

The reason given for building here was the sub station, now they want to build a new one . All adding to the infrastructure work that the area will not cope with. This will be a blot on the landscape for years because the height and area covered can never be hidden. It will not benefit the area in anyway only ruin good farmland which is needed to feed the population as it grows. The ethics of where the panels are made and the labour used is another problem. The people who I spoke to knew nothing about the area and did not seem bothered about the impact it will have on the residents. The effects don't just occur while being built or after commissioning but right up to decommissioning, where and how do get rid of this amount of panels that cannot be recycled and who will be responsible.
