

I must repeat, good agricultural land is essential to avoid food shortages. Lindsey has productive land, a suitably dry climate and security from flooding, drought, earthquakes and war. It is the most precious thing the country has and must not be used for solar, when there are viable alternatives.

There will be severe loss of habitat and biodiversity, not only on the fields themselves but the many miles of hedgerow which will be destroyed, species-rich verges lost to road widening and trees removed. These TAKE IN CARBON DIOXIDE so their loss will make climate change worse.

Disposal after useful life will be a big problem, so much junk for landfill, as in Australia now, derelict sites not fit for agriculture.

Most of all, again, food security will be compromised, loss of oil-seed rape, when olives are no longer growing in parts of S. Europe as it is too hot. Lack of food is terrifying and can be avoided.
