Executive Summary

Following closure of the statutory consultation period under Section 56 of the Planning Act 2008 for Rampion 2, the Applicant has reviewed each of the Relevant Representations received from stakeholders who registered as Interested Parties in the Examination.

This document has been submitted for Examination Deadline 1 to provide the Applicant's responses to the Relevant Representations received, as categorised by the Planning Inspectorate:

- 10 representations from Local Planning Authorities;
- 18 representations from parish and towns councils and representations from 3 Members of Parliament;
- 12 representations from prescribed consultees;
- 91 representations from and on behalf of Affected Parties;
- 275 representations from members of the public or businesses; and
- 16 representations from non-prescribed organisations.

1. Introduction

1.1 Introduction

Rampion Extension Development Limited (hereafter referred to as 'RED') (the 'Applicant') is developing the Rampion 2 Offshore Wind Farm Project ('Rampion 2') located adjacent to the existing Rampion Offshore Wind Farm Project ('Rampion 1') in the English Channel.

1.1.1 Rampion 2 will be located between 13km and 26km from the Sussex Coast in the English Channel and the offshore array area will occupy an area of approximately 160km^2. A detailed description of the Proposed Development is set out in **Chapter 4: The Proposed Development, Volume 2** of the Environmental Statement (ES) **[APP-045]**, submitted with the Development Consent Order (DCO) Application.

1.2 Purpose of this Document

1.2.1 Following closure of the statutory consultation period under Section 56 of the Planning Act 2008 for Rampion 2, the Applicant has reviewed each of the Relevant Representations (RRs) received from stakeholders who registered as Interested Parties in the Examination.

1.2.2 The registration of Interested Parties (IPs) began on 20 September 2023 and closed on 6 November 20203. During this period, a total of 425 Relevant Representations (RRs) were received by the Planning Inspectorate (PINS). The RRs were published on PINS' website 28 November 2023.

1.2.3 This document is submitted for Deadline 1 of the Examination and provides the Applicant's responses to the RRs received, as categorised by PINS:

- 10 representations from Local Planning Authorities;
- 18 representations from parish and towns councils and representations from 3 Members of Parliament;
- 12 representations from prescribed consultees;
- 91 representations from and on behalf of Affected Parties;
- 275 representations from members of the public or businesses; and
- 16 representations from non-prescribed organisations.

1.2.4 Details of the Applicant's response to each of those RRs received are set out in the subsequent sections of this document and its appendices.

1.3 Structure of the Applicant's Responses

1.3.1 This document sets out the Applicant's responses to RRs. For ease of referencing and to facilitate future cross-referencing, the Applicant has included references for the RRs.

1.3.2 There are also 29 Appendices which can be found at the end of this document.

1.3.3 The responses are divided into six categories as follows:

- Local Authorities (including both host and neighbouring authorities)
- Parish Councils and Members of Parliament
- Prescribed Consultees (as set out in Schedule 1 of the Infrastructure Planning (Application: Prescribed Forms and Procedures) Regulations 2010, noting that Parish Councils are also Prescribed Consultees)
- Affected Parties (Category 1, 2 and 3 Land Interests as identified in the Book of Reference **[PEPD-014]**)
- Members of the Public and Businesses
- Non-Prescribed Consultees

1.3.4 Each section below includes responses to each category of RR. For members of the public and businesses, the responses are provided by theme of comment rather than providing a separate response for each RR individually to avoid repetition where possible. Each RR is identified in the relevant table in this category where that Interested Party has raised a comment on that topic.

1.3.5 The response to Natural England sits in a separate section, as there were a number of appendices that also required responses. Further clarification is provided in paragraph 4.1.1.

2. Applicant's Response to Relevant Representations: Local Planning Authorities

Table 2-1 Applicant's Response to Arun District Council

Ref	Relevant representation comment	Applicant's response
2.1.1	There is considered to be insufficient evidence and justification for selection of some aspects of the Project and the alternatives studied by the Applicant, taking into account environmental effects.	**Chapter 3: Alternatives, Volume 2** of the Environmental Statement (ES) **[APP-044]** describes the alternatives studied by the Applicant and a comparison of their environmental effects.
2.1.2	ADC has concerns about the location, substantial size and the likely effects of Climping Compound during the construction period.	An outline of requirement and description of uses for the temporary construction compounds (TCCs) is given in the **Statement of Reasons** **[APP-021]** (**Paragraph 6.10** onwards) which states *"Temporary Construction Compounds will comprise of a hardstanding and a perimeter fence and will be used for the storage of plant and machinery and the stockpiling of materials, as well as for the provision of site management offices, parking, and welfare facilities for construction personnel (kitchen facilities, storerooms, toilets) in accordance with Health and Safety and Construction Design and Management Regulations".* The TCCs have been located strategically to each serve a section of onshore cable route during construction. A TCC is best located near to a trunk road for ease of transport links, outside of designated areas, of sufficient size to fulfil its purpose and on flat land where possible to reduce the need for cut/fill. Commitments are provided in the **Commitments Register** **[APP-254]** (provided at Deadline 1 submission) in relation to effects of construction compounds during and after construction including: • C-27 (Reinstatement) secured in the **Outline Code of Construction Practice** **[PEPD-033]** and Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**; • C-129 (Aggregate for Surface Protection) secured in the **Outline Code of Construction Practice** **[PEPD-033]** and Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**; • C-196 (Landscape Re-instatement) secured in the **Outline Landscape and Ecology Management Plan** **[APP-232]** and Requirement 13 of the **Draft Development Consent Order** **[PEPD-009]**; • C-204 (BS 5837:2012 (British Standards Institution, 2012), tree protection) secured in the **Outline Code of Construction Practice** **[PEPD-033]** and Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**; and • C-282 and C-285 (Arboricultural Method Statement) secured in the **Outline Code of Construction Practice** **[PEPD-033]** and Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. **Volume 2** of the ES [**APP-042–APP-072]** has assessed the effects of the Climping compound during the construction phase. Though impacts will arise, there are no significant effects arising from noise, dust, ecology, settlement/residential areas, Public Rights of Way access and traffic impacts when considering the embedded environmental measures secured in the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]**, the **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** and **Outline Public Rights of Way Management Plan (PRoWMP)** **[APP-230]**. The Applicant acknowledges that there will be significant landscape and visual effects associated with the presence of the Climping compound on the local landscape character and views from PRoW 168, Church Lane/A259 (partly overlapped with the Arun Way and South Coast Cycle Route), Clymping Village Hall/recreation area and the Climping Caravan Site. These will be temporary and limited by retention of the perimeter vegetation along the A259. Where removal is required (as per the **Vegetation Retention Plan–Appendix B** of the

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		Outline CoCP **[PEPD-033]**), this will be temporary as per the commitment to reinstatement in the Outline Landscape and Ecology Management Plan (LEMP) **[APP-232]** is considered. Each of the above plans will be subject to submission of stage specific details for approval (including the stage specific CoCP and stage specific LEMP to Arun District Council who will also be consulted on the stage specific CTMP and stage specific PRoWMP (for approval by West Sussex County Council)). This is as per the Draft Development Consent Order (DCO) **[PEPD-009]** Requirements 22, 12, 24 and 20 respectively. See below chapters: • Chapter 17: Socio-economics, Volume 2 of the ES **[APP-058]**; • Chapter 18: Landscape and visual impact, Volume 2 of the ES **[APP-059]**; • **Table 2-3** of Appendix 18.3: Landscape assessment, Volume 4 of the ES **[APP-169]**; • **Table 1-3, Table 1-14, Table 1-16, Table 1-35 and Table 1-43 of** Appendix 18.4: Visual assessment, Volume 4 of the ES **[APP-170]**; • Chapter 19: Air quality, Volume 2 of the ES **[APP-060]**; • Chapter 21: Noise and vibration, Volume 2 of the ES **[PEPD-018]**; • Chapter 22: Terrestrial ecology and nature conservation, Volume 2 of the ES **[APP-062]**; and Chapter 23: Transport, Volume 2 of the ES **[APP-063]** for further information on the assessment of effects.
2.1.3	ADC has concerns of the lack of commitment and securing mechanism of mitigation, monitoring and compensation. It is not always clear mitigation/compensation is followed though to a securing mechanism and the Commitments Register appears more aspirational rather than embedded environmental measures.	The Commitments Register **[APP-254] (**provided at Deadline 1 submission) includes a column for the securing mechanism for each embedded environmental measure and its related commitment reference. This cross-refers to the mechanism (e.g. a requirement in Schedule 1 Part 3 of the Draft Development Consent Order (DCO) **[PEPD-009]**). Where there is an accompanying document such as an outline plan submitted with the DCO Application with which works must be undertaken accordance, this is also referred to under the 'Relevant Application Documents' column. The Applicant has provided an update to the Commitments Register **[APP-254]** at Deadline 1 to including further detail e.g. the full reference to DCO requirements and addition of the location of further information within the Application documents.
2.1.4	2. Outline Skills and Employment Strategy – limited detail is outlined within the Outline Skills and Employment Strategy and ADC is not listed as a consultee to this document. This is a concern given the adverse effects the District will experience during construction. ADC is expecting to be a recipient and consultee regarding benefits – being particularly interested in learning related opportunities at all levels including apprenticeships and universities. The Strategy is very high-level and it is not clear how different elements inter relate, for example, para. 2.3.3 refers to "Encouraging and supporting growth and employment in local supply chain companies… Increasing visibility of local SMEs" whereas supporting local business is not included as an objective in para 5.1.2. Further to this, the Environmental Statement (ES) (Chapter 17, Table 17.19) cites "RED will identify opportunities for companies based or operating in the region to access supply chain for the Proposed	The outline Skills & Employment Strategy (oSES) **[APP-256]** was intentionally high-level and the Applicant was not in a position to document concrete commitments without further consultation with key skills & employment stakeholder organisations in Sussex. The first tranche of consultation took place between July and October 2023, the results of which have fed into the second iteration of the oSES **[PEPD-037]**, submitted to the Examining Authority (ExA) in January 2024. This latest version of the oSES **[PEPD-037]** includes seven additional key skills & employment stakeholder organisations, including Arun District Council, alongside Horsham and Adur & Worthing Councils, educational institutions and Gatwick Airport. Following this series of consultation meetings and the examination itself, the Applicant will produce a final Skills & Employment Strategy outlining key objectives and activities, which is likely to include details regarding an apprenticeship scheme and engagement with educational institutions.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	Development" as being secured through measure C-34 in the Outline Code of Construction Practice (OCCP). This measure, however, is not within the OCCP.	
2.1.5	Community Benefits Package - ADC has concerns about securing benefits from this package. Reference is made to the Community Benefits Package in the Outline Skills and Employment Strategy. Due to adverse effects identified (below) the Community Benefits Package is necessary to assist in mitigation.	Adverse impacts of the scheme have been greatly reduced, through evolving design (in response to consultation feedback and survey findings), the identification of mitigation solutions and their subsequent implementation through management plans. Community benefits are not a legal or DCO requirement and are quite distinct from the consenting process, a point reiterated in the UK Government (Department for Energy Security and Net Zero) response to the consultation on Community Benefits for Electricity Transmission Network Infrastructure (December 2023), which stated: *"The proposals on community benefits for electricity transmission network infrastructure discussed within this document will remain separate to the planning process. It will not be a material consideration in planning decisions, and not secured through those decisions."* That said, Rampion 2 will be a permanent neighbour in the Sussex community and the Applicant intends to develop and implement a community benefits package of proposals. In the second half of 2024, the Applicant will therefore be consulting key stakeholders and local communities on how a community benefit package could best support Sussex communities. The final package may include a range of initiatives to benefit business, education and residential communities.
2.1.6	Jobs – ADC has concerns that there will be a low number of locally skilled jobs created in Arun from the Project. The construction benefits are described in the ES as being 80 jobs across Sussex and operational benefits as being 100-110 jobs across Sussex (Chapter 17, Tables 17.25 and 17.32). The potential for employment by location may be influenced by the Skills and Employment Strategy in terms of preparing and informing local business. Details on this are therefore important.	It is acknowledged that the number of local jobs during the construction phase is low in comparison to other offshore wind farms. However, there are several important points to note: i. The 80 full time equivalent (FTE) construction phase jobs quantified in **Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]** are based on the annual number of jobs supported with suppliers in Sussex or accessed by local residents. This therefore does not include non-Sussex resident construction workers. ii. It is noted that the actual number of peak jobs onsite will be higher than this due to the inclusion of non-local jobs and the variations in construction activity across the construction phase. iii. The assessment is based on a realistic worst case scenario. This uses conservative assumptions about the level of local sourcing and assumes that the port used for construction will be outside the local study area. Operational employment benefits of 100-110 FTE jobs across Sussex are consistent with offshore wind farms so the Applicant disagrees that this represents a low number of skilled jobs. It should be noted, however, that these jobs are more likely to be accessed by residents of districts closer to the O&M base (which is likely to be located in Newhaven, East Suffolk). It is noted that positive activity and engagement that takes place due to the **Outline Skills and Employment Plan** **[PEPD-037]** and subsequent Skills and Employment Plan will help to increase the local benefits as the Project may be able to achieve more local employment due to the commitments outlined in the plan. ADC is correct to note that preparing and informing local businesses of supply chain opportunities may help the project achieve higher levels of local employment.
2.1.7	Tourism – ADC has concerns regarding displaced tourism from Arun. The ES (Chapter 17) notes that regarding construction effects of wind farms 'the research typically focusses on measuring opinions of what the impacts on the visitor economy could be prior to implementation of the	The study being referred to is a report commissioned by Glasgow Caledonian University (Moffat Centre, 2008). The study was used to assess whether government priorities for wind farms in Scotland were likely to have an economic impact on Scottish tourism. The methodology involved a comprehensive literature review of past studies throughout the world; a national visitor intercept survey at four destinations throughout Scotland where windfarms are present; an internet survey of potential visitors to Scotland; GIS and econometric modelling of the impact on local and national visitor economies based on results from the visitor

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	scheme. However, ex-post research suggests that even where there have been negative effects, these often occur in the form of displaced tourism with visitors diverting to neighbouring areas instead'. Whilst this may be considered a neutral effect at the wider area level, it suggests areas directly affected by construction such as Arun will experience at least temporary adverse effects.	surveys. One of the key aims was to undertake interviews with individuals who had actual experience of wind farms (as opposed to mocked up pictures in before/after studies) in part because some held the belief that individuals inadvertently exaggerated their reactions. The intercept surveys were based on onshore wind farms[1]. For onshore wind, displacement of visitors is a greater issue than in offshore wind, particularly in areas that are very close proximity to turbines. This is less of an issue for offshore wind because the turbines are further away and visible along long stretches of the coast. The results are therefore more relevant for onshore wind farms. Nevertheless, the study found that the economic impact on the tourism sector across Scotland would be 'very small'. After this study, given the increase in wind farm development in Scotland, the Scottish Government asked ClimateXChange to identify what new information exists on the impact on tourism of wind farms, and to consider what new conclusions may be drawn from this information (ClimateXChange, 2012 (see **Appendix 1**)). This study found no new evidence to suggest that wind farms are having a discernible negative economic impact on tourism in Scotland. More local evidence from the tourism sector ONS employment data pre, during and post construction of Rampion 1 is presented in **Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]**. As noted in the assessment this shows continued growth of the sector across Sussex when comparing pre construction to post construction (pre Covid-19 pandemic). Likewise, even through the COVID-19 pandemic, Arun has seen steady growth in tourism sector employment during this period, indicating that Rampion has not led to a decline in the tourism sector in Arun. It should be noted that any disruption from construction activity would be temporary, short term duration and would be unlikely to be significant enough to alter visitor perceptions of Arun as a place to visit. C-33 states "*An Outline CoCP will be adopted to minimise temporary disturbance to residential properties, recreational users and existing land users. It will provide details of measures to protect environmental receptors.*"
2.1.8	Tourism Assets – ADC has concerns regarding the adverse effects on tourist assets within Arun. Chapter 17 of the ES states that at the local level 'installation activity along the onshore cable corridor may have a negative impact on walking and cycling routes, coastal paths, holiday parks and other tourism-related assets that are located in close proximity to onshore construction works… the assessment concludes that during the construction phase there would be major / moderate, and therefore significant effects on a limited number of tourist destinations. These locations are Climping Beach, Climping Camp Site, Climping Caravan Park and Washington Caravan Park'. Many of these locations are in Arun and there are more in the vicinity of Climping Compound. Whilst at County level, it may be a negligible effect, however for Arun, the effect on residents and local businesses will be significant in some instances and this should be identified and mitigated.	The assessment on tourism did not find any major / moderate impacts. The reference to major / moderate and significant impacts is related to of the landscape and visual impact assessment (LVIA) which assesses the visual effects likely to be experienced by people as reported in **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]** and **Chapter 15: Seascape landscape and visual impact assessment, Volume 2** of the ES **[APP-056]**. These assessments identified significant visual effects would occur at a limited number of tourist destinations with the effects of the onshore elements of the Proposed Development limited to the construction phase. However, it does not follow that effects on tourism and tourism assets will also be significant. The tourism assessment considers the potential impact on onshore tourism sectors in the round (along with baseline analysis, noise and traffic) and the duration of these effects. Given the embedded environmental measures detailed in the tourism assessment (such as commitments C-1 (buried onshore cable route), C-22 (construction working hours), and C-128 (temporary crossings in place for minimal time) which is secured by Requirement 22 and 23 of the **Draft Development Consent Order [PEPD-009]**). the Applicant did not find that there would be significant effects on the volume and value of onshore tourism assets.

[1] Braes of Doune Wind far, Buolfruich Wind farm, Causeymire Wind farm, Forss Wind farm, Dunlaw Wind farm and Dalswinton Wind farm

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.1.9	Amenity – concerns regarding the significant effects on public rights of way within Arun, some of which are heavily used.	All Public Rights of Way (PRoW) affected during onshore construction works are identified in **Section 4.3** within the **Outline Public Rights of Way Management Plan [APP-230]**. Table 4-1 within the **Outline Public Rights of Way Management Plan [APP-230]** includes each PRoW impacted by the onshore elements of the Proposed Development, the type of impact and if this impact in temporary or permanent. Paragraph 4.2.5 within the **Outline Public Rights of Way Management Plan [APP-230]** secured via Requirement 20 of the **Draft Development Consent Order (DCO) [PEPD-009]** confirms that no PRoW will be permanently affected by the Proposed Development. Section 5 of the **Outline Public Rights of Way Management Plan [APP-230]** outlines the proposed management measures for the impacted PRoWs including (but not limited to): • Temporary closures and diversions; • Managed crossings; • Shared routes; • Inspection and maintenance; • Signage management; and • PRoW sequencing. Section 5.2 of the **Outline Public Rights of Way Management Plan [APP-230]** also identifies commitments (C-18, C-32, C-161, C162, and C-202) within the **Commitments Register [APP-254]** (updated for the Deadline 1 submission) which have been incorporated into the management of PRoWs which are impacted by the onshore elements of the Proposed Development. Details of the proposed PRoW temporary closures and PRoW diversions are provided in the **Access, rights of way and streets plan [APP-012]**. The provision of a Public Rights of Way Management Plan to be submitted to and approved by the highway authority in consultation with the relevant planning authority is secured via Requirement 20 in the **draft Development Consent Order [PEPD-009]**.
2.1.10	Strategic Housing Allocation - the cable route crosses the housing allocation 'Strategic Housing Allocation SD4 Littlehampton – West Bank' as identified in the Arun Local Plan (adopted 2018). No assessment has been identified which considers the effect on the strategic housing allocation and cable route in terms of the implications and any sterilisation of land.	The cable route is proposed to be drilled underneath a section of the allocated land, without breaking the surface. This is secured through Appendix A Crossing Schedule of the **Outline Code of Construction Practice (CoCP) [PEPD-033]** and Requirement 22 of the **Draft Development Consent Order [PEPD-009]**. This site has been considered within **paragraph 4.7.150** of the **Planning Statement [APP-036]** which states that 'The Proposed Development has been designed to take into account the allocation and approved outline application for the site (Arun District Council application ref: CM/1/17/OUT), which identifies a new access off the A259, and the Proposed Development will not preclude the allocation coming forward'.
2.1.11	ADC acknowledge that the spatial extent of the offshore array area and quantity of wind turbine generators has been reduced. However, ADC continues to have significant concerns regarding the scale relative to the proximity to the coastline and the resulting significant visual effects.	The visual effects of Rampion 2 wind turbine generators (WTGs) are assessed in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]**. The Applicant notes that significant effects on views experienced by people have been identified at a number of representative viewpoints from settlements and seafronts along this section of the Arun coastline. The array area is located approximately 14 km from the closest point of the Arun coastline. Design principles are described in Section 15.7 of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]**, which sets out how the design evolution has resulted in changes and embedded environmental measures to help mitigate the visual effects of the Proposed Development, in response to stakeholder comments, including a reduction in the spatial extent of the Rampion 2 array area, it's spread and quantity of wind turbine generators (WTGs) within it. Opportunities to reduce effects

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		through turbine height reduction are limited due to the technical and economic requirements associated with producing renewable energy as well as other environmental factors. For the reasons stated above the need to retain flexibility of WTG numbers, size and location within the Rampion 2 array area through the planning stages and assessment of a Maximum Design Scenario is necessary. The Applicant considers that the visual effects of the Proposed Development are outweighed by the significant scheme benefits, expressed in the **Planning Statement** **[APP-036]**, and thus compensation is not required to make the proposal acceptable in planning terms.
2.1.12	ADC has significant concerns regarding the visual effects associated with the temporary (approximately 3 years and 5 months) construction horizontal directional (HDD) compound and Climping Compound, which is of a significant size and duration.	The temporary construction compound at Climping (Climping Compound) is associated with the onshore cable corridor and is to be used for up to 3.5 years and the Horizontal Directional Drill (HDD) compound for trenchless crossing is to be used for a much shorter period of 3 to 4 months (see Table 4-22, **Chapter 4: The Proposed Development, Volume 2** of the Environmental Statement (ES) [**APP-045]**). The visual effects of the Climping Compound are assessed in **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]**, **Appendix 18.2: Viewpoint analysis, Volume 4** of the ES **[APP-168]** and **Appendix 18.4: Visual assessment, Volume 4** of the ES **[APP-170]**. The visual assessment takes account of a range of embedded environmental measures to reduce significant effects as far as possible, this includes commitments C-6 (secured in Schedule 1, Part 1 of the **Draft Development Consent Order** **[PEPD-009]**), C-115 and C-174 outlined in the **Commitment Register** **[APP-254]** (updated for the Deadline 1 submission), secured in the **Outline Code of Construction Practice** **[PEPD-033]** and Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. During the construction phase, the residual visual effects of the Climping Compound will have a significant effect on the views from PRoW 168 and the views from part of the A259 and Church Lane which are overlapped by the South Coast Cycle Route / Sustrans Cycle Route 2, and Arun Way. These views and the level of effect will vary according to the seasonal change in vegetation from roadside trees. All of these effects will be temporary and limited to the construction phase. During the operation and maintenance phase, the Climping Compound site will be reinstated to arable field within one year and the residual effects will not be significant. During the decommissioning phase, the onshore cable will left in situ (see Section 9 of **Chapter 4: The Proposed Development, Volume 2** of the ES [**APP-045]**) and the decommissioning phase was scoped out of the assessment for the onshore cable corridor due to the lack of potential landscape and visual effects (see paragraph 18.4.8, **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]**).
2.1.13	ADC also has concerns regarding onshore landscape scarring and the effects on landscape landform and visual character. Reference is made to restatement of construction compounds and onshore cable corridors. We expect reinstatement to be an appropriate like for like replacement, taking into account new/emerging threats from diseases and biodiversity enhancements.	As outlined in **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]**, summary Table 18-45, there will be no residual effects on landscape character or landform beyond the construction phase or during the operation and maintenance phase. An **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** and **Outline Landscape and Ecology Management Plan (LEMP)** [**APP-232**] have been developed to ensure the reinstatement of landscape features and habitats following construction of the onshore cable corridor and use of the temporary construction compounds. The maintenance period for the scheme extends up to 10 years. Landscape features or elements (principally hedgerows / trees woodland) that may be lost or retained during construction are documented in **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-062]** and indicated in Figures 7.2.1- 7.2.3 of the **Outline CoCP** **[PEPD-033]**. Where removal is required (as per the **Vegetation Retention Plan–Appendix B** of the **Outline CoCP** **[PEPD-033]**), this will be temporary as per the commitment to reinstatement in the **Outline LEMP** **[APP-232]**. Each of the above plans will be subject to submission of stage specific details for approval (including the stage specific CoCP and stage specific LEMP to Arun District Council. This is as per the **Draft Development Consent Order** **[PEPD-009]** Requirements 22, 12, 24 and 20 respectively.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		Damage to grasslands will be minimised by timing of the work outside of the winter period (see C-117, **Commitments Register [APP-254]** (provided at Deadline 1 submission) which is secured in the **Outline CoCP [PEPD-033]** and Requirement 22 of the **Draft Development Consent Order [PEPD-009]**) that will help maintain soil structure and the sward at the edge of the working areas. The reinstatement of the majority of the habitat will take place within 2 years of construction works occurring (see commitment C-103, **Commitments Register [APP-254]** (provided at Deadline 1 submission) which is secured in the **Outline Code of Construction Practice [PEPD-033]** and Requirement 22 of the **Draft Development Consent Order [PEPD-009]**), however it is expected that these areas will be rapidly returned to grassland to avoid bare soils being washed away during subsequent periods of flood. The improved grassland will be reinstated using a commercial seed mix, whilst the semi-improved and marshy grassland will be allowed to become reinstated from the existing seed bank to maintain species diversity and character (see **Outline LEMP** [**APP-232**] which is secured through Requirement 12 of the **Draft Development Consent Order [PEPD-009]**). **Appendix 22.15: Biodiversity Net Gain Information, Volume 4** of the ES **[APP-193]** allows for discussion with landowners in the first instance to deliver enhancements, compensation, and gain (through the calculation of Biodiversity Net Gain (BNG) using the Biodiversity Metric). It is understood by the Applicant that some landowners will not want to deliver enhancements for biodiversity on their land due to current use (e.g. losing harvestable area) and therefore the **Appendix 22.15: Biodiversity Net Gain Information, Volume 4** of the ES **[APP-193]** provides a hierarchy of choices on how to deliver biodiversity units. Section 5.3 in **Appendix 22.15: Biodiversity Net Gain Information, Volume 4** of the ES **[APP-193]** describes how biodiversity units will be sourced, and the prioritisation of local delivery. On current understanding, it is likely that all required biodiversity units could be delivered within 2km of the proposed DCO Order limits. Local delivery is incentivised through the metric so there is no need for this to be secured further. To ensure that the habitat reinstatement is carried out successfully, the **Draft Development Consent Order [PEPD-009]** includes Requirement 12 securing mitigation through provision of reinstatement or landscaping, Requirement 13 with regards timing and maintenance, Requirement 14 securing Biodiversity Net Gain (BNG) and Requirement 22 securing stage specific Codes of Construction Practice. Requirement 12 ensures that a Landscape and Ecological Management Plan is provided for agreement with the relevant planning authority and Natural England. Requirement 13 ensures that the Landscape and Ecological Management Plan is delivered as agreed, whilst Requirement 14 secures the agreement and implementation of a BNG strategy. Requirement 22 ensures that a stage specific Code of Construction Practice is submitted and approved by the relevant planning authority in consultation with the Environment Agency, the statutory nature conservation body, the highway authority and the lead local flood authority. Individual commitments also add further impetus to deliver successful restoration. This includes Commitment C-103 that allows for a time limit for habitat restoration across the majority of the construction area (excluding temporary construction compounds, cable joint bays the landfall and the onshore substation location), whilst commitment C-115 minimises habitat loss of hedgerows and tree lines and proposes ways in which the reinstatement can take place. Commitment C-199 provides for the long-term management and monitoring of reinstated habitats. C-103 and C-115 are secured in the **Outline CoCP [PEPD-033]** and Requirement 22 of the **Draft Development Consent Order [PEPD-009]**. C-199 is secured in the **Outline LEMP [APP-232]** and Requirement 13 of the **Draft Development Consent Order [PEPD-009]**.
2.1.14	ADC note that the onshore cable route has been refined to approximately 40m in width with permanent infrastructure corridor width up to 25m (or wider at trenchless crossing locations). We seek clarification and detail on the surface treatments within these permanent infrastructure corridors, any requirements for easements in these areas and whether this impacts reinstatement.	The commitment to reinstatement along the infrastructure corridor is set out in Section 4 of the **Outline Landscape and Ecology Management Plan (LEMP) [APP-232]**. This accounts for easement requirements for example Annex A of the **Outline LEMP [APP-232]** details the species selection and location of planting to allow for hedgerow reinstatement to comply with the planting and management wayleaves for underground electrical cables. Otherwise, the surface treatments would be reinstated to match existing as set out in Section 4 of the **Outline LEMP [APP-232]** which is secured through Requirement 12 of the **Draft Development Consent Order [PEPD-009]**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.1.15	We note that the landscape reinstatement will be subject to an on-going minimum 10- year monitoring programme. The maintenance programme will need to align and comply with the requirements of the biodiversity net gain for Nationally Significant Infrastructure Projects, which is expected to come into force in 2025; the same year the Project is planned to commence construction.	The Applicant is committed to delivering Biodiversity Net Gain as outlined in **Appendix 22.15: Biodiversity Net Gain Information, Volume 4** of the Environmental Statement (ES) **[APP-193]** and commitment C-104 in the **Commitment Register [APP-254]** (provided at Deadline 1 submission). The delivery of BNG is secured by Requirement 14 of the **Draft Development Consent Order [PEPD-009]**. This requirement is distinct from the requirement to deliver landscaping as reinstatement and mitigation. It should be noted however, that the ten-year period described within the **Outline Landscape and Ecology Management Plan** [**APP-232**] is focused on ensuring establishment of reinstated habitats has been successful. Habitats that have been reinstated will be returned to the landowners for management in line with that being undertaken in the land parcel (e.g. once established a section of hedgerow that was reinstated, would be managed in the same way as the rest of the field boundary). The Proposed Development is not subject to mandatory BNG and the Applicant is delivering BNG voluntarily. The Applicant is content that the proposed approach to deliver BNG is the most effective to secure the 35 year maintenance period required for success.
2.1.16	ADC has significant concerns regarding the cable route passing beneath and near to the Climping Site of Special Scientific Interest (SSSI) and ecological sensitive areas. Nationally scarce invertebrates have been identified on the sand dunes of Climping beach. We note access would be restricted in the SSSI and no groundbreaking activity. However, the potential for indirect effects is unclear and unplanned events could lead to localised degradation of habitat within the SSSI, which is of a concern.	The Applicant would not expect any effects on the habitats or invertebrates using the sand dunes associated with works at the landfall. The closest proposed works where construction activity is to take place (Works No. 8 within the **Onshore Works Plans [PEPD-005]**) is in excess of 175 m from the boundary of the Climping Site of Special Scientific interest (SSSI). All closer works (including beneath the Climping SSSI) are proposed to be either underground (i.e. the Horizontal Directional Drill (HDD)) secured through Works Nos. 6 and 7 of the **Draft Development Consent Order [PEPD-009]** or pedestrian traffic only (e.g. monitoring of the drill head path) restricted by the **Outline Construction Method Statement [APP-255]**, secured through Requirement 23 of the **Draft Development Consent Order [PEPD-009]**. Under all normal circumstances, indirect effects on the SSSI such as dust deposition and pollutant losses can be effectively managed through the **Outline Code of Construction Practice (CoCP) [PEPD-033]** (including for example commitments C-24, C-77, C-105, C-107, C-143, C-149 and C-207) secured through Requirement 22 within the **Draft Development Consent Order [PEPD-009]**. Only in the event of an unforeseen break-out of drilling fluid to the surface within the SSSI would any effects on habitats and the invertebrates they support be realised. Given the design and ways of working described in the **Outline Construction Method Statement [APP-255]** and **Outline CoCP [PEPD-033]**, the risk of this occurring is very low.
2.1.17	We note that the Applicant seeks to achieve biodiversity net gain of at least ten percent onshore for the Project. Biodiversity net gain has not been assessed at the district level. We would expect biodiversity net gain to be achieved within the administrative area of Arun.	The Applicant is committed to delivering Biodiversity Net Gain (BNG) as outlined in **Appendix 22.15: Biodiversity Net Gain Information, Volume 4** of the ES **[APP-193]** provided with the Development Consent Order (DCO) Application. Detailed calculation of losses and details of the gains to be made will come forward on a staged basis at the detailed design stage. With the detailed design and identification of opportunities to secure biodiversity units, calculations will show losses and gains. **Appendix 22.15: Biodiversity Net Gain Information, Volume 4** of the ES **[APP-193]** demonstrates losses based on a realistic worst case to demonstrate that the scale of the overall reduction in biodiversity value can be compensated for and a net gain achieved. BNG is secured through Requirement 14 of the **Draft Development Consent Order [PEPD-009]**. Section 5.3 in **Appendix 22.15: Biodiversity Net Gain Information, Volume 4** of the ES **[APP-193]** describes how biodiversity units will be sourced, and the prioritisation of local delivery. On current understanding, it is likely that all required biodiversity units could be delivered within 2km of the proposed DCO Order limits. Local delivery is incentivised through the Biodiversity Metric workbook, so there is no need for this to be secured further.
2.1.18	We acknowledge that marine biodiversity is not yet mandatory and the Applicant is exploring opportunities for marine benefits. ADC would expect marine benefits and contribution to marine restoration projects such as Help the Kelp. Consideration should be given to a marine biodiversity net gain assessment.	Whilst Marine Net Gain is not currently mandated in the same way as onshore (terrestrial) Biodiversity Net Gain, in recognition of the principles set out in the National Policy Statement (NPS) EN-1 (Department for Energy Security and Net Zero (DESNZ), 2023a) (published in November 2023) which took effect in January 2024, and is a relevant consideration in the decision-making process, the Applicant is currently exploring opportunities to partner with organisations who are able to deliver marine benefits in the region.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.1.19	There are concerns regarding the adequacy of the noise assessment which in ADC's view may underestimate the construction and operation noise effects (of the proposed Climping Compound). ADC has concerns regarding the modelling of the noise sources, adequacy of the assessment of background noise levels (in relation to the Climping Compound), omissions from the assessment and validity of the assessment method. Further information is required before ADC can determine whether the assessment is a representative assessment of construction noise and vibration.	Noise at the Climping Compound has been assessed in **Chapter 21: Noise and vibration, Volume 2** of the ES **[PEPD-018]** using *British Standard BS5228-1:2009 + A1:2014 Code of practice for noise and vibration control on construction and open sites Part 1: Noise* (British Standard Institution (BSI), 2014). The Code of Practice for Construction Noise (BSI, 2014) is a statutorily supported approach to assessment of construction noise; as such The Control of Noise (Code of Practice for Construction and Open Sites) (England) Order 2015 approves BS5228-1 as the approved code of practice for assessing construction noise under Section 71 of the Control of Pollution Act. Therefore, this is considered to be an accepted approach to the assessment of noise and vibration in EIA. BS5228-1 methodology does not use background noise levels (L_{90}), instead looking at the existing ambient noise ($L_{Aeq,T}$) and BS5228-1 Annex E states: *"Noise levels generated by site activities are deemed to be potentially significant if the total noise (pre-construction ambient plus site noise) exceeds the pre-construction ambient noise by 5 dB or more, subject to lower cut-off values of 65 dB, 55 dB and 45 dB from site noise alone, for the daytime, evening and night-time periods, respectively; and a duration of one month or more, unless works of a shorter duration are likely to result in significant effect."* The use of the ABC method from Annex E of BS5228-1 is also stated as being an appropriate means of achieving the above aims. Therefore, the Applicant considers that construction noise has been assessed appropriately. Commitment C-263 in the **Commitments Register** [APP-254] (included within the **Outline Code of Construction Practice [PEPD-033]** and secured through Requirement 22 within the **Draft Development Consent Order [PEPD-009]**) has been updated for Deadline 1 to state that during detailed design the appointed contractor will review the construction noise assessments and where any significant deviation from the initial sound level predictions is identified, such that levels in excess of the BS5228-1, the Noise and Vibration Management Plan (NVMP) shall identify the necessary mitigation to avoid this. If necessary, a Section 61 application will be made to the relevant Local Planning Authority.
2.1.20	ADC has identified and prepared a list buildings and areas of character which are non-designated heritage assets. There are two associated Local Plan policies (HER DM2 and HER DM4). In terms areas of character, some adjoin conservation areas in Littlehampton. The most relevant is the South Terrace Area of Character adjoining the Littlehampton Seafront Conservation Area. Within the historic environment assessment (Chapter 25 of the ES), it states that 'Assessment of effects on Locally Listed Buildings or Structures of Character and Areas of Character, as identified by Arun District Council, is presented in Sections 25.9 to 25.11'. An assessment has not been undertaken for non-designated heritage assets, even though some are within the 1km study area. In Appendix 25.7 of the ES, Table 5.1 consists of the Step 1 Assessment which fails to identify No's 45-47 South Terrace, which are listed buildings. It also fails to identify any of the locally listed buildings or Area of Character.	*No's 45-47 South Terrace*, identified as 6, St Augustine's Road (NHLE 1191074) within Table 5.1, **Appendix 25.7: Settings assessment scoping report, Volume 4** of the ES **[APP-213]**, is scoped out of the ES Assessment. A proportionate approach was undertaken with regards to the scoping in of heritage assets which may be affected by change to their setting. This approach is described in Section 3 of **Appendix 25.7: Settings assessment scoping report, Volume 4** of the ES **[APP-213]**. This identifies those heritage assets most likely to be sensitive to changes in setting resulting from the Proposed Development. The South Terrace Area of Character (and the locally listed buildings at 48-95 South Terrace & 16 Granville Road, which fall within) lies adjacent to the Littlehampton Seafront Conservation Area, which was scoped into the assessment of effects relating to offshore elements of the Proposed Development, see **Appendix 25.7: Settings assessment scoping report, Volume 4** of the ES **[APP-213]**. The magnitude of change will be of equivalent magnitude to that of the conservation area which the significance of the residual effect is deemed Minor Adverse and Not Significant in EIA terms, with the effect being no greater, if not less, as a result of its local heritage significance.
2.1.21	Within the population and human health assessment (Chapter 28 of the ES), we seek clarification as to why a determination for sensitivity and magnitude can produce two different outcomes. A low sensitivity and a high magnitude of	The Population and Health Significance Matrix applied (Table 28-17 in **Chapter 28: Population and human health, Volume 2** of the Environmental Statement (ES) **[APP-069]**) is derived from '*Table 4.1: Generic indicative EIA significance matrix*' of the "*Institute of Environmental Management and Assessment (IEMA) Guide to: Determining Significance for Human Health in Environmental Impact Assessment*" (IEMA, 2022), which informs best practice. As explained in paragraph 4.9 of the IEMA guide

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	impact can deliver a minor or moderate effect. This ambiguity could lead to a misunderstanding as to whether the Project leads to a non-significant or significant effect on a particular receptor.	(IEMA, 2022), the generic indicative significance matrix is a tool to assist with professional judgement on significance, where there is not a clear cut off between categories and terminologies, and where any judgements made must be supported by appropriate evidence and justification to remove ambiguity on the significance conclusions reached. This approach is reiterated in **paragraphs 28.8.11** and **28.8.12** of **Chapter 28: Population and human health, Volume 2** of the ES **[APP-069]**. As outlined in **paragraph 28.8.9** of **Chapter 28: Population and human health, Volume 2** of the ES **[APP-069]**, the sensitivity applied throughout all of the health assessment is "Low". Therefore, based on the significance matrix provided in **Table 28-17**, the only possible instance where there could be a moderate (significant) or minor (not significant) effect is where a high magnitude of impact on population and human health occurs. Should this occur, the criteria in **Table 28-18** would assist in assigning a level of significance. However, no high magnitudes of impact are reported across any of the health determinants assessed, which removes any need for a professional judgement to be made between a moderate (significant) or minor (not significant) effect.
2.1.22	The Equalities Impact Assessment (Appendix 28.3 of the ES) is based on the Equalities Act and makes specific reference to 'protected characteristics' as defined in Section 4 of the Equalities Act. However, the assessment (Tables 1.4, 1.5 and 1.6) is not limited to the protected characteristics (i.e. age, sex, race, religion etc.). Clarification is therefore required to assess the protected characteristics as per the Equalities Act.	**Appendix 28.3: Equalities Impact Assessment, Volume 4** of the ES **[APP-221]** provides a systematic approach to assess the likely or actual effects of policies or policies or proposals on social groups with protected characteristics (as defined by the *Equality Act 2010*), set out in **Table 1.1**. As stated in **paragraph 1.3.2** of the **Appendix 28.3: Equalities Impact Assessment, Volume 4** of the ES **[APP-221]**, the protected characteristics are correctly identified and the assessment has been undertaken as per the Equalities Act. The assessment tables (**Table 1.4, Table 1.5, and Table 1.6** of the **Appendix 28.3: Equalities Impact Assessment, Volume 4** of the ES **[APP-221]**) refer to these specific protected characteristics, and then provide additional context to the distribution within that characteristic. As an example, within the Age characteristic, any particular age group that might have a disproportionate sensitivity is considered, which helps test for any illegal discrimination, but then also helps consider what the potential influence might be within this group. Therefore, all equality groups referred to in **Table 1.4, Table 1.5, and Table 1.6** of **Appendix 28.3: Equalities Impact Assessment, Volume 4** of the ES **[APP-221]** are listed below, with their protected characteristic confirmed in brackets: • Children (Age); • Young people (Age); • Older people (Age); • Disabled people (Disability); • Pregnant people (Pregnancy and maternity); • People with ethnic minority backgrounds (Race); • Men (Sex); • Women (Sex); and • Lesbian, Gay, Bisexual, Transgender + (LGBTQ+) people (Sexual orientation / Gender reassignment). It should be noted that all protected characteristics (and associated equality groups) were considered in **Appendix 28.3: Equalities Impact Assessment, Volume 4** of the ES **[APP-221]**). However, the inclusion of these are guided by their relevance to the assessment themes or identified community facilities within the EqIA Study Area. In this instance, "being married or in a civil partnership" and "religion or belief" were not included.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		The approach ensures that all the protected characteristics are appropriately considered, whilst providing the additional distinction aids in informing the team, project, design, mitigation and support initiatives to address relative sensitivity and support the wider objective of the Equality Act 2010 (i.e. to improve equality opportunity and foster closer relations between those with and without a protected characteristic).

© WSP Environment & Infrastructure Solutions UK Limited

Table 2-2 Applicant's Response to Mid Sussex District Council

Ref	Relevant representation comment	Applicant's response
Summary		
2.2.1	1.1 In summary the key issues for Mid Sussex are as follows: a) This Council is supportive of the principle of Low Carbon Energy Schemes provided that any adverse local impacts, including cumulative impacts, can be made acceptable.	Mid Sussex District Council's being supportive of the principle of Low Carbon Energy Schemes is welcomed by the Applicant. The Proposed Development will help meet the urgent need for new renewable energy infrastructure in the UK and supporting the achievement of the UK Government's climate change commitments and carbon reduction objectives. The Proposed Development type is recognised as being a critical national priority in the revised NPS EN-1 (Department for Energy Security and Net Zero (DESNZ), 2023a) and NPS EN-3 (DESNZ, 2023b), which came into force in January 2024 and are considered to be relevant to the determination of the DCO Application. This additional generating capacity will contribute towards meeting the urgent need for new energy infrastructure in the UK, provide enhanced energy security, support the economic priorities of the UK Government and, critically, make an important contribution to decarbonisation of the UK economy. The Proposed Development will contribute materially towards meeting the urgent national need for renewable electricity, significantly reducing carbon emissions from energy. The assessment set out in **Chapter 29: Climate change, Volume 2** of the ES **[APP-070]** concludes the Proposed Development has a lifetime greenhouse gas (GHG) emissions saving of 35,901 kilotonne carbon dioxide equivalent ($ktCO_2e$). The Proposed Development will continue to offset greenhouse gas (GHG) emissions until 2050, and therefore make a positive contribution the UK Government target to reach net zero emissions in 2050. Section 104 of the Planning Act 2008 outlines that the DCO Application must be decided in accordance with the relevant NPS (in this case: NPS EN-1 (DECC, 2011a), NPS EN-3 (DECC, 2011b) and NPS EN-5 (DECC, 2011c) with NPS EN-1 (DESNZ, 2023a), NPS EN-3 (DESNZ, 2023b) and NPS EN-5 (DESNZ, 2023c), that came into force in 2024, relevant considerations in the decision-making process) unless (inter alia) the adverse impacts of a proposal would outweigh its benefits. **Section 5.4** of the **Planning Statement** **[APP-036]** summarises the potential environmental, social and economic benefits and the adverse impacts of the Proposed Development drawing on relevant information in line with NPS EN-1 (DECC, 2011a and DESNZ, 2023a). Section 5.5 of the **Planning Statement** **[APP-036]** sets out the planning balance where the potential benefits and impacts of the Proposed Development are weighed up. Although, inevitably, there are adverse impacts associated with the scale and type of infrastructure that forms the Proposed Development, the Applicant considers that the planning balance is firmly in favour of the Proposed Development and the benefits outweigh the adverse impacts.
2.2.2	b) Mitigation of landscape impacts is necessary, particularly from PROW 1T. Loss of vegetation should be minimised. c) The proposed extension to the existing substation will have a degree of less than substantial harm in respect of the special interest of identified heritage assets. Consideration should be given to further planting around the site to mitigate any negative impact on views from the PROW to the east, and Bob Lane to the south	**Section 3.3** of the **Design and Access Statement (DAS)** **[AS-003]** secures the design principles that are embedded to manage the landscape impacts of the National Grid Bolney substation extension works. This includes Indicative Landscape Plans (ILP, **Appendix C**) for the existing National Grid substation at Bolney which shows the retention of the existing vegetation and the associated design principles (**paragraph 3.3.12** of the **DAS** **[AS-003]**) with which the detailed design must accord. The ILP shows the area of additional planting proposed along the border to Bob Lane to the south and which is secured as a design principle in the **DAS** **[AS-003]** in paragraph 3.3.12 to be secured through Requirement 9 of the **Draft Development Consent Order** **[PEPD-009]**. The **Outline Landscape and Ecology Management Plan** **[APP-232]** (secured via Requirement 12 within the **Draft Development Consent Order** **[PEPD-009]** details further information on landscaping. Together with the **Draft Development Consent Order** **[PEPD-009]** Requirement 13 this secures the provision of a

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		detailed landscape plan for the existing National Grid Bolney substation extension works in accordance with design principles in the **DAS** **[AS-003]** for the approval of Mid Sussex District Council (MSDC). Loss of vegetation has been minimised during the construction phase including areas of vegetation to be retained which is presented in the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** – **Appendix B – Vegetation Retention Plans:** Figure 7.2.1k, Figure 7.2.2h and Figure 7.2.3k for the existing National Grid Bolney substation extension works. The **Outline CoCP** **[PEPD-033]** is secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**.
2.2.3	d) Any above ground structures that create an impermeable area will require some drainage so as not to create or exacerbate flood risk.	The **Outline Operational Drainage Plan** **[APP-223]** provides the surface water drainage proposals for the National Grid Bolney substation extension works (**Section 3.4**) and the detailed design will be submitted to the Lead Local Flood Authority for approval as per the **Draft Development Consent Order** **[PEPD-009]** Requirement 18.
2.2.4	e) To mitigate the impact on residents from construction noise, it is recommended that the applicant amends their proposed core construction hours to: 08:00 to 19:00 hours Monday to Friday; and 09:00 to 13:00 hours on Saturday."	Working hours are stated in Section 4 of **Chapter 4: The Proposed Development, Volume 2** of the ES **[APP-045]** and are outlined in Section 4.4 of the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]**. Following receipt of Relevant Representations and information shared at Issue Specific Hearing 1, C-22 within the **Commitments Register** **[APP-254]** has been updated at the Deadline 1 submission to the following: '*Core working hours for construction of the onshore components will be 08:00 to 18:00 Monday to Friday, and 08:00 to 13:00 on Saturdays, apart from specific circumstances that are set out in the Outline COCP, where extended and continuous periods of construction are required.* *Prior to and following the core working hours Monday to Friday, a 'shoulder hour' for mobilisation and shut down will be applied (07:00 to 08:00 and 18:00 to 19:00). The activities permitted during the shoulder hours include staff arrivals and departures, briefings and toolbox talks, deliveries to site and unloading, and activities including site and safety inspections and plant maintenance. Such activities shall not include use of heavy plant or activity resulting in impacts, ground breaking or earthworks.'* This has been updated in the **Outline Construction Traffic Management Plan** **[PEPD-035a]** for the Deadline 1 submission and will be updated in the **Outline Code of Construction Practice** **[PEPD-033]** for the next submission of this document. As outlined in the **Outline Code of Construction Practice** **[PEPD-033]**, no activity outside these hours (including Sundays, public holidays, or bank holidays) will take place apart from under the following circumstances: • Where continuous periods (up to 24 hours, 7 days per week) of construction work are required for HDD (as HDD is a continuous activity that cannot be paused once started); • for other works requiring extended working hours such as concrete pouring which will require the relevant planning authority to be notified at least 72 hours in advance; • or the delivery of abnormal loads to the connection works, which may cause congestion on the local road network, and will require the relevant highway authority to be notified at least 72 hours in advance; or • as otherwise agreed in writing with the relevant planning authority.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.2.5	f) The applicant's commitment to deliver a Biodiversity Net Gain (BNG) of at least 10% for all onshore habitats is welcomed. The habitats to be created at the existing National Grid Bolney substation extension should be subject to agreement/consultation with the District Council at the appropriate time.	The habitat creation and reinstatement measures for the existing National Grid Bolney substation extension works are secured through the design principles in the **Design and Access Statement** **[AS-003]** and the **Outline Landscape and Ecology Management Plan (LEMP)** **[APP-232]**. MSDC will approve the stage specific LEMP for the extension works as per the **Draft Development Consent Order** **[PEPD-009]** requirements. Biodiversity Net Gain is separate to the documents above, and is secured through Requirement 14 of the **Draft Development Consent Order** **[PEPD-009]**.
2.2.6	g) Appropriate mitigation through a detailed Construction Traffic Management Plan, will be essential.	The **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** details the control mechanisms and mitigation that will be employed during the construction phase. Stage-specific CTMPs will be submitted for the approval of the highways authority (WSCC) in consultation with Mid Sussex District Council in accordance with Requirement 24 of the **Draft Development Consent Order** **[PEPD-009]**.
2.2.7	h) MSDC supports the key design principle that the substation extension will be screened by existing vegetation and proposed landscape planting. It is important that these aims are appropriately secured. Recognition should be made of the contribution the site makes to the setting of Coombe House, Cowfold Road and not just Twineham Court Farmhouse, Bob Lane. Consideration should be given to the inclusion of ecological enhancements (such as the new bat boxes at Oakendene substation) within the Terrestrial Ecology Design Principles or the substation extension. MSDC supports the use of the existing access onto Wineham Lane for the construction and operational phases of the substation extension.	The retention of existing screening will be secured through design principles, outlined in **Section 3.3.3** of the **Design and Access Statement (DAS)** **[AS-003]** secured through Requirement 9 of the **Draft Development Consent Order** **[PEPD-009]** and **Outline Code of Construction Practice** **[PEPD-033]** – **Appendix B – Vegetation Retention Plans:** Figure 7.2.1k, Figure 7.2.2h, Figure 7.2.3k secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]** for the existing National Grid Bolney substation. The proposed creation of new habitats and reinstatement of existing vegetation will be secured through the **Outline Landscape and Ecology Management Plan** **[APP-232]** as detailed in Section 3.5 secured through Requirement 12 of the **Draft Development Consent Order** **[PEPD-009]**. The impact on the setting of Coombe House was assessed during the EIA scoping phase and scoped out for further assessment in the Environmental Statement (ES). Table 5-3 in **Appendix 25.7: Settings assessment scoping report, Volume 4** of the ES **[APP-213]** justifies this conclusion . Setting of the asset is defined by the surrounding garden and grounds within which the house and associated garden features are set. No change is anticipated during construction or operation of Proposed Development due to intervening distance, buildings, topography and planting between the asset and the existing National Grid substation at Bolney. The suggestion for consideration of ecological enhancements at the existing National Grid Bolney substation extension works is noted. Any such enhancement would need to be agreed with National Grid Electricity Transmission (NGET) who will continue to be responsible for operation and maintenance of the site. The Applicant will discuss this during engagement with NGET where appropriate and record this in the Statements of Common Ground with NGET and MSDC.
Introduction		
2.2.8	2.1 This correspondence forms Mid Sussex District Council's response to the request for Relevant Representations in respect of the Rampion 2 DCO.	The Applicant has no further comments on this matter at this time.
2.2.9	2.2 The Rampion 2 DCO application was accepted for examination by the Secretary of State on the 7th September. Mid Sussex District Council is a host authority, with proposed works taking place within its boundary that include an	The Applicant has no further comments on this matter at this time.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	extension to the existing National Grid substation at Bolney and onshore cable installation.	
2.2.10	2.3 The objective of the Rampion 2 project is to make a significant contribution towards the generation of clean sustainable energy supplies. This Council is supportive of the principle of Low Carbon Energy Schemes provided that any adverse local impacts, including cumulative impacts, can be made acceptable.	The acknowledgement that Proposed Development will contribute to generation of clean sustainable energy supplies is welcomed by the Applicant. The Proposed Development will help meet the urgent need for new renewable energy infrastructure in the UK and supporting the achievement of the UK Government's climate change commitments and carbon reduction objectives. The Proposed Development type is recognised as being a critical national priority in the revised NPS EN-1 (Department for Energy Security and Net Zero (DESNZ), 2023a) and NPS EN-3 (DESNZ, 2023b), which came into force in January 2024 and are considered to be relevant to the determination of the DCO Application. This additional generating capacity will contribute towards meeting the urgent need for new energy infrastructure in the UK, provide enhanced energy security, support the economic priorities of the UK Government and, critically, make an important contribution to decarbonisation of the UK economy. The Proposed Development will contribute materially towards meeting the urgent national need for renewable electricity, significantly reducing carbon emissions from energy. The assessment set out in **Chapter 29: Climate change, Volume 2** of the ES **[APP-070]** concludes the Proposed Development has a lifetime GHG emissions saving of 35,901ktCO_2e. The Proposed Development will continue to offset greenhouse gas (GHG) emissions until 2050, and therefore make a positive contribution the UK Government target to reach net zero emissions in 2050. Section 104 of the Planning Act 2008 outlines that the DCO Application must be decided in accordance with the relevant NPS (in this case: NPS EN-1 (DECC, 2011a), NPS EN-3 (DECC, 2011b) and NPS EN-5 (DECC, 2011c) with NPS EN-1 (DESNZ, 2023a), NPS EN-3 (DESNZ, 2023b) and NPS EN-5 (DESNZ, 2023c), that came into force in 2024, relevant considerations in the decision-making process) unless (inter alia) the adverse impacts of a proposal would outweigh its benefits. Section 5.4 of the **Planning Statement** **[APP-036]** summarises the potential environmental, social and economic benefits and the adverse impacts of the Proposed Development drawing on relevant information in line with NPS EN-1 (DECC, 2011a and DESNZ, 2023a). Section 5.5 of the **Planning Statement** **[APP-036]** sets out the planning balance where the potential benefits and impacts of the Proposed Development are weighed up. Although, inevitably, there are adverse impacts associated with the scale and type of infrastructure that forms the Proposed Development, the Applicant considers that the planning balance is firmly in favour of the Proposed Development and the benefits outweigh the adverse impacts.
2.2.11	2.4 The Council is keen to ensure that all appropriate mitigations are implemented to manage any impacts on residents and the local environment.	The **Commitments Register** **[APP-254]** (updated at Deadline 1 submission) presents the mitigation and monitoring commitments. It includes a column for the securing mechanism for each embedded environmental measure and its related commitment reference. This cross-refers to the mechanism (e.g. a requirement in the **Draft Development Consent Order** Schedule 1 Part 3 **[PEPD-009]**). Where there is an accompanying document such as an outline plan submitted with the DCO Application with which works must be undertaken accordance, this is also referred to under the 'Relevant Application Documents' column.
2.2.12	2.5 The Council's Relevant Representations, which are those matters considered to be the key issues to be assessed in the planning balance as far as they affect Mid Sussex, are set out below.	The Applicant has no further comments on this matter at this time.
Landscape		

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.2.13	3.1 The summary of visual effects of the extension to the existing National Grid Bolney substation at Table 18-43 of Chapter 18: Landscape and visual impact assessment, Volume 2, are noted. Given these findings show a 'major' level of effect from Public Right of Way 1T(PROW), it is important that adequate mitigation is secured here.	**Paragraph 3.3.12** of the **Design and Access Statement** **[AS-003]** includes the design principle that existing vegetation will be protected and retained as indicated on the Indicative Landscape Plan and in accordance with **Appendix B- Vegetation Retention Plans** of the **Outline Code of Construction Practice (CoCP)** **[APP-224]**. The compliance with principles in the Design and Access Statement [AS-003] is secured through Requirement 9 of **Draft Development Consent Order** **[PEPD-009]**. The **Outline CoCP** **[PEPD-033]** is secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. The associated design principle is that the existing National Grid Bolney substation extension will be screened by existing vegetation and proposed landscape planting. As per DCO Requirements 9 and 22, detailed in the **Draft Development Consent Order** **[PEPD-009]**, the works must not commence until details of landscaping of the extension to the existing National Grid substation at Bolney have been submitted to and approved in writing by the relevant planning authority, in this case Mid-Sussex District Council. Work must be carried out in accordance with the approved details.
2.2.14	3.2 When considering the visual impact in respect of long-distance views from within the National Park to the south, the comments of the South Downs National Park Authority should be given appropriate weight.	**The** South Downs National Park (SDNP) is outwith the landscape and visual assessment (LVIA) Study Area for the existing National Grid Bolney substation extension and the related onshore cable corridor in Mid Sussex. Both are also beyond 5km distance as indicated in **Figure 18.4c of** **Chapter 18: Landscape and visual impact assessment – figures (Part 1 of 6), Volume 3** of the ES **[APP-098]**. Despite this some long-distance views, north from the SDNP have been considered as a precaution. No significant visual effects relating to views from the SDNP have been identified in respect of the existing National Grid Bolney substation extension and the related onshore cable corridor in Mid Sussex. **Appendix 18.1: Landscape and visual impact assessment methodology, Volume 4** of the ES **[APP-167]** defines the Study Area used for the landscape and visual assessment. This Study Area is illustrated in Figure 18.1 (**Chapter 18: Landscape and visual impact assessment – figures (Part 1 of 6), Volume 3** of the ES **[APP-098]**) and extends to a 2km buffer beyond the proposed DCO Order Limits. This Study Area has been supported by a number of elevated, long-distance panoramic viewpoint locations within the wider landscape, beyond 2km, as agreed with consultees, in particular the South Downs National Park to demonstrate any visibility at these distances (see paragraph 1.2.13 of **Appendix 18.1: Landscape and visual impact assessment methodology, Volume 4** of the ES **[APP-167]**).
2.2.15	3.3 A comprehensive Arboricultural Impact Assessment and Landscape and Ecological Management Plan (LEMP) will be expected to be submitted to MSDC for consideration once the final designs are known.	An Arboricultural Impact Assessment (AIA) (see **Appendix 22.16: Arboricultural Impact Assessment, Volume 4** of the ES **[APP-194]**) and an **Outline Landscape and Ecology Management Plan (LEMP)** **[APP-232]** were submitted with the DCO Application. As noted in paragraph 4.7.1 of the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** and commitment C-285, a stage specific Arboricultural Method Statement and Tree Protection Plan will be submitted with the stage specific detailed CoCP. This is reflected in the **Draft Development Consent Order** **[PEPD-009]** Requirement 22 (5) (a). As per requirements 12 and 22 of the **Draft Development Consent Order** **[PEPD-009]**, no stage of the authorised project within the onshore DCO Order Limits are to commence until, for that stage, a written Landscape and Ecology Management Plan and associated work programme (which accords with the relevant provisions of the **Outline LEMP** **[APP-232]** and **Outline CoCP** **[PEPD-033]**) has been submitted to and approved by the relevant planning authority. The **Outline LEMP** **[APP-232]** is secured through

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		Requirement 12 of the **Draft Development Consent Order [PEPD-009]**. The **Outline CoCP [PEPD-033]** is secured through Requirement 22 of the **Draft Development Consent Order [PEPD-009]**.
2.2.16	3.4 The final designs should demonstrate a commitment to minimising existing vegetation loss to that which is necessary to facilitate the development, with careful justification expected on any removal of designated 'important hedgerows'.	The design process has followed the mitigation hierarchy, and the final designs will continue to see to minimise existing vegetation loss. **Appendix B – Vegetation Retention Plans** of the **Outline CoCP [PEPD-033]** demonstrates the embedded environmental measures included to minimise the loss of vegetation associated with the Proposed Development. This is reflected in Table 5-5 of the **Outline CoCP [PED-033]**, commitments C-115 and C-220 that commit to reducing habitat loss and landscape and heritage impacts wherever possible, through the Vegetation Retention Plans. This includes minimising loss to 6m for Important Hedgerows wherever possible. DCO requirement 22, detailed in the **Draft Development Consent Order [PEPD-009]**, outlines that no stage of any works landward of Mean Low Water Springs (MLWS) is to commence until a detailed CoCP for the stage has been submitted to and approved by the relevant planning authority, MSDC in this instance. This includes the requirement 22 (5) (b) for a Vegetation Retention Plan.
Historic Environment		
2.2.17	4.1 There are a number of heritage assets within the vicinity of the National Grid substation at Bolney which include the Grade II listed Twineham Court Farmhouse, Bob Lane and the Grade II listed Coombe House, Cowfold Road. The setting of the grade II Royal Oak Public House, which lies on the western side of Wineham Lane within Horsham District, is not considered to be materially affected by the proposals.	The Applicant notes that in Table 5-3 of **Appendix 25.7: Settings assessment scoping report, Volume 4** of the Environmental Statement (ES) **[APP-213]** it was concluded that there would be no change to the setting of the grade II Royal Oak Public House (NHLE 1285777).
2.2.18	4.2 It is considered that the site of the proposed substation extension has some limited positive contribution to the setting of each of these heritage assets. As such it is considered that the height of the Bolney substation extension will have an impact on the currently positive contribution this part of the site makes to the setting of these heritage assets.	The extension of the existing National Grid Bolney substation is not anticipated to be perceptible from Grade II Listed Twineham Court Farmhouse (NHLE 1025579), though it is noted that the extension contributes to the erosion of the asset's wider agricultural setting through associated land take. As described at paragraph 25.10.21 of the Environmental Statement **Chapter 25: Historic environment, Volume 2** of the Environmental Statement (ES) **[APP-066]** this would entail a very low magnitude of change. Grade II listed Coombe House (NHLE 1025752) was scoped out of the assessment as described in Table 5-3 of the **Appendix 25.7: Settings assessment scoping report, Volume 4** of the ES **[APP-213]** as there would be no change to the setting of this asset.
2.2.19	4.3 The proposed development will therefore result in a degree of less than substantial harm in respect of the special interest of these heritage assets. This must be given considerable importance and weight in the planning balance.	The assessment within **Chapter 25: Historic environment, Volume 2** of the Environmental Statement (ES) **[PEPD-020]** of the Environmental Statement (ES) identifies a very low magnitude of change, resulting in a Minor adverse residual effect during the construction and operation and maintenance phases of the onshore cable and extension of the existing National Grid Bolney substation, which would be not significant. This will be at the lower end of less than substantial harm to a designated heritage asset. Effects during the construction phase will be temporary. Paragraph 5.9.30 of NPS EN-1 notes that less than substantial harm to the significance of a designated heritage asset should be weighed against the public benefit of a proposal. The **Planning Statement**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		[APP-036] states "*It is considered that the substantial public benefits of the Proposed Development outweigh the residual harm to the heritage assets outlined in the ES.*
2.2.20	4.4 In terms of mitigation, consideration should be given to the potential for further planting around the site, to mitigate any negative impact on views from the PROW to the east, and Bob Lane to the south.	See response above to Landscape representations in **references 2.2.13 to 2.2.16**.
Water Environment		
2.2.21	5.1 The site where it is located within Mid Sussex is in flood zone 1 and is at low fluvial flood risk (risk of flooding from Main Rivers). The site is shown to be at very low, low, medium and high surface water flood risk (comparable to flood zones 1, 2, 3a, and 3b). 5.2 This flooding appears to be linked to existing field boundary ditches/watercourses associated with agricultural land use. Though some areas within the Bolney substation site may be at an elevated risk of surface water flooding.	Surface water flood risk to the existing National Grid Bolney substation extension site area is detailed in Section 5.3.14 of **Appendix 26.2: Flood Risk Assessment (FRA), Volume 4** of the ES **[APP-216]**. The paragraph states that: "*There are no noted surface water flowpaths intersecting the proposed extension works at the existing National Grid Bolney substation. An area of mapped isolated flood risk relates to a historic pond that was removed in association with previous extension works. The overall run-on to the extension area is therefore negligible.*" The Environment Agency Risk of Flooding from Surface Water (RoFSW) mapping (Environment Agency, 2023b) at this specific location is not based on up-to-date topographic information and is therefore considered to be inaccurate by the Applicant. Based on review of the RoFSW mapped area of elevated risk within the historic pond, this is related to ponded water 'in-situ' rather than any significant surface water flowpath running onto the area. If updated modelling was undertaken based on the latest topographic layout of the National Grid site, it is envisaged that no areas of risk would be mapped across the site. In addition, it was stated in a meeting with WSCC and MSDC on 01 April 2022 that there was no record of historic flooding at the existing National Grid Bolney substation site. Minutes of this meeting are provided in Appendix A of the **Appendix 26.2: FRA, Volume 4** of the ES **[APP-216]**. On the basis of the above, the Applicant considers there to be a negligible risk of flooding from surface water towards the existing National Grid Bolney substation extension area.
2.2.22	5.3 Mid Sussex District Council's records do not contain records of the site flooding. Our records also contain no records of flooding within the area immediately surrounding the site. However, Mid Sussex District Council's records are not complete, and flooding may have occurred which is not recorded. A site having never flooded in the past does not mean it won't flood in the future.	The Applicant agrees with Mid Sussex District Council's comment with respect to there being no records of site flooding at the existing National Grid Bolney substation site which is consistent with the feedback recorded with MSDC and Horsham District Council (HDC) at a meeting on 01 April 2022. The embedded flood risk management measures presented within the **Appendix 26.2: Flood Risk Assessment (FRA), Volume 4** of the ES **[APP-216]** and **Outline Operational Drainage Plan** **[APP-223]** will ensure that the Proposed Development will not be subject to an unacceptable level of flood risk throughout its lifetime (and incorporating the anticipated impacts of climate change), nor will it increase flood risk elsewhere. This is in line with the overall conclusion presented in Section 10.2 of **Appendix 26.2: FRA, Volume 4** of the ES **[APP-216]**. The Operational Drainage Plan will be produced at the post-DCO award stage, and must accord with the **Outline Operational Drainage Plan** **[APP-223]** as per draft DCO Requirement 18 of the **Draft Development Consent Order** **[PEPD-009]**.
2.2.23	5.4 Any above ground structures that create an impermeable area will require some drainage so as not to create or exacerbate flood risk. Any surface water drainage will need to be designed to meet the latest national and local drainage policies. The drainage system will need to consider climate change, the allowances for which should be based on the latest climate change guidance from the Environment Agency.	Climate change allowances are discussed in Section 3.2 of the **Outline Operational Drainage Plan** **[APP-223]**, which are based on current Environment Agency guidance (Environment Agency, 2023a). As set out in the Environment Agency's climate change allowances for flood risk assessments (Environment Agency 2023a) and Planning Practice Guidance (Ministry of Housing, Communities and Local Government, 2022), for developments with lifetimes between 2061 and 2100 developments should

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		be designed for the central allowance in the one percent Annual Exceedance Probability (AEP) event so that there is no increase in flooding elsewhere and the development itself should be safe from surface water flooding. The design requirement for attenuation volume storage is therefore deemed to be the one percent AEP plus 25 percent climate change allowance for increase in peak rainfall intensity. This is secured via the **Outline Operational Drainage Plan [APP-223]** as set out in paragraphs 3.2.2 and 3.2.3 and secured via Requirement 18 of the **Draft Development Consent Order [PEPD-009]**. The climate change allowances will be reviewed and confirmed prior to undertaking detailed design.
2.2.24	5.5 The BGS infiltration potential map shows the site to be in an area with low infiltration potential. Therefore, the use of infiltration drainage such as permeable paving or soakaways is unlikely to be possible on site. To ensure the drainage hierarchy is followed this will need to be confirmed through infiltration testing on site as part of detailed drainage design.	The **Operational Drainage Plan [APP-223]** paragraph 3.2.15 outlines that "Given the presence of clay and the poorly drained soils, discharge of surface water to the ground is not considered feasible. If deemed necessary by the Lead Local Flood Authority (LLFA), soakage testing could be undertaken post-granting of DCO consent to demonstrate this, but this is considered unnecessary if ground investigation undertaken to support the wider detailed design of the existing National Grid Bolney substation extension indicates ground conditions unsuitable for infiltration." The **Outline Operational Drainage Plan [APP-223]** is secured via Requirement 18 of the **Draft Development Consent Order [PEPD-009]**.
2.2.25	5.6 To ensure the final surface water drainage design meets with the latest design requirements the applicant is advised to confirm the design parameters required in relation to climate change etc prior to undertaking detailed design.	All design parameters (including climate change allowances) will be reviewed and confirmed prior to undertaking detailed design. **Reference 2.2.23** (above) outlines relevant climate change allowances for rainfall intensity.
Air Quality and Noise		
2.2.26	6.1 The issues are construction noise & dust and, in respect of the substation extension at Bolney, operational noise. Regarding the latter, it is noted that the applicant's submissions state that "the operational plant of the existing National Grid Bolney substation extension (GIS or AIS) will not be audible outside of the extension site boundary." 6.2 The GIS infrastructure is expected to be minimal as the equipment will be housed within a building. Although not enclosed within a building, the proposed AIS infrastructure does not include the larger noise generating equipment (transformers, shunt reactors or condenser) associated with onshore substation infrastructure and therefore would not be expected to increase noise from Bolney substation at receptor locations. 6.3 Any changes to either of these proposals will require further consideration. 6.4 Measures should be put in place to ensure that noise from the substation extension is not increased at the nearest receptors. Mitigation measures should also include comprehensive management plans to minimise the impacts of construction dust and noise.	The Applicant acknowledges relevant representation from Mid Sussex District Council and notes that any changes to the proposals would require further consideration in discussion with key stakeholders. The air quality and noise effects related to the existing National Grid Bolney substation extension are assessed within **Chapter 19: Air quality, Volume 2** of the ES **[APP-060]** and **Chapter 21: Noise and vibration, Volume 2** of the ES **[PEPD-018]**. The **Outline CoCP [PEPD-033]** includes an embedded environmental measure to produce Dust Management Plans for the areas within the proposed DCO Order Limits that are associated with medium dust risk. The **Outline CoCP [PEPD-033]** is underpinned by commitment C-24 of the **Commitment Register [APP-254]** (updated at Deadline 1 submission) which outlines that '*Best practice air quality management measures will be applied as described in Institute of Air Quality Management (IAQM) (2016) guidance on the Assessment of Dust from Demolition and Construction 2016, version 1.1*'. The **Outline CoCP [PEPD-033]** is secured through Requirement 22 of the **Draft Development Consent Order (DCO) [PEPD-009]**. Construction noise at the existing National Grid Bolney substation will be mitigated and managed through the application of the stage specific Code of Construction Practice in accordance with the **Outline Code of Construction Practice (CoCP) [PEPD-033**] which will be submitted to and approved by the relevant planning authority (Requirement 22 within the **Draft Development Consent Order [PEPD-009]**).Commitment C-263 in the **Commitments Register [APP-254]** (updated at Deadline 1 submission) states that during detailed design the appointed contractor will review the construction noise assessments and where any significant deviation from the initial sound level predictions is identified, such that levels in excess of the BS5228-1 thresholds of significance are likely, the Noise and Vibration Management Plan

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		(NVMP) secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]** shall be updated or a Section 61 application will be made to the relevant Local Planning Authority. Table 21-19 within **Chapter 21: Noise and vibration, Volume 2** of the ES **[PEPD-018]** includes the maximum assessment assumption that operational plant of the existing National Grid Bolney substation extension will not be audible outside of the extension site boundary for the operational phase; *'GIS infrastructure is expected to be minimal as the equipment will be housed within a building. Although not enclosed within a building, the proposed AIS infrastructure does not include the larger noise generating equipment (transformers, shunt reactors or condenser) associated with onshore substation infrastructure and therefore would not be expected to increase noise from Bolney substation at receptor locations.'* Therefore, no additional measures to control operational noise at the existing National Grid Bolney substation are proposed. The **Outline CoCP** **[PEPD-033]** includes an embedded environmental measure to produce Dust Management Plans for the areas within the proposed DCO Order Limits that are associated with medium dust risk. The **Outline CoCP** **[PEPD-033]** is underpinned by commitment C-24 of the **Commitment Register** **[APP-254]** (updated at Deadline 1 submission) which outlines that '*Best practice air quality management measures will be applied as described in Institute of Air Quality Management (IAQM) (2016) guidance on the Assessment of Dust from Demolition and Construction 2016, version 1.1*'. The **Outline CoCP** **[PEPD-033]** is secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**.
2.2.27	6.5 Regarding construction noise, the applicant has set out in their submissions (Outline Code of Construction Practice for example) that they intend to operate within the following core working hours: "07:00 to 19:00 hours Monday to Friday; and 08:00 to 13:00 hours on Saturday." 6.6 There is no concern raised around the specific activities or circumstances highlighted by the applicant that may occur outside of these hours. There is, however, concern around the impact that these working hours, will have on the residential amenity of neighbouring residents who live in close proximity to the construction areas, and specifically, a 07:00 start time on weekdays and 08:00 on Saturdays. 6.7 The strong preference for MSDC would be for the applicant to amend their proposed core construction hours to more closely reflect those that are applied to other development within the district by the Council. Consideration should therefore be given to following proposed core construction hours being applied to the development to mitigate the impact of construction noise on residents: "08:00 to 19:00 hours Monday to Friday; and 09:00 to 13:00 hours on Saturday."	Working hours are stated in Section 4 of **Chapter 4: The Proposed Development, Volume 2** of the ES **[APP-045]** and are outlined in Section 4.4 of the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]**. Following receipt of Relevant Representations and information shared at Issue Specific Hearing 1, C-22 within the **Commitments Register** **[APP-254]** has been updated at the Deadline 1 submission to the following: **'***Core working hours for construction of the onshore components will be 08:00 to 18:00 Monday to Friday, and 08:00 to 13:00 on Saturdays, apart from specific circumstances that are set out in the Outline COCP, where extended and continuous periods of construction are required.* *Prior to and following the core working hours Monday to Friday, a 'shoulder hour' for mobilisation and shut down will be applied (07:00 to 08:00 and 18:00 to 19:00). The activities permitted during the shoulder hours include staff arrivals and departures, briefings and toolbox talks, deliveries to site and unloading, and activities including site and safety inspections and plant maintenance. Such activities shall not include use of heavy plant or activity resulting in impacts, ground breaking or earthworks.'* This has been updated in the **Outline Construction Traffic Management Plan** **[PEPD-035a]** for the Deadline 1 submission and will be updated in the **Outline Code of Construction Practice** **[PEPD-033]** for the next submission of this document.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		As outlined in the **Outline Code of Construction Practice** **[PEPD-033]**, no activity outside these hours (including Sundays, public holidays, or bank holidays) will take place apart from under the following circumstances: • Where continuous periods (up to 24 hours, 7 days per week) of construction work are required for HDD (as HDD is a continuous activity that cannot be paused once started); • for other works requiring extended working hours such as concrete pouring which will require the relevant planning authority to be notified at least 72 hours in advance; • or the delivery of abnormal loads to the connection works, which may cause congestion on the local road network, and will require the relevant highway authority to be notified at least 72 hours in advance; or • as otherwise agreed in writing with the relevant planning authority.
Biodiversity		
2.2.28	7.1 The mitigation for individual ecological features/impacts must be adequately secured. 7.2 The applicant's commitment to deliver a Biodiversity Net Gain (BNG) of at least 10% for all onshore habitats subject to permanent or temporary losses as a result of the construction and operation of the development is welcomed. 7.3 The habitats to be created at the existing National Grid Bolney substation extension include the planting of additional trees and this element of the proposals should be subject to agreement/consultation with the District Council at the appropriate time.	The mitigation for individual ecological features / impacts will be adequately secured. The **Draft Development Consent Order (DCO)** **[PEPD-009]** has Requirements 12, 13,14 and 22 securing mitigation, compensation and biodiversity net gain (BNG). Requirement 12 and 22 of the **Draft DCO** **[PEPD-009]** ensures that a Landscape and Ecological Management Plan and a Code of Construction Practice are provided for agreement with the relevant planning authority and Natural England. Requirement 13 of the **Draft DCO** **[PEPD-009]** ensures that the Landscape and Ecological Management Plan is delivered as agreed, whilst Requirement 14 of the **Draft DCO** **[PEPD-009]** secures the agreement and implementation of a BNG strategy.
Traffic and Transport		
2.2.29	8.1 The environmental effects of the construction traffic impact are a key consideration and the views of West Sussex County Council, as the local highways authority, and National Highways should be carefully considered.	The environmental effects of the construction traffic have been assessed in **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064]** and **Chapter 32: ES Addendum, Volume 2** of the ES **(Reference: 6.2.32)** submitted at Deadline 1. The Applicant has regularly engaged with West Sussex County Council and National Highways during the pre-application stage and will continue to do so during the Examination.
2.2.30	8.2 Appropriate mitigation through a detailed Construction Traffic Management Plan, will be essential.	An **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** has been produced as part of the Development Consent Order (DCO) Application which includes mitigation measures to limit the impacts of construction traffic associated with the Proposed Development. Stage specific CTMPs will be produced following the grant of the DCO and prior to construction of that stage of works which will follow the controls defined within the **Outline CTMP** **[PEPD-035a]** secured through Requirement 24 of the **Draft Development Consent Order** **[PEPD-009]**. These will be agreed with the Local Highway Authority (WSCC) in consultation with Mid Sussex District Council within its area or the relevant local planning authority.
2.2.31	8.3 Effective mitigation is needed for the impacts on recreational users of the PROW network, especially during the construction period.	The **Outline Public Right of Way Management Plan (PRoWMP)** **[APP-230]** outlines the management measures for all Public Rights of Way affected during the construction phase of the onshore elements of the Proposed Development.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		The provision of a stage specific Public Rights of Way Management Plan to be submitted to and approved by the highway authority in consultation with the relevant planning authority is secured via Requirement 20 in the **Draft Development Consent Order** **[PEPD-009]**.
Design Principles – Existing National Grid Bolney Substation extension		
2.2.32	9.1 The applicant states that one of the key design principles is the intention that the substation extension will be screened by existing vegetation and proposed landscape planting. MSDC supports this key design principle, and it is important that the aims of it are appropriately secured.	See response above to **reference 2.2.7**.
2.2.33	9.2 Under the Historic Environment Design Principles, a recognition should be made of the contribution the site makes to the setting of Coombe House, Cowfold Road and not just Twineham Court Farmhouse, Bob Lane.	See response above to **reference 2.2.7**.
2.2.34	9.3 Consideration should be given to the inclusion of ecological enhancements (such as the new bat boxes at Oakendene substation) within the Terrestrial Ecology Design Principles for the substation extension.	See response above to **reference 2.2.7**.
2.2.35	9.4 MSDC supports the use of the existing access onto Wineham Lane for the construction and operational phases of the substation extension rather than have a new access directly onto Bob Lane.	The Applicant welcomes Mid Sussex District Council's support on the use of the existing access onto Wineham Lane for the construction and operational phases of the existing National Grid Bolney substation extension.
Draft Development Consent Order		
2.2.36	10.1 There are some aspects of the draft development consent order that may need refinement. The following comments are not therefore exhaustive although any additional comments will be shared with the applicant and set out in the Local Impact Report.	Noted, the Applicant has no further comments on this matter at this time.
2.2.37	10.2 Part 3, Requirements, 9 (Detailed design approval – extension to National Grid substation): Cross reference is made with the ground level definitions from the DAS but confirmation of the need to provide the existing ground levels should made explicit here or within the DAS.	Reference to 'existing and proposed ground levels' has been added at point (c), requirements 8 and 9 of Part 3 of Schedule 1 to the **Draft Development Consent Order** **[PEPD-009]** submitted at the Pre-Examination Procedural Deadline.
2.2.38	10.3 Part 3, Requirements,12 (Provision of Landscaping): Reference should be made to the need to submit a comprehensive Arboricultural Impact Assessment as part of the landscaping.	An Arboricultural Impact Assessment (AIA) has been submitted with the DCO Application (see **Appendix 22.16: Arboricultural Impact Assessment, Volume 4** of the ES **[APP-194]**). Section 4.7 of the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** includes a commitment (C-285) to produce an Arboricultural Method Statement (AMS) and Tree Protection Plan (TPP) based on the detailed design. The provision of the AMS and TPP is secured as part of the CoCP secured in the **Draft Development Consent Order** **[PEPD-009]** Requirement 22 and shall be provided as part of the stage specific detailed CoCP prior to the commencement of the relevant stage of works.
2.2.39	10.4 Part 3, Requirements, 22 (5) (Code of Construction Practice): Should reference be made here to the 'temporary construction compounds' and 'temporary soil storage areas' identified as Works No 10 and 11 respectively?	The embedded environmental measures related to onshore temporary construction activities are included in the **Outline Code of Construction Practice (CoCP)** **[APP-224]**, including the construction compounds and soil storage. As per **Draft Development Consent Order** **[PEPD-009]** Requirement 22, the detailed CoCP must accord with the **Outline CoCP** **[APP-224]** and will cover such activities where applicable in the stage of works.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.2.40	10.5 Part 3, Requirements, 32 (Travel Plan): The wording appears to suggest that the OTP could be implemented at any time during the lifetime of the development. It is considered the timescale for implementation should be made more explicit. For example "to be implemented at the time the project becomes operational and retained for the operational lifetime of the project."	The word 'during' has been changed to 'throughout' in Requirement 32 in the **Draft Development Consent Order [PEPD-009]** submitted at the Pre-Examination Procedural Deadline A on 16 January 2024. This change has also been made to Requirements 29, 30, 31 and 33
Closing Comments		
2.2.41	11.1 Without prejudice to the above representations Mid Sussex District Council will, at the required time, produce a Local Impact Report (LiR) which will set out its position in full on the above and any other relevant matters. 11.2 In the meantime, Mid Sussex District Council will continue to engage with the applicant regarding the DCO.	The Applicant has no further comments on this matter at this time.

Table 2-3 Applicant's Response to West Sussex County Council

Ref	Relevant representation comment	Applicant's response
2.3.1	**2 Overview** 2.1 WSCC acknowledges the target set by the UK Government of delivering over a third of electricity from offshore wind by 2030 and, therefore, it is supportive of the principle of offshore wind development in helping to tackle the challenges faced by climate change. WSCC recognises the national importance of having a balanced supply of electrical generation, including increasing renewable energy supplies from offshore turbines in helping decarbonise the UK's energy sector. Critical national infrastructure must not only deliver the Government's energy objectives but also deliver sustainable societal and economic impacts in the regions that are hosting them. Therefore, the Project needs to be achieved without significant adverse effects on the environment, local communities, and economy of West Sussex.	West Sussex County Council's support to the principle of offshore win development in helping to tackle challenges faced by climate change is welcomed by the Applicant. The Proposed Development will help meet the urgent need for new renewable energy infrastructure in the UK and supporting the achievement of the UK Government's climate change commitments and carbon reduction objectives. The Proposed Development type is recognised as being a critical national priority in the revised NPS EN-1 (Department for Energy Security and Net Zero (DESNZ), 2023a) and NPS EN-3 (DESNZ, 2023b), which came into force in January 2024 and are considered to be relevant to the determination of the DCO Application. This additional generating capacity will contribute towards meeting the urgent need for new energy infrastructure in the UK, provide enhanced energy security, support the economic priorities of the UK Government and, critically, make an important contribution to decarbonisation of the UK economy. The Proposed Development will contribute materially towards meeting the urgent national need for renewable electricity, significantly reducing carbon emissions from energy. The assessment set out in **Chapter 29: Climate change, Volume 2** of the ES **[APP-070]** concludes the Proposed Development has a lifetime greenhouse gas (GHG) emissions saving of 35,901 kilotonne carbon dioxide equivalent ($ktCO_2e$). The Proposed Development will continue to offset greenhouse gas (GHG) emissions until 2050, and therefore make a positive contribution the UK Government target to reach net zero emissions in 2050. Section 104 of the Planning Act 2008 outlines that the DCO Application must be decided in accordance with the relevant NPS (in this case: NPS EN-1 (DECC, 2011a), NPS EN-3 (DECC, 2011b) and NPS EN-5 (DECC, 2011c) with NPS EN-1 (DESNZ, 2023a), NPS EN-3 (DESNZ, 2023b) and NPS EN-5 (DESNZ, 2023c), that came into force in 2024, relevant considerations in the decision-making process) unless (inter alia) the adverse impacts of a proposal would outweigh its benefits. Section 5.4 of the **Planning Statement [APP-036]** summarises the potential environmental, social and economic benefits and the adverse impacts of the Proposed Development drawing on relevant information in line with NPS EN-1 (DECC, 2011a and DESNZ, 2023a). Section 5.5 of the **Planning Statement [APP-036]** sets out the planning balance where the potential benefits and impacts of the Proposed Development are weighed up. Although, inevitably, there are adverse impacts associated with the scale and type of infrastructure that forms the Proposed Development, the Applicant considers that the planning balance is firmly in favour of the Proposed Development and the benefits outweigh the adverse impacts.
2.3.2.	2.2 The Applicant has identified that the offshore infrastructure associated with Rampion 2 will have potentially significant adverse impacts on the seascape, coastal landscapes, and people who live, work and visit West Sussex. The onshore infrastructure at the substation site also has the potential to negatively impact on a number of environmentally sensitive areas and features, and on residential amenity during the lifetime of the Project.	The likely significant environmental effects of the Proposed Development have been assessed in **Chapter 6: Coastal processes** to **Chapter 30 Inter-related effects, Volume 2** of the Environmental Statement (ES) **[APP-047** to **APP-071]**. Wherever practicable, likely significant adverse effects have been avoided or minimised through embedded environmental measures in the design of the Proposed Development, taking into account the findings of the ES, consultation with stakeholders and national and local policy requirements. The ES has identified significant seascape, landscape and visual effects for areas of the South Downs National Park (SDNP), West Sussex, East Sussex, and the City of Brighton & Hove (see **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]**). A number of measures are embedded as part of the design of the Proposed Development to avoid, minimise or reduce any significant environmental effects on seascape, landscape and visual receptors, as far as possible. Although there are some significant effects on views and perceived special quality of the Chichester Harbour Area of Outstanding Natural Beauty (CHAONB) designation, no effects are of such magnitude or significant enough, on their own or cumulatively to compromise the statutory purposes of the designation.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		The likely significant onshore landscape and visual impacts linked to the Proposed Development are limited to the construction phase, and early in the operational phase, and impacts will be temporary (see **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]**). Embedded measures aim to minimise effects on the special qualities of the SDNP through careful design consideration and planning in respect of the construction process and activity, taking account of relevant policy and guidance. The assessment within **Chapter 25: Historic environment, Volume 2** of the ES **[APP-066]** has found some significant effects on the setting of designated assets in the construction phase along the onshore cable corridor. These effects will be temporary. There is also potential to encounter archaeological remains. In line with the requirements of National Policy Statement (NPS) EN-1 (Department of Energy and Climate Change (DECC), 2011) and mitigation within Section 5.9 the revised 2023 EN-1 (Department for Energy Security and Net Zero (DESNZ), 2023a), archaeology at risk of loss or disturbance would be recorded before any loss occurs. This recording would be provided for in a WSI (site-specific, as described in the **Outline Onshore Written Scheme of Investigation** [**APP-231]**). There are some significant effects on recreational users of a very limited number of public right of way (PRoW) and on two inshore and offshore receptors (recreational fishing and scuba diving) in the construction phase (see **Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]**). These effects will be temporary and can be moderated through the implementation of environmental measures. The wider benefits of Rampion 2 and the need for offshore wind energy must be weighed against the adverse impacts that have been identified as well as any local issues and concerns. This balancing should also take into account national and international policies and obligations that seek to tackle climate change and achieve net zero carbon emissions in 2050.
2.3.3	2.3 Therefore, although the Rampion 2 Offshore Wind Farm is supported in principle by WSCC (because it would make a significant contribution to the provision of renewable energy), there are number of matters of significant concern that have not been satisfactorily addressed to date by the Applicant. These are: i. Concerns about the size and layout of the offshore wind turbines and the significant adverse effect on views out to sea; ii. The significant scale of the onshore substation creating an adverse effect on the existing landscape and surrounding local communities; iii. The anticipated scale of historic environment impacts, which could cause an unacceptably high degree of harm to heritage assets, including those of national significance; iv. Concerns about the downplaying of temporary impacts of cable route construction, without securing construction phasing and timescales within the dDCO; v. The impacts on ecological receptors, including key species and habitats, and the needs for ecological enhancement (including Biodiversity Net Gain);	The Proposed Development will contribute materially towards meeting the urgent national need for renewable electricity generation, significantly reducing carbon emissions from energy. The Applicant's response to these points is set out in more detail in the subsequent **references 2.3.4** to **2.3.56** below.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	vi. Concerns about impacts on the West Sussex transport network during construction and the level of mitigation proposed through the Outline Construction Traffic Management Plan (OCTMP); vii. The limited mitigation measures proposed to safeguard minerals, which require strengthening; viii. The limited socio-economic benefits to West Sussex (including employment opportunities, supply chain expenditure, and the creation of a Community Benefit Fund), the limited scope of the Outline Skills and Employment Strategy (OSES), and potential adverse impacts on tourism; ix. Requirement for further environmental assessment and justification of assumptions across a number of technical elements, as highlighted within this representation; x. Ensuring the commitments and mitigation measures to reduce the adverse effects presented are secured sufficiently with the control documents and dDCO, including defining the role of WSCC in the discharge of requirements process; and xi. The limited scope and scale of the draft section 106 principles presented by the Applicant, which indicate a disappointing level of commitment to West Sussex. The concerns are reflected in the gap in expectations that currently exist between the Applicant and WSCC.	
2.3.4	2.4 As part of the DCO process, WSCC wishes to engage proactively with the Applicant to reduce the areas of concern and seek to achieve the best possible outcomes for the local communities and other sensitive receptors that would be most affected by the construction and long-term operational impacts of Rampion 2. This work will contribute to further refinement of the PADS, as well as informing the drafting of Statements of Common Ground (SoCG), Written Representations, and any response to the ExA's questions during the forthcoming examination. WSCC also recognises the importance of liaising meaningfully on the detail of the s106 Agreement. of environmentally sensitive areas and features, and on residential amenity during the lifetime of the Project.	The Applicant welcome's WSCC's wish to engage proactively to reduce areas of concern and will work towards a Statement of Common Ground.
2.3.5	**Assessment of Alternatives** 3.3 The site selection process for identifying the least impactful option for project infrastructure should have been presented to stakeholders in a robust, transparent and detailed manner, ensuring that all environmental and social criteria had been taken into account. WSCC raises concerns that this has not been sufficiently demonstrated through the application documentation for the above ground infrastructure and the areas of continuous construction presence. Key concerns are as follows: i. Justification for the choice of Oakendene as the onshore substation location - a critical part of the EIA process is to review	**Chapter 3: Alternatives, Volume 2** of the Environmental Statement (ES) **[APP-044]** describes the alternatives studied by the Applicant and a comparison of their environmental effects across the project as a whole. This includes the alternatives considered and consulted on prior to the DCO Application. As described in **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]**, the Proposed Development has been developed through a multi-disciplinary design process including environment, engineering, landowner and cost considerations. With regard identifying the "least impactful option" or the "most environmentally acceptable location" as noted in this Relevant Representation, the Applicant has sought to avoid, reduce or minimise the effects through the design process and also by identifying and securing embedded environmental measures. It is acknowledged that some residual effects remain.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	the alternatives considered during the evolution of the Project and to set out why they have been discarded in favour of preferred sites. WSCC has concerns that the limited evidence in the DCO application documents does not allow this process to be understood fully, especially with the Applicant stating there was only a marginal preference for the Oakendene site.	Section 3.6 of **Chapter 3: Alternatives, Volume 2** of the Environmental Statement (ES) **[APP-044]** provides the information on the onshore substation site selection process. Section 3.6 describes the site selection process and the reasons for other sites being discounted based on the multi-disciplinary factors identified in the paragraph above. The selection of Oakendene is clearly stated as favourable for engineering, cost and landowner considerations in paragraphs 3.6.23 to 3.6.25 of **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]**. Significant weight was also given to the environmental constraints and related policy in the overall balance of the decision. This Applicant has also developed further embedded environmental measures that have been presented in the application including the design principles in the **Design and Access Statement [AS-003]**, **Outline Landscape and Ecology Management Plan [APP-232]** and **Outline Operational Drainage Plan [APP-223]**. The Applicant has provided further information on the decision to select the Oakendene site for the onshore substation (see Appendix 2 – Further information for Action Point 4, **Applicant's Response to Action Points Arising from Issue Specific Hearing 1 (Document Reference: 8.25)** (submitted at Deadline 1).
2.3.6	ii. Justification for the locations of construction compounds - five main compound locations will be required along the onshore cable corridor and substation site, and whilst they are termed 'temporary', this would still represent approximately three years and six months of continuous construction presence. WSCC has concerns about the proximity of these compounds to sensitive receptors and therefore needs evidence that they have been sited in the most environmentally acceptable location.	The Applicant requires three temporary construction compounds as bases to support the construction of the onshore cable corridor to reduce the distance travelled between the compounds and cable work sites, and another two to support substation works. This includes for logistics, preparing materials, equipment maintenance, project management and to support mitigation works. Compounds must have sufficient space for the required purposes, be close to major roads, be outside of protected areas, be near the cable corridor and key construction activities, and be on level clear ground. Four sites were identified near Washington that could serve as the middle compound, and three were shown in the first statutory consultation in 2021. Considering consultation feedback as well as the technical and environmental appraisal of each compound site, the site on The Pike near Washington Village was selected. This compound site is: • Sufficiently large (3.9ha) for the required use; • Close to the A24 dual carriageway, reducing the need for construction traffic to traverse villages and rural roads; • Outside of the South Downs National Park and flood zones; • Directly on the onshore cable construction corridor; • Close to the site of two trenchless crossings (including the long crossing under the A24 and Washington playing fields) allowing for construction efficiencies, reducing overall impact; and • Level with limited vegetation within the site, but well screened around the perimeter. The Applicant considered an alternative compound site at Climping to the west of Church Lane prior to consultation but this was rejected due to the area overlapping with an approved Outline Application CM/1/17/OUT for the erection of up to 300 dwellings and ancillary development (for more information please see Table 3-1 in **Appendix 5.4 Cumulative effects assessment, Volume 4** of the ES **[APP-128]**). The temporary construction compounds at the onshore substation site and the National Grid Bolney substation extension works are required to support the construction of these elements of the works. The Environmental Statement has assessed the effects of each compound for during construction. Though impacts will arise, there are no significant effects arising from noise, dust, ecology, Public Rights of Way and traffic impacts when considering the embedded environmental measures secured in the **Outline Code of Construction Practice (CoCP) [PEPD-033]**, the **Outline Construction Traffic Management Plan (CTMP) [PEPD-035a]** and the **Outline Public Rights of Way Management Plan (PRoWMP) [APP-230]**. The

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		Applicant acknowledges that significant landscape and visual effects associated with the presence of the compound however these are temporary and reversible when the commitment to reinstatement in the **Outline Landscape and Ecology Management Plan (LEMP)** **[APP-232]** is considered. It is noted that each of the above plans will be subject to submission of stage specific details for approval by the relevant authority including West Sussex County Council (WSCC) for the CTMP and PRoWMP and the relevant planning authority for the CoCP and LEMP. This is as per the **Draft Development Consent Order** **[PEPD-009]** Requirements 24, 20, 22 and 12 respectively. See **Environmental Statement, Volume 2** of the Environmental Statement (ES): • **Chapter 17: Socio-economics** **[APP-058]**; • **Chapter 18: Landscape and visual impact** **[APP-059]**; • **Chapter 19: Air quality** **[APP-060]**; • **Chapter 21: Noise and vibration** **[PEPD-018]**; • **Chapter 22: Terrestrial ecology and nature conservation** **[APP-063]**; and • **Chapter 23: Transport** **[APP-064]** for further information on the assessment of effects.
2.3.7	iii. Justification for Longer Alternative Cable Route Option 1d (LACR-01d) – the pre-application consultation undertaken by the Applicant for a number of onshore cable route options (and the subsequent mitigation through avoidance this resulted in) is acknowledged by WSCC. However, WSCC has a significant concern about option LACR-01d taken forward by the Applicant. The archaeological sensitivity of this section of the route is exceptionally high. LACR-01d crosses an area of the South Downs that forms part of an incredibly rich and complex multi-period prehistoric landscape of national significance. The assessment of alternatives does not provide sufficient detail as to the weighting given to these sensitivities within the site selection process.	Paragraphs 3.4.55 to 3.4.67 of **Chapter 3: Alternatives, Volume 2** of the Environmental Statement (ES) **[APP-044]** provide a detailed description of the justification for the onshore cable route selection in this location. This includes comparison of alternatives to the selected onshore cable route. As presented in paragraphs 3.4.63 and 3.4.66 of **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]** and the bullet points that follow these paragraphs, each of the alternative routes presented pass through Archaeological Notification Areas (ANAs) with potential or known archaeological remains of high heritage significance. The high potential for archaeological remains of high heritage significance in the South Downs National Park (SDNP) was given substantial weight (based on their potential and known archaeological significance) in the decision making process, in accordance with the protection afforded by policy in NPS EN-1 (2011) and the revised 2023 NPS EN-1 (Department for Energy Security and Net Zero, 2023a). Based on the available historic environment evidence, when comparing the environmental effects or policy outcomes during the decision making process, there was no material difference for each onshore cable route for archaeology.
2.3.8	**Project Description and Construction Phase Detail** 3.4 It is essential to ensure that key design and construction decisions do not result in unacceptable or adverse impacts on residents, visitors or businesses within West Sussex over the four-year onshore construction period. Key concerns are as follows: i. Given the duration of the onshore construction programme will be up to four years, there is a lack of construction phasing information, which should be presented more clearly to enable local communities and WSCC to understand if the impacts have been appropriately addressed and mitigated through the outline control documents. The proposed Construction and Communications Plan (CCP) as part of the Outline Code of Construction Practice (OCOCP) (APP-224), as very broadly	Section 4.7 of **Chapter 4: The Proposed Development, Volume 2** of the Environmental Statement (ES **[APP-045]** provides a summary of the indicative construction programme that has informed the assessments within the ES. Schedule 1, part 3, requirement 10 of the **Draft Development Consent Order** **[PEPD-009]** secures that the detail of the stages (equivalent to phases) of works are to be submitted and approved by the relevant planning authorities.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	outlined, is welcomed and should build upon similar arrangements adopted for Rampion 1, and experience gained and lessons learnt. ii. There is limited, if any detail on how the commitment (C-19) within the Commitments Register (APP-254) to construct the onshore cables in discrete sections, will be secured and the type of information that will be provided on detailed phasing, sequencing of construction activities. Given assessments are predicated on the durations of construction activities, it is essential to understand the scope of the information to be provided and timescales of activities no longer than that assessed as a worst case.	
2.3.9	iii. The detailed design for trenchless crossings (HDD) will be confirmed at the detailed design stage as part of Construction Method Statements (CMS). This leaves significant uncertainty as the potential for impacts. The Outline CMS (OCMS) (APP-255) suggests for any changes to trenchless crossings (currently identified as preferred options), confirmation will be provided that there are no new or materially different environmental effects arising compared to those assessed in the ES. However, no methodology as to how this will be assessed/established has been provided and requires clarification.	The **Outline Construction Method Statement** **[APP-255]** provides further information regarding the detailed design of the trenchless crossings in Section 3.4 and the further information required to inform this (e.g. ground investigation). The detailed design of a trenchless crossing will be undertaken within the established parameters assessed in the Environmental Statement (ES) as detailed in paragraph 4.5.27 of **Chapter 4: The Proposed Development, Volume 2** of the ES **[APP-045]** and secured in the **Draft Development Consent Orde r[PEPD-009]** through Requirement 23 (g) to be approved by the relevant planning authority. Any assessment required at the detailed design stage would be undertaken in accordance with the established methodologies outlined in the ES.
2.3.10	iv. There is a concern about the lack of detail and clarity in the CoCP and Outline Construction Traffic Management Plan (OCTMP) (APP-228). This includes in relation to some of the proposed measures to reduce the construction impact.	The Applicant will continue to engage with West Sussex County Council (WSCC) to seek discuss matters with regards the measures identified in the **Outline Code of Construction Practice** **[PEPD-033]** and the **Outline Construction Traffic Management Plan** **[PEPD-035a]**. This will be recorded during the development of the Statement of Common Ground (SoCG) with WSCC. Stage specific CoCPs and CTMPs will be required to be submitted and approved before the commencement of a stage as secured by Requirements 22 and 24 respectively of the **Draft Development Consent Order** **[PEPD-009]**.
2.3.11	**Seascape, Landscape and Visual Impacts (SLVIA)** 3.5 The Project will result in significant seascape, landscape, and visual effects to people living, working, and visiting West Sussex during both the construction and operational phases. Therefore, WSCC has concerns about the scale of likely impacts of Rampion 2, in addition to, and in combination with, the currently operating Rampion 1 Offshore Wind Farm. There are concerns that the dDCO (APP-019) does not secure robust design principles relevant to West Sussex receptors necessary to reduce the potential visual effects of the offshore infrastructure by sensitive detailed design if consent is given.	The seascape and visual effects of Rampion 2 wind turbine generators (WTGs) are assessed in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]**. The Applicant notes that significant effects on views experienced by people living, working, and visiting West Sussex have been identified at a number of representative viewpoints along the West Sussex coastline. The spatial extent of the Rampion 2 array area has been reduced and designed according to a set of SLVIA specific design principles (Section 15.7 of the **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]**) which provide embedded environmental measures by reducing the magnitude of effects and minimising harm on the perceived seascape qualities and views, focusing particularly on the South Downs National Park (SDNP). Opportunities to reduce effects through further design principles specific to West Sussex are limited by the technical, economic and functional requirements of the Proposed Development to produce renewable energy, as well as other environmental factors as presented in the final array area extent in the **Offshore Works Plan** **[PEPD-004]**. The refinement process for the offshore array site selection considered has been presented in Section 3.2 of **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]**.The Applicant has produced and submitted a **Seascape, Landscape and Visual Design Principles Clarification Note** **(Document Reference 8.35)** (submitted at Deadline 1), which provides further commentary on these SLVIA specific design principles.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.3.12	*Assessment Methodology* i. The assessment undertaken to date and presented in the DCO submission is detailed and although it provides useful information to enable the consideration of impacts on SLVIA aspects, there is a concern that a worst-case scenario relative to West Sussex receptors has not been presented. It must be demonstrated that the Maximum Design Scenario, which has balanced the number of turbines between both Zone 6 and the western Extension Area, is truly the worst case for receptors in West Sussex, if the dDCO allows for a greater number of turbines to be placed to the west. ii. The SLVIA does not provide an assessment of nighttime views from the agreed viewpoints outside of the International Dark Sky Reserve, relative to West Sussex receptors agreed during the Expert Topic Groups (ETGs). iii. The cumulative effects assessment does not include the assessment of the potential decommissioning/repowering of the Rampion 1 Offshore Wind Farm during the operational phase of the Project.	i. The Applicant has produced and submitted a **SLVIA Maximum Design Scenario and Visual Design Principles Clarification Note (Document Reference 8.35)** (submitted at Deadline 1), which provides further justification that the maximum design scenario (MDS), with a balance of turbine numbers between the Zone 6 and western Extension Area, is representative of the worst case in terms of seascape, landscape and visual effects. ii. The assessment of aviation and navigation night-time lighting is undertaken within **Appendix 15.5: Assessment of aviation and navigation night-time lighting, Volume 4** of the ES **[APP-161]** and this assessment includes consideration of effects of night-time lighting on the urban areas outside the South Downs International Dark Sky Reserve (IDSR). The Applicant has provided an additional Supporting Study in **Appendix 15.6: Supplementary Night-Time Viewpoint Assessment, Volume 4** of the ES **[PEPD-024]**). This provides a further assessment of the visual effects of night-time aviation and marine navigation lighting from the agreed viewpoints at Worthing (Viewpoint 10) and Pagham (Viewpoint 13) outside the IDSR, which is supported with night-time photomontage visualisations from these locations. iii. The Applicant recognises that the assessment undertaken in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]** does not include assessment of the potential decommissioning / repowering of the Rampion 1 Offshore Wind Farm. The decommissioning programme for the offshore elements of Rampion 1 (ROW, 2018) (submitted in accordance with Requirement 8 of the Rampion Offshore Wind Farm Order 2014) assumes that *'full decommissioning will commence after the design life of the Rampion 1 WTGs (24 years)'*, but that Rampion 1 wind farm *'may be 're-powered' after 24 years with new wind turbines to take advantage of the available lease period with The Crown Estate (40 years), subject to the findings of a new EIA and consent application'*. Under the first scenario, the decommissioning assumption is complete removal of all offshore components of Rampion 1 in 2042 (24 years after April 2018). In this scenario, the 116 WTGs comprising Rampion 1 would be removed from the seascape and would contribute to a reduced effect on seascape, landscape and visual receptors. Under the second scenario (i.e. repowering), the Applicant considers that repowering of Rampion 1 Wind Farm is not in the foreseeable future. This is due to the uncertainty about what may occur and therefore, the project design for a possible future Rampion 1 repowering project with 'new turbines' cannot reasonably be assessed, as it is not well-defined or of sufficient detail to make an informed assessment. Guidance in Guidelines for Landscape and Visual Impact Assessment 3 (GLVIA3) (Landscape Institute and Institute of Environmental Management and Assessment (IEMA), 2013), the *Infrastructure Planning (Environmental Impact Assessment) Regulations 2017* ('EIA Regulations') and PINS Advice Note 17 (PINS, 2019) all encourage an approach of assessing cumulative effects of projects that are reasonably foreseeable (i.e. subject to planning consent, a valid planning application or at scoping/pre-application stage).
2.3.13	*Assessment of Effects* iv. The provided photomontages are useful tools that aid in the assessment of visual effects. They show the significance of impacts likely to be experienced by receptors in West Sussex, in particular, the impacts that would result from the lengthy westerly extension, which would significantly extend the field of view over which impacts on seascape would be experienced; this is a major concern to WSCC.	iv. The Applicant welcomes West Sussex County Council's (WSCC) feedback on the usefulness of the photomontage visualisations (as submitted with **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]**) in aiding the assessment of visual effects of the Proposed Development. The Applicant notes WSCC's concerns regarding the significant visual effects identified in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]** on views experienced by people living, working and visiting the West Sussex coastline, resulting particularly from the apparent scale and western lateral spread of wind turbine generators (WTGs) in the field of view out to sea.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	v. Whilst WSCC recognise that offshore wind energy would inevitably result in changes to coastal seascapes and views, it had concerns about the following SLVIA related impacts to West Sussex: a) The scale of both individual wind turbines and the extent of the array as a whole would result in a significantly greater visual impact from a number of viewpoints than views of the existing Rampion 1. This would, in turn, cause the offshore wind farms to become the dominant feature in the seascape and lead to a curtaining effect across Sussex Bay; b) The proposed array would lie close to, and affect the setting of, a number of coastal landscape features. It would significantly affect the seascape character, and detract from the appreciation of the coastal landscape feature; and c) It is acknowledged that after engagement with stakeholders, a set of design principles were developed for the offshore turbine layout during the pre-application stage. This, however, did not lead to a reduction in the offshore boundary to the western extent. Therefore, consideration needs to be given to an offshore boundary and layout that has an overall potential for lesser impacts, which can be secured through the dDCO.	v. a) The spatial extent of the Proposed Development array area has been reduced and designed according to a set of seascape, landscape and visual impact assessment (SLVIA) specific design principles (Section 15.7 of **Chapter 15: Seascape, Landscape and visual impact assessment, Volume 2** of the ES **[APP-056]**) which provide embedded environmental measures by reducing the magnitude of effects and minimising harm on the perceived seascape qualities and views, focusing particularly on the South Downs National Park (SDNP). Opportunities to reduce effects through further design principles specific to West Sussex are limited by the technical, economic and functional requirements of the Proposed Development to produce renewable energy, as well as other environmental factors. The Applicant has produced and submitted a **SLVIA Maximum Design Scenario and Visual Design Principles Clarification Note (Document Reference 8.35)** (submitted at Deadline 1), which provides further commentary on these SLVIA specific design principles. b) The effects of Rampion 2 on seascape and setting of coastal landscape features will primarily be experienced on the coastline of the South Coast Shoreline Landscape Character Assessment (LCA) (SC1) and its associative seascape context of the Selsey Bill to Seaford Head Marine Character Area (MCA) (07). The landscape sensitivity of this coastline is considered to be medium because it is not subject to landscape designation for its scenic quality but does function as a valued coastal landscape resource for tourism and recreation, focused on the beaches and seafront. Although it is susceptible to changes associated with the offshore elements of Rampion 2, there are factors that reduce its landscape sensitivity, including the extent of the urbanised developed coast, the presence of ports and industrial elements, and the extent of tourism related development and activities, which provide detractors to scenic/perceptual qualities, and the WTGs of Rampion 1 are a characteristic feature. The seascape is also of large, expansive scale, with a simple broad coastal landform that is separated from the Rampion 2 array area by open sea and the operational Rampion 1 wind farm. The assessment in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]** found that Rampion 2 will result in changes to the visual aspects of the perceived character of the South Coast Shoreline LCA (SC1) as a result of the addition of the Rampion 2 in its seascape context of the Selsey Bill to Seaford Head MCA (07). These changes occur to specific aesthetic/perceptual aspects, particularly its open and exposed character, partial loss of open seascape and change in seascape composition, as a result of further WTG development influence in its open views out across the sea to the horizon, with the changes assessed as being medium to medium-high and the effect significant from the long narrow shoreline extending between Selsey Bill and Shoreham-by-Sea. The characteristic views along the coastline will however remain and will continue to be appreciated. There will still be open views out across the sea, and it will remain an exposed, shoreline landscape whose character is governed by the dynamic influences of the sea and weather, and the linear urban coastal developments that define this coastline. c) The spatial extent of the Rampion 2 array area has been reduced and designed according to a set of SLVIA specific design principles (Section 15.7 of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES) **[APP-056]** which provide embedded environmental measures by reducing the magnitude of effects and minimising harm on the perceived seascape qualities and views, focusing particularly on the SDNP. Opportunities to reduce effects through further design principles specific to West Sussex are limited by the technical, economic and functional requirements of the Proposed Development to produce renewable energy, as well as other environmental factors. The Applicant has produced and submitted a **SLVIA Maximum Design Scenario and Visual Design**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		Principles Clarification Note **(Document Reference 8.35)** (submitted at Deadline 1), which provides further commentary on these SLVIA specific design principles.
2.3.14	*Mitigation, Compensation and Enhancement* vi. The findings of the SLVIA conclude that even with embedded mitigation measures, significant adverse effects for areas of West Sussex will be felt during all stages of the Project. No attempt at further mitigation through the reduction in size and scale of the turbines or production of design principles for the detailed design stage, if consented, have been presented by the Applicant, to reduce these effects. vii. The Applicant must continue to work with stakeholders to further develop commitments to the layout and extent of turbines to reduce the significant visual impacts. In working with WSCC to secure a set of design principles specific to views experienced from West Sussex, there needs to be commitment by the Applicant that a lesser impactful design can be secured.	vi. As noted in previous responses, opportunities to reduce effects through further design principles specific to West Sussex are limited by the technical, economic and functional requirements of the Proposed Development to produce renewable energy, as well as other environmental factors. The Applicant has produced and submitted a **SLVIA Maximum Design Scenario and Visual Design Principles Clarification Note (Document Reference 8.35)** (submitted at Deadline 1), which provides further commentary on these SLVIA specific design principles. vii. The Applicant will continue to engage with WSCC on matters regarding seascape landscape and visual impacts.
2.3.15	**Socio-Economics** 3.6 The focus of this representation is upon the socio-economics implications of the Project, namely employment, economic output, and the visitor economy. Key areas of concern relating to socio-economics, include: implications of data limitations; the methodology for assessing quantitative effects; limited local benefits of the Project during construction; lack of secured Community Benefit Fund; measures and commitments to the visitor economy sector and; details of provisions and outputs of the Outline Skills and Employment Strategy (OSES) (APP-256). *Assessment Methodology* i. An outdated West Sussex Transport Plan has been used to inform the assessment. The ES should be reviewed against the latest plan (West Sussex Transport Plan 2022-2036) and amended as necessary. ii. For baseline data gathering, the justification of 2020 population estimates when more recent data is available, has not been given. The baseline data included in the OSES has no source/year and, as such, an up-to-date baseline with all sources referenced should be included in the document. iii. A number of data limitations are set out; the implications of these limitations for the assessment are not provided. This includes for people seeking work, GVA data by sector, tourism employment, and the lack of appropriate literature evidence on impacts.	i. The Applicant acknowledges that West Sussex Transport Plan 2011-2026 (West Sussex County Council, 2011) has now been superseded by the West Sussex Transport Plan 2022-2036 (West Sussex County Council, 2022). Nevertheless, the updated strategy shares many of the same objectives as the earlier strategy, including identifying opportunities to enhance walking, cycling and equestrian infrastructure and improve the recreational user experience. As such, the updated strategy does not affect the findings or conclusions in the assessment within **Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]**. ii. The Applicant notes that 2020 population estimates were presented in **Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]**. This is because, at the time the chapter was produced, more recent data was not yet available in the detail that was required (at the local / county district level). The Applicant has reviewed the latest data for 2022 based on the ONS Mid-Year Population Estimates. The latest data shows that in 2022 Sussex had a population of 1.7 million, 1.03 million of whom are of are of working age (i.e., aged 16-64). This is only slightly different to the data for 2020 presented in the **Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]** (1.73 million and 1.03 million respectively). Changes in demographics are not considered as a socio-economic effect in the ES (as they were scoped out) and therefore this data was presented as wider contextual baseline data rather than data that is specifically used in the assessment of a change on baseline conditions. Whilst it is acknowledged that more recent data is now available the inclusion of more recent data available would not materially alter the findings of the assessment. iii. The Applicant can confirm that none of the baseline conditions data limitations noted in Section 17.5 of **Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]** would have a material effect on the assessment. These data limitations increase the uncertainty when assessing and quantifying impacts, but not to the extent that they would affect the significance conclusions. For example, the gaps in literature related to tourism impacts relate to a lack of ex post studies. Despite this, the literature has strengthened over time. This has improved the confidence and robustness of tourism assessment findings related to offshore wind farms.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	iv. There is extensive reference within the baseline conditions analysis to specific features of the Project. This section should be a review of the baseline without the Project in place. v. Effects on economy and visitor economy should be reported at a local authority level, which would be more appropriate to show how the employment opportunities will be spread within Sussex. vi. The implications of the decision by the Applicant to exclude consideration of induced economic impacts are not clear. vii. A key issue for WSCC is the relatively low economic beneficial impact expected for West Sussex through the construction phase and further assurance work is required. Therefore, it is requested that the Applicant works with WSCC to ensure sufficient strategies are put in place to maximise benefits locally, as per the commitment made, with a view towards the percentage figure for Sussex increasing from a currently low base. viii. Concern is raised about how local businesses could capture supply chain expenditure (see detailed below).	iv. The baseline analysis presents a review of the existing baseline without the Proposed Development in place. However, reference to the Proposed Development is used to help put the baseline assets into the context of the Proposed Development infrastructure, especially with regards to the study areas over which baseline information is presented, which varies by effect. v. The Applicant notes that, through the scoping phase and evidence plan process, Sussex was agreed as an appropriate study area for effects on the economy and on volume and value of tourism because of the scale over which tourism impacts could occur: • Coastal districts in Sussex with potential visual impacts from offshore infrastructure – (City of Brighton and Hove, Lewes, Wealden, Eastbourne, Worthing, Arun, Adur and Chichester); and • Districts onshore infrastructure proposed (Arun, Horsham, Mid Sussex) as well as the South Downs National Park. To address concerns about more localised effects raised following the first Statutory Consultation exercise (July – September 2021) feedback the **Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]** sought to provide a more detailed assessment on coastal areas and areas in close proximity to the onshore cable infrastructure. This included consideration of areas of potentially higher sensitivity/impact. The local sensitivities were therefore considered in the assessment. Given the evidence base and local characteristics, the Applicant notes that the assessment findings would not change if the whole assessment on value and volume of tourism was conducted at a more granular local authority district level. vi. As noted in paragraph 17.8.5 of **Chapter 17 Socio-economics, Volume 2** of the ES **[APP-058]** "*the socio-economic assessment excludes the induced impacts generated by Rampion 2 across all phases, as these are typically affected by greater uncertainty and are more difficult to measure and defend robustly in terms of their scale and additionality.*" This follows approaches taken on other offshore wind projects. This assessment approach was taken to ensure that the economic effects were robust and not overstated. The implications of excluding this are that there is further employee expenditure-related economic benefits that the assessment has not quantified. Based on the Applicant's knowledge of economic multipliers and the scale of employment of Rampion 2, the inclusion of induced effects would be similar but lower than the indirect effects and would not materially impact on the magnitude of impact assessment for jobs and gross value added (GVA). vii. Please refer to the Applicant's response in **reference 2.3.16** for points x, xi, and xii below. viii. Please refer to the Applicant's response in **reference 2.3.16** for points x, xi, and xii below.
2.3.16	*Mitigation, Compensation and Enhancement* ix. The assessment identifies measures aimed at reducing the disruption caused by the Project and the consequent impacts on tourism economy. However, measures and commitments that would support a boost to the tourism sector specifically are not provided. These should be provided to reflect the priority the sector is given in the Economy Plan for West Sussex. x. The OSES lacks specific detail with regards to existing skills gaps and current levels of provision, and on specific initiatives which are tailored to local issues and need. A route map for developing the OSES further should	ix. Given that the assessment does not find a significant effect on tourism, the Applicant is not required to provide additional measures and commitments that would support a boost to tourism. This would only be provided where significant effects have been identified. Any measures to boost the tourism sector would therefore need to be agreed outside the planning process. x & xi. The **Outline Skills & Employment Strategy (oSES)** **[APP-256]** was intentionally high-level and the Applicant was not in a position to document concrete commitments without further consultation with key skills and employment stakeholder organisations in Sussex. The first tranche of consultation took place between July and October 2023 when The Applicant met with nine skills and employment stakeholder organisations. The

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	be provided, including setting out when engagement with WSCC and other stakeholders is needed and how it will take place. xi. The Applicant states they will identify opportunities for companies based or operating in the region to access the supply chain for the Project, and that this is secured through a commitment (C-34) in the OCoCP. This measure, however, is not included within the OCoCP and should be addressed. xii. Reference within the OSES is made to a Community Benefits Package, however it is described as 'remaining separate' from the planning process. Due to the adverse effects identified by the Project, the Community Benefits Package should be a firm commitment and secured through the DCO.	results of this consultation have fed into the second iteration of the **oSES [PEPD-037]**, submitted to the Examining Authority (ExA) in January 2024. This latest version of the **oSES [PEPD-037]** includes seven additional key skills and employment stakeholder organisations and The Applicant has identified two additional organisations to consult. Meetings will be held with these stakeholders in Q1 2024. As implied in Paragraph 43 of the **oSES [PEPD-037]**, following this next series of consultation meetings and the examination itself, the Applicant will produce a final Skills and Employment Strategy (SES) outlining key objectives, initiatives and activities, which will also include greater detail on timelines, monitoring and commitments'. The **oSES [PEPD-037]** is very much an evolving work-in-progress. The final oSES is secured through Requirement 33 in the **Draft Development Consent Order [PEPD-009]**. The Industry Leadership section of the latest **oSES [PEPD-037]** sets out a series of initiatives to respond to local skills gaps and local need, and opportunities for local companies to access the supply chain for the project, all of which will be further developed during the subsequent consultation. Examples of local initiatives set out in the latest **oSES [PEPD-037]** include: Support for jobs and skills in the local supply chain: • Encouraging and supporting growth and employment in local supply chain companies; • Increasing visibility of local Small and Medium-sized Enterprises (SMEs) within the employment market; • Promoting training and employment opportunities to local residents; • Supporting transition from other sectors, e.g. military, fossil fuel-based sectors, etc.; and • Creating opportunities to collaborate with other developers, Tier 1 contractors, and companies in the supply chain. While the **oSES [PEPD-037]** doesn't specify how we will deliver these initiatives, some of those we are seeking to develop which will be set out in the final SES, include: • Mapping the supply chain across tiers in the southeast area, to include clarification of capacity and capability to support construction and operational elements for Rampion 2; • Launch of the Supplier Engagement Platform, which will set out the likely Rampion 2 opportunities to come during construction and operation; and • Meet the Buyer Events / Supplier Engagement Days to offer local suppliers the chance to meet Rampion 2's Tier 1 contractors to maximise opportunities for potential contracts. xii. Community benefits are not a legal or DCO requirement and are quite distinct from the consenting process, a point reiterated in the UK Government (Department for Energy Security and Net Zero) response to the consultation on Community Benefits for Electricity Transmission Network Infrastructure (December 2023), which stated:

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		"The proposals on community benefits for electricity transmission network infrastructure discussed within this document will remain separate to the planning process. It will not be a material consideration in planning decisions, and not secured through those decisions." That said, Rampion 2 will be a permanent neighbour in the Sussex community and the Applicant intends to develop and implement a community benefits package of proposals. In the second half of 2024, the Applicant will therefore be consulting key stakeholders and local communities on how a community benefit package could best support Sussex communities. The final package may include a range of initiatives to benefit business, education and residential communities.
2.3.17	**Landscape and Visual Impact (LVIA)** 3.7 The LVIA demonstrates that, even with mitigation, the construction and operation of the Project would give rise to wide ranging significant impacts on a number of both landscape and visual receptors. The LVIA downplays landscape and visual impacts of both construction activities (for the entire Project) and installation/operation of the Oakendene substation. In this regard, the LVIA places too great a reliance on reinstatement being carried out as soon as possible, which cannot be guaranteed, and there is too strong a reliance on specific selected viewpoint locations (for which additional VPs are considered necessary). Overall, therefore, there is a failure to give consideration the full range landscape and visual receptors likely to be impacted. 3.8 Visual impacts of the Oakendene substation have been downplayed, with additional viewpoint locations and associated visualisations required to best represent key visual receptors and provide accurate assessment of the level of impacts, and to inform appropriate mitigation. Design principles identified in the Design and Access Statement (AS-003) need further refinement, engagement, and to be presented in a clearer manner. *Assessment Methodology* i. The LVIA places too much reliance on specific selected viewpoint locations and fails to give consideration to the full range of landscape and visual receptors likely to be impacted, which will be wide-ranging as indicated by Zones of Theoretical Visibility (ZTVs). There is a need to provide a full assessment/quantification of all visual receptors likely to be impacted, and to recognise that selected viewpoints are only indicative of impacts for a limited proportion of receptors affected. ii. With specific regard to viewpoints identified, it is considered that additional viewpoints and/or amended photography/visualisations are required to understand the extent of visual impacts, in particular, at construction compounds and the Oakendene substation. iii. The submitted Residential Visual Amenity Assessment (RVAA) is not considered fit for purpose. The findings in respect of visual impacts	3.7 & 3.8 – These paragraphs provide an overview of West Sussex County Council's (WSCC) concerns which are elaborated upon in points i. to vii. The landscape and visual impact assessment (LVIA) is reported in **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]** which is supported by **Figures 18.1 to 18.76, Volume 3** of the ES **[APP-098-103]** includes 69 viewpoints (viewpoint locations have been discussed and agreed with a number of stakeholders see paragraph 18.4.41 within **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]**) illustrating the onshore elements of the Proposed Development. The LVIA draws from the methodology and detailed assessment set out in: • **Appendix 18.1: Landscape and visual impact assessment methodology, Volume 4** of the ES **[APP-167]** • **Appendix 18.2: Viewpoint Analysis, Volume 4** of the ES **[APP-168]** • **Appendix 18.3: Landscape Assessment, Volume 4** of the ES **[APP-169]** • **Appendix 18.4: Visual Assessment, Volume 4** of the ES **[APP-170]** • **Appendix 18.5: Residential Visual Amenity Assessment, Volume 4** of the (ES) **[APP-171]** • **Appendix 18.6: Viewpoint directory, Volume 4** of the ES **[APP-172]** It is agreed that 'even with mitigation' the construction effects of the onshore elements of the Proposed Development would result in a number of significant landscape and visual effects. This would be temporary through the construction phase and in some cases extending into the early years of the operation and maintenance phase. The Applicant disagrees regarding WSCC's assertion that the LVIA 'downplays' the construction effects of the entire Proposed. The LVIA is focused on the assessment of the onshore elements of the Proposed Development. Considering the landfall and onshore cable corridor, the LVIA has focused on a 2km Study Area (approximately 4km wide in total, 2km from the proposed DCO Order Limits), agreed with key stakeholders. This is greater or equal to the Study Area used for other similar projects for example, the Awel y Mor Offshore Wind Farm used a Study Area of 1km on either side of the onshore cable corridor. In addition, **Figure 18.4a-c** and **18.6b, Volume 3** of the ES **[APP-098-103]** shows an extended Zone of Theoretical Visibility (ZTV) which has not been cropped to the Study Area and a 5km buffer on either side of the onshore cable corridor. There are a total of 60 illustrated, annotated and assessed viewpoints along the onshore cable corridor at varying distances also agreed through discussions with stakeholders. This compares with only the provision of contextual photos provided for other similar projects such as the Awel y Mor Offshore Wind Farm.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	(not visual amenity) identify significant impacts for most individual properties assessed, which have not been considered or incorporated into the LVIA, including as part of consideration of impacts on settlements. This demonstrates a further underestimation of the extent of significant visual impacts upon key receptors. iv. In addition, visualisations provided thus far omit the tallest proposed structures (lightning mast) and thus do not provide a true representation of that proposed.	The Applicant disagrees with WSCC's assertion that there has been '*too great a reliance on reinstatement being carried out as soon as possible*' and while there is a need for mitigation to be carried out in a timely manner this is not a matter that has affected the level of assessed effects (see **reference 2.3.18**) which are predicated on the sensitivity of the receptor and the maximum scale / magnitude of the change and geographical extent. The Applicant also disagrees with WSCC's assertion that there has been '*too strong a reliance on specific selected viewpoint locations*' as each landscape and visual receptor has been assessed separately from the viewpoint analysis within **Appendix 18.3: Landscape Assessment, Volume 4** of the ES **[APP-169]** and **Appendix 18.4: Visual Assessment, Volume 4** of the ES **[APP-170]**. It is not accepted that the 'full range landscape and visual receptors' is not considered. For example, the LVIA includes visual assessment of sequential views from the affected lengths of 114 public rights of way (PRoWs) and the landscape assessment includes 19 Landscape Character Areas and numerous landscape elements along the onshore cable corridor. The Applicant disagrees with WSCC's assertion that the '*visual impacts of the Oakendene substation have been downplayed*'. The site is well screened by existing perimeter vegetation which will be retained and consequently has a limited ZTV as indicated in **Figure 18.2a, Volume 3** of the ES **[APP-098-103]**. The views are represented by five viewpoints, four of which include photomontages for years 1, 5 and 10 of the operation and maintenance phase. The LVIA for the onshore substation is reported in **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]** and includes assessments, informed by site surveys, of the views from Cowfold and individual residential properties, three transport routes, and four PRoWs. Whilst it is accepted that a viewpoint from Oakendene Manor would complement the assessment, the addition of a viewpoint is unlikely to alter the identification of a significant visual effect, reported in the LVIA (**Appendix 18.5: Residential Visual Amenity Assessment, Volume 4** of the (ES) **[APP-171]**). Access to land at Oakendene Manor was not available prior to DCO Application submission and efforts are being made to complete this during the Examination as a result of consultation with WSCC. The Applicant is considering the extent to which the design principles identified in the **Design and Access Statement** **[AS-003]** can be refined and how the principles could be re-presented. Please see the Applicant's response to points i. to vii. below. (i) The Applicant does not accept that there is "*too strong a reliance on specific selected viewpoint locations*". The viewpoints and visualisations illustrate the range of likely effects both near and far to the onshore elements of the Proposed Development and help to define the focus of the LVIA and the likely levels of effect. It should be noted that whilst the ZTV indicates theoretical visibility, it cannot illustrate areas of significant effect. Equally the LVIA Study Area is not intended to encapsulate all areas from which the Proposed Development would be visible, rather it is indented to capture those areas of significant effects. The viewpoint analysis is provided in **Appendix 18.2: Viewpoint Analysis, Volume 4** of the ES **[APP-168]** with a summary in Tables 1.1-3. It should be noted that this part of the LVIA is referred to as 'analysis' and not assessment. In contrast, the LVIA provides a full assessment of visual receptors in **Appendix 18.4: Visual Assessment, Volume 4** of the ES **[APP-170]**. For example, the LVIA assesses 114 PRoWs overlapped by the ZTV. Viewpoints are referred to where relevant, but the assessment of each PRoW draws on desk and site-based study, specific to each receptor and records a sequential assessment of the visual effects along the effected part of each route. This is in contrast to a 'single' viewpoint assessment from a fixed point at one location. It would not be practical or proportionate to provide a viewpoint for each PRoW, but where appropriate, reference to a viewpoint is provided to help illustrate the assessment. The same principle has been applied to all landscape and visual receptors some of which are area based (e.g. settlements or landscape character areas) and other linear and therefore cannot be fully represented by one viewpoint. (in this sense there is agreement with WSCC that

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		"*selected viewpoints are only indicative of impacts for a limited proportion of receptors affected*"). Collectively the LVIA provides an assessment of a proportionate range of receptors and visualisations that illustrate a range of impacts sufficient to allow a reasonable understanding of the likely significant effects of the onshore elements of the Proposed Development. (ii) The LVIA Study Area for the onshore substation at Oakendene has been subject to detailed desk and site-based assessment as well as discussion and agreement on viewpoint location with key stakeholders. The onshore substation site is well screened by existing mature vegetation and the design process focused on protecting and enhancing this existing screening. The assessment includes five viewpoints (a further three viewpoints were not progressed as a result of the assessment in the Preliminary Environment Information Report (PEIR) provided at the first statutory consultation in 2021 (RED, 2021) due to high levels of vegetation screening). Access to land at Oakendene Manor was not available prior to DCO Application submission and efforts are being made to complete this during the Examination as a result of consultation with WSCC. Whilst it is accepted that a viewpoint from Oakendene Manor and associated land would complement the assessment, the addition of further viewpoints is unlikely to alter the conclusions reported in the LVIA. Nevertheless, the Applicant confirms that they are in the process of seeking to agree access to Oakendene Manor to undertake viewpoint photography and will engage with WSCC, and Horsham District Council, in this process and supply visualisations of additional viewpoint photography at a later Examination Deadline subsequent to completion of this work, where required. In summary, the following viewpoints are noted: • Viewpoint SA1: Kent Street – **Figures 18.10a-d, Volume 3** of the ES **[APP-098]** demonstrates the views through a gap in vegetation along Kent Street during the winter months; • Viewpoint SA2: A272 – **Figures 18.11a-e, Volume 3** of the ES **[APP-099]**. A viewpoint was considered at the new access point, but safety concerns precluded this location and Viewpoint SA2 was provided as an alternative. Significant effects from along the A272 are reported in the LVIA and the design principles in the **Design and Access Statement** (**DAS**) **[AS-003]** and **Outline Landscape and Ecology Management Plan (LEMP) [APP-232]** include mitigation and are secured through Requirements 8 and 12 of the **Draft Development Consent Order [PEPD-009]** . The outline layout design shows a curved approach road to the substation, so that direct views can be screened by landscaping. It has been agreed with WSCC to examine a possible alternative viewpoint on land at Oakendene Manor on the southern side of the fence, at the access point to avoid safety concerns associated with taking photos on the A272. The provision of an additional viewpoint at this location may be useful for future detailed design although it would not alter the conclusions in the LVIA that significant effects on views from the A272 would occur at this point; • Viewpoint SA3: PRoW 1786 Taintfield Wood – **Figures 18.12a-j, Volume 3** of the ES **[APP-099]**. The viewpoint is representative of the views from the footpath between Kent Street and Oakendene Industrial Estate and captured the view from the edge of Taintfield Wood towards Oakendene Manor. Although alternative viewpoints could have been provided from the route of the onshore cable corridor or closer to the onshore substation, this viewpoint is between the two and views across to Oakendene Manor which is revealed on exiting the wood. Although a further viewpoint could have been provided as suggested, it is not considered by the Applicant to be proportionate and it would not alter the conclusions in the LVIA that significant effects on views from the footpath would occur and affect much of this route. The **Outline LEMP [APP-232]** includes partial mitigation and is secured through Requirement 12 of the **Draft Development Consent Order [PEPD-009]**;

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		• Viewpoint SA7: PRoW 1788 southwest of Site, west of Taintfield Wood – **Figures 18.13a-h, Volume 3** of the ES **[APP-099]**. The viewpoint illustrates significant effects from receptors along this route and is representative of significant effects from the A272 and the residential properties, which are included in the LVIA; and • Oakendene Manor – it has been agreed with WSCC to pursue a further viewpoint to the northwest of the onshore substation in the vicinity of Oakendene Manor. The provision of an additional viewpoint at this location may be useful for future detailed design although it would not alter the conclusions in the LVIA of significant effects on views from this location. There is a practical difficulty in positioning viewpoints too close to a development to the extent that they cannot be viewed in their landscape context and the whole of the image would be taken up by a close-range image of development which cannot be modelled at a detailed level and would extend beyond the confirms of the image. Receptors this close to development obviously have a high magnitude of change and that is reported in **Chapter 18: Landscape and visual impact assessment, Volume 2** of the ES **[APP-059]** where this occurs. Viewpoints at further distance are considered by the Applicant to be more useful in that they help to define the outer geographical extent of significant effects. 1. (iii) The methodology for Residential Visual Amenity Assessment (RVAA) accords with the advice in the Landscape Institute's Residential Visual Amenity Assessment Technical Note 2/19, 15 March 2019 and full details of this are provided in **Appendix 18.5: Residential Visual Amenity Assessment, Volume 4** of the ES **[APP-171]** including Annex A. As such the RVAA is considered fit for purpose and follows a methodology that has been used for many other developments and found to be acceptable. 2. The RVAA addresses the private views from residential properties and the Landscape Institute's Residential Visual Amenity Assessment Technical Guidance Note 2/19 ('the LI guidance' CD009.003) advises that the planning system is designed to act in the public interest when making planning decisions. It is not uncommon for significant adverse effects on views and visual amenity to be experienced by people at their place of residence as a result of introducing a new development into the landscape. In itself this does not necessarily cause particular planning concern. However, there are situations where the effect on the outlook / visual amenity of a residential property is so great that it is not generally considered to be in the public interest to permit such conditions to occur where they did not exist before. In summary, there are essentially two stages to a RVAA concerning the identification of significant effects and the consideration of RVAA. The RVAA (Stage 1) identifies those properties which are likely to be significantly affected and subjects these to RVAA (Stage 2) which is summarised in Table 1-2 and detailed for each property in Annex A of **Appendix 18.5: Residential Visual Amenity Assessment, Volume 4** of the ES **[APP-171]**. By assessing those properties which are 'most affected' or closest to the onshore cable corridor the RVAA has included the 'worst case'. If these properties are assessed as not breaching the residential visual amenity threshold, it can be reasonably assumed that properties less affected or further distance from the onshore cable corridor would not breach that threshold either. Furthermore, the RVAA makes a clear distinction between visual effects (Stage 1) and effects on residential visual amenity (Stage 2). Table 1-1 of the RVAA (**Appendix 18.5: Residential Visual Amenity Assessment, Volume 4** of the ES **[APP-171]**) provides information / rational for how residential properties were selected for RVAA and included in the RVAA. This has allowed a proportionate approach which takes account of the main living rooms and garden areas within each residential property included in the RVAA. The settlement assessment in **Appendix 18.4: Visual Assessment, Volume 4** of the ES **[APP-170]** considers the visual effects likely to be experienced from settlements, which includes the residential areas public realm and public open spaces within the

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		settlement boundaries that will be frequented by people and also refers to the RVAA which comments on particular properties, in most cases located beyond a settlement boundary. It is not therefore accepted that the settlement assessment has been underestimated. (iv) It is agreed that the visualisations omit the lightning mast at 18m tall. This is because the visualisations provide an impression of the Proposed Development based on the main components as described in the project description in **Chapter 4: The Proposed Development, Volume 4** of the ES **[APP-045]** and the Indicative layouts and elevations shown in Appendix A of the **Outline LEMP** **[APP-232]**. The lightning mast, although tall, is a narrow rod that would have a limited visual impact when viewed from the viewpoints and would not contribute towards significant visual effects.
2.3.18	*Assessment of Effects* v. The LVIA downplays the potential landscape and visual impacts of construction activities, considering them short-term, when 3.5-4 years is a considerable period of time to be subjected to moderate to major and significant impacts. For the cable route, too much reliance is placed on reinstatement being carried out as soon as possible, which cannot be guaranteed as phasing/sequencing of works has yet to be determined. Based on experience of Rampion 1, large lengths of the cable route and associated haul routes are likely to remain in place throughout the construction period to provide access and for cable pulling/jointing activities, which extend the periods over which landscape and visual impacts take place. vi. It is not clear how selected Viewpoint Locations and Analysis (Appendix 18.2) has considered the impacts of visibility splays (be that for new or upgraded side access points), with the LVIA suggesting that Commitment C-165 (visibility to DMRB standards) would reduce landscape impacts. On the contrary, such a specification would likely open views and give rise to increased landscape/visual impacts. Such impacts are not reflected in visualisations. vii. As the key and most prominent permanent onshore structure, it is crucial that the full extent of landscape and visual impacts at the Oakendene substation are understood and opportunities to minimise impacts are maximised. At present, visual impacts at the Oakendene substation have been downplayed, with additional viewpoint locations and associated visualisations required to best represent key visual receptors and provide accurate assessment of the level of impacts and to inform mitigation.	(v) The Applicant disagrees with WSCC's assertion that the landscape and visual impact assessment (LVIA) has 'downplayed' the potential landscape and visual effects of the construction activities by considering them as 'short-term'. It is technically correct to describe the duration of the landscape and visual effects during the construction phase as 'short-term' which covers development under 5 years duration in accordance with the Guidelines for Landscape and Visual Impact Assessment Third Edition (GLVIA3) (Landscape Institute and Institute of Environmental Management and Assessment (IEMA), 2013) paragraph 5.51. The LVIA methodology is set out in **Appendix 18.1: Landscape and visual impact assessment methodology, Volume 4** of the ES **[APP-167]** and in turn accords with GLVIA3 which also describes the duration of 'medium term' effects as 6-10 years and 'long term' effects as greater than 10 years. The level of effect and its significance is assessed for each landscape and visual receptor through a combination of the sensitivity of the receptor, and the scale or magnitude of change and its geographical extent in accordance with GLVIA3 and the LVIA methodology set out in **Appendix 18.1: Landscape and visual impact assessment methodology, Volume 4** of the ES [**APP-167**]. The duration of the effect is reported separately and is not part of the assessment of the level of effect and its significance as noted in paragraphs 1. 5.14 and 1.6.14 of the Appendix. The duration is however used to describe the nature of the effect. This approach ensures that the level of effect is presented as a 'worst case' and not 'discounted' due to the short-term duration of the effect. This demonstrated by the summary reporting in Tables 18.40-45 of **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]**, which describe the sensitivity, magnitude, level of effect and its significance separately under the heading for the phase of development and its duration. By way of example the A3 Arun and Adur Open Downs Landscape Character Area is assessed as Major (combination of High magnitude and High sensitivity as guided by the matrix in Table 1-5 of **Appendix 18.1: Landscape and visual impact assessment methodology, Volume 4** of the ES **[APP-167]**. This is the highest level of effect possible in the LVIA and demonstrates no discounting or downplaying of the level of effect or its significance due to the nature of the effect being of short term duration. In other examples where the magnitude is lower, for example the England Coast Path the magnitude is described as Medium due to reductions in the scale and / or geographical extent due to vegetation screening and intervening distance. This has resulted in Major / Moderate level of effect as guided by the matrix in Table 1-5 which is the highest level of effect possible for that combination of sensitivity and magnitude in the LVIA and demonstrates no discounting or downplaying of the level of effect or its significance due to the nature of the effect being of short term duration. In describing the nature of the effect, the LVIA recognises that the onshore development will be subject to phases of development and progressive restoration which would cause the assessed levels of effect would reduce or vary during the construction phase according to the phasing. The phasing details are not currently available to the assessment and consequently there is no 'effects pathway' by which the assessment could be

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		downplayed or discounted due to the duration or phasing of the works. Therefore, a 'worst case' is assessed and significant effects are not 'downplayed'. Whilst the phasing/sequencing of works has yet to be determined, the Applicant considers it is correct to describe the nature of these effects as part of the assessment which are described in Commitment C-19 of the **Commitments Register** **[APP-254]** (provided at Deadline 1 submission) outlines '*The onshore cable will be constructed in discrete sections. The trenches will be excavated, the cable ducts will be laid, the trenches back-filled and the reinstatement process commenced in as short a timeframe as practicable'*. Details of how this will be secured are set out in reference 2.3.8. (vi) Whilst Commitment 165 (*Construction access will be provided with visibility splays designed to Design Manual for Roads and Bridges (DRMB) design standards as agreed with West Sussex County Council (WSCC)*) is relevant to the LVIA it is agreed that this should not have been included in Table 18-25 of **Chapter 18: Landscape and visual impact assessment, Volume 2** of the ES **[APP-059]** as an embedded environmental measure that would mitigate landscape and visual effects. The viewpoints illustrated in **Figures 18.10-76, Volume 3** of the ES **[APP-099]** do not show the details of vegetation removal or visibility splays and for the onshore cable corridor they are limited to the extent of the onshore cable corridor and the envelope for temporary construction compounds. Where vegetation removal is indicated on the Vegetation Retention Plans in **Appendix B** of the **Outline Code of Construction Practice** **[PEPD-033]** this is included in the LVIA The Applicant is undertaking a review of accesses to establish if there are any instances where the extent of vegetation removal may exceed that currently shown on the vegetation retention plans in Appendix B of the **Outline Code of Construction Practice** **[PEPD-033]**. Should the outcome of this exercise require updates to the vegetation retention plans or other DCO Application documents this will be updated in due course. (vii) Please refer to the Applicant's response to **reference 2.3.17 part ii** above.
2.3.19	*Mitigation, Compensation and Enhancement* viii. The mechanism to secure meaningful advance planting at the substation is unclear, and further consideration needs to be given to maximising advance planting opportunities. Design principles identified in the Design and Access Statement (DAS) need further refinement and to be presented in a clearer manner and need to provide greater certainty over the likely appearance, scale and design of structures proposed. Further, given the substation would be a significant alien feature within a rural setting, proposed planting requires refining and reinforcing to ensure that existing tree/hedgerow losses are compensated, and screening effects maximised. ix. Whilst the proposed mitigation measures as set out in the Commitments Register and associated outline control documents are noteworthy, in many cases there is considerable uncertainty as to extent of mitigation they may realistically provide. Many of the commitments include significant caveats such as 'where this is the best environment solution and is financially and	(viii) The Indicative Landscape Design for the onshore substation at Oakendene and its design principles are set out in the **Design and Access Statement (DAS)** **[AS-003]** and further expanded on in the **Outline Landscape and Ecology Management Plan (LEMP)** [**APP-232**]. Design elements within the LEMP will be secured and developed through Requirements 12 and 13 of the **Draft Development Consent Order** **[PEPD-009]** and Commitment C-196 of the **Commitments Register** **[APP-254]**. Further, the Design principles identified in the **DAS** **[AS-003]** which are secured through Requirement 8 of the **Draft Development Consent Order** **[PEPD-009]** are expanded on in the **Outline LEMP** **[APP-232]** and the design will be developed further as the design process matures in the stage specific LEMP as noted above. DCO Requirement 12 ensures that a LEMP is provided for agreement with the relevant planning authority and Natural England. Requirement 13 of the **Draft Development Consent Order** **[PEPD-009]** ensures that the LEMP is delivered as agreed, whilst Requirement 14 secures the agreement and implementation of a Biodiversity Net Gain (BNG) strategy. Requirement 22 ensures that a stage specific Code of Construction Practice is submitted and approved by the relevant planning authority in consultation with the Environment Agency, the statutory nature conservation body, the highway authority and the lead local flood authority. The Applicant is considering the extent to which the design principles identified in the **Design and Access Statement** **[AS-003]** can be refined and how the principles could be re-presented.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	technically feasible' or 'where practicable/necessary/possible', meaning it is unclear as to what can or will be realistically secured by DCO requirements. x. Of particular concern for construction activities along the cable route, is the reliance on reinstatement being carried out as soon as possible and minimising periods of activities/storage of materials. However, this cannot be guaranteed as phasing has yet to be determined (i.e. it is to be dealt with by requirement). This is a considerable area of uncertainty, which will be a key factor in determining the magnitude of landscape and visual impacts. Proposed Requirements and Outline Control documents provide little certainty as to the likely duration of impacts.	(ix) There have been opportunities for the development of environmental measures which have been adopted to reduce the potential for environmental impacts and effects. These were included directly into the design of Rampion 2 as embedded environmental measures and are detailed in the **Commitments Register** **[APP-254**] (updated at Deadline 1 submission). The Commitments Register was initially presented in the Scoping Report and subsequently updated throughout the Statutory Consultation exercises and in the Environmental Statement to reflect design evolution and consultation feedback. The **Commitments Register** **[APP-254]** (update at Deadline 1 submission) includes a column for the securing mechanism for each embedded environmental measure and its related commitment reference. This cross-refers to the mechanism, for example a requirement in the **Draft Development Consent Order (DCO)** **[PEPD-009]** Schedule 1 Part 3. Where there is an accompanying document such as an outline plan submitted with the DCO Application with which works must be undertaken in accordance with, this is also referred to under the 'Relevant Application Documents' column. The Applicant provided the **Commitments Register** **[APP-254]** (updated at Deadline 1 submission) as part of the DCO Application and have provided an update to this at Deadline 1 to include further detail e.g. the full reference to DCO requirements and addition of the location of further information within the Application documents. (x) Please refer to the Applicant's response in **reference 2.3.18 part v** above. The magnitude of the landscape and visual effects is based on scale and geographical extent and not duration. It provides a worst-case assessment of the level of effects and significance for the periods of construction and operation which define the duration of these effects. As more detailed control documents are developed there will be greater certainty around phasing, duration and timing of the assessed effects which currently occur within the construction phase.
2.3.20	**Noise and Vibration** 3.3 The submitted assessment of noise and vibration impacts concludes that there would be no significant noise and vibration impacts on any identified receptors either during construction or operation of the onshore elements of the Project. Given the nature of construction activities (and their significant duration, in particular, at construction compounds) and noting the low background noise levels in the vicinity of the Oakendene substation, this is concerning and considered an underestimation. Noise impacts are downplayed with too much reliance on embedded mitigation measures, the effectiveness of which cannot be certain at this stage. WSCC is also concerned that the Oakendene substation operational noise impacts are underplayed within the assessment. *Assessment Methodology* i. The methodology to establish the magnitude of construction impacts, in many cases results in noise levels above BS5228 thresholds (for medium impacts) only giving rise to low impacts, which are not significant. This underestimates potential impacts. Part of the methodology is seemingly predicated on the duration of some impacts being no more than one month; however, it is unclear how these durations have been identified, whether these represent a worst	Construction noise will be mitigated and managed through the application of the stage specific Code of Construction Practice in accordance with the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** which will be submitted to and approved by the relevant planning authority (Requirement 22 within the **Draft Development Consent Order (DCO)** **[PEPD-009]**). i) British Standard 5228-1 (British Standards Institution (BSI), 2014) is the Secretary of State (SoS) approved code of practice for construction noise. The Applicant has illustrated the potential magnitude of the noise impacts by comparing the predicted construction noise levels to the existing ambient noise levels at each receptor location. The Applicant has assessed the magnitude of impact with reference to BS5228-1 Annex E (BSI, 2014) which states: "*Noise levels generated by site activities are deemed to be potentially significant if the total noise (pre-construction ambient plus site noise) exceeds the pre-construction ambient noise by 5 dB or more, subject to lower cut-off values of 65 dB, 55 dB and 45 dB from site noise alone, for the daytime, evening and night-time periods, respectively; and a duration of one month or more, unless works of a shorter duration are likely to result in significant effect.*" ii) The Applicant considers that the temporary construction compound activity levels reported are worst-case. This is through an accumulation of activities that are unlikely to all be operating at the same time, along with the use of percentage on-times that suggest plant would be working for longer than would generally be expected. Generally, the receptors assessed are the most exposed to a particular element of the Proposed Development. If properties are considered to be omitted, it is likely that a more sensitive receptor at a

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	cases scenario, and even if only for a one-month that the magnitude of change should still be higher. ii. There is limited information on the methodology adopted to establish a 'key' receptor and how receptors (e.g. individual residential properties) have been established. Concerns are raised that some properties/receptors may have been missed or omitted, including no reference to Public Rights of Way (PRoW). iii. No noise contours for the cable route have been provided and the full extent of receptors are not identified in the accompanying figures. iv. The assessment suggests cable trenching and trenchless crossings are sufficiently temporary that cumulative impacts with other developments do not need to be considered. Given concerns regarding the potential duration and impacts of such works and high levels of noise that would be generated by trenchless crossings on a 24hr basis, concerns are raised about this omission. v. Construction plant identified is not comprehensive, leading to noise impact predictions being underestimated.	similar distance to the project has been used as the representative receptor. Public Rights of Way (PRoWs) are an important receptor, however BS5228-1 Annex E states, "*Noise levels generated by site activities are deemed to be potentially significant if the total noise (pre-construction ambient plus site noise) exceeds the pre-construction ambient noise by 5 dB or more, subject to lower cut-off values of 65 dB, 55 dB and 45 dB LAeq, T from site noise alone, for the daytime, evening and night-time periods, respectively; …For public open space, the impact might be deemed to cause significant effects if the total noise exceeds the ambient noise (LAeq, T) by 5 dB or more for a period of one month or more. However, the extent of the area impacted relative to the total available area also needs to be taken into account in determining whether the impact causes a significant effect*." Therefore, the exposure of a PRoW to high noise levels is not in itself a significant effect. This is usually because users of such resources will not tend to be resident in any one area for a long time exposing themselves to noise and can move away from that noise, whereas static receptors (e.g. residential dwellings) are unable to relocate away from the noise. Although certain receptors are named as being representative, and these will generally be the nearest receptor to an element of the works, all receptors within the Study Area, which is defined within Section 21.4 of **Chapter 21: Noise and vibration, Volume 2** of the ES **[APP-062]**, have been assessed. iii) Noise contours have not been provided for the cable route on the basis that this construction activity moves linearly, and the noise contours would exaggerate the magnitude of noise from the works. The qualitative assessment concludes that receptors will be subject to minor adverse sound levels for one or two days as the trenching, cabling, or the refilling of the trench works occur in the near vicinity of residential receptors, which is considered not significant in EIA terms. iv) The Applicant maintains that cumulative effects with other developments are very unlikely to give rise to significant effects. The night-time works are accompanied by more stringent thresholds of significance. The same temporal thresholds apply irrespective of the time of day that the works are occurring and as such, cumulative noise effects from other developments is unlikely. Commitment C-263 in the **Commitment Register** **[APP-254]** (updated at the Deadline 1 submission) includes the production of a Noise and Vibration Management Plan (NVMP) during detailed design based on the principles in the **Outline Code of Construction Practice** **[PEPD-033]** secured via Requirement 22 in the **Draft Development Consent Order** **[PEPD-009]**: "*During detailed design the contractor will review the construction noise assessments. Where any significant deviation from the initial sound level predictions is identified, such that levels in excess of the BS 5228 thresholds of significance are likely, the Noise and Vibration Management Plan (NVMP) shall be updated or a Section 61 application will be made to the relevant Local Planning Authority".*
2.3.21	*Assessment of Effects* vi. There is a lack of consideration and/or noise impacts of cable route construction and side access routes are downplayed. Consideration of impacts of cable route construction and use of side accesses are largely excluded as considered short in duration, despite having the potential to result in noise levels above 75dB at sensitive noise receptor locations. The assessment fails to take into account longer duration works associated with construction and does not recognise that the cable route will likely serve as a key haul route in rural areas and thus remain in place for long periods.	vi) The noise effects of the onshore cable route and accesses have been considered in Section 21.9 of **Chapter 21 Noise and vibration, Volume 2** of the Environmental Statement (ES) **[PEPD-018]**. The levels above 75 decibels (dB) would not be experienced all day, every day of the works, however is a worst case. When taking into consideration the temporal threshold of significance from BS5228-1 (BSI, 2014), the approved code of practice for construction noise, such noise levels will not be present for the periods of time that would make the noise a significant effect. If the situation changes and significant effects become likely, then there is commitment C-263 of the **Commitments Register** **[APP-254]** (which has been updated at Deadline 1) that requires *"the Noise and Vibration Management Plan (NVMP) shall identify the necessary mitigation to avoid this. If necessary, Section*

Ref	Relevant representation comment	Applicant's response
	vii. Noise impacts from construction compounds at night-time are underplayed. Despite noise level predictions identifying several properties/receptors close to trenchless crossings (night-time) being subject to noise levels significantly above BS5228 thresholds, conclusions downplay the magnitude of impacts as 'low' and are predicated on the use of acoustic barriers. At this stage, there are no guarantees that barriers will be effective or practicable in all circumstances. viii. Except for trenchless crossings, there is limited consideration of works that may be required outside of normal working hours. Whilst it is accepted that these will not be the norm and that provisions are made for further approval to be required as part of stage specific CoCPs, there are likely to be several activities that may require 'out of hours' working, which experience of Rampion 1 OWF has shown will regularly need to be exceeded. ix. Oakendene Substation operational noise impacts are underplayed. Despite noise level predictions identifying three properties/receptors close to the substation being above background levels by +4 or +5dB (night-time), the conclusions downplay the magnitude of impacts as 'low' and not significant.	*61 application will be made to the relevant Local Planning Authority"* secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. An assessment for the use of every haul route was not undertaken, however the worst-case use of such construction haul routes (or access points) has been undertaken and determined to be not significant (see paragraphs 21.9.63 to 21.9.66, **Chapter 21 Noise and vibration, Volume 2** of the Environmental Statement (ES) **[PEPD-018]**. vii) Night-time noise effects are covered by more stringent thresholds of significance than daytime works, and therefore, works that are needed at night will usually have more mitigation built in from the outset. Again, it is important to draw attention to the temporal threshold, such that the exceedance of the thresholds of significance does not itself constitute a significant effect. Use of temporary barriers for acoustic screening is a standard industry approach and is demonstrably an appropriate mitigation solution. If there are circumstances that arise that mean that any mitigation is insufficient, there are measures in the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** and the **Commitment Register** **[APP-254]** (updated at Deadline 1 submission) to address this. The **Outline CoCP** **[PEDP-033]** is secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. viii) Construction working hours are outlined within the **Outline CoCP** **[PEPD-033]** (and updated at Deadline 1) and are governed by Requirement 22 (5)(c) of the **Draft Development Consent Order** **[PEPD-009]**. Any works required to be undertaken under such provision will be carefully planned to ensure that significant noise effects are avoided. ix) Although the initial estimate of impact with respect to BS4142 considers a 5dB difference between the rating level and representative background level as being indicative of an adverse impact, the standard requires that the assessor considers the context of the assessment of the new noise source in its environment. As such, the operational noise levels have been considered alongside the presence of low background noise levels and have considered both absolute and relative noise levels compared to the observable adverse effect levels at night-time. Recommendations have been made to reduce the sound level below the Lowest Observable Adverse Effect Level (LOAEL) at all receptors, and therefore the conclusions of no significant effects are considered by the Applicant to align with the requirements of BS4142 and EIA.
2.3.22	*Mitigation, Compensation and Enhancement* x. Considerable reliance has been placed on 'embedded measures' set out in the Commitments Register, all to be captured as part of stage-specific CoCPs (C-33). Whilst such measures may well help to reduce noise, the extent to which they can reduce noise levels is uncertain at this stage (noting measures will be adopted 'where practicable' in many cases and that the Noise and Vibration Management Plan (NVMP) will be 'updated'). Only noise mitigation measures where specified attenuation levels can be confidently established/applied should be considered at this stage: 2.1 There is considerable concern about the reliance of stage specific NVMPs to be provided as part of CoCPs. Although such NVMPs will be vital in specifying appropriate noise controls for each stage, the extent to which they can reduce noise levels is uncertain at this stage. In this regard, it is concerning that the relevant commitment (C-263) states "*Where any significant deviation from the initial sound level predictions is identified, such that levels in excess of the BS 5228 thresholds of*	x. No significant impacts are identified as the potential for such impacts has been removed by design i.e., routing of the linear aspects of the works, and the choice of embedded mitigation. Considerable reliance is placed on embedded measures because such measures are demonstrably effective. a. Assessments are made on the basis of information provided by the Applicant's engineers and of experience of similar infrastructure construction. Mitigation recommendations are made on experience of demonstrable acoustic reductions in situ such that the Applicant has confidence that what has been assessed and recommended are appropriate and fit for purpose. It is recognised that there will be occasions where individual circumstances mean that what was assessed is needed to be amended when the Contractor reviews the assessments and proposals and that is why the commitment C-263 exists and is secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**, i.e. so any changes are captured and reassessed and resubmitted for comment to the relevant Local Planning Authorities and minimise the risk of significant effects. b. Although the initial estimate of impact with respect to BS4142 considers a 5dB difference between the rating level and representative background level as being indicative of an adverse impact, the standard requires that the assessor considers the context of the assessment of the new noise source in its

Ref	Relevant representation comment	Applicant's response
	significance are likely, the NVMP shall be updated or a Section 61 application will be made to the relevant Local Planning Authority". It is concerning that noise levels above ES predictions will only be addressed by subsequent review, at which point it is only likely to be able minimise noise levels rather than address any potential significant impacts. 2.2 Rating levels applied at the Oakendene substation (C-231) are considered too high and at a level where adverse impacts may be expected. Further, although an operational noise management plan (NMP) is to be secured through the dDCO, no draft NMP has been provided and it is unclear how or if lessons learnt from Rampion 1 will be incorporated. 2.3 Stage-specific construction Noise Management Plans (NVMP) will be produced; however, no drafts have been provided to date, leaving uncertainty as to the mitigation measures which may be possible in individual circumstances.	environment. As such, the operational noise levels have been considered alongside the presence of low background noise levels and have considered both absolute and relative noise levels compared to the observable adverse effect levels at night-time. Recommendations have been made to reduce the sound level below the Lowest Observable Adverse Effect Level (LOAEL) at all receptors, and therefore the conclusions of no significant effects are considered by the Applicant to align with the requirements of BS4142 and EIA. c. As outlined in Commitment C-263 of the **Commitments Register** **[APP-254]** secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]** (which has been updated at Deadline 1), during detailed design the appointed contractor will review the construction noise assessments and where any significant deviation from the initial sound level predictions is identified, such that levels in excess of the BS5228-1, the Noise and Vibration Management Plan (NVMP) shall identify the necessary mitigation to avoid this. If necessary, a Section 61 application will be made to the relevant Local Planning Authority. Mitigation proposed in such documents will follow the guidelines as set out in BS5228-1, the code of practice for construction noise and shall be drafted to align the construction works with Best Practicable Means (BPM). As the NVMPs will be stage specific, they require input from the contractors undertaking the work to avoid the imposition of impractical recommendations and will also be approved by the relevant local planning authority in consultation with other stakeholders.
2.3.23	**Ecology and Nature Conservation** 3.10 The key ecological impacts, which are associated with the construction phase, are habitat loss, habitat fragmentation and disturbance to species. The Project is reliant on a package of avoidance, mitigation, compensation and enhancement measures to address the ecological impacts. Adoption of the embedded environmental measures in the commitments register will help minimise adverse impacts. Successful and rapid reinstatement of habitats, and landscape features, along the cable corridor and at the temporary construction compounds will be key; this will require appropriate management and monitoring, plus timely remedial works, as necessary. In seeking to achieve compensatory habitat and BNG off-site, the Applicant will need to demonstrate that this is achievable and that it will deliver greater nature conservation benefits. The proposal for advance habitat creation is welcome but lacking in detail. *Assessment Methodology* i. Although the Vegetation Retention Plans for hedgerows, tree lines, woodland, scrub and grasslands are very helpful, there do not appear to be any such plans for ponds and watercourses. ii. It is proposed to re-instate habitats along the cable corridor and at the temporary construction compounds to their current condition. Concern is raised that enhancement opportunities may not be realised. iii. WSCC has concerns about the success of hedgerow 'notching', a technique that could be affected by soil type and drought. Any	The Applicant agrees with the summary of effects and welcomes the acknowledgement that the adoption of environmental measures in the **Commitments Register** **[APP-254]** (provided at Deadline 1 submission) will help minimise adverse effects. Regarding the request for successful and rapid reinstatement, the mitigation for individual ecological features / impacts is adequately secured. The **Draft Development Consent Order** **[PEPD-009]** includes Requirement 12 securing mitigation through provision of reinstatement or landscaping, Requirement 13 with regards timing and maintenance and Requirement 14 securing mitigation, compensation and Biodiversity Net Gain (BNG). Requirement 12 ensures that a Landscape and Ecological Management Plan is provided for agreement with the relevant planning authority and Natural England. Requirement 13 ensures that the Landscape and Ecological Management Plan is delivered as agreed, whilst Requirement 14 secures the agreement and implementation of a BNG strategy. Requirement 22 ensures that a stage specific Code of Construction Practice is submitted and approved by the relevant planning authority in consultation with the Environment Agency, the statutory nature conservation body, the highway authority and the lead local flood authority. Individual commitments also add further impetus to deliver successful restoration. This includes Commitment C-103 that allows for a time limit for habitat restoration across the majority of the construction area (excluding temporary construction compounds, cable joint bays the landfall and the onshore substation location), whilst commitment C-115 minimises habitat loss of hedgerows and tree lines and proposes ways in which the reinstatement can take place. Commitment C-199 provides for the long-term management and monitoring of reinstated habitats. These commitments are secured through the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** and **Outline Landscape and Ecology Management Plan** **[APP-232]** which are in turn secured through Requirements 12, 13 and 22 of the **Draft Development Consent Order** **[PEPD-009]**. There is a large number of biodiversity units available for purchase within West Sussex currently including those delivering grassland, woodland, scrub, coastal and floodplain grazing marsh and hedgerows. This is demonstrated on the websites of various projects / market places such as:

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	necessary remedial works, such as re-stocking, must be implemented as soon as possible. iv. There is a lack of detail relating to the pedestrian monitoring of the HDD drill head as it passes beneath ancient woodland. Impacts on the ground flora and shrub layer must be minimised. It is requested that an Ecological Clerk of Works is present. v. Further ecological guidance will be required on the content of stage specific Code of Construction Practice (CoCP) and stage specific Landscape and Ecology Management Plan (LEMP). The outline version of the latter should include advance planting, habitats to be reinstated, planting specifications and programme, maintenance and monitoring specifications.	1. The Weald to Waves Project showing opportunities around Climping / Lyminster, within the South Downs National Park (to the south and south-east of Washington); 2. The Gaia market place lists eight projects in the South Downs National Park and one in Mid-Sussex; and 3. The land agent Savills shows one project in Arun District and three in South Downs National Park. It is acknowledged that some of the opportunities may be listed on more than one of these websites and locations are vague given commercial sensitivities, however it does demonstrate that there is a plethora of opportunities alongside those that may be leveraged from affected landowners. The delivery of biodiversity net gain will follow the process laid out in **Appendix 22.15: Biodiversity Net Gain Information, Volume 4** of the ES [**APP-193**] which is secured via Requirement 14 of the **Draft Development Consent Order** **[PEPD-009]**. Regarding comments on the 'Assessment Methodology': The Vegetation Retention Plans in Appendix B of the **Outline Code of Construction Practice** **[PEPD-033]** have been updated for submission at Pre-Examination Procedural Deadline A (16 January 2024). Appendix B has been updated to include plans showing ponds for clarity, these were omitted previously as all 17 within the proposed DCO Order Limits are retained. The watercourse crossings (including the type of crossing) are provided in the **Appendix 4.2: Crossing schedule, Volume 4** of the ES **[APP-122]**. Reinstatement of habitat to current condition has been assumed as a realistic worst-case scenario. This is because without a detailed design agreeing to any enhancements with any given landowner would be difficult. It is also apparent that any agreement would necessarily have to be wider than the reinstatement in many instances due to the scale in any particular location (e.g. there is limited benefit to enhancing a short section of hedgerow (e.g. 6m) only). **Appendix 22.15: Biodiversity Net Gain Information, Volume 4** of the ES **[APP-193]** allows for discussion with landowners in the first instance to deliver enhancements, compensation and gain (through the calculation of Biodiversity Net Gain (BNG) using the Biodiversity Metric). It is understood by the Applicant that some landowners will not want to deliver enhancements for biodiversity on their land due to current use (e.g. losing harvestable area) and therefore the **Appendix 22.15: Biodiversity Net Gain Information, Volume 4** of the ES **[APP-193]** provides a hierarchy of choices on how to deliver biodiversity units. The realistic worst-case scenario assessed within **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-063]** is based on hedgerow notches being cut to the ground, roots excavated and discarded, soil replaced and new planting. This is a typical approach to linear projects, other than here the proposal is for multiple smaller notches as opposed to a single large gap. It is expected that replanting would be successful through the implementation of stage specific Code of Construction Practice CoCP) and stage specific Landscape and Ecological Management Plan (LEMP) secured and via Requirements 12,13 and 22 of the **Draft Development Consent Order** **[PEPD-009]**. The second part of Commitment C-115 (**Commitments Register** **[APP-254]**) has been updated for Deadline 1 to state that '*Hedgerows subject to temporary translocation will be lifted using a tree spade to maintain diversity and structure and result in more rapid reinstatement. Where chances of success are questionable, notches will be made by removal and reinstatement through planting. The ECoW will justify the approach being taken in line with the responsibilities of implementing the vegetation retention plan (see C-220).*'. This means where chances of success are low then this option will not be exercised and instead a typical approach of re-planting will be specified. This will necessarily be described within the reinstatement measures in the Landscape and Ecological Management Plan. In locations where temporary translocation is appropriate (e.g. soils that are at

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		least 60cm deep and support vegetation that does not appear to be drought stressed) translocated hedgerows would be subject to regular aftercare. Where it appeared that translocated sections are failing new planting would be established along the line of the translocated section (on both sides). These plantings would develop into the hedge with the failed / partially failed translocated section providing a matrix to develop around. The Applicant recognises that the translocation of hedgerow will have more chance of failure than replanting using whips. The translocation has been provided as an option to maintain character and provide more rapid gapping up. However, should this option not be considered relevant then the relevant local authority and Natural England will have the opportunity to request translocation is not used at any given location through approval of the stage specific LEMP and stage specific CoCP in accordance the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** and **Outline Landscape and Ecology Management Plan** **[APP-232]** which are in turn secured through Requirements 12, 13 and 22 of the **Draft Development Consent Order** **[PEPD-009]**. It should be noted that this approach (temporary translocation and replacement of hedgerows) was considered acceptable in the consented Brechfa Forest Connection project (see paragraph 5.2.99 and Requirement 28 of the Examining Authority's Report of Findings and Conclusions to the Secretary of State for Energy and Climate Change (Planning Inspectorate, 2016). The pedestrian monitoring of the progress of the horizontal directional drill (HDD) (including beneath Ancient Woodland) is non-intrusive with personnel utilising hand-held equipment. Commitment C-207 provides for an Ecological Clerk of Works (EcoW) within the **Outline CoCP** **[PEPD-033]** which is secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. The EcoW would be expected to be in place for any works that involve sensitive ecological features such as HDD crossings of Sites of Special Scientific Interest, ancient woodland or Local Wildlife Sites. The Applicant agrees that the detail in the Code of Construction Practice (CoCP) and the Landscape and Ecological Management Plan (LEMP) will need to be stage and location specific and provide information on scheduling (including advance planting), establishment, management and monitoring. Stage specific LEMPs and CoCPs are secured through Requirement 12 and 22 of the **Draft Development Consent Order** **[PEPD-009]**.
2.3.24	*Assessment of Effects* iv. The key ecological impacts are associated with the construction phase. They are habitat loss (including broadleaved semi-natural woodland, hedgerow and semi-improved grassland), habitat fragmentation (with consequent reduction in ecological connectivity) and disturbance to species (such as from noise and lighting). Habitat reinstatement may take many years to achieve.	The Applicant agrees with the characterisation of the effects associated with the construction phase. Habitat reinstatement will take time to reach target condition (e.g. as trees / hedgerows will take time to grow and mature) but Commitment C-103 of the **Commitments Register** **[APP-254]** presented in the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]** does ensure that in the majority of locations (other than at temporary construction compounds, landfall, substation and cable joint bays) the reinstatement of habitats will begin within two years (e.g. saplings planted). The time for woodland, and other habitats, to become ecologically functional is accounted for within the way the Statutory Biodiversity Metric calculates Biodiversity Net Gain (i.e. temporal risk discounts the value of the proposed habitat) as described in **Appendix 22.15 Biodiversity Net Gain Information** [**APP-193**]. Biodiversity Net Gain is secured through requirement 14 of the **Draft DCO [PEPD-009]**.
2.3.25	*Mitigation, Compensation and Enhancement* v. In order to address the presented ecological impacts, the Project is reliant on a range of avoidance, mitigation, compensation and enhancement measures, including off-site compensation. Further enhancements are proposed to achieve 10% BNG. There is a lack of clarity	Avoidance measures have evolved through the design process and are demonstrated by both the shape and location of the proposed DCO Order Limits (for example, where possible it has been drawn to exclude various ecological features including areas of ancient woodland and areas of Priority Habitat) and through the Vegetation Retention Plan that is appended to the **Outline Code of Construction** **Practice [PEPD-033]**. Further measures of avoidance are provided in **Commitments Register** **[APP-254]** (provided at Deadline 1

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	on the distinction between what constitutes essential mitigation and compensation, and BNG. Concern is raised about the delivery of off-site habitat compensation and enhancement, including how it will be secured. vi. There is considerable uncertainty about the severity and duration of short-term adverse impacts, such as habitat fragmentation associated with the loss of hedgerows and woodlands, and the success of subsequent restoration. Effective mitigation measures (such as timing of the works, micro-siting of the ducts and hedgerow 'notching'), advance habitat creation and rapid, and successful reinstatement, will be essential to lessen the impacts on biodiversity. Additional compensation may be required. vii. Concern is raised about the lack of information on advance habitat creation, including locations, specifications, how it will be secured and timescales. Advance habitat creation, to be implemented before and during the early stages of construction, is a key component to reduce biodiversity impacts to an acceptable level. viii. In seeking to achieve the majority of BNG off-site, the Project must prove that this is achievable and that it will deliver greater nature conservation benefits.	submission) and include those that describe construction scheduling such as commitment C-21 (avoidance of active nests of reeding birds during vegetation clearance), C-112 and C-114 (avoidance of physical effects within Site of Special Scientific Interest (SSSI) and Local Wildlife Site (LWS)), C-117 (avoidance of disturbing activity during the coldest winter months), C-174 (avoidance of veteran trees), C-203 (avoidance of disturbance / damage to active nests of ground nesting birds) and C-215 (avoidance of disturbing activities close to occupied barn owl boxes). Mitigation measures to lessen the effects on biodiversity include: • specification of trenchless techniques to cross main rivers, SSSI, LWS and ancient woodland (C-112, C-114 and C-216); • implementation of wildlife sensitive lighting design (C-105); • implementation of speed restrictions to avoid collisions with wildlife (C-106); • implementation of biosecurity measures (C-107); • measures to minimise disruption to watercourses and maintain fish passage (C-64, C-205 and C-229); • reinstatement of temporary habitat loss within two years (C-103); • measures to reduce hedgerow loss (C-115 and C-224); • imposition of stand-off distances to watercourses (C-135); • reduction in woodland loss (C-204); and • pre-construction survey programme to implement appropriate mitigation based on latest distribution (C-203, C-209, C-210, C-211, C-214 and C-232). The **Outline Landscape and Ecological Management Plan [APP-232]** secured through Requirements 12 and 13 of the **Draft Development Consent Order [PEPD-009]** also describes mitigation and compensation measures at the onshore substation site and grid connection point in terms of providing advanced planting to maintain connectivity and buffer disturbance and compensation in the form of habitat creation. This document will be updated at a future deadline to include further detail regarding advanced planting, monitoring, management and remedial works as discussed with WSCC during post-DCO Application meetings. The severity and duration of short-term effects is addressed in section 22.9 of **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES [**APP-063**]. It should be acknowledged that, in any given locale, the extent of the effects on habitats such as hedgerow is limited and being carried in out such a way as to minimise loss and minimise potential for fragmentation. Disturbance in any given location will be short term, with activity confined to bursts of activity associated with individual tasks (e.g. cable duct installation, cable pulling, haul road removal and reinstatement). Compensation (to reach a point of no net loss as calculated within the Biodiversity Metric) and biodiversity net gain (BNG) will be provided either through working with affected land owners or by purchase of biodiversity units from strategic schemes or habitat banks. This could be both at a small scale (e.g. agreeing additional tree planting or hedgerow gapping up) or at a larger scale (e.g. woodland or grassland creation or enhancement). The latter would be secured in the same way as those development projects delivering mandatory BNG via the Environment Act 2021 by way of planning agreement or conservation covenant. Ensuring that all steps of the

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		guidance are followed provides comfort that appropriate steps will be taken to ensure suitable habitat creation and enhancement work is backed up by robust management and monitoring to deliver the necessary biodiversity units. It should be noted that when discussing provision of biodiversity units that they could be delivered within the proposed DCO Order Limits should suitable arrangements with landowners be made during the detailed design phase. The types of biodiversity units to be purchased will reflect the needs of the Proposed Development (e.g. ensure that the trading rules within the metric are met) thereby delivering habitats known to be present and functioning within the locality. Further information on BNG is provided in **Appendix 22.15: Biodiversity Gain Information, Volume 4** of the ES **[APP-193]** which also provides Natural England and West Sussex County Council (WSCC) with the opportunity to review and approve the units purchased.
2.3.26	**Arboriculture** 3.11 The Project proposes adequate mitigation and compensation strategies to limit impacts to arboricultural features where avoidance has not been possible. However, multiple anomalies were found within information supplied in relation to hedgerows, which remains of concern and will need addressing by the Applicant going forward. Proposed landscaping for the Oakendene substation is not supported due to the impacts proposed on notable trees and hedgerows of historical relevance and limited landscape design proposed; similarly, better connectivity between green corridors was expected at the extension proposals at Bolney Substation. The Outline-LEMP negates enhancement opportunities. Of principle concern is the loss of trees reaching near veteran status and lack of protection measures to secure their retention. *Assessment Methodology* i. Although appropriate baseline information is supplied within the chapter and has derived from a number of surveys, including hedgerow and arboricultural surveys in accordance with best practice or recognised methodology, surveying is required for both hedgerows and trees where it has not yet been possible to undertake them (and valuable trees, as well as veteran trees, should be avoided or mitigated for). ii. The methodology for potential veteran trees only considers their biodiversity value in context with the definition within NPPF (pg. 65). Cultural or heritage value has not been demonstrated on tree lines to be removed (notably those within the Oakendene substation).	The Applicant is happy to engage with West Sussex County Council (WSCC) to review any identified anomalies in relation to the treatment of hedgerows, noting that there has already been constructive meetings to discuss. The updated **Outline Code of Construction Practice** **[PEPD-033]** and the **Tree Preservation Order and Hedgerow Plan** **[PEPD-007]** were submitted at the Pre-Examination Procedural Deadline A on 16 January 2024 following these meetings and a review of the documents. Further updates are proposed following points raised at the Issue Specific Hearing 1 in February 2024. Figure 1 of the **Outline Landscape and Ecology Management Plan** **[APP-232]** presents one possible arrangement of landscaping around the proposed onshore substation at Oakendene, with the aim of creating variable habitat types that complement the existing landscape character and incorporate Sustainable Urban Drainage. Compensation for tree and hedgerow loss will also be provided through the delivery of off-site measures described in **Appendix 22.15 Biodiversity Net Gain Information, Volume 4** of the Environmental Statement (ES) **[APP-193]**. BNG is secured in Requirements 14 of the **Draft Development Consent Order [PEPD-009]**. A calculation rate for the replacement of individual trees to be removed is presented as a function of their current stem size within the **Appendix 22.16: Arboricultural Impact Assessment, Volume 4** of the ES **[APP-194]** and secured by Commitment C-286 of the **Commitment Register** **[APP-254]** (updated at Deadline 1 submission). In this way the amount of replacement planting would respond to the scale of impact and mean that up to 14 new trees would be provided for the loss of a single tree at the onshore substation at Oakendene in some instances. The full extent of replacement planting has not yet been designed but will be incorporated into future landscape plans based on a detailed design. Measures to mitigate the loss and disturbance of the features and niche habitats that contribute to the 'approaching veteran status' of several of the trees are also embedded into the scheme. Section 8.6 of the **Appendix 22.16: Arboricultural Impact Assessment, Volume 4** of the ES **[APP-194]** describes a hierarchy of options that minimises both the displacement and processing of arisings (cut timber and vegetation). Through the implementation of this hierarchy, features of habitat value on felled trees would be retained intact and would be relocated to the nearest suitable location. It would also be possible to simulate the existing habitat arrangement and conditions in some instances, for example by installing cut timber at the same orientation and/or height as it is currently growing. This information will be presented as part of a set of stage specific Arboricultural Method Statements at the detailed design stage in accordance with commitment C-282 of the **Commitments Register** **[APP-254]** and ensured by the Ecological Clerk of Works under commitment C-207 (secured via Requirements 22 and 23 of the **Draft Development Consent Order** [**PEPD-009**].

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		The ability to deliver augmentation and increased connectivity of tree and woodland habitat around the existing National Grid Bolney substation will be dependent on landowner agreement. Without a detailed design, agreeing to any enhancements with any given landowner will be difficult. This will involve discussion with landowners around the existing National Grid Bolney substation at the detailed design stage. The 19 trees and 622m of hedgerow proposed for removal to construct the onshore substation at Oakendene all lie directly within its footprint. Their loss is consequently unavoidable and there are no available temporary or permanent protection measures that could be implemented to change this effect. As stated in paragraph 4.4.2 of the **Appendix 22.16: Arboricultural Impact Assessment, Volume 4** of the ES **[APP-194]**, survey detail will be required for all trees and hedgerows that were inaccessible during the preparation of the Arboricultural Impact Assessment (AIA) to inform a detailed design and the Applicant is committed to providing it at this time. A historic landscape assessment of the historic parkland at Oakendene was requested by WSCC during the non-statutory consultation exercise held between 14 January and 11 February 2021. The assessment was undertaken in line with WSCC Archaeologist on 05 October 2022, and is presented in **Appendix 25.5: Oakendene parkland: historic landscape assessment, Volume 4** of the ES **[APP-211]**. This exercise informed the design process and the assessment of effects presented in **Chapter 25: Historic environment, Volume 2** of the ES **[APP-066]**. The assessment of veteran trees in the **Appendix 22.16: Arboricultural Impact Assessment, Volume 4** of the ES **[APP-194]** considered the cultural and heritage value, insofar as the information provided in the **Appendix 25.8**: **Onshore Heritage Asset Baseline Report**, **Volume 4** of the ES **[APP-214]** but found insufficient evidence to conclude exceptional cultural or heritage value in any trees included in the survey. There is no prescribed or standardised method for the assessment of cultural or heritage value in trees and it is inherently more difficult to assess these consistently than physical habitats, which can be viewed and counted. The trees at the onshore substation at Oakendene are within the parkland at Oakendene Manor. The presence of these trees discussed in general within the **Appendix 25.8**: **Onshore Heritage Asset Baseline Report**, **Volume 4** of the ES **[APP-214]**, but none of those included in the tree survey are specifically referenced, or identified as particularly having or contributing to heritage, which would be a possible justification for veteran classification on these grounds. It is the Applicants view that these trees, and others included in the tree survey, have some heritage and/or cultural value because of their association with a known heritage assets, but this is insufficient to qualify them as veterans under the National Planning Policy Framework (NPPF) (Ministry of Housing, Communities and Local Government (MHCLG), 2021) definition, which requires *exceptional* value.
2.3.27	*Assessment of Effects* iii. Effects are considered to be appropriate for arboricultural-related receptors, including ancient woodland, veteran trees and woodland. However, the assessment of native hedgerows is of concern as 'important' hedgerows differ between documents and plans; the findings presented are of low confidence as a result. Worst-case scenarios are applied, though reference is made to mitigation measures, which are likely to reduce the findings further throughout detailed design and project delivery.	The **Tree Preservation Order and Hedgerow Plan** **[PEPD-007]** shows important hedgerows that are identified in **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-063]** and **Appendix 25.2: Onshore historic environment desk study Part 1 of 2, Volume 4** of the ES **[APP-200]**. This has led to some confusion as a consolidated list of important hedgerows was not provided in a single location. The **Tree Preservation Order and Hedgerows Plan** **[PEPD-007]** and Figure 7.2.1 of the **Outline Code of Construction Practice** **[APP-224]** have also been reviewed and a small number of discrepancies identified. These were corrected and provided in advance of the Examination. A further request to review vegetation losses and align documents was made at the Issue Specific Hearing 1 in February 2024 (Action Point 24). This is being undertaken and any updates provided at a later deadline.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.3.28	*Mitigation, Compensation and Enhancement* iv. Environmental mitigation measures have been adopted to aid considerate design of the project resulting in minimised likely effects to arboricultural receptors; further, proposed mitigation measures to protect trees as appropriate are also outlined. Although the mitigation technique of 'notching' is welcomed, there is a lack of methodology, aftercare and assessment of suitability. v. Although a strategy for the compensation of arboricultural loss is proposed, which proportionately reflects the loss of arboricultural features, the landscape design strategy for tree planting is not clear (replacing removed landscape features trees contribute to should be considered). vi. The majority of the proposed planting is expected to be planted within the DCO limits. Where this is not possible and offsite planting is required to provide essential compensation, it is considered that a planning obligation should require the submission of such detail to the responsible LPA. vii. The OLEMP provides no enhancements to arboricultural features; this is disappointing given the scale of the project and significant findings of worst-case design scenarios. Landscape proposals for both the Oakendene Substation and the extension proposals at Bolney Substation, lack proportionate and appropriate landscape design to compensate hedgerow and tree loss.	Removal of trees and hedgerows must be undertaken in accordance with the Vegetation Retention Plans in **Appendix B** of the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** which limits the maximum length to be lost. This is in accordance with commitment C-115 (see the **Outline CoCP** **[PEPD-033]** and **Commitments Register** **[APP-254]** updated for Deadline 1 submission and is secured though Requirement 22 of the **Draft DCO** **[PEPD-009])**. This commits to minimising loss by notching hedgerows and treelines wherever possible, which is the removal of a shorter section of hedgerow or treeline compared to the construction corridor width. The creation of notches, under a realistic worst-case scenario, is based on vegetation being cut to the ground and the roots excavated and discarded as necessary. This is a typical approach to linear projects, other than that there would be multiple smaller notches as opposed to a single large gap where possible. The **Appendix 22.16: Arboricultural Impact Assessment, Volume 4** of the ES **[APP-194]** also states that '*the ability to successfully implement 'notching' will be assessed on a case-by-case basis as part of further survey to support the development of a detailed design. This will include mapping of the individual component trees within hedges and groups to allow tree removal and retention around notches to be shown on the final tree removal plans with a higher resolution than exists in this assessment.'* This information will be presented as part of a set of stage specific Arboricultural Method Statements at the detailed design stage in accordance with Commitment C-282. The methodology for notching will be described and controlled through a stage specific Code of Construction Practice via Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]** and any required aftercare for reinstated hedgerows and treelines will be detailed within a Landscape and Ecological Management Plan in accordance with Commitment C-286 and Requirements 12 and 13 of the **Draft Development Consent Order** **[PEPD-009]**. The Applicant agrees that the contribution existing trees make to removed landscape features should be a key consideration of any proposed replacement planting proposals. Section 8.5 of the **Appendix 22.16: Arboricultural Impact Assessment, Volume 4** of the ES **[APP-194]** establishes the principle that '*the design of replacement tree, group and woodland planting will aim to replace or recreate the benefits provided by trees that were removed*.' It provides guidance on suitable species selection based the primary qualities (arboricultural, landscape or habitat) that will be adopted during detailed planting plan design. The use of tree species that are characteristic of the area also forms a part of Commitments C-193. This is secured through Requirements 12 and 13 of the **Draft Development Consent Order** **[PEPD-009]** with reference to a stage specific Landscape and Ecology Management Plan. Arboricultural offsetting and enhancement measures (quantum of proposed tree planting) are described in the **Appendix 22.16: Arboricultural Impact Assessment, Volume 4** of the ES **[APP-194]**. Planting plans would be produced in response to a detailed design according to the planting location hierarchy provided in the AIA. The landscaping proposals presented at Figure 1 and Figure 2 of the **Outline Landscape and Ecology Management Plan (LEMP)** **[APP-232]** presents one possible arrangement of landscaping around the onshore substation at Oakendene and existing National Grid Bolney substation. The designs are preliminary in nature and will evolve in response to a detailed design. It is however, not intended that this is the sole provision of off-setting or enhancement measures that will be delivered in response to tree and hedgerow loss. A calculation rate for the replacement of individual trees to be removed is presented as a function of their current stem size within the **Appendix 22.16: Arboricultural Impact Assessment, Volume 4** of the ES **[APP-194]** and secured by commitment C-286 of the **Commitments Register** **[APP-254]** (provided at Deadline 1 submission) detailed in the **Outline LEMP** **[APP-232]** secured through Requirement 12 of the **Draft Development Consent Order** **[PEPD-009]**. In this way the amount of replacement planting will respond to the scale of impact and mean that up to 14 new trees will be provided for the loss of a single tree at in some instances. Groups of trees and woodland will also be replanted at a higher area ratio than that being removed depending on the median stem size and at least an equal length of hedgerow to that being removed would be planted. These measures have

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		been designed to ensure that there is no net loss of arboricultural value in the longer term and no permanent degradation of the treescape at the onshore substation at Oakendene but also across the entire Proposed Development. The Applicant has provided an indicative layout of the habitats to be established on-site at the onshore substation location and at the extension of the existing National Grid Bolney substation. The exact nature and scale of these will need to be flexible at this stage as the design will inevitably change to accommodate the installed number of turbines / turbine capacity / types of transmission cable etc. As the final Landscape and Ecological Management Plan will be agreed with the relevant planning authority before being implemented the Applicant considers there is adequate opportunity to influence the design post-DCO consent. For off-site habitat creation this will not be known until detailed design has highlighted the quantity and type of biodiversity units required. It is noted in **Appendix 22.15: Biodiversity Net Gain Information, Volume 4** of the ES **[APP-193]** that 70% of the biodiversity units required will be delivered ahead of the commencement of construction for each stage of the delivery (e.g. based on stage specific detailed design). The ability to deliver enhancement planting beyond the proposed DCO Order Limits is dependent on landowner agreement. Without a detailed design, agreeing to any enhancements with any given landowner would be difficult. The **Appendix 22.15: Biodiversity Net Gain Information, Volume 4** of the ES **[APP-193]** allows for discussion with landowners in the first instance to deliver enhancements, compensation and gain (through the calculation of biodiversity net gain (BNG) using the Biodiversity Metric 4.0 (Natural England and Other Parties, 2023)) which will involve tree and hedgerow planting. It is the Applicant's intention to discuss the potential delivery of new or enhanced habitats once detailed design has identified the losses which are expected to be less than those assessed within the **Appendix 22.16: Arboricultural Impact Assessment, Volume 4** of the ES **[APP-194]**.
2.3.29	**Traffic and Transport** 3.12 The focus of this representation is on the traffic and transport implications of the onshore elements of the proposals (specifically the construction of the cable route and associated works, as well as permanent works including the Oakendene substation and vehicle accesses) on the West Sussex transport network. *Assessment Methodology* i. The assessment has been undertaken in accordance with rescinded and replaced guidance from IEMA, Guidelines for Environmental Impact Assessment of Road Traffic (1993). This was replaced in July 2023 by Environmental Assessment of Traffic and Movement. The ES should be reviewed against the latest guidance and as necessary amended. ii. WSCC is content with the base data used within the assessment. This data includes traffic surveys of all routes that will be used by construction traffic.	3.12i. Use of the Guidelines for the Assessment of Road Traffic (1993) was defined within the Applicant's request for an EIA Scoping Opinion submitted to the Planning Inspectorate on 2 July 2020 and following consultation with WSCC prior to the DCO Application being submitted. At the time of writing the Environmental Statement **Chapter 23: Transport, Volume 2** of the ES **[APP-064]** in early 2023 the new Institute of Environmental Management and Assessment (IEMA) (2023) Guidance Environmental Assessment of Road Traffic and Movement (July 2023) had not been published. The Applicant will provide a note on the principal differences between the 1993 and 2023 Institute of Environmental Management and Assessment's (IEMA) Traffic Assessment Guidance (IEMA, 1993; 2023) documents and whether there would be difference in the outcome of the assessment if the latter was used at the Deadline 2 submission. 3.12ii. The Applicant welcomes West Sussex County Council's (WSCC) agreement on the base data used within the assessment and that it includes traffic surveys of all routes to be utilised by construction traffic.
2.3.30	*Assessment of Effects* iii. For the purposes of the transport network, it is acknowledged that most effects will occur during the construction phase and, as such, will be temporary in nature (albeit for an approximately four-year period). Once	3.12iii. The Applicant has entered into discussions with West Sussex County Council (WSCC) regarding the design requirements for key permanent access junctions, including the onshore substation at Oakendene, with a view of reaching an agreement in principle on the proposals before the end of the Examination.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	operational, traffic impacts will be minimal. Details of permanent, operational accesses, including that serving the onshore substation, are yet to be agreed with WSCC. iv. There remain areas of concern relating to transport matters as presented in the DCO submission documents. These relate primarily to construction phase impacts on the West Sussex transport network, and the concern about the measures outlined in the OCTMP (APP-228).	3.12iv. The **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** includes mitigation measures to limit the effects of construction traffic associated with the Proposed Development. The Applicant will continue to discuss construction phase effects with WSCC with a view of resolving areas of concern prior to the end of the DCO Examination.
2.3.31	*Mitigation, Compensation and Enhancement* v. The focus of the highway assessment provided by the Applicant is on the construction phase, which has been accepted by WSCC given the anticipated increase in traffic flows during this time compared with the operational phase. Although an OCTMP has been submitted by the Applicant to provide mitigation during construction, there are a number of concerns, including: a. Those relating to the physical construction access arrangements, including the overall number of accesses and the ability to achieve necessary visibility splays at identified accesses (including those to the main construction compounds); b. Areas where additional mitigation is necessary, including the provision of road safety audits and the management of traffic on single track roads; and c. Aspects where clarification is required or where information appears to be missing from the submitted information. This includes numbered accesses being missing or construction vehicle trips being absent from tables within the OCTMP. vi. Some minor comments are made in respects of measures within the Outline Operational Travel Plan (OOTP) (APP-227). vii. In reviewing the submitted information, it is acknowledged that some construction traffic will route through the Air Quality Management Area (AQMA) in Cowfold. For the purposes of traffic routing, this traffic will make use of A-classed roads (the A281, which runs north to south, and the A272, which runs east to west). Notwithstanding the AQMA, in light of their classification, these roads are appropriate for construction traffic. Further mitigation measures will nevertheless be expected for the purposes of managing traffic through the AQMA and Cowfold itself, and WSCC expects this traffic to be reduced to the minimum where possible. viii. Mitigation will need to be agreed for the end-of-life decommissioning. A commitment should be secured as part of the DCO requiring a decommissioning construction traffic management plan to be submitted and agreed with WSCC. This CTMP should be provided and agreed prior to decommissioning works commencing.	The **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** includes mitigation measures to limit the effects of construction traffic associated with the Proposed Development. The Applicant will continue to discuss construction phase effects with West Sussex County Council (WSCC) with a view of resolving areas of concern prior to the end of the Examination. In addition, the Applicant provides the following responses to the specific points made by WSCC: a. Section 4.4 of the **Outline CTMP** **[PEPD-035a]** provides details of visibility splay requirements for construction access junctions. Where it is proposed to use an existing farm gate accesses or farm tracks a visibility splay in accordance with Design Manual for Roads and Bridges will be provided by coppicing. Where this is not possible (for example due to ecological reasons) these accesses will be managed through traffic management. Further to this, the Applicant is also in discussion with WSCC on the visibility splays requirements at key accesses, with speed surveys being completed to inform visibility splay requirements. These speed surveys will be used to inform the requirements set out in the **Outline CTMP** **[PEPD-035a]** and access designs where these are being undertaken. b. The Applicant is in discussion with WSCC on the requirements for Road Safety Audits and management of single-track roads. The Applicant will continue to discuss construction phase effects with WSCC with a view of resolving areas of concern prior to the end of the examination. c. An updated to the **Outline CTMP** **[PEPD-035a]** was submitted at Pre-Examination Procedural Deadline A on 16 January 2024 which corrected these errors. vi. The Applicant will discuss the **Outline Operational Travel Plan** **[APP-227]** with WSCC and will address any WSCC outstanding concerns during the course of the Examination. vii. The **Outline CTMP** **[PEPD-035a]** contains details of required construction traffic routing for the Proposed Development. Where possible HGV traffic has been routed via the A23 and from the east along the A272 avoiding Cowfold. Heavy goods vehicle (HGV) traffic has been minimised as much as possible as detailed paragraph 1.2.5, Commitment C-157 and C-158 **Commitment Register** **[APP-254]**. Further discussions will be held with WSCC to establish appropriate mitigation measures for the Air Quality Management Area (AQMA) and Cowfold for inclusion within the **Outline CTMP** **[PEPD-035a]** secured through Requirements 24 of the **Draft Development Consent Order** **[PEPD-009]**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		viii. As stated in the **Outline CTMP** **[PEPD-035a]**. The decommissioning phase is anticipated to involve the removal and reinstatement of the onshore substation site at Oakendene and the existing National Grid Bolney substation extension. The onshore cable will be left in situ during the decommissioning phase. The decommissioning works are likely to be undertaken in reverse to the sequence of construction works and involve similar levels of equipment but much reduced numbers of vehicles for decommissioning. Paragraph 3.81 within the **Outline CTMP** **[PEPD-035a]** states that a decommissioning plan and programme will be developed prior to construction and updated during operation of Proposed Development to account for any changes to decommissioning best-practice and developments in technology. For onshore decommissioning, Requirement 34 within the **Draft Development Consent Order** **[PEPD-009]** secures the provision of an onshore decommissioning plan with must be submitted to and approved by the relevant planning authority.
2.3.32	**Minerals Safeguarding** 3.12WSCC is concerned that proper consideration has not been given to avoiding needless sterilisation of safeguarded minerals. The potential volumes of material that could be recovered are unknown and there are no clear mechanisms in place to secure prior extraction or which demonstrate that prior extraction is not practicable or environmentally feasible. *Assessment Methodology* i. Parts of the cable route are underlain by minerals (building stone, brickmaking clay, and soft sand) that are safeguarded by the West Sussex Joint Minerals Local Plan (JMLP) (July 2018, Partial Review March 2021). The NPS for Energy (EN-1) states that, '*where development has an impact upon a Mineral Safeguarding Area (MSA), appropriate mitigation measures should be put in place…'.* It is important, therefore, that consideration is given to ensuring that minerals are not needlessly sterilised. Of particular importance is soft sand aggregate, a safeguarded resource that is scarce and for which the landbank is below the required seven years (NPPF Para 213e). ii. Chapter 24 of the ES (APP-065) seeks to address the issue of mineral safeguarding and Figure 24.3 shows the cable route crosses the above noted mineral resources. However, the Applicant has not provided a Mineral Resource Assessment, which assesses impacts on safeguarded minerals or addresses the issue of severance of resources.	Due to the location of the relevant Minerals Safeguarding Areas (MSAs), it is not possible for the onshore cable route to avoid the MSAs, however the route proposed for the onshore cable has taken the MSAs into account and minimises the extent of impact on the MSAs by running in as direct a line as possible, or for soft sand, running adjacent to the A283 (an existing constraint to extraction). The onshore cable route therefore avoids needless sterilisation as a first principle. In common with other projects of this nature, ground investigations to determine the precise amounts of mineral have not been undertaken at this stage of the project, and this information would not become available until the construction phase. It is therefore not possible to identify the potential volumes of materials that could be recovered. This information would also be needed in order to identify the quality of material and its possible end-uses, so it is not possible to identify whether prior extraction could be utilised, and if so, how this would take place. It is therefore not possible for the minerals assessment provided in **Chapter 24: Ground conditions, Volume 2** of the ES **[APP-065]** to provide a formal Minerals Resource Assessment, but where required it does provide proper consideration through a robust assessment based on the information available and, where appropriate, considers worst case scenarios for the quantum of minerals affected by the Proposed Development. Assessment methodology i. In line with National Policy Statement EN-1 (DECC, 2011a and DESNZ, 2023) and as noted above, the onshore cable route design avoids needless sterilisation of minerals and in addition, the **Outline Code of Construction Practice (CoCP)** **[APP-224]** commits to producing a Materials Management Plan (MMP) for the project and is secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. Within the MMP there is a commitment that the Plan will "*seek to maximise the reuse of excavated clean materials from the onshore cable construction corridor where practical and feasible*". Due to the level of information that is available on the minerals at this point in time, specifically for soft sand, this currently provides the most robust mitigation available to the Proposed Development. Further information on this matter is provided below in response reference 2.3.34 below. ii. As noted above, a formal Mineral Resource Assessment is not achievable at this point in time, however a robust assessment following both the environmental impact assessment (EIA) methodology and where applicable, the safeguarding policies and guidance available from WSCC has been undertaken. This provides a worst case scenario for the minerals resource which may be sterilised, including the

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		severance of deeper sand deposits for the operational life span of the Proposed Development, and therefore a worst case determination can be made on this issue.
2.3.33	*Assessment of Effects* iii. The assessments for clay and building stone focus on current demand, needs, and quarries in the vicinity, and not the safeguarding of minerals for future generations as intended. The assessments do not provide any quantitative assessment of the amount of mineral that may be sterilised (either directly or through severance). Therefore, WSCC questions whether the assessment of significance of impact for clay and stone has been underplayed. iv. The assessment states that some 1.16 million m^3 of soft sand may be sterilised (para 24.9.47, APP-065), and that the sensitivity of the soft sand resource is 'medium' and during the construction phase, the magnitude of change is 'high' (para 24.9.47 – 24.9.50, APP-065), and that the proposed development will therefore lead to 'major negative' effect, considered to be 'significant' (para 24.10.11 and Table 24-24, APP-065). This is of concern, and this must be recognised in any final assessment of overriding need. V. The assessment states that the impacts will only occur during construction; however, the presence of a cable, and 35m buffer, would mean sterilisation throughout the life of the windfarm. vi. The assessment does not consider the suggestions set out within the West Sussex Mineral Safeguarding guidance, which is referenced in APP-065. The assessment does not provide any details of the likely volumes of material that may be possible to prior extract (given the limited extent and depths of proposed excavations for the cable route), as proposed to be secured by a Materials Management Plan (MMP). Therefore, the effectiveness of any mitigation is unknown at this stage. vii. The Secretary of State (SoS), as the decision maker for the Project, will be required to consider whether there is an overriding need for the Project. Consideration is required to ensure that the mechanisms proposed are sufficient to avoid needless sterilisation.	Assessment of Effects The Applicant notes that the future demands for brick clay and building stone are not readily quantifiable beyond the WSCC Joint Minerals Local Plan (JMLP) period, and as such, has used information from the JMLP to consider the issue of future demand. For Brick Clay, the JMLP states (Paragraph 6.5.5) that national policy requires a 25 year landbank to be maintained, and for a number of sources of clay to be available. At the time of publication, the JMLP identified three clay extraction with over 25 years of reserves, one with 24 years of reserves and one with 10 years of reserves. The 10-year site then had an allocation made for its extension (Policy M11). For brick clay, Section GC-C-08 of the **Chapter 24: Ground conditions, Volume 2** of the ES **[APP-065]** goes on to identify that alongside the permitted reserves for brick clay, there is a substantial safeguarding area available for brick clay. This is well in excess of any of the other mineral safeguarding areas within the county. Although this means that the overlap between the proposed DCO Order Limits and the safeguarding area covers a greater area than for other minerals under consideration, it remains a small proportion of the overall safeguarding resource; estimated at less than 1%. For building stone, the JMLP (Paragraph 6.6.2) states that there were 2.7 million tonnes of permitted sandstone reserves (at the time of publication) and annual sales were in the region of 24,000 tonnes (using 2016 data). The JMLP also identifies (paragraph 6.6.4) that there is no evidence that suggest a need to allocate any additional sites or site extensions to meet the projected demand for sandstone. Section GC-C-08 of the **Chapter 24: Ground conditions, Volume 2** of the ES **[APP-065]** uses the WSCC Minerals and Waste Safeguarding Guidance (2020) to consider Building Stone. This Guidance states that a consideration needs to be made about whether any proposal would lead to a sterilisation of building stone, due to the extent of the safeguarded area and the low level of demand. The low level of demand is shown by there only being four active building stone quarries in the county which produced around 24,000 tonnes per annum, from a permitted reserve of around 2.7 million tonnes in 2016 (WSCC Joint Minerals Local Plan, 2021). Although the Minerals Safeguarded Area for building stone does overlap with the proposed DCO Order Limits, this is not close to any of the existing four quarry sites. It has not been possible to date to obtain shapefile data for the building stone safeguarding area within WSCC, however from reviewing the maps within the WSCC Joint Minerals Local Plan, the building stone MSA is greater than the soft sand safeguarding area. The overlap between the proposed DCO Order Limits and the building stone safeguarding is estimated as being around 11ha. Following the WSCC (2020) Minerals and Waste Safeguarding Guidance, there is evidence of low demand for building stone compared to the extent of both permitted reserves and the safeguarding area identified. It is therefore considered that the assessment undertaken within the EIA, is appropriate for both minerals, and the conclusions drawn of 'not significant' in EIA terms are correct. iii. For soft sand, it is agreed that the worst-case calculation provided within Section GC-0C-08 of **Chapter 24: Ground conditions, Volume 2** of the ES **[APP-065]** shows a potential sterilisation figure of 1.16 million tonnes, and that this would be a significant, negative effect in EIA terms. It is also relevant that this figure is subsequently used within the **Planning Statement** **[APP-036]** when considering the overall need case for the Proposed Development. The Applicant notes that this calculation is based on using the maximum design parameter stated in Table 24-13 of **Chapter 24: Ground conditions, Volume 2** of the ES **[APP-065]** which comprises of a 40m wide onshore cable corridor located within the onshore part of the proposed DCO Order Limits and not the 35m stated in WSCC's Relevant Representation.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		iv. Within **Chapter 24: Ground conditions, Volume 2** of the ES **[APP-065]**, section GC-O-05 states that the effects identified within section GC-C-08 (that will occur during the construction phase) will also be relevant for the operational phase of the Proposed Development for building stone, brick clay and soft sand and therefore do cover the life of the Proposed Development. v. The assessment within **Chapter 24: Ground conditions, Volume 2** of the ES **[APP-065]**, section GC-C-08, does not contain details of the volumes of material that may be possible to prior extract, as the detailed assessment required to identify these figures are not possible at this point in time. However, the Applicant notes that such work would not change the conclusions in the EIA, given that it would not alter the assessment of effects which are already noted to be Significant. vi. It is agreed that, given the conclusions found in **Chapter 24: Ground conditions, Volume 2** of the ES **[APP-065]** in relation to minerals safeguarding, the Secretary of State will be required to consider these findings in the context of the overriding need case for the Project.
2.3.34	*Mitigation, Compensation, and Enhancement* vii. The Applicant intends to mitigate against mineral sterilisation through the preparation of a MMP that will be produced prior to construction and to be secured through the OcoCP (APP- 224). However, the OcoCP and the information contained within the MMP is limited, with no reference to mineral safeguarding (particularly soft sand), prior extraction, or evidence of discussions with local mineral operators that have the required equipment to process any safeguarded minerals that are extracted. The potential volumes of material that could be recovered are unknown and there are no clear mechanisms in place to secure prior extraction or to demonstrate that prior extraction is not practicable or environmentally feasible.	The **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** submitted with the Environmental Statement commits to a Materials Management Plan (MMP) being produced along with a commitment that the MMP will "*seek to maximise the reuse of excavated clean materials from the onshore cable construction corridor where practical and feasible*". At this point in time, it is not expected that prior extraction of soft sand for off-site sales/use will be practical, as this would leave a substantial void along the cable corridor which will then need infilling with imported materials to allow the cable construction to take place. It is considered that this approach would be unsustainable due to the additional transport and excavation / fill works required. The proposed approach would therefore maximise the re-use within the Proposed Development of material that is excavated for the cable construction, thereby not sterilising this resource which is already subject to sterilisation effects from the constraints of the A283's proximity. Whilst soft sand remaining under the onshore cable route would be sterilised for the duration of the construction and operational phases, it would become available again upon decommissioning. As noted within response to RR 2.3.33, it is not possible to calculate the potential volumes of soft sand that may be affected at this time, and the proposed worst-case approach is therefore considered acceptable and provides confidence that mitigation will be enacted. Stage specific CoCPs will be required in accordance with Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**.
2.3.35	**Historic Environment** 3.13The main focus of this representation is the concern about the anticipated scale of historic environment impacts that may arise as a result of the Project. The risk of harm to heritage assets, including those of national significance, along with the absence of field investigations and inconsistent approach to evaluation of high-risk areas, results in the possibility of an unacceptably high degree of harm to the historic environment. *Assessment Methodology* i. WSCC disagrees with some aspects of the ES methodology, principally the assessment of: the significance for high value heritage assets; the magnitude of change; the assessment of effects of mitigation; substantial vs less than substantial harm and how these equate to the EIA assessment framework;	Whilst the nature of any disagreement is not made clear, it is noted that the assessment methodology followed in **Chapter 25: Historic environment, Volume 2** of the Environmental Statement (ES) **[APP-066]** is consistent with the methodology that was set out within the Scoping Report. It is also consistent with the approach which has been used in previous environmental assessments for other recent Development Consent Order (DCO) projects such as Sizewell C nuclear new build and Yorkshire GREEN grid connection. In the case of Sizewell C, where a decision was made and consent was granted, the approach was accepted by the Examining Authority. The Yorkshire GREEN grid connection decision is still awaited. The embedded environmental measures for the Proposed Development were established and adapted through the pre-DCO Application consultation process. Following a meeting on 27 October 2023 with West Sussex County Council (WSCC) Archaeologist, C-225 has been updated by the Applicant within the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** (submitted at the Procedural A Deadline) and the **Commitments Register** **[APP-254]** (updated at the Deadline 1 submission) to the following: C-225: "*Where previously unknown archaeological remains of high heritage significance are identified through surveys along the cable route, and where these locations have not been possible to avoid during earlier design*

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	medium (potentially significant) residual effects; and what constitutes a 'worst-case scenario'. ii. WSCC is concerned that some of the content and wording of the Commitments Register and Draft DCO may not robustly secure the delivery of historic environment commitments, including mitigation measures, public engagement measures, and appropriate archive provision. iii. WSCC remains concerned that heritage assets were not afforded sufficient consideration in the selection of viewpoint locations within the LVIA. As a result, visualisations are not always sufficient to assess the degree of change within the setting of heritage asset.	*stage, consideration will be made for engineering solutions (e.g. narrowing of the construction corridor, divert cable route within DCO Order Limits, re-siting stockpiles) to avoid impacts in the first instance ~~minimise direct impacts~~. Where impacts are not avoidable, these will be minimised where possible through design solutions and an appropriate programme of mitigation will be undertaken to ensure preservation by record. Such measures will be reviewed in consultation with relevant stakeholders (WSCC Archaeologist and Historic England). An onshore outline WSI provides detail of appropriate methodologies to be implemented during the evaluation and mitigation stages of the archaeological works.*" Commitment C-225 will be secured within the **Outline Onshore Written Scheme of Investigation (WSI) [APP-231]**, which would itself be secured by Requirement 19 of the **Draft Development Consent Order (DCO) [PEPD-009]**. Further consultation is currently being undertaken with the WSCC Archaeologist and Historic England on the **Outline Onshore WSI [APP-231]** and a revised version will be submitted at Examination Deadline 3. The Applicant would welcome specific examples for further discussion. The approach to the assessment of effects though change to setting is provided in Section 25.7 in **Chapter 25: Historic environment, Volume 2** of the ES **[PEPD-020]**. Viewpoint (VP) selection has been an iterative process with the LVIA team and informed by engagement with key stakeholders, to ensure that where VPs are selected in the vicinity of heritage assets with settings that are sensitive to change, that these VPs are located to the advantage of illustrating views and supporting the historic environment assessment within the ES. However, along the onshore cable route, where effects arising through change to setting will be limited to the construction phase and therefore temporary, the Applicant has placed less of an emphasis on requiring heritage-specific VPs but rather ensuring, that VPs are selected/adapted to better support both the landscape and visual impact assessment (LVIA) and the historic environment assessments. Following the first ISH in February 2024, the Applicant has agreed to undertake additional viewpoint assessment from Oakendene Manor, which will be photographed when land access and suitable weather is available.
2.3.36	*Assessment of Effects* iv. Due to the scale of the proposals, significant effects upon the historic environment are inevitable. Given the absence of field evaluation, a risk to nationally significant archaeology has not yet been ruled out. v. Despite acknowledging major concerns about LACR-01d, consideration of alternatives (Chapter 3) appears to give insufficient weighting to the historic environment and to the risk to nationally significant archaeology and associated NPS-EN1 policy requirements. vi. Concern is raised about the identified significant residual adverse effects to a number of heritage assets, and lower levels of harm to a large number of additional heritage assets.	The assessment within **Chapter 25: Historic environment, Volume 2** of the ES **[PEPD-020]** identifies significant effects on historic environment receptors. The **Planning Statement [APP-036]** outlines the position with regards the planning balance with regard to the benefits of the Proposed Development and the harm to heritage assets that is identified in **Chapter 25: Historic environment, Volume 2** of the ES **[PEPD-020]**, as per paragraphs 4.7.66 and 5.4.10 of the **Planning Statement [APP-036]**. Commitments C-225 (updated by the Applicant within the **Outline Code of Construction Practice (CoCP) [PEPD-033]** (submitted at the Pre-Examination Procedural Deadline A on 16 January 2024)) and C-79 in the **Commitments Register [APP-254]** (updated at the Deadline 1 submission) provide for mitigation through design and archaeological recording. This will be secured through the **Outline Onshore Written Scheme of Investigation (WSI) [APP-231]**, which also sets out the methodological approach for archaeological investigations which ensures further investigation will be undertaken prior to construction. The **Outline Onshore WSI [APP-231]** is secured by Requirement 19 of the **Draft Development Consent Order [PEPD-009]**. Further consultation is currently being undertaken with the WSCC Archaeologist and Historic England on the **Outline Onshore WSI [APP-231]** and a revised version will be submitted at Examination Deadline 3.

Ref	Relevant representation comment	Applicant's response
2.3.37	*LACR-01d* vii. The archaeological sensitivity of sections of the route is exceptionally high. LACR-01d crosses an area of the South Downs, which forms part of an incredibly rich and complex multi-period prehistoric landscape of national significance, including scheduled Early Neolithic flint mining sites constituting the earliest evidence industrial activity in Britain. In particular, the lack of field evaluation within this area is wholly unacceptable. viii. There is an identified risk of harm to highly sensitive and nationally significant heritage assets. Notwithstanding the comprehensive package of field investigations and mitigation measures set out within the OOWSI, it cannot currently be demonstrated that mitigation will reduce potential harm to acceptable levels. Mitigation via 'avoidance by micrositing' is not demonstrated to be a securable option within the application.	The **Chapter 25: Historic environment, Volume 2** of the Environmental Statement (ES) **[PEPD-020]** identifies a high potential for archaeological remains of high heritage significance within the area of the South Downs. Archaeological field evaluation has been undertaken within the South Downs in the form of a geophysical survey and the results are described in the **Onshore Geophysical Survey Report** **[PEDP-031, PEDP-113 - PEDP-119]**. Specifically, the South Downs is covered by Fields 050-117. Survey in this area identified just two features identified as definite or probable archaeology: • (52_1) possible ditch forming part of an enclosure; and • (85_1) a possible barrow. Other features were identified as having a possible archaeological origin, including multiple dispersed pit-type anomalies (e.g. 75_1) or areas of enhanced magnetism with unclear origins (e.g. 73_2, 74_3 and 75_2), weaker linear bands (e.g. 66_1, 66_2, 74_1) and weak curving anomaly (e.g. 62_1), which could be of archaeological origin. However, the geophysical survey did not indicate the presence of extensive or complex archaeological remains in which to targeted archaeological trial trenching, and so it is proposed to include this area within further evaluation to be undertaken prior to construction as specified in the **Outline Onshore Written Scheme of Investigation (WSI)** **[APP-231]**. Please refer to the Applicant's response to **reference 2.3.35** above, in relation to embedded environmental measures. The **Outline Onshore WSI** **[APP-231]** sets out the methodological approach for archaeological investigations which ensures further investigation will be undertaken prior to construction. Engagement will be undertaken with West Sussex County Council to provide comment/input to this document which will be updated throughout the Examination. Stage specific WSIs will be produced in accordance with Requirement 19 of the **Draft Development Consent Order** **[PEPD-009]**.
2.3.38	*Oakendene substation* ix. WSCC is concerned about the proposed harm to grade II listed Oakendene Manor, arising via permanent changes to its setting from construction and operation of Oakendene substation and compounds. Locations of viewpoints do not allow accurate assessment of the magnitude of change within the setting of the asset. WSCC does not consider that there is sufficient evidence to conclusively rule out substantial harm.	Whilst West Sussex County Council's relevant representation refers only to viewpoint locations, it is noted that the assessment of effects on settings during the construction phase and operation and maintenance phase considered not only views but also other relevant factors including changing land use and noise (for example during the construction phase). This is in accordance with relevant guidance, and the methodology described in Section 25.8 of **Chapter 25: Historic environment, Volume 2** of the ES **[APP-066]**. It was not possible to secure landowner access for a photograph viewpoint directly from Oakendene Manor but a viewpoint was obtained from a Public Right of Way (PRoW), with a view of the onshore substation site and Oakendene Manor (Figure 18.12, **Chapter 18: Landscape and visual impact assessment – figures, Volume 3** of the ES **[APP-099]**). This informed the assessment, along with baseline information on the Oakendene historic parkland and the topography of the onshore substation site (see **Appendix 25.5: Oakendene parkland historic landscape assessment, Volume 4** of the ES **[APP-211]**). The assessment also took account of the measures proposed in **Outline Landscape and Ecology Management Plan** **[APP-232]**, detailing the indicative landscape plan and design principles, which have been formed with consideration to the setting of Oakendene Manor and will be secured through Requirements 12 and 13 of the **Draft Development Consent Order** **[PEPD-009]**. Design principles within the **Design and Access Statement** **[AS-003]** are secured through Requirement 8 of the **Draft Development Consent Order** **[PEPD-009]**. In response to the request for further information made by WSCC, the Applicant confirms that they are in the process of seeking to agree access to Oakendene Manor to undertake viewpoint photography directly from the manor house, in line with viewpoint HE 01, as identified in Figure 25.5h, **Chapter 25: Historic environment –**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		figures, Volume 3 of the ES **[APP-099]**. Further photography will be undertaken from other locations within the vicinity of Oakendene and reviewed to determine appropriateness for generating further visualisations for submission. The Applicant will engage with WSCC, and Horsham District Council, in this process and supply visualisations of additional viewpoint photography at a deadline subsequent to completion of this work, where required. It is noted that with regard to Oakendene Manor, Horsham District Council has stated in their Relevant Representation **reference 2.5.89** that: "*HDC confirms that, having reviewed the location of designated above-ground heritage assets within the vicinity of the development and evaluated the contribution that their settings make to the significance of the asset, the impact of the development, including the substation, on these would be less than substantial at the lower end of the scale of that category in all cases of the historic environment and individual heritage assets*." This response is consistent with the conclusions of the assessment within **Chapter 25: Historic environment, Volume 2** of the ES **[APP-066]**.
2.3.39	*Offshore* i. Some concerns remain regarding the impact of offshore arrays on onshore designated heritage assets, arising via changes to their wider settings. Whilst significant effects are not identified for individual assets, there will be less than substantial harm to a large number of designated heritage assets. This amounts to a not insignificant cumulative effect on the historic environment. WSCC is concerned that assessment methodologies for medium residual effects have been used to downplay the effects of offshore turbines on onshore designated heritage assets.	Effects through change to setting have been assessed according to methodology set out in the Scoping Report (Rampion Extension Development (RED), 2020). The approach is detailed in Section 25.8 in **Chapter 25: Historic environment, Volume 2** of the ES **[PEPD-020]** and **Appendix 25.7: Settings assessment scoping report, Volume 4** of the ES **[APP-213]**. The methodology which is in line with relevant legislation and policy and includes a narrative description of the extent and nature of any identified effect. The assessment did not identify any significant effects as a result of changes in the settings of heritage assets as a result of the offshore array. A comprehensive set of assets were included within the assessment. This included a range of asset types over a wide area and the number of not significant effects would not lead to a significant cumulative effect.
2.3.40	Mitigation, Compensation and *Enhancement* ii. The OOWSI sets out a comprehensive suite of proposed archaeological mitigation measures which in general will allow for appropriate and proportionate mitigation, to be secured via the SSWSIs. However, some areas need to be addressed, including: a. Timing, scope, extents and sampling size of field evaluations; b. Provision for further detailed geophysical survey and/or alternative survey techniques, if appropriate; c. Research aims, including specific palaeo-environmental research questions; and d. Details of the mechanisms for and feasibility of securing 'avoidance by micrositing', if nationally significant and potentially spatially extensive remains are encountered.	The field evaluations outlined in the **Outline Onshore Written Scheme of Investigation (WSI)** **[APP-231]** is secured through Requirement 19 of the **Draft Development Consent Order** **[PEPD-009]** and will be undertaken pre-construction, with the precise timing, scope, extents and sampling size to be determined and subject to further agreement with the relevant stakeholders. Potential areas of archaeological trial trenching, fieldwalking and test pitting are shown in Figures 3 and 4 of the **Outline Onshore WSI** **[APP-231**]. Magnetometry geophysical survey has continued following Development Consent Order (DCO) Application submission with survey results up to December 2024 provided in the updated **Onshore geophysical survey report, Volume 4** of the ES **[PEPD-031]** submitted at Pre-Examination Procedural Deadline A. The **Onshore geophysical survey report, Volume 4** of the ES **[PEPD-031**]) includes 88% of land within the proposed DCO Order Limits considered suitable for survey. Provision for use of other geophysical survey techniques, where appropriate, will be made in an update to the **Outline Onshore WSI** **[APP-231]**. Consultation is ongoing with the WSCC Archaeologist and Historic England on the update to the **Outline Onshore WSI** **[APP-231** and this will be submitted at Examination Deadline 3. The **Outline Onshore WSI** **[APP-231]** provides relevant overarching research context for further archaeological investigations, which will be further refined and detailed within relevant stage specific Written Scheme of Investigation (SSWSIs), to be agreed with the relevant consultees.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		Please refer to the Applicant's response to **reference 2.3.35** above, in relation to embedded environmental measures. A flow chart will be appended to the **Outline Onshore WSI** **[APP-231]** to include procedures following discovery of previously unknown archaeological remains. This will be included in the updated **Outline Onshore WSI** **[APP-231]** to be submitted at Examination Deadline 3.
2.3.41	*Oakendene Substation* iii. Embedded mitigations cannot fully offset the identified harm to Oakendene Manor and are likely to be limited by the required functionality of the substation. iv. Identified mitigation (landscaping and design) measures are not yet sufficiently secured by design principles. Options for changes to the indicative layout should be explored, and further details of the design (roofline, materials, colour scheme, landscaping etc.) should be provided during the Examination.	A historic landscape assessment of the historic parkland at Oakendene is presented in **Appendix 25.5: Oakendene parkland: historic landscape assessment, Volume 4** of the ES **[APP-211]**. This exercise informed the design process and the assessment of effects for the parkland and listed building presented in **Chapter 25: Historic environment, Volume 2** of the ES **[PEPD-020]**. The assessment of effects on settings during the construction phase and operation and maintenance phase considered relevant factors including views, changing land use and noise (for example during the construction phase). The understanding of the historic environment interests of Oakendene Manor then informed the design principles identified to reduce and minimise the impact on the setting of the building and these are secured in the **Design and Access Statement (DAS)** **[AS-003]**. The detailed design of the onshore substation must be undertaken in accordance with these design principles and provided for approval of the planning authority as per the requirements of the **Draft Development Consent Order** **[PEPD-009]** including 8 (2) which states that the design for approval, "*must accord with the principles set out in the relevant part of the design and access statement*". Requirement 12 (3) of the **Draft Development Consent Order** **[PEPD-009]** also requires accordance with the DAS for provision of the landscaping details for the onshore substation. The Applicant is considering an update to the **DAS** **[AS-003]** following issues raised at Issue Specific Hearing 1 in February 2024. This response is consistent with the conclusions of the assessment within **Chapter 25: Historic environment, Volume 2** of the ES **[PEPD-020]**.
2.3.42	**Water Environment** 3.14The focus of this representation is on the implications of the Project on flood risk across West Sussex. As the Lead Local Flood Authority (LLFA), WSCC is concerned with flooding from surface water, groundwater and Ordinary Watercourses. Key areas of concern relating to flood risk include the consideration of the drainage hierarchy, use of source control Sustainable urban Drainage Systems (SuDS) features and further detail being required to demonstrate the drainage design. *Assessment Methodology* 1. The Applicant should adhere to the requirements of the Land Drainage Act 1991 and WSCC's policy with regards to the requirements of work within Ordinary Watercourses, which has not been fully recognised in the documents.	The below responses address each of the particular concerns of the Lead Local Flood Authority (LLFA) in relation to flood risk. **Appendix 26.2: Flood Risk Assessment (FRA), Volume 4** of the ES **[APP-216]** fully considers all sources of potential flood risk in turn including surface water, groundwater and Ordinary Watercourses. The **Outline Operational Drainage Plan** **[APP-223]** documents how it has followed the drainage hierarchy and puts forwards a range of relevant sustainable urban drainage systems (SuDS) features. The final Operational Drainage Plan must accord with the **Outline Operational Drainage Plan** **[APP-223]** and is secured via Requirements 17 and 18 of the **Draft Development Consent Order** **[PEPD-009]**. The preliminary findings of both the **Appendix 26.2: FRA, Volume 4** of the ES **[APP-216]** and **Outline Operational Drainage Plan** **[APP-223]** were previously discussed with West Sussex County Council (WSCC) at targeted stakeholder consultation meetings (on 01 April 2022 and 22 June 2022). The requirement for Ordinary Watercourse consent (OWC) is outlined by the Applicant in commitments C-182, C-126, C-17, provided in Table 8-1 of the **Appendix 26.2: FRA, Volume 4** of the ES **[APP-216]** and Table 26-10 in the **Chapter 26: Water environment, Volume 2** of the ES **[APP-067]**. As stated in commitment C-182: *"Work within banktop of any other watercourse (not Main River and outside of IDB) will require consent from the LLFA". Whilst* C17 states" Appropriate *environmental permits or land drainage consents will be applied for works from the Environment Agency…or from the LLFA (for Ordinary Watercourse crossings)".*Commitment C-126 *states "Minor watercourses (where open cut techniques are*

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		proposed for the permanent cable crossings) will also have temporary crossings for the haul road to provide vehicular access along the route. A mixture of culverts and / or clear span bridges could be employed based on crossing specific requirements (size of watercourse and flood risk). These will be subject to permits and consents with the Environment Agency and Lead Local Flood Authority (LLFA).” Although the OWC is outside of the scope of the **Draft Development Consent Order** **[PEPD-009]**, the Applicant will adhere to each of the OWC requirements in accordance with legislation as noted in the above measures. In paragraph 26.2.8 of **Chapter 26: Water environment, Volume 2** of the ES **[APP-067]** the need for an OWC is also acknowledged by the Applicant.
2.3.43	*Assessment of Effects* ii. The Outline Operational Drainage Plan (OODP) (APP-223) defines the basis of the design for the operational drainage at the Oakendene substation and National Grid extension works, following the outputs of the flood modelling and drainage assessments undertaken. WSCC raises concerns that the current FRA and design proposals for the Oakendene substation do not truly reflect the winter flooding that occurs at this location. Therefore, evidence that consideration of local groundwater conditions have been factored into the FRA and outline design is required.	Consideration of flood risk at the onshore substation site is in the interest of the applicant, to ensure the scheme is able to operate as planned, as referred to in section 6.5.12 of the **Appendix 26.2: Flood Risk Assessment (FRA), Volume 4** of the ES **[APP-216]**. The indicative site layout has been developed accordingly, taking risk of flooding into account. The Applicant is confident the precautionary approach in the **Appendix 26.2: FRA, Volume 4** of the ES **[APP-216]** and **Design and Access Statement** **[AS-003]** will ensure the substation will not be at flood risk, nor increase flood risk elsewhere (addressed through the adherence to National Grid Target Guidance (C-230) (secured via the **Design and Access Statement** **[AS-003]** and via draft DCO Requirement 8 for the onshore substation at Oakendene and Requirement 9 for the extension of the existing National Grid Bolney substation. The Operational Drainage Plan must accord with the **Outline Operational Drainage Plan** **[APP-223]** and will be secured via Requirement 17 for Oakendene and Requirement 18 for the extension of the existing National Grid Bolney substation)). The assessment of flood risk and outline design was prepared in accordance with the West Sussex County Council (WSCC) and Horsham District Council (HDC) advice, as recorded in meeting minutes included in Annex A of the **Appendix 26.2: FRA, Volume 4** of the ES **[APP-216]**. As outlined in the **Appendix 26.2: FRA, Volume 4** of the ES **[APP-216]** the onshore substation at Oakendene is situated within Flood Zone 1 (low probability of flooding). The main sources of flood risk at the onshore substation site are fluvial and surface water, associated with run-off due to the clayey ground conditions. The approach to assessment of fluvial flood risk from the ordinary watercourse to the south of the substation site was agreed with the Lead Local Flood Authority (LLFA) (WSCC) and the Local Planning Authority (HDC) during a consultation meeting on 22 June 2022. It was agreed that the 0.1% Annual Exceedance Probability (AEP) flood extent (defined by the Environment Agency Risk of Surface Water mapping) was a suitably precautionary proxy for the 1% AEP plus a climate change allowance for the operation and maintenance phase (2030 to 2060). The HDC flood officer commented that as long as the onshore substation was positioned outside of the 0.1% AEP extent they would not be concerned. HDC also advised that no HDC records of historical flooding indicated flood incidents at the onshore substation site at Oakendene. No advice to the contrary was provided by WSCC during pre-DCO application consultation. Groundwater flood risk is considered in Section 5.5 of the **Appendix 26.2: FRA, Volume 4** of the ES **[APP-216]**. At the Oakendene substation site, the risk of groundwater flooding has been informed based on the Area's Susceptible to Groundwater Flooding data and GeoSmart Groundwater Flood Risk Map (GW5), both of which are presented in the Horsham District Council (HDC) Strategic Flood Risk Assessment (SFRA) (Appendix A, Figure 3A and 3B) (AECOM, 2020). The risk of groundwater flooding is indicated as '<25%' in Figure 3A, and as 'Negligible' within the more detailed GeoSmart data in Figure 3B. This is consistent with the onshore substation being underlain by clayey ground conditions. On this basis, the risk of groundwater flooding (and the possibility of high groundwater levels) at the Oakendene substation site was not considered further.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		The key flood risk to the site was deemed to be from surface water, given the underlying soils detailed in Paragraphs 2.2.15 and 2.2.16 of the **Outline Operational Drainage Plan** **[APP-223]** which are noted to be "*slowly permeable seasonally wet with impeded drainage*". The drainage hierarchy was followed and on this basis infiltration was not considered a viable means for the outline operational drainage plan. Therefore, high groundwater is not thought to be driving local flood risk in this area. Surface water flood risk indicated in Figure 26.2.6a of **Appendix 26.2: FRA, Volume 4** of the ES **[APP-216]** would be adequately dealt with via the drainage infrastructure for the site, as set out in the **Outline Operational Drainage Plan** **[APP-223]**. As set out in paragraphs 2.4.10 to 2.4.13 of the **Outline Operational Drainage Plan** **[APP-223]**, there is significant flexibility in how the final design of the onshore substation could be delivered. Therefore, there is deemed to be sufficient flexibility within the current outline strategy such that it can be revised and adapted at the detailed drainage design phase to address any concerns regarding winter flooding and associated loss of basin storage. As stated in Paragraph 6.5.6 of the **Appendix 26.2: FRA, Volume 4** of the ES **[APP-216]**, final design and sizing of drainage mitigation measures will be determined at the detailed drainage design stage in liaison with WSCC (as Lead Local Flood Authority (LLFA)). At present the comments made in relation to 'winter flooding' are vague and lack details about location, flood mechanism and timing. The Applicant requested further details and any supplementary data from WSCC and HDC on 08 February 2024, and will continue to carry out engagement with both stakeholders during the Examination. Nonetheless the Applicant considers that any additional winter flooding information identified by WSCC in their Relevant Representation can be factored into the detailed drainage design. The outline drainage strategy presented within the **Outline Operational Drainage Plan** **[APP-223]** is based on several conservative assumptions (regarding the maximum design parameters for the substation, impermeability and climate change allowance). Note that the Applicant has provided the further information of the proposed onshore substation site at Oakendene with site levels in relation to flood risk in Action Point 20. This has been submitted at Deadline 1 in **8.25 Applicant's Response to Action Points Arising from Issue Specific Hearing 1, Appendix 4 – Further information for Action Point 20** **(Document Reference: 8.25.4)**.
2.3.44	*Mitigation, Compensation and Enhancement* iii. Surface water flood risk should be considered within any emergency response plan, given the topography of the central section of the onshore cable route and historic flooding records. The OcoCP does not cover this within its emergency response planning. iv. Temporary haul roads and accesses should be constructed so as not to cut-off existing surface water flow paths. This could increase surface water flood risk off-site and should be demonstrated within the documents.	Table 4-6 in Section 4.8 of the **Outline Code of Construction Practice** **[PEPD-033]** outlines commitments relevant to emergency planning procedures which includes commitment C-118 *'Emergency Response Plans (ERP's) for flood events will be prepared for all construction activities, working areas, access and egress routes in floodplain areas (tidal and fluvial)'*. The requirements of the Emergency Response Plan are outlined in Section 8.2 of the **Appendix 26.2: Flood Risk Assessment, Volume 4** of the ES **[APP-216]**. Paragraph 8.2.3 includes provisions for surface water flood risk outlining that "*the circumstances under which different responses will be implemented should be specified, with an escalation of response associated with increasing levels of danger. For example, a 'be prepared' alert may be raised upon receipt of an Environment Agency Flood Alert or a Met Office Severe Weather Warning for heavy rain, followed by an 'evacuate' order upon receipt of an Environment Agency Flood Warning, or at the discretion of the site Health, Safety, Security and Environment (HSSE) Manager, based upon an appraisal of local conditions*". It is envisaged that these measures will be sufficient to address surface water flood risk to construction activities and personnel. This will be secured as part of the emergency response plan via Requirement 22 (j) of the **Draft Development Consent Order** **[PEPD-009]**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		A number of embedded environmental measures have been included within the **Appendix 26.2: Flood Risk Assessment, Volume 4** of the ES **[APP-216]** to ensure that temporary haul roads and associated crossings do not result in a detrimental impact to flood risk. Specifically, environmental measure C-73 states that: "*Where the development intersects overland flow pathways or areas of known surface water flooding appropriate measures will be embedded into the design*". In addition, environmental measure C-181 states that "*Access roads will have cross drainage provided where necessary at topographic low points*". Commitments C-128, C-145, C-176, C-177 and C-178 outline further provisions made in relation to temporary watercourse crossings. These environmental measures have been secured by the **Outline Code of Construction Practice (CoCP) [PEPD-033]** via the Construction Phase Drainage Plan (as outlined in Table 3-1 which will accompany the stage specific CoCP to be submitted post-consent and approved by the local authority), which, as set out in paragraph 5.10.9, states that "Details of construction phase drainage will be developed by the Contractor*(s) and will be presented in a Construction Phase Drainage Plan and approved as part of the stage specific CoCP. Details of the Construction Phase Drainage Plan will be subject to consultation with WSCC and other relevant consenting authorities prior to the start of construction*". This will be secured as part of the construction phase drainage plan via Requirement 22 (c) of the **Draft Development Consent Order [PEPD-009]**.
2.3.45	**Major Accidents and Disasters** 3.15 WSCC requires the dDCO to secure consultation with West Sussex Fire and Rescue Service (WSFRS) during detailed design and pre-construction phases for the Oakendene substation, to ensure that it has the opportunity to apply control measures to mitigate a number of risks and uncertainties raised through the DCO documentation. These are: i. Responding- the potential for extended response times for emergency service attendance at incidents. ii. Emergency Planning – sharing of emergency plans associated with Oakendene substation and Bolney substations, and associated works during Rampion 2 onshore construction. iii. Allowing for pre-planning – development of emergency plans, potential additional training of FRS personal through the emergence of new technologies, and suppressions systems/techniques required to safely deal with emergency incidents. iv. Fire suppression systems – WSFRS will require information on the intended access to the substation, the alternative access if the layout requirements require, and the supply of water for firefighting.	The **Draft Development Consent Order [PEPD-009]** was updated at the Pre-Examination Procedural Deadline A submission on 16 January 2024 to include the requirement (Requirement 8) to consult with West Sussex Fire and Rescue Service (WSFRS) during detailed design for the Oakendene substation.
2.3.46	**Public Health** 3.16 The focus of this representation is on the assessment of the communities affected by the Project during the construction and operational phases and the Equality Impact Assessment (EqIA)	Responses are provided to each point accordingly: i. As stated in paragraph 28.9.58 of **Chapter 28: Population and human health, Volume 2** of the ES **[APP-069]**, while overnight drilling would occur and could cause noise levels to exceed the night time lowest observed adverse effect level (LOAEL), such operations would be temporary and transient in

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	(APP-221) undertaken by the Applicant. Key concerns are as follows: i. In periods of overnight drilling, nearby receptors will be impacted, which could impede on the residents' quality of sleep, affecting health and wellbeing. Stage-specific CMS and the OcoCP need to satisfy these concerns regarding noise, vibration and lighting at the construction compounds and drilling sites. Impacts must be kept to a minimum through secured mitigation, including detailed plans on phasing of the onshore works to ensure construction timescales are minimised. ii. HGVs movement during construction should, where possible, avoid routes through the Cowfold and Storrington AQMAs. For the occasions where this cannot be avoided, WSCC seeks assurance that all mitigation has been taken to reduce impacts on air quality and disruption to residents. iii. WSCC seeks assurances that the emergency response plans, secured through the dDCO, will include timely actions that are taken in the event of damage to utilities, which is a potential risk due to trenching a large swathe through the County. Owing to the potential for, and significant issues associate with, utility outages, delays in the mobilisation of support to the communities affected, especially to those who are vulnerable in the communities, needs to be planned and mitigated for. iv. The Application does not evidence engagement with the affected communities and how the outcome of those engagements have influenced the Applicant's assumptions used as a basis for the assessment findings and decisions on mitigation measures to reduce these impacts. Specifically, impacts on communities near the proposed site of the onshore substation and the temporary construction compound sites. v. WSCC seeks assurance that the EqIA for any decommissioning in the future would be carried out prior to decommissioning as this is estimated 30 years in the future and would require updating to include any changes within that timeframe.	nature, thereby limiting the potential for health and wellbeing effects which would require long-term exposure to changes in the noise environment. Table 5-3 of the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** outlines management measures and mitigation proposed at all onshore construction areas to reduce the effects relating to noise and vibration from construction of the Proposed Development, including commitment C-26. Commitment C-263 for the production of a Noise and Vibration Management Plan (NVMP) during detailed design based on the principles in the **Outline CoCP** **[PEPD-033]**, detailing best practicable means and location specific mitigation. The **Outline CoCP** **[PEPD-033]** is secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. ii. A range of embedded environmental measures have been provided by the Applicant as detailed within the **Commitments Register** **[APP-254]** which has been updated at Deadline 1 submission and secured through **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** which has been updated at Deadline 1 submission. This includes: • Commitment C-157: *The proposed heavy goods vehicle (HGV) routing during the construction period to individual accesses will be developed to avoid major settlements of Storrington, Cowfold, Steyning, Wineham, Henfield, Woodmancote and other smaller settlements where possible*; and • Commitment C-158: *The proposed heavy good vehicle (HGV) routing during the construction period to individual accesses will avoid the Air Quality Management Area in Cowfold where possible.* These commitments are also reflected in Table 5-1 of the **Outline CTMP** **[PEPD-035a]** which has been updated at Deadline 1 submission and confirms prescribed local HGV access routes for all sections of the onshore cable corridor and Table 5-2 which details specific local constraints and proposed management of construction traffic routes. These routes and other detailed contained within the Outline CTMP will be secured Requirement 24 within the **Draft Development Consent Order** **[PEPD-009]**. These commitments ensure that HGV construction traffic will route along the A27 and A23 to gain access to the A272 east of Cowfold wherever possible, thereby avoiding the village centre. Therefore, only accesses A-52, A-56 and A-57 will require construction traffic to route through Cowfold Village centre. As calculated by using data included in Table 5-3 of the **Outline CTMP** **[PEPD-035a]** which has been updated at Deadline 1 submission, the impact of this commitment is the removal of up to 22,000 two-way HGV trips (11,000 HGVs) from Cowfold Village centre over the construction phase. These commitments will be secured Requirement 24 within the **Draft Development Consent Order** **[PEPD-009]**. The likely significant transport effects associated with the construction phase of the Proposed Development have been assessed in **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064]**, ES Addendum (submitted at Deadline 1) and **Appendix 23.2: Traffic Generation Technical Note, Volume 4** of the ES **[APP-197]** which has been updated at the Deadline 1 submission. As noted within Institute of Environmental Management and Assessment (IEMA) (1993) publication Guidelines for the Environment Assessment of Road Traffic an increase of less than 10% is not discernible environmental impact as is within day-to-day fluctuations in traffic flow. Therefore, no significant effects are predicted to occur within Cowfold. With regards to use of the 1993 guidance, it is also noted that the Applicant has committed to producing a Technical Note for Deadline 2 that reviews the conclusions of **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064]** and **Chapter 32: ES Addendum, Volume 2** of the ES **(Document**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		Reference: 6.2.32) (submitted at Deadline 1) against the 2023 IEMA publication Environmental Assessment of Traffic and Movement. This has replaced the 1993 guidance but was not published in time the Applicant to use as part of the DCO application. At this this stage, it is not anticipated that use of the 2023 guidance will impact upon the conclusions of **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064]** and **Chapter 32: ES Addendum, Volume 2** of the ES **(Document Reference: 6.2.32)** submitted at Deadline 1. **Chapter 19: Air quality, Volume 2** of the ES **[APP-060]** presents an assessment of air quality impacts from construction traffic. The assessment concludes that the Proposed Development will not result in significant impacts on air quality, as a result of increased traffic on the local road network. An air dispersion traffic modelling study of the potential impacts on the Cowfold Air Quality Management Area (AQMA) is presented in Section 1.4 within **Appendix 19.1: Full results of construction road traffic modelling, Volume 4** of the ES **[APP-174]** with the assessment in **Chapter 19: Air quality, Volume 2** of the ES **[APP-060]** concluding that there are no significant impacts confirmed by the **Chapter 32: ES Addendum, Volume 2** of the ES **(Document Reference: 6.2.32)**submitted at Deadline 1. Table 19-9 within **Chapter 19: Air quality, Volume 2** of the ES **[APP-060]** states that there will be no significant traffic travelling through the Storrington High Street Air Quality Management Area (AQMA) and that Annual Average Daily Traffic (AADT) along the Storrington High Street AQMA are below the Institute of Air Quality Management (IAQM) and EPUK 92017) screening criteria for road links in AQMA's, therefore potential effects are negligible.
		iii. The Applicant confirms that an amendment to Paragraph 4.8.1 of the **Outline Code of Construction Practice (CoCP) [APP-224]** will be amended to include damage to utilities. iv. The **Consultation Report [APP-027]** and associated appendices demonstrate the changes to the Proposed Development that have arisen from consultation and engagement. The **Consultation Report [APP-026]**, sets out the numerous rounds of statutory and non-statutory consultation including notices, advertisements and leaflets around the proposed cable route, including the villages of Cowfold, Washington and Climping. Additionally, the Applicant attended a public Q&A session organised by Cowfold Parish Council, a meeting of Washington Parish Council, and briefed members of Clymping Parish Council, in November 2022. A public information event relating to the onshore substation was held in Cowfold in June 2023. Issues pertaining to Cowfold are drawn together from page 35 of the **Consultation Report [APP-026]**. Noise and vibration and air quality impacts arising from the Proposed Development are mitigated within the **Outline Code of Construction Practice [PEPD-033]** secured by Requirement 22 within the **Draft Development Consent Order [PEPD-009]**. Traffic and transport impacts are mitigated through the **Outline Construction Traffic Management Plan [PEPD-035a**] as secured by Requirement 24 within the **Draft Development Consent Order [PEPD-009]**. v. Should the onshore substation need to be decommissioned in the future, this would be subject to a separate planning application. The planning application would need to comply with regulatory requirements, such as Equalities Impact Assessment (EqIA), prior to the commencement of any decommissioning activities.
2.3.47	**Public Rights of Way**	The Applicant welcomes the acceptance of the principles outlined in the **Outline Public Rights of Way Management Plan (PRoWMP) [APP-230]**. The **Outline PRoWMP [APP-230]** has corrected inaccuracies in

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	3.17 The principles set out in the Outline Public Rights of Way Management Plan (OPRoWMP) (APP-230) are accepted by WSCC. Mitigation measures are considered for each location where a ProW will be impacted, to reduce this potential effect upon the public user. However, there are current inaccuracies in the documents that may affect the extent of these measures and should be addressed by the Applicant. *Assessment Methodology* i. The status of the route being impacted must be clearly presented, as this will determine what public rights exist. Currently there are some inaccuracies in the documents in relation some of the routes, which will have a big effect upon the proposed mitigation measures presented. These will be further discussed with the Applicant.	the errata list in the **Cover Letter** [**PEPD-001**] provided at Pre-Examination Procedural Deadline A on 16 January 2024.
2.3.48	*Assessment of Effects* ii. The construction phase presents potential effects to a number of ProW, some heavily used such as the Downs Link and the South Downs Way. The interactions of these routes with construction activities needs to be kept to a minimum and any management, including alternative routes, must be suitable for lawful users.	A total of 50 Public Rights of Way (ProWs) and two areas of Open Access Land will be affected by the onshore elements of the Proposed Development. Section 5 of the **Outline Public Rights of Way Management Plan [APP-230]** describes how those impacts can be managed and mitigated where appropriate as secured by Requirement 20 within the **Draft Development Consent Order [PEPD-009]**.
2.3.49	*Mitigation, Compensation and Enhancement* iii. The OPRoW makes reference to users waiting whilst construction traffic passes over the route. It is important to note that public access rights take precedent over any private right of vehicular access; therefore, vehicles should give way to lawful public path users and this should be addressed in the outline plan.	The **Outline Public Rights of Way Management Plan [APP-230]** will be updated at the Deadline 2 submission to state that where it is safe to do so construction traffic will give-way to PRoW users. However, very occasionally PRoW users may have to wait for a short period of time whilst the shared route is in use by construction traffic as it may not always be possible or safe for HGVs to give way (e.g. HGVs turning into a side road or along a narrow track).
2.3.50	**Draft Development Consent Order (APP-019)** 3.18 In June 2023, WSCC commented on an early draft of the Ddco and while the Applicant has made some of the changes suggested, WSCC remains concerned about numerous matters. These will be shared with the Applicant in due course and set out in the LIR. A summary of the main concerns (which is not exhaustive) is set out below: i. The definition of '*commencement'* and, in particular, the implications arising from certain operations that fall outside that definition and which do not appear to be controlled.	As noted, the Applicant has addressed a number of the WSCC previous comments in the draft **Draft Development Consent Order [PEPD-009]**. In relation to the definition of 'commencement', this term has been defined so as to allow some preparatory activities to take place without triggering compliance with various of the requirements imposed through Part 3 of Schedule 1. However, where the preparatory activities themselves may have an impact, this is reflected in the wording of the specific requirements. For example, in relation to onshore archaeology (requirement 19) it is confirmed at requirement 19(5) that the term "commence" as used in paragraph (1) includes any intrusive onshore site preparation works including trial trenching. Similar wording appears in the requirement securing submission of the stage specific Codes of Construction Practice
2.3.51	ii. Article 43 (1) & 44. (2) should be referenced in accordance with approved plans and 25m maximum easement, not the entire DCO limits.	Whilst these articles provide broad permissive powers, they are subject to the operation of the requirements in Schedule 1 to the **Draft Development Consent Order [PEPD-009]**. This includes the **Outline Landscape and**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		Ecology Management Plan (LEMP) **[APP-232]** secured by Requirement 12, and it is also subject to the terms of the Outline Code of Construction Practice **[PEPD-033]** and specifically the Vegetation Retention Plan in Appendix B secured by Requirement 22.
2.3.52	iii. Part 3 Requirements – the drafting of certain requirements including Requirement 10 (programme of works), Requirement 22 (OcoCP), Requirement 19 (onshore archaeology) and Requirement 23 (onshore construction method statements).	It is not clear what WSCC's concerns are in relation to these Requirements.
2.3.53	iv. Clarification within each Requirement for named stakeholders	The requirements have been framed to ensure approval and discharge by the appropriate stakeholders for the subject matter of the requirement. This does not prevent the discharging bodies from consulting others before determining an application for discharge.
2.3.54	v. Role of WSCC in the discharging of Requirements.	WSCC is noted to have a role in discharging a number of requirements in its capacity as highway authority and local lead flood authority. An amendment has been made to Schedule 14 of the Draft Development Consent Order **[PEPD-009]** (which is given effect by Article 46) to allow local planning authorities to charge for requirement discharge
2.3.55	vi. Schedule 13 – permit excessive powers to fell or lop trees within DCO limits; not reflect appropriate plans to be approved; and contain multiple mistakes.	The Applicant has engaged with WSCC with regards their references to mistakes within Schedule 13 of the Draft Development Consent Order **[PEPD-009]**. The Applicant has reviewed the Schedule and has submitted an updated version of Schedule 13 as part of the Draft Development Consent Order **[PEPD-009]** at Pre-Examination Procedural Deadline A (16 January 2024) including addition of H13 and H27 to Schedule 13 Part 1 (Removal of hedgerows) and the deletion of H377 from Part 1 but added to Part 2 (Removal of Important hedgerows). Removal of trees and hedgerows must be undertaken in accordance with the Vegetation Retention Plans in Appendix B of the Outline Code of Construction Practice (CoCP) **[PEPD-033]** which limits the maximum length to be lost. This is in accordance with commitment C-115 (see the Outline CoCP **[PEPD-033]** and Commitments Register **[APP-254]** updated for Deadline 1 submission and is secured though Requirement 22 of the Draft Development Consent Order **[PEPD-009]).** This commits to minimising loss by notching hedgerows and treelines wherever possible, which is the removal of a shorter section of hedgerow or treeline compared to the construction corridor width. Further detailed description of how both hedgerow and treeline crossings will be managed is provided in paragraphs 5.6.33 to 5.6.41 of the Outline CoCP **[PEPD-033]**. The Applicant is also currently reviewing accesses comprising the Proposed Development as requested by the highway authority and should this indicate that there may be some instances where the additional removal is required such that updates to the Vegetation Retention Plan are required this will be submitted to the Examination.
2.3.56	vii. Schedule 14 – The timeframes for determining applications (and requesting further information) by the relevant authority after consent is granted need to be extended and the fees proposed for determining applications need including.	Schedule 14 already provides 56 days for the determination of applications for discharge of requirements where all necessary information is provided and allows for the period to be extended by agreement. The applicant needs to have certainty as to the timeframe for determination of its submissions in order to be able to plan for its construction programme. Provision for payment of a fee on application for discharge of a requirement has now been included in the Draft Development Consent Order **[PEPD-009]**

© WSP Environment & Infrastructure Solutions UK Limited

Table 2-4 Applicant's Response to South Downs National Park Authority

Ref	Relevant representation comment	Applicant's response
2.4.1	**Principle of Developing in a National Park** National Parks are a protected landscape and afforded the highest level of protection in terms of landscape. The SDNPA considers that the cost and scope for delivering outside of the National Park has not been appropriately considered as required by paragraph 5.9.10 of National Policy Statement EN-1. This states that the Secretary State may only grant consent in these areas in exceptional circumstances and where the development is in the public interest, subject to a series of 'Major Development Tests', Further, the selected route for the onshore cable corridor has failed to adequately undertake an assessment of detrimental effect on the environment, landscape and recreational activities, and the extent to which these could be moderated.	Section 4.4 of the **Planning Statement** **[APP-036]** sets out the consideration of the key policy test regarding nationally significant infrastructure development taking place in the South Downs National Park (SDNP) in line with the requirements of 5.9.10 of NPS EN-1 (DECC, 2011) and protections for National Parks in paragraph 5.10.32 of the revised NPS EN-1 (DESNZ, 2023). The consideration of the need for the development is outlined in paragraphs 4.4.7 – 4.4.21 of the **Planning Statement** **[APP-036]**. The consideration of the cost and scope of development alternatives outside the SDNP is outlined in paragraphs 4.4.22 – 4.4.67. This section draws on **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]** which details the process of site selection and the consideration of alternatives. Section 3.3 of **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]** outlines the alternatives considered in terms of grid connection and Section 3.4 sets out the alternatives considered in terms of landfall and onshore cable route. Together, these sections outline the cost and scope of delivering the reasonable alternatives outside of the SDNP. Therefore, this has been appropriately considered, as summarised in the **Planning Statement** **[APP-036]**. The detrimental effects on the environment, landscape and recreational opportunities and extent to which these could be moderated is considered in paragraphs 4.4.68 – 4.4.90 of the **Planning Statement** **[APP-036]**. Specifically, paragraphs 4.4.69 – 4.4.75 considers the environment; paragraphs 4.4.76 – 4.4.84 consider landscape; and paragraphs 4.4.85 – 4.4.88 consider recreational activities. Section 4.4 of the **Planning Statement** **[APP-036]** draws on various assessments in the aspect chapters within the ES (particularly **Chapter 25: Historic environment, Volume 2** of the ES **[PEPD-020]**, **Chapter 18**: **Landscape and visual impact, Volume 2** of the ES **[APP-059]**; and **Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]**) to outline the detrimental effects of the onshore cable route and the extent to which these could be avoided, prevented, reduced or offset. The **Commitments Register** **[APP-254]** sets out the full range of embedded environmental measures to minimise or mitigate the environmental effects a number of which are relevant to the South Downs National Park. Paragraph 4.4.4 of the **Planning Statement** **[APP-036]** confirms that a judgment as to whether a proposal constitutes major development is not necessary, as all Nationally Significant Infrastructure Projects (NSIPs) are assumed to be major. Therefore, whether development is major or not is a test which does not apply to NSIPs. The Applicant therefore considers that it has appropriately considered the key policy tests in NPS EN-1 5.9.10 (DECC, 2011) and protections for National Parks in paragraph 5.10.32 of the revised NPS EN-1 (DESNZ, 2023)relating to development taking place within the SDNP. Further clarification on special qualities including reference to the designating legislation is provided in **Appendix 5 – Further information for Action Point 27** **(Document Reference: 8.25.5)** submitted at Deadline 1.
2.4.2	**Seascape, Landscape and Visual Impact (Offshore)** The offshore array, by virtue of their proximity to the coastline, size, number and spread is considered to have significant adverse effects on the character and setting of the SDNP. In particular, and as advised in Review and Update of Seascape and Visual Buffer Study for Offshore Windfarms (March 2020) commissioned by the	The seascape and visual impacts of the Rampion 2 wind turbine generators (WTGs) are assessed in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]**. In its conclusions, paragraphs 15.15.9 – 15.15.40, the assessment recognises that the South Downs National Park (SDNP) is of particular relevance due to the associative relationship between parts of the SDNP and the marine environment, particularly within the Sussex Heritage Coast, which

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	Department for Business, Energy and Industrial Strategy (BEIS as it was then) the combination of National Park and Heritage Coast is particularly sensitive and needs to be given great weight in the planning balance.	has the most prominent association with the seascape along its section of coastal cliffs forming the maritime edges of the SDNP. The closest areas of the Sussex Heritage Coast near Seaford Head and Severn Sisters are identified as representing the geographic extent of the SDNP most likely to experience significant effects to its 'diverse, inspirational landscapes and breathtaking views' as a result of the offshore elements of Rampion 2, however the effects are assessed to be of lesser (medium) magnitude (and not significant) from the more distant parts of the Sussex Heritage Coast around Beachy Head and Birling Gap. Significant visual effects are also assessed as occurring in views experienced from the tops of the wider SDNP open downs, from a range of inland vantage points where the sea is a key component and where Rampion 2 will increase the influence of offshore wind farm development in 'breathtaking views' from the tops of the downs. Due regard to the statutory purpose of the SDNP has been had through the project design process, which has reduced adverse effects on the 'breathtaking views' and 'stunning, panoramic views to the sea' defined in Special Quality 1. The spatial extent of the Rampion 2 array area has been reduced and designed according to a set of seascape, landscape and visual impact assessment (SLVIA) specific design principles, which are set out in Section 15.7 of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]** and the **SLVIA Maximum Design Scenario and Visual Design Principles Clarification Note (Document Reference 8.35)** (submitted at Deadline 1), which provides further commentary on these SLVIA specific design principles. In summary, the area to the east of Rampion 1 has been avoided with the Rampion 2 WTGs array focused to the south and west of Rampion 1 wind farm (see section 3.2 within **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]** which describes the offshore array site selection). These areas are further offshore at greater distance from the Sussex Heritage Coast of the SDNP, while also having a narrow additional lateral spread in the field of view. A clear line of sight between Rampion 1 and 2 arrays also ensures that it appears as a distinct array with less contrast and a degree of balance with Rampion 1. Although some significant effects on views from the SDNP have been identified in the assessment, effects of major significance in environmental impact assessment (EIA) terms have been avoided on the Sussex Heritage Coast area of the SDNP. It is the conclusion of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]** (paragraphs 15.15.9 – 15.15.40) and the position of the Applicant, that Rampion 2 will not compromise the statutory purpose of the SDNP designation. Further justification and clarification with regards the matter of statutory purpose of the SDNP and effects on special qualities of the SDNP is set out in **Appendix 5 – Further information for Action Point 27** (Document Reference 8.25.5) submitted at Deadline 1.
2.4.3	**Landscape and Visual Impact Assessment (Onshore)** The effects on landscape character throughout the construction period, as well as beyond, are considered to have been underestimated. This includes the effects on tranquillity and those caused by noise and lighting. Importantly, the visual assessment insufficiently reflects the impacts on receptors within and looking into the National Park. Insufficient mitigation - and no compensation – has been put forward by the applicant to address the harm caused (e.g. the application is not accompanied by a draft S106 legal agreement).	The Applicant disagrees with South Downs National Park Authority's (SDNPA) assertion that the effects on landscape character have been underestimated. The Applicant has undertaken further engagement with SDNPA to explain this further as described below: Although the SDNPA are not specific, they do make reference in the Statement of Common Ground to I3 Arun to Adur Scarp Down: The construction effects on this Landscape Character Area (LCA) are assessed as "Negligible to Zero" in **Appendix 18.3: Landscape Assessment, Volume 4** of the ES [**APP-169**]. As explained in the Statement of Common Ground, this section of the onshore cable

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		corridor will be underground during construction due to the use of trenchless crossing techniques (as outlined in **Appendix A Crossing Schedule** of the **Outline of Construction Practice** **[PEPD-033]** secured via Required 22 within the **Draft Development Consent Order** **[PEPD-009])** Therefore, there can be no direct significant effect on this LCA. The only effects will be related to the visibility of the trenchless crossing temporary construction compounds which are located in the adjacent LCAs (A3: Arun to Adur Open Downs and J3: Arun to Adur Scarp Footslopes). Trenchless crossings are identified in Appendix A Crossing Schedule of the **Outline of Construction Practice** **[PEPD-033]** and secured via Required 22 in the **Draft Development Consent Order** **[PEPD-033]**.The assessment examined a 3D model of the onshore cable corridor within the Digital Terrain Model (DTM) to determine specifically the likely visibility of the trenchless crossing temporary construction compounds from areas within the I3 Arun to Adur Scarp Down LCA. This was supplemented with site visits which determined limited visibility due either to landform screening and / or intervening distance. This analysis confirmed the assessment of non-significant effects on this LCA alone. In respect of tranquillity, this is recognised as one of the Special Qualities of the South Downs National Park (SDNP) and an assessment of the relevant Special Qualities is assessed in **Appendix 18.3: Landscape Assessment, Volume 4** of the ES **[APP-169]**. The assessment takes account of the landscape effects on landscape character and elements including any perceptual qualities such as tranquillity that are noted as a key characteristic and the range of visual effects recorded at numerous receptors across the SDNP and within its setting. This includes reference to noise and lighting. The assessment of Special Qualities identifies a significant effect on Special Quality 3 "*tranquil and unspoilt places*" extending along the geographical extent of the onshore cable corridor and within approximately 250m to 650m of the onshore cable corridor. The **Commitments Register** **[APP-254]** (updated at the Deadline 1) addresses perceptual qualities included as part of the SDNP Special Qualities in commitment C-66 stating: *The Proposed Development will aim to minimise effects on the special qualities of the South Downs National Park and High Weald Area of Outstanding Natural Beauty (AONB) through careful design consideration in terms of scale, size and location, and taking account of the relevant policy and guidance*. In respect of the visual assessment, it is not accepted that the '*visual assessment insufficiently reflects the impacts on receptors within and looking into the National Park'* For example, the LVIA includes a 2km Study Area (2km from the proposed DCO Order Limits), agreed with stakeholders. In addition, ES **Figure 18.4a-c and 18.6b, Volume 3** of the ES **[APP-098-103]** shows an extended zone of theoretical visibility (ZTV) which has not been cropped to the Study Area and a 5km buffer on either side of the onshore cable corridor. There are a total of 60 illustrated, annotated and assessed viewpoints along the onshore cable corridor at varying distances also agreed through consultation, including 29 within the SDNP and others within the setting that view both towards the SDNP and from within the SDNP viewing out. The LVIA includes visual assessment of settlements, transport routes, National Trails, public rights of way (PRoWs), Open Access Land and tourist / visitor attractions within the Study Area that are overlapped by the ZTV and have the potential to be significantly affected. A number of these receptors included in the assessment such as the South Downs Way, other PRoWs, Open Access Land and transport routes that cross the boundary of the SDNP and or view into the SDNP or out from the SDNP.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		The Applicant will continue to engage with SDNPA on these points.
2.4.4	**Lessons Learned from Rampion 1 Offshore Wind Farm** Much has been made by the applicant of the success of the reinstatement of the Rampion 1 onshore cable corridor in the application, however the SDNPA's experience (which it will evidence at the examination) has been that whilst some areas have been successfully reinstated, other elements still cause harm to the landscape many years later. There have also been issues regarding the ongoing maintenance and management of the corridor, again which is causing harm to the SDNP.	The Applicant cannot comment on the reinstatement of land following the Rampion 1 works as this is not a matter for this DCO Application. The methodologies that will be used to ensure construction (including restoration) is undertaken in a sensitive and appropriate way can be found in the **Outline Construction Method Statement** **[APP-255]**, the **Outline Code of Construction Practice** **[APP-224]**, and the **Outline Landscape and Ecology Management Plan (LEMP)** **[APP-232]**. These documents are secured under Requirements 12, 22 and 23 of the **Draft Development Consent Order** **[APP-019]**.
2.4.5	**Terrestrial Ecology and Nature Conservation (Chapter 22 of Environmental Statement)** The landscape-scale ecological effects are considered to have been inadequately assessed, particularly in assessing the direct and indirect effects of removing potential important linear features from the landscape. We are also concerned that insufficient evidence has been provided to demonstrate the likely significant impact of Horizontal Directional Drilling on the hydrology, soil structure and geology of ancient woodland, chalk streams and chalk grassland habitats. Overall, it is considered there are large areas of missing survey data that are needed to support the assertions made in respect of ecology and nature conservation.	The terrestrial ecology field surveys classify the habitats present and identify the presence and potential presence of legally protected species (see Table 22-11 of **Chapter 22: Terrestrial ecology and nature conservation**, **Volume 2** of the ES **[APP-063]**). Although it is acknowledged that 100% coverage is not achieved for survey due to land access restrictions (see Table 22-12 of **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES [**APP-063**]), this is common with large infrastructure projects. Further, this does not undermine the assessment as sufficient information is available to understand the baseline. For example, bats are known to be present across the length of the onshore cable corridor, the range of bats identified is consistent with desk study records, their distribution is common with general understandings of bats habitat preferences and levels of activity are understood (see **Appendix 22.8: Passive and active bat activity report**, **Volume 4** of the ES **[APP-186]**). Trenchless crossing (for example horizontal directional drill (HDD)) is a mitigation that has been used routinely for linear projects (electrical transmission cables and pipelines (e.g. gas, oil and water) for both large infrastructure and smaller scale applications. Trenchless crossings have been used frequently to cross a range of sensitive ecological features including designated sites, ancient woodland, rivers and other priority habitats. For example, a trenchless crossing of 550m through chalk substrate, with a sizeable change in elevation (80 to 90m difference) was successfully completed at Dunstable Downs on the Kensworth to Rugby Pipeline project for CEMEX in 2008 (including crossing part of Dunstable and Whipsnade Downs Site of Special Scientific Interest). It is also notable that HDD within chalk substrate was carried out successfully on the route of the transmission cable for the Rampion 1 Offshore Wind Farm. The approach to minimising and effectively managing the risks of trenchless crossings is outlined in the **Outline Construction method statement** **[APP-255]** and the **Outline Code of Construction Practice** **[PEPD-033]** as secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**.
2.4.6	**Transport and Rights of Way** The SDNPA has concerns regarding the impact on the local highway network during construction for both the onshore and offshore aspects of development, and the Public Rights of Way Network within the National Park.	A detailed assessment of the environmental effects of construction traffic has been completed as documented In the **Chapter 23: Transport, Volume 2** of the ES **[APP-064]**. The scope and methodology of this assessment was agreed with West Sussex County Council and National Highways during pre-DCO Application stakeholder engagement. This assessment outlines that during the construction phase, when taking account of embedded measures such as the **Outline Construction Traffic Management Plan** **[PEPD-035]** (secured via Requirement 24 in the **Draft Development Consent Order** **[PEPD-009]**) and **Outline Public Rights of Way Management Plan** **[APP-230]** (secured via Requirement 20 in the **Draft Development Consent Order** **[PEPD-009]**), the Proposed Development will not result in significant effects to transport receptors.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		The **Outline Public Rights of Way Management Plan [APP-230]** (secured via Requirement 20 in the **Draft DCO [PEPD-009]**) describes how Public Rights of Way impacted by the construction phase can be managed and mitigated where appropriate.
2.4.7	**Historic Environment** The area between (and including) Blackpatch Hill and Harrow Hill forms a rich and complex multi-period prehistoric landscape of national significance. The selection of this route was flagged as being of significant concern during the consultation stage given the area constitutes some of the earliest evidence of industrial activity in Britain. Although mitigation is proposed, it is considered that this has still under-estimated and under-represented the potential for this dry valley in the context of the landscape setting and known archaeological sites in the area. Given the extremely high potential for archaeology of national significance it is considered further works need to be undertaken prior to the determination of the application.	The onshore cable route selection process took into consideration the potential for archaeological remains of high heritage significance to be present across all alternative routes, as evidenced by available baseline data and reflected in the archaeological notification areas. This was balanced against other criteria as described in **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]**. The assessment presented in **Chapter 25: Historic environment, Volume 2** of the ES **[PEPD-020]** is based on a worst case scenario. Therefore, the Applicant considers that further investigation would not change the outcome of the assessment. Taking a landscape approach and considering all available desk-based and geophysical survey data, **Chapter 25: Historic environment, Volume 2** the ES **[PEPD-020]** identifies a high potential for archaeological remains of high heritage significance within the area of the South Downs. Commitments C-225 (updated by the Applicant within the **Outline Code of Construction Practice [PEPD-033]** (submitted at the Procedural A Deadline)) and C-79 in the **Commitments Register [APP-254]** (updated at the Deadline 1 submission) provide for mitigation through design and archaeological recording. Commitments C-79 and C-225 would be secured within The **Outline Onshore Written Scheme of Investigation (WSI) [APP-231**], which would itself be secured by Requirement 19 of the **Draft Development Consent Order [PEPD-009**]. Further consultation is currently being undertaken with the WSCC Archaeologist and Historic England on the Outline WSI and a revised version will be submitted at Deadline 3. The **Outline Onshore WSI [APP-231]** sets out the methodological approach for archaeological investigations which ensures further investigation will be undertaken prior to construction.

Table 2-5 Applicant's Response to Horsham District Council

Ref	Relevant representation comment	Applicant's response
2.5.1	1.1 Horsham District Council ('HDC') supports renewable energy generation and carbon reduction objectives to meet climate change commitments. However, as a Host Authority, HDC has some concerns regarding mitigations and enhancements associated with environment impacts, particularly regarding nature conservation and biodiversity and green infrastructure assets and impacts to residents and businesses given potential disruption during the construction phase, particularly regarding air quality and noise. HDC will continue to engage with the Applicant to ensure that should the DCO be granted, that social, economic, and environmental benefits are delivered.	The Applicant notes and welcomes Horsham District Councils (HDC's) support for renewable energy projects. The acknowledgement that Proposed Development will contribute to provision of green energy is welcomed by the Applicant. The Proposed Development will help meet the urgent need for new renewable energy infrastructure in the UK and supporting the achievement of the UK Government's climate change commitments and carbon reduction objectives. The Proposed Development type is recognised as being a critical national priority in the revised NPS EN-1 (Department for Energy Security and Net Zero (DESNZ), 2023a) and NPS EN-3 (DESNZ, 2023b), which came into force in January 2024 and are considered to be relevant to the determination of the DCO Application. This additional generating capacity will contribute towards meeting the urgent need for new energy infrastructure in the UK, provide enhanced energy security, support the economic priorities of the UK Government and, critically, make an important contribution to decarbonisation of the UK economy. The Proposed Development will contribute materially towards meeting the urgent national need for renewable electricity, significantly reducing carbon emissions from energy. The assessment set out in **Chapter 29: Climate change, Volume 2** of the ES **[APP-070]** concludes the Proposed Development has a lifetime greenhouse gas (GHG) emissions saving of 35,901 kilotonne carbon dioxide equivalent ($ktCO_2e$). The Proposed Development will continue to offset greenhouse gas (GHG) emissions until 2050, and therefore make a positive contribution the UK Government target to reach net zero emissions in 2050. The Applicant notes the comments on air quality and noise and responses can be found on these topics at **references 2.5.51** to **2.5.54** and **references 2.5.55** to **2.5.75** respectively below.
2.5.2	1.2 HDC is the planning authority for Horsham District, except for the area of the district within the South Downs National Park. West Sussex County Council is the highways authority and Lead Local Flood Authority and Minerals and Waste Authority that covers Horsham District. The initial principal areas of concerns set out below therefore relate primarily to the administrative area and remit of responsibility of Horsham District Council. WSCC will also lead on archaeology given their in-house expertise on this matter.	The Applicant has no further comments on this matter at this time.
2.5.3	**1.3 Draft Development Consent Order and Securing Mitigation.** Horsham District Council (HDC) has concerns across several topic areas to the lack of commitment and securing mechanisms of mitigation, monitoring and compensation. It is not always evidently demonstrated that mitigation/compensation is captured in a securing mechanism and the Commitments Register appears more aspirational rather than embedded environmental measures.	The **Commitments Register** **[APP-254]** (updated at Deadline 1 submission) includes a column for the securing mechanism for each embedded environmental measure and its related commitment reference. This cross-refers to the mechanism, for example a requirement in the **Draft Development Consent Order** **[PEPD-009]** Schedule 1 Part 3. Where there is an accompanying document such as an outline plan submitted with the DCO Application with which works must be undertaken in accordance with, this is also referred to under the 'Relevant Application Documents' column. The Applicant has provided an update to the **Commitments Register** **[APP-254]** at Deadline 1 to include further detail e.g. the full reference to DCO requirements and addition of the location of further information within the Application documents.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		An amendment has been made to Schedule 14 of the **Draft Development Consent Order [PEPD-009],** given effect by Article 46, to allow local planning authorities to charge for requirement discharge.
2.5.4	**1.4 Socio-economics and Transport.** The Outline Skills and Employment Strategy (OSES) has limited detail and HDC is not listed as a consultee to this document. HDC is excepting to be a recipient and consultee regarding benefits given the adverse effects the district will experience during construction. The OSES is very high level and supporting existing local business is not included as an objective. The Community Benefits Package is treated as being divorced from the OSMS but there is opportunity for these to be aligned to assist in mitigation. HDC shares and supports the overarching concerns raised on highways and traffic impacts in particular regard to lack of sufficient mitigation including with the Outline Construction Traffic Management Plan, and with regard to mitigations for the purposes of managing traffic through the AQMA and Cowfold to minimise disruption to traffic flow impacts along the A272, and as identified as Principal Issues of Disagreement by WSCC in their capacity as responsible Local Highway Authority.	The **outline Skills & Employment Strategy (oSES) [APP-256]** was intentionally high-level and the Applicant was not in a position to document concrete commitments without further consultation with key skills & employment stakeholder organisations in Sussex. The first tranche of consultation took place between July and October 2023, the results of which have fed into the second iteration of the **oSES [PEPD-037]**, submitted to the Examining Authority (ExA) at the Pre-Examination Procedural Deadline A (16 January 2024). This latest version of the **oSES [PEPD-037]** includes seven additional key skills & employment stakeholder organisations, including Horsham District Council, alongside Arun and Adur & Worthing Councils, educational institutions and Gatwick Airport. Following this series of consultation meetings and the examination itself, the Applicant will produce a final Skills & Employment Strategy (SES) outlining key objectives and activities, which is likely to include details regarding an apprenticeship scheme and engagement with educational institutions. Supporting existing local business is integral to the ultimate delivery of skills and employment objectives which will be set out in the final SES. The **oSES [PEPD-037]** already documents the intended industry leadership in this area in Section 16, Page 13, which sets out two related initiatives: • Encouraging and supporting growth and employment in local supply chain companies; and • Increasing visibility of local Small and Medium-sized Enterprises (SMEs) within the employment market. Community benefits are not a legal or policy requirement and are quite distinct from the consenting process, a point reiterated in the Government (Department for Energy Security and Net Zero) response to the consultation on Community Benefits for Electricity Transmission Network Infrastructure (Dec 2023), which stated: *"The proposals on community benefits for electricity transmission network infrastructure discussed within this document will remain separate to the planning process. It will not be a material consideration in planning decisions, and not secured through those decisions."* That said, Rampion 2 will be a permanent neighbour in the Sussex community and the Applicant intends to develop and implement a community benefits package of proposals. In the second half of 2024, the Applicant will therefore be consulting key stakeholders and local communities on how a community benefit package could best support Sussex communities. The final package may include a range of initiatives to benefit business, education and residential communities.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		The **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** contains details of required construction traffic routing for the Proposed Development. Where possible HGV traffic has been routed via the A23 and from the east along the A272 avoiding Cowfold. Heavy goods vehicle (HGV) traffic has been minimised as much as possible as detailed in paragraph 1.2.5, Commitment C-157 and C-158 **Commitment Register** **[APP-254]** which has been updated at Deadline 1. The Applicant has assessed effects on the Cowfold AQMA as negligible in **Chapter 19: Air quality, Volume 2** of the Environment Statement (ES) **[APP-060]**, and in a further sensitivity test in the **Chapter 32: ES Addendum, Volume 2** of the ES **(Document reference: 6.2.32)**. Further information regarding the traffic and air quality assessments has been provided in response to **reference 2.3.46** below.
2.5.5	**1.5 Terrestrial Ecology and Nature Conservation.** HDC has concerns on the lack of demonstration of water neutrality, lack of clarity on mitigation, compensation, and terrestrial biodiversity net gain, and feasibility of habitat creation at Oakendene substation site. HDC shares and supports the overarching concerns raised on terrestrial ecology and nature conservation impacts, and as identified as Principal Issues of Disagreement, by WSCC.	This is noted as a summary comment and the specific issues summarised are addressed by the Applicant in **references 2.5.24** (water neutrality), **2.3.25** (biodiversity net gain) and **2.3.28** (habitat creation at the onshore substation at Oakendene).
2.5.6	**1.6 Landscape and Visual Assessment.** Concern is expressed in the lack of clarity on the delivery of advanced planting with the Outline Landscape and Ecology Management Plan, particularly (but not limited to) advanced and existing hedgerow management arrangements and how some mitigation measures are to be monitored and action including the reinstatement of hedgerows. Additionally, issue is raised with the consistently applied to the execution of the Landscape and Visual Impact Assessment methodology regarding receptors. This might mean that a potentially significant effect will be overlooked if effects are diluted down due to their limited geographical extents. These include visual receptors at Washington recreation ground. Key visual receptors are being assessed as part of a group and not being given dure consideration to reflect the actual likely effects experienced by those receptors. Landscape features at Oakendene substation are not described and assessed within the core assessment of effects, but rather dealt as part of the character area. This overlooks the actual likely effects on the landscape features as receptors in their own right, and the need arising from the LVIA to refine and fix more precise parameters to the development of the Oakendene substation site is identified. These are key and heavily relied upon to the success of the Project's embedded environmental measures and proposed mitigation measures on the LVIA conclusions.	The Indicative Landscape Plan (ILP) for the onshore substation at Oakendene and its design principles are set out in the **Design and Access Statement (DAS)** **[AS-003]** and further expanded on in the **Outline Landscape and Ecology Management Plan (LEMP)** **[APP-232]**. The ILP in Appendix D shows indicative areas for advance planting see key and design principles committing to maximising opportunities for advanced planting. With respect to advance planting, this is secured by the design principles for in the **DAS** **[AS-003]**. As per the design principles in the bullets after paragraph 3.3.10 of the **DAS** **[AS-003]**, the stage specific Landscape and Ecological Management Plan (LEMP) will include a "*landscape programme, according to relevant planting seasons, maximising opportunities for advance planting prior to construction to allow trees to mature during the construction works and in advance of completion of the onshore substation*." Further advance planting is to be provided for ecological mitigation as per the bullets after paragraph 3.5.6, "*Advance planting will be provided along the western extent of the Oakendene onshore substation site to provide mitigation for the loss of dormouse habitat* ". Requirement 8 (2) of the **Draft Development Consent Order** **[PEPD-009]** requires detailed design for the substation to accord with the principles established in the **DAS** **[AS-003]**. The Applicant is considering possible amends to the **DAS** **[AS-003]** as a result of matters raised at the Issue Specific Hearing 1 in February 2024. Further information on advanced planting is provided in paragraph 2.6.4 of the **Outline LEMP** **[APP-232]** which states "*A programme of landscape works will be provided setting out the programme according to relevant planting seasons and maximising opportunities for advance planting prior to construction to allow trees to mature during the construction works and in advance of completion of the onshore substation. Some of the landscaping will be established prior to the beginning of construction (advance planting), with the remainder being delivered following the completion of the substation and the decommissioning of temporary construction compounds*."

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		The LEMP is secured through Requirements 12 and 13 of the **Draft Development Consent Order** **[PEPD-009]**. The Applicant has discussed this matter with Horsham District Council (HDC) and welcomes their constructive advice. Hedgerow management along the A272 is included in the **DAS** **[AS-003]** secured via Requirement 8 within the **Draft Development Consent Order** **[PEPD-009]** and **Outline LEMP** **[APP-232]** to increase screening, subject to requirements for visibility splays. The Applicant will endeavour to ensure that further planting immediately south of the hedgerows along the A272 is included as advance planting to further increase the screening potential of views along the A272. This aligns with the existing design principle to maximising opportunities for advanced planting. The landscape and visual impact assessment (LVIA) in **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]** is supported by its appendices and should be read as a whole: • **Appendix 18.1: Landscape and visual impact assessment methodology, Volume 4** of the ES **[APP-167]** • **Appendix 18.2: Viewpoint Analysis, Volume 4** of the ES **[APP-168]** • **Appendix 18.3: Landscape Assessment, Volume 4** of the ES **[APP-169]** • **Appendix 18.4: Visual Assessment, Volume 4** of the ES **[APP-170]** • **Appendix 18.5: Residential Visual Amenity Assessment, Volume 4** of the (ES) **[APP-171]** • **Appendix 18.6: Viewpoint directory, Volume 4** of the ES **[APP-172]** The Applicant does not agree with HDC's assertion that "*a potentially significant effect will be overlooked if effects are diluted down due to their limited geographical extents*". The landscape and visual effects (and whether they are significant) are determined by an assessment of the nature or 'sensitivity' of each receptor or group of receptors and the nature of the effect or 'magnitude of change' that will result from the onshore elements of the Proposed Development as described in **Appendix 18.1: Landscape and visual impact assessment methodology, Volume 4** of the ES **[APP-167]**. In determining the magnitude of change, the assessment takes account of the size and scale of the proposed change and the geographical extent. Other factors regarding the nature of the effect such as the duration of change and whether the effect is cumulative are also noted. This approach as set out in Appendix 18.1 accords with the Landscape Institute and Institute of Environmental Management and Assessment (IEMA) (2013) Guidelines for Landscape and Visual Impact Assessment, 3rd Edition (GLVIA 3). Therefore, it is reasonable and accords with guidance for a limited geographical effect to be determined as not significant. However, exceptions would arise if the sensitivity of the receptor is higher, or the scale or magnitude of change is also higher. In that case the level of effect may also be judged as significant, despite a limited geographical extent. An example of this is the effect of the onshore substation at Oakendene on the host landscape

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		character, the J3 Cowfold & Shermanbury. The sensitivity of this landscape is assessed as Medium-high and although the geographical extent of the likely significant effects is relatively small, due to the screening of existing vegetation which is to be retained, the magnitude and scale of change is considered to be high. In combining all of these factors together, the LVIA has concluded that this landscape would be significantly affected by the Proposed Development. The settlement assessment contained in **Appendix 18.4: Visual Assessment, Volume 4** of the ES **[APP-170]** assesses the visual effects of the settlement and includes consideration of residential areas, the public realm and public open spaces within the settlement boundaries that will be frequented by people. In this sense it is a 'grouped' assessment, the approach of which accords with GLVIA3 as explained in paragraph 6.13 where visual receptors are defined as "*the people within the area who will be affected by the changes in views and visual amenity - usually referred to as 'visual receptors'. They may include people living in the area, people who work there, people passing through on road, rail or other forms of transport, people visiting promoted landscapes or attractions, and people engaged in recreation of different types*." Nonetheless, the assessment highlights the areas of greatest visual effects and the particular receptors affected within that group. The landscape assessment includes an assessment of the landscape character, its key characteristics and the constituent elements or features (which includes trees). The assessment makes specific reference to the loss of individual trees and hedgerow trees within the footprint of the onshore substation and assess a High magnitude of change and a Major and significant effect on the landscape character and landscape elements (trees / field trees / hedgerows with trees hedges etc.). Further assessment of individual landscape elements would not alter the findings or conclusions of the LVIA that the effects would be significant. These elements are also assessed within **Appendix 16: Arboricultural Impact Assessment, Volume 4** of the ES **[APP-194]**. The loss of these features has been recognised as part of the Biodiversity Net Gain (BNG) as set out in **Appendix 22.15: Biodiversity Net Gain information, Volume 4** of the ES **[APP-193]**. The **Draft Development Consent Order** **[APP-019]** has requirements 12, 13,14 and 22 securing mitigation, compensation and BNG. Summary assessment Tables 18.40-45 presented in **Chapter 18: Landscape and visual Impact, Volume 2** of the ES **[APP-059]** set out how mitigation including reinstatement will reduce the effects over time. The assessment of residual effects is a requirement of the environmental impact assessment (EIA) process in line with *The Infrastructure Planning (Environmental Impact Assessment) Regulations 2017*. Please see **reference 2.5.28** below with respect to Washington recreation ground The LVIA methodology has been consistently applied. Further clarification is sought from HDC, and the Applicant will continue to engage with HDC on these points.
2.5.7	**1.7 Noise and Air Quality.** HDC is concerned regarding the adequacy of the noise and air quality assessments which both potentially underestimate the impacts arising from construction and operation phase	In relation to onshore noise, please refer to more detailed responses to **references 2.5.57** below (construction phase noise) and **2.5.71** below (operation and maintenance phase noise)

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	effects. HDC has concerns regard the modelling of the noise sources, adequacy of the assessment of background noise levels, omissions from the assessment and validity of the assessment method. There is inadequate consideration of the Air Quality and emissions mitigation guidance for Sussex (2021) and insufficient robust mitigations pertaining to the Cowfold Air Quality Management Area.	**Chapter 19: Air quality, Volume 2** of the ES **[APP-060]** has considered the Air Quality and Emissions Mitigation Guidance for Sussex (Mid Sussex District Council, 2021) in defining the scope of the assessment and in particular the extent of any construction traffic modelling required for the Proposed Development. The Applicant concludes no significant effects on air quality are likely and does not consider that the Proposed Development meets the criteria set out in the Sussex Guidance for an air emissions mitigation strategy. However, recognising Horsham District Council's concerns, the Applicant is preparing an Air Quality Mitigation Plan in accordance with the Sussex Guidance.
2.5.8	**1.8 Water Environment.** HDC shares and supports the overarching concerns raised on water environment impacts to the design for the operational drainage at the Oakendene Substation works and that the current FRA and design proposals for the Oakendene Substation do not truly reflect the winter flooding that occurs at this location and as identified as Principal Issues of Disagreement by WSCC in its capacity as responsible LLFA.	Flood risk at the onshore substation site is considered to ensure the Proposed Development is able to operate as planned, as referred to in Section 6.5.12 of the **Appendix 26.2: Flood Risk Assessment (FRA), Volume 4** of the Environmental Statement (ES) **[APP-216]**. The indicative onshore substation site layout has been developed accordingly, taking risk of flooding into account. The Applicant is confident the precautionary approach in the **Appendix 26.2: FRA, Volume 4** of the ES **[APP-216]** and **Design and Access Statement** **[AS-003]** will ensure the onshore substation will not be at flood risk, nor increase flood risk elsewhere (addressed through the adherence to National Grid Target Guidance (C-230) secured via the **Design and Access Statement** **[AS-003]** and Requirement 8 within the **Draft Development Consent Order** **[PEPD-009]**. The Operational Drainage Plan must accord with the **Outline Operational Drainage Plan** **[APP-223] and will be** secured via requirement 17 within the **Draft Development Consent Order** **[PEPD-009]**. The assessment of flood risk and outline design was prepared in accordance with West Sussex County Council (WSCC) and Horsham District Council (HDC) advice, as recorded in meeting minutes included in Annex A of the **Appendix 26.2: FRA, Volume 4** of the ES **[APP-216]**. As outlined in the **Appendix 26.2: FRA, Volume 4** of the ES **[APP-216]** the onshore substation at Oakendene is situated within Flood Zone 1 (low probability of flooding). The main sources of flood risk at the onshore substation site are fluvial and surface water flood risk in nature, associated with run-off due to the clayey ground conditions. The approach to assessment of fluvial flood risk from the ordinary watercourse to the south of the onshore substation site was agreed with the Lead Local Flood Authority (LLFA) (WSCC) and the Local Planning Authority (HDC) during a consultation meeting on 22 June 2022. It was agreed that the 0.1% Annual Exceedance Probability (AEP) flood extent (defined by the Environment Agency Risk of Surface Water mapping) was a suitably precautionary proxy for the 1% AEP plus a climate change allowance for the operational period (2030 to 2060). HDC flood officer commented that as long as the onshore substation was positioned outside of the 0.1% AEP extent he would not be concerned. He also advised that no HDC records of historical flooding indicated flood incidents at the onshore substation site at Oakendene. No advice to the contrary was provided by WSCC as recorded within the meeting minutes presented in Annex A of **Appendix 26.2: FRA, Volume 4** of the ES **[APP-216]**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		Surface water flood risk indicated in Figure 26.2.6a of **Appendix 26.2: FRA, Volume 4** of the ES **[APP-216]** would be adequately dealt with via the drainage infrastructure for the onshore substation site, as set out in the **Outline Operational Drainage Plan** **[APP-223]**. As set out in paragraphs 2.4.10 to 2.4.13 of the **Outline Operational Drainage Plan** **[APP-223],** there is significant flexibility in how the final design of the onshore substation could be delivered. Therefore, there is deemed to be sufficient flexibility within the current **Outline Operational Drainage Plan** **[APP-223]** such that it can be revised and adapted at the detailed drainage design phase to address any concerns regarding winter flooding and associated loss of basin storage. As stated in paragraph 6.5.6 of the **Appendix 26.2: Flood Risk Assessment (FRA), Volume 4** of the ES **[APP-216]**, final design and sizing of drainage mitigation measures will be determined at the detailed drainage design stage in liaison with WSCC (as Lead Local Flood Authority (LLFA)). The final Operational Drainage Plan must be approved prior to the works to construct the onshore substation in accordance with Requirement 17 of the **Draft Development Consent Order** **[PEPD-009]**. At present the comments made in relation to 'winter flooding' are unclear and lack details about location, flood mechanism and timing. The Applicant requested further details and any supplementary data from WSCC and HDC on 08 February 2024, and will continue to carry out engagement with both stakeholders during the examination phase. Nonetheless the Applicant considers that any additional winter flooding information identified by WSCC in their Representation reference 2.3.43 can be factored into the detailed drainage design. The outline drainage strategy presented within the **Outline Operational Drainage Plan** **[APP-223]** is based on several conservative assumptions (regarding the maximum design parameters for the substation, impermeability and climate change allowance).
2.5.9	**2 Introduction** 2.1 This Relevant Representation ('RR') is submitted by Horsham District Council ('HDC') in respect of the application by Rampion Extension Development Limited ('the Applicant') for a Development Consent Order ('DCO') for the Rampion 2 Offshore Windfarm Project ('the Project'). HDC is a Host Authority as classified by the Planning Act 2008. This RR is accompanied by HDC's initial draft (version 1) Principal Area of Disagreement Summary Statement ('HDC PADSS'). 2.2 Although HDC is a 'B' Authority in the Development Control Order ('DCO') process it is not intended that its RR duplicates that of West Sussex County Council (WSCC) in its responsibilities as Local Highway Authority, Local Lead Flood Authority, and Minerals and Waste Authority. 2.3 Accordingly, WSCC in its own RR will consider the finer details related to concerns related to transport and traffic, flood risk and drainage, and minerals and waste. Where there is common ground HDC's RR is intended to compliment the WSCCs on these matters, and primarily address concerns from the district planning authority's remit. 2.4 Equally, the South Downs National Park Authority (SDNPA) is the Planning Authority for the National Park area of Horsham District, and the planning needs for this area will be	2.1 – The Applicant welcomes Horsham District Council as an interested party and the provision of the initial draft of their Principal Area of Disagreement Summary Statement. 2.2 – The Applicant appreciates the effort to not cause duplication with West Sussex County Council (WSCC) on these points. 2.3 – The Applicant has provided a response to WSCC RR, please see **Table 2-3**, **reference 2.3.29** to **2.3.34** and **2.3.42** to **2.3.44**. 2.4 – The Applicant appreciates the effort to not cause duplication with South Downs National Park Authority (SDNPA) on these points. The Applicant has provided a response to SDNPA RR, please see **Table 2-4**. 2.5, 2.6, & 2.7 – The Applicant has no further comments on this matter at this time.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	set out by the Park Authority. It is therefore not intended that this RR duplicate that of the SDNPA in its responsibility for planning for this area. Where there is common ground HDC's RR is intended to compliment the SNDPAs on these matters, and primarily address concerns from the district planning authority's remit. 2.5 This RR relates only to onshore impacts of the proposed development as it affects the administrative area of Horsham District Council (HDC). 2.6 Specifically, it describes the impact of the proposed development within the administrative area of Horsham District (as described in Chapter 4: The Proposed Development, Volume 2 of the Environmental Statement (ES), namely: Buried onshore cables in a single corridor using trenching and backfilling installation techniques and trenchless and open cut crossings. A new onshore substation, proposed near Cowfold, which will connect to an extension to the existing National Grid Bolney substation, via buried onshore cables. 2.7 This Relevant Representation is structured firstly, with a setting out of the district context and then under relevant topic-based headings (split by discipline as detailed and ordered in the Applicant's ES).	
2.5.10	**3. District Context** Character 3.1 Horsham District is located within the northwest part of West Sussex. The district is predominantly rural in character and contains several small villages and towns. 95km2 (36.49 square miles) of the district falls within the South Downs National Park. 3.2 The onshore cable corridor would pass through several National Character Areas (NCA) on route through Horsham District. This includes the Low Weald (NCA) that comprises of a mosaic of irregular pastoral and arable fields enclosed by a strong framework of mature trees, woodland shaws and Ancient Woodlands, which makes a significant 4 contribution to district character. Two Valued Landscapes in the district are of national importance: the High Weald Area of Outstanding Natural Beauty covering the eastern part of the District and the South Downs National Park in the southern part. The cable corridor would pass through the latter. 3.3 Habitats and species found across the Development Area is varied, including arable, and grassland as well as rivers and associated environments but a key characteristic is the network of woodland blocks (some Ancient and Semi-Natural) and dense hedgerows linking wildlife habitats across the district. The south-west of the district provides an important feeding ground for the internationally important Barbastelle bats. The Arun Valley floodplain is a distinctive habitat of both national and international importance within the district. 3.4 The Development Area itself is largely rural countryside, mostly in agricultural use and managed rural estate, but sections of the cable corridor would pass close by settlements and their valued open space and green infrastructure, including the villages of Washington,	The Applicant has no further comments on this matter at this time.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	Storrington and Sullington, and Cowfold. The latter is near to where the cable route would terminate to form a new substation to connect to the existing National Grid substation at Bolney. Economy and Housing 3.5 The rural surroundings of the district support a rural economy. Additionally, employment opportunities in the district are generated from leisure, tourism, and retail businesses. The majority of Horsham District is located within the Gatwick Diamond economic area. Transport access and ease of movement is a key factor in the performance of the local economy, enabling residents to travel to their place of work, and allow the movement of goods and services. The A272 crosses the northern part of the Parish. Within the district, it runs in a broadly west-east direction from Billingshurst to Haywards Heath. The A24 runs in a north-south direction down the western side of the district and crosses the A272 to the north. 3.6 The Cowfold Road (A272) is a key local distributor, taking traffic east-west across the district and linking several other strategic road networks (A23 to the east and the A24 to the west) with quieter, rural lanes. At Cowfold, the natural restriction created by the staggered A272/A281 junction, combined with the volume of traffic using the A272 as a major link road, results in significant standing traffic during morning and evening peak periods. This is reflected in congestion being raised as a key issue by the community. 3.7 The district has seen a significant development in recent years with strategic-scale housing schemes under construction particularly in the northern and central parts of the district. The larger settlements have also accommodated developments of scale in recent years, however, pressure for housing development remains. Environmental Quality and Climate Change - Water Neutrality 3.9 Horsham District is in an area of serious water stress, as identified by the Environment Agency Water Stressed Areas Classification. Horsham District is supplied with water by Southern Water from its Sussex North Water Resource Zone. This supply is sourced from abstraction points in the Arun Valley, which includes locations such as Amberley Wild Brooks Site of Special Scientific Interest (SSSI), Pulborough Brooks SSSI and Arun Valley Special Protection Area/Special Area of Conservation and Ramsar site. In September 2021, the council received a Position Statement from Natural England. The Natural England position is that it cannot be concluded that existing abstraction within the Sussex North Water Supply Zone is not having an impact on the Arun Valley sites. It advises that development within this zone must not add to this impact. - Nature Conservation and Biodiversity 3.10 The District benefits from a high-quality natural environment, some of which is designated for its international and national importance (including the Arun Valley SPA and The Mens SAC and its qualifying feature of Barbastelle bats). However, alongside much of the UK, biodiversity has been impacted by changing land management practices, increased pressure for development and climate change. In this regard, HDC is working

Ref	Relevant representation comment	Applicant's response
	with the Sussex Wildlife Trust in a five-year partnership called Wilder Horsham District. The main objective of this partnership is to deliver a Nature Recovery Network which will seek to reverse the decline in species and habitats and enrich the district's natural environment. - Air Quality 3.11 There is a high reliance on car travel in the district. In addition to traffic congestion, this also contributes to emissions of air pollutants. The district has two Air Quality Managements Areas (AQMAs) within 5km of the onshore cable corridor; Storrington Air Quality Management Area (declared in 2010) and Cowfold Air Quality Management Area (declared in 2011). HDC has declared the whole of the district an 'Emission Reduction Area' and is a member of the Sussex Air Quality Partnership. Monitoring of air quality in the district has revealed that some areas have high levels of nitrogen dioxide and therefore a key consideration for the Council is the impact of development on air quality. 3.12 Cowfold is a location where an Air Quality Management Scheme is in operation. The natural restriction created by the staggered A272/A281 junction, combined with the volume of traffic using the A272 as a major link road, results in significant standing traffic during morning and evening peak periods. The Cowfold Air Quality Management Area (AQMA) was designated in December 2011. - Climate Change 3.13 In June 2023, Horsham District Council declared a Climate and Ecological Emergency for the Horsham District. The declaration of a Climate and Ecological Emergency will strengthen and further enable the Council to move forward with its carbon neutral agenda, enabling it to achieve its own carbon neutral target for 2030 and the Horsham District carbon neutral target for 2050. HDC has produced a draft Climate Action Strategy to support the whole of Horsham District to become carbon neutral by 2050.	
2.5.11	4. Climate Change 4.1 The proposed wind farm would generate a significant amount of electricity from a renewable source, meeting the energy needs of many homes. A grid connection offer in place means the scheme could make an early and significant contribution to the objectives of the Council's draft Climate Action Strategy (March 2023).	The acknowledgement that Proposed Development will contribute to climate change mitigation is welcomed by the Applicant. The Proposed Development will help meet the urgent need for new renewable energy infrastructure in the UK and supporting the achievement of the UK Government's climate change commitments and carbon reduction objectives. The Proposed Development type is recognised as being a critical national priority in the revised NPS EN-1 (Department for Energy Security and Net Zero (DESNZ), 2023a) and NPS EN-3 (DESNZ, 2023b), which came into force in January 2024 and are considered to be relevant to the determination of the DCO Application. This additional generating capacity will contribute towards meeting the urgent need for new energy infrastructure in the UK, provide enhanced energy security, support the economic priorities of the UK Government and, critically, make an important contribution to decarbonisation of the UK economy. The Proposed Development will contribute materially towards meeting the urgent national need for renewable electricity, significantly reducing carbon emissions from energy. The assessment set out in **Chapter 29: Climate change, Volume 2** of the ES **[APP-070]** concludes the Proposed Development has a lifetime greenhouse gas (GHG) emissions saving of 35,901 kilotonne carbon dioxide equivalent ($ktCO_2e$). The Proposed Development

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		will continue to offset greenhouse gas (GHG) emissions until 2050, and therefore make a positive contribution the UK Government target to reach net zero emissions in 2050.
2.5.12	4.2 It is important to continue to manage development and change within the district, considering both the effect that the development would have on the character and appearance of the area and mitigating the environmental impact of new development both at the time of construction and in the future, as well as the need for infrastructure requirements to meet the Council's Climate Action Strategy. It is preferable to do this in a proactive way rather than a reactive way.	Horsham District Council's (HDC) Climate Action Strategy is a policy document which has informed both the greenhouse gas (GHG) Assessment and Climate Change Resilience Assessment in **Chapter 29: Climate change, Volume 2** of the ES **[APP-070]**. These assessments support the proactive management of the effect that the Proposed Development will have on the climate change and the effect that the changing climate will have on the Proposed Development.
2.5.13	4.3 HDC has declared a Climate Emergency and is committed to reducing carbon emissions. The development of renewable energy is a key means of reducing the district's contribution to climate change. Nonetheless, renewable energy proposals will need to consider the impact that they may have on valued landscapes, including the need to consider views from Valued Landscapes to proposals which lie outside the South Downs National Park or High Weald AONB.	**Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]** assesses effects in relation to valued landscapes including nationally designated landscapes, such as the SDNP and High Weald AONB, landscape character areas, and views and visual receptors as set out principally in Sections 18.9 to 18.13, and in more detail in **Appendix 18.3: Landscape Assessment, Volume 4** of the ES **[APP-169] and Appendix 18.4: Visual Assessment**, Volume 4 of the ES **[APP-170]** The design of the onshore elements of the Proposed Development has been an iterative process (see **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]**) that has sought to avoid sensitive features in the landscape wherever possible. Strategic principles to the landscape design and approach to embedded environmental measures are presented in Section 18.7 (**Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]**).
2.5.14	4.4 The location of the development area within the countryside will have effects on the spatial pattern of development in the district. It will need to be judged whether the development is an appropriate use of land which it proposes to authorise.	Paragraph 2.5.36 of National Policy Statement (NPS) EN-3 (Department of Energy and Climate Change (DECC), 2011b), extant at the time of submission of the Development Consent Order (DCO) Application and against which it will be tested, sets out that a sequential approach to the location of renewable energy should not be applied to the consideration of renewable energy projects (citing the use of giving priority to previously development land as an example). This is replicated in paragraph 2.3.9 of NPS EN-3 (Department for Energy Security and Net Zero (DESNZ), 2023b) (published in November 2023) which took effect in January 2024, and is a relevant consideration in the decision-making process. Paragraph 5.10.3 of NPS EN1 (DECC, 2011a) and paragraph 5.11.3 NPS EN-1 (DESNZ, 2023a), which came into force in 2024, recognises that the use of countryside could be reduced by use of previously developed land but that may not be possible for energy infrastructure. The location, within the countryside, of the onshore cable and grid connection infrastructure that is required as part of a NSIP is therefore implicitly recognised as being appropriate in principle within the NPSs and is therefore an appropriate use of land. Section 104 of the 2008 Planning Act outlines that the DCO Application must be decided in accordance with the relevant NPS (in this case: NPS EN-1 (DECC, 2011a), NPS EN-3 (DECC, 2011b) and NPS EN-5 (DECC, 2011c) with NPS EN-1 (DESNZ, 2023a), NPS EN-3 (DESNZ, 2023b) and NPS EN-5 (DESNZ, 2023c), that came into force in 2024, relevant considerations in the decision-making process) unless (inter alia) the adverse impacts of a proposal would outweigh its benefits. The potential environmental impacts of the Proposed Development, including landscape and visual impacts and impacts on land use, have been

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		comprehensively assessed in the ES. Wherever practicable, likely adverse effects have been avoided or minimised through embedded environmental measures in the design of the Proposed Development, taking into account the findings of the ES, consultation with stakeholders and national and local policy requirements.
2.5.15	5. Terrestrial ecology and nature conservation 5.1 The Development Proposal has the potential to harm biodiversity both directly and indirectly. Direct effects include loss of land to new development, whereas indirect effects include increased water abstraction to serve the development resulting in harm to water quality and water levels; and increased traffic resulting in a decline in air quality, both of which can impact habitats and species some distance from the development area.	The direct and indirect effects described have been considered during the Environmental Impact Assessment (EIA) process and outlined in: • **Chapter 19: Air quality, Volume 2** of the ES **[APP-060]**; • **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-063]**; • **Chapter 23: Transport, Volume 2** of the ES **[APP-064]**; and • **Chapter 26: Water environment, Volume 2** of the ES **[APP-067]**.
2.5.16	5.2 Overall, HDC supports the approach to cable routeing undertaken as it has sought to avoid locally and nationally designated sites and woodland wherever possible and to narrow the working width at important hedgerow crossings. Additionally, HDD techniques are proposed at several environmentally sensitive locations, including river crossings and under woodland to further reduce the ecological impacts. HDC advises that where trenches may be left open outside of working hours, ramps should be placed intermittently along the length of the trench, to allow trapped animals to escape with ease.	The Applicant welcomes HDC's support on the approach taken to the cable routeing. As stated in the **Outline Code of Construction Practice** **[PEPD-033]**, all excavations left open overnight will be provided with a means of escape should an animal enter (see paragraph 5.6.50) and this will be implemented through Requirements 12 and 22 in the **Draft Development Consent Order** **[APP-019]**.
2.5.17	Ecology surveys and assessments 5.3 Sufficient information has been provided to assess the effects of development on biodiversity, along with necessary ecological surveys together with any proposed prevention, mitigation, or compensation measures. Specific comments to note are set out below.	The Applicant has no further comments on this matter at this time.
2.5.18	Irreplaceable and Priority Habitat 5.4 It is the understanding of HDC that the Applicant will not be removing any irreplaceable habitat within the DCO Order Limits within the administrative area of Horsham District. For the pocket of ancient woodland south of the Oakendene Industrial Estate, HDD will occur, with the drill entry complying with Root Protection Area and at a 6 metres depth. This is the only irreplaceable habitat mapped within the Phase 1 report in this area. 5.5 According to the Phase 1 report, there is a species-rich and species-poor hedgerow (priority habitat) running along the north and west boundary of the Washington Recreation Ground, a very small woodland pocket in the field to the west, and scattered trees across London Rd/The Pike. According to section 22.9.100 in Chapter 22 Terrestrial ecology report, no species-rich and/or important hedgerows will be permanently lost, with all permanent losses being associated with the Oakendene substation (22.9.103). Temporary losses will be reinstated within 2 years, either via planting or hedgerow translocation. With regards to potential protected/priority species within these habitats, any relevant mitigation licences granted will be followed, and an Ecological Clerk of Works will be present during the works.	The Applicant will not be removing any irreplaceable habitat within the DCO Order Limits within the HDC administrative area. The Applicant invites HDC and its advisors to read **Appendix A Crossing Schedule** of the **Outline of Construction Practice** **[PEPD-033]**.and **Appendix B: Vegetation Retention Plan** of the **Outline Code of Construction Practice** **[PEPD-033]** secured via Required 22 within the **Draft Development Consent Order** **[PEPD-009]** The Applicant confirms that the Washington Recreation Ground will be crossed by trenchless crossing methodology and all reinstatement, other than at the landfall, joint bays, within temporary construction compounds and at the onshore substation will take place within two years of the losses occurring (secured via Commitment C-103 of the **Outline Code of Construction Practice** **[PEPD-033]** secured via Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**).

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.5.19	Wintering birds 5.6 Due to the scale of the proposed development, the Applicant used a sampling approach when choosing wintering bird survey sites, focussing on areas that were mostly likely to support aggregations informed by desk study returns (particularly those nearby designated sites; para 2.1.2 of Appendix 23.3 Rampion 2 Winter Bird Report). This method is acceptable.	The Applicant welcomes Horsham District Council's acceptance of wintering bird survey sampling approach and has no further comments on this matter at this time.
2.5.20	The Mens 5.7 The DCO works fall within the 12km conservation zone defined around the Mens Special Area of Conservation (Mens SAC). It has been identified as being in use by Barbastelle bats, which are a qualifying feature of the Mens SAC (where minimisation of disturbance and maintenance of habitat connectivity is important). The site also lies within the Sussex North Water Supply Zone, in relation to which an existing adverse effect on the Arun Valley SAC, Special Protection Area and Ramsar site ('the Arun Valley sites') was identified by Natural England (NE) in 2021 due to water abstraction. Likely significant effects on the integrity of these habitats sites because of the development cannot therefore be excluded. In accordance with the Conservation of Habitats and Species Regulations 2017 (Habitats Regulations) an Appropriate Assessment (AA) is therefore required. 5.8 In relation to the Mens qualifying features, in addition to the wider importance of woodland and Ancient Woodland, individual trees, including 'veteran trees' are also important contributors to the bat biodiversity of the district. It should be recognised that it may sometimes be necessary to undertake work on or fell protected trees and/or remove hedges. Mitigation such as hedgerow enhancement has been proposed. This includes control of article light emissions to specifically relate to the need for it, to be informed by further bat surveys.	The proposed Order Limits overlap with The Mens Special Area of Conservation (SAC) 12km conservation zone by 6.3 hectares (ha). This overlap is within areas that are largely made up of access routes following existing tracks. Construction in this area would not require removal of hedgerows, trees or woodland. This limits potential effects on barbastelle bats. Further, any temporary lighting for the trenchless crossing at Sullington Hill (which would be outside of the 12km conservation zone, but within relatively close proximity) would be designed to be bat friendly in line with commitment C-105 of the **Commitments Register [APP-254]** and secured through the **Outline Code of Construction Practice [PEPD-033]** and Requirement 22 of the **Draft Development Consent Order [PEPD-009]**). Assessment of the Mens SAC is provided in **Section 22.9 of Chapter 22: Terrestrial ecology and nature conservation**, **Volume 2** of the ES **[APP-063] a**nd an appraisal of potential adverse effect on integrity is provided in Chapter 7 of the **Report to Inform Appropriate Assessment [APP-038]**.
2.5.21	Biodiversity Net Gain 5.9 The Development Proposal has sought to mitigate and enhance biodiversity through a range of measures, including a commitment to Biodiversity Net Gain and enhancements either on or off the site and provide buffer strips around protected sites, including Ancient woodland and other vulnerable habitats, and maintain, reinstate and enhance wildlife corridors. The location of areas with potential for enhancing biodiversity within Horsham 8 District is identified in the Council's Green Infrastructure Strategy and Wilder Horsham Strategy. 5.10 It is welcomed that the Applicant proposes to deliver a 10% BNG in West Sussex as part of the development (see C-104 on Commitments Register), despite not becoming mandatory for NSIPs until November 2025. It is also encouraged that where on-site BNG is not possible, off-site efforts are prioritised in locations that fall under the upcoming Local Nature Recovery Strategy (LNRS) and/or Biodiversity Opportunity Areas (para 5.3.6 of Appendix 22.15 Biodiversity Net Gain Information). Delivery of off-site habitat creations and enhancements before or during the early stages of construction is strongly supported (para 22.7.9 of Chapter 22 Terrestrial Ecology and Nature Conservation). 5.11 Nevertheless, a full assessment of the BNG plans cannot be made without the submission of a completed statutory biodiversity metric, a habitat management and	The Applicant has committed to deliver at least 10% biodiversity net gain (BNG) (see commitment C-104 of the **Commitments Register [APP-254]** updated at Deadline 1 submission) which has the potential to lead to real benefit in the local authority areas that are directly crossed by the onshore cable corridor and support the other onshore infrastructure. The Applicant welcomes Horsham District Council's proactiveness and the sharing of the Wilder Horsham Strategy. As noted, the Applicant will be seeking units within the host authority areas. Although the full details of losses and gains will come forward in the detailed design phase, the front loading of delivery will ensure positive works for biodiversity are occurring prior to habitat losses associated with the construction phase beginning. **Appendix 22:15: Biodiversity Net Gain Information, Volume 4** of the Environmental Statement (ES) **[APP-193]** and associated requirement (Requirement 14) of the **Draft Development Consent Order [PEPD-009]** ensures that the opportunity to contribute to local and strategic biodiversity improvements will be maximised. Requirement 14 of the **Draft DCO [PEPD-009]** secures the delivery of Biodiversity Net Gain (BNG) and **Appendix 22.15: Biodiversity Net Gain Information, Volume 4** of the ES **[APP-193]** describes the mechanism by which it will be delivered including information on the timing of delivery (including front loading), the process for identifying biodiversity units (i.e. a hierarchy of criteria to identify the most suitable units available) and how these would be secured and managed (effectively as units purchased from strategic projects or via

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	monitoring plan in full (including details of off-site BNG sites; see C-199) and a map of proposed areas for BNG. However, it is understood that these documents will be submitted later when more information is acquired, and the overall project design is finalised. 5.12 As per para 4.2.7 of Appendix 22.15, given the nature of some of the habitats within the DCO Order Limits (namely coastal and flood plain grazing marsh, lowland mixed deciduous woodland and other rivers and streams), the Applicant proposes to satisfy the trading rules through enhancement of already existing habitats of the same type. This is because these habitats require specific physical elements and are therefore difficult to create. Furthermore, the Applicant will be replacing all 'temporary' loss of woodland with scrub, due to the need to protect transmission cables from root damage caused by large trees (para 3.1.7 of Appendix 22.15). Because of this, HDC strongly advises incorporating planting of woodland as part of BNG uplift off-site.	habitat banks (including potentially on land owned by affected parties). Without a detailed design and the opportunity to then fully quantify the losses, identify where these occur (including in which district) and identify what opportunities for provision are available at the time it is not possible to provide information on location, type etc. at present. This information would be provided and agreed as per Requirement 14 of the **Draft Development Consent Order [PEPD-009]**.
2.5.22	5.13 HDC also requests there is scope to enhance Cowfold Stream, as it is in bad ecological status according to DEFRAs catchment data explorer. This would benefit the potential local water vole population, with desk study records being identified within tributaries of the waterbody (see 22.5.74 of Chapter 22) and surveys recording signs of water vole near to the site (Figure 22.11.6 of Appendix 22.11 Badger, Otter, and Water Vole Survey Report). Furthermore, HDC recommends creation and/or enhancement of hedgerows in Henfield (particularly with blackthorn), a current hotspot for the brown hairstreak butterfly, a Sussex BAP. HDC would also encourage incorporating black poplar trees as part of the wet woodland habitat creation plans at the Cowfold substation, given this tree species is a Sussex BAP. 5.14 Where replacement planting is required, replanting with native species is proposed to ensure that ecological networks remain functional and to prevent the isolation of trees and woodland in the landscape. HDC requests that the proposed level of net gain is committed to by the Applicant and secured in the DCO, should the application be consented.	The Applicant will seek to identify opportunities for the delivery of habitat creation and enhancement measures in and around Henfield and the Cowfold Stream should these be available following the approach to locate and secure biodiversity net gain (see **Appendix 22.15: Biodiversity Net Gain Information, Volume 4 of the ES** [**APP-193**]). The Applicant is committed to delivering at least 10% biodiversity net gain as part of the Proposed Development as noted in **Appendix 22.15: Biodiversity Net Gain Information, Volume 4** of the ES **[APP-193]** and secured through Requirement 14 of the **Draft Development Consent Order** [**PEPD-009**].
2.5.23	The Oakendene Substation 5.15 In the case of the substation, it has been agreed with the applicant through the production of Principles of that biodiversity enhancements will be considered as part of the building design and layout (including proposals for Sustainable Drainage). Nonetheless, HDC further consideration of appropriate mitigation to minimise any harm is required, and HDC requests the applicant look further at enhancement measures to compensate for the residual impacts that had been identified in the ES. 5.16 According to Figure 22.8.23b of Appendix 22.8 (Passive and active bat activity report), there was a total of 3,621 bat passes along hedgerows H511 and H512 (transect AT10) located at the Cowfold substation site, which are to be permanently lost. Furthermore, a single juvenile hazel dormouse was recorded in October 2022 along this hedgerow network (para 22.5.64 of Chapter 22), and grass snake and slow worm were identified in low numbers within the proposed substation site (para 22.5.69 of Chapter 22). Edna surveys for great crested newt returned positive results in ponds nearby to the substation site (Figure 22.7.6m of Appendix 22.7 Great Crested Newt Environmental DNA Survey	The views of Horsham District Council (HDC) are noted by the Applicant and updates to the **Outline Landscape and Ecology Management Plan [APP-232]** will come forward at Deadline 3 of the Examination. This will include further information on management and monitoring, advanced planting and amendments to the indicative landscape plan. It will also include reference to the provision of nest boxes for dormouse as requested. These measures will be secured through Requirement 12 of the **Draft Development Consent Order [PEPD-009]**. It is acknowledged that wet woodland is sub-optimal habitat for dormouse as they cannot hibernate in the area. However, wet woodland provides feeding and commuting opportunities. The wet woodland shown on the Indicative Landscape Plan (Figure 1 of the **Outline Landscape and Ecology Management Plan [APP-232]**) lies within the detention basins that form part of the drainage design and the opportunity has been taken to use these to create a wooded habitat, as opposed to grassed basin. This has been done as it provides additional screening of the onshore substation, connectivity for bats and dormice and provides habitat for nightingale (especially around woodland edges or the scrubby interior), great crested newt and grass snake.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	Report 2021-2023), and breeding bird surveys identified multiple nightingale territories on site (para 3.4.1 of Appendix 22.13 Breeding Bird Survey). 5.17 Therefore, many protected and notable species utilise this hedgerow, acting as a wildlife corridor to other suitable habitats. To mitigate against the potential for roosting bats in the trees within the hedgerow, the Applicant will conduct pre-construction surveys of trees with bat roost potential that require removal or pruning (C-211 on commitment register). Should roosts be identified, suitable mitigation will be delivered in accordance with an EPSL from NE and works supervised by an Ecological Clerk of Works. Likewise for hazel dormouse (C-232), reptiles (C-208), and great crested newt (C-214), preconstruction checks will be carried out and an EPSL sought where necessary. As part of commitment C-232, enhancement opportunities to improve habitat connectivity will be sought through C-103, C-104, C193, C-196 and C-199. 5.18 The proposed landscape plan (Figure 1 of Rampion 2 Outline Landscape and Ecological Management Statement) includes retention of existing hedgerows along Kent Road, the A272, and the southern boundary of the site. It also includes planting of new scrub, woodland/wet woodland and scattered trees around the periphery of the substation, which are all suitable habitat for nightingale. 0.56ha of woodland/scrub is also due to be planted adjacent to the strip of scrub where the hazel dormouse was recorded, before construction of the substation commences (22.9.158 of Chapter 22). This will provide foraging opportunities in the short-term, and nesting opportunities as the habitat establishes. 5.19 Therefore, the commitment to retain connectivity of the site with surrounding habitats and mitigate impacts on protected species is adequate. However, wet woodland is suboptimal habitat for hazel dormouse, and HDC would therefore suggest an increase in native scrub planting along the western boundary of the site, where current gaps between retained vegetation and native scrub planting currently exist. Additionally, due to the initial reduction in dispersal habitat for hazel dormouse (22.9.160 of Chapter 22), HDC advises consideration of further mitigation measures such as installing dormouse nest boxes within suitable habitat, to assist the populations' persistence during the construction phase. 5.20 Further to the above, assumed permanent lighting is restricted to the onshore substation (Table 22-19 of Chapter 22). Therefore, a lighting scheme will need to be submitted, as per commitment C-105, that complies with BCT Artificial Lighting Guidance Note and illustrates wildlife sympathetic lighting on the substation site. Moreover, during the management of onsite habitats, HDC discourages the use of chemical spot treatment of weeds (para 4.3.3 of Rampion 2 Outline Landscape and Ecological Management Statement) near to areas of wet woodland / SuDS, to avoid contamination of the water sources.	Operational lighting at the onshore substation is described in paragraph 4.8.27 of **Chapter 4: The Proposed Development, Volume 2** of the Environmental Statement (ES) **[APP-045]**: '*Lighting during onshore operation and maintenance activities is expected to be minimal. External lighting will be directional and limited to essential security and safety requirements. External works will usually be scheduled during daylight hours. If night working is required, then portable directional task lighting will be deployed*.' This description alongside the implementation of commitment C-105 of the **Commitments Register** **[APP-254]** (provided at Deadline 1 submission) will ensure effects of lighting on biodiversity at the onshore substation are minimised. The control of artificial lighting during the operation and maintenance phase is secured in Requirement 30 of the **Draft Development Consent Order** **[PEPD-009]**.
2.5.24	Water Neutrality and the Arun Valley sites 5.21 In the case of Arun Valley sites, designation relates to birds, invertebrates and to aspects of the underlying wetland habitat. Increased demands for water would be at odds with these objectives. Proposals must demonstrate that they will avoid harm to the water	The Applicant presents a dedicated commitment in relation to water neutrality (C-260 of the **Commitments Register** **[APP-254]** updated at Deadline 1 and paragraphs 26.7.10 to 26.7.12) within Section 26.7 of **Chapter 26: Water environment, Volume 2** of the ES **[APP-067]**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	quality and water levels on the site, and Natural England advises that one way of doing so is to demonstrate water neutrality. 5.22 Although, water usage at the substation welfare facilities (including toilet, wash hand basin and additional sink) and a fire control (sprinkler) system) would be sporadic (the substation is not a permanently staffed facility, with people present for routine maintenance and repairs only) to achieve water neutrality mitigation would still be necessary. 5.23 The appellant has proposed efficient fittings and a centralised system of grey water recycling for the proposed development. Affected authorities are currently working towards the delivery of a strategic scheme whereby developers can contribute financially to an offsetting scheme that will deliver the necessary water use reductions across the area to enable developments to achieve water neutrality. Assuming this strategic scheme is available at the time of commissioning, the Applicant would provide the required financial contribution to the scheme to enable the water usage at the substation to be fully mitigated. If the strategic scheme is not available at the time, then a range of bespoke measures would be put in place. This would include the reduction of potential water use on-site at the substation (as per commitment C-260) via water harvesting and recycling and other measures (such as alternative supply of water via tanker). Currently the strategic scheme is being formulated but is expected to be in operation well before the substation would be commissioned. 5.24 There is no strategic solution currently in place. The scale of the financial contribution cannot yet be estimated as there is neither a detailed design for the substation (which is reliant on a large range of factors including number, type and output of individual wind turbines, number of transmission cables etc.) allowing for an estimate of water usage. Shifting the burden of proof to some point in the future neither does nor would satisfy the need for certainty at the point of undertaking an AA. Given that uncertainty remains, and use of a condition could not resolve the matter, HDC cannot conclude that likely significant effects on the integrity of the Arun sites would be mitigated. 5.25 In this instance, the nature of the proposed development would result in an increased consumption of water that would result in a significant impact on the Arun Valley sites, either alone or in combination with other plans and projects.	These commitments are secured by Requirement 8 (2) in the **Draft Development Consent Order** **[PEPD-009]** so that further work can be progressed once the detailed design of the onshore substation has been developed. This requires that the details to be submitted with respect to the onshore substation (which must be approved prior to the commencement of works there) include water harvesting and recycling measures, or any other measures necessary to ensure water neutrality. Water used during the operation and maintenance phase will be limited and could be secured through any of the potential mitigation routes described in **Chapter 26: Water environment, Volume 2** of the ES **[APP-067]**. The quantification (based on a worst case) of water usage, alongside details of possible routes to mitigation will provide the type of information that proved satisfactory for the Planning Inspectors to settle discussions of water neutrality in the recent Storrington appeal APP/Z3825/W/22/3308455 (The Planning Inspectorate, 2023). A 'strategic scheme' (endorsed by Natural England) Is currently in development (with a dedicated HDC local authority delegate), to help improve the efficiency of appliances/devices elsewhere in the Sussex North water supply zone and to help reduce regional water use. The idea behind a strategic scheme is to enable developers to purchase credits to offset any water consumed at the Proposed Development. As noted in paragraphs 26.7.10, in the unlikely event of the strategic scheme not being available on time then other options could include a private scheme and / or not drawing water from a mains source (through off site water imports / exports sourced from outside the Sussex North Water Supply Zone). A firm commitment has been secured towards neutrality, with flexibility as to the exact means by which this will be achieved and this is secured via Requirement 8 (2) of the **Draft Development Consent Order** **[PEPD 009]**. It is noted by the Applicant that in a recent appeal decision Horsham District Council (HDC) confirmed that its own led strategic offsetting scheme should be operational in 2024 and the Mitigation Strategy prepared for the West Sussex Water Resource Zone (Crawley Borough Council et al., 2022) states that offsetting capacity delivered by the Southern Water demand reduction programme is likely to be available to contribute to water neutrality in new development proposals in 2025. Whilst the Mitigation Strategy will have to prioritise sites participating in the scheme, the Proposed Development will provide much needed renewable energy (which has been identified as a critical national priority in the recently designated National Policy Statement (NPSs) (Department for Energy Security and Net Zero, 2023a; 2023b and 2023c)); the amount of water required to be offset by the Proposed Development will be small; and by the time the onshore substation is developed, the schemes will have been established for some time allowing for additional offsetting capacity to be established. Paragraph 2.41 within the **Report to Inform Appropriate Assessment (RIAA)** **[APP-038]** concludes that there is *'no potential for an AEoI to the conservation objectives on the features of the Arun Valley Ramsar site due to over abstraction of water from the Proposed Development alone and therefore, subject to natural change, the features will be maintained in the long term'.* In terms of construction water usage, water for construction usage will not be taken from the mains and it will instead be tankered to main compounds (for their welfare facilities

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		systems, and wheel washing) and Trenchless Crossing (TC) compounds (for use of as drilling fluids), for wheel washing, potentially dust suppression, and welfare facilities. On this basis, construction use was not considered and effectively screened out of the **Report to Inform Appropriate Assessment (RIAA)** **[APP-038]**.
2.5.25	6. Landscape and Visual Impact Assessment 6.1 The scope of a Landscape Visual Impact Assessment (LVIA) does not include visiting or assessing individual private views. The documents identify the impacts to users of Public Right of Way 1786 (and also 1788), which is as required as part of the LVIA. These and other viewpoints around the proposed substation are also accompanied by a visualizations, see (part 2 of 6), viewpoints SA2 (fig 18.11a-e); viewpoint SA3a (fig 18.12a-e); SA3b (fig 18.12f-j); viewpoint SA7a (Fig 18.13a-c); viewpoint SA7b (fig 18.13d-h; viewpoint SA8 (fig 18.14). Notwithstanding, HDC considers that generally the network of public rights of way in this area is not extensive and the fact that adverse harm has been identified on these receptors, this would be unlikely a strong enough reason to reject the location, particularly when receptors already experience some urban influence and walk through the Oakendene Industrial estate.	6.1 - The Applicant agrees and has no further comments on this matter at this time.
2.5.26	6.2 The proposals would have an adverse impact on the landscape character and visual resources of the Low Weald National Character Area; and direct and indirect effects on the National Park designated landscape. In turn, this would change the character of the 11 landscape of Local Character Areas (five plus those where theoretically will have a visibility during construction). HDC agrees with the landscape character area receptors identified. 6.3 The Applicant has sought to mitigate this harm by use of engineering measures along the routeing of the underground cabling, to avoid significant residual visual impacts. The DCO submission sets out in principle how removed hedgerows will be effectively restored and replanted. This is a key approach to mitigation to be implemented correctly, as the entire Landscape Visual Impact Assessment is based on the success of these measures.	6.2 - The Applicant agrees that the Proposed Development would have an adverse effect on the landscape character and visual resources of the Low Weald National Character Area and direct and indirect effects on the South Downs National Park (SDNP). It is not agreed however that that this would in turn change the character of the 11 landscapes of Local Character Areas (LCA) (five plus those where theoretically will have a visibility during construction). **Chapter 18: Landscape and visual impact assessment, Volume 2** of the ES **[APP-059]** identifies that part of six LCAs north of the SDNP and within the Low Weald National Character Area would be significantly affected by the Proposed Development. This includes D1: Amberley to Steyning Farmlands; F1: Pulborough, Chiltington & Thakeham Farmlands; G1: Ashurst & Wiston Wooded Farmlands; O3: Steyning & Henfield Brooks; and J3: Cowfold & Shermanbury Farmlands; and LW1: Hickstead Low Weald. A further four LCAs would be significantly affected within the SDNP including R1: South Downs Upper Coastal Plain; B4: Angmering and Clapham Wooded Estate Downland; A3: Arun to Adur Open Downs; and J3: Arun to Adur Scarp Footslopes. 6.3 - The Applicant has no further comments on this matter at this time.
2.5.27	6.4 Embedded environmental measures (table 18-25) re C-115, which proposes that reinstated hedgerows and tree lines will be monitored over a period of 10 years and remedial action swiftly taken, and this is followed through into the Landscape Environmental Management Plan (LEMP) but no guidance on procedure is yet provided. Para 2.6.11 (of the LEMP) says this is to be submitted with the maintenance works but not clear at what stage this is to be submitted. It is unclear if this means with a LEMP for each phase. Triggers need to be clear to what is considered completion and when the 10 years is started (is it for full construction period or partial completion at each phase) and equally for the 10 years post planting (is it from practical completion or partial completion of each phase).	All landscaping (including reinstated vegetation such as hedgerows and trees and new landscape planting as part of the mitigation (including the Indicative Landscape Plans at Oakendene and Bolney) will be maintained and monitored for 10 Years. This is set out in the **Design and Access Statement (DAS)** **[AS-003]** and the **Outline Landscape and Ecology Management Plan (LEMP)** **[APP-232]** secured by requirements 8 and 12 of the **Draft Development Consent Order** **[PEPD-009]**. Requirement 12 of the **Draft Development Consent Order** **[PEPD-009]** is required for each stage of the Proposed Development prior to its commencement. A programme of works defining the phases is required to be submitted pursuant to Requirement 10 of the **Draft Development Consent Order** **[PEPD-009]**. Following Issue Specific Hearing 1 in February 2024, the Applicant is considering adding further clarifications on the detail of the monitoring and maintenance and remedial action plan for a future deadline.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		The Applicant notes that the commencement of the 10 year aftercare requirement is after the planting for that stage has been completed. This is stated in the **Draft Development Consent Order [PEPD-009]** requirement 13, under paragraph (1) which states "*All landscape works must be carried out in accordance with the landscape and ecology management plan for the relevant stage approved under requirement 12*" and paragraph (2) which states, "*Any tree or shrub planted as part of an approved landscape and ecology management plan that, within a period of ten years after planting, is removed [etc…]*". The Outline LEMP advises (paragraph 2.6.3) "*stage specific LEMP will include detailed 'contract ready' Landscape Plans, suitable for implementation of the works*" and (paragraph 2.6.4-5) "*A programme of landscape works will be provided setting out the programme according to relevant planting seasons and maximising opportunities for advance planting prior to construction to allow trees to mature during the construction works and in advance of completion of the onshore substation. Some of the landscaping will be established prior to the beginning of construction (advance planting), with the remainder being delivered following the completion of the substation and the decommissioning of temporary construction compounds*." In respect of other habitat creation / landscaping works along the route of the cable corridor the **Outline LEMP [APP-232]** (paragraph 5.1.2) advises "*All habitats created and reinstated will be monitored and managed for a period of no less than ten years. Where habitats are to count towards the commitment for BNG this period will be no less than 30 years (Department for Environment, Food and Rural Affairs (Defra), 2022). Each stage specific LEMP will provide this information in a monitoring and management schedule*." It intended that the programme of landscape works would be provided as part of the first stage specific LEMP and reviewed / updated annually as the works progressed. In this manner the programme would cover advance planting completed at the beginning of the construction phase (maintained for 10 Years) as well as planting completed at the end of the 3.5 to 4 year construction phase, also (maintained for 10 Years). The Applicant will continue to engage with HDC on these points and is considering wording to make this clearer in the **Outline LEMP [APP-232]** and the **Draft Development Consent Order [PEPD-009]** and will update the Order as necessary at Deadline 3.
2.5.28	6.5 In terms of construction phase, the temporary works compounds at Washington would be visible from and would sit within views to the South Downs National Park. Impact on a National Park is afforded the highest levels of protection and includes an express requirement to consider impact on its setting. Concern is raised over the impact arising the outlook from the South Downs National Park, particularly given the elevated viewpoints within the Park. During construction stage, due to construction compounds, there are also likely significant effects to users of the Washington recreation ground. These have not been identified as likely significant effects but will need to be considered as part of the receptors accessed. Additionally, at table 18-23 Onshore cable corridor –visual receptors within 2km (south north) Part SDNP (page 119 of the LVIA), Washington is included within settlements receptors and reference is made to recreation ground, allotments, and village green.	Views of the temporary Washington construction compound from the South Downs National Park (SDNP) are provided in Viewpoint NP5: PRoW 2282, east of Sullington Hill (**Figure 18.73, Volume 3** of the ES **[APP 103]**), Viewpoint I: Chanctonbury Ring (**Figure 18.49, Volume 3** of the ES **[APP 102]**) and Viewpoint N: Devils Dyke (**Figure 18.58, Volume 3** of the ES **[APP 102]**). An assessment of these views and visual effects is provided in **Appendix 18.2: Viewpoint Analysis, Volume 4** of the ES **[APP-168],** **Appendix 18.4: Visual Assessment, Volume 4** of the ES **[APP-169]** and **Appendix 18.3: Landscape Assessment**, **Volume 4** of the ES **[APP-170]**. The magnitude of change affecting these views will be Negligible to Zero with most views screened by landform and / or vegetation and the level of effect Minor to None and Not Significant. In undertaking the assessment of Washington, many different streets and public open spaces (such as recreation ground / village greens and allotments and where appropriate)

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	However, this into then followed during the visual assessment (appendix 18.4) and needs to be addressed.	are included within the settlement, and all are afforded high sensitivity as representative of the view as likely to be experienced by groups of residents. The relevant assessment is set out in **Appendix 18.2: Viewpoint Analysis, Volume 4** of the ES **[APP-168],** **Appendix 18.4: Visual Assessment, Volume 4** of the ES **[APP-169]**. Washington has very limited views of the Proposed Development as indicated by the limited zone of theoretical visibility (ZTV) coverage of the settlement and the trenchless crossing of the playing fields, located just to the north of the village (settlement boundary). Consequently, views from the settlement would not be significant. This also applies to the allotments, located further to the north of the recreation ground at Washington, which would be screened by perimeter hedges and vegetation / buildings associated with Washington Caravan Park The assessment does however acknowledge that there would be significant views of the Washington construction compound from Viewpoint H1 along the A283 on the northeastern edge of Washington (**Figure 18.32 Volume 3** of the ES **[APP 100]**). The Applicant will continue to engage with HDC on these points.
	6.6 Furthermore, Washington Recreation ground effects are assessed within the settlement receptor rather than a receptor on its own right (Appendix 18.4: Visual assessment, Volume 4 of the ES (Document Reference: 6.4.18.4); Page 39 – Table 1-7 visual effects of onshore cable corridor on settlements: Washington). This is considered acceptable to simplify the complexity of the LVIA but HDC disagree that the level of effect is considered minor and not significant, mostly justified by the fact that the cabling is underground and view H1 (acknowledges the compound as significantly visible) is not considered as being representative of views from the settlement. Whilst this may be the case from the settlement overall, it is considered that users of the recreation ground, are not being given a proportionate assessment and in this case, it may perhaps make more sense to include it as a receptor within recreational and tourist destination receptor group. No assessment of the allotments and village green as previously indicated at table 18-23.	Please refer to the Applicant's response in **reference 2.5.28** above. Viewpoints H and H1 illustrate 'worst case' views from the edge of the settlement and along the A283 near Washington. It is considered that a 'representative view' from the settlement illustrating the non-significant visual effects (which HDC acknowledge this will be the case from the settlement overall) would further aid this assessment. The Applicant welcomes HDCs Representation and it is agreed that significant effects assessed for the recreation ground / playing fields on the northern edge of Washington will be presented as a recreational receptor within **Appendix 18.4: Visual Assessment, Volume 4** of the ES **[APP-169]** and added to summary Table 18.45 of **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]**.
2.5.29	6.7 In terms of the operational phase, the overriding issue is the substation at Cowfold; and whether all reasonable endeavours had been made to minimise the scale, both through the parameters of the building itself and through its siting, and whether adequate provisions were being made to secure mitigation. The proposals would impose the substation site as a permanent feature in the landscape, notably by way of the scale of the proposed substation, and its indicative design, and supporting industrial features 12 such as fencing, CCTV cameras, and tracks, and on visual receptors, including the nearby Public Right of Way network. The Applicant has sought to mitigate this harm by boundary planting that would of benefit in filtering the development once established.	Please refer to the Applicant's response in **reference 2.5.6** above.
2.5.30	6.8 The Applicant has identified likely Significant effects have been identified on landscape effects to the Oakendene substation. This identifies significant effects on the Local Character Area during construction, operation and maintenance and decommissioning phase. This is agreed with. In addition, it is considered that the substation will have a significant effect on some of the onsite existing landscape features (such as the removal of the internal tree and hedgerow boundary). Likely Significant effects have also been identified on visual effects to the Oakendene substation. Significant effects are identified on receptors (prow 1786 and 1788 and road users on A272 and Kent Street) during	6.8 - It is agreed that significant effects would affect public right of way (PRoW) 1787, included previously as part of PRoW 1786 in the assessment (to be included in the Errata Tracker at a future deadline). The Applicant has met with HDC to discuss this matter and it has been agreed that commitment C-68 (**Commitments Register** **[APP-254]** within the **Design and Access Statement (DAS)** **[AS-003]** secured via Requirement 8 within the **Draft Development Consent Order** **[PEPD-009]**) will be updated at a future deadline to take specific account of

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	construction. These are likely to reduce to some degree once mitigation measures mature during operation stage but there will still be significant residual effects to users of prow 1786. HDC also consider that significant effects will be experienced by users along 1787. Commitment C-68 on the substation design and material/finishes should take account of WSCC land management guidelines and given the substation is within Horsham District, the proposals should also take account of local character areas guidance's and characteristics within the J3 Cowfold and Shermanbury Farmlands, of the Horsham District Character assessment. 6.9 Landscape elements and recreational destinations are identified as receptors (in the scope of the assessment) but not assessed as likely to result in significant effects during construction, operational and decommissioning stage. HDC has concerns the effects on landscape elements are understated, as the loss of the internal boundary hedgerows and trees, as landscape features, to facilitate the new proposed Oakendene station for example, are significant. It is positive however to see that these have been identified as receptors, even if the conclusions are disagreed at this stage. Additionally, in the baseline conditions for the onshore substation at Oakendene – landscape receptors, the site's landscape features are not identified. Only the character areas are discussed. The site's landscape features need to be part of the assessment as they are also identified (as receptors in the scope of the assessment). The LVIA confirms that the operational stage of the proposals at Oakendene substation (completed development) and concludes that there are significant landscape effects to the host landscape character area (J3: Cowfold and Shermanbury Farmlands). This is also the case for the landscape character of the site itself and immediate setting, particularly to the south and southwest. The loss of the landscape features (internal boundary hedgerows and trees), recognised in the LVIA as contributing to the landscape character, is considered of high magnitude. HDC concurs with this.	West Sussex County Council (WSCC) land management guidelines (*A Strategy for the West Sussex Landscape*, October 2005, page 32 - County Wide Landscape Guidelines) and the *Horsham District Landscape Character Assessment*, 2003, pages 111-113. Commitment C-68 already refers to the WSCC land management guidelines and both of these documents are referenced in Table 18-16 of **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059].** 6.9 – In respect of landscape elements please refer to the Applicant's response in **reference 2.5.6** above. The Applicant does not accept that these have been understated. In respect of recreational receptors please refer to the Applicant's response in **reference 2.5.28** above. The Applicant has no further comments on this matter at this time.
2.5.31	6.10 To note, in Appendix 18.3 Landscape assessment, volume 4 of the ES (Doc Refence 6.4.18.3) tables refer to visual receptors but it is assumed this is a typing error and mean landscape receptors. In here, the land landscapes elements are assessed separately but this does not seem to follow onto the overall conclusions of the core document.	The Applicant will include this amendment (change table heading from 'Visual receptor' to 'Landscape receptor') to Table 2-1 of **Appendix 18.3: Landscape Assessment**, Volume 4 of the ES **[APP-170]** and Table 18-40 and 18-44 of **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]** in the Errata Tracker at a future Deadline). Landscape elements are also summarised and listed out on paragraph 18.9.20 and page 229 of **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]**.
2.5.32	6.11 As previously highlighted, how removed hedgerows will be effectively restored and replanted is a key approach to mitigation to be implemented correctly, as the entire Landscape Visual Impact Assessment is based on the success of these measures. Whilst the Outline LEMP sets out an acceptable strategy, HDC would encourage commitment to the delivery of advanced planting where possible and existing hedgerow management arrangements actioned from the outset, with details submitted prior to commencement on site. The Landscape Management section of the LEMP refers to monitoring proformas to be made available to HDC and any adaptive measures to be discussed and agreed prior to implementation, but no details to how this will be triggered and secured. At para 4.5.4 it is suggested that reinstatement plans will not be produced for all areas of landscape. However, my interpretation of the stage specific LEMP (para 2.6) would be that this is for all areas works, which must include proposed, and reinstatement works. Otherwise, it raises query to how would the reinstatement be monitored. The submission of planting	Please refer to the Applicant's response in **references 2.5.6** and **2.5.27** above. The Applicant will amend the **Outline Landscape and Ecology Management Plan (LEMP) [APP-232]** at Deadline 3 to ensure that it is clear that a plan and programme of all landscape / habitat creation works is maintained, the reference in paragraph 4.5.4 amended to refer to a detailed plan for sensitive areas if required. 'Planting plans' are referred to in the **Outline LEMP [APP-232]** as 'Landscape Plans'.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	plans are not referred to within the LEMP although this is suggested within the DAS that would form part of this report. No reference to planting plans within the DCO either. 6.12 The issue with part-completion dates has been identified throughout documents as each phase will have a different construction completion date. This will make monitoring of the various aspects of maintenance of proposed landscape difficult to kept track of and difficult to establish the end of the 10 year period referred to as part of the maintenance and monitoring period. A clear programme as to how this is to be addressed needs to be secured.	
2.5.33	6.13 Whilst it is agreed that in time the proposed mitigation will reduce the identified visual adverse effects, this will not be the same during construction and pre planting areas should be explored. The pre-planting of landscaping works is referred to within the DCO under 'onshore site preparation works' (page 8, under the interpretation section), and also within the LVIA as mitigation measures, however the locations where this would be feasible doesn't seem to be identified anywhere yet. HDC also cannot see this identified as a commitment within the register. In the draft Development Consent Order, preplanting is discussed as being part of the 'on-shore site preparation works' (Part 1 Preliminary, Page 8, under the interpretation section). However, there is no reference to this as a commitment or to which geographical area this would be implemented. This is important to help mitigate temporary effects during construction but also where possible, it will offer advanced screening prior to operation stage. One example will be to action the management and maintenance of the hedgerow along the A272 to soften views of the temporary compound, but also introduce any enhancement planting along this boundary and Kent Road. Additionally, Part 3 Requirements, provision of landscaping requires works no. 16 (onshore project substation and associated construction works) not to be delivered without being accompanied by the relevant part of works 17 (environmental mitigation). However, it is unclear if the detail of each works type will be subject to detailed design secured within the DCO under the various commitments/ requirements. The wording in Part 3 13 (2)" requires clarification – is removal or damage (Such as vandalism) by a third party covered by this clause. It is also unclear when the 10-year trigger starts in reference to 'within a period of 10 years after planting'. Is it post completion for the overall scheme or are these targeted, based on part completion certificates for each phase and therefore different completion dates.	Please refer to the Applicant's responses in **references 2.5.6** and **2.5.27** above. The Applicant will continue to engage with HDC on these points, including **Draft Development Consent Order [PEPD-009]** Part 3 Requirement 13 (2) in respect of vandalism / third party action.
2.5.34	6.14 With regard to the Design and Access Statement (DAS), the principles identified to maintain the rural landscape character are agreed with but these principles do not take into consideration the adverse effects of the construction period and therefore any identified adverse effects during the construction will remain and temporarily will not 'maintain the rural character' and adverse effects are experienced. For example views and experience of rural character from the A272, Figure 18.11b, Figure 18.13b (doc ref 6.3.18, Vol 3, Chapter 18 LVIA figures (Part 2 of 6)). Notwithstanding, it is recognised that views from several receptors, such as near the lake to the south of Oakendene Manor and part of ProW 1786, will be adversely affected by experiencing some loss of rural character and views across the parkland landscape at Oakendene Manor.	6-14 – The **Design and Access Statement [AS-003]** secured via Requirement 8 within the **Draft Development Consent Order [PEPD-009]** includes principles to retain and protect existing vegetation and manage hedgerows where possible to increase screening along the A272. The **Outline Landscape and Ecology Management Plan [APP-232]** seeks to maximise opportunities for advance planting prior to construction, although this will provide limited screening during the construction phase. Whilst some visual effects during the construction phase will be unavoidable these measures will make a noticeable contribution to the screening of construction effects and are secured through requirement 12 of the **Draft DCO [PEPD-009]** on a staged basis.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	6.15 The DAS proposes that amongst others, amongst others, planting plans and specifications are to be included within the LEMP, and HDC is supportive of this approach. The DAS also directs the reader to plans where it is shown areas of vegetation to be removed and retained. This can be found at Outline Code of Construction Practice (CoCP) Appendix B – Vegetation Retention Plan (Document Reference: 7.2). Within the 14 context of Oakendean Manor/substation, one section of woodland clearance (20m) is proposed within our district, see Fig 7.2.2h (vegetation retention plans). Also as identified and discussed previously, the development will require the removal of the internal field's boundary of hedgerow and trees, which will have an adverse effect on the landscape character and visual amenity. These are historic field boundaries shown on old OS Maps 1888 and will result in the loss of key characteristics of the character area. However, mitigation, is proposed and described within the LVIA through additional planting.	The Applicant will continue to engage with HDC and seek clarification on these points. 6-15 – Noted, the Applicant has no further comments on this matter at this time.
2.5.35	Trees and Hedgerows 6.16 The submitted Arboricultural Impact Assessment appears to be fair assessment of the quality, and condition of tree along the route and the potential impact of the proposed development on trees, woodlands, and hedgerows.	The Applicant has no further comments on this matter at this time.
2.5.36	- Tree survey method 6.17 The trees have been surveyed using the BS5837 Trees in relation to design demolition and construction Recommendations (2012) survey methodology. They have been allocated a category reflecting their condition and estimated remaining lifespan. 6.18 The tree survey covered approximately 96% of the proposed DCO order route. The trees within the remaining 4% of the area were not surveyed due to limited access. As such, they were recorded as groups of trees or woodlands depending on the geometry of each feature using aerial images of the surveyed area. Para 4.4.2 of the AIA. 6.19 Para 5.1.2 of the AIA refers to the number of trees, woodlands and hedgerows inside or within influencing distance of the DCO Order limits. Para 5.1.2 states that 974 individual trees, 792 groups of trees, 41 woodlands and 224 hedges were recorded as part of the survey. However, these numbers do differ from the number of trees recorded in ANNEX 4 Arboricultural Survey Data Sheets, where the number of individual trees surveyed is listed as 1482, the number of groups is listed as 1152, the number of Woodlands recorded is listed as 66, and the number of hedgerows surveyed is listed as 349. HDC does not have any significant concerns with how the survey data has been recorded or the classifications allocated to the trees. 6.20 Para 3.2.11 refers to how the recorded hedgerows were assessed using basic observations on species, form and dimensions, and the effects on hedgerows regarding retention, removal and management. The interpretation of these effects regarding landscape, visual significance and habitats forms part of the ES Chapter 22:Terrestrial ecology and nature conservation, Volume 2 (Document Reference: 6.2.22).	The reason for the apparent discrepancy in number of features (trees, groups, woodlands and hedgerows) in the main AIA text presented in **Appendix 16: Arboricultural Impact Assessment, Volume 4** of the Environmental Statement (ES) **[APP-194]** and ANNEX 4 is due to an original survey extent that was later refined based on the proposed DCO Order Limits. This is explained in paragraph 4.1.4 of the AIA which states, "*The initial survey was based on the Preliminary Environmental Information Report (PEIR) Assessment Boundary (RED, 2021). Following refinement of the PEIR Assessment Boundary during the project design process, trees falling outside the final proposed Order Limits have been removed from the data to ensure clarity of the final drawings. To ensure continuity, original feature references have been preserved but do not now always run sequentially. This is why some numbers in the tree survey data at Appendix A appear to be missing.*" The Applicant has no further comments on any other matters at this time.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	6.21 The way Root Protection Areas (RPA) of the surveyed trees have been calculated is in accordance with BS 5837. Para 4.7.2 of the AIA states that due to a lack of detailed topographical information, the RPAs of the trees have been adjusted to reflect site conditions that might have influenced the rooting pattern of trees. 6.22 Para 4.6.2 & 4.6.3 of BS 5837 states, "The RPA for each tree should initially be plotted as a circle centred on the base of the stem. Where pre-existing site conditions or other factors indicate that rooting has occurred asymmetrically, a polygon of equivalent area should be produced. 6.23 Para 4.6.3 of the BS states "Any deviation in the RPA from the original circular plot should take account of the following factors whilst still providing adequate protection for the root system" To compensate for the lack of topographical information, Para 4.7.2 of the AIA suggests that the RPA of any groups and woodlands has been applied as an offset from 15 the canopy edge depending on tree quality (and the individual attributes of the feature (i.e. age and average stem size). 6.24 Para 4.7.3 of the AIA states that where there is a concern with how the RPAs have been plotted in a specific location, they can be refined at the detailed design stage when more detailed topographical information is available; this would appear reasonable given the lack of any area-specific topographical data.	
2.5.37	- Statutory Controls and Non-statutory controls 6.25 In section 3.2, the AIA refers to Statutory Controls and Non-statutory controls and designations, such as Tree Preservation Orders (TPOs), Felling licences, regulations concerning Countryside hedgerows, Ancient Woodland, Veteran trees, and Habitats of Principal Importance such as Traditional Orchards.	The Applicant has no further comments on this matter at this time.
2.5.38	- TPO impact 6.27 Within Horsham District, only one TPO appears to be recorded within the DCO limits: TPO/1296 - W1 - Conifer plantation Land West of Wiston Cricket Club Steyning Road Wiston West Sussex. This woodland is recorded as W39 in the AIA. The Proposed DCO Order Limits are shown to abut the north-western corner of the woods but not within it, and from the AIA, it would suggest that no trees within the TPO area are indicated for removal.	The Applicant agrees with this statement and can confirm no trees within the TPO area are indicated for removal.
2.5.39	- Impacts on hedges. 6.28 Para 7.9.1 of the AIA states that, in total, 58 hedges will be affected by the cable route, with sections of the hedges in question being removed. The total length of the hedgerows to be removed across the whole development is 1,440m, and only 5 of these sections would not be able to be replaced post-development at the same location. In the proposed Oakendene substation area, 646m would be permanently removed, and this loss would be compensated for elsewhere through the enhancement of existing hedgerows or the creation of new hedgerows in the local area.	Please note that these loss estimates are taken from **Appendix 22.16: Arboricultural Impact Assessment, Volume 4** of the ES **[APP-194]** which records hedgerows, scrub and woodland in a different way to that described in **Appendix 22.3: Extended Phase 1 habitat survey report, Volume 4 of the ES [APP-181]** and **Appendix 22.5, Hedgerow survey report, Volume 4** of the ES **[APP-183]** as per the different survey methodologies. The assessment of hedgerow loss provided in **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-063]** is based on the extended Phase 1 habitat survey and hedgerow survey. Following the Issue Specific Hearing Action Point 24 has requested that the Applicant reviews habitat losses and ensures consistency between documents. This work will be undertaken and the results provided at a future deadline.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.5.40	- Ancient Woodland impact 6.29 Para 3.3.6 of the AIA provides details of ancient woodland identified inside or within 100m of the proposed DCO Order Limits. This has been undertaken by way of desktop searches. They have recorded 21 designated Ancient Woodland (AW) areas in the Horsham district within 100m of the DCO Order limits. Para 7.8.2, 7.8.3 and 7.8.4 of the AIA refer to how the development would be implemented so that there would be no loss of AW arising from development. 6.30 Where areas of AW are encountered, the AIA suggests that the onshore cable installation in such locations will be undertaken using trenchless methods to reduce the risk of damage to the AW, and it proposed that any tunnelling beneath AW will be maintained at a depth of at least 6m to avoid root damage and disturbance; this is positive to see. Additionally, Para 7.8.4 of the AIA States that all ground works will be restricted to areas more than 25m from the edge of Ancient Woodland (C-216). Thereby avoiding potential damage to tree roots, changes in local hydrology and providing space to contain any accidental pollutant spillages. This 25m stand-off is more than the 15m minimum recommended by Natural England and the Forestry Commission given in Standing Advice." This is satisfactory and positive to see. In addition, it is good to see that this construction method has also been proposed where the cable route will pass under the Jockeys Meads field and Washington Village recreation ground and will ensure 16 that the trees within the area will be unaffected by the below-ground works, due to the 6m depth of the cable tunnels.	The retention and protection of valuable trees, including ancient woodland is recognised by the Applicant and is reflected in the design of the Proposed Development and use of trenchless crossing techniques where possible and appropriate.
2.5.41	- Veteran tree survey method and impact 6.31 The AIA shows that only 7 Veteran trees have been recorded, though the documents acknowledge that veteran trees may be found in the unsurveyed areas along the DCO. In this instance, the survey method used to identify veteran trees is set out in para 4.8 –4.8.1 to 4.8.15 of the AIA. The assessment has been guided by the definition of a veteran tree provided in the National Planning Policy Framework ('NPPF'), which is widely used as the standard definition for planning decisions in England. The NPPF defines veteran trees are defined as those being collectively of an age, size and condition, and are of exceptional biodiversity, cultural or heritage value. This assessment method appears robust, and HDC do not have any significant concerns with how the AIA has recorded veteran trees. At the same time, it is acknowledged that a relatively high number of trees surveyed display some veteran characteristics; however, despite this, they would need to satisfy all the tests to meet the definition of 'veteran' set by NPPF.	The Applicant has no further comments on this matter at this time.
2.5.42	- Tree Removal, Management and Mitigation Planting 6.32 The total percentage of trees indicated for removal accounts for 6.5% of the total number of trees surveyed; this is shown in Table 7-1 para 7.3.1 of the AIA. Table 7-3 of the AIA provides a breakdown of the tree stock indicated for removal according to the category allocated to the trees under BS5837, i.e., cat A, B and C.	The Applicant has no further comments on this matter at this time.
2.5.43	- Individual tree removal 6.33 In total, 15 individual Cat A trees would need to be removed; these account for 5% of the total amount of Cat A trees surveyed. 36 Cat B trees, 9% of the total surveyed, 10 Cat C trees, 10% of the total surveyed and 5 Cat U trees, 10% of the total surveyed.	The Applicant has no further comments on this matter at this time.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.5.44	- Tree group removal 6.34 In total, 9 groups of Cat A trees would need to be removed; this accounts for 12% of the total amount of groups of Cat A trees. 25 Cat B groups, 10% of the total surveyed, and 55 Cat C trees, 14% of the total surveyed; no Cat U groups are indicated for removal. 6.35 From the submitted data, the removal of trees, groups of trees and woodland by canopy area equates 68% and 52% of hedgerow removal this is associated with open-cut cable installation. 6.36 The extension of the existing National Grid Bolney Substation represents 10% of tree removals by canopy area, but no hedgerow removal is proposed. 6.37 To accommodate the new Oakendene Substation, 11 Category A trees and 10 Category B trees are proposed to be removed; this is associated with 9% of tree removals by canopy area and 40% of hedgerow removals for the scheme. 6.38 Para 7.4.5 of the AIA suggests that 5% of Cat A trees surveyed would need to be felled, which is lower than the overall percentage of the Cat A tree surveyed (29%), and 9% of the Cat B trees surveyed would also need to be felled out a total population rate of 40%. 6.39 The proposed replacement planting appears robust and commiserate for the number and size of the trees and groups indicated for removal; this is set out in Para 8.5.7 and Table 8-1 Indicative Tree replacement rates of the AIA. However, it should be noted that 17 the younger trees proposed to be removed are, of course, more readily replaceable, while the older trees are not. Any replacement tree, even if of heavy-duty nursery stock, would take many years to reach a similar stature as the mature trees indicated for removal and thus would take many years to reinstate an equivalent level of visual amenity and ecological benefits that mature trees provided.	The Applicant welcomes HDC's comment on the robustness of the replacement tree planting plans, and the Applicant agrees that new trees of variable nursery stock size and species will develop relatively slowly. The approach taken in the **Appendix 22.16: Arboricultural Impact Assessment, Volume 4** of the Environmental Statement (ES) **[APP-194]** is to provide a greater number of replacement trees for the removal of larger trees to offset the net loss of canopy area and reduction in average tree size. A calculation rate for the replacement of individual trees to be removed is presented as a function of their current stem size within the **Appendix 22.16: Arboricultural Impact Assessment , Volume 4** of the ES **[APP-194]** and secured by Commitment C-286 within the **Outline Landscape and Ecology Management Plan (LEMP) [APP-232]** secured via Requirement 12 within the **Draft Development Consent Order [PEPD-009]**. In this way the amount of replacement planting would respond to the scale of impact and mean as an example, that up to 14 new trees would be provided for the loss of a single tree at Oakendene Substation in some instances. Groups and woodland would also be replanted at a higher area ratio than that being removed depending on the median stem size and at least an equal length of removed hedgerow would be planted. These measures have been designed to ensure that there is no net loss of arboricultural value in the longer term and no permanent degradation of the treescape.
2.5.45	- Tree pruning works 6.40 Para 8.2.5 of the AIA suggests that A detailed schedule of all proposed tree pruning would be produced with annotated plans as part of an Arboricultural methods statement AMS to be provided at a later date. This would include operational standards for all types of pruning and tree felling method according to best practice. I do not have any significant concerns with this proposal.	The Applicant has no further comments on this matter at this time.
2.5.46	- Tree Protection 6.41 The proposed tree protection as advised in section 8.3 is satisfactory and in accordance with the current industry standard British Standard 5837:2012;	The Applicant has no further comments on this matter at this time.
2.5.47	- The Oakendene Substation Site 6.42 The draft DCO seeks consent in outline only for the substation element of the proposed development. Design matters are, therefore, reserved for later determination, however, to demonstrate how the proposed quantum of development can be delivered an illustrative layout was submitted.	The Applicant agrees and has no further comments on this matter at this time.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	6.43 It is noted the substation is not a special landscape area or particularly visible from the wider area but there are local considerations of the setting of Oakendene Manor associated landscape parkland; views from ProW 1786 near Taintfield Wood, towards Oakendene Manor; and the appearance and character of immediate surroundings, which are important considerations. To this extent these matters are to be addressed at reserved matters stage. 6.44 However, the draft DCO and Design and Access Statement does include parameters for the substation site and the design principles with which the detailed design could accord, providing a degree of control over the future design of the onshore infrastructure; as the principles established will inform the detailed design phase as the finalised layout and size of the substation, access tracks and sustainable drainage solutions (SuDS). The illustrative layout, The Oakendene Onshore Substation – Indicative Landscape Plan in Appendix D of the Design and Access Statement, shows one way this could be achieved. 6.45 The Architectural Strategy (determining building colour, texture, and roofline or profile of buildings and roofline) will also be required to soften the visual appearance of the substation in any remaining views to reduce its visibility from the wider landscape and when viewed from the surrounding area.	
2.5.48	6.46 To address residual visual impacts through new hedgerow and tree planting within a radius of the substation will help reinforce the character of the land use and be used to address visual impacts from key views as identified through the ES. HDC believes that without this agreement the residual impacts of the substation would be unacceptable and consequently consider that it meets the test of development consent obligations.	The Applicant will continue to engage with HDC and seek clarification on these points.
2.5.49	6.47 Lighting requirements (for scheduled maintenance outages or emergencies) within the substation will be directed downward and shielded to reduce glare outside the facility. The principles of lighting design will be informed by the joint guidance provided by the 18 Bat Conservation Trust and Institution of Lighting Professionals (2018). The lighting design will account for the potential effects on people (residents, road users, walkers and tourists) and biodiversity by taking measures to minimise lighting use, minimise light spill, use most appropriate wave lengths of light and locate lighting in the most appropriate locations.	The Applicant agrees and has no further comments on this matter at this time.
2.5.50	6.48 Along the A272 outside of visibility splays and access requirements, existing roadside vegetation (trees and hedgerow) will be maintained, and hedgerow height managed to infill any gaps and allow it to grow to an increased height. Increased native woodland planting will be provided to the south of the existing hedgerow to increase roadside screening. The site access road will include a curve or 'S' bend, with planting to prevent a direct line of sight from the A272 of the substation.	The Applicant agrees and has no further comments on this matter at this time.
2.5.51	7. Air Quality 7.1 Air quality issues have been identified. Clarification is required regarding the extent to which the Air Quality and Emissions Mitigation Guidance for Sussex (2021) was given consideration in assessing and mitigating the emissions, as is the expectation for any major development.	**Chapter 19: Air quality, Volume 2** of the ES **[APP-060]** has considered the Air Quality and Emissions Mitigation Guidance for Sussex (Mid Sussex District Council, 2021) in defining the scope of the assessment and in particular the extend of any construction traffic modelling required for the Proposed Development.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	7.2 The overarching principle of the Sussex guidance is to, as far as it is possible, design emissions out of a scheme, and mitigate or offset any residual emissions. Thus, the guidance aligns with the aims of Defra's Clean Air Strategy on reducing emissions to protect health and protect the environment, and the HDC environmental policy, which is why it is essential applicants adhere to its principles.	The Applicant concludes no significant effects on air quality are likely and does not consider that the Proposed Development meets the criteria set out in the Air Quality and Emissions Mitigation Guidance for Sussex for an air emissions mitigation strategy. However, recognising Horsham District Council's concerns, the Applicant is preparing an Air Quality Mitigation Plan in accordance with the Sussex Guidance. This includes damage cost calculations and preparing an Air Quality Mitigation Plan for Horsham District Council to address impacts from construction traffic associated with the onshore substation works at Oakendene on the Cowfold Air Quality Management Area (AQMA).
2.5.52	Construction Phase 7.3 During site clearance, preparation and construction there is the potential for local residents to experience adverse impacts from noise, dust and construction traffic movements. These should be minimised and controlled by the developer and a construction environmental management (CEMP) plan. 7.4 It is expected that the Dust Management Plan to be prepared accounts for emissions of off road construction vehicles. The recommendation would be to ensure all Non Road Mobile Machinery and constant speed engines comply with the requirements of the London Low Emission Zone and the London LEZ Non-Road Mobile Machinery/constant speed engines standards. 7.5 Construction traffic will use the strategic route network in the district. Welcomed is Environmental measure C-158 which proposes the proposed heavy goods vehicle (HGV) routeing during the construction phase to individual accesses will avoid the Air Quality management Area (AQMA) in Cowfold where possible. Proposed routeing set out in Outline Construction Traffic Management Plan (CTMP). Enforcement of the outline CTMP is secured through commitment C-158. 7.6 The key concern is that the Outline Construction Traffic Management Plan (CTMP) does not account for emissions of the on road and off road construction traffic. Section 8.4.11 of the CTMP proposes to use Euro V on road vehicles "or better whenever possible". The emission rates for Euro V heavy duty vehicles are circa 50% higher for PM and Nox compared to those of Euro VI vehicles – so it makes a significant difference what emission standard gets adopted. 7.7 The concern is also that the details of the final HGV routes are not known, and whether those mirror the assumptions used to model the impacts.	**Chapter 19: Air quality, Volume 2** of the ES **[APP-060]** presents the construction dust assessment from the different components of the Proposed Development, undertaken in line with the Institute of Air Quality Management (IAQM) (2016) guidance on '*Assessment of Dust from Construction and Demolition'* following best practice. The assessment identifies suitable mitigation according to the risk of dust impacts from the different components of the Proposed Development to ensure appropriate mitigation measures are applied. The relevant dust mitigation measures form part of the **Outline Code of Construction Practice (CoCP) [PEPD-033]** which includes an embedded environmental measure to produce Dust Management Plans for the areas within the proposed DCO Order Limits that are associated with medium dust risk. The **Outline CoCP [PEPD-033]** is underpinned by commitment C-24 of the **Commitment Register [APP-254]** (provided at Deadline 1 submission). The **Outline CoCP [PEPD-033]** secured in Requirement 22 of the **Draft Development Consent Order [PEPD-009]**. The **Outline Construction Traffic Management Plan (CTMP) [PEPD-035a**] has been updated at the Deadline 1 submission to state that all vehicles used in the construction of the onshore elements of the Proposed Development will be to a EURO standard VI class or better wherever possible. The **Outline CTMP [PEPD-033]** is secured in Requirement 24 of the **Draft Development Consent Order [PEPD-009]**. The assessment within **Chapter 23: Transport, Volume 2** of the ES **[APP-064]** and the **Chapter 32: ES Addendum, Volume 2** of the ES **(Document Reference: 6.2.32)** (submitted at Deadline 1) is based on construction traffic flow estimates as described in **Appendix 23.2: Traffic Generation Technical Note, Volume 4** of the ES **[APP-197]** which has been updated at the Deadline 1 submission. All assumptions within **Appendix 23.2: Traffic Generation Technical Note, Volume 4 of the ES [APP-197]** (updated at the Deadline 1 submission) follow prescribed traffic routing for HGVs set-out in the **Outline CTMP [PEPD-035a**] which has been updated at the Deadline 1 submission. Stage specific CTMPs will be submitted to and approved by the highway authority in consultation with the relevant planning authority prior to commencement of each stage of works in accordance with the **Outline CTMP [PEPD-035a**] (Requirement 24 within the **Draft Development Consent Order [PEPD-009]**.
2.5.53	Model set up and methodology 7.8 Clarification needed to understand the assumptions used the Assessment Scenario. The concern is that the Assessment Scenario includes assumptions on HGV routing which may not materialise for project implementation.	**Chapter 19: Air quality, Volume 2** of the ES **[APP-060]** present the results of the construction traffic modelling. Section 3 of this ES addendum (**Document Reference: 6.2.32**) presents an updated assessment of the likely significant air quality effects of construction traffic emissions expected from Rampion 2 in light of the new traffic data

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	7.9 Regarding model verification (Appendix 19.1: Full results of construction road traffic modelling), full information is required on the methodology to select monitoring sites for model verification. It is noted that the worst-case site (Cowfold 37) was not used in model verification, neither were a number of other sites. Details are therefore required of the initial verification including Monitored Road Nox Contribution versus Unverified Modelled Road Nox, which monitoring sites were used, and which were removed from the verification process with justification for both. It is recommended that all statistical parameters for model performance including the RMSE, fractional bias and correlation coefficient, be presented to give a full picture of the model performance, in line with the recommendations of the TG(16) guidance. 7.10 Clarification is sought on why the latest LAQM tools such as background maps and Emissions Factors Toolkit were not used in the air quality assessment, given that Revision A of the assessment is dated August 2023. 7.11 Also sought is clarification regarding the choice of meteorological data to model Cowfold. Data from Shoreham station does not reflect the conditions at Cowfold.	produced. The results of this assessment have been compared with the results of the assessment of air quality effects of construction traffic emissions reported in the **Chapter 19: Air quality, Volume 2 of the ES [APP-060]**. Model verification has been updated as part of the detailed modelling assessment of construction traffic effects within Cowfold. The results of this updated model verification are reported within **Chapter 32: ES Addendum, Volume 2** of the ES **(Document Reference 6.2.32)** (submitted at Deadline 1) in **Appendix B: Full results of Cowfold AQMA assessment**. This details the use of more monitoring locations which report annual averaged concentrations of nitrogen dioxide (NO_2) during 2019 to incorporate into the model verification. The Cowfold Air Quality Management Area (AQMA) model verification report, within the **Chapter 19: Air quality, Volume 2** of the Environmental Statement (ES) **[APP-060]**, has been updated in the **Chapter 32: ES Addendum, Volume 2** of the ES **(Document Reference 6.2.32)** (submitted at Deadline 1) to include more monitoring locations within the Cowfold AQMA, including Cowfold 37. The verification of the modelling output was performed in accordance with the methodology provided in LAQM.TG(22) (Department for Environment, Food and Rural Affairs (Defra), 2022). The assessment of construction traffic effects within Cowfold AQMA has used meteorological data from the Gatwick Airport observing station and from Shoreham to enable a comparison of the model outputs. This is reported within Section 3 of **Chapter 32: ES Addendum, Volume 2** of the ES **(Document Reference 6.2.32)** (submitted at Deadline 1) where clarification regarding the choice of meteorological data is provided.
2.5.54	Health Damage Cost Calculation. 7.12 The emissions calculation and total calculated value of emissions' health damage cost associated with construction traffic were not included in the DCO Documents. 7.13 Understanding costs is essential to effective and necessary mitigation and Table 19-7 of ES Volume 2, Chapter 19: Air quality confirms that the applicant agreed to "consider the inclusion of an air emissions mitigation strategy". However, the strategy was not included with the DCO submission. 7.14 Air Quality and Emissions Mitigation Guidance for Sussex (2021) takes a low-emission strategies' approach to avoid health impacts of cumulative development, by seeking to mitigate or offset emissions from the additional traffic and buildings. Hence, applicants are required to submit a mitigation plan detailing measures to mitigate and/or offset the impacts and setting out itemised costing for each proposed measure, with the total estimated value of all the measures being equal to the total damage costs. Air Quality Mitigation Plan for construction phase (air emissions mitigation strategy) 7.15 There is a lack of a standalone Air Quality Plan for the construction phase of the development. The concern is that air quality improvements in the Cowfold AQMA do not stall and that the improvements are continuous and maintained into the future. The Sussex	The requirement in the Air Quality and Emissions Mitigation Guidance for Sussex (Mid Sussex District Council, 2021) for damage cost calculations is not relevant to the majority of the Proposed Development considering its nature and scheduling. It is therefore anticipated, subject to a review of the revised traffic generation and considering the knowledge of the construction schedule, that damage costs will be calculated for the works at the onshore substation at Oakendene where construction is likely to last longest. This is in line with the HDC RR which highlights that the key concern is potential air quality effects on the Cowfold Air Quality Management Area (AQMA), located near the onshore substation at Oakendene. An Air Quality Mitigation Plan will be produced for the onshore substation at Oakendene.

Ref	Relevant representation comment	Applicant's response
	guidance draws on Defra's methodology for the appraisal of impacts produced by a project. It requires that each application is supported by an air quality mitigation plan detailing measures to mitigate and/or offset the impacts and setting out itemised costing for each proposed measure. 7.16 An effective air quality plan would contain the following elements for each proposed measure: • Costings; • Performance indicators; • Delivery timescales. These are the essential mechanisms that enable authorities to work for the benefit of local communities and public health. It is essential that there is confidence that proper monitoring mechanisms and indicators are established at the outset and reviewed as necessary. 7.17 The proposed Air Quality Mitigation Plan should be informed by local monetisation of air quality impacts. Whilst this may not be a requirement of the National Networks National Policy Statement (NNNPS), this is a matter of local concern, as shown in the local guidance prepared by the Sussex Air Quality Partnership and participating members in 2021. There should be a Damage Cost Calculation for the air quality impacts, and the Transport Analysis Guidance forms the basis for the calculation	
2.5.55	8. Noise and Vibration Construction Phase 8.1 The project will involve construction works in rural areas where background noise levels will be very low, particularly at night. An accurate assessment of noise and vibration impacts should be based on detailed information on the phasing, sequencing, and duration of construction activities. There is no information as to when this detailed information will become available or the type of information that will be provided.	The Proposed Development will involve construction works in rural areas and baseline noise monitoring has been undertaken to characterise receptors existing ambient noise levels. The assessment of construction noise in **Chapter 21: Noise and vibration, Volume 2** of the Environmental Statement (ES) **[PEPD-018]** has considered these. In locations where it was not possible to determine baseline levels, the lowest cut-off levels for construction noise have been used for the assessment. This is considered a robust and conservative approach to the assessment of construction noise. A programme of works will be supplied to the relevant planning authorities prior to onshore construction commencement, identifying the stages of the works, secured by Requirement 10 of the **Draft Development Consent Order [PEPD-009]**. A Noise and Vibration Management Plan will be drafted for each stage, and approved prior to the commencement of that stage, secured by Requirement 22 of the **Draft Development Consent Order [PEPD-009]**.
2.5.56	8.2 The description of the construction works as temporary does not fully reflect the potential for adverse impacts. The construction compounds will be in operation for at least 3 years. Sites along the cable route will also entail construction of haul roads and may host additional works such as cable jointing which further extends the duration of operations at these sites.	BS 5228 (BSI, 2014a) provides criteria for the assessment of noise over a period of time. There will be temporary periods of time where noise will be high outside residences. Timescales of different construction aspects were specified in in Section 21.9 **Chapter 21: Noise and vibration, Volume 2** of the ES **[APP-062]**. In Section 21.15, the assessment concluded that the potential effect during the construction phase will be negligible to minor adverse following the implementation of embedded environmental measures, which is not significant in terms of EIA.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		The **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** outlines management measures and mitigation proposed at all onshore construction areas to reduce the effects relating to noise and vibration from construction of the Proposed Development, including commitments C-10, C-26, and C-263. Commitment C-263 for the production of a Noise and Vibration Management Plan (NVMP) during detailed design based on the principles in the **Outline CoCP** **[PEPD-033]**, detailing best practicable means and location specific mitigation. The NVMP will be based on further assessment on where noisy construction activities, including piling will occur. Additional measures will be considered at these locations, such as mufflers, acoustic shrouds, and temporary noise barriers, where appropriate. The **Outline CoCP** **[PEPD-033]** includes an embedded environmental measure to produce Dust Management Plans for the areas within the proposed DCO Order Limits that are associated with medium dust risk. The **Outline CoCP** **[PEPD-033]** is underpinned by commitment C-24 of the **Commitment Register** **[APP-254]** (updated at Deadline 1 submission) which outlines that '*Best practice air quality management measures will be applied as described in Institute of Air Quality Management (IAQM) (2016) guidance on the Assessment of Dust from Demolition and Construction 2016, version 1.1*'. The **Outline CoCP** **[PEPD-033]** is secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**.
2.5.57	8.3 For construction noise the assessment of impact has been undertaken with regard to Annex E of BS5228-1 and particularly the thresholds of significant effects. Annex E details several methodologies for assessing impacts but for all significant impacts from construction noise are only considered to occur above 65dBLAeqT. As noted above, the works will take part in areas where background noise levels are low and therefore adopting this approach may not fully portray the noise impacts from the construction phase. For longer term construction projects lower noise limits should be considered.	This comment appears to refer to paragraph E.5 in Annex E of British Standard BS5228-1. However, the criteria within E.5 are specifically related to long term earth moving in a single area, akin to surface extraction works, which does not represent the construction activity within the Proposed Development. The Applicant considers that as the advice within Annex E paragraph E.2 is more appropriate. Paragraph E.2 states *"For projects of significant size such as the construction of a new railway or trunk road, historically, there have been two approaches to determining whether construction noise levels could be significant. The older and more simplistic is based upon exceedance of fixed Ise limits..."* Paragraph E.2 provides an example of the fixed limits approach *"Noise from construction and demolition sites should not exceed the level at which conversation in the nearest building would be difficult with the windows shut. The noise can be measured with a simple sound level meter, as we hear it, in A-weighted decibels (dB(A))– see note below. Noise levels, between say 07.00 and 19.00 hours, outside the nearest window of the occupied room closest to the site boundary should not exceed:* • *70 decibels (dBA) in rural, suburban and urban areas away from main road traffic and industrial noise;* • *75 decibels (dBA) in urban areas near main roads in heavy industrial areas.* *These limits are for daytime working outside living rooms and offices. In noise-sensitive situations, for example, near hospitals and educational establishments – and when working outside the normal hours say between 19.00 and 22.00 hours – the allowable noise levels from building sites will be less: such as the reduced values given in the contract specification or as advised by the Environmental Health Officer (a reduction of 10 dB(A) may often be appropriate)."*

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		But E.2 goes on to state that *"The above principle has been expanded over time to include a suite of noise levels covering the whole day/week period taking into account the varying sensitivities through these periods. Examples are provided in E.3.2 (see Table E.1) and in E.4 (see Table E.2), and the levels shown in Table E.2 are often used as limits above which noise insulation would be provided if the temporal criteria are also exceeded."* As such the approach to construction noise assessment within **Chapter 21: Noise and vibration, Volume 2** of the ES **[PEPD-018]** (the ABC method as specified within E.3.2) is consistent with the method as set out by BS5228-1 as being appropriate for the assessment of construction noise related to construction projects of significant size. The Applicant considers that the assessment uses the correct methodology.
2.5.58	8.4 The adoption of the thresholds quoted in Annex E to BS5228-1 as LOAELs and SOAELs is questioned. BS5228-1 does not reference WHO documents and principally relies on publications regarding protection of site workers from noise. The assessment methodology in Annex E states that other project-specific factors, such as the number of receptors affected and the duration and character of the impact, will also determine if there is a significant effect.	The determination of the Lowest and Significant Observable Adverse Effect Levels is on the basis of the semantic description in Planning Practice Guidance – Noise (PPG-N) (Ministry of Housing, Communities and Local Government (MHCLG), 2019) "Noise Exposure Hierarchy". Although the selection of where the lowest observable adverse effect level (LOAEL) and significant observable adverse effects level (SOAEL) for the Proposed Development can be argued, the advice in PPG-N (MHCLG, 2019) is that levels above the LOAEL should be mitigated and reduced to a minimum, and as such by following BS5228-1, the Code of Practice for Construction Noise, noise will be mitigated and reduced to a minimum in line with the planning practice guidance note. The Applicant draws attention to the fact that BS5228-1 is a statutorily supported approach to assessment of construction noise. Section 71 of the Control of Pollution Act 1974 (CoPA74) provides the Secretary of State the power to prepare and approve codes of practice for the purpose of giving guidance on appropriate methods for minimising noise; including the power to approve such codes of practice issued or proposed to be issued otherwise than by the Secretary of State as in the opinion of the Secretary of State are suitable for the purpose. The *Control of Noise (Code of Practice for Construction and Open Sites) (England) Order 2015* approves BS5228- 1 as the code of practice for assessing construction noise under Section 71 of CoPA74. That the standard does not refer to World Health Organisation (WHO) guidelines (1999; 2009) does not diminish its standing as the primary resource in the UK by which, construction noise significance is established and the mechanisms by which such noise should be controlled.
2.5.59	8.5 It is important to ensure the potential noise impacts for the receptors are fully understood beyond the narrow confines of BS5228-1. The Applicant should illustrate the potential magnitude of the noise impacts by comparing the predicted construction noise levels to the existing ambient noise levels at each receptor location.	British Standard BS5228-1 is the Secretary of State (SoS) recommended guidance for construction noise. The Applicant has illustrated the potential magnitude of the noise impacts by comparing the predicted construction noise levels to the existing ambient noise levels at each receptor location. The Applicant has assessed the magnitude of impact with reference to BS5228-1 Annex E which states *"Noise levels generated by site activities are deemed to be potentially significant if the total noise (pre-construction ambient plus site*

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		noise) exceeds the pre-construction ambient noise by 5 dB or more, subject to lower cut-off values of 65 dB, 55 dB and 45 dB from site noise alone, for the daytime, evening and night-time periods, respectively; and a duration of one month or more, unless works of a shorter duration are likely to result in significant effect."
2.5.60	8.6 The methodology for the identification of receptors is not clearly explained. This is important for establishing if all relevant receptors have been identified and factors such as differences in topography have been included in determining the predicted construction noise levels.	Although certain receptors are named as being representative, and these will generally be the nearest receptor to an element of the works, all receptors within the Study Area, which is defined within Section 21.4 of the **Chapter 21: Noise and vibration, Volume 2** of the Environmental Statement (ES) **[PEPD-018]**, have been assessed. Topography is included in the noise models and assessed accordingly.
2.5.61	8.7 Noise sensitive receptors for short term works such as cable route construction are not considered. These works may be of limited duration, but this doesn't mean the noise impacts should not require assessment and mitigation, particularly when mobile plant such as generators are deployed. The construction of haul roads and cabling works could extend the periods of noisy activity close to sensitive receptors beyond the 10 days presumed for cable route construction.	8.7 Although a quantitative assessment may not have been carried out for such works as the onshore cable installation, it would be incorrect to say no assessment has been undertaken, as the cable route is assessed qualitatively in paragraphs 21.9.46 to 21.9.53 within **Chapter 21: Noise and vibration, Volume 2** of the ES **[PEPD-018].** The assessment within **Chapter 21: Noise and vibration, Volume 2** of the ES **[PEPD-018]** concludes that the potential effect during the construction phase will be negligible to minor adverse following the implementation of embedded environmental measures, which is not significant in terms of EIA. The **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** outlines management measures and mitigation proposed at all onshore construction areas to reduce the effects relating to noise and vibration from construction of the Proposed Development, including Commitments C-10, C-26, and C-263 (**Commitments Register** **[APP-254]** updated at the Deadline 1 submission). Commitment C-263 includes the production of a Noise and Vibration Management Plan (NVMP) during detailed design based on the principles in the **Outline CoCP** **[PEPD-033]**, detailing best practicable means and location specific mitigation and secured by Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. The NVMP will be based on further assessment on where noisy construction activities, including piling will occur. Additional measures will be considered at these locations, such as mufflers, acoustic shrouds, and temporary noise barriers, where appropriate.
2.5.62	8.8 Short term works are also excluded from the consideration of cumulative impacts on the grounds these will be of limited duration. Given the uncertainties regarding the potential phasing, duration and impacts of such works this exclusion is not justified.	The works excluded from cumulative assessment are those that are of such a short duration that it would not be possible to quantify any such accumulation. The construction work for the Proposed Development has potential to affect the areas closest to the trenching line for a short duration whilst the works occur in that location, then once complete the works will move along the onshore cable route and not impact receptors. However, this temporary impact will not be significant.
2.5.63	8.9 Noise impacts from trenchless crossings at night are a concern. Predicted night noise levels have identified receptors significantly above BS5228 threshold screening adopted in the Environmental Statement. It is proposed that screening will be deployed to reduce these impacts. The effectiveness of screening will depend on several factors. These include the height, mass and length of the barrier and the position of noise source relative to the identified receptor. Noise from construction equipment contains particular frequency components and these are not all attenuated to the same degree by a barrier. It should not be assumed the predicted mitigation will be achieved.	Experience of monitoring noise from construction sites gives the Applicant confidence that using temporary acoustic screening is a suitable mitigation strategy. The diminishment of performance over certain frequencies is a valid concern, nevertheless, with mitigation measures applied, significant effects are avoided. The **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** outlines management measures and mitigation proposed at all onshore construction areas to reduce the effects relating to noise and vibration from construction of the Proposed Development, including

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		Commitments C-10, C-26, and C-263 (**Commitments Register** **[APP-254]** updated at the Deadline 1 submission). Commitment C-263 includes the production of a Noise and Vibration Management Plan (NVMP) during detailed design based on the principles in the **Outline CoCP** **[PEPD-033]**, detailing best practicable means and location specific mitigation and secured by Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. The NVMP will be based on further assessment on where noisy construction activities, including piling will occur. Additional measures will be considered at these locations, such as mufflers, acoustic shrouds, and temporary noise barriers, where appropriate.
2.5.64	8.10 An Outline Code of Construction Practice (CoCP) has been provided which confirms that stage specific CoCP will be submitted along with a Noise and Vibration Management Plan (NVMP). These documents will detail the mitigation measures to be adopted but have yet to be submitted. This results in considerable uncertainty as to the deployment and efficacy of the mitigation measures. Noise levels above the predicted levels will only be addressed retrospectively which would severely limit the ability to resolve such impacts.	**Chapter 21: Noise and vibration, Volume 2** of the ES **[PEPD-018]** assessment concluded that the potential effect during the construction phase will be negligible to minor adverse following the implementation of embedded environmental measures, which is not significant in terms of EIA. The **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** outlines management measures and mitigation proposed at all onshore construction areas to reduce the effects relating to noise and vibration from construction of the Proposed Development, including Commitments C-10, C-26, and C-263 (**Commitments Register** **[APP-254]** updated at the Deadline 1 submission). Commitment C-263 includes the production of a Noise and Vibration Management Plan (NVMP) during detailed design based on the principles in the **Outline CoCP** **[PEPD-033]**, detailing best practicable means and location specific mitigation and secured by Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. The NVMP will be based on further assessment on where noisy construction activities, including piling will occur. Additional measures will be considered at these locations, such as mufflers, acoustic shrouds, and temporary noise barriers, where appropriate.
2.5.65	8.11 The noise impacts are assessed on the basis that most of the site works will take place in the normal weekday hours (07:00 to 19:00). The need for additional working outside these times should be limited to emergency works only and should not be relied on.	Working hours are stated in Section 4 of **Chapter 4: The Proposed Development, Volume 2** of the ES **[APP-045]** and are outlined in Section 4.4 of the **Outline Code of Construction Practice** **[PEPD-033]**. Following receipt of Relevant Representations and information shared at Issue Specific Hearing 1, C-22 within the **Commitments Register** **[APP-254]** has been updated at the Deadline 1 submission to the following: '*Core working hours for construction of the onshore components will be 08:00 to 18:00 Monday to Friday, and 08:00 to 13:00 on Saturdays, apart from specific circumstances that are set out in the Outline COCP, where extended and continuous periods of construction are required.* *Prior to and following the core working hours Monday to Friday, a 'shoulder hour' for mobilisation and shut down will be applied (07:00 to 08:00 and 18:00 to 19:00). The activities permitted during the shoulder hours include staff arrivals and departures, briefings and toolbox talks, deliveries to site and unloading, and activities including site and safety inspections and plant maintenance. Such activities shall not include use of heavy plant or activity resulting in impacts, ground breaking or earthworks.'*

Ref	Relevant representation comment	Applicant's response
		This has been updated in the **Outline Construction Traffic Management Plan [PEPD-035a]** for the Deadline 1 submission and will be updated in the **Outline Code of Construction Practice [PEPD-033]** for the next submission of this document. As outlined in the **Outline Code of Construction Practice [PEPD-033]**, no activity outside these hours (including Sundays, public holidays, or bank holidays) will take place apart from under the following circumstances: • Where continuous periods (up to 24 hours, 7 days per week) of construction work are required for HDD (as HDD is a continuous activity that cannot be paused once started); • for other works requiring extended working hours such as concrete pouring which will require the relevant planning authority to be notified at least 72 hours in advance; • or the delivery of abnormal loads to the connection works, which may cause congestion on the local road network, and will require the relevant highway authority to be notified at least 72 hours in advance; or • as otherwise agreed in writing with the relevant planning authority. Any out of work hours beyond those listed above will be detailed by a Section 61 application of the Control of Pollution Act 1974 with agreement sought by the relevant Local Planning Authority. Commitment C-263 includes the production of a Noise and Vibration Management Plan (NVMP) during detailed design based on the principles in the **Outline Code of Construction Practice [PEPD-033]**, which is secured by Requirement 22 of the **Draft Development Consent Order [PEPD-009]**.
2.5.66	8.12 The proposals for construction noise monitoring are inadequate for a project of this scale and duration. Construction noise monitoring should be undertaken proactively by the developer to ensure that the site works are complying with required target noise limit. Compliance checking should be undertaken regularly at every location where noise sensitive receptors may be impacted by noise arising from construction activities. It should not be for the local planning authorities to resource routine compliance checking of the developer's construction noise targets.	The **Outline Code of Construction Practice [PEPD-033]** is secured through Requirement 22 of the **Draft Development Consent Order [PEPD-009]** and provides the relevant planning authority the opportunity to request that construction noise monitoring is undertaken during specific activities or at specific receptors as outlined in paragraph 5.4.15. The requirement for noise monitoring will be identified by the Contractor(s) based on the confirmed list of plant and equipment and construction programme and a monitoring framework will be provided in the stage specific Noise and Vibration Management Plan (NVMP). The monitoring proposals are equivalent to other Nationally Significant Infrastructure Projects of this size and nature.
2.5.67	8.13 There are no sanctions or penalties proposed in the draft DCO to deal with noncompliance with the construction noise and vibration targets. The procedure for arbitration set on 15 of the DCO is unlikely to respond effectively to identified noncompliance with the CoCP or NVMP's.	The measures to control noise and vibration during the construction phase will be outlined within a Noise and Vibration Management Plans that is to be discharged for each relevant stage, in accordance with Requirement 22 of the **Draft Development Consent Order [PEPD-009]**. Measures for noise control during the operation and maintenance phase will be secured through Requirement 28 of the **Draft Development Consent Order [PEPD-009]**. The local planning authority is the enforcing body for compliance with a made Development Consent Order, under Section 161 of the Planning Act 2008, which states that a person commits an offence if they fail to comply with the terms of an order granting development consent.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.5.68	8.14 The Construction Communications Plan should include provision for regular local meetings with representatives for the communities where the construction compounds will be sited. The costs should be met by the developer.	Section 2.6 within the **Outline Code of Construction Practice (CoCP) [PEPD-033]** provides an overview of the community liaison approach during the construction phase in and states that the Applicant will produce a Construction Communications Plan prior to the commencement of construction for approval with the relevant planning authorities and this will be secured through Requirement 22 of the **Draft Development Consent Order [PEPD-009]**. The Construction Communications Plan will: • outline the Proposed Development; • build on stakeholder engagement carried out throughout development to strengthen relationships with key stakeholder organisations and individuals, alongside the wider community; • identify a range of communication tools, methods and opportunities to reach this target audience and enable them to reach the construction team; • include a range of communication materials designed to reach the target audience; • include a series of tailored Communication and Mitigation Plans to provide more detail for local communities along the 38.8km onshore cable route; • produce dedicated Communications Plans for special interest user groups; and • such as fishers, diver and public rights of way users; and set out the complaints procedure.
2.5.69	8.15 The volume of HGVs and the consequential impacts on noise levels experienced by receptors is not predicted to be of a level of warrant.	Noted, the Applicant has no further comments on this matter at this time.
2.5.70	8.16 In terms of construction noise, the draft DCO provides for a written scheme for noise management to be agreed with HDC. This, combined with limited the working hours and 22 deployment of appropriate mitigation to further reduce disturbance set out in the outline CoCP, should control noise impacts during construction to an acceptable level.	The Applicant welcomes Horsham District Council's relevant representation and has no further comments on this matter at this time.
2.5.71	Operational Phase 8.17 From reviewing Table 21-20 'Relevant noise and vibration embedded environmental measures' HDC notes that the following is stated under Commitment C-231 - The detailed substation design will be built and operated such that the Rating levels (noise emissions plus any character correction) do not exceed the following noise levels at the private amenity space associated with the closest residential receptors.	Noted, the Applicant has no further comments on this matter at this time.
2.5.72	8.18 Given the low background noise levels in this part of our District, in particular during the nighttime hours, HDC considers that the proposed rated noise levels are too high and are at level where adverse impacts may be expected. 8.19 From reviewing Table 21-38 'Operational noise assessment – Onshore substation Unmitigated' it is apparent that the rated level during the night time hours (2300 – 0700) to be +7 above background at Oakendene Manor, +6 above background at Southlands and +5 above background at Westridge. From reviewing Table 21-39 'Operational noise	The low background sound levels are acknowledged, although it is understood that Horsham District Council would prefer that the Rating levels from such electrical infrastructure is mitigated to as low as level as possible, the assessment has to consider a range of factors in arriving at suitable limits British Standard (BS) 4142 (British Standard Institution (BSI), 2019) states *"Where the initial estimate of the impact needs to be modified due to the context, take all pertinent factors into consideration, including the following.*

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	assessment – Onshore substation Mitigated' it is apparent that even with proposed mitigation the rated levels at Oakendene Manor during the night-time hours are still +5dB above background. 8.20 It is appreciated that report states that in accordance with the IEMA Assessment (2014) that the magnitude of change is 'very low'. However, with the above in mind, BS4142 makes it very clear however that the greater the noise level above background the greater the magnitude of impact, and, that a difference of +5dB is likely to be an indication of an adverse impact.	*1) The absolute level of sound. For a given difference between the rating level and the background sound level, the magnitude of the overall impact might be greater for an acoustic environment where the residual sound level is high than for an acoustic environment where the residual sound level is low.* *Where background sound levels and rating levels are low, absolute levels might be as, or more, relevant than the margin by which the rating level exceeds the background. This is especially true at night."* Earlier versions of BS4142 defined +5dB as the onset of adverse impact, the current revision BS4142:2014 +A1:2019 is more nuanced (though it should also be recognised that the earlier versions of the standard (e.g. BS4142:1997) did include low background level cut-off below which the standard did not apply. The Association of Noise Consultants (ANC) Good Practice Working Group prepared a technical note on the use of the BS4142:2009 +A1:2019 (ANC, 2020 *BS 4142:2014+A1:2019 Technical Note*). The Technical Note, although being a discussion as opposed to a prescriptive guide, is considered within the industry to be an authority on how to interpret the technical elements of the standard. The Technical Note states *"BS 4142 does not indicate how the initial estimate of impact should be adjusted when background and rating levels are low, only that the absolute levels may be more important than the difference between the two values. It is likely that where the background and rating levels are low, the absolute levels might suggest a more acceptable outcome than would otherwise be suggested by the difference between the values. For example a situation might be considered acceptable where a rating level of 30dB is 10dB above a background sound level of 20dB, i.e. an initial estimate of a significant adverse impact is modified by the low rating and background sound levels may be situations where the opposite is true, and it is for the assessor to justify any modifications to the initial estimate of impact. BS 4142 does not define 'low' in the context of background sound levels nor rating levels. The note to the Scope of the 1997 version of BS 4142 defined very low background sound levels as being less than about 30 dB LA90, and low rating levels as being less than about 35 dB LAr,Tr. The WG suggest that similar values would not be unreasonable in the context of BS 4142, but that the assessor should make a judgement and justify it where appropriate.*" **Chapter 21: Noise and vibration, Volume 2** of the Environmental Statement **[PEPD-018]** makes these points and also ties the criteria used to World Health Organisation ((WHO), 2009) evidence to demonstrate that night operational rating levels are not significant at the proposed level of 35 decibels (dB).
2.5.73	8.21 It is also noted that the following is stated in section—1.3 of BS4142 - The standard is not applicable to the assessment of low frequency noise. Information on the assessment of low frequency noise is given in NANR45. Given the low frequency noise associated with the proposed substation HDC is of the view that an assessment in accordance with NANR45 is required in support of this application.	The ANC (2020) Technical Note on BS 4142 *BS 4142:2014+A1:2019 Technical Note* states " *Sound referred to as low frequency in NANR45 is energy within the 10 – 160 Hz frequency range. The Working Group considered that BS 4142 does not necessarily exclude such a wide range. It would be reasonable to use BS 4142 down to 50 Hz and possibly lower as part of a tonality assessment, for example*." This point was discussed with Horsham District Council (HDC) via email in August 2022. HDC Environmental Protection Officers stated at the time "*From re-visiting the ANC Technical Note I would like to make the following comments. We note the following is stated in the Technical Note it would be reasonable to*

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		use BS 4142 down to 50 Hz and possibly lower as part of a tonality assessment, for example. Given this we are of the view that an objective assessment of the tonal noise should form part of assessment...."
2.5.74	8.22 Further to the above it is noted that the following is stated Further discussion was undertaken with regard to low frequency noise. It was agreed with HDC that the assessment methodology within BS 4142:2019 (BSI, 2019) was sufficient to assess the effects of low frequency noise at the nearest noise sensitive receptors. HDC commented that BS 4142:2019 is not applicable to assess ground borne low frequency noise. These comments remain valid.	Although the representation mentions ground borne noise, such operational ground borne noise generation is not likely with the plant being installed. It is assumed that the author meant airborne noise. Following discussion with Horsham District Council (HDC) (August 2022, as stated in **reference 2.5.73** above), the Applicant undertook the assessment of low frequency noise to guidance standards (NANR45) in agreement with HDC. As this approach was previously agreed with HDC, the Applicant would like to understand the potential contradiction between the previous discussion with HDC and this comment in their RR.
2.5.75	8.23 In summary on operational phase, mitigated noise impacts at identified receptors are reliant on specific physical mitigation measures to be adopted at the substation including harmonic filter dampening, dampening and enclosures for transformers etc. Whilst it is understood that such mitigation would be secured where necessary to achieve noise specified noise limits, given the low background noise levels in part of the district, as quantified in the background noise monitoring, and given the impact from low frequency noise, as detailed above, HDC are of the view that the noise impacts have not been fully assessed and that noise levels below the levels as detailed in Commitment C-231 could still result in significant noise impact to residential amenity.	Horsham District Council (HDC) refers above in 8.18 (**reference 2.5.72**) that adverse impacts could be experienced due to the approximately +5dB difference between background and rating levels. As per the Applicant's response in **reference 2.5.72** above, the Applicant disagrees with this position. The suggestion that significant adverse impacts would be possible even if proposed limits are met has no basis in the guidance from BS4142 (British Standard Institution, 2019) or in the Noise Policy Statement for England (Department of Energy and Climate Change, 2010), or Planning Practice Guidance – Noise (Ministry of Housing, Communities and Local Government, 2019).
2.5.76	9. Transport 9.1 The focus of this RR is on the traffic and transport implications of the onshore elements of the proposals; the construction of the cable route and associated works; and permanent works including the Oakendene substation and vehicle accesses on the West Sussex transport network. 9.2 The Council endorses the comments of West Sussex County Council (WSCC) as the Local Highways Authority for Horsham District regarding the above matters. It is understood that reviewing the transport modelling work may be subject to further updates from the Applicant. In the first instance, HDC raises the following concerns:	The environmental effects of the construction traffic have been assessed in **Chapter 23: Transport, Volume 2** of the ES **[APP-064]** and the **Chapter 32: ES Addendum, Volume 2** of the ES **(Reference 6.2.32)** provided at the Deadline 1 submission. The Applicant has regularly engaged with West Sussex County Council during the pre-DCO Application stage and will continue to do so during the Examination with an aim of resolving any outstanding concerns.
2.5.77	Assessment Methodology 9.3 The assessment has been undertaken in accordance with rescinded and replaced guidance from IEMA, Guidelines for Environmental Impact Assessment of Road Traffic (1993). This was replaced in July 2023 by Environmental Assessment of Traffic and Movement. The ES should be reviewed against the latest guidance and as necessary amended.	Use of the Guidelines for the Assessment of Road Traffic (1993) was defined within the Applicant's request for an EIA Scoping Opinion submitted to the Planning Inspectorate on 2 July 2020 and following consultation with WSCC prior to the DCO Application being submitted. At the time of writing the Environmental Statement **Chapter 23: Transport, Volume 2** of the ES **[APP-064]** in early 2023 the new Institute of Environmental Management and Assessment (IEMA) (2023) Guidance Environmental Assessment of Road Traffic and Movement (July 2023) had not been published. The Applicant will provide a note on the principal differences between the 1993 and 2023 Institute of Environmental Management and Assessment's (IEMA) Traffic Assessment Guidance (IEMA, 1993; 2023) documents and whether there would be difference in the outcome of the assessment if the latter was used at the Deadline 2 submission.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.5.78	9.4 WSCC is content with the base data used within the assessment. This data includes traffic surveys of all routes that will be used by construction traffic.	The Applicant has no further comments on this matter at this time.
2.5.79	Assessment of Effects 9.5 For the purposes of the transport network, it is acknowledged that most effects will occur during the construction phase and, as such, will be temporary in nature (albeit for an approximately four-year period). Once operational, traffic impacts will be minimal. Details of permanent, operational accesses, including that serving the onshore substation, are yet to be agreed with WSCC.	The environmental effects of the construction traffic have been assessed in **Chapter 23: Transport, Volume 2** of the ES **[APP-064]** and the **Chapter 32: ES Addendum, Volume 2** of the ES **(Reference 6.2.32)** provided at the Deadline 1 submission. The Applicant has entered into discussions with West Sussex County Council regarding the design requirements for key permanent access junctions, including at the onshore substation at Oakendene, with a view of reaching an agreement in principle on the proposals before the end of the Examination.
2.5.80	9.6 There remain areas of concern relating to transport matters as presented in the DCO submission documents. These relate primarily to construction phase impacts on the West Sussex transport network, and the concern about the measures outlined in the OCTMP (APP-228).	The **Outline Construction Traffic Management Plan** **[PEPD-035a]** (updated at Deadline 1 submission) includes mitigation measures to limit the effects of construction traffic associated with the Proposed Development. The Applicant will continue to discuss construction phase effects with West Sussex County Council with a view of resolving areas of concern prior to the end of the Examination.
2.5.81	9.7 The number, size, timing, and routeing of HGV (an abnormal load) vehicles is a substantive concern of local communities. HDC is aware of the strong feeling on this issue expressed by parishes at Storrington, Washington, and Cowfold and their local communities. The concerns also relate to the suitability of such vehicles on rural roads and general disturbance from increased level of activity.	The **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** includes details of required construction traffic routing for the Proposed Development. Heavy Goods Vehicle (HGV) traffic will avoid travelling through Cowfold and Storrington where possible as detailed in Table 5-2 of the **Outline CTMP** **[PEPD-035a]** and commitments C-157 and C-158 **Commitment Register** **[APP-254]** (provided at Deadline 1 submission). The **Outline CTMP** **[PEPD-035a]** is secured through Requirement 24 of the **Draft Development Consent Order** **[PEPD-009]**.
2.5.82	9.8 HDC shares concerns over the need for safe access to works and the need to encourage sustainable travel by workers. WSCC's highway assessment of the proposal will address these two matters in greater detail, amongst all other technical transport matters, reflective of their role as Local Highway Authority. HDC defers to the expert opinion of WSCC on whether the proposed visibility splay improvements and swept path diagrams, and proposed delivery numbers across the construction period, demonstrate the development area is accessible safely by way of temporary construction access and access routes.	The **Outline Construction Workforce Travel Plan (CWTP)** **[APP-229]** sets out principles for managing the effects of travel by construction personnel during the construction phase. The **Outline CWTP** **[APP-229]** sets out a plan to maximise the sustainability of travel methods used to get to and from onshore sites, as well as minimise the impacts on the local road network and by the association the local communities and road users in West Sussex. The **Outline CWTP** **[APP-229]** is secured through Requirement 24 of the **Draft Development Consent Order** **[PEPD-009]**. The Applicant has entered discussions with West Sussex County Council regarding junction design with a view of overcoming any areas of concern before the end of the Examination.
2.3.83	Mitigation, Compensation and Enhancement 9.9 The focus of the highway assessment provided by the Applicant is on the construction phase, which has been accepted by WSCC given the anticipated increase in traffic flows during this time compared with the operational phase. Although an OCTMP has been 24 submitted by the Applicant to provide mitigation during construction, there are several concerns set out below. i) Those relating to the physical construction access arrangements, including the overall number of accesses and the ability to achieve necessary visibility splays at identified accesses (including those to the main construction compounds).	It is noted that HDC's representation is the same as West Sussex County Council's (WSCC) in relation to Comment 9.9 (including i), ii) and iii) and 9.10. The Applicant's responses provided in **reference 2.3.31** have been included below. The **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** includes mitigation measures to limit the effects of construction traffic associated with the Proposed Development. The Applicant will continue to discuss construction phase effects with WSCC with a view of resolving areas of concern prior to the end of the Examination. In addition, the Applicant provides the following responses to the specific points made by WSCC and HDC:

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	ii) Areas where additional mitigation is necessary, including the provision of road safety audits and the management of traffic on single track roads. iii) Aspects where clarification is required or where information appears to be missing from the submitted information. This includes numbered accesses being missing or construction vehicle trips being absent from tables within the OCTMP. 9.10 HDC shares concerns over the need for safe access to works and defers to WSCC on whether the visibility splay and swept path diagrams, and proposed delivery numbers across the construction period, demonstrate the development area is accessible safely. 9.11 Additional comment is made in respects of measures within the Outline Operational Travel Plan (OOTP) (APP-227), set out below. i) In reviewing the submitted information, it is acknowledged that some construction traffic will route through the Air Quality Management Area (AQMA) in Cowfold. For the purposes of traffic routing, this traffic will make use of A-classed roads (the A281, which runs north to south, and the A272, which runs east to west). Notwithstanding the AQMA, considering their classification, these roads are appropriate for construction traffic. Further mitigation measures will nevertheless be expected for the purposes of managing traffic through the AQMA and Cowfold itself, and WSCC expects this traffic to be reduced to the minimum where possible. ii) Mitigation will need to be agreed for the end-of-life decommissioning. A commitment should be secured as part of the DCO requiring a decommissioning construction traffic management plan to be submitted and agreed with WSCC. This CTMP should be provided and agreed prior to decommissioning works commencing.	i). Section 4.4 of the **Outline CTMP** **[PEPD-035a]** provides details of visibility splay requirements for construction access junctions. Where it is proposed to use an existing farm gate accesses or farm tracks a visibility splay in accordance with Design Manual for Roads and Bridges will be provided by coppicing. Where this is not possible (for example due to ecological reasons) these accesses will be managed through traffic management. Further to this, the Applicant is also in discussion with WSCC on the visibility splays requirements at key accesses, with speed surveys being completed to inform visibility splay requirements. These speed surveys will be used to inform the requirements set out in the **Outline CTMP** **[PEPD-035a]** and access designs where these are being undertaken. ii). The Applicant is in discussion with WSCC on the requirements for Road Safety Audits and management of single-track roads. The Applicant will continue to discuss construction phase effects with WSCC with a view of resolving areas of concern prior to the end of the examination. iii). An updated to the **Outline CTMP** **[PEPD-035a]** was submitted at Procedural Deadline 1 which corrected these errors. On point 9.11 The Applicant believes that references to points i) and ii) is an error in HDC's relevant representation as these points do not refer to the Operational Travel Plan. However, the Applicant will discuss the **Outline Operational Travel Plan** **[APP-227]** with WSCC and will address any WSCC outstanding concerns during the Examination. The **Outline CTMP** **[PEPD-035a]** contains details of required construction traffic routing for the Proposed Development. Where possible HGV traffic has been routed via the A23 and from the east along the A272 avoiding Cowfold. Heavy goods vehicle (HGV) traffic has been minimised as much as possible as detailed paragraph 1.2.5, Commitment C-157 and C-158 **Commitment Register** **[APP-254]** (provided at Deadline 1 submission). Further discussions will be held with WSCC to establish appropriate mitigation measures for the Air Quality Management Area (AQMA) and Cowfold for inclusion within the **Outline CTMP** **[PEPD-035a]** secured by Requirement 24 within **Draft Development Consent Order (DCO)** [PEPD-009. ii) As stated in the **Outline CTMP** **[PEPD-035a]**, the decommissioning phase is anticipated to involve the removal and reinstatement of the onshore substation site at Oakendene and the existing National Grid Bolney substation extension. The onshore cable will be left in situ during the decommissioning phase. The decommissioning works are likely to be undertaken in reverse to the sequence of construction works and involve similar levels of equipment but much reduced numbers of vehicles for decommissioning. Paragraph 3.81 within the **Outline CTMP** **[PEPD-035a]** states that a decommissioning plan and programme will be developed prior to construction and updated during operation of Proposed Development to account for any changes to decommissioning best-practice and developments in technology. For onshore decommissioning, Requirement 34 within the **Draft Development Consent Order** **[PEPD-009]** secures the provision of an onshore

Ref	Relevant representation comment	Applicant's response
		decommissioning plan with must be submitted to and approved by the relevant planning authorities.
2.5.84	9.12 Further mitigation for the purposes of managing traffic through the AQMA and Cowfold could include but not limited to: limits on all vehicular traffic in terms of volumes, timings, restricted hours, and duration of movements. detailed Phasing Strategy of the project. traffic monitoring and management details, with penalties and mitigation set out for exceeding limits. co-ordinated traffic flows limit, duration limits, time periods limits (e.g. limits on all vehicular traffic movements and measures to adhere to these limits; confirmation of the size of vehicles to access each part of the construction route network; restriction on movements between temporary compounds to outside the peak hours; requirement upon the applicant to secure agreement on the number of vehicles that can access the temporary compounds during peak hours; provide for HGV timing restrictions to be implemented where access routes coincide with access to school routes and to account for variations associated with the agricultural and tourism seasons; measures to ensure HGVs are marked in such a way that the public can associate them with Rampion 2 for monitoring and enforcement purposes. pre and post construction surveys to ensure any damage to the highway is remediated. review mechanisms should be set up to full range of impacts monitor and unforeseen consequences as the project develops, to review the adequacy of mitigation or compensation measures and adjust as necessary.	The **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** includes mitigation measures to limit the effects of construction traffic associated with the Proposed Development. Details of mitigation strategies, management and enforcement of construction traffic movements is contained within Section 8 and 9 of the **Outline CTMP** **[PEPD-035a]**. Further details of these measures will be contained within stage specific CTMPs secured through Requirement 24 of the **Draft Development Consent Order** **[PEPD-009]** and prior to construction of that stage of works which will follow the controls defined within the **Outline CTMP** **[PEPD-035a]**. These will be agreed with the Local Highway Authority (West Sussex County Council) in consultation with Horsham District Council.
2.5.85	10. Socio-economics 10.1 The Development Proposal presents opportunities for local businesses to become part of the on-and-offshore supply chain and provision of indirect services. However, it is not clear whether any local job opportunities would be created through the development to Horsham District, for example during the construction phase. Whilst the DCO provides for an Outline Skills and Employment Strategy document, with a commitment to a Supply Chain Plan, this Strategy does not provide sufficient detail on, amongst other things, tailored local initiatives; outputs; and approach to monitoring. There does not appear to have been any evidenced engagement with education, training and employment support providers based within the district. This will be critical in the delivery of the wider benefits. 10.2 Concerns have been expressed to Horsham District over the implications on rural landbased enterprises during both construction and operational phases, including for agricultural operations once the cable has been installed, i.e., whether it would be buried deep enough, and whether the width of the cable corridor could be justified. 10.3 The ES states that within the permanent easement land operations would be able to continue as normal. The Outline Code of Construction Practice (COCP) sets out how the construction methods to be deployed to ensure drainage patterns are interrupted as little as possible and that, where possible, trenches will be backfilled with onsite arising, with material returned in the order they were extracted. Consequently, to the best of HDC's	The **outline Skills & Employment Strategy (oSES)** **[APP-256]** submitted with the DCO Application was intentionally high-level and the Applicant was not in a position to document concrete commitments without further consultation with key skills and employment stakeholder organisations in Sussex. The first tranche of consultation took place between July and October 2023 and included meetings with Science, Technology, Engineering and Maths (STEM) Learning UK and Sussex Chamber of Commerce. The results of this consultation have fed into the second iteration of the **oSES** **[PEPD-037]**, submitted to the Examining Authority in January 2024. This latest version of the **oSES** **[PEPD-037]** includes seven additional key skills & employment stakeholder organisations, including Horsham District Council and the Institute of Technology Sussex. Meetings will be held with these stakeholders in early 2024. Tailored education, training and employment initiatives are already documented in Section 16, Page 13, which will be further developed during the subsequent consultation. In relation to outputs and monitoring, Paragraph 43 of the **oSES** **[PEPD-037]** highlights that, '*Further consultation will be held with the stakeholders listed in Table 4 forming the basis of commitments within a subsequent Skills and Employment Strategy which will include greater detail on timelines, monitoring and commitments*'.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	understanding, impacts on land estate use and/or agricultural activities should be minimised. HDC would urge the Applicant to ensure this is the case through liaison with individual landowners. If the land became sterilised, this could have consequential impacts for the character of landscape, towards food security, as well as tackling climate change and securing ongoing financial stability and viability for the farm holding, should land use change be enforced. 10.4 The ES provides an adequate assessment of effects, except for the possible impact on tourist accommodation and cumulative effects. HDC accept the development would not have significant negative effects on the tourism industry for its own administrative area (as the Outline Public Rights of Way Management Plan sets out measures to manage and mitigate effects on PRoW network) but query if impact on the businesses located in Oakendene Industrial Estate have been sufficiently assessed. 10.5 It is noted access for routine checking and maintenance will be via manhole covers to the buried joint bays, which wherever possible will not be sited under PRoW or within Access Land. This should be extended to a commitment to this applying this also to the Local Green Spaces namely; Washington Recreation Ground, The Triangle, and Jockey's meadow. In the unlikely event that cable repairs and/or replacement is required, this will be implemented via the existing joint bays situated outside of these important green spaces and will not require new excavation. HDC would welcome a Commitment to the Applicant liaison group with Washington Parish to help address any matters arising from disruption to the recreation ground over the construction phase.	Following this next series of consultation meetings and the examination itself, the Applicant will produce a final Skills & Employment Strategy (SES) outlining key objectives, initiatives and activities, and details on timelines and monitoring. Section 6 paragraph 6.1.2 within the **Outline Soils Management Plan (SMP)** [APP- 226] secured via Requirement 22 of the **Draft Development Consent Order** **[APP-009]** states *'A pre-construction drainage programme will be necessary to divert drainage systems which will be intercepted by the works, in order to prevent waterlogging of the trench during working. This work is likely to involve the installation of one or more land drains complete with permeable fill installed parallel to intercept soil and groundwater before it reaches the trench. The Outline CoCP (Document Reference: 7.2) includes measures to ensure that the condition of existing drainage systems are appropriately maintained and restored*'. The assessment within **Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]** explores the impact on tourism and finds that overall, when all influencing factors are considered, the effect of the Proposed Development on the volume and value of tourism across Sussex is expected to be negligible across employment, gross value added, volume and value of the tourism economy, access to and enjoyment of onshore recreation activity, which is considered not significant in EIA terms. **In addition to this, the Applicant has included a number of commitments** specifically included to maximise the benefits of all project phases (construction, operation, and decommissioning) on the local economy and the local employment benefits: • C-34 RED will identify opportunities for companies based or operating in the region to access supply chain for the Proposed Development. • C-35 RED will work with local partners and seek to maximise the ability of local people to access employment. The Applicant will consider HDCs Representation with respect to extending commitment to Local Green Spaces namely; Washington Recreation Ground, The Triangle, and Jockey's meadow.
2.5.86	11. Historic and Water Environments Above ground Heritage Assets 26 11.1 HDC is satisfied all above ground heritage assets within Horsham District have been identified in the document Category 6: Environmental Statement Volume 4, Appendix 25.1: Gazetteer of onshore heritage assets. 11.2 HDC considers there has been an appropriate consideration of impact to designated and non-designated heritage assets. The Applicant has undertaken a comprehensive survey of assets and the impact of the development.	The Applicant welcomes Horsham District Councils (HDC's) acknowledgement that all above ground heritage assets within Horsham District have been identified and that there has been appropriate consideration of impact to designated and non-designated heritage assets including a comprehensive survey of assets.
2.5.87	Impact along cable routing	The acknowledgement that there will be no lasting impact within the setting of the heritage assets is welcomed by the Applicant.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	11.3 The cabling through Horsham District will be buried and no above ground cabling infrastructure will remain once the project is completed (except for manhole covers to the buried joint bays). There will be impact within the setting of several listed buildings as described in Volume 4, Appendix 25.7: Settings assessment scoping report. This impact will last the duration of the construction phase of the project. The impact of trenching, service roads and compounds, lighting, vehicular movement, other activity, and noise will have a harmful impact within the setting of various designated and nondesignated assets. However, this impact will be relatively short term and have no lasting impact within the setting of the heritage assets. 11.4 The making good of ground and restoration of hedgerows and other landscape features is essential in ensuring there are no long-term impacts once the construction phase is completed. The approach to mitigating construction impact is described in Category 7: Other Documents Outline Code of Construction Practice. Section 4.10 states the principles of reinstatement of land. This approach is agreeable. 11.5 Although there will be short term impact within the setting of the conservation area in Washington Village whilst the recreation ground is partially utilised during the construction phases, this impact will cease once this phase of the work is complete. HDC has no concern regarding above ground heritage in Washington village.	The Applicant welcomes Horsham District Council's support on the approach to the reinstatement of land.
2.5.88	The Oakendene substation 11.6 The Oakendene substation will be visible following completion of the project. The extent of potential visual impact is illustrated in Volume 3, Chapter 25: Historic environment – Figures (Part 4 of 5) This will have an impact within the setting of Oakendene Manor, a grade II listed building, through change within its setting.	The Applicant has no further comments on this matter at this time.
2.5.89	Oakendene Manor 11.7 The information contained in Category 6: Environmental Statement. Volume 4, Appendix 25.5: Oakendene parkland: historic landscape assessment describes the history of the house and its parkland. Section 6 describes the significance of the parkland setting in reinforcing the special interest of the listed building. The historic parkland is stated as being of low heritage significance. And makes a moderate contribution to the heritage significance of Oakendene Manor. HDC is satisfied this is an accurate conclusion. 11.8 The potential impacts of the proposed infrastructure are listed in section 7. The mitigation for these impacts have been included in the indicative landscape planting proposals. At this stage HDC considers that the impact will result in less than substantial harm through change within the setting of the listed building, Oakendene Manor. Mitigation for this impact is described in Category 7: Other Documents Outline Landscape and Ecology Management Plan; specifically, section 2. And Category 5: Reports Design and Access Statement; specifically, section 3.4. The principles and intentions of mitigating any harm within the setting of Oakendene Manor should be ensured through inclusion in the DCO.	11. 7 The Applicant welcomes HDC's Representation that the Oakendene historic parkland significance and assessment is accurate. 11.8 The design principles identified to reduce and minimise the impact on the setting of Oakendene Manor are secured in the **Design and Access Statement (DAS)** **[AS-003]** and the **Outline Landscape and Ecology Management Plan (LEMP)** **[APP-232]**. The detailed design of the onshore substation must be undertaken in accordance with these design principles and provided for approval of the planning authority as per the requirements of the **Draft Development Consent Order** **[PEPD-009]** including 8 (2) which states that the design for approval, "*must accord with the principles set out in the relevant part of the design and access statement*". Requirement 12 (3) also requires accordance with the DAS for provision of the landscaping details for the onshore substation. 11.9 The Applicant welcomes HDC's Representation regarding the provision to implement historic parkland style tree planting with Works No. 17 (**Draft Development Consent Order** **[PEPD-009]**), secured in the **Design and Access Statement (DAS)** **[AS-003]** and the

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	11.9 Welcomed is provision made in the proposed DCO Order Limits in Works No. 17 (see Onshore Works Plans (Document Reference: 2.2.2) to implement historic parkland style tree planting, to be confirmed at detailed design. 11.10 HDC confirms that, having reviewed the location of designated above-ground heritage assets within the vicinity of the development and evaluated the contribution that their settings make to the significance of the asset, the impact of the development, including the substation, on these would be less than substantial at the lower end of the scale of that category in all cases of the historic environment and individual heritage asserts.	**Outline Landscape and Ecology Management Plan (LEMP) [APP-232]** Requirements 8, 12 and 13 within the **Draft Development Consent Order [PEPD-009]**. 11.10 The Applicant welcomes HDC's Representation that the above-ground heritage asset assessment is accurate.
2.5.90	Water Environment 11.12 SuDs has been included into the overall design proposal and the likely impact arising would be minimal, subject to a robust Sustainable Drainage Strategy being required to ensure existing greenfield run-off rate is maintained and the impacts in the locality from surface water are controlled. WSCC is the LLFA incorporating Horsham District.	The outline drainage strategy presented as set out within the **Outline Operational Drainage Plan [APP-223]** has been designed to maintain greenfield run-off rates and address surface water run-on. The Operational Drainage Plan will accord with the **Outline Operational Drainage Plan [APP-223]** secured via draft DCO requirement 17. The response from the Applicant to comment 2.5.8 also covers this point in more detail.
2.5.91	11.13 HDC shares and supports the overarching concerns raised on water environment impacts to the design for the operational drainage at the Oakendene Substation works and that the current FRA and design proposals for the Oakendene Substation do not truly reflect the winter flooding that occurs at this location, and as identified as Principal Issues of Disagreement by WSCC in its capacity as responsible LLFA.	The Applicant considers that additional winter flooding information identified by West Sussex County Council (WSCC) in their Representation can be factored into the detailed drainage design. The outline drainage strategy presented within the **Outline Operational Drainage Plan [APP-223]** is based on several conservative assumptions (regarding the maximum design parameters for the substation, impermeability and climate change allowance).Therefore, there is deemed to be sufficient flexibility within the current outline drainage plan such that it can be revised and adapted at the detailed drainage design phase to address any concerns regarding winter flooding and associated loss of basin storage. As stated in Paragraph 6.5.6 of **Appendix 26.2: Flood Risk Assessment (FRA), Volume 4** of the ES **[APP-216]**, final design and sizing of drainage mitigation measures will be determined at the detailed drainage design stage in liaison with WSCC (as Local Lead Flood Authority (LLFA)).
2.5.92	11.14 It is necessary to be confident that the operational drainage is fit for purpose, due to its multi-functional purpose as associated biodiversity habitat (wet woodland), and the feasibility of delivering this, given potential attenuation basin design requirements (cross-section, depth and slope profile) and the implications to requested refinement and fixing of design parameters (developable area, building heights due to potential concrete base and other flood prevention measures) with respect to the development of the substation site.	The need to be sure that the operational drainage is fit for purpose is noted. As raised in the above response, there is sufficient flexibility within the current strategy to accommodate any concerns with regard to the implication of winter flooding issues at the detailed drainage design stage.
2.5.93	12. Concluding remarks on Horsham District Council's Relevant Representation 12.1 HDC has identified its substantive areas of concerns in the preceding paragraphs of this Relevant Representation. HDC has also identified wide-ranging concerns about the draft DCO. These will be shared with the Applicant in due course and will be set out in the Council's Local Impact Report. 12.2 HDC looks forward to liaising with the Applicant on the draft DCO and proposed Section 106. It should be noted that the Council may wish to be party to legal agreements to secure mitigation for any impacts in Horsham District.	The Applicant has no further comments on this matter at this time.

© WSP Environment & Infrastructure Solutions UK Limited

Table 2-6 Applicant's Response to Mole Valley District Council

Ref	Relevant representation comment	Applicant's response
Introduction		
2.6.1	Mole Valley District Council (MVDC, or 'the Council') acknowledges the Secretary of State's decision (7 September 2023) to accept for examination the application for the Rampion 2 Offshore Wind Farm (Ref: EN010117), made by Rampion Extension Development Limited (RED, 'the Applicant') for a Development Consent Order (DCO). The Council requests that it is registered as an Interested Party (IP) for this process. 1.2 This Relevant Representation ('Representation') sets out a summary of the Council's views on the submitted application. 2.0 Position and Comments 2.1 The Council is supportive of innovative and sustainable schemes that contribute to the energy production for the region and limit/avoid environmental impact. As such, while MVDC is not raising any material objections, and recognises the environmental benefits of the project, it is keen to ensure that these benefits are balanced against any adverse impacts of the construction and operation of the proposed wind farm. To address this important matter the following points will need to be suitably explored and any issues addressed through the examination process.	The Applicant welcomes MVDC Representation and that MVDC is not raising any material objections to the proposals. The acknowledgement that Proposed Development will contribute to sustainable energy production is welcomed by the Applicant. The Proposed Development will help meet the urgent need for new renewable energy infrastructure in the UK and supporting the achievement of the UK Government's climate change commitments and carbon reduction objectives. The Proposed Development type is recognised as being a critical national priority in the National Policy Statement (NPS) EN-1 (November 2023) and NPS EN-3 (November 2023) (Department for Energy Security and Net Zero, 2023a; 2023b), for which there is an urgent need to deliver. The Applicant has provided individual responses to the specific remaining concerns raised below.
Seascape, Landscape and Visual Impact Assessment		
2.6.2	The Seascape, Landscape and Visual Impact Assessment (SLVIA) (APP-056), needs to be properly scrutinised to ensure that all of the correct viewpoint locations have been included in the assessment of 'out to sea' visual impacts, including the size and layout of the offshore wind turbines. Any additional viewpoints should be identified, where necessary, and additional assessment carried out. Any cumulative visual impacts with Rampion 1 should be considered within this context.	Detailed consultations were undertaken on the viewpoints, which brought forward many suggestions from stakeholders regarding the inclusion of certain viewpoint locations for assessment. In total, 54 viewpoints (Table 15-14 of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]**) were agreed and included in the seascape, landscape and visual impact assessment (SLVIA), which provide a wealth of representative locations from which to understand the likely significant effects of the Proposed Development. Details of the viewpoint selection is explained in Section 15.3 of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]**. Cumulative SLVIA effects of the Proposed Development with other wind farm projects have been scoped out as described in Table 15-10 of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]**, in agreement with The Planning Inspectorate (PINS ID: 4.12.4). Rampion 1 is considered as part of the baseline conditions in **Section 15.6** and impact assessments in Section 15.10 of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]**.
Cabling and construction phase		
2.6.3	While the majority of the development is offshore, the cabling and construction phase will be onshore and any adverse impacts and mitigation on ecological receptors, including key species and habitats need to be scrutinised. It is noted that the chosen cabling route has been chosen to try and avoid both natural and historic impacts (APP-193, APP-063, APP-180 and APP-232). However, the Council's view that more detail regarding how biodiversity net gains will be achieved and the type of ecological enhancements that will be delivered is needed. There could be a number of opportunities outside of the cabling route and offshore development area that should be explored.	Biodiversity units provided off-site, calculated via the Statutory Biodiversity Metric, will be provided in line with UK Government (Department for Environment, Food and Rural Affairs (Defra), 2024) guidance and be registered with Natural England. In this way, it will be no different to those development projects delivering mandatory biodiversity net gain (BNG) via the Environment Act 2021. Ensuring that all steps of the guidance are followed provides comfort that appropriate steps will be taken to ensure suitable habitat creation and enhancement work is backed up by robust management and monitoring to deliver the necessary biodiversity units. It should be noted that when discussing provision of off-site biodiversity units that they could be delivered within the proposed DCO Order Limits should suitable arrangements with landowners be made during the detailed design phase.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		The types of biodiversity units to be purchased will reflect the needs of the Proposed Development (e.g. ensure that the trading rules within the metric are met) thereby delivering habitats known to be present and functioning within the locality. Further information on BNG is provided in **Appendix 22.15: Biodiversity Gain Information, Volume 4** of the ES **[APP-193]** and is secured by Requirement 14 of the **Draft Development Consent Order [PEPD-009]**
Impacts on Tourism		
2.6.4	While the public perception of renewable and sustainable infrastructure is changing, visual changes to onshore and offshore landscapes can influence tourism habits and visitor economies, thereby influencing visitor numbers and socio-economic return. The Environmental Statement - Volume 2: Chapter 17 - Socioeconomics (APP-058) does not currently appear to explore the impacts/benefits on tourism to the extent that would be expected and should be further considered by the ExA and additional information requested from RED as necessary.	The assessment of the impact on the volume and value of tourism detailed in Sections 17.9, 17.10 and 17.11 of **Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]** considered the changing public perceptions of offshore wind as evidenced by the UK Governments Public Attitudes Tracker. The assessment within **Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]** explores the impact on tourism and finds that overall, when all influencing factors are considered, the effect of the Proposed Development on the volume and value of tourism across Sussex is expected to be negligible. While there may be some people with negative perceptions of offshore wind farms who may be deterred from visiting, these are likely to be small in number and could be offset by those who are more likely to visit the area due to the development of offshore wind. For example, those visiting the existing Rampion visitor centre or those going on boat trips to the offshore infrastructure of Rampion 2.
Conclusion		
2.6.5	The Council does not principally object to the Application but considers it prudent for visual, ecological and socioeconomic impacts to be properly explored and scrutinised during the examination to ensure the best outcomes of the scheme.	Discussed in the points above, the Applicant has no further comments on this matter at this time.

© WSP Environment & Infrastructure Solutions UK Limited

Table 2-7 Applicant's Response to Adur District Council

Ref	Relevant representation comment	Applicant's response
General		
2.7.1	These are officer level comments on behalf of Adur District Council. Adur District Council declared a climate emergency in July 2019. As part of this declaration, the Council has made a commitment to work towards being a carbon neutral council by 2030 and to be a net zero carbon district by 2045. The Council also acknowledges national targets set for delivering offshore wind, and for carbon reduction, and notes the important role offshore wind power can play in contributing to these. As such, the Council supports the increased provision of green energy that would be delivered by Rampion 2.	The acknowledgement that Proposed Development will contribute to provision of green energy is welcomed by the Applicant. The Proposed Development will help meet the urgent need for new renewable energy infrastructure in the UK and supporting the achievement of the UK Government's climate change commitments and carbon reduction objectives. The Proposed Development type is recognised as being a critical national priority in the revised NPS EN-1 (Department for Energy Security and Net Zero (DESNZ), 2023a) and NPS EN-3 (DESNZ, 2023b), which came into force in January 2024 and are considered to be relevant to the determination of the DCO Application. This additional generating capacity will contribute towards meeting the urgent need for new energy infrastructure in the UK, provide enhanced energy security, support the economic priorities of the UK Government and, critically, make an important contribution to decarbonisation of the UK economy. The Proposed Development will contribute materially towards meeting the urgent national need for renewable electricity, significantly reducing carbon emissions from energy. The assessment set out in **Chapter 29: Climate change, Volume 2** of the ES **[APP-070]** concludes the Proposed Development has a lifetime greenhouse gas (GHG) emissions saving of 35,901 kilotonne carbon dioxide equivalent ($ktCO_2e$). The Proposed Development will continue to offset greenhouse gas (GHG) emissions until 2050, and therefore make a positive contribution the UK Government target to reach net zero emissions in 2050.
2.7.2	However these positive aspects must be balanced against the need to take wider matters into account. Whilst it is recognised that larger turbines generate renewable electricity more efficiently and that there must be a trade-off between aesthetic impact and renewable energy production we do have some concerns about the visual impact of the turbines. Any assessment of visual impact should ensure that the coastline of Adur District is adequately addressed, given its important role as a recreational resource for residents and visitors, and heritage assets.	The likely significant environmental effects of the Proposed Development have been assessed in the Environmental Statement (ES). Wherever practicable, likely adverse effects have been avoided or minimised through embedded environmental measures in the design of the Proposed Development, taking into account the findings of the ES, consultation with stakeholders and national and local policy requirements. **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]** has identified significant seascape, landscape and visual effects for areas of the South Downs National Park Authority (SDNP), West Sussex, East Sussex, and the City of Brighton & Hove. A number of measures are embedded as part of the Rampion 2 design to avoid, minimise or reduce any significant environmental effects on seascape, landscape and visual receptors, as far as possible for example the Windfarm Separation Zones within the **Offshore Works Plans** **[PEPD-004]**. Although it is acknowledged that there are some significant effects on views and perceived special quality of the Chichester Harbour Area of Outstanding Natural Beauty (CHAONB) designation, no effects are of such magnitude or significant enough, on their own or cumulatively to compromise the statutory purposes of the designation. The likely significant onshore landscape and visual impacts (**Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]**) linked to the Proposed Development are limited to the construction phase, and early in the operation and maintenance phase, and impacts will be temporary. Embedded measures aim to minimise effects on the special qualities of the SDNP through careful design consideration and planning in respect of the construction process and activity, taking account of relevant policy and guidance. **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059**] has identified a number of significant effects on the setting of designated assets in the construction phase along the onshore cable corridor. These effects will be temporary. There is also potential to encounter archaeological remains as outlined in **Chapter 25: Historic environment, Volume 2** of the ES **[APP-066]**. In line with the requirements of National Policy Statement (NPS) EN-1 (DECC, 2011a), archaeology at risk of loss or disturbance would be recorded before any loss occurs. This recording would be provided for in a Written Scheme of Investigation (WSI) (site-

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		specific, as described in the **Outline Onshore Written Scheme of Investigation (WSI)** **[APP-231]**) which is secured through Requirement 19 of the **Draft Development Consent Order** **[PEPD-009]**. **Chapter 17: Socio-economics, Volume 2** of the ES **[APP058]** identifies some significant effects on recreational users of a very limited number of public rights of way (PRoWs) and on two inshore and offshore receptors (recreational fishing and scuba diving) in the construction phase. These effects will be temporary and can be moderated through the implementation of environmental measures such as the **Outline Public Rights of Way Management Plan** **[APP-230]** secured via Requirement 20 within the **Draft Development Consent Order** **[PEPD-009]** and the **Outline Diver Communication Plan** **[APP-242]** secured in Condition 11(1)(h) of the dMLs (Schedules 11 and 12 of the **Draft Development Consent Order** **[PEPD-009]**. The wider benefits of Rampion 2 and the need for offshore wind energy must be weighed against the adverse effects that have been identified as well as any local issues and concerns. This balancing should also take into account national and international policies and obligations that seek to tackle climate change and achieve net zero carbon emissions in 2050.
2.7.3	The Council is also concerned that any adverse impacts to biodiversity are minimised, and an overall net gain for biodiversity is delivered.	The design of the Proposed Development and then the development of measures to mitigate and minimise effects, followed by identification of enhancements and delivery of Biodiversity Net Gain (BNG) have followed the mitigation hierarchy expected through planning policy as outlined in **Appendix 22.15 Biodiversity Net Gain Information, Volume 4** of the ES **[APP-193]**. The mitigation for individual ecological features / impacts will be adequately secured. The **Draft Development Consent Order** **[PEPD-009]** has Requirements 12, 13 and 14 securing mitigation, compensation and BNG. • Requirement 12 ensures that a Landscape and Ecological Management Plan and a Code of Construction Practice are provided for agreement with the relevant planning authority and Natural England; • Requirement 13 ensures that the Landscape and Ecological Management Plan is delivered as agreed; and • Requirement 14 secures the agreement and implementation of a BNG strategy. Individual commitments (as shown in the **Commitments Register** **[APP-254]** provided at Deadline 1 submission) also add further impetus to deliver successful restoration. This includes commitment C-103 that allows for a time limit for habitat restoration across the majority of the construction area (excluding temporary construction compounds, cable joint bays the landfall and the onshore substation location), whilst commitment C-115 minimises habitat loss of hedgerows and tree lines and proposes ways in which the reinstatement can take place. Commitment C-199 provides for the long-term management and monitoring of reinstated habitats.
2.7.4	The Council considers that benefits arising from the Rampion scheme should be distributed throughout those communities impacted by the schemes, particularly coastal communities and areas experiencing deprivation. The Council would welcome the opportunity to discuss how this can be supported, in more detail. The Council wishes to highlight the opportunities that could arise from facilitating direct links between energy generated by the Rampion schemes and the green energy technologies emerging along the south coast. Adur District Council is keen to explore opportunities to support green energy hub(s) within the district. Although there are no physical works proposed within Adur, we understand that other local authorities and organisations have raised concerns about potential	Community benefits are not a legal or DCO requirement and are quite distinct from the consenting process, a point reiterated in the Government (Department for Energy Security and Net Zero) response to the consultation on Community Benefits for Electricity Transmission Network Infrastructure (Dec 2023), which stated: *"The proposals on community benefits for electricity transmission network infrastructure discussed within this document will remain separate to the planning process. It will not be a material consideration in planning decisions, and not secured through those decisions."* That said, Rampion 2 will be a permanent neighbour in the Sussex community and the Applicant intends to develop and implement a community benefits package of proposals. In the second half of 2024, the Applicant will therefore be consulting key stakeholders and local communities on how a community benefit package could

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	impacts of construction, operation, and decommissioning (both offshore and onshore). As a neighbouring authority, we seek to ensure that these matters are adequately considered and mitigated as appropriate.	best support Sussex communities. The final package may include a range of initiatives to benefit business, education and residential communities. The Applicant welcomes green energy technologies along the coast but in terms of direct links from energy generated from the wind farm, The Applicant must emphasise that the Rampion 2 scheme is designed with a grid connection agreement in place for 100% of the power generation. While the local population density and associated electricity demand means much of the power generated will be consumed locally through the existing distribution network, it is not possible to feed individual businesses or green energy hubs directly from the Rampion 2 wind farm.

© WSP Environment & Infrastructure Solutions UK Limited

Table 2-8 Applicant's Response to Brighton & Hove City Council

Ref	Relevant representation comment	Applicant's response
Principle of the Development		
2.8.1	BHCC acknowledges the benefit of the scheme in terms of providing renewable energy to address the UK's impact on climate change. This accords with the national target of net zero carbon by 2050, but also the Council's own target of becoming carbon neutral by 2030. While the energy would go into the national grid rather than directly to local use within Sussex, we acknowledge the overall benefit the scheme would deliver and are supportive of the increased provision of green energy.	The Proposed Development will contribute materially towards meeting the urgent national need for renewable electricity, significantly reducing carbon emissions from energy.
Seascape, Landscape and Visual Impact Assessment		
2.8.2	We note and support the conclusion that the impact of the scheme on the Brighton and Hove seafront would be 'major/moderate', particularly noting the high sensitivity to change. We are pleased that this impact has reduced since the preliminary (PEIR) assessment through revisions to the layout. However, we would highlight our concerns over the remaining impact, particularly noting the seafront is visited by millions of visitors each year and enjoyed year-round by locals. It is at the core of the City and its character. The capacity for the character of the view to be 'changed by seafront and beach activity' is noted in the SLVIA (p257), and we would certainly characterise this as a positive change. The beachfront activity is part of what attracts people to live and visit the city and increases the potential for the visual impact to be experienced more widely. Periods of reduced activity are also potentially subject to greater visual impact as those using the seafront expect more tranquil, less busy views. For this reason, we raise concerns over the impact of the scheme on the Brighton and Hove seafront. We also note the 'major' impact on Rottingdean highlighted in relation to viewpoint. Although this viewpoint is within the South Downs National Park, it is just 75m north and 100m west of the Brighton & Hove City boundary so the impact would be similar to that on areas within our jurisdiction (noting that they are outside of our jurisdiction only in relation to planning matters). The impact on this part of our coastline is also of concern, given the lack of mitigation set out in the submission.	The Applicant welcomes feedback on the revisions to the spatial extent of the proposed DCO Order Limits that have contributed to reducing the magnitude of change on views from Brighton. The Applicant notes Brighton and Hove City Council's concerns over the residual significant impact on views from Brighton Seafront and the Rottingdean area, close to Brighton. The sensitivity and importance of the sea views from Brighton seafront and the contribution of the seascape to the city character and sensation of space within Brighton is recognised and assessed accordingly, as being of high sensitivity, in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the Environmental Statement (ES) **[APP-056]** and **Appendix 15.4: Viewpoint assessment, Volume 4** of the ES **[APP-160]** (Viewpoint 8). The Applicant also notes that the effect remains 'major' in environmental impact assessment (EIA) terms as assessed in **Appendix 15.4: Viewpoint assessment, Volume 4** of the ES **[APP-160]** (noting an error transposing this detailed assessment into the summary Table 15-36 in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]**). The Applicant notes that the visual assessment for Rottingdean (Viewpoint 7) is high sensitivity, major-moderate magnitude of change and significant (major) effect which is consistent with the effect on Brighton seafront. Although the ES assessment finds a significant visual effect on views from Brighton seafront and Rottingdean, changes to the design of the Proposed Development have contributed to reducing the magnitude of change on views from Brighton seafront (Viewpoint 8) and Rottingdean (Viewpoint 7) from 'High' magnitude assessed in Rampion 2's first Statutory Consultation exercise running from 14 July 2021 to 16 September 2021, Preliminary Environmental Information Report (PEIR), to 'Medium-high' magnitude assessed in the ES. The key factors that contribute to this reduction in magnitude of change, which provide mitigation are: • Increased distance away from these receptors. The proposed DCO Order Limits (offshore array area) is located 18.4km from Brighton Seafront (Viewpoint 8) compared to 13.8km from the PEIR Assessment Boundary. Similarly, the proposed DCO Order Limits (offshore array area) is located 18.7km from Rottingdean (Viewpoint 7) compared to 14.0km from the PEIR Assessment Boundary. The vertical height/apparent scale of the Rampion 2 wind turbine generators (WTGs) reduced in views from these receptors at this increased distance offshore. • Reduced lateral spread of WTGs in the horizontal field of view (HFoV). The spatial extent of the proposed DCO Order Limits (offshore array area) has been reduced both to the

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		east and west of Rampion 1 and this reduction is evident in views from Brighton and Rottingdean. The eastern (Zone 6) array is viewed mainly behind the operational Rampion 1 WTGs, with limited additional eastern spread. Although the Rampion 2 WTGs will be viewed as being larger in scale than the operational Rampion 1 WTGS, there is a better balance in apparent scale of the Rampion 1 and Rampion 2 WTGs, with stark scale comparisons minimised by siting Rampion 2 WTGs further offshore, introducing wind farm separation zones and avoiding the seascape immediately to the east of Rampion 1. The magnitude of change is also moderated by the presence of Rampion 1 in the baseline which is now an established part of the seascape setting / sea views from Brighton seafront. Rampion 2 will introduce further WTG elements with a similar form to those that are already characteristic in the views from these areas of Brighton. These factors resulted directly from the design changes made to the design of the Proposed Development between PEIR and ES through the design principles described in Section 15.7 **of Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]**. The Applicant has also produced and submitted a **SLVIA Maximum Design Scenario and Visual Design Principles Clarification Note (Document Reference 8.35)** (submitted at Deadline 1), which provides further commentary on these seascape, landscape and visual impact assessment (SLVIA) specific design principles. Opportunities to reduce effects further are limited due to the technical and economic requirements of the Proposed Development associated with generating renewable energy as well as other environmental factors.
2.8.3	Impact on Heritage Features We query the conclusion that the impact of the offshore works on all heritage features along the coastline, including within Brighton & Hove would be 'not significant', regardless of the magnitude of change and their sensitivity to it. For Brighton & Hove, we do not agree that the impact on the numerous heritage features along our coastline would be 'not significant'. We acknowledge the distance to the turbines but would highlight the views shown in the SLVIA (viewpoints 7 and 8) which make it clear that the impact is greater than 'not significant'. The existing turbines have already visibly changed the setting of these historic features, and as is apparent in these viewpoints, the increased number and height would increase this impact.	The Applicant refers Brighton & Hove City Council to Section 26.8 of **Chapter 25: Historic environment, Volume 2** of the ES **[PEPD-020]**, which outlines the methodology for assessment of effects, in particular the classification of effects which is judged on the relationship of the magnitude of impact to the assessed heritage significance of an asset. Where relevant, the assessment of heritage assets in **Chapter 25: Historic environment, Volume 2** of the ES **[PEPD-020**] takes the representative views in seascape, landscape and visual impact assessment (SLVIA) Viewpoint 7 and Viewpoint 8 into consideration, alongside all other baseline information provided in **Appendix 25.8: Onshore heritage asset baseline report, Volume 4** of the ES **[APP-214]**. The Applicant invites Brighton & Hove City Council to clarify the assessment outcome of which specific heritage assets are being disputed.
2.8.4	Socio-Economic Impact As we did at the PEIR stage, we note the lack of socio-economic benefit the scheme would deliver to Brighton & Hove, despite the city bearing the long-term brunt of the visual impact on our coastline and its heritage features. We query the applicant's justification for not using ex-ante (post-development) windfarm survey data which they state is because responses are 'subject to bias' depending on people's feelings about windfarms. This justification could relate to any development. It is not, therefore, considered sound reasoning for not undertaking, or excluding survey data from people living and visiting Brighton & Hove – i.e. people experiencing Rampion 1.	The main aim of the tourism assessment is to assess the impact of the wind farm on the volume and value of tourism (driven by the number of people who visit the area). There are a number of well-established reasons why pre-development (ex-ante) surveys have a greater risk of bias, which could result in an overestimate of the impact on visitor numbers including: • Responses to hypothetical scenarios may not accurately reflect actual behaviour. People's opinions or intentions can change over time, especially when

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		confronted with the reality of the situation; • Respondents may not have a clear or accurate understanding of what the offshore wind farm will look like, leading to responses based on misconceptions; • Reactions might be driven by their emotional or kneejerk response to change (or their feelings about windfarms) rather than considered opinions or their true intentions; and • There is a risk that the survey sample could be skewed towards people who have strong feelings about wind farms (positive or negative) and are therefore more likely to be willing to take part in a survey. This would mean the sample is not representative of the broader population of visitors. Brighton & Hove City Council appears to suggest that a post-development survey of visitors and their views of Rampion 1 should have been undertaken. However, it is not clear how this would help to understand the impact on visitor numbers. The only way to identify and survey visitors to an area is face-to-face, and on location. Therefore, by definition, the respondents will be people who do not feel strongly enough about Rampion 1 for it to have deterred them from visiting the area. There would have been no way of identifying the visitors who have been deterred from visiting Brighton due to Rampion 1. Therefore, the sample would be skewed towards people who have positive or indifferent feelings towards wind farms. A more robust method for assessing the impact on visitor numbers is to use longitudinal data on the number of visitors to Brighton, or the value of their expenditure, before and after the construction of Rampion 1 and compare this to a benchmark (e.g. a regional or national average). This is already included in **Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]**, paragraph 17.9.32 and Graphic 17-5. This shows that the total number of visits to Brighton remained broadly stable during the construction period of Rampion 1 (around 11 million) but declined in Great Britain as a whole. It also shows there was a sharp increase in visitor numbers in Brighton in the year after completion (2019) compared to a further fall in visitor numbers in Great Britain. Data after 2019 were not included because they were significantly affected by the COVID-19 pandemic which led to a large fall in visitor numbers in all areas. Therefore, based on the data available, Brighton has consistently outperformed the national average during the construction and post-commissioning phases, suggesting there has been limited impact on visitors.
Outline Skills and Employment Strategy		
2.8.5	We welcome the Outline Skills and Employment Strategy and RED's recent engagement on this in a meeting with officers. However, it lacks any commitment to financial contributions to education or employment within Brighton & Hove. For our purposes it cannot therefore be considered mitigation and we can only conclude that the proposal would have no economic benefit for the city.	The **outline Skills & Employment Strategy (oSES)** **[APP-256]** submitted with the DCO Application was intentionally high-level and the Applicant was not in a position to document concrete commitments without further consultation with key skills & employment stakeholder organisations in Sussex. The first tranche of consultation took place between July and October 2023, the results of which have fed into the second iteration of the **oSES** **[PEPD-037]**, submitted to the Examining Authority in January 2024. This latest version of the **oSES** **[PEPD-037]** includes seven additional key skills & employment stakeholder organisations and following this series of consultation meetings and

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		the examination itself, the Applicant will produce a final Skills & Employment Strategy outlining key objectives and activities, which is likely to include details of education, training and employment objectives, initiatives and activities. The oSES is secured through Requirement 33 of the **Draft Development Consent Order** **[PEPD-009]**.
Conclusion		
2.8.6	BHCC notes the national benefits of the scheme in terms of the provision of renewable energy and the positive impact this will have on climate change. However, BHCC raises concerns over the visual impact of the scheme on our coastline, particularly its sensitive heritage features, and the lack of any economic or other benefits for the city, or contribution towards mitigating the visual impacts of the scheme, such as through financing schemes to improve/upgrade heritage features and the public realm along the city's coastline. On the basis of the above, BHCC raises a holding objection to the proposal.	The Applicant has no further comments at this time.

© WSP Environment & Infrastructure Solutions UK Limited

Table 2-9 Applicant's Response to Waverley Borough Council

Ref	Relevant representation comment	Applicant's response
2.9.1	Waverley Borough Council has declared a climate emergency and supports the expansion of renewable energy in consultation with local communities. The Council has no further comments to make and does not wish to present evidence at the inquiry.	The Applicant welcomes Waverley Borough Council's consideration of the Rampion 2 proposals. Rampion 2 has undergone consultation with local communities and will make an important contribution to UK efforts in tackling climate change. The Proposed Development will contribute materially towards meeting the urgent national need for renewable electricity, significantly reducing carbon emissions from energy.

© WSP Environment & Infrastructure Solutions UK Limited

Table 2-10 Applicant's Response to Worthing Borough Council

Ref	Relevant representation comment	Applicant's response
2.10.1	Worthing Borough Council Comments (officer level response) Worthing Borough Council declared a climate emergency in July 2019. As part of this declaration, the Council has made a commitment to work towards being a carbon neutral council by 2030 and to be net zero carbon by 2045. The Council also acknowledges national targets set for delivering offshore wind, and for carbon reduction, and the important role offshore wind power can play in contributing to these. As such, the Council supports the increased provision of green energy that would be delivered by Rampion 2.	The Applicant welcomes Worthing Borough Council's support that the Proposed Development will contribute to climate change mitigation. The Proposed Development will help meet the urgent need for new renewable energy infrastructure in the UK and supporting the achievement of the UK Government's climate change commitments and carbon reduction objectives. The Proposed Development type is recognised as being a critical national priority which there is an urgent need to deliver in the revised National Policy Statement (NPS) EN-1 (Department for Energy Security and Net Zero (DESNZ), 2023a) and NPS EN-3 (DESNZ, 2023b) published in November 2023, which took effect in January 2024, and is a relevant consideration in the decision-making process. The assessment set out in **Chapter 29: Climate change, Volume 2** of the ES **[APP-070]** concludes the Proposed Development has a lifetime greenhouse gas (GHG) emissions saving of 35,901ktCO_2e.
SLVIA		
2.10.2	However, these positive aspects must be balanced against the need to take wider matters into account. Whilst it is recognised that larger turbines generate renewable electricity more efficiently and that there must be a trade-off between aesthetic impact and renewable energy production there are some concerns about the visual impact of the turbines. Any assessment of visual impact should ensure that the coastline of Worthing Borough is adequately addressed, given its important role as a recreational resource for residents and visitors, and heritage assets including Worthing Pier.	The seascape and visual impacts of Rampion 2 wind turbine generators (WTGs) are assessed in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]** including the effects on Worthing Borough. The Applicant notes that significant effects on views experienced by people living, working, and visiting the coastline of Worthing Borough have been identified at representative viewpoints including Viewpoint 10 from Worthing sea front (**Figure 15.35 in Chapter 15: Seascape, landscape and visual impact assessment – Figures (Part 5 of 8), Volume 3** of the ES **[APP-092]**. The spatial extent of the Rampion 2 array area has been reduced and designed according to a set of SLVIA specific design principles (**Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES) **[APP-056]** which provide embedded environmental measures by reducing the magnitude of effects and minimising harm on the perceived seascape qualities and views. Opportunities to reduce effects through further design principles specific to West Sussex are limited by the technical, economic and functional requirements of the Project to produce renewable energy, as well as other environmental factors.
Biodiversity Net Gain		
2.10.3	The Council is also concerned that any adverse impacts to biodiversity are minimised, and an overall net gain for biodiversity is delivered. In particular the Council seeks assurance that any damage to the seabed arising from construction, cabling, operation or decommissioning works is appropriately restored and monitored in order to provide a stable seabed. Any disturbance should be minimised and mitigated appropriately. Benefits arising from the Rampion scheme should be distributed throughout those communities impacted by the schemes, particularly coastal communities and areas experiencing deprivation. The Council would welcome the opportunity to discuss how this can be supported, in more detail.	In relation to terrestrial ecology, Rampion 2 will deliver Biodiversity Net Gain as set out in **Appendix 22.15: Biodiversity Net Gain information, Volume 4** of the ES **[APP-193]**. BNG is secured by Requirement 14 of the **Draft Development Consent Order** **[PEPD-009]**. Impacts to the seabed arising from construction, cabling, operation and decommissioning works are assessed in **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2** of the ES **[APP-050]**. A range of environmental measures are embedded as part of the Proposed Development design to remove or reduce any significant environmental effects on benthic subtidal and intertidal ecology receptors, as far as possible. These measures are detailed in **Table 9-16** of **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2** of the ES **[APP-050]** and included in the **In Principle Sensitive Features Mitigation Plan** **[APP-239]** secured

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **Draft Development Consent Order [PEPD-009]**). Following the implementation of the embedded environmental measures, no significant effects are predicted to occur.
Opportunities for Green Energy Hubs		
2.10.4	The Council wishes to highlight the opportunities that could arise from facilitating direct links between energy generated by the Rampion schemes and the green energy technologies emerging along the south coast. We are keen to explore opportunities to support green energy hub(s) within the borough. Although there are no physical works proposed within Worthing, we understand that other local authorities and organisations have raised concerns about potential impacts of construction, operation, and decommissioning (both offshore and onshore). As a neighbouring authority, we seek to ensure that these matters are adequately considered and mitigated as appropriate.	This is not a matter directly relevant to the DCO Application, however the Applicant is open to liaison with the developers of other green energy technologies and green energy hubs. Regarding potential impacts of construction, operation and maintenance and decommissioning – the concerns of neighbouring authorities are being addressed through these Relevant Representations, the process of Written Representations and the agreement of Statements of Common Ground and Local Impact Reports.

© WSP Environment & Infrastructure Solutions UK Limited

3. Applicant's Response to Relevant Representations: Parish Councils and Members of Parliament

Table 3-1 Applicant's Response to Aldwick Parish Council [RR-007]

Ref	Relevant representation comment	Applicant's response
2.11.1	The Parish Council is an interested party in terms of representing residents' views: There are concerns over the scale of the proposals and visual impacts affecting Aldwick residents, and with the potential environmental impact of land based cabling/servicing required.	The Rampion 2 array area will have significant visual effects from Aldwick, and this is assessed in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the Environmental Statement (ES) **[APP-056]**, with relevant viewpoints assessed near Aldwick being Viewpoint 12 from Bognor Regis (**Figure 15.37, Volume 3** of the ES) **[APP-092]** and Viewpoint 13 from Pagham (**Figure 15.38, Volume 3** of the ES) **[APP-092]**. The Design principles are described in Section 15.7 within **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]** which sets out how the design of the Proposed Development provides embedded environmental measures addressing visual effects, in response to stakeholder comments, including a reduction in the spatial extent of the Rampion 2 array area, its spread and quantity of wind turbine generators (WTGs) within it. Opportunities to reduce effects through WTG height reduction are limited due to the technical and economic requirements associated with producing renewable energy as well as other environmental factors. The visual impacts associated with the onshore elements of the Proposed Development are assessed in **Appendix 18.4: Visual Assessment, Volume 4** of the ES **[APP-170]**. Due to its location, Aldwick is well outside the onshore landscape and visual impact assessment (LVIA) 2km study area as shown in **Figure 18.1, Volume 3** of the ES **[APP-098]**. Paragraph 18.4.6 within **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]** states that the 2km LVIA Study Area (based on a detailed analysis of the Zone of Theoretical Visibility (ZTV)) defines a limit based on professional judgement beyond which it is considered unlikely for significant effects to arise.

© WSP Environment & Infrastructure Solutions UK Limited

Table 3-2 Applicant's Response to Ashington Parish Council [RR-034]

Ref	Relevant representation comment	Applicant's response
2.12.1	Ashington Parish Council wish to register as an interested party. Rampion 2 Offshore Windfarm project - this matter was discussed at parish council meetings on Oct 5th and Nov 2nd 2023. With respect to the parish of Ashington, the council are concerned specifically about the impact that additional traffic will bring to an already busy local network.	Noted. Response to concerns regarding traffic are provided in **references 2.12.2 – 2.12.8** below.
2.12.2	The Washington roundabout, just south of Ashington village, already deals with a large volume of traffic with commuters and general traffic travelling north and south via the A24, and east and west via the A283, with traffic using this route to travel from the A272 down to the A27 on the coast.	The **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** defines that the A24 and A283 are designated construction traffic routes for the Proposed Development noting that these form part of West Sussex County Council's (WSCC's) Lorry Route Network These routes are therefore considered suitable for construction traffic. The likely significant transport effects of the construction phase of the Proposed Development have been assessed within **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064]**, **Chapter 32: ES Addendum, Volume 2** (Document reference: 6.2.32) (submitted at Deadline 1) and in **Appendix 23.2: Traffic Generation Technical Note, Volume 4** of the ES **[APP-197]** which has been updated at the Deadline 1 submission. Based on the peak week sensitivity test used within **Chapter 32: ES Addendum, Volume 2** (Document reference: 6.2.32) (submitted at Deadline 1), a worst-case HGV flow will occur in week 87 of the construction phase where the Proposed Development will generate 44 Heavy Goods Vehicles (HGVs) and 91 Light Goods Vehicles (LGVs) per day at Receptor 17 (A283 east of the A24). In addition, the worst-case overall increase in traffic will occur in week 85 where there will be 43 HGV and 114 LGVs per day. Noting that construction traffic movements will occur across the core working hours of 07:00-19:00 each day (see paragraph 8.4.13 of the **Outline CTMP** **[PEPD-035a]**), this is the equivalent of approximately 3-4 HGVs per hour and 9-10 LGVs per hour. It is therefore not anticipated that this construction traffic will have a material impact on the operation of the Washington Roundabout. For the A24 in proximity to Ashington, **Chapter 32: ES Addendum, Volume 2** (Document reference: 6.2.32) (submitted at Deadline 1) shows a peak HGV week increase in traffic at Receptor 20 of 39 HGVs per day and 26 LGVs per day and a total construction traffic peak of 19 HGVs and 78 LGVs per day. During the HGV peak week, the average construction traffic flow will therefore be 3-4 HGVs per hour and 2-3 LGVs per day and during the total construction traffic peak the average construction traffic flow will be 1-2 HGVs per hour and 6-7 LGVs per hour. It is therefore concluded that construction traffic will not have a significant effect on the A24 as it passes through Ashington.
2.12.3	Increased traffic will encourage drivers to take alternative routes along the country lanes of Hole Street at Ashington to Water Lane at Wiston to reach the A283. These roads are unsuitable for heavy vehicles and any increased movement of traffic.	The **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** provides details of construction traffic routes for the Proposed Development. The strategy for Heavy Good Vehicle (HGV) traffic includes the use of strategic elements of the highway network (A27 and A23) as far as possible before routing onto the local highway network. Construction traffic routes that form part of the local highway network also use West Sussex County Councils (WSCC's) prescribed Lorry Route Network wherever possible. HGV access beyond these routes has been limited to three routes taking account of local constraints, access locations and embedded environmental measures that aim to limit the impacts during the construction phase of the Proposed Development. These HGV access routes are defined in Table 5-1 of the **Outline CTMP** **[PEPD-035a]** and consist of: • Route 1: A27-A284-A259-Ferry Road or Church Road; • Route 2: A27-A280-A24-A283-B2135-B2116; and • Route 3: A23-A272-Wineham Lane or A272-Kent Street or A272-A281.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		Construction traffic will be required to adhere to prescribed routing in accordance with the **Outline CTMP** **[PEPD-035a]**. A Transport Coordination Officer (TCO) will be appointed by the Contractor and employed by the Applicant to implement the stage specific CTMP. The TCO will undertake monitoring as necessary to comply with the requirements of the stage specific CTMP and apply enforcement and corrective measures where appropriate.
2.12.4	Increased traffic will also encourage drivers to travel through Ashington village if the A24 is congested.	Five temporary construction compounds are included within the Proposed Development, one of which is located at Washington (Washington Compound). In response to feedback following the Second Statutory Consultation exercise (October – November 2022) the proposed temporary construction compound at Rock Common Quarry has been discounted and not taken forward as part of the Proposed Development (see Table 23-5 within **Chapter 23: Transport, Volume 2** of the ES **[APP-064]**. **Figures 4.5a** to **4.5c, Volume 3** of the Environmental Statement (ES) **[APP-077]** show the five proposed onshore temporary construction compounds. **Figures 4.3a** to **4.3u, Volume 3** of the ES **[APP-076]** show the indicative onshore trenchless crossing compounds and trenchless crossing limits of deviation. The likely significant transport effects of the construction phase of the Proposed Development including temporary construction compounds and trenchless crossing compounds have been assessed within **Chapter 23: Transport, Volume 2** of the ES **[APP-064]**. As outlined in **reference 2.12.3** above, Heavy Goods Vehicles (HGVs) will be routed along strategic elements of the highway network as far as possible and with the implementation of embedded environmental measures (as described in the **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]**), no significant transport effects have been identified in relation to identified sensitive receptors.
2.12.5	There is concern about the increase in HGV traffic and again the use of the local country lanes as cut through routes to access works.	**Chapter 19: Air quality, Volume 2** of the Environmental Statement (ES) **[APP-060]** presents an assessment of air quality effects from construction traffic associated with the Proposed Development. The assessment concluded that the Proposed Development will not result in significant air quality effects, as a result of increased traffic on the local road network. A range of environmental measures within the **Commitments Register** **[APP-254]** related to air quality (such as Commitment C-24 Which includes best practice air quality management measures to be applied as described in Institute of Air Quality Management (IAQM) (2016) guidance) are embedded as part of the Rampion 2 design to remove or reduce significant environmental effects (included within the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** and secured through Requirement 22 within the **draft Development Consent Order** **[PEPD-009]**).
2.12.6	There is concern about the possibility that one of the construction works compounds for the project may be sited locally, again creating additional traffic movements, particularly HGVs, in the locality.	Table 19-9 within **Chapter 19: Air quality, Volume 2** of the ES **[APP-060]** states that there will be no significant traffic travelling through the Storrington High Street Air Quality Management Area (AQMA) and that Annual Average Daily Traffic (AADT) along the Storrington High Street AQMA are below the Institute of Air Quality Management (IAQM) and EPUK 92017) screening criteria for road links in AQMA's, therefore potential effects are negligible. The Applicant responses to Washington Parish Council and MP Andrew Griffiths Relevant Representations are provided in **Table 2-28 and Table 2-29** respectively below.
2.12.7	Increased traffic will undoubtedly have an impact on the air quality for local residents, and	Noted. Response to concerns regarding traffic are provided in **references 2.12.2 – 2.12.8** below.
2.12.8	The local village of Storrington already has an Air Quality Management Area that has been in place since 2010, due to existing high traffic flow. Ashington Parish Council also supports the responses already submitted by Washington Parish Council and by the MP Andrew Griffiths.	The **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** defines that the A24 and A283 are designated construction traffic routes for the Proposed Development noting that these form part of West Sussex County Council's (WSCC's) Lorry Route Network These routes are therefore considered suitable for construction traffic. The likely significant transport effects of the construction phase of the Proposed Development have been assessed within **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064]**, **Chapter 32: ES Addendum, Volume 2** (Document reference: 6.2.32) (submitted at Deadline 1) and in **Appendix 23.2: Traffic Generation Technical Note, Volume 4** of the ES **[APP-197]** which has been updated at the Deadline 1 submission. Based on the peak week

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		sensitivity test used within **Chapter 32: ES Addendum** (Document reference: 6.2.32) (submitted at Deadline 1), a worst-case HGV flow will occur in week 87 of the construction phase where the Proposed Development will generate 44 Heavy Goods Vehicles (HGVs) and 91 Light Goods Vehicles (LGVs) per day at Receptor 17 (A283 east of the A24). In addition, the worst-case overall increase in traffic will occur in week 85 where there will be 43 HGV and 114 LGVs per day. Noting that construction traffic movements will occur across the core working hours of 07:00-19:00 each day (see paragraph 8.4.13 of the **Outline CTMP [PEPD-035a]**), this is the equivalent of approximately 3-4 HGVs per hour and 9-10 LGVs per hour. It is therefore not anticipated that this construction traffic will have a material impact on the operation of the Washington Roundabout. For the A24 in proximity to Ashington, **Chapter 32: ES Addendum, Volume 2** (Document reference: 6.2.32) (submitted at Deadline 1) shows a peak HGV week increase in traffic at Receptor 20 of 39 HGVs per day and 26 LGVs per day and a total construction traffic peak of 19 HGVs and 78 LGVs per day. During the HGV peak week, the average construction traffic flow will therefore be 3-4 HGVs per hour and 2-3 LGVs per day and during the total construction traffic peak the average construction traffic flow will be 1-2 HGVs per hour and 6-7 LGVs per hour. It is therefore concluded that construction traffic will not have a significant effect on the A24 as it passes through Ashington.

Table 3-3 Applicant's Response to Bognor Regis Town Council [RR-041]

Ref	Relevant representation comment	Applicant's response
2.13.1	The application is for an offshore wind farm with an area up to approximately 196km2 comprising up to 90 wind turbines off the coast of Bognor Regis. With the proposed development in such close proximity to Bognor Regis, it is acknowledged by elected Members of the Town Council that it would likely have a significant impact on the lives of residents and visitors to the Town. Therefore, Bognor Regis Town Council would like to register as an interested party to ensure that the Council continues to have a voice. Members of the Planning and Licensing Committee will review the application documents again at its meeting to be held on 31 October 2023 at which they will be invited to agree any further comments to be submitted in response to the examination.	**Chapter 17: Socio-economics, Volume 2** of the Environmental Statement (ES) **[APP-058]** details relevant studies and evidence from offshore wind farms in the UK which shows that there has been no evidence of overall negative impact on the tourism economy from the development of offshore wind farms in the UK. This evidence included analysis of tourism employment numbers for Rampion 1 which showed higher levels of tourism and employment across Sussex coastal seaside towns over the period in which Rampion 1 was operational compared to before Rampion 1 began construction. The assessment of the impact on the volume and value of tourism detailed in Sections 17.9, 17.10 and 17.11 of **Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]** considers the changing public perceptions of offshore wind as evidenced by the UK Governments Public Attitudes Tracker. The assessment explores the impact on tourism and finds that overall, when all influencing factors are considered, the effect of Rampion 2 on the volume and value of tourism across Sussex is expected to be negligible. While there may be some people with negative perceptions of offshore wind farms who may be deterred from visiting, these are likely to be small in number and could be offset by those who are more likely to visit the area due to the development of offshore wind (see paragraph 17.9.27 of **Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]**. For example, those visiting the existing Rampion 1 visitor centre or those going on boat trips to the offshore infrastructure of Rampion 2. The Rampion 2 array area will have significant visual effects from Bognor Regis, and is assessed in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]**, with relevant viewpoints assessed being Viewpoint 12 from Bognor Regis (**Figure 15.37, Volume 3** of the ES) **[APP-092].** The Design principles are described in Section 15.7 within **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]** which sets out how the design of the Proposed Development provides embedded environmental measures addressing visual effects, in response to stakeholder comments, including a reduction in the spatial extent of the Rampion 2 array area, its spread and quantity of wind turbine generators (WTGs) within it. Opportunities to reduce effects through WTG height reduction are limited due to the technical and economic requirements associated with producing renewable energy as well as other environmental factors.

© WSP Environment & Infrastructure Solutions UK Limited

Table 3-4 Applicant's Response to Bolney Parish Council [RR-042]

Ref	Relevant representation comment	Applicant's response
2.14.1	For the amenity of neighbouring residential properties, the construction hours permitted for both the works on the underground cable route through the Parish from the Oakendene substation to the Bolney National Grid substation, and for the works at the Bolney substation, must be the same as those required by Mid Sussex District Council in all construction projects across the District. The hours of construction must be: Monday to Friday 0800 – 1800 hrs Saturdays 0900 – 1300 hrs No construction work on Sundays or Public Holidays;	The working hours are detailed in Section 4.4 of the **Outline Code of Construction Practice (CoCP) [PEPD-033]** which is secured through Requirement 22 of the **Draft Development Consent Order** (DCO) **[PEPD-009]** along with other activity specific requirements including continuous working for trenchless crossing (e.g. Horizontal Directional Drill (HDD)). These working hours will apply across the Proposed Development and are consistent across all local authority areas. The assessments in **Chapter 19: Air quality, Volume 2** of the Environmental Statement (ES) **[APP-060]** and **Chapter 21: Noise and vibration, Volume 2** of the ES **[PEPD-018]** are based on the core construction working hours of 07:00 to 19:00 Monday to Friday and 08:00 to 13:00 hours on Saturday. No significant effects have been identified in the assessments. The Applicant considers that on this basis the proposed working hours are acceptable.
2.14.2	The permitted construction route through the Parish for all construction vehicles - that is HGVs, large and small vans, construction workers and private vehicles – must be on the A23, A272 and Wineham Lane only. The use of the Broxmead Lane/A23 and Hickstead/A23 junctions must be prohibited for all vehicles. There must be no use by any vehicle of the roads in the centre of the village of Bolney or any of the narrow, rural minor roads in any circumstances including London Road, Bolney Chapel Road, Foxhole Lane, Jeremys Lane, Spronketts Lane and Cross Colwood Lane;	The **Outline Construction Traffic Management Plan (CTMP) [PEPD-035a]** provides details of construction traffic routes for the Proposed Development. The strategy for heavy goods vehicle (HGV) traffic includes the use of strategic elements of the highway network (A27 and A23) as far as possible before routing onto the local highway network. Construction traffic routes that form part of the local highway network also use West Sussex County Council's (WSCC's) prescribed Lorry Route Network wherever possible, which includes the A272. Wineham Lane will only be used to access the existing National Grid Bolney substation extension works and a very limited number of light goods vehicles (LGVs) required during construction of the onshore cable route. The Applicant can also confirm that none of the other routes listed by the Parish Council form part of permitted construction routes included within the **Outline CTMP [PEPD-035a]** which is secured through Requirement 24 of the **Draft Development Consent Order** (DCO) **[PEPD-009]**
2.14.3	Wheel washing and dust management is required in all construction areas; All reversing beepers on all construction vehicles must be replaced by 'white noise' beepers;	Section 5.3 of the **Outline Code of Construction Practice (CoCP) [PEPD-033]** details the practical measures and monitoring procedures that will be implemented to manage the impact of dust in construction areas. This includes implementing a wheel wash system with rumble grids to dislodge accumulated dust and mud, prior to leaving site, where reasonably practicable. Section 5.4.8 of the **Outline CoCP [PEPD033]** details the practical measures that will be implanted to manage the impact of noise generated during construction. This includes the avoidance of reversing, where practicable and the fitting of low noise reversing warnings to pertinent vehicles. Procedures and measures stated in the **Outline Code of Construction Practice (CoCP) [PEPD-033]** are secured through Requirement 22 of the **Draft Development Consent Order** (DCO) **[PEPD-009]**.
2.14.4	There must be no use of generators or lighting outside of construction hours; There must be no use of traffic lights on Wineham Lane nor on the A272 outside of construction hours.	Section 4.5 of the **Outline Code of Construction Practice (CoCP) [PEPD-033]** details the measures that will be implemented to manage the impact of construction

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		lighting, including considerate positioning and directing. Construction will be limited to core working hours outlined in Section 4.4 of the **Outline CoCP** **[PEPD-033]** to limit the need for artificial lighting. At specific locations where continuous working is required (such as trenchless crossings), or in poor light conditions, directional lighting will be used where necessary to ensure safety and security. The Applicant notes that working hours stated in Section 4 of **Chapter 4: The Proposed Development, Volume 2** of the ES **[APP-045]** and as outlined in Section 4.4 of the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** and as secured through Requirement 22 of the **Draft Development Consent Order** (DCO) **[PEPD-009]** have been updated in the **Outline Construction Traffic Management Plan** **[PEPD-035a]** for the Deadline 1 submission and will be updated in the **Outline Code of Construction Practice** **[PEPD-033]** for the next submission of this document. Section 5.4.8 of the **Outline CoCP** **[PEPD-033]** details the best practice measures that will be implanted to manage the impact of noise generated during construction. This includes ensuring plant and machinery is turned off when not use and applies to generators. Generators will be low-noise models with manufacturers' acoustic packs and silencers fitted, and located in a position that they are screened by site buildings and/or temporary acoustic screening. Whilst it is not anticipated that traffic signals will be required on Wineham Lane or the A272, any traffic measures will need to be agreed with West Sussex County Council (WSCC) as part of the design submission for the onshore Oakendene Substation and the existing National Grid Bolney substation extension. Should traffic signals be required (or any other form of traffic management) these will be applied in accordance with guidance and procedures contained in Section 14 of the Road Traffic Regulation Act 1984.

© WSP Environment & Infrastructure Solutions UK Limited

Table 3-5 Applicant's Response Clapham Parish Council [RR-071]

Ref	Relevant representation comment	Applicant's response
2.15.1	Whilst Clapham Parish Council recognises the importance of wind farms as an alternative source of energy it concerns regarding the onshore route which will go through the South Downs National Park remain as set out as part of its consultation responses in December 2022 and March 2023. Rampion 2 is a Nationally Significant Infrastructure Project which will inevitably pose risks to wildlife, flora and fauna, and, whilst we rely on specialists to identify these to avoid irreparable harm, the Council is extremely concerned at the impacts given the scale of the project and the sensitive area through which it will pass, the area of Clapham and Patching, lying wholly within the South Downs National Park.	**Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the Environmental Statement (ES) **[APP-063]** describes the effects on the terrestrial ecology features present. The mitigation hierarchy has been applied through the design of the Proposed Development so that efforts have been made to avoid ecological features, minimise levels of effect where avoidance is not possible (e.g. trenchless crossings), mitigate effects (e.g. through sensitive temporary lighting design) and compensate for residual effects. Although there will be short term effects on a number of ecological features, the approach to construction, the reinstatement of habitats and habitat creation (both at the onshore substation site and as part of biodiversity net gain delivery) will provide a positive legacy for terrestrial ecology in the medium to long term.
2.15.2	WSCC's March 2023 response to the consultation process specifically highlighted a 'notable verge' within the parishes of Clapham and neighbouring Patching; "Attention is drawn to a Notable Road Verge (NRV) (Nature-friendly road verges - West Sussex County Council) on the south side of the A280 (Long Furlong) in the vicinity of Long Furlong Lane. This road verge supports an outstanding range of butterflies. Twenty species of butterfly were recorded in August 2021, including two notable species, small blue and brown argus. It is noted that access would be required from the A280 (very close to this NRV) should AA-33 be used. Measures may be required to ensure that there is no potential for damage to the considerable wildlife interest of the verge. For example, construction traffic and materials must, on no account, be allowed onto the NRV". We also understand that there is currently no policy requirement for the project to leave wildlife in a better state then it was before the development but that Rampion has given an undertaking to do so as part of the project. We want to make sure that this happens as part of the DCO application and examination. We are aware that WSCC "has a significant concern over option LACR-01d taken forward by the Applicant.	No works are proposed on the Notable Road Verge (NRV) on the south of the A280. This road verge is outside of the proposed DCO Order Limits and therefore no activity on this NRV will be permitted by the grant of development consent. The Applicant has made a commitment to deliver Biodiversity Net Gain (BNG), quantified using the method developed by Natural England, for the onshore elements of the Proposed Development. This is secured through Requirement 14 of the **draft DCO [PEPD-009]**.
2.15.3	The archaeological sensitivity of this section of the route is exceptionally high. LACR-01d crosses an area of the South Downs which forms part of an incredibly rich and complex multi-period prehistoric landscape of national significance including scheduled Early Neolithic flint mining sites constituting the earliest evidence industrial activity in Britain". These concerns are also shared by the Parish Council, as previously reported. Clapham Parish Council opposes this application on the basis of the selected onshore option.	The assessment within **Chapter 25: Historic environment, Volume 2** of the Environmental Statement (ES) **[PEPD-020]** identifies a high potential for archaeological remains of high heritage significance within the onshore cable route which crosses the South Downs. Paragraphs 3.4.55 to 3.4.67 within **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]** provides the details of the selection of the onshore cable route in this area. The **Planning Statement [APP-036]** outlines the position with regards the planning balance with regard to the benefits of the Proposed Development and the harm to heritage assets that is identified in **Chapter 25: Historic environment, Volume 2** of the ES **[PEPD-020]**, as per paragraphs 4.7.66 and 5.4.10 of the **Planning Statement [APP-036]**. Commitments C-225 and C-79 in the **Commitments Register [APP-254]** (updated at the Deadline 1 submission) provide for mitigation through design and archaeological recording and are secured through Schedule 1, Part 3, Requirement 19 of **draft DCO [PEPD-009]**:

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		• C-225 Where previously unknown archaeological remains of high heritage significance are identified through surveys along the cable route, and where these locations have not been possible to avoid during earlier design stage, consideration will be made for engineering solutions (e.g. narrowing of the construction corridor, divert cable route within DCO Order Limits, re-siting stockpiles) to avoid impacts in the first instance. Where impacts are not avoidable, these will be minimised where possible through design solutions and an appropriate programme of mitigation will be undertaken to ensure preservation by record. Such measures will be reviewed in consultation with relevant stakeholders (WSCC Archaeologist and Historic England). An onshore outline WSI provides detail of appropriate methodologies to be implemented during the evaluation and mitigation stages of the archaeological works (as updated by the Applicant within the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** (submitted at the Procedural A Deadline); and • C-79 Archaeological and paleoenvironmental mitigation will entail an agreed programme of archaeological recording and dissemination to mitigate any significant adverse effects during construction. Provision will be made for appropriate curation/deposition of the site archive.

Table 3-6 Applicant's Response to Clymping Parish Council [RR-075]

Ref	Relevant representation comment	Applicant's response
2.16.1	The impact that the installation will have on Clymping Village. Rampion 2 Offshore Windfarm Submission to Planning Inspectorate Clymping Parish Council November 2023 1. Clymping is a small rural parish of 690 hectares on the south coast to the west of Littlehampton. It is bisected roughly east to west by the A259 Littlehampton to Bognor Road. The other through routes in the parish are the B2233 and Church Lane going from their junctions with the A259 north-west to Yapton and northward to Ford and Arundel respectively. It faces considerable issues with coastal erosion threatening homes and livelihoods, housing development that will double the size of the village and traffic issues that lie behind a major upgrade of the A259 in the village. Rampion 2 will only add to the pressures on the community. When Rampion made the proposal to bring the cabling ashore at Climping beach, it was immediately clear that the village is likely to be disproportionately impacted by this development. It is likely to suffer severe disruption during the works to bring the power cables ashore and the onshore construction works. The visual impact of the turbines will affect the setting of this coastal community and the beach amenity.	Disruption has been minimised through the production of the **Outline Construction Traffic Management Plan (CTMP) [PEPD-035a]**. Stage specific CTMPs (including a stage specific CTMP for the works at Climping Beach) are required to be submitted in accordance with Requirement 24 of the **Draft Development Consent Order [PEPD-009]** and will be produced by the appointed Contractor(s) following the grant of the DCO and prior to the relevant stage of construction. This will be produced in accordance with the **Outline CTMP [PEPD-035a]** for approval of the relevant highway authority, prior to the commencement of that stage of works. The likely significant transport effects of the construction phase of the Proposed Development including temporary construction compounds and trenchless crossing compounds have been assessed within **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064]**. With the implementation of embedded environmental measures (as described in the **Outline CTMP [PEPD-035a]**), no significant transport effects have been identified in relation to identified sensitive receptors within Climping. The visual impacts of the wind turbines are assessed in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]**. The Design principles are described in Section 15.7 within **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]** which sets out how the design of the Proposed Development provides embedded environmental measures addressing visual effects, in response to stakeholder comments, including a reduction in the spatial extent of the Rampion 2 array area, its spread and quantity of wind turbine generators (WTGs) within it. Opportunities to reduce effects through WTG height reduction are limited due to the technical and economic requirements associated with producing renewable energy as well as other environmental factors.
2.16.2	Clymping Parish Council has engaged in the consultation process for the proposed Rampion 2 Offshore Windfarm. Through the process we have registered the following principal concerns of Council, residents, and local businesses: • Once Operational: ▸ The visual impact of the turbines that will dominate the horizon viewed from Clymping beach, a popular community and visitor amenity. ▸ The post construction landscape in the Littlehampton to Middleton gap that is protected within the Arun Local Plan. • During Construction: Offshore impacts of marine trenching in an area currently the focus of rewilding as part of the Weald to Waves project and work to restore the kelp forest. ▸ Onshore construction disruption to village life and amenities The precise line of cable routing, areas trenched and those drilled horizontally.	The Applicant has no further comments on this matter at this time.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.16.3	The impact of onshore activities was the focus of our submission to the cable routing consultation in November 2022, which is attached for completeness. The proposed revised cable routing in Clymping was shown in areas 1a and 1b in pink (rather than that originally considered in blue). The solid route lines shows where the cable was to be trenched. The hatched sections are to be drilled horizontally, for instance under the beach. Our conclusions were as follows, as they related to this consultation. The Parish Council are strongly opposed to the compounds/operational sites as they affect the Church Green, to the north and west of the school and down Bread Lane. The reasons for this view are: • There will be considerable disruption in the village for 3 years 2026-29 • This will be compounded by the timing of the A259 developments and the Strategic housing site which are extremely likely to coincide with these proposals. • These include a new roundabout on the A259, works at Ferry Road junction, a new roundabout near the Oystercatcher. The proposed access AA01 will be opposite a new access to the 300 House development. • Locating a compound to the north and west of the school is unacceptable due to disruption, noise, dust in dry weather depending on the as yet undefined operations. This compound and the access down Bread Lane should be withdrawn given the proposals to move the cable east towards the river Arun for which access from Ferry Road is more suitable. • Residents have made it clear to the Parish Council that the operational area at Church Green is unacceptable given the sensitivity of the green for the village as an area of memorial and the setting of the Church and Church Hall. [Additionally, there has been bulb planting carried out over the last few years, which will also be impacted in the Spring of each of the years.] It should be removed given the proposed increase in operational flexibility south of Field Place and access to MR02. • There is no information or assessment of the drainage through the area south of Field Place. This is a serious omission given the critical importance of proposals for drainage from the Clymping strategic housing site through this area. It is the Parish Council's recommendation that site MR01 be used as the sole operational and construction compound south of A259 routing from Ferry Road.	The likely significant transport effects of the construction phase of the Proposed Development have been assessed in **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064]**, **Chapter 32: ES Addendum** (Document reference: 6.2.32) (submitted at Deadline 1) and in **Appendix 23.2: Traffic Generation Technical Note, Volume 4** of the ES **[APP-197]** which has been updated at the Deadline 1 submission. Based upon the peak week sensitivity test included in **Chapter 32: ES Addendum, Volume 2** (Document reference: 6.2.32) (submitted at Deadline 1), receptor 5 (the A259 west of Wick) will experience the following traffic flow increases as a result of the Proposed Development: • A 5.3% increase in heavy goods vehicles (HGVs) during the peak HGV week across the construction programme (week 83), which is an increase of 50 HGVs and 57 light goods vehicles (LGVs) per day; and • A 4.5% increase in total traffic flow during the overall peak construction traffic week (week 72), which is an increase of 45 HGVs and 76 LGVs per day. All estimates of future baseline traffic flows used within used within **Chapter 23: Transport, Volume 2** of the ES **[APP-064]** and **Chapter 32: ES Addendum, Volume 2** (Document reference: 6.2.32) (submitted at Deadline 1) were based on TEMPro forecasts, which is a program developed by the Department for Transport providing traffic growth projections. These projections take account of national and local predicted growth in population, employment, housing (including sites allocated in the Local Plan) and is the industry standard approach to assessing future baseline traffic. Use of this methodology was agreed with West Sussex County Council (WSCC) and National Highways during consultation. Following the implementation of embedded environmental measures (such as the **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** which is secured through Requirement 24 of the **Draft Development Consent Order** **[PEPD-009]**, no significant effects have been identified in relation to transport receptors within Climping. With respect to concerns raised around the operational area at Church Green, the previously proposed operational access along the road adjacent to St Mary's Church and Green is not proposed to be used for the Proposed Development and not included within the proposed DCO Order Limits (Section 6.8.1 (ID A1-39), **Appendix 6, Annex 2 Consultation Report** **[APP-029]**). The Bread Lane access (A-04) is defined in Table 23-25 within **Chapter 23: Transport, Volume 2** of the ES **[APP-064]** as an operational access only for the onshore cable route. Paragraphs 23.4.21 and 23.4.22 within **Chapter 23: Transport, Volume 2** of the ES **[APP-064]** describe the expected operation and maintenance phase activities which includes periodic testing of the onshore cable involving attendance by up to three light vehicles such as vans in a day at any one location a few times a year. Unscheduled maintenance or emergency repair visits for the onshore cable will typically involve a very small number of vehicles, typically light vans. In exceptional circumstances, equipment may be required to be replaced, then the use of an occasional HGV may be utilised, depending on the nature of the repair. (Paragraph 23.4.22 within **Chapter 23: Transport, Volume 2** of the ES **[APP-064]**). There are a range of commitments that allow for the control of indirect effects from the land fall such as commitment C-76 (implementation of pollution prevention plans) to control risks of loss of pollutants (including dust) (see **Commitments Register** **[APP-254]**) within the **Outline CoCP** **[PEPD-033]** which is secured through Requirement 22 of the **Draft DCO** **[PEPD-009]**. Regarding the concerns around drainage and sea defences please find the responses under **reference 2.16.8 and 2.16.9** respectively below. The Applicant has no further comments on this matter at this time.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	The Parish Council also strongly recommends that the proposals for operations and access from Church Green are withdrawn given the proposal to expand flexibility of operations south of Field Place with the inclusion of area AA01 shown on Plan 1b. • Routing from Ferry Road removes the impact on Bread Lane, a very popular walking route to the beach. • Any access from Ferry Road however, requires careful timing consideration, in conjunction with the proposed A259 works at Ferry Road/Climping Park. • All this work is critically dependant on the EA maintaining the bund sea defences for an extended period, rather than seeing "what they can do" annually. Emergency works were underway this weekend owing to overtopping and flooding due to storm damage to the bund. The project should be encouraged to contribute to the shingle moving costs annually whilst the works compound is in situ. • Access south of Field Place removes the impact on the Grade 1 listed heritage Church and the Church Green. ▸ Supporting these concerns, with specific reference to the cumulative effects of traffic flows on the A259 and the wider road network around Clymping, is the apparent lack of comprehension and understanding of the current traffic issues, and no detail or modelling of future traffic flows. Any traffic assessment must look at the cumulative effects and not just on the additional traffic movements from this project.	
2.16.4	5. The Examination Library of Documents deposited with the Planning Inspectorate as part of the submission are very extensive, detailed, and technical. A small Parish like us has to focus its detailed and constructive comments on those aspects of most concern to the community e.g.: • APP-007 Land Plans Onshore (2.1.2) • APP-009 Onshore Work Plans (2.2.2) • APP-012 Access, Rights of Way and Streets Plan (2.5) • APP-032 Statutory Nuisance statement (5.3) And specific parts of the Environmental Statement:	The Applicant has no further comments on this matter at this time.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	• APP-059 Landscape and Visual Impact (6.2.18), • APP-060 Air Quality (6.2.19), • APP-062 Noise and vibration (6.2.21), • APP-064 Transport (6.2.23) • APP-224 Code of Construction Practice (7.2) APP-232 Landscape and Outline Ecology Management Plan	
2.16.5	We are pleased to note that our concerns have been heeded in relation to the removal of: • A works area adjacent to the north and west of St Mary's Primary school. • The use of Church Green and the access to the north and very close to St Mary's Church (Grade 1 listed building).	The Applicant welcomes acknowledgement that these concerns raised in consultation have informed Rampion 2 design work.
2.16.6	We object to the use of Crookthorn Lane, Brookpit Lane and Byway 197, Bread Lane as access to the work areas south of A259. The lanes are not suitable for heavy vehicles and provide the main access to the primary school. They are narrow with limited visibility and with grass edges that are easily damaged and prone to flooding. Recognising the limitations of the lanes at busy times the school operates a voluntary one system for parents driving their children to and from school. Bread Lane is the community's primary walking route to the beach and open countryside of the Littlehampton to Middleton gap in this area. Although unrestricted, it passes very close to the school and is not suitable for use by heavy vehicles. An alternative route south from Ferry Road would be far more suitable.	Access A-04 is served by Crookthorn Lane directly from the A259 and is for operational purposes only as shown on the **Onshore Works Plans Sheet 1** **[PEDP-005]**. Such access will be associated with scheduled and unscheduled maintenance with byway 197 used to access the onshore cable route from the public highway. Paragraphs 23.4.21 and 23.4.22 within **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064]** describe the expected operational and maintenance phase activities which includes periodic testing of the cable through attendance by up to three light vehicles such as vans in a day at any one location. Unscheduled maintenance or emergency repair visits for the onshore cable will typically involve a very small number of vehicles, typically light vans. Infrequently, equipment may be required to be replaced, then the use of an occasional HGV may be utilised, depending on the nature of the repair.
2.16.7	8. We have several remaining concerns that should be considered carefully, and suitable planning conditions and mitigation applied: • The critical importance of the area south of Field Place (Works areas 10, 14, & 15) which is the sole drainage route from the strategic development of 300 homes on the western side of Church Lane and its SUDS scheme. At the end of October and into November the development site has suffered severe surface water flooding with run-off across Church Lane resulting in flooding of the grounds of Field Place. • The noise and lighting associated with the 24-hour drilling operations undertaken within work areas No 7 and No 8 to the south of A259. This will affect wildlife in the open countryside and	Regarding the concerns around drainage: The Applicant notes that drainage from the proposed Climping strategic housing site (Application Reference CM/48/21/RES/) will discharge via an existing culvert beneath Church Lane and to a drainage ditch that runs west to east between the temporary construction compound (to the south) and access track A-06 (to the north). A Cumulative Effects Assessment (CEA) was carried out as reported in Table 26-32 and Table 26-34 of **Chapter 26: Water environment, Volume 2** of the Environmental Statement (ES) **[APP-067]** for relevant developments within a delineated hydrological Zone of Influence (ZOI). The CEA concluded that there would be no likely significant cumulative effects arising from the strategic housing site (CM/48/21/RES/), in combination with Rampion 2. This is based on the implementation of good industry practice measures and other measures as outlined in the accompanying Flood Risk Assessment and Drainage Strategy Report (Bright Plan Civils, 2021) being implemented on the housing site. This is in combination with the implementation of embedded environmental measures as part of this Proposed Development which would mitigate any likely significant effects. As outlined in paragraph 5.10.9 of the **Outline Code of Construction Practice (CoCP)** **[PEPD033]**, a Construction Phase Drainage Plan will be developed by the contractor(s) to determine potential location specific risks in relation to the water environment and identify appropriate measures to avoid or reduce risk. The Construction Phase Drainage Plan is secured via Requirement 22 of the **Draft DCO** **[PEPD-009]**. In addition, the following embedded environmental measures (as outlined in Table 5-9 of the **Outline CoCP** **[PEPD-033]**) are of

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	residents close by will potentially suffer a significant loss of amenity if these works are insufficiently screened. • We are seeking assurance that the internal operations within the works compounds will be conditioned and enforced in such a way to minimise disturbance to residents. • We want to ensure that operational hours and times are adhered to and that suitable penalties are in place if they are not. • We want to ensure that traffic orders are in place to ensure no works vehicles use Horsemere Green Lane as a cut through. • It is essential that the open landscape is required to be returned to its original condition and agricultural quality.	relevance to ensure that the existing functionality and conveyance capacity of the drainage ditch is not compromised. These are secured via Requirement 22 of the **Draft DCO** **[PEPD-009]**: • C-28 (existing land drainage regime); • C-30 (erosion and sediment control); • C-73 (drainage design for surface water); • C-119 & C-175 (temporary construction areas and flood conveyance); • C-126 (temporary watercourse crossings); • C-130 (soil stockpile standoff distances); • C-179 (soil stockpiling and management of surface water); • C-181 (access roads and management of surface water); and • C-182 (watercourse consents). The implementation of these embedded environmental measures in combination with those proposed on the third party housing site are envisaged to avoid any significant cumulative effects (on the shared drainage regime). Regarding the work taking place at the construction compound and across the works areas: Working hours are stated in Section 4 of **Chapter 4: The Proposed Development, Volume 2** of the ES **[APP-045]** and are outlined in Section 4.4 of the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]**. Following receipt of Relevant Representations and information shared at Issue Specific Hearing 1, C-22 within the **Commitments Register** **[APP-254]** has been updated at the Deadline 1 submission to the following: **'***Core working hours for construction of the onshore components will be 08:00 to 18:00 Monday to Friday, and 08:00 to 13:00 on Saturdays, apart from specific circumstances that are set out in the Outline COCP, where extended and continuous periods of construction are required.* *Prior to and following the core working hours Monday to Friday, a 'shoulder hour' for mobilisation and shut down will be applied (07:00 to 08:00 and 18:00 to 19:00). The activities permitted during the shoulder hours include staff arrivals and departures, briefings and toolbox talks, deliveries to site and unloading, and activities including site and safety inspections and plant maintenance. Such activities shall not include use of heavy plant or activity resulting in impacts, ground breaking or earthworks.'* This has been updated in the **Outline Construction Traffic Management Plan** **[PEPD-035a]** for the Deadline 1 submission and will be updated in the **Outline Code of Construction Practice** **[PEPD-033]** for the next submission of this document. As outlined in the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]**, no activity outside these hours (including Sundays, public holidays, or bank holidays) will take place apart from under the following circumstances: • Where continuous periods (up to 24 hours, 7 days per week) of construction work are required for HDD (as HDD is a continuous activity that cannot be paused once started); • for other works requiring extended working hours such as concrete pouring which will require the relevant planning authority to be notified at least 72 hours in advance;

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		• or the delivery of abnormal loads to the connection works, which may cause congestion on the local road network, and will require the relevant highway authority to be notified at least 72 hours in advance; or • as otherwise agreed in writing with the relevant planning authority. Any out of work hours beyond those listed above will be detailed by a Section 61 application of the Control of Pollution Act 1974 with agreement sought by the relevant Local Planning Authority. Commitment C-263 includes the production of a Noise and Vibration Management Plan (NVMP) during detailed design based on the principles in the **Outline CoCP** **[PEPD-033]**, which is secured by Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. Section 4.4 of the **Outline CoCP** **[PEPD-033]** details of aspects of general site management and good housekeeping that will be enforced at all construction work areas. This includes positioning of temporary offices, plant and storage sites away from sensitive receptors, speed limits and pest control. In addition, lighting will be designed and positioned to minimise light spillage outside of construction areas and disturbance to nearby residents. Section 5.4.8 of the **Outline CoCP** **[PEPD-033]** includes details of best practicable means that the Contractor(s) will adopt to minimise noise impact at construction areas. The **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** provides details of construction traffic routes for the Proposed Development. As part of this, the Applicant can confirm that Horsemere Green Lane is not included as a permitted construction traffic route. This will be secured through the stage specific CTMP in accordance with Requirement 24 of the **Draft DCO** **[PEPD-009]** Details regarding reinstatement are outline in Section 4.10 within the **Outline CoCP** **[PEPD-033]** which states that following completion of onshore construction activities, temporary infrastructure including main temporary construction compounds, trenchless crossing compounds, soil storage areas, cable stringing out areas and accesses will be reinstated to the extent possible. Section 4 of the **Outline Landscape and Ecology Management Plan (LEMP)** **[APP-232]** details the reinstatement approach for each landscape element and habitat type and is secured through Requirements 12 and 13 of the **Draft DCO** **[PEPD-009]**.
2.16.8	9. General concerns that the Inspector should consider are: • The instability of the coastline shown as Work Area 6 in document APP – 009. The coast has been subject to significant erosion and its defences breached in early 2020 extensively flooding Work Areas 7, 8, and 9 south of the A259 see attachment 2). Recent flooding in October and November 2023 is a reminder of the fragility of the remaining shingle bunds maintained by the Environment Agency. The Inspector should note the threat that the Environment Agency will withdraw further work if they judge further maintenance uneconomic. • The cumulative impact of the proposed Rampion 2 development works, traffic being undertaken on a similar timescale to West Sussex County Council plans to upgrade the A259 through Clymping, and the Arun District Council strategic housing development just to the west of Church Lane. Together these are likely to cause major disruption to the lives of residents by	**Appendix 26.2: Flood Risk Assessment, Volume 4** of the ES **[APP-216]** and its associated Annex A: Meeting minutes cover the Environment Agency's 'do minimum' strategy for the management of the Climping shingle defences as set out in the Arun to Pagham Flood and Coastal Erosion Risk Management Strategy. Meetings were held with the Environment Agency (in November 2020 and March 2022) to understand the baseline and future flood risk at these locations and within the Arun Valley within the context of recent storms (Annex A of **Appendix 26.2: Flood Risk Assessment, Volume 4**). The Environment Agency stated their preferred approach for the long-term management of this defence is to allow the shingle embankment to naturally realign to a more naturally sustainable position. Whilst there is noted uncertainty with regards to the anticipated future coastlines presented, a sequential approach has been considered to locate the transitional joint bay on the landward side of the most extreme of these estimates. The landfall options were also located as part of a sequential approach at the most optimal locations in relation to the peak sea levels sourced from the Environment Agency's Coastal Design Sea Levels Database and Lower Arun tidal modelling results. The landfall locations TC-01 and TC-01a were sited on higher land in Flood Zone 1 (low flood risk) with the lowest hazard ratings for both the present day and future (2070) 0.5% Annual Exceedance Event (AEP) Probability events as illustrated on Figure 26.2.3a and 26.2.3b in **Appendix 26.2: Flood Risk Assessment, Volume 4** of the ES **[APP-216].** Drone footage also illustrates the typical flowpaths from sea flooding in the event of overtopping in Feb 2020 (Storm Ciara) where floods were channelled along the lower lying land and circumnavigated around the landfall sites. This provided evidence that the landfall areas were not inundated, consistent with the assessment of flood risk in the FRA.

Ref	Relevant representation comment	Applicant's response
	seriously restricting travel, both private and public, and access by emergency services. • We feel that the documentation fails to recognise today's coastal, travel chaos and development pressures on the Climping community and to which Rampion 2 will only add. We wonder what steps the Project will take to compensate the community. So far, we see only evidence of the downsides of this project locally.	As noted in paragraph 10.2.3 of **Appendix 26.2: Flood Risk Assessment, Volume 4** of the ES **[APP-216]** there is a suite of suitable embedded environmental measures in Table 8-1 of **Appendix 26.2: Flood Risk Assessment, Volume 4** of the ES **[APP-216]** which have been put in place to minimise any potential residual risk from tidal flooding to and from the proposed works. The key commitments (C-247 and C-118) in relation to the landfall works are summarised as follows. Further ground investigation will be carried out at the landfall location post-DCO as outlined in C-247 (**Commitments Register [APP-254])** which will inform the exact siting and detailed design, as well as the need for any further adaptation measures to help minimise the vulnerability of assets. The investigations will be carried out pursuant to article 18 of the **Draft DCO [PEPD-009]**, to inform the coastal erosion and future beach profile estimate assessment and implementation of mitigation secured via the **draft DCO [PEPD-009]**, Schedule 1, Part 3, Requirement 26 Coastal erosion (1), (2). Requirement 26 (**draft DCO [PEPD-009])** states that: "*No works comprising Work Nos. 6 or 7 are to commence until a coastal erosion and future beach profile estimation assessment has been carried out and a scheme identifying any mitigation or adaptive management measures required to help minimise the vulnerability of this part of the Order land from future coastal erosion and tidal flooding (if required) has been submitted to and approved in writing by the Environment Agency*." An Emergency Response Plan for Flood Events (C-118, **Commitments Register [APP-254]**) will also be prepared to address the flood risk to construction activities and personnel as within the **Outline CoCP [PEPD-033]** secured via Requirement 22 of the **draft DCO [PEPD-009]**. This will help effectively protect site personnel and equipment from any risk of flooding from the sea during construction. On this basis the construction site will be safe from flooding even in the event of sea flooding and proposals are not reliant on the defences remaining in position. Longer term (during the operational and maintenance phase) this will also be the case as the landfall will be buried and resilient to flooding. Coastal erosion around the Climping landfall has been assessed within **Chapter 6: Coastal processes, Volume 2** of the ES **[APP-047]** and no significant effects are predicted to occur.
2.16.9	The Government has set ambitious targets for offshore wind which has a key role to play in tackling climate change and the UK's move towards Net Zero, setting a target to deliver up to 50GW by 2030, including up to 5GW of floating wind. Rampion 2 was first consulted on in 2021, the Parish Council raised the following concerns which are relevant to this round of consultation which deals with onshore cable route changes: • The details of the construction plan and the impact on the village of the construction and installation works, the construction traffic and where equipment might be stored locally. The detail of the proposed horizontal drilling works and the potential risks of this to the fragile coastline and sea defences at Clymping. The Parish Council have looked in detail at the issues raised in Areas 1a and 1b of the consultation documents and carefully considered the supporting PEIR SIR. It is very clear that Clymping faces disproportionate impacts on village life and the Parish Council cannot support the proposals until suitable impact mitigation measures have been agreed.	The likely significant transport effects of the construction phase of the Proposed Development including temporary construction compounds and trenchless crossing compounds have been assessed within **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064]**. With the implementation of embedded environmental measures (as described in the **Outline Construction Traffic Management Plan (CTMP) [PEPD-035a]** which is secured through Requirement 24 of the **Draft DCO [PEPD-009]**), no significant transport effects have been identified in relation to identified sensitive receptors within Climping. Horizontal Directional Drill (HDD) has been proposed to minimise risk to the integrity of the embankment as noted in embedded environmental measure C-43 in the **Commitments Register [APP-254]** secured via **Draft DCO [PEPD-009]**, Schedule 12, Part 2, Condition 2 (8). The outcome of the ground investigation as outlined in C-247 (**Commitments Register [APP-254])** will inform the exact siting and detailed design of the drilling works. Environmental measure C-17 is also included to ensure adherence to the permitting regime which will cover any temporary construction activities in close proximity to the Environment Agency flood defence.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.16.10	• Horizontal Directional Drilling MR01 and MR02 North of A259 The modified route shown in brown would reduce the length of cabling needed, but noise and vibration would be a major concern. The Parish Council have been advised that the drilling operation would be 24 hours continuously with a noise level of 90decibels. The background noise level for this rural area in daytime is approximately 50 decibels. There is no detail of any noise reduction measures. There is no detail of any monitoring or remedial actions. No details of the period of time for drilling has been shown. The Parish Council anticipates noise nuisance. For a 24 hour operation night time lighting will also be required. There appears to be no evidence of any lighting assessment. The Parish Council strongly oppose drilling in MR01 and MR02 unless there are adequate steps to mitigate the operational noise and the impact of lighting especially on the residents of Climping Park and Brookpit Lane.	Section 5.4 of the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** describes the practical measures and monitoring to be implemented to reduce the impact of onshore noise and vibration during construction. A Noise and Vibration Management Plan will be developed in accordance with the **Outline CoCP** **[PEPD-033]** and include best practicable means the Contractor(s) will adopt to minimise noise during construction in all areas. Construction plant will be carefully procured to ensure compliance with noise limits quoted in European Commission Directive 2000/14/EC, United Kingdom Statutory Instruments (SI) 2001/1701. Localised screening and temporary barriers will be also be installed in proximity to sensitive receptors. As stated in Table 21-29, **Chapter 21: Noise and vibration, Volume 2** of the ES **[PEPD-018]**, estimated drilling duration is provided for each HDD location, typically trenchless crossings are short term construction activities. For trenchless crossings (such as horizontal directional drill (HDD)), drills will be housed within acoustic cladding and associated acoustic louvres. Mud pumps will be housed in temporary acoustic shrouds. Noise monitoring will be agreed with the relevant planning authority, through Section 61 of the *Control of Pollution Act 1974* consent, where applicable Commitment C-263 includes the production of a Noise and Vibration Management Plan (NVMP) during detailed design based on the principles in the **Outline CoCP** **[PEPD-033]**, which is secured by Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. (Please refer to the Applicant's response to **reference 2.16.8** above). The effects of lighting during the construction phase on settlements, transport routes and recreational receptors have been considered at a high level in Sections 1.2 to 1.5 within **Appendix 18.4: Visual Assessment, Volume 4** of the Environmental Statement (ES) **[APP-170]**. **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]** summarises the visual effects on views from sensitive receptors during construction in Section 18.11. No 'lighting assessment' has been undertaken in relation to onshore construction works due to the practical difficulties with such an assessment based on methodology, detailed design, location, duration / timing and specification. We are not aware of any other examples of a night-time lighting assessment being undertaken for construction lighting along cable corridors / temporary HDD compounds. Rather, the advice from the South Downs National Park Policy SD8: Dark Night Skies has been incorporated into Commitment C66 and C200. These measures will minimise the effects of any night-time construction lighting across all of the onshore works areas.
2.16.11	Landscape Features There are insufficient details in the PEIR SIR to understand the type of landscape features which may be lost during the construction phase and also no details of the types of planting during reinstatement. The cable corridor may look very different during operation compared with preconstruction. The Parish Council are aware that the local land owner is developing a wild life corridor across this area, but can find no evidence to suggest this matter has been looked at or considered as part of the proposals. The Parish have been informed that remedial works on the Coastal Path (path 829) are scheduled for early 2023. The proposals will have implications for this work and the proposed English Coastal Pathway, but there is no evidence that this has been given any consideration. Until there is clarity, the Parish Council will oppose cabling works in this area.	**Chapter 18: Landscape and visual impact, Volume 2** of the Environmental Statement (ES) **[APP-059]** assesses landscape and visual effects of the onshore elements of the Proposed Development. The landscape assessment is provided in Table 2-1 of **Appendix 18.3: Landscape assessment, Volume 4** of the ES **[APP-169]**, and reports on the effect of the onshore elements of the proposed development on the local landscape character and landscape elements or features. A visual assessment is also provided in **Appendix 18.4: Visual Assessment, Volume 4** of the ES **[APP-170]** and Section 1.4 provides an assessment of the visual effects of the onshore elements of the Proposed Development on views from the English Coastal Path. Significant visual effects are assessed as likely to affect up to 400m of the route, during the construction period. Whole project effects resulting from the visibility of the offshore elements of the Proposed Development including the Wind Turbine Generators will also be significant and are reported in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]**. The proposals for planting and reinstatement of the onshore cable corridor are included in Section 4 of the **Outline Landscape and Ecology Management Plan** **[APP-232]** and will be secured through Requirements 12 and 13 of the **Draft DCO** **[PEPD-009]**. The Applicant has had an introductory meeting with the Weald to Waves project that a Climping landowner is involved with. Opportunities to work with local landowners on biodiversity enhancements are sought by the

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		Applicant. Should landowners express an interest in the area affected (or other areas within their local landholding) being enhanced for biodiversity this would be delivered through the commitment made to Biodiversity Net Gain (BNG) (see **Appendix 22.15: Biodiversity Net Gain information, Volume 4** of the ES **[APP-193]**. BNG is secured through Requirement 14 of the **Draft DCO** **[PEPD-009]**. With regards the English Coastal Path, this will not be directly affected by the Proposed Development as this will be crossed via a trenchless crossing as outlined in Table 4-1 of the **Outline Public Rights of Way Management Plan** **[APP-230]** secured via Requirement 20 of the **Draft DCO** **[PEPD-009]**.
2.16.12	Impact on the School and Community Amenities A number of routes and construction compounds are shown in Areas 1a and 1b. There is no information on the types of vehicles and plant to be used or stored there during the construction/operational phase or the steps that will be taken to manage the operations.	The **Outline Construction Traffic Management Plan (CMTP)** **[PEPD-035]** details the vehicles and routing during the construction phase of the Proposed Development. It also provides details of controls and mitigation measures that will be applied to minimise the impact of construction traffic associated with the Proposed Development. Tables 5-3 and 6-2 within the **Outline CMTP** **[PEPD-035]** show the number of heavy goods vehicles (HGVs) and light goods vehicles (LGVs) that will use each access junction along the onshore cable route secured via Requirement 24 of the **Draft DCO** **[PEPD-009]**. Access A-01 located on Ferry Road (providing access to Area 1a) will be used by 1,812 HGV two-way movements and 2,178 LGV two-way movements during the construction phase. Access A-09 located on the northern side of the A259 will be used by 1,338 HGV two-way movements and 1,026 LGV two-way movements.
2.16.13	Is it proposed to produce a construction Traffic management plan and will Parishes have an input? The Parish Council are strongly opposed to the compounds/operational sites as they affect the Church Green and to the north and west of the school and down Bread Lane. The reasons for this view are:	The **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** provides details of controls and mitigation measures that will be applied to minimise the effects of construction traffic associated with the Proposed Development. The consultation and engagement feedback provided by key stakeholders informed the need for an **Outline CTMP** **[PEPD-035a]** accompanying the DCO Application and informed this document. Please see the Applicant's response to **2.16.3** above regarding concerns raised on Bread Lane and Church Green. Furthermore, the **draft DCO** **[PEDP-009]** includes a Requirement 24 to submit a stage specific CTMP (which accords with the **Outline CTMP** **[PEPD-035a]**) for approval by the highway authority in consultation with the relevant planning authority before that stage can commence.
2.16.14	There will be considerable disruption in the village for 3 years 2026-29	Disruption has been minimised through the measures set out in the **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]**. The likely significant transport effects of the construction phase of the Proposed Development including temporary construction compounds and trenchless crossing compounds have been assessed within **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064]**. With the implementation of embedded environmental measures (as described in the **Outline CTMP** **[PEPD-035a]**), no significant transport effects have been identified in relation to identified sensitive receptors within Climping.
2.16.15	This will be compounded by the timing of the A259 developments and the Strategic housing site which are likely to coincide with these proposals. These include a new roundabout on the A259, works at Ferry Road junction, a new roundabout near the Oystercatcher. The proposed access AA01 will be opposite a new access to the 300 House development	The likely significant transport effects of the construction phase of the Proposed Development has been assessed in **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064]** **Chapter 32: ES Addendum** (Document reference: 6.2.32) (submitted at Deadline 1) and in **Appendix 23.2: Traffic Generation Technical Note, Volume 4** of the ES **[APP-197]** which has been updated at the Deadline 1 submission. Based upon the peak week sensitivity test included in the **Chapter 32: ES Addendum** (Document reference: 6.2.32) (submitted at Deadline 1), receptor 5 (the A259 west of Wick) will experience the following traffic flow increases as a result of the Proposed Development:

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		• A 5.3% increase in heavy goods vehicles (HGVs) during the peak HGV week across the construction programme (week 83), which is an increase of 50 HGVs and 57 Light Goods Vehicles (LGVs) per day; and • A 4.5% increase in total traffic flow during the overall peak construction traffic week (week 72), which is an increase of 45 HGVs and 76 LGVs per day. Noting that construction traffic movements will occur across the core working hours of 07:00-19:00 each day (see paragraph 8.4.13 of the **Outline Construction Traffic Management Plan** (**CTMP**) **[PEPD-035a]**), this is the equivalent of approximately 3-4 HGVs and 6-7 LGVs per hour in each of the peak scenarios. It is therefore not anticipated that this construction traffic will have a material impact on traffic conditions during construction of the strategic housing development or associated highway works. All estimates of future baseline traffic flows used within **Chapter 23: Transport, Volume 2** of the ES **[APP-064]** and **Chapter 32: ES Addendum** (Document reference: 6.2.32) (submitted at Deadline 1) were based on TEMPro forecasts, which is a program developed by the Department for Transport providing traffic growth projections. These projections take account of national and local predicted growth in population, employment, housing (including sites allocated in the Local Plan) and is the industry standard approach to assessing future baseline traffic. Use of this methodology was also agreed with West Sussex County Council (WSCC) and National Highways during consultation. Following the implementation of embedded environmental measures (such as the **Outline CTMP** **[PEPD-035a]**, no significant effects have been identified in relation to transport receptors in Climping. The 300 house development project referenced was included as part of the cumulative effects assessment within the ES where relevant (**Chapter 6: Coastal processes, Volume 2** **[APP-047]** to **Chapter 29: Climate change, Volume 2** of the ES **[APP-070]**), this development is referred to as ID13 (CM/48/21/RES).
2.16.16	Locating a compound to the north and west of the school is unacceptable due to disruption, noise, dust in dry weather depending on the as yet undefined operations. This compound and the access down Bread Lane should be withdrawn given the proposals to move the cable east towards the River Arun for which access from Ferry Road is more suitable.	Access A-04 is located on Bread Lane and is for operational purposes only as shown on the **Onshore Works Plans Sheet 1** **[PEDP-005]**. Such access will be associated with scheduled and unscheduled maintenance with byway 197 used to access the onshore cable route from the public highway. Paragraphs 23.4.21 and 23.4.22 within **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064]** describe the expected operational and maintenance phase activities which includes periodic testing of the cable through attendance by up to three light vehicles such as vans in a day at any one location. Unscheduled maintenance or emergency repair visits for the onshore cable will typically involve a very small number of vehicles, typically light vans. Infrequently, equipment may be required to be replaced, then the use of an occasional HGV may be utilised, depending on the nature of the repair.
2.16.17	Residents have made it clear to the Parish Council that the operational area at Church Green is unacceptable given the sensitivity of the green for the village as an area of memorial and the setting of the Church and Church Hall. It should be removed given the proposed increase in operational flexibility south of Field Place and access to MR02.	With respect to concerns raised around the operational area at Church Green the previously proposed operational access along the road adjacent to St Mary's Church and Green is no longer proposed to be used for the Proposed Development and not included within the proposed Order Limits (Section 6.8.1 (ID A1-39), **Appendix 6, Annex 2 Consultation Report** **[APP-029]**).
2.16.18	There is no information or assessment of the drainage through the area south of Field Place. This is a serious omission given the critical importance of proposals for drainage from the Clymping strategic housing site through this area. It is the Parish Council's recommendation that site MR01 be used as the sole operational and construction compound south of A259 routing from Ferry Road. The	See detailed responses under **reference 2.16.8** above with regard to Clymping Parish's drainage concerns at the area south of Field Place. The implementation of embedded environmental measures as detailed in the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]**, which will be secured by Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]** as part of the Construction Phase Drainage Plan. The delivery of these measures in combination with the drainage strategy for the third party strategic housing site, is anticipated

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	Parish Council also strongly recommends that the proposals for operations and access from Church Green are withdrawn given the proposal to expand flexibility of operations south of Field Place given the inclusion of area AA01 shown on Plan 1b.	to ensure there are no significant cumulative effects on the functionality of that drainage regime. This is outlined in Table 26.32 and Table 26.34 of **Chapter 26: Water environment, Volume 2** of the ES **[APP-067]**.
2.16.19	Routing from Ferry Road removes the impact on Bread Lane a very popular walking route to the beach.	See above response to **reference 2.16.17**.
2.16.20	Any access from Ferry Road however requires careful timing consideration with the proposed A259 works at Ferry Road/Climping Park.	See above response to **reference 2.16.16**.
2.16.21	All this work is critically dependant on the EA maintaining the bund sea defences for an extended period rather than seeing "what they can do" annually. Emergency works were underway this weekend owing to overtopping and flooding due to storm damage to the bund. The project should be encouraged to contribute to the shingle moving costs.	The Applicant has sited the landfall options in accordance with the advice received from the Environment Agency during consultation. The work is not dependent on the Environment Agency maintaining the bund sea defences. In relation to concerns about flood risk from the sea during construction, we are confident that the sequential approach to careful siting of the landfall, the implementation of HDD works and emergency flood response planning will ensure that there is no increase in flood risk in the area from the development and that the construction personnel, and equipment will all be adequately safe during the works. **Appendix 26.2: Flood Risk Assessment, Volume 4** of the ES **[APP-216]** and its associated 'Annex A: Meeting minutes cover the Environment Agency's 'do minimum' strategy for the management of the Climping shingle defences as set out in the Arun to Pagham Flood and Coastal Erosion Risk Management Strategy' held with the Environment Agency (in November 2020 and March 2022) to understand the baseline and future flood risk at these locations and within the Arun Valley within the context of recent storms (Annex A Meeting minutes of **Appendix 26.2: Flood Risk Assessment, Volume 4** of the ES **[APP-216]**). The Environment Agency stated their preferred approach for the long-term management of this defence is to allow the shingle embankment to naturally realign to a more naturally sustainable position. Whilst there is noted uncertainty with regards to the anticipated future coastlines presented, a sequential approach has been considered to locate the transitional joint bay on the landward side of the most extreme of these estimates. The landfall options were also located as part of a sequential approach at the most optimal locations in relation to the peak sea levels sourced from the Environment Agency's Coastal Design Sea Levels Database and Lower Arun tidal modelling results. The landfall locations TC-01 and TC-01a were sited on higher land in Flood Zone 1 (low flood risk) with the lowest hazard ratings for both the present day and future (2070) 0.5% Annual Exceedance Event (AEP) Probability events as illustrated on Figure 26.2.3a and 26.2.3b in **Appendix 26.2: Flood Risk Assessment, Volume 4** of the ES **[APP-216]**. Drone footage also illustrates the typical flowpaths from sea flooding in the event of overtopping in Feb 2020 (Storm Ciara) where floods were channelled along the lower lying land and circumnavigated around the landfall sites. This provided evidence that the landfall areas were not inundated, consistent with the assessment of flood risk in the **Appendix 26.2: Flood Risk Assessment, Volume 4** of the ES **[APP-216]**. As noted in paragraph 10.2.3 of **Appendix 26.2: Flood Risk Assessment, Volume 4** of the ES **[APP-216]** there is a suite of suitable embedded environmental measures in Table 8-1 of **Appendix 26.2: Flood Risk Assessment, Volume 4** of the ES **[APP-216]** which have been put in place to minimise any potential residual risk from tidal flooding to and from the proposed works. Further ground investigation will be carried out at the landfall location post-DCO as outlined in C-247 (**Commitments Register** **[APP-254]**) which will inform the exact siting and detailed design, as well as the need for any further adaptation measures to help minimise the vulnerability of assets. The investigations will be carried out pursuant to article 18, to inform the coastal erosion and future beach

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		profile estimate assessment and implementation of mitigation secured via the **draft Development Consent Order [PEPD-009]**, Schedule 1, Part 3, Requirement 26 Coastal erosion (1), (2). Requirement 26 (**draft DCO [PEPD-009])** states that: "*No works comprising Work Nos. 6 or 7 are to commence until a coastal erosion and future beach profile estimation assessment has been carried out and a scheme* identifying any mitigation or adaptive management measures required to help minimise the vulnerability of this part of the Order land from future coastal *erosion and tidal flooding (if required) has been submitted to and approved in writing by the Environment Agency*". With these commitments in place there will be no impact on the sea defence from construction itself. **Chapter 6: Coastal processes, Volume 2** of the ES **[APP-047]** concludes that construction (and operation and maintenance activities) will not significantly impact coastal morphology and offshore sediment transport and therefore the development will not increase the risk of coastal flooding and erosion. An Emergency Response Plan for Flood Events (C-118, **Commitments Register [APP-254**]) will also be prepared to address the flood risk to construction activities and personnel. This will help effectively protect site personnel and equipment from any risk of flooding from the sea during construction. On this basis the construction site will be safe from flooding even in the event of sea flooding therefore the proposals are not critically dependant on the maintenance of the sea defence as suggested within the relevant representation comment. Longer term during the operational and maintenance phase, the landfall will be buried and resilient to flooding.
2.16.22	Access south of Field Place removes the impact on the Grade 1 listed heritage Church and the Church Green. Supporting these concerns, with specific reference to the cumulative effects of traffic flows on the A259 and the wider road network around Clymping, is the lack of comprehension and understanding of the current traffic issues, and no detail or modelling of future traffic flows. Any traffic assessment must look at the cumulative effects and not just on the additional traffic movements from this project.	The **Outline Construction Traffic Management Plan (CTMP) [PEDP-035a]** includes prescribed traffic routes for construction traffic associated with the Proposed Development. As shown on Figure 7.6.6a of the **Outline CTMP [PEDP-035a]** all construction traffic will access the Temporary Construction Compound at Climping via the A27, A284 and A259 (i.e. from the South). The **draft Development Consent Order [PEDP-009]** includes Requirement 24 to submit a stage specific CTMP (which accords with the **Outline CTMP [PEPD-035a]**) for approval by the highway authority in consultation with the relevant planning authority before that stage can commence. The traffic and transport impacts of the construction phase of the proposed development has been assessed in detail within **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064]**. All estimates of future baseline traffic flows used within **Chapter 23: Transport, Volume 2** of the ES **[APP-064]** and **Chapter 32: ES Addendum, Volume 2** (Document reference: 6.2.32) (submitted at Deadline 1) were based on TEMPro forecasts, which is a program developed by the Department for Transport providing traffic growth projections. These projections take account of national and local predicted growth in population, employment, housing (including sites allocated in the Local Plan) and is the industry standard approach to assessing future baseline traffic. Use of this methodology was also agreed with West Sussex County Council (WSCC) and National Highways during consultation. Taking account of the incorporation of appropriate embedded environmental measures (such as the **Outline CTMP [PEPD-035a])**, no significant effects have been identified in relation to transport receptors in Climping.
2.16.23	The PEIR SIR refers to meetings and discussions with various stakeholders, but Parish Councils have only been aware of high-level detail through the liaison group. This means local knowledge and experience have not been given the appropriate weighting. Clymping Parish Council remains open to further detailed discussion of all the points above but cannot support the proposals as they stand.	In addition to the written consultation process which has presented detailed proposals and called for feedback, the Applicant has undertaken engagement primarily through the Evidence Plan Process, which is with technical stakeholders, including local authorities. The minutes of these meetings are presented within the **Evidence Plan [APP-243-253]**. Parish Councils have been able to participate in the Onshore Project Liaison Group, and members of the Rampion 2 project team visited officers of Clymping Parish Council to explain the onshore proposals during the 2022 Supplementary Onshore Statutory Consultation.

Ref	Relevant representation comment	Applicant's response
		The Applicant held a virtual meeting on 20 August 2020 to present the initial offshore Area of Search and cable corridors, highlighting the need to make landfall at Climping Beach and promoting upcoming consultations. In addition to membership of the Onshore Project Liaison Group, Clymping Parish Council were also invited to the Parish Councillors virtual meetings during the statutory project-wide consultation in 2021. The consultation as a whole was promoted with a roadshow on Climping Beach on 25 August 2021. As part of the statutory onshore consultation, The Applicant held one of the four public exhibitions at Arun Yacht Club on Rope Walk Riverside West, a short walk from Climping Beach.

Table 3-7 Applicant's Response to Cowfold Parish Council [RR-083]

Ref	Relevant representation comment	Applicant's response
2.17.1	This letter of representation is made by Cowfold Parish Council on behalf of its residents and provides a proportionate response, taking into account the varied views put forward by householders within the parish. The Parish Council acknowledges the progress made in diverse green energy generation across Great Britain and the future scope of non-fossil based alternatives. However, the impact of the proposed Rampion 2 project on the road infrastructure, an ongoing cause of anxiety in Cowfold as the village stands on the confluence of the A272 and A281, is of concern to the whole community. Particular aspects of which are highlighted below at Serial 2. Correspondence between the Chairman of the Parish Council and Rampion 2 (dated respectively 11 January 2023 and 24 April 2023) iterated and reiterated misgivings about the volume and clarity of communication between Rampion 2 and the local community which resulted in confusion, disinformation a lack of understanding regarding the potential longer term impacts on the parish. Cowfold Parish Council wishes to take a proactive part of the Development Consent Order process of inquiry and investigation supporting the Examining Authority's exhaustive process to ensure that further uncertainties do not proliferate. Principal Areas of Concern Identified by the Parish Council on Behalf of Residents.	The Applicant has no comment to make on this introduction and addresses comments on specific matters in the following **references 2.17.2 – 2.17.6** below.
2.17.2	Clarity of information provided: As noted above the initial standards of communication(s) from Rampion 2 to residents, in particular those proximate to the proposed substation development site, were found to be varied and at times sparse. The volume of material given on the Rampion 2 website is exhaustive but not necessarily easily digested by the general public. This has been a recurring issue, raised directly with Rampion 2 by a number of residents and the Parish Council, the concerns remain outstanding causing perplexity and upset within the community.	As noted by Cowfold Parish Council, the Applicant provided detailed and extensive information to support consultations, including a Preliminary Environmental Information Report, draft Works Plans and a draft Development Consent Order, which go far beyond the standards required by legislation and guidance. These have been supplemented by public facing consultation brochures and websites to summarise this information and signpost further detail. Throughout the consultations, the project team responded to queries by phone, email, online presentations, and (after Covid restrictions were lifted) in-person information events (see **Consultation Report** **[APP-027** to **APP-030]**.
2.17.3	Traffic, Road Safety and Levels of Pollution: Cowfold parish is already subject to significant daily levels of traffic movements with concomitant concerns in specific areas of the village relating to air pollution levels. Rampion 2 initially provided, at a Parish Council sponsored Public Meeting held in November 2022, an overview of proposed traffic volumes specifically relating to the project. Sight of recent material indicates these have been revised by Rampion 2 showing the A272 and A281 (south) routes through Cowfold as being used for construction traffic. This is directly in contravention to the assurances given by Rampion 2 to the Parish Council and residents. There are extant concerns over road safety usage, particularly in respect of traffic volume and speed management, as a number of recent accidents (November 2022 – October 2023) on both arms of the A272 east and west of Cowfold have demonstrated. Additional vehicular movements will enhance the possibility of further accidents and incidents. Increased traffic volume (heavy and light) is likely to see significant numbers of motor vehicles travel down adjacent narrow, single	To limit the effects on these receptors a range of embedded environmental measures have been provided by the Applicant as detailed within the **Commitments Register** **[APP-254**] which has been updated at the Deadline 1 submission and secured through the **Outline Construction Traffic Management Plan (CTMP) [PEPD-035a]**. The production of a stage specific CTMP in accordance with the **Outline CTMP** **[PEPD-035a]** is secured through Requirement 24 of the **Draft DCO** **[PEPD-009].** The **Outline CTMP** **[PEPD-035a]** has been updated at the Deadline 1 submission including: • Commitment C-157: The proposed heavy goods vehicle (HGV) routing during the construction period to individual accesses will be developed to avoid major settlements of Storrington, Cowfold, Steyning, Wineham, Henfield, Woodmancote and other smaller settlements where possible; and • Commitment C-158: The proposed heavy goods vehicle (HGV) routing during the construction period to individual accesses will avoid the Air Quality Management Area (AQMA) in Cowfold where possible. These commitments are also reflected in Table 5-1 of the **Outline CTMP** **[PEPD-035a]** which has been updated at the Deadline 1 submission and confirms prescribed local Heavy Goods Vehicle (HGV) access

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	track roads which are unsuitable for such use. Cowfold has a primary school, situated adjacent to the A272 (west) with parents bringing, often by foot, their children to the school five days per week. For those families which live within Cowfold village there is at least one major road (A272 or A281) to cross whilst walking their children to school. Increased traffic is likely to impact on the already challenging road safety issues both pedestrian and vehicular for parents taking their children to or collecting them from the primary school.	routes for all sections of the onshore cable corridor and Table 5-2 which details specific local constraints and proposed management of construction traffic routes. These commitments ensure that HGV construction traffic will route along the A27 and A23 to gain access to the A272 east of Cowfold wherever possible, thereby avoiding the village centre. Therefore only accesses A-52, A-56 and A-57 will require construction traffic to route through Cowfold Village centre. As calculated by using data included in Table 5-3 of the **Outline CTMP [PEPD-035a]** which has been updated at the Deadline 1 submission, the impact of this commitment is the removal of up to 22,000 two-way HGV trips (11,000 HGVs) from Cowfold Village centre over the construction phase. Whilst commitment C-157 and C-158 (**Commitments Register [APP-254]**) discourages traffic from routeing through the Cowfold AQMA for robustness within **Chapter 23: Transport, Volume 2** of the ES **[APP-064]**, it has been assumed that approximately 25% of HGV traffic will route through Cowfold from the A24 and A272 east of the village centre when entering or exiting construction accesses at Oakendene, Kent Street or Wineham Lane. In relation to construction LGV traffic, these have been split into three categories within the **Outline CTMP [PEPD-035a]** (which has been updated at Deadline 1) to allow consideration of LGV staff traffic, LGV delivery traffic and LGV construction traffic. Whilst no routing restrictions have been placed on LGV staff traffic routing to and from the temporary construction compounds and onshore substation at Oakendene (as is normal for staff routing to a place of work), routes have been identified for all LGV delivery traffic and LGV construction traffic. This also assumes that all LGV construction traffic including deliveries will route to one of the temporary construction compounds first and then if needed onto work sites via Multi-Occupancy Vehicles to limit the amount of construction traffic traveling to individual work sites. The likely significant transport effects associated with the construction phase of the Proposed Development have been assessed in **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064]**, **Chapter 32: ES Addendum, Volume 2** (Document reference: 6.2.32) (submitted at Deadline 1) and **Appendix 23.2: Traffic Generation Technical Note, Volume 4** of the ES **[APP-197]** which has been updated at the Deadline 1 submission. At peak construction, taking account of the construction traffic routing contained within the **Outline CTMP [PEPD-035a]** which has been updated at the Deadline 1 submission, the following effects have been identified for Cowfold: • At A281 south of Cowfold (Receptor 23): ▸ An HGV peak week increase of 12 HGVs per day, equivalent to an increase of 7.5% and approximately one HGV per hour; and ▸ A total construction traffic peak week increase of one HGV per day and 71 light goods vehicles (LGVs) per day (5-6 per hour), equivalent to a 1.1% increase in total traffic flow. • The A281 / A272 in the centre of Cowfold (Receptor 24): ▸ An HGV peak week increase of 39 HGVs, equivalent to an increase of 3.5% and 3-4 HGVs per hour; and ▸ A total construction traffic peak week increase of 19 HGVs and 154 LGVs (12-13 per hour), equivalent to a 0.7% increase in total traffic flow. • The A272 Station Road west of Cowfold Village centre (Receptor 25):

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		▸ An HGV peak week increase of 39 HGVs, equivalent to an increase of 4.6% and 3-4 HGVs per hour; and ▸ A total construction traffic peak week increase of 19 HGVs and 154 LGVs (12-13 per hour), equivalent to a 0.9% increase in total traffic flow. • The A272 Bolney Road east of Cowfold Village centre (Receptor E): ▸ An HGV peak week increase of 39 HGVs, equivalent to an increase of 5.5% and 3-4 HGVs per hour; and ▸ A total construction traffic peak week increase of 19 HGVs and 147 LGVs (12-13 per hour), equivalent to a 0.8% increase in total traffic flow. As noted within Institute of Environmental Management and Assessment (IEMA) 1993 publication *Guidelines for the Environment Assessment of Road Traffic* (IEMA, 1993) an increase of less than 10% is not discernible environmental effect as is within day-to-day fluctuations in traffic flow. Therefore, no significant effects are predicted to occur within Cowfold. Impacts from construction road traffic emissions at sensitive receptor locations within Cowfold, and Cowfold Air Quality Management Area (AQMA) specifically, have been assessed in **Chapter 19: Air quality, Volume 2** of the ES **[APP-060]**. The air dispersion traffic modelling used traffic data based on annual peak daily traffic, rather the annual average daily traffic stipulated in the Department for Environment, Food And Rural Affairs (Defra) *Local Air Quality Management Technical Guidance* (2022). Therefore, the completed assessment was highly conservative. Impacts from emissions of Nitrogen Dioxide (NO_2), Particulate Matter 10 (PM_{10}) and Particulate Matter 2.5 ($PM_{2.5}$) were considered. The assessment concluded that the impact from construction road traffic emissions are negligible at all sensitive receptor locations, including residential receptors within the AQMA.
2.17.4	Impacts on Local Economy: Reservations have been expressed by a number of businesses in the parish, particularly in the proximate Oakendene Light Industrial Estate, about the impact of construction traffic on their ability to conduct, supply and fulfill their business obligations throughout the extended construction period. This in turn may impact on the continuation of these businesses in Cowfold and the supporting employment which they provide to the members of the local community.	Please see responses in **references 2.17.3** above. At peak construction activity, access A-62 (Oakendene Compound) will cater for 326 HGV two-way movements and 456 LGV two-way movements across a one-week period. This is the equivalent of 156 construction traffic two-way movements per day or 13 per hour (approximately 6 entering and 6 exiting the compound). At peak construction activity, access A-63 (Oakendene Substation) will cater for 326 HGV two-way movements and 564 LGV two-way movements across a one-week period. This is the equivalent of 178 construction traffic two-way movements per day or 14-15 per hour (approximately 7 entering and 7 exiting the access junction). Based on these construction traffic flows and the conclusions of the **Chapter 23 Transport, Volume 2** of the ES **[APP-064]** and **Chapter 32: ES Addendum** (Document reference: 6.2.32) (submitted at Deadline 1), no significant effects have been identified in relation to transport receptors.
2.17.5	Landscape and Ecological Impacts: The earliest documented records of Cowfold date back between 1210-1232 (Common Era) and it has remained a primarily rural parish with areas of historic woodland, diverse wildlife and established ecology. Cowfold Parish Council, whilst	**Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-063]** describes the effects on the ecological features present. Through design of the Proposed Development the mitigation hierarchy has been applied so that efforts have been made to avoid ecological features, minimise levels of effect where avoidance is not possible (e.g. trenchless crossings), mitigate effects (e.g. through sensitive

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	appreciating that part of the Rampion 2 project requirements are the reinstatement of areas affected by the cable trenches and the provision of an effective and appropriate green screen/landscaping protocol around the substation, raises concerns about habitat disturbance. This is at a time when conservation groups have evidenced a 41% decline in UK species since the 1970s (Natural History Museum) with more than one in seven native species facing extinction. Clarification in respect of preserving this noteworthy landscape and its associated habitats is a matter of particular concern to the Parish Council and residents alike. The community looks to the Examining Authority to ensure that all government guidelines in respect of nature preservation and promotion are upheld.	temporary lighting design) and compensate for residual effects. Although there will be short term effect on a number of ecological features, the approach to construction, the reinstatement of habitats and habitat creation (both at the onshore substation site and as part of biodiversity net gain delivery) will provide a positive legacy for ecology in the medium to long term. With regards to the general UK and global decline in species, climate change is the greatest driver behind these trends. Offshore wind is a leading form of renewable energy generation and is an available technology that can be deployed swiftly at scale for reducing carbon emissions.
2.17.6	In Conclusion: As the formal representative body for the community and thus an Interested Party, Cowfold Parish Council wishes to play a proactive part for the duration of the Inquiry in addressing these issues identified in the Development Consent Order process.	The Applicant has no further comments on this matter at this time.

© WSP Environment & Infrastructure Solutions UK Limited

Table 3-8 Applicant's Response to Kingston Parish Council [RR-192]

Ref	Relevant representation comment	Applicant's response
2.18.1	Kingston Parish Council strongly opposes the application for the Rampion 2 Offshore Wind Farm. Council first raised its concerns during consultations held by Rampion in the lead up to this application and is disappointed that these concerns have not been sufficiently addressed. Council's objections are set out below.	The Applicant is grateful for Kingston Parish Council's participation in the statutory consultation. The themes raised by the Parish were addressed in the **Consultation Report** [**APP-027**] provided with the DCO Application, and are further discussed in the rows below. Notably, since the Parish Council's statutory consultation response, the extent of the offshore array and number of turbines has been reduced, and a suite of ecological mitigation measures embedded into the design of the Proposed Development.
2.18.2	The Location: Whilst Council fully supports the need to bring on stream more renewable energy, wind farms need to be located with sensitivity to the amenity and landscape of the local area. It is important to focus investment on projects which will give the best return in the efficiency of producing energy and balancing this against the impact it will have on the local area. There have been reports that over the summer the power output from the existing Rampion 1 installation has fallen to only 2.25% of its nominal capacity due to lack of wind power. There are other sites around the coast where the turbines can be set much further out to sea to reduce the visual impact such as at Dogger Bank in the North Sea and these will also benefit from increased wind strength and efficiency. There is no justification for the argument that there is a need for a wind farm to be sited along the Sussex Coast to serve the local population, as power from the wind farm is fed into the National Grid whether it is generated off of Sussex or in the North Sea. The location is contrary to government policy: - It is within inshore waters, and this is against the OESEA2 government guidelines that all offshore wind projects should actually be offshore i.e. more than 12 nautical miles (14 miles) from shore. - It is contrary to the OESEA3/White report that identifies that wind farms with the height of the Turbines proposed should be more than 25 miles from a sensitive area such as the South Downs National Park.	The overarching National Policy Statement for Energy (EN-1 – both 2011 and 2024 versions) state that the urgent need for new energy generation justifies a variety of projects, which should not be compared against each other. The requirement for a diversity of supply is most clearly expressed in the 2024 NPS EN-1 in paragraph 3.2.4. A wind farm on the south coast, alongside those in the North Sea, may provide power at different times based on local wind conditions, smoothing the availability of supply. Further, generation close to the south coast conurbation reduces the need for grid reinforcements to carry power across the country in new overhead lines. The Applicant has provided information on the performance and output from the Rampion 1 Offshore Wind Farm in in the summary from the oral submissions from the Issue Specific Hearing 1, agenda point 2(ii) (see **Applicant's Response to Action Points Arising from Issue Specific Hearing 1** (**Document Reference 8.25**) (submitted at Deadline 1)) and in response to the Examination Authority's Action Point 2. The Offshore Energy Strategic Environmental Assessment (OESEA) (White Consultants and Northumbria University, 2020) proposes 34 km (21.3 miles) offshore as a suggested buffer for all scales of wind farm development to avoid significant adverse effects on a combined National Park and Heritage Coast. The OESEA is a strategic tool that does not suggest no-go areas for development and is not guidance or a roadmap for placing of wind farms, which are allocated by The Crown Estate and it is not in the Applicant's remit to locate sites to avoid all impacts.
2.18.3	The Visual Impact: There will be an extremely detrimental visual effect on the seascape given: - Rampion 2 is to be sited only some 8 miles from the shoreline - this is far too close. Turbines of this size and quantity should be sited much further out to sea and not inshore. - This stretch of the West Sussex coastline is an inappropriate location for such a large wind farm. The English Channel is too narrow to enable the turbines to be positioned far enough out to sea to be acceptable. - The much larger sized turbines than for Rampion 1 (up to 325m above the sea at low tide – taller than the Eiffel Tower!) will have a greater visual impact than Rampion 1, during the day and when lit at night. - The combined and extended span of Rampion 1 and 2 will unacceptably affect the seascape of an extensive part of the Sussex coastline, 'fencing' in the Sussex Bay. This will impact on the views for residents and tourists as well as views from iconic sites such as Arundel Castle and the South Downs National Park.	The visual effects of the wind turbine generators are assessed in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP056]**. The Design principles are described in Section 15.7 of the chapter which sets out how the design of the Proposed Development provides embedded environmental measures addressing visual effects, in response to stakeholder comments, including a reduction in the spatial extent of the Rampion 2 array area, it's spread and quantity of wind turbine generators within it. Opportunities to reduce effects through turbine height reduction are limited due to the technical and economic requirements associated with producing renewable energy as well as other environmental factors.
2.18.4	The Environmental Impact: There will be a detrimental impact on the Environment due to: - The effect of turbines on birds, bats etc. as their safe flight corridors will be lost. - The disturbance of the seabed that will impact on the plants and sea creatures. For instance, the loss of Black Bream in our area and of breeding grounds for lobsters and	The potential effects on birds are assessed in **Chapter 12: Offshore and intertidal ornithology, Volume 2** **[APP-053]** and the proposed embedded environmental measures are set out in Table 12-20, for the effect of turbines on birds, this includes:

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	crabs. - The adverse effect on the countryside and its wildlife due to the laying of cables from Climping to Bolney. This includes passing through, and disturbing, the protected South Downs National Park.	• There will be a minimum blade tip clearance of at least 22m above MHWS. As bird flight heights tend to be skewed towards lower altitudes, collision risk is reduced if the minimum blade tip height is larger. This is secured by Requirement 2 (2)(c) of the **Draft DCO** **[PEPD-009]**. Following the implementation of the measures set out in Table 12-20, no significant effects are predicted to occur. A suite of mitigation measures has been proposed to reduce effects on the seabed and Black Seabream (*Spondyliosoma cantharus*); these are set out in detail in the **In Principle Sensitive Features Mitigation Plan** **[APP-239]**. The potential effects on lobsters and crabs have been assessed in Section 8.9 to 8.12 of **Chapter 8: Fish and shellfish ecology, Volume 2** of the ES **[APP-049]** and no significant effects are predicted to occur. In addition to this, the introduction of wind turbine generator foundations and scour protection will create additional refuge areas which have the potential to result in positive effect for crustacean species such as the brown crab and European lobster. The Applicant acknowledges that some residual effects have been identified on the onshore cable route. The design of the Proposed Development has sought to avoid, reduce and minimise any residual effects through provision of embedded environmental measures during the construction phase. This includes the measures in the **Outline Code of Construction Practice** **[PEPD-033]** which will be secured by Requirement 22 of the **Draft DCO** **[PEPD-009]**, **Commitments Register** **[APP-254]**, technical chapters of the ES (**Chapter 6 Coastal processes, Volume 2** **[APP-047]** to **Chapter 29: Climate change, Volume 2** of the ES **[APP-070]**) and other topic specific plans including those for landscape, terrestrial ecology (see **Outline Landscape and Ecology Management Plan** **[APP-232]** which will be secured by Requirement 12 of the **Draft DCO** **[PEPD-009]**. The grid connection point is a key driver for identifying the initial cable route options. As identified in Section 3.3 of **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]**, the grid connection options that would avoid the South Downs National Park that were considered were assessed as not being economically viable, and do not present a viable alternative to development taking place within the South Downs National Park. Further explanation of the choice of the landfall location and cable route options is provided in **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]**.
2.18.5	The Economic Impact: The sea view is cited as one of the main reasons to visit the West Sussex coastline and the proposal will affect tourism which is vital to the area and to our larger towns such as Littlehampton, Bognor and Arundel. Additionally, Fisherman will be adversely affected due to the loss of breeding grounds and habitats for marine life, including crab and lobster.	**Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]** details relevant studies and evidence from offshore wind farms in the UK which shows that there has been no evidence of overall negative impact on the tourism economy from the development of offshore wind farms in the UK. This evidence included analysis of tourism employment numbers for Rampion 1 which showed higher levels of tourism and employment across Sussex coastal seaside towns over the period in which Rampion 1 was operational compared to before Rampion 1 began construction. The assessment of the impact on the volume and value of tourism detailed in Sections 17.9, 17.10 and 17.11 of **Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]** considers the changing public perceptions of offshore wind as evidenced by the UK Governments Public Attitudes Tracker. The assessment explores the impact on tourism and finds that overall, when all influencing factors are considered, the effect of Rampion 2 on the volume and value of tourism across Sussex is

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		expected to be negligible. While there may be some people with negative perceptions of offshore wind farms who may be deterred from visiting, these are likely to be small in number and could be offset by those who are more likely to visit the area due to the development of offshore wind. For example, those visiting the existing Rampion visitor centre or those going on boat trips to the offshore infrastructure of Rampion 1 (see paragraph 17.9.27, **Chapter 17 Socio-economics, Volume 2** of the ES **[APP-058]**. **Chapter 10: Commercial fisheries, Volume 2** **[APP-051]** examines the likely significant effects on commercial fisheries that may be experienced as a result of the Proposed Development. A range of environmental measures are embedded as part of the Proposed Development design (as set out in Table 10-12) to remove or reduce any significant environmental effects on commercial fisheries, as far as possible. These include: • Advance warning and accurate location details of construction, maintenance and decommissioning operations, delivered via Notices to Mariners and Kingfisher Bulletins (as secured by Condition 5 (7) & (8), Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**. • Ongoing liaison with fishing fleets through all stages of the Proposed Development. Including the appointment of a Fisheries Liaison Officer and the production of a Fisheries Liaison and Co-existence Plan (as secured by Condition 11(1)(g) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**) in accordance with the **Outline Fisheries Liaison and Co-existence Plan** **[APP-241]** was submitted with the Application. Based on the proposed location of the offshore infrastructure and its subsequent operation, plus the incorporation of appropriate environmental measures, No Significant Effects have been identified in relation to the potential impact of the Proposed Development on commercial fisheries. Additionally, an **Outline Fisheries Liaison and Co-existence Plan** **[APP-241]** was submitted with the application.
2.18.6	Conclusion: The adverse impacts of Rampion 2 would demonstrably outweigh the benefits for both current and future generations of residents and visitors. The wind farm will damage our seaside views and beauty, deterring people attracted to visit or live here and stifling the economic benefits that visitors and new residents bring.	The Applicant considers that, when considered with reference to National Policy Statements, the considerable climate change benefits of the project would outweigh the assessed harms. This is set out in the **Planning Statement** **[APP-036]**.

© WSP Environment & Infrastructure Solutions UK Limited

Table 3-9 Applicant's Response to Littlehampton Town Council [RR-203]

Ref	Relevant representation comment	Applicant's response
2.19.1	These proposals were considered by the Town Council at its meeting held on 12 October 2023. The Council welcomed the proposal which embraced the use of wind farm technology as both a sustainable form of power generation and, recent evidence would suggest, encouraged the regeneration and growth of the marine environment. The proposed development will have a significant effect on the Town.	The acknowledgement that Proposed Development will contribute to climate change mitigation is welcomed by the Applicant. The Proposed Development will help meet the urgent need for new renewable energy infrastructure in the UK and supporting the achievement of the UK Government's climate change commitments and carbon reduction objectives.
2.19.2	The visual, environmental, and engineering challenges that the scheme presents are significant and Council sought reassurances regarding the safety and minimisation of the impact on the environment of the onshore cabling system needed to transmit the energy generated to the inland network. In the early days of these proposals, the Town Council identified the impact of the wind farm on the local fishing fleet, the Harbour, and the existing sea and river flood defences as their primary concerns in connection with this scheme. In terms of the impact on the local fishing industry and harbour, we await publication of Arun District Council's Local Impact Assessment.	The Applicant acknowledges that some residual effects have been identified on the onshore cable route as presented in Table 22-30 of **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the Environmental Statement (ES) **[APP-063]**. The design process has sought to avoid, reduce and minimise any residual impacts through providing embedded environmental measures during construction. This includes the embedded environmental measures in the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** and other topic specific plans including those for landscape and ecology, and on the local fishing fleet (see **Outline Landscape and Ecology Management Plan (LEMP)** **[APP-232]** secured via requirement 12 of the **Draft Development Consent Order** **[PEPD-009]** and the **Outline Fisheries Liaison and Co-Existence Plan** **[APP-241]**) secured via Schedule 11, Part 2, Condition 11 (1) (g) and Schedule 12, Part 2, Condition 11 (1) (g) of the **Draft DCO** **[PEPD-009]**.
2.19.3	The other concerns however remain, and the Council would like to put forward some practical ways in which the Scheme, if approved, could contribute to the area. It is our view that a development of this size and significance could have a significant impact on the existing sea and river flood defences and their management in the future. We therefore consider that the Scheme should make a meaningful contribution to the much-needed repair and ongoing maintenance of the existing river and coastal defence infrastructure.	The Applicant considers that the impacts of the Proposed Development, as proposed, are adequately mitigated. Nonetheless, where local authorities propose a mitigation in relation to an assessed harm, these will be considered.
2.19.4	Another way that the Scheme could provide long-term community support would be a visitor centre facility similar to that which has been set up in Brighton for Rampion 1. Our members believe this would work well as a visitor attraction and could be introduced in Littlehampton. Finally, regarding the process of approving this type of development and in view of its central location and facilities, we would like to offer the Town Council's Offices as a possible venue for the Public Examination	The Rampion Visitor Centre has proved to be a visitor attraction. However, the Applicant can't commit to a Visitor Centre for Rampion 2 at this stage in development and such a proposal would be separate and distinct from the DCO application. The Planning Inspectorate decided the venue for the Preliminary Meeting and Public Hearings.

© WSP Environment & Infrastructure Solutions UK Limited

Table 3-10 Applicant's Response to Lyminster and Crossbush Parish Council [RR-207]

Ref	Relevant representation comment	Applicant's response
2.20.1	We understand that members of our community have previously responded to your consultation exercise, yet their views appear to have been disregarded in some of the latest proposals. Namely routes traversing higher quality farming land including the area of the organic egg farm at The Brewhouse and a possible diagonal section of route through prime agricultural land from Lyminster towards Poling are highly undesirable. It has been pointed out that low productivity agricultural land to the south of Black Ditch would be a more preferable route traversing north alongside the Southern water high pressure main/ gas main and sewage pipe or even along the Angmering/ Poling border. We remain of the opinion that all of the routes coming directly through our parish are generally to a greater or lesser degree detrimental to our community. Other options are available including investigating the possibility of laying a cable up the course of the River Arun. We have heard no technical argument as to why this could not be pursued and would appreciate your response specifically on this matter.	The Applicant welcomes the involvement of Lyminster and Crossbush Parish Council during the cable routeing process. This representation appears to reiterate a consultation response received in 2023, which was responded to at the time. Environmental factors have been taken into consideration with regard to the cable routing such as minimising construction works in flood risk zones. Construction works along the course of the River Arun would be unlikely to meet policy requirements such as minimising works in high flood risk areas, associated with the River Arun transitional Water Framework Directive (WFD) body. From an ecological perspective the River Arun is extensively protected with the Arun Valley Local Wildlife site, Arundel Park SSSI, Amberley Wild Broos SSSI and Pulborough Brooks SSSI, Arun Valley SPA, Arun Valley Ramsar and Arun Valley SCA (the latter 3 being international designations). The refinement process for the alterative cable routes considered have been presented in Section 3.4 of **Chapter 3: Alternatives, Volume 2 [APP-044]**.
2.20.2	We would also appreciate a full technical explanation as to why Rampion 2 could not be connected to Rampion 1 and partially utilise the existing infrastructure to reach the National Grid. Even if the entire length of that infrastructure connection to the National Grid required upgrading it would significantly minimise the additional environmental damage (biodiversity loss, habitat destruction, long-term ecosystem damage, etc) caused by an entirely new connection following an entirely new path as you now propose.	The Applicant considered using the route of the Rampion 1 export cable for its own export cable, which is described in Section 3.4 of **Chapter 3: Alternatives, Volume 2** of the Environmental Statement (ES) **[APP-044]**. This found that the route was heavily constrained, and it would not have been possible to place new cables alongside the existing – see paragraph 3.4.18 and Table 3-5. At the time of investment in 2015, there was no immediate prospect of future Crown Estate leasing rounds for this area. The Crown Estate first suggested a round for extension proposals in 2018. The industry regulator requires every project to be designed and invested in an economic and efficient manner, to minimise cost to the end consumer, which prevents us from building speculative/spare capacity. The cables for the original Rampion project were therefore rated at a maximum capacity of 400 MW. There are a number of pinch points where the land is congested with environmental and physical constraints. The original landfall location at Brooklands Pleasure Park, in Lancing, is highly congested with underground pipes and services, as well as cables from the Rampion 1 scheme. There are significant constraints at Teville Stream and at the old landfill site at Brooklands. Further north at Tottington Mount, the original cable route has utilised the available width on the crest of the hill, such that a parallel route would require 'benching' into the side of a hillside (such as used for roads/railways running across slopes), which has potential significant and unacceptable impacts due to visual and habitat sensitivities. The Rampion 1 onshore and offshore transmission assets have been integrated into the National Grid through the OFTO (Offshore Transmission operator) regime and is now owned and operated by TC Rampion OFTO Ltd. Hence the Applicant doesn't own or operate the network.
2.20.3	The undeniable benefit of sustainable energy schemes should not licence the project to deliver irreversible environmental and disruption to the communities affected. The disruption and medium-term inconvenience likely to be caused to our community warrants a compensatory consideration from the proposed scheme. Just like communities affected by on-shore wind turbine schemes we believe there should be a mechanism for residents in	The Applicant notes the comments made with regards to benefits for local communities. Community benefits are not a legal or DCO requirement and are quite distinct from the consenting process, a point reiterated in the Government (Department for Energy Security and Net Zero) response to the consultation on Community Benefits for Electricity Transmission Network Infrastructure (Dec 2023), which stated,

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	our community to benefit from a discounted energy tariff as a result of this scheme should it go ahead.	"*The proposals on community benefits for electricity transmission network infrastructure discussed within this document will remain separate to the planning process. It will not be a material consideration in planning decisions, and not secured through those decisions*." That said, the Proposed Development will be a permanent neighbour in the Sussex community and the Applicant intends to develop and implement a community benefits package of proposals. In the second half of 2024, the Applicant will therefore be consulting key stakeholders and local communities on how a community benefit package could best support Sussex communities. The final package may include a range of initiatives to benefit business, education and residential communities.

© WSP Environment & Infrastructure Solutions UK Limited

Table 3-11 Applicant's Response to Pagham Parish Council [RR-283]

Ref	Relevant representation comment	Applicant's response
2.21.1	Members are extremely concerned by the scale of the turbines proposed under the scheme. It was noted that on p51-60 of the Rampion 2 Wind Farm Category 6: Environmental Statement Volume 3, Chapter 15: Seascape, landscape and visual impact assessment (Part 5 of 8) Date: August 2023 Revision A, a visualisation of the impact on the views from Pagham Beach were shown. For perspective, the current marker for Pagham's historic Mulberry Harbour is shown and it is clear that at 325m tall, the turbines will dwarf this marker and be of huge impact on the views from the beach. Members believed this impact to be severe and felt it could impact visitor numbers to Pagham which would harm the local economy. Members believe the location of turbines of this size (only 16km offshore) is too near. There is no other site in the UK where turbines of this size are used this close to shore; they are usually 25km away. In the EU, they are located 60km away. No rationale given as to why this would be acceptable given the obvious pronounced impact on the visual amenity of the area.	The Applicant has considered the visual impact of the offshore infrastructure in its assessment of the impact on the tourism economies of Sussex coast. There are a number of significant operational UK offshore wind farms that are less than 25km from shore (including Westermost Rough, Humber Gateway, Lincs, Thanet, Kentish Flats Extension, Gwynt y Mor and Rampion 1). **Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]** details relevant studies and evidence from offshore wind farms in the UK which shows that there has been no evidence of overall negative impact on the tourism economy from the development of offshore wind farms in the UK. This evidence included analysis of tourism employment numbers for Rampion 1 which showed higher levels of tourism and employment across Sussex's coastal seaside towns over the period in which Rampion 1 was operational compared to before Rampion 1 begun construction. The Rampion Visitor Centre is attracting tens of thousands of visitors each year and a number of independent charter vessels have diversified their businesses to run trips to visit the Rampion Wind Farm. In November 2022, the Applicant commissioned Yonder, an independent polling organisation, to conduct a public opinion survey of local attitudes towards Rampion 2, with 82% of the Sussex community supporting principally rising to 86% after hearing the policy proposals. Just 9% feel the disadvantages outweigh the advantages and just 7% think the potential visual impact means they oppose the project despite any advantages.
2.21.2	Turbines of this size are appropriate for offshore locations, not inshore as in this case.	The visual effects of the wind turbine generators are assessed in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP056]**. The Design principles are described in Section 15.7 of the chapter which sets out how the design of the Proposed Development provides embedded environmental measures addressing visual effects, in response to stakeholder comments, including a reduction in the spatial extent of the Rampion 2 array area, it's spread and quantity of wind turbine generators within it. Opportunities to reduce effects through turbine height reduction are limited due to the technical and economic requirements associated with producing renewable energy as well as other environmental factors. OESEA4 (2022) is the latest Strategic Environment Assessment (SEA). Considerations with respect to the visual impacts of offshore wind farms are provided In Section 5.8 and Appendix 1, with reference to the White 2020 report (White Consultants, March 2020). OESEA4 (2022) recognises that *"In practice development scenarios will vary for each individual wind farm and also the variables determining visibility for individual wind farms. The visibility of structures from the coast, or their intrusion on sites designated for their visual qualities, does not necessarily preclude development in planning (see: NPS (EN-1) and the MPS), and any consideration of coastal "buffers" is too generalised an approach to take into consideration the many anthropogenic and natural variations along the coast and the variety of development scenarios which might take place (e.g. installation number, type, design and orientation)".* The OESEA (2022) therefore does not suggest no-go areas for development, it is a strategic tool and is not guidance or a roadmap for placing of wind farms, which are allocated by The Crown Estate and it is not in the Applicant's remit to locate sites to avoid all impacts.
2.21.3	The wind is insufficient.	The developer for Rampion 2, RWE, has over 20 years of experience in constructing and operating offshore wind farms, and has determined that Rampion 2 is a viable site and productive location for wind energy generation, with a predicted wind speed of ~9.3 m/s.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		The latest figures show that the operating Rampion Wind Farm exceeded target generation[1] by 15% in 2023. Rampion has exceeded its target for three of the four complete years of operation from 2020-23 and in terms of total generation across this period, Rampion has exceeded the target by 8%[2]. It is not only the wind resource that makes Rampion 2 an ideal location for an offshore wind farm. With the southeast of England being one of the most densely populated regions in Europe, it's a huge demand centre for electricity. Rampion 2 can therefore create a greater contribution to electricity generation close to where the demand centre is located, which reduces transmission losses and requires no electricity storage facilities. 1. Target generation is 1,367GWh per year. Assumed capacity factors for offshore wind, The Contracts for Difference (Standard Terms) Regulations August 2014, DECC. Generation: 400MW x 0.39 x 8760 x 1,000 = 1,366,560,000KWh / 1,367GWh pa) 2. Total target for 2020 – 2023 = 5,468GWh (4 x 1,367GWh). Total actual generation for 2020 – 2023 = 5,919GWh (2020 = 1,600GWh, 2021 = 1,363GWh, 2022 = 1,376, 2023 = 1,580GWh.

© WSP Environment & Infrastructure Solutions UK Limited

Table 3-12 Applicant's Response to Pulborough Parish Council [RR-305]

Ref	Relevant representation comment	Applicant's response
2.22.1	From a local standpoint the concern would be the proposed compound at Washington. Considering the extra traffic that this would this generate on already busy roads through Pulborough given the restrictions on the A29 and A283 where would the points of access be.	The likely significant transport effects of the construction phase of the Proposed Development have been assessed within **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064]** **Chapter 32: ES Addendum, Volume 2** (**Document reference: 6.2.32**) (submitted at Deadline 1) and in **Appendix 23.2: Traffic Generation Technical Note, Volume 4** **[APP-197]** which has been updated at the Deadline 1 submission. Based on the peak week sensitivity test used within the ES Addendum (submitted at Deadline 1) a worst-case heavy goods vehicle (HGV) flow will occur in week 87 of the construction programme where the Proposed Development will generate 44 heavy goods vehicles (HGVs) and 91 light goods vehicle (LGVs) per day at Receptor 17 (A283 east of the A24). In addition, the worst-case overall increase in traffic will occur in week 85 where there will be 43 HGV and 114 LGVs per day. Noting that construction traffic movements will occur across the hours of 07:00-19:00 each day (see paragraph 8.4.7 and 8.4.8 of the **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** **(**updated at Deadline 1) which is secured through requirement 24 of the **Draft Development Consent Order** **[PEPD-009]**), this is the equivalent of approximately 3-4 HGVs per hour and 9-10 LGVs per hour. It is therefore not anticipated that this construction traffic will have a material impact on the operation of Washington Roundabout. It should also be noted that this construction traffic impact is related to construction traffic movements taking place between the A24 and A283 east of Washington Roundabout. The A283 west of construction access A-32 and A-34 do not form permitted HGV routes within the **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a].** Further to this, discussions between the Applicant and West Sussex County Council (WSCC) are ongoing regarding the design for the access junction to the Washington temporary construction compound with a view of finding an acceptable solution before the end of the Examination.
2.22.2	Likely damage to the South Downs escarpment required to connect the power cables to the inter-connectors and will cause further disruption to the environment.	The **Outline Construction Method Statement** **[APP-225]** (secured through Requirement 23 of the **Draft DCO** **[PEPD-009]**) describes the methods of construction which will be implemented during the onshore elements of the Proposed Development including temporary haul road and accesses, open trenching and trenchless crossings. The **Outline Code of Construction Practice (CoCP)** **[PEPD-033**] (secured through Requirement 22 of the **Draft DCO** **[PEPD-009]** includes and secures the embedded environmental measures to avoid, prevent or reduce the impacts arising during the construction of the Proposed Development. The **Outline CoCP** **[PEPD-033]** is supported by a number of management plans including (but not limited to): • **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]**) secured through Requirement 24 of the **Draft DCO** **[PEPD-009]**); • **Outline Public Rights of Way Management Plan** **[APP-230]** secured through Requirement 20 of the **Draft DCO** **[PEPD-009]**;

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		• **Outline Soils Management Plan [APP-226]** secured through Requirement 22 of the **Draft DCO [PEPD-009]**; • **Outline Landscape and Ecological Management Plan (LEMP) [APP-232]** secured through Requirement 12 of the **Draft DCO [PEPD-009]**; and • **Outline Site Waste Management Plan (SWMP) [APP-225]** secured through Requirement 22 of the **Draft DCO [PEPD-009]**. Details regarding reinstatement are outline in Section 4.10 within the **Outline CoCP [PEPD-033]** secured through Requirement 22 of the **Draft DCO [PEPD-009]** which states that following completion of onshore construction activities, temporary infrastructure including main temporary construction compounds, trenchless crossing compounds, soil storage areas, cable stringing out areas and accesses will be reinstated to the extent possible.
2.22.3	The turbine pylons cause considerable damage to the seabed during construction and further damage occurs due to the vortices created by the strong currents between the pylons.	Impacts from wind turbine generator foundations to the seabed and changes to the tidal, wave and sediment transport regimes due to the presence of wind farm infrastructure are assessed in**, Chapter 6: Coastal processes, Volume 2** of the Environmental Statement (ES) **[APP-047]** and **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2** of the ES **[APP-050]**. The design of the Proposed Development has sought to avoid, reduce and minimise any residual effects through provision of embedded environmental measures, these include: • C-38 – *The selection of the foundation type will primarily be based upon the site conditions combined with the wind turbine generator (WTG) that is selected. The following foundation types are being considered: Monopile and Multi-leg*. C-38 is secured via Requirement 2 of the Draft DCO **[PEPD-009]**. • C-39 – *To maintain suitable operational conditions for the combined foundation and wind turbine generator (WTG) structure, scour protection (typically consisting of rock aggregate or stone/concrete mattresses) may need to be installed. The method of scour protection will generally be to use rock armour or other large size aggregate placed around the periphery of the foundation at the seabed. However, other methods of scour protection may be used.* C-39 is secured via Schedule 11, Part 2, Condition 11 (1) (i) and Schedule 12, Part 2, Condition 11 (1) (i) of the Draft DCO **[PEPD-009]**. Full details of the embedded environmental measures are listed in Table 6-12 and 9-16, **Chapter 6: Coastal processes, Volume 2** of the ES **[APP-047]** and **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2** of the ES **[APP-050]** respectively. Additionally, an **Outline Scour Protection and Cable Protection Plan [APP-234]** has been submitted with the DCO Application. The final Scour Protection and Cable Protection Plan is secured via Schedule 11, Part 2, Condition 11 (1) (i) and Schedule 12, Part 2, Condition 11 (1) (i) of the Draft DCO **[PEPD-009]**. No significant effects are predicted to occur in the coastal processes or benthic, subtidal and intertidal ecology assessments.
2.22.4	Concern with disruption of the flight of migratory birds each year. We are already suffering considerable losses of House Martins, Swifts and Swallows.	Impacts on migratory birds are assessed in **Chapter 12: Offshore and intertidal ornithology, Volume 2** of the ES **[APP-053]**. The design of the Proposed

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		Development has sought to avoid, reduce and minimise any residual impacts through providing embedded environmental measures, these include: • C-89 – *There will be a minimum blade tip clearance of at least 22m above MHWS.* As bird flight heights tend to be at lower altitudes, collision risk is reduced if the blade tip clearance is larger. The blade tip clearance for the Proposed Development has been increased to 22m to minimise this risk whilst considering other factors (i.e. SLVIA concerns). This parameter is secured in Requirement 2 and Schedule 11 *Deemed Marine Licence under the 2009 Act – Generation Assets* of the **Draft Development Consent Order [PEPD-009]**. No significant effects are predicted to occur to migratory birds.

© WSP Environment & Infrastructure Solutions UK Limited

Table 3-13 Applicant's Response to Selsey Town Council [RR-345]

Ref	Relevant representation comment	Applicant's response
2.23.1	Selsey Town Council Selsey Town Council supports the need to invest in renewable energy infrastructure, including wind farms. This Council recognises that we have a Climate Emergency. Wind farms need to be located sensitively, taking into account the effect they have on wildlife both above and below the waves, the economic impact of local communities and the land and seascapes of the local area.	The acknowledgement that the Proposed Development will contribute to climate change mitigation is welcomed by the Applicant. The Proposed Development will help meet the urgent need for new renewable energy infrastructure in the UK and supporting the achievement of the UK Government's climate change commitments and carbon reduction objectives.
2.23.2	Above the waves, there are still unknown impacts that wind farms have on the airborne wildlife of birds, bats and insects. Below the waves the disturbance during construction and the vibrations during generation will disturb the breeding grounds of protected seahorses, crustaceans including the famous Selsey crab and lobster, and other wildlife. More research is required to understand and quantify this environmental damage. Beyond the waves, the construction and ongoing maintenance of underground cabling and associated infrastructure, will have lasting impact on wildlife throughout the Sussex countryside.	Impacts on birds, bats, insects, seahorse and crustaceans are assessed following relevant legislation and best practice in: • **Chapter 8: Fish and shellfish ecology, Volume 2** of the ES **[APP-049]**; • **Chapter 12: Offshore and intertidal ornithology, Volume 2** of the ES **[APP-53]**; and • **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-53]**. The following plans include relevant embedded environmental measures: • **Outline Landscape and Ecology Management Plan [APP-232]** secured via Requirement 12 of the **Draft Development Consent Order (DCO) [PEPD-009]**; and • **In Principle Sensitive Features Mitigation Plan [APP-239]** secured via Schedule 11, Part 2, Condition 11 (k) and Schedule 12, Part 2, Condition 11 (k) of the **Draft DCO [PEPD-009]**.
2.23.3	Selsey and the Manhood Peninsular supports a vibrant leisure and tourism industry. This forms the core of the local economy. In addition to leisure and tourism, there is a valued commercial fishing community. The impact of environmental damage on the marine environment, seascape, landscape and connected countryside will all have negative impact on the economic health for the area. The power generation will not bring more reliable, cheaper electricity or financial support to the local economy and those most directly impacted by the infrastructure. The wind farm extension will restrict the safe access to a significant area of commercial fishing. It creates an obstacle to the safe passage of the lifeboat in the event of emergency (especially during periods of poor visibility).	The assessment on tourism is provided in **Chapter 17: Socio-economics, Volume 2** of the Environmental Statement (ES) **[APP-058]** and it concludes that no significant effects would occur. The design of the Proposed Development has sought to avoid, reduce and minimise any residual effects, including on commercial fishing operations and has incorporated embedded environmental measures which are set out in Table 10-12 of **Chapter 10: Commercial fisheries, Volume 2** of the ES **[APP-051]**. In addition, an **Outline Fisheries Liaison and Co-existence Plan [APP-241]** has been submitted with the DCO Application. Following the implementation of the embedded environmental measures, no significant effects on commercial fisheries operations are predicted to occur. The Maritime Coastguard Agency has been consulted pre-DCO Application submission and suitable lines of sight for Search and Rescue (SAR) have been incorporated into the design of the Proposed Development as outlined in **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]**. The lines of sight required for SAR or "Wind farm Separation Zones" are areas adjacent to the west and south of the Rampion 1 boundary, where no turbines are permitted to be constructed, these are secured by the **Offshore Works Plans [APP-008]** and shown as areas on sheet 1 of 3 with only horizontal hatching.
2.23.4	Visual Impact The proposed extension to the Rampion Wind Farm potentially extends to within 5 miles of the Selsey coastline. The navigation route between the Mixon and the wind farm is less than 4 miles. OESEA2 government guidelines indicate that wind farms should be located at a minimum of 14 miles from the shoreline. OESEA3 guidelines indicate that the turbines of the proposed size (three times greater than the existing turbines), should be	The visual effects of the wind turbine generators are assessed in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP056]**. The Design principles are described in Section 15.7 of the chapter which sets out how the design of the Proposed Development provides embedded environmental measures addressing visual effects, in response to stakeholder comments, including a reduction in the spatial extent of the Rampion 2 array area, its spread and quantity of wind turbine generators within it. Opportunities to reduce effects through turbine height reduction are limited due to the

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	located at least 25 miles from the shoreline. To construct this wind farm extension so close to the shoreline and to build such large turbines, will have a negative impact on the beauty of the views from land and sea. This negative visual impact adds to the negative impact on the local leisure economy. That impact extends far into the surrounding areas.	technical and economic requirements associated with producing renewable energy as well as other environmental factors. The Offshore Energy Strategic Environmental Assessment (OESEA Appendix 2) (OESEA, 2020) proposes 34 km (21.3 miles) offshore as a suggested buffer for all scales of wind farm development to avoid significant adverse effects on a combined National Park and Heritage Coast. The OESEA is a strategic tool that does not suggest no-go areas for development and is not guidance or a roadmap for placing of wind farms, which are allocated by The Crown Estate and it is not in the Applicant's remit to locate sites to avoid all impacts.
2.23.5	Summary The negative impacts of the Rampion 2 extension far outweigh the benefits of renewable energy production and related climate emergency. The wind farm will be an increased blight on the views of the land and seascapes and will cause detriment to the tourism economy. Tourists will go elsewhere. People living in Selsey and the Manhood Peninsular will be economically impacted in a negative way.	National Policy Statement (NPS) EN-1 (DECC, 2011a), extant at the time of submission of the DCO Application and against which it will be tested, outlines that there is an urgent need for new renewable electricity projects. The Proposed Development type (offshore wind) is recognised as being a critical national priority (CNP) in NPS EN-1 and NPS EN-3 (DESNZ, 2023a; 2023b), which came into force in January 2024, for which there is an urgent need to deliver. The Proposed Development could generate enough renewable electricity to meet the equivalent annual electricity demand of 1 million UK homes. It will contribute towards meeting the urgent need for new energy infrastructure in the UK, provide enhanced energy security, support the economic priorities of the UK Government and, critically, make an important contribution to decarbonisation of the UK economy. **Chapter 17: Socio-economics, Volume 2** of the ES **[APP-058]** details relevant studies and evidence from offshore wind farms in the UK which shows that there has been no evidence of overall negative effect on the tourism economy from the development of offshore wind farms in the UK. This evidence included analysis of tourism employment numbers for Rampion 1 which showed higher levels of tourism and employment across Suffolks coastal seaside towns over the period in which Rampion 1 was operational compared to before Rampion 1 begun construction.

Table 3-14 Applicant's Response to Shermanbury Parish Council [RR-350]

Ref	Relevant representation comment	Applicant's response
2.24.1	Shermanbury Parish Council (SPC) notes that the final decision regarding cable routes through Shermanbury Parish have yet to be decided and depend upon the choice of substation location. The following are our concerns: There will be inevitable disruption to roads, footpaths, and bridleways; this must be minimized if the Parish is to retain its functionality? Wineham Lane is an unclassified, narrow country road which is unsuitable for heavy traffic. Rampion 1 construction has already severely damaged the road surface and verges, and the proposed cable route will finally terminate in the Bolney National Grid site. Greater care of Wineham Lane is important to the local population, and repairs should be undertaken as and when necessary and not on a preordained schedule? Traffic management systems should not be used at the Bolney National Grid site. The road is straight, and a simple give way system is adequate. The Rampion 1 traffic light system became an unacceptable traffic hazard as locals soon learnt that they were largely irrelevant. This breeds contempt for a system which should always be adhered to.	This representation appears to duplicate an earlier consultation response provided to Rampion 2, at a stage when the onshore substation and onshore cable route was not finalised. The onshore substation site selection process considered a number of onshore substation options. Following the first Statutory Consultation exercise in 2021, the onshore substation location was confirmed as Bolney Road/Kent Street (now referred to as 'Oakendene'). The optioneering outcomes for the onshore substation location have been detailed in Section 3.6 of **Chapter 3 Alternatives, Volume 2** of the ES **[APP-044]**. During the construction phase, the onshore elements of the Proposed Development will have a direct, temporary effect on various existing public rights of way (PRoWs). Consideration is given in the **Outline Public Rights of Way Management Plan (PRoWMP)** **[APP-230]** secured via Requirement 20 of the **Draft DCO** **[PEPD-009]** to how those effects can be managed and mitigated where possible and appropriate. The likely significant transport effects of the construction phase of the Proposed Development have been assessed within **Chapter 23: Transport, Volume 2** of the ES **[APP-064]**, **Chapter 32: ES Addendum, Volume 2** (Document reference: 6.2.32) (submitted at Deadline 1) and in **Appendix 23.2:Traffic Generation Technical Note, Volume 4** **[APP-197]** which has been updated at the Deadline 1 submission. Based on the peak week sensitivity test used within the **Chapter 32: ES Addendum, Volume 2** (Document reference: 6.2.32) (submitted at Deadline 1), Wineham Lane will experience the following traffic increases during the construction phase of the Proposed Development: • A heavy goods vehicle (HGV) peak week increase of 41 HGVs per day or 3-4 vehicles per hour; and • An overall construction traffic increase of 19 HGVs and 147 light goods vehicle (LGVs) per day or 13-14 construction traffic vehicles per hour. Noting the very low baseline traffic flows and taking account of appropriate embedded environmental measures (such as the **Outline Construction Traffic Management Plan (CTMP)** secured via Requirement 24 of the **Draft DCO** **[PEPD-009]** **[PEPD-035a]**, no significant environmental effects have been identified on Wineham Lane. The **Outline Public Rights of Way Management Plan (PRoWMP)** **[APP-230]** covers how regular inspection of the physical infrastructure will be to maintained paths and other infrastructure in a safe and usable condition. The **Outline CTMP** **[PEPD-035a]** states each access point to any public highway by any temporary construction access road or track utilised as part of the onshore elements of the Proposed Development will be inspected at frequent intervals during the construction phase to enable any repairs to be made in a timely manner throughout the construction phase so that the surface of the highway remains in good repair. The Applicant can confirm that it is not intended to implement traffic signals on Wineham Lane as part of the Proposed Development. The **draft DCO** **[PEDP-009]** includes a requirement (Requirement 24) to submit a stage specific CTMP (which accords with the **Outline CTMP** **[PEPD-035a]**) for approval by the highway authority in consultation with the relevant planning authority before that stage can commence.
2.24.2	Kent Street is extremely narrow and unsuitable for any traffic other than cars, farm machinery, and deliveries for the local inhabitants. Rampion 2 vehicles should not use Kent Street at any time, other than to cross it if necessary. If crossing Kent Street is required, priority for the previously described usage should be maintained at all	Kent Street is identified within the **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** (which has been updated at Deadline 1) secured via Requirement 24 of the **Draft DCO** **[PEPD-009]** as a single track road which will be used as a construction traffic route to accesses A-61 and A-64 as shown on Figure 7.6.4d within the **Outline CTMP** **[PEPD-035a]**.

Ref	Relevant representation comment	Applicant's response
	times. Sub-Station Sites 1. Bolney Rd/Kent Street (Preferred Option) ? This site has the advantage of easy access from the A272 and is an extension of a brown field site- the Oakendene Industrial Estate. It is also the site which is least likely to have an unfavourable impact on local residential communities. ? However.... • The long footprint along Kent Street requires any development to be set back a considerable distance from the small country lane and well screened to avoid visual impact. • The impact on the Grade II Listed building (Oakendene Manor) would need substantial mitigation. • No access for Rampion traffic to the proposed sub-station should be permitted via Kent Street. Entrance and exit should be via the A272. Wineham Lane North This would be an extension of the existing substation/ brownfield site. It would have less of an impact on Wineham Lane if set back further towards the East and must be well screened to reduce visual impact. ? However, it would still increase the industrialisation of the area immeasurably. O the impact on properties on Wineham and Bob Lane (especially Old Doctors sandwiched in between 2 substations) will result in the loss of quality of life, will damage the environment, and will cause financial damage to property values. As a profit-making organisation Rampion must make reparation for this loss oa the affected area if natural justice is to prevail.	At peak construction at this location approximately 274 heavy goods vehicles (HGV) will use Kent Street in one week, equivalent to 55 HGVs per day or 4-5 per hour. This peak construction traffic flow, as detailed in Table 2.4.57 of the **Chapter 32: ES Addendum, Volume 2** of the ES (Document reference 6.2.32), is related to construction access A-64, which is located 200m south of the junction with the A272. The peak construction traffic flow associated with Access A-64, located 700m south of the A272, however is much lower than A-64 with a total construction traffic peak of 31 vehicles per day and an HGV peak of 28 vehicles per day or 2-3 HGVs per hour. Construction traffic will need to use Kent Street for approximately 38 weeks of the construction programme although it is noted that this will not be continuous. There are multiple peaks in construction traffic for access A-61 and A-64, associated with different construction activities that include haul road construction, cable trenching, duct laying, backfilling, HDD activities, cable pulling and haul road reinstatement. Whilst the peak week of construction traffic is predicted to lead to a significant environmental effect (as identified in the **Chapter 32: ES Addendum, Volume 2** of the ES (Document reference 6.2.32) submitted at Deadline 1) this peak lasts for only approximately two weeks of the construction programme. In between peaks the traffic flows will be minimal per day. For example, it is outside of these peak periods, it is predicted HGV flows will be more than 10 vehicles per day (one per hour) for only 13 weeks of the construction programme. It should be noted that both access A-61 and A-64 are located north of residential properties on Kent Street and therefore construction traffic will not route past these properties. This reflects commitment C-157 (**Commitment Register [APP-254]**) which states that HGVs should avoid smaller settlements where possible, the prescribed local access routes defined in Table 5-1 of the **Outline CTMP [PEPD-035a]** and the mitigation identified to avoid the use of small single-track roads as much as possible as defined and secured in Table 5-2 of the **Outline CTMP [PEPD-035a]**. For clarification, the Applicant would like to note that **Outline CTMP [PEPD-035a]** Figure 7.6.6c showing local access routes, Figure 7.6.9c showing routes from compounds to sites and Figure 7.6.13c showing light goods vehicle (LGV) construction access routes are inconsistent and incorrect in relation to use of Kent Street south of the accesses A-61 and A-64. These plans have been updated and submitted as part of an update to the **Outline CTMP [PEPD-035a]** at Deadline 1 to reflect that construction traffic will not use Kent Street south of access A-61 and A-64. Given the single lane track nature of Kent Street, the Applicant is currently reviewing options for the implementation of traffic management along Kent Street and accesses A-61 and A-64 to provide safe access for construction and general traffic. This may involve measures such the implementation of a speed limit reduction, passing places, or managed access via banksmen. A traffic management plan for Kent Street will be produced as required at Deadline 2. The outcomes of this review will be discussed with West Sussex County Council at the earliest opportunity with the aim of reaching an agreement in principle to the traffic management strategy. This would then be secured through a detailed CTMP for the stage of the authorised development comprising Kent Street which will be required to be submitted and approved by the highways authority before commencement within that stage in accordance with Requirement 24(1)(a) of the **draft DCO [PEPD-009]**. The optioneering outcomes for the onshore substation location have been detailed in Section 3.6 of **Chapter 3 Alternatives, Volume 2** of the ES **[APP-044]**. The onshore substation site selection process considered a number of onshore substation options. Following the first Statutory Consultation exercise in 2021, the onshore substation location was confirmed as Bolney Road/Kent Street (now referred to as 'Oakendene'). Paragraphs 3.6.18 to 3.6.26 of **Chapter 3 Alternatives, Volume 2** of the ES

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		[APP-044] provides further detail regarding this onshore substation site selection process and outcomes. The Oakendene option was taken forward and presented at the second Statutory Consultation exercise in 2022. Regarding the visual effects of the onshore substation at Oakendene assessed in **Chapter 18 Landscape and visual impact, Volume 2** of the ES **[APP-059]** and **Appendix 18.4 Visual assessment, Volume 4** of the ES **[APP-170]**, Section 3.3 of the **Design and Access Statement** **[AS-003]** details the Landscape Strategy for both the onshore Oakendene substation site and existing National Grid Bolney substation extension site. Bullet point two in Paragraph 3.3.3 of the **Design and Access Statement** **[AS-003]** describes views towards the onshore substation will be designed to maintain the existing rural landscape character as follows: *'Kent Street: existing mature trees and hedges along this wooded road corridor will be retained and strengthened with additional native woodland planting provided to ensure limited views of the substation even in winter. The wooded, rural character of Kent Street will be retained.'* **Appendix D: Oakendene Onshore Substation – Indicative Landscape Plan** of the **Design and Access Statement** **[AS-003]** presents the planned mitigation for the site, including views from the highway. The principles of the **DAS** **[AS-003]** are secured via Requirement 8 of the **Draft DCO** **[PEPD-009]**. The impact on the Grade II Listed Oakendene Manor from the onshore substation at Oakendene is assessed in **Chapter 25: Historic environment, Volume 2** of the ES **[APP-066]** and **Appendix 25.5: Oakendene parkland: historic landscape assessment, Volume 4** of the ES **[APP-212]**, Section 3.4 of the **Design and Access Statement** **[AS-003]** details the historic environment design principles for the onshore substation. Bullet point two in Paragraph 3.4.3 of the **Design and Access Statement** **[AS-003]** describes design principles to mitigate effects at Oakendene Manor. **Appendix D Oakendene Onshore Substation – Indicative Landscape Plan** of the **Design and Access Statement** **[AS-003]** (secured via Requirement 8 of the **Draft DCO** **[PEPD-009]**) presents the planned mitigation for the onshore substation site, including measures targeted at protecting the views from Oakendene Manor.
2.24.3	General comments: Shermanbury Parish Council is aware that these proposals will initially have a huge impact on the local environment. Unfortunately, as the consultation does not give us access to any Environmental Reports, we are not able to fully ascertain the extent of any impact on the local wildlife, flora and fauna. Local residents are still recovering from problems relating to local highways caused by the Rampion 1 project, with 24-hour traffic management systems that failed to work and no way of contacting engineers to rectify the situation. Residents reported sitting at red lights for up to 30 minutes until realising these lights were once again faulty. Should the Wineham Lane North site be selected, Council would like to see the traffic management plan adjusted to ensure that any traffic management system is only in situ during expected working hours which should be restricted to between 08:00 – 17:00 Monday to Friday and 08:00 – 13:00 on Saturdays. Outside of these times no works should be allowed to take place. Provision should also be made for a layby located away from the site on the A23/A272 for HGVs to park up prior to gaining access to the site as this may go some way to reducing the number of movements per hour. As the	The introduction of the Environmental Statement (ES) is presented in **Chapter 1: Introduction, Volume 2** of the ES **[APP-042]**, with a description of the Proposed Development provided in **Chapter 4: The Proposed Development, Volume 2** of the ES **[APP-045]**. The approach to the Environmental Statement is set out in **Chapter 5: Approach to the Environmental Impact Assessment, Volume 2** of the ES **[APP-046]**. The details and outcomes from the environmental assessment of the Proposed Development relating to the local wildlife, flora and fauna are presented in the **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-063]**. Further details of the surveys undertaken as part of the environmental assessment for terrestrial ecology and nature conservation are provided in **Appendices 22.2: Terrestrial ecology desk study** to **22.17 Bat tree ground level visual assessment survey report, Volume 4** of the ES **[APP-180]** to **[APP-195]**. The Applicant can confirm that it is not intended to implement traffic signals on Wineham Lane as part of the Proposed Development. Any temporary construction traffic management implementation plans will need to be approved by the highways authority and will be applied in accordance with guidance and procedures as defined within the Act (Section 14 of the Road Traffic Regulation Act 1984). Given the location of Oakendene compound and conclusions of **Chapter 23: Transport, Volume 2** of the ES **[APP-064]** and **Chapter 32: ES Addendum** (Document reference: 6.2.32) (submitted at Deadline 1) it is not considered necessary to implement a holding layby for construction traffic.

Ref	Relevant representation comment	Applicant's response
	village of Wineham is the largest residential settlement nearest to either of the proposed substation sites likely to be affected by the inevitable aggravation, Shermanbury Parish Council very much hopes that these considerations will be taken into account. Should permissions be granted for any works within our Parish we would welcome the opportunity to work with Rampion to minimise the disruption to our residents.	Working hours are stated in Section 4 of **Chapter 4: The Proposed Development, Volume 2** of the ES **[APP-045]** and are outlined in Section 4.4 of the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]**. Following receipt of Relevant Representations and information shared at Issue Specific Hearing 1, C-22 within the **Commitments Register** **[APP-254]** has been updated at the Deadline 1 submission to the following: '*Core working hours for construction of the onshore components will be 08:00 to 18:00 Monday to Friday, and 08:00 to 13:00 on Saturdays, apart from specific circumstances that are set out in the Outline COCP, where extended and continuous periods of construction are required.* *Prior to and following the core working hours Monday to Friday, a 'shoulder hour' for mobilisation and shut down will be applied (07:00 to 08:00 and 18:00 to 19:00). The activities permitted during the shoulder hours include staff arrivals and departures, briefings and toolbox talks, deliveries to site and unloading, and activities including site and safety inspections and plant maintenance. Such activities shall not include use of heavy plant or activity resulting in impacts, ground breaking or earthworks.'* This has been updated in the **Outline Construction Traffic Management Plan** **[PEPD-035a]** for the Deadline 1 submission and will be updated in the **Outline Code of Construction Practice** **[PEPD-033]** for the next submission of this document. As outlined in the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]**, no activity outside these hours (including Sundays, public holidays, or bank holidays) will take place apart from under the following circumstances: • Where continuous periods (up to 24 hours, 7 days per week) of construction work are required for HDD (as HDD is a continuous activity that cannot be paused once started); • for other works requiring extended working hours such as concrete pouring which will require the relevant planning authority to be notified at least 72 hours in advance; • or the delivery of abnormal loads to the connection works, which may cause congestion on the local road network, and will require the relevant highway authority to be notified at least 72 hours in advance; or • as otherwise agreed in writing with the relevant planning authority.
Additional Submission by Shermanbury Parish Council accepted 19 December 2023		
2.24.4	Conditions for continued access to be agreed prior to any works Shermanbury Parish Council have been made aware that should the DCO be granted Rampion propose to close a section of Kent Street. The latest plan, see Sheet 32 on the attached Access, Rights of way and Streets Plan, still shows that they plan to close the lane in two places while they cut an open trench to lay the cables. sheet 32 of the attached which shows closures at points 48a – 48b and 50a – 50b with no alternative access to properties. Although Rampion representatives have assured us RED is cognisant of the need for private residents and business owners to access their land, homes and businesses during the construction period and that uncertainty from the lack of presently available detailed planning information on individual Private Means of Access (PMA)	For clarification, the Applicant would like to confirm that there is no intention to close Kent Street during the construction phase of the Proposed Development. Temporary road closures to facilitate the open cut trench crossing of Moatfield Lane (48a-48b) and Kings Lane (50a-50b) are shown within the **Access, Rights of Way and Streets Plans** **[APP-012]**. The strategy to maintain private means of access during this period is described in Paragraph 5.7.10 of the **Outline Code of Construction Practice (CoCP)** [**PEPD-033**]. The following general principles will apply to the managed or private means of access during the cable route construction: • Any access restrictions or effect on individual properties will be kept to a minimum and the Applicant will work with local stakeholders to develop individual solutions to keep disruptions as slow as is reasonably possible;

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	management during the construction, could cause concern. Comprehensive management strategies and construction design solutions for individual affected accesses will be developed during the detailed construction design phase after the DCO has been granted, in collaboration with affected stakeholders. engineering design providers and construction contractors the ten households who will effectively be cut off during this road closure would like conditions imposed on the granting of any DCO to ensure the road remains opens at all times. For clarification the lane in question is a dead end which leads to ten households and additional farm land. The closure of this lane will result in all residents and livestock effectively being cutoff from their only means of access. Although Rampion assure council any access restrictions or effect on individuals / businesses will be kept as short as possible even a minimum closure period will cutoff these residents and mean should emergency vehicle access be required this will not be available during the proposed long periods of closure indeed Rampion representatives have highlighted to council "Where a closure is required and no diversion is possible, the duration of this closure will be reduced as much as possible. As a guideline, the closure of a single-track road is anticipated to take approximately 2-3 days." In view of the impact on both residents and livestock we require conditions to be agreed with the residents prior to any works to ensure access is provided at all times	• All crossings of private means of access will be developed to allow emergency access at all times; • Contractors will be required to accommodate reasonable requests for access during the working day by temporary plating of the trench unless a suitable diversion is provided around the works; • The trench will be plated or temporarily backfilled outside of construction working hours where feasible to restore access, unless a suitable diversion is provided around the works; • Any access restrictions or closures will be communicated to all residents and businesses with affected rights of access; and • A nominated point of contact on behalf of the applicant will be communicated to all residents and businesses at least three months before the start of construction. A final Code of Construction Practice will be required to be submitted and approved on a staged basis, in accordance with the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]**, pursuant to requirement 22 of the **draft DCO** **[PEPD-009]**.

Table 3-15 Applicant's Response to Storrington and Sullington Parish Council [RR-369]

Ref	Relevant representation comment	Applicant's response
2.25.1	Members fully support the Government's target to reduce CO2 emissions to zero and believe this should be undertaken as soon as possible. To that end, Members are also fully supportive of the investment in wind power and the building of wind farms including at sea.	The acknowledgement that the Proposed Development will contribute to climate change mitigation is welcomed by the Applicant. The Proposed Development will help meet the urgent need for new renewable energy infrastructure in the UK and supporting the achievement of the UK Government's climate change commitments and carbon reduction objectives.
2.25.2	However, despite this, there are still questions which Rampion 2 consultations have failed to address. Maps provided by Rampion 2 are lacking in detail and do not adequately demonstrate the purpose of all access points. In particular, the issue of the precise usage of the access points along the A283 has been raised multiple times now but we are still awaiting an answer.	Table 4-1 of the **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** provides details of the type of all accesses associated with the Proposed Development with further detail of the use and requirements for each category provided in Sections 4.3 to 4.7 within the **Outline CTMP** **[PEPD-035a]**. The locations of proposed access junctions is also shown on Figure 7.6.4b and 7.6.4c of the **Outline CTMP** **[PEPD-035a]** and sheets 19, 20 and 21 of the **Onshore Works Plans** **[PEDP-005]**. For clarity, proposed accesses located west of the A25 consist of: • A-30 on Chantry Lane: Operational only; • A-31 on Sullington Lane: Operational only; • A-32 on Barns Farm Lane: Operational only; • A-33 on A283 opposite Hampers Lane: Construction only; • A-34 on A283: Operational only; and • A-35 on A283: Construction only.
2.25.3	Regarding traffic, Storrington is an incredibly busy village whose air quality is known to be suboptimal, resulting in the Air Quality Management Area (AQMA). Rampion 2 will result in an increase in traffic that may well be occurring concurrently with the permitted 60 bed care home on the site of Old Clayton, the permitted planning application of Care South's Sussexdown care home, and the pending application of the Rock Common Quarry, alongside the plans for the Washington compound to serve as the hub of operations in this area. There have been no assurances that construction/maintenance traffic will not go through the AQMA. Strict routing conditions need to be applied that prohibit traffic from entering the AQMA, but these also need to be enforced. Existing prohibitions regarding surrounding quarries are routinely breached and with the rise in traffic that can be reliably predicted this situation is unacceptable.	**Chapter 19: Air quality, Volume 2** of the Environmental Statement (ES) **[APP-060]** presents an assessment of air quality effects from construction traffic associated with the Proposed Development. The assessment concluded that the Proposed Development will not result in significant air quality effects, as a result of increased traffic on the local road network. Table 19-9 within **Chapter 19: Air quality, Volume 2** of the ES **[APP-060]** states that there will be no significant traffic travelling through the Storrington High Street Air Quality Management Area (AQMA) and that Annual Average Daily Traffic (AADT) along the Storrington High Street AQMA are below the IAQM and EPUK 92017) screening criteria for road links in AQMA's, therefore potential effects are negligible. The likely significant transport effects of the construction phase of the Proposed Development have been assessed within **Chapter 23: Transport, Volume 2** of the ES **[APP-064]**, **Chapter 32: ES Addendum** (Document reference: 6.2.32) (submitted at Deadline 1) and in **Appendix 23.2: Traffic Generation Technical Note, Volume 4** of the ES **[APP-197]** which has been updated at the Deadline 1 submission. Based on the peak week sensitivity test used within **Chapter 32: ES Addendum** (Document reference: 6.2.32) (submitted at Deadline 1) the A283 north east of Sullington Lane (receptor O) will experience the following traffic increases during the construction phase of the Proposed Development: • A heavy goods vehicle (HGV) peak week increase of 51 HGVs per day or 4-5 vehicles per hour, which is an increase of 6.3%; and

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		• An overall construction traffic increase of 51 HGVs and 86 light goods vehicles (LGVs) per day or 11-12 construction traffic vehicles per hour, which is an overall traffic flow increase of 0.6%. Noting the very low baseline traffic flows and taking account of appropriate embedded environmental measures (such as the **Outline CTMP** **[PEPD-035a]** secured via Requirement 24 of the **Draft DCO** **[PEPD-009]**), no significant environmental effects have been identified on the A283.
2.25.4	There has also been little information to show where and why the routes were changed in the supporting documentation, which has been unhelpful in following the progression of the application and understanding how appropriate conclusions as to a prescribed route are being drawn. Previous consultations are not felt to have truly taken local concerns on board. With a shared Neighbourhood Plan with Washington Parish Council, Storrington and Sullington Parish Council are also strongly supportive of their legitimate concerns, one of which is why a route around Washington, rather than through the village and across the recreation ground, was rejected with no clear or logical explanation. It would appear illogical to enter a further consultation period when there are still questions outstanding that could have been addressed by now. Without informative data, the meaningfulness of this consultation is in doubt.	The refinement process for the alterative cable routes considered have been presented in Section 3.4 of **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]**. The Applicant has considered options for the cable route that avoid the underground crossing of the Washington Recreation Ground, including the 'southerly alternative' requested by Washington Parish Council. The option was not presented or commented on in the **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]**as it was deemed less suitable on technical engineering and environmental grounds, specifically in relation to the pinchpoint of the proposed route crossing a gas pipeline in the vicinity of ancient woodland. Constrained access from the A24, and the need for existing tracks forming the South Downs Way to be widened, with impacts on hedgerows was a further key factor. The Applicant attended and presented feedback on this decision at the Washington Parish Council meeting on the 7 November 2022. Washington village has been considered in the assessment of environmental effects, which has identified no significant effects with respect to the aspects that affect amenity during construction including traffic and transport, noise, air quality and socio-economics including Public Rights of Way. Please see the response **in reference 2.28.1** below to Washington Parish Council.

© WSP Environment & Infrastructure Solutions UK Limited

Table 3-16 Applicants Response to Twineham Parish Council [RR-406]

Ref	Relevant representation comment	Applicant's response
2.26.1	The Bolney National Grid substation, to which the cable for Rampion 2 will be connected, lies in the Parish of Twineham. Residents of Twineham Parish have already endured the very badly run contract for the construction of the Rampion 1 substation, located in the Parish of Twineham, together with the cable route. Construction work lasted for 6 years (September 2014 - September 2020), rather than the projected 28 months. Frequently there was weekend and Bank Holiday working, together with work starting in the early morning and going on until 9.20 pm in the evening throughout one summer. Twineham Parish Council would be grateful if it could be made a Requirement (Condition) that working hours are 8.00 am - 6.00 pm Mondays - Fridays and 8.00 am - 1.00 pm on Saturdays and absolutely no working on Sundays or Bank Holidays. Further conditions must be imposed to ensure all vehicles should be fitted with "white noise" and not reversing beepers. We also have concerns regarding the amount of traffic in connection with this construction project and its impact on local residents.	The assessment for Rampion 2 in **Chapter 21: Noise and vibration, Volume 2** of the Environmental Statement (ES) **[PEPD-018]** is based on the core construction working hours of 07:00 to 19:00 Monday to Friday and 08:00 to 13:00 hours on Saturday. No significant effects have been identified in the assessment of construction noise and vibration. The Applicant considers that on this basis the proposed working hours are acceptable. These working hours are detailed in Section 4.4 of the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** along with other activity specific requirements including continuous working for trenchless crossing secured via Requirement 22 of the **Draft DCO** **[PEPD-009]**. As stated in response to reference 2.24.3 (above), working hours are stated in Section 4 of **Chapter 4: The Proposed Development, Volume 2** of the ES **[APP-045]** and are outlined in Section 4.4 of the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]**. Following receipt of Relevant Representations and information shared at Issue Specific Hearing 1, C-22 within the **Commitments Register** **[APP-254]** has been updated at the Deadline 1 submission to the following: Paragraph 5.4.8 of the **Outline CoCP** **[PEPD-033]** details the best practicable means that Contractor(s) will adopt (as appropriate to the planned works) to minimise noise during construction. This includes best practicable means to ensure avoidance of unnecessary engine revving, avoidance of reversing, where practicable, and fitting of low noise reversing warnings to pertinent vehicles. The likely significant transport effects of the construction phase of the Proposed Development have been assessed in detail within **Chapter 23: Transport, Volume 2** of the ES **[APP-064]**. The implementation of embedded environmental measures (such as the **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035]** secured via Requirement 24 of the **Draft DCO** **[PEPD-009]**), no significant effects have been identified in relation to transport receptors.

© WSP Environment & Infrastructure Solutions UK Limited

Table 3-17 Applicants Response to John Goring on behalf of Wiston Parish Council [RR-421]

Ref	Relevant representation comment	Applicant's response
2.27.1	Lack of consultation. Not listening to local parish councils and communities. Very poor communication with landowners over whose land the proposed route would cross.	The Applicant undertook an extensive programme of consultation and engagement with local people, landowners and statutory bodies prior to the submission of the DCO Application. The **Consultation Report** **[APP-027]** describes how the Applicant has had regard to this feedback, including the many changes made to the project as a result. Engagement with landowners continues and is additionally documented in the **Land Rights Tracker** **[PEPD-016]**.
2.27.2	Not trying to minimise disruption to farmers and rural households.	The project has embedded mitigation in its design to reduce disruption to communities along the cable route; these are listed in the **Commitments Register** **[APP-254]**.
2.27.3	Not properly scoping alternative routes.	Five different grid connection points combined with multiple possible landfall locations were considered to scope alternative onshore cable routes, reported in sections 3.3 and 3.4 of **ES Chapter 3 Alternatives** **[APP-044]**. Within the Climping to Bolney route selected, a number of alternative routes were developed, many arising from community and landowner feedback, and consulted upon; these are described in section 3.4 **of ES Chapter 3 Alternatives** **[APP-044]**.

Table 3-18 Applicant's Response to Washington Parish Council [RR-413]

Ref	Relevant representation comment	Applicant's response
2.28.1	This representation is made by Washington Parish Council representing the local community in our area. The Parish Council is separately the Charity Trustee of the Washington Recreation Ground which is a protected Green Space in the made Storrington & Sullington and Washington Neighbourhood Plan, and a registered Community Asset. The Parish Council as Trustee will register separately as an Interested Party. Nothing in this representation should be taken to prejudice the position of the Trustee in any future negotiations. The Parish Council does not oppose the principle of the development but considers that the proposed route causes unnecessary and avoidable impact on Washington village and its residents. We made representations during the consultation process in support of the more southerly alternative Route A for the cable, which avoids the village. We have never been provided with a proper explanation as to why this is not viable or seen an evaluation of the costs/benefits in comparison to the proposed Route B. We are also concerned about the options proposed for the location of a construction compound adjacent to the village which would serve the whole of the central part of the project area. It is impossible for us to comment more specifically since we have not been informed of the final site selection prior to the DCO submission – something we find discourteous and unhelpful. As indicated above, our concerns arise in part from what we do know about the proposed route and its potential impact, and in part from the absence of detailed information provided by the applicant. We intend to participate constructively in the DCO Inquiry and we look to the Examining Authority to ensure that the applicant is required to provide detailed and comprehensive evidence which is then thoroughly tested before any decision is reached. The Parish Council's principal issues of concern are as follows.	The Applicant has been in regular correspondence with the Clerk of Washington Parish Council and has welcomed feedback on the evolving design process. regularly engaged with Washington Parish Council, including several meetings with the council to explain the proposals under consultation. We are grateful for the responses from the Parish, and have demonstrated our regard for them in the **Consultation Report** **[APP-027]**. Issues raised by Washington Parish are responded to directly in Appendix 11 **[APP-030]**. The Applicant has considered options for the cable route that avoid the underground crossing of the Washington Recreation Ground, including the 'southerly alternative' requested by the Parish Council. The option was not presented or commented on in the Alternatives Chapter as it was deemed less suitable on technical engineering and environmental grounds, specifically in relation to the pinchpoint of the proposed route crossing a gas pipeline in the vicinity of ancient woodland. Constrained access from the A24, and the need for existing tracks forming the South Downs Way to be widened, with impacts on hedgerows was a further key factor. The Applicant attended and presented feedback on this decision at the Washington Parish Council meeting on the 7 November 2022. Four temporary construction compound (TCC) locations were considered in the Washington area, following the Scoping stage of the project. Following further engineering design review, environmental and land reviews, these were refined to the three alternatives presented at PEIR (RED 2021), Washington TCC Option D, Washington TCC Option E and Washington TCC Option F were consulted on as part of the first Statutory Consultation. Following PEIR (RED 2021), further design progress, including designs for trenchless crossing locations, land owner and stakeholder feedback and further environmental appraisals, reviewing impacts such as traffic, were taking into consideration. This enabled further refinement of options, and resulted in Washington TCC Option D, - renamed as 'Washington Temporary Construction Compound', as the chosen option in this location for the DCO Application submission.
2.28.2	Traffic and Road Safety: Despite our requests Rampion Extension Development (RED) has not confirmed its preferred location for the construction works compound (one of only three or four for the entire project) which it would appear will be located in or near our parish. We recognise that this will be identified in the final submission but it would have been helpful and considerate for RED to engage with the community more openly on this matter. We raised serious concerns in our consultation responses about any option being considered for a compound adjacent to the working quarry at Rock Common and the impact of additional traffic in this location accessing the A283. These concerns are compounded by the possible impact of restoration proposals at the quarry, and by the delay to the programming of delivery of the A27 Arundel Bypass. We consider that the impact of additional HGVs and traffic which may be generated by the construction process has not yet been properly assessed and could have an adverse effect on local road network and access points. There could be significant additional pressure on the A24 Washington roundabout which receives traffic from Steyning on the A283 (east), from Ashington and Horsham on the A24 (north), Worthing and Findon (south), and Storrington on the A283 (west). The parish is near Storrington which is an Air Quality Management Area and any additional construction related traffic passing through this	The Temporary Construction Compound in Washington is located north of the A283 approximately 300m east of the A24 / A283 Washington Roundabout as shown on Sheet 22 of the **Onshore Works Plans** **[PEDP-005]**. The likely significant transport effects of the construction phase of the Proposed Development have been assessed within **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064]**, **Chapter 32: ES Addendum, Volume 2** (Document reference: 6.2.32) (submitted at Deadline 1) and in **Appendix 23.2: Traffic Generation Technical Note, Volume 4** of the ES **[APP-197]** which has been updated at the Deadline 1 submission. Based on the peak week sensitivity test used within **Chapter 32: ES Addendum** (Document reference: 6.2.32) (submitted at Deadline 1), a worst-case HGV flow will occur in week 87 of the construction phase where the Proposed Development will generate 44 Heavy Goods Vehicles (HGVs) and 91 Light Goods Vehicles (LGVs) per day at Receptor 17 (A283 east of the A24). In addition, the worst-case overall increase in traffic will occur in week 85 where there will be 43 HGV and 114 LGVs per day. Noting that construction traffic movements will

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	area would be unacceptable. We ask the Examining Authority to test the proposals thoroughly taking into account local knowledge and concerns as well as the 'higher level' assessment made by the highway authority.	occur across the hours of 07:00-19:00 each day (see paragraph 8.4.13 of the **Outline CTMP [PEPD-035a]**), this is the equivalent of approximately 3-4 HGVs per hour and 9-10 LGVs per hour. It is therefore not anticipated that this construction traffic will have a material impact on the operation of the Washington Roundabout. It should also be noted that he A283 west of the A24 is a construction traffic route only as far as access A-33 and A-35 as defined in the **Outline CTMP [PEDP-035a]**. Construction HGV traffic associated with the Proposed Development will therefore not be permitted to travel through the Storrington Air Quality Management Area.
2.28.3	Potential impact on Ecology and the Local Environment: We are concerned that it has not been possible, using the information provided so far, to properly evaluate the full ecological/environmental impact of the cable route adjacent to and through the Washington Recreation Ground, which has a number of mature trees and hedgerows. RED has provided bland assurances that there will be no 'above ground' impact either during construction or in the longer term but we have not been satisfied with the information or level of detail provided thus far. The recreation ground is a vital community asset and important to the setting of the village and it is imperative that no harm is done either during installation or future maintenance to its existing landscape value. Our position is that this is best and most easily achieved by avoiding the area entirely but given that the application has not proposed to do so, these impacts become critical in determining whether the proposal is acceptable.	Instead of open-cut trenching, trenchless crossing of the cables under the Washington Recreation Ground avoids any surface construction works at this location. It is an environmental mitigation measure that has been applied specifically to minimise the effects on the Washington Recreation Ground. The trenchless crossing also passes under the A24 and the A283. The trenchless crossing is secured in Appendix A: Crossing Schedule of the **Outline Code of Construction Practice (CoCP) [PEPD-033]** which is secured through Requirement 22 of the **Draft DCO [PEPD-009]**. This means there will be no surface construction works between the A24 and London Road. In this location, pedestrian access will be required to monitor the head of the drill using hand held equipment only and this is consistent with the approach at Sullington Hill Local Wildlife Site outlined in paragraph 5.6.24 of **Outline Code of Construction Practice [PEPD-033]**. To summarise the key local potential environmental effects that Washington Parish Council may have concerns about: Regarding the vegetation in the vicinity of Washington, the retention of hedgerows is confirmed in Figure 7.2.1f (B) Hedgerow retention and treeline retention plan; the retention of woodland is confirmed in Figure 7.2.2d Woodland retention plan and the retention of scrub is on the Figure 7.2.3g Scrub retention plan. The figures outlined above are located in the **Outline Code of Construction Practice [PEPD-033]**. Section 21.9 of **Chapter 21: Noise and vibration, Volume 2** of the ES **[APP-062]** outlines the assessment of trenchless crossings, the Washington Compound, and use of accesses. Effects in Washington range from negligible to minor adverse which are temporary and Not Significant in EIA terms. The embedded environmental measures related to noise and vibration during construction are provided in Section 5.4 of the **Outline Code of Construction Practice (CoCP) [APP-224]** which is secured through Requirement 22 of the **Draft DCO [PEPD-009]**. This includes the application of Best Practicable Means to mitigate noise and vibration during construction. For example, the use of acoustic cladding or shrouds for equipment related to trenchless crossings including during continuous working hours. A stage specific Noise and Vibration Management Plan (as part of the stage specific CoCP to be approved by the relevant planning authority) will include the detail of this mitigation for the planned works in Washington and also any monitoring required. Section 19.9 of **Chapter 19: Air quality, Volume 2** of the ES **[APP-060]**, outlines the assessment of emissions from construction equipment, construction traffic and dust emissions during construction in Washington. Effects are predicted to be temporary and negligible to minor adverse, which are Not Significant in EIA terms. The embedded environmental measures related to air quality and dust during the construction phase are provided in Section

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		5.3 of the **Outline CoCP** **[APP-224]** which is secured through Requirement 22 of the **Draft DCO** **[PEPD-009]**. Best practice air quality management measures in accordance with industry guidance will be applied in the Washington area, assessed as being at medium risk from dust impacts. This will include a detailed in a Dust Management Plan (as part of the stage specific CoCP to be approved by the relevant planning authority). This includes dust control and inspection and corrective action requirements. **Chapter 17: Socio economics, Volume 2** of the ES **[APP-058]** includes assessment of the Washington Recreation Ground and allotments. The primary embedded environmental measure is that the onshore cable corridor will be installed by trenchless means in this location, avoiding construction works on these grounds, and therefore, there is a negligible residual effect which is Not Significant.
2.28.4	Horizontal Drilling Compounds: RED has proposed to mitigate the impact of the route by using Horizontal Directional Drilling to install the cable under the recreation ground and adjacent land. Despite our requests we have not been provided with detailed information about the large compounds required at each end of the drilling site on the east side of the A24. We ask that the Examining Authority specifically investigates the nature and impact of the drilling operation, its duration and what measures will be taken to minimise the disturbance to local residents and to normal use of the facilities.	The area to the east side of the A24 is one of four construction compounds that will serve the wider onshore cable corridor. The **Statement of Reasons** The area to the east side of the A24 is one of four construction compounds that will serve the wider onshore cable corridor. The **Statement of Reasons** **[APP-021]** provides an outline of requirement and description of uses for the temporary construction compounds in Paragraph 6.10.5: *"Temporary Construction Compounds will comprise of a hardstanding and a perimeter fence and will be used for the storage of plant and machinery and the stockpiling of materials, as well as for the provision of site management offices, parking, and welfare facilities for construction personnel (kitchen facilities, storerooms, toilets) in accordance with Health and Safety and Construction Design and Management Regulations"".* The function and maximum parameters of the compounds are described in **Chapter 4: The Proposed Development, Volume 2** of the ES **[APP-044]** at Table 4.22. The **Onshore Works Plans Sheet 1** **[PEDP-005]** confirm that this construction compound directly adjoins the cable corridor where there are two indicative trenchless crossing compounds (TC16 and TC17). Paragraph 4.5.27- 4.5.29 in **Chapter 4 The Proposed Development, Volume 2** of the ES **[APP-044]** set out what trenchless crossing compounds entail. The Applicant is seeking consent using a 'Rochdale envelope' approach, constrained by worst case parameters. These are described in Section 4.5 of **Chapter 4: The Proposed Development, Volume 2** **[APP-045]**. Detailed specifications for trenchless crossing compounds and drilling methods are not available prior to the appointment of a contactor. However, measures to mitigate the effects of the Proposed Development are set out in the **Outline Code of Construction Practice** **[PEPD-033]**. There is no need (nor is any provision sought) to close the recreation ground to implement a trenchless crossing underneath it. The Environmental Statement has assessed the effects of each compound for during construction. Though impacts will arise, there are no significant effects arising from noise, dust, ecology, Public Rights of Way and traffic impacts when considering the embedded environmental measures secured in the **Outline Code of Construction Practice** **[APP-224]** (CoCP), the **Outline Construction Traffic Management Plan** **[APP-228]** (CTMP) and the **Outline Public Rights of Way Management Plan** **[APP-230]** (PRoWMP). The Applicant acknowledges that significant landscape and visual effects associated with the presence of

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		the compound but these are temporary and reversible when the commitment to reinstatement in the **Outline Landscape and Ecology Management Plan [APP-232]** (LEMP) is considered. It is noted that each of the above plans will be subject to submission of stage specific details for approval by the relevant authority including WSCC for the CTMP and PRoWMP and the relevant planning authority for the CoCP and LEMP. This is as per the **draft DCO [PEPD-009]** Requirements 24, 20, 22 and 12 respectively.
2.28.5	Future use of the Recreation Ground: It is essential that the future use of the recreation ground by our community is not compromised or put at risk by the presence of the supply cable at any point during its lifetime. This is best achieved by routing the cable elsewhere and therefore avoiding the recreation ground altogether. However, acknowledging that this is not the current proposal, we believe it is essential to have complete reassurance that the presence of the cable can be effectively 'forgotten' for all practical purposes in the use, maintenance and repair of the recreation ground, with no constraints or requirements to seek consents from the cable owner for routine operations. We are also concerned that it should not prejudice the future extension of facilities, such as the sports pavilion, at the recreation ground. We cannot accept a situation where the presence of the cable becomes the most important determinant of how and when our community makes use of its own recreation facilities.	Following completion of the works, usual maintenance activities can be carried out. Activities such as mowing and grounds maintenance can therefore be undertaken over the easement area. The area of the recreation ground is affected by Works No.9 – Cable Installation works (including construction and operational access)), for which a package of Cable Rights and a Cable Restrictive Covenant are sought. The proposed future easement will therefore impose some covenants on the ground directly above the easement strip. These are detailed within the Option and Easement documentation and include, 'not to erect, construct or place any building or structure on the Cable Strip without the previous consent in writing of the Grantee'. The Applicant understands there are currently no planning proposals to extend any part of the sports pavilion or tennis courts on the recreation ground.
2.28.6	Consultation process: We have made repeated requests for clearer and more easily understood maps and plans to aid community understanding of the proposals. We recognise that there is an evolving design process. However, the sheer volume of material produced by the applicant has often made it difficult for us to be clear about the proposals and their potential impact. In some cases options are put forward for consultation with no subsequent explanation as to how a final selection has been made – for instance in relation to construction compounds. The volume and presentation of material has also obscured the location or impact of elements of the scheme or its chronology. The applicant has constantly advised that details of the final proposals will become available when the DCO is submitted which may be true but is unhelpful and not in the spirit of good public engagement. At the public meeting held in September 2021 we (meaning the residents of our community) asked the developer to reconsider a route which avoids the middle of the parish and the village. The community asked that serious consideration be given to reverting to the original preferred Route A option south of the village, about which Wiston Estate later provided significant supporting information. Our concerns were raised in the written responses to the 2021, 2022 and targeted 2023 consultations, with a request that the other route option, which would avoid the village, is robustly evaluated. There is no evidence that this has been done nor has the Parish Council received a satisfactory response to its requests for additional information. It is therefore no surprise that residents feel let down by the consultation process. This is one of the key issues that we hope the Examining Authority will investigate during the Inquiry.	The Applicant has addressed this matter under the response to **reference 2.28.1** above.
2.28.7	Funding arrangements for Professional Fees: The Parish Council (as community representative) also wishes to raise the concern that landowners, such as the Parish Council as Trustee, are faced with a developer's cap on the reimbursement of professional fees. The effect of this is to limit their ability to properly consult an agent for advice or to take legal advice in relation to property interests. There is no justification for residents of our small	The Applicant has provided written confirmation to the Clerk of Washington Parish Council that 'fees reasonably and properly incurred will be paid within 28 days of receipt of a properly addressed invoice' in respect of a survey licence.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	community being required to pick up a large bill so that it can deal with a property matter which is entirely of benefit to a commercial entity. We urge the Examining Authority to ensure that this cap is removed and that all reasonable costs are reimbursed by RED.	The Applicant understands that the Parish Council does not want to progress with signing Heads of Terms on the basis that their constituents' preferred route to the south of Washington was not taken forwards. Should the Land Interest wish to progress discussions on Heads of Terms, reasonable fees are offered to cover landowner's costs. Reasonable fees are paid on an hourly rate, to be agreed, there being a requirement upon the Land Interest to inform Carter Jonas where fees are to exceed the figures stated in the Heads of Terms, so a decision can be made as to how to proceed.
2.28.8	Conclusion: These issues are all material to the DCO process. The Parish Council has a specific interest as a community representative to participate in the Inquiry and looks forward to being given the opportunity to raise these matters as an Interested Party.	The Applicant has no further comments on this matter at this time.

© WSP Environment & Infrastructure Solutions UK Limited

Table 3-19 Applicant's Response to Andrew Griffith Member of Parliament for Arundel and South Downs [RR-016]

Ref	Relevant representation comment	Applicant's response
2.29.1	I am writing in my capacity as Member of Parliament for Arundel and South Downs to register as an Interested Party in relation to RWE's application for the construction of the Rampion 2 Offshore Windfarm and its associated infrastructure, specifically the proposed Onshore Cable Corridor. I am registering as an Interested Party so I am able to share the views of the residents I represent in relation this application. The majority of the 40km cable route runs through parishes in my constituency, across the Arun and Horsham districts, from Lyminster in the south, through to the substation at Bolney and the proposed new substation at Cowfold. To reiterate what I have set out in my previous submission to you, it is my view, and the view of affected residents, that the cable corridor will be hugely damaging to communities and wildlife habitats within the special landscape of the South Downs during its construction phase. There is clear concern around the expectation that its construction will disrupt households and businesses in West Sussex for many years. I have been engaged with the Rampion 2 windfarm since their first indication of intention to construct the project. I responded to the initial RWE consultation on 16th September 2021 to share my views and those concerns which had been raised to me. I did so again on 29th November 2022 with a second submission which focussed purely on the Onshore Cable Corridor route (OCC). These views are based on deep local knowledge, my meetings with impacted landowners, parish councils and communities, and a high level of correspondence from concerned residents who understand the considerable impact the build phase will have on their local landscapes and roads. There is also considerable concern about the inadequacy of the consultation process and lack of proper consultation materials to respond to, with the detailed maps only being published as part of the examination process. I separately wrote to you about this on 6th September 2023 and these are points I wish to make again as part of my full written representation.	Various options were considered for connecting the offshore wind turbines to the national grid, which are discussed in Section 3.3 and 3.4 of **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]**. Given the distance between the grid and the coast, a lengthy cable is required, but the Applicant considers the selected route to be the preferred based on its extensive consideration of options. Disruption to local people and the environment has been assessed in the Environment Statement and should be weighed against various other factors including climate change benefits (as the disruption to people is different in different locations where the cable route location has been influenced by environmental considerations) of the Proposed Development. The **Planning Statement** **[APP-036]** concludes that the Proposed Development accords with government policy as set out in relevant National Policy Statements. The Proposed Development has been subject of multiple rounds of iterative consultation with local people, statutory and non-statutory bodies. This process, and evidence of regard had to consultation responses, is set out in the **Consultation Report** **[APP-027]**.
2.29.2	There are significant and well-founded concerns regarding the impact of additional construction vehicles on existing local traffic and access, particularly at the Cowfold section, and at the Washington roundabout which is close to Sullington and Storrington. Both Cowfold and Storrington are Air Quality Management Areas, the latter with vehicle weight restrictions in place. Added to this are concerns about the proximity of the route to residential properties and areas of environmental sensitivity. Progress on across the whole project up to date has already caused blight, and has burdened landowners and parish councils with unreasonable costs as a result of the need to employ professionals to fully survey the properties and land impacted so that they can respond in full to each stage of the process.	The temporary effects of construction traffic are assessed in **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064],** which concludes no significant effects on transport receptors within the centre of Cowfold, Sullington or Washington following the implementation of embedded environmental measures such as the construction traffic routing prescribed within the **Outline Construction Traffic Management Plan (CTMP)** **[PEDP-035a]**. To limit the effects on the Cowfold and Storrington, a number of commitments have been made by the Applicant as detailed within the **Commitments Register** **[APP-254]** and secured through **Outline CTMP** **[PEPD-035a]** secured via Requirement 24 of the **Draft DCO** **[PEPD-009]**. This includes: • Commitment C-157: The proposed HGV routing during the construction period to individual accesses will be developed to avoid major settlements of Storrington, Cowfold, Steyning, Wineham, Henfield, Woodmancote and other smaller settlements where possible; and • Commitment C-158: The proposed HGV routing during the construction period to individual accesses will avoid the Air Quality Management Area in Cowfold where possible.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		Further information related to the assessment completed in Cowfold and details of assessments undertaken on the A283 west provided **in references 2.17.3 and 2.25.3** respectively above. The Applicant has not received any Blight Notices nor does it anticipate that any persons would meet the statutory criteria to do so. This is covered in section 3 of the **Funding Statement** **[APP-025]**.
2.29.3	Summary of representation I wish to summarise my representation regarding the onshore cable corridor (OCC) and will provide further detail in my full written representation when requested to do so. As the Member of Parliament for Arundel and South Downs, I represent the constituency which is most impacted by the proposed OCC. Whilst I am wholly supportive of renewable energy and an expansion of offshore wind, my view remains that this is the wrong project in the wrong place. Much of the route is proposed to cut through vast swathes of the delicate chalklands in the South Downs. Area 2 and Area 4 – Lyminster to Sullington Hill, Area 5 – West and North of Washington, Area 6 – Wiston to Kings Lane, and Area 7 – Substation Approach, all fall within Arundel and South Downs.	The Applicant has no further comments on this matter at this time.
2.29.4	I share the view of Cowfold residents that the decision to site the new substation at Oakendene has lacked the much needed input from the communities most impacted because they were not properly consulted. There has been little consideration for the impact that RWE construction works will have on the flow of the A272 traffic – a road which is already one of the most dangerous in Sussex.	The likely significant transport effects of the construction phase of the Proposed Development has been assessed within **Chapter 23: Transport, Volume 2** of the Environmental Statement (ES) **[APP-064]**. The **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** contains details of required construction traffic routing for the Proposed Development. Where possible HGV traffic has been routed via the A23 and from the east along the A272 avoiding Cowfold. HGV traffic has been minimised as much as possible as detailed paragraph 1.2.5, Commitment C-157 and C-158 **Commitment Register** **[APP-254]**. Furthermore, the **draft Development Consent Order** **[PEDP-009]** includes a requirement (Requirement 24) to submit a stage specific CTMP (which accords with the **Outline CTMP** **[PEPD-035a]**) for approval by the highway authority in consultation with the relevant planning authority before that stage can commence. Further information related to assessment completed for Cowfold is provided in **reference 2.17.3** above.
2.29.5	Oakendene's location - away from the existing substation at Bolney – will require additional cable routing as well as a substantial industrial development, the construction of which will bring a heavy burden of even more traffic onto an already congested road. The proposed new substation will be an industrial eyesore which is visible from Kent Street, an otherwise rural lane, and any tree planting to obscure its visual impact will realistically take many years to mature. I have heard from affected residents in several parishes who say that there has been a notable lack of information and consultation.	Please see the Applicant's response to **reference 2.29.4** above. The onshore substation at Oakendene will be well screened by existing vegetation which will be retained. Consequently, it has a limited ZTV as indicated in **Figure 18.2a, Volume 3** of the ES **[APP-098-103]**. The Indicative Landscape Design for the onshore substation at Oakendene and its design principles are set out in the **Design and Access Statement** **[AS-003]** and further expanded on in the **Outline Landscape and Ecology Management Plan (LEMP)** [**APP-232**]. This will provide further screening and includes design principles committing to maximising

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		opportunities for advanced planting. The outline layout design shows a curved approach road to the substation, so that direct views can be screened by landscaping. Design elements within the LEMP will be secured and developed through Requirements 12 and 13 of the **Draft DCO** **[PEPD-009]** and Commitment C-196 of the **Commitments Register** **[APP-254]**.
2.29.6	I share the views that the documentation from RWE's online consultation was overtly convoluted and incomprehensible for a layperson. Even the most technically literate readers struggled to properly evaluate the full ecological and environmental impacts from the information provided. I am quite sure that the lack of proper non-technical summaries will have discouraged a large number of potential respondents from engaging with the consultation.	As development for which an Environmental Impact Assessment is required, the Applicant has published a Preliminary Environmental Impact Report of a sufficient degree of detail and complexity to meet the regulations. However, these were accompanied by Non--Technical Summaries to inform the lay reader. Further, environmental impacts were also summarised within the consultation document and website, demonstrated in the **Consultation Report** **[APP-027]**.
2.29.7	A number of residents have also voiced their concerns that they were unaware of Oakendene being an option for the substation and would like to have had an earlier opportunity to feed in local knowledge before a decision was taken. I will continue to be supportive generally to the expansion of offshore power, but I remain unmoved from my original position in pointing out the well-justified concerns that so many residents in the South Downs have regarding the cable corridor and the location of the substation project. It continues to be my long-held view that the North Sea offers far better opportunities to expand the UK's low carbon renewable energy. You will have received a number of responses to this current stage of the Examination process, and many will have come from my constituents and parish councils. The consultations have been very poor indeed and I do not think meet the standards required to progress with the Development Consent Order application. I would be grateful if you could include my comments in your consideration and I associate myself with any comments submitted by the local councils. I associate myself with their submissions and ask that you consider each response carefully and respect the local knowledge they share. I look forward to being invited to make full and detailed representation in the next Stage of your examination process. Andrew Griffith MP	The Applicant has held extensive rounds of public consultation where local residents were able to provide feedback on the proposals. In addition to public consultation, the project team held a dedicated public event on 21 June 2023 for the Cowfold community, close to the proposed Oakendene Onshore Substation site for the Project. The consultation procedure undertaken by the Applicant for Rampion 2 has met the requirements for consultation that are specified in the Planning Act 2008 as confirmed by the acceptance of the DCO Application. Further information on the consultation undertaken by the Applicant can be found in the **Consultation Report** **[APP-027]**. This event was attended by 140 people and responded to concerns about the level of engagement. The Cowfold Information Event was advertised on posters locally, on community Facebook pages and through a targeted maildrop to everyone within 1km of the proposed Oakendene substation site and the main Cowfold conurbation. The Parish Council also helped promote the event and attended in person. Further information on public consultation and engagement with the local community can be found within the **Consultation Report** **[APP-027]** **Section 3.4**. The proposed location of the project was also subject to non-statutory consultation (14 January to 11 February 2021) and statutory consultation (14 July to 16 September 2021, plus extension 7 February to 11 April 2022). From 2021 to 2023, the applicant delivered five rounds of adequate public consultation. Table 1.1 in Section 1 of the **Consultation Report** **[APP-027]** summarises which consultation stages consulted under section 42 of the Act. Each relevant section covering a consultation stage then covers the details of that consultation (section 5.3, 6.3, 7.3, 8.3, 9.3 and 10.3). Sections 5.4 and 6.4 of the Report cover notification under section 46. Copies of the notifications can be found in Appendix 4.5 and 6.5.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		Section 47 consultation, in accordance with section 47 of the Act, a draft Statement of Community Consultation was developed by the Applicant (section 5.5 and appendix 4.1). Details of the process are presented in this section of the consultation report. Sections 5.6 and 6.6 presents how the Applicant publicised the proposals in the 'prescribed manner' in accordance with section 48. Copies of the notices can be found in Appendices 4.6 and 6.6. To demonstrate compliant with section 49, the duty to take account of responses, each consultation stage has a dedicated 'responses to the consultation' section in the appendices. Annexes 1, 2 and 3 present detailed summaries of issues raised at consultation and the project's official response.
2.29.8	I am writing regarding the DCO for RWE's Rampion 2 offshore windfarm which includes plans to build a 40km cable motorway through communities within the Arun and Horsham Districts and across the South Downs National Park protected landscape. In places, this cable motorway will be up to 50 metres wide. It will be hugely damaging to communities within Arun and Horsham districts and its construction phase alone is expected to disrupt households and businesses in West Sussex for many years. Whilst I am supportive of renewable energy in general and offshore wind in particular, there are many other and better sites around the UK's coastal waters which benefit from greater wind and where the onshore cable motorway can be constructed without the issues presented by the denser communities of the Arun valley or our very special natural landscape.	The selection process for the cable route is fully described in Environmental Statement (ES) **Chapter 3: Alternatives, Volume 2 [APP-044]** Engagement and consultation undertaken for the project have informed the assessment work and the evolution of the design of the Proposed Development. Construction activity will be planned to minimise disruption to residents and businesses in the local area. An **Outline Code of Construction Practice (OCoCP) [PEPD-033]** has been prepared to secure the embedded environmental measures that will apply to all activities associated with the construction of the onshore elements of the Proposed Development. The production of detailed CoCP is secured via Requirement 22 of the **Draft Development Consent Order [PEPD-009]**. This will confirm the width of the cable corridor. In relation to the location of the project, please see the Applicant's response to reference 2.29.7.
2.29.9	I do not believe that RWE have delivered an adequate consultation at all – a view which is widely shared by the villages most impacted and which you will be aware of from the representations shared through the process. RWE have obfuscated the process by providing a poor standard of information and public engagement. The maps they have provided have lacked the detail needed for most residents to make an informed assessment of the route. There has been a comprehensive failure to engage properly with those landowners, businesses and residents affected. All of these are points which I have already made in my own detailed submissions to both consultations on behalf of my constituents. I am deeply disappointed by RWE's lack of real engagement or interest in the views of my constituents with landowners commenting that they have struggled to engage with RWE and their agents. Lyminster Parish Council have advised that they also consider the level of RWE's public engagement and information to be inadequate. They said that members of their community have previously responded to the consultation exercise yet their views appear to have been disregarded in some of the latest proposals. Namely routes traversing higher quality farming land. In the Horsham District, the parishes of Cowfold, Ashurst, Wiston, Washington and Sullington are all impacted by the Onshore Cable Corridor route (OCC).	The Applicant undertook a range of Statutory and non-statutory consultations including both in-person events and online consultations in which it engaged with the wider public as set out in the **Consultation Report [APP-027]**. The statutory and non-statutory consultations included visualisations of the Proposed Development, in order to allow the public to understand its appearance and visual impacts from the initial early design and throughout the design evolution. To enable easy access to the consultation proposals across a 40km cable route, the Applicant created an interactive map at the top of the webpage, allowing the visitor to select cable route areas from 1 – 7 to investigate the area most local to, or of most interest to them. The 7 areas are also recognisable via geographical references and place names. Upon clicking a cable route area, it was then broken down further into smaller sections e.g. a) b) c) etc, again easily identifiable via geographical references and place names. The consultation procedure undertaken by the Applicant for Rampion 2 has met the requirements for consultation that are specified in the Planning Act 2008 as confirmed by the acceptance of the DCO Application. Further information on the consultation undertaken by the Applicant can be found in the **Consultation Report [APP-027]**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.29.10	In Cowfold, residents have been able to demonstrate that they were not informed of the proposal to locate the Rampion substation at Oakendene Farm until the second consultation. Complaints have been raised directly to Rampion, including from Cowfold Parish Council, regarding the lack of consultation materials for residents. Those residents who would be most affected by the substation and the OCC route were not in receipt of the proper notices in advance of the second consultation. The residents had just weeks to respond to the consultation and the new information which did not give them time to collate the ecological and geographical information needed to evidence their objections, and this is of great concern. I think this serious lack of engagement will have had some impact on the level of response to the consultation, in a village that will have the only lasting overground infrastructure as part of the Rampion project.	The Applicant has held extensive rounds of public consultation where local residents were able to provide feedback on the proposals. The consultation procedure undertaken by the Applicant for Rampion 2 has met the requirements for consultation that are specified in the Planning Act 2008 as confirmed by the acceptance of the DCO Application. Further information on the consultation undertaken by the Applicant can be found in the **Consultation Report** **[APP-027]**.
2.29.11	Cowfold Parish Council wrote to Rampion in January 2023 to state that they also consider the level of RWE's public engagement and information to be inadequate. The Parish Council called for a fresh period of consultation for the parish of Cowfold, given the identifiable failures of communication. This request was not agreed to. The parish council also highlighted the lack of detail and clarity in the maps provided. A common theme throughout my constituency in areas which are impacted by the Onshore Cable Route.	Please see the Applicant's response to **reference 2.29.7** above.
2.29.12	Washington Parish Council also wrote to RWE in the second consultation to express their dissatisfaction with the consultation and engagement. They also highlighted the technical level of the documents which were unfathomable for the majority of residents. They stated: "Route and access plans in particular have been produced in such a way that it is difficult to identify the underlying map information."	Please see the Applicant's response to **reference 2.29.9** above.
2.29.13	In a recent meeting between Wiston Parish Council and RWE to discuss the final route, one landowner pointed out to RWE that they did not appear to have given the alternative route any serious consideration. RWE said that they "could not really recall any detail about the alternative Southern route". This further demonstrates the RWE Project directors' lack of assessment of information during the consultation phase.	The Applicant has considered options for the cable route including the 'southerly alternative'. The option was not presented or commented on in the Alternatives Chapter as it was deemed less suitable on technical engineering and environmental grounds, specifically in relation to the pinchpoint of the proposed route crossing a gas pipeline in the vicinity of ancient woodland. Constrained access from the A24, and the need for existing tracks forming the South Downs Way to be widened, with impacts on hedgerows was a further key factor. **Consultation Report** **[APP-027]** **Annex 2 Application Reference 5.1.2** presents detailed summaries of issues raised onshore at consultation and the project's official response.
2.29.14	The most recent proposals for the OCC, which were consulted on in October/November last year, were a significant departure from the original ones proposed. Rampion's PR company emailed notice of the DCO submission 10 days after it was submitted, sending their email on 18th August to state the DCO had been submitted to the Planning Inspectorate on the 10th August.	Having listened to feedback from the statutory project-wide consultation alongside the results of ongoing environmental and engineering surveys, The Applicant considered a number of potential alternatives and modifications to the onshore cable route to help improve the project and reduce impacts. These alternative proposals formed the basis of the statutory onshore consultation held in October and November 2022. The email sent on 18th August was a courtesy communication to stakeholders (during the holiday season), to indicate submission of the DCO application. However, the more formal communication was sent on the morning of 8th September following confirmation of [Planning Inspectorate] Acceptance of the application on 7th September. In this communication, The Applicant summarised the application documents and the next steps under S56 of the

Ref	Relevant representation comment	Applicant's response
		Planning Act (2008), signposting the Rampion 2 page on the Planning Inspectorate website and setting out how to register as an Interested Party.
2.29.15	In summary, the consultations have been very poor indeed and I do not think meet the standards required to progress with the Development Consent Order application. I would be grateful if you could include my comments in your consideration and I associate myself with any comments submitted by the local councils.	Please see the Applicant's response to **reference 2.29.7** above.

Table 3-21 Applicant's Response to Caroline Ansell MP [RR-055]

Ref	Relevant representation comment	Applicant's response
2.31.1	I write in support of the expansion of the Rampion Wind Farm. I do this in my capacity as the Member of Parliament for Eastbourne and Willingdon. Offshore Wind has been a British success story rapidly rising to become the most significant generator of renewable energy in the UK. It is also an area of increasing British expertise with the world's largest wind farms located in UK EEZ. Just this month, the connection to the grid of what will become the world's largest wind farm at Doggerbank is part of this success story. Whilst not of the same size and scope of these projects, Rampion 1 and 2 will form the largest wind farm on the South Coast and taken together will power the equivalent electricity of all the homes in Sussex. The nationwide target of 50GW of wind power by 2030 will be helped by the additional generation of wind power at Rampion. My constituents of Eastbourne & Willingdon have endured steep rises in the price of electricity and gas this year past. Domestic wind power is therefore mission critical to improve our environment, prevent the volatility of bills and reduce reliance on imports. Estimates that renewables saved £5.9 billion of additional imports suggests energy prices could have been higher without this. This fact also demonstrates the need to continue investing in our renewable capabilities. As we continue to decarbonise the grid – itself essential to meet carbon neutrality ambitions – expanding local wind power will help with new technologies of tomorrow such as hydrogen and powering electric vehicles. I very much hope this project will be successful in securing the necessary planning requirements.	The acknowledgement that Proposed Development will contribute to climate change mitigation is welcomed by the Applicant. The Proposed Development will help meet the urgent need for new renewable energy infrastructure in the UK and supporting the achievement of the UK Government's climate change commitments and carbon reduction objectives. The Proposed Development type is recognised as being a critical national priority in the revised NPS EN-1 (November 2023) and NPS EN-3 (November 2023), for which there is an urgent need to deliver. The assessment set out in **Chapter 29: Climate change, Volume 2** of the ES **[APP-070]** concludes the Proposed Development has a lifetime GHG emissions saving of 35,901ktCO_2e.

4. Applicant's Response to Relevant Representations: Prescribed consultees

Table 4-1 Applicant's Response to Environment Agency [RR-116]

Ref	Relevant representation comment	Applicant's response
2.32.1	Marine Environment: • We are pleased to confirm we are satisfied with the Water Framework Directive (WFD) assessment provided, which has been provided in a format agreed during pre-application advice in the Environmental Statement Volume 4, Appendix 26.3: Water Framework Directive compliance assessment. • In our view the WFD assessment justifies the proposal's claim for compliance for the marine water quality WFD elements. We are pleased to see that all our potential concerns have been included and adequately addressed. We feel it is clear that there have been lessons learnt from Rampion 1 which have been incorporated and satisfactorily addressed in the WFD assessment. • The release of sediment contaminants was scoped out of the Environmental Statement. However, we have raised concerns about the release of significant quantities of bentonite during the drilling process during the offshore construction phase and the potential impacts to the newly establishing kelp beds in proximity. Assurances were given at the last expert topic group meeting that contact had been made with the Sussex Kelp Recovery Project (SKRP) and discussions / consultation were ongoing. We would welcome further clarification on this.	These comments are welcomed by the Applicant. The Applicant is engaging with Sussex Kelp Recovery Project (SKRP) and SKRP is aware that the Rampion 2 DCO Application has been published on the Planning Inspectorate's website. Whilst the Applicant has not engaged with SKRP on direct impacts on the kelp beds, **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2** of the ES **[APP-050]** has assessed all algal features, including kelp, and no significant effects are predicted to occur. Additionally, Section 2.7 of **Appendix 6.3: Coastal processes technical report: Impact assessment, Volume 4** of the ES **[APP-131]** has assessed drilling fluid release during HDD at the landfall and no significant effects are predicted to occur. It is therefore considered unlikely that construction works, including the potential release of bentonite during drilling activities at landfall, would result in the deterioration of relevant biological quality elements under the Water Framework Directive (WFD (England and Wales) Regulations 2017, although it is also noted that the Sussex coastal water body is not assessed / classified for macroalgae.
2.32.2	Landfall: • The cable makes landfall at Climping and will be installed using Horizontal Directional Drilling (HDD) as detailed in the Environmental Statement Volume 2, Chapter 4: The Proposed Development Paragraphs 4.4.1-4.4.15 which makes reference to landfall, construction works and the Transition Joint Bay (TJB). The TJB is to be a permanent below-ground infrastructure where the offshore and onshore export cables are joined and is to be located landward of the beach. • We have previously discussed with the applicant the rapidly changing coastal morphology at the Landfall site. We are confident that references in Environmental Statement Volume 2, Chapter 6: Coastal processes demonstrate that this has been understood by the Applicant. We would urge the Applicant to ensure that they are satisfied that the risk to their equipment is appropriately mitigated. • Further details of the chosen landfall connection and associated work at Climping including details of any flood mitigation will be required. A FRAP will need to be obtained prior to the commencement of such works.	During design evolution of the Proposed Development, a sequential approach and approach of avoidance was taken to siting the landfall options (TC-01 and TC-01a), whereby they were sited topographically on the highest ground in the areas of the least flood risk and landward of the most extreme Environment Agency geomorphological report estimates. Assessment of coastal morphology at the landfall site was undertaken in **Chapter 6: Coastal processes, Volume 2** of the ES **[APP-047]**. Commitment C-247 of the **Outline Code of Construction Practice (CoCP) [PEPD-033]** which is secured through Requirement 22 of the **Draft Development Consent Order (DCO) [PEPD-009]**. Requirement 26 of the **Draft DCO [PEPD-009]** also secures further mitigation to be identified and implemented post-DCO consent as necessary. The 'coastal erosion and future beach profile estimation assessment' will be undertaken by the Applicant prior to construction at the post-DCO award stage as part of the final site selection process, and prior to finalisation of the engineering design. The assessment would be a desktop study, compiled with the latest information available at that time, including: existing studies and estimates of likely coastal erosion patterns and new targeted ground investigation works; the position of the coastline; the state of the beach and hinterland, including any remaining coastal defences; the existing environmental baseline understanding; any updates to the predicted effects of climate change; and any relevant updates to the coastal protection strategy or options being considered for the wider coastal area. Further ground investigation will be carried out at the landfall at the post-DCO Application stage as outlined in commitment C-247 (**Commitments Register [APP-254]** which has been updated at Deadline 1) and secured within Requirement 26 of the **Draft DCO [PEPD-009]**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		This, in combination with the future beach profile estimation described above, will help identify the need for and design of any further adaptive management mitigation measures to help minimise the vulnerability of assets from future coastal erosion and flooding. During the detailed design stage post-DCO award, the preparation of the Flood Risk Activity Permit (FRAP) application will contain further detailed information. The Applicant will commence this process in advance of any construction works. Commitment C-118 (**Commitments Register [APP-254]** which has been updated at Deadline 1) also commits to an Emergency Response Plan for flood events, which will help effectively protect site personnel and equipment from any risk of flooding from the sea during construction. This is secured in Requirement 22 of the **Draft DCO [PEPD-009].** Additionally, the landfall transition joint bay will be resilient to flooding once constructed as documented in paragraph 4.3.8 of the **Appendix 26.2: Flood Risk Assessment (FRA), Volume 4** of the ES **[APP-216]**.
2.32.3	Crossings, Flood Risk and Flood Risk Activity Permits (FRAPs) Note for the Planning Inspectorate: the Environment Agency has responsibility for protecting designated 'Main Rivers'. Local Authorities are responsible for protecting 'Ordinary Watercourses'. There are both Main Rivers and Ordinary Watercourses along the proposed cable route. The Applicant would separately have to apply for an Ordinary Watercourse Consent from the Lead Local Flood Authority (LLFA) where required.	The responsibilities for protecting designated Main Rivers and Ordinary Watercourses (held by the Environment Agency and Local Authorities respectively) are reflected in the relevant legislation, planning policy and other documentation Section 26.2 of the ES **Chapter 26: Water environment, Volume 2** of the ES **[APP-067]**.
2.32.4	The Applicant has acknowledged the requirement to obtain FRAPs from us before commencement of works in, under, over or within 8m of the top of the bank of any designated Main River and 16m from a Coastal Defence. However, we have not yet received any detailed methodology for such works, and therefore are not able to comment on this aspect, nor indicate whether such permits can be obtained, or advise upon any requirements that would be applied to such permits if obtained. It is our understanding that the Applicant does not intend to disapply the need for FRAPs under section 150 of the Planning Act 2008.	Detailed methodologies for works where there is a requirement for a Flood Risk Activity Permit (FRAP) (e.g. works in, under, over or within 8 m of the top of the bank of any designated Main River and 16 m from a Coastal Defence) will be provided by the contactor who will be appointed at the post-Development Consent Order (DCO) award stage. The permitting requirements within embedded environmental measure C-17 are set out in Section 26.7 (Table 26-20) of **Chapter 26: Water environment, Volume 2** of the ES **[APP-067]**. Other embedded environmental measures are provided which address points made by the Environment Agency in relation to temporary works in the floodplain and flow conveyance including the programming of works, Emergency Flood Response Plans, and temporary haul road and soil stockpiling considerations (Commitments C-117 to C-119, C-130 to C-133, C-154 and C-175 in the **Commitments Register [APP-254]** which has been updated at Deadline 1) which are set out in the **Outline Code of Construction Practice (CoCP) [PEPD-033]** and secured via Requirement 22 of the **Draft DCO [PEPD-009]**. The Applicant confirmed in a consultation meeting with the Environment Agency on 22 June 2023 that it is not intending to disapply the need for permitting under section 150 of the Planning Act 2008.
2.32.5	Should this position change, and the Applicant intends to seek disapplication of the need for FRAPs, then further discussion regarding disapplication of consents for both FRAPs will be required. We would expect methodologies to be provided for our examination (with sufficient time granted for this work) and also recommend that a number of protective provisions are included in the DCO.	As outlined in **reference 2.32.4** (above), the Applicant is not seeking to disapply the need for Flood Risk Activity Permits (FRAPs).

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.32.6	It has been noted that this has been acknowledged in the latest documentation, but we would recommend that a requirement is included in the DCO, to cover the need for such permits to be obtained prior to works being undertaken.	The requirement for permitting is captured within the embedded environmental measure C-17 as set out in Section 26.7 (Table 26-20) of **Chapter 26: Water environment, Volume 2** of the ES **[APP-067]**. It is also identified in Table 3-1 in **Other Consents and Licences [APP-033]** which sets out the other consents and licences which will be required in connection with the Proposed Development, such as Flood Risk Activity Permits. Part 4, Article 16 (7) of the **Draft DCO [PEPD-009]** acknowledges that the article does not authorise entry into controlled waters as prohibited by the Environmental Permitting (England and Wales) Regulations 2016. The Applicant will apply for Flood Risk Activity Permits in adherence with the Environmental Permitting (England and Wales) Regulations 2016 as required.
2.32.7	During our pre-application engagement with the Applicant, we advised that our preferred method for crossing a Main River is HDD, as this presents the least risk in terms of flood risk and effects on river ecology. HDD essentially involves drilling underneath the river. An alternative method to cross is open trench cutting, which involves excavating a trench, installing the cable, and refilling the trench. This method poses a much greater risk to the fish, ecology and geomorphology of a river system. We, therefore, prefer to see HDD over open trenching cutting. The documentation has stated that all "Main Rivers" and watercourses considered to provide good habitat for fish are proposed to be crossed by "trenchless crossing" and we require justification for those exceptions. The statement "where this represents the best environment solution, is financially and technically feasible" infers some ambiguity. It would be helpful to have more clarity on this.	Commitment C-5 in the **Commitments Register [APP-254]** (updated for the Deadline 1 submission) states that: "*Main Rivers, watercourses, railways and roads that form part of the Strategic Highways Network will be crossed by HDD or other trenchless technology, in accordance with Appendix A Crossing Schedule of the Outline of Construction Practice.*". For clarity, the Applicant confirms that all Main Rivers will be crossed by trenchless crossing technology as reflected in Figures 26.2a-t of **Chapter 26: Water environment – Figures (Part 1 of 2), Volume 3** of the ES **[APP-117]** as per Appendix A: Crossing schedule and paragraph 5.10.13 of the **Outline Code of Construction Practice (CoCP) [PEPD-033]**. This is secured via Requirement 22 of the **Draft DCO [PEPD-009]**. Also, as outlined in Table 26.7 of **Chapter 26: Water environment, Volume 2** of the ES **[APP-067]**, a collaborative approach was carried out between the water environment and terrestrial ecology aspects in the design of the Proposed Development to identify sensitive watercourses which required trenchless crossings. A fisheries habitat survey report recorded the key findings in **Appendix 22.6: Fisheries habitat survey report, Volume 4** of the ES **[APP-184]**. All watercourse crossings which were identified as having 'good' potential fisheries habitat have trenchless crossings proposed (RVX-01, RVX-02, STRX-18). One crossing which was identified as offering 'moderate – good' coarse fishery habitat near Buncton adjacent to Water Lane (STRX-05) was updated to a trenchless crossing to minimise effects from channel disturbance at that location. Several others were described as having 'moderate' potential fisheries habitat (STRX-14, STRX-15, STRX-16), and a range of mitigation measures (such as erosion control, channel profile management, soil storage, bank reinstatement, works timing and duration, pump screening, fish rescue etc) have been embedded to minimise potential effects at those locations, as set out in the **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES [APP-063]. The crossings which were identified as having 'poor' potential fisheries habitat are predominantly open cut trenched crossings, owing to their low overall sensitivity.
2.32.8	As previously discussed, and as far as practically possible, we encourage the Applicant to avoid the use of temporary culvert crossings. We would recommend the use of existing access points or using temporary bridges as an alternative. It has been noted that this has been addressed in the latest documentation and we would welcome a further discussion when more detailed locations have been determined.	Feedback from the Environment Agency regarding temporary culvert crossings was taken into account in paragraphs 5.10.13 – 5.10.14 of the **Outline Code of Construction Practice (CoCP) [PEPD-033]**. In the context of this Proposed Development, temporary crossings relate to the proposed temporary haul roads only as the onshore cable will be installed below the bed of watercourses. All trenchless cable watercourse crossings would have no need for associated temporary haul road crossings as they would be accessed via adjacent fields / accesses.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		An embedded environmental measure (C-229) outlined in the **Commitments Register [APP-254]** (which has been updated for Deadline 1) secured through the **Outline CoCP [APP-224]** and Requirement 22 of the **Draft Development Consent Order (DCO) [PEPD-009].** This will ensure that where the onshore cable route is open cut trenched, sensitive watercourse locations will be crossed by open span haul road bridges (e.g. DTX-1de-14 and STRX-1de-03 as outlined in outlined in paragraph 5.10.14 of the **Outline CoCP [APP-224]** which states that "*Clear span bridges will also be used for those watercourses too wide or deep to be crossed using culverts*" and that "*watercourse crossings will be designed to minimise morphological and conveyance effects and sized to maintain existing flow conveyance*". **Appendix 4.1: Crossing schedule, Volume 4** of the ES **[APP-122]** provides information on proposed cable crossing methodologies and of those listed, only open cut trenched crossings of Ordinary Watercourses will require temporary haul road crossings.
2.32.9	We welcome the opportunity to look at in more detail and comment on those crossings which will require FRAPs, including methods to create dry working areas, over-pumping, and temporary crossings or culverts.	On the basis of the above information (**references 2.32.7** and **2.32.8**), all Main Rivers identified by the Environment Agency would be crossed via trenchless crossing technology with no need for associated temporary culverts. As such, it is not anticipated that there will be any Flood Risk Activity Permit (FRAP) requirements associated with methods to create dry working areas, over-pumping and temporary crossings or culverts, but there may be FRAP requirements for drilling under the Main Rivers (River Arun, Black Ditch, River Adur and Cowfold Stream). Methodologies for works where there is a requirement for a FRAP (e.g., works in, under, over or within 8m of the top of the bank of any designated Main River and 16m from a Coastal Defence) will be provided by the contactor who will be appointed post-Development Consent Order (DCO) award.
2.32.10	It is noted that the Applicant has acknowledged in the latest documentation that stockpiles should be ideally situated outside of Flood Zones 2 and 3. If they are in the floodplain, the Applicant should ensure the floodplain is connected to minimise any impacts on flow conveyance. Steps have been taken to address the issue, but the location of stockpiles will still need to be agreed.	Table 8-1 of **Appendix 26.2: Flood Risk Assessment (FRA), Volume 4** of the ES **[APP-216]** identifies a range of flood risk management measures identified to ensure there will be no adverse impacts on flood conveyance and these include commitments C-130, C-131, C-132, C-179, C-180 and C-133 in the **Commitments Register [APP-254]** (which has been updated for Deadline 1) secured through the **Outline Code of Construction Practice (CoCP) [APP-224]** and Requirement 22 of the **Draft Development Consent Order (DCO) [PEPD-009]**. C-132 commits to a ratio of regular stockpile gaps at topographic low points to prevent floodplain compartmentalization. Stockpiling activities will be carried out in accordance with the principles discussed with the Environment Agency on 22 March 2022, with follow up email correspondence from the Applicant on 03 August 2022 with the Environment Agency. During those exchanges the Environment Agency noted that it agreed in principle with the approaches to soil stockpile management within the Arun Valley floodplain. Engagement will continue throughout the DCO Examination. During the post-DCO consent detailed design stage, the Flood Risk Activity Permit (FRAP) applications will contain further detailed information about specific stockpile locations.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.32.11	It is noted that the Applicant has acknowledged in the latest documentation that further details of access tracks and construction compounds will need to be discussed, with any consenting requirements considered.	The five proposed temporary construction compounds and indicative temporary construction haul road (related to the onshore cable corridor) are shown in Figures 26.2.1a – e and 26.2.2 of **Appendix 26.2: Flood Risk Assessment (FRA), Volume 4** of the ES **[APP-216]**. As noted in paragraph 10.1.9 of **Appendix 26.2: FRA, Volume 4** of the ES **[APP-216]**, the temporary construction compounds will be located in Flood Zone 1 with runoff rates from those areas limited to pre-development rates through site specific drainage strategies incorporating sustainable drainage systems (SuDS) principles as outlined in commitment C-73 (**Commitments Register** **[APP-254]** which has been updated for Deadline 1) and secured through the **Outline Code of Construction Practice (CoCP)** **[APP-224]** and Requirement 22 of the **Draft DCO** **[PEPD-009]**. Information on temporary construction access and haul road parameters are presented in Paragraph 4.4.19 to 4.4.20 of **Appendix 26.2: FRA, Volume 4** of the ES **[APP-216]**. The temporary construction haul road will run along the length of the onshore cable route, except for locations where there are trenchless watercourse or road crossings. In areas where it is anticipated that the raised stone haul road and associated stockpiles may cause an obstruction to flood water (e.g., on the floodplain), then road mats (also often referred to as 'trackway') placed on the existing ground surface will be used instead (thus avoiding both the raised stone road and the associated stockpiles) as outlined in C-119 (**Commitments Register** **[APP-254]** which has been updated for Deadline 1) and secured through the **Outline CoCP** **[APP-224]** and Requirement 22 of the **Draft DCO** **[PEPD-009]**. The temporary construction haul road will be approximately 6m in width, occasionally increasing to 10m at its widest point. The temporary construction haul road will be used during installation works and construction activities and will be removed prior to final reinstatement. Detailed methodologies for works where there is a requirement for a Flood Risk Activity Permit (FRAP) (e.g., works in, under, over or within 8m of the top of the bank will be provided by the contactor who will be appointed following the Examination phase. The relevant permitting and consenting requirements contained within embedded environmental measure C-17 are set out in Section 26.7 (Table 26-20) of **Chapter 26: Water environment, Volume 2** of the ES **[APP-067]**. This will be secured via adherence to The Environmental Permitting (England and Wales) Regulations 2016.
2.32.12	Consideration for pre-construction and post-construction asset condition surveys will be required. This will be relevant to any construction activities in close proximity to Main Rivers and subsequent assets. Further details of this will be required as part of the consenting process.	The Applicant acknowledges that any requirements for asset condition surveys would be covered under the relevant permits as part of the consenting process. Table 26-9 in **Chapter 26: Water environment, Volume 2** of the ES **[APP-067]** outlines "*Environmental measures (C-17, C-77, C-126, C-142 and C-182) are included to ensure adherence to the permitting regime (see Section 26.7) which will cover any temporary construction activities in close proximity to Main Rivers and subsequent assets*". This relates to the trenchless crossings of the Main Rivers such as River Arun, Black Ditch, River Adur (West Branch) and Cowfold Stream as well as the Environment Agency flood defences at the Climping Beach frontage, River Arun and River Adur (West Branch).
2.32.13	Biodiversity: The Applicant has provided a significant amount of documentation and detail has with regard to the elements that might impact upon water dependent habitats and species of which the Environment Agency leads. We are happy with the quantity of data collected on biodiversity elements and comfortable that concerns we have previously raised are being addressed.	The Applicant has no further comments on this matter at this time.

Ref	Relevant representation comment	Applicant's response
2.32.14	We support the standoff distance proposed from watercourse bank tops, though this currently has no specified distance. Clarification would be welcomed and, in our opinion, this should be a minimum of 3m in most locations.	Stand-offs to watercourses will be implemented in all locations where they are not crossed using open cut trenching methodology or where an access road is located. Outside of crossing points (by openly trenched cable or access road) a stand-off in excess of 3m will be achieved from all construction works. The exception to this will be where any existing access routes (e.g. farm tracks), including existing crossing points, require repair and their original alignment takes them in close proximity to a watercourse. The stand-off distance of at least 3m has been included in the **Commitments Register** **[APP-254]** (updated for the Deadline 1 submission). This will be secured through the **Outline Code of Construction Practice** **[PEPD-033]** and Requirement 22 of the **Draft** **[PEPD-009]**.
2.32.15	There is mention of a 30m length of vegetation removal for those watercourse crossings which are "open cut". We would like confirmation if this is 30m on both banks (ie 60m in total) or 15m per bank?	Watercourse crossings that are subject to open cut trenching would require the removal of 30m of bankside vegetation (paragraph 22.9.117 of **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-063]**). This vegetation will be removed on each bank (60m in total) to enable the duct blocks to be craned into place and give access to excavators etc. This is a realistic worst-case scenario and may be reduced at detailed design stage.
2.32.16	The Applicant has confirmed that preconstruction surveys will be carried out for water vole and Great Crested Newts where the route intersects suitable habitat, which we support given the timeframes involved in the proposal.	The Applicant has no further comments on this matter at this time.
2.32.17	We are pleased to see that all 17 ponds within the Development Consent Order limit are confirmed to be retained, and that all ponds have been considered Habitats of Principal Importance (HPI).	The Applicant welcomes the Environment Agency's support for the approach to ponds. For clarity there are a total of 13 ponds and 4 ditches within the proposed Order Limits. A ponds plan has been included as a visual aid alongside the vegetation retention plan, Figure 7.2.5 of Appendix B Vegetation Retention Plans, **Outline Code of Construction Practice** **[PEPD-033]** updated at Pre-Examination Procedural Deadline A dated 16 January 2024.
2.32.18	There are some discrepancies that need resolving: For example, there is some confusion in the Water Environment Document (River Adur Catchment 26.6.18-25) - it appears that several times when the tidal Arun is referred to this is an error, and further on in the document. This is important to amend to remove uncertainty.	This is noted as an erratum to the DCO Application (attached to the covering letter for Pre-Examination Procedural Deadline A **[PEPD-001]** dated 16 January 2024).
2.32.19	The Lyminster Bypass, currently being built, is not mentioned in cumulative effects although the proposed cable route intersects with this. We would like it to be acknowledged in the documents that contact has been made with the developers as this is now more pertinent than the A27 bypass which is currently on hold.	This is noted as an erratum to the DCO Application (attached to the covering letter for Pre-Examination Procedural Deadline A **[PEPD-001]** dated 16 January 2024).
2.32.20	Groundwater and Contaminated Land: We are largely satisfied with the Hydrogeological Risk Assessment as provided. The contents would appear to align with previously agreed techniques and mitigation methods. However, the risk assessment does not preclude the use of drilling fluids containing hazardous or environmental harmful substances. We have previously agreed that these will not be used in sensitive locations such as within a SPZ. We would wish to agree as to exactly where and in what circumstances drilling fluids containing hazardous or environmentally harmful substances are used. We are comfortable that this can be agreed as part of general works moving forward.	The **Commitments Register** **[APP-254]** (updated for the Deadline 1 submission) and **Appendix 26.4: Hydrogeological Risk Assessment, Volume 4** of the ES **[APP-218]** identify commitment C-137 which outlines that "*there will be no storage of hazardous materials including chemicals, oils and fuels within any SPZ*". This is secured through the **Outline Code of Construction Practice (CoCP)** **[APP-224]** and Requirement 22 of the **Draft DCO** **[PEPD-009]**. Further assurances regarding use of drilling fluids are provided within the embedded environmental measures outlined in paragraph 5.2.16 of **Appendix 26.4: Hydrogeological**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		Risk Assessment, Volume 4 of the ES **[APP-218]**, which states that "*Environmentally hazardous drilling fluids, or those containing groundwater hazardous substances, will not be used during trenchless crossings (including HDD)*" (C-245) as secured through the **Outline CoCP** **[APP-224]** and Requirement 22 of the **Draft DCO** **[PEPD-009]**. The locations of the indicative trenchless crossing (including HDD) compounds and their Limits of Deviation are shown on Figures 26.6a-n in **Chapter 26: Water environment – Figures (Part 2 of 2), Volume 3** of the ES **[APP-118]**.
2.32.21	We also note that monitoring will take place of private and public water supplies in the vicinity of the development corridor. It would be helpful if we could also be supplied with this monitoring.	The Applicant acknowledges the Environment Agency's request for future public and private water supply monitoring data where monitoring is undertaken. Commitment C-253 in the **Commitments Register** **[APP-254]** (updated for the Deadline 1 submission) sets out commitments in relation to Private Water Supply (PWS) monitoring which are all registered with Arun District Council (ADC) as secured through the **Outline Code of Construction Practice (CoCP)** **[APP-224]** and Requirement 22 of the **Draft DCO** **[PEPD-009]**. Provision of monitoring data to the Environment Agency will be subject to the consent from the PWS supply owners and ADC under General Data Protection Regulation (GDPR).
2.32.22	We are generally satisfied with the geo-environmental desk study. We would remain of the opinion that the historic contamination risks associated with the study area are on the whole low.	The Applicant welcomes the Environment Agency's Representation with respect to the content within **Appendix 24.1: Phase 1 geo-environmental desk study, Volume 4** of the ES **[APP-198]** and the agreement that historic contamination risks associated within the Study Areas are on the whole low.
2.32.23	As identified in the desk study though there may be some hotspots of contamination. These should be appropriately managed and investigated to ensure no risk to any controlled water receptors.	The **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** provides the Applicant's commitment (C-71) that the locations identified in the **Appendix 24.1: Phase 1 geo-environmental desk study, Volume 4** of the ES **[APP-198]** will be subject to further contamination assessment, post-DCO consent, in line with the Environment Agency's guidance on land contamination and risk management (LCRM). This is secured through Requirement 25(1) of the **draft DCO** **[PEPD-009]**.
2.32.24	Historical Landfill: We note the presence of historical landfill(s) within the route plans. These probably represent the largest contamination risk, though we acknowledge that these are largely non-biodegradable waste and mostly fairly old. This would reduce the overall risk potential.	The Applicant welcomes the Environment Agency's agreement that the historical landfill(s) likely represent the largest contamination risk and the acknowledgement that the overall risks from the historical landfills is low given their age and waste type.
2.32.25	Any works associated with this scheme must not compromise any containment features of these landfills or create preferential pathways for contaminants within the landfill, to offsite receptors. We would though acknowledge that due to the age and suspected nature of the landfill, it is unlikely that many containment features were incorporated in their designs, however if any features are present then proposed works must ensure that these are not compromised.	The Applicant welcomes the Environment Agency's comment that whilst works must not compromise any containment features, the age of the historical landfills means containment features are unlikely to be present. The **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** outlines the Applicant's commitment that the historical landfills (as one of the locations identified in **Appendix 24.1: Phase 1 geo-environmental desk study, Volume 4** of the ES **[APP-198]**) will be subject to further contamination assessment, post-DCO consent, and that appropriate remediation will be implemented where required in line with the Environment Agency's guidance on land contamination and risk management (LCRM). This is secured through Requirement 25 of the **Draft DCO** **[APP-019]**.
2.32.26	We would also highlight that any waste material removed from the landfills as part of construction would be classed as waste material. As such they cannot be re-deposited and must be appropriately disposed of as waste material.	Section 4.12 of the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** provides the Applicant's commitments to the management of excavated soils in line with the Contaminated Land: Applications in Real Environments (CL:AIRE) (2011) Definition of Waste Code of Practice and Waste Regulations (DoWCoP). This includes development of a

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		Materials Management Plan (MMP) declared by a Qualified Person and for material that is not suitable for reuse to be managed as waste material in accordance with the Waste Regulations (2011) and removed offsite for treatment / disposal under Duty of Care (commitment C-31 and C-69). Stage specific CoCPs will detail these measures and be secured via Requirement 22 of the **Draft DCO** **[PEPD-009]**.
2.32.27	If the borehole will be lost as part of the development, then it should be suitably decommissioned and backfilled, prior to constructions, this must be done to ensure it does not represent a rapid pathway to any underlying aquifers.	Where boreholes are installed by the Applicant or found to be present onsite prior to construction, these will be decommissioned in line with Environment Agency (2012) *Good Practice for decommissioning redundant boreholes and wells*. The Applicant considers that this forms part of the commitment in the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** to ensure land is suitable for the proposed use in line with the Environment Agency's land contamination and risk management (LCRM) guidance and will be secured via Requirement 22 of the **Draft DCO** **[PEPD-009]**.
2.32.28	If, during development works, contamination (including any contamination not previously identified) is found to be present then appropriate remedial works should be undertaken to address any residual risks.	The **Outline Code of Construction Practice (CoCP)** **[PEPD-003]** provides the Applicant's commitment that an unexpected contamination protocol will be developed and in place prior to construction to ensure appropriate management of unexpected contamination in line with the Environment Agency's land contamination and risk management (LCRM) guidance as detailed in commitment C-72 in the **Commitments Register** **[APP-254]** (updated for the Deadline 1 submission), which is secured through Requirement 25(3) of the **Draft DCO** **[PEPD-009]**. Stage specific CoCPs are required pursuant to Requirement 22 of the **Draft DCO** **[PEPD-009].**

Table 4-2 Applicant's Response to Historic England [RR-146]

Ref	Relevant representation comment	Applicant's response
2.33.1	Significance of the Study Area Parts of the onshore Study Area have demonstrable historical and archaeological interest (exceptional in some areas). This includes several scheduled monuments: Medieval earthworks east and southeast of St Mary's Church; Itford Hill style settlement and an Anglo-Saxon barrow field at New Barn Down; Prehistoric flint mine and part of a round barrow cemetery at Blackpatch, Farm; Group of four bowl barrows at the Chantry Post; Muntham Court Romano-British site. Furthermore, there is high potential for archaeological deposits outside the scheduled areas that may be of equal significance. This is particularly notable in Zone 2: South Downs. Within the marine archaeology study area, the Applicant has identified 179 known marine heritage receptors including 100 wrecks and 17 recorded aircraft losses. The area has been shown to also contain a complex system of prehistoric inundated valleys and channels. There may also be related archaeological potential at the proposed landfall location.	The onshore historic environment baseline presented in the **Chapter 25: Historic environment, Volume 2** of the Environmental Statement (ES) **[APP-066]** and associated appendices in **Volume 4** of the ES **[APP-199** to **214]**) include a description of these onshore heritage assets identified within the Study Area and consider the potential for presence of archaeological remains within the proposed Order Limits, including a high potential for archaeological remains of high heritage significance within the South Downs. Prehistoric inundated valleys and channels in and around the marine archaeology Study Area, including at the proposed landfall location have been taken into account in the **Chapter 16: Marine archaeology, Volume 2** of the ES **[APP-057]** as described below. Paragraphs 16.6.29 to 16.6.42 of **Chapter 16: Marine archaeology, Volume 2** of the ES **[APP-057]** summarise the interpretation of the archaeological assessment of the offshore sub-bottom data and places the current understanding of the complex prehistoric landscapes and the correlation between marine and terrestrial sediment phases in the context. The channel and valley features have been mapped, as detailed in **Appendix 16.1: Marine archaeology technical report, Volume 4** of the ES **[APP-162]**. Figure 16.3 of **Chapter 16: Marine archaeology – Figures, Volume 3** of the ES **[APP096]** shows Archaeological exclusion zones, including those near the proposed landfall location. Figure 16.4 of **Chapter 16: Marine archaeology – Figures, Volume 3** of the ES **[APP096]** presents the valleys and channels of geoarchaeological potential within and around the Study Area, including the proposed landfall location. An archaeological assessment of sub-bottom profiler data was undertaken which has resulted in a number of features being identified as of geoarchaeological interest. The features reveal a complex system of inundated valleys and channels interlinked and associated with The Northern Palaeovalley. The palaeo-Arun valley (MA3000), as mapped by (Gupta et al, 2008), is clearly visible. The extent of a channel feature (MA3001) identified during the development of the Rampion 1 ES has also been confirmed as it extends into the Proposed Development Survey Area.
2.33.2	Concerns regarding the Proposed Development 1. Inadequate onshore archaeological baseline assessment and evaluation. The reporting fails to fully understand that the archaeological resource, in some areas, must be considered at a landscape scale, rather than as individual, spatially defined sites. For example, although the chosen onshore route avoids the scheduled areas of the Blackpatch prehistoric flint mine and barrow cemetery and the New Barn Down monument, it passes through an area of the South Downs that has very high potential for discovery of archaeological remains of equal significance to, and potentially directly related to, the scheduled sites. We raised concerns previously that sufficient archaeological evaluation to understand the impacts on archaeological remains of potentially national significance had not taken place along the onshore route. We advised that if appropriate evaluation work was not done prior to application for DCO, the Environmental Statement should describe how the project will provide for retention in situ of any archaeological remains of national significance that are discovered during works. Having reviewed the information supporting the application it	**Chapter 25: Historic environment, Volume 2** of the ES **[APP-066]** has considered all available desk-based and geophysical survey data at a landscape scale, drawing on a range of desk-based and survey data to inform an assessment of archaeological potential as well as considering individual sites and identifies a high potential for archaeological remains of high heritage significance within the area of the South Downs. The assessment presented in **Chapter 25: Historic environment, Volume 2** of the ES **[PEPD-020]** is based on a worst case scenario. Therefore, the Applicant considers that further investigation would not change the outcome of the assessment. Commitments C-79 and C-225 in the **Commitments Register** **[APP-254]** (updated at the Deadline 1 submission) provide for mitigation through design and archaeological recording. Archaeological interest retained in an asset which is actively conserved is more valuable and actively sought though detailed design, which will be informed by evaluation.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	appears that our concerns about the likely presence of, and harm to, potentially important non-designated archaeological remains, have not been addressed. The applicant has not clearly and convincingly demonstrated how they would practicably provide for retention in situ. In the embedded environmental measures, we consider there is too much reliance on the recording of archaeological remains as mitigation. Avoiding harm to nationally important heritage assets, not mitigation of impacts, should be the primary objective.	The environmental embedded measures were established and adapted through the pre-DCO Application consultation process. Following a meeting on 27 October 2023 with the West Sussex County Council (WSCC) Archaeologist, C-225 has been updated by the Applicant within the and the **Commitments Register** **[APP-254]** (updated at the Deadline 1 submission) to the following: C-225 states "*Where previously unknown archaeological remains of high heritage significance are identified through surveys along the cable route, and where these locations have not been possible to avoid during earlier design stage, consideration will be made for engineering solutions (e.g. narrowing of the construction corridor, divert cable route within DCO Order Limits, re-siting stockpiles) to avoid impacts in the first instance ~~minimise direct impacts~~. Where impacts are not avoidable, these will be minimised where possible through design solutions and an appropriate programme of mitigation will be undertaken to ensure preservation by record. Such measures will be reviewed in consultation with relevant stakeholders (WSCC Archaeologist and Historic England). An onshore outline WSI provides detail of appropriate methodologies to be implemented during the evaluation and mitigation stages of the archaeological works.*" Commitments C-79 and C-225 are secured within the **Outline Onshore Written Scheme of Investigation (WSI)** **[APP-231]**, which would itself is secured by Requirement 19 of the **Draft DCO** **[PEPD-009]**. Further consultation is currently being undertaken with the WSCC Archaeologist and Historic England on the Outline WSI and a revised version will be submitted at Examination Deadline 3. The **Outline Onshore Written Scheme of Investigation (WSI)** **[APP-231]** sets out the methodological approach for archaeological investigations which ensures further investigation will be undertaken prior to construction. The **Outline Onshore Written Scheme of Investigation (WSI)** **[APP-231]** also sets out the measures that will be taken in response to the disturbance of archaeological remains resulting from work at onshore construction areas and which cannot be avoided through appropriate design measures. Engagement will be undertaken with Historic England to provide comment/input to this document which will be updated and throughout the Examination. Site specific WSIs are secured through Requirement 19 of the **Draft DCO** **[PEPD-009]**.
2.33.3	2. Limitations of marine archaeology evaluation We note that, following our comments on the PEIR consultation exercise, all potential effects on the marine historic environment previously scoped out have been scoped in and are now included and assessed in this Environmental Statement (ES). We are aware that marine geophysical survey was undertaken in 2020 and in 2021 and we concur with the Applicant that there is the possibility that presently unidentified marine heritage receptors might be discovered within the proposed DCO Order Limits which could be impacted directly or indirectly by the proposed development. The ES describes the use of historic datasets and geophysical data acquired for this project. However, it is apparent that geotechnical survey work has not been conducted. It is therefore important that the Outline Written Schemes of Investigation (WSI) provides for geoarchaeological analysis of geotechnical survey materials. We will provide further advice as may be necessary in our Written Representation.	During the Evidence Plan Process, discussions included the geophysical surveys, the use of historic datasets, and the Applicant advised that geotechnical survey work would not be carried out during the pre-DCO Application stage. However, all available information will be used to ensure that the Final offshore Written Scheme of Investigation (WSI) and embedded environmental measures state that archaeological input must be sought ahead of geotechnical campaigns (in accordance with commitment C-59 (Offshore geotechnical surveys prior to construction will be undertake)) secured in Condition 11(2) of the draft Marine Licence (dML) (Schedules 11 and 12 of the **Draft DCO** **[PEPD-009]**). The Applicant awaits further advice from Historic England as may be necessary in their Written Representation.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
2.33.4	3. Inaccurate assessment of magnitude of impact and significance of effect Embedded environmental measures (EEM), such as recording archaeology before any loss, would not reduce harm or magnitude of impact. While investigating archaeology at risk of loss or disturbance is essential and will reduce the loss of knowledge and understanding, it cannot reduce the actual harm. Therefore, the downgraded assessment of the impact and the resultant effects being classified as 'Not Significant' is misguided and misleading. This pertains to both onshore and marine heritage receptors.	The assessment methodology followed in the **Chapter 25: Historic environment, Volume 2** of the ES **[PEPD-020]** is consistent with the methodology that was set out within the Scoping Report. It is also consistent with the approach which has been used in previous environmental assessments for other recent DCO projects such as Sizewell C nuclear new build and Yorkshire Green grid connection. In the case of Sizewell C, where a decision was made and consent was granted, the approach was accepted by the Examining Authority. **Chapter 25: Historic environment, Volume 2** of the ES **[APP-066]** provides an assessment of effects on a 'worst-case' basis based on the description and parameters of the Proposed Development, as set out in **Chapter 4: The Proposed Development, Volume 2** of the ES **[APP-045],** and therefore in the absence of engineering responses to be implemented through Commitment C-225 in **Commitments Register [APP-254]** (updated at the Deadline 1 submission). It is acknowledged that an agreed scheme of archaeological investigation, recording and dissemination, following any mitigation by detailed design (such as narrowing of the construction corridor, refinement of the onshore cable route within Order Limits), would still result in loss or truncation of archaeological remains but the archaeological interest would be preserved by record before the loss occurs. Archaeological interest retained in an asset which is actively conserved is more valuable and actively sought though detailed design, which will be informed by evaluation. Mitigation through recording would serve as partial mitigation. The assessment of residual effects in **Chapter 25: Historic environment, Volume 2** of the ES **[APP-066]** takes this mitigation into account in determining the magnitude of change. The **Outline Onshore Written Scheme of Investigation (WSI) [APP-231]** provides the overarching approach to further evaluation and subsequent mitigation, which is to be updated in line with feedback from stakeholders. The **Outline Onshore WSI [APP-231]** (secured by Requirement 19 of the **Draft DCO [PEPD-009]**) provides for the production of site-specific WSIs which will set out the requirements for further investigation where this has not been completed pre-DCO consent, as well as for mitigation measures to secure archaeological recording and reporting. Heritage assets in the marine zone as defined in Table 16-8 (**Chapter 16: Marine archaeology, Volume 2** of the ES **[APP-057]**) and the archaeological potential within the marine archaeology study area have been considered and assessed in **Appendix 16.1: Marine archaeological technical report, Volume 4** of the ES **[APP-162]**. The **Outline Marine WSI [APP-235]** which is secured through the **Draft DCO [PEPD-009]**) include the commitment to avoid all known marine heritage receptors and to further investigate areas of potential impacts ensuring that unknown receptors are located, and impact mitigated which will ensure preservation *in situ*. Where items might be removed from the seabed, conservation strategies will be clearly outlined in the relevant method statements produced and submitted to Historic England ahead of any such archaeological works.
2.33.5	Policy The National Policy Statements are of relevance to the proposals: Overarching National Policy Statement for Energy (EN-1) (Department of Energy and Climate Change (DECC), 2011a); National Policy Statement for Renewable Energy (EN-3) (DECC, 2011b); and National Policy Statement for Electricity Networks (EN-5) (DECC, 2011c). Each of these statements includes policies specifically related to the avoidance of harm to heritage assets and guidance for the Examining Authority on determining applications which would cause	The National Policy Statements EN-1, EN-3 and EN-5 (Department of Energy and Climate Change (DECC), 2011a; 2011b and 2011c) extant at the time of submission of the DCO Application and against which it will be tested are considered in the historic environment assessments within **Chapter 16: Marine archaeology, Volume 2** of the ES **[APP-057]** and **Chapter 25: Historic environment, Volume 2** of the ES **[PEPD-020]**. These ES chapters also consider the revised NPS EN-1, EN-3 and EN-5 (Department for Energy Security and

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	harm to the significance of heritage assets and guidance for the Examining Authority on determining applications which would cause harm to the significance of heritage assets.	Net Zero (DESNZ), 2023a; 2023b and 2023c) which took effect in January 2024, and are a relevant consideration in the decision-making process. A NPS review document (**Statement on the new National Policy Statements for Energy** (**Document Reference 8.29**)) has been submitted at Deadline 1 to provide a comparison of significant changes between the draft NPSs of March 2023 against the NPS as subsequently designated by Parliament in January 2024.
2.33.6	**Historic England's Position** Historic England do not object in principle to the Proposed Development. However, we consider there is the potential for a high level of harm to non-designated archaeological heritage assets, some of which may be of national significance. This pertains to both the onshore and marine receptors, but particularly concerns the area within Zone 2: South Downs, which has a concentration of nationally important heritage assets and high archaeological potential. Our concerns therefore are that i) insufficient evaluation has been done in advance of the application for onshore, intertidal and offshore areas, ii) the onshore route selection process was determined without due regard to the potential significant effects on heritage, and iii) the embedded environmental measures do not include convincing and practicable provision to avoid the risk of harm to potentially nationally important archaeological remains.	The acknowledgement that Historic England do not object to the principle of the Proposed Development is welcomed by the Applicant. The project will contribute materially towards meeting the urgent national need for renewable energy generation, significantly reducing carbon emissions from energy, and supporting the achievement of the UK Government's climate change commitments and carbon reduction objectives. **Chapter 25: Historic environment, Volume 2** of the ES **[PEPD-020]** takes into consideration the concentration of nationally important heritage assets and high archaeological potential within Zone 2: South Downs. The assessment adopts a precautionary approach and identifies potential for significant harm to heritage assets with archaeological interest, within this zone (Tables 25-30 in **Chapter 25: Historic environment, Volume 2** of the ES **[PEPD-020]**). **Onshore** i) The methodology for baseline data gathering is detailed in Section 25.5 of **Chapter 25: Historic environment, Volume 2** of the ES **[PEPD-020]**, including a combination of desk-based research, site walkovers, geophysical survey and targeted trial trenching, to inform the assessment. It is recognised that there is a potential for further as yet unknown archaeological remains to be present and impacted by the development. Relevant embedded environmental measures set out the commitment to ensure sufficient evaluation work is undertaken pre-construction to inform appropriate mitigation responses, to be agreed with relevant stakeholders. **Chapter 25: Historic environment, Volume 2** of the ES **[PEPD-020]** was updated at Pre Examination Procedural Deadline A on 16 January 2024 to include the updated assessment reflecting additional geophysical survey undertaken. ii) **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]** describes the alternatives studied by the Applicant and a comparison of their environmental effects across the Proposed Development as a whole. This includes the alternatives considered and consulted on prior to the submission of the DCO Application in August 2023. As described in **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]**, the Proposed Development has been developed through a multi-disciplinary design process including environment, engineering, landowner, and cost considerations. It identifies that there was no viable connection option which would have avoided the South Downs National Park (SDNP) altogether, and also describes the multi-disciplinary approach to selecting the onshore cable route within the SDNP. It is noted that historic environment considerations were given due weight in this process, alongside other environmental considerations. With regard identifying that there are no reasonable alternatives, the Applicant has sought to avoid, reduce, or minimise the effects through the design process and also by identifying and securing embedded environmental

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		measures. It is acknowledged that some residual effects remain across the Proposed Development. Section 3.4 of **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]** provides the information on the onshore cable route selection process. Section 3.4 describes the onshore cable route selection process and the reasons for other sites being discounted based on the multi-disciplinary factors identified in the paragraph above. Significant weight was also given to the environmental constraints and related policy in the overall balance of the decision. iii) Embedded environmental measures outlined in the **Commitments Register** **[APP-254]]** (updated at the Deadline 1 submission), and the **Outline Onshore Written Scheme of Investigation (WSI)** **[APP-231]** provide for an appropriate and proportionate programme of evaluation, and subsequent mitigation by avoidance/reducing effects through design, and preservation by record. Archaeological interest retained in an asset which is actively conserved is more valuable and actively sought though detailed design, which will be informed by evaluation. The environmental embedded measures were established and adapted through the consultation process. **Offshore** i) & iii) Known heritage assets in the marine zone as defined in Table 16-8 (**Chapter 16: Marine archaeology, Volume 2** of the ES **[APP-057]**) and the archaeological potential within the marine archaeology Study Area have been identified and assessed in **Appendix 16.1: Marine archaeological technical report, Volume 4** of the ES **[APP-162]**. The archaeological significance and potential impact on the marine heritage identified within the Proposed Development was undertaken according to the methodology outlined in Section 16.8. Table 16-15 and details the maximum design scenario and relevant activities that may impact archaeological receptors. Evaluation of potential in the marine zone is undertaken by the archaeological assessment of geophysical and geotechnical surveys which have and will continue to be conducted throughout the lifetime of the Proposed Development as detailed in the **Outline Marine WSI** **[APP-235]** which is secured through Requirement 19 and Condition 11 (2) Schedule 11 and 12 of the **Draft DCO** **[PEPD-009]**. Commitment C-225 (in the **Commitments Register** **[APP-254]** updated at the Deadline 1 submission) provides for the use of engineering solutions to minimise impacts to previously unknown archaeological remains of high heritage significance along the onshore cable route and mitigation through recording and dissemination. C-225 would be secured by the **Outline Onshore Written Scheme of Investigation (WSI)** **[APP-231**], an updated version of which will be submitted at Examination Deadline 3.
2.33.7	The Development Consent Order should contain requirements to ensure that appropriate safeguards are in place regarding the historic environment. For example, the outline WSIs for onshore (Document 7.9) and Marine (Document 7.13) will be key documents to ensure adequate provision for historic environment protection, mitigation and enhancement post DCO, should consent be forthcoming. These documents should form the basis of detailed WSIs to be submitted for approval to the relevant bodies and secured through the Schedule of Requirements and the Deemed Marine Licence respectively, should consent be granted. The results of archaeological work undertaken in accordance with the onshore and marine WSIs	Embedded environmental measures (C-225 and C-79 in the **Commitments Register** **[APP-254]** (updated at the Deadline 1 submission)), the **Outline Onshore Written Scheme Investigation (WSI)** **[APP-231]**, and the **Outline Marine Written Schemes of Investigation (WSI)** **[APP-235]** provide for appropriate and proportion programme of evaluation, and subsequent mitigation by avoidance/reducing effects through design and preservation by record. See response to **reference 2.33.2** above for proposed amendments to commitment C-225.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	should inform amendments to the design to avoid or mitigate harm to heritage assets. Harm to nationally important heritage assets should be avoided, if possible.	The **Outline Onshore WSI [APP-231]** and the **Outline Marine WSI [APP-235]** are secured through Requirement 19 and Condition 11 (2) Schedule 11 and 12 of the **Draft Development Consent Order [PEPD-009]** respectively, and provide the overarching approach to further evaluation and subsequent mitigation, which is to be updated in line with feedback from stakeholders, as well as embedded mitigations relevant to marine heritage receptors and detail how data will be collected and assessed to ensure that as yet undiscovered marine heritage receptors are identified. The **Outline Onshore WSI [APP-231]** and the **Outline Marine WSI [APP-235]** provide for the production of site-specific WSIs which will set out the requirements for further investigation where this has not been completed pre-DCO consent, and the results of these further investigations will underpin the subsequent design and amendments as required to avoid and/or mitigate harm to heritage assets. The Applicant will seek agreement of finalised mitigation proposals with the relevant stakeholders at this stage. Should unidentified marine heritage receptors be located during project works, a Protocol for Archaeological Discoveries (PAD) is implemented as detailed in the **Outline Marine WSI [APP-235]**. All intrusive activities undertaken during the life of the Proposed Development will be routed and microsited to avoid any identified marine heritage receptors with Archaeological Exclusion Zones. The **Outline Marine WSI [APP-235]** will be superseded by a Draft WSI and thereafter a final Agreed WSI which will take into accounts stakeholder feedback. Any archaeological campaigns undertaken will be clearly outlined in relevant method statements produced and submitted to Historic England ahead of works commencing.
2.33.8	If consent is granted, provision should be made in the Schedule of Requirements to secure avoidance and/or mitigation of harm by requiring the approval of Relevant Authorities. The scale of this project requires the collection of a significant quantity and variety of historic environment and archaeological data in a wide range of formats including digital and physical artefact resource. We recommend it should be a requirement of the DCO, should it be granted, that a project plan be approved by the LPA for a secure project archive and outreach programme, which should then be implemented to the satisfaction of the relevant authorities. For the reasons outlined above, Historic England wishes to register its interest in the examination of the Rampion 2 Offshore Wind Farm DCO.	Embedded environmental measure C-261 in the **Commitments Register [APP-254]** (updated at the Deadline 1 submission) provides for an appropriate and proportional programme of public outreach to be developed and implemented by the Applicant. Commitment C-79 provides for appropriate curation/deposition of the site archive and is secured through Requirement 19 of the **Draft DCO [PEPD-009]**. The requirement for a proportionate programme of public outreach is secured in Section 7 of the **Outline Onshore Written Scheme Investigation (WSI) [APP-231]**, which identifies possible methods of providing public outreach. Securing and treatment of a project archive is also provided for in the **Outline Onshore WSI [APP-231]**. The Applicant invites Historic England to provide specific comment/input to this document, which will be updated throughout the Examination. Site specific WSIs are required through Requirement 19 of the **Draft DCO [PEPD-009]**.

Table 4-3 Applicant's Response to National Highways [RR-263]

Ref	Relevant representation comment	Applicant's response
2.34.1	Overall, given the nature of the project and its implications for the SRN, and taking into account the processes followed and details agreed in connection with the original Rampion Project, NH believes all outstanding matters regarding Rampion 2 can be similarly resolved. However, for the purposes of the RR and PADS as set out in the Rule 9 letter, a number of matters remain unresolved. NH principal concerns requiring resolution are summarised below:	The Applicant agrees with National Highways that all outstanding matters can be resolved before the end of the Examination and will continue to work with National Highways to resolve the outstanding areas of concern.
2.34.2	NH have particular concerns and requirements in the vicinity of the A27 between Arundel and Worthing: a) The route is proposed to pass under the A27 in the area known as Hammerpot, east of Arundel Sussex which has safety and operational implications for the SRN. NH are concerned to ensure that the A27 ahead of, during and after any construction and throughout the lifetime of the project, or after it becomes redundant, remains at all times a safe, reliable part of the SRN in accordance with section 10 of the Highways Act 1980, the National Planning Policy Framework (2023) and DfT C1/22. To achieve these requirements, NH needs to receive, assess and agree a number of details, including (but not limited to) • Technical specification for all works in the vicinity of (adjacent to/ under/over) the A27 and any other NH assets. The specification must comply with the Design Manual for Roads and Bridges ('DMRB') and would also need to cover consequential aspects of the construction, such as any necessary Traffic Management and impacts on flow rates/ routing etc on the wider SRN (noting that West Sussex County Highways may also have concerns and requirements with regards any consequential effect on the local highway network). It is considered that while the original Rampion scheme successfully accomplished a pass under the A27 further east in 2018, there have been changes to regulatory requirements, technology or other factors which mean there is no guarantee that the proposed location is suitable, viable and deliverable. It may also be the case that more localised factors such as ground conditions, drainage, utilities or other assets or other environmental or other considerations could also mean that the current route cannot be delivered. • Legal framework under appropriate legislation including the Planning Act 2008 and Highways Act 1980 and covering all works in the vicinity of (adjacent to/ on/ under/ over) the A27 and any other NH assets including NH standard protective provisions to sit on the face of the DCO, requirements, side agreements where project specific protective provisions are required by the Applicant, indemnities and other relevant legal agreements where considered necessary. • Any necessary current or future financial considerations covering all works in the vicinity of (adjacent to/ on/ under /over) the A27 and any other NH assets. This could include	The Applicant is in consultation with National Highways on this section of the route and has provided further technical specifications for review. The Applicant is in negotiation with National Highways in respect of protective provisions for inclusion in the DCO and anticipates that these will be concluded within the timeframe of Examination.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	any necessary fees or payments to cover NH costs to process applications, progress any necessary legal agreements or to cover any necessary future monitoring, maintenance or other costs related to the presence of and implications of the cable or other equipment or sundry paraphernalia on the A27 or other NH assets. • Any necessary future maintenance, repair, renewal, redundancy or removal provisions covering all works in the vicinity of (adjacent to/ on/ under/ over) the A27 and any other NH assets. NH needs to fully understand the future physical or other implications of the cable route. For example, the degree to which the presence, maintenance, repair, renewal, redundancy or removal of the cable or other related, equipment or sundry paraphernalia may fetter NH ability to maintain and operate the SRN per se and this section of the A27 in particular. This will require detailed documentation setting out all the implications and any consequential financial, legal or provisions. NH considers that this is a major and significant outstanding matter, comprising a variety of interwoven work strands, needing to be resolved ahead of any decision on the DCO. NH is keen to engage with the Applicant to agree the scope of necessary submissions in order to receive and assess the Applicant's submissions through the appropriate processes.	
2.34.3	b) Traffic attracted to, generated by or routed or rerouted as a result of the proposals which has potential implications for the SRN. The Applicant has not made clear to NH the potential impact on drainage of the SRN where the route passes under the A27 at Hammerpot and whether there is an increased risk of flooding of the SRN or neighbouring highway land (including verges) which may place a risk on users of the SRN.	The traffic generated and routed as a result of the Proposed Development are considered by the Applicant in **Chapter 23: Transport, Volume 2** of the ES **[APP-064]** and **Chapter 32: ES Addendum, Volume 2** of the ES **(Document Reference: 6.2.32)** submitted at Deadline 1. The A27 is a key route for access to the Proposed Development and assessment of nine receptors on the A27 and two on the A23 has been undertaken, as stated at paragraph 23.3.47 including: • Receptor 4 – A27 west of Arundel • Receptor 9 – A27 at Arundel Railway Station • Receptor 11 – A27 south of Crossbush • Receptor 12 – A27 High Salvington • Receptor 13 – A27 / A24 Offington • Receptor 28 – A23 North of the A272 • Receptor 31 – A23 North of the A27 • Receptor 32 – A27 west of the A23 • Receptor 33 – A27 east of the A23 Based on the peak week sensitivity test include within the **Chapter 32: ES Addendum, Volume 2** of the ES **(Document Reference: 6.2.32)** (submitted at Deadline 1), the worst-case heavy goods vehicle (HGV) increase of 97 HGVs per day is predicted to occur at A27 High Salvington (receptor 12) which is equivalent to a 9.7% increase. The peak week for all construction traffic accounts for an increase in total traffic of less than 1% on all assessed receptors. It should be noted that, according to Guidelines for the Environmental Assessment of Road Traffic (GEART) (Institute of Environmental Assessment (IEA), 1993), predicted traffic flow increases below 10% are generally not considered to be significant as daily variations in

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		background traffic flow may fluctuate by this amount. The total 18-hour impact at Receptors 13, 34 and 35 are all lower than Receptor 12. The Applicant has been in contact with National Highways to discuss trenchless cable crossing under the strategic road network (SRN). The Applicant is preparing a Design Manual for Roads and Bridges (DMRB) (Standards for Highways, 2020) compliant design for the construction access junction and will progress the trenchless construction design as per the principles set out by DMRB standard CD 622. With regard to the potential impact to drainage and flooding of the SRN, a wide range of environmental measures have been embedded into the Proposed Development to minimise the risk of culvert blockage, changes in watercourse conveyance and increased surface water runoff. Environmental measures include C-28, C-73, C-130, C-133, C-135 and C-176 (provided in paragraph 7.22 of the **Commitments Register** **[APP-254]** (updated at the Deadline 1 submission) within the **Outline Code of Construction Practice** **[PEPD-033]** secured through Requirement 22 of the **Draft DCO** **[PEPD-009]**. Following the implementation of these measures, it is anticipated that there will be no significant adverse effects to the risk of flooding of the SRN or to neighbouring highway land.
2.34.4	c) The construction, operation or maintenance of a site (construction/ compound/ permanent) associated with the project adjacent to or in close proximity to the SRN which is expected to have an impact on the SRN. National Highways have engaged in and commented on the Transport Assessment ('TA) throughout the pre-submission process. While NH do not necessarily agree with all aspects of the TA, NH is content that even if it were to be amended, it would not show a materially different impact on the SRN per se (acknowledging other parties may have different views, for example with regards the local road network). At the SRN level, NH is content that the quantum of traffic generated during the construction, operation and any decommissioning of Rampion 2 would not exceed the thresholds set out in NPPF(2023) or C/122 that would warrant an objection on grounds of congestion or safety. However, at the individual SRN junction level, in the absence of detailed evidence on the type, numbers, timing and management of vehicles (including abnormal loads or other loads with particular needs or characteristics eg cable drum vehicles), NH continue to have outstanding safety concerns. For example, submission document 7.6 Outline Construction Management Plan proposes to utilise Decoy Lane accessed directly from the A27. NH has concerns with regards whether this junction can be utilised while maintaining the safety and reliability of the A27. For example, Decoy Lane is narrow and may not be able to accommodate passing vehicles. This means vehicles may block back (possibly unexpectedly) onto the A27 creating safety concerns and risks. If Decoy Lane cannot be demonstrated to be a safe means of access to the nearby compound and works areas covering quite a long length of the route, then this may have wider implications for the route and its delivery. Hence why NH consider it necessary to resolve this matter prior to the DCO decision rather than at a later date. In addition, given the outstanding details in connection with the viability of a number of sites/compounds etc accessed via the local road network (for example due to	The Applicant welcomes this relevant representation and is engaged with National Highways to resolve the various items described. Further information on use of access junctions is contained within the **Outline Construction Traffic Management Plan (CTMP)** **[PEPD-035a]** with Table 4-1 outlining the use of each access in relation to construction and operation and maintenance, whilst Tables 5-3 and 6-2 showing the heavy goods vehicle (HGV) and light goods vehicle (LGV) traffic associated with each access. Access A-20 on Decoy Lane south of the A27 will be for light construction vehicles only whilst Poling Crossroads provides routes to access A-25 to the north of the A27 and accesses A-17 and A-18 to the south of the A27. Access A-25 is for operational and light construction purposes whilst accesses A-17 and A-18 are for operational only. As defined in Section 5.6 of the **Outline CTMP** **[PEPD-035a]**, light construction accesses will only be used by only a very small number of LGVs on a very occasional basis to check progress of trenchless crossing construction work. Operational access requirements will also be minimal with scheduled maintenance of the onshore cable route required every 2-5 years generating approximately three LGVs for one day. Some unscheduled or emergency repair visits may also be required but this also typically involve a very small number of LGVs. A stage specific CTMP which accords with the **Outline CTMP** **[PEPD-035a]** will be required to be submitted and approved prior to the commencement of development in the relevant stages, in accordance with Requirement 24(1)(a) of the **Draft DCO** **[PEPD-009]**. It is therefore the Applicant's view that this level of construction traffic generation will not lead to a road safety issue on the A27 or adjacent junctions.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	uncertainty on the deliverability of accesses that comply with standards and safeguard environmental designations and considerations), NH remains uncertain of the routing and hence SRN implications of other proposed elements of the scheme. For example, other mapping from the Outline CTMP indicates potential reliance on the A27 Poling Crossroads to access various compounds. Again, given the current configuration of the junction and the narrow local road network, NH would wish to understand greater details of type, numbers, timing and management of vehicles to individual work locations and cumulatively. Without this detail it is not clear whether the proposals can be delivered without unacceptably affecting the safety of the SRN. It will also be noted that the two mapping extracts do not appear to show consistent locations for compounds/ works areas (A17-A18 south of Poling junction appears on one but not the other).	
2.34.5	d) The construction, operation or maintenance of a site (construction/ compound/ permanent) associated with the project adjacent to or in close proximity to the SRN has implications for the SRN. NH notes from the Outline CTMP (see map above) that various compounds/ work sites will be located immediately adjacent to the SRN. Some, for example, Access 21 (see extract from OCTMP below) will require works to the SRN. In the absence of further details, it is not known whether the enabling works will be possible and hence whether this site can be used as part of the project. Some, for example, Access 22 (see mapping extracts below) suggest it does not need any enabling works on the SRN, yet the project plans show part of the SRN being within the DCO red line boundary. Therefore, NH is unclear as to the meaning and intention of either inclusions or exclusions of parts of the SRN within the redline. Without the necessary clarifications it is unclear on whether the details can be agreed, including any Protective Provisions, legal or technical agreements etc. It could be that these prove not possible and hence the location of works sites or the cable route could come into doubt.	The Applicant welcomes this Representation and is engaged with National Highways to resolve the various items described. The Applicant has prepared a Design Manual for Roads and Bridges (DMRB) compliant access design for Access A-21/A-22 and has shared this with National Highways for review. It is the intention that this design will be subject to an independent Road Safety Audit so that an agreement in principle can be reached on the proposals prior to the end of the Examination. The Applicant is in discussion with National Highways as to the inclusion of protective provisions on the face of the Development Consent Order for the benefit of National Highways and the Strategic Road Network,
2.34.6	e) The need to safeguard NH interests with regards to compulsory acquisition proposals or proposals concerning the acquisition of other rights. Part of the SRN is included in the DCO red line boundary. The implications of this are unclear and need to be clarified and as appropriate included in any Protected Provisions, agreements etc.	Initial contact was made by the Applicant with the National Highways in September 2020 then continued correspondence to confirm land ownership, adopted highway designation and project requirements through to the end of October 2020. Discussions were restarted by the Applicant in June 2021 with clarification and update of project requirements, ownership, and Section 42 consultation in October 2022 through to December 2022. In October 2023, discussions were taken forward the Relevant Representations and Principal Areas of Disagreement Statement submitted to the Planning Inspectorate by the Highways Authority on 3 November 2023 with further meetings and correspondence between the parties through to December 2023. In January 2024, the Applicant contacted the Highways Authority to connect with the property team to confirm the understanding of requirements. The Applicant seeks New Rights and a Restrictive Covenant (i.e. an easement) for the construction, operation, maintenance and protection of the underground cable where it passes underneath the A27 highway (Plots 7/3, 7/5, 7/6, 7/12 and 7/13 of the **Land Plans [PEPD-003]**. Temporary possession powers are sought in relation to the construction access

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		(Plots 7/7-7/9, 7/14-7/19). No express objection which particularises any issues relating to compulsory acquisition has been raised by National Highways in their Relevant Representation. The Applicant is satisfied that protective provisions will be agreed between the Applicant and National Highways and secured in the **Draft Development Consent Order [PEPD-009]** to safeguard National Highways' interests as Strategic Highway Authority.
2.34.7	f) The need to safeguard NH interests as the Strategic Highway Authority via the DCO, Protective Provisions, Requirements or other appropriate or relevant legal agreements. Required to cover all works in the vicinity of (adjacent to/ under/over) the A27 and any other NH assets including NH land through NH standard protective provisions to sit on the face of the DCO, requirements, side agreements where project specific protective provisions are required by the Applicant, indemnities and other relevant legal agreements where considered necessary.	The Applicant is sharing further details of the works on and under the strategic road network with National Highways and are confident that detailed designs can be agreed. The Applicant is negotiating protective provisions with National Highways for inclusion on the face of the DCO and expects these to be progressed alongside detailed design work. The Applicant is confident that appropriate protections can be accommodated.
2.34.8	Protective Provisions. NH submitted a draft Protective Provisions document to the Applicant and NH understands the draft Protective Provisions have been passed to the Applicant's legal advisors for consideration and discussion with NH. Agreement to a standard Protective Provisions is essential to enable National Highways to discharge its duties under the Infrastructure Act (2015) on behalf of the Secretary of State for Transport. It is therefore requested that these Protective Provisions attached at Annex B are incorporated into the finalised DCO to afford National Highways with sufficient protection in respect of the safe operation of the SRN and its commercial position.	The Applicant is negotiating protective provisions with National Highways and are confident that appropriate protections can be accommodated.
2.34.9	We have reviewed the main submission documents that may contain information or proposals relevant to the SRN or other NH assets. Our comments on them are as follows: **APP-064 6.2.23 Environmental Statement - Volume 2 Chapter 23 Transport (plus AAP107-APP110 comprising appendices thereto)** We note the document. Our advice to the applicant throughput has been that the ES Transport Chapter should ensure that it appropriately chimes with the Transport Assessment. However, it is for those statutory consultees with specific remits regarding Environmental Statements (for example, the Environment Agency and Natural England) to comment on whether the ES Transport Chapter has met the ES transport related requirements (for example, with regards to air quality, noise, other forms of pollution, climate change etc) and then to consider whether in doing so it means it has appropriately chimed with the Transport Assessment.	The Applicant has no further comments on this matter at this time.
2.34.10	**2) APP-173 6.4.19.1 Environmental Statement - Volume 4 Appendix 19.1 Full results of construction road traffic modelling** **APP-174 6.4.19.2 Environmental Statement - Volume 4 Appendix 19.2 Full results of construction plant modelling**	The Applicant welcomes this Representation and is engaged with National Highways to resolve the various items described.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	We have no comments as such on these documents. Elsewhere we have stated that while we have commented on the Transport Assessment per se, including, modelling methodology, outputs, interpretation etc, overall, we are content that even if it had been done differently, it would have resulted in similar overall levels of traffic and general impacts on the SRN. However, as started elsewhere, we have particular concerns and requirements with regards to identified SRN junctions or site accesses, that the applicant will need to provide sufficient details for to enable NH to confirm that the proposals will not have an adverse impact on the safety, reliability and/or operational efficiency of the SRN.	
2.34.11	**3) APP-196 6.4.23.1 Environmental Statement - Volume 4 Appendix 23.1 Abnormal Indivisible Loads assessment** We have no comments as such on this high-level document. However, as indicated elsewhere in these RRs, we have concerns regarding the potential safety or operation impacts of the use by the applicant of particular SRN junctions or proposed work/ compound sites directly off the SRN. Therefore, we require (as set out elsewhere) the Applicant to provide more details with regards the need for, use/ frequency/ timing of, and management of abnormal loads in connection with various SRN junctions or proposed work/ compound sites.	The Applicant welcomes this Representation and is engaged with National Highways to resolve the various items described.
2.34.12	**4) APP-197 6.4.23.2 Environmental Statement - Volume 4 Appendix 23.2 Traffic Generation Technical Note** We note that the document does not include text referring to or demonstrating compliance with DfT C1/22. However, as stated elsewhere, given the nature of the project with most transport implications arising from the construction and/or decommissioning stages, and given the outline and later required detailed Travel Plans, we are content that the project should be able to, in practice, comply with C1/22 in terms of encouraging active and sustainable travel. With regards other matters covered in the document, as stated elsewhere, our concerns and requirements relate to the specifics of a few SRN junction and access points rather than the overall and generalized traffic impacts, that we require the applicant to address into order to demonstrate their compliance with national transport policy.	The Applicant welcomes this Representation and is engaged with National Highways to resolve the various items described.
2.34.13	**5) APP-224 7.2 Outline Code of Construction Practice** We have no comments as such on this high-level document. However, as indicated elsewhere in the RRs, we have concerns and requirements regarding the potential safety or operation impacts of the use by the applicant of particular SRN junctions or proposed work/ compound sites directly off the SRN. We also have particular concerns with regards the proposed works in the vicinity of (near to/ under/ on /over) A27 at Hammerpot. It would appear most likely that our general concerns and requirements will need to be addressed via either additional detail in or an addendum to the Outline Construction Traffic Management Plan, while the Hammerpot detail will need to be addressed via either additional detail in or an addendum to the Outline Code of Construction Practice.	The Applicant welcomes this Representation and is engaged with National Highways to resolve the various items described.

Ref	Relevant representation comment	Applicant's response
2.34.14	**6) APP-228 7.6 Outline Construction Traffic Management Plan** We have no comments as such on this high-level document. However, as indicated elsewhere in the RRs, we have concerns and requirements regarding the potential safety or operation impacts of the use by the applicant of particular SRN junctions or proposed work/ compound sites directly off the SRN. It would appear most likely that our concerns and requirements will need to be addressed via either additional detail in or an addendum to the Outline Construction Traffic Management Plan.	The Applicant welcomes this Representation and is engaged with National Highways to resolve the various items described.
2.34.15	**7) APP-229 7.7 Outline Construction Workforce Travel Plan** We have no comments as such on this high-level document. However, as indicated elsewhere in the RRs, we have concerns and requirements regarding the potential safety or operation impacts of the use by the applicant of particular SRN junctions or proposed work/ compound sites directly off the SRN. It would appear most likely that our concerns and requirements will need to be addressed via either additional detail in or an addendum to the Outline Construction Traffic Management Plan	The Applicant welcomes this Representation and is engaged with National Highways to resolve the various items described.

Table 4-4 Applicant's Response to UK Health Security Agency [RR-047]

Ref	Relevant representation comment	Applicant's response
2.36.1	Thank you for your consultation regarding the above development. The UK Health Security Agency (UKHSA) welcomes the opportunity to comment on your proposals at this stage of the project. Please note that we request views from the Office for Health Improvement and Disparities (OHID) and the response provided is sent on behalf of both UKHSA and OHID. We can confirm that: With respect to Registration of Interest documentation, we are reassured that earlier comments raised by us on 31 July 2020 have been addressed. In addition, we acknowledge that the Environmental Statement (ES) has not identified any issues which could significantly affect public health. Following our review of the submitted documentation we are satisfied that the proposed development should not result in any significant adverse impact on public health. On that basis, we have no additional comments to make at this stage and can confirm that we have chosen NOT to register an interest with the Planning Inspectorate on this occasion.	The Applicant welcomes the Relevant Representation **[RR-047]** from the UK Health Security Agency's including the acknowledgement that the comments raised on 31 July 2020 have been addressed and that the Proposed Development will not result in any significant effects on public health.

© WSP Environment & Infrastructure Solutions UK Limited

Table 4-5 Applicant's Response to National Grid Electricity Transmission PLC [RR-032]

Ref	Relevant representation comment	Applicant's response
2.37.1	NGET's rights of access to inspect, maintain, renew and repair such apparatus must also be maintained at all times and access to inspect and maintain such apparatus must not be restricted. Further, where the Applicant intends to acquire land or rights, or interfere with any of NGET's interests in land or NGET's apparatus, NGET will require appropriate protection and further discussion is required on the impact to its apparatus and rights. Further detail is set out below. NGET infrastructure within/in close proximity to the proposed Order Limits NGET owns or operates the following infrastructure within or in close proximity to the proposed Order Limits for the Project: Electricity Transmission NGET owns a 400 kV substation and multiple high voltage electricity overhead transmission lines within or in close proximity to the proposed Order Limits. These assets form an essential part of the electricity transmission network in England and Wales. The details of the electricity assets are as follows: Substations Bolney 400 kV Substation Assets within the DNO's Bolney 132 kV Substation Associated cables and apparatus Overhead Lines 4VM 400 kV OHL Bolney – Ninfield 1 Bolney – Ninfield 2 4VF 400 kV OHL Bolney – Lovedean 1 Bolney – Lovedean 2 Associated cable fibre As a responsible statutory undertaker, NGET's primary concern is to meet its statutory obligations and ensure that any development does not impact in any adverse way upon those statutory obligations.	The Land interests owns and operates the existing 400 kV National Grid Bolney substation and multiple high voltage electricity overhead transmission lines within or in close proximity to the Proposed Development. There are further land interests along the proposed onshore cable installation route affected. Focussing upon the Land Interest's freehold ownership at Bolney the existing 400kV National Grid Bolney substation is enclosed by a security fence which the Applicant understands defines the operational land. This land, comprising Plots 34/29, 34/30, is included in the Order Limits for the purposes of Work No 20 but is not subject to Powers of Compulsory Acquisition or Temporary Use. The Land Interest also owns land outside of the security fence which is pasture land, Plot 34/28 of which is proposed to be acquired permanently for the extension to the Bolney substation (work no 20). The Land Interest's plots at Bolney which are required for the permanent and temporary works are shown on Sheets 32, 33 and 34 of the **Onshore Works Plans [PEPD-005]. D**etails of the proposals as they affect the Land Interest at Bolney are shown on Sheets 32, 33 and Sheet 34 of the **Onshore Works Plans [PEPD-005]**. The Land outside of the NGET operational land at Bolney is impacted by the Proposed Development as follows: • the onshore connection works - Works no. 19 for the cable construction and easement; • proposed Bolney Extension Works (Plot 34/28) which would form permanent infrastructure – Works no. 20; • Construction access – Works no. 13 temporary possession powers are required outside the substation operational perimeter fence (Plots 34/15, 34/33, 34/35. 34/36 and 34/37 for an access to build the permanent Bolney extension infrastructure; • Construction compound – (Plots 33/13) Works no. 10 temporary possession powerspowerts are required outside of the perimeter fence for a compound to build the permanent extension infrastructure; • Operational access at the entrance to the existing National Grid Bolney substation - Works no. 19 (Plot 34/25); and • Environmental mitigation – land to the south of the existing National Grid Bolney substation extension Works no. 17. (Plots 34/26 and 34/27) The Applicant has been in regular correspondence with the Land Interest concerning the impacts of the project on its landholding since June 2021. The Applicant visited the proposed location of the cable construction corridor in February 2023 to undertake buried services and other surveys on the area. Since then, the Applicant has had regular contact with the Land

Ref	Relevant representation comment	Applicant's response
	As such, NGET has a duty to protect its position in relation to infrastructure and land which is within or in close proximity to the draft Order Limits. As noted, NGET's rights to retain its apparatus in situ and rights of access to inspect, maintain, renew, repair and refurbishment such apparatus located within or in close proximity to the Order Limits should be maintained at all times and access to inspect and maintain such apparatus must not be restricted. NGET will require protective provisions to be included within the draft Development Consent Order (the "Order") for the Project to ensure that its interests are adequately protected and to ensure compliance with relevant safety standards. NGET is liaising with the Applicant in relation to such protective provisions, along with any supplementary agreements which may be required. NGET requests that the Applicant continues to engage with it to provide explanation and reassurances as to how the Applicant's works pursuant to the Order (if made) will ensure protection for those NGET assets which will remain in situ, along with facilitating all future access and other rights as are necessary to allow NGET to properly discharge its statutory obligations. NGET will continue to liaise with the Applicant in this regard with a view to concluding matters as soon as possible during the DCO Examination and will keep the Examining Authority updated in relation to these discussions.	Interest's multi-aspect team, most recently via online meetings in November and December 2023. NGET have been willing to engage with the Applicant and have supported project assumptions through an open and constructive dialogue. Teams which have been engaged with are; UK Land and Property, Customer Connections and Asset Protection Teams. Through this regular dialogue, critical information is shared, and this information will inform the necessary agreements to the satisfaction of both parties. The Applicant is in negotiation with NGET in respect of protective provisions for inclusion in the Development Consent Order and anticipates that these will be concluded within the timeframe of examination. The Applicant is continuing discussions to agree a Statement of Common Ground with NGET and will be looking to resolve matters before the end of Examination. SOCG
2.37.2	Compulsory Acquisition Powers in respect of the Project NGET objects to the compulsory acquisition of its land or rights over its land in the absence of an agreed form of Protective Provisions. As noted, NGET's rights to retain its apparatus in situ and rights of access to inspect, maintain, renew, repair and refurbishment such apparatus located within or in close proximity to the Order Limits should be maintained at all times and access to inspect and maintain such apparatus must not be restricted. NGET will require protective provisions to be included within the draft Development Consent Order (the "Order") for the Project to ensure that its interests are adequately protected and to ensure compliance with relevant safety standards. NGET is liaising with the Applicant in relation to such protective provisions, along with any supplementary agreements which may be required. NGET requests that the Applicant continues to engage with it to provide explanation and reassurances as to how the Applicant's works pursuant to the Order (if made) will ensure protection for those NGET assets which will remain in situ, along with facilitating all future access and other rights as are necessary to allow NGET to properly discharge its statutory obligations.	The Applicant is engaged in discussions with NGET to agree suitable arrangements in respect of property rights. Heads of Terms (HoTs) for a deed of easement for the cable installation within NGET owned land and a lease of the Bolney substation extensionland were issued in November 2023 and the land agent acting for NGET has confirmed that the Land Interest would like to work collaboratively with the Applicant and in principle agreed to the structure of agreements proposed subject to NGET approval. NGET subsequently issued a NGET deed of easement HoTs which the applicant understands is based on NGET standard documentation. At this stage, The Applicant remains of the view that a lease is required for the Bolney substation extension with associated construction access and compound rights which NGET is considering, however discussions on the structure of the agreement are ongoing.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
	NGET will continue to liaise with the Applicant in this regard with a view to concluding matters as soon as possible during the DCO Examination and will keep the Examining Authority updated in relation to these discussions.	
2.37.3	**Connections** The Project proposes a connection to Bolney 400 kV Substation. In relation to the connection NGET is working with the Applicant to enter into connection agreements and other commercial arrangements at the relevant time. Further updates will be provided in the Statement of Common Ground.	The Applicant is in discussions with NGET and awaits a design proposal for consideration in March 2024.

Applicant's Response to Natural England [RR-265]

4.1.1 Natural England has submitted a Relevant Representation (RR-265) which includes a cover letter that provides a summary of the legislative and policy framework, Natural England's approach to Relevant Representations and Written Representations, and overview on designated sites affected by the DCO Application, their overall position, a summary of key environmental concerns, and a summary of overarching comments on the DCO Application. Supporting the cover letter, Natural England has provided 11 appendices (Appendix A to K) which provide the more detailed commentary and explanation of key issues. These appendices cover Natural England's representations which are summarised in the cover letter and therefore, the Applicant acknowledges the information contained within the cover letter and has provided detailed responses to each of Natural England's appendices in the tables below.

- **Table 4-6 Applicant's Response to Natural England - Appendix A (Development Consent Order, Deemed Marine Licence)**
- **Table 4-7 Applicant's Response to Natural England - Appendix B (Offshore and Intertidal Ornithology)**
- **Table 4-8 Applicant's Response to Natural England - Appendix C (Marine Mammals)**
- **Table 4-9 Applicant's response to Natural England - Appendix D (Coastal Processes)**
- **Table 4-10 Applicant's response to Natural England - Appendix E (Fish and Shellfish Ecology)**
- **Table 4-11 Applicant's response to Natural England - Appendix F (Benthic, Subtidal and Intertidal Ecology)**
- **Table 4-12 Applicant's response to Natural England - Appendix G (Other plans)**
- **Table 4-13 Applicant's Response to Natural England - Appendix H (Landscape and Visual Impact)**
- **Table 4-14 Applicant's response to Natural England - Appendix I (Seascape, Landscape and Visual Impact)**
- **Table 4-15 Applicant's response to Natural England - Appendix J (Terrestrial Ecology and Nature Conservation)**

© WSP Environment & Infrastructure Solutions UK Limited

Table 4-6 Applicant's Response to Natural England - Appendix A (Development Consent Order, Deemed Marine Licence)

Ref	Section	Natural England's Comment	RAG	Recommendations	Applicant's Response
Summary of Main Issues					
A1		We are concerned that there is a risk that the In Principle Sensitive Features Mitigation Plan (IPSFMP) (Schedule 11 Part 2 Condition 21 (b)) may not deliver sufficient mitigation, with regards to spatial and temporal piling activity restrictions		We advise that a full piling exclusion March-July inclusive should be included in relation to black seabream as a feature of Kingmere Marine Conservation Zone (MCZ) (Schedule 11 Part 2 Condition 11(1)(k)).	The Applicant is not currently in agreement with Natural England on this issue. Please refer to the Applicant's responses in **Table 4-11 Natural England - Appendix E – Fish and Shellfish Ecology** (below).
A2		We advise that a period of four months is insufficient for approval of some documentation as detailed in Schedule 11 Part 2 Condition 12 (1).		We request that this be amended to a period of no less than six months, in line with the recently agreed period for some conditions during the Examination of the Dudgeon and Sheringham Shoal Extensions Project	As the project comprises a nationally significant infrastructure project it is necessary for there to be a degree of certainty as to the programme for its delivery, particularly given the need for the project to contribute to the Government achieving its net zero target. Four months is considered an appropriate period for the approval of submitted details. However, the applicant is willing to work with the Natural England and the MMO to identify any approvals which require a longer determination period.
A3		We advise that there is a lack of clarity and several omissions to the pre- construction monitoring and survey proposals relating to side scan sonar, benthic ecology features, ornithology features and marine mammals (Schedule 11 Part 2 Condition 16). Therefore, we advise that the relevant condition needs to be amended.		We advise that this condition is updated in line with our comments.	The condition has been amended in the **Draft Development Consent Order (DCO) Revision B (Clean)** [PEPD-009], submitted at Procedural Deadline A.
A4		We note that the construction monitoring plan (Schedule 11 Part 2 Condition 17) does not cover the required construction piling monitoring. Nor does it allow for a halt to works should the noise be significantly in excess of that predicted within the ES.		We advise this is amended to include appropriate during construction monitoring requirements.	It is proposed that monitoring should be undertaken in respect of the first four piled foundations of each piled foundation type piles as provided in the in the **Offshore In Principal Monitoring Plan [APP-240]** submitted as part of the application documents, and with which the construction phase monitoring plan is to accord (pursuant to conditions 11(1)(j) and 17). No further monitoring is considered necessary based on the assessment of predicted effects.
A5		We note that an Outline Kittiwake Implementation and Monitoring Plan (KIMP) has		We advise this should contain a draft compensation schedule to demonstrate how the compensation measures will be secured.	The draft compensation schedule was erroneously omitted from the DCO Application submission, the document has now been

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comment	RAG	Recommendations	Applicant's Response
		been submitted with the without prejudice derogation case.			submitted to the Examination at Pre Examination Procedure Deadline (16 January 2024), see **Alternative Schedule 17** **[PEPD-017]**.
A6		We also advise that there are a number of seascape commitments and design principles that have not been included.		We advise that once agreed, these should be specifically secured in the Development Consent Order.	The Applicant will continue to work with stakeholders throughout the Examination period to agree additional seascape commitments and design principles, where appropriate, these will be secured through the Development Consent Order.
Document used: [APP-019] 3.1 Draft Development Consent Order					
A7	Part 1, Para 2 Interpretations	We note that no interpretation is provided to define the Relevant Statutory Nature Conservation Body. We advise that, for consistency with other Development Consent Orders (DCOs) and to future proof the DCO against any potential changes, a definition of Relevant Statutory Nature Conservation Body should be provided, and references to Natural England throughout the document replaced with Relevant Statutory Nature Conservation body.		We advise that the DCO is amended to include the appropriate definition and wording. Natural England advise that similar wording that was used in the recent East Anglia 2 DCO.	In the updated **Draft DCO** **[PEPD-009]** submitted at Procedural Deadline A the term Statutory Nature Conservation Body has been defined in article 2 and the deemed marine licences, and references to Natural England in the requirements and the conditions of the deemed marine licences have been updated to use the defined term
A8	Para 1, Para 2 Interpretations Page 8	We note that there is no definition here of the Outline Offshore Operations and Maintenance plans (OOOMP) (document 7.16). The document is also not listed under Schedule 16. The definition of 'maintain' should link not only to the Environmental Statement (ES) but also to the OOOMP, The OOOMP takes the detail from the ES to provide the clear scope for operations and maintenance activities considered under the Deemed Marine Licence (dMLs).		Given the OOOMP defines the scope of operations and maintenance permitted under the DCO/dMLs, we advise this document is included within the definitions and the Schedule 16 list of documents. We advise that the definition of 'maintain' should also include the extent assessed in the environmental statement and defined in the OOOMP. This will make the extent of Operations and Maintenance clear and reduce the potential for misunderstanding during the long operations and maintenance period. Please note that, due to the length of this period, the individuals involved from all parties will change a number of times, and there is significant benefit to having a simple small defined document to cross reference ongoing operations and maintenance requests against.	It is agreed that the **Outline Offshore Operations and Maintenance Plan** **[APP-238]**; (OOMP) should be referenced in the **draft DCO** **[PEPD-009]** and included in Schedule 16. This will be addressed at the next revision to the draft DCO at Deadline 2. The **OOMP** **[APP-238]** will also be updated at this stage including to clarify the condition of the deemed Marine Licences pursuant to which the final document is to be submitted.
A9	Schedule 1 Part 3 para 2 (5) (c) Page 53	Natural England notes that the DCO only provides for a maximum volume of scour protection, while the ES parameters document provides both a maximum volume and area of scour protection. We advise that, given the area of impact is one of the most important factors to be controlled, it should also be provided for here.		We advise the applicant updates these requirements to list the maximum extent of scour protection per turbine/substation and a maximum total.	The **Draft DCO** **[PEPD-009]** has been updated at Procedural Deadline A to include reference to the maximum area of scour protection of for the wind turbines and offshore substations at paragraph 2(6) which already dealt with volume; paragraph 5(c) deals with monopile foundations..

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comment	RAG	Recommendations	Applicant's Response
		Natural England notes that requirement 4 also only lists a maximum volume, and we advise this should also provide a maximum area of scour protection.			The scour protection and cable protection plan, to be approved in accordance with condition 11(1)(i) of the deemed marine licences at Schedules 11 and 12 to the DCO will control this further at detailed design stage.
A10	Schedule 1 Part 3 para 14 (1) Page 56	This requirement relates to the approval of the Biodiversity Net Gain (BNG) strategy. The wording does not contain a requirement to consult the relevant statutory nature conservation body on this strategy.		We advise the wording is updated to include a requirement to consult the relevant statutory nature conservation body prior to the approval of an BNG strategy.	Requirement 14 in the **Draft DCO** **[PEPD-009]** has been amended to secure that the BNG strategy is submitted to and approved by the relevant planning authority in consultation with the statutory nature conservation body.
A11	Schedule 1 Part 3 general point	Natural England notes that this condition relies on a requirement for a landscape and ecology management plan, based on the outline plan. Natural England advises that you refer to our terrestrial ecology and landscape advise in relation to our concerns regarding this outline plan		We advise that the outline plan is revised to account for terrestrial ecology and landscape advise provided.	Please see responses in relation to ecology and landscape. To the extent that the plan is updated this will be reflected in the DCO by a change in the version referenced in schedule 16.
A12	Schedule 1 Part 3 general point	Natural England notes there is no requirement providing for the surveying for European Protected Species onshore and preventing commencement of works until these surveys are completed. This is a standard DCO requirement and should be included to ensure protection of important species		We advise that the DCO is updated to include the appropriate requirement and recommend that the wording used in the most recent Dudgeon and Sheringham Extension Projects DCO is considered.	The **Outline Code of Construction Practice** **[APP-224]** secures the commitment to pre-commencement surveys for European Protected Species and Protected Species. This is detailed in in **Table 5-5** for reptiles [C-208], badgers [C-209], water vole and otter [C-210], bats [C-211], GCN [C-214] and dormouse [C-232]. Additional description of management measures related to these species is provided in **paragraphs 5.6.47 to 5.6.68** and commitment to securing licences where necessary. Requirement 22 secures submission of detailed codes of construction practice which accord with the outline document for each stage of the onshore works
A13	Schedule 11 and 12 interpretations	We advise that our comments provided above on interpretations (Part 1, Para 2 Interpretations) also apply to the interpretations provided within Schedule 11 and 12 of the deemed Marine Licences.		We advise that the wording is amended as appropriate	The changes made to Schedule 11 have also been made to Schedule 12 of the **draft DCO** **[PEPD-009].**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comment	RAG	Recommendations	Applicant's Response
A14	Schedule 11 Part 2 Conditions 1-2 Page 115-116	Natural England notes there is no condition limiting the maximum hammer energy. Given the environmental sensitivities of the area, particularly black bream, we advise that the upper limit of hammer energy for each foundation option is an important part of the projects Rochdale Envelope and should be defined to ensure it is not exceeded. This should be in line with the maximum hammer energies defined in the ES.		We advise that the condition is amended to include a maximum hammer energy. Wording similar to that used on Dudgeon and Sheringham Extension DCO would be appropriate to include in this.	Condition 11(1)(c) of the deemed marine licence at Schedules 11 and 12 to the **draft DCO [PEPD-009]** requires the Applicant to submit and secure approval for a construction method statement in accordance with the construction methods assessed in the environmental statement. These assessed methods include piling. The condition has been amended in the **draft DCO [PEPD-009]** to confirm that the construction method statement must include details of piling methods for approval and therefore the submission and approval of this document will deal with the maximum hammer energies and ensure that they do not exceed with those assessed in the ES. Condition 12 requires that the authorised scheme must be carried out in accordance with the approved documents. Consequently, it is not necessary to include a condition specifically limiting hammer energies to protect the sensitive species
A15	Schedule 11 Part 2 Condition 2 (6) Page 116	Natural England notes that the consent allows for deployment of cable protection up to 15 years from the date of the order. Our advice is this should be 10 years from the commencement of operations, as this is the maximum scope that we can support outside of designated sites. We also note that the wording used may give the Applicant less time to deploy cable protection if the project suffers a delay in the start of works or during construction.		We advise that this wording is amended	The condition has been amended in the updated **draft DCO [PEPD-009]** to allow cable protection to be deployed over a period of 10 years as requested. The trigger for the 10 year period is commencement of the authorised scheme, as the term 'commencement of operations' is not used in the Proposed Development draft DCO.
A16	Schedule 11 Part 2 Condition 3 (1) Page 121	Natural England notes that the wording here is to supply an operations and maintenance plan. However, it does not require that the plan submitted be in accordance with the OOOMP. Please see our above comments regarding the inclusion of the OOOMP within interpretations and definition of 'maintain'.		We advise the condition is amended to ensure the maintenance plan is in accordance with the OOOMP.	As noted above, it is agreed that the **Outline Offshore Operations and Maintenance Plan (APP-238; OOMP)** should be referenced in the **draft DCO [PEPD-009]** and included in Schedule 16. This will be addressed at the next revision to the draft DCO at Deadline 2. The **OOMP [APP-238]** will also be updated at this stage including to clarify the condition of the deemed Marine Licences pursuant to which the final document is to be submitted.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comment	RAG	Recommendations	Applicant's Response
A17	Schedule 11 Part 2 Condition 11 (1) (a) Page 121	Natural England notes that the standard micro-siting requirement has been omitted. The requirement here refers to avoiding historic receptors only. While we note there is a specific requirement later to cover the avoidance of chalk, other features of ecological importance, such as *Sabellaria* reef features, should be provided for within the conditions		We advise this condition is amended.	Condition 11(1)(a) of Schedules 11 to the **draft DCO [PEPD-009]** has been amended to remove the reference to specific for historic receptors and instead a new limb has been added to provide for micrositing required for other sensitive receptors at condition 11(1)(a)(v) added.
A18	Schedule 11 Part 2 Condition 11 (1) (c) (v) page 148 and page 121	Natural England notes that the wording here states 'cable routing to ensure micrositing and where possible to avoid subtidal chalk features and areas which have potential to support black seabream nesting'. We advise that this commitment does not include all sensitive ecological features. We advise it should be amended in line with our advice on the benthic ecology chapter. We advise that key omissions are Sabellaria spinulosa reef, peat and clay exposures, and Stony/cobble reef.		We advise this condition is amended in line with out comments on the benthic ecology chapter.	As with condition 11(1)(a) the text of condition 11(1)(c) has been broadened in the **draft DCO [PEPD-009]** to include reference to any exclusion zones/environmental micrositing requirements for cable routing rather than setting out a list of sensitive receptors
A19	Schedule 11 Part 2 Condition 16 (2) (a)	We advise this condition should specify side scan sonar.		We advise this condition is amended.	Condition 16(2)(a) has been amended to include side scan sonar in the **draft DCO [PEPD-009].**
A20	Schedule 11 Part 2 Condition 16 (2) (b)	We advise that this should also include Peat and Clay exposures in line with our benthic comments		We advise this condition is amended	The purpose of the surveys has been expanded in condition 16(2)(b) of the **draft DCO [PEPD-009]** to include the location, extent and composition of peat and clay exposures.
A21	Schedule 11 Part 2 Condition 21 (b) – Piling Schedule 11 Part 2 Condition 11 (1) (k)	We advise that there is a risk that the In Principle Sensitive Features Mitigation Plan (IPSFMP) may not deliver sufficient mitigation. In line with our comments on the ES and MCZ Assessment, we advise that a full piling exclusion March-July inclusive is included in relation to black seabream as a feature of Kingmere MCZ.		Based on the evidence provided to date we advise that a full seasonal pilling restriction is included in the DCO.	As noted above, the Applicant is not currently in agreement with Natural England on this issue. The IPSFMP is already required to include spatial and temporal restrictions on piling activities.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comment	RAG	Recommendations	Applicant's Response
A22	Schedule 11 Part 2 Condition 12 (1) Page 123	Given the increase in size and complexity of offshore wind farm construction, Natural England considers that a period of four months is insufficient for approval of some documentation. We request this is amended to a period of no less than 6 months.		We advise the condition is amended to provide 6 months. Natural England notes that for the Dudgeon and Sheringham Extension Project, a 6-month period was agreed for some conditions. We would be willing to engage with the Applicant and the Marine Management Organisation (MMO) to potentially come to a similar agreement.	As noted above, four months is considered an appropriate period for the approval of submitted details. However, the applicant is willing to work with Natural England, and the MMO, to identify any approvals which require a longer determination period.
A23	Schedule 11 Pat 2 condition 16 and 18 general point	We note that no monitoring has been included in relation to marine mammals. We refer you to our marine mammals' comments, where we have discussed this point.		We refer you to our comments on marine mammals and advise you to update accordingly.	Marine mammal monitoring is to be undertaken for the first four piles in accordance with the **Draft Piling Marine Mammal Mitigation Protocol [APP-236]** (and the detailed protocol which must accord with this document and is to be submitted and approved in accordance with condition 11(1)(l) of the deemed marine licence). No other monitoring is proposed as the outcome of the assessment is that no significant effects are predicted to occur.
A24	Schedule 11 Part 2 Condition 17 Page 125	Natural England notes the wording here does not cover the required during construction piling monitoring. Nor does it allow for a halt to works should the noise be significantly in excess of that predicted within the ES. Given the environmental sensitivities of the area, we request that this monitoring and the stop requirement be appropriately secured, as it has been in all previous Offshore Wind Farm DCOs.		We advise that this is amended to include appropriate during construction monitoring requirements. Natural England suggests wording similar to the Dudgeon and Sheringham Extension Project DCO is used.	It is proposed that monitoring should be undertaken in respect of the first four piled foundations of each piled foundation type as provided in the in the **Offshore In Principal Monitoring Plan [APP-240]** submitted as part of the application documents, and with which the construction phase monitoring plan is to accord (pursuant to conditions 11(1)(j) and 17). No further monitoring is considered necessary based on the assessment of predicted effects.
A25	Schedule 11 Part 2 Condition 18	We advise that post consent monitoring is not limited to Sabellaria *spinulosa* reef and black seabream. This should be updated in line with our benthic and fish and shellfish comments. We also refer you to our comment on marine mammal monitoring		We advise this is amended in line with our advice on these topics.	It is proposed that monitoring should be undertaken as provided in the in the **Offshore In Principal Monitoring Plan [APP-240]** submitted as part of the application documents with the final monitoring plan secured through condition 11(1)(j) of the deemed Marine Licences at Schedules 11 and 12 of the DCO. No additional monitoring is considered necessary as a result of the outcome of the environmental impact assessment.
A26	Schedule 12 General point	We advise that all points raised above on Schedule 11 are applicable to Schedule 12 where similar provisions exist. To ensure brevity, Natural England will not repeat our comments.		We advise points raised in Schedule 11 should also be addressed in Schedule 12.	Where changes to the **draft DCO [PEPD-009]** are agreed above they have been made to Schedule 12 as well as Schedule 11 as appropriate.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comment	RAG	Recommendations	Applicant's Response
A27	General Comment	We note that no compensation provisions or schedules are provided. We advise that, based on our comments on the ornithology thematic area, this is likely to be required.		We refer you to our comments on ornithology and request this is updated accordingly.	The compensation schedule was omitted from the DCO application submission in error. This has now been submitted to the Examination on a without prejudice basis- see **Alternative Schedule 17 [PEPD-017].** .
A28	General Comment	Natural England notes that an Outline Kittiwake Implementation and Monitoring Plan (KIMP) has been submitted to provide for compensation on a without prejudice basis.		The outline KIMP should be updated to contain a draft compensation schedule to demonstrate how the compensation measures will be secured.	As noted above a compensation schedule has now been submitted to the Examination on a without prejudice basis - see **Alternative Schedule 17 [PEPD-017].**
A29	General Comment	In relation to impacts on seascape, there are a number of commitments and design principles. We advise that once agreed upon, we would expect to see these specifically secured in the DCO.		We advise that agreed commitment and design principles are included in the DCO.	The Applicant will continue to work with stakeholders throughout the Examination period to agree additional seascape commitments and design principles. Where agreed these will be secured through the Development Consent Order.

© WSP Environment & Infrastructure Solutions UK Limited

Table 4-7 Applicant's Response to Natural England - Appendix B (Offshore and Intertidal Ornithology)

Ref	Section	Natural England Comments	RAG	Recommendations	Applicant's Response
B1	Identified Impacts	For several species, the breeding season impacts of other projects have not been included in the cumulative assessment. The Applicant has not given justification for this decision.		Impact figures for all relevant projects for all seasons should be included in the cumulative assessment.	As discussed previously with Natural England and presented within Chapter 12: Offshore and intertidal ornithology of the Preliminary Environmental Information Report[2] (PEIR), a regional approach was taken to breeding season cumulative assessments due to the discrete location within the English Channel. No issues were flagged by Natural England with regard to this approach within the Section 42 responses, therefore this approach was kept consistent for **Chapter 12: Offshore and intertidal ornithology, Volume 2** **[APP-053]**. In the PEIR, no cumulative assessment was presented for herring gull due to the limited potential effect from the project alone. Following review of the PEIR chapter, Natural England requested inclusion of a cumulative assessment for herring gull. For ES submission, cumulative assessment of herring gull was assessed and presented as requested within **Chapter 12: Offshore and intertidal ornithology, Volume 2** **[APP-053]**. However, due to a change in Natural England's best practice guidance (Parker et al., 2022) between drafting of the PEIR and ES, the decision was made to present the cumulative herring gull breeding season impacts for all projects within the UK North Sea and Channel Biologically Defined Minimum Population Scales (BDMPS) as recommended in the latest guidance, rather than a regional approach as was agreed appropriate with Natural England for other cumulative assessments.
B2	Cumulative Effect Assessment Conclusions	Natural England does not agree with Applicant's view that the cumulative effects on great black-backed gull are not significant.		Natural England advises that there is evidence to suggest that the cumulative impact on great black-backed gull is moderate adverse at the EIA scale, and therefore the Applicant should carefully consider whether there are ways to mitigate this effect without negatively impacting on other receptors (e.g. seascape impacts).	In accordance with Natural England's recommendations, the Applicant will undertake further consideration of the potential impact on great black-backed gull from the project alone and cumulatively. This will include further refinement of potential connectivity between the UK great black-backed gull population and the project, spatial usage of the project area by great black-backed gulls and if necessary, and feasible, potential mitigation options to further reduce predicted impacts levels. This information will be presented within **Appendix 19 - Great Black-Backed Gull Assessment Sensitivity** **(Document reference 8.31.19)** submitted at Deadline 1.
Habitats Regulations Assessment					
B3	Assessment -	Natural England does not agree with the Applicant's conclusion that there is no increased risk of Adverse		We note that the Applicant has	The Applicant is continuing to progress a collaborative approach to deliver additional nest spaces on an Artificial Nesting Structure (ANS)

[2] https://rampion2.com/wp-content/uploads/2021/07/Rampion-2-PEIR-Volume-2-Chapter-12-Offshore-ornithology.pdf

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England Comments	RAG	Recommendations	Applicant's Response
	Kittiwake in-combination at Flamborough and Filey Coast (FFC) Special Protection Area (SPA).	Effect on Integrity (AEOI) for kittiwake at Flamborough and Filey Coast (FFC) Special Protection Area (SPA). This site has already reached AEoI for this species, and therefore even small increases could have the potential to act in-combination. Prior to the Hornsea 3 OWF decision (which required compensatory measures), in-combination impacts had already reached a level where an AEOI could not be ruled out. As a result, particularly when considered with impacts from other soon-to-be submitted OWF proposals, additional impacts from Rampion 2 risk furthering the adverse effect.		already submitted a without-prejudice derogations case for compensation for kittiwake at FFC, which is welcomed. At present, Natural England considers a collaborative approach with other developers to deliver additional nest spaces on an Artificial Nesting Structure (ANS) is the most promising option, though further detailed information is required before the measure can be considered secured. Please see our Detailed Comments for Natural England's advice on the derogations case.	and have submitted a letter of intent signed by the Dogger Bank South Wind Farms project (see **Cover Letter** submitted with the Applicant's Pre Examination Procedural Deadline Submission **[PEPD-001]**) confirming their intention to participate in such a collaborative approach to the Examining Authority. The Applicant welcomes further comments from Natural England on this proposal, in the event that a AEoI cannot be ruled out.
B4	Assessment - Guillemot and Razorbill in-combination assessment – Flamborough and Filey Coast SPA	The Applicant has not carried out a thorough in-combination assessment for guillemot and razorbill for FFC SPA. The Applicant states that the project-alone impacts are so small that they do not make a material contribution towards AEoI. At the Hornsea 4 Examination, NE advised that AEoI could not be ruled out for these two species in-combination with other plans and projects, and there is the potential for effects from Rampion 2 to combine with those from projects likely to be submitted in the near future. Therefore, the effects of Rampion 2 in-combination with other projects should be properly considered, rather than just assuming the contribution is not material.		The Applicant should carry out a full in-combination assessment of impacts for guillemot and razorbill at FFC SPA, to allow NE to advise further regarding the risks of adverse effects in-combination	As presented within Table 7-10 of the **Report to Inform Appropriate Assessment** **[APP-038]**, based on the Applicant's approach to assessment of both auk species the level of impact apportioned to the qualifying auk features of the FFC SPA was approximately a single breeding adult per annum. When considering the level of potential effect, likely potential connectivity between the project and the SPA and the favourable status of the two auks at the SPA, the Applicant concluded that the potential for an impact of approximately a single additional breeding adult per annum could confidently be concluded as a non-material contribution to any in-combination assessment. However, the Applicant acknowledges Natural England's request and will proceed to undertake an updated in-combination assessment for the requested sites and features to be submitted at Deadline 1 - **Appendix 14 - In Combination Assessment Update for Guillemot and Razorbill** **(Document reference 8.31.14)**.
B5	Assessment - Guillemot in-combination assessment – Farne Islands SPA	The Applicant has not carried out a thorough in-combination assessment for guillemot for the Farne Islands SPA. Natural England advised Marine Scotland that the Berwick Bank OWF that adverse effects on the Farne Islands SPA could not be ruled out due to impacts on guillemot from that project alone, and other consented /proposed projects could also impact the site. Therefore, there is the potential for effects from Rampion 2		The Applicant should carry out a full in-combination assessment of impacts for guillemot at the Farne Islands SPA, to allow NE to advise further regarding the risks of adverse effects in-combination	As presented within **Table 7-10** of the **Report to Inform Appropriate Assessment** **[APP-083]**, based on the Applicant's approach to assessment of guillemot the level of impact apportioned to the Farne Islands SPA was approximately a single breeding adult per annum. When considering the level of potential effect, likely potential connectivity between the project and the SPA and the favourable status of guillemot at the SPA, the Applicant concluded that the potential for an impact of approximately a single additional breeding adult per annum could confidently be concluded as a non-material contribution to any in-combination assessment.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England Comments	RAG	Recommendations	Applicant's Response
		to combine with those from Berwick Bank and other North Sea projects, and this should be properly considered, rather than just assuming the contribution is not material.			However, the Applicant acknowledges Natural England's request and will procced to undertake an updated in-combination assessment for the requested sites and features has been submitted at Deadline 1 - **Appendix 14 - In Combination Assessment Update for Guillemot and Razorbill (Document reference 8.31.14).**
B6	Assessment Conclusion	The Applicant concludes no AEoI for any feature, alone or in-combination. Whilst we agree for the project alone for all species, Natural England advise that AEoI cannot be excluded for kittiwake at FFC SPA. Further, until a full in-combination assessment is carried out, we are unable to advise whether we can rule out AEOI for guillemot and razorbill at FFC SPA, and guillemot at the Farne Islands SPA.		See comments above.	As presented within **Table 7-8** of the **Report to Inform Appropriate Assessment [APP-038]**, the level of impact apportioned to the kittiwake feature of the FFC SPA was predicted to be less than a single breeding adult per annum. When considering the level of potential effect, likely potential connectivity between the project and the SPA and the recent breeding success observed in the latest colony counts, the Applicant concluded that the potential for an impact of less than a single additional breeding adult per annum could confidently be concluded as a non-material contribution to any in-combination assessment. However, the Applicant acknowledges Natural England's request and will proceed to undertake an updated in-combination assessment for the requested sites and features this has been submitted at Deadline 1 - **Appendix 14 - In Combination Assessment Update for Guillemot and Razorbill (Document reference 8.31.14).** With respect to the guillemot feature of the FFC SPA please see Applicant's response to Comment B4 and of the Farne Islands SPA Comment B5.
Document used: [APP-053] 6.2.12 Rampion 2 ES Volume 2 Chapter 12 Offshore and intertidal ornithology.					
B7	Table 12-16	Natural England notes that breeding season Biologically Defined Minimum Population Scales (BDMPS) figures are presented using our approved method, alongside the alternative method proposed by the Applicant. In the case of great black-backed gull, guillemot, and razorbill, the Applicant's method employs the greatest annual BDMPS figure, and the Applicant has chosen to take this forward to compare annual predicted mortalities against. Natural England does not support this and considers that either the breeding season figure using our approved method or the largest non- breeding season BDMPS from Furness (2015) should be used. We note the differences are relatively minor and should not result in a material change to the impact totals.		The Applicant should use, as a reference population, either the breeding season population from Natural England's advised method or the largest BDMPS population from Furness (2015), whichever is larger.	The Applicant welcomes confirmation that the approach to calculation of the breeding BDMPS follows Natural England's approved method. With respect to the alternative method employed by the Applicant, this builds on the Natural England method by including consideration of seabirds associated with non-UK colonies. Given the location of the Proposed Development, the Applicant considered this to be an appropriate deviation from the approved method, especially considering that non-UK seabirds designated sites have been screened in and assessed within the **Report to Inform Appropriate Assessment [APP-038]**. Although Natural England do not agree with this deviation, the Applicant welcomes Natural England's conclusion that this would not materially affect the conclusions drawn within **Chapter 12: Offshore and intertidal ornithology, Volume 2 [APP-053]**.

Ref	Section	Natural England Comments	RAG	Recommendations	Applicant's Response
B8	12.13.93	The purpose of the PVA was to model the cumulative impacts for gannet, rather than project alone, so it is unclear why the results are presented in the project alone section.		The results of the PVA for gannet should be presented in paragraph 12.15.84, where the combined cumulative impacts for gannet on a BDMPS scale are given.	The Applicant undertook PVA analysis for gannet prior to Natural England's updated interim guidance on avoidance rates. When the new guidance was incorporated within cumulative assessments, the baseline mortality rate increase fell below the 1% threshold for PVA requirement. However, it was considered the information would still be beneficial to include within the EIA to further validate the Applicant's conclusions, hence being included within the alone assessment for gannet.
B9	12.13.126	There appears to be a mistake in this section. The predicted annual number of collisions for herring gull due to the Project alone is stated here to be 634, and the PVA has been carried out on that basis. Previously, in paragraph 12.13.122, it was given as 63. Natural England requires clarification on this.		Please provide clarification and amend, as necessary.	The Applicant can confirm that the predicted collisions for herring gull should be 63 (62.62) individuals per annum, as highlighted. Subsequently the inclusion of PVA within the alone section was applied in error due to the typo. As summarised within Table 12-38 of **Chapter 12: Offshore and intertidal ornithology, Volume 2** **[APP-053]**, when considering the correct alone impact value of 63 individuals per annum, the increase baseline mortality does not exceed the 1% threshold requirement for further investigation of potential population consequences through PVA**.** This has been added to the Errata submitted at Pre Examination Procedural Deadl (see **Cover Letter** **[PEPD-001]**).
B10	Table 12-45, Table 12-46, Table 12-47, Table 12-48, Table 12-49, Table 12-50, Table 12-51	In the cumulative impact assessment for gannet, guillemot, razorbill, kittiwake, great black-backed gull, and lesser black-backed gull, breeding season impacts appear to have been screened out for most other projects. This is presumably due to the breeding season reference population comprising adults within foraging range of Rampion 2, plus immatures from the preceding BDMPS season. Natural England does not agree with this method. It is not clear why this appears to have been done for the species mentioned above, but not herring gull.		The Applicant should clearly explain their method for undertaking cumulative impact assessments and the rationale behind which figures are included. Natural England advises that the impacts for all projects within the relevant BDMPS for all seasons should be included in the cumulative impact assessment. This is particularly important for lesser black-backed gull and great black-backed gull, were the threshold of a 1% increase in mortality has been exceeded even without inclusion of these breeding season impact figures, and for gannet, guillemot, and razorbill, where Natural England already considers that there is a cumulative EIA level impact for the North Sea and Channel BDMPS.	Please see the Applicant's response to Comment B1 above.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England Comments	RAG	Recommendations	Applicant's Response
B11	Table 12-49	The cumulative impact assessment for kittiwake contains numerous data gaps and cannot be considered comprehensive. However, given the total collision mortality estimates, as presented, amount only to a 0.27% increase in baseline mortality, and given the wind farm projects for which data are missing are generally small, we consider that the true cumulative impact is unlikely to exceed a 1% increase in baseline mortality across the UK Western waters and Channel BDMPS.		No further action – Natural England simply wishes to state that the methodology used here would not be appropriate for other cases where impacts were more likely to arise on seabird receptors.	The Applicant has undertaken cumulative assessments using the best available data though notes that due to the age of some of the projects no quantitative data were available for inclusion within cumulative assessments. However, the absence of data does not mean that the Applicant did not exclusively exclude such older projects when concluding cumulative assessments. Of the 11 such historic projects in question, six were fully commissioned between 2003 – 2010, and the remaining five were commissioned between 2011 – 2015. Given a significant amount of time has passed since these historic projects were commissioned and fully operational, any level of effect would already be impacting against the baseline population for which assessments are assessed against and, therefore, already accounted for in the baseline environment. Considering the above information, the Applicant welcomes and agrees with Natural England that the cumulative impact would not exceed a 1% increase in baseline mortality across the UK Western waters and Channel BDMPS.
B12	12.15.55 – 12.15.70	Natural England does not agree that the cumulative impact of Rampion 2 and other projects on great black-backed gull across the UK South-west & Channel BDMPS is not significant. A 1.99% increase on baseline mortality is significant in Environmental Impact Assessment (EIA) terms, and the PVA results show that, this would severely impact the regional population, resulting in a population 19% smaller than the counterfactual after 30 years. The Applicant has not considered the magnitude of this result. The statement that while the national population is declining, the Isles of Scilly Special Protection Area (SPA) population is increasing, is inaccurate. Initial indications from the results of SPA surveys carried out this year indicate that the SPA population has been in decline since 2015. While many of the figures presented by other wind farms may be precautionary, the Applicant has not taken into account the fact that the cumulative assessment contains numerous data gaps from older wind farms. We advise this is considered further. Natural England disagrees with the Applicant's suggestion that the contribution of Rampion 2 to the		Natural England disagrees with the Applicant's suggestion that the contribution of Rampion 2 to the cumulative total is small. Rampion 2 contributes 19.8 collisions out of a total of 90.5, and therefore, of the 20 projects listed in the cumulative assessment (of which only 8 have figures available – Table 12-50), Rampion 2 contributes 22%.	Please see the Applicant's response to Comment B2 above.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England Comments	RAG	Recommendations	Applicant's Response
		cumulative total is small. Rampion 2 contributes 19.8 collisions out of a total of 90.5, and therefore, of the 20 projects listed in the cumulative assessment (of which only 8 have figures available – Table 12-50), Rampion 2 contributes 22%.			
B13	8.5.31	Natural England does not agree that the contribution of Rampion 2 to the in-combination assessment of collision risk to kittiwake, as a feature of Flamborough and Filey Coast SPA (FFC SPA), is so small that it is of no consequence. Prior to the Hornsea 3 OWF decision (which required compensatory measures), in- combination impacts had already reached a level where an AEOI could not be ruled out. As a result, particularly when considered with impacts from other soon-to-be submitted OWF proposals, additional impacts from Rampion 2 risk furthering the adverse effect.		Natural England advises that further discussion with the Applicant is necessary to define and agree an appropriate compensation package for kittiwake in relation to the FFC SPA. See our comments on the derogation case below.	Please see the Applicant's response to Comment B3.
B14	In combination Assessment	Natural England agrees with no AoEI in- combination for gannet in relation to FFC SPA (0.66-0.85 adult mortalities per annum).		No action needed.	The Applicant welcomes Natural England's agreement that an AEoI can be ruled out for the gannet feature of the FFC SPA for the project alone and in-combination.
B15	8.6.33-8.6.34	Natural England agrees with no AoEI in-combination for Lesser black-backed gull (LBBG) in relation to Alde-Ore Estuary SPA, as it has been predicted that there would be less than one adult mortality across the entire lifetime of the project (predicted annual collision rate of 0.018 LBBG from the SPA per annum).			The Applicant welcomes Natural England's agreement that an AEoI can be ruled out for the lesser black-backed gull feature of the Alde-Ore Estuary SPA for the project alone and in-combination.
B16	Appendix E 28. Matrix 24	Natural England note that the Applicant has screen out great black-backed gull from the Habitats Regulations Assessment (HRA) in relation to Littoral Seino-Marin SPA, on the basis of perceived low collision risk with turbines. We advise that this species is at high risk of collision with turbines and therefore we advise that advice is sought from the French authorities in relation to the decision to screened this out.		We advise that advice is sought from the French authorities in relation to this screening decision.	The Applicant has engaged with the French Authorities with respect to any transboundary effects. A further email asking for information on the Littoral Seino-Marin SPA has been sent to the French Authorities prior to Deadline 1.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England Comments	RAG	Recommendations	Applicant's Response
B17	7.5.319 – 7.5.326, 8.5.19	Natural England does not agree with the Applicant that adverse effect on integrity can be ruled out for Flamborough and Filey Coast SPA due to impacts on guillemot and razorbill in- combination with other projects. We do not accept that the project alone apportioned impacts are so low that there is not a detectable contribution to the in-combination effect. At the Hornsea 4 Examination, Natural England advised that AEoI could not be ruled out for these two species in-combination with other plans and projects, and there is the potential for effects from Rampion 2 to combine with those from projects likely to be submitted in the near future. Therefore, the effects of Rampion 2 in- combination with other projects should be properly considered, rather than just assuming the contribution is not material.		A full in-combination assessment of impacts should be presented for guillemot and razorbill for Flamborough and Filey Coast SPA. Natural England should be consulted on the results of this assessment, at which point we can advise on whether AEoI can be excluded.	Please see the Applicant's response to Comments B4 and B6 above.
B18	8.5.12	Natural England does not agree with the Applicant that adverse effect on integrity can be ruled out for the Farne Islands SPA due to impacts on guillemot in-combination with other projects. We do not accept that the project alone apportioned impacts are so low that there is not a detectable contribution to the in-combination effect. Natural England advised Marine Scotland that the Berwick Bank OWF that adverse effects on the Farne Islands SPA could not be ruled out due to impacts on guillemot from that project alone, and other consented /proposed projects could also impact the site. Therefore, there is the potential for effects from Rampion 2 to combine with those from Berwick Bank and other North Sea projects, and this should be properly considered by the Applicant, rather than just assuming the contribution is not material.		A full in-combination assessment of impacts should be presented for guillemot for the Farne Islands SPA. Natural England should be consulted on the results of this assessment, at which point we can advise on whether AEoI can be excluded.	Please see the Applicant's response to Comment B5 above.
Document used: [APP-039] 5.10 Rampion 2 Habitats Regulations Assessment (Without Prejudice) Derogation Case					

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England Comments	RAG	Recommendations	Applicant's Response
B19	General	Natural England notes that the Applicant has presented a without-prejudice derogation case describing options for compensating for potential AEoI on kittiwake for Flamborough and Filey Coast. The most promising opportunity is the provision of additional nest spaces on an existing or proposed Artificial Nesting Structure (ANS) through a collaborative approach. This intervention is likely to be practicable and proportionate to the level of risk and given any AEOI will be in-combination with other projects, a collaborative approach is logical and appropriate. At present, insufficient details on the proposals are provided for the compensatory measures to be considered secured. We also consider that a Marine Recovery Fund (MRF) payment could provide an opportunity to contribute to strategic compensatory measures in the future but highlight that at present the MRF is not in place, and that limited information on the likely scope and delivery mechanism of the Fund is available. Therefore, it may be that at the point of decision-making, the Secretary of State may not have sufficient confidence in the MRF to mandate its use as a compensatory measure. The other measures set out in paragraph 6.2.27 of the derogations document are of uncertain merit and/or may be challenging to implement or effectively monitor, and therefore are not worth progressing further at this stage.		We recommend that the Applicant develop the collaborative ANS option further, and that specific proposals (i.e., confirmed location of the ANS to be used, number of nest spaces to be provided etc.) are submitted into the Examination in due course through an updated Kittiwake Implementation and Monitoring Plan (KIMP). The Applicant should stay abreast of any progress with the MRF and update the Examination (and the derogations case) as required.	The Applicant is continuing to progress a collaborative approach to deliver additional nest spaces on an Artificial Nesting Structure (ANS) and have submitted a letter of intent signed by the Dogger Bank South Wind Farms project confirming their intention to participate in a such a collaborative approach to the Examining Authority (see **Cover Letter [PEPD-001]**). The Applicant welcomes further comments from Natural England on this proposal, in the event that a AEoI cannot be ruled out. If additional details of the Marine Recovery Fund are published, the derogations documents will be updated accordingly.
B20	3.2.2	As noted above, Natural England is not able to provide advice on the potential for AEOI on the guillemot and razorbill features of FFC SPA and on the guillemot feature of the Farne Islands SPA without a full in-combination assessment being provided.		As above.	Please see Applicant's response to Comment B4 and B5 above.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England Comments	RAG	Recommendations	Applicant's Response
B21	6.2.32	Natural England does not generally support further deployment of onshore ANS, given the number of nest spaces that consented and submitted developments have already installed or are required to install in the future. As a result, we do not support the proposition that the recently installed onshore ANS on the River Tyne at Gateshead would provide appropriate compensation for the Dogger Bank South projects, noting that these 2 large Round 4 projects have not been tested through the Examination process. However, given the predicted level of contribution to in-combination effects, we do consider this ANS could provide compensatory benefits that would be proportionate to less impactful 'extension' projects such as Rampion 2.		To note.	The Applicant welcomes confirmation that onshore ANS could provide compensatory benefits that would be proportionate to less impactful 'extension' projects such as the Proposed Development in the event that a AEoI cannot be ruled out.

© WSP Environment & Infrastructure Solutions UK Limited

Table 4-8 Applicant's Response to Natural England - Appendix C (Marine Mammals)

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
C1	Project Description	The number of piles and pile locations per day needs to be clarified.		Natural England advises the WCS is clarified in terms of number of piles and pile locations per day.	The Worst-Case Scenario for spatial impacts is 2 concurrent monopiles in a day at the E and W modelling locations in the array area as stated in **Section 4** of **Appendix 11.3 Underwater noise assessment technical report, Volume 4 [APP-149].** The Worst-Case Scenario for the number of piles is 360 pin piles for WTG and 36 pin piles for the Offshore Substations, this results in a total of 396 pin piles and 99 piling days with 4 pin piles per day as stated in the MDS Table 11-13 of **Chapter 11: Marine Mammals, Volume 2 [APP-052]**.
C2	NE Position on Worst Case Scenario (WCS)	The worst-case spatial extent of the noise impact (particularly for disturbance) requires review.		We advise the WCS noise impact spatial extent is reviewed.	The Applicant confirms the Worst-Case Scenario has been reviewed. The worst-case scenario is the piling of 2 monopiles concurrently (simultaneously) at the E and W locations within the array area, as this has the largest spatial effect for marine mammals as stated in **Section 4** of **Appendix 11.3 Underwater noise assessment technical report, Volume 4 [APP-149]** and Table 11-13 of **Chapter 11: Marine Mammals, Volume 2 [APP-052].**
Baseline Characterisation					
C3	Data Suitability and baseline characterisation	The survey data have not been used for the final baseline parameters (e.g. density, abundance) taken forward to the assessment; instead, the literature has been used.			The Applicant confirms the site-specific survey data was not the worst-case density, therefore it was not carried forward into the quantitative assessment. The reasoning for which density estimates were used for each species is detailed in Sections 3.9, 4.9, 6.9, and 7.9 and summarised in Table 10-1 of **Appendix 11.1: Marine mammal baseline technical report, Volume 4 [APP-147].**
C4	Data Gaps	Date from the recent literature on bottlenose dolphin is required.		We advise the bottlenose dolphin baseline is characterised based on the recent literature.	The marine mammal baseline (**Appendix 11.1 Marine mammal baseline technical report [APP-147]**) was drafted in 2021, therefore the Applicant recognises that this document is outdated at the time of Application. The key change since the drafting of the baseline is the change in the bottlenose dolphin Management Units. At the time of writing the baseline, Rampion 2 was located within the Offshore Channel and SW England Management Unit. The boundary of the **Coastal West Channel Management Unit** was revised by the IAMMWG in 2023 (after the baseline was

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					finalised). Rampion 2 is now located partly within both the new boundary of the Coastal West Channel Management Unit and the **Offshore Channel and SW England Management Unit**. Impacts from the Project therefore cross into the 2 Management Units. Assuming the reference population is updated to be the combined MUs, this results in a reference population of: **40 dolphins from CWC + 10,653 dolphins from OCSW = 10,693 bottlenose dolphins.** This is almost the same as the reference population size used in the ES assessment **Chapter 11: Marine Mammals, Volume 2 [APP-052]** which was 10,497 dolphins, and thus is not considered to be significantly different. No changes to the magnitude of any impact pathway would occur when considering the new reference population size. The Applicant will commit to providing an updated baseline for bottlenose dolphin at Deadline 2. Please refer to response C28 for further details.
Environmental Impact Assessment					
C5	Identified impacts	We are satisfied that all impacts have been identified.		N/A	This is welcomed by the Applicant.
C6	Definitions for magnitude and sensitivity	We have concerns over the definitions used.		We advise the definitions are revised and updated in the assessment.	The Applicant notes this comment and has addressed the concerns in the specific comment responses in the Overarching Comments section of this document, see responses CA1, CA2, CA3 and CA4.
C7	Cumulative Effect Assessment Screening	We deem the projects included to be appropriate.		N/A	This is welcomed by the Applicant.
C8	Cumulative Effect Assessment Impacts	It is unclear whether all the relevant projects have been included in the assessment of cumulative disturbance to harbour porpoise.		We advise a review of the projects included in the assessment and revise if necessary	The Applicant confirms that there was an error in Table 11-37 of **Chapter 11: Marine Mammals, Volume 2 [APP-052]**, and that some non-UK projects and Scottish projects in the CEA longlist that are located in the North Sea Management Unit were accidently omitted from the harbour porpoise CEA when it was updated prior to Application.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					The projects missing from the porpoise CEA are: 8 Scottish projects, 1 Belgian project, 3 French projects, 6 Dutch projects, 2 Norwegian projects, 2 Danish projects and 7 German projects. The Applicant has provided a revised cumulative effect assessment for the harbour porpoise North Sea MU at Deadline 1.This has been incorporated into the updated **Chapter 11: Marine Mammals, Volume 2** of the ES **(document reference 6.2.11)**.
C9	Cumulative Effect Assessment Conclusions	Unable to agree at this stage due to the above comments.		We advise Natural England's concerns are addressed in an updated assessment.	This Applicant notes the concerns raised on the CEA conclusions. The Applicant confirms the error in Table 11-37 of **Chapter 11: Marine Mammals, Volume 2** **[APP-052]** and that a revised assessment will be submitted at Deadline 1. This has been incorporated into the updated **Chapter 11: Marine Mammals, Volume 2** of the ES **(document reference 6.2.11)**.
Habitats Regulations Assessment					
C10	Screening	We are satisfied that all sites/receptors have been identified.		N/A	This is welcomed by the Applicant.
C11	Methodology (impact)	We are satisfied that all impacts have been identified.		N/A	This is welcomed by the Applicant.
C12	Assessment Conclusions	All marine mammal SACs have been screened out at Stage 1, no LSE.		N/A	This is welcomed by the Applicant.
Mitigation Summary					
C13		The embedded environmental measures outlined by the Applicant (in Table 11-14 in the ES Chapter 11 Marine Mammals) should be secured in the DCO/dML. Specifically: • C-51 (Vessel Management Plan) – this should be secured for all phases of the project. • C-52 (piling Marine Mammal Mitigation Plan). • C-102 (UXO Clearance Marine Mammal Mitigation Protocol) We note that the Table 11-14 details that C-51 and C-52 will be secured in the DCO or dML conditions.			The Applicant confirms that Commitment C-51 is secured in Condition 11(1)(f) of the draft dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009])**. The Applicant confirms that Commitment C-52 is secured in Condition 11(1)(l) of the draft dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009])**, should driven or part-driven pile foundations be used. The Applicant confirms that Commitment C-102 is secured in Condition 11(1)(m) of the draft dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		C-102 will be secured through the application for UXO clearance works marine licence. Natural England query whether this secures that the final MMMP will be in accordance with the Draft MMMP submitted with this Application. There are also two other commitments Natural England strongly support in Table 11-14 and welcome the proposal to secure these in the dML: • C-265 (piling noise mitigation technology). • C-275 (low order detonations)			**009])**. The Applicant also confirms that when the Marine Licence for UXO clearance works application is made, should this be required, the final MMMP will be drafted in line with the **Draft Piling Marine Mammal Mitigation Protocol** **[APP-236]** submitted with the Application for the Proposed Development. The Applicant notes that, should driven or part-driven pile foundations be used, the use of piling noise mitigation technology (Commitment C-265) will be confirmed within the final version of the **In Principle Sensitive Features Mitigation Plan** **[APP-239],** which will be submitted to and approved in writing by the MMO as secured in Condition 11(1)(k) of the draft dMLs (Schedules 11 and 12 of the **draft DCO**) **[PEPD-009]**. The Applicant notes that should UXO clearance be required, the use of low order methods to dispose of UXOs using deflagration will be used where practicable (Commitment C-275) (as secured in Condition 11(1)(m) of the draft dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009])**. The Applicant also confirms that when the Marine Licence for UXO clearance works application is made, should this be required, the final MMMP will be drafted in accordance with **the Draft Piling Marine Mammal Mitigation Protocol** **[APP-236]** submitted with the Application for the Proposed Development as secured in Condition 11(1) (m) of the draft dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009])**.
C14		Other plans: • Draft Marine Mammal Mitigation Plan -this plan is necessarily high level and has a suitable list of potential mitigation measures. The Applicant should clearly state the soft start/ramp up profile that will need to be adhered to. • Offshore In-Principal Monitoring Plan – the marine mammal section is lacking and should be revised as per the detailed comment. • Outline Vessel Monitoring Plan (VMP) – we request to see an outline VMP as the Applicant			The Applicant confirms that both the soft start/ramp-up will be detailed in the final Piling MMMP, which is to be submitted to approved in writing by the MMO as secured in Condition 11(1)(l) of the draft dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009])**. The Applicant has provided **Appendix 10 – Further Information for Action Point 42 - Proximity to Marine Wildlife** **(Document reference 8.31.16**) at Deadline 1 which details the mitigation measures relied upon within the assessment presented in **Chapter 11: Marine Mammals, Volume 2** **[APP-**

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		is relying on the VMP and mitigation measures therein in their assessment conclusions.			**052].** This document will form part of the final VMP, the provision of which is secured in Condition 11(1)(f) of the draft dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]).** The comment on the Offshore In-Principal Monitoring Plan is addressed in the Applicant's response to comment **C56**.
Overarching comments					
		Firstly, the sensitivity rating that corresponds to each of the definitions has changed; the terms have been qualitatively downgraded. To illustrate, the definition that previously corresponded to medium sensitivity now corresponds to low sensitivity. Secondly, the actual definitions of the sensitivity ratings have changed. To illustrate, the definition of medium sensitivity at the PEIR stage stated, "some tolerance – effect unlikely to cause a change in both reproduction and survival rates." In the application, the equivalent statement for low sensitivity PEIR is "some tolerance – no significant change in individual vital rates (survival and reproduction)". Important here is the addition of the "significant level" as a threshold, which was not present in the definition at PEIR. In practice, this means that a sensitivity rated "high" at the PEIR stage, can in the submitted ES be determined to be 'not significant' and so result in a low sensitivity. This has significant ramifications for the impact assessment. We advise that our comments in our main overarching letter regarding the way overall significance has been derived from the matrix are also taken into account. Action: Define what a "significant level" of change is, in the context of the definitions of medium and low sensitivity. Review the sensitivity assigned in the individual impact assessments, and provide robust, transparent justification for the final sensitivity			The Applicant confirms that the sensitivity ratings have been renamed from Very High, High, Medium, and Low to High, Medium, Low, and Very Low. Regarding the change in the definitions of sensitivity between PEIR and ES, the Applicant acknowledges this may have caused some confusion. This was an oversight following consideration of specific questions relating to the impacts of PTS – and has resulted in a lack of clarity in the presentation of the assessment ratings. To clarify - the reference to significance in 'Sensitivity definition' was designed to clarify the likelihood of event impacting the vital rates of an individual. As is standard, 'Magnitude' addresses the consequence of any impact at a population level (see Magnitude definitions). The use of the term 'significance' in the Sensitivity definition was intended to correlate to 'non-negligible' or to distinguish from 'inconsiderable' or more 'trivial' effects. The Applicant can see how the use of this term has detracted from the focus of the 'Sensitivity' element of the assessment – which (as stated above) is related to the **likelihood** of an event occurring. Crucially, the Applicant can confirm the overall assessment result is the same using either the PEIR or ES application definitions.
		There is little distinction between the definitions of low and medium magnitudes, leading to subjective conclusions.			The Applicant confirms there has been no change to the definition of magnitude between PEIR and ES. The four levels have been renamed from Major,

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		The definition of medium magnitude does not make reference to a proportion of the population affected, unlike the definition for low magnitude, which states a small proportion of the population. It is therefore not clear what proportion of the population would need to be affected to be considered medium magnitude. Both low and medium definitions reference some effect to reproductive success but not enough to affect the population trajectory. The distinction between low and medium in reference to this parameter is unclear. Action: The definitions of low and medium magnitude should be made clearer and/or the justification for one chosen magnitude over another should be made more robust in the species-specific assessments.			Moderate, Minor, Negligible to High, Medium, Low, Very Low with the definitions remaining the same. In Table 11-16 in **Chapter 11: Marine Mammals, Volume 2 [APP-052]**, Medium magnitude is defined as a **lifetime change** in reproductive success and Low magnitude is defined as a **short-term change** in reproductive success.
		Note that the defined terminology for magnitude should be used consistently throughout the document. The Applicant has not defined "negligible" magnitude and so this term should not be used in the assessment.			The Applicant confirms that negligible is not defined terminology for magnitude and that these should be Very Low. This is corrected in the 'Errata' submitted at Deadline 1.
		It is stated that the VMP will be developed pre-construction. However, the Applicant is relying upon the VMP to reduce the residual magnitude to "Very Low" and so conclude no significant effect from vessel-related pathways. An outline VMP should be submitted into the Examination, so Natural England can appraise its likely effectiveness. Action: Provide an outline Vessel Management Plan.			This document will form part of the final VMP, the provision of which is secured in Condition 11(1) (f) of the draft dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]).**
Document used: [APP-052] Volume 2, Chapter 11: Marine Mammals					
C15	General	The Applicant should ensure that any changes, following comments, made to the supporting documents (e.g. marine mammal baseline technical report, marine mammal quantitative underwater noise assessments) are carried through to the Environmental Statement sections where relevant.		To note.	The Applicant ensures that all amendments have been recorded and are noted in the Errata. An updated version of **Chapter 11: Marine Mammals, Volume 2** of the ES **(Document reference 6.2.11)** has been submitted at Deadline 1, in accordance with Agenda Item 43 of Issue Specific Hearing 1.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
C16	Table 11-2	Natural England have not had sight of the draft European Protected Species (EPS) licence application.		The Applicant should consult Natural England on the draft EPS licence application (expected post- consent). Natural England advise that this is considered sufficiently far in advance of the licence being required to ensure sufficient mitigation measures are in place, and for us to advise on any further measures that might be required. We would welcome sight of a draft as soon as possible	The Applicant will submit an EPS licence application in the post-consent phase once details of the final design are understood and Natural England, the MMO and other relevant Statutory Nature Conservation Bodies ('SNCBs') will be consulted on the application. The Applicant notes the request to consider providing a draft in advance of licence being required to allow for advice on mitigation measures, however appropriate mitigation measures will be set out at the time the EPS licence application is made.
C17	Table 11-13	There is a discrepancy in the number of pin pile foundations required for offshore substations; both 18 and 36 are listed in this table.		The Applicant should clarify the correct maximum number of pin piles for the offshore substation.	The Applicant can confirm that the reference to 18 pin pile foundations is incorrect. The correct number of pin pile foundations for offshore substations is 36. This has been amended in the updated version of **Chapter 11: Marine Mammals** submitted at Deadline 1.
C18	Table 11-13	Vessel disturbance may also occur when the vessels are in proximity to land during transit to/from ports. The Applicant should include information on known or likely ports and transit routes for the Rampion 2 project and should use this information to identify any seal haul out sites nearby that could be at risk of disturbance.		The Applicant should detail known or likely port options, and proximity to known seal haul outs.	The maintenance port and facilities will be located in Sussex, and it is assumed that all direct labour will be resident within the area. It is likely that the existing facilities at Newhaven Port will be utilised (and expanded where necessary) as the base for operations management of Rampion 2, as this will yield synergies and enable effective coordination with the existing operations team on Rampion 1. Further information regarding the Applicant's intentions for the additional facilities at Newhaven Harbour are provided in the response to Issue Specific Hearing 1, agenda item 50 in the **Applicant's post hearing submission - Issue specific hearing 1 (Document reference 8.25).** The closest known haul out sites for and grey seals are in the Solent around Langstone harbour and Chichester harbour. Newhaven port is located more than 80 km from both Langstone harbour and Chichester harbour, therefore disturbance at haul outs has not been assessed in the ES as there are likely no significant effects due to the distance in the operational phase. For the construction phase a single port has not been chosen and it is likely numerous ports in UK and Europe will be used.

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
C19	Table 11-14	Whilst we welcome a commitment like C-275 regarding low order methods, we consider that the wording should be made stronger. This would align it with the imminent update to the joint position statement: https://www.gov.uk/government/publications/marine-environment-unexploded-ordnance-clearance-joint-interim- position-statement on Unexploded Ordnance (UXO) clearance. The statement will outline that low noise methods have to be the primary method of clearance.		The Applicant should revise wording of commitment C-275.	The Applicant welcomes the comment from Natural England however the wording of C-275 in **Chapter 11: Marine Mammals, Volume 2** of the ES **[APP-052]** and the **Draft Unexploded Ordnance Clearance Marine Mammal Mitigation Protocol [APP-237]** (as secured in Condition 11(1)(m) of the draft dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009])** has not been changed. The current commitment wording states that *"the use of low order detonations to dispose of Offshore UXOs using the 'deflagration method' will be implemented, where practicable".* Therefore, low order clearance is deemed to be the first approach taken with all confirmed UXOs (cUXO), and only if it isn't possible would high order clearance be undertaken. The stages to be included in this process are the UXO campaign to determine if cUXO and the size, then to determine the method that would be appropriate for clearance. Low order clearance would be attempted on all cUXO deemed appropriate and if failed high order would only be undertaken after multiple failed attempts. The clearance of UXO will be controlled through a separate Marine Licence
C20	Table 11-31	The percentage of the Management Unit (MU) affected does not tally with the number of individuals affected for bottlenose dolphin and common dolphin.		The Applicant should review the numbers in Table 11-31.	The Applicant notes this error and confirms that this has been amended to 0.72% of the bottlenose dolphin MU and 0.35% of the common dolphin MU. This has been incorporated into the updated **Chapter 11: Marine Mammals, Volume 2** of the ES **(Document reference 6.2.11)**.
C21	11.9.85	As highlighted by the Applicant, it is possible that vessel traffic could result in hauled out animals flushing into the water. Therefore, the project should commit to best practice measures that reduce the likelihood of this occurring as part of a Vessel Management Plan (VMP).		The VMP should include best practice measures to reduce the risk of seals flushing due to vessel disturbance.	The Applicant has included best practice measures in **Appendix 10 – Further Information for Action Point 42 - Proximity to Marine Wildlife (Document reference 8.25.10**) submitted at Deadline 1. This document will form part of the final VMP (as secured in Condition 11(1)(f) of the draft dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009])**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
C22	11.10 (general)	Disturbance to seal haul out sites at landfall should also be assessed against the use of operation and maintenance (O&M) vessels over the lifetime of the project. The assessment of this impact pathway during construction can conservatively be applied to the impact pathway during the O&M phase. The embedded environmental measure of a VMP covering all phases of the project should reduce the risk of disturbance, subject to having the appropriate measures therein.		The Applicant's assessment should acknowledge that the impact pathway of disturbance to seal haul out sites and landfall can occur during operation and maintenance phase too. A separate assessment is not needed - the one for construction is applicable. The Applicant should clearly commit to following the VMP during the O&M phase.	The Applicant acknowledges that disturbance to seal haul out sites at landfall is an impact pathway during the operation and maintenance phase. The sensitivity of seals to disturbance at haul out sites remains the same as during the construction phase and as such is medium sensitivity. The magnitude of disturbance at seal haul out sites during operation phase is the same as during the construction phase, and as such is very low magnitude. In conclusion, the significance for disturbance at haul out sites during the operation and maintenance phase is minor which is not significant in EIA terms. The Applicant welcomes the comment from Natural England that a separate assessment is not needed and also confirms it will commit to following measures in the Working in Proximity to Wildlife document throughout the operation and maintenance phase. The Working in Proximity to Wildlife document will be submitted at Deadline 1 and will form part of the final VMP (as secured in Condition 11(1)(f) of the draft dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**).
C23	11.10.16	The sensitivity of marine mammals to vessel disturbance should be the same irrespective of the phase of the Project.		The Applicant should ensure sensitivity is the same across Project phase.	The Applicant confirms that sensitivity of marine mammals to vessel disturbance should be the same throughout the lifetime of the Proposed Development, as sensitivity to activities is a species-specific metric irrespective of project phase. The sensitivity of vessel disturbance during operation should be low (instead of very low as had been previously stated) to align with the sensitivity of vessel disturbance during the construction phase. As a result, the significance following the implementation of embedded environmental measures is minor significance. These changes have been captured in the updated version of **Chapter 11: Marine Mammals, Volume 2** of the ES **(Document reference 6.2.11)** submitted at Deadline 1.
C24	Table 11-34	This table should present the relevant species-specific. Management Units that each project is situated in.		The Applicant include the relevant species specific MUs that each project in the cumulative effects assessment (CEA) lies in.	This is noted by the Applicant. Whilst the information was not included in **Table 11-34 of Chapter 11: Marine mammals, Volume 2** **[APP-052]**, the projects in the species specific MUs are included in the individual species assessments in **Table 11-37, Table 11-39, Table 11-41** and **Table 11-43** of

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					Chapter 11: Marine Mammals, Volume 2 [APP-052]. Additionally, **Table 11-45 of Chapter 11: Marine Mammals, Volume 2 [APP-052]** on vessel disturbance CEA lists the projects in the species specific MUs.
C25	Table 11-37	We are concerned that not all relevant projects have been included in the CEA for harbour porpoise disturbance. Table 11-37 presents less than half of the projects listed in Table 11- 35, and at a glance some of the omitted projects are in non-UK parts of the North Sea so should be in the relevant MU for harbour porpoise. The projects taken forward to the CEA should be reviewed to ensure it captures all the relevant ones, and that the impact presented (in terms of percentage of the MU affected) is correct.		The Applicant should review the projects taken forward to the CEA for harbour porpoise and update the assessment accordingly.	The Applicant confirms the error in Table 11-37 in **Chapter 11: Marine Mammals, Volume 2 [APP-052]**, and that some non-UK projects and Scottish projects in the CEA longlist that are located in the North Sea Management Unit were accidently omitted from the harbour porpoise CEA when it was updated prior to Application. The projects missing from the porpoise CEA are: 8 Scottish projects, 1 Belgian project, 3 French projects, 6 Dutch projects, 2 Norwegian projects, 2 Danish projects and 7 German projects. The Applicant has provided a revised cumulative effect assessment for the harbour porpoise North Sea MU at Deadline 1. This has been incorporated into the updated **Chapter 11: Marine Mammals, Volume 2** of the ES **(Document reference 6.2.11)**.
Document used: [APP-147] Volume 4, Appendix 11.1: Marine mammal baseline technical report					
C26	General comment	The complete results of the site-specific digital aerial surveys have not been presented in the application. These should be presented for review		The Applicant should provide a separate document that has the complete results of the site-specific digital aerial surveys.	The Applicant has submitted the final two years DAS survey report: **Ornithological and Marine Mammal Aerial Survey Results of Rampion 2 - 2021 [Document reference 8.33]** to the Examination at Deadline 1.
C27	General comment	In the site-specific surveys there were many sightings of unidentified species (unidentified dolphin; unidentified dolphin/porpoise; unidentified seal etc.). These unidentified species have not been allocated to the identified species in the baseline characterisation. We advise that the worst-case scenario is to assume that all unidentified observations could be the specific constituent species. For example, all unidentified seals could be both harbour seals or grey seals, and so should be included in the density estimate for both harbour and grey seals. However,		The Applicant should allocate the unidentified species to specific species, then present the updated densities from the site-specific digital aerial surveys.	The site-specific surveys were not the worst-case density estimates for any species and therefore were not carried forward into the quantitative impact assessment therefore apportioning of unidentified species is not required. It is an acceptable approach to assume that all unidentified small cetacean sightings are harbour porpoise in the more offshore central/southern North Sea as dolphins are considered rare in this area. However, this is not the case at the Proposed Development where there is a known mix of small cetacean species in the area (dolphins and porpoise).

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		we are open to the Applicant proposing alternate ways to allocate unidentified species if preferred.			The Proposed Development surveys recorded: • 25 harbour porpoise • 23 dolphin/porpoise • 2 unknown dolphins • No bottlenose dolphins The identification rate in the site-specific surveys was so low that it was inappropriate to assign unidentified sightings to species level. They were deemed to be inappropriate to use in the quantitative impact assessment. For both harbour and grey seals, the most appropriate at-sea density estimate is considered to be the Carter et al. (2020,2022) habitat preference maps.
C28	2.2.1	Updated Management Unit boundaries were reviewed and published in March 2023. The relevant change to this project is the eastward extension of the Coastal West Channel (CWC) MU boundary for bottlenose dolphin. The Rampion 2 project now overlaps this MU. The Applicant must undertake their assessment relative to this updated MU.		The Applicant should update assessment of bottlenose dolphin so that it reflects that updated CWC MU that now overlaps with the Rampion 2 area.	The marine mammal baseline (**Appendix 11.1 Marine mammal baseline technical report [APP-147]**) was drafted in 2021, therefore the Applicant recognises that this document is outdated at the time of Application. The key change since the drafting of the baseline is the change in the bottlenose dolphin Management Units. At the time of writing the baseline, Rampion 2 was located within the Offshore Channel and SW England Management Unit. The boundary of the **Coastal West Channel Management Unit** was revised by the IAMMWG in 2023 (after the baseline was finalised). Rampion 2 is now located partly within both the new boundary of the Coastal West Channel Management Unit and the **Offshore Channel and SW England Management Unit**. Impacts from the Project therefore cross into the 2 Management Units. Assuming the reference population is updated to be the combined MUs, this results in a reference population of: **40 dolphins from CWC + 10,653 dolphins from OCSW = 10,693 bottlenose dolphins.** This is almost the same as the reference population size used in the ES assessment **Chapter 11: Marine Mammals, Volume 2 [APP-052]** which was 10,497 dolphins, and thus is not considered to be significantly different. No changes to the magnitude

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					of any impact pathway would occur when considering the new reference population size. The Applicant will provide an updated baseline for bottlenose dolphin at Deadline 2.
C29	Table 4-3	The density estimates presented in Table 4-3 do not reflect the latest picture of bottlenose dolphin abundance in this region, which has increased recently due to the expansion of a semi- resident inshore population (Corr, 2020; IAMMWG, 2023). The Applicant should update the population estimates accordingly. One approach to calculating density, which we suggest the Applicant presents, is to assume uniform density of bottlenose dolphin in the extended CWC MU.		The Applicant should review sources of bottlenose dolphin density that could reflect the recent changes in distribution. The Applicant should present bottlenose dolphin density in the CWC MU assuming uniform distribution.	There is a lack of density estimates for bottlenose dolphins in the Coastal West Channel Management Unit. • Assuming a uniform distribution of dolphins within the Coastal West Channel Management Unit, the density estimate would be 40 dolphins/ MU area of 18,685.3 km^2 = **0.002 dolphins/km^2**. • This is substantially lower than the density used in **Chapter 11: Marine mammals, Volume 2 [APP-052]** which was 0.037 dolphins/km^2. The Applicant therefore considers that the density estimate used for bottlenose dolphins in the ES remains precautionary and appropriate.
C30	5.8	Natural England agrees that, based on the information presented, white-beaked dolphin can be scoped out of the assessment.		Agreement.	This is welcomed by the Applicant.
C31	7.9	The Applicant has stated that, for minke whale, they will use the Small Cetaceans in the European Atlantic and North Sea III (SCANS-III) data for the density estimate, even though this is not the highest estimate. We note the highest estimate is found in the Software Assurance Maturity Model (SAMM) survey; 0.012 whales/km^2 in summer. It is unclear why the justification for using the SCANS-III data over the SAMM survey is applicable to minke whale but no other species e.g., common dolphin.		The Applicant should clarify why the SAMM survey source/the most precautionary has not been used for minke whale density or use the most precautionary density estimate.	SCANS-III (Hammond et al., 2017) density for minke whales was selected as it was the more recent survey compared to the SAMM surveys (Laran et al., 2017). The SAMM surveys were conducted in the winter between November 2011 and February 2012 and in the summer between May and August 2012, whereas the SCANS III survey was conducted between June and August 2016. Therefore, SCANS III provides a more recent and therefore appropriate density estimate for the area. SAMMS survey data (Laran et al., 2017) was used for bottlenose dolphins because no bottlenose dolphins were sighted in SCANS III block C (Hammond et al., 2017). SAMMS survey data (Laran et al., 2017) were used for common dolphins because no common dolphins were sighted in SCANS III block C (Hammond et al., 2017).

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
C32	Figure 8.1	There appear to be 9 sightings on this figure, yet Table 8-1 only list a total count of 5. This difference should be clarified.		The Applicant should clarify the difference in count between the figure and the table.	**Table 8.1 Appendix 11.1: Marine mammal baseline technical report, Volume 4 [APP-147]** presents the counts of all seal species sighted over the two years of surveys that could not be identified to a species level and **Figure 8.1 Appendix 11.1: Marine mammal baseline technical report, Volume 4 [APP-147]** presents the locations of sightings of all seals species. The Applicant notes the error in **Table 8.1 Appendix 11.1: Marine mammal baseline technical report, Volume 4 [APP-147]** and confirms that this has been corrected to 7 sightings of unidentified seal species: 3 in July 2019, 1 in December 2019, 1 in February 2020, 1 in March 2020 and 1 in August 2020. The total number of 9 sightings in **Figure 8.1 Appendix 11.1: Marine mammal baseline technical report, Volume 4 [APP-147]** is correct when considering the total number of seal species identified: 7 unidentified seal species sightings and the 2 sightings of grey seals that were positively identified. This is corrected in the 'Errata' submitted at Deadline 1.
C33	8 and 9	The Applicant has not presented the final density which they intend to use for harbour and grey seal. This should be specified here. It is noted that Table 10-1 states the density estimate will be grid cell specific. This information should be provided in Sections 8 and 9, and the approach clarified e.g., is the highest grid cell density in the 25 km radius of Rampion 2 being used, or the density within the zone of impacts?		The Applicant should clarify in Sections 8 and 9 what density(s) will be used in the assessment.	The assessment of the number of seals impacted by pile driving activities was conducted by overlaying the underwater noise impact contours on the seal spatially explicit density surface, extracting all grid cells within the disturbance contours and calculating the number of animals present within the contours. Therefore, the assessment did not use a single uniform density to estimate number of animals impacted but used a density surface within which density changed spatially over the grid cells.
C34	9.3.5	The reference population for grey seals has been calculated based on the combined population of the South and Southeast England Seal MUs, rather than 50% of this combined total. This departs from Natural England's advice in paragraph 8.3.1.		The Applicant should update the grey seal reference population in accordance with Natural England's previous advice.	This approach was advised by Natural England for harbour seals **only** given the limited ranging behaviour of the species. Given the much larger ranging behaviour of grey seals, it is typical to assume a reference population is multiple MUs, as is presented in **Chapter 11: Marine mammals, Volume 2 [APP-052]**.
Document used: Volume 4, Appendix 11.2 Marine mammal quantitative underwater noise impact assessment [APP-148]					

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
C35	General Para 2.3.3 *et seq*	This document does not appear to have been updated with the revised Maximum Design Scenario (MDS) e.g., it still refers to 116 turbines. All documents should reflect the submitted MDS.		The Applicant should review and update document accordingly.	The Applicant notes this error and confirms the revised MDS is 90 WTG, and this is corrected in the Errata submitted at Deadline 1. As there are fewer turbines it will result in fewer piling days and there will be less impact. Therefore, no change is required to the conclusions in **Chapter 11: Marine mammals, Volume 2 [APP-052]**.
C36	3.4.2	The first sentence states that most piling noise energy is between 30 – 500Hz, with some noise extending above 2kHz. The research quoted does not include any low frequency species, such as minke whale, and the summary of research by Finneran et al., 2015, only includes tests of noise above 1- 2kHz. We therefore consider that the Temporary Threshold Shift (TTS) notch at 2-10kHz is unlikely to be applicable to minke whales, as the tests used to ascertain this notch did not use the primary frequencies of piling noise that occur within the peak hearing range of minke whales (<1kHz).		Review the sensitivity of minke whale to piling noise, particularly addressing the points made.	The PTS expert elicitation report (Booth & Heinis, 2018) provides a summary of the potential effect of piling noise on mammalian hearing and summarises the judgments of 7 world leading experts on marine mammal hearing and noise. The first day of the workshop was spent scoping the current state of knowledge of threshold shifts in response to low frequency broadband sound sources (before later focusing on species-specific judgments as part of the elicitation process). The experts agreed that "*it was important to realise that reduced hearing ability does not necessarily mean a less fit animal (i.e. an animal of lower fitness)*." The elicitation included harbour and grey seals – two species with good low frequency hearing. Following a review and discussion of the current literature, experts determined: *"**Following exposure to low frequency broadband pulsed noise, TTS was typically observed 1.5 octaves** (see Appendix 1 - Glossary) **higher than the centre frequency of the exposure sound** for seals and porpoise (Kastelein et al. 2012a, Kastelein et al. 2012b, Kastelein et al. 2013a, Finneran 2015). For piling noise and airgun pulses, most energy is between ~30 Hz- 500 Hz, with a peak usually between 100 – 300 Hz and energy extending above 2 kHz (e.g. Kastelein et al. 2015a, Kastelein et al. 2016)".* **Based on this, the experts concluded that if piling noise resulted in a threshold shift, that this would manifest in the mammalian ear as a notch in hearing sensitivity somewhere between 2-10 kHz.** This assessment was not species-specific and was considered to apply to all marine mammals (including minke whales) based on the best available

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					knowledge (TTS studies involving low frequency broadband pulsed noise stimuli). The low frequency noise produced during piling may be more likely to overlap with the hearing range of low frequency cetacean species such as minke whales. Minke whale communication signals have been demonstrated to be below 2 kHz (Edds-Walton 2000, Mellinger et al. 2000, Gedamke et al. 2001, Risch et al. 2013, Risch et al. 2014). Tubelli et al. (2012) estimated the most sensitive hearing range (the region with thresholds within 40 dB of best sensitivity) to extend from 30 to 100 Hz up to 7.5 to 25 kHz, depending on the specific model used. Ongoing studies to directly estimate the hearing of live minke whales provide initial results suggesting *"minke whales have a much higher frequency limit to their hearing range than previously believed based upon their ear anatomy and the frequencies at which they vocalize."* (Houser, *pers comm.)* Booth & Heinis (2018) highlighted that experts considered that if PTS occurs, this would occur as a notch in hearing loss in a narrow frequency band (occurring somewhere between 2-10 kHz). They stressed this was not a loss of hearing across this entire band. Booth & Heinis (2018) also summarised the mechanisms experts considered as to whether PTS could significantly affect vital rates: *"In considering how any PTS could affect vital rates (i.e. probability of survival, probability of fertility), experts discussed the mechanisms by which this could occur. In general, experts noted that where communication has a significant social or reproductive function, that this might be a means by which survival and/or reproduction are affected.* ***Experts noted however that PTS would likely occur over a small frequency range and that much of the energy of communication signals either fell outside the likely range affected by PTS or that the loss of part of the signal would likely not affect detection of the communication signals."***

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					The Applicant acknowledges that data on minke whale hearing and potential effects of threshold shifts on vital rates are lacking. However, given the current understanding of how PTS from piling is expected to manifest in the mammalian ear – and the mechanisms that could lead to an effect on vital rates (*sensu* Booth & Heinis, 2018)- the Applicant considers that it is unlikely that vital rates would be altered in a biologically meaningful way as a result of PTS from piling. Therefore, the Applicant maintains the sensitivity of minke whales to PTS from piling should be Low. It is noted however, that if the sensitivity of minke whales to PTS from piling was to be increased, then the following would apply, and the impact would remain not significant: • Mitigated magnitude: Very Low • Sensitivity: Medium • Significance: Minor (not significant)
C37	3.5.3	Natural England notes that The Wash harbour seal population has undergone a 20-30% decline in the last 5 years. Therefore, the Applicant's justification that the sensitivity is low due to the increasing Wash harbour seal population despite offshore wind farm construction in the region should be reviewed.		The Applicant should review the sensitivity of harbour seal to piling noise, particularly addressing the points made	The sentence in 3.5.3 of **Appendix 11.2: Marine mammal quantitative underwater noise impact assessment, Volume 4** **[APP-148]** states "*The Wash harbour seal population has been increasing over this period*". The period being referred to (as stated in the preceding paragraph) was the last 10 years as presented in Russell et al., 2016 (so 2006-2016). The Applicant agrees that the SE England harbour seal population is now in decline. However, it is not known what is causing this decline. Therefore, there is no evidence to suggest that the sensitivity of harbour seals to PTS needs to be increased as a result of the current decline.

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
C38	5.2.9	The Applicant has assumed that in the worst-case temporal impact is 1 day per location. We query whether this should be higher to accommodate the use of pin piles. How likely is it that 4 pin piles would be installed every day on which there was piling? Whilst not the worst-case scenario, we also query the temporal worst-case scenario for 2 monopiles being installed per day.		The Applicant should review the worst-case number of pin piles (and monopiles) installed per day, potentially using other offshore wind farms as evidence.	The Applicant confirms the worst case for pin piles assumes that an entire four-leg multileg foundation can be installed by a piling rig, or up to two monopiles in a 24-hour period. It is not expected that more than two full multileg foundations will be driven in a day in the event that two rigs are operating, and the underwater noise assessment has been undertaken on this basis.
Document used: [APP-149] Volume 4, Appendix 11.3 Underwater noise assessment technical report.					
C39	General	In the text the Applicant has stated that up to 2 monopiles and 4 pin piles may be installed in a 24-hour period (Section 3.2.2). However, the Applicant appears to have modelled simultaneous and sequential piling occurring within a 24-hour period (Tables 4-31 and 4-33). If both sequential and simultaneous piling is within the envelope, then theoretically up to 4 monopiles or 8 jacket pin piles could be installed in a 24- hour period (and indeed this is what is stated as the worst-case scenario in Appendix 11.2). The worst-case piling scenario in a 24-hour period must therefore be clarified and modelled. It should also be clarified whether a maximum of 2 locations may be installed in a 24-hour period. We note that there is a similar lack of clarity on this matter in relation to fish, and we understand that simultaneous piling was not consented for Rampion 1.		The Applicant should clarify the piling worst-case scenario, ensure it is modelled and used consistently throughout all assessment documents.	The Applicant confirms that the assessment assumes a worst-case scenario of two piling rigs, which could in theory each install two monopiles or four pin piles in a 24-hour period.
C40	3.2	Cumulative effects have been considered with piling at the East and West locations. However, it is stated that the worst-case propagation occurs at the South and East locations (Section 4). We query whether the east and west locations are the worst- case in terms of spatial extent of underwater noise impact. Should this instead be south and east (or another location)? This may make a difference to the noise impacts that occur over larger spatial scales (e.g., disturbance assessment using noise contours).		The Applicant should ensure that the worst-case spatial extent for noise impacts from simultaneous piling has been modelled and update the assessments accordingly.	The Applicant notes that whilst the S and E locations would have the greatest impact ranges individually, in combination they would have a significant overlap, reducing the maximum total area. Therefore, the Applicant confirms that the greatest cumulative ranges were assessed to be from the combined East and West locations.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
C41	4.3	The acoustic deterrent device (ADD) duration is typically based on the permanent threshold shift (PTS) range. If the impact range is not presented for simultaneous piling, we query how an appropriate ADD duration can be calculated. The Applicant should consider this. The ADD is an important part of the mitigation measures and an appropriate duration is needed to demonstrate that its usage can reduce impacts to acceptable levels.		The Applicant should present an approach to determining appropriate ADD duration for simultaneous piling.	The Applicant highlights that there is no accepted definition for how to define a PTS range for multiple simultaneous piling locations. Where an ADD could theoretically cause fleeing towards a second piling location, this cannot be mitigated by an ADD. Therefore, the ADD duration for simultaneous piling has not been presented.
C42	5.1	Natural England notes that the underwater noise modelling has assumed a worst-case of a maximum 12 hours of operation in any 24-hour period. Evidence needs to be provided to support this assumption.		The Applicant should provide evidence to confirm assumption that piling construction noise does not occur for more than 12 hours at a time.	The Applicant notes the request to confirm the position in modelling that piling would not occur for more than 12 hours, and would like to clarify that the reference to 12 hours of noisy operation in section 5 of **Appendix 11.3: Underwater noise assessment technical report [APP-149]** refers to the 'other noise sources' such as dredging and cable laying, and does not cover piling. Modelling of piling is covered in Section 4.1, 4.2 and 4.3 and includes for a maximum 4 piles installed in a day, each of which could take 4.5 hours, for a total of up to 18 hours.
C43	5.3	Natural England expects that low order methods and/or noise abatement systems will be included in the suite of mitigation measures for UXO clearance. It would therefore be beneficial to model likely underwater noise impacts from these.		The Applicant should model impact ranges from low order UXO clearance and abated UXO clearance.	The Applicant will include the noise modelling for low order UXO clearance and using noise abatement systems in the post-consent UXO MMMP. The modelling will be undertaken before the commencement of the works licensed by the dMLs and submitted as part of the UXO clearance Marine Licence application.
C44	5.4	The Applicant should use a maximum UXO weight of 750 kg in their modelling, as per Natural England's best practice advice Environmental considerations for offshore wind and cable projects – Home (sharepoint.com) (this should also be updated in relation to fish).		The Applicant should model the impact ranges from a 750 kg UXO as the worst-case scenario.	Given the close proximity of Rampion 2 to Rampion 1, a charge weight of 525kg has been used as the maximum worst case charge weight for the project based on the previous charges found at Rampion 1. This is therefore the maximum that has been considered in **Appendix 11.3: Underwater noise assessment technical report, Volume 4 [APP-149].** The Applicant will review the UXO clearance noise modelling at the post-consent stage as part of the UXO clearance Marine Licence application.
Document used: [APP-038] Volume 5, 5.9 Report to Inform Appropriate Assessment

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
C45	Executive Summary	Natural England agree that no English sites with marine mammal designated features are required to be taken to Stage 2 of the Habitats Regulations Assessment (HRA) i.e., Likely Significant Effect can be screened out.		Agreement.	The Applicant welcomes Natural England's agreement that no English sites with marine mammal designated features are required to be taken to Stage 2 of the Habitats Regulations Assessment (HRA).
Document used: [APP-236] 7.14 Draft Piling Marine Mammal Mitigation Protocol.					
C46	Tables 2-1 and 2-2, Paragraph 5.1.30	The Joint Nature Conservation Committee (JNCC) guidelines for piling mitigation state that the soft start should be a minimum of 20 minutes. It is therefore not appropriate to have a soft start that is 7.5 minutes. The terminology used should match that in the guidelines and clearly demonstrate that the guidelines are being adhered to.		The Applicant should review mitigation terminology to ensure it matches and demonstrates accordance with the guidelines: https://data.jncc.gov.uk/data/31662b6a-19ed-4918-9fab-8fbcff752046/JNCC-CNCB-Piling-protocol-August2010-Web.pdf	The Applicant highlights that the JNCC (2010) guidance (**Appendix 3**) states: "The soft-start is the gradual ramping up of piling power, incrementally over a set time period, until full operational power is achieved. The soft-start should be a period of not less than 20 minutes." Thus, the "soft-start" is defined by JNCC as the time before full operational power is achieved. For both monopiles and pin-piles, the full time before operational power is achieved is 30 minutes as detailed in **Table 3-2, Table 3-3 and Table 3-4** of **Appendix 11.3 Underwater noise assessment technical report, Volume 4** [APP-149] and **Table 11-13** of **Chapter 11: Marine Mammals, Volume 2** **[APP-052]**. The 7.5 minutes identified in the piling parameters is only the initial phase of this overall soft-start period before full hammer energy is reached.
C47	General	We welcome the inclusion of at-source noise abatement methods in the draft MMMP, however, limited current evidence on the noise reduction of various systems and their efficacy in the environmental characteristics of the site that may affect their deployment.		The Applicant should ensure that the final MMMP considers bottlenose dolphin.	The Applicant is undertaking additional work to provide a comparison of the environmental conditions at the Proposed Development with other projects where Noise Abatement Systems (NAS) have been deployed, this will be submitted to the Examination in due course.
C48	5.1.16	Recent evidence has shown an increased presence of bottlenose dolphins in the Rampion 2 area (see our comment on the ES) and so they could be present on-site during piling activities. This species should therefore be considered when selecting the final mitigation measures for piling.		The Applicant should ensure that the final MMMP considers bottlenose dolphin.	The Applicant notes the evidence highlighted by Natural England. The **Draft Piling Marine Mammal Mitigation Protocol** **[APP-236]** include modelling of impact ranges for high frequency cetaceans which includes bottlenose dolphins. The final MMMP (as secured in Condition 11(1)() of the draft dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009])** for piling submitted in the plost-consent stage will include impacts and mitigation for bottlenose dolphins.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
C49	5.1.30	The MMMP should explicitly outline the soft start/ramp up procedure that has been modelled as the worst-case, and state that this soft start/ramp up profile will not be exceeded. This will ensure that the worst-case impact ranges are not exceeded.		The Applicant should explicitly outline the soft start/ramp up profile in the MMMP and commit to not exceeding this profile.	The soft-start/ramp up procedure is presented in the ES. This will be added into the **Draft Piling Marine Mammal Mitigation Protocol [APP-236]** at Deadline 1.
Document used: [APP-237] 7.15 Draft Unexploded Ordnance Clearance Marine Mammal Mitigation Protocol.					
C50	General	There are some details not presented in the UXO MMMP (but are presented in the piling MMMP). These include the outline ADD durations, and evidence on the reduction of noise from mitigation technologies. This information would be beneficial to present in the MMMP.		The Applicant should consider this for the final UXO MMMP, to be developed at the post-consent stage.	The Applicant acknowledges the information highlighted should have been presented in the **Draft Unexploded Ordnance Clearance Marine Mammal Mitigation Protocol [APP-237]** ADD duration and efficiency of selected noise abatement systems will be detailed in the final UXO MMMP developed in post-consent stage.
C51	2.1.9	We note that the maximum charge weight differs from Natural England's best practice advice; 525kg rather than 750kg has been used. We advise that the measures in the draft UXO MMMP are sufficient up to the 525kg maximum charge weight that has been selected. If a UXO with a higher charge weight is found, the mitigation measures would likely need revising.		The Applicant should consider this for the final UXO MMMP, to be developed at the post-consent stage.	The Applicant welcomes the advice from Natural England on this matter. A maximum charge weight of 525 kg was selected based on a review of UXO sizes found that required clearance at Rampion 1. Given the area is low risk for UXO, this was deemed an appropriate maximum charge weight for the underwater noise impact assessment. The Applicant acknowledges the point regarding the mitigation measures in the **Draft Unexploded Ordnance Clearance Marine Mammal Mitigation Plan [APP-237]** only being sufficient for UXO up to 525 kg. The Applicant will review the best practice advice and the UXO clearance noise modelling at the post-consent stage as part of the UXO clearance Marine Licence application and update if required.
C52	3.1.7	For clarity, we do not consider that an application for an EPS licence contributes to the risk of PTS being negligible. Indeed, an EPS licence is only sought if there is still a residual risk of an offence occurring after the application of mitigation (in this case, PTS or an injury offence). By seeking an EPS licence, the Applicant is acknowledging that there is still a risk of PTS occurring; therefore, the risk is not negligible.		The Applicant should consider this for the final UXO MMMP, to be developed at the post-consent stage.	The Applicant welcomes the advice on EPS licencing, satisfactory alternatives test, low order techniques and noise abatement systems for UXO clearance. The final UXO MMMP will be in line with the latest positions statements on UXO.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		When applying for an EPS licence the Applicant will need to demonstrate that all satisfactory alternatives have been considered. The Applicant is already committing to the use of the low order clearance technique "deflagration" which we support. We advise that this technique (or a similar well-evidenced low order technique) is used as the preferred option for UXO clearance. Should high order clearance be needed, we advise that this is undertaken with noise abatement e.g., a bubble curtain. For the current position on UXO clearance please see https://www.gov.uk/government/publications/marine-environment-unexploded-ordnance-clearance-joint-interim- position-statement Note that this position statement is likely to be updated before the UXO MMMP is finalised. The latest position statement should be used to inform the final UXO MMMP			
C53	5.2.10	Natural England advise that UXO clearance is only undertaken during conditions that are conducive to visual monitoring (i.e. not during periods of fog, or high sea state (≥SS4). We do not recommend that PAM is solely relied on as mitigation for UXO clearance. For UXO clearance, PAM may be used to supplement visual observations only.		The Applicant should include this clarification in the final UXO MMMP, to be developed at the post-consent stage.	The Applicant welcomes the advice on mitigation measures for UXO clearance. As UXO can only be carried out in conditions that allow for visual monitoring, the Applicant will clarify the mitigation in the final UXO MMMP to only using PAM to supplement visual monitoring not as a stand-alone mitigation.
C54	5.2.13	Recent evidence has shown an increased presence of bottlenose dolphins in the Rampion 2 area (see our comment on the ES) and so they could be present on site during piling activities. This species should therefore be considered when selecting the final mitigation measures for UXO.		The Applicant should consider this for the final UXO MMMP, to be developed at the post-consent stage.	The Applicant notes the evidence highlighted by Natural England. The **Draft Piling Marine Mammal Mitigation Protocol [APP-236]** and **Draft Unexploded Ordnance Clearance Marine Mammal Mitigation Protocol [APP-237]**) include modelling of impact ranges for high frequency cetaceans which includes bottlenose dolphins. The final MMMPs for UXO clearance submitted in the post-consent stage will include impacts and mitigation for bottlenose dolphins.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
C55	5.2.21	The statement here by the Applicant does not mention the possibility of high order clearance without bubble curtains. We recommend that the Applicant consider committing to no unabated high order UXO clearance (should high order be required). As per our comment above the efficacy of noise abatement measures in the environmental conditions that exist at the Rampion 2 site should also be considered.		The Applicant should consider this for the final UXO MMMP, to be developed at the post-consent stage.	At the post-consent stage, the Applicant will follow the latest mitigation guidelines and advice from SNCBs. When considering potential Noise Abatement Systems, the site and environmental conditions will be taken into consideration as well.
Document used: [APP-240] 7.18 Offshore in Principle Monitoring Plan					
C56	General	At present, the only post-consent monitoring that has been proposed is the industry-standard monitoring of underwater noise from the first 4 piles. However, monitoring undertaken as part of the MMMP should not be considered as post-consent monitoring as it does not meet the objective of validating impacts. Natural England are concerned that no monitoring has been outlined that would evidence the impacts to marine mammals e.g., monitoring of animal responses to impacts, including mitigated impacts. We highlight that some of the impact pathway assessments factor in mitigation to conclude no significance, therefore validating the effectiveness of the mitigation is a reasonable aim for post-consent monitoring. There has been no consideration of the areas of the assessment where assumptions have been made and where the project could contribute to filling knowledge gaps that would inform the project's assessment. Further detailed discussion is required on the monitoring plans. We understand that this is proposed to occur post-consent. However, at present we have limited understanding, and therefore low confidence, in how the monitoring will evidence the outcomes of the marine mammal assessments.		The Applicant should revise the In Principle Monitoring Plan (IPMP) in discussion with Natural England.	The Applicant confirms the only underwater noise monitoring in the **Offshore in Principle Monitoring Plan [APP-240]** is the industry standard monitoring of the first 4 piles and notes that this is not considered post-consent monitoring by Natural England. The monitoring proposed in **Offshore in Principle Monitoring Plan [APP-240]** will be used to validate the impact ranges presented in the post-consent MMMP. The Applicant welcomes Natural England's detailed comments on the **Offshore In Principle Monitoring Plan [APP-240]** to be submitted at Deadline 1 and will continue to collaborate with Natural England to develop the **Offshore In Principle Monitoring Plan [APP-240]** (as secured in Condition 11(1)(j) of the draft dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]).**

Table 4-9 Applicant's response to Natural England - Appendix D (Coastal Processes)

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
Project Parameters					
D1	NE Position on Worst Case Scenario (WCS)	In most cases Natural England agree with the position on WCS, except the following: • Impacts to the seabed due to spud legs, anchoring and propeller wash. • Maximum design scenario (MDS) sandwave clearance width and length. • Suspended sediment, plume concentration, extent, orientation, and subsequent deposition footprint. • Chalk drill arising nature and evolution. • Changes to tidal conditions due to the scheme layout(s) alone or cumulatively with Rampion 2. • Changes to the sediment transport regime due to the scheme layout(s) alone or cumulatively with Rampion 2. • Temporary sand/gravel bed impacts in shallow water.		Natural England advises the Applicant to provide the necessary updated project parameters, evidence and assessment in updated Application documents as discussed in detailed comments.	Individual points made in the detailed comments are addressed separately below. These specific identified potential pressures/impacts are considered by the Applicant to be accounted for and included within the MDS envelope for each potential impact type (e.g., seabed disturbance associated with cable burial, sandwave levelling, changes to the wave regime, changes to patterns of currents, landfall activities and infrastructure, scour) in **Chapter 6: Coastal Processes, Volume 2 [APP-047]**.
Baseline Characterisation					
D2	Data Suitability and baseline characterisation	There is a lack of post-construction evidence from Rampion 1 included in the impact assessment.		All best available evidence should be used to inform the Rampion 2 application. Therefore, Natural England advises the Applicant to include relevant lessons learned and post-construction evidence from Rampion 1 in the updated impact assessment. Natural England advises that an updated S is submitted with definitions for the significance of effect for Coastal Processes. See our detailed comments for specific points on magnitude, sensitivity, and effect significance	The Applicant notes that Rampion 1 and the Proposed Development are two distinct projects and entities. However, there is ongoing dialogue between the two projects/entities and information generated by Rampion 1 has been and is being taken into account by The Applicant. Regarding Rampion 1 post-construction monitoring data specifically, it is the Applicant's understanding that the reports for the first two years of monitoring have been submitted to the respective discharging authorities in August 2023 and that these have not yet been approved. Therefore, the evidence within such reports is still confidential and not yet in the public domain and as such, should not form the basis for this

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					representation. Additionally, the reports have not yet been signed off by the discharging authorities and are therefore subject to change. The evidence from the Rampion 1 post-construction reports is not yet available for the Proposed Development to include in the ES, due to the reasons mentioned above.
D3	Data Gaps	• Up-to-date, post-Rampion 1 installation suspended particulate matter (SPM) data, if available. • Overlapping wake effects with Rampion 1. The analysis is generally appropriate. However, we request further clarification on the following: • Bathymetry and measured wave data that underpin the wave modelling. • Representative current speed in the sediment plume modelling.		Natural England advises that more up-to-date post-Rampion 1 installation data, should be included in updated application documents, if available. Natural England requests that the applicant provides further clarification/rationale within update Application documents.	Please see the Applicant's response to Comment D2 above. In situ SPM levels have not been routinely monitored in the Rampion 1 or the Proposed Development areas, either pre- or post-construction of Rampion 1. The baseline understanding of naturally occurring SPM levels is informed by an analysis of multiple years of satellite derived values, providing better spatial and temporal extent and resolution than would otherwise be available from a limited number of point observations. A wide range of natural variability in local SPM is expected due to the process that drive it (local sediment type, height of sample in water column, recent tidal and wave conditions, etc). No measurable difference in SPM is/was expected due to the presence of Rampion 1 in its present operational phase (also see response D35)**.** As described in **paragraph 6.10.1** onwards of, **Chapter 6: Coastal processes, Volume 2 [APP-047]**, tidal current wake effects are a narrow corridor of slightly reduce speed and proportionally elevated turbulence, that rapidly recovers towards ambient conditions with distance downstream from each foundation. Each wake extends downstream in the order of only metres wide when measurable. For two wakes to overlap, the effect would need to: 1) remain measurable over the distance between foundations (many hundreds of metres); and 2) happen to coincide spatially. Both conditions are highly unlikely to result in any meaningful additive effect other than that already described for all of the individual foundations (for the Proposed Development and Rampion 1) (also see response D37)**.** The wave modelling undertaken to inform assessments of potential impacts on wave height is informed by project specific bathymetry in the Rampion 1 and the Proposed Development array areas, as well as other regional scale data sources. Three locations of measured wave data from the Rampion 1 metocean survey were used to validate the long term hindcast data that were used to define the specific wave scenarios actually (also see response D38 and D39).

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					For a given total volume and rate of sediment disturbance, there is a proportional relationship between the ambient current speed and the resulting plume concentration, extent and thickness of deposition at certain distances. The representative case provided by a 0.5m/s current speed is experienced frequently by all locations in the array area and ECC. Other current speeds are possible, but there are a very large range of possible local values. The assessment provides the basis for a proportional understanding of differences in this respect (also see the Relevant Representation submitted by Natural England **D41**)
Environmental Impact Assessment					
D4	Identified impacts	The following potential pressures/impacts have not been considered/assessed: • See those listed in the WCS section above. • Pre-lay grapnel run (PLGR), UXO and boulder clearance. • Impacts to the sandwave field within the array area and their recovery. • Impacts on Kingmere MCZ due to changes in the wave regime. • Impacts to sandbanks and sandwaves due to changes in the tidal regime. • Extent and magnitude of overlapping wakes between Rampion 2 and Rampion 1. • Impacts in the nearshore, inter-tidal and shallow areas due to the presence of cable protection measures during operation. • Palaeo-channel infill substrate scour.		Natural England advises that an updated ES is submitted which includes and assess these pressures/impacts across the EIA	These specific identified potential pressures/impacts are considered by the Applicant to be accounted for and included within the assessments and MDS envelope for each potential impact type (e.g. seabed disturbance associated with cable burial, sandwave levelling, changes to the wave regime, changes to patterns of currents, landfall activities and infrastructure, scour) in Sections 6.9 and 6.10 of **Chapter 6: Coastal processes, Volume 2 [APP-047].** Potential impacts were assessed to be not significant. Pre-lay grapnel run (PLGR), UXO and boulder clearance are addressed in response D12. Impacts to the sandwave field within the array area and their recovery are addressed in responses D15 and D31. Impacts on Kingmere MCZ due to changes in the wave regime is addressed in response D19. Impacts to sandbanks and sandwaves due to changes in the tidal regime are addressed in response D26. Extent and magnitude of overlapping wakes between Rampion 2 and Rampion 1 is addressed in response D27. Impacts in the nearshore, inter-tidal and shallow areas due to the presence of cable protection measures during operation. are addressed in response D25. Palaeo-channel infill substrate scour is addressed in response D36.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
D5	Definitions for magnitude and sensitivity	The definitions of magnitude and sensitivity are acceptable for this assessment only. However, it is worth noting that Chartered Institute of Ecology and Environmental Management (CIEEM) (2018) avoid and discourage use of the matrix approach and categorisation. There are a number of category assessments for Coastal Processes which have been downplayed, resulting in a lower significance of effect. We also note that the definitions for significance of effect have not been provided for Coastal Processes. There are also inconsistencies in the criteria for magnitude of change used in Chapters 5 and 6.		Natural England advises that an updated S [sic] is submitted with definitions for the significance of effect for Coastal Processes. See our detailed comments for specific points on magnitude, sensitivity, and effect significance.	The Applicant notes that alternative assessment methodologies are described in the wider literature. However, the magnitude/sensitivity categories and definitions, and the resulting matrix of significance of effect used in relation to **Chapter 6: Coastal processes, Volume 2 [APP-047]** is consistent with the majority of other contemporary and historical assessments for other offshore wind farms. The change would not affect the conclusions of the assessment and so there would be no material benefit in submitting an updated assessment. The significance of effect is the result of the combination of the assessed magnitude and sensitivity inputs and is not normally separately defined for this topic. The other detailed comments (of Natural England) regarding the conclusions of magnitude /sensitivity / significance of effect are addressed in the responses below on a case-by-case basis.
Cumulative Effect Assessment Screening					
D6	Cumulative Effect Assessment Impacts	Climping Beach SSSI and the adjacent stretch of coast at landfall are vulnerable, fragile, and susceptible to erosion. Consequently, we have concerns regarding potential impacts due to the presence of cable protection measures in the nearshore and intertidal, export cable installation, and asset integrity through the lifetime of the project. In light of the latest coastal flooding at Climping Beach and surrounding area, we also question whether sufficient consideration has been given to the resilience of infrastructure to coastal change/flooding		Natural England advises that further consultation with the EA on future beach management plans is required to demonstrate that assets are resilient to coastal change at the landfall area and will remain buried for the lifetime of the project. Natural England advises that the placement of cable protection in shallow nearshore areas should be avoided. Natural England advises that an additional assessment of cable protection measures in shallow nearshore areas using wave modelling should be included within an outline Cable Specification and Installation Plan to be submitted as part of the consenting considerations.	Potential impacts to the coastline at the landfall are assessed in **paragraph 6.9.46** onwards of **Chapter 6: Coastal process, Volume 2 [APP-047]**. The present day and likely future nature of the coastline is accounted for in the assessments of impacts of installation. The actual nature of future coastal change and flood risk is largely subject to wider future coastal protection strategy decisions to be made by the EA and the Applicant has, and will continue to, engage with the EA to understand this further. Further ground investigation will be carried out at the landfall at the post-DCO Application stage as outlined in commitment C-247 (**Commitments Register [APP-254]**) and secured within the **Draft DCO [PEPD-009]** Requirement 26. The ground investigation will inform a 'coastal erosion and future beach profile estimation assessment' which will advise regarding the need for and design of any further mitigation and adaptive measures to help minimise the vulnerability of these assets from future coastal erosion and tidal flooding. To confirm what has been assessed already: Assessment of risks and impacts seaward of MHWS are covered in the offshore assessment(s), and specifically ES **Chapter 6: Coastal Processes, Volume 2, [APP-047]** of

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					the ES in which coastal processes, including the future coastal erosion / alignment, were considered in more detail. The onshore assessment (**Chapter 26: Water Environment, Volume 2 [APP-067]**) covered the onshore elements of the Proposed Development landward of MHWS and considered tidal flood risk. The Environment Agency geomorphological studies (2020a; 2020b) assessed the likelihood of different coastal evolution scenarios across the coastal frontage. These geomorphological studies were reproduced in **Figure 6.1.9 of Appendix 6.1: Coastal processes technical report: Baseline description, Volume 4 [APP-129]** of the ES. The Environment Agency geomorphological reports were used as a basis to assess the future risk of coastal change to the onshore development (being considered in an onshore coastal change vulnerability assessment). The risk related specifically to the potential exposure of the landfall cables and associated joint bay due to further coastal erosion. Whilst there is noted uncertainty with regards to the anticipated future coastlines presented, a sequential approach has been considered to locate the landfall transitional joint bay on the landward side of the most extreme of these estimates. In a meeting held with the Environment Agency in March 2023, they noted that that short-term changes associated with recent storms are unlikely to have consequences to the validity of the future estimated coastlines at the landfall location. **Chapter 6: Coastal processes, Volume 2 [APP-047]** of the ES concludes that construction and operation and maintenance activities will not significantly impact coastal morphology and offshore sediment transport and therefore the development will not increase the risk of coastal flooding and erosion. On the basis of the assessment undertaken in **Chapter 6: Coastal processes, Volume 2 [APP-047]** and commitment C-247(**Commitments Register [APP-254]**) which secures a coastal erosion and future beach profile assessment via the **Outline Code of Construction Practice (CoCP) [APP-224]** (Table 5-9) (Requirement 22 & 26, Schedule 1 of the **draft DCO [PEPD-009])** the coastal vulnerability of the Proposed Development is considered to be low, for which further mitigation will be identified and implemented post-granting of DCO as necessary.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					For further information **the draft DCO** Requirement 26 **[PEPD-009]** states that i. No works comprising Work Nos. 6 or 7 are to commence until a coastal erosion and future beach profile estimation assessment has been carried out and a scheme identifying any mitigation or adaptive management measures required to help minimise the vulnerability of this part of the Order land from future coastal erosion and tidal flooding (if required) has been submitted to and approved in writing by the Environment Agency. ii. Any mitigation or adaptive management measures identified as part of the scheme submitted pursuant to (1) above must be implemented as approved. The following embedded environmental measure is in the **Commitments Register [APP-254]**: C-247: RED will undertake ground investigation at the landfall site at the post-DCO application stage. This will be carried out to inform the exact siting and detailed design of the transition joint bay (TJB) and associated apparatus. In addition, this will inform a 'coastal erosion and future beach profile estimation assessment', which in turn will inform the need for and design of any further mitigation and adaptive measures to help minimise the vulnerability of these assets from future coastal erosion and tidal flooding (as secured by Requirement 26, Part 2 of the **draft DCO [PEPD-009]**). A Cable Specification and Installation Plan is also secured by Condition 11(1)(n) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**) which requires *"proposals for monitoring offshore cables including cable protection during the operational lifetime of the authorised scheme which includes a risk-based approach to the management of unburied or shallow buried cables".* The Applicant would like to discuss with Natural England what further consideration it might seek or if this response clarifies the matter. The Applicant notes that the export cable will be installed by Horizontal Directional Drilling and that there will be only underground works in the intertidal area (as secured by Work No. 5— (a) up to four temporary horizontal directional drilling exit pits located seaward of MLWS Schedule 1, Part 1 of the **draft DCO [PEPD-009]).**
D7	Cumulative Effect Assessment Conclusions	Currently, we need further information and/or assessment, as listed above and in our detailed comments before we can agree with any conclusions drawn.		We advise that further information and additional assessment are required, based upon relevant evidence and/or lessons learned from Rampion 1.	A specific DCO commitment to undertake suitable further assessments as part of the engineering design process has also been made in **Table 6-12** of **Chapter 6: Coastal processes, Volume 2 [APP-047]** C-247 (secured by Requirement 26, Schedule 1 of the **draft DCO [PEPD-009])**:

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		Moreover, limited evidence or lessons learned from Rampion 1 have been included in this EIA.			The Applicant will undertake ground investigation at the landfall site at the post-DCO application stage. This would be carried out to inform the exact siting and detailed design of the TJB and associated apparatus. In addition, this would inform a 'coastal erosion and future beach profile estimation assessment', which in turn would inform the need for and design of any further mitigation and adaptive measures to help minimise the vulnerability of these assets from future coastal erosion and tidal flooding. Please see the Applicant's response to Comment D2 above regarding Rampion 1.
Mitigation Summary					
D8		• Scour monitoring to validate ES predictions, including export cable, array(s) and palaeo-channel infill substrate. • Sandbank/sandwave recovery analysis.			For further information, the **draft DCO** Requirement 26 **[PEPD-009]** states that i. No works comprising Work Nos. 6 or 7 are to commence until a coastal erosion and future beach profile estimation assessment has been carried out and a scheme identifying any mitigation or adaptive management measures required to help minimise the vulnerability of this part of the Order land from future coastal erosion and tidal flooding (if required) has been submitted to and approved in writing by the Environment Agency. ii. Any mitigation or adaptive management measures identified as part of the scheme submitted pursuant to (1) above must be implemented as approved. The following embedded environmental measure is in the **Commitments Register** **[APP-254]**: C-247: RED will undertake ground investigation at the landfall site at the post-DCO application stage. This will be carried out to inform the exact siting and detailed design of the transition joint bay (TJB) and associated apparatus. In addition, this will inform a 'coastal erosion and future beach profile estimation assessment', which in turn will inform the need for and design of any further mitigation and adaptive measures to help minimise the vulnerability of these assets from future coastal erosion and tidal flooding (as secured by Requirement 26, Part 2 of the **draft DCO** **[PEPD-009]**). The Applicant would like to discuss with Natural England what further consideration it might seek or if this response clarifies the matter.

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					Sandbank/ sandwave recovery analysis is addressed in response D31.
Document Used: [APP-045] 6.2.4 Chapter 4 The Proposed Development					
D9	Chapter 4 Section 4.4	We note that Horizontal Directional Drilling (HDD) is to be used to install ducts that will house the cables under Climping Beach. Will any access be required to the beach? Furthermore, will cofferdams be required for the HDD exit pits? And have jointing bay depths taken into account potential changes in sea level and flood defence management over the lifetime of the project.		Natural England advises that further information is required from the Applicant before we can fully advise on the potential impacts. This additional information and associated assessment should be provided within updated Application documents.	It is noted that Climping beach is currently being and will continue to be changed by coastal processes, including changes in sea level. Changes to flood defence management may also occur over the lifetime of the Proposed Development. The land site of the landfall location has been defined with a relatively wide redline boundary to account for observed and potential future changes at Climping beach, enabling a flexible approach to the detailed design work, which will be undertaken after the grant of consent. At the PIER stage a single TJB was consulted on and in response to comments received a second TJB location was included in the second Statutory Consultation exercise (18 October to 29 November 2022) within the Preliminary Environmental Information Report Supplementary Information Report (PEIR SIR). This second TJB location, though further from MLWS, is in a slightly higher location which has an even lower chance of flooding. The joint bay depths will be at same at either location used. The horizontal directional drilling (HDD) will be designed to avoid the need to access Climping beach, principally by the exit pits being located seaward of MLWS. There are no plans for cofferdams to be used for the HDD exit pits and this has not been assessed within the Environmental Statement.
D10	Chapter 4/Table 4-5	Maximum sandwave clearance impact width, for the array and interconnector cables in the array area, is 10m and the maximum length of cables affected by sandwaves is anticipated to be 60km. Are these realistic? In terms of the length of cables likely to be affected by sandwaves, is there evidence from Rampion 1 that can be used to inform this maximum value? Furthermore, of the 60km quoted, what is the proportion of array vs interconnector cable length that is anticipated to be affected by sandwaves?		Natural England advises that further evidence is required to support the realistic WCS parameters and Maximum Design Scenario (MDS) parameters as set out in the DCO/dML. Ideally, this would be included within an Outline Cable Specification and Installation Plan submitted to support the consenting phase	Maximum sandwave clearance trench dimension Maximum Design Scenario ("MDS") has been informed by standard descriptions and protocols for this activity. The base of the trench will have a minimum fixed width that must be achieved to subsequently allow the cable burial tool to pass (which is the purpose of the levelling). Sloped sides to the cleared path will increase the apparent width in proportion to the local depth of sediment cleared (i.e. continuously varying from trough to crest of individual sandwaves). Allowance for this is made in the estimated total volume of sandwave clearance required, also informed by the detailed bathymetry of the project area and the realistic height and number of sandwaves that might be encountered. The estimated values are conservatively determined for the purpose of the EIA (not based on a specific route through specific features).

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					No specific sand wave clearance work was undertaken for Rampion 1, hence there is no evidence that can be provided from this project. There is no proportion of array vs interconnector cable length anticipated to be affected by sand waves which can be provided ahead of detailed design being undertaken.
Document used: [APP-046] 6.2.5 Chapter 5 Approach to the Environmental Impact Assessment					
D11	Chapter 5/ Graphic5.4 and [APP-047]. Chapter 6/ Section 6.8	Graphic 5-4 sets out the general process of evaluating significance, incorporating magnitude of impact and value or sensitivity of receptor. The embedded matrix shows the categories for magnitude of change as: major, moderate, minor, and negligible. However, these do not agree with the definitions provided in Section 6.8 of [APP-047] Chapter 6 (Coastal Processes) which states that the categories for impact magnitudes are: high, medium, low, and very Low.		Natural England requests that the Applicant provides further clarity on this matter and updates Application document s accordingly. Please note also that the Chartered Institute of Ecology and Environmental Management (CIEEM) do not advocate the use of a matrix approach to determining effect significance.	The Applicant agrees that the terms "High; Medium; Low; Very Low" are used to describe categories of assessed magnitude of potential impact in **Chapter 6: Coastal processes, Volume 2 [APP-047]** (defined in **paragraph 6.8.2** and then used consistently throughout **Chapter 6: Coastal processes, Volume 2 [APP-047]**). The same definitions section also refers to the project wide EIA approach for details of the matrix of significance and other EIA methodology details, which instead uses the terms (Major; Moderate; Minor; Negligible) to describe categories of assessed magnitude (**Chapter 5: Approach to the Environmental Impact Assessment, Volume 2 [APP-046]**). There is therefore, an unintended difference in terminology (that was not updated from an earlier stage of work). The Applicant can confirm that equivalent terms are: High = Major; Medium = Moderate; Minor = Low; Negligible = Very Low. The conclusions of magnitude and significance in the assessments remain unchanged.
Document used: [APP-047] 6.2.6 Chapter 6 Coastal Processes					
D12	Chapter 6	We note that Pre-Lay Grapnel Run (PLGR), Unexploded Ordnance (UCO) clearance and boulder clearance have not been considered for impacts on coastal processes. Yet they can lead to pressures such as abrasion/disturbance of the substrate on the surface of the seabed, changes in suspended solids, smothering etc.		We advise that coastal process impacts due to PLGR, UXO clearance, and boulder clearance should be considered and assessed within updated Application documents.	Pre-Lay Grapnel Run ("PLGR") and Unexploded Ordnance ("UXO") clearance are common preparatory activities as part of cable burial. The assessed MDS for cable burial is represented by the relatively more energetic cable trenching and associated sandwave clearance activities. PLGR and UXO clearance in the same locations may produce a broadly similar type of disturbance, but of a clearly smaller magnitude and potential for impact. The potential impacts of these activities are considered by the Applicant to be already contained and assessed within the MDS envelope for cable burial. The impact of MDS PLGR (boulder clearance) and UXO clearance on benthic ecology receptors is assessed in

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 **[APP-050]**.
D13	Chapter 6	We note that jack-up vessels/anchoring may be used during construction. Have impacts to the seabed been assessed for spud leg/anchoring depressions?		Natural England requests that if not already done so, these impacts are considered and assessed in an updated ES.	The use of jack-up vessels and (to a lesser extent) vessels with anchors is common in offshore wind farm construction. However, any actual indentations in the seabed left by such activities have not previously been identified as a meaningful potential or actual impact to coastal processes receptors. As such, this is not normally scoped into the coastal processes assessment. The impact of MDS jackup leg footprints on benthic ecology receptors is assessed in Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 **[APP-050]**.
D14	Chapter 6 Page 5/ Executive Summary	The Executive Summary states that for the most part 'coastal processes are not in themselves receptors…but are instead 'pathways' of effect. However, we highlight that there are a number of coastal processes receptors within the study area, including the coastline, sandbanks/sandwaves, and designated sites		Natural England requests that the applicant confirms that all coastal process receptors have been identified and therefore assessed.	The Applicant can confirm that the specifically identified coastal processes receptors are identified in Table 6-6 of Chapter 6: Coastal processes, Volume 2 **[APP-047]**, which includes all named receptors identified within the study area for the following categories: nationally or internationally designated sites; local coastlines; regional coastlines; offshore sandbanks; and recreational surfing venues. The Applicant also confirms that the identified receptors are assessed with respect to the relevant potential impacts and pathways of effect.
D15	Page 31/ Table 6-7	We note that the **sandwave field** within the array has not been included in the list of receptors. However, this is an important seabed morphological feature and potential supporting habitat which should be included in the assessment. Similarly, sandbanks **(designated or otherwise)** are important geomorphological features that may provide supporting habitat and should be identified as receptors and scoped into the assessment.		Natural England advises **that sandbanks/sandwaves** are included within the list of **receptors** and the application documents are updated accordingly.	Mobile sediment is present in the array area, with associated bedforms (in some locations) ranging in size from ripples to (relatively small) sandwaves. These features are not part of a nationally or internationally designated site and are a common natural feature of this type of environment. As a result, they have not been assessed as a sensitive receptor in their own right. The pathway of potential effect on sediment transport in the wider study area, and so the processes controlling future bedform development in Chapter 6: Coastal Processes, Volume 2 **[APP-047]**, identified no likely measurable effect on sediment transport (or bedforms) and no significant effect on named sandbank receptors.

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
D16	Page 42/ Table 6-11	Construction: Changes in Suspended Sediment Concentration (SSC) and deposition of disturbed sediments due to dredging, 3rd Column, Maximum Assessment Assumptions, Seabed Preparation Area. Total dredge/disposal volume of 19,500m^3 is quoted for Offshore Substation (OSS) foundation, based on seabed preparation area of 100 x 60m x 1m x 3 OSS, but we query whether this should be 18,000m^3.		Natural England requests that the Applicant checks these figures and ensures that correct volumes are included in any assessment and the DCO/DML.	The quoted value is based on the principles for dredging footprint (footprint +15 m all around) and dredge dimensions of 100 m x 65 m (based on an earlier maximum leg separation of 35 m and up to 6 legs). The difference in the quoted width of the dredge area does not affect the basis or the conclusions of the assessments already made and remains representative of realistic dimensions within the maximum possible ranges. Maximum disposal volumes are specified in part 1 of each of the dML (Schedules 11 and 12 of the **draft DCO [PEPD-009]).**
D17	Page 52/ Table 6-12	Commitment C-283 – it does not state where the proposed gravel bags may be placed, or which areas of seabed may be affected.		Natural England requests that the Applicant provides a map of gravel bag locations in order for us to agree with conclusions drawn on the significance of their use. Ideally, this would be included within an Outline Cable Specification and Installation Plan submitted to support the consenting phase.	The requirement for the use of gravel bags will be determined during detailed design, once the contractor completing the works has been appointed following consent. If it is deemed that gravel bags are needed, the location of where these need to be placed will also be determined during the detailed design, this will be detailed in the Cable Specification and Installation Plan secured by Condition 11(1)(n) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**). In response to Issue Specific Hearing 1 agenda item 46, the Applicant has produced an assessment of temporary gravel beds: **Appendix 13 - Further Information for Action Point 45 and 46 – Physical Processes and Benthic (Document reference 8.25.13).**
D18	Page 52/6.8	Methodology for ES Assessment – impact magnitude definitions and coastal process receptor sensitivity definitions have been provided, but no definitions are provided for the resulting significance of effects.		Natural England requests that the Applicant includes the matrix, or other **method used for determining significance of effect** with an updated Application document. Without this, we are unable to agree with any conclusions drawn.	Please refer to the Applicant's response to Comments D5 and D11 above. **Chapter 6: Coastal processes, Volume 2 [APP-047]** provides definitions for categories of impact magnitude and receptor sensitivity. The project wide approach detailed in **Chapter 5: Approach to the Environmental Impact Assessment, Volume 2 [APP-046]** is referred to for the corresponding matrix of significance. The significance of effect is the result of the combination of the assessed magnitude and sensitivity inputs, and is not normally separately defined (for this topic).

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
D19	Page 55/6.8.19	We note that for the assessment of potential changes to the wave and hydrodynamic regimes, no coastal processes receptors have been identified. However, a reduction in significant wave heights on the downwind boundary could affect sensitive receptors that overlap with the wave shadow area (e.g. Kingmere MCZ).		We advise that there are coastal process receptors which may be affected by changes to the wave and hydrodynamic regimes. These should be identified and assessed accordingly within updated Application documents.	The extent and magnitude of maximum proportional reduction in significant wave height is illustrated in **Figure 6.4, Chapter 6:, Coastal processes – Figures, Volume 3 [APP-079]** and the location of all designated sites, including the extent of Kingmere Marine Coastal Zone (MCZ) is illustrated in **Figure 6.2, Chapter 6:, Coastal processes – Figures, Volume 3 [APP-079]**. The figures indicate that a minimal reduction (2.5 to 5 % reduction) in smaller (50 % non-exceedance) waves might overlap with Kingmere MCZ, or areas updrift of it. Figures A6 to A20 in **Appendix 6.3, Coastal processes technical report Impact assessment, Volume 4 [APP-131]** illustrate that for other larger wave conditions from a range of coming directions, the reduction is less than 2.5 %. As assessed in **Chapter 6: Coastal processes, Volume 2 [APP-047]**, in all cases, the reduction in wave height is small in relative and absolute terms, and in comparison to the normal range of natural variability. As a result, no measurable change to the environmental processes (waves or sediment transport) in the Kingmere MCZ was identified.
D20	Page 59.6.9.7	The minimum turbine spacing for the smaller and larger WTG options is 950m to 1130m, respectively. However, in the footnote, a minimum spacing of 830m for even smaller WTGs which could be employed, is provided. It also states that only relatively fine sediment is likely to be advected far enough to potentially cause overlapping effects of SSC.		Natural England requests that the Applicant clarifies the separation distances for the proposed turbines and that plume dispersal range and settlement thickness are appropriately assessed within the application documents. If not, these would require updating.	Minimum turbine spacing at 950m and 1130m represents the minimum spacing for the smaller and larger turbines scenarios respectively, however for the purposes of the EIA, and specified within the draft DCO **[PEPD-009]**, a minimum of 830m has been used to provide for the possibility of smaller WTGs being employed (note that such a scenario would not exceed any other relevant assessment parameters, including the maximum of 90 WTGs. If activities causing sediment disturbance are undertaken simultaneously at two or more locations that are aligned in relation to the ambient tidal streams, then there is potential for overlap between the areas of effect on SSC and sediment deposition. The potential for in-combination effects on SSC and sediment deposition is considered to be low, due to the low likelihood of sufficiently close alignment (along the tidal axis) between WTG foundations that are being simultaneously installed. The assessment of overlapping and cumulative impacts for sediment plumes is provided in, **Appendix 6.3: Coastal processes technical report: Impact assessment, Volume 4 [APP-131]**. The relative distance between the foundations is not a key factor in this statement as the majority of coarser sediment (sand and gravel) is expected to be redeposited out of the plume

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					over distances less than the minimum separation distance between foundations, and the remaining finer material will persist in suspension for distances longer than the maximum separation distance between foundations.
D21	6.9.33	We note that **significance of residual effect has not been assessed for increases in SSC and deposition of disturbed sediments due to cable installation**, on the basis that there are no coastal process receptors sensitive to the impact pathway. However, this impact has the potential to affect **designated MCZ features which are identified as coastal processes receptors** requiring assessment (see Table 6-6),		We advise that significance of effect should be defined within the application documents. And where impacts on MCZ features are assessed in other documents, this should be signposted.	Whilst seabed disturbance and associated changes in suspended sediment concentrations ("SSC") and deposition of sediment will occur, the Kingmere MCZ is not identified as a receptor (or containing receptors) that is/are directly or indirectly sensitive to the occurrence of such changes (similar to fluctuating everyday natural processes). As such, the nature and magnitude of the effect is described as a pathway (in **paragraph 6.9.21** onwards, **Chapter 6: Coastal processes, Volume 2 [APP-047]**). Impacts and impact assessment on other MCZ features (e.g. benthic ecology features) are signposted in the same assessment, **paragraph 6.9.32**, **Chapter 6: Coastal processes, Volume 2 [APP-047]**.
D22	6.9.71-6.9.72 & [APP-216] Appendix 26.2	We advise that **cable protection measures installed at landfall** represent a lasting rather than short-term/temporary change even if removed at the time of decommissioning. Consequently, we advise that the **magnitude of change** would be **greater than low.**		We advise that the **magnitude of change** is **greater than low** for Climping Beach SSSI and the wider coastal morphology at the landfall. We advise that cable protection should be avoided within the depth of closure. An additional assessment should be carried out (e.g., wave modelling) based on the WCS for cable protection requirements	The magnitude of change categories are described in **paragraph 6.8.2**, **Chapter 6: Coastal processes, Volume 2 [APP-047]**. The magnitude of change potentially caused by nearshore cable protection (paragraphs 6.9.71-6.9.72 of the same document) is assessed as Low due to both the temporary (during the lifetime of the project) and localised nature of any potential effect from the realistically anticipated design of cable protection nearer to the landfall (i.e. sufficient low profile to avoid any measurable effects other than changes to seabed type in the footprint of the protection itself, and the possibility of a small amount of very near-field scour). The protection is not expected to present any measurable blockage to currents or local sediment transport, or changes to the wave climate coming onto the adjacent beach, and therefore, no far field changes to Climping Beach SSSI or the wider coastal morphology at the landfall. An assessment of Medium magnitude of change would imply permanent changes to key characteristics or features of the seabed or coastline in far-field areas, which are not realistically expected. Further ground investigation will be carried out at the landfall at the post-DCO Application stage as outlined in commitment C-247 (**Commitments Register [APP-254]**) and secured within the **Draft DCO [PEPD-009]** Requirement

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					26. The ground investigation will inform a 'coastal erosion and future beach profile estimation assessment' which would inform the final cable burial and protection designs. Wave modelling at the scale of the cable protection units (tens of centimetres to a few metres overall dimensions) is not normally undertaken as part of the design process. However, the cable protection design process is informed by a large evidence base of empirical formulae and relationships based on a wide range of historical data including laboratory testing, computer simulations and real-world observations.
D23	Page 73/6/9/73	In 6.4.26.2, it states that the section of sea defence at the proposed landfall *"is considered to be 'very vulnerable,' not just to overtopping, but also erosion and natural coastal realignment."* Natural England highlights that Climping Beach SSSI is a stretch of coast with a vegetated shingle beach, backed by a sand dune system, with the intertidal zone supporting important wintering birds. Vegetated shingle beaches are nationally uncommon and sand dune systems are fragile and susceptible to erosion. Thus, given that cable protection requirements are not presently known, we would advise that the **sensitivity** of the Climping Beach SSSI as well as the wider coastal morphology at landfall, is **greater than medium**.		We advise that the **sensitivity** of the Climping Beach SSSI and the wider coastal morphology at landfall, is **greater than medium**. We note that the sea defences at Climping have failed in the recent storms, causing further coastal erosion and flooding. It is imperative that landfall HDD burial depths and cable protection options are adequately interrogated to future proof the asset integrity and prevent unnecessary coastal rock armouring. Especially as the shoreline management plan is to let the coast roll back, see: https://se-coastalgroup.org.uk/media/2019/02/Selsey- Bill-to-Littlehampton-RBMP.pdf	Please refer to the Applicant's response to comment D6 above. The Applicant considers that the assessed sensitivity of the Climping Beach SSSI and the wider coastal morphology at landfall is medium, as per the definitions established in **paragraph 6.8.3** of **Chapter 6: Coastal Processes, Volume 2 [APP-047]** and also based on the capacity to accommodate the proposed form of change (which is localised and of very small potential magnitude). The HDD profiles will be designed by the appointed landfall HDD contractor post consent once sufficient site investigation information has been obtained (to be approved as part of the onshore construction method statement pursuant to Requirement 23, Schedule 1 and following the completion of the coastal erosion and future beach profile estimation assessment secured by Requirement 26 Schedule 1 of the **Draft DCO [PEPD-009])**. Though subject to what is determined to be the soil and rock profile at the landfall, the drill will typically be at least 6 m below ground/beach/seabed level with the exception of the short transition distance at the start and exit points of the drilling works. With this significant level of overburden above the HDD ducts, there is no expected need for any rock armouring in this vicinity either during construction or during operation.
D24	Page 73/6/9/74	Following on from our comments above, we advise that the significance of **residual effect** on morphology at landfall, including Climping SSSI, is **greater than minor adverse and cable installation is an operation likely**		We advise that the **residual effect** on morphology at landfall, including Climping SSSI, is **greater than minor adverse**. Therefore, we advise that impact assessments are updated, and the mitigation hierarchy is adopted.	Please refer to the Applicant's response to comment D6 above.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		to damage the notified features of the SSSI.			
D25	Section 6.10	Changes to the **nearshore wave regime/longshore sediment transport due to the presence of cable protection measures** have not been considered for the **operational phase.**		Natural England advises that the Applicant needs to assess changes to the **nearshore wave regime/longshore sediment transport** due to the presence of **cable protection measures during the operational phase**. Ideally this would be included in an Outline Cable Specification and Installation Plan.	Changes to the nearshore wave regime/ longshore sediment transport due to the presence of cable protection measures are assessed in paragraph 6.9.71 onwards of **Chapter 6: Coastal processes, Volume 2 [APP-047]**. The assessment (listed here under construction phase potential impacts) finds that "*if cable protection is installed at the landfall it will be installed with a sufficiently low profile relative to the surrounding bed to present minimal barrier to the passage of waves and so cause no change to long term patterns of sediment transport*". The same assessment implicitly extends throughout the operational and decommissioning phases. A Cable Specification and Installation Plan is secured by Condition 11(1)(n) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**).
D26	Page 75.6.10.7-6.10.8	**Outer Owers Bank that overlaps, and sandwaves within the array,** are coastal process receptors that may be affected by changes to the tidal regime. However, this has not been considered or assessed.		Natural England advises that sandbanks**/sandwaves** that overlap/within the array areas are included within the list of **receptors** and assessed within updated application documents.	Changes to the tidal regime due to presence of windfarm infrastructure are assessed in paragraph 6.10.1 onwards, of **Chapter 6: Coastal processes, Volume 2 [APP-047]**. Outer Owers Bank is one of the named receptors in this chapter, however, the active or raised part of the bank does not overlap the array area. The MDS potential changes to currents are found not to overlap any of the identified coastal processes receptors.
D27	Page 75/6.10.7/2nd bullet point	It is stated that there is the potential for **overlapping wake effects** between Rampion 2 foundations and a small number of foundations in the adjacent Rampion 1 array. What is the extent and magnitude of these overlapping wake effects?		Natural England advises that this should be considered and assessed, and any evidence from Rampion 1 included in updated application documents.	As described in paragraph 6.10.1 onwards of **Chapter 6: Coastal processes, Volume 2 [APP-047]**, tidal current wake effects are a narrow corridor of slightly reduced speed and proportionally elevated turbulence, that rapidly recovers towards ambient conditions with distance downstream from each foundation. Each wake extends downstream in the order of only metres wide when measurable. For two wakes to overlap, the effect would need to: 1) remain measurable over the distance between foundations (many hundreds of metres); and 2) happen to coincide spatially. Should this effect arise, both conditions are highly unlikely to result in any meaningful additive effect other than that already described for all the individual foundations (for the Proposed Development and Rampion 1).

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
D28	Page 78/6.10.18	Impacts to **designated sites** should also be included as receptors that could be affected by **changes in the wave regime** through the presence of the proposed development alone and in combination with Rampion 1.		Natural England advises that **designated sites** as receptors that could be affected by changes to the wave regime (due to the presence of the proposed development alone and cumulatively), are included by the Applicant in updated impact assessments.	Please refer to the Applicant's response to comment D19 above. The assessment results shown include MDS for the Proposed Development alone and for the Proposed Development in combination with Rampion 1.
D29	Page 79/6.10.21	The use of **cable protection measures within shallow, sandbank/sandwave, nearshore and intertidal areas** have the potential to alter the **sediment transport regime**. However, this has not been included here.		We advise that potential changes to the sediment **transport regime** due to the presence of **cable protection within shallow, sandbank/sandwave, nearshore and intertidal areas** need to be considered and assessed within updated application documents	Please refer to the Applicant's response to comment D25 above with regard to cable protection measures nearshore (i.e. in shallow, nearshore and intertidal areas). The potential impact of cable protection measures is otherwise described in **Section 5** of **Appendix 6.3: Coastal processes technical report Impact assessment, Volume 4 [APP-131]**.
D30	Page 81/6.10.34	With respect to changes at the coast, it is stated that *"there will be no measurable reduction in wave height at adjacent coastlines…Accordingly, these changes are not predicted to have any measurable influence on alongshore and cross-shore sediment transport."* Is there any evidence from Rampion 1 regarding changes to the wave climate due its presence?		Natural England advises that the Applicant includes/considers any relevant evidence from Rampion 1 regarding changes to the wave climate due to the presence of the wind farm within updated application documents.	Please see the Applicant's response to Comment D2 above.
D31	Page 82/6.10.35	We note that the **sensitivity of the sandwaves** within the array has not been considered/assessed. In addition, the sensitivity and significance of effect have been evaluated for nationally and internationally designated sites, but not their magnitude of impact.		Natural England advises that the Applicant assesses **sensitivity of the sandwaves** within the array. The magnitude of impact to designated sites also needs to be evaluated. Both of which should be included in updated Application documents.	Concerns were discussed as part of the ETG meeting 3 November 2021 attended by Natural England (see **Evidence Plan** part 1 of 11 **[APP-243])**. It was agreed that limited or no measurable change is assessed as likely to occur to the wave climate or tidal regimes affecting these areas, and therefore, there would logically be no change to regional sediment transport patterns or patterns of sandwave mobility. Direct impacts on sandwaves (e.g. localised levelling) will only temporarily redistribute sediment volume locally and therefore features are likely to recover.
D32	83/6.10.41	We advise, as with Rampion 1, that **scouring around cable protection and cable crossings** may occur in **shallow water/nearshore**.		We advise that this needs to be considered and assessed by the Applicant and included in updated application documents. Noting that any remediation sound also be assessed.	Please refer to the Applicant's response to comment D25 above, with regard to cable protection measures nearshore (i.e. in shallow, nearshore and intertidal areas).

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
D33	Page 84/6.10.42	It is stated that there are no coastal processes receptors sensitive to the effects of scour. However, there are sandbanks**/sandwaves** overlapping/within the array areas. Therefore, the **potential impact of scour** to these seabed geomorphological features should be considered.		We advise that the potential impact of **scour** needs to be considered and assessed within update application documents for **sandbanks/sandwaves** overlapping/within the array areas.	The potential dimensions of scour are described in **Section 6** of **Appendix 6.3: Coastal processes technical report Impact assessment, Volume 4** **[APP-131]**. Seabed scour is a very localised process that deforms the seabed only immediately around the installed infrastructure. Scour has no effect on wider scale sediment transport rates or patterns and does not represent any net change in the volume of sediment available in the local or regional system. Therefore, any related potential impact is assessed to be not significant.
D34	Page 86/6.11.14	The coastal stretch at landfall, including Climping Beach SSSI, is very vulnerable and the future of beach management works uncertain. Therefore, we advise that its sensitivity is likely to be **greater than medium**.		We advise that the **sensitivity** of the coastal **stretch at landfall, including Climping SSSI**, is **greater than medium.**	Please refer to the Applicant's response to comment D23 above.
Document Used: [APP-129] 6.4.6.1 Appendix 6.1 Coastal Processes Technical Report Baseline Description					
D35	Appendix 6.1 Page 54/5.4	The Cefas suspended particulate matter (SPM) concentration are now quite old (1998-2015) and Rampion 1 is now part of the baseline. Are more up-to-date SPM data available?		Natural England recommends that if available, the Applicant includes more up-to-date SPM data.	The Applicant is not aware of any more recently collected or processed data. The previous data period 1998-2015 represents an approximate 17-year duration, which should provide a reasonable indication of normal seasonal and interannual variability. Any newer data would represent only up to an additional 50 % of the previous data duration.
D36	Appendix 6.1/ Figure 6.1.19	We note that there are a number of paleo-channels across the study area (export cable corridor and array areas) where the infill substrate maybe mobile or poorly consolidated. Are there any post-construction evidence/lessons from Rampion 1 regarding paleo**-channel scour**?		We advise that scour monitoring may be necessary at these sites due to the unpredictable nature of the channel infill substrate and localised hydrodynamics. Include any evidence/lessons learned from Rampion 1. We advise that a Cable Burial Risk Assessment (including relevant geotechnical information) should be provided at the consenting stage to understand the potential for successful burial in paleo channels.	Please see the Applicant's response to Comment D2 above regarding evidence from Rampion 1. The Applicant has based its assessment of cable burial potential on current data, which is considered appropriate at this pre-consent stage; a full Cable Burial Risk Assessment based on the results of the pre-construction surveys (in accordance with Schedule 11 and 12, Condition 11 and 16 of the **draft DCO** **[PEPD-009]**) will be undertaken when the final cable design parameters are determined post-consent. The Applicant has replied to the Examining Authority explaining why geotechnical information cannot be provided at the consenting stage in Item 47 of **Applicant's post hearing submission - Issue specific hearing 1** **(Document reference 8.25)**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
D37	Appendix 6.2/2.2.7	We note that the model bathymetry was sourced from European Marine Observation and Data Network (EMODnet). Given that the bathymetry underpins the modelling, can the rationale be provided for not using up-to-date project-specific data?		Natural England requests that the Applicant provides rationale for using EMODnet rather than up-to-date project-specific bathymetry data.	EMODnet bathymetry (collated from other publicly available sources, including surveyed bathymetry in some locations) provides a consistent, convenient and complete coverage bathymetry data set for the whole wider study area, within which to frame the various assessments. The resolution of these data is also suitable to inform the numerical modelling (resolution tens to hundreds of metres). In addition to this, Condition 16 (2) (a), dML Schedules 11 and 12 , of the **draft DCO** **[PEPD-009]** requires a pre-construction survey of a full sea floor coverage swath–bathymetry survey undertaken to IHO Order 1a standard that meets the requirements of MGN654 and its annexes, and side scan sonar of those parts of the offshore Order limits in which it is proposed to carry out the authorised scheme and an appropriate buffer.
Document Used: [APP-130] 6.4.6.2 Appendix 6.2 Coastal Processes Model Design and Validation					
D38	Appendix 6.2/2.3.2	The Rampion 1 wave data used to locally validate the SEASTATES wave hindcast model were collected during November-December 2010. Similarly, the wave buoy data used to validate the model regionally are also old (2013), and pre-date the now built Rampion 1 array.		Natural England advises that the Applicant must provide evidence-based justification as to how representative these data are of the present-day prevailing wave conditions across the study area	It is common practice to utilise a limited duration of previously collected wave measurements to locally validate a longer term hindcast wave timeseries (extending over a longer period and closer to present). The longer-term data set is then used as the basis for any statistical description of wave climate. The quality of the validation is limited only by the quality of the measurement device, not the age of the data. The wave impact modelling undertaken was based on scenarios of wave height (height, period and direction) based on the statistics of the wave climate over 30-40 years, but otherwise independent of time (and of the limited duration of available wave measurements).
D39	Appendix 6.2/2.3.3	The SEASTATES wave hindcast model is shown to provide a close representation of wave conditions measured at wave buoys within and near the eastern Rampion 2 array. However, we note that none of the Rampion 1 wave buoys were located within the western array. How do the model data fit wave conditions at the western array?		Natural England advises that best available evidence should be presented in updated application documents in order to support the current assessments.	Please also refer to the Applicant's response to comment D38 above. The use of a wave model (validated against measured data at nearby locations) provides modelled data at locations throughout the study area. Whilst uncertainty in the validation might increase with distance from the locations where validation has been possible, the size of the model /study area in this case is relatively small, and the validation is considered by the Applicant to be suitably robust over the whole study area.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
D40	Appendix 6.2/2.3.8	Were measurements of inshore wave conditions used to validate the model?		Please can the Applicant clarify if present- day inshore wave conditions informed the models used within the ES? If not, please can rationale be provided?	Please refer to the Applicant's response to comment **D39** above.
Document Used: [APP-131] 6.4.6.3 Appendix 6.3 Coastal Processes Technical Report Impact Assessment					
D41	Appendix 6.3/ Page15/ 2.3.4	The 2nd bullet point states that a representative current speed for the Rampion 2 offshore array area is 0.5m/s, which is representative of mid to higher tidal flow conditions, occurring on most flood and ebb cycles for a range of spring and neap conditions. However, we note that there is a marked variation in current speed across the array areas, from west to east, and north to south. Would it be more appropriate to use more than one current speed in the sediment plume modelling to represent these different conditions?		We advise the Applicant to use more refined model parameters to ensure that a realistic worst-case scenario has been assessed.	For a given total volume and rate of sediment disturbance, there is a proportional relationship between the ambient current speed and the resulting plume concentration, extent and thickness of deposition at certain distances. Marginal cases are the shortest distance (zero current speed) and the longest distance (one tidal excursion distance on a large spring tide, for a release over a complete ebb or flood tide with continuously varying current speed in that time). Lower speeds and so shorter distances will result in less dispersion and so potentially higher SSC and greater thicknesses of deposition, but only in a very small footprint. Higher speeds will increase the footprint of effect, but the disturbed material will be proportionally more dispersed leading to much lower SSC and deposition thicknesses. The representative case provided by a 0.5 m/s current speed is experienced frequently by all locations in the Array Area and Export Cable Corridor. Other current speeds are possible, but there are a very large range of possible local values. The assessment provides the basis for a proportional understanding of differences in this respect.
D42	Appendix 6.3/ Section 2.4	We note that there are no maps showing foundation/pin pile drilling plume maximum sediment plume concentration, spatial extent, and orientation, as well as associated deposition footprint. These are important for understanding potential impacts on sensitive receptors (*e.g.,* benthic habitats, WFD water body status).		We advise that **maps should be provided by the Applicant to show anticipated maximum sediment plume concentration, spatial extent, and orientation**, as well as associated **deposition footprint**	A map showing the extent of SSC and sediment deposition effects from sediment plumes is provided in **Figure 2-3** together with the text in **Section 2.9** of **Appendix 6.3 Coastal processes model design and validation, Volume 4 [APP-131].**
D43	Appendix 6.3/ Page 18/ 2.4.4-2.4.6	It is stated that there is limited field evidence of WTG installation into chalk using drill-drive methods, and the evidence provided is taken from Lynn and Inner Dowsing OWFs and environmental conditions may not be similar. Is there any		Natural England advises that further assessment of drill arisings is required.	All Rampion 1 foundations were installed by impact piling with no need for any drilling activities. Therefore, there is no evidence from Rampion 1 regarding the nature and evolution of drill arisings. Please see the Applicant's response to Comment D2 above.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		evidence or lessons learned from Rampion 1 that can be drawn upon regarding the nature and evolution of drill arisings?			
D44	Appendix 6.3/ Page 31/ Table 2-7	The maximum Wind Turbine Generator (WTG) jacket dimensions at the seabed are 45 x 45m. Dredging to 70 x 70m. It is not clear why the dredged area will be 70 x 70m.		Natural England requests that the Applicant provide further justification for the large dredge areas compared to foundation diameter.	The quoted values are from the MDS for a single WTG foundation in **Table 2.7** of **Appendix 6.3: Coastal processes technical report Impact assessment, Volume 4 [APP-131]**. The dimensions of the outer edge of a multi-leg jacket with suction caissons is 45 x 45 m. The 70 x 70 m footprint was a previously used value and may require updating (the earlier value accounts for 87% of the updated volume and the difference would not affect the conclusions of the assessment). The maximum footprint (up to 15 m beyond the outer edge of the foundation) is up to 75 x 75 m. However, the MDS total volume for all WTG foundations is associated instead with the larger number of small foundations (30 x 30m footprint with dredging to 15m beyond the footprint of the jacket, i.e. 60 x 60m), as outlined in **Table 6-11** of **Chapter 6: Coastal processes, Volume 2 [APP-047]**.
D45	Appendix 6.3/ Section 2.5	As above. We note that there are no maps or schematics to show foundation and cable installation dredging plume model results.		We advise that maps should be provided by the Applicant to show **anticipated maximum sediment plume concentration, spatial extent, and orientation**, as well as associated **deposition footprint**.	Please refer to the Applicant's response to comment **D42** above.
D46	Appendix 6.3/ 2.5.5	We note that 1,375,000m^3 could be dredged as part of the sandwave levelling/clearance in the Rampion 2 array area.		Natural England advises the Applicant to provide further details including information on how sandwave recovery will be established following this activity, and how dredging could influence patterns of sediment transport and/or lead to morphological change should be included in updated Application documents.	Sandwaves are only present in part of the eastern offshore array area, as described in **paragraph 4.2.8** and **Figure 6.1.13** of **Appendix 6.1: Coastal processes technical report Baseline description, Volume 4 [APP-129]**. The sandwaves are up to 2 m in height and are migrating actively towards the east at an annual average rate of ~2 m/yr. Sandwave levelling approaches typically keep the displaced sediment in the local sedimentary system, so there is no change in total volumes of sediment available for transport. The local levelling is a local deformation of individual sandwave crests, but the seabed type will remain similar (i.e. sandy, surrounded by sandwaves) during the subsequent recovery period. The available evidence suggests that any change to the local flow field in the levelled area is unlikely to have any measurable effect on

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					the future form and function of other sandwaves. As the sandwaves are demonstrably mobile, it is certain that locally levelled areas will recover through a combination of local infill and onward migration of the feature. The timescale for full recovery is difficult to estimate, but partial recovery to a natural seabed surface (similar seabed type to troughs in the surrounding area) is expected in the order of months to one year.
D47	Appendix 6.3/2.5.2	If the Trailing Suction Hopper Dredger (TSHD) operates in shallow water with small under keel clearance, there is the potential for the overspill plume to combine with a propeller wash plume due to scouring of the seabed. This propeller wash plume will release fines that are additional to those in the overspill plume and should be considered and assessed.		Natural England advises the Applicant to consider and assess the relative contribution of fines to the passive/far-field plume due to **propeller-induced bed erosion during dredging,** where relevant. And update the Application where appropriate.	Such specific scenarios of dredging operations (vessel type, dimensions, propulsion configuration, water depth, ambient conditions, seabed composition, dredging protocols followed, etc) are difficult to reasonably define with any certainty, without becoming over-conservative. The actual effect will be mitigated and controlled to some extent by the design of the vessel dredging plan and protocols used (secured through Condition 11(c), Schedules 11 and 12 of the dMLS, of the **draft DCO [PEPD-009]**), following industry best practice. As such, any effect should be no worse than standard marine dredging operations in a similar situation.
D48	Appendix 6.3/ Section 2.6	We note that there are no maps or schematics to show cable burial plume model results.		We advise that **maps** should be provided to show anticipated maximum sediment plume **concentration, spatial extent, and orientation,** as well as associated **deposition footprint.**	A map showing the extent of SSC and sediment deposition effects from sediment plumes is provided in **Figure 6.3.4** together with the text in **Section 2.9** of **Appendix 6.3: Coastal processes technical report Impact assessment, Volume 4 [APP-131]**.
D49	Appendix 6.3/ 2.6.3-2.6.9	We note that the recent Rampion 1 seabed analysis report (2023) identified exposure risk of short lengths of the export cables and array cables. The 2021 Rampion 1 seabed analysis report observed that all four export cables were experiencing an erosive trend, particularly towards onshore and near the offshore substation. Yet, the Rampion 1 Environmental Statement (ES) predicted that cable exposure would be unlikely due to their burial depth and the ability of the mobile sediments at the seabed to keep the cables buried.		We advise that lessons learned, and post- construction survey results should be used to inform the Rampion 2 cable burial depth assessment. Incorporate evidence from Rampion 1 into the assessment of cable burial depths for Rampion 2.	Please see the Applicant's response to Comment D2 above.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
D50	Appendix 6.3/3.4	The assessment of **changes to the wave regime** due to Rampion 2 and the built Rampion 1 array has not considered impacts to the sandwave field in the eastern Rampion 2 array and Rampion 1 array.		We advise that changes to the wave regime at the **sandwave field** should be considered and assessed by the Applicant in updated application documents.	Please also refer to the Applicant's response to comment D19 above for details of the wave impact modelling undertaken. Noting that the sandwaves are located in the eastern array area. Similarly, **Figures A6 to A20** in **Appendix 6.3: Coastal processes technical report Impact assessment, Volume 4 [APP-131]** illustrate that for scenarios where all WTGs are installed in the western array area, there is no expected change in the waves overlapping the location of the sandwaves (for the scenarios tested); and, for scenarios where WTGs are installed in the eastern and western array areas, there is only a small expected change (2.5 % to 5 %, i.e. not measurable) in the height of waves overlapping the location of the sandwaves (for the scenarios tested). This also informs the conclusion of no expected measurable change to resulting sediment transport patterns as a result of changes to the wave (or tidal) regimes, and therefore, no expected change in the natural form and function, or future evolution, of the sandwaves present in the array area.
D51	Appendix 6.3/ Section 4.2	We note that the **baseline tidal conditions** have not been presented.		Natural England advises that **baseline tidal conditions** (current and speed) for neap and spring tides should be presented in updated documents (i.e., maps) for the study area.	A map of baseline tidal currents is presented as **Figure 6.1.4** in **Appendix 6.1: Coastal processes technical report Baseline description, Volume 4 [APP-129].**
D52	Appendix 6.3/ Section 4.4	The assessment of **change to tidal conditions due to the proposed scheme layouts** has not been included.		Natural England advises that an Assessment of **change to tidal conditions due to the proposed scheme layouts** should be provided (i.e. maps) to support Application documents.	A detailed assessment of change to tidal conditions due to the proposed scheme layouts is provided in **Section 4** of **Appendix 6.3: Coastal processes technical report Impact assessment, Volume 4 [APP-131].** This information is summarised in paragraph 6.10.1 onwards of **Chapter 6: Coastal Processes, Volume 2 [APP-047]**. The assessment (based on a review of modelling studies for other wind farms, including Rampion 1) concludes that analogous offshore wind farms consistently have no measurable array scale effect (<a few cm/s or <1 degree) on tidal current speed or direction. Narrow wake features (with relatively lower mean current speed and proportionally increased turbulence intensity) are likely to be present behind individual foundations, but the distance for recovery to near ambient conditions is in the order of tens to a few hundreds of metres and the wakes are unlikely to overlap. The Applicant considers that the assessment and conclusion is robust and clear in the form of the statements made. As the determined effect is negligible in magnitude and no new

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					modelling has been undertaken to define a specific pattern to plot, no new map of potential impact has been created.
D53	Appendix 6.3/ Section 4.5	**Cumulative changes to tidal conditions** due to the presence of the proposed Rampion 2 scheme layout(s) and the built Rampion 1 have not been presented.		Natural England advises that **cumulative changes to tidal conditions** due to the presence of the proposed Rampion 2 scheme layout(s) and built Rampion 1 array need to be presented by the Applicant to support their application.	Please refer to the Applicant's response to comment D52 above.
D54	Appendix 6.3/5.4.7	It is stated that during large storm events, '*waves may stir the seabed within shallower parts of the offshore array areas, naturally causing an additional short-term contribution to SSC levels locally*.' It would be useful if these areas could be shown on a map.		Natural England requests that maps to show where **shallow areas of seabed have the potential to be stirred up during large storm events** are provided by the Applicant.	Although the statement is correct and meaningful in a general sense, the exact area that would be affected would vary depending on the nature of the storm (size and length of waves) and the tidal water level (affecting local water depth). For a given scenario, there would also be a gradient of effect moving from very shallow, through intermediate, to deep water. A map of absolute effect therefore cannot be created without significant uncertainty. As a guide, everyday waves (4 to 5 s wave period) will start to interact with the seabed (although not necessarily causing sediment resuspension) in 12-20 m water depth. Larger storm waves (8 to 10 s wave period) will start to interact with the seabed (although not necessarily causing sediment resuspension) in 50-75 m water depth.
D55	Appendix 6.3/ 5.4.3-5.4.5 and 5.5	We note that the assessment of predicted **sediment transport regime changes** has not been presented either for the proposed Rampion **2 scheme layout(s) alone or in combination with the built Rampion 1 OWF**.		Natural England advises that predicted sediment **transport regime changes due to Rampion 2 alone and in combination with Rampion 1**, should be presented.	The assessment of potential changes to the sediment transport regime is a logical conclusion based on the assessed very low magnitude of change to tidal currents and waves (for the Proposed Development alone, and for the Proposed Development in combination with Rampion 1). The detailed assessments are provided in **Appendix 6.3: Coastal processes technical report Impact assessment, Volume 4 [APP-131]**. The summary assessment and conclusions of significance are provided in **Chapter 6: Coastal processes, Volume 2 [APP-047]**. The Applicant considers that the assessment and conclusion is robust and clear in the form of the statements made. As the determined effect is negligible in magnitude and no new modelling has been undertaken to define a specific pattern to plot, no new map of potential impact has been created.
D56	Appendix 6.3/Section 6.3 & 6.4.13	The evidence base for **scour** does not refer to Rampion 1 post-construction surveys. It is also stated that the erosion resistant (pre-Holocene) material is present		Natural England advises that best available evidence **and/or lessons learned from Rampion 1** are submitted into examination within updated Application documents to support predictions of **scour** and scour protection requirement.	Please see the Applicant's response to Comment D2 above.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		at, or close, to the seabed in most parts of the western and northeast parts of the offshore array areas, which is likely to lead to a natural limitation of scour depth. Is there any supporting post-construction evidence from Rampion 1 that can be drawn on for the scour assessment?			
D57	Document 7.1.2/3.2.3	We note that cable protection forms such as geotextile bags and polyethylene half shells are included as potential options.		Natural England advises that where cable protection cannot be avoided, our preference is for the use of cable protection materials that match the receiving environment whilst also avoiding introducing plastics to the marine environment. Recoverability on decommissioning should also be considered.	The Applicant is in agreement with Natural England to minimise the use of plastics and geotextiles. The Applicant commits to using suitable alternatives, where this is practicable. The Applicant has committed to minimising the release of plastics into the marine environment this has been added to the commitments register as C-288 and will be secured through the **Outline Scour Protection and Cable Protection Plan** **[APP-234]** to be updated at Deadline 3**.**
D58	Document 7.1.2/ Table 3-1	We note that the Maximum Design Scenario (MDS) inter-array cable target burial depth is 1m, the proportion of array cable requiring protection is 20% and replenishment of cable protection during operations is 25% (of construction total). Has post-construction evidence or lessons learned from Rampion 1 been used to inform and validate these assumptions?		Natural England advises that further information is required before we are able to provide further advice on the potential impacts. See also our related comments on Benthic Ecology.	The MDS envelope for cable burial and estimates of future cable protection requirements for the Proposed Development, are informed by the Applicant's experience of the construction and maintenance of offshore wind farms.. Relevant embedded mitigation and conservatism has already been included in the engineering design options and envelope. No detailed/specific data about cable burial or protection at Rampion 1 (the design and location of which does not provide a direct analogue for the Proposed Development) is required to inform the assessments in this ES. Regarding Rampion 1 post-construction monitoring data please see the Applicant's response to Comment D2 above.
D59	Document 7.1.2/3.4.3	It is stated that in shallow water sections of the cable route, where ground conditions are not suitable to 'ground out' the export cable installation vessel on the seabed, the construction of **temporary sand/gravel beds** may be required. There are no details of these temporary sand/gravel beds or impact assessment.		We request the Applicant provides further details of the **temporary sand/gravel beds** and assess their impact on the seabed /substratum. We request the Applicant provides further details of the temporary sand/gravel beds and assess their impact on the seabed/substratum.	The beach and shallow intertidal and subtidal areas at the landfall comprise a mixture of sands and gravels. The temporary addition and subsequent removal of sand/gravel beds in the nearshore area is unlikely to change the composition or form or function of the sediments present following the construction phase, especially following a reasonable period of reworking (e.g. one large storm). Further details of the temporary gravel beds has been provided in **Appendix 13 – Further Information for Action**

Table 4-10 Applicant's response to Natural England - Appendix E (Fish and Shellfish Ecology)

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
E1	F & S 8.3.41 IPSFMP Table 3.1	We note that Natural England's advice letter of the 14/07/2023, based on the Targeted meeting - Underwater Noise and Impacts on Fish Receptors, 30/03/2023, has been omitted. This letter contains key advice on outstanding issues and concerns in relation to black seabream as highlighted in the summary at the start of this section		We advise this document is updated to include consideration of our advice of the 14/07/2023.	The Natural England advice letter was submitted with the Application within the **Evidence Plan (Part 10 of 11) [APP-252]**. The Applicant has reviewed the advice letter received from Natural England on the 14 July 2023, and acknowledges the key concerns raised. The advice letter was received in July, after the drafting of the **In Principle Sensitive Features Mitigation Plan [APP-239]**, therefore the Plan was not updated to include Natural England's feedback. The points raised in the advice letter have therefore been addressed in this response below. The Applicant notes Natural England's concerns about the potential for piling activities to be undertaken in the latter part of the black bream nesting period (July) and confirms that a full piling exclusion from March-July inclusive would have significant issues for the practical construction of the Proposed Development. Following a detailed assessment undertaken on a precautionary basis, as detailed in **Chapter 8: Fish and Shellfish Ecology, Volume 2 [APP-049]**, the Applicant is confident that a full piling restriction from the 01 March to 31 July is not appropriate or required to avoid significant population level effects on nesting black bream. Whilst, in 2021, the black seabream spawning/nesting period was extended to include the month of July, spawning/nesting activity during this month is considerably reduced and therefore with much less potential for impact on the population breeding success than the preceding months, as set out in **Chapter 8: Fish and Shellfish Ecology, Volume 2 [APP-049]**, with 5% of nests attended by males by the 10th July and 0% by the 30th July in a 2020 survey (Seven Tenths Ecology Ltd. (7TE) (2021)). This compared with 89.4% nests attended by males in June of the same year. Noting that some nesting is still potentially occurring in July, the **In Principle Sensitive Features Mitigation Plan [APP-239]**, the delivery of which secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **Draft Development Consent Order (DCO) [PEPD-009]**) sets out multiple mitigation measures to be implemented during the month of July; these include (in the event that piling is undertaken in July in the the array area) the combination of a low noise hammer technology and

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					Double Big Bubble Curtain, and a sequencing approach to piling starting in locations furthest from the MCZ. Through the application of a variety of mitigation measures in July, the Applicant is confident that piling operations will not hinder the Kingmere MCZ conservation objectives. The Applicant also notes that Natural England does not support the use of the 141dB threshold to inform the zoning approach to mitigation as detailed in the **In Principle Sensitive Features Mitigation Plan [APP-239]**. The Applicant considers the disturbance threshold of 141dB SELss (Sound Exposure Level, single-strike) as suitably precautionary, as it is based on a short-lived startle response observed in sea bass. As informed by Popper et al., (2014), behavioural disturbances are considered to be long term changes in behaviour and distribution, and should not include effects on single animals, or small changes in behaviour such as startle responses or minor movements. The use of the disturbance threshold of 141dB SELss is therefore considered to be suitably precautionary. Further to this, the approach used by the Applicant to define a suitable threshold for disturbance from underwater noise aligns with that used in other OWF applications and assessments (e.g. Hornsea Four Offshore Wind Farm Application (Ørsted, 2021) Hornsea Project Three Offshore Wind Farm Application (Ørsted, 2018), Sheringham and Dudgeon Extension Offshore Wind Farm Projects Application (Equinor, 2022) Awel y Môr Offshore Wind Farm Application (RWE, 2023)) and therefore complies with current practice when approaching issues such as scientific data gaps and uncertainties, in order for consenting decisions to be made. The Applicant welcomes Natural England's support for the ambient noise survey conducted during the black bream nesting period. The Applicant confirms that the data were submitted to the Examination by Procedural Deadline A of 16 January 2024.
E2	Table 8.10	We note that the data sources used to inform the Environmental Statement (ES) Assessment appear to be up to 2020. We seek clarity that this has been updated since 2020, to ensure it includes current best available evidence in 2023?		We advise this is reviewed and updated.	The Applicant has undertaken a review of the data sources used to inform the Environmental Assessment and can confirm that there are no significant changes to the baseline environment as defined in **Chapter 8: Fish and Shellfish Ecology, Volume 2 [APP-049]**.

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					The Applicant notes Natural England's request to review aggregates 2022 survey data in relation to black seabream reproductive activities (comment E16). The Applicant is in discussions to potentially purchase additional black seabream datasets.
E3	8.5.8, 8.6.28, 8.6.30-8.6.37	Natural England defer to Cefas on the assessment methodology and its conclusions in relation to herring and sandeel.		We advise you refer to the comments of Cefas as advisors to the MMO on this matter	This is noted by the Applicant. Responses to specific feedback from the MMO on the assessment methodology and its conclusions relative to herring and sandeel have been provided.
E4	Table 8.11	We concur that sandeel are a key prey species in relation to tern species designated under the Solent and Dorset Coast Special Protection Area (SPA). We advise that tern species are also known to prey on herring.		We advise that both species are considered as prey species for the tern features of the SPA throughout the assessment	This is noted by the Applicant, and indirect effects from potential impacts to prey availability on ornithological receptors have been assessed for both species in **Chapter 12: Offshore and intertidal ornithology, Volume 2 [APP-053]**. The potential effects on prey species from construction activities to impact tern species from south coast SPAS was discounted (i.e. with respect to the common tern features of Pagham Habour SPA and Solent and Dorset SPA). This potential pathway was removed on the basis of tern species were scarcely recorded foraging withing the Proposed Development Array Area during sitie specific surveys which took place during the breeding season.
E5	Table 8-16	We note that the descriptions of significance in this matrix do not match the ones used in the text.		We advise this is amended.	The Applicant requests that Natural England provide clarification to the ExA on where there are inconsistencies between the matrix in Table 8-16 in **Chapter 8: Fish and Shellfish Ecology, Volume 2 [APP-049]** and the assessment text.
E6	Table 8.12	We note that there are inconsistencies between the worst-case scenario presented here in terms of piling and in Appendix 11.3, particularly in relation to the maximum duration of piling. These inconsistencies exist across all areas of the project and must be rectified.		We advise that the assessment is updated to ensure the worst case is consistently presented across all the relevant documents.	Please refer to the Applicant response to comment E8, where the worst-case piling scenarios used to inform the assessment are defined. The Applicant acknowledges the inconsistency in terms of piling durations and confirms this has been corrected to "*4.5 hours piling per pile"* in the Errata submitted at Pre-Examination Procedural Deadline **[PEPD-001]**.
E7	Table 8.12	We note that for the interconnector cable the 'maximum rock protection area for interconnector cables (based on 20% of 10km cable requiring protection) = 122,000m^{2}'. However, we note in the project description chapter the length of cables is 40km rather than 10km		We advise this is corrected and the assessment updated as necessary.	The Applicant acknowledges this inconsistency and confirms this has been corrected to "*40 km*" in the Errata submitted at Pre-Examination Procedural Deadline **Cover Letter [PEPD-001]**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
E8	Table 8.17	We advise that this table includes a line stating the figure number for the model of each of these scenarios. We advise all models need to include the boundaries of the MCZs for us to be able to understand the impacts on MCZ features. We note that Appendix 11.3 only models the following scenarios in relation to fish: Single location: • Worst-case monopile foundation – single pile • Worst-case monopile foundation – 2 sequentially installed piles Worst-case jacket foundation -single pile • Worst-case jacket foundation – 4 sequentially installed piles • Worst-case monopile/jacket foundation modelling using the Hawkins et al. (2014) Multiple Locations (2 locations): ▸ Single monopile – installed simultaneously both E and W Locations ▸ 2 sequentially installed monopiles – installed simultaneously at both E and W Locations • Single jacket pile – installed simultaneously at both E and W Locations • 2 sequentially installed jacket piles- installed simultaneously at both E and W Locations (noting the table refers to jacket piles, but the descriptions on figure 4.9 and table 4.37 refer to monopiles, one of which is incorrect) With regards to piling at multiple locations, only the impacts of 2 sequentially installed piles at two different locations at one time has been modelled. Therefore, it is unclear why Table 8.17 refers to more than four piles being installed simultaneously at the East and West locations. The spatial worst case appears to relate to Table 4.37 of Appendix 11.3. We advise explanation is provided on how 2 pin piles piled at the same time which require up to 2500kj hammer energy can create a greater worst-case scenario than 2 monopiles being piled at the same time with up to 4400kj hammer energy.		Advise that clarity is provided on the worst-case scenario being presented and demonstration that this has been modelled.	The Applicant confirms that the following scenarios were modelled to inform the underwater noise assessments for fish, marine mammals and the marine conservation zone assessment. Monopile foundations (13.5 m diameter) – single pile, - 2 sequentially installed piles. • Jacket foundation (4.5 m diameter) - single pile, - 4 sequentially installed piles • Monopile/jacket foundation modelling using Hawkins et al. (2014) Multiple Locations (E and W Locations): • Monopile foundations (13.5 m diameter) - single pile installed simultaneously, - 2 sequentially installed piles installed simultaneously at both E and W Locations. • Jacket foundation (4.5 m diameter) - single pile installed simultaneously at both E and W Locations., - 4 sequentially installed piles installed simultaneously at both E and W Locations. The modelling outputs from the sequential installation of 4 jacket piles at the East and West locations in the array area are presented in **Table 4.37** of **Appendix 11.3: Underwater noise assessment technical report, Volume 4 [APP-149]**. The Applicant confirms that the descriptions of **Figure 4.9** and **Table 4.37** of **Appendix 11.3: Underwater noise assessment technical report, Volume 4 [APP-149],** should refer to the sequential installation of four jacket piles at the East and West locations, rather than the simultaneous monopile installation scenario. This clarification will result in no impact on the outcome of the assessment of underwater noise impacts. The maximum design scenario for stationary fish receptors will be the sequential installation of four pin piles, at two locations (East and West locations in the array area) within a 24-hour period. When the receptor is presumed to remain stationary, this will create a total area

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					of ensonification that is greater than the simultaneous installation of two monopiles. This is different to the fish and marine mammal fleeing model, where the monopile scenario introduces more sound energy to the water more quickly, while the receptor remains relatively close to the pile. By the time the third and fourth pin piles are driven, the fleeing animal is much further from the pile and so the additional exposure this causes to the total is small.
E9	Table 8-13	The spatial worst case appears to relate to Table 4.37 of Appendix 11.3. We advise explanation is provided on how 2 pin piles piled at the same time which require up to 2500kj hammer energy can create a greater worst-case scenario than 2 monopiles being piled at the same time with up to 4400kj hammer energy.		Same answer as line above.	Please refer to the Applicant's response to comment E8 above.
E10	8.9.24, 8.9.195	Natural England defer to the advice of Cefas but based on the overlap with the Downs herring spawning ground (IHLS larval abundance data) shown in the Figures document, it seems unlikely to be appropriate that the magnitude of impact has been assessed as negligible for both TTS and behavioural impacts		We advise that you refer to the advice of Cefas on this matter, but Natural England highlight that the magnitude assign needs to be reviewed based on the IHLS data and that it is likely mitigation will be required.	As larvae lack swim bladders or the connection between the swim bladder and the inner ear has not yet formed at this stage, they are therefore considered to be less sensitive to underwater noise than spawning adult herring. The Applicant has assessed the potential for impacts on eggs and larvae in **Chapter 8: Fish and shellfish ecology, Volume 2 [APP-049]**. Given the stationary nature of eggs and larvae the potential for behavioural impacts is considered limited, therefore the worst-case impact ranges for effects on larvae is considered to relate to the potential for temporary threshold shift ("TTS"). As detailed in **paragraph 8.9.238** *et seq* in **Chapter 8: Fish and shellfish ecology, Volume 2 [APP-049],** given the low degree of disturbance at intermediate (100s of metres) and far (1,000s of metres) of larvae (in accordance with the Popper et al., (2014) criteria) and the distance of areas of high-density herring larvae from the Proposed Development array area (30 km), the risk of disturbance to herring larvae is considered to be low, and therefore not significant. Notwithstanding this, as detailed in the **In Principle Sensitive Features Mitigation Plan [APP-239]**, the Applicant has committed to the implementation of at least one offshore piling noise mitigation technology, therefore mitigating against potential impacts from underwater noise to herring eggs and larvae from spawning in

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					November through to January (Coull et al., 1998). The Applicant has therefore presented the mitigated mortality and potential mortal injury impact ranges (210 dB SEL_{cum}) relative to areas of high densities of herring larvae in **Appendix 9 – Further Information for Action Points 38, 39 – Underwater Noise (Document reference 8.25.9)**. As evident, with the implementation of at least one noise abatement measure, there is no interaction of the recoverable injury impact contours with areas of high-density herring larvae. Furthermore, the Applicant is undertaking underwater noise modelling of both unmitigated and mitigated piling scenarios, using the precautionary 135 dB threshold, to define the potential range of behavioural effects on spawning adult herring. The Applicant reiterates that they do not support the application of the 135 dB SEL contour to establish behavioural impact ranges for sensitive receptors. Specifically, this threshold is based on a study undertaken within a quiet loch on fish not involved in any particular activity (i.e. not spawning) It is therefore not considered appropriate to use this threshold within a much noisier area such as the English Channel (which is subject to high levels of anthropogenic activity and consequently noise), as the fish within this area will be acclimated to the noise and would be expected to have a correspondingly lower sensitivity to noise levels. The outputs of the modelling are presented at Deadline 1 in **Appendix 9 – Further Information for Action Points 38, 39 – Underwater Noise (Document reference 8.25.9)**.
E11	F & S – 8.5.6- 8.5.7, 8.6.80, 8.6.85 MCZ A-Table 2.2 (point 9) and Table 2.3 IPSFM 2.5.4	We note that 'A site-specific geophysical survey was undertaken between July and August 2020'. As Natural England have raised throughout the evidence plan process this only overlaps with the end of the spawning season for black seabream. Any data collected in August falls outside of the spawning season. The 'Site-specific benthic grab and drop-down video (DDV) surveys were also undertaken between December 2020 and February 2021', far outside of the black seabream season. Natural England therefore disagree that this information can be relied upon 'to supplement existing data on likely black seabream nesting locations in areas relevant to the Proposed Development, but outside of areas previously subject targeted survey (principally within the			As requested in an advice note from Natural England (20 May 2022), the timings and spatial limitations of the geophysical surveys have been recognised in **Section 8.5** in **Chapter 8: Fish and shellfish ecology [APP-049]**. Principal densities and aggregations of black bream nesting sites will be mapped in the Final Sensitive Features Mitigation Plan, utilising historic desk studies, survey data drawn from the aggregates industry surveys, geophysical survey data for the export cable corridor carried out in 2020 and the pre-construction data that will be collected post-consent. The final mitigation plan will be provided post-consent once project parameters are finalised (as secured in

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		Kingmere MCZ)', given the timing of the surveys. Natural England disagree that the data sets referred to 'allows a conclusion to be drawn that nests are likely to be present across a discrete area of the export cable corridor, and as such demonstrates the data to be representative and robust for the purposes of EIA'. We advise there is also no evidence presented to justify the statement 'that the assessment takes a precautionary approach' Natural England advises that the aggregates data is spatially discrete and therefore does not fill data gaps for areas outside of these boxes. We advise areas located outside of these survey boxes should not be considered to be absent of black seabream nests. Point 8.6.80 also suggests 'Sussex IFCA data indicated that the majority of black seabream nest areas in 2014 fell outside of the repeat monitoring areas'.			Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**).
E12	8.5.12	It is stated that 'The post consent survey, undertaken as part of a suite of pre-construction surveys, will allow a determination to be made as to the extent of the nesting area, and specifically the key nesting areas, in order to identify the best cable route, minimising interaction with key sensitive features where practical, prior to offshore export cable installation'. Natural England advise that due to both seasonal variation and interannual variation with regards to nesting locations a single pre-construction survey should not be presumed as definitively and absolutely defining nesting locations. We advise that the focus should be on ensuring that that survey identifies potentially suitable habitat for nesting and avoids this.		We advise that an appropriate methodology for pre-construction surveys has yet to be agreed and that this should be agreed with the MMO in consultation with Natural England. Whilst we understand that the final details of this are likely to be agreed post-consent, we advise that an outline plan should be included in the In Principle Monitoring Plan.	The Applicant agrees that the details of the pre-construction survey are necessarily finalised post-consent and agreed with the MMO, in consultation with Natural England. The post-consent survey will consist of high-resolution full sea floor coverage swath-bathymetric surveys, inclusive of side scan surveys and MBES undertaken to International Hydrographic Organization (IHO) Order 1A standard (secured by dML Condition 16, Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**.
E13	8.6.77, 8.6.88	It is stated that 'Historical analysis of black seabream monitoring data identified black seabream nesting areas tend to correspond to shallow waters (<10m) with thin layers of coarse sediments (10 to 30cm deep) overlying bedrock within the general vicinity of rocky outcrops (GoBe, 2015). BGS data identified areas of chalk beds within the intertidal area of the offshore export cable corridor and within the north-eastern tip of the array area (see Figure 8.13, Volume 3 of the ES (Document Reference 6.3.8))'. However, the data presented in 8.13 is broadscale. Additionally, no key is provided to		Natural England advises consideration is given to what site-specific information could be gathered pre-consent to strengthen this information. We advise this information could be used to improve confidence in avoiding suitable black bream nesting habitat were possible within the cable corridor.	This advice is welcomed by the Applicant. The Applicant is confident that all available data has been provided in **Chapter 8: Fish and shellfish ecology, Volume 2** **[APP-049]**. As detailed in the **In Principle Sensitive Features Mitigation Plan** **[APP-239]**, the final mitigation plan, which will be developed post consent based on the final design parameters (secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**), will map out the principal densities and aggregations of nesting sites utilising historic desk

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		explain what the area shaded in each colour signifies.			studies, survey data drawn from the aggregates industry surveys, geophysical survey data for the export cable corridor carried out in 2020 and the pre-construction data that will be collected post-consent. These data will be used to inform the subsequent micrositing around sensitive features within the export cable corridor.
E14	8.6.79	We advise that it is important to distinguish bream as a feature of a designated site in a key nesting location (Kingmere MCZ), from the general population described over a wide area in this paragraph.		We advise clarity is provided on this throughout the ES chapter and the MCZ assessment.	The Applicant confirms that impacts on black seabream as a receptor have been assessed in **Chapter 8 Fish and shellfish ecology, Volume 2 [APP-049]**. The potential for impacts on black seabream as a feature of the Kingmere MCZ have been assessed in the **Draft Marine Conservation Zone assessment [APP-040]**.
E15	8.6.81	The current licence conditions for Area 453 are incorrectly stated.		We advise this is confirmed with the MMO and corrected in the text. Our understanding is that the relevant condition on the licence for 453 states 'All licensed activities must not be undertaken in the Eastern Section of Area 453 (Zone B) between 1st April and 31st July inclusive, and in the Western Section of Area 453 (Zone A) between 1st April and 30th June'.	The Applicant acknowledges this inconsistency and confirms this has been corrected to the relevant condition, in the Errata submitted at Pre-Examination Procedural Deadline **Cover Letter [PEPD-001]**.
E16	8.6.85	Natural England advise that the data presented here does not represent the full best available evidence base. This is because further surveys were conducted in 2022 and reported in March 2023. We advise that the ES is updated to reflect this data, particularly in relation to reproductive activities in July. We advise that the aggregates data supports reproductive activities occurring in July over multiple years of data.		Natural England's position is that the aggregates data supports our understanding that reproductive behaviour occurs in July, hence the inclusion of July in the sensitive season in line with the conservation advice. Therefore, we advise July should not be regarded as less important in relation to mitigation measures proposed.	The Applicant is confident that the data presented in **Chapter 8: Fish and shellfish ecology, Volume 2 [APP-049]**, which span 17 years, provide a robust baseline, considered to be sufficient for the purposes of EIA, noting that an additional year's data are now available from the aggregates companies. The data suggested by Natural England are not publicly available. The Applicant is in discussions to potentially purchase additional black seabream datasets.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
E17	8.6.87	It is stated 'Site specific data indicate that the area surveyed as part of the aggregate extraction monitoring is likely to represent a discrete area of sediment veneer that does not extend across the full export cable corridor'.		We advise a reference to this information is provided to support this statement. We agree that it should be considered that direct impacts on spawning areas are still possible.	The Applicant welcomes this agreement with Natural England and confirms that in order to mitigate against direct disturbance impacts on breeding black bream within the export cable corridor, the Applicant has committed to ensuring that all cable installation activities within the offshore export cable corridor area are undertaken outside of the identified breeding season of March to July (as defined in the **In Principle Sensitive Features Mitigation Plan** **[APP-239] (**secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**). The Applicant confirms that the site-specific data referenced in **paragraph 8.6.87** of **Chapter 8: Fish and shellfish ecology, Volume 2** **[APP-049]** refer to the environmental monitoring reports for marine aggregate extraction areas (Area 435/ 396, Area 453 and Area 488) within the region, as detailed in **Table 8-10** in **Chapter 8: Fish and shellfish ecology, Volume 2** **[APP-049]**.
E18	8.6.89	It is stated that 'there is a risk of direct disturbance to areas of nesting and / or nesting potential that may not be avoidable. Whilst a specific environmental measure has not been embedded within the design of the Proposed Development at this stage, there are a suite of measures available to reduce the magnitude, and therefore significance of direct disturbance (see RED, 2022)'.		Natural England understood that the Applicant had committed to avoiding direct impacts on all known black seabream nesting areas in the first instance, where possible. Whilst we understand that mitigation measures have been proposed, greater confidence is required in the efficacy, as well as their potential to succeed, in the seabed conditions along the cable route. The Applicant needs to demonstrate that these measures will be effective or introduce additional mitigation.	The Applicant has made a commitment to avoid direct impacts on all known black seabream nesting areas in the first instance, where possible (C-269) as detailed in the **Commitments Register** **[APP-254]** and the **In Principle Sensitive Features Mitigation Plan** **[APP-239]** secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**). The cable routing design will be informed by pre-construction surveys, and a Cable Burial Risk Assessment, undertaken when the final design parameters are determined post-consent, as conditioned in Part 2, Condition 11(1)(a) (Deemed Marine Licence). The Applicant confirms that the mitigation proposed provides for eventualities where this is not possible. As detailed in **Chapter 8: Fish and shellfish ecology, Volume 2** **[APP-049]**, the mitigation measures proposed include the adoption of specialist offshore export cable laying and installation techniques to minimise direct and indirect seabed disturbance footprint to reduce impacts on sensitive features.
E19	Table 8-18	NE agrees that the best available evidence would place black seabream in hearing category 3, and seahorse in hearing category 4. It should, however, be noted that these species were not specifically classified within the original citation.		We advise this is clarified in the text.	Clarification of these classifications will be provided in the Errata to be submitted at Deadline 1 (see Covering Letter).

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
E20	8.9.16	Natural England support black seabream (as well as herring, sandeel, and seahorses) being modelled as stationary receptors, we do not consider fleeing receptor models appropriate for these species		We therefore advise any reference or modelling of fleeing receptors should be disregarded in relation to these species	The Applicant considers that the fleeing receptor approach is relevant where mobile species are not spatially restricted (due to breeding activity for example). Where species are restricted in such ways, the assessment has been undertaken using the static receptor modelling outputs. The Applicant confirms that breeding black seabream, spawning herring, sandeel, and seahorses have all been assessed as stationary receptors when regarding impacts from underwater noise.
E21	8.9.21	Natural England question why the south modelling location has been considered the worst case within the array area. We not this is not the closest modelling location to Kingmere MCZ or Beachy Head West MCZ.		We advise that justification is provided in an updated assessment.	Due to the bathymetry of the site, the greatest impact ranges result from piling operations at the south modelled location. It is for this reason that the Applicant has presented these ranges in **Chapter 8: Fish and shellfish ecology, Volume 2 [APP-049]**. The full suite of underwater noise modelling results is provided in **Appendix 11.3: Underwater noise assessment technical report, Volume 4 [APP-149]**. The worst-case noise modelling contours in relation to specific features, such as the Kingmere MCZ are presented spatially, in **Figures 8.18 to 8.21** in **Chapter 8: Fish and shellfish – Figures, Volume 3 [APP-081]**.
E22	Commitment 52 (Also in MCZ A), F & S 8.9.48 MCZ A (7.2.6)	A piling Marine Mammal Mitigation Protocol (MMMP) will be implemented during construction. A Draft Piling Marine Mammal Protocol (Document Reference 7.14) has been submitted with this application, which includes soft start procedures.		Natural England consider the MCZ features (particularly black seabream and seahorses) to be effectively static features, therefore mitigation measures that relate to fleeing features are not applicable. We therefore advise it is removed from the assessment in relation to these features, and more appropriate mitigation presented.	The Applicant confirms that the inclusion of **Draft Piling Marine Mammal Mitigation Protocol [APP-236]** in **Table 8-13** in **Chapter 8: Fish and shellfish ecology, Volume 2 [APP-049]**, and in **Draft Marine Conservation Zone assessment [APP-040]**), as an embedded environmental mitigation measure purely relates to the use of soft start procedures for piling to deter mobile marine life, therefore reducing the noise exposure to mobile fish and shellfish receptors (such as black bream outside of the breeding season). With regards to mitigating against the potential for impacts to sensitive stationary receptors such as breeding black seabream and seahorse, further mitigation measures have been proposed. These are detailed in the **In Principle Sensitive Features Mitigation Plan [APP-239]** and include noise abatement measures and the development of a spatial and temporal zoning plan for piling.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
E23	Commitment 274 (Also in MCZ A) Commitment 280 and 281 (Also in MCZ A and IPSFMP) MCZ A (7.2.24)	Commence piling at locations furthest from the MCZ the Kingmere MCZ during the black seabream breeding period (March-July). No piling will occur in the piling exclusion zones during the seabream breeding period (March-July) which will be defined by the modelling in the Final Sensitive Features Mitigation Plan. No piling within the western part of the Rampion 2 offshore array closest to the Kingmere MCZ during the majority of the black seabream breeding period (March – June); and sequenced piling in the western part of the Offshore Array Area during July in accordance with the zoning plan to be set out in the Final Sensitive Features Mitigation Plan.		Based on the modelling for the worst-case scenarios provided, we consider that piling at locations further from Kingmere MCZ, could still result in TTS and behavioural impacts within Kingmere MCZ. Therefore, we are not persuaded that this mitigation would prevent the conservation objectives being hindered. We advise that based on the evidence presented to date, our outstanding concerns around the lack of a suitable threshold and the likely efficacy of mitigation measures, the exclusion should cover all piling works March to July inclusive. We also question if the worst-case scenario including simultaneous and sequential pilling has been considered in the mitigation plan. If not, this should be reviewed. We highlight that there is a risk that delaying the production of a final mitigation plan to the and delay, and urge the Applicant to bring something forward prior to consent that Natural England can agree	The Applicant confirms that the behavioural threshold used to inform the zoning exercise and mitigation (141dB re 1 µPa2s (SELss)) is for single strike, and represents disturbance, which by nature does not require or consider timed exposures. Multiple piling scenarios are therefore not applicable for this criterion. As presented in the **In Principle Sensitive Features Mitigation Plan [APP-239]**, through the implementation of noise abatement measures, and seasonal restrictions and zoning, the Applicant is confident that the conservation objectives of the Kingmere MCZ will not be hindered due to the measures of precaution. Furthermore, significant measures of precaution are applied throughout the mitigation plan, including the use of a precautionary disturbance threshold of 141 dB SELss based on research by Kastelein et al. (2017) (**Appendix 6**) (which recorded a short-lived response to 141 dB (SELss) in seabass), and the modelling of minimal underwater noise attenuations afforded by each noise abatement measure. The Applicant confirms that the production of a final mitigation plan pre-consent is not possible given the need to use the final design parameters and piling parameters, which will only be known once design refinement has been completed post consent. The **In Principle Sensitive Features Mitigation Plan [APP-239]** presented alongside the Application provides both the key principles and the framework upon which the final Mitigation Plan will be drafted for agreement with the MMO, in consultation with Natural England (as secured in Condition 11 (1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**).
E24	Commitment 265 (Also in MCZ A and IPSFMP) MCZ A 7.2.29	At least one offshore pilling noise mitigation technology will be utilised to deliver underwater noise attenuation in order to reduce predicted impacts to sensitive receptors at relevant Marine Conservation Zone (MCZ) sites and reduce the risk of significant residual effects on the designated features of these sites.		Notwithstanding Natural England's current concerns regarding the efficacy of mitigation measures, we advise that instead of being one measure, this commitment should be to use the noise abatement combination that achieves the greatest amount of noise reduction year-round. In relation to reducing impacts on MCZ features to an acceptable level, it needs to be demonstrated that the mitigation will be sufficient given the environmental	The Applicant is undertaking additional work to provide a comparison of the environmental conditions at the Proposed Development with other projects where Noise Abatement Systems (NAS) have been deployed, this will be submitted to the Examination in due course.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
				conditions in the Rampion 2 array to reduce noise to an agreed level within the MCZ's. Environmental conditions that could affect efficacy, include factors such as depth, the speed of local currents, wave height, wind speed and geology. We advise this information needs to be submitted into the Examination.	
E25	8.9.49 8.9.49	It is stated that 'Although it is likely that potential predators will also vacate the area during potential piling thus limiting this potential effect'. Natural England advise that no evidence has been presented to support this statement. We are aware that observation of nests in Dorset included predation by invertebrates such as whelks and urchins. We advise it should not be assumed that resident animals will have both the swimming capability and incentive to vacate the area, particularly if they are territorial/highly residential animals.		Natural England advise that no evidence has been presented to support this statement, we advise this is provided or this assumption is removed from consideration in the assessment	This advice is welcomed by the Applicant. The Applicant confirms that a precautionary approach has been taken, assuming the potential disturbance of breeding black bream from piling operations. The Applicant has therefore made several commitments to ensure no population level effects arise from underwater noise from piling. These are detailed in full in the **Commitments Register [APP-254]** and the **In Principle Sensitive Features Mitigation Plan [APP-239]**. The text "'Although it is likely that potential predators will also vacate the area during potential piling thus limiting this potential effect'" has been removed from the paragraph, this has been added to the Errata submitted at Deadline 1.
E26	8.9.56, 8.9.80, 8.1.12.3	We note that the 100km^2 is stated as the underwater noise search area in the cumulative effects section. However, the distances stated for simultaneous piling are significantly greater than this. We advise the use of 100km^2 to define the underwater noise study area across the documents, may not represent the worst-case scenario.		We advise that the appropriateness of the 100km^2 search area is re-considered, and further justification is provided.	The Applicant clarifies that the cumulative search area is defined in **Chapter 8: Fish and shellfish ecology, Volume 2 [APP-049]** as a 100 km buffer from the proposed Order Limits, and not a 100 km^2 area. As such the 100 km buffer is significantly larger than the impact areas presented for simultaneous piling.
E27	F & S 8.9.50, 8.9.133, 8.9.199 MCZ A 7.2.12, 7.2.13	Natural England do not agree that the modelling locations used represent the worst-case scenario within Kingmere MCZ. We advise that modelling from the location within array area closest to the MCZ would appear to represent the greatest potential for overlap for a single pile. Visually it appears a location to the northeast of the current north-western modelling location could result in greater overlap with the MCZ in relation to 207dB, 203dB, and 186dB contours. Additionally, where piling is conducted simultaneously at two locations in terms of the MCZ we question what the closest distance between locations is likely to be, and how this is considered in		We advise that further explanation and justification is provided to explain how this has been considered.	The Applicant acknowledges that in using two piling locations that represent the maximum separation within the Proposed Development boundary, and therefore the maximum calculable total potentially affected area, neither of these locations are close to the Kingmere MCZ. However, for the recoverable injury impact or greater, the rigs would both have to be close to one another with one of the WTG installation locations directly adjacent to the MCZ even under worst case, unmitigated, conditions: the recoverable injury range is approximately 5 km towards shallower water to the north in the NW location, close to the MCZ. The greatest combined effect is between two noise sources, and any increase to the outer extents (i.e. further away from a secondary piling noise source, towards the MCZ) is generally minimal. As piling is not

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		terms of impacts on the MCZ. Currently the east and west locations appear to represent one of the better cases for the MCZ, as opposed to the closest together possible piling locations in closest proximity to the MCZ. We advise further explanation is required on this before Natural England can agree on there not being a significant impact in relation to mortality, potential mortal injury and recoverable injury of black seabream.			proposed at the closest location to the MCZ at its sensitive time, any increased risk of recoverable injury or greater effect is not expected, unless under combined layers of worst case scenarios (as set out in the **In Principle Sensitive Features Mitigation Plan** [**APP-239**].(secured in Condition 11 (1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**). The Applicant, however, has taken a precautionary approach in the assessment and has defined mitigation measures to ensure no disturbance impacts from the Proposed Development will occur within the MCZ boundary, and therefore the Conservation Objectives of the MCZs will not be hindered. These are detailed in the **Commitments Register** **[APP-254]** and the **In Principle Sensitive Features Mitigation Plan** **[APP-239]**.
E28	F&S 8.9.57, 8.9.138, 8.9.205 MCZ A 7.2.12, 7.2.13	Natural England advises that it is the interaction with the boundary of the MCZ that should be referred to here, and not the perceived highest density nesting locations within the MCZ. We advise this needs to be amended across the assessment. In relation to recoverable injury, we seek clarity that this contour does not overlap with the MCZ in any of the worst-case scenarios. We note that Figure 8.18 for example seems to show this contour on the boundary not going into the MCZ. We advise that should any of the worst-case scenarios involve the 203dB contour overlapping with the MCZ (even over a small area) this is likely to change our advice on this matter.		We advise that clarity is provided here in relation to the interaction with the boundary of the MCZ.	The Applicant welcomes the advice provided by Natural England and confirms that the areas of primary importance for black seabream are identified in **Figures 8.14a** and **8.14b** of **Chapter 8: Fish and shellfish – Figures, Volume 3** **[APP-081]**. The Applicant, however, has taken a precautionary approach in the assessment and has defined mitigation measures to ensure no disturbance impacts from the Proposed Development will occur within the MCZ boundary, and therefore the Conservation Objectives will not be hindered. These are detailed in the **Commitments Register** **[APP-254]** and the **In Principle Sensitive Features Mitigation Plan** **[APP-239]**. The Applicant reassures Natural England that the worst-case piling scenario recoverable injury impact contours have been presented in relation to the Kingmere MCZ (as shown in **Figures 8.18, 8.19 and 8.21** of **Chapter 8: Fish and shellfish – Figures, Volume 3** **[APP-081]**). Whilst the Applicant acknowledges a minor interaction of the 203dB contour with the Kingmere MCZ boundary, the Applicant would like to direct Natural England to **Appendix 11.3: Underwater Noise Assessment Technical Report, Volume 4** **[APP-149]**, where the built in precaution of the noise modelling is detailed, and therefore the recoverable impact ranges on the Kingmere MCZ are considered over precautionary. Furthermore, as detailed in the **In Principle Sensitive Features Mitigation Plan** **[APP-239]**, the Applicant has committed to the implementation of various noise abatement measures, inclusive of a piling restriction from

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					March through to June, the implementation of a piling sequencing plan in July, and the use of at least one offshore piling noise mitigation technology from August through to February. The Applicant has therefore presented the mitigated recoverable injury noise contours, relative to the Kingmere MCZ in **Appendix 9 - Further Information for Action Points 38, 39 (document reference 8.25.9)**. As evident, with the implementation of at least one noise abatement measure, there is no interaction of the recoverable injury impact contours with the Kingmere MCZ.
E29	8.9.58, 8.9.139, 8.9.206	Black seabream are protected by Kingmere MCZ, and under the second conservation objective this specifically includes 'the population (whether temporary of otherwise) of that species occurring in the zone be free of the disturbance of a kind likely to significantly affect the survival of its members or their ability to aggregate, nest, or lay, fertilise or guard eggs during breeding.' Natural England advise that this protection is afforded as black seabream are considered to be highly vulnerable during the breeding season due to their specific nest locations and nest guarding behaviours, which mean expending more energy, reducing their feeding opportunities, and increasing their predation risk. Overall, these behaviours take an increased physiological toll compared to non-breeding behaviours, and impacts affect larger proportions of the local population, and so during the breeding season the black seabream have a heightened sensitivity to disruptive impacts. Therefore, we advise that they are treated as a receptor with high sensitivity to impacts from underwater noise throughout the noise assessment. The current sensitivity of medium only takes into account the hearing sensitivity of the species and not the ecological sensitivity, effectively treating its behaviour as simply normal shoaling activity as opposed to specific black seabream spawning behaviours.		We advise that the sensitivity is amended to high.	The Applicant confirms that the sensitivity to underwater noise of the receptor is the primary measure of sensitivity to the impact. As detailed in paragraph 8.9.48 of **Chapter 8: Fish and shellfish ecology, Volume 2 [APP-049]**, black seabream have swim bladders that are close but not intimately connected to the ear. It is on this basis that the receptor is considered by the Applicant to be of medium vulnerability. Due consideration of the spawning behaviours of black seabream within the Kingmere MCZ are incorporated into the underwater noise modelling. Whereby the receptor is considered a stationary receptor, therefore assuming increased exposure to underwater noise when guarding their nests. Furthermore, consideration of effects on life-cycle aspects is also given in terms of impact consequence (i.e. significance of effect), within the assessment.

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
E30	8.9.138- 8.9.140	Natural England disagree with the downgrading of the magnitude of impact based on there being 'limited interaction with the areas of primary importance'. We advise clarification is provided that the area of primary importance included the closest boundary of the MCZ.		We advise this is clarified and if it is not MCZ boundary it is amended to this.	The Applicant confirms that the areas of primary importance for black seabream within the Kingmere MCZ are identified in **Figures 8.14a** and **8.14b** in **Chapter 8: Fish and shellfish – Figures, Volume 3** **[App-081]**. Whilst the Applicant acknowledges a minor interaction of the 203dB contour with the Kingmere MCZ boundary, the Applicant would like to direct Natural England to **Appendix 11.3: Underwater Noise Assessment Technical Report, Volume 4** **[APP-149]**, where the built in precaution of the noise modelling is detailed, and therefore the recoverable impact ranges on the Kingmere MCZ are considered precautionary. The Applicant however has taken a precautionary approach in the assessment and has defined mitigation measures to ensure no disturbance impacts from the Proposed Development will occur within the MCZ boundary, and therefore the Conservation Objectives will not be hindered. These are detailed in the **Commitments Register** **[APP-254]** and the **In Principle Sensitive Features Mitigation Plan** **[APP-239]**. he Applicant has presented the mitigated recoverable injury noise contours, relative to the Kingmere MCZ in **Appendix 9 - Further Information for Action Points 38, 39** **(document reference 8.25.9)**. As evident, with the implementation of at least one noise abatement measure, there is no interaction of the recoverable injury impact contours with the Kingmere MCZ.
E31	F& S 8.9.205 MCZ A 7.2.14	Natural England note that there is an interaction between the TTS contours and Kingmere MCZ. Based on the information presented Natural England does not have confidence the mitigation presented in C-265, C-274, C-281 will be sufficiently effective. Therefore, we do not agree that the impact can be consider negligible for TTS. We advise that an assessment with and without mitigation is provided to present the worst-case scenario. We advise that based on our lack of confidence in the mitigation measures, we cannot conclude that the conservation objectives of Kingmere MCZ will not be hindered by this impact.		We advise that information on the efficacy of the migration measures proposed in the same environmental conditions as are present at the Rampion 2 site is presented to demonstrate confidence that the noise levels would not exceed 186dB within the MCZ boundary.	The Applicant has provided underwater modelling outputs for the implementation of various noise abatement measures to ensure the Conservation Objectives of the Kingmere MCZ will not be hindered. Furthermore, the Applicant has also proposed seasonal restrictions and zoning to mitigate against impacts from underwater noise on sensitive features. These are provided in the **In Principle Sensitive Features Mitigation Plan** **[APP-239]**. In addition to this, the Applicant has applied significant measures of precaution when defining appropriate mitigation measures, including the modelling of conservative underwater noise attenuations which can be achieved by each noise abatement measure. The Applicant is undertaking additional work to provide a comparison of the environmental conditions at the

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					Proposed Development with other projects where NAS have been deployed, this will be submitted to the Examination in due course.
E32	8.9.247- 8.9.248	Breeding black seabream exhibit breeding behaviours that if subject to a behavioural response could even in the short-term lead to effects breeding success that could be significant. We strongly disagree that these effects can be considered to have no wider effect on the MCZ feature, considering the impacts of potentially failed breeding at Kingmere across the local population (given site fidelity) and in the light of the conservation objectives of the MCZ. We therefore advise that the application of the concept of acclimatisation to noise is inappropriate in this instance. This is because even if acclimatisation where to occur, the time frames over which it may occur would mean that it is likely this effect would have already had a significant impact on the breeding success of bream before this point, and that it is feasible breeding attempts could have failed for that year		We advise that this is Natural England's position on this point and that habitation is not taken into account within the assessment	The Applicant would like to highlight to Natural England that various measures of precaution have been applied when informing appropriate mitigation for black seabream. Firstly, as detailed in the In **Principle Sensitive Features Mitigation Plan [APP-239]**, a precautionary disturbance threshold has been applied (141dB SELss), based on the startle response of sea bass. As informed by Popper et al., (2014), behavioural disturbances are considered to be long term changes in behaviour and distribution, and should not include effects on single animals, or small changes in behaviour such as startle responses or minor movements. Therefore, the use of the 141dB SELss disturbance threshold is inherently precautionary. Furthermore, as detailed in the **Chapter 8: Fish and shellfish ecology, Volume 2 [APP-049]**, evidence has shown the potential for receptors to habituate to repeated sound exposure (Anderson et al., 2011 (**Appendix 7**) ; Neo et al., 2018). Therefore, taking into account the precautionary disturbance threshold, and the implementation of proposed mitigation measures (including noise abatement measures, seasonal restrictions and zoning), the Applicant is confident that there will be no wider effects on sensitive features of the MCZs.
E33		In relation to black seabream as a feature of Kingmere MCZ, Natural England does not support a behavioural threshold being derived for black seabream from studies that: • Are a proxy species for black seabream, as opposed to directly studying black seabream; • Are based on playback, particularly when this is in a tank and does not represent well the effects of particle motion that would be expected as a result of pile driving in the open ocean; • Are undertaken in captivity as opposed on receptors in the wild;		We advise that this is Natural England's position on this point	The Applicant's position on the behavioural threshold for black seabream has been reliant upon existing literature and best available knowledge and understanding, as detailed in **Paragraph 8.9.247 *et seq***. of **Chapter 8: Fish and shellfish Ecology, Volume 2 [APP-049]**. Throughout the pre-application period, the Applicant has attempted to reach agreement with Natural England on a number of key issues through extensive work on this topic relating to, *inter alia*, establishing a disturbance threshold relevant to black seabream, upon which to inform the impact assessment and appropriate mitigation. These include, but are not limited to, the modelling of more precautionary disturbance thresholds, and the commissioning of dedicated surveys of ambient noise levels in 2022 and 2023 to provide contemporary site-

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		• Use for example an air gun as opposed to a noise source akin to piling noise; • Are conducted within a quiet loch as opposed to the open sea.			specific data, and the proposal of a variety of mitigation measures over the consultation period. As detailed in the **In Principle Sensitive Features Mitigation Plan [APP-239]**, the Applicant considers the disturbance threshold of 141dB SELss as suitably precautionary, as it is based on a short-lived startle response observed in sea bass. As informed by Popper et al., (2014), behavioural disturbances are considered to be long term changes in behaviour and distribution, and should not include effects on single animals, or small changes in behaviour such as startle responses or minor movements. The use of the disturbance threshold of 141dB SELss is therefore considered to be overly precautionary. Further to this, the approach used by the Applicant to define a suitable threshold for disturbance from underwater noise aligns with that used in other OWF applications and assessments (e.g. Hornsea Four Offshore Wind Farm Application (Ørsted, 2021) Hornsea Project Three Offshore Wind Farm Application (Ørsted, 2018), Sheringham and Dudgeon Extension Offshore Wind Farm Projects Application (Equinor, 2022) Awel y Môr Offshore Wind Farm Application (RWE, 2023)), and therefore complies with current practice when approaching issues such as scientific data gaps and uncertainties, in order for planning decisions to be made.
E34	8.9.261	Natural England disagrees with the addition of 30dB to the background noise levels based on the Radford et al. (2016) study, which was conducted on seabass, in a laboratory conditions and based on playback. We note Radford et al (2016) noted increases in ventilation rate (a secondary indicator of stress) due to noise increases which were less than 30dB above ambient levels. Therefore, we do not support the use of this study to justify a lack of behavioural disturbance for black seabream above ambient noise levels. We advise that Collett et al. (2012) included a temporally limited measure that is now 11 years out of date. Therefore, this cannot be relied upon as evidence. We also advise that consideration needs to be given to the fact that naturally occurring peaks are unlikely to represent a continuous noise source in the same way piling would. We understand Cefas have concerns with		We advise that the assessment is amended to account for these comments.	The Applicant recognises the challenges in using a study like Radford et al. (2016) (**Appendix 8**) to predict the effect of noise disturbance on seabream, given that the study was not conducted in an open sea area and based on a proxy species. However, the conditions can be compared based on background noise recorded: • 117 dB RMS, captive fish (Radford et al, 2016) • 115 dB RMS recorded at Rampion 1 (Collett et al, 2012) • 111-117 dB RMS recorded over 5 months at Proposed Development (Subacoustech, 2023) The species studied by Radford et al (2016), seabass, are more similar (physiologically and with respect to hearing sensitivity) to black seabream than those in the study recommended by Natural England i.e. sprat. Sprat have special structures mechanically linking the swim bladder

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		background noise being defined as peaks, as opposed to minimums.			to the ear, whereas black seabream have swim bladders that are close, but not intimately connected to the ear, and are therefore less sensitive to the impacts of underwater noise. Therefore, the Applicant maintains that the findings of Radford et al., (2016) are the most appropriate, as the study represents both conditions and fish species that are the most applicable and comparable to the black seabream situation at the Proposed Development, for which data is available.
E35	F & S 8.9.267, 8.9.278, 8.9.280 MCZ A Table 7-1, 7.2.19, 7.2.20, 7.2.22, 7.2.23	Natural England does not support the use of 141dB re 1uPa SELss (taken from Kastelein et al. (2017), as a threshold for black seabream behavioural disturbance and we do not agree that the threshold is highly precautionary. Natural England advise that this study cannot be used to predict fish behavioural responses to pile driving in the natural environment because: • The experiment was conducted in a bare 7m x 4m container, in which seabass occupied 25% of the space. As recognised by the authors, this highly artificial environment permits only a narrow range of natural responses. • The noise stimuli was produced by playing recordings of piledriving through speakers. As recognised by the authors, this method is highly limited and does not replicate pile driving at sea (e.g. the playback range was inhibited by the capacity of the speaker). • Behavioural response was monitored by video from a distance, and response classifications were based on the collective behaviour of the school. Individual physiological responses were not recorded (such as ventilation rate, blood chemistry) and neither did the survey design permit investigation of natural behavioural changes or subpopulation level impacts. • The study tested only 7 pre-defined noise levels, not a continuous spectrum. The lowest level of noise tested was 122dB re 1 mPa2 s which did elicit some responses in the main study (i.e it was perceived and reacted to by some of the seabass).		We advise that this is Natural England's position on this point. As an overarching task TL will provide a strategy on the strategy for delivering the Scheme, what is buildable in the context of the constraints NE is proposing. Lack of hammers, drills capacity.	Please refer to the Applicant's response to **E33** above.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		Additionally, we advise that this study is not suitable to assess noise impacts to nesting black seabream in Kingmere MCZ for the following reasons: • The study was based on adult seabass, which do not exhibit demersal nest guarding or the breeding behaviours protected by Kingmere MCZ. • Natural England recognise that seabass and black bream are in the same hearing category, but note this is based solely on a grouping of physical characteristics and lacks any species specific information or context. We advise that fish are extremely diverse and exhibit complex behaviours in response to a changeable environment. The authors of Kastelein also make this point: 'Trying to predict behavioural responses simply by using energy in a model is not realistic, as responses to sound depend not only on the received level, but also on a large number of other sound parameters, the context, and parameters relating to the animal'. • The study found a 50% initial response threshold occurred at an SELss of 141 dB re 1 mPa2 s for 44cm sea bass. We note that 31cm seabass demonstrated a 50% initial response threshold occurring at 131 dB re 1 mPa2 s. Given Natural England's conservation advice suggests that juveniles black seabream mature at around 20cm in length as females and are commonly 35cm in length, we advise the use of a threshold for a larger 44cm sea bass is clearly not appropriate. • Seabass are broadcast spawners with pelagic eggs, and therefore they do not exhibit the same spawning, nesting and nest guarding behaviours as black seabream. This crucial element of black seabream ecology, as specifically detailed in the conservation objectives for the MCZ, needs to be duly considered in the impact assessment. We highlight that Natural England's has advised against this approach throughout the evidence plan process. We note that Figure 6 of Appendix 8.3 shows that even with using a			

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		141dB re 1uPa SELss, this noise contour covers the entirety of Kingmere MCZ. This Appendix also references Kojima et al. (2010), which relates to red seabream, which is again inappropriate as this species does not have the same spawning behaviours as black seabream. Natural England advise that any behavioural threshold must be specific to the species (black seabream), the site (Kingmere MCZ) and the conservation objectives (breeding/spawning behaviours of black seabream) in order to successfully quantify and mitigate for the impacts. Currently Natural England's advice is that we cannot conclude that the behavioural disturbance impacts of the project would not cause the conservation objectives of the MCZ to be hindered. We note in point 8.9.266 it is stated that 'the use of the identified thresholds to inform the assessment of behavioural impacts on fish and shellfish is not supported by RED' due to the lack of understanding of how a wild animal will respond and viability in existing noise studies. Natural England advise that when coupled with all the existing issues in this specific case, it does appear unlikely a suitable threshold can be agreed.			
E36	Appendix 8.3	Natural England support a further noise study being undertaken in 2023, given the temporal limitations of the previous 15-day study. Our understanding was that whilst this longer dataset would not be included with the ES, this would be available for the examination. Natural England advise that we are not content for this information to only be provided at the post-consent stage. We also advise that once this data is available there is still no certainty that a suitable behavioural threshold could be derived and agreed from this.		We advise that this data is provided as soon as possible.	**Appendix 8.4 Black Seabream Underwater Noise Technical Note and Survey Results [PEPD-023]** contains details of the additional survey undertaken in 2023 and was submitted at Pre-Examination Procedural Deadline.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
E37	8.9.280, Appendix 8.3, IPSFMP MCZ A 7.2.14 MCZ A 7.2.23	We advise that the efficacy of the measures in the environmental conditions of the Rampion 2 location has not been satisfactorily demonstrated. Based on the lack of evidence to derive a suitable threshold, even if the mitigation measures could be proven to achieve the level proposed, we advise this would not be sufficient to justify a Negligible magnitude of impact. We advise that in the context of the MCZ this should be a Major impact (i.e. there is a significant risk of the activity hindering the MCZ conservation objectives).		We advise that the magnitude of impact is revised.	The Applicant confirms that the magnitude of impact is determined after the implementation of the proposed embedded environmental mitigation (C-265, C-274, C-280, C-281 all secured in secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**)) during the black bream nesting season, which will ensure that the predicted noise levels at the black seabream nesting areas within the Kingmere MCZ do not exceed the 141dB level that could (on a precautionary basis) elicit a response from black seabream. Therefore, with the implementation of the proposed mitigation measures, the Applicant is confident that there will be a Negligible magnitude of impact, and therefore a Minor Significant effect.
E38	8.9.281	Given the proximity of Kingmere MCZ to both the cable corridor and the array, and the fact this is a designated feature of this protected site, their sensitivity to disturbance during the breading/spawning season, Natural England advise that the sensitivity of this feature should be high.		We advise that the sensitivity is revised.	The Applicant confirms that the sensitivity of black seabream to underwater noise is the primary measure of sensitivity to the impact. As detailed in paragraph 8.9.48 of **Chapter 8: Fish and shellfish Ecology, Volume 2 [APP-049]**, black seabream have swim bladders that are close, but not intimately connected to the ear, it is on this basis that the receptor is considered to be of medium vulnerability. Due consideration of the spawning behaviours of black seabream within the Kingmere MCZ is incorporated into the underwater noise modelling, whereby the receptor is considered a stationary receptor, therefore assuming increased exposure to underwater noise when guarding their nests. Furthermore, consideration of effects on life-cycle aspects is also given in terms of impact consequence (i.e significance of effect), within the assessment. In relation to potential habitat disturbance impacts (including potential impacts from increased SSC and smothering) from works undertaken within the cable corridor, the Applicant confirms the sensitivity of black bream has been assessed as high, and mitigation measures have been proposed in the **In Principle Mitigation Plan for Sensitive Features [APP-239]**.
E39	8.9.282	Due to our disagreement with both the magnitude of impact assigned to this assessment and the sensitivity of the receptor, we do not agree that this impact can be considered not significant.		We advise that this is revised in line with our comments above.	Please refer to the Applicants responses to E37 and E38 above.
Seahorses (see also comments on the MCZ Assessment for seahorses below)					

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
E40	8.6.4, 8.6.18, 8.9.23, 8.9.338. 8.9.347, 8.9.366, 8.9.415, 8.10.54, 8.6.68	We note that one short-snouted seahorse (Hippocampus hippocampus) was found in the October to November 2011 surveys and three in the February 2012 surveys. Two were found in the north-eastern part of the Rampion 1 array and two in the western part. We note that short-snouted seahorse were also found in three post- construction trawls conducted in the autumn.		We note this is evidence of the potential for seahorse species to be present in the area, particularly overwinter (when they are understood to move offshore). We advise that the fact that they have been found on multiple occasions from surveys that only offer a short snapshot in time, indicates their consistent presence, but that conclusions should not be drawn on them only being found in low numbers throughout the assessment based on this. The assessment should be updated to reflect the this	The Applicant is confident that based on these data presented in **Chapter 8, Fish and Shellfish Ecology, Volume 2 [APP-049]**, seahorse numbers within the vicinity of the Proposed Development are generally low. The Applicant has undertaken a suitably precautionary assessment and assumed the presence of overwintering seahorse in the vicinity of the Proposed Development. Therefore, as detailed in the **In Principle Sensitive Features Mitigation Plan [APP-239]**, as a further precaution, the Applicant has committed to the use of at least one offshore piling noise mitigation technology for the duration of the construction phase, this will ensure any potential for impact on seahorse in its offshore winter phase is minimised.
E41	8.9.75, 8.9.151, 8.9.219	We seek clarification that the locations modelled represent the closest location piling could occur in relation to each MCZ designated for seahorse.		We advise clarity is provided and the assessment updated if needed.	The Applicant confirms that locations modelled represent the extents of the Proposed Development boundary. The modelling locations used to inform the assessment of potential impacts on the features of the Beachy Head East and Beachy Head West MCZs (**Draft Marine Conservation Zone assessment [APP-040]**), and the proposed mitigation measures as detailed in the **In Principle Sensitive Features Mitigation Plan [APP-239]**, are based on the worst-case piling locations on the project boundary relative to sensitive features, and the bathymetry of the site. Regardless, any difference in distances between these locations and the closest points at an MCZ will lead to a negligible change in the overlapping area.
E42	8.9.74, 8.9.158, 8.9.227	Given there are MCZs designated for seahorses surrounding the site, and seahorses were found during the Rampion 1 surveys, Natural England advise there does not appear to be any evidence to support the Applicant's statement that they are 'not present in significant numbers'. Additionally, it should be considered that a significant proportion of the local population may not have to be a large number. We advise that impacts on the scale of kilometres could span the entire range of local populations and so potentially pose a significant risk.		We advise the assessment is amended in line with our advice.	Please refer to the Applicant's response to **E40** above.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
E43	F & S 8.9.81, 8.9.157 IPSFMP 5.2.44	Natural England understand the Applicant has predicted no overlap (of the underwater noise contours relevant to this impact) with the MCZs designated for seahorses. Based on the reasoning in our comment to 8.9.74, we do not agree that the Applicant can determine the risk of impacts on seahorses outside of the MCZ's is low when they could feasibly be present in the array area. Both species of the UK seahorses–- spiny (Hippocampus guttulatus) and short-snouted–- are protected under Section 9 of the Wildlife and Countryside Act 1981. We advise that the Applicant is aware that there is a possibility of seahorses being killed or injured, disturbed, or damage or destruction to their place of shelter or protection, all of which are offences under Section 9. We advise that it is therefore not appropriate.		We advise the assessment is amended in line with our advice.	Please refer to the Applicant's response to **E40** above.
Seahorse – Underwater Noise–- Temporary Threshold Shift					
E44	8.9.226-8.9.229	Natural England note that there is an interaction between the TTS contour and Beachy Head West MCZ. We note that the wording of commitment C-265 does not reflect the wording in the MCZ Assessment. Our understanding is the commitment is a minimum of one noise abatement measure, year-round. Please see our comment on 8.1.4 of the MCZ Assessment/the commitments on this. Based on this level of mitigation, we do not agree that the magnitude of impact can be consider negligible. We advise that an assessment with and without mitigation is provided to present the worst-case scenario. We advise that seahorses are a protected feature of the MCZ year round, therefore any mitigation would also need to be proven to be below the threshold for TTS year-round within the MCZ.		We advise the assessment is amended in line with our advice, and that the further information is provided.	The Applicant confirms that the wording of commitment C-265 has been amended in this document within the Errata (see Covering Letter submitted at Deadline 1). The Applicant highlights the precautionary nature of the parameters built into the underwater noise modelling (**Appendix 11.3: Underwater Noise Assessment Technical Report, Volume 4 [APP-149]**), and the modelling of noise abatement measures (modelling of minimal underwater noise attenuations afforded by each noise abatement measure). Therefore, the TTS contour as presented in relation to the Beachy Head West MCZ are considered largely precautionary. Furthermore, as the modelling of noise abatement measures also only reflects the minimal level of noise abatement provided to ensure a precautionary approach; the Applicant is therefore confident that the implementation of a noise abatement system year-round (with the inclusion of additional mitigation measures from March-July) will ensure the conservation objectives of the Beachy Head West MCZ are not hindered.
Seahorse – Underwater Noise–- Behavioural impacts

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
E45	8.9.259	We advise you refer to our comments on 3.1.1, 5.3.28 of the IPSFMP with regards to uncertainty over thresholds.		Refer to IPSFMP comments	Please refer to the Applicant's responses to E107 below.
E46	8.9.287- 8.9.291	As noted above for Beachy Head West MCZ there is overlap with the TTS contour, given TTS thresholds are likely to be significantly larger than those for behavioural disturbance logically behavioural disturbance is highly likely to occur. We note that the 135dB contour mapped on figure 8.20 (which does not appear to consider all WCS) gives an indication that there is a clear overlap with Beachy Head West MCZ and possibly other MCZ's. We advise that the WCS contour is mapped in relation to the lower figures quoted in the text for behavioural disturbance and the boundaries of the MCZ's are included on this.		We advise that a worst-case threshold is mapped and that the assessment is amended to account for the contours of this. We advise the mitigation measures would need to be proven to reduce this to a threshold level	The Applicant is confident that a suitably precautionary assessment has been undertaken to establish the potential impacts from underwater noise on seahorse. Furthermore, the Applicant would like to direct Natural England to **Appendix 11.3: Underwater Noise Assessment Technical Report, Volume 4 [APP-149]**, where the built in precaution of the noise modelling is detailed, and therefore the TTS impact ranges on seahorse are considered over precautionary. Furthermore, as stated in **Chapter 8: Fish and shellfish ecology, Volume 2, [APP-049]**, the Applicant does not support the application of the 135dB SEL contour to establish behavioural impact ranges for sensitive receptors. Specifically, this threshold is based on a study undertaken within a quiet loch on fish not involved in any particular activity (i.e. not spawning), and it is therefore not considered appropriate to use this threshold within a much noisier area such as the English Channel (which is subject to high levels of anthropogenic activity and consequently noise) as the fish within this area will be acclimated to the noise and would be expected to have a correspondingly lower sensitivity to noise levels.
Other Impacts					
E47	8.9.398, 8.9.415	Natural England advise there is an inconsistency with seahorses being treated a stationary receptor for underwater noise, but a fleeing report in terms of suspended sediment and smothering. We note that 8.9.398 suggest they would flee, whereas 8.9.415 suggest they have limited capacity to flee. We advise that they are considered as not having capacity to flee		We advise this is amended and that seahorses are treated as a stationary receptor throughout.	The Applicant welcomes the advice from Natural England regarding the consistency of the impact assessment on seahorse. The Applicant is confident that a suitably precautionary assessment of seahorse has been undertaken, and mitigation proposed where appropriate (as defined in the **In Principle Mitigation Plan for Sensitive Features [APP-239]** and the **Commitments Register [APP-254]**). The Applicant is confident that when considering seahorse as a receptor to impacts from increased SSC and deposition, seahorse will move away from areas of disturbance. Furthermore, as detailed in **Table 8-26** and **paragraph 8.9.392** of **Chapter 8: Fish and shellfish Ecology, Volume 2, [APP-049]**, sediment plumes are anticipated to be localised, and will quickly dissipate after

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					cessation of the activities, due to settling and wider dispersion with the concentrations reducing quickly over time to background levels. Therefore, taking this into consideration, the Applicant is confident that the impact, and therefore significance of effect will be minor. These species are expected to be resilient to any increase in SSC as winter storm events in their natural environment cause temporary increases in suspended sediment concentration of a similar magnitude to that which will be produced by the construction operations.
Underwater Noise–- UXO clearance activities					
E48	8.9.13, 8.9.305, 8.9.311-8.9.321	When consulted on the separate marine licence for UXO clearance, it should be noted Natural England will advise that UXO detonation occurs outside of the sensitive season for black seabream (MarchJuly) given the close proximity of Kingmere MCZ to potential clearance locations. Therefore, we advise that the Project will need to consider this in their construction programme. Specific consideration also needs to be given to impacts on seahorses MCZ's.		We advise this will need to be considered.	The Applicant confirms that UXO removal will be sought in a separate future marine licence application when there is greater certainty on the quantum of UXO requiring clearance prior to construction using high resolution geophysical survey data. The Applicant also confirms that no UXO clearance will be undertaken within the black bream breeding period (March–- July).
E49	Commitment 102 and Commitment 275	A UXO Clearance Marine Mammal Mitigation Protocol (MMMP) will be developed. A Draft UXO Clearance MMMP (Document Reference 7.15) has been submitted with this application. The use of low order detonations to dispose of Offshore UXOs using the 'deflagration method' will be implemented, where practicable.		We question how mitigation plans measures for marine mammals will specifically address impacts to black seabream and seahorse as MCZs features. Given it is stated that UXO clearance works have the potential to affect a similar area to that of piling, we advise that full consideration needs to be given to mitigation specifically aimed at the MCZ features.	Please see the Applicant's response to **E48** above.
Cable Corridor Works					
E50	8.9, 8.10 Commitment 273 (Also included in the MCZ A and IPSFMP) 8.10.91	Natural England advise that the impacts from direct disturbance from installation of the export cable and impacts from suspended sediment are dependent on Commitment 273. This is a seasonal restriction will be put in place to ensure offshore export cable corridor installation activities are undertaken outside the black seabream breeding period (March-July) to avoid any effects from installation works on black seabream nesting within or outside of the Kingmere MCZ.		Natural England supports this measure. We advise that this should include all aspects of export cable installation, including but not limited to seabed preparation works, cable protection work, UXO works(which we understand would form part of a separate licence). We advise that should any activities not be included we would have concerns regarding the impacts of these.	The Applicant welcomes Natural England's advice. The Applicant confirms that the implementation of Commitment 273 in the **Commitments Register [APP-254] (as** secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**) applies to all aspects of export cable installation (including seabed preparation works, cable protection works and UXO works). The Applicant confirms that UXO removal will be sought in a separate future Marine License application, when there is greater certainty on the

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					quantum of UXO requiring clearance, prior to construction, using high resolution geophysical survey data.
E51	Commitment – 269, 270 (Also included in MCZ A and IPSFMP)	Commitments 269 and 270 include: • 'Cable routeing design will be developed to ensure micrositing where possible to identify the shortest feasible path avoiding areas considered to potentially support black seabream nesting'. • 'A working separation distance (buffer) will be maintained wherever possible from sensitive features, notably black seabream nesting areas, as informed by the outputs of the physical processes assessment, to limit the potential for impacts to arise (direct or indirect)'.		We advise that there needs to be clear prioritisation in this measure with micrositing (avoiding) being the preference in the first instance and if there is absolutely no way of avoiding black seabream nesting habitats, the shortest path should be taken as a mitigation measure. We advise this measure does not guarantee no direct impacts (as stated in the assessment), it only seeks to minimise them. We advise a robust pre-construction survey plan and a final micrositing plan are agreed with Natural England. Until this data is available the assessment should assume that it may not be possible to avoid potential black seabream nesting habitats. We advise this measure should apply to the placement of all infrastructure, construction equipment and include the operation and maintenance phase. We advise a commitment to the separation distance that will be employed should be made, and also a distance from the edge of the cable corridor where works will not occur. Should this not be possible in an area it should be highlighted in the final micrositing plan and discussed with Natural England.	The Applicant affirms that avoidance of sensitive features through micro-siting is the preference in the first instance; subsequently if this proves impossible for certain areas then mitigation measure (Commitment 269 in the **Commitments Register** **[APP-254] as** secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**)) will then be applied. The Applicant confirms that the pre-construction survey plan and the final sensitive features mitigation plan will be developed in consultation with Natural England. The mitigation measures as set out in the **In Principle Sensitive Features Mitigation Plan** **[APP-239]** (as secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**)) provide for the situation where avoidance of specific habitat features may not be possible, and the assessment undertaken has been presented on that basis. The Applicant also confirms that Commitments 269 and 270 (as detailed in the **Commitments Register** **[APP-254]** (secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**) will apply to the placement of all infrastructure and construction equipment within the export cable corridor and include the operation and maintenance phase. The buffering distances between the relevant receptors and the proposed locations of the works are set out in **Section 5.2** of the **In Principle Sensitive Features Mitigation Plan** **[APP-239]** as informed by findings of the physical processes assessment work. As detailed in the **In Principle Mitigation Plan for Sensitive Features** **[APP-239]**, any reductions of buffers that might be required will be clearly set out in the Final Plan, which will be submitted to MMO in consultation with Natural England for approval pre-construction.
E52	8.9.337, 8.9.359, 8.10.9,	It is recognised that 'Seabed disturbances resulting from construction activities such as cable trenching within the black seabream nesting area may		We advise that long term and ongoing loss of black seabream nesting habitat is recognised as potentially being	The Applicant notes that each eventuality from all phases of the Proposed Development in respect to black bream nesting habitats, have been taken into consideration in

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
	8.10.41	damage nests and could potentially prevent future use of the seabed for nest building if a physical change in its character in discrete locations was to occur. The cable installation may, in discrete locations, have a long-term negative effect on areas of high intensity black seabream nesting if the physical nature of the seabed habitat is altered'. Natural England also considers there may be long term habitat loss during operation and maintenance, as 'it is recognised that some nesting habitat may potentially be lost through the introduction of cable protection'. Even with the mitigation proposed there is still a residual risk of unidentified nesting areas being impacted/ or not being avoidable/requiring cable protection, therefore we do not agree that there will be no long-term loss of habitat and that this can be assessed as Negligible. Additionally, there could be ongoing direct and indirect impacts from operations and maintenance (O&M) works on the export cable corridor		unavoidable and having ongoing impacts through the lifetime of the project. In relation to Operation and Maintenance works we advise a Disturbance Management Plan (DMP) is produced. This should set out impacts from each aspect of these works and present measures (and supporting information of efficacy) to avoid/reduce/mitigate the disturbing effect arising from operations such as cable repair, replacement, reburial operations in or adjacent to sensitive features including Kingmere MCZ and locations suitable for black seabream nests. Adherence to the measures listed in the DMP could/should be a condition of the DCO/dML	**Chapter 8: Fish and Shellfish Ecology, Volume 2 [APP-049]**. Specifically, the potential for impacts on black bream nesting habitats from the operation and maintenance phase of the Proposed Development, including the installation and potential replacement of cable protection, have been assessed in **Section 8.10** of **Chapter 8: Fish and Shellfish Ecology, Volume 2 [APP-049]**. The process for mitigating against the potential for impacts on sensitive features to ensure all effects are minimised, inclusive of impacts and effects from the operation and maintenance phase is detailed in the **In Principle Sensitive Features Mitigation Plan [APP-239]**. This Plan details the hierarchy of mitigation, following an avoid, reduce, mitigate process. Where mitigations are required during the operation and maintenance phase of the development, the principles of the mitigation have been captured in the **Outline Offshore Operations and Maintenance Plan [APP-238]** at high level. The details of which will be finalised once the final design information is available, and captured in the Final Offshore Operations and Maintenance Plan post-consent (as required under the deemed Marine Licence (dML) Condition 3 in Schedules 11 and 12 of the **Draft DCO [PEPD-009]**.
E53	8.9.357	Natural England question why there would be direct disturbance outside of the DCO boundary of the cable corridor (e.g., for anchor placement). We advise that activities are only permitted within the DCO boundary, and that anchor placement potentially in the MCZ outside of the DCO boundary has not been assessed.		We advise this is clarified in the assessment.	The Applicant confirms that there will be no direct disturbance outside of the DCO boundary of the cable corridor. The statement made in the ES was a general assertion that, should anchoring of vessels occur in areas adjacent to the Proposed Development works, no significant effects would be anticipated. The Applicant also confirms that no such activities would be undertaken within the MCZ boundaries, or indeed those of any designated site (this will be captured in a future iteration of the **In Principle Sensitive Features Mitigation Plan [APP-239]**), and further notes that anchoring vessels at sea is not a licensable activity.
E54	Commitment 271, 272 Also included in MCZ A and IPSFMP	'The offshore export cable routeing design will target areas of the seabed that enable maximising the potential for cables to be buried, thus providing for seabed habitat recovery in sediment areas and reducing the need for secondary protection and consequently minimising any potential for longer-term residual effects'.		Whilst Natural England support cable burial as the most preferable form of cable protection and the potential for this to minimise the long term effects. However, we understand that there are areas where the Applicant does not anticipate cable burial being possible and that up to 54% of the export cable	Geotechnical information will be collected after consent is granted and will be provided to potential cable installers during the tendering for these works. A technical evaluation of the methods proposed by the tendering parties will be undertaken as the start of cable burial risk assessment process and used as part of the decision-making process to select the preferred supplier. The aim of the project will be to select a contractor who, with their

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		'Adoption of specialist offshore export cable laying and installation techniques will minimise the direct and indirect (secondary) seabed disturbance footprint to reduce impacts, which will provide mitigation of impacts to potential (unknown) black seabream nesting locations, where avoidance is not possible. The Applicant will seek to utilise the most appropriate technology available at the time of construction to reduce the direct footprint impact from cutting machinery.		corridor may require mechanical trenching, and that up to 20% of the corridor will need cable protection. We advise that it should be made clear across the documentation that there are clear limitations in the applicability of these measure across the whole cable corridor. Additionally, it should be recognised that methods such as mechanical trenching have the potential to reduce the likelihood of recovery of nesting habitats. Additionally, where cable protection is required this may represent a loss of suitable nesting habitat. Natural England advise that a cable burial risk assessment, which contains site specific geotechnical information, is provided during the Examination. Without this information, it would have to be assumed that the worst-case scenario would be realised. This includes cable protection and/or the most impactful trenching methodology being required in habitat suitable for black seabream nesting	selected equipment and proposed methods, will be able to bury the subsea cables in accordance with the commitments and the mitigation secured through the dML and minimise the likelihood of future cable exposures. This will help the project avoid having to undertake expensive remediation works. The cable burial risk assessment will be completed by the party contracted to undertake these works during the detailed design stage and therefore cannot be provided during the Examination.
E55	Commitment 44	An Outline Scour Protection and Cable Protection Plan (Document Reference 7.12)'		We advise that further detail is provided on how this plan will minimise long term loss of habitat in relation to black seabream and seahorses, and how this considers lessons learnt from Rampion 1	Commitment C-44 in the **Commitments Register** **[APP-254]** sets out that a Final Scour Protection and Cable Protection Plan will be completed prior to construction commencing and submitted to the Marine Management Organisation (MMO) for approval and this is secured in Condition 11(1)(i) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**). The potential dimensions of scour are described in **Section 6, Appendix 6.3 Coastal processes technical report Impact assessment, Volume 4** **[APP-131]**. The assessment identifies that seabed scour will be very localised and where it does develop, limited to the area immediately adjacent to the installed infrastructure. There is no predicted significant effect on wider scale sediment transport rates or patterns and will not result in any net change in the volume of sediment available in the local or regional system.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		It is stated in relation to impacts from EMF that the cables will be buried at a target depth of '1.0 to 1.5m below the seabed surface for the majority of the route'. We understand that burial could be challenging in rock and that there are areas where cable protection will be required. Additionally, it is unclear why there is a range of 1m -1.5m, and so we advise that information is provided to evidence that burial 1m would still provide sufficient mitigation. We advise that a Cable Burial Risk Assessment is provided at the consenting stage. If this target depth cannot be met along the route then this could invalidate the ES conclusions. It is suggested that cable protection would provide the same mitigation as burial, but we advise no evidence has been provided here to support this statement. We advise that should installation methods such as pinning be used to minimise impacts on habitats such as chalk, this could invalidate EMF mitigation measures.		We advise that further geotechnical information, including a Cable Burial Risk Assessment is provided.	The cable burial depths will be determined as set out in **paragraph 4.3.54** within **Chapter 4: The Proposed Development, Volume 2** **[APP-045],** which is reflected in commitment C-41 in the **Commitments Register** **[APP-254]** for the array cables. A full Cable Burial Risk Assessment based on the results of the pre-construction surveys will be undertaken when the final design parameters are determined post-consent. In the event that it is not possible to bury a particular section of cable to the desired burial depth, cable protection will be considered as described in in **paragraph 4.3.68** within **Chapter 4: The Proposed Development, Volume 2** **[APP-045]**), The proposed burial of the subsea cables and the application of additional cable protection if needed, will provide a separation between buried cables and the seabed.
E56	8.10.75, 8.10.82 Commitments 41,45 and 96	'An Outline Marine Pollution Contingency Plan (MPCP) has been produced in Appendix A of the Outline Project Environmental Management Plan (PEMP)'		We note Appendix A of this outline plan is still brief at this stage and Natural England should be consulted on the final version post consent.	The Applicant confirms that the Marine Pollution Contingency Plan will be updated accordingly post consent (secured in Condition 11 (1)(d) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009])**, and consultation with the relevant statutory marine and nature conservation bodies (including Natural England) will be undertaken on the final version.
E57	Commitment 53	Mitigation and control of invasive species measures has been incorporated into the Outline Project Environmental Management Plan'.		We note that only the benthic section of this plan mentions invasive species, so this needs to consider fish. Natural England should be consulted on the final version.	The Applicant confirms that the Project Environmental Management Plan will be updated accordingly post consent (secured in Condition 11 (1)(d) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009])**, and consultation with the relevant statutory marine and nature conservation bodies (including Natural England) will be undertaken on the final version.
E58	Commitment 95 (Also in MCZ A)	It is suggested that the impacts due to decommissioning will have a magnitude no greater or less than the construction phase, but that a decommissioning programme will be developed. We advise that the magnitude of impacts is not reduced in this assessment from construction until the content of the Decommissioning Plan is known, and that Natural England should be consulted on this plan post consent.		We advise the decommissioning assessment is also updated.	As stated in **Chapter 8: Fish and Shellfish Ecology, Volume 2** **[APP-049]**, at this time no large offshore wind farm has been decommissioned in UK waters. Therefore, any future programme of decommissioning will be developed in close consultation with the relevant statutory marine and nature conservation bodies (including Natural England), and captured within a Decommissioning Plan, to ensure that the guidance and best practice at the time can be applied to minimise any potential impacts (as detailed in C-111 of the **Commitments Register** **[APP-**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					254] (secured in Part 3, Requirement 11 of the **draft DCO [PEPD-009])** in accordance with the Energy Act 2004).
E59	F & S 8.11-8.11.4 Commitment 11 (also in the MCZ A) MCZ A 7.2.33,7.5.8, 7.7.7	We advise that much of the mitigation proposed for construction is likely to be required for decommissioning. Where we have advised the sensitivity of features needs to be amended for the construction phase, this would also apply to decommissioning. We advise our comments above also apply to underwater noise from decommissioning. We advise that underwater noise impacts will need to be re-considered at the point where the full extent of these works and the machinery used is decided upon.			At this time no large offshore wind farm has been decommissioned in UK waters. Therefore, any future programme of decommissioning will be developed in close consultation with the relevant statutory marine and nature conservation bodies (including Natural England), and captured within a Decommissioning Plan, to ensure that the guidance and best practice at the time can be applied to minimise any potential impacts (as detailed in C-111 in the **Commitments Register [APP-254]** secured in Part 3, Requirement 11 of the **draft DCO [PEPD-009])** in accordance with the Energy Act 2004).
E60	8.11.11	Natural England advises that the default should be that cable protection should be removed, to avoid permanent loss of habitat that could support features naturally found in the area, such as black seabream nests.		We advise this should be made a commitment, but that the worst case of not being able to remove cable protection is considered.	Any decommissioning activities will be undertaken in accordance with guidance and best practice available at the time of decommissioning. Any future programme of decommissioning will be developed in close consultation with the relevant statutory marine and nature conservation bodies (including Natural England), and captured within a Decommissioning Plan (as detailed in C-111 of the **Commitments Register [APP-254]** secured in Part 3, Requirement 11 of the **draft DCO [PEPD-009])** in accordance with the Energy Act 2004).
E61	8.11.15	We advise that Black seabream show interannual variation in their nesting locations. Therefore, it cannot be assumed that these locations would be the same, many years down the line at decommissioning.		We advise this supports the need for ongoing data collection.	A noise buffer of 100 km for cumulative effects is a highly conservative screening range, that encompasses any feasible propagation of underwater noise associated with an offshore wind project which would be detectable above background levels. The Applicant also notes that the 100 km radius is also far greater than all modelled impact ranges for underwater noise with respect to fish receptors, as set out within **Appendix 11.3: Underwater noise assessment technical report, Volume 4 [APP-149]** and therefore represents a precautionary screening range for cumulative projects. The Applicant directs Natural England to its response to F37, regarding possible cumulative effects with aggregates licences in relation to sedimentation.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
E62	F & S 8.12.24 - 8.12.28 MCZ 7.8.3	We advise clarity is provided on the information used to generate the 100km noise buffer for cumulative effects. We advise you refer to our benthic comments in relation to possible cumulative effects with aggregates licences in relation to sedimentation.		We advise evidence is provided to support this and that are benthic comments are referenced.	The Applicant confirms that as detailed in paragraph 7.2.5 of the **Draft Marine Conservation Zone Assessment [APP-040]**, the noise modelling scenario presented in Graphic 1-1 represents the simultaneous piling of jacket foundations, which is the worst-case scenario for underwater noise on MCZs with noise sensitive features, such as black seabream and seahorses. The contours depicted represent the accepted criteria for onset mortality or mortal injury (207dB SEL_{cum}), recoverable injury (203 dB SEL_{cum}) and temporary threshold shift (186 dB SEL_{cum}). As noted in response to E62 above, the Applicant highlights that the 100 km radius is also far greater than all modelled impact ranges for underwater noise with respect to fish as noise sensitive receptors, as set out within **Appendix 11.3: Underwater noise assessment technical report, Volume 4 [APP-149]** and therefore represents a precautionary screening range. The ZoI used for screening other impacts, for example sedimentation, is based on the maximum spring tidal excursion from the Proposed Development and again is considered by the Applicant to be both appropriate and precautionary. The Applicant notes that behavioural thresholds for underwater noise impacts remain a key area of disagreement between Natural England and the Applicant and will continue to work with Natural England to agree a resolution.
E63	Graphic 1-1, Table 2.2, Table 5.1, 4.2.4	Natural England seek clarification that the graphic demonstrates the absolute worst case in terms of spatial overlap with designated sites, as no explanation is provided as to what scenario this represents. Additionally, we note that the contours shown on this graphic do not consider behavioural impacts, and neither does the noise ZoI (Zone of Influence) that is used to screen impacts (Table 5.1). Given this is critical to the assessment of MCZ features, such as black seabream and seahorses, we advise this contour is included. We therefore advise the screening decisions should not rely on this ZoI as drawn. We advise that currently viewed in isolation this graphic does not provide a clear understanding of the issues to the reader. We advise all noise		We advise confirmation is provided in the report of what scenario this represents, and that it is the worst case. We advise that the noise ZoI is updated to include behavioural impacts in relation to specific species. We advise that behavioural thresholds are still a key area of disagreement between Natural England and the Applicant	The embedded environmental measures set out in **Table 3-1** of the **Draft Marine Conservation Zone Assessment [APP-040]** are contained within the offshore environmental management plans, including: • **Outline Project Environmental Management Plan (PEMP) [APP-233]** • **Outline Scour Protection and Cable Protection Plan [APP-234]** • **Draft Piling Marine Mammal Protocol [APP-236]** • **Draft Unexploded Ordnance Clearance Marine Mammal Mitigation Protocol [APP-237]** • **In Principle Sensitive Features Mitigation Plan [APP-239]** • **Offshore In Principle Monitoring Plan [APP-240]** The above plans are secured through Condition 11, Schedules 11 and 12 of the **draft DCO [PEPD-009]**,

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		modelling/figures should include the boundary of the MCZ's			which relates to Pre-construction plans and documentation.
E64	3.1.3	Natural England advises that it is key all these measures are secured in any consent issued.		We advise all embedded mitigation measures proposed are secured in the DCO/DML.	The pre-application consultations on impacts from construction noise on spawning/nesting black seabream are listed in **Table 3-1** of the **In Principle Sensitive Features Mitigation Plan**, **[APP-239].** The responses of the Applicant to the relevant stakeholders, included issuing technical notes; **Underwater Noise Mitigation for Sensitive Features [APP-251]**), and **Additional underwater noise modelling** of Appendix D, in the **Evidence Plan (Part 9 of 11) [APP-251]**), summarising the results of underwater noise modelling for noise mitigation for black seabream and the proposal to use a disturbance threshold of 147 decibels (dB) SELss (Radford et al., 2016), based on a low response reaction in seabass. The Applicant commissioned a dedicated survey of ambient noise levels to provide contemporary data on noise levels at the Kingmere MCZ site and within surrounding areas whereby much of the black seabream nesting activity is focused. This survey was undertaken over 15 days in July 2022. A further technical note, **Evidence Plan (Part 3 of 11) Piling Noise and Black Bream [APP-245]** was issued to Natural England and the MMO in March 2023, providing responses to the following key issues raised: approaches to dealing with uncertainty and the application of precaution in the assessment; approach to improving the rigour of the baseline soundscape data; additional context from Rampion 1 construction; and additional empirical evidence to support the efficacy of mitigation techniques. In response to further consultation, the Applicant commissioned a second in-situ noise monitoring survey, targeted at collecting data across the March to July black seabream spawning/nesting period in 2023. As outlined in **Section 5.3** of the **In Principle Sensitive Features Mitigation Plan [APP-239],** this commitment has now been updated so that noise mitigation technology will be in place for the entirety of the piling operations, with additional measures put in place during the breeding

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					season, the Applicant will continue to liaise with Natural England on this issue.
E65	4.1.3	Natural England notes that agreement was not reached in the Expert Topic Groups (ETG's) with regards to underwater noise impacts on black seabream.		We advise that this is still a key area of disagreement between Natural England and the Applicant.	The Applicant considers it has appropriately applied the assessment outcomes from the EIA relating to potential impacts arising on MCZ features, or relevant components of those features, before providing a concluding statement on the potential for hindrance of the Conservation Objectives for each feature within the **Draft Marine Conservation Zone Assessment [APP-040]**. Noting the concern raised, the Applicant will engage with Natural England to clarify where the assessment presented introduces confusion through terminology in order to resolve the concerns and will update the ExA in due course. In regard to the comments on determination of impact magnitude and significance of effect, the Applicant has responded to each item raised by Natural England in its Relevant Representation (see responses to E29, E37-E39, E43 and E44 above). The Applicant considers the assessment presented within the ES to be robust and appropriate, and on this basis is not intending to change its findings. However, the Applicant will seek to discuss and resolve these issues with Natural England. Discussions with Natural England will be recorded in the Statement of Common Ground.
E66	4.3.7	Natural England notes that EIA terminology and methodology to assess impacts are being applied throughout the MCZ Assessment. For clarity, the MCZ Assessment should seek to define and understand the potential of the conservation objectives being hindered by external activities/impacts. We advise that to avoid confusion the MCZ Assessment should not use EIA terminology. Additionally, we note that our comments within the thematic chapters regarding significance of effect and magnitude also apply to the MCZ assessment where the Applicant has brought forward these conclusions into it.		We advise the MCZ Assessment is revised accordingly.	Whilst, as noted above in response to E66, the Applicant considers the assessment presented within the MCZ assessment to be robust and appropriate, it will seek to discuss and resolve these issues with Natural England. Discussions with Natural England will be recorded in the Statement of Common Ground.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
E67	5.2.5	We note that indirect impacts that were assigned a 'negligible' magnitude in the ES and have therefore been screened out and not taken to a stage 1 MCZ Assessment. We advise that our comments on the relevant chapters are taken into account and this screening is adjusted as necessary. Furthermore, the different impacts of the proposal on the MCZ features in question should be considered cumulatively rather than in isolation to avoid 'salami-slicing' the overall impact.		We advise that our comments on the relevant thematic chapters are considered against any conclusions made in the MCZ Assessment.	The Applicant notes that in relation to the same effects arising from construction as assessed in **Chapter 8: Fish and shellfish ecology, Volume 2 [APP-049]**, no significant effects were concluded. Therefore, considering the low order impacts arising from the short term and intermittent maintenance activities associated with cable repair, replacement and reburial, any impacts from these activities would be substantially less and therefore also not significant. It is on this basis that the Applicant screened such impacts out for fish and shellfish features of the Kingmere MCZ.
E68	5.2.5 - 5.2.6	Natural England advises that cable repair, replacement and reburial as part of O&M activities in proximity to Kingmere MCZ have the potential to cause impacts that have not been included in the screening		Natural England advises that these impacts should be screened in.	Please refer to the Applicant's response to E67 above.
E69	Table 5.1	Natural England advises that where impacts have been screened out due to impacts on coastal and marine processes not being significant, Natural England's comments on this chapter should be taken into account.		Natural England advises our comments on coastal and marine processes are referred to and the assessment updated as necessary	Please refer to the Applicant's response to E8 above.
E70	7.2.5	It is suggested that 'The maximum design scenarios (spatial and temporal) with respect to underwater noise relates to the simultaneous and sequential piling of pin piles: - Spatial worst case - Simultaneous installation of jacket foundations. (Piling of 396 pin piles (4 pin piles piled simultaneously at both the East and West piling locations in the array area)), driven with a 2,500 kilojoule (kJ) hammer energy; - Temporal worst case - Sequential piling of 396 pin piles (pin piles piled sequentially at separate locations within a period of 24 hours), driven with a 2,500kJ hammer energy'. This is not the same as the Maximum Design Scenario (MDS) presented in the fish and shellfish chapters, which includes detailed parameters including, for example, number of piles per day. We advise clarity is provided on why this differs.		We advise that you refer to our more detailed comments on the fish and shellfish chapter on this. We advise that a clear worst-case scenarios are presented across all documents, with any difference explained. We advise clarity is provided on the modelled scenario used to inform the assessment and included on the graphic	Please refer to the Applicant's response to E66 above. The Applicant confirms that within the **Marine Conservation Zone Assessment [APP-040]**, and **Chapter 8: Fish and shellfish ecology, Volume 2 [APP-049]**, black bream have been assigned a sensitivity of Medium to underwater noise, on the basis that the receptor has a swim bladder that is close but not intimately connected to the ear. A negligible magnitude of impact has been assigned when regarding impacts from underwater noise on black bream within the Kingmere MCZ. This is due to the lack of overlap from underwater noise contours for injurious effects, and the application of mitigation for TTS and behavioural effects (as detailed in full in the **In Principle Sensitive Features Mitigation Plan [APP-239]**). The Applicant confirms that the assessment presented in the **Chapter 8: Fish and shellfish ecology, Volume 2 [APP-049]**, assesses the potential for impacts on black bream at a population level (with a focus on areas of primary importance to black seabream), and **Marine Conservation Zone Assessment [APP-040]**, assesses the potential for hindrance on the Conservation Objectives

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					of the Kingmere MCZ. Therefore, any differences between the magnitude of impact between the two assessments will be on account of this.
E71	7.2.8-7.2.34	Notwithstanding our comments regarding the appropriateness of using of EIA terminology in the MCZ Assessment, we advise that clarity is provided where there are differences between the magnitude of impact and sensitivity applied between the two assessments. We do not agree with the negligible magnitude of impact applied here. Please see comments on the chapter above.		We advise any differences are recognised and clearly justified. Please refer to our chapter comments with regards to the magnitude of impact.	The Applicant is confident that a suitably precautionary assessment was undertaken in relation to the potential for impacts to features of the Kingmere MCZ, as informed by physical processes modelling. Notwithstanding this, the Applicant has committed to a seasonal restriction to ensure offshore export cable corridor installation activities are undertaken outside the black seabream breeding period (March-July) to avoid any effects from installation works on black seabream nesting within or outside of the Kingmere MCZ.
E72	7.2.35- 7.2.59	Natural England agrees with the sensitivity assigned to the features of Kingmere MCZ in relation to increases in suspended sediment concentrations (SSC) and sediment deposition, as these are in line with our advice on operations. However, based on the fact the 500m buffer does overlap with an area of Kingmere MCZ, we do not agree with the assessment of a minor magnitude of impact.		We advise that the magnitude of impact should be revised to consider the actual impact on the area of overlap, as opposed to contextualising this in relation to the site as a whole.	Following a detailed assessment undertaken on a precautionary basis, as detailed in **Chapter 8: Fish and shellfish ecology, Volume 2** **[APP-049]**, the Applicant is confident that a full piling restriction from 1 March to 31 July is not appropriate or required to avoid significant population level effects on nesting black bream. Whilst, in 2021, the black seabream spawning/nesting period was extended to include the month of July, spawning/nesting activity during this month is considerably reduced and therefore with much less impact on the population breeding success is anticipated than the preceding months, as set out in **Chapter 8: Fish and shellfish ecology, Volume 2** **[APP-049]**, with 5% of nests attended by males by 10 July and 0% by 30 July in a 2020 survey. This compared with 89.4% nests attended by males in June of the same year. Noting that some nesting is still potentially occurring in July, the **In Principle Sensitive Features Mitigation Plan** **[APP-239]**, the provision of which is secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**) sets out multiple mitigation measures during the month of July; these include (in the event that piling is undertaken in July in the western part of the array) the combination of a low noise hammer technology and bubble curtains, and a sequencing approach to piling starting in locations furthest from the MCZ. Through the application of a variety of mitigation measures in July, the Applicant is confident that piling operations will not hinder the Kingmere MCZ conservation objectives.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					The Applicant reiterates that a full piling exclusion from March-July inclusive would have significant issues for the practical development of the Proposed Development.
E73	7.2.25	Natural England's position is that the piling restriction should run from 1st March – 31st July inclusive in line with the sensitive season for spawning/breeding black seabream in the conservation advice for Kingmere MCZ.		We advise this is the appropriate length of the piling restriction needed to avoid hindering the conservation objectives of the MCZ.	Please refer to the Applicant's response to E73 above.
E74	7.2.28	Natural England advise that July should not be seen as less important in relation to the potential to hinder the conservation objectives of Kingmere MCZ. Whilst we agree that it appears from the aggregates data that the levels of spawning/nesting may be lower in July, this difference does not represent evidence that this period is not important to designated bream. It is thought possible that later spawning could be an important 'last attempt' if spawning has been unsuccessful earlier in the season.		We advise that July should be consider equally important in line with the conservation advice	The Applicant is undertaking additional work to provide a comparison of the environmental conditions at the Proposed Development with other projects where NAS have been deployed, this will be submitted to the Examination in due course.
E75	7.2.30, 7.2.31	It is stated that 'Details of available mitigation technology have been presented to provide confidence that the required levels of noise attenuation can be delivered (either through one of the examples given, or through other future potential mitigation technology) and can therefore be relied upon to avoid potentially significant effects that may arise in the absence of mitigation'. Natural England advise that insufficient evidence has been presented to provided certainty that these measures can achieve the levels of attention proposed within the specific environmental conditions present at the construction site of Rampion 2. Natural England has concerns about the approach of effectively pushing this issue to post consent, given it may still not be possible to resolve at that stage. We advise that certainty of provision of the commitments is not the same thing as certainty that the commitments will be sufficient to prevent the conservation objectives of a designated site being hindered.		The mitigation technology proposed has not been used in like for like conditions as Rampion 2. We encourage the Applicant to trial and monitor the noise attenuation achieved by the mitigation outside of the sensitive period for black seabream and present findings to the MMO and Natural England for review. Without such evidence we cannot agree that the conservation objectives of Kingmere MCZ will not be hindered.	As presented in the **In Principle Sensitive Features Mitigation Plan [APP-239]**, through the implementation of noise abatement measures, and seasonal restrictions and zoning, the Applicant is confident that the conservation objectives of the Kingmere MCZ will not be hindered. Furthermore, significant measures of precaution are applied throughout the mitigation plan, including the use of a precautionary disturbance threshold of 141 decibels (dB) SELss based on research by Kastelein et al. (2017) (which recorded a short-lived response to 141 dB (SELss) in seabass), and the modelling of minimal underwater noise attenuations afforded by each noise abatement measure.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
E76	7.2.32, 7.2.34	Based on the information presented to date Natural England does not have confidence that a 'noise reduction is achievable to reduce the impact ranges of TTS and behavioural effects to outside of areas of primary importance for breeding black seabream'. Therefore, advise we do not agree with the conclusion that 'there will be no impact from underwater noise on nesting black seabream within the Kingmere MCZ, and the magnitude of impact is considered to be negligible'. Additionally, we advise piling is not short-term and intermittent, particularly if it is conducted sequentially as stated in the WCS		We disagree that underwater noise will not hinder the conservation objectives of the site	Please refer to the Applicant's response to E58 above.
E77	7.2.33	In relation to decommissioning we understand that underwater noise from cutting has the potential to generate a lower level of underwater noise than pile driving. However, no reference is presented to demonstrate this and support the subsequent conclusion of no significant effect		We advise evidence is provided to support this conclusion.	The Applicant confirms that the implementation of Commitment 273 of the **Commitments Register** **[APP-254] (**secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**) applies to all aspects of export cable installation (including seabed preparation works and trenching for cables.
E78	7.2.37	The three main sources of SSC and sediment deposition may arise from Rampion 2 are listed as: drilling for foundations, trenching for cables, and seabed preparation activities (such as seabed levelling and sandwave clearance). We seek clarification that the seasonal restriction on cable installation activities in the export cable corridor during March-July includes the trenching activities and seabed preparation activities in this area.		We advise the clarity is provided on the activities include in this restriction and any activities that would not be included before we can provide our final advice on this matter.	The Applicant is confident that a suitably precautionary assessment has been undertaken to establish the potential impacts from underwater noise on seahorse. As stated in **Chapter 8: Fish and shellfish ecology, Volume 2** **[APP-049]**, the Applicant does not support the application of the 135dB SEL contour to establish behavioural impact ranges for sensitive receptors. Specifically, this threshold is based on a study undertaken within a quiet loch, and it is therefore not considered appropriate to use this threshold within a much noisier area such as the English Channel (which is subject to high levels of anthropogenic activity and consequently noise) as the species within this area will be acclimated to the noise and would be expected to have a correspondingly lower sensitivity to noise levels.
E79	7.5.7, 7.7.6	Natural England note that it is suggested that there is the 'potential for behavioural effects on breeding seahorse, there is the potential for an interaction of the impact ranges from piling in the array area with the Selsey Bill and the Hounds MCZ, Beachy Head West MCZ, Beachy Head East MCZ and Bembridge MCZ'. However, this noise contour has not been included on Graphic 1.1.		We advise Graphic 1 is updated to include this contour.	The Applicant is confident that a suitably precautionary assessment has been undertaken to establish the potential impacts from underwater noise on seahorse. Furthermore, the Applicant directs Natural England to **Appendix 11.3: Underwater noise assessment technical report, Volume 4** **[APP-149]** where the built in precaution of the noise modelling is detailed, and therefore the impact ranges on seahorse are considered precautionary.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					Furthermore, as stated in **Chapter 8: Fish and shellfish ecology, Volume 2 [APP-049]**, the Applicant does not support the application of the 135dB SEL contour to establish behavioural impact ranges for sensitive receptors. Specifically, this threshold is based on a study undertaken within a quiet loch on fish not involved in any particular activity (i.e. not spawning), and it is therefore not considered appropriate to use this threshold within a much noisier area such as the English Channel (which is subject to high levels of anthropogenic activity and consequently noise) as the fish within this area will be acclimated to the noise and would be expected to have a correspondingly lower sensitivity to noise levels. The Applicant is undertaking additional work to provide a comparison of the environmental conditions at the Proposed Development with other projects where NAS have been deployed, this will be submitted to the Examination in due course.
E80	7.5.7, 7.7.6	It is stated that the 'The implementation of embedded environmental measures to employ one or more noise abatement mitigations, during the summer breeding season of seahorse (C-265, C-274, C280, and C- 281, Table 3-1) will reduce the impact ranges of behavioural effects to outside of the MCZs.' However, no evidence has been provided here to support this statement, and therefore the subsequent conclusion of not hindering the conservation objectives of the relevant MCZ's. We also advise that we have not discussed an appropriate threshold for behavioural disturbance on seahorses with the Applicant.		We advise that evidence is provided to demonstrate that the mitigation measures put forward have proven efficacy (in the same environmental conditions as are present at the Rampion 2 site) to reduce the noise levels to below an acceptable behavioural threshold level within Beachy Head West MCZ. We advise without this information we do not consider the magnitude to be negligible.	The Applicant is confident that a suitably precautionary assessment has been undertaken to establish the potential impacts from underwater noise on seahorse. Furthermore, the Applicant would like to direct Natural England to **Appendix 11.3: Underwater noise assessment technical report, Volume 4 [APP-149]** where the built in precaution of the noise modelling is detailed, and therefore the impact ranges on seahorse are considered over precautionary. Notwithstanding this, the Applicant is undertaking additional work to provide a comparison of the environmental conditions at the Proposed Development with other projects where NAS have been deployed, this will be submitted to the Examination in due course.
E81	7.7.5	As recognised in 7.5.3 Seahorses have been put into Group 4 'Fishes that have special structures mechanically linking the swim bladder to the ear', which means they are a particularly sensitive receptor to underwater noise impacts. Natural England note that there is a potential for 'TTS impacts on breeding seahorse' as 'there is an interaction of the impact ranges from piling in the array area, with Beachy Head West MCZ'. It is stated that 'embedded mitigation to reduce impacts from underwater noise on sensitive receptors will		We advise that evidence is provided to demonstrate that the mitigation measures put forward have proven efficacy (in the same environmental conditions as are present at the Rampion 2 site) to reduce the noise levels to below the TTS level within Beachy Head West MCZ. We advise without this information we do not consider the magnitude to be negligible	Please refer to the Applicant's response to **E47** above.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		reduce the impact ranges of TTS to outside of the MCZ'. However, no evidence has been provided here to support this statement, and therefore the subsequent conclusion of not hindering the conservation objectives of the relevant MCZ's.			
E82	7.5.11	We advise that short-snouted seahorse are treated as a stationary receptor in terms of increases in SSC and sediment deposition, in the same way they have been for noise.		We advise the assessment is amended to reflect this	Please refer to the Applicant's response to **E23** above.
E83	8.1.4	Natural England does not agree the conservation objectives of Kingmere MCZ will not be hindered in relation to underwater noise impacts (both TTS and behavioural impacts) on black seabream. This primarily relates to insufficient certainty regarding the efficacy of mitigation proposed specifically in the environmental conditions at Rampion 2, and disagreement with the suitability of the threshold for behavioural impacts proposed by the Applicant.		This is Natural England's position. Our position that a full seasonal restriction is required has not changed from Rampion 1.	The Applicant is confident that a suitably precautionary assessment has been undertaken to establish the potential impacts from underwater noise on seahorse. As stated in **Chapter 8: Fish and shellfish ecology, Volume 2 [APP-049]**, the Applicant does not support the application of the 135dB SEL contour to establish behavioural impact ranges for sensitive receptors. Specifically, this threshold is based on a study undertaken within a quiet loch, and it is therefore not considered appropriate to use this threshold within a much noisier area such as the English Channel (which is subject to high levels of anthropogenic activity and consequently noise) as the species within this area will be acclimated to the noise and would be expected to have a correspondingly lower sensitivity to noise levels. The Applicant is undertaking additional work to provide a comparison of the environmental conditions at the Proposed Development with other projects where NAS have been deployed, this will be submitted to the Examination in due course.
E84	MCZ A 8.1.4 IPSFMP 5.3.43	Natural England also note that in relation to short snouted seahorse there is a potential for underwater noise impacts on the following MCZ's: • Beachy Head West MCZ (TTS and behavioural) • Beachy Head East MCZ, Selsey Bill and the Hounds MCZ, Bembridge MCZ (behavioural) The Applicant has proposed the mitigation put forward will ensure these impacts are not realised within the MCZs, however, the assessment does not refer to evidence/modelling that demonstrates this. In relation to the mitigation measures themselves,		We advise that suitable evidence is provided to support this conclusion.	Document used: **Report to Inform Appropriate Assessment [APP-039]**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		Natural England has the same concerns around efficacy as raised above in relation to black seabream. Additionally, we have not agreed or discussed a suitable behavioural threshold with the Applicant.			
Document used: APP-039] 5.9 Rampion 2 Report to Inform Appropriate Assessment					
E85	7.3.14	Natural England are likely to agree with the conclusion of no AEoI in relation to the Atlantic salmon feature of The River Itchen SAC. However, we note that Table 7.1 includes figures for a fleeing receptor and Natural England advise that fish are not considered a fleeing receptor. Additionally, we advise that it would be more accurate to show the noise modelling location closest to the SAC on Figure 7.1 and for clarity to be provided on which of the WCS this figure is showing. We advise that the full range of stationary noise effects are shown in Figure 7.1 in order to support the conclusions drawn.		We advise the Table is updated to the figures for a stationary receptor and that the full range of effects is modelled on Figure 7.1 to support the conclusions drawn.	Commitment C-44 in the **Commitments Register [APP-254]** sets out that a Final Scour Protection and Cable Protection Plan will be completed prior to construction commencing and submitted to the Marine Management Organisation (MMO) for approval and this is secured in Condition 11(1)(i) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**). The potential dimensions of scour are described in **Section 6, Appendix 6.3 Coastal processes technical report Impact assessment, Volume 4 [APP-131]**. The assessment identifies that seabed scour will be very localised and where it does develop, limited to the area immediately adjacent to the installed infrastructure. There is no predicted significant effect on wider scale sediment transport rates or patterns and will not result in any net change in the volume of sediment available in the local or regional system.
Document used: [APP-239] 7.17 Rampion 2 In Principle Sensitive Features Mitigation Plan (IPSFMP)					
E86	Executive summary, 1.1.2, 5.4.1, 1.1.6-1.1.17	Natural England has concerns regarding the IPSFMP not being finalised until the post-consent/pre-construction phase, and that it is stated the mitigation measures are not confirmed. We advise that where mitigation measures are essential to the assessment, we cannot agree the assessment conclusions without sufficient certainty in the measures being progressed and being able to achieve the levels of mitigation required.		Natural England advise that further investigation and information is provided into the Examination to demonstrate the effectiveness of the measure	The Applicant confirms that the measures will be progressed but will be refined based on the Final Design information and piling parameters. This information will only be known once design refinement has been completed post consent. The Final Plan must accord with **In Principle Sensitive Features Mitigation Plan [APP-239]** as secured in secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**).
E87	1.1.4	Natural England notes it appears to be implied here that if the worst-case scenario is not realised some of these measures may be reduced. Therefore, we advise that we do not have sufficient certainty of exactly what we might be agreeing to at this stage.		We advise that this is clarified.	The Applicant confirms that the measures presented in the **In Principle Sensitive Features Mitigation Plan [APP-239]**. are purely considered 'In Principle' on the basis that the optimised design for construction is not yet finalised. The Final Plan will be submitted pre-construction for agreement with the MMO in consultation with Natural England (secured in secured in Condition

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**)). The commitments as detailed in the **Commitments Register** **[APP-254]** will be adhered to by the Project regardless of the realisation of the worst-case scenario.
E88	Flowchart 1	Natural England advise that post construction monitoring to verify the predicted effects will be required.		We advise this is clarified	The Applicant confirms that the monitoring to be undertaken is detailed in the **Offshore In Principle Monitoring Plan** **[APP-240]**. The details of monitoring will be agreed with the MMO in consultation with Natural England prior to construction (secured in secured in Condition 11(1)(j) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**).
E89	2.5.5	We advise this information from the Rampion 1 surveys is of limited relevance, given Rampion 1 had a piling restriction April-June, and the export cable was not located in an area of known bream nesting		We advise that the limitations of this a clearly recognised.	The Applicant notes these limitations raised. This will be acknowledged in the Final Plan, however the Applicant also highlights that piling was undertaken through the month of July during the construction of Rampion 1 and although anecdotal, the post-construction monitoring for that project did not identify any adverse population effects on black seabream in the region. The Final Plan must accord with **In Principle Sensitive Features Mitigation Plan** **[APP-239]** as secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**).
E90	Table 3.1	Natural England maintains our advice that the only measure that provides confidence that the conservation objectives of Kingmere MCZ in relation to Black seabream will not be hindered is a full pilling exclusion between March-July inclusive		We advise in the absence of further evidence being presented this will remain our advice.	Please refer to the Applicant's response to **E73** above.
E91	Table 3-2	Natural England would expect that monitoring would be undertaken to demonstrate recovery, with further measures potentially being triggered if this was not shown.		We advise that this aspect is included in an updated Plan.	The Applicant confirms that the monitoring to be undertaken is detailed in the **Offshore In Principle Monitoring Plan** **[APP-240]** as secured in Condition 11(1)(j) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**). The details of monitoring will be agreed with the MMO in consultation with Natural England prior to construction.
E92	Table 3.2	It is stated that 'Updates to the project design that could impact the conclusions of the assessment may be subject to further assessment if deemed appropriate in consultation with the relevant authority'.		We advise that all reasonable efforts should be made to narrow down this uncertainty prior to consent being granted.	The Applicant confirms that any changes will represent a refinement of the current project design envelope to ensure they are appropriate to the final design (as recognised in the Planning Inspectorate Advise Note Nine.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		Natural England advises that we have concerns over assessments being changed post-consent and the process that would need to be followed to achieve this. We advise that updates to the underwater noise monitoring proposed also appear to be leaving handling the uncertainty to post consent.			Any changes that require a marine licence variation or new licence would need to be appropriately supported by updated assessments and evidence as relevant.
E93	4.2, 5.2.4	We advise our benthic comments on the features to be included and comments above on the mitigation measures are considered here		Refer to our comments and amend	Please refer to the Applicant's responses to **F64** to **F80**. The Applicant has responded to each of the comments on the mitigation measures individually in the responses given above.
E94	4.3.3	In relation to Black seabream Natural England advise that the focus of the survey should be mapping habitats with the potential for nesting.		See comments above.	As stated in the **In Principle Sensitive Features Mitigation Plan [APP-239]**, the mapping of black bream nesting habitats will be a key focus of the pre-construction survey. The outputs of the survey will be presented within the Final Plan. The Final Plan must accord with **In Principle Sensitive Features Mitigation Plan [APP-239]** as secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**).
E95	4.3.2	Natural England advise that we do not have confidence in the ability of the 'spatial and temporal zoning plan' to deliver effective mitigation to prevent the conservation objectives of Kingmere MCZ being hindered. As Cefas have raised, such plans rely on the modelling, which is not sufficiently reliable to make predictions to such specific boundaries. In addition, there is not sufficient information on the efficacy of mitigation measures in this environment and their ability to achieve thresholds to such defined boundaries. Finally, we advise that in the absence of an agreed threshold for behavioural disturbance to reduce the impact down to within the MCZ, mitigation cannot be agreed.		Unless additional information is provided, it will remain our position that a pilling exclusion from March-July inclusive is the only measure we can have confidence will not hinder the conservation objectives of Kingmere MCZ	The Applicant acknowledges Natural England's concerns regarding the efficacy of noise abatement measures in the Proposed Development location. The Applicant is undertaking additional work to provide a comparison of the environmental conditions at the Proposed Development with other projects where NAS have been deployed, this will be submitted to the Examination in due course. The Applicant's position on the behavioural threshold for black seabream has been reliant upon existing literature and best available knowledge and understanding, as detailed in **Paragraph 8.9.247** et seq. of **Chapter 8: Fish and shellfish Ecology, Volume 2 [APP-049]**. As detailed in the **In Principle Sensitive Features Mitigation Plan [APP-239]**, the Applicant considers the disturbance threshold of 141dB SELss as suitably precautionary, as it is based on a short-lived startle response observed in sea bass. As informed by Popper et al., (2014) behavioural disturbances are considered to be long term changes in behaviour and distribution, and should not include effects on single animals, or small changes in behaviour such as startle responses or minor

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					movements. The use of the disturbance threshold of 141dB SELss is therefore considered to be suitably precautionary. Further to this, the approach used by the Applicant to define a suitable threshold for disturbance from underwater noise aligns with that used in other OWF applications and assessments (e.g. Hornsea Four Offshore Wind Farm Application (Ørsted, 2021) Hornsea Project Three Offshore Wind Farm Application (Ørsted, 2018), Sheringham and Dudgeon Extension Offshore Wind Farm Projects Application (Equinor, 2022) Awel y Môr Offshore Wind Farm Application (RWE, 2023)), and therefore complies with current practice when approaching issues such as scientific data gaps and uncertainties, in order for planning decisions to be made.
E96	5.2.14	We advise that the post-consent data collection will require an agreed plan to ensure that this will be sufficient to inform micrositing.		We advise that an agreed monitoring plan, should be approved to the MMO in consultation with Natural England, well in advance of any surveys taking place to ensure survey can go ahead at the optimum time of year.	The Applicant confirms that the details of the pre-construction survey will be produced post consent and agreed with the MMO in consultation with Natural England. Pre-construction monitoring and surveys are secured by secured in Condition 16 of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**).
E97	5.2.15	We advise that aiming for a 300m buffer from the edge of nesting areas is desirable. Any reduction in buffers would need to be clearly set out and agreed with MMO and Natural England. Please also refer to our detailed benthic comments.		We advise that this is detailed in a final plan for micrositing to be agreed post-consent with the MMO in consultation with Natural England. Refer to our benthic comments.	The Applicant welcomes this advice from Natural England. The Applicant confirms that agreement of the Final Plan for micrositing as part of the Sensitive Features Mitigation Plan will be sought from the MMO in consultation with Natural England post-consent. The Final Plan must accord with **In Principle Sensitive Features Mitigation Plan** **[APP-239]** as secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**).
E98	5.3.1	Natural England disagree that based on the information to date the levels of noise attenuation specified can be achieved and relied upon. Natural England has not been presented with evidence from the Applicant that these levels of attenuation would be achievable in the specific environmental conditions at the Rampion 2 site.		We advise that this information should be submitted into the Examination.	The Applicant is undertaking additional work to provide a comparison of the environmental conditions at the Proposed Development with other projects where NAS have been deployed, this will be submitted to the Examination in due course.
E99	5.3.3	We advise that clarity is provided here that this is relevant to Temporary Threshold Shift and behavioural disturbance.		We advise clarity is provided.	The Applicant confirms that this statement relates to both Temporary Threshold Shift and behavioural disturbance.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
E100	5.3.3	This incorrectly refers to records of seahorses in the south-western region, whereas Rampion 2 is in the south-east.		This should be amended in an updated assessment.	The Applicant confirms this has been amended to 'south-eastern region' in the Errata submitted at Pre-Examination Procedural Deadline **Cover Letter [PEPD-001]**.
E101	5.3.3	With regards to mitigation measures for Herring, Natural England defers to the advice of Cefas (see comments on the fish and shellfish chapter).		To note.	This is noted by the Applicant.
E102	5.3.4	Refer to our comment on mitigation measure C-265. It is stated that 'Assumptions on attenuation performance of the noise mitigation techniques are based on demonstrable performance of the technology, to ensure confidence in delivering the required noise level reductions'. We advise we are not aware that a full comparison between environmental conditions at test locations and those at Rampion 2 has been conducted. We understand that the Applicant to date has not had this information, and therefore we disagree that confidence in the noise attention to be achieved has been provided.		We advise that full comparison of environmental conditions is undertaken, to aid in providing further confidence in the levels of abatement proposed. This should be submitted into the examination.	The Applicant is undertaking additional work to provide a comparison of the environmental conditions at the Proposed Development with other projects where NAS have been deployed, this will be submitted to the Examination in due course.
E103	5.3.19	We advise that the information shared confidentiality with Natural England is not sufficient to address our concerns. In relation to double big bubble curtains, we advise that other factors such as the strength of the current, depth of water and benthic substrate are critical to performance. These have not been compared		We advise that full comparison of environmental conditions is undertaken, to aid in providing further confidence in the levels of abatement proposed.	Please refer to the Applicant's response to E98 above.
E104	5.3.21, 5.3.26	Please refer to comments above in Point 35 regarding 141dB. We do not support 141dB re 1 µPa2s being used as the basis of this plan.		Natural England position is that a full pilling exclusion March-July (inclusive) should be implemented.	Please refer to the Applicant's response to E35 above.
E105	5.3.22-5.3.23	Please refer to our comments above in relation to the studies referenced here, and how they have been applied. We have concerns over the methodology used to determine a threshold from the ambient noise data collected. It is clear that the peak levels of noise have been referenced, but these are not the same as continuous noise from piling, and		We advise that you refer to the more detailed advice of Cefas with regards to how the Applicant has proposed deriving a threshold ambient noise data.	This is noted by the Applicant. More detailed ambient noise data has been acquired in 2023 which provides additional information (this was submitted to the Examination at Pre-Examination Procedural Deadline **Chapter 21 Noise and vibration, Volume 2** of the ES **[PEPD-018]**). It should be noted that piling noise, even from 'continuous' piling, should not be considered

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		therefore it may be more appropriate to look toward the minimum levels of noise. However, we defer to Cefas on this matter.			continuous and can be described in different ways using multiple noise metrics. It is agreed that comparisons between different metrics should be avoided, although under some circumstances this may provide useful information.
E106	5.3.25	Please see our comments on Appendix 8.3 above regarding the further noise study.		See above.	Please refer to the Applicant's response to E105 above.
E107	3.1.1, 5.3.28	Natural England advise that no detailed discussion regarding this mitigation being suitable for seahorses has been had as part of the evidence plan process. We advise that the maximum noise attenuation measures should be used year-round in all areas. We advise evidence is provided that this will sufficiently reduce the impacts within seahorse MCZ's. No evidence has been provided to support 141dB re 1 µPa2s (SELss) being a suitable behavioural threshold for seahorses. We advise that seahorses are a 'group 4' receptor. Group 4 receptors are defined as having the highest sensitivity to noise and therefore we would expect to see evidence that this threshold was suitable for seahorses. We note that 8.9.259 of the Fish and Shellfish Chapter suggests lower thresholds		We advise that this advice is taken into consideration, the plan amended, and evidence provided.	The Applicant is confident that a suitably precautionary assessment has been undertaken to establish the potential impacts from underwater noise on seahorse. Furthermore, the Applicant would like to direct Natural England to **Appendix 11.3: Underwater Noise Assessment Technical Report, Volume 4 [APP-149]**, where the built in precaution of the noise modelling is detailed, and therefore the impact ranges on seahorse are considered suitably precautionary. Furthermore, as stated in **Chapter 8: Fish and shellfish Ecology, Volume 2, [APP-049]**, the Applicant does not support the application of the 135dB SEL contour to establish behavioural impact ranges for sensitive receptors. Specifically, this threshold is based on a study undertaken within a quiet loch on fish not involved in any particular activity (i.e. not spawning), and it is therefore not considered appropriate to use this threshold within a much noisier area such as the English Channel (which is subject to high levels of anthropogenic activity and consequently noise) as the fish within this area will be acclimated to the noise and would be expected to have a correspondingly lower sensitivity to noise levels.
E108	5.3.29	Natural England question whether this accounts for simultaneous piling at different locations, and the cumulative potential this has.		We advise clarity is provided within the assessment.	The Applicant confirms that the behavioural threshold used to inform the zoning exercise and mitigation (141dB re 1 µPa2s (SELss)) is for single strike, and represents disturbance, which by nature does not require or considered timed exposures. Multiple piling scenarios are therefore not applicable for this criterion.
E109	5.3.30	Notwithstanding our advice above on the uncertainty of what can be achieved with noise abatement, Natural England note that the footnote here states ' It should be noted that detailed octave or 1/3rd octave band attenuations for the PULSE (IQIP) and MNRU (MENCK) hammers were not supplied despite direct requests, and therefore these		We advise that further effort to obtain this information is made.	The Applicant confirms that direct requests have been made for this information to the manufacturers, and to date these have not been made available to the Applicant. The Applicant however reiterates the precautionary nature of the parameters built into the underwater noise modelling (**Appendix 11.3: Underwater Noise**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		predictions are made with limited data and should be considered indicative for the equipment and conditions at Rampion 2'. We advise this further reduces the confidence that these measures will achieve the values of abatement stated.			**Assessment Technical Report, Volume 4 [APP-149]**), and the modelling of noise abatement measures (modelling of minimal underwater noise attenuations afforded by each noise abatement measure). Furthermore, the modelling of noise abatement measures also only reflects the minimal level of noise abatement provided to ensure a precautionary approach.
E110	5.3.30	We note that the Applicant has proposed combining mitigation measures to achieve higher level of attenuation. We advise that no evidence is provided to support this being viable, or that it is possible to achieve these values through a combination of measures.		We advise further evidence is provided to have confidence that this is viable.	Please refer to the Applicant's response to E98 above. During pre-examination the Applicant provided confidential information to Natural England on the use of noise abatement measures in the context of offshore piling activities. This report demonstrates that combining mitigation measures to achieve a higher level of noise attenuation has been achieved.
E111	5.3.38	Natural England support a piling exclusion in the western array (given we support this for the whole of the array March to July). We advise that the conservation advice notes the sensitive period is March to July inclusive (not March to June). There is evidence of active nests in July from the aggregates data, which informed the conservation advice for the site.		We advise that July is included in any seasonal restriction.	Please refer to the Applicant's response to **E73** above.
E112	5.3.39	Natural England advises that insufficient evidence is available in relation to the efficacy of the mitigation measures and a suitable threshold to mitigate to in order to allow piling to proceed in the eastern array during March-July		We advise that currently there is insufficient evidence that a full seasonal restriction is not required in the eastern array.	The Applicant is undertaking additional work to provide a comparison of the environmental conditions at the Proposed Development with other projects where NAS have been deployed, this will be submitted to the Examination in due course.
E113	5.3.39-5.3.40	We note the buffers on Figure 5.15 appear to relate to distances from the MCZ. It is not clear what sounds levels are expected within the MCZ at each of these distances. We note turbine locations have yet to be decided, therefore currently it is possible that even starting from the furthest piling location could result in piling significantly closer than band A in the eastern array or be significantly further east than the far western portion of the western array (band C)		We advise that further information is provided. We advise that there are clear uncertainties in relation to where the furthest pile will be located and therefore the effectiveness of this element of the measure. Refer to comments above regarding the noise modelling specifically.	As described in paragraph 5.3.39 of the **In Principle Sensitive Features Mitigation Plan [APP-239]**, the purpose of these bands is to define sections of permitted areas of piling that move progressively closer to the Kingmere MCZ, with the purpose of keeping piling as far from the Kingmere MCZ for as long as possible, irrespective of the final wind turbine generator layout.
E114	5.3.40-5.3.41	Natural England disagree with the approach to piling in the western array currently proposed for July. Refer to comments above.		We advise that July is included in any seasonal restriction.	Please refer to the Applicant's response to E73 above.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
E115	5.3.42	In relation to piling noise mitigation between August to February, we advise that this period could offer an opportunity for the Applicant to test the efficacy of the mitigation measures outside of the sensitive period for spawning/breeding black seabream. However, considerations during this time would have to be given to other mitigation requirement e.g., for herring and seahorses.		We advise that the Applicant considers trialling mitigation measures outside of sensitive seasons, to test their effectiveness in reducing noise levels.	The Applicant is undertaking additional work to provide a comparison of the environmental conditions at the Proposed Development with other projects where NAS have been deployed, this will be submitted to the Examination in due course.
E116	5.3.43	Refer to comments above regarding underwater noise impacts and seahorses and further evidence.		We advise this evidence is provided in an updated assessment.	The Applicant confirms that all comments relating to underwater noise impacts and seahorses and further evidence have been addressed accordingly.

© WSP Environment & Infrastructure Solutions UK Limited

Table 4-11 Applicant's response to Natural England - Appendix F (Benthic, Subtidal and Intertidal Ecology)

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
Document Used: [APP-045] 6.2.4 Chapter 4 The Proposed Development					
F1	[APP-050] Table 9.6 456, 9.6.7,9.6.8, 9.9.55	It should be recognised that the Applicant failed to collect 7 of the 15 chemical samples, which almost halves the agreed sample size. Given the grab samples were conducted 4 months after the collection of geophysical data, we question why so many of these samples appear to still have been located within rock, as they were likely to fail. We note that all 7 stations record arsenic above the threshold effect level, and one station exceeded the probable effect level.		We advise that the advice of CEFAS is sought in relation to this and appropriate management measures which may be required.	The Applicant recognises that some sampling effort was unsuccessful, however the samples obtained provide representative data for the characterisation of sediment-bound contaminants, appropriate for the purposes of EIA. The Applicant would further highlight that such contaminants are associated with fine sediment fractions and as such, the lack of such material at locations where samples were not obtained due to the coarse nature of the seabed do not therefore represent a data gap. It is of note that for the south coast of the UK higher levels of Arsenic are naturally observed in sediments and that the levels identified, subject to agreement on extraction methods with the MMO, are noted by the MMO in its Relevant Representation as not posing a concern for release of contaminants in suspended sediments arising from seabed disturbance activities.
F2	[APP-050] 9.5.4 -9.5.5.	Natural England notes that, because of the delays to the programme, the site-specific survey data is already approximately 3 years old in certain areas. The limitations of the reliability of basing an ES Assessment on data that is outdated, particularly in relation to ephemeral species, such as *Sabellaria spinulosa*, should be recognised. The assessment should therefore assume that the habitats listed above are present and are unavoidable as a worse-case scenario. The Applicant should note that we expect micrositing to be conducted using up to date pre-construction data to avoid impacts where possible. NB: we advise that any data used to infer presence or absence of Sabellaria spinulosa is only valid for work within 2 years of the collection of the data.		We advise that age of the data is acknowledged in the assessment and that the importance of the pre-construction surveys is noted.	Full details of the data underpinning the baseline characterisation for benthic ecology receptors are set out within **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050]**, which includes specific reference to the date of the site-specific surveys, along with the wide range of other datasets drawn upon to set out a robust characterisation of the receiving environment, appropriate for the purposes of EIA. Whilst the Applicant notes the comments on the age of the site-specific data, this is only relevant for certain ephemeral features, such as certain forms of *Sabellaria* habitat, for which detailed pre-construction surveys will be conducted, as set out in the **Offshore In Principle Monitoring Plan [APP-240]**, the delivery of which is secured in Condition 11(1)(j) of the dMLs (Schedules 11 and 12 of the **draft Development Consent Order (DCO) [PEPD-009]**). This will ensure provision of an

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					appropriately contemporary dataset (i.e. less than 2 years old) with which to finalise any required micrositing to avoid such features, should these be found to comprise 'reef' rather than ephemeral crust habitats.
F3	Table 9.10	Natural England understands that the DDV survey occurred between December 2020 to February 2021. As per our advice to the Applicant (02/11/2020), this was not the optimum time for such surveys, and there was a risk the imagery would be poor quality and not fit for purpose. We note that Appendix 9.3 states that 'The main assessment was conducted using the still images captured during the DDV transects and stations due to high turbidity levels, which reduces the resolution of analysis from the video imagery'. Sections 9.5.10-9.5.12 of the chapter allude to data limitations but does not explicitly acknowledge that some of these limitations stem from the lack of transect data. We advise this needs to be acknowledged in the main chapter. Natural England queries if any further data has been collected by Applicant over the last two years to fill this known data gap and provide a more robust baseline for assessment.		We advise this ES chapter should fully acknowledge the limitations of the site-specific data collected in providing a robust baseline. And advise the Applicant to update the ES where possible with additional site-specific evidence.	The Applicant confirms that image resolution acquired from the site specific surveys were of high quality as identified within both **Appendix 9.3 Rampion 2 Offshore wind farm subtidal benthic characterisation survey report, Volume 4 [APP-137]** and **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050]**. The Applicant highlights that the characterisation of the receiving environment has been based on a wide range of datasets, including site-specific survey, and does not solely rely upon the DDV imagery. The Applicant considers the baseline described to be a robust characterisation of the receiving environment, appropriate for the purposes of EIA; no further data have been collected to map ecological features within the proposed Order limits since these surveys were completed.
F4	9.5.8	This section states, in relation to the Predictive Habitat Mapping, 'Where site-specific data have been collected, this has been prioritised within the predictive habitat model and supersedes the historical data in the habitat map …it has been retained to understand the occurrence of potential biotopes where ground-truth data weren't collected to support the Application and the assessment of effects on the subtidal benthic ecology'. If data gaps have been identified, we advise that further information is provided regarding the risks to the reliability of the assessment due to such data gaps, and question why further data was not gathered to ensure a robust baseline.		We advise that unless the Applicant can provide more site-specific data to update the ES a more precautionary approach is required due to the uncertainties with the current characterisation survey. This would include, but is not limited to, adoption of a suite of mitigation measures which would suitably avoid, reduce, mitigate impacts to any/all of the priority habitats.	The Applicant notes that the predictive habitat model uses the best available data for the proposed Order limits. The initial purpose of creating the predictive habitat model was to address data gaps identified at PEIR, due to planned survey work being delayed and site-specific data therefore being unavailable at that time. The site-specific data have since been added to the model and it is this updated version, which supersedes the previous habitat map, that is presented in **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050]**. The Applicant considers the combined data, including site-specific benthic and geophysical survey data, to be of sufficient spatial resolution to allow confidence in the benthic characterisation for the purposes of EIA.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					The Applicant would also highlight that it has committed to undertaking detailed pre-construction surveys as referenced in the **Offshore In Principle Monitoring Plan [APP-240]**, the provision of which is secured in Condition 11(1)(j) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**). Proposals for micrositing around priority habitats, which importantly will be based on the results of the pre-construction surveys, are presented within the **In Principle Sensitive Features Mitigation Plan [APP-239]** secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**.
F5	9.6.13	Section 9.6.13 suggests 15 biotopes were found in the site-specific survey, but table 9.11 lists 17 biotopes. We note that 5 of these biotopes are not included in the Key of Figure 9.4, which shows the spatial distribution of the biotopes (A4.131, A4.134, A4.214, A4.221, A5.611). We request clarification on which is these scenarios is correct, and that all documents are updated to reflect this.		We advise that the Applicant provides an updated ES, with the correct figures throughout.	The Applicant can confirm that the modelling of biotopes and the assessment of biotopes included data from historic sources and not solely the site-specific data for the Proposed Development, as highlighted within **Section 5.6.1**, **Appendix 9.3: Rampion 2 Offshore wind farm subtidal benthic characterisation survey report, Volume 4 [APP-137]**. The site-specific data were prioritised within the final model with explanation of methods described within **Appendix 9.3: Rampion 2 Offshore wind farm subtidal benthic characterisation survey report, Volume 4 [APP-137].** 17 biotopes were taken through to the assessment of impact as a worst-case scenario of biotopes present within the footprint of the development, as set out within **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2, [APP-050]**.
F6	[APP-135 & APP-137] Appendix 9.1 and Appendix 9.3	Natural England's best practice advice is to collect comprehensive/robust site-specific project data. However, Natural England notes that, outside of the site-specific project data, the Applicant has undertaken predictive modelling which relies heavily on data from literature and other surveys, which are dated and not specifically collected for this purpose. We understand these data have been used to substitute for the lack of site-specific data. But in using non-site-specific project data the confidence in the modelling methodology can only be low.		We advise that the conclusions drawn from the modelling are disregarded and instead greater emphasis is placed on avoiding, reducing and mitigating any potential impact pathway as much as possible. We also advise that a requirement is placed on the Applicant to undertake comprehensive pre-construction surveys which encompass sufficient data collection to inform micrositing and provide a robust baseline, that includes a rigorous power analysis.	As noted in response to F4 above, the Applicant reiterates that the initial purpose of creating the predictive habitat model was to address data gaps identified at PEIR, due to planned survey work being delayed and site-specific data therefore being unavailable at that time. The baseline characterisation, including the benthic habitat map presented within the ES documents, has been developed drawing upon a range of datasets including site-specific benthic survey, historic data and

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		Therefore, Natural England does not support this approach.		As well as informing the baseline, the addition of these data would help to provide greater confidence in the ES predictions.	site-specific geophysical surveys. The assessment does not rely upon a habitat model based solely on historic data; the site-specific survey information has been used to augment the habitat model to provide a robust baseline appropriate for the purposes of EIA rather than substituting for a lack of site-specific data and the resulting combined dataset is considered by the Applicant to be robust. The Applicant would also highlight that it has committed to undertaking detailed pre-construction surveys as referenced in the **Offshore In Principle Monitoring Plan [APP-240]**, the provision of which is secured in Condition 11(1)(j) of the dMLs (Schedules 11 and 12 of the **draft (DCO)) [PEPD-009]**). Proposals for micrositing around priority habitats, based on the results of the pre-construction surveys, are presented within the **In Principle Sensitive Features Mitigation Plan [APP-239]** secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**.
F7	[APP-135] Appendix 9.1 Page 6, 1.3 Predictive Habitat Mapping	We advise that maximum likelihood estimates can be heavily biased for small samples. The optimality properties may not apply for small samples; therefore, the maximum likelihood can be sensitive to the choice of starting values. Depending on the setting of the bathymetry survey and the subsequent data collected, the underlying data being fed into the predictive model via the Maximum Likelihood Classification (MLC) methodology may not be as acute to have a level of sensitivity to pick up smaller/ low rugosity features. We advise that, as the MLC is trained via truthing and assumes that neighbouring cells correspond to higher likely hood of similarity, it is easy to underrepresent smaller or less distinguishable habitats (such as *Sabellaria spinulosa*). This under-representation is more likely to occur when the scale of the cells used are larger, as an overall assumption is derived for the most prevalent sediment or habitats		We advise that the conclusions drawn from the modelling are disregarded and instead greater emphasis is placed on avoiding, reducing and mitigating any potential impact pathway as much as possible. We also advise that a requirement is placed on the Applicant to undertake comprehensive pre-construction surveys which encompass sufficient data collection to inform micrositing and provide a robust baseline, that includes a rigorous power analysis. As well as informing the baseline, the addition of these data would help to provide greater confidence in the ES predictions.	Notwithstanding that the Applicant considers the baseline presented within the ES to be appropriate for the purposes of EIA, it recognises that there is potential for the Maximum Likelihood Classification (MLC) methodology to under-represent or lack sensitivity for some smaller less-distinguishable habitat features. However, the Applicant would highlight that it is not these data that will inform future mitigation efforts, and also that the targeted geophysical ground-truthing campaign is the most useful output in relation to areas of potential *Sabellaria spinulosa* as depicted in **Figure 4, Appendix 9.3: Rampion 2 Offshore wind farm subtidal benthic characterisation survey report, Volume 4, [APP-137]**. The Applicant has committed to targeted pre-construction surveys of priority habitats, including *Sabellaria spinulosa* and stony reef,

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		found within that cell. Therefore, the MLC model may lack appropriate sensitivity.			as referenced in the **Offshore In Principle Monitoring Plan [APP-240]**. Proposals for micrositing around priority habitats is presented within the **In Principle Sensitive Features Mitigation Plan [APP-239]** secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**.
Environmental Impact Assessment					
F8	[APP-050] 9.3.22	We note that the matrix now does not include the 'very high' category, in line with the MarLIN information that has been used to inform the assessment. However, it appears that a single consistent matrix has not been used across chapters.		Whilst Natural England has raised issue across all projects with the use of matrices and potential for underestimating impacts, we advise that if the matrix approach remains acceptable to the regulator then a consistent matrix should be used by the Applicant across chapters.	The Applicant can confirm that the sensitivity matrix was updated since PEIR to ensure that the assessment was consistent with the MarLIN MarESA sensitivity categories. The magnitude/sensitivity categories and definitions, and the resulting matrix of significance of effect used in relation to **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050]** is consistent with the majority of other contemporary and historical assessments for other offshore wind farms for the assessment of effects significance for benthic receptors. The use of matrices for the assessment of significance, adopting a source-pathway-receptor model follows that adopted for other projects, considering aspects such as the magnitude of effect, sensitivity of receptor, probability of effect-receptor interaction etc. The matrices will not, however, be wholly consistent across all topics, since the assessments for each aspect (topic) follow guidance and best-practice according to the topic being considered. The specific approach in each case is set out within each specific chapter of the ES.
F9	Table 9.18	We note that the Applicant's definitions, relating to the magnitude impact, suggests that 'Major/Moderate' includes permanent/irreversible change, whereas Minor is temporary change over a minority of the receptor, and Negligible means the receptor is not sensitive. There appears to be quite a leap between Moderate as a permanent change over the majority of the receptor, to Minor which is a temporary change over a minority of the receptor,		Whilst Natural England has raised issue across all projects with the use of matrices and potential for underestimating impacts, we advise that if the matrix approach remains acceptable to the regulator, then magnitudes used throughout the assessment are amended to reflect the definitions in this table. It is particularly key that permanent/irreversible changes are defined as Major or Moderate.	The matrix presented in **Table 9-8**, **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050]** not only delineates the temporal nature of the impact but is also clear in stating other aspects, for example in the 'Minor' category it also states 'and/or limited but discernible alteration to key characteristics or features of the particular receptors character or distinctiveness'. For example,

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		with a wide range of magnitudes fitting between the two. Throughout the assessment, there are numerous incidences where the magnitude assigned does not match the definitions in this table, and a lower magnitude has been used against this guidance.			whilst permanent habitat loss from cable protection is regarded as long-term/permanent in relation to the availability of broadscale habitats, the impact magnitude is regarded as non-material or de minimis and therefore should not be classified as a major/moderate impact on account of the limited alteration. Sensitive features have additional mitigation applied to reduce the magnitude of the impact. On this basis the Applicant does not propose to update the magnitudes presented within the ES.
Cable Burial and Scour Protection					
F10	[APP-050] 4.4.5, 9.10.15, Table 9.15, C- 111. Table 9.6 448	Natural England has concerns over the long-term degradation of geotextile bags as cable protection and/or stabilisation for installation barges due to concerns over their removability and potential release of plastics, as well as the introduction of plastic to the marine environment generally. In relation to decommissioning scour protection, surface laid cables, external cable protection, and crossing protection, we advise that decommissioning should aim to remove infrastructure to reduce the potential for irreversible (permanent) habitat loss. We understand that the Applicant plans on producing a '*decommissioning Programme which will be developed and updated throughout the lifetime of the Proposed Development to account for changing best practice*'. It would be helpful if an Outline Decommissioning Plan was included at this stage, with the details agreed with stakeholders, including Natural England, based on best practice at the time of decommissioning.		Natural England considers external scour protection to be a last resort. We would welcome limits being placed on the Maximum Design Scenario to only use types of scour protection that have the greatest likelihood of being removed. We advise careful consideration should be given to the nature of the cable protection materials used as some may be damaging to the marine environment in their own right. We advise that an Outline Decommissioning Plan is provided by the Applicant that utilises lessons learnt from projects that are due to be decommissioned the near future.	The Applicant notes that secondary protection will only be used where necessary as preferentially cables will be buried where possible, as informed by the cable burial risk assessment. The Applicant confirms that it will commit to the use of secondary protection material that has the greatest potential for removal on decommissioning of the Proposed Development as set out within the new Commitment C-289. The Applicant is committed to minimising the release of plastics into the marine environment, and commits to using suitable alternatives, where this is practicable. C-288 and C-289 have been added to the commitments register and will be secured through the next iteration of the **Outline Scour Protection and Cable Protection Plan [APP-234],** secured in Condition 11(1)(i) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**) at Deadline 3. The Applicant notes the comments made with regards to an Outline Decommissioning Plan. At this stage it is too early for the Applicant to specify methodologies for decommissioning.
F11	Table 9.6 (point relating to Section 42 Consultation	We note that mitigation measures that require burial and the potential need for scour prevention, and options for cable protection will be considered in a detailed Cable Burial Risk Assessment. We highlight		We advise geotechnical information is provided within a Cable Burial Risk Assessment at the consenting phase.	The outline methods proposed for cable burial on the Proposed Development are broadly similar to those proposed by Rampion 1 at the consenting stage. The comment *'RED will be*

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
	(ID: 367, 396, 397, 400, 439, 447) Table 9.6 441, C-45, Cable protection Table 9.6 442	the limitations in our confidence in the impact assessment, and the viability of mitigation measures presented prior to more detailed site-specific geonical data being gathered to inform this. It is stated that this report *'will consider geological conditions in detail. RED will be using different burial equipment on Rampion 2 (compared to Rampion 1) and so the likelihood of exposure is considered much lower'*. Natural England advises that it would be useful for a comparison on the equipment and methods to be clearly set out (including lessons learnt), given the Rampion 1 monitoring identified cable exposure, and there appears to still be a range of burial options under consideration for Rampion 2.		We request that a clear comparison between the burial equipment used for Rampion 1, and all options that might be used for Rampion 2, is provided to evidence this point. We advise that the Rampion 1 monitoring data are considered in any assessment.	*using different burial equipment on Rampion 2 (compared to Rampion 1)'* reflects that the majority of the cable burial works on Rampion 1 were completed in 2017 and 2018, with works on the Proposed Development likely being undertaken circa 10 years after this. Since the construction of Rampion 1, the industry has and will have installed thousands more km's of subsea cable before these works are carried out on the Proposed Development. The learnings from this experience applied to the development and fabrication of new and more efficient burial tools, which are expected to be proposed by contractors bidding for the cable installation works, are likely to lower the risk of exposure. Geotechnical information will be collected after consent award and will be provided to potential cable installers during the tendering for these works. A technical evaluation of the methods proposed by the tendering parties will be undertaken as the start of cable burial risk assessment process and used as part of the decision-making process to select the preferred supplier. The aim of the project will be to select a contractor who, with their selected equipment and proposed methods, will be able to bury the subsea cables in accordance with the commitments and the mitigation secured through the dML and minimise the likelihood of future cable exposures. This will help the project avoid having to undertake expensive remediation works. The cable burial risk assessment will be completed by the party contracted to undertake these works during the detailed design stage. Regarding Rampion 1 post-construction monitoring data specifically, it is the Applicant's understanding that the reports for the first two years of monitoring have been submitted to the respective discharging authorities in August 2023 and that these have not yet been approved. Therefore, the evidence within such reports is still

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					confidential and not yet in the public domain and as such, should not form the basis for this representation. Additionally, the reports have not yet been signed off by the discharging authorities and are therefore subject to change. The evidence from the Rampion 1 post-construction reports is not yet available for the Proposed Development to include in the ES, due to the reasons mentioned above. When the information is publicly available, it will be taken into account in the relevant management plans.
F12	Table 9.6 444	We note that there are areas where cable burial is not expected to be possible, and therefore scour may occur or scour prevention may be required, which could be in close proximity to Kingmere MCZ. Additionally, it is possible that turbines and associated scour prevention could be placed near to Offshore Overfalls MCZ. Therefore, we advise that further justification is required within this chapter in relation to the potential secondary impacts on designated benthic features within these sites. This should also be fully considered in the MCZ Assessment.		We advise that further justification is provided, and the Applicant provides an up-to-date MCZ assessment.	As detailed within paragraph 9.10.15 *et seq*., within **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050]** where cable protection is used, some scouring is predicted to occur throughout the operational phase at these features. The extent of this scouring is predicted to be local, occurring around the perimeter of rock berms. This is confirmed within **Chapter 6: Coastal processes, Volume 2 [APP-047]**, which informs the benthic assessment, with the magnitude of the impact on all benthic receptors is therefore considered to be negligible. The maximum extent of scour predicted within **Appendix 6.3: Coastal processes technical report Impact assessment, Volume 4 [APP-131]** relates to that occurring around foundation structures, with a maximum of up to 28.1m radius from the largest monopile foundations and up to 100m from the centre of the largest jacket foundations (this is measured from the centroid of the foundation structure; maximum radius from an individual pin-pile equates to a maximum of 10.4m). The assessment of potential impacts arising on the conservation objectives of features within the MCZs are thus screened out as reported in Table 5-1 of the **Draft Marine Conservation Zone Assessment [APP-040]**.
F13	Table 9.15, C-44, C-45	We advise that monitoring from Rampion 1 is used to inform predictions of impacts from scour prevention. We seek clarity regarding whether the figures stated		Within updated ES documents the	The potential dimensions of scour are described in **Section 6**, **Appendix 6.3: Coastal processes technical report Impact**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		for scour prevention are based on benthic survey information. Natural England should be consulted on the final Scour Prevention and Cable Protection Plan.		Applicant must demonstrate how Rampion 1 monitoring and the benthic survey data have been considered. As well as working with the Applicant on the revised Scour Prevention and Cable protection plan during the examination Natural England must be consulted on final plan as part of a DCO/dML conditioned.	**assessment, Volume 4 [APP-131]**. The assessment identifies that seabed scour will be very localised and where it does develop, limited to the area immediately adjacent to the installed infrastructure. There is no predicted significant effect on wider scale sediment transport rates or patterns, and will not result in any net change in the volume of sediment available in the local or regional system. An **Outline Scour Protection and Cable Protection Plan [APP-234]** has been submitted alongside the Application, with the final Plan submitted to and approved in writing by the MMO as secured in Condition 11(1)(i) of the dMLs Schedules 11 and 12 of the **draft DCO [PEPD-009]**). Regarding Rampion 1 post-construction monitoring data specifically, it is the Applicant's understanding that the reports for the first two years of monitoring have been submitted to the respective discharging authorities in August 2023 and that these have not yet been approved. Therefore, the evidence within such reports is still confidential and not yet in the public domain and as such, should not form the basis for this representation. Additionally, the reports have not yet been signed off by the discharging authorities and are therefore subject to change. The evidence from the Rampion 1 post-construction reports is not yet available for the Proposed Development to include in the ES, due to the reasons mentioned above.
F14	Table 9.15, Table 9.16, C-41, C-45, C-96, 9.10.41- 9.10.44	We note that Table 9.15 mentions burial of 1.5m with regards to reducing the effects of Electro Magnetic Fields (EMF). We note that a target burial depth of 1m is quoted for interconnector and array cables, which is less than 1.5m. Additionally, commitment C-41 states 1m. We advise that a consistent value is used, and evidence is referenced to support this. We question whether current information of benthic conditions has been used to inform the likelihood of achieving this across the various seabed conditions of the site. Has insight from success or failure of		The Applicant is to clarify what the burial depth commitment is, and how likely it is that the cable burial depth will provide the required mitigation. We advise that the viability of this should be informed by geotechnical data, lessons learnt for Rampion 1 and the Cable Burial Risk Assessment.	The cable burial depths will be determined as set out in **paragraph 4.3.54** within **Chapter 4: The Proposed Development, Volume 2 [APP-045]**, which is reflected in commitment C-41 of the **Commitments Register [APP-254]** for the array cables (as secured by Draft Development Consent Order, Schedule 11, Part 2, Condition 2 (7)). The response to F11 sets out the process for selecting the cable installation contractors in order to meet the required burial depth according to the cable

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		achieving burial depth at Rampion 1 in different sediment types been used to inform the assessment? If this target is not likely to be achievable based on the current information, the effectiveness of this mitigation measure for EMF pathways is reduced.			burial risk assessment. This will take into account information from the post construction monitoring from Rampion 1, when publicly available. If it is not possible to bury a particular section of cable to the desired burial depth, cable protection will be considered as described in in **paragraph 4.3.68** within **Chapter 4: The Proposed Development, Volume 2** **[APP-045]**). The proposed burial of the subsea cables and the application of additional cable protection if needed, will provide a separation between buried cables and the seabed surface and therefore effects from EMF will be appropriately reduced.
F15	9.10.16	Our comments in the coastal processes section regarding scour should be considered here, including consideration of scour monitoring in relation to Rampion 1. Based on our current understanding of the situation at Rampion 1, and the fact that it is suggested that there are likely to be issues burying the cable and scour around any scour protection, we advise that the magnitude of impact is not Negligible.		We advise further consideration of this issue is required by the applicant in the cable specification and installation plan and/or the Scour prevention and cable protection plan and the magnitude adjusted in the ES.	Commitment C-44 of the **Commitments Register** **[APP-254]** sets out that a Final Scour Protection and Cable Protection Plan will be completed prior to construction commencing and submitted to the Marine Management Organisation (MMO) for approval and this is secured in Condition 11(1)(i) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**). This will consider scour monitoring experience from the post construction monitoring from Rampion 1, when publicly available. The potential dimensions of scour are described in **Section 6**, **Appendix 6.3 Coastal processes technical report Impact assessment, Volume 4** **[APP-131]**. The assessment identifies that seabed scour will be very localised and where it does develop, limited to the area immediately adjacent to the installed infrastructure. There is no predicted significant effect on wider scale sediment transport rates or patterns, and will not result in any net change in the volume of sediment available in the local or regional system.
F16	9.10.22- 9.10.26	Natural England advises that we do not regard a change to new hard sediment as a beneficial impact, as this is loss of what would naturally be present. Additionally, as this is a permanent change, the magnitude cannot be Minor based on the Applicants own definitions.		We advise the Applicant updates the ES assessment accordingly.	The Applicant is clear within **paragraphs 9.10.22** and **9.10.23**, **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2** **[App-050]** that any biodiversity and biomass increase as a result of introduction of new hard substrate may also have indirect adverse

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					effects on the soft sediment communities and also represents a change in the baseline. The final sensitivity assessment is also regarded as medium and is not noted as positive to sediment biotopes.
F17	9.10.43	It is stated in this section that *'In total, 2.35km of route length (per cable) may require a level of alternative protection, such as rock dumping. Overall, the engineering study has identified that a mechanical cutting trencher is necessary for up to 54% of the route length, of which 13% is considered likely to require further protection with rock placement. The remaining 46% is considered possible to achieve with jet trenching. This can be further clarified when route- specific geotechnical data is obtained at the pre-construction stage and the burial potential is confirmed (RED, 2022)'*. Natural England requires clarity on where this information has been sourced, and whether this includes all aspects cabling, or just the export cable? We advise that consideration needs to be given to the impact this could have on the efficacy of the mitigation measures proposed generally, considering less than half the route appears to be suitable for jet installation.		We advise that the source of this information is provided, and that the impact of this on the mitigation measures is considered here and throughout the impact assessment. We advise that, based on this situation a Cable Burial Risk Assessment, including route-specific geotechnical data is provided at the consenting stage.	The source of this information is provided within **Appendix 9.5: Technical Note Cable Corridor area mitigation for sensitive features, Volume 4 [APP-145]** and relates to the export cable. Geotechnical information will be collected after the DCO is made with the cable burial risk assessment (which will be submitted for approval, prior to construction commencing, secured in Condition 11(1)(n) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009])** also carried out after consent award. Please see the Applicant's response to F11 for further details.
F18	9.10.3	Natural England seeks clarity on whether any rock protection is likely to be required around the HDD exit pit, either temporarily or permanently.		We advise information is provided on this and the ES chapter updated accordingly including any mitigation measures.	As indicated in the ES, the final construction design for the landfall HDD, including the need for rock protection at the HDD exit pit, will be determined post-consent and will take into account pre-construction ground investigation surveys.
Nearshore Grounding of Vessels					
F19	[APP-050] 9.3.19, C-283	It is stated in this section that *'RED confirmed that floatation pits are no longer required for Rampion 2. RED will commit to using an alternative solution, such as rock filter bags (or similar) for seabed preparation purposes.'* Natural England supports the commitment to not use floatation pits, given the known impacts and loss of irreplaceable habitat incurred by this methodology for Rampion 1. It is stated in this section that *'Gravel bags laid on the seabed to protect the cable barge during construction of Rampion 2, will be removed prior to*		Natural England advises that an appraisal of all possible options is provided, which includes consideration of lessons learnt from Rampion 1. This is required so that the full environmental impacts can be considered and assessed, and to evidence the achievability of mitigation. Please also see previous comments in relation to the use of gravel bags.	The Applicant highlights that, as set out within the ES, the final construction design for landfall HDD will be determined post-consent and will be based on detailed geotechnical and geological data to develop the final HDD alignment that is in keeping with its commitments including minimising the distance of the route through subtidal chalk as per C-269 (secured in Condition 11(1)(c)(v) of the dMLs (Schedules 11 and 12 of the **draft**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		the completion of construction, where practicable'. Natural England advises that this commitment is not sufficient in relation to mitigating impacts on priority habitats, Annex I habitat and potential habitats suitable for bream nests. If gravel bags are to be used, the Applicant needs to provide sufficient evidence that they can be removed and that the bags will not break down during use (particularly from abrasion with the barge). We note there is inconsistency throughout the application documents regarding the methodology to be employed. We advise that the Applicant should provide a lesson learnt from Rampion 1 and a full appraisal of all possible options, with a commitment to using the methodology that minimises the environmental impacts the most. This should include the possibility of extending the HDD further out. The total impacts of			DCO **[PEPD-009])** in the **Commitments Register [APP-254]**. Taking construction risk and the maximum distance limitations of the technique into account, it is not possible to extend the HDD to the extent that all the inshore chalk area is avoided, and it is on this basis that the assessment has been undertaken and presented within **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [App-050]**. In response to Issue Specific Hearing 1 agenda item 46, the Applicant has produced an assessment of temporary gravel beds: **Appendix 13 - Further Information for Action Point 45 and 46 (document reference 8.25.13)**.
F20	Table 9.6 (point relating to Section 42 Consultation (ID: 372)	Whilst we understand that the Applicant is committing to minimising the distance of the route through subtidal chalk, we advise that our previous advice regarding consideration of extending the HDD exit pit location further offshore to potentially further minimise impacts on chalk does not appear to have been considered.		We advise this is considered as part of an appraisal of all potential options to minimise the damage to this irreplaceable habitat.	As indicated in the ES, the final construction design for landfall HDD will be determined post-consent and will be based on detailed geotechnical and geological data to develop the final HDD alignment that is in keeping with the Applicant's commitments including minimising the distance of the route through subtidal chalk as per C-269 (secured in Condition 11(1)(c)(v) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009])** in the **Commitments Register [APP-254]**, whilst appropriately taking construction risk into account.
Priority Habitats and Micrositing					
F21	[APP-050] Table 9.14 9.6.22, C-269, [APP-137] Appendix 9.3 Subtidal Benthic	Natural England notes that following key Habitats of Principal Importance (Section 41 of the NERC Act (2006)) have been identified within the study area: • ***Sabellaria spinulosa*** • **Littoral, sublittoral chalk, subtidal chalk** • **Fragile sponge and anthozoan communities on subtidal rocky habitats**		We advise that the requirement to avoid priority habitats where possible is specified in the commitments, and that this should be a condition of the DCO/DML. The monitoring to inform micrositing should also be included within the IPMP. NB: Rampion 1 microsited around areas of stony reef in consultation with Natural England and the	The Applicant has committed to undertaking targeted pre-construction surveys of priority habitats as referenced in the **Offshore In Principle Monitoring Plan [APP-240]** and secured in Condition 16(2)(b) of the dMLs (Schedules 11 and 12 of the draft DCO **[PEPD-009]**. The Applicant will ensure the extent of these features are mapped as part of these surveys and can confirm that these data

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
	Characterisation Report	• **Peat and clay exposures** • **Sublittoral sands and gravels, and sheltered muddy gravels** Additionally, the following Annex I features have been identified: **Annex I stony reef** **Annex I Bedrock Reef** Black seabream (a feature of the adjacent MCZ) nests have also been known occur over the cable corridor. Natural England's conservation advice suggests these are often found on near horizontal bedrock with a thin layer of sediment, and often track the moderate energy infralittoral rock and thin mixed sediments feature of the MCZ. Nests are often associated with rocky outcrops in shallow waters (<10 m) with thin sediment veneers. Natural England advises that these features should have their extent fully mapped as part of the pre-construction surveys, to inform avoidance via micrositing around them wherever possible. In addition to known black seabream nests sites, we advise that, as part of the pre-construction survey, suitable habitat for bream nesting is mapped. In relation to stony reef, we advise Golding (2020) is considered in addition to Irving (2009). We advise that the commitment to micrositing in relation to these features (C29) should also be applied to the siting of turbines, construction equipment (such as jack up barges and anchors), and all operations and maintenance works. This will require the Applicant to have data less than two years old to inform any ongoing operations and maintenance works that results in direct disturbance to areas where priority or Annex 1 biogenic reef habitats could be present.		MMO so there is a similar expectation that Rampion 2 would instigate micrositing too.	will be less than two years old to inform installation and operation/maintenance activities. Proposals for micrositing around priority habitats are presented within the **In Principle Sensitive Features Mitigation Plan [APP-239]**. The final Plan is to be submitted to and approved in writing by the MMO, as secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**). Additionally, Conidition 11 (1)(a) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**) secures a design plan that must include details of any exclusion zones/ environmental micrositing requirements.
F22	[APP-050] Table 9-14	Natural England requires clarification that both outcropping chalk and chalk with a thin sediment veneer, which would also be considered subtidal chalk, have been considered in the assessment.		Natural England requests that the Applicant provides clarity on this and ensures that the ES has assessed outcropping chalk correctly.	The Applicant can confirm that all chalk has been considered in relation to potential impacts within **Chapter 4: The Proposed Development, Volume 2 [APP-045]** thereby

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					presenting the worst case on the occurrence of chalk across the Order Limits.
F23	9.6.22, Table 9.14	It is stated in this section that *'Observations of discrete Sabellaria spinulosa reef habitats were deemed to be of low 'reefiness' across the development site.* Natural England advises that *Sabellaria spinulosa* reef of all quality is protected under Section 40 and 41 of the Natural Environmental and Rural Communities (NERC) Act 2006. Therefore, due regard must be given to the conservation of this habitat. We advise these biotopes are given national importance.		Natural England advises that all areas of *Sabellaria spinulosa* and stony reef are identified and mapped as part of the pre-construction survey to information micrositing and this should form part of the IPMP. We advise that this work is key to informing the micrositing of the cable route to avoid these features and is in line with what occurred for Rampion 1.	The Applicant has committed to undertaking targeted pre-construction surveys of priority habitats, including *Sabellaria spinulosa* and stony reef, as referenced in the **Offshore In Principle Monitoring Plan [APP-240] (**as secured in Condition 11(1)(j) of the dMLs Schedules 11 and 12 of the **draft DCO [PEPD-009]**). Proposals for micrositing around priority habitats is presented within the **In Principle Sensitive Features Mitigation Plan [APP-239] (**as secured in Condition 11(1)(k) of the dMLs Schedules 11 and 12 of the **draft DCO [PEPD-009])**.
F24	9.5.6, 9.3.21	Natural England seeks clarity on whether all areas where potential reef was identified from the geophysical survey were investigated with DDV. We advise that this will be required for pre-construction surveys to ensure the full extent of all areas of reef is understood to inform micrositing.		Natural England advises that all areas of *Sabellaria spinulosa* and stony reef are identified and mapped as part of the pre-construction survey to information micrositing and this should form part of the IPMP.	The Applicant can confirm that representative examples of all potential features of conservation interest (including Habitats of Conservation Importance (HOCI)) were adequately ground-truthed within the baseline characterisation study **Appendix 9.3: Rampion 2 Offshore wind farm subtidal benthic characterisation survey report, Volume 4 [APP-137]**. The Applicant has committed to undertaking targeted pre-construction surveys of priority habitats, including *Sabellaria spinulosa* and stony reef, as referenced in the **Offshore In Principle Monitoring Plan [APP-240] (**as secured in Condition 11(1)(j) of the dMLs Schedules 11 and 12 of the **draft DCO [PEPD-009])**, which aims to map the full extent of all *Sabellaria spinulosa* and stony reef.
F25	C-270	Natural England advises that across industry a 50m buffer is implement around all Sabellaria spinulosa reef to reduce the likelihood of direct impacts.		We advise that the commitment/Schedule of mitigation is updated to include the 50m buffer.	The Applicant has included a Commitment (C-270 of the **Commitments Register [APP-254]**), which comprises: "*As part of the routeing design, a working separation distance (buffer) will be maintained wherever possible from sensitive features, notably black seabream nesting areas, as informed by the outputs of the physical*

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					processes assessment, to limit the potential for impacts to arise (direct or indirect)." This commitment is included within the measures set out within the **In Principle Sensitive Features Mitigation Plan [APP-239] (**as secured in Condition 11(1)(k) of the dMLs Schedules 11 and 12 of the **draft DCO [PEPD-009]),** which also details the approach to establishing buffers for sensitive receptors where avoidance can be achieved within the routeing design. Where avoidance is possible, the buffer will be set based on the potential for significant effects to arise on the receptor as informed by the physical processes assessment. The Applicant considers this to be more appropriate than a blanket buffer commitment.
F26	C-272	In addition to considering cable laying techniques that minimise the footprint, consideration should also be given to reducing suspended sediment, and maximising recovery/avoiding persistent trenches.		We advise this is considered further by the Applicant as part of the outline Cable Specification and Installation plan.	Consideration will be given to reducing suspended sediment, and maximising recovery/avoiding persistent trenches in the Cable Specification and Installation Plan, which will be submitted to and approved in writing by the MMO, as secured in Condition 11(1)(n) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**).
F27	[APP-050] 9.9.3- 9.9.16	Natural England advises that habitat loss or disturbance during construction should not be contextualised in relation to habitat availability in the wider area, particularly where it is protected under Section 41. Where the cable is installed through chalk, this represents a permanent loss of irreplaceable habitat listed as a Habitat of Principle Importance as under section 41 of the Natural Environmental and Rural Communities (NERC) Act 2006, which both the developer as a statutory undertaker and the regulator have a duty to protect. We understand that it is currently thought a mechanical trencher may be required over 54% if the route, which has the potential to cause wider damage to chalk compared to some of the other trenching methods mentioned. Therefore, the magnitude of impact should be Major/Moderate.		We advise the magnitude is amended to reflect permanent loss of irreplaceable chalk, and that there is a clear commitment to how evidence will be provided to show the mitigation measures have been adhered to. We advise monitoring will be required and that this should be secured in the monitoring plan. Natural England advises that further consideration is required in relation where trenched chalk will be deposited. Ideally it would infill any trench as a form of cable burial protection (rather than impacting on other habitats) decreasing the need for further external cable protection. However, it should be noted that because the structure of the chalk will be irreparable will still be classed as a permanent impact.	The assessment of permanent habitat loss is presented in **Section 9** of **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050]**, with the sensitivity of chalk afforded a 'high' sensitivity category within the assessment as a result of its protected status. Recognising that due to the widespread nature of chalk in the region, often as underlying geology beneath surficial sediment cover, not all chalk can be avoided, the Applicant has provided its approach to minimising permanent loss of chalk within the **In Principle Sensitive Features Mitigation Plan [APP-239]**, which includes the use of specialist equipment to minimise impact footprints in such areas where full avoidance is not possible. The development of the

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		We advise the mitigation measures are amended to allow for more detailed consideration particularly measure C-272. Natural England should be consulted on the Cable Burial Risk Reporting and the Outline Cable Specification and Installation Plan at the consenting stage. Within these, we would expect to see evidence that the commitments proposed have been adhered to and the loss of chalk minimised as far as possible. We disagree that the current information on the mitigation measures provided allows the reduction of the magnitude of impact to Negligible. Natural England advises that monitoring of the of the cable route through chalk will be required and that this should be considered in the monitoring plan.			mitigation, which will be provided in the final mitigation Plan, forms an important component of the approach to ensuring the 'minor' magnitude impact assigned to chalk receptors is appropriate. The final Plan will be submitted to and approved in writing by the MMO, as secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009])**. Alongside the Cable Specification and Installation Plan, Condition 11(1)(n) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**), both of which will draw upon the cable burial risk assessment (secured in Condition 11(1)(n) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009])** . The **Offshore In Principle Monitoring Plan [APP-240] (**as secured in Condition 11(1)(j) of the dMLs Schedules 11 and 12 of the **draft DCO [PEPD-009]**) presents details of the monitoring proposals. The Applicant confirms that trench cutting on the seafloor using a mechanical cutter would be able to deposit the majority of the cuttings back into the trench, however this process will obviously be influenced by the characteristics of the chalk rock itself.
F28	[APP-050] 9.9.3- 9.9.13	While the same advice applies for any loss of cobble reef *Sabellaria spinulosa,* peat and clay exposures, and bream nests etc. (as the environmental conditions may no longer be suitable where they had potentially been before), we understand that in the first instance the intention will be to avoid these habitats, whereas not all chalk can be avoided. We advise that, should micrositing not be possible, then recovery will need to be robustly demonstrated in the monitoring. The assessment should assume the worst-case scenario that these features cannot be avoided. The assessment in relation to *Sabellaria spinulosa* refers to recovery within two to ten years, but this does not consider if the underlying habitat has been lost or changed, and therefore *Sabellaria spinulosa*		We advise that the Applicant further considers the magnitude of impact and sensitivity with regards to these features, and that monitoring of recoverability is included in the IPMP.	The **Offshore In Principle Monitoring Plan [APP-240] (**as secured in Condition 11(1)(j) of the dMLs Schedules 11 and 12 of the **draft DCO [PEPD-009]**) presents details of the monitoring proposals. The Applicant notes that monitoring proposals have been based on the identification of significant effects within the EIA. Where relevant, the Applicant will consider whether, in light of Natural England's comments, any additional detail is required within the current **Offshore In Principle Monitoring Plan [APP-240]** secured in Condition 11(1)(k) of the dMLs Schedules 11 and 12 of the **draft DCO [PEPD-009]**).

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		cannot recover in such locations. We advise this will require monitoring to demonstrate recovery.			
F29	9.10.2	We do not agree with the methodology of contextualising the magnitude of impact from long-term habitat loss, with it being 0.6% of the proposed DCO. This is an oversimplistic assessment, given that habitats are present in different proportions within the boundary. We do not consider any loss of biotopes representing subtidal chalk, *Sabellaria spinulosa*, stoney reef, peat and clay exposures, or bream nests as Negligible in magnitude. Based on the definitions in Table 9.18, permanent loss is either Major or Moderate magnitude, and therefore at a minimum the magnitude here needs to be Moderate, as opposed to Negligible which suggest no sensitivity of the receptor to this change. Natural England also does not agree with the concept that changing the habitat is a beneficial effect, as it represents a change from natural habitat to a habitat type that is not natural in this area.		We advise that the assessment is revised by the Applicant to account for this.	The consideration of total habitat loss presented within paragraph 9.10.2 of **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050]** represents an overall (total) percentage loss across all habitats within the proposed Order limits to provide an overall context of impact magnitude as a result of the total area subject to the installation of infrastructure. The sensitivity of the habitats within the area have subsequently been considered in order to provide the effect significance finding. The location of specific infrastructure within the proposed Order Limits is not yet known and it should be noted that project design will also be subject to mitigations through avoidance of sensitive features where practicable as informed by pre-construction surveys. The Applicant also clarifies that no account of any potentially beneficial impacts arising from a change in habitat type as a result of the introduction of infrastructure is taken within the assessment.
F30	[APP-050] 9.9.72	We advise that in addition to underwater noise from UXO clearance, the potential for this activity to physically damage the priority habitats, designated site features and seabream nests outside of the MCZ also needs to be considered.		Natural England advises that the Applicant needs to consider the potential impacts from UXO detonation on benthic habitats and/or mitigation measures for making the UXO safe without impacting on benthic habitats.	The Applicant is not seeking UXO clearance consent at this stage. Should UXO be identified within the Proposed Development area that require removal for safety reasons, a separate Marine Licence will be applied for at that stage, when details of the number, location(s) and size(s) of the UXO are better understood. This will include assessment of the potential for seabed disturbance and effects on proximal sensitive habitats, as relevant and appropriate. The Applicant has included a Commitment (C-275 of the **Commitments Register [APP-254]**), to the use of low order techniques as the primary method for detonation (where required).
Sediment Plume					
F31	[APP-050]	Natural England previously requested illustrative plume modelling to understand the impact ranges presented in the Table, in relation to impacts on		We advise that a clearer figure is provided by the Applicant in an updated chapter, and that further consideration is given to this matter in line with our	As detailed within **Chapter 6: Coastal processes, Volume 2 [APP-047]** fine sediment may persist in suspension for longer

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
	Table 9.6 (point relating to Section 42 Consultation (ID: 353, 414, 415, 416, 417, 418, 426)	surrounding designated sites. Whilst we note that the Applicant has attempted to address this with the provision of Figure 2.3 in Appendix 6.3, the 50m buffer on this is not discernible, and the 500m buffer is unclear. It also does not specifically demonstrate depth contours within the adjacent designated sites (Kingmere MCZ and Offshore Overfalls MCZ). We seek clarification that, given the volume of underlying chalk substate, chalk has been considered specifically in the plume modelling. Natural England is aware that persistent chalk plumes were visible as part of the Rampion 1 construction, and therefore advises that it is important that this has been specifically considered as part of Rampion 2.		comments on marine processes, so that the impacts on benthic features of designated sites can be clearly and fully understood. We advise that detail is added to the reporting to demonstrate chalk plumes have been considered, based on lesson learnt from plumes that occurred during Rampion 1's construction. Monitoring of chalk plumes should be included within the IPMP.	than sands (order of days) but the plume will be subject to significant dispersion in that time, reducing any change to SSC to tens of mg/l or less in the same timeframe. As a result of dispersion, no measurable thickness of deposit or accumulation of fine sediment is expected. **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050]** gives due consideration of the characterising biotopes to increased SSC and sediment deposition. It is noted that the underlying chalk is exposed extensively along this coastline. Chalk might be put into suspension as anything from a fluid mud/fine suspension to big chunks, and/or anything in-between (depending on the geotechnical properties of the chalk locally, and the method and tool used to disturb it). The density of chalk is not dissimilar to other sediments in this context and so the behaviour of a plume would be broadly similar. The outputs presented within the ES (SSC and thickness of deposition) therefore equally apply to all grainsizes of chalk. Furthermore, loose chalk boulders (and likely smaller pieces) are commonly observed on the beach and seabed. The introduction of an additional relatively small volume of chalk clasts (especially following a reasonably short period of reworking, e.g. one large storm) would not noticeably change the seabed in this area.
F32	Table 9.6 451	As previous highlighted to the Applicant Natural England highlights that plume modelling for Rampion 1 may no longer be appropriate for Rampion 2 due to progression of sustainable development in the convening time e.g., construction of Rampion 1 and changes to the aggregate's licenses. Natural England advises that robust justification should be provided as to why this is still applicable.		We advise this justification is provided by the Applicant as part of the consenting phase.	The Applicant can confirm that new (spreadsheet based) modelling for the Rampion 2 assessments for a range of different activities causing sediment disturbance was undertaken as detailed within **Chapter 6: Coastal processes, Volume 2 [APP-047],** Section 6.8 Methodology for ES assessment - Assessment of potential changes to suspended sediment concentration and seabed deposition. The results are described as consistent with previous plume modelling for Rampion 1 (and other OWFs), but are not directly reliant on them.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
F33	Table 9.8	Natural England notes that the wording of the activity of impact line two in Table 9.8 should be clarified. We advise the wording is amended to recognise that temporary increase in SSC and sediment deposition is an issue for as far as the plume extends, and not just within the DCO limits.		We advise this wording is amended by the Applicant and informs the monitoring requirements within the IPMP.	The Applicant can confirm that indirect impacts outside the DCO Limits have been fully assessed, and the table is incorrect. As stated within **section 9.4**, **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2** **[APP-050]** indirect impacts from SSC and deposition were undertaken for the wider benthic study area which includes a 16 km buffer surrounding the array area and offshore export cable corridor in order to include the 16 km maximum sediment plume distance during spring tides. This is clear within the Chapter. This has been added to the Errata submitted at Deadline1.
F34	[APP-050] Table 9.8	We note that habitat disturbance during the operation and maintenance phase is prefaced by the word 'temporary'. We advise that it should not be assumed that this impact would be temporary. We advise that it is also possible that cable maintenance activities could lead to temporary increase in SSC and sediment deposition.		We advise this wording is amended, and that the full range of relevant impacts are assessed.	The Applicant can confirm that the assessment considered the impact to biotopes from increases in SSC and deposition within the operation and maintenance phase, however the MDS was not stipulated. The impact to be assessed was agreed throughout the scoping and consultation process.
F35	9.9.28, 9.9.43-9.9. 44	We acknowledge the description that '*Drilling mud noted as persisting and very high levels of suspended sediments expected around export cable route'*. We seek clarification that this has been considered in the plume modelling. The text suggests that the release of drilling mud has the potential to persist in suspension for days or longer. We advise this timeframe is not consistent with a negligible magnitude.		We advise clarification is provided by the Applicant and consideration is given to updating the magnitude with an updated ES chapter.	Drilling mud might be released in the offshore ECC as part of HDD at the landfall. Any drilling mud that is put into suspension would behave similarly to any other fine sediment in suspension (as already described for plumes generally). Plumes associated with HDD could be advected up to the tidal excursion distance in timescales of hours. Beyond this time, the concentration of these plumes is expected to become progressively dispersed and the level of SSC will fall to levels within the range of natural variability. The magnitude of this impact will therefore not be re-assessed and the Applicant considers the assessment to be robust and accurate.
F36	9.9.26	Natural England disagrees that the impacts within the 500m buffer, where they affect the MCZs, can be determined to be Minor. The impact on features within this area should not be contextualised as being small within the context of the whole of the MCZs. We advise more detailed consideration is required in relation to impacts on the features		We advise that further consideration is given by the Applicant to impacts on the specific features of Kingmere and Offshore Overfalls MCZs within the ES.	The assessment presented within **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2** **[APP-050]** sets out the potential impact magnitudes based on the physical processes assessment, which identifies limited impacts due to suspended sediment concentrations (SSC) and subsequent deposition over areas at 50m to 500m

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		specifically within this area of impact. We disagree with the overall magnitude of impact being Minor.			distance from the location of the construction activity on a worst-case basis, noting this includes an assumption that works are conducted on the boundary of the Order limits itself, closest to the MCZs. As illustrated in **Figure 6.3.4** of **Appendix 6.3: Coastal processes technical report: Impact assessment, Volume 4** [APP-131], even with this assumption, the only anticipated overlap to a discrete area on the northern boundary of the Offshore Overfalls MCZ and the western boundary of the Kingmere MCZ. SSC and subsequent deposition in these areas is assessed as being low level and short-term, with characterising habitats noted as naturally subject to a degree of sedimentation and scour and characterising species are therefore likely to tolerate intermittent episodes of sediment movement and deposition. The Applicant considers the assessment presented to be robust and adequate.
F37	In-combination 9.12.13	Natural England advises that any modelling conducted in 2012 needs to be validated to consider the Rampion 2 proposals (which are closer to the aggregates sites) and would need to take into account the current aggregates licences.		We advise this evidence is provided by the Applicant to inform the cumulative impact assessment and the ES updated accordingly.	The Applicant considers the results of the modelling undertaken for Rampion 1 relevant as informing scale of potential interactions with the Proposed Development, however specific consideration of the potential for cumulative interaction between the Proposed Development and aggregate dredging activities is provided in **Chapter 6: Coastal processes, Volume 2 [APP-047]**. The finding of this assessment was that small number of active aggregate dredging license areas (namely: Inner Owers; Inner Owers North; and Inner Owers Extension) are sufficiently close to the Proposed Development (within one tidal excursion distance) that an overlapping plume effect is at all likely. The orientation of the tidal axis means that interaction between plumes created by aggregate dredging and activities in the array area are very unlikely. Some overlap of plumes might occur in relation to export cable burial in the offshore end of the export cable corridor only, however, as assessed in **Section 6.9 paragraphs 6.9.21** to **6.9.31** of **Chapter 6: Coastal processes, Volume 2 [APP-047]**, the extent and duration

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					of sediment plumes from cable burial are very limited. Any cumulative increase in either the spatial footprint or peak concentration of sediment plumes are therefore likely to be indistinguishable from background levels. Any associated cumulative changes in bed level (different to that already assessed for the Proposed Development alone) are also unlikely to be measurable in practice. It is on this basis that the assessment for benthic ecology identified only minor cumulative effects arising, which are not significant.
Designated sites					
F38	[APP-050] Table 9.13	Natural England advises that potential benthic supporting habitats identified in the conservation advice for the bird features of Solent and Dorset Coast SPA are listed here.		We advise this is chapter is updated to include supporting habitats of the SPA which is import [sic] for wider ecosystem consideration in the EIA.	The Applicant has undertaken assessment of secondary (indirect) impacts on features within the study area for the Proposed Development, within which the Solent and Dorset Coast SPA falls. The features of the site have therefore been assessed within the Chapter for secondary impacts, where appropriate, as detailed within **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050]**.
F39	Table 9.13	Natural England highlights there is inconsistency with the descriptions of Solent and Dorset Coast SPA and Pagham Harbour SPA. The bird features have not been mentioned here and it is unclear if the habitat description relates to the supporting habitats for these species listed in Natural England's conservation advice. We also note that Pagham Harbour Ramsar has been omitted from this table. We advise this should be considered in relation to supporting habitats for bird features. We further note that none of the SPAs, and only Climping Beach SSSI, have been labelled on Figure 9.8 'Designated sites in relation to Rampion 2'. We advise all the sites under consideration should be clearly labelled.		We advise this is updated by the Applicant to help support the Ornithological considerations.	The Applicant can confirm that some of the differences in descriptions of the SPA's reflect the differences within the conservation packages associated with each designation. **Table 9-13** within **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050]** makes it clear what sites have been taken through to the assessment. An updated Figure 9.8 with all the sites under consideration clearly labelled will be submitted to the Examination at Deadline 2.
F40	Table 9.13	We advise the features of SSSIs should match the citation on Natural England's Designated Sites System.		We advise this is reviewed by the Applicant and the ES updated accordingly.	The Applicant notes that there are some differences between the citation presented for Bognor Reef SSSI in **Table 9-13** within **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050]** in comparison to the citation given on Natural England's Designated Sites System. However, an

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					update to the features (to include lowland acid grassland and Earth heritage (lower shore rocks) would not change the outcome of the assessment, as such the Applicant does not intend to update the assessment.
F41	Table 9.6 (point relating to Section 42 Consultation (ID: 357, 398, 405), 9.6.24, 9.6.28	Natural England seeks clarification on whether habitats protected under the NERC Act/ Habitats of Principal Importance identified in the intertidal area will be entirely avoided due to the use of HDD. We note that Climping Beach SSSI and Worthing Lumps Local Wildlife Site (LWS) will be subject to mitigation measure C-43, and so there will be no direct impacts on these sites. We seek clarification on whether access to these areas by works vehicles or equipment will be required.		We advise clarity is provided on this point by the Applicant, to provided confidence in the commitment to fully avoid direct impacts on the SSSI and that priority habitats will be avoided in the intertidal area. If there is any reason why this might not be possible, this should be presented upfront as a worst-case scenario.	The Applicant can confirm that all such habitats will be avoided in the intertidal area and draws attention to the following: Commitment C-43 of the **Commitments Register [APP-254]**: Offshore The subsea export cable ducts will be drilled underneath the beach using horizontal directional drilling (HDD) techniques. As noted in **Table 9-6** of **Chapter 9: Benthic Subtidal and Intertidal Ecology, Volume 2 [APP-050]**: The onshore landfall proposed DCO Order Limits overlaps with Climping SSSI. However, this is to allow for an area of HDD works, which will be underneath the cliff face and the intertidal area. It will not be on the surface of the beach. The overlap with the proposed DCO Order Limits has not been removed, to allow space for the HDD. Potential indirect effects to features have been assessed within **Section 9.9** of **Chapter 9: Benthic Subtidal and Intertidal Ecology, Volume 2 [APP-050]**. The Applicant can confirm that there will be no direct impacts to the Climping Beach SSSI and Worthing Lumps Local Wildlife Site (LWS). Access to these areas by works vehicles or equipment will not be required.
Other					
F42	[APP-050] Boulder Clearance Table 9.6 ID: 381, 382, 383	It is in this section it is stated that '*RED will undertake pre-construction surveys to determine the exact amount of clearance required prior to construction within the array area and the offshore export cable corridor. Micro-sitting around boulders will be considered where appropriate. Furthermore, RED propose to use a plough to remove boulders.'* We advise that there is no specific commitment to		We advise this is considered further by the Applicant and included in the outline Cable Specification and Installation Plan.	The Applicant will indeed undertake pre-construction surveys to determine the exact amount of clearance required prior to construction within the array area and the offshore export cable corridor and micrositing around boulders will be considered were appropriate. Furthermore, the Applicant proposes to use a plough to remove boulders,

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		this, and that consideration should be given to placing boulders on similar habitats, and not on any of the habitats listed in the summary.			which will move boulders to adjacent areas of seabed and within the same habitat type. No boulders will be removed and placed on priority sensitive habitat areas to ensure no impacts from boulder placement will arise on such receptors. **Appendix 9.5: Technical Note Cable Corridor area mitigation for sensitive features, Volume 4 [APP-145]** exemplifies how the micrositing exercise will be conducted based on data from the pre-construction surveys.
F43	[APP-050] Dredge disposal 9.9.29, C279	Natural England has concerns regarding the statement that '*material excavated from HDD exit pits might also be temporarily stored within the offshore array area or export cable corridor, if and where designated as a spoil disposal area'.* We disagree with the wording that measure C279 will be of *'direct benefit to benthic habitats.'* Instead, this is about minimising impact. We advise that with any disposal locations, the Applicant would need to consider potential impacts on the designated sites, avoiding locations of sensitive features and consider placement of material on similar sediment types. Natural England has particular concerns about material being stored in proximity to bream nesting habitats. Additionally, we question if the Applicant considers that they will be able to retrieve this material successfully, particularly if it were chalk. We would expect to see monitoring included in relation to any disposal locations within the DCO boundary.		We advise this is further considered by the Applicant in the Outline cable specification and installation plan, and Natural England is consulted on a final plan. Monitoring to ensure that the disposal impacts whereas predicted e.g. did not impact negatively on designated site features and/or supporting habitats should be included within the IPMP.	The Applicant notes this comment from Natural England and, whilst the wording identified the benefit delivered by the measure was in relation to minimising and managing impacts, the Applicant agrees that the measure is related to minimising impacts rather than providing a direct benefit to benthic habitats. All relevant potential impacts arising from the deposition of spoil material arising from the Proposed Development have been assessed in relevant Chapters of the ES, recognising the occurrence of sensitive receptors in the area.
F44	Marine INNS 9.9.61, 9.9.65, 9.10.32	Natural England should be consulted on the final Project Environmental Management Plan (PEMP), which we understand will include a biosecurity plan to ensure that the risk of potential introduction and spread of Marine INNS from increased vessel activity is minimised.		We advise that the Applicant provides an updated outline PEMP throughout the examination process. Consultation with Natural England on the finalise plan (pre-construction) is a condition as part of the DCO/DML.	The Final Project Environmental Management Plan will be submitted to the MMO in accordance with Schedule 11, Part 2, Condition 11 of the **draft DCO [PEPD-009]**, the MMO may consult with Natural England (as the statutory nature conservation body) on the final plan.
F45	Marine pollution 9.9.68, 9.10.37	Natural England should be consulted on the final Marine Pollution Contingency Plan (MPCP) in		We advise that the Applicant provides an updated outline MPCP throughout the examination process. Consultation with Natural England on the finalise	The Final MPCP, included within the Final Project Environmental Management Plan will be submitted to the MMO in accordance with

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		relation to the measures to prevent accidental release of pollutants.		plan (pre-construction) is a condition as part of the DCO/DML.	Schedule 11, Part 2, Condition 11 of the **draft DCO [PEPD-009]**, the MMO may consult with Natural England (as the statutory nature conservation body) on the final plan.
F46	9.10.7	We advise that in relation to '*Temporary habitat disturbance from jack-up vessels and cable maintenance works',* indirect impacts on Kingmere MCZ and Offshore Overfalls MCZ should be considered. We advise that the Applicant need to demonstrate how ongoing works will continue to microsite around sensitive features, and that this will require ongoing data collection where there is biogenic reef.		Natural England advises that monitoring will be required to inform recovery of benthic habitats from construction and the 5 yearly review of the Operations and Maintenance plan, which is yet to be agreed. We will work with the Marine Management Organisation (MMO) to secure adequate monitoring conditions.	The assessment presented in **Chapter 9: Benthic Subtidal and Intertidal Ecology, Volume 2 [APP-050]** includes consideration of the potential for indirect effects (SSC and deposition) on the MCZs as a result of operations and maintenance activities at the Proposed Development, as detailed in **paragraphs 9.10 6 to 9.10.12** of **Chapter 9: Benthic Subtidal and Intertidal Ecology, Volume 2 [APP-050]**, making reference to the assessment presented for the same impacts arising from construction. Where micrositing has been required during construction, the Applicant asserts that the measure would be anticipated to provide for maintenance at the same infrastructure locations.
F47	9.10.11	Natural England advises that further explanation is provided here as to how these mitigation measures will be applied to cable repair works during the operational period. We do not agree with the reduction to negligible here, as it is unclear that measures such as installation techniques would carry over to the operational works.		We advise further information is provided by the Applicant to demonstrate how the mitigation measures would be applicable to the operation and maintenance phase.	The Applicant has updated commitment C-272 to include reference to the operation phase of the Proposed Development. *C-272 Adoption of specialist offshore export cable laying and installation techniques will minimise the direct and indirect (secondary) seabed disturbance footprint to reduce impacts, which will provide mitigation of impacts to all seabed habitats, but particularly chalk and reef areas as well as potential (unknown) black seabream nesting locations, where avoidance is not possible. The Applicant will seek to utilise the most appropriate technology available at the time of construction* ***and during operation, if required,*** *to reduce the direct footprint impact from cutting machinery, where practicable.* This will be added to the next iteration of the **In Principle Monitoring Plan [APP-240]**, the delivery of which is secured in Condition 11(1)(j) of the dMLs (Schedules 11 and 12 of

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					the **draft Development Consent Order (DCO) [PEPD-009]**).
F48	Decommissioning 9.11	We support the decommissioning phase being assessed as potentially the same significance as the construction phase at this stage. We advise that all scour and cable protection should be considered as needing to be removed.		We advise this is considered by the Applicant during the consenting phase as part of an Outline Decommissioning Plan.	The Applicant welcomes Natural England's support that the decommissioning phase has been assessed as potentially the same significance as the construction phase. The Energy Act (2004) requires that a decommissioning plan must be submitted to and approved by the relevant Secretary of State, a draft of which will be submitted prior to the construction of the Proposed Development. The decommissioning plan and programme will be updated during the Proposed Development's lifespan. To take account of changing best practice and new technologies, the approach and methodologies employed at decommissioning will be compliant with the legislation and policy requirements at the time of decommissioning. In accordance with the requirements provided in the **draft DCO [PEPD-009]**, a written decommissioning programme will be provided prior to works commencing. The details of the proposed decommissioning process will be included within the Decommissioning Programme which will be developed and updated throughout the lifetime of the Proposed Development to account for changing best practice. It is noted that this will be subject to best practice at the time of decommissioning and surveys conducted to assess the quality of the communities established and a decision on their removal made in conjunction with the statutory authorities.
F49	9.12.17-9.12.18	While the intention may be to bury the cables, it is assumed that these cables require some cable protection allocation for where burial is not possible. This should be considered within this cumulative assessment.		We advise that cable protection is included by the Applicant in an updated cumulative assessment.	Certain impacts assessed for the project alone are not considered in the cumulative assessment due to the highly localised nature of the impacts (i.e. they occur entirely within the Order Limits only) and/or where the potential significance of the impact from the Project alone has been assessed as negligible. Therefore the impact of cable

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					protection has not been included within the CEA.
Document used: [APP-040] 5.11 Draft Marine Conservation Zone assessment					
F50	[APP-038] 7.4.28	Natural England notes that it is stated that *'the distance to the Solent Maritime SAC (15.9km at closest point)'*. We advise that the Applicant checks this, as based on Figure 9.8 of the Benthic Ecology Chapter, Solent Maritime SAC is outside of the study area, which we understand is based on the 16km tidal exclusion.		We advise this is checked and amended as necessary.	The Applicant can confirm that the distance from the Proposed Development Order limits to the Solent Maritime SAC is 20.9 km at the closest point. This information has been added to the Errata at Deadline 1.
F51	General Comment	Natural England agrees with the conclusion of no adverse effects on integrity (AEoI) alone or in combination for Solent Maritime SAC, South Wight Maritime SAC, or Solent and Isle of Wight Lagoons SAC. We understand that these sites are located outside of the 16km tidal exclusion.		N/A	The Applicant welcomes Natural England's agreement.
Document used: [APP-040] 5.11 Draft Marine Conservation Zone assessment					
F52	[APP-040] 1.3.1	We note that Utopia MCZ is in close proximity to the boundary of the study area. Therefore, we seek clarification on the preciseness of the information used to define the study area		We advise further clarity is provided by the Applicant in an updated MCZ assessment.	Utopia MCZ is located outside the benthic ecology study area based on a precautionary spring tidal excursion which informs a theoretical maximum potential Zone of Impact (ZOI) as shown in Graphic 1-1 of the **Draft Marine Conservation Zone Assessment [APP-040]** and Figure 9.8 of **Chapter 9: Benthic Subtidal and Intertidal Ecology - Figures, Volume 3 [APP-082]**. As such, there are no potential impacts to protected features of the MCZ due to separation distance from the Proposed Development. Utopia MCZ has not, therefore, been included within the MCZ assessment.
F53	3.1.3	Natural England advises that it is key that all mitigation measures are secured in any consent issued. Whilst we understand there is a commitment to implementing them, it cannot be fully understood at this stage the level of mitigation some measures may be able to provide.		We advise that all embedded mitigation measures proposed are secured in the DCO/DML. We advise the levels of mitigation provided by these measures cannot be assumed at this stage.	The embedded environmental measures set out in **Table 3-1** of the **Draft Marine Conservation Zone Assessment** [APP-040] are contained within the offshore environmental management plans, including: • **Outline Project Environmental Management Plan (PEMP)** [APP-233] • **Outline Scour Protection and Cable Protection Plan** [APP-234]

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					• **Draft Piling Marine Mammal Protocol** [APP-236] • **Draft Unexploded Ordnance Clearance Marine Mammal Mitigation Protocol** [APP-237] • **In Principle Sensitive Features Mitigation Plan** [APP-239] • **Offshore In Principle Monitoring Plan** [APP-240] The above plans are secured through Condition 11, Schedule 11 of the **draft DCO** [PEPD-009], which relates to Pre-construction plans and documentation
F54	Table 3.1	We note that many of the measures included have limited relevance to the MCZ Assessment specifically. Measures that reduce or prevent indirect effects are relevant, such as suspended sediments, scour, or changes to seabed processes.		We advise that the Applicant update the assessment accordingly.	The Applicant considers all of the commitments included within Table 3.1 of the **Draft Marine Conservation Zone Assessment [APP-040]** are appropriate to include within the document and has detailed referenced each where relevant to specific impact assessment sections within the report. The Applicant therefore considers no updates to the document are required on this basis.
F55	C-272	We advise cable installation techniques that minimise suspended sediments, and therefore secondary impacts on Kingmere MCZ, are considered.		We advise that the Applicant should give further consideration to this within the assessment.	The Applicant confirms that indirect impacts arising as a result of elevated suspended sediments caused by cable installation have been assessed on a worst-case basis within **Chapter 9: Benthic Subtidal and Intertidal Ecology, Volume 2 [APP-050]**, Notwithstanding, the approach to mitigating significant effects is set out within the **In Principle Sensitive Features Mitigation Plan [APP-239]**, which includes provision for the use of equipment to minimise suspended sediment impacts, where practicable.
F56	Table 3.1 - measure C- 95, 7.33, 7.3.6, 7.3.10, 7.4.10, 7.4.13, 7.5.23, 7.5.30	We note that the Outline Project Environmental Management Plan (OPEMP), is currently very high level and will be developed further pre-construction. It is key this contains sufficient measures in relation to invasive species.		We advise that Natural England is consulted on the final document to agree that the final measures proposed are sufficient. And that the outline PEMP is further refined during examination.	The Final Project Environmental Management Plan will be submitted to the MMO in accordance with Schedule 11, Part 2, Condition 11 of the **draft DCO [PEPD-009]**, the MMO can consult with Natural England (as the statutory advisor to the MMO) on the final plan.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
F57	4.3.7	Natural England notes that EIA terminology and methodology to assess impacts are being applied throughout the MCZ Assessment. For clarity, the MCZ Assessment should seek to define and understand the potential of the conservation objectives being hindered by external activities/impacts. We advise that, to avoid confusion, the MCZ Assessment should not use EIA terminology. Additionally, we note that our comments within the thematic chapters regarding significance of effect and magnitude also apply to this assessment, where the Applicant has brought forward these conclusions to the MCZ Assessment.		We advise that the MCZ assessment should be amended to reflect our comment. Otherwise, agreements cannot be reach on the conclusions drawn.	The Applicant considers it has appropriately applied the assessment outcomes from the EIA relating to potential impacts arising on MCZ features, or relevant components of those features, before providing a concluding statement on the potential for hindrance of the Conservation Objectives for each feature within the **Draft Marine Conservation Zone Assessment** **[APP-040]**. Noting the concern raised, the Applicant will engage with Natural England to clarify where the assessment presented introduces confusion through terminology in order to resolve the concerns and will provide an update in due course if required. In regards to the comments on determination of impact magnitude and significance of effect, the Applicant has responded to each item raised by Natural England in its Relevant Representation (see responses to F8, F9, F15, F27, F29, F35 and F36 above). The Applicant considers the assessment presented within the ES to be robust and appropriate, and on this basis is not intending to change its findings, however the Applicant will seek to discuss and resolve these issues with Natural England.
F58	5.2.5	We note that indirect impacts that were assigned a 'Negligible' magnitude in the ES EIA have been screened out, and not taken to Stage 1 Assessment. We advise that our comments on the relevant chapters are taken into account and the screening is adjusted as necessary.		We advise that our comments on the relevant thematic chapters are considered against any decisions made in the MCZ Assessment and potential impact pathways that could hinder the conservation objectives for the site assessed.	Whilst, as noted above in response to F57, the Applicant considers the assessment presented within the MCZ assessment to be robust and appropriate, it will seek to discuss and resolve these issues with Natural England.
F59	Table 5.1	Natural England advises that where impacts have been screened out due to insignificant effects on coastal and marine processes, our outstanding comments on benthic chapter should be taken into account.		Natural England advises that the Applicant considers our comments on coastal and marine processes and the assessment updated as necessary noting that there may be residual benthic impact pathways.	See response to F58 above.
F60	7.3.3	We advise that the sensitivity of both moderate energy infralittoral rock and thin mixed sediments, and subtidal chalk (a feature of Kingmere MCZ) in relation to marine INNS, is a worst-case scenario		We advise that the sensitivity is revised to High by the Applicant in an updated assessment and mitigation measures adopted accordingly.	The Applicant has reviewed the sensitivity ascribed to these features within both the draft MCZ assessment [APP-040] and **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2** **[APP-050]**, and notes that whilst

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		within Natural England's advice on operations. Therefore, we advise this is assessed as High.			the relevant components of the features considered in the MCZ assessment were given a medium sensitivity, as supported by the ecology of the characteristic species, the wider habitats were afforded a precautionary 'high' sensitivity within Chapter 9. In either case, whether a high or medium sensitivity is ascribed, the assessment outcome remains the same for the negligible impact magnitude. As such the Applicant is confident that the assessment outcome reported within the MCZ assessment is appropriate.
F61	7.4.7	It is stated that the *'maximum sensitivity of the benthic receptors is low, as a result of the tolerance and recoverability of the majority of the benthic receptors*.' We seek clarity that the WCS in terms of all relevant benthic receptors has been used to inform the maximum sensitivity?		We advise that information on the sensitivity of the receptors involved is stated by the Applicant within an updated assessment to demonstrate that the worst case in terms of sensitivity has been taken forward.	The Applicant confirms that the majority of the relevant biotopes have MarESA assessed sensitivities of either not sensitive or of low sensitivity to changes in SSC, and light or heavy smothering. The Applicant does, however, acknowledge that there are some exceptions. For the Offshore Overfalls MCZ, this relates solely to the biotope A5.261 (*Abra alba* and *Nucula nitidosa* in circalittoral muddy sand or slightly mixed sediment). For this biotope, the sensitivity is noted by MarESA as low for both changes in SSC and light smothering, but medium for heavy smothering (5-30cm deposition depth). For the Kingmere MCZ, the biotope A3.215 (*S. spinulosa* with kelp and red seaweeds on sand influenced infralittoral rock) is listed as having medium sensitivity to changes in SSC, not sensitive to light smothering (<5cm) and medium sensitivity to heavy smothering (5-20cm). Also at Kingmere MCZ, the biotope A4.231 (Piddocks with a sparse associated fauna in sublittoral very soft chalk or clay) is also of medium sensitivity to smothering (light and heavy), though is not sensitive to changes in SSC. Whilst the Applicant acknowledges that these do therefore fall outwith the 'low' sensitivity noted in the general summary statement presented in paragraph 7.4.7 of the MCZ assessment, ascribing a medium sensitivity to the assessment does not alter the outcome in

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					terms of the derived significance of effect, which remains Minor.
F62	7.2.35- 7.2.59	Natural England agrees with the sensitivity assigned to the features of Kingmere MCZ in relation to increases in suspended sediment concentrations (SSC) and sediment deposition, as these are in line with our advice on operations. However, based on the fact the 500m buffer does overlap with an area of Kingmere MCZ, we do not agree with the assessment of a Minor magnitude of impact. We disagree with this being contextualised in relation to the site as a whole. We draw your attention to our detailed comment above on this impact.		We advise that the magnitude of impacts should be revised to consider the impact on the area of overlap specifically, as opposed to contextualising this in relation to the site as a whole.	See response to **F36** above.
F63	7.4.5	We advise that our comments with regards to points 7.2.35- 7.2.59 for Kingmere MCZ also applies here in relation to Offshore Overfalls MCZ.		We refer you to our comments on 7.2.35- 7.2.59.	See response to **F36** above.
Document used: **[APP-239] 7.17 In Principle Sensitive Features Mitigation Plan** **[APP-145] 6.4.9.5 ES Volume 4 Appendix 9.5 Technical Note Cable Corridor area mitigation for sensitive features**					
F64	Executive summary, 1.1.2	Natural England has concerns regarding the plan not being finalised until the post-consent/pre-construction phase, and that it is stated the mitigation measures are not confirmed. We advise that where mitigation measures are essential to the assessment, we cannot agree to the assessment conclusions without sufficient certainty in the measures being progressed, and the ability to achieve the levels of mitigation required.		Natural England advises that there is a risk that mitigation through this plan may not achieve its aims. We advise that further investigation and information is provided by the Applicant at this stage and mitigation measures secured.	The Applicant highlights that the application of suitable mitigation is secured through Condition 11(1)(j) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]** and reiterates that the measures set out within the **In Principle Sensitive Features Mitigation Plan** **[APP-239]** at this stage need to allow scope for refinement once the final design and construction methods for the Proposed Development have been confirmed. This will enable the most appropriate project related measures to be confirmed, based on best knowledge, evidence and proven technology available at the time of construction. The need to provide scope for refinement arises, in part, due to the range of complex interdependencies common to all offshore wind farms in the early (pre-consent) development stages. These include the selection of specific infrastructure, equipment, and collection and analysis of more detailed site engineering data, which means that design work continues up until the immediate

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					pre-construction period. As a result, it is not possible to provide final detailed method statements for construction prior to consent and, as a result, the specific detail of required mitigation also cannot be finalised at this stage. In addition, and as discussed through the Evidence Plan Process (EPP) via Expert Topic Group (ETG) meetings, further contemporary data acquisition is required to provide confirmation on the location of certain sensitive receptors at the pre-construction stage, notably including ephemeral features which require survey data less than 2 years old. The Applicant will continue to engage with Natural England on the proposed mitigation measures and any relevant additional information that can be brought forward to support the proposed measures will be submitted to the Examination.
F65	1.1.3, 5.2.5	Natural England understands that final pre-construction survey data is required to inform micrositing. Natural England requests that further information is provided on the contents of the pre-construction surveys. Natural England advises the inclusion of full geophysical coverage (including side scan sonar) and full drop-down video coverage of all the sensitive features identified, as this is required to determine the extent of these features and inform micrositing. We advise that any data used to inform micrositing should be less than 24 months old at the time of construction. We refer the Applicant to our detailed comments above.		We advise that the Applicant updated the IPMP accordingly as part of the consenting process.	The Applicant will continue to engage with MMO, their advisors and the Examining Authority to develop the proposed monitoring measures. The **Offshore In Principle Monitoring Plan [APP-240]** identifies that a single survey geophysical (side scan sonar or Multibeam Echo Sounder) survey of those areas within which it is proposed that seabed works will be carried out at resolution sufficient to identify chalk habitat, stony reef, and potential *S. spinulosa* reef and is secured in Condition 16 of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**. In areas where chalk reef, stony reef, and potential *S. spinulosa* reef is identified from the review of the geophysical data, drop down video and/or stills will be deployed to confirm presence and extent. The plan also details that survey programmes and methodologies for the purposes of monitoring shall be submitted to the MMO for written approval at least four months prior to the commencement of any survey works.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
F66	1.1.6-1.1.17	We support the final plan needing to be signed off by Natural England but advise that further information is required to understand the feasibility and effectiveness of mitigation measures through the consenting phase.		We advise that further information is required, particularly geotechnical information to inform the Cable Burial Risk Assessment and this is to be updated during the consenting phase.	The **In Principle Sensitive Features Mitigation Plan [APP-239]** and the Cable Specification and Installation Plan will be developed and refined on the basis of the additional pre-construction data. Geotechnical information gathered during the pre-construction surveys will inform Cable Burial Risk Assessment. Relevant information from these plans will be shared with Natural England, with the final Plan is to be submitted to and approved in writing by the MMO, as secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**).
F67	Flowchart 1	Natural England advises that post construction monitoring will be required.		We advise this is included by the Applicant within the updated IPMP.	The **Offshore In Principle Monitoring Plan [APP-240]** details the plan for post-construction. It should be noted that the requirement for post-construction monitoring will be dependent on the findings of the pre-construction surveys
F68	Figure 2.1	Natural England advises that the offshore MCZs are missing from this Figure.		We request that these are added by the Applicant.	The Applicant has provided an updated version of the **In Principle Sensitive Features Mitigation Plan (document reference 7.17)** with Figure 2.1 marking the offshore MCZ sites at Deadline 1.
F69	Table 3-2	Natural England expect that monitoring would be undertaken to demonstrate recovery, with further measures being triggered if this was not shown.		We advise that this is included by the Applicant with the IPMP.	The **Offshore In Principle Monitoring Plan [APP-240]** presents details of the monitoring proposals. The Applicant notes that monitoring proposals have been based on the identification of significant effects within the EIA. Where relevant, the Applicant will consider whether, in light of Natural England's comments, any additional detail is required within the current **Offshore In Principle Monitoring Plan [APP-240]**.
F70	4.2, 5.2.2, 5.2.4	We advise that it should be acknowledged that up to 20% of the export cable may require cable protection, and that 54% may need to be mechanically trenched. Therefore, there is the potential for permanent habitat loss/potentially significant habitat alteration if sensitive features cannot be avoided.		We advise the limitations to the achievability of the mitigation proposed need to be fully considered by the Applicant and informed by the updated Cable Burial Risk Assessment as part of the consenting phase.	The installation of cables potentially requires differing techniques according to the nature of the seabed in different parts of the Export Cable Corridor, as informed by the cable burial risk assessment, which will be completed pre-construction but post-consent. The selection of the technique deemed most appropriate to the seabed conditions does not negate the mitigation strategy of micrositing

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		In reference to the points regarding 'routeing design and micrositing', and 'use of specialist cable laying and installation techniques' we advise that the Applicant has not acknowledged the above mechanical trenching situation, which potentially renders this mitigation ineffective over more than half the route already.			and avoidance during the routeing design works; rather, this is a critical component considered alongside the mapping of sensitive features derived from the pre-construction surveys in the cable routeing design as part of the cable specification and installation Plan, secured in Condition 11(1)(n) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**). The objective of the Plan is to identify cable routeing that delivers avoidance of sensitive features where practicable and the minimisation of impacts where this cannot be achieved. The Applicant therefore disagrees that the use of mechanical trenching renders mitigation ineffective over more than half of the route. The specific locations that require the placement of cable protection will also be determined on the results of the cable burial risk assessment and cable routeing design work and again does not negate the mitigation strategies set out within the **In Principle Sensitive Features Mitigation Plan [APP-239]** for the reasons given above. The Applicant highlights that in respect of both cable protection and cable installation works, the potential for habitat loss (where avoidance is not achievable following the application of the approaches detailed in the mitigation Plan) is assessed as such within **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050].**
F71	5.1	We refer you to our comment above regarding these mitigation measures/commitments.		Refer to our comments above.	The Applicant has responded to each point individually in the responses given above.
F72	5.2.7	We advise that a commitment to the buffers is stated in this report. We understand that a 50m buffer would be applied to all sensitive features and advise that this should be applied as a minimum to the limits of the cable corridor geophysical data collected, to account for any potential features just over the boundary. This is independent to buffering requirements in relation to other aspects.		We advise this is amended to provide commitment to the buffers and the Applicant updates the IPMP accordingly.	The **In Principle Sensitive Features Mitigation Plan [APP-239]** details the approach to establishing buffers for sensitive receptors where avoidance can be achieved within the routeing design, being defined on the basis of the potential for significant effects to arise on the receptor as informed by the physical processes assessment. The Applicant considers this to be more

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					appropriate than a blanket buffer commitment. The Applicant notes, in respect of the potential occurrence of sensitive features proximal to, but outside, the Order limits, it is unlikely that infrastructure installation will be undertaken within 50m of the Order limit boundaries, however if this was to occur, the pre-construction geophysical surveys would encompass a sufficient buffer around the Order limits and would therefore appropriately inform the need for any such separation within the cable routeing design.
F73	Figure 5.1	We note that when the environmental and technical constraints are combined visually, there already appears to be areas of potential biogenic reef that could be impacted, or where a buffer may not be possible. Whilst we support micrositing, we advise that it already appears it may not be possible to avoid some features, particularly when 4 cables will need to be installed. We also note that this figure just includes biogenic reef or potential black bream nests and advise that there are other sensitive features that have not been added (see comments above), which may compound the issue.		We advise that the mapping is updated by the Applicant to include all sensitive features that require micrositing, and that discussion is provided in relation to where avoiding features may be unavailable, or buffers may be insufficient i.e., how will impacts be minimised?	The cable routeing design illustrated in **Figure 5.1** of the **In Principle Sensitive Features Mitigation Plan [APP-239]** is based on the best available current data and demonstrates that there is the potential for the design mitigation to avoid impacts to the majority of sensitive features. The assessment and mitigation plan recognise the potential for some features to be unavoidable, however further mitigation as set out in the Plan will be applied as far as possible to ensure that where impacts are unavoidable, these are appropriately minimised. Further refinement of the routeing design will be provided on the basis of the detailed pre-construction survey data, which will establish a contemporary and definitive basis for the micrositing measures.
F74	5.2.14	We advise that the post-consent data collection will require an agreed plan to ensure that this will be sufficient to inform micrositing. We advise that an agreed monitoring plan should be approved by the MMO, in consultation with Natural England, well in advance of any surveys taking place, to ensure surveys can go ahead at the optimum time of year.		We advise that a pre-construction monitoring plan will need to be agreed in consultation with NE and this should be guided by the IPMP which should be updated by the Applicant to ensure key questions will be answered by the monitoring.	Proposed pre-construction surveys are set out in the **Offshore In Principle Monitoring Plan [APP-240]**, the final version of which is required to be submitted to and approved in writing by the MMO as secured in Condition 11(1)(j) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**). The pre-construction data and the cable specification and installation Plan, secured in Condition 11(1)(n) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**) will subsequently inform any further monitoring that may be required.
F75	5.2.21- 5.2.23	It is suggested that paleochannels will be targeted to maximise successful burial and minimise cable		We advise that a Cable Burial Risk	See response to **F11**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		protection. We advise that successful burial in paleochannels is dependent on the depth of sediment and how dynamic the area is. Our understanding is that sediments in this area are generally thin. Additionally, we advise that consideration needs to be given to the width of the paleochannels, as there is a possibility that four cables with appropriate separation distances will result in the outside cables being buried on the potentially shallower edges of the channel. Considering both these points, we advise that further geotechnical information is gathered and that a Cable Burial Risk Assessment is provided pre-consent as opposed to post consent, to provide confidence on whether burial in paleochannels is likely to be successful.		Assessment is provided by the Applicant pre-consent due to the uncertainty of burial in paleochannels being achievable.	
F76	5.2.21- 5.2.23	It is stated in this section that *'the geological conditions are not entirely conducive to burial. Even so, many of the geological formations along the route are considered trenchable with mechanical cutting, although other formations that are strongly cemented are likely to pose an issue'*. We advise that mechanical trenching and cable protection (over up to 20% of the route) may limit, or even prevent the recovery of sensitive features, where sufficient micrositing is not achievable. We agree that a hierarchy of jetting where possible first, before trenching is considered and minimising cable routing through harder strongly cemented formations is preferable. Pinning the of the cable and extending the HHD ducts should also be considered. Without the Cable Burial Risk Assessment and pre-construction information, we cannot fully understand the final constraints and therefore final impacts. We therefore advise that the Cable Burial Risk Assessment should be provided pre-consent.		We advise that the Cable Burial Risk Assessment should be provided by the Applicant pre-consent.	See response to **F11**.
F77	5.2.24 - 5.2.27	It is stated that *'With regards to trenching and burial, it is clear from the geophysical survey data for the offshore export cable corridor area that a mechanical trencher is required to achieve burial in chalk areas without sufficient soft sediment cover.'* We advise that this should be clearly assessed in the Benthic		We advise that impacts and mitigation success is fully considered by the Applicant in an updated Benthic Chapter. We advise that the Cable Burial Risk Assessment should be provided pre-consent.	A full assessment of potential impacts, including to chalk areas, is provided in **Section 9** of **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050]** which includes consideration of the effects of

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		Ecology Chapter, as this makes some of the mitigation measures proposed for chalk unviable. We would expect to see consideration pre-consent of all options for resolving this issue of cabling through chalk, for example, consideration should be given to be possibility of pinning the cable to the seafloor to minimise the loss of this irreplaceable habitat.			habitat loss and disturbance to chalk habitats where avoidance is not possible. The Applicant notes its comments in respect of provision of a cable burial risk assessment being provided at the post-consent stage in its response to F11 above.
F78	5.2.27	In relation to *'the ability of the nearshore trencher to continue on to successfully complete the offshore scope',* we advise that a situation may exist where minimising the environmental impacts involves using different techniques for the two areas. This should not be ruled out based on cost.		We advise that it is critical the methodology selected furthest minimises the environmental impacts selected and is informed by the Cable burial risk Assessment.	The Applicant notes that impacts will be mitigated as far as practicably possible in the selection of the most appropriate mitigation measures and cable routeing design, however economic viability and construction logistics are both relevant considerations in the process. The Applicant would highlight that the cable specification and installation Plan will be subject to scrutiny prior to construction as , secured in Condition 11(1)(n) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**), which requires the final plan to be submitted to and approved in writing by the MMO. The Applicant further confirms that the final Plan will be informed by the cable burial risk assessment.
F79	5.2.29-5.2.32	We note that both these methods require support vessels in the nearshore environment. We advise that this has the potential to further impact the chalk, due to grounding of vessels. Natural England advises that although we understand that floatation pits will not be used to aid nearshore vessels, there is no clear and consistent alternative presented. We advise that full consideration of the environmental impacts of all options is provided, alongside sufficient information to determine effectiveness. Natural England has concerns that without this information, the Applicant will find that they need to amend the methodology to included floatation pits post- consent, something that NE is unlikely to be supportive of.		We advise that the Applicant provides a clear and consistent methodology alongside further information on the possible effects and feasibility.	The Applicant can confirm that flotation pits will not be required for the vessels detailed within the **Offshore In Principle Monitoring Plan [APP-240]**, and further will not be required for alternative construction vessels or approaches. Vessel grounding, where required within the inshore area, will be facilitated using bagged gravel beds to protect both the seabed and the vessel during any such grounding and subsequently removed. Evidence of experience of removing similar bagged gravel (rock) is noted in the Applicant's response to F19.
F80	7.1.2	We refer you to our comments on the Offshore In-principle Monitoring Plan.		Refer to these comments.	The Applicant has responded to each point individually in the responses given above.

© WSP Environment & Infrastructure Solutions UK Limited

Table 4-12 Applicant's response to Natural England - Appendix G (Other plans)

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
Document Used: [APP-240] Offshore in Principle Monitoring Plan					
G1	Executive Summary	We advise that this is the first time Natural England has had sight of this plan, and that we have not been involved in its development.		We look forward to working with the Applicant to defining the parameters of the plan to ensure it is fit for purpose.	The Applicant welcomes collaboration with Natural England to develop the **Offshore In Principle Monitoring Plan [APP-240]**.
G2		In providing our advice Natural England is drawing on our wealth of experience of post-consent monitoring discussions and implementation. We strongly advise that rather than focusing on the exact details of the surveys as highlighted by the Applicant in the IPMP; the IPMP should set out the fundamental hypotheses/questions that will be tested by the monitoring based on the outcomes of the HRA, EIA and address issues of uncertainty and/or residual impacts. In addition, Natural England highlights that, while there is agreement that IPMPs are finalised post consent based on project design and timescales; this should not limit agreeing the IPMP prior to consent. Lessons have been learnt since the development of the IPMP for Rampion 1, which are based upon ongoing and reoccurring post- consent disagreements with the developers on ecological monitoring requirements and survey effort required in order demonstrate key predictions of the Environmental Statement and/or HRA.		Because this is a fundamental plan relating to all project phases - Natural England will submit detailed advice on the IPMP at Deadline 1. We will continue to work on this plan with the Applicant through the examination to process.	The monitoring proposals within the **Offshore In Principle Monitoring Plan [APP-240]** have been based on the identification of significant effects within the EIA, and the outcomes of the HRA. Where relevant, the Applicant will consider whether, in light of Natural England's detailed advice at Deadline 1, any additional detail is required within the current in-principle Plan.
G3		Natural England is concerned with how the purpose of the monitoring is conditioned within the DCO, we advise that the DCO/DML conditions should ensure that the monitoring is relevant to the issues raised and that adaptive management is secured should post-construction monitoring identify impacts that are significantly outside of those predicted in the Application.		Natural England will work with the developer to ensure that all monitoring conditions are sufficiently fit for purpose.	The Applicant notes that monitoring proposals have been based on the identification of significant effects within the EIA. Monitoring for the Proposed Development is secured in the following locations: • Condition 11(1)(j) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]** for the **Offshore In Principle Monitoring Plan [APP-240];** • Condition 16 of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]** Condition 11(1)(j) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]** • Condition 17 of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]** • Condition 18 of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					• Condition 20 of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009** The approach set out above appropriately secures all the monitoring considered necessary by the Applicant, and is adequate. The Applicant will continue to work with Natural England to consider whether specific monitoring needs to be referred to in the DCO/dML.
Document used: [APP-234] Outline Scour Protection and Cable Protection Plan					
G4	Executive Summary, 2.1.2, 3.2.3	Natural England advises that a key consideration is that the type of scour protection used will be removable upon decommissioning. Natural England advises that options that involve introducing plastic to the marine environment have the potential to degrade during the lifetime of the project and raise concerns with regards to marine pollution.		We advise consideration is given to this.	The Applicant notes the issue raised by Natural England and recognises the need to minimise the introduction of plastics into the marine environment where practicable options are available. The Applicant is committed to minimising the release of plastics into the marine environment and commits to using suitable alternatives, where this is practicable, and this has been added to the commitments register as C-288 and will be secured through the **Outline Scour Protection and Cable Protection Plan** **[APP-234]** secured in Condition 11(1)(i) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**). The Applicant notes the point by Natural England on the removability of scour protection and highlights that as set out in section 105(2) of the Energy Act 2004, a decommissioning programme is required, the delivery of which is secured in Requirement 11, Part 3 of the **draft DCO** **[PEPD-009]**, with specific requirements for decommissioning of the Proposed Development being detailed within the programme. The Applicant highlights that the engineering suitability is necessarily the primary consideration, however recoverability will also be an important factor in the selection of the appropriate material for the Proposed Development. The Applicant also notes that the decommissioning plan and programme will be updated during the lifetime of the Proposed Development to take account of changing best practice and new technologies. The approach and methodologies employed at decommissioning will

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					be compliant with the legislation and policy requirements at the time of decommissioning.
G5	1.1.8	Natural England advises that we should be consulted on the final scour prevention and cable protection plan and the requirements for future surveys.		We advise that consultation of Natural England on this plan is stipulated in the DCO.	An **Outline Scour Protection and Cable Protection Plan [APP-234]** has been submitted alongside the Application, with the final Plan submitted to and approved in writing by the MMO as secured in Condition 11(1)(i) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**).
G6	3.1-3.2	We advise the Applicant considers lessons learnt from other wind farm projects alongside those from Rampion 1 in relation to potential scour and cable exposure, particularly around WTG's. This plan should also consider the monitoring from Rampion 1.		We advise that this is considered and evidenced within the plan.	The Applicant notes that Rampion 1 and the Proposed Development are two distinct projects and entities. However, there is ongoing dialogue between the two projects/entities and information generated by Rampion 1 has been and is being taken into account by The Applicant. Regarding Rampion 1 post-construction monitoring data specifically, it is the Applicant's understanding that the reports for the first two years of monitoring have been submitted to the respective discharging authorities in August 2023 and that these have not yet been approved. Therefore, the evidence within such reports is still confidential and not yet in the public domain and as such, should not form the basis for this representation. Additionally, the reports have not yet been signed off by the discharging authorities and are therefore subject to change. The evidence from the Rampion 1 post-construction reports is not yet available for the Proposed Development to include in the ES, due to the reasons mentioned above.
G7	3.2, 3.3.2, Table 3.1, Table 3.2. Table 3.3	We note that the 20% quoted for cable protection seems to be an arbitrary figure across each aspect (inter-array cable, offshore interconnector cable, export cable) and is considerably higher than for all other OWF projects.		We advise that further detail is provided within an updated plan on the information used, including any lessons learnt from Rampion 1, to inform this figure given this will be the maximum allowable amount. We advise that geotechnical data and a Cable Burial Risk Assessment (CBRA) is provided at the consenting phase to further understand the scour and cable protection requirements to ensure that a realistic worst-case scenario is presented.	The Applicant notes the comment from Natural England, however it would highlight in response that the estimate of the proportion of cables potentially requiring some form of secondary protection is not an arbitrary number. The 20% figure quoted is an informed estimate based on the site conditions evident at the Proposed Development site and initial consideration of engineering constraints related to cable routeing and installation. Estimates have sensibly been made on a precautionary basis to ensure that the actual total realised from the Proposed

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					Development will be within the case assessed at the consenting stage, in-line with the design envelope and maximum design (worst-case) scenario approach. The Applicant notes that secondary protection will only be used where necessary as preferentially cables will be buried where possible, as informed by the cable burial risk assessment. Geotechnical information will be collected after consent award, as secured for submission and approval pursuant to Condition 11(1)(n) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**) and will be provided to potential cable installers during the tendering for these works. A technical evaluation of the methods proposed by the tendering parties will be undertaken as the start of the cable burial risk assessment process and used as part of the decision-making process to select the preferred supplier. The Applicant's aim will be to select a contractor who, with their selected equipment and proposed methods, will be able to bury the subsea cables in accordance with the commitments and the mitigation secured through the dML and minimise the likelihood of future cable exposures. This will help the project avoid having to undertake expensive remediation works. The cable burial risk assessment will be completed by the party contracted to undertake these works during the detailed design stage. The Applicant also highlights that the final Scour Protection and Cable Protection Plan will be submitted to and approved in writing by the MMO as secured in Condition 11(1)(i) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**).
G8	Table 3.1	In relation to the figure for 'replenishment during operations (% of construction total) 25%', does this mean 25% of the original 20% put down during construction will need replacing during operation? Furthermore, will this be within the footprint of the protection put down during construction? We also note that this does not allow for any scour/exposure in locations that were not protected at construction. We advise that this seems unlikely, particularly in any areas of mobile sediment. This needs to be clarified.		We advise that further detail is provided within an updated plan on the information used, including any lessons learnt from Rampion 1, to inform this figure given this will be the maximum allowable amount. We advise that geotechnical data and a Cable Burial Risk Assessment (CBRA) is provided at the consenting phase to further understand the scour and cable protection requirements to	Final details regarding cable installation will be provided to the MMO for approval in the cable specification and installation plan secured under Condition 11(1)(n) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**. This plan will be developed once detailed site investigation information has been collected post-consent. The Applicant can confirm that the cable protection replenishment during operations does

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
				ensure that a realistic worst-case scenario is presented.	relate to 25% of the original 20% deployed during construction as an estimate, and this may be deployed where required, subject to both the total volume limits set out in the draft DCO and the requirement for cable protection material consented under this DCO is to be deployed within 10 years of commencement of the authorised scheme unless otherwise agreed in writing with the MMO. This has been added to the **draft DCO [PEPD-009])** as condition 2(6) of Schedules 11 and 12. The Applicant refers Natural England to its response to G7 above with regard to the request for geotechnical data and a cable burial risk assessment.
G9	3.4.1	Natural England notes that many different cable protection methodologies are included within the plan; some of which are not conducive to minimising the impact footprint and maximising recovery, as committed to in the mitigation measures. Therefore, we advise that it is critical that engineering decisions include a hierarchy of the different methodologies and their relative environmental impacts, and that these work areas are progressed in tandem. We advise that the options within the outline plan for scour prevention and cable protection should be limited to those options which sufficiently meet both engineering and ecological requirements and this is agreed as part of the consenting phase. Natural England advise that post-installation/decommissioning recovery will need to be demonstrated by monitoring, particularly for methods where full recovery has not been achieved previously in similar sedimentary conditions.		We advise the Applicant refines the scour prevention and cable protection options included within the outline plan prior to consent.	The Applicant highlights that the cable methodologies included in the plan are not a prerequisite and are a contingency measures within the Proposed Development design envelope. A degree of precaution has been built into this assessment. The exact form of cable protection used will depend upon local ground conditions, hydrodynamic processes, and the selected cable protection contractor. This information will be specified in the Final Scour Protection and Cable Protection Plan as secured by Condition 11 (1)(i) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**). When pre-construction surveys to identify local ground conditions have been completed, the different cable protection methodologies will be chosen with specific consideration of the need to limit environmental impacts, including impacts of plastics, as relevant, in accordance with the embedded environmental measures set out in the **In Principle Sensitive Features Mitigation Plan [APP-239]** as secured by Condition 11 (1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]** and the **Commitments Register [APP-254]**. The Applicant would like to maintain the options for the materials used for cable protection works, as set out in the application and defined in the

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					DCO, to enable the most appropriate design solution for the situation which evolves after the initial cable burial methods detailed in the application have been applied. The monitoring proposals for the Proposed Development, as set out within the **Offshore In Principle Monitoring Plan [APP-240]**, have been based on the identification of significant effects within the EIA and no significant effects are predicted to occur as a result of the installation of cable protection material. Where relevant, the Applicant will continue to engage with Natural England to determine whether any additional detail is required within the current in-principle Plan.
G10	3.4.2	It is stated that 'In the inshore area approaching the landfall, duct extensions may be required to enable the landfall Horizontal Directional Drilling (HDD) ducts to be extended further offshore to facilitate cable installation from an installation vessel situated offshore. These duct extensions will be of a similar diameter to the HDD ducts and installed in their own trench at a similar depth of cover to the export cables. The duct extensions will be backfilled before the arrival of the cable installation vessel.' We advise that this does not appear to have been considered within the ES. Natural England would potentially support extension of the HDD further offshore if it could be demonstrated that this would further minimise the loss and damage of habitats, such as irreplaceable chalk. However, in order to understand this, all potential methodologies should be clearly set out and assessed. Especially, as written, there still appears to be significant inconsistencies and uncertainties regarding nearshore installation methodologies.		Natural England advise that this is fully considered in an updated ES. We advise that within the updated plan and/or ES a clear appraisal of consistent options is required. Lessons learnt of the limitations and constraints of constructing in shallow chalk needs to be clearly presented and discussed.	As indicated in the ES, the final construction design for landfall HDD will be determined post-consent and will be based on detailed geotechnical and geological data to develop the final HDD alignment that is in keeping with the Applicant's commitments, including C-269 in the **Commitments Register [APP-254] (**secured by Condition 11 (1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009])**. The Applicant highlights that the relevant activities associated with the installation of HDD ducts comprise the excavation of the trench for the ducts (and subsequently the export cables), which is fully considered within the construction impacts assessment presented, *inter alia*, within the following chapters of the ES: • **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050]** – Section 9.9; • **Chapter 8: Fish and Shellfish Ecology, Volume 2 [APP-049]** -Section 8.9; and • **Chapter 6: Coastal processes, Volume 2 [APP-047]** – Section 6.9.
G11	3.4.3	It is stated that where ground conditions are not suitable, the 'construction of temporary sand/gravel beds may be required.'		As per comment above.	The Applicant can confirm that deployment of temporary sand/gravel beds will be effected using

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
		We advise this is not what is assessed in the benthic chapter of the ES (where bag material is mentioned). We have concerns regarding the environmental impacts of loose material being placed on the seabed and the ability to retrieve this after the works as required by OSPAR. Additionally, we advise that the grounding of vessels with or without a buffering material under the barge will damage underlying habitats.			bagged solutions; the material used will not be loose sand/gravel. Gravel bags were used to assist with other operations during the construction of Rampion 1. An example of this was through the wet storage of the offshore export cables. As the offshore export cables were laid before the arrival of the offshore substation topside, it was not possible for the export cables to be pulled into the substation. The offshore export cables were wet stored on the seabed for a period of months by using rock bags to hold the cables in place. Once the offshore substation topside has be installed, the rock bags were removed from the export cables, which were then pulled into the offshore substation. At the end of the construction period, the rock bags were removed from the site. In response to Issue Specific Hearing 1 agenda item 46, the Applicant has produced an assessment of temporary gravel beds: **Appendix 13 - Further Information for Action Point 45 and 46 (document reference 8.25.13)**.
Document used: [APP-233] Outline Project Environmental Management Plan (offshore)					
G12	1.1.7	Natural England understand that the final Project Environmental Management Plan (PEMP) will be produced prior to construction and will be developed following the detailed design process. We advise that until these details are fully understood Natural England cannot provide final comment on the suitability of the management measures proposed. Therefore, we advise that a more detail is provided within an updated plan to provide the necessary comfort to the Secretary of State that impacts will and can be sufficiently managed. We advise a holistic approach to the final plan to bring together all agreed measures across the ES and to ensure that the contractor is fully aware of all commitments.		We advise that an updated plan is submitted into examination and that Natural England are consulted on the final version prior to construction.	The Final Project Environmental Management Plan will be completed post-consent and will be based on detailed design and construction information. The Applicant notes that the Plan will be submitted to and approved in writing by the MMO as secured in Condition 11(1)(d) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**). The Applicant will continue to engage with Natural England to develop aspects of the **Outline Project Environmental Management Plan [APP-233]** of relevance to this stage of the consenting process.
G13	Appendix A Outline Marine Pollution Contingency Plan	We advise that pollution incidents, reports, and situation updates should be emailed to the Natural England Marine Incidents Mailbox:marineincidents@naturalengland.org.uk. We advise that Appendix A is primarily a list of headings, with the details to be included in the final plan. Therefore, we cannot comment on the suitability of the measures to be included.		We advise this contact is added to the plan. We advise that an updated plan is submitted into examination and that Natural England are consulted on the final version prior to construction.	The contact email address suggested by Natural England has been added to the Errata submitted at Deadline 1. The Final Marine Pollution Contingency Plan will be determined post-consent, will be based on detailed design and construction information, and submitted to and approved in writing by the MMO

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					as secured in Condition 11(1)(d) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**). The Applicant will continue to engage with Natural England to develop aspects of the **Outline Project Environmental Management Plan** **[APP-233]** of relevance to this stage of the consenting process.
G14	Appendix J Marine Biosecurity Plan	We advise that until this plan has been produced, we cannot comment on the suitability of the measures to be included.		We advise that an updated plan is submitted into examination and that Natural England are consulted on the final version prior to construction.	The Final Marine Biosecurity Plan will be based on detailed design and construction information and submitted to and approved in writing by the MMO as secured in Condition 11(1)(d) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**). The Applicant will continue to engage with Natural England to develop aspects of the **Outline Project Environmental Management Plan** **[APP-233]** of relevance to this stage of the consenting process.
Document used: [APP-238] Outline Offshore Operations and Maintenance Plan					
G15	1.1.1	Natural England understands that this is an outline plan, which will be developed post consent. We advise that clarity should be provided regarding how the potential impacts of the finalised plan will be checked against the assessments made in the ES, MCZ Assessment, HRA etc. We advise that sufficient information should be provided at the pre- consent stage to allow operations and maintenance (O&M) activities to be fully assessed.		We advise that this plan is developed further pre-consent to provided sufficient certainty in the accuracy of what is included in the assessments.	Operations and maintenance activities have been fully assessed throughout the assessments in the Environmental Statement and suitably precautionary levels of operations and maintenance activities have been incorporated into the maximum design scenarios set out in each respective assessment. The Applicant therefore considers the OOMP to be adequate without further revision. For the purposes of clarity, the assessment presented in **Chapter 8: Fish and Shellfish Ecology, Volume 2** **[APP-049]** includes consideration of the potential for direct disturbance resulting from operations and maintenance within the array area and the offshore cable corridor as a result of operations and maintenance activities at the Proposed Development, as detailed in **paragraphs 8.10.88 et seq.** of **Chapter 8: Fish and Shellfish Ecology, Volume 2** **[APP-049]**, making reference

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					to the assessment presented for the same impacts arising from construction. The assessment presented in **Chapter 9: Benthic Subtidal and Intertidal Ecology, Volume 2 [APP-050]** includes consideration of the potential for indirect effects (SSC and deposition) on the MCZs as a result of operations and maintenance activities at the Proposed Development, as detailed in **paragraphs 9.10 6 to 9.10.12** of **Chapter 9: Benthic Subtidal and Intertidal Ecology, Volume 2 [APP-050]**, making reference to the assessment presented for the same impacts arising from construction. The assessment presented in **Chapter 12: Offshore and intertidal ornithology, Volume 2 [APP-053]** includes consideration of the potential for impacts to arise during operations and maintenance activities that could affect birds, which also follows through to relevant aspects for the HRA, as set out in the **Report to Inform Appropriate Assessment [APP-038],** alongside **Chapter 11: Marine mammals, Volume 2 [APP-052]** with regards to marine mammals.
G16	2.1.2	Whilst an 'additional Marine License may be required where works exceed those assessed within the ES or described within the DCO', we advise that all reasonably predictable activities should be considered within the ES at the pre-consent stage, and sufficient data should be gathered to avoid the need for further licences unless something unpredictable comes up. The Applicant should be aware that depending on the situation a non-material or material amendment to the DCO/dML may be required. In relation to unpredictable works, we advise that the Applicant seeks to understand what may have been required on other offshore wind projects to date, alongside lessons learnt from Rampion 1, to inform their predictions at the pre-consent stage. We also advise including a definition of what constitutes emergency work.		Natural England advise that sufficient information needs to be gathered at the consenting stage, to minimise the requirements for unexpected further licences.	The Applicant can confirm that all reasonably predictable activities have been considered in the Environmental Statement. Only two items in Appendix A of the **Outline Offshore Operations and Maintenance Plan [APP-238]** fall into the amber category of *'additional Marine Licence may be required where works exceed those assessed within the ES or described within the DCO':* • Cable repair/ replacement • New cable protection For cable repair/ replacement a maximum number of 4 cable repairs/replacement have been allowed for export cable repairs and a maximum of 6 for array cable repairs these numbers are considered suitably precautionary and are unlikely to be exceeded. The Applicant notes Natural England's comments on material or non-material changes to a DCO.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
G17	Appendix A	In relation to cable repair/replacement/new cable protection, we advise that the Applicant seeks to gather sufficient information to give confidence that the ES assessment is as accurate as possible. We advise this includes gathering and considering geophysical and geotechnical information, as well as consulting requirements from other projects (including Rampion 1) for similar sedimentary conditions.		We advise further information is provided and lessons learnt from Rampion 1 should be considered in relation to export cable cables not functioning immediately after installation.	Geophysical data for the extent of the array area and the export cable corridor and limited geotechnical data in the array area have been collected. Figures illustrating the results of the geophysical surveys may be found in **Appendix 6.1: Coastal processes technical report Baseline description, Volume 4 [APP-121]**. Data types include: bathymetry (**Figure 6.1.11**); interpreted bedfrom distribution (**Figure 6.1.12**); interpreted sediment type (**Figure 6.1.18**); isopach thickness of surficial sediment horizons (**Figure 6.1.19**). Geotechnical information will be collected after consent award and will be provided to potential cable installers during the tendering for these works. A technical evaluation of the methods proposed by the tendering parties will be undertaken as the start of cable burial risk assessment process and used as part of the decision-making process to select the preferred supplier. The aim of the project will be to select a contractor who, with their selected equipment and proposed methods, will be able to bury the subsea cables in accordance with the commitments and the mitigation secured through the dML and minimise the likelihood of future cable exposures. This will help the project avoid having to undertake expensive remediation works. The cable burial risk assessment will be completed by the party contracted to undertake these works during the detailed design stage.
G18	General Comment	We advise undertaking required monitoring and recording and in turn this should be used to inform 5 yearly reviews of the activities, which Natural England wish to be consulted on. We advise that deployment of scour/cable protection under the DCO should be within the first 10 years from commencement of operations.		We advise this is stipulated and is a condition of the DCO/dML.	The **Outline Operations and Maintenance Plan [APP-238]** will be developed post consent and will incorporate the monitoring commitments set out in the Environmental Statement. The monitoring proposals for the Proposed Development are set out within the **Offshore In Principle Monitoring Plan [APP-240]** and have been based on the identification of significant effects within the EIA and no significant effects are predicted to occur as a result of operations and maintenance activities. Where relevant, the Applicant will consider whether, in light of Natural England's detailed advice at Deadline 1, any

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					additional detail is required within the current in-principle Plan. The Applicant confirms that the requirement for cable protection material consented under this DCO is to be deployed within 10 years of commencement of the authorised scheme unless otherwise agreed in writing with the MMO. This has been added to the **draft DCO [PEPD-009])** as condition 2(6) of Schedules 11 and 12. The Applicant would question the need for, or merit of, undertaking 5 yearly reviews of activities for an OWF project. Whilst this may be relevant for activities that have a continuing and accumulative effect on the receiving environment, such as marine aggregate dredging, for which such a review cycle is in place (and from which the Applicant assumes the suggestion derives), this review is targeted at ascertaining the effects of such ongoing impacts to seabed habitats as well as serving to require confirmation of remaining resource depths etc. This is not comparable to the nature of impacts arising through the lifetime of an OWF. The Applicant would also highlight that appropriate notifications and reporting of activities is also set out within the dMLs, in line with other consented OWF projects.
G19	General Comment	Where seabed disturbance is necessary and use of equipment such as jack-up barges is required, the Applicant should provide details showing how they will ensure that sensitive features (as identified in the benthic and fish ecology chapters), will be avoided. This is particularly pertinent to activities that could directly disturb ephemeral features such as *Sabellaria spinulosa* and inter annual variation of black bream nests. We advise that the pre- construction data (greater than 24 months old) will not be sufficient to inform micrositing of activities during the O&M phase. We advise that consideration needs to be given to ongoing data collection required to inform micrositing of activities during the lifetime of the project		We advise this is considered and further details provided as part of the consenting phase	The Applicant has provided its approach to minimising permanent loss of sensitive features within the **In Principle Sensitive Features Mitigation Plan [APP-239]**, with the intention to microsite to avoid impacts in the first instance and subsequently the use of specialist equipment to minimise impact footprints in such areas where full avoidance is not possible. The final Plan will be submitted to and approved in writing by the MMO, as secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009])**. Alongside the Cable Specification and Installation Plan, Condition 11(1)(n) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**), both of which will draw upon the cable burial risk assessment.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					The Applicant will consider this further in the next iteration of the Outline Offshore Operations and Maintenance Plan at Deadline 3. Whilst the Applicant notes the comments on the age of the site-specific data, this is only relevant for certain ephemeral features, such as certain forms of *Sabellaria* habitat, for which detailed pre-construction surveys will be conducted, as set out in the **Offshore In Principle Monitoring Plan [APP-240]**, the delivery of which is secured in Condition 11(1)(j) of the dMLs (Schedules 11 and 12 of the **draft Development Consent Order (DCO) [PEPD-009]**). Condition 16 (2)(b) makes specific reference to the need for the survey secured under Condition 11(1)(j) to provide for the identification of the locations of, *inter alia*, *Sabellaria spinulosa* reef features. The pre-construction survey data will ensure provision of an appropriately contemporary dataset (i.e. less than 2 years old) with which to finalise any required micrositing to avoid such features, should these be found to comprise 'reef' rather than ephemeral crust habitats. These micrositing provisions will apply to the construction phase and, therefore, also include control over the locations of spud legs for jack-up barges, where these are used, and through the operations and maintenance phase of the Proposed Development where relevant, although it should be noted that as a result of the construction phase micrositing, the Applicant would anticipate that infrastructure would already be separated from sensitive habitat features thus reducing the potential for impacts to arise on such receptors during operations and maintenance works. The Applicant does not agree that there is a requirement for ongoing data collection to inform such micrositing as the need for such would be determined by the requirement to undertake works (which require jack-ups or cable de-burial/re-burial) rather than relying upon widescale data collection throughout the lifespan of the project. During the operations and maintenance phase, where geogenic or non-ephemeral sensitive habitats have been identified, the

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					Applicant would assert that the pre-construction data would provide for such micro-siting throughout the operational lifespan of the Proposed Development, however where locations have been recorded as supporting biogenic or ephemeral habitats, then a targeted survey would be undertaken ahead of such works if an extant dataset less than 2 years old is not available.
G20	General Comment	Natural England would support reburial where exposure has occurred, or where cable repair/replacement is required, over the placement of rock protection. This would potentially allow recovery following reburial, whereas the addition of scour protection would lead to permanent habitat change/loss.		We advise that the Applicant includes a cable burial hierarchy which make reburial the priority.	A Cable Specification and Installation Plan will be produced post consent (as secured in Condition 11(1)(n) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**) which will include proposals for monitoring offshore cables including cable protection during the operational lifetime of the authorised scheme, this includes a risk-based approach to the management of unburied or shallow buried cables. An assessment of seabed disturbance as result of cable maintenance/ repairs, including the placement of rock protection, has been incorporated into Section 9.10 of **Chapter 9: Benthic, Subtidal, and Intertidal Ecology [APP-050].** The impacts from these works will be spread over the approximate 30-year period of operation and maintenance activities, with only a limited number of activities occurring within any one year. As such, the magnitude of temporary habitat disturbance from jack-up vessels and cable maintenance activities relating to the Proposed Development will have on benthic subtidal receptors is considered to be minor, indicating that the disturbance of habitat does not threaten the long-term viability of the benthic resource within the proposed DCO Order Limits. **Chapter 9: Benthic, Subtidal, and Intertidal Ecology [APP-050]** concludes that no significant effects are expected to occur as a result of cable maintenance/ repairs. Reburial would be the preferred method to remedy cable exposure, where ground conditions, hydrodynamic processes, and the selected cable protection contractor allow. The environmental

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					impacts of addressing cable exposure would be determined on a case-by-case basis depending on the nature of the exposure.
G21	General Comment	In line with the commitment to not undertake construction activities in the cable corridor during the sensitive season for black seabream, and the final piling mitigation, which is yet to be agreed, we advise that consideration is given to the impacts of operation and maintenance (O&M) activities. In relation to black seabream, we advise that the Applicant also commits to only undertaking planned O&M activities outside of the sensitive period and that consideration is given to how impacts could be reduced during the sensitive period for any emergency works where a potential pathway for impact is identified. Natural England advise that the potential pathway for impact will depend on the activity and the location. We would have concerns for example should cable repair/reburial/replacement be undertaken in close proximity to the MCZ given the location of known seabream nesting areas. We advise it may be useful to set out a disturbance management plan, which sets out parameters of certain areas and when Natural England might need to be reconsulted for more significant activities in sensitive locations.		We advise that this needs to be considered further by the Applicant. And a clear definition of what constitutes emergency works should be presented. We advise that a disturbance management plan should be consider in relation to O & M activities in sensitive areas.	The Applicant can confirm that scheduled cable maintenance activities in close proximity to the Kingmere MCZ will not be undertaken during the sensitive season for black seabream. Where emergency works are required, the Applicant proposes the same definition for 'emergency' as adopted by the MMO in its statutory guidance note, Marine Licensing exempted activitieswhere, in the context of the Article 34 exemption it states *""Emergency" means a serious, unexpected, and often dangerous situation requiring immediate action".* This text will be added to the next iteration of the **Outline Operations and Maintenance Plan [APP-238]** at deadline 3.
G22	General Comment	We note that there is currently no information on how the impacts of O&M works will be monitored. We advise that clarity is needed on this.		We advise that the Applicant considers this further in an updated plan.	The **Outline Operations and Maintenance Plan [APP-238]** will be developed post consent and will incorporate the monitoring commitments set out in the Environmental Statement. The monitoring proposals for the Proposed Development are set out within the **Offshore In Principle Monitoring Plan [APP-240]** and have been based on the identification of significant effects within the EIA and no significant effects are predicted to occur as a result of operations and maintenance activities. . Where relevant, the Applicant will consider whether, in light of Natural England's detailed advice at Deadline 1, any additional detail is required within the current in-principle Plan. The **Offshore In Principle Monitoring Plan [APP-240]** provides a framework for further discussions post consent with the Marine Management Organisation (MMO) and the relevant bodies to agree the exact detail (timings,

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section	Natural England's Comments	RAG	Recommendations	Applicant's Response
					methodologies etc.) of the monitoring that is required.

© WSP Environment & Infrastructure Solutions UK Limited

Table 4-13 Applicant's Response to Natural England - Appendix H (Landscape and Visual Impact)

Ref	Natural England's Comments	Applicant's Response
H1	**Summary of Natural England's Advice** The natural beauty of the SDNP and the opportunities afforded for open-air recreation are the reasons for the National Park's statutory designation. The Landscape and Visual Impact Assessment (LVIA) [APP-059] finds that the onshore cable route will cause short term, temporary harm to two of the SDNP special qualities during the construction phase of the proposed development. Natural England advises that any harm to the natural beauty harms the purpose of the designation, and this cannot be reduced by claiming that the effect is limited in any way. The LVIA relies on a number of embedded mitigation measures to support the final conclusion that there will be no residual effects on the SDNP and on its special qualities, setting or integrity, while the construction phase effects on the National Park are assessed as significant, temporary and largely reversible. There are two key embedded mitigation measures which underpin the assessment in the LVIA: trenchless crossings for through the chalk scarps at Michelgrove Park and Sullington Hill and the translocation of sections of field boundary hedgerows or replacement planting (commitment C-115). A third key commitment which supports commitment C-115, C-19 is that of a rolling programme of reinstatement to field boundaries. Natural England advises that the application documents do not put forward sufficient and credible evidence in relation to these key mitigation measures to justify the assessment of significance in the LVIA. The geology of the SDNP and in particular the chalk scarps are one of the key reasons for the National Park's designation. The scarps are therefore of the highest landscape and visual sensitivity. If the scarps were crossed using an open trench method, there would be significant, permanent harm to the natural beauty of the SDNP and its landscape character; there would also be harm to Ancient Woodland which is irreplaceable in planning policy. HDD is the most important component of the mitigation programme for the proposed scheme in relation to landscape, given the very high sensitivity these landscape features, and the LVIA conclusion of no residual landscape and visual effects on the SDNP or its special qualities is based upon this mitigation measure. However, no detailed studies have been undertaken on the suitability of the ground conditions for the use of HDD or how the technique will accommodate each of the scarp's changes in topography without resulting in damage to the scarps. All feasibility further work on HDD is proposed in stages once the DCO has been approved. There is a substantial risk that construction could be underway through the SDNP before it is found that site conditions will prevent HDD proceeding through one or both of the scarps. Moreover, none of the embedded mitigation commitments [APP-254] state that the chalk scarps will be protected by trenchless crossings. Natural England advises that without a clear commitment to protect the chalk scarps, and detailed design and all site investigation works being undertaken prior to commencement of the construction of any part of the cable route through the SDNP, the SDNP landscape will be placed at substantial risk of long term, permanent harm. The removal of field boundary tree lines and hedgerows along the cable route of the SDNP has the potential for lasting change to the landscape character of the National Park, as can be seen in sections of the Rampion 1 cable route. Commitment C-115 aims to reduce the effect of field boundary removal on the landscape of the National Park by translocating sections of hedgerows along the route and reinstating them or replacing them with new planting. Hedgerow translocation is another of the key measures used to substantiate the assessment that the effects on the SDNP special qualities and on the landscape and visual amenity of the	As this is a summary of the relevant representations from Natural England, the individual points are responded to by the Applicant in the responses below.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Natural England's Comments	Applicant's Response
	area will be temporary and reversible. Irrespective of the success of commitment C-115, there will be long term changes to the structure of the SDNP landscape as no trees can be returned/replanted over the cable route. No evidence has been provided that translocation will be effective for the soil and climactic conditions of the SDNP and the commitment wording contains a number of caveats in relation to its implementation. As a Page 4 result of the uncertainty of this commitment and the loss of field boundary trees, Natural England advises that the effects of the cable route on the landscape features of the SDNP have been under assessed in the LVIA. Commitment C-19 aims to support commitment C-115. Throughout the LVIA reference is made to reinstatement of hedgerows occurring at 600m to 1,000m intervals, while the actual commitment to interval length is for joint bays/pits at this interval while the commitment to reinstatement is in as shorter a timeframe as possible. Natural England advises that due to the substantial lack of credible and detailed evidence, the assessment of effects as set out in the LVIA cannot be relied upon, and that there will be significant residual adverse landscape and visual effects on the SDNP and on its special qualities, setting or integrity.	
H2	**South Downs National Park - Statutory Purposes and Special Qualities** 1.1 The primary statutory purpose of the South Downs National Park (SDNP) is the conservation and enhancement of natural beauty, wildlife and cultural heritage. This is underpinned by national planning policy as set out in NPS EN-1 (see paragraph 5.9.9), and locally in SDNPA Policy 1, which aims to 'conserve and enhance the natural beauty and special qualities of the landscape and its setting'. 1.2 Unless otherwise noted, the comments within this section relate to APP-169 Volume 4, Appendix 18.3: Landscape Assessment. 1.3 Section 3.3 of Appendix 18.3: Landscape Assessment aims to assess the '… effects of the onshore elements of the Proposed Development on the natural beauty of the national park which are encapsulated by the SLQs [special qualities] as well as the setting and integrity of the designation' (para. 3.2.4, Assessment Methodology). The assessment considers three of the SDNP special qualities as being potentially affected by the proposed development: Special Quality 1: diverse, inspirational landscapes and breath-taking views; Special Quality 3: tranquil and unspoilt places Special Quality 5: great opportunities for recreational activities and learning experiences. 1.4 In relation to Special Quality 1, 'diverse, inspirational landscapes and breath-taking views' the Landscape Assessment concludes that the cable corridor and the associated trenchless crossing compounds will have short-term, temporary major to moderate and significant effects on the landscape character of the SDNP, as well as on adjoining landscapes to the north which define the setting of the National Park, limited to the construction phase. As set out in paragraphs 3.3.44 to 3.3.46 these assessed effects are considered to be limited in geographical extent (between 250m and 650m from the cable corridor) and their duration reduced by the embedded mitigation measure of a rolling programme of backfill. A similar assessment is made in terms of Special Quality 3, 'tranquil and unspoilt places'. 1.5 In relation to Special Quality 5, 'great opportunities for recreational activities and learning experiences', the assessment finds the effect to be minor and not significant, although it is noted that the individual PRoW which are directly or indirectly affected by the works '… are significantly affected on an individual and local basis.' (para. 3.3.71).	As this is a summary of the relevant representations from Natural England, the individual points are responded to by the Applicant in the sections below.

Ref	Natural England's Comments	Applicant's Response
	1.6 Natural England advises the following in relation to the assessment of the effects on the special qualities, and thus the effect of the proposed development on the statutory purpose of the designation.	
H3	1.7 There is an incorrect reliance on the mitigating effect of geographic extent on the assessed harm to the special qualities. For 'diverse, inspirational landscapes and breath-taking views' and 'tranquil and unspoilt places' the effect is considered to be limited to '…approximately 250m to 650m of the onshore cable corridor…', while in the case of 'great opportunities for recreational activities and learning experiences' a quantitative measure is applied to the extent of the effect. 1.8 While for the assessment of landscape effects, GLVIA sets out the need to consider geographical location as part of an assessment of magnitude of change, for the assessment of the special qualities and thus the assessment of effects on the statutory purpose of a designated landscape, the extent of geographical harm is irrelevant. The assessment finds that the special qualities of the SDNP will be harmed. The natural beauty of the National Park and the opportunities afforded for open-air recreation are the reasons for which it was designated in statute. Any harm to the natural beauty harms the purpose of the designation, and this cannot be moderated by a quantitative judgement about the size or scale of the harm in relation to a particular part of the SDNP or to any of its special qualities. We would advise reference be made to the designating legislation. In addition, the irrelevance of geographical effect was understood and set out by the Examining Authority in the Navitus Bay Wind Park case in June 2015[1]. We conclude that the primary statutory purpose of the SDNP, to conserve and enhance natural beauty, is harmed by the proposed development as described in the ES.	Further detailed information and guidance from Natural England is needed to support this relevant representation. The Landscape and Visual Impact Assessment (LVIA) in **Chapter 18: Landscape and visual impact, Volume 2** of the Environmental Statement (ES) **[APP-059]** has correctly assessed the landscape and visual effects in accordance with Guidelines for Landscape and Visual Impact Assessment 3 (GLVIA3) (Landscape Institute and Institute of Environmental Management and Assessment (IEMA), 2013). The inclusion of geographical extent is a requirement of GLVIA3 (Landscape Institute and IEMA, 2013) to define the nature of these effects and has been supported by site survey and photography. The Applicant has identified significant levels of effect on the special qualities (SQs) in **Appendix 18.3: Landscape Assessment, Volume 4** of the ES **[APP-169]**. Further clarification on special qualities including reference to the designating legislation is provided in **Appendix 5 – Further information for Action Point 27 – South Downs National Park (Document Reference: 8.25.5)** submitted at Deadline 1.
H4	1.9 The significant effects on Special Qualities 1 and 3 are set out as being short term and temporary, limited to the construction phase and largely reversible due to the mitigation measures proposed. While Natural England welcomes these measures, we do not agree with the assessment for the following reasons: Special Quality 1: 'diverse, inspirational landscapes and breath-taking views' a) In relation to Special Quality, it is noted in paragraphs 3.3.38-3.3.40 that planting will be undertaken in years 1 to 10, and that '…localised and significant effects on particular landscape elements (trees, woodland and hedges) will be sustained through Years 1 to 10 reflecting the loss of mature trees, woodland and hedges that cannot be replaced in Year 1.' It is assumed that these localised effects will be considered in isolation and that; '…will not be sufficient in number, density, pattern or distribution to sustain significant effects on landscape character. There will be no obvious 'linkage' between them due to the reinstatement of the onshore cable corridor.' b) Natural England does not agree with this statement. The experience of the landscape and breath-taking views of the SDNP are enjoyed by being in the landscape, whether by means of walking, cycling, horse riding or other pursuits. The landscape is therefore experienced in an active, mobile, and sequential way. Prior to construction commencing preparatory works will be undertaken which will; 1 Navitus Bay Wind Park Examining Authority's Report of Findings and Conclusions and Recommendation to the Secretary of State for Energy and Climate Change, 11 June 2015 (File Ref EN010024), Navitus Bay Wind Park | National Infrastructure Planning (planninginspectorate.gov.uk) accessed 26.10.23	1.9 a) is covered under the related matter 1.9 d) below. 1.9 b) **Chapter 18: Landscape and visual impact, Volume 2** of the Environmental Statement (ES) **[APP-059]** and assessment of special qualities (SQs) draws from the methodology and detailed assessment set out in: • **Appendix 18.1: Landscape and visual impact assessment methodology, Volume 4** of the ES **[APP-167]**; • **Appendix 18.2: Viewpoint Analysis, Volume 4** of the ES **[APP-168]**; • **Appendix 18.3: Landscape Assessment, Volume 4** of the ES **[APP-169]**; • **Appendix 18.4: Visual Assessment, Volume 4** of the ES **[APP-170]**; • **Appendix 18.5: Residential Visual Amenity Assessment, Volume 4** of the (ES) **[APP-171]**; and • **Appendix 18.6: Viewpoint directory, Volume 4** of the ES **[APP-172]**. This includes sequential assessment of routes through the landscape (public rights of way (PRoW) and National Trails) by means of walking, cycling or horse riding and covers a range of varying landscape and visual effects that will occur during the construction phase and operation and maintenance phase as set out in the summary tables 18-40 to 18-46 of **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]**.

Ref	Natural England's Comments	Applicant's Response
	'…include vegetation clearance, access road construction, installation of drainage systems, stone fill, installation of a construction compound, temporary site offices, fencing, delivery of materials, plant, machinery and fuel' (para. 4.5.56, Chapter 4: Proposed Development) c) In addition, up to 66 joint bays, and 264 separate link boxes and fibre optic cable junction boxes are proposed. Commitment C-19 refers to route joint bays/pits at 600m to 1,000m intervals, which will extend along the full length of the route. These will not only have an industrialising effect on the landscape, but it is likely that they will be fenced as they are along the Rampion 1 cable route. All of these new alien features will all act to highlight the route to those who move through the landscape of the National Park. The localised and significant effects will be experienced therefore, not as isolated incidents, but as significant construction works traversing through and detracting from the South Downs landscape and breath-taking views; they will be clearly sequential. This would be particularly evident in the A3: Arun to Adur Open Downs landscape character area, where it would significantly change the character of this open downland landscape and damage its natural beauty for more than 10 years which in LIVA terms is long term. d) Paragraph 3.3.38, which relates to the state of the landscape at the end of the construction phase, notes that as a minimum the fencing and haul roads will be removed and that topsoil and, where required, grass/pasture will be reinstated. The planting will be undertaken between years 1 and 10, and therefore the users of this landscape will experience changes to it for at least 10 years, if not longer as the planting in year 10 will need time to establish (again this is long term as set out in the LVIA). In addition, no trees removed for the cable route can be replaced over the route. As a result there will be permanent changes to the structure of field boundaries and thus patterns in the landscape which will continue to provide a visual indicator of the route of the cable for the long term. The Rampion 1 cable route remains visible in several of the sections, in particular around Truleigh Hill area. e) We would therefore consider that significant effects on the landscape of the SDNP and its special qualities are under assessed. Effects will extend for at least the medium term (6 to 10 years based on the LVIA methodology) into the operation and maintenance phase, with permanent effects lasting longer than 10 years. These comments are notwithstanding our considerable concerns in relation to embedded mitigation measures (C-19, C-115, C235, C-236) as set out below. Special Quality 3: 'tranquil and unspoilt places' f) In relation to Special Quality 3, the LVIA notes that the duration of the construction phase effects will be '…limited to a few days as the works pass through the landscape' (para. 3.3.55). Commitment C-19 sets out to reinstate the landscape in '…as short a timeframe as possible' and to complete the cable installation in discrete sections. While Natural England welcomes this approach and the acknowledgement of the acute contrast with the perceptual character, we do not agree that the effect on the tranquillity of the landscape can be limited to a few days. The cable corridor through the National Park is approximately 12km in length. As set out in Table 1-36 (PRoW along the cable route within the SDNP) the construction phase will continue for 4 years. The tranquillity of the National Park can be experienced in motion, in the same way as views and the diversity of the landscape. The sound of construction in the tranquil landscape will reach further than the visible activity which may be screened from view and movement of construction vehicles and the sound they make will have a significant effect on this special quality. g) SDNP is designated as an International Dark Sky Reserve. Paragraph 3.3.20 states that there would be no effect on this designation due to embedded mitigation measures. Those quoted are: C-22 (sets out working	The preparatory works referred to by Natural England are included in the construction phase. 1.9 c) The joint bays will be unfenced subsurface features, marked by manholes as described in **Chapter 4: The Proposed Development, Volume 2** of the ES **[APP-045]**. The landscape and visual impact of these features would not be significant and people travelling sequentially through the landscape would not encounter these in sufficient number / frequency to be significant. 1.9 d) Reinstatement planting will be undertaken within two years of its loss as set out in the **Outline Landscape and Ecology Management Plan (LEMP) [APP-232]**. Landscape and visual effects resulting from reinstatement of hedgerows and trees will be of a different nature and character to those experienced during construction. The young plants will grow and become established over a 5 Year period with maintenance continued until Year 10 with the nature, level and significance of these effects changing and reducing over this period. Consequently, the construction effects are described as short term and temporary, these would be of a different nature and reduced geographical extent during operation. They would also be short-term, temporary and progressively reducing with the exception of those areas where trees cannot be reinstated over the cable trenches. Here, scrub/ small tree species will be planted as reinstatement and it is acknowledged that there would be a permanent change to those affected landscape elements. For those landscape and visual effects extending into the operation and maintenance phase, the changes to landscape elements in terms of age and scale of vegetation will not be sufficient in number, density, pattern or distribution to sustain significant effects on the overall landscape character, sequential experience of travelling through the landscape or the special qualities (SQs). Areas of new planting / altered landscape elements are also a feature of the baseline landscape. 1.9 e) As noted above, whilst the majority of effects will be short-term (less than 5 Years), some effects will extend for up to 10 Years, but covering two distinct phases of development encompassing different nature and scale of effects. Permanent effects resulting from the loss of trees will be mitigated by replanted hedges and smaller native trees constituting a change to the landscape that is not necessarily adverse and / or significant in terms of the landscape character, sequential experience and SQ. 1.9 f) Although some phases of the work (e.g. trenchless crossing) may be completed in a few days and Commitment C-19 in the **Commitments Register [APP-254]** (which has been updated at Deadline 1) sets out to reinstate the landscape in '*…as short a timeframe as possible*', the assessment in **Landscape Assessment, Volume 4** of the ES **[APP-169]** concludes that there

Ref	Natural England's Comments	Applicant's Response
	hours as 0700 to 1900 Monday to Friday); C-66 Page 7 (minimising effects on the special qualities of the SDNP, through design and compliance with policy) and C-200 (directional task lighting where needed to limit effects on walkers and residents of the SDNP). The Outline Code of Construction Practice (document 7.02) states that Horizontal Directional Drilling (HDD) work will continue for 24 hours, 7 days a week. The detailed description of Special Quality 3 includes the retention of dark night skies. Natural England welcomes the commitments referred to in relation to lighting. However, there is no assessment of the landscape effects of the necessary lighting, that will be needed for the HDD work where the cable extends through the scarp at Michelgrove Park or Sullington Hill. While vehicle and task lighting in relation to the identified viewpoints are mentioned frequently in the Viewpoint Analysis (Appendix 18.2), there is no mention of the lighting needed for the trenchless crossing compounds given their 24 hour, 7 day a week working hours. Similarly, no mention of lighting for trenchless crossing compounds is mentioned in Table 18-24, which sets out the maximum parameters and assessment assumptions for the landscape and visual impact assessment (Chapter 18, p.125-132). Natural England advises that further evidence should be provided to support the conclusion that there is no effect on the dark skies of the SDNP or the South Downs International Dark Sky Reserve.	will be a significant effect on Special Quality (SQ3) because of both audible and visual effects on the landscape and visual resource, experienced by people that will be temporary and short term (up to 5 Years duration). Further clarification on special qualities is provided in **Appendix 5 – Further information for Action Point 27 – South Downs National Park (Document Reference 8.25.5)** submitted at Deadline 1. 1.9 g) The assessment of no effect on the South Downs International Dark Sky Reserve is based on the fact that none of the Dark Skies Discovery Sites or core areas of the Dark Sky Reserve are located within the LVIA Study Area (see Figure 15.12 in **Chapter 15: Seascape, landscape and visual impact assessment – Figures (Part 1 of 8), Volume 3 [APP-088]**). The nearest of these being located beyond 10km distance from the proposed DCO Order Limits. A portion of the onshore cable corridor is however routed through the "*E1a - 2km Buffer Zone & Intrinsic Rural Darkness*" area and as such the recommendations of the South Downs National Park (SDNP) Local Plan Policy SD8: Dark Night Skies have been followed and incorporated into Commitments C-66 (minimise effects on the special qualities of the National Park and High Weald Area of Outstanding Natural Beauty) and C-200 (construction lighting limited to directional task lighting where required) in the **Commitments Register [APP-254]** updated at Deadline 1, These commitments are secured through Requirement 12 (**Outline Landscape and Ecology Management Plan [APP-232]**) and Requirement 22 (**Outline Code of Construction Practice [PEPD-033]**) respectively in the **Draft Development Consent Order [PEPD-009]**. The Applicant will continue to engage with Natural England on these points.
H5	1.10 Commitment C-66 and C-67 are aimed at reducing the effects of the proposed development on the SDNP. While we welcome these in principle, we do not believe that they will have any meaningful effect. C-66 aims to minimise the effects on the special qualities of the National Park '…through careful design consideration in terms of scale, size and location, and taking account of the relevant policy and guidance.' The proposed development is assessed in the LVIA as having a significant effect on two special qualities of the SDNP during the construction phase, and we consider that this extends into the long term. Natural England therefore advises that the natural beauty of the designation will be harmed.	The Applicant will continue to engage with Natural England on these points, but please see the Applicant's response to H4 (1.9 (d)) and the Applicant's **Post Hearing Submission – Issue Specific Hearing 1, Appendix 5 – Further information for Action Point 27 – South Downs National Park (Document Reference: 8.25.5)**. This document provides further information and sign-posting to effects of the Proposed development on the special qualities of the South Downs National Park including mitigation and enhancement proposals. A number of design considerations have already been taken as a result of commitment C-66 and this principle will continue through the stage specific Landscape and Ecology Management Plans (LEMPs) during construction and operation secured through Requirement 12 of the **Draft Development Consent Order [PEPD-009]**.
H6	1.11 Finally, Natural England has significant concerns about the permanent harm to the special qualities of the SDNP as a result of the reliance placed on the HDD crossing embedded mitigation measure which proposes a trenchless crossing method of taking the cable route through Michelgrove Park and Sullington Hill chalk scarps. The landscape and visual effects assessment in the Environmental Statement, and the assessed harm to the special qualities of the SDNP are all predicted upon the success of this mitigation	The chalk scarps are recognised as key landscape characteristics / features and the relevant Local Character Areas (LCAs) are assessed as of High sensitivity in the Landscape and Visual Impact Assessment (LVIA) (see **Chapter 18: Landscape and visual impact, Volume 2** of the ES **[APP-059]**.

Ref	Natural England's Comments	Applicant's Response
	measure. As set out in more detail below, no studies or further evidence has been provided of its likely feasibility or success.	The Applicant is committed to undertaking ground investigations for all trenchless crossings prior to commencement of the works. This is a standard requirement to inform detailed design of trenchless crossings and is secured in the **Outline construction method statement** **[APP-255]** within section 3.4, which is secured by Requirement 23 of the **Draft Development Consent Order** **[PEPD-009]**. The details of the crossings will be confirmed in the stage specific onshore construction method statement as per **Draft Development Consent Order** **[APP-019]** Requirement 23. Please refer to the Applicant's response in **references J3 and J4** for full detailed response.
H7	**Embedded mitigation measures** **Horizontal Directional Drilling for chalk scarps and Ancient Woodland** 1.12 The geology of the SDNP is quoted in the SDNP Special Qualities document as underpinning the special qualities of the area, and in particular Special Quality 1, 'diverse, inspirational and breathtaking views'. The chalk scarps are one of the most prominent manifestations of the geology of the SDNP, and one of its most sensitive landscape features. The chalk scape faces are a key reason for the area's designated as a National Park. The cable route is designed to cross two scarps within the SDNP; Michelgrove Park and Sullington Hill. In addition to the sensitivity of the scarps, there is a substantial area of Ancient Woodland on the Michelgrove Park scarp and Sullington Hill is a Local Wildlife Site; further increasing the landscape sensitivity of each of these areas. HDD is proposed as the means of crossing each of the scarps.	In addition to chalk scarps, ancient woodland is recognised in **Appendix 18.3 Landscape Assessment, Volume 4** of the Environmental Statement **[APP-169]** of Landscape Character Areas (LCAs) and Special Qualities (SQs) (diversity of landscape and tranquillity / time depth). It is assessed as of High sensitivity.
H8	1.13 Natural England has raised major concerns about the feasibility of the HDD technique since the publication of the PEIR, due to the lack of information on the suitability of the ground conditions for the use of this embedded mitigation measure. We have further concerns regarding how the technique will accommodate each of the scarp's changes in topography without resulting in damage to the scarp. HDD is the most important component of the mitigation programme for the proposed scheme in relation to landscape, because of the potential significant landscape and visual effects on the SDNP as a result of crossing the scarps. The assessment in the LVIA that no residual harm will result from the proposals is entirely predicted upon this mitigation measure. Natural England has advised and continues to advise, that without further information regarding the feasibility of HDD in relation to these scarps, all conclusions with regard to residual landscape and visual effects on the landscape of the SDNP as a consequence of the cable route can only be considered provisional and optimistic. 1.14 While we welcome commitments C-235 and C-236 which aim to use best practice HDD techniques and undertake detailed pre-works, we note that there remains considerable uncertainty regarding the technique, as set out in the references to DCO application documents below.	Please refer to the Applicant's response in **references J3 and J4**.The Applicant has no further comments on this matter at this time.
H9	1.15 In Table 22-6 in the Terrestrial ecology and nature conservation chapter (APP-063), it states that proposed trenchless crossings '…have been visited by a 'no dig' specialist to determine feasibility and the activity within these designated sites confirmed'. However, it is also noted that the width of trenchless crossings are wider to allow for '…uncertainty in ground conditions' (APP-045 para. 4.5.8, ES Volume 2, Chapter 4: The Proposed Development), and paragraph 4.5.26 of the same chapter states: For trenchless crossings, HDD has been assessed in the DCO Application as this is the likely preferred option based on their reduced complexity and relatively low cost compared to other techniques. The detailed methodology and design of the trenchless crossing will be determined following site investigation and confirmed within	Please refer to the Applicant's response in **references J3 and J4**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Natural England's Comments	Applicant's Response
	stage specific Onshore Construction Method Statements including confirmation that there are no new or materially different environmental effects arising compared to those assessed in the ES. 1.16 It is also noted in Table 22-6 in the ecology chapter (APP-063 - 3rd section) that in Chapter 4: The Proposed Development '… the DCO does not consent open trenching methods in areas where HDD is being proposed (should HDD fail additional consent would be required to deliver an alternative solution)'.	
H10	1.17 Natural England also notes that trenchless crossings are mentioned in the Crossings Schedule (APP-122 Volume 4, Appendix 4.1) for Michelgrove Park and Sullington Hill. However, Michelgrove Park is not mentioned in the Commitments register [APP-254] in relation to trenchless crossings and the commitment in relation to trenchless crossings at Sullington Hill is relation to the Local Wildlife Site and not in relation to the chalk scarp (Commitments C-114 and C-278). Across the Rampion 2 DCO documents where reference is made to trenchless crossing techniques (including HDD) its use is set out as being '… to avoid or minimise identified constraints, such as main watercourses, railways and roads that form part of the Strategic Highways Network' (para 1.2.3). This is repeated in several documents, including in Commitment C-5 which refers to main rivers, watercourses, railways and roads. The lack of clear commitments to trenchless crossings for the two most sensitive landscape features within the SDNP, which contribute significant to Special Quality 1, create further uncertainty about the use of HDD to mitigate the effects on the natural beauty of the designated landscape.	Commitment C-5 of the **Commitments Register** **[APP-254]** has been updated at Deadline 1 to note that crossings will be as per Appendix A: Crossing Schedule of the **Outline Code of Construction Practice** **[PEPD-033]** secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. The scarps at Michelgrove (TC-12) and Sullington Hill (TC-15) are shown to be crossed via trenchless crossing techniques.
H11	1.18 Natural England advises that open cut trenching either through the chalk scarps or in areas of Ancient Woodland[3] would leave them irreparably and irrevocably damaged. The combination of topography and the complex soil type of the scarps is anticipated to prevent full reinstatement of the chalk ridges whilst Ancient Woodland is irreplaceable in planning policy terms. This would not only result in significant, permanent and adverse landscape and visual effects during the construction phase of the project, but the inability to remediate the harm caused would result in significant, permanent residual adverse landscape and visual effects. The proposals to undertake site investigations in detailed stages puts the landscape of the SDNP at greater risk of harm. If one or both of the chalk scarps prove unsuitable for HDD. As noted above, an alternative solution would have to be found, and this would most likely occur after construction of the cable route has commenced through the National Park. Natural England advise that in order to protect the landscape of the SDNP, all site investigation works should be undertaken prior to the commencement of the construction of any part of the cable route through the SDNP. Failure to do so would put the SDNP landscape at substantial risk of harm.	Please refer to the Applicant's response in **references J3 and J4**.The Applicant has no further comments on this matter at this time.
H12	1.19 We would further advise that should HDD be deemed feasible, the substantial construction equipment needed for drilling and servicing the drilling operation would significantly threaten the highly sensitive landscape character and the special qualities of the SDNP. The effects will be all the more serious if trenchless crossing alternative option TC-12b [APP-044] is used given its planned location in a clearing within the woodland of Michelgrove Park.	The location of trenchless crossing alternative option TC-12b **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]** is located within a woodland clearing at Michelgrove Park for the precise reason of avoiding adverse effects on woodland . Trenchless crossing has been chosen in this location to minimise adverse impacts on woodland. The use of trenchless crossing will be for a temporary period and compounds will be reinstated to their prior condition on completion.
H13	1.20 The chalk scarps are a defining landscape feature of the two landscape character areas where trenchless crossings are proposed (B4: Angmering and Clapham Wooded Estate Downland relating to proposed alternative trenchless crossing TC-12a at Michelgrove Park and A3: Arun to Adur Open Downs where the rest of the trenchless crossings associated with Michelgrove Park and all those relating to Sullington Hill apart from TC-15a). As a result, the landscape effects during the construction phase on these landscape character areas should be Major and Significant, not limited by geographical extent.	Trenchless crossings and associated compounds (TC-12, TC-12a-d and TC-15b-c) are all included in the LVIA for B4: Angmering and Clapham Wooded Estate Downland and A3: Arun to Adur Open Downs as set out in **Appendix 18.3: Landscape Assessment, Volume 4** **[APP-169]**. Both are already assessed as Major adverse and Significant. It is a requirement of Guidelines for Landscape and Visual Impact Assessment 3 (GLVIA3) (Landscape Institute

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Natural England's Comments	Applicant's Response
		and Institute of Environmental Management and Assessment (IEMA), 2013) that the sensitivity, magnitude and geographical extent is stated.
H14	1.21 We would also request further clarification about the height of the trenchless crossing compounds within the SDNP. The maximum development parameters for these are stated as 50m and 75m (length and width) [APP-124 Volume 4, Appendix 4.3 Proposed Development Parameters, p.6], but there is no maximum height parameter given. The Zone of Theoretical Visibility plans show the height for the cable route as 7m in Figures 18.4a, 18.4b, 18.4c Zone of Theoretical Visibility with viewpoints – Onshore cable corridor (APP-098 to APP-103, Volume 3, Chapter 18, LVIA – Figures (Part 1 of 6)). In Table 18-24 of the LVIA (APP-059, Chapter 18, p.126) it states that the assessment is based on a fully extended mechanical elevator at an 'assumed' height of 6m. We also note the proposed use of a crane during trenchless crossings construction (APP-169, Appendix 18.3: Landscape Assessment, p.57, first paragraph) and would ask for clarification of the height of this equipment. No heights are given in the development parameters for trenchless crossings, and since these define the limits of assessment, we would expect the height parameters to be included as part of the development parameters.	The trenchless crossing compounds are contained within the onshore cable corridor. This outlined in Table 18-24 of **Chapter 18: Landscape and visual impact, Volume 2** of the Environmental Statement (ES) **[APP-059]** which states "*It is assumed that the tallest elements will be the mechanical excavator which has been modelled to a maximum height of 6m (fully extended*)."
H15	**Commitment C-115 [APP-254] 7.22 Commitments Register** 1.22 Commitment C-115 aims to limit the harm caused by cable crossings on hedgerows and tree lines, by temporarily translocating hedgerows ('notching'). In principle Natural England welcomes the commitment to reduce the loss of hedgerows and tree lines using the notching approach and by limiting the sections of hedgerow removed. We also welcome the more realistic wording in this commitment in comparison to that at the PEIR FSIR Commitment **C-19** which aims to construct the cable corridor in discrete sections, with '…reinstatement commencing in as short a timeframe as possible' is also welcomed. 1.23 As mentioned above, the Rampion 1 cable route remains visible in several of the sections. For Rampion 2, Commitment C-115 forms one of the key embedded mitigation measures, alongside those commitments in relation to HDD. It is as a result of these commitments, that the LVIA [APP-059] concludes that there will be no residual effects on the landscape character of the SDNP, and that by year 10, the visual effects will be minor and not significant. Commitment C-115 is relied upon to mitigate the significant visual effects during the operational and maintenance phase on part of the A283 (The Pike), east of Washington and on seven sections of PRoW. 1.24 Natural England raised concerns in relation to the likely efficacy of commitment C-115 in the PEIR SIR and PEIR FSIR consultations, and we advise that we remain concerned as set out below: - Translocated sections of hedgerow would require significant management and maintenance, at each stage of the process to ensure success. In Volume 2, Chapter 22, Terrestrial ecology and nature conservation (APP-063, para. 22.9.102) it is claimed that the technique had an 80% success rate in the Lake District National Park, but there are no further details given of where this was successful and how the technique was undertaken. While the success rate elsewhere is encouraging, we remain unconvinced of the technique's suitability to the SDNP. One of the major factors for failure in the translocation of mature plants is the lack of adequate irrigation. The Lake District receives on average at least twice the level of rainfall than the South Downs, which continues even in the summer months ; and the soil conditions are not comparable. Natural England advises that more information is needed to be convinced of the efficacy of this approach when applied to the SDNP. - Our concerns about the success rate of this embedded mitigation appear to be reflected in additional wording to commitment C-115 (since the PEIR FSIR), which now includes: 'where appropriate' and '… where	1.22 – The Applicant welcomes Natural England's support on the updates to wording of commitments C-115 and C-19 of the **Commitments Register [APP-254]** provided at Deadline 1 submission. Note to ensure further clarity, commitment C-115 has been updated as errata for Deadline 1. 1.23 – The Applicant has no further comments on this matter at this time. 1.24 – It is common landscape and visual impact assessment (LVIA) practice to rely on landscape mitigation and reinstatement to reduce residual effects of development post-construction. The reinstatement of hedges is a credible and robust technique for mitigation. The LVIA has therefore assessed the reinstatement of hedgerows as set out in the **Outline Landscape and Ecology Management Plan (LEMP) [APP-232]** and includes an assessment for those areas where it will not be possible to re-establish trees above the cable corridor. This is documented in **Appendix 18.3: Landscape Assessment, Volume 4** of the ES **[APP-169]**. The **Outline Code of Construction Practice [APP-224]**, commitment C-115 of the **Commitments Register [APP-254]** (provided at Deadline 1 submission) and the assessment in **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-063]** therein describe the approach to hedgerow notching. In response to Relevant Representations, the text for commitment C-115 has been amended to ensure it is easier to understand. The removal of short sections of hedgerow to allow the installation of cables and replanting is a typical approach used on the majority of cabling / pipeline projects the only difference is the extent of the gap, which the Applicant has sought to minimise already by considering what is feasible and proportionate for each individual hedgerow crossing. Further information on this is provided in Annex A of the **Outline Landscape and Ecology Management Plan (LEMP) [APP-232]**. The existence of hedgerows planted and established across the SDNP provides evidence that hedgerows can be established in this area and there is no reason to suppose that new hedgerow plants, planted to

Ref	Natural England's Comments	Applicant's Response
	chances of success are questionable' mitigation for the loss of hedgerows would be via removal and reinstatement. General uncertainty in relation to ground conditions is evidenced by the widening of the DCO limits in parts of the cable route as noted in ES chapter 4: Proposed Development (APP-045, para. 4.5.8). While the additions to C-115 add a level of realism, they also add to the uncertainty of the success and the likelihood of the use of the measure and suggest that translocation of hedgerows will be less frequently used than was envisaged in the PEIR SIR and PEIR FSIR. This has the effect of turning C-115 into one of replanting removed hedgerows, which we would expect to be the absolute minimum requirement for the loss of field boundary vegetation. - The justification for the decision as to whether or not to translocate the hedgerows will be undertaken by the Ecological Clerk of Works (ECoW), who will ensure '… compliance with relevant legislation, agreed mitigation & best practice' (C-207). We welcome a need to justify the decision and commitment C-196 which aims to '…maintain[ing] levels and types of vegetation and landscape patterns within each Landscape Character Area'. However, there is a strong potential of the landscape and visual effects of decisions being ignored in 4 Based on Met Office UK Climate Averages 1991-2020, considering Keswick and Ambleside and Bognor Regis and Shoreham Airport (these are the closest climate stations to the cable route) Bognor Regis (West Sussex) UK climate averages - Met Office accessed 06.10.2023 Page 11 favour of ecological considerations. Natural England advises that ECoW should be instructed to consider effects on landscape character and visual amenity in all decisions regarding translocation and replacement of hedgerows. 1.25 Natural England advises that for the above reasons the likely efficacy of C-115 is uncertain, and that the commitment can be considered no more than one of replacement planting. The use of commitment C-115 underpins both the assessment of the harm likely to be sustained by the special qualities of the SDNP as well as the landscape and visual assessment of the likely harm to arise from the construction and operation of the cable route. In addition, given the tree planting restrictions along the route, we advise that significant adverse residual landscape and visual effects on the SDNP, and is special qualities will remain beyond year 10 of the operational phase of the scheme, and thus long term. We would therefore conclude that the effects on the SDNP have been under assessed in the LVIA. Commitment C-115 will not prevent the severance of significant numbers of the field boundaries along the cable route, and thus there will be significant harming to the landscape character and visual amenity of the SDNP and its special qualities.	infill gaps in hedgerows that have been notched would not establish in a similar manner to the existing hedges. The **Outline LEMP** **[APP-232]** sets out management and maintenance including replanting should any plants fail. Translocation is a method that would be investigated on a hedgerow-by-hedgerow basis by the Ecological Clerk of Works (ECoW) during the detailed design phase. This would be evidenced and agreed to by the appropriate authorities through the agreement of stage specific Code of Construction Practice and Landscape and Ecology Management Plan documents (secured via Requirements 12, 13 and 22 of the **Draft Development Consent Order** **[PEPD-009]**). The Applicant has altered commitment C-115 (**Commitments Register** **[APP-254]** updated at Deadline 1 submission) so as not to presume translocation at all hedgerows on the advice of stakeholders but is content to use this technique wherever possible. General uncertainty in relation to ground conditions is evidenced by the widening of the proposed DCO Order Limits in parts of the onshore cable route as noted in paragraph 4.5.8 of **Chapter 4: The Proposed Development, Volume 2** of the ES **[APP-045]**) is a comment that relates to engineering and not the suitability of soils / ground conditions in respect of replanting and or translocation. The ECoW will be tasked with considering all aspects of each hedgerow during the detailed design including from a biodiversity, landscape and cultural heritage perspective. Please refer to The Applicants response to **reference J30**. 1.25 – The LVIA has assumed as a minimum that the mitigation for vegetation (trees / hedges) lost to the construction works will that take 5 Years to establish regardless of whether it is translocated or replanted and that it will be maintained and monitored for a further 5 Years (10 Years in total). The use of translocation with a similar success rate to the examples provided would ensure a faster establishment such that the LVIA is not under-assessed and the time periods for mitigation (planting establishment, maintenance and monitoring) are not unrealistic and reflect common practice. In respect of claimed significant long-term effects beyond year 10 of the operational phase please see the Applicant's response in **reference H4 (1.9 (d))**.
H16	**Commitment C-19 [APP-254]** 1.26 Natural England welcomes commitment C-19 in principle. Commitment C-19 relates to construction and reinstatement of the cable route being undertaken in discrete sections and for the reinstatement process to be '…commenced in as short a timeframe as practicable'. There are a number of occasions in the LVIA [APP-059] where the excavation and backfill of discrete sections are referred to in relation to 600m to 1000m intervals to reduce the effects of the route on the landscape and ecology (for instance, APP-059 Chapter 18,	The Applicant is reviewing this request made in Natural England's Relevant Representation.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Natural England's Comments	Applicant's Response
	p.133 first bullet point, para. 18.11.18, 18.11.87). This is also mentioned in the Outline Code of Construction Practice (APP-224, para. 5.2.4, point 2). However, the wording of the commitment says: 'At regular intervals (typically 600m – 1,000m) along the route joint bays/pits will be installed to enable the cable installation and connection process'. There are no other commitments which mention backfilling on a rolling programme of 600m to 1,000m. There are also no clear indications as to the maximum length of time to be taken before backfilling commences or any indication of the length of cable route to be reinstated within the commitments register. The Proposed Development Parameters do not include mention of a backfilling duration. In addition, the use of the wording 'as practicable' allows for considerable flexibility. In order for this commitment to benefit the route through the SDNP we would advise that a particular duration/length of time is included in the commitments register and the Proposed Development Parameters, and that 'as practicable' is removed from the commitment wording.	
H17	**Avoiding the removal of key characteristics - commitments C-21, C-115, C-174 [APP-254]** APP-059, paragraph 18.7.8, point 6 in Chapter 18: Landscape and visual impact states that commitments C-21, C-115 and C-174 aim to '…avoid the removal of landscape elements, particularly where these are key characteristics and [/] or veteran and mature trees'. In the Executive Summary, these commitments are also claimed to reduce or remove significant environmental effects as far as possible. The Outline Code of Construction Practice [APP-224] also includes a reference to the avoidance of landscape elements where these are key characteristics (APP-224, para. 5.2.4, point 3). While measures to protect important hedgerows are welcomed by Natural England in commitment C-115, as is the protection of veteran trees in commitment C-174, commitment C-21 relates to vegetation removal in the context of breeding birds. Natural England accepts that commitment C-115 may, if successful protect the landscape elements which are key characteristics. However, as set out above we are unconvinced of the feasibility and efficacy of this embedded mitigation measure and therefore request further information as to how commitments C-21, C-115 and C-174 fulfil the suggested environmental protection.	See response in **reference H15** above regarding commitment C-115. In respect of commitment C-21, the commitment refers to any vegetation removal will be undertaken in line with British Standard (BS) 5837:2012 (Trees in relation to design, demolition and construction). This standard will help secure appropriate landscape management during the construction works. Commitment C-174 is regarding veteran trees and details how these will be protected.
H18	**LVIA Methodology [APP-167]** (Comments relate to APP-167, Appendix 18.1: Landscape and visual impact assessment methodology) 1.28 The methodology for the assessment of significance of effects is set out in section 1.8 and Table 1-5 of the LVIA methodology. Paragraph 1.8.3 sets out the instances when a landscape or visual effect is deemed significant. It notes that 'moderate' levels of effect may or may not be judged as significant and would be subject to the assessor's opinion. Natural England notes that the guidance provided in GLVIA3 relates to the general assessment of landscape and visual effects but does not give details of how to assess designated landscapes. Based on the national importance of designated landscapes and their protection in statute, we would advise that a 'moderate' effect in the context of a designated landscape is considered significant.	The landscape and visual receptors of national importance are all assessed as of High sensitivity in **Chapter 18: Landscape and visual impact, Volume 2** of the Environmental Statement **[APP-059]** (and associated appendices in **APP-167 – APP-172**) meaning that a 'Moderate' effect can only result from a low magnitude of change. It is for the assessor to then consider if identified Moderate effects are Significant in line with the methodology outlined in **Appendix 18.1: Landscape and visual impact assessment methodology, Volume 4** of the ES **[APP-167]**.
H19	**Visualisations** 1.29 In principle Natural England welcomes the visualisations provided as supporting evidence. We note that the LVIA methodology states that the viewpoint photography which supports the LVIA has been developed based on the guidance set out in Landscape Institute TGN 06/19 (LI TGN06/19). However, they are labelled Type 1 Visualisations, which the guidance in APP-167, paragraph 3.5.2 refers to as 'annotated viewpoint photographs'. If wireframe/wirelines follow the protocols as set out in the LVIA Methodology (APP-167, Appendix 18.1 paragraphs 1.10.17 and 1.10.18), the visualisations should be labelled as Type 2 visualisations according to the guidance. Natural England asks for clarification that the viewpoint images as presented are Type 2 visualisations and all follow the protocols for wireline/wireframe production set out in the methodology.	The landscape and visual impact assessment (LVIA) visualisations are annotated photos (Type 1) and not wirelines (Type 2). The wirelines and photomontages are presented as part of the seascape, landscape and visual impact assessment (SLVIA) in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** of the ES **[APP-056]** and supporting Figures **[APP-088 – APP-095]**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Natural England's Comments	Applicant's Response
H20	**Cultural Heritage and landscape** 1.30 The accepted definition of landscape is an area of land '… as perceived by people, whose character is the result of the action and interaction of natural and / or human factors.' The definition highlights that landscape has a long temporal dimension, and its current state is the result of millennia of changes to the landscape, both human and naturally induced. Any harm to the cultural heritage of the landscape will result in harm to the landscape character, and therefore any damage to the cultural heritage of the SDNP would significantly damage the landscape character of the National Park. We defer to Historic England and the Local Authorities to comment on the historic environment part of the application.	The Applicant disagrees that "*Any harm to the cultural heritage of the landscape will result in harm to the landscape character, and therefore any damage to the cultural heritage of the SDNP would significantly damage the landscape character of the National Park*." Effects on cultural heritage and LVIA are assessed differently and an effect on cultural heritage may or may not also have a similar or different effect on the landscape resource.

Detailed Comments

Table 4-14 Applicant's response to Natural England - Appendix I (Seascape, Landscape and Visual Impact)

Ref	Natural England's Position	Applicant's Response
I1	**Summary of Key Environmental Concerns: Seascape, Landscape and Visual Impact** Natural England recognise that a number of iterative changes have been made to the DCO order limits between the PEIR and ES stages. However, whilst accepting that the design changes introduced following the Section 42 consultation have reduced the adverse effects of the scheme on the portion of the South Downs National Park (SDNP) contained within the Sussex Heritage Coast (SHC), we continue to advise that the proposal will significantly affect the statutory purposes of the SDNP and the special character of the SHC, as well as the statutory purposes of the Chichester Harbour Area of Outstanding Natural Beauty (CHAONB) and Isle of Wight Area of Outstanding Natural Beauty (IoWAONB).	The Applicant welcomes the recognition from Natural England that changes were made to the Order Limits between the PEIR and ES stages and that the design changes introduced following the Section 42 consultation have reduced the adverse effects of the Proposed Development on the portion of the SDNP contained within the Sussex Heritage Coast. This reduction in spatial extent of the PEIR assessment boundary (offshore array area) to the Order Limits (offshore array area) is illustrated in **Figure 3.3, Chapter 3: Alternatives - Figures, Volume 3 [APP-075]**. The seascape and visual impacts of the Proposed Development Wind Turbine Generators (WTGs) are assessed in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]**. The Applicant recognises that significant effects on '*breathtaking views'* and '*stunning panoramic views to the sea'* defined in SDNP Special Quality 1 (SQ1) have been identified from representative viewpoints in the SDNP. However, the Proposed Development does not have significant effects on any other SDNP special qualities, and it is the conclusion of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056] (paragraphs 15.15.9 – 15.15.40)** and the position of the Applicant, that the Proposed Development will not compromise the statutory purpose of the SDNP designation. With regards the CHAONB, the assessment in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]** also finds, as summarised in its conclusions (**paragraphs 15.15.50 – 15.15.53**), that the Proposed Development will result in not significant effects on the majority of special qualities of the CHAONB and that there is a very localised significant effect on the perceived '*unique blend of land and sea'* (SQ1) and *'significance of…. Distant landmarks across land and water'* (SQ3) experienced from a limited area of the coastal edges/open seascape at the mouth to Chichester Harbour. It is the finding of the assessment and position of the Applicant that the Proposed Development will not compromise the statutory purpose of the CHAONB designation. With regards the IoWAONB, the assessment in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]** also finds, as summarised in its conclusions (paragraphs 15.15.60 – 15.15.74), that the Proposed Development will result in not significant effects on views or special qualities of the IoWAONB. The Isle of Wight Council is in agreement with this finding that the effects of the Proposed Development on the perceived character and views from the Isle of Wight will be not significant (as noted in Table 15.7 in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]**).
I2	Natural England's advice remains that the proposed Rampion 2 wind turbine generators (WTGs) are too big and located too close to the coastline of the SHC portion of the SDNP. Their sheer size and lateral spread, combined with the marked contrast in height with the existing Rampion 1 WTGs, will be visually incoherent, clutter-up the seascape setting of the SDNP, and dramatically degrade views out to sea, particularly from Beachy Head to Birling Gap. Natural England's advice remains that the Rampion 2 WTGs should be excluded from the eastern Array (Zone 6) area.	As assessed in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]**, the Proposed Development array area is located some 23.9km from the closest point of the SDNP coastline within the Sussex Heritage Coast (at Seaford Head) and 31.9 km from its more distant parts at Beachy Head. In views from Beachy Head and Birling Gap, the additional lateral spread of the Proposed Development (beyond that occupied by Rampion 1) will only be around 7°, which is considered a relatively small spread. The Proposed Development will form a clearly separate array grouping that has a narrower lateral spread than the existing Rampion 1 Wind Farm. The height of the Proposed Development WTGs will appear larger in apparent scale due to their taller height and larger rotor diameter; however, there is a relative balance in apparent scale and spread in perspective with the Proposed Development

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Natural England's Position	Applicant's Response
		closer and Rampion 1 more distant. Stark scale comparisons are also avoided through the evident separation or 'gap' between the distinct Rampion 1 and the Proposed Development arrays. As such it is the assessment of **Chapter 15**: **Seascape, landscape and visual impact assessment, Volume 2** **[APP-056]**, that significant effects on views from Beachy Head and Birling Gap are avoided; with significant effects occurring only on views from the closest parts of the Sussex Heritage Coast (at Seaford Head, Seven Sisters/Cuckmere Haven). The design of the Proposed Development (offshore array area) does not exclude WTGs from the eastern (Zone 6) area however the spatial extent of this Zone 6 area has been reduced considerably and the eastern edge of the Rampion 2 Offshore Array Area has been aligned with that of Rampion 1. This reduction in spatial extent of the PEIR assessment boundary (offshore array area) to the Order Limits (offshore array area) is illustrated in **Figure 3.3, Chapter 3: Alternatives, Volume 3** **[APP-075]**. As a result, the Proposed Development Order Limits within this Zone 6 area is located at greater distance from viewpoints within the Sussex Heritage Coast of the SDNP (approximately 7km further offshore than the PEIR assessment boundary) and the Proposed Development WTGs in this area will occupy a narrower lateral spread in the field of view and will be sited to the south of Rampion 1, which is considered the optimal location within the Zone 6 area, in seascape, landscape and visual terms. Through this design change, the Applicant considers that it has minimised impacts and harm to special qualities of the SDNP, particularly its 'breathtaking views' and shown regard to the statutory purpose of the SDNP.
I3	Natural England considers that the two key policy tests of concern to the Rampion 2 Examination are whether the Rampion 2 Design Principles fulfil the requirement for good design as set out in the Overarching National Policy Statement for Energy (EN-1); and (with respect to designated landscapes) the acceptability of further harm to the statutory purposes of the SDNP and special character of the SHC, and harm to the statutory purposes of the CHAONB and IoWAONB. Consequently, we do not agree that the Rampion 2 Design Principles fulfil the requirement for good design as set out in the Overarching National Policy Statement for Energy (EN-1).	**Section 15.7** of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** **[APP-056]** sets out how the Proposed Development responds to 'good design' in respect of seascape, landscape and visual receptors. SLVIA topic specific design principles are described, which set out how the design of the Proposed Development has been shaped by potential seascape, landscape and visual effects, with the aim of reducing the magnitude of effects of the Proposed Development, principally through a reduction in the spatial extent of the array area and reduction in the number of WTGs. Detailed consultations were undertaken on the design of the project during Expert Technical Group (ETG) meetings, in which SLVIA matters were a key consideration in driving the design changes made to address comments of stakeholders and provide embedded environmental measures with regard to potential seascape, landscape and visual impacts. The spatial extent of the Proposed Development array area has been substantially reduced, which reduces the horizontal spread of WTGs visible; increases the distance of the Proposed Development from the most sensitive areas of coastline (reducing the apparent height and visibility of WTGs); and achieves a separation between the Rampion 1 and the Proposed Development arrays in key views, with a better balance in apparent WTG size. The Applicant has produced and submitted a **SLVIA Maximum Design Scenario (MDS) and Visual Design Principles Clarification Note** (Appendix 17) **(Document Reference 8.31.17)** at Deadline 1, which provides further commentary on these SLVIA specific design principles and illustrates the consultations undertaken on the design of the project during ETG meetings. It is the conclusion of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** **[APP-056]** (paragraphs 15.15.9 – 15.15.74) and the position of the Applicant, that the Proposed Development will not compromise the statutory purpose of the SDNP, CHAONB and IoWAONB designations. Further justification and clarification with regards the matter of statutory purpose of the SDNP and effects of the Proposed Development on the special qualities of the

Ref	Natural England's Position	Applicant's Response
		SDNP is set out in **Appendix 10 - Further information for Action Point 27 (document reference 8.25.10)** submitted at Deadline 1.
I4	Lastly, our assessment of the SLVIA has identified further evidence that Natural England will require to fully understand the impacts of the project on protected landscapes. This information will allow Natural England to advise on whether the current proposed design is the 'least worst possible'.	The Applicant has prepared and submitted supporting studies/clarification papers at Deadline 1 in response to Natural England's request for further evidence, as follows: • **SLVIA MDS and Visual Design Principles Clarification Note** (Appendix 17) (Document Reference 8.31.17) – to address Natural England's request for further evidence points I2 (a), (b), (c), (d), (e) and (h). • **Appendix 10 - Further information for Action Point 27** (document reference 8.25.10) – providing further information requested in response to Action Point 27 of Issue Specific Hearing 1 relating to the effects of the Proposed development on the special qualities of the SDNP and the statutory duties in relation to the SDNP.
I5	**Introduction** Please note: This appendix should be read in conjunction with the Summary of Key Environmental Concerns contained within our Relevant Representations. Natural England is the Government's statutory adviser on landscape, the designating authority for National Parks and Areas of Outstanding Natural Beauty, and the defining authority for Heritage Coasts. The following advice is offered without prejudice, and relates only to the seascape, landscape, and visual effects associated with the statutory purposes and the seascape settings of the following designated and defined landscapes; • South Downs National Park (SDNP), inclusive of the special character of the Sussex Heritage Coast (SHC) that is located wholly within it • Chichester Harbour Area of Outstanding Natural Beauty (CHAONB) • Isle of Wight Area of Outstanding Natural Beauty (IoWAONB) To assist the Examining Authority, the advice provided in this response is high-level and focused on the Design Principles of the Rampion 2 OWF (Part 1 of this response). These design principles aim to respond to the need for good design as set out in the Overarching National Policy Statement for Energy (EN-1) to reduce the potential for significant major adverse effects on the SDNP and SHC. Part 2 of this response sets out advice on the significant effects on the statutory purposes of designated landscapes that remain outstanding. Particular attention should be given to the detailed advice provided by the SDNP Authority during the Examination, since their local knowledge is of a greater depth than can be provided by Natural England. To assist in the preparation of this advice, Natural England conducted additional site visits in August 2023. Further site visits are planned ahead of the Examination commencing.	The Applicant's responses to Natural England's Summary of Key Environmental Concerns (in respect of seascape, landscape and visual matters) is provided above in response to ref 5.29 – 5.32. It is noted that Natural England's advice relates only to the SDNP (including the Sussex Heritage Coast), CHAONB and IoWAONB. The Applicant has provided responses to Natural England's advice with regards to the Design Principles of the Proposed Development and advice regarding the statutory purposes of designated landscapes in the following responses and in the supporting studies/clarification papers submitted at Deadline 1: • **SLVIA MDS and Visual Design Principles Clarification Note** (Appendix 17) (Document Reference 8.31.17)– to address Natural England's request for further evidence points I2 (a), (b), (c), (d), (e) and (h). • **Appendix 10 - Further information for Action Point 27** (document reference 8.25.10) – providing further information requested in response to Action Point 27 of Issue Specific Hearing 1 relating to the effects of the Proposed development on the special qualities of the SDNP and the statutory duties in relation to the SDNP.
I6	**Summary of Advice** 1.1 Natural England considers that the two key policy tests of concern to the Rampion 2 Examination are whether the Rampion 2 Design Principles fulfil the requirement for good design as set out in the Overarching National Policy Statement for Energy (EN-1). And	The Applicant recognises the two key policy tests of concern. **Section 15.7** of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]** sets out how the Proposed Development responds to 'good design' in respect of seascape, landscape and visual receptors. Opportunities for enhancement of the quality of an area through the 'Good Design' of

Ref	Natural England's Position	Applicant's Response
	(with respect to designated landscapes) the acceptability of further harm to the statutory purposes of the SDNP and special character of the SHC, and harm to the statutory purposes of the CHAONB and IoWAONB. 1.2 Natural England does not agree that the Rampion 2 Design Principles fulfil the requirement for good design as set out in the Overarching National Policy Statement for Energy (EN-1). We also advise that the project will significantly affect the statutory purposes of the SDNP and the special character of SHC, as well as the statutory purposes of the CHAONB and the IoWAONB. 1.3 Natural England do recognise the iterative changes made to the DCO order limits between the PEIR and ES stages (as shown in Figure 15.2), as well as the use of design principles to inform these changes. However, whilst accepting that the design changes introduced following the Section 42 consultation have reduced the adverse effects of the scheme on the portion of the SDNP contained within the SHC, Natural England maintains that the proposal will significantly affect the statutory purposes of the SDNP. This is for the following reasons: a. The wind turbine generators (WTG) of the Rampion 2 OWF maximum design scenario are too big and located too close to the coastline of the SHC portion of the SDNP. Their sheer size and the lateral spread, combined with the marked contrast in height with the existing Rampion 1 WTG will be visually incoherent, clutter-up the seascape setting of the SDNP and dramatically degrade views out to sea, particularly from Beachy Head to Birling Gap. Natural England therefore advises that WTG should be excluded from the Rampion Zone 6 western array area, thereby adhering to the Design Principles as secured in the Rampion 1 DCO/DML. b. The expansion of the influence of turbines westwards through development within the Rampion extension area will increase the industrialisation of the seascape setting of the SNDP, particularly for inland locations located to the west of Wilmington Hill. Their presence in the seascape setting of the SDNP will further degrade the quality of views out to sea which are already adversely influenced by the turbines of the Rampion 1 array and will lead to further loss of the natural beauty for which this landscape was designated. c. The westward expansion will also result in significant effects on the seascape setting of the CHAONB (although this will be limited) and more extensively the eastern portions of the IoWAONB at Bembridge Down and St. Boniface Down, resulting in further loss of natural beauty for these designations as well. 1.4 Our assessment of the SLVIA has identified further evidence that Natural England will require to fully understand the impacts of the project on protected landscapes. This information will allow Natural England to advise on whether the current proposed design is the 'least worst possible'.	an offshore wind farm are limited to some degree, due to the technical and economic requirements associated with producing renewable energy as well as other environmental factors. The need to retain flexibility of WTG numbers, size and location within the Proposed Development array area through the planning stages and assessment of a Maximum Design Scenario (a necessary part of the process that is recognised through the NPS at paragraphs 4.2.11 – 4.2.12) also limits opportunities for good design to a degree, however the Applicant has undertaken and applied the principles of good design as far as practicable to arrive at the Proposed Development design selected for the DCO application. The spatial extent of the Zone 6 area has been reduced considerably as part of the design of the Proposed Development (offshore array area) and the eastern edge of the Rampion 2 Offshore Array Area has been aligned with that of Rampion 1. This reduction in spatial extent of the PEIR assessment boundary to the Order Limits (offshore array area) is illustrated in **Figure 3.3, Chapter 3: Alternatives - Figures, Volume 3 [APP-075]**. As a result of this design change and the embedded measures that address the design principles in **Section 15.7** of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]**, the Proposed Development Order Limits within this Zone 6 area is located at greater distance from viewpoints within the Sussex Heritage Coast of the SDNP (approximately 7km further offshore than the PEIR assessment boundary) and the WTGs in this area will occupy a narrower lateral spread in the field of view than the existing Rampion 1 Wind Farm and will be sited to the south of Rampion 1, which is considered the optimal location within the Zone 6 area, in seascape, landscape and visual terms. 'Wind farm separation zones' also achieve a separation between Rampion 1 and Rampion 2 arrays, with a clear line of sight between arrays in key views from the Heritage Coast of the SDNP. The Applicant considers that the current design for the Proposed Development is the *'least worst possible'* in respect of the Zone 6 area. The Applicant has produced and submitted a **SLVIA MDS and Visual Design Principles Clarification Note** (Appendix 17) (Document Reference 8.31.17) at Deadline 1, which provides further commentary on these SLVIA specific design principles. The Applicant considers that the design of the Proposed Development (offshore array area) has minimised impacts and harm to special qualities of the SDNP, particularly its 'breathtaking views' and that it has shown regard to the statutory purpose of the SDNP. It is the conclusion of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]** (**paragraphs 15.15.9 – 15.15.74**) and the position of the Applicant, that the Proposed Development will not compromise the statutory purpose of the SDNP, CHAONB and IoWAONB designations. Further justification and clarification with regard the matter of statutory purpose of the SDNP and effects of the Proposed Development on the special qualities of the SDNP is set out in **Appendix 10 - Further information for Action Point 27** (document reference 8.25.10) submitted at Deadline 1. Addressing points (a) to (c) specifically: a. As assessed in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]**, the Proposed Development array area is located some 23.9 km from the closest point of the SDNP coastline within the Sussex Heritage Coast (at Seaford Head) and 31.9 km from its more distant parts at Beachy Head. In views from Beachy Head and Birling Gap, the additional lateral spread of the Proposed Development (beyond that occupied by Rampion 1) will only be around 7°, which is considered a relatively small spread. The Proposed Development will form a clearly separate array grouping that has a narrower lateral spread than

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Natural England's Position	Applicant's Response
		the existing Rampion 1 Wind Farm. The height of the Proposed Development WTGs will appear larger in apparent scale due to their taller height and larger rotor diameter; however, there is a relative balance in apparent scale and spread in perspective with the Proposed Development closer and Rampion 1 more distant. Stark scale comparisons are also avoided through the evident separation or 'gap' between the distinct Rampion 1 and the Proposed Development arrays. As such it is the assessment of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** **`[APP-056]**, that significant effects on views from Beachy Head and Birling Gap are avoided; with significant effects occurring only on views from the closest parts of the Sussex Heritage Coast (at Seaford Head, Seven Sisters/Cuckmere Haven). The design of the Proposed Development (offshore array area) does not exclude WTGs from the eastern (Zone 6) area however the spatial extent of this Zone 6 area has been reduced considerably and the eastern edge of the Rampion 2 Offshore Array Area has been aligned with that of Rampion 1. This reduction in spatial extent of the PEIR assessment boundary (offshore array area) to the Order Limits (offshore array area) is illustrated in **Figure 3.3, Chapter 3: Alternatives - Figures, Volume 3** **[APP-075]**. As a result, the Proposed Development DCO Order Limits within this Zone 6 area is located at greater distance from viewpoints within the Sussex Heritage Coast of the SDNP (approximately 7km further offshore than the PEIR assessment boundary) and the Proposed Development WTGs in this area will occupy a narrower lateral spread in the field of view and will be sited to the south of Rampion 1, which is considered the optimal location within the Zone 6 area, in seascape, landscape and visual terms. Through this design change, the Applicant considers that it has minimised impacts and harm to special qualities of the SDNP, particularly its 'breathtaking views' and shown regard to the statutory purpose of the SDNP. b. The conclusions of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** **[APP-056]** (**paragraphs 15.15.24 – 15.15.28**) summarise the effects of the Proposed Development on the open downs of the SDNP (*'inland locations located to the west of Wilmington Hill'*), which occur particularly as a result of the expansion of the influence of the Proposed Development WTGs westwards, in which its full western spread can be appreciated in the context of Rampion 1. Although significant effects on views will be experienced by people within this range of inland vantage points along the open tops of the downs, due to the increase in the WTG developed seascape in panoramic views from the tops of the downs, the Proposed Development will be located at considerable distance (generally 20-30 km to the closest WTG) and will be experienced within a remote context setting beyond the intervening, non-designated and urbanised coastal strip between these open downs and the sea. c. With regards to the CHAONB, the assessment in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** **[APP-056]** also finds, as summarised in its conclusions (paragraphs 15.15.50 - 15.15.53), that the Proposed Development will result in not significant effects on the majority of special qualities of the CHAONB and that there is a very localised significant effect on the view from Eastoke Point (Viewpoint 22) at the mouth of the harbour and the perceived '*unique blend of land and sea'* (SQ1) and '*significance of…. distant landmarks across land and water'* (SQ3) experienced from a limited area of the coastal edges/open seascape at the mouth to Chichester Harbour. It is the finding of the assessment and position of the Applicant that the Proposed Development will not compromise the statutory purpose of the CHAONB designation. With regards the IoWAONB, the assessment in **Chapter 15: Seascape,**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Natural England's Position	Applicant's Response
		landscape and visual impact assessment, Volume 2 [APP-056] also finds, as summarised in its conclusions (paragraphs 15.15.60 – 15.15.74), that the Proposed Development will result in not significant effects on views or special qualities of the IoWAONB. The Isle of Wight Council are in agreement with this finding that the effects of the Proposed Development on the perceived character and views from the Isle of Wight will be not significant (as noted in **Table 15.7** in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]**).
I7	**A summary of the key further evidence needed to inform the SLVIA** 2.1 This section summarises the further evidence that Natural England require from the Applicant to fully understand the impacts to designated landscapes and advise on whether the current proposed design is the 'least worst possible' i.e. that sufficient effort has been taken to avoid, reduce and mitigate impacts. a. Detail on how the Rampion 1 Design Principles have influenced the Rampion 2 maximum design scenario. b. The Applicant's justification for why the Rampion 1 mitigation measures do not directly apply to the Rampion 2 project. c. Evidence to demonstrate why constructing more WTG in the Zone 6 (Eastern Array Area) than described within the indicative layout would not present a 'greater worse-case effect'. d. Evidence to show that a greater densification of WTG in either the Zone 6 Area or Extension Area will not materially increase the effect of the Proposed Development on coastal views from protected landscapes. e. An explanation of the balancing exercise that was undertaken between the spatial extent of the Rampion 2 array and the apparent height of Rampion 2 WTGs. f. A report on the cumulative visual effects, which includes an assessment of the visual effects from the perceived heights of the Rampion 2 WTGs in comparison to the Rampion 1 WTGs. g. Paragraph 15.7.29 states that 'the less HFoV that is affected, the lower the magnitude of change'. The Applicant should provide a detailed explanation of how the magnitude of change at representative viewpoints has been determined exactly, given the Preliminary Environmental Impact Report (PEIR) or Environmental Statement (ES) design option. h. A demonstration of how the design of Rampion 2 limits as far as possible the horizontal field of view (HFoV) of WTG from the SDNP and the SHC. i. A clear and direct assessment of the impact that the Rampion 2 Design Principles have on the special qualities of the SDNP. j. Justification as to how the natural beauty of the SDNP, in those proportions of the National Park adversely effected by the scheme, will remain unchanged given the SLVIA conclusion that significant harm is likely to occur to Special Quality 1 - diverse, inspirational landscapes and breath-taking views. k. A conclusion on the significance of the change to tranquillity (SDNP Special Quality 3 – tranquil and unspoilt places) at night-time 'around the tops of the downs' where 'tranquillity is greatest'. l. An assessment of the impact that the Rampion 2 Design Principles have on the special qualities of the CHAONB and IoWAONB.	The Applicant has provided further evidence requested by Natural England in the following supporting studies/clarification notes submitted at Deadline 1: • **SLVIA MDS and Visual Design Principles Clarification Note** (Appendix 17) (Document Reference 8.31.17) – to address Natural England's request for further evidence points I2 (a), (b), (c), (d), (e) and (h). • **Appendix 10 - Further information for Action Point 27** (document reference 8.25.10) – providing further information requested in response to Action Point 27 of Issue Specific Hearing 1 relating to the effects of the Proposed development on the special qualities of the SDNP and the statutory duties in relation to the SDNP. Clarification with regards the remaining points (f), (g) and (i) is provided as follows. f. As set out in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056] Section 15.12**, there are no under-construction, consented, application stage or scoping stage offshore wind farms within the SLVIA study area (nor within UK waters within approximately 140 km of the array area), therefore it is considered that there is no potential for the Proposed Development (offshore array area) to have cumulative effects with other under-construction, consented, application stage or scoping stage projects. In accordance with guidance (GLVIA3, Landscape Institute 2013, para 7.13), existing projects and those which are under construction (i.e. Rampion 1) are included in the SLVIA baseline and described as part of the baseline conditions, including the extent to which these have altered character and views. An assessment of the effect of the Proposed Development is therefore undertaken against a baseline that includes the operational Rampion 1 as part of the main assessment in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056] Section 15.10** (O&M phase). This includes assessment of the Proposed Development against magnitude factors such as its size, scale, spread and landscape context, as well as factors relating to the operational Rampion 1 wind farm, such as its increase in spread, aesthetic relationship and consistencies of perceived scale and spacing in comparison to the Rampion 1 WTGs. In undertaking its cumulative assessment with Rampion 1, the Applicant has followed the Planning Inspectorate's Advice Note Seventeen: Cumulative effects assessment relevant to nationally significant infrastructure projects, in particular the note under table 2 which does not include operational projects in its tiered approach to assessing cumulative effects (Table 2) and states: *"Where other projects are expected to be completed before construction of the proposed NSIP and the effects of those projects are fully determined, effects arising from them should be considered as part of the baseline and may be considered as part of both the construction and operational*

Ref	Natural England's Position	Applicant's Response
	m. A technical assessment, inclusive of modelling work, on potential visual effects from both navigation and aviation lighting to IoWAONB Special Quality 5 – great opportunities for recreational activities and learning experiences. Further context and explanation is provided within our detailed advice below.	*assessment. The ES should clearly distinguish between projects forming part of the dynamic baseline and those in the CEA."* g. and h. - The Applicant would note that the magnitude of change has been assessed at representative viewpoints based on the magnitude of change factors and definitions set out in **Appendix 15.2: Seascape, Landscape, and Visual Impact Assessment methodology, Volume 4 [APP-158]** (paragraph 1.6.16 and Table 1-5). In relation to horizontal field of view (HFoV) specifically, an assessment is provided for each representative viewpoint assessed in detail in **Appendix 15.4: Viewpoint assessment, Volume 4 [APP-160]**. Each viewpoint, under the bullet point 'Field of View' includes a description and measurement (in degrees) of the overall HFoV affected by the Proposed Development as a proportion of the available view, as well as the additional HFoV that the Proposed Development adds beyond the HFoV already affected by Rampion 1 i.e. its additional contribution or extension to the wind farm developed HFoV. HFoV is one of several factors that are considered to arrive at an assessment of magnitude of change. i. A clear assessment of the effect of the Proposed Development (offshore array area) on the special qualities of the SDNP is provided in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]** (**Table 15-32**), with **Section 15.7** setting out the design principles and embedded measures that have reduced the impact of the Proposed Development on the special qualities of the SDNP. The Applicant has produced and submitted a **SLVIA MDS and Visual Design Principles Clarification Note** (Appendix 17) **(Document Reference 8.31.17)** at Deadline 1 which provides further commentary on these SLVIA specific design principles, including how they have reduced the impact of the Proposed Development on the special qualities of the SDNP.
I8	**Detailed Comments** **PART 1: The Rampion 2 Design and Design Principles** 3.1 Natural England welcomes the efforts of the Applicant in updating the design of the Rampion 2 project, and developing the four Design Principles that now underpin it. In particular, Natural England note the reduction in the extent of the eastern boundary of Rampion 2; a design change to ensure that the DCO for Rampion 2 does not compromise the Structures Exclusion Zone (SEZ) crucial to the Rampion 1 DCO (which serves to mitigate impacts of Rampion 1 on the SDNP and SHC). However, it should be noted that although there is a notable reduction in impact, the updated design will still cause harm to the Statutory purposes of the SDNP, including the SHC, CHAONB and the IoWAONB. 3.2 On page 85 of the SLVIA it is noted by the Applicant that; 'These Design Principles were developed in consultation with Natural England, drawing on the Rampion 1 Design Principles and those specifically recommended by Natural England for Rampion 2 during consultations.' While the SLVIA is true in stating that the new Design Principles for the Rampion 2 project 'have been developed in consultation with stakeholders' (para 15.7.24), this statutory consultation is the first time that Natural England have seen and commented on the details of the evolved design of Rampion 2 since PEIR, and the Design Principles that informed it (as described from page 286 of ES Chapter 15).	The Applicant welcomes the recognition from Natural England that changes were made to the DCO Order Limits have reduced the adverse effects of the Proposed Development on the portion of the SDNP contained within the Sussex Heritage Coast. This reduction in spatial extent of the PEIR assessment boundary (offshore array area) to the DCO Order Limits (offshore array area) is illustrated in **Figure 3.3, Chapter 3: Alternatives - Figures, Volume 3 [APP-075].** It is the conclusion of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056] (paragraphs 15.15.9 – 15.15.74**) and the position of the Applicant, that the Proposed Development will not compromise the statutory purpose of the SDNP, CHAONB and IoWAONB designations. Further justification and clarification with regards to the matter of statutory purpose of the SDNP and effects of the Proposed Development on the special qualities of the SDNP is set out in **Appendix 10 - Further information for Action Point 27 (document reference 8.25.10)** submitted at Deadline 1. The Applicant notes the set of design principles proposed by Natural England in its Section 42 advice. Design principles (b), (c), (d), (e) have been incorporated within the SLVIA topic specific design principles that have shaped the design of the Proposed Development, as described in **Section 15.7** of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]**. The Applicant has produced and submitted a **SLVIA MDS and Visual Design Principles Clarification Note** (Appendix 17) **(Document Reference 8.31.17)(**submitted at

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Natural England's Position	Applicant's Response
	3.3 We wish to highlight that Natural England proposed a set of design principles for the Rampion 2 development in our Section 42 advice, as follows: • There should be no turbines constructed within Zone 6 • Reducing the combined horizontal extent (lateral spread) of turbines associated with a visually combined R1 and R2 scheme, or • There should be perceptible separation distance (from all land-based viewpoints) between the existing R1 OWF and the new R2 array by concentrating development in the western end of the Rampion Extension area. The distance should be sufficient that a clear distinction can be made between the two arrays, in order that they are perceived as separate objects in the seascape when viewed from the shore and from within the SDNP. • Clear lines of sight should be left between the arrays (R1 and R2), so that open views to the horizon are maintained when viewed from shore and from within the SDNP. • The design of the new array should aim to balance the two arrays as far as practicable in terms of apparent turbine size and spacing, taking advantage of the effects of perspective to reduce any apparent difference in size between turbines. • Implement reduced aviation lighting intensity for the R1 array (from 2000cd to 200cd). (Nb. the Applicant has already agreed to the dimming of aviation lights to 200cd where visibility conditions permit, which is welcomed). 3.4 Natural England continues to consider that these design principles have greater potential to reduce the potential impacts of the proposal on designated landscapes.	Deadline 1), which provides further commentary on these SLVIA specific design principles. The degree to which the Applicant has been able to embed Natural England's suggestions within the project design has been limited to some degree by the technical and economic requirements associated with producing renewable energy as well as other environmental factors. In respect of Natural England's recommended design principle (a), the design of the Proposed Development (offshore array area) does not exclude WTGs from the eastern (Zone 6) area, however the spatial extent of this Zone 6 area has been reduced considerably, as shown in **Figure 3.3, Chapter 3: Alternatives - Figures, Volume 3 [APP-075]**. As a result, the Proposed Development DCO Order Limits within this Zone 6 area is located at greater distance from viewpoints within the Sussex Heritage Coast of the SDNP (approximately 7km further offshore than the PEIR assessment boundary) and the Proposed Development WTGs in this area will occupy a narrower lateral spread in the field of view than the existing Rampion 1 Wind Farm and will be sited to the south of Rampion 1, which is considered the optimal location within the Zone 6 area, in seascape, landscape and visual terms. Through this design change, the Applicant considers that it has minimised impacts and harm to special qualities of the SDNP, particularly its 'breathtaking views' and 'panoramic views of the sea' and shown regard to the statutory purpose of the SDNP.
I9	**Policy Test: Do the Rampion 2 Design Principles fulfil the requirement for good design as set out in EN-1?** 3.5 Natural England's current position regarding the extent to which the Rampion 2 meet the policy tests in the Overarching National Policy Statement (NPS) for Energy (EN-1) is as follows: a. Proposed environmental measure C-61 demonstrates the Applicant's commitment to applying 'due regard' to 'Design Principles held in Rampion 1 Design Plan'. These Design Principles related entirely to upholding the statutory purposes of the coastal portion of the SDNP and SHC. For ease of reference the Rampion 1 Design Principles' (Condition 11, Part 2, 11 (3a) of Schedule 13 (p.106)) are included here; (3) The design plan required to be approved under paragraph (1)(a) must— (a) be prepared having regard to the need to— (i) limit as far as possible the horizontal degree of view of wind turbine generators from the South Downs National Park and the Sussex Heritage Coast; (ii) increase as far as possible the distance of the wind turbine generators from the South Downs National Park and the Sussex Heritage Coast; (iii) locate the largest turbines, in any hybrid scheme, to the south-western portion of the Order limits; and (iv) provide clear sight lines through the wind turbine layout in order that the regular geometric pattern of the array is apparent in views from the South Downs National Park and Sussex Heritage Coast; and b. The Rampion 2 project is now associated with four new Design Principles which 'draw on' (page 85 of ES SLVIA), but do not replicate, the four principles listed in	The Applicant notes Natural England's current position regarding the extent to which the Proposed Development meets the policy tests in NPS EN-1 and provides the following responses to each point as follows: a. The Applicant considers that it has had, and is having, due regard to the design principles held in the Rampion 1 Design Plan, however it would note that The Proposed Development is a different project that should respond to its own design parameters and principles. The topic specific SLVIA design principles that have shaped the design of the Proposed Development (**Section 15.7** of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]**) have nonetheless, incorporated many elements of the Rampion 1 design principles including limiting the HFoV of WTGs from the SDNP and Sussex Heritage Coast; increasing the distance of WTGs from the Sussex Heritage Coast of the SDNP; locating WTGs further to the south-west; and providing a clear line of sight between the Rampion 1 and the Proposed Development arrays. b. The Applicant considers that it would not be appropriate to replicate the Rampion 1 design principles in their entirety and that the Proposed Development should respond to its own design parameters and principles, while having cognisance of those implemented for Rampion 1. Design principles that help reduce effects on the Sussex Heritage Coast of the SDNP have been incorporated or adapted to apply to the design of the Proposed Development, while other Rampion 1 principles that are not considered appropriate for the Proposed Development have not been included. h. and ii The design evolution of the Proposed Development offshore array is described in **Chapter 3: Alternatives, Volume 2 [APP-044]** (paragraphs 3.2.1 – 3.2.44) and the SLVIA specific design principles are described in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]** (**Section 15.7**). The Applicant

Ref	Natural England's Position	Applicant's Response
	Condition 11, Part 2, 11 3(a) (page 106) of the Rampion 1 DCO. Natural England consider that the purpose of the Rampion 2 Design Principles is the same as the Rampion 1 Design Principles, i.e. to reduce the risk of harm to the statutory purposes of the designations. Natural England highlights the following points: i. Natural England's Section 42 response requested that the Applicant produce a 'detailed account as to how the R1 Design Principles have influenced the R2 maximum design scenario as a matter of urgency'. However, Natural England cannot find this account within the Rampion 2 submission documents. We advise that this account is also a requirement of national policy. Section 4.5.4 of EN-1 states: *'applicants should be able to demonstrate in their application documents how the design process was conducted and how the proposed design evolved'.* ii. Natural England advises that a statement is submitted into the Examination by the Applicant on why the Rampion 1 mitigation measures do not directly apply to the Rampion 2 Project, which in effect, is a direct extension of the Rampion 1 array. We believe this is necessary because: • The Applicant's justification for environmental measure C-61 is that 'where appropriate, the intentions of the Design Principles established for Rampion 1 are followed through to the Rampion 2 design plan'. Consequently, the Examining Authority must be provided with information on where it was not appropriate to apply Rampion 1 Design Principles to the Rampion 2 Project, and a rationale for why this is the case. This information is not currently available in the Environmental Statement. • Natural England has identified direct consequences of the Rampion 1 DCO Design Principles not being fully applied; for example, see 3 (c) (ii) and 5 (b) within this response. c. Considering that the 'maximum assessment assumptions require flexibility on the balance of WTGs located within the Zone 6 Area and Extension Area' and appreciating that the Maximum Design Scenario (MDS) layout is 'weighted towards the northern coastward perimeters of the wind farm array area, as close as possible to the coastline', Natural England does not understand how a 'greater proportion of WTGs in either zone will not result in a greater worse-case effect' than is already presented by R1. This is because: i. Natural England advised at the Section 42 consultation (and continues to advise) that there should be no turbines in the Crown Estate Zone 6 due to the potential for major adverse seascape and visual effects on the most sensitive views from within the SHC, which is located wholly within the SDNP. Therefore constructing more turbines in the Zone 6 Area than described within the indicative layout would present a 'greater worse-case effect'. ii. Evidence has not been provided with the ES to show that a greater densification of turbines in either the Zone 6 Area or Extension Area 'will not materially increase the effect of the Proposed Development in coastal views' (SLVIA page 277). This evidence will be crucial for the Examining Authority to consider in the light of the following factors: • the density of turbines is an important element of how the array will be perceived from many of the representative viewpoints,	has produced and submitted a **SLVIA MDS and Visual Design Principles Clarification Note**' (Appendix 17) (Document Reference 8.31.17) (at Deadline 1), which provides further commentary on the SLVIA specific design principles for the Proposed Development and the degree to which they have been influenced by the Rampion 1 Design Principles. c. i. and ii. The MDS for seascape, landscape and visua is described in **Table 15-25, Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]** and the MDS layout is shown in **Figure 15.1** of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 3**) **[APP-088]** with WTGs located to the full eastern and western extent of the wind farm array area, and in positions that are weighted towards the coastward perimeters of the Proposed Development array area, as close as possible to the coastline within the array area, to represent the maximum effect in terms of the proximity, scale and spread of the WTGs in coastal views from receptors around the coastline, including Sussex Heritage Coast and South Downs National Park (SDNP) to the north and east, and West Sussex, the CHAONB and IoW AONB to the west. c. iii. The Applicant is currently unable to commit to defining a maximum number of WTGs within each of the western extension area and Zone 6 area. The Crown Estate is currently exploring the opportunity for Rampion 2 (along with other projects) to increase the capacity currently allowed in their respective Agreements for Lease. If this is awarded by the Crown Estate, the balance between the turbines in each of the two areas of the array may change. Until then the Applicant needs to retain flexibility in the project design and the number of WTGs located in each zone. • The minimum spacing for the larger WTG type is defined in **Chapter 4: The Proposed Development, Volume2 [APP-045]** (**Table 4-2**) as 1,130 m. In respect of the Zone 6 area, the Applicant can confirm that the SLVIA MDS layout is based on a grid of 'nodal points' at 1,130 m spacing (**Chapter 4: The Proposed Development, Volume 2 [APP-045] Table 4-2**). 34 of these nodal points are located within the DCO order limits of the Zone 6 area, with 30 nodal points occupied by an indicative WTG location in the SLVIA MDS layout shown in **Figure 15.1** of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 3** [**APP-088**] and only four nodal points not utilised, in the far south-western part of Zone 6. At the minimum spacing (1,130 m) it is therefore only possible to accommodate a further four of the larger WTG type at the rear of the Zone 6 array, furthest offshore from the Sussex Heritage Coast of the SDNP, which would not notably increase the densification of WTGs in views. Based on the minimum separation for the larger WTG type, the Applicant considers that the potential for further densification within DCO order limits of the Zone 6 area is limited. In this respect, it is reasonable to assume that a notably higher number WTGs, and therefore potential densification, could only be accommodated within the western extension area and not the eastern Zone 6 area. However, an increase in the number of WTGs in the western zone would be accompanied by a decrease in the Zone 6 area. • The Applicant would highlight that Rampion 1 Design Principle (a) (iii) applied to larger WTGs within any hybrid scheme (WTGs of different heights in different parts

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Natural England's Position	Applicant's Response
	• the presence of a reduced perceived density of turbines is also crucial to achieving the 'separation foreground' Design Principle (SLVIA paragraph 15.7.49). iii. Based on such evidence (when available) and to achieve the 'separation foreground' Design Principle, Natural England advises that there should be an agreed maximum number of turbines in each zone. This is because: • The proposed minimum spacing of the larger height turbines has reduced since the S42 consultation (Table 4-2), exacerbating the potential for a densification of turbines in either zone. • The Applicant committed to applying 'due regard' to 'Design Principles held in Rampion 1 Design Plan' with proposed environmental measure C-61. Design Principle (a) (iii) listed in Condition 11, Part 2, 11 3(a) (page 106) of the Rampion 1 DCO required the largest turbines (in any hybrid scheme) to be located to the south-western portion of the order limits and were not to be constructed in most sensitive areas of the Rampion 1 order limits. Therefore, this is in contrast with the Applicant's request to construct in zone 6, and the flexibility being requested by the Applicant regarding the 'balance of WTGs located within the Zone 6 Area and Extension Area'. This is of particular concern given the difference in height between the existing array and the proposed WTG for Rampion 2. d. Natural England agrees that the reduction in the spatial extent of the Rampion 2 array will result in a 'better balance in apparent WTG size' compared to the original proposal (Table 15-7, page 65). But the SLVIA does not describe any balancing exercise undertaken or contain a narrative to support this claim. Natural England would like to understand how this 'better balance' was determined. i. A 'better balance in apparent WTG size' does not mean that the apparent Rampion 2 turbine sizes will not remain significant in EIA terms from key viewpoints within designated landscapes. This is because: • The apparent heights to blade tip of the nearest Rampion 2 WTGs do not fall below 0.4 degrees from any of the viewpoints included within the Environmental Statement that are situated within a designated landscape, indicating that the scale of effects from all viewpoints within designated landscapes have the potential to be significant (see Part 2 of this response for more details, and Appendix 2 for further information on apparent heights). • The apparent differences in size between the Rampion 1 and Rampion 2 WTGs will still exacerbate the adverse seascape and visual issues associated with the Rampion 2 project; particularly since the minimum turbine size has now increased since the Section 42 consultation. ii. Natural England agrees with paragraph 15.6.27 of the SLVIA , which reports that the perceived heights of the Rampion 2 turbines in comparison to the Rampion 1 turbines 'is likely to be central to the potential for cumulative visual effects'. However, it is not clear where an assessment of these cumulative visual effects is undertaken within the SLVIA, or what the conclusion of this assessment on cumulative visual effects is. If it has not been undertaken this assessment should be submitted into the Examination as a matter of urgency.	of the site), which was not implemented at Rampion 1 and is not under consideration for the Proposed Development (this has been secured in the updated **draft DCO [PEPD-009])**. (and therefore would not be an appropriate design principle). Furthermore, the Rampion 1 consented area extended notably further east than is proposed in the Proposed Development DCO order limits. This is illustrated in the **SLVIA MDS and Visual Design Principles Clarification Note** (Appendix 17) **(Document Reference 8.31.17)** (submitted at Deadline 1). The Proposed Development has already applied design mitigation in this regard through the revised spatial extent of the Order Limits, which avoids the 'most sensitive areas' to the east of the Rampion 1 consented area and Zone 6 area. The Proposed Development Order Limits (offshore array area) do not extend to the east of Rampion 1 and entirely avoid the consented areas of Rampion 1 that were in closer proximity to the Suffolk Heritage Coast of the SDNP. Further explanation of the how the Proposed Development has been designed to avoid these areas of Zone 6 to occupy the optimal area to the south of Rampion 1 (the less sensitive south-western portion of Zone 6) is described in the **SLVIA MDS and Visual Design Principles Clarification Note** (Appendix 17) (Document Reference 8.31.17) (submitted at Deadline 1). d. The Applicant welcomes Natural England's view that (as reported in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]**), the reduction in the spatial extent of the Proposed Development array will result in a better balance in apparent WTG size compared to that proposed in the PEIR. The Applicant considers that this is clear in visual representations provided in the ES from views on the Sussex Heritage Coast of the SDNP, including Viewpoint 1 Beachy Head (**Chapter 15: Seascape, landscape and visual impact assessment - Figures, Volume 3, Figure 15.26**, **[APP-091]**) and Viewpoint 2 Birling Gap (**Chapter 15: Seascape, landscape and visual impact assessment, Volume 2, Figure 15.27**, **[APP-091]**), and the viewpoint assessments described for these in **Appendix 15.4: Viewpoint assessment, Volume 4 [APP-160]**. Further narrative around the balancing exercise undertaken between design principles is provided in the **SLVIA MDS and Visual Design Principles Clarification Note** (Appendix 17) (**Document Reference 8.31.17**) (submitted at Deadline 1). i. With regard to the apparent height of the Proposed Development WTGs, the Applicant would note a number of considerations and limitations with using apparent height calculations. Firstly, the analysis in Table 1 of Natural England's relevant representation only considers the apparent height of the closest visible turbine in the Proposed Development array. It does not allow for variations in apparent height that will occur between different WTGs in the array, depending on their distance offshore. WTGs located at greater distance offshore within the Proposed Development Order Limits will have a lower apparent height, creating variations and similarities in scale/apparent height between windfarms depending on distance of turbines offshore. The Applicant considers that judgements on significance should properly be based on the assessment material provided in the ES and not on the quantitative assessment of vertical angle values. Variations in the apparent height and distance of turbines between different viewpoints are incorporated in the Applicant's visual assessment in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]** and shown clearly in the visualisations in **Chapter 15: Seascape, landscape and visual impact assessment - Figures, Volume 3, Figures 15.26 – 15.79 [APP-091 to APP-095]**.

Ref	Natural England's Position	Applicant's Response
	e. Natural England recognises the efforts of the Applicant in reducing the horizonal field of view of the Rampion 2 array. The SLVIA states that this Design Principle reduces the magnitude of change for many viewpoints, with significant implications for the Applicant's own assessment of effects. However, given the substantial scale and lateral spread of development that the reduced array area still represents (bearing in mind the human eye physically cannot see the entirety of the R2 array in a single view from the majority of the representative viewpoints), clarification should be provided by the Applicant regarding how the actual decreases in magnitudes of change between design options have been determined. i. Natural England advises that addressing this issue is critical to understanding the judgements made in the SLVIA, as the horizonal extent of Rampion 2 will be double or triple the horizonal extent of Rampion 1 from most viewpoints within designated landscapes (Table 15-27). This means that a very large proportion of the visible seaward horizon will be enclosed by Rampion 2. It is not clear from the SLVIA whether the significance of visual effects described have reduced simply because the Rampion 2 ES design now has a smaller Horizontal Field of View (in degrees). ii. The Applicant has committed to applying due regard 'to Design Principles held in Rampion 1 Design Plan' with proposed environmental measure C-61. Design Principle (a) (i) listed in Condition 11, Part 2, 11 3(a) (page 106) of the Rampion 1 DCO refers to the 'need to limit as far as possible the horizonal degree of view of wind turbine generators from the SDNP and the SHC'. However, it has not been established whether the design of Rampion 2 now limits, as far as possible, the horizonal field of view of wind turbine generators from the SDNP and the SHC. Evidence on this matter is not presented within the SLVIA and should be submitted into the Examination. f. Natural England supports the inclusion of the 'wind farm separation zones' Design Principle, as it successfully acts to significantly reduce seascape and visual effects on the most sensitive views from parts of the SHC within the SDNP. The comparative wirelines drawings presented in Figures 15.93 to 15.109, Volume 3, of the ES (Document Reference: 6.3.15) are particularly helpful in demonstrating this design success. However, contrary to aims of this Design Principle, no view from within the SDNP provides a clear line of sight between Rampion 1 and Rampion 2. In no view, with the possible exception of the view from the beach at Cuckmere Haven where westerly views are obscured by cliffs, are the WTGs of Rampion 1 and 2 actually perceived as separated. In all instances, even at Beachy Head, the visible separation 'between arrays' is actually a separation between the Zone 6 Area and the Extension Area of the Rampion 2 project. Consequently, in many views, Rampion 2 itself appears as two separate wind farms. 3.6 Due to the above, Natural England considers that the Rampion 2 Design Principles do not fulfil the requirement for good design as set out in the Overarching National Policy Statement for Energy (EN-1).	It is noted from Table 1 of Natural England's relevant representation that the apparent vertical angle (in degrees) taken up by the closest WTG is between 0.4˚ and 0.9˚ from the viewpoints presented in the SDNP. The Applicant notes that there may be up to 180˚ vertical angle of sky visible to an observer from open locations along the coast or the tops of the South Downs, over which the Proposed Development WTGs may occupy less than 0.9˚ of this arc. The Applicant also considers that the apparent scale of the closest WTG between 0.4˚ and 0.9˚ is comparable to the range of other consented and operational offshore windfarms, including: • Rampion 1 (116 x 140 m blade tip WTGs) operational 14.4 km from the SDNP (at its closest point), where the closest WTG would have an apparent height of approximately 0.51˚. • Burbo Bank Extension (32 x 190 m WTG) operational 14.6 km from the Clwydian Range AONB (at its closest point), where the closest turbines would have an apparent height of approximately 0.73˚. • Scroby Sands (100 m blade tip WTGs) operational 2.5 km off the Norfolk coast, which has an apparent height of 1.85˚ in the view from the closest section of coast near Caister-on-Sea. • Gunfleet Sands (129 m – 144 m blade tip WTGs) operational 7 km off the Essex coast has an apparent height of 1.1˚ in the view from the closest section of coast at Clacton-on-Sea. • East Anglia TWO (300 m blade tip WTGs) consented 32.6 km off the Suffolk Coast and Heaths AONB, has an apparent height of 0.47˚. The Applicant notes the apparent differences in size between the Rampion 1 and the Proposed Development WTGs. Variations in the apparent height of the WTGs are incorporated in the Applicant's visual assessment in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]** and shown clearly in the visualisations in **Chapter 15: Seascape, landscape and visual impact assessment - Figures, Volume 3, Figures 15.26 – 15.79 [APP-091 to APP-095]**. As described in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]** (**Section 15.7**), the spatial extent of the Proposed Development was defined with reference to the 'separation foreground' design principle, to minimise scale differences insofar as possible, in views from the Sussex Heritage Coast of the SDNP. The easterly spatial extent of the Proposed Development was substantially reduced such that the Proposed Development WTGs are no longer to the east of Rampion 1, which reduces the apparent scale juxtaposition of larger WTGs in front of smaller WTGs in coastal views. ii. As set out in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056] Section 15.12**, in accordance with guidance (GLVIA3, Landscape Institute 2013, para 7.13), existing projects and those which are under construction (i.e. Rampion 1) are included in the SLVIA baseline and described as part of the baseline conditions. An assessment of the effect of the Proposed Development is therefore undertaken against a baseline that includes the operational Rampion 1 as part of the main assessment in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056] Section 15.10** (O&M phase). This includes

Ref	Natural England's Position	Applicant's Response
		assessment of the Proposed Development against magnitude factors such as its size, scale, spread and landscape context, as well as factors relating to the operational Rampion 1 wind farm, such as its increase in spread, aesthetic relationship and consistencies of scale in comparison to the Rampion 1 WTGs. The difference in perceived heights of the Proposed Development turbines in comparison to the Rampion 1 turbines is therefore considered and reported as part of the main assessment in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2, [APP-056] Section 15.10.** e. The Applicant would note that the magnitude of change has been assessed at representative viewpoints based on the magnitude of change factors and definitions set out in **Appendix 15.2: Seascape, Landscape and Visual Impact Assessment methodology [APP-158]** (**paragraph 1.6.16, Table 1-5**). The lateral spread of the Proposed Development in the horizontal field of view (HFoV) is one of several factors that are considered to arrive at an assessment of magnitude of change. In relation to HFoV specifically, an assessment is provided for each representative viewpoint assessed in detail in **Appendix 15.4: Viewpoint Assessment, Volume 4, [APP-160]**. Further clarification is provided in the **SLVIA MDS and Visual Design Principles Clarification Note** (Appendix 17) (Document Reference 8.31.17) (submitted at Deadline 1) regarding how the decrease in HFoV has influenced the design and contributed to reductions in magnitude of change between PEIR and ES assessments. i. The Applicant would note that in **Appendix 15.4: Viewpoint assessment, Volume 4 [APP-160]** each viewpoint, under the bullet point 'Field of View' includes a description and measurement (in degrees) of the overall HFoV affected by the Proposed Development as a proportion of the available view, as well as the additional HFoV that the Proposed Development adds beyond the HFoV already affected by Rampion 1 i.e. its additional contribution or extension to the wind farm developed HFoV. This additional HFoV is a key consideration in assessment judgements and needs to be considered as well as the overall HFoV of the Proposed Development (**Table 15-7**), since it provides a better indication of how much additional spread of WTGs the Proposed Development will contribute to the view (over and above that already affected by Rampion 1). In many cases, this additional lateral spread is considerably less, because either the eastern (Zone 6) array or the western extension area of the Proposed Development is viewed almost entirely behind Rampion 1, so only part of the array contributes to extending the lateral spread. In particular it should be noted that the additional lateral spread of the Proposed Development in views from the Sussex Heritage Coast is less than 10.5° degrees and is as low as 6.5° from Beachy Head - a narrower lateral spread than Rampion 1. ii. Further clarification is provided in the **SLVIA MDS and Visual Design Principles Clarification Note** (Appendix 17) (**Document Reference 8.31.17**) (submitted at Deadline 1) regarding how the design of the Proposed Development limits, as far as possible, the horizonal field of view of WTGs from the SDNP and the SHC. The Applicant welcomes Natural England's view that the inclusion of the 'wind farm separation zones' Design Principle successfully acts to significantly reduce seascape and visual effects on the most sensitive views from parts of the SHC within the SDNP. Given the spatial extent of the Order Limits to both the south and west of Rampion 1, the Applicant considers that it is not possible to provide clear lines of sight between Rampion

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Natural England's Position	Applicant's Response
		1 and all of the Proposed Development at the same time (i.e. in the same views). The Proposed Development design principle focused on providing wind farm separation zones between each of the western and eastern array areas with Rampion 1, so that they will (in particular key views) be viewed with a clear distinction and so that the apparent scale difference of the Rampion 1 and the Proposed Development WTGs would be minimised, insofar as possible. Further clarification is provided in the **SLVIA MDS and Visual Design Principles Clarification Note (Appendix 17)** (Document Reference 8.31.17) (submitted at Deadline 1) regarding how the 'wind farm separation zones' Design Principle acts to reduce seascape and visual effects on the views from the SHC and SDNP.
I10	**PART 2: The significance of impacts to protected landscapes from Rampion 2**. **Policy Test - The acceptability of further harm to the statutory purposes of the SDNP and special character of the SHC, and harm to the statutory purposes of the CHAONB and IoWAONB.** 3.7 Natural England considers that the adjustment of the MDS to reflect a smaller number of turbines will reduce the magnitude and geographic extent of the seascape, landscape and visual effects of Rampion 2 on designated and defined landscapes. 3.8 However, on balance the proposed Design Principles do not reduce Natural England's judgement regarding the significance of effects on designated landscapes. The Design Principles act mainly in the SHC area within the SDNP; a very small geographic area of the SDNP with the potential to be impacted by Rampion 2. 3.9 **We therefore advise that the project will significantly affect the statutory purposes of the SDNP and the special character of SHC, as well as the statutory purposes of the CHAONB and the IoWAONB.**	The Applicant welcomes Natural England's opinion that the adjustment of the MDS to reflect a smaller number of WTGs will reduce the magnitude and geographic extent of the seascape, landscape and visual effects of the Proposed Development on designated and defined landscapes. The seascape and visual impacts of the Proposed Development WTGs are assessed in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]**. The Applicant recognises that significant effects on views, perceived character and certain special qualities of the designated landscapes have been identified, including on the SDNP and a limited part of the CHAONB. The spatial extent of the Proposed Development array area has been reduced and designed according to a set of SLVIA specific design principles (**Section 15.7** of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2**) **[APP-056]** which provide embedded environmental measures by reducing the magnitude of effects and minimising harm on the perceived seascape qualities and views, focusing particularly on the Sussex Heritage Coast area of the SDNP. It is the conclusion of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056] (paragraphs 15.15.9 – 15.15.74**) and the position of the Applicant, that the Proposed Development will not compromise the statutory purpose of the SDNP, CHAONB and IoWAONB designations. Further justification and clarification with regards the matter of statutory purpose of the SDNP and effects of the Proposed Development on the special qualities of the SDNP is set out in **Appendix 10 - Further information for Action Point 27 (document reference 8.25.10)** submitted at Deadline 1. The Isle of Wight Council are in agreement with this finding that the effects of the Proposed Development on the perceived character and views from the Isle of Wight will be not significant (as noted in **Table 15.7** in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]**).
I11	3.10 We advise that the Applicant provides further information as set out in Part 1 above to be able to advise in more detail regarding the likely magnitude of impact. However, on the basis of the material that has been provided, the advice below highlights where Natural	**Magnitude of change/significance of effects on SDNP** The Applicant notes that paragraphs 3.10a and 3.10b relate primarily to the magnitude of change/significance of effects on views from the SDNP and its special qualities.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Natural England's Position	Applicant's Response
	England's judgements on the significance of these reductions, in EIA terms, differ from those of the Applicant. a. The effects of Rampion 2 on the SHC area within the SDNP (i.e. the views from Beachy Head and surrounding headland to Birling Gap) have been assessed as 'decreasing to Not Significant (Moderate) on perceived seascape setting in panoramic views from the coastal downs between Birling Gap and Beachy Head, where the effect of Rampion 2 reduces with distance, its narrower field of view and relative balance in apparent scale and spread'. The SLVIA concludes in paragraph 15.15.21 that 'Significant visual effects have been avoided in views from the eastern half of the Heritage Coast area of the SDNP between Beachy Head (Viewpoint 1) and Birling Gap (Viewpoint 2)'. Natural England considers that the Rampion 2 Design Principles have resulted in a reduction in the magnitude of effects in views from Beachy Head to Birling Gap. However, we still consider that these effects remain significant (major/moderate) and therefore disagree with the Applicant's assessment. This is because: i. The apparent heights of the Zone 6, western array WTGs (MDS) will be 0.569 degrees at Beachy Head and 0.6 degrees at Birling Gap. The Rampion 2 WTGs will appear to be nearly twice the height of the Rampion 1 WTGs from these locations. See Table 1 and Appendix 2 for further detail. • The Rampion 2 turbines will be frequently perceivable from this highly ensitive protected landscape and add a sense of industrialisation to one of the last coastal stretches in Sussex Bay where relative remoteness (despite the presence of the Rampion 1 turbines) can be experienced. • The experience of SDNP Special Quality 1 'Breath-taking views' is an important characteristic of this coastal stretch, and in part why the area was defined as a Heritage Coast in 1973. Impacts to this special quality here have been assessed as medium-low magnitude and Not Significant (moderate), despite the SLVIA concluding that significant harm will be caused to this quality. The impacts to SDNP Special Quality 1 along this coastal stretch are assessed by Natural England as significant (major/moderate). ii. Given the sensitivity of the landscape between Beachy Head to Birling Gap to change, Natural England does not agree that the Rampion 2 Design Principles are sufficient to remove the significance of landscape, seascape and visual effects from this ~2.5 mile stretch of designated and defined coastline. b. Natural England has not changed any original judgements of impact significance associated with the key representative viewpoints as presented within the R2 PEIR. It is not disputed that the recent design changes have, particularly between Beachy Head and Birling Gap, reduced landscape, seascape and visual effects on the SDNP and SHC. However, given the sheer size and lateral geographical spread of the R2 Project, and the effect that a development of this scale will have on the SDNP, this reduction of predicted impacts between Beachy Head to Birling Gap is not sufficient for Natural England to change any of our assessments of the significance of effects upon landscape, seascape and visual receptors (and by extension the SDNP) arising from R2.	A detailed assessment of the magnitude of change and significance of effect is provided for each representative viewpoint in the SDNP in **Appendix 15.4: Viewpoint assessment, Volume 4 [APP-160]**. The Applicant notes that Natural England's judgements differ on the significance of effects assessed for the eastern half of the Sussex Heritage Coast area of the SDNP, between Beachy Head (Viewpoint 1) and Birling Gap (Viewpoint 2). It is noted that Natural England agrees that there has been a reduction in the magnitude of effects in views from Beachy Head to Birling Gap, however it considers these do not tip below the significant effect threshold and that these effects remain significant (major/moderate). The Applicant's assessment is that the eastern half of the Sussex Heritage Coast of the SDNP is the key area that benefits from a reduction in effect, as a result of the design changes made to the Proposed Development between PEIR and ES. The revised spatial extent of the DCO order limits do not extend east of Rampion 1 and avoid the 'most sensitive areas' to the east of the Rampion 1 consented area and Zone 6 area, which were in closer proximity to the Suffolk Heritage Coast of the SDNP. This design evolution occurred since the PEIR stage and has resulted in the reduction of the PEIR Boundary to the proposed Order Limits (**Figure 15.1** of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 3**) **[APP-088]**. The Applicant's assessment in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]** and **Appendix 15.4: Viewpoint assessment, Volume 4 [APP-160]** is that these design changes have led to tangible reductions in the magnitude of change arising from the Proposed Development on views and scenic qualities of the Sussex Heritage Coast area of the SDNP, which was the focus of the design mitigation given its maritime coastline, heightened sensitivity and feedback from stakeholders. The magnitude of change was therefore assessed as reducing from medium to medium-low and the effects assessed as Not Significant (Moderate) on views and special qualities of the eastern half of the Sussex Heritage Coast area of the SDNP, between Beachy Head (Viewpoint 1) and Birling Gap (Viewpoint 2), as set out in **Appendix 15.4 Viewpoint assessment, Volume 4 [APP-160]** and summarised as the following reasons: • Increased distance away from these receptors from viewpoints within the Heritage Coast of the SDNP (by approximately 7km). Beachy Head is located 31.9 km and Birling Gap 28.8 km from the Proposed Development array area. • The vertical height/apparent scale of the proposed WTGs will be reduced at this distance and given the large scale of the seascape in the view. • Reduced and limited additional spread, with the eastern array of the Proposed Development adding only an additional 6.5 ° to the HFoV from Beachy Head and 7.3 ° from Birling Gap. This a narrower lateral spread than Rampion 1 and is relatively narrow additional portion of the wider panoramic sea views available. • The Proposed Development will introduce elements that are already characteristic in the receiving view, with a similar form to the Rampion 1 WTGs. • There is a relative balance in apparent scale and spread in perspective, with stark scale comparisons avoided through the separation between the distinct Rampion 1 and the Proposed Development arrays in these views. • The line of sight between the arrays allows the Proposed Development array to be viewed with less contrast and as a distinct element.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Natural England's Position	Applicant's Response
	i. The area most benefitted by the Rampion 2 Design Principles covers a distance of ~2 miles between the very sensitive viewpoints of Beachy Head and Birling Gap. The SLVIA describes the aim of the Rampion 2 Design Principles as 'minimising harm to the special qualities of nationally designated landscapes, particularly the SDNP and the associated Sussex Heritage Coast'. However, the Design Principles Wind Farm Separation Zones and Separation Foreground do not aim to mitigate impacts to those areas of the SDNP encompassed by the ZTV (see other SDNP viewpoints).	All of these factors resulted directly from the design changes made to the Proposed Development DCO order limits between PEIR and ES through the design principles described in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 (Section 15.7) [APP-056]**. The Applicant's assessment is that there is a change in impact threshold within the Sussex Heritage Coast at Seven Sisters and Seaford Head with closer proximity, where the magnitude of change increases to medium and the effect becomes significant (major/moderate). This effect was observed in the field during site surveys and is reported in the **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]**. The influence of the weather on visibility was also found to be a notable factor in the visibility of Rampion 1 between the eastern and western half of the Sussex Heritage Coast. The significance of effects on views from the range of inland vantage points along the open tops of the downs is recognised in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]**, due in part to the lateral spread of the western extension area, however as noted in the response above, the Applicant considers that the 'Wind Farm Separation Zones' and 'Separation Foreground' design principles afford mitigation in certain viewing angles from the open downs of the SDNP (as per the viewpoint listed above), where a clear line of sight is evident between Rampion 1 and the Proposed Development western extension area. The Proposed Development will also be located at considerable distance (generally 20-30 km to the closest WTG) and will be experienced within a remote context setting beyond the intervening, non-designated and urbanised coastal strip between these open downs and the sea. It is the conclusion of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]** (paragraphs 15.15.9 – 15.15.74) and the position of the Applicant, that the Proposed Development will not compromise the statutory purpose of the SDNP designation. Whilst some harm would be caused to these qualities ('breathtaking views' and 'stunning, panoramic views to the sea'), this would not compromise the purpose of the SDNP designation, as the majority of its special qualities would be unaffected, and the natural beauty of the SDNP will remain and opportunities will still be present for understanding and enjoyment of the special qualities of the SDNP. Further justification and clarification with regards to the effects of the Proposed Development on the SDNP Special Qualities and the matter of statutory purpose of the SDNP is set out in **Appendix 10 - Further information for Action Point 27** (document reference 8.25.10) submitted at Deadline 1.
I12	c. Natural England does not agree that the Design Principles that have informed the Rampion 2 design have acted to remove the significance of effects to the SDNP in relation to Special Quality 1 or for Special Quality 3. This is because; i. There is no direct assessment of the impact that the Rampion 2 Design Principles have on the SDNP special qualities. This assessment should be made available within an updated Environmental Statement. ii. Critical evidence is missing from the SLVIA as described in Part 1 (1-5) of this response.	**Impacts on Special Qualities 1 and 3 of SDNP** The Applicant notes that paragraphs 3.10c relate primarily to the significance of effects on SDNP Special Qualities 1 and 3. The Applicant notes that a clear assessment of the effect of the Proposed Development (offshore array area) on the special qualities of the SDNP is provided in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]** (**Table 15-32**). It is the effect of the Proposed Development with its embedded design measures that requires to be assessed, not the impact of the design principles. Further clarification is provided in the **SLVIA MDS and Visual Design Principles Clarification Note** (Appendix 17) **(Document**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Natural England's Position	Applicant's Response
	In addition, Natural England offers the following comments to inform an updated impact assessment; iii. **Special Quality 1**. In paragraph 15.15.40 of the SLVIA the Applicant states that 'Whilst significant harm would be caused to this quality ('breathtaking views' and 'stunning, panoramic views to the sea'), this would not compromise the purpose of the designation, as the natural beauty of the SDNP will remain and opportunities will still be present for understanding and enjoyment of the special qualities of the SDNP, and Rampion 2 will not therefore undermine the statutory purpose of the SDNP or compromise the purposes of its designation.' We do not agree with this reasoning. The Applicant concludes that the Rampion 2 project will cause significant harm to Special Quality 1, so it is illogical to conclude that it will not compromise the statutory purpose of the SDNP, which is to conserve and enhance natural beauty. Natural England agrees with the Applicant the Rampion 2 project will result in significant harm to SDNP Special Quality 1, particularly the 'stunning, panoramic views to the sea'. We highlight that Special Quality 1 is also experienced at multiple locations within the SDNP and is particularly prominent on the tops of the downs, as experienced for example at Devils Dyke (VP17) and Levin Down (VP32). iv. **Special Quality 3**. The Applicant has justified in Table 15-32 (page 397) that night-time lighting of Rampion 2 will 'result in relatively low change to the tranquillity experienced within the SDNP coastline' and has not offered a conclusion on the significance of the change to tranquillity at night-time 'around the tops of the downs' where 'tranquillity is greatest'. It is understood from Appendix 15.5, which unfortunately does not assess special qualities, that the representative night-time viewpoints from 'tops of the downs' were assessed as not significant due to the lighting being perceived as an 'extension of a familiar feature' i.e. Rampion 1. Natural England does not agree with this assessment, as the lateral spread of the Rampion 2 lighting will be perceived as a tripling of the extent of lighting that is already visible from Rampion 1. The Applicant's should bring forward evidence-based conclusions regarding the significance of the predicted changes on the night-time tranquillity of these specific areas.	**Reference 8.31.17)** (submitted at Deadline 1) regarding how the design of the Proposed Development limits, insofar as possible, the impacts on the SDNP and SHC. As noted above, it is the conclusion of **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]** (**paragraphs 15.15.9 – 15.15.74**) and the position of the Applicant, that the Proposed Development will not compromise the statutory purpose of the SDNP designation. Whilst some harm would be caused to these qualities ('breathtaking views' and 'stunning, panoramic views to the sea'), this would not compromise the purpose of the SDNP designation, as the majority of its special qualities would be unaffected, and the natural beauty of the SDNP will remain and opportunities will still be present for understanding and enjoyment of the special qualities of the SDNP. Further justification and clarification with regards to the effects of the Proposed Development on the SDNP Special Qualities and the matter of statutory purpose of the SDNP is set out in **Appendix 10 - Further information for Action Point 27** (document reference 8.25.10) submitted at Deadline 1. This includes clarification in respect of Special Quality 1 and further assessment of the effects of night-time lighting of the Proposed Development on the tranquillity experienced within the SDNP at night (in respect of Special Quality 3). The Applicant has committed to C-266 "During operation, and where visibility conditions permit, the intensity of aviation warning lights will be reduced to no less than 200cd (in Accordance with the Air Navigation Order 2016), subject to the availability of a commercial system." (as secured by Part 2, Condition 8 (5) Schedules 11 & 12 of the **draft DCO [PEPD-009]**).
I13	d. Natural England's assessment on the special qualities of the CHAONB and IoWAONB remains unchanged from our s42 response. We advised that the westward expansion of WTGs will result in significant effects on the seascape setting of the CHAONB and more extensively the eastern portions of the IoWAONB at Bembridge Down and St. Boniface Down resulting in further loss of natural beauty for these designations. We have the following further comments to make: i. We note that there is no direct assessment of the impact that the Rampion 2 Design Principles have on the special qualities of the CHAONB and IoWAONB. We advise that introducing a separation distance between the Rampion 1 and Rampion 2 arrays could exacerbate landscape, seascape and visual impacts for the CHAONB and IoWAONB. However, the SLVIA does not indicate whether this is the case, and despite the redesign of the project our concern on this matter remains. We would like to see evidence submitted into the Examination as a matter of urgency, noting the apparent height values for viewpoints located within these designations.	**Impacts on Special Qualities of CHAONB and IOWAONB** The Applicant notes that paragraphs 3.10d and 3.10e relate to the significance of effects on the special qualities of the CHAONB and IOWAONB. With regards the CHAONB, the assessment in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2 [APP-056]** also finds, as summarised in its conclusions **(paragraphs 15.15.50 - 15.15.53)**, that the Proposed Development will result in no significant effects on the majority of special qualities of the CHAONB and that there is a very localised significant effect on the perceived '*unique blend of land and sea'* (SQ1) and *'significance of…. distant landmarks across land and water'* (SQ3) experienced from a limited area of the coastal edges/open seascape at the mouth to Chichester Harbour. It is the finding of the assessment and position of the Applicant that the Proposed Development will not compromise the statutory purpose of the CHAONB designation.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Natural England's Position	Applicant's Response
	ii. We acknowledge the narrative provided in relation to night-time impacts to IoWAONB special quality 5 (Table 15-42). However, in the absence of a detailed assessment (inclusive of modelling work of potential lighting visual effects from both navigation and aviation lighting), we do not agree that effects can be discounted. Figure 15.25 (Zone of Theoretical Visibility for the aviation lighting of Rampion 2) indicates that all IoWAONB viewpoints, the maximum number of turbine aviation lights (34 – 42) are theoretically visible, and therefore this matter requires further assessment. e. We are disappointed that, despite our Section 42, the study area used for the 'Assessment of aviation and navigation night-time lighting' (Appendix 15.5) does not include an assessment of; i. effects on Special Quality 5 of the IoWAONB 'dark starlit skies'; ii. effects on the Special Quality 5 of the CHAONB 'overall sense of wilderness within the seascape' iii. effects on landscape character. We advise that the Applicant should carry out these assessments, or submit evidence into the Examination to provide a rationale for excluding assessments (a) to (c), and how, in the absence of an assessment on night-time landscape character, how Appendix 15.5 can conclude that 'The proposed aviation and marine navigation lighting will not result in effects on landscape character'. (SLVIA paragraph 8.1.24)	With regards the IoWAONB, the assessment in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** **[APP-056]** also finds, as summarised in its conclusions (**paragraphs 15.15.60 – 15.15.74**), that the Proposed Development will result in not significant effects on views or special qualities of the IoWAONB. The Isle of Wight Council are in agreement with this finding that the effects of the Proposed Development on the perceived character and views from the Isle of Wight will be not significant (as noted in **Table 15.7** in **Chapter 15: Seascape, landscape and visual impact assessment, Volume 2** **[APP-056]**).

Table 4-15 Applicant's response to Natural England - Appendix J (Terrestrial Ecology and Nature Conservation)

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
Project Parameters					
J1	Summary and Conclusions				The Applicant acknowledges this summary of advice from Natural England. Please refer to the Applicant's responses in **references J2 to J132** below for detailed responses.
J2	Project Parameters	Natural England acknowledges that the majority of the onshore project parameters have been clearly defined, with the exception of sections of the onshore cable route, where trenchless crossing under ecologically and visually sensitive locations has been proposed as mitigation.		N/A	This is a summary comment from Natural England. Further information is provided in **references J3, J4 and J6**.
J3	Project Parameters	Natural England notes that RED has not submitted an options appraisal, for if trenchless methods (such as Horizontal Directional Drilling (HDD)) were to fail. RED has stated that an additional consent would be required if an alternative solution was required. Natural England advise that contingency measures should be assessed within the Environmental Statement, in the event that trenchless crossings are not feasible at ecologically and visually sensitive sites.		N/A	Trenchless crossing (such as Horizontal Directional Drilling (HDD) is a mitigation that has been used routinely for linear projects (electrical transmission cables and pipelines (e.g., gas, oil and water) for both large infrastructure and smaller scale projects. Trenchless crossing has been used frequently to cross a range of sensitive ecological features including designated sites, ancient woodland, rivers and other priority habitats and make landfall for both offshore wind farm transmission cables and electrical interconnectors. For example, an HDD crossing of 550m through chalk substrate, with a sizeable change in elevation (80 to 90m difference) was successfully completed at Dunstable Downs on the Kensworth to Rugby Pipeline project for CEMEX in 2008 (including crossing part of Dunstable and Whipsnade Downs Site of Special Scientific Interest (SSSI)). It is also notable that HDD within chalk substrate was carried out successfully on the route of the transmission cable for the Rampion 1 Offshore Wind Farm, as was an HDD to make landfall. The approach to minimising and effectively managing the risks of trenchless crossings is outlined in the **Outline construction method statement [APP-255]** and the **Outline Code of Construction Practice [PEPD-033]** secured via Requirement 22 and 23 of the **Draft Development Consent Order [PEPD-009]**) respectively. Further, consideration of the risk is provided in Section 22.9 of **Chapter 22: Terrestrial ecology and nature conservation,**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					Volume 2 of the Environmental Statement [**APP-063**]. Commitment C-5 (**Commitments Register [APP-254]** (provided at Deadline 1 submission) has been updated at the Deadline 1 submission to clarify that Horizontal Directional Drill (HDD) or other trenchless technology will be deployed in accordance with Appendix A: Crossing Schedule of the **Outline of Construction Practice [PEPD-033]** secured via Required 22 within the **Draft Development Consent Order [PEPD-009]**. The Applicant will not switch to open-cut trenching at these locations. The appropriate realistic Worst-Case Scenario has been assessed in the ES. Note, that in the unlikely event that another trenchless technology is deployed at a specific crossing, this would require demonstration that there are no materially new or materially different environmental effects. Any change will need to be approved by the relevant planning authority through amendment to the stage specific Code of Construction Practice and Crossing Schedule.
J4	Natural England's position on Worst Case Scenario (WCS)	The rationale and parameters for the selection of the realistic Worst-Case Scenarios (WCS) for the development is generally clear and is based on the project parameters. Natural England however notes that the feasibility of trenchless crossings has not been assessed and evidenced in any detail. Natural England advise that there is a risk that there is an over reliance placed on trenchless crossings (HDD) of mitigating impacts to ecologically and visually sensitive locations. As mentioned above, Natural England advises that contingency measures should be assessed within the Environmental Statement, in the event that trenchless crossings are not feasible at ecologically and visually sensitive sites.		N/A	Concern about trenchless crossing feasibility and the assessment of the appropriate realistic WCS is addressed above in **reference J3**. The Applicant has a high degree of confidence that all trenchless crossings on the Crossing Schedule in Appendix A of the **Outline Code of Construction Practice [PEPD-033]** are feasible, including those at ecologically and visually sensitive sites. The **Outline construction method statement [APP-255]** provides further information regarding the detailed design of the trenchless crossings in Section 3.4 and the further information required to inform this (e.g., ground investigation). The detailed design of a trenchless crossing will be undertaken within the established parameters assessed in the ES as detailed in 4.5.27 of **Chapter 4: The Proposed Development, Volume 2** of the ES **[APP-045]** and secured in Schedule 1 Part 3, Requirement

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					23 of the **Draft Development Consent Order (DCO)** **[PEPD-009]** to be approved by the relevant planning authority in consultation with the statutory nature conservation body. Any assessment required at the detailed design stage would be undertaken in accordance with the established methodologies outlined in the ES. However, consideration of risk arising from the use of HDD is provided in **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-063]**, in particular paragraphs 22.9.43 to 22.9.46.
Baseline Characterisation					
J5	Data suitability, baseline characterisation and data gaps	Natural England consider the data and baseline characterisation is broadly suitable, however additional clarification is required on whether additional pre-construction surveys will be provided for the section of the route which passes through the SDNP (from the A27 up to Sullington Hill. We raise this, as this section falls outside of the original DCO scoping boundary, which has resulted in a number of protected species survey sites no longer within or adjacent to the proposed DCO Order Limits. Our detailed comments cover these points in more detail.		N/A	Additional survey data for the area between the A27 and Sullington Hill has been collected since submission of the DCO Application in August 2023. Further bat survey data is provided in **Appendix 22.18: Passive and active bat activity report 2023, Volume 4** of the ES [**PEPD-029**] and hazel dormouse survey data provided in **Appendix 22.19: Hazel dormouse report, Volume 4** of the ES [**PEPD-030** which were provided at Pre-Examination Procedural Deadline A on 16 January 2024]. Within the DCO Application and described in **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-063]** habitat surveys, badger survey, water vole and otter survey, breeding bird survey and a preliminary ground level roost assessment for bats were detailed for the area between the A27 and Sullington Hill. However, due to seasonal constraints further bat activity survey and hazel dormouse survey were ongoing at the time of DCO Application. This has now been completed and was provided at Pre-Examination Procedural Deadline A on 16 January 2024. The results are broadly similar to those identified previously and do not alter the outcome of the Ecological Impact Assessment in **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-063]**.
Environmental Impact Assessment					

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
J6	Identified impacts	Natural England is broadly satisfied that the majority of impacts are identified and assessed, however some areas where Natural England advise further clarity is required on the identification and assessment of impacts are outlined within the Detailed Comments table. This includes further clarity regarding the impacts on Climping Beach SSSI and areas of ancient woodland from associated risks of HDD, as no detailed HDD feasibility assessments have been undertaken to date, which incorporate local ground conditions, in order to robustly quantify localised risks associated with HDD operations (i.e. likely occurrence of sink holes, frac out, bentonite breakout etc). Natural England advise that continency measures and their associated impacts should be further assessed, if detailed HDD feasibility assessments are to be conducted post DCO acceptance.		N/A	Concern about trenchless crossing feasibility is addressed above under **reference J3**. The Applicant has a high degree of confidence that all trenchless crossings in the Crossing Schedule in Appendix A of the **Outline Code of Construction Practice (CoCP)** **[APP-224]** which is secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]** are feasible, including those at ecologically sensitive sites. **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-063]**, paragraph 22.9.43 to 22.9.46 includes the expected scale and approach should a frac out occur at Climping Beach Site of Special Scientific Interest (SSSI). The risk is identified as being very low based on the location of the entry and exit points that ensure that the drill head will be at depth when underneath the Climping Beach SSSI (also see Appendix 6 – Further information for Action Point 7 – Horizontal Directional Drilling at Climping Beach (Document Reference: 8.25.6) provided at Deadline 1 submission). The design of the Proposed Development and the measures to minimise and mitigate effects results in no significant effects on either Climping Beach SSSI or ancient woodland being predicted in **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-063]**.
J7	Cumulative Effect Assessment (CEA)	Natural England agree with the conclusions of the cumulative effect assessment.		N/A	The Applicant welcomes Natural England's agreement with the conclusions of the cumulative effect assessment.
J8	Assessment Conclusion	Natural England generally concurs with the assessment conclusions, however we advise that there is a risk of an over reliance placed on the feasibility of HDD as a mitigation measure, to avoid significant harm to sensitive ecological and visual receptors. As mentioned above, we advise that continency measures and their associated impacts should be further assessed, if detailed HDD feasibility assessments are to be conducted post DCO acceptance.		N/A	Detailed trenchless crossing (such as horizontal directional drilling (HDD)) feasibility assessments are to be conducted post-DCO consent. For further response regarding trenchless crossing see answers to **references J3** and **J6**. The mitigation hierarchy has been and will continue to be taken into account during the

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
		Natural England advise RED that the mitigation hierarchy must be followed. Furthermore, micro-siting of cable route should be considered if sensitive habitats can be avoided.			design process. Avoidance is the first objective, followed by measures to minimise and mitigate effects with compensation only necessary where other design factors (e.g. engineering feasibility etc.) result in effects on ecological features. This has been followed to date to limit effects on biodiversity as described in **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-063].** However, at this stage, there are still options to further reduce effects during the detailed design stage (e.g. aiming for existing gaps in hedgerows to minimise loss, micro-siting around hedgerow standards or field trees etc.). The detailed design will seek to reduce the level of effect wherever possible within the proposed DCO Order Limits. This will include things such as micro-siting, altering standard construction set up (e.g. avoiding vegetation removal by avoiding soil storage in certain areas) and methods of working (e.g. type of plant). These measures will be described within the stage specific Code of Construction Practice and the Landscape and Ecological Management Plan that are secured through Requirements 22 and 12 respectively of the **Draft Development Consent Order** [**PEPD-009**].
Habitats Regulations Assessment					
J9	Screening	Natural England generally concurs with the conclusions of the HRA screening. However, with regard to likely impacts to Arun Valley SPA, SAC and Ramsar site from excessive water abstraction, we advise that water use within the Sussex North Water Supply Zone (SNWSZ), during the construction phase, should be assessed through a routine screening exercise. This is to determine if water use during the construction phase is likely to have a significant effect (LSE) on the Arun Valley designated sites.		N/A	All water to be used in the construction phase within the Sussex North Water Supply Zone including for welfare facilities and to enable trenchless crossing (such horizontal directional drilling (HDD)) will be imported into the area with no mains connections proposed. Therefore, it is possible to screen out water neutrality for the Arun Valley Special Protection Area (SPA), Special Area for Conservation (SAC) and Ramsar site during the construction phase.
J10	Assessment	Further details should be submitted to consider how water neutrality for the operational phase could be demonstrated, without overly relying on a strategic mitigation scheme which is yet to become operational. Further			For clarity, the small operational water use is only envisaged at the onshore substation and will be meeting the demands of basic welfare

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
		consideration of how suitable water neutrality mitigation can be suitable secured should be considered and provided by RED. In addition, we request further clarity on how impacts upon functionally linked land (FLL) for APP-254 has been assessed, as it is not clear if embedded mitigation measures (APP-254) have underestimated the length of time that it will take to reinstate the FLL back to previous condition and agricultural use. We also seek further clarity on how the foraging range of the Northern Pintail has been estimated. Our further detailed advice can be found within the detailed comments section.			facilities. At this stage, it is likely to consist of toilet, faucet and shower for irregular use (i.e. the onshore substation is not permanently manned). The Applicant can clarify that fire suppression systems at the onshore substation can be sourced from water tanks (i.e. not mains supplied) with reliance on the fire services to attend as soon as possible. Potable water use will also be brought into the onshore substation site (e.g. via water dispensers sourced from outside of the Sussex north water zone) further reducing any water requirements. Requirement 8 (2) of the **Draft DCO** **[PEPD-009]** sets out that measures necessary to ensure water neutrality are part of the detailed design for the onshore substation. The Applicant presented dedicated commitments in relation to water neutrality within Section 26.7 of **Chapter 26: Water environment, Volume 2** of the ES **[APP-067]**. These mitigations are secured by a DCO requirement (Requirement 8 (2)) so that further work can only be progressed once the detailed design of the onshore substation has been developed. Commitment C-260 in the **Commitments Register** **[APP-254]** (provided at Deadline 1 submission), will ensure that water usage at the onshore substation would be minimised through reuse / recycling, and this is secured via the aforementioned DCO requirement. In order to offset any negligible residual footprint, imports could come from outside of the Sussex North Water Supply Zone, either via a connection to the nearby neighbouring zone or water tankers. Should the strategic scheme be available, this also provides an option to meet water neutrality. A firm commitment has been secured towards water neutrality, with flexibility as to the exact means by which this will be achieved. It is also noted by the Applicant that the strategic scheme of Horsham District Council (HDC) is expected to be operational in early

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					2024, as described in a recent planning appeal decision[3]. Furthermore, the Southern Water demand reduction programme is likely to be available to contribute to water neutrality in new development proposals in 2025. With regards reinstatement of functionally linked land (FLL), it is noted that the commitment is to begin reinstatement of land within a two-year period of temporary losses occurring, as opposed to noting that all habitats will be reinstated to target condition within a 2 year period. Much of the habitat within the area defined as functionally linked land would be expected to reach target condition rapidly following reinstatement works given its intensively managed agricultural nature. The foraging range of Northern pintail (referred to as pintail within rest of the Applicant's responses) was taken as the largest distance quoted in studies referenced in Johnson et al (2014). Although this distance was recorded in the United States of America (USA), it has been used within the assessment for Rampion 2 as it is the most precautionary. Should the only European based mean flight distance have been used (1.3km recorded in France) then no pintail associated with the Arun Valley Special Protection Area (SPA) and Ramsar site would be expected in the vicinity of the Proposed Development as the closest FLL within the proposed DCO Order Limits is approximately 9km away.
J11	Incorporated Mitigation	Natural England considers that the embedded mitigation identified in the RIAA (APP-038) are broadly acceptable with respect to impacts on designated nature conservation sites. We however advise that clarity should be provided on measures (i.e. APP-254, commitment C-103) which relate to reinstatement of temporary lost FLL of the Arun Valley SPA and Ramsar site, as we recognise that full reinstatement will likely take longer than the stated commitment, of a maximum of two years from initial loss.		N/A	Commitment C-103 in the **Commitments Register [APP-254]** (provided at Deadline 1 submission) is definitive that restoration in the vast majority of functionally linked land (FLL) will begin within 2 years. It is only at the landfall, temporary construction compounds, joint bays, grid connection point and the onshore substation at Oakendene where this may not occur (the definition of FLL within the **Report to**

[3] Appeal A Ref: APP/Z3825/W/22/3308455 and Appeal B Ref: APP/Y9507/W/22/3308461 decision dated 6 October 2023

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
		Natural England note that the wording of securing mechanism is ambiguous such as "where possible" and "as far as practicable" are still used and relied on in a number of embedded mitigation measures. We advise that greater detail of embedded mitigation measures which utilise these ambiguous terms, should be provided, to greater fully understand the risks and likely success rates of these mitigation measures.			**Inform the Appropriate Assessment** [**APP-038**] includes the landfall and a small number of joint bays). The FLL present is generally modified grassland and arable land, both of which can be restored to original condition rapidly. The commitment is not noting that the restoration of any habitat will be complete (I.e. reaching target condition) within 2 years. Rather reinstatement work will have begun in a structured way with management implemented in the establishment phase. This is secured through the Landscape and Ecology Management Plan pursuant to Requirement 12 of the **Draft Development Consent Order** [**PEPD-009**].
J12	Appropriate Assessment Conclusion	With respect to the onshore elements of the project, Natural England does not disagree with the summary of potential effects on the Arun Valley SPA, SAC and Ramsar site. However, as mentioned above and in our detailed comments, further clarity and information is required to; • determine if full reinstatement of temporary lost FLL will take several years to complete, as opposed to the stated maximum of two years. • demonstrate how suitable water neutrality mitigation can be suitable secured, as there is over reliance on a strategic mitigation scheme which is yet to become operational. • provide greater detail of proposed mitigation measures before conclusion of no adverse of effect on integrity of designated sites can be concluded		N/A	As noted above in the response to **reference J11**, commitment C-103 in the **Commitments Register [APP-254]** (provided at Deadline 1 submission) is not stating that reinstatement will achieve target condition within 2 years. Rather it is stating that works to establish habitats will begin within this time frame. Commitment C-103 was included following discussions with Natural England and others (see Section 22.3 Evidence Plan Process in **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-063]**) regarding delays to reinstatement for the Rampion 1 Offshore Wind Farm to provide certainty about timescales for reinstatement. Reinstatement of functionally linked land (FLL) as defined in the assessment is required, but is not necessary to ensure a conclusion of no adverse effects on integrity. FLL is defined by Natural England as '*land or sea occurring outside a designated site which is considered critical to, or necessary for, the ecological or behavioural functions in a relevant season of a qualifying feature for which a Special Area of Conservation (SAC)/Special Protection Area (SPA)/Ramsar site has been designated. These habitats are frequently used by SPA species and supports the functionality and integrity of the designated sites for these features*.' (Natural England, 2021 – *NECR361 Edition 1*

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					Identification of Functionally Linked Land supporting SPAs waterbirds in the North West of England). Typically, FLL is identified for waterbirds as suitable habitat that lies within a typical foraging distance flown on a daily basis from a known roost to feed. The FLL identified within the **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the Environmental Statement (ES) **[APP-063]** and the **Report to Inform the Appropriate Assessment** **[APP-038]** is highly precautionary. It was defined based on identifying habitats within or close to the proposed DCO Order Limits without reference to flight distances as the design process of the Proposed Development was at an early stage and no winter bird survey work had been completed. The FLL identified for the Proposed Development was not altered based on winter bird survey results or design changes to the Proposed Development to ensure sufficient precaution within the assessments provided. The Arun Valley Special Protection Area (SPA) and Ramsar site is 4.8km at the closest point to the proposed DCO Order Limits, with the closest suitable habitat for designated features (i.e. that which could be functionally linked) being in excess of 9km away in the Arun Valley (west of Littlehampton and Lyminster) and over 13km away in the Adur Valley (north west of Henfield). On the basis that the roosts for the populations on the Arun Valley SPA / Ramsar site being within the designated site the FLL identified for assessment for Rampion 2 would not typically qualify based on usual foraging distances. Typical foraging distances (taken from *Johnson, W.P., Schmidt, P,M. Taylor, D, (2014) Foraging flight distances of wintering ducks and geese: A review. December 2014 Avian Conservation and Ecology 9 (2): pp1-19*) for Eurasian wigeon (2.5km), shoveler (2.5km) and teal (3.8km) suggest that they would usually be foraging much more closely to the SPA / Ramsar site boundary than close to any of the proposed working areas.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					Pintail are shown in Johnson et al., 2014, as foraging up to 18.5km (maximum distance recorded from 17 studies) from roost, although this is from a study reported from the United States of America (USA) and 1.3km from a study in France. Within the DCO Application documents including the **Report to Inform the Appropriate Assessment [APP-038]**, the conservative 18.5km distance was used as a precaution. Alternatives to this approach would be to use the mean (7.4km) or median (5.0km) distance of the studies referenced by Johnson et al., 2014 or rely on the single European example (1.3km). Assuming the mean is used as a reasonable assumption of typical foraging distance pintail would usually be foraging much more closely to the SPA / Ramsar site boundary than close to any of the proposed working areas. Two years of winter bird survey were undertaken in areas that were noted, on a precautionary basis, as FLL in the assessment (see **Appendix 22.14: Onshore winter bird report 2020 – 2022, Volume 4** of the ES **[APP-192]**). The data shows that within the Arun Valley (including the coastal strip) very limited use of Climping Beach, arable fields behind the sea defences and the coastal and floodplain grazing marsh west of Littlehampton and Lyminster was made by waterbirds. The only aggregations noted regularly were wigeon on waterbodies close to the church of St Mary Magdalene, Lyminster. These waterbodies are approximately 300m north of the proposed DCO Order Limits and are heavily screened from the construction area by scrub fringing the waterbodies, farm buildings and residential development. At the coast numbers of key species were small, recorded irregularly and often were of birds flying along the coast as opposed to using the area for foraging. This suggests that the area assessed as being FLL in the Arun Valley is not critical or necessary for the ecological or behavioural functions in a relevant season of a qualifying feature for which

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					the Arun Valley SPA/Ramsar site has been designated. In the Adur Valley wigeon, teal, pintail and shoveler were all recorded. Shoveler and pintail were recorded on a single occasion each only and in small numbers suggesting that they are not reliant on this area, regardless of whether or not they form part of the population for the Arun Valley SPA/Ramsar site. Wigeon and teal were noted more regularly, sometimes in large number (up to 600 wigeon and 151 teal were recorded on 19 January 2021) although numbers fluctuated. These birds all used flooded fields, with water covering pasture, arable fields, ditches and ruderal vegetation. Wigeon usually eat seeds by day (within water) and move onto open grassland at night to feed, whilst teal mainly eat seeds from the water surface or just below it. Within the FLL of the Adur Valley (defined as Flood Zones 2 and 3) there are large areas of potentially suitable habitat. The area of FLL within the proposed DCO Order Limits in the Adur Valley is approximately 9.3ha, with the realistic worst case scenario (based on a 40m working width plus access route, but discounting area over which a trenchless crossing is proposed) being the temporary loss of 3.2ha of agricultural grassland. This is less than 1% of the available habitat (within Flood Zones 2 and 3) between Steyning and Partridge Green. In the realistic worst case scenario, temporary works would have been undertaken outside of the winter period and the soil dressed back although no vegetation has been reestablished. For teal who are feeding on seeds and other items on or just below the water, this should present no change, for wigeon coming out of the water to feed on grassland at night (assuming these areas are not flooded) this would represent a very small reduction in available habitat. This is regardless of whether or not the wigeon noted are also reliant on the Arun Valley SPA/Ramsar site (over 13km away), given the large geographical separation between the areas. Bewick's swans were not recorded within or close to the proposed DCO Order Limits and

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					historical data from the Sussex Ornithological Society shows that they regularly occur well away from the proposed DCO Order Limits (around Burpham and Wepham) and can therefore be discounted. Ruff were not recorded by winter bird surveys and can also be discounted. In summary, the FLL identified within the assessment (see **Report to Inform the Appropriate Assessment [APP-038]**) was done so on a highly precautionary basis given that birds using the areas are unlikely to be reliant on these and the Arun Valley SPA/Ramsar site given geographical separation. Even if the land is functionally linked, any potential effect would be small and confined (based on field survey data) to wigeon in the Adur Valley. These birds have considerable opportunity to forage in a range of suitable fields in this area. Finally, commitment C-103 in the **Commitments Register [APP-254]** (provided at Deadline 1 submission) ensures that reinstatement will occur within 2 years (noting target condition would take further time to reach) of the loss in these areas. It is also noted that commitment C-117 in the **Commitments Register [APP-254]** (provided at Deadline 1 submission) avoids works on areas assessed as FLL to minimise any potential disturbance. Commitments C-103 and C-117 are secured in the **Outline Code of Construction Practice [PEPD-033]** which is secured through Requirement 22 of the **Draft Development Consent Order [PEPD-009]**. See response to **reference J10** for position regarding water neutrality.
Mitigation Summary that must be secured in the DCO/DML					
J13		• EPS mitigation licences required – bats, badger, District Level Licence (DLL) - Great Crested Newt (GCN) and water vole (if found during pre-construction surveys). • Pre-construction surveys and appropriate mitigation measures (if required pre/post installation) to be submitted to LPA and agreed in consultation with NE for reptiles, birds, badger, bat roost potential surveys for		N/A	In summary, the Applicant agrees to the set of mitigation related requests in this section. The Applicant agrees that European Protected Species licences and other derogation licences may be required for the following species:

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
		structures (includes trees), breeding birds, water voles, invertebrates and for follow up surveys to be carried out where required, e.g., bat activity surveys, bat hibernation surveys, survey of receptor site for reptiles if translocation is required. • Post installation monitoring surveys for where EPS mitigation licences are required. Reasonable Avoidance Measures (RAMS) for GCN and reptiles. Post-construction surveying/monitoring for designated habitats and species that will be affected, such as hedgerows used by bats, grasslands, ponds, GCN, cereal field margins and for reports to be submitted. Where mitigation is proven not effective further mitigation measures may be required and will need to be approved. Methodology and any remediation to be agreed with the LPA and in consultation with Natural England. • Landowner and stakeholder agreement of land for mitigation – to be secured. If mitigation and compensation are required outside of the DCO boundary this also needs to be agreed with landowners and secured in the DCO. • • If translocation of a species is required, the habitat areas needs to be suitable and area secured. • Protection areas (buffer areas) of habitats particularly SSSIs, ancient woodland and veteran trees to be secured. • With respect to the above comments, Natural England advises consultation and agreements with landowners and stakeholders is required to secure mitigation. We remind the Applicant the mitigation hierarchy must be followed with the commitment to BNG additional to this.			dormouse, bats, great crested newt (via a district level licence), water vole and badger dependent on detailed design and future survey results. The Applicant agrees that a range of pre-commencement surveys will be required to inform detailed design and to ensure measures within the detailed stage specific Code of Construction Practice documents are appropriate. These surveys are secured through a range of commitments (C-203, C-208, C-209, C-210, C-211, C-214 and C-215) detailed in the **Outline Code of Construction Practice** [**PEPD-033**] which is secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. The Applicant agrees that Reasonable Avoidance Measures for great crested newt and reptiles will be implemented through an Ecological Clerk of Works (commitment C-207), as described in the **Outline Code of Construction Practice** **[PEPD-033]** which is secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. Monitoring as part of any protected species licence will be agreed with Natural England, with monitoring of reinstated habitats described in the **Outline Landscape and Ecology Management Plan (LEMP)** **[APP-232]** which is secured through Requirement 12 of the **Draft Development Consent Order** **[PEPD-009]**. This includes the scope for adaptive management measures should difficulties in habitat establishment be identified. All mitigation required can be delivered within the proposed DCO Order Limits. All compensation required to deliver protected species licensing can be delivered within the proposed DCO Order Limits. Compensation for habitats (e.g. to reach 'no net loss') is to be delivered in line with the UK Government's approach to biodiversity net gain (BNG) (see **Appendix 22.15: Biodiversity Net Gain Information, Volume 4** of the ES **[APP-193]**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					which is secured through Requirement 14 of the **Draft Development Consent Order [PEPD-009]**). It is agreed that any areas for translocation will require suitable habitat within the proposed DCO Order Limits. The most likely need is for reptiles at the onshore substation and grid connection points where indicative landscape plans in the **Outline Landscape and Ecology Management Plan (LEMP) [APP-232]** provide the opportunity. Provision of landscaping at the onshore substation areas is secured by Requirement 12 in the **Draft Development Consent Order [PEPD-009]**. Buffer areas for ancient woodland and veteran trees are secured through commitments C-174 and C-216 as outlined in the **Outline Code of Construction Practice [PEPD-033]** which is secured through Requirement 22 of the **Draft Development Consent Order [PEPD-009]**. Protections for the Climping Beach SSSI are provided via commitments C-112 and C-278 in the **Outline Code of Construction Practice [PEPD-033]** and **Outline Construction Method Statement [PEPD-255]** in Requirements 22 and 23 of the **Draft Development Consent Order [PEPD-009]** respectively. The Applicant is confident that the necessary mitigation and compensation (to deliver with respect to protected species licensing) can be provided for within the proposed DCO Order Limits and that the **Draft Development Consent Order** [**PEPD-009**] provides the means to secure this.

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
J14	1.7.53 to 57	Natural England note that impacts of lighting to the South Downs National Park's dark skies has not been referenced.		Increase in lighting in the SDNP during the construction phase should be mitigated against if the impact cannot be avoided in the first instance.	It is noted that temporary construction lighting will be used for short periods only at discrete locations (e.g. trenchless crossing compounds during the drilling process). This lighting will be designed in accordance with guidance from the Bat Conservation Trust and Institute of Lighting Professionals (2023) as per commitment C-105 in the **Commitments Register** **[APP-254]** (provided at Deadline 1 submission). Commitment C-105 is secured in the **Outline Code of Construction Practice** **[PEPD-033]** which is secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. The effects of construction lights have been considered as part of **Appendix 18.2: Viewpoint Analysis, Volume 4** of the Environmental Statement (ES) **[APP-168]** and from some visual receptors **Appendix 18.4: Visual Assessment, Volume 4** of the ES **[APP-170]**. Drawing from this information, 'dark skies' were considered as part of the assessment of South Downs National Park (SDNP) Special Quality 2 (SQ2) in **Appendix 18.4: Landscape Assessment, Volume 4** of the ES **[APP-169]** – Noting that there would be no effect on the South Downs International Dark Sky Reserve or 'dark skies' within the SDNP. This conclusion was based on the fact that none of the Dark Skies Discovery Sites or core areas of the Dark Sky Reserve are located within the landscape and visual impact assessment (LVIA) Study Area (for cross reference see Figure 15.12 in **Chapter 15: Seascape, landscape and visual impact assessment – Figures (Part 1 of 8), Volume 3** of the ES **[APP-088]**). The nearest of these being located beyond 10km distance from the proposed DCO Order Limits. The onshore cable corridor is however routed through the "*E1a - 2km Buffer Zone & Intrinsic Rural Darkness*" area and as such the recommendations of the SDNP Local Plan Policy SD8: Dark Night Skies have been incorporated into Commitments C-66 and C-200 in the **Commitments Register** **[APP-254]** (provided at Deadline 1 submission).

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					The SDNP Local Plan Policy SD8: Dark Night Skies includes specific lighting requirements for developers (South Downs National Park Authority (SDNPA), 2019), and states: "*Wherever possible new development will be required to avoid installing lighting. If new lighting is unavoidable steps must be taken to avoid its impacts on our dark night skies by making sure that it's properly designed, taking into consideration direction of lighting and number of lumens emitted. If that is not possible, adverse impacts of lighting will be required to be mitigated – for example, by installing timing restrictions and making sure that the light emitted is of a colour that won't disturb wildlife*." Therefore, the focus has been on the commitments in the **Commitments Register [APP-254]** (updated for the Deadline 1 submission) and the **Outline Code of Construction Practice** [**PEPD-033**]. In order to avoid construction lighting where possible, core working hours for construction of the onshore components will be 08:00 to 18:00 Monday to Friday, and 08:00 to 13:00 on Saturdays. Apart from specific circumstances that are set out in the **Outline Code of Construction Practice** [[**PEPD-033**], where extended and continuous periods of construction are required. Prior to and following the core working hours Monday to Friday, a 'shoulder hour' for mobilisation and shut down will be applied (07:00 to 08:00 and 18:00 to 19:00). The activities permitted during the shoulder hours include staff arrivals and departures, briefings and toolbox talks, deliveries to site and unloading, and activities including site and safety inspections and plant maintenance. Such activities shall not include noise generating activity including use of heavy plant or activity resulting in impacts, ground breaking or earthworks (commitment C-22 in the **Commitments Register** [**APP-254**] provided at Deadline 1 submission).

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					Although the detail of any lighting design for all temporary and permanent lighting will be developed once contractors are appointed, the principles of any lighting regime are set out in **Chapter 4: The Proposed Development, Volume 2** of the ES [**APP-045**]. Where required, construction lighting will be limited to directional task lighting positioned to minimise glare and nuisance to residents and walkers within the SDNP and informed by British Standard (BS) EN 12464-2:2014 Lighting of outdoor workplaces (British Standards Institution (BSI), 2014) and guidance provided by the Chartered Institution of Building Services Engineers (CIBSE) Society of Light and Lighting, The Bat Conservation Trust and the Institution of Lighting Professionals (C-200 in the **Commitments Register** [**APP-254**] provided at Deadline 1 submission). These measures will all be secured via the stage specific CoCPs to be submitted pursuant to Requirement 22 of Part 3, Schedule 1 of the **Draft Development Consent Order [PEPD-009]**.
Document used: [APP-038] 5.9 Report to Inform Appropriate Assessment					
J15	5.3.4	Natural England seek clarification as to why information has not been provided relating to traffic modelling/air quality.		Natural England seek clarification of this point. We are of the understanding that air quality impacts to designated sites have not been considered within the Air Quality (AQ) chapter or RIAA, as air quality impacts were scoped out of having a likely significant effect.	The effects of emissions associated with construction traffic and plant on all relevant ecological features (European sites and Sites of Special Scientific Interest (SSSIs)) were scoped out as confirmed by the Planning Inspectorate in reference 5.5.5 in Section 5.5 of the **Appendix 5.1: Planning Inspectorate's Scoping Opinion, Volume 4** of the Environmental Statement **[APP-125]**. This is referenced in the **Report to Inform the Appropriate Assessment [APP-038]** in paragraph 5.3.4. The Planning Inspectorate states in reference 5.5.5 in Section 5.5 of the **Appendix 5.1: Planning Inspectorate's Scoping Opinion, Volume 4** of the Environmental Statement **[APP-125]**:

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					'*The Inspectorate agrees that this matter can be scoped out based on the temporary and transient nature of the effect, the location of the nearest European sites and SSSI's and the limited amount of traffic likely serving construction at any single location.* *The Inspectorate also notes that this approach in line with advice from Natural England as cited in paragraph 6.6.68, and Natural England have not expressed concern in their scoping consultation response relating to the Proposed Development.*'
J16	7.2.11	Natural England note that a foraging range of ~18km (utilised by the northern pintail) has been stated, which has been used to assess the available functionally linked land (FLL), and then compared against the portion of the FLL which will be temporarily impacted during the construction phase. The ~18km foraging range appears to have been selected from a USA study from SW Louisiana, out of a comparison of 16 other foraging ranges studies (Johnson et al., 2014). Of this data set, "~18km" appears to be the highest figure chosen, whilst a study in France evidenced a foraging range of 1.3km.		Natural England question why "~18km" was chosen to estimate the likely foraging range of pintails, when the France figure may be more representative, due to closer proximity. A much lower foraging range of 1.3km (France) would mean the northern pintail relies on the FLL a lot more than a pintail from Louisiana (~18km). Natural England request further explanation be provided by RED.	The 18km mean flight distance was selected as it automatically includes a greater area of potentially functionally linked land (FLL) than using a shorter distance (see **Report to Inform the Appropriate Assessment [APP-038]**). Should a shorter distance have been selected potential effects on pintail would all have been screened out as the Arun Valley Ramsar site is more than 1.3km from either the Arun or Adur Valley (I.e. any pintail observed would have been assumed to be unconnected to the Ramsar site population). Therefore, the assumption made is precautionary (see **Report to Inform the Appropriate Assessment [APP-038]**).
J17	7.2.13	Natural England note that a potential for Adverse Effect on Integrity (AEoI) to the conservation objectives of the northern pintail of the Arun Valley Ramsar site (in relation to land take/land cover change effects) has been ruled out. However, our previous point regarding foraging range should be addressed by RED before making a conclusion.		Our previous comment above should be addressed in greater detail, to understand any likely impacts in relation to land take/land cover change effects, to the conservation objectives of the northern pintail of the Arun Valley Ramsar site.	There would be no potential for an Adverse Effect on Integrity (AEoI) on pintail if those associated with the Ramsar site only regularly move from the designated sites to functionally linked land (FLL) within 1.3km from the boundary. The Arun Valley Ramsar site is 4.8km from the proposed DCO Order Limits at the closest point (over 9km to the nearest potentially FLL). It is also noted that the flight distances to other species of interest (e.g. wigeon, teal, shoveler) are under 4.8km thereby again demonstrating a precautionary approach to the

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					assessment (see **Report to Inform the Appropriate Assessment [APP-038]**).
J18	7.2.21	Natural England note that the area of land left behind following construction may take several years to re-establish recover / fully. This linear habitat fragmentation causes severance of the landscape which could impact upon the Northern Pintail. Works may not be taking place during the vast majority of time Pintail is present, but habitat degradation may last for years after the construction and impact the species for negatively for years. In general, Natural England note that temporary loss of functionally linked land of the Arun Valley SPA and Ramsar site could occur for a number of years post construction. We note that reinstatement of the cable route corridor is proposed to take place within two years of the initial habitat loss. Natural England advises there is not sufficient certainty that full reinstatement to previous condition, and agricultural use, is likely to occur within the proposed time frame and is likely to be greatly longer if the construction phase is to last up to five years. This is made more likely if temporary fencing is to remain in place for the entirety of the five-year construction period. Furthermore, temporary fencing of the cable route within the FLL could be maintained beyond the five-year construction period (as seen with original Rampion cable route development), which could add further time delay until the FLL is fully reinstated to its previous agricultural use.		Natural England advise that further assessment should be made into potential impacts of temporary loss of FLL. Precautionary principle should be applied to allow for a longer period of habitat loss and reinstatement back to previous condition. With regard to temporary fencing, Natural England advise that detail should be provided to demonstrate when or if temporary fencing will be removed following the construction period.	As described above in the response to **reference J11** the reinstatement under commitment C-103 in the **Commitments Register [APP-254]** is to begin within 2 years of loss and is not assuming target condition is reached within that period. However, it is noted that reinstatement of modified grassland and arable land is expected to occur rapidly given the type of habitats in question. The habitat reinstatement is to be done sequentially which means that it is divorced from the overall length of the construction phase in any given location. Habitat reinstatement is secured in the **Outline Landscape and Ecology Management Plan [APP-232]**, pursuant to Requirement 12 of the **Draft Development Consent Order [PEPD-009]**. Temporary fencing will be maintained for the duration of the construction works - up to 3.5 – 4 years years at the landfall, temporary construction compounds, joint bays, grid connection point and the onshore substation. Along the onshore cable route, the temporary fencing will be potentially needed for up to 2 years for the safe operation of the haul roads. As described in **reference J12**, the areas of suitable habitat for the designated species are considerable distance from the Arun Valley Special Protection Area / Ramsar site (in excess of 9km) suggesting that fragmentation will not be an issue as birds are unlikely to be moving across the works when travelling to or from the designated site.
J19	7.2.24	*'With respect to wigeon and teal there will be periods when construction activity will be close to the waterbodies near the Church of Mary Magdalene, Lyminster (around 285m away) and within the coastal and floodplain grazing marsh within the Adur Valley. For these birds to move between the Arun*		Natural England raises the same query as above in terms of long-term impact on the land and reinstatement potentially	Please see response to **references J12** and **J18**. It is also noted that there are no construction works proposed between the Church of Mary Magdalene, Lyminster and the

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
		Valley Ramsar and these areas will require them to cross the working area or divert around it.'		taking over 2 years before it may attract bird species again.	Arun Valley Special Protection Area / Ramsar site.
J20	7.2.25	Natural England note that the *'…works will mainly be undertaken outside the period when wigeon and teal are present…'.*		Natural England question why works cannot take place entirely outside the periods where the birds are present, instead of 'mainly'.	Commitment C-117 in the **Commitments Register [APP-254]** (provided at Deadline 1 submission) has been designed to avoid the main period in which wintering wildfowl are present. It is acknowledged that some birds will be present in September and March, however it is also necessary to enable works to take place in the area when the area is not subject to flooding and the ground is not waterlogged. Typically, this will be in mid to late summer. However, flexibility is required due to unpredictability of the weather. The October to February period includes the times when the birds are likely to be most energetically stressed (as it is coldest) and accords with the times in the survey data when aggregations of birds were identified. As numbers were not overly large (see **Appendix 22.14: Onshore Winter Bird Survey, Volume 4** of the ES [**APP-192**]) and the Arun Valley Special Protection Area / Ramsar site is 4.8km (more than 9km from nearest potentially functionally linked land (FLL)) away from the proposed DCO Order Limits the commitment is seen as more than adequate to avoid any adverse effects. Commitment C-117 is secured in the **Outline Code of Construction Practice [PEPD-033]** which is secured through the **Draft Development Consent Order [PEPD-009]**.
J21	7.2.21 7.2.24	In some circumstances, it appears the land disturbed by open trenching along the cable corridor will not be reinstated for 2 years post cable installation, meaning there is the potential for the existing habitat to not return to the standard it was before, for many years. This linear habitat fragmentation causes severance of the landscape which could impact upon species, for example displacing important bird species using the area as functionally linked land (FLL).		Natural England advise that greater detail should be provided on the efficacy of embedded mitigation measure C-103 to prevent long sections of lost habitat awaiting reinstatement too long and causing severance through fragmentation.	Please see responses to **references J12** and **J18**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
				Can reinstatement begin as soon as practically possible, i.e. within a year, for the majority of the corridor of habitat lost following construction to prevent there being large gaps of habitat degradation?	
J22	7.2.40 & 7.2.65-66	Whilst Natural England has confidence that The Sussex North Offsetting Water Scheme (SNOWS) will be in place by the time of commissioning, we question whether a suitably worded condition can be relied upon with certainty, at the appropriate assessment stage. This is due to the fact that the mitigation scheme is not currently operational. As set out in Natural England's Advice Note regarding Water Neutrality within the Sussex North Water Supply Zone, the existing water supply in the Sussex North water supply zone cannot be ruled out as contributing to the declines in wildlife within internationally protected sites in the Arun Valley SPA, SAC and Ramsar site. Achieving water neutrality is recognised as a suitable method to rule out potential adverse effects on the integrity of these sites arising from development. The Sussex North Water Supply Zone includes supplies from a groundwater abstraction which cannot with certainty conclude no adverse effect on the integrity of; • Arun Valley Special Area Conservation (SAC); • Arun Valley Special Protection Area (SPA); and • Arun Valley Ramsar Site. As it cannot be concluded that the existing abstraction, which supplies mains water use within the Sussex North Water Supply Zone, is not having an impact on the Arun Valley site we advise that developments within this zone must not add to this impact. This is required by recent caselaw, Case C-323/17 People over wind and Sweetman, ruling of CJEU (often referred to as Sweetman II) and Coöperatie Mobilisation for the Environment and Vereniging Leefmilieu Case C-293/17 (often referred to as the Dutch Nitrogen cases). Between them, these cases require Plans and Projects affecting sites where an existing adverse effect is known (i.e., the site is failing its conservation objectives), to demonstrate certainty that they will not contribute further to the		Natural England would advise that additional details be submitted, which considers how water neutrality could be demonstrated, without overly relying on a strategic mitigation scheme which is yet to become operational. Further consideration of how suitable water neutrality mitigation can be suitable secured, should be considered and provided by RED. To support in the assessment, Natural England would advise that an estimated water use should be calculated to inform the evidence base, for which mitigation measures should be proposed against. Without these details, it may not be possible to conclude with certainty, of no adverse effect on the integrity of the Arun Valley designated sites, from over abstraction of groundwater from within	Please see the response to **reference J10**. On the basis of that information, regardless of the availability of the strategic scheme, the Proposed Development can be delivered whilst retaining water neutrality.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
		existing adverse effect or go through to the latter stages of the Regulations (no alternatives IROPI etc). Given this development would increase water demand within Sussex North, it must therefore not add to the impact of the existing groundwater abstractions on the Arun Valley sites. Plans and projects within Sussex North can rule out this potential adverse impact either by demonstrating with certainty that their water demand can be met without any mains supply or by demonstrating that water neutrality for mains demand can be achieved. The simple definition of water neutrality is that "The use of water in the supply area before the development is the same or lower after the development is in place". It should also be noted that the Gatwick Sub regional Water Cycle Study concluded that water neutrality is required for Sussex North to enable sufficient water to be available to the region.		the Sussex North Water Supply Zone. Be advised that it is also not apparent whether the SNOWS strategy will have sufficient capacity to offset this proposal's water demands in addition to the demands of wider development in Sussex North. This is an additional reason why the estimated water use should be calculated.	
J23	General Comment on Water Neutrality	Natural England note that water use within the SNWSZ during the construction phase of the proposal, has not been screened to determine whether any increase in water use is likely to have a significant effect (LSE) on Arun Valley designated sites (SPA, SAC and Ramsar site).		Natural England advise that RED conduct a routine screening exercise, to determine whether increased water use during the construction phase of the proposal is likely to have a significant effect (LSE) on the Arun Valley designated sites.	In terms of construction water usage, the Applicant can confirm that water for construction within the Sussex North Water Supply Zone will not be taken from the mains, and it will instead be imported to main compounds (for their welfare systems, and wheel washing) and Trenchless Crossing (TC) compounds (for use of drilling fluids), for wheel washing, potentially dust suppression, and welfare facilities. On this basis construction was not considered and screened out of the **Report to Inform Appropriate Assessment (RIAA)** **[APP-038]**.
Document used: [APP-044] 6.2.3 Environmental Statement - Volume 2 Chapter 3 Alternatives					
J24	3.1.12	Natural England note the reference to 'some designated sites'. Does this relate to SSSIs and Local Wildlife Sites (LWS)?		Clarification of 'some designated sites' requested.	In **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]** all statutory and non-statutory designated sites were considered during the optioneering and design phases including European sites, Sites of Special Scientific Interest, National Nature Reserves, Local Nature Reserves and Local Wildlife Sites. European sites were considered as hard constraints (see paragraph 3.1.11, **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]**), with other designated sites and ancient woodland considered as softer constraints (see

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					paragraph 3.1.12, **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]**).
J25	3.1.12	Have designated site and irreplaceable habitats such as Ancient Woodland have been selected as 'soft' constraints due to the reliance of embedded measures. Natural England are concerned that RED are overly reliant on specific embedded measures (i.e. HDD), to mitigate against permanent loss of irreplaceable habitats such as Ancient Woodland. Site specific feasibility studies for embedded measures such as HDD have not been undertaken to date.		Natural England advise that the commitment register should be updated, so that open trenching is not a back-up option through irreplaceable habitats if trenchless crossing operations were to fail.	Please refer to responses to **references J3**. It is also noted that irreplaceable habitats have been considered during the design process mainly via avoidance.
J26	3.4.38	Natural England note that a number of proposed alternatives and modifications considered within the PEIR SIR (RED,2022) were outside of the original proposed scoping boundary (RED, 2020)		Natural England are of the understanding that this has been discussed and agreed with The Planning Inspectorate.	Section 5.6 within **Chapter 5: Approach to the EIA, Volume 2** of the ES **[APP-046]** outlines the process undertaken by the Applicant with respect to Environmental Impact Assessment (EIA) Scoping. Paragraphs 5.6.4 within **Chapter 5: Approach to the EIA, Volume 2** of the ES **[APP-046]** describes that in response to Statutory Consultation feedback the Applicant developed a number of potential modifications and alternative cable routes and prior to consulting this was discussed with the Planning Inspectorate including the potential requirements for re-scoping. It was acknowledged that the requirement for a full EIA re-scoping would be dependent on the specific updates to the design of the Proposed Development and/or changes to the scope of the environmental assessments. Paragraph 5.6.8 within **Chapter 5: Approach to the EIA, Volume 2** of the ES **[APP-046]** states that '*although changes to the design of the Proposed Development have been considered since the initial scoping of the EIA, the extent of deviation from the Scoping Boundary is limited, and the features and receptors encountered are similar to those within the Scoping Boundary. RED have discussed the evolution of the Proposed Development throughout the pre-application stage during the EPP process with stakeholders. Therefore, it is considered that the*

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					Proposed Development remains materially the same as that on which scoping undertaken.'
J27	3.4.51	Natural England are concerned with the proposed permanent and irreplaceable loss of approximately 0.99 ha of plantation on ancient woodland soils (PAWS), associated with proposed LACR-02. Natural England does not endorse the loss of and damage to ancient woodlands, which are afforded significant protection in planning policy. This route option should only be considered where no other routes are found to be viable. Should this route be selected Natural England request to be consulted to ensure the best environmental outcomes and that the least impactful methodology is used.		Natural England advise that PAWS receives equal protection as ancient woodland under the NPPF. Ancient woodlands are irreplicable habitats and impacts should be avoided. We would therefore advise that the NPS – EN-1 and NPPF are followed when selecting the most appropriate cable route. We specifically signpost paragraphs 180. a) and c) of the NPPF (September 2023), which outlines the level of protection that is given to ancient woodland, and in addition highlights the mitigation hierarchy which should be followed to avoid and minimise significant harm to biodiversity. In addition, we would also signpost paragraph 5.5.54 of the draft NPS EN-1 (March 2023), which gives great weight to the protection of irreplaceable habitats such as ancient woodland.	The alternative route LACR-02 was discounted following the Second Statutory Consultation exercise (October to November 2022) and is not included within the proposed DCO Order Limits (see **Chapter 3: Alternatives, Volume 2** of the ES **[APP-044]**. The Applicant can confirm that the design of the Proposed Development avoids all loss of ancient woodland and this is secured through commitment C-216 in the **Commitments Register [APP-254]** (updated at the Deadline 1 submission) which is secured in the **Outline Code of Construction Practice [PEPD-033]** which is secured through Requirement 22 of the **Draft Development Consent Order [PEPD-009]**.

				to avoid and minimise significant harm to biodiversity. In addition, we would also signpost paragraph 5.5.54 of the draft NPS EN-1 (March 2023), which gives great weight to the protection of irreplaceable habitats such as ancient woodland. Compensation measures should only be considered as a last resort, when impacts cannot be avoided or mitigated for, and when alternative, less damaging options are not available. We refer the Applicant to Natural England's standing advice for ancient woodland and the management of buffers. Ancient woodland, ancient trees and veteran trees: advice for making planning decisions - GOV.UK (www.gov.uk)	
J28	3.9.25	Trenchless crossings are an embedded mitigation measure, which if enacted successfully, will avoid impacts to ancient woodland. However, Natural England note that most mitigation measures carry their own risks. Without understanding these risks, it can be difficult to assess whether the mitigation will be effective, and the damage avoided.		Natural England advise that reassurances are needed to ensure this significant effect are truly avoided.	Please refer to responses to **references J3** and **J6**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
				We note that there appears to be a risk of regressing to open trench techniques through irreplaceable habitats, should trenchless techniques not be possible.	
Document used: [APP-045] 6.2.4 Environmental Statement – Volume 2 Chapter 4 The Proposed Development					
J29	4.5.26	As previously mentioned, Natural England have concerns that the feasibility assessment of trenchless crossings has not been included within the DCO submission.		Without details of trenchless crossing feasibility, it is difficult to assess the scale and significance of the effect of the proposal on protected sites and important ecologically sensitive areas.	Please refer to **references J3** and **J6**.
Document used: **[APP-046] 6.2.5 Environmental Statement – Volume 2 Chapter 5 Approach to the Environmental Impact Assessment**					
J30	3.3.15	Natural England note that efficacy of a number of embedded mitigation measures have not been fully assessed with sufficient detail.		Natural England advise that greater detail should be provided on the efficacy of embedded mitigation measures C-5, C-43 (trenchless crossings) and C-115 (hedgerows). Natural England note that detailed feasibility assessment for trenchless crossings is proposed to be conducted post DCO acceptance.	Please refer to responses to **references J3** and **J6** with regards trenchless crossings. For hedgerows, the realistic worst-case scenario assessed within **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-063]** is based on hedgerow notches being cut to the ground, roots excavated and discarded, soil replaced and new planting. This is a typical approach to linear projects, other than that there would be multiple smaller notches as opposed to a single larger gap (to minimise losses). In these instances, it is expected that replanting would be successful on the basis that a robust Code of Construction Practice and Landscape and Ecological Management Plan is secured and delivered via Requirements 22 and 12 respectively of the **Draft Development Consent Order** [**PEPD-009**]. Commitment C-115 in the **Commitments Register** **[APP-254]** (updated at the Deadline 1 submission) has been refined to ensure that the description above is clear. It is noted that the smaller notches are equivalent to those often

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					created and then reinstated by local Distribution Network Operators (DNO) delivering cable connections on local distribution networks. Commitment C-115 in the **Commitments Register** **[APP-254]** (updated for the submission at Deadline 1) states that '*Hedgerows subject to temporary translocation will be lifted using a tree spade to maintain diversity and structure and result in more rapid reinstatement. Where chances of success are questionable, notches will be made by removal and reinstatement through planting. The ECoW will justify the approach being taken in line with the responsibilities of implementing the vegetation retention plan (see C-220).*'. This means where chances of success are low then temporary translocation will not be exercised and instead a typical approach of re-planting will be specified. This will necessarily be described within the reinstatement measures in the Landscape and Ecological Management Plan (secured via Requirements 12 and 13 of the **Draft Development Consent Order** [**PEPD-009**]). In locations where temporary translocation is appropriate (e.g. soils that are at least 60cm deep and support vegetation that does not appear to be drought stressed), translocated hedgerows would be subject to regular aftercare. Where it appears that translocated sections are failing new planting would be established along the line of the translocated section (on both sides). These plantings would develop into the hedge with the failed / partially failed translocated section providing a matrix to develop around. The Applicant recognises that the translocation of hedgerow will have more chance of failure than replanting using whips. The translocation has been provided as an option to maintain character and provide more rapid gapping up. However, should this option not be considered relevant then the relevant local authority and Natural England will have the opportunity to request translocation is not used at any given location through the approval of the stage specific Code of Construction Practice (CoCP)

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					and stage specific Landscape and Ecology Management Plan (LEMP) secured via Requirements 22, 12 and 13 of the **Draft Development Consent Order** [**PEPD-009**].
J31	3.3.18	*'…limited detail is provided as to the content of the management and mitigation plans that are listed, and many of the matters included are suffixed by statements such as "where possible" or "as far as practicable". It is therefore difficult for the Inspectorate to gain confidence as to the likely efficacy of such plans at this stage. The ES should therefore set out these plans (or the reliance placed on them) in sufficient detail so as to understand the significance of residual effects.'*		Natural England note that the wording of securing mechanism is ambiguous such as "where possible" and "as far as practicable" are still used and relied on in a number of embedded mitigation measures. Greater detail of embedded mitigation measures which utilise these ambiguous terms, should be provided, to greater fully understand the risks and likely success rates of these mitigation measures.	The statements referenced in this relevant representation are commonly used and accepted throughout the industry and in other Development Consent Order applications. An updated version of the **Commitments Register [APP-254]** is provided at Deadline 1 submission, including a revision of commitments where phrases have been used, such as 'where possible'. The Applicant has identified the appropriate embedded environmental measures to avoid, reduce or minimise effects based on best practice and industry experience. There is the need for some flexibility where a measure may not be applicable in a specific scenario during construction or require slight adjustment. The Applicant would need to confirm that no new or materially different environmental effects would arise in this instance. In such instances this would be confirmed in the stage specific documents secured the **Draft Development Consent Order (DCO) [PEPD-009]** such as the stage specific Code of Construction Practice (CoCP) secured through Requirement 22. Stages will be identified in accordance with the project programme and Requirement 10 of the **Draft Development Consent Order [PEPD-009]**.
Document used: [APP-061] 6.2.20 Environmental Statement - Volume 2 Chapter 20 Soils and agriculture					
J32	General Comment on Agricultural Land Classification (ALC)	It is unknown whether the survey was carried out by a suitably qualified (such as member of British Society of Soil Scientists (M I Soil Sci). We have noted this in previous PEIR comments.		Clarification requested	The Agricultural Land Classification (ALC) survey for Rampion 2 was completed by Land Research Associates. The lead author and approvers are both members of the British Society of Soil Science (BSSS), the approver is registered with the Institute of Professional Soil Scientists, qualified to MISoilSci and holds a PhD in agricultural soil management. The main

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					author holds a Master of Science degree in Soils and Sustainability and a Bachelor of Science (Hons) in Environmental Science. For further details, see **Chapter 20: Soils and agriculture, Volume 2** of the Environmental Statement **[APP-061]** and **Appendix 1.1: Competent Experts, Volume 4** of the ES **[APP-120]**.
J33	General Comment on ALC	Site information on micro relief, gradient and flood risk is absent.		Further information requested.	Paragraph 3.5 in **Appendix 20.1: Detailed Agricultural Land Classification Report, Volume 4** of the Environmental Statement (ES) **[APP-175]** lists the limiting factors and states that other factors were assessed but do not affect the grading. Microrelief was considered during the survey but was not identified as a limiting factor. Flood risk and gradient are listed as limiting factors for parts of the site. Limiting factors are also listed in the observation logs. Flooding is considered to be a limiting factor for some land near the coast with no flood protection, Environment Agency flood mapping was consulted alongside information gathered in the field (as stated in paragraph 3.10 in **Appendix 20.1: Detailed Agricultural Land Classification Report, Volume 4** of the ES **[APP-175]**. Gradient is also a limiting factor for some land within the proposed DCO Order Limits, gradient was measured in field with a clinometer.
J34	General Comment on ALC	Munsell soil colour notation is only provided for the soil pits. Munsell colours are necessary to determine whether the soil horizon is gleyed or not. It is not clear which colours have been used in the list of auger samples, therefore it is not clear whether the wetness class ascribed to each auger observation has been correctly assessed in accordance with the published ALC criteria for grading (MAFF, 1988). However, we note that gley indicators have been identified and noted in paragraphs 2.3.		Clarification requested	The colours at each auger point were checked against Munsell Colours for gleying as set out in the Survey Log Key (page 24 of **Appendix 20.1: Detailed Agricultural Land Classification Report, Volume 4** of the ES **[APP-175]**) with 'xxx' recorded where a gleyed horizon is identified. Mottles can be distorted in an auger and horizons are confirmed by soil pits where profiles are fully described. For the avoidance of doubt, the Applicant proposes that the **Outline Soils Management Plan** **[APP-226]** is updated to confirm that in future agricultural land classification (ALC) surveys completed for Rampion 2. The update will form part of the **Outline Code of**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					Construction Practice [PEPD-033], secured through Requirement 22 of the **Draft Development Consent Order [PEPD-009]**. The Munsell colour notation will be used for all observation points. The proposed addition (as new paragraph 3.1.7) is noted as an errata, see **1.1 Cover Letter** which has been submitted at Deadline 1.
J35	20.1.3	Natural England is aware of available site-specific data that has not been included as part of the published information. The applicant should use all known published data when assessing the proposals impacts within the DCO boundary. A report and accompanying map (ref 4202\056\98) can be found here.		Natural England advise that all known published data should be used when assess the proposals impacts within the DCO boundary.	The Applicant has reviewed all available post-1988 agricultural land classification (ALC) reports and accompanying maps within the proposed DCO Order Limits (ref 4202\056\98 - dated 1998, ref 4205\244\93 - dated 1993, and ref 4205\247\93 - dated 1993). In all instances, where the areas included in these reports overlap with the proposed DCO Order Limits for Rampion 2, the land has been subject to partial agricultural land classification (ALC) survey for Rampion 2 (**Appendix 20.1: Detailed Agricultural Land Classification Report, Volume 4** of the Environmental Statement (ES **[APP-175]**). However, for completeness the post-1988 ALC information has been included in updated calculations of the areas of ALC grades across the proposed DCO Order Limits. This is noted as an errata, see **1.1 Cover Letter** which has been submitted at Deadline 1. The inclusion of the post-1988 survey data results in a slight increase in the total area of Grade 2 (to 128.5 hectares (ha) / 23% of the proposed DCO Order Limits, previously 126.1ha / 22%), a slight decrease in Subgrade 3a (200.0ha / 35%, previously 203.7ha / 36%), and a slight increase in Subgrade 3b (154.2ha / 27%, previously 153.5ha / 27%). The Applicant concludes that the published data does not increase the estimated total area of best and most versatile land in the assessment or change the assessment outcome. Given the period since the post-1988 survey data was obtained, it is the Applicant's intention that agricultural land which may be affected by the Proposed Development and which has not been included in the recent ALC survey (**Appendix**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					20.1: Detailed Agricultural Land Classification Report, Volume 4 of the ES **[APP-175]**) will be surveyed to confirm its current ALC status during pre-construction, to inform the stage-specific Soils Management Plans (SMPs) in accordance with the **Outline Soils Management Plan [APP-226]**.
J36	20.2.2	Natural England notes there has been no lab analysis for particle size distribution analysis by the pipette method to confirm soil textures.		Natural England question why this lab analysis has not been conducted.	The Ministry of Agriculture, Fisheries and Food (MAFF) guidance (MAFF, 1988) states that the soil texture class may be assessed in the field by hand texturing or measured in a laboratory by particle-size analysis. For the Rampion 2 agricultural land classification (ALC) survey (**Appendix 20.1: Detailed Agricultural Land Classification Report, Volume 4** of the ES **[APP-175]**), hand texturing was completed by experienced surveyors.
J37	20.3.4	As mentioned above notation on micro relief, gradient and flood risk is absent however in this paragraph it is recognised that these are limiting factors in ALC grade.		Natural England request clarification.	See response to **reference J33**.
Document used: **[APP-062] 6.2.21 Environmental Statement - Volume 2 Chapter 21 Noise and vibration**					
J38	21.9.12	Natural England note that there are no temporary construction compounds within the SDNP, however there is one proposed temporary construction compound at Washington, which is adjacent to the SDNP boundary. We further note that tranquillity of the SDNP adjacent to the proposed construction compound has been classed as being relatively low, due the existing noise levels from A283.		Natural England question whether the tranquillity of the area already being low is a valid reason to add more noise impact to the SDNP. Natural England request further clarification and quantification of the terms '*substantially lower' and 'most of the works'*.	The National Planning Policy Framework states that policies and decisions should "*identify and protect tranquil areas which have remained relatively undisturbed by noise and are prized for their recreational and amenity value*". Under planning policy guidance, for an area to justify being protected for its tranquillity "*it is likely to be relatively undisturbed by noise from human sources that undermine the intrinsic character of the area. It may, for example, provide a sense of peace and quiet or a positive soundscape where natural sounds such as birdsong or flowing water are more prominent than background noise, e.g. from transport".* Although the Washington compound is proposed to be adjacent to the SDNP, the compound is also adjacent to an A283; so, the

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					area of the National Park near to the proposed compound is not compatible with the NPPF definition of tranquil. Therefore, the sensitivity of this part of the SDNP to noise is low. The terms for clarification relate to the difference between the worst-case noise levels from the site and the idea that most of the time, the compound noise would be lower than those worst-case levels. The levels of 70dB at the SDNP were predicted for the highest concentration of activity to establish the compound. This is the worst-case. The worst case construction noise, when the compound is operational is predicted to be 65dB at the SDNP. Again, this is when the highest level of overlapping noisy activity is present at the compound. Substantially lower noise levels at the SDNP would mean more than 5dB lower than the stated worst case (i.e. such that BS 5228 threshold values of significance are not exceeded). The phrase "most of the works" identifies that the worst case noise levels at the SDNP, as discussed above, will occur for a short duration that the compound will be operational. At this stage, the construction details are not available to quantify this time, but the purpose of the phrase is to establish the general idea of lower noise levels than those for an assessment envelope resulting from works which are varied and intermittent. Please also see **Appendix 5 - Further information for Action Point 27 - South Downs National Park** (**Document Reference: 8.25.5**).
J39	21.9.21	Natural England note that trenchless crossing locations will result in noise levels of between 55dB and 75dB within the SDNP, which will likely impact the high tranquillity of the area.		Natural England note that the elevated noise levels will result in harm to special quality 3 of the SDNP, 'tranquil and unspoilt places'.	Whilst the assessment at residences focuses on specific locations, trenchless crossings will be within the SDNP and therefore the boundary of trenchless crossing is also effectively the receptor location for the SDNP. Due to this proximity, noise levels have been predicted at up to 75 dB without mitigation at the SDNP temporarily. Due to the temporary nature of this

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
				Natural England request further clarification on how embedded mitigation measures (i.e. C-26) can reduce the noise levels within the SDNP. Have noise levels of 75dB been calculated, without consideration of embedded mitigation measures?	impact, it was concluded to be of minor effect and not significant. Embedded mitigation including screening of drilling equipment and compounds (Commitment C-26 (**Commitments Register [APP-254]** which is secured through stage specific Code of Construction Practices pursuant to Requirement 22 of the **Draft Development Consent Order [PEPD-009]**), the extent of potential harm will be localised and temporary. Where public rights of way (PRoWs) lie within the vicinity of such works, the mitigation will need to ensure that passers by are not exposed to dangerous levels of noise (i.e. Contractors will need to maintain their obligations under the *Health and Safety at Work etc. Act 1974* in addition to compliance with the **Outline Code of Construction Practice [PEPD-033]**). It should be noted that the noise sources used to predict construction noise at the sites are considered by the Applicant to represent a worst case of all activities being undertaken simultaneously. And therefore, the predictions also represent a worst case.
J40	21.9.48 to 52 & 21.9.60	Natural England note that the worst-case noise levels for works close to sensitive receptors, will be for a maximum of two days. Using residential receptor, this magnitude of change has been classed as low.		Construction throughout the SDNP will last considerably longer than two days. When assessing the noise level over a much longer time period. Natural England question whether by concluding minor adverse significance to individual receptors within the SDNP, is RED under assessing the cumulative impact to the whole of the SDNP from the construction works.	The two days assessment in **Chapter 21: Noise and vibration, Volume 2** of the Environmental Statement **[APP-062]** is based upon the line of onshore cable route for trenching passing by residential receptors. However, British Standard 5228 states that, in relation to public open spaces, "*the extent of the area impacted relative to the total available area also needs to be taken into account in determining whether the impact causes a significant effect*". As the area affected by noise from the discrete location of the trenching works as they progress along the cable route is a small the minor adverse significance, in this context, is considered by the Applicant to be the correct designation. With respect to cumulative impact, the short duration that the works are in any single area are unlikely to give rise to a cumulative noise impact upon

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					the same receptors, even if there are more than one activity area in the SDNP as a whole. For context the activity noise of the trenching would not be dissimilar in magnitude and spectrum to agricultural machinery, which is a regular feature of the National Park.
J41	21.9.66	*"The noise levels predicted at human receptors are above the SOAEL identified in Table 21-26. However, these levels are for a very temporary period. The toxicological effects of noise as stated in WHO guidance, upon which the SOAEL is based, are relevant to a longer duration and therefore are not considered relevant*."		Natural England request further information on this statement. What longer duration is being referred to? Weeks and months as opposed to days?	The significant observed adverse effect level (SOAEL) identified in **Chapter 21: Noise and vibration, Volume 2** of the Environmental Statement **[APP-062]** is based on criteria from Annex E of BS 5228. There are different temporal criteria that apply depending on the magnitude of the sound but as a guide the exposure would be at least 10 days, and more likely at least a month. Where receptors can move away from the works (i.e. transient receptors) there is a higher tolerance to noise than when compared to static receptors (for instance residential dwellings). For reference, the WHO guidance that is referred to here is averaged over a year or more.
Document used: [APP-063] 6.2.22 Environmental Statement - Volume 2 Chapter 22 Terrestrial ecology and nature conservation					
J42	22.6.14	Natural England question whether no LSEs on hydrological regimes across designated sites can be concluded, as mitigation will need to be demonstrate Water Neutrality for the proposed development.		Natural England advise that clarification should be provided, to determine whether the requirement to demonstrate water neutrality for the Arun Valley designated sites, relates to changes in hydrological regimes of the Arun Valley designated sites.	Water neutrality will be achieved by the Proposed Development during the operation and maintenance phase based on securing of mitigation (see **reference J23**). Furthermore, during the construction phase all water used within the Sussex North Water Supply Zone will be delivered in tankers and therefore, the hydrological regime of designated sites can be confirmed to have no likely significant effects.
J43	Table 22-6	*'Chapter 4: The Proposed Development, Volume 2 of the ES (Document Reference: 6.2.4) notes that the DCO does not consent open trenching methods in areas where HDD is being proposed (should HDD fail additional consent would be required to deliver an alternative solution).'* – Natural England question whether the Environmental Statement has an over reliance on trenchless crossing as an embedded measure.		Natural England note that additional consent would be required if an alternative solution is necessary should embedded mitigation measures such as trenchless crossings fail.	See response in **references J3 and J4**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
				Natural England has raised significant risks associated with the feasibility of trenchless crossings (such as HDD) since the publication of the PEIR in 2021. There is a lack of information regarding the suitability of ground conditions. It is difficult to understand whether this embedded mitigation can be suitably relied upon. It has also been difficult to understand the specific risk levels normally associated with HDD operations (i.e. likelihood of success, likelihood of frac outs, sink holes or impacts to hydrology). Without details of trenchless crossing feasibility, it is difficult to assess the scale and significance of the effect of the proposal on protected sites and important ecologically sensitive areas (as well as visually sensitive locations. Natural England request clarification as to whether trenchless crossings investigations will be concluded prior to the commencement of the construction phase? If new or materially different environmental effects arise (compared to those assessed in the	

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
				Environmental Statement), we advise that these should be identified prior to the commencement of the construction phase, to allow for greater scope to avoid any potential adverse environmental effects. Natural England advise that contingency measures should be assessed within the Environmental Statement, in the event that trenchless crossings are not feasible at ecologically and visually sensitive sites.	
J44	Table 22-12	Natural England note that 30 hedgerows were not accessible for survey. Will these 30 hedgerows be assumed to be "important" as a precaution.		Clarification requested on importance of un-assessed hedgerows.	The hedgerows not surveyed have been classified as 'hedgerows' or 'potentially important hedgerows' based on available information. This information includes the opportunity to have viewed these hedgerows in relatively close proximity where diversity of the woody species in the hedgerow could be judged, or its status (e.g. intact or defunct, absence of shrubby layer etc.) could be determined. The potentially important hedgerows are shown on the **Tree Preservation Order and Hedgerow Plan [PEPD-007]**.
J45	Table 22-8	Natural England acknowledge the separation of Importance (legislation and policy) against scale of effects.		This clarification since the original PEIR is welcome, as we had previous concerns that HGV and LGVs would utilise this access route during the construction phase, which could have led to air quality impacts (dust suppression) to the adjacent SSSI.	Noted, the Applicant has no further comments on this matter at this time.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
J46	Table 22-8	Natural England acknowledge the separation of Importance (legislation and policy) against scale of effects.		No further comments.	Noted, the Applicant has no further comments on this matter at this time.
J47	22.7.8	'…*the delivery of BNG is not used when conclusions are drawn about the significance of effects identified in this assessment'* – Natural England acknowledged this statement.		Natural England request clarification as to whether BNG is to be used as compensation for loss of priority habitats.	The Proposed Development provides mitigation and some compensation. This is in the form of reinstatement of habitats temporarily lost and the creation of habitats around the onshore substation and grid connection point. However, there will still be a shortfall to meet 'no net loss' (i.e. the compensation element) and provide biodiversity net gain (BNG) (i.e. delivery of units above no net loss). This will include habitats including hedgerows and woodland. However, the assessment of significant effects in **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the Environmental Statement **[APP-063]** is not predicated on the delivery of BNG. Rather, as the losses will be relatively small (especially at any given location) and will be reinstated, the overall effect is considered to be not significant. The statutory biodiversity metric will provide for both the shortfall to no net loss and to deliver a biodiversity net gain of at least 10% as described in **Appendix: 22.15 Biodiversity Net Gain Information, Volume 4 o**f the ES [**APP-193**].
J48	22.9.29	'Given that barbastelle will cross disturbed areas (such as the A27) and make nightly long-distance movements it is likely that individual bats could make minor deviations in flight routes to avoid the disturbance source without resulting in detectable increases in energy expenditure.' – Natural England question why level of disturbance and energy expenditure is being compared against existing infrastructure. Is this an attempt to reduce the significance of impacts to Barbestelle bats from The Mens SAC?		Additional clarification should be provided to show how impacts from road crossings (A27) are directly comparable with HDD compounds (which are to be lit all night long, with increased levels of noise).	The Mens Special Area of Conservation (SAC) 12km area (defined by the Sussex SAC Bat Protocol) falls outside any area where the Proposed Development would result in losses of typical barbastelle bat (*Barbastella barbastellus*) habitat (such as hedgerows, scrub and woodland edge). Lighting at any trenchless crossing (such as horizontal directional drill (HDD)) compound will be temporary and highly localised (I.e. within a 50 x 70m area). Therefore, it would seem reasonable to conclude that barbastelle could navigate around one of these areas, especially given that the lighting would be located in open habitat areas not favoured by this species. During the construction phase, the lighting design will also be controlled (see commitment C-105 in the **Commitments Register** **[APP-254]** provided at Deadline 1 submission) to ensure it is wildlife

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					friendly. Commitment C-105 is secured in the **Outline Code of Construction Practice [PEPD-033]** which is secured through the **Draft Development Consent Order [PEPD-009]**. Noting that barbastelle cross roads or navigate other areas disturbed by human activity was simply used to demonstrate that they have some flexibility to operate in environments where artificial light is used. It should be noted that the vast majority of the onshore works will require no temporary or permanent lighting.
J49	22.9.41	Natural England note that trenchless techniques such as HDD is a form of mitigation that carries its own risks. Proposed trenchless crossing at Climping beach could be located beneath the western end of Climping Beach SSSI, though we note that Climping Beach SSSI could be completely avoided.		Natural England advise that the mitigation hierarchy should be followed at Climping Beach SSSI. Impacts should be 'avoided, mitigated or as a last resort compensated'. Natural England would advise that HDD beneath Climping Beach SSSI should be avoided, in the first instance, before wholly relying on the embedded mitigation measure of trenchless techniques.	The landfall optionality has been maintained to account for future coastal realignment and the selection of the route and landfall point for the export cable offshore. The majority of the area (at the beach) interacts with the Littlehampton Golf Course and Atherington Beach Local Wildlife Site (LWS), as opposed to the Climping Beach Site of Special Scientific Interest (SSSI). The routeing of cables is to be determined during the detailed design phase with the mitigation hierarchy applied in light of engineering detail.
J50	22.9.43	Natural England note that monitoring during HDD nighttime operations have not been detailed. It is also not clear if Climping Beach SSSI will receive increased levels of light during the nighttime operations.		Natural England request that details are submitted, to outline what type of monitoring will occur during HDD operations at nighttime. Further impacts should be assessed if likely impacts to Climping Beach SSSI are expected from this type of monitoring.	Climping Beach Site of Special Scientific Interest (SSSI) is more than 175m from the location of the closest landfall option and lighting design will be wildlife friendly (commitment C-105 in the **Commitments Register [APP-254]** provided at Deadline 1 submission). Therefore, no light spill is expected. Likewise, the vessel that will be in inshore waters as part of the landfall works will also be too far away from the SSSI to create light spill upon it. In terms of monitoring the horizontal directional drill (HDD) during the overnight period the same measures apply as described in the **Outline Construction Method Statement [APP-255]**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					and **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** and secured through Requirements 23 and 22 respectively of the **Draft Development Consent Order** **[PEPD-009]**. This includes monitoring pressures at the drill head to note any changes that would be associated with losses of drilling fluids.
J51	22.9.54	'*A 'no dig' specialist has appraised the trenchless crossing locations and assessed them as suitable, with risks of a fluid breakout being very low and manageable as described in the Outline CoCP (Document Reference: 7.2).*' – Natural England note that no detailed feasibility to outline the risks of trenchless crossings has been submitted to date. Natural England note that RED have stated that impacts to irreplaceable habitats (such as ancient woodland) will be re- assessed if an alternative option to trenchless crossings is required. Natural England would like to understand when the trenchless crossings will be undertaken (i.e. will majority of cable installed by trenched crossing will have already been installed?). If HDD is not feasible, Natural England are concerned that potential significant loss of irreplaceable habitat could occur.		Natural England have raised concerns (in above comments) as to the efficacy of trenchless crossings techniques. Natural England advise that contingency measures should be assessed within the Environmental Statement, in the event that trenchless crossings are not feasible at ecologically and visually sensitive sites.	Please see responses to **references J3 and J6**.
J52	22.9.73	Natural England note that 2.7ha of woodland is to be provided around the location of the onshore substation. It is however not clear if this compensation is being delivered separate, or as part of BNG delivery.		Natural England advise that RED need to clearly differentiate between habitat being delivered for compensation, and habitat being delivered for BNG. Natural England advise that one clear log should be created, to clearly list and audit the habitat compensation, BNG enhancement and BNG habitat creation, being proposed for the entirety of the onshore phase of the development.	The Applicant has followed the mitigation hierarchy when designing the Proposed Development. As distinct from mitigation, compensation is to be delivered in two ways, firstly within the proposed DCO Order Limits where necessary to enable the grant of protected species licences (for example for dormouse at the Oakendene substation location – see the **Outline Landscape and Ecological Management Plan (LEMP)** **[APP-232]**) which is secured through Requirement 12 of the **Draft Development Consent Order** **[PEPD-009]**. Compensation for habitat loss not delivered on site will also be provided through the Biodiversity Net Gain strategy (C-104) which is detailed in **Appendix 22.15: Biodiversity Net Gain Information, Volume 2** of the ES **[APP-193]**. This is in line with the UK Government's mandatory biodiversity net gain system (implemented through the Environment Act 2021) where the statutory biodiversity metric calculates both compensation need (i.e. the point

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					at which no net loss is reached) and net gain (i.e. at least 10% above the no net loss point). Biodiversity net gain is secured through Requirement 14 of the **Draft Development Consent Order [PEPD-009]**. Below is a description of how the mitigation hierarchy has been applied at each stage. Avoidance measures have evolved through the design process and are demonstrated by both the shape and location of the proposed DCO Order Limits (for example where possible it has been drawn to exclude various ecological features including areas of ancient woodland and areas of Priority Habitat) and through the Vegetation Retention Plan that is appended to the **Outline Code of Construction Practice [PEPD-033]** which is secured through Requirement 22 of the **Draft Development Consent Order [PEPD-009]**. Further measures of avoidance include those that describe construction scheduling such as commitments C-21 (avoidance of active nests of reeding birds during vegetation clearance), C-112 and C-114 (avoidance of physical effects within Site of Special Scientific Interest (SSSI) and Local Wildlife Site (LWS)), C-117 (avoidance of disturbing activity during the coldest winter months), C-174 (avoidance of veteran trees), C-203 (avoidance of disturbance / damage to active nests of ground nesting birds) and C-215 (avoidance of disturbing activities close to occupied barn owl boxes). These commitments are secured in the **Outline Code of Construction Practice [PEPD-033]** and **Outline Construction Method Statement [APP-255]** which are secured through Requirements 22 and 23 respectively of the **Draft Development Consent Order [PEPD-009]**. Embedded environmental measures in the **Commitments Register [APP-254]** (updated at the Deadline 1 submission) include the following commitments secured in the **Outline Code of Construction Practice [PEPD-033]** and **Outline Construction Method Statement**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					[APP-255] which are secured through Requirements 22 and 23 respectively of the **Draft Development Consent Order [PEPD-009]**: • the specification of trenchless techniques to cross main rivers, SSSI, LWS and ancient woodland (commitments C-112, C-114 and C-216); • the implementation of wildlife sensitive lighting design (commitment C-105); • implementation of speed restrictions to avoid collisions with wildlife (commitment C-106); • implementation of biosecurity measures (commitment C-107); • measures to minimise disruption to watercourses and maintain fish passage (commitments C-64, C-205 and C-229); • reinstatement of temporary habitat loss within two years (commitment C-103); • measures to reduce hedgerow loss (commitment C-115 and C-224); • imposition of stand-off distances to watercourses (commitment C-135); • reduction in woodland loss (commitment C-204); and • pre-construction survey programme to implement appropriate mitigation based on latest distribution (commitments C-203, C-209, C-210, C-211, C-214 and C-232). The **Outline Landscape and Ecological Management Plan (LEMP) [APP-232]** which is secured through Requirement 12 of the **Draft Development Consent Order [PEPD-009]** also describes mitigation and compensation measures at the onshore substation site and grid connection point in terms of providing advanced planting to maintain connectivity and buffer

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					disturbance and compensation in the form of habitat creation. The measures summarised above will be delivered alongside a Biodiversity Net Gain strategy (commitment C-104) which is detailed in **Appendix 22.15: Biodiversity Net Gain Information, Volume 2** of the ES **[APP-193]** and is secured through Requirement 14 of the **Draft Development Consent Order** **[PEPD-009]**. This allows for enhancement and biodiversity net gain (BNG) to be delivered on land within affected districts. The habitats delivered at the onshore substation and reinstatement at areas of temporary habitat loss will be included within the BNG calculations as per Department for Environment, Food and Rural Affairs (Defra) guidance '*What you can count towards a development's biodiversity net gain*' (Defra, 2023). Regardless, there will remain a shortfall to reach a position of 'no net loss'. Therefore, this shortfall (alongside BNG) is to be delivered through the process described in **Appendix 22.15: Biodiversity Net Gain Information, Volume 2** of the ES **[APP-193]**.
J53	Table 22-25	As a precaution, potentially important hedgerows should be crossed via trenchless techniques. H245, H372, H464, H474, appears to be being crossed via trenched notched technique (14m temporary loss), as opposed to trenchless techniques (6m temporary loss), which has been stated for potentially important hedgerows H527 and H528.		Natural England request clarification be provided on how specified potentially important hedgerows are being crossed.	It is not possible in all instances to cross important and potentially important hedgerows with a 6m notch only. This is due to engineering considerations including where the cable changes direction, at road / track crossings and proximity to an trenchless crossing location (and therefore the need to string out ducts). The Vegetation Retention Plan within the **Outline Code of Construction Practice** **[PEPD-033]** is secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]** and it shows what will occur at each hedgerow.
J54	Table 22-25	Natural England also question why important hedgerows have the same length of temporary loss as not important hedgerow (noted for H481). Have embedded measures such as trenchless crossings not been assumed when calculating the estimated length of loss (i.e. depicting the realistic worst-case scenario)		Clarification from RED requested	See response to **reference J53**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
J55	22.9.101	Natural England note that the length of tree line to be temporarily lost is stated as 378m – Natural England question if this temporary loss is due to an access route, or due to the proposed cable route. If temporary loss is due to the cable route, Natural England were of the understanding that trees could not be planted over the cable.		Clarification from RED requested, as to the nature of the tree line reinstatement.	All tree line losses are associated with cable installation or access to the onshore cable route. **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the Environmental Statement **[APP-063]** states in footnote 46 in Section 22.9 that '*Reinstatement of tree lines may require different species to be planted above the cable ducts to ensure root damage can be prevented.' This is in acknowledgement that large trees such as oak and beech cannot be replanted over cables, however some smaller trees that may be typically thought of as hedgerow species (such as hawthorn, blackthorn, hazel etc.) could be grown and managed as individual trees.'* It is noted that in the assessment of BNG (**Appendix 22.15: Biodiversity Net Gain Information, Volume 4** of the ES **[APP-193]**) all habitat temporarily lost to development is considered to be lost and then replaced through creation. This ensures that the temporal risk associated with the length of time it requires for habitats to re-establish is taken into account.
J56	22.9.102	Natural England note that reference is made to 80% success rate for embedded measure (hedgerow translocation) used in the Lake District National Park. We question whether an 80% success rate is expected for this development.		Natural England advise that further justification and evidence be provided to support this 80% success rate for hedgerow translocations for this development. Local context/factors should be considered to assess the likely success rate for this development, this should be used to inform the Landscape and Ecology Management Plan (LEMP). Natural England are also concerned that	The realistic worst-case scenario used within **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the Environmental Statement (ES) **[APP-063]** as the basis for assessment is that all hedgerows that are crossed are cut and replanted (mainly within notches). The temporary translocation of hedgerows has been included in commitment C-115 (**Commitments Register [APP-254]** which is secured in the **Outline Code of Construction Practice [PEPD-033]**, Requirement 22 of the **Draft Development Consent Order [PEPD-009]**) (updated for the Deadline 1 submission) as it could provide a good option to retain diversity, aid the speed of reinstatement and provide structure. However, it is noted in commitment C-115 (**Commitments Register [APP-254]**) that this will only be delivered where appropriate conditions exist and chances of success are good. This would be detailed in the Code of

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
				temporary visual impacts to the SDNP could occur if the translocation success rate has been overstated. Collectively, temporary hedgerow loss within the SDNP could lead to significant visual impacts, until the hedgerows are fully reinstated. Natural England would therefore advise that these impacts could be appropriately avoided (or greatly reduced) to the SDNP, if trenchless techniques (such as pipe jacking) were utilised for all hedgerow crossings within the SDNP.	Construction Practice and the Landscape and Ecology Management Plan secured through Requirements 22 and 12 of the **Draft Development Consent Order [PEPD-009]**. It is a technique that has been highlighted as a way in which effects could be mitigated, however whether it is used or not depends on the Code of Construction Practice and the Landscape and Ecology Management Plan being approved by the relevant local planning authority and Natural England. The Applicant is of the opinion that this approach may be beneficial, on the basis of the implementation of appropriate monitoring and pre-agreed rapid responses to failure (i.e. ensuring additional planting is provided promptly). It should be noted that this approach (temporary translocation and replacement of hedgerows) was considered acceptable in the consented Brechfa Forest Connection project (see paragraph 5.2.99 and Requirement 28 of the Examining Authority's Report of Findings and Conclusions to the Secretary of State for Energy and Climate Change NI Report Template (planninginspectorate.gov.uk).
J57	22.9.104	Natural England note that there is no direct compensation proposed for the permanent loss of approximately 622m of hedgerow/tree line.		Majority of loss is located at the proposed substation location. Natural England would therefore expect to see substantial BNG proposed in the local area, as outlined within commitment C-104.	Loss of hedgerows with trees from the Oakendene site are not re-provided within the indicative landscape plan shown in the **Outline Landscape and Ecological Management Plan (LEMP) [APP-232]** which is secured through Requirement 12 of the **Draft Development Consent Order [PEPD-009]** and comprising part of the **Design and Access Statement [AS-003]**. This is because other habitats in this location are considered more appropriate and beneficial in terms of screening and provision for protected species such as dormouse. The use of the Statutory Biodiversity Net Gain system as laid out by the Department for Environment, Food and Rural Affairs (Defra) (November, 2023) will be used to deliver the short fall of biodiversity units to reach 'no net loss' (i.e. compensation) and biodiversity net gain (BNG). **Appendix 22.15: Biodiversity Net Gain**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					Information, Volume 4 of the ES **[APP-193]** provides a hierarchy for choice of appropriate opportunities with priority for delivering local BNG on landholdings that have been affected by the Proposed Development.
Document used: [APP-064] 6.2.23 Environmental Statement - Volume 2 Chapter 23 Transport					
J58	23.4.18	Natural England query why traffic generation has only been calculated for a 5-day working week when it says the working hours will be Mon-Fri 07:00-19:00 and Sat 08:00-13:00.		Further consideration advised.	Paragraph 5.8.11 (first bullet) within the **Traffic Generation Technical Note [APP-197]** which has been updated at the Deadline 1 submission states that *'for robustness, weekday traffic numbers have been calculated on the basis of dividing the weekly traffic by five working days per week'*. This provides a worse case for assessment as dividing the weekday traffic to include Saturday working (e.g. dividing by 5.5) would result in lower construction traffic flows. An update to the core working hours in commitment C-22 has been included within the updated **Commitments Register [APP-254]** provided at Deadline 1 submission. It states: *'Core working hours for construction of the onshore components will be 08:00 to 18:00 Monday to Friday, and 08:00 to 13:00 on Saturdays. Apart from specific circumstances that are set out in the Outline COCP, where extended and continuous periods of construction are required.* *Prior to and following the core working hours Monday to Friday, a 'shoulder hour' for mobilisation and shut down will be applied (07:00 to 08:00 and 18:00 to 19:00). The activities permitted during the shoulder hours include staff arrivals and departures, briefings and toolbox talks, deliveries to site and unloading, and activities including site and safety inspections and plant maintenance. Such activities shall not include noise generating activity including use of heavy plant or activity resulting in impacts, ground breaking or earthworks.'* This will be updated in the next revision of the **Outline Code of Construction Practice [PEPD-**

					033] which is anticipated to be at Examination Deadline 3.
J59	23.7.28	Natural England note that 100 vehicle movements per day during operation associated with the development is far below what we would normally screen in for traffic related air quality impacts.		No further comments.	Noted, the Applicant has no further comments on this matter at this time.
J60	23.7.39	Natural England note that 39 HGVs per day during construction is below the 200 AADT screening threshold for traffic related air quality impacts.		No further comments.	Noted, the Applicant has no further comments on this matter at this time.
Document used: [APP-067] 6.2.26 Environmental Statement - Volume 2 Chapter 26 Water environment					
J61	Table 26-10	Dew pond at Hill Barn, Warningcamp has been screened in as per Natural England's request.			Noted, the Applicant has no further comments on this matter at this time.
J62		It is not clear whether the cable route splits into two sections at TC-12 and TC-15.		Natural England seek clarification as to the purpose of having multiple options at TC-12 and TC-15. Would the worst-case scenario see all trenchless crossings compound alternatives used to install the proposed cables?	The flexibility (described further below) is required due to the engineering complexity of the crossings in these two locations and allows further ground investigation and detailed design to take place to optimise the crossing. The flexibility in the routes sought at TC-12 and TC-15 is illustrated in the Crossing Schedule in Appendix A of the **Outline Code of Construction Practice** **[PEPD-033]** in Table 1-1, 1-2 and 1-3 and Sheet 9 and Sheet 12 of the accompanying figure. Only one final route will be used as opposed to the suggested worst case described in this comment of all crossing locations being used. The location of the trenchless crossing and onshore cable route will be confirmed in the stage specific Onshore Construction Method Statement, provided in accordance with the **Outline construction method statement** **[APP-255]** which is secured through Requirement 23 of the **Draft Development Consent Order** **[PEPD-009]**. Each of these potential routes have been considered to be equal in the assessment of potential effects provided in Section 26.9 –

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
J66	2.4.5	'Final bank reinstatement may require further measures to stabilise the banks and prevent erosion' – Natural England would like to query the length of time for post construction monitoring and remedial works. Will this also be up to 10 years after completion of construction.		Clarification requested.	All reinstated habitats including watercourses and associated riparian vegetation will be maintained and monitored for 10 years. This is stated within the **Outline Landscape and Ecology Management Plan (LEMP) [APP-232]** Section 5. The delivery of a detailed Landscape and Ecology Management Plan, which accords with the outline version submitted as part of the application, is secured through Requirements 12 and 13 of the **Draft Development Consent Order [PEPD-009]**.
J67	Table 3-1 F	'Keep the duration of the isolation works as short as possible.' – is there a rough timeframe, or a maximum amount of time that can be stated? "Short as possible" is a lax term which should be further defined.		Natural England request clarification on the term "short as possible".	Paragraph 22.9.116 of **Chapter 22: Terrestrial ecology and nature conservation, Volume 2** of the ES **[APP-063]** describes the placement of duct blocks thus '*The trenches to receive the cable ducts will be dug and the duct blocks put in place. These blocks will then be buried using the existing material, and the bank sides returned to the original shape. Estimates are that the ducts will all be put in place within a 48 hour period*.' The associated haul road (where necessary) would be installed within this period, but would be in place for a longer period of time whilst being used to deliver the cabling works within the relevant section.
J68	General Comment	Natural England defer to our standing advice for fish, which can be found on Fish: advice for making planning decisions - GOV.UK (www.gov.uk)		Natural England defer to standing advice	Noted, the Applicant has no further comments on this matter at this time.
Document used: **[APP-185] 6.4.22.7 Environmental Statement - Volume 4 Appendix 22.7 Great Crested Newt environmental DNA survey report**					
J69	1.1.3	250 metre (m) survey buffer around the scheme boundary.		More justification will be required to explain why a 250m buffer has chosen to be pursued over a 500m buffer from the Order Limit.	A buffer of 250m was used, as the intent is to retain all ponds within the proposed DCO Order Limits (whether supporting great crested newts or not). Therefore, the impact in question is largely temporary displacement from areas within which cable ducts would be buried. Much of the habitat in these locations is suboptimal. The desk study highlighted the presence of great crested newts in most areas along the onshore cable route and the survey effort was tailored to confirm this finding.

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
				full picture of the waterbodies involved.	
J74	All	Consideration of all waterbodies.		From reviewing the Figures, there appears to a number of waterbodies that did not receive survey effort, such as ditches and lakes. In addition, please be mindful that GCN can also choose to utilise artificial structures for breeding, such as concrete lagoons, fire ponds or disused swimming pools. Where waterbodies have been discounted for suitability, this will need to be justified should an EPS mitigation licence be required.	Surveys were undertaken on waterbodies where great crested newt habitat was identified. Commitment C-214 of the **Commitments Register [APP-254]** (provided at Deadline 1 submission) provides for further great crested newt survey prior to construction and is secured through the **Outline Code of Construction Practice [PEPD-033]**, Requirement 22 of the **Draft Development Consent Order [PEPD-009]**. This will include a review of waterbodies present at the time, with survey work then tailored to meet results.
J75	All	GCN waterbodies fall within the development boundary.		Should an EPS mitigation licence be required, where GCN breeding waterbodies are being lost as a result of the development, consideration must be given to suitable and proportionate compensation. For every GCN waterbody lost, there would be the expectation of two suitable GCN waterbodies to be created.	As outlined in **reference J69**, all ponds within the proposed DCO Order Limits are to be retained.

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
J76	All	Multiple clusters of GCN waterbodies and metapopulations across the length of the route.		Should an EPS mitigation licence be required, consideration needs to be given to the potential for fragmentation or severed connectivity and how this will be addressed through suitable mitigation and compensation solutions. Establishment periods for compensation habitat must be considered and built into Works Schedule approaches. This is particularly important in situations where the created compensation feature(s) is to be relied upon in a receptor area. It is also likely to be necessary to consider multiple receptor locations. Each captured GCN would ideally be moved no further than 500m from the location that it was captured and be moved to an area where it would have access to suitable supporting habitat for foraging resting and breeding.	Cable duct laying is expected to progress rapidly at approximately 150m per day. Therefore, exclusion from a working area due to active construction efforts will be transitory. However, it is recognised that the habitat prior to and following reinstatement (until it matures) will be less easy to commute through. No herptile fencing is expected to be used. Instead, a district level licensing approach to cover off temporary and permanent loss of terrestrial habitat will be used.
Document used: APP-186 6.4.22.8 Environmental Statement - Volume 4 Appendix 22.8 Passive and active bat activity report					
J77	All	The transects and static detector surveys with the above GLVA have provided a good understanding of the likely bat species assemblage to be impacted as well as the likely bat activity levels in the proposed DCO order limits. They have also been able to provide an indication of how bats are utilising the impacted habitat.		Should an EPS mitigation licence be required Natural England would expect that pre-construction surveys are	Commitment C-211 of the **Commitments Register [APP-254]** (provided at Deadline 1 submission) provides for further bat survey prior to construction and is secured through the **Outline Code of Construction Practice**

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
		No hibernation surveys have been completed and therefore no information on the hibernation potential of the areas to be impacted has been provided.		conducted to further inform on bat activity as well as roost status and location. Surveys should be designed appropriately and proportionately for the impacts. An assessment of the hibernation potential as well as any follow up hibernation surveys should be included in any licence application. As Annexe II species have been identified during the desk studies then this may warrant surveys including Advanced Level Bat Survey Techniques to be able to fully understand the predicted impact to favourable conservation status.	**[PEPD-033]**, Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. Hibernation surveys were not carried out as no structures or underground sites will be affected by the Proposed Development. The ground level visual assessment (GLVA) provides information on the trees that have the potential to support roosting bats.
J78	2.4.10 3.4	Survey limitations -Some of the manual transect routes required modification due to a number of varying reasons this has now meant that some of the data may not be comparable across years. Also due to technical issues several of the passive detectors have not been successful in capturing useable data.		Should an EPS mitigation licence be required these surveys may need to be repeated if an ecological interpretation of the habitat and bat activity in these areas affected cannot be made due to lack of data.	Commitment C-211 of the **Commitments Register** **[APP-254]** (provided at Deadline 1 submission) provides for further bat survey prior to construction and is secured through the **Outline Code of Construction Practice** **[PEPD-033]**, Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. These will be used to inform future licence applications as necessary.
J79	3.1	Land access limitations.		Once the DCO is granted it would be expected that areas previously not surveyed due to access issues should be included in the pre-construction surveys.	Commitment C-211 of the **Commitments Register** **[APP-254]** (provided at Deadline 1 submission) provides for further bat survey prior to construction and is secured through the **Outline Code of Construction Practice** **[PEPD-033]**, Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**.

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
J82	2.4.7	As the design of the Proposed Development evolved, a number of the survey sites are no longer within or adjacent to the proposed DCO Order Limits.		Suitability and connectivity of habitat can change and may mean that dormouse adapt how they utilise the landscape. It is recommended to regularly update the surveys based on the proposed impacts within and adjacent to the proposed DCO Order Limits. With the change in the Order Limits, it may be that the survey locations are updated/adjusted in line with the Best Practice Guidelines, 'The Dormouse Conservation Handbook, Second Edition'.	Commitment C-232 of the **Commitments Register** **[APP-254]** (provided at Deadline 1 submission) provides for further dormouse survey prior to construction and is secured through the **Outline Code of Construction Practice** **[PEPD-033]**, Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**.
J83	2.5.2 & 2.5.3	Nest tube deployment timing has ranged across the chosen sites.		It is recommended that nest tubes should also be left in place for several months. Nest tubes are most frequently occupied in May and August/September. Timing their deployment is therefore important. Setting them out in April may get early results, while setting them out in June may be less immediately successful. It is best to leave them out for the entire season, from March onwards, for checking in November.	Commitment C-232 of the **Commitments Register** **[APP-254]** (provided at Deadline 1 submission) provides for further dormouse survey prior to construction and is secured through the **Outline Code of Construction Practice** **[PEPD-033]**, Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**. Those undertaken during the detailed design process will not take a sampling approach as they will need to cover all suitable habitats for dormouse where vegetation removal is anticipated. These surveys will follow guidance in The Dormouse Conservation Handbook, Second Edition (Bright et al., 2006).

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
		badger setts that would be directly impacted by the proposed works in terms of sett closures. However, areas of loss of foraging ground have been identified. Natural England agree that the survey effort and survey area is appropriate and proportionate for the proposed low impact works that could affect badgers described regarding the proposed Rampion 2 Wind Farm works. Natural England agree that the preconstruction surveys should be conducted on habitat that is suitable to support badgers which is warranted to due to the high levels of badger activity in the area, the presence of badger setts that have already been recorded as well as taking into consideration the mobile nature of the species. Natural England would agree based on the survey evidence collected to date and the Environmental measures proposed in the above documents that overall impacts to badgers would be low.		consulted further. Surveys to inform on licence applications should be robust and proportionate for the scales of the proposed impacts of the development. NB If a main sett is required to be damaged or destroyed then bait marking surveys are likely to be required as part of the licence application to ensure the best placement for any artificial setts proposed.	Comments on licensing are noted. Commitment C-209 of the **Commitments Register** **[APP-254]** (provided at Deadline 1 submission) is secured through the **Outline Code of Construction Practice** **[PEPD-033]**, Requirement 22 of the **Draft Development Consent Order (DCO)** **[PEPD-009]** and provides for further badger survey prior to construction.
J87	General advice	**Water Vole:** It has been stated that 90.75% of water vole suitable habitat has been surveyed that included the area within the red line boundary as well as a 50m buffer. For a development of this type of work and size the Water Vole Mitigation Handbook (Box 1 survey design) (Dean, Strachan, Gow, & Andrews, 2016) would suggest surveying for water voles within the footprint of the development boundary as well as 200m upstream and downstream. The deviation from this has not been fully explained within the documentation. Due to the small footprint of the works, the short time frame that the works are scheduled to be taking place and that all habitats lost will be reinstated, Natural England agree that the overall impacts to water voles would be low.		Where it is not possible to avoid direct impacts to water vole additional surveys would be required. These surveys should be used to determine the presence or absence of water vole burrows as well as looking for field signs. Where possible the locations of the burrows and field signs should be mapped and used to inform on appropriate mitigation plans. Surveys should follow best practice as described in the Water Vole Mitigation Handbook (Dean, et al 2016). The environmental measures to reduce impacts on water vole habitats, as described within the above	The Applicant welcomes Natural England's comments on water vole survey conclusions and acknowledgement of the suitability of the proposed environmental mitigation measures. It is noted that the Water Vole Mitigation Handbook recommends surveying both 200m upstream and downstream of the development boundary. This was not possible due to access restrictions, however the Applicant is confident that during the detailed design phase sufficient survey and design avoidance and mitigation will be available to ensure water vole are maintained within the local area without changes to their local population viability. Commitment C-210 of the **Commitments Register** **[APP-254]** (provided at Deadline 1 submission) is secured through the **Outline Code of Construction Practice** **[PEPD-009]**, Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]** and provides for further water vole survey prior to construction. This will be undertaken at a scale relevant to the works proposed in individual areas. Commitments C-5, C-8, C-64, C-76, C-135 and C-255 of the **Commitments Register** **[APP-**

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
				documents, such as the use of trenchless crossings, would appear to be appropriate and proportionate approaches. All works that may cause disturbance such as site traffic, use and storage of materials, noise and vibration should be considered, and water voles potentially displaced temporarily from the sites affected. Natural England would require additional information should a licence for displacement be required. This would include the full survey data (carried out under best practice) as well as any other limitations such as unsuitable habitat to displace into along with any necessary compensation proposals. As displacement over short areas is currently being proposed then Natural England's CL31 licence may be applicable.	**254]** (provided at Deadline 1 submission) all provide for necessary elements of water vole mitigation. These will be tailored to individual water course crossings following further post consent surveys with the aim being to avoid or reduce any potential effects. Should a mitigation licence be required this would be applied for following guidance provided by Natural England. These commitments are secured in the **Outline Code of Construction Practice** **[PEPD-033]** which is secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**.
J88	General advice	**Otter:** As above Natural England would expect that all suitable habitat within 200m of the proposed development footprint should be surveyed for the presence of otter. The deviation from this has not been fully explained within the documentation. Natural England are in agreement that otters can be scoped out for now and acknowledge that otters will be considered further during the implementation		No further comments.	Noted, the Applicant has no further comments on this matter at this time.

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
		of the Ecological Clerk of Works role as well as in any preconstruction surveys.			
J89	General advice on water vole licensing	With regard to timings, Natural England can offer general comments at this stage to factor into scheme design. If necessary, displacement during spring is the recommended approach and most likely to achieve successful results. Please see Water voles: licence to intentionally damage or destroy water vole burrows by displacement (CL31) - GOV.UK (www.gov.uk) for more information on Natural England water vole class licence that may be applicable. Given the timescales, if following the necessary detailed surveys or duration of works, trapping water voles becomes necessary during spring or autumn, there is adequate time to prepare any receptor sites ahead of trapping and as such taking water voles into captivity over winter will not be considered a viable option. It should be noted that as a result in changes in legislation brought about by Environment Act 2021, if an individual water vole licence is required for the works the application now needs to be submitted under the new purpose of 'reasons of overriding public interest' using new forms which have been published on Gov.uk. https://www.gov.uk/government/publications/water-voles-apply- for-a-mitigation-licence-a11 In addition, A Reasoned Statement – is now mandatory for water vole applications that are submitted for the purpose of Reasons of Overriding Public Interest. With regards to compensation or suitable receptor sites, thought should be given to preparing local (same river catchment) receptor sites and / or areas of habitat that could be improved for water voles as soon as possible to give the habitat chance to establish and become suitable. If the receptor sites are not ultimately required for translocation these sites could equally be offered in terms of compensation for any water vole habitat likely to lost/disturbed during the works.		No further comments.	Noted, the Applicant has no further comments on this matter at this time.
J90	General Badger Advice (ABS):	Construction of an artificial setts must be complete prior to the exclusion works and there should be evidence that the badgers have found the set. Evidence could be gained from a variety of monitoring techniques. Attractive bait such as peanuts as well as bedding can be used to assist the badgers locate the artificial sett. Artificial setts must be constructed: - in a suitable location, - within the territory of the affected badger social group (this can be determined using a bait-marking survey) - away from main roads, public rights of way or sources of danger to badgers,		No further comments.	Noted, the Applicant has no further comments on this matter at this time.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
		- using materials and in a manner which is sufficiently robust for long-term use by badgers, - made of materials not harmful to badgers, - of a size to reflect the importance and extent of the sett to be lost - provide a dry and well-ventilated (but not draughty) refuge, - ideally with vegetative cover immediately around the structure. - with the minimum internal diameter of artificial tunnels, chambers and sett entrances, being 300mm.			
Document used: **[APP-190] 6.4.22.12 Environmental Statement - Volume 4 Appendix 22.12 Reptile survey**					
J91	General comment	Natural England defer to our standing advice for reptiles, which can be found on Reptiles: advice for making planning decisions - GOV.UK (www.gov.uk)		Natural England defer to standing advice	Noted, the Applicant has no further comments on this matter at this time.
Document used: **[APP-191] 6.4.22.13 Environmental Statement - Volume 4 Appendix 22.13 Breeding bird survey**					
J92	General comment	Natural England defer to our standing advice for breeding birds, which can be found on Wild birds: advice for making planning decisions - GOV.UK (www.gov.uk)		Natural England defer to standing advice	Noted, the Applicant has no further comments on this matter at this time.
Document used: **[APP-192] 6.4.22.14 Environmental Statement - Volume 4 Appendix 22.14 Onshore winter bird report 2020-2022**					
J93	General	Natural England acknowledge and welcome that two seasons of wintering bird surveys have been successfully undertaken, as previously requested within our original PEIR response (16 September 2021)		No further comment.	Noted, the Applicant has no further comments on this matter at this time.
Document used: **[APP-193] 6.4.22.15 Environmental Statement - Volume 4 Appendix 22.15 Biodiversity Net Gain information**					
J94	General comment	Natural England welcome the commitment of delivering a Biodiversity Net Gain (BNG) of at least 10% for all onshore and intertidal habitats subject to permanent or temporary loss as a result of the construction and operation of the proposed development.		Natural England would advise that it would be beneficial if RED submitted a rough metric to demonstrate the 10%, which is then to be built upon at detailed design stage.	The Biodiversity Metric 4.0 workbook that was used to demonstrate the extent of the shortfall in habitat, hedgerow and river units will be submitted at a future deadline following programmed discussions with Natural England, West Sussex County Council and South Downs National Park Authority.
J95	General comment	To avoid confusion and double counting, there should be a clear differentiation between the delivery of compensation and enhancement (BNG). Would highly recommend that a clear log is created, to identify and track delivery of compensation and enhancements (BNG).		Natural England advise that proposed delivery of compensatory habitat, and enhancement and habitat delivery from BNG, need to be set out in an easily understandable log. This is to prevent confusion	Please see response in **reference J52**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
				and the risk for double counting.	
J96	3.1.7	Natural England note that Local Nature Recovery Strategies (LNRS) will be published by March 2025. However, we are aware that some local authorities are producing interim documents, so it is sensible to keep checking if an interim report is submitted for West Sussex.		No further comment. Notification only.	Noted, the Applicant has no further comments on this matter at this time.
J97	Table 4-2	Natural England note that there is no guarantee that hedgerows that have been 'temporary lost' will be reinstated.		Natural England note that 10 years of monitoring and hedgerow reinstatement is proposed. However, is it appropriately precautionary to propose that 100% of the 'temporary lost' hedgerow will be successfully reinstated within the 10 year post construction monitoring period? Greater evidence should be provided to support the claim that all temporary lost hedgerows will be reinstated.	There will be permanent loss of hedgerow at the onshore substation site at Oakendene as shown in Table 4-2 of **Appendix 22.15: Biodiversity Net Gain information, Volume 4** of the Environmental Statement **[APP-193]** equating to 0.62km of permanent loss. Other locations have hedgerow removed temporarily to allow for cable installation and access. These locations have all been assumed to have hedgerow reinstated. Given that hedgerows are routinely planted and managed across England, the Applicant is unsure as to why Natural England are concerned that hedgerow would not be able to be reestablished within a 10 year time frame. Especially as the plantings will be in locations already supporting this habitat type. Further discussions and clarifications with Natural England will be sought on this point.
J98	Table 4-1 & Table 4-2	Natural England note that numerous documents refer to loss of woodland that cannot be replaced due to the presence of cables, however the tables appear to show no permanent loss of woodland.		Natural England requests clarification on this discrepancy.	Table 4-1 of **Appendix 22.15: Biodiversity Net Gain information, Volume 4** of the Environmental Statement **[APP-193]** notes (see footnote 5) that reinstatement will be with mixed scrub. It is acknowledged that this could be clearer. However, it is noted that in the on-site habitat creation tab of the Biodiversity Metric workbook all woodland creation is associated with the onshore substation site at Oakendene only.
Document used: **[APP-194] 6.4.22.16 Environmental Statement - Volume 4 Appendix 22.16 Arboricultural Impact Assessment**

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
J99	General Comment	Natural England support the planting of native and naturalised species		No further comment	Noted, the Applicant has no further comments on this matter at this time.
J100	Species Selection Table 8-5	Natural England note that species mix reference C includes Quercus *cerris* – Turkey Oak, which is a non-native species, which can host parasitic wasps which can indirectly affect native oak trees.		Natural England advise that Turkey Oak be removed off the species mix reference C list, or justification should be provided for the selection of this species.	This is noted as an errata, see **1.1 Cover Letter [PEPD-001]** which was submitted at Pre-Examination Procedural Deadline A on 16 January 2024.
Document used: **[APP-195] 6.4.22.17 Environmental Statement - Volume 4 Appendix 22.17 Bat tree ground level visual assessment survey**					
J101	All	Natural England has no comments on the methods used in the ground level visual inspections surveys described in the above documentation.		n/a	Noted, the Applicant has no further comments on this matter at this time.
Document used: **[APP-224] 7.2 Outline Code of Construction Practice**					
J102	General comment	Natural England welcome the commitment to reinstate to pre-existing conditions in line Defra 2009 Code of Construction Practice for the Sustainable Use of Soils on Construction Sites, but this needs to go wider so that best and most versatile agricultural land is returned to the same Agricultural Land Classification (ALC) grade as pre-construction.		Natural England advise that this commitment should extend, more specifically, to returning best and most versatile agricultural land back to the same Agricultural Land Classification (ALC) grade as pre-construction. This design principle should also extend to land temporarily required for construction but being returned to a 'soft' non-agricultural after-use.	Commitment C-7 of the **Commitments Register [APP-254]** has been amended for the Deadline 1 submission as follows: '*Post construction, reinstatement of agricultural land, or other areas of 'soft' land use where the natural soil profile is present, will be ~~the work area will be reinstated~~ to pre-existing conditions, and if remaining in agricultural use to the original ALC grade, where the design allows (including over the onshore cable ducts which form the majority of the Proposed Development), ~~as far as reasonably practical~~ in line with the Materials Management Plan (MMP) (C-69) and Defra 2009 Code of Construction Practice for the Sustainable Use of Soils on Construction Sites PB13298. The stage specific Soil Management Plan(s) (SMP(s)) are to be used in conjunction with the MMP (and Soil Resource Plan – which will be integrated with and may form a sub-section of the MMP) to maximise the restoration of excavated soils to their pre-existing condition and location, and if this is not possible, to maximise the reuse of soils within the Proposed Development, minimising soils being relocated outside the Proposed Development or becoming waste.*'

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
J103	C-7	ALC grades need to be maintained – 'as far as reasonably practical' seems to imply that restoration back to previous state is not necessarily a requirement.		Natural England advise that wording for commitment C-7 is modified, to state that ALC will be reinstated to their pre-existing condition.	Please see response in **reference J102**.
J104	C-27	*'Following construction, construction compounds will be returned to previous conditions as far as reasonably possible'*		Same as above comments – Natural England advise that commitment wording should be updated and should more accurately define the expectation for reinstatement.	Please see response in **reference J102**.
J105	5.3.5	Treatment of soil during reinstatement –Natural England note that it is unclear whether subsoil material is being retained and reinstated separately, in the same way as topsoil.		Natural England advise that both topsoil (typically top 25cm) and subsoil (typical remaining soil to 1.2m) require reinstatement.	Section 5.2 of the **Outline Soils Management Plan** **[APP-226]** states in paragraph 5.2.7 that topsoil and subsoil resources should be stripped and stored separately in low bunds. To ensure clarity, it is proposed to update this measure. This is noted as an errata, see **1.1 Cover Letter** which has been submitted at Deadline 1.
J106	C-12	Natural England note that the machinery to be used has not been specified.		Natural England advise that the machinery used should accord with best practice as set out in Defra 2009 Code of Construction Practice for the Sustainable Use of Soils on Construction Sites, namely using excavators and dump trucks. Use of bulldozers should not be permitted for any subsoils being returned to best and most versatile quality due to the high risk of soil compaction due to repeated trafficking. Bulldozers should not normally be used, other than if a modified loose tipping method of topsoil	The Applicant agrees and machinery to be used for soil handling is specified in paragraph 5.2.19 of the **Outline Soils Management Plan** **[APP-226]** which states that soil stripping, stockpiling, and removal from storage will be carried out in accordance with Section 5.4 in the Department for Environment, Food and Rural Affairs (Defra) Construction Code of Practice (Defra, 2009), and that soils will be reinstated, or placed, by tracked hydraulic excavator using the loose tipping method (Section 6.1 in the Defra Construction Code of Practice (Defra, 2009), with only gentle firming by tracked vehicles.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
				(not subsoil) replacement is employed in line with the Defra Construction Code.	
J107	Management Measures 5.5.4	Natural England advise that the Soil Management Plan (SMP) should show the areas and type of topsoil and subsoil to be stripped, haul routes to be used, the location and type of each soil stockpile.		Natural England advise that the SMP should be a key document feeding into the Materials Management Plan (MMP) and should include: the areas and type of topsoil and subsoil to be stripped, haul routes to be used, the location and type of each soil stockpile.	The Applicant is committed to developing a Soil Resource Plan (as defined in the **Outline Soils Management Plan [APP-226]**), during pre-construction, which is either a sub-section of the Materials Management Plan (MMP) or which cross-references the MMP, and which will cross-reference the Final SMP and the Site Waste Management Plan. The Soil Resource Plan will identify the areas and types of topsoil and subsoil to be stripped, haul routes, and the location and type of each stockpile.
J108	5.4.4	Natural England advise that soil handling should normally be avoided during November to March inclusive, irrespective of soil moisture conditions, because it will generally not be possible to establish vegetative cover over winter to help dry out soils and protect them from erosion.		Natural England advise that soil handling is avoided during November to March inclusive.	The **Outline Soils Management Plan [APP-226]** states that activities including topsoil stripping and trench excavation will be focused in drier periods where possible (typically between the start of May and end of October).
J109	5.4.4	Natural England advise that soils should only be handled in a dry and friable condition.		A field suitable method for assessing whether soils are in a dry and friable condition based on plastic limits is set out in Part One (Explanatory Note 4 – Table 4.2) of the Institute of Quarrying's Good Practice Guide for Handling Soils in Mineral Working. We advise that this approach together with the associated rainfall protocols should be adopted.	This approach is included as a requirement for assessing whether soils are sufficiently dry to be handled in Section 5.2 of the **Outline Soils Management Plan [APP-226]**.
J110	C-21	Natural England advise that an intention to remove vegetation over the winter period needs to be balanced against the risk of soil damage from use of heavy machinery on wet soils and leaving soils bare over-winter.		Natural England advise that in most circumstances, soils should remain vegetated over –winter and trafficking by heavy	A Vegetation Retention Plan is included within Appendix B of the **Outline Code of Construction Practice [PEPD-033]**. Scheduling of works in individual areas and approach to working over winter and vegetation removal will be covered in the stage specific

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
				machinery should be avoided.	CoCP (secured through Requirement 22 of the **Draft Development Consent Order [PEPD-009]**) which will be submitted to and approved by the relevant planning authority in consultation with the statutory nature conservation body.
J111	C-257	It is unclear whether the proposed stage specific Materials Management Plans (MMPs) will be provided prior to consent or post consent as noted for the stage specific Soil Management Plans (SMPs).		Natural England request clarification.	The stage specific Soil Management Plans (SMPs) and Materials Management Plans (MMPs) will be provided post consent.
Document used: **[APP-226] 7.4 Outline Soils Management Plan**					
J112	1.2.5	Natural England concurs with this approach		We would be happy for stage specific surveys to be undertaken post consent, but would expect a more detailed desk-based assessment at the planning stage. Utilising published soil information to provide a likely indication of the soil properties and likely ALC grade and using site specific post 88 ALC data where available	The Applicant has utilised available published provisional agricultural land classification (ALC) data and post-1988 ALC data (see response in **reference J35**) in conjunction with ALC survey data obtained for the Proposed Development in the assessment. The likely presence of best and most versatile land has been considered throughout the design process and environmental assessment as an environmental constraint, initially using only the published provisional and post-1988 ALC information, and at the ES stage also using the ALC survey data obtained for circa 40% of the proposed DCO Order Limits. Due to the linear nature of the Proposed Development, there is limited opportunity for micro-siting to avoid specific ALC grades, however the Applicant is committed to doing this in the detailed design where possible, such as in the locating of joint bays (commitment C-259 of the **Commitments Register [APP-254]** provided at Deadline 1 submission and is secured through the **Outline Soils Management Plan [APP-226]**, Requirement 22 of the **Draft Development Consent Order [PEPD-009]**).
J113	1.2.6	Natural England support the provision of a Soil Management Plan (SMP) and we advise under para 5.1 of the Defra Construction Code of Practice (Defra, 2009). An SMP will normally form part of the Materials Management Plan for the site. It should include the following:		No further comments.	The Applicant is committed to developing a Soil Resource Plan (as defined in the **Outline Soils Management Plan [APP-226]**), during pre-construction, which will form part of the suite of management plans including the stage specific

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
		• maps showing topsoil and subsoil types, and the areas to be stripped and left in-situ. • Methods (including machinery) for stripping, stockpiling, respreading and ameliorating the soils. • location of soil stockpiles and content (e.g. Topsoil type A, subsoil type B). • schedules of volumes for each material. • expected after-use for each soil whether topsoil to be used on site, used or sold off site, or subsoil to be retained for landscape areas, used as structural fill or for topsoil manufacture. • identification of person responsible for supervising soil management			Soils Management Plan (SMP), Materials Management Plan (MMP), and Site Waste Management Plan (SWMP). Commitment C-183 of the **Commitments Register** [**APP-254]** (provided at Deadline 1 submission) states that an *'Outline Soils Management Plan (SMP) has been developed (included in the Outline CoCP) to enable construction works to be completed in accordance with the Defra Code of Construction Practice for the Sustainable Use of Soils on Construction Sites 2009 to protect soil resources from damage during the construction phase'* and is secured by Requirement 22 of the **Draft Development Consent Order (DCO) [PEPD-009]**. In accordance with Section 5.1 of the Defra Construction Code of Practice (Defra, 2009), the Soil Resource Plan will include: • maps showing topsoil and subsoil types, and the areas to be stripped and left in-situ. • schedules of volumes for each material. • expected after-use for each soil whether topsoil to be used on site, used or sold off site, or subsoil to be retained for landscape areas, used as structural fill or for topsoil manufacture. • identification of the person responsible for supervising soil management. See response in **reference J106** regarding specification of methods (including machinery) for stripping, stockpiling, respreading and ameliorating the soils in accordance with the Defra Construction Code of Practice (Defra, 2009). Section 5.2 of the **Outline Soils Management Plan [APP-226]** details how soil stripping, storage and soil reinstatement are to be carried out. The stage specific SMP(s) are to be used in conjunction with the SRP and MMP to maximise the restoration of excavated soils to their pre-existing condition and location, and if this is not possible, to maximise the reuse of soils within the Proposed Development, minimising soils

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					being relocated outside the Proposed Development or becoming waste.
J114	3.1.2 & 3.1.3	The SMP should recognise the exact amount (%) of Best Most Versatile (BMV) land that has been identified in the ALC report. I.e. 53.5ha (23%) of grade 2 BMV land and 22.1ha (10%) of grade 3a BMV land totalling some 33% of the cable route is BMV land.		No further comments.	The Applicant has utilised available published provisional agricultural land classification (ALC) data and post-1988 ALC data (see response in **reference J35**) in conjunction with ALC survey data obtained for the assessment in **Chapter 20: Soils and agriculture, Volume 2** of the Environmental Statement **[APP-061]**. The Applicant proposes to add the summary findings to the **Outline Soils Management Plan [APP-226]** in the baseline agricultural land quality section. This is noted as an errata, see **1.1 Cover Letter** which has been submitted at Deadline 1.
J115	3.1.4	Predictive mapping would provide an additional indication of the ALC grade, and thus the potential impact on BMV agricultural land, however, it does not provide the soil details required to inform soil management which would feed into the Soil Management Plan. There is a risk of soil damage, ALC degradation and long term or permanent loss of BMV from cable installation.		Natural England advise that soil will need to be handled according to best practice and reinstated to a high standard to reduce the impacts. The results from a detailed ALC survey would provide soils data to inform a soil management plan for the whole site regardless of whether the use is permanent or temporary in nature	The Applicant agrees with this recommendation and is committed to full soil and agricultural land classification (ALC) survey coverage during pre-construction (see response in **reference J35** and commitment C-183 in Table 20-17 in **Chapter 20: Soils and agriculture, Volume 2** of the Environmental Statement **[APP-061]**), the results of which will inform the stage specific Soil Management Plans (SMPs) and Materials Management Plans (MMPs) to be produced post-DCO award during pre-construction.
J116	3.1.6	Natural England support this approach.		No further comments.	The Applicant welcomes Natural England's support on this matter.
J117	5.2.7	For topsoils the preference is for 1 to 3m height in order to minimize the impact of storage on biological processes, whereas for subsoils where the biological activity is lower, subject to safe operations, mounds are often raised to heights of 3 to 5m depending on the resilience of the soils to compaction. Additionally, will bunds be single or multi-tier? The ALC has identified gleyed subsoils therefore Natural England seek clarification of the rationale of storage over direct placement.		Further information requested.	In relation to stockpile / bund height, Section 5.2 of the **Outline Soils Management Plan [APP-226]** the Applicant proposes to update paragraph 5.2.7 to confirm a maximum topsoil stockpile height of 3m and maximum subsoil stockpile height of 5m. This is noted as an errata, see **1.1 Cover Letter** which has been submitted at Deadline 1. No requirement for multi-tier bunds has been identified and these are not recommended in the **Outline Soils Management Plan [APP-226]**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					In relation to handling and storage of gleyed subsoils requiring excavation and reinstatement, some storage in stockpiles is likely to be needed to enable construction. Section 5.2 of the **Outline Soils Management Plan [APP-226]** includes the field test for assessing whether soils are sufficiently dry to be handled. The Applicant is committed to minimising the period of temporary storage of excavated soils, where they can be reinstated at their original location along the onshore cable route, this is stated in commitment C-19 within Table 20-17 of **Chapter 20: Soils and agriculture, Volume 2** of the ES **[APP-061]** which is secured by Requirements 10 Programme of works, 22 Code of Construction Practice and 23 Construction Method Statement of the **Draft Development Consent Order [PEPD-009]**.
J118	5.2.10	As mentioned above soil colour has only been recorded for the soil pit location.		Where further survey is required, Natural England request that soil colour is recorded using the Munsell colour notation where borings are taken in addition to soil pit notations.	See response to **reference J34** confirming that colours were checked against the Munsell colour notation. Therefore, the Applicant proposes that the **Outline Soils Management Plan [APP-226]** is updated to confirm that in future agricultural land classification (ALC) surveys completed for Rampion 2, the Munsell colour notation will be used for all observation points. The proposed addition (as new paragraph 3.1.7) is noted as an errata, see **1.1 Cover Letter** which has been submitted at Deadline 1. The update will be made in the next iteration of the **Outline Soils Management Plan [APP-226]**.
J119	5.2.12	In addition to our previous comment above on C-257.		We advise that stockpiles should not be positioned within the root or crown spread of trees, or adjacent to ditches, watercourses or existing or future excavations.	The Applicant proposes that this recommendation is included as a measure in the **Outline Soils Management Plan [APP-226]**. The proposed addition (as new paragraph 5.2.18) is noted as an errata, see **1.1 Cover Letter** which has been submitted at Deadline 1.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
J120	5.2.22	The depth of decompaction should reflect the depth of compaction. Additionally, where compaction is likely to take place further consideration should be given to providing a decompaction strategy to maximise the effectiveness of decompaction methods. Further guidance may be found here; IQ Soil Guidance Sheet O.pdf (hubspotusercontent30.net)		Natural England advise that our comments should be considered by RED.	The Applicant proposes to update paragraph 7.1.3 of the **Outline Soils Management Plan [APP-226]** to state that the proposed decompaction strategy for the soil types present will be outlined in the stage specific Soils Management Plans, to be produced post-DCO Application during pre-construction, and that the decompaction measures will be designed to reflect the depth of compaction observed. This is noted as an errata, see **1.1 Cover Letter** which has been submitted at Deadline 1.
Document used: **[APP-2327].10 Outline Landscape and Ecology Management Plan**					
J121	4.2.4	*'Any remediation required post initial restoration will be driven by commercial considerations of farming practice (land drainage is not functioning as previously) as opposed to habitat quality for biodiversity'* – Natural England note that visual impacts to SDNP have not been considered in the requirement for remedial action.		Natural England would advise that remediation required post initial restoration for landscape visual impacts to the SNDP should be for material consideration, if initial landscape restoration works have failed.	The Applicant is reviewing the **Outline Landscape and Ecological Management Plan (LEMP) [APP-232]** secured through Requirement 12 of the **Draft Development Consent Order [PEPD-009]** and considering Natural England's recommendation in the updated Outline LEMP to be submitted at Deadline 3.
J122	4.6.2	Reinstatement of calcareous grasslands could prove challenging at certain times of year. The seed bank stockpile should be stored for the shortest amount of time possible, and ideally reinstated during the autumn or late winter/early spring.		Timing of reinstated of the seedbank should be considered, whilst also minimising the length of time spent in a stockpile. If reinstatement is to occur during the summer months, we would expect a greater level of monitoring (and perhaps watering) during the initial reinstatement. This is to improve the success rates of reinstatement during the summer months. Additional consideration should also be given to areas of calcareous grassland to be reinstated within the SDNP, as poor or failure	No calcareous grassland is located in areas where proposed construction works are to take place (although a large expanse at Sullington Hill is crossed by trenchless crossing method). Should calcareous grassland be identified during surveys prior to construction (this would only be expected in areas where access for survey has been previously limited) then appropriate measures for construction and reinstatement would be described in the stage specific Code of Construction Practice (CoCP) and Landscape and Ecology Management Plan (LEMP) that are secured through Requirements 22, 12 and 13 of the **Draft Development Consent Order [PEPD-009]**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
				to reinstate could have visual landscape impacts upon the SDNP.	
Document used: **[APP-254] 7.22 Commitments Register**					
J123	General Comment	Natural England note that numerous commitments include flexible wording such as 'where practical, as far as reasonably practical, as far as reasonably possible, practicable minimum, as practical, or are not practical, wherever possible, minimal time possible, shortest practical timeframe'. Such wording reduces the confidence if the delivery of the proposed commitments, which also make up embedded mitigation measures. We observed such wording used in the following commitments C-1, C-6, C-7, C-12, C-17, C-19, C-27, C-67, C-75, C-78, C- 115, C-117 and C-128.		Natural England note there is regular use ambiguous terms utilised within a number of the embedded measures and commitments. As these embedded mitigation measures are to be relied upon for the project. Natural England advise that such terms should be further defined by RED, to understand the likely parameters and improve confidence in the delivery of these measures.	See response above in **reference J31**. The **Commitments Register [APP-254]** has been updated at Deadline 1 to signpost to where in the **Draft Development Consent Order [PEPD-009]** the commitment is secured.
J124	C-103	Natural England acknowledge the commitment that areas of temporary habitat loss will begin reinstatement within 2 years of loss. However, to ensure the successful reinstatement of sensitive habitats, or habitats in visually sensitive locations. This maximum timeframe of within 2 years, could be shortened for sensitive habitats and habitats in visually sensitive locations.		Natural England advise that an additional commitment could made for sensitive habitats (i.e. calcareous grassland being reinstated within 6 months of the temporary habitat loss)	The Applicant acknowledges Natural England's recommendation, but is not in a position to shorten this duration without detailed design information. It should be noted that as the cable duct installation will be delivered in sections the haul road will need to be retained regardless of habitat type being crossed (i.e. to avoid isolating parts of the works from the access point from the highway network).
J125	C-105	Lighting design commitment has not considered avoiding and minimising lighting impacts to the SDNP International Dark Sky Reserve.		Natural England advise that the commitment should also reference and consider minimising impacts SDNP International Dark Sky Reserve	See response provided in **reference J14**. Commitments C-66, C-105 and C-200 in the **Commitments Register [APP-254]** (provided at Deadline 1 submission) are secured through Requirements 12, 8 and the **Outline Code of Construction Practice [PEPD-033]**, Requirement 22 of the **Draft Development Consent Order [PEPD-009]** respectively and ensure minimisation of lighting effects from

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					construction of the onshore elements of the Proposed Development.
J126	C-112	Full risks of HDD operations at Climping Beach should be assessed in detail prior to commencement of operations.		Natural England request to be consulted in the event that remedial action requires works to be conducted within Climping Beach SSSI	Please see responses at **references J3** and **J6**. The Applicant notes that, should any remedial works be required, Natural England would be consulted.
J127	C-133	Natural England note that subsoil stockpiles should not be covered with topsoil as it will be impossible to remove the topsoil separately without mixing when soil is removed from the stockpile.		We advise that subsoil stockpiles should not be covered with topsoil and that this needs to be made clear in the text.	The Applicant proposes to update paragraph 5.2.7 in the **Outline Soils Management Plan [APP-226]** to confirm that subsoil stockpiles / bunds are not to be covered with topsoil to avoid mixing of topsoil and subsoil. This is noted as an errata, see **1.1 Cover Letter** which has been submitted at Deadline 1.
J128	C-148	During HDD operations under waterways, how will rivers appropriately be monitored during the night time.		Natural England advise that further clarification should be provided to outline how night time monitoring will be conducted during 24hr HDD operations.	Several embedded environmental measures have been put in place as part of the **Outline Code of Construction Practice (CoCP) [APP-224]** and secured via Requirement 22 of the **Draft Development Consent Order [PEPD-009]**. These measures will help minimise the potential risk of accidental contamination from drilling fluids upwelling and entering watercourses during the 24 hour HDD operations, which the Applicant considers to be very unlikely. This includes commitments C-234, C-236, C-241 and C-148 in the **Commitments Register [APP-254]** (provided at Deadline 1 submission) which are secured through the **Outline Code of Construction Practice [PEPD-033]**, Requirement 22 of the **Draft Development Consent Order (DCO) [PEPD-009]**. For example, C-241 (which covers day and night time fluid monitoring) sets out that "*during HDD activities, the drilling fluid engineer will carefully monitor the fluid usage in the recycling system and will quickly identify if fluid is being lost into the strata. If fluid loss is identified is identified there are a number of*

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
					measures that can be taken to seal the bore, including the following: 1. *Modifying the drilling fluid properties to increase the effectiveness of the bentonite clay filter cake that lines the line of the borehole;* 2. *Standard process and procedures in place for drilling, data collection, and communication;* 3. *Appropriate drill fluid monitoring (fluid properties, fluid volume and flow, and downhole annular pressure);* 4. *Addition of stop-loss materials to bridge and seal larger voids in the soil; and* 5. *Modifying the mud weight (drilling fluid density) to either balance or counter the groundwater pressure depending on ground conditions.*" In summary the above measures ensure that the risk will be routinely monitored by drill crews observing fluid levels in their drill fluid tanks. Loss of circulation would result in fluid levels in the tank dropping. In the unlikely event of drilling fluid entering the rivers, drill crews would pull back and adjust fluid properties to remediate.
J129	C193 & C196	Natural England acknowledge that replacement planting will be characteristic of the area and resilient to climate change.		Natural England advise that careful consideration of the landscape characteristics of the SDNP should be considered when selecting replacement planting within the SDNP.	The replacement planting will be detailed within the stage specific Landscape and Ecology Management Plan for agreement with the relevant local planning authority and Natural England. This is secured through Requirements 12 and 13 of the **Draft Development Consent Order** **[PEPD-009]**.
J130	C-200	In addition to minimising lighting impacts to residents and walkers of the SDNP, consideration should also be made to minimising impacts to the SDNP International Dark Sky Reserve.		Natural England advise that the commitment should also reference and consider minimising impacts SDNP International Dark Sky Reserve.	See response provided in **reference J14**. Commitments C-66, C-105 and C-200 in the **Commitments Register** **[APP-254]** (provided at Deadline 1 submission) ensure minimisation of lighting effects from construction of the onshore elements of the Proposed Development.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
J131	C-216	Natural England welcome commitment for all ancient woodland to be retained. Natural England request clarification as to whether this commitment only relates to trenchless crossing operations.		Natural England seek clarification to the specifics of this commitment.	No ancient woodland or veteran trees would be lost to the Proposed Development. Commitment C-216 within the **Commitments Register** **[APP-254]** (provided at Deadline 1 submission) has been updated at the Deadline 1 submission. Similarly veteran trees would have an appropriate stand off (as per UK Government guidance Natural England and Forestry Commission, 2022) applied (commitment C-174 within the **Commitments Register** **[APP-254]** provided at Deadline 1 submission).
Document used: **[APP-255] 7.23 Outline construction method statement**					
J132	2.11.1 & 3.4.2	Natural England note that ground investigation works are to be conducted post DCO acceptance. As ground investigation works are key to understanding the risks and feasibility of trenchless crossings, Natural England has consistently advised that ground investigation works be brought forward to inform the Environmental Statement of the DCO submission, specifically for trenchless crossing locations below sensitive habitats (e.g. ancient woodland) and in visually sensitive locations (e.g. chalk scarp at Sullington Hill LWS).		Without details of trenchless crossing feasibility, it is difficult to assess the scale and significance of the effect of the proposal on protected sites and important ecologically sensitive areas. Natural England request clarification as to whether trenchless crossings investigations will be concluded prior to the commencement of the construction phase. If new or materially different environmental effects arise (compared to those assessed in the Environmental Statement), we advise that these should be identified prior to the commencement of the construction phase, to allow for greater scope to avoid any potential adverse environmental effects.	See response above in **references J3** and **J4**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Section / Subject	Natural England's Comments	RAG	Recommendations	Applicant's Response
				As previously mentioned, Natural England advise that contingency measures should be assessed within the Environmental Statement, in the event that trenchless crossings are not feasible at ecologically and visually sensitive sites.	

© WSP Environment & Infrastructure Solutions UK Limited

Table 4-16 Applicant's Response to Addleshaw Goddard on behalf of Southern Gas Networks plc [RR-359]

Ref	Relevant representation comment	Applicant's response
2.39.1	Objection on behalf of Southern Gas Networks Plc (SGN) Addleshaw Goddard LLP acts on behalf of SGN and is authorised to make this relevant representation on its behalf in objection to the proposed Order. SGN is the licensed gas transporter for the Order area, and objects so as to ensure the protection of its interests in land and apparatus and the safe and effective operation of its gas transportation network. As a responsible statutory undertaker, SGN's primary concern is to meet its statutory obligations and ensure that any development does not impact in any adverse way upon those statutory obligations. The Promoter seeks powers within the Order for the compulsory acquisition of land and rights in which SGN is interested. SGN therefore wishes to protect its position in light of existing apparatus which is both within, and in the vicinity of, the proposed Order boundaries through suitable protective provisions being secured in the Order. SGN's rights to retain its infrastructure in situ and rights of access to inspect, repair and renew such apparatus within the limits of the respective Order must be maintained at all times, and access by SGN and its servants and agents to that apparatus for the purpose of its undertaking must not be restricted. Accordingly, SGN will require appropriate protective provisions to be included within the Order to protect its statutory undertaking and to ensure that public safety is not compromised. Equally both the Examining Authority and the Secretary of State will need to be satisfied that the project will not cause a serious detriment to the carrying out by SGN of its statutory undertaking before granting consent to the proposed Order. In view of the above, and pending agreement with the Promoter, SGN objects to the Promoter's application and reserves its right to make further representations during the Examination process should that be so necessary. However, SGN is in the process of reviewing the draft Order and associated plans and looks forward to engaging constructively with the Promoter in an effort to resolve all issues of concern. Should the Examining Authority require any additional information from SGN further to this representation, please contact Charlotte Jones of Addleshaw Goddard LLP, 3 Sovereign Square, Sovereign Street, Leeds LS1 4ER. Yours faithfully Addleshaw Goddard LLP.	The Applicant is in discussions with Southern Gas Networks Plc (SGN) to agree suitable Protective Provisions to maintain SGN's rights of access to inspect, repair and renew its infrastructure. There are several areas that require the provision and review of technical information which both parties are engaged with and anticipate to have resolved before the end of the Examination period. The Applicant will continue to seek compulsory acquisition rights to ensure that the Proposed Development can be delivered in parallel agree suitable protective provisions with SGN. The applicant will also engage with SGN to agree suitable arrangements in respect of property rights to avoid the need to exercise compulsory acquisition powers.

© WSP Environment & Infrastructure Solutions UK Limited

Table 4-17 Applicant's Response to Southern Water Services Limited [RR-360]

Ref	Relevant representation comment	Applicant's response
2.40.1	Relevant Representation – Rampion 2 Offshore Windfarm Project This relevant representation is submitted on behalf of Southern Water Services Limited ("SWS"). SWS is the appointed water and sewerage undertaker under the Water Industry Act 1991 for the area of the proposed development. As a result, SWS is subject to a number of strict statutory duties for the supply of water to c. 2.6 million people and providing sewerage services to c. 46 million people. SWS is therefore a statutory undertaker for the purposes of section 127 of the Planning Act 2008. Should the proposed Development Consent Order ("the DCO") be made to authorise Rampion Extension Development Limited ("the Applicant") to construct, operate and maintain the proposed Rampion 2 Offshore Windfarm ("the Scheme"), it would permit development within the Order limits in areas where SWS is responsible for providing water and sewerage services. To fulfil its statutory duties, SWS maintains a wide range of apparatus that is critical to the continuing efficacy of its services. If made, the DCO would authorise the exercise of powers over or near land in which SWS maintains assets and/or has other rights for the purposes of discharging its statutory duties. Unchecked, the exercise of such powers in respect of SWS's interests would cause severe detriment to it. Furthermore, should the DCO be made, it would authorise works within certain of SWS's groundwater abstraction capture zones – further information is required from the Applicant to confirm that the construction and operation of the Scheme would not give rise to any adverse effects on these zones, and that sufficient mitigation measures will be put in place. SWS notes the 'standard' set of protective provisions for the benefit of statutory undertakers contained in Part 1 of Schedule 10 to the draft DCO. SWS intends to engage with the Applicant on these matters going forward but absent such an arrangement having yet been formalised, SWS is obliged at this stage to formally object to the DCO application on the basis of the Scheme causing severe detriment to SWS's apparatus and operations. SWS will engage with the Applicant with a view to reaching a satisfactory arrangement during the examination. SWS does not propose at this stage to submit a Principal Areas of Disagreement Summary ("PADS"), given SWS understands there to be no SoCG between SWS and the Applicant in front of the Examining Authority presently. However, SWS would be very happy to submit a PADS alongside any SoCG in due course, if the Examining Authority would consider it beneficial.	Relevant information in relation to Southern Water Services Limited's (SWS') groundwater abstraction zones is provided in **Chapter 26: Water environment, Volume 2** of the ES **[APP-067]** and **Appendix 26.4: Hydrogeological Risk Assessment, Volume 4** of the ES **[APP-218]**. As noted in paragraph 26.6.72 of **Chapter 26: Water environment, Volume 2** of the ES **[APP-067]** the "…*proposed temporary construction corridor crosses the inner SPZ2s associated with the Southern Water public water sources at Angmering (10/41/310210, NGR TQ 064065) and Patching (10/41/310210, NGR TQ 091074), within the Worthing Chalk groundwater catchment. There is a proposed temporary construction and operational route along Michelgrove Lane within SPZ1 which will require minor road upgrades at several locations (A-26). There is also another light construction access route within Warningcamp SPZ1, which utilises existing farm tracks (A-25).*" Each of these matters were discussed with the Environment Agency and Southern Water at a targeted stakeholder meeting on 06 March 2023. Embedded environmental measures (C-246, C-250, C-251 and C-253) have been included within Table 26-20 in Section 26.7 of **Chapter 26: Water environment, Volume 2** of the ES **[APP-067]** to ensure the protection of these public water supplies (along with other licensed abstractions and PWSs) during proposed works. These measures are secured in the **Outline CoCP [APP-224]** and via Requirement 22 of the **Draft DCO [PEPD-009]**. Sections 26.9 to 26.10, and Table 26-26 and 26-27 of **Chapter 26: Water environment, Volume 2** of the ES **[APP-067]** conclude that there would be no significant adverse effects on those Southern Water public water supplies as a result of the implementation of embedded environmental measures. The Applicant is agreeing commercial terms with SWS to progress protective provisions discussions and it is anticipated that an agreement will be reached on them before the end of the Examination.

© WSP Environment & Infrastructure Solutions UK Limited

Table 4-18 Applicant's Response to Corporation of Trinity House of Deptford Strond [RR-081]

Ref	Relevant representation comment	Applicant's response
2.44.1	Dear Sir / Madam, The Rampion 2 Offshore Wind Farm Order We refer to the above application for development consent. Trinity House is the General Lighthouse Authority for England, Wales, the Channel Islands and Gibraltar with powers principally derived from the Merchant Shipping Act 1995 (as amended). The role of Trinity House as a General Lighthouse Authority under the Act includes the superintendence and management of all lighthouses, buoys and beacons within its area of jurisdiction. Trinity House wishes to be registered as an interested party due to the impact the developments may have on navigation within Trinity House's area of jurisdiction. Trinity House is likely to have further comments to make on the application and the draft Order(s) throughout the application process.	The Applicant welcomes Trinity House as an Interested Party and looks forward to receiving further comments throughout the application process.

© WSP Environment & Infrastructure Solutions UK Limited

Table 4-19 Applicant's Response to Forestry Commission (Forestry Commission) [RR-123]

Ref	Relevant representation comment	Applicant's response
2.45.1	The Forestry Commission is the government department responsible for protecting, expanding and promoting the sustainable management of woodlands. As part of our role, we are a non-statutory consultee for development proposals that include or are likely to affect ancient woodland. As a Non-Ministerial Government Department, we do not provide an opinion supporting or objecting to planning applications. Instead, we provide advice on the potential impact that proposed developments could have on trees and woodland using our local knowledge and expertise, planning policy and legislation that could be relevant and measures that could help to avoid or limit impacts and result in overall gains wherever possible. Our comments should be read in conjunction with our previous advice relating to this project. While we are concerned by the significant tree and woodland loss associated with Rampion 2, we recognise that effort has been made to explore less damaging options, and we welcome the selection of the preferred route that avoids direct ancient woodland loss, over more harmful alternatives, and the efforts for significant compensation measures being proposed.	The retention and protection of valuable trees, including ancient woodland is recognised by the Applicant and is reflected in the design of the Proposed Development and use of trenchless crossing techniques where possible and appropriate. An updated version of the **Commitments Register** **[APP-254]** has been submitted at Deadline 1, detailing the measures to be implemented to ensure avoidance of veteran trees (C-174) and ancient woodland (C-216), minimisation of woodland (C-204) and hedgerow loss (including where they support standard trees – commitment C-115) and are secured through Requirement 22 of the **Draft Development Consent Order** **[PEPD-009]**.
2.45.2	We accept the principle of Horizontal Direct Drilling underneath the Michelgrove Park ancient woodland compared to more harmful methods, where evidence demonstrates that this is feasible and will not result in loss or deterioration of the ancient woodland.	Trenchless crossing techniques (e.g. Horizontal Directional Drill (HDD)) is a mitigation that has been used routinely for linear projects (electrical transmission cables and pipelines (e.g., gas, oil and water) for both large infrastructure and smaller scale applications. HDD has been used frequently to cross a range of sensitive ecological features including designated sites, ancient woodland, rivers and other priority habitats and make landfall for both offshore wind farm transmission cables and electrical interconnectors. For example, an HDD crossing of 550m through chalk substrate, with a sizeable change in elevation (80 to 90m difference) was successfully completed at Dunstable Downs on the Kensworth to Rugby Pipeline project for CEMEX in 2008 (including crossing part of Dunstable and Whipsnade Downs Site of Special Scientific Interest (SSSI). It is also notable that HDD within chalk substrate was carried out successfully on the route of the transmission cable for the Rampion 1 Offshore Wind Farm, as was an HDD to make landfall. The approach to minimising and effectively managing the risks of trenchless crossings is outlined in the **Outline Construction Method Statement** **[APP-255]** and the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** secured through Requirements 23 and 22 respectively of the **Draft DCO** **[PEPD-009]**. Paragraph 4.2.2 of Section 4.2 of the **Outline CoCP** **[PEPD-033]** states that '*This Outline CoCP is accompanied by a Crossing Schedule (Appendix A) identifying locations where trenchless crossings will be provided*'. Paragraph 4.2.3 of the **Outline CoCP** **[PEPD-033]** also states ***'****Should an unexpected obstacle or constraint be encountered that requires an additional trenchless crossing, this would be confirmed in the crossing schedule accompanying the stage specific detailed CoCP for approval by the relevant planning authority*'. The Applicant will not switch to open-cut trenching at Michelgrove Park. Commitment C-5 in the **Commitments Register** **[APP-254]** (updated for the Deadline 1 submission) has been revised to clarify that

Ref	Relevant representation comment	Applicant's response
		Horizontal Directional Drill (HDD) or other trenchless technology will be deployed in accordance with Appendix A: Crossing Schedule of the **Outline CoCP** **[PEPD-033]**. Commitment C-216 (**Commitments Register** **[APP-254]**) (updated for the Deadline 1 submission) ensures that: • all ancient woodland will be retained; • a stand-off of a minimum of 25m from any surface construction works will be maintained in all locations from cable installation works; and • construction traffic may operate within 25m of an ancient woodland on existing tracks, with any track maintenance works being restricted to the current width. Works to provide safe access from the highway are required in three locations within 25m of ancient woodland notably accesses A-42, A-56 and A-57. At these locations specific design measures detailed in the **Outline CoCP** **[PEPD-033]** will manage any potential indirect effects on ancient woodland. Where ancient woodland is crossed via trenchless crossing a depth of at least 6m below ground will be maintained to avoid root damage and drill launch and retrieval pits will be at least 25m from the woodland edge. In addition, it is worth noting that the Applicant has specified a wider onshore cable corridor for Works No 9 at Michelgrove Park to retain the ability to construct the preferred trenchless crossing alignment in compliance with existing commitments. The Applicant intends to complete the trenchless crossings with the minimal impact to the sensitive environmental features and stakeholders.
2.45.3	One of the most important features of ancient woodlands is the quality and inherent biodiversity of the soil; they being relatively undisturbed physically or chemically. This applies both to Ancient Semi Natural Woodland (ASNW) and Plantations on Ancient Woodland Sites (PAWS). However, we are concerned that there appears to be minimal on-site assessments regarding the ground conditions to demonstrate that HDD will be viable underneath the ancient woodland site.	Section 7.8 within **Appendix 22.16: Arboricultural impact assessment, Volume 4** of the ES **[APP-194]** consider impacts of the Proposed Development on Ancient Woodland and states that there would be no loss of Ancient Woodland arising from the Proposed Development. The design of the onshore cable installation ensures that Ancient Woodland at Michelgrove Park and Calcot Wood will be crossed via trenchless methods. All avoidance and mitigation measures regarding ancient woodland and veteran trees has been specified following information provided in Natural England and Forestry Commission's joint Standing Advice for Ancient Woodland and Ancient and Veteran Trees, updated in January 2022. In addition, commitment C-216 (**Commitments Register** **[APP-254]**) (updated for the Deadline 1 submission) ensures that: • all ancient woodland will be retained; • a stand-off of a minimum of 25m from any surface construction works will be maintained in all locations from cable installation works; and • construction traffic may operate within 25m of an ancient woodland on existing tracks, with any track maintenance works being restricted to the current width. Works to provide safe access from the highway are required in three locations within 25m of ancient woodland notably accesses A-42, A-56 and A-57. At these locations specific design measures detailed in the **Outline CoCP** **[PEPD-033]** will manage any potential indirect effects on ancient woodland.

Ref	Relevant representation comment	Applicant's response
		Where ancient woodland is crossed via trenchless crossing a depth of at least 6m below ground will be maintained to avoid root damage and drill launch and retrieval pits will be at least 25m from the woodland edge.
2.45.4	We are concerned that if consent is issued before this has been adequately demonstrated, there is a risk that HDD may not be deliverable and that more harmful methods (such as open-trench) may need to be considered which would result in direct loss and deterioration of ancient woodland.	The Applicant agrees that providing compensatory planting or enhancements early in the programme is beneficial and as such, the approach to Biodiversity Net Gain (see **Appendix 22.15: Biodiversity Net Gain information, Volume 4** of the ES **[APP-193]** is based on front-loading provision. The criteria for selecting suitable biodiversity units prioritises local delivery on land owned by those affected by the Proposed Development. Therefore, there is likely to be opportunities to enhance or plant new woodland on or close to the proposed DCO Order Limits. The commitment to biodiversity net gain is secured through Requirement 14 of the **Draft DCO** **[PEPD-009]**. Habitats temporarily lost during the construction phase will be reinstated. Commitment C-103 (**Commitments Register** **[APP-254]**) ensures that in the majority of locations (other than at temporary construction compounds, landfall, substation and cable joint bays) the reinstatement of habitats will begin within two years of their removal secured in the **Outline Code of Construction Practice** **[PEPD-033]** which is secured through Requirement 22 of the **Draft DCO** **[PEPD-009]**. It should be noted that woodland cannot be planted over the cable ducts and therefore, these areas will be replaced by mixed scrub. This is to ensure connectivity and provide valuable habitat.
2.45.5	During Examination, we advise the developer to provide sufficient evidence, based on on-site assessments that robustly demonstrates that the HDD method is feasible for the ancient woodland site in particular and that a sufficient contingency plans are in place to ensure that direct loss or deterioration of ancient woodland does not occur. Ancient woodlands, ancient trees and veteran trees are irreplaceable habitats. Paragraph 180© of the NPPF sets out that development resulting in the loss or deterioration of irreplaceable habitats should be refused unless there are wholly exceptional reasons, and a suitable compensation strategy exists.	The retention and protection of valuable trees, including ancient woodland is recognised by the Applicant and is reflected in the design of the Proposed Development and use of trenchless crossing techniques where possible and appropriate. An updated version of the **Commitments Register** **[APP-254]** has been submitted at Deadline 1, detailing the measures to be implemented to ensure avoidance of veteran trees (C-174) and ancient woodland (C-216), minimisation of woodland (C-204) and hedgerow loss (including where they support standard trees – commitment C-115) and are secured through Requirement 22 of the **Draft DCO** **[PEPD-009]**.
2.45.6	In considering the impacts of the development on Ancient Woodland, Ancient and Veteran trees, the planning authority should consider direct and indirect impacts resulting from both construction and operational phases. Please refer to Natural England and Forestry Commission joint Standing Advice for Ancient Woodland and Ancient and Veteran Trees, updated in January 2022. The Standing Advice can be a material consideration for planning decisions and contains advice and guidance on assessing the effects of development, and how to avoid and mitigate impacts. It also includes an Assessment Guide which can help planners assess the impact of the proposed development on ancient woodland or ancient and veteran trees in line with the NPPF.	Trenchless crossing techniques (e.g. Horizontal Directional Drill (HDD)) is a mitigation that has been used routinely for linear projects (electrical transmission cables and pipelines (e.g., gas, oil and water) for both large infrastructure and smaller scale applications. HDD has been used frequently to cross a range of sensitive ecological features including designated sites, ancient woodland, rivers and other priority habitats and make landfall for both offshore wind farm transmission cables and electrical interconnectors. For example, an HDD crossing of 550m through chalk substrate, with a sizeable change in elevation (80 to 90m difference) was successfully completed at Dunstable Downs on the Kensworth to Rugby Pipeline project for CEMEX in 2008 (including crossing part of Dunstable and Whipsnade Downs Site of Special Scientific Interest (SSSI). It is also notable that HDD within chalk substrate was carried out successfully on the route of the transmission cable for the Rampion 1 Offshore Wind Farm, as was an HDD to make landfall. The approach to minimising and effectively managing the risks of trenchless crossings is outlined in the **Outline Construction Method Statement** **[APP-255]** and the **Outline Code of Construction Practice (CoCP)** **[PEPD-033]** secured through Requirements 23 and 22 respectively of the **Draft DCO** **[PEPD-009]**. Paragraph 4.2.2 of Section 4.2 of the **Outline CoCP** **[PEPD-033]** states that '*This Outline CoCP is accompanied by a Crossing Schedule (Appendix A) identifying locations where trenchless crossings will be provided*'.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	Relevant representation comment	Applicant's response
		Paragraph 4.2.3 of the **Outline CoCP** **[PEPD-033]** also states *'Should an unexpected obstacle or constraint be encountered that requires an additional trenchless crossing, this would be confirmed in the crossing schedule accompanying the stage specific detailed CoCP for approval by the relevant planning authority'*. The Applicant will not switch to open-cut trenching at Michelgrove Park. Commitment C-5 in the **Commitments Register** **[APP-254]** (updated for the Deadline 1 submission) has been revised to clarify that Horizontal Directional Drill (HDD) or other trenchless technology will be deployed in accordance with Appendix A: Crossing Schedule of the **Outline CoCP** **[PEPD-033]**. Commitment C-216 (**Commitments Register** **[APP-254]**) (updated for the Deadline 1 submission) ensures that: • all ancient woodland will be retained; • a stand-off of a minimum of 25m from any surface construction works will be maintained in all locations from cable installation works; and • construction traffic may operate within 25m of an ancient woodland on existing tracks, with any track maintenance works being restricted to the current width. Works to provide safe access from the highway are required in three locations within 25m of ancient woodland notably accesses A-42, A-56 and A-57. At these locations specific design measures detailed in the **Outline CoCP** **[PEPD-033]** will manage any potential indirect effects on ancient woodland. Where ancient woodland is crossed via trenchless crossing a depth of at least 6m below ground will be maintained to avoid root damage and drill launch and retrieval pits will be at least 25m from the woodland edge. In addition, it is worth noting that the Applicant has specified a wider onshore cable corridor for Works No 9 at Michelgrove Park to retain the ability to construct the preferred trenchless crossing alignment in compliance with existing commitments. The Applicant intends to complete the trenchless crossings with the minimal impact to the sensitive environmental features and stakeholders.
2.45.7	We also request that we are consulted on the detailed design of mitigation and compensation measures for the significant impacts/loss to non-ancient woodland and the severance of connectivity of ancient woodland that will occur, to help ensure that measures are as effective as possible. Compensation measures should be sought that retain connectivity as far as possible and create compensatory linear habitat in the form of hedgerows and woodland creation. Other compensation measures that we request is bringing unmanaged woodland along the route into active sustainable management (in line with UK Forestry Standard) for all of the benefits that this can bring. We advise that the proposed Environmental Measures including compensatory planting are implemented as early in the programme as is reasonable to help them establish quicker and to minimise short term impacts.	Section 7.8 within **Appendix 22.16: Arboricultural impact assessment, Volume 4** of the ES **[APP-194]** consider impacts of the Proposed Development on Ancient Woodland and states that there would be no loss of Ancient Woodland arising from the Proposed Development. The design of the onshore cable installation ensures that Ancient Woodland at Michelgrove Park and Calcot Wood will be crossed via trenchless methods. All avoidance and mitigation measures regarding ancient woodland and veteran trees has been specified following information provided in Natural England and Forestry Commission's joint Standing Advice for Ancient Woodland and Ancient and Veteran Trees, updated in January 2022. In addition, commitment C-216 (**Commitments Register** **[APP-254]**) (updated for the Deadline 1 submission) ensures that: • all ancient woodland will be retained;

Table 4-20 Applicant's Response to The Crown Estate [RR-388]

Ref	Relevant representation comment	Applicant's response
2.46.1	The Crown Estate requests to be registered as an Interested Party in the examination of the Rampion 2 Offshore Wind Farm. Our interest in the project is that Rampion Extension Development Limited holds an Agreement for Lease from The Crown Estate.	The Crown Estate has interests in land and property and is a prescribed consultee. Two Agreements for Lease (one dated September 2020 and another dated February 2021) have been entered into between the Applicant and The Crown Estate for leases of seabed areas required for the Proposed Development wind farm array. The Applicant is working collaboratively with The Crown Estate to secure a third Agreement for Lease for the Offshore Transmission Assets, which lease is proposed to include land up to the mean high water mark. Solicitors have been instructed by both parties and are currently working up the Agreement. The Applicant is also seeking the consent of The Crown Estate as the "*appropriate Crown authority*" under section 227(5) of the Planning Act 2008 ("the Act") for the making of the proposed Rampion 2 Offshore Wind Farm Order in accordance with sub-sections (1) and (2) of section 135 of the Act. The Applicant's appointed solicitors are liaising with The Crown Estate's appointed solicitors in this regard.

Table 4-21 Applicant's Response to the Maritime and Coastguard Agency [RR-221]

Ref	Relevant representation comment	Applicant's response
2.50.1	MCA will be responding to the ExA on matters concerning the safety of maritime navigation and maritime emergency response. MCA will provide comments on the Navigation Risk Assessment, Shipping & Navigation chapter of the EIA Report, and the content of the DCO and DML. The main issues for MCA are concerning vessel routeing, vessels' ability for continued safe passage, that risks to all vessels and craft are at an acceptable level, and the project is not at the detriment to the provision of Search and Rescue, and other emergency response.	The Applicant has received the Maritime and Coastguard Agency's response to the Rule 6 letter and will respond to their written representation at Deadline 2, in accordance with the Examination Timetable outlined in Rule 8 – Notification of timetable for the examination **[PD-007]**.

© WSP Environment & Infrastructure Solutions UK Limited

Table 4-22 Applicant's response to Marine Management Organisation

Ref	MMO's Comment	Applicant's Response
1.1 Proposed Development Details		
MMO 1.1.1	Rampion 2 Offshore Wind Farm will be adjacent to and form an extension to the existing Rampion Offshore Wind Farm, and all infrastructure required to transmit the power generated, to the Bolney National Grid Substation.	Noted, the Applicant has no further comments on this matter at this time.
MMO 1.1.2	The Proposed Development includes an offshore generating station with an electrical export capacity of in excess of 100 Megawatts (MW) comprising up to 90 turbines, and array cables, in an area approximately 196 square kilometres (km^2), located approximately 13 kilometres (km) south of the Sussex coast located to the west of the existing Rampion Offshore Windfarm.	Noted, the Applicant has no further comments on this matter at this time.
MMO 1.1.3	The Proposed Development will comprise up to three offshore substations. Cables between the wind turbine generators (WTG) between the WTGs and the offshore substations, and between the offshore substations themselves and the landfall location at Climping, West Sussex. An underground cable connection between the landfall and a satellite substation known as Oakendene, and then onwards to connect into the existing National Grid substation at Bolney, together with an extension to the existing substation.	Noted, the Applicant has no further comments on this matter at this time.
MMO 1.1.4	Two DMLs are included in the draft DCO, one in relation to the generation assets and the second in relation to the transmission assets.	Noted, the Applicant has no further comments on this matter at this time.
2.1 Marine Plans		
MMO 2.1.1	The Applicant should demonstrate that they have considered whether the project adheres to all the relevant marine plans and policies in the area. MMO recommends that this is presented in a single, coherent document instead of a number of separate references throughout the submission. The relevant marine plan policies that should be met can be identified using the Explore Marine Plans tool and policy information on the following website: https://www.gov.uk/guidance/explore-marine-plans MMO requires the Applicant to detail how the proposed project is compliant with the relevant marine plans by producing a marine plan policy assessment in one document.	A single document showing adherence to the relevant marine plans and policies is being prepared to demonstrate the Proposed Development. This will be submitted at Deadline 2.
2.2 Fishing Community		
	The MMO has received the following Tier 1 complaint from commercial fisherman working along the Sussex Coast. The MMO views the complaint as a major issue, and resolution of the below is strongly recommended during examination, MMO has also advised the fisherman to register as an interested party and submit a representation. "*I'm a commercial fisherman from the Sussex coast and I would like to enlighten you about the devastation Rampion has caused to marine life.*	It should be noted that Rampion Offshore Windfarm (Rampion 1) and the Proposed Development are two distinct projects and entities, therefore the Applicant cannot comment on the works conducted during the construction of Rampion 1 or interfere with any resolution of any issues for which the MMO should contact Rampion Offshore Windfarm directly. However, there is ongoing dialogue between the two

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
	I am talking about the Rampion wind farm 7 miles off the coast of Worthing Sussex that spans 7 miles long and 4miles wide and is soon to be extended west towards Littlehampton West Sussex. The reason why I am writing to you is, when all the trenches were dug on the sea bed for the cable routes also trenches and foundations dug within the windfarm it's self they told us fisherman in one of many meetings that we had with them that all the spoil I. E. rocks and boulders would be buried back down the trenches after the cables were laid and it would be large rocks, small rocks on top of that then sand and gravel to cover everything, well as we told them before they disturbed the sea bed it was compact and once they dug the trenches and put the cables down they realised that they were left with hundreds of thousands of tons of rocks that wouldn't go back down the hole. So obviously they needed somewhere to put these rocks and without asking anyone or even consulting us commercial fishermen who make our living from these grounds they dumped them in piles about every 50mtrs in a 7 mile radius! *The bay that we are in is renowned of shallow water so the first gale of wind all these piles were knocked over to leave loose boulders rolling around on what was already quite a hard seabed. Because the sea bed was already hard there is no way these rocks are going to bed in or take root so for the past 3 years it only takes a big tide or a little bit of wind and these rocks are rolling around, now this has absolutely ruined the area for us fishermen as we fish bottom nets we are ripping nets up quicker than we can make them most of the time, also it has caused devastation on the sea bed for marine life.* *If you look at a map and you draw a line from Beachy head to selsea bill everywhere to the north of that line is classed as a nursery area where young fish come in to the shallow waters to spawn, as fishermen we are at sea fishing every day and we have noticed that the young fish are not coming in to spawn anymore. The bream, cuttlefish, Dover sole, Brill, turbot, cod are not laying their eggs in this area simply because of all the rocks that are constantly moving around. We have noticed that mussel beds are not forming limpits are not attracting themselves to rocks also weed and kelp is not growing because of all the movement and this In its self if devastating to marine life. I understand that it's law that a polluter must clean up after itself, maybe they should be made to somehow remove these rocks.* *Rampion have all information and charts on where all of this spoil was dumped it was shown to us at one of many meetings so I guess they have this on record. Please look into this and this cannot be allowed to happen again in phase two of the windfarm."*	projects/entities and information generated by Rampion 1 has been and is still being taken into account by The Applicant.
3.1 Draft Development Consent Order		
MMO 3.1.1	MMO has reviewed the draft DCO and provided detailed comments below and in Table 1. The MMO considers that both DMLs (Schedule 11 and 12) are very similar in structure and therefore we have based our comments on Schedule 11, but at this stage these are equally applicable to Schedule 12.	The Applicant notes this comment from the MMO and has responded to each detailed comment in the table sections below.
3.2 Unexploded Ordnance (UXO)		
MMO 3.2.1	The MMO would like clarity on if the investigation of and the detonation of UXO's are included within the licenced activities. These are not part of any of the Works order or set out within the activities of Schedule 11 & 12, however a draft UXO marine mammal mitigation plan is proposed.	The activities to which the deemed marine licences apply do not include investigation and detonation of UXO. However, as the clearance of UXO may be required as part of the project the potential impacts have been assessed as part of the Environmental Impact Assessment. Further, these deemed marine licences will remain in force until the authorised project is decommissioned. The approval of the **Draft Unexploded Ordnance Clearance Marine Mammal**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
		Mitigation Protocol [APP-237] now provides confidence that mitigation can and will be secured if UXO are required to be detonated. This is consistent with other DCOs for offshore wind farms where separate licences for UXO detonation may be sought.
3.3 Article 5 Benefit of the Order		
MMO 3.3.1	MMO requests the word 'including' to 'excluding' is changed in the following text: *"(2) Subject to sub-paragraph (4), the undertaker may with the written consent of the Secretary of State—* *(a) transfer to another person ("the transferee") any or all of the benefit of the provisions of this Order (including the deemed marine licences) and such related statutory rights as may be agreed between the undertaker and the transferee; and 12* *(b) grant to another person ("the lessee") for a period agreed between the undertaker and the lessee any or all of the benefit of the provisions of the Order (including the deemed marine licences) and such related statutory rights as may be so agreed, except where sub-paragraph (7) applies, in which case no consent of the Secretary of State is required."*	Please see response to 3.3.3 below.
MMO 3.3.2	MMO requests the following sections are removed: *"[…]* *(5) The Secretary of State must consult the MMO before giving consent to the transfer or grant to another person of the benefit of the provisions of the deemed marine licences.* *[…]* *(12) Section 72(7) and (8) of the 2009 Act (Variation, suspension, revocation, and transfer) do not apply to a transfer or grant of the benefit of the provisions of any of the deemed marine licences to another person by the undertaker pursuant to this article."*	Please see response to 3.3.3 below.
MMO 3.3.3	Explanation for the text amendments Article 5(2)(a) allows for the permanent transfer of the DML with the consent of the Secretary of State (SoS), with Article 5(2)(b) allowing for a temporary grant to a lessee for an agreed period. Here the consent of the SoS is not required. Although this is not made explicit this is possibly intended because the transfers are temporary and there is a desire to avoid unnecessary delays. There is, however, no mechanism either in the DCO or the MCAA 2009 for a marine licence to be 'leased', because there are no provisions for the licence 'reverting' to the licence holder after the agreed lease period and the MMO does not recognise that this would create a more streamlined system. Rather it simply operates to create an additional administrative procedure for marine licences (and one not envisaged by Parliament) and with no clarity in how it will operate. The proposed drafting represents a clear departure from the MCAA 2009, which would normally require the licence holder (here "the undertaker") to make an application to the MMO for a licence to be transferred. Instead, this provision operates to make the decision that of the undertaker, with the SoS providing consent to the transfer, rather than the MMO as the regulatory authority for marine licences considering the merits of any application for a transfer. Article 5(5) is also of concern because there is no obligation for the SoS to take into account the views of the MMO when providing its consent. Furthermore, there is no obligation for the MMO to be informed of the decision of the SoS, notwithstanding its impact on the MMO as the licencing authority. From a regulatory perspective it is highly irregular that a decision to transfer a licence should not be the	The concern raised by the MMO appears to be in respect of the scope for a development consent order to include provision for the transfer of a marine licence at all. The ability for an undertaker to transfer a marine licence has been included in numerous DCOs for offshore wind farms dating back to 2015 when this power was included in The Dogger Bank Creyke Beck Offshore Wind Farm Order 2015. Whilst the drafting of the relevant provisions has evolved since that time, the principle of the ability to transfer a marine licence has remained, and features in the recently granted orders for East Anglia One North, East Anglia Two and Hornsea Four offshore wind farms. The wording of Article 5 in the **draft DCO [PEPD-009**], including for circumstances in which the Secretary of State's consent is required for a transfer of powers

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
	decision of the regulatory authority in that area (the MMO) but instead should be subject to such a cursory process as is set out in Article 5(1)-(3).	under the Order and for their consultation with the MMO, follows the approach adopted in the recently made Orders including in respect of disapplication of sections 72(7) and (8) of the Marine and Coastal Access Act 2009.
MMO 3.3.4	Powers already existing to transfer. Article 5(12) explicitly disapplies sections 72(7) and (8) of the 2009 Act, which would otherwise govern these procedures. This conflicts with MMO's stated position that the DML granted under a DCO should be regulated by the provisions of 2009 Act, and specifically by all provisions of section 72. Section 72(7)(a) permits a licence holder to make an application for a marine licence to be transferred, and where such an application is approved for the MMO to then vary the licence accordingly (s. 72(7)(b)). This power should be retained and used in relation to the DML granted under the DCO.	Please see comments in 3.3.3 above.
MMO 3.3.5	Inconsistencies with PINS guidance The wording is inconsistent with the PINS Guidance on how DMLs should operate within a DCO. Advice Note Eleven, Annex B – Marine Management Organisation | National Infrastructure Planning (planninginspectorate.gov.uk) provides that where the undertaker choses to have a marine licence deemed by a DCO, the MMO, "*will seek to ensure wherever possible that any deemed licence is generally consistent with those issued independently by the MMO"*.	As noted above, the wording of the draft DCO [PEPD-009] is consistent with that included in a number of recently granted development consent orders for offshore wind farms. The terms of the deemed marine licences are intended to be consistent with those issued independently by the MMO.
MMO 3.3.6	Inconsistent with intention of the DCO regime Under the DCO legislative regime, it remains possible for developers (undertakers) to seek consent for a marine licence directly with the MMO (rather than having a DML integrated into the DCO). This flexibility underlines the fact that the DCO process simply integrates the existing mechanism for granting a marine licence. It should not therefore be used as a vehicle to alter or distort established process and procedures, such as those for the transfer of a marine licence.	Please see response above to 3.3.3. It is acknowledged that it remains open for an applicant to seek a marine licence directly from the MMO, as the Applicant intends to do in respect of clearance of UXO. .
MMO 3.3.7	Undermining enforcement capabilities of the MMO Piecemeal changes to aspects of the marine licence regime by way of the DCO can undermine the ability to enforce the marine licence. Under the DCO, it remains the MMO who will be responsible for enforcing marine licences (both deemed or granted independently). It is therefore vital that all marine licences are clear and enforceable. Consistency is a key element in achieving this, and this is best achieved by ensuring that the MMO has full responsibility for the marine licence process.	Please see response to 3.3.3 above.
MMO 3.3.8	Purpose of Secretary of State written consent is unclear. Not only is this an unnecessary (given that Parliament has already created a statutory regime for such a process), but it is also unclear what purpose the written consent of the SoS actually serves here. For example: If the intention is for the undertaker to be able to transfer the benefits under the terms of the DCO outside the established procedures under 2009 Act (which the MMO opposes), why is it considered necessary or appropriate for the SoS to 'approve' the transfer of the DML (even going so far as to include an obligation to consult the MMO)?);	Please see response to 3.3.3 above.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
	It is also unclear what criteria the SoS would be taking in determining whether to approve any transfer, and how this would differ from a consent granted by MMO under the existing 2009 Act regime?	
MMO 3.3.9	Practical concerns It is unclear how the wording would work in practice. It would be necessary to vary the licence to change the details of the licence holder at the beginning of the agreed period and then again at the end of the agreed period. The transfer of the licence would happen first, and then the licence would need to be varied. After the transfer of the licence, the new licensee would have a marine licence which would still be in the name of the licensee who had transferred the licence. The new licensee would have no authorisation to carry out any acts until the variation had taken place and until the variation had been affected the old licence holder would remain liable for any actions undertaken. Once again this creates additional confusion and administrative layers in lieu of relying on the existing legislative provisions. The procedure under s. 72 MCAA avoids this issue, which is an additional reason why it is preferred. Because of this confusion and potential duplication, it is the position of the MMO that these provisions should be removed, and that any transfer should be subject to the existing regime under the 2009 Act, with the decision maker remaining the MMO.	Please see response to 3.3.3 above.
3.4 Schedule 11 & 12 DMLs		
MMO 3.4.1	Determination dates The MMO strongly considers that it is inappropriate to put timeframes on complex technical decisions of this nature. The time it takes the MMO to make such determinations depends on the quality of the application made, and the complexity of the issues and the amount of consultation the MMO is required to undertake with other organisations to seek resolutions. The MMO's position remains that it is inappropriate to apply a strict timeframe to the approvals the MMO is required to give under the conditions of the DML given this would create disparity between licences issued under the DCO process and those issued directly by the MMO, as marine licences issued by the MMO are not subject to set determination periods. Whilst the MMO acknowledges that the Applicant may wish to create some certainty around when it can expect the MMO to determine any applications for an approval required under the conditions of a licence, and whilst the MMO acknowledges that delays can be problematic for developers and that they can have financial implications, the MMO stresses that it does not delay determining whether to grant or refuse such approvals unnecessarily. The MMO makes these determinations in as timely manner as it is able to do so. The MMO's view is that it is for the developer to ensure that it applies for any such approval in sufficient time as to allow the MMO to properly determine whether to grant or refuse the approval application. The MMO believes that if time scales are included within the DML for plans then these should be 6 months not 4 months. However, without prejudice to this position the MMO is open to discussions on which documents should be 6 months and which documents could be 4 months to take into account the concerns that the Applicant may have.	As the project comprises a nationally significant infrastructure project it is necessary for there to be a degree of certainty as to the programme for its delivery, particularly given the need for the project to contribute to the Government achieving its net zero target. Recently made DCOs for offshore wind farms include a mix of periods for determination of either four or six months. Four months is considered an appropriate period for the approval of submitted details. However, the Applicant is willing to work with the MMO, and Natural England as statutory nature conservation body, to identify any approvals which require a longer determination period.
3.5 Additional Conditions		

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
MMO 3.5.1	MMO has set out comments on the draft DCO/DML in Table 1 in addition to these the MMO requests the following conditions are added to the DML.	Please see responses to **Table 1**, below.
MMO 3.5.2	Reporting of impact pile driving To comply with UK requirements on noise reporting the MMO requests this condition is added to both Schedule 11 and 12. *"25.— (1) Only when driven or part–driven pile foundations are proposed to be used as part of the foundation installation the undertaker must provide the following information to the Marine Noise Registry—* *(a) prior to the commencement of each stage of construction of the licensed activities, information on the expected location, start and end dates of impact pile driving to satisfy the Marine Noise Registry's Forward Look requirements:* *(b) at six month intervals following the commencement of pile driving, information on the locations and dates of impact pile driving to satisfy the Marine Noise Registry's Close Out requirements; and* *(c) within 12 weeks of completion of impact pile driving, information on the locations and dates of impact pile driving to satisfy the Marine Noise Registry's Close Out requirements.* *(2) The undertaker must notify the MMO in writing of the successful submission of Forward Look or Close Out data pursuant to paragraph (1) above within seven days of the submission.* *(3) For the purpose of this condition, "Forward Look" and "Close Out" mean the requirements as set out in the UK Marine Noise Registry Information Document Version 1 (July 2015) as amended, updated, or superseded from time to time."*	An additional condition has been included in the **draft DCO** **[PEPD-009]** based on the wording provided. It excludes (b) on the basis that pile driving is unlikely to be carried out continuously throughout the construction period due to seasonal piling restrictions likely to be put in place. The approach is consistent with that used in the East Anglia One North and East Anglia Two Offshore Wind Farm Orders.
MMO 3.5.3	Maintenance reporting To ensure the MMO is able to know the maintenance activities throughout the lifetime of the operation including understanding any impacts the MMO requests this condition is added to both Schedule 11 and 12. *"26.—(1) An annual maintenance report must be submitted to the MMO in writing within one month following the first anniversary of the date of commencement of operations, and every year thereafter until the permanent cessation of operation.* *(2) The report must provide a record of the licensed activities as set out in condition 3 during the preceding year, the timing of activities and methodologies used.* *(3) Every fifth year, the undertaker must submit to the MMO in writing, within one month of that date, a consolidated maintenance report, which will—* *(a) include a review of licensed activities undertaken during the preceding five years with reference to the reports submitted in accordance with condition XX(1) of this licence;* *(b) reconfirm the applicability of the methodologies and frequencies of the licensable activities permitted by this licence for the remaining duration of this licence."*	It is agreed that the **Outline Offshore Operations and Maintenance Plan** **(APP-238; OOMP)** should be referenced in the **draft DCO** **[PEPD-009]** and included in Schedule 16. This will be addressed at the next revision to the draft DCO at Deadline 3. The OOMP will also be updated at this stage to clarify the condition of the deemed Marine Licences pursuant to which the final document is to be submitted. The **draft DCO** **[PEDP 009]** includes provision for the undertaker to provide the MMO with its Operation and Maintenance Plan and further to the above amendment the draft DCO will be updated to require that this document is in accordance with the OOMP. Consequently, this additional condition is considered unnecessary.
MMO 3.5.4	Stages of construction To ensure the MMO has the full timetable for construction the MMO requests this condition is added to both Schedule 11 and 12. *"27.—(1) The licenced activities must not be commenced until a written scheme setting out the stages of construction of the authorised development seaward of MHWS has been submitted to and approved by the MMO in writing.* *(2) The stages of construction referred to in sub–paragraph (1) will not permit the authorised development to be constructed in more than one overall phase.* *(3) The scheme must be implemented as approved.* *(4) The written scheme referred to in sub-paragraph (1) must be submitted to the MMO in writing six months prior to the planned commencement of the licenced activities."*	The purpose of including a scheme of stages for the onshore works is to allow the discharge of requirements in respect of each stage separately. This is not relevant for the offshore works. However a construction programme is required to be submitted and approved prior to commencement of the authorised scheme pursuant to condition 11(1)(b) of Schedules 11 and 12 to the **draft DCO** **[PEPD-009].**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
MMO 3.5.4	Mitigation – seasonal restrictions To ensure it is clear to all involved the MMO requests any seasonal restrictions for any activities are clearly conditioned as a stand-alone condition and not within an additional plan.	The incustion of a standalone condition is not considered necessary. The MMO will be able to enforce compliance with the terms of a plan, including the Sensitive Features Mitigation Plan, the content and approval of which, and implementation, is secured by condition 11(1)(k) of Schedules 11 and 12 to the **draft DCO [PEPD-009]**.
3.6 Schedule 15 – Documents to be Certified		
MMO 3.6.1	To ensure clarity across all areas the MMO recommends this Schedule being split into 3 Parts: Part 1 documents forming the environmental statement to be certified Part 2 examination documents forming part of the environmental Statement to be certified Part 3 other documents to be certified.	This is not considered necessary at the present time due to the number of documents listed in schedule 16. However, should the number of documents increase consideration will be given to splitting them for clarity.
MMO Table 1	**Table 1. MMO comments on draft DCO/DML**	

Main DCO		MMO Comments	
Part 2	Principal Powers		
	Article 5 Benefits of the Order	See section 3.3 above. In summary, any reference to the MMO and DML should be removed from article for transfer of the benefit of the DCO. This also relates to Part 1 (7) of the DML, which also needs removing.	The Applicant's response in respect of article 5 is set out above in 3.3.3.
	Article 5(8)"prior to any transfer or grant under this article taking effect the undertaker must give notice in writing to the Secretary of State, and if such transfer or grant relates to the exercise of powers in their area, to the MMO and/or to the relevant planning authority."	MMO suggests removing reference to the MMO in the rest of article 5 because this transfer process should exclude the DML. However, there may be transfers which relate to the exercise of MMO's power beyond the deeming of the marine licence. If this is the case, please consult with the MMO. If there are no such likely scenarios then reference to the MMO in the rest of article 5 should be excluded, so that there is no confusion that this might apply to the DML.	See response at 3.3.3 above
Part 4	Supplemental Powers		
	Article 20 Public rights of navigation	MMO requests clarity on the inclusion of this article. MMO notes that the public rights of navigation where any permanent structures are located within territorial waters will be extinguished and will take effect 14 days after the undertaker has submitted a plan to the SoS, Martine Coastguard Agency and the MMO. However, there are no powers under the DCO for the MMO to comment or refuse.	This article is included because the wind farm is partially located in territorial waters where there is a right of public navigation. The article confirms the suspension of public rights of navigation where permanent infrastructure is located. This infrastructure will be located in accordance with the detailed design plan to be submitted and approved by the MMO under condition 11(1)(a) of the deemed marine licences, as required by condition 12.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment			Applicant's Response
	Schedule 1			
	Authorised Project			
	Part 3 Requirements	Detailed offshore design parameters		
		5(4) "The number of cable crossings comprising Works No.2 must not exceed four unless otherwise agreed with the MMO"	MMO acknowledges the reference of MMO involvement and would like clarity on what situations would require agreement for further cable crossings. If cable crossings are identified would the associated cable protection be within the maximum permitted area and volume?	The Applicant notes that potential cable crossings relate to a single interconnector project, which is yet to be determined. The need for additional crossings would only arise if additional cable projects were brought forward; given no such projects are known, no additional crossings above the four sought within the DCO are reasonably foreseeable. The Applicant therefore confirms that it is not intended that any additional cable crossings will be required. Any associated cable protection would require to be within the cable protection parameters. Should any additional cable protection be required this would be subject to separate approval.
	Part 3 Requirements	Programme of works 10(1) No part of the authorised project within the Order limits landward of MLWS is to commence until a written programme identifying the stages of those works has been submitted to and approved by the relevant planning authorities.	MMO notes that this sets out the programme of works for onshore activities but also Works No. 6, it would be beneficial to be consulted on the programme for this work or this could be included within the Stages of Condition requested above.	This requirement requires the identification of stages in order to facilitate the discharge of conditions on a staged basis. Provision has been made in the **draft DCO** [**PEPD-009**] for consultation with the MMO in respect of Work No. 6.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment			Applicant's Response
	Part 3 Requirements	Onshore constructions method statement 23(1) "No stage of the authorised project within the Order limits landward of MLWS is to commence until an onshore construction method statement for the construction method statement has been submitted to and approved in writing by the relevant planning authority in consultation with Natural England and to the extent that it relates to works seaward of the mean high water springs comprising Work No. 6, the MMO."	MMO notes that we will be consulted on the onshore construction method statement insofar as it relates to works seaward of the mean highwater springs (Works 6). MMO would like clarity on what the timescale for this consultation would be.	The construction method statement for the stage including Work No. 6 will require to be approved prior to the commencement of any works comprising that stage. It will be for the relevant planning authority to arrange consultation with the MMO.
	Schedule 11 – Deemed Marine Licence			
	Part 1			
		"array cable" means … Works	A space needs to be inserted here "Works No. 1"	This has been addressed in the **draft DCO** **[PEPD-009]**.
		"draft UXO marine mammal mitigation plan"	MMO requests this is removed if UXO activities are not part of the licenced activities.	It is proposed that this document is still approved as part of this application. Please see the Applicant's response to 3.2.1.
		"draft piling marine mammal mitigation plan"	MMO requests an outline plan being included part of a certified documents.	A draft piling marine mammal mitigation protocol is included in Schedule 16 for certification (amended from 'plan').
		2.(b) "the disposal of up to 2,568,500m3"	MMO recommends this is amended to m3.	The area is already stated as cubic metres so 'm³' has been deleted in the **draft DCO** [**PEPD-009**]**.**
		2.(b) "the disposal […] comprising the array area […]"	MMO notes that at present, this is an extremely broad disposal area. MMO acknowledges that it is common for offshore wind farms to ask to designate the whole area as a disposal site to allow them to clear the substrate for construction without needing to lift the material and transport to another disposal site. MMO welcomes the site characterisation report and has requested further information in Section 4.4 before the MMO is able to provide disposal site references.	Noted

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment			Applicant's Response
		7. "The provisions of section 72 (variation, suspension, revocation and transfer) of the 2009 act apply to this licence except that the provisions of section 72(7) and (8) relating to the transfer of the licence only apply to a transfer not falling within article 5 (benefit of the Order) of the Order."	This provision needs to be removed, along with the other sections of Article 5. See above section 3.3.	Please see response above regarding article 5.
		8. "With respect to any condition which requires the licensed activities to be carried out in accordance with the plans, protocols or statements approved under this licence, the approved details, plan or scheme are taken to include any amendments that may subsequently be approved in writing by the MMO."	MMO requests that the following is added: "subsequent to the first approval of those plans, protocols or statements provided it has been demonstrated to the satisfaction of the MMO that the subject matter of the relevant amendments do not give rise to any materially new or materially different environmental effects to those assessed in the environmental information."	It is not considered necessary to include this wording as this is covered by **paragraph 9**.
		9. "…satisfaction of the MMO that it is unlikely to give rise to any materially new or materially different environmental effects from those assessed in the environmental statement."	MMO requests that this is updated to state: "…satisfaction of the MMO that the subject matter of the relevant amendments do not give rise to any materially new or materially different environmental effects to those assessed in the environmental information."	The change to environmental information is inappropriate as environmental statement is the document to be certified.
	Part 2 Conditions			
	Design parameters	Condition 2. – (2) "Work No 2"	MMO recommends this is changed to "Work No. 2"	This has been addressed in the **draft DCO** **[PEPD-009]**.
		Condition 2(6) "Any cable protection authorised under the licence must be deployed within 15 years from the date of the Order unless otherwise agreed with the MMO."	MMO would like to understand the reason for the inclusion of this condition. MMO notes this is for 15 years when the lifetime of a licence could be longer. Does this include cable protection within the maintenance phase? This should be clear within the DML.	This condition has been amended at the request of Natural England to allow cable protection to be deployed within 10 years from the commencement of licenced activities in order to control the period during which this activity can take place following the grant of the licence. Cable protection may be deployed in the operation and maintenance phase subject to the 10 year time limit and the parameters for cable protection in the **draft DCO** **[PEPD-009];** this would be subject to the Operation and Maintenance Plan secured by condition 3 of the draft DCO.
	Maintenance of the authorised project	Condition 3(1) "MMP"	This is a typo and should be corrected to MMO.	This has been addressed in the **draft DCO** **[PEPD-009]**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment			Applicant's Response
		Condition 3(1) "Not more than 3 months following the completion of construction of the authorised project the undertaker must provide the MMO with an operations and maintenance plan."	MMO requests that this is updated to refer to the outline operation and maintenance plan "in accordance with the outline…". This is to ensure all parties and consultees are clear what activities will take place within the Operation and Maintenance phase and ensure all required sections within the plan have been highlighted at this stage.	It is agreed that the **Outline Offshore Operations and Maintenance Plan** (OOMP) **[APP-238]** should be referenced in the **draft DCO** **[PEPD-009]** and included in Schedule 16. This will be addressed at the next revision to the draft DCO at Deadline 3. The OOMP will also be updated at this stage to clarify the condition of the deemed Marine Licences pursuant to which the final document is to be submitted.
		Condition 3(5) "Where the MMO's approval is required under paragraph (3), approval may be given only where it has been demonstrated to the satisfaction of the MMO that the approval sought is unlikely to give rise to any materially new or materially different" environmental effects from those assessed in the environmental statement."	MMO requests that this is updated to state: "…satisfaction of the MMO that the subject matter of the relevant amendments do not give rise to any materially new or materially different environmental effects to those assessed in the environmental information."	The change to environmental information is inappropriate as environmental statement is the document to be certified.
	Extension of time periods	Condition 4(1) "Any time period given in this licence given to either the undertaker or the MMO may be extended with the agreement of the other party."	All agreements must be in writing and this should be clear throughout the DML.	Reference to agreements being in writing has been included throughout the dML.
	Notifications and inspections	Condition 5(6) "The undertaker must inform the MMO Coastal Office in writing at least five days prior to the commencement of the licensed activities or any part of them and within five days of the completion of each licenced activity."	MMO requests that this is updated to "at least 14 days prior to the commencement of the licensed activities or any part of them"	This has been left as 5 days in accordance with a set of requested conditions provided by Trinity House noted to have been agreed with the MMO and MCA
	Aids to navigation	Condition 6(1)	This is a very long single sentence and the MMO recommends breaking into two or three sentences to provide clarity of meaning.	This condition has been reworded in accordance with conditions provided by Trinity House noted to have been agreed with the MMO and MCA.
		Condition 6(3)	Reference to 11(1)(o) is incorrect, MMO requests that this is please checked.	Condition 6(3) refers to the aids to navigation management plan agreed pursuant to condition 11(1)(o). Condition 11(1)(o) requires '*an aid to navigation management plan to be agreed in writing by the MMO following consultation with Trinity House, to include details of how the undertaker will comply with the provisions of condition 6*.'

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment			Applicant's Response
	Chemicals, drilling and debris	Condition 9 "(1) Unless otherwise agreed in writing by the MMO all chemicals used in the construction of the authorised project must be selected from the List of Notified Chemicals approved for use by the offshore oil and gas industry under the Offshore Chemicals Regulations 2002(a) (as amended)."	MMO suggests that this condition is changed to the wording below, as the offshore chemical regulations 2002(a) (as amended) do not apply to chemicals used by the offshore wind industry, and the regulations only pertain to chemicals used in the oil and gas industry. "Unless otherwise agreed in writing by the MMO all chemicals, paints and coatings used in the construction and operation and maintenance of the authorised project (not subject to other regulations) with a pathway to the marine environment must be approved by the MMO. Chemicals should be submitted to the MMO at least eight weeks prior to the use of the chemical, unless otherwise agreed in writing by the MMO." Please also see section 4.4.19 - 4.4.23 within the ES below for more information about notifications to the MMO.	The wording has not been amended as it is consistent with the approach adopted in a number of previously granted DCOs for windfarms including the Hornsea Four Offshore Wind Farm Order, 2023, in order to provide prior approval for some chemicals. Written approval will be required for the use of any chemical not included in the list approved under the Offshore Chemicals Regulations 2002.
		Condition 9(5)	Please update "District Marine Office" to "Local Marine Office".	This has been addressed in the **draft DCO** **[PEPD-009]**.
		Condition 9(8) *"All dropped objects must be reported to the MMO using the Dropped Object Procedure Form as soon as reasonably practicable and in any event within five days of the undertaker becoming aware of an incident. On receipt of the Dropped Object Procedure Form, the MMO may require relevant surveys to be carried out on the undertaker (such as side scan sonar) if reasonable to do and the MMO may require* obstructions which are hazardous to other marine users to be removed from the seabed at the undertaker's expense if reasonable to do so."	MMO requests this wording is amended to be in line with current consents: "(1) The undertaker must report all dropped objects to the MMO using the dropped object procedure form as soon as reasonably practicable and in any event within 24 hours of becoming aware of an incident. (2) On receipt of the dropped Object Procedure Form, the MMO may require, acting reasonably, the undertaker to carry out relevant surveys. The undertaker must carry out surveys in accordance with the MMO's reasonable requirements and must report the results of such surveys to the MMO. (3) On receipt of such survey results, the MMO may, acting reasonably, require the undertaker to remove specific obstructions from the seabed. The undertaker must carry out removals of specific obstructions from the seabed in accordance with the MMO's reasonable requirements and at its own expense."	This condition has been amended to remove reference to notice having to be given within five days; notice must therefore be given as soon as reasonably practicable following the undertaker becoming aware of an incident in all instances; this is consistent with the condition imposed on the grant of the Hornsea Four Offshore Wind Farm Order, 2023. The wording of the condition in the **draft DCO** **[PEPD-009]** is otherwise consistent with the provision included in previously made DCOs for offshore wind farms including Hornsea Four, and East Anglia One North and Two.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment			Applicant's Response
	Force majeure	Condition 10 "(1) If, due to stress of weather or any other cause the master of a vessel determines that it is necessary to deposit the authorised deposits within or outside of the Order limits because the safety of human life or if the vessel is threatened, within 48 hours full details of the circumstances of the deposit must be notified to the MMO. (2) The unauthorised deposits must be removed at the expense of the undertaker unless written approval is obtained from the MMO."	The MMO recommends this clause is taken out as it duplicates s.86 of MCAA and causes confusion. Although s.86 of MCAA does not include timescales for submission to the MMO of the undertaking of these actions. The defence under Section 86 of MCAA has two limbs, and in the event that the undertaker fails to notify the appropriate licensing authority, in this case the MMO, within a reasonable time of their actions (Section 86(2) "matters") the defence cannot be relied upon in the event of any enforcement action. If the applicant maintains that the proposed provision does not duplicate Section 86 MCAA and instead introduces a reporting requirement which did not previously exist, the MMO advises that it should be made clear that this provision is in addition to Section 86 and its requirements.	The condition imposes a requirement to report any deposits made in an emergency within 48 hours which can be enforced alongside section 86. Similar provision is included in numerous Orders for offshore wind farms including East Anglia One North and Two, and Hornsea Four. It is not considered appropriate for the Order, which will be a statutory instrument, to state that this is in addition to the terms of section 86 of the Marine and Coastal Access Act 2009.
	Pre-construction plans and documentation	Condition 12(1-3)	All reference of timescales must be six months not four months. Please see further comments in 3.4.1 above.	Please see response above regarding time periods for determination of applications for approval.
		Condition 12(3)	MMO requests the condition is updated to the following wording: "(3) Unless otherwise agreed in writing with the undertaker, the MMO must use reasonable endeavours to determine an application for approval made under condition 11 as soon as practicable and in any event within a period of 6 months commencing on the date the application is received by the MMO." Please see further comments in 3.4.1 above.	Please see response above regarding time periods for determination of applications for approval.
	Offshore safety management	Condition 14	MMO is currently discussing this wording with the MCA to confirm the most recent agreed wording.	Noted

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment			Applicant's Response
	Reporting of engaged agents, contractors and vessels	Condition 15 "15.—(1) The undertaker must provide the following information to the MMO— (a) the name and function of any agent or contractor appointed to engage in the licensed activities within seven days of appointment; and (b) each week during the construction of the authorised project a completed Hydrographic Note H102 listing the vessels currently and to be used in relation to the licensed activities. (2) Any changes to the supplied details must be notified to the MMO in writing prior to the agent, contractor or vessel engaging in the licensed activities."	The following suggestions are for changes to improve clarity, but note also change to 24 hours' notice before carrying out activity, rather than a week after appointment. "(1) The undertaker must provide the name, address and function of any agent, contractor or subcontractor that will carry out any licenced activity listed in this license on behalf of the undertaker to the MMO in writing no less than 24 hours before the agent, contractor or subcontractor carries out any licensed activity; and (2) Any changes to the name and function of the specified agent, contractor or subcontractor that will carry out the specified licenced activities must be notified to the MMO in writing prior to the agent, contractor or subcontractor carrying out the licensed activity. (3) The undertaker must ensure that a copy of this licence and any subsequent revisions or amendments has been provided to any agents, contractors or subcontractors that will carry out the licensed activity on behalf of the undertaker prior to them carrying out any licensed activity."	This change has been addressed in the **draft DCO [PEPD-009]** as requested but reference to provision of information regarding vessels has been retained.
	Pre-construction monitoring and surveys	Condition 16(1)(b) "Postconstruction"	This wording should be consistent throughout the condition.	This change has been addressed in the **draft DCO [PEPD-009]**.
		Condition 16	MMO may have further requirements during Examination.	Noted

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment			Applicant's Response
	Construction monitoring	Condition 17	MMO requests that the following information is included within this condition: "(2) Subject to receipt from the undertaker of specific proposals pursuant to this condition the construction monitoring plan must include, in outline— (b) where piled foundations are to be employed, unless otherwise agreed by the MMO in writing, details of proposed monitoring of the noise generated by the installation of the first six piled foundations of each piled foundation type to be constructed collectively under this licence and the licence granted under Schedule 12 of the Order. (3) The results of the initial noise measurements monitored in accordance with sub-paragraph 17(2)(b) must be provided in writing to the MMO within six weeks of the installation (unless otherwise agreed in writing) of the first six piled foundations of each piled foundation type. The assessment of this report by the MMO will determine whether any further noise monitoring is required. If, in the opinion of the MMO in consultation with the statutory nature conservation body, the assessment shows impacts significantly in excess to those assessed in the environmental statement and there has been a failure of the mitigations set out in the marine mammal mitigation protocol, all piling activity must cease until an update to the marine mammal mitigation protocol and further monitoring requirements have been agreed. (4) The undertaker must carry out the surveys specified within the construction monitoring plan or plans in accordance with that plan or plans, including any further noise monitoring required in writing by the MMO under condition 17(3), unless otherwise agreed in writing."	It is proposed that monitoring should be undertaken in respect of the first four piles as provided in the in the offshore in-principle monitoring plan submitted as part of the application documents, and with which the construction phase monitoring plan is to accord (pursuant to conditions 11(1)(j) and 17 of Schedules 11 and 12 of the **draft DCO [PEPD-009]**.). No further monitoring is considered necessary based on the assessment of predicted effects.
	Timing of monitoring report	Condition 19	Update to include "agreed in writing"	This has been addressed in the **draft DCO [PEPD-009]**
	Updating of cable monitoring plan	Condition 20 "or as instructed by the MMO."	Update to "or as instructed in writing by the MMO."	This has been addressed in the **draft DCO [PEPD-009]**
	Piling	Condition 21(1) "Sensitive Features Mitigation Plan"	MMO recommends that this is not capitalised.	This has been addressed in the **draft DCO [PEPD-009]**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment			Applicant's Response
	Piling	Condition 21	Please include the following condition: "In the event that driven or part-driven pile foundations are proposed to be used, the hammer energy used to drive or part-drive monopile foundations must not exceed 4,400kJ and the hammer energy used to drive or part-drive pin pile foundations must not exceed 2,500kJ.	Condition 11(1)(c) of Schedules 11 and 12 has been amended in the **draft DCO** **[PEPD-009]** to secure that all piling methods are specified and submitted for approval as part of the construction method statement. As the contents of this document must accord with the construction methods assessed in the environmental statement, which include piling, the submission and approval of this document will deal with the maximum hammer energies and ensure they do not exceed those assessed in the ES. Condition 12 requires that the authorised scheme is constructed in accordance with the approved documents. An additional condition to secure this limit is therefore unnecessary.
	Reporting of cable protection	Condition 22	Please change "Natural England" to "relevant Statutory Nature Conservation Body".	This has been addressed in the **draft DCO** **[PEPD-009]**
	Decommissioning	Condition 23 "(1) Prior to any decommissioning activities being undertaken the undertaker must submit and secure the written approval of the MMO for a decommissioning mammal protection protocol (Decommissioning MPP). (2) The Decommissioning MPP must be implemented as approved."	MMO requests clarity on the inclusion of this condition and whether decommissioning activities are included and if so, this should be made clear in the licensed activities.	The licence will remain in force for the life off the windfarm and this condition ensures that marine mammals will be protected during decommissioning activities which have been assessed in the environmental statement.
	Completion of construction	Condition 24	MMO requests the following is included in this condition: "25. The undertaker must submit a close out report to the MCA and the UK Hydrographic Office within three months of the date of completion of construction. The close out report must confirm the date of completion of construction and must include the following— (a) the final number of installed wind turbine generators; (b) a plan of the layout of installed wind turbine generators and offshore accommodation platform; and (c) latitude and longitude coordinates of the centre point of the location of each wind turbine generator and offshore accommodation platform, provided as Geographical Information System data referenced to WGS84 datum."	The condition has been amended in the **draft DCO** **[PEPD-009]**to include a requirement for a plan of the layout of installed wind turbine generators and offshore substations and the coordinates of these structures. There are no offshore accommodation platforms.

Ref	MMO's Comment	Applicant's Response
4.1 General Comments		
MMO 4.1.1	MMO is aware that several major points raised during the Preliminary Environmental Information Report (PEIR) process have not been addressed sufficiently, and this poses a major issue. Please see points 4.6.6, 4.6.33, 4.6.35, 4.6.59 - 4.6.61, 4.7.9 and 4.7.10.	Please see responses to the points below.
MMO 4.1.2	MMO has focused its review on the following chapters of Volume 2 of the ES, however, has also reviewed the accompanying figures in Volume 1, and relevant appendices where required: • Explanatory Memorandum • Rampion 2 ES Volume 1 Non-technical summary • Chapter 1: Introduction. • Chapter 4: The Proposed Development. • Chapter 5: Approach to the EIA. • Chapter 6 Coastal Processes. • Chapter 8: Fish and shellfish ecology. • Chapter 9: Benthic, Subtidal and Intertidal ecology. • Chapter 10: Commercial fisheries. • Chapter 26 Water environment. • Chapter 30: Inter-related effects. • Volume 4, Appendix 11.3 Underwater noise assessment technical report. • Volume 4, Appendix 8.3 Underwater noise study for sea bream disturbance, • Revision A. • Rampion 2 Site Characterisation Report	The Applicant notes the comments on the listed ES chapters which are addressed below.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
MMO 4.1.3	The DCO Part 3.1 Schedule 1 Article 3 Part 1 authorised development Work No. 2, states that Rampion 2 must comprise no more than 90 wind turbine generators. Part 14 of the DCO 3(a) then states that *"Notwithstanding article 3(1) no more than 116 wind turbine generators and 1 offshore substation may be constructed. Also, in the ES Chapter 1 Introduction section 1.2.3 the overview of the proposed development suggests "up to 90 offshore wind turbine generators".* However, in the Non-Technical Summary -Volume 1 of the ES the project is described as being made up of as 116 wind turbine generators, before Chapter 4 (4.1.13) states that up to 90 wind turbine generators will be a key element, before it states in 4.1.17 that the area and number of WTG have been reduced from 116 to 90.The DCO and ES and different chapters in the ES should contain the same specifications for consistency and to ensure impacts are accurately described mitigated and monitored appropriately.	Article 7 within Part 2 Principal Powers of the **draft Development Consent Order [PEPD-009]** (page 14) deals with the interaction between the Proposed Development and the existing Rampion Wind Farm. The purpose of the article is to ensure that no further construction is undertaken at Rampion 1 beyond that currently in situ, being 116 wind turbine generators and 1 offshore substation. Article 7 amends the existing Rampion Offshore Wind Farm Order 2014 by replacing its existing Article 3 with the new wording set out in Article 7 of the **draft DCO [PEPD 009]**: The wording of Article 7 does not relate to the maximum turbines for Rampion 2. Section 1.2 of the **Non-Technical Summary [APP-041]** is referring to Rampion 1, which has 116 wind turbine generators installed and operating. The maximum number of wind turbines for Rampion 2, is 90, as stated in **Chapter 4: The Proposed Development, Volume 2 [APP-045] and the draft Development Consent Order [PEPD-009].**
4.2 Coastal Processes		
MMO 4.2.1	MMO considers that all potential impacts have been identified. However, specific comments about the assessment of significance have been set out below ES Volume 2 Chapter 4 – Table 4-3 – please advise if the WTG structure have sufficient bunding to contain the 29,819 litres of fluids?	Wind turbines are designed to avoid creating an environmental impact through a leakage of fluids from the turbine. Whilst there isn't bunding to account for all fluid loss the Nacelle canopy is designed in a way to contain leaks from each of the main systems. The amounts described represent the "most likely worst case" contained in the turbine as a whole and will be dependent on each individual turbine design. It does not necessarily mean this is the total amount that could theoretically leak at one time. In addition some of these same fluid types may be split between distinct systems. As part of the turbine design risk assessment the turbine manufactures will carry out assessment to ensure sufficient bunding is in place for foreseen failure scenarios. Most fluid levels are constantly measured and the turbine will react in a way to minimise leakage, for example turning off pumps, in some cases this will lead to complete shutdown of the turbine. The largest amounts of fluid are seen in the gearbox (on turbine types that have gearboxes) and glycol-based cooling fluid which is

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
		used for both component cooling and in some cases for ballast in tower dampening. In the case of the gearbox oil any leaks will be contained in the nacelle canopy (which acts as bunding). In the case of glycol fluid the most likely scenario is that only part of the system is compromised and the that the fluid collects in the Nacelle canopy or tower bunding systems.
MMO 4.2.2	ES Volume 2 Chapter 4 – Table 4-3 – to note details from this table should be provided in the Outline Scour Protection and Cable Protection Plan when completed.	Details from **Table 4-3, Chapter 6: Coastal processes, Volume 2 [APP-047]** will be included in the final Scour Protection and Cable Protection Plan which is servured by condition 11(1)(i) of Schedules 11 and 12 of the **draft DCO [PEPD-009]**.
MMO 4.2.3	ES Volume 2 Chapter 4 Table 4-5 – please provide evidence to show that the sand wave clearance of 10 metres (m) will be sufficient to create and maintain a corridor for the plough or trenching device.	Maximum sandwave clearance trench dimension MDS has been informed by standard descriptions and protocols for this activity. The base of the trench will have a minimum fixed width that must be achieved to subsequently allow the cable burial tool to pass (which is the purpose of the levelling). Sloped sides to the cleared path will increase the apparent width in proportion to the local depth of sediment cleared (i.e. continuously varying from trough to crest of individual sandwaves). Allowance for this is made in the estimated total volume of sandwave clearance required, also informed by the detailed bathymetry of the project area and the realistic height and number of sandwaves that might be encountered. The estimated values are conservatively determined for the purpose of the EIA (not based on a specific route through specific features).
MMO 4.2.4	ES Volume 2 Chapter 4 section 4.3.31 – plastic fronds can introduce plastics into the marine environment as they degrade over time. If there is scope to minimise the use of plastic fronds and geotextile bags, this would be welcomed and should be set out within the Outline Scour Protection and Cable Protection Plan.	The Applicant is committed to minimising the release of plastics into the marine environment, and commits to using suitable alternatives, where this is practicable. C-288 has been added to the commitments register as and will be secured through the the next iteration of the **Outline Scour Protection and Cable Protection Plan [APP-234]** secured in Condition 11(1)(i) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**) at Deadline 3.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
MMO 4.2.5	ES Volume 2 Chapter 4 section 4.3.76 – the impacts of "ground-out" area has not been assessed especially in the near shore environment and should be included.	The beach and shallow intertidal and subtidal areas at the landfall comprise a mixture of sands and gravels. The temporary addition and subsequent removal of sand/gravel beds in the nearshore area is unlikely to change the composition or form or function of the sediments present following the construction phase, especially following a reasonable period of reworking (e.g. one large storm). In response to Issue Specific Hearing 1 agenda item 46, the Applicant has produced an assessment of temporary gravel beds: **Appendix 13 - Further Information for Action Point 45 and 46 (document reference 8.25.13)**.
MMO 4.2.6	ES Volume 2 Chapter 4 Table 4-17 – it is not clear if a "jetter" include the use of Continuous Flow Devices (CFD). These are very powerful devices and can move considerable volumes of sediment which should be assessed.	The Applicant can confirm, a jetter includes the use of Continuous Flow Devices (CFD).
MMO 4.2.7	ES Chapter 6 Coastal Processes (executive summary) –sand banks and the shoreline are "sensitive receptors" and any impacts on them need to be assessed.	The Applicant can confirm that the specifically identified coastal processes receptors are identified in **Table 6-6, Chapter 6: Coastal processes, Volume 2 [APP-047]**, which includes all named receptors identified within the study area for the following categories: nationally or internationally designated sites; local coastlines; regional coastlines; offshore sandbanks; and recreational surfing venues. Potential impacts on local and regional coastlines, and offshore sandbanks, are assessed in **Chapter 6: Coastal processes, Volume 2 [APP-047]**, with respect to: the tidal regime (**paragraph 6.10.1** onwards); the wave regime (**paragraph 6.10.11** onwards); and, the sedimentary regime (**paragraph 6.10.21** onwards). More detail of the basis for these assessments is contained in **Appendix 6.3: Coastal processes technical report Impact assessment, Volume 4 [APP-131], Sections 4, 3 and 5**, respectively.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
MMO 4.2.8	ES Volume 4 Appendix 6.3 Coastal Process Technical report – section 2.1.2 – clarity is sought if any dredge pits (for sourcing of materials) or borrow pits are proposed?	The Applicant can confirm that no dredge or borrow pits are required for the sourcing of material.
MMO 4.2.9	ES Volume 4 Appendix 6.3 Coastal Process Technical report – section 2.4.4– what lessons from Rampion 1 disposals can be applied to Rampion 2 if drill-drive operations are used?	Rampion 1 did not utilise drill-drive methods and therefore no information was taken from this specific project. The Applicant does not anticipate that drill-drive operations will be undertaken in areas where chalk arisings would occur.
MMO 4.2.10	ES Volume 4 Appendix 6.3 Coastal Process Technical report – section 2.4.6 – the equivalence in drill volumes and mound volumes is surprising as the 0.6 ratio (Soulsby, 1997) would imply an expanded volume to grains/particles overlapping etc. this should be explained.	The text being referred to (**paragraph 2.4.6** in **Appendix 6.3: Coastal processes technical report Impact assessment, Volume 4** **[APP-131]** is comparing the volume of a drilled hole (~347 m^3 based on the expected dimensions) for a monopile installation at Lynn and Inner Dowsing Wind Farm, to the approximate surveyed/measured volume of the resulting drill spoil mound that accumulated on the seabed (~290 m^3). The drill was into chalk and the majority of material in the drill spoil mound comprised relatively larger 'chunks'. The comment appears to question why the volume of the drill spoil mound is less than volume of the drilled hole, also noting that disaggregation of the highly compressed soil in the ground should result in a relatively larger volume of spoil following drilling. The logic of the question is fair and clear - however, simply, it is likely that some proportion of the drilled material did not accumulate in the drill spoil mound and was deposited in a more dispersed manner elsewhere nearby. Not all of the drilled and redeposited material is accounted for by the available survey data in this particular case (as also noted in the original text).
MMO 4.2.11	ES Volume 4 Appendix 6.3 Coastal Process Technical report – section 2.4.8 – MMO suggests that samples from Vibro corers etc are used to fully characterise the chalk substrate in order to validate the assumptions made in this ES (in terms of particle size, consolidate and settling velocity).	The Applicant confirms that geotechnical data will be collected pre-construction, and core samples will be analysed to characterise the seabed substrata to inform construction design decisions.

Ref	MMO's Comment	Applicant's Response
MMO 4.2.12	ES Volume 4 Appendix 6.3 Coastal Process Technical report – section 2.5.19 MMO hoped to see diagrams of the Suspended Sediment Concentration (SSC) plume showing the concentrations orientations and depositions so that pathways to receptors could be established, please can these be provided.	A map showing the extent of SSC and sediment deposition effects from sediment plumes is provided in **Figure 6.3.4** together with the text in **Section 2.9 of Appendix 6.3: Coastal processes technical report Impact assessment, Volume 4** **[APP-131]**. A map showing tidal excursion ellipses (i.e. the spatial path that would be followed by a sediment plume released at any location in the study area) is provided in **Figure 6.3.3** of **Appendix 6.3: Coastal processes technical report Impact assessment, Volume 4** **[APP-131]**.
MMO 4.2.13	ES Volume 4 Appendix 6.3 Coastal Process Technical report – section 5.4.3 – no maps of the changes in terms of tidal currents due to the structures – either for Rampion 1 or cumulative with Rampion 2 (analogously to waves shown in Annex A of the document) have been included, MMO would expect to see this and would request these are added to the document.	A more detailed assessment of change to tidal conditions due to the proposed scheme layouts is provided in **Section 4 of Appendix 6.3: Coastal processes technical report Impact assessment, Volume 4** **[APP-131].** This information is summarised in **paragraph 6.10.1** onwards of **Chapter 6: Coastal processes, Volume 2** **[APP-047]**. The assessment (based on a review of modelling studies for other wind farms, including Rampion 1) concludes that analogous offshore wind farms consistently have no measurable array scale effect (<a few cm/s or <1 degree) on tidal current speed or direction. Narrow wake features (with relatively lower mean current speed and proportionally increased turbulence intensity) are likely to be present behind individual foundations, but the distance for recovery to near ambient conditions is in the order of tens to a few hundreds of metres and the wakes are unlikely to overlap. The Applicant considers that the assessment and conclusion is robust and clear in the form of the statements made. As the determined effect is negligible in magnitude and no new modelling has been undertaken to define a specific pattern to plot, no new map of potential impact has been created.
MMO 4.2.14	ES Volume 4 Appendix 6.3 Coastal Process Technical report – section 5.4.3 – no maps for changes in sediment transport have been provided, please can these be provided for full review.	The assessment of potential changes to the sediment transport regime is a logical conclusion based on the assessed very low magnitude of change to tidal currents and waves (for the Proposed Development alone, and for the Proposed Development in combination with Rampion 1).

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
		The detailed assessments are provided in **Appendix 6.3: Coastal processes technical report Impact assessment, Volume 4 [APP-131]**. The summary assessment and conclusions of significance are provided in, **Chapter 6: Coastal processes, Volume 2 [APP-047]**. The Applicant considers that the assessment and conclusion is robust and clear in the form of the statements made. As the determined effect is negligible in magnitude and no new modelling has been undertaken to define a specific pattern to plot, no new map of potential impact has been created.
MMO 4.2.15	A number of embedded mitigation measures are presented in Table 9-16 and appear to be realisable. No additional specific licence conditions are required, however upon review of the Scour Protection and Cable Protection Plan further information may be required within the Plan.	The Applicant welcomes agreement from the MMO regarding the embedded mitigation measures. Responses to the MMO's points on the **Outline Scour Protection and Cable Protection Plan [APP-234]** are in section 5.2.
MMO 4.2.16	MMO notes that the outcomes of the ES report indicated that no significant coastal processes were predicted, and thus, no monitoring is formally required.	The Applicant welcomes the comment.
MMO 4.2.17	The quality of the data is high and informative in terms of Coastal processes. MMO requires further information above before being fully satisfied with the in relation to coastal processes.	The Applicant welcomes the comment. Please see responses to specific points raised in the sections above.
4.3 Benthic Ecology		
MMO 4.3.1	The baseline features of the region have been adequately characterised using a wide range of desk-based data sources (listed in Table 9-9) and, to augment this, both intertidal and subtidal targeted surveys have been conducted (listed in Table 9-10). These data sources have together been suitably used to characterise the benthic ecological baseline for the project which is appropriate.	The Applicant welcomes the MMO's confirmation that the Applicant has appropriately characterised the baseline environment.
MMO 4.3.2	Overall MMO considers all potential impacts to have been identified. However, below are some comments about the assessment of significance which require action.	The Applicant welcomes the MMO's confirmation that all impacts have been considered, and has responded to the detailed comments below.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
MMO 4.3.3	In Section 9.6.3.1, regarding valuable ecological receptors ("VERs") the report states *"only a very small proportion of marine habitats and species are afforded protection under the existing legislative or policy framework. Therefore, evaluation must also assess value according to the functional role of the habitat or species. For example, some features may not have a specific conservation value in themselves but may be functionally linked to a feature of high conservation value".* MMO fully supports this notion and was expecting to see references to a suite of species which are considered to have important functional presence such as key prey species for bottom feeding fish, key drivers of benthic-pelagic coupling and/or bioturbators which are likely to play an important role in the ability of the seabed to affect nutrient flux and/or carbon sequestration. However, in the relevant Table (Table 9-14) no such species are listed, only those of conservation interest are identified (which seems to contradict the statement given above in Section 9.6.3.1), the MMO requests that this is updated, or justification is provided as to why the prey species are not included.	The Applicant can confirm that all biotopes identified during the benthic characterisation were taken through to **Table 9-14** and consequently grouped by description of habitat where they are not a protected feature/species. This allows all biotopes to be highlighted through the VER process. The detail of each VER/biotope is then further discussed within the assessment **Section 9.9 – 9.11 Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050]** which breaks down important species that characterise biotopes and have a functional role for that habitat, where this information is deemed valuable to the EIA process.
MMO 4.3.4	While the report follows the Marine Evidence based Sensitivity Assessment (MarESA) approach regarding the sensitivity of receptors (biotopes in this respect) to potential pressures resulting from the project, which is of course acceptable, the MMO has reservations regarding the "temporary increase in SSC and sediment deposition". In Table 9-22, a number of biotopes are listed to be "not sensitive" to heavy smothering with which the MMO is not in agreement with. For example, the biotope "sponges and anemones on circalittoral rock" is considered as not sensitive to heavy smothering 5-30 centimetre (cm) of sediment overburden. Given the sessility and feeding methods of these taxonomic groups (i.e., sponges and anemones), the MMO argues that they must be rather sensitive to this degree of sediment overburden, unless it can be demonstrated that this overburden for this project will be experienced for very short timeframes. If there is no supporting information that the sediment overburden for this (and other biotopes where sensitivity to heavy smothering is either "low" or "not sensitive") then the sensitivity ranking should be reconsidered.	The Applicant can confirm that the methodology for defining sensitivity follows the Marine Evidence based Sensitivity Assessment (MarESA), as detailed through the ETG process. In relation to the biotope Sponges and anemones on vertical circalittoral bedrock (A4.139), this biotope relates to vertical bedrock which would therefore avoid direct pressures from smothering due to its orientation in the water column. Throughout the assessment **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050]**, additional information on sensitive fauna has been presented where further justification is deemed valuable.
MMO 4.3.5	On a similar note, MMO has noticed that the report combines increased SSC with smothering into a single pressure. MMO considers that these two pressures, and importantly the mechanism by which they affect benthic organisms, are rather different and they should be separated out as part of an impact assessment.	The Applicant has combined these pressures into one assessment, however the impact has been split out within each assessment, including for defining sensitivity following the Marine Evidence based Sensitivity Assessment (MarESA).
MMO 4.3.6	Section 9.4.9 states *"All likely significant effects identified will be considered at further stages of the assessment as more detail regarding the design becomes available and greater levels of baseline data are collected and analysed. No matters aspects are being scoped out at this stage".* MMO considers that this is a logical and precautionary approach at this time.	The Applicant welcomes the MMO's confirmation that this approach is suitable.
MMO 4.3.7	The Applicant has responded to comments raised during the Evidence Plan Process and PEIR regarding the use and reliance on predicted habitat maps (Table 9-6), by informing stakeholders that subsequently acquired site-specific survey data will be used and prioritised over predictive maps.	The Applicant welcomes this comment.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
MMO 4.3.8	The outcomes of the ES report indicated that no significance benthic ecological impacts were predicted and, thus, no monitoring is formally required. However, in line with Natural England advice, the applicant has committed to undertake monitoring of habitats/species of principal importance pursuant to section 41 of the Natural Environment and Rural Communities (NERC) Act 2006. Thus, the proposed monitoring approach to Sabellaria spinulosa reef and chalk habitat is presented in Table 4.3 of the report cited in 3.3.1 above. MMO considers this approach to be sensible.	The Applicant welcomes the MMO support of this approach.
MMO 4.3.9	MMO would welcome monitoring of the sedimentary benthic communities throughout the construction and operation to provide valuable data to fill a large gap in current understanding. While such monitoring is not a formal request, the MMO would consider its inclusion here as a benefit to the whole.	The Applicant does not agree that there is a large gap in understanding in relation to sedimentary benthic habitats/ communities. However, where the location and extent of priority habitats and species require monitoring to be able to apply the appropriate mitigation, this should be the focus to minimise impacts. As detailed within the **Offshore In Principle Monitoring Plan [APP-240]**, which is secured in Condition 11(1)(j) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**), pre-construction surveys will be undertaken to confirm presence and extent of primary marine features. The requirement for post-construction monitoring will be dependent on the findings of the pre-construction surveys.
4.4 Dredge, Disposal and Chemical Use		
MMO 4.4.1	The survey for Rampion 2 offshore export cable corridor and array areas was extended to provide adequate coverage to be able to provide characterisation for benthic ecology. Samples collected and analysed as part of this survey were to support the determination of impacts on benthos and not specifically for sediment quality for dredge and disposal. MMO provided advice on the PEIR that suggested 30 samples should be taken across the areas. Considering the coarse nature of most of the construction areas, which were dominated by sand (some stony reef and bedrock were also identified), with finer sediments closer to the nearshore cross the export cable area as would be expected, the limited samples collected for analysis is likely to be indicative of the site overall.	The Applicant welcomes the MMO support of the sediment sampling and analysis.
MMO 4.4.2	ES Volume 4 Appendix 9.3 section 3.2 sampling strategy - MMO notes that the applicant states in that the final sample stations were signed off by the MMO across the subtidal survey area (Figure 1) based on the rationale outlined in Section 3.1 and presented in Figure 3. In total eight samples were collected across the ES assessment boundary area which were analysed for particle size analysis (PSA) heavy trace metals (including arsenic) and seven for Polyaromatic Hydrocarbons (PAHs), total organic carbon and total organic matter.	This is noted by the Applicant.
MMO 4.4.3	MMO notes that the samples were collected for chemical analysis using a 0.1 square metre (m2) Day grab which is appropriate, however it is preferable for the samples for PSA to be from the same grab operation as the chemical analysis procedure. In this instance a mini-hamon grab sample was taken for separate PSA sample. PSA was analysed by Ocean Ecology who are an MMO-validated laboratory for this procedure.	As presented in **Section 4.2.1 of Appendix 9.3: Rampion 2 Offshore wind farm subtidal benthic characterisation survey report, Volume 4 [APP-137]**, the Applicant can confirm that a day grab was utilised for the collection of samples for subsequent chemical analysis and that a mini-hamon grab was used for sediment samples for PSA analysis. The reason that PSA samples are collected from a mini-hamon grab is because this grab is more successful in a range of habitat types, including coarse sediments.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
		The Day grab is only successful in fine/soft sediments and therefore would not be appropriate across the majority of the site.
MMO 4.4.4	ES Volume 4 Appendix 9.3 section 6.3.2 sampling strategy - If these sediments have been sieved to less than 63 microns and hydrofluoric acid used, the comparison to Centre for Environment, Fisheries and Aquaculture Science (Cefas) Action Levels in the text in Table 11 should be removed. However, depending on the methods used the comparison to Canadian threshold effects levels and OSPAR Background Assessment Concentrations (BAC) (OSPAR et al.2009) may conversely be inappropriate. Therefore, only where methods of extraction match those of the preparation of the metric it is being compared to OSPAR BACS, Canadian TELS, US Environmental Protection levels, Cefas Action Levels, etc) can the results actually be assessed.	The Applicant has provided detailed methods of preparation and extraction in Appendix VI of **Benthic - Subtidal benthic characterisation survey report appendices** **[Document Reference 8.34]** submitted at Deadline 1.. The Applicant welcomes this initial judgement and hopes to reach agreement on these matters following the MMO's review the Applicant's Deadline 1 submission. In addition, the Applicant has provided an assessment of the release of contaminants as a result of proposed dredging and disposal activities. This assessment is presented in the **Site Characterisation Report** **[APP-031]**.
MMO 4.4.5	It is of note that for the south coast of the UK dredge higher levels of Arsenic are naturally observed in sediments (Cefas report E5403 indicates for normalised sediments less than 63 microns that the regional background level for the Eastern Channel for Arsenic is proposed to be around 23 milligrams per kilograms (mg/kg) with levels of reference concentrations of 30 mg/kg and proposed levels of Chromium for background around 90 mg/kg where the OSAPR BAC is 80 mg/kg). Therefore Table 11 OSPAR BAC has a typo for Chromium as none of the sites fail this should be 80 mg/kg (if methods are comparable). The methods of preparation and extraction should be clarified.	The Applicant acknowledges this error and agrees that the OSPAR BAC should be 80 mg/l and therefore, that none of the sites failed. The Applicant has provided detailed methods of preparation and extraction in Appendix VI of **Benthic - Subtidal benthic characterisation survey report appendices** **[Document Reference 8.34]** submitted at Deadline 1. The Applicant confirms that the methods are comparable. The Applicant welcomes this initial judgement and hopes to reach agreement on these matters following the MMO's review of the Applicant's Deadline 1 submission.
MMO 4.4.6	Provided the methods of preparation and extraction are comparable MMO believes the levels observed do not pose a concern for release of contaminants in suspended sediments during dredging/relocation/disposal activities and will confirm upon review of the clarifications.	The Applicant has provided detailed methods of preparation and extraction in Appendix VI of **Benthic - Subtidal benthic characterisation survey report appendices** **[Document Reference 8.34]** submitted at Deadline 1. The Applicant welcomes this initial judgement and hopes to reach agreement on these matters following the MMO's review of the Applicant's Deadline 1 submission. In addition, the Application has provided an assessment of the release of contaminants as result

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
		of proposed dredging and disposal activities. This assessment is presented in the **Site Characterisation Report [APP-031].**
MMO 4.4.7	ES Volume 4 Appendix 9.3, Table 12 - Results of samples analysed for PAHs were compared to OSPAR BACs Effects Range Lows (ERLs), International Sediment Quality Guidelines (ISQG), Threshold Effects Levels (TELs) and Probable Effects Levels (PELs), in the absence of agreed UK Action levels for PAHs. The levels of PAHs observed other than Phenanthrene and Pyrene at two stations were below the limit of detection.	This is noted by the Applicant.
MMO 4.4.8	Appendix 26.3 WFD compliance assessment (page 29) - It was noted that the Sussex coastal water body is currently failing with regards to mercury and its compounds, and Polybrominated diphenyl ether therefore it would have been preferable to see levels of these polybrominated flame retardants as well as metals and PAHs to provide confidence that the levels of contaminants likely to be released from the dredging and relocation is acceptable. However, given the coarseness of the material further offshore in the array area (sands and gravels) and the levels observed, the risk to the marine environment from the release of contamination appears to be low.	The Applicant agrees that the risk to the marine environment from the release of contaminants is low as presented in **Section 6** of the **Site Characterisation Report [APP-031].** The Applicant wishes to highlight, as per the Environment Agency's section 42 responses, that all coastal and transitional waterbodies are currently failing for chemistry based on the 2019 results. Further details are provided in **Table 2-1 of Appendix 26.3: Water Framework Directive compliance assessment, Volume 4 [APP-217]**. When the surveys were scoped, designed and undertaken, the Sussex coastal water body was not failing.
MMO 4.4.9	ES v2 chapter 9 Benthic, Subtidal and Intertidal Ecology – pathways for likely significant effects were identified on benthic subtidal and intertidal ecology receptors as a result of release of pollutants from the construction and decommissioning activities. This should be amended for the release of pollutants during construction, operation, maintenance, and decommissioning, to ensure that consideration of the impacts of the use and discharge of chemicals are adequately addressed. The release of accidental pollutants could also transpire during maintenance and operation as well as for construction and decommissioning therefore this statement in the non-technical summary and chapter 9 should be amended.	The Applicant can confirm that the accidental pollution events were not scoped into the assessment due to the feedback received during scoping. As detailed within **Table 9-5 of Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050]** "*The Inspectorate agrees that, with the implementation of measures to limit any potential pollution incidents, any potential impacts on benthic subtidal and intertidal ecology are unlikely to result in significant effects and therefore further assessment is not required*". Therefore, accidental pollution events (construction, operation and maintenance and decommissioning) were not included within the assessment.
MMO 4.4.10	MMO notes the estimated deposits on the seabed as a result of disposal for the initial mounds are said to be in the order of tens of hundreds of metres in diameter and from 10s to a few metres in thickness, with potential overlap of consecutive disposal events on the seabed. Fine grained material is not anticipated to settle locally with measurable thickness.	This is noted by the Applicant.
MMO 4.4.11	Chapter 9 Benthic Subtidal and Intertidal Ecology. Figure 9.2 shows the location of Benthic survey samples tested for contaminants. The MMO has found no other reference to sampling to determine the quality of the material to be displaced to be able to determine sediment quality from the chapters provided, this should be made clear.	**Section 4** of the **Site Characterisation Report [APP-031]** provides a detailed characterisation report of the proposed disposal area and dredged material. Furthermore, this report provides sufficient information to aid the licencing of the proposed disposal activities and site. **Section 4** of the **Site Characterisation**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
		Report **[APP-031]** provides a detailed site characterisation in terms of the physical, biological and human environment. Section 5 of the Site Characterisation Report **[APP-031]** presents a detailed characterisation of the physical, biological and chemical characteristics of the material to be disposed of. These characterisations have then informed the assessment of potential adverse effects of disposing this material at the proposed disposal site (Section 6). Paragraph 7.1.3 concluded "*As the assessment has not identified any significant adverse effects on receptors for this proposed disposal activity*…". As stated in Section 5.3 of Appendix 9.3: Rampion 2 Offshore wind farm subtidal benthic characterisation survey report, Volume 4 **[APP-137]**, all organic matter, hydrocarbon and metals analysis was undertaken by SOCOTEC UK Limited. All other analysis of sediment samples was undertaken by Ocean Ecology Limited.
MMO 4.4.12	Previous advice from the MMO during the PEIR consultation commented that there was an absence of sufficient physical and chemical detail for the proposed dredge and disposal area and therefore it was not possible to say whether disposal activity was acceptable. There is now some chemical and physical data available, which appears to indicate that the release of contamination from the construction activity is likely to be low, although the provenance for chemical analysis requires confirmation to be confident of the results provided to support this assessment.	The Applicant refers the MMO to its response to **4.4.11** above.
MMO 4.4.13	Whilst coarse sediments may not be appropriate for chemical analysis over the likely disposal area (most likely across the array area) from the characterisation figures 9 and 10 (Appendix 9.2) the MMO recommends not disposing of chalk arising from the export cable area to the array area and relocation of material other than side casting for such sediments should be further justified to ensure that impacts on sensitive receptors is minimised. The MMO welcomes discussions on how this can be captured as part of the consent.	The Applicant confirms that material arising from installation works will not be relocated to other areas of the Order limits. The Applicant will engage with the MMO to establish whether a Condition to this effect is required within the dMLs and, if so, to develop an agreed form of words for such.
MMO 4.4.14	ES chapter 6 appendix Table2-6 -MMO has previously raised concerns that there was a lack of explanation as to how "drilling protocols" would limit the deposits of arisings over a thickness over 4-5m thick. The Applicant's response was such that the sediment volume would be managed through either selective placement or redistribution of sediments after, as part of the construction method statement a foundation installation methodology including a dredging protocol, drilling methods and disposals of drill arisings and material extracted (C-279) (chapter 6). MMO is now content with these comments provided that these documents show adequate justification of how this limit will be achieved. MMO would welcome a draft drilling protocol at this stage or specific reference to these documents within the DML.	The Applicant welcomes this confirmation from the MMO and refers to Commitment C-279, which relates to the provision of a construction method statement secured through Condition 11(1)c of the dMLs (Schedules 11 and 12 of the draft DCO **[PEPD-009]**). This Condition states that the CMS must accord with the construction methods assessed in the ES and references inclusion of drilling methods and the disposal of drill arisings.
MMO 4.4.15	The installation of the cables will require ploughing, trenching or jetting or a combination of any such techniques. ES V1 section 3.2 states that some form of seabed preparation and the addition of any required cable protection may be required. The need for cable	The Applicant will provide the details of the type of protection material proposed to be deployed within the

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
	protection for inter-array and export cables may be site- specific and require different methods however this statement suggests that any protection will be used. This sentence could be better worded to show that the regulator will have the opportunity for considered approval of the options and locations to ensure that impacts on protected features is minimised using best available practice and techniques. The MMO notes this could be covered within the outline scour protection and cable protection plan.	scour protection and cable protection plan, which details the need, type, sources, quantity and installation methods for scour protection, which must be updated and resubmitted for approval if changes to it are proposed following cable laying operations. An **Outline Scour Protection and Cable Protection Plan [APP-234]** has been submitted alongside the Application, with the final Plan submitted to and approved in writing by the MMO as secured in Condition 11(1)(i) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**).
MMO 4.4.16	Options for scour protection (Section 4.3.31 of the ES) included gabion baskets and nets, it should be noted that this will result in the potential introduction of plastic particles and cement to the marine environment, and MMO would support efforts to minimise where possible and recommend the type of protection to be used including impact from plastics is provided. Please see comments in Section 5.2 of this document of how this can be managed.	The Applicant is committed to minimising the release of plastics into the marine environment, and commits to using suitable alternatives, where this is practicable. C-288 has been added to the commitments register as and will be secured through the the next iteration of the **Outline Scour Protection and Cable Protection Plan [APP-234]** secured in Condition 11(1)(i) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**) at Deadline 3.
MMO 4.4.17	Please note, at decommissioning, where excavation of piles and or suction buckets is needed to be undertaken prior to cutting and or removal, an evaluation of the contamination and potential from release of chemicals from this activity will be recommended to be included as a licence condition (Chapter 4 4.9.7, 4.9.8 of the ES). This is to minimise the potential of the release of chemicals into the marine environment as a result of chemical use on the structures over the lifetime of the project. Once clarity is provided on decommissioning activities within the deemed marine licence the MMO may have further comments.	The Applicant notes the comments made with regards to the need to provide for evaluation of the potential for release of contaminants during decommissioning works, however at this stage it is too early for the Applicant to specify methodologies for decommissioning. The Energy Act (2004) requires that a decommissioning plan must be submitted to and approved by the relevant Secretary of State, a draft of which will be submitted prior to the construction of the Proposed Development. The decommissioning plan and programme will be updated during the Proposed Development's lifespan. To take account of changing best practice and new technologies, the approach and methodologies employed at decommissioning will be compliant with the legislation and policy requirements at the time of decommissioning. In accordance with the requirements provided in the **draft DCO [PEPD-009]**, a written decommissioning programme will be provided prior to works commencing.
MMO 4.4.18	ES Volume 2 Section 3.2 Explanatory Memorandum states that two types of foundation are provided for the WTG, however this omits the use of suction buckets and therefore should be amended for consistency.	The Applicant will ensure clarity is provided within the **Explanatory Memorandum [APP-020]** to ensure both pin-piles and suction buckets are included for the

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
		multileg foundation option. The Applicant will provide an updated Explanatory Memorandum at Deadline 2.
MMO 4.4.19	Chapter 4 section 4.8.12 references touch up and full paint jobs for the WTG and Substation(s). MMO requires the volume and quantity as well as the frequency of use as well as how they are applied, and function to be fully described. Although chemicals used in 'closed systems' (within gears etc.) do not require notification to the regulator to support signatory obligations under OSPAR, where there is a requirement for top up of potential for release to the marine environment the quantities and characteristics of these chemicals should be included in the notification to the regulator for approval. Please see comments on this condition in Table 1	The Applicant notes that the relevant operations and maintenance activities are set out within the **Outline Offshore Operations and Maintenance Plan [APP-238]**. As detailed in response to MMO 3.5.3 above, this Plan will be referenced in the **draft DCO [PEPD-009]** and included in Schedule 16, which will be updated at the next revision to the draft DCO at Deadline 3. The OOMP will also be updated at this stage to clarify the condition of the deemed Marine Licences pursuant to which the final document is to be submitted. The use of approved chemicals for the Proposed Development and control over any coatings or treatments used to ensure these are suitable for use in the marine environment are secured in Condition 9(1) and 9(2), respectively, of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**.
MMO 4.4.20	Table 6-11 (Chapter 6, Coastal Processes) describes the potential for chemicals (bentonite) to be expelled or lost to the marine environment as part of the Horizontal Directional Dredging (HDD). An estimate of the risk to the marine environment should be provided to the MMO for any chemical used and discharged either intentionally or potentially accidentally as per OSPAR guidelines (2008-3) unless used within a closed system, on vessels, grey water etc. (e.g., falls within other regulations). Please refer to 4.4.21 for further information.	The Applicant notes this comment and refers the MMO to its response to 4.4.21 below.
MMO 4.4.21	Table 4-4 (Chapter 9, Benthic subtidal and intertidal ecology) discusses the release of Bentonite as a non-toxic inert natural clay mineral on the list of notified chemicals for use and discharge into the marine environment. This statement is incorrect as this is not a list of 'approved' chemicals. This is a list of products where their contents have been hazard assessed and ranked using generic modelling parameters for oil and gas platforms that are not appropriate for use for offshore wind farms.	The Applicant notes that Bentonite is listed as posing little or no risk (PLONOR) into the marine environment, as referred to by the MMO in its Relevant Representation MMO 4,4,22 below, but acknowledges this is not strictly a list of 'approved' chemicals. The Applicant would highlight that it has assessed the fate of bentonite and potential direct and indirect impacts of its release into the marine environment in the following documents: **Chapter 6: Coastal processes, Volume 2 [APP-047]**; **Appendix 6.3: Coastal processes technical report impact assessment, Volume 4 [APP-131]**; **Chapter 9: Benthic, subtidal and intertidal ecology, Volume 2 [APP-050]**; and **Appendix 26.3: Water Framework Directive compliance assessment, Volume 4 [APP-217]**.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
MMO 4.4.22	Risk assessment at a site-specific level is undertaken when operators apply to use and discharge these chemicals providing adequate environmental justification to their regulator. Whilst Bentonite is listed as posing little or no risk (PLONOR) into the marine environment, this chemical would still require notification and approval for use by the MMO on offshore wind farms depending on quantities frequency and location as a minimum. Other chemicals added like dyes, cement, additives etc. would also require individual notification.	The Applicant refers to its response to MMO 4.4.21 above.
MMO 4.4.23	The notification for approval should include methodological information including chemical type, methodology for its use, quantity, and frequency of use. A further "Chemical Risk Assessment" should be provided for any chemical with a "pathway to the marine environment", this includes chemicals used in both open systems and closed systems where "top-up" is required. A Chemical Risk Assessment should include information on the toxicity, persistence, and biodegradability of the chemical (please note that further information may be requested following the review of this Assessment). For chemicals used in closed systems without the need for "top-up" only the methodology information is required. Following a review of the information and/or in consultation with Cefas, the MMO will make a decision on its use. This will be done through condition 9(1) and the MMO is currently reviewing this condition wording.	The Applicant notes this comment and refers to its response to the MMO's comment in relation to Condition 9(1) (Table 1 MMO above) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**).
MMO 4.4.24	Alternative use: Consideration is given (section 3) for alternative use including beneficial placement and relocation, and no viable uses were thought possible which is understandable given the constraints regarding the nature of the material and potential uses available in the area at this time.	The Applicant welcomes this confirmation from the MMO.
MMO 4.4.25	The potential use of seven open disposal sites included that of Rampion 1 is also provided (3.3). MMO acknowledge that none of the open sites were considered of use as they were designated with respect to the site-specific applications. The applicant should note that this is not always true, and once designated they may be of use to other applicants, provided adequate characterisation for the site is undertaken considering the proposed activity. However, given the volume and the location and nature of these works, MMO agrees that these sites would likely be unsuitable.	The Applicant welcomes this confirmation from the MMO.
MMO 4.4.26	Physical and Chemical Contamination: MMO has been unable to find the name of the laboratory undertaking the analysis for trace heavy metals and PAHs in the reports and therefore have major concerns in the confidence of the levels indicated. The levels of hydrocarbons are said to be below the limit of detection (LOD), however the reported LOD value (1mg/kg) appears to be higher than would usually be expected from an MMO-validated laboratory. In addition, the table appears to state that all the determinands have an Action Level 1 (AL1) of 100 mg/kg, this is incorrect. This AL1 is for the total hydrocarbons analysis only (fluorescence method) and not individual determinands (MMO 2015). Therefore, additional information is required regarding the methods of extraction for sample analysis to be appropriately compared to action levels cited.	As stated in **Section 5.3 of Appendix 9.3: Rampion 2 Offshore wind farm subtidal benthic characterisation survey report, Volume 4** **[APP-137]**, all organic matter, hydrocarbon and metals analysis was undertaken by SOCOTEC UK Limited. All other analysis of sediment samples was undertaken by Ocean Ecology Limited. The Applicant has provided detailed methods of preparation and extraction in Appendix VI of **Benthic - Subtidal benthic characterisation survey report appendices** **[Document Reference 8.34]** submitted at Deadline 1. The Applicant welcomes this initial judgement and hopes to reach agreement on these matters following the MMO's review of the Applicant's Deadline 1 submission. The Applicant can confirm that the LOD used for PAHs was 1 µm/g and 1 mg/kg was stated in error. This is confirmed by **Appendix XI** **of** **Benthic - Subtidal benthic characterisation survey report appendices** **[Document Reference 8.34]** submitted at Deadline 1. As confirmed in **Section 6.3.1 of Appendix 9.3: Rampion 2 Offshore wind farm**

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
		subtidal benthic characterisation survey report, Volume 4 [APP-137], "*With the exception of Phenanthrene (1.39 µg kg^{-1} at ST020) and Pyrene (1.09 µg kg^{-1} at ST030), all PAHs were recorded below limits of detection across all 7 sampling stations (**Table 12**). At the two stations where PAHs were detected, reference levels were not exceeded (**Table 12**).*" Therefore, the Applicant can confirm that there are no exceedances of CAL for any of the PAHs analysed. Full details of the PAH results are provided in **Appendix XI of Benthic - Subtidal benthic characterisation survey report appendices [Document Reference 8.34]** submitted at Deadline 1.
MMO 4.4.27	Each of the four cables may require excavation at the punch outside (30m long x 4m wide x 2m deep) between 800 and 1,500m offshore at 2.5m LAT. These pits are anticipated to be in use for up to four months with the resulting volume excavated 720 metres cubed (m³)) potentially stored at the array (section 6.9.61) as well as material trenched from trenches or in the export cable area. If this material was to comprise chalk, they might cause mounds on the seabed. The impact of chalk rather than silt sand and gravel must also be considered as part of the discussion in the impact assessment, as chalk can have a toothpaste like consistency. This should be considered within the ES and the document should be updated.	The potential impact of excavating HDD exit pits is described and assessed in **paragraph 6.9.61** onwards in **Chapter 6: Coastal processes, Volume 2 [APP-047]**. The assessment mainly addresses the potential impact of the pit depression on local waves and currents (and therefore on local beach processes and morphology) and also as a sediment trap. It is noted that the excavated material would be temporarily stored 'in the array area or export cable corridor' and recovered to provide backfill for the HDD exit pits as part of finishing the cable installation. The material nature of the excavated spoil (other than its overall volume and typical clast size) is not relevant to the assessment of the physical processes impacts described above. It is noted that the underlying chalk is exposed extensively along this coastline, and that loose chalk boulders (and likely smaller pieces) are commonly observed on the beach and seabed. The introduction of an additional relatively small volume of chalk clasts (especially following a reasonably short period of reworking, e.g. one large storm) would not noticeably change the seabed in this area.
4.5 Shellfish Ecology		
MMO 4.5.1	MMO considers the potential impacts on shellfisheries and shellfish receptors to have been accurately identified and no receptors have been scoped out. The appropriate evidence has been proposed for the assessments and the Applicant has made use of several relevant data sources. The MMO agrees that no species- specific surveys need to be conducted to characterise the baseline environment for shellfisheries and shellfish receptors.	This confirmation from the MMO is welcomed by the Applicant.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
MMO 4.5.2	Additionally, there is an adequate description of the potential cumulative and inter-related impacts and effect on the physical and biological environment in relation shellfish and shellfisheries receptors.	This confirmation from the MMO is welcomed by the Applicant
MMO 4.5.3	In table 8-7 Receptors requiring assessment for fish and shellfish ecology (Chapter 8, p50), cuttlefish (Sepia officinalis) is put under the mobile fish species. The MMO recommends including cuttlefish under shellfish rather than mobile fish species.	This advice is noted by the Applicant. The Applicant is confident that a suitably precautionary assessment has been undertaken on cuttlefish (*Sepia officinalis*) and highlights that this species has been considered, where relevant, as a stationary receptor due to its demersal spawning behaviours, for example as set out in Paragraph 8.9.87 of **Chapter 8: Fish and shellfish ecology, Volume 2** **[APP-049]**.
4.6 Fisheries and Fish Ecology		
MMO 4.6.1	A number of comments and concerns raised by the MMO have not been addressed within the ES. Additionally, it appears that a number of concerns and recommendations made subsequently have not been taken forward by the Applicant. The MMO is very disappointed in this approach as further information and discussions will be required within the Examination period. The MMO notes that pre- application should be used to minimise the engagement within the Examination period and as the information requested has not been provided at this stage, this will cause more resource to be utilised during the short period of Examination. The MMO urges the Examining Authority to request the required information at the earliest opportunity to allow all evidence to be assessed and discussions to take place, to enable a robust decision to be made on fish ecology.	These concerns are acknowledged by the Applicant; these are responded to individually in the below responses
MMO 4.6.2	During the pre-application stage the MMO has raised major concerns regarding: • the likelihood of significant impacts to black seabream during the construction, operation and maintenance; • the disturbance of black seabream from sedimentation and noise generated during export cable laying activities and the mitigation and surveys required; • to disturbance of black seabream from underwater noise (UWN) as a result of piling, concerns and uncertainty around the modelling behavioural effects; and • impacts to herring from UWN including modelling	These concerns are acknowledged by the Applicant, these are responded to individually below.
MMO 4.6.3	Comments have been set out below, if anything requires further clarification the MMO recommends specific questions being asked as part of the Examination.	This is noted by the Applicant.
MMO 4.6.4	The MMO is still reviewing the cumulative impacts assessment and will provide further comments in due course.	This is noted by the Applicant.
MMO 4.6.5	MMO notes a project description has been provided within Chapter 4 of the ES, a detailed description of each element of the marine works, and a construction programme has been provided for the construction phase of the works. In Table 8.12 of Chapter 8, the Applicant has presented the maximum design scenario (MDS) relating to each project phase activity and the potential impacts to fish associated with each activity have been identified. MMO is content the MDS presented is consistent with the parameters outlined in the project description.	This is welcomed by the Applicant.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
MMO 4.6.6	There are discrepancies between the maximum duration of piling per day stated in the UWN Impact Assessment and throughout Chapter 8. In Chapter 8, the maximum duration to install a monopile is stated as 4 hours. However, in Appendix 11.3 (the Underwater Noise Impact Assessment), the worst-case duration for monopile and jacket foundation installation is stated as 4.5 hours. It is also noted in Section 3.3.8 that *"In a 24-hour period it is expected that either a maximum of two monopile foundations or four jacket foundations can be installed. This is included as part of the modelling assuming that the foundations are installed consecutively. This increases the overall upper limit of piling durations in a 24-hour period for monopile foundations to 9 hours and 5 hours 50 minutes for worst-case and most likely scenarios, respectively. For jacket foundations this is 18 hours and 11 hours 40 minutes for worst-case and most likely scenarios, respectively".* This was also raised in advice provided during PEIR, and the MMO requests clarity as to why this has not been amended.	This inconsistency is acknowledged by the Applicant, and was amended in the Errata submitted to the Planning Inspectorate at procedural deadline of 16th January 2024.
MMO 4.6.7	The Applicant has defined the fish and shellfish ecology study area as a 16km zone of influence encompassing the proposed DCO Order Limits, this has been determined from the full potential maximum sediment plume excursion distance during spring tides. The MMO considers this to be a very small study area in relation to the size and scale of the project, particularly when accounting for the mobility of fish receptors. The Rampion 2 study area is also small in comparison to other Offshore Wind Farm (OWF) projects of a similar scale, size and significance where the respective study areas have been defined as the surrounding wider region, rather than limited to the area influenced by the anticipated sediment plume excursion. The MMO notes that for impacts of UWN, the area of search has been increased to 100km, which is appropriate, given the greater area of effect of UWN.	As set out in Paragraph 8.4.3 of **Chapter 8: Fish and shellfish ecology, Volume 2 [APP-049]**, excluding underwater noise, the Study Area for fish and shellfish ecology was defined by the potential zone of impact arising from construction, operation and maintenance, and decommissioning activities of the Proposed Development and was informed by the maximum tidal excursion extent and the likely extent of potential sediment plume impacts described in **Chapter 6: Coastal processes, Volume 2 of the ES [APP-047]**. The Study Area therefore encompasses all direct and indirect (secondary) impacts arising from the Proposed Development. The Applicant also highlights that as detailed in **Table 8-26** and summarised in **paragraph 8.9.392** of **Chapter 8: Fish and shellfish ecology, Volume 2 [APP-049],** the coastal processes modelling confirmed the zone of measurable SSC and sediment deposition is anticipated to be localised to the locations of works (<500 m from the source). From 500 m to the maximum tidal excursion (16 km on a spring tide) lesser but measurable SSC increase is anticipated, and no measurable thickness of deposition is predicted. Therefore, the 16 km study area defined is considered suitably precautionary, considering the largely localised nature of increased SSC and sediment deposition. I line with the source-pathway-receptor model for impact assessment, the study area in regard to underwater noise was extended to ensure this encompassed all relevant receptors for which an impact could potentially arise, extending to a 100km radius from the Proposed Development. The Applicant welcomes the MMOs approval of the underwater noise study area.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
MMO 4.6.8	The spawning and nursery grounds of multiple commercially important fish species, and species of significant conservation importance are detailed within Section 8.6 of Chapter 8, and figures indicating the presence of spawning and nursery grounds (as per Coull et al., (1998) and Ellis et al., (2012)) have also been provided in the volume of figures for Chapter 8. As far as the MMO can reasonably determine, these have been accurately reported. For ease of interpretation, given the volume of information provided, it would be useful to have a table presented alongside this text, which presents a list of species as per Ellis et al., (2012), and indicates via tick boxes whether the spawning and/or nursery grounds of each species overlaps with the Fish and Shellfish Ecology Study Area.	This advice is noted by the Applicant. The Applicant is confident that spawning and nursery grounds of multiple commercially important fish species, and species of significant conservation importance have been accurately reported, as acknowledged by the MMO.
MMO 4.6.9	The Applicant has completed a herring potential spawning habitat and Sandeel potential habitat suitability assessment. Site-specific sediment grab samples have been collected from within and around the array, with PSA of samples used to classify sediment composition as 'preferred', 'marginal' or 'unsuitable' for herring spawning and sandeel habitat, according to the methodologies described in Reach et al., (2013) and Latto et al., (2013) respectively.	This is noted by the Applicant.
MMO 4.6.10	Whilst this is appropriate, the Applicant has not followed the recommended MarineSpace (2013a) and (2013b) methodologies for herring and sandeel, respectively. These methods use a suite of data including PSA data, British Geological Survey (BGS) data, Regional Seabed Monitoring Plan (RSMP) data, herring larval survey data (for herring assessments), as well as fishing fleet data and scientific publications, to determine potential herring spawning habitat and potential sandeel habitat. This data is methodically layered to generate a single 'heatmap' output. Simply put, areas of higher 'heat' are representative of areas with higher potential herring spawning habitat, or potential sandeel habitat, respectively. Areas of 'heat' are assigned a score based on confidence of the data. The MarineSpace methods were developed in consultation with Cefas and are considered appropriate for use for other offshore activities and have been widely used in EIAs for OWF.	This is noted by the Applicant. A habitat suitability assessment following the MarineSpace (2013a) and (2013b) methodologies for herring and sandeel as recommended by the MMO has been undertaken and is provided in **Appendix 9 - Further Information for Action Points 38 and 39 (document reference 8.25.9)** at Deadline 1.
MMO 4.6.11	The MMO requests that the Applicant revises their habitat suitability assessments by following the MarineSpace (2013a and 2013b) methods and provides 'heat' maps of herring potential spawning habitat, and sandeel potential habitat, for the fish ecology study area as an addendum to the ES.	Please refer to the Applicant's response to ref 4.6.10.
MMO 4.6.12	Further to the above, both habitat suitability assessments presented within Volume 3, Chapter 8 (Fish and Shellfish Ecology Chapter Figures 8.9 and 8.10), use UK Sea Map 2021 seabed data to characterise seabed habitats inside the project boundary and across the wider study area. The UK Sea Map 2021 seabed data presents sediments classified as 'hard substrata, coarse substate, sand, mixed sediment and undefined' seabed types. These categories are far too broad and do not present the necessary resolution for identifying sediments which are preferentially selected by herring and sandeel.	This is acknowledged by the Applicant. Revised Figures, as recommended by the MMO have been provided in **Chapter 8: Fish and Shellfish, Volume 3 of the ES – Figures (document reference 6.3.8)** at Deadline 1. The broadscale seabed sediment data presented within the revised figures has been sourced from EMODnet seabed sediment data.
MMO 4.6.13	In the methodologies of Reach et al., (2013) and Latto et al., (2013), habitat suitability is determined according to sediment type as classified according to the Folk Sediment classification units (Folk, 1954). For herring, 'preferred' potential spawning habitats are those classified as gravel and sandy gravel sediments, and 'marginal' potential spawning habitats are those classified as gravelly sand, as per Reach et al., (2013). Potential sandeel habitats are classified similarly, into 'preferred' (gravelly sand, slightly gravelly sand and sand sediments) and 'marginal' (sandy gravel) habitats as per Latto et al., (2013) based on Folk (1954). The broadscale UK Sea Map habitat data presented in Figures 8.9 and 8.10 do not align with the methodologies of Reach et al., (2013) and Latto et al., (2013) which makes the habitat suitability assessments presented difficult to interpret, with much of the nuance of determining areas of higher or lower suitability being lost.	Please refer to the Applicant's response to ref 4.6.12.

© WSP Environment & Infrastructure Solutions UK Limited

Ref	MMO's Comment	Applicant's Response
MMO 4.6.14	The Applicant should redo their habitat suitability assessments following the methodologies of MarineSpace (2013a) and (2013b) for herring and sandeel respectively. Broadscale seabed sediment data should be sourced from either the BGS 1:250,000 scale seabed sediment maps, or EMODnet seabed sediment data, both of which are underpinned by the Folk Sediment classification scheme (Folk, 1954). Ideally, PSA samples overlain onto the broadscale sediment map should also be classified according to Folk, (1954) for increased compatibility with the broadscale sediment map.	Please refer to the Applicant's response to ref 4.6.10.
MMO 4.6.15	In comparing the symbology of Figures 8.9 and 8.10 in Chapter 8 of the ES, it is not clear why the UK Sea Map data is presented differently in each figure. The legend indicates that the colours selected for the categories of substrate is the same for both plots, however in Figure 8.9 (sandeel), seabed habitats surrounding and to the south of the Rampion array are predominantly 'coarse substrates' (pink), whereas in Figure 8.10 (herring), the same area of seabed habitat is classified as 'hard substrata' (grey). The MMO recommends that the Applicant addresses this inconsistency.	The Applicant acknowledges this inconsistency between **Figures 8.9 and 8.10** of **Chapter 8: Fish and Shellfish – Figures, Volume 3** **[APP-081]**. Revised Figures, as recommended by the MMO have been provided in **Chapter 8: Fish and Shellfish, Volume 3 of the ES – Figures** **(document reference 6.3.8)** ,at Deadline 1, with the inconsistencies amended. The Applicant also notes, that to address recommendations made in ref 4.6.14, the broadscale seabed sediment data has been sourced from EMODnet seabed sediment data.
MMO 4.6.16	Herring are reliant on specific seabed substrates in order to undertake spawning, and therefore do not have the ability to spawn successfully in unsuitable habitats when gravel is unavailable. In relation to their herring habitat suitability assessment, the Applicant concludes that "whilst preferred habitat is illustrated in Figure 8.10, there is no evidence of herring spawning in the area". At present, this conclusion is not supported by the Applicant's herring habitat suitability assessment (within Chapter 8).	The Applicant confirms that the conclusion provided in **paragraph 8.6.33** of **Chapter 8: Fish and shellfish ecology, Volume 2** **[APP-049]**, relates to the presence of prime/preferred sediments (as classified in accordance with the Reach et al., 2013 classifications) within the western portion of the array area and the offshore extent of the ECC. This statement is supported by the expanse of coarse sediments across the study area as informed by the UKSeaMap (2021) broadscale marine habitat data. As evidenced by the IHLS data, presented in **Figure 8.8** of **Chapter 8: Fish and Shellfish – Figures, Volume 3** **[App-081]**, there is no active herring spawning occurring in the area, with high intensity herring spawning activity occurring offshore of the Proposed Development array area, in the centre of the English Channel. As such, the Applicant is confident in the conclusions made based on the herring habitat suitability assessment as detailed in **Chapter 8: Fish and shellfish ecology, Volume 2** **[APP-049]**.
MMO 4.6.17	Whilst the MMO recognises that the highest intensity herring spawning occurs over grounds located more towards the centre of the English Channel than the array (as shown in Figure 8.8), Figure 8.10 clearly indicates that sediments within and surrounding the Rampion array are a mixture of "prime, sub-prime and suitable" potential spawning habitat, and therefore have sufficient composition to support herring spawning. In addition to this, Figure 8.8 shows herring larval densities amalgamated into a 'heat' map for the years 2007 – 2020, the map indicates that herring larval abundance within and surrounding the Rampion 2 array falls between 0.1 – 2,500 larvae per m2. Supplementary figures are presented in Appendix 8.1 Herring Annual Heatmaps, to illustrate the interannual variability in herring larval density across the Downs herring spawning grounds. These figures show a scale of larval abundance per m2 from 0.1 –	Please refer to the Applicant's response to ref 4.6.36.

Ref	MMO's Comment	Applicant's Response
	750. Both figures represent an incredibly large range for the lowest larval abundances, and this does not seem to support the Applicant's conclusion considering that 2,500, or 750, larvae per m2 still represents a significant larval density, particularly at a more localised scale. In order to evidence their assertion that there is no evidence of herring spawning in the vicinity of the array, the Applicant should produce a heatmap following the methodology of MarineSpace (2013a), as outlined in points 4.6.10 and 4.6.11.	
MMO 4.6.18	Short snouted seahorse has been appropriately identified as a sensitive feature of the Beachy Head East and West Marine Conservation Zone (MCZ) and of the Selsey Bill and the Hounds MCZ. Seahorses are generally slow moving and are categorised as having high hearing sensitivity according to the Popper et al., (2014) criteria. Figures 8.22 and 8.23 indicate the likely range of impact from UWN from both sequential and simultaneous monopiling in relation to these MCZs, however it has been recognised by the Applicant that the species may spend periods of the year outside of MCZ site boundaries and potentially in the vicinity of Rampion 2. Within the In Principle Sensitive Features Mitigation Plan, the Applicant has recognised this and considered that there is potential for UWN from impact piling to propagate out towards the MCZs. The MMO welcomes this and defers to natural England as the Statutory Nature Conservation Body (SNCB) in relation to the MCZ assessment.	This is welcomed by the Applicant.
MMO 4.6.19	Black seabream have been included in the assessment as a species of concern which is appropriate. The presence and density of nest sites have been characterised throughout Chapter 8, and the sources used appear to be largely appropriate for this purpose. Monitoring data from marine aggregate dredging sites (2002-2020) have also been included to indicate the location and relative density of black seabream nests across the years of data. Whilst nests appear to occur in the same approximate locations, within the Kingmere MCZ and within a discrete area of the export cable corridor (ECC), each year, the Applicant should note there is usually some interannual variability in the density and position of nesting sites between years (Figures 8.14a and 14b). The Applicant has also noted a relative increase in nest density in data collected during surveys undertaken for marine aggregates Areas 453 and 488 from 2017 onwards.	The Applicant notes the comments from the MMO
MMO 4.6.20	MMO highlights the limitations of the aggregate monitoring data. To the best of our knowledge, to date, there have been inconsistencies in the timing of the post-June aggregate monitoring surveys. The 2017 surveys were undertaken on the 31 May and 7 & 25 August. Thereafter, the surveys undertaken in 2018, 2019 and 2020 were completed between May and July, thus making comparisons between the 2017 data and the July 2018-2020 data is not appropriate. This should be discussed within he documents	The limitations of the aggregates monitoring data have been acknowledged in **paragraph 8.5.12** of **Chapter 8: Fish and shellfish ecology, Volume 2** **[APP-049]**. The Applicant confirms that in acknowledging these limitations, an assessment has been undertaken with the assumption of the presence of black seabream within the proposed DCO Order Limits. As stated in **paragraph 8.5.12** of **Chapter 8: Fish and shellfish ecology, Volume 2** **[APP-049]**, post consent surveys, undertaken as part of a suite of pre-construction surveys, will allow a determination to made as to the extent of the nesting area, and specifically the key nesting areas within the DCO Order Limits as detailed within the **Offshore In Principle Monitoring Plan** **[APP-240]**, which is secured in Condition 11(1)(j) of the dMLs (Schedules 11 and 12 of the **draft DCO** **[PEPD-009]**), To ensure that the conservation objectives of the Kingmere MCZ are not hindered and that there are no population level effects on black seabream, the Applicant has proposed several embedded mitigation measures. These are detailed in **In Principle Sensitive Features Mitigation Plan** **[APP-239]**, the

		delivery of which is secured in Condition 11(1)(k) of the dMLs (Schedules 11 and 12 of the **draft DCO [PEPD-009]**).
MMO 4.6.21	The MMO notes in paragraph 8.9.267 in Chapter 8, that the assessment of behavioural effects of black seabream to UWN disturbance has been based on a threshold of 141 decibel (dB) re 1 micropascal (µPa) Sound Exposure Level, single strike (SELss) as defined by Kastelein et al., (2017).	The Applicant notes the comment from the MMO.
MMO 4.6.22	This goes against the advice from the MMO throughout the pre-application stage. In the Kastelein et al., (2017) study, a 50% initial response threshold occurred at an SELss of 141 dB re 1 mPa2 s for 44 centimetre (cm), captive-bred seabass. The study used piling playback and was conducted under laboratory conditions. However, under the same conditions, smaller seabass (31cm) responded to a lower SELss than the large fish, with a 50% initial response threshold occurring at 131 dB re 1 mPa2 s. As black seabream attain reproductive maturity at 30cm it is more appropriate to draw comparisons to the smaller seabass in the Kastelein et al., (2017) study. Furthermore, we do not consider a SELss of 141 dB re 1 mPa2 s used for a 44cm captive seabass to be an appropriate or conservative threshold, as adult black seabream usually only attain a size of 35-40cm (Ruiz, 2008).	The Applicant's position on the behavioural threshold for black seabream has been reliant upon existing literature and best available knowledge and understanding, as detailed in **paragraph 8.9.247** *et seq*. of **Chapter 8: Fish and shellfish ecology, Volume 2 [APP-049]**. Throughout the consultation period, the Applicant has proposed a number of compromises to the MMO and Natural England in order to reach agreement on key issues relating to, inter alia, establishing a disturbance threshold relevant to black seabream, upon which to inform the impact assessment and appropriate mitigation. These include, but are not limited to, the modelling of more precautionary disturbance thresholds, and the commissioning of dedicated surveys of ambient noise levels in 2022 and 2023 to provide contemporary site-specific data, and the proposal of a variety of mitigation measures over the consultation period. As detailed in the **In Principle Sensitive Features Mitigation Plan [APP-239]** and **paragraph 8.9.296** of **Chapter 8: Fish and shellfish ecology, Volume 2 [APP-049]** the Applicant considers the disturbance threshold of 141 dB SELss (based on a startle response observed in seabass) as an appropriate threshold for adult black seabream, as European seabass are of the same order as black seabream, perciform, and are therefore a suitable proxy for black seabream anatomically, physiologically and geographically. Furthermore, as detailed in **paragraphs 8.9.262** and **8.9.280** of **Chapter 8: Fish and shellfish ecology, Volume 2 [APP-049]** a SELss of 141 dB re 1 mPa2 s is considered a conservative threshold for larger fish such as black seabream, as it is based on a short-lived startle response observed in seabass. (sudden short-lived

		changes in swimming speed). Specifically, as reported by Kastelein et al. (2017), there was no evidence of any consistent sustained response to sound exposure by the study animals (changes in school cohesion, swimming depth, and speed) at levels up to 166dB SELss. As informed by Popper et al., (2014), behavioural disturbances are considered to be long term changes in behaviour and distribution, and should not include effects on single animals, or small changes in behaviour such as startle responses or minor movements. The use of the disturbance threshold of 141 dB SELss is therefore considered to be suitably precautionary, as if black seabream are exposed to underwater noise from pile driving, there are unlikely to be any adverse effects on their ecology, because the initial responses of European seabass after the onset of the piling sound observed were short-lived. Further to this, the approach used by the Applicant to define a suitable threshold for disturbance from underwater noise aligns with that used in other OWF applications and assessments, and therefore complies with current practice when approaching issues such as scientific data gaps and uncertainties, in order for planning decisions to be made. The Applicant will continue to engage with the MMO and Natural England to seek resolution in respect of this matter.
MMO 4.6.23	It should also be noted that, whilst seabass and black seabream have some physiological and anatomical similarity, seabass are broadcast spawners with pelagic eggs, so do not exhibit the same spawning, nesting and nest guarding behaviours. Given that the biological drivers and spawning behaviours in seabass are significantly different to those of black seabream, it is not possible to confidently infer whether wild black seabream will be affected in the same way that captive-bred seabass were in the Kastelein et. al., (2017) study.	Please refer to the Applicant's response to ref 4.6.22. The Applicant confirms that in the absence of a behavioural impact threshold for black seabream in available literature, a suitable proxy species, European seabass, has been used, as the physiological similarities provide the best available evidence for reaction to noise stimulus irrespective of the breeding behaviour differences between the two species.
MMO 4.6.24	The threshold of 135 dB SELss, as per Hawkins et al., (2014), could be considered a precautionary approach to modelling. However, this is still making inferences from a proxy species, the 135 dB threshold was based on a study of wild sprats i.e., clupeids with greater hearing sensitivity than seabass and black seabream.	Please refer to the Applicant's response to ref 4.6.22. The Applicant does not support the use of the threshold of 135 dB SELss, as per Hawkins *et al*., (2014) which is based on startle responses in sprat, a species not considered to be a suitable proxy for black seabream. Black seabream are less sensitive to underwater noise impacts than sprat, as they do not possess special structures mechanically linking the

Ref	MMO's Comment	Applicant's Response
		swim bladder to the ear. Sprat are therefore not considered a suitable proxy for black seabream, anatomically or physiologically.
MMO 4.6.25	The MMO understands there was no agreement between MMO, Natural England (NE) and the Applicant on a noise threshold or proxy species for black seabream prior to submission of the Application. If the Applicant wants to pursue a noise threshold route the MMO would expect to see more noise modelling based on the 135 dB threshold. However, even if this is provided the MMO is unlikely to agree a threshold approach for black seabream.	Please refer to the Applicant's response to ref 4.6.22.
