The four individual representations should be done as one , my concerns are the mining and use of precious metals, the damage to the countryside from the schemes . The impact on food production from the land area in the four schemes, in a dry year the type of grade 3a or 3b is valuable when compared to lighter soil type .

The impact of the disposal of all of the panels, what happens to them all.

How effective and efficient are these panels, especially in high temperatures over 25 Degrees centigrade?,

I am concerned about the battery storage? , any water contamination will go through the centre of Lincoln and down the River Witham to the Wash .

What is the Environment Agency contingency plan for such a scenario?
