

I disagree totally with comments about adverse affects on the environment and agree with the Mallard Pass experts that the solar farm will improve the natural environment. Only this week we hear from beekeepers that in the vicinity of a farm, honey quantities have soared and that insect life has improved greatly. This is mostly due to the quantity of wild flowers and improved hedgerows. This in turn will improve bird numbers as well as small country animals, mice, stoats etc which in turn form part of the life cycle in the countryside.

The land around the farm if managed correctly can also support smaller farm animals such as sheep or hens as part of a grazing programme so that the land will still continue to supply the food chain.
