Date: March 2023

Revision: 02

## 1 Introduction

### 1.1 Brief

- 1.1.1 This report was prepared by Lanpro with the assistance of Daniel Baird Soil Consultancy Ltd (Baird Soil). It provides an assessment of the Agricultural Land Quality, Soil Resources and Farming Circumstances baseline for the proposed Solar PV development site West Burton.
- 1.1.2 The site area covers approximately 758 hectares of predominately agricultural land in the District of West Lindsey.

## 2 Agricultural Land Classification Methodology

- 2.1.1 The MAFF ALC system of grading land quality for use in land use planning purposes divides farmland into five grades according to the degree of limitation imposed upon land use by the inherent physical characteristics of climate, site and soils. Grade 1 land is of an excellent quality, whilst Grade 5 land has very severe limitations for agricultural use. Grade 3 land is split between the subgrades of 3a (good quality) and 3b (moderate quality).
- 2.1.2 Accordingly, a detailed assessment of the Site has been undertaken using the Ministry of Agriculture Fisheries and Food (MAFF) revised guidelines and criteria for Agricultural Land Classification (ALC) (Ref 19.1.1) published October 1988.
- 2.1.3 A report is given as an Annex to this Baseline report, presenting the results of the detailed ALC site assessment. This report shows ALC grades for the full extent of their survey area. Subsequent to this work the site boundary has excluded parts of the initial wider assessment area. The distribution of ALC Grades within the Sites is shown on Figures 19.1, 19.2 and 19.3, covering areas West Burton 1, West Burton 2 and West Burton 3 respectively [EN010132/APP/WB6.4.19.1 - WB6.4.19.3].
- 2.1.4 The MAFF revised guidelines and criteria for ALC of October 1988 require that the following factors be investigated:
- Climate: Average Annual Rainfall (AAR) and Accumulated Temperature above 0°C between January and June (AT0);
  - Site: Gradient, Micro Relief and Flooding;
  - Soils: Texture, Structure, Depth, Stoniness, and Chemical Toxicity; and
  - Interactive Factors Soil Wetness, Soil Droughtiness and Liability to Erosion.
- 2.1.5 Use of the ALC methodology is also supported by Natural England Technical Advice Note 049 (TIN049) (Ref 19.1.2) as revised December 2012.

## 3 Soil Resources Methodology

- 3.1.1 The Defra Construction Code of Practice for the Sustainable Use of Soils on Construction Sites (Ref 19.1.3) provides guidance on the conservation of soil for

beneficial reuse at development sites, safeguarding both the mass of the soil resource and its functional capacity. The application of this code of practice is voluntary, however following the guidance can deliver clear benefits in terms of the sustainable use of a finite resource, minimising the generation of waste and sediment from a construction site, and the cost effective delivery of the Development.

- 3.1.2 Data on the physical characteristics of the soil (including depth of horizons and soil texture) will inform the appropriate segregation of different soil materials present at the site, and the appropriate management of that material, both where topsoil is to be stripped, stored and reinstated, and where the soil remains in place through the lifetime of the development.

## 4 **Farming Circumstances Methodology**

- 4.1.1 The assessment methodology for farming circumstances is taken from the IEMA publication, A New Perspective on Land and Soils in Environmental Impact Assessment (Ref 19.1.4). It broadly continues the guidance from the now superseded planning guidance PPG7 which had remained a common approach for EIA in England, and was for a time included in the Design Manual for Roads and Bridges. This practice is in common with EIA for other qualifying development proposals, High Speed 2 EIA being a prominent example.

## 5 **Agricultural Land Classification Assessment**

- 5.1.1 Detailed ALC surveys within the site found agricultural land in ALC Grades 2, 3a and 3b. The distribution of ALC grades within the site is shown on Figures 19.1, 19.2 and 19.3, with areas given in Table 2 below [EN010132/APP/WB6.4.19.1 - WB6.4.19.3].

**Table 1 : ALC Grade Distribution**

ALC Grade	Area (ha)*	%
1	17.6	2.3
2	9.5	1.3
3a	172.4	22.8
3b	557.0	73.5
Non Agricultural	1.3	0.2
<b>Total</b>	<b>757.8</b>	<b>100</b>

- 5.1.2 Grade 3b land covers the majority of the Sites. The land typically has a heavy textured (high clay content) topsoil that is vulnerable to structural degradation if disturbed when wetted to a plastic consistency. Clayey subsoil impedes drainage of excess water down through the soil profile resulting in seasonal water logging

(Wetness Class III). As a result, the opportunities for cultivation and carrying livestock are limited by the risk of incurring persistent soil degradation, particularly in the autumn and spring periods for arable cultivation and sowing. This soil wetness and workability limitation is sufficient to limit the land to ALC Grade 3b.

- 5.1.3 For Grade 3a land, soils are broadly similar to those on the Grade 3b land. Topsoil clay content is lower (medium textured) and/or there is a significant presence of naturally occurring calcium. This topsoil has greater resilience to structural degradation than the heavy textured topsoil of the Grade 3b land. As a result, the soil wetness and workability limitation restricts this land to Grade 3a. Pockets of land with a lighter textured soil are also encountered where there is a drought limitation to Grade 3a.
- 5.1.4 Where Grade 1 and 2 land is found the slowly permeable subsoil starts at a greater depth or is not found within the 1.2m assessment depth. Soils are Seldom Wet (Wetness Class II) to Rarely Wet (Wetness Class I), reducing the period that excess water is held in the topsoil. This in turn reduces the severity of the soil wetness and workability limitation, to Grade 2 or no limitation (Grade 1). No Grade 1 and 2 land is found in the West Burton 1 area. A small pocket of Grade 2 land is found in West Burton 2 and two fields of Grades 1 and 2 land is present in the south of the West Burton 3 area.
- 5.1.5 Best and most versatile land together (ALC Grades 1, 2 and 3a) covers 199.5ha of land within the sites, 26%. This predominantly comprises Grade 3a land.

## 6 **Soil Resources Assessment**

- 6.1.1 As described above soils within the site typically have medium to heavy textured topsoils over clayey subsoils. The high clay content of heavy textured soil material makes structural degradation (such as compaction and smearing) from trafficking over and handling, more persistent and difficult to remediate.
- 6.1.2 However, in contrast to built development or minerals extraction, there is no widespread soil movement entailed in a solar farm development. Soil stripping is limited in extent to just the areas of access track and compound. For tracks and hard standing this soil stripping will be limited to just the topsoil, with a geotextile and hardcore being laid above the subsoil to create a permeable surface. For the majority of the solar farm development the soil profile will remain in place with a year round green cover. This is in contrast to the business as usual for arable land of annual intensive periods of cultivation and traffic that have limited capacity for delay in response to rainfall events.

## 7 **Farming Circumstances Assessment**

- 7.1.1 Four farm businesses manage land within the site. All are owner occupiers of the land occupied and all own and occupy additional agricultural land outside of the site

area. Figure 19.4 within the ES Chapter 19 shows the extent of land within the Sites for each of these farm businesses.

#### Farm Business A

- 7.1.2 Farm Business A occupies approximately 1200ha of agricultural land, the majority of which is owner occupied. All of the Farm Business A land within the site (90.4ha) is owner occupied. Approximately 120ha of land outside of the Sites is held on short term Farm Business Tenancy (FBT) agreements. The land comprises seven separate areas of land with six farm yards. There are no farm yards or buildings within the Sites.
- 7.1.3 Combinable cropping (such as cereals, oilseed and field beans) is the dominant enterprise of the farm business, and the land use found within the Sites. This land is managed ‘in hand’ by the farm business using its own staff and equipment for cultivation, sowing, crop protection and harvest. The farm employs eight full time staff including the owner. In addition, the farm employs a neighbouring farmer seasonally to assist with peak workload.
- 7.1.4 The farm business has grain storage for 25,000 to 30,000 tonnes which is more than is required for its own harvest. The surplus capacity is let to grain merchants and used by the farm business for its own grain merchant enterprise.
- 7.1.5 On lighter land outside of the Sites, combinable crops are rotated with potato, carrot, parsnip and beetroot crops supported by irrigation. There is no connection to supply the land within the Sites with irrigation water from the licenced abstraction points.
- 7.1.6 Farm Business A does not have its own livestock but does operate a pig ‘Bed and Breakfast’ enterprise accommodating pigs belonging to another farm. There are approximately seven thousand pigs housed by the farm at any one time.
- 7.1.7 In addition to the grain merchant diversified enterprise noted above, the farm manages a commercial shoot but this does not operate on the land in the Sites.
- 7.1.8 The farm has no SSSI or Scheduled Monument sites that impede agricultural management. Approximately 39ha of land is entered into a mid tier Countryside Stewardship agreement.
- 7.1.9 Flytipping is a common nuisance but the principal problem the farm has is on land adjoining the A1 (away from the sites) with damage from criminal gangs crossing land to target HGVs for diesel theft.
- 7.1.10 The farmer’s overall opinion is that the solar farm will improve the viability of the farm through diversification. A small reduction in the total arable area will not undermine that enterprise and the farm may respond by taking on additional land should suitable sites become available.

### Farm Business B

- 7.1.11 Farm Business B is the owner occupier of approximately 810ha of land. While not in a single block the land is all within a 10min drive. There are two farm yards on the land, with the farm being managed from the yard that adjoins the Sites. The centre of operations could be moved to the secondary farm yard without difficulty. Approximately 303ha of Farm Business B land is in the Sites.
- 7.1.12 Approximately 708ha of land is in arable management, with rotations of combinable crops. Some occasional maize and sugar beet crops are included in the rotations but not at the site where the heavy land is not suited to these late harvested crops. About 20ha of the arable area is also under a rotational ley grass crop at any one time.
- 7.1.13 Most landwork is in hand with the farm employing three and a half full time equivalent staff including one of the owners. The farm jointly owns a combine harvester and a sugarbeet seed drill with another farm.
- 7.1.14 The remaining land (approximately 102ha) is under permanent pasture. This land is used by a tenant, a livery business with thirty stables.
- 7.1.15 A poultry enterprise has approximately 130,000 broiler hens raised in barns. Litter from the poultry is applied to the farms own arable land and following development the farm will retain sufficient arable land to continue to do so without difficulty. Feed is bought in, the farm being unable to feed its own grain to the poultry.
- 7.1.16 In addition to letting land to a livery business as noted above, Farm Business B has a diversified enterprise of self storage units.
- 7.1.17 The farm has land in Higher Level Schemes that are ending in the autumn of 2023. Away from the Sites the farm has land in a pilot of the Sustainable Farm Initiative (SFI). Areas of artificial flood plain (to attenuate flooding downstream) are close to but not within the Sites. A Scheduled Monument outside of the Sites is managed by grazing to avoid disturbance of the former village.
- 7.1.18 What little nuisance the farm experiences is concentrated on the river bank where walkers access the land.
- 7.1.19 The farmer considers that the diversification of having land under solar would be economically beneficial to the farm. They also anticipate that the extended fallow period will improve soil health, in particular the structural stability of topsoil that at present, is unable to be managed for direct drilling of crops.

### Farm Business C

- 7.1.20 Farm Business C is an arable enterprise with approximately 562ha spread across three farm units. All of the land is in arable production aside from a small paddock. The farm uses outside contractors for all landwork (cultivation, sowing, application and harvest) and has no staff or machinery of its own.

- 7.1.21 Spread between the three units the farm has sufficient grain storage to accommodate the yield of a typical year. It does not have its own grain dryer.
- 7.1.22 Land within the solar farm would comprise approximately 210.8ha out of a total area of 562ha owned by the farm. Farm Business C is also the landowner of approximately 132.3ha of land that is part of a separate application for a solar energy development. Land within the Sites is not currently entered into any environmental scheme but some land has previously been in a Higher Level Scheme (HLS) agreement. Land management is not constrained by nuisance factors such as fly tipping.
- 7.1.23 With all farming operations undertaken by contractors, Farm Business C will not have any surplus capacity of farm labour or machinery should one or both solar farm applications progress. Any surplus grain storage could be let to other farm businesses or grain merchants. For Farm Business C the solar farm will be the addition of a diversified enterprise that is not subject to the same fluctuations of income as the arable enterprise.

#### Farm Business D

- 7.1.24 Farm Business D manages approximately 274ha of owner occupied land. At present the majority of the land is in arable production with approximately 17ha of permanent grass. 154.9ha of this land sits within the Sites.
- 7.1.25 The arable land is in rotations of cereals with beans as a break crop. In addition a small area (2.5ha) of bird seed crop is grown. The landowner undertakes his own cultivation work but relies on third parties for harvest, crop protection and fertiliser application. There are no farm workers in addition to the owner. The farm has grain storage for approximately 1000 tonnes which is not sufficient for annual yield.
- 7.1.26 Hay crops taken off the permanent pasture are sold off the farm. Straw from the arable enterprise goes to a power station. There are no farm livestock and no diversified enterprises.
- 7.1.27 In 2018 the farm closed down its primary enterprise, a dairy unit with 180 milking cows plus followers. The land that supported this enterprise transitioned to the current arable enterprise. The dairy enterprise was ended because of the planned retirement of the farmer, with equipment including a robot milking system, sold. A dairy unit of this scale in Lincolnshire is not considered economically viable by the farmer, for any successor to take on following the owner's retirement.
- 7.1.28 The farm has land in the Entry Level Scheme with agreements centred on hedge management and field margins. These measures have approximately one year remaining.

- 7.1.29 The farmer wants the diversification to solar to progress so that the farm business has a more stable income that will enable retirement and be able to support any successor taking over the farm.

## **7.2 Effect of Development on Farm Businesses**

- 7.2.1 The farmers were questioned regarding the likely response of their farm business to the proposed development. All farm businesses would have a reduction in area managed for combinable crops. For Farm Business D the farmer is seeking to retire and has already terminated a dairy enterprise, seeing no medium to long term viability for continuing dairy production at this scale, and needing to reduce their own working hours because of age.

APPENDIX 3 – SAMPLE ASSESSMENT

APPENDIX 4 – WETNESS ASSESMENT

APPENDIX 5 – DESCRIPTION OF AGRICULTURAL LAND CLASSIFICATION GRADES

APPENDIX 6 – MAP OF LAND GRADING

## 1. EXECUTIVE SUMMARY

- 1.1 This report assesses the Agricultural Land Classification (ALC) grading of 1077Ha, of agricultural land in West Lindsey District and Bassetlaw District.
- 1.2 The limiting factor is found to be predominantly soil wetness, with some areas of lighter (sandy) land limited by droughtiness. Both wetness and droughtiness are a combination of the soils found on sites and the climatic regime.
- 1.3 The land is graded as follows:

Grade 1:	28.7Ha	2.6%
Grade 2:	48.7Ha	4.5%
Grade 3a:	381.6Ha	35.4%
Grade 3b:	617.8Ha	57.3%
Non-Agricultural	2ha	0.2%
Total:	1078.8Ha	

- 1.4 The surveyed site totals 1076.8 Ha of agricultural land of which 459ha (42.6%) is best and most versatile and 617.8Ha (57.4%) is not best and most versatile agricultural land.

## 2. INTRODUCTION

- 2.1 Amet Property Ltd have been instructed by Island Green Power Limited to produce an ALC report on the area of a proposed solar project. The solar project is split across 5 sites known as West Burton 1, West Burton 2, West Burton 3, West Burton 4 and West Burton Substation. West Burton 1, West Burton 2 and West Burton 3 are all in West Lindsey District while West Burton 4 and West Burton Substation are in Bassetlaw District. The ALC report is being prepared to accompany a planning application for the proposed West Burton Solar Project.
- 2.2 The report's author is James Fulton BSc (Hons) MRICS FAAV who has worked as a chartered surveyor, agricultural valuer, and agricultural consultant since 2004, has a degree in agriculture which included modules on soils and over 10 years' experience in advising farmers on soil structure and cultivation methods and in producing agricultural land classification reports.
- 2.3 The report is based on 35 days of sampling conducted in August and September 2021 a day in February 2022 to survey the grid connection point. The survey consisted of taking approximately one sample per hectare using a Dutch/Eidelman 50mm soil auger to a depth of 1.2m (where possible). A plan of auger points can be found at **appendix 1** with a separate map for each site. In addition to the sampling with a soil auger trial pits were dug as required to determine soil structure and confirm colour where it was difficult to accurately gauge with the auger alone. Some of these trial pits were to the full 1.2m depth while others were shallower to investigate a specific change found whilst sampling with the auger. Accurate soil structures were recorded where trial pits were dug to examine soils. Where an auger was used subsoil structures are described as good, moderate or poor based on figure 9,10 and 11 in the MAFF guidance.
- 2.4 During the sampling conditions were generally good with the subsoil state described as moist allowing samples to be removed and examined easily. The topsoils were generally dry and so a lot of water had to be added to hand texture samples. In places the subsoil was dry and so a further visit was conducted to re-examine several trial pit locations in January 2022 to examine the subsoils when in a moist condition and to check hand textured samples.
- 2.5 A number of locations are described in literature as possibly calcareous and so hydrochloric acid was used to test in field for a reaction that would indicate calcareous soils. Some areas were identified as calcareous while others where a reaction might be expected did not and so additional lab testing was ordered and the report updated accordingly.

2.6 The five sites are described as follows:

WEST BURTON 1

91.2 hectares of arable land to the northeast of Broxholme, generally flat with elevation ranging from 4m to 7m above ordnance datum (AOD). At the time of the survey the land had just had a cereal crop removed and was still stubble.

WEST BURTON 2

347.3 hectares of predominantly arable land with some small areas of permanent pasture to the east and west of Ingleby, generally flat with some shallow slopes with elevation ranging from 3m to 18m AOD. At the time of the survey the majority of the land had just had a cereal crop removed and was still stubble with some areas of miscanthus and maize still growing.

WEST BURTON 3

379.6 hectares of predominantly arable land to the east of Brampton, ranging from flat shallow slopes with elevation ranging from 4m to 23m AOD. At the time of the survey the majority of the land had just had a combinable crop removed and was still stubble with some areas cultivated and a single field of temporary grass.

WEST BURTON 4

252.3 hectares of predominantly arable land to the northeast of Clayworth and south of Gringley on the Hill mostly shallow slopes and smaller flat areas with elevation ranging from 15m to 73m AOD. At the time of the survey the majority of the land had just had a combinable crop removed and was still stubble with small areas of permanent pasture.

WEST BURTON SUBSTATION

6.6 hectares of arable land at Best Burton flat to gently sloping with elevation ranging from 11m to 13m AOD. At the time of the survey the two fields were drilled with a winter cereal crop.

- 2.7 Further information has been obtained from the MAGIC website, the Soil Survey of England and Wales, the British Geological Survey, the Meteorological Office and 1:250,000 series agricultural land classification maps.
- 2.8 The collected information has been judged against the Ministry of Agriculture Fisheries and Food Agricultural Land Classification of England and Wales revised guidelines and criteria for grading the quality of agricultural land.

- 2.9 The principal factors influencing agricultural production are climate, site and soil and the interaction between them MAFF (1988) & Natural England (2012)<sup>1</sup>.

### **3. PUBLISHED INFORMATION**

- 3.1 The British Geological Survey 1:50,000 scale map shows there to be a range of basal geology and various overlying deposits.

#### WEST BURTON 1

The bedrock geology is shown to be Charmouth Mudstone Formation - Mudstone. The superficial deposits for the west of the site are not recorded and for the east of the site are shown to be Till, Mid Pleistocene - Diamicton.

#### WEST BURTON 2

The bedrock geology for the majority of the site is shown to be Scunthorpe Mudstone Formation – Mudstone and Limestone and for a strip to the west near to the river is shown to be Charmouth Mudstone Formation – Mudstone. The superficial deposits for the majority of the site are not recorded with the area to the east of the site shown to be Alluvium – Clay, Silt, Sand, and Gravel.

#### WEST BURTON 3

The bedrock geology is shown to be Scunthorpe Mudstone Formation – Mudstone and Limestone. The superficial deposits for the majority of the site are not recorded and for a strip through the centre of the site are shown to be Holme Pierpoint Sand and Gravel Member – Sand and Gravel.

#### WEST BURTON 4

The bedrock geology for the majority of the site is shown to be Mercia Mudstone Group – Mudstone. Small areas within the site boundary are shown to be Mercia Mudstone Group – Siltstone, Dolomitic and Clarborough Member – Siltstone. The superficial deposits for the site are not recorded.

#### WEST BURTON SUBSTATION

The bedrock geology for the site is shown to be Mercia Mudstone Group – Mudstone. The superficial deposits for the site are not recorded.

---

<sup>1</sup> MAFF (1988) - Agricultural Land Classification of England and Wales. Revised guidelines and criteria for grading the quality of agricultural land. MAFF Publications

Natural England (2012) - Technical Information Note 049 - Agricultural Land Classification: protecting the best and most versatile agricultural land, Second Edition

- 3.2 The national soils map shows a variety soil types across the site.

#### WEST BURTON 1

A small area to the north of the site adjacent to the river is identified as Fladbury 2 Association – Stoneless clayey soils variably affected by groundwater some with sandy subsoils. A small area to the west of the site is identified as Wickham 2 Association – slowly permeable seasonally waterlogged fine loamy over clayey, fine silty over clayey and clayey soils and the majority of the site is identified as Beccles 1 Association - slowly permeable seasonally waterlogged fine loamy over clayey soils

#### WEST BURTON 2

The strip of land to the east of the site adjacent to the river is identified as Fladbury 2 Association – Stoneless clayey soils variably affected by groundwater some with sandy subsoils. A very small area to the southwest of the site is identified as Blackwood Association – Deep permeable sandy and coarse loamy soils. The majority of the site is identified as Wickham 2 Association – slowly permeable seasonally waterlogged fine loamy over clayey, fine silty over clayey and clayey soils.

#### WEST BURTON 3

An area to the southwest of the site is identified as Evesham 3 Association – slowly permeable calcareous clayey, and fine loamy over clayey soils. A strip through the middle of the site is identified as Blackwood Association – deep permeable sandy and coarse loamy soils. The majority of the site is identified as Wickham 2 Association – slowly permeable seasonally waterlogged fine loamy over clayey, fine silty over clayey and clayey soils.

#### WEST BURTON 4

An area to the northwest of the site is identified as Whimble 3 Association – reddish fine loamy or fine silty over clayey soils with slowly permeable subsoils and slight seasonal waterlogging. A very small area to the west Highfield Farm is identified as Brockhurst 2 Association – slowly permeable seasonally waterlogged reddish fine loamy over clayey soils. The majority of the site is identified as Worcester Association – slowly permeable non calcareous and calcareous reddish clayey soils over mudstone, shallow on steeper slopes.

#### WEST BURTON SUBSTATION

The site is identified as Brockhurst 2 Association – slowly permeable seasonally waterlogged reddish fine loamy over clayey soils.

- 3.3 The 1:250,000 series Agricultural Land Classification maps show the land to be Grade 3. These plans are of strictly limited value, using an out-of-date methodology at a very small scale (low detail) level of survey. Further information on the limits of their use can be found in TIN049.

#### **4. CLIMATE**

- 4.1 Climate has a major, and in places overriding, influence on land quality affecting both the range of potential agricultural uses and the cost and level of production.
- 4.2 There is published agro-climatic data for England and Wales provided by the Meteorological Office, such data for the subject site is listed in the table below.
- 4.3 The climatic data for each of the sites was determined separately as the distance between locations and difference in altitude could provide different results.

Agro-Climatic Data – Full details can be found at **appendix 2**

##### WEST BURTON 1

Grid Reference	491631 378498
Altitude (ALT)	5.58
Average Annual Rainfall (AAR)	609.12
Accumulated Temperature - Jan to June (ATO)	1421.86
Duration of Field Capacity (FCD)	125.97
Moisture Deficit Wheat	112.94
Moisture Deficit Potatoes	104.66

##### WEST BURTON 2

Grid Reference	489198 377715
Altitude (ALT)	9.7
Average Annual Rainfall (AAR)	604.23
Accumulated Temperature - Jan to June (ATO)	1418.06
Duration of Field Capacity (FCD)	121.89
Moisture Deficit Wheat	112.91
Moisture Deficit Potatoes	105.50

##### WEST BURTON 3

Grid Reference	485694 380101
Altitude (ALT)	11.54
Average Annual Rainfall (AAR)	586.62
Accumulated Temperature - Jan to June (ATO)	1416.24
Duration of Field Capacity (FCD)	116.45
Moisture Deficit Wheat	114.64
Moisture Deficit Potatoes	107.34

## WEST BURTON 4

Grid Reference	474053 389193
Altitude (ALT)	35.51
Average Annual Rainfall (AAR)	573.49
Accumulated Temperature - Jan to June (ATO)	1386.90
Duration of Field Capacity (FCD)	110.84
Moisture Deficit Wheat	113.02
Moisture Deficit Potatoes	99.65

## WEST BURTON SUBSTATION

Grid Reference	478686 385652
Altitude (ALT)	12
Average Annual Rainfall (AAR)	566.03
Accumulated Temperature - Jan to June (ATO)	1415.29
Duration of Field Capacity (FCD)	109.51
Moisture Deficit Wheat	115.16
Moisture Deficit Potatoes	105.06

- 4.4 The main parameters used in assessing the climatic limitation are average annual rainfall (AAR), as a measure of overall wetness; and accumulated temperature (ATO), as a measure of the relative warmth of a locality.
- 4.5 The AAR and ATO provide no climatic limitation to grade.
- 4.6 Large areas of West Burton 1, 2 and 3 are shown by the predictive mapping to be in flood zone 2 and 3 – areas with a high risk of flooding. The rest of the land was shown to be flood zone 1 – areas with a less than 1 in 1000 annual chance of flooding. Despite this, there was no evidence of flooding seen during the site visits and it is considered that any flooding is of a low enough frequency that it will not be the most limiting factor to land grade.

## 5. STONINESS

- 5.1 The majority of the site was stoneless. Where there were stones in the topsoil, they very rarely exceeded 5% and with very few exceptions were too small to be retained by a 2cm grid. Where stone content was less than 5% it was not recorded. Stoniness is not considered a limiting factor to land grade.

## 6. GRADIENT

- 6.1 The steepest areas of the site are only a gentle slope with gradient never representing the most limiting factor to land grade.

## 7. SOILS

- 7.1 The soils found on site largely follow the expectations set by the national soils map with occasional anomalies. Full information on the sample points along with lab results of topsoil textures and a number of descriptions and photographs from trial pits can be found at **appendix 3**.

### WEST BURTON 1

A small area of land adjacent to the river at the north of the site was made up of a sandy loam topsoil over a loamy sand or sand first subsoil with a clay or sand second subsoil. This small area was completely different to the rest of the site and does not reflect any of the expected soils based upon available data.

The rest of the site was extremely consistent with either a clay or clay loam topsoil over a subsoil that is grey, greyish brown or brown, gleyed from between 30 and 35cm slowly permeable clay, or sandy clay.

The topsoil was occasionally deeper than would be expected extending to approximately 40cm which was clearly below the usual cultivation depth but as the colour and texture remained unchanged this was not recorded as a first subsoil.

### WEST BURTON 2

Despite the national soils map showing two different soil associations across the site the soils identified were extremely consistent across all the area. Topsoils were either dark grey, dark greyish brown or very dark greyish brown and almost all clay, sandy clay or heavy clay loam with some small areas of lighter textured topsoils, either sandy clay loam or medium clay loam. Subsoils were almost all grey, greyish brown or brown, gleyed from between 30 and 35cm slowly permeable clay, sandy clay, or clay loam.

The topsoil was often deeper than would be expected extending to 35cm or 40cm which was clearly below the usual cultivation depth but as the colour and texture remained unchanged this was not recorded as a first subsoil.

None of the samples on site reacted to hydrochloric acid but two of the samples showed a slight neutralizing value in the lab tests. The subsoils were not reactive to HCl and discussions with the farmer confirmed that both Mag Lime and Gypsum have been used on site. It is not considered that the neutralizing value is caused by the soils being naturally calcareous.

### WEST BURTON 3

There is a small area of land to the southwest of stow park with sandy clay loam topsoils of deep permeable loamy sand subsoils over a slowly permeable clay layer at around 80cm. This appears to be a mix of the Wickham 2 and

Blackwood Associations providing the best of both worlds resulting in very good land.

The rest of the land all has largely similar subsoils being slowly permeable clay or sandy clay gleyed subsoils from around 30cm occasionally becoming reddish from 80-90cm.

The topsoils range from sandy loam through sandy, medium, and heavy clay loams to clay and sandy clay. The topsoils often change texture over quite short distances although there are patterns of lighter and heavier areas.

The areas that were shown on the national soils map to be Evesham Association were found to be calcareous based on an in-field test with HCL.

The topsoil was often deeper than would be expected extending to 35cm or 40cm and occasionally even 50cm which was clearly below the usual cultivation depth but as the colour and texture remained unchanged this was not recorded as a first subsoil.

The soils to the southwest that reacted to HCL on site showed a very high neutralizing value in the lab tests as would be expected. The lab test on the soil to the north of the site showed a neutralizing value of just over 1% despite the in-field test not reacting. Following discussions with the landowner it was determined that this area had recently had lime applied and so the neutralizing value was not the result of naturally calcareous soils.

#### WEST BURTON 4

The topsoil across the site was almost all brown or dark greyish brown and except for a small number of locations was either heavy clay loam or medium clay loam. The samples taken at sample points 70 and 71 show how quickly the soil texture changed over very short distances and were generally just one side or the other of the boundary between medium and heavy clay loam. Occasionally the topsoil was noticeably heavier and was recorded as clay while a similar number of points were noticeably lighter, and a lab test confirmed these to be a sandy loam.

The area to the southwest of Highfield Farm is made up of a sandy loam topsoil over a silty sandy loam first subsoil with a slowly permeable clay subsoil starting at around 80cm from the surface.

The small number of sample points to the north of the site had grey heavily gleyed, slowly permeable clay subsoils from depths of between 30 and 35cm.

The rest of the site had extremely consistent subsoils being slowly permeable reddish-brown clay or silty clay starting at around 30cm. Several locations were impenetrable to the soil auger during sampling in summer and when dug appeared to be mudstone. When a small proportion of these were re-assessed in January it was found that where the impenetrable layer was shallow (around

30cm) this was identified as a slowly permeable reddish-brown clay that had presumably dried to such an extent in the summer that it had hardened to the point of being impenetrable. Where the impenetrable layer was deeper it was found to still be impenetrable and thus determined to be a mudstone layer.

While the national soils map suggests that some of the areas may be calcareous none of the tests on site with hydrochloric acid reacted and so all points have been recorded as non-calcareous.

The topsoil was often deeper than would be expected extending to 35cm or 40cm which was clearly below the usual cultivation depth but as the colour and texture remained unchanged this was not recorded as a first subsoil.

Despite the in-field tests with hydrochloric acid showing no reaction all of the clay/clay loam soils on the site that were tested in the lab shows a neutralizing value of between 2.5 and 3.8. There is no adequate explanation from the management of the land to explain this and so the land must be considered to be naturally calcareous.

The majority of the soils on site correspond very strongly to the Whimble 3 Association and Worcester Association soils expected.

#### WEST BURTON SUBSTATION

The topsoil across this area is very consistent being a dark brown clay or heavy clay loam extending to approximately 40cm which was clearly below the usual cultivation depth but as the colour and texture remained unchanged this was not recorded as a first subsoil. The subsoils varied but were generally reddish with a slowly permeable layer occurring around 40cm except for one sample point where there was a sand layer from 40-60cm with the slowly permeable layer from 60cm.

#### INTERACTIVE FACTORS

##### 8. WETNESS

- 8.1 An assessment of the wetness class of each sample point was made based on the flow chart at Figure 6 in the MAFF guidance. The wetness class and topsoil texture were then assessed against Table 6 of the MAFF guidance to determine the ALC grade according to wetness. The wetness assessment can be found at **appendix 4**.
- 8.2 Wetness was found to be the limiting factor across the majority of sample points over the whole survey area.

#### WEST BURTON 1

The slowly permeable gleyed subsoils result in most areas being calculated as Wetness class III which based on Table 6 in the MAFF guidance results in a

grade 3b, where the topsoil is clay or heavy clay loam; and grade 3a where the topsoil is medium clay loam.

#### WEST BURTON 2

The slowly permeable gleyed subsoils result in most areas being calculated as Wetness class III which based on Table 6 in the MAFF guidance results in a grade 3b, where the topsoil is clay or heavy clay loam; grade 3a, where the topsoil is medium clay loam; and grade 2, where the topsoil is sandy loam. Where there is no slowly permeable subsoil the sample points are calculated to be Wetness class I which result in grade 3a, where the topsoil is clay or sandy clay.

#### WEST BURTON 3

The slowly permeable gleyed subsoils result in most areas being calculated as Wetness class III which based on Table 6 in the MAFF guidance results in a grade 3b, where the topsoil is clay or heavy clay loam; and grade 3a, where the topsoil is calcareous clay or calcareous heavy clay loam or medium clay loam. Where there is no slowly permeable subsoil the sample points are calculated to be Wetness class I which result in grade 3a where the topsoil is clay; and grade 2 where the topsoil is heavy clay loam.

#### WEST BURTON 4

The slowly permeable gleyed subsoils result in most areas being calculated as Wetness class III which based on Table 6 in the MAFF guidance results in a grade 3a, where the topsoil is calcareous clay or calcareous heavy clay loam; and grade 2, where the topsoil is calcareous medium clay loam or sandy loam.

#### WEST BURTON SUBSTATION

The slowly permeable gleyed subsoils result in all sample points being calculated as Wetness class III which based on Table 6 in the MAFF guidance results in a grade 3b, where the topsoil is clay or heavy clay loam.

### 9. DROUGHTINESS

- 9.1 Droughtiness limits are defined in terms of moisture balance for wheat and potatoes using the formula:

$$MB \text{ (Wheat)} = AP \text{ (Wheat)} - MD \text{ (Wheat)}$$

and

$$MB \text{ (Potatoes)} = AP \text{ (Potatoes)} - MD \text{ (Potatoes)}$$

Where:

MB = Moisture Balance

AP = Crop Adjusted available water capacity

MD = Moisture deficit

- 9.2 Moisture deficit for wheat and potatoes can be found in the agro-climatic data and are as follows:

West Burton 1

MD (Wheat) = 125.97  
MD (Potatoes) = 104.66

West Burton 2

MD (Wheat) = 112.91  
MD (Potatoes) = 105.50

West Burton 3

MD (Wheat) = 114.64  
MD (Potatoes) = 107.34

West Burton 4  
MD (Wheat) = 113.02  
MD (Potatoes) = 99.65

West Burton Substation

MD (Wheat) = 115.16  
MD (Potatoes) = 105.06

- 9.3 Crop adjusted available water is calculated by reference to the total available water and easily available water which is calculated by reference to soil texture and structural condition and the stone content. Where it was considered that droughtiness was likely to be a limiting factor the MD (Wheat) and MD (Potatoes) was calculated and then assessed against table 8. This assessment can be found at **appendix 4**.

## 10. AGRICULTURAL LAND CLASSIFICATION

- 10.1 The Agricultural Land Classification provides a framework for classifying land according to which its physical or chemical characteristics impose long-term limitations on agricultural use. The limitations can operate in one or more of four principle ways: they may affect the range of crops that can be grown, the level of yield, the consistency of yield and the cost of obtaining it.
- 10.2 The principle physical factors influencing agricultural production are climate, site and soil and the interactions between them which together form the basis for classifying land into one of 5 grades; grade 1 being of excellent quality and grade 5 being land of very poor quality. Grade 3 land, which constitutes approximately half of all agricultural land in the United Kingdom is divided into 2 subgrades – 3a and 3b. A full definition of all of the grades can be found at **appendix 5**.

- 10.3 This assessment sets out that the principal limiting factor found across the site is wetness with droughtiness affecting occasional sample points.
- 10.4 The MAFF guidance sets out that 'where soil and site conditions vary significantly and repeatedly over short distances and impose a practical constraint on cropping and land management a 'pattern' limitation is said to exist. Where wetness is the limiting factor areas of land with a lighter topsoil are downgraded when they are surrounded by areas with topsoil with a higher clay content when it is considered that accessing the lighter areas would be constrained by the surrounding heavier land.

10.5 The breakdown of land by classification is:

#### WEST BURTON 1

Grade 3a:	18.4Ha	20.2%
Grade 3b:	72.8Ha	79.8%
Total:	91.2Ha	

#### WEST BURTON 2

Grade 2:	2.5Ha	0.7%
Grade 3a:	11.9Ha	3.4%
Grade 3b:	332.9Ha	95.9%
Total:	347.3Ha	

#### WEST BURTON 3

Grade 1:	19.3Ha	5.0%
Grade 2:	6.6Ha	1.7%
Grade 3a:	148Ha	38.9%
Grade 3b:	205.5Ha	53.9%
Non-Agricultural	2Ha	0.5%
Total:	381.4Ha	

WEST BURTON 4

Grade 1:	9.4Ha	3.7%
Grade 2:	39.6Ha	14.7%
Grade 3a:	203.3Ha	81.6%
Total:	252.3Ha	

WEST BURTON SUBSTATION

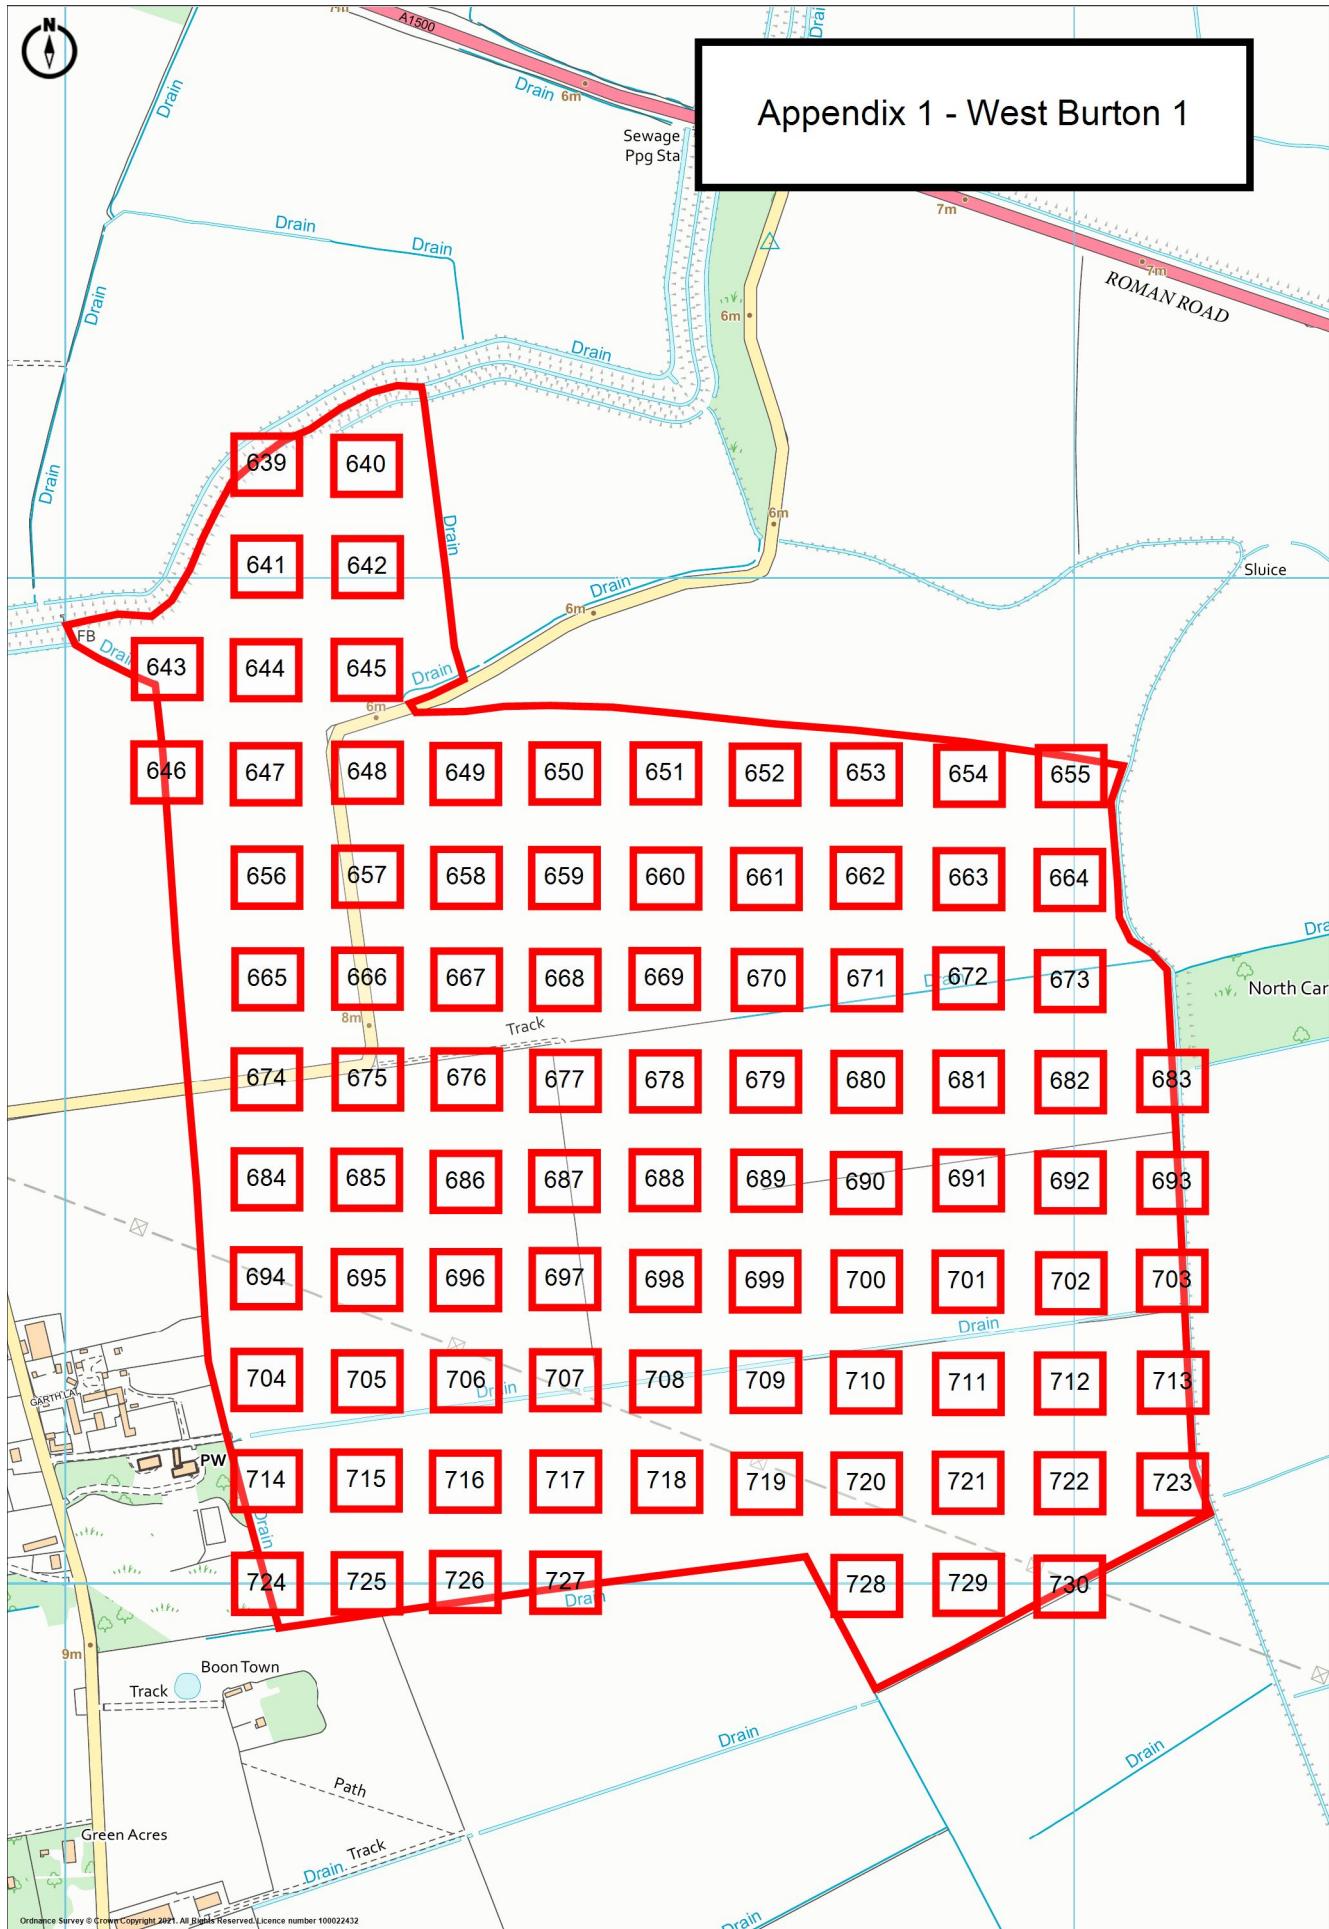

Grade 3b:	6.6Ha	100%
Total:	6.6Ha	

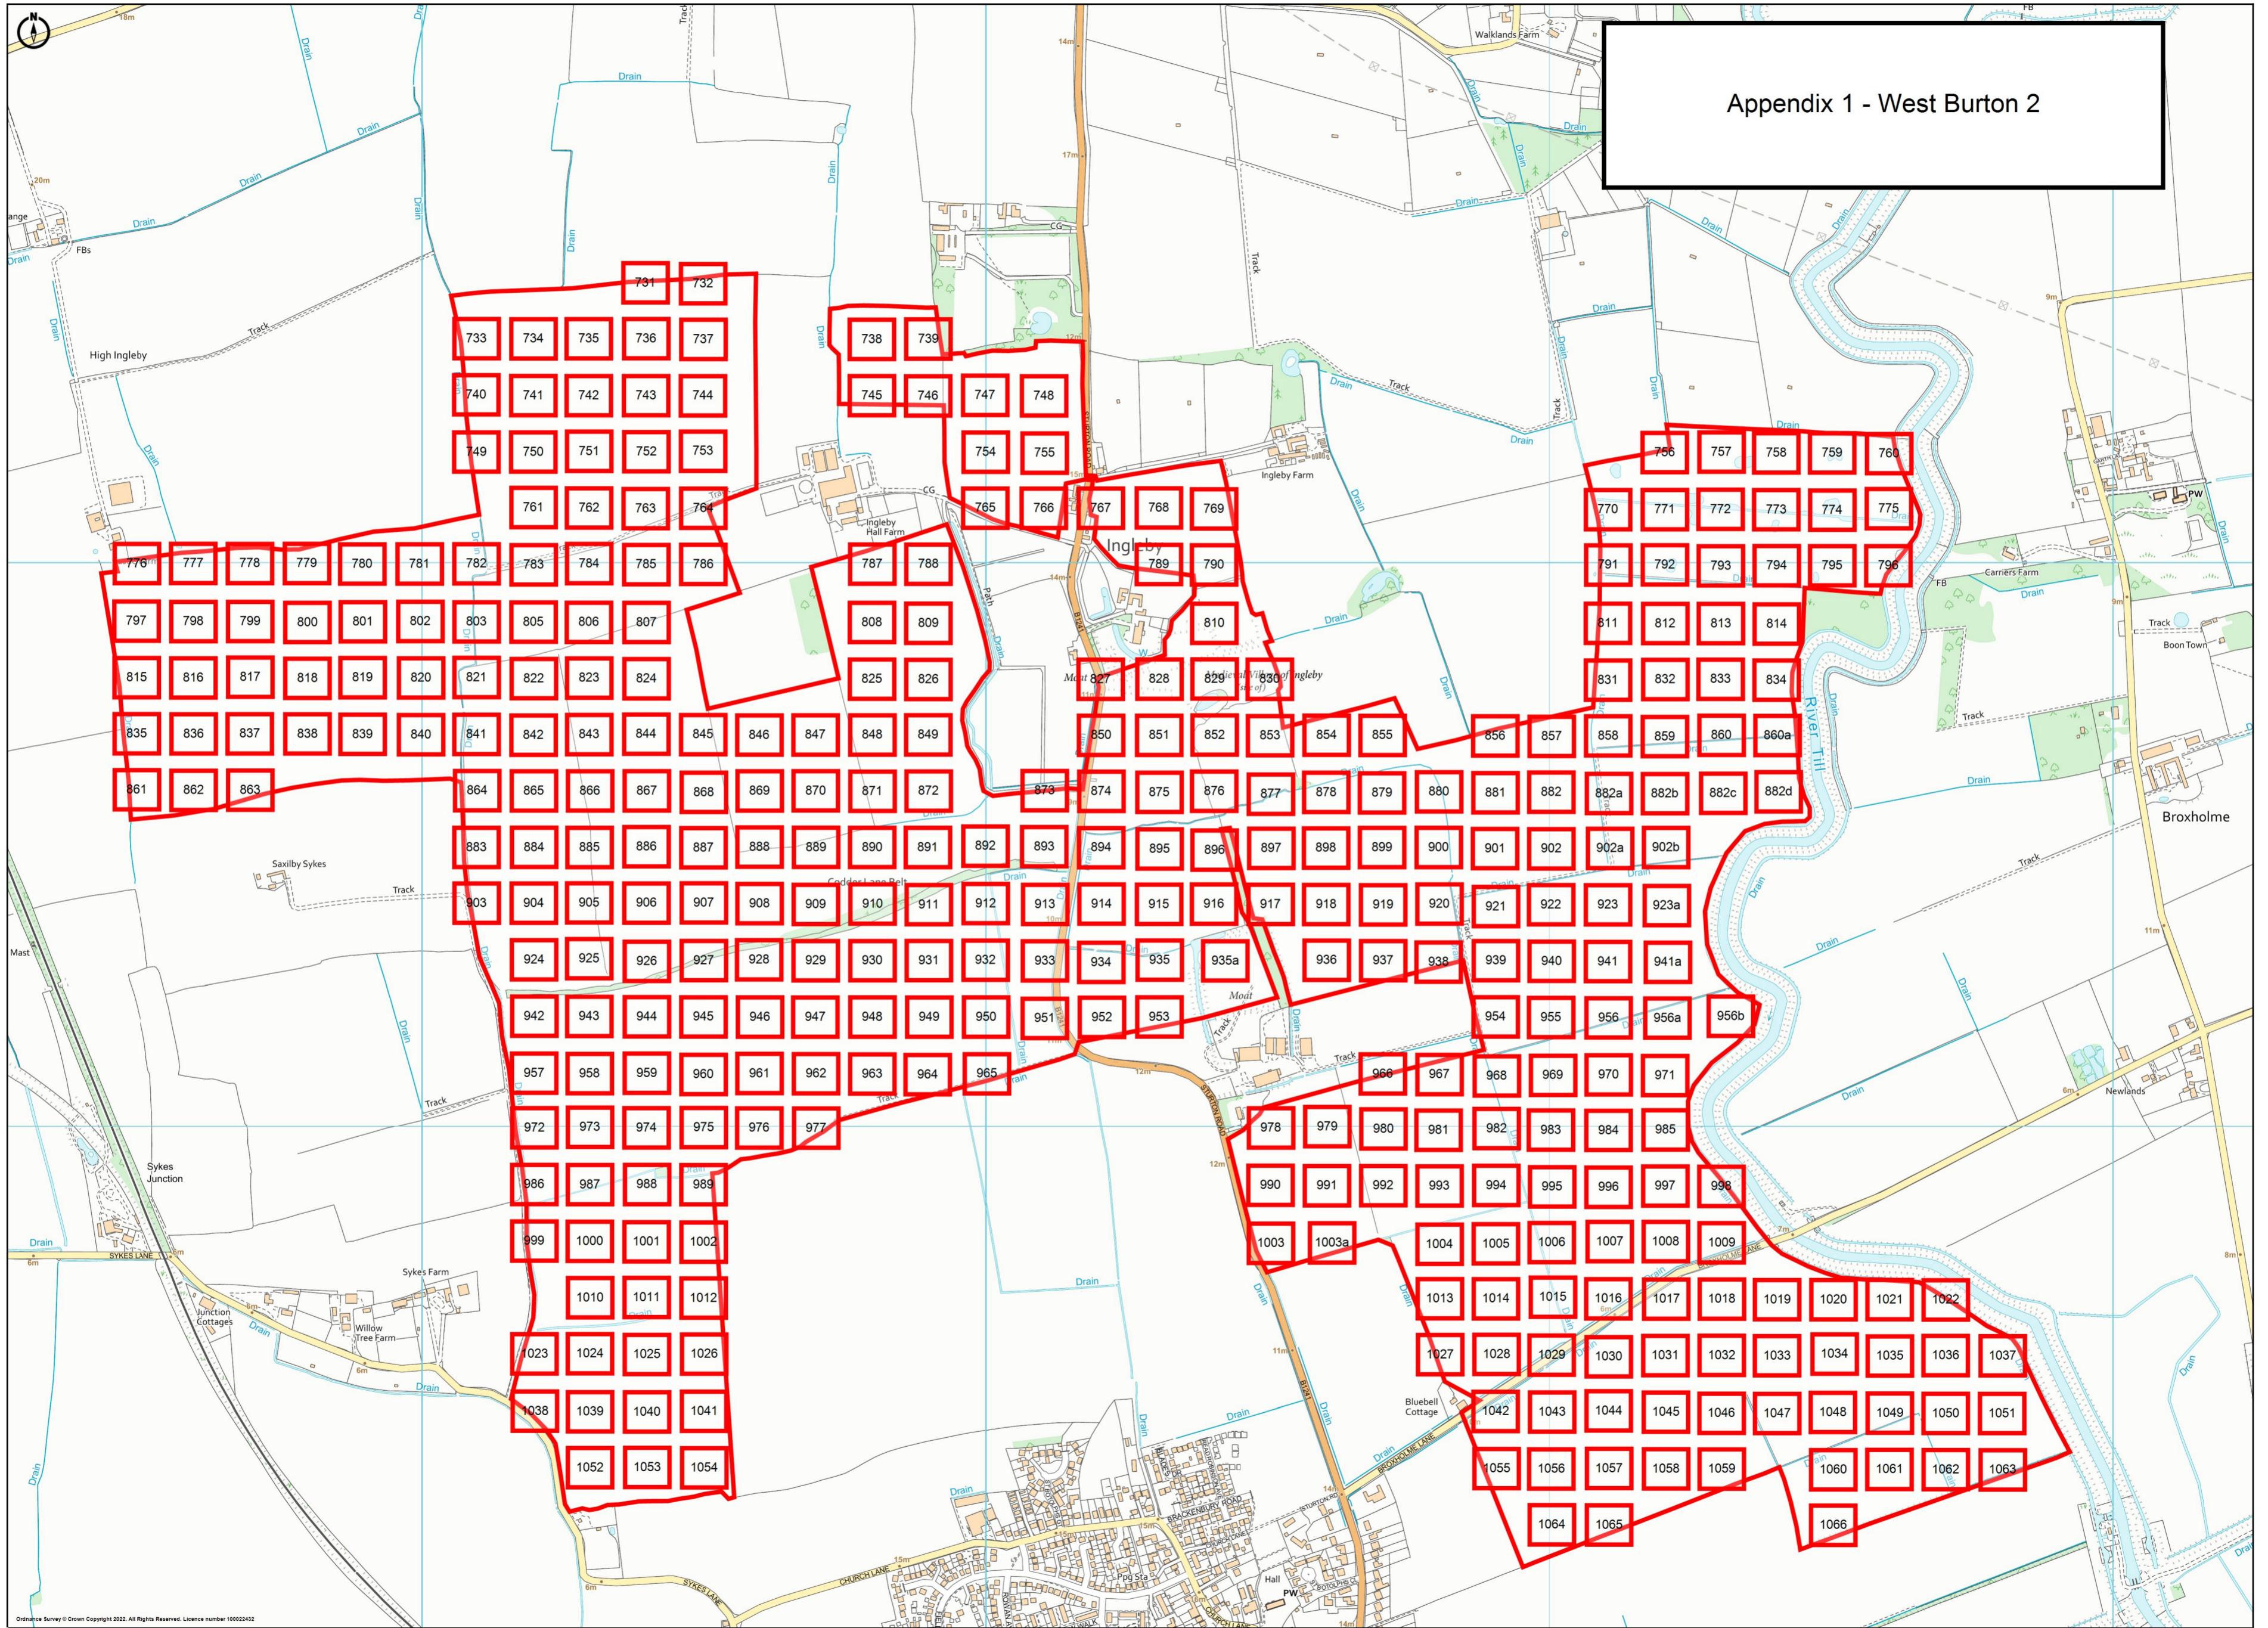

TOTAL

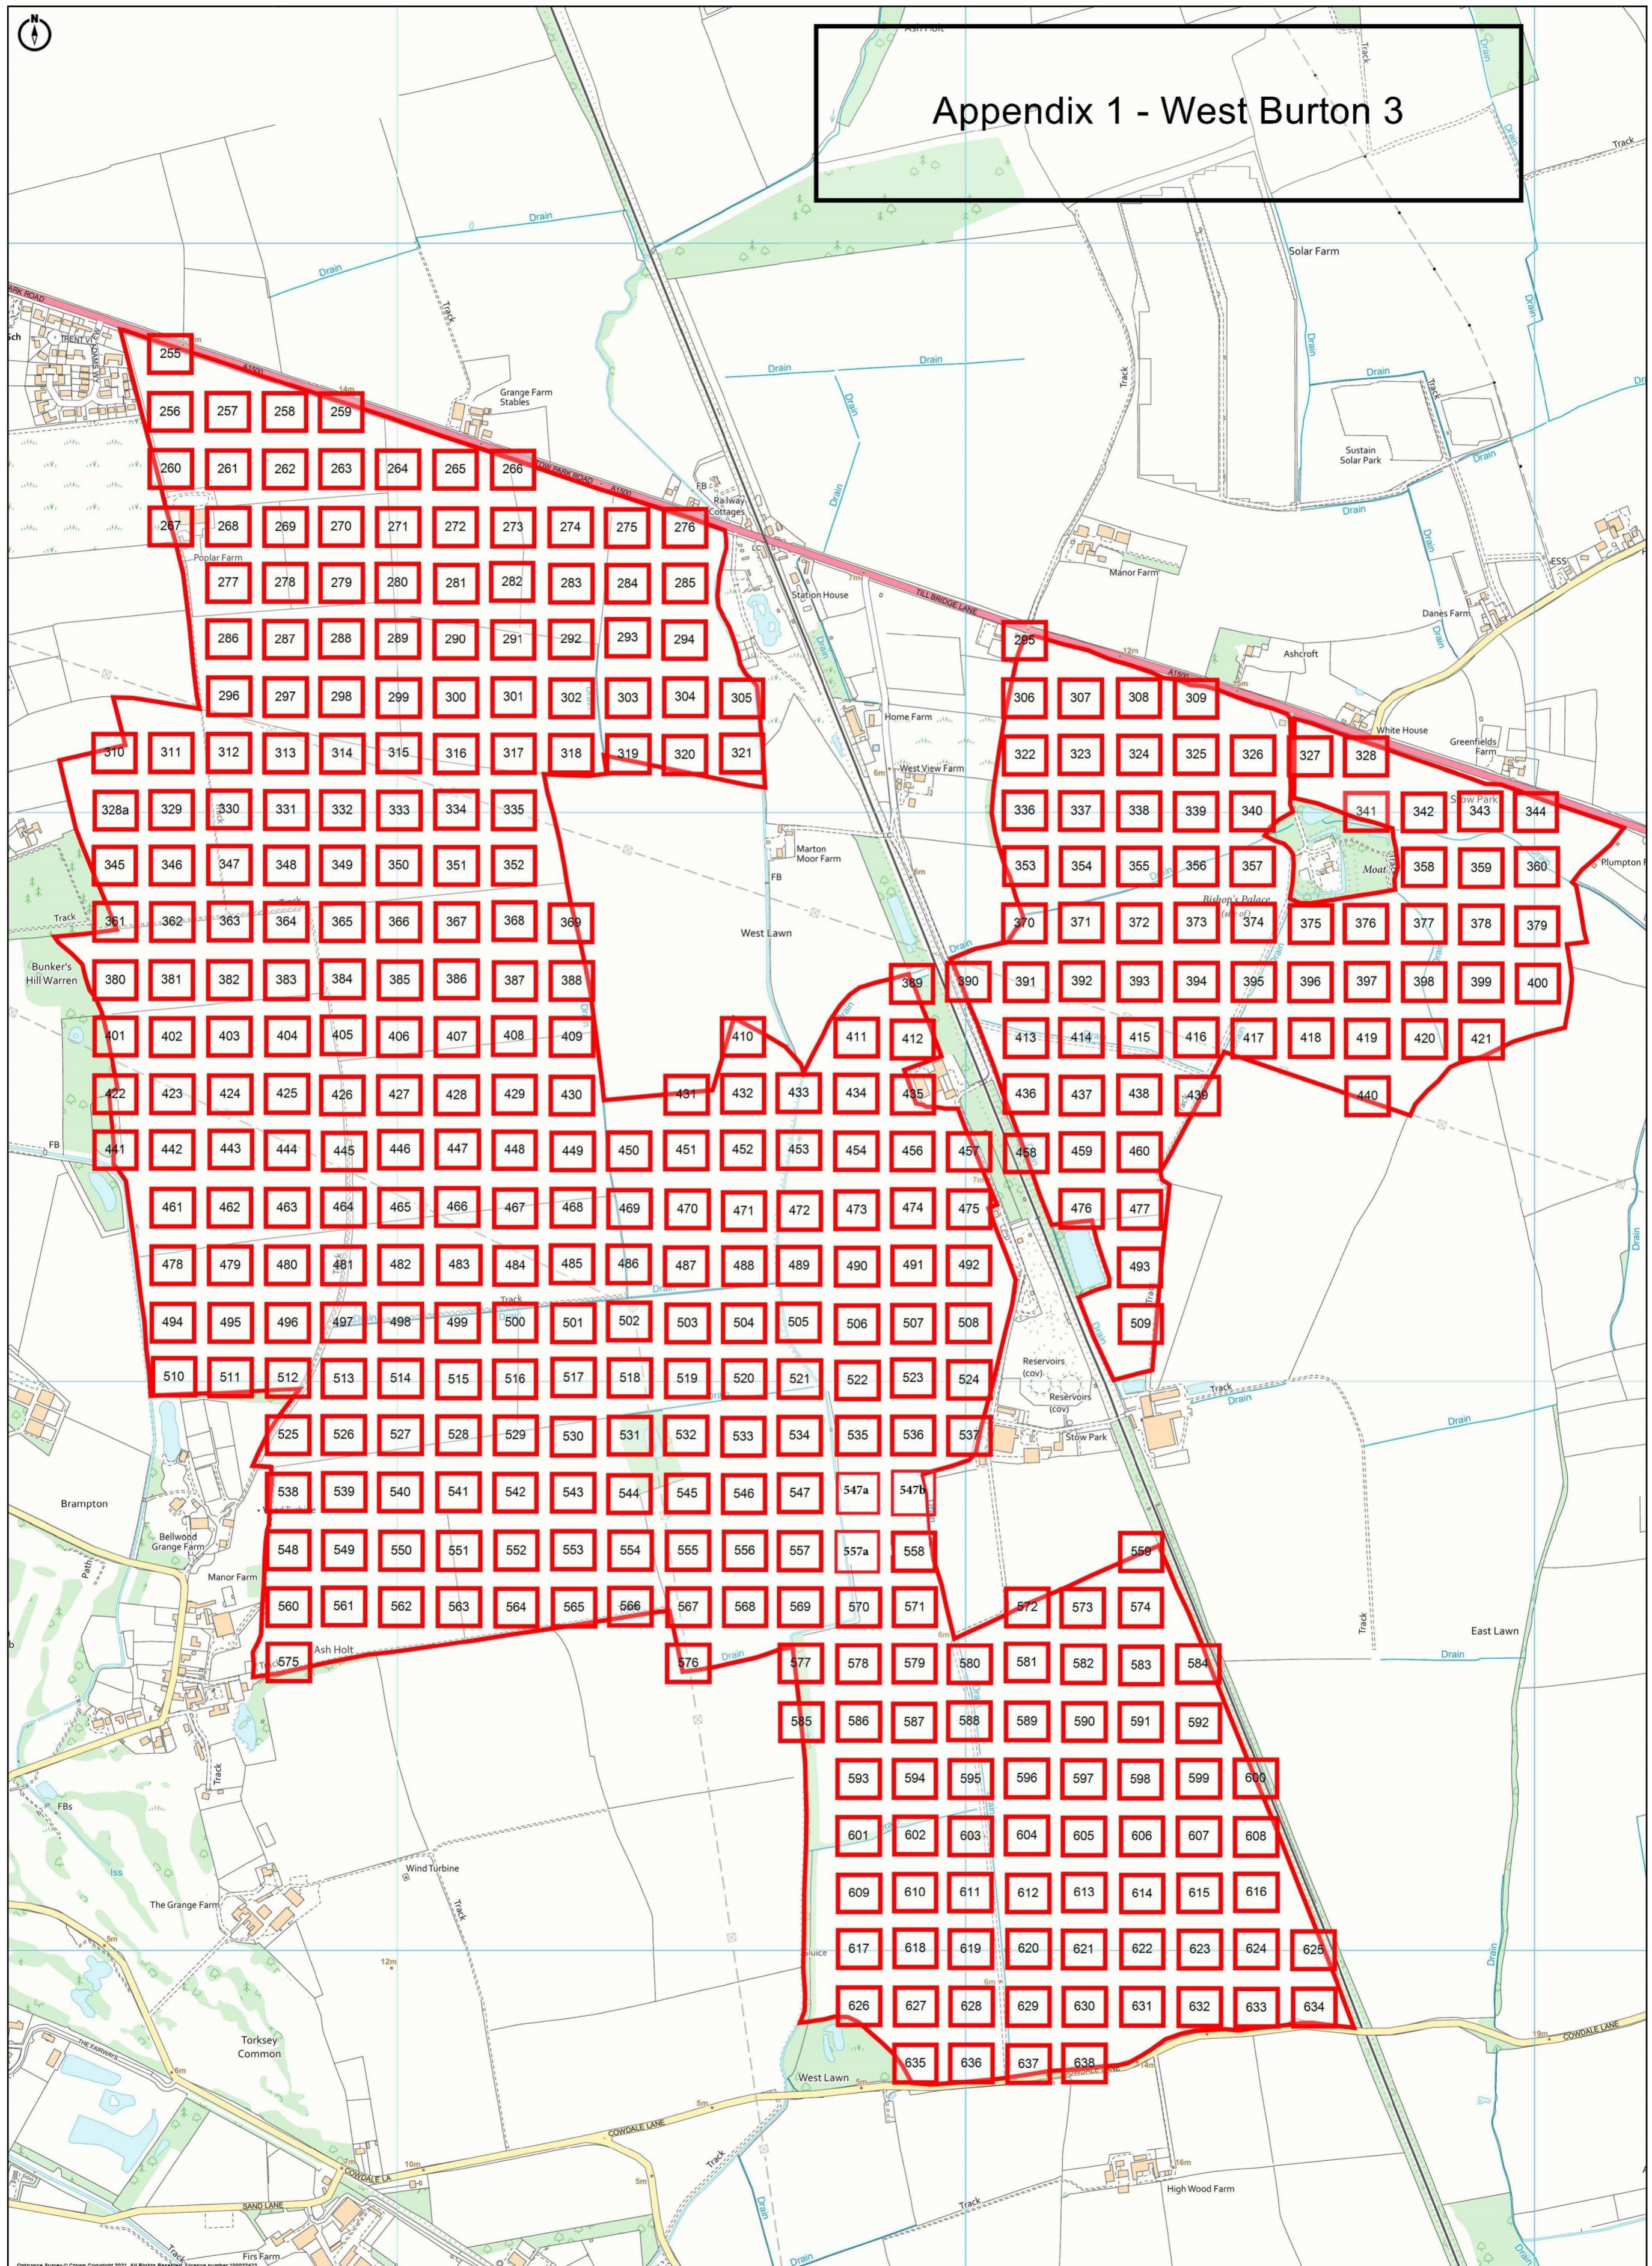

Grade 1:	28.7Ha	2.6%
Grade 2:	48.7Ha	4.5%
Grade 3a:	381.6Ha	35.4%
Grade 3b:	617.8Ha	57.3%
Non-Agricultural	2ha	0.2%
Total:	1078.8Ha	

10.6 A plan of the land grading can be found at **appendix 6**.

### **Appendix 3e - Augur sample results - West Burton Substation**

### **Appendix 3f – Selection of Trial Pit Descriptions**

#### **Sample point 15:**

Surface flat and partly slaked

Horizon 1: 0-30cm Brown (7.5YR 4/2) heavy clay loam with a weak fine angular blocky structure

Horizon 2: 30-90cm Reddish brown (5YR 4/4) clay with a course prismatic structure and common black and grey mottles.

At 90cm the ground became impenetrable to a soil auger and only small chips could be removed with a heavy spade. Colour continued to be reddish brown as above.

#### **Sample point 70:**

Surface flat and partly slaked in summer – unslaked at second visit in winter.

Horizon 1: 0-35cm Brown (7.5YR 4/2) medium clay loam with generally a weak fine subangular blocky structure but small areas where a medium platy structure appeared to be forming.

Horizon 2: 35-50cm Reddish brown (2.5YR 4/4) silty clay with a medium to coarse prismatic structure and few black mottles.

At 50cm the ground became impenetrable to a soil auger and only small chips could be removed with a heavy spade. Colour continued to be reddish brown as above.

Sample point 131:

Surface flat and partly slaked at both visits.

Horizon 1: 0-30cm Brown (7.5YR 4/2) sandy loam with a weak fine subangular blocky structure

Horizon 2: 30-40cm Brown (7.5YR 4/3) silty clay with a medium angular blocky structure

Horizon 3: 40cm – 120cm Reddish Brown (5YR 4/4) clay with any grey and black mottles and a coarse prismatic structure.

\*In the summer, at 40cm the ground became impenetrable to a soil augur and only small chips could be removed with a heavy spade. Colour continued to be reddish brown as above. On returning in January it was found that this layer was as described above.

Sample point 194:

Surface flat, partly slaked in summer unslaked in winter

Horizon 1: 0-30cm Brown (10YR 4/3) heavy clay loam with a weak course subangular blocky structure.

Horizon 2: 30-70cm Dark greyish brown (10YR 4/2) clay with a course angular blocky structure and many ochreous mottles.

Horizon 3: 70-120cm Grey (10YR 6/1) clay with a massive structure and many ochreous mottles.

Sample point 257:

Surface unslaked at both visits

Horizon 1: 0-40cm Dark greyish brown (10YR 4/2) sandy clay loam with a weak medium subangular blocky structure

Horizon 2: 40-60cm Brown (10YR 5/3) clay with a weak medium angular blocky structure and ochreous and black mottles.

Horizon 3: 60-120cm Grey (10YR 5/1) clay with a massive structure and ochreous and black mottles.

Sample point 286:

Surface state unrecorded.

Horizon 1: 0-30cm very dark greyish brown (10YR 3/2) sandy clay loam with a weak fine subangular blocky structure.

Horizon 2: 30-100cm Brown (10YR 5/3) sandy clay with a coarse angular blocky structure and many ochreous mottles

Horizon 3: 100-120cm Grey (10YR 5/1) Clay with a massive structure

Sample point 413:

Surface unslaked at both visits

Horizon 1: 0-30cm Very dark greyish brown (10YR 3/2) clay with a weak course subangular blocky structure.

Horizon 2: 30-60cm Light olive brown (2.5Y 5/3) clay with a weak course subangular blocky structure and any ochreous mottles

Horizon 3: 60-120cm Grey (10YR 5/1) clay with a massive structure and many ochreous mottles

Sample Point 643:

Surface unslaked at both visits

Horizon 1: 0-40cm Dark greyish brown (10YR 4/2) medium clay loam with a weak medium angular blocky structure

Horizon 2: 40-70cm Brown (10YR 5/3) sandy clay with a course platy structure and many ochreous mottles

Horizon 3: Grey (10YR 5/1) clay with a course prismatic structure and many ochreous and black mottles.

Sample Point 681:

Surface flat and unslaked.

Horizon 1: 0-35cm Dark greyish brown (10YR 4/2) clay with a weak course subangular blocky structure and few ochreous mottles

Horizon 2: 35-120cm Grey (10YR 5/1) clay with a course prismatic structure and many ochreous and black mottles

Sample point 768:

Surface flat and unslaked.

Horizon 1: 0-35cm Very dark greyish brown (10YR 3/2) sandy clay loam with a weak medium subangular blocky structure

Horizon 2: 35-120cm Brown (10YR 5/3) clay with a weak medium angular blocky structure and few ochreous and black mottles.

Sample point 800:

Surface flat and unslaked.

Horizon 1: 0-35cm Dark greyish brown (10YR 4/2) clay with a weak course angular blocky structure

Horizon 2: 35-120cm Grey (10YR 5/1) clay with a massive structure and many ochreous and black mottles.

Sample point 963:

Surface flat and unslaked.

Horizon 1: 0-35cm Dark grey (10YR 4/1) clay with a weak course subangular blocky structure

Horizon 2: 35-50cm Brown (10YR 5/3) clay with a course angular blocky structure and many ochreous and black mottles.

Horizon 3: 50-120cm Grey (10YR 5/1) clay with a course prismatic structure and many ochreous and black mottles

## ADAS (UK) Textural Class Abbreviations

The texture classes are denoted by the following abbreviations:

Class	Code
Sand	S
Loamy sand	LS
Sandy loam	SL
Sandy Silt loam	SZL
Silt loam	ZL
Sandy clay loam	SCL
Clay loam	CL
Silt clay loam	ZCL
Clay	C
Silty clay	ZC
Sandy clay	SC

For the *sand*, *loamy sand*, *sandy loam* and *sandy silt loam* classes the predominant size of sand fraction may be indicated by the use of prefixes, thus:

- vf Very Fine (more than 2/3's of sand less than 0.106 mm)
- f Fine (more than 2/3's of sand less than 0.212 mm)
- c Coarse (more than 1/3 of sand greater than 0.6 mm)
- m Medium (less than 2/3's fine sand and less than 1/3 coarse sand).

The subdivisions of *clay loam* and *silty clay loam* classes according to clay content are indicated as follows:

- M medium (less than 27% clay)
- H heavy (27-35% clay)

Organic soils i.e. those with an organic matter greater than 10% will be preceded with a letter O.

Peaty soils i.e. those with an organic matter greater than 20% will be preceded with a letter P.

## **APPENDIX 5 - DESCRIPTION OF ALC GRADES**

- Grade 1 - excellent quality agricultural land Land with no or very minor limitations to agricultural use. A very wide range of agricultural and horticultural crops can be grown and commonly includes top fruit, soft fruit, salad crops and winter harvested vegetables. Yields are high and less variable than on land of lower quality.
- Grade 2 - very good quality agricultural land Land with minor limitations which affect crop yield, cultivations or harvesting. A wide range of agricultural and horticultural crops can usually be grown but on some land in the grade there may be reduced flexibility due to difficulties with the production of the more demanding crops such as winter harvested vegetables and arable root crops. The level of yield is generally high but may be lower or more variable than Grade 1.
- Grade 3 - good to moderate quality agricultural land Land with moderate limitations which affect the choice of crops, timing and type of cultivation, harvesting or the level of yield. Where more demanding crops are grown yields are generally lower or more variable than on land in Grades 1 and 2.
- Subgrade 3a - good quality agricultural land Land capable of consistently producing moderate to high yields of a narrow range of arable crops, especially cereals, or moderate yields of a wide range of crops including cereals, grass, oilseed rape, potatoes, sugar beet and the less demanding horticultural crops.
- Subgrade 3b - moderate quality agricultural land Land capable of producing moderate yields of a narrow range of crops, principally cereals and grass or lower yields of a wider range of crops or high yields of grass which can be grazed or harvested over most of the year.
- Grade 4 - poor quality agricultural land Land with severe limitations which significantly restrict the range of crops and/or level of yields. It is mainly suited to grass with occasional arable crops (e.g. cereals and forage crops) the yields of which are variable. In moist climates, yields of grass may be moderate to high but there may be difficulties in utilisation. The grade also includes very droughty arable land.
- Grade 5 - very poor-quality agricultural land Land with very severe limitations which restrict use to permanent pasture or rough grazing, except for occasional pioneer forage crops.
