

A pleasant countryside will turn into a depressing industrial dystopia. High security fencing, cameras and apocalyptic looking compounds. A now 'Green and Pleasant Land', not a lot left in this country, providing living space for deer, hares, hedgehogs, curlews and so many so badly needed insects will be turned into a sterile nightmare. How can anybody justify 'alternative green energy' by destroying some fairly intact nature? How can anybody claim, that those panels will provide us with 'green' energy for 40 years. I am not an engineer but just the trivial example of a 40 year old car is proof enough that those panels with todays technology will be special and hazardous non recyclable waste in less than 20 years. Where will our children have to go to find some healthy and intact countryside? A project at this scale with such terminal consequences for nature must not be allowed.
