

The importance of agricultural, food producing land is being completely overlooked, in order to tick a box relating to energy provision. During this time of flooding, much land will be delayed in sowing or will not be fit to grow a crop this year, thus price increase and shortages. It is paramount to retain land for food production and complete folly to think that solar panels will be the solution to energy production. Our roads are barely managing with the current rise in traffic from the new housing estates situated next to them and will certainly fail with added pressure from industrial solar plants....NOT SOLAR FARMS OR SOLAR PARKS!
