About Us

Delta-Simons is a trusted, multidisciplinary environmental consultancy, focused on delivering the best possible project outcomes for customers. Specialising in Environment, Health & Safety and Sustainability, Delta-Simons provide support and advice within the property development, asset management, corporate and industrial markets. Operating from across the UK we employ over 180 environmental professionals, bringing experience from across the private consultancy and public sector markets.

As part of Lucion Services, our combined team of 500 in the UK has a range of specialist skill sets in over 50 environmental consultancy specialisms including asbestos, hazardous materials, ecology, air and water services, geo-environmental and sustainability amongst others.

Delta-Simons is proud to be a founder member of the Inogen Environmental Alliance, enabling us to efficiently deliver customer projects worldwide by calling upon over 5000 resources in our global network of consultants, each committed to providing superior EH&S and sustainability consulting expertise to our customers. Through Inogen we can offer our Clients more consultants, with more expertise in more countries than traditional multinational consultancy.

Delta-Simons is a 'Beyond Net-Zero' company. We have set a Science-Based Target to reduce our Scope 1 and Scope 2 carbon emissions in line with the Paris Agreement and are committed to reducing Scope 3 emissions from our supply chain. Every year we offset our residual emissions by 150% through verified carbon removal projects linked to the UN Sustainable Development Goals. Our consultancy services to you are climate positive.

If you would like support in understanding your carbon footprint and playing your part in tackling the global climate crisis, please get in touch with your Delta-Simons contact above who will be happy to help.

1.0 Introduction

1.1 Appointment

Delta-Simons Limited ("Delta-Simons") was instructed by Cottam Solar Project Limited (the "Client") to prepare a Preliminary (Geo-Environmental) Risk Assessment for a cable route corridor located between Blyton, Gainsborough, DN21 3PF and Cottam Power Station, Retford, DN22 0TF (the "Site").

This Report was undertaken in accordance with Delta-Simons fee proposal dated 10th June 2022. The standard limitations associated with this Assessment are presented in Appendix A.

1.2 Context & Purpose

The aim of this Report is to support the submission of a planning application for the proposed development of Cottam Solar Project. The project comprises three land parcels proposed to house the solar arrays and batteries: Cottam 1, Cottam 2 and Cottam 3. This report has been prepared for the cable corridor which connects Cottam 3 1 near Blyton, Gainsborough to Cottam 1 near Willingham by Stow and finally towards the existing sub-station located at Cottam Power Station, Retford. The exact location of the cable route is unknown at this stage, however a search area as shown on Drawing 1 has been provided for assessment.

It is considered that the cable route will be subject to a number of external restrictions and as such, will not cross below private infrastructure such as dwellings or buildings. It is also understood that the cable is proposed to be above ground to cross significant surface water features such as the River Trent. It is anticipated that the soils excavated during installation of the cable will be stockpiled prior to re-instatement upon completion.

To that end this study assesses the likely environmental and geotechnical issues associated with soil and groundwater conditions that may affect the proposed development of the Site. This Report is designed in general accordance with guidance on Land Contamination: Risk Management pages of the GOV.UK web pages, the relevant requirements of the National Planning Policy Framework (NPPF) (as revised 2021) (paragraphs 174 & 183-184)¹ and the Planning Practice Guidance (Land Affected by Contamination)².

1.3 Scope of Works

- Review of the environmental setting of the Site, including the current use / status of the Site and surrounding area, and review of the geology, hydrogeology and hydrology;
- Review of the historical activities of the Site and surrounding area;
- Review of regulatory information relating to the Site;
- Review of the online planning records for the Site;
- Consult and review information from the Local Authority in relation to Part 2A of the 1990 Environmental Protection Act;
- Review online records of potential unexploded ordnance risks;
- Complete a Site reconnaissance by undertaking a visual inspection of readily accessible areas of the Site;
- Review of readily available third party reports relating to the Site or surrounding area;
- Develop an outline Conceptual Site Model, including site zoning, and undertake a Preliminary Risk Assessment with respect to potential contamination focussed on the proposed land use;

1

https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/1004408/NPPF_JULY_2021.pdf

2 <https://www.gov.uk/guidance/land-affected-by-contamination>

- Provide commentary on potential land contamination and geotechnical constraints in the context of the proposed development.

Data sources used in this assessment are listed in Appendix B.

1.4 Limitations

The standard limitations associated with this Assessment are presented in Appendix A. In addition, there are the following specific limitations that apply to this Assessment:

- A Site walkover has been undertaken as part of this assessment, however, given the scale, it is not feasible to inspect all of the Site, although key areas have been examined; and
- The Report includes an initial assessment of unexploded ordnance (UXO) risks for the Site using online data sources. A detailed UXO assessment falls outside of the scope of this Report, further specialist assessment may be required.

2.0 Site Context & Data Review

The following sections provide a summary of the key site features based on the data sources listed in Appendix B. All distances, measurements and dates are approximate and the accuracy limitations of the data sources should be noted.

2.1 Site Information

Site Overview			
 <p style="text-align: center;">Contains OS data © , Crown Copyright and Database Right (2021)</p>			
Co-ordinates	Extending from National Grid Reference 486950, 395170 to 481300, 378910.	Elevation	Approx. 4- 24m AOD
		Area	2,042 Ha
Site Address and Location	The Site extends from Blyton, Gainsborough, DN21 3PF in the north to Cottam Power Station, Retford, DN22 0TF in the south. The Site is also approximately centred around Willingham by Stow, Gainsborough. Google Maps Link		

<p>Site Description</p>	<p>Delta-Simons conducted a Site visit on 6th July 2022. Pertinent information that was observed or reported on-Site is summarised below and a series of Relevant Features Plans are included as Figures 2A - 2D.</p> <p>The Site comprises mainly agricultural land used for cropped farming with occasional use for livestock farming (Fig. 2A, PH06). The fields are generally separated by hedgerows with small, scattered woodlands interspersed across the Site (e.g. Heaton's Wood, Fig. 2B, PH03).</p> <p>Most fields present on-Site are also bounded by fields drains. Other surface water features include small becks and rivers such as the Aisby Beck and River Till. As well as multiple small ponds present across the Site. The most significant surface water feature present on-Site is the River Trent, an approximately 1.56 km section of the river bisects the western section of the Site.</p> <p>Several roads intersect the Site, predominately in the form of single track road and public bridleways (e.g. Wooden Lane, approximately 590 m west of the centre of Stow). However, main roads such as the A621, A1500 and A156 are also observed to bisect the Site. Three railway lines are present on Site: south of Blyton running from east to west; east of Marton running from north to south; and leading to the Cottam Power Station presumably used for coal deliveries to the power station.</p> <p>Telegraph poles are seen commonly across the Site either running parallel to road ways (e.g. Fig. 2B, PH05) or bisecting individual fields. This includes high voltage electrical pylons present bisecting the north west corner of the Site approximately 580 m south east of Blyton (Fig 2A, PH01 & PH02). These pylons lead to an electrical infrastructure site approximately 1 km south of Blyton. Pylons are also present bisecting the Site from the northwest in between Marton and Brampton.</p> <p>Stockpiles of manure were observed in several locations on-Site including on Wooden Lane and off Headsted Bank (approximately 1.20 km north of the Cottam Power Station).</p> <p>Fly tipping was identified in two locations, one of which was in a field off the B1205 that marks the northern boundary of the Site (Fig. 12A, PH04). Recent fly tipped material was located on the access road to the sewage works on the A156, approximately 550 m south of Marton (Fig 2D, PH04 & PH05).</p> <p>Located off Marton Road, 1.40km south west of Willingham by Stow, is a gas pipeline substation (Block Valve Station AGI), operated by Uniper.</p>
<p>Description of Adjacent and Surrounding Land Uses</p>	<p>The Site is located in a rural to semi-rural region with mainly agricultural land bounding the Site. Residential properties associated with farms, villages and hamlets such as Stow, Willingham by Stow and Marton also bound the Site. The wider Cottam Power Station (ceased power production) is located adjacent to the site in the western area. Discrete pockets of development comprising villages and farm buildings are present adjacent to the study area. In addition, Sturgate Airfield is located adjacent to the Site in the central area.</p>

2.2 Physical Setting

The physical setting of the subject property can influence the susceptibility to, and relative magnitude of, environmental impacts and liabilities associated with on- and off-Site sources of contamination. The following table provides physical setting information for the subject property and surrounding area.

<p>Published Geology</p>	<p>British Geological Survey (BGS) online viewer [REDACTED] and mapping [REDACTED] (1:50,000 Sheet Numbers 89 - Brigg, 101 - East Retford and 102 - Market Rasen) indicates the cable search route is underlain by superficial deposits including Till in the northern and central areas, Alluvium and the Holme Pierrepont</p>
---------------------------------	---

	<p>Sand and Gravel Member in the southern areas and occasional discrete pockets of Glaciofluvial deposits in the south.</p> <p>The underling bedrock is noted to comprise the Charmouth Mudstone Formation in the most eastern area, the Scunthorpe Mudstone Formation in the central and northern areas and the Penarth and Mercia Mudstone Group in the west.</p>
<p>Site-Specific Geology</p>	<p>There are a number of BGS recorded boreholes ([REDACTED]) located within the cable corridor search area.</p> <p>Four boreholes Ref. SK89SE115-117 and SK89NE102 are located in the Pilham and Aisby area (between Cottam 2 and 3) and record a generalised sequence of Boulder Clay (Till) comprising of brown silt with occasional quartzite gravel. These boulder clay beds are interbedded by a bed of Glacial Sand and Gravel comprising of clayey sand with fine angular to rounded gravel. These superficial deposits were found to a maximum depth of 9.00 m bgl and are underlaid by dark grey mudstone from the Lower Lias. Groundwater was identified at 3.00 m bgl.</p> <p>South of Marton there are five boreholes in a linear trend moving northwest (Ref. SK88SW22 - 26) present on-Site. Additionally, borehole Ref. SK87NW41 is located adjacent to the A156 near Marton. Superficial material is generally granular up until the boreholes are in the vicinity of the River Trent, with slightly gravelly clayey sand found to completion of some boreholes at 12.00 m bgl. Bedrock comprising red mudstone was observed in SK88SW22 and SK87NW41 from 2.50 m bgl and 4.50 m bgl respectively. Boreholes Ref. SK88SW27 and SK88SW28 are present on the eastern and western banks of the River Trent respectively, within 50 m of the cable route boundary. The ground conditions generally comprising of silty clay and clayey silt with some sand (Alluvium). Granular material was found from 4.42 m bgl in SK88SW27 and 9.14 m bgl in SK88SW28. Bedrock comprising of stiff grey marl is found from 11.58 m bgl in SK88SW28 and no bedrock was identified in SK88SW27. Groundwater was generally identified at <2.00 m bgl.</p> <p>Three boreholes Ref. SW88SW17, SK87NW43, SK87NW44 and SK88SW8 are located to the north of Cottam Power Station and record a generalised sequence of light brown clay to a maximum depth of 1.10 m bgl. Underlain by clayey sand/sandy gravel to depths between 2.10 m bgl and 8.00 m bgl. Mudstone bedrock is recorded beneath the superficial deposits.</p> <p>SK87NW139, SK87NW108-109 and SK87NW45 are located on or to the south of Cottam Power Station. The ground conditions are recorded to comprise ash Made Ground in one location underlain by very dense slightly gravelly sand suggested to be a possible fill found to a maximum depth of 6.60 m bgl. Boreholes to the south record a thin layer of clay Alluvium underlain by medium dense sand and gravels to approximately 10.00 m bgl, followed by mudstone bedrock initially recorded as firm to stiff clay/silt. Groundwater was recorded between 3.00 - 4.00 m bgl.</p>
<p>Aquifers and Groundwater Receptors</p>	<p>The Environment Agency (EA) data (magic.defra.gov.uk) indicates that the Alluvium, Holme Peirrepoint Sand and Gravel Member and Glacio-fluvial deposits classify as Secondary A Aquifers and the Till classifies as a Secondary (Undifferentiated) Aquifer.</p> <p>The underlying Scunthorpe Mudstone Formation and Mercia Mudstone bedrock classify as Secondary B Aquifers and the Charmouth Mudstone Formation and Penarth Group classify as a Secondary (Undifferentiated) Aquifers.</p> <p>The EA data also indicated that the Site is not located in or within 1 km of a designated groundwater Source Protection Zone.</p>

	According to the Envirocheck Report there are no licensed groundwater abstractions on-Site. Within the wider area abstractions relate to mineral washing (Rampton) and industrial processing (Cottam Power Station).
Groundwater Levels and Flow Direction	The available BGS borehole information indicated the presence of shallow groundwater (<2.00 m bgl) adjacent to the River Trent. Drainage ditches are present across the Site, as such, perched groundwater may be present. Groundwater is expected to flow locally towards drainage channels and regionally towards the River Trent or River Till.
Hydrology	A number of drainage ditches are present across the cable corridor Site. In addition, the River Till is located in the southern area in the central area between Willingham by Stow and Stow and the River Trent is located in the west of the Site adjacent to Cottam Power Station. According to the Envirocheck Report there are thirteen licenced surface water abstractions located on-Site in the western area associated with extraction from the River Trent/adjoining water course, listed for use in spray irrigation.
Site Topography	The Site topography varies from approximately 24 m AOD in the north of the Site to 4 m AOD to the west of the Site near the River Trent. There are no significant breaks in slope with the exception of the river banks.
Mining & Quarrying	Reference to the Coal Authority on-line viewer (██████████) indicates that the Site is not with a Coal Mining Reporting Area, and is not within a Development High Risk Area. Consequently, a Coal Mining Risk Assessment (CMRA) is unlikely to be required under the planning regime. The Envirocheck report records two BGS recorded Mineral Sites located on-Site: <ul style="list-style-type: none"> • Rampton Quarry located south of Cottam Power Station for the opencast extraction of Alluvium. This operation is ceased; and • Brampton Grange Sand Pit located near Marton for the opencast extraction of material from the Holme Pierrepont Sand and Gravel Member. This operation is ceased.
Ground Stability Hazards	The Envirocheck Report indicates that the hazard arising from collapsible, compressible, ground dissolution, landslide, running sand and shrinking or swelling clay stability is generally very low to low across the Site. A moderate to high hazard from compressible ground stability is recorded in the western area of the Site adjacent to the River Trent and in the central area of the Site adjacent to the River Till. In addition, a moderate landslide hazard is noted in the western area of the Site near the River Trent.
Radon Gas	Public Health England (██████████) data indicates that the Site lies within an area where <1% of homes are at or above the radon action level.

2.3 Sensitive Land Use

Ecological Receptors	From the information provided within the Envirocheck Report there are no statutory ecological receptors on or within 500 m of the Site.
Heritage Interest	Historic England Records (██████████) indicate that no areas of designated heritage interest on-Site.

2.4 Historical Use of the Site & Surrounding Area

2.4.1 Approach

The historical development of the Site and surrounding area has been assessed through a review of historical maps, aerial photographs, internet sources and Google Earth historical satellite imagery. A

summary of the key historical Site uses and developments in the surrounding area is presented below. Copies of selected historical maps are included as Appendix D.

2.4.2 Key Historical use and Summary

The following key historical land uses have been identified on-Site:

- Manchester, Sheffield and Lincolnshire Railway located on-Site in the west from 1885. The line is noted to divert to Cottam Power Station by the 1974 map edition and no longer mapped towards the River Trent to the east;
- The Great Northern and Great Eastern Joint Railway located on and adjacent to the Site in the west from the earliest map edition dated 1885 until present;
- A railway line on-Site near Blyton from the earliest map edition dated 1885 until present;
- A sand pit located in the western area, south of Marton from at least 1885 until 1920; and
- Cottam Power Station is noted on and adjacent to the Site by the 1974 map edition including cooling towers and sub-station by 1980;
- The 1973 map edition records a small area of runway associated with Sturgate Airfield to encroach onto Site. However, the airfield was constructed in 1943 during the Second World War ([Sturgate Airfield History](#)) and following closure 1964 the majority of the eastern area (including the on-Site runway) was reverted back to agricultural use. Given the time elapsed since land reclamation the potential for significant contamination associated with the airfield is considered low; and
- A sand pit located to the south of Cottam Power Station in the 2000 map edition only.

Based on a review of the compilation of historical sources dating back to 1885, it appears that the cable route search area has largely been in use as agricultural land to the present day. Discrete areas of development such as agricultural farms, private dwellings and three railway lines are also present on-Site.

Cottam Power Station represents the most significant development on or in the surrounding area of the Site. From readily available online information [REDACTED] commencement of coal-fired power generation began in 1968 and the power station ceased operations in September 2019 and is now within a decommissioning phase. Demolition of the power station began in early 2021.

2.4.3 Unexploded Ordnance (UXO)

The Zetica Regional Unexploded Bomb Risk Map for the area of the Site [REDACTED] indicates that there is a low risk of UXO in the area of the Site.

2.5 Environmental Database Review

The Landmark Envirocheck® Report provides a database of environmental information held by various statutory bodies including the EA, Local Authority (LA), Health & Safety Executive (HSE) and Public Health England amongst others. A copy of the Envirocheck Report is provided in Appendix E and the most relevant information is summarised below.

<p>Features On-Site</p>	<p>The Landmark Envirocheck® Report lists the following as relating to the Site:</p> <ul style="list-style-type: none"> • Four Pollution Incidences to Controlled Water, all of which were categorised as minor and as such are not considered further; • A historical landfill site (Rampton Gravel Pit) located to the south east of Cottam Power Station. The first input date is listed as December 1993, no further information is provided; • Four Licensed Waste Management Facilities (Landfill Boundaries) listed as Cottam Ash Disposal, Rampton R2 (located adjacent to the power station), and Cottam Power Station;
--------------------------------	---

	<ul style="list-style-type: none"> • A single Licensed Waste Management Facilities (Locations) entry for the use of lagoons at Cottam Power Station; and • Four Contemporary Trade Entries for Fertilisers, car breakers and agricultural engineers. <p>It is anticipated that the cable route will be designed to avoid key features such as identified landfill sites. In addition, two underground electrical cables are noted on-Site in the area of Cottam Power Station.</p>
<p>Potentially Contaminative Features Off-Site</p>	<p>The Landmark Envirocheck® Report lists the following pertinent entries within 250 m of the Site:</p> <ul style="list-style-type: none"> • Numerous records relating to Integrated Pollution Controls, Integrated Pollution Prevention and Control entries are listed for Cottam Power Station and activities relating to power generation; • Cottam Power Station is also recorded as a as a Control of Major Accident Hazards Site (COMAH) and operates under Planning Hazardous Substance Consent; • A Registered Landfill Site associated with the West Bank of the River Trent which is noted to have accepted river dredging waste and is also recorded as dormant; • Two Registered Waste Treatment or Disposal sites for very small (less than 10,000 tonnes per year) scrapyards with transfer stations. Operated by W J Furber Ltd located approximately 1.60 km south east of Springthorpe and G L Barker located approximately 800 m south of Blyton. G L Barker also has a surrendered Licensed Waste Management Facilities (Locations) entry listed for Metal recycling Sites the license was surrendered in November 2003; • A single Licensed Waste Management Facilities (Locations) operated by P.H. Europe Ltd for Household, Commercial and Industrial Transfer Stations which has been subsequently expired. P.H. Europe Ltd also has a Registered waster Transfer Sites listing for the same property with a small maximum input rate (equal or greater than 10,00 and less than 25,000 tonnes per year). The authorised waster is Meat and Bonemeal; and • Several Contemporary Trade Entries listed for Cottam Power Station site for cement manufacturers, electricity companies, lubrication services and engineering materials.

2.6 Planning Review/Regulatory Enquiries

<p>On-line Planning Review</p>	<p>West Lindsey District Council Bassetlaw District Council (Council Planning Portal and Council Planning Portal)</p>	<p>Date Accessed</p>	<p>28th July 2022</p>
<p>On-Site Applications</p>	<p>Within the section of the Cottam Power Station which is included within the cable route search area there are two applications listed both of which were granted (20/0123/CTP & 18/00249/FUL) for the construction of replacement cooling water make up and purge water supplies for the Cottam Development Centre and the construction of a 50 MW battery storage facility.</p> <p>There are multiple applications for the areas of the Cottam power Station that are not included on-Site which relates to construction of new amenity blocks, construction of lighting poles and modifying existing infrastructure and facilities.</p>		

	<p>There are applications (including 12/06/00002) related to the disposal of pulverised fuel ash (PFA) east of the Cottam Power Station and subsequent restoration of the land.</p> <p>East of Marton, an application has been accepted for the construction of residential dwellings, an attenuation feature and associated infrastructure which is included in the cable route search area (West Lindsey District Council Application Number: 144922).</p>
<p>Part 2A of the Environmental Protection Act (EPA) 1990</p>	<p>West Lindsey District Council include their Contaminated Land register on their website. This confirms that no sites in the district are currently registered as 'Contaminated Land' and there have been no remediation notices served by the authority.</p> <p>Bassetlaw District Council Contaminated land register indicates that there are currently two sites classed as contaminated land which were remediated in 2011 and 2013. However, the closest of these sites is located approximately 11 km south west of the Site, therefore, not considered significant.</p>

2.7 Previous Reports

No third party reports have been made available to review from the Client or sourced through a review of planning application records.

3.0 Conceptual Site Model

3.1 Introduction

A Conceptual Site Model (CSM) represents the relationships between contaminant sources, pathways and receptors, to support the identification and assessment of contaminant linkages.

3.2 Overall Site Sensitivity

The Site is considered to be of low to moderate environmental sensitivity given the presence of underlying Secondary A, B and Secondary undifferentiated aquifers and major surface water courses (River Trent and River Till, however, there is also an absence of source protection zones or licensed public potable water supply abstractions.

3.3 Potential Contamination Sources

A source is a contaminant or pollutant that is in, on or under the land that has the potential to cause harm or pollution.

The following identified potential contamination sources are considered in the CSM:

- Cottam Power Station mainly in relation to the development of the existing sub-station prior to 1980.. Boreholes data has also shown that potentially 6.60 m of Made ground is present;
- Small scale fuel spills/leaks associated with agricultural land use;
- Contaminants associated with the construction and use of railways line present on-Site;
- No significant sources of volatile organic vapours have been identified; and
- Fly-tipped materials entrained with the surface soils observed in multiple places on Site.

3.4 Potential Pathways

A pathway is a route by which a receptor is or could be affected by contaminant.

The potential pathways are considered to be as follows:

- Direct contact, ingestion or inhalation of soil bound contaminants / dust during or following redevelopment.
- Leaching of contamination into groundwater followed by migration of groundwater to the wider groundwater environment or discharge to surface waters.
- Direct contact between aggressive ground conditions and new infrastructure.

3.5 Potential Receptors

A receptor is something that could be adversely affected by a contaminant, for example a person, controlled waters, an organism, an ecosystem, or Part 2A receptors such as buildings crops or animals.

Relevant potential receptors are considered to include:

- Construction workers;
- Third parties during construction (adjacent Site users and adjacent residents);
- Surface waters including the River Trent, River Till and drainage ditches;
- The underlying aquifers; and
- The Built Environment (new buildings and infrastructure / utilities).

Contaminant Linkage Assessment					
Source(s)	Pathway(s)	Receptor(s)	Risk	Comments	Requires Investigation
Potentially contaminated soils and/or groundwater located beneath the Site.	Direct contact/ ingestion and inhalation of dust and vapours.	Site users.	Low Risk	Limited potential sources of contamination have been identified along the cable route search area associated with the Sites historic and current agricultural use and minor development limited to mainly residential and agricultural construction. The exception to this is the Cottam Power Station. It is understood that the cable will connect to the existing sub-station. Although considered low risk, Site workers may become exposed to localised contaminated soils and shallow groundwater during intrusive groundworks. Safe working practices should be undertaken, and appropriate Personal Protective Equipment (PPE) should be used that will reduce the risk to low. A Discovery Strategy should also be introduced in the event localised contamination is found during groundworks on-Site. Additional protective measures may be required in the area of the Cottam Power Station. It would be prudent to assess the ground conditions at the power station at the time of any geotechnical investigation.	No
	Leaching of contaminants and vertical migration. Lateral migration through any groundwater beneath the Site.	Groundwater beneath the Site. Off-Site receptors (neighbouring properties/ users).	Low Risk	The potential for significant contamination along the majority of the proposed cable route as a result of former land uses is low, therefore is unlikely to be an impact in terms of mobilising contaminants during construction. Localised contamination may be present associated with Cottam Power Station. Any disruption to the ground/hydrogeology during the cable installation would be temporary and localised. In addition, the Site is not located within a groundwater source protection zone and there are no potable groundwater abstractions within 500 m of the corridor.	No

Contaminant Linkage Assessment					
Source(s)	Pathway(s)	Receptor(s)	Risk	Comments	Requires Investigation
	Direct Contact	Buried Infrastructure	Low Risk	Sulphates within the ground have the potential to degrade buried infrastructure. Based on the anticipated natural soils at the Site, the risk is considered low, however it would be prudent to assess the sulphate class of the soils at the time of any geotechnical investigation for concrete structures.	No

4.0 Conclusions & Recommendations

4.1 Land Contamination Risks and Liabilities

Uncertainty and Data Gaps	This assessment is based on desk study information only. No Site specific ground investigation data has made available for review.
Soils	<p>Significant on-Site sources have not been identified with the exception of land associated with Cottam Power Station. However, given the development does not comprise a change in land use the risk is considered low.</p> <p>Site workers may become exposed to localised contaminated soils and shallow groundwater during intrusive groundworks, in particular within the Cottam Power Station area. Safe working practices should be undertaken, and appropriate Personal Protective Equipment (PPE) should be used that will reduce the risk to low. A Discovery Strategy should also be introduced in the event localised contamination is found during ground works on Site. Additional protective measures may be required in the area of Cottam Power Station. It would be prudent to assess the ground conditions at the power station at the time of any geotechnical investigation.</p>
Groundwater	The potential for significant contamination along the majority of the proposed cable route as a result of former land uses is low, therefore, is unlikely to be an impact in terms of mobilising contaminants during construction. Localised contamination may be present associated with Cottam Power Station. It is considered that any disruption to the ground/hydrogeology during the cable installation would be temporary and localised, as such the risk to controlled waters is considered low.
Potential Contaminated Land Development Risks	Widespread contamination is considered unlikely and the preliminary risk assessment has identified a low risk of soil/groundwater contamination along to cable route search area.

4.2 Geotechnical Considerations

Uncertainty and Data Gaps	This assessment is based on desk study information only. No Site specific ground investigation data has made available for review.
Preliminary Ground Model	<p>Based on the available information, it is anticipated that the ground conditions will vary along the route of the cable corridor. However, the majority of the route will likely comprise a sequence of topsoil underlain by superficial clays/ sands and gravels and mudstone bedrock initially comprising weathered clays. Increased thicknesses of soft and compressible Alluvium is likely to be encountered adjacent to surface water features including the River Till and Trent.</p> <p>The available BGS borehole information indicated the presence of shallow water (<2.00 m bgl) adjacent to the River Trent. Drainage ditches are present across the Site and wider area, as such, perched groundwater may be present.</p>
Plausible Geo-Hazards	<p>The geohazards listed below have been identified to follow guidance presented in the HE document CD622 'Managing Geotechnical Risk' (2019) which aims to identify and manage the geotechnical risks associated with a scheme throughout its lifespan, from planning to construction to maintenance.</p> <p>The following geohazards are considered to be substantial ground related risks associated with the proposed development. A substantial risk is defined by Delta-Simons in Appendix C.</p>

	<ul style="list-style-type: none"> • High groundwater table/perched groundwater: - May lead to unstable excavations which will required suitable shoring and dewatering; • Variable strata: - Further requirement for suitable shoring of excavations; • Hard Strata: - Hard dig conditions may be required where shallow bedrock is present and will required suitable excavation techniques; and • Aggressive Ground Chemistry: - Sulphate testing may be required to determine a suitable concrete grade for any buried infrastructure. • Potential deep Made Ground;- Potentially present at Cottam Power Station.
--	---

4.3 Recommendations and Other Development Considerations

Recommendations	<p>The following recommendations and development abnormals area considered appropriate;</p> <ul style="list-style-type: none"> • Confirmation on the routes of below ground services crossing the route, including electrical cables known to be present in the Site area; • A geotechnical Site investigation to assess in-situ ground conditions and determine soil strength within the area of proposed above ground infrastructure e.g. above ground cable supports; • A Discovery Strategy should be put in place for groundworks to act upon should potential contamination be identified; and • Subject to the proposed development scheme a Materials Management Plan (MMP) may be required in accordance with regulatory protocols during redevelopment.

Appendix A - Limitations

Limitations

This Report was prepared by Delta-Simons Ltd (Delta-Simons) for the sole and exclusive use of the Client and for the specific purpose for which Delta-Simons was instructed. Nothing contained in this Report shall be construed to give any rights or benefits to anyone other than the Client and Delta-Simons, and all duties and responsibilities undertaken are for the sole and exclusive benefit of the Client and not for the benefit of any other party. Delta-Simons does not intend, without its written consent through a formal letter of reliance or warranty, for this Report to be disseminated to any party other than the named Client or to be used or relied upon by any party other than the named Client. Use of the Report by any other party is unauthorised and such use is at the sole risk of the user. Any party using or relying upon this Report, other than the Client, agrees by virtue of its use to indemnify and hold harmless Delta-Simons from and against all claims, losses and damages (of whatsoever nature and howsoever or whensoever arising), arising out of or resulting from the performance of the work by Delta-Simons. Unless explicitly agreed otherwise, in writing, this Report has been prepared under Delta-Simons' Standard Terms and Conditions as included within our proposal to the Client.

The recommendations contained within this Report represent Delta-Simons professional opinions, based upon the information detailed within the Report, exercising the reasonable skill and care to be expected of a professional consultant holding itself out as having the competence, experience and resources necessary for the purpose of carrying out similar work in scope and character to the services performed. The Report needs to be considered in the light of the proposal and associated limitations of scope. The Report needs to be read and considered in full and isolated sections cannot be used without full reference to other elements of the report and any previous works referenced within the Report.

Where Delta-Simons has obtained, reviewed and evaluated information in preparing this Report from the Client and others and Delta-Simons conclusions, opinions and recommendations has been reasonably determined using this information, Delta-Simons does not warrant the accuracy of the third-party information provided to it and cannot be responsible for any opinions which Delta-Simons has expressed, or conclusions which it has reached in reliance upon information which is subsequently proven to be inaccurate.

Site surveys document the conditions encountered at the time of survey only and conditions may change due to natural processes or human intervention. As such, surveys represent an assessment at a specific point in time and Delta-Simons cannot be responsible for adverse conditions which arise or become apparent after the time of the survey or for conditions which sit outside the scope for which the survey or Report was commissioned.

Where intrusive investigations have been completed, information, comments and opinions given in this report are based on the ground conditions encountered during the site work period and on the results of laboratory and field tests performed during the investigation. Ground conditions are inherently variable such that no investigation can be exhaustive to the extent that all adverse conditions are revealed. Conditions may therefore be present beneath the site that were not apparent in the data reviewed or obtained as part of this assessment. It should be noted that groundwater levels vary due to seasonal and other effects and may at times differ to those measured during the investigation. Delta-Simons does not warrant or guarantee that the Site is free of hazardous or potentially hazardous materials or conditions. Where risk assessment is undertaken, this is based upon the standards, guidance and common practice at the time of the assessment and Delta-Simons cannot be responsible for conditions which become apparent following changes in guidance or practice or advancements in scientific knowledge which change the position in relation to assessment of risk.

No aspect of this Report constitutes a design. Where this information is used in design, the designer should verify the information has been used appropriately.

Where budgets are prepared and presented within the Report, these are for information only to indicate the likely magnitude of a cost and do not represent an invitation to treat for the works. All budgets and programmes presented should be reviewed and verified by appropriately qualified and experienced independent Project Managers and Cost Consultants.

Appendix B - Data Sources

In completing this Assessment, Delta-Simons has utilised the following data sources and third party information:

- Current and Historical Ordnance Survey (OS) maps;
- British Geological Survey (BGS) data;
- Environment Agency (EA) online data;
- Coal Authority (CA) online data;
- A Landmark Envirocheck® Report for the Site (Ref. 297990210_1_1, 297990273_1_1 & 298004566_1_1), dated July 2022;
- Historical Maps included as part of the Envirocheck Report; and
- Information provided by West Lindsey District Council and Bassetlaw District Council.

Appendix C - Risk Definitions

Contaminated Land Risk Definitions

The following methodology is based on the methodology presented in CIRIA C552 Contaminated Land Risk Assessment: A Guide to Good Practice 2001. It requires the classification of the:

Magnitude of the potential consequence (severity) of the Risk occurring: and

Magnitude of the Probability (likelihood) of the Risk occurring.

The classifications are then compared to indicate the risk presented by each pollutant linkage.

Consequence to Receptor Definition Matrix

	Human Health	Controlled Waters	Buildings/Services
Severe Consequence	Acute or chronic permanent impact on human health.	Sensitive controlled water pollution ongoing, or just about	Catastrophic collapse
Medium Consequence	Chronic permanent impact on human health	Gradual pollution of sensitive controlled water	Degradation of materials
Mild Consequence	Chronic temporary impact on human health	Gradual pollution of non-sensitive controlled water	Damage to building rendering it unsafe to occupy (e.g. foundation damage resulting in instability).
Minor Consequence	Non-permanent health effects to human health (easily prevented by means such as personal protective clothing etc).	Slight discoloration of water	Easily repairable effects of damage to buildings, structures and services, i.e. discoloration of concrete

Probability Definitions

Probability	Definition in Context
Higher	There is a pollution linkage and an event that either appears very likely in the short term and almost inevitable over the long term, or there is evidence at the receptor of harm or pollution. Positive evidence of source, pathway and receptor.
Likely	There is a pollution linkage and all the elements are present and in the right place, which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short term and likely over the long term. Suspect source, pathway, and receptor
Low Likelihood	There is a pollution linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a longer period such event would take place, and is less likely in the shorter term.
Unlikely	There is a pollution linkage but circumstances are such that it is improbable that an event would occur even in the very long term. No evidence of hazard, pathway, and receptor

Standard Risk Matrix

		Consequence/Magnitude of impact			
		Severe	Medium	Mild	Minor
Probability	High	Very High	High	Moderate	Moderate/Low
	Likely	High	Moderate	Moderate/low	Low
	Low Likelihood	Moderate	Moderate/low	Low	Very Low
	Unlikely	Moderate/low	Low	Very Low	Very Low

Classified Risks and Likely Action

Significance Level	Definition/Comments
Very High Risk	<p>There is a high probability that severe harm could arise to a designated receptor from an identified hazard, OR, there is evidence that severe harm to a designated receptor is currently happening.</p> <p>This risk, if realised, is likely to result in a substantial liability. Urgent investigation (if not undertaken already) and remediation are likely to be required.</p> <p>Demonstrable contaminated land situation, highest threat & liability level, urgent action recommended.</p>
High Risk	<p>Harm is likely to arise to a designated receptor from an identified hazard.</p> <p>Realisation of the risk is likely to present a substantial liability. Urgent investigation (if not undertaken already) is required and remedial works may be necessary in the short term and are likely over the longer term.</p> <p>Likely contaminated land situation, risk assessment and action recommended.</p>
Moderate	<p>It is possible that harm could arise to a designated receptor from an identified hazard. However, if it is either relatively unlikely that any such harm would be severe, or if any harm were to occur it is more likely that the harm would be relatively mild.</p> <p>Investigation (if not already undertaken) is normally required to clarify the risk and to determine the potential liability. Some remedial works may be required in the longer term.</p> <p>Plausible contaminated land situation, risk assessment and possible action recommended.</p>
Low Risk	<p>It is possible that harm could arise to a designated receptor from an identified hazard, but it is likely that this harm, if realised, would at worst normally be mild.</p> <p>Unlikely contaminated land situation, possible risk assessment and possible action.</p>
Very Low Risk	<p>There is a low possibility that harm could arise to a receptor. In the event of such harm being realised it is not likely to be severe.</p> <p>Negligible risk, no action recommended except vigilance for changes in conditions.</p>

Geotechnical Risk Classification

The geohazards listed in the report within Section 4 follow guidance presented in Clayton, C.R.I. (2001) *Managing Geotechnical Risk*, Thomas Telford and the Highways Agency document CD622 '*Managing Geotechnical Risk*' (2008) which aims to identify and manage the geotechnical risks associated with a scheme throughout its lifespan, from planning to construction to maintenance.

For each geohazard the probability of the hazard occurring (P) has been considered together with the impact it would have (I) if it were to happen to calculate the risk rating between 1 and 25.

Risks that fall within Moderate, Significant and Severe categories below are considered to be *substantial* and are therefore listed within the report.

Probability	(P)	X	Impact	(I)	=	(R)	Risk
Very Likely (VLk)	5		Very High (VH)	5		20 - 25	Severe
Likely (Lk)	4		High (H)	4		15 - 19	Substantial
Plausible (P)	3		Medium (M)	3		10 - 14	Moderate
Unlikely (U)	2		Low (L)	2		5 - 9	Minor
Very Unlikely (VU)	1		Very Low (VL)	1		1 - 4	Negligible

Published 1885

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Lincolnshire

Published 1921 - 1922

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

10k Raster Mapping
Published 2000
Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

**Large-Scale National Grid Data
Published 1994
Source map scale - 1:2,500**

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Published 1885

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Large-Scale National Grid Data

Published 1994

Source map scale - 1:2,500

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Lincolnshire

Published 1885 - 1886

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Nottinghamshire

Published 1885

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Lincolnshire

Published 1885 - 1886

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Additional SIMs Published 1992 Source map scale - 1:2,500

The SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data Published 1994

Source map scale - 1:2,500

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Published 1956

Source map scale - 1:10,000

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

10k Raster Mapping
Published 2000
Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

Large-Scale National Grid Data

Published 1994

Source map scale - 1:2,500

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

**Large-Scale National Grid Data
Published 1994
Source map scale - 1:2,500**

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

**Large-Scale National Grid Data
Published 1994
Source map scale - 1:2,500**

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Nottinghamshire

Published 1886

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

**Large-Scale National Grid Data
Published 1994
Source map scale - 1:2,500**

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Published 1885

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

10k Raster Mapping

Published 2000

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

Nottinghamshire

Published 1885

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Nottinghamshire

Published 1885

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Large-Scale National Grid Data

Published 1994

Source map scale - 1:2,500

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Nottinghamshire

Published 1885

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Large-Scale National Grid Data

Published 1994

Source map scale - 1:2,500

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

The SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data
Published 1994
Source map scale - 1:2,500

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Lincolnshire

Published 1886

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Lincolnshire

Published 1886

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

10k Raster Mapping
Published 2000
Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

Large-Scale National Grid Data

Published 1994

Source map scale - 1:2,500

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Lincolnshire

Published 1906

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Large-Scale National Grid Data

Published 1994

Source map scale - 1:2,500

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Lincolnshire

Published 1885

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.
