

Project must NOT go ahead primarily because it takes fertile agricultural land from food production. Food security is paramount and this land, safe from flooding, wars, drought, is a priceless asset.

Destruction of wildlife habitats, from sites themselves and collateral damage from cable routes, construction traffic etc.

Inefficient, barely working in Winter, limited lifespan posing disposal problems when obsolete.

Noise, light pollution vibration during construction and operation will disrupt wildlife and spoil dark skies and peace throughout the area.

Strongly oppose, already obsolescent, should be superseded by rooftop solar/shingle and mandatory on all new build.
