

I am finding this process of commenting so confusing....It is impossible to keep up with so many different deadlines for different sites...I conclude this is done on purpose to deter people from proceeding.

However, I reiterate my comments as strongly as possible.

1 Solar panels should be placed on roofs and not on productive agricultural land, food production is more important.

2 The size and scale of these projects is monstrous - 13,000 acres within 6 miles radius equals destruction of rural communities.

3 Ruination of ancient and historical villages and the small businesses that exist within them.

4 Ruination of the fragile infrastructure and village commute connections already under massive strain.

5 Loss of working family farms, and the communities around them.

6 A gold rush of prospecting finance companies from the south looking

to take advantage of the green energy incentives.

7 None-one yet knows the physical and mental effects that these monstrous solar industrial sites have on people living near to them.

8 No-one yet knows the effects on the climate in the area they are proposed to be built. There are very few in this country as there is not enough sunshine.

9 Solar panels should be placed in remote areas in hot countries to reap the reward of solar energy.

Importing our food plus transport negates any benefit of solar.

Where will all the used solar panels go once defunct?
