- *Dramatic and prominent hills such as Brent Knoll, the Isle of Avalon and Barrow Mump, rising above the Levels and Moors.*
- *Sparse tree cover on Levels and Moors contrasting with woodland, hedges and orchards of surrounding hills.*
- *Sparsely populated Moors but settlements common on hills, ridges and islands.*
- *Historic landscape strongly evident in features ranging from prehistoric trackways and lake villages, to post-medieval enclosures and peat working.*
- *International nature conservation significance for wetland, waders and waterfowl.*
- *Narrow dune belt fringing Bridgwater Bay.*
- *Raised rivers and levees, with main roads and causeways flanked by houses. Flooding in winter over large areas."*

22.5.41 Approximately 5km to the south-west of the HPC development site rises the Quantock Hills National Character Area (NCA 144). The Quantock Hills is described as an open moorland and heath covered ridge, from which wide views (reputedly over nine counties) are possible. The eastern slopes are described as gently undulating and farmed, with a mixture of hedged pasture and arable land. This contrasts to the steeper western slopes which are deeply dissected by thickly wooded combes below the springline. The open and exposed summits are described as being devoid of settlement and possessing an air of solitude and wilderness, imparting a feeling of space and remoteness.

22.5.42 Key characteristics of the Quantock Hills include (Ref. 22.32):

- *"Central high, heathland ridge, with some beech clumps.*
- *Irregular field patterns and farmsteads in sheltered fringes.*
- *Steep wooded valleys and lower slopes, commonly with former deer parks. Beech copses and lines are characteristic.*
- *Red sandstone and shales used in older buildings and giving colour to the soils.*
- *High archaeological interest of Bronze Age monuments such as burial mounds."*

22.5.43 Approximately 14km to the west of the HPC development site is the Exmoor National Character Area (NCA 145). Exmoor is described as an extensive upland landscape displaying strong contrasts between open moorland, sheltered hollows, steep valleys and wooded slopes. The assessment notes that from the rolling moorlands at its centre, there are wide views across a largely treeless landscape. It goes on to describe the whale-back ridges and steep combes forming a "*spectacular coastline*".

22.5.44 The central moorlands are described as possessing a remote upland character and being largely devoid of settlement. Towards the outer edges of the moor and the Brendon Hills heather moorland is common, but the central areas of Exmoor are often cloaked in purple moor grass. The moorland edge is characterised by rectangular fields dating to the 19^{th} century. In more sheltered areas there is an older landscape of scattered farmsteads, hedged fields and sunken lanes.

22.5.45 Key characteristics of Exmoor include (Ref. 22.32):

- *"A diverse upland landscape, rising abruptly out of the surrounding lowlands and ending in a high and spectacular cliffed coastline with coastal heath at the edge of the Bristol Channel.*
- *Central high, treeless heather and grass moorlands used for rough grazing.*
- *Extensive 19th century moorland-edge enclosures and farms with beech-topped hedgebanks and beech windbreaks.*
- *Steep, wooded inland valleys and steep, coastal combes.*
- *Regular, straight-sided fields usually enclosed by earth banks and stone walls.*
- *Villages and farmsteads nestle in sheltered valley bottoms.*
- *Wooded lower slopes in some places, some with former deer parks.*
- *Slates and sandstones used in older buildings.*
- *Complex and visually outstanding coastline of headlands, steep cliffs and coves.*

- *High archaeological interest of Bronze Age monuments such as hill-forts."*

22.5.46 Approximately 17km to the north east of the HPC development site is the Mendip Hills National Character Area (NCA 141). The NCA is described as rising abruptly out of the flat landscape of the Somerset Levels and Moors to the west and combing classic features of a karst landscape, including cave and river systems with complex ritual, industrial and agricultural landscapes extending in time from the prehistoric period to modern quarrying.

22.5.47 The central feature of the Mendip Hills is described as a gently undulating limestone plateau with an outstanding assemblage of prehistoric features on which sits a rectilinear pattern of 18th century fields. Contrasting to the plateau are four outcrops of Old Red Sandstone. Here heathland and acid grassland mark a sharp contrast to the remainder of the landscape which is mainly agriculturally improved pasture. Settlement is mainly in the form of scattered farmsteads, often with clusters of wind-shaped trees around them. Trees are otherwise described as being scarce.

22.5.48 Compact villages are noted at the foot of the steep slopes that surround the plateau, with the slopes above displaying a mosaic of woodland and scrub, small fields and the remnants of sheep walks. To the west of the plateau, the land breaks up into groups of individual hills narrowing to a prominent ridge at Brean Down, beyond which the limestone islands of Steep Holm and Flat Holm emerge from the Bristol Channel.

22.5.49 The key characteristics of the Mendip Hills include (Ref. 22.32):

- *"A chain of prominent hills extending inland from the cast and rising up sharply from surrounding lowlands.*
- *An open, largely treeless, limestone plateau with karst features, cave systems, dry stone walls and sparse settlement.*
- *Dramatic gorges, cliffs and escarpment slopes around the plateau.*
- *A sharp contrast between the open plateau and steep escarpment slopes of the karst landscape and the more complex, gentler landforms in the east.*
- *Many industrial archaeological sites reflecting the lead, coal and cloth industries.*
- *Perpendicular church towers.*
- *Country houses in the east with wooded parks.*
- *Buildings in local stone with pantile roofs: stones include grey limestone, reddish dolomitic limestone and grey or honey-coloured oolitic limestone.*
- *Outstanding prehistoric ritual landscapes."*

Wales

22.5.50 At the national scale of assessment in Wales, the Countryside Council for Wales (CCW) has developed a draft 'Landscape Character Map' (Ref. 22.31) to map and describe the broad variations in character that can be identified across the country. The draft assessment identifies 48 regional scale landscape character areas (RLCA); each one possessing a distinct sense of place. It is noted that within each area different parts will have their own identity as well, and as such reference is made to CCWs LANDMAP landscape information system.

22.5.51 With reference to draft character area descriptions supplied by CCW, part of two regional scale character areas lie within the LVIA study area (refer to **Figure 22.5**).

22.5.52 Approximately 18.5km to the north of the HPC development site is the Cardiff and Newport Regional Character Area (RLCA 35).

22.5.53 This intensively urbanised area is dominated by Cardiff and Newport and occupies the lowland margins to the south-east of the South Wales coalfield. The landscape us underlain by a varied geology of mudstones, sandstones and occasional limestone outcrops. A number of major rivers cut through the area, and through glacial moraine features.

22.5.54 The sense of place is dominated by built up areas, notably Cardiff, Newport and the towns of Cwmbran, Penarth and Barry. The rural landscape between these built up areas is typically a patchwork of medium sized, hedged pastoral fields with broadleaved woodlands, sometimes penetrating urban areas.

22.5.55 The M4 and other transport infrastructure are noted as dominating parts of the landscape. The assessment also makes reference to the oil refinery near Sully as standing prominent on the skyline of the surrounding agricultural landscape. Despite the influence of urban areas, the assessment records that the open rural landscape between the urban areas is under pressure but is tranquil in areas away from major transport corridors.

22.5.56 The town of Barry is noted as being best known for its pleasure beach. The assessment adds that its docks are being redeveloped and that the town retains an industrial character with its large chemical works which draw the eye at night with its lit structures.

22.5.57 The assessment also notes that the landscape and coast between Pennarth and Barry is partly urban fringe in character and includes the Cosmeston Lakes Country Park. The coast is described as having features of interest including cliffs, coves and wave platforms and includes the distinctive Sully Island and Lavernock Point with its views to Flatholm and the Somerset Coast.

22.5.58 Approximately 19km to the north-west of the HPC development site is the Vale of Glamorgan Regional Character Area (RLCA 36).

22.5.59 This is a described as a distinctive lowland landscape, largely comprising a rolling Blue Lias limestone plateau. Older Carboniferous Limestone outcrops from areas of higher ground and Triassic mudstones define the eastern area. The Piedmont ice deposited glacial till across the landscape contributing to its undulating topography.

22.5.60 A variety of land uses define the area, including dairying, sheep rearing, arable, pony paddocks and pig rearing. A mixture of field patterns and sizes is evident, enclosed by hedges or hedge-banks, with frequent hedgerow trees. Limestone walls define land above the cliffs in the west. Frequent woodland clumps, field trees, riparian woodlands and small plantations characterise the eastern area.

22.5.61 In the centre of the Vale compact and historic settlements with limited modern development reinforce the area's distinctive sense of place. However, the assessment also records that many of the Vales villages have expanded with modern housing detracting from their historic character and that a cement works are visually prominent features of the south coast.

22.5.62 The coasts are described as affording a number of attractive beaches. The assessment also records that the rural and historic character of the Vale engenders a strong sense of enclosure, tranquillity, intimacy and timelessness and that long and attractive views are possible from the coast across the Bristol Channel to Somerset.

iv. Local Landscape Character

22.5.63 Many planning authorities, AONB Units and National Park Authorities in England have undertaken assessments of their administrative or designated areas in order to contribute a greater level of detail and local relevance to the national scale character assessment.

22.5.64 In order to understand local landscape character and to provide a basis for assessing the impact of the project on landscape character, several existing studies have been reviewed and their findings verified:

- West Somerset Landscape Character Assessment 1999 adopted in 2006 as part of the West Somerset Local Plan (Ref. 22.33);
- The Sedgemoor District Landscape Assessment and Countryside Design Summary 2003 (Ref. 22.34);
- North Somerset Landscape Character Assessment 2005 (Ref. 22.35);
- Landscape Assessment of the Mendip Hills AONB 1999 (Ref. 22.36);
- Somerset and Exmoor Historic Landscape Characterisation Project 1999-2000 (Ref. 22.37);
- Landscape Character Assessment of the Borough of Taunton Deane 2008 (Ref. 22.38); and
- The Quantock Hills Landscape (Ref. 22.39).

22.5.65 These landscape character assessments have been undertaken at different times, draw on different best practice guidance and in some cases have been undertaken for overlapping geographies. As such it was necessary to draw their findings together to establish a composite map and description of local landscape character for the LVIA study area.

22.5.66 To supplement information contained in published landscape character assessments for terrestrial areas, the LVIA also maps and describes five seascape character areas within the LVIA study area, extending to the low water mark.

22.5.67 The assessment of local seascape character draws on relevant information from the West Somerset Landscape Assessment (Ref. 21.33) and Sedgemoor Landscape Character Assessment (Ref. 21.34) supplemented with field survey by qualified landscape professionals. Reference has also been made to the Bridgwater Bay to Bideford Bay Shoreline Management Plan (Ref. 21.40).

22.5.68 As illustrated on **Figures 22.6** and **22.6a**, parts of nine local landscape character areas (LLCAs) and 5 local seascape character areas (LSCAs) lie within the study area for local landscape character. Descriptions of all relevant LLCAs and LSCAs follow.

Quantock Vale LLCA

22.5.69 The HPC development site is located within the Quantock Vale local landscape character area, which comprises four distinct sub areas; Eastern Lowlands, Coast, Wick Moor and Coast; and Wall Common and Coast. The principal source for the following description is the West Somerset Landscape Character Assessment.

22.5.70 The Quantock Vale local landscape character area is a flowing lowland landscape of valleys and gentle hills although the Quantock ridge is noted as being a dominant feature to the south-west. In common with most of the district, the landform is overlain by an essentially agricultural landscape of small fields, hedges, hedgerow trees and small woodlands. Stogursey is the only village of significant size but there are several small settlements and numerous farms. The lowlands define this character area, but two small areas of marsh and coast are locally distinctive.

22.5.71 The Eastern Lowlands sub area, in which the existing Hinkley Point Power Station Complex and HPC development site are located, is an extensive tract of low rolling hills where variations in landform and soils do not appear to have had a significant influence on vegetation and land use patterns. Medium sized deciduous woodlands and copses are noted as being scattered throughout the area and reference is also made to mixed species hedgerows and hedgerow trees as a key characteristic.

22.5.72 Within this long settled area, the only village of any size is Stogursey. All other settlements are small, nucleated villages and hamlets and farms. The existing Hinkley Point Power Station Complex is described as a notable modern development, but that it is not as visually dominant from within the area as might be expected, although it is acknowledged that it is a significant feature in views of the area from the Quantock Hills. Overhead lines are described as locally dominant features.

22.5.73 The coastal element of the Eastern Lowlands sub area is described as an erodible cliffed coastline with the cliffs fronted by a wave cut, intertidal rock platform; both of which are noted as being of geological and geomorphological interest. Other areas, such as land slips are also described as being of biodiversity interest. In comparison to other areas of the coast, the coastal element of the Eastern Lowlands landscape character sub area is described as containing virtually no settlement or tourist development.

22.5.74 The Wick Moor and Coast sub area is a finger of coastal marsh immediately to the east of Hinkley Point. The area is predominantly used as grazing marsh in the summer and some scrub is evident along the lines of drainage ditches. Subject to flooding, the marsh is of high nature conservation value. A submarine forest is also noted as being of importance for marine archaeology. Lying below 10m Above Ordnance Datum (AOD) the area is described as open and bleak. The existing Hinkley Point Power Station Complex is described as being visually dominant on this landscape.

22.5.75 Wall Common and Coast shares characteristics with the Wick Moor and Coast sub area. However, reference is also made to a series of low cobble embankments separating fields from the sea and a strip of salt marsh to the seaward side. The coast is noted as being of high nature conservation value.

22.5.76 The landscape character sensitivity of the Quantock Vale local landscape character area is judged to be **medium**. Landscape character is currently influenced by the existing Hinkley Point Power Station Complex which has varying visual prominence dependent on location and the influence of localised characteristics such as landform and vegetation. The majority of the character area is not designated at the national or local authority scale for its landscape or biodiversity value. However, some areas, notably in the west of the character area beyond the HPC development site boundary are designated as an area of outstanding scenic interest. Only a very small part of its western fringe is designated as AONB. The landscape character area also contains areas designated for their nature conservation interest, notably along the coastline.

22.5.77 Further descriptions of Quantock Vale sub character areas and the assessment of their sensitivity are provided below in a separate, more detailed analysis of Quantock Vale landscape character.

Doniford Stream and Quantock Fringe LLCA

22.5.78 The principal sources for the following description are the West Somerset Landscape Character Assessment (Ref. 22.33) and The Quantock Hills Landscape (Ref. 22.39).

22.5.79 Along the northern boundary of the Quantock Hills AONB, the main ridge is fringed by productive farmland that sweeps down to the coastline affording open views across Bridgewater Bay. The steeper foothill slopes remain under pastoral land uses, whereas where gentler gradients occur near the coast, larger, rectangular hedged fields are characteristic. Evidence suggests these have been cultivated for many hundreds of years, and they retain arable weeds in the field margins that are usually associated with traditional land management. This relatively low lying narrow band of land has long been an important communication route and now carries the A39. Its strategic importance and the productivity of the land led in the Middle Ages to the development of two estate villages at East Quantoxhead and Kilve.

22.5.80 To the west, and largely outside the AONB boundary lies the Doniford valley. The landscape is characterised by a similar pattern of hedged fields albeit with more extensive areas of woodland and frequent copses. The valley has a distinct linear quality being enclosed by elevated landform; to the east by the Quantock ridge and to the west by the Brendon Hills. The western slopes of the Quantock ridge, below the wooded scarp, are characterised by an apron of enclosed pastoral landscape. Streams issuing from the steep combes continue in shallow depressions creating wetland flushes with damp grassland and patches of willow and alder. This fringe is dominated by the rising landform of the hills and several villages, including Bicknoller sit along the spring line at the foot of the scarp.

22.5.81 The coastal edge of the AONB is considered to be of international geological importance. Here low cliffs of interbedded limestone and mudstone are being gradually eroded by the sea to reveal the foreshore landscape and the fossil remains of many animals. Despite some tourist development, the AONB coastline retains an exposed, wild character that contrasts to the productive, enclosed inland scenery of the northern Quantock foothills.

22.5.82 The sensitivity of the Doniford Stream and Quantock Fringe landscape character is assessed as **medium**. Although the coastal part of this LLCA is of higher sensitivity due to its location within an AONB, the existing Hinkley Point Power Station Complex has a very low prominence within this area due to topography and distance. The majority of the character area is not designated at the national or local authority scale for its landscape or scenic interest or biodiversity value.

Central Quantocks LLCA

22.5.83 The principal sources for the following description are the West Somerset Landscape Character Assessment (Ref. 22.33) and The Quantock Hills Landscape (Ref. 22.39).

22.5.84 The Central Quantocks comprises a high plateau underlain by Devonian sandstones known as the Hangman Grits. The plateau rises into smooth, rounded summits cut by deep combes, creating the characteristic landform of repeating ridges and valleys. Woodland, at one time common, now only remains on the steep combe sides and on some of the eastern hill flanks. The loss of woodland on the summits led to the degradation of hilltop soils and they now support a heathland cover that is managed as common land of great ecological value.

22.5.85 The open summits and combes with heathland is one of the most distinctive landscape types in the AONB. It is a rolling landscape where the elevation, exposure and long views engender a sense of wilderness, isolation and solitude. The low heathland vegetation reveals the distinctive landform and permits long views beyond the hills and down through the combes. The plateau has a long history of human use. It formed part of a Bronze Age ritual landscape and the remains of barrow cemeteries can be found on many high summits, ridges and spurs. Dowsborough Hill is also significant as the site of an Iron Age hillfort with views over the surrounding lowlands. The existing Hinkley Point Power Station Complex is a visible feature in panoramic views to the east.

22.5.86 The open combes dissect this upland plateau. They lead gently from the foothills to the summits where they open out to reveal unexpected views and panoramas, framed by landform. The effect is made more dramatic by the juxtaposition of enclosed sheltered valleys and open exposed summits.

22.5.87 On the eastern flanks of the northern portion of the Quantock Ridge, deep wooded combes are characteristic. Here the steep valley sides are clothed with western oak woodland which merges with the moorland at the head of the combes and on their upper slopes. Here the trees are severely wind pruned and sculpted by strong westerly winds. The valleys are threaded with well-used paths up onto the hilltops where the woodland falls away to reveal panoramic views.

22.5.88 On the western edge of the ridge is a wooded scarp which falls steeply from the upland plateau down to the rich agricultural land of the Quantock Vale. The steep slope and smooth crest are distinctive features in views to the hills. The slopes are generally well wooded with broadleaved copses, forestry plantations and medieval and designed parklands. Lines of beech often cut sharply across the contours and are a particularly dominant feature where they descend down the spurs.

22.5.89 The sensitivity of the Central Quantocks landscape character is assessed as **high** due to its location within the Quantock Hills AONB. The open, elevated summits of

NOT PROTECTIVELY MARKED

the Central Quantocks have very distinctive landscape characteristics, high scenic value, and provide long distance views in all directions.

Quantock Hills LLCA

22.5.90 The principal sources for the following description are the Sedgemoor District Landscape Assessment and Countryside Design Summary 2003 (Ref. 22.34) and The Quantock Hills Landscape (Ref. 22.39).

22.5.91 The southern part of the AONB is generally underlain by younger, softer rocks which have been weathered to create lower, rounded undulating hills that carry a mantle of enclosed farmland. The surrounding farmland is made up of a patchwork of small pasture fields with mature hedgerows and some larger arable fields. The landscape is described as small scale and domestic with settlement clustered in small hamlets villages and farmsteads. The landscape includes long gentle combes draining eastwards which combine with the undulating topography to create an interior landscape of complexity and variety.

22.5.92 The open southern summits are isolated from the main block of heathland. They are rounded and open and rise up from the surrounding enclosed agricultural landscape echoing the more expansive heathland summits of the northern plateau, albeit lacking the same qualities of remoteness and wilderness. The sense of openness is also diminished, notably because of the fringe of developing woodland and scrub. The existing Hinkley Point Power Station Complex is a visible feature in panoramic views to the east.

22.5.93 Between the open southern summits is a landscape of rolling hills and fringes. The landscape is characterised by soft rounded hills and long, low ridges rolling gently down to the Vale of Taunton Deane and the Somerset Levels. These green foothills are enclosed by a patchwork of mature hedgerows. The fields are mainly permanent pasture, although some areas have been converted to arable production, notably on the long ridges running south eastwards. Where intact field patterns survive, they are of considerable historic interest and in places reflecting Iron Age patterns or phases of Saxon and medieval expansion. Some parts of the higher land have been converted to coniferous plantations and are recorded as having had a significant visual impact within this intimate pastoral landscape.

22.5.94 Long combes drain the hills eastwards. They have gentler gradients than those to the west and are covered by a patchwork of hedged pastures created by medieval and earlier enclosures. Some steeper valley sides have retained woodland and small patches of semi improved grassland. Many combes contain narrow lanes winding up the valleys, sometimes bordered by stone faced hedgebanks bound by the roots of beech trees. Villages shelter in the combes although farms are dispersed along the valleys.

22.5.95 The sensitivity of the Quantock Hills landscape character is considered to be **high** due to its strongly distinctive character and scenic quality. The combination of landform and topography means that these landscapes are particularly vulnerable to change as they are frequently seen in views within and across the AONB, both from the hilltop summits and the many lanes that cross the area.

Central West Somerset LLCA

22.5.96 The principal source for the following description is the West Somerset Landscape Character Assessment (Ref. 22.33).

22.5.97 Central West Somerset is an area of rolling or undulating hills, rarely over 100m AOD, divided by numerous streams and rivers in generally narrow but not exceptionally steep valleys. The hills of Exmoor and the Quantocks visually enclose this area yet the sea to the north creates openness to the view.

22.5.98 Essentially this is an ancient agricultural landscape of small fields, hedges, hedgerow trees and small woodlands but it also contains the main settlements of the district as well as numerous farms, hamlets and villages. The enclosure provided by the surrounding hills and the sea gives this area a cohesion which is difficult to divide. Therefore, this area is considered as two simple sub areas, namely Carhampton to Quantock Coastal Hills and The Coast (Blue Anchor to St Audries).

22.5.99 Carhampton to Quantock Coastal Hills sub area is characterised by a distinctive field pattern form which it is possible to read to medieval influence on landscape. Hillsides contain numerous tree groups and copses and some medium sized woodlands, which create a localised sense of enclosure often combined with undulating topography. This complex pattern is enriched by numerous hedges and hedgerow trees and small settlements, hamlets and farms.

22.5.100 The Coast (Blue Anchor to St Audries) sub area is characterised as an erodible cliffed coastline with wave cut, intertidal rock platform fronting the cliff. Both are of considerable interest for their geological and geomorphological features. The sub area also contains some nationally important examples of coastal flora. The development of caravan sites has led to some localised visual impact on the character of the coastline.

22.5.101 The sensitivity of the Central West Somerset landscape character is assessed as **medium** being of moderately distinctive character and scenic quality. Landscape character is currently influenced by modern development and the majority of the character area is not designated at the national scale for its landscape value. However, some areas are designated as an area of outstanding scenic interest. The landscape character area also contains areas designated for their nature conservation interest, notably along the coastline.

Lowland Hills LLCA

22.5.102 The principal source for the following description is the Sedgemoor District Landscape Assessment and Countryside Design Summary 2003 (Ref. 22.34).

22.5.103 The Lowland Hills rise out of the low and wet landscape of the Levels and Moors and are a series of hills and isolated knolls. The hills historically provided dry land for village settlements and agriculture. Settlement patterns vary between hills from significant, large villages through to a dispersed pattern of hamlets and farmsteads. Use of local stone, dominantly lias limestone, as a building material is common. Hedgerows are the most significant vegetation and vary from being unmanaged and outgrown with many mature trees to lower flailed forms. The area includes land of similar key characteristics lying within parts of two National Landscape Character

Areas; 146 Vale of Taunton and Quantock Fringes and 142/143 Somerset Levels and Moors/Mid Somerset Hills.

22.5.104 The sub areas within this landscape character area of particular relevance to the proposed development site are Quantock Foothills, Stockland Hills, Polden Hills and Isolated Hills.

22.5.105 Quantock Foothills sub area is characterised by low, broad, rolling, hills forming a transition to the steeply folded AONB. The undulating topography contains an ancient network of lanes and field patterns and a scatter of settlements and farms punctuates the landscape. It contains numerous small deciduous woodlands and some remnant parkland landscapes. However, it is a predominantly farmed landscape, with field boundaries demarcated by hedgerows with hedgerow trees, such as ash (*Fraxinus excelsior*) and oak (*Quercus robur*). The area is drained by a number of small streams and brooks, many of which run to the River Parrett. The M5 and overhead lines are described as a notable feature within this sub area.

22.5.106 The Stockland Hills sub area is similar to Quantock Foothills in that it is characterised by low, broad, rolling hills which form a transition between the steeply folded AONB and the wetlands of the Levels and Moors landscape character area but the Stockland Hills are more diverse and smaller in scale. This area has also a strong relationship with the coastal and estuarine areas. Small hills, such as Cannington Park Hill Fort, are present in the area. The area contains a patchwork of larger arable and small pasture fields, unmanaged hedgerows and small woodlands. Settlement in this area includes the old port of Combwich and a small settlement of Stockland Bristol.

22.5.107 The Polden Hills sub area is a long low ridge of variable topography which cuts across the levels, with steeper slope and hillocks to the south and shallower gradients to the north. To the west the area is characterised by small scale agricultural land with hedgerows and trees, particularly ash and oak, and frequent small orchards. A string of loosely rectilinear settlements dating from medieval and Saxon Periods exists along north side of ridge, where there is a sense of unspoilt, peaceful rural charm.

22.5.108 The Isolated Hills sub area is characterised by isolated hills rising out of the levels, visually dominant landmarks and landscape components similar to those of Polden or Wedmore Hills, but with blocks of woodland on steeper slopes. These hills were a natural location for early settlement which has developed on some of them. A sense of rural isolation prevails and long views over surrounding areas can be experienced in this area.

22.5.109 The sensitivity of the Lowland Hills landscape character is assessed as **medium** being of moderately distinctive character and scenic quality. The character area is not designated at the national scale for its landscape value. However, some areas are designated for their nature conservation interest, notably along River Parrett.

Levels and Moors LLCA

22.5.110 The principal source for the following description is the Sedgemoor District Landscape Assessment and Countryside Design Summary 2003 (Ref. 22.34).

22.5.111 The Somerset Levels and Moors are a vast area of drained wetland with limited tree cover and a strong sense of openness. The Moors are an area of summer pastures criss-crossed with a geometric pattern of rhynes, long straight access droves and distinctive pollarded willows (*Salix spp.*) or hawthorn (*Crataegus monogyna*) hedgerows. The Levels and Moors landscape contains several distinctive sub areas. These are described below.

22.5.112 The Levels sub area is characterised by lowland areas on largely flat landscape with irregular field pattern defined by a combination of drainage channels, hedgerows and hedgerow trees. The areas close to the coast are generally open and windswept. Hedgerows are widespread throughout the Levels except in the open coastal areas. Despite the area being the location of urban areas, coastal holiday sites and the M5 motorway, much of the countryside retains a strong sense of remoteness and unspoilt rural character.

22.5.113 The Estuarine Levels sub area has similar characteristics to Levels sub area, but is less developed and more tranquil than the Levels and has a strong relationship with the coastal and estuarine areas. The area around the River Parrett contains a number of environmental designations of international and national importance.

22.5.114 The sensitivity of the Levels and Moors landscape character is assessed as **high** being a landscape of highly distinctive character and scenic quality and an important component of a distinctive Somerset landscape. Much of the western part of this LLCA has a highly remote, rural character and as such is particularly vulnerable to change.

LLCA Limestone Ridges and Combes

22.5.115 The principal source for the following description is the North Somerset Landscape Character Assessment (Ref. 22.35).

22.5.116 Limestone Ridges and Combes are characterised by steep escarpment slopes forming a distinctive and visible topographic feature rising above and creating the backdrop to the low lying areas of the North Somerset District. This LLCA is known for an outstanding collection of historic monuments, earthworks (hillforts) along the scarp top and local legends associated with the gorges/cleeves. The slopes are wooded, with large-scale mixed and deciduous plantations and extensive areas of ancient woodland. Spring line settlement is concentrated along road following the foot of the escarpment ridge. Hidden, deep wooded combes/gorges extend into the scarp slopes providing important historic routeways and now steep, winding rural lanes. This intimate, enclosed wooded landscape is counterbalanced by occasional dramatic and views out to the surrounding lowlands. The field pattern is a mosaic of medieval and post medieval enclosure.

22.5.117 The Mendip Ridge sub area is of particular relevance to this assessment as it provides long distance views towards the west and the existing Hinkley Point Power Station Complex. It is characterised by steep scarp slopes clothed in broad leaved and mixed woodland forming distinctive backdrop to the surrounding low lying areas. Its dramatic combes form routes for winding rural roads often with exposed geology of grey Limestone. The summits are typically grassland plateaus while lower slopes contain pastures in fields bounded by hedgerows. Settlement is sparse with a few scattered stone farmsteads on the plateau and villages centred on historic stone churches on lower slopes. This sub area is known for its rich heritage of historic landscape features, notably the Bronze Age hill fort on Banwell Hill.

22.5.118 The sensitivity of the Limestone Ridges and Combes landscape character area is assessed as **high** being a landscape of strongly distinctive character and scenic quality located within the Mendip Hills AONB.

LLCA Mendips

22.5.119 The principal source for the following description is the Sedgemoor District Landscape Assessment and Countryside Design Summary 2003 (Ref. 22.34).

22.5.120 The Mendip Hills rise from the steep scarp slope on the northern edge of the Sedgemoor District, dominating views from much of the lowland areas and the Isle of Wedmore. The south face of the Mendip Hills presents a dramatic landscape, rising from the low and flat landscape of the Levels, through a narrow band of fertile farmland and settlements, to the steep scarp face with deciduous woodland, enclosed pastures, open heath and downland and a relatively bare plateau skyline. The area contains many pre-historic features and intact medieval patterns. Much of the plateau is a landscape of large fields contained by drystone walls, the unenclosed heathland and downland of Wavering Down, Crook Peak and Brean Down retain a more natural character.

22.5.121 The sub areas within this landscape character area of particular relevance to the proposed development site are Scarp slope, West Mendip Summits and Cheddar Gorge, and Brean Down.

22.5.122 The Scarp slope, West Mendip Summits and Cheddar Gorge sub area rises steeply to a height of 190m to 250m AOD. The relatively steep hillside land is cloaked by a mixture of open downland, heath, deciduous woodland and pasture. Unenclosed heath and downland is the dominant feature of the western part of this zone, giving a distinctly upland character and dramatic contrast with the pastoral Levels landscape it overlooks. The bare skyline includes the distinctive profile of Crook Peak.

22.5.123 The Brean Down sub area is an outlier of the Mendips standing isolated at the mouth of River Axe. It rises to over 90m AOD and has steep cliffs on all sides. Rising abruptly above the estuary and the Levels it is an imposing landmark. It is characterised by the open grassland with panoramic views and is a popular destination for local residents and visitors to the area.

22.5.124 The sensitivity of the Mendips local landscape character area is considered to be **high** being a landscape of strongly distinctive character and scenic quality located within the Mendip Hills AONB with a strong historic influence, including rich historic landscape. Its elevated topography provides dramatic views towards Bridgwater Bay and further towards the Quantocks and Exmoor.

Blue Anchor to St Audries Bay LSCA

22.5.125 The Blue Anchor to St Audries Local Seascape Character Area (LSCA) falls within the Central West Somerset LLCA defined by West Somerset Landscape Character Assessment. The principal sources for the following description are the West Somerset Landscape Character Assessment (Ref. 22.33) and The Bridgwater Bay to Bideford Bay Shoreline Management Plan (Ref. 22.40).

22.5.126 The LSCA is described as an erodible cliffed coastline with the cliffs fronted by a wave cut, intertidal rock platform; both of which are noted as being of geological and geomorphological interest and designated as SSSI. Other areas, such as land slips are also described as being of biodiversity interest. In comparison to other areas of the coast, this LSCA contains only sporadic developments, such as the small harbour of Watchet and a variety of holiday camps, separated by areas of woodland and agricultural land, which is a dominant feature east of Blue Anchor.

22.5.127 The predominantly residential town of Watchet was once a commercial port, however industry which supported it has declined and the harbour is now confined to leisure use. Watchet has a station on the West Somerset Railway, which brings thousands of tourists each year. The railway and the coast road run close to the coast east of Watchet. Beyond this lies Doniford, which has a holiday village and caravan park, surrounded by agricultural land, and St Audries Bay, where there is a cliff top chalet park.

22.5.128 The LSCA contains areas of higher landscape value and part is designated as an area of outstanding scenic interest. An eastern part of this LSCA is adjacent to the Quantock Hills AONB. The existing Hinkley Point Power Station Complex has very low prominence when viewed from the majority of this character area due to the alignment of the coastline and topography.

22.5.129 The landscape character sensitivity of the Blue Anchor to St Audries local seascape character area is judged to be **high** due to its distinctive landscape character and a part of the LSCA being designated as an area of outstanding scenic interest.

St Audries Bay to Hinkley Point LSCA

22.5.130 St Audries Bay to Hinkley Point LSCA, as defined within the West Somerset Landscape Character Assessment. The principal sources for the following description are the West Somerset Landscape Character Assessment (Ref. 22.33) and The Bridgwater Bay to Bideford Bay Shoreline Management Plan (Ref. 22.40).

22.5.131 St Audries Bay to Hinkley Point is essentially a continuation of the coast from Blue Anchor Bay to St Audries. It falls within the Quantock Vale LLCA and is also described as an erodible cliffed coastline fronted by wave cut, intertidal rock platforms of geological and geomorphological interest, designated as SSSI. The LSCA has continuous undeveloped land along the coast, used primarily for agriculture and differs from the Blue Anchor to St Audries section in that there is virtually no settlement or tourist development. The settlements of East Quantoxhead, Kilve, and Lilstock are set slightly back from the coast which remains largely undeveloped. To the east of Lilstock the majority of the coast is of international nature conservation importance, and is also designated as a NNR. There are small areas at Kilve and Lilstock liable to flooding, giving way to a low coastal slope towards Hinkley Point.

22.5.132 Between St Audries and Quantocks Head, the coastline forms part of the Quantock Hills AONB designation and is also designated as an area of outstanding scenic value. The HPC development site lies within the eastern part of this LSCA and is a dominant feature on this otherwise undeveloped part of the Somerset coastline.

22.5.133 The landscape character sensitivity of the Blue Anchor to St Audries LSCA is judged to be **high** due to its distinctive landscape character in particular around East

Quantockshead and large part of the LSCA being designated as an area of outstanding scenic interest.

Hinkley Point to River Parrett LSCA

22.5.134 The principal sources for the following description are the West Somerset Landscape Character Assessment (Ref. 22.33), Sedgemoor District Landscape Assessment and Countryside Design Summary 2003 (Ref. 22.34) and The Bridgwater Bay to Bideford Bay Shoreline Management Plan (Ref. 22.40).

22.5.135 Hinkley Point to River Parrett LSCA falls within the Quantock Vale Landscape Character Area as defined in the West Somerset Landscape Character Assessment and the Levels and Moors Landscape Character Area (Estuarine Levels sub area) as defined in the Sedgemoor Landscape Character Assessment.

22.5.136 The entire LSCA lies adjacent to the predominantly flat landscape of eastern Quantock Vale and coastal Levels and Moors and the entire intertidal area is of international nature conservation importance for migrant bird populations. No landscape designations of international or national importance exist within this area. Stolford and Steart are the only settlements along the coastline within this area, which otherwise has a largely undeveloped character.

22.5.137 The existing Hinkley Point Power Station Complex is a visually dominant feature when viewed from this flat, open landscape. Agriculture continues to dominate the coast east of the existing Hinkley Point Power Station Complex and cliffs are absent on this part of the coastline.

22.5.138 The landscape character sensitivity of the Hinkley Point to River Parrett LSCA is judged to be **medium** due to its moderately distinctive landscape character. Furthermore, no national landscape designations are present in this area.

Burnham-on-Sea to Brean Down LSCA

22.5.139 Burnham-on-Sea to Brean Down LSCA falls within the Levels and Moors Landscape Character Area. The principal sources for the following description are the Sedgemoor District Landscape Assessment and Countryside Design Summary 2003 (Ref. 22.34) and The Bridgwater Bay to Bideford Bay Shoreline Management Plan (Ref. 22.40).

22.5.140 This LSCA is characterised by broad open landscape of sand dunes, mud flats and river estuaries. The dunes have created a slightly higher strip of land along which the coastal settlements have developed and there is almost uninterrupted development along this part of the coastline, which is characterised by a mixture of residential, commercial, tourism and leisure interests. Burnham-on-Sea is the largest development on this west facing stretch of coastline. To the north, and adjacent to Berrow flats, are the tourist developments of Berrow and Brean.

22.5.141 The estuarine flats are an important, designated area for nature conservation. The dunes and long flat sandy beaches are a popular tourist destination. Caravan sites, some coastal residential development and a golf course are a linear development along the coastline in the northern part of the area, while the southern part of the LSCA is dominated by the urban area of Burnham-on-Sea with its historic seafront buildings and a pier.

22.5.142 The landscape character sensitivity of the Burnham-on-Sea to Brean Down LSCA is judged to be **medium** due to its moderately distinctive landscape character and the influence of Burnham-on-Sea and other settlements, including a number of caravan sites. No national landscape designations are located in this area.

Brean Down LSCA

22.5.143 Brean Down LSCA falls within the Mendips Landscape Character Area. The principal sources for the following description are the Sedgemoor District Landscape Assessment and Countryside Design Summary 2003 (Ref. 22.34) and The Bridgwater Bay to Bideford Bay Shoreline Management Plan (Ref. 22.40).

22.5.144 Brean Down is a prominent, undeveloped headland and an outlier of the Mendips standing isolated at the mouth of River Axe. It is an area of high nature conservation and amenity value. It rises to over 90m AOD and has steep cliffs on all sides. It is characterised by open grassland with panoramic views and is a popular destination for residents and visitors. A nineteenth century fort is located at its seaward point.

22.5.145 The landscape character sensitivity of the Brean Down LSCA is judged to be **high** due to its highly distinctive character and scenic quality. Although it is not designated as an AONB or any other national designation, it falls within the Mendips LLCA, and is a very popular tourist destination due to open views of Bridgwater Bay and towards Quantocks and Exmoor.

v. Site Scale Landscape Character

22.5.146 At a local level, the West Somerset Landscape Assessment (Ref. 22.33) encompasses the HPC development site and the surrounding area. The study further refines the local character areas into more detailed sub character areas (see **Figure 22.7**). The HPC development site falls within the Quantock Vale Landscape Character Area, further divided into four local sub character areas, namely; Eastern Lowlands; The Coast (St. Audries to Hinkley Point); Wick Moor and Coast and Wall Common and Coast.

22.5.147 According to the original description of the Wick Moor and Coast Area from the West Somerset Landscape Character Assessment (Ref. 22.33), the middle part of the HPC development site (Holford Stream Valley) would fall within the Wick Moor and Coast sub character area. Following consultation with Natural England and detailed landscape characterisation studies on site, the boundary of this area was refined and its new boundary redrafted to follow the Wick Moor Drove. It has been concluded (and agreed with Natural England) that the landscape character of the Holford Stream Valley (to the south of Green Lane and within the HPC development site) is characteristic of the Eastern Lowlands sub area. This adjustment has been taken into account in this assessment. The landscape character areas shown on **Figure 22.7** illustrate the adjusted boundary between Wick Moor and Coast, and Eastern Lowlands.

22.5.148 Also, due to the large size of the Eastern Lowlands sub character area compared to the other three Quantock Vale sub areas a further sub-division of Eastern Lowlands into four smaller landscape sub character areas has been undertaken. This sub-division is for descriptive purposes for this LVIA and is not intended as a full Landscape Character Assessment of the Eastern Lowlands Area.

22.5.149 The Countryside Agency's (now Natural England) guidance (Ref. 22.28) on landscape character assessment recommends that landscapes are initially characterised and that judgements about the nature and value of these landscapes are then based on this characterisation process. The guidance recommends that the characterisation process should be based on an assessment of natural factors, cultural social factors and aesthetic and perceptual factors. This approach has been used to identify the following site scale landscape character areas.

22.5.150 The four additional sub character areas of the Eastern Lowlands are: Coastal - Lilstock, Rolling Farmland East - Stogursey, Fairfield and Quantock Fringes - Dodington (see **Figure 22.7**).

22.5.151 As a result of this characterisation process, the LVIA identifies six site scale landscape character sub areas of the Quantock Vale, which are carried forward to the assessment of landscape impacts, namely:

- Wick Moor and Coast;
- Wall Common and Coast;
- Coastal – Lilstock;
- Rolling Farmland East – Stogursey;
- Fairfield; and
- Fairfield and Quantock Fringes – Dodington.

22.5.152 The character areas which are excluded from the assessment are Eastern Lowlands (now covered by four more detailed sub areas) and the Coast (St. Audries to Hinkley Point), which overlaps with the St. Audries to Hinkley Point Local Seascape Character Area identified above.

22.5.153 A description of the relevant sub character areas and the assessment of their sensitivity is provided below.

Wick Moor and Coast

22.5.154 The principal source for the following description is the West Somerset Landscape Character Assessment (Ref. 22.33) and field work undertaken as part of the LVIA.

22.5.155 The Wick Moor and Coast sub area is a finger of coastal marsh immediately to the east of Hinkley Point. The land is below 10m AOD and covered with recent alluvial deposits.

22.5.156 The area is predominantly used as grazing marsh in the summer and some scrub is evident along the lines of drainage ditches. Subject to flooding, the marsh is of high nature conservation value, designated as SAC, Ramsar Site, SPA and SSSI. A submarine forest is also noted as being of importance for marine archaeology. Lying below 10m AOD the area is described as open and bleak. Hinkley Point is described as being visually dominant on this landscape. However, due to a lack of development, open views across Bridgwater Bay (to the east), high nature conservation interest and effective screening of the existing Hinkley Point Power Station Complex, this area of landscape is highly valued by the local residents.

22.5.157 The character of this sub character area is strongly influenced by the Bridgwater Bay and the coast. Due to topography and vegetation surrounding the existing Hinkley Point Power Station Complex, the area is visually and physically separated at its western edge from the rural landscape within the Coastal-Lilstock sub character area and to the south. This separation results in a prevailing intimate character and strong relationship with Bridgwater Bay.

22.5.158 The sensitivity of the Wick Moor and Coast character area is assessed as **high** due to the area being designated for its nature conservation interest and its high recreational and amenity value.

Wall Common and Coast

22.5.159 The principal source for the following description is the West Somerset Landscape Character Assessment (Ref. 22.33) and field work undertaken as part of the LVIA.

22.5.160 Wall Common and Coast shares characteristics with the Wick Moor and Coast sub area. The land within Wick Moor is located below 10m AOD and covered with recent alluvial deposits, sands and gravels. Humic alluvial gleyed soils cover these deposits and it is drained by a complex rectilinear pattern of drainage ditches that divide the common into pasture fields. The area is open and bleak, it is used as grazing marsh in the summer and some scrubby vegetation has developed along the line of drainage ditches.

22.5.161 Towards the coast there are low cobble embankments separating fields from the sea and a strip of salt marsh to the seaward side. Similar to Wick Moor and Coast, the coast is noted as being of high nature conservation value, designated as SAC, Ramsar Site, SPA and SSSI. It also forms part of Stert Flats National Nature Reserve.

22.5.162 Two farms are located in the area on rising land toward the Stolford ridge which separates this lowland from Wick Moor to the west.

22.5.163 The sensitivity of the Wall Common and Coast landscape character area is assessed as **medium** due to some recreational and amenity value and its coastline falling within broader nature conservation designations.

Coastal – Lilstock

22.5.164 The principal source for the following description is an assessment of landscape character undertaken as part of this LVIA.

22.5.165 This area lies within the Eastern Lowlands character area to the west of the existing Hinkley Point Power Station Complex and extends approximately 1-1.5km inland from the coastline. The villages of Knighton, Burton, and the adjacent local road indicate the southern boundary of this area in the east and in the west the boundary is defined by the edge of the Quantock Fringes where the land begins to rise towards the Quantock Hills. Levels are typically between 10m and 50m AOD. Land immediately to the south of Lilstock is below 10m AOD. It is a relatively open area of rolling farmland, with few settlements and limited tree cover. It is designated as an area of outstanding scenic interest. The existing Hinkley Point Power Station Complex is a prominent landmark visible along the adjacent coastline however, it becomes less dominant to the west of Lilstock, where rolling topography and vegetation provide a degree of screening from the west. The Quantock Hills form a striking backdrop to the south-west.

22.5.166 Inland, views of the coast are limited due to the coastal cliff. This rolling pastoral landscape of large regular fields is divided by an angular pattern of thick hedgerows and small windswept copses and woodland brakes or shelter belts. The large square field pattern is characteristic of a planned 18th-19th century landscape. Hedgerows are intact and well managed and contain elm (*Ulmus minor*), hawthorn, spindle (*Euonymus europaeus*), blackthorn (*Prunus spinosa*), field maple (*Acer campestre*), dogwood (*Cornus spp.*) and wild privet (*Ligustrum vulgare*) with few hedgerow trees. Shelterbelts contain the same shrub species with larger ash, field maple and oak trees.

22.5.167 Settlement consists of villages set on elevated land to the west with prominent church spires or scattered farm buildings. The predominant building style is generally painted render, pantile, slate or thatch roofs and grey/blue lias stone garden walls. Soils are calcareous sub-soils over underlying Jurassic Lower (Blue) Lias.

22.5.168 The sensitivity of the landscape character area is assessed as **high** due to its nature conservation interest and its designation as an area of outstanding scenic interest.

Rolling Farmland East – Stogursey

22.5.169 The principal source for the following description is an assessment of landscape character undertaken as part of this LVIA.

22.5.170 This is a typically undulating rolling farmland, which flattens out to meet the coastline, and rises gently towards the Stockland Hills in the south and the Quantock Fringes in the west. Land is mainly between 10 and 50m AOD with a few hills rising to 80m in the central and southern part of the area. There are coastal views mainly from northern parts of the area, where the existing Hinkley Point Power Station Complex and the pylons leading to it are prominent landmarks punctuating the skyline. The Quantock Hills dominate views to the south-west.

22.5.171 There is a balance of open grazing fields contrasting with numerous dense copses. Field boundaries are clearly defined by thick hedgerows on raised hedge-banks and ditches forming angular fields. Hedgerows are generally well maintained, dense and species rich including blackthorn, hawthorn, field maple, guelder rose (*Viburnum opulus*) with bramble (*Rubus fruticosus*), iris (*Iris foetidissima*), ivy (*Hedera helix*) and honeysuckle (*Lonicera periclymenum*) ground flora. Hedgerow trees are not characteristic in some areas, which may be explained by the high incidence of English elm.

22.5.172 Rural settlements of Stogursey, Knighton, Burton, Shurton, Stolford and scattered small farms and local roads are characteristic for this area. As a result this area is less tranquil than the Coastal – Lilstock area. Buildings are mainly rendered with red clay pantiles and grey/blue stone walls.

22.5.173 Underlying geology consists of Lower Lias to the north and Mercia mudstones to the south, overlain with calcareous sub-soil and clay sub-soil respectively.

22.5.174 The sensitivity of the landscape character area is assessed as **medium** due to its moderately distinctive character.

Fairfield

22.5.175 The principal source for the following description is an assessment of landscape character undertaken as part of this LVIA.

22.5.176 This area forms part of a planted landscape surrounding Fairfield House (Grade II* Listed Building) and includes the Great Plantation, Fairfield Historic Park and Garden, Fairfield Wood and adjacent farmland. Landform rises from 30m AOD in the east to over 70m AOD in the west. Local views are limited by blocks of woodland. However, there are long distance views towards the coastline.

22.5.177 Fairfield is a mixture of designed parkland with blocks of woodland set in gently rolling farmland made up of medium fields of open pasture and orchards contrasting with some fields of switchgrass (*Panicum virgatum*) grown for biomass. Thick hedgerows of hawthorn, elm and field maple are planted on hedge-banks with ash, oak, horse chestnut (*Aesculus hippocastanum*) and Scots pine (*Pinus sylvestris*) hedgerow trees and mature parkland trees around Fairfield House. There are no villages in this area but a number of farmhouses are evident. Calcareous sub-soils lie on Lower Lias in the north and brown earth loamy clay enriched soils cover Mercia Mudstones in the south.

22.5.178 The sensitivity of the landscape character area is assessed as **high** due to its designation as an area of outstanding scenic interest, and heritage value associated with the Fairfield House and the Fairfield Historic Park and Garden.

The Quantock Fringes – Dodington

22.5.179 The principal source for the following description is an assessment of landscape character undertaken as part of this LVIA.

22.5.180 This character area is located between the Fairfield area and the Quantock Hills AONB. The A39 road forms the western and southern boundaries. The topography rises gently from 70m AOD in the east to 140m AOD in the south-west and long distance views across the Eastern Lowlands towards the sea and the existing Hinkley Point Power Station Complex are possible for elevated locations. This area has attractive views of the Quantock Hills, however, farm buildings and pylons are present within views.

22.5.181 Gently rolling farmland with large angular fields defined by high hedgerows contrast with the steep heavily wooded Quantock Hills above. Land use is a mixture of arable and grazing pasture, Hedgerows are made up of elm, field maple, hazel (*Corylus avellana*), wild privet with ash, oak, sweet chestnut (*Castanea sativa*), Scots pine and sycamore (*Acer pseudoplatanus*) hedgerow trees. The small settlements of Holford, Stringston and Dodington and scattered farms are mainly stone built with red pantile roofs. Soils are brown earth loamy with little clay or clay enriched soils overlying Mercia Mudstones. The area retains a rural character although the A39 and pylons impose an urbanising influence locally.

22.5.182 The sensitivity of the landscape character area is assessed as **high** due to its designation as an area of outstanding scenic interest.

22.5.183 The summary of all relevant local landscape character areas assessed in this chapter is provided in **Table 22.7** at the end of landscape baseline.

vi. Landscape Elements and Features

22.5.184 A site scale landscape character assessment has been undertaken to describe the HPC development site and its immediate landscape setting up to approximately 50m from the HPC development site boundary (on-shore) and ascribe landscape sensitivity to key landscape elements and features that contribute to landscape character.

Landform

22.5.185 The northern part of the HPC development site is located on the coastal slope with a cliff edge at its northern boundary. A prominent ridge of Green Lane bisects the site in an east-west direction and reaches 35m AOD at its highest point.

22.5.186 This ridge is an important local landmark and is visible from a number of locations around the site. It screens views of the northern part of the site and the coast from local villages and footpaths. To the south of Green Lane a shallow valley is formed along Holford Stream. The southern valley slopes fall towards reach Bum Brook which runs along the southern boundary of the site.

22.5.187 The sensitivity of the landform is assessed as **medium**. Landform features are not judged to be of national importance. However, Green Lane ridge is locally valued for its amenity value and screening capabilities.

Land Use/Settlement

22.5.188 The HPC development site is surrounded mainly by farmland, which is the principal land use within the site. The field pattern is irregular and the fields are predominantly small to medium becoming more regular and larger further to the west. Historically and culturally it is possible to read the medieval pattern of the landscape. The majority of the fields within the site boundary were enclosed within the 17th to 18th century.

22.5.189 The local built form consists mainly of small, two storey cottages, agricultural buildings of a simple form, and nucleated hamlets and farms. Four barns are located within the HPC development site. There is a strong emphasis on the use on local materials. Roofs are made of thatch, slate or pantiles. Buildings are mainly rendered and painted and walls are red sandstone or grey/blue Lias. The existing Hinkley Point Power Station Complex is a prominent local land use. Villages and hamlets around the HPC development site, such as Wick, Shurton, Burton or Knighton are small and centred on farmhouses within the village contributing to the agricultural character of the surrounding area.

22.5.190 Electricity pylons form a prominent feature in the low-lying landscape to the east.

22.5.191 The sensitivity of land use/settlement is considered to be **medium** due to its character being typical of the Quantock Vale local landscape character area. There are no nationally important land uses or settlements and buildings of exceptional landscape value within the HPC development site or its immediate surroundings.

Landcover and Vegetation

22.5.192 The HPC development site contains small to medium agricultural fields divided by hedgerows and hedgerow trees on boundaries. Pollarded willow along the field boundaries are a common feature as are elm, hawthorn, field maple and blackthorn on hedge-banks with ash, oak and sycamore hedgerow trees. Bramble, ivy, iris and honeysuckle make up the ground flora. Some small pockets of predominantly deciduous woodlands and copses and shelter belts or breaks of similar species are located within and around the HPC development site along field boundaries. Three large fields of semi-improved grassland and one field of semi-improved calcareous grassland are located in the north-eastern corner of the site. A strip of calcareous grassland is adjacent to the coastal cliff. Other large areas of grassland include semi-improved calcareous grassland covering the fields along the Holford Stream. There are small copses of woodland within and around the HPC development site.

22.5.193 A recently planted woodland, Bishop's Wood, is located on the southern slope of the Holford Stream valley. The site contains a number of hedgerows, some of which have important local ecological and amenity value. The most significant of these features is the hedgerow along Green Lane, which has important landscape amenity value due to its prominent location on the highest ridge within the site, and Benhole Lane along the western site boundary.

22.5.194 The existing landscape plan including landcover and vegetation within the HPC development site and its surroundings is shown on **Figure 22.8**.

22.5.195 **Table 22.6** shows the existing landscape elements coverage within the HPC development site (all figures are approximate).

Table 22.6: Existing Landscape Elements Coverage within the HPC Development Site

Areas and Linear Features	Measurement
Broad-leaved woodland	3.5 ha
Plantation woodland	3.5 ha
Scrub (including scrub/hedges)	1.1 ha
Calcareous Grassland (including Bishop's Wood)	3.5 ha
Improved Grassland	30.6 ha
Species-poor semi-improved grassland	16.1 ha
Semi-improved grassland/ Species rich hay meadow	n/a
Arable	97.6 ha
Agricultural Land	n/a
Wetland (including ponds)	<0.01 ha
Native Species-rich Hedgerow	7.74 km
Species-poor Hedgerow	3.4 km
Watercourses (excluding Bum Brook and including Holford Valley ditches)	2.02 km

22.5.196 The sensitivity of the landcover and vegetation on the site and close to its boundaries has been assessed as **medium** due to its local amenity value and biodiversity interest.

Watercourses/water bodies

22.5.197 The landscape in the immediate vicinity of the site contains numerous drains and ditches typical of an agricultural landscape. The most significant watercourses within and in the vicinity of the HPC development site is Holford Stream, which is not of significant landscape value and Bum Brook, which is highly valued locally for its amenity and the planting along its banks. Bum Brook is also located in the immediate vicinity of several residential properties of Shurton. No other significant watercourses are present in the immediate vicinity of the HPC development site. The existing landscape plan including watercourses and water bodies within the HPC development site and its surroundings is shown on **Figure 22.8**.

22.5.198 The sensitivity of the watercourses/water bodies is considered to be **medium** due to the presence of Bum Brook, which is locally valued for its amenity.

Public Rights of Way

22.5.199 There is a large network of Public Rights of Way (PRoW) crossing the HPC development site and in its immediate vicinity, including the West Somerset Coast Path National Trail which runs along the top of the low cliff line. All footpaths were walked during the field assessment. For more details on the existing PRoW see **Chapter 25** of this volume. The existing PRoW network within the HPC development site and its surroundings is shown on **Figure 22.8**.

22.5.200 The sensitivity of the PRoW within and in the immediate vicinity of the site has been assessed as **high** due to the presence of nationally important West Somerset Coast Path within the HPC development site.

22.5.201 Summary of landscape receptors and their sensitivity is provided in **Table 22.7**.

Table 22.7: Summary of Landscape Receptors

ID	Receptor	Sensitivity
	Local Landscape Character	
1	Quantock Vale LLCA	Medium
2	Doniford Stream and Quantock Fringe LLCA	Medium
3	Central Quantocks LLCA	High
4	Quantock Hills LLCA	High
5	Central West Somerset LLCA	Medium
6	Lowland Hills LLCA	Medium
7	Levels and Moors LLCA	High
8	Limestone Ridges and Combes LLCA	High
9	Mendips LLCA	High
10	Blue Anchor to St Audries LSCA	High
11	St Audries Bay to Hinkley Point LSCA	High
12	Hinkley Point to River Parrett LSCA	Medium
13	Burnham-on-Sea to Brean Down LSCA	Medium
14	Brean Down LSCA	High

ID	Receptor	Sensitivity
	Site Scale Landscape Character	
15	Wick Moor and Coast	High
16	Wall Common and Coast	Medium
17	Coastal – Lilstock	High
18	Rolling Farmland East – Stogursey	Medium
19	Fairfield	High
20	The Quantock Fringes – Dodington	High
	Landscape Elements and Features	
21	Landform	Medium
22	Land Use/Settlement	Medium
23	Landcover/Vegetation	Medium
24	Watercourses/water bodies	Medium
25	Public Rights of Way	High

e) Visual Baseline

i. Introduction

22.5.202 To confirm the theoretical visibility of the HPC proposed development a Zone of Theoretical Visibility (ZTV) analysis has been undertaken. The Bare Ground ZTV does not take into account the extensive screening effects of woodland, settlements or urban area and therefore represents a 'worst case scenario' in regard to the potential visibility of the HPC proposed development. As a result, there may be residential properties, roads, tracks and footpaths in the vicinity of the HPC development site and in the wider setting which, although shown as falling within the ZTV, in reality will have no views to the site or development.

22.5.203 A combination of desktop study, Bare Ground ZTV analysis, field survey and consultation has confirmed a range of visual receptors within the LVIA study area with the potential to be affected by the proposed development. They include residents, users of PRoW and other publicly accessible land including visitors to Exmoor National Park, Quantock Hills AONB and Mendip Hills AONB, users of schools, motorists and people at their place of work.

22.5.204 These receptors are represented by a series of viewpoints. A representative Viewpoint Location Plan including a ZTV is shown on **Figure 22.9** (wide area) and **Figure 22.9a** (local area).

ii. Visual Baseline Summary

22.5.205 The visual baseline records views towards the development site from a total of 48 viewpoints (42 Principal Viewpoints and 6 Secondary Viewpoints) agreed with consultees and extending throughout the study area. All viewpoints are assessed; however, Secondary Viewpoints are not supported by photomontages due to limited views of the HPC development site and the distance from the development site. These viewpoints can be broadly subdivided into short, medium and long distance views. The following viewpoints illustrated on **Figure 22.9** and **Figure 22.9a** are highlighted for summary purposes, as broadly representative;

- Short range – Principal Viewpoints 1 (west), 11 (south) and 16 (east);
- Medium range – Principal Viewpoint 4 (west), 18 (south) and 19 (east); and
- Long Range – 26 (west), 29 (south west) and 33 (south).

22.5.206 Views from the north are open and panoramic, and available predominantly from the Welsh coast. The South Wales coastline across the Bridgwater Bay, approximately 19km to the north of the HPC development site at its narrowest point, has very limited views of the site even under clear weather conditions.

22.5.207 Views from the east are available predominantly from the coastline (Hinkley Point to Weston-super-Mare) and areas of higher topography, including Brent Knoll and Puriton Hill, as well as Mendip Hills AONB (Bleadon Hill and Crook Peak). The ZTV to the east of the site was reviewed during field work and the majority of the lower lying areas within the LVIA study area were found not to have views of the HPC development site and the existing Hinkley Point Power Station Complex due to intervening vegetation, urban areas and landform. The areas located up to approximately 5km from the HPC development site provide views of the tallest structures within the existing Hinkley Point Power Station Complex.

22.5.208 Views from the south and south west are generally located on the low hills located around the HPC development site and the prominent ridgeline of the Quantocks, with undisturbed but distant views of the HPC development site from areas of highest elevation. The Quantock Hills AONB obscures any views to the site from south-west of the AONB itself.

22.5.209 To the west of the HPC development site, views are available predominantly from the coastline and some higher areas located in the eastern part of the Exmoor National Park, however, these views are very limited due to long distance from the HPC development site.

iii. Viewpoint Descriptions

22.5.210 Viewpoint descriptions and the assessment of their sensitivity are provided below. The schedule of Figures showing baseline views and photomontages is provided on **Figure 22.9b**.

22.5.211 High resolution baseline photographs at full scale and VVIs showing the HPC proposed development at year 15 of the operational phase are provided for all Principal Viewpoints.

22.5.212 Dusk views were recorded for agreed 13 viewpoints to fully understand the night time baseline conditions. Site visits were also carried out in October 2010, when light glow from the existing Hinkley Point Power Station was assessed. These additional night time views are included in the **HPC Construction Lighting Strategy** appended to **Construction Method Statement** and the **HPC Operational Lighting Strateg y** appended to **Chapter 2** of this volume, and informed the assessment of baseline conditions and night time views.

22.5.213 VVIs showing the HPC proposed development have been prepared for all Principal Viewpoints. The assessment of cumulative impacts of the HPC proposed development and the NG proposals is included in **Volume 11** of this ES.

22.5.214 Viewpoint and camera details, such as OS rid reference, date and time of a photograph, field of view, lens, elevation and distance from the HPC development site and the nearest reactor dome, are provided on viewpoint sheets.

Principal Viewpoint 1 – PRoW No. WL23/110 west of Benhole Lane

22.5.215 This viewpoint is sited on a local track (PRoW No. WL 23/110) and is representative of the view for walkers on the small ridge located to the west of the HPC development site and other local PRoW located on elevated topography immediately to the west of the site. It is situated within the Quantock Vale (Coastal - Lilstock) Local Landscape Character Area and is also located within the area of outstanding scenic interest.

22.5.216 This short distance view is open and consists of an expanse of sky, farmland and the sea with some coastal vegetation in the foreground and middle ground. The tallest structures within the existing Hinkley Point Power Station Complex punctuate the skyline while its lower buildings are screened by belts of mature vegetation.

22.5.217 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a prominent and highly valued local ridge which is a popular local destination and is one of the most prominent local historic landscape features in the vicinity of the site. See **Figure 22.10** and **Figure 22.10a**.

Principal Viewpoint 2 – West Somerset Coast Path, PRoW No. WL 23/95

22.5.218 This short distance viewpoint is located on the West Somerset Coast Path National Trail (PRoW No. WL 23/95) and situated within the Quantock Vale (Coastal - Lilstock) Local Landscape Character Area. It is also located within the area of outstanding scenic interest. It represents views experienced by walkers.

22.5.219 The HPC development site and significant areas of farmland on gently undulating topography are visible in the foreground. The tallest structures within the existing Hinkley Point Power Station Complex punctuate the skyline in views eastwards. Small shrubs partially screen the views of the sea. The coastal path provides open views of Bridgwater Bay and coastal rock platforms.

22.5.220 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a nationally important footpath. See **Figure 22.11** and **Figure 22.11a**.

Principal Viewpoint 3 – West Somerset Coast Path, Lilstock, PRoW No. WL 24/10

22.5.221 This medium distance viewpoint is situated adjacent to the West Somerset Coast Path (PRoW No. WL 24/10) to the north of Lilstock and within the area of outstanding scenic interest, and represents views available for walkers. The viewpoint is situated within the Quantock Vale (Coastal - Lilstock) Local Landscape Character Area.

22.5.222 The existing view is open and consists of an expanse of sky and the seascape of Bridgwater Bay with shingle beach and coastal shrub visible in the foreground. The existing Hinkley Point Power Station Complex is visible as a simple and distinctive landmark punctuating the skyline. The ground level of the HPC development site is screened by the cliff.

22.5.223 There is no lighting in the foreground and middle ground and the coastline is generally characterised by dark skies at night. Some localised lighting is visible across Bridgwater Bay on the coastline between Burnham-on-Sea and Brean. Lighting associated with the existing Hinkley Point Power Station Complex is visible, in particular under low cloud cover or mist.

22.5.224 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a nationally important footpath, which provides open views of Bridgwater Bay. See **Figure 22.12** and **Figure 22.12a**.

Principal Viewpoint 4 – PRoW No. WL 24/8

22.5.225 This medium distance viewpoint is located on PRoW No. WL 24/8, to the west of the site, within an area of outstanding scenic interest and represents views experienced by walkers. It is situated within the Quantock Vale (Coastal - Lilstock) Local Landscape Character Area.

22.5.226 The view predominantly comprises large areas of agricultural land (arable) on gently undulating topography with isolated areas of shrubs and trees. Trimmed hedgerows are located on field boundaries and offer no screening to the existing Hinkley Point Power Station Complex, whose tallest structures are visible in the distance. The HPC development site and lower development within the Complex are screened by intervening landform.

22.5.227 The sensitivity of visual receptors at this viewpoint has been rated as medium due to its location on a locally important footpath. See **Figure 22.13** and **Figure 22.13a**.

Principal Viewpoint 5 – Higher Hill, PRoW No. 24/3

22.5.228 This medium distance viewpoint is located on PRoW No. 24/3 on Higher Hill to the west of the site and within an area of outstanding scenic interest and Doniford Stream and Quantock Fringe Local Landscape Character Area.

22.5.229 It represents views experienced by walkers. Due to its hilltop location (approximately 108m AOD) and few intervening elements, open views of Bridgwater Bay and the HPC development site and its surroundings are available from this viewpoint. Green Lane and Holford Stream valley are visible below the existing Hinkley Point Power Station Complex. The view is dominated by agricultural fields with trimmed hedgerows on boundaries and large expanse of sky. Low lying farmland of the Quantock Vale (Eastern Lowlands) Local Landscape Character Area is visible in the distance.

22.5.230 The sensitivity of visual receptors at this viewpoint has been rated as medium due to its location on a locally important footpath. See **Figure 22.14** and **Figure 22.14a**.

Principal Viewpoint 6 – PRoW No. WL 24/11 near the edge of the Great Plantation

22.5.231 This medium distance viewpoint is sited on a PRoW No. WL 24/11 near the Great Plantation to the south-west of the site and is representative of the view for walkers.

It is located within the Quantock Vale (Fairfield) Local Landscape Character Area and within the area of outstanding scenic interest.

22.5.232 The view is contained on one side by the Fairfield Estate's Great Plantation woodland, and trees and shrubs are visible. Lower lying development associated with the existing Hinkley Point Power Station Complex is obscured by topography; however, the tallest structures of the Complex punctuate the skyline. The tree-lined Green Lane ridge running across the HPC development site forms the skyline just to the west of the existing HPA buildings and offers good screening of the coastline to the west of the existing Hinkley Point Power Station Complex up to the level of approximately 35m AOD.

22.5.233 The sensitivity of visual receptors at this viewpoint has been rated as medium due to its location on a locally important footpath. See **Figure 22.15** and **Figure 22.15a**.

Principal Viewpoint 7 – Fairfield House Driveway

22.5.234 This medium distance viewpoint is located on the driveway to Fairfield House, a Grade II* Listed Building to the south-west of the site. It is located within the Quantock Vale (Fairfield) Local Landscape Character Area and within an area of outstanding scenic interest. It is representative of the view experienced by residents and visitors to Fairfield House.

22.5.235 The view is dominated by agricultural grassland with some trees and man-made influences such as telegraph poles and fences in the foreground. A mix of hedgerows and tree blocks can be seen in the middle distance and the existing Hinkley Point Power Station Complex is clearly visible against the skyline. Small patches of woodland, unmanaged hedgerows and some small residential buildings obscure views towards the Bridgwater Bay and the HPC development site.

22.5.236 There is no lighting in the foreground and middle ground (in the parkland area). Lighting of the both HPA and HPB stations is visible above the vegetated ridge in the middle ground. Looking further towards Bridgwater Bay, distant lighting from the coastal settlements. The complex is also a source of significant light glow, which becomes more noticeable, in particular under low cloud cover or mist.

22.5.237 The sensitivity of visual receptors at this viewpoint has been rated as high due to Fairfield House being a residence and a popular tourist attraction. See **Figure 22.16** and **Figure 22.16a**.

Principal Viewpoint 8 – Knighton Farm, PRoW No. WL 23/46

22.5.238 This short distance viewpoint is located on a PRoW No. WL 23/46 adjacent to Knighton Farm, which is located on the eastern edge of Knighton. It is located within the Quantock Vale (Rolling Farmland East - Stogursey) Local Landscape Character Area and within the area of outstanding scenic interest.

22.5.239 This view is experienced by walkers and residents of Knighton Farm and shows agricultural land gently ascending towards the local ridge to the west of the HPC development site. The ridge provides screening of the lower development within the Hinkley Point Power Station Complex and only the tallest structures are visible and punctuate the skyline. Small blocks of woodland and hedgerows contribute to screening. A stone wall along the footpath is visible in the foreground.

22.5.240 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location to adjacent residential properties, whose residents experience similar views. See **Figure 22.17** and **Figure 22.17a**.

Principal Viewpoint 9 – Burton

22.5.241 This short distance viewpoint is located on a local road to the south-west of the site in the vicinity of PRoW No. WL 23/47 (north of the road) and WL 23/25 (south of the road). The viewpoint is located within the Quantock Vale (Rolling Farmland East - Stogursey) Local Landscape Character Area on the edge of the area of outstanding scenic interest.

22.5.242 This view is experienced by walkers and motorists and shows agricultural land gently ascending towards the local ridge to the west of the HPC development site and Green Lane. The existing landform provides screening of lower level development within the existing Hinkley Point Power Station Complex and only the tallest structures are visible punctuating the skyline. Small blocks of woodland and hedgerows contribute to screening.

22.5.243 The existing Hinkley Point Power Station Complex is the only light source within the view. Although lower level lighting is screened by vegetation, there is light spill onto the HPA reactor building and HPB is a notable source of light itself. The complex is also a source of light glow, which becomes more noticeable, in particular under low cloud cover or mist.

22.5.244 The sensitivity of visual receptors at this viewpoint has been rated as medium due to its location on a local road but also in the vicinity of a PRoW of local importance. See **Figure 22.18** and **Figure 22.18a**.

Principal Viewpoint 10 – Shurton West, Local Farm near PRoW No. WL 23/48

22.5.245 This short distance viewpoint is located within a local farm in the immediate vicinity of PRoW No. WL 23/48 at the western edge of Shurton, looking north-east towards the site. The viewpoint is located within the Quantock Vale (Rolling Farmland East - Stogursey) Local Landscape Character Area.

22.5.246 It represents views experienced by the residents of the residential properties and farms in western part of Shurton and was selected following consultation with the local residents. Unlike several other views from this part of Shurton it provides relatively open views towards the southern sections of the site due to a wide gap in vegetation along the Bum Brook which demarcates the southern boundary of the site. It is therefore considered as the 'worst case scenario' for visual impacts from the western parts of Shurton. Other properties at this part of the village are located within a similar distance from the proposed HPC development site but receive limited views of the site due to mature riparian vegetation along the Bum Brook and planting in residents' gardens.

22.5.247 However lighting of the existing Hinkley Point Power Station Complex is not visible at dusk, light glow from the Complex becomes more noticeable under low cloud cover or mist.

22.5.248 Taller buildings within the existing Hinkley Point Power Station Complex are visible above the small ridge to the north of Bum Brook. This small, unvegetated ridge is a distinctive local landscape feature, highly valued by the local residents of Shurton, Knighton and Burton and provides good screening of the development area. Sections of a tree line along Green Lane punctuate the skyline.

22.5.249 The sensitivity of visual receptors at this viewpoint has been rated as high because it is representative of views from residential properties. See **Figure 22.19** and **Figure 22.19a**.

Principal Viewpoint 11 – Shurton East, PRoW No. WL 23/56

22.5.250 This short distance viewpoint is located on the PRoW No. WL 23/56 located within the village of Shurton next to the pumping station to the south of the HPC development site. The viewpoint is located within the Quantock Vale (Rolling Farmland East - Stogursey) Local Landscape Character Area.

22.5.251 It represents views experienced by walkers and local residents, who receive similar views in the vicinity of the viewpoint. This view was selected following consultation with the local residents. Unlike several other views from this part of Shurton it provides relatively open views towards the HPC development site due to a wide gap in vegetation along the Bum Brook which demarcates the southern boundary of the HPC development site. It is therefore considered as the ‘worst case scenario’ for visual impacts from the eastern parts of Shurton. Properties within the eastern parts of the village are located at a similar distance from the site but receive limited views of the site due to mature riparian vegetation along the Bum Brook and planting in residents’ gardens.

22.5.252 The view encompasses large areas of farmland, hedgerows and hedgerow trees. The lower levels of the HPC development site are obscured by the topography, however, the existing Hinkley Point Power Station Complex buildings, due to their height (65 metres), punctuate the skyline and are a prominent landmark within the view.

22.5.253 The existing Hinkley Point Power Station Complex is the only light source within the view. Although lower level lighting is screened by landform and vegetation, there is light spill onto the HPA reactor building and HPB is a notable source of light itself. The existing Complex is also a source of light glow, which becomes more noticeable, in particular under low cloud cover or mist.

22.5.254 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a locally important footpath and because it is representative of views from residential properties. See **Figure 22.20** and **Figure 22.20a**.

Principal Viewpoint 12 – Local road to the south of the site (near Gunter’s Grove)

22.5.255 This short distance viewpoint is located to the south of the site on a local road near Gunter’s Grove farm and represents the view experienced by motorists. Located within the Quantock Vale (Rolling Farmland East - Stogursey) Local Landscape Character Area, the viewpoint is not situated within any landscape designation.

22.5.256 An open area of coastal marsh at Wick Moor is visible in middle distance with scrubby vegetation and individual trees partially screening views towards the site. The Green Lane ridge and the adjacent southern slopes within the HPC development site are visible from this viewpoint. The existing Hinkley Point Power Station Complex and low level ancillary buildings are visible.

22.5.257 The existing Hinkley Point Power Station Complex is the only light source within the view. Road, car park and other low level lighting is visible. There is light spill onto the HPA reactor building and HPB is a notable source of light itself. The existing Complex is also a source of light glow, which becomes more noticeable under low cloud cover or mist.

22.5.258 The sensitivity of visual receptors at this viewpoint has been rated as low due to its location on a local road. See **Figure 22.21** and **Figure 22.21a**.

Principal Viewpoint 13 – PRoW No. WL 23/57, West of Wick

22.5.259 The short distance viewpoint is located on a local track (PRoW No. WL 23/57), west of Wick and a local farmhouse, looking north-west towards the site through Wick Moor. The viewpoint is located within the Quantock Vale (Rolling Farmland East - Stogursey) Local Landscape Character Area.

22.5.260 It is representative of the view for experienced by walkers. The view is open and dominated by a large agricultural field in the foreground with hedgerows along field boundaries, which provide screening within the flat landscape. The existing Hinkley Point Power Station Complex is visible in the distance but its lower buildings are partially screened by planting around it.

22.5.261 The sensitivity of visual receptors at this viewpoint has been rated as medium due to its location on a locally important footpath. See **Figure 22.22** and **Figure 22.22a**.

Principal Viewpoint 14 – Pixies Mound (Wick Barrow)

22.5.262 This short distance viewpoint is located on a footpath adjacent to Pixies Mound (Wick Barrow) Scheduled Ancient Monument looking west towards the site. The viewpoint is located within the Quantock Vale (Coastal - Lilstock) Local Landscape Character Area.

22.5.263 It is representative of the view experienced by visitors to Hinkley Point and walkers around Pixies Mound. The view is dominated by grassland with tree plantation screening the existing Hinkley Point Power Station Complex. The access road (Wick Moor Drove) to the existing power station cuts through the grassland in the view. The majority of the skyline is dominated by the vegetation within the HPC development site, including small blocks of woodland, hedgerows and individual trees. Lamp posts and fencing poles are distinctive vertical elements within the view.

22.5.264 The sensitivity of visual receptors at this viewpoint has been rated as high due to the historic importance of Pixies Mound and the viewpoint representing the views experienced by visitors to the heritage site. See **Figure 22.23** and **Figure 22.23a**.

Principal Viewpoint 15 - PRoW No. WL 23/61

22.5.265 This short distance viewpoint is located on PRoW No. WL 23/61 to the east of the Hinkley Point Power Station Complex. The viewpoint is located within the Quantock

Vale (Wick Moor and Coast) Local Landscape Character Area and is noted for several national and international nature conservation designations.

22.5.266 A ditch, grazing fields and shrubs are visible in the foreground. The HPC development site is screened by a belt of woodland planted around the perimeter of the existing Hinkley Point Power Station Complex.

22.5.267 The sensitivity of visual receptors at this viewpoint has been rated as high. The PRoW falls within an area popular among the local residents for its wildlife and landscape value. See **Figure 22.24** and **Figure 22.24a**.

Principal Viewpoint 16 – Wick, PRoW No. WL 23/61

22.5.268 The short distance viewpoint is located at the gate on a local track (PRoW No. WL 23/61) in the vicinity of the hamlet of Wick, looking north-west towards the site through Wick Moor. The viewpoint is located within the Quantock Vale (Rolling Farmland East - Stogursey) Local Landscape Character Area and is representative of the view experienced by walkers.

22.5.269 Although more open view through Wick Moor is available at the end of the track (further to the north), this location was selected due to its proximity to the hamlet. The track is almost entirely enclosed by a hedgerow running along its western edge. However, some gaps in this hedgerow (as illustrated by the selected viewpoint location) show the best available view. The existing Hinkley Point Power Station Complex is partially screened by hedgerows and small blocks of woodland.

22.5.270 A hedgerow in the foreground screens lighting from the existing Hinkley Point Power Station Complex, although there is some light spill onto the HPA reactor building. Under low cloud cover or mist and later at night, the existing Complex is also a source of light glow.

22.5.271 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a locally important footpath and proximity to residential properties in and around the hamlet of Wick. See **Figure 22.25** and **Figure 22.25a**.

Principal Viewpoint 17 – Farrington Hill Lane (Farringdon Farm)

22.5.272 This short distance viewpoint is located near Farrington Farm and represents views experienced by walkers along Farringdon Hill Lane. The viewpoint is not located within any landscape designation and is located within the Quantock Vale (Rolling Farmland East - Stogursey) Landscape Character Area.

22.5.273 It is representative of views experienced by walkers in the countryside, locally, including PRoW overlooking the site and farmland immediately to the north of Stogursey located approximately 1.5km to the south of the site. The view is dominated by farmland, hedgerows along field boundaries and hedgerow trees. The existing Hinkley Point Power Station Complex buildings punctuate the skyline. The Green Lane ridge and its southern slopes within the HPC development site are visible.

22.5.274 The sensitivity of visual receptors at this viewpoint has been rated as medium due to its location adjacent to locally important footpath and because it is representative of views experienced by users of locally important PRoW. See **Figure 22.26** and **Figure 22.26a**.

Principal Viewpoint 18 – Residential area at Stogursey, Burgage Road/Lime Street

22.5.275 This short distance viewpoint is located on a footpath along Lime Street (junction with Burgage Road) in the northern part of Stogursey, which is located within the Quantock Vale (Rolling Farmland East - Stogursey) Local Landscape Character Area.

22.5.276 The view is experienced by residents, pedestrians and motorists. The low level development within the existing Hinkley Point Power Station Complex and the farmland around it are obscured by high hedgerows and built form within the view. First floor views of the HPC development site are possible from properties on the edge of the village. Only the tallest structures within the existing Complex are partially visible above the vegetation from the road.

22.5.277 Lighting along Lime Street is visible and spills onto the adjacent buildings, which are a source of light themselves. Lighting of the existing Hinkley Point Power Station Complex is screened by vegetation in views from the road but is likely to be visible from properties. Light glow from HPA and HPB is evident but less noticeable due to due to road lighting in the foreground.

22.5.278 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a frequently used footpath of local importance and its location within a residential area. See **Figure 22.27** and **Figure 22.27a**.

Principal Viewpoint 19 – Stolford, West Somerset Coast Path, PRoW No. WL 23/95

22.5.279 This medium distance viewpoint is located on the West Somerset Coast Path (PRoW no WL 23/95) to the north of Stolford, within the Quantock Vale (Wall Common and Coast) Local Landscape Character Area and represents views experienced by walkers and residents of the western edge of Stolford.

22.5.280 The existing Hinkley Point Power Station Complex buildings and the associated overhead lines are dominant features within the view and punctuate the skyline. Small clumps of trees are visible around the existing Complex. The hilltops of the northern Quantock Hills AONB are visible in the long distance as a backdrop to some electricity pylons. Small parts of the HPC development site adjacent to the eastern sections of Green Lane are visible; however, the majority of the HPC development site is screened by intervening elements and vegetation.

22.5.281 The existing Hinkley Point Power Station Complex is the only notable source of light within the view. Lighting from HPA is evident in this dark sky area. Lighting along Welsh coastline is barely noticeable. The existing Hinkley Point Power Station Complex is also a source of light glow, which becomes more noticeable in this dark sky area, in particular under low cloud cover or mist.

22.5.282 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a nationally important footpath, within ecological designations of international and national importance and its proximity to residential properties with similar views. See **Figure 22.28** and **Figure 22.28a**.

Principal Viewpoint 20 – Stockland Bristol, PRoW No. BW 32/3

22.5.283 This medium distance viewpoint is located on the edge of Stockland Bristol, on PRoW No. BW 32/3 and in the vicinity of PRoW No. BW 32/2, within the Lowland Hills Local Landscape Character Area. It is representative of views experienced by walkers and residents of properties located on the western edge of the village.

22.5.284 The existing Hinkley Point Power Station Complex and the associated overhead lines are visible in the distance. A large number of electricity pylons which punctuate the skyline combined with the Complex have an urbanising influence on this rural area. Green Lane ridge is visible in the far distance however the majority of the site is obscured by intervening landscape features, notably as landform and tree cover.

22.5.285 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on footpath of local importance and in the immediate vicinity of residential properties. See **Figure 22.29** and **Figure 22.29a**.

Principal Viewpoint 21 – Quantock Hills AONB, PRoW No. WL 24/1

22.5.286 This medium distance viewpoint is located on a PRoW No. WL 24/1 located to the north of Kilve which is located within the Quantock Hills AONB. It is sited within an area of outstanding scenic interest and Doniford Stream and Quantock Fringe Local Landscape Character Area. The viewpoint is representative of the view experienced by walkers and residents of Kilton.

22.5.287 This viewpoint was selected during a site visit with the Statutory Consultees (Natural England) as the most representative of the local landscape character and also likely to be used by the public. There are other views of the Hinkley Point Power Station Complex along the coastline from East Quantoxhead to Kilve Pill, however due to the elevation of these viewpoints, the nature of the development and surrounding topography, no views of the HPC development site would be available. Similar and sometimes more open views towards the existing Hinkley Point Power Station Complex also exist from lay-bys and gaps in hedgerows along Hilltop Lane but they are not as representative of a local landscape character. No direct views of the site are available for the residents of Kilton due to screening provided by vegetation and rolling topography to the east of Kilton, which are visible within the view.

22.5.288 The viewpoint has open views across farmland with hedgerow boundaries and a few trees. Local houses and farm buildings, wooden fencing, telegraph poles and small clumps of trees are visible in the foreground. The existing Hinkley Point Power Station Complex buildings are partially visible in the distance as they punctuate the skyline, however lower level development within the existing Complex is screened by landform.

22.5.289 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location in the nationally designated landscape on a footpath of local importance. See **Figure 22.30** and **Figure 22.30a**.

Principal Viewpoint 22 – East Quantoxhead, PRoW No. WL 8/30

22.5.290 This long distance viewpoint is located on a PRoW No. WL 8/30 which lies within the Quantock Hills AONB, to the north-east of the Court House. The viewpoint is located towards the western fringes of the Quantock Vale (Coastal - Lilstock) Local Landscape Character Area and designated as an area of outstanding scenic interest.

22.5.291 The viewpoint is representative of the view experienced by walkers and was selected during a site visit with the statutory consultees (Natural England and English Heritage). This typical view of the coastal edge of the Quantock Hills AONB is open and characterised by farmland on gently undulating topography with small patches of woodland and dense unmanaged hedgerows bounding large rectangular fields. The existing Hinkley Point Power Station Complex is partially screened by landform and vegetation and only the tallest structures within the Complex punctuate the skyline. The HPC development site is completely screened by the existing landform.

22.5.292 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location in the nationally designated landscape on a footpath of local importance. See **Figure 22.31** and **Figure 22.31a**.

Principal Viewpoint 23 – East Quantoxhead, Court House Gardens

22.5.293 This long distance viewpoint is located in the gardens of Court House, a listed building within the Quantock Hills AONB that is seasonally open to public. It is representative of the view experienced by walkers and visitors to Court House. The viewpoint is located within the western fringes of the Quantock Vale (Coastal - Lilstock) Landscape Character Area and within the area of outstanding scenic interest.

22.5.294 This viewpoint is located in close proximity to Principal Viewpoint 22 but it was selected by the Statutory Consultees due to its higher elevation providing the best possible views into the site from the surrounding area and its historic importance. The existing Hinkley Point Power Station Complex is generally well screened by the undulating topography of the Eastern Lowlands and coastal vegetation. The HPC development site is completely screened by the existing landform.

22.5.295 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location at Court House (of high historic importance) which is also a popular tourist attraction within the nationally designated landscape of the Quantock Hills AONB. See **Figure 22.32** and **Figure 22.32a**

Principal Viewpoint 24 – Entrance to Dodington House

22.5.296 This medium distance viewpoint is located at the entrance to Dodington House, a Listed Building within the Fairfield Estate. The viewpoint is representative of the view experienced by residents and visitors to Dodington House and is located within the Quantock Vale (Quantock Fringes - Dodington) Landscape Character Area and the area of outstanding scenic interest.

22.5.297 The view encompasses a driveway in front of Dodington House surrounded by ornamental tree planting which provide a degree of enclosure. In the medium distance large blocks of woodland obscure views across the Eastern Lowlands. The existing Hinkley Point Power Station Complex is partially screened by vegetation in the middle ground lying behind the barn in the foreground.

22.5.298 The sensitivity of visual receptors at this viewpoint has been rated as high due to residential character of the location but also its heritage importance. See **Figure 22.33** and **Figure 22.33a**

Principal Viewpoint 25 – Nether Stowey, Stogursey Lane

22.5.299 This medium distance viewpoint is located on a footpath adjacent to the residential area at Stogursey Lane in Nether Stowey and is representative of the view experienced by pedestrians. The viewpoint is located within the Lowland Hills Local Landscape Character Area.

22.5.300 Located on the edge of Nether Stowey and elevated ground the viewpoint offers views across Lowland Hills and Eastern Lowlands towards the Hinkley Point Power Station Complex, which is a distinctive landmark in the far distance. The landscape within the view is characterised by lowland hills with several small blocks of woodland and fields bounded by hedges. Garden planting and trimmed hedges in the foreground are evident within the view. The eastern part of the Green Lane ridge within the HPC development site is partially visible in the distance.

22.5.301 The sensitivity of visual receptors at this viewpoint has been rated as medium due to its location on a public footpath of local importance. See **Figure 22.34** and **Figure 22.34a**

Principal Viewpoint 26 – Quantock Hills AONB, Beacon Hill

22.5.302 This long distance viewpoint is located on the summit of Beacon Hill in the northern part of the Quantock Hills AONB, within the Central Quantocks Local Landscape Character Area. It represents views experienced by walkers.

22.5.303 The viewpoint provides an open view of a large scale landscape with few built elements and overlooks the Quantock Vale Landscape Character Area and the existing Hinkley Point Power Station Complex. The view is dominated by heathland vegetation covering Beacon Hill in the foreground, Quantock Vale farmland and large areas of sea and sky. Due to its high elevation this viewpoint provides long and almost uninterrupted views of the HPC development site.

22.5.304 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a very popular destination within the nationally designated landscape. . See **Figure 22.35** and **Figure 22.35a**.

Principal Viewpoint 27 – A39, Holford Lay-by

22.5.305 This long distance viewpoint is located approximately 5.5km to the south-west of the site in lay-by on the A39 towards north-eastern edge part of the Quantock Hills AONB, within the Central Quantocks Local Landscape Character Area. The Green Lane ridge and the southern part of the HPC development site are partially visible in the distance.

22.5.306 The lay-by is used by motorists on the A39 but also horse riders and visitors to the northern fringes of the Quantock Hills AONB. Beyond views of the A39 in the foreground, this viewpoint provides views of undisturbed countryside with a few farmhouses located in the middle distance. Several patches of woodland partially screen views towards the coastline. The existing Hinkley Point Power Station Complex is visible in the centre of the view.

22.5.307 There is no lighting in the foreground and middle ground and the Quantock Vale appears as generally dark area. Lighting from settlements on the coastline between Burnham-on-Sea and Brean is visible across Bridgwater Bay. Lighting of the existing Hinkley Point Power Station Complex is visible above the vegetation. The existing Complex is also a source of light glow, which becomes more noticeable in this dark sky area, in particular under low cloud cover or mist.

22.5.308 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location within a popular lay-by within a nationally designated landscape. See **Figure 22.36** and **Figure 22.36a**.

Principal Viewpoint 28 – Quantock Hills AONB, PRoW No. WL 10/9

22.5.309 This long distance viewpoint is located within the Quantock Hills AONB on a PRoW No. WL 10/9 between Woodland Hill and Dowsborough and represents views experienced by walkers. It is located within the Central Quantocks Local Landscape Character Area.

22.5.310 The taller buildings of the Hinkley Point Power Station Complex are a visible feature in the distance. The viewpoint overlooks the rolling lowland landscape of Quantock Vale with a distinctive and regular field pattern, hedges, woodland blocks, and small settlements and farms. In the very far distance, Steep Holm and Brean Down are visible. Due to the elevation of this viewpoint, farmland within the HPC development site is visible but its prominence is limited due to the distance and its location set within the wider complex panorama, which includes numerous features including settlement, woodland and the existing HPA and HPB stations. The local ridge of Green Lane screens the northern parts of the HPC development site.

22.5.311 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a popular footpath within the nationally designated landscape. See **Figure 22.37** and **Figure 22.37a**.

Principal Viewpoint 29 – Quantock Hills AONB, Walford's Gibbet

22.5.312 Located on PRoW No. WL 10/20, on the central eastern edge of the Quantock Hills AONB, this long distance viewpoint provides undisturbed views of countryside around the existing Hinkley Point Power Station Complex, which is visible in the centre of the view. The viewpoint is located within the Central Quantocks Local Landscape Character Area and representative of views experienced by walkers on public footpaths. The HPC development site is visible but its prominence is limited due to distance and its location set within the wider complex panorama which includes numerous features including settlement, woodland and the existing HPA and HPB stations.

22.5.313 There is no lighting in the foreground and middle ground and the Quantock Vale appears as generally dark area, although some limited spot lighting is visible. Lighting from settlements on the coastline between Burnham-on-Sea and Brean is visible across Bridgwater Bay. Lighting of the existing Hinkley Point Power Station Complex is visible against the backdrop of Bridgwater Bay. The existing Complex is also a source of significant light glow, which becomes more noticeable in this dark sky area, in particular under low cloud cover or mist.

22.5.314 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a public footpath within the nationally designated landscape. See **Figure 22.38** and **Figure 22.38a**.

Principal Viewpoint 30 – Quantock Hills AONB, PRoW No. 10/28

22.5.315 This long distance viewpoint is located within the Quantock Hills AONB on a PRoW No. 10/28 overlooking Frog Combe. The viewpoint is located within the Central Quantocks Local Landscape Character Area and represents views experienced by walkers.

22.5.316 The hilltops of the central Quantocks Hills are visible in the middle distance. These hills obscure the majority of views towards Bridgwater Bay and the coastline; however, the tallest buildings of the existing Hinkley Point Power Station Complex form a distinctive landmark in the far distance as they punctuate the skyline between the hills. The visibility of the HPC development site is very low due to the distance.

22.5.317 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a public footpath within the nationally designated landscape. See **Figure 22.39** and **Figure 22.39a**.

Principal Viewpoint 31 – Quantock Hills AONB, Will's Neck

22.5.318 This long distance viewpoint is located on Will's Neck ridge (PRoW No. T 30/10) within the Quantock Hills AONB and represents views experienced by walkers. It is located within the Quantock Hills Local Landscape Character Area.

22.5.319 The hilltops of the central Quantocks Hills are visible in the middle distance. These hills obscure the majority of views towards Bridgwater Bay and the coastline; however, the tallest buildings of the existing Hinkley Point Power Station Complex are visible in the distance punctuating the coastline between the hills with the backdrop of Bridgwater Bay. The HPC development site is visible but its prominence is limited due to distance and its location set within the panorama which includes the existing HPA and HPB stations.

22.5.320 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a popular footpath within the nationally designated landscape. See **Figure 22.40** and **Figure 22.40a**.

Principal Viewpoint 32 – Quantock Hills AONB, Cothelstone Hill

22.5.321 This long distance viewpoint is located within the Quantock Hills AONB on the summit of Cothelstone Hill (adjacent to PRoW T 9/11 and in the vicinity of PRoW No. T 9/9) and overlooks the lower-lying coastal landscape with Bridgwater Bay in the distance. This viewpoint is located within the Quantock Hills Local Landscape Character Area.

22.5.322 The viewpoint represents views experienced by walkers on Cothelstone Hill. The viewpoint provides open views of the Quantock Hills landscape and the immediate foreground is formed by the grassy hilltop of Cothelstone Hill. The surrounding landscape of the Quantock Hills comprises a patchwork of agricultural fields and forest plantations separated by hedgerows delineating field boundaries. Despite the long distance, the existing Hinkley Point Station Complex is visible; its tallest structures viewed against the backdrop of Bridgwater Bay. The lower levels of the existing Hinkley Point Power Station Complex are screened by rolling landform and vegetation. The HPC development site is visible but its prominence is limited due to distance and its location set within the wider complex panorama which includes numerous features such as settlement, woodland, farmland and the existing HPA and HPB stations.

22.5.323 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a very popular footpath within the nationally designated landscape. See **Figure 22.41** and **Figure 22.41a**.

Principal Viewpoint 33 – Quantock Hills AONB, Broomfield Hill

22.5.324 This long distance viewpoint is located adjacent to a small forest plantation on Broomfield Hill within the Quantock Hills AONB. This viewpoint is located within the Quantock Hills Local Landscape Character Area and represents views experienced by walkers.

22.5.325 The viewpoint overlooks the lower-lying coastal landscape with Bridgwater Bay in the distance, and Quantock Summits and Quantock Hills and Combes in the medium distance. There is a clear distinction between the dominating landscape of the Quantock Hills AONB characterised by hills covered by a patchwork of small woodland blocks and large agricultural fields divided by hedgerows, and the low lying farmland beyond. The existing Hinkley Point Power Station Complex is visible set against the backdrop of the Bridgwater Bay. The HPC development site is visible but its prominence is limited due to distance and its location set within the wider complex panorama which includes numerous features such as settlement, woodland, farmland and the existing HPA and HPB stations.

22.5.326 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a publicly accessible land within the nationally designated landscape. See **Figure 22.42** and **Figure 22.42a**.

Principal Viewpoint 34 – Quantock Hills AONB, Wind Down, lay-by

22.5.327 This long distance viewpoint is located within the south-eastern fringe of the Quantock Hills AONB, at a popular lay-by at Wind Down. It represents views experienced by drivers stopping in the lay-by, and people starting their walks. This viewpoint is located within the Quantock Hills Local Landscape Character Area.

22.5.328 The Quantock Hills and Combes, characterised by large fields of grassland and some hedges and trees, gently descend and transform into the low lying farmland which is clearly demarcated by small settlements and farms. The existing Hinkley Point Power Station Complex is visible on the coastline with the backdrop of the Bridgwater Bay. The HPC development site is visible but its prominence is limited due to distance and its location set within the wider complex panorama which includes numerous features including settlement, extensive woodland and tree cover, farmland and the existing HPA and HPB stations.

22.5.329 There is no lighting in the foreground and middle ground. Local spot lighting is visible within the Lowland Hills and along the Bridgwater Bay coastline. Lighting of the existing Hinkley Point Power Station Complex is visible against the backdrop of the Bridgwater Bay. The existing Complex is also a source of light glow, which becomes more noticeable in this dark sky area, in particular under low cloud cover or mist.

22.5.330 The sensitivity of visual receptors at this viewpoint has been rated as high due to its popularity and location on the edge of the nationally designated landscape. See **Figure 22.43** and **Figure 22.43a**.

Principal Viewpoint 35 – Cannington Park, Public Footpath

22.5.331 This long distance viewpoint is located on a public footpath leading to the Cannington Park Hill Fort, which is designated as a Scheduled Ancient Monument. The viewpoint is located within the Lowland Hills Local Landscape Character Area and it represents views experienced by walkers.

22.5.332 The existing vegetation covering the hill effectively screens almost all views towards the coast and the HPC development site. However, the tallest buildings within the existing Hinkley Point Power Station Complex and the associated overhead lines are partially visible through gaps in vegetation.

22.5.333 The sensitivity of visual receptors at this viewpoint has been rated as high due to the historic importance of Cannington Park Hill and its visual setting. See **Figure 22.44** and **Figure 22.44a**.

Principal Viewpoint 36 – Puriton Hill, PRoW No. BW 28/3

22.5.334 This long distance viewpoint is located on a PRoW No. BW 28/3 located on the Puriton Hill adjacent to Junction 23 of M5 and provides open views of the countryside between Bridgwater and the coastline. It is located within the Lowland Hills Local Landscape Character Area and represents views experienced by walkers.

22.5.335 The M5 and the adjacent built form are visible in the foreground and several small settlements and can be seen in the distance. The existing Hinkley Point Power Station Complex punctuates the coastline in the far distance on the backdrop of Bridgwater Bay. Green Lane ridge immediately to the south of the application site, is visible in the distance within the wider panorama which includes views of the flat to the gently undulating farmland and scattered woodland and hedgerows, and HPA and HPB stations.

22.5.336 The sensitivity of visual receptors at this viewpoint has been rated as medium due to its location on a PRoW of local importance. See **Figure 22.45** and **Figure 22.45a**.

Principal Viewpoint 37 – Burnham-on-Sea, waterfront (west of the pier)

22.5.337 This long distance viewpoint is located adjacent to the pier on Burnham-on-Sea waterfront within the built up area. It represents views experienced by walkers, motorists and local residents. It is located within the Burnham-on-Sea to Brean Down Local Seascape Character Area.

22.5.338 The sandy beach and waters of the Severn Estuary out into Bridgwater Bay dominate the view with the Quantock Hills forming the backdrop. The view is dominated by a vast expanse of the sea and sky. The existing Hinkley Point Power Station Complex is visible and a notable landmark on the coastline and screens parts of the HPC development site.

22.5.339 The Burnham-on-Sea waterfront is well lit. The existing Hinkley Point Power Station Complex is the only noticeable light source along the distant Bridgwater Bay coastline.

22.5.340 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a very popular waterfront with a number of residential properties and a formal viewpoint on the pier. See **Figure 22.46** and **Figure 22.46a**.

Principal Viewpoint 38 – Brent Knoll (monument)

22.5.341 This long distance viewpoint is located on the top of Brent Knoll hill (near the monument) and represents views experienced by walkers. It is located within the Lowland Hills Local Landscape Character Area.

22.5.342 This viewpoint provides open views of the Bridgwater Bay and the adjacent coastline. The visibility of the taller buildings of the Hinkley Point Power Station Complex is limited due to the long distance from the site (over 14km) set within an expansive panorama of farmland, settlement and Bridgwater Bay and the distant coastline.

22.5.343 The sensitivity of visual receptors at this viewpoint has been rated as medium due to its location on a popular walking destination. See **Figure 22.47** and **Figure 22.47a**.

Principal Viewpoint 39 – Berrow Beach

22.5.344 This long distance viewpoint is located on Berrow Beach and represents views experienced by the visitors to the beach. The sandy beach and waters of the Severn Estuary out into Bridgwater Bay dominate the view with the Quantock Hills forming a backdrop to views to the south west. The viewpoint is located within the Burnham-on-Sea to Brean Down Local Seascape Character Area

22.5.345 This simple view is dominated by a vast expanse of the sand, sea and sky. The existing Hinkley Point Power Station Complex is visible and a notable landmark on the coastline and screens parts of the HPC development site.

22.5.346 The sensitivity of visual receptors at this viewpoint has been rated as medium due to its location on a locally important beach. See **Figure 22.48** and **Figure 22.48a**.

Principal Viewpoint 40 – Brean Down

22.5.347 This long distance viewpoint is located on the ridge of Brean Down, on PRoW No. AX 7/16, looking across Bridgwater Bay. It represents views experienced by walkers and is located within the Mendips Local Landscape Character Area.

22.5.348 The viewpoint provides open views of Bridgwater Bay and long distance views across to the Quantock Hills and parts of Exmoor. This simple view is dominated by a vast expanse of the sea and sky. The visibility of the existing Hinkley Point Power Station Complex and the HPC development site is limited due to long distance (over 15km) and set within the expansive view of Bridgwater Bay.

22.5.349 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location within a popular tourist destination of landscape and historic importance. . See **Figure 22.49** and **Figure 22.49a**.

Principal Viewpoint 41 – Mendip Hills AONB, Bleadon Hill

22.5.350 This long distance viewpoint is located on a public footpath within the Mendip Hills AONB and represents views experienced by walkers. It is located within the Limestone Ridges and Combes Local Landscape Character Area. The Quantock Hills are visible in the far distance establishing a distant backdrop. The visibility of the existing Hinkley Point Power Station Complex and the HPC development site is limited due to the distance and angle of view with the middle ground on Bridgwater Bay and extensive farmland.

22.5.351 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a footpath within a nationally designated landscape. See **Figure 22.50** and **Figure 22.50a**.

Principal Viewpoint 42 – Mendip Hills AONB, Crook Peak

22.5.352 This viewpoint is located on a public footpath leading to Crook Peak (near the summit) within the Mendip Hills AONB and represents views experienced by walkers. It is located within the Mendips Local Landscape Character Area. The Quantocks Hills are visible in the far distance. The visibility of the existing Hinkley Point Power Station Complex and the HPC development site is limited due to the distance.

22.5.353 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a footpath within the nationally designated landscape. See **Figure 22.51** and **Figure 22.51a**.

Secondary Viewpoint S1 – Minehead Waterfront

22.5.354 This long distance viewpoint is located on the waterfront, within urban area of Minehead and represents views experienced by residents, pedestrians and motorists. It is located over 22km from the development site and the existing Hinkley Point Power Station Complex appears as a feature of low prominence punctuating the skyline to the north of the distinctive Quantock ridge. The view is dominated by a vast expanse of the sky and sea and Minehead waterfront development is visible on the side.

22.5.355 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a pedestrian track of local importance and in the vicinity of residential properties. See **Figure 22.52**.

Secondary Viewpoint S2 – Exmoor National Park, North Hill

22.5.356 This long distance viewpoint is located on a PRoW No. WL 14/14 on the North Hill within the Exmoor National Park and represents views experienced by walkers.

22.5.357 The vegetation in the foreground screens views towards Bridgwater Bay and the Hinkley Point Power Station Complex is the only man-made structure visible in the distance through gaps in vegetation. Due to the distance from the site the existing Hinkley Point Power Station Complex is of very low prominence.

22.5.358 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a footpath within a nationally designated landscape. See **Figure 22.53**.

Secondary Viewpoint S3 – Minehead, Paganel Road

22.5.359 This long distance viewpoint is located on Paganel Road, within the most elevated urban area of Minehead. The view is experienced by motorists, pedestrians and residents of the adjacent houses.

22.5.360 The foreground of the view has typically suburban character with a mix of housing and planting located on a slope descending towards the sea. The distinctive Quantock ridge is visible in the long distance, just above the coastline, the existing Hinkley Point Power Station Complex punctuates the skyline. Similarly to other views in this area, due to long distance (over 23km) the existing Complex is of low prominence.

22.5.361 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location in a residential area. See **Figure 22.54**.

Secondary Viewpoint S4 – Exmoor National Park, Conygar Tower

22.5.362 This long distance viewpoint is located within the Exmoor National Park, adjacent to Conygar Tower in Dunster. Conygar Tower is a Grade II listed building in the vicinity of the Dunster Castle (located on a nearby hilltop but not experiencing views of the HPC development site) and a popular tourist destination. The viewpoint represents views experienced by walkers.

22.5.363 The woodland surrounding the tower screens the majority of views towards Bridgwater Bay and the existing Hinkley Point Power Station Complex is visible through gaps in the existing woodland. Due to distance and woodland obscuring the views the Complex is barely perceptible from this viewpoint.

22.5.364 The sensitivity of visual receptors at this viewpoint has been rated as high due the cultural, and heritage importance of the Conygar Tower and its popularity as a walking destination for people visiting and living in Dunster. See **Figure 22.55**.

Secondary Viewpoint S5 – Exmoor National Park, Rodhuish Common

22.5.365 This viewpoint is located within the Exmoor National Park on Rodhuish Common and represents views experienced by walkers on publicly accessible land (south of PRoW No. WL 29/6).

22.5.366 The viewpoint provides open views of the coastline and low lying farmland to the west of the Quantock Hills AONB, whose ridge forms a distinctive skyline. Due to the long distance (over 20km), the existing Hinkley Point Power Station Complex is barely perceptible against a backdrop of Bridgwater Bay and its coastline around Weston-Super-Mare. Similar to other views from this distance and direction, the visibility of the existing Complex depends on the direction of sunlight and weather conditions.

22.5.367 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a footpath within a nationally designated landscape. See **Figure 22.56**.

Secondary Viewpoint S6 – Welsh Coast, Barry Island Waterfront

22.5.368 This long distance viewpoint is located on the Barry Island Waterfront, on the Welsh coast, approximately 19km to the north of the HPC development site. This simple view is characterised by sea, sky and beach and is experienced by residents of Barry, motorists and pedestrians. Due to the long distance, the existing Hinkley Point Power Station Complex and the HPC development site are visible but barely perceptible. The distinctive ridge of the Quantock Hills AONB forms the skyline to the west of the existing Complex in the view.

22.5.369 The sensitivity of visual receptors at this viewpoint has been rated as high due to its location on a popular waterfront and its representative character for a number of receptors, including residents of Barry. See **Figure 22.57**.

22.5.370 **Table 22.8** provides a summary of viewpoints and visual receptors.

Table 22.8: Summary of Viewpoints and Visual Receptors

ID	Viewpoint Name	Receptor	Distance	Sensitivity
1	PRoW No. WL 23/110 west of Benhole Lane	Walkers	Short	High
2	West Somerset Coast Path, PRoW No. WL 23/95	Walkers	Short	High
3	West Somerset Coast Path, Lilstock, PRoW No. WL 24/10	Walkers	Medium	High
4	PRoW No. WL 24/8	Walkers	Medium	Medium
5	Higher Hill, PRoW No. 24/3	Walkers	Medium	Medium
6	PRoW No. WL 24/11 near the edge of the Great Plantation	Walkers	Medium	Medium
7	Fairfield House Driveway	Residents, visitors to Fairfield House	Medium	High
8	Knighton Farm, PRoW No. WL 23/46	Residents, walkers	Short	High
9	Burton	Walkers, motorists	Short	Medium
10	Shurton West, Local Farm near PRoW No. WL 23/48	Residents, walkers	Short	High
11	Shurton East, PRoW No. WL 23/56	Walkers, residents	Short	High
12	Local road to the south of the site (near Gunter's Grove)	Motorists	Short	Low
13	PRoW No. WL 23/57, West of Wick	Walkers	Short	Medium
14	Pixies Mound (Wick Barrow)	Walkers	Short	High
15	PRoW No. WL 23/61	Walkers	Short	High
16	Wick, PRoW No. WL 23/61	Walkers, residents	Short	High
17	Farrington Hill Lane (Farringdon Farm)	Walkers	Short	Medium
18	Residential area at Stogursey, Burgage Road/Lime Street	Pedestrians, motorists, residents	Short	High
19	Stolford, West Somerset Coast Path, PRoW No. WL 23/95	Residents, walkers	Medium	High
20	Stockland Bristol, PRoW No. BW 32/3	Residents, walkers	Medium	High
21	Quantock Hills AONB, PRoW No. WL 24/1	Residents, walkers	Medium	High

ID	Viewpoint Name	Receptor	Distance	Sensitivity
22	East Quantoxhead, PRoW No. WL 8/30	Walkers	Long	High
23	East Quantoxhead, Court House Gardens	Walkers, visitors to Court House	Long	High
24	Entrance to Dodington House	Residents, visitors to Doddington House	Medium	High
25	Nether Stowey, Stogursey Lane	Pedestrians	Medium	Medium
26	Quantock Hills AONB, Beacon Hill	Walkers	Long	High
27	A39, Holford Parking Bay	Motorists, walkers, horse riders	Long	High
28	Quantock Hills AONB, PRoW No. WL 10/9	Walkers	Long	High
29	Quantock Hills AONB, Walford's Gibbet	Walkers	Long	High
30	Quantock Hills AONB, PRoW No. 10/28	Walkers	Long	High
31	Quantock Hills AONB, Will's Neck	Walkers	Long	High
32	Quantock Hills AONB, Cothelstone Hill	Walkers	Long	High
33	Quantock Hills AONB, Broomfield Hill	Walkers	Long	High
34	Quantock Hills AONB, Wind Down, lay-by	Motorists, walkers	Long	High
35	Cannington Park, Public Footpath	Walkers	Long	High
36	Puriton Hill, PRoW No. BW 28/3	Walkers	Long	Medium
37	Burnham-on-Sea, waterfront (west of the pier)	Residents, pedestrians, motorists	Long	High
38	Brent Knoll (monument)	Walkers	Long	Medium
39	Berrow Beach	Walkers, tourists	Long	Medium
40	Brean Down	Walkers	Long	High
41	Mendip Hills AONB, Bleadon Hill	Walkers	Long	High
42	Mendip Hills AONB, Crook Peak	Walkers	Long	High
S1	Minehead Waterfront	Residents, pedestrians, motorists	Long	High
S2	Exmoor National Park, North Hill	Walkers	Long	High
S3	Minehead, Paganel Road	Residents, pedestrians, motorists	Long	High
S4	Exmoor National Park, Conygar Tower	Walkers	Long	High
S5	Exmoor National Park, Rodhuish Common	Walkers	Long	High
S6	Welsh Coast, Barry Island Waterfront	Pedestrians, walkers, motorists, residents	Long	High

iv. Conclusions of Visual Baseline

22.5.371 **Figures 22.9** and **22.9a** show the ZTV and viewpoint locations selected to illustrate the visual impact of the HPC proposed development. Field work has identified the nature of the visibility of the HPC development site illustrated in the viewpoint photographs.

22.5.372 The main areas where the HPC development site is visible and has the potential for visual impact of the HPC proposed development to be apparent can be broadly summarised as:

- Lowland hills around the site (up to 5km), including nearby villages and farms and a number of local Public Rights of Way;
- Somerset coastline from Minehead to Brean Down, including important coastal footpaths and popular recreational areas;
- Eastern hills of Exmoor National Park;
- Summits and north-east facing slopes of the Quantock Hills AONB;
- Western fringe of the Mendip Hills AONB;
- Brent Knoll;
- Puriton Hill; and
- South Wales coastline.

22.5.373 The overall sensitivity of the surrounding area to visual impact is considered to be medium to high. The areas of the highest sensitivity exist along the coastline, Quantock Hills AONB, Mendip Hills AONB, Exmoor National Park, and lowland hills to the east of the HPC development site.

22.6 Assessment of Impacts

a) Introduction

22.6.1 This section assesses the potential landscape and visual impacts which would result from the construction and operational activities relating to the HPC proposed development before implementing mitigation measures.

22.6.2 Mitigation measures embodied in the project have been addressed from the earliest stages of project design and benefited significantly from the inputs of stakeholders. Mitigation measures, whether they take the form of landscape proposals, masterplan configuration and the selection of materials for buildings, are embodied in the DCO application proposals and as such are regarded as being inherent to the scheme.

22.6.3 Residual landscape and visual impacts following implementation of the proposed further mitigation measures are assessed in section 22.8 of this LVIA.

22.6.4 This section of the LVIA provides a summary of key elements of the HPC proposed development that would cause landscape and visual impacts during construction and operational phases and are assessed in the LVIA.

22.6.5 Detailed description of the HPC proposed development is available in the following HPC project DCO application documents:

- Description of Proposed Development (**Chapter 2** of this volume);
- Construction (**Chapter 3** of this volume);
- **Construction Method Statement**;
- Operation (**Chapter 4** of this volume);

- **Hinkley Point C Design and Access Statement**;
- **HPC Landscape Strategy**, which contains detailed description of the landscape proposals during construction and operation;
- **HPC Construction Lighting Strategy** (appended to the **Construction Method Statement**); and
- **HPC Operational Lighting Strategy** (appended to **Chapter 2** of this volume).

22.6.6 The iterative design process included consideration of other EIA disciplines, in particular terrestrial ecology and ornithology (**Chapter 20** of this volume), historic environment (**Chapter 23** of this volume), amenity and recreation (**Chapter 25** of this volume) and transport matters (**Chapter 10** of this volume). The landscape proposals and assessment described in this section have been informed by these disciplines.

22.6.7 This LVIA does not assess landscape and visual impacts arising from HPC off-site associated development which are described in separate ES chapters. Cumulative impacts relating to landscape and visual matters arising from the HPC proposed development in combination with other elements of the HPC project and other relevant plans and projects, including National Grid overhead lines to the east of the HPC proposed development are identified and assessed in **Volume 11** of this ES.

22.6.8 Eleven off-site highway improvement schemes will be included in the HPC project DCO application. They are presented in **Chapter 2** of this volume. The schemes concern land that is presently within the highway, on highway land, such verges, limited areas of hard surfacing and urban green space. The works are of two principal types; modifications to existing road alignments or junction/roundabout arrangements and enhanced safety measures. The highway improvements works have been considered and the sites visited and are considered to be of small scale and have no potential to exert significant landscape and visual impact, with the exception of likely lighting impacts during the hours of darkness at Washford Cross Roundabout and A39 New Road/B3339 Sandford Hill Roundabout.

22.6.9 In terms of visual impact it is assessed that the only receptors affected by the HPC proposed development and the lighting at Washford Cross Roundabout would be PRoW users in Exmoor, represented by Secondary Viewpoint s6 at Rodhuish Common, and no other visual receptors would affected by the HPC proposed development and by lighting at A39 New Road/B3339 Sandford Hill Roundabout. The assessment of lighting impact on receptors at Rodhuish Common is included in this LVIA.

22.6.10 The impact of lighting of the proposed highway improvements at Washford Cross Roundabout and A39 New Road/B3339 Sandford Hill Roundabout is considered for the relevant Local Landscape Character Areas, namely Central West Somerset LLCA and Lowland Hills LLCA. It is considered that both proposed schemes would not cause significant impacts on the landscape character of the remaining LLCAs due to the distance, use of cut-off lanterns, and the reduction of the proposed lighting to the minimum levels possible to minimise upward light spill.

22.6.11 It is considered that none of the remaining schemes have potential for significant landscape and visual impact, and as such the 9 remaining schemes have been scoped out from assessment in this chapter.

22.6.12 A summary of key elements of the project with the potential for exerting landscape and visual impact during HPC construction and operational phases is provided below.

b) Summary of HPC Construction Phase

22.6.13 During the construction phase the intensity, nature and duration of impacts will vary and this is assessed with reference to the overall HPC project programme and construction phasing plans (see **Chapter 3** of this volume and the **Construction Method Statement**). Reference should be made to **Figure 3.1** and **Figure 3.2** in **Chapter 3** of this volume, which illustrates the construction parameters upon which this landscape and visual impact assessment is based.

22.6.14 The construction phasing plans, set out in the **Construction Method Statement**, have been informed by landscape and visual impact considerations to minimise the duration of impacts on landscape and visual receptors. The LVIA informed the construction site layout to minimise the magnitude of landscape and visual impacts by locating the structures of most significant size in clusters or in areas of the site with the least potential for visual impacts (for instance away from the HPC development site boundary and residential receptors).

22.6.15 The key elements of HPC and associated activities during the construction phase which are assessed in this chapter include:

- Site preparation works, including site clearance works, removal of vegetation, excavations and earthworks.
- Construction of the HPC Unit 1 and Unit 2, other ancillary buildings and structures (including sea wall, on-site pylons and meteorological mast).
- Erection of temporary buildings required for construction.
- Construction of roads and other infrastructure.
- Construction machinery, including a number of tower cranes, smaller cranes, batching plants, drilling rigs and others.
- Movement of construction related traffic, including delivery and removal of materials to and from site, off-site road traffic including travel of workers to and from site, and load shipments to and from site.
- Construction, operation and removal of the temporary jetty, including on-shore elements of the temporary jetty such as a sand shed, aggregate stockpiles and silos.
- Construction, operation and removal of on-site accommodation campus.
- Construction of the National Grid substation.
- Landscaping during construction, including: remodelled landform; woodland, hedgerow and shrub planting; creation of water bodies; restoration of arable land and areas of grassland; implementation of the proposed PRoW network; retention of landscape features within the site.

22.6.16 Landscape proposals during DCO construction works is shown on **Figure 22.58**. Landscape proposals during the construction phase comprise retained and proposed landscape features, such as the majority of the locally prominent Green Lane ridge or boundary vegetation, which were considered of landscape value or contribute to visual screening for local residents. The existing boundary vegetation would be reinforced by additional planting to increase screening.

22.6.17 The project involves extensive bulk earthworks, excavation, earth placement and modelling. At this stage indicative information is presented on the soil and rock pile storage heights. See **Figure 3.1** in **Chapter 3** of this volume of the ES.

22.6.18 To help ensure early screening for the local residents, landscaping is proposed within the southern part of the HPC development site which is in advance of the implementation of the final landscape restoration proposals. Proposals include raised, naturally modelled landform and native woodland screen planting which would continue maturing during the HPC construction phase to eventually form part of the final landscape restoration scheme at commencement of HPC operation. The southern area of the HPC development site already contains the advanced screen planting implemented in Spring 2011.

22.6.19 Early landscape restoration proposals also include establishment of new hedgerows along Wick Moor Drove to reduce visual impact on residential receptors to the south east of the HPC development site and additional hedgerows forming an ecological link between Wick Moor Drove and Green Lane.

22.6.20 The planting proposals between Pixies Mound and the proposed northern access roundabout and the adjacent car park would be implemented during the initial construction phase and continue maturing during the HPC construction phase to eventually form part of the final landscape restoration scheme.

22.6.21 It should be noted that the proposed bund along the north-western HPC development site boundary shown on **Figure 22.58** is a temporary screening bund to be implemented specifically and only for the construction phase, and as such is treated as a mitigation measure and assessed in Section 22.8, Residual Impacts.

22.6.22 Due to the large scale of the construction works, it is not possible to define the exact activities taking place at a specific moment in time. Instead, the construction within the HPC development site has been divided into zones, for which a set of parameters has been defined. The indicative construction parameters are described in **Figure 3.1** and **Table 3.2** of **Chapter 3** of this volume. For each construction zone within the HPC development site the potential height and working parameters have been defined under general (normal) conditions. Two zones showing exceptional conditions ('worst-case scenario') have also been defined. The landscape and visual assessment is based on the most likely, general condition, but it also takes account the potential exceptional condition, which may occur during limited periods of construction and its occurrence (or lack of it) cannot be accurately predicted at this stage.

22.6.23 The indicative heights for spoil and rock storage, together with the parameters set out in **Figure 3.1** in **Chapter 3** of this volume have been assessed and in conclusion there would be no change to the significance of impacts reported in this LVIA.

22.6.24 The majority of construction would require 24-hour working, however, the intensity of construction activities would vary between day and night. The main construction activities would be carried out between 6.00 and 22.00 from Monday to Friday and 6.00 to 15.00 on Saturday with no major construction activities on Sunday. The night shifts would be predominantly required for maintenance and logistics, however, it may be also used to catch up delayed day-time works or in other exceptional circumstances.

c) Summary of HPC Operational Phase

22.6.25 The operational phase of the HPC would commence following the completion of all construction works and the full implementation of the landscape restoration plan (see **Figure 22.59**).

22.6.26 The HPC proposed development would include the following key components with the potential to exert landscape and visual impacts:

- Permanent development including completed HPC Unit 1 and Unit 2 and other ancillary buildings and structures (including sea wall, on-site pylons and meteorological mast).
- National Grid substation and associated transmission infrastructure within the HPC development site.
- Access roads (including emergency access road within the southern part of the HPC development site) and parking.
- Perimeter security fence, which will enclose the majority of the HPC permanent development.
- Vehicle movements associated with the operational activities within the HPC proposed development.
- Fully implemented landscape restoration plan, including remodelled landform; woodland, hedgerow and shrub planting; creation of water features; restoration of arable land and areas of grassland; implementation of the proposed PRoW network.

22.6.27 The final landscape restoration proposals are illustrated on the landscape restoration plan (see **Figure 22.59**) and landscape restoration rendered masterplan (see **Figure 22.60**).

22.6.28 The landscape restoration plan aims to re-establish the existing landform within the HPC development site and outside the HPC permanent development area incorporating enhanced screening through local landform modification and the provision of new woodland areas. The relative height and prominence of Green Lane within the local landscape will be maintained. The landform to the west of the HPC proposed development and in the southern part of the HPC development site is modelled for visual screening. The Holford Stream valley will be restored and a smooth transition between the HPC development site and adjacent land, and integration with the surrounding landscape will be provided.

22.6.29 The landscape restoration plan involves extensive bulk earthworks, excavation, earth placement and modelling. At this indicative information on the formation levels across the landscape restoration area is provided in the landscape restoration plan (see **Figure 22.59**), setting out the likely finished ground levels. Details including the finished ground levels will be submitted as part of the detailed landscape scheme, submitted pursuant to a requirement in the DCO.

22.6.30 The impact assessment has therefore been based on the likely ground levels across the site and has factored into the assessment potential changes to ground levels that may arise in the design development process, allowing for a potential variation in the stated heights of +1m to +1.5m has been assumed. Such variations have been assessed and it is considered that such change across the site would not give rise to any additional significant impact on landscape or visual receptors than that already identified. The effectiveness of the proposed screening earthworks and planting mitigation proposed and illustrated in the VVIs will not be materially altered.

22.6.31 The land use proposals, outside the built development, have been guided by the objective to integrate with the existing landscape character of the Quantock Vale. The landscape character restoration for the HPC development site would comprise:

- A coastal slope field pattern character, recreated with hedgerows and hedgerow trees, a mix of grazing and arable land and neutral grassland, and a scrub edge to the cliffs and hedgerows.
- Retention and enhancement of the Green Lane hedgerow through additional planting.
- Holford Valley field pattern character recreated with hedgerows and hedgerow trees, and species rich grassland.
- Land to the north-west of the HPC development site is proposed to be returned to the land owner following the construction period.

22.6.32 The **HPC Landscape Strategy** contains details of the proposed landscape restoration plan, including the phasing of landscape works, description of how the HPC development site restoration has been integrated with the plot plan, and description of restored PRoW network. It also contains details of landscape materials and proposed management within the restored HPC development site, including the integration of the ecological strategy and associated biodiversity targets.

22.6.33 The **HPC Landscape Strategy** submitted with the DCO application provides further illustrations and plans and includes supporting cross-sections, planting strategy, planting schedules and hardscape palette.

22.6.34 The assessment of impacts takes account of the proposed planting mixes and growth rates taking account of the local context. The planting palette comprises 3 distinctive planting typologies: ‘coastal slopes’, ‘valley wetlands’ and ‘inland wooded ridge’.

22.6.35 The landscape strategy has been designed to accommodate a PRoW network and providing wider access opportunities to the restored landscape. Green Lane will be upgraded to a bridleway following the construction period and the existing footpath along Bum Brook will be maintained providing access for streamside walks. The restored South West Coast Path would be located on the landward side of the new sea wall.

22.6.36 The assessment of operational impacts on landscape and visual receptors is based on the parameters of the project described in **Chapter 2** of this volume and includes an allowance for the proposed height of the buildings and structures (illustrated on **Figure 2.3** in **Chapter 2** of this volume) to increase by an additional 3m above stated roof heights to permit additional roof plant or machinery to be secured. Visually

Verifiable Images (VVIs) are based on building height parameters without the 3m additional height allowance.

d) Landscape Impacts

i. Summary of Landscape Impacts

22.6.31 The following paragraphs provide a summary of key construction and operational impacts on landscape receptors identified in the baseline assessment.

National Landscape Character

22.6.32 The construction and operation of the HPC proposed development will result in both direct and indirect impacts to the Vale of Taunton and Quantock Fringes NCA. Direct impacts will arise as a result of changes to the fabric of the landscape within the HPC development site such as through the loss of landscape elements and features, modification of the environment and introduction of new elements to the landscape, including built elements and landscape proposals such as permanent landform and planting. Indirect impacts will arise as a result to changes to views and experience of the wider NCA landscape as a result of the HPC proposed development.

22.6.33 The Vale of Taunton and Quantock Fringes NCA is an extensive area as such direct impact on its key characteristics would be localised to a small proportion of the overall area. Indirect impacts would also be limited in extent and significance, as the HPC proposed development is located in close proximity to, and would therefore be seen in the context of, the existing Hinkley Point Nuclear Power Station Complex that is a well-established local landmark.

22.6.34 The HPC proposed development would not result in direct impacts on any other NCAs or RLCAs located within the LVIA study area as all material changes to the fabric of the landscape are limited to the HPC development site. Indirect impacts on neighbouring NCAs within the LVIA study area will occur principally as a result of changes to views, most notably views towards the coast from neighbouring elevated areas such as the Quantock Hills. Indirect impacts on key characteristics of neighbouring NCAs are judged to be not significant as alterations to views will be of a limited extent, form part of wider panoramas and view the HPC in the context of the existing Hinkley Point Power Station Complex. It is judged that the intrinsic character of all neighbouring NCAs and RLCAs within the LVIA study area will prevail.

Local Landscape Character

22.6.35 During construction, impact the Quantock Vale LLCA and the St Audries Bay to Hinkley Point LSCA would be of major adverse significance due to significant loss of landscape features (direct impact) within these areas and the visibility of HPC construction. There would be no direct impact on the remaining LLCAs and LSCAs and the main impact would be associated with the change (negative) in views from these areas. The construction impact on the character of Central Quantocks LLCA, Quantock Hills LLCAs and Blue Anchor to St Audries Bay would be of moderate adverse significance. The remaining LLCAs and LSCAs would experience limited views of HPC construction and the impact would be adverse or neutral and of minor significance during HPC construction.

22.6.36 During operation, the impact on the Quantock Vale LLCA would be adverse and of minor significance (year 1) to become neutral and of minor significance (year 15) when the planting proposals begin to mature. The key characteristics of the LLCA would not change, and the proposed landscape features would contain features of high value which would contribute to the character of this LLCA. During operation (year 1 and 15) the impact on St Audries Bay to Hinkley Point LSCA would decrease from major to moderate adverse due to cessation of construction activities and lower magnitude of changes in coastal views, but a degree of physical change due to the operational HPC, including a sea wall which would be created along the cliff fronting the HPC. The operational impacts on the remaining LLCAs and LSCAs would not be significant and would be adverse or neutral and of minor significance, depending on the visibility of the HPC proposed development.

Site Scale Landscape Character

22.6.37 During construction, impacts of major adverse significance would occur in 3 site scale landscape character sub areas of the Quantock Vale LLCA, namely Coastal – Lilstock, Rolling Farmland East – Stogursey and Wick Moor and Coast. The HPC construction would cause significant changes in views from these sub areas and a significant loss of landscape features within the HPC development site, which would affect Coastal – Lilstock and Rolling Farmland East – Stogursey. The impact on Fairfield character area would be of moderate adverse significance due to change in views from this area (but no direct impact on its landscape elements and features). Due to the distance of the Quantock Fringes – Dodington and Wall Common and Coast sub areas from the HPC development site and limited change in views compared to other site scale landscape character sub areas, the construction impact on their character would be of minor adverse significance.

22.6.38 During operation (year 1), the impact on the Coastal – Lilstock sub area would be of major adverse significance. The landscape proposals would have been implemented, however, they would not be mature, so their screening and landscape value would be still limited at this stage. This impact would change to neutral and of moderate significance during year 15 of the operational phase, due the increasing integration of the HPC development into the landscape character of this area and maturation of landscape proposals within the restored HPC development site.

22.6.39 During the operational phase (year 1 and 15) impacts on the character of the remaining landscape character sub areas within the Quantock Vale would not be significant due to increasing screening of the HPC development and introduction of valuable landscape features within the HPC development site.

Landscape Elements and Features

22.6.40 The construction of HPC would cause adverse impacts of major significance on landscape elements and features within the HPC development site and the adjacent landscape up to 50m from its boundary due to widespread loss of landscape elements and features as a result of construction activities.

22.6.41 During operation year 1, the most significant adverse impacts of moderate to major significance would be on land use / settlement and landcover and vegetation. Once the landscape proposals begin to mature (year 15 of the operational phase), the impact on landcover and vegetation would be beneficial and of moderate significance due to a significant gain in valuable landscape features, such as woodland and species-rich hedgerows. The impact on the remaining landscape elements and features, such as landform, and PRoW would not be significant once the HPC development site is restored.

ii. National Landscape Character

22.6.42 National Character Areas for England and Regional Landscape Character Areas for Wales provide a context for the detailed assessment of the impact on local and site scale landscape character areas.

22.6.43 The key characteristics of NCAs (England) and RLCAs (Wales) were described in the landscape baseline and the potential for change of these key characteristics due to the proposed HPC development is evaluated below.

Vale of Taunton and Quantock Fringes

22.6.44 The HPC development, due to its location and large scale, would cause direct (physical) changes to the Area 146: Vale of Taunton and Quantock Fringes however would not cause any substantial change the key characteristics of this area. Although the proposed development is of large scale it is effectively an extension of the existing Hinkley Point Power Station Complex, which is described as a prominent, existing landmark. The combined HPC and the existing Hinkley Point Power Station Complex would become more prominent within this area; however this change would not be substantial in the existing context. During operation, the proposed landscape strategy would create several valuable landscape elements and features, such as hedgerows or woodlands, which are characteristic for this area.

Somerset Levels and Moors/Mid Somerset Hills

22.6.45 The HPC proposed development would not cause any direct change to this area or affect its key characteristics described in the landscape baseline.

22.6.46 The existing Hinkley Point Power Station Complex is visible from the coast and hills within Somerset Levels and Moors/Mid Somerset Hills and has some influence (negative) on the views out from these areas. The HPC would have some impact on views (especially during construction) but this change would not be significant on the character on the NCA.

Quantock Hills AONB

22.6.47 The HPC proposed development is located outside Area 144: The Quantock Hills and as such it would not cause any direct change to this area. The proposed HPC development would have some negative impact on views out from Quantock Hills (particularly from the main ridge and summits), but this change would not alter the character of the area itself due to the long distance of the HPC development site and the presence of the existing Hinkley Point Power Station Complex, which has influence on the character of views from this NCA.

Exmoor

22.6.48 The HPC proposed development is located outside Area 145: Exmoor and it would not cause any direct change to this area. The proposed HPC development would have very limited negative impact on views out from Exmoor (particularly from the main ridge and summits), but this change of views out from Exmoor would not alter the character of the area itself due to the long distance of the HPC development site.

Furthermore, when viewed from the west the HPC would be seen in line with the existing Hinkley Point Power Station Complex and the intensification of built form in views from Exmoor would be minimal.

Mendip Hills AONB

22.6.49 The proposed development is located outside Area 141: Mendip Hills and it would not cause any direct change to this area. The proposed HPC development would have some negative impact on views out from the western fringe of Mendips, but this change would not alter the character of the area itself due to the long distance of the HPC development site and the presence of the existing Hinkley Point Power Station Complex, which has influence on the character of views from this NCA.

Cardiff and Newport RLCA

22.6.50 The proposed development is located outside this RLCA and it would not cause any direct change to this area. The proposed HPC development would have some negative impact on views from the Welsh coastline; however this change would not alter the character of the area itself due to the long distance of the HPC development site and the presence of the existing Hinkley Point Power Station Complex, which has influence on the character of views from this RLCA.

Vale of Glamorgan RLCA

22.6.51 The proposed development is located outside this RLCA and it would not cause any direct change to this area. The proposed HPC development would have some negative impact on views out from this part of the Welsh coastline, but this change would not alter the character of the area itself due to the long distance of the HPC development site and the presence of the existing Hinkley Point Power Station Complex, which has influence on the character of views from this RLCA.

iii. Local Landscape Character

Quantock Vale

22.6.52 The HPC development site is situated entirely within the Quantock Vale LLCA. The HPC construction would cause a direct impact on landscape elements and features within this area. In this lowland landscape of gentle hills, the construction of HPC would be partially visible due to its scale, however, the construction activities taking place at the lower level would be screened from many areas. The skyline would be affected by the construction of the tallest structures and the presence of tower cranes but these features would be seen next to the existing Hinkley Point Power Station Complex and therefore the impact is less significant than it would be in a remote rural landscape. This adverse change in views across Quantock Vale would gradually decrease during site restoration and would eventually become neutral once the HPC is operational and the landscape proposals begin to mature. This includes the impact of lighting, which must be seen against the existing Hinkley Point Power Station Complex and would decrease once the construction activities are complete.

22.6.53 During the construction phase, the impact on the landscape of Quantock Vale would be an adverse medium-term impact of high magnitude and **major** significance, predominantly due to large scale loss of landscape elements and features within the HPC development site (direct impact). The key characteristics of this landscape character area would not change but some of the valued coastal agricultural landscape within the HPC development site would be temporarily lost.

22.6.54 During the operational phase, the adverse impacts on the physical landscape of this character area would gradually decrease and would eventually become neutral once the HPC is operational. The restored landscape would contain many new valuable landscape features and provide good screening of the lower levels of the HPC proposed development.

22.6.55 In the context of the entire Quantock Vale character, the operational impact (year 1) would be adverse, medium-term, of low magnitude and **minor** significance. During the operational phase (year 15) the impact would become long-term, neutral, of low magnitude and **minor** significance.

22.6.56 **Table 22.9** provides a summary of impacts on the Quantock Vale LLCA.

Table 22.9: Impacts on the landscape character of Quantock Vale LLCA

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	Medium	Adverse, medium-term	High	Major
2	Operation year 1	Medium	Adverse, medium-term	Low	Minor
3	Operation year 15	Medium	Neutral, long-term	Low	Minor

Doniford Stream and Quantock Fringe

22.6.57 The HPC proposed development is located outside the Doniford Stream and Quantock Fringe LLCA and its construction and operation would not cause any direct impact on the landscape or the key characteristics of this LLCA, as described in the landscape baseline.

22.6.58 The Doniford Valley, sub area of Doniford Stream and Quantock Fringe character area, would not receive any views of the proposed development due to its location to the west of the Quantocks ridge screening all views of the proposed development.

22.6.59 The only impact associated with the construction and operation of the HPC proposed development would be impact on the views from the North East Quantock Agricultural Fringe sub area towards the east. Construction impacts would be adverse, medium-term, of low magnitude and **minor** significance due to the distance of the HPC proposed development from this area, the rolling topography that would provide some screening to the construction activities, and the location of the HPC development site adjacent to the existing Hinkley Point Power Station Complex (and in line with it when looking from the west).

22.6.60 The during the operational phase (year 1 and year 15) it is judged that the impact would change to neutral, medium to long-term, of very low magnitude and **minor** significance due to the limited change in skyline created by the HPC reactor domes.

22.6.61 **Table 22.10** provides a summary of impacts on the Doniford Stream and Quantock Fringe LLCA.

Table 22.10: Impacts on the landscape character of Doniford Stream and Quantock Fringe LLCA

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	Medium	Adverse, medium-term	Low	Minor
2	Operation year 1	Medium	Neutral, medium-term	Very low	Minor
3	Operation year 15	Medium	Neutral, long-term	Very low	Minor

Central Quantocks

22.6.62 The HPC proposed development is located outside the Central Quantocks and its construction and operation would not cause any direct impact on landscape or the key characteristics of this LLCA described in the landscape baseline.

22.6.63 The Western Scarp Slope, sub area of the Central Quantocks character area, would not receive any views of the proposed development as the views would be screened by the main Quantocks ridge and the sub character area is located outside the ZTV.

22.6.64 The impact of the HPC development on the Central Quantocks would be limited to the summits and eastern slopes of the Upland Plateau and Combes sub area. The impact would be indirect as a result of a change in distant, elevated views towards Bridgwater Bay and the HPC development site. During the construction phase, this is assessed as being of adverse, medium-term, low magnitude and **moderate** significance due to construction activities within the view. During the operational phase (year 1 and year 15) the HPC proposed development would be visible but the impact would change to adverse, medium to long-term, of very low magnitude and **minor** significance. This is due to the simple outline of the completed HPC which would be an extension of the existing Hinkley Point Power Station Complex and due to the distance from the HPC development site.

22.6.65 **Table 22.11** provides a summary of impacts on the Central Quantocks LLCA.

Table 22.11: Impacts on the landscape character of Central Quantocks LLCA

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	High	Adverse, medium-term	Low	Moderate
2	Operation year 1	High	Adverse, medium-term	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Very low	Minor

Quantock Hills

22.6.66 The HPC proposed development is located outside the Quantock Hills LLCA and its construction and operation would not cause any direct impact on landscape or the key characteristics of this LLCA described in the landscape baseline.

22.6.67 The construction impact would be indirect as a result of a change in distant, elevated views towards Bridgwater Bay and the HPC development site. During the construction phase, this is assessed as being of adverse, medium-term, low magnitude and **moderate** significance due to construction activities within the view.

22.6.68 The HPC proposed development during the operational phase (year 1 and year 15) would have an adverse, medium to long-term impact of very low magnitude and of **minor** significance on the landscape character of the Quantock Hills LLCA predominantly due to the long distance of the proposed development from the southern part of the AONB and the site forming a small part of the wide panorama and the presence of the existing Hinkley Point Power Station Complex.

22.6.69 **Table 22.12** provides a summary of impacts on the Quantock Hills landscape character area.

Table 22.12: Impacts on the landscape character of Quantock Hills

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	High	Adverse, medium-term	Low	Moderate
2	Operation year 1	High	Adverse, medium-term	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Very low	Minor

Central West Somerset

22.6.70 The HPC proposed development is located outside the Central West Somerset LLCA and its construction and operation would not cause any direct impact on landscape or the key characteristics of this LLCA described in the landscape baseline.

22.6.71 The majority of this character area would not receive any views of the proposed development due to its location to the west of the Quantocks ridge screening all views of the proposed development.

22.6.72 The only impact associated with the construction and operation of the HPC development would be the impact on the views from the Coast (Blue Anchor to St Audries) sub area and the impact of lighting from the proposed highway improvement scheme at Washford Cross Roundabout. The construction and operational impacts (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance due to limited views of the HPC development site, the distance of the HPC proposed development from this area (over 10km), and the location of the HPC development site adjacent to the existing Hinkley Point Power Station Complex (and in line with it when looking from the west). The proposed lighting at Washford Cross Roundabout would cause a very localised impact (predominantly visual) which would be seen in the context of existing lighting effects at Williton and Watchet, and would not increase the significance of impacts on landscape character caused by the HPC development.

22.6.73 **Table 22.13** provides a summary of impacts on the Central West Somerset landscape character area.

Table 22.13: Impacts on the landscape character of Central West Somerset

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	Medium	Neutral, medium-term	Very low	Minor
2	Operation year 1	Medium	Neutral, medium-term	Very low	Minor
3	Operation year 15	Medium	Neutral, long-term	Very low	Minor

Lowland Hills

22.6.74 The HPC proposed development is located outside the Lowland Hills LLCA and its construction and operation would not cause any direct impact on landscape or the key characteristics of this LLCA described in the landscape baseline.

22.6.75 The only impact associated with the construction and operation of the HPC proposed development would be impact on the views from the western fringe of this character area, and from Isolated Hills and Polden Hills sub areas, and the impact associated with lighting from the proposed highway improvement scheme at A39 New Road/B3339 Sandford Hill Roundabout. This impact would be limited due to the distance of these elevated areas from the HPC development site and the alignment of the proposed development with the existing Hinkley Point Power Station Complex, which would provide some screening of the HPC. Views from the Stockland Hills would also be available, however they would be also limited due to the rolling topography providing some screening, the distance from the HPC development site and the presence of the existing Hinkley Point Power Station Complex. The HPC would be viewed as an extension of the existing Hinkley Point Power Station Complex rather than a separate new development. The proposed lighting at Washford Cross Roundabout would cause a very localised impact (predominantly visual) due to the reduction of upward light spill and would not increase the significance of impacts on landscape character caused by the HPC proposed development. The construction impacts would be adverse, medium-term, of low magnitude and **minor** significance. Once the HPC becomes operational (year 1 and year 15), the impacts would become neutral, medium to long-term, of very low magnitude and **minor** significance.

22.6.76 **Table 22.14** provides a summary of impacts on the Lowland Hills landscape character area.

Table 22.14: Impacts on the landscape character of Lowland Hills

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	Medium	Adverse, medium-term	Low	Minor
2	Operation year 1	Medium	Neutral, medium-term	Very low	Minor
3	Operation year 15	Medium	Neutral, long-term	Very low	Minor

Levels and Moors

22.6.77 The HPC proposed development is located outside the Levels and Moors LLCA and its construction and operation would not cause any direct impact on landscape or the key characteristics of this LLCA described in the landscape baseline.

22.6.78 The main impact associated with the construction and operation of the HPC proposed development would be on the views from the coast within this character area. Inland areas of Levels and Moors would receive very limited or no views of the HPC proposed development due to the low elevation of this character area and its flat topography, where any intervening features (notably vegetation and built form) provide screening of long distance views. The impact would be also limited due to the distance of the eastern areas of Level and Moors from the HPC development site and the alignment of the proposed development with the existing Hinkley Point Power Station Complex, which would provide some screening of the HPC. The magnitude of the construction and operational impacts would be neutral, medium to long-term of very low magnitude and **minor** significance due to very limited visibility of the HPC proposed development, the simple outline of the HPC compared to the construction phase, the long distance and existing features obscuring the views.

22.6.79 **Table 22.15** provides a summary of impacts on the Levels and Moors landscape character area.

Table 22.15: Impacts on the landscape character of Levels and Moors

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	High	Neutral, medium-term	Very low	Minor
2	Operation year 1	High	Neutral, medium-term	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor

Limestone Ridges and Combes

22.6.80 The HPC proposed development is located outside the Limestone Ridges and Combes LLCA and its construction and operation would not cause any direct impact on landscape or the key characteristics of this LLCA described in the landscape baseline.

22.6.81 The only impact associated with the construction and operation of the HPC proposed development would be impact on views from the Limestone Ridges and Combes to the west. Due to distance of the proposed development from this elevated area and the location of the HPC adjacent to the existing Hinkley Point Power Station Complex, which would partially screen the HPC, the construction and operational impact on the character of Limestone Ridges and Combes would not be significant. The impacts during all phases would be neutral, medium to long-term, of very low magnitude and **minor** significance.

22.6.82 **Table 22.16** provides a summary of impacts on the Limestone Ridges and Combes landscape character area.

Table 22.16: Impacts on the landscape character of Limestone Ridges and Combes

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	High	Neutral, medium-term	Very low	Minor
2	Operation year 1	High	Neutral, medium-term	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor

Mendips

22.6.83 The HPC proposed development is located outside the Mendips LLCA and its construction and operation would not cause any direct impact on landscape or the key characteristics of this LLCA described in the landscape baseline.

22.6.84 The only impact associated with the construction and operation of the HPC proposed development would be a visual impact on the views from the Mendips to the west. Due to long distance of the proposed development form this elevated area, and the location of the HPC location adjacent to the existing Hinkley Point Power Station Complex, which would partially screen the HPC, the construction and operational impact on the character of Mendips would not be significant. The impacts during all phases would be neutral, medium to long-term, of very low magnitude and **minor** significance

22.6.85 **Table 22.17** provides a summary of impacts on the Mendips LLCA.

Table 22.17: Impacts on the landscape character of Mendips LLCA

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	High	Neutral, medium-term	Very low	Minor
2	Operation year 1	High	Neutral, medium-term	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor

LSCA Blue Anchor to St Audries Bay

22.6.86 The HPC proposed development is located outside the Blue Anchor to St Audries LSCA and its construction and operation would not cause any direct impact on seascape or the key characteristics of this LSCA described in the landscape baseline.

22.6.87 The only impact associated with the construction of the HPC proposed development would be impact on the coastal views to the east, which are generally limited due to topography and the alignment of the coast. Impact would be caused by construction activities within the HPC development site and off-shore construction activities, such as the temporary jetty and movements of vessels. The construction impacts on this local seascape character area would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.88 During the operational phase the impacts would decrease compared to the construction phase due to the removal of the temporary jetty and the cessation of off-shore activities related to construction. There would be very limited views of the HPC development due to the long distance of the HPC proposed development from this area, and the location of the HPC development site adjacent to the existing Hinkley Point Power Station Complex (and aligned with it when looking from the west). The operational impact (year 1 and 15) on this LSCA would be neutral, medium to long-term, of very low magnitude and of **minor** significance.

22.6.89 **Table 22.18** provides a summary of impacts on the Blue Anchor to St Audries Bay LSCA character area.

Table 22.18: Impacts on the seascape character of Blue Anchor to St Audries Bay LSCA

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	High	Adverse, medium-term	Low	Moderate
2	Operation year 1	High	Neutral, medium-term	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor

LSCA St Audries Bay to Hinkley Point

22.6.90 The HPC development site is located within the St Audries Bay to Hinkley Point LSCA and its construction and operation would cause a direct impact on the character of this LSCA described in the landscape baseline.

22.6.91 The construction of HPC would cause a direct impact on the eastern part of the cliff within the HPC development site, as a result of sea wall construction. Although the direct impact of the temporary jetty on the intertidal zone (wave cut rock platforms) would be limited, the visibility of the temporary jetty and the on-shore and off-shore HPC construction activities would be evident, in particular from Lilstock to Hinkley

Point. West of Lilstock, the indirect impact would be lower due to decreasing visibility of the construction activities. The construction impact would be adverse, medium-term, of medium magnitude and **major** significance.

22.6.92 During the operational phase (year 1 and year 15) the seascape impacts would decrease as a consequence of the removal of the temporary jetty and cessation of off-shore activities related to construction. The main impacts would be associated with the physical change to a cliff adjacent to the Permanent Development (sea wall) and visibility of the HPC along the coastline. The operational impact (year 1 and year 15) on this LSCA would be adverse, medium to long-term, of low magnitude and **moderate** significance.

22.6.93 **Table 22.19** provides a summary of impacts on the St Audries Bay to Hinkley Point LSCA.

Table 22.19: Impacts on the seascape character of St Audries Bay to Hinkley Point LSCA

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	High	Adverse, medium-term	Medium	Major
2	Operation year 1	High	Adverse, medium-term	Low	Moderate
3	Operation year 15	High	Adverse, long-term	Low	Moderate

LSCA Hinkley Point to River Parrett

22.6.94 The HPC proposed development is located outside the Hinkley Point to River Parrett LSCA and its construction and operation would not cause any direct impact on seascape or the key characteristics of this LSCA described in the landscape baseline.

22.6.95 The only impact associated with the construction of the HPC proposed development would be impact on the coastal views to the west towards the existing Hinkley Point Power Station Complex. This impact would be caused by construction activities within the HPC development site (partially screened by the HPA, HPB and coastal vegetation) and off-shore construction activities, such as the temporary jetty and movements of vessels. The construction impacts on this local seascape character area would be adverse, medium-term, of low magnitude and **minor** significance.

22.6.96 During the operational phase (year 1 and year 15) the impacts would decrease due to the removal of the temporary jetty and cessation of off-shore activities related to construction. There would be very limited views of the HPC development due screened by the existing Hinkley Point Power Station Complex and the alignment of the coastline. The operational impact (year 1 and year 15) on this LSCA would be neutral, medium to long-term, of very low magnitude and of **minor** significance.

22.6.97 **Table 22.20** provides a summary of impacts on the Hinkley Point to River Parrett LSCA character area.

Table 22.20: Impacts on the seascape character of Hinkley Point to River Parrett LSCA

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	Medium	Adverse, medium-term	Low	Minor
2	Operation year 1	Medium	Neutral, medium-term	Very low	Minor
3	Operation year 15	Medium	Neutral, long-term	Very low	Minor

LSCA Burnham-on-Sea to Brean Down

22.6.98 The HPC proposed development is located outside the Burnham-on-Sea to Brean Down LSCA and its construction and operation would not cause any direct impact on seascape or the key characteristics of this LSCA described in the landscape baseline.

22.6.99 The only impact associated with the construction of the HPC proposed development would be impact on the coastal views to the west towards the existing Hinkley Point Power Station Complex. This impact would be caused by construction activities within the HPC development site (partially screened by the HPA and HPB) and off-shore construction activities, such as the temporary jetty and movements of vessels. The construction impacts on this local seascape character area would be adverse, medium-term, of low magnitude and **minor** significance.

22.6.100 During the operational phase (both year 1 and 15) the impacts would decrease due to removal of the temporary jetty and cessation of off-shore activities related to construction. There would be very limited views of the HPC development predominantly due to the long distance. The operational impact (year 1 and year 15) on this LSCA would be neutral, medium to long-term, of very low magnitude and of **minor** significance.

22.6.101 **Table 22.21** provides a summary of impacts on the Burnham-on-Sea to Brean Down LSCA character area.

Table 22.21: Impacts on the seascape character of Burnham-on-Sea to Brean Down LSCA

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	Medium	Adverse, medium-term	Low	Minor
2	Operation year 1	Medium	Neutral, medium-term	Very low	Minor
3	Operation year 15	Medium	Neutral, long-term	Very low	Minor

LSCA Brean Down

22.6.102 The HPC proposed development is located outside the Brean Down LSCA and its construction and operation would not cause any direct impact on seascape or the key characteristics of this LSCA described in the landscape baseline.

22.6.103 The only impact associated with the construction of the HPC proposed development would be impact on the coastal views to the west towards the existing Hinkley Point Power Station Complex. This impact would be caused by construction activities within the HPC development site (partially screened by the HPA and HPB) and off-shore construction activities, such as the temporary jetty and movements of vessels. The construction impacts on this LSCA would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.104 During the operational phase (year 1 and year 15) the impacts would decrease due to removal of the temporary jetty and cessation of off-shore activities related to construction. There would be very limited views of the HPC development predominantly due to the distance to the HPC proposed development from this LLCA. The operational impact (year 1 and year 15) on this LSCA would be neutral, medium to long-term, of very low magnitude and of **minor** significance.

22.6.105 **Table 22.22** provides a summary of impacts on the Brean Down LSCA character area.

Table 22.22: Impacts on the seascape character of Brean Down LSCA

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	High	Adverse, medium-term	Low	Moderate
2	Operation year 1	High	Neutral, medium-term	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor

iv. Site Scale Landscape Character

Wick Moor and Coast

22.6.106 The only impact associated with the construction and operation of the HPC proposed development would be an impact on views within this character area. Due to the screening provided by the existing Hinkley Point Power Station Complex, the northern parts of the Wick Moor and Coast would receive limited or no views of the HPC proposed development. The middle and southern part of Wick Moor and Coast would receive views of construction and operation of the HPC.

22.6.107 The construction impacts on the character of this area would be adverse, medium-term, of medium magnitude and **major** significance due to a change in views. The operational phase impacts (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance due to a limited change in views once the HPC is operational.

22.6.108 **Table 22.23** provides a summary of impacts on the Wick Moor and Coast landscape character area.

Table 22.23: Impacts on the Wick Moor and Coast landscape character area

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	High	Adverse, medium-term	Medium	Major
2	Operation year 1	High	Adverse, medium-term	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Very low	Minor

Wall Common and Coast

22.6.109 The proposed development is located outside the Wall Common and Coast character area and its construction and operation would not affect any of the area's key characteristics described in the landscape baseline.

22.6.110 The main impact associated with the construction and operation of the HPC proposed development would be impact on some views within this character area.

The impact would be similar to the impact on Wick Moor and Coast but more limited due to the longer distance of the Wall Common and Coast character area from the HPC development site, lower visibility of the site from the coastline (due to its alignment) and the prominence of the existing Hinkley Point Power Station Complex and electricity infrastructure, which is visible from this area. The magnitude of construction phase impacts would be adverse, medium-term, of low magnitude and **minor** significance. The operational phase impacts (year 1 and year 15) would change to neutral, medium to long-term of very low magnitude and **minor** significance due to the simpler form of the HPC compared to its construction phase, the distance and existing landscape features obscuring the views towards the HPC.

22.6.111 **Table 22.24** provides a summary of impacts on the Wall Common and Coast landscape character area.

Table 22.24: Impacts on the Wall Common and Coast landscape character area

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	Medium	Adverse, medium-term	Low	Minor
2	Operation year 1	Medium	Neutral, medium-term	Very low	Minor
3	Operation year 15	Medium	Neutral, long-term	Very low	Minor

Coastal - Lilstock

22.6.112 The northern part of the HPC development site (north of Green Lane) lies within the eastern part of the Coastal – Lilstock character sub area, adjacent to the existing Hinkley Point Power Station Complex.

22.6.113 The construction impact on the character of this area would include both physical changes to landscape within the HPC development site and changes to views, predominantly within the eastern part of this character area. The construction of the HPC, including the temporary jetty, would be visible along the coastline. To the west of Lilstock the visibility would decrease due to the distance and gently undulating topography, which would provide some screening from the areas located at a lower elevation. The visibility of HPC construction would be very limited in the western parts of Coastal – Lilstock character area. The construction impact on the character of the Coastal – Lilstock area would be adverse, medium-term, of high magnitude and of **major** significance.

22.6.114 Following landscape restoration, the operational (year 1) impact would change to adverse, medium-term, of medium magnitude and of **major** significance due to the completed restoration of landform within the HPC development site, which would provide screening of the lower levels of the proposed development along the coastline and returning the land outside the HPC permanent development to gently sloping topography which is characteristic of this character area. The landscape proposals would have been implemented however, they would not be mature at this stage, so their screening and landscape value would be limited at this stage. The proposed PRoW network would restore access to the countryside around the HPC.

22.6.115 The HPC proposed development would cause a significant loss of greenfield areas within the HPC development site. However, during the operational phase (year 15), the addition of valuable landscape features, and the decreasing visual impact to the west of Lilstock would change of nature of landscape impacts in the long term as the planting matures and integrates with the surrounding landscape. Therefore, following the maturation of landscape proposals, the operational (year 15) impacts would change to neutral, long-term, of low magnitude and of **moderate** significance.

22.6.116 **Table 22.25** provides a summary of impacts on the Coastal - Lilstock landscape character sub area.

Table 22.25: Impacts on the Coastal – Lilstock landscape character sub area

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	High	Adverse, medium-term	High	Major
2	Operation year 1	High	Adverse, medium-term	Medium	Major
3	Operation year 15	High	Neutral, long-term	Low	Moderate

Rolling Farmland East - Stogursey

22.6.117 The southern part of the HPC development site (south of Green Lane) lies within the north-western part of the Rolling Farmland East –Stogursey landscape character sub area, in the vicinity of the existing Hinkley Point Power Station Complex.

22.6.118 The construction impact on the character of this area would include both physical changes to landscape within the HPC development site and changes to views. The construction impact on the character of the entire Rolling Farmland East – Stogursey area would be adverse, medium-term, of high magnitude and of **major** significance due to change is views and significant loss of landscape features within the HPC development site.

22.6.119 Following landscape restoration, the operational (year 1) impact would change to adverse, medium-term, of low magnitude and of **minor** significance due to the completed restoration of landform within the HPC development site and returning the land outside the HPC permanent development to naturalistic rolling topography characteristic of this character area. The landscape proposals would have been implemented however, they would not be mature at this stage, so their screening and amenity value would be limited at this stage. The proposed PRoW network would restore access to the countryside around the HPC.

22.6.120 Following the maturation of landscape proposals the operational (year 15) impacts would change to neutral, long-term, of low magnitude and of **minor** significance.

22.6.121 **Table 22.26** provides a summary of impacts on the Rolling Farmland East – Stogursey landscape character sub area.

Table 22.26: Impacts on the Rolling Farmland East – Stogursey landscape character sub area

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	Medium	Adverse, medium-term	High	Major
2	Operation year 1	Medium	Adverse, medium-term	Low	Minor
3	Operation year 15	Medium	Neutral, long-term	Low	Minor

Fairfield

22.6.122 The proposed development is located outside the Fairfield character area and its construction and operation would not affect any of the area's key characteristics described in the landscape baseline.

22.6.123 The proposed development would cause no direct impact on the landscape features within this landscape character sub area during construction and operational phases. The only impact on Fairfield would be associated with the change of views towards the coast. This change would be higher during the construction phase, when the construction machinery and some construction activities would be visible above the local vegetation and would punctuate the skyline. During the operational phase the impact would decrease due to the simple form of the HPC, which would not significantly change the character of this area as it would be seen in the context of the existing Hinkley Point Power Station Complex. During construction phase the impact would be adverse, medium-term, of low magnitude and **moderate** significance. During operation (year 1 and year 15) the impact would change to neutral, medium to long-term, of very low magnitude and **minor** significance.

22.6.124 **Table 22.27** provides a summary of impacts on the Fairfield landscape character sub area.

Table 22.27: Impacts on the Fairfield landscape character sub area

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	High	Adverse, medium-term	Low	Moderate
2	Operation year 1	High	Neutral, medium-term	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor

The Quantock Fringes - Dodington

22.6.125 The proposed development is located outside The Quantock Fringes – Dodington character area and its construction and operation would not affect any of the area's key characteristics described in the landscape baseline.

22.6.126 The proposed development would cause no direct impact on landscape features within this landscape character area during construction and operational phases. The only impact on The Quantock Fringe - Dodington would be associated with the change of views towards the coast as a result of the construction activities and the visibility of the operational HPC proposed development. The general visibility of the HPC from this area is lower than from Fairfield due to the longer distance from the HPC development site.

22.6.127 The visual change would be more noticeable during the construction phase, when the construction machinery would be visible above the local vegetation and would punctuate the skyline looking from Dodington House and other elevated areas of farmland. During the operational phase the impact would decrease due to the simple form of the HPC, which would not significantly change the character of this area as it would be seen in the context of the existing Hinkley Point Power Station Complex. During the construction phase the impact would be adverse, medium-term, of very low magnitude and **minor** significance. During operation (year 1 and year 15) the impact would change to neutral, medium to long-term, of very low magnitude and **minor** significance.

22.6.128 **Table 22.28** provides a summary of impacts on the Quantock Fringes – Dodington landscape character sub area.

Table 22.28: Impacts on the Quantock Fringes – Dodington landscape character sub area

ID	Phase	Sensitivity	Nature	Magnitude	Significance
1	Construction	High	Adverse, medium-term	Very low	Minor
2	Operation year 1	High	Neutral, medium-term	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor

v. Landscape Elements and Features

Landform

22.6.129 There would be significant changes to the topography within the HPC development site during the construction phase due to major earthworks including topsoil stripping, site levelling and terracing to create the development platforms. During construction, the majority of the locally important Green Lane ridge and the area to the south of construction zone (immediately north of Bum Brook) would be retained. The construction impact on topography within the HPC development site would be adverse, medium-term, of high magnitude and **major** significance.

22.6.130 During operation the landform within the HPC development site located outside the HPC permanent development would be restored to recreate the gently undulating topography of the Coastal – Lilstock landscape character area and rolling topography of the Rolling Farmland East – Stogursey landscape character area (to the south of Green Lane). The restored landform is designed to make a smooth transition with surrounding landform at the edges of the landscape restoration scheme, building on existing ridges and valleys, and using characteristic shapes and gradients already found in the area. During the operational phase (year 1 and 15), the impact on landform would be neutral, medium to long-term, of very low magnitude and **minor** significance.

Land Use/Settlements

22.6.131 During the construction phase, land use within the HPC development site would change due to construction activities. The construction phase impact on land use / settlements within the HPC development site and its immediate vicinity would be adverse, medium-term, of high magnitude and **major** significance.

22.6.132 During operation the majority of the HPC development site to the north of Green Lane and outside the HPC permanent development area would be returned to agricultural use. The majority of land to the south of Green Lane would become a nature reserve managed by EDF Energy. The operational impact (year 1 and year 15) on land use / settlements within the HPC development site and its immediate vicinity would be adverse**,** medium to long-term, of high magnitude and **major** significance.

Landcover and Vegetation

22.6.133 During the construction phase, the majority of landcover and vegetation within the HPC development site would be cleared for construction activities. The most valuable features, such as vegetation along Green Lane and Benhole Lane, riparian vegetation along Bum Brook, hedgerows within the southern part of the HPC development site (to the south of construction zone) and some boundary hedgerows in the eastern part of the application site would be retained. Advanced planting implemented in Spring 2011 within the southern part of the HPC development site would continue to mature during the construction phase providing both visual mitigation to residents of western Shurton and some overall compensation of the vegetation lost within the HPC development site. The construction impact on landcover and vegetation would be adverse, medium-term, of high magnitude and **major** significance.

22.6.134 During the operational phase (year 1), the implemented landscape restoration plan would create an angular field pattern defined by hedgerow field boundaries. The field boundary pattern would be based on existing field patterns, which would link to the surrounding remnant hedgerows. Additional hedgerows would be added, to replace some of the hedgerows that have been lost in the last 100 years due to changes in agricultural practices. Woodland blocks would be angular, shaped as linear north-south aligned brakes or shelter belts on the coastal slopes, and shaped as a linked group of fields on the rolling farmland to the south of Green Lane. During operational phase (year 1) the majority of the proposed vegetation would not be mature (except from advance planting implemented in Spring 2011 and early restoration). The impact on landcover / vegetation during operational phase (year 1) would be adverse, medium-term, of medium magnitude and **moderate** significance.

22.6.135 Following the maturation of restoration proposals, the impact during operational phase (year 15) would be beneficial, long-term, of medium magnitude and of **moderate** significance.

22.6.136 **Table 22.29** shows the proposed landcover and vegetation coverage within the HPC development site (all figures are approximate).

Table 22.29: Proposed Landscape Elements Coverage within the HPC Development Site

Areas and Linear Features	Measurement
Broad-leaved woodland	39.7 ha (gain of 36.2 ha)
Plantation woodland	n/a (loss of 3.2 ha)
Scrub (including scrub/hedges)	0.9 ha (loss of 0.2 ha)
Calcareous Grassland	17.7 ha (gain of 14.2 ha)
Improved Grassland	n/a (loss of 30.6 ha)
Species-poor semi-improved grassland	n/a (loss of (16.1 ha)
Semi-improved grassland/ Species rich hay meadow	30.9 ha (gain of 30.9ha)
Arable (Farmland Birds Annual Cover Crop)	3.8 ha (loss of 93.8 ha)
Agricultural Land	16 ha (gain of 93.8 ha)
Wetland (including ponds)	0.43 ha (gain of 0.42 ha)
Native Species-rich Hedgerow	13.1 km (gain of 5.36 km)

Species-poor Hedgerow	n/a (loss of 3.4 km)
Watercourses (excluding Bum Brook and including Holford Valley ditches)	1.2 km (loss of 0.82km)

Watercourses/water bodies

22.6.137 During the construction phase there would be no direct impact on Bum Brook. The Holford stream, which does not have a high landscape value, would be culverted during construction. The impact on watercourses / water bodies during construction would be adverse, medium-term, of medium magnitude and **moderate** significance.

22.6.138 Once the site is restored, the Holford Stream valley would be restored, however. the Holford Stream would remain in the culvert. The landscape strategy would compensate for this loss by creating a number of watercourses and wetland areas of similar landscape value. The impact during the operational phase (year 1 and year 15), would be neutral, medium to long-term, of very low magnitude and **minor** significance.

Public Rights of Way

22.6.139 During the construction phase all PRoW within the HPC development site would be closed and diverted around the HPC development site boundary, including the West Somerset Coast Path. The impact on the local PRoW during construction would be adverse, medium-term, of high magnitude and **major** significance.

22.6.140 Once the site is restored, the PRoW would be restored with some minor modifications. The impact during operational phase (year 1 and year 15), would be neutral, medium to long-term, of very low magnitude and **minor** significance.

22.6.141 **Table 22.30** provides a summary of impacts on landscape elements and features.

Table 22.30: Impacts on Landscape Elements and Features

ID	Phase	Sensitivity	Nature	Magnitude	Significance
Landform					
1	Construction	Medium	Adverse, medium-term	High	Major
2	Operation year 1	Medium	Neutral, medium-term	Very low	Minor
3	Operation year 15	Medium	Neutral, long-term	Very low	Minor

c) Visual Impacts

i. Introduction

22.6.142 The assessment of magnitude and significance of impacts has been undertaken in line with the criteria set out in section 22.4 and includes consideration of mitigation proposals embodied in the proposal. The assessment of impacts is also influenced by the professional judgment of the assessor, which is informed by a number of factors including the quality of the design, understanding of context and perceptual factors associated with the architectural design.

22.6.143 In relation to the HPC proposed development, this professional judgement has been influenced by a number of factors, principally based on the understanding of the design in the context of the baseline views. These factors included:

- scale of existing and new development at Hinkley Point and their relationship and relative massing;
- extent of visual separation between each power station and the perception of the extent of development along the coast;
- distribution of built elements and relative scale of individual buildings and the amount of ‘clutter’ within each view;
- the consideration of building colour; and
- the effects of the landscape strategy and its integration with the surroundings and its screening effects over time.

22.6.144 For each viewpoint, the potential visual impacts are summarised in tables showing the sensitivity of receptors, nature, duration, magnitude and significance of impact of the HPC proposed development during the day and at night.

ii. Visual Impacts Summary

22.6.145 The visual impact assessment records impacts on the 48 viewpoints identified in the visual baseline and extending throughout the LVIA study area. These views can be broadly subdivided into short, medium and long distance views. The following viewpoints are highlighted as broadly representative for summary purposes;

- Short range – Principal Viewpoints 1 (west), 11 (south) and 16 (east);
- Medium range – Principal Viewpoints 4 (west), 18 (south) and 19 (east);
- Long range – Principal Viewpoints 26 (west), 29 (south west) and 33 (south).

22.6.146 The range of impacts resulting from the HPC proposed development varies and is not only related to distance from the development. A summary of the range of impacts from short, medium and long range views is provided below.

Short range viewpoints

22.6.147 During construction, visual impacts on the local residents up to approximately 1.5km from the HPC development site (short distance views) would be adverse and predominantly of major significance. Advance planting and early restoration would provide a degree of screening to the construction activities taking place at the lower levels of the HPC development site, but the construction activities would be visible above the landscape proposals due to the large scale of HPC construction. The main visual impacts would arise during the peak of construction activities and would be lower during the initial and last phases of construction, when the largest construction machinery will not be operating.

22.6.148 During the first year of operation and in the short distance, the significance of visual impacts on the local residents would generally decrease to moderate adverse to become neutral and moderate in the residential areas in the vicinity of the mature landscape proposals in year 15 of the operational phase.

22.6.149 In the short distance, the significance of visual impacts on the PRoW users would be predominantly moderate to major adverse during construction, to become minor to moderate adverse once the landscape proposals are mature during year 15 of the operational phase.

Medium range viewpoints

22.6.150 In the middle distance, visual impacts on residents on settlement edges would be predominantly adverse and of minor to moderate significance during construction. Localised major adverse impacts may occur in open areas from elevated viewpoints.

22.6.151 In the medium distance (1.5km to 5km), visual impacts during construction would slightly decrease compared to short range views due to distance, topography and screening effects of intervening landscape, and would be predominantly of moderate significance. The visual impacts on PRoW users along the coastline and between Lilstock and the HPC development site would be relatively high due to proximity of the HPC development site and small potential for visual mitigation of the large scale construction. Users of PRoW to the east of the existing Hinkley Point Power Station Complex, would experience a smaller change in views due to screening provided by the existing Complex, however the visual impacts would remain high.

22.6.152 During operation, the significance of these impacts would decrease to minor / moderate (adverse), due to removal of construction machinery, more ‘static’ views broadly similar to the views of the existing Hinkley Point Power Station Complex, but with higher amount of built form within views, which, however, would better integrate with the surrounding landscape once the proposed landscape matures (year 15).

Long range viewpoints

22.6.153 The visual impacts of construction phase activity in long range views on PRoW users and walkers within the Quantock Hills AONB would be adverse and more significant in the north-eastern, elevated areas of the AONB. Moving further south-east along the main Quantocks ridge, adverse visual impacts would decrease in significance due to longer distance, different angle of views and different character of these views that would decrease the prominence of the proposed HPC development compared to more open views from the north-eastern part of the Quantocks. During the construction phase, the visual impacts on residents and PRoW users in Exmoor, Mendips, Wales and Lowland Hills would be typically of minor adverse significance due to distance from the HPC development site. The majority of these impacts would change from adverse to neutral during the operational phase.

22.6.154 The operational impacts on the PRoW users and walkers within the Quantock Hills AONB would vary from moderate adverse within the north-eastern part of the AONB to neutral (adverse) in the south-eastern, more distant part.

Lighting impacts

22.6.155 During construction, lighting impacts in the short to medium distance would vary from minor to major adverse significance, depending on the distance to the HPC development site and the proportion of construction activities apparent in the view. The majority of long distance viewpoints would experience minor adverse visual impacts; however, elevated long distance views from the Quantock Hills AONB would experience impacts of moderate adverse significance.

22.6.156 During operation, the lighting impacts would vary from minor neutral to minor adverse for all viewpoint ranges.

22.6.157 The following paragraphs provide a summary of key construction and operational impacts on visual receptors within the LVIA study area.

iii. Visual Impacts

Principal Viewpoint 1 – PRoW No. WL23/110 west of Benhole Lane

22.6.158 All construction activities taking place within the HPC development site to the north of Green Lane would be visible from this viewpoint. Earthworks, construction of the HPC permanent development, the temporary jetty, contractors' areas and machinery within the site, including tower cranes would change the character of the view. Due to the large scale of works and the large proportion of the view occupied by the construction activities, the impact would be adverse, medium-term, of high magnitude and **major** significance during the construction phase.

22.6.159 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction. Lighting during site restoration works would be limited to day time hours. The visual impact of lighting during construction would be adverse, medium-term, of medium magnitude and **major** significance.

22.6.160 During year 1 of the operational phase, the HPC permanent development would be seen from this viewpoint, substantially screening the existing HPA and HPB buildings. The lower levels of HPC would be significantly screened by the proposed landform. The early coastal planting would not offer screening at this stage. The proposed development would be more prominent than the existing Hinkley Point Power Station Complex due to its proximity to the viewpoint. The view would alter to comprise undulating farmland integrated with the surrounding landscape and it is acknowledged that long distance views across the Bridgwater Bay will be screened.

However, long distance views would still be possible from many other locations in the vicinity. Following the removal of the temporary jetty, construction compound and the implementation of landscape restoration plan, the character of the view would be substantially settled as part of the Coastal – Lilstock sub character area. The impact during operation phase (year 1) would be adverse, medium-term, of medium magnitude and **major** significance.

22.6.161 During the operational phase (year 15) the majority of the proposed landscape would increase in maturity, leading to greater integration and assimilation of the HPC proposed development within the view with the surrounding rural landscape. Landform and vegetation will also help screen the lower levels of the HPC proposed development. The impact during operation phase (year 15) would be adverse, long-term, of low magnitude and **moderate** significance.

22.6.162 The existing lighting scheme for the HPA and HPB would be screened by the HPC proposed development. The impact of operational lighting (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.10b**.

Table 22.31: Impacts on receptors at Principal Viewpoint 1

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	High	Major	Medium	Major
2	Operation year 1	High	Adverse, medium-term	Medium	Major	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Low	Moderate	Very low	Minor

Principal Viewpoint 2 – West Somerset Coast Path, PRoW No. WL 23/95

22.6.163 The majority of construction activities taking place within the HPC development site to the north of Green Lane would be visible from this viewpoint due to its location on the open, gently undulating topography of the Quantock Vale (Coastal - Lilstock) Local Landscape Character Area and few intervening landscape features. Earthworks, construction of the HPC permanent development, the temporary jetty, contractors' areas and machinery within the site, including tower cranes would alter the skyline. Despite the distance to the HPC development site the character of the view would change due to the addition of construction activities to the simple form of the existing Hinkley Point Power Station Complex. The impact would be adverse, medium-term, of high magnitude and **major** significance during the construction phase.

22.6.164 The construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction. Lighting during site restoration works would be limited to day time hours. The visual impact of lighting during construction would be adverse, medium-term, of medium magnitude and **major** significance.

22.6.165 During year 1 of the operational phase, the majority of the HPC permanent development would be seen from this viewpoint. The early coastal planting would not offer screening at this stage, however, from this elevation the proposed landform would be effective in screening the lower levels of the proposed development. The proposed buildings would screen the existing Hinkley Point Power Station Complex. The view would alter to comprise undulating farmland integrated with the surrounding landscape, surmounted by the varied forms of the HPC proposed development. The amount of 'clutter' within the view would be minimal due to screening provided by the proposed landform. The impact during operation (year 1) would be adverse, medium-term, of medium magnitude and **major** significance.

22.6.166 During year 15 of the operational phase the majority of the proposed planting would increase in maturity and soften the transition between the rural landscape and the proposed development, and assimilate with the surrounding landscape. The planting would also help screen the lower levels of the HPC proposed development. The impact during operation phase (year 15) would be adverse, long-term, of low magnitude and **moderate** significance. The operational lighting (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.11b**.

Table 22.32: Impacts on receptors at Principal Viewpoint 2

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	High	Major	Medium	Major
2	Operation year 1	High	Adverse, medium-term	Medium	Major	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Low	Moderate	Very low	Minor

Principal Viewpoint 3 – West Somerset Coast Path, Lilstock, PRoW No. WL 24/10

22.6.167 The character of this simple open coastal view would change during the HPC construction phase due to the visibility of large scale construction activities within the HPC development site, which would be seen in the context of and to a degree screen the existing Hinkley Point Power Station Complex, and the addition of views of the temporary jetty and associated barges. Due to the distance from the HPC development site, the construction detail would have limited visibility and the main impact would be associated with the erection of the tallest structures within the HPC development site (reactor buildings), tower crane operations and the temporary jetty. Due to the low elevation of the viewpoint the construction activities at the lower level would be screened by the cliff within the view. The impact during construction would be adverse, medium-term, of medium magnitude and **major** significance.

22.6.168 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction. Lighting during site restoration works would be limited to day time hours. The visual impact of lighting during construction would be adverse, medium-term, of medium magnitude and **major** significance.

22.6.169 Due to the distance from the site and the low elevation of this viewpoint, the proposed vegetation would not contribute to visual screening, and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. Over time, the proposed woodland would begin to appear within the view, however this change would be minimal and the woodland would not fully screen the proposals even when mature. During the operational phase, the simple main structures of the HPC proposed development would screen the existing Hinkley Point Power Station Complex and views of low level development within the view would be minimal, similar to the baseline view. The impact during the entire operational phase (year 1 and year 15) would be adverse, medium to long-term, of low magnitude and **moderate** significance. The operational lighting (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figures 22.12b, 22.12c, 22.12d**.

Table 22.33: Impacts on receptors at Principal Viewpoint 3

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Medium	Major	Medium	Major
2	Operation year 1	High	Adverse, medium-term	Low	Moderate	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Low	Moderate	Very low	Minor

Principal Viewpoint 4 – PRoW No. WL 24/8

22.6.170 During the first phase of construction only small changes in views would be experienced from this viewpoint due to the existing landform screening the ground level of the HPC development site. The site preparation works, construction of lower smaller buildings and the temporary jetty would be screened from this viewpoint. The main visual impact would be associated with the construction of the reactor buildings (Unit 1 and Unit 2) and operation of the large machinery, such as the tower cranes or silos, which would punctuate the skyline. The character of this simple view would temporarily change due to a variety of new built form (including partially completed Unit 1 and Unit 2) and construction machinery punctuating the skyline. The construction impact would be adverse, medium-term, of medium magnitude and **moderate** significance.

22.6.171 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be reduced by the landform screening the lower levels of the construction site. Due to light glow from the existing Hinkley Point Power Station Complex, the change caused by the proposed construction lighting would not be high. Lighting during site restoration works would be limited to day time hours. The visual impact of lighting during construction would be adverse, medium-term, of low magnitude and **minor** significance.

22.6.172 During operation, only the upper portions of Unit 1, Unit 2, and associated stacks and electricity pylons, would be visible. A large part of HPA would be screened by the proposed HPC proposed development, which would appear generally of the same scale. The proposed planting would not be seen from this viewpoint due to existing landform obscuring views and as such the impacts during the entire operational phase would be the same. The addition of simple structures of the HPC and partial replacement of HPA buildings would not substantially change the character of this view. The impact during the operational phase (year 1 and year 15) would be adverse, medium to long-term, of low magnitude and **minor** significance.

22.6.173 The operational lighting impact (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.13b**.

Table 22.34: Impacts on receptors at Principal Viewpoint 4

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	Medium	Adverse, medium-term	Medium	Moderate	Low	Minor
2	Operation year 1	Medium	Adverse, medium-term	Low	Minor	Very low	Minor
3	Operation year 15	Medium	Adverse, long-term	Low	Minor	Very low	Minor

Principal Viewpoint 5 – Higher Hill, PRoW No. 24/3

22.6.174 Due to the elevation of this viewpoint and few intervening elements, the construction area to the south of Green Lane would be visible. Detailed construction activities would be apparent but limited at this distance (over 3km). Construction activities taking place in the northern part of the HPC development site (to the north of Green Lane) would be also visible from this viewpoint, however the retained Green Lane ridge would screen the lower construction activities, such as earthworks, southern part of the temporary jetty, smaller machinery or low buildings. The construction of the tallest structures within the HPC permanent development site and the construction machinery of significant size, including tower cranes, would be visible next to the existing Hinkley Point Power Station Complex and would punctuate the skyline. The construction impact would be adverse, medium-term, of medium magnitude and **moderate** significance.

22.6.175 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction. Lighting during site restoration works would be limited to day time hours. The impact of lighting during construction would be adverse, medium-term, of medium magnitude and **moderate** significance.

22.6.176 During year 1 of the operational phase, the tallest structures of the HPC would be visible above the Green Lane ridge, which would screen views of the lower buildings. The early planting would not offer screening at this stage. The HPC proposed development would be seen in the context of the existing Hinkley Point Power Station Complex. The impact during the operational phase (year 1) would be adverse, medium-term, of low magnitude and **minor** significance.

22.6.177 During the operational phase (year 15) the majority of the proposed planting would be maturing and the proposed woodland areas to the south of Green Lane would soften the visual transition between the rural landscape and the proposed development, however it would not fully screen the built form visible above Green Lane. The impact during the operational phase (year 15) would be adverse, long-term, of low magnitude and **minor** significance. The operational lighting (both year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.14b**.

Table 22.35: Impacts on receptors at Principal Viewpoint 5

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	Medium	Adverse, medium-term	Medium	Moderate	Medium	Moderate
2	Operation year 1	Medium	Adverse, medium-term	Low	Minor	Very low	Minor
3	Operation year 15	Medium	Adverse, long-term	Low	Minor	Very low	Minor

Principal Viewpoint 6 – PRoW No. WL 24/11 near the edge of the Great Plantation

22.6.178 During the first phase of construction only a small change in views would be experienced from this viewpoint due to the landform screening most of the ground level of the HPC development site. The construction of lower buildings and the temporary jetty would be screened from this viewpoint. Earthworks associated with site preparation works would be partially visible just below the ridge of Green Lane but they would not cause a significant change in the view. The main visual impact would be associated with the construction of the reactor buildings (Unit 1 and Unit 2) and operation of the large machinery, such as the tower cranes or silos, which would punctuate the skyline above the Green Lane ridge. The character of this simple view would temporarily change due to a variety of new built form (including partially completed Unit 1 and Unit 2) and construction machinery punctuating the skyline. The construction impact would be adverse, medium-term, of medium magnitude and **moderate** significance.

22.6.179 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be reduced by the landform screening the lower levels of the construction site. Due to light glow from the existing Hinkley Point Power Station Complex, the change caused by the proposed construction lighting would not be high. Lighting during site restoration works would be limited to day time hours. The visual impact of lighting during construction would be adverse, medium-term, of low magnitude and **minor** significance.

22.6.180 During operation, the main structures within the HPC proposed development, such as Unit 1, Unit 2 and associated stacks and electricity pylons, would be visible above the ridge of Green Lane and seen in the context of the existing Power Station Complex. The proposed planting in the southern part of the HPC development site would not be seen from this viewpoint due to existing landform obscuring views. The impacts during the entire operational phase would be the same. The addition of the HPC structures would not change the character of this view but extend the visual influence of the existing Hinkley Point Power Station Complex. The impact during the operational phase (year 1 and year 15) would be adverse, medium to long-term, of medium magnitude and **moderate** significance.

22.6.181 The operational lighting impact (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.15b**.

Table 22.36: Impacts on receptors at Principal Viewpoint 6

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	Medium	Adverse, medium-term	Medium	Moderate	Low	Minor
2	Operation year 1	Medium	Adverse, medium-term	Medium	Moderate	Very low	Minor
3	Operation year 15	Medium	Adverse, long-term	Medium	Moderate	Very low	Minor

Principal Viewpoint 7 – Fairfield House Driveway

22.6.182 The early phases of construction, including the site preparation works, the construction and operation of the temporary jetty, and construction activities at a lower level would be entirely screened from this viewpoint due to existing landform and planting. The construction of Unit 1 and Unit 2, including operation of large construction machinery, such as tower cranes, would be visible above the vegetated skyline. The restoration phase activities and planting scheme would not be visible from this viewpoint. The construction impact would be adverse, medium-term, of medium magnitude and **major** significance.

22.6.183 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be reduced by the landform and vegetation screening the lower levels of the HPC development site. Due to light glow from the existing Hinkley Point Power Station Complex, the change caused by the proposed construction lighting would not be high. Lighting during site restoration works would be limited to day time hours. The visual impact of lighting during construction would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.184 During operation, only the tallest structures within the HPC proposed development, including Unit 1, Unit 2, and associated stacks and electricity pylons, would be visible above the vegetated skyline, which would provide some screening and additional detail in the middle ground. The proposed planting in the southern part of the HPC development site would not be seen from this viewpoint due to existing landform obscuring views, and as such visual impacts during the entire operational phase (year 1 and 15) would be the same. The addition of upper portions of main HPC structures would not change the character of this view and its skyline but be seen in the context of the existing Hinkley Point Power Station Complex. The impact during the operational phase (year 1 and year 15) would be adverse, medium to long-term, of low magnitude and **moderate** significance.

22.6.185 The operational lighting impact (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figures 22.16b, 22.16c, 22.16d**.

Table 22.37: Impacts on receptors at Principal Viewpoint 7

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Medium	Major	Low	Moderate
2	Operation year 1	High	Adverse, medium-term	Low	Moderate	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Low	Moderate	Very low	Minor

Principal Viewpoint 8 – Knighton Farm, PRoW No. WL 23/46

22.6.186 During the first phase of construction only a small change in views would be experienced from this viewpoint due to the existing landform and vegetation screening the majority of construction activities to the north and south of Green Lane. The main visual impact would be associated with the construction of Unit 1 and Unit 2, the presence of large machinery, such as tower cranes or silos, to the north of Green Lane, and some construction activities to the south of Green Lane. The construction of Unit 1 and Unit 2 would be partially screened by a small block of woodland within the view. The character of this view would temporarily change due to a variety of man-made structures (including partially completed Unit 1 and Unit 2) and machinery punctuating the skyline. The construction impact would be adverse, medium-term, of medium magnitude and **major** significance.

22.6.187 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be reduced by the landform screening the lower levels of the northern part of the HPC development site. Due to light glow from the existing Hinkley Point Power Station Complex, the change caused by the proposed construction lighting would not be high. Lighting during site restoration works would be limited to day time hours. The visual impact of lighting during construction would be adverse, medium-term, of medium magnitude and **major** significance.

22.6.188 During operation year 1, only the tallest structures within the HPC proposed development would be visible, such as Unit 1, Unit 2, and associated stacks and electricity pylons, which would be visible above the existing ridge. Smaller buildings within the HPC permanent development would be screened by the existing landform and vegetation. During the first year of the operational phase only the early restoration planting and advanced planting proposals would be visible from this viewpoint. Once the remaining proposed restoration planting within the southern part of the HPC development site increases in maturity (year 15) it would partially screen the existing electricity pylons to the east of the HPC development site. The addition of the HPC Unit 1 and Unit 2 would not significantly change the character of this view and would be seen in the context of the existing Hinkley Point Power Station Complex. The mature landscape restoration planting would complement the existing planting along Benhole Lane and create a more densely vegetated skyline. The impact during the operational phase year 1 would be adverse, medium-term, of low magnitude and **moderate** significance. The impact during the operational phase (year 15) would reduce due to the maturation of restoration proposals, which would effectively screen the HPB. Long term impacts would be adverse, long-term, of very low magnitude and **minor** significance.

22.6.189 The operational lighting impact (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.17b**.

Table 22.38: Impacts on receptors at Principal Viewpoint 8

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Medium	Major	Medium	Major
2	Operation year 1	High	Adverse, medium-term	Low	Moderate	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 9 – Burton

22.6.190 During the first phase of construction only a small change in views would be experienced from this viewpoint due to the existing landform and vegetation screening the majority of construction activities to the north of Green Lane. The main visual impact would be associated with the construction of Unit 1 and Unit 2, the presence of large machinery, such as tower cranes or silos, to the north of Green Lane, and some construction activities to the south of Green Lane. The construction of Unit 1 and Unit 2 would be partially screened by vegetation. The character of this view would temporarily change due to a variety of man-made structures (including partially completed Unit 1 and Unit 2) and machinery punctuating the skyline. The construction impact would be adverse, medium-term, of medium magnitude and **moderate** significance. The impact of lighting during construction would be adverse, medium-term, of medium magnitude and **moderate** significance.

22.6.191 During operation year 1, only the tallest structures within the HPC proposed development would be visible, including Unit 1, Unit 2, and associated stacks and electricity pylons, which would punctuate the skyline over the existing ridge. Smaller buildings within the HPC permanent development would be screened by the existing landform and vegetation. During the first year of the operational phase only the early restoration planting and advanced planting proposals would be visible from this viewpoint. The addition of the HPC Unit 1 and Unit 2 would not significantly change the character of this view which would be seen in the context of the existing Hinkley Point Power Station Complex. The impact during the operational phase year 1 would be adverse, medium-term, of medium magnitude and **moderate** significance.

22.6.192 Once the remaining proposed restoration planting within the southern part of the HPC development site matures (year 15) it would add more landscape features to the view and partially screen the existing electricity pylons to the east of the HPC development site. It would complement the existing planting along Benhole Lane and create a more densely vegetated skyline. The impact during the operational phase (year 15) would change due to the maturation of restoration proposals and increased assimilation and would be adverse, long-term, of low magnitude and **minor** significance. The operational lighting impact (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figures 22.18b, 22.18c, 22.18d**.

Table 22.39: Impacts on receptors at Principal Viewpoint 9

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	Medium	Adverse, medium-term	Medium	Moderate	Medium	Moderate
2	Operation year 1	Medium	Adverse, medium-term	Medium	Moderate	Very low	Minor
3	Operation year 15	Medium	Adverse, long-term	Low	Minor	Very low	Minor

Principal Viewpoint 10 – Shurton West, Local Farm near PRoW No. WL 23/48

22.6.193 During the first phase of construction, construction activities would take place behind the local ridge within the view (latitude 144750m), which would minimise the visual impact on the residents of Shurton. Moving the construction zone behind this latitude was requested by the local residents during informal consultation. Due to this buffer zone, the majority of the initial construction activities would be screened from this viewpoint, however security fence and limited amount of earthworks would be visible on top of the ridge causing a very low visual impact. Once the main construction activities commence, including the construction of the HPC permanent development and the use of tower cranes and other tall plant, they will become visible to the north of the ridge and the magnitude of impacts would rise. To ensure the visual impact of construction is minimised, the areas of the landscape restoration scheme which are located within the buffer zone would be implemented early during the construction process. The advance planting proposals agreed during the consultation process and implemented within the HPC development site would also contribute to early screening and softening the view during the main phases of construction. The construction impact would be adverse, medium-term, of medium magnitude and **major** significance.

22.6.194 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be reduced by the ridge screening the construction activities. Due to light glow from the existing Hinkley Point Power Station Complex, the change caused by the proposed construction lighting would not be high. The construction zone immediately to the north of the viewpoint would not be well lit. Lighting during site restoration works would be limited to day time hours. The impact of lighting during construction would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.195 During the operational phase (year 1) the main visual impact would be caused by the HPC Unit 1 and Unit 2, which would be partially visible above the ridge line. The early landscape restoration and advance planting would be maturing at this stage and provide some screening to the HPC proposed development. The impact during the operational phase (year 1) would be neutral (screening existing views of HPA and HPB resulting in greater sense of enclosure), medium-term, of low magnitude and

moderate significance. The impact of lighting during the operational phase (year 1) would be neutral, medium-term, of very low magnitude and **minor** significance.

22.6.196 During the operational phase (year 15) the planting within the view would increase in maturity (advance planting would be approximately 25 years old, early landscape restoration would be 22 years old and the remaining planting would be 15 years old) and would provide screening of the HPC, although glimpsed views of Unit 1 and Unit 2 are likely to be available in winter months. The proposed planting would also increase the screening of the existing Hinkley Point Power Station Complex, and as it matures, establish a new, wooded character of the local ridge, which would complement the existing local landscape character and integrate with the landscape restoration proposals for the HPC development site. The impact during the operational phase (year 15) would be neutral, long-term, of low magnitude and **moderate** significance. The operational lighting impact (year 15) would be neutral, long-term, of very low magnitude and **minor** significance. See **Figures 22.19b, 22.19c, 22.19d**.

Table 22.40: Impacts on receptors at Principal Viewpoint 10

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Medium	Major	Low	Moderate
2	Operation year 1	High	Neutral, medium-term	Low	Moderate	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Low	Moderate	Very low	Minor

Principal Viewpoint 11 – Shurton East, PRoW No. WL 23/56

22.6.197 During the first phase of construction, construction activities would take place behind the local ridge within the view (latitude 144750m), which would minimise the visual impact on the residents of eastern parts of Shurton. Moving the construction zone behind this latitude was requested by the local residents during informal consultation. Due to this buffer zone, the majority of the initial construction activities would be screened from this viewpoint, however, security fencing and limited amount of earthworks would be visible on top of the ridge causing a very low impact. The upper storeys of the on-site campus accommodation blocks would be visible above the existing ridge. Once the main construction activities commence, the construction of the HPC permanent development, use of tower cranes and other tall machinery will become visible behind the ridge and the impacts would rise, especially due to open character of this view and a simple skyline created by the local ridge. To ensure the visual impact of construction is minimised, the areas of the landscape restoration scheme which are located within the buffer zone would be implemented early during the construction process. These proposals include a bund located immediately to the south of the proposed on-site campus accommodation to reduce its visual impact. The advance planting proposals agreed during the consultation process and implemented within the HPC development site would also contribute to early screening during the last phases of construction. The construction impact would be adverse, medium-term, of high magnitude and **major** significance.

22.6.198 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be greatly reduced by the ridge screening the construction activities. Due to substantial light glow from the existing Hinkley Point Power Station Complex, the change caused by the proposed construction lighting would not be high. The proposed lighting within the on-site construction zone immediately to the north of the viewpoint would not be significant. Lighting during site restoration works would be limited to day time hours. The impact of lighting during construction would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.199 During the operational phase (year 1) the main visual impact would be caused by Unit 1 and Unit 2, which would be visible above the ridge line. The early landscape restoration and advance planting increase maturity at this stage and would provide some screening to the HPC proposed development and the existing Hinkley Point Power Station Complex. The proposed planting would change the character of the local ridge from its simple outline (in its central part) to a more varied, vegetated ridge, which would be similar to the adjacent areas. The impact during the operational phase (year 1) would be neutral, medium-term, of low magnitude and **moderate** significance.

22.6.200 During the operational phase (year 15) the planting within the view would be maturing (advance planting would be in the order of 25 years old, early landscape restoration would be 22 years old and the remaining planting would be 15 years old) and would provide screening of the HPC, with likely glimpsed views of Unit 1 and Unit 2 in winter months. The proposed planting would also increase the screening of the existing Hinkley Point Power Station Complex. As planting matures the impact during the operational phase (year 15) would be neutral, long-term, of low magnitude and **moderate** significance. The operational lighting impact (both year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. See **Figures 22.20b, 22.20c, 22.20d**.

Table 22.41: Impacts on receptors at Principal Viewpoint 11

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	High	Major	Low	Moderate
2	Operation year 1	High	Neutral, medium-term	Low	Moderate	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Low	Moderate	Very low	Minor

Principal Viewpoint 12 – Local road to the south of the site (near Gunter's Grove)

22.6.201 During the first phase of construction only a small change in views would be experienced from this viewpoint due to the existing landform and vegetation screening the majority of construction activities to the north of Green Lane. Site preparation works to the south of Green Lane would be visible but due to their nature (predominantly earthworks) and their location below the ridge of Green Lane, site preparation works would not significantly change the character of the view. The main visual impact would be associated with the construction of Unit 1 and Unit 2, the presence of large machinery, such as tower cranes or silos, to the north of Green Lane, construction activities to the south of Green Lane and the on-site campus accommodation located in the south-eastern part of the HPC development site. Some construction activities to the north of Green Lane (and below its ridge) would be screened by vegetation. Construction traffic on the local road network will be apparent. The character of this view would temporarily change due to a variety of man-made structures (including partially completed Unit 1 and Unit 2) and machinery punctuating the skyline, although this change would not be of high magnitude due to the prominence of the existing Hinkley Point Power Station Complex, which has a strong influence on the existing view. The construction impact would be adverse, medium-term, of medium magnitude and **minor** significance.

22.6.202 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be reduced by the landform screening the lower levels of the northern part of the HPC development site. Due to light glow from the existing Hinkley Point Power Station Complex, the change caused by the proposed construction lighting would not be high but it would be noticeable. Lighting of the on-site accommodation campus would be partially screened by the proposed early restoration landform. Lighting during site restoration works would be limited to day time hours. The impact of lighting during construction would be adverse, medium-term, of medium magnitude and **minor** significance.

22.6.203 During operation year 1, the majority of the HPC proposed development would be visible, in particular Unit 1, Unit 2, stacks, electricity pylons and other tall structures, which would punctuate the skyline over the existing vegetated ridge. Smaller buildings within the HPC permanent development site would be screened by the Green Lane ridge. During the first year of the operational phase only limited amount of early restoration planting and advanced planting proposals would be visible from this viewpoint, and it would not contribute to visual screening from this viewpoint. The addition of the HPC Unit 1 and Unit 2 would not significantly change the character of this view but be seen in the context of the existing Hinkley Point Power Station Complex, adding additional structures to the skyline. The impact during the operational phase year 1 would be adverse, medium-term, of medium magnitude and **minor** significance. The lighting impact during year 1 of the operational phase would be adverse, medium-term, of low magnitude and **minor** significance.

22.6.204 As the remaining proposed restoration planting within the southern part of the HPC development site increases in maturity (year 15), a significant area of woodland would become visible but it would not fully screen the HPC proposed development. The impact during the operational phase (year 15) would be adverse, long-term, of medium magnitude and **minor** significance. The operational lighting impact (year 15) would be adverse, long-term, of low magnitude and **minor** significance. See **Figures 22.21b, 22.21c, 22.21d**.

Table 22.42: Impacts on receptors at Principal Viewpoint 12

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	Low	Adverse, medium-term	Medium	Minor	Medium	Minor
2	Operation year 1	Low	Adverse, medium-term	Medium	Minor	Low	Minor
3	Operation year 15	Low	Adverse, long-term	Medium	Minor	Low	Minor

Principal Viewpoint 13 – PRoW No. WL 23/57, West of Wick

22.6.205 During the first phase of construction a limited change in views would be experienced from this viewpoint due to the existing vegetation along Wick Moor Drove screening early construction activities. In subsequent construction phases, the visual impact would increase due to the construction of Unit 1 and Unit 2, the presence of large machinery, such as tower cranes or silos, which would be visible above the existing vegetation and would punctuate the skyline, and construction activities to the south of Green Lane, including on-site campus accommodation. The existing hedgerow and tree planting along Wick Moor Drove would effectively screen some construction activities in the lowest parts of the HPC development site but would not be effective in screening the largest machinery and main HPC buildings. Construction traffic would be apparent on the local road network. The character of this view would temporarily change due to a variety of man-made structures (including partially completed Unit 1 and Unit 2) and machinery punctuating the skyline. The construction impact would be adverse, medium-term, of medium magnitude and **moderate** significance. The impact of lighting during construction would adverse, medium-term, of medium magnitude and **moderate** significance.

22.6.206 During operation year 1, only the tallest structures within the HPC proposed development would be visible, such as Unit 1, Unit 2, stacks and electricity pylons, and some lower buildings, such as the National Grid substation, within the south-eastern parts of the HPC permanent development. Smaller HPC buildings would be screened by the existing vegetation along Wick Moor Drove. The addition of the HPC Unit 1 and Unit 2 would not significantly change the character of this view which would be seen in the context of the existing Hinkley Point Power Station Complex. The extent of visual separation between HPA, HPB and HPC would retain the character of the skyline in this view. The restoration planting would not be mature and would not provide significant screening at this stage. The impact during the operational phase (year 1) would be adverse, medium-term, of medium magnitude and **moderate** significance. The lighting impact during the operational phase (year 1) would be adverse, medium-term, of low magnitude and **minor** significance

22.6.207 Once the proposed restoration planting increases in maturity (year 15) it would add to the existing planting along Wick Moor Drove, create a more densely vegetated skyline and provide some screening of the lower levels of the HPC. The impact during the operational phase (year 15) would change due to the maturation of restoration proposals and would be adverse, long-term, of medium magnitude and **moderate** significance. The operational lighting impact (year 15) would be adverse, long-term, of low magnitude and **minor** significance. See **Figure 22.22b**.

Table 22.43: Impacts on receptors at Principal Viewpoint 13

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	Medium	Adverse, medium-term	Medium	Moderate	Medium	Moderate
2	Operation year 1	Medium	Adverse, medium-term	Medium	Moderate	Low	Minor
3	Operation year 15	Medium	Adverse, long-term	Medium	Moderate	Low	Minor

Principal Viewpoint 14 –Pixies Mound (Wick Barrow)

22.6.208 Due to close proximity of this viewpoint to the HPC development site the construction activities would change the existing view which presently includes views of the Hinkley Point Power Station Complex. The viewpoint would include views of all major construction activity across the site and construction traffic on the local road and site access. The impact would be adverse, medium-term, of high magnitude and **major** significance. Construction lighting would be visible and its impact would be adverse, medium-term, of high magnitude and **major** significance.

22.6.209 During the operational phase (year 1) the HPC permanent development would dominate the view and the restoration planting within the HPC development site in the vicinity of the Pixies Mound would be apparent but not be mature enough to effectively screen the proposed development. The impact during the operational phase (year 1) would be adverse, medium-term, of medium magnitude and **major** significance. The operational lighting impact (year 1) would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.210 During the operational phase (year 15) the maturing belt of woodland within the HPC development site, planted between the Pixies Mound and the adjacent northern roundabout at Wick Moor Drove, would screen the majority of the development, although the tallest structures would be apparent punctuating the skyline. The impact during the operational phase (year 15) would be adverse, long-term, of low magnitude and **moderate** significance. The operational lighting impact (year 15) would be adverse, long-term, of low magnitude and **moderate** significance. See **Figure 22.23b**.

Table 22.44: Impacts on receptors at Principal Viewpoint 14

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	High	Major	High	Major
2	Operation year 1	High	Adverse, medium-term	Medium	Major	Low	Moderate
3	Operation	High	Adverse,	Low	Moderate	Low	Moderate

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
	year 15		long-term				

Principal Viewpoint 15 - PRoW No. WL 23/61

22.6.211 During the construction phase, the majority of construction activities would be screened by the adjacent vegetation, which effectively screens the existing Hinkley Point Power Station Complex. The tower cranes which would be used during the construction of Unit 1 and Unit 2 are likely to be visible above the existing vegetation but the resulting visual change would be low due to the distance and very small proportion of view which would be affected. The construction impact would be adverse, medium-term, of low magnitude and **moderate** significance. Some lighting would be visible but the visual change would not be significant due to the light glow associated with the existing Hinkley Point Power Station Complex. The impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance.

22.6.212 Once the tower cranes are removed, the proposed development would be screened by the existing vegetation within the view, however, in winter months, glimpsed views of the reactor domes would be potentially available. No vegetation proposed as part of the landscape restoration scheme would be seen from this viewpoint therefore the impacts during the entire operational phase would remain the same. The operational impact (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. The impact of lighting during the operational phase would be neutral, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.24b**.

Table 22.45: Impacts on receptors at Principal Viewpoint 15

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Low	Moderate	Very low	Minor
2	Operation year 1	High	Neutral, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 16 – Wick, PRoW No. WL 23/61

22.6.213 During the first phase of construction only a small change in views would be experienced from this viewpoint due to the existing vegetation within Wick Moor screening the majority of early construction activities, including site preparation works to the south of Green Lane. The main visual impact would be associated with the construction of Unit 1 and Unit 2, the presence of large machinery, such as tower cranes or silos, to the north of Green Lane, some construction activities to the south of Green Lane and the on-site campus accommodation located in the south-eastern part of the HPC development site and construction traffic. The construction activities to the north of Green Lane and below its ridge would be screened by landform and vegetation. The character of this view would temporarily change due to a variety of man-made structures (including partially completed Unit 1 and Unit 2) and machinery punctuating the skyline, although this change would not be of high magnitude due to the presence of the existing Hinkley Point Power Station Complex, which influences the character of the existing view and due to the distance from the HPC proposed development. The construction impact would be adverse, medium-term, of medium magnitude and **major** significance.

22.6.214 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be reduced by the landform and vegetation screening the lower levels of the HPC development site and distance from its boundary. Due to light glow from the existing Hinkley Point Power Station Complex, the change caused by the HPC construction lighting would not be high but it would be noticeable. Lighting during site restoration works would be limited to day time hours. The impact of lighting during construction adverse, medium-term, of low magnitude and **moderate** significance.

22.6.215 During operation year 1, only the tallest structures within the HPC proposed development would be visible, such as Unit 1, Unit 2, stacks and electricity pylons, which would be seen against the skyline over the existing vegetation. Smaller buildings within the HPC permanent development would be screened by the Green Lane ridge and Wick Moor hedgerows which provide effective screening in this gently undulating landscape. The addition of the HPC Unit 1 and Unit 2 would not significantly change the character of this view but extend the visual influence of the existing Hinkley Point Power Station Complex. The impact during the operational phase year 1 would be adverse, medium-term, of low magnitude and **moderate** significance. The operational lighting impact (year 1) would be adverse, medium-term, of very low magnitude and **minor** significance.

22.6.216 Once the remaining proposed restoration planting within the southern part of the HPC development increases in maturity (year 15) it would add more characteristic landscape features to the existing planting visible along Wick Moor Drove but its overall visibility would be low. The impact during the operational phase (year 15) would be adverse, long-term, of low magnitude and **moderate** significance. The operational lighting impact (year 15) would be adverse, long-term, of very low magnitude and **minor** significance. See **Figures 22.25b, 22.25c, 22.25d**.

Table 22.46: Impacts on receptors at Principal Viewpoint 16

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Medium	Major	Low	Moderate
2	Operation year 1	High	Adverse, medium-term	Low	Moderate	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Low	Moderate	Very low	Minor

Principal Viewpoint 17 – Farrington Hill Lane (Farringdon Farm)

22.6.217 During the first phase of construction only a small change in views would be experienced from this viewpoint due to the existing landform and vegetation screening the majority of construction activities to the north of Green Lane. The construction of smaller buildings and the temporary jetty would be screened from this viewpoint. Site preparation works, the construction of on-site campus accommodation to the south of Green Lane construction traffic on the local road network would be visible. Due to the distance from the HPC development site, the construction activities would occupy a smaller proportion of the view compared to viewpoints located in the immediate vicinity of the HPC development site but the character of this view would temporarily change due to a variety of new built form (including partially completed Unit 1 and Unit 2) and machinery punctuating the skyline. The construction impact would be adverse, medium-term, of medium magnitude and **moderate** significance.

22.6.218 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be reduced by the landform screening the lower levels of the northern parts of the construction site. Due to light glow from the existing Hinkley Point Power Station Complex, the change caused by the proposed construction lighting would not be high. Lighting during site restoration works would be limited to day time hours. The visual impact of lighting during construction would be adverse, medium-term, of medium magnitude and **moderate** significance.

22.6.219 During operation year 1, only the tallest structures within the HPC proposed development would be visible, including Unit 1, Unit 2, stacks and electricity pylons, which would punctuate the skyline over the Green Lane vegetated ridge, similar to HPA and HPB. Most of the lower buildings within the HPC permanent development would be screened. During the first year of the operational phase only the early restoration planting and advanced planting proposals would be visible from this viewpoint. The addition of the HPC Unit 1 and Unit 2 would not significantly change the character of this view and the new structures would be seen in the context of the existing Hinkley Point Power Station Complex. The impact during the operational phase year 1 would be adverse, medium-term, of low magnitude and **minor** significance.

22.6.220 Once the remaining proposed restoration planting within the southern part of the HPC development site increases in maturity (year 15), a dense belt of woodland would be visible below the Green Lane ridge. This maturing vegetation would screen part of the low level buildings / operations within the HPC proposed development. The impact during the operational phase (year 15) would change due to the increasing maturity of restoration proposals and would be adverse, long-term, of low magnitude and **minor** significance. The operational lighting impact (both year 1 and year 15) would be adverse, medium to long-term, of low magnitude and **minor** significance. See **Figure 22.26b**.

Table 22.47: Impacts on receptors at Principal Viewpoint 17

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	Medium	Adverse, medium-term	Medium	Moderate	Medium	Moderate
2	Operation year 1	Medium	Adverse, medium-term	Low	Minor	Low	Minor

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
3	Operation year 15	Medium	Adverse, long-term	Low	Minor	Low	Minor

Principal Viewpoint 18 – Residential area at Stogursey, Burgage Road/Lime Street

22.6.221 The majority of construction activities would be screened by the existing vegetation and residential buildings within the view from the road with views to the wider construction area apparent from upper floors of residential dwellings on the northern edge of Stogursey. The construction of Unit 1 and 2 and the tallest construction machinery, such as tower cranes, would be the principal elements that would be partially visible in the gap between the buildings and apparent in views from the first floor of properties. As a result, the visual change would be small due to the small proportion of the view occupied by the HPC construction and the character of the existing view. The construction impact would be adverse, medium-term, of low magnitude and **moderate** significance. The impact of lighting during construction would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.222 The proposed restoration planting would not be visible from this viewpoint at road level but would be apparent from upper floors of dwellings, therefore the visual impacts would remain the generally the same during the entire HPC operational phase. The HPC proposed development would be barely visible in the break between the residential buildings, above the hedge in the vicinity of the Village Hall but would be visible in first floor views from dwellings. The impact during the operational phase (both year 1 and year 15) would be adverse, medium to long-term, of low magnitude and **moderate** significance. The operational lighting impact (both year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figures 22.27b, 22.27c, 22.27d**.

Table 22.48: Impacts on receptors at Principal Viewpoint 18

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Low	Moderate	Low	Moderate
2	Operation year 1	High	Adverse, medium-term	Low	Moderate	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Low	Moderate	Very low	Minor

Principal Viewpoint 19 – Stolford, West Somerset Coast Path, PRoW No. WL 23/95

22.6.223 The character of this open coastal view would change during the construction phase due to the visibility of construction activities within the HPC development site, which would be partially screened by the existing Hinkley Point Power Station Complex. Due to the distance from the HPC development site, the construction details would not be evident and the main impact would be associated with the erection of the tallest structures within the HPC development site (reactor buildings) and the tower crane operations. The temporary jetty would not be visible due to screening by the existing Hinkley Point Power Station Complex and the existing cliff, although some barge movements around the temporary jetty head are likely to be visible. Due to the low elevation of the viewpoint the construction activities at the ground level within the HPC development site would be screened by the existing landform and vegetation. The impact during construction would be adverse, medium-term, of medium magnitude and **major** significance.

22.6.224 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction. Lighting during site restoration works would be limited to day time hours. The visual impact of lighting during the construction phase would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.225 Due to the distance from the site and the low elevation of this viewpoint, the proposed vegetation would not contribute to visual screening, and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. During the operational phase, the HPC proposed development would be seen in the context of the existing Hinkley Point Power Station Complex. This addition would not change the view's character, which is influenced by the existing Hinkley Point Power Station Complex and the associated power line infrastructure. The impact during the entire operational phase (year 1 and year 15) would be adverse, medium to long-term, of low magnitude and **moderate** significance. The operational lighting (both year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figures 22.28b, 22.28c, 22.28d**.

Table 22.49: Impacts on receptors at Principal Viewpoint 19

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Medium	Major	Low	Moderate
2	Operation year 1	High	Adverse, medium-term	Low	Moderate	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Low	Moderate	Very low	Minor

Principal Viewpoint 20 – Stockland Bristol

22.6.226 The character of this open view would change during the HPC construction phase due to the visibility of large scale construction activities within the HPC development site. This change would not be high, as the existing view is heavily influenced by the existing power line infrastructure. The construction details would not be evident from this distance, and the main impact would be associated with the erection of the HPC Unit 1 and Unit 2 and the tower cranes operations. The construction activities at the lower levels within the HPC development site would be partially screened by the existing landform and vegetation. The impact during construction would be adverse, medium-term, of medium magnitude and **major** significance.

22.6.227 The construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction. Lighting during site restoration works would be limited to day time hours. The visual impact of lighting during construction would be adverse, medium-term, of medium magnitude and **major** significance.

22.6.228 Due to the distance from the site, combined with the relatively low elevation of this viewpoint the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. During the operational phase, the simple HPC proposed development would appear next to the existing Hinkley Point Power Station Complex, behind the existing pylons, extending the impact of the existing Complex. This addition would not change the view's character, which is influenced by the existing Hinkley Point Power Station Complex and the associated power line infrastructure. The impact during the entire operational phase (year 1 and year 15) would be adverse, medium to long-term, of low magnitude and **moderate** significance. The operational lighting (both year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.29b**.

Table 22.50: Impacts on receptors at Principal Viewpoint 20

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Medium	Major	Medium	Major
2	Operation year 1	High	Adverse, medium-term	Low	Moderate	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Low	Moderate	Very low	Minor

Principal Viewpoint 21 – Quantock Hills AONB, PRoW No. WL 24/1

22.6.229 During the construction phase the large scale construction activities within the HPC development site would be seen in the context of the existing Hinkley Point Power Station Complex. Due to the distance of the viewpoint from the HPC development site (approximately 3.7km), the construction detail would not be evident and the main impact would be associated with the erection of the tallest structures (HPC Unit 1 and Unit 2) and the tower cranes operations. Due to the distance and rolling landform screening the HPC development site (including the Green Lane ridge), the construction activities below Green Lane would not be visible. The impact during the construction phase would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.230 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction. Lighting during site restoration works would be limited to day time hours. The visual impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance.

22.6.231 Due to surrounding landform which would screen the lower levels of the proposed development, the restoration proposals would not be visible, and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. During the operational phase, the HPC proposed development would partially replace the existing Hinkley Point Power Station Complex (HPA in particular) in views and would not significantly alter the character of the view and the skyline due its similar scale and extent. The existing Hinkley Point Power Station Complex would remain apparent within the view but the landscape, even in the more distant background, would retain its dominance. The HPA, HPB and HPC buildings would remain subservient to the landscape. The impact during the entire operational phase (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. The operational lighting (both year 1 and year 15) would be also adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.30b**.

Table 22.51: Impacts on receptors at Principal Viewpoint 21

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Low	Moderate	Very low	Minor
2	Operation year 1	High	Adverse, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 22 – East Quantoxhead, PRoW No. WL 8/30

22.6.232 During the construction phase the large scale construction activities within the HPC development site would be seen in the context of the existing Hinkley Point Power Station Complex. Due to the distance of the viewpoint from the HPC development site, the construction detail would not be evident and the main impact would be associated with the construction of the tallest structures (HPC Unit 1 and Unit 2) and the tower crane operations. Due to the distance and rolling landform most of the construction activities would be screened. The impact during the construction phase would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.233 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction but due to the long distance and the light pollution from the existing Hinkley Point Power Station Complex, the change in view would be limited. The visual impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance.

22.6.234 Due to landform screening the lower levels of the HPC proposed development, the restoration proposals would not be visible, and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. During the operational phase, the simple HPC proposed development would replace the existing Hinkley Point Power Station Complex (HPA) and would not significantly alter the character of the view and the skyline due its similar scale and extent. The impact during the entire operational phase (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. The operational lighting (both year 1 and year 15) would be also neutral, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.31b**.

Table 22.52: Impacts on receptors at Principal Viewpoint 22

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Low	Moderate	Very low	Minor
2	Operation year 1	High	Neutral, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 23 – East Quantoxhead, Court House Gardens

22.6.235 During the construction phase the large scale construction activities within the HPC development site would be seen in the context of the existing Hinkley Point Power Station Complex. Due to the distance from the HPC development site, the construction detail would not be evident and the main impact would be associated with the construction of the tallest structures (HPC Unit 1 and Unit 2) and the tower crane operations. Due to the distance and rolling landform the majority of the construction activities would be screened. The impact during construction would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.236 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction but due to the long distance and the light pollution from the existing Hinkley Point Power Station Complex, the change in view would be limited. The visual impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance.

22.6.237 Due to landform screening the lower levels of the HPC proposed development, the restoration proposals would not be visible, and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. During the operational phase, the HPC proposed development would replace the existing Hinkley Point Power Station Complex (HPA in particular) in the view and would therefore not significantly alter the character of the view and the skyline due its similar scale and extent. The impact during the entire operational phase (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. The operational lighting (both year 1 and year 15) would be also neutral, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.32b**.

Table 22.53: Impacts on receptors at Principal Viewpoint 23

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Low	Moderate	Very low	Minor
2	Operation year 1	High	Neutral, medium-term	Very low	Minor	Very low	Minor
3	Operation	High	Neutral,	Very low	Minor	Very low	Minor

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
	year 15		long-term				

Principal Viewpoint 24 – Entrance to Dodington House

22.6.238 The early phases of construction, including the site preparation works, the temporary jetty development, and most of construction activities would be entirely screened from this viewpoint by the mature woodland and tree planting visible in middle distance behind the existing barn. The construction of Unit 1 and Unit 2, including operation of large construction machinery, such as tower cranes, would be visible above the vegetated skyline. The existing planting would partially screen the construction activities which would appear less prominent in this view than in simpler views with less landscape features. The restoration phase activities and planting scheme would not be visible from this viewpoint. The construction impact would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.239 Construction lighting impacts would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be reduced by the vegetation screening the lower levels of the HPC development site. Due to light glow from the existing Hinkley Point Power Station Complex and the distance (over 4.6km), the change caused by the proposed construction lighting would be limited. The visual impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance.

22.6.240 Landscape restoration proposals would not be visible from this viewpoint, and therefore the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. During operation, the visual impact would be caused by the partially visible reactor domes of HPC Unit 1 and 2 and the associated stacks. The addition of these structures, of which only a very small proportion would be visible, would not change the character of this view. The impact during the operational phase (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. The operational lighting impact (both year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.33b**.

Table 22.54: Impacts on receptors at Principal Viewpoint 24

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Low	Moderate	Very low	Minor
2	Operation year 1	High	Neutral, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 25 – Nether Stowey, Stogursey Lane

22.6.241 During the construction phase only glimpsed views of construction activities would be available due to vegetation screening the HPC development site. The main visual change would be caused by the tower cranes. The HPC structures themselves would be almost completely screened by the vegetation. The construction impact would be adverse, medium-term, of low magnitude and **minor** significance. The impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance.

22.6.242 The landscape restoration proposals would not be visible from this viewpoint, therefore the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. Glimpsed views of the HPC proposed development would be visible through vegetation but due to the distance from the development (over 4.2km) reducing the visibility of the HPC proposed development and much higher visual influence of the existing Hinkley Point Power Station Complex, the character of the view would not change substantially. The impact during the operational phase (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. The operational lighting impact (both year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.34b**.

Table 22.55: Impacts on receptors at Principal Viewpoint 25

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	Medium	Adverse, medium-term	Low	Minor	Very low	Minor
2	Operation year 1	Medium	Neutral, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	Medium	Neutral, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 26 – Quantock Hills AONB, Beacon Hill

22.6.243 The summit of Beacon Hill offers some of the best views into the HPC development site from the Quantock summits. Further to the south-east, along the Quantock Hills ridgeline, the visibility will gradually decrease, which is documented by the viewpoint panoramas. Due to the high elevation of the viewpoint the majority of construction activities within the HPC development site would be visible and the existing landform and vegetation would provide a limited degree of screening during construction. The visibility of construction details would be limited due to the long distance from the HPC development site (above 8km) but the proposed development under construction and the construction machinery, in particular tower cranes, would be clearly evident from this viewpoint and would provide temporary ‘clutter’ in the view. The existing Hinkley Point Power Station Complex is evident in the view, lying in the vale forming an intermediate element, backed by more distance views of the intertidal platform and ultimately the Mendip Hills. In its context, the HPC proposed development represents an intensification of the Hinkley Point Power Station Complex and is seen in the context of the existing development due to the angle of view and the limited of visual separation between the HPA, HPB and HPC. Furthermore, the scale of the proposed development is not appreciably different from the existing and therefore would not significantly alter the character of the view which will prevail. The construction impact would be adverse, medium-term, of medium magnitude and **major** significance.

22.6.244 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be reduced due to the long distance from the HPC development site and light glow from the existing Hinkley Point Power Station Complex. The impact of lighting during construction would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.245 During operation year 1, the completed HPC proposed development would be visible. Once all construction machinery is removed, especially the tower cranes, the visual impact would decrease compared to the construction phase due to removal of construction 'clutter' from the view. The remaining simple form of the HPC would not significantly change the character of the view due to the presence of the existing Hinkley Point Power Station Complex, which has an influence on the existing view. The visibility of the lower HPC structures would be very low. The impact during the operational phase (year 1) would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.246 Once the proposed restoration planting within the southern part of the HPC development increases in maturity (year 15), a dense belt of woodland would be visible below the Green Lane ridge and to the west of the HPC permanent development site. The impact during the operational phase (year 15) would not change following the restoration planting growth and would be adverse, long-term, of low magnitude and **moderate** significance. The operational lighting impact (both year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.35b**.

Table 22.56: Impacts on receptors at Principal Viewpoint 26

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Medium	Major	Low	Moderate
2	Operation year 1	High	Adverse, medium-term	Low	Moderate	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Low	Moderate	Very low	Minor

Principal Viewpoint 27 – A39, Holford Parking Bay

22.6.247 Due to the location of this viewpoint at the edge of the Quantock Hills and its relatively low elevation compared with the Quantock summits, many construction activities within the HPC development site would be screened by the existing landform and vegetation. Due to the long distance from the HPC development site, the construction detail would not be evident and the main impact would be associated with the erection of the tallest structures (HPC Unit 1 and Unit 2) and the tower cranes operations. Due to the long distance and rolling landform and vegetation screening the HPC development site, the construction activities to the north of and below the Green Lane ridge would not be visible. The construction impact would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.248 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be reduced due to the long distance from the HPC development site and light glow from the existing Hinkley Point Power Station Complex. The impact of lighting during construction would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.249 During operation year 1, the completed HPC proposed development would be visible. Once all construction machinery is removed, in particular the tower cranes, the visual impact would decrease (compared to the construction phase) due to removal of construction 'clutter' from the view. The remaining simple form of the HPC would not significantly change the character of the view seen in the context of the existing Hinkley Point Power Station Complex, which has an influence on the existing view. The lower structures of the HPC would be barely visible. The impact during the operational phase (year 1) would be adverse, medium-term, of very low magnitude and **minor** significance.

22.6.250 Once the proposed restoration planting within the southern part of the HPC development site increases in maturity (year 15), a dense belt of woodland would be apparent below the Green Lane ridge. This maturing vegetation would become visible in the long term but its visibility would be very low due to the elevation of the viewpoint and distance. The impact during the operational phase (year 15) would be adverse, long-term, of very low magnitude and **minor** significance. The operational lighting impact (both year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figures 22.36b, 22.36c, 22.36d**.

Table 22.57: Impacts on receptors at Principal Viewpoint 27

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Low	Moderate	Low	Moderate
2	Operation year 1	High	Adverse, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 28 – Quantock Hills AONB, PRoW No. WL 10/9

22.6.251 The PRoW No. WL 10/9 located between Woodland Hill and Dowsborough offers views into the HPC development site due to its elevation and location at the north-eastern edge of the Quantocks ridge. The majority of construction activities within the HPC development site would be visible and the existing landform and vegetation would provide a limited degree of screening during construction. The construction machinery, in particular tower cranes, and construction activities would be evident from this viewpoint and would provide temporary 'clutter' in the view. The existing Hinkley Point Power Station Complex is evident in the view, lying in the vale forming an intermediate element, backed by more distance views of the intertidal platform and ultimately the Mendip Hills. In its context, the HPC proposed development represents an intensification of the existing Hinkley Point Power Station Complex and is seen in the context of the existing development due to the angle of view and the limited of visual separation between the HPA, HPB and HPC. Furthermore, the scale of the proposed development is not appreciably different from the existing and therefore would not significantly alter the character of the view which will prevail. The construction impact would be adverse, medium-term, of medium magnitude and **major** significance.

22.6.252 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be reduced due to the long distance from the HPC development site and light glow from the existing Hinkley Point Power Station Complex. The impact of lighting during construction would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.253 During operation year 1, the completed HPC proposed development would be visible. The HPC would not significantly change the character of the view due to the presence of the existing Hinkley Point Power Station Complex, which has an influence on the existing view. The visibility of the lower structures of the HPC would be very low. The impact during the operational phase (year 1) would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.254 Once the proposed restoration planting within the southern part of the HPC development increases in maturity (year 15), a dense belt of woodland would be visible below Green Lane and to the west of the HPC permanent development site. The impact during the operational phase (year 15) would be adverse, long-term, of low magnitude and **moderate** significance. The operational lighting impact (both year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.37b**.

Table 22.58: Impacts on receptors at Principal Viewpoint 28

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Medium	Major	Low	Moderate
2	Operation year 1	High	Adverse, medium-term	Low	Moderate	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Low	Moderate	Very low	Minor

Principal Viewpoint 29 – Quantock Hills AONB, Walford's Gibbet

22.6.255 Due to the location of this viewpoint at the edge of the Quantock Hills and its relatively low elevation (compared to the Quantock summits), many construction activities within the HPC development site would be screened by the existing landform and vegetation. Due to the distance from the HPC development site (approximately 7km), detailed construction activities would not be evident and the main impact would be associated with the erection of the tallest structures (HPC Unit 1 and Unit 2) and the tower cranes operations. Due to the long distance and rolling landform and vegetation screening the HPC development site, the construction activities to the north of and below the Green Lane ridge would not be visible. The construction impact would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.256 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be reduced due to the long distance from the HPC development site and light glow from the existing Hinkley Point Power Station Complex. The impact of lighting during the construction phase would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.257 During operation year 1, the completed HPC proposed development would be visible above the ridge of Green Lane. The HPC proposed development would not significantly change the character of the view as it would be seen in the context of the existing Hinkley Point Power Station Complex, which has an influence on the existing view. The visibility of the lower structures of the HPC would be low due to the distance. Due to the angle of view there would a degree of visual separation between HPA, HPB and HPC but the scale of the HPC proposed development is not appreciably different from the existing and therefore would not significantly alter the character of the view which will prevail. The impact during the operational phase (year 1) would be adverse, medium-term, of very low magnitude and **minor** significance.

22.6.258 Once the proposed restoration planting within the southern part of the HPC development site increases in maturity (year 15), the visibility of a dense belt of woodland below Green Lane would be very low. This maturing vegetation would add some benefit in the longer term but this change would be very low due to the long distance, the low elevation of the viewpoint and limited visibility of the landscape restoration proposals. The impact during the operational phase (year 15) would be adverse, long-term, of very low magnitude and **minor** significance. The operational lighting impact (both year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figures 22.38b, 22.38c, 22.38d**.

Table 22.59: Impacts on receptors at Principal Viewpoint 29

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Low	Moderate	Low	Moderate
2	Operation year 1	High	Adverse, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 30 – Quantock Hills AONB, PRoW No. 10/28

22.6.259 During the construction phase the main visual impact would be associated with the erection of the tallest HPC structures (Unit 1 and Unit 2) and the tower cranes operations. Due to the distance from the HPC development site (approx. 8600m), and rolling landform and vegetation screening much of the HPC development site, the construction activities to the north of ridge below the Green Lane ridge would not be apparent. The construction impact would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.260 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be reduced due to the long distance from the HPC development site and light glow from the existing Hinkley Point Power Station Complex. The impact of lighting during construction would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.261 The magnitude of impacts during year 1 and year 15 of the operational phase would be the same. The visibility of landscape restoration proposals would be very low from this viewpoint due to the distance, although woodland planting would become more visible once increased in maturity (year 15). During the operational phase the completed HPC proposed development would be visible above the ridge of Green Lane, which would screen the lower HPC structures. The visibility of pylons and stacks would be very low due to the distance. The operational HPC proposed development would not significantly change the character of the view as it would be seen in the context of the existing Hinkley Point Power Station Complex, which has an influence on the existing view, however it would extend its visual impact due to a degree of visual separation between HPA, HPB and HPC. The summits visible in middle ground visually dominate the view and decrease the perception of visual change as a result of the HPC proposed development. The impact during the operational phase (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance.

22.6.262 The impact of the operational lighting would be significantly lower than during the construction phase due to design features in the operational lighting scheme, such as light control measures and measures to reduce light pollution. The operational lighting impact (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.39b**.

Table 22.60: Impacts on receptors at Principal Viewpoint 30

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Low	Moderate	Low	Moderate
2	Operation year 1	High	Adverse, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 31 – Quantock Hills AONB, Will's Neck

22.6.263 During the construction phase the main visual impact would be associated with the erection of the tallest HPC structures (Unit 1 and Unit 2) and the tower cranes operations. Due to the distance of the viewpoint from the HPC development site, rolling landform and intervening vegetation detailed construction activities would not be evident. The construction impact would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.264 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be reduced due to the long distance from the HPC development site and light glow from the existing Hinkley Point Power Station Complex. The impact of lighting during construction would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.265 The magnitude of impacts during year 1 and year 15 of the operational phase would be the same. The visibility of landscape restoration proposals would be very low from this viewpoint due to the distance, although woodland planting would become more visible once it increases in maturity (year 15). During the operational phase the completed HPC proposed development would be visible above the ridge of Green Lane, which would screen the lower HPC structures. The visibility of pylons and stacks would be very low due to the distance. The operational HPC would not significantly change the character of the view as it would be seen in the context of the existing Hinkley Point Power Station Complex, which has an influence on the existing view, however it would extend its visual impact due to a degree of visual separation between HPA, HPB and HPC. The wooded rolling hills visible in middle ground have a strong influence on the existing view and decrease the perception of visual change as a result of the HPC proposed development. The impact during the operational phase (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. The operational lighting impact (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.40b**.

Table 22.61: Impacts on receptors at Principal Viewpoint 31

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Low	Moderate	Low	Moderate
2	Operation year 1	High	Adverse, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 32 – Quantock Hills AONB, Cothelstone Hill

22.6.266 During the construction phase the visual impact would be associated with the erection of the tallest HPC structures (Unit 1 and Unit 2) and the tower cranes operations. Due to the distance from the HPC development site, rolling landform and vegetation, the construction activities below the Green Lane ridge would not be apparent. The construction impact would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.267 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be reduced due to the long distance from the HPC development site and light glow from the existing Hinkley Point Power Station Complex. The impact of lighting during construction would be adverse, medium-term, of low magnitude and moderate significance.

22.6.268 The magnitude of impacts during year 1 and year 15 of the operational phase would be the same. The visibility of landscape restoration proposals would be very low from this viewpoint due to the distance, although woodland planting would become more visible once it increases in maturity (year 15). During the operational phase the completed HPC proposed development would be visible above the ridge of Green Lane, which would screen the lower HPC structures. The visibility of pylons and stacks would be very low due to the distance. The operational HPC proposed development would not significantly change the character of the view as it would be seen in the context of the existing Hinkley Point Power Station Complex, which has an influence on the existing view, however it would extend its visual impact due to a degree of visual separation between HPA, HPB and HPC. The wooded summits of the south-eastern Quantock Hills visible in middle ground visually dominate the view and decrease the perception of visual change as a result of the HPC proposed development visible in the distance. The impact during the operational phase (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance.

22.6.269 The impact of the operational lighting would be significantly lower than during the construction phase due to design features in the operational lighting scheme, such as light control measures and measures to reduce light pollution. The operational lighting impact (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.41b**.

Table 22.62: Impacts on receptors at Principal Viewpoint 32

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Low	Moderate	Low	Moderate
2	Operation year 1	High	Adverse, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 33 – Quantock Hills AONB, Broomfield Hill

22.6.270 During the construction phase the visual impact would be associated with the erection of the tallest HPC structures (Unit 1 and Unit 2) and the tower cranes operations. Due to the distance from the HPC development site, rolling landform and vegetation, the construction activities below the Green Lane ridge would not be apparent. The construction impact would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.271 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be reduced due to the long distance from the HPC development site and light glow from the existing Hinkley Point Power Station Complex. The impact of lighting during construction would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.272 The magnitude of impacts during year 1 and year 15 of the operational phase would be the same. The visibility of landscape restoration proposals would be very low from this viewpoint due to the distance, although woodland planting would become more visible once increased in maturity (year 15). During the operational phase the completed HPC proposed development would be visible above the ridge of Green Lane, which would screen the lower structures of the HPC. The visibility of pylons and stacks would be very low due to the distance. The operational HPC would not significantly change the character of the view as it would be seen in the context of the existing Hinkley Point Power Station Complex, which has an influence on the existing view, however it would extend its visual impact due to a degree of visual separation between HPA, HPB and HPC. The rolling hills visible in middle ground visually dominate the view and decrease the perception of visual change as a result of the HPC which would be visible in the distance. The impact during the operational phase (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance.

22.6.273 The impact of the operational lighting would be significantly lower than during the construction phase due to design features in the operational lighting scheme, such as light control measures and measures to reduce light pollution. The operational lighting impact (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.42b**.

Table 22.63: Impacts on receptors at Principal Viewpoint 33

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Low	Moderate	Low	Moderate
2	Operation year 1	High	Adverse, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 34 – Quantock Hills AONB, Wind Down, lay-by

22.6.274 During the construction phase the visual impact would be associated with the erection of the tallest HPC structures (Unit 1 and Unit 2) and the tower crane operations. Due to the distance of the viewpoint from the HPC development site, rolling landform and vegetation, the construction activities below the Green Lane ridge would not be apparent. The construction impact would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.275 Construction lighting would be visible from this viewpoint 24 hours a day during the main phases of construction, however, this impact would be reduced due to the long distance from the HPC development site and light glow from the existing Hinkley Point Power Station Complex. The impact of lighting during construction would be adverse, medium-term, of low magnitude and **moderate** significance.

22.6.276 The magnitude of impacts during year 1 and year 15 of the operational phase would be the same. The visibility of landscape restoration proposals would be very low from this viewpoint due to the distance, although woodland planting would become more visible once it increases in maturity (year 15). The rolling hills and vegetation visible in middle ground visually dominate the view and decrease the perception of visual change as a result of the HPC proposed development visible in the distance. During the operational phase the completed HPC proposed development would be visible above the ridge of Green Lane, which would screen the lower structures of the HPC. The visibility of pylons and stacks would be very low due to the distance. The operational HPC proposed development would not significantly change the character of the view as it would be seen in the context of the existing Hinkley Point Power

Station Complex, which has an influence on the existing view, however it would extend its visual impact due to a degree of visual separation between HPA, HPB and HPC. The impact during the operational phase (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance.

22.6.277 The impact of the operational lighting would be significantly lower than during the construction phase due to design features in the operational lighting scheme, such as light control measures and measures to reduce light pollution. The operational lighting impact (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figures 22.43b, 22.43c, 22.43d**.

Table 22.64: Impacts on receptors at Principal Viewpoint 34

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Low	Moderate	Low	Moderate
2	Operation year 1	High	Adverse, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 35 – Cannington Park, Public Footpath

22.6.278 During the construction phase, glimpsed views of construction activities would be available but due to screening provided by the vegetation in the foreground all construction activities, including the construction of Unit 1 and Unit 2 and the use of large construction machinery, would be barely perceptible. The construction impact would be adverse, medium-term, of very low magnitude and **minor** significance. The impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance.

22.6.279 The landscape restoration proposals would not be visible from this viewpoint and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. Due to the screening provided of vegetation in the foreground, the visibility of the HPC proposed development through the existing vegetation would be very low. The operational HPC would not change the character of the view as it would be seen in the context of the existing Hinkley Point Power Station Complex, which would be more visible than the HPC. The impact during the operational phase (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. The operational lighting impact (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. . See **Figure 22.44b**

Table 22.65: Impacts on receptors at Principal Viewpoint 35

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse,	Very Low	Minor	Very low	Minor

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
			medium-term				
2	Operation year 1	High	Neutral, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 36 – Puriton Hill, PRoW No. BW 28/3

22.6.280 During the construction phase, only the construction of the main HPC buildings (Unit 1 and Unit 2) would be visible. These buildings, together with tower cranes, would punctuate the skyline, but due to the long distance between this viewpoint and the HPC development site (11.5km), and the presence of the existing Hinkley Point Power Station Complex, which would screen some of the construction activities and is seen in the existing view, the resulting visual change during the construction phase would be very low. The construction impact would be adverse, medium-term, of very low magnitude and **minor** significance. The impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance.

22.6.281 The landscape restoration proposals would not be visible from this viewpoint and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. Following the removal of all construction machinery and cessation of construction activities, the visibility of the HPC proposed development through the existing vegetation would be very low. The operational HPC would not change the character of the view as it would be seen in the context of the existing Hinkley Point Power Station Complex. The impact during the operational phase (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. The operational lighting impact (both year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.45b**

Table 22.66: Impacts on receptors at Principal Viewpoint 36

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	Medium	Adverse, medium-term	Very low	Minor	Very low	Minor
2	Operation year 1	Medium	Neutral, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	Medium	Neutral, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 37 – Burnham-on-Sea, waterfront (west of the pier)

22.6.282 During the construction phase, the majority of the HPC proposed development, including Unit 1 and Unit 2, would be screened by the existing Hinkley Point Power Station Complex. The tower cranes would punctuate the skyline and be seen against a backdrop of the distinctive ridges of the Quantock Hills AONB and Exmoor National

Park. The visibility of the temporary jetty would be low due to its alignment with the horizon line and its limited height. The construction impact would be adverse, medium-term, of low magnitude and **moderate** significance. The impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance due to the light glow from the existing Hinkley Point Power Station Complex but also visual screening it provides.

22.6.283 Landscape restoration proposals would not be visible from this viewpoint and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. Following the removal of all construction machinery and cessation of construction activities, the HPC proposed development would be almost entirely screened by the existing Hinkley Point Power Station Complex, which would remain the main feature within the view. The impact during the operational phase (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. The operational lighting impact (both year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. See **Figures 22.46b, 22.46c, 22.46d**.

Table 22.67: Impacts on receptors at Principal Viewpoint 37

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Low	Moderate	Very low	Minor
2	Operation year 1	High	Neutral, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 38 – Brent Knoll (monument)

22.6.284 During the construction phase, a large proportion of the HPC would be screened by the existing Hinkley Point Power Station Complex. The tower cranes would be seen against a backdrop of the distinctive ridge of the Quantock Hills AONB and Exmoor National Park. The visibility of the temporary jetty and other, less visually intrusive construction activities, would be low due to long distance (over 14km) from the HPC development site. The construction impact would be adverse, medium-term, of low magnitude and **minor** significance. The impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance due to the distance, light glow from the existing Hinkley Point Power Station Complex but also visual screening it provides.

22.6.285 Landscape restoration proposals would not be visible from this viewpoint and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. Following the removal of all construction machinery and cessation of construction activities, the proposed development would be almost entirely screened by the existing Hinkley Point Power Station Complex, which would remain the main feature within the view. The impact during the operational phase (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. The operational lighting impact (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.47b**.

Table 22.68: Impacts on receptors at Principal Viewpoint 38

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	Medium	Adverse, medium-term	Low	Minor	Very low	Minor
2	Operation year 1	Medium	Neutral, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	Medium	Neutral, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 39 – Berrow Beach

22.6.286 During the construction phase, the main construction activities to the north of Green Lane, including the construction of Unit 1 and Unit 2 and large construction machinery such as tower cranes, would be visible next to the existing Hinkley Point Power Station Complex, which would screen the construction activities located further beyond within the HPC development site. The tower cranes and the HPC under construction would be seen against the backdrop of the distinctive ridge of the Quantock Hills AONB. The visibility of the temporary jetty would be low due to its alignment with the horizon line, limited height and long distance from the viewpoint (over 11km). The construction impact would be adverse, medium-term, of low magnitude and **minor** significance. The impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance due to the light glow from the existing Hinkley Point Power Station Complex but also a degree of visual screening it provides.

22.6.287 Landscape restoration proposals would not be visible from this viewpoint and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. Following the removal of all construction machinery and cessation of construction activities, the HPC proposed development would not significantly change the character of the view as it would be seen in the context of the existing Hinkley Point Power Station Complex, which has an influence on the existing view. The impact during the operational phase (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. The operational lighting impact (both year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.48b**.

Table 22.69: Impacts on receptors at Principal Viewpoint 39

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	Medium	Adverse, medium-term	Low	Minor	Very low	Minor
2	Operation year 1	Medium	Adverse, medium-term	Very low	Minor	Very low	Minor

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
3	Operation year 15	Medium	Adverse, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 40 – Brean Down

22.6.288 During the construction phase, the main construction activities to the north of Green Lane, including the construction of Unit 1 and Unit 2 and large construction machinery such as tower cranes, would be visible next to the existing Hinkley Point Power Station Complex. The tower cranes and the HPC under construction would be seen against the backdrop of the distinctive ridge of the Quantock Hills AONB. The visibility of the temporary jetty would be low due to its alignment with the horizon line, limited height and long distance from the viewpoint. The construction impact would be adverse, medium-term, of low magnitude and **moderate** significance. The impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance due to the distance and light glow from the existing Hinkley Point Power Station Complex.

22.6.289 Landscape restoration proposals would not be visible from this viewpoint and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. Following the removal of all construction machinery and cessation of construction activities, the HPC proposed development would not significantly change the character of the view as it would be seen in the context of the existing Hinkley Point Power Station Complex, which has an influence on the existing view. The impact during the operational phase (year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. The operational lighting impact (both year 1 and year 15) would be adverse, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.49b**.

Table 22.70: Impacts on receptors at Principal Viewpoint 40

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Low	Moderate	Very low	Minor
2	Operation year 1	High	Adverse, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Adverse, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 41 – Mendip Hills AONB, Bleadon Hill

22.6.290 During the construction phase, the construction activities within the HPC development site would be barely noticeable from this viewpoint due to the long distance. The tallest construction machinery within the site is unlikely to punctuate the skyline due to the high elevation of this viewpoint. From this distance the HPC construction activities would be seen against the backdrop of the Quantock Hills. The construction impact would be adverse, medium-term, of very low magnitude and **minor** significance. The impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance.

22.6.291 Landscape restoration proposals would not be visible from this viewpoint and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. Following the removal of all construction machinery and cessation of construction activities, the proposed development would be seen in the context of the existing Hinkley Point Power Station Complex and its visibility would be very low due to the long distance. The character of the view would not change, as the proposed development would be an extension of the existing Hinkley Point Power Station Complex. The impact during the operational phase (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. The operational lighting impact (both year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.50b**.

Table 22.71: Impacts on receptors at Principal Viewpoint 41

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Very low	Minor	Very low	Minor
2	Operation year 1	High	Neutral, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor	Very low	Minor

Principal Viewpoint 42 – Mendip Hills AONB, Crook Peak

22.6.292 During the construction phase, the construction activities within the HPC development site would be barely noticeable from this viewpoint due to the long distance. The tallest construction machinery within the site is unlikely to punctuate the skyline due to the high elevation of this viewpoint. From this distance the HPC construction activities would be seen against the backdrop of the Quantock Hills. The construction impact would be adverse, medium-term, of very low magnitude and **minor** significance. The impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance.

22.6.293 Landscape restoration proposals would not be visible from this viewpoint and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. Following the removal of all construction machinery and cessation of construction activities, the HPC would be seen in the context of the existing Hinkley Point Power Station Complex and its visibility would be very low due to the long distance. The character of the view would not change, as the proposed development would be an extension of the existing Hinkley Point Power Station Complex. The impact during the operational phase (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. The operational lighting impact (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. See **Figure 22.51b**.

Table 22.72: Impacts on receptors at Principal Viewpoint 42

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-	Very low	Minor	Very low	Minor

3	Operation year 15	High	Neutral, long-term	Very low	Minor	Very low	Minor

Secondary Viewpoint S1 – Minehead Waterfront

22.6.294 During the construction phase large scale construction activities within the HPC development site would be seen in the context of the existing Hinkley Point Power Station Complex and would partially screen the HPA and HPB stations. Due to the very long distance of the viewpoint from the HPC development site, all construction activities, machinery (including the tower cranes) and HPC buildings would be barely perceptible. The impact during construction would be adverse, medium-term, of very low magnitude and **minor** significance. The visual impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance due to the distance from the HPC development site and light glow from the existing Hinkley Point Power Station Complex.

22.6.295 Landscape restoration proposals would not be visible from this distance, and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. During the operational phase, the HPC proposed development would be seen in the context of the existing Hinkley Point Power Station Complex and would partially screen the HPA and HPB stations. The impact during the entire operational phase (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. The operational lighting impact (year 1 and year 15) would be also neutral, medium to long-term, of very low magnitude and **minor** significance.

Table 22.73: Impacts on receptors at Secondary Viewpoint S1

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Very low	Minor	Very low	Minor
2	Operation year 1	High	Neutral, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor	Very low	Minor

Secondary Viewpoint S2 – Exmoor National Park, North Hill

22.6.296 During the construction phase large scale construction activities within the HPC development site would be seen in the context of the existing Hinkley Point Power Station Complex and would partially screen the HPA and HPB stations. Due to the very long distance of the viewpoint from the HPC development site, all construction activities, machinery (including the tower cranes) and HPC buildings would be barely perceptible. The impact during construction would be adverse, medium-term, of very low magnitude and **minor** significance. The visual impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance due to the distance from the HPC development site and light glow from the existing Hinkley Point Power Station Complex.

22.6.297 Landscape restoration proposals would not be visible from this distance, and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. During the operational phase, the HPC would be seen in the context of the existing Hinkley Point Power Station Complex and would partially screen the HPA and HPB stations. The impact during the entire operational phase (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. The operational lighting impact (year 1 and year 15) would be also neutral, medium to long-term, of very low magnitude and **minor** significance.

Table 22.74: Impacts on receptors at Secondary Viewpoint S2

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Very low	Minor	Very low	Minor
2	Operation year 1	High	Neutral, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor	Very low	Minor

Secondary Viewpoint S3 – Minehead, Paganel Road

22.6.298 During the construction phase large scale construction activities within the HPC development site would be seen in the context of the existing Hinkley Point Power Station Complex and would partially screen the HPA and HPB stations. Due to the very long distance of the viewpoint from the HPC development site, all construction activities, machinery (including the tower cranes) and HPC buildings would be barely perceptible. The impact during construction would be adverse, medium-term, of very low magnitude and **minor** significance. The visual impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance due to the distance from the HPC development site, light glow from the existing Hinkley Point Power Station Complex and residential area lighting in the foreground.

22.6.299 Landscape restoration proposals would not be visible from this distance, and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. During the operational phase, the HPC would be seen in the context of the existing Hinkley Point Power Station Complex and will partially screen the HPA and HPB stations. The impact during the entire operational phase (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. The operational lighting impact (both year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance.

Table 22.75: Impacts on receptors at Secondary Viewpoint S3

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Very low	Minor	Very low	Minor
2	Operation year 1	High	Neutral, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor	Very low	Minor

Secondary Viewpoint S4 – Exmoor National Park, Conygar Tower

22.6.300 During the construction phase large scale construction activities within the HPC development site would be seen in the context of the existing Hinkley Point Power Station Complex and would partially screen the HPA and HPB stations. Due to the long distance of the viewpoint from the HPC development site and mature vegetation in the foreground, all construction activities, machinery (including the tower cranes) and HPC buildings would be barely perceptible. The impact during construction would be adverse, medium-term, of very low magnitude and **minor** significance. The visual impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance due to the distance from the HPC development site and light glow from the existing Hinkley Point Power Station Complex.

22.6.301 Landscape restoration proposals would not be visible from this distance, and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. During the operational phase, the HPC proposed development would be seen in the context of the existing Hinkley Point Power Station Complex and would partially screen the HPA and HPB stations. The impact during the entire operational phase (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. The operational lighting (both year 1 and year 15) would be also neutral, medium to long-term, of very low magnitude and **minor** significance.

Table 22.76: Impacts on receptors at Secondary Viewpoint S4

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Very low	Minor	Very low	Minor
2	Operation year 1	High	Neutral, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor	Very low	Minor

Secondary Viewpoint S5 – Exmoor National Park, Rodhuish Common

22.6.302 During the construction phase, all construction activities, machinery (including the tower cranes punctuating the skyline) and HPC buildings would be barely perceptible due to the long distance of the viewpoint from the HPC development site (over

20km). The proposed highway improvement scheme at Washford Cross Roundabout would not increase the significance of impacts caused by the HPC proposed development due to the distance from the viewpoint. The impact during construction would be adverse, medium-term, of very low magnitude and **minor** significance. The visual impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance due to the distance from the HPC development site and the existing Hinkley Point Power Station Complex and the presence of existing light glow apparent in the fore/mid ground in nearby settlement at Watchet and Williton.

22.6.303 The restoration proposals would not be visible from this distance, and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. During the operational phase, the proposed development would be seen in the context of the Hinkley Point Power Station Complex. During the operational phase, the proposed highway improvement scheme at Washford Cross Roundabout, which includes lighting, would be visible during the hours of darkness but is approximately 6km from the viewpoint and would be seen in the context of sky glow already present from built up areas at Watchet and Williton. The impact during the entire operational phase (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. The operational lighting (year 1 and year 15) would be also neutral, medium to long-term, of very low magnitude and **minor** significance.

Table 22.77: Impacts on receptors at Secondary Viewpoint S5

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Very low	Minor	Very low	Minor
2	Operation year 1	High	Neutral, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor	Very low	Minor

Secondary Viewpoint S6 – Welsh Coast, Barry Island Waterfront

22.6.304 During the construction phase, the only visual impact on receptors at this viewpoint would be associated with the construction of Unit 1 and Unit 2 and the tallest machinery operating on site (tower cranes), which would be seen against the backdrop of the Quantocks ridge but their visibility would be very low due to the long distance of the viewpoint from the HPC development site (over 22km). The impact during construction would be adverse, medium-term, of very low magnitude and **minor** significance. The visual impact of lighting during construction would be adverse, medium-term, of very low magnitude and **minor** significance due to the distance from the HPC development site and light glow from the existing Hinkley Point Power Station Complex.

22.6.305 The restoration proposals would not be visible from this distance, and as such the magnitude of impacts during year 1 and year 15 of the operational phase would be the same. During the operational phase, the proposed development would be seen adjacent to the existing Hinkley Point Power Station Complex but would occupy a small percentage of the view. The visibility of HPC would be very limited due to distance. The impact during the entire operational phase (year 1 and year 15) would be neutral, medium to long-term, of very low magnitude and **minor** significance. The operational lighting (year 1 and year 15) would be also neutral, medium to long-term, of very low magnitude and **minor** significance.

Table 22.78: Impacts on receptors at Secondary Viewpoint S6

ID	Phase	Sensitivity	Nature	Magnitude	Significance	Magnitude (Night)	Significance (Night)
1	Construction	High	Adverse, medium-term	Very low	Minor	Very low	Minor
2	Operation year 1	High	Neutral, medium-term	Very low	Minor	Very low	Minor
3	Operation year 15	High	Neutral, long-term	Very low	Minor	Very low	Minor

22.7 Mitigation of Impacts

a) Introduction

22.7.1 The majority of landscape and visual mitigation measures are embodied in the HPC development proposals and form an inherent part of the design. It should be noted that the HPC design, including landscape proposals inherent to the scheme, has been influenced by consultation with local residents, Natural England and English Heritage, and Quantocks AONB. The proposed HPC landscape restoration plan (see **Figure 22.59**) incorporates consultation comments on landscape design aimed to minimise landscape and visual impacts. The permanent landscape proposals within the HPC development site (during construction and operation) have been outlined and assessed in the previous section and are described in detail on the HPC landscape restoration plan.

22.7.2 This section identifies the proposed mitigation measures which are temporary (during construction) or are located off-site. They are considered as ‘further landscape mitigation measures’ and are assessed in section 22.8 as part of the residual impact assessment.

b) Mitigation during construction and operation

22.7.3 To mitigate visual impacts during construction a temporary screening earth bund varying in height from 2m to 8.5m (relative to adjacent ground levels) would be created along the north-western boundary of the HPC development site (see **Figure 22.58**). This temporary bund would be planted with native coastal shrub on slopes and would be managed during construction. The temporary bund would be implemented during site preparation works and would be effective for screening the HPC development in the short distance, predominantly from the adjacent PRoW. Although it cannot screen all of the main construction works, it will effectively screen the early construction works (site preparation works) reducing the magnitude of visual impacts.

22.7.4 The temporary screening bund and associated planting along the north-western HPC development site boundary would be used specifically for the construction phase. Following construction, the temporary bund and planting will be replaced by a landscape restoration scheme designed for the operational phase (see **Figure 22.59**).

22.7.5 To safeguard the existing vegetation to be retained, fenced tree protection zones would be created to ensure that development would not encroach onto the root protection areas. Details of tree and hedgerow removal are provided in **Appendix 22C**.

22.7.6 The HPC construction mitigation measures include off-site mitigation measures proposed following consultation with the landowners of the land to the west of the HPC development site. The off-site landscape and visual mitigation measures identified include:

- wildflower meadow planting;
- hedgerow reinforcement;
- changes in management of the existing hedgerows allowing for their full growth; and
- woodland screen planting.

22.7.7 This off-site planting is aimed specifically to minimise visual impacts on Fairfield House and the surrounding land. It also aims to mitigate local visual impacts from some PRoW within the Coastal – Lilstock sub character area. Further details on the off-site mitigation measures are available in the **HPC Landscape Strategy**.

22.7.8 Off-site planting proposals have been prepared to mitigate the impacts on Pixies Mound. They are illustrated on **Figure 22.61** and include predominantly woodland and hedgerow planting along Wick Moor Drove to screen the HPC proposed development when viewed from Pixies Mound. It is estimated that the landscape proposals around Pixies Mound would reach their full screening potential at year 15 of the operational phase, while providing only partial screening during the construction phase.

22.7.9 The off-site planting scheme proposed following consultation with the landowners of the land to the west of the HPC development site would continue mitigating landscape and visual impacts during the HPC operational phase.

22.8 Residual Impacts

22.8.1 The permanent landscape restoration proposals within the HPC development site were assessed in section 22.6.

22.8.2 This section identifies and assesses the potential residual impacts on landscape visual receptors after implementing the proposed mitigation measures described in section 22.7. A summary of impacts, assessed after taking account of mitigation inherent within the design and impacts assessed after any further mitigation has been taken into account, is provided in section 22.9.

22.8.3 Due to the scale of the HPC development, and the extent and magnitude of its landscape and visual impacts, it is not possible to propose sufficient mitigation measures to mitigate the impacts on the majority of the receptors. The proposed further mitigation measures will therefore affect only localised receptors, which are summarised below.

a) Residual Landscape Impacts

22.8.4 The proposed further landscape mitigation measures would be in keeping with the local landscape character. There would be direct impact on the Quantock Vale LLCA, however, due to the small scale of additional planting compared to the area of Quantock Vale, and the magnitude of change due to the HPC construction and operation, the residual impacts on this LLCA would remain the same as before implementing the off-site mitigation measures.

22.8.5 The proposed off-site mitigation measures would be more relevant to the site scale landscape sub character areas, due to their smaller scale.

22.8.6 The site scale landscape character sub areas that would benefit from the implementation of the off-site landscape mitigation measures would be Coastal – Lilstock and Fairfield. Although some off-site landscape mitigation measures are located within the Rolling Farmland East – Stogursey landscape character sub area, the contribution of these measures to the character of the area would be too small to justify any beneficial impact and change of the significance of impact assessed in the Section 22.6.

Coastal - Lilstock

22.8.7 During construction, the proposed screening bund along the north western boundary would provide a degree of screening of early construction activities (site preparation works) within the HPC development site. The magnitude of construction impacts on landscape character would slightly decrease, however during the entire construction phase the impact would remain of major adverse significance. The significance of residual operational impact would not change due to the small scale of off-site planting and hedgerow management compared to the impact of the completed HPC development.

Fairfield

22.8.8 During construction, the proposed off-site planting within this sub area would not be mature enough to screen the construction activities. During operation year 15, the proposed woodland and hedgerow planting would screen the majority of the proposed HPC development and the existing Hinkley Point Power Station Complex from the parkland around Fairfield House. This impact would be localised (limited to the Fairfield House and the parkland) and in the context of the entire Fairfield sub character area the significance of residual landscape impact would not change.

b) Residual Visual Impacts

22.8.9 Due to the scale of the proposed HPC development, under construction and operation, off-site landscape proposals are effective only in close proximity to visual receptors. The proposed further mitigation during construction would reduce localised visual impacts occurring in the vicinity of the western boundary of the HPC development site.

22.8.10 During construction, the most efficient mitigation measure with almost immediate screening effect would be the proposed bund along the north-western boundary of the HPC development site. The off-site planting proposals would not be mature enough to mitigate any visual impacts during construction. The north-western bund would be removed during site restoration.

22.8.11 During operation, the proposed further landscape mitigation measures would include off-site planting which would mitigate visual impacts at year 1 (to a lesser extent) and year 15 of the operational phase and beyond.

22.8.12 The visual receptors likely to be affected by the proposed off-site mitigation include users of PRoW in the vicinity of the north-western boundary of the HPC development site and around Burton; residents of Knighton, Burton and Fairfield; walkers and users of PRoW within the Fairfield and eastern part of the Coastal – Lilstock landscape character sub areas.

22.8.13 The residual impact on the representative viewpoints is assessed below.

Principal Viewpoint 1 – PRoW No. WL23/110 west of Benhole Lane

22.8.14 During the construction phase, the proposed north-western bund would provide a small degree of screening to the site preparation works activities, however due to the elevation of the viewpoint the residual magnitude of change would be too small to justify the change of impact significance from major adverse assessed for the potential visual impact. It should be noted that the bund would be effective in reducing early visual impacts from the PRoW along Benhole Lane.

Principal Viewpoint 2– West Somerset Coast Path, PRoW No. WL 23/95

22.8.15 During the construction phase, the proposed north-western bund would provide a small degree of screening to the site preparation works and the temporary jetty. Once the main construction activities commence, the screening bund would screen vehicle movement and some other activities within on the lower levels of the HPC development site, but would not change the overall major adverse significance of visual impact during the entire construction phase.

Principal Viewpoint 4 – PRoW No. WL 24/8

22.8.16 Visual receptors on PRoW No. WL 24/8 would benefit from off-site hedgerow reinforcement/ management on the raising topography in the foreground of the view. Fully grown hedgerows would have a potential to partially screen the proposed HPC development and the existing Hinkley Point Power Station Complex. It is assessed that the magnitude would not change; however the nature of year 15 residual operational impact would change from adverse to neutral, once the existing hedgerows reach their full growth.

Principal Viewpoint 7 – Fairfield House Driveway

22.8.17 Visual receptors on Fairfield House Driveway would benefit from off-site woodland planting and hedgerow reinforcements implemented adjacent to the existing woodland visible in middle ground. Due to the short distance of the proposed off-site planting from the viewpoint, the proposed HPC development and the existing Hinkley Point Power Station Complex would become partially screened. As a result of the off-site planting, the vegetated skyline would change and some long distance views towards Bridgwater Bay would be lost but the presence of the HPC and the existing Complex would be less evident. It is assessed that the proposed off-site planting would change only the impacts during year 15 of the operational phase, when the proposed off-site planting begins to mature. The residual visual impact during the operational phase (year 15) would be adverse, long-term, of very low magnitude and minor significance.

Principal Viewpoint 8 – Knighton Farm, PRoW No. WL 23/46

22.8.18 Visual receptors on PRoW No. WL 23/46 and the residents of adjacent Knighton Farm would benefit from the change in the management of existing hedgerows on the local ridge in the foreground of the view. The fully grown hedgerows would contribute to screening of the proposed HPC development and the existing Hinkley Point Power Station Complex. It is assessed that the magnitude and nature of impact would not change even during operational phase (year 15) once the hedgerows are fully grown. The construction and operational residual impact (year 1) would remain the same.

Principal Viewpoint 9 – Burton

22.8.19 Visual receptors on PRoW around Burton, and motorists, would benefit from the change in management of existing hedgerows on the local ridge in middle ground. The fully grown hedgerows would contribute to screening of the proposed HPC development and the existing Hinkley Point Power Station Complex. It is assessed that the magnitude and nature of impacts would not change when the hedgerows are fully grown.

Principal Viewpoint 14 – Pixies Mound (Wick Barrow)

22.8.20 The proposed off-site planting around Pixies Mound is illustrated on **Figure 22.62**. The woodland and hedgerow planting would not screen the construction of HPC and would have limited screening potential during the operational phase (year 1). Once the planting increases in maturity, at year 15 of the operational phase, the proposed HPC development would be almost entirely screened from this viewpoint (due to the proximity of planting). It is assessed that the magnitude of change would remain low, however the nature of residual visual impact would change from adverse to neutral.

22.9 Summary of Impacts

22.9.1 **Table 22.79**, **Table 22.80** and **Table 22.81** summarise the predicted construction impacts, operational impacts year 1 and operational impacts year 15 (respectively) of the identified landscape and visual receptors without further mitigation during daylight hours and the residual impacts remaining after further mitigation.

Table 22.79: Summary of Construction Phase Impacts

Receptor	Sensitivity	Potential Impact	Nature	Magnitude	Impact Significance	Proposed further Mitigation	Magnitude	Residual Impact Significance
Landscape								
Local Landscape Character								
Quantock Vale LLCA	Medium	Change in landscape character	Adverse, medium-term	High	Major	Screening north-western bund, off-site hedgerow and woodland planting	High	Major

CHAPTER 23: HISTORIC ENVIRONMENT

CONTENTS

TABLES

PLATES

FIGURES

APPENDICES

23. HISTORIC ENVIRONMENT

23.1 Introduction

23.1.1 This Chapter of the Environmental Statement (ES) provides an assessment of the potential impacts to the terrestrial historic environment during the construction, and operational phases of Hinkley Point C (HPC). A detailed description of the proposed development is provided in **Chapter 2** in this volume. Where required, mitigation measures are identified to prevent, reduce and where possible, off-set any potential adverse impacts that are identified to be of significance.

23.2 Scope of Assessment

23.2.1 The scope of this assessment has been determined through a formal Environmental Impact Assessment (EIA) scoping process undertaken with the Infrastructure Planning Commission (IPC). It has also been informed by ongoing consultation with statutory consultees (including Somerset County Council (SCC), English Heritage, West Somerset Council (WSC), Sedgemoor District Council (SDC)) and the local community and the general public in response to the Stage 1, Stage 2, Stage 2 Update and M5 Junction 24 and Highway Improvements consultations.

23.2.2 The assessment of the construction and operational impacts on the terrestrial historic environment arising from the proposed development has been undertaken adopting the methodologies described in Section 23.4.

23.2.3 The existing historic environment baseline conditions, against which the likely environmental impacts of the development are assessed, are described in Section 23.5 of this chapter.

23.2.4 **Figure 23.1** shows the HPC Development Site boundary and a 500m study area on all sides of the site. For the purposes of this assessment, the HPC Development Site has been sub-divided into the Built Development Area West (BDAW), the Built Development Area East (BDAE) and the Southern Construction Phase Area (SCPA).

23.2.5 Where it has been considered that the setting of a heritage asset within a wider study area extending up to 10km from the HPC Development Site may be impacted upon, this has also been included in this assessment. In consultation with English Heritage, it was agreed that only certain designated heritage assets (Scheduled Monuments, Grade I, Grade II* Listed Buildings, Conservation Areas and Registered Parks and Gardens) needed to be identified within the zone of theoretical visibility (ZTV) up to 10km from the HPC Development Site. Grade II Listed Buildings were identified within the ZTV up to 5km from the HPC Development Site.

23.2.6 Eleven off-site highway improvement schemes will be included in the HPC Project DCO application. They are presented in the project description in **Volume 2, Chapter 2** of this ES. The schemes concern land that is presently within the highway, on highway land, such as verges, limited areas of hard surfacing and urban greenspace. Only two schemes, Washford Cross and Sandford Hill, have the potential to affect the historic environment. The remaining nine are scoped out of the baseline and hence are not assessed further in this chapter.

23.2.7 Section 23.6 assesses the potential construction and operational impacts on the historic environment. Appropriate mitigation measures to prevent, reduce or off-set any potential adverse impacts that are identified to be of significance are identified in Section 23.7. The assessment of residual impacts following implementation of the mitigation measures is presented in Section 23.8.

23.2.8 The assessment of cumulative impacts to the historic environment arising from the activities within and adjacent to the HPC Development Site are considered in this chapter.

23.2.9 The objectives of this assessment were to:

- identify all known heritage assets within the HPC Development Site and within 500m of the HPC Development Site boundary that may be affected by the proposed development;
- identify designated heritage assets within 10km of the HPC Development Site boundary that have the potential to be affected by the proposed development;
- identify all known heritage assets within, and in the vicinity of, the Washford Cross and Sandford Hill highway improvements site boundaries that may be affected by the proposed works;
- assess the likely extent of previous impacts on the historic environment resource;
- assess the potential for buried archaeological remains to be present and their likely level of preservation;
- assess the potential impact of the proposed development on the historic environment resource;
- recommend mitigation strategies aimed at preventing, reducing or off-setting any significant adverse impacts in respect of the proposed development, if necessary; and
- determine residual impacts where appropriate.

23.3 Legislation, Policy and Guidance

23.3.1 This section identifies and describes legislation, policy and guidance of relevance to the assessment of potential impacts to the historic environment associated with the construction and operational phases of the proposed development.

23.3.2 As stated in **Volume 1, Chapter 4,** the overarching National Policy Statement (NPS) for Energy (NPS EN-1) when combined with the NPS for Nuclear Power Generation (NPS EN-6) provides the primary basis for decisions by the IPC on applications for nuclear power generation developments that fall within the scope of the NPSs.

23.3.3 Notwithstanding this, the IPC may consider other matters that are both important and relevant to its decision-making. This could include Planning Policy Statements (PPSs), Planning Policy Guidance Notes (PPGs), regional and local policy documents, although, if there is a conflict between these and the NPS, the NPS prevails for the purposes of IPC decision making.

23.3.4 Further, the Planning Act 2008 provides that the IPC must, in making its decision on an application, have regard to any Local Impact Report (LIR) prepared by relevant local authorities. It is anticipated that the LIRs will rely in part on PPSs, PPGs, regional and local policy to provide a context for their assessment. On this basis, regard has been given to these documents (where relevant to the technical assessment) since they are likely to inform the LIRs prepared by the relevant local authorities.

a) International Legislation

23.3.5 The scope of assessment is not affected by European or other international legislation.

b) National Legislation

i. Ancient Monuments and Archaeological Areas Act 1979 (Ref. 23.1)

23.3.6 Under the terms of this act (Ref. 23.1) an archaeological site or historic building of national importance can be designated as a Scheduled Monument and is registered with the Department of Culture, Media and Sport (DCMS).

23.3.7 Any development that might affect either the Scheduled Monument or its setting is subject to the granting of Scheduled Monument Consent. English Heritage advises the government on individual cases for consent and offers advice on the management of Scheduled Monuments.

ii. Planning (Listed Buildings and Conservation Areas) Act 1990

23.3.8 The Planning (Listed Buildings and Conservation Areas) Act 1990 (Ref. 23.2) covers the registration of Listed Buildings (that is those buildings that are seen to be of special architectural or historical interest) and designation of Conservation Areas (areas of special architectural or historic interest, the character or appearance of which it is desirable to preserve or enhance).

23.3.9 A Listed Building may not be demolished or altered or extended in any manner which would affect its character as a building of special architectural or historic interest without listed building consent being granted. There are three grades of listing (in descending order):

- Grade I: buildings of exceptional interest.
- Grade II*: particularly important buildings of more than special interest.
- Grade II: buildings of special interest warranting every effort to preserve them.

iii. Hedgerows Regulations 1997

23.3.10 Important hedgerows (referred to as historic hedgerows in this chapter), as defined by the Hedgerows Regulations 1997 (Ref. 23.3), enjoy statutory protection. A hedgerow is ‘important’ if it or the hedgerow of which it is a part:

> *“(a) has existed for 30 years or more; and*
>
> *(b) satisfies at least one of the criteria listed in Part II of Schedule 1.”*

23.3.11 The archaeological and historical criteria listed in Part II of Schedule 1 are:

"1. The hedgerow marks the boundary, or part of the boundary, of at least one historic parish or township; and for this purpose "historic" means existing before 1850.

2. The hedgerow incorporates an archaeological feature which is: (a) included in the schedule of monuments compiled by the Secretary of State under section 1 (schedule of monuments) of the Ancient Monuments and Archaeological Areas Act 1979; or (b) recorded at the relevant date in a Sites and Monuments Record.

3. The hedgerow: (a) is situated wholly or partly within an archaeological site included or recorded as mentioned in paragraph 2 or on land adjacent to and associated with such a site; and (b) is associated with any monument or feature on that site.

4. The hedgerow: (a) marks the boundary of a pre-1600 AD estate or manor recorded at the relevant date in a Sites and Monuments Record or in a document held at that date at a Record Office; or (b) is visibly related to any building or other feature of such an estate or manor.

5. The hedgerow: (a) is recorded in a document held at the relevant date at a Record Office as an integral part of a field system pre-dating the Inclosure Acts; or (b) is part of, or visibly related to, any building or other feature associated with such a system, and that system (i) is substantially complete; or (ii) is of a pattern which is recorded in a document prepared before the relevant date by a local planning authority, within the meaning of the 1990 Act, for the purposes of development control within the authority's area, as a key landscape characteristic."

c) National Guidance

i. English Heritage Register of Parks and Gardens in England

23.3.12 The Register of Parks and Gardens of Special Historic Interest in England is maintained by English Heritage and divides the sites into three grade bands similar to those used for Listed Buildings.

ii. English Heritage Register of Historic Battlefields in England

23.3.13 The English Heritage Register of Historic Battlefields in England presently identifies 43 important English battlefields. Its purpose is to offer them protection and to promote a better understanding of their significance, but it does not offer any statutory protection.

iii. Ancient Woodlands

23.3.14 Ancient woodlands consist of land that has been continuously wooded since AD 1600. Areas of ancient woodland can be protected as nationally important Sites of Special Scientific Interest (SSSIs), Special Areas of Conservation (SAC) or as Wildlife Sites recognised at a local level.

23.3.15 Ancient woodland is not a statutory designation and does not give the wood legal protection. However, increasingly, national, regional and local planning policies mention protection of ancient woodland in planning documents. The Woodland Trust (the UK's leading woodland conservation charity) acts wherever possible to secure protection of ancient woodland.

iv. Tax-exempt Heritage Assets

23.3.16 This scheme aims to encourage private owners of land of scenic, scientific or historic value or buildings of outstanding historic or architectural interest to retain and care for our heritage by excluding them from inheritance tax and or capital gains tax provided that the owner, in the case of land, maintains and preserves its character and, in the case of historic buildings, their amenity land and their historically associated contents, maintains, repairs and preserves them and keeps the contents at the building with which they are associated, as well as securing reasonable access to the public. The owner of each asset must make a undertaking setting out the specific steps agreed with Her Majesty's Revenue and Customs (HMRC) to fulfil these obligations.

d) National Planning Policy

i. Planning Policy Statement 1: Delivering Sustainable Development (PPS1) (January 2005) (Ref. 23.4)

23.3.17 PPS1 sets out the Government's overarching planning policies on the delivery of sustainable development through the planning system.

23.3.18 Paragraph 5 states that planning should facilitate and promote sustainable and inclusive patterns of urban and rural development by, amongst other things: protecting and enhancing the natural and historic environment, the quality and character of the countryside, and existing communities.

ii. Planning Policy Statement 5: Planning for the Historic Environment (PPS5) (March 2010) (Ref. 23.5)

23.3.19 PPS5 sets out planning policies on the conservation of the historic environment. It states that planning has a central role to play in conserving our heritage assets and utilising the historic environment in creating sustainable places. The policies contained within PPS5 will enable the Government's vision for the historic environment to be implemented through the planning system (page 2).

23.3.20 PPS5 introduces the concept of a "heritage asset", which is defined as those parts of the historic environment that have significance because of their historic, archaeological, architectural or artistic interest (page 5). Heritage assets include designated heritage assets (World Heritage Sites, Scheduled Monuments, Listed Buildings, Protected Wreck Sites, Registered Parks and Gardens, Registered Battlefields and Conservation Areas) and assets identified by the local planning authority during the process of decision-making or through the plan-making process (including local listing) (page 13).

23.3.21 Policy HE1.3 states that, where conflict between climate change objectives and the conservation of heritage assets is unavoidable, the public benefit of mitigating the effects of climate change should be weighed against any harm to the significance of heritage assets in accordance with the development management principles in this PPS and national planning policy on climate change.

23.3.22 Policy HE6.1 states that local planning authorities should require an applicant to provide a description of the significance of the heritage assets affected and the contribution of their setting to that significance. The level of detail should be proportionate to the importance of the heritage asset and no more than is sufficient to understand the potential impact of the proposal on the significance of the heritage asset. Policy HE6.2 states that this information, together with an assessment of the impact of the proposal, should be set out in the application as part of the explanation of the design concept. Policy HE6.3 states that local planning authorities should not validate applications where the extent of the impact of the proposal on the significance of any heritage assets affected cannot adequately be understood from the application and supporting documents.

23.3.23 Policy HE7.2 states that, in considering the impact of a proposal on any heritage asset, local planning authorities should take into account the particular nature of the significance of the heritage asset and the value that it holds for this and future generations.

23.3.24 Policy HE7.7 states that, where loss of significance is justified on the merits of new development, local planning authorities should not permit the new development without taking all reasonable steps to ensure the new development will proceed after the loss has occurred by imposing appropriate planning conditions or securing obligations by agreement.

23.3.25 Policy HE8.1 considers non-designated heritage assets and states that the effect of an application on the significance of such a heritage asset or its setting is a material consideration in determining the application.

23.3.26 Policy HE9.1 states that there should be a presumption in favour of the conservation of designated heritage assets and the more significant the designated heritage asset, the greater the presumption in favour of its conservation should be. Significance can be harmed or lost through alteration or destruction of the heritage asset or development within its setting. Loss affecting any designated heritage asset should require clear and convincing justification.

23.3.27 Policy HE9.4 states that, where a proposal has a harmful impact on the significance of a designated heritage asset which is less than substantial harm, in all cases local planning authorities should:

> *"(i) weigh the public benefit of the proposal (for example, that it helps to secure the optimum viable use of the heritage asset in the interests of its long-term conservation) against the harm; and*
>
> *(ii) recognise that the greater the harm to the significance of the heritage asset the greater the justification will be needed for any loss."*

23.3.28 Policy HE9.6 states that there are many heritage assets with archaeological interest that are not currently designated as Scheduled Monuments, but which are demonstrably of equivalent significance. The absence of designation for such heritage assets does not indicate lower significance and they should be considered subject to the policies in HE9.1 to HE9.4 and HE10.

23.3.29 Policy HE10.1 states that, when considering applications for development that affect the setting of a heritage asset, local planning authorities should treat favourably applications that preserve those elements of the setting that make a positive contribution to or better reveal the significance of the asset. When considering applications that do not do this, local planning authorities should weigh any such harm against the wider benefits of the application. The greater the negative impact on the significance of the heritage asset, the greater the benefits that will be needed to justify approval.

23.3.30 Policy HE12.3 states that, where the loss of the whole or a material part of a heritage asset's significance is justified, local planning authorities should require the developer to record and advance understanding of the significance of the heritage asset before it is lost, using planning conditions or obligations as appropriate. The extent of the requirement should be proportionate to the nature and level of the asset's significance. Developers should publish this evidence and deposit copies of the reports with the relevant historic environment record.

e) Regional Planning Policy

23.3.31 The Government's revocation of regional strategies was quashed in the High Court on 10 November 2010. However, on that same date the Government reiterated in a letter to Chief Planners its intention to revoke regional strategies through the Localism Bill. This letter was also challenged but, on 7 February 2011, the High Court held that the Government's advice to local authorities that the proposed revocation of regional strategies was to be regarded as a material consideration in their planning development control decisions should stand. The decision of the High Court was upheld by the Court of Appeal on 27 May 2011. Therefore, the regional strategies remain in place but in the case of development control decisions it is for planning decision makers to decide on the weight to attach to the strategies. **Volume 1, Chapter 4** of this ES provides a full summary of the position regarding the status of regional planning policy.

i. Regional Planning Guidance 10 for the South West 2001-2016 (RPG10) (2001) (Ref. 23.6)

23.3.32 RPG 10 sets out the broad development strategy for the period to 2016 and beyond. Policy EN 3 (The Historic Environment) seeks the protection of historic and archaeological areas, sites and monuments of international, national and regional importance. This policy also advises that new development should preserve or enhance historic buildings and conservation areas and important archaeological features and their settings.

ii. The Draft Revised Regional Spatial Strategy (RSS) for the South West Incorporating the Secretary of States Proposed Changes 2008-2026 (July 2008) (Ref. 23.7)

23.3.33 The draft Revised Regional Spatial Strategy (RSS) looks forward to 2026 and sets out policies in relation to the development of land within the region.

23.3.34 Policy SD3 (The Environment and Natural Resources) seeks to protect and enhance the region's environment and natural resources by, amongst other things, positive planning and design to set development within, and to enhance, local character (including setting development within the landscape of the historic environment), and bringing historic buildings back into viable economic use and supporting regeneration.

23.3.35 Policy ENV1 (Protecting and Enhancing the Region's Natural and Historic Environment) states that, where development and changes in land use are planned which would affect the natural and historic environment, local authorities will first seek to avoid loss of or damage to the assets, then mitigate any unavoidable damage, and compensate for loss or damage through offsetting actions.

23.3.36 Policy ENV5 (Historic Environment) states that the historic environment of the South West will be preserved and enhanced.

iii. Somerset and Exmoor National Park Joint Structure Plan Review 1991-2011 (2000) (Policies 'saved' from 27 September 2007) (Ref. 23.8)

23.3.37 The Somerset and Exmoor National Park Joint Structure Plan was adopted in 2000 with relevant policies saved from 27 September 2007. All policies have been saved with the exception of Policy 53 which is unrelated to historic environment impacts. The Plan provides a strategic base for all land use planning within the plan area for the period up to 2011.

23.3.38 Policy 9 (The Built Historic Environment) states that the setting, local distinctiveness and variety of buildings and structures of architectural or historic interest should be maintained and where possible enhanced. The character or appearance of Conservation Areas should be preserved or enhanced.

23.3.39 Policy 10 (Historic Landscapes) states that development proposals should take account of their impact on historic landscape character areas and registered historic landscapes (historic parks, gardens and battlefields).

23.3.40 Policy 11 (Areas of High Archaeological Potential) states that development proposals should take account of identified Areas of High Archaeological Potential or, elsewhere where there is reason to believe that important remains exist, so that appropriate assessment and necessary protection can be afforded to any archaeological remains identified.

23.3.41 Policy 12 (Nationally Important Archaeological Remains) states that there should be a presumption in favour of the physical preservation in-situ of nationally important archaeological remains. The setting and amenity value of the archaeological remains should also be protected.

23.3.42 Policy 13 (Locally Important Archaeological Remains) states that development proposals which affect locally important archaeological remains should take account of the relative importance of the remains. If the preservation in-situ of the archaeological remains cannot be justified, arrangements should be sought to record those parts of the site that would be destroyed or altered.

f) Local Planning Policy

i. West Somerset Local Plan (2006) (Policies 'saved' from 17 April 2009) (Ref. 23.9)

23.3.43 The West Somerset Local Plan forms part of the Development Plan for West Somerset. The Local Plan was adopted in April 2006 (with relevant policies 'saved' from 17 April 2009). The Proposals Map indicates that the HPC Development Site itself is not subject to any specific historic environment designations. A Scheduled Monument, Wick Barrow (Pixies Mound) lies just outside of the eastern boundary of site.

23.3.44 The HPC Development Site is outside of the Development Boundary defined in the Local Plan.

23.3.45 The following saved policies are potentially relevant to the historic environment:

- Policy AH/2 (Locally Important Archaeological Remains) states that development which is likely to damage archaeological remains of local importance will only be permitted where the importance of the development outweighs the intrinsic importance of the remains.
- Policy AH/3 (Areas of High Archaeological Potential) states that within areas of high archaeological potential, planning permission will not be granted unless an evaluation has been carried out to determine whether archaeological remains of local or national value exist on the site.

ii. West Somerset Local Development Framework (LDF) Core Strategy (Options Paper) (January 2010) (Ref. 23.10)

23.3.46 The Core Strategy is at a preliminary stage of preparation and the Options Paper does not include any specific policies relating to historic environment impacts. The paper does however identify the types of policy that the Council considers could be included in the Core Strategy. In relation to historic environment impacts this includes policies which recognise the historic character of settlements where development will be focused, and which will ensure that new development contributes positively to that character.

iii. Supplementary Planning Guidance

23.3.47 Sedgemoor District Council and West Somerset Council have jointly prepared draft supplementary planning guidance in relation to the HPC Project. Box 19 in the draft HPC SPD sets out the approach to masterplanning and design of the HPC Development Site, and sets out a number of requirements that the County Council and District Councils will expect of the HPC project promoter.

23.3.48 In relation to the historic environment at the HPC Development Site, Box 19 states that the HPC Promoter will be expected to:

> *"…minimise the individual and cumulative visual impacts on the landscape and setting of designated areas, buildings and monuments, including Exmoor National Park, AONBs, Conservation Areas, Outstanding Heritage Settlements, Listed Buildings and Scheduled Ancient Monuments and where it has been demonstrated by the HPC project promoter that the*

impacts are unavoidable provide appropriate levels of mitigation and compensation (p.36)".

23.3.49 Further planning policy context is provided in the Legislative Planning Policy Context chapter (**Volume 1, Chapter 4**) and the Introduction chapter (**Volume 2, Chapter 1**).

23.4 Methodology

23.4.1 The baseline assessment and all supporting surveys have been undertaken in accordance with the published guidelines set out by the Institute for Archaeologists' (IfA) Standards and Guidance for Archaeological Desk-Based Assessment (Ref. 23.11) and Archaeological Field Evaluation (Ref. 23.12).

23.4.2 There is, as yet, no standard or guidance published by the IfA or English Heritage specifically relating to EIA for the historic environment. In the absence of this, use has been made (as appropriate) of guidance on assessing the effects of roads schemes on heritage, given in the Design Manual for Roads and Bridges (DMRB), **Volume 11**: Environmental Assessment, Section 3, Part 2, Cultural Heritage (Ref. 23.13).

23.4.3 The generic descriptions used to define the level of significance and the likelihood of occurrence are those given in **Volume 1, Chapter 7** of this ES. This provides a matrix comparing the magnitude of an impact with the value and sensitivity (importance) of the receptor, to determine the level of significance of predicted impacts.

a) Study Area

23.4.4 The geographical extent of the study area comprises:

- the proposed HPC Development Site and a 500m area around the HPC Development Site for which undesignated and designated assets have been considered (shown in **Figure 23.1** and listed in **Appendix 23A**);
- a 10km area around the HPC Development Site for which designated assets within the ZTV have been considered (5km for Grade II) (shown in **Figure 23.2 and Figure 23.3** and listed in **Appendix 23B**); and
- the Washford Cross road junction on the A39 to the west of Williton (shown in **Figure 23.9** and listed in **Appendix 23C**) and the Sandford Hill road junction on the A39 to the west of Wembdon (shown in **Figure 23.9** and listed in **Appendix 23C**) for which undesignated and designated assets have been considered.

b) Baseline Assessment

23.4.5 Heritage assets were initially identified through:

- a search of the records held at the National Monuments Record (NMR) and the Somerset Historic Environment Record (HER), both initially conducted in August 2008 and updated;
- analysis of the Historic Landscape Characterisation (HLC) data conducted in August 2008;

- a search of historical maps and documentation at the Somerset Record Office conducted in October and November 2008;
- an examination of other data sources including the National Mapping Programme, Portable Antiquities Scheme and the South West Archaeological Research Framework (SWARF) (Ref. 23.14) from August 2008 onwards; and
- consultation with Somerset County Council Historic Environment Service (SCC HES) and English Heritage.

23.4.6 On the HPC Development Site, non-intrusive site investigations were also carried out in order to identify previously unrecorded or undiscovered heritage assets (e.g. historic landscape features, buried archaeological remains). These surveys included:

- field reconnaissance survey (FRS) (Ref. 23.15) conducted in September 2008;
- assessment of the extant historic buildings on the Built Development Area West (Ref. 23.16) conducted in November 2008; and
- geophysical survey (Ref. 23.17 and Ref. 23.18) of Built Development Area West and the Southern Construction Area conducted October 2008 to May 2009.

23.4.7 These were followed by a programme of trial trenching carried out in the Built Development Area West and the Southern Construction Phase Area between November 2009 and April 2010 in order to characterise potential archaeological features identified by the non-intrusive site investigations (Ref. 23.19).

23.4.8 Following geophysical survey of selected test areas on Built Development Area East (which demonstrated that the area had been subject to previous disturbance which would have removed any remains of archaeological interest (Ref. 23.18)), it was agreed with SCC HES that no further archaeological investigation was warranted in this area.

23.4.9 The programme of trial trenching was designed in consultation with SCC HES. All work was carried out in accordance with the IfA's Standards and Guidance for Archaeological Field Evaluation (Ref. 23.12) and a Written Scheme of Investigation (WSI) for archaeological investigation (Ref. 23.20).

23.4.10 The aims of the archaeological trial trenching, defined in the WSI, were to:

- undertake trial trenching on areas of suspected archaeological remains identified by the geophysical survey;
- investigate and record all features of possible archaeological origin uncovered within the trial trenches;
- determine (where possible) the nature, depth, extent, character and date of any archaeological deposits or features;
- determine the likely range, quality and quantity of artefact and environmental evidence present; and
- inform the design of appropriate archaeological mitigation.

23.4.11 In addition to the above baseline surveys, various archaeological watching briefs were undertaken during geotechnical site investigations across the HPC

Development Site. The scope of the watching briefs was agreed with SCC HES and carried out in accordance with a WSI (Ref. 23.21).

23.4.12 The aims of the archaeological watching briefs were to:

- monitor mechanical excavation of topsoil and subsoil layers that could contain archaeological deposits; and
- identify and record any archaeological features, deposits, artefacts or other material uncovered during the proposed works.

23.4.13 The full list of identified archaeological and historical sites, features and finds identified within the 500m study area is presented in the gazetteer in **Appendix 23A**.

23.4.14 The locations of heritage assets identified within the HPC Development Site are shown on **Figure 23.4** and detailed in **Table 23.4** and **Table 23.5**.

23.4.15 The locations of designated sites within the wider 10km study area, whose settings may be impacted by the proposed development, are shown on **Figure 23.2** and **Figure 23.3** and are listed in the designated heritage assets gazetteer in **Appendix 23B**.

23.4.16 Designated sites beyond the HPC Development Site boundary were assessed through a combination of desk-based research and site visits. The results of this assessment are presented in a Setting Baseline report (Ref. 23.22).

23.4.17 Heritage assets within and in the vicinity of the Sandford Hill and Washford Cross highway improvements sites were also assessed through a combination of desk-based research and site visits, The areas of landtake for the proposed highway improvements are relatively small, and these areas, adjacent to the existing highway, are likely to have been subject to previous impacts associated with highways construction. The potential for buried archaeological remains to be encountered within the proposed areas of landtake for highway improvements is very, low and therefore it was agreed with SCC HES that further surveys were not required.

c) Consultation

23.4.18 Consultation has been undertaken throughout the EIA process and further information may be found in the **Consultation Report**.

23.4.19 Meetings were held with SCC HES to discuss all stages of the assessment, including the strategy for the archaeological surveys reported herein, and to determine appropriate mitigation.

23.4.20 In 2008, a site walkover was held with the County Archaeologist, the Development Control Archaeologist and the Senior Conservation Officer from SCC HES to discuss the strategy for mitigating impacts on the historic buildings and historic landscape features within the Built Development Area West.

23.4.21 It was agreed that the undesignated historic buildings (barns) within this area should be the subject of a historic buildings assessment, to be carried out by a recognised historic buildings specialist. The results and conclusions are summarised in the Historic Buildings section below (Ref. 23.16).

23.4.22 It was agreed with SCC HES in September 2008 that surviving historic landscape features, and in particular a historic track way occupying a prominent east/west ridge across the centre of the HPC Development Site (known as 'Green Lane'), should be considered to be important features. As a reflection of its longevity, physical survival and the contribution it makes to the historic landscape character of the HPC Development Site, it was considered that Green Lane should be assigned equal, or higher, value than archaeological remains and historic buildings within the assessment.

23.4.23 Meetings were held with English Heritage throughout the EIA process to discuss and agree the scope of the assessment, identify potential impacts on designated sites within the study area and inform the mitigation proposals (including landscaping). Site visits, both to the HPC Development Site and to certain designated assets within the wider study area (including the Fairfield Estate, East Quantoxhead Estate, Dodington Hall, Kilve Chantry and Orchard Wyndham Estate) were also undertaken.

23.4.24 It was agreed with English Heritage at a meeting in March 2010 that a **Monument Management Plan (MMP)** for the Scheduled Monument Wick Barrow should be put in place in order to mitigate any impact to the setting of the monument. Meetings were held with English Heritage and SCC HES on and off-site to discuss and agree the proposals. The MMP will be drafted to address the requirements of the relevant stakeholders.

23.4.25 A Historic Landscape Assessment of the Fairfield Estate (**D18, D19**) was requested by English Heritage in order to inform off-site planting proposed as mitigation (Ref. 23.23). Site visits to discuss this assessment with English Heritage were also undertaken.

d) Assessment Methodology

23.4.26 **Volume 1, Chapter 7** of this ES describes the assessment methodology for this EIA. In addition the following specific methodology was applied for the historic environment in the determination of receptor importance (value) (see **Table 23.1**) and of impact magnitude (see **Table 23.2**).

i. Value and Sensitivity

23.4.27 All of the heritage assets that may be impacted by the development have been assigned a level of importance (value) in accordance with those definitions set out in **Volume 1 Chapter 7** and with the historic environment definitions given in **Table 23.1.**

23.4.28 Assessment of the importance, or value, of heritage assets is based upon existing designations, the potential to contribute to the aims of SWARF (Ref. 23.14) and the criteria described in **Table 23.1**, which are based on the DMRB (Ref. 23.13).

23.4.29 As there are no internationally important sites within the study area (e.g. World Heritage sites), the DMRB category of "Very High Importance" has not been applied.

23.4.30 PPS 5 uses the phrase "*significance of a heritage asset*" to mean "*the value of a heritage asset*" (Ref. 23.5).

23.4.31 Sensitivity, with regard to the historic environment, is a subjective term which describes the potential for a heritage asset to absorb change. It reflects the current setting of an asset and the extent to which changes to that setting would affect the significance of the asset. The importance of a Scheduled Monument, for example, is always high (as shown in **Table 23.1**), regardless of its setting. The sensitivity of a Scheduled Monument in a developed or semi-urban environment would usually be lower than the sensitivity of a similar monument in a remote, or unspoilt, setting. Consequently, sensitivity has been taken into account in the assessment of impacts on setting.

23.4.32 Setting is defined in PPS 5 (Ref. 23.5) as:

23.4.33 *"the surroundings in which an asset is experienced. Its extent is not fixed and may change as the asset and its surroundings evolve. Elements of a setting may make a positive or negative contribution to the significance of an asset, may affect the ability to appreciate that significance or may be neutral."*

23.4.34 In terms of considerations which may affect setting, Paragraph 114 of the PPS 5 Practice Guide (Ref. 23. 5) states that:

23.4.35 *"The extent and importance of setting is often expressed by reference to visual considerations. Although views of or from an asset would play an important part, the way in which we experience an asset in its setting is also influenced by other environmental factors such as noise, dust and vibration; by spatial associations; and, by our understanding of the historic relationship between places."*

Table 23.1: Criteria Used to Determine Importance (Value)

Importance	Description
High	Ancient monuments scheduled under the Ancient Monuments and Archaeological Areas Act 1979, or archaeological sites and remains of comparable quality, assessed with reference to the Secretary of State's non-statutory criteria, as set out in DCMS Guidance on Scheduled Monuments, Annex 1 (Ref. 23.1). Historic buildings that can be shown to have exceptional qualities in their fabric or historical association (for example Grade I or II* Listed Buildings). Well preserved historic landscapes preserving visible elements from medieval or earlier patterns.
Medium	Archaeological sites and remains which, while not of national importance, fulfil several of the Secretary of State's criteria and are important remains in their regional context. Historic buildings that can be shown to have important qualities in their fabric or historical association (for example many Grade II Listed Buildings). Averagely well-preserved historic landscapes.
Low	Archaeological sites and remains that are of low potential or minor importance. Historic buildings of modest quality in their fabric or historical association. Historic landscapes with specific and substantial importance to local interest groups, but with limited wider importance.
Very Low	Buildings of no architectural or historical merit. Areas in which investigative techniques have produced negative or minimal evidence for archaeological remains, or where previous large-scale disturbance or removal of deposits can be demonstrated. Almost wholly modern landscapes created through the removal of historic boundaries.

ii. Magnitude of Impacts

23.4.36 The magnitude of impacts has been based on the consequence that the proposed development would have on the historic environment resource and has been considered in terms of high, medium, low and very low (see **Table 23.2**, adapted from DMRB (Ref. 23.13)).

23.4.37 Potential impacts have also been considered in terms of permanent or temporary, adverse (negative) or beneficial (positive) and cumulative.

Table 23.2: Guidelines for the Assessment of Magnitude

Magnitude	Impact
High	Complete removal of an archaeological site. Severe transformation of the setting or context of a designated heritage asset or significant loss of key components in a monument group.
Medium	Removal of a major part of an archaeological site's area and loss of research potential. Partial transformation of the setting or context of a designated heritage asset or partial loss of key components in a monument group. Introduction of significant noise or vibration levels to a designated site, increased traffic, and/or reduction in air quality leading to changes to amenity use, economic viability, accessibility or appreciation of an archaeological site. Diminished capacity for understanding or appreciation (context) of a designated heritage asset site.
Low	Removal of an archaeological site where a minor part of its total area is removed, but that the site retains a significant future research potential. Minor change to the setting of a designated heritage asset.
Very Low	No significant physical impact or change. No significant change in setting or context. No impact from changes in use, amenity or access.

iii. Significance of Impacts

23.4.38 The significance of the impact is judged on the relationship of the magnitude of impact to the assessed sensitivity and/or importance of the resource. The predicted significance of the impacts, without mitigation, is outlined in **Volume 1, Chapter 7.**

23.4.39 For the purpose of this assessment, mitigation measures have been proposed where there is an impact of greater than minor adverse significance and are appropriate given their magnitude, spatial scope and temporal nature.

e) Cumulative Impacts

23.4.40 **Volume 1, Chapter 7** of this ES sets out the methodology used to assess cumulative impacts. Additive and interactive effects between site-specific impacts are considered within this chapter. The assessment of cumulative impacts with other elements of the HPC Project and other proposed and reasonably foreseeable projects are considered in **Volume 11** of this ES.

f) Limitations, Assumptions and Uncertainties

23.4.41 Due to the presence of made ground within Built Development Area East, this area was not investigated by trial excavation. However, historic map evidence, aerial photographs and geophysical survey suggest that there is little, if any, potential for archaeological remains to survive on this part of the HPC Development Site.

23.4.42 Physical and ecological constraints posed by the trees and scrub that form the woodland plantations across Built Development Area West and the Southern Construction Phase Area and the presence of badgers within these areas prevented access for geophysical survey and trial trenching. As such, it has not been possible to determine whether archaeological remains recorded on the Built Development Area West extend into these wooded areas. It is assumed that any archaeological remains within the wooded areas would have been damaged when the trees were planted. Subsequent root action would also have disturbed any archaeological deposits, if present.

23.5 Baseline Environmental Characteristics

a) Introduction

23.5.1 This section presents the historic environment baseline for the HPC Development Site and study area. The information set out in this section is drawn from the Heritage Gazetteers presented in **Appendix 23A, Appendix 23B** and **Appendix 23C**, and the results of the archaeological trial trenching (Ref. 23.19).

23.5.2 Heritage assets have been assigned a unique identification number. These are referred to in the text in **bold**. The prefix **D** denotes an asset in the wider 10km study area and the prefix **H** denotes a heritage asset associated with the highway improvements at Washford Cross and Sandford Hill. The periods and dates used largely follow the terminology included in the Department for Transport's (DfT's) Transport Assessment Guidance (WebTag) Unit 3.3.9 The Heritage of Historic Resources (Ref. 23.24).

b) Study Area Description

23.5.3 The HPC Development Site and 500m study area are located in Stogursey Parish in West Somerset District in the County of Somerset.

23.5.4 The HPC Development Site is bounded to the north by Bridgwater Bay, from which it is separated by a low cliff. The village of Shurton is located to the south of the HPC Development Site. The land immediately to the east of the HPC Development Site is occupied by two existing power stations, Hinkley Point A and Hinkley Point B (known collectively as the Hinkley Point Power Station Complex). Land to the south of this complex forms part of the Bridgwater Bay Site of Special Scientific Interest (SSSI), and an area of flat, open, improved grassland. Land to the west of the HPC Development Site is farmland.

23.5.5 Generally from the village at Shurton, to the south of the HPC Development Site, the ground level climbs gently towards the coast from around 13m Above Ordnance Datum (AOD) up to a east-west ridge at a level of between 29m and 20m AOD. The ground then falls gently towards Holford Stream to the north which lies between 5m and 7m AOD, before climbing steeply to Green Lane running west to east at a maximum elevation of around 35m AOD. This feature generally forms the boundary between the Built Development Areas West and East and the Southern Construction Phase Area.

23.5.6 The ground then falls through several east-west trending undulations from Green Lane towards the coastal cliffs, which are at an elevation of around 15m AOD. The exception to this is the presence of a large spoil mound feature which is located towards the centre of the Built Development Area East. The mound has two main peaks at 24.5m AOD and 21.7m AOD with the area between forming a 'saddle' of land which is elevated relative to the surrounding area.

23.5.7 The general character is rural with the majority of the irregular fields given over to arable farming with some meadow used to graze cattle and a small amount of woodland.

23.5.8 A description of the geology of the HPC Development Site is presented in **Volume 2, Chapter 14**.

23.5.9 Detail on the wider 10km study area is provided in the "Historic Landscape" and "Settings of Designated Heritage Assets" sections below.

23.5.10 The highway improvements study areas are described in the "Washford Cross Highway Improvements" and "Sandford Hill Highway Improvements" sections, below.

c) Statutory Constraints

23.5.11 Within the HPC Development Site there are no Scheduled Monuments, Listed Buildings, Conservation Areas, Registered Parks and Gardens, Registered Battlefields or ancient woodlands.

23.5.12 There are a number of hedgerows that meet the archaeological and historical criteria of 'important' hedgerows as defined in the Hedgerow Regulations 1997 (**Figure 23.5**).

23.5.13 These hedgerows have existed for 30 years or more (Hedgerow Regulations 1997, criterion a) and are recorded in a document held at the County Record Office as an integral part of a field system pre-dating the Inclosure Acts, namely the 1614 Norton maps (Hedgerow Regulations 1997, criterion b).

23.5.14 Immediately outside of the HPC Development Site to the east there is one Scheduled Monument, Wick Barrow (**2**), also known as Pixies Mound (**Plate 23.1**). Wick Barrow dates from the Neolithic and Bronze Age periods and was partially excavated in 1907 (**Table 23.3**).

23.5.15 There are 37 Scheduled Monuments located within 10km of the HPC Development Site that fall within the Zone of Theoretical Visibility (ZTV, described in **Chapter 22** of this volume). These include Wick Barrow, immediately to the east of the HPC Development Site, Stogursey Castle and Stowey Castle (**Appendix 23B**).

Plate 23.1: Wick Barrow Scheduled Monument from the East

23.5.16 Within the 500m study area there are eight Listed Buildings, situated to the south of the HPC Development Site in the nearby village of Shurton. They are all Grade II Listed Buildings of medium importance.

Table 23.3: Statutory Designations within 500m of the HPC Development Site

ID	Name	Designation	Description	Importance
2	Wick Barrow	Scheduled Monument	Neolithic/Bronze Age round barrow, North Moor, Stogursey	High
42	Thatch End	Listed Building	17th century cottages with bridge over stream at entrance to south-east wing, Shurton, Grade II	Medium
43	Footbridge	Listed Building	18th century footbridge, 5m south-west of Thatch End, Shurton, Stogursey, Grade II	Medium
44	Fishers and Brookside	Listed Building	Late 16th/early 17th century farmhouse, Shurton, Stogursey, Grade II	Medium
45	Shurton Lodge and outbuilding	Listed Building	17th century house and outbuilding attached at south-east corner, Shurton, Stogursey, Grade II	Medium
46	Cottage	Listed Building	17th century cottage, 15m north of Shurton Lodge, Shurton, Grade II	Medium
47	Shurton Court and No.2 Shurton Court	Listed Building	Early 17th century farmhouse, Shurton, Grade II	Medium
48	Ash Cottage and Little Ash	Listed Building	16th century farmhouse, Shurton. Grade II	Medium
49	Shurton Mills	Listed Building	17th century mill owner's house, and attached outbuildings to north, Shurton, Grade II	Medium
	Historic hedgerows	Important under Hedgerow Regulations 1997	Surviving hedgerows that are depicted on 1614 Norton maps. Shown on map in **Figure 23.5**.	Low

23.5.17 There are five Grade I Listed Buildings within the 10km study area, including the Church of St Andrew in Stogursey and Court House at East Quantoxhead.

23.5.18 There are 26 Grade II* Listed Buildings within the 10km study area, including Fairfield House, Stogursey Castle and causeway bridge, and the remains of Stowey Castle keep (which is also designated as a Scheduled Monument).

23.5.19 There are 75 Grade II Listed Buildings within a 5km radius of the HPC Development Site, including the eight Listed Buildings in Shurton, mentioned above.

23.5.20 There are two Registered Parks and Gardens within the 10km study area at Fairfield and St Audries.

23.5.21 There are four Conservation Areas within the 10km study area; Holford, Stogursey, Nether Stowey and Spaxton and Four Forks.

23.5.22 There are no Registered Historic Battlefields within the 10km study area (Ref. 23.22).

23.5.23 With regard to the sites for highways improvements, there are no Scheduled Monuments, Listed Buildings, Conservation Areas, Registered Parks and Gardens, Registered Battlefields, historic hedgerows or ancient woodlands within the proposed site boundaries of Washford Cross or Sandford Hill.

23.5.24 There are nine Listed Buildings within 1km of the Washford Cross proposed site, including one Grade I and eight Grade II Listed Buildings. The Grade I Listed Cleeve Abbey (**H1**), a 12th century Cistercian abbey, is also a Scheduled Monument.

23.5.25 Within 1km of the Sandford Hill proposed site there is one Scheduled Monument, a medieval settlement (**H22**), and two Grade II Listed Buildings, Cokerhurst Farmhouse and Sandford Manor (**H26**).

d) Archaeological and Historical Background

23.5.26 The importance of the heritage assets within the study area have been assessed.

23.5.27 Detail on the heritage assets within the wider 10km study area is provided in the "Historic Landscape" and "Settings of Designated Heritage Assets" sections below. Detail on the heritage assets within the highway improvements study areas is provided in the "Washford Cross Highway Improvements" and "Sandford Hill Highway Improvements" sections, below.

23.5.28 Heritage assets within the HPC Development Site boundary are listed in **Table 23.4** and discussed below. The remainder of this section describes the archaeological remains by chronological period.

Table 23.4: Archaeological Sites and Historic Landscape Features within the HPC Development Site

ID	Name and Description	Designation	Importance
3	St Sidwell's Well – medieval (possibly Iron Age) well or spring west of Wick Barrow, North Moor	Undesignated	Low
4	Romano-British settlement – ditched enclosure, ring ditch, pits, post holes etc dating to 3rd – 4th centuries AD	Undesignated	Medium

ID	Name and Description	Designation	Importance
9	Water meadows – post-medieval catch meadow system west of Hinkley Point	Undesignated	Low
11	Water meadows – possible water meadow system north of Shurton	Undesignated	Low
12	Water meadows – possible water meadow system north of Shurton	Undesignated	Low
14	Possible limekiln – north of Knighton, largely destroyed due to cliff erosion	Undesignated	Low
25	Track way – east-west track way running along ridge shown on 1614 map (Green Lane)	Undesignated	Medium
31	Stone bridge – small stone bridge over drainage ditch between fields in north of Built Development Area West	Undesignated	Low
41	Remains of North Lane – ditch (*c* 4 m wide) at northern section of field boundary. A dip in the field to the north probably represents a continuation of the lane northwards	Undesignated	Low
50	Deserted farm, north of Shurton – Corner Farm shown on 1841 Tithe map and OS maps until 1983	Undesignated	Low
53	Stone wall built along Bum Brook – short stretch of stone wall built along north stream bank to prevent undercutting at southern boundary	Undesignated	Low
54	20th century accommodation camp – indistinct earthworks in north-east of site. Possible remains of accommodation block/camp from construction of power station in 1950s and 60s	Undesignated	Low
56	Canalised stream running east-west across Southern Construction Phase Area	Undesignated	Low
67	Romano-British settlement – ditched enclosures and settlement features, dating to 1st – 3rd centuries AD, possibly laid out on line of earlier Iron Age ditch	Undesignated	Medium
68	Middle-late Bronze Age Enclosure – penannular ditched enclosure, with south facing entrance, identified during geophysical survey	Undesignated	Medium
69	Middle-late Bronze Age deposit – large mid-late Bronze Age pottery assemblage (182 sherds) in a charcoal rich matrix	Undesignated	Medium
70	Early Bronze Age cremation – truncated remains of an early Bronze Age cremation	Undesignated	Medium
71	Possible Burnt Mound – truncated pits containing charcoal-rich deposits and fire-cracked stones	Undesignated	Low
72	Mid-late Iron Age settlement – heavily truncated traces of a ditched enclosure and ring ditch	Undesignated	Low
73	Medieval settlement – heavily truncated pits and boundary ditches containing 12th – 14th century – possible medieval precursor to Corner Farm	Undesignated	Low

i. Lower Palaeolithic – Upper Palaeolithic (pre 30,000 BP (Before Present) – 10,000 BP)

23.5.29 There are no recorded archaeological sites of these dates and no evidence for human occupation within the HPC Development Site boundary during this period.

ii. Mesolithic (10,000 BP – 4,500 BC)

23.5.30 Scatters of Mesolithic flints (**1**) were found during field walking in the northern part of the Built Development Area West in 1992, but no evidence for Mesolithic activity was recovered during trial trenching in this area.

iii. Neolithic (4,500 BC – 2,000 BC)

23.5.31 There are no recorded sites of Neolithic date within the HPC Development Site boundary.

23.5.32 Wick Barrow (**2**), a scheduled round barrow with origins in the late Neolithic period, is located 50m beyond the HPC Development Site boundary to the east.

iv. Bronze Age (2,000 – 700 BC)

23.5.33 There are no previously recorded sites of Bronze Age date within the HPC Development Site boundary.

23.5.34 During trial trenching, middle to late Bronze Age pottery was recovered from a shallow, linear feature (**69**) on the eastern edge of Built Development Area West (see **Figure 23.4**). The charcoal rich deposit also contained animal bone and shell. Although the nature of the deposited material suggests domestic activity no structures were identified in the vicinity of this feature.

23.5.35 The remains of a possible prehistoric burnt mound (**71**) were uncovered in the west of the Built Development Area West (see **Figure 23.4**). A small pit containing a single fragment of prehistoric pottery and a shallow pit containing heavily burnt and fragmented stone mixed with charcoal were recorded. The pits were less than 2m apart. Deposits of heat fractured stones, known as burnt mounds, are often interpreted as the remains of ritual sites (akin to a sweat lodge) or, more prosaically, as domestic cooking sites.

23.5.36 Further evidence for Bronze Age activity was recorded close to the southern boundary of the Southern Construction Phase Area (see **Figure 23.4**).

23.5.37 The truncated remains of an early Bronze Age cremation (**70**) were recorded in an area of later archaeological features spanning the Iron Age, Roman and medieval periods (see below).

23.5.38 A substantial ditched enclosure (**68**), approximately 50m in diameter, was previously identified from crop marks and geophysical survey in the south-west of the Southern Construction Phase Area (Ref. 23.15 and Ref. 23.18). Domestic refuse, comprising pottery sherds and butchered animal bone recovered from the fill of the enclosure ditch, suggest that the enclosure was built and occupied during the middle – late Bronze Age (Ref. 23.19.

23.5.39 Wick Barrow (**2**) was enlarged to over 25m in diameter during this period. Three secondary crouched burials were interred within the enlarged mound. One of the burials contained a bell-beaker, the second contained a necked-beaker and the third contained a necked-beaker and a flint knife-dagger. The pottery is typical of the Neolithic/Bronze Age transition phase known as the Beaker period.

v. Iron Age (700 BC – AD 43)

23.5.40 A shallow ditch of probable Iron Age date was excavated during the evaluation of a Romano-British settlement located in the north of the HPC Development Site (centre of the Built Development Area West) (**4**).

23.5.41 Residual Iron Age pottery and possible features of later prehistoric date were also recorded within an area of Romano-British features in the south-east of the Built Development Area West (see **Figure 23.4**). These sites are discussed below.

23.5.42 A possible ring ditch of mid-late Iron Age date and a possible ditched enclosure were recorded in the south-east of the Southern Construction Phase Area (**72**). The full extent of these features was obscured by later disturbance (Ref. 23.19).

23.5.43 St Sidwell's Well (**3**) located just within the eastern site boundary to the west of Wick Barrow (**2**), is a natural spring also known as St Sativolas' Well. During the medieval period it was believed to be a holy well with great healing powers and it is possible that this historical association may have its origins in the Iron Age. The presence of a "well" is inferred from documentary references and place-name evidence but no evidence for a well structure was recovered during archaeological excavations in 1907 (Ref. 23.25). As there is no evidence that St Sidwell's Well is anything other than natural it will not be discussed further.

vi. Roman (AD43-AD450)

23.5.44 A series of possible enclosures and settlement features (**67**) were identified by geophysical survey on the southern boundary of the Built Development Area West. Trial trenching demonstrated that the features in the western half of the site were geological in origin.

23.5.45 Roman pottery sherds and domestic refuse recovered from the backfilled enclosure ditches to the east, suggest that the site was occupied during the 1st to 3rd centuries AD. It is possible that the enclosures were laid out on the line of an earlier, Iron Age ditch, extending across the foot of the steep south-facing slope.

23.5.46 Undated features (**21**) recorded during the construction of a site compound adjacent to Wick Moor Drove, may be associated with a possible Romano-British settlement (**5**) identified by geophysical survey in 1996 (Ref. 23.26) on land east of the road and outside the site boundary.

23.5.47 A 3rd to 4th century Romano-British settlement (**4**) had been identified during previous archaeological investigations in the centre of the Built Development Area West.

23.5.48 Geophysical survey revealed a five-sided enclosure approximately 140m across with probable internal round houses. Trial trenching subsequently confirmed the presence of the enclosure ditches, a round house, occupation spreads, post holes, beam slots and pits (Ref. 23.27).

23.5.49 Fragments of Roman pottery recovered from the upper fills of earlier Iron Age features on the Southern Construction Phase Area suggest that this area was used as agricultural land once the Iron Age settlement went out of use (Ref. 23.19).

vii. Early-medieval (AD 450-AD1066)

23.5.50 There are no known sites of early medieval date within the HPC Development Site boundary.

23.5.51 It has been suggested that the settlement of Sedtammtone (**7**), recorded in the Domesday Book of 1086, may be located in the northern part of the HPC Development Site (centre of the Built Development Area West).

23.5.52 No indication of early medieval or medieval settlement was detected in this location during the field reconnaissance or geophysical surveys. No finds of this date were recovered during the trial trenching.

viii. Medieval (AD 1066-AD1540)

23.5.53 There are no recorded sites of medieval date, and there is no primary documentary evidence relating to land within the HPC Development Site boundary during the medieval period.

23.5.54 However it is probable that the representation of landscape features on the 1614 Norton maps date from the later medieval period, or earlier including the track way (**25**) and field boundaries/hedgerows (Ref. 23.28).

23.5.55 Medieval pottery fragments, of 12th to 14th century date, were recovered from a series of heavily truncated pits and ditches in the south-east corner of the Southern Construction Phase Area (**73**). It is likely that these represent the heavily disturbed remains of the medieval precursor to the deserted post-medieval farm, Corner Farm (**50**), which is described below.

ix. Post-medieval (AD1540 Onwards)

23.5.56 Within the HPC Development Site boundary much of the land may already have been enclosed by the beginning of the post-medieval period. The fields in the centre of the Built Development Area West were enclosed by 1614 in an early example of private enclosure (Ref. 23.28).

23.5.57 A building (**36**) is shown in the west of the Built Development Area West on the more detailed of the 1614 Norton maps (Ref. 23.28), but is not present on the 1794 map. This is likely to be the barn referred to in the fieldname Old Barn 7 acres (referred to as *12* on the 1794 map) (Ref. 23.29). Trial trenching recovered no evidence of this farm building.

23.5.58 The 1794 map shows approximately the same fields as the 1614 Norton maps, with added detail indicating the use of each field (Ref. 23.29).

23.5.59 The enclosure and amalgamation of strip fields was officially implemented in Stogursey Parish by the Stogursey Enclosure Bill of 1800 (Ref. 23.30). Some of the enclosure field boundaries have continued in use and are visible in the landscape today.

23.5.60 The site of Benhole Farm (**10**), in the west of the Built Development Area West, is recorded on the edge of Chilcott's 1794 map of Bullen Farm as Penhole (Ref. 23.29). The 1841 tithe map (Ref. 23.31) shows two buildings, the extant barn and, presumably, the farmhouse to the north-east. Another building is shown adjoining the south-west corner of the barn on the 1st Edition Ordnance Survey 6" map (Ref. 23.32).

23.5.61 Benhole Farm is recorded as having burnt down in 1952 and only the barn survives. Minor earthworks and fragments of brick and tile embedded in the soil were noted at this location during the walkover. Geophysical survey identified magnetic disturbance in the areas known to have been occupied by the former buildings of Benhole Farm and are likely to be indicative of the spread of building debris (Ref. 23.17).

23.5.62 A small, undated hearth structure was recorded to the north of Benhole during the trial trenching. A shallow gully uncovered to the west of the barn contained butchered cattle bone but no dating evidence.

23.5.63 There are several water meadow systems and associated drainage features on the Built Development Area West. The northernmost water meadow (**9**) stretches to the east and west of the Benhole Farm site (**10**). The fields have been ploughed during recent years and no signs are visible on the surface.

23.5.64 Another water meadow system (**12**) with drains and feeder channels lies further south and is visible as earthworks on aerial photographs.

23.5.65 Earthworks present in the same field represent disused field boundaries and possible platforms that are presently undated (**60**).

23.5.66 A small stone utilitarian bridge (**31**), of possible 19th century date, spans the drainage ditch separating two fields in the Built Development Area West.

23.5.67 Holford Stream, which runs through the Southern Construction Phase Area and the second water meadow system (**12**) has been canalised (**56**). It is not shown on the tithe map (Ref. 23.31), but is recorded on the 1st Edition Ordnance Survey (Ref. 23.32).

23.5.68 The site of a former lime kiln (**14**) in the north of the HPC Development Site (Built Development Area West) is described as a damaged mound 20m across in the Somerset Historic Environment Record (HER). The location was investigated during the field reconnaissance survey, but the mound had disappeared during erosion of the coastal cliff. A small mound of stone rubble survives at the top of the cliff. This site will therefore not be discussed further.

23.5.69 The site of a deserted farm (**50**) is recorded in the Southern Construction Phase Area. The earliest record of this is on the 1841 tithe map where it is referred to as "Corners" and includes a "house, barton and garden" and two orchards (Ref. 23.31).

23.5.70 Few signs of the deserted farm survive above ground; there are minor earthworks and crop differentiation and the geophysical survey identified magnetic anomalies that are probably related to the farmstead and orchards (Ref. 23.18).

23.5.71 A short stretch of stone wall (**53**) has been built along a section of the north bank of Bum Brook on the southern boundary of the Southern Construction Phase Area.

This was constructed to prevent further erosion of the bank at this point and may be of 20th century date.

23.5.72 An accommodation camp associated with the construction of Hinkley Point A and B (**54**); but which no longer survives, was situated on the Built Development Area East (Ref. 23.33). The northern half of this site is now a car park, but the field containing the southern half has earthworks that are probably the remains of former construction activity. As a result it is not anticipated that any archaeological resource remains in this area.

x. Undated Features

23.5.73 Possible archaeological features, identified through previous fieldwork within the HPC Development Site boundary, were investigated during the programme of trial trenching.

23.5.74 No evidence of a possible doubled-ditched enclosure (**64**) identified from the geophysical survey (Ref. 23.17), located in the north of the Built Development Area West, was recorded during the trial trenching (Ref. 23.19). A single undated ditch was uncovered in the east of this area.

23.5.75 No evidence was uncovered during the trial trenching (Ref. 23.19) of the possible enclosures (**35** and **65**) identified from the geophysical survey (Ref. 23.17), recorded to the east and south-west of the Romano-British settlement (**4**), in the Built Development Area West.

23.5.76 Similarly, there was little or no trace of the possible enclosures (**66**), interpreted as medieval field systems with a possible drove way leading to Wick Moor Drove.

23.5.77 The sites described above, and other undated features detected within the HPC Development Site boundary during the field reconnaissance surveys (Ref. 23.15) have been excluded from the assessment. Trial trenching and further investigation, suggests that they either did not survive or that they are geological rather than archaeological in origin. These include sites (**20**, **26**, **27**, **29**, **30**, **32**, **33**, **34**, **59**, **61**, **62 and 63**), see **Appendix 23A**.

e) Historic Buildings

23.5.78 There are three historic buildings within the HPC Development Site boundary on the Built Development Area West (**Table 23.5**).

Table 23.5: Historic Buildings within the Site Boundary

ID	Name and Description	Designation	Importance
10	Benhole Farm and Barn – Site of post-medieval farmstead largely destroyed in 1950s. Only a heavily altered barn remains north of Knighton, Stogursey	Undesignated	Low
22	Langborough Barn and linhay – Farm complex of two buildings, one of which is a substantial barn, within a courtyard	Undesignated	Low
23	Sidwell Barn – Extant barn and adjacent features relating to a now demolished barn	Undesignated	Low

23.5.79 The surviving historic buildings are Benhole Barn (**10**), Langborough Barn and linhay complex (**22**), and Sidwell Barn (**23**). None of these buildings are designated and are all considered to be of local importance (Ref. 23.15).

23.5.80 These buildings were the subject of the historic buildings assessment (Ref. 23.16) which concluded that:

> *'All three buildings are vernacular structures of late 18th or early 19th century date, displaying varying degrees of modification and historic survival. Visual inspection of the architectural details indicates that they were originally designed as cattle sheds.'*

23.5.81 The full description of the historic buildings on the HPC Development Site can be found in the Historic Building Assessment, Hinkley Point (Ref. 23.16).

23.5.82 Benhole Barn (**10**) is the only surviving building of a farm complex that was destroyed by fire in 1952 (see **Plate 23.2**).

Plate 23.2: Benhole Barn

23.5.83 Benhole Farm is referred to on the 1794 Chilcott map as Penhole, but the extant barn is not shown (Ref. 23.29). The barn is first depicted on the 1841 tithe map (Ref. 23.31). It was heavily altered in the 20th Century by the insertion of a milking parlour at its western end.

23.5.84 The original roof has been lost and Benhole Barn now has a corrugated asbestos roof supported by 60mm galvanised steel piping forming king post trusses placed upon an Ordinary Portland Cement (OPC) concrete lift at eaves level (Ref. 23.16).

23.5.85 Langborough Barn and linhay form a small complex of two farm buildings (**22**) arranged around a walled courtyard. Both buildings are constructed of lias rubble with timber-framed roof structures covered by Bridgwater pantiles (see **Plate 23.3**).

23.5.86 A substantial open fronted lean-to extension has been built in stone along the south elevation of the larger building. The western third of the roof of Langborough Barn has collapsed as has the eastern two-thirds of the lean-to.

23.5.87 The larger Langborough Barn is visible on both the 1794 Chilcott map of Stogursey (Ref. 23.29) and the 1841 tithe map (Ref. 23.31). Both the barn and linhay are visible on the 1st Edition Ordnance Survey (Ref. 23.32).

Plate 23.3: Langborough Barn

23.5.88 Sidwell Barn (**23**) is constructed of lias with a half-hipped, timber framed, pan-tiled roof that has an asymmetrical pitch (Ref. 23.16) (**Plate 23.4**).

23.5.89 Sidwell Barn is shown on the 1841 tithe map (Ref. 23.31), but on the 1st and 2nd Edition Ordnance Survey maps (Ref. 23.32 and Ref. 23.34), there is a second building adjoining the first with both standing within a compound.

Plate 23.4: Sidwell Barn

f) Historic Landscape

23.5.90 The HPC Development Site lies within Landscape Character Area 146: Vale of Taunton and Quantock Fringes (Ref. 23.35), described as lowland, mixed farming landscape, with dense hedges, sparse woodland and scattered villages, hamlets and farmsteads linked by winding lanes.

23.5.91 The historic landscape of the wider study area extends from the Quantock Hills to the west and encompasses the mouth of the River Parrett to the east.

23.5.92 Surviving earthwork monuments, including barrows, cairns and hillforts attest to intensive utilisation of the Quantocks during the prehistoric period. Scheduled Monuments located further to the east, including Wick Barrow (**2**, Pixies Mound) and Cynwit Castle hillfort (Cannington Camp, **D1**) indicate that prehistoric settlement and ritual activity was not confined to the higher ground of the Quantocks.

23.5.93 The mixed farming landscape described above preserves elements of the medieval landscape. Stogursey, Shurton, Knighton, Burton, Wick and Stolford, are all mentioned in the Domesday Book of 1086. The remains of the motte and bailey castle (**D20**) dominate the settlement at Nether Stowey. There are also surviving earthwork remains of the medieval castle at Stogursey (**D13**) and just beyond the 10km study area to the east of the River Parrett at Down End. The remains of the medieval manor house at Kilve, (known as Kilve Chantry) and the medieval remains of the chapel at Adscombe (**D24**) are also Scheduled Monuments.

23.5.94 Three large estates – Fairfield, East Quantoxhead and, just beyond the 10km boundary, Orchard Wyndham, dominate much of the landholding to the west of the HPC Development Site. Within the 10km study area there is a substantial amount of land owned by the Fairfield and East Quantoxhead estates which has been designated as land of outstanding scenic interest, including land immediately to the west of the HPC Development Site.

23.5.95 The earliest record of a manor house at Fairfield dates to the 12th century. Fairfield House (**D18**), a Grade II* Listed Building dating from the 16th century, lies at the centre of the Fairfield Estate, which occupies a large part of the area between the HPC Development Site and the Quantocks. The house sits within a Registered Park and Garden (**D19**) comprising gardens, parkland and woodland known as the Great Plantation. There are parcels of Ancient Woodland within the estate to the west of the HPC Development Site.

23.5.96 There are 75 Grade II Listed Buildings within the 5km study area, many of which date from the 18th-19th centuries. Many of these are located within the Conservation Areas at Spaxton and Four Forks (**D10**), Stogursey (**D17**) Nether Stowey (**D23**) and Holford (**D38**).

23.5.97 Elements of the medieval landscape, including strip fields and ridge and furrow earthworks, survive within the study area. Traces of the medieval field pattern are discernible in surviving hedgerows, field boundaries and green lanes, but the majority of the field pattern reflects agricultural intensification during the 19th and 20th centuries following the Inclosure Act of 1800. The small hamlets in the vicinity of the site, including Stolford, Wick and Otterhampton to the east and south-east, and Shurton, Burton and Knighton to the south and west, preserve elements of post-medieval estate planning.

23.5.98 The existing Hinkley Point Power Station Complex, built in the 1950s and 1960s, introduces an industrial element into the predominantly rural landscape. This occupies an area of *c.*60ha, and lies immediately to the east of the HPC Development Site boundary.

23.5.99 The HPC Development Site itself is made up of recently enclosed irregular arable fields broken by anciently enclosed, low-lying meadow land cut by streams.

23.5.100 The Somerset Historic Landscape Characterisation (HLC) (**Figure 23.6**) describes the majority of fields within the site boundary as recently enclosed land of a 17th – 18th century date (**HLC3**-**HLC5**). The 1614 map (Ref. 23.28) indicates that the fields in area **HLC4** in the Built Development Area West were already enclosed by the early 17th Century and could possibly be described as anciently enclosed pre-17th Century fields.

23.5.101 An east to west band of fields across the southern part of the Built Development Area West has been identified as anciently enclosed land pre-17th century (**HLC2**). The northern boundary of this HLC is the east to west trackway, Green Lane (**25**). The southern boundary is formed of a second east to west boundary running parallel to the first. **HLC2** is reminiscent of co-axial field systems found elsewhere in the South West and may possibly date to the Bronze Age (Ref. 23.36).

23.5.102 The Somerset HLC indicates that there has been 25-50% boundary loss within the HPC Development Site boundary with over 50% in some areas presumably as a result of agricultural intensification. Some of these lost field boundaries (**32** and **33**) are visible as slight earthwork banks.

23.5.103 Surviving field boundaries within the site boundary are usually formed of a hedge on a bank commonly with a drainage ditch. Many of these boundaries are shown on the 1614 and 1794 maps (Ref. 23.28 and Ref. 23.29), indicating that they pre-date the official Stogursey Inclosure Act of 1800.

23.5.104 Under the Hedgerow Regulations 1997 all the surviving hedgerows shown on the 1614 and 1794 maps are deemed 'important' hedgerows (**Figure 23.5**).

23.5.105 The most prominent historic landscape feature is an east-west trackway, Green Lane (**25**) that is depicted on all historic maps of the study area dating back to 1614 (**Plate 23.5**).

23.5.106 Green Lane follows a sinuous course for over 2.5km (1.5 miles), crossing the Built Development Area West, and terminating as a field boundary at ST 184 453. The section of Green Lane crossing the HPC Development Site is *c.* 1.1km (*c.* ¾ of a mile) and occupies a well defined ridge at *c.* 30m AOD to a maximum of 35m AOD.

23.5.107 A substantial hedge survives along most of the southern side of Green Lane and there is a shorter stretch of hedge along its northern edge that continues for approximately 200m.

Plate 23.5: The Trackway, 'Green Lane', from the West

23.5.108 The hedges have been removed at the eastern end of the Green Lane, which appears to have been re-laid along a slightly different alignment during the 20th century (Ref. 23.37).

23.5.109 North Lane (**41**) is a probable drove way that no longer exists, but once ran north-south through the Southern Construction Phase Area from Shurton onto the meadowland surrounding the canalised stream (**56**). This is shown on the tithe map (Ref. 23.31) and on Ordnance Survey maps into the late 20th and early 21st centuries (Ref. 23.37).

23.5.110 North Lane survives only as a section of 4m wide ditch (**41**) contained in a field boundary and as a linear depression which was detected by geophysical survey (Ref. 23.18).

g) Setting of Designated Heritage Assets

23.5.111 It was identified that 70 designated heritage assets lie within the 10km ZTV comprising: 37 Scheduled Monuments; five Grade I Listed Buildings; 22 Grade II* Listed Buildings; two registered parks and gardens; and four Conservation Areas. In addition, 75 Grade II Listed Buildings lie within the 5km ZTV (**Appendix 23B**). Five of the Scheduled Monuments are also Grade II* Listed Buildings.

23.5.112 The setting of a heritage asset is not considered important in its own right. The importance of setting is the contribution it makes to the significance (value) of a heritage asset.

23.5.113 It has been assessed that of the 145 designated heritage assets considered, the settings of two Scheduled Monuments and two Grade II Listed Buildings do not contribute to the significance (value) of the heritage asset. These are the settlement south-east of Cannington Park (**D2**); the chapel east of Adscombe farm (**D24**); St. Andrew's Well in Stogursey (**D104**); and the dovecote in Stogursey (**D105**). They would have the same significance (value) whatever their setting was. Therefore these four heritage assets will not be discussed further.

23.5.114 Of the remaining 141 designated heritage assets, it has been determined that for 109 assets the HPC Development Site does not form part of that setting, for a number of reasons.

23.5.115 The HPC Development Site does not form part of setting for many of these assets due to the ZTV being based on a bare earth model without trees and buildings. During the site visits to certain heritage assets it was identified that such above ground features prevent the HPC Development Site from being a part of the setting. This was the reason why the HPC Development Site is not a part of the setting for Cynwit Castle (Cannington Camp, **D1**), and Church of All Saints, Otterhampton (**D3**). The other heritage assets where the HPC Development Site does not form a part of their setting are: **D5**; **D7**-**D16**; **D21**-**D23**; **D25**-**33**; **D35**-**D38**; **D40**-**D42**; **D71**; **D79**; **D80**; **D83**; **D87**-**D103**; **D106**-**D116**; **D132**-**136**; and **D138**-**D145**.

23.5.116 A number of heritage assets are on the boundary of the ZTV. In this situation the heritage assets were included within the site visits as a precaution. However, site visits subsequently showed that the HPC Development Site was not a part of the setting for a number of barrows and cairns in the Quantock Hills, including: **D44**-**D46**; **D54**; **D58**; **D59**; **D64**-**D66**; and **D69**.

23.5.117 While the HPC Development Site is visible from a number of the heritage assets, it does not form a part of their setting in the same way that the existing Hinkley Point Power Stations are not a part of their setting. This is generally because their setting is more localised or is focussed away from Hinkley Point. These include: **D4**; **D6**; **D20**; **D34**; **D72**-**78**; **D81**, **D82**; **D84**-**D86**; **D117**-**D121**; and **D137**.

23.5.118 As the HPC Development Site does not form part of the setting of these 109 heritage assets, they will not be discussed further.

23.5.119 The remaining 32 designated heritage assets within the 10km ZTV do have the HPC Development Site as a part of their setting, and their setting does contribute to their significance (value).

23.5.120 Wick Barrow (**2**, Pixies' Mound) is discussed in the Statutory Constraints section above, only its setting is discussed here.

23.5.121 Wick Barrow is located within 500m of the existing Hinkley Point Power Station Complex. The main access road to the Complex (Wick Moor Drove) is less than 100m away and separates the monument from the farmland to the west.

23.5.122 The monument is located below the ridgeline of a south-facing slope overlooking Wick Moor, which is crossed by overhead power lines leading from the Hinkley Point Nuclear Power Station Complex to the north of the monument. Wick Barrow would have been designed to be visible from the south, south-west and south-east, but the current boundary treatments, with the County Wildlife Site to the north and east, effectively encloses the monument on these sides.

23.5.123 The agricultural landscape to the west of Wick Moor Drove retains elements of an earlier medieval landscape but the majority of fields within the site are described as recently enclosed land of 17^{th} to 18^{th} century date in the Somerset Historic Landscape Characterisation (HLC). The current setting of Wick Barrow reflects post-medieval agricultural practices associated with the development of the Fairfield Estate to the west. The immediate setting of Pixies Mound is dominated by the industrial development of the existing Hinkley Point Power Station Complex to the north, but the monument retains its connection with Wick Moor to the south-east (**Plate 23.6**).

Plate 23.6: Wick Barrow from the North with Wick Moor in the Background.

23.5.124 Eight Grade II Listed Buildings **(42-49**) are located in Shurton and are described in **Table 23.3**. Shurton is a small settlement in a rural location. All of the Listed Buildings in Shurton are located on the southern side of the settlement. The Hinkley Point Power Station Complex is visible to the north-east across the arable fields of the HPC Development Site and low-level operational noise is occasionally audible.

23.5.125 The Baptist Chapel (**D130**) and the adjoining Manse (**D131**) are both Grade II Listed Buildings set in the quiet rural hamlet of Burton. The Manse dates from the late 18th century while the chapel was built in 1833.

23.5.126 Burton comprises scattered buildings laid out along either side of a no-through road. The hamlet is surrounded by agricultural fields with Honibere Wood to the west and small, scattered plantations on the rising land to the north-west. The rolling landscape to the north and north-east extends to the Bristol Channel coastline.

23.5.127 The local topography and thick hedges mask views of the existing Hinkley Point Power Station Complex at ground level from a number of locations along the track through Burton, but the Hinkley Point Power Station Complex is a feature on the horizon across the fields to the north-east. Low-level operational noise is occasionally audible from Burton.

23.5.128 Stogursey Conservation Area (**D17**) covers the centre of Stogursey Village (**Plate 23.7**). It is a rural village containing numerous Grade II Listed Buildings as well as the Grade I Listed Church and the scheduled village cross. These buildings are all in a rural village setting with appropriate noise and air quality levels to such a situation.

Plate 23.7: Stogursey High Street, the Core of the Conservation Area (**D17**) from the East

23.5.129 Views from buildings facing into the village are predominantly of other buildings, gardens and the nearby roads. Views from buildings looking out into the wider landscape beyond the village are of rolling fields with small patches of woodland crossed by hedgerows and country lanes.

23.5.130 Views to the coast are largely obscured by low hills, but there are restricted views of the Hinkley Point Power Station Complex from certain locations along Shurton Lane in the north of the village.

23.5.131 Fairfield House (**D18**) is a Grade II* Listed manor house with medieval origins set within extensive grounds that are Grade II on the National Register of Parks and Gardens (**D19**) (**Plate 23.8**). The house was rebuilt in the late 16th century when much of the earlier building was demolished. Further additions and alterations were made during the late 18th and early 20th centuries.

Plate 23.8: Fairfield House (**D18**) and Park (**D19**) from the South-East

23.5.132 Fairfield House is set within a planned landscape in a rural setting that has been developed and altered over centuries by the owners. The grounds contain a variety of gardens, parkland and areas of woodland that eventually lead into an agricultural landscape.

23.5.133 There are extensive views from the house and grounds into the wider area with views towards the nearby village of Stogursey, Stogursey School, the Quantocks and to the coast.

23.5.134 Certain outlooks to the north-east from the house and grounds contain views of the Hinkley Point Power Station Complex. There are glimpsed views of the Hinkley Point Power Station Complex through gaps in the hedgerows alongside the approach to the house from the east. Low-level operational noise and occasional alarms can also be heard at Fairfield.

23.5.135 Court House (**D39**) at East Quantoxhead is a Grade I Listed Manor House situated in a quiet rural setting close to a small village with nearby footpaths leading northwards through a rolling landscape to the coast (**Plate 23.9**).

Plate 23.9: Court House (**D39**) at East Quantoxhead from the North-East

23.5.136 Court House occupies a prominent position with grounds extending beyond the immediate environs of the house. Certain outlooks from the gardens, in particular from the tennis lawn, look out across the coast to the east with far-reaching views that include the Hinkley Point Power Station Complex.

23.5.137 The Quantocks are the location of many prehistoric sites, in particular barrows and cairns that have been dated to the Bronze Age. Not all of these are positioned on the highest points of the hills as there are numerous examples of burial mounds located on the hill slopes facing both to the east and the west.

23.5.138 The Quantock Hills are relatively remote from modern settlements and are generally quiet and peaceful. On clear days it is possible to have views over the River Parrett floodplain, Bridgwater Bay and the Bristol Channel that stretch across to south Wales. On other days, dense fog can severely limit the ability to see any distance at all from the Quantock Hills.

23.5.139 The Quantock Hills are predominantly open heathland with some woodland. The heathland is used for grazing sheep and occasionally horses. The land is open-access meaning that people can walk freely across the area. There are usually very few motorised vehicles using the heathland tracks on the Quantock Hills. However, on certain occasions, such as drag hunts, there can be a large number of off-road cars on the heathland slopes.

23.5.140 A number of these cairns and barrows have views towards the coast to the north-east which include Hinkley Point. These include Hurley Beacon (**D43**); two barrows or cairns (**D47**) positioned on the northern arm of Longstone Hill; four Bronze Age bowl barrows and a small cairn (**D48**-**D52**) on the slopes of Thorncombe Hill; a cairn located at the western end of Longstone Hill (**D53**); three cairns on Beacon Hill (**D55**-**D57**); two cairns on Thorncombe Hill (**D60**, **D61**); two barrow groups on Black Hill (**D62**, **D63**); and a large platform cairn on Higher Hare Knap (**D67**).

23.5.141 The earthwork remains of an Iron Age hillfort, known as Dowsborough Camp, and an associated Bronze Age bowl barrow (**D68**) are recorded on Dowsborough Hill. The hillfort is described as a univallate hillfort with a nearly complete counterscarp bank. The rampart and ditch encloses an oval area of approximately 2 hectares at the summit of the hill with an entrance at the eastern end.

23.5.142 The dense woodland planting on the slopes and summit of the hill disguise the nature of the monument and overwhelm the interior of the hillfort. There is little or no impression of the power of place from the interior of the hillfort. Its commanding position is more easily discernible from the hills to the west.

23.5.143 There are limited views out from Dowsborough Camp. A viewing platform, created by a small clearing at the north-western end of the earthworks, allows limited views to the north. The Hinkley Point Power Station Complex is clearly visible on the horizon.

h) Foreshore and Intertidal Zone (see also Chapter 24)

23.5.144 Bridgwater Bay, especially the Steart Point mudflats, contains a large number of wooden stake fish weirs, some of which have been dated by dendrochronology to the end of the early-medieval period. Fish weirs continued to be used on the intertidal mudflats during the medieval period.

23.5.145 Increased use of fertilizers, from the later 16th century onwards, had an increasing effect on the local area as coal was imported from Wales in order to fuel the lime kilns necessary for fertilizer production. A possible coal landing point was located to the east of the HPC Development Site at Burton Quay.

23.5.146 A dry dock, *c.* 80 to 100m wide and surrounded by sheet piles, was excavated on the foreshore area in the late 1950s to allow construction of the water intake structure for Hinkley Point A. The water intake structure was floated out to sea on a high tide to its current location. The dock was then backfilled with unknown materials (Ref. 23.38).

23.5.147 A foreshore survey (undertaken in June 2010) confirmed that there are no archaeological remains above the Mean High Water Springs (MHWS) (Ref. 23.39).

i) Washford Cross Highway Improvements

23.5.148 Within the Washford Cross proposed site boundary there are three recorded heritage assets (**Figure 23.9**). Two of these are records of the 18th century Minehead to Nether Stowey turnpike road (**H6**) and the Watchet to Skilgate turnpike road (**H7**). These were on the same alignment as the modern A39 and B3190 roads. Due to the modernisation of these roads little, if anything, remains of the original turnpike roads other than the route.

23.5.149 A late 18th century milestone (**H5**) has been recorded in a ditch adjacent to the modern junction of the A39 and B3190. This milestone is constructed of sandstone and cast iron and had been broken prior to 1989 when it was recorded in the HER. The milestone is not in its original position.

23.5.150 Within the study area for Washford Cross there are nine designated heritage assets and five undesignated heritage assets (**Figure 23.9**).

23.5.151 Cleeve Abbey, a Scheduled Monument and Grade I Listed Building (**H1**), is located at the south-western extent of the study area. This Cistercian abbey, founded in AD

1198, has been described as the best preserved and most complete example of its type in southern England. Notable features include the 15th century oak roof of the refectory and the 13th century recess within the central cloister. The church is the oldest stone building on the abbey site, begun in 1200 and completed by the middle of the 13th century.

23.5.152 A medieval to post-medieval deserted settlement (**H2**) is located east of Lower Washford village. Fragmentary remains of possible tofts appear on the north and south of the modern road while ridge and furrow, bounded to the south by a possible hollow way, is visible surrounding Washford Farm. An associated quarry is sited along the ridge to the south-east of High Washford Farm and may be linked by a hollow way.

23.5.153 Bardon Farmhouse (**H3**) is a Grade II Listed Building dating from the 16th century located to the south-west of the Washford Cross site.

23.5.154 A Grade II Listed milestone (**H4**) dating to the late 18th to early 19th century is located alongside the A39 (which, as described above, was originally the 18th century turnpike road between Minehead and Nether Stowey).

23.5.155 Other Grade II Listed Buildings within the study area include the stables and granary (**H8**), a range of farmbuildings (**H9**), and a barn (**H10**) at Washford Farm. A Methodist chapel (**H11**) and a linhay (**H12**) are also Grade II Listed. These five buildings all date to the 18th or 19th century and are located in Washford on the western edge of the study area.

23.5.156 The BBC radio transmitter centre building (**H13**) dates to 1933 and is Grade II Listed. The radio station was designed by architects Wimperis, Simpson and Guthrie. The land surrounding the transmitter centre building, which is now occupied by the Tropiquaria amusement park, is also recorded in the HER (**H14**).

23.5.157 Various undated cropmark enclosures (**H15**, **H16**, **H17**) have been identified in the fields surrounding the proposed site.

23.5.158 The Somerset HLC has classified the majority of the proposed site and the land to the south, east and north-east as 'Anciently Enclosed Land pre-17th century' and the area to the north-west as 'Recently Enclosed Land 17th to 18th century'. Neither of these HLC areas would be impacted by the highway improvements and therefore they will not be discussed further.

j) Sandford Hill Highway Improvements

23.5.159 Within the Sandford Hill proposed site boundary there are two recorded heritage assets (**Figure 23.10**). The 18th century Nether Stowey to Ashcott turnpike road (**H24**) is recorded as running through Cannington, along the A39 to the Sandford Hill junction and then along Sandford Hill to Wembdon. Due to modernisation, little, if anything, remains of the original turnpike road other than the alignment.

23.5.160 The second record is the site of a tollhouse (**H23**) associated with the turnpike road and originally located at the western corner of the junction. There are no identifiable remains of this building.

23.5.161 Within the 1km study area for the Sandford Hill highway improvements, there is one Scheduled Monument, a deserted medieval settlement (**H22**), and two Grade II Listed Buildings, Cokerhurst Farmhouse (**H25**) and Sandford Manor (**H26**). There are also nine undesignated heritage assets recorded (**Figure 23.10**).

23.5.162 The Scheduled Monument is a deserted medieval village (**H22**) approximately 250m south of the Sandford roundabout, along the A39 Quantock Road. The settlement, comprising a village, is believed to have existed at the time of the Norman Conquest. It is mentioned in the Domesday Survey as the land of Roger de Corcelle, tenanted by Ralph, and worth 30 shillings. Investigations of the earthworks suggest a street remaining as a hollow-way, several house platforms or farm sites and a large ditched enclosure, probably the manorial site. There is also a large bank and ditch in surrounding fields, interpreted as the village boundary bank. The decline and desertion of the village is considered to be due to economic reasons.

23.5.163 Cokerhurst Farmhouse (**H25**), a Grade II Listed Building, is situated at Wembdon Hill on the eastern boundary of the Sandford Hill study area. It is believed to date from the 15th century with later 16th, 19th and 20th century alterations.

23.5.164 Sandford Manor House (**H26**), also Grade II Listed, is situated approximately 150m south of the Sandford Hill junction. The manor house is 16th century in origin (inscribed 1570) with some 19th century alterations. It is believed to be the former manor house of the Manor of Sandford.

23.5.165 To the north-west of the Sandford Hill site, the Somerset HER indicates that a number of archaeological features were identified in close proximity to one another. A possible Mesolithic flint core and other worked flints (**H18**), of Mesolithic to Early Neolithic date, were recovered from a large north-west to south-east aligned ditch. A curvilinear ditch (**H19**), dating to the middle Bronze Age may have formed a circular enclosure. It was cut by two parallel ditches defining a north-south aligned trackway. A singular sub-circular pit in the vicinity produced a moderately large quantity of middle Bronze Age pottery, a number of worked flints and charred plant remains, identified as barley, wheat and grass seed. An Iron Age to Roman post hole and a truncated section of ditch (**H20**) were found close to the Bronze Age ditch.

23.5.166 An early medieval inhumation cemetery (**H21**) was excavated in Wembdon, on the easternmost edge of the Sandford Hill study area.

23.5.167 Chilton Trivett Park (**H27**) encompasses the central northern portion of the Sandford Hill study area. It is believed to have originated in the post-medieval period.

23.5.168 There are four cropmark sites within the Sandford Hill study area which remain undated. These include two sites in the vicinity of Perry Green in the north of the study area. The cropmarks south-west of Perry Green comprise a rectangular, single ditched enclosure (**H28**) and those to the west may be another enclosure (**H29**).

23.5.169 Another undated cropmark enclosure has been recorded at Sandford Hill (**H30**) in the east of the Sandford Hill study area and near Cannington on the northern edge (**H31**) is a cropmark of a sub-rectangular enclosure joined at the corner to a triangular enclosure.

23.5.170 The Somerset Historic Landscape Characterisation (HLC) has classified the majority of the landscape in the south and east of the Sandford Hill study area as Recently

Enclosed Land. This is land that has been predominantly enclosed during the 18th to 21st centuries, sometimes as early as the 17th century. Generally it has been determined that there has been less than 50% boundary loss across this area during the last 100 years. This HLC area would not be impacted by the highway improvements proposed at Sandford Hill and therefore it will not be discussed further.

k) Previous Impacts

23.5.171 The Built Development Area East was altered in 1957 when work began on the Hinkley Point A power station. Further alteration occurred in 1967 when work commenced on Hinkley Point B power station.

23.5.172 The construction of the power stations greatly affected the immediate area surrounding the two facilities. Temporary works, including an accommodation camp, installations of lifting equipment and an off-shore loading facility, would have impacted upon any archaeological remains in these areas.

23.5.173 During the construction phase for the Hinkley Point A power station, part of the Built Development Area East was used for an accommodation camp (**54**) (Ref. 23.33).

23.5.174 Construction of the dry dock, to allow construction of the water intake structure for Hinkley Point A, would have removed a large part of the foreshore area (Ref. 23.38).

23.5.175 Other areas to the west of Hinkley Point A power station were used during its construction phase and subsequently as a waste transfer station (Ref. 23.40).

23.5.176 These activities have resulted in the removal of historic field boundaries and would have destroyed any remains of archaeological interest that were present.

23.5.177 Some of the wooded areas in the Built Development Area East appear to have been left untouched by the construction possibly allowing archaeological remains to survive in these areas.

23.5.178 The majority of the Built Development Area West and Southern Construction Phase Area have remained in agricultural use. Therefore, successive phases of ploughing would have impacted upon earthworks above ground and shallow archaeological features close to the ground surface.

23.5.179 Agricultural intensification has resulted in significant boundary loss during the last 100 years, although a number of historic landscape features survive within the site boundary.

23.5.180 Other impacts include the fire that destroyed Benhole Farm (**10**) in 1952, the alterations to the eastern end of the track way (**25**) and the creation of a compound adjacent to Wick Moor Drove for use during the geotechnical site investigations undertaken in 2008.

23.6 Assessment of Impacts

a) Construction Impacts

23.6.1 This section describes the impacts on the historic environment that would occur during the construction phase of the HPC Development both within the site boundary and in the ZTV up to 10km. A general description of the construction phase is contained in **Chapter 3** of this Volume. A summary of the assessment of impacts and their significance is provided in **Table 23.6**.

i. On-site Heritage Assets

23.6.2 Topsoil stripping, site levelling, fencing, vegetation clearance and planting would take place across the site during the construction phase. These activities would impact adversely on any surviving sub-surface archaeological remains.

23.6.3 All topsoil and up to 500mm subsoil (where present) would be removed from areas to be used for excavations, levelling or stockpiling during the construction phase.

23.6.4 Topsoil stripping would expose archaeological remains below ground within the HPC Development Site. Rutting and ground compaction, arising from vehicle movements, would also result in a permanent impact of high magnitude to any buried archaeological remains prior to the implementation of mitigation.

23.6.5 The Romano-British settlement (**4**) to the south of Benhole Farm and the earlier Romano-British settlement (**67**) in the east of the HPC Development Site are considered to be of medium importance. Topsoil stripping and site levelling would result in the destruction of these heritage assets. The impact magnitude is therefore assessed as high, permanent and the impact significance is **major adverse**.

23.6.6 Boundary ditches and features associated with the Romano-British settlement (**4**) may extend beneath a rectangular plantation to the east of the settlement in the centre of the Built Development Area West. The removal of the trees would impact any archaeological features in this plantation, but this would be of lower magnitude and significance than the major adverse significance of impact caused by the topsoil stripping.

23.6.7 The Romano-British settlement (**67**) would also be impacted by the construction of the fencing installed to enclose and secure the HPC Development Site. These fences, a simple timber post and rail fence and an inner 2.14m high chain link construction (security) fence, would run along the southern edge of the settlement. The works to auger the post-holes and erect the fence would impact the buried archaeology along this line. However these works would be of lower magnitude and significance than the major adverse significance of impact caused by the topsoil stripping.

23.6.8 The Bronze Age pottery assemblage in a charcoal rich matrix (**69**) in the centre of the HPC Development Site is considered to be of medium importance. Topsoil stripping and site levelling would result in the destruction of this asset. Consequently, the impact is assessed as high, permanent magnitude and is of **major adverse** significance.

23.6.9 The middle to late Bronze Age enclosure (**68**) and the early Bronze Age cremation (**70**) in the southernmost part of the HPC Development Site are also considered to be of medium importance. Topsoil stripping and site levelling would result in the destruction of these heritage assets and has therefore been assessed as high, permanent magnitude with **major adverse** significance.

23.6.10 The possible burnt mound (**71**) in the west of the HPC Development Site is considered to be of low importance. Topsoil stripping and site levelling would result in the destruction of this asset. The impact magnitude is assessed as high, permanent and the impact significance **moderate adverse**.

23.6.11 This burnt mound (**71**) would also be potentially impacted by the construction of the fencing installed to enclose and secure the HPC Development Site. The fence would run near to the western edge of the heritage asset. Works to auger the post-holes and excavate the threshold have the potential to impact on any buried archaeological remains along the alignment of the security fence. However these works would be of lower magnitude and significance than the moderate adverse significance of impact caused by the topsoil stripping.

23.6.12 The mid-late Iron Age ring ditch and ditched enclosure (**72**) and the heavily disturbed medieval settlement remains (**73**) recorded in the south-east of the SCPA had been truncated by later disturbance including the post-medieval Corner Farm (**50**), see below. Topsoil stripping and site levelling would result in the destruction of these assets, which are both considered to be of low importance. The impact magnitude is assessed as high, permanent and the impact significance **moderate adverse**.

23.6.13 The water meadow features (**9**, **11** and **12**) and the small stone bridge (**31**) are of low importance. The topsoil stripping and site levelling would result in the removal of these assets which has been assessed as high, permanent magnitude with an overall impact significance of **moderate adverse**.

23.6.14 The deserted farm "Corner" (**50**), the remains of North Lane (**41**), the stone wall along Bum Brook (**53**) and the canalised stream (**56**) are considered to be of very low importance. Topsoil stripping and site levelling would also result in the destruction of these heritage assets, but while the magnitude would still be high, permanent, the overall impact would be of **minor adverse** significance.

23.6.15 It has been assumed that there will be no surviving remains of the Hinkley Point A accommodation Camp (**54**) and therefore there will be **no impact** on this recorded heritage asset.

23.6.16 It will be necessary for the three barns within the HPC Development Site boundary to be demolished and all material to be removed. None of these three barns, Benhole Barn (**10**), Langborough Barn complex (**22**) and Sidwell Barn (**23**) are designated, but they are of local historic interest. They are therefore of low importance. It has been identified that the impact would be of permanent, high magnitude with a **moderate adverse** significance.

23.6.17 The historic trackway, Green Lane (**25**), is an averagely well-preserved historic landscape feature. The central section of the trackway is flanked by a hedgebank on both sides; but to the west the northern hedgebank has been lost and to the east the hedgebanks have been removed and the alignment of the trackway has been altered. Therefore, the trackway is considered to be of medium importance.

23.6.18 A section of the trackway, approximately 700m long and flanked by hedgerows on both sides, would be retained within the development.

23.6.19 A haul road would cross Green Lane (**25**) at its western end. This crossing would sit over the lane preserving the track underneath, which is considered to be of medium importance. Short sections of hedgerow would be removed but the majority of the trackway would be unaffected.

23.6.20 Approximately, 400m of the trackway would be removed to achieve required site levels. The eastern section of the trackway that would be lost has already been partially modified. Approximately 120m of hedge bank at the very eastern end of the trackway has previously been grubbed out and the trackway re-laid on a different alignment leading to Wick Moor Drove.

23.6.21 It is assessed that the magnitude of impact for the removal of the sections of trackway would be medium, permanent resulting in an impact of **moderate adverse** significance.

23.6.22 A number of hedges require removal as part of the construction phase. Hedgerows around the perimeter of the HPC Development Site boundary, including the historic hedgerow alongside Benhole Lane, would be retained. The major portion of the hedges located alongside Green Lane, including the section of parallel hedgerows, would also be retained.

23.6.23 Hedges that are to be removed would be cut to stump level and then the undergrowth and roots of the shrubs would be grubbed out with a mechanical excavator.

23.6.24 The majority of the hedgerows to be removed meet the criteria of archaeological or historical importance defined in the Hedgerow Regulations 1997. However, although these historic hedgerows contribute to the historic landscape of the study area, they are individually of limited importance beyond the local area and therefore they are considered to be of low importance in this assessment (see **Table 23.1**). Removal of historic hedgerows would comprise a high magnitude of permanent impact to these specific hedgerows. The overall impact would be of **moderate adverse** significance due to their low (local) importance.

23.6.25 The Historic Landscape Characterisation (HLC) for Somerset defines the majority of the land within the HPC Development Site as 'recently enclosed land' (**HLC3**-**HLC5**) (Ref. 23.15). This is land that has been enclosed during 17th-18th century, though there has been 25-50% field boundary loss. These HLC areas are considered to be of very low importance because of their date and the proportion of boundaries lost. Removing the field boundaries of these areas would be a medium magnitude permanent impact of **minor adverse** significance as only part of these HLC areas will be removed.

23.6.26 The east to west band of fields that have been identified as anciently enclosed land pre-17th century (**HLC2**) have less than 25% boundary loss (Ref. 23.15). This HLC area has been assessed as being of medium importance because of the level of survival and its earlier date. Removing the boundaries of this HLC area will be a permanent impact of medium magnitude of **moderate adverse** significance as only part of **HLC2** will be removed.

ii. Off-site Heritage Assets within 500m of the HPC Development Site

23.6.27 Heritage assets may be affected not only by a direct physical change, but also by a change to their setting. It is accepted that the setting of a designated site would include elements of the landscape that are of importance to it (Ref. 23.41). 'Setting' does not merely relate to views to and from a designated site, but also includes elements that may contribute to the amenity value of a site (Ref. 23.42).

23.6.28 There are nine designated heritage assets within 500m of the HPC Development Site boundary. The setting of each of these assets contributes to that asset's significance (value) and will also be impacted upon by the construction of Hinkley Point C.

23.6.29 The Scheduled Monument, Wick Barrow (**2**), is located less than 500m to the east of the HPC Development Site boundary (**Figure 23.1**). Wick Barrow would be affected during the proposed works as the area immediately to the west would become a construction site. A new roundabout and access road would be constructed off line from the existing Wick Moor Drove approximately 100m to the west of the monument. There will be an increase in traffic along Wick Moor Drove (**Chapter 10** of this volume) and the additional lighting required at the roundabout and across the HPC Development Site generally (**Chapter 3** of this volume) would also be visible and intrude upon the monument's setting.

23.6.30 This partial transformation of the setting of the monument, and potential increases in noise levels (see **Chapter 11** of this volume) and also, potentially, dust (see **Chapter 12** of this volume) are assessed as comprising a temporary impact of medium magnitude. Given the high importance of the Scheduled Monument, this would result in an overall impact of **major adverse** significance.

23.6.31 The development may result in a minor change to the setting of the Listed Buildings (**42**-**49**) in Shurton. Although the general character of the village would be retained, visual intrusions (see **Chapter 22** of this volume), coupled with minor increases in noise levels (see **Chapter 11** of this volume) during the construction phase, would have a low magnitude temporary impact on the setting of these buildings. As the buildings are considered to be of medium importance, the significance of this temporary impact is assessed as being **minor adverse**.

iii. Off-site Heritage Assets within the 10km Zone of Theoretical Visibility (ZTV)

23.6.32 There are 32 designated heritage assets within the 10km Zone of Theoretical Visibility (ZTV) (see **Chapter 22** of this volume) that include the HPC Development Site as part of their setting, which in turn, contributes to their significance (value). Disturbances due to noise and air quality impacts are not expected to extend beyond 500m of the HPC Development Site boundary and would therefore not affect the majority of assets.

23.6.33 In considering the heritage assets within the 10km ZTV as a whole, the construction phase would not have an impact on the spatial associations or the historic relationships between any heritage assets, nor between heritage assets and the coast. This is due to the location of the HPC Development Site in relation to heritage assets and the presence of the existing Hinkley Point Power Station Complex.

23.6.34 For most of the 32 heritage assets, any impact on setting would be visual. The impact to the setting of Wick Barrow and the eight Grade II Listed Buildings in Shurton during the construction phase has been assessed above as they are within 500m of the HPC Development Site boundary. The impacts to the remaining 23 designated heritage assets are assessed below.

23.6.35 The Baptist Chapel (**D130**) and the adjoining Manse (**D131**) are both Grade II Listed Buildings set in the quiet rural hamlet of Burton. As with the designated heritage assets in nearby Shurton, there would be minor visual intrusions coupled with very minor increases in noise levels (see **Chapter 11** of this volume), though the general character of the hamlet would be retained. This would lead to a low magnitude impact on the setting of these buildings. As the buildings are considered to be of medium importance, the significance of this temporary impact is assessed as being **minor adverse**.

Plate 23.10: View Towards Hinkley Point from the Northern Edge of Burton Looking North-East

23.6.36 Fairfield House (**D18**) is a Grade II* Listed manor house with medieval origins set in extensive grounds (**D19**) that are Grade II on the National Register of Parks and Gardens.

23.6.37 The rural setting and landscape views to the south and south-east would be unaffected by the construction phase. Certain outlooks to the north-east from the house and grounds contain restricted views of the Hinkley Point Power Station Complex. Hinkley Point B also creates some industrial noise that can occasionally be heard at Fairfield.

23.6.38 The construction phase would result in changes to the setting of Fairfield House and Park. The rural landscape to the north-east would be altered by changes to ground levels, the removal of hedgerows and trees, and the addition of temporary cranes on the skyline. Additional visual and lighting impacts would arise from the new site compounds and associated infrastructure.

23.6.39 The associated infrastructure, including a temporary 11kV electricity substation, concrete batching plant and storage silos would be installed on the HPC Development Site during the construction phase. The layout and massing of these features, especially the batching plant and the silos, would have a temporary impact on the settings of Fairfield House (**D18**), and its associated Registered Park (**D19**), to the west.

23.6.40 These changes would comprise a medium magnitude of impact on the setting of Fairfield House and Park, which are considered to be heritage assets of high importance. This would result in an overall, temporary impact of **major adverse** significance.

23.6.41 Stogursey Conservation Area (**D17**) lies to the south of the HPC Development Site. While the settings of the individual designated heritage assets within the Conservation Area would not be impacted upon, the Conservation Area as a larger entity will be indirectly impacted.

23.6.42 At present an industrial area already exists to the north of Stogursey in the form of the Hinkley Point Power Station Complex. During the construction phase for Hinkley Point C this industrial area would be enlarged. While there would be a minor visual impact to Stogursey Conservation Area's setting, the presence of a larger industrial complex nearby would impact on its setting as a rural village.

23.6.43 It has been assessed that these minor changes to Stogursey Conservation Area's setting would result in a very low magnitude of impact. As Conservation Areas are managed at a local level by the District Council, the value of the asset has been assessed as being of medium importance. This results in an overall, temporary impact of **minor adverse** significance.

23.6.44 Court House (**D39**) at East Quantoxhead is a Grade I Listed manor house situated in a quiet rural setting close to a small village. Hinkley Point Power Station Complex is a prominent visual marker in the landscape.

23.6.45 Earthmoving activities and temporary lighting during the proposed construction phase works would change the appearance of the HPC Development Site. This would comprise a very low magnitude of impact on the setting of Court House, a heritage asset of high importance. This would result in an overall, temporary impact of **minor adverse** significance.

23.6.46 The heritage assets in the Quantock Hills, where the HPC Development Site is a part of the setting and where the setting contributes to the significance (value) of each asset, are: Hurley Beacon (**D43**, **Plate 23.11**); two barrows or cairns (**D47**) positioned on the northern arm of Longstone Hill; four Bronze Age bowl barrows and a small cairn (**D48**-**D52**) on the slopes of Thorncombe Hill; a cairn located at the western end of Longstone Hill (**D53**); three cairns on Beacon Hill (**D55**-**D57**); two cairns on Thorncombe Hill (**D60**, **D61**); two barrow groups on Black Hill (**D62**, **D63**); a large platform cairn on Higher Hare Knap (**D67**); and the Iron Age hillfort, Dowsborough Camp (**D68**).

23.6.47 The Hinkley Point Power Station Complex acts as a strong visual influence, drawing the eye and foreshortening the appearance of the distance to the coast.

Plate 23.11: View Towards Hinkley Point Power Station Complex from Hurley Beacon Barrow (**D43**)

23.6.48 Earthmoving activities, building construction and lighting (see Lighting Strategy contained in **Chapter 3** of this volume) associated with the construction phase would change the appearance of the HPC Development Site as seen from the Quantock Hills. However, given that these activities would be adjacent to a pre-existing industrial complex, it has been assessed that the construction phase activities would comprise a very low magnitude of impact. As these heritage assets are Scheduled Monuments with a high importance, this would result in an overall impact of **minor adverse** significance.

iv. Washford Cross Highway Improvements

23.6.49 The proposed construction of a roundabout at Washford Cross on the A39 west of Williton would create localised impacts at the junction and immediately adjacent to it. These would include removal of the existing road, topsoil stripping, relaying of the tarmac, signage and lighting.

23.6.50 Within the proposed site three heritage assets would be affected by the proposed works. The milestone (**H5**) would be moved from its present location. However it is not in its original location and has been broken into pieces. Therefore it has been given a very low importance and moving it would be a permanent, very low impact of **negligible** significance.

23.6.51 The two turnpike roads (**H6** and **H7**) have previously been modernised and improved and little survives of the original road besides the alignment. These are therefore considered to be of very low importance. Construction of the proposed roundabout would only impact them to a permanent very low magnitude and be of **negligible** significance.

23.6.52 The Washford Cross junction does not form part of the setting of the designated heritage assets within 1km of the proposed works. Therefore, there would be **no impact** to the settings of designated heritage assets arising from the construction of the proposed roundabout at Washford Cross.

v. Sandford Hill Highway Improvements

23.6.53 The proposed construction of a roundabout at Sandford Hill on the A39 south-east of Cannington would create localised impacts at and immediately adjacent to the junction. These would include removal of the existing road, topsoil stripping, relaying of the tarmac, signage and lighting.

23.6.54 Within the proposed site there are the records of two heritage assets. The toll house (**H23**) is no longer standing and there is no evidence of it above ground. The site of the toll house immediately adjacent to the junction would be affected, but at most this would result in a very minor loss to any below ground remains that might survive. This would be a very low magnitude of impact to an asset of very low importance resulting in **negligible** significance.

23.6.55 The turnpike road (**H24**) has been modernised and improved and little survives of the original road besides the alignment. It is therefore considered to be of very low importance. The construction of the proposed roundabout would only impact the historic aspects of the road to a very low magnitude and of **negligible** significance.

23.6.56 The construction of the roundabout would affect the settings of the Scheduled medieval settlement (**H22**) of high importance and the Grade II Listed Sandford Manor (**H26**) of medium importance, both to the south-east. The additional noise and lighting required on a temporary basis would create a very low magnitude of impact to these heritage assets resulting in an overall impact to each of **minor adverse** significance.

b) Cumulative Construction Impacts

23.6.57 A temporal overlap in the construction phases of the HPC site preparation works, temporary jetty and HPC Development Site may result in increased impacts to the settings of designated heritage assets beyond the HPC Development Site boundary.

23.6.58 The setting of the Scheduled Monument, Wick Barrow (Pixies Mound) would be affected during the proposed site preparation works. A new roundabout and access road would be constructed approximately 100m to the west of the monument and the area to the west would become a construction site with potential increases in noise levels.

23.6.59 The majority of the onshore infrastructure associated with the temporary jetty would be screened from the Scheduled Monument, by existing topography and planting. However, the rock extraction area immediately to the west of Wick Barrow would result in a minor change to the setting of the monument.

23.6.60 Construction of HPC Development Site would result in a medium magnitude of impact on the setting of Wick Barrow. The site preparation works would result in a medium magnitude of impact and the temporary jetty development would result in a low magnitude of impact on the setting of Wick Barrow.

23.6.61 The cumulative effect of the three developments will not result in an increase in the overall impact; the low - medium magnitude of the impacts on an asset of high importance would result in an overall impact of **major adverse** significance.

23.6.62 Construction of HPC Development Site may result in a minor change to the setting of the Listed Buildings (**42**-**49**) in Shurton. Although the general character of the village would be retained, visual intrusions (see **Chapter 22** of this volume), coupled with minor increases in noise levels (see **Chapter 11** of this volume) during the construction phase, would have a low magnitude temporary impact on the setting of these buildings. Similarly, site preparation works would have a low magnitude temporary impact on the setting of the Listed Buildings in Shurton. Construction of the temporary jetty would have a very low magnitude of impact.

23.6.63 Thus, the cumulative effect of the three developments will not result in an increase in the overall impact; the very low - low magnitude of the impacts on assets of medium importance would result in an overall impact of **minor adverse** significance.

23.6.64 The site preparation works would result in a minor change to the setting of Fairfield House and Park. The rural landscape to the north-west would be altered by changes to ground levels and the removal of hedgerows and trees. Additional visual impacts would arise from the new site compounds and associated infrastructure.

23.6.65 The temporary jetty development would result in a change to the setting of Fairfield House and Park. The rural landscape to the north-west would be altered by erection of the site compound, haul road and soil storage. However, the jetty development's construction would largely be screened by existing vegetation and topography, see **Chapter 21**, of this volume).

23.6.66 Construction of HPC Development Site would result in a medium magnitude of impact on the setting of Fairfield House and Park. The site preparation works would result in a medium magnitude of impact and the temporary jetty development would result in a low magnitude of impact on the setting of Fairfield House and Park.

23.6.67 Thus, the cumulative effect of the three developments will not result in an increase in the overall impact; the low - medium magnitude of the impacts on an asset of high importance would result in an overall impact of **major adverse** significance.

23.6.68 Construction of HPC Development Site would result in a very low magnitude of impact on the setting of Court House. Earthmoving activities and temporary lighting during site preparation works would change the appearance of the application site, and comprise a very low magnitude of impact on the setting of Court House. Temporary lighting during construction of the jetty would have a very low impact on the setting of Court House.

23.6.69 The cumulative effect of the three developments will not result in an increase in the overall impact; the very low magnitude of the impacts on an asset of high importance would result in an overall impact of **minor adverse** significance.

23.6.70 The HPC Development Site forms a part of the setting of a number of designated heritage assets in the Quantock Hills, including Hurley Beacon (**D43**); two barrows or cairns (**D47**) on Longstone Hill; four Bronze Age bowl barrows and a small cairn (**D48**-**D52**) on Thorncombe Hill; a cairn on Longstone Hill (**D53**); three cairns on Beacon Hill (**D55-D57**); two cairns on Thorncombe Hill (**D60, D61**); two barrow groups on Black Hill (**D62**, **D63**); a large platform cairn on Higher Hare Knap (**D67**); and the Iron Age hillfort, Dowsborough Camp (**D68**).

23.6.71 Earthmoving activities, building construction and lighting during the construction phase would change the appearance of the HPC Development Site as seen from the Quantock Hills and result in a very low magnitude of impact on the settings of these Scheduled Monuments. Similarly, site preparation works and construction of the temporary jetty would result in a very low magnitude of impact on the settings of these Scheduled Monuments.

23.6.72 The cumulative effect of the three developments will not result in an increase in the overall impact on the settings of these Scheduled Monuments; the very low magnitude of the impacts on assets of high importance would result in an overall impact of **minor adverse** significance.

23.6.73 Operation of the temporary jetty, for a period of up to eight years, would coincide with the construction phase of the HPC Development Site, Temporary impacts to the settings of designated assets would be the same as those described for the jetty development's construction phase.

23.6.74 Thus, the cumulative effect of construction of the HPC Development Site and operation of the temporary jetty will not result in an increase in the overall impact on the settings of designated assets.

23.6.75 Where the setting of a heritage asset would be affected by multiple topic specific impacts, such as: noise; air quality; lighting and visual, the combined impact of these on setting has been assessed in the Construction Impacts Section above.

c) Operational Impacts

23.6.76 This section describes the impacts on the historic environment that will arise during the operational phase of Hinkley Point C Power Station both within the HPC Development Site boundary and beyond it. A general description of the operational phase is contained in **Chapter 4** of this volume. A summary of the assessment of impacts and their significance is provided in **Table 23.6**.

i. On-site Heritage Assets

23.6.77 All impacts to on-site heritage assets would have taken place during the construction phase. There would be **no impact** to on-site heritage assets.

23.6.78 The on-site portions of the HLC areas (**HLC2**, **HLC3-5**) that are on-site would already have been lost during the construction phase and therefore **no impact** would occur during the operational phase.

ii. Off-site Heritage Assets within 500m of the HPC Development Site

23.6.79 During the operational phase of Hinkley Point C there will continue to be an impact to the settings of the designated heritage assets within 500m of the HPC Development Site boundary.

23.6.80 Wick Barrow (**2**) will be affected by the increased traffic leading to Hinkley Point C Power Station, although this impact would be less than during the construction phase and more similar to current levels (**Chapter 10** of this volume). There would be additional lighting across the HPC Development Site generally, with lighting of the roundabout to the west of Wick Barrow having the most impact on the Scheduled Monument. The visual impact would be substantial with numerous buildings visible to the north-west of Wick Barrow (**Chapter 22** of this volume).

23.6.81 These impacts would result in a partial transformation of setting where the existing industrial area would be considerably enlarged to occupy the present agricultural land to the north-east of Wick Barrow. This has been assessed as being an adverse permanent impact of medium magnitude. As Wick Barrow is a heritage asset of high importance, this impact would be of **major adverse** significance.

23.6.82 The settings of the eight Listed Buildings in Shurton (**42**-**49**) would be affected during the operational phase by occasional alarms and noise (**Chapter 11** of this volume), general lighting across the Built Development Area East and Built Development Area West, and the visual impact of the buildings in these areas of the HPC Development Site (**Chapter 22** of this volume). The natural topography, trees along Green Lane and other houses in Shurton will provide some shielding against car parks and low buildings, though taller buildings, such as the reactors would be visible.

23.6.83 The setting of the Listed Buildings would be largely unchanged as the general character of the village would be retained, though with minor visual intrusions. The operation of Hinkley Point C would have a low adverse permanent magnitude impact on the setting of these buildings. As the buildings are considered to be of medium importance, the significance of this impact is **minor adverse**.

iii. Off-site Heritage Assets within the 10km Zone of Theoretical Visibility (ZTV)

23.6.84 There are 32 designated heritage assets within the 10km ZTV (see **Chapter 22** of this volume) for which the HPC Development Site is a part of their setting and for which their setting contributes to their significance (value). Nine of these designated heritage assets lie within 500m of the HPC Development Site boundary and have been considered above.

23.6.85 Disturbance due to noise and air quality impacts is not expected to extend beyond 500m of the HPC Development Site boundary and would therefore not affect the majority of the remaining 23 heritage assets, although assets very near to the boundary of the 500m boundary may experience occasional noise disturbance.

23.6.86 The operational phase of Hinkley Point C would not have an impact on the spatial associations or the historic relationships between any heritage assets, nor between heritage assets and the coast.

23.6.87 Fairfield House (**D18**) is a Grade II* Listed manor house set into extensive grounds (**D19**) that are Grade II on the National Register of Parks and Gardens.

23.6.88 During the operational phase certain views to the north-east from the house and grounds would contain restricted views of Hinkley Point C (**Chapter 22** of this volume) though the rural character of the immediate area and the landscape views to the south and south-east would be unaffected.

23.6.89 The views to the north-east would include general lighting across the Built Development Area East and Built Development Area West. This would increase the visibility of the HPC Development Site during periods of low-light levels and darkness.

23.6.90 It is expected that some industrial noise would occasionally be heard at Fairfield House, but probably no more than at present.

23.6.91 These changes constitute an impact of medium adverse permanent magnitude to heritage assets of high importance. This would be of **major adverse** significance.

23.6.92 Stogursey Conservation Area (**D17**) lies to the south of the HPC Development Site. During the operational phase of Hinkley Point C the industrial area would form a large complex to the north. There will be a minor visual impact to Stogursey Conservation Area's setting, and the expansion of the current industrial complex onto what was previously an area of agricultural land.

23.6.93 These minor changes to Stogursey Conservation Area's setting would result in a very low, adverse, permanent magnitude of impact. The Conservation Area is of medium importance resulting in an overall impact of **minor adverse** significance.

23.6.94 Court House (**D39**) at East Quantoxhead is a Grade I Listed Manor House situated in a quiet rural setting close to a small village. The existing Hinkley Point Power Station Complex is a prominent visual marker in the landscape. The HPC Development would enlarge the whole industrial area making it more prominent. The additional lighting would increase the visibility of the HPC Development Site during periods of low light and darkness. These would be a low adverse permanent magnitude of impact on a high importance heritage asset, which would be of **moderate adverse** significance.

23.6.95 The HPC Development would be a strong visual influence on the 17 heritage assets (**D43**, **D47**, **D48**-**D53**, **D55**-**D57**, **D60**-**D63**, **D67** and **D68**) in the Quantock Hills during its operational phase. Like the existing Hinkley Point Power Stations, it would draw the eye towards it and would appear prominent on the horizon (**Chapter 22** of this volume). The lighting of the HPC Development Site would cause the complex to be visible from a distance during periods of low light and darkness. It has been assessed that the operation phase activities would be a low magnitude of permanent adverse impact. As these assets are all Scheduled Monuments of high importance, this would result in impacts of **moderate adverse** significance.

23.6.96 The Baptist Chapel (**D130**) and the adjoining Manse (**D131**) are both Grade II Listed Buildings set in the quiet rural hamlet of Burton. During the operational phase there would be minor visual intrusions (see **Chapter 22** of this volume) coupled with very minor increases in noise levels (see **Chapter 11** of this volume), though the general character of the hamlet would be retained.

23.6.97 These changes would lead to a low adverse permanent magnitude impact on the setting of these buildings. The buildings are considered to be of medium importance, and the significance of this impact is **minor adverse**.

iv. Impacts due to Washford Cross Highway Improvements

23.6.98 All impacts to on-site heritage assets would have taken place during the construction phase. There would be **no impact** to on-site heritage assets during operation.

23.6.99 There would be **no impact** to off-site heritage assets during the operational phase of the proposed Washford Cross roundabout.

v. Impacts due to Sandford Hill Highway Improvements

23.6.100 All impacts to on-site heritage assets would take place during the construction phase. There would be **no impact** to on-site heritage assets during the operational phase of the proposed Sandford Hill roundabout.

23.6.101 During the operational phase the settings of the Scheduled medieval settlement (**H22**) of high importance and the Grade II Listed Sandford Manor (**H26**) of medium importance would be affected to a very minor degree by the additional lighting required. This would be a very low magnitude of impact to both assets of **minor adverse** significance.

d) Cumulative Operational Impacts

23.6.102 The cumulative effect of construction of the HPC Development Site and operation of the temporary jetty will not result in an increase in the overall impact on the settings of designated assets (see Cumulative Construction Impacts section, above).

23.6.103 Where the setting of a heritage asset would be affected by multiple topic specific impacts, such as: noise; air quality; lighting; and visual, the combined impact of these on setting has been assessed in the Operational Impacts Section above.

23.7 Mitigation of Impacts

a) Introduction

23.7.1 This section describes the proposed mitigation measures to manage and reduce the identified impacts on the historic environment within, and in the vicinity of, the proposed development.

23.7.2 For the purpose of this assessment, mitigation measures have been proposed where there is an adverse impact of greater than minor significance and the impact magnitude, spatial scope and temporal nature make it appropriate to do so.

23.7.3 Following discussion with English Heritage and SCC, the following mitigation is proposed.

b) Mitigation of Impacts within the HPC Development Site Boundary

23.7.4 It is proposed that part of the trackway (Green Lane) (**25**) would be preserved in-situ. The section of trackway that would be retained is the central section where the hedgerow is preserved on both sides.

23.7.5 The eastern section of the track that is to be removed would be preserved by record (see below). Excavation and recording would also take place across the western section of the track where the track would be crossed by a temporary haul road. It is proposed that, where it is appropriate, optically stimulated luminescence (OSL) dating shall be used. The hedgerow and track way would be reinstated once the haul road has been removed. The details of the excavation and recording of both ends of the trackway have been agreed with SCC HES.

23.7.6 Due to the nature of the proposed development, the preservation in-situ of the remainder of heritage sites and features within the HPC Development Site would not be an option.

23.7.7 The majority of the heritage assets would experience a high adverse permanent magnitude of impact, with either a moderate or major adverse significance during the construction phase. Due to the nature of the development and the medium to low importance of the archaeological remains, suitable mitigation would entail preservation by record as described in PPS 5 Policy HE 12: Policy Principles Guiding the Recording of Information Related to Heritage Assets (Ref. 23.5).

23.7.8 Preservation by record would comprise archaeological investigation and recording of specified site areas. This would adhere to the IfA Standards and Guidance for Archaeological Field Evaluation (Ref 23.14), IfA Standards and Guidance for Excavation (Ref. 23.43) and SCC Heritage Service Archaeological Handbook (Ref. 23.44).

23.7.9 The following sites would be subject to set-piece excavation: the Romano-British settlements (**4**) and (**67**); the middle-late Bronze Age enclosure (**68**); Bronze Age pottery assemblage (**69**); early Bronze Age cremation (**70**); possible burnt mound (**71**); the mid-late Iron Age settlement (**72**); and the medieval settlement (**73**). The areas to be excavated have been agreed with SCC HES and are shown in **Figure 23.8**.

23.7.10 Benhole Barn (**10**), Langborough Barn complex (**22**) and Sidwell Barn (**23**) would not be retained, but would be preserved by record. This would adhere to the IfA Standards and guidance for the archaeological investigation and recording of standing buildings or structures (Ref. 23.45) and would take the form of a brief written record and photographic survey of appropriate architectural features by a specialist. It has also been agreed with SCC HES that the reusable stone from the barns will be provided to Fairfield Estate for reuse as appropriate.

23.7.11 The programme of archaeological investigation and recording would be designed to mitigate the impacts of the proposed development on historic landscape features. This would include field boundaries and the sections of the track way that would not be preserved in situ.

23.7.12 The historic hedgerows would be investigated with profile sections to be excavated and recorded as appropriate. The number and location of the profile sections have been agreed with SCC HES and are shown in **Figure 23.7.**

23.7.13 Archaeological excavation and recording would be followed by an appropriate programme of post-excavation works; comprising assessment, analysis, publication and archiving.

23.7.14 Written Schemes of Investigation for the work detailed above have been agreed with SCC HES (Ref. 23.46, Ref. 23.47 and Ref. 23.48).

c) Mitigation of Impacts Outside the Site Boundary

23.7.15 The setting of the Scheduled Monument, Wick Barrow (**2**), will be altered by the proposed development. Following discussion with English Heritage and SCC HES, a

Monument Management Plan (MMP) would be implemented to ensure the long-term conservation, and enhancement, of the monument and its immediate setting.

23.7.16 The MMP establishes the baseline condition of the monument and proposes to: clear the vegetation; remove the fence; place geotextile and wire mesh over the mound; cover the mound with topsoil; and restore the grass cover. These measures will help to protect and preserve the surviving parts of the Scheduled Monument from long-term gradual deterioration.

23.7.17 The interpretation of the monument will also be improved and it will be more fully integrated within the existing and proposed land management proposals as part of the nature trail and, longer term, as part of the public information centre. The long-term management, monitoring and maintenance of the monument would also be improved.

23.7.18 Landscaping, including hedgerow and screen planting, is proposed along the western edge of the barrow field. This landscaping will help to shield Wick Barrow from Hinkley Point C to the north-west and west, while keeping the important views open to the south and south-east across Wick Moor. The full details of the proposed landscaping are provided in **Chapter 22,** of this volume.

23.7.19 Details of proposals to mitigate noise, air quality, lighting and visual impacts that could impact on the settings of designated sites are included in **Chapter 11**, **Chapter 12**, and **Chapter 22**, respectively.

23.7.20 These mitigation measures include advance planting of blocks of woodland and scattered trees along the southern HPC Development Site boundary to provide visual screening during the construction phase. This will help reduce the visual impacts to the eight Listed Buildings in Shurton.

23.7.21 Retention of HPC Development Site boundary hedgerows, including Benhole Lane, and off-site planting on the Fairfield Estate to the south-west of the HPC Development Site will reduce visual impacts to Fairfield House and Park (**D18**, **D19**).

23.7.22 No specific mitigation is proposed for the heritage assets on the Quantock Hills 10km to the west of the HPC Development Site. The implementation of the proposed Lighting Strategy (see **Chapter 3** of this volume), including directional lighting and reduction of glare at night, will minimise the impact of light pollution.

23.7.23 More substantial areas of woodland will be planted once the construction areas in the south and west of the HPC Development Site are available for restoration. These areas will provide ecological mitigation, enhance the biodiversity value of this area (**Chapter 20** of this volume), and add amenity value (**Chapter 25** of this volume) as well as providing mitigation for visual impact (**Chapter 22** of this volume) and impact on the settings of offset heritage assets.

23.7.24 These areas of woodland will reduce the impact on the settings of the Listed Buildings in Shurton (**42**-**49**) and Burton (**D130**, **D131**), Fairfield House and Park (**D18**, **D19**); and Court House (**D39**).

23.7.25 The historic landscape has been taken into account as part of the landscape restoration plans (**Chapter 22** of this volume), by replacing hedgerows along their existing lines where possible and by shaping the woodland using recommendations presented in the Fairfield Historic Landscape Assessment (Ref. 23.23). This will also partially mitigate the impact of the works on the historic landscape character.

d) Mitigation of Impacts at Washford Cross Highway Improvements

23.7.26 No mitigation is proposed for impacts to heritage assets at Washford Cross as only impacts of negligible significance have been identified.

e) Mitigation of Impacts at Sandford Hill Highway Improvements

23.7.27 No mitigation is proposed for impacts to heritage assets at Sandford Hill as only impacts of minor and negligible significance have been identified.

f) Mitigation of Cumulative Impacts

23.7.28 As the cumulative construction impacts on the settings of designated assets are assessed as being of no greater significance than that assessed for the proposed HPC Development Site, no further mitigation measures are proposed beyond those described above.

23.8 Residual Impacts

a) Construction Impacts

23.8.1 The implementation of the mitigation measures would ensure that the impacts on buried archaeological remains and other heritage assets on-site would be adequately reduced through investigation and recording, in accordance with the requirements of PPS 5 Policy HE 12 (Ref. 23.5).

23.8.2 Following mitigation, the construction phase would result in a residual impact of **minor adverse** significance on buried archaeological remains within the HPC Development Site boundary.

23.8.3 The mitigation for the trackway means that part of this feature would be retained. This partial in-situ preservation and the investigation and recording of the parts to be removed would ensure that the residual impact on this feature would be of **minor adverse** significance.

23.8.4 The MMP is designed to ensure the long-term conservation of Wick Barrow (**2**). The residual impact on the Scheduled Monument would be of **minor adverse** significance.

23.8.5 The impact to the setting of Fairfield House and Park (**D18**, **D19**) would be mitigated by advanced on-site tree planting as well as off-site planting on the Fairfield Estate. Proposals to mitigate temporary noise, air quality, lighting and visual impacts are included in **Chapter 10**, **Chapter 11**, and **Chapter 22** of this volume and these would also help to mitigate the settings impact. These measures would ensure that the residual impact is of **minor adverse** significance.

23.8.6 The advanced on-site tree planting and visual, noise, air quality and lighting proposals would also help to mitigate the impact to the remaining off-site designated heritage assets, but the residual impact to these assets would remain of **minor adverse** significance.

b) Cumulative Construction Impacts

23.8.7 The residual cumulative impacts on the settings of designated assets are no more significant than was assessed for the construction of the proposed HPC development. The predicted residual impact would be **minor adverse**.

c) Operational Impacts

23.8.8 The MMP produced to ensure the long-term conservation of Wick Barrow (**2**), and the proposed landscaping agreed with English Heritage and SCC, would ensure that the residual impact on the Scheduled Monument during the operational phase would be of **minor adverse** significance.

23.8.9 The landscaping and planting that would take place to the south and west of the HPC Development Site once the construction phase is completed, would reduce the impact on the settings of the Listed Buildings in Shurton (**42**-**49**), Burton (**D130**, **D131**), Fairfield House (**D18**, **D19**), and Court House (**D39**). The noise, air quality, lighting and visual mitigation (**Chapter 10**, **Chapter 11**, and **Chapter 22** of this volume) would also help to reduce the impact to these designated heritage assets. This would result in a residual impact of **minor adverse** significance.

23.8.10 The Scheduled Monuments on the Quantock Hills are at an elevation where it would be difficult to negate the visual impact to their setting. The proposed operational lighting (see **Chapter 4** of this volume), with directional lighting and reduction of glare at night, would minimise the impact of light pollution. The HPC Development Site would not be fully screened, but the landscaping and planting mitigation would soften the visual impact. For these reasons the residual impact to these Scheduled Monuments would be of **minor adverse** significance.

d) Cumulative Operational Impacts

23.8.11 There are no residual cumulative operational impacts to heritage assets.

23.9 Summary of Impacts

23.9.1 **Table 23.6** provides a summary of assessed impacts prior to mitigation and residual impacts with mitigation in place. No mitigation is required where impacts are assessed as of negligible or minor significance.

23.9.2 Heritage assets not affected by the works are not considered in this table.

Table 23.6: Summary of the Potential Impacts

ID	Receptor	Potential Impact	Magnitude	Description	Value/ Sensitivity	Significance	Proposed Mitigation	Residual Impact
Construction Phase								
2	Wick Barrow (Pixies Mound)	Partial transformation of setting	Medium	Indirect Adverse Permanent	High	Major Adverse	**Monument Management Plan** and enhancements to immediate setting	Minor Adverse
4	Romano-British settlement	Loss to construction	High	Direct Adverse Permanent	Medium	Major Adverse	Preservation by record	Minor Adverse
9	Water meadows and drainage features	Loss to construction	High	Direct Adverse Permanent	Low	Moderate Adverse	Preservation by record	Minor Adverse
10	Benhole Farm and Barn	Loss to construction	High	Direct Adverse Permanent	Low	Moderate Adverse	Preservation by record	Minor Adverse
11	Possible water meadow system	Loss to construction	High	Direct Adverse Permanent	Low	Moderate Adverse	Preservation by record	Minor Adverse
12	Water meadow system	Loss to construction	High	Direct Adverse Permanent	Low	Moderate Adverse	Preservation by record	Minor Adverse
22	Langborough Barns	Loss to construction	High	Direct Adverse Permanent	Low	Moderate Adverse	Preservation by record	Minor Adverse
23	Sidwell Barn	Loss to construction	High	Direct Adverse Permanent	Low	Moderate Adverse	Preservation by record	Minor Adverse

ID	Receptor	Potential Impact	Magnitude	Description	Value/ Sensitivity	Significance	Proposed Mitigation	Residual Impact
25	East-west trackway, Green Lane	Partial loss to construction	Medium	Direct Adverse Permanent	Medium	Moderate Adverse	Preservation by record for lost section. Preservation in-situ for the majority of the trackway	Minor Adverse
31	Small stone bridge	Loss to construction	High	Direct Adverse Permanent	Low	Moderate Adverse	Preservation by record	Minor Adverse
41	Remains of North Lane	Loss to construction	High	Direct Adverse Permanent	Very Low	Minor Adverse	None Required	Minor Adverse
42	Thatch End	Minor change to setting	Low	Indirect Adverse Permanent	Medium	Minor Adverse	Landscaping and screen planting	Minor Adverse
43	Footbridge	Minor change to setting	Low	Indirect Adverse Permanent	Medium	Minor Adverse	Landscaping and screen planting	Minor Adverse
44	Fishers and Brookside	Minor change to setting	Low	Indirect Adverse Permanent	Medium	Minor Adverse	Landscaping and screen planting	Minor Adverse
45	Shurton Lodge and outbuilding	Minor change to setting	Low	Indirect Adverse Permanent	Medium	Minor Adverse	Landscaping and screen planting	Minor Adverse
46	Cottage	Minor change to setting	Low	Indirect Adverse Permanent	Medium	Minor Adverse	Landscaping and screen planting	Minor Adverse
47	Shurton Court and No.2 Shurton Court	Minor change to setting	Low	Indirect Adverse Permanent	Medium	Minor Adverse	Landscaping and screen planting	Minor Adverse

ID	Receptor	Potential Impact	Magnitude	Description	Value/ Sensitivity	Significance	Proposed Mitigation	Residual Impact
48	Ash Cottage and Little Ash	Minor change to setting	Low	Indirect Adverse Permanent	Medium	Minor Adverse	Landscaping and screen planting	Minor Adverse
49	Shurton Mills	Minor change to setting	Low	Indirect Adverse Permanent	Medium	Minor Adverse	Landscaping and screen planting	Minor Adverse
50	Deserted farm, Corner, N of Shurton	Loss to construction	High	Direct Adverse Permanent	Very Low	Minor Adverse	None Required	Minor Adverse
53	Stone wall built along Bum Brook	Loss to construction	High	Direct Adverse Permanent	Very Low	Minor Adverse	None Required	Minor Adverse
54	Remains of accommodation camp	Loss to construction	No Impact	N/A	Very Low	N/A	None Required	No Impact
56	Canalised stream	Loss to construction	High	Direct Adverse Permanent	Very Low	Minor Adverse	None Required	Minor Adverse
67	Romano-British settlement	Loss to construction	High	Direct Adverse Permanent	Medium	Major Adverse	Preservation by record	Minor Adverse
68	Middle-Late Bronze Age Enclosure	Loss to construction	High	Direct Adverse Permanent	Medium	Major Adverse	Preservation by record	Minor Adverse
69	Middle-Late Bronze Age deposit	Loss to construction	High	Direct Adverse Permanent	Medium	Major Adverse	Preservation by record	Minor Adverse

ID	Receptor	Potential Impact	Magnitude	Description	Value/ Sensitivity	Significance	Proposed Mitigation	Residual Impact
70	Early Bronze Age Cremation	Loss to construction	High	Direct Adverse Permanent	Medium	Major Adverse	Preservation by record	Minor Adverse
71	Possible Burnt Mound	Loss to construction	High	Direct Adverse Permanent	Low	Moderate Adverse	Preservation by record	Minor Adverse
72	Mid-Late Iron Age Settlement	Loss to construction	High	Direct Adverse Permanent	Low	Moderate Adverse	Preservation by record	Minor Adverse

CHAPTER 24: OFFSHORE AND INTERTIDAL ARCHAEOLOGY

CONTENTS

TABLES

FIGURES

[This page is intentionally left blank]

24. OFFSHORE AND INTERTIDAL ARCHAEOLOGY

24.1 Introduction

24.1.1 This chapter of the Environmental Statement (ES) provides an assessment of the potential impacts to submerged and intertidal archaeology during the construction and operational phases of Hinkley Point C (HPC). A detailed description of the proposed development is provided in **Chapters 2, 3 and 4 of** this volume. Where required, mitigation measures are identified to prevent, reduce and where possible, off-set any potential adverse impacts that are identified to be of significance.

24.2 Scope of Assessment

24.2.1 The scope of this assessment has been determined through a formal Environmental Impact Assessment (EIA) scoping process undertaken with the Infrastructure Planning Commission (IPC). It has also been informed by ongoing consultation with statutory consultees (including Somerset County Council (SCC), English Heritage, West Somerset Council (WSC) and Sedgemoor District Council (SDC)) and the local community and the general public in response to the Stage 1, Stage 2, Stage 2 Update and M5 Junction 24 and Highway Improvements consultations.

24.2.2 The assessment of the construction and operational impacts on the submerged and inter-tidal archaeology arising from the proposed development has been undertaken adopting the methodologies described in Section 24.4 of this chapter. The existing baseline conditions, against which the likely environmental effects of the development are assessed, are described in Section 24.5.

24.2.3 **Figure 24.1** shows the location of the proposed HPC Development Site and the wider study area discussed within this report.

24.2.4 Section 24.6 of this chapter assesses the potential construction and operational impacts on the offshore and intertidal archaeology. Appropriate mitigation measures aimed at preventing, reducing or off-setting any potential adverse impacts, identified to be of significance, of the proposed development on offshore and intertidal archaeology are identified in Section 24.7 of this chapter. The assessment of residual impacts following implementation of the mitigation measures is presented in Section 24.8 of this chapter.

24.2.5 The assessment of cumulative impacts on offshore and intertidal archaeology arising from the proposed development in combination with other components of the HPC Project is made in this chapter. Cumulative impacts arising from the proposed development in combination with other relevant projects are assessed in **Volume 11** of the ES.

24.2.6 The objectives of this assessment were to:

- identify all known heritage assets within the study area boundary below the Mean High Water Springs (MHWS) that may potentially be affected by the proposed HPC development;
- assess the potential for submerged and buried archaeological remains and their likely level of preservation;
- assess the likely extent of previous impacts on submerged and buried archaeological remains;
- assess the impact of construction and operation on submerged and buried archaeological remains;
- recommend mitigation strategies aimed at preventing, reducing or off-setting any potential adverse impacts that are identified to be of significance in respect of the proposed development, if necessary; and
- identify any residual impacts.

24.3 Legislation, Policy and Guidance

24.3.1 This section identifies and describes legislation, policy and guidance of relevance to the assessment of potential impacts to the historic environment associated with the construction, operation and post-operational phases of the proposed development.

24.3.2 As stated in **Volume 1, Chapter 4**, the Overarching National Policy Statement (NPS) for Energy (NPS EN-1) when combined with the NPS for Nuclear Power Generation (NPS EN-6) provides the primary basis for decisions by the IPC on applications for nuclear power generation developments that fall within the scope of the NPSs.

24.3.3 Notwithstanding this, the IPC may consider other matters that are both important and relevant to its decision-making. This could include Planning Policy Statements (PPSs), Planning Policy Guidance Notes (PPGs), regional and local policy documents, although, if there is a conflict between these and the NPS, the NPS prevails for the purposes of IPC decision making.

24.3.4 Further, the Planning Act 2008 provides that the IPC must, in making its decision on an application, have regard to any Local Impact Report (LIR) prepared by relevant local authorities. It is anticipated that the LIRs will rely in part on PPSs, PPGs, regional and local policy to provide a context for their assessment. On this basis, regard has been given to these documents (where relevant to the technical assessment) since they are likely to inform the LIRs prepared by the relevant local authorities.

a) International Legislation

i. United Nations Convention on the Law of the Sea (UNCLOS) 1982

24.3.5 UNCLOS (Ref. 24.1) became recognised as international law in 1982 and was ratified by the UK on 25 July 1997. Article 303(1) states that: *"States have the duty* *to protect objects of an archaeological and historical nature found at sea and shall cooperate for this purpose."*

ii. European Convention on the Protection of the Archaeological Heritage (Revised) (The Valetta Convention), 1992

24.3.6 The European Convention on the Protection of the Archaeological Heritage (Revised) 1992, (Ref. 24.2) was ratified by the UK Government in 2000 and came into force on 21 March 2001.

24.3.7 The Convention clearly defines archaeological heritage as comprising "*all remains and objects and any other traces of mankind from past epochs*". This is said to include "*structures, constructions, groups of buildings, developed sites, moveable objects, monuments of other kinds as well as their context, whether situated on land or under water.*"

24.3.8 Article 2 of the Convention addresses inventorying and protection of sites and areas, the mandatory reporting of chance finds and provides for the creation of "*archaeological reserves*" on land or underwater. Article 3 promotes high standards for all archaeological work which should be carried out by suitably qualified people and Article 4 requires the conservation of excavated sites and the safe-keeping of finds. Article 5 is concerned with consultation that should take place between planning authorities and developers to reconcile and combine the respective requirements of archaeology and development. This convention binds the UK to implement protective measures regarding the archaeological heritage within its jurisdiction.

iii. UNESCO Convention on Underwater Cultural Heritage, 2001

24.3.9 The UNESCO Convention on Underwater Cultural Heritage (Ref. 24.3) was approved at the plenary session of the General Conference in 2001 and entered into force for those states that ratified it on 2 January 2009. Although the UK has not ratified it the Government has adopted the Annex to the Convention as best practice for archaeology. This Annex comprises a series of ethical rules concerning activities directed at underwater cultural heritage which provide objective standards by which to judge the appropriateness of actions in respect of archaeology underwater.

b) UK Legislation

i. Ancient Monuments and Archaeological Areas Act 1979

24.3.10 Under the terms of this act (Ref. 24.4) an archaeological site or historic building of national importance can be designated as a Scheduled Monument and is registered with the Department of Culture, Media and Sport (DCMS). This Act extends to monuments in, on or under the sea-bed in territorial waters excluding those designated under the Protection of Wrecks Act 1973 but no monuments below MHW have yet been designated in England.

24.3.11 Any development that might affect either a Scheduled Monument or its setting is subject to the granting of Scheduled Monument Consent. English Heritage (EH) advises the Government on individual cases for consent and offers advice on the management of Scheduled Monuments.

ii. The Protection of Wrecks Act (PWA) 1973

24.3.12 Under section 1 of the PWA (Ref. 24.5) wrecks and wreckage of historical, artistic and archaeological importance can be protected via designation. Once a wreck/area is designated it is an offence to carry out certain activities (e.g. survey, excavation) unless a licence is obtained. Section 2 of the Act provides for designation of wrecks that are considered dangerous due to their contents.

iii. Protection of Military Remains Act (PMRA) 1986

24.3.13 The PMRA (Ref. 24.6) automatically protects aircraft that have crashed as a part of military service. The Ministry of Defence may also choose to protect any vessel that was lost whilst serving the military.

iv. The Merchant Shipping Act (MSA) 1995

24.3.14 The MSA (Ref. 24.7) documents the procedures for determining ownership of flotsam, jetsam, derelict and lagan found in or on the shores of the sea or any tidal water. Ships, aircraft, hovercraft, cargo, equipment or any part of the above are covered by the Act. If any such material is encountered and recovered it must be reported to the Receiver of Wreck.

c) National Planning Policy

i. Planning Policy Statement 1: Delivering Sustainable Development (PPS1) (January 2005) (Ref. 24.8)

24.3.15 PPS1 sets out the Government's overarching planning policies on the delivery of sustainable development through the planning system.

24.3.16 Paragraph 5 states that planning should facilitate and promote sustainable and inclusive patterns of urban and rural development by, amongst other things: protecting and enhancing the natural and historic environment, the quality and character of the countryside, and existing communities.

ii. Planning Policy Statement 5: Planning for the Historic Environment (PPS5) (March 2010) (Ref. 24.9)

24.3.17 PPS5 sets out planning policies on the conservation of the historic environment. It states that planning has a central role to play in conserving our heritage assets and utilising the historic environment in creating sustainable places. The policies contained within PPS5 will enable the Government's vision for the historic environment to be implemented through the planning system (page 2).

24.3.18 PPS5 introduces the concept of a "heritage asset", which is defined as those parts of the historic environment that have significance because of their historic, archaeological, architectural or artistic interest (page 5). Heritage assets include designated heritage assets (World Heritage Sites, Scheduled Monuments, Listed Buildings, Protected Wreck Sites, Registered Parks and Gardens, Registered

Battlefields and Conservation Areas) and assets identified by the local planning authority during the process of decision-making or through the plan-making process (including local listing) (page 13).

24.3.19 Policy HE1.3 states that, where conflict between climate change objectives and the conservation of heritage assets is unavoidable, the public benefit of mitigating the effects of climate change should be weighed against any harm to the significance of heritage assets in accordance with the development management principles in this PPS and national planning policy on climate change.

24.3.20 Policy HE6.1 states that local planning authorities should require an applicant to provide a description of the significance of the heritage assets affected and the contribution of their setting to that significance. The level of detail should be proportionate to the importance of the heritage asset and no more than is sufficient to understand the potential impact of the proposal on the significance of the heritage asset. Policy HE6.2 states that this information, together with an assessment of the impact of the proposal, should be set out in the application as part of the explanation of the design concept. Policy HE6.3 states that local planning authorities should not validate applications where the extent of the impact of the proposal on the significance of any heritage assets affected cannot adequately be understood from the application and supporting documents.

24.3.21 Policy HE7.2 states that, in considering the impact of a proposal on any heritage asset, local planning authorities should take into account the particular nature of the significance of the heritage asset and the value that it holds for this and future generations.

24.3.22 Policy HE7.7 states that, where loss of significance is justified on the merits of new development, local planning authorities should not permit the new development without taking all reasonable steps to ensure the new development will proceed after the loss has occurred by imposing appropriate planning conditions or securing obligations by agreement.

24.3.23 Policy HE8.1 considers non-designated heritage assets and states that the effect of an application on the significance of such a heritage asset or its setting is a material consideration in determining the application.

24.3.24 Policy HE9.1 states that there should be a presumption in favour of the conservation of designated heritage assets and the more significant the designated heritage asset, the greater the presumption in favour of its conservation should be. Significance can be harmed or lost through alteration or destruction of the heritage asset or development within its setting. Loss affecting any designated heritage asset should require clear and convincing justification.

24.3.25 Policy HE9.4 states that, where a proposal has a harmful impact on the significance of a designated heritage asset which is less than substantial harm, in all cases local planning authorities should:

"(i) weigh the public benefit of the proposal (for example, that it helps to secure the optimum viable use of the heritage asset in the interests of its long-term conservation) against the harm; and

(ii) recognise that the greater the harm to the significance of the heritage asset the greater the justification will be needed for any loss."

24.3.26 Policy HE9.6 states that there are many heritage assets with archaeological interest that are not currently designated as Scheduled Monuments, but which are demonstrably of equivalent significance. The absence of designation for such heritage assets does not indicate lower significance and they should be considered subject to the policies in HE9.1 to HE9.4 and HE10.

24.3.27 Policy HE10.1 states that, when considering applications for development that affect the setting of a heritage asset, local planning authorities should treat favourably applications that preserve those elements of the setting that make a positive contribution to or better reveal the significance of the asset. When considering applications that do not do this, local planning authorities should weigh any such harm against the wider benefits of the application. The greater the negative impact on the significance of the heritage asset, the greater the benefits that will be needed to justify approval.

24.3.28 Policy HE12.3 states that, where the loss of the whole or a material part of a heritage asset's significance is justified, local planning authorities should require the developer to record and advance understanding of the significance of the heritage asset before it is lost, using planning conditions or obligations as appropriate. The extent of the requirement should be proportionate to the nature and level of the asset's significance. Developers should publish this evidence and deposit copies of the reports with the relevant historic environment record.

iii. Planning and Policy Guidance 20: Coastal Planning (PPG20) (1992) (Ref. 24.10)

24.3.29 PPG20 is cancelled with the exception of paragraphs 2.9, 2.10, and 3.9, which concern development plans and large scale projects that require coastal locations.

24.3.30 Paragraph 2.9 states that, in the coastal zone, development plan policies should normally not provide for development which does not require a coastal location. Paragraph 2.10 goes on to state that the coast, particularly the undeveloped parts, will seldom be the most appropriate location for development. Few developments require a coastal location and, given both the physical and policy constraints in most parts of the undeveloped coast, it should not be expected to accommodate new development that could be located inland or in existing developed areas.

24.3.31 Paragraph 3.9 states that public access to the coast should be a basic principle, unless it can be demonstrated that this is damaging to nature conservation or impractical. This applies both to the developed and undeveloped coast.

iv. Consultation Paper on a New Planning Policy Statement – Planning for a Natural and Healthy Environment (2010) (Ref. 24.11)

24.3.32 In its final form, it is intended that this PPS will replace PPG20 in so far as it relates to coastal access, heritage coast and the undeveloped coast (paragraphs 2.9, 2.10 and 3.9 in PPG 20).

24.3.33 Policy NE7 (Local planning approach to the undeveloped coast and coastal access) states:

> *"Local planning authorities should maintain the natural character of the undeveloped coast, protecting and enhancing its distinctive landscapes, cultural, biodiversity and geodiversity interest. They should also seek to improve opportunities for public access and enjoyment of the coast. Particular attention should be given to areas defined as heritage coast. Policies should be consistent with their objectives, special qualities and management strategies.*
>
> *When considering suitable locations for development, local planning authorities should ensure, as far as reasonably practicable, that access to the coast and the integrity of coastal rights of way and National Trails is not constrained. Account should be taken of the likely impacts of climate and coastal change."*

v. Marine Policy Statement (MPS) March 2011 and Marine Plans drawn up under the Marine and Coastal Access Act 2009

24.3.34 The MPS (Ref. 24.12) is intended to be the first component of new systems of marine planning set to be introduced throughout the UK. The MPS provides the policy context within which Marine Plans will be developed and implemented, and establishes the direction for marine licensing and authorisation systems.

24.3.35 Paragraph 1.1.1 of the MPS states that:

> *"The MPS and Marine Plans form a new plan-led system for marine activities. They will provide for greater coherence in policy and a forward-looking, proactive and spatial planning approach to the management of the marine area, its resources, and the activities and interactions that take place within it. Marine Plans will be prepared and adopted in accordance with the relevant legislation. If appropriate, an Administration will provide guidance on the content, structure, context for and preparation of Marine Plans."*

d) National Guidance

i. England's Coastal Heritage: a statement on the management of coastal archaeology 1996

24.3.36 This document (Ref. 24.13) sets out principles for the management of coastal archaeology. It promotes the adoption of terrestrial standards to the sub-tidal area and a commitment to in situ preservation of material where possible.

ii. Code of Practice for Seabed Development, Joint Nautical Archaeology Policy Committee (JNAPC) 2006

24.3.37 This voluntary code (Ref. 24.14) provides a framework for seabed developers that is similar to current terrestrial policy and practice. The aim of the Code is to ensure best practice for seabed development, offering guidance to developers on issues ranging from risk management to legislative implications.

e) Regional Planning Policy

24.3.38 The Government's revocation of regional strategies was quashed in the High Court on 10 November 2010. However, on that same date the Government reiterated in a letter to Chief Planners its intention to revoke regional strategies through the Localism Bill. This letter was also challenged but, on 7 February 2011, the High Court held that the Government's advice to local authorities that the proposed revocation of regional strategies was to be regarded as a material consideration in their planning development control decisions should stand. The decision of the High Court was upheld by the Court of Appeal on 27 May 2011. Therefore, the regional strategies remain in place but in the case of development control decisions it is for planning decision makers to decide on the weight to attach to the strategies. **Volume 1, Chapter 4** of this ES provides a full summary of the position regarding the status of regional planning policy.

i. Regional Planning Guidance 10 for the South West (RPG10) 2001-2016 (2001) (Ref. 24.15)

24.3.39 RPG 10 sets out the broad development strategy for the period to 2016 and beyond. Policy EN3 (The Historic Environment) seeks the protection of historic and archaeological areas, sites and monuments of international, national and regional importance. This policy also advises that new development should preserve or enhance historic buildings and conservation areas and important archaeological features and their settings.

ii. The Draft Revised Regional Spatial Strategy (RSS) for the South West Incorporating the Secretary of States Proposed Changes 2008 – 2026 (July 2008) (Ref. 24.16)

24.3.40 The draft Revised Regional Spatial Strategy (RSS) looks forward to 2026 and sets out the Region's policies in relation to the development of land within the South West.

24.3.41 Policy SD3 (The Environment and Natural Resources) seeks to protect and enhance the region's environment and natural resources by, amongst other things, positive planning and design to set development within, and to enhance, local character (including setting development within the landscape of the historic environment).

24.3.42 Policy ENV1 (Protecting and Enhancing the Region's Natural and Historic Environment) states that, where development and changes in land use are planned which would affect the natural and historic environment, local authorities will first seek to avoid loss of or damage to the assets, then mitigate any unavoidable damage, and compensate for loss or damage through offsetting actions.

24.3.43 Policy ENV5 (Historic Environment) states that the historic environment of the South West will be preserved and enhanced.

iii. Somerset and Exmoor National Park Joint Structure Plan Review 1991-2011 (2000) (Policies 'saved' from 27 September 2007) (Ref. 24.17)

24.3.44 The Somerset and Exmoor National Park Joint Structure Plan was adopted in 2000 with relevant policies saved from 27 September 2007. All policies have been saved with the exception of Policy 53 which is unrelated to historic environment impacts. The Plan provides a strategic base for all land use planning within the plan area for the period up to 2011.

24.3.45 Policy 10 (Historic Landscapes) states that development proposals should take account of their impact on historic landscape character areas and registered historic landscapes (historic parks, gardens and battlefields).

24.3.46 Policy 11 (Areas of High Archaeological Potential) states that development proposals should take account of identified Areas of High Archaeological Potential or, elsewhere where there is reason to believe that important remains exist, so that appropriate assessment and necessary protection can be afforded to any archaeological remains identified.

24.3.47 Policy 12 (Nationally Important Archaeological Remains) states that there should be a presumption in favour of the physical preservation in situ of nationally important archaeological remains. The setting and amenity value of the archaeological remains should be protected.

24.3.48 Policy 13 (Locally Important Archaeological Remains) states that development proposals which affect locally important archaeological remains should take account of the relative importance of the remains. If the preservation in situ of the archaeological remains cannot be justified, arrangements should be sought to record those parts of the site that would be destroyed or altered.

24.3.49 Policy 15 (Coastal Development) states that, where any development requires an undeveloped coastal location, it should respect the natural beauty, biodiversity and geology of the coast. New coastal developments should minimise the risk of flooding, erosion and landslip.

f) Local Planning Policy

i. West Somerset Local Plan (2006) (Policies 'saved' from 17 April 2009) (Ref. 24.18)

24.3.50 The West Somerset Local Plan forms part of the Development Plan for the West Somerset. The Local Plan was adopted in April 2006 (with relevant policies ‘saved’ from 17 April 2009). The Proposals Map indicates that the HPC Development Site itself is not subject to any specific historic environment designations. The HPC Development Site lies outside of the defined Development Boundary.

24.3.51 The following policies are considered to be potentially relevant:

24.3.52 Policy AH/2 (Locally Important Archaeological Remains) states that development which is likely to damage archaeological remains of local importance will only be permitted where the importance of the development outweighs the intrinsic importance of the remains.

24.3.53 Policy AH/3 (Areas of High Archaeological Potential) states that within areas of high archaeological potential planning permission will not be granted unless an evaluation has been carried out to determine whether archaeological remains of local or national value exist on the site.

24.3.54 Policy CO/1 (The Coastal Zone) states that development proposals in any part of the Coastal Zone, including those areas of existing developed coast, will only be permitted where: the development and its associated activities are unlikely to have an adverse effect, either directly or indirectly on heritage features, landscape character areas, nature conservation interests, including sub-tidal and marine habitats, and residential amenities; the development is unlikely to have an adverse effect on the character of the coast and maintains and where possible, enhances, improves or upgrades the environment particularly in derelict and/or despoiled coastal areas; and the development requires a coastal location.

ii. West Somerset District Local Development Framework (LDF) Core Strategy (Options Paper) (January 2010) (Ref. 24.19)

24.3.55 The Core Strategy is at a preliminary stage of preparation and the Options Paper does not include any specific policies relating to offshore and intertidal archaeology impacts. The paper does however identify the types of policy that West Somerset Council (WSC) considers could be included in the Core Strategy. In relation to heritage, this includes: policies which recognise the historic character of settlements where development will be focused, and which will ensure that new development contributes positively to that character; and policies to manage the coastal zone in conjunction with the emerging **Shoreline Management Plan** (page 24).

iii. Supplementary Planning Guidance

24.3.56 Sedgemoor District Council and West Somerset Council have jointly prepared draft supplementary planning guidance in relation to the HPC Project. Box 19 in the draft HPC SPD sets out the approach to masterplanning and design of the HPC Development Site, and sets out a number of requirements that the County Council and District Councils will expect of the HPC project promoter.

24.3.57 The draft HPC SPD does not include any specific policies relating to offshore and intertidal archaeology impacts, however, in relation to general historic environment impacts at the HPC Development Site, Box 19 states that the HPC Promoter will be expected to:

> *"…minimise the individual and cumulative visual impacts on the landscape and setting of designated areas, buildings and monuments, including Exmoor National Park, AONBs, Conservation Areas, Outstanding Heritage Settlements, Listed Buildings and Scheduled Ancient Monuments and where it has been demonstrated by the HPC project promoter that the impacts are unavoidable provide appropriate levels of mitigation and compensation (page 36)".*

24.3.58 Further planning policy context is provided in the Legislative Planning Policy Context chapter (**Volume 1, Chapter 4**) and the Introduction chapter (**Volume 2, Chapter 1**).

24.4 Methodology

24.4.1 The baseline assessment and all supporting surveys have been undertaken in accordance with the published guidelines set out by the Institute for Archaeologists' (IfA) Standards and Guidance for Archaeological Desk-Based Assessment (Ref. 24.20).

24.4.2 There is, as yet, no standard or guidance published by the IfA or English Heritage specifically relating to EIAs for the historic environment. In the absence of this, therefore, use has been made (as appropriate) of guidance on assessing the effects of roads schemes on heritage, given in the Design Manual for Roads and Bridges (DMRB), Volume 11: Environmental Assessment, Section 3, Part 2, Cultural Heritage (Ref. 24.21).

24.4.3 Within this chapter, the generic descriptions used to define the level of significance and the likelihood of occurrence are those given in **Volume 1, Chapter 7** of this ES. This provides a matrix comparing the magnitude of an impact with the importance (value) of the receptor, to determine the level of significance of predicted impacts.

a) Study Area

24.4.4 The geographical extent of the study area comprises:

- the proposed jetty site located to the north of the HPC Development Site;
- the off-shore cooling water intake and outfall heads;
- the off-shore fish return outfall; and
- the onshore study area to identify terrestrial heritage assets.

24.4.5 The location of the proposed development at Hinkley Point and the wider study area is illustrated in **Figure 24.1.**

b) Baseline Assessment

24.4.6 Heritage assets were initially identified through:

- a search of the records held at the National Monuments Record (NMR) and the Somerset Historic Environment Record (HER);
- analysis of data provided by EMU, including multi-beam bathymetry, boomer data, side-scan sonar, magnetic anomalies, side-scan sonar anomalies and interpretation of boomer data;
- analysis of data provided by CEFAS/BEEMS including multi-beam bathymetry, single-beam bathymetry, side scan sonar mosaics, side scan sonar raw data and Light Detection and Ranging (LiDAR) and bathymetry merged for the River Parrett;

- analysis of bathymetry data provided by Seazone;
- examination of historical maps and Ordnance Survey Data;
- examination of LiDAR data and aerial photographs held by the Channel Coastal Observatory;
- examination of other data sources, including, the Hinkley Point Physical Sciences Report (Ref. 24.22), Scour Assessment (Ref. 24.23) and the report on Sediment Transport (Ref. 24.24) produced by CEFAS; and
- consultation with English Heritage.

24.4.7 Detailed deposit models were prepared using the borehole and vibrocore logs recovered by Fugro during the offshore geotechnical site investigation.

24.4.8 Detailed analysis of selected vibrocores was undertaken to determine the nature, date and extent of surficial deposits offshore of Hinkley Point (Ref. 24.25).

24.4.9 A summary of data sources used in this assessment is included in **Table 24.1**.

Table 24.1: Datasets reviewed as part of the Offshore and Intertidal Archaeology assessment

c) Consultation

24.4.10 Consultation has been undertaken throughout the EIA process and further information may be found in the **Consultation Report**.

24.4.11 Meetings were held with English Heritage throughout the EIA process to discuss and agree the scope of the assessment, identify potential impacts and inform the mitigation proposals.

24.4.12 It was agreed with English Heritage that an assessment of existing data would be undertaken to identify potential constraints and inform the siting of jack-up rigs, boreholes and vibrocores for the offshore geotechnical site investigation. The results of the assessment confirmed that there were no known submerged archaeological sites in the proposed borehole locations.

24.4.13 It was subsequently agreed that deposit modelling based on the core logs and data from the offshore geotechnical site investigation would be used to identify potential archaeological features and submerged landscapes. The results of the deposit modelling are summarised in Section 24.5 of this chapter.

24.4.14 Based on the results of the deposit modelling, it was agreed that a programme of specialist assessment should be undertaken on selected vibrocores to determine the nature, date and archaeological potential of surficial deposits identified in the core logs (Ref. 24.25). The results of the assessment are summarised in Section 24.5 of this chapter.

24.4.15 Following completion of the assessment it was agreed with English Heritage that a programme of further analysis and scientific dating would be undertaken on selected deposits, as recommended in the assessment report and that the dissemination of the results in appropriate, peer-reviewed, academic journals would offset the minor loss of deposits and comprise suitable mitigation of the impacts. The proposed mitigation is described in Section 24.7 of this chapter.

d) Assessment Methodology

24.4.16 **Volume 1, Chapter 7** of this ES describes the assessment methodology for this EIA. In addition the following specific methodology was applied for the historic environment in the determination of receptor importance (value) (see **Table 24.2**) and of impact magnitude (see **Table 24.3**).

i. Value and Sensitivity

24.4.17 All of the heritage assets that may be impacted by the proposed development have been assigned a level of importance in accordance with those definitions set out in **Volume 1, Chapter 7** and with the specific definitions given in **Table 24.2**.

24.4.18 PPS 5 uses the phrase "*significance of a heritage asset*" to mean "*the value of a heritage asset*" (Ref. 24.9). Assessment of the importance, or value, of heritage assets is based upon existing designations, the potential to contribute to the aims of the South West Archaeological Research Framework (SWARF) (Ref. 24.26) the Marine and Maritime Research Framework (Ref. 24.27) and the criteria described in **Table 24.2**, which is based on the DMRB (Ref. 24.21).

24.4.19 As there are no internationally important sites within the study area (e.g. World Heritage sites) the DMRB category of "Very High Importance" has not been applied.

24.4.20 Sensitivity, with regard to the historic environment, is a subjective term which describes the potential for a heritage asset to absorb change. It is generally applied to the setting of terrestrial heritage assets and is not used in this assessment.

Table 24.2: Criteria Used to Determine Importance (Value)

Importance	Description
High	Ancient monuments scheduled under the Ancient Monuments and Archaeological Areas Act 1979, or archaeological sites and remains of comparable quality, assessed with reference to the Secretary of State's non-statutory criteria, as set out in Department of Culture, Media and Sport (DCMS) Guidance on Scheduled Monuments, Annex 1 (Ref. 24.28). Sites protected under the Protection of Wrecks Act 1973. Wreckage covered by the Protection of Military Remains Act 1986. Well preserved sites/features not previously detected but considered to be of high importance based upon arguments made in relevant research frameworks.
Medium	Archaeological sites and remains which, while not of national importance, fulfil several of the Secretary of State's criteria and are important remains in their regional context.
Low	Archaeological sites and remains that are of low potential or minor importance.
Very low	Areas in which investigative techniques have produced negative or minimal evidence for archaeological remains, or where previous large-scale disturbance or removal of

Importance	Description
	deposits can be demonstrated.
Unknown	Areas that may contain potential for significant archaeological remains.

ii. Magnitude of Impacts

24.4.21 The magnitude of impacts has been based on the consequence that the proposed development would have upon the submerged archaeology resource and has been considered in terms of high, medium, low and very low (see **Table 24.3**, adapted from DMRB (Ref. 24.21)).

24.4.22 Potential impacts have also been considered in terms of permanent or temporary, adverse (negative) or beneficial (positive) and cumulative. The sources of impact may arise during construction and/or operation.

Table 24.3: Guidelines for the Assessment of Magnitude

Magnitude	Impact
High	Complete removal of an archaeological site. Severe transformation of the setting or context of a designated heritage asset or significant loss of key components in a monument group.
Medium	Removal of a major part of an archaeological site's area and loss of research potential. Partial transformation of the setting or context of a designated heritage asset or partial loss of key components in a monument group. Diminished capacity for understanding or appreciation (context) of a designated heritage asset.
Low	Removal of an archaeological site where a minor part of its total area is removed, but where the site retains a significant future research potential. Minor change to the setting of a designated heritage asset.
Very Low	No significant physical impact or change. No significant change in setting or context. No impact from changes in use, amenity or access.
Uncertain	The magnitude of the impact cannot be predicted.

iii. Significance of Impacts

24.4.23 The significance of the impact is judged on the relationship of the magnitude of impact to the assessed importance (value) of the resource. The approach taken to predict the significance of impacts, without mitigation, is outlined in **Volume 1 Chapter 7.**

24.4.24 The assessment of impact significance is the most important step in the EIA process, since it is this which is used to determine whether mitigation is required and also to determine whether mitigation measures have reduced the impact to an acceptable residual level.

24.4.25 For the purpose of this assessment, mitigation measures have been proposed where there is an impact of greater than minor adverse significance and are appropriate given their magnitude, spatial scope and temporal nature.

e) Cumulative Effects

24.4.26 **Volume 1, Chapter 7** refers to the methodology used to assess cumulative impacts. Additive and interactive effects between impacts generated within the site boundary are assessed within this chapter. Cumulative effects that consider activities and impacts generated at distance from the site are considered in **Volume 11**; this assesses the project-wide cumulative impacts and in-combination impacts with other proposed, or reasonably foreseeable projects.

f) Limitations, Constraints and Assumptions

24.4.27 Identification of buried archaeological remains offshore has been based on a staged approach comprising detailed desk-studies. The NMR, HER and core logs consulted in this chapter represent secondary data. These data are assumed to be accurate unless proven otherwise during the course of research.

24.4.28 The assessment of impacts has been based on indicative locations, existing design details and construction methodologies. It is assumed that the detailed design at construction will not substantially alter from the design described in Section 24.6.

24.4.29 Dates within the following section have been presented in three forms: prior to the Holocene, in thousand years before present (ka); for overview, date ranges in years BC/AD; and where robust calibrated radiocarbon dates are available in years cal BC/AD.

24.5 Baseline Environmental Characteristics

a) Introduction

24.5.1 This section presents the historic environment baseline for the offshore and intertidal area of the HPC Development Site and, in order to provide context, for the onshore study area. It also provides a brief summary of the geological history of the area and an account of pertinent marine processes. Further information may be found in the reports by Cefas (Ref. 24.22), EMU (Ref. 24.29) and AMEC (Ref. 24.30).

24.5.2 The heritage resource along shorelines, estuary river banks and within and below the tidal zone falls into three broad categories; sites exposed above MHWM, submerged terrestrially deposited archaeology and wrecks.

24.5.3 Throughout the Quaternary (*c.* 1.8 Million years ago (Mya) to present) the landscape of the north-west European peninsula was transformed by major cyclical changes in climate, most clearly represented by the growth and decay of continental ice sheets and the concomitant rise and fall of global and local sea levels. These fluctuations in sea level resulted in an ever changing landscape so that any one area (e.g. the Severn Estuary) could experience all physical environments from full terrestrial conditions to intertidal and even full marine conditions through a single glacial to interglacial cycle.

24.5.4 Despite these major changes Britain remained a peninsula of continental Europe for most of the Quaternary, with isolation occurring only during brief interglacial highstand events. Time transgressive separation from Europe last occurred between *c.* 14 ka (thousand years ago) and the start of the Holocene as sea levels rose in response to the deglaciation of the Last Glacial Maximum ice sheets. Unsurprisingly, considering this changing landscape history, the archaeological record of the UK shelf and its coastal margins provides essential data from the earliest occupation event (now placed at *c.* 900-800 ka (Ref. 24.31) from coastal deposits at Happisburgh in Norfolk) through to the 20th Century.

24.5.5 These dramatic changes also influenced the human colonisation of Britain such that its occupation was spatially and temporally discontinuous, marked by repeated episodes of inward migration and colonisation from Continental Europe interspersed with depopulation and localised extinction events. As such, when considering the potential of the historic environment resource, it is essential to carefully account for the submerged terrestrially deposited record. This allows for an assessment of the probability of encountering evidence for past hominin activity offshore.

b) Study Area Description

i. Topography and Bathymetry

24.5.6 The study area shown lies on the coast of Somerset, incorporating the southern and western edges of Bridgwater Bay, and comprising part of the Outer Severn Estuary (**Figure 24.1**). Bridgwater Bay lies on a bend of the Severn Estuary (**Figure 24.2**), with a deeper channel (maximum depth 42.18m Ordnance Datum (OD)) giving way to a relatively shallow and gently north-west/south-east sloping bay to the south (**Figure 24.3**).

24.5.7 Although folded and faulted bedrock dominates the seabed of the Severn Estuary, there is clear evidence of Quaternary lowstand terrestrial river systems – the “palaeo-Severn” (**Figure 24.2**). These are best defined in the northern part of the Estuary where an east-west trending main channel is fed by a number of north-south running tributaries between Porthkerry and Lavernock Point, on the South Wales coastline. On the southern margin of the Estuary the regional bathymetry only identifies two tributary systems: one running north for *c.* 9km from Porlock Bay; and a second *c.* 6.5km north-west of Hinkley Point.

24.5.8 In the higher resolution swath bathymetry data available in the immediate sub-tidal zone of the study area, no clear channel systems are present as the area is covered by unconsolidated sediments associated with the south-western margin of the Bridgwater Bay mudpatch. However, there is evidence of buried channel systems with a similar orientation to these outer exposed channels within the offshore study area.

24.5.9 **Figure 24.3** illustrates the steep nature of the eroding cliff edge at Hinkley Point, compared to the ridged, (reflecting exposed beds of limestone), yet predominantly gently sloping intertidal area below it. A clear rectangular cut (50m x 330m) oriented SSW-NNE can be identified at [GR: 321575, 146670] and is related to the construction of the existing Hinkley Point Power Station Complex.

24.5.10 The estuary of the River Parrett forms the southern part of Bridgwater Bay. LiDAR and bathymetric data supplied by CEFAS indicates a channel depth of *c.* -7mOD and width of *c.* 800m at its mouth.

ii. Geology and Marine Environment

Pre-Quaternary Geology

24.5.11 The Inner Bristol Channel and Severn Estuary area is floored by a folded and faulted succession of Carboniferous to Lower Jurassic limestones, mudstones and siltstones (**Figure 24.4**). This part of the Bristol Channel/Severn Estuary system is severely depleted in unconsolidated sediment, with large areas of the seafloor consisting of exposed bedrock (Ref. 24.32). During early Cretaceous deformation these sediments were folded into an east-west trending syncline (the Bristol Channel Basin). A comprehensive account of the geological evolution of the area is given by Tappin *et al.* (Ref. 24.33).

24.5.12 In the immediate vicinity of Hinkley Point, the exposed and partially buried bedrock is composed of a sequence of limestones, shales and mudstones, the Lower Jurassic, Blue Lias Formation.

24.5.13 At Hinkley Point tidal action has eroded the softer mudstone to leave wide rock platforms of the more competent limestone bands extending out from the cliff lines up to 500m offshore. An outlier of this erosion platform is also present offshore at Stolford, separated from Hinkley Point by the incision of a, now buried, lowstand river channel (Ref. 24.34).

Quaternary Geology

24.5.14 The Quaternary geology of the Bridgwater Bay area is dominated by cyclical changes in sea levels, through a combination of eustatic (global ocean volume) and isostatic (crustal movement) processes.

24.5.15 During the lowstand (lowest sea level) phases, fluvial incision and associated floodplain accumulation were the dominant sedimentological processes operating, whilst during the transgressions, deposition and erosion were controlled by rising base levels, leading first to estuarine and then full marine environments. During the penultimate interglacial, sea level was at approximately 70m above OD (Ref. 24.33), depositing marine and estuarine sediments inland of the present day coastline.

24.5.16 Although, these processes have been operating throughout the Quaternary, the remnant sedimentary record is probably dominated by sequences formed since the Last Glacial Maximum (*c.* 18 ka). Over this period the Bristol Channel has experienced a high rate of sea level rise through to the early Holocene, a period of deceleration during the mid Holocene and then a relatively steady increase in sea level right up to the present (Ref. 24.32). **Figure 24.5** shows (Ref. 24.32) a relative sea level curve for the Bridgwater Bay area, documenting the relatively rapid and dramatic rise in sea level through the earlier Holocene.

24.5.17 The stratigraphically earliest components of this landscape are the incised river channels identified both within the wider bathymetric data (**Figure 24.2**) and from the sub-bottom interpretation of data provided by EMU. The latter dataset describes fragments of relatively narrow (< 250m) ESE-WNW running channels that can be tentatively correlated with tributaries, exposed in the regional bathymetry, which ultimately join the main palaeo-Severn river channel system (**Figure 24.6**). These river cut features do not necessarily relate to incision during the last lowstand and could represent either a single or multiple phases of incision throughout the Quaternary.

24.5.18 During the deglaciation of the Last Glacial Maximum ice sheet and the climatic amelioration of the Holocene the area has experienced both inundation and exposure due to the complex interplay of rising sea levels, and highly differential sedimentation patterns. This complex sequence of environmental change has left a record of intercalated muds, sands and peats that describe the growth (and subsequent decay) of a major estuary in the region that extended to at least 25km inland.

24.5.19 These deposits express a broad tripartite lithostratigraphic division described as the Lower (silt dominated – deposition pre 5,000 cal BC (calibrated BC)), Middle (intercalated silts and peats – 5,000-1,500 cal BC) and Upper (silt dominated – post 1,500 cal BC) Somerset Levels Formation (Ref. 24.35), which corresponds to the Wentlooge Formation found on the Welsh coast.

24.5.20 Detailed work on the terrestrial sequences found throughout the Bridgwater Bay hinterland (broadly the Somerset Levels), demonstrates that this broad classification hides highly spatially heterogeneous sedimentary variations within these sequences.

24.5.21 Thin peat layers are found at depths between -26mOD to -8mOD with dates that range from *c.* 7,500 cal BC to c. 5,900 cal BC and are associated clearly with the Lower Somerset Levels Formation. This suggests the difference between the Lower and Middle Formations are not as different as has been previously suggested (Ref. 24.36).

24.5.22 The Middle Somerset Levels Formation corresponded to a decrease in sea level rise resulting in the sedimentation rate outstripping sea level rise, resulting in the regression of the coastline and the dominance of organic rich peat horizons within the stratigraphy. These peat horizons represent both freshwater and saltwater variants interspersed with alluvium and relate to a period of high intertidal and supra-tidal marsh and bog formation running from the late Mesolithic through to the late Bronze Age. Deposits of this Middle Somerset Levels Formation are again highly spatially heterogeneous and relatively poorly studied.

24.5.23 In addition to these natural changes, much of the land within the Somerset Levels has been repeatedly influenced by human intervention (Ref. 24.37). At least two major periods of enclosure and land reclamation have been identified, firstly during the Roman period with a second wave of reclamations beginning in the Saxon period (Ref. 24.38). Rippon reports that by the mid 3rd to mid 4th century AD, wholly freshwater conditions prevail in palaeoenvironmental studies of the Levels indicating that enclosure and reclamation had taken place (Ref. 24.39). Haslett *et al*. report a date for reclamation, based on the dated onset of Roman lead mining, of 130-221 AD (Ref. 24.40).

24.5.24 In the post-Roman period much of the area of Somerset Levels underwent a period of flooding (Ref. 24.41). The Levels were re-colonised with extensive enclosure following the Norman Conquest and the primary colonising settlements were established by the mid 12th century. A third period of flooding took place during the late Medieval period, with the levels becoming completely inundated by up to 3.5m of water during the flood of 1607 (Ref. 24.32).

24.5.25 The Somerset Levels Formation deposits are thought to be contiguous with the intertidal and subtidal zones of the Bridgwater Bay area, including the unconsolidated, muds, sands and gravels that intermittently cap the incised bedrock surface identified offshore of Hinkley Point.

24.5.26 The Steart Flats represent a significant area of the Middle Somerset Levels Formation, and are considered in more detail by Jordan (Ref. 24.42). Here, deep deposits of alluvium and freshwater peat, including the Stolford Submarine Forest, are to be found in close association with a small amount of Mesolithic archaeological material.

24.5.27 Of particular note, offshore of Hinkley Point, is the western margin of the Bridgwater Bay settled mud patch, a thin accumulation of intercalated sands and muds that are believed to have been deposited, below wave base, in response to human management of the adjacent Somerset Levels over the last two thousand years (Ref. 24.32).

c) Lithological and Stratigraphic Modelling of Deposits

24.5.28 Detailed lithological and stratigraphic modelling of coastal/offshore deposits in the region has been undertaken to extend current understanding of the pre-Quaternary geology and archaeology of the area.

24.5.29 This modelling has been based on the boreholes and vibrocores taken offshore of Hinkley between late 2009 and early 2010 by Fugro on behalf of EDF Energy.

24.5.30 In total, 23 boreholes and 64 vibrocores were recovered offshore from Hinkley Point. Fugro provided core logs and photographs for all cores, the data from which were entered into the geotechnical utilities package Rockworks 15 in order to carry out both lithological and stratigraphic modelling of these deposits (Ref. 24.30).

24.5.31 Six representative vibrocores were taken from across the offshore survey area for more detailed analysis including: detailed stratigraphic logging, photographic imaging, particle size analysis, x-radiography, pollen, microfossils (foraminifera, and diatoms) and macrofauna (shells), radiocarbon and palaeo-magnetic dating, and sediment geochemistry. Details of this work are presented in *Hinkley Point C: Archaeological Assessment of Offshore Vibrocores* (Ref. 24.25).

24.5.32 The stratigraphic model is shown in **Table 24.4** and described in detail below.

Table 24.4: Stratigraphic Sequence for the Assessed Cores

Unit	Interpretation	Somerset Level Formation Equivalent
Upper Marine sands, silts and gravels	Marine seabed sediments	Upper
Upper Peat and organic rich silts	Peat and organic rich silt deposits	Middle
Marine Silts II	Low energy intertidal/shallow water marine deposits	
Intercalated Peat	Intercalated Peat	
Marine Silts I	Low energy intertidal/shallow water marine deposit	
Lower Peat/Organic rich silts	Peat and organic rich peat deposits	Lower
Lower Silts/Clays	Freshwater and Estuarine Alluvium	
Lower Gravel	Lower Gravel	N/A
Blue Lias Bedrock	Reworked Quaternary gravels	

i. Lower Gravel

24.5.33 This unit comprised brown silty very coarse gravel. It was only recorded in the base of a sub-set of the cores and appears to rest directly on the top of bedrock. These deposits are interpreted as reworked Quaternary gravels, probably under fluvial conditions.

ii. Lower Silts and Clays

24.5.34 This unit comprised silts and gravelly silts and was recorded in the majority of cores. Where x-radiographs have been taken of this unit there is evidence of small millimetre scale density laminations. This would suggest rhythmic deposition of material in very low energy environments. In these coastal settings, such a signature is indicative of tidal rhythmites, suggesting connection with the open ocean. However, the pollen and micro-fossil assemblages suggest a freshwater origin for these and may be more akin to the varve like sequences seen commonly in lakes or still ponded water.

24.5.35 These sediments are barren of foraminifera and diatoms further supporting their deposition in a freshwater environment. Further, these sediments record low $\delta 13C$ values which is consistent with the interpretation that this is not a marine deposit, but instead is a terrestrial environment associated with a strong freshwater influence.

24.5.36 This unit is therefore interpreted as being a freshwater sequence, with the Lower Gravels, where found, indicating a higher energy potential base of the deposit.

iii. Lower Peat and Organic Rich Silt Deposits

24.5.37 The lower peat and associated organic rich clays are found throughout the area and in over 50% of the core logs. The base of this unit varies in height from *c.* -10.7mOD to a maximum recorded depth of -16 mOD.

24.5.38 The peat layers vary in thickness between 2 and 20cm in thickness, but they are heavily compacted by overlying sediment. Multiple samples have been radiocarbon dated with those from the strongest stratigraphic contexts giving consistent dates of between 7,040-6,700 cal BC.

24.5.39 The palynological data from this horizon supports the radiocarbon dates for the early Holocene and Boreal ages (Flandrian chronozone Ib and Ic). This represents a period of dynamic vegetation whereby, after the close of the last (Devensian) cold stage and thermal amelioration, flora was able to migrate from their glacial refugia. This saw the progressive establishment of warm/interglacial stage vegetation through a series of seral woodland vegetation changes. This occurred asynchronously across the country in response to ability/rate to colonise and associated edaphic (soil condition) changes (Ref. 24.43).

24.5.40 Typically, early establishment of *Juniperus* (juniper) and *Betula* (birch) as pioneer colonisers occurred at, and shortly after, c. 8,000 BC This was followed by *Corylus avellana* (hazel) and *Pinus* (pine) – the former early in south-east England – followed by *Quercus* (oak) and *Ulmus* (elm) which, as slower colonisers, ultimately ousted *Pinus* at different times during the Boreal period in southern Britain (and much later in northern parts of the country). Here, the period of pine importance/dominance was c. 6,550 BC. giving way to oak and elm domination by c. 6,050 BC. Other thermophiles (*Tilia, Fagus, Ilex*) arrived prior to c. 5,000 BC.

24.5.41 It is within this broad framework of change that the pollen data from Hinkley can be placed/correlated. The earliest phase recorded here is dominance of pine (*Pinus*) with hazel (*Corylus avellana* type). This gave the often described, Boreal, pine-hazel forest discussed in the early years of pollen analysis (Ref. 24.44; Ref. 24.45; Ref. 24.46). During this woodland phase, there are also small numbers of oak (*Quercus*) and elm (*Ulmus*). These represent the first traces after arrival of these trees into the region probably representing pollen coming from small stands in the vicinity or from more extensive, expanding woodland at greater distance from the site. Subsequently, their expansion to become the main woodland constituents is also seen.

24.5.42 Further expansion of woodland saw the arrival and expansion of other, more thermophilous taxa and those with slower migration rates. Thus, taxa such as *Hedera* (ivy) *Fagus* (beech), *Ilex* (holly) and *Alnus* (alder) are seen in the upper levels/zones.

24.5.43 Peat formation occurred under wet herb fen with evidence of grasses, sedges, reed mace, bur reed, arrowhead Royal Fern and other typical fen taxa. There is some evidence for standing water with cysts of algal *Pediastrum* and possibly pondweed (*Potamogeton*). Because of the early Holocene age of peat formation, *Alnus* (alder) carr woodland did not develop; it probably had not arrived at this location. It is, however, possible that hazel and some oak colonised drier areas of peat, especially in the latter stages of peat accumulation prior to transgression.

24.5.44 The peat horizons either contain low abundance, low diversity assemblages or are effectively barren suggestive of non-marine conditions. The effects of marine incursion are however seen in the pollen record with expansion of halophytes, predominantly *Chenopodiaceae* (goosefoots, oraches, and samphire) in the upper peat and overlying mineral sediment. Abundances do appear to increase towards the upper contacts. The species that are present are indicative of a range of environments including typical saltmarsh environments near the upper limit of marine influence; and brackish estuarine conditions with minor contributions of both high intertidal settings and open/high energy conditions.

24.5.45 Within one core (VC06) the lower peat deposit has a good transgressive contact and so represents a potential sea level index point. This interpretation is supported by the micro-fossil analysis and isotope analysis, which show progressive change within and between this and the overlying units which is suggestive of an unbroken sedimentary sequence.

24.5.46 This peat horizon would appear to be an offshore correlative of the oldest sections of the submerged forest peats identified at Stolford and in boreholes of the immediate hinterland (Ref. 24.47; Ref. 24.48).

iv. Marine Silts I

24.5.47 This unit comprised fine silts, varying in consistency between compact and soft. Marine shell fragments were found within infrequent bands.

24.5.48 This unit, along with the intercalated peat and Marine Silts II, represents part of the Middle Somerset Levels Formation. These sediments have a distinct foraminferal assemblage, more typical of brackish, low intertidal to subtidal environments with some evidence of fully marine species suggesting proximal connectivity to open marine conditions. In contrast, diatom assemblages are of rather low diversity but still contain diagnostic taxa associated with marine and brackish water conditions.

24.5.49 This unit is interpreted as a low energy marine/estuarine deposit, probably accumulating in a full subtidal condition but in close proximity to more extensive intertidal environments.

v. Intercalated Peat

24.5.50 This unit comprises very thin bands of intercalated peats. The unit has only been identified in a small number of cores, with the possibility remaining that the thin organic layers are re-deposited rather than being in-situ.

24.5.51 However, the contemporaneous Stolford stratigraphy has been interpreted as representing spatially and temporally heterogeneous progradation of the coastal zone in response to the combination of a lowering in the rate of sea level rise and hence an increased dominance of sediment accumulation. Therefore, it is more likely that they are in-situ (Ref. 24.47; Ref. 24.48).

vi. Marine Silts II

24.5.52 This unit comprises fine marine silts, identical to Marine Silts I and was also identified as a low energy marine/estuarine deposit.

vii. Upper Peat and Organic Rich Silts

24.5.53 This unit comprises organic rich silts and has been tentatively identified from Fugro geotechnical records. It is possible these relate to thin peat deposits belonging to the Middle Somerset Levels Formation.

viii. Upper Marine Sands, Silts and Gravels

24.5.54 This unit comprises the upper silt, sand and gravel deposits, potentially forming part of the Upper Somerset Level Formation. The x-radiographs for this layer show clear preservation of strong density laminations which in this location could represent tidal rhythmites. Such a tidal signal in a sedimentary sequence requires temporally or spatially restricted depositional conditions with a high sediment supply and adequate accommodation space (Ref. 24.49). This interpretation would suggest protection from the open inner shelf conditions prevalent today.

24.5.55 This unit is interpreted as marine sands, silts and gravels, forming the current seabed surface in the study area.

ix. Modern Environment

24.5.56 Bridgwater Bay is notable for its large tidal range (the mean spring tidal range is 10.74m and the mean neap tidal range is 4.8m) and extensive mudflats stretching up to 4 kilometres wide. These mudflats developed as a result of a change in sediment regime, from sand dominated to mud dominated, brought about by human land reclamation practices over the last 2,000 years.

24.5.57 The mudflats accrete during periods of calm weather, especially in summer when helped by algal binding. This forms a blanket or drape of fine sediment over the underlying more consolidated Holocene deposits. During storm events this surface blanket is eroded away, the fossil clays are exposed and are themselves weathered (Ref. 24.50).

24.5.58 The relatively raised position of Hinkley Point compared to the lower lying ground to the east, combined with the solid nature of the limestone cliffs, has ensured that changes in coastline throughout the late Holocene have had minimal impact upon the immediate area of the present Hinkley Point Power Station Complex.

24.5.59 The developmental configuration of the mouth off the Parrett, with its islands and sandbanks, has changed considerably over the last few hundred years (Ref. 24.51; Ref. 24.52; Ref. 24.53; Ref. 24.54; Ref. 24.55). Between Hinkley Point and the Parrett, Holocene deposits are mostly overlain by storm shingle ridges whilst sand beaches with dune formations stretch northwards from the Parrett up to Brean Down (Ref. 24.32).

d) Archaeological and Historical Background

24.5.60 A total of 3,235 heritage assets were identified from the records consulted for the broader study area (**Figure 24.7**). In addition three sites of archaeological interest that had not previously been recorded were located after examination of side-scan sonar and bathymetric data. The full data sets associated with this search are available within the desk based assessment (Ref. 24.30).

24.5.61 The purpose of the very broad search area was to inform the baseline assessment and therefore not all sites are commented on directly here. Those sites that are of particular significance, or that lie in close proximity to proposed areas of work are discussed. It should be noted that no sites were recorded offshore in the 'Hinkley Point Area' described in **Figure 24.1**, but that three new potential sites were found within the broader study area.

24.5.62 The period summaries below provide the broader context for the Hinkley Point study area. This is essential in order to allow determination of archaeological potential below the MHWS.

i. Palaeolithic (c. 700 ka- 9,700 BC)

24.5.63 In Britain the Palaeolithic stretched from the first recorded human arrival up to the end of the last ice age. During the colder periods of ice sheet advance *homo heidelbergensis* and *homo neanderthalensis* populations, and later *homo sapiens sapiens* appear to have retreated out of the land mass that corresponds to the British Isles and returned at warmer times. Most Palaeolithic evidence comes from the east and south of Britain and primarily from the context of caves or the generally more re-worked secondary context of river gravels.

24.5.64 There are no recorded Palaeolithic remains in the study area. However, mammoth tusks and flint assemblages have been found at St Audries Bay *c.* 10km to the west (Ref. 24.36), and Uphill c.17km to the north-east (Ref.24.26). Recent work at Doniford, 13km west of Hinkley Point, recorded a stretch of the cliffs from which Palaeolithic material was recovered (Ref. 24.56). The gravel deposits themselves varied from those which were complex and disturbed, to ones which appeared to be intact and well-bedded. This is significant as it points to the potential for primary context, or minimally moved material to be recovered from fluvial gravels even in areas which have until recently been considered of 'very low potential' for Palaeolithic archaeology. Thus, although the overall chance of encountering Palaeolithic material is seen to be low, this points to the importance of carefully considering offshore deposits for potential data pertaining to submerged land surfaces.

ii. Mesolithic (9,700 - c. 4,500 BC)

24.5.65 The end of the last ice age in the late Palaeolithic gave way to the warmer temperatures and sea level rise associated with the Holocene. Britain became separated from mainland Europe at *c.* 6,000 BC and a grassland environment was established that eventually became dense forest interspersed with freshwater lakes.

24.5.66 Sea level changes between 7,000 BC and 5,000 BC affected the upper Severn Estuary, with the marine transgression drowning the coastal woodlands and low lying landscape. The sedimentary sequences are indicative of a landscape changing between saltwater estuary, reed beds and a drier bog forming environment within which Mesolithic populations existed and adapted (Ref. 24.57).

24.5.67 Mesolithic life was characterised by seasonal rhythms and movement, a hunter gatherer lifestyle based upon the exploitation of a wide range of resources. This was achieved using a sophisticated toolkit of worked bone, antler and composite tools constructed using small blades or microliths. Coastal and riverine environments were heavily exploited by Mesolithic populations and, whilst no remains have been found, may have incorporated the use of skin and hide based watercraft (Ref. 24.58; Ref. 24.59).

24.5.68 Mesolithic flint scatters are recorded to the immediate west of Hinkley Point and also to the south of Stolford. These were found during field walking in the northern part of the site in 1992, but no evidence for Mesolithic activity was recovered during trial trenching in this area (Ref. 24.60). Portions of the offshore peat deposits and submerged forest at Stolford date to the late Mesolithic. Similar submerged forests and peat deposits at Minehead and Porlock have produced large amounts of Mesolithic material, as have the Gwent levels on the other side of the Severn Estuary (Ref. 24.61). Major Mesolithic sites in the wider area are located at Hay Wood Cave 5km to the east of Brean Down, and further inland at Avelaes Hole and Goughs Cave (Ref. 24.26).

24.5.69 Vibrocore samples and the modelling described above indicate the presence of buried peat horizons below the soft sediments offshore of Hinkley Point. Archaeologically this data provides information on the environment of the early Mesolithic. Although, no sound evidence of human effect on the vegetation has been found, micro-charcoal has been found in some of the peat. It is not possible to determine whether this is derived from anthropogenic or natural causes.

iii. Neolithic (c. 4,500- 2,000 BC)

24.5.70 The Neolithic in Britain was a period of considerable change away from the previously established Mesolithic way of life. The domestication of animals, the adoption of agriculture and at times a sedentary settled lifestyle, with land clearance for grazing and cultivation, resulted in gradual deforestation. An increase in material culture was produced by the adoption of pottery and funerary monuments began to be constructed in the landscape.

24.5.71 There has been no Neolithic material recorded in the offshore zone at Hinkley Point. Wick Barrow (also known as Pixies Mound), a scheduled round barrow with origins in the Neolithic period, is located 50m to the east of the HPC Development Site. (Ref. 24.62). Neolithic settlement evidence has been excavated in the local area to the north, at Brean Down.

24.5.72 During the early Neolithic, extensive coastal organic peat deposits were formed and preserved beneath the silty clays of subsequent mid-Holocene flooding events. These peat deposits and the environmental information contained with them are given a high priority for archaeological investigation (Ref. 24.26; Ref. 24.36; Ref. 24.63).

iv. Bronze Age (2,000 - 700 BC)

24.5.73 The Bronze Age was characterised by the adoption from the continent of metalworking, notably copper and then, with the alloying of copper and tin, bronze.

Exploitation of the environment become more intensive following this development and scattered farming settlements loosely formed into chiefdoms. The Bronze Age is notable for a marked increase in funerary monument building due to a shift away from communal burial towards single inhumations and cremation. This transition from the Neolithic into the Bronze Age is also associated with a material culture complex most readily identified with Beaker Ware pottery. Archaeological remains of Bronze Age date were recorded across the HPC Development Site (Ref. 24.60. Middle to Late Bronze Age pottery was recovered from a shallow, linear feature in the north of the HPC Development Site. The charcoal rich deposit also contained animal bone and shell. Although the nature of the deposited material suggests domestic activity no structures were identified in the vicinity of this feature. The remains of a possible prehistoric burnt mound were uncovered further to the west.

24.5.74 A substantial ditched enclosure, approximately 50m in diameter, appears to have been built and occupied during the Middle to Late Bronze Age in the south of the HPC site. In addition the truncated remains of an Early Bronze Age cremation were recorded in an area of later archaeological features spanning the Iron Age, Roman and medieval periods, to the east of the enclosure.

24.5.75 Wick Barrow was enlarged to over 25m in diameter during this period. Three crouched secondary burials were interred in the enlarged mound. In a break from earlier Neolithic practices grave goods including beaker pottery were also interred with the bodies. A large hoard of Bronze Age metalwork recovered from Wick Park in 1870 included a significant number of weapons that have led to speculations of a ritual deposit in a watery environment (Ref. 24.64).

24.5.76 A large amount of Bronze Age material has been recorded within the area along the Welsh side of the Severn Estuary (Ref. 24.60). This spatial bias is in part due to the work of Upton and Bell on the Gwent Levels (Ref. 24.36).

24.5.77 Partial remains of Bronze Age boats have been recovered from along the opposite bank of the Severn Estuary to the study area at Gold Cliff and Caldicot (Ref. 24.36). Remains, probably from Bronze Age wreck sites, have been located off Moor Sands and Langdon Bay on the south Devon coast (Ref. 24.65; Ref. 24.66; Ref. 24.67).

v. Iron Age (700 BC-AD 43)

24.5.78 The Iron Age is identified with the adoption of iron working, and greater agricultural output, in part linked to the exploitation of new varieties of barley and wheat along with other crops such as peas and beans. Settlement consisted of round houses that varied in levels of enclosure, ranging from open houses through to large defended hillforts.

24.5.79 Marine transgression during the Iron Age meant that much of the low lying study area was flooded saltmarsh (Ref. 24.32). Occupation was located on raised ground associated with outcrops of underlying geology (Ref. 24.41).

24.5.80 Residual Iron Age pottery and possible features of later prehistoric date were recorded within two later Romano-British settlements located within the HPC development site. A possible ring ditch of Mid-Late Iron Age date and a possible ditched enclosure were recorded in the south-east of the HPC development site, but the full extent of these features was obscured by later disturbance (Ref 24.60).

24.5.81 The local area contains hillforts, at Dowsborough c.8km to the south-west, Cannington, 6km to the south, Brent Knoll landward of Burnham-on-sea c.13km to the north-east, and at Brean Down 15km to the north-east.

24.5.82 An Iron Age lake settlement was located at Alstone 10km east of Hinkley Point. An Iron Age log boat has been recovered from the Somerset levels at Shapwick and shows the use of river systems and lakes as a means of transport.

vi. Roman (AD 43-450)

24.5.83 The Roman invasion in AD43 brought with it a series of sweeping changes that are visible in the archaeological record through the varied adoption of Roman material culture, building types and settlement patterns.

24.5.84 A 1st to 3rd century Romano-British settlement and a later 3rd to 4th century Romano-British settlement were identified during archaeological investigations on the HPC development site (Ref 24.60).

24.5.85 Evidence of Roman period salt production has been uncovered at Burnham and also possibly at Combwich. The discovery of over 167 salt production related sites in the area, a number that is likely an underestimate due to burial by post Roman flooding, highlights the extent of these activities (Ref. 24.41).

vii. Early medieval (AD 450-1066)

24.5.86 After the end of Roman rule there was some continuity of settlement through to the 6th and 7th centuries. Most of the evidence for the development of early medieval (Saxon) landscape comes from documentary sources and surviving landscape features such as boundaries, field divisions and place names. Drove ways were established to move livestock between pastures and settlements, open fields were divided into strips for cultivation and waterlogged land began to be reclaimed.

24.5.87 No finds or features of this date were recorded during the trial trenching or watching briefs on the HPC site (Ref 24.60).

24.5.88 Bridgwater Bay, especially the Steart mudflats, contains a large number of wooden stake fish weirs, some of which have been dated by dendrochronology to the end of the early medieval period (Ref. 24.68). These surviving structures indicate the local populations’ exploitation of marine resources and are considered to be of regional if not national importance (Ref. 24.69).

viii. Medieval (1066 – 1540 AD)

24.5.89 The medieval period built upon the already established rural landscape and agricultural systems, based upon feudal land ownership. The Norman invasion in 1066 produced a significant change in overall land ownership, along with the increasing influence of the monasteries until their dissolution between 1536 and 1541.

24.5.90 Medieval pottery fragments, of 12th to 14th century date, were recovered from heavily truncated pits and ditches close to the southern Hinkley Point C development site boundary. Fish weirs continued to be used on the intertidal mudflats through the medieval period (Ref. 24.70).

ix. Post medieval (1540-1899 AD)

24.5.91 The post medieval period saw an increase in trade and the increased growth of Bridgwater as an economic centre. Land use changed as field systems began to be enclosed, a process that started in the early medieval period before becoming almost complete by 1850.

24.5.92 Water meadows were constructed in low lying areas to further increase the productivity of pasture land. This was coupled with the increased use of fertilisers from the later 16th century onwards. This had an increasing effect on the local area as coal was imported from Wales in order to fuel the lime kilns necessary for fertiliser production. Lime kilns dot the coastline and may also be an indicator of coal landing points, with Burton Quay as an example. Stolford is recorded as being an important coal landing point, and surrounding parishioners are recorded as investing in local shipping.

24.5.93 The Severn Estuary became a major shipping channel as trade with Europe, and later the New World flourished. A number of wrecks dating from this period are present within Bridgwater Bay, ten of them positively identified (*Auckland, Edward, Endeavour, Favourite, Friends, Frances and Mary, Hope, Halcyon, Merioneth and Molly*).

x. Modern (1900 AD – present day)

24.5.94 The twentieth century again saw a change in landscape use with a loss of field boundaries due to the mechanisation of farming methods, and substantial appropriation of the area for first military and then energy generation purposes. Large offshore areas at Hinkley Point and Stolford were used by the military, with a variety of different ordnance dropped or fired into them.

24.5.95 A number of modern wrecks are identified on the mud banks of Bridgwater Bay (Ref. 24.71). Five are reported in this area within the NMR (*Providence*, *Diana*, *Borderdene* and the remains of two unidentified craft).

24.5.96 Thirteen aircraft crash sites are located within the area of Bridgwater Bay. The majority of these are either military target aircraft from the offshore firing range or losses from the Second World War, for example a German Heinkel He-111 bomber (1400154 NMR).

24.5.97 A search of the United Kingdom Hydrographic Office (UKHO) wreck record for the area shown in **Figure 24.7** produced 14 results (**Table 24.5**). Only one of these results (Wreck_ID 67535) lies close to the area of the proposed HPC development works. This is classified within UKHO records as a diffuser and was reported by the British Nuclear Group. This relates to the existing Hinkley Point nuclear plant's outfall diffuser and as such has been registered with the UKHO as a navigation hazard, rather than the remains of a wrecked vessel.

24.5.98 No protected wrecks were identified in the study area.

Table 24.5: UKHO search results for the study area (with NMR equivalency shown where available)

Wreck ID	NMR	State	Accuracy	Latitude N	Longitude W	Category	Date sunk	Type and Name
12421		Live	Precisely known	51 19'.167	003 16'.450	Foul ground	1940	S. Trawler HMS Oswalidan

12528	1002981	Live	Unreliable	51 11'.000	003 03'.167	Undefined	Not known	Not known

24.5.99 A full archaeological assessment of the bathymetric and side-scan sonar datasets identified in **Table 24.1** has been undertaken to look for wreck or associated material. Thirty-eight anomalies were detected (**Table 24.6**). Of these, two are considered to be of potential archaeological significance (ID 1 and ID 38) and two may warrant further investigation (ID 2 and ID 3). The remainder are believed to be of a geological origin or debris.

24.5.100 However, in all cases these anomalies lie outside of the areas of the proposed HPC development works.

24.5.101 Geophysical anomaly ID 1 (**Figure 24.8**) represents the most significant potential wreck site identified. This is due to its previously unrecorded nature (there is no associated UKHO record), size, visibility and proximity to planned HPC development works. This anomaly lies 210m north-west of the proposed location of Intake 2.

24.5.102 The anomaly is 35m long, 15m wide, oriented NNW-SSE and resides in a scour pit oriented sub-parallel to the major tidal current direction. Although data quality is good over the anomaly, it is not possible to offer a definitive interpretation of the type of wreck/wreckage this feature represents.

24.5.103 Geophysical anomalies ID 2 and ID 3 are a pair of *c.* 10m x 10m upstanding (*c.* 0.5m relief) rectangular blocks 30m apart. They both sit within their own scour pits and are located 260m to the north-east of the diffuser target (ID 7) described above. These blocks probably relate to the construction of the existing Hinkley Point Power Station Complex.

24.5.104 A diffuser, identified in the UKHO records 600m offshore of Hinkley Point, was reported by the British Nuclear Group. These relate to the existing nuclear plant's outfall diffuser and as such have been registered with the UKHO as a navigation hazard, rather than the remains of a wrecked vessel.

24.5.105 In association with UKHO ID 67535 (which correlates with geophysical anomaly ID 7), the nuclear plant's outfall diffuser, there is evidence of two buried and partially buried dry dock structures which relate to the initial construction of the existing Hinkley Power Station Complex in the late 1950s. The first lies *c.* 300m west of the existing complex and can be seen as a partially filled cut in the bedrock 60 – 70m wide and extending offshore. A short report by Jacobs (Ref. 24.72) has identified contemporary photographs of this structure and confidently identified it as a dry dock structure.

24.5.106 A similar feature is identified on the eastern margin of the existing Hinkley Point Power Station complex. It is also cut into the local bedrock but is slightly smaller (50m) with a more consistent width. There is no associated archive material with this so it cannot be as confidently described as a dry dock.

24.5.107 In addition, to the bathymetric and side scan data EMU (Ref. 24.73) also conducted a magnetometry survey along selected transects offshore of Hinkley Point. This data was not independently assessed but suggests there are 244 'significant' anomalies in the area. Significant being defined as all anomalies greater than 0.5 nanoTesla (nT) in water depths less than 8m and greater than 3nT elsewhere.

24.5.108 Of these 'significant' anomalies only three correspond with surface anomalies identified in the sonar and swath data. Two correspond with geophysical anomaly ID 1 and one with geophysical anomaly ID 19, which is a small (5m x 5m object, 0.1m high) sitting in a larger scour pit in the far west of the survey area.

24.5.109 As discussed in the EMU report (Ref. 24.73), and the archaeological assessment for the borehole locations (Ref. 24.30), the other anomalies are likely to be indicative of buried ferrous material (potentially unexploded ordnance (UXO) or potentially archaeology) near to the anomaly locations. Only three of these anomalies, EMU Mag ID 54 (15.9 nT), ID 66 (4.2 nT) and ID 223 (1 nT), fall within a 250m box centred on the proposed site of intake 2. There are no surface expressions for these anomalies in any of the other geophysical datasets.

Table 24.6: Anomalies identified during review of side-scan sonar and swath bathymetry data

Object ID	East (OSGB)	North (OSGB)	Dimensions	Relief (m)	EMU SSS ID	EMU Mag ID	Interpretation
ID 1	317,892.62	149,029.10	35 x 15m	3	1	51, 52	Possible wreck in scour pit
ID 2	321,026.09	147,054.55	10 x 12m	0.5			Two possible concrete blocks
ID 3	321,051.87	147,062.42	11 x 9m	0.6			Two possible concrete blocks
ID 4	321,195.27	146,925.28	7 x 7m	0.4			Debris/or possible UXO
ID 5	321,184.27	146,901.01	7 x 5m	0.6			Possible oildrum
ID 6	321,260.67	146,950.01					Possible cobbles
ID 7	320,875.34	146,860.55	40 x 40m				Nuclear plant water intake
ID 8	320,258.38	147,367.56	342 x380m	2			Possible sand and gravel outcrop
ID 9	319,613.91	147,997.47	150 x 80m	0.8			Sand dune
ID 10	318,642.52	148,472.81	415 x 230m	2			Cobbler patch on chart, sand and gravel
ID 11	318,913.85	148,803.90	50 x 60m	1			Scour pit
ID 12	320,627.39	147,039.49	16 x 18m	0.7			Concrete block
ID 13	317,758.59	149,729.38	24m lines and scars				Trawl scars, anchor drags
ID 14	317,899.45	149,648.86		0.8			Scour pits, anchor drags, debris
ID 15	317,953.18	149,552.02	5 x 6	0.2			Scour pit
ID 16	316,541.32	148,998.49	16 x 3m	0.5			Scour pits
ID 17	316,120.09	148,886.85	145 x 58	0.3			Debris, possible trawl net scoop
ID 18	316,097.36	148,507.63	90m	1.2			Scour pit
ID 19	315,450.05	148,893.22	5 x 5m	0.1		190	Scour pits with objects in bottom
ID 20	317,332.83	148,741.44	80 x 40m	0.8			Probable sand bank
ID 21	316,335.70	148,782.64	5 x 3m	0.2			Small scour pits
ID 22	317,628.16	147,709.97	60 x 50m	0.1			Mound with low relief, sand and gravel detected on side scan sonar

Object ID	East (OSGB)	North (OSGB)	Dimensions	Relief (m)	EMU SSS ID	EMU Mag ID	Interpretation
ID 23	318,394.08	148,454.09	10 x 10m	0.7			Scour and raised feature
ID 24	322,374.55	148,721.38	30 x 40m	0.4			Shallow pit
ID 25	324,595.88	150,007.79	25 x 29m	0.6			Shallow pit
ID 26	318,322.12	148,362.33	7 x 7m	0.2			3 x 7m diameter objects with scour
ID 27	313,716.94	147,984.56	7 x 8m	0.5			Object with 40m of scour
ID 28	315,286.04	147,100.60	5 x 5m	0.4			Object within shallow scour
ID 29	315,696.77	147,791.05	7m across	0.2			Three possible scour features, though faint
ID 30	318,019.75	149,362.58	10 x 6m	0.3			Shallow scour pit
ID 31	324,693.42	147,871.42	21 x 9m	0.4			Pit with object
ID 32	324,830.47	149,995.31	5 x 5m	0.3			Pit with object
ID 33	322,664.62	155,550.38	24 x 8m	0.6			Pit
ID 34	324,354.83	147,607.71	5 x 5m	0.3			Pit
ID 35	321,886.15	147,431.08	18 x 5m	0.3			Pit
ID 36	324,977.50	150,674.46	2 x 2m	0.5			Raised object with pit
ID 37	327,692.56	143,965.47	26 x 23m	0.2			Unknown possible debris

e) Previous Impacts

24.5.110 Previous impacts on the known and potential submerged archaeology within the offshore area at Hinkley Point shown on **Figure 24.1** include dredging for shellfish (trawl marks visible on side-scan sonar), military use of the area, the construction of the existing Hinkley Point Power Station Complex and borehole/vibrocore extraction carried out for the HPC Project design and feasibility studies.

24.5.111 Dredging for shellfish, military use of the area, and the construction of the original Hinkley Point Power Station Complex do not appear to have impacted directly on the submerged landscape deposits identified through the modelling process.

24.5.112 The boreholes/vibrocores excavated as part of the offshore geotechnical site investigation had a minimal impact on the submerged landscape. There is no evidence of impact on any submerged archaeological sites within the area.

24.6 Assessment of Impacts

a) Construction Impacts

24.6.1 This section describes the impacts on submerged and intertidal archaeology that would occur during the construction phase of HPC. Work offshore of Hinkley Point would comprise the construction of two cooling water intake tunnels and one outfall tunnel all drilled through bedrock and each with a structure protruding from the seabed surface; construction of a temporary jetty to facilitate the construction of HPC to be dismantled and removed at the end of construction; and a fish return system.

24.6.2 A general description of the construction phase is contained in **Chapter 3** of this volume. A summary of the assessment of impacts and their significance is provided in **Table 24.7**.

i. Removal of Holocene deposits during installation of the temporary jetty

24.6.3 The jetty head arrangement will comprise a main berthing island, a berthing dolphin to the west and two mooring dolphins positioned either side and set back from the berthing face. It is anticipated that the jetty deck would be a 1.5m thick reinforced concrete slab supported by a combination of both vertical and raking piles some of which will need to be anchored to withstand the berthing loads. It may not be feasible to drive the piles directly into the rock mass hence the installation method is anticipated to be either ‘drill and drive’ or pre-drill and concrete the pile into the socket.

24.6.4 With the drill and drive approach, the pile is seated onto the rock head, a drill is then inserted down the pile shaft and a hole drilled into the rock mass, the pile is then driven into the hole, the hole is then extended and the pile is driven further into the hole until the required penetration is achieved. This technique would generate a degree of piling noise but is not anticipated to create much in the way of bed disturbance.

24.6.5 The alternative pile installation approach is for the pile to be placed into a concrete filled rock socket. The pile is firstly driven to rock head, a drill is inserted down the pile and the rock socket is drilled then enlarged using the under-reaming blades to a diameter greater than the pile. Concrete is placed into the rock socket and the pile is driven into the wet concrete. Shear rings on the pile provide a degree of tension capacity. The steel tubular piles to support the jetty head and dolphins would be driven in a similar manner to those installed for the access bridge. Pile installation would be undertaken from a jack-up barge.

24.6.6 In constructing the jetty bridge, 45 to 55 steel tubular piles of c. 860mm diameter would be installed 4m to 5m into the bedrock layer. It is estimated that 70-90 piles of c. 910mm diameter would be installed to support the jetty head deck, dolphins and fendering. Tension anchors would be installed in selective piles or the piles could be concreted into rock sockets.

24.6.7 The jetty head deck and dolphins are anticipated to be cast in-situ reinforced concrete, with construction activities being undertaken from a jack up barge. During detailed design the use of pre-cast concrete elements will be considered.

24.6.8 Consideration has been given to using monopole construction for both the mooring and berthing dolphins. It is anticipated that such an installation would involve a pile of some 2.5m to 3.0m diameter for the berthing dolphin and 1.5m to 2.0m diameter for the mooring dolphin, grouted into a 12m deep pre-drilled rock socket. The preference is likely to be for multiple piles.

24.6.9 In order to retain cement vessels afloat during unloading it is proposed to form a dredged berth pocket, 160m long, 27m wide and 3m deep (4,320m^2), seaward of the berthing face (a level c. 4.5m Below Chart Datum (BCD)).

24.6.10 There are no recorded archaeological sites, or geophysical anomalies identified within the vicinity of the proposed temporary jetty location.

24.6.11 Piling would impact on the offshore unconsolidated deposits of sands, silts, gravels and clay that occur beyond the intertidal bedrock platform and include both basal and intercalated peats.

24.6.12 Dredging of the berthing pocket would also disturb the unconsolidated sediments described above. However, none of the three vibrocores (VCJ 18, VCJ19 and VCJ21) in the proposed pocket have any clearly identified organic horizons (only ‘possible’ organics were noted between 2.36m and 2.45m below bed in VCJ21).

24.6.13 The combined footprint of the berthing pocket and piles for the jetty structure would remove less than 1% of the area of submerged landscape recorded during the offshore surveys. Thus, although the importance of the deposits is high, installation of the structures would represent a permanent impact of low magnitude. This would result in an overall impact of **moderate adverse** significance.

ii. Removal of Holocene Deposits during Construction of The Intake Tunnels and Outfall Pipe

24.6.14 Construction of the tunnels, at depth through bedrock, would not impact directly on archaeological deposits.

24.6.15 Pre-construction seabed works and installation of the intake/outfall heads would cut through the unconsolidated sediments and break the seabed surface. There would also be an impact from the footprint/anchors of the installation vessels.

24.6.16 The current designs for the intake heads have a footprint of *c.* 35.5m x 10m and a height above seabed of 2.8m, whilst the outfall pipe has a foot print of *c.* 8.8m x 9.4m with a height above seabed of *c.* 5m. The vertical connecting pipes have diameters of *c.* 6m.

24.6.17 There are no known, or potential, archaeological sites within the area of the proposed development works offshore of Hinkley Point.

24.6.18 Three magnetic anomalies have been identified within the proximity of one of the intake heads (Unit 2, Intake 2; located NGR 318014, 148854). The nearest of these, a 1 nT magnetic anomaly (EMU ID 223), is 70m to the SSE of the installation point. The other two magnetic anomalies (EMU ID 54 and EMU ID 66) are in excess of 165m away. Consequently, there is no envisaged installation impact on these features unless a very large vessel is used. If this were to be the case, avoidance blocks should be placed around magnetic anomalies (EMU ID 54 and EMU ID 66) to ensure no direct impact from the vessel footprint.

24.6.19 Similarly, Unit 2 Intake 2 lies *c.* 210 m from the location of Geophysical Anomaly ID 1 and *c.* 185m from the southern edge of its scour pit. There are no envisaged installation impacts on Geophysical Anomaly ID 1 unless very large vessels (150 m+) are used.

24.6.20 The installation of the surface intake and outfall head structures and connecting vertical shafts would impact on the sediment stratigraphy including, at one locality, examples of the basal and intercalated peats.

24.6.21 Unit 1 Intake 2, coincides with the position of borehole CBH5, which records 4.8m of unconsolidated sediment above the Blue Lias bedrock. The stratigraphy here consists of interbedded silts and sands with three peat horizons at 1.37m, 2.6m and 3.7m beneath the seabed. Unit 2 Intake 2 coincides with CBH7 which describes 4.5m of unconsolidated intercalated clays and sands with a single peat horizon 1.75m beneath the seabed. The outfall structure coincides with CBH19 which describes 9m of clays with occasional sand horizons.

24.6.22 The combined footprint of the structures (*c.* 150m^2) would remove an insignificant volume of the identified extent of the peat horizons across the offshore area (at least 160,000m^2). Thus, although the importance of the deposits is high, installation of the structures would represent a permanent impact of low magnitude. This would result in an overall impact of **moderate adverse** significance.

iii. Changes to the Potential Wreck Site (ID 1)

24.6.23 There would be **no impact** on the potential wreck site (ID 1) as a result of construction. A preferred installation pattern will be agreed with English Heritage and the installation contractor, if required, to ensure that the jack-up rigs used during construction do not interfere with the site of ID1.

iv. Fish Recovery and Return System

24.6.24 The Fish Recovery and Return System discharge line would pass landward under the seawall and intertidal zone to a sea bed outfall. A tunnel (0.8m diameter) would be drilled through bedrock. A small headwork structure at its seaward end would be located below Lowest Astronomical Tide (LAT), on the exposed surface of the Blue Lias bedrock.

24.6.25 None of the structures associated with the proposed fish return system are in the vicinity of any known archaeological sites.

24.6.26 There is a cluster of magnetic anomalies immediately offshore of Hinkley Point (EMU ID1, ID6, ID8, ID9 and ID13), which range in size from 4.5 nT to 8.2 nT. The closest one of these anomalies is located over 60m away from the proposed tunnel and headwork.

24.6.27 It is not considered that the magnetic anomalies would be impacted during construction. There is assessed to be **no impact** on submerged and intertidal archaeology from the construction of the proposed fish return system.

b) Cumulative Construction Impacts

24.6.28 Construction of the temporary jetty structure and dredging of the berthing pocket would result in an overall impact of **moderate adverse** significance. Construction of the intake tunnels and outflow pipe would also result in an overall impact of **moderate adverse** significance. However, the combined footprint of all of these structures (*c.* 5,000m^2) would remove less than 1% of the area of submerged landscape recorded during the offshore surveys. Thus, the combined low magnitude impact on deposits of high importance would not increase the overall, permanent impact of **moderate adverse** significance.

c) Operational Impacts

24.6.29 This section describes the impacts on the historic environment that would arise during the operational phase of Hinkley Point C both within the site boundary and beyond it. A general description of the operational phase is contained in **Chapter 4**. A summary of the assessment of impacts and their significance is provided in **Table 24.7**.

i. Scour of Holocene Deposits associated with the Intake Tunnels and Outfall Pipe

24.6.30 A number of studies have been undertaken to assess the operational impacts of the intake tunnels and outfall pipe.

24.6.31 It is predicted that, in the worst case scenario, structural scour would occur to a depth of 0.6m at the intake structures and 2.2m at the outflow structure. Further, at the outflow site, scour from the discharge jet is predicted to range from 1.5m to 6m (Ref. 24.23). It has also been suggested that, although localised scour may occur, there is also the possibility of accumulation of fluid muds at these sites (Ref. 24.24).

24.6.32 The proposed location of Unit 1 Intake 2 corresponds to CBH5, which records 4.8m of unconsolidated sediment, with the first peat horizon occurring at 1.37m beneath the seabed. Unit 2 intake 2 coincides with CBH7, which records 4.5m of unconsolidated intercalated clays and sands with a single peat horizon 1.75m beneath the seabed. The proposed outfall location coincides with CBH19 which records 9m of clays with occasional sand horizons.

24.6.33 The spatial extent of scour development is always difficult to predict particularly in cohesive sediments such as occur at the seabed at all of these localities. Slopes greater than 40-45^{o} can be maintained which would result in scour extents of only a few metres (Ref. 24.30). Even if coarser material was encountered at depth and began to dominate the process the predictions would suggest scour up to a maximum extent of 10 metres. However, it is worth noting that at the site of geophysical anomaly ID_1 an object of roughly similar dimensions to the outfall structure has caused an east-west scour footprint of *c.* 100m a north south scour of 48m and a depth below ambient seabed of 1.4m. This is in an area of sands, as opposed to silts and clays, but it suggests that more extensive scour is possible.

24.6.34 Scour pits associated with the proposed structures, would be oriented parallel to tidal flow, which, from the bedform features alone is clearly in a broadly east to west direction. Consequently, there would be **no impact** on the potential wreck site (ID 1), or any of the offshore magnetic anomalies (EMU ID 54, ID 66 and ID 223) as a result of post installation scour.

ii. Scour and Maintenance Dredging of Holocene Deposits Associated with the Temporary Jetty

24.6.35 The scour assessment for the jetty (Ref. 24.23) suggests that scour would occur at depths of up to 1.3m based on an assumed side-by-side placement of piles which, for a single pile, would reduce to 1.1m deep. This would impact on the unconsolidated sediment stratigraphy and could potentially encounter peat horizons that occur at this depth beneath the seabed, although the majority of organic horizons in the general vicinity of the jetty and pier head occur at least 2m beneath the seabed.

24.6.36 The sediment transport studies (Ref. 24.24) suggest that the dredging pocket may silt up and it may require some form of maintenance dredging. Consequently, there are possible subsequent impacts that would occur due to post installation dredging.

24.6.37 Although the importance of the organic horizons is high, scour and maintenance dredging would represent a permanent impact of very low magnitude. This would result in an overall impact of **minor adverse** significance.

iii. Fish Recovery and Return System

24.6.38 The headwork structure for the proposed fish recovery and return system would be located below Lowest Astronomical Tide (LAT), on exposed Blue Lias bedrock surfaces. There are no recorded archaeological remains in the vicinity of the proposed locations. Consequently, there would be **no impact** on submerged or intertidal archaeology.

d) Cumulative Operational Impacts

24.6.39 There would be no cumulative operational impacts to heritage assets as no interacting offshore works in the vicinity of HPC will be required. There would be no cumulative operational impacts to heritage assets as a result of the onshore HPC development.

24.7 Mitigation of Impacts

a) Introduction

24.7.1 This section describes the proposed mitigation measures to manage and reduce, wherever possible, the impacts on the submerged and intertidal archaeology during the construction and operation of the site. Following consultation with English Heritage the following mitigation is proposed.

b) Mitigation of Impacts to Holocene Deposits

24.7.2 The most highly sensitive archaeological material offshore of Hinkley Point is represented by the submerged early Holocene landscapes buried at depth beneath the seabed. Following, extensive consultation with English Heritage, the proposed mitigation strategy is one of research and publication, to ensure preservation by record, through a two phase approach.

24.7.3 Phase 1 comprised the archaeological assessment of six of the vibrocores. These were chosen on the basis of spatial distribution, core recovery, presence of peat horizons across the full depth range and the overall stratigraphy of each core, as identified from the desk based assessment (Ref. 24.30).

24.7.4 The assessment was carried out by specialists attached to the University of Southampton led by Dr Justin Dix and Dr Fraser Sturt. The assessment comprised detailed stratigraphic logging, photographic imaging, particle size analysis, and x-radiography of the majority of the fine grained sections for each core.

24.7.5 Preliminary analysis was also undertaken to identify pollen, micro-fossils (foraminifera and diatoms) and macrofauna (shells). Radiocarbon dating was carried out on appropriate peat horizons and relative dating of part of the fine grained fraction was carried out through comparison with palaeomagnetic secular variation curves. Comparison of the sediment geochemistry against geochemical index curves of the Severn Estuary was also completed.

24.7.6 The results from this original phase, have further developed understanding of the offshore palaeo-landscapes as described in Section 24.5. Subsequently, Phase 2, will include further targeted analysis and ultimately publication of the results, in local, national and international journals.

24.7.7 Although no actual archaeological material has been identified within the proposed location for the temporary jetty, protocols for archaeological monitoring will be applied during dredging of the berth pocket.

24.7.8 Appropriate protocols for investigation and recording of suspected archaeological artefacts recovered during the construction phase, have been agreed with English Heritage. The dredge operator would observe the guidance note 'Marine Aggregate Dredging and the Historic Environment' (Ref. 24.74), and the related 'Protocol for Reporting Finds of Archaeological Interest' (Ref. 24.75).

24.7.9 These protocols would also include toolbox talks prior to commencement of works, briefing the dredge operatives on the potential for archaeological remains and provision of visual aids (posters and handouts) to assist in the identification of archaeological remains. An archaeological specialist will be on call to assist in the recovery of archaeological remains (if required).

24.7.10 If finds of archaeological interest were encountered in the course of dredging, the operator would comply with the provision of the Protocol (Ref 24.75) noted above and ensure that their discovery is reported to the Marine Management Organisation, English Heritage and SCC Historic Environment Service.

24.7.11 Provision will be made for consolidation, conservation and archiving of the remains in an appropriate museum, as well as publication of the results of appropriate assessment and analysis in a peer-reviewed, academic journal (if applicable).

24.8 Residual Impacts

a) Construction Impacts

24.8.1 The implementation of the mitigation measures would ensure that the impacts on submerged and intertidal archaeological remains would be adequately reduced through investigation and recording, in accordance with the requirements of PPS 5 Policy HE 12 (Ref. 24.9).

24.8.2 Following mitigation, the construction phase would result in a residual impact of **minor adverse** significance on Holocene deposits offshore of Hinkley Point.

b) Cumulative Construction Impacts

24.8.3 There would be no residual cumulative construction impacts to heritage assets as no interacting offshore works in the vicinity of HPC will be undertaken.

c) Operational Impacts

24.8.4 Following mitigation, the operational phase would result in a residual impact of **minor adverse** significance on Holocene deposits offshore of Hinkley Point.

d) Cumulative Operational Impacts

24.8.5 There would be no residual cumulative operational impacts to heritage assets as no interacting offshore works in the vicinity of HPC will be undertaken. There would be no cumulative operational impacts to heritage assets as a result of the onshore HPC development.

24.9 Summary of Impacts

24.9.1 **Table 24.7** provides a summary of assessed impacts prior to mitigation and residual impacts with mitigation in place.

24.9.2 Sites and features not affected by the works are not considered in this table.

Table 24.7: Summary of Impacts

ID	Receptor	Potential Impact	Magnitude	Description	Value/Sensitivity	Significance	Proposed Mitigation	Residual Impact
Construction Phase								
	Holocene deposits	Minor loss of research potential through construction activities	Low	Direct Adverse Permanent	High	Moderate adverse	Preservation by record comprising analysis and publication to address national and regional research aims	Minor adverse
Operational Phase								
	Holocene deposits	Minor loss of research potential through operational activities/scour	Very Low	Direct Adverse Permanent	High	Minor adverse	Preservation by record comprising analysis and publication to address national and regional research aims	Minor adverse

APPENDICES

25. AMENITY AND RECREATION

25.1 Introduction

25.1.1 This chapter of the Environmental Statement (ES) provides an assessment of the potential amenity and recreation impacts associated with the construction and operational phases of the proposed development at Hinkley Point C (HPC) and the proposed highway improvement works (see **Chapters 2**, **3**, **4** and **5** of this volume for a description of the development).

25.2 Scope and Objectives of Assessment

25.2.1 The scope of this assessment has been determined through a formal Environmental Impact Assessment (EIA) scoping process undertaken with the Infrastructure Planning Commission (IPC). It has also been informed by ongoing consultation with statutory consultees, including Sedgemoor District Council (SDC), Somerset County Council (SCC) and West Somerset Council (WSC), the local community and the general public in response to the Stage 1, Stage 2, Stage 2 Update, Junction 24 and Highway Improvements consultations for the Hinkley Point C Project Development Consent Order (DCO) application.

25.2.2 The assessment of amenity and recreation impacts has been undertaken adopting the methodologies described in Section 25.4 of this chapter.

25.2.3 The existing baseline conditions, against which the likely environmental impacts of the proposed development are assessed, have been determined through desk-based data collation, field surveys and consultation with various sports and recreation organisations, and are described in Section 25.5 of this chapter. The study area for this assessment comprises:

- the HPC development site;
- the surrounding Public Rights of Way (PRoW) network (within a 1km radius of the HPC development site), including the West Somerset Coast Path (which follows the foreshore on the northern boundary of the HPC development site) and the footpaths and bridleways that extend to the east, south and west across the HPC development site to the settlements of Stogursey, Burton, Shurton, and Stolford;
- the foreshore of the Bristol Channel immediately north of the HPC development site boundary;
- a 500m wide corridor on either side of the C182 (Wick Moor Drove) running from Hinkley Point to the A39 at Cannington; and
- a 500m area around proposed off-site highway improvements works.

25.2.4 Section 25.6 of this chapter assesses the potential impacts to amenity and recreation, including:

- obstruction to PRoW;
- disturbance to users of PRoW from noise, dust, and landscape and visual changes;

- obstruction to sports and recreation facilities, open access land and public open space; and
- disturbance to sports and recreation facilities, open access land and public open space from noise, dust, and landscape and visual change during the various development stages.

25.2.5 The effects of the construction workforce are examined separately in **Chapter 9** of this volume.

25.2.6 Appropriate mitigation measures aimed at reducing the impact of the proposed development on amenity and recreation are presented in Section 25.7 of this chapter. The assessment of residual impacts following implementation of these mitigation measures is presented in Section 25.8 of this chapter.

25.2.7 The assessment of cumulative impacts with other proposed and reasonably foreseeable projects are considered in **Volume 11** of the ES.

25.2.8 The objectives of the assessment were to:

- identify the location and importance of the existing amenity and recreation resource within the study area;
- assess the effects of the proposed development during the construction and operational phases on the amenity and recreation resource;
- recommend mitigation strategies, if determined necessary, to reduce the impacts of the proposed development on the amenity and recreation resource; and
- assess the residual effects of the proposed development during the construction and operational phases on the amenity and recreation resource after implementation of the proposed mitigation measures.

25.3 Legislation, Policy and Guidance

25.3.1 This section identifies and describes legislation, policy and guidance of relevance to the assessment of potential amenity and recreation impacts associated with the construction and operational phases of the proposed development.

25.3.2 As stated in **Volume 1**, **Chapter 4**, the Overarching National Policy Statement (NPS) for Energy (NPS EN-1) when combined with the NPS for Nuclear Power Generation (NPS EN-6) provides the primary basis for decisions by the IPC on applications for nuclear power generation developments that fall within the scope of the NPSs.

25.3.3 Notwithstanding this, the IPC may consider other matters that are both important and relevant to its decision-making. These could include Planning Policy Statements (PPSs), Planning Policy Guidance Notes (PPGs), regional and local policy documents, although, if there is a conflict between these and the NPS, the NPS prevails for the purposes of IPC decision making.

25.3.4 Further, the Planning Act 2008 provides that the IPC must, in making its decision on an application, have regard to any Local Impact Report (LIR) prepared by relevant local authorities. It is anticipated that the LIRs will rely in part on PPSs, PPGs, regional and local policy to provide a context for their assessment. On this basis, regard has been given to these documents (where relevant to the technical assessment) since they are likely to inform the LIRs prepared by the relevant local authorities.

a) International Legislation

25.3.5 The scope of this assessment is not affected by European or other international legislation.

b) UK Legislation

i. The Marine and Coastal Access Act 2009 (Ref. 25.1)

25.3.6 The Marine and Coastal Access Act 2009 aims to improve public access to, and enjoyment of the English coastline, by creating a coastal margin that is available for access around the coast of England.

25.3.7 The Marine and Coastal Access Act 2009 amends the Countryside and Rights of Way (CRoW) Act 2000 (Ref. 25.2) to ensure that a two-metre wide strip of land on either side of the new route (the coastal margin that will be created through this legislation), all land seaward of the route and any of the classic coastal land types (such as dunes and cliffs to the landward side of the route) would normally be accessible to the public. Consequently, identifying the line of the route will have consequences not only for the route itself, but would lead to access being given to land around the route.

ii. The Countryside and Rights of Way (CRoW) Act 2000 (Ref. 25.2)

25.3.8 Part I of the CRoW Act is intended to give greater freedom for people to explore open countryside. It contains provisions to introduce a new statutory right of access for open-air recreation to mountain, moor, heath, down and registered common land. It also includes a power to extend the right to coastal land by order, and enables landowners voluntarily to dedicate irrevocably any land to public access.

25.3.9 Part II of the CRoW Act contains provisions designed to reform and improve rights of way. It introduces measures for the strategic review, planning and reporting of improvements to rights of way, and the promotion of increased access for people with mobility problems. A new category of right of way – restricted byway – having rights for walkers, cyclists, horse riders and horse drawn vehicles, is provided which replaces the previous category of Roads Used as Public Paths. Under Section 69, local authorities are required to have regard to the needs of disabled people when authorising the erection of gates and other barriers across rights of way to control livestock. There is also provision for occupiers of any land to temporarily divert a footpath or bridleway which passes over that land where works are likely to cause danger to users of the right of way.

iii. The Highways Act 1980 (Ref. 17.3)

25.3.10 The statutory provisions for creating, diverting and extinguishing public rights of way are enshrined in the 1980 Act, in order to protect both the public's rights and the interests of owners and occupiers. The Act also protects the interests of bodies such as statutory undertakers. The requirements for making, confirming and publicising orders are set out in Schedule 6 to the 1980 Act.

25.3.11 The duty to maintain highways rests with local highway authorities under the 1980 Act, though the authorities may also maintain public rights of way that are not publicly maintainable. Maintenance should be such that ways are capable of meeting the use that is made of them by ordinary traffic at all times of the year (Ref. 17.4), and this can include surfacing.

25.3.12 Under the Act, landowners are responsible for any structures across the public rights of way, including gates, stiles, and other structures, as well as ensuring that trees, shrubs and hedges do not overhang or obstruct the passage of pedestrians, horse-riders, and vehicles subject to the status of the public right of way.

iv. The Wildlife and Countryside Act 1981 (Ref. 25.5)

25.3.13 Part III of the Wildlife and Countryside Act 1981 places a duty on surveying authorities to keep the definitive map and statement under continuous review and to modify the map, for example, if it becomes known to the surveying authority that a right of way being a public path not shown on the map subsists over land in the area to which the map relates. The Act also contains other elements of protection of PRoW, such as the prohibition against keeping bulls on land crossed by PRoW and the appointment of wardens for PRoW.

25.3.14 The Act also includes enactment for making and confirmation of certain orders creating, extinguishing or diverting footpaths and bridleways.

v. Equality Act 2010 (Ref. 25.6)

25.3.15 The purpose of the Act is to harmonise discrimination law and to strengthen the law to support progress on equality. The Act brings together and re-states domestic discrimination law as contained in a number of pieces of legislation, including the Disability Discrimination Act 1995. The Equality Act 2010 provides that every public authority shall, in carrying out any of its functions, have due regard to the provisions of this Act. It must therefore be taken into account by public authorities when exercising their functions in respect of the provision of public footpaths and other rights of way.

25.3.16 Whilst there are no mandatory specifications laid down in the Equality Act 2010 for structures such as gaps, gates and stiles, the British Standards Institute has developed a comprehensive standard, the current version of which has been published as BS5709:2006 (Ref. 25.7).

c) National Planning Policy

i. Planning Policy Statement 1: Delivering Sustainable Development (PPS1) (2005) (Ref. 25.8)

25.3.17 PPS1 sets out the Government's overarching planning policies on the delivery of sustainable development through the planning system.

25.3.18 Paragraph 5 states that planning should facilitate and promote sustainable and inclusive patterns of urban and rural development by, amongst other things: protecting and enhancing the natural and historic environment, the quality and character of the countryside, and existing communities.

ii. Planning Policy Guidance 17: Planning for Open Space, Sport and Recreation (PPG17) (2002) (Ref. 25.9)

25.3.19 PPG17 sets out the role of the planning system in assessing opportunities and needs for open space, sports and recreation provision in development proposals. It also describes the necessity of safeguarding open space which has recreational value.

25.3.20 Paragraph 10 of PPG17 states that existing open space, sports and recreational buildings and land should not be built on unless an assessment has been undertaken which has clearly shown the open space or the buildings and land to be surplus to requirements.

25.3.21 In respect of planning applications, either within or adjoining open space, paragraph 16 of PPG17 states that local authorities should weigh any benefits being offered to the community against the loss of open space that will occur. It states that planning authorities may wish to allow small scale structures where these would support the existing recreational uses, or would provide facilities for new recreational uses.

25.3.22 Paragraph 32 of PPG17 states that recreational rights of way are an important resource and local authorities should seek opportunities to provide better facilities for walkers, cyclists and horse-riders (for example by adding links to existing rights of way networks); and to protect and enhance those parts of the rights of way network that might benefit open space.

iii. Planning and Policy Guidance Note 20: Coastal Planning (PPG 20) (1992) (Ref. 25.10)

25.3.23 PPG20 sets out the planning policies for the coast. PPG20 has been cancelled with the exception of paragraphs 2.9, 2.10 and 3.9, which concern development plans and large scale projects that require coastal locations. Paragraph 3.9 states that public access to the coast should be a basic principle, unless it can be demonstrated that this is damaging to nature conservation or impractical. This applies to both the developed and undeveloped coast.

25.3.24 Paragraphs 2.9 and 2.10 set out policies in relation to development which does not require a coastal location and are therefore not considered relevant.

iv. Planning Policy Statement 25 Supplement: Development and Coastal Change (DCC) (March 2010) (Ref. 25.11)

25.3.25 This PPS supplement sets out the Government's objectives for development and coastal change. The Government's aim is to ensure that coastal communities continue to prosper and adapt to coastal change.

25.3.26 Development Management Policy DCC5 (Policy principles guiding the consideration of applications for development in Coastal Change Management Areas) specifically states that applications for development should be considered appropriate where, following the outcome of consultation with relevant agencies and bodies, particularly the Environment Agency and local communities, it can be demonstrated, amongst other things, that the development does not hinder the creation and maintenance of a continuous signed and managed route around the coast.

v. Consultation Paper on a New Planning Policy Statement – Planning for a Natural and Healthy Environment (2010) (Ref. 25.12)

25.3.27 In its final form, it is intended that this PPS will replace PPG17. A key objective of this PPS is to bring together related policies on the natural environment and on open space and green spaces in rural and urban areas. This is to ensure that the planning system delivers healthy sustainable communities which adapt to and are resilient to climate change and gives the appropriate level of protection to the natural environment (page 10).

25.3.28 The consultation document explains that the Government continues to support the need to make adequate provision of land and facilities for sport, recreation and children's play, and intends to maintain the existing policies in PPG17. Local planning authorities will continue to be required to protect from development existing land and facilities unless it can be demonstrated that they are surplus to requirements. Where deficits are identified, local planning authorities should identify opportunities to improve provision either by providing new facilities or by making better use of existing ones (page 11).

25.3.29 The proposed PPS will also incorporate policies dealing with coastal access, heritage coasts and the undeveloped coast policies currently set out in PPG20 (page 41).

d) Regional Planning Policy

25.3.30 The Government's revocation of regional strategies was quashed in the High Court on 10 November 2010. However, on that same date the Government reiterated in a letter to Chief Planners its intention to revoke regional strategies through the Localism Bill. This letter was also challenged but, on 7 February 2011, the High Court held that the Government's advice to local authorities that the proposed revocation of regional strategies was to be regarded as a material consideration in their planning development control decisions should stand. The decision of the High Court was upheld by the Court of Appeal on 27 May 2011. Therefore, the regional strategies remain in place but in the case of development control decisions it is for planning decision makers to decide on the weight to attach to the strategies (see **Volume 1, Chapter 4** for a full summary of the position regarding the status of regional planning policy).

i. Regional Planning Guidance 10 for the South West 2001 – 2016 (2001) (RPG10) (Ref. 25.13)

25.3.31 RPG10 sets out the broad development strategy for the period to 2016 and beyond. Policy TCS2 (Culture, Leisure and Sport) states that local authorities and other agencies in their plans, policies and proposals should, amongst other things: identify and protect recreational open spaces and playing fields; identify sites and opportunities for the provision of new cultural, leisure and community sports facilities; ensure that new facilities are readily accessible by sustainable modes of transport; and encourage less intensive recreation in other areas such as river valleys and coastal areas by providing essential facilities, such as toilets, bus stops, footpaths and cycleways in appropriate sustainable locations.

ii. The Draft Revised Regional Spatial Strategy for the South West Incorporating the Secretary of State's Proposed Changes 2008 – 2026 (RSS) (July 2008) (Ref. 25.14)

25.3.32 The draft revised Regional Spatial Strategy (RSS) looks forward to 2026 and sets out the Government's policies in relation to the development of land within the region. Policy SD4 (Sustainable Communities) states that growth and development will be planned and managed positively to create and maintain sustainable communities throughout the region by, amongst other things, providing networks of accessible green space for people to enjoy.

25.3.33 Policy D (Infrastructure) states that the planning and delivery of development should ensure efficient and effective use of existing infrastructure and should provide for the delivery of new or improved transport, education, health, culture, sports and recreation, and green infrastructure in step with development.

iii. Somerset and Exmoor National Park Joint Structure Plan Review 1991-2011 (2000) (Policies 'saved' from 27 September 2007) (Ref. 25.15)

25.3.34 The Somerset and Exmoor National Park Joint Structure Plan was adopted in 2000 with relevant policies saved from 27 September 2007. All policies have been saved with the exception of Policy 53 which is unrelated to amenity and recreation impacts. The Plan provides a strategic base for all land use planning within the plan area for the period up to 2011.

25.3.35 Policy 37 (Facilities for Sport and Recreation within Settlements) states that provision should be made for the protection, maintenance and improvement of the range of facilities for sports and recreation, where they are compatible with the size and function of the settlement involved. New developments which would generate substantial transport movements should be accessible by public transport.

25.3.36 Policy 38 (Sport and Recreation in the Countryside) states that, outside of settlements, provision may be made for sport and recreation facilities, provided that they are compatible with the amenity, landscape and environment of the area. Additionally, protection should be afforded to land accessible to the public and associated public access routes, including bridleways and green lanes. New developments which would generate substantial transport movements should be accessible by public transport.

25.3.37 Policy 42 (Walking) states that facilities for pedestrians should be improved by maintaining and extending the footpath network, particularly between residential areas, shops, community facilities, workplaces and schools and by ensuring that improvements to the highway provide for safe use.

iv. Somerset's Future Transport Plan 2011- 2026 (2011)

25.3.38 The Somerset's Future Transport Plan sets out SCC's long term strategy for delivering the County's transport priorities for the period between 2011 and 2026.

25.3.39 The document recognises the value of Somerset's PRoW network and commits to maintain it and to improve the information available for people to use it. The document also states that it will seek to help people make more trips on foot and help people see the benefits of walking.

v. Somerset County Council Rights of Way Improvement Plan (2006) (Ref. 25.16)

25.3.40 The SCC Rights of Way Improvement Plan (RoWIP) sets out SCC's proposals to improve the provision of PRoW in Somerset for walkers, cyclists, equestrians and those with visual or mobility impairments. The RoWIP is based on the following six key aims which are supported by policy statements and prioritised actions (RoWIP, Section 9):

- raise the strategic profile of the PRoW network;
- improve how the PRoW network is maintained;
- improve how Definitive Map Modification and Public Path Orders are processed;
- improve access information provision;
- work in partnership with key organisations; and
- develop a safe access network.

25.3.41 The RoWIP recognises that walking is the most popular reason for the general public to visit the countryside in Somerset (page 26).

e) Local Planning Policy

i. The West Somerset District Local Plan (Adopted April 2006) (Ref. 25.17)

25.3.42 The West Somerset Local Plan forms part of the development plan for West Somerset. The Local Plan was adopted in April 2006 (with relevant policies 'saved' from 17 April 2009). The Proposals Map indicates that the HPC development site itself is not subject to any specific amenity or recreation designations.

25.3.43 The following saved policy is considered to be potentially relevant:

> *"Development proposals which would facilitate and enhance informal recreational activities and access related to the enjoyment and interpretation of the countryside will be permitted where they would:*
>
> *(i) be integrated with the PRoW system or public transport network;*
>
> *(ii) not adversely affect the character of the area; and*
>
> *(iii) not be likely to have an adverse affect on other land uses in the vicinity.""*

ii. West Somerset District Local Development Framework Core Strategy (Options Paper) (January 2010) (Ref. 25.18)

25.3.44 The Core Strategy is at a preliminary stage of preparation and the Options Paper does not include any specific policies relating to amenity and recreation impacts. The paper does however identify the types of policy that WSC considers could be included in the Core Strategy, including a policy to protect and enhance natural networks through developer contributions and the Nature Map and policies to encourage multifunctional Green Infrastructure and the creation of/improvement of access to the countryside (page 24).

iii. Supplementary Planning Guidance

25.3.45 Sedgemoor District Council and West Somerset Council have jointly prepared draft supplementary planning guidance in relation to the HPC Project. Public consultation on the Consultation Draft version of the HPC Project Supplementary Planning Document (the draft HPC SPD) commenced on 1 March 2011 and concluded on 12 April 2011. EDF Energy has submitted representations which object to the draft HPC SPD. See **Volume 1, Chapter 4** for a full summary of the position regarding the status of the draft HPC SPD.

25.3.46 In relation to PRoW, Box 16 in the draft HPC SPD states that strategic enhancements and maintenance of the PRoW network, which provides links between attractions and points of interest, should be undertaken to mitigate and compensate for cumulative obstruction and disturbance impacts (page 31).

25.4 Methodology

25.4.1 The assessment and all supporting surveys have been undertaken in accordance with the relevant EIA Directive, regulations, and various guidance documents as identified in **Volume 1**, **Chapter 7**, in particular the Guidelines for Environmental Impact Assessment (Ref. 25.19). The methodology and criteria adopted for the assessment is described in detail in **Volume 1**, **Chapter 7**.

a) Study Area

25.4.2 For the purpose of this assessment, the geographical extent of the study area under consideration includes the site itself and a 1km buffer area around the site, to ensure that the implications of the proposed development on the wider amenity and recreation resource are identified (see **Figure 25.1**). However, the study area for disturbance (indirect effects) such as noise and vibration, air quality, and landscape and visual is identified in the relevant topic chapters (**Chapters 11**, **12** and **22** of this volume).

25.4.3 The study area includes a 500m wide corridor on either side of the C182 (Wick Moor Drove), running from Hinkley Point to the A39 at Cannington; this area is shown on **Figure 25.2**.

25.4.4 A 500m study area was also selected around the proposed off-site highway improvements (as shown in **Figure 25.3**). These works would occur at the following sites:

- A38 Bristol Road/The Drove junction (see **Figure 25.6**);
- A39 Broadway/A38 Taunton Road junction (see **Figure 25.6**);
- A38 Bristol Road/Wylds Road junction (see **Figure 25.6**);
- Wylds Road/The Drove junction (see **Figure 25.6**);
- A39 New Road/B3339 Sandford Hill Roundabout (see **Figure 25.7**);
- M5 junction 23 Roundabout (see **Figure 25.8**);
- Washford Cross Roundabout (see **Figure 25.9**);
- Claylands Corner junction (see **Figure 25.10**);

- C182 Farringdon Hill Lane, Horse Crossing (see **Figure 25.11**);
- Cannington Traffic Calming Measures (see **Figure 25.12**); and
- Huntworth Roundabout (see **Figure 25.13**).

b) Baseline Assessment

25.4.5 Baseline environmental characteristics of the site and surrounding areas with specific reference to amenity and recreation were identified through:

- A Recreational Access Survey, carried out in July and August 2009 (see **Appendix 25A**). The survey entailed counts of users of PRoW, both within and outside of the school holiday period, covering the PRoW linking Shurton, Burton, Wick and the western end of Stolford to the coastline around Hinkley Point, including the West Somerset Coast Path. A questionnaire survey was undertaken as part of this exercise to gain an understanding of the patterns of use of the PRoW.
- A review of existing information, including Ordnance Survey (OS) maps and relevant websites (see Refs. 25.20, 25.21, 25.22, 25.23, 25.24, 25.25, 25.26, 25.27, 25.28, 25.29, 25.30, 25.31, and 25.32), carried out in March 2010.
- Site walkover surveys, carried out on 14 November 2007, 4 April 2008, 8 January 2010 and 11 May 2011.
- Consultation with appropriate statutory consultees and non-statutory consultees, including SCC's Rights of Way Team and local sports and recreation clubs that may be affected by, or have an interest in, the proposed development.

c) Consultation

25.4.6 A number of meetings were held with SCC's Rights of Way Officers between November 2009 and September 2011, in which discussions centred on recreational use of PRoW, the likely effects of PRoW diversions/closures, and potential mitigation measures for any impacts. Site meetings were held with a SCC Rights of Way Area Officer and a Stogursey Parish Council representative in January 2010, July 2010, November 2010, and August 2011.

25.4.7 Consultation has also been undertaken with:

- Natural England (Taunton office);
- local equestrians;
- the Ramblers Association;
- local residents;
- users of the PRoW network (members of the public) through the Recreational Access Survey carried out in July and August 2009;
- a number of local and regional sailing clubs, including the Combwich Motor Boat and Sailing Club, Burnham on Sea Motor Boat and Yacht Club, the Bristol Channel Yachting Association, and the Royal Yachting Association (RYA);
- a number of local angling organisations, including the Bridgwater Angling Association and the Burnham Boat Owners Sea Angling Association; and

- wildfowling clubs, namely the Bridgwater Bay Wildfowlers Association and the Highbridge and Huntspill Wildfowling Association.

25.4.8 Further information on the consultation undertaken is provided within the **Consultation Report**.

d) Assessment Methodology

25.4.9 **Volume 1**, **Chapter 7** of this ES describes the assessment methodology for this EIA. In addition the following specific methodology was applied for the determination of receptor value and sensitivity (see **Table 25.1**) and impact magnitude (see **Table 25.2**).

e) Value and Sensitivity

25.4.10 All of the amenity and recreation receptors that may be impacted by the proposed development have been assigned a level of importance in accordance with Institute of Environmental Management and Assessment (IEMA) guidelines (Ref. 25.19). The value or potential value of a receptor is a function of a variety of factors (e.g. community value or designation) and can be determined within a defined geographical context. For example, the following hierarchy is recommended by IEMA:

- international;
- UK;
- national (i.e. England/Northern Ireland/Scotland/Wales);
- regional;
- county (or metropolitan, e.g. in London);
- district (or unitary authority, city, or borough);
- local or parish; and
- within zone of influence only (which might be the project site or a larger area).

25.4.11 The sensitivity of an amenity or recreation receptor is defined by its ability to continue to function and or maintain its intrinsic value subject to any change caused by a development and its related activities. Sensitivity is therefore a function of the nature of the amenity or recreation receptor and its current environmental setting. It is also the case that each amenity or recreation receptor will have different sensitivities to differing types of effects. Hence the nature of direct and indirect impacts is also an important factor in the assessment.

25.4.12 Determination of the sensitivity of an amenity or recreation receptor is based on two analyses:

- Could the activity or any aspect of the development fundamentally affect the use and function of a receptor (e.g. obstructing a public right of way, or obstructing areas used for formal recreational activities such as angling and wildfowling)?
- Could the activity or any aspect of the development significantly reduce the enjoyment of the users of the receptor (e.g. through visual intrusion in what was

an area of open countryside, or though increased noise levels in previously quiet and peaceful areas)?

25.4.13 In order to help define the importance of relevant receptors, the guidance provided in **Table 25.1** has been adopted for the purposes of the evaluation of amenity and recreation assets.

Table 25.1: Criteria Used to Determine Importance

Importance/ Sensitivity	Description
High	Feature/receptor possesses key characteristics which contribute significantly to the distinctiveness and character of the site e.g. PRoW of national significance such as the West Somerset Coast Path, and receptor is identified as having very low capacity to accommodate proposed form of change (i.e. is very highly sensitive). Feature/receptor possesses very significant social/community value. Feature/receptor is extremely rare.
Medium	Feature/receptor possesses key characteristics which contribute to the distinctiveness and character of the site e.g. PRoW of regional significance, and receptor is identified as having low capacity to accommodate proposed form of change (i.e. is moderately sensitive). Feature/receptor possesses significant social/community value. Feature/receptor is rare.
Low	Feature/receptor only possesses characteristics which are locally significant e.g. local PRoW network. Feature/receptor not designated or only designated at a local level. Feature/receptor identified as having some tolerance of the proposed change subject to design and mitigation (i.e. is of low sensitivity). Feature/receptor possesses moderate social/community value. Feature/receptor is relatively common.
Very low	Feature/receptor characteristics do not make a significant contribution to the character or distinctiveness of the site and surroundings at a local scale. Feature/receptor not designated. Feature/receptor identified as being generally tolerant of the proposed change (i.e. of very low sensitivity). Feature/receptor possesses low social/community value. Feature/receptor is common.

i. Magnitude

25.4.14 Determination of the magnitude of an impact is based on the effect that the proposed development would have upon the amenity and recreation resource in the study area, and has been considered in terms of high, medium, low and very low (see **Table 25.2**). Magnitude refers to the ‘size’ or ‘amount’ of an impact and it is a function of other aspects, such as the impact’s extent, duration, likelihood and reversibility. In order to help define the level of magnitude of an impact on an amenity or recreational resource, the following guidance (see **Table 25.2**) has been adopted.

25.4.15 Where an impact could reasonably be placed within more than one magnitude rating, conservative professional judgement has been used to determine which rating would be applicable.

25.4.16 Definitions of timescales (short/medium/long-term) are presented in **Volume 1**, **Chapter 7**.

Table 25.2: Guidelines for the Assessment of Impact Magnitude

Magnitude	Guidelines
High	Significant, permanent loss or obstruction/irreversible changes to key characteristics, features or the function of amenity and recreation assets. Impact may occur over the whole asset. Impact certain or likely to occur.
Medium	Obstruction or change to key characteristics, features or the function of amenity and recreation assets in the medium term. Impact may occur over the majority of the asset. Impact likely to occur.
Low	Noticeable but not significant obstruction or change (temporary/potentially reversible), over a part of the asset, to key characteristics, features or the function of amenity and recreation assets in the short-term. Impact possibly would occur.
Very low	Barely discernible obstruction or changes over a small area, to key characteristics, features or the functions of amenity and recreation assets, which are infrequent or temporary. Impact unlikely to occur.

ii. Significance of Impacts

25.4.17 The significance of the impact is judged on the relationship of the magnitude of impact to the assessed sensitivity and/or importance of the resource. The predicted significance of the impacts, without mitigation, is outlined in **Volume 1**, **Chapter 7.**

iii. Cumulative Impacts

25.4.18 The influence of noise, air and visual related disturbance effects on the amenity and recreational resource cannot be assessed cumulatively for the reasons explained in **Volume 11** of this ES. That is, there is no established EIA methodology for assessing the interactive or combined impact of ‘change’ or ‘disturbance’ (e.g. the combined effect of increased noise and dust) on human receptors and quality of life. Human receptors tend to respond to disturbance in different ways and to varying degrees, which typically reflect personal perception and valuation of the relevant amenity and recreation asset(s). Therefore combined ‘responses’ cannot be assessed. However, such effects on human receptors are considered in the Health Impact Assessment and the direct cumulative impacts on amenity and recreation assets are assessed in **Volume 11** of this ES.

f) Limitations, Constraints and Assumptions

25.4.19 The assessment does not consider the effects of the construction workforce on the amenity and recreation provision within the study area. Impacts of the construction workforce are addressed in **Chapter 9** of this volume.

25.4.20 For the purposes of the assessment of impacts on the PRoW network, the construction phase includes the period during which the construction site is restored (as part of the landscape restoration strategy) up until the PRoW are reopened (a period of approximately 11 years).

25.4.21 The assessment of disturbance to users of amenity and recreation assets which could arise from noise, dust and visual intrusion is examined in the relevant chapters (**Chapters 11**, **12**, and **22** of this volume). The sensitivity of receptors and the criteria used in the disturbance assessments is also presented in these chapters. This chapter only provides a summary of the disturbance effects.

25.4.22 Navigational risk in relation to recreational sailing and boating is examined in **Chapter 26** of this volume.

25.5 Baseline Environmental Characteristics

a) Introduction

25.5.1 This section of the ES presents the baseline environmental characteristics for the study area, including the site.

b) Study Area Description

25.5.2 The study area for the HPC development site lies in Stogursey Parish in Somerset.

25.5.3 As shown in **Figures 25.1** and **25.2**, the northern boundary of the HPC development site is delineated by the Severn Estuary. The HPC development site extends southwards for approximately 1.5km, terminating at the village of Shurton. The western boundary runs alongside Benhole Lane, in a northerly direction to the coast, while the eastern boundary is formed by the C182 (Wick Moor Drove), which lies immediately south of the existing Hinkley Point Power Station Complex.

25.5.4 The study area includes the foreshore of the Severn Estuary and the PRoW network that services Hinkley Point and the surrounding settlements. This includes the West Somerset Coast Path, which follows the foreshore on the northern boundary of the HPC development site, and the footpaths that extend to the east, south and west across the HPC development site to Stogursey, Burton, Shurton, and Stolford.

25.5.5 The study area also extends to the south, as a 500m corridor along the C182 (Wick Moor Drove), where it joins the A39 at the south-east corner of Cannington. The C182 runs south-east from Hinkley Point, passing to the west of Combwich, before entering the northern end of Cannington and passing through the village in a north-south direction.

25.5.6 In addition, the study area encompasses a 500m area around the proposed highway improvements as identified in Section 2.4 of this chapter.

i. PRoW

HPC Development Site PRoW Network

25.5.7 **Figure 25.1** shows the PRoW network around Hinkley Point. There are a total of *c.*8.1km of PRoW within the HPC development site, including 230m of restricted byway. A total of *c.*34.5km of PRoW are located within the study area, and a total of c.73.5km are located within the Parish of Stogursey.

25.5.8 The HPC development site and study area contain a section of the West Somerset Coast Path (see **Plate 25.1** and **Plate 25.2**). A resource of national importance, the West Somerset Coast Path is a 35km linear walk that links the River Parrett Trail at Steart in Bridgwater Bay with the West Somerset Coast Path National Trail at Minehead.

Plate 25.1: View of the Foreshore from the West Somerset Coast Path (Looking East towards the Existing Hinkley Point Power Station Complex)

Plate 25.2: View of the Foreshore from the West Somerset Coast Path (Looking West)

25.5.9 The PRoW within the study area are listed in **Table 25.3**. The average length of the PRoW sectors (i.e. between the start and any connecting link with another footpath) within the study area is around 390m. To the west of the C182, a network of north-south PRoW link the settlements of Shurton, Burton, and Knighton with the West Somerset Coast Path. All of PRoW WL23/57 and part of PRoW WL23/70 are restricted byways (represented on **Figure 25.1** by the brown hashed line).

Table 25.3: PRoW within 1km of the HPC Development Site

Note: PRoW in bold are either within or partially within the HPC development site.
Source: SCC [http://webapp1.somerset.gov.uk/SCCPROW/Index.asp?showalerts=1]

25.5.10 The PRoW network across the study area provides access to a mix of coastal and inland environments (see **Plate 25.3**), with long distance views to the west and along the West Somerset Coast Path. To the east of Hinkley Point, views are constrained with occasional distant glimpses of Exmoor and the Quantock Hills Area of Outstanding Natural Beauty (AONB) to the west and south-west, or the Brean Down/Bleadon Hills, and Mendip Hills AONB to the east. Views are experienced from Green Lane, which follows the east-west ridge running through the HPC development site (see **Plate 25.4**).

Plate 25.3: View from Junction of PRoW WL23/56 and WL23/105 (within the HPC Development Site Looking North to the Severn Estuary)

Plate 25.4: View from the East-west Ridge Path (Green Lane, WL23/110) Looking East towards the Existing Hinkley Point Power Station Complex

Usage of HPC development site PRoW Network

25.5.11 Data regarding use of the West Somerset Coast Path is presented in **Figure 25.4** and **Table 25.4**, and was obtained through consultation with SCC's Rights of Way Team. The data provides approximate visitor numbers each month along the West Somerset Coast Path between 2006 and 2009, with counts taken from the junction of PRoW WL23/56 and WL23/95. The data indicates that use of the West Somerset Coast Path generally peaks during the summer months, and also during holiday periods, including Easter.

Table 25.4: West Somerset Coast Path – Visitor Count Data 2006 to 2009

Month	Number* of Counts				
	2006	2007	2008	2009	Average
January	–	80	100	140	105
February	–	90	120	95	100
March	–	125	150	125	135
April	30	265	170	200	165
May	125	155	160	–	145
June	180	125	170	–	160
July	175	75	200	–	150
August	190	150	410	–	250
September	225	195	260	–	225
October	155	100	180	–	145
November	70	95	125	–	95
December	70	90	130	–	95

** Counts have been rounded up to nearest 5 from the original data.*
Source: Somerset County Council Environmental Directorate (2009).

25.5.12 Based on a rolling 12 months total, this shows an increasing number of users from April 2006 to April 2009, up by about 30%. However, this may be due to a depression in the number of users in 2006 and 2007 as a consequence of the foot and mouth outbreak, with numbers now rebounding. The total number of yearly users reaches a maximum of around 2,200 (for the 12 months between February 2008 and January 2009), reaching equilibrium around that number in later counts.

25.5.13 The Marine and Coastal Access Act provides for the expansion of recreational access to the coast; including the development of the England Coast Path (a coastal corridor with public access along the whole length of England's shore). This would encompass the route of the West Somerset Coast Path and Natural England and SCC (as one of the pilot authorities) are working on ensuring that there is access along the entire Somerset coast ahead of publicising the route. Following this, it is likely that numbers using the Coast Path will increase, though it is expected to take up to five years to arrange and process the Coast Path in relation to the Marine and Coastal Access Act requirements.

25.5.14 The Recreational Access Survey, carried out in 2009 (see **Appendix 25A**), identified that 70% of those surveyed using the PRoW were local residents who lived within

3km of the HPC development site, and 90% of those surveyed resided in Somerset. Of those surveyed that were not Somerset residents (10%), their purpose for visiting Somerset was to visit relatives or to go fishing.

25.5.15 The PRoW network is predominantly favoured for dog walking (85% of those surveyed) although, for some lengths, use is specific to the interest along it (such as fishing along the coastal path). Approximately 65% of those surveyed indicated that they intended to follow a circular route whilst the remainder intended to return the way they had come.

25.5.16 The counts presented and reported in **Appendix 25A** did not reveal significant differences in visitor/user numbers between weekdays and weekends, which reflects the fact that it is mostly local residents using the PRoW network, and mainly for the regular walking of their dogs. Use of the PRoW network, therefore, can be seen to be dominated by a relatively small number of repeat users (mainly residents), who use the PRoW network frequently (i.e. once or twice every day). **Table 25.5** presents the combined user counts generated from the four day survey for the various PRoW. Although there are methodologies available for generating annual user counts for PRoW these can provide widely differing numbers depending on the assumptions and factors applied. **Table 25.5** provides an indicative estimate of user numbers daily and annually based on averaging the user counts over the survey period, and multiplying this up using a 12 hour day and 365 day each year factor.

Table 25.5: Combined User Counts from Four Day Survey

Footpath	Combined Survey Count (number of users)	Indicative Daily Numbers (Factored)	Indicative Annual Numbers (Factored)
WL23/43 (north of WL23/110)	2	6	2,190
WL23/45 (south of WL23/110)	7	21	7,665
WL23/46	2	6	2,190
WL23/48 (southern end)	1	3	1,095
WL23/48 (south of WL23/110)	2	6	2,190
WL23/56 (north of Shurton Road)	1	3	1,095
WL23/56 (south of WL23/110)	4	12	4,380
WL23/56 (north of WL23/110)	2	6	2,190
WL23/95 (east of Hinkley Point)	4	12	4,380
WL23/95 (shoreline in front of site)	3	9	3,285
WL23/95 (coast path west of site)	1	3	1,095
WL23/107	3	9	3,285
WL23/110 (east of WL23/48)	2	6	2,190
WL23/110 (west of WL23/48)	1	3	1,095
WL23/110 (west of WL23/46)	5	15	5,475

25.5.17 Those surveyed identified the most desirable characteristics of a footpath as ‘good views’ (80%) and ‘peace and quiet’ (65%), followed by ‘a mix of countryside and coast’ (50%), ‘good condition of the footpaths’ (40%), ‘connections to other footpaths’ (30%), ‘well marked footpaths’ (25%), and ‘far from the road’ (20%).

25.5.18 The PRoW network within the HPC development site provides a variety of routes to the West Somerset Coast Path from the settlements of Shurton, Knighton, Burton, and Wick, and vice versa. **Appendix 25B** presents the PRoW routes through the HPC development site and the destinations. The routes through the HPC development site connect to Knighton (with eight routes), Shurton (with ten routes), and to a lesser extent Wick (with three routes).

25.5.19 The PRoW network is also used for circular walks. Within the study area around Hinkley Point, there are just under 50 discrete circular routes, of which 18 are completely off-road. Eight of these are located wholly or partially within the HPC development site boundary. Given that the discrete routes may be combined, the number of circular routes currently available is therefore considerably greater. A list of the circular routes is provided in **Appendix 25C** and shown on **Figure 25.5**.

Importance and Sensitivity of HPC development site PRoW Network

25.5.20 With the exception of the West Somerset Coast Path, the PRoW within the study area comprise a locally important (low importance) network of footpaths. The West Somerset Coast Path is considered to be a nationally important (high importance) resource because it will ultimately form part of the England Coast Path. PRoW are sensitive to obstruction which would prevent their use. Sensitivity to indirect (disturbance) impact is identified in the relevant topic chapter (**Chapters 11**, **12** and **22** of this volume) where the indirect (disturbance) impact has been assessed.

PRoW along the C182

25.5.21 There are a large number of footpaths that run adjacent to, or connect with the C182 between Hinkley Point and Cannington, and a smaller number that specifically cross the C182 within the study area. PRoW within the C182 route study area are presented in **Table 25.6** and shown in **Figure 25.2**.

Table 25.6: PRoW within 500m of the C182 between Hinkley Point and Cannington

PRoW Reference Number (Somerset County Council)		
WL23/15	WL23/110	**BW25/12**

WL23/71	BW5/33	**BW32/5**
WL23/88	BW5/34	**BW32/7**

*Note: PRoW in **bold** are those that cross the C182 or link PRoW on either side of the C182.*
Source: SCC [http://webapp1.somerset.gov.uk/SCCPROW/Index.asp?showalerts=1]

25.5.22 The PRoW within or adjacent to the C182 comprise a locally important (low importance) network of footpaths. PRoW are sensitive to obstruction which would prevent their use. Sensitivity to indirect (disturbance) impact is identified in the relevant topic chapter (**Chapters 11**, **12** and **22** of this volume) where the indirect (disturbance) has been assessed.

Off-Site Highway Improvements Sites

25.5.23 There are a number of PRoW within 500m of the proposed off-site highway improvements. The off-site highway improvements and PRoW are presented in **Figures 25.6** to **25.12**. A list of the specific PRoW within or adjacent to each off-site highway improvements site is presented in **Appendix 25D**. A summary of the PRoW network for each is as follows:

- A38 Bristol Road/The Drove junction – the nearest PRoW (BW38/1) is located 100m away, and another 2 PRoW are located within 500m (see **Figure 25.6**).
- A39 Broadway/A38 Taunton Road junction – one PRoW (BW38/26) connects to the highway pavement in the works area, whilst another 6 PRoW are located between 190m and 500m away (see **Figure 25.6**).
- A38 Bristol Road/Wylds Road junction – the nearest PRoW (BW38/2) is located 30m away, and another 3 PRoW are located between 100m and 500m away (see **Figure 25.6**).
- Wylds Road/The Drove junction – one PRoW (BW38/2) is located immediately adjacent to the works area, whilst another 8 PRoW are located between 70m and 500m away (see **Figure 25.6**).
- A39 Quantock Hill Road/Sandford Hill (B3339)/Charlynch Lane junction – one PRoW (BW34/23) is located immediately adjacent to the works area, whilst another 3 PRoW are located between 330m and 500m away (see **Figure 25.7**).
- M5 junction 23 – one PRoW (BW28/3) connects to the highway pavement in the works area, another PRoW (BW28/6) runs underneath the roundabout structure, whilst eight other PRoW (including two lengths of bridleway) are located between 50m and 500m away (see **Figure 25.8**).
- A39/B3190 (Washford Cross) junction – the nearest PRoW (WL28/14) is located 120m away, whilst another PRoW (WL28/13) is located 450m away (see **Figure 25.9**).
- C182 Clayland Corner – one PRoW (BW32/4) connects to the highway pavement in the works area, whilst another 2 PRoW are located between 310m and 500m away (see **Figure 25.10**).

- C182/Farringdon Hill Lane horse crossing – one PRoW (WL23/15) connects to the site boundary, whilst another 6 PRoW (including one restricted byway) are located between 500m and 700m away (see **Figure 25.11**).
- Cannington traffic calming measures– five PRoW (BW5/1, BW5/3, BW5/4, BW5/5A, and BW5/16) connect to the highway pavement in the works area, whilst another 11 PRoW are located between 20m and 500m away (see **Figure 25.12**).
- Huntworth roundabout – two PRoW are located 470m (BW23/69) and 490m (BW23/4) away from the site (see **Figure 25.13**).

25.5.24 All of these PRoW form part of the local network and are of low (local) importance.

ii. Equestrians

25.5.25 The total length of restricted byways within the study area and Stogursey Parish is 2,276m, but only 230m of this is located within the HPC development site. Of the total length, 1,500m is along public highways (the C182 and Wick Lane).

25.5.26 Many local residents own and ride horses for recreational purposes. In addition, there are two professional horse trainers in Stogursey, an equestrian centre located at Stockland Lovell Manor, and horse stables and training facilities located at Farringdon Hill Lane. Data on numbers of registered horse-riders in the wider study area was obtained from SCC, and this is presented in **Table 25.7**. Further information on equestrian numbers in the local area was provided by members of the equestrian community in 2010 and is presented in **Table 25.8**.

25.5.27 Through consultation, it was established that the limited number of restricted byways within and around the HPC development site are used by equestrians. However, due to the limited availability of restricted byways (or any other PRoW available for use by equestrians), most equestrian activity takes place on private land (with the permission of local farmers) or on the existing road network. The equestrian community frequently cross at the Farringdon Hill Lane/Wick Moor Drove junction, and also the Doggetts Lane and Wick Moor Drove junction. During consultation, equestrians raised concerns regarding crossing the C182 due to high speeds travelled by traffic along this road.

25.5.28 While there are a number of professional trainers and stables, as well as private owners, within the Parish of Stogursey (see **Table 25.8**), given the limited bridleway provision and access, equestrian facilities are considered to be of local importance.

Table 25.7: Registered Horse-riders within Local Parishes

Parish	Horses	Adult Riders	Child Riders	Carriage Drivers
Cannington	10	4	2	0
Fiddington	25	13	0	1
Kilve	41	32	16	0
Nether Stowey	22	10	4	0
Otterhampton	No Data			
Stockland Bristol	34	15	4	0
Stogursey	70	39	4	0

Table 25.8: Registered Horses within the Parish of Stogursey

Settlement Location	Number of Horses
Farringdon Hill	14
Stogursey	26
Monkton	4
Burton	5
Shurton	12
Stolford	10
Wick	3
Idson	9
Doggetts	3

Source: Equestrian community based on information provided in 2010.

25.5.29 There is no equestrian access (bridleway or restricted byway) within or adjacent to any of the proposed off-site highway improvements, with the exception of the study area around the M5 junction 23 and the C182 / Farringdon Hill Lane which are proposed equestrian crossing sites.

iii. Cyclists

25.5.30 As described above, there is limited byway or bridleway (both of which cyclists may use) provision within the study area. There are no cycle paths. Cycling takes place locally on the rural roads, but there are no indications of popular cycle routes within the study area and limited cycling has been observed during the site visits and surveys undertaken within the study area.

25.5.31 There is no cycle provision (other than on highways) within or adjacent to any of the proposed off-site highway improvements, with the exception of the study area around the M5 junction 23 and the C182 / Farringdon Hill Lane sites.

iv. Water-based Recreation

25.5.32 There are a large number of sailing, cruising, boating and yacht clubs that sail or cruise within the Severn Estuary and Bristol Channel.

25.5.33 Burnham Yacht Club, whose facilities are located at the mouth of the River Brue in Highbridge (approximately 9km east of the HPC development site), use the Bridgwater Bay and Severn Estuary for sailing and motor boating.

25.5.34 Combwich Motorboat and Sailing Club have mooring facilities and slipways at Combwich Wharf, which lies on the River Parrett, approximately 5km south-east of the HPC development site, but within 600m of the C182. With regard to use of open water, consultation indicates that the majority of members use the River Parrett and Bridgwater Bay for sailing and motor boating, but would not use the foreshore in the vicinity of Hinkley Point due to insufficient depth of water.

25.5.35 With regard to sea based recreational fishing, there is only one known organisation in the area, the Burnham Boat Owners Sea Angling Association. Consultation indicated that they fish (for bass, cod, ling, thornback and spurdog) in a 15km radius from Burnham every weekend over the winter; the location varies (dependent on the fish) but association members are often in Bridgwater Bay / the Hinkley Point area, which covers 17,330ha offshore and 3,093ha inshore (within 1km of low tide).

25.5.36 Given that no formal water-based recreation (organised by clubs and other organisations) takes place along the foreshore or immediately offshore of the HPC development site, a low (local) importance has been assigned to this recreational resource. In addition, during the Recreational Access Survey, as well as the many other walkover studies carried out during the assessment, no recreational boating activity was observed. Given the limited usage and the extremely large area of available estuary in the surrounding area, this resource is not considered to be sensitive to obstruction.

v. The Foreshore

25.5.37 In terms of proximity to the HPC development site, the foreshore is the largest available area of informal/undesignated open space, albeit limited in extent by tides.

25.5.38 The access points onto the foreshore within the study area are presented on **Figure 25.1**; the nearest are located 300m west of the site; at the north-west corner of the HPC development site; to the immediate north-west of the junction between PRoW WL23/56 and WL23/95; at the western end of the sea defences fronting Hinkley Point (at the north-east corner of the HPC development site); and from the sea defences north-east of the existing Hinkley Point Power Station Complex.

25.5.39 The foreshore is also used for a number of other activities including walking, angling and wildfowling, although by relatively low numbers of people.

25.5.40 In terms of walkers, The Marine and Coastal Access Act specifies that all land seaward of the route of the proposed England Coast Path should normally be accessible to the public. In this context, once the West Somerset Coast Path becomes part of the England Coast Path, the foreshore would be regarded as of national importance to users of PRoW.

25.5.41 Two wildfowling clubs, the Highbridge and Huntspill Wildfowling Association and the Bridgwater Bay Wildfowlers Association operate within the Bridgwater Bay National Nature Reserve (NNR), which extends along the foreshore from Lilstock in the west, to the Steart Peninsula and beyond, and includes the foreshore in the immediate vicinity of Hinkley Point. The clubs also have rights to shoot in the Parrett Estuary and on the Huntspill Foreshore, some 6km east of the HPC development site.

25.5.42 **Figures 25.1** and **25.2** show the Excepted Area for wildfowlers on the foreshore at Hinkley Point. This stretches from Stolford in the east, past Hinkley Point, to the boundary of the Bridgwater Bay NNR in the west. The Excepted Area can be used for shooting by any member of the British Society for Shooting and Conservation (BASC). Consultation with Natural England has indicated that usage of the Excepted Area is low, although due to the often solitary nature of the sport, Natural England and BBWA have indicated that it is not possible to quantify usage, 25.5.43 In terms of shore-angling, the majority of fishing activity occurs to the east of the existing Hinkley Point Power Station Complex due to the ease of access for vehicles. In this context the HPC development site is located over 1.2km from the nearest vehicular access point known to be used by anglers (which makes it less popular due to this distance and the need to carry the equipment over rough terrain). The Recreational Access Survey (see **Appendix 25A**) did not identify anglers on the shore fronting the HPC development site, though anglers were observed to the east of Hinkley Point B (1km away).

25.5.44 Angling also takes place at many other locations along the Somerset coastline (excluding the River Parrett Estuary), though locations characterised by higher use levels are influenced by accessibility. Locations identified from the Bristol Channel Sea Angling Club (Ref. 25.33) include Porlock Weir, Bossington, Minehead (Town Beach and Gasworks Beach), Dunster, Blue Anchor, Watchet, Doniford, St Audries, Kilve, Lilstock, and also Hinkley Point.

25.5.45 Fishing lakes are located 730m to the south-west of the HPC development site (see **Figure 25.1**) and approximately 200m to the east of the C182 at Combwich (see **Figure 25.2**).

25.5.46 Amateur geologists are known to visit the foreshore and the cliff exposure along the Blue Angel to Lilstock Coast SSSI. However, the best geological sections are further to the west of the HPC development site (see **Chapter 14** of this volume).

25.5.47 Given the limited recreational use of the foreshore directly in front of the HPC development site and the availability of similar recreational resource in the surrounding area, local importance is ascribed to the use of the foreshore in terms of recreational activities (other than walking on the Coast Path). These activities would be sensitive to obstruction of the foreshore. Sensitivity to indirect (disturbance) impacts, where relevant, is identified in the relevant topic chapter (**Chapters 11**, **12** and **22** of this volume) where the indirect (disturbance) has been assessed.

vi. Sports and Recreation Facilities

25.5.48 A search of the Sport England Active Places database (Ref. 25.21) indicates only one existing sports and recreation facility (including playing fields and sports clubs) within the study area for the HPC development site which is:

- Stogursey and District Victory Hall – local facilities for the residents of Stogursey, including a village hall, playing field and outdoor basketball court, located approximately 1km south of the HPC development site.

25.5.49 The following sports and recreation facilities (including playing fields and sports clubs) were identified (Ref. 25.21) within the study area (within 500m) for the C182 from Hinkley Point to Cannington (A39):

- Combwich Fishing Lakes (Site 22 on **Figure 25.2**) – located approximately 190m east of the C182.
- A sports pitch and clubhouse (Site 21 on **Figure 25.2**) – located near Shark's Lane 30m east of the C182, immediately north of Cannington.
- A playing field (Site 20 on **Figure 25.2**) owned and operated by Bridgwater College approximately 50m to the west of the C182 within Cannington.

- Recreation facilities operated by Bridgwater College (Site 82 on **Figure 25.2**), including golf course and a horse riding school – located approximately 160m to the east and north-east of the C182 at Cannington.
- Cannington Church of England Primary School (Site 18 on **Figure 25.2**) – located towards the centre of the village, approximately 30m east of the C182 at Cannington.
- Cannington Cemetery (Site 15 on **Figure 25.2**) – located approximately 410m west of the C182 at Cannington.
- Cannington Grange (Site 17 on **Figure 25.2**) – a private estate located approximately 250m south-east of the C182. The estate has been divided into a series of cottages and apartments for letting purposes and provides a range of recreational facilities, including tennis, badminton and fishing.

25.5.50 The following sports and recreation facilities (including playing fields and sports clubs) were identified (Ref. 25.21) within the study area (within 500m) for the proposed off-site highway improvements:

- The Exchange (Site 1 on **Figure 25.6**) – a health and fitness centre located at Express Park, approximately 480m north of the A38 Bristol Road / Wylds Road junction off-site highway improvements site.
- Drove House (Site 3 on **Figure 25.6**) – a health and fitness centre located approximately 460m south-west of the A38 Bristol Road/Wylds Road junction off-site highway improvements site, 130m west of the A38 Bristol Road / The Drove off-site highway improvements site, and 130m east of The Drove / Wylds Road junction (NDR) off-site highway improvements site.
- Trim Wise (Site 4 on **Figure 25.6**) – a health and fitness centre located 350m north-east of the A38 Taunton Road / A39 Broadway junction off-site highway improvements site.
- Eastover Park Tennis Centre and Eastover Park Bowling Club at Eastover Park (Site 5 on **Figure 25.6**) – located 300m east of the A38 Taunton Road / A39 Broadway junction off-site highway improvements site.
- Bridgwater Town Football Club (Site 10 on **Figure 25.6**) – facilities include three outdoor football pitches located 420m south-east of the A38 Bristol Road / The Drove off-site highway improvements site.
- Bridgwater and Albion Rugby Football Club (Site 11 on **Figure 25.6**) – facilities include two rugby football pitches and ancillary buildings located 360m south-east of the A38 Bristol Road / The Drove off-site highway improvements site.
- Bridgwater Sports and Social Club (Site 12 on **Figure 25.6**) – facilities include a bowling green, a cricket net, two outdoor football pitches, and a club house with additional facilities, located 300m south-east of the A38 Bristol Road / Wylds Road junction off-site highway improvements site, and 330m to the east of the A38 Bristol Road / The Drove off-site highway improvements site.
- Cannington Cemetery (Site 15 on **Figure 25.12**) – located approximately 10m north-west of the Cannington Traffic Calming Measures.

- Cannington Church of England Primary School (Site 18 on **Figure 25.12**) – located towards the centre of the village, approximately 220m south-east of the Cannington Traffic Calming Measures.
- A playing field (Site 20 on **Figure 25.12**) − owned and operated by Bridgwater College approximately 50m to the west of the Cannington Traffic Calming Measures.
- A sports pitch and clubhouse (Site 21 on **Figure 25.12**) – located near Shark's Lane, 300m north of the Cannington Traffic Calming Measures.
- Puriton playing fields providing indoor bowls (Site 25 on **Figure 25.8**) − an outdoor grass football pitch, and an outdoor cricket pitch, located 430m to the north-east of the M5 Junction 23 off-site highway improvements site.
- Bridgwater Lawn Tennis Club (Site 28 on **Figure 25.13**) − the club facilities include 5 courts, of which 3 are all-weather 'Astroturf' that are floodlit and two American fast clay courts, and a clubhouse with shower and changing facilities. Membership is open to the public, and there are 8 teams that play in the North Somerset League. The Club is open all day and evening, 7 days a week, being weather dependent. The Club is located 440m to the east of the Huntworth Roundabout off-site highway improvements site.
- The Tropiquaria Zoo (Site 59 on **Figure 25.9**) − located 800m to the south of the site, and is accessed from the B3190 and the A39. Tropiquaria is a tourism and leisure facility that comprises a tropical hall, aquarium, a radio museum, and outdoor play areas. It is accessible to the public from February to November, seven days a week from 10:30 to 17:00 (and 10:00 to 18:00 in summer), for an admission fee.
- Recreation facilities operated by Bridgwater College (Site 82 on **Figure 25.12**) − including golf course and a horse riding school, located approximately 160m to the east of the Cannington Traffic Calming Measures.

25.5.51 All of these sports and recreational facilities are considered to be of local importance. The facilities would be sensitive to obstruction which would prevent access or interfere with the use of the facilities. Sensitivity to indirect (disturbance) impact is identified in the relevant topic chapter (**Chapters 11**, **12** and **22** of this volume) where the indirect (disturbance) impact has been assessed.

vii.Open Access Land and Public Open Space

Open Access Land

25.5.52 There are no areas of open access land within the HPC development site itself. A search of Natural England's Common Rights of Way (CRoW) database (Ref. 25.22) indicated that the nearest areas of open access land include a series of commons immediately east of the HPC development site, to the south of the existing Hinkley Point Power Station Complex, extending east along the foreshore to the Steart Peninsula. These comprise Wick Moor Common, North Moor Common and Great Hooks and Little Hooks Common (see **Figure 25.1**).

25.5.53 The nearest to the HPC Development Site are North Moor Common and Wick Moor Common (separated from each other by Wick Moor Drain). These are located directly east of the HPC development site and south of the existing Hinkley Point Power Station Complex. No significant use of North Moor or Wick Moor Commons was indicated during consultation, which is supported by the results of the Recreational Access Survey and observations made during field surveys in the course of this EIA. Hence use of North Moor and Wick Moor Commons is assessed as being infrequent and low for the purposes of this assessment.

25.5.54 Given the limited recreational use of the North Moor and Wick Moor Common and the availability of similar recreational resource in the surrounding area, local importance is ascribed. The Commons would be sensitive to obstruction which would prevent access or use. Sensitivity to indirect (disturbance) impacts is identified in the relevant topic chapter (**Chapters 11**, **12** and **22** of this volume), where relevant, where the indirect (disturbance) has been assessed.

25.5.55 There are no areas of open access land within the study area for the proposed off-site highway improvements, with the exception of the equestrian crossing proposed on the C182/Farringdon Hill junction, where common land (part of Wick Moor Common) is located 390m to the north of the works area.

Public Open Space

25.5.56 There are no areas of public open space, such as formal parks and gardens within the HPC development site. The nearest formal areas of public open space adjacent to the C182 or the off-site highway improvements include:

- Cranleigh Gardens and Eastover Park (Site 56 on **Figure 25.6**) – comprising a 3ha park that contains mainly open grass areas which are surrounded by mature and semi-mature trees, with a fenced play area for toddlers and juniors in the north of the park (inspected on a weekly basis by Sedgemoor Council). The Park also includes a football pitch which is available for hire from SDC's Clean Surroundings. It is located 350m east of the A38 Taunton Road / A39 Broadway junction off-site highway improvements site.
- Cannington Walled Garden in Cannington (Site 84 on **Figure 25.2**) – located approximately 4m south of the C182 and the Cannington Traffic Calming Measures.

25.5.57 A number of areas of public open space, such as formal parks and gardens, are located adjacent to or within 500m of the C182 between Hinkley Point and Cannington, as follows:

- an area of amenity grassland adjacent to Folly Close (Site 67 on **Figure 25.2**) – located 50m east of the C182 at Cannington;
- an area of amenity grassland on Church Street (Site 68 on **Figure 25.2**) – located 80m south of the C182 at Cannington;
- St Mary the Virgin Churchyard (Site 69 on **Figure 25.2**) – located 50m west (or 110m south) of the C182 at Cannington;
- Cannington Play Area (Site 70 on **Figure 25.2**) – located 5m east of the C182 at Cannington;
- an area of amenity grassland on Duke Avenue (Site 71 on **Figure 25.2**) – located 175m east of the C182 at Cannington;
- an area of amenity grassland situated between Brooks Street and Main Road (Site 72 on **Figure 25.2**) – located 5m west of the C182 at Cannington;

- an area of amenity grassland adjacent to Denmans Lane (Site 73 on **Figure 25.2**) – located 30m west of the C182 at Cannington;
- an area of amenity grassland on Teals Acre (Site 74 on **Figure 25.2**) – located 90m west of the C182 at Cannington;
- an area of amenity grassland on Rydon Crescent (Site 75 on **Figure 25.2**) – located 70m east of the C182 at Cannington;
- an area of amenity grassland on Southbrook Crescent (Site 76 on **Figure 25.2**) – located 50m east of the C182 at Cannington;
- two areas of amenity grassland on Oak Tree Way (Site 77 and 78 on **Figure 25.2**) – located 40m to 80m west of the C182 at Cannington;
- an area of amenity grassland on Southbrook Close (Site 79 on **Figure 25.2**) – located 285m east of the C182 at Cannington;
- two areas of amenity grassland on Lonsdale Road (Site 80 and 81 on **Figure 25.2**) – located 145m to 210m east of the C182 at Cannington; and
- allotments north of East Street (Site 82 on **Figure 25.2**) – located 130m east of the C182 at Cannington.

25.5.58 A number of areas of public open space, such as formal parks and gardens, are located near to but not within the areas of proposed off-site highway improvements, as follows:

- Crowpill Lane area of grassland and play area (Site 38 on **Figure 25.6**) – located 380m west of The Drove / Wylds Road junction (NDR) off-site highway improvements site.
- Chilton Street Children's Play Area (Site 44 on **Figure 25.6**) – located 250m west of The Drove / Wylds Road junction (NDR) off-site highway improvements site.
- Union Street Children's Play Area (Site 48 on **Figure 25.6**) – located 190m to the south-east of the A38 Bristol Road / The Drove off-site highway improvements site, and 420m south-east of the Drove / Wylds Road junction (NDR) off-site highway improvements.
- King Square (Site 50 on **Figure 25.6**) – an area of public open space located 360m north-west of the A38 Taunton Road / A39 Broadway junction off-site highway improvements site.
- Blake Gardens (Site 53 on **Figure 25.6**) –municipal garden located 30m north of the east end of the A38 Taunton Road / A39 Broadway junction off-site highway improvements site.
- An area of amenity grassland adjacent to Folly Close (Site 67 on **Figure 25.12**) – located 50m east of the Cannington Traffic Calming Measures.
- An area of amenity grassland on Church Street (Site 68 on **Figure 25.12**) – located 70m south of the Cannington Traffic Calming Measures.
- St Mary the Virgin Churchyard (Site 69 on **Figure 25.12**) – located 120m south-east (or 110m south) of the Cannington Traffic Calming Measures.
- Cannington Play Area (Site 70 on **Figure 25.12**) – located 300m south-east of the Cannington Traffic Calming Measures.

- An area of amenity grassland on Duke Avenue (Site 71 on **Figure 25.12**) – located 370m south-east of the Cannington Traffic Calming Measures.
- An area of amenity grassland situated between Brooks Street and Main Road (Site 72 on **Figure 25.12**) – located 240m south-east of the Cannington Traffic Calming Measures.
- An area of amenity grassland adjacent to Denmans Lane (Site 73 on **Figure 25.12**) – located 250m south of the Cannington Traffic Calming Measures.
- An area of amenity grassland on Teals Acre (Site 74 on **Figure 25.12**) – located 350m south of the Cannington Traffic Calming Measures.
- An area of amenity grassland on Rydon Crescent (Site 75 on **Figure 25.12**) – located 495m south-east of the Cannington Traffic Calming Measures.
- Two areas of amenity grassland on Oak Tree Way (Site 77 and 78 on **Figure 25.12**) – located 445m to 450m south of the Cannington Traffic Calming Measures.
- Allotments north of East Street (Site 82 on **Figure 25.12**) – located 290m east of the Cannington Traffic Calming Measures.

25.6 Assessment of Impacts

a) Introduction

25.6.1 This section identifies and assesses the potential impacts associated with the proposed development throughout the construction and operational phases. A description of construction and operational activities is presented in **Chapters 2** and **3** of this volume. The assessment includes the examination of the construction phase impacts associated with the proposed off-site highway improvements.

b) Construction Phase Impacts

i. Obstruction to PRoW

HPC Development Site

25.6.2 On commencement of construction works a timber post and rail fence would be erected around the perimeter of the HPC development site, and a chain link inner security fence would be installed around the construction area. There would be a space between the two fences, varying from 4m to 30m wide. All PRoW within the inner security fence would be obstructed and public access would be prohibited for health and safety reasons for the duration of the construction works (up to 11 years). The fencing would also include the coastal edge as construction works for the seawall would prevent access to this area from commencement for a period of up to three years.

25.6.3 **Figure 25.14** shows the site and the PRoW that would be affected by the construction works, including the construction of the jetty and sea wall. The total length of PRoW obstructed would be 7,875m, which constitutes 23% of the 34.5km resource within the study area, and 11% of the 73.5km resource within Stogursey Parish. **Table 25.9** provides a summary of the footpaths that would be obstructed and the nature of the impact on each PRoW.

Table 25.9: Significance of Impacts for Each PRoW Affected during Construction

Footpath ID	Length	Description of Impact	Importance	Impact Magnitude	Significance
WL 23/48	740m	Obstruction for up to 11 years	Low	High	Moderate adverse
WL 23/50	300m	Obstruction for up to 11 years	Low	High	Moderate adverse
WL 23/56	1,530m	Obstruction for up to 11 years	Low	High	Moderate adverse
WL 23/68	627m	Obstruction for up to 11 years	Low	High	Moderate adverse
WL 23/69	694m	Obstruction for up to 11 years	Low	High	Moderate adverse
WL 23/70	1,147m	Obstruction for up to 11 years	Low	High	Moderate adverse
WL 23/95 (Part of the West Somerset Coast Path)	1,250m	Obstruction for up to three years and for a short period during jetty dismantling	High	High	Major adverse
WL 23/105	557m	Obstruction for up to 11 years	Low	High	Moderate adverse
WL 23/110	1,030m	Obstruction for up to 11 years	Low	High	Moderate adverse

25.6.4 Following completion of the jetty and seawall, the West Somerset Coast Path (WL23/95) would be re-opened, and would run along the top of the new sea wall. **Figure 25.15** shows the site and the PRoW that would be affected by obstruction after completion of the jetty and seawall.

25.6.5 Once the Coast Path (WL23/95) is reopened, the total length of PRoW obstructed during the construction phase would represent a maximum of 6,625m, which constitutes 19% of the resource within the study area, and 8% within Stogursey Parish.

25.6.6 During dismantling of the temporary jetty at the end of the construction phase, a further short duration closure would be required for the West Somerset Coast Path for health and safety reasons.

25.6.7 In terms of the wider PRoW network, the presence and retention of PRoW to the east, south, and west of the HPC development site would maintain an indirect access route to Stolford from the settlements of Burton, Shurton and Knighton. Consequently, although direct routes would be affected, particularly during the closure of the West Somerset Coast Path, indirect routes would be available which have minimal lengths along or crossing roads and lanes.

25.6.8 The permanent obstruction of the affected PRoW (excluding the West Somerset Coast Path (WL23/95)) for up to eleven years would be, on a conservative premise, a change of a high magnitude for each individual PRoW because the right of passage would be prevented for this duration. The affected PRoW network is a resource of low (local) importance and, consequently, an impact of **moderate adverse** significance is predicted.

25.6.9 The temporary obstruction of the nationally important West Somerset Coast Path would be a change of a high magnitude due to the loss of right of access along the coast, albeit for a lesser period of time than for the other PRoW on site. Given the high importance of this asset, a medium-term impact of **major adverse** significance is predicted.

25.6.10 The closure of the restricted byway within the HPC development site would result in a loss of 230m or 10% of the restricted byways (2,279m) available to equestrians and cyclists in the study area. However, as the affected byway results in a dead end currently, it is of limited use. Taking this into account, along with the low (local) importance of the restricted byway, a medium-term **negligible** impact is predicted.

PRoW along the C182 and Off-Site Highway Improvements

25.6.11 The PRoW that cross, connect or run parallel to the road are all of low (local) importance and users of these PRoW would experience a change of very low magnitude due to increased traffic and associated longer waiting times to cross the C182. Therefore, a **negligible** impact is predicted.

25.6.12 During consultation, equestrians raised concerns about the safety of horses and riders crossing the road at the junction of Farringdon Hill and the C182 in particular. This impact is related to road safety rather than specific effects on users (including equestrians) of PRoW and is therefore considered in **Chapter 10** (Transport) rather than within this assessment.

25.6.13 The following off-site highway improvements are located adjacent to PRoW or contain PRoW within their site boundaries (see **Appendix 25D**):

- M5 Junction 23 – BW28/3;
- The Drove/Wylds Road junction – BW38/2;
- A38 Taunton Road / A39 Broadway junction – BW38/26;
- Sandford Hill junction – BW34/23;
- C182 Clayland Corner – BW32/4; and
- C182/Farringdon Hill Lane – WL23/15.

25.6.14 However, the off-site highway improvement construction activities would not result in the obstruction of or physical disturbance to any PRoW. Consequently, **no impact** is predicted.

ii. Disturbance to Users of PRoW

25.6.15 The construction works could result in noise, air quality and visual disturbance, which could cause an adverse impact on the amenity value of the PRoW in the study area for up to 11 years. These impacts are examined in **Chapters 11**, **12**, and **22** of this volume, and are summarised below.

HPC Development Site

25.6.16 **Chapter 11** (Noise and Vibration) considers PRoW in the category of outdoor public amenity receptor locations and as of 'low' sensitivity due to the transient presence of human receptors in these locations, and the options that such receptors would have available allowing them to select other locations at any given time.

25.6.17 Disturbance impacts to the section of the West Somerset Coast Path running along the north of the HPC development site (WL23/95) and at two points along WL23/48 adjacent to and within the western boundary of the HPC development site (one on Benhole Lane and the other at the junction of WL23/48 and WL23/50) are assessed. Impacts are also assessed at Wick Barrow (Pixies Mound) Scheduled Monument. PRoW WL23/71 runs directly south of the field in which the monument is located so this may be considered indicative of impacts on the section of WL23/71 directly to the east of the site (see **Figure 11.1**, **Chapter 11** for specific monitoring and assessment locations).

25.6.18 Noise impacts will vary over the construction phase depending on activities underway and their location in relation to the PRoW.

25.6.19 At worst case, short-term high magnitude construction noise levels are predicted to occur at Pixies Mound (WL23/71) during the nearby upgrade of roads (2-3 months) and this is assessed as being of **moderate adverse** significance. Similarly, at the assessed West Somerset Coast Path (WL23/95) location during construction of the temporary jetty, high magnitude noise levels are predicted. As a worst-case assessment, the significance of this noise magnitude is also assessed as **moderate adverse**.

25.6.20 During final landscaping activities close to the site boundary, short-term noise impacts of **moderate adverse** significance are also predicted at all three assessed public footpath receptors. However, it should be noted that noise impacts for the majority of this phase of works, when plant is operating further away from the site boundary, will be less significant.

25.6.21 At each of the assessed outdoor public amenity receptor locations, during all other phases of works, the noise magnitude will vary between very low and medium. Therefore the impact significance is predicted to be **minor adverse** to **negligible**.

25.6.22 The magnitude assigned to public amenity receptors is given as if the receptors at these locations would be stationary. However, human receptors at these amenity locations will be transient and are therefore very unlikely to be subject to the same exposure duration as defined for fixed property receptor locations. Therefore, whilst the predicted noise levels might result in short-term disturbance, the impact on a person's enjoyment of these amenities is likely to be less significant than has been assessed.

25.6.23 **Chapter 12** (Air Quality) of this volume considers that the sensitivity of users of PRoW to air quality impacts is low because adverse health impacts are not expected due to the transient short-term exposure to potentially elevated air pollutant concentrations. For this reason air quality impacts upon users of PRoW are scoped out of the Air Quality assessment and consequently from the remainder of this assessment.

25.6.24 **Chapter 22** (Landscape and Visual) considers impacts on PRoW in terms of change in landscape character and in terms of change in composition of view for specific viewpoints, as follows (see **Chapter 22** for detailed viewpoint descriptions):

- Principal Viewpoint 1 – PRoW WL23/110 west of Benhole Lane;
- Principal Viewpoint 2 − PRoW WL23/95, West Somerset Coast Path,;
- Principal Viewpoint 3 − PRoW WL 24/10, West Somerset Coast Path, Lilstock;
- Principal Viewpoint 4 − PRoW WL24/8;
- Principal Viewpoint 5 − PRoW 24/3, Higher Hill;
- Principal Viewpoint 6 − PRoW WL 24/11 near the edge of the Great Plantation;
- Principal Viewpoint 8 − PRoW WL23/46, Knighton Farm;
- Principal Viewpoint 10 − local Farm near PRoW WL23/48, Shurton West;
- Principal Viewpoint 11 − PRoW WL23/56, Shurton east;
- Principal Viewpoint 13 − PRoW WL23/57, west of Wick;
- Principal Viewpoint 15 − PRoW WL23/61;
- Principal Viewpoint 16 − PRoW WL23/61, Wick;
- Principal Viewpoint 19 − PRoW WL23/95, West Somerset Coast Path, Stolford;
- Principal Viewpoint 20 − PRoW No. BW32/3, Stockland Bristol;
- Principal Viewpoint 21 − PRoW WL24/1, Quantock Hills AONB;
- Principal Viewpoint 22 − PRoW WL8/30, East Quantoxhead;
- Principal Viewpoint 28 − PRoW WL10/9, Quantock Hills AONB;
- Principal Viewpoint 30 − PRoW WL10/28, Quantock Hills AONB;
- Principal Viewpoint 35 − Cannington Park, public footpath; and
- Principal Viewpoint 36 – PRoW BW 28/3, Puriton Hill.

25.6.25 For the construction phase, impacts on PRoW in terms of change in landscape character are predicted to be **major adverse** while impacts on the viewpoints set out above are predicted to be **major adverse** on Viewpoints 1, 2, 3, 8, 10, 11, 16, 19, 20 and 28; **moderate adverse** on Viewpoints 4, 5, 6, 13, 15, 21, 22, 29 and **minor adverse** on Viewpoints 35 and 36.

25.6.26 However, as for the noise and vibration assessment above, people using the PRoW would usually be transient and are, therefore, unlikely to be subject to the same exposure duration as defined for fixed receptor locations on which the assessment is based.

PRoW along the C182 and Off-Site Highway Improvements

25.6.27 **Chapter 11** (Noise and Vibration) does not specifically assess disturbance impacts to PRoW along the C182. However, it does assess general impacts to low sensitivity receptors along the route and concludes that the magnitude of change in terms of day time traffic noise would be either low or very low and therefore a **minor adverse** impact is predicted.

25.6.28 In terms of the highway improvements, **Chapter 11** (Noise and Vibration), considers that of the 11 off-site highway improvements, the only works of sufficient scale to cause significant adverse noise effects are associated with construction of the new roundabouts at Washford Cross and Sandford Hill. PRoW are not identified as sensitive receptors in terms of noise disturbance in these locations however.

25.6.29 **Chapter 12** (Air Quality) has scoped out disturbance impacts to PRoW.

25.6.30 **Chapter 22** (Landscape and Visual) scopes out disturbance impacts to users of PRoW on the C182 as this comprises an existing road. The highway improvements are also scoped out as the proposed works are of small scale and have no potential to exert significant landscape and visual impacts.

iii. Obstruction to Sports and Recreation Facilities

25.6.31 No formal sports or recreational facilities are located within the HPC development site, alongside the C182 or within or immediately adjacent to any of the off-site highway improvements. Therefore **no impact** is predicted.

iv. Disturbance to Users of Sports and Recreation Facilities

HPC Development Site

25.6.32 The nearest sports and recreational facility is the fishing lakes to the south-west of the site. However these are located in excess of 730m from any major works and are therefore scoped out of the Noise and Vibration (**Chapter 11**), Air Quality (**Chapter 12**) and Landscape and Visual (**Chapter 22**) assessments and therefore from the remainder of this assessment.

Along the C182 and Off-Site Highway Improvements

25.6.33 **Chapter 11** (Noise and Vibration) does not specifically assess disturbance impacts to sports and recreation receptors along the C182. However, it does assess general impacts along the designated transport routes for construction traffic and the impacts on sports and recreation facilities may be derived from these.

25.6.34 For 2013, a high magnitude impact is assessed for receptors along Cannington High Street and Rodway and this would result in a **major adverse** impact on Cannington Cemetery (medium sensitivity, Site 15 on **Figure 25.2**) and **moderate adverse** on the sports pitch on Shark's Lane (low sensitivity, Site 21 in **Figure 25.2**), for example.

25.6.35 For 2016, when the Cannington bypass is predicted to be in place, receptors on C182 (Rodway) south of the northern roundabout of the bypass and on Main Road / Fore Street through Cannington would experience a decrease in daily traffic noise. For the sports pitch on Shark's Lane this would result in a **minor beneficial** impact. For Cannington Cemetery, an adverse impact would remain but this would reduce to **moderate adverse**.

25.6.36 In terms of the highway improvements, as described in the PRoW section above, **Chapter 11** (Noise and Vibration) considers that the only works of sufficient scale to cause significant adverse noise effects are associated with construction at the new roundabouts at Washford Cross and Sandford Hill.

25.6.37 There are no sports and recreation facilities within the vicinity of the Sandford Hill highway improvement works. The closest sensitive noise receptor to Washford Cross is Tropiquaria Zoo (25m to the north west). Construction of the Washford Cross roundabout is expected to last a maximum of six months and a **moderate adverse** impact is predicted on the closest outdoor area of Tropiquaria during this time.

25.6.38 As for PRoW, **Chapter 12** (Air Quality) considers that the sensitivity of users of sports and recreation facilities to air quality impacts is low because adverse health impacts are not expected due to the transient short-term exposure to potentially elevated air pollutant concentrations. For this reason air quality impacts upon users of sports and recreation facilities are scoped out of the Air Quality assessment and consequently from the remainder of this assessment.

25.6.39 **Chapter 22** (Landscape and Visual) scopes out disturbance impacts to users of sports and recreation facilities along the C182 as this comprises an existing road. The highway improvements are also scoped out as the proposed works are of small scale and have no potential to exert significant landscape and visual impacts.

v. Obstruction to Open Access Land and Public Open Space (including Foreshore)

HPC Development Site

25.6.40 There are no areas of open access land or public open space within the landward footprint of the construction area for the HPC development site, nor would the common land which is located along part of the eastern boundary of the works area be obstructed. Therefore, **no impact** is predicted.

25.6.41 On commencement of construction, two foreshore access locations would be obstructed for up to three years during the construction of the jetty and the seawall. The two points obstructed would be the access near the northwest corner of the HPC development site, and the access to the northwest of the junction between WL23/56 and WL23/95 (see **Figure 25.16**). The access point 300m west of HPC development site and off the sea defences fronting the existing Hinkley Point Power Station Complex) would remain unobstructed. The obstruction of two access points for up to three years is considered to represent a very low magnitude impact, due to the availability of the two other access points in close proximity.

25.6.42 In addition, for the construction of the jetty and the seawall, an area from the base of the cliff extending along the northern boundary of the development site and then 30m outwards towards the sea would be obstructed. The construction drainage outfall would also extend across the foreshore but appropriate measures would be provided to allow access over these works and along the foreshore.

25.6.43 The foreshore to the north of the HPC development site is accessible to the public and is used for a variety of recreational activities, including walking, angling, and wildfowling. Impacts on these activities are assessed as follows:

25.6.44 In terms of users of the West Somerset Coast Path, the foreshore is considered of national importance as the Marine and Coastal Access Act specifies that all land seaward of the proposed England Coast Path route should normally be accessible to the public. However, as the West Somerset Coast path will be closed during the construction of the sea wall and jetty, no additional impact is assessed.

25.6.45 In terms of shore-angling, the foreshore at the HPC development site is located approximately 1.2km from the nearest vehicular access point known to be used by anglers (to the east of Hinkley Point B), which makes the site less suitable for angling (due to this distance and the need to carry equipment over rough terrain). Given the current limited accessibility to the area of foreshore that would be obstructed and the limited time period of the obstruction, as well as the availability of more suitable and accessible locations to the east and west of the site, a change of very low magnitude would be expected. The foreshore is considered of local (low) importance for shore-angling and therefore a short-term **minor adverse** impact is predicted.

25.6.46 The foreshore is an Excepted Area for wildfowling and is assessed as a locally (low) importance resource for this activity as use of the site is made by a relatively small number of people and there are two other Excepted Areas within Bridgwater Bay National Nature Reserve alone. Only a small amount of the area available for wildfowling (less than five percent) would be obstructed during the construction of the jetty and sea wall. Consequently, a change of low magnitude is assessed for up to three years and a direct medium-term **minor adverse** impact is predicted.

25.6.47 The estuary to the north of the HPC development site is also used for a variety of recreational activities, including sea-angling and boating. Exclusion requirements due to the construction, operation and dismantling of the jetty and the construction of the offshore structures is detailed in **Chapter 26** (Navigation) of this volume.

25.6.48 Based on the limited scale of the extent of obstruction, there would be a change of a low magnitude. The recreational resource is ascribed low (local) importance and therefore a medium-term **minor adverse** impact is predicted with respect to sea angling and boating.

Along the C182 and Off-Site Highway Improvements

25.6.49 No areas of open access land or public open space alongside the C182 or within any of the proposed off-site highway improvements would be obstructed and therefore **no impact** is predicted.

vi. Disturbance to Users of Open Access Land and Public Open Space (including Foreshore)

HPC Development Site

25.6.50 The construction works could result in noise, air quality and visual disturbance impacts on the amenity value of the open access land and public open space in the study area for up 11 years.

25.6.51 **Chapter 11** (Noise and Vibration) does not specifically identify open access land and public open space receptors. However, noise impacts on visitors to Wick Barrow (Pixies Mound) Scheduled Monument, which is directly north of North Moor and Wick Moor Commons, are assessed as are impacts to the West Somerset Coast Path, which is considered to be representative of the foreshore and intertidal zone.

25.6.52 As detailed in the disturbance impacts to PRoW above, impacts on Pixies Mound (North Moor and Wick Moor Commons) are assessed as being of **moderate adverse** significance during road upgrading works reducing to **minor adverse** during all other construction works.

25.6.53 Impacts on the West Somerset Coast Path are assessed as **moderate adverse** during construction of the jetty and during landscape restoration and **negligible** to **minor adverse** for the remainder of the construction phase.

25.6.54 As for PRoW, this is a worse-case scenario because users of these amenity locations are likely to be transient and are unlikely to be subject to the same exposure duration as defined for fixed property receptor locations (on which the assessment is based). Furthermore, following completion of the seawall and jetty construction, noise levels along the foreshore would decrease significantly.

25.6.55 **Chapter 12** (Air Quality) scopes out users of the foreshore and Wick Common, where they are adjacent to the construction site boundary, because of the transitory nature of these receptors, their short-term exposure, and the intermittent nature of such emissions.

25.6.56 **Chapter 21** (Landscape and Visual) assesses "Wick Moor and Coast" (which would include Wick Moor Common and North Moor Common) in terms of impacts on landscape character and predicts a **major adverse** impact during the construction phase.

25.6.57 Impacts on the West Somerset Coast Path may be considered representative of impacts on the foreshore and these are assessed by Viewpoints 2, 3 and 19. For the construction phase, impacts are predicted to be **major adverse** on these viewpoints.

Along the C182 and Off-Site Highway Improvements

25.6.58 **Chapter 11** (Noise and Vibration) does not specifically assess disturbance impacts to users of open access land and public open space along the C182. However, it does assess general impacts along the designated transport routes for construction traffic and the impacts on open access land and public open space recreation facilities may be derived from these.

25.6.59 For 2013, a high magnitude impact is assessed for receptors along Cannington High Street and Rodway. There is no open access land or public open space directly adjacent to these roads, with the exception of Cannington Walled Garden (Site 84 on **Figure 25.2**), the north western edge of which is located on the corner of High Street and Rodway. As this is of local importance, a **moderate adverse** impact is predicted.

25.6.60 For 2016, when the Cannington bypass is predicted to be in place, receptors on C182 (Rodway) south of the northern roundabout of the bypass and on Main Road / Fore Street through Cannington would experience a decrease in daily traffic noise. This would result in a **minor beneficial** impact on St Mary the Virgin Churchyard (Site 69 on **Figure 25.2**), as well as a number of areas of amenity grassland.

25.6.61 In terms of the highway improvements, as described in the PRoW section above, **Chapter 11** (Noise and Vibration) considers that the only works of sufficient scale to cause significant adverse noise effects are associated with construction at the new roundabouts at Washford Cross and Sandford Hill. There are no areas of open access land or public open space in proximity to these sites and therefore impacts are scoped out of the noise and vibration assessment.

25.6.62 As for PRoW, **Chapter 12** (Air Quality) considers that the sensitivity of users of open access land and public open space to air quality impacts is low because adverse health impacts are not expected due to the transient short-term exposure to potentially elevated air pollutant concentrations. For this reason air quality impacts upon users of sports and recreation facilities are scoped out of the Air Quality assessment and consequently from the remainder of this assessment.

25.6.63 **Chapter 22** (Landscape and Visual) scopes out disturbance impacts to users of sports and recreation facilities along the C182 as this comprises an existing road. The highway improvements are also scoped out as the proposed works are of small scale and have no potential to exert significant landscape and visual impacts.

c) Operational Phase Impacts

25.6.64 Operational phase impacts are only considered in terms of the HPC development site and the C182 as all highway improvements works would be completed during the construction phase.

25.6.65 **Chapter 11** (Noise and Vibration) does consider traffic-related noise impacts to some sports and recreation, open access land and public open space receptors within Cannington, which fall within the C182 study area for this assessment. However, these are summarised in the Cannington Bypass Amenity and Recreation chapter (**Volume 5**, **Chapter 17**) and are therefore not repeated here.

i. Obstruction to PRoW

25.6.66 On commencement of the operational phase, only the HPC permanent development site boundary would result in the obstruction of any PRoW. However, as the PRoW within the HPC permanent development site boundary would already have been closed for the duration of the construction phase, the operational footprint of HPC would not result in additional closure or loss of PRoW.

25.6.67 **Figure 25.17** shows the HPC permanent development site boundary and the PRoW that would be affected on commencement of the operational phase (on the basis that the construction phase assessment covers the period up to reinstatement of the PRoW on the construction site land outside the operational footprint).

25.6.68 The total length of PRoW obstructed by the operational boundary would be 4,549m, which constitutes 13% (of the 34.5km resource) within the study area, and 6% (of the 73.5km) within Stogursey Parish. **Table 25.10** provides a summary of the footpaths that would be obstructed and the nature of the impact on each PRoW.

Table 25.10: Significance of Impacts for Each PRoW Affected by the Operational Site Footprint

Footpath ID	Length	Description of Impact	Importance	Impact Magnitude	Significance
WL23/48	738m	Permanent obstruction	Low	High	Moderate adverse
WL23/50	299m	Permanent obstruction	Low	High	Moderate adverse
WL23/56	840m	Permanent obstruction	Low	High	Moderate adverse
WL23/68	627m	Permanent obstruction	Low	High	Moderate adverse
WL23/70	1,148m	Permanent obstruction	Low	High	Moderate adverse
WL23/105	557m	Permanent obstruction	Low	High	Moderate adverse
WL23/110	340m	Permanent obstruction	Low	High	Moderate adverse

25.6.69 The density of PRoW per km^2 within the study area would decrease from 3,272m of PRoW per km^2 to 2,986m of PRoW per km^2, a permanent reduction of 9%. In terms of circular routes within the study area, five of the current 49 routes forming the PRoW network would be affected.

25.6.70 The permanent obstruction of the affected PRoW is, on a conservative premise, considered to represent a high magnitude change for each individual PRoW because the right of passage would be permanently prevented. The affected PRoW network is considered to represent a resource of low (local) importance and, consequently, a permanent **moderate adverse** impact is predicted.

25.6.71 The permanent closure of a restricted byway within the HPC development site would result in a loss of 230m or 10% of the restricted byways (2,279m) available to equestrians and cyclists in the study area (and Stogursey Parish). However, the legal route currently results in a dead end and therefore a low magnitude change on this resource of local (low) importance is assessed and a permanent **minor adverse** impact is predicted.

ii. Disturbance to Users of PRoW

25.6.72 The operation of HPC could result in noise, air quality and visual disturbance which could impact the amenity value of PRoW in the study area.

25.6.73 **Chapter 11** (Noise and Vibration) does not identify PRoW as sensitive receptors for the operational phase while **Chapter 12** (Air Quality) has scoped out impacts to PRoW (see construction phase section above).

25.6.74 **Chapter 22** (Landscape and Visual) considers impacts on PRoW in terms of change in landscape character and in terms of change in composition of view for specific viewpoints, as follows:

- Principal Viewpoint 1 – PRoW WL23/110 west of Benhole Lane;
- Principal Viewpoint 2 − PRoW WL23/95, West Somerset Coast Path;
- Principal Viewpoint 3 − PRoW WL 24/10, West Somerset Coast Path, Lilstock;
- Principal Viewpoint 4 − PRoW WL24/8;
- Principal Viewpoint 5 − PRoW 24/3, Higher Hill;
- Principal Viewpoint 6 − PRoW WL 24/11 near the edge of the Great Plantation;
- Principal Viewpoint 8 − PRoW WL23/46, Knighton Farm;
- Principal Viewpoint 10 − local Farm near PRoW WL23/48, Shurton West;
- Principal Viewpoint 11 − PRoW WL23/56, Shurton east;
- Principal Viewpoint 13 − PRoW WL23/57, west of Wick;
- Principal Viewpoint 15 − PRoW WL23/61;
- Principal Viewpoint 16 − PRoW WL23/61, Wick;
- Principal Viewpoint 19 − PRoW WL23/95, West Somerset Coast Path, Stolford;
- Principal Viewpoint 20 − PRoW No. BW32/3, Stockland Bristol;
- Principal Viewpoint 21 − PRoW WL24/1, Quantock Hills AONB;
- Principal Viewpoint 22 − PRoW WL8/30, East Quantoxhead;
- Principal Viewpoint 28 − PRoW WL10/9, Quantock Hills AONB;
- Principal Viewpoint 30 − PRoW WL10/28, Quantock Hills AONB;
- Principal Viewpoint 35 − Cannington Park, public footpath; and
- Principal Viewpoint 36 – PRoW BW 28/3, Puriton Hill.

25.6.75 For the operational phase, **Chapter 22** considers impacts at Year 1 (first year of the operational phase) and then again at Year 15 when the screen planting which has been built into the design of the scheme would have become more established. The Year 15 assessment provides a good indication of the longer-term impacts of the proposed development.

25.6.76 At Year 1, impacts on PRoW in terms of change in landscape character are predicted to be **minor adverse** while impacts on the viewpoints set out above are predicted to be **major adverse** on Viewpoints 1 and 2, **moderate adverse** on Viewpoints 3, 6, 8, 10, 11, 13, 16, 19, 20 and 28 and **minor adverse** on Viewpoints 4, 5, 15, 21, 22, 30, 35 and 36.

25.6.77 At Year 15, impacts on Viewpoints 1 and 2 are predicted to have reduced to **moderate adverse** and on Viewpoint 8 to **minor adverse.** Impacts on all other Viewpoints are predicted to remain as assessed at Year 1.

25.6.78 However, as for the construction phase, people using the PRoW would usually be transient and are, therefore, unlikely to be subject to the same exposure duration as defined for fixed receptor locations on which the assessment is based. Hence, whilst the predicted visual impacts might result in short-term disturbance as walkers pass through the zone of influence, the impact on a person's enjoyment of the amenity is likely to be less significant than has been assessed.

iii. Obstruction to Sports and Recreation Facilities

25.6.79 There are no formal sports or recreational facilities within the HPC permanent development site boundary. Therefore no physical disturbance or obstruction would occur and **no impact** is predicted.

iv. Disturbance to Users of Sports and Recreation Facilities

25.6.80 The nearest sports and recreation facility to HPC is the fishing lakes to the southwest of the site (Site 22 on **Figure 25.2**). Given that these are in excess of 1.5km from the HPC permanent development site boundary, they are scoped out of the Noise and Vibration (**Chapter 11**), Air Quality (**Chapter 12**) and Landscape and Visual (**Chapter 22**) assessments.

v. Obstruction to Open Access Land and Public Open Space

25.6.81 There are no areas of open access land or public open space (including common land) within the landward footprint of the HPC permanent development site boundary. Consequently **no impact** is predicted.

25.6.82 No operational structures or activities would cause obstruction to the foreshore. The permanent footprint of the seawall could obstruct two existing access points. However, the seawall design comprises an access ramp to the foreshore at the western end, and two stepped access points equidistant between the eastern and western ends of the seawall so, overall, access to the foreshore would be slightly improved.

25.6.83 The foreshore is used for a variety of recreational activities, including shore-angling and wildfowling, and may be designated as part of the England Coast Path in the future. As no obstruction of the foreshore would take place during the operational phase and as access would be retained, **no impact** is predicted.

25.6.84 Navigational risk in relation to recreational sailing and boating is examined in **Chapter 26** of this volume. Following dismantling of the jetty, no off-shore obstructions would remain, with the exception of navigational marker buoys to show the location of the intake and outfall head structures and the fish return system. Based on the limited scale of the extent of obstruction, but considering its duration, a very low magnitude change would be expected. Therefore, a permanent **negligible** impact is predicted.

vi. Disturbance to Users of Open Access Land and Public Open Space

25.6.85 The operation of HPC could result in noise, air and visual disturbance impacts to open access land and public open space within the study area.

25.6.86 **Chapter 11** (Noise and Vibration) does not identify open access land and public open space as sensitive receptors during the operational phase.

25.6.87 **Chapter 12** (Air Quality) scopes out disturbance to users of the foreshore and Wick Common.

25.6.88 **Chapter 22** considers impacts at Year 1 (first year of the operational phase) and then again at Year 15 when the screen planting which has been built into the design of the scheme would have become more established. The Year 15 assessment provides a good indication of the longer-term impacts of the proposed development.

25.6.89 **Chapter 21** (Landscape and Visual) assesses "Wick Moor and Coast" (which would include Wick Moor Common and North Moor Common) in terms of impacts on landscape character and predicts a **minor adverse** impact at Year 1 and at Year 15.

25.6.90 Impacts on the West Somerset Coast Path may be considered representative of impacts on the foreshore and these are assessed by Viewpoints 2, 3 and 19.

25.6.91 At Year 1, the impact on Viewpoint 2 is predicted to be of **major adverse** significance while impacts on Viewpoints 3 and 19 are predicted to be of **moderate adverse** significance. At Year 15, the impact on Viewpoint 2 is predicted to have reduced to **moderate adverse** while impacts on Viewpoints 3 and 19 are predicted to remain as assessed at Year 1.

25.6.92 However, it should be noted that users of the foreshore would often be facing away from the source of the visual disturbance (that is, the HPC permanent development site). In addition, users of the PRoW would usually be transient and are, therefore, unlikely to be subject to the same exposure duration as defined for fixed receptor locations on which the assessment is based. Hence, whilst the predicted visual impacts might result in short-term disturbance the impact on a person's enjoyment of the amenity is likely to be less significant than has been assessed.

25.7 Mitigation of Impacts

a) Introduction

25.7.1 This section identifies mitigation measures proposed for certain receptors to avoid, minimise or offset the potential impacts on amenity and recreation associated with the construction and operational phases of HPC.

b) Construction Phase

i. Obstruction to PRoW

25.7.2 Following consultation with local residents, Stogursey Parish Council, and SCC's Rights of Way officers, it has been agreed that a temporary alternative route would be provided around the boundary of the HPC development site. This route would also be used by those following the West Somerset Coast Path for the duration of jetty and seawall construction. On completion of jetty and seawall construction, the West Somerset Coast Path would be reinstated as soon as possible, incorporated into the sea wall design.

25.7.3 The following objectives informed the design of the alternative route:

- it should provide a connection to existing PRoW;
- it should not result in a dead end;
- it should be clear and accessible throughout the year;
- it should be sufficiently wide to provide ease of access, and to avoid a 'tunnel' effect;

- it should be appropriately signposted;
- it should allow for disabled access as far as practicable; and
- where separation through a boundary is necessary, self-closing pedestrian gates should be used, otherwise gaps should be left (and stiles avoided).

25.7.4 The alternative route would be prepared prior to the closure of existing PRoW within the HPC development site. In addition, signposting would be in place on access routes and at the access point where closures would occur. The alternative route would be available at all times for the duration of the construction phase.

25.7.5 The alternative route entails, for the most part, the relocation of PRoW to a route around the perimeter of the HPC development site (set between the inner security fence and the outer boundary fence). **Figure 25.18** presents the proposed diversion route and PRoW closures for the first three years of the construction phase.

25.7.6 Due to the requirement to maintain foreshore access as close to the site as possible, the West Somerset Coast Path (WL23/95) would remain unobstructed from the northeast corner of the HPC development site. However, the alternative route to maintain coastal access around the site would be directed from the junction of WL23/95 and WL23/61 to the immediate east of Hinkley Point B (see **Figure 25.18**). The diversion route for the West Somerset Coast Path would run from this point along WL23/61, and then continue along WL23/71 until it reaches the C182 on the eastern boundary of the HPC development site. From here the diversion would follow the alternative route that passes around the HPC development site boundary until it reconnects to the West Somerset Coast Path (WL23/95) at the northwest corner of the HPC development site.

25.7.7 The alternative route around the HPC development site boundary would run southwards along the site boundary, around the area of common land and around the planned new southern roundabout. The route would cross the access road into the site once the new southern roundabout is constructed.

25.7.8 Once the route reaches the south eastern corner of the site, it would move east-west to the north of Doggetts to WL23/56. The section of WL23/56 to the south of the diverted route would be retained and a self-closing pedestrian gate provided in the land boundary fence (replacing the current stile) to enable continued access to the WL23/56 to the south and into Shurton.

25.7.9 The route would continue running east-west until it joins Benhole Lane (WL23/48) to the north of the stretch of Benhole Lane that is frequently flooded (in the extreme south-west corner of the HPC development site).

25.7.10 The alternative route would then continue south to north up Benhole Lane (WL23/48) (outside the HPC development site, using the existing PRoW) until it reaches the junction with Green Lane (WL23/110). At this point a new route would be provided along the western boundary of the site up to the coast and connecting with the West Somerset Coast Path (WL23/95). There are no existing boundary gates along this western side of the HPC development site and consequently no gates would be installed, as gaps would be appropriate.

25.7.11 In addition, a new access route from Shurton would be provided which would run northwards and connect to the alternative route. This would ease local concerns about increased use of the PRoW route along Benhole Lane (WL23/48) which passes through a resident's field.

25.7.12 By providing alternative routes the magnitude of impacts may be significantly reduced, as the right of passage would be retained to the existing destinations of the PRoW, such as from the Coast Path to Shurton, Knighton, Burton and Wick (as listed in **Appendix 25B**).

25.7.13 **Table 25.11** presents the approximate distance of diversion routes expected for the PRoWs affected. It is predicted that the alternatives would reduce the distance of some routes, whilst others would be extended by up to 4.2km (specifically the West Somerset Coast Path).

Table 25.11: PRoW Diversions and Likely Magnitude Reduction

Footpath ID	Diversion Length	Original Length of PRoW	Additional Distance	Magnitude of Reduction
WL 23/48	400m	740m	-340m	Medium to Very Low
WL 23/50	Closed for the duration of the construction phase (11 years)			
WL 23/56	2,060m	1,530m	530m	Medium to Very Low
WL 23/68	Closed for the duration of the construction phase (11 years)			
WL 23/69	Closed for the duration of the construction phase (11 years)			
WL 23/70	450m	1,147m	-697m	Medium to Very Low
WL 23/95 (Part of the West Somerset Coast Path)	5,420m	1,250m	4,170m	Medium to Very Low
WL 23/105	Closed for the duration of the construction phase (11 years)			
WL 23/110	2,550m	1,030m	1,522m	Medium to Very Low
New access route at the west end of Shurton	294m	0m	294m	None

25.7.14 Early restoration works are planned to take place within the southern part of the HPC development site to ensure early screening for local residents. As part of these, the PRoW diversion alignment would alter slightly and a permissive stretch of bridleway would be created. Proposals for early restoration works, including the footpath diversion and permissive bridleway are shown in **Chapter 22**, **Figure 22.58**).

25.7.15 In order to provide mitigation and enhancement to the wider PRoW network (outside the site boundary), a number of actions have been identified as part of EDF Energy's Site Preparation Works (Planning Application Reference 3/32/10/037) Section 106 agreement. These would be implemented, subject to landowner consent where required, by SCC with the support of EDF Energy. These measures are listed in **Appendix 25E** and the locations presented on **Figures 25.19A**, **25.19B**, **25.20**). These measures would be implemented in the early years of construction.

25.7.16 Actions would include resurfacing, clearance of vegetation and provision of self-closing gates, new bridges and waymarks, all of which would improve access to the wider PRoW network. In addition, additional bridleway provision is proposed, by creating a new bridleway along Woolstone Lane and by upgrading of PRoW Wl23/106.

25.7.17 Successful implementation of all of these actions would result in improved accessibility to over 13,307m of PRoW within Stogursey Parish (5,979m within the study area). As well as benefitting walkers, bridleways within the Parish would increase by 1,149m and this would significantly improve accessibility by different user groups (e.g. cyclists and equestrians).

25.7.18 At the end of the construction phase, a number of PRoW would be reinstated in the construction area, although following consultation with SCC Rights of Way Team and the implementation of the landscape restoration proposals, the routes would be slightly altered from their baseline locations. The routes and the lengths to be reinstated are listed in **Table 25.12** and shown on **Figures 25.19A** and **25.19B**. The benefit arising from this reinstatement is examined with respect to the operational phase of HPC.

Table 25.12: Reinstatement of PRoW (including Permanent Diversions) to be Carried Out at the End of Construction of HPC (see Figures 25.19A and 25.19B)

Reference	Reinstatement Action	Length
3-1	Permanent diversion of altered route of PRoW WL23/48 from WL23/110 north to WL23/95 along western bund.	831m
3-2	Reinstate diverted route of PRoW WL23/110.	1,070m
3-3	Upgrade part of PRoW WL23/110 (diversion) to bridleway.	380m
3-4	Reinstate route of PRoW WL23/56 from WL23/110 to reconnect with WL23/56 to the south of the construction area; route would follow a line proposed by Somerset County Council, and will incorporate pedestrian gates and waymarks where required.	836m
3-5	Create new PRoW bridleway from WL23/56 and connect to WL23/110.	450m
3-6	Upgrade PRoW WL23/56 from 3-5 to 3-8, to bridleway status.	637m
3-7	Reinstate diverted route of PRoW reference WL23/69; route would follow a line proposed by Somerset County Council, and will incorporate pedestrian gates and waymarks where required.	991m
3-8	Create permanent PRoW (bridleway) from Shurton Lane (entrance to the Emergency Access Road) to C182.	1,063m
3-9	Create permanent PRoW from WL23/48 to PRoW created for Action Reference 3-8.	250m

25.7.19 Monitoring of access along the PRoW diversion route within and adjacent to the HPC development site would be undertaken throughout the construction phase to ensure that access is not obstructed (for example, by growth of vegetation, waterlogged ground conditions) and maintenance would be undertaken, where appropriate. An automated counter would be installed along the diversion route where it connects onto Benhole Lane (WL23/48), in order to identify the number of users of the diversion route. Furthermore, an appropriate mechanism for reporting, logging and investigating complaints would be employed and monitored during the construction phase, accompanied by an action plan to ensure that any issues are tackled rapidly.

ii. Obstruction to Open Access Land and Public Open Space

25.7.20 During the construction phase, permissive access would be permitted to the southern area between the inner security fence and the HPC development site boundary fence in response to requests from local residents for the provision of space for short circular walks. This would provide a maximum of 13ha of 'permissive' access land, for amenity and recreation for the residents of Shurton in particular. However, it should be noted that access to certain parts of this area would be restricted at certain times such as during archaeological excavations and construction of the emergency access road.

iii. Disturbance to Users of PRoW, Sports and Recreation Facilities, Open Access Land and Public Open Space

25.7.21 The majority of measures designed to limit disturbance impacts are either inherent in the design or are built into the construction methodology or procedures.

25.7.22 Some specific mitigation is proposed for visual impacts however. This includes provision of a bund on the north-west boundary of the HPC development site which would help to mitigate impacts on Viewpoints 1 and 2. The PRoW diversion route would run directly west of the bund and so this would effectively screen views of the construction site for walkers in this location. Offsite planting is also proposed to mitigate visual impacts on Viewpoints 4 and 8.

c) Operational Phase

i. Obstruction to PRoW

25.7.23 In order to mitigate the closure of PRoW located within the footprint of the proposed HPC permanent development site, a number of measures have been identified. Consultation with SCC's Rights of Way Team identified the rationalisation and enhancement of the existing PRoW to be a key mitigation measure. This has been incorporated into the scheme design, where EDF Energy has the relevant ownership rights.

25.7.24 **Table 25.12** lists the measures to be undertaken at the end of the construction phase (see **Figures 25.19A** and **25.19B**). These measures would reinstate (and in some cases create) 5,491m of designated PRoW (footpaths) and would increase the length of designated bridleway by 2,530m, thereby providing a significant increase in accessibility for a wider range of recreational activities (horse riding, cycling) in the study area.

25.7.25 In addition, a number of permissive paths and bridleways would be provided throughout the former southern construction phase area, as well as interpretation boards with information on the natural and historic environment (tying in with the displays within the Public Information Centre) at a number of locations. In total, 2,340m of permissive rights of way would be created, of which 893m would be permissive bridleway.

25.7.26 In addition, although not specifically related to PRoW obstruction impacts, a horse crossing would be provided at the junction of the C182 and Farringdon Lane as part of the highway improvements. This is designed to increase the safety of horses and riders.

ii. Obstruction to Open Access Land and Public Open Space

25.7.27 Although no mitigation is required in this respect, general access would be permitted to the land north of Shurton up to Green Lane, as an enhancement measure. This area is shown on the Landscape Restoration/Habitats Plan in **Chapter 22, Figure 22.59**. This also shows the location of the designated and permissive PRoW (footpaths) and bridleways.

iii. Disturbance to Users of PRoW, Sports and Recreation Facilities, Open Access Land and Public Open Space

25.7.28 As for the construction phase, the majority of measures designed to limit disturbance impacts are inherent in the design. In terms of visual impacts, following construction, the bund on the north-west boundary would be removed to be replaced by permanent landscaping within the HPC operational site boundary. The offsite planting would be more established during the operational phase and would continue to mitigate visual impacts on Viewpoints 4 and 8.

25.8 Residual Impacts

a) Introduction

25.8.1 This section identifies the residual impacts associated with the proposed HPC development throughout the construction and operational phases, following the implementation of the mitigation measures described in Section 25.7.

b) Construction Phase Residual Impacts

25.8.2 The implementation of the mitigation measures identified above would reduce the magnitude of the obstruction impacts on PRoW on the HPC development site to very low and, consequently, a long-term **minor adverse residual** impact is predicted.

25.8.3 The provision of a diversion route for the West Somerset Coast Path during the first three years of construction would retain the connection to the coast either side of the HPC development site and thereby reduce the magnitude of the effect to very low. Consequently, a medium-term **minor adverse residual** impact would remain. The impact would cease on the reopening of the West Somerset Coast Path.

25.8.4 The mitigation measures proposed for visual disturbance on Viewpoints 1, 2, 4 and 8 (**Chapter 22**, Landscape and Visual) are not predicted to reduce the assessed impact significance. For Viewpoints 1 and 2, this is because of the scale of the bund in comparison to the scale of construction activities. For Viewpoints 4 and 8, this is because the planting would not be sufficiently mature to provide an effective screen. Therefore impacts on these Viewpoints would remain as initially assessed.

25.8.5 No other mitigation measures have been proposed for the construction phase, other than those inherent in the scheme design, and therefore all other impacts remain as initially assessed. In the case of disturbance impacts, however, the transient nature of users of amenity and recreation assets means that impacts are likely to be less significant than assessed.

25.8.6 In addition, the actions identified as part of EDF Energy's Site Preparation Works planning application (Planning Application Reference 3/32/10/037) Section 106 agreement are designed to provide users of PRoW with improved access to the wider PRoW network should they wish to avoid the PRoW diversion around the site because of the predicted disturbance impacts.

c) Operational Phase Residual Impacts

25.8.7 The implementation of the mitigation measures described above would, on commencement of the operational phase, reduce the predicted magnitude of the impacts on PRoW on the HPC permanent development site to a neutral level as connections to routes and right of passage around the site would be available. Furthermore, the provision of additional permissive footpaths to the south of HPC would result in an overall net increase in the available footpath network. Consequently, a **negligible residual** impact is predicted from commencement of the operational phase.

25.8.8 In terms of bridleways, the mitigation measures would result in an increase in the length of bridleways within the study area and Stogursey Parish and would also improve the accessibility of the area to cyclists and equestrians. Overall, the length of bridleway within Stogursey Parish would increase by 6,721m, from a baseline of 3,198m. Consequently, a permanent **minor beneficial residual** impact is predicted on accessibility for equestrians and cyclists.

25.8.9 The mitigation measures proposed for Viewpoints 4 and 8 (**Chapter 22**, Landscape and Visual) are predicted to reduce the assessed impact significance at Year 15 to of **minor adverse residual** significance.

25.8.10 No other specific mitigation measures have been proposed for the operational phase, other than those inherent in the scheme design and therefore all other impacts remain as initially assessed. In the case of disturbance impacts, however, the transient nature of users of amenity and recreation assets means that impacts are likely to be less significant than assessed.

25.9 Summary of Impacts

25.9.1 **Table 25.13** presents a summary of the potential impacts associated with the proposed development.

Table 25.13: Summary of Construction and Operational Phase Impacts on the Amenity and Recreation Resource

Receptor	Potential Impact	Magnitude	Description	Importance	Significance	Proposed Mitigation	Residual Impact
Construction Phase							
PRoW (HPC Development Site)	Obstruction to PRoW	High	Direct Medium-term Adverse Reversible	Low	Moderate adverse	PRoW diversions, and wider network enhancement	Minor adverse
	Obstruction to Coast Path	High	Direct Medium-term Adverse Reversible	High	Major adverse	PRoW diversion and alternative route, and reinstatement on completion of seawall	Minor adverse for three years reducing to no impact
	Obstruction to bridleways and byways accessible to equestrians and cyclists	Very low	Direct Medium-term Adverse Reversible	Low	Negligible	PRoW diversions, and wider network enhancement	Negligible
	Noise disturbance	Very low to high	Localised Direct Adverse Temporary Long-term Reversible	Low	Negligible to moderate adverse	None other than that inherent in scheme design/operating practices	Negligible to moderate adverse
	Air quality disturbance	N/A	N/A	N/A	N/A	N/A	N/A
	Visual disturbance	Very low to high	Medium-term Adverse	Medium to high	Minor adverse to major adverse	North-west bund Off-site planting	Minor adverse to major adverse

Receptor	Potential Impact	Magnitude	Description	Importance	Significance	Proposed Mitigation	Residual Impact
Construction Phase							
PRoW (C182)	Obstruction to PRoW users crossing C182	Low	Direct Temporary Medium-term Adverse Reversible	Low	Negligible	None proposed	Negligible
	Noise, air quality, visual disturbance	N/A	N/A	N/A	N/A	N/A	N/A
PRoW (off-site highway improvements)	Obstruction	N/A	N/A	N/A	N/A	N/A	N/A
	Noise, air quality, visual disturbance	N/A	N/A	N/A	N/A	N/A	N/A
Sports and recreation facilities (HPC Development Site)	Obstruction	N/A	N/A	N/A	N/A	N/A	N/A
	Noise, air quality, visual disturbance	N/A	N/A	N/A	N/A	N/A	N/A
	Obstruction	N/A	N/A	N/A	N/A	N/A	N/A
	Noise disturbance 2013 – Cannington Cemetery / Sports pitch on Shark's Lane	High	Localised Adverse Temporary Long-term Reversible	Medium/low	Major adverse/ moderate adverse	None proposed other than that inherent in design	Major adverse/moderate adverse but reduces in 2016
	Noise disturbance 2016 - Cannington Cemetery / sports pitch on Shark's Lane	Medium to very low	Localised Adverse/beneficial Temporary Long-term Reversible	Medium/low	Moderate adverse/minor beneficial	None proposed other than that inherent in design	Moderate adverse/minor beneficial

Receptor	Potential Impact	Magnitude	Description	Importance	Significance	Proposed Mitigation	Residual Impact
Construction Phase							
Sports and recreation facilities (C182)	Air quality and visual disturbance	N/A	N/A	N/A	N/A	N/A	N/A
Sports and recreation facilities (off-site highway improvements)	Obstruction	N/A	N/A	N/A	N/A	N/A	N/A
	Noise disturbance – Tropiquaria	High	Localised Adverse	Low	Moderate adverse	None proposed	Moderate adverse
	Air quality and visual disturbance	N/A	N/A	N/A	N/A	N/A	N/A
Open Access Land and Public Open Space (HPC Development Site)	Obstruction to common land / public open space	N/A	N/A	N/A	N/A	N/A	N/A
	Obstruction to foreshore access for anglers	Very low	Direct Medium-term Adverse Reversible	Low	Minor adverse	None proposed	Minor adverse
	Obstruction to Excepted Area for wildfowling	Low	Direct Medium-term Adverse Reversible	Low	Minor adverse	None proposed	Minor adverse
	Obstruction to sea-angling / recreational boating	Low	Direct Medium-term Adverse Reversible	Low	Minor adverse	None proposed	Minor adverse

Receptor	Potential Impact	Magnitude	Description	Importance	Significance	Proposed Mitigation	Residual Impact
Construction Phase							
Open Access Land and Public Open Space (HPC Development Site)	Noise disturbance to Wick Moor Common and North Moor Common	Very low to high	Localised Adverse Temporary Long-term Reversible	Low	Minor adverse to moderate adverse	None proposed	Minor adverse to moderate adverse
	Noise disturbance to foreshore	Very low to high	Localised Direct Adverse Temporary Long-term Reversible	Low	Negligible to moderate adverse	None other than that inherent in scheme design/operating practices	Negligible to moderate adverse
	Air quality disturbance	N/A	N/A	N/A	N/A	N/A	N/A
	Visual disturbance (change in landscape character) to Wick Moor Common and North Moor Common	Medium	Adverse Medium-term	High	Major adverse	None proposed	Major adverse
	Visual disturbance (change in composition of view) to foreshore	Medium to high	Adverse Medium-term	High	Major adverse	None proposed	Major adverse
Open Access Land and Public Open Space (C182)	Obstruction	N/A	N/A	N/A	N/A	N/A	N/A
	Noise disturbance 2013 – Cannington Walled Garden	High	Localised Direct Adverse Temporary Long-term Reversible	Low	Moderate adverse	None proposed other than that inherent in design	Moderate adverse

Receptor	Potential Impact	Magnitude	Description	Importance	Significance	Proposed Mitigation	Residual Impact
Construction Phase							
Open Access Land and Public Open Space (C182)	Noise disturbance 2016 – Cannington Walled Garden, amenity grassland, St Mary the Virgin Churchyard	Very low	Localised Direct Beneficial Temporary Long-term Reversible	Low to medium	Minor beneficial	N/A	Minor beneficial
	Air quality and visual disturbance	N/A	N/A	N/A	N/A	N/A	N/A
Open Access Land and Public Open Space (off-site highway improvements)	Obstruction	N/A	N/A	N/A	N/A	N/A	N/A
	Noise, air quality, visual disturbance	N/A	N/A	N/A	N/A	N/A	N/A
Operational Phase							
PRoW	Obstruction to PRoW	High	Direct Permanent Adverse Reversible	Low	Moderate adverse	PRoW diversions, and wider network enhancement	Negligible impact
	Obstruction to West Somerset Coast Path	N/A	N/A	N/A	N/A	N/A	N/A
	Obstruction to bridleways and byways accessible to equestrians and cyclists	Low	Direct Permanent Reversible	Low	Minor adverse	PRoW diversions, and wider network enhancement	Minor beneficial
	Noise, air quality disturbance	N/A	N/A	N/A	N/A	N/A	N/A
	Visual disturbance - Year 1	Very low to high	Medium-term Adverse	Medium to high	Minor adverse to major adverse	Construction phase off-site planting	Minor adverse to major adverse
	Visual disturbance -Year 15	Very low to medium	Long-term Adverse	Medium to high	Minor adverse to moderate adverse	Construction phase off-site planting (maturing)	Minor adverse to moderate adverse

Receptor	Potential Impact	Magnitude	Description	Importance	Significance	Proposed Mitigation	Residual Impact
Operational Phase							
Sports and recreation facilities	Obstruction	N/A	N/A	N/A	N/A	N/A	N/A
	Noise, air quality disturbance	N/A	N/A	N/A	N/A	N/A	N/A
Open Access Land and Public Open Space	Obstruction to common land / public open space	N/A	N/A	N/A	N/A	N/A	N/A
	Obstruction to foreshore for walkers, anglers, wildfowlers	N/A	N/A	N/A	N/A	N/A	N/A
	Obstruction to sea-angling / recreational boating	Very low	Permanent Adverse	Low	Negligible	None proposed	Negligible
	Noise, air quality disturbance	N/A	N/A	N/A	N/A	N/A	N/A
	Visual disturbance (change in landscape character) to Wick Moor Common and North Moor Common – Year 1 and Year 15	Very low	Adverse Medium-term	High	Minor adverse	None proposed	Minor adverse
	Visual disturbance (change in composition of view) to foreshore – Year 1	Low to medium	Adverse Medium-term	High	Major adverse to moderate adverse	None proposed	Major adverse to moderate adverse
	Visual disturbance (change in composition of view) to foreshore – Year 1	Low	Adverse Long-term	High	Moderate adverse	None proposed	Moderate adverse

CHAPTER 26: NAVIGATION

CONTENTS

TABLES

PLATES

[This page is intentionally left blank]

26. NAVIGATION

26.1 Introduction

26.1.1 This chapter of the Environmental Statement (ES) provides an assessment of the potential risks to navigation at and around Hinkley Point (including the River Parrett, Bridgwater Bay and the wider Bristol Channel) associated with all of the marine aspects of the Hinkley Point C (HPC) Project, namely: the proposed Temporary Jetty development, the cooling water intake and outfall structures, and the refurbishment and extension of Combwich Wharf. Construction, operational and post-operational risks are all considered (see **Chapters 2**, **3**, **4** and **5** of **Volumes 2** and **7** of the ES for details). Where considered necessary, measures are proposed to mitigate and/or manage risks such that they are deemed to be as low as reasonably practicable (ALARP) or acceptable.

26.2 Scope of Assessment

a) EIA Scoping

26.2.1 The scope of this assessment has been determined through a formal Environmental Impact Assessment (EIA) scoping process undertaken with the Infrastructure Planning Commission (IPC). In their April 2010 Scoping Opinion (see **Annex 1**), the IPC identified that the implications on navigation of the power station buildings and the use of Combwich Wharf and the Temporary Jetty should be assessed.

26.2.2 In their consultation response to the IPC on the scope of the EIA, Trinity House advised that the EIA

> *"should include a Navigational Risk Assessment of the project to establish how the development may affect existing navigation in the area. This assessment should include establishing by means of a physical survey of all marine traffic in the area (which takes account of seasonal variations, if any, particularly of leisure craft) over a representative period (usually 28 days of data), existing vessel traffic routes and types. The traffic survey area should include movements in Bridgwater Bay within 5 nautical miles of Hinkley Point and the entrance to the River Parrett. The Navigational Risk Assessment should also include consideration of the potential impact of the proposed works during both construction and operation, which can be used to inform any consideration of the requirement for additional aids to navigation (because of the changed vessel traffic in the area) and/or navigational marking of the development as risk mitigation. The assessment should also consider whether any lighting exhibited from the works during construction and/or from the power station once constructed will adversely affect existing aids to navigation ("a false light"). This should include measures that need to be taken to reduce potential interference with the night vision of mariners."*

b) Scope and Objectives of the Assessment

26.2.3 Key legislation and planning policy relating to navigation is identified in Section 26.3. The assessment has been undertaken using the risk assessment methodology described in Section 26.4. The baseline conditions described in Section 26.5 are based on information derived from a range of databases and other data sources.

26.2.4 This assessment includes consideration of potential risks to navigation posed by the HPC Project, including relevant associated development. Section 26.6 provides an assessment of the potential risks associated with the Temporary Jetty, the intake and outfall structures, and the proposed refurbishment and extension of Combwich Wharf. Appropriate mitigation aimed at making any risks acceptable or ALARP is identified in Section 26.7. Any residual risks that would remain following the implementation of mitigation measures are set out in Section 26.8.

26.2.5 For the purpose of this assessment, the following objectives were applied:

- identify the existing navigation conditions in the study area that may be affected by the Hinkley Point C Project;
- assess the risks to navigation of the Hinkley Point C Project's construction, operation and post-operation (where applicable); and
- recommend mitigation measures, where necessary, to reduce the risks to navigation of the Hinkley Point C Project.

26.2.6 Potential cumulative impacts with other proposed or reasonably foreseeable projects are considered in **Volume 11** of this ES.

26.3 Legislative and Policy Context

a) International Conventions

26.3.1 The International Maritime Organisation (IMO) has introduced a number of conventions concerning navigation and shipping that are applied in the UK through international conventions and national legislation and policy. The conventions, legislation and policy that are relevant to this assessment are described below.

26.3.2 The Convention for the Safety of Life at Sea 1974 (SOLAS) specifies minimum standards for the construction, equipment and operation of ships compatible with their safety. Chapter V of SOLAS identifies certain navigation safety services to be provided by Government, including meteorological services, ship routing services, and search and rescue services. For example, the Government is required to arrange for the establishment of Vessel Traffic Services (VTS) where the volume of traffic or the degree of risk justifies such services.

26.3.3 The Convention on the International Regulations for Preventing Collisions at Sea 1972 (COLREGs) specifies requirements for navigation including steering, sailing, lighting and signalling, and provides guidance for determining safe speed, collision risk and the conduct of vessels operating in or near traffic separation schemes. This convention covers the conduct of vessels in all conditions of visibility, and sets out rules for safe speeds, taking action to avoid collisions in head-on situations.

b) National Legislation and Policy

26.3.4 The requirements for maintaining safety in ports and harbours are set out in marine-related legislation as well as the provisions of local Acts and Orders made under the Harbours Act 1964 (e.g. Harbour Empowerment Orders), and general legislation such as the Health and Safety at Work etc Act 1974 and the Docks Regulations 1988 made under that 1974 Act.

26.3.5 The Port Marine Safety Code (PMSC) (DfT 2009, Ref. 26.1) applies to all harbour authorities in the UK that have statutory powers and legal duties relating to the safety of people who use ports and harbours and their property, and to the wellbeing of the port environment and community. It supports the undertaking of powers and duties in relation to harbour authorities' local Acts and Orders and marine-related legislation such as the Harbours Act 1964, the Dangerous Vessels Act 1985, the Pilotage Act 1987 and the Merchant Shipping Act 1995 as amended by, for example, the Marine Safety Act 2003 and supported by, for example, the Merchant Shipping (Vessel Traffic Monitoring and Reporting Requirements) Regulations 2004. The PMSC establishes the principle of a national standard for every aspect of port marine safety and aims to enhance safety for those who use or work in ports, their ships, passengers and the environment. It applies to port marine operations, the well-established principles of risk assessment and Safety Management Systems (SMS). The supporting Guide to Good Practice on Port Marine Operations (GTGP) (DfT 2009; Ref. 26.2) complements the PMSC and provides harbour authorities with generic advice and examples about how they might meet the requirements under the Code.

26.3.6 Marine Notices publicise important safety, pollution prevention and other relevant information. There are three different types of notices:

- Merchant Shipping Notices (MSNs) often communicate UK law and are legally enforceable when referred to by a Statutory Instrument;
- Marine Guidance Notes (MGNs) give guidance and strong recommendations about best practice on interpretation of law and general safety advice; and
- Marine Information Notes (MINs) provide less important time limited information and changes of address after which they expire.

26.3.7 For example, MGN 401 (Navigation: VTS and Local Port Services (LPS) in the United Kingdom) (MCA, 2009; Ref. 26.3) defines the UK's interpretation of VTS, provides guidance for determining the need to establish a VTS, defines the responsibilities of those authorities concerned with providing VTS, and complements the PMSC and the GTGP on the management of safety in ports.

c) Local Policy and Guidance

26.3.8 The Port of Bridgwater has its own Marine Operations Plan (CF Spencer & Co Ltd/ Sedgemoor District Council, 2009; Ref. 26.4) in place to meet the requirements of the PMSC. This was last revised in July 2009. The plan includes a SMS and an Operations Plan, covering communications, collision, navigation control, speed limits, passage plan and pilotage. Combwich Wharf is within the Port of Bridgwater's harbour limits. The Temporary Jetty and the cooling water intake and outfall head structures would be situated outside of the Port of Bridgwater's harbour limits, but vessels using the Temporary Jetty might pass through or sufficiently near to the Port of Bridgwater's jurisdiction/control so that some of Marine Operations Plan's SMS and the Operations Plan come into effect and are therefore considered to be relevant to this assessment. The Port of Bridgwater also has in place an oil spill contingency plan and a port waste management plan.

26.4 Methodology

26.4.1 This assessment has been undertaken using an approach that differs from the general approach to EIA described in **Volume 1**, **Chapter 7** and instead undertakes an assessment of risk, rather than an assessment of impacts to navigation. The approach is described below. It considers the risks to all navigation expected and proposed to occur within the study area.

a) Consultation

26.4.2 Consultation has been undertaken throughout the EIA process and further information may be found in the **Consultation Report**. EDF Energy commenced consultation on navigation with key statutory consultees and other interested parties through the Stage 1 consultation process on Initial Proposals and Options (in November 2009) and then followed this with Stage 2 consultation on preferred proposals (in July 2010). This included consultation on the key development features potentially affecting navigation: that is, the Temporary Jetty, the cooling water intake and outfall head structures, and the refurbishment and extension of Combwich Wharf.

26.4.3 In addition, consultation with, amongst others, Sedgemoor District Council (SDC) and the Port of Bridgwater was undertaken over the course of 2009 and early 2010 at monthly meetings of the Marine Authorities Liaison Group (MALG). The MALG comprised a technical forum organised by EDF Energy and attended by representatives of regulatory and advisory agencies with an interest in the HPC Project from a marine and coastal perspective. The purpose of the MALG meetings was to provide a mechanism for continual consultation on technical aspects of the proposals for the HPC Project, relating to the water and marine environments in particular, as the project moved from conceptual through to detailed design, and also facilitated discussion on the assessment of potential environmental impacts.

26.4.4 Specific consultation concerned with navigation was undertaken in the form of a hazard identification (HAZID) workshop held on 5 May 2010. The workshop was hosted by EDF Energy and specialist navigation consultants Arcadis Vectra and Anatec, and attended by representatives of: the Port of Bridgwater, Bristol Port, Maritime and Coastguard Agency (MCA), Devon Sea Fisheries, the Royal Yachting Association (RYA) and Bristol Channel Yachting Association, Tarmac Marine Dredging (and the British Marine Aggregate Producers Association (BMAPA) and the Chamber of Shipping), and SDC as the harbour authority for the Port of Bridgwater. Trinity House was also invited to the workshop but could not attend.

26.4.5 The workshop was initiated to consider the ship collision risks associated with the proposed intake and outfall head structures associated with HPC. Ship collision risks associated with the Temporary Jetty development and Combwich Wharf were also raised at the workshop.

26.4.6 At the time of conducting the workshop, the positions of the intake and outfall head structures were indicated rather than fixed. The finalised positions of the head structures will not vary sufficiently from the indicated positions and, therefore, they will not alter the findings of the HAZID workshop. The workshop has, in part, informed the assessments made in this chapter.

26.4.7 In addition to the workshop, separate consultation was undertaken with SDC and/or the Port of Bridgwater on 21 February 2011, 9 March 2011 and 2 June 2011. Consultation included discussion on how the HPC Project could affect ongoing navigation to and operations within the Port of Bridgwater due to, in particular, the operation of the Temporary Jetty and the operation of the refurbished and extended Combwich Wharf. Key aspects of this discussion included the potential navigation issues and coordinated management requirements in relation to the shared approaches to the Temporary Jetty and the Port of Bridgwater (including discussion about moving the Gore Buoy) and the tidal restrictions that limit navigation within the River Parrett and Port of Bridgwater.

26.4.8 Separate consultation was also undertaken with the Ministry of Defence (MoD) in relation to the jetty's potential impact on the activities undertaken within the Bridgwater Bay Danger Area (D119) and the Lilstock Range Firing Area. Consultation included meetings held on 3 November 2010 and 20 September 2011 with representatives from the Defence Estates' Safeguarding team and Fleet Air Arm of the Royal Navy. At the first of these meetings, the MoD outlined their concerns about the Temporary Jetty where it could interfere with the MoD's activities within the Danger Area and Firing Area. Solutions were identified to allow the MoD's activities to continue with the facility in place.

26.4.9 Finally, a meeting was held with Combwich Motor Boat and Yacht Club on 21 February 2011. At this meeting, the club's representatives identified their concerns about the interaction of sailing activities with increased use of Combwich Wharf, with particular reference to the tidally constrained nature of navigation along the River Parrett.

26.4.10 The navigation issues identified during the Stage 1 and Stage 2 consultation, HAZID workshop and other consultations are addressed in Section 26.6 (assessment of risks).

b) Study Area

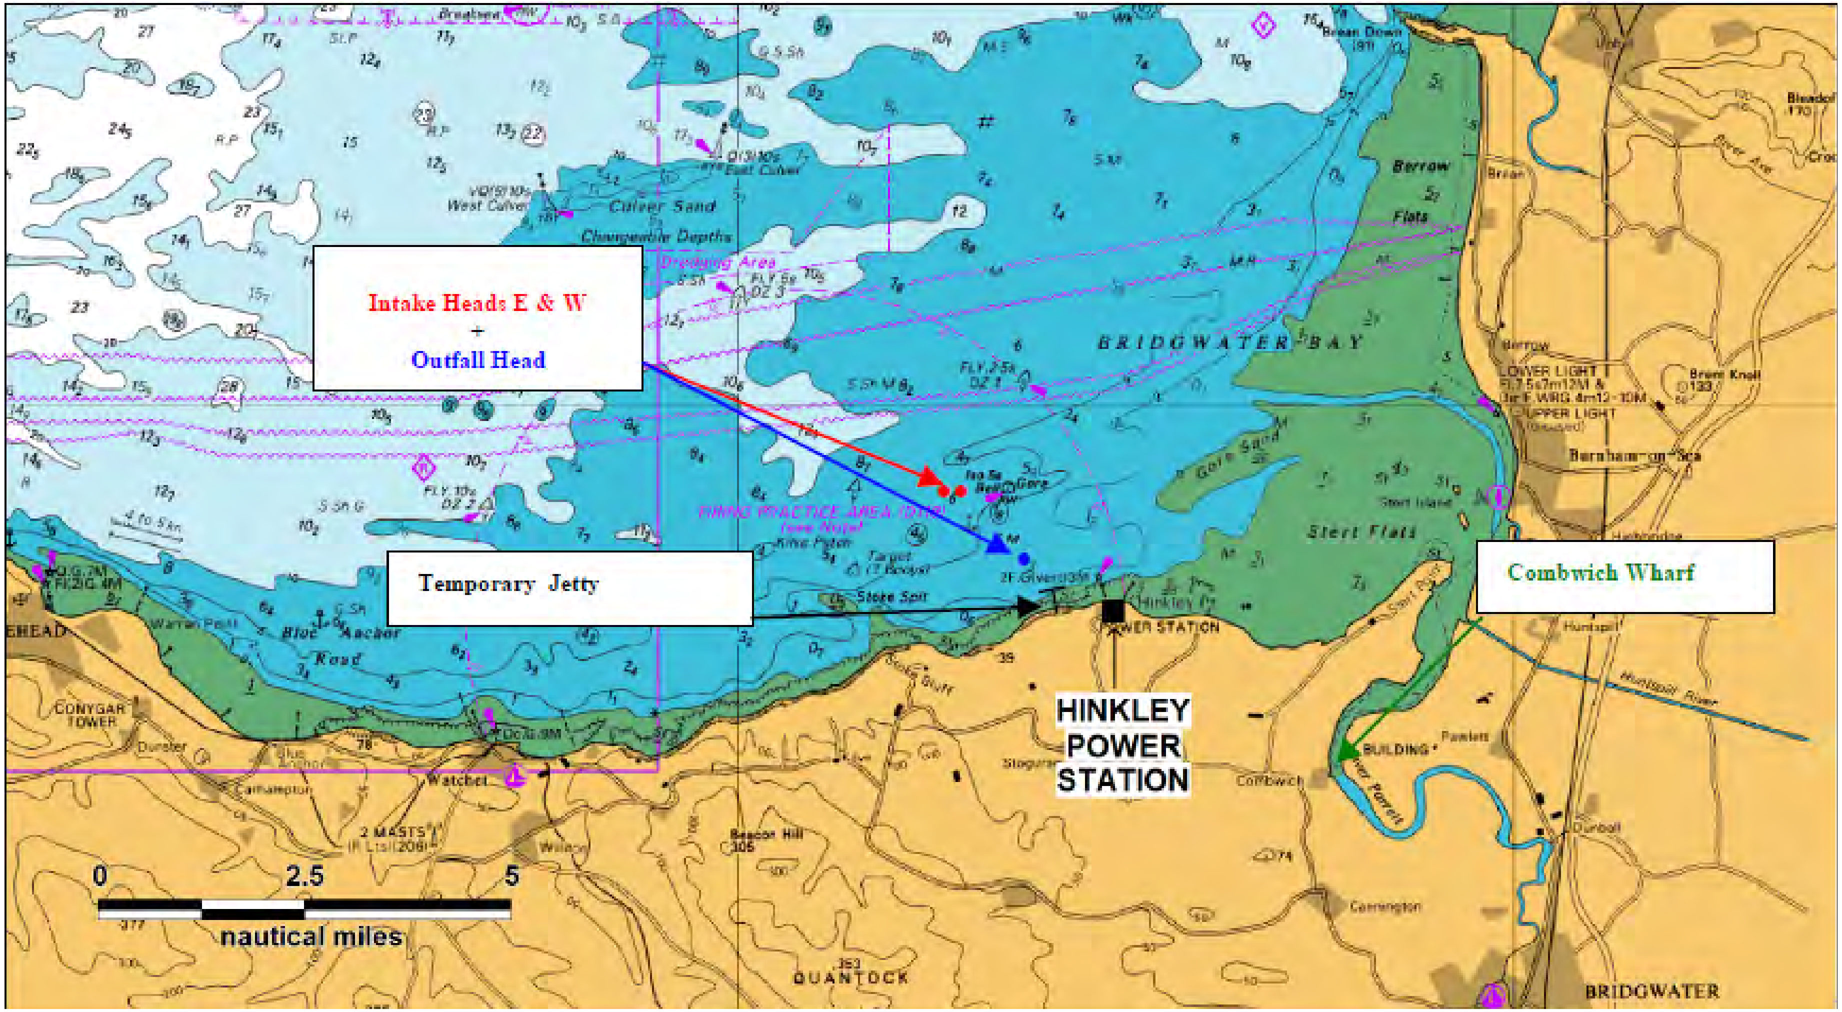
26.4.11 The study area covers the key maritime activities in relation to navigation, including commercial, military, fishing and recreational activities, and is therefore necessarily broad because it covers the waters at and around Hinkley Point, the River Parrett, Bridgwater Bay and the wider Bristol Channel. **Plate 26.1** provides an overview of Bridgwater Bay and the locations of the proposed intake and outfall head structures and the Temporary Jetty. Combwich Wharf is located on the River Parrett.

26.4.12 The various key maritime activities each have a different study area, as identified in **Plates 26.5** to **26.9** in Section 26.5. **Plate 26.5** indicates the broadest extent of the study area.

c) Baseline Environment Assessment

26.4.13 The existing navigation conditions were identified through reference to and use of publicly and commercially available databases, including ShipRoutes database, Automatic Identification System (AIS) data, and reference to and use of navigation data, including satellite and sightings data.

Plate 26.1: Location Chart of Bridgwater Bay and the River Parrett



d) Assessment Methodology

i. Hazard Identification

26.4.14 The HAZID method employed uses a team based approach which incorporates a structured brainstorming technique used to draw out information from participants at a HAZID workshop. The aim is to identify hazards capable to leading to undesirable consequences as well as the current and recommended control measures for each hazard.

26.4.15 The team is made up of appropriately qualified persons. The activity under review is broken down into tasks and steps. As each step is identified, they are in turn assessed for potential hazards. The hazards are further assessed in terms of the associated consequences and likelihood of occurrence.

26.4.16 A HAZID workshop was undertaken and its outcomes inform the assessment presented in this chapter. Consultation also informs the assessment presented in this chapter.

ii. Assessment of Inherent Risk

26.4.17 In order to assess the risks associated with the HPC Project's hazard components, frequency and consequence need to be determined. Frequency represents the likelihood of a risk's occurrence during navigation activities. Consequence represents the magnitude of the outcome of a risk's occurrence; for example, in terms of personal injury, equipment damage and environmental damage. In line with the standard approach used for navigation risk assessment, frequency and consequence can be expressed quantitatively using the categories and ranking numbers identified in **Table 26.1** and **Table 26.2**, respectively.

Table 26.1: Frequency Categories

Category	Likelihood Ranking Number (LRN)	Frequency Definition
High	5	Very likely to occur during activity
Medium	4	Likely to occur during activity
Low	3	May occur during activity
Very low	2	Unlikely to occur during activity
Remote	1	Not expected to occur during activity

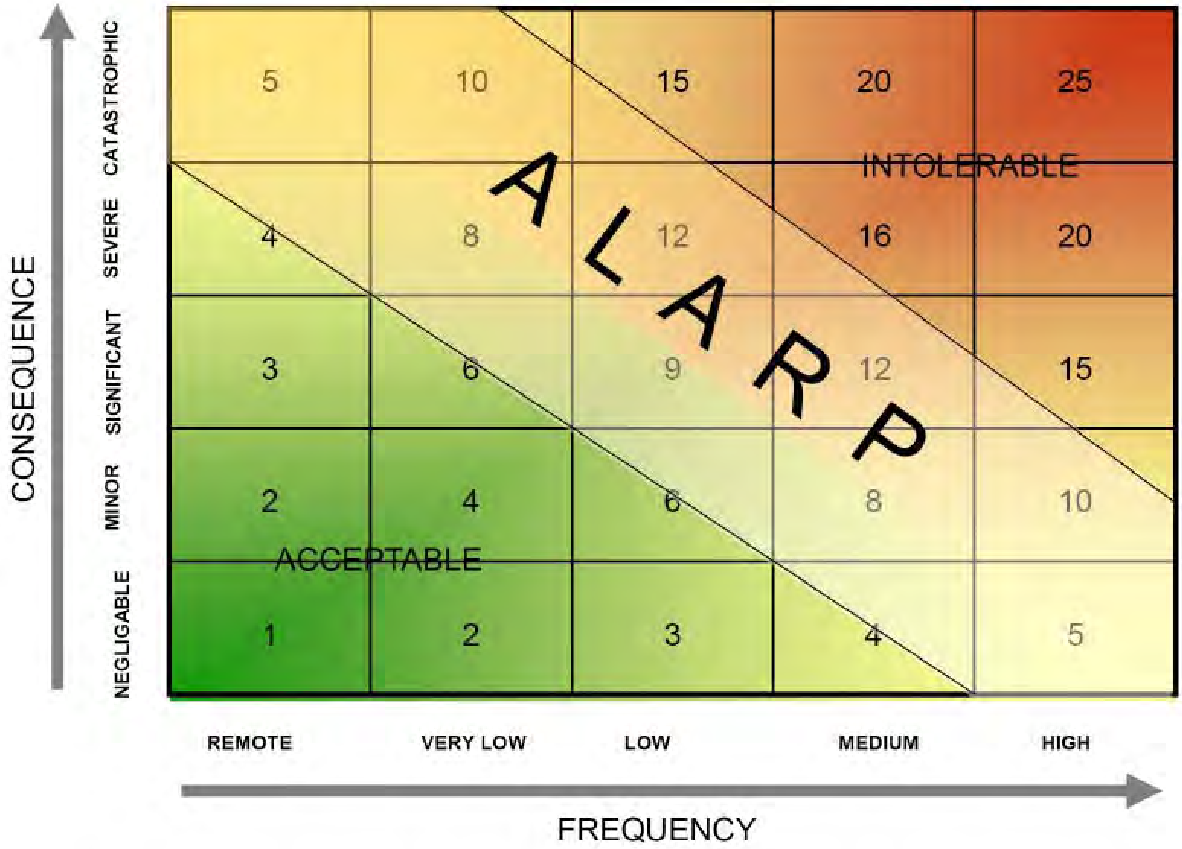
Table 26.2: Consequence Categories

Category	Consequence Ranking Number (CRN)	Consequence Definition
Catastrophic	5	Fatality, or severe personal injury, total plant loss, irreversible environmental damage.
Severe	4	Serious/moderate personal injury. Major/long term equipment damage. Long term environmental damage.

Category	Consequence Ranking Number (CRN)	Consequence Definition
Significant	3	Minor/serious injury. Medium term equipment and environmental damage.
Minor	2	Minor personal injury. Minor/short term equipment damage. Short term environmental damage.
Negligible	1	Negligible personal injury/plant or equipment failure/environmental damage.

26.4.18 A risk score for each hazard is predicted by multiplying the likelihood ranking number (LRN) by the consequence ranking number (CRN), and this score is then used to determine a risk's position within the risk matrix (see **Plate 26.2**).

Plate 26.2: Navigation Risk Assessment Matrix



26.4.19 Risks are assessed and put into one of the following significance categories:

- Low risk - acceptable/tolerable (risk score of 1 to 6) and no risk control measures are required;
- Moderate risk - tolerable (risk score of 7 to 15) and risk is as low as reasonably practicable (ALARP); and
- High risk - unacceptable/intolerable (risk score of 16 to 25) and further risk reduction measures are required.

e) Uncertainties, Limitations and Assumptions

26.4.20 No specific uncertainties relate to the risk assessment, which uses existing available information to establish the baseline conditions. This information includes detailed records of vessel movements throughout the study area. Given the extent of data available (see Section 26.5), a navigation traffic survey was not carried out to inform the EIA process; however this is not considered to be a limitation to the assessment on the basis that the data available from the relevant sources is considered to be more than sufficient for the purposes of this assessment.

26.4.21 The risk score and assessment described above, inherently assumes that awareness of navigation hazards can and will be raised, as appropriate, through the following measures that are typically put in place to manage navigation in accordance with relevant legislation and guidance:

- issue of Notices to Mariners;
- ensure marking on Admiralty Charts;
- circulate information to local sailing clubs, fishermen associations;
- deploy and use marker buoys and lights; and
- use of exclusion (i.e. safety) zones.

26.4.22 A key assumption for the risk assessment is that all the marine activities are undertaken in a competent manner (i.e. appropriate use of aids to navigation and in accordance with relevant laws and navigation advice provided by, for example, Notices to Mariners), and that all appropriate navigation information is updated (i.e. Admiralty Charts, Pilot Books, List of Lights, etc).

26.5 Baseline Environmental Characteristics

a) Ports and Harbours in the Severn Estuary

26.5.1 The Severn Estuary is an important shipping route, with commercial vessels navigating through the deep water approaches to several ports and harbours. Commercial ports in the Severn Estuary include the following:

- Royal Portbury and Avonmouth Docks (owned and operated by the Bristol Port Company);
- Cardiff, Newport and Barry Docks (owned and operated by Associated British Ports); and
- small ports and harbours including those located at Bridgwater, Watchet, Minehead, Knightstone (Weston-super-Mare), Sharpness and Chepstow.

26.5.2 Apart from the Port of Bridgwater, the other commercial ports are situated some distance away from Hinkley Point, either on the south coast of Wales or at and upstream of Bristol. As described below, they generate the majority of the commercial shipping activity passing through the study area.

26.5.3 Marinas and other recreational boating facilities in the study area include those located along the Somerset coast. That is, the Weston Bay Yacht Club at Uphill, Combwich Motor Boat and Sailing Club on the River Parrett, Burnham-on-Sea Yacht Club to the east of the River Parrett, and Watchet Marina seven nautical miles (nm) to the west of Hinkley Point.

b) Port of Bridgwater

i. Port Facilities

26.5.4 The Port of Bridgwater was established by the Bridgwater Navigation and Quays Act 1845. The port limits cover approximately 25nm^2 (see **Plate 26.3**), including the following areas:

- Bridgwater Bay from Brean Down to Hinkley Point;
- the River Parrett as far as Bridgwater;
- the River Brue as far as Highbridge; and
- a small part of the tidal River Axe.

26.5.5 The port limits include Combwich Wharf and Dunball Wharf on the River Parrett.

26.5.6 Bridgwater Harbour Authority (part of SDC) is responsible for navigation and mooring, safety, rights of access, pilotage, maintenance of channels and navigation aids, oil spill contingency and port waste management. Port operations, oil spill contingency and port waste management plans are in place.

26.5.7 Recreational moorings within the port limits are located mainly in the River Brue Estuary and Combwich Pill, although recreational activity tends to be focused around Burnham on Sea.

26.5.8 Commercial vessel movements at the Port of Bridgwater totalled 41 in 2007 and 37 in 2008 (Ref. 26.5). Most vessels were carrying aggregates from Area 472 (i.e. Culver Sands in the Bristol Channel, situated approximately 8nm north of Minehead) and general cargo to Dunball Wharf. A similar level of vessel movements at the Port of Bridgwater is assumed to occur in the future on the basis that the Port's key commercial use for aggregates will continue into the foreseeable future. The basis for this assumption is that a new licence to extract up to one million tonnes of marine sand and gravel per annum from Area 472 was granted by the Marine and Fisheries Agency (MFA; now the Marine Management Organisation (MMO)) to three aggregate extraction companies in May 2008; this licence lasts for 15 years (i.e. until 2023) subject to reviews after five and ten years.

Plate 26.3: Port of Bridgwater Harbour Limits

Source: www.sedgemoor.gov.uk (accessed 4 August 2011)

ii. Navigation

26.5.9 Vessels inbound for the River Parrett and the Port of Bridgwater pass to the west and south of the Gore Buoy. Due regard should be given to Cobblers Patch Shoal, which has a charted depth of 1.8m below Chart Datum (CD), and is located 2.5 cables (0.25nm) south-south-west of Gore Buoy. A special buoy is positioned 2 cables (0.2nm) east of the aforementioned shoal.

26.5.10 There is a designated anchorage, Gore, available some 5.8 cables (0.58nm) south-west of Gore Buoy for vessels awaiting tide to enter the River Parrett and the Port of Bridgwater. Whilst this anchorage offers good holding ground by the nature of the seabed (sand and mud), it is somewhat exposed and having a depth of approximately 6.0m above CD should be considered as a short stay/good weather anchorage.

26.5.11 The River Parrett is approached through a channel between Steart Flats and Gore Sand and is entered at the Bridgwater bar some 5nm west of Burnham-on-Sea. Pilotage is compulsory for all vessels over 30m length overall (LOA). Pilots board at the Brue Beacon, which is located inside the Port of Bridgwater's harbour limits in sheltered water.

26.5.12 **Plate 26.4** illustrates the typical route taken by a typical inbound commercial vessel for facilities on the River Parrett, including Combwich Wharf and Dunball Wharf, as identified in the Port of Bridgwater's Approaches Plan (Ref. 26.6). Recreational vessels bound for the Combwich Motor Boat and Sailing Club may take a more direct or alternative route than that used by commercial vessels.

c) Shipping Activity

26.5.13 The existing shipping activity in the vicinity of Hinkley Point covers the following vessel types:

- commercial vessels;
- military vessels;
- fishing vessels; and
- recreation vessels.

i. Commercial Shipping

26.5.14 The assessment of commercial shipping activity is based on two data sets: Anatec's ShipRoutes UK Database and in-house AIS database (see Ref. 26.5).

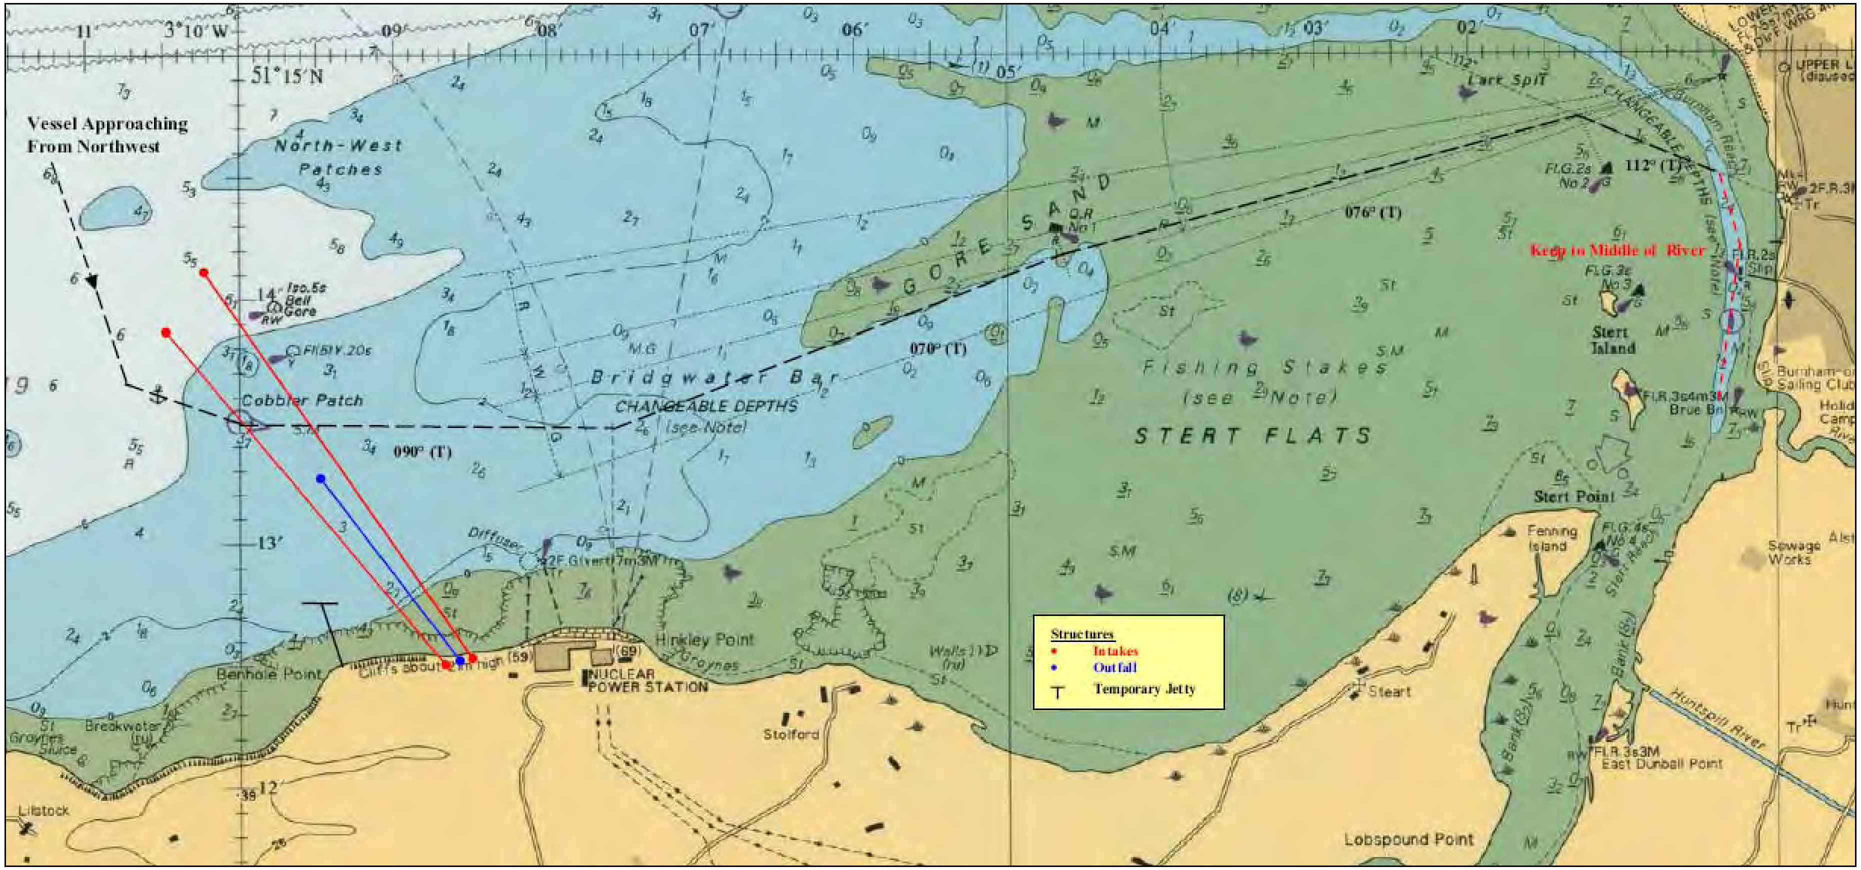
26.5.15 ShipRoutes is a shipping route database developed by Anatec to assist in identifying shipping passing in proximity to proposed offshore developments. The database was developed in two main phases: movements analysis and routeing analysis.

26.5.16 The number of movements per year on routes passing through UK waters was estimated by analysing a number of data sources, including port callings data and voyage information obtained directly from ship operators. It is noted that ShipRoutes excludes the movements of 'non-routine traffic' such as fishing vessels, naval vessels, tugs, dredgers, yachts and offshore service vessels to mobile rigs.

26.5.17 The routes taken by ships between ports were obtained from several data sources, including:

- offshore installation, standby vessel and shore-based survey data;
- passage plans obtained from ship operators;
- consultation with ports and pilots; and
- Admiralty Charts and publications.

Plate 26.4: Recommended Route for Inbound Commercial Vessels



NOT PROTECTIVELY MARKED

26.5.18 This information was combined to create the ShipRoutes database containing all the shipping routes passing through UK waters, with each route having a detailed distribution of shipping characteristics. The ShipRoutes database was analysed and it was identified that there were no routes in proximity to HPC, with the nearest shipping heading to and from Bristol, some 10 miles to the north of Hinkley Point.

26.5.19 The AIS database was based on two months of data from 2009. An overall plot of the information held is presented in **Plate 26.5** with a more local plot provided in **Plate 26.6**. It should be noted that **Plate 26.4** to **26.9** show the alignments of the intake (red) and outfall (blue) structures. In addition, it should be noted that the AIS database includes information on dredging vessels (including movements of dredgers between aggregate dredging Area 472 in the Bristol Channel (at Culver Sands) and the Port of Bridgwater), but ShipRoutes does not.

26.5.20 The outputs from both databases indicate that shipping in the study area is very low, with AIS providing a better basis due to its ability to track non-routine shipping. The more detailed plot (**Plate 26.6**) shows that there were four vessels passing to the south of the study area over the two month survey period, all of which were the Arco Dart dredger inbound from the Culver Sands aggregate extraction area to the Port of Bridgwater (Dunball Wharf). Only two other vessels were tracked within the area; there was Trinity House's multi-functional tender vessel Patricia, which was tracked to and from the Gore buoy, and Briggs Marine’s Cameron, which was tracked inspecting/servicing the buoys within the Lilstock Range Firing Area.

ii. Military Vessels

26.5.21 The proposed location for the head structures is within or adjacent to the Bridgwater Bay Danger Area (D119) and the Lilstock Range Firing Area, which are used mainly for military helicopter gunnery training.

26.5.22 No military vessels were identified in this area over the two month survey period. Overall the Temporary Jetty development is not considered to be in an area where military shipping levels are likely to be high.

iii. Fishing Vessels

26.5.23 According to the Port of Bridgwater’s Marine Operations Plan (2009; Ref. 26.4), no commercial fishing vessels are registered at the port or on the River Parrett, although there is one vessel that can be chartered for angling.

26.5.24 Two data sources were used to identify fishing vessels further afield: satellite data and sightings data (see below) (as described in Ref. 26.5).

26.5.25 The MMO operates a satellite vessel monitoring system from its Fisheries Monitoring Centre. This is used as part of the sea fisheries enforcement programme to track the positions of fishing vessels in UK waters. It is also used to track all UK registered fishing vessels globally.

26.5.26 Vessel position reports are received approximately every two hours, unless a vessel has a terminal on board which cannot be polled, in which case it must report once per hour. The data cover all European Union countries within British territorial waters and other countries (e.g. Norway and Faeroe Islands).

Plate 26.5: AIS Data for the Bristol Channel

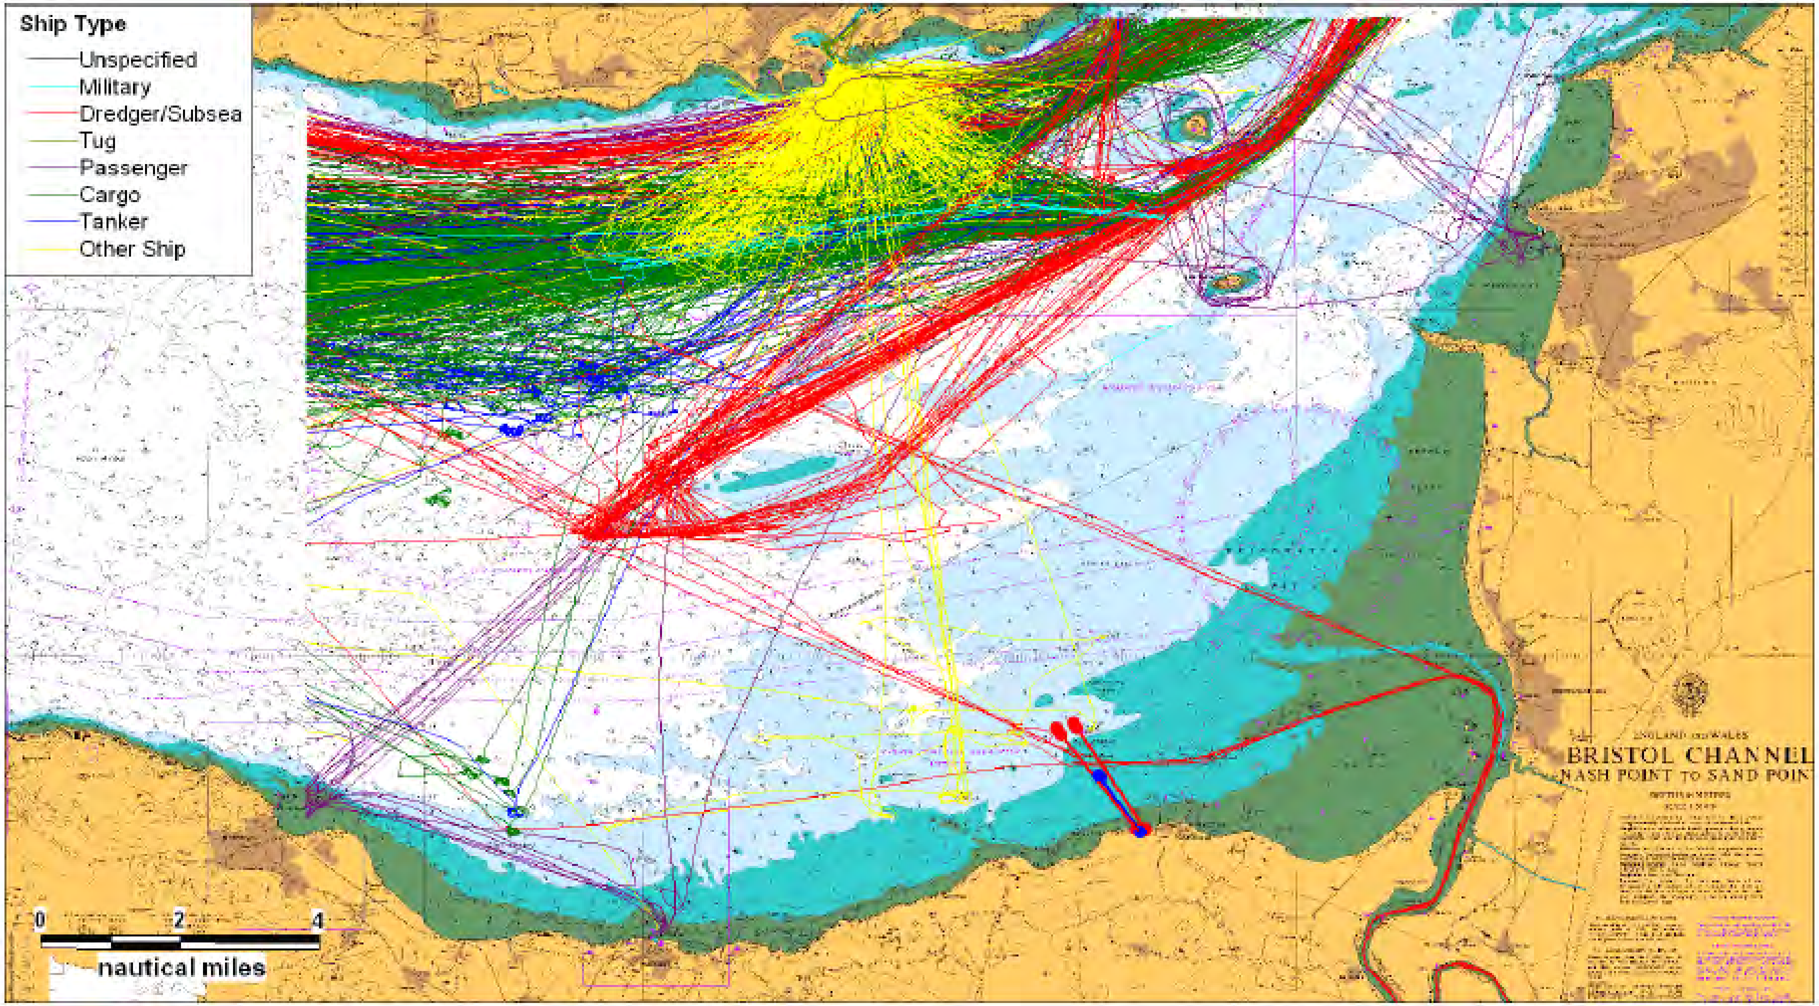


Plate 26.6: AIS Data for Hinkley Point

26.5.27 The MFA stopped releasing satellite data on non-UK vessels from 2006 and on UK vessels from 2008 (pending legal advice); data from these two latest years (i.e. 2006 and 2008 respectively) are presented in **Plate 26.7** (where fishing vessels are shown as block dots).

26.5.28 Data on fishing vessel sightings were obtained from the MMO and the Scottish Fisheries Protection Agency (SFPA). Each patrol logs the positions and details of fishing vessels within the rectangle being patrolled. All vessels are logged, irrespective of size, provided they can be identified by their Port Letter Number (PLN). Five years of data for the period from 2005 to 2009 were used to plot fishing vessels (see **Plate 26.8**).

iv. Recreational Craft

26.5.29 The water area surrounding Hinkley Point is a designated sailing area for recreational craft and the water area approximately 3.5nm to the west of Hinkley Point is used for racing (see **Plate 26.9**). The sailing area covers most of the Severn Estuary.

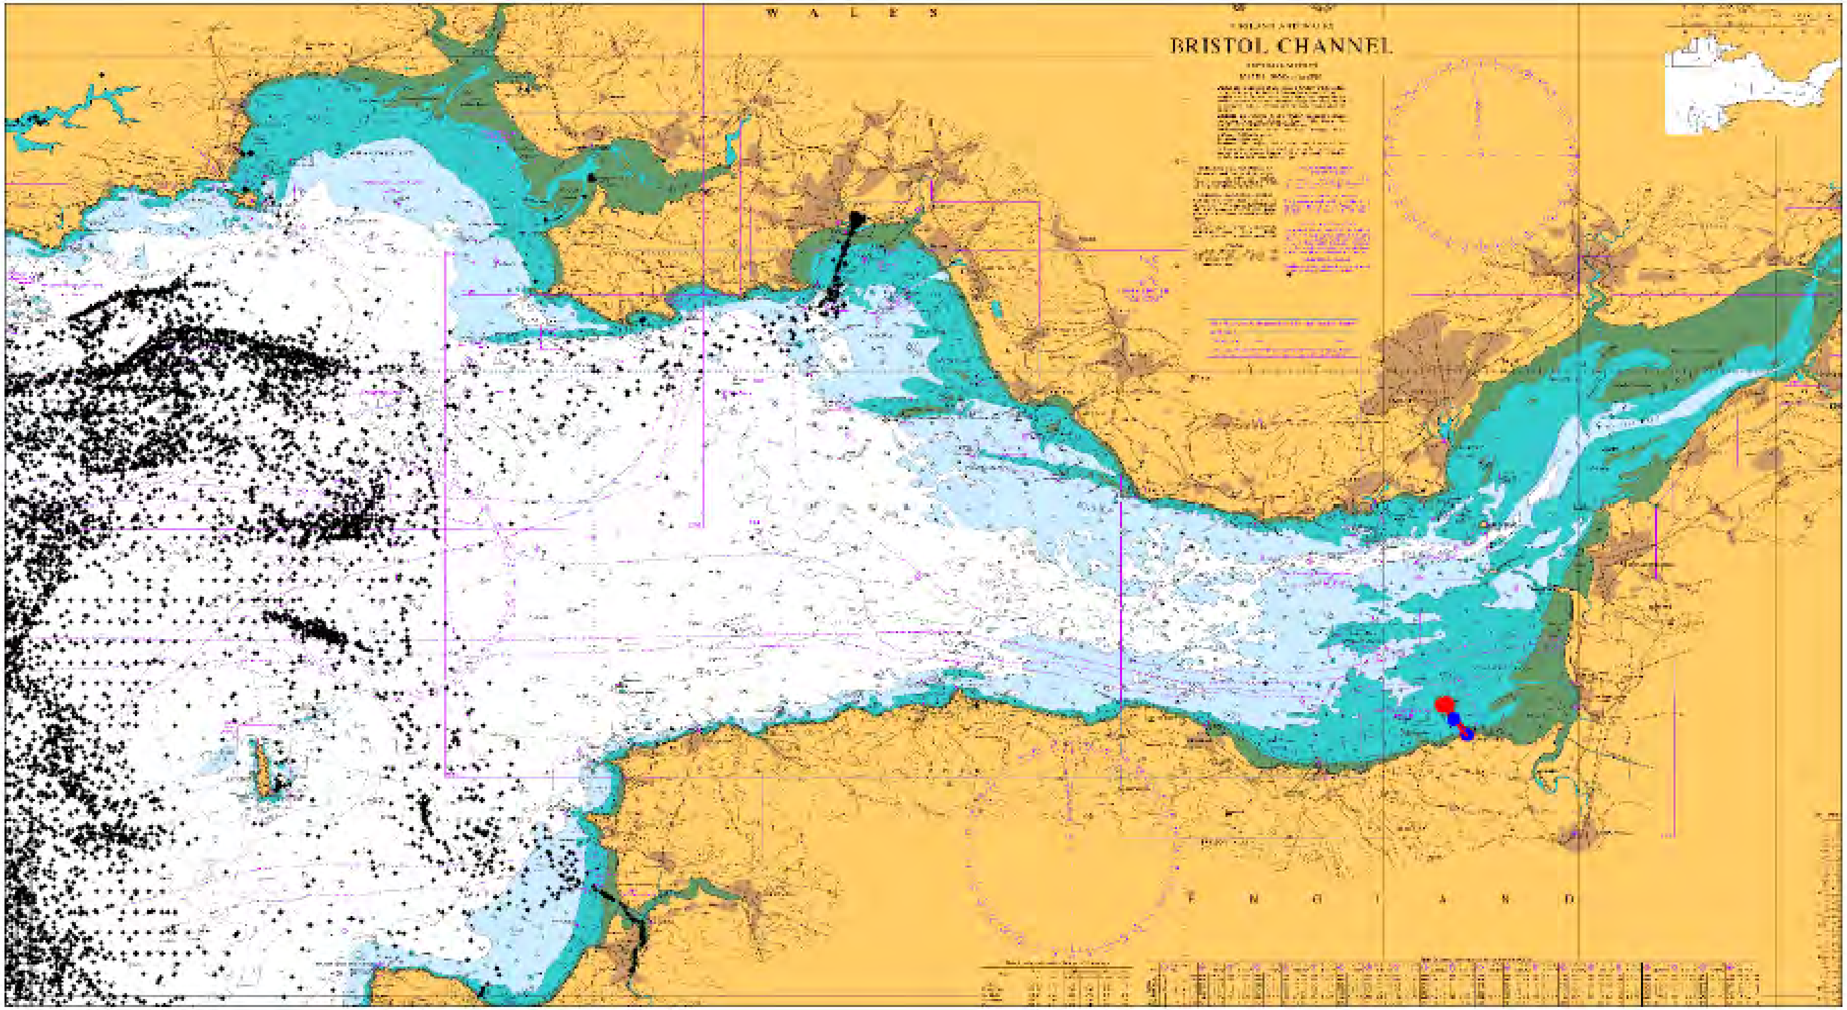
26.5.30 According to the Port of Bridgwater's Marine Operations Plan (2009; Ref. 24.4), there are three sailing clubs within the Port of Bridgwater. Combwich Motor Boat and Sailing Club is based at Combwich (adjacent to Combwich Wharf), and the Burnham-on-Sea Motor Boat and Sailing Club is based on the River Brue. Both clubs have afloat moorings. The Burnham Boat Owners' Sea Angling Association has a substantial membership but only small boats, which members launch from Burnham Slipway when required. Some visiting yachts call at these clubs.

26.5.31 There is a marina approximately 7nm to the west of Hinkley Point at Watchet and another approximately 9nm to the north-east at Uphill. A number of light, medium and heavy use cruising routes extend to and from the marinas and sailing clubs based at Watchet, Combwich, Burnham-on-Sea and Uphill (see **Plate 26.9**). Watchet's marina is the start/end point for several cruising routes including one busy route across the Severn Estuary to south Wales. Cruising routes to and from these marinas and clubs tend to avoid the area where the proposed intake and outfall head structures would be located. However, a medium use cruising route providing access to the River Parrett passes in between the proposed location for the intake and outfall head structures and Combwich Wharf (see **Plate 26.9**) in a similar manner to commercial shipping (see **Plate 26.4**).

d) Bridgwater Bay Danger Area and Lilstock Range Firing Area

26.5.32 The Bridgwater Bay Danger Area (D119) establishes the air space allocated for military activities. D119 covers a circular area over land in West Somerset and sea in Bridgwater Bay. Its extent over the sea is marked on Admiralty Charts (as "Firing Practice Area D119") and covers a partial circular area offshore that could be defined by an arc extending from Hinkley Point to beyond the 10m bathymetric contour towards Culver Sands and returning to land at Watchet. The Danger Area is a delineation of the air space above the water and does not place any restrictions on navigation and vessels have the right to transit it at any time.

Plate 26.7: Fishing Activity from Satellite Data



NOT PROTECTIVELY MARKED

Plate 26.8: Fishing Activity from Sightings 2005-2009

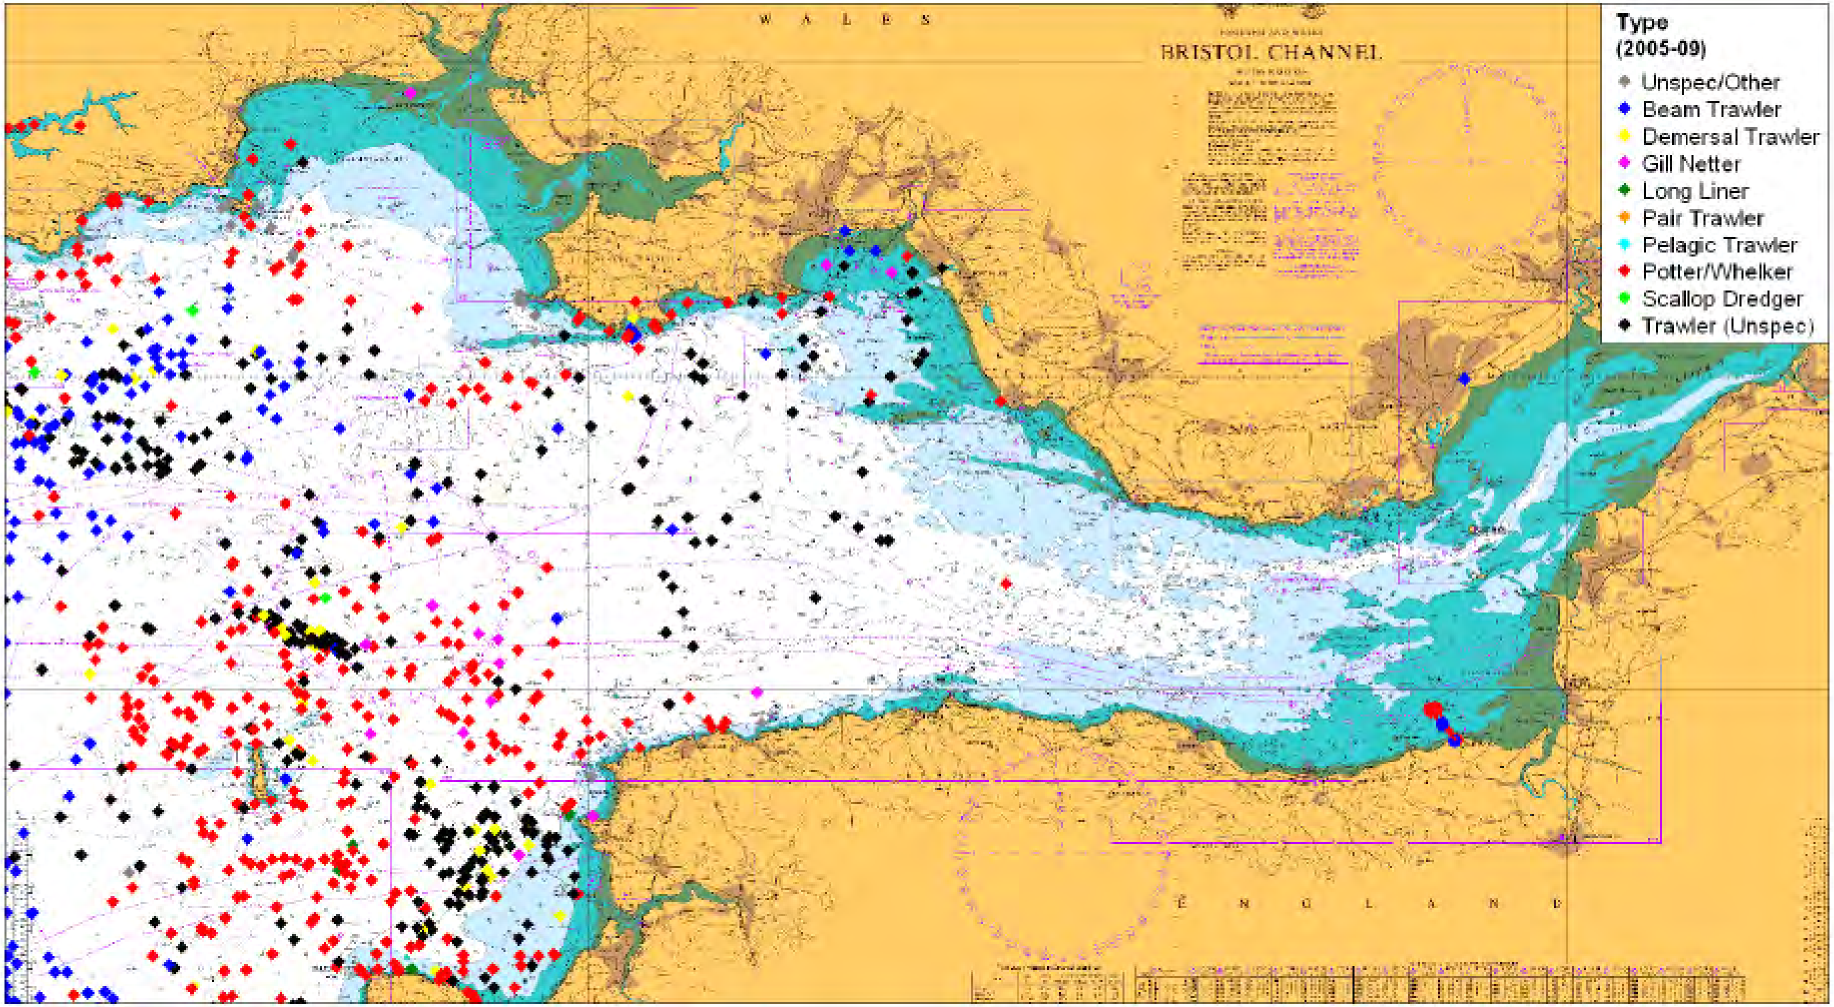


Plate 26.9: Recreational Activity

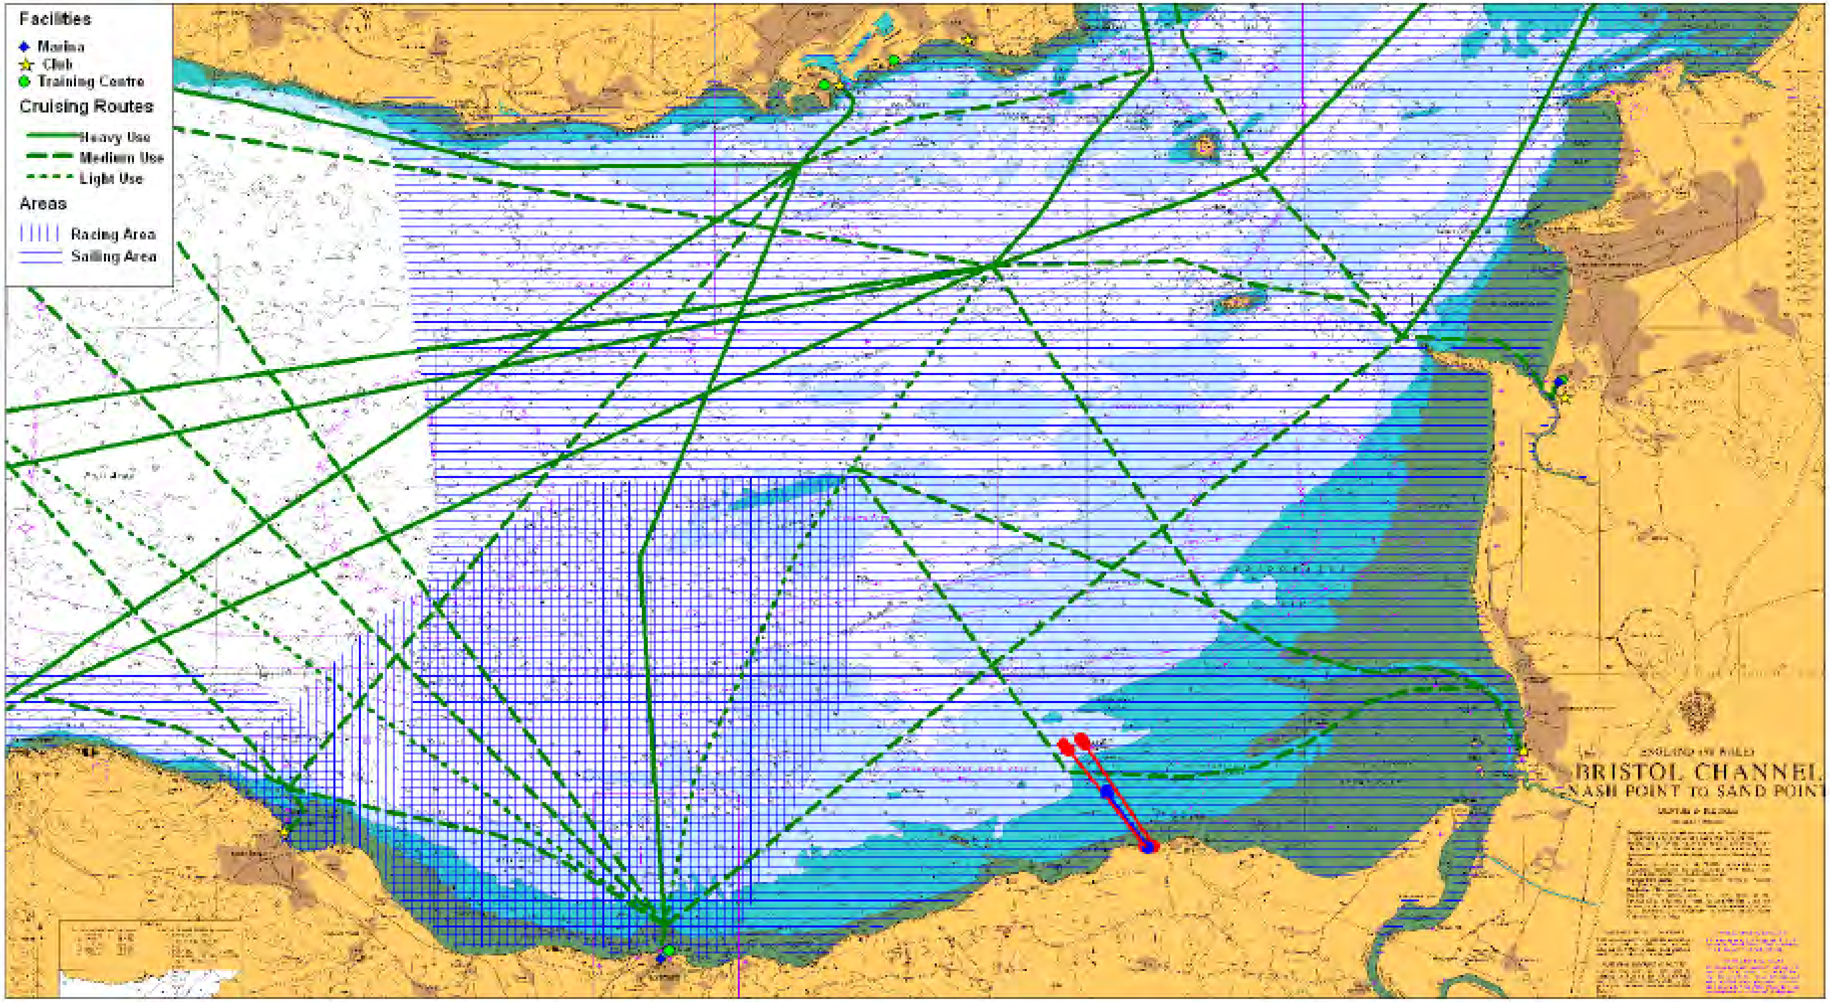


26.5.33 The Lilstock Range Firing Area is smaller and is situated within D119 but only extends over the sea in Bridgwater Bay. Similar to D119, the firing area covers a partial circular area offshore that could be defined by an arc extending from east of Hinkley Point and returning to land to the west of Watchet. The firing area delineates the water surface template for air to surface gunnery activities and is marked by buoys. The firing area's full extent is not marked on Admiralty Charts, although the water surface template is shown on Admiralty Charts and marked in the water by seven buoys. The firing area is used primarily for military helicopter gunnery training and is operated under a clear range procedure so that exercises and training only take place when the area is clear of vessels. It is typically used for activities undertaken by the Fleet Air Arm from Royal Navy Air Service, Yeovilton.

e) Other Features

26.5.34 There are a number of other physical features within the study area that influence navigation. These features include natural features (e.g. sands bars or 'patches', islands) and man-made features (e.g. HPB intake and outfall head structures, wave rider buoys). Where these features pose a risk to navigation (e.g. a risk of a vessel colliding with or grounding on a feature), then they are appropriately marked and identified on Admiralty Charts. For the purposes of this assessment, these features are considered to be part of the baseline conditions in which navigation already takes place and are sufficiently integrated into existing navigation systems that they do not contribute to the hazards posed by the HPC Project and assessed in this chapter.

26.6 Assessment of Risks

a) Introduction

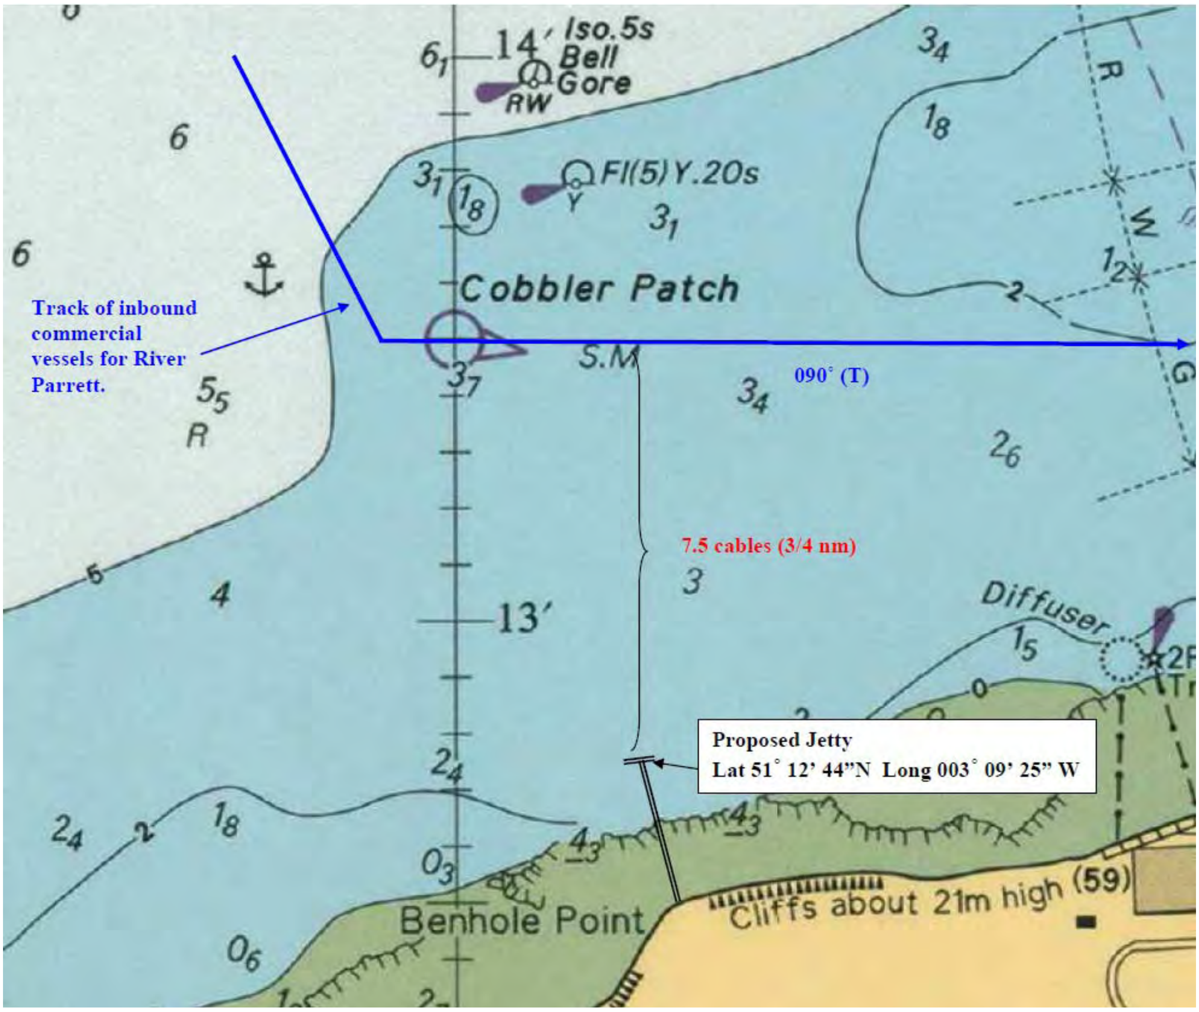
26.6.1 The following assessments focus on the risks to navigation posed by the HPC Project including the Temporary Jetty, cooling water intake and outfall head structures and the proposed refurbishment and extension of Combwich Wharf in the context of this assessment of the risks to navigation posed by those elements of the project.

26.6.2 The proposed site for the Temporary Jetty is located at Hinkley Point on the West Somerset coast, some 25km to the east of Minehead and 12km to the north-west of Bridgwater (see **Plate 26.1**). The onshore storage facility for the proposed Temporary Jetty and the associated access corridor would be situated on land to the west of HPA. The facility would extend approximately 550m offshore and the Temporary Jetty head would be approx 1.4km (0.75nm) south of the track that inbound vessels adopt in negotiating the approach channel to the River Parrett (see **Plate 26.9**).

26.6.3 The cooling water intake head structures would be located approximately 3.4 and 3.5km (1.8nm) offshore and the outfall head structures will be located approximately 1.8km (1.1nm) offshore. At these locations, the intake and outfall head structures would be positioned to the north and south respectively of the established inbound route for vessels accessing the River Parrett and Port of Bridgwater, including Combwich Wharf (as shown in **Plate 26.4**), and therefore has the potential to pose a risk to navigation. The undersea tunnels from HPC would be bored beneath the seabed before rising to meet head structures and, therefore, would not pose a risk to navigation.

26.6.4 Combwich Wharf lies on the western bank of the River Parrett and is currently used for the handling of Abnormal Indivisible Loads (AILs) for HPA and HPB. The wharf would be refurbished and extended to handle the arrival of approximately 180 AILs and other materials associated with the construction of HPC. It is anticipated that there would be on average eight or nine deliveries and a maximum of up to 15/16 deliveries per month to Combwich Wharf during the construction of HPC.

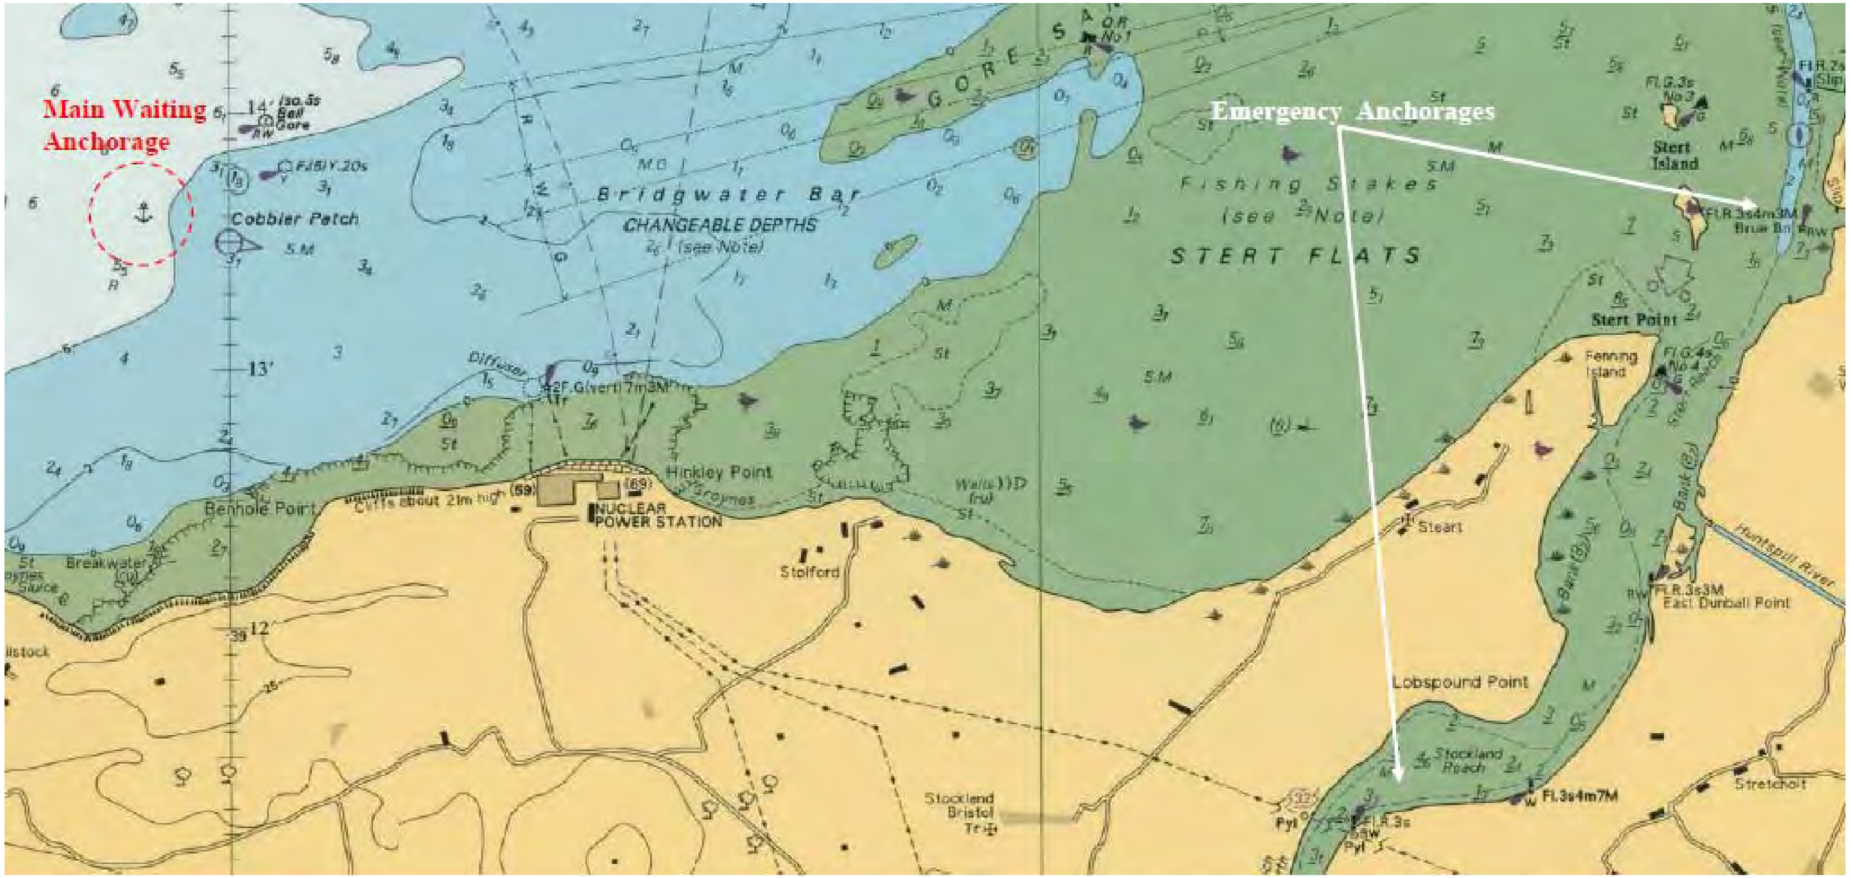
Plate 26.10: Jetty Passing Distances



26.6.5 Navigation to and on the River Parrett requires skill and local knowledge to deal with the tidal conditions. The tidal range restricts access to and berthing at Combwich Wharf and Dunball Wharf and in this respect all navigation to the Port of Bridgwater typically commences with the vessel passing the Gore Buoy at least two hours before High Water at Bridgwater (two and a half hours would be preferable). A passage plan is essential for berthing each AIL, with contingency plans built into the system for anchoring in an emergency. It is anticipated that these contingency plans will address circumstances when vessels carrying AILs and other commodities destined for Combwich Wharf are constrained by the tidal window or other cause which precludes the vessel completing the transit between the Gore Buoy and Combwich Wharf. For example, should an AIL vessel find itself in a position where it cannot arrive at the predetermined points given in the passage plan, as a contingency plan measure, use should be made of points where the vessel may abort the passage plan and seek safety in deeper water outside of the River Parrett or make use of one of the safe anchorages available off Brue Beacon and the West end of Stocklands Reach (see **Plate 26.11**).

26.6.6 The material that is to be removed from within the barge berth bed area during the refurbishment works at Combwich Wharf is to be removed using land-based plant operating in the dry and transported away by land. Clearance of the berth during the operational phase for maintenance purposes would be undertaken by excavator under low tide conditions and the sediment deposited back into the River Parrett channel (as it is now).

Plate 26.11: Main and Contingency Anchorage Locations



b) Navigation Receptors

26.6.7 The risk assessments in this chapter are made in relation to a number of navigation receptors that could be affected by the HPC Project. The navigation receptors are:

- commercial vessels;
- military vessels;
- fishing vessels;
- recreational vessels in Bridgwater Bay (i.e. the open water area covering Bridgwater Bay and the Severn Estuary);
- recreational vessels in the River Parrett (i.e. the enclosed water area covering the estuary of the River Parrett);
- the Port of Bridgwater and SDC's interests (where SDC is the harbour authority for the Port of Bridgwater); and
- the Lilstock Range Firing Area.

c) Risk Consequences and Likelihoods

i. Port and Shipping Receptors

26.6.8 The risk assessments in this chapter are based on the potential consequences and likelihoods of an incident occurring with respect to the hazards (i.e. the Temporary Jetty, the intake and outfall head structures and the refurbishment and extension of Combwich Wharf) in relation to the various navigation receptors. The following paragraphs set out the potential consequences and likelihoods of an incident for each hazard based on the definitions for each Consequence Ranking Number (CRN) and Likelihood Ranking Number (LRN) identified in Tables 26.1 and 26.2 respectively.

Temporary Jetty

26.6.9 For the purposes of the risk assessments for the Temporary Jetty's construction, operation and dismantling and restoration phases, the potential consequences of an incident are considered to be severe (CRN=4) for commercial vessels and the Port of Bridgwater's interests and minor (CRN=2) for military, fishing and recreational vessels passing through Bridgwater Bay. The higher CRN for commercial vessels reflects the inbound route taken by commercial vessels to the River Parrett and Port of Bridgwater. This route passes directly north of the proposed Temporary Jetty location (see **Plate 26.9**). Military, fishing and recreational vessels would not normally use the Port of Bridgwater (i.e. the port's berths) and/or do not need to take this route to the River Parrett, so they would not need to pass as close to the Temporary Jetty development as commercial vessels.

26.6.10 The potential likelihoods of a incident are considered to be medium (LRN=4) for commercial vessels and the Port of Bridgwater's interests and very low (LRN=2) for military, fishing and recreational vessels passing through Bridgwater Bay. The higher LRN for commercial vessels reflects the greater number of commercial vessels sailing on the inbound route to the River Parrett and the Port of Bridgwater.

Intake and Outfall Head Structures

26.6.11 For the purposes of the risk assessments regarding the construction and operation of the intake and outfall head structures, the potential consequences are considered to be severe (CRN=4) for commercial vessels and the Port of Bridgwater's interests and minor (CRN=2) for military, fishing and recreational vessels passing through Bridgwater Bay. The higher CRN for commercial vessels reflects the inbound route taken by commercial vessels to the River Parrett and Port of Bridgwater. This route should pass around to the two intake head structures (see **Plate 26.4**). Military, fishing and recreational vessels would not normally use the Port of Bridgwater (i.e. the port's berths) and/or do not need to take this route to the River Parrett, so they would not need to pass as close to the intake and outfall head structures as commercial vessels.

26.6.12 The potential likelihoods are considered to be medium (LRN=4) for commercial vessels and the Port of Bridgwater's interests and very low (LRN=2) for military, fishing and recreational vessels passing through Bridgwater Bay. The higher LRN reflects the greater number of commercial vessels sailing on the inbound route to the River Parrett and Port of Bridgwater.

Combwich Wharf

26.6.13 For the purposes of the risk assessments regarding the refurbishment and extension and operation of Combwich Wharf, the potential consequences of an incident are considered to be high (CRN=4) for commercial vessels and the Port of Bridgwater's interests and minor (CRN=2) for military and fishing vessels. The higher CRN for commercial vessels reflects the inbound route taken by commercial vessels to the River Parrett and Port of Bridgwater. Military and fishing vessels would not normally use the Port of Bridgwater (i.e. the port's berths) and/or do not need to take this route to the River Parrett. For recreational vessels the potential consequences have been split between recreational vessels in Bridgwater Bay and recreational vessels in the River Parrett. The CRN for recreational vessels in Bridgwater Bay is considered to be minor (CRN=2) but the CRN for recreational vessels in the River Parrett is significant (CRN=3).

26.6.14 The potential likelihoods are considered to be medium (LRN=4) for commercial vessels and the Port of Bridgwater's interests and very low (LRN=2) for military, fishing and recreational vessels in Bridgwater Bay. The higher LRN reflects the greater number of commercial vessels sailing on the inbound route to the River Parrett and Port of Bridgwater. For recreational vessels in the River Parrett the LRN is medium (LRN=4).

ii. Lilstock Range Firing Area Receptor

26.6.15 Potential consequences and likelihoods of an incident are also identified for the Lilstock Range Firing Area. The firing area is not a true navigation receptor because the military activities that take place within it (i.e. helicopter gunnery training) are affected by navigation rather than being navigation. Therefore, potential impacts on this receptor have been considered separately to impacts on the other receptors.

26.6.16 For the purposes of the risk assessments, the potential consequences are considered to be severe (CRN=4) and the potential likelihoods are considered to be medium (LRN=4). These are hypothetical assignments that provide context to the assessments because, in reality, military activities would not take place within the firing area if a vessel is present. Accordingly, it is relevant to acknowledge the fact that military activities and navigation would not take place in the firing area simultaneously. Nevertheless, there is potential conflict in this part of the sea between the MoD's desired use of it for military activities and EDF Energy's desired use of it for vessel movements as part of the HPC Project.

26.6.17 **Table 26.3** summarises the consequences (CRNs) and likelihoods (LRNs) assigned to the various receptors identified.

26.6.18 The risks identified below are all assessed on the basis that all the marine activities are undertaken in a competent manner (as described in Section 26.4) but without the implementation of the mitigation measures identified in Section 26.7.

Table 26.3: Assigned Risk Consequences and Likelihoods

Receptor	Consequence (CRN)	Likelihood (LRN)
Commercial vessels	Severe (4)	Medium (4)
Military vessels	Minor (2)	Very low (2)
Fishing vessels	Minor (2)	Very low (2)
Recreational vessels in Bridgwater Bay	Minor (2)	Very low (2)
Recreational vessels in the River Parrett	Significant (3)	Medium (4)
Port of Bridgwater's interests	Severe (4)	Medium (4)
Lilstock Range Firing Area	Severe (4)	Medium (4)

d) Construction Risks

i. Construction Plant in the Water during the Construction and Dismantling of the Temporary Jetty and Construction of the Cooling Water Intake and Outfall Head Structures

26.6.19 Construction plant (e.g. jack-up platforms) would be in the water during the construction and the dismantling of the Temporary Jetty and would, therefore, potentially pose a hazard to navigation. The Temporary Jetty head would lie in a position some 7.5 cables (i.e. 0.75nm or 1.4km) south of the track inbound vessels adopt in negotiating the approach channel for the River Parrett and Port of Bridgwater (see **Plate 26.9**). This track is typically used by commercial vessels rather than military, fishing and recreational vessels.

26.6.20 Construction plant (e.g. jack-up platforms) would also be in the water during the construction of the intake and outfall head structures and, similarly, would potentially pose a hazard to navigation. The intake and outfall head structures would lie east and south of the track that inbound vessels adopt in negotiating the approach channel for the River Parrett and Port of Bridgwater (see **Plate 26.4**); with the western intake head structure in very close proximity to the approach (approximately within two cables (0.2nm)). Further to this the inbound track also comes within approximately two cables (0.2nm) of the outfall head structure. This track is typically used by commercial vessels rather than military, fishing and recreational vessels.

26.6.21 Despite the distance and taking a precautionary approach, the risk to commercial traffic and the interests of the Port of Bridgwater is considered to be high (unacceptable) because of the volume of vessels and their inbound track to the Port of Bridgwater's harbour limits and berths in the River Parrett in relation to the Temporary Jetty and head structures' positions (i.e. there would be more potential for interference with navigation).

26.6.22 The risk to fishing activity is considered to be low (acceptable) because the activity vessels of 15m and more is confined mainly to the west of a north to south line between Bideford (north Devon) and Swansea (south Wales), while fishing activity to the east of this line is much reduced, particularly east of a north to south line through Lynmouth (north Devon).

26.6.23 The risk to military activity is considered to be low since naval vessels are not known to navigate in this area.

26.6.24 The risk to recreational activity in Bridgwater Bay is considered to be low. Some sailing does occur in this area of the Bristol Channel - there are a number of cruising routes and marinas along the Somerset coast (e.g. at Uphill, on the River Parrett, Burnham-on-Sea and Watchet) - and the jetty and head structures are located in a sailing area for recreational craft (although this sailing area covers a large part of the Severn Estuary (see **Plate 26.9**). Use is made by recreational vessels of the same inbound route through Bridgwater Bay to the River Parrett as commercial vessels, as shown in **Plate 26.4**.

26.6.25 In summary, the risks (without mitigation measures) associated with the construction plant for the temporary jetty are considered to be:

- **high/unacceptable** for commercial vessels;
- **low/acceptable** for military vessels;
- **low/acceptable** for fishing vessels;
- **low/acceptable** for recreation vessels in Bridgwater Bay; and
- **high/unacceptable** for the Port of Bridgwater and SDC's interests.

ii. Passage of Dredging Plant to/from the Offshore Disposal Site (Cardiff Grounds)

26.6.26 Dredging plant would be used to create the berthing pocket at the end of the Temporary Jetty head and would have to sail to and from an offshore disposal site to deposit the dredged material. Accordingly, the passage of dredging plant between the Temporary Jetty and the disposal ground could pose a hazard to navigation.

26.6.27 For the purposes of this risk assessment, it is assumed that the dredged material arising from the berthing pocket would be transported to the Cardiff Grounds offshore disposal site by either a small trailing suction hopper dredger or a self-propelled barge. The Cardiff Grounds offshore disposal site is situated on the Welsh side of the Bristol Channel, just off Cardiff, within the following latitude (north) and longitude (west) coordinates:

- 051°27'24.208, 003°05'53.942.
- 051°25'36.056, 003°06'24.233.
- 051°25'36.281, 003°06'42.184.
- 051°26'30.132, 003°07'06.192.

26.6.28 Sailing routes to and from the jetty's approaches would usually follow tracks between the Gore Buoy to the south and a position between Mackenzie Can Buoy and Holm Middle to the north. There are no significant hazards to be registered in this passage which could affect the navigation of the dredging plant.

26.6.29 Dredging plant navigating between the Cardiff Grounds and a position in the vicinity of Mackenzie Can Buoy and Holm Middle may navigate to the east or west of Flat Holm. The navigation hazards associated with this passage are:

- acceptable for passage to the east, where there is ample sea-room to be found and the route is well marked between Flat Holm, Monkstone Lighthouse and the Cardiff Grounds;
- ALARP for passage to the west - although shorter in distance, there are numerous shoal patches with the main ones marked by cardinal marks Wolves and South Cardiff; and
- ALARP in both cases where vessels would be crossing busy east-west shipping lanes, especially in the northern part of the Bristol Channel (see **Plate 26.5**).

26.6.30 Dredging plant would approach the jetty on return from the Cardiff Grounds. The hazards associated with this passage are:

- unacceptable for dredging plant navigating to and from the Temporary Jetty berthing pocket;
- unacceptable for dredging plant arriving from the Cardiff Grounds and hindering the path of inbound vessels in the approach channel bound for berths on the River Parrett; and
- unacceptable for dredging plant arriving from/departing for the Cardiff Grounds and passing close to the anchorage.

26.6.31 In summary, the risks (without mitigation measures) associated with the hazards posed by dredging plant to the navigation receptors are predicted to be highest in and around the Temporary Jetty (rather than on the sailing route to and from the disposal ground), particularly for interference with commercial vessels and the Port of Bridgwater's interests, as follows:

- **high/unacceptable** for commercial vessels;
- **low/acceptable** for military activity;
- **low/acceptable** for fishing activity;
- **low/acceptable** for recreation activity; and
- **high/unacceptable** for the Port of Bridgwater and SDC's interests.

iii. Construction Plant for the TemporaryJetty and Cooling Water Intake and Outfall Structures Interfering with Activities at the Lilstock Range Firing Area

26.6.32 The Temporary Jetty would be constructed and dismantled close to the Lilstock Range Firing Area and the marked water surface template (see 'Target' identified on **Plate 26.11**) - while the head structures would also be constructed close to the Lilstock Range Firing Area marked water surface template. Although there are no restrictions on navigation within these areas, the firing range is only used when it is clear of vessels. Therefore, depending on the presence and movement of construction plant in the firing area, the construction activities could preclude the use and/or the safe use of the firing area for military training and exercises.

26.6.33 Based on informal consultation with the MoD (described above), it is anticipated that the risk of interference to military activities would be **moderate/ALARP** since construction plant should not be present within or sufficiently close to the firing area during the construction and dismantling periods to the extent that the MoD could not use the firing area to undertake military training and exercises.

iv. Construction Plant in the Water at Combwich Wharf

26.6.34 The refurbishment and extension of Combwich Wharf will entail the following relevant demolition/construction aspects:

- demolition of the existing dolphin berthing structures;
- demolition of the existing finger pier;
- construction of the goods wharf including piling;
- construction of the abnormal loads out quay, including piling; and
- construction of the berth bed.

26.6.35 Construction plant may be in the water during the refurbishment and extension of Combwich Wharf and would, therefore, potentially pose a hazard to navigation. The following plant is anticipated, some of which will potentially need to be brought to the wharf via the inbound route to the Port of Bridgwater and the River Parrett:

- delivery ship;
- barges;
- piling rig;
- work support boat;
- crane barge; and
- mobile track crane.

26.6.36 The risk to commercial traffic and the interests of the Port of Bridgwater is considered to be high (unacceptable) because of the volume of vessels and their inbound track to the Port of Bridgwater's harbour limits and berths in the River Parrett. Work on the wharf may entail using plant that may protrude out into the main River Parrett Channel.

26.6.37 There will be no use of the existing wharf at Combwich by commercial vessels during the refurbishment.

26.6.38 The risk to fishing activity is considered to be low (acceptable).

26.6.39 The risk to military activity is also considered to be low since naval vessels are not known to navigate in this area.

26.6.40 Some sailing does occur in this area of the Bristol Channel and Combwich Wharf is located in the designated sailing area for recreational craft (although this sailing area covers a large part of the Severn Estuary). There are also a number of moorings for small recreational vessels within the area of Combwich Wharf (e.g. associated with Combwich Motor Boat and Sailing Club). The refurbishment and extension of the wharf may cause interference with the use of the moorings. The risk to recreational craft in Bridgwater Bay is therefore considered to be low (acceptable) but may be considered high (unacceptable) within the River Parrett.

26.6.41 In summary, the risks (without mitigation measures) associated with the refurbishment and extension of Combwich Wharf are considered to be:

- **high/unacceptable** for commercial vessels accessing berths in the River Parrett;
- **low/acceptable** for military vessels;
- **low/acceptable** for fishing vessels;
- **low/acceptable** for recreation vessels in Bridgwater Bay;
- **high/unacceptable** for recreation vessels in the River Parrett; and
- **high/unacceptable** for the Port of Bridgwater and SDC's interests.

e) Operational Risks

i. Presence of the Temporary Jetty

26.6.42 Once constructed, the Temporary Jetty would extend into the open water of Bridgwater Bay and would, therefore, potentially pose a risk to navigation.

26.6.43 The Temporary Jetty itself presents a low risk to navigation due to its presence in open water. It should not create any major hazards during its operation given that it would be marked and assuming that marine activities would be undertaken in a competent manner.

26.6.44 The potential navigational hazards associated with and posed by the Temporary Jetty itself include interference with:

- the general flow of traffic in the Bristol Channel;
- passing commercial coastal traffic;
- commercial vessels bound for River Parrett;
- commercial vessels departing River Parrett;
- vessels at Gore anchorage;

- ‘drifting vessels’ and vessels ‘not under command’ (i.e. vessels with restricted abilities to manoeuvre);
- fishing vessels;
- recreational vessels in Bridgwater Bay; and
- the Port of Bridgwater and SDC’s interests.

26.6.45 However, the Temporary Jetty itself, as a static structure, poses little hazard to navigation other than with respect to unforeseen ‘drifting vessels’ and vessels ‘not under command’, due to the situation that vessels could find themselves in. This risk has been conservatively ranked as high/unacceptable, but, notwithstanding the conservative risk assessment, it should be borne in mind that vessels have anchors and, therefore, it is likely that drifting vessels and vessels not under command could be brought under control through the use of anchors to avoid potential collision.

26.6.46 In summary, the risks (without mitigation measures) are predicted to be:

- **high/unacceptable** for commercial vessels;
- **low/acceptable** for military vessels;
- **low/acceptable** for fishing vessels;
- **low/acceptable** for recreation vessels in Bridgwater Bay; and
- **low/acceptable** for the Port of Bridgwater and SDC’s interests.

ii. Presence and Movement of Vessels Using and Maintaining the Temporary Jetty

26.6.47 Vessels would use the Temporary Jetty for the importation of aggregates, cement and, potentially, other construction materials, and their presence and movement would potentially pose a risk to navigation. In addition, there may be some need for maintenance dredging of the berthing pocket. Unlike capital dredging, it is anticipated that maintenance dredging would be undertaken by hydraulic methods (i.e. ploughing/bed levelling, agitation or water injection), which would require vessel movements to and from the Temporary Jetty to conduct the maintenance dredging but would not require any additional vessel movements to dispose of dredged material (e.g. to the Cardiff Grounds offshore disposal site). Since aggregate vessels will comprise the majority of vessels sailing to and from and using the Temporary Jetty, this risk assessment focuses on the risk associated with these vessels.

26.6.48 This risk assessment gives consideration to the following features:

- anchorages;
- approach route to the jetty;
- depths of water (i.e. tidal windows);
- existing aids to navigation; and
- berthing and mooring.

26.6.49 Anchorages are relevant for this assessment because vessels using the Temporary Jetty may be required to anchor to wait for berth availability, a suitable tidal range or due to adverse weather conditions. The closest anchorage is located some six (6) cables (0.6nm) south-west of the Gore Buoy, which itself is 1.1nm north-north-west of the structure. Whilst this anchorage offers good holding ground by the nature of the seabed (sand and mud), it is somewhat exposed and, having a depth of approximately 6.0m above CD, it should be considered as a short stay/good weather anchorage.

26.6.50 Anchorages affording greater protection are those which by definition lie in the lee of land, and this is then determined by the direction of the wind. Vessels requiring protection from southerly and westerly wind may find suitable anchorage at Blue Anchor Bay, 7.0m above CD some 9nm (c.1 hour steaming) from the Temporary Jetty. Safe anchorage may also be found close in to the east of Lundy Island, but being approximately 60nm away (c.6 hours steaming) may well conflict with other operations. Vessels requiring protection from a northerly wind will find suitable anchorages off Barry Roads and nearby Lavernock Point (small ship), both of which are some 10 to 12nm (in excess of 1 hours steaming) from the Temporary Jetty.

26.6.51 Clearly, the vessels' approach to the Temporary Jetty would depend on their origin. It is anticipated that aggregates could be imported from a land-based source, possibly in south Wales. Various ports in south Wales could be used to export the aggregates, including Swansea (at 37nm), Britton Ferry (37nm), Port Talbot (37nm), Barry (10nm), Cardiff (13nm) and Newport (19nm).

26.6.52 If approaching the Temporary Jetty, it is expected that vessels from all origins should at all times pass to the west of the Gore Buoy and Cobbler Patch, with due regard being given to the nearby 1_8m shoal patch (see **Plate 26.10**). Thereafter, the berthing will be determined by the master who would consider wind and tidal direction when deciding on which side to berth the vessel. The Temporary Jetty will have sufficient facilities to berth (e.g. fenders) and restrain (e.g. mooring hooks) vessels.

26.6.53 It is expected that vessels, when departing from the Temporary Jetty, should follow the same track as described for approaching vessels.

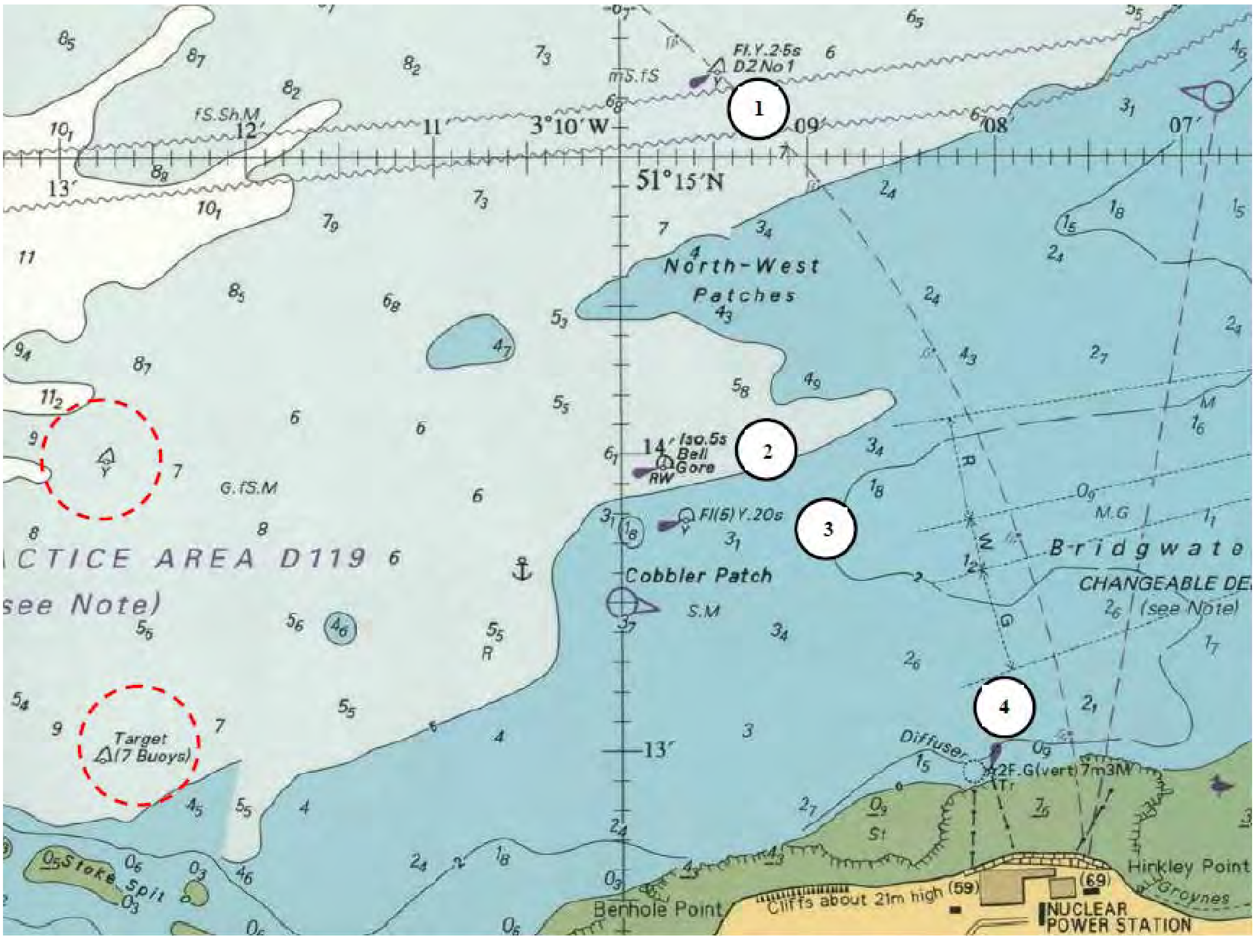
26.6.54 In terms of water depth, once vessels are inshore of the 5m bathymetric contour they would navigate within an operating envelope where the depth at Chart Datum is an average of 3.75m below CD, approaching 2.5m below CD nearer the berth.

26.6.55 There are few existing aids to navigation presently deployed in the locality of the Temporary Jetty. The aids include four lights and two unlit buoys (see **Plate 26.12**).

26.6.56 The following risk assessment factors are relevant in terms of the potential hazards associated with the aggregates vessels' potential for interference with navigation along their route between the Temporary Jetty and source of aggregates:

- vessels have several anchorage options and so the associated risk is considered to be ALARP;
- vessels cross the main shipping lanes on their approaches and departures from the aggregate loading ports in south Wales and so the associated risk is considered ALARP;

Plate 26.12: Existing Aids to Navigation



- vessel approaches and departures interface with commercial vessels in Gore anchorage and the approach channel to the River Parrett and so the associated risk is considered unacceptable;
- the range and flow of tides in the Bristol Channel are important variables for safe navigation and so the associated risk is considered unacceptable;
- there are some aids to navigation but improvements are required for some obstacles in the water, and so the associated risk is considered unacceptable; and
- there are some assumptions in place that masters should have sufficient experience and the Temporary Jetty should have the appropriate infrastructure to berth and restrain vessels, and so the associated risk is considered acceptable.

26.6.57 In summary, the risks (without mitigation measures) are predicted to be:

- **high/unacceptable** for commercial vessels;
- **low/acceptable** for military vessels;
- **low/acceptable** for fishing vessels;
- **low/acceptable** for recreation vessels; and
- **high/unacceptable** for the Port of Bridgwater and SDC’s interests.

iii. Presence of the Intake and Outfall Head Structures

26.6.58 Once constructed, the intake and outfall head structures would extend into the open water of Bridgwater Bay and would, therefore, potentially pose a risk to navigation.

26.6.59 The potential navigational hazards associated with and posed by the head structures include interference with:

- the general flow of traffic in the Bristol Channel;
- passing commercial coastal traffic;
- commercial vessels bound for River Parrett;
- commercial vessels departing River Parrett;
- vessels at the Gore anchorage;
- 'drifting vessels' and vessels 'not under command';
- fishing vessels;
- recreational vessels in Bridgwater Bay; and
- the Port of Bridgwater and SDC's interests.

26.6.60 As already discussed, the current inbound course for vessels approaching the Port of Bridgwater and the River Parrett passes between the intake and outfall head structures. The risk to commercial traffic and the interests of the Port of Bridgwater is considered to be high (unacceptable) because of the volume of vessels and their current inbound track to the Port of Bridgwater's harbour limits and berths in the River Parrett in relation to the intake and outfall head structures' positions and the distance between them.

26.6.61 Specific assessments with regard to the collision risk found that for single or multiple structure collisions, the frequency of potential collisions is dominated by powered passing vessel collision scenarios (historically found to be mostly due to human error on the bridge of the vessel in question). Drifting vessel collisions would also be possible for single or multiple collisions although the frequency would be much lower for this type of collision.

26.6.62 In summary, the risks (without mitigation measures) associated with the presence of the intake/outfall structures are considered to be:

- **high/unacceptable** for commercial vessels;
- **low/acceptable** for military vessels;
- **low/acceptable** for fishing vessels;
- **low/acceptable** for recreation vessels in Bridgwater Bay; and
- **high/unacceptable** for the Port of Bridgwater/SDC's interests.

iv. Presence and Movements of Vessels maintaining the Intake and Outfall Head Structures

26.6.63 Once the head structures are in place there may be a need to undertake maintenance activities. The presence of a maintenance vessel would not be permanent since maintenance would be intermittent. The maintenance vessel would be positioned very close to the head structures and would not increase the navigational interference already existing due to the presence of the head structures themselves. The movement into place of the maintenance vessel would result in a relatively small increase in vessel movements in the area.

26.6.64 In summary, the risks (without mitigation measures) associated with the presence and movements of vessels maintaining the intake and outfall head structures are considered to be:

- **high/unacceptable** for commercial vessels;
- **low/acceptable** for military vessels;
- **low/acceptable** for fishing vessels;
- **low/acceptable** for recreation vessels in Bridgwater Bay; and
- **high/unacceptable** for the Port of Bridgwater and SDC's interests.

v. Temporary Jetty and Cooling Water Intake and Outfall Head Structures interfering with activities at the Lilstock Range Firing Area

26.6.65 The Temporary Jetty in particular and the intake and outfall head structures (including the presence and movement of operational and maintenance vessels) would be situated close to the Lilstock Range Firing Area and the marked surface water template (see 'Target' identified on **Plate 26.12**). Although there are no restrictions on navigation within these areas, the firing area is only used when it is clear of vessels. Therefore, depending on the presence of the Temporary Jetty, head structures and operational and/or maintenance vessels in relation to the firing area, operational activities could preclude the use or the safe use of the firing area for military training and exercises.

26.6.66 Based on informal consultation with the MoD (see Section 26.4), it is anticipated that the risk of interference to military activities would be **high/unacceptable** if the Temporary Jetty (in particular) and heads structures were sufficiently close to the firing area and/or if operational/maintenance vessels were to be frequently present within and/or transit the firing area, to the extent that the MoD could not use the firing area to sufficiently undertake military training and exercises.

vi. Presence of the Refurbished and Extended Combwich Wharf

26.6.67 The refurbished and extended wharf facility will not impinge on the River Parrett to any greater extent than at present. No increased navigational risk is anticipated due to the presence of the wharf.

26.6.68 In summary, the risks (without mitigation measures) associated with the physical presence of the refurbished and extended Combwich Wharf are considered to be:

- **low/acceptable** for commercial vessels;
- **low/acceptable** for military vessels;
- **low/acceptable** for fishing vessels;
- **low/acceptable** for recreation vessels in the River Parrett; and

- **low/acceptable** for the Port of Bridgwater and SDC's interests.

vii. Presence and Movements of Vessels using Combwich Wharf

26.6.69 Vessels would use Combwich Wharf for the importation of AILs and possibly other construction materials, and their presence and movement would potentially pose a risk to navigation. The newly refurbished and extended wharf will be able to accommodate larger vessels. The risk assessment focuses on the risk associated with these vessels.

26.6.70 This risk assessment considers the following navigation issues:

- anchorages;
- approaches to the wharf;
- depths of water (i.e. tidal windows);
- existing aids to navigation; and
- berthing and mooring.

26.6.71 Anchorages are relevant for this assessment because vessels using the wharf may be required to anchor to wait for berth availability, a suitable tidal range or adverse weather conditions. The closest anchorage to the wharf is located some six (6) cables south-west of the Gore Buoy, which itself is 1.1nm north-north-west of the Temporary Jetty and approximately four nautical miles west of the entrance to the River Parrett. Whilst this anchorage offers good holding ground by the nature of the seabed (sand and mud), it is somewhat exposed and, having a depth of approximately 6.0m above CD, it should be considered as a short stay/good weather anchorage.

26.6.72 Anchorages affording greater protection are those which by definition lie in the lee of the land; in a given situation the location of the lee of the land is determined by the direction of the wind. Vessels requiring protection from southerly and westerly winds may find suitable anchorage at Blue Anchor Bay, 7.0m above CD approximately 15nm from the entrance to the River Parrett. Safe anchorage may also be found close in to the east of Lundy Island, but being approximately 60nm away may well conflict with other operations. Vessels requiring protection from northerly wind will find suitable anchorages off Barry Roads and nearby Lavernock Point (small ship), both of which are approximately 15nm from the River Parrett entrance.

26.6.73 Anchoring in the River Parrett is not recommended unless the situation dictates that the action is necessary. Anchoring should therefore only be considered in an emergency. There are two areas set aside for this eventuality one being off the Brue Beacon (close to the pilot boarding/disembarking area) in about 2.0m of water at low spring tides and at the west end of Stockland Reach. The vessel will be dry at low water (i.e. Not Always Afloat But Safe Aground (NAABSA)).

26.6.74 The River Parrett is generally orientated in a north-south direction. It is equipped with lights, marks and buoys as aids to navigation. Through direct observation and informal consultation with the port of Bridgwater's Harbour Master, the navigable channel varies throughout its length but approximates to two thirds river width off Combwich. Average current flow is approximately three knots but can be as much as five knots. The overhead clearance of the power lines situated just north of

Combwich Reach North is 32m. The under-keel clearance (UKC) required is not less than 0.5m. No reductions on this figure are considered.

26.6.75 There are no restrictions for night time berthing.

26.6.76 Approaches to the wharf are split into two distinct phases. Guidance as far as the River Parrett and then pilotage on the River Parrett. These phases are described below.

26.6.77 Vessels bound for Combwich Wharf are monitored by Bridgwater Pilots on radar/AIS on passing the Gore Buoy. Pilots ‘talk’ vessels in on VHF, Channel 8. Guidance is given from passing the Gore Buoy onwards to the vessel passing Burnham on Sea No.2 Buoy where direction is given to head for the pilot boat. The pilot will board shortly thereafter.

26.6.78 Pilotage is compulsory on the River Parrett. After boarding and passing the Brue Beacon, RW, the vessel proceeds mid river in the direction of Black Rock Light. A distance of approximately 2nm. Passing close to Black Rock and staying close to the port-side bank along Stocklands Reach. On passing Combwich North Light the vessel crosses the river and remains close to the starboard-side of the river to Combwich Wharf.

26.6.79 On approach to Combwich Wharf, the start time for passing the Gore Buoy must not be less than 2.25 hours before high water at Bridgwater, and preferably 2.5 hours to allow for the unforeseen and/or personnel changes/additions which may be required en route.

26.6.80 The following risk assessment factors are relevant in terms of the potential hazards associated with a vessel’s potential for interference with navigation along the route to Combwich Wharf:

- vessels have several anchorage options and so the associated risk is considered to be ALARP;
- vessel approaches and departures interface with commercial vessels in the Gore anchorage and the approach channel to the River Parrett and so the associated risk is considered unacceptable;
- the range and flow of tides in the Bristol Channel are important variables for safe navigation and so the associated risk is considered unacceptable;
- there are several aids to navigation within the River Parrett and so the associated risk is considered ALARP; and
- there are some assumptions in place that masters should have sufficient experience and Combwich Wharf should have the appropriate infrastructure to berth and restrain vessels, and so the associated risk is considered acceptable.

26.6.81 In summary, the risks (without mitigation measures) are predicted to be:

- **high/unacceptable** for commercial vessels;
- **low/acceptable** for military vessels;
- **low/acceptable** for fishing vessels;

- **low/acceptable** for recreation vessels in Bridgwater Bay;
- **high/unacceptable** for recreation vessels in the River Parrett; and
- **high/unacceptable** for the Port of Bridgwater and SDC's interests.

viii. Maintenance of the Berth at Combwich Wharf

26.6.82 Should silt accrete on the berthing platform at Combwich Wharf, it is proposed that it would be cleared by an excavator, with a blade attachment, and returned to the River Parrett channel. It is anticipated that these works would take place subject to an inspection of silt accretion in the berth prior to the delivery of an AIL to the Wharf. If a sufficient amount of silt has accreted, then maintenance works would be required and would involve an excavator being positioned on the berthing platform from where it would plough / push the accreted silt from the berth into the adjacent channel. In effect, these works would be a continuation of the existing maintenance works that take place to clear the current berthing base at Combwich Wharf.

26.6.83 At present, maintenance of the existing berthing base occurs very infrequently (i.e. approximately once a year). It is anticipated that maintenance dredging of the proposed berthing platform would be undertaken more often but smaller quantities would be dredged, given that there would be more AIL deliveries during the construction of HPC and less time for silt accretion in between these deliveries.

26.6.84 The potential obstruction to navigation associated with these works would be limited to interference with the navigation and moorings of recreational craft in the River Parrett, in and immediately adjacent to Combwich Pill, and members of the Combwich Motor Boat and Sailing Club. Given the very localised nature and limited frequency of the works proposed, the potential hazard they pose to navigation is considered to be low.

26.6.85 Since future maintenance at Combwich Wharf would be a continuation of existing maintenance and limited to the berthing platform, navigational risk would be associated with the works in the berth and the immediately adjacent area of the River Parrett and would be (without mitigation measures):

- **low/acceptable** for commercial vessels;
- **low/acceptable** for military vessels;
- **low/acceptable** for fishing vessels;
- **moderate/ALARP** for recreation vessels in the River Parrett; and
- **low/acceptable** for the Port of Bridgwater and SDC's interests.

26.7 Mitigation of Risks

26.7.1 This section sets out the mitigation measures that are proposed to reduce high/unacceptable risks to moderate/ALARP or low/acceptable risks. In general, these measures include standard approaches for managing navigation issues and should be straightforward to implement since they typically reflect good practice (e.g. use of anchorages, installation of navigation marks, issuing of Notices to Mariners, etc) and/or previously established methods (e.g. use of an exclusion zone).

26.7.2 The mitigation measures identified below assume that all the marine activities will be undertaken in a competent manner and that EDF Energy, as harbour authority for the Temporary Jetty, will appoint a harbour master and will prepare and implement a SMS Operations Manual for the Temporary Jetty in accordance with the PMSC. The harbour master and the SMS will provide key mechanisms through which EDF Energy will address and manage navigational risks, and particularly risks associated with the Temporary Jetty element of the HPC Project. In addition, on the basis of consultation with SDC and the Port of Bridgwater, it is expected that this SMS would dovetail into the Port of Bridgwater's SMS Operations Manual and should facilitate a coordinated approach to managing safe navigation in the water areas under the jurisdictions of both parties.

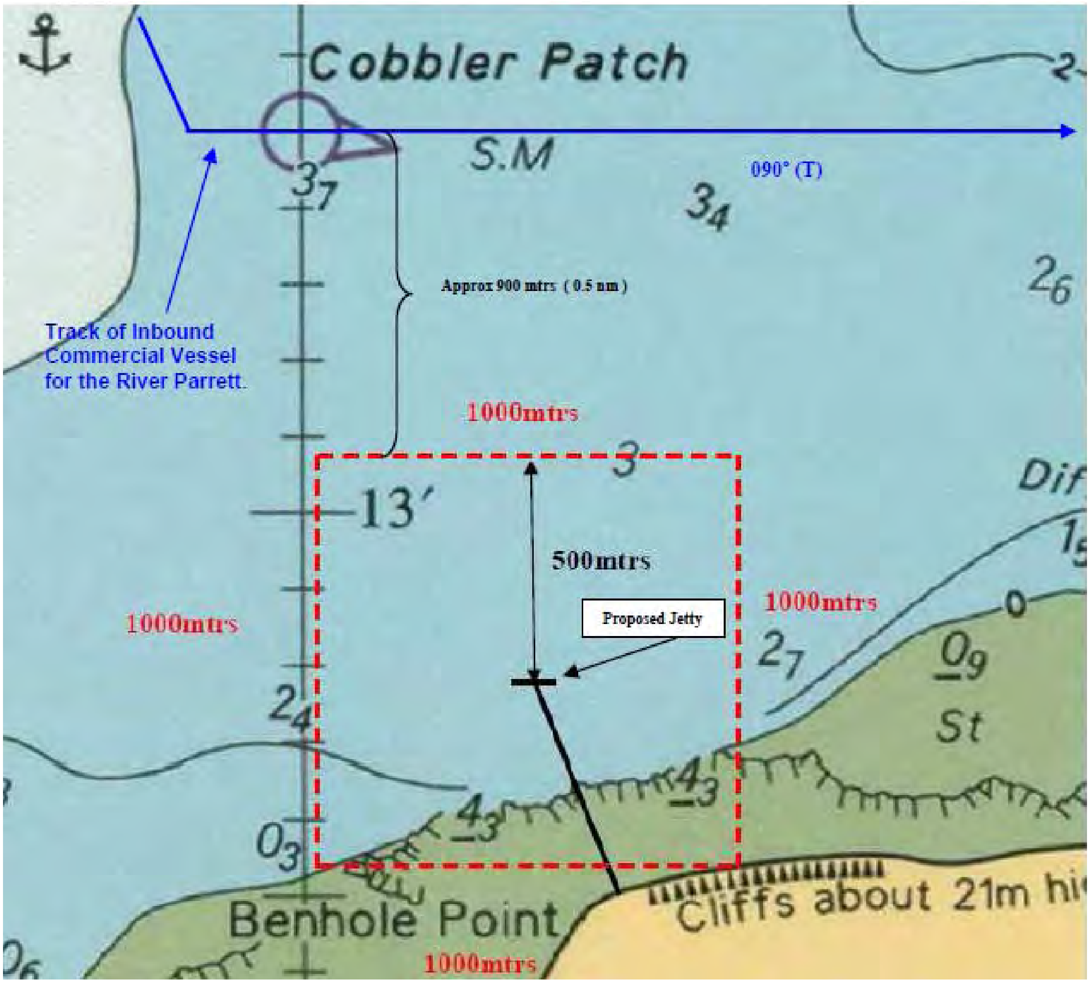
26.7.3 On the basis of consultation between EDF Energy and Sedgemoor District Council (as the harbour authority for the Port of Bridgwater), EDF Energy acknowledge that Combwich Wharf is situated within the Port of Bridgwater's harbour limits and, therefore, it will be necessary to consult with Sedgemoor District Council on the mitigation measures proposed below (e.g. traffic supervision, Notices to mariners, exclusion zones) in relation to the construction and operation of Combwich Wharf's refurbishment and extension.

a) Mitigation during Construction

i. Construction and Dismantling of the Temporary Jetty and Construction of the Cooling Water Intake and Outfall Head Structures

26.7.4 In relation to the Temporary Jetty, it is recommended that an exclusion zone of some 500m is provided temporarily around the construction plant during construction and dismantling (see **Plate 26.13**). The exclusion zone would mean that passing vessels would have to avoid entering this area of the water and, thereby, the exclusion zone would reduce the risk of passing vessels colliding with construction plant during its construction and dismantling works. This exclusion zone should be marked, at its corners, with marks and lights in line with the requirements to be advised by Trinity House. In addition, it may be prudent to implement a standby vessel (small patrol vessel) during working hours.

Plate 26.13: Proposed Exclusion Zone for the Jetty



26.7.5 These recommendations will be incorporated within the SMS for the jetty.

26.7.6 In relation to the head structures, a number of mitigation measures should be considered. It is recognised that the head structures will lie outside the harbour limits of both EDF Energy and the Port of Bridgwater and, therefore, it will be necessary for both harbour authorities to work together on mitigating and managing navigation issues.

26.7.7 It is recommended that exclusion zones are provided temporarily around the construction plant during the construction works for the head structures. It is anticipated that the exclusion zones would extend approximately 100m from the centre points of each of the head structures. In addition, it is recommended that the Gore Buoy be re-positioned and hence alter the recommended route for vessels navigating toward the River Parrett and the Port of Bridgwater to reduce the risk of collision with the construction plant and works for the head structures. Re-positioning of the Gore Buoy would be subject to discussion with the Port of Bridgwater and Government agencies, including the MCA, Trinity House and UKHO, and the approval of Trinity House.

26.7.8 In addition, it is recommended that one or more of the following measures be used, as appropriate:

- charting and marking the structures appropriately, although this could result in the intake and outfall heads being encased in fort like structures;
- notices to Mariners, as issued on a weekly basis by the UKHO;
- 'M' Notices issued by the MCA;
- Local Notices to Mariners, port directives and public notices, as issued by the Harbour Authority for the jetty;
- re-positioning of the anchorage area to increase distance from the head structures; and
- traffic supervision in Bridgwater Bay (e.g. via VHF communications) by the Harbour Authority for the Temporary Jetty, potentially in collaboration with the Harbour Authorities for the Port of Bridgwater and the Port of Bristol. This will be incorporated within the SMS for the structure.

26.7.9 In addition, Sedgemoor District Council and West Somerset Council have advised "Given the methodology adopted by the Port of Bridgwater to guide ships in over Gore Sands utilises a shore based radar at Burnham on Sea, it is possible that increased risk in the approaches warrants an upgrade to the existing system to allow for more accurate assessment of vessels' positions in the approaches". Although, EDF Energy believe that the recommended mitigation measures are sufficient to manage risks to at level that can be considered as ALARP, the quality of the Port of Bridgwater's guidance from the Gore Buoy is not dependant on an upgrade to this system, and the risks are greater in the vicinity of the No. 2 Buoy over Steart Flats, they nevertheless propose to discuss the sufficiency of the existing system with the Port of Bridgwater.

ii. Passage of Dredging Plant to/from the Offshore Disposal Site (Cardiff Grounds)

26.7.10 To reduce the risk to navigation associated with the passage of plant between the temporary jetty and the Cardiff Grounds offshore disposal site, should this occur, the following measures are proposed to reinforce good practice for navigation under COLREGS:

- dredging plant should not cross vessels that may be restricted by their draught or restricted by their ability to manoeuvre due to being in a narrow channel; and
- all dredging plant should, at all times, pass to the west of Gore Buoy and Cobbler Patch, with due regard given to the shoal patch of 1_8m.

26.7.11 These recommendations will also be incorporated within the SMS for the Temporary Jetty.

26.7.12 During the dredging works national level Notice to Mariners will be issued by the UKHO and local level Notices and directives will be issued by the Harbour Authority for the Temporary Jetty.

iii. Construction Plant for the Jetty and Cooling Water Intake and Outfall Structures Interfering with Activities at the Lilstock Range Firing Area

26.7.13 On the basis of informal consultation with the MoD (see paragraph 26.4.7), it is proposed that the potential interference with activities at the Lilstock Range firing area by navigation is managed through the implementation of an approved communications management plan between EDF Energy and the MoD. With the implementation of this plan, EDF Energy and the MoD believe that conflict would be avoided and that both parties' activities could successfully co-exist. The following key elements of the communications management plan have been discussed between EDF Energy and the MoD:

- regular provision of planned vessel movement information from EDF Energy to the MoD. This information is to be provided on a monthly basis (outline of planned movements), weekly basis (details of planned movements) and daily basis (confirmation of all anticipated movements);
- establishment of clear procedures and channels of communication between EDF Energy and the MoD in relation to any difficulties or emergencies that require a rapid departure from planned movements;
- use of passage plans wherever possible that avoid the area of potential conflict or, where this is unavoidable, establishment of predictable planned movements at given times of day; and
- procedures for escalation of concerns where necessary or appropriate.

iv. Construction Plant in the Water at Combwich Wharf

26.7.14 In order to mitigate the potential risk to navigation during the construction phase at Combwich Wharf, a number of mitigation measures have been identified for further consideration with Sedgemoor District Council since Combwich Wharf is situated within the Port of Bridgwater's harbour limits.

26.7.15 Firstly, the use of a temporary exclusion zone is recommended at relevant times to safeguard construction personnel and plant and to safeguard passing commercial and recreational vessels. EDF Energy acknowledge that the exclusion zone would have to be sanctioned and applied by the Port of Bridgwater and that the extent of the exclusion zone would have to take into account existing navigation requirements in relation to the Port of Bridgwater. For example, Sedgemoor District Council and West Somerset Council have advised "an exclusion zone…could be problematic if it extended into the River [Parrett] beyond the existing dolphins as an open port duty applies to the Port of Bridgwater and vessels bound to Dunball have to pass Combwich".

26.7.16 Other measures include:

- Notices to Mariners, as issued on a weekly basis by the UKHO;
- 'M' Notices issued by the MCA;
- Local Notices to Mariners, port directives and public notices, as appropriate and issued by the Port of Bridgwater;
- re-positioning of the anchorage area to increase distance from the head structures; and
- traffic supervision in Bridgwater Bay (e.g. via VHF communications) by the Harbour Authority for the jetty, potentially in collaboration with the Harbour Authorities for the Port of Bridgwater and the Port of Bristol.

b) Mitigation during Operation

i. Presence of the Temporary Jetty

26.7.17 In accordance with the advice from Trinity House, the Temporary Jetty would have to be marked appropriately for safety. Whilst Trinity House would confirm the marking required, the general marking would be as follows for the lights on the jetty head:

- single flash green; and
- two fixed green lights vertically disposed 2m apart.

ii. Presence and Movement of Vessels Using and Maintaining the Jetty

26.7.18 To reduce the risk to navigation associated with the presence and movement of vessels using the jetty, it is recommend that navigation information be clearly documented in each vessel's SMS. The SMS should document the following information:

- utilisation of appropriate anchorages;
- avoidance of close proximity with anchorage and crossing approach channel;
- prioritisation of suitable tidal windows;
- documentation of procedures for berthing in relation to wind and current parameters; and
- documentation of procedures in relation to vessel emissions.

iii. Jetty and Cooling Water Intake and Outfall Operation Interfering with Activities at the Lilstock Range Firing Area

26.7.19 On the basis of informal consultation with the MoD (see paragraph 26.4.8), it is proposed that the communications management plan to be implemented during the construction phase for the Lilstock Range Firing Area is maintained through the operational phase.

iv. Presence of the Intake and Outfall Head Structures

26.7.20 The intake and outfall head structures would have to be marked appropriately for safety in accordance with guidelines and recommendations established by the International Association of Marine Aids to Navigation and Lighthouse Authorities (IALA). Whilst Trinity House would confirm the marking required, the general marking would be as follows for the lights on the structures:

- either Green or Yellow Conical Buoys (Fl.G or Fl.Y) to mark the extreme seaward end; or
- a Green Conical Buoy (Fl.G) marking the extreme seaward end and Yellow Conical Buoys (Fl.Y) spaced intermittently along the line of the Intake/ Outfall trench.

26.7.21 In order to mitigate the potential risk to navigation during the operational phase, a similar set of mitigation measures to those proposed in the construction phase have been identified for further consideration. They are:

- revision of the position of the Gore Buoy and hence the recommended route for vessels navigating toward the River Parrett;
- charting and marking the structures appropriately could result in the inlets and outfall heads encased in fort like structures;
- notices to Mariners, as issued on a weekly basis by the UKHO;
- local Notices to Mariners, port directives and public notices, as issued by the Harbour Authority for the Temporary Jetty;
- re-positioning of the anchorage area to increase distance from the head structures;
- protection of head structures; and
- traffic supervision in Bridgwater Bay (e.g. via VHF communications) by the Harbour Authority for the jetty (for the period that the Harbour Authority exists/that the jetty is present) in collaboration with the Harbour Authorities for the Port of Bridgwater and, potentially, the Port of Bristol. This will be incorporated within the SMS for the Temporary Jetty.

v. Presence and Movements of Vessels maintaining the Cooling Water Intake and Outfall Head Structures

26.7.22 To reduce the risk to navigation associated with the presence and movement of vessels used during any necessary maintenance of the structures, it is recommend that navigation information be clearly documented in the vessels' SMS. The SMS should document the following information:

- utilisation of appropriate anchorages;
- avoidance of close proximity with anchorage and crossing approach channel;
- prioritisation of suitable tidal windows; and
- documentation of procedures for berthing in relation to wind and current parameters.

vi. Presence of the Refurbished and Extended Combwich Wharf

26.7.23 The newly refurbished and extended wharf would be marked appropriately for safety in accordance with guidelines and recommendations established by the IALA as directed by Trinity House and discussed with the Port of Bridgwater (since Combwich Wharf is situated within the harbour limits of the Port of Bridgwater).

26.7.24 In addition, berthing procedures would need to be reviewed with respect to the new wharf to ascertain that there is no appreciable change in the value of current effect post construction. Passage planning would need to be reviewed and agreed for each shipment/delivery.

vii. Presence and Movements of Vessels using Combwich Wharf

26.7.25 Good passage planning is essential to ensure all marine operations are carried out safely and efficiently. Operations on the River Parrett are undertaken under difficult conditions due to the extreme tidal range, winding river and constantly changing channels which consequentially contribute to a small tidal window for berthing at facilities on that river and in particular Combwich Wharf.

26.7.26 All vessel movements to and from Combwich Wharf will be within the harbour limits of the Port of Bridgwater and, therefore, will be subject to the controls and requirements of the harbour authority, including the need for pilotage and compliance with the Port of Bridgwater's SMS and Operations Plan, as appropriate. It should be noted that EDF Energy operate the existing facility at Combwich Wharf for the delivery of AILs and, accordingly, EDF Energy and the vessel operators using Combwich Wharf already communicate and work with the Port of Bridgwater on such matters.

26.7.27 In addition, to reduce the risk to navigation associated with the presence and movement of vessels used using Combwich Wharf, it is recommend that navigation information be clearly documented in the vessels' SMS. The SMS should document the following information:

- utilisation of appropriate anchorages;
- avoidance of close proximity with other vessels within the anchorage and crossing approach channel;
- utilisation of suitable tidal windows;
- documentation of procedures for berthing in relation to wind and current parameters;
- strict adherence to the Port of Bridgwater's Approaches Plan; and
- strict adherence to the contingency plan and Emergency Anchorages.

viii. Maintenance of the Berth at Combwich Wharf

26.7.28 In advance of maintenance works a local Notice to Mariners would be issued, together with general guidance to advise local mariners of, for example, the presence of an excavator on the berthing platform in Combwich Wharf.

26.7.29 In addition, it might be necessary to restrict access to Combwich Pill for recreational craft during the works to safeguard against accidents or injuries that could occur in the immediate proximity of the workplace.

26.8 Residual Risks

26.8.1 With the mitigation measures in place - including good practice, previously established methods and lines of communication between EDF Energy and key parties (e.g. the Port of Bridgwater and the MoD) - the residual risks to navigation would be reduced to levels that are either moderate/ALARP or low/acceptable. The following paragraphs summarise the assessments of residual risks.

a) Residual Construction Risks

i. Construction and Dismantling of the Temporary Jetty and Construction of the Cooling Water Intake and Outfall Head Structures

26.8.2 With suitable mitigation measures in place, the residual risks associated with the construction plant during the construction of the jetty are considered to be:

- **moderate/ALARP** for commercial vessels;

- **low/acceptable** for military vessels;
- **low/acceptable** for fishing vessels;
- **low/acceptable** for recreation vessels in Bridgwater Bay; and
- **moderate/ALARP** for the Port of Bridgwater and SDC's interests.

ii. Passage of Dredging Plant to/from the Offshore Disposal Site (Cardiff Grounds)

26.8.3 With the mitigation measures in place, the residual risks are predicted to be:

- **moderate/ALARP** for commercial vessels;
- **low/acceptable** for military vessels;
- **low/acceptable** for fishing vessels;
- **low/acceptable** for recreation vessels in Bridgwater Bay; and
- **moderate/ALARP** for the Port of Bridgwater and SDC's interests.

iii. Construction Plant for the Jetty and Cooling Water intake and Outfall Structures Interfering with Activities at the Lilstock Range Firing Area

26.8.4 With the mitigation measures in place, the residual risk is predicted to be **low/acceptable**.

iv. Construction Plant in the Water at Combwich Wharf

26.8.5 With suitable mitigation measures in place, the residual risks associated with the construction plant during the refurbishment and extension of Combwich Wharf are considered to be:

- **moderate/ALARP** for commercial vessels accessing berths in the River Parrett.
- **low/acceptable** for military vessels;
- **low/acceptable** for fishing vessels;
- **low/acceptable** for recreation vessels in Bridgwater Bay;
- **moderate/ALARP** for recreation vessels in the River Parrett; and
- **moderate/ALARP** for the Port of Bridgwater and SDC's interests.

b) Residual Operational Risks

i. Presence of the Temporary Jetty

26.8.6 With the mitigation measures in place, the residual risks associated with the presence of the temporary jetty are considered to be:

- **moderate/ALARP** for commercial vessels;
- **low/acceptable** for military vessels;
- **low/acceptable** for fishing vessels;
- **low/acceptable** for recreation vessels in Bridgwater Bay; and

- **low/acceptable** for the Port of Bridgwater and SDC's interests.

ii. Presence and Movement of Vessels Using and Maintaining the Jetty

26.8.7 With the mitigation measures in place, the residual risks associated with the presence and movement of vessels using the temporary jetty are considered to be:

- **moderate/ALARP** for commercial vessels;
- **low/acceptable** for military vessels;
- **low/acceptable** for fishing vessels;
- **low/acceptable** for recreation vessels in Bridgwater Bay; and
- **low/acceptable** for the Port of Bridgwater and SDC's interests.

iii. Jetty and Cooling Water Intake and Outfall Operation Interfering with Activities at the Lilstock Range Firing Area

26.8.8 With mitigation measures in place, the residual risk is predicted to be **moderate/ALARP**.

iv. Presence of the Intake and Outfall Head Structures

26.8.9 With suitable mitigation measures in place, the residual risks associated with the presence of the intake and outfall head structures are considered to be:

- **moderate/ALARP** for commercial vessels;
- **low/acceptable** for military vessels;
- **low/acceptable** for fishing vessels;
- **low/acceptable** for recreation vessels in Bridgwater Bay; and
- **moderate/ALARP** for the Port of Bridgwater and SDC's interests.

v. Presence and Movements of Vessels Maintaining the Intake and Outfall Head Structures

26.8.10 With suitable mitigation measures in place, the residual risks associated with the presence and movements of vessels maintaining the intake/outfall head structures are considered to be:

- **low/acceptable** for commercial vessels;
- **low/acceptable** for military vessels;
- **low/acceptable** for fishing vessels;
- **low/acceptable** for recreation vessels in Bridgwater Bay; and
- **low/acceptable** for the Port of Bridgwater and SDC's interests.

vi. Presence of the Refurbished and Extended Combwich Wharf

26.8.11 In summary, the risks associated with the presence of refurbished Combwich Wharf remain as:

- **low/acceptable** for commercial vessels;
- **low/acceptable** for military vessels;
- **low/acceptable** for fishing vessels;
- **low/acceptable** for recreation vessels in the River Parrett; and
- **low/acceptable** for the Port of Bridgwater and SDC's interests.

vii. Presence and Movements of Vessels using Combwich Wharf

26.8.12 With suitable mitigation measures in place, the residual risks associated with the presence and movement of vessels using Combwich Wharf are considered to be:

- **moderate/ALARP** for commercial vessels;
- **low/acceptable** for military vessels;
- **low/acceptable** for fishing vessels;
- **low/acceptable** for recreation vessels in Bridgwater Bay;
- **moderate/ALARP** for recreation vessels in the River Parrett; and
- **moderate/ALARP** for the Port of Bridgwater and SDC's interests.

viii. Maintenance of the Berth at Combwich Wharf

26.8.13 Based on the assumption that an excavator would be used to clear the silt off the berthing platform and into the adjacent River Parrett, the residual risks associated with the hazards posed by the maintenance works at Combwich Wharf are considered to be:

- **low/acceptable** for commercial traffic;
- **low/acceptable** for military activity;
- **low/acceptable** for fishing activity;
- **low/acceptable** for recreation vessels in the River Parrett; and
- **low/acceptable** for the Port of Bridgwater and SDC's interests.

26.9 Summary of Risks

Table 26.4 presents a summary of the risks associated with the construction and operation of the proposed development on navigation with respect to the temporary jetty, the intake and outfall head structures and the refurbishment and extension of Combwich Wharf. It also summarises the risks associated with the dismantling/restoration of the temporary jetty. The table summarises the risks prior to mitigation, the mitigation measures proposed and the residual risks.

Table 26.4: Summary of the Potential Risks to Navigation

Risks: H = high, M = moderate, L = low

Potential Hazard	Potential Consequence	Predicted Risk			Mitigation Measure	Residual Risk		
		CRN	LRN	Risk		CRN	LRN	Risk
Construction and Dismantling of the Temporary Jetty and Construction of the Cooling Water Intake and Outfall Head Structures								
Commercial vessels	Frequent interference	4	4	H	Use of an exclusion zone and possible use of a small patrol vessel, to be implemented through a SMS.	4	2	M
Military vessels	Minor interference	2	2	L		2	2	L
Fishing vessels	Minor interference	2	2	L		2	2	L
Recreation vessels (Bridgwater Bay)	Minor interference	2	2	L		2	2	L
Port of Bridgwater's interests	Liability, stakeholder concerns	4	4	H		4	2	M
Passage of Dredging Plant between Jetty and Cardiff Grounds Disposal Site								
Commercial vessels	Frequent interference	4	4	H	Robust operational procedures for dredging plant, to be implemented through a SMS.	4	2	M
Military vessels	Minor interference	2	2	L		2	2	L
Fishing vessels	Minor interference	2	2	L		2	2	L
Recreation vessels (Bridgwater Bay)	Minor interference	2	2	L		2	2	L
Port of Bridgwater's interests	Liability, stakeholder concerns	4	4	H		4	2	M
Construction Plant for the Jetty and Cooling Water Intake and Outfall Structures Interfering with Activities at the Lilstock Range Firing Area								
Lilstock Range Firing Area	Frequent interference with military exercises and training	4	2	M	Implementation of an approved communications management plan between EDF Energy and the MoD.	2	2	L
Presence of Construction Plant in the Water at Combwich Wharf								
Commercial vessels	Frequent interference	4	4	H	Use of an exclusion zone, charting and marking of head structures, use of Notice to Mariners, port directives, public notices, repositioning of anchorage area, and traffic supervision to be implemented through a SMS.	4	2	M
Military vessels	Minor interference	2	2	L		2	2	L
Fishing vessels	Minor interference	2	2	L		2	2	L
Recreation vessels (Bridgwater Bay)	Minor interference	2	2	L		2	2	L

Potential Hazard	Potential Consequence	Predicted Risk			Mitigation Measure	Residual Risk		
		CRN	LRN	Risk		CRN	LRN	Risk
Recreation vessels (River Parrett)	Frequent interference	4	4	H		4	2	M
Port of Bridgwater's interests	Liability, stakeholder concerns	4	4	H		4	2	M
Risks during Operation								
Presence of the Jetty								
Commercial vessels	Frequent interference	4	4	H	The jetty would be marked appropriately.	4	2	M
Military vessels	Minor interference	2	2	L		2	2	L
Fishing vessels	Minor interference	2	2	L		2	2	L
Recreation vessels (Bridgwater Bay)	Minor interference	2	2	L		2	2	L
Port of Bridgwater's interests	Minor interference (possible benefit)	2	2	L		2	2	L
Vessels using and Maintaining the Jetty								
Commercial vessels	Frequent interference (anchorages, transits, approaches, departures, tidal windows, aids to navigation, berthing and mooring	4	4	H	Use of anchorages, use of tidal windows, use of procedures for berthing to be implemented through a SMS.	4	2	M
Military vessels	Minor interference	2	2	L		2	2	L
Fishing vessels	Minor interference	2	2	L		2	2	L
Recreation vessels (Bridgwater Bay)	Minor interference	2	2	L		2	2	L
Port of Bridgwater's interests	Minor interference (possible benefit)	4	4	H		4	2	L
Jetty and Cooling Water Intake and Outfall Operation Interfering with Activities at the Lilstock Range Firing Area								
Lilstock Range Firing Area	Frequent interference with military exercises and training	4	4	H	Implementation of an approved communications management plan between EDF Energy and the MoD.	4	2	M

Potential Hazard	Potential Consequence	Predicted Risk			Mitigation Measure	Residual Risk		
		CRN	LRN	Risk		CRN	LRN	Risk
Presence of the Intake/Outfall Structures								
Commercial vessels	Frequent interference	4	4	H	The structures would be marked appropriately. Use of an exclusion zone, charting and marking of head structures, use of Notice to Mariners, port directives, public notices, repositioning of anchorage area, and traffic supervision to be implemented through a SMS.	4	2	M
Military vessels	Minor interference	2	2	L		2	2	L
Fishing vessels	Minor interference	2	2	L		2	2	L
Recreation vessels (Bridgwater Bay)	Minor interference	2	2	L		2	2	L
Port of Bridgwater's interests	Liability, stakeholder concerns	4	4	H		4	2	M
Presence and Movement of Vessels Maintaining Intake/Outfall Structures								
Commercial vessels	Frequent interference	4	2	M	Use of anchorages, use of tidal windows, use of procedures for berthing to be implemented through a SMS.	3	2	L
Military vessels	Minor interference	2	2	L		2	2	L
Fishing vessels	Minor interference	2	2	L		2	2	L
Recreation vessels (Bridgwater Bay)	Minor interference	2	2	L		2	2	L
Port of Bridgwater's interests	Liability, stakeholder concerns	4	2	M		3	2	L
Presence of the refurbished and extended Combwich Wharf								
Commercial vessels	Minor interference	2	2	L	The refurbished **and extended** wharf would be marked appropriately. Passage planning and berthing procedures.	2	2	L
Military vessels	Minor interference	2	2	L		2	2	L
Fishing vessels	Minor interference	2	2	L		2	2	L
Recreation vessels (River Parrett)	Minor interference	2	2	L		2	2	L
Port of Bridgwater's interests	Minor interference	2	2	L		2	2	L
Presence and Movement of Vessels using Combwich Wharf								
Commercial vessels	Frequent interference	4	4	H	Use of anchorages, use of tidal windows, use of procedures for	4	2	M
Military vessels	Minor interference	2	2	L		2	2	L

Potential Hazard	Potential Consequence	Predicted Risk			Mitigation Measure	Residual Risk		
		CRN	LRN	Risk		CRN	LRN	Risk
Fishing vessels	Minor interference	2	2	L	berthing to be implemented through a SMS.	2	2	L
Recreation vessels (Bridgwater Bay)	Minor interference	2	2	L		2	2	L
Recreation vessels (River Parrett)	Frequent interference	4	4	H		4	2	M
Port of Bridgwater's interests	Liability, stakeholder concerns	4	4	H		4	2	M
Maintenance of the Berth at Combwich Wharf								
Commercial vessels	Minor interference	2	2	H	Notice to Mariners, potential for restricted access to recreational moorings during dredging operations.	2	2	L
Military vessels	Minor interference	2	2	L		2	2	L
Fishing vessels	Minor interference	2	2	L		2	2	L
Recreation vessels (River Parrett)	Minor interference	4	2	M		2	2	L
Port of Bridgwater's interests	Minor interference	2	2	H		2	2	L

CHAPTER 27: SUMMARY OF ENVIRONMENTAL MITIGATION

CONTENTS

APPENDICES

[This page is intentionally left blank]

27. SUMMARY OF ENVIRONMENTAL MITIGATION

27.1 Introduction

27.1.1 This chapter summarises the significant environmental impacts predicted as a result of the construction and operation (including the landscaping works when the construction works are complete) of the proposed new nuclear power station known as Hinkley Point C (HPC). Full details of the predicted impacts and corresponding mitigation measures are described in **Volume 2** of the Environmental Statement (ES).

27.1.2 Significant environmental impacts and proposed mitigation measures for each of the associated development sites are summarised in **Volumes 3** to **10** of the ES.

27.1.3 A summary of predicted impacts on local residents ('community impacts', in terms of transport, amenity, noise and air quality impacts, and socio-economic issues), and a summary of proposed mitigation measures, is provided in the **Community Impact Report** (see **Appendix 27A**).

a) Hinkley Point C Development Site

27.1.4 The development site for HPC is located at Hinkley Point on the Somerset coast, in a predominantly rural location within the District of West Somerset. The site is located approximately 13km north-west of Bridgwater and approximately 17km from Junction 24 of the M5 motorway.

27.1.5 The on-shore area of the HPC development site comprises 175.2 hectares. This area comprises both the permanent HPC development site (67.5ha), and the land required for the construction phase which will include contractor working and material stockpile areas, a temporary accommodation campus and early landscaping works and screening.

27.1.6 Immediately to the east of the HPC development site, the land is occupied by two existing nuclear power stations, Hinkley Point A and Hinkley Point B (HPA and HPB), which together are referred to as the Hinkley Point Power Station Complex.

27.1.7 The topography of the HPC development site is typical of that in the wider locality, consisting of gently rolling, mixed lowland farmland with a series of east-west ridges. The ground falls through several west-east undulations from Green Lane (which occupies the highest ridge within the HPC development site) towards the coastal cliffs and Bridgwater Bay. There are a number of small watercourses within the development site, including Holford Stream and Bum Brook to the south of the site, and the HPC Drainage Ditch.

b) Hinkley Point C

27.1.8 The new nuclear power station would comprise two UK EPR reactor units (Units 1 and 2) and shared infrastructure and facilities. The generator would be capable of producing around 1,630 megawatts (MW) of electrical power for each reactor giving a total site capacity of 3,260MW.

27.1.9 The two UK EPR reactor units would be constructed 18 months apart with Unit 1 scheduled for operation in 2019 and Unit 2 in 2020. Prior to operation each reactor will undergo commissioning which involves a series of tests to demonstrate that HPC is capable of performing in accordance with its design specification, safety and environmental requirements.

27.1.10 HPC would have an operational lifetime of 60 years before being decommissioned. HPC would have a permanent workforce of approximately 900 staff during normal operations.

c) Environmental Impacts and Mitigation

27.1.11 Environmental impacts which are predicted to be of negligible or minor adverse significance have not been assigned specific mitigation measures. However, management and control measures have already been built into the project design which in many cases has reduced potential impacts to a "not significant" level. Compliance with regulatory requirements and standard good construction and operational practices are also part of the project design, and are not considered as formal mitigation.

27.1.12 Mitigation measures have been proposed where there is likely to be a significant adverse impact of greater than minor significance and the impact magnitude, spatial scope and temporal nature make it appropriate to do so. Predicted significant impacts and the measures proposed to mitigate these are summarised in this chapter and are identified by project phase: construction and operation. All impacts listed are adverse unless otherwise stated.

27.2 Socio-economics

a) Construction Phase Impacts and Mitigation

27.2.1 The construction phase is likely to have the widest range of impacts on the local labour market, economy, availability of accommodation and provision of public services as a result of the large workforce required to build HPC.

27.2.2 The size of the construction workforce would vary at different stages of the construction period, with a peak in 2016 of around 5,600 workers. This construction worker demand would bring significant benefits to the local area in terms of local recruitment and supply chain opportunities for Somerset businesses. These benefits would likely provide £45 million per year in wages and multiplier impacts and £45 million per year of construction supply chain benefits. EDF Energy has developed a **Construction Workforce Development Strategy** and **Local Procurement Strategy** to enhance these positive impacts and would also make a financial contribution to the marketing and promotion of Somerset.

27.2.3 At the peak construction phase, approximately 3,700 workers are expected to move to the area temporarily. This demand for places could potentially have a significant impact upon the supply of accommodation. EDF Energy has therefore planned a campus based **Accommodation Strategy** to minimise pressure on local housing markets, providing 1,510 campus places across three sites, including an on-site HPC campus and two campuses in Bridgwater. These accommodation campuses would ensure that the HPC workforce does not exceed available capacity in the area. EDF Energy has also proposed additional precautionary mitigation through a £5 million housing fund, which could be used to support the provision of additional accommodation in the wider area equivalent to 1,000 spaces.

27.2.4 The socio-economic assessment also considered the potential impacts on the full range of public services including emergency services, health services, education, and leisure. Because of the worker profile, i.e. mainly single persons of working age, impacts on these local services are likely to be negligible. EDF Energy has nevertheless taken additional steps to ensure that any potential change or impacts would be mitigated. The proposed mitigation measures include on site provision of sports pitches and other amenities at accommodation campuses.

27.2.5 EDF Energy would also take measures to mitigate potential impacts to local communities. These measures include contributions to emergency service and health providers based upon the numbers of workers assumed for their area. For education it would include contributions towards additional school places should these be required; and for leisure, EDF Energy also plans to make contributions to enhance the local recreational facilities.

27.2.6 It is recognised that a concentration of workers could have an impact on the quality of life of some residents. Therefore EDF Energy is proposing a Neighbourhood Support Scheme for residents immediately around the HPC development site and a wider Community Fund to spend on local initiatives which would enhance the quality of life in local settlements. In addition, a Worker Code of Conduct would be implemented.

b) Operational Phase Impacts and Mitigation

27.2.7 The 60 year operation of HPC would also bring major benefits to the area. It is expected that it will employ around 900 people in normal operation, generating a contribution to GDP of £144 million per annum, wages of £30 million per annum, and indirect long term effects of £40 million supporting 360 jobs. It is estimated that around half of the employees will be initially recruited locally. By the time the plant is fully operational virtually the entire workforce are expected to live in the three districts of West Somerset, Sedgemoor and Taunton Deane. This will be of significant benefit to the area providing highly skilled and well paid jobs and injecting significant annual expenditure to the local economy.

27.2.8 In addition to this permanent employment there will also be regular outage periods (for essential maintenance works and refuelling of the reactors) which will bring a further temporary workforce of up to 1,000. The majority of this workforce would be likely to come from outside the area but will bring additional expenditure to accommodation providers and local businesses.

27.2.9 EDF Energy is also committed to enhancing benefits through work with schools to encourage young people to study STEM (Science, technology, engineering and mathematics subjects) through its Education Inspire Strategy (a strategy to invest in skills and employment in the area) and operating an apprenticeship programme for young people.

27.2.10 The HPC development will also include a Public Information Centre (PIC) which is expected to attract up to 250,000 visitors per year, which would make it the equal most popular tourist attraction (with West Somerset Railway) in the Somerset County Council area.

27.3 Transport

a) Construction and Operational Phase Impacts for the Road Network

27.3.1 The key transport impacts during HPC construction are expected to be related to severance and pedestrian amenity. Severance refers to the feeling of separation in a community caused by changes in traffic flow. Pedestrian amenity refers to the pleasantness of the journey by foot alongside a road.

27.3.2 The ES considers three representative years for the assessment of impacts a being:

- 2013 when HPC construction has commenced but all the associated development sites are not operational. At this stage park and ride and freight management facilities along with the temporary Induction Centre are operational at Junction 24, but the Cannington bypass is still under construction.
- 2016 is the assessment of peak construction impacts. At this stage all highway improvement measures are in place, including the Cannington bypass. Based on the workforce and freight movement profiles, the fourth quarter is the period when traffic impacts are likely to be at their greatest.
- In 2021 the HPC development site is fully operational and some of the associated development sites are being dismantled and removed. Junction 24 and Cannington park and ride are still operational. In addition some construction activity would still be ongoing on the HPC development site (mainly the construction of the Intermediate Spent Fuel Store and the final landscaping works). The quarter used for assessment is a combination with the worst case for freight movements and workforce.

27.3.3 Given that 2021 is not just an operational year, comment is made in the analysis about the likely effects when all construction activity ceases and there are just the operational staff on site. This occurs at the end of 2022.

27.3.4 During construction, there will be significant increases in flows on EDF Energy's designated HGV routes from Junction 23 and 24 of the M5 and onwards through Bridgwater. The route from Junction 23, uses the A38 Bristol Road and Western Way (Northern Distributor Road (NDR)) to the Quantock roundabout and then the A39 to Cannington. From Junction 24, the route uses Taunton Road and then Broadway before passing through the Quantock roundabout on the way to Cannington. These routes are all on 'A' roads with high existing traffic flows. Given the nature and character of the routes and the temporary nature of the peak construction phase, there is considered to be a significant impact on severance and pedestrian amenity. There would be some improvement to journey times through Bridgwater due to the proposed highway improvements package.

27.3.5 In 2013, significant impacts are predicted in Bridgwater but these would be less than in later years since there would be less construction workers required at this time. The Cannington bypass will be under construction and therefore all HPC construction traffic would be passing through Cannington resulting in a substantial impact. However, this will be for a limited period and once the bypass is constructed there will be significant benefits to the majority of the village inhabitants. The bypass would not only remove HPC traffic but also non-HPC traffic.

27.3.6 In 2021 the level of construction activity at HPC development site would be much less with only the ongoing construction interim spent fuel store and landscaping works remaining, and off-site the post-operational use of the associated developments including the dismantling, removal and reinstatement of some associated development sites. During this time, there would be still HGV flows in Bridgwater. Once the associated development sites have been removed and reinstated then there would be no material impacts on severance and pedestrian amenity. At this early operational stage of HPC, there would be benefits to journey times within Bridgwater due to the proposed highway improvements which would remain.

27.3.7 A number of road safety improvements are planned along the A38, A39 and Northern Distributor Road. In addition to the proposed highway improvements, EDF Energy propose to contribute to potential safety enhancements and pedestrian and cycle improvements within Bridgwater that Somerset County Council are progressing as part of their ongoing programme of improvements. In addition, the effects of the construction of the HPC Project would be monitored throughout and if any unforeseen impacts are identified then EDF Energy would work with the authorities to mitigate their impact.

27.4 Noise and Vibration

a) Construction Phase Impacts and Mitigation

27.4.1 The assessment of potential HPC construction noise impacts has used computer modelling to determine impacts at and around the site. The greatest potential for significant impacts is from short-term activities associated with the emergency access road construction and landscaping close to the southern site boundary. These activities could result in a slight noise increase at the nearest residential dwellings. These occurrences would however be of short duration and landscaping works to the south of the site early in the construction programme would help to reduce the noise impacts of subsequent construction activities.

27.4.2 Visitors to Pixies Mound could experience significant noise impacts due to road upgrading works during the construction phase. These impacts would be of short duration due to length of time to complete the road works and transient nature of visitor trips to the mound.

27.4.3 Potential construction noise impacts from the generation of road traffic on local public highways during HPC construction have also been assessed. The assessment was based on traffic modelling predictions during two key construction phase years, 2013 and 2016. The main public highway access routes in 2013, prior to construction of the Cannington bypass by EDF Energy, are expected to experience high numbers of heavy goods vehicles (HGV) movements to and from the HPC site. During this period, construction of a number of the associated development sites would also be on-going. The daily road traffic noise impacts would be most significant between the A39 and the HPC development site (through Cannington High Street and on the C182 Rodway). During night-time shift changes, when buses are transporting construction staff to and from the HPC development site, the most significant noise impacts would occur between the A39 and the HPC site between the hours of 05:00-07:00 and 23:00-01:00. Other areas which are predicted to be adversely affected by the change in hourly road traffic noise are along the A39, notably between Cannington and Bridgwater, and North Street and Broadway in Bridgwater, as well as the NDR.

27.4.4 The peak of the HPC construction workforce would be in 2016. At this time, HGV movements would also be significant. In the day time, the new bypass around the village of Cannington would provide a beneficial change to Cannington High Street and the C182 road (south of the bypass roundabout). The assessment of hourly traffic noise impacts takes account of the freight management measures which restrict the movement of HGVs associated with HPC construction. HGV movements will be prohibited entirely between the hours of 22:00 and 07:00.

27.4.5 Without mitigation, significant impacts are predicted to occur along the A39 between Cannington and Bridgwater, within Bridgwater, Williton and along the main route connecting the Williton park and ride site with the HPC development site (through Stringston and Stogursey). These impacts (occurring as a result of changes from current conditions) would be primarily a result of the existing very low number of vehicle movements along these routes during the night time period.

27.4.6 In recognition of the duration of the proposed HPC development construction and its effects on sensitive receptors in proximity to the adopted transport routes, EDF Energy has committed to a Property Price Support Scheme and voluntary Transport Noise Insulation Scheme to mitigate adverse impacts arising during construction. This insulation scheme would allow eligible residential property owners along affected highways to apply for either secondary glazing or new double-glazing with acoustic ventilation to be fitted. EDF Energy also plans to monitor noise levels at representative residential properties in the villages of Knighton, Shurton, Burton and Wick. In addition, residents would be able to contact a 24-hour noise complaints telephone number so that appropriate response steps could be investigated. These schemes would be offered irrespective of the significance of the noise impacts as determined through the impact assessment and demonstrate a fair and responsible action as a commitment to being a good neighbour.

27.4.7 Significant adverse vibration impacts are not anticipated as a result of construction works at the HPC development site or from construction related traffic on the highway network.

b) Operational Phase Impacts and Mitigation

27.4.8 Significant noise impacts are not anticipated due to the operation of HPC. However, during the operational phase significant traffic noise impacts could occur to residences along the proposed Cannington bypass and at Cannington cemetery. The voluntary Transport Noise Insulation Scheme proposed to help mitigate these impacts is described above.

27.4.9 Cannington bypass would continue to provide significant road traffic noise benefits to Cannington village.

27.5 Air Quality

a) Construction Impacts and Mitigation

27.5.1 During construction, prior to mitigation significant impacts from fugitive dust and PM_{10} may occur at amenity and recreation locations at human receptor locations (residential properties) in close proximity to the HPC development site including Doggetts Farm, Bishops Farm House and residences in Shurton Village. Best practice guidance control methods and other mitigation measures would be implemented to manage fugitive nuisance dust and PM_{10} emissions during the construction works.

27.5.2 Typical good construction practice methods and dust mitigation that would be implemented where appropriate to control fugitive dust and PM_{10} generation during the construction works include:

- vehicles carrying loose aggregate and workings to be sheeted during periods of dry and windy weather, or if dust emissions become a problem;
- implementation of design controls for construction equipment and vehicles and use of appropriately designed vehicles for materials handling;
- completed earthworks/stockpiles to be covered or seeded as soon as is practicable in order to stabilise surfaces (finished platforms would be covered, external slopes would be seeded and vegetated);
- use of mobile or fixed spray units to dampen surfaces as dictated by weather conditions;
- provision and use of wheel washing facilities at exits onto the public highway as well as procedures for effective cleaning and inspection of vehicles, which should include total vehicle washing and ticketing of vehicles;
- regular inspection and, if necessary, cleaning of local highways and site boundaries to check for dust deposits (and removal if necessary);
- use of dust-suppressed tools for all operations, and use of dust extraction techniques where available;
- ensuring that all construction plant and equipment is maintained in good working order and not left running when not in use; and
- regulating on-site movements to keep dust generating activities to a minimum.

27.5.3 A formal system would be put in place during the works which identifies the roles and responsibilities of site staff regarding the procedures to be applied to respond to any complaints relating to air quality. Site logs would be maintained, detailing any complaints received relating to air quality, investigations of the complaints, and the corresponding action taken including the response made to each complainant. The extent to which dust mitigation would be implemented on site during the construction works would be flexible and responsive, with additional measures introduced especially during particularly dust generating activities, particular weather conditions, or upon receipt of substantiated dust complaints or observations. Working practices would be systematically audited and revised where necessary in order to ensure fugitive dust impacts are mitigated to an acceptable level.

b) Operation Impacts and Mitigation

27.5.4 No significant air quality impacts requiring mitigation were identified with respect to human or ecological receptor locations during the operation (including commissioning) of HPC. This is because emissions from the plant would be limited in nature occurring, typically, for short lengths of time.

27.6 Soils and Land Use

a) Construction Phase Impacts and Mitigation

27.6.1 Prior to mitigation significant impacts on soil quality are predicted during construction due to vegetation removal, topsoil and subsoil stripping and stockpiling. To protect the physical condition of on-site soils during vegetation removal and soil stripping, access routes and working areas would be clearly delimited. Stripped and stored soil materials would be conserved for re-use during landscape restoration following construction for the creation of a variety of new wildlife habitats and agricultural land use. Measures that would be implemented include: segregation of topsoil and subsoil from other excavated materials, appropriate methods of stockpiling and criteria for cessation of works if prolonged wet weather conditions occur.

27.6.2 Habitats to be restored or created on site post-construction would include grassland, scrub, woodland, wetland and hedgerow. There would be monitoring of the condition of the soils which are placed within the restored areas over a minimum of three growing seasons (i.e. during the landscape planting establishment phase) to ensure that the aims of the landscape restoration strategy are achieved.

27.6.3 Prior to mitigation, significant impacts to field drainage within the HPC development site are predicted during construction due to disruption to the existing drainage infrastructure. Ahead of ground preparation works and soil stripping, inspections would be made of agricultural field drainage systems, both on site and adjacent to the site boundary. Inspections would assess whether any connections to adjacent drainage systems exist. If so, plans would be put in place to disconnect, block off and subsequently reinstate (as practical) adjacent drainage systems so as to prevent any waterlogging or flooding to off-site receptors from the HPC construction activities.

27.6.4 With these mitigation measures in place, impacts on soils, land use and agriculture during the HPC construction phase would not be significant.

b) Operational Impacts and Mitigation

27.6.5 Once the construction works are complete and both units operational, impacts on soil quality and soil profiles are predicted to be significant without prior mitigation. Impacts would arise from vehicle and plant activities during final landscaping in accordance with the landscape strategy. Mitigation measures would closely follow those to be used during initial site preparation works to ensure that there is minimal damage to soils due to the handling and removal of soils from stockpiles, soil transport, deposition and grading on previously stripped areas.

27.6.6 Prior to mitigation, significant impacts on field drainage as a result of disruption of drainage infrastructure or connections to adjacent agricultural drainage systems during restoration activities would be mitigated following those measures outlined for construction.

27.6.7 Normal operation of the HPC development would not prevent continued agricultural activity on adjacent land outside the boundary of the operational site and should not lead to any further impacts on soils and land use.

27.7 Geology and Land Contamination

a) Construction Phase Impacts and Mitigation

27.7.1 Construction of the sea wall, foreshore construction drainage outfall and temporary jetty will have an impact upon the geology of Hinkley Point. In particular the rock strata which are currently exposed in the cliffs at the northern boundary of the HPC development site will not be accessible due to the sea wall which is required to protect HPC from coastal erosion. The impact of the outfall and the jetty, will not be significant. Geological mapping survey has shown that the rock strata which are exposed at Hinkley Point are not unique and comparative or better examples which are accessible to the public exist along the coastline to the west.

27.7.2 There is no evidence of significant land contamination across most of the HPC development site and this reflects the previous agricultural land use. Within the north-east area the site (BDAE) localised contamination does exist principally in the form of asbestos containing materials (ACMs) and a small area of hydrocarbon contamination. Remediation of this contamination will be substantially complete prior to the commencement of construction of HPC. Remediation works will result in an overall beneficial impact with respect to land quality ahead of HPC construction.

27.7.3 As the geological units within the cliffs along the northern boundary of the HPC development site are fossiliferous, a watching brief would be maintained for identification of any finds of scientific importance during excavations associated with the cliffs. The foreshore along the northern boundary of the HPC development site is also fossiliferous, therefore, a pre-construction survey to identify any palaeontological finds of scientific importance is intended on the foreshore and intertidal wave-cut platform.

27.7.4 Materials arising from the construction works which are of suitable quality would be re-used for the proposed landscape restoration, and any unacceptable contaminated soils would be removed from site or remediated to render them suitable for use. It is intended to retain as much material on site for re-use as possible. Materials would be managed in accordance with a **Materials Management Plan**.

b) Operational Phase Impacts and Mitigation

27.7.5 Impacts associated with operational phase on the existing geology, or as a result of existing or potential land contamination are not considered to be significant and would be managed through legislative compliance, standard good practice and control measures.

27.8 Groundwater

a) Construction Phase Impacts and Mitigation

27.8.1 It will be necessary to dewater the deep excavations which are required for the foundations and below ground structures of HPC to create a safe working environment and allow construction works to progress under dry conditions. To do this, the groundwater level within the excavations will need to be lowered by up to 30m compared to current baseline conditions. Groundwater levels would be affected over a period of several years, leading to localised drawdown (a depression in the natural groundwater level).

27.8.2 It is anticipated that the influence of this drawdown will reach outside the HPC development area into the north-western part of the neighbouring HPA power station site. However, it is not anticipated that the dewatering will result in significant groundwater contamination being drawn into the dewatering zone for HPC.

27.8.3 There would be no significant increase in the salinity of groundwater as a result of dewatering, except immediately between the HPC development site excavations and the Bristol Channel.

27.8.4 Groundwater which is collected during dewatering will be discharged under controlled conditions to the Bristol Channel. Monitoring of the levels of contamination will be undertaken and treatment prior to discharge will be carried out if necessary to meet the requirements of an environmental permit that will be regulated by the Environment Agency.

27.8.5 Groundwater modelling has indicated that there will be no significant impact on groundwater levels away from the HPC development site to the west, south and south-east. Groundwater abstractions will not be affected and surface watercourses within Wick Moor (which is part of the Bridgwater Bay SSSI) are not anticipated to be subject to any reduction in flows due to dewatering activities. However, as a precautionary measure, EDF Energy has agreed with the Environment Agency to undertake a groundwater monitoring programme during construction.

b) Operational Phase Impacts and Mitigation

27.8.6 A passive drainage system would be installed during the construction phase that would control groundwater levels over the operational lifetime of the HPC. The influence of this drainage system (which will be regularly inspected and maintained) on groundwater levels will be localised and no effects outside the HPC development site boundary are anticipated. This system would discharge via the cooling water outfall.

27.9 Surface Water

a) Construction Phase Impacts on Surface Water and Mitigation

27.9.1 Bum Brook and Holford Stream are important water supply streams to the Bridgwater Bay SSSI and to freshwater wetland habitats which lie downstream and to the east of the HPC development site. Prior to implementation of mitigation, significant water quality impacts could result on these watercourses from:

- the generation of sediment-laden surface drainage water from a range of construction and earth working activities;
- surface drainage discharges with elevated concentrations of nutrients discharged into Holford Stream;
- discharges of low pH (acidic) drainage from rock stock piles into Holford Stream; and
- accidental spillages of chemicals, including hydrocarbons, during construction activities on the site.

27.9.2 The surface water drainage systems across all phases of the development will be fully compliant with applicable legislation, regulations and guidance and subject to environmental permitting. A key design feature of the construction phase drainage system is the inclusion of Water Management Zones (WMZ) to attenuate and treat to a suitable quality, water requiring discharge from the HPC development site into the local surface water features. A range of mitigation and controls would be implemented including the treatment of sewage effluent; measures to reduce the potential for sediment-laden water; and monitoring and treatment of surface waters for elevated nutrient concentrations, low pH and contamination through accidental spillages.

27.9.3 A range of techniques would be employed to reduce erosion and generation of sediment-laden surface drainage from newly excavated areas. These include locating stockpiles away from floodplains of surface watercourses where possible. Stockpiled areas would be ring fenced with either sediment fencing or sediment tubes to retain sediment run-off. Haul roads would be constructed for areas and routes of frequent plant movement and restrictions on traffic movements enforced so that there is no unnecessary access for vehicles or plant to areas of soft soils.

27.9.4 Main collection ditches that feed into settlement lagoons in the WMZs would be stone or geotextile lined to prevent bed erosion during periods of high flows. They would incorporate stepped weirs to encourage sediment settlement within the ditch. Temporary settlement lagoons to allow both the settlement of solids and attenuating flows.

b) Flood Risk during Construction and Operation

27.9.5 An assessment of flood risk to the development and arising from the development has been undertaken and reported in a Flood Risk Assessment (FRA). The FRA concluded that there is no significant flood risk to the development site during construction and operation and whilst there is the potential for occasional flood risk in the future (2100) of the main access road to the site, this would only be for a few hours during which time the site could be accessed by an alternative route.

27.9.6 Consideration of climate change predictions indicate that some local properties could be adversely impacted by flooding in the future due to the infilling of the Holford Stream valley. Predictive modelling for the year 2100 indicates that the levels of flooding would be increased slightly as a result of the HPC development. EDF Energy will develop an appropriate monitoring and compensatory management plan with the Environment Agency for managing potential flood risk impacts to third party receptors.

c) Operational Phase Impacts on Surface Water and Mitigation

27.9.7 Once HPC is operational, with the land restored, no significant impacts on surface water features are expected, particularly as the operational site would effectively be isolated from the local terrestrial surface water environment. Nonetheless, monitoring and maintenance of the drainage systems and surface water channels will continue during the operational phase.

27.10 Coastal Hydrodynamics and Geomorphology

a) Construction Phase Impacts and Mitigation

27.10.1 The construction components of the HPC development which have been identified as having a potential impact on coastal hydrodynamics and geomorphology are: positioning of the new sea wall; construction outfall drainage across the shore; construction, operation and dismantling of the temporary jetty; drilling of vertical shafts offshore for the cooling water intake and outfall structures; establishment of a discharge point for the fish recovery and return system; and dredging of the temporary jetty berthing pocket. Due to the short duration and localised nature of these activities, their impacts are assessed as being small in scale, or to interfere very little with the existing highly dynamic coastal processes (i.e. not significant).

27.10.2 Although no significant impacts are predicted due to the dynamic nature of the environment and protective measures included in the design, there are a number of best/protective practices which will be implemented during construction. These will include the use of pre-defined working zones only, limiting any damage caused to surface rock and seabed; restoring and remodelling disturbed features should this prove necessary and using 'microtunnelling' for the fish recovery and return system rather than excavating a route or laying pipe-work across the intertidal area. The main cooling water tunnels would likewise be tunnelled under the intertidal area and the seabed with no surface disturbance except at the locations of the intake and outfall structures themselves, several kilometres offshore. The effects associated with the temporary jetty and any associated dredging activities for the creation and maintenance of the berthing area for vessels are assessed as not significant.

b) Operational Phase Impacts and Mitigation

27.10.3 The operational components identified as having a potential influence on coastal hydrodynamics and/or coastal geomorphology are: the presence of the sea wall; the abstraction and discharge of cooling water; and the presence of cooling water intake and outfall structures on the seabed, including that for the fish recovery and return system. It is not anticipated that these features would have a discernable effect on the hydrodynamics and coastal geomorphology of the Inner Bristol Channel.

27.11 Marine Water and Sediment Quality

a) Construction Phase Impacts and Mitigation

27.11.1 No significant impacts on marine water or sediment quality are expected to occur during the construction phase. This conclusion reflects both the dynamic nature of the marine environment, with dominant tidal flows and high levels of suspended sediment, and the mitigation measures that are built into the design.

27.11.2 Even without mitigation, the assessment concluded that all discharges (of surface drainage, or groundwater, from temporary sewage works, commissioning test waters or accidental discharges) would not be significant. The assessment also concluded that excavation of the cooling water tunnels assuming the worst-case would still only have an impact of negligible significance.

b) Operational Phase Impacts and Mitigation

27.11.3 Potential operational impacts on marine water quality were considered insignificant even before mitigation. Thermal discharge (water that is warmer by 10-12.5°C than the intake water temperature) from HPC is arguably the most significant operational impact on marine water quality. For HPC operating on its own, the thermal discharge is assessed as being a minor impact, and if combined with the output from HPB, that impact is considered to remain the same. Nevertheless, monitoring of the thermal plume through the water column would be undertaken in the vicinity of the discharge point and at more remote monitoring locations.

27.12 Marine Ecology

a) Construction Phase Impacts and Mitigation

27.12.1 In terms of habitat loss, impacts are not predicted to be significant on intertidal and subtidal habitats, except for the potential significant impact of delivering rock armour for the sea wall construction. Landings of such material by sea going barge would be limited to a specific area to avoid sensitive habitats and minimise the area impacted.

27.12.2 Without mitigation, noise and vibration associated with piling was found by the assessment to pose a moderate, adverse impact on certain fish species and cetaceans (e.g. porpoises). An appropriate ‘soft-start’ protocol for piling would be adopted as a matter of precaution. Soft-start is the incremental increase in pile power over a set time period until full operational power is achieved. Once pile driving is initiated then the potential for physical damage effectively ceases as any fish within the zone of influence (ensonification) would move out of the area to avoid the increase in noise levels/pressure.

b) Operational Phase Impacts and Mitigation

27.12.3 There will be a need to route construction and commissioning discharges across the shore from a discharge point at the cliff face. Potential significant impacts could occur to intertidal habitats due to the disturbance from these discharges. In order to avoid areas of habitat that would be particularly sensitive to such flows, a number of possible outfall configurations have been tested in relation to biotope mapping. The route selected across the shore would avoid potentially sensitive and valuable biotopes.

27.12.4 Various waste waters will be discharged via the cooling water system, including, if necessary, residual biocides used to prevent the biological fouling of the cooling water circuits themselves. Without mitigation, a significant impact could occur due to the influence of the residual biocide on intertidal habitats. To mitigate this impact, a risk-based dosing strategy would be applied, limited to actual observation of need.

27.12.5 Species losses from the cooling water screens, without mitigation, were predicted as potentially significant for 14 species of fish, some of which are designated conservation species, and one crustacean. However, the combination of the introduction of a fish recovery and return system, the use of acoustic fish deterrent devices and an intake design that maintains a low intake velocity at all times, will reduce such impacts to a not significant level.

27.13 Terrestrial Ecology and Ornithology

a) Construction Phase Impacts and Mitigation

27.13.1 The proposals for HPC, including the early and final restoration landscaping, have been designed with consideration of existing sensitive ecological features, and include a wide range of measures to avoid or minimise potentially significant impacts on wildlife and to comply with protected species legislation. Extensive areas of new wildlife habitat will be provided.

27.13.2 One non-statutory designated site, the Hinkley County Wildlife Site (CWS) lies partly within the HPC development site. The habitats within this CWS include calcareous grassland (i.e. grassland growing on lime-rich soils), woodland, hedgerows and watercourses. The assessment of impacts during the construction phase concludes that the loss of part of the Hinkley CWS and of flower-rich calcareous grassland within the CWS, are likely to be significant. The landscape restoration proposals for the HPC development site include an extensive programme of habitat creation work. The habitats to be created would include calcareous grassland, woodland, wetland and hedgerows. Over time, these habitats would provide a significant ecological benefit to the site both in its own right and in relation to the Hinkley CWS.

27.13.3 A number of ecological measures have been incorporated as part of the iterative design process. Some measures have already been implemented, some would be implemented during the construction phase, and other measures would continue into the operational phase. Ecological measures include:

- management of hedgerows associated with the Green Lane to increase their biodiversity value;
- creation of areas of areas of woodland/grassland habitat mosaic near Benhole Lane And in the southern part of the development site;
- creation of small areas of wetland habitat, comprising ponds, and reedbeds adjacent to Bum Brook;
- collection of grass and wildflower seed from areas of calcareous grassland located within that part of the Hinkley CWS within the site during 2009 and 2010, for use during the restoration;
- planting of approximately 2.2ha of broad-leaved woodland planting, using a species-rich mixture of native whips and mature specimens, along the western part of Bum Brook at the beginning of 2011;
- planting of approximately 1.4ha of broad-leaved woodland/scrub on a created bund along the north-western boundary of the development site at an early stage of the construction phase. This would be connected to Green Lane and Benhole Lane by a retained species-rich hedgerow;
- seeding of a total of 25ha of arable land and/or improved pasture off-site with a native wildflower mix; and

- construction of a bat barn, erection of bat boxes and creation of bat hop-overs across construction haul roads. Design of the lighting strategy for the development site with reference to the Bat Conservation Trust's recommendations.

b) Operational Phase Impacts and Mitigation

27.13.4 Although no significant impacts are predicted on terrestrial ecology during the operation phase, a number of habitat creation and enhancement measures would be implemented. These measures are in many cases a continuation of measures implemented in the construction phase.

27.13.5 Once the site has been restored there would be monitoring of selected species and management of wildlife habitat to ensure that the biodiversity value is maintained over time.

27.14 Radiological

a) Construction Phase Impacts and Mitigation

27.14.1 The assessment has determined that there is no significant radiochemical contamination of soils within the HPC development site. Low levels of tritium (well below levels that would be of regulatory concern) have been found in groundwater samples taken from monitoring boreholes in the north-eastern area of the site close to the boundary with HPA. Predictive modelling has indicated that groundwater dewatering during the construction phase should not lead to a significant impact with respect to the quality of recovered groundwater that will be discharged to the marine environment.

27.14.2 Radiation doses to the construction workforce and members of the public during the construction phase will not be significant.

b) Operational Phase Impacts and Mitigation

27.14.3 The assessment considered the potential impact of discharges of radioactive liquids and gases and disposal of solid radioactive wastes during all routine operations of HPC.

27.14.4 The assessment considered the impacts of the discharges of radioactive gases and liquids from routine operation by identifying typical individuals who were representative of those receiving the highest radiation exposure as a result of the discharges and direct radiation. The radiation dose from the site is so small that it does not add measurably to their dose and is well below the regulatory dose constraints and far below the statutory dose limit.

27.14.5 The assessment found that the predicted short-term dose which accounts for the impact of large discharges made over shorter periods of time, is significantly less than that due to continuous long-term releases and again are significantly less than the relevant dose criteria.

27.14.6 Taking into account the discharges from the Hinkley Point Power Station Complex and HPC, the combined impact on dose levels is predicted to be well below the regulatory dose constraint.

27.14.7 The radiological impact on non-human species was assessed using internationally recognised methodology. The radiological impact on non-human species for continuous discharges was below relevant screening level and therefore the impacts are considered to be very low.

27.14.8 The facilities have been designed, and will be operated applying Best Available Techniques (BAT) so as to minimise the discharges of gaseous and aqueous effluents. BAT is the means by which an EDF Energy will operate HPC order to reduce and keep exposures from emissions into the environment as low as reasonably achievable (ALARA).

27.15 Landscape and Visual

a) Construction Impacts and Mitigation

27.15.1 The assessment acknowledges that the large scale nature of the development would have a significant adverse but temporary impact on landscape character and visual receptors during construction that cannot be completely mitigated by landscaping due to its scale.

27.15.2 The most significant landscape impacts would occur in the local landscape (Quantock Vale area) and site scale landscape character sub areas (in particular along the coastline and to the south of Green Lane), where HPC construction would lead to a locally significant loss of landscape features. However, the most valuable landscape features within the HPC development site, such as the locally prominent ridge of Green Lane or mature boundary vegetation, would be retained during construction. A temporary and significant adverse change in the local landscape and seascape character would occur.

27.15.3 Proposals for landscaping adjacent to the local settlements to the south of the site would also be implemented in the first phase of construction to provide early screening and reduce adverse impacts on the local community. These include temporary screening bunds along the north-western site boundary (during construction) and planting which would also be implemented in the early stages of construction to provide additional screening as soon as possible.

27.15.4 Construction machinery, including a number of tower cranes and other temporary structures of significant size, would lead to changes in views and affect the character of the local landscape and seascape. It would also have a significant temporary visual impact on viewers.

27.15.5 The most significant temporary visual impacts would be on the residents of Shurton, Burton, Knighton, Wick and local farms, and also on users of other elevated areas of landscape, such as the north-eastern summits of the Quantock Hills AONB. The temporary screening bund would offer some screening for Public Right of Way (PRoW) users to the west of the site during early phases of construction, and the early implementation of proposed landscaping in the southern part of the site would reduce visual impacts on the local residents.

27.15.6 The temporary visual impacts would decrease with distance (5km and above) but would still be significant in the southern areas of the Quantock Hills AONB and along the Burnham-on Sea to Brean Down coastline and would become minor adverse in more distant areas, including Exmoor National Park, Mendip Hills AONB and the coastline of South Wales.

b) Operation Impacts and Mitigation

27.15.7 Once the HPC development is complete the majority of landscape and visual impacts would decrease due to removal of construction machinery and restoration of the landscape. However, some significant impacts would remain in the local area due to the large scale of the completed HPC development which cannot be completely screened by landform or vegetation, particularly when viewed from elevated locations.

27.15.8 In the residential areas around the application site the visual impacts would remain significant, even though landscaping, including landform and vegetation, has the highest screening potential in these areas. Significant visual impacts would remain for users of PRoW along the coastline adjacent to the site due to the proximity of HPC. Some of these impacts would slightly decrease in the long term, when the planting proposals, including off-site mitigation measures, mature.

27.15.9 A localised area of significant visual impact would remain in the north-eastern part of the Quantock Hills AONB due to its high elevation and the angle of view.

27.16 Historic Environment

a) Construction Phase Impacts and Mitigation

27.16.1 Prior to mitigation a significant impact due to partial transformation of the setting of a Scheduled Monument, Wick Barrow (Pixies Mound) which is a prehistoric burial mound of Neolithic – Bronze Age date located to the east of the HPC site; is predicted. A **Monument Management Plan** has been prepared. It establishes the baseline condition of the monument and proposes a range of measures that will help to protect and preserve the surviving parts of the Scheduled Monument from long-term gradual deterioration. The level of interpretation information available to visitors to the monument will also be improved.

27.16.2 The majority of the heritage assets within the HPC development site would experience significant impacts during the construction phase. Due to the nature of the development and the medium to low importance of the archaeological remains, suitable mitigation would entail preservation by record. Preservation by record would comprise archaeological investigation and recording of specified site areas.

27.16.3 The following sites would be subject to set-piece excavation prior to their removal due to construction works: the Romano-British settlement; the middle-late Bronze Age enclosure; Bronze Age pottery assemblage; early Bronze Age cremation; possible burnt mound; the mid-late Iron Age settlement; and the medieval settlement.

27.16.4 Benhole Barn, Langborough Barn complex and Sidwell Barn (23) would not be retained, but would be preserved by record.

27.16.5 There would be partial loss of the east-west trackway Green Lane (known by EDF Energy as Green Lane) during construction which is considered a significant impact. The eastern section of the track that is to be removed would be preserved by record. Excavation and recording would also take place across the western section of the track where the track would be crossed by a temporary haul road. It is proposed that, where it is appropriate, optically stimulated luminescence (OSL) dating shall be used. The hedgerow and track way would be reinstated once the haul road has been removed.

27.16.6 The finds and records from the site would be archived in an appropriate museum. A programme of public outreach, a published booklet describing the archaeology and history of the site would be also undertaken in conjunction with Somerset County Council Historic Environment Service.

b) Operation Impacts and Mitigation

27.16.7 The HPC development would have a significant impact on the settings of certain designated heritage assets beyond the site boundary. These include Wick Barrow (Pixies Mound), Fairfield House and its registered park and garden located to the west of the HPC site, and Court House located on the East Quantoxhead Estate to the west of the HPC development site. There would be a lesser impact on the settings of Grade II Listed Buildings in Shurton and Burton and the Stogursey Conservation Area. The Quantock Hills (10km to the west of the proposed HPC site) are the location of many prehistoric sites. Although these sites are located at some distance from the HPC site, the development would have a significant impact on some of their settings.

27.16.8 Appropriate measures for the mitigation of impacts include screen planting and landscaping that has been designed to minimise visual impacts to the settings and preserve important views. The HPC site would not be fully screened but the landscaping and planting mitigation would soften the visual impact of the proposed development. In addition, the Scheduled Monuments on the Quantock Hills are at an elevation where it would be difficult to negate the visual impact to their setting.

27.17 Offshore and Intertidal Archaeology

a) Construction Phase Impacts and Mitigation

27.17.1 Significant impacts have been identified resulting from the construction of the temporary jetty. The combined footprint of the berthing pocket and piles for the jetty structure would remove less than 1% of the area of Holocene deposits identified during offshore surveys. Although the installation of the structures would represent a permanent impact of low magnitude, the importance of the deposits is high.

27.17.2 The mitigation of impacts to Holocene deposits will take the form of research and publication, to ensure preservation by record. Following the implementation of mitigation measures the residual impacts upon Holocene deposits during the construction phase would be reduced to not significant.

b) Operation Impacts and Mitigation

27.17.3 No impacts resulting from the operational phase of development have been identified on offshore or intertidal archaeology. This is because any scour pits associated with the proposed structures would not affect a potential wreck site and operational maintenance and dredging would be of a very low magnitude. The location of the proposed fish recovery and return system is on exposed Blue Lias bedrock and there are no recorded archaeological remains in the vicinity. Consequently no impact is predicted.

27.18 Amenity and Recreation

a) Construction Impacts and Mitigation

27.18.1 Amenity and recreation receptors (public rights of way (PRoW), sports and recreation facilities, public open space and open access land) could be affected by the HPC development, either through direct obstruction or disturbance (such as noise or changes in views), potentially detracting from the characteristics that give them their value for enjoyment in the first place.

27.18.2 During construction, all PRoW within the inner security fence of the HPC development site would be obstructed and public access would be prohibited for health and safety reasons for the duration of the construction works (i.e. for up to 11 years). During construction works on the jetty and sea wall, the West Somerset Coast Path which runs along the northern edge of the HPC development site would also be obstructed, for up to three years.

27.18.3 Mitigation measures would include the provision of a PRoW diversion route, wider network enhancements, and reinstatement of the West Somerset Coast Path on completion of the seawall. In addition, in response to request by local residents, a 13 hectare area of amenity grassland would be available to the public along a strip between the site and Shurton. As a result, a non-significant residual impact is predicted.

27.18.4 No loss or physical disturbance would occur to nearby areas of common land or any sports and recreation facilities during construction of Hinkley Point C. However, during construction of the temporary jetty and seawall, access to areas of the foreshore and offshore would be restricted. Given the limited extent of the foreshore and offshore areas affected, the presence of similar and as accessible areas immediately outside the area of exclusion, medium-term minor adverse impacts are predicted on angling, wildfowling and recreational boating.

b) Operational Impacts and Mitigation

27.18.5 During the operational phase, all PRoW within the HPC development site boundary would be permanently closed. This obstruction would result in a significant impact for about 4,700m of PRoW. Throughout the remainder of the construction site, PRoW would be reinstated on a rationalised pattern, as part of the landscape restoration. Several lengths of PRoW would be upgraded to bridleway to improve access to other recreational users such as equestrians and cyclists. In addition, several permissive footpaths and bridleways would be created and permissive access would be granted to land in excess of 100ha, forming a nature reserve between the permanent site and Shurton. As a result, a negligible residual impact is predicted for PRoW and a minor beneficial residual impact for equestrian use.

27.18.6 No loss or physical disturbance would occur to areas of Common Land, sports and recreation facilities or the foreshore and its associated recreational uses during the operational phase. However, the presence of the cooling water infrastructure offshore from the site would leave small areas of the estuary excluded from recreational boating and sailing. Given, the extremely small area excluded compared to the area available, a negligible residual impact is predicted.

27.19 Navigation

a) Construction Risks and Mitigation

27.19.1 Potential risks associated with the construction and dismantling of the temporary jetty and construction of the cooling water intake and outfall head structures would be managed through the implementation of an exclusion zone and possible use of a small patrol vessel.

27.19.2 Dredging plant used to create the berthing pocket for the temporary jetty would be routed for disposal off-shore at Cardiff Grounds. Through marine safety and management systems and the issue of a notice to Mariners, the potential risks of passage to other vessels in the area are considered to be low.

27.19.3 Construction of the jetty and cooling water intake and outfall structures could cause interference with the Lilstock range firing area exercises and training. However, the implementation of a communications management plan between EDF Energy and the MoD would ensure that any potential for significant disruption in use of the range would be avoided.

27.19.4 Presence of construction plant in the water at Combwich Wharf has the potential to interfere with, and pose a hazard to, commercial traffic and recreational users of the River Parrett. During the works, a temporary exclusion zone may be required to safeguard the passing of vessels subject to sanction by the Port of Bridgwater.

b) Operational Risks and Mitigation

27.19.5 Presence of the jetty has the potential to interfere with marine activities, however with appropriate signage this risk is considered to be low for most shipping and only a moderate risk is posed to commercial vessels.

27.19.6 The jetty would be used by vessels to import materials for construction and their presence and movement could pose a risk to navigation, however the jetty would be marked with navigational lights and a management system would be implemented to ensure vessels berth during suitable weather conditions and tidal conditions, and use appropriate anchorages.

27.19.7 The risk for the jetty and cooling water intake/outfall operations to interfere with the Lilstock Range firing area activities are not considered to be significant as a communications management plan would be implemented with the MoD.

27.19.8 The presence and movement of maintenance vessels for the intake and outfall structures and similarly, Combwich Wharf vessels and its berth would cause only minor periodic and short term interference and therefore present a low risk to the majority of marine activities. The risk to commercial vessels can be managed through:

- marking of structures and charted appropriately;
- the use of an exclusion zones, port directives, public notices and notice to Mariners;

- repositioning of anchorage areas and restricted access to recreational moorings during dredging operations; and
- traffic supervision, use of tidal windows and passage planning and berthing procedures.

27.19.9 In summary, all potential risks can be managed through good practice, previously established methods and lines of communication between EDF Energy and relevant parties.
