

General Notes & Key

For this geophysical investigation, the fluxgate gradiometer array manufactured by Senoys (Germany) was used. The sensors were mounted on a wheeled frame approximately 0.25- 1.0 m apart with positional data provided by an RTK GNSS.

A small amount of post-acquisition processing is required to extract and visualise useful information from the acquired data. Once this is achieved successfully, the data are gridded and presented in this greyscale format.

Geophysical techniques are a measurement of material properties. Detecting and mapping the desired targets requires a measurable contrast between the target and the surrounding ground material. Interpretation of geophysical data should be carried out by qualified and experienced personnel but remains inherently subjective.

 AG1803 Botely West

Client:
 Photovolt Development Partners GmbH

Project: AG1803	Sheet: Field 2.64
Date: November 2024	
Scale: 1 : 4000 @A3	

General Notes & Key

For this geophysical investigation, the fluxgate gradiometer array manufactured by Senoys (Germany) was used. The sensors were mounted on a wheeled frame approximately 0.25- 1.0 m apart with positional data provided by an RTK GNSS.

A small amount of post-acquisition processing is required to extract and visualise useful information from the acquired data. Once this is achieved successfully, the data are gridded and presented in this greyscales format.

Geophysical techniques are a measurement of material properties. Detecting and mapping the desired targets requires a measurable contrast between the target and the surrounding ground material. Interpretation of geophysical data should be carried out by qualified and experienced personnel but remains inherently subjective.

Overview map

- Possible Archaeology
- Natural
- Agricultural (Strong)
- Agricultural (Weak)
- Ferrous Point
- Ferrous Spread
- Magnetic Interference
- Extraction
- Unable to Survey
- Agricultural (Strong)
- Agricultural (Weak)
- Buried Utility
