

In a time when food security should be at the forefront of everyone's minds isn't wrong that land that produces food for our tables is earmarked to be covered with solar panels. With the effects of climate change more countries are experiencing difficulties with agriculture. So it would be very short sighted to industrialize farm land for the profit of these pop up solar companies. When we should be looking into ways we can increase our food security and not rely on other countries to fill in the short fall. There are plenty of brown field sites. Many other countries have been much more imaginative where they put solar panels. But these options are more costly. So again its profit over people. 40 years is a long time. Which is how long these companies want the land for then it will take a few more years for the land to be fully productive again. Then there is the issue of what to do with the spent batteries and obsolete solar panels. Of which there will be many.
