

I'm completely against this application and strongly request that you consider my following points, thank you:
It's simply too large for this area and will impact too much on the existing peaceful way of life and will industrialise our rural landscape.

Government guidelines state that in any one area only 3% of the land should be given over for solar. In this area it will be 6%, why are we being unfairly overrun by them?

High fencing and CCTV will be an eyesore to the countryside

Tourism will be badly affected by the change on visual attraction.

Noise level – Electrical buzzing & electrical noise especially in the still of night will have to be unpleasant.

We already have lots of wind turbines on our skyline, how much more industrialisation do we have to take, in such a small area?

I understand that mid-field hedges will be removed, these 100-year-old well-established sanctuaries are a natural habitat for wildlife and an excellent natural barrier which should be left alone.

Wildlife will be hindered from roaming freely.

How long will it take for this project to be carbon neutral, bearing in mind this is a global initiative, if we include the mining of lithium and thousands of hours of labour, thousands of hours of diesel etc to do this?

Food security – Farming land is disappearing fast and we need to be more independent as a nation and support our farmers in the UK.

Digestate – Farmers already being paid for the spreading of this waste on to their land, and now have forgotten about it in favour of earning more money by renting their land, where will this digestate go in the future?
