

The global and UK population is growing all the time, unchecked. Therefore more food will be needed. Much food is imported currently but with climate change/drought/flooding, land available for food production is decreasing. Agricultural land is being used for housing, roads and economic growth.

Much of UK, especially this part of Lincolnshire, has excellent land, a stable climate, is not subject to earthquakes , floods, drought..it is UK's greatest asset and source of food security. There are alternatives to covering this wonderful area with solar panels, roof-top solar, putting pv panels on all new-build and subsidising covering existing large roofs. Careful thought must be given before our food security is jeopardised. This and the other applications must be rejected.
