# 1. OPERATION PHASE AIR QUALITY ASSESSMENT RESULTS TABLES: ECOLOGICAL RECEPTORS

---

## 1.1. IMPACTS ON ECOLOGICAL RECEPTORS

- 1.1.1. The results of the modelling assessment at each modelled ecological receptor are presented in the below tables for each relevant pollutant and averaging period applicable to the study. The maximum modelled concentration and deposition values are presented, which is based on modelling over all five years of meteorological data (2016-2020). The change in PC and PEC, as a percentage of the relevant critical level / load, is presented for each receptor.
- 1.1.2. The PC impact in the with Proposed Scheme scenario represents the change in concentration / deposition between the Baseline scenario and Proposed Scheme scenario.
- 1.1.3. In all results tables presented in this appendix, the following designated site names are shortened to 'Thorne Moor SPA' and Thorne Moor SSSI', respectively:
- a. Thorne & Hatfield Moors SPA
  - b. Thorne, Crowle and Goole Moors SSSI.

### CORE MODEL SCENARIOS

- 1.1.4. Results pertaining to the core model scenarios are presented in **Tables 1.1 to 1.6**.

**Table 1.1 - Modelled Maximum Operational Impacts at Ecological Receptors – Annual Mean NO<sub>x</sub>**

Receptor	Annual Mean NO <sub>x</sub> concentration (µg/m <sup>3</sup> )					
	Critical Level	Background	Max PC Impact	Max PC Impact as % of CL	Proposed Scheme Max PEC	Max PEC as % of CL

## **SENSITIVITY TEST: WORST CASE EMISSIONS PROFILE**

- 1.1.7. Results pertaining to the worst-case emissions profile sensitivity test are presented in **Tables 1.19 to 1.24**, based on emissions from the Proposed Scheme alone.
- 1.1.8. For all pollutant concentrations and deposition rates, it is evident that the modelled maximum PC impacts attributed to the with Proposed Scheme scenario are lower at all receptors relative to the core model scenarios. This is a function of all four biomass units in the Baseline scenario switching from 'mid-merit' operation (full load for 4,000 hours per year) to continuous operation (full load for 8,760 hours per year), resulting in more pollutants being emitted and thus more pronounced changes (increases) in concentrations / deposition rates relative to the With Proposed Scheme scenario. In the With Proposed Scheme scenario, operation changes from 'mid-merit' to continuous full load at the two non-BECCS biomass units only (BECCS units already assumed to operate at continuous full load in core modelling scenario), meaning the changes (increases and decreases) in concentrations / deposition rates are relatively small compared to the Baseline.
- 1.1.9. As a consequence, the maximum modelled impacts of the Proposed Scheme decrease at all receptors under the worst-case emissions profile scenario relative to the core modelling. Whilst some modelled maximum PEC concentrations do increase under worst case emissions in both the Baseline and With Proposed Scheme scenarios, there are no material changes relative to the core modelling equivalents, meaning that the respective assessment significance criteria are not exceeded.
- 1.1.10. The results confirm that the assessment of likely significant effects reported in **Chapter 6 (Air Quality)** is not affected when considering the worst-case emissions profiles in both the Baseline and With Proposed Scheme scenarios. Given that the modelled maximum impacts are lower under a worst-case emissions profile, there was no need to repeat the test in relation to cumulative impacts, as the core modelling results for the cumulative scenarios represent the most conservative results in terms of potential impacts.
