

I wish to object to this project.

It is based upon flawed information both regarding the 'climate change' that is driving the whole project and the long term effect the project will have upon the ecosystem. Also the long term psychological effects of green space being reduced. On one hand we are being told of the potential issues regarding food production and yet here is a project going to take up a vast area of arable land, which despite it being supposedly 'low quality' still produces food. This is therefore a crazy solution, we should instead be maximising use of roof spaces, car parks, etc. where the land is already no longer available for crop production.

Given the unstable political world situation surely we need to maximise "home grown" food to ensure continuity as best we can.

Have all the recent industrial development sites around Goole for instance been utilised for solar panels?

Solar farms of this size are as yet untried as to the effect they may have on the local climate. It has been suggested that they may well become 'hot spots' causing thermal activity. Great for glider pilots! But will we get our own tornado generator?

I'm also concerned that there will also be shipping containers to house the batteries and other electrical equipment. Are they really suitable both aesthetically and practically. They do seem to attract condensation which is generally not good around electrical equipment.

We in this area of East Yorkshire have had to put up with Drax and all the issues that has caused over the years, then wind farms have sprung up to further blight the landscape, and now solar 'farms'.

All I can do is plead for rejection of this scheme.
