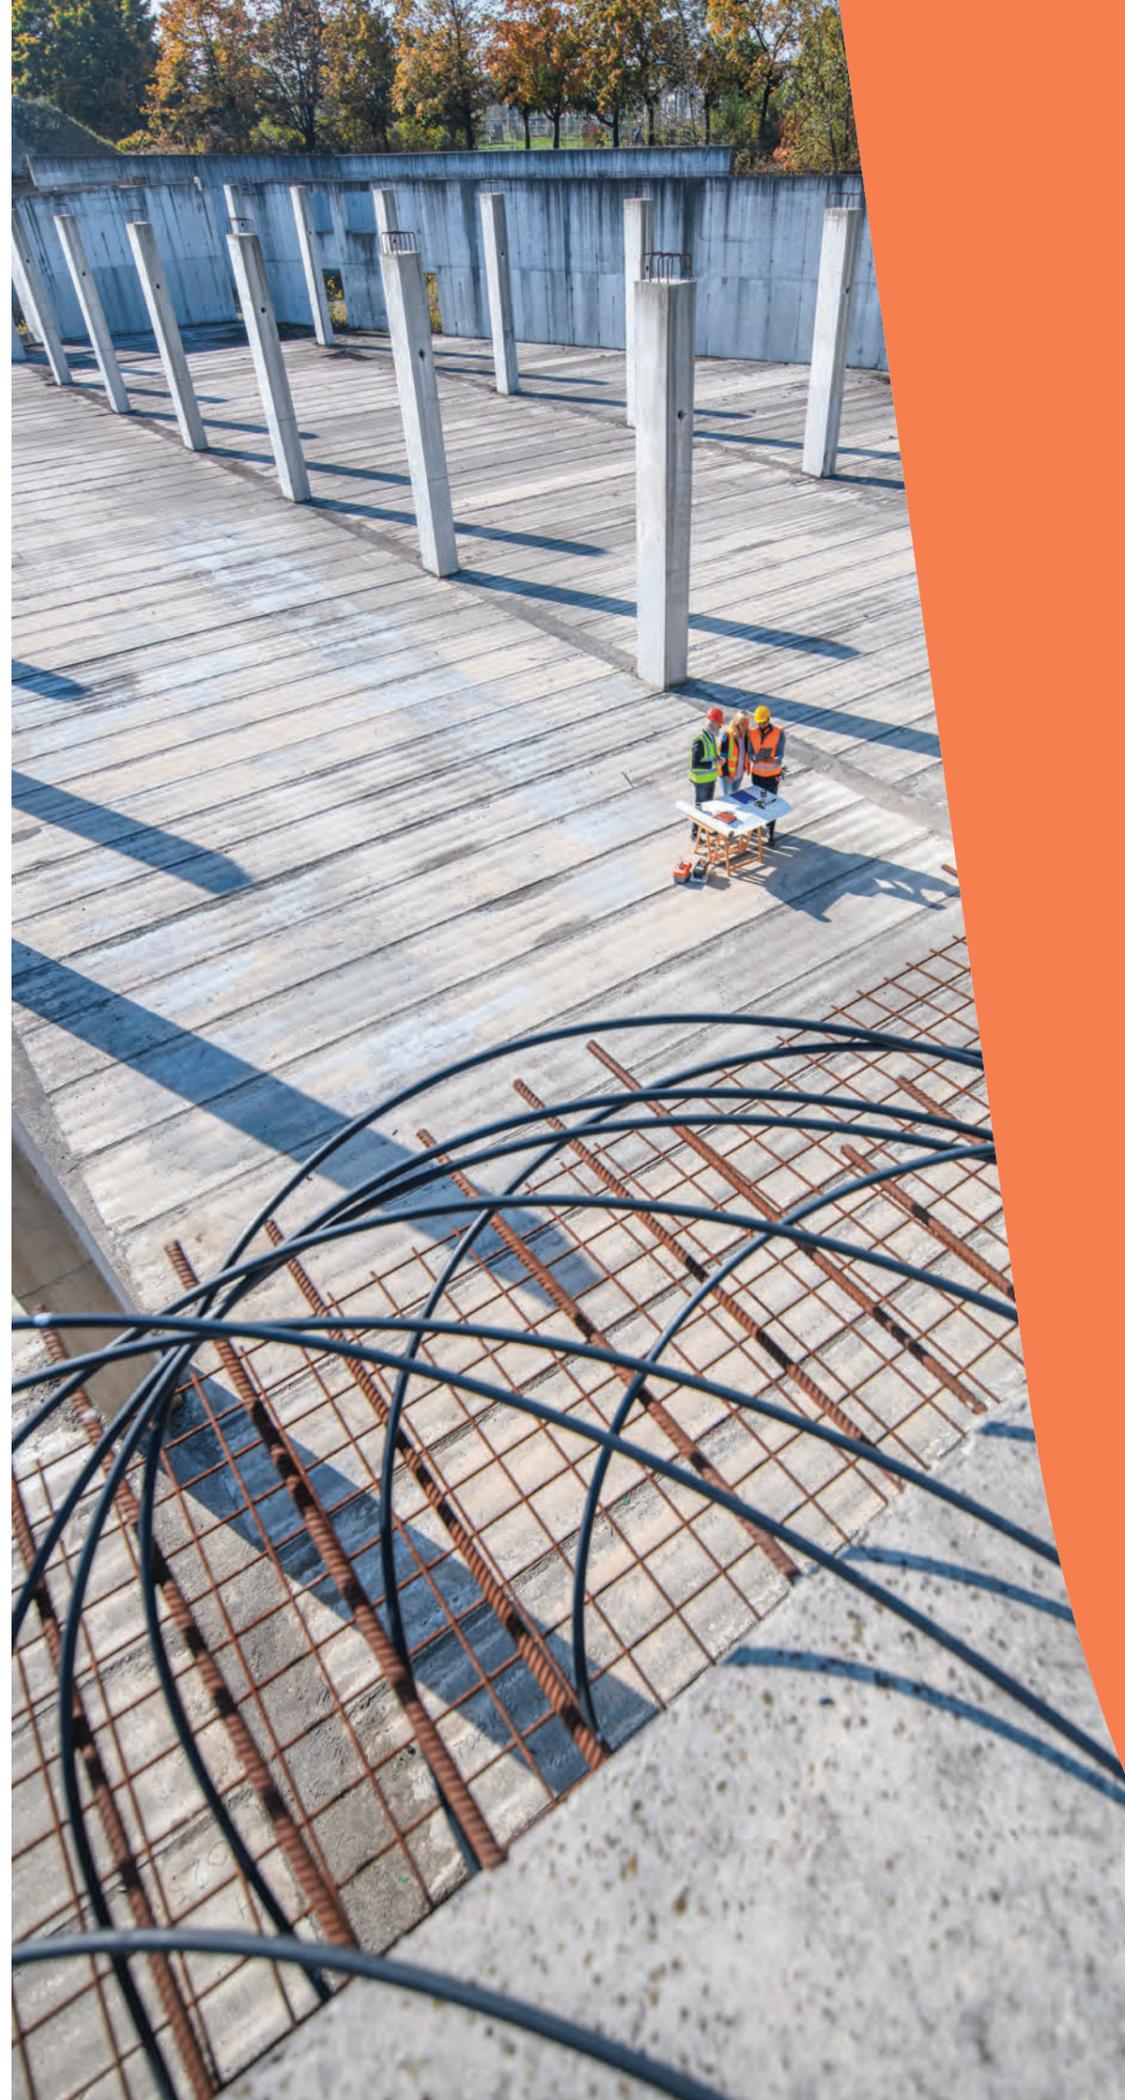

The government will also review the NIC's role and responsibilities in 2021, including updating their Charter and Framework documents if necessary, to ensure the Commission can continue to shape and support this government's infrastructure ambitions. This work will be carried out alongside a review of the NIC's fiscal remit.

## Responding to NIC studies

Since the National Infrastructure Assessment was published in 2018, the NIC has also produced three separate studies: on freight, economic regulation and resilience. The response to the NIC's regulation recommendations has been provided in 'Government response to NIC regulation study – Strategic investment and public confidence.' The Department for Transport will also provide a formal response to the Freight Study in 2021.

The NIC resilience report, 'Anticipate, React, Recover: Resilient infrastructure systems', published in May 2020, proposes a new framework for resilience and makes a series of recommendations to government to help ensure infrastructure operators can deliver and maintain truly resilient infrastructure. The current public health situation has shown that unpredictable 'black swan' events can and do happen, and that preparedness for these shocks is vital.

In light of COVID-19, and given the ever-present threat of climate change, there is a stronger case to talk about resilience of infrastructure – both in the context of the current pandemic and also the increasing risks from climate change and other threats. The government will therefore respond in full to the NIC report in early 2021.

# Executive summary

## Reaching net zero is essential for long term prosperity

Climate change is an existential threat to humanity. Without global action to limit greenhouse gas emissions, the climate will change catastrophically with almost unimaginable consequences for societies across the world. In recognition of the risks to the UK and other countries, the UK became, in 2019, the first major economy to implement a legally binding net zero target.

The UK has made significant progress in decarbonising its economy but needs to go much further to achieve net zero. This will be a collective effort, requiring changes from households, businesses and government. It will require substantial investment and significant changes to how people live their lives.

This transformation will also create opportunities for the UK economy. New industries and jobs will emerge as existing sectors decarbonise or give way to low-carbon equivalents. The Ten Point Plan for a Green Industrial Revolution and Energy White Paper start to set out how the UK can make the most of these opportunities, with new investment in sectors like offshore wind and hydrogen.<sup>1</sup> The transition will also have distributional and competitiveness impacts that the government will need to consider as it designs policy.

In recognition of these challenges, the Climate Change Committee (CCC), in its advice on the net zero target, noted that “if policies are not sufficiently funded or their costs are seen as unfair, then they will fail” and recommended that the Treasury undertake a review to consider:

“how the costs of achieving net zero emissions are distributed and the benefits returned... the fiscal impacts, risks of competitiveness effects and the impacts of decarbonisation across the whole economy”; and

“the full range of policy levers, including carbon pricing, taxes, financial incentives, public spending, regulation and information provision.”<sup>2</sup>

The Treasury accepted this recommendation and published the terms of reference for the Net Zero Review in November 2019. This interim report and the final report

that follows will sit alongside a comprehensive Net Zero Strategy next year, as well as sectoral decarbonisation strategies. They will form part of a government-wide effort to achieve net zero, address wider environmental issues and make the most of growth and employment opportunities.

## The interim report

This interim report sets out the analysis so far and seeks feedback ahead of the final report. This section presents a summary of the findings.

### **1. The combined effect of UK and global climate action on UK economic growth is likely to be relatively small. The scale, distribution and balance of new growth opportunities and challenges will depend on how the economy and policy respond to the changes required.**

The transition to net zero will create new opportunities for economic growth and job creation across the country. The demand for low-carbon goods and services will encourage new industries to emerge, with the potential to boost investment levels and productivity growth. Moving decisively in areas of comparative advantage could generate export opportunities and establish the UK as global leader across the low-carbon economy. Co-benefits from decarbonisation, such as improved air quality, can also be economically significant. However, reaching net zero will also involve costs and lead to significant structural change.

Overall, in the context of the rest of the world decarbonising, the net impact of the transition on growth to 2050 is likely to be small compared to total growth over that period, and it could be slightly positive or slightly negative. Policies like those in the government's Ten Point Plan have a role in ensuring the UK is able to make the most of the potential opportunities.

Regardless of the size or direction of the impact on the economy, the transition will lead to structural changes. Employment opportunities in green industries will emerge, while high-carbon sectors will have to adapt or decline. Some of these effects will be regionally concentrated. New green jobs are already appearing in sectors such as offshore wind, with growth and opportunities centred around regional clusters in the Humber and East Anglia. The net impact of the transition on local labour markets will depend on the costs of decarbonising for individual firms and the flexibility of the labour market to match vacancies with the necessary skills. This means that, though the macroeconomic impact might be small, there could be significant distributional implications. Government policy will need to continue to respond to this, ensuring levelling up across the country.

Structural changes in the economy will also have implications for fiscal policy. Revenues from taxes on the consumption of fossil fuels and from emissions-intensive industries will decline during the transition, for example, as petrol cars are replaced by electric vehicles. Over time the government will need to consider how to offset these lost tax revenues – whether through adjustments to other taxes or reductions in government spending – so that the UK can reach net zero while maintaining the long-term health of the public finances.

## **2. The costs of the transition to net zero are uncertain and depend on policy choices.**

The amount of investment required to reach net zero and the consequential impacts on operating costs are difficult to estimate. They are affected by a range of factors, including the precise path of the transition, changes in behaviour and the rate at which technology costs fall and efficiency gains are made, all of which are subject to significant uncertainty.

## **3. Government needs to use a mix of policy levers to address multiple market failures and support decarbonisation**

In choosing the best way to support the transition, government policy should seek to target market failures directly where possible, subject to distributional and international competitiveness impacts. The most important market failure to address is the negative externality associated with the emission of greenhouse gases, but there are many others holding back the transition to net zero, including inertia and lack of information. The market failures interact in complex ways within and across sectors.

Carbon pricing is an important lever in addressing the negative externality problem but should be supplemented by other policies in order to achieve an equitable balance of contributions from households, businesses and taxpayers. The government has announced it will introduce a domestic emissions trading scheme covering heavy industry, power generation and aviation after the UK leaves the EU.

## **4. Well-designed policy can reduce costs and risk for investors, support innovation and the deployment of new technologies.**

The development of technology will be important for meeting the net zero target, keeping costs down and maximising the potential economic benefits. Much of the finance required can come from the private sector, but the risks and uncertainties associated with novel technologies can hold this back. A clear policy framework setting out the government's approach at different levels of technological development can help address these uncertainties. Where uncertainty is at its greatest, government may need to provide more direct support.

The government's Ten Point Plan announced support for some of these emerging technologies, including an extra £200 million for two new carbon capture clusters by the mid-2020s, with another two for the 2030s and up to £500 million for trialling the use of hydrogen for domestic heating and cooking, starting with a Hydrogen Neighbourhood in 2023.

## **5. The risk of carbon leakage will increase with efforts to reduce emissions.**

The transition to net zero will have implications for the competitiveness of the UK economy. Some sectors will enjoy new export opportunities, but others could become less competitive if other countries follow different decarbonisation paths. These changes could lead to carbon leakage where policies achieve their goal of lowering emissions in one jurisdiction but inadvertently increase emissions

elsewhere. The size of the risk depends on each sector's costs of decarbonising, their trade exposure and international policies.

There is little evidence to suggest that carbon leakage has been a significant factor so far, but as the UK implements new policies to support this transition, the risk of carbon leakage may increase. The government has a number of ways to seek to mitigate this risk, including through its climate diplomacy and the design of policies to support the transition.

Additionally, the UK will host the COP26 climate negotiations next year and take over the G7 presidency. The UK is determined to use these opportunities to encourage ambitious international climate action and reduce global emissions. Collective action to reduce global emissions worldwide helps to reduce the risk of carbon leakage globally. The government is also using domestic policies like the £315 million Industrial Energy Transformation Fund to help sectors in the UK to decarbonise.

## **6. Households are exposed to the transition through their consumption, labour market participation and asset holdings. Government needs to consider these patterns of exposure in designing policies for the transition.**

Different types of household will have different levels of exposure to the transition. For example, higher-income households consume more carbon in absolute terms, but lower-income households tend to consume more carbon relative to their income, and households in Northern Ireland tend to have larger carbon footprints due to a higher prevalence of oil-heated housing.

Households are also exposed to the transition through the labour market, with people in certain occupations (skilled trade, and process plant and machine workers) more likely to work in more carbon-intensive industries. People in these occupations are also disproportionately likely to have a lower level of education and to be lower-income workers.

Analysis of households' exposure to the transition does not show where the costs will fall. This will depend on a range of factors, including the cost of decarbonising each sector, the availability of alternative low-carbon products and the distribution of new green jobs in the economy. However, government will need to be mindful of these issues as they consider the best way to design policy to support the transition. The government is already taking action with a £6.7 billion package of measures to help the lowest paid with their energy bills and by providing support for the creation of jobs in new green industries.

## **The final report**

The final report will be published in spring 2021. This will build on the analysis set out in the interim report, including by looking at:

- **Innovation and growth:** How the government can reduce policy uncertainty to encourage innovation, technological development and investment. It will

look at areas where the UK might have comparative advantage and consider how to maximise the economic benefits.

- **Competitiveness:** The scope for addressing the risks of carbon leakage and competitiveness that may arise from the transition to net zero.
- **Household impacts:** More detailed analysis of the implications for households from the decarbonisation of transport, buildings and power and options for managing any adverse impacts, as well as the trade-offs the government may face.
- **Embedding the findings:** How HM Treasury could incorporate climate considerations into spending reviews and fiscal events and how to embed the principles of the Net Zero Review into policy making across government.

# Chapter 1

## The net zero challenge

The UK has made significant progress towards decarbonising its economy over the last 30 years and was one of 195 countries to sign the Paris Agreement in 2015. Consistent with this and on the advice of the Climate Change Committee, the UK adopted a target of net zero greenhouse gas emissions by 2050.

The transition to net zero will lead to a more sustainable economy but implies significant changes for households, businesses and government. HM Treasury's Net Zero Review will consider how these changes can be managed. It will look at how to maximise the economic opportunities from the transition to net zero, how the costs associated with the transition should be met and how to ensure an equitable balance of costs and benefits across different parts of society.

The Review sits alongside other work by the UK government and the devolved administrations examining how best to decarbonise the economy and achieve net zero.

### Net zero is the “pro-growth strategy for the longer term”

1.1 In 2006, HM Treasury commissioned the Stern Review of the Economics of Climate Change. This estimated the overall costs and risks of global warming to be equivalent to losing between 5 and 20% of global GDP each year. Action to reduce greenhouse gas emissions reduces this risk, with the costs of action necessary to stabilise greenhouse gases concentrations in the atmosphere at 500 to 550 parts per million estimated to be between 1 and 2% of global GDP. Stern concluded that “tackling climate change is the pro-growth strategy for the longer term, and it can be done in a way that does not cap the aspirations for growth”.<sup>1</sup>

1.2 The Climate Change Act 2008 established the independent Climate Change Committee (CCC) to recommend emissions reduction targets for the UK (known as carbon budgets) and to evaluate progress towards meeting them. The initial goal set

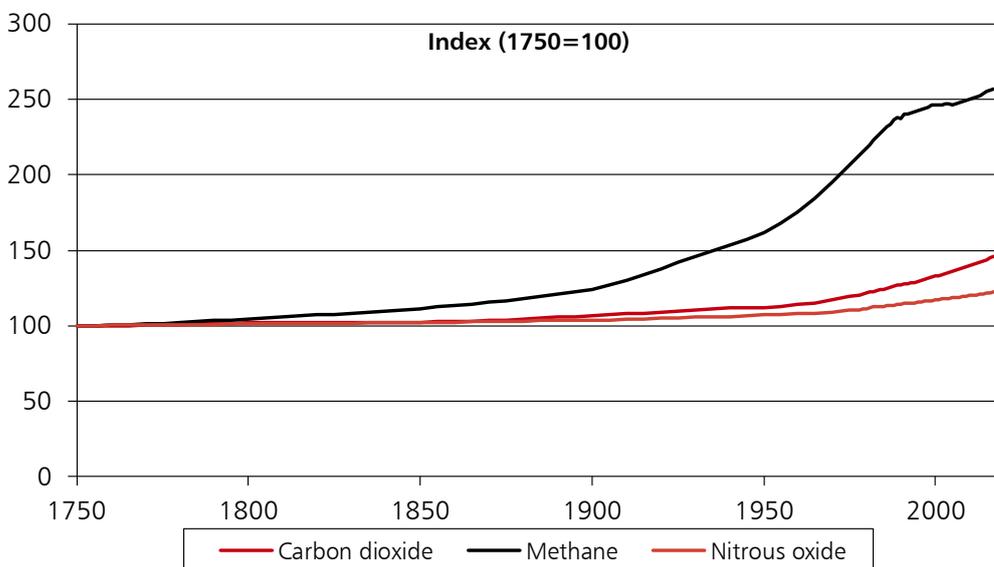

---

<sup>1</sup> ‘Stern Review: The Economics of Climate Change’, HM Treasury, October 2006; the data for the cost of action was revised from 1% in the original report, to 2% in 2008.

in the Act was to reduce emissions by 80% compared to 1990 levels by 2050,<sup>2</sup> in line with advice at the time from the CCC.<sup>3</sup>

**1.3** Although the UK has made significant progress in reducing greenhouse gas emissions since 1990, global atmospheric concentrations of greenhouse gases have continued to rise (Chart 1.A) with consequential implications for the climate. The average temperature in the UK between 2008 and 2017 was 0.8°C higher than in the period from 1961 to 1990. The UK is seeing wetter winters and drier summers and has experienced several extreme weather events in recent decades. These include significant flood events in England in the winters of 2013 to 2014 and 2015 to 2016 and the joint hottest summer on record in 2018, with temperatures equalling the summers of 2006, 2003 and 1976. There are 240,000 homes and properties currently in high flood risk areas, and if shoreline management plans are not implemented, 5,000 properties could be affected by coastal erosion over the next 20 years as sea levels rise and more wave energy reaches the coast.<sup>4</sup>

**Chart 1.A: Atmospheric concentration of selected greenhouse gases**

Source: *European Environment Agency*.

**1.4** In recognition of the risks to the UK and globally, the UK was one of 195 countries to sign the Paris Agreement in 2015, committing to hold the increase in the global average temperature to well below 2°C above pre-industrial levels and to pursue efforts to limit the temperature increase to 1.5°C.<sup>5</sup> It is implicit in this target that global greenhouse gas emissions should reach net zero in the second half of this century.<sup>6</sup>

**1.5** Following the Paris Agreement, the UK, Scottish and Welsh governments asked the CCC for advice on when it would be feasible to reach net zero greenhouse

<sup>2</sup> Climate Change Act 2008 as enacted.

<sup>3</sup> 'Interim advice by the Climate Change Committee', Climate Change Committee (CCC), October 2008.

<sup>4</sup> 'Climate change impacts and adaptation report', Environment Agency, November 2018.

<sup>5</sup> 'Paris Agreement', United Nations, 2015, article 2.

<sup>6</sup> Ibid, article 4.1.

gas emissions.<sup>7</sup> In May 2019, the CCC published its recommendation that the UK should reach net zero by 2050, with individual targets for Scotland and Wales.<sup>8</sup> Later that year, the UK became the first major economy to implement a legally-binding net zero target.<sup>9</sup>

**1.6** The net zero target requires that by 2050 any greenhouse gas emissions produced within the UK must be reduced as far as possible and any residual emissions must be offset, for example by increasing natural carbon sinks such as forests or using technology like carbon capture and storage.<sup>10</sup>

**1.7** The target is focused on the flow of emissions into the atmosphere and applies to tonnes of CO<sub>2</sub>-equivalent (tCO<sub>2</sub>e). This measure aggregates emissions of different greenhouse gases based on their global warming potential relative to carbon dioxide.<sup>11</sup>

**1.8** The target covers emissions that take place on UK territory. It does not include the emissions embedded in goods and services that the UK imports: under internationally agreed frameworks for emissions accounting, established under the 1990 UN Framework Convention on Climate Change, these are the responsibility of the country of origin. The target therefore focuses decarbonisation efforts on the emissions over which the UK government and devolved administrations have most influence and which they are best able to measure.

## **The UK has made good progress since 1990, but has a long way to go to reach net zero**

**1.9** Between 1990 and 2019, the UK reduced its greenhouse gas emissions by 43%, compared to just 5% for the G7 as a whole (Chart 1.B). At the same time, the UK economy grew by almost 80%.<sup>12</sup> The rate of reduction in the carbon intensity of the UK economy since 2000 has also been the fastest in the G20.<sup>13</sup>

**1.10** This progress so far has been led by the power sector (Chart 1.C), where emissions have fallen by over 70% since 1990, largely through reducing the role of coal in electricity generation and increasing the role of renewables. Industrial emissions have also fallen significantly, by more than 50% over the same period. This represents emissions reductions across all parts of industry, manufacturing, construction and fossil fuel supply. In the manufacturing sector, CO<sub>2</sub> emissions fell by 25% between 2009 and 2017. These falls reflect a combination of reduced energy intensity, a shift to less carbon-intensive energy sources and changes in the structure of the manufacturing sector.

<sup>7</sup> 'UK climate targets: letter to the Climate Change Committee (CCC) – 15 October 2018', Department for Business, Energy & Industrial Strategy (BEIS), Welsh Government and Scottish Government, October 2018. Northern Ireland does not currently have its own climate change legislation or emissions targets, but emissions from Northern Ireland are still covered by the wider UK target.

<sup>8</sup> 'Net Zero: The UK's contribution to stopping global warming', CCC, May 2019.

<sup>9</sup> 'UK becomes first major economy to pass net zero emissions law', BEIS, June 2019; Climate Change Act 2008 (2050 Target Amendment) Order 2019.

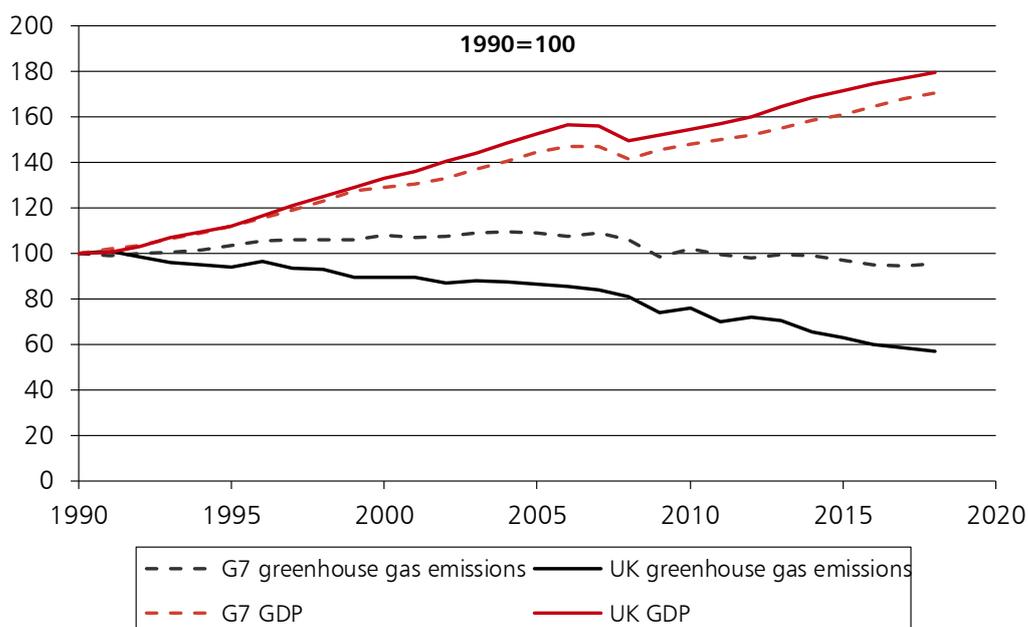

<sup>10</sup> Climate Change Act 2008; 'UK becomes first major economy to pass net zero emissions law', BEIS, June 2019.

<sup>11</sup> 'Annual statement of emissions for 2018', BEIS, 2020, p.5.

<sup>12</sup> 'Greenhouse gas emissions: Total emissions including LULUCF', OECD.Stat, 2020; GDP: 'World Economic Outlook Database' International Monetary Fund, April 2020.

<sup>13</sup> 'The Low Carbon Economy Index 2019', PwC, 2019.

**Chart 1.B: UK emissions reductions and economic growth since 1990**

Source: Organisation for Economic Cooperation and Development, International Monetary Fund.

**1.11** Other sectors have not decarbonised to the same extent, though there have been some successes. Waste policy reforms and emissions savings from fluorinated gases used in refrigeration and air conditioning equipment have driven down emissions in those sectors.<sup>14</sup> Elsewhere, emissions from agriculture, land use and land use change have been broadly flat since 2008. In the transport sector, emissions have remained relatively flat as increasingly efficient road vehicles have been offset by increased traffic levels. Emissions from international aviation and shipping have increased by nearly 90%, entirely due to aviation.

**1.12** Emissions associated with the UK's consumption are higher than territorial emissions. Chart 1.D shows that there has been a gap between UK emissions measured on a territorial basis and on a consumption basis since the mid-1980s. UK consumption-based CO<sub>2</sub> emissions peaked in 2007, at which point the UK's territorial CO<sub>2</sub> emissions were 37% lower than the consumption-based measure. Since 2008, both measures have declined.<sup>15</sup>

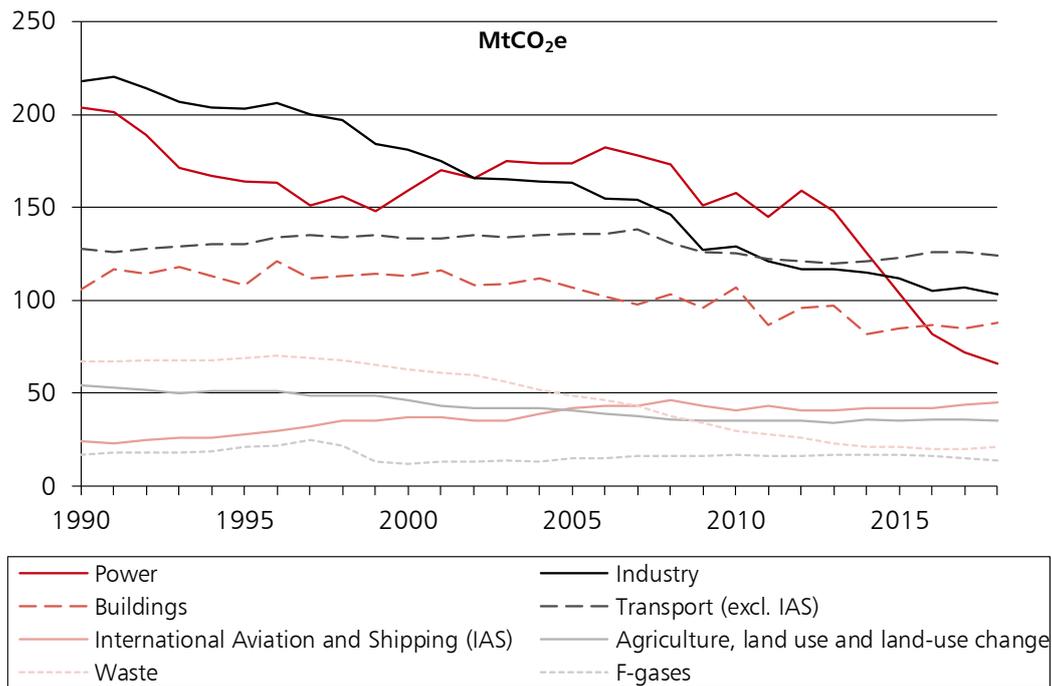

**1.13** For any country, the gap between consumption and territorial emissions will reflect the country's trade patterns and industrial structure. For some countries the gap will be positive, and for others it will be negative, in the same way that some countries run a trade deficit and others a surplus. Chart 1.E shows the balance of imported and exported emissions for a selection of large economies. Countries with a positive balance are net exporters of emissions and those with a negative balance, like the UK, are net importers of emissions.

<sup>14</sup> This report will predominately, though not exclusively, refer to 'sectors' as the groupings used by the CCC to sub-divide the economy. These sector groupings are more meaningful for understanding decarbonisation but are different and not comparable to the Standard Industrial Classifications (SIC code) that routinely used in other economic analysis.

<sup>15</sup> 'The decoupling of economic growth from carbon emissions: UK evidence', Office for National Statistics (ONS), October 2019.

1.14 In the UK, the services sector now represents around 79% of Gross Value Added,<sup>16</sup> and emissions-intensive industries around 2%.<sup>17</sup> This means that the UK exports relatively few emissions compared to other countries, explaining much of the gap between territorial and consumption-based emissions. It also means that the UK economy is relatively less exposed to the risk of losing competitiveness internationally as the government moves to decarbonise the economy. Nevertheless, some sectors will face a risk of losing competitiveness. This means that the UK's efforts to work with international partners to secure collective international agreement to reduce emissions globally are essential.

**Chart 1.C: UK emissions by sector**

Source: 'Reducing UK emissions: 2020 Progress Report to Parliament', CCC, May 2019; Final UK greenhouse gas emissions national statistics 1990-2018.

1.15 The effort to reach net zero will require innovation to reduce the costs of existing net zero-consistent technologies and to ensure that any new technologies are fully developed and commercially viable. While the innovation process needs to happen rapidly, such a transition is possible and advances in digital technology over the last 30 years highlight the potential for innovation over a similar time period.

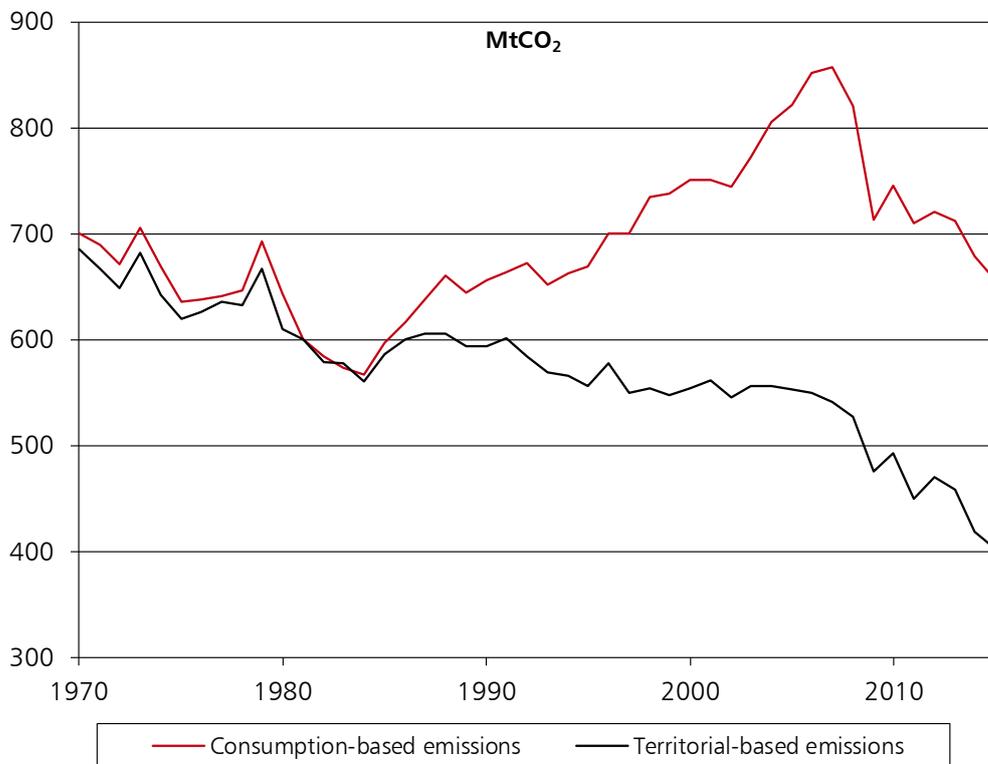

1.16 Increasing awareness and understanding of how the impacts and implications of the net zero target will affect the public is also crucial. In June 2020, 63% of the public said they were aware of net zero in some way but only 4% said they knew a lot about it. As the measures to reach net zero will require much greater public involvement and affect the public to a far greater extent than

<sup>16</sup> 'GDP output approach – low-level aggregates', ONS, November 2020.

<sup>17</sup> 'Electricity Intensive Industries: Relief from the Indirect Costs of Renewable Energy Schemes', BEIS, September 2018. This figure refers to industries covered by EU free allowances, the UK Carbon Price Support Mechanism, as well as the Renewable Obligation, Feed in Tariff and Contracts for Difference schemes. This differs from the official BEIS definition that covers all of manufacturing group C SIC, including mining and quarrying.

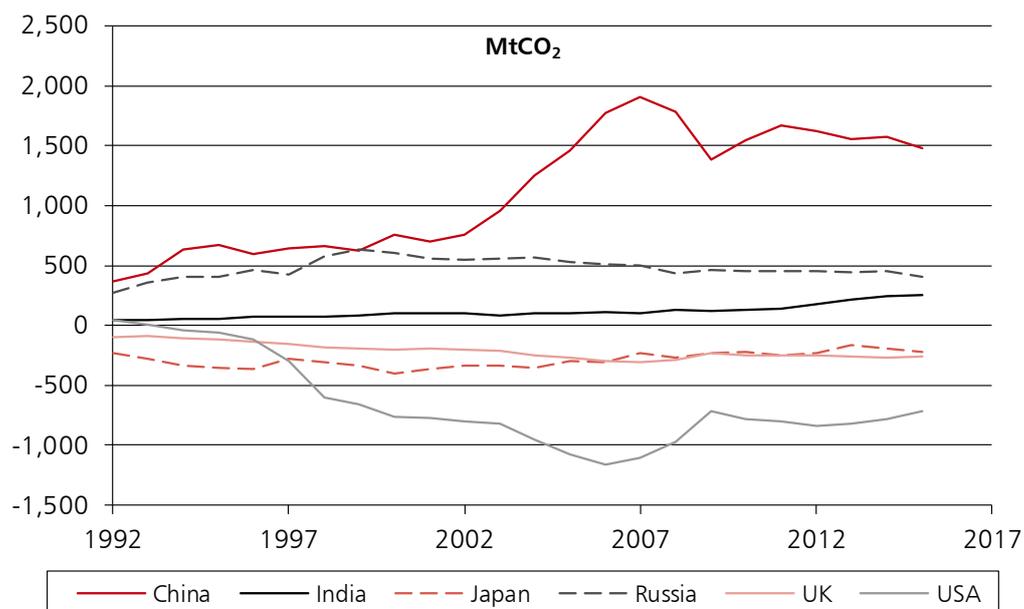

previous decarbonisation activities, ensuring greater access to information will be essential to reaching the target.<sup>18</sup>

**Chart 1.D: Different measures of UK CO<sub>2</sub> emissions**

Source: Office for National Statistics (ONS).

**Chart 1.E: UK imported emissions compared to other major economies<sup>a</sup>**

Source: ONS.

a A positive number indicates a net exporter of emissions: consumption emissions are less than territorial emissions. A negative number indicates a net importer of emissions: consumption emissions are greater than territorial emissions.

<sup>18</sup> 'BEIS Public Attitudes Tracker (June 2020, Wave 34, UK)', BEIS, August 2020.

## The Net Zero Review will support the transition to net zero

1.17 Alongside its recommendation that the UK adopt a net zero emissions target, the CCC recommended that HM Treasury do further work to examine how the costs of the transition should be funded and where the costs will fall, saying:

“If policies are not sufficiently funded or their costs are seen as unfair, then they will fail. HM Treasury should undertake a review of how the transition will be funded and where the costs will fall. The review should cover the use of fiscal levers and Exchequer revenue costs from carbon trading schemes, the impact on energy bill-payers and motorists, and the costs to industries especially where they are carbon-intensive and trade-exposed. It should cover costs from now through to 2050”.<sup>19</sup>

1.18 HM Treasury accepted the CCC’s recommendation to undertake this review. In doing so, HM Treasury intends to create additional clarity about how governments might approach decisions in the transition and seek to ensure an equitable balance of costs and benefits across different parts of society.

### Scope of the Review

1.19 HM Treasury published the Terms of Reference for the Review in November 2019 (see Annex A). It will look at how government policy can support technological development and deployment to maximise the potential growth opportunities from net zero. It will analyse the distributional and competitiveness impacts of the transition to net zero and considerations for determining the appropriate balance of policy levers.

1.20 Some of these levers are the responsibility of the devolved administrations, and net zero will only be achieved through a combination of reserved and devolved policies, building on initiatives already in place across the UK. The Review considers the role of the UK government, acknowledging the specific distributional challenges and opportunities across the UK.

1.21 This interim document sets out initial analysis and considerations:

- Chapter 2 sets out HM Treasury’s assessment of the macroeconomic impacts of the transition, the structural changes it entails and implications for fiscal policy;
- Chapter 3 considers the investment and costs that will be required in order to reach net zero;
- Chapter 4 looks at how different policy levers can best address the market failures causing climate change and holding back the transition;
- Chapter 5 considers the role of technology and innovation in maximising the benefits of move to net zero;

---

<sup>19</sup> ‘Net Zero: The UK’s contribution to stopping global warming’, CCC, May 2019, p33.

- Chapter 6 sets out HM Treasury’s assessment of potential impacts on business from the transition and the potential impacts on carbon leakage; and
- Chapter 7 considers how these impacts could affect households.

## The report sits alongside action across the government

1.22 This review is just one part of the UK government’s work on the transition to net zero and to address wider environmental issues. This work includes the government’s Ten Point Plan for a Green Industrial Revolution,<sup>20</sup> the development of ambitious sectoral strategies such as the recent Energy White Paper<sup>21</sup> and the publication of a comprehensive Net Zero Strategy that will set out the government’s vision for the transition and how it intends to make the most of the growth and employment opportunities (see Box 1.A).

1.23 In addition, the UK will host the COP26<sup>22</sup> climate negotiations next year and take over the G7 presidency. The UK is determined to use these opportunities to encourage ambitious global action and achieve the transformational international change required by the Paris Agreement.

### Box 1.A: Activity across the UK government

**Green recovery:** The UK is looking to build back better and greener as it recovers from the economic impact of the COVID-19 pandemic. Budget 2020 announced:

- A £100 million scheme to help households and small businesses invest in low-carbon heating systems;
- A consultation on a Green Gas Levy to increase biomethane production for the gas grid;
- A Green Heat Networks scheme to encourage new and existing heat networks to adopt low-carbon heat sources, backed by £270 million funding.

July’s Plan for Jobs included a new £2 billion Green Homes Grant for homeowners and landlords to upgrade the energy and cost efficiency of their homes; a £1 billion Public Sector Decarbonisation Scheme to reduce greenhouse gas emissions from public sector buildings and £50 million for a demonstrator project to decarbonise social housing.

<sup>20</sup> ‘The Ten Point Plan for a Green Industrial Revolution’, HM Government, November 2020.

<sup>21</sup> ‘Energy White Paper: Powering our Net Zero Future’, HM Government, December 2020.

<sup>22</sup> 2021 United Nations Climate Change Conference, or 26<sup>th</sup> Conference of the Parties (COP26) to the United Nations Framework Convention on Climate Change (UNFCCC).

The £191 million Sustainable Innovation Fund will help businesses across the UK drive forward cutting-edge new tech and recover from the impacts of coronavirus.

**Setting Carbon Budget 6:** Analytical work is on-going across government to set the next carbon budget. This will cover emissions between 2033 and 2037. The CCC published its advice earlier this month, and the government will respond by the end of June 2021.

**Energy:** Budget 2020 included a pledge to at least double funding for energy innovation, as well as to bring forward the phase-out date for unabated coal generation to 2025. The government has also committed to supporting the development of one power Carbon Capture and Storage (CCS) plant by 2030 to reduce emissions from gas-fired power stations; £1.03 billion for the CCS Infrastructure Fund to help establish four CCS clusters by 2030; and a £240 million Net Zero Hydrogen Fund to help develop up to 5GW of low-carbon hydrogen capacity by 2030. Finally, the Energy White Paper addresses the transformation of the entire energy system in the context of net zero, looking across the power generation, networks, buildings, industry, energy markets and oil and gas sectors.

**Buildings:** At Spending Review 2020 (SR20), the government allocated £1.13 billion in 2021/22 to decarbonise buildings in England and support the creation of clean heat networks. (£1 billion for building efficiency, £122 million for Heat Networks).

The government's Ten Point Plan also sets out an ambition to install 600,000 heat pumps by 2028 and included commitments to:

- implement the Future Home Standard in the shortest possible time;
- consult on non-domestic building standards;
- strengthen energy efficiency requirements for private sector landlords;
- create a market led incentive framework to drive growth; and
- bring forward regulations to support heat pump take up in off gas grid properties.

The government will shortly publish a Heat and Buildings Strategy, which will set out the immediate actions to reduce emissions from buildings, and the programme of work required to enable important strategic decisions in the first half of the 2020s on how to achieve mass transition to low-carbon heating.

**Industry:** The government is planning an Industrial Decarbonisation Strategy for spring 2021 and a Hydrogen Strategy to provide a framework for a hydrogen economy in the UK.

**Infrastructure:** SR20 announced £100 billion of capital expenditure next year, supported by a new National Infrastructure Strategy and the creation of a new infrastructure bank to catalyse private investment in projects across the UK, as well as a comprehensive set of reforms to the way infrastructure is delivered.

**Transport:** The Transport Decarbonisation Plan will set out for the first time how the government will accelerate a holistic, cross-modal shift to greener transport and drive more sustainable behaviours. The government has already announced significant investment in low and zero carbon transport. At SR20, the government confirmed almost £2.4 billion for transport decarbonisation, including £1.9 billion for electric vehicle charging infrastructure and grants for zero and ultra-low emission vehicles, and funding for active travel, zero emission buses and a range of R&D programmes to help decarbonise aviation, maritime and freight.

**Agriculture, land use and land use-change:** The upcoming England Tree Strategy and England Peat Strategy will set out the medium-long term strategy for securing greater carbon and wider natural capital benefits from woodlands and peatlands through public and private finance and non-spending measures. Budget 2020 announced £640 million for tree planting and peatland restoration.

**Greenhouse gas removal technologies:** At the Summer Economic Update the government announced £100 million for Direct Air Capture – a type of greenhouse gas removal (GGR) technology. The government has also published a call for evidence on GGR technologies in December 2020 and is commissioning the National Infrastructure Commission to undertake a new study on GGRs, to report in summer 2021.

**Green finance** can support the transition across all the sectors of the economy. The government continues to work closely with the financial services sector to implement the actions in the Green Finance Strategy. The government has announced plans to achieve mandatory climate-related financial disclosures and to implement a Green Taxonomy and its intention to issue a sovereign green bond and follow up with a series of further issuances.<sup>23</sup>

**Carbon pricing:** After the UK leaves the EU Emissions Trading System (ETS), the government will introduce a domestic UK ETS covering heavy industry, power generation and aviation, with a cap on emissions that decreases over time. Alongside this, the Carbon Price Support, an existing tax on fossil fuels used in electricity generation, provides a top-up to the UK ETS, incentivising investment in lower-carbon technology in the power sector.

1.24 Finally, alongside this work to address climate change, the 25-Year Environment Plan sets out the government's goals for improving the wider environment, in line with the commitment to ensure this is the first generation to

---

<sup>23</sup> 'Green Finance Strategy', HM Treasury and BEIS, July 2019.

leave the environment in a better place than it found it.<sup>24</sup> The Dasgupta Review of the Economics of Biodiversity, an independent review commissioned by HM Treasury, looking at the interactions between the economy and nature and the causes and implications of biodiversity loss (Box 1.B), will also be published next year.

### **Box 1.B: Nature and climate change**

Alongside climate change, biodiversity is declining faster than at any time in history. This is severely eroding the natural world's resilience.

The two problems are inextricably linked. Loss and degradation of nature from human activity such as deforestation and poor soil management is contributing to greenhouse gas emissions and reducing the scope for natural sequestration of carbon from the atmosphere. Climate change in turn is damaging the natural world and is expected to become the biggest driver of biodiversity loss this century.

However, the ways to address climate change and biodiversity loss are also linked. The conservation and restoration of natural habitats such as peatlands, forests and coastal habitats can reduce greenhouse gas emissions, sequester carbon, build resilience in ecosystems (which protects biodiversity and provides benefits for society) and help people adapt to the impacts of unavoidable climate change.

Careful policy design to address both problems is required to ensure opportunities are maximised and to manage the trade-offs. For example, an increase in mining to extract materials required for renewable energy infrastructure could pose a significant threat to biodiversity, reducing the overall benefits of decarbonisation to society. The Dasgupta Review, an independent Review of the Economics of Biodiversity commissioned by HM Treasury, is exploring how society can sustainably engage with nature to support economic prosperity and wellbeing. It will propose solutions that both benefit biodiversity and contribute to climate change mitigation and adaptation.

## **Stakeholder feedback**

**1.25** To support the ongoing work of the review, HM Treasury would welcome feedback on the issues raised in this report. The Net Zero Review team may request more detail where appropriate. Please send responses by 23 January 2021 to: [NZRengagement@hmtreasury.gov.uk](mailto:NZRengagement@hmtreasury.gov.uk).

**1.26** The Net Zero Review will not publish the responses in full or in summary form. However, as explained in the notice below, HM Treasury may be required to disclose this information under the Freedom of Information Act 2000.

---

<sup>24</sup> 'A Green Future: Our 25 Year Plan to Improve the Environment', Department for Environment, Food & Rural Affairs, January 2018.

1.27 Annex C sets out how your response will be treated and how any personal data you provide that identifies you or third parties will be handled.

## Chapter 2

# The economy and net zero

Global action to mitigate climate change is essential to long term prosperity. In the UK, the transition to net zero creates new opportunities for growth and employment. The investment and demand for low-carbon goods and services will encourage new industries to emerge, creating jobs across the country. Further opportunities could come from new areas of innovation and technology and changes in energy costs. Moving decisively in areas of comparative advantage could generate new jobs and export opportunities and establish the UK as a global leader across the low-carbon economy. The co-benefits from adopting low-carbon technologies, such as improved air quality, can also be economically significant.

Reaching net zero will also involve costs and lead to major structural changes in the economy, as existing industries may have to adjust how they operate or face decline. These impacts will be unevenly felt across different sectors, regions and households, and some industries may face greater challenges when adapting.

Policies like those in the government's Ten Point Plan for a Green Industrial Revolution help to ensure that the UK is able to make the most of the opportunities presented by decarbonisation.<sup>1</sup> An understanding of potential impacts and an awareness of the lessons from previous major transitions will also be vital when designing effective policies to ensure an equitable balance of costs and benefits arising from the transition.

## Global action to mitigate climate change is essential to long-term prosperity.

**2.1** Global action on decarbonisation is essential to avoid the effects of unmitigated climate change and to ensure that the global economy is sustainable in the long term.

**2.2** The assessment in this chapter suggests that, within the context of global action, the transition in the UK may have only a small effect on long-run economic growth, although the direction of the effect could be slightly positive or slightly negative. To some extent, the UK has already decoupled economic growth from

---

<sup>1</sup> 'The Ten Point Plan for a Green Industrial Revolution', HM Government, November 2020.

growth in emissions: between 1990 and 2019, the UK reduced its greenhouse gas emissions by 43%, while the UK economy grew by almost 80%.<sup>2</sup>

**2.3** While in aggregate the effect of the transition on long-run UK economic growth may be relatively small, there could be significant structural changes to the economy: along with digitalisation, decarbonisation will probably be among the most important drivers of change in the UK economy to 2050. These structural changes will mean some sectors will expand and others will shrink.

**2.4** Low-carbon sectors could benefit from new domestic and global growth opportunities, whereas more carbon-intensive sectors may face greater constraints as a result of decarbonisation requirements across their global supply chains and markets. Differences in policies across countries may influence growth opportunities and the competitive pressures domestic firms face.

## **A qualitative approach allows macroeconomic assessments amid uncertainty about technology and policy**

**2.5** This chapter includes a qualitative assessment of the macroeconomic impacts resulting from the transition to net zero. It considers the most important channels through which the transition could affect the economy and the likely direction of those impacts, drawing on the existing literature. A qualitative approach allows an assessment of the impact of a generic set of policies. It also permits a rigorous discussion of the potential impacts where factors such as technological development and deployment are still uncertain.

**2.6** Impacts are compared to a counterfactual in which the rest of the world decarbonises, but the UK does not. This baseline enables an assessment of the impacts on competitiveness and productivity and an assessment of how the transition could alter the structure of the UK economy. This report does not seek to compare the costs and benefits of the net zero transition to the costs of unmitigated climate change, as UK action alone would be insufficient to address the problem.

**2.7** This counterfactual differs slightly from that used by the Climate Change Committee (CCC) in estimating the costs of the transition. The CCC assumes a hypothetical baseline of no additional climate action nor climate damage and does not take into account climate action taken by the rest of the world. Chapter 3 returns to this issue.

**2.8** Some organisations have attempted quantitative modelling of the transition to net zero, with a variety of baselines. Different models inevitably give slightly different results, but these estimates suggest that decarbonisation will have a modest overall macroeconomic impact. The European Commission analysis of a net zero-equivalent scenario (1.5°C global warming) indicates a small impact on European GDP out to 2050, ranging from slightly negative to slightly positive (-0.63%, +0.68% or +1.48% depending on the model choice).<sup>3</sup> The analysis the CCC commissioned to accompany their 2019 net zero recommendation similarly

---

<sup>2</sup> Greenhouse gas emissions: Total emissions including LULUCF, OECD.Stat, 2020; GDP: 'World Economic Outlook Database' International Monetary Fund, April 2020.

<sup>3</sup> 'In-depth analysis in support on the COM(2018) 773: A Clean Planet for all – A European strategic long term vision for a prosperous, modern, competitive and climate neutral economy', European Commission, 2018.

suggested a moderate impact on the UK's GDP in 2050 (-0.8% or +3.4% according to model choice).<sup>4</sup> To put these effects into context, the CCC's advisory group on costs and benefits said that, should the UK maintain its normal level of growth, decarbonisation would simply mean "UK citizens would need to wait until half way through September 2051 to reach the level of income they would otherwise have achieved at the end of 2050."<sup>5</sup> Box 2.A sets out some of the challenges of quantitative modelling.

### **Box 2.A: Quantitative modelling approaches to net zero**

Quantitative models could theoretically be used to estimate macro or indirect effects of decarbonisation on the wider economy. There are three main categories of model that could be used, all of which have limitations.

Computable General Equilibrium (CGE) models, such as the one used by the Department for Business, Energy & Industrial Strategy (BEIS) during Carbon Budget 5 and in part by the European Commission, can capture the impact of carbon-cutting initiatives on firms and households. CGE models require assumptions about technological improvements to be imposed on the model. The outputs of any CGE modelling would reflect – and be highly sensitive to – these assumptions (although this is not a unique risk to CGE models).

Energy-systems models such as the one used by the CCC to estimate the costs of the transition discussed in Chapter 3 and BEIS's UK TIMES model fully depict the energy system and can estimate the costs needed to reach net zero under given constraints. These models are neutral about economic policy and have no direct link to wider economic variables. This makes them unsuitable for analysing the impacts of important policies such as carbon pricing.

Finally, there are macro-econometric models such as the model used by the Office for Budget Responsibility (OBR) in producing the UK's official economy forecasts. These models are best considered forecasting tools to enable forecast judgements to be applied consistently across a very wide range of macro-economic variables. The European Commission complemented its CGE climate modelling using such a model. This type of model could produce dynamic outputs over a long horizon, though the OBR's model (which is shared and co-developed with HM Treasury) currently only covers the immediate 5 to 6-year period needed for Budget forecasts. These models typically have no climate-specific variables and are unable to distinguish between low-carbon and high-carbon technology.

---

## Climate action will affect economic growth through multiple channels

2.9 The qualitative assessment of the macroeconomic impacts of the transition in this report considers each of the potential channels in turn, alongside evidence in the literature on the likely direction of any impact.

### Productivity

2.10 Productivity growth is essential for increasing household living standards and firm competitiveness in the long term. A well-designed transition that stimulates innovation and investment in low-carbon sectors with strong growth opportunities could improve long-term productivity growth in the UK. The government's Ten Point Plan outlines a programme of green growth and innovation to seek to achieve this.<sup>6</sup>

2.11 In contrast, a transition that discourages carbon-intensive activity without encouraging investment and production into low-carbon alternatives risks lower productivity growth.

2.12 In the short run, and at an industry level, several empirical studies suggest a link between environmental policies and negative productivity impacts, although some also find positive productivity effects.<sup>7</sup> The precise impact depends on the specific policy design and conditions in the sectors to which the policy applies. Where firms are currently not making the best use of their inputs, policy can encourage or compel them to improve efficiency.<sup>8</sup>

2.13 In the long run, the impact on productivity of policies to address climate change and environmental harm is less clear. The Porter Hypothesis suggests that environmental regulation can boost investment and innovation<sup>9</sup> because companies that innovate quickly may also experience first-mover advantages. The hypothesis suggests that these benefits more than offset the initial cost of regulation.<sup>10</sup>

2.14 There is sound empirical evidence to support a positive link between environmental regulation and innovation.<sup>11</sup> However, the limited number of studies undertaken do not provide clear evidence that this translates into improved productivity at the macroeconomic, firm or industry level.<sup>12</sup>

2.15 It is also worth noting that measures of productivity often only include labour and capital as inputs, ignoring the depletion of natural resources. GDP is the only output measured, with no accounting for the cost of damage from pollution associated with economic activity. The evidence cited above may therefore

overestimate the productivity of carbon-intensive industries compared to low-carbon alternatives.<sup>13</sup>

## Investment

**2.16** Investment is a vital component of economic growth, and significant investment will be necessary to achieve net zero. Many of the technological pathways to decarbonise the UK economy are currently uncertain, so the precise amount of investment required is still unclear. The government's Ten Point Plan outlines the ambition to mobilise £12 billion of government investment, and potentially up to three times as much private investment.<sup>14</sup>

**2.17** Some investment will move from carbon-intensive industries to low-carbon alternatives, but new investment is also likely to be necessary. Additional and productive investment in low-carbon growth areas could stimulate economic output in the near term and support productivity growth in the longer term.

**2.18** If decarbonisation leads to high additional investment, then this could reinvigorate overall investment levels in the UK and help support aggregate demand in the economy. UK investment levels have been below G7 and OECD<sup>15</sup> averages as a share of GDP in recent years, as shown in Chart 2.A. Higher total investment could increase the UK's economic growth rate. This would increase the size of the economy and so reduce the relative challenge of funding the required investment for decarbonisation.

**2.19** The investment in net zero could be from public or private sources. It is possible that a substantial increase in public investment for the transition would risk crowding out private investment or other targets for public investment. If the supply chain of low-carbon capital goods is constrained, for example due to skill shortages, then increases in public sector demand may simply out-bid and thus deter private investment.

**2.20** Public investment is less likely to crowd out private investment when economic growth is below trend and counter-cyclical public investment can be expansionary. Well-designed government investment may also crowd in private investment where it creates new markets, reduces technology costs or reduces risk for private investors.

**2.21** In summary, the technology and investment requirements for net zero are uncertain. The level of investment necessary for decarbonisation, and how much of that is additional, will determine whether total UK investment is higher,<sup>16</sup> lower<sup>17</sup> or

at the same level<sup>18</sup> than it otherwise would have been. Higher economic growth due to increased investment can reduce the relative funding challenge of decarbonisation.

### Chart 2.A: Total Gross Fixed Capital Formation

Source: World Bank, Organisation for Economic Cooperation and Development (OECD).

## Changes in energy prices for businesses and households

**2.22** Energy is a significant component of household consumption. It is also an input cost for production. The scale, direction and longevity of potential price changes will depend on the relative prices of energy produced by existing and new technologies. This in turn depends on the potential for technology, innovation and production at scale to lead to efficiencies in energy production and reduce the cost of clean energy over time.

**2.23** Costs of wind and solar energy have already seen significant falls, and some forms of renewable electricity generation in the UK, such as onshore wind, are expected to have lower estimated costs per unit than electricity derived from fossil fuels.<sup>19</sup> Lower long-run energy costs and greater energy efficiency could benefit both businesses and households. One of the priorities of the Energy White Paper is keeping energy bills affordable as the UK decarbonises, especially for the most vulnerable households.<sup>20</sup> Analysis by the National Infrastructure Commission further suggests that household energy bills could be potentially lower or equal to current levels after switching to clean energy.<sup>21</sup>

**2.24** Taxes that increase the price of energy, policies that add costs to bills, or regulations that constrain the use of the more cost-efficient but more heavily

<sup>18</sup> 'Environmental regulations and innovation activity in UK manufacturing industries', Resource and Energy Economics, vol. 34, issue 2, R. Kneller and E. Manderson, 2012. in their analysis of 25 UK manufacturing industries from 2000 to 2006, Kneller and Manderson do not find a positive impact of environmental compliance on total R&D or total capital investment. The study also finds evidence that more stringent environmental regulation directly lowers optimal expenditure on non-environmental innovation.

<sup>19</sup> 'Electricity Generation Costs 2020: Levelised Cost Estimates for Projects Commissioning in 2025, 2030, 2035, and 2040', Table 4.17, BEIS, 2020.

<sup>20</sup> 'Energy White Paper: Powering our Net Zero Future.', HM Government, December 2020.

<sup>21</sup> 'Technical annex: Energy and fuel bills today and in 2050', National Infrastructure Commission, 2018.

polluting technologies could therefore weigh on economic activity and productivity. The investment required for a widespread switch to low-carbon energy infrastructure may also add to energy prices.

## Competitiveness

**2.25** Where the level of ambition of UK climate change mitigation policies exceeds that of its trading partners, there is a risk of reduced UK competitiveness, particularly in highly traded sectors.<sup>22</sup> At the same time, the UK has areas of comparative advantage in a number of green and renewable sectors. Where the UK can capitalise on its leadership in decarbonisation, it may generate economic opportunities, including in technologies that are not yet established, such as carbon capture and floating offshore wind.

**2.26** One would expect the UK's opportunities to be aligned with its economic strengths as a world-leading knowledge economy, with a global financial services sector and advantages in renewable energies such as offshore wind engineering services.<sup>23</sup> The UK's ability to take advantage of these opportunities will be partly determined by the effective use of public policy, which can support the transition of important sectors and create an attractive environment for investment in innovation.

## Sectoral and structural impacts of the transition are likely to be significant regardless of the net impact

**2.27** Regardless of the magnitude and direction of aggregate economy-wide impacts, the transition will lead to significant changes in the structure of the economy. This will have knock-on impacts on sectors, jobs and regions.

**2.28** Some of these impacts will be locally concentrated, but precise impacts will depend on the ease with which the existing sectors can decarbonise, the rate at which new areas of economic activity emerge and on policies to manage the impacts or support the transition.

**2.29** It is not a given that the areas with currently high emissions will face the largest costs to decarbonise, and many of these regions could see new jobs as a result of policies such as those in the government's Ten Point Plan.<sup>24</sup> This included £12 billion of government investment to create and support up to 250,000 highly skilled green jobs, including an extra £200 million to create two carbon capture clusters by the mid-2020s, with another two set to be created by 2030. This increased the total invested to £1 billion, helping to support 50,000 jobs, potentially in areas such as the Humber, Teesside, Merseyside, Grangemouth and Port Talbot. Box 2.B further illustrates some of the potential economic opportunities that decarbonisation can bring across the country.

---

<sup>23</sup> The UK has an established comparative advantage in areas including offshore engineering (oil and gas), installation and maintenance of offshore drilling platforms, manufacture of platforms, cabling and substations, and development of offshore sites. 'Offshore Wind Energy Outlook', International Energy Agency (IEA), 2019.

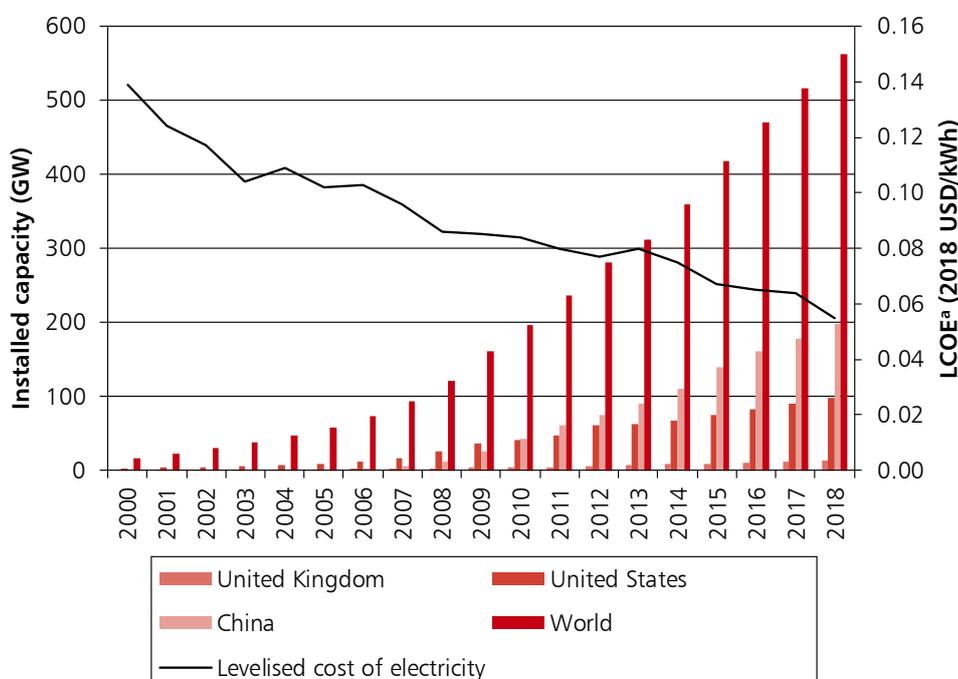

<sup>24</sup> 'The Ten Point Plan for a Green Industrial Revolution', HM Government, November 2020.

## Box 2.B: Onshore and offshore wind

Wind technology has developed rapidly over the past few decades. Since 2000, global onshore wind installations have seen a compound annual growth rate of 21%,<sup>25</sup> rising to nearly 30% annual growth since 2010<sup>26</sup> (Chart 2.B). Turbine prices have fallen on average by 38% since 2009.<sup>27</sup>

Offshore wind is also a rapidly developing technology of increasing importance for electricity generation. The UK has been a global leader in the promotion of offshore wind and has more installed capacity than any other country.<sup>28</sup> The UK's share of electricity generated by offshore wind has increased from 0.8% in 2010 to 6.2% in 2017 and is expected to reach 10% in 2020.<sup>29</sup> The average cost of electricity from offshore wind projects fell by over 25% between 2010 and 2019.<sup>30</sup>

Chart 2.B: Onshore wind installed capacity and average cost of electricity<sup>a</sup>

Source: 'Interactive Datasets, Wind Capacity', BloombergNEF, 2020; 'Renewable Power Generation Costs in 2019', International Renewable Energy Agency, 2020.

a The levelised cost of electricity (LCOE) is the average cost of the lifetime of the plant per MWh of electricity generated.

<sup>26</sup> 'Offshore Wind Outlook 2019', IEA, 2019.

<sup>27</sup> 'Renewable Power: Sharply Falling Generation Costs', IRENA, 2017.

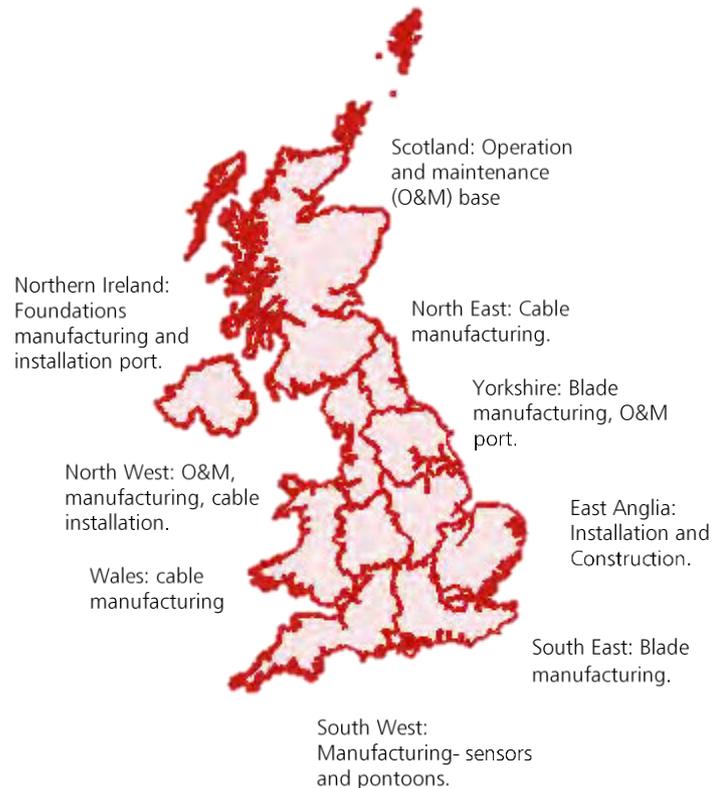

<sup>28</sup> 'Offshore Wind Outlook 2019', IEA, 2019.

<sup>29</sup> 'Offshore Wind Sector Deal Policy Paper', BEIS, 2020.

<sup>30</sup> 'Renewable Power Generation Costs in 2019', IRENA, 2020.

The UK has developed a successful offshore wind supply chain (Chart 2.C). In 2018, almost 50% UK projects' content was sourced in the UK,<sup>31</sup> with the sector aiming to increase this to 60% by 2030.<sup>32</sup> Offshore wind is associated with over 7,200 jobs, with regional clusters in the Humber and East Anglia.<sup>33</sup> Increasing offshore wind capacity to 40GW, from 10GW in 2020,<sup>34</sup> could support 27,000 jobs, including in manufacturing.<sup>35</sup> Some of these will replace jobs in high-carbon sectors; others will be additional.

**Chart 2.C: The wind supply chain has developed across the UK**

Source: 'Supply Chain Map', RenewableUK, 2020; 'NUTS Level 1 Fully Clipped Boundaries the UK', Office for National Statistics (ONS), 2018.

## Labour market

**2.30** Any structural changes to the economy will have knock-on impacts to the labour market and to demand for particular skills in the economy. The transition could generate a significant number of green or green-related employment opportunities across the UK across the skills and wage distributions as new industries emerge. However, employment losses concentrated in high-carbon sectors are possible if these sectors cannot adapt or absorb the costs of decarbonisation. The distribution of employment opportunities will depend on the flexibility in the

<sup>31</sup> 'Export Nation. A year in UK wind, wave and tidal exports', RenewableUK, 2018.

<sup>32</sup> 'Offshore Wind: Sector Deal Policy Paper', BEIS, 2020.

<sup>33</sup> 'Offshore Wind Sector Deal Policy Paper', BEIS, 2020.

<sup>34</sup> 'Wind Energy Statistics', RenewableUK, 2020.

<sup>35</sup> 'Offshore Wind: Sector Deal Policy Paper', BEIS, 2020.

labour market to match vacancies with the necessary skills, as well as government policy choices, and will not automatically match existing distributions of skills and labour. The potential labour market impacts are explored further in Chapter 7.

## The transition also has implications for financial stability

**2.31** A gradual and smooth transition can support (for example, by reducing the volume of stranded assets) and limit systemic risks to the financial system.<sup>36</sup> To this end, it is important that the government takes early and decisive action, providing clear signals on the direction of net zero policy to give certainty to investors and allow businesses to plan and adapt effectively.

**2.32** The Bank of England has identified a number of financial risks that could be realised if there were a disorderly transition to a low-carbon economy.<sup>37</sup> Credit risks can arise through stranded assets (fossil fuel assets and other carbon-intensive assets that become unusable) and losses from banks' and non-banks' loan exposure to companies vulnerable to transition risks. Insurers may be at risk if decarbonisation leads to a fall in value of the long-term assets held to support future pension benefits.<sup>38</sup> Market risk can arise from sharp re-pricing of fossil fuel and other carbon-intensive assets.

**2.33** The Bank also identifies operational risks, where shifting customer sentiment may pose reputational risks, for example through increasing pressure to divert capital flows away from carbon intensive companies towards sectors that contribute to the transition to a low-carbon economy. If such risks were to materialise at scale and pace, there could be significant implications for financial stability. These risks to the financial system could amplify the costs that climate change poses to the real economy.

**2.34** The Bank of England's proposed scenarios for modelling climate impacts on the financial system illustrate the difference that policy timescales to address climate change can have on financial stability.<sup>39</sup> A scenario where there is early and decisive action to address climate change would allow financial markets to price in the transition in an orderly fashion and take advantage of the opportunities it provides. In a late policy action scenario, where action to address climate change is delayed by ten years, a deeper adjustment is likely to be required. This may lead to significant shifts in global carbon prices, incurring risks to the financial system and the macroeconomy.

## The transition comes with co-benefits

**2.35** Co-benefits are ancillary benefits that result from greenhouse gas reduction. These include positive benefits such as improved public health outcomes (as a result of better air quality, better diets and more active travel), warmer, more comfortable

---

<sup>36</sup> 'Too Little Too Late', European Systemic Risk Board, 2018. The Bank of England will also use the 2021 biennial exploratory scenario to explore the financial risks from climate change by looking at the difference in the costs between early and steady transition, and late transition with a sudden repricing shocks of assets.

<sup>37</sup> 'Transition in thinking: The impact of climate change on the UK banking sector', Bank of England, September 2018.

<sup>38</sup> Speech by Anna Sweeney (Bank of England), Moody's Insurance Summit Webinar, 9 September 2020.

<sup>39</sup> 'Discussion Paper: The 2021 biennial exploratory scenario on the financial risks from climate change', Bank of England, 2019.

homes, and wellbeing improvements from improved environmental amenities and green spaces.<sup>40</sup>

**2.36** Co-benefits have generally been excluded from macroeconomic modelling. However, they can be significant, realised in the near-term and largely benefit the country doing the emissions abatement. For example, the World Health Organization estimated the cost of premature deaths from air pollution in the UK as \$83 billion in 2010.<sup>41</sup> Therefore, co-benefits should not be excluded from final policy considerations.

## **The changes in the structure of the economy will also have fiscal implications**

**2.37** The transition to net zero and consequent structural changes in the economy will also have implications for the UK's public finances and fiscal sustainability. As some sectors grow and others shrink, the mix of tax revenues will change. Chart 2.D illustrates the cumulative relationship between employment and corporation taxes against emissions by industry. This shows that a small number of industries are responsible for a large share of emissions, but a much smaller share of tax. The top three sectors by greenhouse gas emissions account for 63% of UK industrial emissions but contribute just 14% of PAYE and Corporation Tax revenues.<sup>42</sup>

**2.38** Decarbonisation will mean significant changes for these high polluting sectors and industries, should decarbonisation lead to innovation and higher productivity in these sectors, the government might see associated tax revenues increasing. Alternatively if the costs of decarbonisation affect the near-term productivity of these firms, then the government might expect to collect less revenue from these industries. Nevertheless, these sectors' current small share of the tax-take suggests that the impact of the net zero transition on total tax revenues could be limited.

**2.39** Other taxes are more directly dependent on emissions. Chart 2.E shows the current tax revenues that are wholly dependent on individuals' and businesses' consumption of fossil fuels or emission of greenhouse gases. These sum to approximately £37 billion in the financial year 2019-20 or just over 4% of total revenues. While not all these taxes were designed solely to reduce carbon in the economy, much of this revenue is likely to be eroded during the transition to a net zero economy.

Source: 'Atmospheric emissions: greenhouse gases by industry and gas', ONS, 2020; 'PAYE tax deducted from pay, by industry', ONS, 2019; 'Tax receipts and NICs', HMRC, 2020; 'Corporation Tax liabilities', HMRC, 2019.

a Industrial emissions account for 74.1% of total GHG emissions. Revenue contributions by industry are calculated using PAYE + CT receipts. Sector refers to ONS Section level SIC code.

2.40 Taxes included in this analysis are wholly or partially at risk. For example, it is estimated that up to 90% of current Landfill Tax revenue could be at risk, as a significant proportion of the revenue is derived from biodegradable waste which releases methane and carbon dioxide.

2.41 Other tax revenues have mostly been excluded from this analysis where the net fiscal impact of the transition is uncertain. For example, the transition will have an ambiguous effect on revenues from the Climate Change Levy (CCL), a levy on business energy consumption. Consumption of electricity is expected to increase significantly, which would tend to increase CCL revenues, but this is to some extent offset by use of gas and solid fuels falling nearly to zero, reducing CCL revenues. Chart 2.E therefore only includes CCL revenues from the Carbon Price Support.

**Chart 2.E: Tax revenues from greenhouse gas consumption<sup>a</sup>**

Source: HMRC tax receipts and NIC contributions, 2020; PAYE deducted from pay, 2020), OBR economic and fiscal outlook, 2020.

a Current revenues from EU ETS receipts are at risk due to low greenhouse gases at the end of the transition.

2.42 On the expenditure side there is a potential fiscal benefit, with the spending on domestic decarbonisation expected to decline by 2050 as the economy decarbonises and markets and technologies mature. Some related spending pressures may remain, subject to decisions on how to fund capital and operating costs, and how to manage carbon leakage. In 2019-20 the government spent £1.5 billion<sup>43</sup> on domestic climate mitigation, with additional support of £11.4 billion through fiscally neutral spend, such as Contracts for Difference, where policy is funded through consumer bills.<sup>44</sup>

<sup>43</sup> This is the sum of all domestic climate mitigation spending from BEIS, the Department for Transport (DfT) and the Department for Environment, Food and Rural Affairs (DEFRA) and their arms-length bodies. This excludes international or climate adaptation spending. It also excludes spending on programmes where decarbonisation is one of multiple objectives, and it is difficult to isolate the decarbonisation spend.

<sup>44</sup> There are eight environmental levies that are added to energy bills, but are not included in this tax-at-risk assessment, as they are fiscally neutral. This means they do not represent a fiscal risk because, once decarbonisation has been completed, all revenue and spending pressures are fully offset. The removal of the levies will, however, reduce the overall size of the public sector. The ONS treats these levies in three different ways in the public sector finances. Four environmental levies (Renewables Obligation,

2.43 As set out above, global decarbonisation is necessary for sustainable economies in the long run, and therefore for the health of the public finances. Nevertheless, the UK still needs to act to maintain public finances' sustainability as it achieves net zero. This is to ensure that government can continue to fund other public service priorities and respond to future economic shocks. The importance of maintaining fiscal space to be able to respond to shocks has been underscored during recent months by the response to the COVID-19 pandemic. This has led to a significant rise in public debt that is both necessary and affordable and supported by historically low borrowing costs.

2.44 The transition to net zero will coincide with a period during which the OBR expects greater pressure on the public finances due to demographic trends.<sup>45</sup> Given the risks facing tax receipts over the transition period, the government will need to make decisions over time and in light of economic conditions about whether or not to adjust taxes in order to maintain revenue in a low-carbon economy, or to balance any loss of tax revenue with reductions in spending. Carefully considering impacts such as these is crucial for ensuring sustainable public finances into the future.

---

Contracts for Difference, Capacity Markets and the Green Gas Levy) are included within the public sector finances, but for the Renewable Heat Incentive, only the spend aspect is included as annually managed expenditure. Three levy-obligations are not classified within the public sector but operate in a similar manner (Feed-in tariffs, Warm Home Discount and the Energy Company Obligation). The OBR discusses the classification of environmental levies in more detail in 'Restated March 2019 forecast', November 2019, paragraphs 1.20 to 1.22.

<sup>45</sup> 'Fiscal Sustainability Report', Office of Budget Responsibility (OBR), 2020.

# Chapter 3

## Estimating the costs of the transition

The transition to net zero requires new investment. Households, businesses and taxpayers will need to insulate homes and buildings, install low-carbon heating systems and replace internal combustion engine vehicles with low emission alternatives. These investments will lead to changes in households' and businesses' ongoing costs, particularly through their energy use.

The scale of the investment and changes to ongoing costs will vary from household to household and from business to business. The net impact will depend on the household's or business's current carbon exposure and their ability to change consumption patterns or business processes. It will also be affected by the timing of natural investment cycles, the rate at which technology costs fall, innovation and nationwide system-level decisions, such as the choice of energy mix over the next decade.

As a result, any cost estimate is highly complex, speculative and should be considered as a scenario based on assumptions rather than a projection. Nevertheless, such estimates can provide a sense of the scale of the challenge. To support its report on net zero last year, the Climate Change Committee (CCC) estimated that the transition would have a net cost of £50 billion across all economic sectors in 2050.<sup>1</sup> They have now updated this estimate to £16 billion.<sup>2</sup> This includes assumptions about changes to behaviour, falls in technology costs and efficiency gains, all of which are highly uncertain. These costs are partial and do not include the costs of policy interventions or broader supporting investment such as skills development, nor do the CCC cost estimates capture the wider economic effects, the fiscal impacts, the non-financial costs to households and businesses, or all the co-benefits of decarbonisation.

### What are the costs?

**3.1** The transition to net zero will require households and businesses to incur new costs. These costs are primarily capital expenditures, but also encompass changes to the long-term operating costs of the economy.

---

<sup>1</sup> 2018 prices.

<sup>2</sup> 2019 prices

**3.2** The size of these costs is difficult to estimate. Technological development can bring costs down, but the rate is hard to predict. Government policy can also affect how quickly new technology is adopted, as well as adding to the total cost directly through expenditures on administering and enforcing policies to support the transition.

**3.3** Nevertheless, some organisations have attempted to estimate the cost of achieving net zero in order to give a sense of the scale of the challenge. The Climate Change Committee (CCC) last year put the cost at £50 billion in 2050, considering only the investment required and the impact on the running costs of technologies.<sup>3</sup> Their latest publication updates this estimate to £16 billion, as a result of changes in their modelling assumptions and lower costs forecasts for some important technologies.<sup>4</sup> The potential benefits from the transition, described in Chapter 2, could offset these costs to some extent.

## The nature of the costs

**3.4** The transition to net zero will be capital-intensive. This new capital equipment will have different – and in many cases lower – running costs to the high-carbon equipment it replaces.

**3.5** The capital and running costs will vary between sectors and between households, businesses and taxpayers depending on market structures and government policy. The impact of some costs will be small where new low-carbon products are more attractive than the current equivalent and the cost of changing is low. Others will prove more difficult. Table 3.A shows the types of changes in business practices and consumption patterns, investments and ongoing running costs that will be required over the next 30 years in different sectors of the economy.

## Factors affecting the total cost

**3.6** The final size of the cost is difficult to predict. This is because many of the details of how the transition will evolve are unknown. They will be determined by business decisions, consumer choices, trends in innovation and government policies over a 30-year period.

## Natural investment cycles

**3.7** The investments required to meet net zero will often mean replacing existing machinery or equipment with lower-carbon equivalents. Timely policy interventions with adequate lead times for households and businesses, can reduce the additional outlay required, for example by allowing a gas boiler to be replaced with a low-carbon alternative at the end of its natural life rather than having to scrap the boiler early. This is discussed in greater detail in Chapters 2 and 5.

b Carbon capture, usage and storage

### Rate of innovation

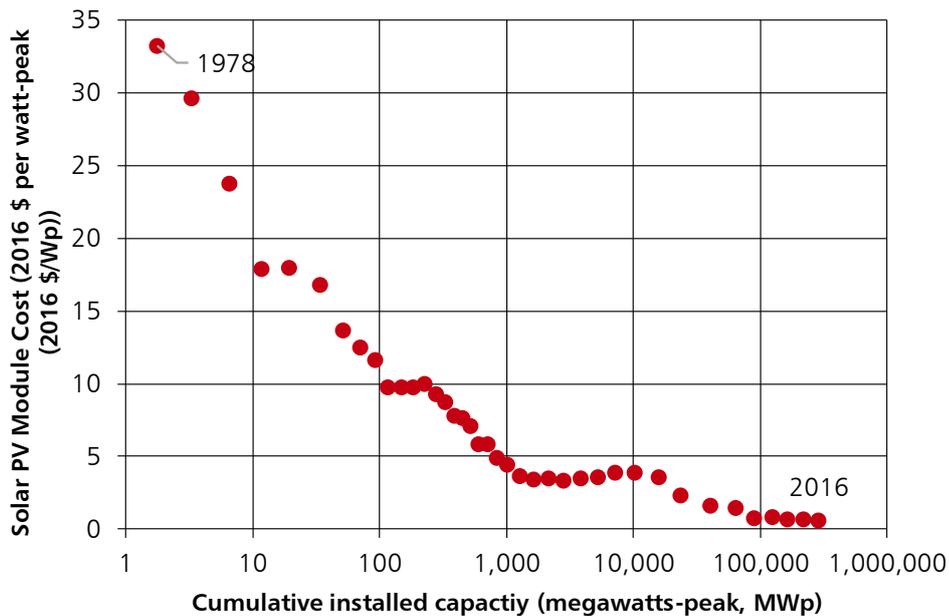

**3.8** The costs of new technologies tend to fall as they become more developed and are deployed more widely. Technology costs could be considerably lower in the 2030s and 2040s than in current forecasts, but the speed at which they will fall is unknown. Cost reductions can be driven by several factors including economies of

scale, research and development spillovers and the learning-by-doing process.<sup>5</sup> Box 3.A discusses how solar panel costs have fallen since their invention in 1954.

### Box 3.A: Innovation in solar energy has spurred global cost reductions

The cost of solar photovoltaic (PV) technology has fallen dramatically since it was invented in 1954. The cost of solar PV modules has fallen by 20-25% on average for each doubling of global solar PV capacity (Chart 3.A).<sup>6</sup>

#### Chart 3.A: Solar module cost and cumulative installed capacity

Source: Unit cost: 'How well do experience curves predict technological progress? A method for making distributional forecasts', F. Lafond, A.G. Bailey, J.D. Bakker, D. Rebois, R. Zadourian, P. McSharry & J.D. Farmer, March 2018; Cumulative capacity: Lanford et al. (2017) up to 2009 and International Renewable Energy Agency (IRENA) Global solar PV installed capacity and solar PV model price. Cited in Ritchie (2017) 'Renewable Energy'.

Innovation and scientific cooperation across the world have spurred these cost reductions.

First, the US government funded the commercial use of solar PV in 1956 in satellites.<sup>7</sup> Then, during the 1980s-90s, the Japanese government worked with Japanese corporations to find commercial uses for PV and created a rooftop subsidy scheme. This meant that by the mid-2000s Japan was producing roughly 50% of global PV modules.<sup>8</sup>

<sup>5</sup> 'Wright meets Markowitz: How standard portfolio theory changes when assets are technologies following experience curves', Journal of Economic Dynamics and Control, Volume 101, R. Way, F. Lafond, F. Lillo, V. Panchenko and J. D. Farmer, April 2019.

<sup>7</sup> Vanguard Satellite 1958, NASA 2017.

<sup>8</sup> 'How Solar Energy Became Cheap', G.F. Nemet, 2019.

In 2000, Germany introduced feed-in tariffs and prioritised grid access for renewables. This led to Germany accounting for over half of global installations of solar panels between 2004 and 2007.<sup>9</sup>

The rise in demand for PV as a result of policy in Germany transformed Chinese production. Between 2000 and 2007, the solar PV industry in China grew from just a few start-ups to being a world leader, with the success of a few pioneering companies encouraging more investors to move into the industry.<sup>10</sup>

Global installed capacity of solar PV rose from 808 MW to 570,000 MW between 2000 and 2019. Over a third of installed capacity in 2019 was in China,<sup>11</sup> which also manufactured approximately two-thirds of modules that year.<sup>12</sup>

Investment in solar PV is predicted to continue to rise, with a potential six-fold increase over the next decade. By 2050, installed capacity is predicted to be eighteen times higher than in 2018.<sup>13</sup>

The UK plays a role in research and development in the global solar supply chain, leading the development of next-generation PV technologies. Nippon Sheet Glass (NSG) and Oxford Photovoltaics (PV) are UK based companies leading the development of new technologies.<sup>14</sup>

**3.9** Forecasting falls in technology prices is difficult. Estimates can be conservative, thereby overstating the cost of achieving net zero.<sup>15</sup> Chart 3.B, for example, shows the difference between the predicted cost of onshore wind projects commissioned in a given year and actual levelised<sup>16</sup> cost of electricity for projects in the corresponding year.

**3.10** Underestimating falls in technology prices can also be seen at the economy-wide level. In 2008, the CCC estimated that the costs required to reduce carbon emissions by 80% by 2050 would be the equivalent of 1 to 2% of GDP in 2050. Technological progress in the subsequent decade meant that when the CCC gave their advice in 2019, they estimated that it would be possible to achieve the more

<sup>16</sup> Levelised costs is a measurement used to assess and compare alternative methods of energy production. It can be thought of as the average total cost of building and operating the asset per unit of total electricity generated over an assumed lifetime.

ambitious target of net zero emissions by 2050 for the same cost.<sup>17</sup> The latest CCC cost estimates show the cost could be lower than 1% of GDP.

**Chart 3.B: Projected onshore wind costs and average cost of past projects<sup>a</sup>**

Source: 'DECC Electricity Generation Costs', Department for Energy & Climate Change, 2012 and 2013; 'BEIS Electricity Generation Costs', Department for Business, Energy & Industrial Strategy, 2016; 'BEIS electricity generation cost report (2020)', BEIS, 2020; 'Renewable Power Generation Costs in 2018', IRENA, 2018; 'Historic LCOE', BNEF, 2020.

<sup>a</sup> The average, or 'levelised', cost of the lifetime of the plant per MWh of electricity generated.

**3.11** There may be limits to the falls in costs that could take place, and cost reductions may be limited to certain technologies. The learning-by-doing effect appears to be strongest with technologies that are built using highly repeatable activities, usually involving the manufacture of small unit pieces. For example, about 1 billion solar PV modules have been made globally since the invention of the product in 1954, allowing cumulative learning by doing to occur.<sup>18</sup>

**3.12** The effect is less visible for technologies where this does not apply. The cost of building nuclear power stations has not fallen in recent years as safety regulations in the sector have tightened in response to the 2011 Fukushima nuclear disaster.<sup>19</sup>

<sup>17</sup> 'Net Zero: The UK's contribution to stopping global warming', Climate Change Committee, 2019.

<sup>18</sup> 'Sunny Uplands: Alternative energy will no longer be alternative', The Economist, C. Stoescu, November 2012; BloombergNEF, 2020.

<sup>19</sup> 'High costs and renewables challenge the case for nuclear power', The Financial Times, Pfeifer, 2018.

**3.13** However, learning can, and does, occur for nuclear power station construction where nations are able to invest in fleet deployment, using the same design across multiple projects, as seen in the Republic of Korea and elsewhere.<sup>20</sup> There remains strong interest in developing new nuclear power plants as resource-poor countries seek to decarbonise their power systems. Therefore, while costs have not uniformly fallen as a result of the c. 500 nuclear power stations that have been built globally,<sup>21</sup> there is an understanding of the potential for learning in the future. This could be aided by international coordination and a degree of regulatory alignment. In the UK, the developer of Hinkley Point C is reporting evidence of a tangible learning benefit between reactors 1 and 2 with some milestones for reactor 2 being achieved with fewer man-hours of labour than were expended to reach equivalent milestones on reactor 1.<sup>22</sup>

**3.14** Nuclear project developers are also exploring ways to modularise construction where possible to mitigate delays caused by weather and therefore reduce overall project risk. Furthermore, pending global regulatory approval, small modular reactors (SMRs), could have the potential to go further by using repeat manufacture and on-site assembly techniques that accelerate learning and enable cost reductions. The Prime Minister announced in November 2020 up to £215 million from the Advanced Nuclear Fund would be made available for investment in this technology.

### **Pace of behavioural change**

**3.15** Changes in patterns of demand can also affect the cost of transitioning to net zero. This is especially true of difficult-to-decarbonise sectors like aviation and agriculture, where the abatement options needed for residual emissions will tend to be the most expensive. The pace at which behaviour change will take place is highly uncertain and may depend on societal changes and government policy.

### **Policy certainty**

**3.16** Certainty on policy direction is also a driver of costs for the private sector.<sup>23</sup> Uncertainty about how government policy will evolve across the transition can push up financing costs or deter investment entirely as the private sector awaits government decisions. This can increase costs if decisions are delayed sub-optimally.

**3.17** The beneficial effects of policy certainty can be seen through the greater fall in the cost of wind energy, which has had a more consistent policy direction, compared to nuclear energy. Chapter 5 discusses the role of signalling and stability in reducing uncertainty for economic actors.

### **System-level decisions**

**3.18** The transition to net zero includes a number of system-level decisions. These include decisions about the UK's overall approach to decarbonisation, infrastructure choices and the shape of the energy system. These decisions may affect the balance between investment and ongoing running costs.

---

<sup>20</sup> 'The ETI Nuclear Cost Drivers Project: Summary Report', Energy Technologies Institute, 2018.

<sup>21</sup> 'Sunny Uplands: Alternative energy will no longer be alternative', The Economist, C. Stoenescu, November 2012; BloombergNEF, 2020.

<sup>22</sup> 'Building on experience - the route to unit 2 (Hinkley Point C), EDF Energy, 2020.

<sup>23</sup> 'Cost of Energy Review: independent report', Professor Dieter Helm, October 2017.

**3.19** For example, decisions about the final roles of hydrogen and electricity in the future UK economy will affect how households and businesses heat their buildings, fuel use in industry and long-haul transport. This will have consequential impacts on investments required to reach net zero and operating costs. The viability of hydrogen in turn partly depends on whether Carbon Capture, Use and Storage (CCUS) can be deployed at scale to produce clean hydrogen on a cost-competitive basis. Demonstrations are underway, with at least one hydrogen-CCUS cluster expected to be operational by the mid-2020s.

**3.20** Another system-level decision is the scale of negative emission technologies in a net-zero UK. The CCC's net zero scenario included a significant role for greenhouse gas removals, including those yet to be developed and deployed, over the next 30 years to balance residual emissions from some of the most difficult to decarbonise sectors, such as industry, agriculture and aviation.<sup>24</sup> How quickly and cheaply negative emissions technologies develop will determine the degree to which those emissions can be offset or more expensive sectoral abatement options will be needed.

## **Cost estimates are still useful, despite the uncertainty**

**3.21** Despite the challenges set out above, cost estimates are still useful in understanding the scale of costs required to achieve net zero. The CCC, and other groups such as the Energy Systems Catapult, have produced estimates for a UK net zero target. The European Commission has also estimated total costs for an EU-wide net zero target in 2050. These estimates vary in their baselines, scope and assumptions about technologies and behavioural change.

**3.22** Choosing a particular baseline or counterfactual is challenging and has a large impact on the final cost estimate. Consumer behaviour and preferences are constantly shifting. For example, the current trend in plant-based diets will lead to lower costs for the transition, but the degree to which this trend continues, and whether it should be counted in the counterfactual scenario is a matter of judgement. Given the 30-year time period, assumptions could compound to produce large differences in cost estimates by the end of the forecast period.

**3.23** Further variability comes in the scope and measurement of the greenhouse gas emissions to be abated. UK estimates are based on international best practice accounting standards as set out by the Intergovernmental Panel on Climate Change (IPCC),<sup>25</sup> but the methodology is subject to review and revision. For example, the IPCC has recently re-classified the greenhouse gas effect of peatland degradation.<sup>26</sup> This has increased estimated UK greenhouse gas emissions from all peatland sources by between 17.2 and 21.7 MtCO<sub>2</sub>e in 2017. Emissions from degraded peatlands are not currently included in the UK's Greenhouse Gas Emissions Inventory. Once they are, this will increase the UK's total emissions by 3 to 4%.<sup>27</sup>

<sup>27</sup> 'Net Zero: The UK's contribution to stopping global warming', CCC, 2019; 'Implementation of an Emissions Inventory for UK Peatlands', Centre for Ecology and Hydrology – Natural Environment Research Council, C. Evans et al, December 2017.

## The Climate Change Committee's cost estimate

**3.24** In December 2020, the CCC published its advice on the Sixth Carbon Budget. In this analysis they provided new estimates of the cost of achieving net zero by 2050.<sup>28</sup>

**3.25** In their 2019 report, the CCC advised that the annual cost in the final year of the net zero transition would be £50 billion.<sup>29</sup> In their Carbon Budget 6 advice, published earlier this month, this figure has been revised down to £16 billion. The reduction is due to lower cost forecasts for some important technologies and a change in the scenario they have modelled; they have assumed greater behavioural change over the next 15 years and less reliance on greenhouse gas removals in the final years of the transition.<sup>30</sup> Table 3.B sets out how the CCC's estimate breaks down across sectors.

**3.26** In the CCC's net zero scenario, buildings is the most costly sector to decarbonise, at around £7 billion a year on average. These are mainly capital investments, with some operating cost savings. The high cost for buildings (over 50% of the total cost for all sectors) compares with a 17.8% share of direct emissions in 2018 (88 MtCO<sub>2</sub>e). These investments mean that buildings will have relatively limited residual emissions of 1 MtCO<sub>2</sub>e in 2050, around 0.2% of total 2018 emissions.

**3.27** Transport was the largest emitting sector in 2018, but the CCC's net zero scenario has a net cost saving from decarbonising the sector due to savings from using electric vehicles relative to internal combustion engines. Savings are largely driven by an assumption of falling battery costs, and by lower running costs compared to petrol and diesel vehicles. Other forecasters predict less rapid declines in costs and lower savings. Transport remains the highest emitting sector in 2050, but most residual emissions are from aviation. Those residual emissions increase the need for the development of negative emission technologies to remove greenhouse gases from the atmosphere, with an average annual net cost for these removals of £2.3 billion.

**3.28** Agriculture also remains challenging to decarbonise fully in the CCC's scenario. It maintains a large proportion of its 2018 emissions level and will require significant offsets according to the CCC.

---

<sup>28</sup> 'Sixth Carbon Budget – The path to Net Zero', CCC, 2020.

<sup>29</sup> Under the CCC's definition, costs are estimated by summing costs and cost savings from carbon abatement measures and comparing them to costs in an alternative scenario (a hypothetical world with no climate action or climate damages). For example, installing energy efficiency measures (e.g. loft insulations, cavity wall insulations) in homes has an upfront cost but reduces energy demand and emissions. There is an investment cost from installing the measures (e.g. labour costs, costs of building materials), followed by an ongoing stream of fuel and cost savings. The total cost of the measure will be the sum of its annualised costs and cost savings. This exercise is applied to all abatement measures in the economy to estimate total resource costs. See 'Net Zero: The UK's contribution to stopping global warming', CCC, 2019, p.227.

<sup>30</sup> 'Sixth Carbon Budget – Methodology Report', CCC, 2020.

**Table 3.B: CCC estimates of UK emissions and costs of decarbonisation by sector**

Sector	2050 residual emissions as a share of 2018 UK emissions (%)	Average annualised net cost (£bn) <sup>a</sup>	Average in-year operating cost (£bn)	Average in-year investment cost (£bn)	Peak in-year investment cost (£bn)	Peak year
Buildings	0.2	7.3	-2.7	11.7	19.0	2028
Industry	0.5	2.2	0.5	1.8	4.1	2036

a Annualised costs spread the investment costs over the lifetime of an asset and include the cost of finance. Therefore, the sum of in-year operating and investment costs do not equal the annualised net cost.

b This row contains electricity production and network costs. The majority of network costs are related to electricity, though a small part relates to carbon capture and storage networks used in industry, greenhouse gas removals and hydrogen production.

c CCC estimates of residual emissions and costs include international aviation and shipping. All costs in 2019 prices.

### Understanding the CCC's net cost estimate

**3.29** Forecasts over a 30-year horizon are highly uncertain. For this reason, the CCC has produced several scenarios for how the UK might reach net zero. Their main scenario includes a number of assumptions relating to technologies used, technological development rates, technological adoption rates and resulting efficiencies, and behavioural change. For example, the CCC analysis assumes a 20% reduction in beef, lamb and dairy consumption by 2030 and a reduction up to 17% of total car miles by 2050.

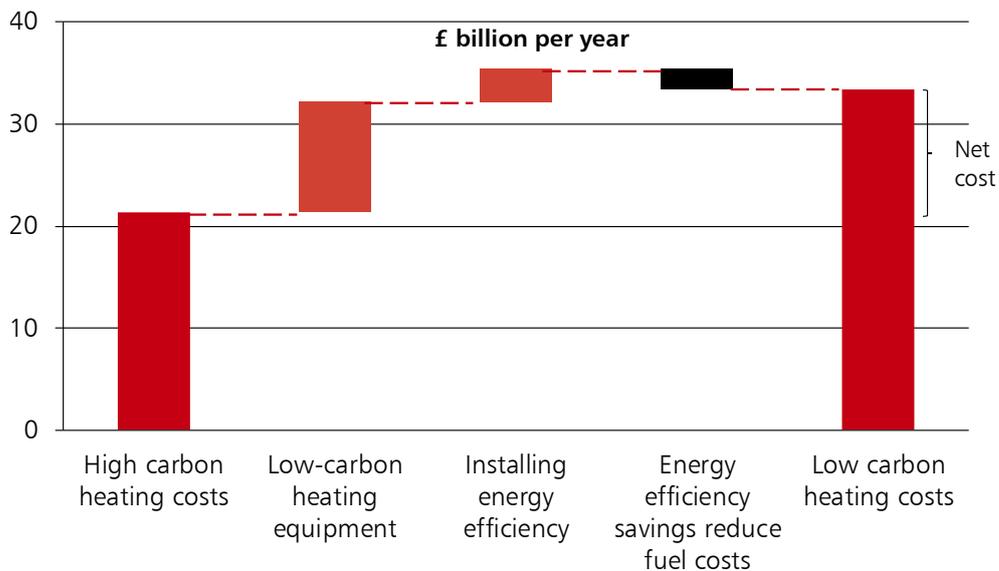

**3.30** On the basis of these assumptions, the CCC produced a 'net resource costs' estimate, which is the additional capital and operating costs required, offset by savings from efficiencies that may be realised. For example, if a household was to buy a new hydrogen boiler costing A, instead of a traditional boiler costing B, the

CCC would conclude that the net resource cost was A-B rather than A. The resource costs estimate also takes account of whether the running costs over the boiler's lifetime would be relatively higher or lower.

**3.31** The CCC's aggregate resource cost estimate is ultimately the net effect of a series of large costs outweighed by slightly smaller savings and varies significantly by sector. It is worth noting that, during the transition, operating cost changes mainly relate to energy consumption costs. In the CCC's net zero scenario, they estimate that there will be a 70% reduction in gas use and an 85% reduction in oil. These are replaced by low-carbon sources of energy such as renewable electricity, which in turn benefits from assumptions about efficiencies over time leading to lower cost electricity generation. This implies a significant operating cost saving for the economy as a whole and that the majority of the net cost relates to capital expenditure and the return on that capital.

**3.32** Chart 3.C illustrates the CCC's calculations for the heating sector. The first bar shows household spend of £21 billion on high-carbon sources of heating on average over the transition. The second and third bars show the additional capital cost of installing energy efficiency measures and low-carbon heating systems, such as heat pumps, which totals around £14 billion in additional costs. These costs may be borne by households, property owners or by the taxpayer, depending on policy choices. Installing energy efficiency measures has an upfront capital cost (e.g. costs of building materials, labour costs), but reduces operational costs as less energy is used to reach the same heat level. The fourth bar shows operating cost savings of around £2 billion in 2050 as a result of reduced energy usage. This leaves the position on the right, with net costs of around £12 billion.

**Chart 3.C: Impact of net-zero emissions scenario on household heating costs, 2020 to 2050**

Source: 'Sixth Carbon Budget – The path to Net Zero', CCC, 2020, Figure 6.5.

**3.33** Other technology options have both upfront capital costs and higher operating costs, like hydrogen heating for homes. For these technologies, costs will continue to be incurred after 2050. The final financial impact on households,

businesses and taxpayers depends on government policy choices, as well as the materialisation of costs and benefits from the rest of the transition.

### Limitations of the CCC's net cost estimate

**3.34** While the CCC's net cost estimate is a helpful guide, it remains a scenario based on assumptions.

**3.35** The CCC did not directly include all macroeconomic modelling of the wider effects of net zero on the economy in their cost estimate<sup>31</sup>. If decarbonisation causes the economy to grow at a slower (or faster) rate than it would have done, the compounding effect over several decades could lead to costs (or benefits) that may be significantly larger than the CCC's net cost estimate in 2050.

**3.36** The CCC's net cost estimates do not include the cost of designing, implementing and enforcing decarbonisation policies, nor the development of the supporting skills and knowledge to create, install and use low-carbon technologies. For example, the CCC assumes that there are no net costs associated with individuals choosing to walk and cycle rather than to drive. However, there will be costs (and benefits) to the individual as well as new costs to taxpayers from building new cycling infrastructure. If new skills are not acquired, such as those required for retrofitting buildings with energy efficiency measures, there will be supply-side constraints that will affect growth.

---

<sup>31</sup> Cambridge Econometrics provided the CCC with supporting research on the macroeconomic context of decarbonisation. See 'Economic impact of the sixth carbon budget', Cambridge Econometrics, 2020.

# Chapter 4

## Market failures and policy choices

One way to approach the problem of climate change and the transition to net zero is by considering market failures. In this framework, climate change is caused by market failures in the form of externalities and public goods. Those who emit greenhouse gases do not always pay for the damage their emissions cause, nor can they be excluded from enjoying the benefits of the climate. Compounding the problem are market failures that hold back the adoption of low-carbon technologies and practices, including inertia and lack of information.

In designing policies to support decarbonisation, the government will need to consider how best to address these market failures. Carbon pricing can be a good way to address the negative externality and realign incentives but will not be sufficient to achieve net zero by itself. Further measures will be needed to address the other market failures and to manage the distributional impacts of the transition and its effects on business competitiveness.

### Decarbonisation means addressing a variety of market failures

4.1 Addressing global warming involves overcoming a series of market failures. Perhaps the most significant of these is the negative externality driving climate change: those who emit greenhouse gases generally do not face the full costs of their actions, leading to increasing concentrations of greenhouse gases in the atmosphere.<sup>1</sup> However, the path to a net zero economy is further impeded by other market failures that may need to be addressed to support the process of decarbonisation.

4.2 There are three broad types of market failure:

- **static price failures** where market prices of goods and services do not reflect their full cost or benefit to society. A change in prices, and a resulting change in patterns of consumption and production, could make society as a whole better-off. These market failures include negative externalities, positive externalities, public goods and natural monopolies.

---

<sup>1</sup> 'The Economics of Climate Change: The Stern Review', Nicholas Stern, Cabinet Office – HM Treasury, 2006.

- **static non-price failures** where there are appropriate price incentives, but other constraints prevent a socially optimal outcome. This group of market failures includes static information failures, split-incentives, inertia or bounded rationality, property rights failures and liquidity constraints.
- **dynamic failures** where people make choices that appear to be economically sensible in the short-run but leave society worse off in the long-run. This is a particular feature of the development of new technologies. These market failures include uncertainty and multiple equilibria problems, relating both to coordination failures and technological development curves.

**4.3** Many sectors experience multiple market failures simultaneously. Even if a negative externality associated with greenhouse gas emissions is addressed, other market failures may need to be overcome to achieve net zero. For example, in the power sector, the primary market failure is the negative externality associated with the use of fossil fuels to generate electricity but there are also dynamic market failures associated with the development of new technologies, and liquidity constraints may hold back major infrastructure projects such as the construction of new nuclear power plants. Distortions in the power sector can also affect other sectors of the economy, potentially magnifying their impact. The Prime Minister’s Council for Science and Technology has advised on the importance of systems thinking in the government’s approach to decarbonisation. Annex B examines the types of market failure in more detail and considers how they apply in different sectors.

## **There are a variety of policy levers to address these various market failures**

**4.4** The government has a range of policy levers available to support the transition to net zero. The main policy levers can be broken down as follows:

- Levers that change the price of emitting greenhouse gases, including carbon pricing (through taxes or emissions trading schemes), subsidies and regulations, which affect prices by promoting or limiting certain activities;
- Facilitative levers that change market institutions – or the rules of the game – so that private actors are better able to decarbonise; and
- Broader public interventions, for example, through public spending or the design of regulatory frameworks to support the transition where the market will not.

**4.5** Some of the policy levers that drive decarbonisation are reserved to the UK government, but many are devolved to the Scottish and Welsh governments and Northern Ireland Executive. This means that, while this report considers the role of the UK government, some of the choices between policy levers will be for the devolved administrations, working in collaboration with the UK government.

**4.6** Some policy levers may be better suited to addressing particular types of market failure, but the most appropriate lever will also depend on issues of practicality and consideration of other government objectives. For example, in cases where it is not possible to measure or target emissions directly, policies may have to address the market failure indirectly, by targeting some proxy for emissions. Equally,

in cases where this is possible, it may be undesirable due to the impact certain businesses or groups of households. This means that there may be trade-offs between the efficiency and equity of decarbonisation policies. It may also be hard to fully identify the wider impacts of a policy at the outset. Markets will adjust in response to new incentives, and links between sectors may mean that policies can sometimes introduce new distortions or perverse incentives. This further complicates the decision-making.

## Emissions pricing

**4.7** Given its central role in driving climate change, addressing the negative externality associated with greenhouse gas emissions is likely to be an important part of any strategy to achieve net zero. One way of doing so is to attach a price to emissions. This creates an economic incentive for households and businesses to reduce their emissions. The government can create such a price through emissions taxes, ETS, subsidies or even regulation.

**4.8** Taxes, ETS and subsidies change the relative price of an activity but preserve the optionality for businesses and households to change their behaviour or pay the carbon price (or forgo the subsidy). This creates a market incentive for abatement and can encourage innovation. The IMF suggests that an economy-wide carbon price – implemented in the form of a carbon tax – could be more effective than other policy levers in mobilising capital investments.<sup>2</sup>

**4.9** Prohibitive regulations, in contrast to taxes, subsidies and trading schemes, compel households and businesses to change their behaviour. This gives the private sector less flexibility to innovate but provides more certainty that abatement will occur and can support the development of economies of scale.

**4.10** Each of these policy levers changes the cost of producing emissions, and to some extent they can be used interchangeably to achieve the same policy objectives (Box 4.A). However, different levers will have different distributional impacts and implications for competitiveness. Regulations impose costs on firms and households, but unlike taxes and subsidies, they do not result in a transfer of resources to or from government.

**4.11** The impacts of particular policies or packages of policies will depend on their detailed design, the behavioural response of households and businesses, and the characteristics of the market concerned, including the costs of abatement and the availability and affordability of alternative products. For example, where a market is competitive and trade-exposed, it is harder for firms to pass costs onto consumers, resulting in potentially bigger impacts through wages and profits. These effects will also evolve as technology develops and prices change over time. Chapters 6 and 7 discuss these issues in more detail.

**4.12** Finally, although emissions pricing is likely to be an important component of any policy package, it will not on its own be sufficient to achieve net zero given the presence of other non-price market failures which can act as a barrier to private investment.

---

<sup>2</sup>Fiscal Monitor: How to Mitigate Climate Change', International Monetary Fund (IMF), October 2019.

#### Box 4.A: Pricing carbon emissions

Taxes, ETS, subsidies and regulations are all important policy tools to support decarbonisation. However, they have different functions and distributional implications.

**Emissions taxes** can increase the cost of greenhouse gas emissions directly or implicitly through relative rates of indirect taxes on carbon-intensive and low-carbon products or services. Taxes can apply to emissions, particular inputs or outputs and can be sector-specific or more broadly applied. As well as creating an incentive to reduce emissions, emissions taxes can spur innovation and greener investments to reduce future tax liabilities. For example, if the tax system allows carbon offsetting, it could help drive innovation in negative emissions technologies.

In an **emissions trading scheme** (ETS) an emitter must buy a quantity of permits equivalent to the amount of greenhouse gases they emit. The number of permits is fixed, and the price is determined by the market for permits.

ETS and taxes are conceptually similar levers. Both provide price signals to drive behaviour change, granting the private sector substantial flexibility on how best to decarbonise, while raising revenue, directly or from the sale of the permits. However, their deployment and technical specification is different. While a tax fixes a price for emissions, an ETS fixes the quantity through a system-wide cap. This cap on emissions can then be reduced over time to provide confidence that the UK will mitigate its emissions to meet its net zero target and to provide an effective, responsive price signal to drive decarbonisation.

An alternative to increasing the price of emitting greenhouse gases is to decrease the price of carbon abatement through a subsidy or tax relief. **Subsidies** may be effective at supporting new markets to develop, helping to manage high initial costs for producers or stimulating demand to encourage supply chains to develop. They tend to be linked to specific actions rather than general abatement. This may limit the incentive for firms to innovate in non-subsidised technologies that could prove more effective. Unlike regulation or tax, it is not possible to compel action through subsidies, as they rely on economically rational responses and awareness of the government offer. Additional market failures, such as inertia, may therefore affect uptake.

A subsidy is more likely to be inefficient when there is uncertainty about the technological pathway, while a tax can encourage decarbonisation in a technology neutral way. Subsidies may be more effective, however, where households or firms do not have access to the money required to adopt lower-carbon technologies or there is a risk of carbon leakage.

**Regulations** can ban use of certain technologies, require adoption of others or impose standards for efficiency, packaging or the allowable level of emissions. The feasibility depends on the complexity of the regulation, the characteristics

of the regulatory base, the frequency of reform and the efficiency of the enforcement authority. The implied carbon price of a regulation is the cost of adhering to it.

Regulations can allow government to directly drive the pace of decarbonisation in certain sectors and set direction for innovation and technological development by providing certainty and creating a level playing field. This can drive large scale adoption and allow firms to generate economies of scale. Regulations can also help ensure decarbonisation where firms and households are not responding in the expected way to price signals. As with subsidies, there is a risk that the government does not choose the optimal technology and limits the scope for the private sector to innovate, although this is less of a risk with technology neutral standards.

## Indirect taxes

**4.13** As well as pricing the consumption of emissions directly, the tax system, including tariffs on imports, can be used to set additional incentives or disincentives. For example, the Company Car Tax is designed to make it more attractive for employers and employees to choose cars with the lowest carbon dioxide emissions.

**4.14** Indirect taxes can also target activities with emissions as a by-product. For example, Landfill Tax aims to divert waste away from landfill, one of the main sources of emissions from waste, to more environmentally friendly alternatives. Since 2000, Local Authority waste going to landfill in England has fallen by 87%, with an associated reduction in emissions.

## Facilitative levers

**4.15** Facilitative levers seek to change the structure of the market or the way people make decisions in order to make it easier for households and firms to choose low-carbon options. These levers can complement carbon pricing by addressing the other market failures that hold back the process of decarbonisation. This can lower the overall costs of the transition, change who pays and who is able to cover the necessary costs.

- **Leadership:** Government leadership in decarbonisation can range from political commitments to environmental requirements for government procurement decisions. Such interventions can provide direction and certainty for the private sector, supporting innovation, driving cost reductions and creating opportunities for firms that have already adopted low-carbon methods. It can also help nudge public attitudes towards greener behaviours by setting greener default options in public buildings, for example. UK leadership in multilateral fora, including through our COP26 and G7 Presidencies, can encourage international action to reduce emissions. Government coordination domestically and internationally can reduce the cost to the UK of reaching net zero by spreading the cost and risk associated with innovation, driving economies of scale and by helping to facilitate collaboration.

- **Awareness:** Measures to improve information about low-carbon choices can help drive consumer and producers towards alternative products. Examples include information and educational campaigns; government advice centres and online support services; and mandating improved labelling to help drive consumer and producer choices towards low-carbon alternatives. They usually come at low fiscal costs and can increase businesses' accountability to consumers for their emissions. However, they can come with high compliance costs for businesses.
- **Capability:** New skills, technologies and ideas will be needed to reach net zero. This may require training programmes, development of new financial products to facilitate the investment required for net zero, and support for innovation to help the development of green products. This latter is discussed further in Chapter 5.

## Direct public interventions

**4.16** Further government intervention can be required where carbon pricing and the facilitative levers described above cannot resolve all the market failures holding back the transition. This is particularly likely in the case of public goods and infrastructure or where new markets are needed for net zero. These interventions can include:

- **support for innovation** and the development of new technologies;
- **regulation of utilities** and other sectors with risks of monopoly power;
- support for **development of new markets**. For example, the government is providing support for electric vehicle charging infrastructure to help develop a viable private market; and
- **delivery of large capital investment and infrastructure**. As set out in the National Infrastructure Commission's National Infrastructure Assessment,<sup>3</sup> government can absorb risks by providing a proportion of the initial capital funding, crowding in private investment.

**4.17** There are various risks associated with government intervening in this way, principally that it will misallocate resources. Actively developing new markets through public spending or regulation runs the risk of locking in technology that turns out to be less cost effective in the long run. However, such interventions may be necessary to guarantee an adequate pace to meet the 2050 target. The distributional impacts of these policies depend on the users of the infrastructure or innovation supported and the opportunity-cost of public funds.

## Adjustments to existing policies

**4.18** Existing policies may not be aligned to net zero, as government must balance multiple priorities. Small changes to existing schemes can improve incentives for decarbonisation across the economy with lower policy costs, though potentially at the cost of making existing schemes more complicated or compromising other policy aims.

# Chapter 5

## Innovation and private finance

The majority of the technologies needed to meet net zero already exist, but many need further development to become cost competitive and be proven at scale. Developing and deploying these technologies requires investment, much of which will come from the private sector, but the uncertainties associated with novel technologies can make it difficult to raise finance. Government can help increase certainty and reduce the cost of capital but may also in some cases want to provide more direct support.

### Technological change will be an important factor in reaching net zero

**5.1** Many of the technologies required to meet net zero already exist, but it is not yet clear which will be the most appropriate or cost effective, or which will provide the biggest opportunities for economic growth. Several important technologies are not yet proven at scale or cost competitive. Further technological developments could also create cheaper, or more efficient, technologies than those that are currently available.

**5.2** This development process needs to happen rapidly. It can take many years for scientific discoveries to lead to the creation of a new product and even longer for the product to reach the point where it can be widely deployed. For example, as shown in Chart 5.A, it took over 50 years for solar photovoltaic (PV) technology to reach mass deployment following its invention. Any new technologies will need to be developed and deployed at a faster rate than solar PV if they are going to contribute to the UK reaching net zero by 2050.

**5.3** Such a transformation is possible. Advances in digital technology over the last 30 years illustrate the potential for innovation over a similar period. Net zero technology could make similarly rapid advances in the next 30 years, especially in an environment that supports innovation and investment.

**5.4** Government can play an important role in creating this environment and helping to accelerate the net zero transition. Policy certainty can increase the viability of private sector investment and speed up the deployment of net zero products. Government leadership can also help address dynamic market failures in the transition, particularly in guiding and creating new markets.

**5.5** As an early mover to decarbonisation, the UK is well-positioned to leverage innovation and generate export opportunities. Estimates suggest innovation

opportunities could drive £27 billion in Gross Value Added (GVA) through domestic economic activity and £26 billion through exports by 2050.<sup>1</sup> The largest export opportunities could be in road transport, carbon capture usage and storage (CCUS), smart systems and offshore wind,<sup>2</sup> with export opportunities for the UK at different stages of the supply chain. Box 5.A sets out in more detail some of the opportunities for innovation. Government policy and decisions on innovation could shape where these opportunities will occur over the next decade.

### Box 5.A: Innovation opportunities

**Offshore wind** has developed rapidly in the last decade and the UK has established itself as a world leader in its adoption. The large domestic market for offshore wind in the UK provides a strong platform for the UK to increase its share of the European and global market.

With innovation, the UK could gain first mover advantages in areas such as operations and maintenance (O&M) services and floating platforms. Analysis commissioned by BEIS estimates that by 2050 O&M and decommissioning services could become a £53 billion market. Offshore wind exports could support 21,000 jobs and £2.4 billion GVA per year,<sup>3</sup> including exports of specialised turbine parts to Europe worth over £0.4 billion per year.<sup>4</sup>

In recognition of these opportunities, the Prime Minister announced on 18 November 2020 the government's aim to quadruple the capacity of offshore wind in the UK to 40GW by 2030. The government has made available £160 million to upgrade ports and infrastructure in places like Teesside and the Humber in order to support the industry's growth, and advances in offshore wind such as these could support up to 60,000 jobs in 2030.

**Greenhouse gas removal technologies:** The CCC estimates that 58MtCO<sub>2</sub> per year will need to be captured and stored in 2050 by new greenhouse gas removal (GGR) technologies such as direct air capture and storage of CO<sub>2</sub> (DACCS).<sup>5</sup>

DACCS requires supporting infrastructure such as carbon capture, utilisation and storage (CCUS) which presents a potential growth and export opportunity for the UK. Analysis commissioned by BEIS estimates that the UK could capture £4.3 billion of GVA from exports by 2050 as the global CCUS market expands to an estimated 6,800 MtCO<sub>2</sub> captured annually.<sup>6</sup>

---

<sup>1</sup> 'Energy Innovation Needs Assessment: Overview Report, Department for Business Energy and Industrial Strategy (BEIS), 2019, p25. This analysis was carried out before the UK's net zero target was agreed and is therefore based on an 80% emissions reduction target by 2050.

<sup>2</sup> Ibid, p21.

<sup>3</sup> 'Energy Innovation Needs Assessment: Offshore Wind', BEIS, 2019, p7.

<sup>4</sup> Ibid, p50.

<sup>5</sup> 'The Sixth Carbon Budget: The UK's path to Net Zero', The Climate Change Committee (CCC), 2020.

<sup>6</sup> 'Energy Innovation Needs Assessment: Carbon capture, utilisation and storage', BEIS, 2019.

As these technologies are in the early stages of development the costs are high and the cost trajectory is unclear, but they have the potential to fall with a supportive policy environment. The government's £100 million GGR innovation fund will support research and development of these technologies, alongside the Prime Minister's announcement on 18 November 2020 of up to £1 billion of investment to support the establishment of CCUS in four industrial clusters in the UK and an ambition to capture 10 Mt of CO<sub>2</sub> a year by 2030.

## Innovation will require significant investment

**5.6** Significant investment will be required to reach net zero. Estimates suggest that in order to deploy renewables at the speed required, annual global investments in renewable energy would need to increase from approximately \$330bn in 2018 to close to \$740bn in 2030.<sup>7</sup> In the UK, this investment has already started, with more than £92 billion invested in clean energy since 2010.<sup>8</sup> The UK's world-leading financial, legal and technical advisory services sector is well-placed to support further investment, particularly as new technologies emerge and create further opportunities.

**5.7** The financial services sector is increasingly recognising the investment opportunities associated with the transition to net zero. In 2020, 38% of assets managed in the UK integrated environmental, social and government factors into their investment selection process, up from 26% in 2019.<sup>9</sup> In response to this growing investor demand, the UK government announced that it will issue its first Sovereign Green Bond in 2021, subject to market conditions, and its intention to issue a series of such bonds to build out a green yield curve in the future. These bonds will help finance projects that will address climate change, finance much-needed infrastructure investment and create green jobs across the economy. UK Sovereign Green Bonds will also provide a benchmark for the finance sector, which will help stimulate the UK's domestic green bond market.

**5.8** Risk aversion, overvaluation of carbon-intensive activity and a failure to take account of the environmental impacts can still hold back the flow of private finance into net zero investments. This is in part because there is currently no consensus on the definition of net zero-aligned investments, differing data standards and various methods for evaluating climate-related risks. The Green Finance and Clean Growth Strategies set out the government's approach to overcoming these problems, and an objective of COP26 will be to ensure that climate change is factored into every financial decision.

**5.9** When firms market and leverage finance that is said to be green, it is important that it is clear to everyone what that means and exactly why they define it in this way. To improve understanding of the impact of firms' activities and investments on the environment and support the transition to a sustainable economy the UK is implementing a green taxonomy – a common framework for determining which activities can be defined as environmentally sustainable. The clear

<sup>7</sup> '10 Years Progress to Action', International Renewable Energy Agency (IRENA), 2020.

<sup>8</sup> 'The good, the bad and the ugly in the UK's green finance crusade', Solar Power Portal, J. R. Martin, 2019.

<sup>9</sup> 'Investment management in the UK 2019-2020', The Investment Association Annual Survey, September 2020

and transparent disclosure of climate change risk and the impacts of economic activities on the environment can further help financial institutions, policy makers and consumers to consider these factors in their decision-making. Box 5.B. explores climate risk disclosures in more detail while the rest of this chapter considers risk aversion.

### **Box 5.B: Climate risk disclosure**

Accurate disclosure is crucial to ensuring that financial markets can appropriately price risk to support informed and efficient capital allocation. Climate change presents material financial risks and opportunities to the financial system and real economy, making climate-related financial disclosures particularly important for a smooth transition to a lower-carbon economy.

The Task Force on Climate-related Financial Disclosures (TCFD) was established by the Financial Stability Board in 2015 and published recommendations forming a framework for disclosing the financial risks and opportunities posed by climate change in 2017.

The UK government is highly supportive of the TCFD's framework and, in November 2020, announced its intention to make TCFD-aligned disclosures mandatory in the UK across the economy by 2025, with a significant portion of mandatory requirements in place by 2023.

Climate risk extends beyond national borders, and internationally agreed standards are needed to achieve consistent and comparable reporting. The UK government has also welcomed the International Financial Reporting Standards (IFRS) Foundation Trustees' consultation on a global approach to sustainability reporting.

## **Risk and uncertainty can push up the cost of capital**

**5.10** Investing in new technology always carries risk, but lack of certainty about the future path of government policy can exacerbate these risks in the context of net zero. This in turn can push up the cost of capital, requiring higher returns in order to justify the investment.

**5.11** These risks are particularly acute at the early stages of development, where technologies have not been proven or widely tested. As technology reaches commercial maturity, traditional investors may feel more confident about likely returns and the cost of capital should fall.

**5.12** The UK is also affected by how other countries approach decarbonisation. Many countries have now adopted legally binding targets or policy ambitions for net zero emissions or carbon neutrality, including France, New Zealand and China. As decarbonisation progresses across the world, there will be a global effort to innovate, spreading risk more widely and reducing the cost.

## The government can help to reduce uncertainty

**5.13** Clear government policy signalling, and stability in decision-making, can help reduce risk for investors. This can make it easier for the private sector to justify investment in emerging technology. This section looks at technology policy and how the government can provide signals about the timetable for reaching net zero and wider decarbonisation policy.

### Signalling technology policy under uncertainty

**5.14** Chapter 4 considered the government's role in addressing the market failures that are driving climate change and holding back the transition to net zero. How government approaches these policy decisions affects the returns that investors in emerging technologies might see.

**5.15** Government decisions about infrastructure and the UK's future energy system are particularly important for emerging technology investors. Government can help to increase certainty for investors by sending clear and timely signals about how and when it will take these decisions. This can help reduce the cost of capital.

**5.16** Table 5.A sets out one way of thinking about the different levels of uncertainty involved in the development of technologies for net zero:

- Level 1 describes a situation where technology has been proven to work, market institutions are well established and the technology is usually commercially viable, such as solar or wind energy.
- Level 2 uncertainty exists where there are a small number of known possible pathways, such as the choice between hydrogen or electricity for heating buildings. Hydrogen heating would require repurposing the existing gas grid to carry hydrogen instead of natural gas and deployment of hydrogen boilers, which are currently in only early stages of development and yet to be proven at scale. Using electricity would mean the rollout of heat pumps or heat networks, with a high capital cost.
- Level 3 applies to technologies whose use is more uncertain and which are not currently commercially viable. For example, greenhouse gas removal (GGRs) technologies that are still being developed. The degree to which GGRs will be used in 2050 to meet net zero depends on how quickly these technologies develop and how far costs fall.
- Level 4 describes technologies that have not yet been invented and therefore true ambiguity exists.

**Table 5.A: Technology and innovation uncertainty framework**

Level of technological uncertainty	Level of market uncertainty	Example	Implications
Level 1: Clear-enough future	Are commercially viable	Solar, wind, electrification of cars and vans.	Proven technologies with some uncertainty in costs  Decisions can be taken now
Level 2: Alternative futures	Not necessarily commercially viable, but successful pilots	Hydrogen v mass electrification	Technologies unproven at scale, or options between alternatives  Action needed to prove technical feasibility and enable cost reduction before decisions can be taken
Level 3: Range of futures	Not yet commercially viable	Some greenhouse gas removal technologies	Unproven technologies that could affect decarbonisation choices in other sectors over the next 30 years  Action needed to support innovation before investment decisions can be taken
Level 4: True ambiguity	Pure uncertainty of what the market would look like	New game-changing technology	Unknown unknown  Certainty needed to provide a basis on which economic actors may invest and develop technology

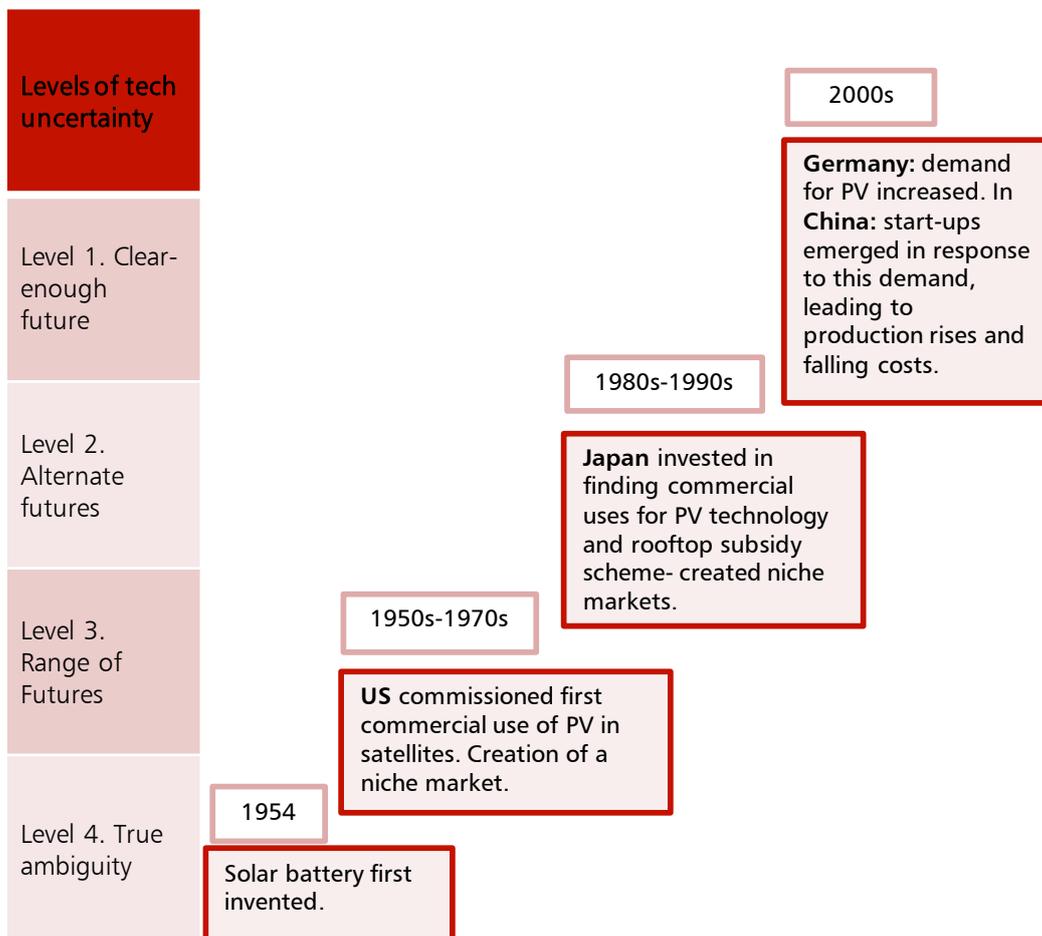

Source: 'Strategy Under Uncertainty', *Harvard Business Review*, H. Courtney, J. Kirkland, P. Viguerie, November-December, 1997.

**5.17** As technologies develop, certainty increases and they move away from level 4 towards level 1. Chart 5.A shows how the solar panels have moved through this process over the last 60 years.

**5.18** Grouping net zero technologies in this way and using this as an organising framework is one way for the government to explain its approach and provide information on how it will make future decisions. If used well, approaches such as these can help ensure signalling is consistent, transparent and timely, which in turn can help the private sector make investment decisions. This is consistent with the

general approach outlined in Technology Readiness Levels frameworks, which can be used in more specific, project-by-project innovation settings.<sup>10</sup>

**Chart 5.A: Solar's progression through uncertainty levels**

Source: 'How Solar Got Cheap', Nemet, 2019.

### Providing certainty over the timetable

**5.19** Government clarity on the pace and timetable for decarbonisation can also help businesses align their investment and planning decisions with the net zero target. This is particularly important given the rapid pace of change required compared to past energy transitions. However, identifying the appropriate moment to accelerate the transition and implement new technologies requires careful assessment and balancing of risk and opportunity.

**5.20** A transition that is left too late or is not sufficiently well communicated could see businesses continuing to invest in high-carbon technologies beyond when would be consistent with achieving net zero. This could lead to stranded assets as these technologies would have to be decommissioned before their natural end of life. It could also increase costs, as low-carbon technologies have to be deployed quickly near the end of the transition. This also increases delivery risk, as there may not always be sufficient numbers of people with the right skills to install the required equipment.

<sup>10</sup> 'Science and Technology Committee – Second Report: Technology and Innovation Centres', House of Commons, February 2011, Annex 1.

**5.21** Moving early may enable the UK to develop a first-mover advantage in important technologies, creating export and growth opportunities. On the other hand, deploying technology at an early stage, before there is sufficient learning-by-doing to bring costs down, may mean missing out on some of the benefits of falling costs and could lock in an inferior technology.

**5.22** The UK uses carbon budgets to set out the profile for its transition. These set legal limits on UK greenhouse gas emissions over 5-year periods and are set 12 years in advance in order to provide long-term guidance to investors. Stability in commitments has been highlighted as important for setting expectations of investors and supporting the effectiveness of decarbonisation efforts.<sup>11</sup> To achieve net zero by 2050, the government will need to consider how best to provide signals, in line with asset replacement cycles, to guide business decisions.

### **Stability in the regulatory and tax environment**

**5.23** A further way government can increase market confidence is through transparency and stability in energy network industry regulation and setting of wider decarbonisation policy.

**5.24** Stability in economic regulation of the electricity sector is a particularly important area given the importance of innovation in the power sector. The government is committed to the model of independent economic regulation, which supports the transparency and stability required to allow investment. The framework will continue to evolve to facilitate the investment required for net zero, and the National Infrastructure Commission's (NIC) 2019 report on regulation of the UK's energy, telecoms and water industries sets out how this might happen.<sup>12</sup> The government published its response to the NIC's recommendations alongside further detail on its plans to decarbonise the UK's infrastructure networks in the National Infrastructure Strategy.<sup>13</sup>

**5.25** How government sets medium to long term product regulation and creates tax certainty can also increase market confidence and provide stability for businesses to make investment decisions. Measures could include clear phase-out and phase-in dates for technologies, with long notice periods, and a clear regulatory framework for a market in negative emissions to support the commercialisation of these technologies. Some commentators indicate that medium-term certainty on carbon pricing and its trajectory, along with other tax policies further strengthen the policy signals for the private sector, helping to guide the timing of investment.<sup>14</sup> The final report will explore these issues further.

## **The government can manage and share risk**

**5.26** Greater certainty over sectoral and in some cases technology policy will provide investors with greater confidence at different stages of the innovation cycle, from research and development to deployment. However, this may not always be sufficient to overcome the barriers to private sector investment. In some limited

<sup>13</sup> 'National Infrastructure Strategy', HM Treasury, 25 November 2020.

<sup>14</sup> 'Innovation: Government's Many Roles in Fostering Innovation', Price Waterhouse Coopers, January 2010.

cases, the government may need to provide greater support. This will particularly be the case for new and innovative technologies, where returns are unclear, pushing up risk and therefore financing costs. This could make projects unviable in some cases. Government intervention to share risks can help make the remainder of the project viable for the private sector.

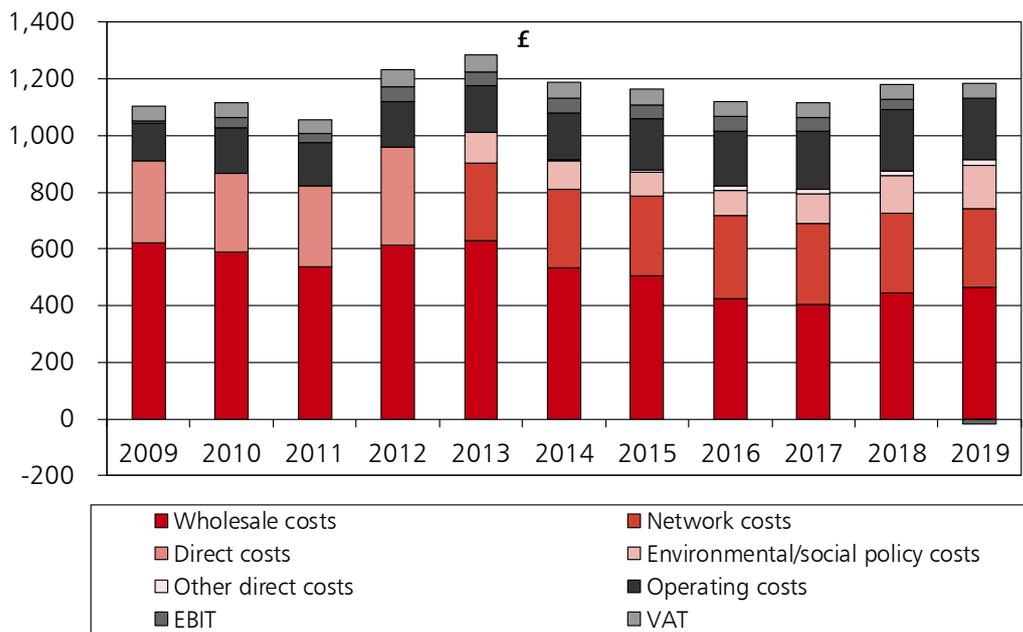

## Reducing revenue and financing risk

**5.27** One way the government can share risk is by guaranteeing loans. For example, the UK Guarantees Scheme (UKGS) supports private investment in nationally significant UK infrastructure projects. The UKGS works by offering a government-backed guarantee to help infrastructure projects access debt finance where they have been unable to raise finance in the financial markets. It has issued £1.8 billion of guarantees over 7 years (10 approved guarantees), averaging around £250 million per year since 2012 in benign market conditions.

**5.28** Government can also regulate to reduce the revenue risk for the private sector. This can be appropriate where the risk or high upfront costs associated with some projects cannot be financed by the private sector without intervention. Such interventions can help diversify risks and costs, both within and across generations. Two examples of this are the Contracts for Difference (CfD) schemes and the Regulated Asset Base (RAB) models, which create stable returns for investments through levies on consumer energy bills, as outlined in Box 5.C. A number of other social and environmental policies are also part-financed through electricity bills, including the Warm Home Discount to provide support to low income households and the Energy Company Obligation, which helps fund the installation of energy efficiency measures, particularly focused on fuel-poor households. Chart 5.B shows the changing make-up of a dual fuel (electricity and gas) bill.

**5.29** While the implementation of social and environment policies have placed additional costs on consumer bills, the overall domestic bill has fallen since 2013, largely due to improved energy efficiency and lower wholesale prices, while also ensuring security of supply. Over the long term the make-up of electricity bills is likely to continue to change, as the transition leads to an increasing proportion of renewables in the energy mix. These generally have higher up-front capital costs, but lower running costs than fossil fuel-based production. The next stages of the review will consider in more detail the implications of passing costs through energy bills; including distributional and behavioural implications.

**Chart 5.B: Domestic dual fuel energy bill breakdown**

Source: 'Large suppliers: Domestic dual fuel bill breakdown over time', Ofgem, 2020.

### Box 5.C: Business models for electricity decarbonisation

The UK has significantly decarbonised its electricity system, reducing emissions by over 50% since 2010.<sup>15</sup> Renewable electricity sources such as solar and wind generated 37% of the UK's electricity in 2019,<sup>16</sup> but these are relatively recent technologies, and volatile energy prices risked making private investment unviable when they remained unproven. The government has used two private finance models to overcome this.

#### Contracts for Difference

The Contracts for Difference (CfD) scheme has been the government's main mechanism for supporting low-carbon electricity generation. The scheme was introduced to protect developers of large-scale renewable projects from volatile market prices. Developers are paid a price agreed through a competitive auction for the electricity they produce over a 15-year period. By guaranteeing prices and providing revenue support for generators of renewable projects, CfDs aim to attract more affordable private finance into the sector. While this has not required any direct action from consumers, consumers have paid for the transition through their energy bills. When the agreed price exceeds the average market price, consumers pay the difference to the generator. The scheme is designed to keep total costs down for consumers. The Control for Low Carbon Levies (CLCL) sets the overall envelope

<sup>15</sup> 'Final UK greenhouse gas emissions national statistics: 1990 to 2018', Department for Business, Energy and Industrial Strategy (BEIS), 2020.

<sup>16</sup> 'UK Energy Statistics, 2019 & Q4 2019', BEIS, 2020.

for each auction, and CfD contracts do not require a difference payment to be made when electricity prices are negative for six consecutive hours or longer.

### **Regulated Asset Base**

The Regulated Asset Base (RAB) is a widely used economic regulation model typically applied for monopoly infrastructure assets such as water, gas and electricity networks. A company receives a licence from an independent economic regulator, which grants it the right to charge a regulated price to users through their bills in exchange for provision of the infrastructure in question. An independent regulator (such as Ofgem) sets the charge and holds the company to account to ensure expenditure is in the interests of consumers. The structure has facilitated significant investment from the private sector over the last 20-30 years, lowering the cost of services and increasing quality for customers.

Supporting private investment through these models has been successful in securing private finance and bringing down overall costs very rapidly. The price of offshore wind projects has fallen from £114.39/MWh in the 2015 CfD<sup>17</sup> auction to just £39.65/MWh in last year's auction (in 2012 prices).<sup>18</sup> However, in some countries financing the costs through energy bills has been highly regressive, as lower income households spend a higher proportion of their incomes on energy.

## **Direct support for early stage innovation efforts**

**5.30** Where uncertainty is at its highest and it is not possible to accurately assess risk, government action to reduce financing and revenue risk may still be insufficient to secure private investment. The government may need to support innovation directly, for example by funding research and development or by taking some of the equity risk directly onto the government's balance sheet. For early-stage technologies, particularly in the research and development stage, the government can provide capital funding to help the project get off the ground where financing constraints may be a barrier.

**5.31** This direct support can help overcome the initial risks, make the project more commercially viable and help to crowd in private investment. The European Investment Bank and UK Green Investment Bank acted in this role for offshore wind projects like the Galloper wind farm. The framework outlined in Table 5.A can be used as a tool by government to consider possible gaps in the innovation ecosystem which may require direct support.

However, government may not always be best placed to identify potentially successful projects. Careful governance around such schemes are required in order to maintain credibility of decision-making.

## Chapter 6

# International competitiveness and net zero

The transition to net zero will involve significant structural change in the UK economy. Sectors will be affected in different ways, depending on the cost of abatement and their exposure to international markets. Where trading partners do not pursue similar policies, some activities could become less competitive. Some businesses might choose to move to jurisdictions with less stringent climate change mitigation policies.

Evidence of carbon leakage to date is inconclusive, but as the UK adopts more ambitious initiatives to reduce its emissions, the risk of carbon leakage could increase without sufficient international and domestic mitigating action. Any action on competitiveness and carbon leakage risks needs to be balanced with the efficiency of policy at driving climate mitigation and that policy's distributional implications and feasibility.

## Climate policy can affect international competitiveness

**6.1** The competitiveness of any sector, and the economy more broadly, depends on a wide range of factors including: the ability of the labour market to match people and jobs effectively; the level of skills in the workforce; accumulation of capital; market size and openness to trade; access to finance; the quality of physical and technological infrastructure; and the effectiveness of the regulatory, public and legal institutions at creating a stable operating environment.

**6.2** Climate change mitigation policies could also affect a sector's competitiveness, for example by placing additional costs on certain activities through regulation. Even countries that have climate policies of a similar level of overall ambition might use different approaches to suit their local circumstances. This means that the profile of climate change mitigation policies and the requirements on different sectors at any given time will differ between countries, with potential implications for competitiveness.<sup>1</sup>

---

<sup>1</sup> For the purposes of this review, we define competitiveness as, "the capacity and ability of a firm or sector to gain and maintain a profitable, sustainable market share relative to rivals in domestic and international markets." This firm or sector-specific definition of competitiveness is useful as it recognises the dynamics of competitiveness over time and defines it in terms of outcomes and follows 'UK Business Competitiveness and the Role of Carbon Pricing: An assessment of the determinants of business competitiveness and the role of carbon pricing policy in the UK', Department for Business, Energy and Industrial Strategy (BEIS), April 2020.

6.3 Nevertheless, climate policy is just one factor in determining business competitiveness, and it is challenging to assess whether and how far competitiveness might be affected as a result of climate policies alone. Different countries' economies have different structures and are constantly changing, with new companies and sectors emerging and others declining. Production can shift from one jurisdiction to another for a wide range of reasons. Disentangling these effects from the impact of differences in climate policies can be difficult.

## Losses in competitiveness can result in carbon leakage

6.4 Loss of competitiveness caused by climate mitigation policies can result in carbon leakage. This occurs when policies designed to reduce emissions in a given country affect the competitiveness of its businesses relative to international competitors that are subject to weaker climate change mitigation policies. This can undermine the effectiveness of mitigation policy if, for example, production moves to a country with a more carbon intensive energy because the net effect may be higher global emissions overall. There could also be economic costs for the country from which production moves including a loss of employment in affected sectors.<sup>2</sup>

## Channels

6.5 There are three main channels by which leakage can occur.<sup>3</sup> The first and second are the focus of this chapter:

- In the short run, competitiveness falls because businesses in the jurisdiction with more ambitious emission reduction policies face higher costs. These costs cannot be passed on entirely to consumers without a loss in demand causing a drop in output, either because of lower sales in the domestic market, or lower exports;
- Over the medium to long run, differences in the strength of emissions reduction policies could influence investment decisions, resulting in a shift in production to other jurisdictions relative to what would otherwise have been the case;
- A reduction in demand for fossil fuels due to mitigation policies in some countries could reduce international fossil fuel prices relative to where they would otherwise have been without those policies. This could incentivise businesses in other countries to increase their consumption of fossil fuels.

## Establishing carbon leakage

6.6 A loss of competitiveness from climate policy only results in carbon leakage if the following three conditions are met:

- Carbon mitigation policies, such as the carbon price or regulations, are not similar across countries;
- Emissions shift to a region with lower-carbon mitigation obligations. Carbon leakage occurs if emissions, along with production and

---

<sup>2</sup> 'Carbon Leakage: Theory, Evidence and Policy Design', World Bank Group, October 2015.

<sup>3</sup> 'Business competitiveness in industrial sectors and the role of carbon pricing policy in the UK', BEIS, 2020.

employment, decrease in the region covered by mitigation policies and increase in the region with less stringent policy. For example, carbon leakage has not occurred if carbon pricing reduces a sector's output because its goods become more expensive, but the production is not replaced by international firms;

- Production shifts to a firm with higher emissions intensity. If production moves to a firm with lower emissions intensity and global emissions decrease as a result, it is not carbon leakage.

**6.7** Although trade can provide a conduit for carbon leakage, it plays an important positive economic role. Trade is central to developing and sustaining livelihoods in the UK and across the world, including in poorer countries, encouraging production where it is most efficient, giving consumers choice and lower prices.

**6.8** Shifts in trade patterns can be misconstrued as carbon leakage if not properly considered in context. For example, trade flows may be affected by short-term shocks. Under such circumstances, it is important that supply chains are as responsive as possible, whether the shock is an unexpected spike in demand for personal protective equipment as seen this year, or a hit to supply, for example, the impact of a drought on domestic cereal production, reducing exports or necessitating increased imports. Agricultural trade is particularly important for channelling food from areas of surplus supply to food-deficit countries. These food security benefits of trade are likely to grow as climate change generates increasingly frequent and significant supply shocks.<sup>4</sup>

**6.9** At the same time, international trade can exacerbate pressures on insufficiently protected areas that are critically important from an environmental perspective because of their roles as carbon sinks and biodiverse habitats. This is particularly true for agricultural trade. Apart from increasing the level of regulatory protection and enforcement for such sensitive areas, pressure on these areas can also be reduced through improvements in agricultural productivity internationally and changes in patterns of global aggregate demand, as illustrated by Box 6.A.

### **Box 6.A: Agriculture**

Aggregate global agricultural demand and its rate of growth affect the degree to which global production is incentivised to expand. Any such expansion is generally achieved by a combination of an intensification of production on existing agricultural land and bringing new land into production. Both are associated with increased emissions and impacts on biodiversity, whether due to increased applications of fertilisers associated with emissions of nitrous oxide (a potent greenhouse gas) or because of deforestation or other forms of land use change that turn important carbon sinks into sources of emissions.

---

<sup>4</sup> A further point relates to the multiple uses to which agricultural land can be put, which can complicate assessments of carbon leakage. For example, changing production patterns may see a contraction in output in one arable crop, but also the expansion in the production of other crops. This raises a question about how those different impacts are traded-off in any assessment of carbon leakage.

As a result, emissions per unit of production at the margin may be substantially higher than the average.

This means that whether and how fast international demand for agricultural products expands, especially if it is quicker than the rate of global agricultural productivity growth on existing farmland, will affect the incentives for agricultural practices (such as land use change) that disproportionately affect the emissions intensity of agricultural production. This puts a premium on improving the rate of agricultural productivity growth on land that is already farmed. This can be achieved in part through technological developments and investment in human capital, but also by ensuring that agricultural land and credit markets function well, so that land is farmed and managed by those best placed to make most effective use of available land. Modest changes in consumption patterns internationally can also, in principle, yield disproportionately beneficial results.

For example, OECD modelling considers a scenario whereby a productivity improvement of 10% by 2030 is achieved globally across all agricultural production.<sup>5</sup> The benefits of such productivity improvements are partly offset because improvements in productivity increase output and reduce prices, stimulating increased consumption relative to the baseline. The overall result is a net reduction in direct global agricultural emissions of 340 MtCO<sub>2</sub>e in 2030.<sup>6</sup>

The same OECD modelling also considers a scenario whereby the global average per capita consumption internationally of ruminant products (specifically beef, sheep meat, butter, cheese, fresh milk and milk powders) gradually reduces so that in 2030 it is 10% lower than 2017 levels. The scenario also assumes that the consumption of non-ruminant products increases by the same proportion, with per capita consumption of calories left unchanged. Under this scenario, international direct greenhouse gas emission savings from agriculture (not counting any savings from avoided land use change) amount to 0.9 GtCO<sub>2</sub>e per year in 2030.

## The risks of carbon leakage vary by sector

**6.10** Some businesses could lose competitiveness as costs associated with the need to decarbonise in their sectors increase. Others could gain as new opportunities emerge to sell low-carbon products in the UK and internationally. The precise impact on businesses will be influenced by the extent to which policy is used to mitigate competitive impacts and enhance opportunities. This means that the net impact on UK businesses of transitioning to net zero is unclear.

---

<sup>5</sup> 'Enhancing Climate Change Mitigation through Agriculture', Organisation for Economic Cooperation and Development (OECD), 2019.

<sup>6</sup> Over the period 2007-2016, agriculture directly resulted in approximately 12% of global anthropogenic GHG emissions (6.2 +/- 1.4 GtCO<sub>2</sub>eq) as well as a further 9% of GHG emissions globally each year (4.9 +/- 2.5 GtCO<sub>2</sub>eq). *ibid*.

## Some sectors will be less exposed

**6.11** In some sectors, the transition to net zero should have limited to negligible impacts on competitiveness, irrespective of the level of mitigation ambition overseas. This could be because the transition imposes limited obligations on those sectors. For example, wages make up the vast majority of costs in the business services sector and are not affected directly by mitigation requirements.

**6.12** Sectors that face high trade costs, or where additional costs for domestic producers can be passed through to consumers, will be less vulnerable to competitiveness effects than sectors that are subject to various trade pressures. For example, only 3% of cement produced globally is traded, largely between close neighbours, as its low value to weight ratio makes it uneconomic to transport large distances.<sup>7</sup> In most cases, mitigation costs affecting the cement industry as a whole are likely to be passed on to consumers of construction.

**6.13** Finally, sectors where international competitors face similar obligations to reduce emissions, or where increased costs due to mitigation are either low or temporary, could also expect little or no change in business competitiveness.

## Highly traded emissions-intensive goods

**6.14** As the UK moves to net zero, producers of emissions-intensive goods may face higher mitigation costs and therefore experience a loss of competitiveness if they are exposed to competition from foreign firms in domestic and international markets. Examples might include the metallurgical and mineralogical sectors.

**6.15** In these sectors, climate change mitigation policies could increase unit costs of production. In the short run, this will affect UK businesses' competitiveness negatively if these businesses' trading partners do not experience similar pressures.<sup>8</sup> The size of the impact will depend on the cost of the policy to the business relative to the size of the competitiveness advantages.

**6.16** Equally, policies that have an initial negative impact on competitiveness could spur innovation, increase productivity and create demand for low-carbon products. Where the UK moves first, this could create opportunities for UK businesses who are early adopters of low-carbon practices or who develop low-carbon technologies. The companies would need to be strong enough to withstand short-run pressures in order to see the medium to long-run benefits.

## Mitigating options

**6.17** There is limited evidence that climate change policies have caused significant carbon leakage to date, or whether, and to what extent, carbon pricing is associated with a loss of competitiveness.<sup>9</sup> This lack of evidence may be explained by, for example, subsidies that have mitigated any competitiveness impact that could have arisen from full exposure to carbon pricing.

**6.18** Historically, the UK's approach to addressing carbon leakage and competitiveness concerns has been to pay compensation to energy-intensive sectors

---

<sup>7</sup> HM Treasury calculations based on UN COMTRADE and the US Geological Survey.

<sup>8</sup> 'Carbon leakage prospects under phase III of the EU ETS', Vivid Economics, June 2014.

<sup>9</sup> 'Competitiveness impacts of carbon policies on UK energy-intensive industrial sectors to 2030', Climate Change Committee (CCC), April 2017.

for the pass-through costs of the EU Emissions Trading System (EU ETS) and Carbon Price Support and to shield trade-exposed industries from the carbon price under the EU ETS through free allowances. This approach has targeted sectors most at risk of carbon leakage and limited the difference in carbon pricing levels internationally. Some sectors, such as domestic agriculture, have not been the subject of emission mitigation obligations to date.

**6.19** The government is committed to using its role hosting the UN Climate Change Conference and presidency of the G7 next year to catalyse ambitious global action to tackle climate change. The government is also providing targeted support to help key sectors transition. For example, the £315 million Industrial Energy Transformation Fund will help energy intensive industries invest in energy efficiency and decarbonisation measures. In addition, the £1 billion Carbon Capture and Storage Infrastructure Fund and the £240 million Net Zero Hydrogen Fund will play a key role in building shared infrastructure that will help key sectors to decarbonise. Next year, the government will set out details on the revenue mechanism to encourage private sector capital into these new technologies.

**6.20** The transition to net zero will require more ambitious climate policy. Whilst this creates a higher risk of carbon leakage, potential options for mitigating these risks include:

- **Climate diplomacy:** Sharing the burden of mitigating global emissions in a balanced way would reduce the risks of carbon leakage significantly. Furthermore, ongoing international climate diplomacy and efforts to secure collective action to reduce global emissions have a really important role in addressing carbon leakage.
- **Prioritisation across sectors:** Frontloading climate change mitigation policies in sectors at least risk of carbon leakage could help emission intensive sectors to adjust gradually over the next 30 years. However, businesses making new long-term investments would still need to take account of the future impact of the transition. Continuing to invest in carbon-intensive technology risks firms being left with stranded assets later in the transition.
- **Prioritisation within sectors:** Within emissions intensive sectors, even where they are trade exposed, acting quickly on mitigation is most sensible where the scope for carbon leakage is lowest relative to the potential for climate mitigation.
- **Improving productivity:** Policies to boost the competitiveness of tradable sectors in a sustainable way. If businesses improve their productivity, this will make them more resilient to potential competitiveness impacts and carbon leakage. More productive businesses are also likely to have lower emissions per unit of output than less productive businesses.
- **Subsidies and revenue recycling:** Building on the targeted support government has already provided, further use of subsidies (or revenue recycling) may help mitigate the risks of carbon leakage even as domestic policy initiatives force a process of domestic emission mitigation.
- **Treatment of imports:** Strong economic arguments can be made for treating imports in ways that seek to compensate for the competitiveness impacts of any asymmetry in domestic and internationally emissions

mitigation policies. There are a number of material practical issues that would need to be carefully considered, such as measurement difficulties, substitution and displacement effects, and the implications of international trade rules.

**6.21** Technological innovations that enable emissions mitigation at reduced cost will also reduce the risk of carbon leakage. In addition, changes in domestic consumption of tradable emissions-heavy products could enable climate change mitigation without increasing the risk of carbon leakage.

# Chapter 7

## Households and net zero

Structural changes during the transition to a net zero economy will have implications for households. They will be affected directly through the goods and services they buy, and indirectly through the impacts on the wages they earn and the value of the assets they hold. Higher-income households consume more carbon in absolute terms, but lower-income households tend to have more carbon embedded in their consumption relative to their income.

The analysis of exposures to the transition presented in this chapter does not seek to calculate the impact of the transition on any particular group. The transition is a dynamic process that will take place over several decades, and its impact on individual households will ultimately depend on a range of factors including: the development of new low-carbon sectors in the UK; the pace of transition and policy levers chosen; the price of low-carbon alternatives to households and businesses' current activities; and the dynamism of the labour and capital market. Nevertheless, the analysis does underline the importance of managing the transition in a way that minimises the risks of adverse impacts for certain groups.

### **The transition will bring costs and benefits to households across the UK over the next 30 years**

**7.1** The structural changes involved in the transition to net zero will have implications for households. New investment will create new economic opportunities, and the relative price of low-carbon goods and energy should fall. However, there will also be costs including new investment, and relative price increases for some higher-carbon goods. All households will be affected by these changes, though some will be affected more than others.

**7.2** The transition will be a dynamic process and one that will take place over 30 years. It is therefore very difficult to predict the impact of the transition on any particular household. However, analysis of exposures can give a sense of the scale of change faced by certain groups and help the government design policy to improve the affordability of low-carbon alternatives and to support green job creation. The Energy White Paper sets out a £6.7 billion package to save families in old inefficient homes up to £400, and the government's Ten Point Plan will mobilise £12 billion of

government investment to create and support up to 250,000 green jobs and spur over three times as much private sector investment by 2030.<sup>1</sup>

**7.3** The transition will also have intergenerational impacts, which will depend on the precise timing of the costs and benefits of the transition. For example, energy efficiency improvements have an upfront cost, but lead to lower ongoing running costs. Other technology choices, such as direct air carbon capture and storage or switches to more expensive, but clean, fuels may have a more enduring impact on costs. Policy design and financing mechanisms, both public and private, can affect the profile of costs and benefits, as well as their distribution across the population.

## **Different groups within the current population have different degrees of exposures to the coming changes**

**7.4** Within the current UK population, different groups will have different degrees of exposure to the transition. Considering the impact of the transition on these groups will be an important factor in determining how best to design policies to support the transition. The analysis in this chapter considers these exposures. It does not take account of the potential benefits to households from decarbonisation discussed in Chapter 2; these also need to be considered in policy design.

**7.5** Beyond taxation and public spending that directly apply to households, the transition to net zero will affect households directly through the goods and services they buy and indirectly through the costs on businesses discussed in the preceding chapter. This chapter focuses on:

- **Consumer prices:** Carbon is emitted in the production of products that households consume, both directly in the consumption of energy and fuel, and indirectly through embodied carbon in the supply chain. Regulation, taxation or abatement activity may increase the prices of these products. At the same time, lower costs in other areas will make some goods more affordable.
- **Labour market:** Individuals work at firms that emit carbon in their production processes. To the extent that decarbonisation reduces worker productivity, it may cause real wages and labour market opportunities in these firms to decline over time. On the other hand, the transition will also create new economic and employment opportunities as new sectors emerge, as set out in Chapter 2.

**7.6** A further channel through which the transition could affect households is business profits. Where businesses become less profitable, this will pass through to the households that own them. The transition will spur a reallocation of capital across the economy. New, low-carbon sectors will be new sources of profit. These profits pass through to households through dividends and through the value of their assets. This interim report does not include analysis of this channel. These channels are complex, and the final costs may pass through to households through all three channels.

---

<sup>1</sup> 'The Ten Point Plan for a Green Industrial Revolution', HM Government, November 2020; 'Energy White Paper: Power our Net Zero Future', HM Government, December 2020.

## Household carbon consumption

**7.7** This section explores UK households' exposure to increases in consumer prices driven by decarbonisation by estimating the carbon footprints of households' consumption in the present day. The analysis does not show the actual impact on households: as prices change, households' consumption patterns will also change, and policy choices will affect how costs are passed through. The final impact will also depend on the distribution of the benefits of decarbonisation, the cost of the alternative low-carbon products and the extent to which costs are passed through via consumer prices as opposed to wages or profits.

### Box 7.A: Estimating households' carbon footprint methodology

The analysis combines spending data from the Living Costs and Food (LCF) survey<sup>2</sup> and Department for Environment, Food & Rural Affairs (Defra)'s Carbon Footprint data.<sup>3</sup> The Defra Carbon Footprint data trace emissions for goods and services through from source to final consumption goods. LCF data on the consumption of these goods is used to allocate this carbon to households (assuming constant CO<sub>2</sub>e per pound within each consumption category).<sup>4</sup> This then allows us to estimate households' carbon footprint and show this by income decile and other characteristics. This can begin to tell us how different households could be affected from the costs of reducing emissions. However, this is just an average and a variety of factors could mean certain households are more or less exposed.<sup>5</sup>

**7.8** Chart 7.A shows the estimated carbon footprint by household income decile. On average, households in the top income decile consume around 20 tCO<sub>2</sub>e per year, while the lowest income decile consume almost 9 tCO<sub>2</sub>e per year. Housing and utilities make up the largest proportion of all households' carbon footprints, but for lower-income households this makes up more than half of their carbon footprint. Transport carbon emissions, on the other hand, are disproportionately emitted by higher-income households. These footprints are on an average basis, so there is likely to be some significant variation within each group due to factors such as housing energy efficiency, employment status and family size.

**7.9** Although the highest-income households emit more than two times as much carbon as the lowest-income households, they have incomes that are more than eight times greater on average. This largely reflects a higher saving rate among higher-income households, reducing their total consumption relative to their income. It also reflects the fact that carbon intensive consumption of, for example, energy and heating makes up a higher proportion of lower-income households'

<sup>2</sup> 'Living Costs and Food Survey', Office of National Statistics (ONS), 2014/15-2016-17 - data is presented in the fiscal year 2020-21.

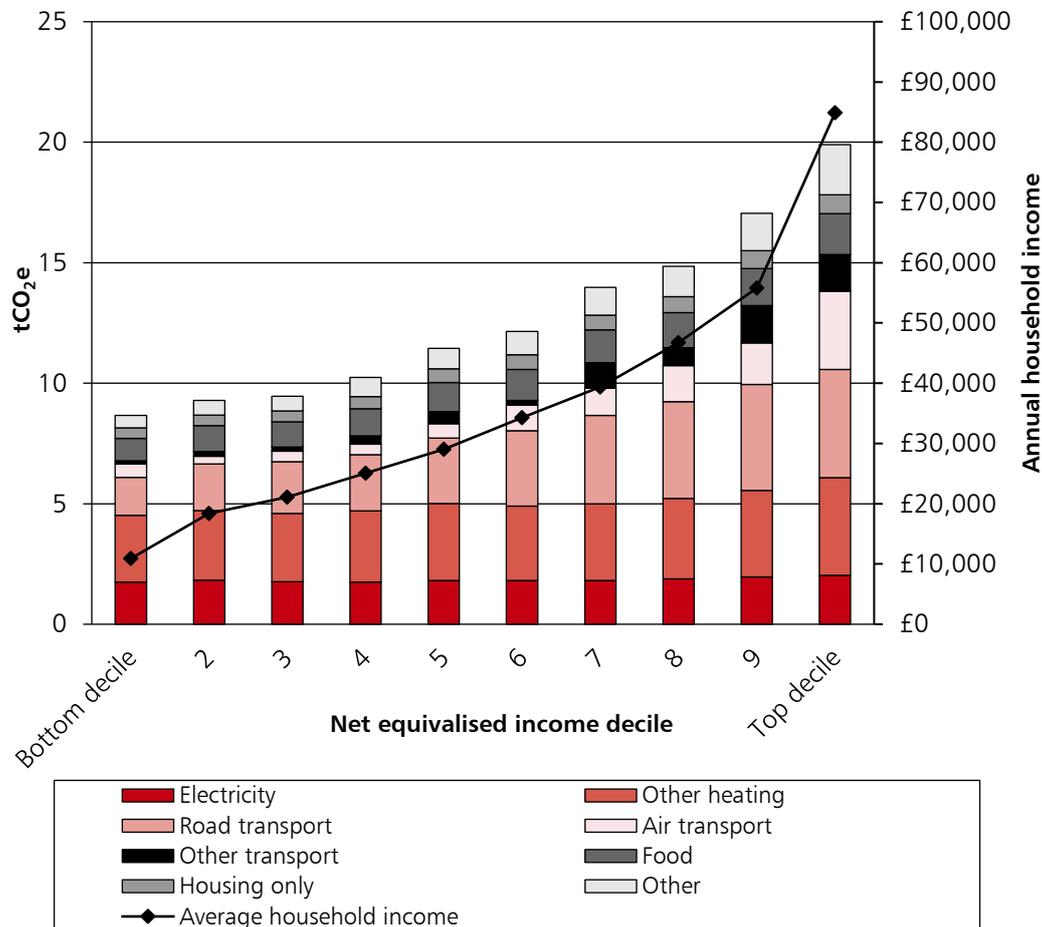

<sup>3</sup> 'UK's Carbon Footprint' (2016 data), Department for Environment, Food and Rural Affairs (DEFRA), 2020.

<sup>4</sup> The analysis uses territorial emissions from the Defra Carbon Footprint data (in line with the rest of this report). The household consumption data in the LCF does not distinguish between spending on domestic versus imported goods (or goods with part of their supply chain imported). Therefore, total spending is used to apportion domestic emissions. This implicitly assumes that all households are equally likely to consume domestic and imported goods. Or put another way, households' carbon footprints are not lower if they disproportionately consume imported products.

<sup>5</sup> This methodology follows a similar approach taken in 'Reducing inequality resulting from UK low-carbon policy', Climate Policy, Volume 20, A. Owen and J. Barrett, June 2020.

footprints. Overall, this means that higher-income households have more room within their budgets to absorb the costs of decarbonisation.

**Chart 7.A: Average household greenhouse gas footprint by net equivalised household income decile**

Source: HM Treasury calculations, LCF data, Defra Carbon Footprint.

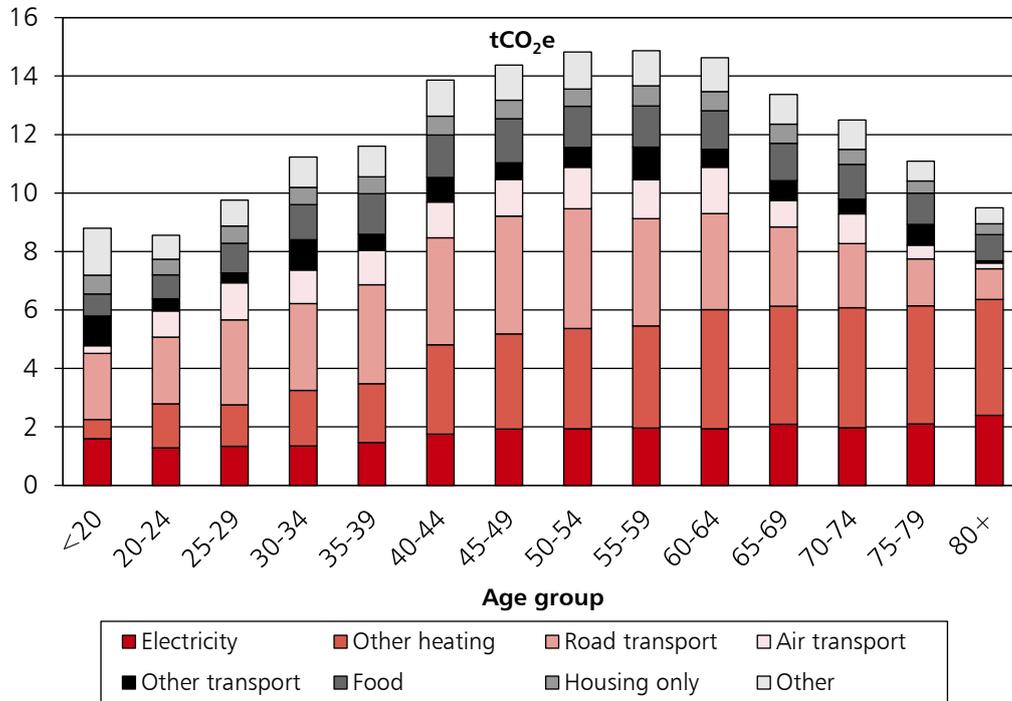

**7.10** Charts 7.B and 7.C consider differences in carbon footprints by age, defined by the age of the household reference person.<sup>6</sup> At the household level, shown in Chart 7.B, the carbon footprint peaks between the age of 40 and 65. However, this is purely the result of household size: households in this group are the most likely to have more members and hence have greater consumption. After adjusting for the number of people in the household, Chart 7.C shows that older age groups have a higher carbon footprint on a per-person basis, driven mainly by greater housing and energy use.

**7.11** Charts 7.D and 7.E look at emissions by household type. Chart 7.D shows that single households emit the least CO<sub>2</sub>e on average, while households with more than one adult emit the most, which is a result of the size of these households. Pensioner households tend to emit less in transport use, relative to other family

<sup>6</sup> The household reference person is the householder who: owns the household accommodation; or is legally responsible for the rent of the accommodation; or; has the household accommodation as an emolument or perquisite; or, has the household accommodation by virtue of some relationship to the owner who is not a member of the household. If there are joint householders, the household reference person will be the one with the higher income. If the income is the same, then the eldest householder is taken.

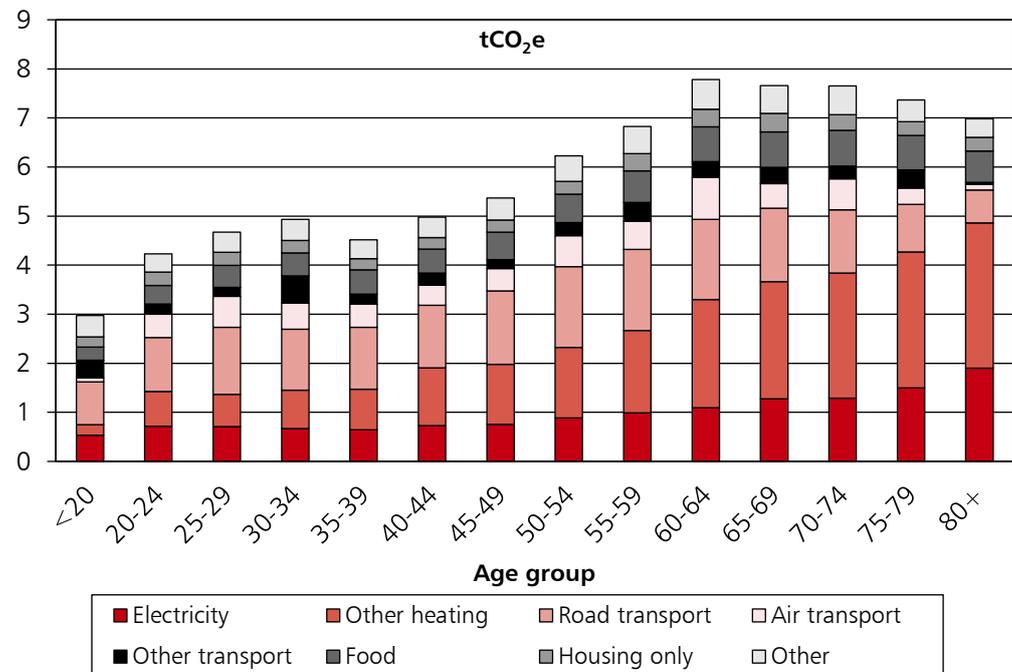

types. As shown in Chart 7.E, on a per-person basis electricity and heating make up a greater proportion of smaller households' carbon footprints, reflecting the economies of scale of living with more than one other person.

**Chart 7.B: Average household greenhouse gas footprint by age**

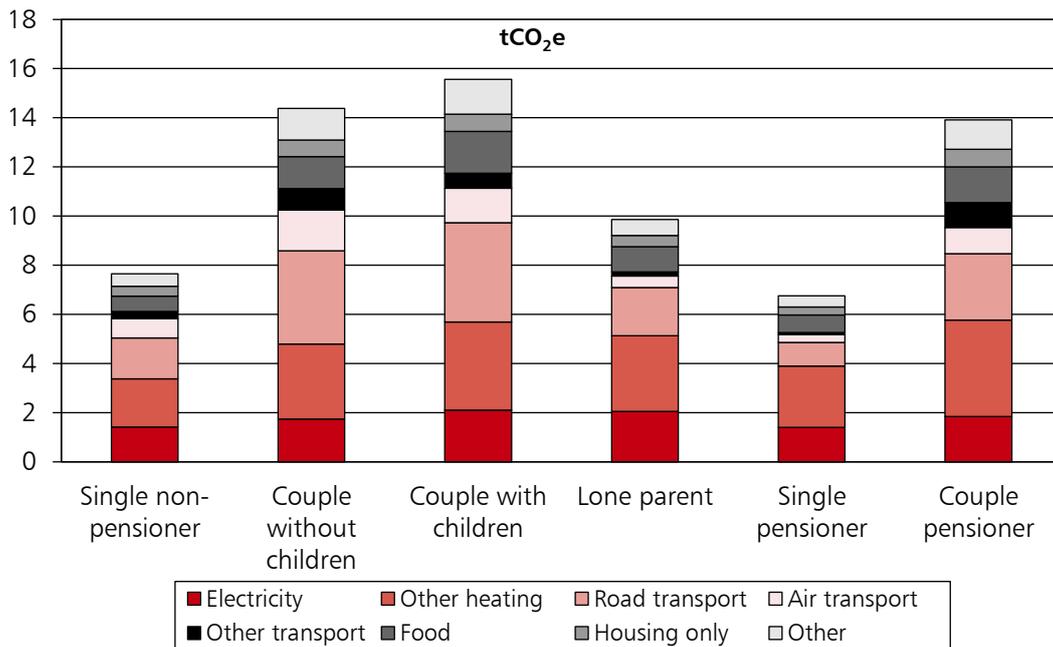

Source: HM Treasury calculations, LCF data, Defra Carbon Footprint.

**Chart 7.C: Average per-person greenhouse gas footprint by age**

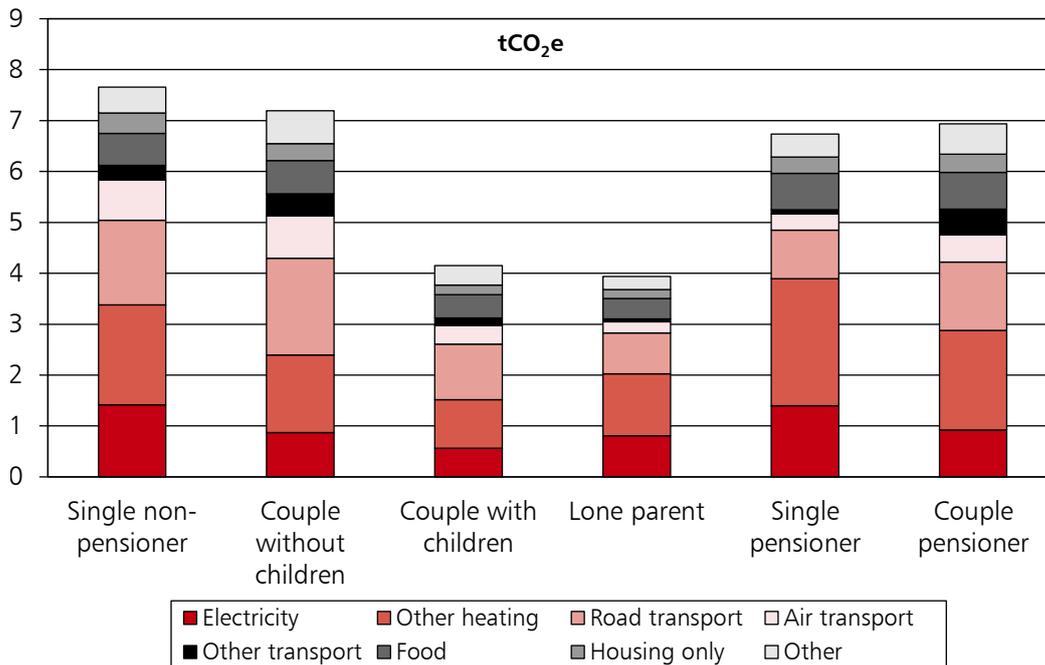

Source: HM Treasury calculations, LCF data, Defra Carbon Footprint.

Chart 7.E: Average per-person greenhouse gas footprint by family type

Source: HM Treasury calculations, LCF data, Defra Carbon Footprint.

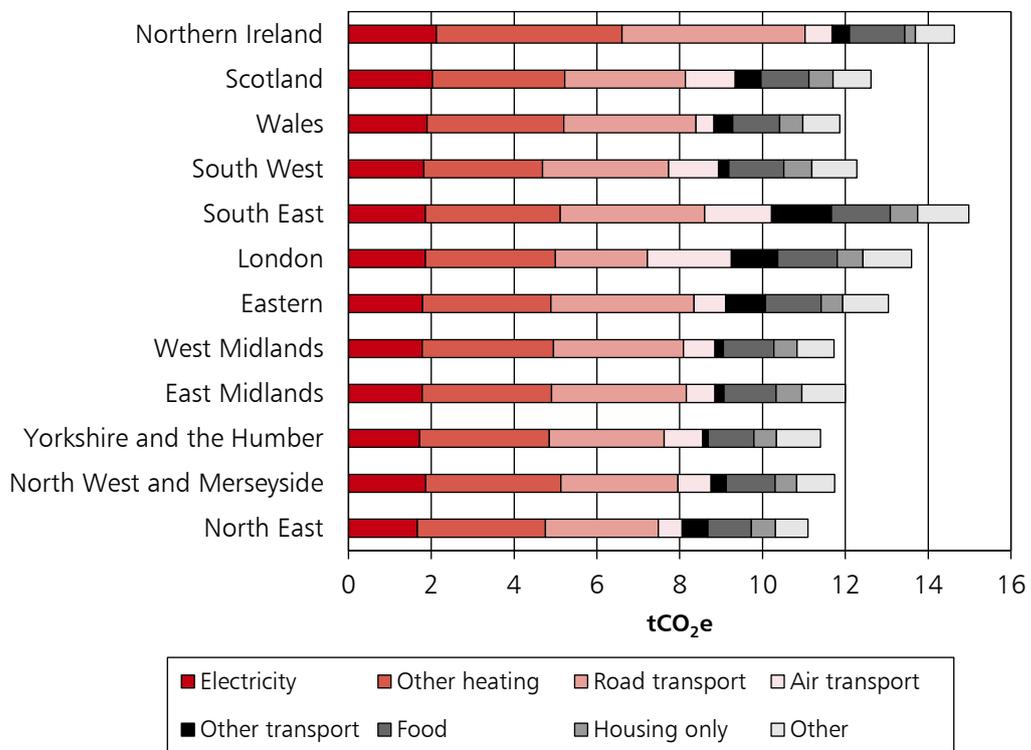

7.12 Chart 7.F then shows the breakdown by region. This shows a relatively similar carbon footprint across the nations and regions, although the South East and Northern Ireland is somewhat higher compared to households in Scotland, Wales and other regions in England.<sup>7</sup> In the South East, this is driven by higher than average use of transport. In Northern Ireland, this could be due to the high

<sup>7</sup> Note that, as elsewhere in the analysis, this uses UK wide carbon factors within each consumption category, so CO<sub>2</sub>(e) per pound spent on electricity in Scotland is the same as in England.

proportion of homes in Northern Ireland using heating oil as their primary heating source – 68% of homes overall and 82% in rural areas – the largest percentage of domestic homes using heating oil in Western Europe.<sup>8</sup>

7.13 Finally, Chart 7.G shows the difference between rural and urban districts in England. The most rural households’ carbon footprints in England are around 9% larger than the most urban households. This could be due to rural households’ consumption of electricity and heating: 14% of households in Great Britain do not have mains gas, or are off the grid,<sup>9</sup> and are therefore often reliant on carbon-intensive heating fuels such as oil. There will also be other factors at play, including income levels and property type.

**Chart 7.G: Average household greenhouse gas footprint by rural urban classification (England only)<sup>a</sup>**

Source: HM Treasury calculations, LCF data, DEFRA Carbon Footprint, 2011 Rural Urban Classification in England.

- <sup>a</sup> Local authorities are categorised as rural or urban based on the percentage of their resident population in rural areas or 'rural-related' hub towns. Mainly Rural: At least 80% living in rural settlements and hub towns; Largely Rural: At least 50% but less than 80% living in rural settlements and hub towns; Urban with Significant Rural: At least 26% but less than 50% living in rural settlements and hub towns; Urban with City and Town, Urban with Minor Conurbation, Urban with Major Conurbation: Less than 26% living in rural settlements and hub towns.

## Households, emissions and the labour market

**7.14** This section considers how households might be affected by the transition through their employment and wages. The analysis shows sectors and types of jobs that are currently associated with high-carbon emissions. As with the consumption analysis, this should not be seen as reflecting the final impact of the transition on those sectors, jobs or employees. This will depend on the policy levers chosen to support the transition, how easily and cheaply these sectors can decarbonise and their international exposure and competitiveness. And for employees, it will depend on where and when new employment opportunities emerge in competing, low-carbon industries.

**7.15** Over the course of the transition, there will be significant changes in the UK labour market. Some of these changes will be directly associated with the transition to net zero, although other technology-driven changes are also likely to be important. Changes in the labour market in one sector may be offset by new employment opportunities elsewhere, including through the expansion of low-carbon industries.

**7.16** The International Labour Organization (ILO) expects 24 million new jobs and 6 million job losses by 2030 as a result of collective action to meet the goals of the 2015 Paris Agreement. This net job creation is primarily driven by growth in

renewable energy, which is expected to be 11% higher than the business-as-usual scenario.<sup>10</sup> The ILO has found that renewable energy growth leads to higher job creation than expanding other energy sources, while reducing emissions.<sup>11</sup> Jobs would also be created in manufacturing and construction, and the economic linkages between sectors mean that employment in services, waste management and agriculture will also grow. For example, over two million jobs will be created worldwide in the manufacture of the electrical machinery required to produce electric vehicles and the generation of electricity from renewables.<sup>12</sup>

### Box 7.B: Labour market exposure methodology

The analysis combines ONS data on atmospheric emission by industry<sup>13</sup> and Living Costs and Food Survey<sup>14</sup> employment data to calculate carbon intensity per worker. Carbon intensity is assigned to workers in the Living Costs and Food Survey based on the industry in which they work.<sup>15</sup>

This is then used to calculate the average carbon intensity for specific occupations and education levels based on the industries in which workers of each occupation and education level work. Charts 7.K and 7.L then show the distribution of education levels and occupations across the income distribution.<sup>16</sup>

## Employment by sectoral emissions

**7.17** Chart 7.H shows the average carbon intensity per worker by industry. Unsurprisingly, the emissions intensity is highest in the electricity and gas sector – with more than three times the emissions per worker than any other industry. In total, the five industries with the highest carbon intensity contribute more than two-thirds of industrial greenhouse gases, but only employ a fifth of all workers.

**7.18** As these sectors decarbonise, the wages and employment opportunities they offer will change, depending on the costs of decarbonising and the policy framework. However, at the same time, there will be growth in lower-carbon sectors. This will create new, competing employment opportunities for people with the skills currently employed in more carbon-intensive sectors.

<sup>10</sup> 'World Employment Social Outlook 2018 – Greening with Jobs', International Labour Organization (ILO), 2018, p. 42.

<sup>11</sup> 'The transition in play: Worldwide employment trends in the electricity sector', Geneva, International Labour Organization, Research Department Working Paper No. 28, G. Montt, N. Maitre, S. Amo-Agyei, 2018.

<sup>12</sup> 'World Employment Social Outlook 2018 – Greening with Jobs', ILO, 2018, p. 42.

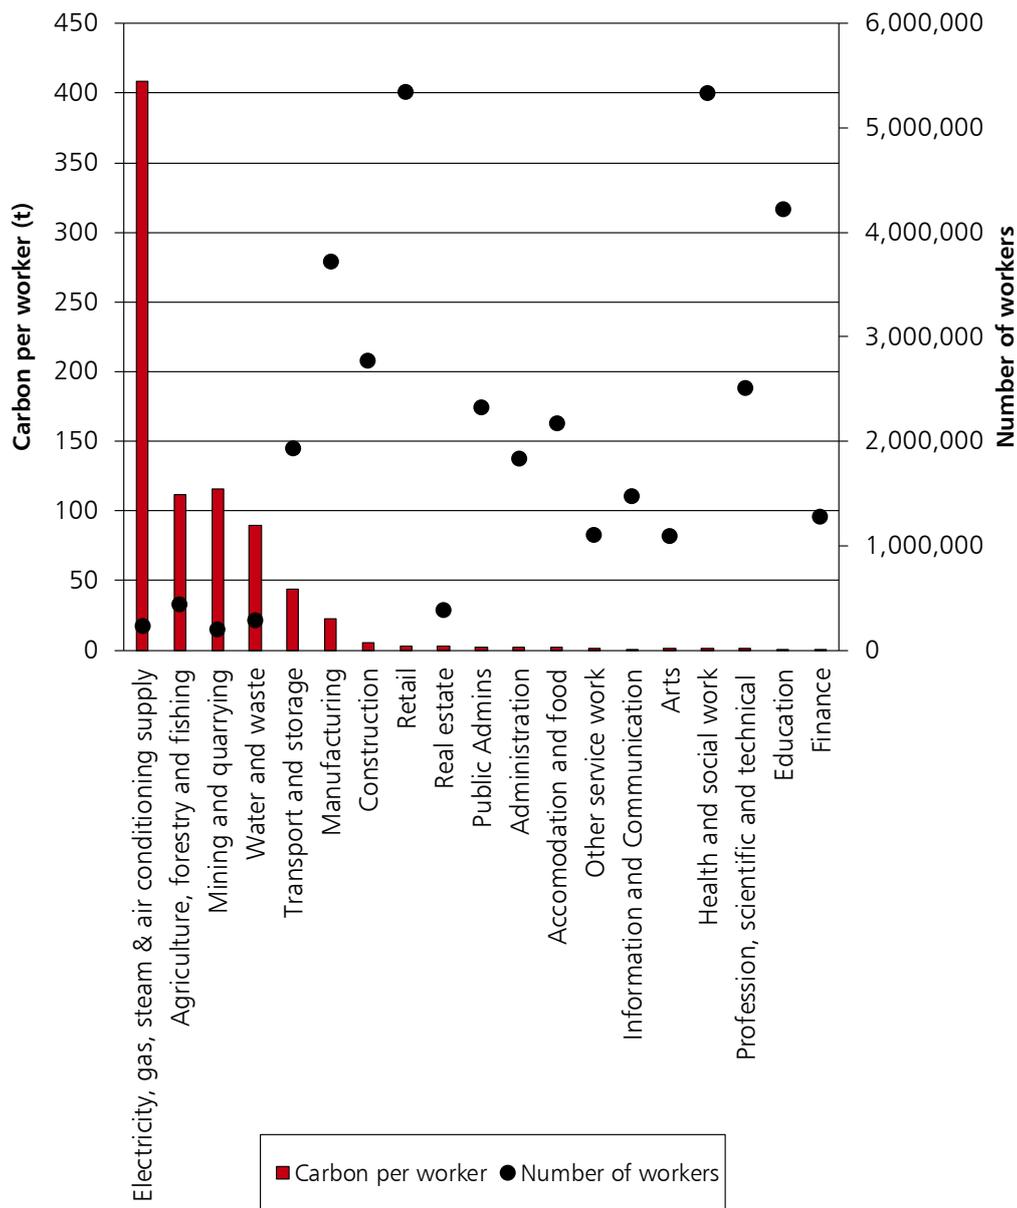

<sup>13</sup> 'Atmospheric emissions: greenhouse gas emissions intensity by industry', 2018 data, ONS, 2020.

<sup>14</sup> 'Living Costs and Food Survey', ONS, 2014/15-2016/17.

<sup>15</sup> These greenhouse gas emissions data record emissions where they occur. They do not account for interdependencies between sectors using outputs that are carbon intensive. For example, many other sector use electricity produced in the electricity and gas sector; however, the carbon associated with the production of electricity is captured in the oil and gas sector rather than passed on to the users of the electricity.

<sup>16</sup> Income deciles are defined based on net household income projected in 2020-21.

Chart 7.H: Average carbon per employee by industry

Source: HM Treasury calculations, LCF household survey, ONS atmospheric emission by industry.

### Employment, skill types and emissions

7.19 Many workers can perform similar jobs in a number of different industries with very different carbon exposures. To more accurately identify which workers might be more exposed to current carbon use in a dynamic labour market Charts 7.I and 7.J show an average carbon intensity for people in different occupations and skill types. This is calculated based on the sector in which workers from each education level or occupation are currently employed. This assumes that all types of roles within each sector are equally affected by the exposure to carbon.

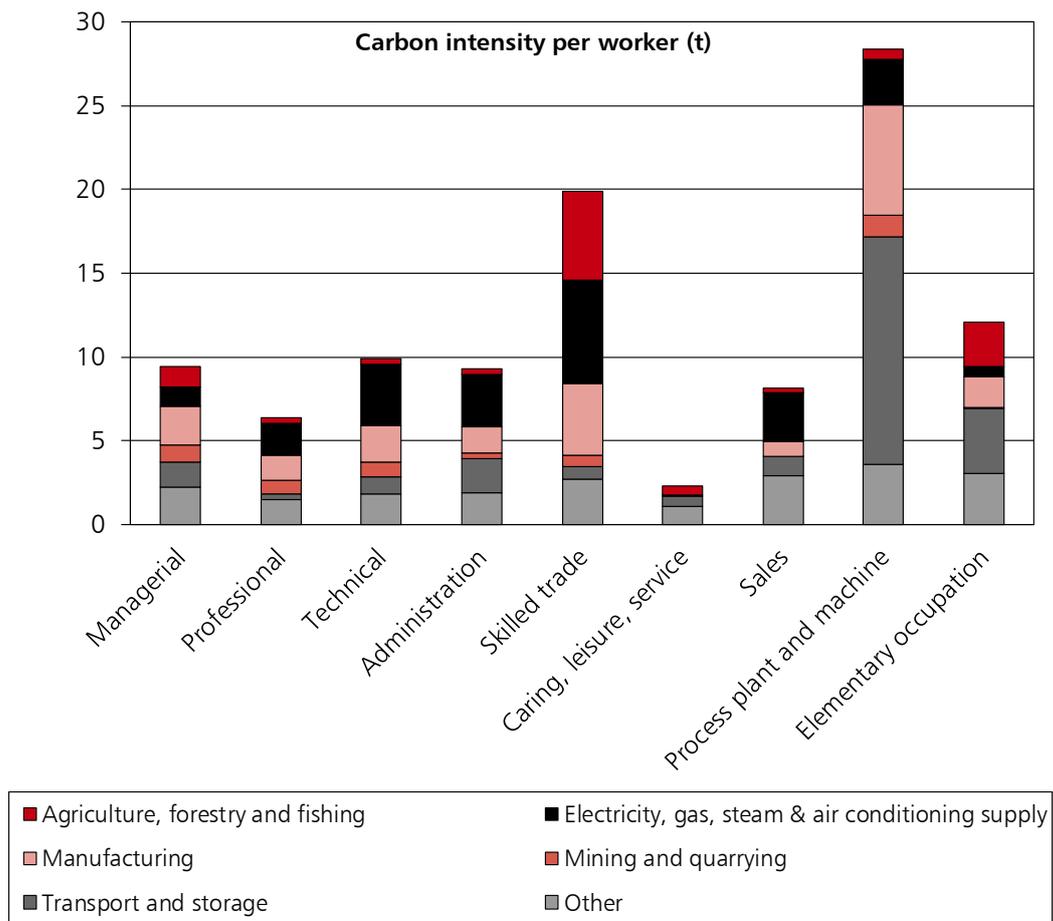

7.20 Skilled trade, and process plant and machine workers tend to be employed in the most carbon-intensive jobs, reflecting higher employment rates in the agriculture and electric and gas sectors. Process plant and machine workers have a higher carbon intensity due to a higher propensity to work in the transport and

storage industry, while skilled trade workers are disproportionately likely to work in the agriculture sector.

**7.21** Similarly, people with low and middle levels of education (those with education up to A-levels) tend to be employed in jobs with an average carbon intensity over 20% more than highly educated employees (degree and above).

**7.22** During the transition, new, lower-carbon industries and jobs will emerge. The UK’s low-carbon industries already support over 460,000 jobs,<sup>17</sup> from electric vehicle manufacturing in the Midlands and the North East to the offshore wind industry in the Humber and the Tees. As discussed in Chapter 2, increasing offshore wind could support 60,000 jobs. Some of these jobs will replace jobs in high-carbon sectors, and some will be additional. However, the transition will still require employers to change their practices to reduce their carbon emissions, which may disproportionately affect these occupations and skills levels. The £315 million Industrial Energy Transformation Fund helps such sectors in the UK to decarbonise. The eventual impact on households will depend on the match between the skills in the jobs lost and the jobs created.

**Chart 7.J: Average carbon per worker by education (based on industry of employment)<sup>a</sup>**

Source: HM Treasury calculations, LCF household survey, ONS atmospheric emission by industry.

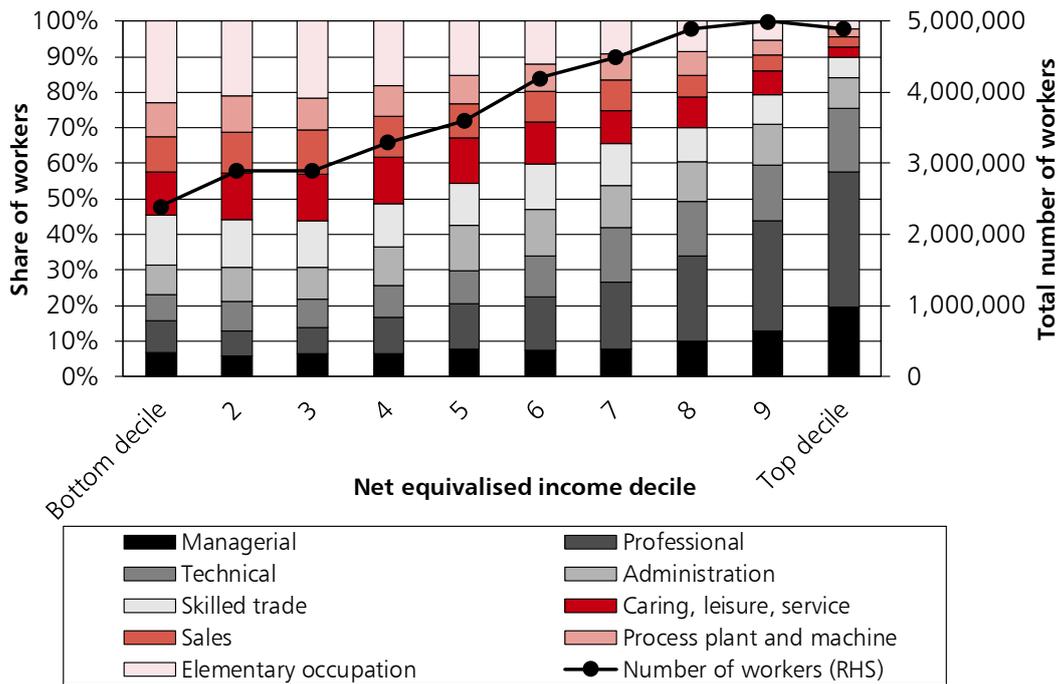

a 'High' education refers to degree level and above, 'Mid' refers to A levels or equivalent, 'Low' refers to GCSE and below.

## Employment, income and emissions

**7.23** The final step is to explore the types of households in these employment groups with higher carbon intensity. Chart 7.K shows occupations of employees broken down by net household income decile (lower income households tend to have fewer or no workers and so fewer workers make up the lower deciles). The high-carbon intensity occupations, skilled trade, and process plant and machine workers are skewed towards lower-income households: almost a quarter of workers in the lowest income quintile of households work in these occupations compared to one in ten of those from the richest quintile. Similarly, Chart 7.L shows low- and mid-education employees are disproportionately drawn from low-income households.

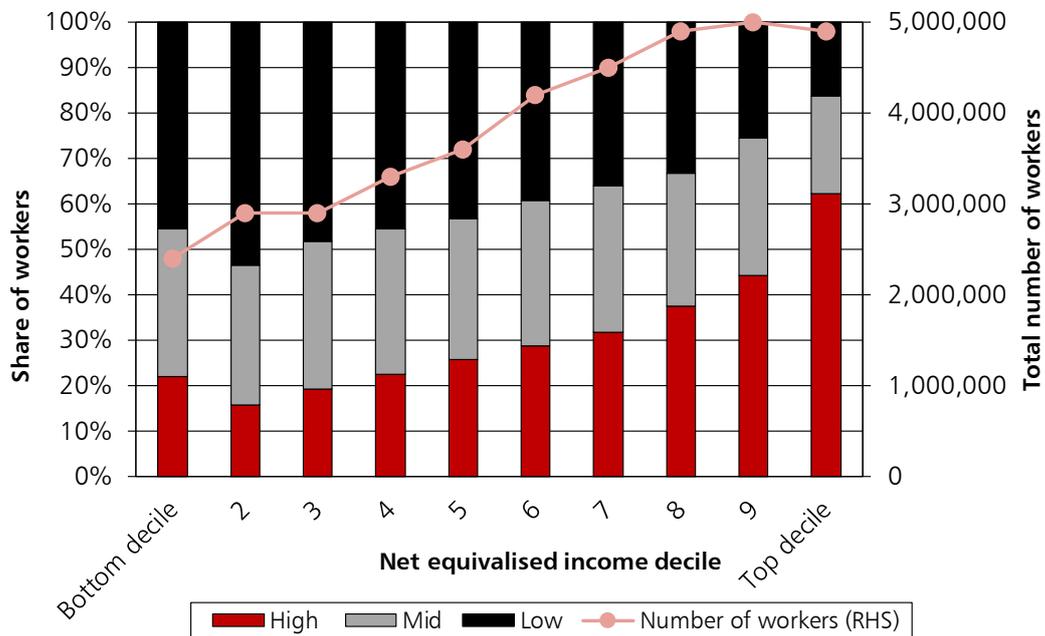

**7.24** However, this does not mean the labour market adjustment would have an overall regressive pattern. Higher-income households receive a significantly greater share of income from earnings, whereas lower-income households receive a greater share of income from welfare. This means that higher-income households are more exposed to any labour market shock. The carbon-specific trends highlighted here are not enough to outweigh this. It is also possible that the carbon intensity of the labour market is geographically concentrated.

<sup>a</sup> 'High' education refers to degree level and above, 'Mid' refers to A levels or equivalent, 'Low' refers to GCSE and below.

## Managing the distributional impacts of the transition

7.25 In designing policies to support the transition, the government will need to take account of the distributional consequences. The design of decarbonisation policies will have implications for distributional outcomes as will decisions on whether to mitigate the impact of the transition through other policy tools, for example:

- a policy can explicitly target distributional impacts alongside other objectives (e.g. progressive interest rates on loans or support for fuel poor homes such as the £6.7 billion package set out in the Energy White Paper<sup>18</sup> that could save families in old inefficient homes up to £400, including the extension of the Energy Company Obligation and Warm Home Discount);
- the ongoing burden of the policy can be increased or reduced for different groups, or some can be excluded from paying altogether (e.g. surcharges, exemptions or targeted reliefs);
- targeted support can be provided to cover the capital and/or running costs caused by a policy (e.g. targeted scrappage schemes coupled with low-emission zones);
- the funds raised by a levy or tax can be redistributed to a particular group to offset the primary impact (e.g. levies with recycling);
- the general tax and welfare system can be used to compensate those who are affected (e.g. targeted tax cuts or higher welfare payments); and
- progressive redistribution can also be a co-product of policies with other explicit aims (e.g. taxes on air travel).

7.26 As with the costs of emission abatement, where there is a need for public financing, funding can be raised through general taxation or through borrowing. They can also be raised through specific taxes or levies, with the revenue raised earmarked to fund these policies. The trade-offs between managing these impacts, effectiveness of policy at driving the transition, and the impact on competitiveness, are discussed in Chapter 6.

<sup>18</sup> 'Energy White Paper: Powering our Net Zero Future' CP 337, HM Government, 2020

# Annex A

## Net Zero Review terms of reference

The text below sets out the terms of reference for the Net Zero Review as published. Although the Review was initially planned to report in autumn 2020, the COVID-19 pandemic has meant the final report has been delayed to spring 2021.

### Context

The UK has a proud record of global leadership in tackling climate change and supporting clean growth.

In 2006, the UK published the first global review into the economics of climate change. This led to the Climate Change Act 2008, which established a comprehensive legal framework for delivering emission reductions in the UK, including a 2050 carbon reduction target and interim carbon budgets.

Between 1990 and 2017, we reduced our emissions by 42% while growing the economy by more than two thirds.

The UK legislated in June 2019 to reach net zero greenhouse gas emissions by 2050, becoming the first major economy to do so.

The government also accepted the Climate Change Committee's recommendation that HM Treasury should undertake a review of how the transition to net zero would be funded and where the costs would fall. This review will take this forward, examining the key choices to transform to a green economy and achieve net zero by 2050.

In parallel, the government will continue its efforts to reduce greenhouse gas emissions and deliver on its carbon budget commitments, while keeping costs down for consumers, supporting the creation of good jobs and growing the economy.

### Objectives

To consider how the transition to net zero will be funded and assess options for where the costs will fall. This will involve:

- 1 Analysing the range of choices for how households, businesses and the taxpayer could contribute towards different elements of the transition to net zero.
- 2 Identifying mechanisms to create an equitable balance of contributions.
- 3 Maximising opportunities for economic growth as we transition to a green economy.
- 4 Evaluating the trade-offs between cost, competitiveness, effects on consumers and impacts on the taxpayer.

## Scope

The review will consider the full range of government levers, including tax. It will not duplicate existing or ongoing work elsewhere, such as:

- detailed policy to decarbonise specific sectors
- the costs of adapting to the impacts of climate change
- the social and global co-benefits of decarbonisation

## Governance, engagement and timetable

The review will be conducted by Her Majesty's Treasury, with close engagement across Whitehall and with the devolved administrations.

The review will consult widely, as well as draw on evidence from experts and insights from those who will have a role in and be impacted by the transition. Further details will be set out in due course.

The review will report to the Chancellor of the Exchequer. Her Majesty's Treasury will publish a report in autumn 2020 setting out principles to guide decision-making during the transition to net zero.

# Annex B

## Market failures and climate change

### Market failures: the theory

This annex sets out further detail on the theory of market failures and the main market failures in each sector.

**Table 7.A: Static price failures**

Market failure	Description
Negative externalities	Arise when the production or consumption of a good or service imposes a cost on a third party that is uninvolved in the initial transaction, imposing a larger cost on society as a whole than on the private actors. Stern judged the lack of a price on emitting greenhouse gases to be the largest market failure driving climate change and pervasive across all sectors of the economy. <sup>1</sup>
Positive externalities	Exist when production or consumption of a good or service benefits a third party uninvolved in the initial transaction. As a result, benefits to society as a whole are greater than benefits experienced by private actors and the goods and services are consequently under-produced or consumed. Positive externalities commonly occur in innovation processes. Early adopters of green technology generate positive externalities for others by supporting supply chain development and bringing down costs over time.
Public goods	Exist when a good or service is non-excludable and has no rival in consumption. Once a public good is supplied, no one can be stopped from consuming it, and its consumption by one person does not reduce the amount available to another person. Consequently, these goods suffer from a free-rider problem, where those accessing the service do not have to pay for it. Greenhouse gas removals, for example by forests that sequester carbon from the atmosphere, are public goods since no one can be excluded from the benefit of lower carbon in the atmosphere. Quasi-public goods partially exhibit these features – being non-rival or non-excludable – up to a point, often in cases where there is a capacity limit. Some of the infrastructure required to achieve a net zero economy can be thought of as quasi-public goods – for example cycle lanes and pedestrian areas which can help encourage a modal shift away from petrol and diesel vehicles.

<sup>1</sup> 'The Economics of Climate Change: The Stern Review, Nicholas Stern', Cabinet Office – HM Treasury, 2006.

---

Natural monopolies	<p>Occur where there are high upfront fixed costs associated with providing a good or service and low marginal costs. These high costs (common in infrastructure) may mean that a market with one producer to supply most of the market is most efficient. However, the lack of competition that results can, if unaddressed, result in inflated prices and poor quality of service.</p> <p>In the UK, economic regulators oversee the network operators that carry risks of natural monopoly. Many of these networks will be important for the transition to net zero. For example, the capacity of the electricity grid will be important for the electrification of large parts of the economy and the gas grid will play a central role if hydrogen is used on a large scale.</p>
--------------------	---

---

**Table 7.B: Static non-price failures**

Market failure	Description
Information failures	<p>Occur when a lack of information means that economic actors cannot make the decision that provides the most benefit to them. Information failure is an issue for net zero where the choices being asked of people may be complex and the information that exists is hard to interpret or there are too many options. A lack of knowledge about the benefits of making energy efficiency improvements to buildings, in production or in personal consumption may also hold back decarbonisation even where there is the will to do so.</p>
Inertia and bounded rationality	<p>Occur where people are satisfied with a sub-optimal outcome. The necessary incentives and information exist but these do not translate into change, because people are biased towards the status quo. It can also be the case that people apply different weights to costs and benefits in different time periods, or of different natures – for instance cost savings versus inconvenience. This could help explain the low rate of adoption of energy efficiency measures in buildings, which would normally pay for themselves without the need for government intervention.</p>
Split incentives	<p>Occur where one party bears the cost of purchasing a good while another party benefits, or the party that bears the cost cannot guarantee it will reap the full benefit over time. This occurs in the rented sector both for homes and for industry, where tenants would experience the benefits of reduced bills from energy efficiency measures but cannot guarantee that they will continue to rent the property for enough time to recoup the costs of their installation. Split incentives also occur in the shipping sector where charterers may be deterred from investment in abatement as they will only receive the benefits when leasing the ship – similarly ship owners can have lower incentives to invest themselves as they may not receive all of the savings from the efficiency improvements.</p>

---

Liquidity constraints	Occur where people are willing to make an investment that is cost saving but do not have access to the capital to pay for it. If they could borrow money to fund the investment, they would do so. This may be an issue throughout the transition due to the large amount of new capital investment required, for both households and businesses.
-----------------------	---

---

**Table 7.C: Dynamic failures**

Market failure	Description
Uncertainty and risk bearing	Uncertainty about the future increases risk. Combined with risk aversion, this can lead to disproportionate increases in financing costs for investment and sub-optimal levels of investment. This is a particular problem for new and developing technologies which will be crucial for the transition, or in circumstances where future policy is unclear.
Multiple equilibria: coordination failures	Occur where a lack of communication between actors in the market, or an inability to coordinate action across time, leads to an outcome that leaves everyone worse off. For example, one possible barrier to increased uptake of electric vehicles may be that drivers are concerned that there are not enough charging points to be able to pursue the journeys they want to. However, it may also only be profitable for firms to roll out sufficient charging points when there is enough demand for them. If these actors were able to coordinate their supply and demand, the market would produce a better outcome.
Multiple equilibria: technology development curves	As new technology is deployed the costs of that technology falls. New, low-carbon technology is often more expensive as it has not yet been deployed at scale – whereas markets dominated by fossil fuel dependent technologies are fully developed. As a result, low-carbon goods and services are often initially not price competitive and demand is lower. There may be tipping points with new technologies: a point when the cost of the technology falls far enough to secure a significant switch in consumer and business demand for the new product. In the power sector, solar panels and wind turbines were initially very costly but have fallen in price substantially over time as they have been taken up at scale.

## Market failures by sector

This section considers how the market failures set out above apply to the various sectors of the economy important to the net zero transition. The list of market failures here is not exhaustive, and many sectors will experience multiple market failures simultaneously.

## Power

Market failures in the power sector are particularly important as the distortions created in this market can affect other sectors of the economy, potentially magnifying the impact. This is particularly relevant in the case of buildings, surface transport and industry.

The primary market failure is the negative externality associated with the use of fossil fuels to generate electricity. In the absence of government intervention, the cost of climate change caused by the emissions is not reflected in the cost of producing or using the electricity. This means that the price of fossil fuel-generated electricity can be lower than for low-carbon power sources such as nuclear and renewables. The existing Emissions Trading System (ETS) and top-up from the Carbon Price Support have been effective in making emissions-intensive power less competitive than some of these alternatives but may not have completely internalised the externality. The Climate Change Levy increases the cost of electricity usage with the aim of encouraging efficiency improvements and reducing emissions.

Dynamic market failures such as uncertainty and multiple equilibria relating to technological development curves exist in the renewable sector. There are a number of existing mechanisms to overcome these, including the price signals given by the ETS and UK government schemes to improve revenue certainty for investors, such as Contracts for Difference. Hydrogen power and carbon capture technologies face similar dynamic market failures.

Liquidity constraints may hold back deployment of nuclear power. Large upfront capital investment is required, and the costs are incurred over a long timeframe, creating a barrier to adoption.

Risks of natural monopoly appear in the electricity and gas grids and in a potential CO<sub>2</sub> network to support carbon capture and storage. For this reason, Ofgem regulates the electricity and gas network companies' revenue, investment and performance standards.

## Buildings

Fossil fuel-powered heating is the primary source of emissions from buildings. The climate cost of these emissions is not fully included in the price of heating, creating a negative externality. Decarbonising buildings therefore requires efficiency improvements to reduce energy use such as double glazing and loft insulation, as well as finding new ways to heat our homes, workplaces and other buildings.

Low-carbon heating systems are currently more expensive than systems to support fossil fuel heating.<sup>2</sup> This should change over time as the technologies are rolled out at scale, but this process is held back by multiple equilibria problems relating to coordination and technological development curves, which keep costs high. As discussed above, electricity and hydrogen grids that would power low-carbon heating systems could also represent natural monopolies.

Split incentives may further hold back investment in energy efficiency as the tenants who would benefit from bill savings cannot guarantee that they will rent the

---

<sup>2</sup> 'Cost of installing heating measures in domestic properties – a study providing cost data for different heating appliances', Department for Business, Energy and Industrial Strategy (BEIS), September 2020.

property for long enough or have high enough energy use to recoup the costs of their installation. Similarly, landlords have little incentive to improve the energy efficiency of their property if it does not increase its rentable value, since they will not benefit from lower bill costs themselves.

Households may wish to avoid the disruption involved in installing energy efficiency measures, and upfront costs can be high with long payback times. People may not value the benefits, given they will only occur over a long time period, and affordability and liquidity constraints could prevent households from making up-front investments, even when these reduce costs overall. Finally, people may not have access to information on the benefits they could experience from taking up these measures.

## Transport

### Surface transport

Emissions from internal combustion engines represent a negative externality as their costs is not fully captured in the relative price of the vehicles or their operating costs. To date there has been limited progress in decarbonising road transport. This is largely because fuel efficiency gains have been offset by increases in miles driven and sales of larger vehicles. Shifts towards public transport and active travel, like walking or cycling, can decrease the size of this negative externality, but the infrastructure needed may be a quasi-public good.

The sector will rely on new markets and developing technologies for producing zero-emission vehicles (ZEVs) to reach net zero. However, electric cars, vans and motorcycles are not yet price competitive with internal combustion engine alternatives, even with government subsidies, both in terms of upfront cost and total cost of ownership. The Climate Change Committee (CCC) estimates that upfront cost will reach parity with conventional vehicles in the second half of the 2020s.<sup>3</sup> This assumes that battery technologies continue to scale-up production and price reduction forecasts materialise.

There is an additional dynamic market failure whereby a lack of adequate charging infrastructure may present a barrier to uptake of ZEVs, but the fact that enough ZEVs are required to be in use to make charging infrastructure profitable may prevent the infrastructure being delivered. There are other static non-price market failures that also present a barrier to adoption of these vehicles: misinformation about range and environmental impact of batteries; inertia; and liquidity (up-front affordability) constraints.

There are still several different technological options in play for zero emission heavy duty vehicles, including lorries, buses and coaches. Where these rely on common infrastructure, such as a network of hydrogen refuelling stations, a super-fast charging network or overhead catenaries, there are limited incentives for firms to make changes to their fleet. At the same time, a limited HDV fleet does not provide the necessary incentives to private actors to start building the infrastructure. Further coordination is required across countries, given that heavy goods vehicles make long journeys across borders. Failure to do so will result in vehicles either needing to be

---

<sup>3</sup> 'Net Zero – Technical Report', Climate Change Committee (CCC), May 2019.

compatible with multiple systems, or goods having to change vehicle at borders, adding to costs.

Rail makes up a small proportion of total emissions from surface transport. The difference in emissions between low-carbon and fossil fuel powered trains is not reflected in the ticket prices or in the cost to train companies of using rail infrastructure. However, railways contribute to decarbonisation by enabling a shift from other more polluting forms of transport. Developing new technologies such as hydrogen trains may provide a lower-cost option for lowering rail emissions in some parts of the network but may come with dynamic market failures around uncertainty and multiple equilibria.

## Air travel

The cost to third parties from the emissions of air travel is a negative externality in the absence of intervention, as it is not reflected in the market price. Decarbonisation of the sector in the short term is largely reliant on fuel-efficiency improvements and reduced demand. There are currently no truly zero-emission solutions for long-haul flights. However, small hydrogen and electric planes are being developed, which could be viable on short and medium-haul flights before 2050.

Given that significant technological development is required in this sector, dynamic market failures will play a significant role. Sustainable aviation fuels present a way to reduce emissions from aviation and production could be scaled over the next ten years to achieve meaningful carbon savings in the decade from 2030. However, these fuels are currently more costly than existing aviation fuels. As fuel costs make up a significant proportion of airlines' costs and the sector is highly competitive, there is currently little incentive to move away from conventional fuels until there is price parity with sustainable fuel cost. International cooperation is also necessary to overcome potential coordination failures.

## Shipping

The cost of using a vessel powered by fossil fuels does not reflect the cost to third parties of emissions and pollution created as a by-product. A range of options exist to reduce shipping emissions, some of which may allow shipping to get to near-zero emissions. These include more fuel-efficient ships, logistical improvements and the use of alternative fuels like ammonia and hydrogen.

Some fuel efficiency and logistical improvements can be price competitive mitigation measures. This implies that static non-price market failures, like inertia, or liquidity constraints faced by smaller ship operators are significant barriers to adoption.

Additionally, the maritime sector is highly fragmented, with a combination of ship owners, operators and charter companies. There is an asymmetry of information between these agents, which may result in sub-optimal outcomes.

There are also split incentives between the owners of the ships and the charter companies that rent them. These mean that necessary net zero investments to these vessels may not be undertaken by the charter companies, as it can be unclear whether they will recoup their investments if the ship owner were to terminate their contract.

Alternative low-carbon maritime fuels still require technological development to become price competitive with existing fuel sources. However, without considerable

roll-out and an internalisation of the negative externality, these fuels may not become price competitive. This is a multiple equilibrium market failure.

## Industry

Emissions from industry are a negative externality problem, insofar as the price set by the current EU Emissions Trading Scheme does not fully internalise those emissions. Non-price market failures such as liquidity constraints, information failures and inertia will all contribute to varying degrees to holding back decarbonisation depending on the sub-sector in question.

Where possible, switching from fossil fuel-based inputs to alternatives like hydrogen, electric heat or biomass will mitigate the negative externality problem. There are also a range of energy efficiency and circular economy measures – industrial symbiosis, reuse, repair, remanufacture of products and recycling of materials – that are currently cost saving and would reduce pollution.

Keeping options open is critical to optimizing the most efficient technological choice. However, this creates a trade off with the long capital lifecycles typical in industry: some industries have action point cut offs within the next five years to achieve net zero by 2050.

Emissions from non-combustion processes, such as in the production of ammonia, cement, iron and steel, can represent a negative externality in the absence of policy intervention. These emissions are an unavoidable consequence of production of what are generally raw materials with only imperfect substitutes. Instead of reducing output, the CCC's modelling assumes the emissions are captured at the point of production and stored underground using a network of carbon dioxide pipes. This new network could represent a natural monopoly, as there are large initial fixed costs to the deployment of the infrastructure that continually fall as the network is expanded. A competing network of pipes might not be feasible, nor economically efficient. However, having only a single provider does create risks of monopoly power that could result in poor quality and overpricing of services if left unaddressed.

## Fluorinated gases

Fluorinated gases (F-gases) are used in a variety of equipment, including refrigeration systems, air-conditioning units, heat pumps, medical inhalers, fire extinguishers and in a variety of other industrial and specialist applications. F-gases can have a global warming potential up to 23,000 times more powerful than CO<sub>2</sub>. If left unaddressed by policy, they would incur a significant negative externality if released to the atmosphere.

For several of these uses, alternatives to F-gases and F-gases that have a lower intensity greenhouse gas effect are becoming available and cost effective. This would mitigate the negative externality. There may also have been an imperfect information failure, but the regulatory approach has been largely effective at reducing F-gas use and developing the market in use of alternatives.

## Waste

When consuming a product, the price paid may not always capture the full costs of disposing of that product after use, including any associated emissions. Charges for

landfill use have internalised some of these costs and indirectly increased the price of emissions. Information failures and inertia in households and businesses may also hold back effective sorting of waste and, consequently, carbon-efficient waste management.

Waste collection and waste-water management can show features of a natural monopolies in the absence of policy intervention. There are high initial fixed costs that fall as the network is expanded and a competing service may be economically inefficient, depending on the precise geography of the area.

Finally, informal or illegal waste disposal such as flytipping and littering create further negative externalities, such as reduced or detrimental visual amenity and pollution of the natural environment. Split incentives across public authorities can also hold back carbon-efficient waste policy.

## Agriculture

A variety of market failures are present in this sector. Many are static, rather than dynamic failures.

The primary source of emissions from the sector is from ruminant livestock production. This is a significant source of methane, a greenhouse gas around 28 times more powerful than carbon dioxide.<sup>4</sup> High or inefficient use of resources such as fertiliser can increase emissions principally through their breakdown in soil which releases nitrous oxide, a greenhouse gas around 298 times more powerful than carbon dioxide.<sup>5</sup> The use of fossil fuels in agricultural machinery and heating emits carbon dioxide, but this is a relatively small proportion (10%) of total emissions from the sector.<sup>6</sup> These all represent negative externalities as the costs they impose on others are not consistently captured in farms' production costs.

The size of the negative externalities can potentially be mitigated through improved farm management practices: improved resource efficiency through best practice management, the adoption of innovative technologies and changes in patterns of land use can mitigate these emissions. This includes adopting different feeding practices for livestock, selective breeding, improving animal health, adopting more fuel-efficient machinery, more efficient fertiliser applications and restoring peatlands. These could create trade-offs with other competing policy objectives.

Many of these measures are consistent with improvements in agricultural productivity. This can bring down resource use per unit of output, as well as the associated emissions.

Inertia is cited regularly in the literature as a barrier to change in this sector. However, it is difficult to distinguish between this and other non-price market failures such as imperfect information, issues around tenure and the impacts of government subsidies.

## Land use and land-use change

When making decisions about land use, farmers' and land managers' incentives do not reflect all the costs to third parties that can arise from different types of land use. As discussed in the section above on agriculture, certain land use choices are more emissions-intensive than others. The market value of land and the market prices of goods produced on that land do not reflect the variance in emissions.

Increasing the resource efficiency or productivity of the land lessens this trade-off, allowing other marginal land to be made available for alternative uses, while maintaining total output.

For example, marginal agricultural land can be freed up for afforestation, peatland restoration or flower meadows, all of which provide third party ecosystem services such as carbon abatement and sequestration. Land prices do not reflect the positive externalities that can come from these alternative uses of land. Aspects of afforestation can also be considered a public good, since the benefits of carbon sequestration don't fall with number of people experiencing them, and no one can be excluded from experiencing those benefits.

In addition, there are non-price market failures that prevent land managers from making the most efficient use of their assets. For example, farming subsidy rules and tenancy law may discourage land managers from changing land use. A transition in land uses will require new skills and knowledge which may be an additional barrier.

## Greenhouse gas removals

The CCC is clear that greenhouse gas removal technologies (GGRs) are likely to have a role in offsetting residual emissions, especially in hard to abate sectors such as air travel. These removals can therefore be viewed as the cost of reducing the negative externality in a given sector, or as positive externality in their own right.

The government has issued a call for evidence on GGRs, as there are a variety of options to be considered. Beyond the measures captured in the land use section above, the CCC identify bioenergy and carbon capture and storage (BECCS) and wood in construction (WIC) as the most currently feasible ways to remove greenhouse gases. However, there are non-price static market failures that must be overcome for the market to work effectively. For example, imperfect and asymmetric information about where the biomass being used for BECCS or WIC is from, the sustainability impacts and the amount of carbon that is sequestered in each unit may prevent the market from working efficiently. This risk becomes greater if biomass is traded overseas, with a need for international transparency and cooperation.

A CO<sub>2</sub> Transport and Storage (T&S) network is required for BECCS, as with all CCUS processes. This new network may present natural monopoly market failures, as there are large initial fixed costs to the deployment of the infrastructure that continually fall as the network is expanded. A competing network of pipes might not be feasible, nor economically efficient. However, having only a single initial provider does create risks of monopoly power that could result in poor quality and/or overpricing of services, if left unaddressed.

There are also other less developed GGRs being considered in the UK such as enhanced weathering and Biochar. Current analysis suggests direct air carbon

capture and storage (DACCS) is likely to have the greatest deployment potential of these approaches in the UK by 2050. These will require further research and development to reduce their costs, to understand their effectiveness and their trade-offs. The knowledge gained from this research and development is a quasi-public good as it is difficult to exclude people from accessing research findings, and information is not depleted by use. In addition, DACCS would require an existing CCS network, as discussed above. Finally, the high levels of uncertainty about the viability in the early stages of development of these technologies may lead to underinvestment by the market.

# Annex C

## Processing of personal data

This notice sets out how HM Treasury as the data controller will use your personal data for the purposes of gathering stakeholder feedback for the Net Zero Review Interim Report and explains your rights under the General Data Protection Regulation (GDPR) and the Data Protection Act 2018 (DPA).

### Your data (Data Subject Categories)

The personal information relates to you as either a member of the public, parliamentarian or representative of an organisation or organisations or company or companies.

### The data we collect (Data Categories)

Information may include your name, address, email address, job title and employer, as well as your opinions. It is possible that you will volunteer additional identifying information about themselves or third parties.

### Legal basis of processing

The processing is necessary for the performance of a task carried out in the public interest. For the purpose of this Interim Report the task is requesting evidence or obtaining opinion data in order to develop to develop good effective proposals and recommendations to government.

HM Treasury may use the contact details provided to contact respondents in the period between the Net Zero Review Interim Report publication to when the Final Report is expected to be published in order to request clarification or further information regarding the response provided where this is deemed necessary.

### Special categories data

We do not expect that any special category data will be processed.

### Legal basis for processing special category data

Where special category data is volunteered by you (the data subject), the legal basis relied upon for processing it is: the processing is necessary for reasons of substantial public interest for the exercise of a function of the Crown, a Minister of the Crown, or a government department.

This function is consulting on departmental policies or proposals, or obtaining opinion data, to develop good effective policies.

### Purpose

The personal information is processed for the purpose of obtaining the opinions of members of the public and representatives of organisations and companies, about

departmental policies, proposals, or generally to obtain public opinion data on an issue of public interest.

### Whom we share your responses with

Information provided in response to this Interim Report may be published or disclosed in accordance with the access to information regimes. These are primarily the Freedom of Information Act 2000 (FOIA), the Data Protection Act 2018 (DPA) and the Environmental Information Regulations 2004 (EIR).

If you want the information that you provide to be treated as confidential, please be aware that, under the FOIA, there is a statutory Code of Practice with which public authorities must comply and which deals with, amongst other things, obligations of confidence.

In view of this it would be helpful if you could explain to us why you regard the information you have provided as confidential. If we receive a request for disclosure of the information, we will take full account of your explanation, but we cannot give an assurance that confidentiality can be maintained in all circumstances. An automatic confidentiality disclaimer generated by your IT system will not, of itself, be regarded as binding on HM Treasury.

Where someone submits special category personal data or personal data about third parties, we will endeavour to delete that data before publication takes place.

Where information about respondents is not published, it may be shared with officials within other public bodies involved in this Interim Report to assist us in developing the policies to which it relates. Examples of these public bodies appear at: <https://www.gov.uk/government/organisations>.

As the personal information is stored on our IT infrastructure, it will be accessible to our IT contractor, NTT. NTT will only process this data for our purposes and in fulfilment with the contractual obligations they have with us.

### How long we will hold your data (Retention)

Personal information in responses to this Interim Report will generally be published and therefore retained indefinitely as a historic record under the Public Records Act 1958.

Personal information in responses that is not published will be retained for three calendar years after the Net Zero Review has concluded.

### Your rights

You have the right to request information about how your personal data are processed and to request a copy of that personal data.

You have the right to request that any inaccuracies in your personal data are rectified without delay.

You have the right to request that your personal data are erased if there is no longer a justification for them to be processed.

You have the right, in certain circumstances (for example, where accuracy is contested), to request that the processing of your personal data is restricted.

You have the right to object to the processing of your personal data where it is processed for direct marketing purposes.

You have the right to data portability, which allows your data to be copied or transferred from one IT environment to another.

### **How to submit a Data Subject Access Request (DSAR)**

To request access to personal data that HM Treasury holds about you, contact:

HM Treasury Data Protection Unit  
G11 Orange  
1 Horse Guards Road  
London  
SW1A 2HQ

[dsar@hmtreasury.gov.uk](mailto:dsar@hmtreasury.gov.uk)

### **Complaints**

If you have any concerns about the use of your personal data, please contact us via this mailbox: [privacy@hmtreasury.gov.uk](mailto:privacy@hmtreasury.gov.uk).

If we are unable to address your concerns to your satisfaction, you can make a complaint to the Information Commissioner, the UK's independent regulator for data protection.

The Information Commissioner can be contacted at:

Information Commissioner's Office  
Wycliffe House  
Water Lane  
Wilmslow  
Cheshire  
SK9 5AF

0303 123 1113

[casework@ico.org.uk](mailto:casework@ico.org.uk)

Any complaint to the Information Commissioner is without prejudice to your right to seek redress through the courts.

### **Contact details**

The data controller for any personal data collected as part of this Interim Report is HM Treasury, the contact details for which are:

HM Treasury  
1 Horse Guards Road  
London  
SW1A 2HQ

020 7270 5000

[public.enquiries@hmtreasury.gov.uk](mailto:public.enquiries@hmtreasury.gov.uk)

The contact details for HM Treasury's Data Protection Officer (DPO) are:

The Data Protection Officer  
Corporate Governance and Risk Assurance Team  
Area 2/15  
1 Horse Guards Road  
London  
SW1A 2HQ

[privacy@hmtreasury.gov.uk](mailto:privacy@hmtreasury.gov.uk)

## HM Treasury contacts

This document can be downloaded from [www.gov.uk](http://www.gov.uk)

If you require this information in an alternative format or have general enquiries about HM Treasury and its work, contact:

Correspondence Team  
HM Treasury  
1 Horse Guards Road  
London
