

My objections are many, and I agree with all the Mallard Pass Action Group's, but these are my main ones

- The size and location of the site. To site this in an area larger than area of Stamford will convert a rural landscape to an industrial site.
- We will need this land to produce food – not the minimal MWatt output when is cut by cloud, dark at night and our northern latitude
- The effect on small rural roads when they are constructing the site – not just the delivery of panels and other equipment but the estimated 400 workers travelling each day
- The equipment manufacture in China and transportation plus site construction will take many years to be offset by the production of “green” energy. Added to this are concerns about the treatment of workers in China
- What guarantees can be given that Windel Energy will be there through the life of the project and future decommissioning? It does not have the backing I believe is necessary to launch the project or sustain it through its life cycle.

A serious bit a development of this and many of the other sites in Lincolnshire and the whole country should be subject to agreed nationwide plan and not piecemeal development by many disparate organisations.

My wife, Patricia Wright would like back up these comments
