

We have just had cloudy weather with no wind and the grid input from renewable energy was negligible respective to the investment.

What this tells us that it is unreliable and will always need a second system back up...so we are paying for 2 energy supplies.

Nuclear is the way forward, with tidal and wind as support.

To put any solar blights on farmland is a retrograde step for the UK.

Houses, warehouses, shops, car parks, etc is the place for solar.

See attached map of proposed solar blights, its not common sense, its not natural, bad for nature and food supplies.

In addition, the mental illness of locals to the solar blights seeing this destruction of nature is yet to be calculated.

Please put a stop this madness before the 'Emperors New Clothes' of renewable goes too far.
