

I would like to submit some important questions that need answers.

- 1) How long after constructing this absorption process can it be expected that the operation will remain usable?
- 2) Will it be effectively public money that will pay for this construction and the running of this process?
- 3) Is independent data readily available on the state of the atmosphere around the Drax plant?
- 4) What extra safety processes will the company plan to take care over the handling of the toxic amine absorbent?

Submission ID: 13249

I believe we all need to know the answers to the following questions:

How long will this carbon dioxide removal system work?

Is public money needed to pay for this installation?

How can the public be informed of the state of the atmosphere around the plant?

What will be the special safety procedures for working of the toxic amine plant?
