1. Introduction

- 1.1.1 This Appendix presents full quantitative results of the air quality modelling of the construction plant associated with Rampion 2. This should be read in conjunction with **Chapter 19: Air quality, Volume 2** (Document Reference: 6.2.19) of the ES. **Table 1-1** presents details of the receptors where air quality impacts have been modelled.
- 1.1.2 **Table 1-2 to Table 1-7** present modelled annual mean nitrogen dioxide (NO_2) and particulate matter (PM) (PM_{10} and $\text{PM}_{2.5}$) concentrations, along with the impact descriptor according to Institute of Air Quality Management (IAQM) and Environmental Protection UK (EPUK) (2017) guidance. Results are presented to several decimal places. This is to aid comparison against Air Quality Objectives (AQO), between receptors and between the 'With Proposed Development' and 'Without Proposed Development' scenarios. The number of decimal places should not be interpreted as an indication of the accuracy of the results.
- 1.1.3 The table headers use terminology promulgated by the Environment Agency (2023) but widely used in air quality assessments. The Process Contribution (PC) is the contribution to the concentration of pollutant arising from the Proposed Development, in this case from road traffic generated by construction activity. The Predicted Environmental Contribution (PEC) is the total concentration, including the contribution from the Proposed Development plus the contribution from all other sources, including background sources and road traffic not associated with the Proposed Development.
- 1.1.4 The results are presented for the following project components:
- Trenchless Crossings (TCs) and landfall area (Receptors H01-H84); and
 - Oakendene substation and existing National Grid Bolney substation extension (Receptors H71-H100). Note that receptors 71-84 are the closest receptors to the Oakendene substation and receptors 85-100 are the closest receptors to the existing National Grid Bolney substation extension.
- 1.1.5 The TCs and landfall have been modelled together to account for the TCs within the landfall area. Similarly, the Oakendene substation and existing National Grid Bolney substation extension were modelled together due to their relative proximity and the fact that they have the potential to impact the same receptors.

Table 1-1 List of receptors where air quality impacts from construction plant are modelled

2. Glossary of terms and abbreviations

Table 2-1 Glossary of terms and abbreviations

Term (acronym)	Definition
Air Quality Objective (AQO)	The Air Quality Objectives are policy targets generally expressed as a maximum ambient concentration to be achieved, either without exception or with a permitted number of exceedances, within a specified timescale. The Objectives are set out in the UK Government's Air Quality Strategy for the key air pollutants.
Construction	Used both to refer to the whole construction phase of a project, and more specifically to refer to an activity involved in the provision of a new structure (building, road, etc.).
IAQM	Institute of Air Quality Management.
NO₂	Nitrogen dioxide.
PC	Process contribution.
PEC	Predicted environmental contribution.
PM	Particulate matter. Microscopic portions of solid matter suspended in air. This includes a wide range of particle sizes and different chemical constituents. It consists of both primary components, which are emitted directly into the atmosphere, and secondary components, which are formed within the atmosphere as a result of chemical reactions. Commonly used to refer to both PM ₁₀ and PM _{2.5} .
PM₁₀	Particulate matter smaller than 10 µm in diameter.
PM_{2.5}	Particulate matter smaller than 2.5 µm in diameter.
Proposed Development	The development that is subject to the application for development consent, as described in Chapter 4: The Proposed Development, Volume 2 of the ES (Document Reference: 6.2.4).
Receptor	These are as defined in Regulation 5(2) of The Infrastructure Planning (Environmental Impact Assessment) Regulations 2017 and include population and human health, biodiversity, land, soil, water, air, climate, material assets, cultural heritage and landscape that may be at risk from exposure to direct and indirect impacts which may arise as a result of the Proposed Development.
