

I understand from government reports that the national grid will not be available to accept any generated electricity until 2035 ? where will the generated electricity from such a large solar field be used. what benefit to the local area and its residence who will see the loss of a recreation facility will this bring ? what the loss of yet more land produce food will this impact ? this will affect all wild animals that live in the area and struggle to find cover with more recent House building programs, the increase of Deer alone seen on the road side besides the real ecological makers of this earth that is being slowly eaten with none needed infrastructure land grab projects such as wind and solar farms who do not contribute to reductions in CO2 but add to the worlds impact with Manufacturing of panels and cables, the high maintenance travel and time needed to allow them to be used, the higher maintenance of the ground and fields them selves and the loss of crop and natural habitat this will destroy.
