List of Annexes

Annex A Calibration Certificates

Annex B Baseline Monitoring Results

1. Introduction

1.1 Background

- 1.1.1 Rampion Extension Development Limited (RED) (the 'Applicant') is in the process of submitting a Development Consent Order (DCO) application for the Rampion 2 offshore wind farm.
- 1.1.2 Rampion 2 comprises of new offshore and onshore energy infrastructure. A summary description of the Proposed Development is provided in **Chapter 21:**Noise and vibration, Volume 2 of the ES (Document Reference: 6.2.21) which this Appendix supports, and a more detailed description is provided in **ES Chapter 4: The Proposed Development, Volume 2** of the ES (Document Reference: 6.2.4)

1.2 Purpose of this Appendix

- The purpose of this Appendix is to present the results of the baseline sound level surveys that were conducted between 06 20 February 2023, 27 29 March 2023, 3 4 May 2023, and 15 17 November 2023. Due to land access constraints prior to the DCO submission, the fourth set of surveys (15 17 November 2023) were undertaken post-DCO Application submission. Further detail on the application of the data obtained post-DCO Application submission is provided in **Section 4.3**.
- The purpose of the baseline sound level surveys was to determine robust and accurate baseline data to inform the noise assessment within the Environmental Statement (ES) accompanying the DCO Application.
- There is potential for noise effects during the construction, operation and maintenance and decommissioning phases of the Proposed Development. This Appendix sets out the measured baseline data used to inform the assessment of likely significant noise effects.
- All personnel contributing to the baseline surveys, analysis of data and the preparation of this Appendix were appropriately qualified.
- 1.2.5 This Appendix includes the following sections:
 - Section 1: Introduction which outlines an overview of the Appendix;
 - Section 2: Terminology which outlines relevant terminology pertaining to noise;
 - Section 3: Technical guidance which presents technical guidance relevant to the sound and noise baseline;
 - **Section 4: Methodology** which outlines the methodology adopted in data collection and the categories of noise receptors where baseline information is required;

- Section 5: Results which outlines the specific baseline results for the Proposed Development, namely the results of the ambient and background sound and noise monitoring at several locations;
- Section 6: Summary;
- Section 7: Glossary of terms and abbreviations;
- Section 8: References
- Annex A: Calibration certificates;
- Annex B: Baseline monitoring results.

2. Terminology

- Throughout this Appendix, the term 'noise' is used to describe an 'unwanted sound' and is generally applied when describing assessment methodologies or the predictions of emissions at receptors for the purpose of assessment. In keeping with relevant policy, standards, and guidance, calculated or measured emissions associated with the existing acoustic environment (such as ambient or background levels), and not associated with road or rail traffic, will be described as 'sound'.
- 2.1.2 Whilst it is recognised that road or rail traffic noise is not always considered 'unwanted', the term 'noise' will be applied when describing their measurement.
- The term 'noise' refers to airborne noise and 'vibration' to ground-borne vibration. For all other terminology, the full technical description is used, such as 'ground-borne noise'. Additional technical terminology relevant to the noise assessment is presented in **Section 7**.

Page intentionally blank

3. Technical guidance

For the purposes of defining the scope of the baseline including the methodology for the sound and noise surveys for the Project, the planning policy, guidance, and standards listed in **Table 3-1** are of specific relevance.

Table 3-1 Planning Policy, Technical Standards, and Guidance

Guidance reference

National Planning Policy Framework (NPPF) (Ministry of Housing, Communities and Local Government, 2021)

Summary

The NPPF advises (para 185) that significant adverse impacts on health and the quality of life as a result of noise from new developments should be avoided. It also advises that other adverse impacts on health and quality of life arising from noise from new developments should be mitigated and reduced to a minimum.

Paragraph 174 of the NPPF states that planning systems should contribute to and enhance the natural and local environment by (amongst other considerations): "Preventing new and existing development from contributing to, being put at unacceptable risk from, or being adversely affected by, unacceptable levels of soil, air, water or noise pollution or land instability.".

The NPPF further states in Paragraph 185 that "Planning policies and decisions should also ensure that new development is appropriate for its location taking into account the likely effects (including cumulative effects) of pollution on health, living conditions and the natural environment, as well as the potential sensitivity of the site or the wider area to impacts that could arise from the development. In doing so they should:

- a) mitigate and reduce to a minimum, potential adverse impacts resulting from noise from new development and avoid noise giving rise to significant adverse impacts on health and the quality of life; and
- b) identify and protect tranquil areas which have remained relatively undisturbed by noise and are

Guidance reference	Summary
	prized for their recreational and amenity value for this reason"
	Paragraph 187 advises that "Planning policies and decisions should ensure that new development can be integrated effectively with existing businesses and community facilities (such as places of worship, pubs, music venues and sports clubs). Existing businesses and facilities should not have unreasonable restrictions placed on them as a result of development permitted after they were established. Where the operation of an existing business or community facility could have significant adverse effects on new development (including changes of use) in its vicinity, the applicant (or 'agent of change') should be required to provide suitable mitigation before the development has been completed." This should be taken into account when considering whether the Project is an acceptable use of land.
BS 5228-1:2009 + A1:2014 Code of practice for noise and vibration control on construction and open sites. Part 1: Noise (British Standards Institution (BSI), 2014)	Provides a recommended scope for construction and demolition noise assessment (the ABC Method) presented in Annex E, and also gives example threshold values for potential significant effects at noise sensitive receptors based upon the results of ambient sound monitoring.
Transport and Road Research Laboratory (1986) Research Project 53 – Ground vibration caused by civil engineering works	Guidance into factors affecting the input and propagation of ground vibration from civil engineering works.
Design Manual for Roads and Bridges LA111: Noise and vibration (Highways England, 2020)	Presents a methodology for determining impacts upon noise sensitive receptors from changes in road traffic noise due to road projects.
Calculation of Road Traffic Noise (CRTN) (Her Majesty's Stationary Office (HMSO), 1988)	Provides a calculation methodology for road traffic noise.
Transport and Road Research Laboratory (2002) – Converting the UK traffic noise index LA10, 18hr to EU noise indices for noise mapping	A method for converting the road traffic noise indexes described in CRTN to produce outputs in the form of European Union indices, in particular TRL Method 3 which outlines the

Guidance reference	Summary
	conversion of the $L_{\text{A10,18hr}}$ noise indices to the $L_{\text{Aeq,16hr}}$ and $L_{\text{Aeq,8hr}}$ indexes.
Calculation of railway noise source terms for Calculation of Railway Noise 1995 (Department for Transport (1995)	A methodology for obtaining and calculating rail traffic noise indexes that is additional to the methodology set out within CRN.
BS 4142:2014 + A1:2019 Methods for rating and assessing industrial and commercial sound (BSI, 2019)	BS 4142:2014 + A1:2019 describes methods for rating and assessing sound of an industrial nature (using outdoor sound levels), such as from factories, industrial premises, or fixed installations affecting people who might be inside or outside a dwelling.
	BS 4142:2014 + A1:2019 does not apply to noise associated with the passage of vehicles on public roads and railway systems.
Noise and vibration management: environmental permits (Environment Agency, 2022)	Describes the principles of noise prediction and measurement, in addition to suggested methods of noise control. The guidance recommends that whenever possible, an assessment of noise should follow a recognised method of assessment, such as the methods presented within the relevant and current British Standards e.g. BS 4142:2014 + A1:2019.
International Standards Organization (ISO) 9613-2:1996 Acoustics – Attenuation of sound during propagation outdoors. Part 2: General method of calculation (ISO, 1996)	Defines a method for calculating the attenuation of sound during propagation outdoors in order to predict the levels of environmental noise at distances from a source.
Guidelines for Environmental Noise Impact Assessment (Institute of Environmental Management and Assessment (IEMA), 2014)	Presents guidelines on how the assessment of noise effects should be presented within the EIA process. The IEMA guidelines cover aspects such as scoping, baseline, prediction, and example definitions of significance criteria.
BS 7445-1:2003 Description and measurement of environmental noise. Part 1: Guide to quantities and procedures (BSI, 2003)	Provides guidance on the measurement and description of environmental noise.
BS EN 61672-1:2013 Electroacoustics – Sound level	Provides specifications for different sound level meters.
	

Guidance reference	Summary
meters. Part 1: Specifications (BSI, 2013)	
BS EN 60942:2018 Electroacoustics - Sound calibrators (BSI, 2018)	Provides specifications for different sound calibrators.

4. Methodology

4.1 Agreed methodology

- The methodology and monitoring locations were agreed through non-statutory consultation with Environmental Health Officers from the following Local Authorities:
 - Arun District Council;
 - Horsham District Council;
 - Mid-Sussex District Council;
 - South downs National Park Authority; and
 - West Sussex County Council.
- 4.1.2 Further detail on the relevant assessment methodologies agreed with each Local Authority are provided in **Section 21.3** of **Chapter 21: Noise and vibration**, **Volume 2** of the ES (Document Reference: 6.2.21).

Identification of receptor locations

- Noise monitoring locations were selected to be representative of Noise Sensitive Receptors (NSRs) with the greatest potential to be affected by noise from the construction and operation of the Proposed Development. The NSRs and noise monitoring locations were identified using aerial imagery, Ordnance Survey (OS) mapping and local knowledge.
- 4.1.4 Chapter 21: Noise and vibration, Volume 2 of the ES (Document Reference: 6.2.21) identifies NSRs where baseline levels are required and have been taken forward when selecting monitoring locations. The receptors for temporary construction activity, and operational and maintenance activity are shown in Table 4-1 and Table 4-2 respectively. Figure 21.2, Volume 3 of the ES (Document Reference: 6.3.21) presents all the receptors within OS mapping.

4.2 Details of monitoring undertaken

Data collection methods

- Sound monitoring was undertaken to determine the existing acoustic environment. Surveys were undertaken at receptor locations most likely to be affected by construction activity and operational activity.
- Noise monitoring equipment was set to measure for intervals of 15 minutes in accordance with BS 4142:2014 + A1:2019 (BSI, 2019), which states:
 - "8.1.3 Ensure that the measurement time interval is sufficient to obtain a representative value of the background sound level for the period of interest. This should comprise continuous measurements of normally not less than 15 min intervals, which can be continuous or disaggregated."
- All sound level measurements were undertaken in accordance with BS 4142:2014+A1:2019 (BSI, 2019) and BS 7445-1:2003 (BSI, 2003), i.e. with microphones mounted to a height of 1.2 to 1.5m above ground level and no less than 3.5m from any reflecting surface other than the ground.
- At each location sound levels were measured using integrating averaging sound level meters (SLMs) conforming to Class 1 as defined by BS EN 61672-1:2013 (BSI, 2013). The SLMs were field calibrated before and at the end of each survey period by applying an acoustic calibrator, conforming to BS EN 60942:2018 (BSI, 2018), to the microphone to check the sensitivity of the measuring equipment. Any drift in calibration levels was noted at the end of the survey period. No significant deviation was found at any location.
- 4.2.5 All SLMs used during the monitoring had undergone laboratory calibration within a period not exceeding two years prior to use. All acoustic calibrators used had undergone laboratory calibration within a period not exceeding one year prior to

- use. See **Annex A** for a summary of laboratory calibrations and calibration certificates.
- Meteorological measurement equipment was deployed to monitor local wind speeds and direction, precipitation, air temperature and relative humidity during the surveys. The logged meteorological data have been used in the analysis of the sound level data to ensure that only data collected during appropriate weather conditions has been used when determining representative sound levels to be used in the assessment.

4.3 Data collection locations

Construction Phase

- Partially attended sound monitoring equipment was installed at locations representative of the nearest NSRs to:
 - trenchless crossing compounds; and
 - temporary construction compounds.
- 4.3.2 The sound monitoring equipment measured sound levels for approximately 24-hours.
- 4.3.3 1-hr attended sound monitoring was undertaken at proposed heavy construction access locations where existing road traffic flows were unlikely to be suitable to calculate baseline noise levels to inform the construction traffic assessment.
- 4.3.4 All measurements were undertaken during local schools' term-time.
- The 24-hour monitoring equipment was unattended for the majority of the survey period. Observations of the sound environment were made during equipment deployment and collection to contextualise the monitoring location.
- Sound monitoring was proposed to be undertaken at 31 locations. To date, sound monitoring has been completed at 25 locations between 27 29 March 2023, 3 4 May and 15 17 November 2023. Monitoring has not been undertaken at all 31 proposed locations due to land access restrictions.
- 4.3.7 Where baseline data is not available to inform the assessment, the approach has subsequently defaulted to using Category A significance thresholds based on Table E.1 from BS-5228-1 (BSI, 2014a). This is the most conservative assessment category as it assumes the lowest existing ambient noise levels at the assessment location in accordance with the assessment methodology. In addition, further detail on the assessment approach is provided in the ES Chapter 21: Noise and vibration, Volume 2 of the ES (Document Reference: 6.2.21). Furthermore, all additional data obtained after DCO Application submission (i.e. surveys undertaken between 15 17 November 2023, has been incorporated into the ES Chapter 21: Noise and vibration, Volume 2 of the ES (Document Reference: 6.2.21) which has been updated at the Procedural Deadline A submission.
- The monitoring comprised 24-hour partially attended measurements to determine ambient and background noise levels at receptors in proximity to trenchless crossing compounds and temporary construction compounds.

- 4.3.9 Attended 1-hour measurements have been undertaken to characterise road traffic noise levels at construction access locations where existing traffic data is unlikely to be sufficient to calculate the corresponding road traffic noise,
- 4.3.10 Partially attended 24-hour monitoring locations are presented in **Table 4-3**.

Meteorological conditions

- A data logging meteorological station was deployed at NML30 (3 March 2023 to 4 March 2023) during the survey period. The meteorological station logged concurrently with the sound level surveys to allow adverse weather conditions (i.e. wind speeds in excess of 5ms⁻¹ or rainfall) to be identified and corresponding sound levels excluded from the data analysis.
- Specific details about the location of the monitoring equipment and observations made during deployment and collection of the long-term measurements are detailed in **Annex B**.
- **Table 4-5** presents the total time monitored at each 24-hour location alongside the total time excluded from the data analysis.

Table 4-5 Time monitored at each 24-hr monitoring location

Monitoring Location ID	Total no. 15- minute samples	Total duration of dataset (HH:MM)	No. samples excluded due to adverse weather	Duration of dataset, with exclusions (HH:MM)

CC-5-NML34	80	20:00	8	18:00

^{*} This survey location has been superseded, during the daytime, by Position TC-12-NML41 which is more representative of the assessment receptors

Operation and maintenance phase

- Long term monitoring equipment was left to measure sound levels at the closest receptors to the proposed onshore substation at Oakendene.
- The long-term monitoring equipment was unattended for the majority of the survey period. Observations of the sound environment were made during equipment deployment and collection to contextualise the monitoring location.
- Sound monitoring was undertaken at four locations around the proposed onshore substation at Oakendene location between 6 20 February 2023. This consisted of long-term monitoring to determine ambient and background noise levels at receptors in proximity to the proposed onshore substation at Oakendene.
- The long-term monitoring locations are presented in **Table 4-6** and **Figure 21.2**, **Volume 3** of the ES (Document Reference: 6.3.21).

5. Results

5.1 Summary

- Annex B contains detailed results for each monitoring location, including site photos and monitoring location. For each assessment period, different parameters have been calculated along with the statistics for the number of periods excluded from the analysis due to adverse weather.
- 5.1.2 The different assessment periods are presented in **Table 5-1**.

Table 5-1 Summary of assessment periods

Assessment Period	Time
Construction daytime	Monday – Sunday: 0700 – 1900
Construction evenings	Monday - Sunday: 1900 - 2300
Construction night-time	Monday - Sunday: 2300 - 0700
Operational daytime	Monday - Sunday: 0700 - 2300
Operational night-time	Monday - Sunday: 2300 - 0700

Construction

A summary of the 24-hour logarithmically averaged ambient noise levels is presented in **Table 5-2**.

Table 5-2 Summary of 24-hr ambient noise levels (logarithmic average)

CA-6-NML40	59	-	-		
CA-7-NML41	70	-	-		
CA-8-NML42	47	-	-		

^{*} This survey location has been superseded during the daytime, by Position TC-12-NML41, which is more representative of the assessment receptors.

^{**}This survey location was constrained due to shooting activity. Consequently, only a small window of survey opportunity was available. Therefore, evening and night-time sound data was not obtained and previously obtained levels from HDD-38 should be used.

Operation and maintenance

A summary of the long-term logarithmically averaged ambient noise levels is presented in **Table 5-3.**

Table 5-3 Summary of long-term ambient noise levels (logarithmic average)

6. Summary

- Baseline sound surveys have been undertaken to inform the assessment in Chapter 21: Noise and vibration, Volume 2 Rev B of the ES (Document Reference: 6.2.21) This Appendix presents the results of the baseline sound surveys which were conducted.
- 6.1.2 All monitoring and subsequent data processing, analysis and reporting was undertaken in accordance with the relevant British Standards and the agreed methodology.
- The measured sound levels are typical of the locations where the data were acquired. Any unrepresentative events / data have been removed from the datasets (periods with wind speeds greater than 5m/s or periods with rain, for example).
- Based on the above, the measured sound levels are considered representative of the NSRs in proximity to each measurement location, and the representative sound levels to be used in the noise assessment in **Chapter 21: Noise and vibration**, **Volume 2** of the ES (Document Reference: 6.2.21) and are provided in **Table 6-1** to **Table 6-3**.

BS 4142 (BSI, 2019) requires that the background sound levels adopted for the assessment be representative for the period being assessed. BS 4142 (BSI, 2019) recommends that the background sound level should be derived from continuous measurements of normally not less than 15-minute intervals, which can be contiguous or disaggregated. However, BS 4142 (BSI, 2019) states that there is no 'single' background sound level that can be derived from such measurements. It is particularly difficult to determine what is 'representative' of the night-time period because it can be subject to a wide variation in background sound levels between the 'shoulder' night periods, i.e. 23:00 – 00:00 and 06:00 – 07:00 when the greatest increase or decrease in background sound levels are likely to occur. The accompanying note to paragraph 8.1.4 states that:

'a representative level ought to account for the range of background sounds levels and ought not automatically to be assumed to be either the minimum or modal value'.

6.1.6 It is considered that the median is suitably representative of the typical background sound level at each operational monitoring location and have subsequently been used to inform the assessment.

7. Glossary of terms and abbreviations

Table 7-1 Glossary of terms and abbreviations

Term	Definition
Acoustic environment	Sound from all sources as modified by the environment.
Ambient sound	Totally encompassing sound in a given situation at a given time, usually composed of sound from many sources near and far.
Ambient sound level	The $L_{Aeq,T}$, of the totally encompassing sound in a given situation at a given time, usually from many sources near and far, at the assessment location over a given time interval, T.
Baseline	Refers to existing conditions as represented by latest available survey and other data which is used as a benchmark for making comparisons to assess the impact of development.
Background sound level	The underlying level of sound over a period, T, and is represented by $L_{\rm A90,T}$, the level exceeded for 90% of the measurement interval T.
dB	A unit used to measure the intensity of a sound or the power level of an electrical signal by comparing it with a given level on a logarithmic scale.
Development Consent Order (DCO)	This is the means of obtaining permission for developments categorised as Nationally Significant Infrastructure Projects, under the Planning Act 2008.
Façade level	A correction factor (addition of 3dB to the free field level when calculated using BS 5228:2009 + A1:2014) to take into account reflections from a building.
Free-field level	Resulting level from a measurement that is undertaken away from the acoustic influence of a reflective façade (i.e. at least 3.5m away from any reflective source, not including the ground).
Frequency in Octave Bands	A range of frequencies where the upper frequency limit is twice that of the lower frequency limit. For example, the 1000 Hertz octave band contains acoustic energy at all frequencies from 707 to 1414 Hertz.
Frequency in One Third Octave Bands	Octave bands that are sub-divided into three parts, equal to 23% of the centre frequency. Used when octave analysis does not provide sufficient detail. Divides the audio spectrum into 33 or more equal parts where the cut-off frequencies have a ratio of 21/3, which is approximately 1.26. For example, a 1 kHz third-octave band filter has

a centre frequency of 1000 Hz with lower and upper frequencies of 891 Hz and 1112 Hz, respectively. The number of waves per second. The unit of measurement for frequency of a sound wave. A sound described as being impulsive will be characterised by a sudden onset rate of a sound. In BS 4142:2014 + A1:2019 the onset rate of a sound must exceed a slope gradient of 10 dB per second on the positive slope for a sound to be characterised as impulsive. A penalty of up to 9 dB can be applied to an impulsive sound dependent on impulse prominence. An intermittent sound will come from a source that has on and off conditions that are readily distinguishable against the residual acoustic environment. In BS 4142:2014 + A1:2019 a penalty of 3 dB can be applied to a sound where it is determined to be intermittent. LA10, 18h The LA10, 18h is the A-weighted sound pressure level that is exceeded for 10% of an 18-hour measurement. LA90, T The A-weighted sound pressure level that is exceeded for 90% of a given time interval, T. Known as the 'background sound level'. The A-weighted equivalent continuous sound level. It is the notional continuous level that, over the defined time period, T, contains the same sound energy as the actual fluctuating sound that occurred over the same time period. LAeq, 18hr / Laeq, 8hr The LAeq over 16 hour and 8 hour periods respectively. The LAeq, over 18 hour and 6 hour periods respectively. The maximum recorded sound level within a given time period, T, measured using a fast time weighting. The level of A-weighted noise exceeded for N% of the measurement time T. Note that the time weighting (usually Fast) is sometimes included, denoted by 'F' (e.g. Larnt) The maximum recorded sound level within a given time period, T, measured using a slow time weighting.		
Hertz (Hz) The number of waves per second. The unit of measurement for frequency of a sound wave. A sound described as being impulsive will be characterised by a sudden onset rate of sound. In BS 4142:2014 + A1:2019 the onset rate of a sound must exceed a slope gradient of 10 dB per second on the positive slope for a sound to be characterised as impulsive. A penalty of up to 9 dB can be applied to an impulsive sound dependent on impulse prominence. An intermittent sound will come from a source that has on and off conditions that are readily distinguishable against the residual acoustic environment. In BS 4142:2014 + A1:2019 a penalty of 3 dB can be applied to a sound where it is determined to be intermittent. La10, 18h The La10, 18h is the A-weighted sound pressure level that is exceeded for 10% of an 18-hour measurement. The A-weighted sound pressure level that is exceeded for 90% of a given time interval, T. Known as the 'background sound level'. The A-weighted equivalent continuous sound level. It is the notional continuous level that, over the defined time period, T, contains the same sound energy as the actual fluctuating sound that occurred over the same time period. Laeq, 16hr / Laeq, 8hr The Laeq over 16 hour and 8 hour periods respectively. The Laeq over 18 hour and 6 hour periods respectively. The maximum recorded sound level within a given time period, T, measured using a fast time weighting. The level of A-weighted noise exceeded for N% of the measurement time T. Note that the time weighting (usually Fast) is sometimes included, denoted by 'F' (e.g. Larn,T) The maximum recorded sound level within a given time period, T, measured using a slow time weighting. Term	Definition
Modal (average)	The mode is the number in a dataset that is repeated more often than any other number in the same set.
Noise	A term used to describe 'unwanted sound' or any sound that is undesired by the recipient.
NSIP	Nationally Significant Infrastructure Projects are major infrastructure developments in England and Wales which are consented by DCO under the Planning Act 2008. These include proposals for offshore wind farms with an installed capacity over 100MW.
Rating level, L _{Ar, T}	The specific sound level, plus any adjustments for the characteristic features of the sound, (such as tonality, impulsivity or intermittency).
Root mean square (rms)	Root Mean Square of a time-varying quantity is obtained by squaring the amplitude at each instant, obtaining the average of the squared values over the interval of interest, and then taking the Square Root of this average.
Sound	A term used to describe airborne waves that can be heard.
Sound level meter (SLM)	SLM is the instrument used for acoustic (sound that travels through air) measurements. It is commonly a hand-held instrument with a microphone. The diaphragm of the microphone responds to changes in air pressure caused by sound waves.
Sound pressure level (L _p)	Sound pressure level is the RMS value of the Instantaneous Sound Pressures measured over a specified period of time, measured in decibels (dB) to a given reference pressure level.
Specific sound level	An equivalent continuous A-weighted sound pressure level produced by the specific sound source at the assessment location over a given reference time interval, Tr.
	Time weightings determine how quickly the sound level meter responds to changes in sound pressure level.
Time weighting	Fast time weighting: the sound level meter samples over a few discrete 125ms periods, with all parameters calculated from these 125ms measurements. E.g. a 15-minute measurement period is actually 432,000 individual measurements. Slow time weighting: the sound level meter samples over several discrete 1 second periods, with all parameters calculated from these 1 second measurements.
Tonal	A sound described as being tonal will be characterised as a sound that contains one or more distinct tones. In BS 4142:2014 + A1:2019 a tone can be identified where a frequency band contains more energy and is shown to have a certain level difference over its neighboring

Term	Definition
	bands. A penalty of up to 6 dB can be applied to a tonal sound dependent on tonal prominence.
Weighting network	An electronic filter in a sound level meter, which approximates, under defined conditions, the frequency response of the human ear. The Aweighting network is most commonly used.

Date Calibrated

30 March 2021

The sound level meter submitted for testing has successfully completed the class 1 periodic tests of IEC 61672-3:2006, for the environmental conditions under which the tests were performed. As public evidence was available, from an independent testing organisation responsible for approving the results of pattern evaluation tests performed in accordance with IEC 61672-2:2003, to demonstrate that the model of sound level meter fully conformed to the requirements in IEC 61672-1:2002, the sound level meter submitted for testing conforms to the class 1 requirements of IEC 61672-1:2002.

Test Procedure Procedure TP 1 Calibration of Sound Calibrators

Description Acoustic Calibrator

IdentificationManufacturerInstrumentModelSerial No.RionCalibratorNC-7434251553

The calibrator has been tested as specified in Annex B of IEC 60942:2003. As public evidence was available from a testing organisation (PTB) responsible for approving the results of pattern evaluation tests, to demonstrate that the model of sound calibrator fully conformed to the requirements for pattern evaluation described in Annex A of IEC 60942:2003, the sound calibrator tested is considered to conform to all the class 1 requirements of IEC 60942:2003.

ANV Job No. UKAS23/06393

Date Received 09 June 2023

Date Calibrated 12 June 2023

Previous Certificate Dated 11 May 2022

Certificate No. UCRT22/1632

Laboratory 0653

Certificate Number UCRT23/1766

UKAS Accredited Calibration Laboratory No. 0653

Measurements

The sound pressure level generated by the calibrator in its WS2 configuration was measured five times by the Insert Voltage Method using a microphone as detailed below. The mean of the results obtained is shown below. It is corrected to the standard atmospheric pressure of 101.3 kPa (1013 mBar) using original manufacturers information.

Test Microphone

Manufacturer

Type

Brüel & Kjær

4134

Results

The level of the calibrator output under the conditions outlined above was

94.01 \pm 0.10 dB rel 20 μ Pa

Functional Tests and Observations

The frequency of the sound produced was

 $1002.91 \pm 0.12 \; Hz$

The total distortion was

 1.14 ± 0.08 % Distortion

During the measurements environmental conditions were

Temperature 22 to 23 $^{\circ}$ C Relative Humidity 39 to 46 $^{\circ}$ Barometric Pressure 100.4 to 100.5 kPa

The reported expanded uncertainty is based on a standard uncertainty multiplied by a coverage factor k=2, providing a coverage probability of approximately 95%. The uncertainty evaluation has been carried out in accordance with UKAS requirements.

The uncertainties refer to the measured values only with no account being taken of the ability of the instrument to maintain its calibration.

A small correction factor may need to be applied to the sound pressure level quoted above if the device is used to calibrate a sound level meter which is fitted with a free-field response microphone. See manufacturers handbook for details.

Date Received 15 June 2023 ANV Job No. UKAS23/06405

Date Calibrated 15 June 2023

The sound level meter submitted for testing has successfully completed the class 1 periodic tests of IEC 61672-3:2006, for the environmental conditions under which the tests were performed. As public evidence was available, from an independent testing organisation responsible for approving the results of pattern evaluation tests performed in accordance with IEC 61672-2:2003, to demonstrate that the model of sound level meter fully conformed to the requirements in IEC 61672-1:2002, the sound level meter submitted for testing conforms to the class 1 requirements of IEC 61672-1:2002.

The reported expanded uncertainty is based on a standard uncertainty multiplied by a coverage factor $k=2$, providing
a coverage probability of approximately 95%. The uncertainty evaluation has been carried out in accordance with
UKAS requirements.
For the test of the frequency weightings as per paragraph 12, of IEC 61672-3:2006 the actual microphone free field
response was used.
The acoustical frequency tests of a frequency weighting as per paragraph 11 of IEC 61672-3:2006 were carried out
TISINO AN EJECTIOSTANO ACIDANOL.

If YES above there is public evidence that the SLM has successfully completed the

applicable pattern evaluation tests of IEC 61672-2:2003

Date Received

13 April 2022

ANV Job No.

UKAS22/04272

Date Calibrated

14 April 2022

The sound level meter submitted for testing has successfully completed the class 1 periodic tests of IEC 61672-3:2006, for the environmental conditions under which the tests were performed. As public evidence was available, from an independent testing organisation responsible for approving the results of pattern evaluation tests performed in accordance with IEC 61672-2:2003, to demonstrate that the model of sound level meter fully conformed to the requirements in IEC 61672-1:2002, the sound level meter submitted for testing conforms to the class 1 requirements of IEC 61672-1:2002.

PROCEDURE Procedure TP 1 Calibration of Sound Calibrators

IDENTIFICATION Sound Calibrator 01dB type CAL21 serial number 34134164(2013)

with one-inch housing and adapter type BAC21 for half-inch

microphone

CALIBRATED ON 21 August 2023

PREVIOUS Calibrated on 13 May 2022, Certificate No. UCRT22/1649 issued by

CALIBRATION this laboratory.

UKAS ACCREDITED CALIBRATION LABORATORY No 0653

Certificate No UCRT23/2091

Page 2 of 2 Pages

MEASUREMENTS

The sound pressure level generated by the Sound Calibrator in its half-inch configuration was measured using a B&K type 4134 microphone with the protective grid in position. The microphone sensitivity was traceable to National Standards.

RESULTS

The mean level of the calibrator output, corrected to the standard atmospheric pressure of 101.3 kPa using manufacturers' data, was

 93.99 ± 0.10 dB rel 20 µPa

The fundamental frequency of the sound output was 1001.95 ± 0.12 Hz, and its total distortion was (2.57 ± 0.17) %.

The reported expanded uncertainty is based on a standard uncertainty multiplied by a coverage factor k=2, providing a coverage probability of approximately 95%. The uncertainty evaluation has been carried out in accordance with UKAS requirements.

During the measurements the laboratory environmental conditions were:

Temperature: 23 to 24 °C

Atmospheric pressure: 101.3 to 101.4 kPa

Relative humidity: 34 to 44 %

The tests carried out were based on Annex B of BS EN 60942:2003, but with five determinations of sound pressure level, and limited to the above level(s) & freq(s). This is a subset of the tests specified in Annex B of BS EN 60942:1998. The mean level, frequency and total distortion of the sound output as measured meet the Class 1 requirements of BS EN 60942:1998 for the environmental conditions under which the tests were performed. This does not imply that the sound calibrator meets this standard under any other conditions. However it has successfully undergone pattern evaluation to the earlier Standard IEC 942:1988

The results on this certificate only relate to the items calibrated as identified above.

PREVIOUS Calibrated on 29 August 2019, Certificate No. UCRT19/1943 issued

CALIBRATION by this laboratory.

UKAS ACCREDITED CALIBRATION LABORATORY No 0653

Certificate No UCRT21/2301

Page 2 of 3 Pages

The sound level meter was set up using the type CAL21 sound calibrator supplied; it was set to frequency weighting A, and initially read 94.0 dB. It was then adjusted to read 93.8 dB (corresponding to 93.8 dB at standard atmospheric pressure). This reading was derived from Calibration Certificate no. UCRT21/2295 supplied by this laboratory and manufacturers' information on the free-field response of the sound level meter when fitted with the windshield. The calibration check frequency was 1kHz.

Procedures from IEC 61672-3:2006 (BS EN 61672-3:2006) as modified by UKAS TPS 49 Edition 2:June 2009 were used to perform the periodic tests.

RESULTS

The sound level meter submitted for testing has successfully completed the class 1 periodic tests of IEC 61672-3:2006 (BS EN 61672-3:2006), for the environmental conditions under which the tests were performed. As public evidence was available, from an independent testing organization responsible for approving the results of pattern evaluation tests performed in accordance with IEC 61672-2: 2003 (BS EN 61672-2: 2003), to demonstrate that the model of sound level meter fully conformed to the requirements in IEC 61672-1: 2002 (BS EN 61672-1: 2003), the sound level meter submitted for testing conforms to the class 1 requirements of IEC 61672-1: 2002 (BS EN 61672-1: 2003).

The self-generated noise recorded with the microphone replaced by the electrical input device was:

14.5 dB (A) 15.2 dB (C) 18.1 dB (Z)

The environmental conditions recorded at the start and end of testing were:

Start: 22 to 23 °C, 31 to 41 %RH and 100.1 to 100.2 kPa End: 24 to 25 °C, 38 to 48 %RH and 100.1 to 100.2 kPa

Technical information including adjustment data specified in the manufacturers' User Manual DOC1131 - Feb 2017 J with further clarification from 01dB has been used to carry out this verification. These data include manufacturer-specified uncertainties for case reflections and windshield, but NOT for the microphone response.

Publicly-available evidence has been found that this configuration of the 01dB FUSION sound level meter design has successfully undergone pattern evaluation in accordance with IEC 61672-2:2002 (BS EN 61672-2:2003) by Physikalisch-Technische Bundesanstalt (PTB), an independent testing organisation responsible for pattern approvals.

All measurement data are held at ANV Measurement Systems for a period of at least six years.

The reported expanded uncertainty is based on a standard uncertainty multiplied by a coverage factor k=2, providing a coverage probability of approximately 95%. The uncertainty evaluation has been carried out in accordance with UKAS requirements.

NOTES

Any opinions or interpretations which may be expressed in the following notes are not UKAS Accredited.

- 1 The high pass filter was set to 10 Hz, the mic correction to 90° and the nosecone usage to "Yes".
- 2 No suitable microphone frequency response information was supplied with the instrument. It was therefore measured by this laboratory using the electrostatic actuator method. This response in isolation is not UKAS accredited.
- 3 The instrument was running application firmware version 2.34 and metrology firmware version 2.10 on hardware version LIS006E
- These periodic tests are valid ONLY for the instrument configuration shown on page 1 of this certificate and for 90° incidence of sound on the microphone.
- When set up to read correctly in response to the sound calibrator, the sound level meter stored a calibration correction of 0.32 dB and a microphone sensitivity of 37.5 mV/Pa
- 6 Typical case reflection factors (for the DMK01 unit) specified by the manufacturer have been used for this verification.

DATE OF RECEIPT 18 October 2021

PROCEDURE Calibration Engineer's Handbook section 3: verification of sound level

meters to BS 7580:Part 1:1997

IDENTIFICATION Sound level meter 01dB type Blue Solo (Master) serial No 61331

connected via a RAL122-10m extension lead and preamplifier type PRE21S serial No 14575 to a half-inch microphone type MCE212 serial No 92344. Associated calibrator Norsonic type 1251 serial No 31460 with a one-inch housing and adapter type 1443 for half-inch

microphone.

CALIBRATED ON 22 October 2021

PREVIOUS Calibrated on 03 May 2019 Certificate No. UCRT19/1544 issued by

CALIBRATION this laboratory.

UKAS ACCREDITED CALIBRATION LABORATORY No 0653

Certificate No UCRT21/2313

Page 2 of 3 Pages

The sound level meter was set to frequency weighting A and adjusted to read 114.0 dB (corresponding to 114.0 dB at standard atmospheric pressure) in response to the sound calibrator supplied. This reading was derived from the Calibration Certificate No. UCRT21/2292 supplied by this laboratory and manufacturers' information on the free-field response of the sound level meter .

The sound level meter was then tested, and its overall sensitivity adjusted, in accordance with clause 5 of BS 7580:Part 1:1997 **

The acoustic calibration at 1kHz specified in subclause 5.6.1 of the standard was performed by application of a standard sound calibrator, whilst the tests at 125Hz and 8kHz (subclause 5.6.2) were performed by the electrostatic actuator method.

At the end of the test, the sound calibrator was reapplied to the sound level meter and the meter reading was recorded. The final sensitivity setting in calibration mode was -0.3 dB.

RESULTS

The sound level meter was found to conform to BS 7580:Part 1:1997 ** for a type 1 meter.

The self-generated noise recorded in the test specified in subclause 5.5.2 was:

9.2 dB (A)

8.0 dB (B)

9.5 dB (C)

13.8 dB (Lin)

The sound level meter reading obtained at the end of the test in response to the sound calibrator was 114.0 dB (corresponding to 114.0 dB at standard atmospheric pressure). This reading, corrected for ambient pressure, should be used henceforth to set up the sound level meter for field use.

The expanded level uncertainty of the Laboratory's 1 kHz sound calibrator used during this verification is \pm 0.10 dB; that of the calibrator supplied with the sound level meter is \pm 0.10 dB.

The reported expanded uncertainty is based on a standard uncertainty multiplied by a coverage factor k=2, providing a coverage probability of approximately 95%. The uncertainty evaluation has been carried out in accordance with UKAS requirements.

All measurement data are held at ANV Measurement Systems for a period of at least six years.

The case reflection factors have been taken as zero, since an extension lead has been used for this verification.

The linearity range and primary indicator range have been obtained from the manufacturer, and are stated to cover the entire measurement range of the instrument, 20 - 137 dB, as given in the handbook (dated 18 June 2003). The maximum level for signals of crest factor 3 has been interpreted from the handbook as 130 dB(A).

The 01dB Solo sound level meter design has successfully undergone pattern evaluation at Physikalisch-Technische Bundesanstalt (PTB). It was found to meet the requirements of BS EN 60651* and BS EN 60804* and was granted pattern approval as a Type 1 sound level meter.

No component of uncertainty for manufacturer-specified corrections has been included in the uncertainty budget and, in accordance with Amendment No 1 to BS 7580:Part 1:1997 ** the measured values obtained during the verification have not been extended by any measurement uncertainty when assessing conformance to the standard.

Conformance as indicated above to BS 7580:Part 1:1997 indicates that the instrument conforms with the relevant accuracy requirements of the testing standard and the expanded measurement uncertainties (k=2 for approximately 95% coverage probability) are no greater in magnitude than the accuracy requirements defined in BS 7580:Part 1:1997.

- 2 No suitable microphone frequency response information was supplied with the instrument. It was therefore measured by this laboratory using the electrostatic actuator method. This response in isolation is not UKAS accredited.
- 3 The instrument was running application firmware version 2.34 and metrology firmware version 2.10 on hardware version 3F2D3D
- These periodic tests are valid ONLY for the instrument configuration shown on page 1 of this certificate and for 90° incidence of sound on the microphone.
- When set up to read correctly in response to the sound calibrator, the sound level meter stored a calibration correction of 0.17 dB and a microphone sensitivity of 49 mV/Pa
- 6 Typical case reflection factors (for the DMK01 unit) specified by the manufacturer have been used for this verification.

Calibrated at & Certificate issued by:

CUSTOMER

ORDER No 20151187 Job No UKAS22/09596

DATE OF RECEIPT 22 September 2022

PROCEDURE Calibration Engineer's Handbook section 3: verification of sound level

meters to BS 7580:Part 1:1997

IDENTIFICATION Sound level meter 01dB type Black Solo (Master) serial No 65806

connected via a RAL122-10M extension lead and preamplifier type PRE21S serial No 16461 to a half-inch microphone type MCE212 serial No 166412. Associated calibrator 01dB type CAL21 serial No 34323904(2012) with a one-inch housing and adapter type BAC21 for

half-inch microphone.

CALIBRATED ON 23 September 2022

PREVIOUS Calibrated on 20 December 2021 Certificate No. UCRT21/2541

CALIBRATION issued by this laboratory.

UKAS ACCREDITED CALIBRATION LABORATORY No 0653

Certificate No UCRT22/2136

Page 2 of 3 Pages

The sound level meter was set to frequency weighting A and adjusted to read 93.8 dB (corresponding to 93.8 dB at standard atmospheric pressure) in response to the sound calibrator supplied. This reading was derived from the Calibration Certificate No. UCRT22/2131 supplied by this laboratory and manufacturers' information on the free-field response of the sound level meter .

The sound level meter was then tested, and its overall sensitivity adjusted, in accordance with clause 5 of BS 7580:Part 1:1997 **

The acoustic calibration at 1kHz specified in subclause 5.6.1 of the standard was performed by application of a standard sound calibrator, whilst the tests at 125Hz and 8kHz (subclause 5.6.2) were performed by the electrostatic actuator method.

At the end of the test, the sound calibrator was reapplied to the sound level meter and the meter reading was recorded. The final sensitivity setting in calibration mode was 0.4 dB.

RESULTS

The sound level meter was found to conform to BS 7580:Part 1:1997 ** for a type 1 meter.

The self-generated noise recorded in the test specified in subclause 5.5.2 was:

9.7 dB (A)

8.5 dB (B)

9.8 dB (C)

14.5 dB (Lin)

The sound level meter reading obtained at the end of the test in response to the sound calibrator was 93.8 dB (corresponding to 93.8 dB at standard atmospheric pressure). This reading, corrected for ambient pressure, should be used henceforth to set up the sound level meter for field use.

The expanded level uncertainty of the Laboratory's 1 kHz sound calibrator used during this verification is \pm 0.10 dB; that of the calibrator supplied with the sound level meter is \pm 0.10 dB.

The reported expanded uncertainty is based on a standard uncertainty multiplied by a coverage factor k=2, providing a coverage probability of approximately 95%. The uncertainty evaluation has been carried out in accordance with UKAS requirements.

All measurement data are held at ANV Measurement Systems for a period of at least six years.

The case reflection factors have been taken as zero, since an extension lead has been used for this verification.

The linearity range and primary indicator range have been obtained from the manufacturer, and are stated to cover the entire measurement range of the instrument, 20 - 137 dB, as given in the handbook (dated 18 June 2003). The maximum level for signals of crest factor 3 has been interpreted from the handbook as 130 dB(A).

The 01dB Solo sound level meter design has successfully undergone pattern evaluation at Physikalisch-Technische Bundesanstalt (PTB). It was found to meet the requirements of BS EN 60651* and BS EN 60804* and was granted pattern approval as a Type 1 sound level meter.

No component of uncertainty for manufacturer-specified corrections has been included in the uncertainty budget and, in accordance with Amendment No 1 to BS 7580:Part 1:1997 ** the measured values obtained during the verification have not been extended by any measurement uncertainty when assessing conformance to the standard.

Conformance as indicated above to BS 7580:Part 1:1997 indicates that the instrument conforms with the relevant accuracy requirements of the testing standard and the expanded measurement uncertainties (k=2 for approximately 95% coverage probability) are no greater in magnitude than the accuracy requirements defined in BS 7580:Part 1:1997.

UKAS ACCREDITED CALIBRATION LABORATORY No 0653

Certificate No UCRT22/2136

NOTES

- *1 BS EN 60651:1994 and BS EN 60804:1994 were formerly numbered BS 5969:1981 and BS 6698:1986 respectively.
- **2 BS 7580:Part 1:1997 was formerly numbered BS 7580:1992.
- 3 No suitable microphone frequency response information was supplied with the instrument. It was therefore measured by this laboratory using the electrostatic actuator method. This response in isolation is not UKAS accredited.
- 4 The instrument firmware version was 1.405 272A 01107
- 5 The verification was carried out in L_p / L_{eq} SLM mode only, and may not be valid for any other mode.
- The frequency weighting designated Z in the meter has been taken as equivalent to *Lin* weighting of BS EN 60651:1994.
- 7 Any opinions or interpretations which may be expressed in these notes are not UKAS Accredited.

Description of monitoring location

The Sound Level Meter (SLM) was deployed along the eastern boundary of a hedge bounding garden. The SLM was located approximately 2.5m above ground in a free-field position, approximately 30m from the closest acoustically reflective façade.

General observations

The noise environment noted during SLM deployment and collection was generally quiet, and typical of a rural location. Noise from distant road traffic movements, along with birdsong, sound of the waves from the sea to the south and noise from tractors in the nearby fields contributed to the overall noise environment.

Location: Cowfold

Duration: 15/11/2023 14:00 -16/11/2023 10:30 Description of monitoring location

The SLM was deployed at the northern boundary of the recreational field directly to the west of Oakendene Industrial Estate, and approximately 45m south of the A272. The SLM was located approximately 1.5m above ground in a free-field position.

General observations

The noise environment noted during SLM deployment and collection was dominated by the traffic movement along the A272 and vehicle activity in and out of the estate. Noise from the wind in vegetation was also noted to be present in the area.
