# Gate Burton Energy Park, Gainsborough Lincolnshire

## Geophysical Survey

### *Summary*

*A geophysical (magnetometer) survey was undertaken on approximately 280 hectares of land located to the south-east of Gainsborough, Lincolnshire. The majority of the anomalies recorded are agricultural including field drains, ridge and furrow cultivation, modern ploughing and former field boundaries. Archaeological anomalies have been recorded which show what appear to be a set of enclosures of a likely medieval date. Possible archaeological anomalies have also been recorded which may indicate further areas of activity. Based on the geophysical survey, the archaeological potential of the Site is deemed to be high in Field 45 and low elsewhere.*

## Report Information

Client: Low Carbon  
 Address: Oxygen House, Grenadier Road, Exeter Business Park, Exeter, EX1 3LH  
 Report Type: Geophysical Survey  
 Location: Gainsborough  
 County: Lincolnshire  
 Grid Reference: SK 8521 8434  
 Period(s) of activity: medieval/post medieval to modern  
 Report Number: 3764  
 Project Number: XE34  
 Site Code: GABU22  
 Museum Accession Number: LCNCC:2022.14  
 OASIS ID: archaeo111-506352  
 Date of fieldwork: March- - April 2022  
 Date of report: April 2022

## 1 Introduction

Archaeological Services ASWYAS has been commissioned by AECOM Limited on behalf of Low Carbon to undertake a geophysical survey at land south of Gainsborough, Lincolnshire. This was undertaken in line with current best practice (CifA 2020; Schmidt *et al.* 2016). The survey was carried out between 28th February and 6th April 2022 to provide additional information on the archaeological resource of the Site.

### Site location, topography and land-use

The Site is located at SK 85218 84348 (approximate centre), comprising *c.* 280ha over three parcels of land, situated to the south of Gainsborough (see Fig. 1).

The site comprises Fields 35 – 68, split into 3 parcels of land, separated by landowner. Fields 35-52 (the Fox Land) are located towards the north of the site and are split down the middle by a railway line, with fields 35-41 located on the western side of the railway line and fields 42-52 located to the east. Field 52-62 (the Henson Land) are located towards the east of site, next to the village of Willingham by Stow. Fields 63-68 (the Marshall Land) are located towards the south east of site, bounded by Marton Road.

All the fields that were surveyed were under different stages of crop growth and were all used as arable fields (see plates 1-12).

### Soils and geology

The recorded bedrock geology comprises Scunthorpe Mudstone Formation – Mudstone and Limestone, a sedimentary bedrock formed approximately 191 to 210 million years ago in the Jurassic and Triassic Periods. To the north-west of site superficial deposits have been recorded as Glaciofluvial deposits, Mid Pleistocene sand and gravel deposits formed up to 2 million years ago in the Quaternary Period (BGS 2020). Soils are Wickham 2 Association (711f) described as slowly permeable seasonally wet slightly acid but base-rich loamy and clayey soils (SSEW 1983).

## 2 Archaeological Background

The following archaeological background is taken from a WSI prepared by AECOM (Wilson 2021) of a study area of 1km from the study areas boundary.

There are four scheduled monuments recorded within the study area, these are: The site of Heynings Priory (1008685); Fleet Plantation moated site (1008594); Roman fort south of Littleborough Lane (1004935); and Roman town of Segelocum (1003669).

Assets recorded on the HER range in date from the Mesolithic (*c.*10000 – 3500 BC) to the modern period (1900 to present). Flint artefacts and a stone pounder found in a field close to

Lea Grange represent the earliest evidence of human activity within the study area. The later prehistoric period, through to the Iron Age (700 BD – AD43), is sparsely represented by individual recorded finds and no evidence of settlement or funerary practices have previously been recorded within the study area. There is significant evidence of the development of the area during the late Iron Age/Romano-British period. The study area is crossed by Till Bridge Lane, a Roman road linking Ermine Street north of Lincoln to a ford crossing the River Trent at Matron to Segelocum Roman town. Evidence of settlement, agricultural practices and a military presence in the form of forts, as well as multiple individual finds, contribute to the understanding of the significance of the Roman presence in this area.

There is evidence of development of the landscape through the early medieval (409AD – 1066) and medieval (1066 – 1500) periods. A number of the villages in the area have origins in the medieval period, and there is widespread evidence of ridge and furrow. Many of the extant settlements, such as the former village of Knaith and the extant village of Marton, have their origins during this time and remnants of these changes are preserved in the landscape. The remains of a moated site at Fleet plantation are scheduled and date to the medieval period. Heyning Priory was founded in 1135 and survives as scheduled earthworks. Many of the churches within the study area, such as St Margaret's Church in Marton, also have their origins in the medieval period.

The deserted settlement of Gate Burton, and the parkland associated with Gate Burton Hall, extends into the Site boundary and is a classic example of population dispersal caused by emparking (the enclosing of land to create parkland) in the 18th century. In the 17th and early 18th century the lordship of Gate Burton formed part of the Knaith estate of the Lords Willoughby of Parham. When the Hutton family purchased the estate, they built the present Gate Burton Hall and developed the surrounding landscaped parkland. It is speculated that the village was cleared at this time to accommodate the changes.

### **3 Aims, Methodology and Presentation**

The aims and objectives of the programme of geophysical survey were to gather sufficient information to establish the presence/absence, character and extent, of any archaeological remains within the specific area and to inform an assessment of the archaeological potential of the site. To achieve this aim, a magnetometer survey covering all amenable parts of the Site was undertaken (see Fig. 2).

The general objectives of the geophysical survey were:

- to provide information about the nature and possible interpretation of any magnetic anomalies identified;
- to therefore determine the presence/absence and extent of any buried archaeological features; and

- to prepare a report summarising the results of the survey.

### **Magnetometer survey**

The cart-based survey was undertaken using an eight channel SenSYS MX V3 system containing eight FGM650 sensors. Readings are taken every 20MHz (between 0.05 and 0.1m). Data were recorded onto a device, using a Carlson GNSS Smart antenna, for centimetre accuracy. These readings were stored in the memory of the instrument and downloaded for processing and interpretation. DLMGPS and MAGNETO software, alongside bespoke in-house software was used to process and present the data. Further details are given in Appendix 1.

### **Reporting**

A general site location plan, incorporating the 1:50000 Ordnance Survey (OS) mapping, is shown in Figure 1. Figure 2 displays the location of the survey areas at a scale of 1:20000. Figure 3 shows the processed magnetometer data of the Fox land at a scale of 1:7500 whilst Figure 4 shows an overview of the interpretation of the Fox land at the same scale. Figure 5 shows the processed magnetometer data of the Henson and Marshall land at a scale of 1:7500 whilst Figure 6 shows an overview of the interpretations at the same scale. Processed and minimally processed data, together with interpretation of the survey results are presented in Figures 7 to 109 inclusive at a scale of 1:1250.

Technical information on the equipment used, data processing and survey methodologies are given in Appendix 1. Technical information on locating the survey area is provided in Appendix 2. Appendix 3 describes the composition and location of the archive. A copy of the completed OASIS form is included in Appendix 4.

The survey methodology, report and any recommendations comply with guidelines outlined by the European Archaeological Council (Schmidt *et al.* 2015) and by the Chartered Institute for Archaeologists (CIfA 2020). All figures reproduced from Ordnance Survey mapping are with the permission of the controller of Her Majesty's Stationery Office (© Crown copyright).

***The figures in this report have been produced following analysis of the data in processed formats and over a range of different display levels. All figures are presented to most suitably display and interpret the data from this site based on the experience and knowledge of Archaeological Services staff.***

## **4 Results and Discussion (see Figures 7 to 109)**

### **Ferrous anomalies and magnetic disturbance**

Ferrous anomalies, as individual ‘spikes’, or as large discrete areas are typically caused by ferrous (magnetic) material, either on the ground surface or in the plough-soil. Little importance is normally given to such anomalies, unless there is any supporting evidence for an archaeological interpretation, as modern ferrous debris or material is common on rural sites, often being present as a consequence of manuring or tipping/infilling. There is no obvious pattern or clustering to their distribution in this survey to suggest anything other than a random background scatter of ferrous debris in the plough-soil.

A large area of magnetic disturbance in the west of Field 36 (Sector 1) corresponds to a large pond marked on historic mapping dating from 1900 (NLS 2022). It is likely that the pond has been infilled with ferrous materials resulting in the magnetic response.

An oval shaped area of disturbance in the south of Field 48 (Sector 17) has been recorded which corresponds to a small pond on historic mapping.

A large area of disturbance in the north of Field 49 (Sector 18) corresponds to the location of Thurlby Farm, which was a 19th century farmstead (monument number MLI118135). The responses are likely to represent demolition rubble.

Circular areas of magnetic disturbance in Fields 45 and 46 (Sectors 13 and 15) correspond to electricity pylons which cross the eastern part of the Site.

Magnetic disturbance in the northwest of Field 58 (Sector 25) have been caused by the adjacent farm building.

Magnetic disturbance along the limits of the survey areas are due to be linked to metal fencing within the field boundaries and interference from the adjacent roads and railway line.

Linear dipolar trends have been recorded in Fields 39 (Sector 4), 49 (Sector 18) and 51 (Sector 19) which relate to service pipes.

Unusual scatters of spikes have also been detected in the survey which are concentrated in Fields 49 and 51 (Sector 19) but are also evident to a much lesser extent in Fields 37-39. The origin of these is not clear and while they may just be modern ferrous debris from recent agricultural practice, other sources could be considered. Sturgate Airfield is located towards the northeast and a modern military origin could be considered but this would not appear to fit with the history of the airfield which did not see active use during the Second World War.

## Geological anomalies

The survey has detected anomalies within some of the areas that have been interpreted as geological in origin. It is thought that the responses have been detected because of the variation in the composition and depth of the deposits of superficial material in which they derive. These are particularly evident in Fields 40, 60, 64, 65, 66 and 68.

Field 40 contains the widest band of geological material and is located within the area of the Glaciofluvial superficial deposits and could well be the course of a former channel associated with a water course caused by the retreat of glaciers in the Quaternary period.

The geological anomalies towards the south of the site are no located within any superficial deposits and have a regularity to them especially the anomaly that passes through Fields 65, 66 and 68. This regularity would suggest it is not a fissure within the underlying geology but this regularity could also suggest they are some form of drain.

## Agricultural anomalies

Former field boundaries have been recorded throughout most of which correspond to the First Edition Ordnance Survey mapping dating from 1900; these are boundaries **FB3** (Field 39, Sector 4), **FB4** and **FB6** (Field 42, Sectors 9 and 10), **FB7** and **FB8** (Field 44, Sectors 12 and 13), **FB12** (Field 46, Sector 15), **FB13** and **FB14** (Field 48 (Sectors 17 and 18), **FB15** and **FB16** (Field 49, Sector 18), **FB17** (Field 58, Sector 25), **FB18** and **FB19** (Field 59/60, Sectors 25 and 26), **FB20** (Field 61, Sector 26), **FB21** (Field 62, Sector 27), **FB23** (Field 63, Sector 29), **FB24** (Field 65, Sectors 30 and 31), **FB25** (Field 66, Sector 32), **FB26** and **FB27** (Field 68, (Sectors 32-34). All of these boundaries are still visible on the historic map published in 1956 (NLS 2022). Removal of these appears to have been undertaken after this point to open up the fields into larger units.

Boundaries which do not correlate to the historic maps are **FB1** (Field 36, Sector 1), **FB2** (Field 38, Sector 3), **FB5** (Field 42, Sector 9), **FB9 - FB11** (Field 45, Sectors 13-15), **FB22** (Field 63, Sector 28). It is likely that these are boundaries which pre-date available mapping. Some of these may also be associated with headlands, particularly those in Field 45 which appear to contain ridge and furrow cultivation.

Field drains can be seen within most of the fields. They are of differing magnetic strength which is likely to be associated with the construction of the drains. Those that are particularly strong are likely to be of a fired clay construction.

Medieval or post-medieval ridge and furrow cultivation have been recorded throughout and can be seen despite the complex of drainage systems in place. The areas of ridge and furrow towards the east of Knaith (Fields 35-39) are likely to be associated with the other areas of

mapped ridge and furrow around the village and formed part of the land used by the village in the medieval period.

Other parallel linear trends can be seen within all areas and are associated with modern ploughing. Only a selection of these have been highlighted on the interpretation diagrams to show the direction of the plough lines.

### **Uncertain anomalies**

Linear response (**U1**) in Field 35 (Sector 1) runs on a northwest to southeast alignment and appears to run to the centre of the former pond to the immediate east in Field 36. It is possible **U1** is a drainage channel feeding the pond or a former boundary which is not shown on historic mapping. A linear response to the south of **U1** running on a southwest to northeast alignment may also represent a former boundary.

A group of linear responses and pits (**U2**) in Field 39 (Sector 5) are on various alignments and an interpretation has proved difficult. The linear features are very straight and while there is no clear cause of them they are likely to be of a modern agricultural origin possible associated with drainage or land management.

Curving trend (**U3**) in Field 40 (Sector 6) corresponds with a cropmark on Google Earth imagery dated 2015 and the cropmarks recorded by Historic England (HE 2022a). It is likely to be a field boundary pre-dating the available historic mapping, although a boundary ditch is also possible.

A pair of linear trends (**U4**) in Field 41 (Sector 8) may be of some interest, possibly a trackway. However they may also represent field drains on a different alignment to the others within this field. The same could be said for trends **U5** in Field 43 (Sector 11), although weaker than those at **U4**.

Linear response (**U6**) in Field 45 (Sector 12) runs close to a change in the crop on Google Images and may be associated with a field boundary and informal trackway that is used for agricultural purposes. Due to the archaeology to the immediate east it may be something more significant such as a boundary ditch.

Linear response (**U7**) in Field 46 (Sector 14) corresponds with a cropmark on Google Earth imagery dated 2015 and although it is not shown on historic mapping it may relate to a former field boundary. It has also been noted that field drains to the east stop at this feature.

A curving response and three parallel trends have been recorded at **U8** in Field 48 (Sector 17). They are magnetically weak and an interpretation has been difficult. It is likely that they are agricultural.

Linear responses (**U9**) in Field 51 (Sector 19) have been difficult to interpret due to the ferrous halo caused by the service pipe in the area. The anomalies also have a fairly high magnetic response and would therefore suggest a modern origin.

Anomaly (**U10**) in Field 52 (Sector 19) has produced a strong magnetic response and may be of some archaeological interest. However, it is an isolated response and may be associated with geology or a deeply buried ferrous object.

Curving trends (**U11**) in Fields 57, 61 and 62 (Sectors 23 and 27) may be of some archaeological interest and show three responses running through the fields. It is uncertain as to what these responses represent.

Weak responses (**U12**) in Field 65 (Sector 30) may form part of a small enclosure although tentative.

Curving trend (**U13**) in Field 66 (Sector 32) is likely to be a former boundary as its western end abuts boundary **FB25**.

### **Possible and definite archaeological anomalies**

Anomalies of both a definite and possible archaeological origin have been recorded within the dataset. The most prominent of these is a complex of linear ditches and trends in Field 45 (Sector 12) which appear to represent a set of enclosures that form part of the southern part of the extensive cropmarks recorded around Park Farm South. These have been suggested to be associated to the Heyning Priory site (HE 2022b).

While there may be no clear link between the anomalies detected in Field 45 and the priory site their close location and shared origination would suggest that they are medieval in date. The archaeological responses cover an area of approximately 166m by 130m. A number of possible archaeological and uncertain responses have been recorded surrounding the complex which are likely to be associated. It is possible that these are associated with leats and water management systems, perhaps even fish ponds.

Linear ditch response (**P1**) in Field 42 (Sector 9) may be of some archaeological interest. The responses have a stronger magnetic response than some of the surrounding features hence the possible archaeological origin. They may be associated with parts of an enclosure or former field systems.

Anomaly (**P2**) in Field 45 (Sector 12) lies to the west of the archaeological complex mentioned above. It measures at least 36m by 32m and may be of some interest. However, the response is similar to some of the geological anomalies within the dataset and caution has therefore be taken.

Anomalies (**P3**) in Field 68 (Sector 34) have been recorded which may be associated with archaeological activity. The responses are magnetically weak but consist of a number of ditches, linear and curvi-linear trends.

## **5 Conclusions**

The geophysical survey has detected a number of magnetic anomalies associated mainly with an agricultural landscape including former field boundaries, medieval/post-medieval ridge and furrow cultivation, modern ploughing and land drains.

Archaeological and possible archaeological origins in the forms of a linear enclosure complex and areas of other activity including possible enclosures have also been recorded. Uncertain anomalies may also be of some interest but agricultural origins may account for these responses.

Geological anomalies within the dataset are likely to be due to variations within the soils and the topography. Service pipes have been recorded in the north of the survey area and large area of magnetic disturbance are associated with a former pond.

Based on the geophysical survey the archaeological potential of the Site is deemed to be high in Field 45 and low elsewhere.

## **Appendix 1: Magnetic survey - technical information**

### **Magnetic Susceptibility and Soil Magnetism**

Iron makes up about 6% of the Earth's crust and is mostly present in soils and rocks as minerals such as maghaemite and haemetite. These minerals have a weak, measurable magnetic property termed magnetic susceptibility. Human activities can redistribute these minerals and change (enhance) others into more magnetic forms. Areas of human occupation or settlement can then be identified by measuring the magnetic susceptibility of the topsoil because of the attendant increase (enhancement) in magnetic susceptibility. If the enhanced material subsequently comes to fill features, such as ditches or pits, localised isolated and linear magnetic anomalies can result whose presence can be detected by a magnetometer (fluxgate gradiometer).

In general, it is the contrast between the magnetic susceptibility of deposits filling cut features, such as ditches or pits, and the magnetic susceptibility of topsoils, subsoils and rocks into which these features have been cut, which causes the most recognisable responses. This is primarily because there is a tendency for magnetic ferrous compounds to become concentrated in the topsoil, thereby making it more magnetic than the subsoil or the bedrock. Linear features cut into the subsoil or geology, such as ditches, that have been silted up or have been backfilled with topsoil will therefore usually produce a positive magnetic response relative to the background soil levels. Discrete feature, such as pits, can also be detected. The magnetic susceptibility of a soil can also be enhanced by the application of heat and the fermentation and bacterial effects associated with rubbish decomposition. The area of enhancement is usually quite large, mainly due to the tendency of discard areas to extend beyond the limit of the occupation site itself, and spreading by the plough.

### **Types of Magnetic Anomaly**

In the majority of instances anomalies are termed 'positive'. This means that they have a positive magnetic value relative to the magnetic background on any given site. However some features can manifest themselves as 'negative' anomalies that, conversely, means that the response is negative relative to the mean magnetic background.

Where it is not possible to give a probable cause of an observed anomaly a '?' is appended.

It should be noted that anomalies interpreted as modern in origin might be caused by features that are present in the topsoil or upper layers of the subsoil. Removal of soil to an archaeological or natural layer can therefore remove the feature causing the anomaly.

The types of response mentioned above can be divided into five main categories that are used in the graphical interpretation of the magnetic data:

*Isolated dipolar anomalies (iron spikes)*

These responses are typically caused by ferrous material either on the surface or in the topsoil. They cause a rapid variation in the magnetic response giving a characteristic 'spiky' trace. Although ferrous archaeological artefacts could produce this type of response, unless there is supporting evidence for an archaeological interpretation, little emphasis is normally given to such anomalies, as modern ferrous objects are common on rural sites, often being present as a consequence of manuring.

*Areas of magnetic disturbance*

These responses can have several causes often being associated with burnt material, such as slag waste or brick rubble or other strongly magnetised/fired material. Ferrous structures such as pylons, mesh or barbed wire fencing and buried pipes can also cause the same disturbed response. A modern origin is usually assumed unless there is other supporting information.

*Linear trend*

This is usually a weak or broad linear anomaly of unknown cause or date. These anomalies are often caused by agricultural activity, either ploughing or land drains being a common cause.

*Areas of magnetic enhancement/positive isolated anomalies*

Areas of enhanced response are characterised by a general increase in the magnetic background over a localised area whilst discrete anomalies are manifest by an increased response on two or three successive traverses. In neither instance is there the intense dipolar response characteristic exhibited by an area of magnetic disturbance or of an 'iron spike' anomaly (see above). These anomalies can be caused by infilled discrete archaeological features such as pits or post-holes or by kilns. They can also be caused by pedological variations or by natural infilled features on certain geologies. Ferrous material in the subsoil can also give a similar response. It can often therefore be very difficult to establish an anthropogenic origin without intrusive investigation or other supporting information.

*Linear and curvilinear anomalies*

Such anomalies have a variety of origins. They may be caused by agricultural practice (recent ploughing trends, earlier ridge and furrow regimes or land drains), natural geomorphological features such as palaeochannels or by infilled archaeological ditches.

**Methodology: Gradiometer Survey**

The main method of using the fluxgate gradiometer for commercial evaluations is referred to as *detailed survey* and requires the surveyor to walk at an even pace carrying the instrument within a grid system. A sample trigger automatically takes readings at predetermined points, typically at 0.25m intervals, on traverses 1m apart. These readings are stored in the memory of the instrument and are later dumped to computer for processing and interpretation.

During this survey an eight channel Sensys MX V3 system containing eight FGM650 sensors was used which was towed across the area using an ATV. Readings were taken every 20MHz (between 0.05 and 0.1m). Data was be recorded onto a device, using a Carlson GNSS Smart antenna, for centimetre accuracy. These readings were stored in the memory of the instrument and downloaded for processing and interpretation

Field 37 was collected using a Bartington Grad601 magnetic gradiometer with readings being recorded at 0.25m intervals on zig-zag traverses 0.5m apart within 30m by 30m square grids. The instrument was checked for electronic and mechanical drift at a common point and calibrated as necessary. The drift from zero was not logged.

The gradiometer data have been presented in this report in processed greyscale format. The data in the greyscale images have been interpolated and selectively filtered to remove the effects of drift in instrument calibration and other artificial data constructs and to maximise the clarity and interpretability of the archaeological anomalies.

## **Appendix 2: Survey location information**

An initial survey station was established using a Trimble VRS differential Global Positioning System (Trimble R6 model). The data was geo-referenced using the geo-referenced survey station with a Trimble RTK differential Global Positioning System (Trimble R6 model). The accuracy of this equipment is better than 0.01m. The survey grids were then super-imposed onto a base map provided by the client to produce the displayed block locations. However, it should be noted that Ordnance Survey positional accuracy for digital map data has an error of 0.5m for urban and floodplain areas, 1.0m for rural areas and 2.5m for mountain and moorland areas. This potential error must be considered if co-ordinates are measured off hard copies of the mapping rather than using the digital co-ordinates.

*Archaeological Services WYAS cannot accept responsibility for errors of fact or opinion resulting from data supplied by a third party.*

### Appendix 3: Geophysical archive and metadata

The geophysical archive comprises:-

- an archive disk containing compressed (WinZip 8) files of the raw data, report text (Microsoft Word 2003), and graphics files (Adobe Illustrator CS6 and AutoCAD 2017) files; and
- a full copy of the report.

At present the archive is held by Archaeological Services WYAS although it is anticipated that it may eventually be lodged with the Archaeology Data Service (ADS). Brief details may also be forwarded for inclusion on the English Heritage Geophysical Survey Database after the contents of the report are deemed to be in the public domain (i.e. available for consultation in the Lincolnshire Historic Environment Record).

	Interpolate: X & Y Doubled.

**Appendix 4: Oasis form**

# Summary for archaeol11-506352

OASIS ID (UID)	archaeol11-506352
Project Name	Geophysical Survey at Gate Burton Energy Park
Sitename	
Activity type	Geophysical Survey, MAGNETOMETRY SURVEY
Project Identifier(s)	
Planning Id	
Reason For Investigation	Planning: Pre application
Organisation Responsible for work	Archaeological Services WYAS
Project Dates	28-Feb-2022 - 06-Apr-2022
Location	Gate Burton Energy Park NGR : SK 85210 84340 LL : 53.3490954870551, -0.721422354594082 12 Fig : 485210,384340
Administrative Areas	Country : England County : Lincolnshire District : West Lindsey Parish : Knaith
Project Methodology	The cart-based survey was undertaken using an eight channel SenSYS MX V3 system containing eight FGM650 sensors. Readings are taken every 20MHz (between 0.05 and 0.1m). Data were recorded onto a device, using a Carlson GNSS Smart antenna, for centimetre accuracy. These readings were stored in the memory of the instrument and downloaded for processing and interpretation. DLMGPS and MAGNETO software, alongside bespoke in-house software was used to process and present the data.
Project Results	A geophysical (magnetometer) survey was undertaken on approximately 280 hectares of land located to the south-east of Gainsborough, Lincolnshire. The majority of the anomalies recorded are agricultural including field drains, ridge and furrow cultivation, modern ploughing and former field boundaries. Archaeological anomalies have been recorded which show what appear to be a set of enclosures of a likely medieval date. Possible archaeological anomalies have also been recorded which may indicate further areas of activity. Based on the geophysical survey, the archaeological potential of the Site is deemed to be high in Field 45 and low elsewhere.
Keywords	Ditched Enclosure - MEDIEVAL - FISH Thesaurus of Monument Types
Funder	
HER	Lincolnshire HER - unRev - STANDARD
Person Responsible for work	Emma, Brunning
HER Identifiers	
Archives	Digital Archive - to be deposited with The Collection: Art and Archaeology in Lincolnshire
