## E1.16 STATUTORY CONSULTATION SUMMARY OF RESPONSES AND APPLICANTS' REGARD

|   |          |
|---|----------|
| <b>(PART 2 OF 2)</b> .....  | <b>1</b> |
| E1.16.16 Geology, hydrogeology and ground conditions table of responses .....                           | 2        |
| E1.16.16.1 Geology, hydrogeology and ground conditions table of responses (via feedback form) .....     | 3        |
| E1.16.16.2 Geology, hydrogeology and ground conditions table of responses (via all other methods) ..... | 16       |
| E1.16.17 Hydrology and flood risk table of responses .....  | 31       |
| E1.16.17.1 Hydrology and flood risk table of responses (via feedback form) .....                        | 32       |
| E1.16.17.2 Hydrology and flood risk table of responses (via all other methods) .....                    | 54       |
| E1.16.18 Onshore ecology table of responses .....   | 110      |
| E1.16.18.1 Onshore ecology table of responses (via feedback form) .....                                 | 111      |
| E1.16.18.2 Onshore ecology table of responses (via all other methods) .....                             | 141      |
| E1.16.19 Onshore and intertidal ornithology table of responses .....                                    | 200      |
| E1.16.19.1 Onshore and intertidal ornithology table of responses (via feedback form) .....              | 201      |
| E1.16.19.2 Onshore and intertidal ornithology table of responses (via all other methods) .....          | 208      |
| E1.16.20 Historic environment table of responses .....  | 238      |
| E1.16.20.1 Historic environment table of responses (via feedback form) .....                            | 239      |
| E1.16.20.2 Historic environment table of responses (via all other methods) .....                        | 244      |
| E1.16.21 Land use and recreation table of responses .....   | 251      |
| E1.16.21.1 Land use and recreation table of responses (via feedback form) .....                         | 252      |
| E1.16.21.2 Land use and recreation table of responses (via all other methods) .....                     | 298      |
| E1.16.22 Traffic and transport table of responses .....   | 368      |
| E1.16.22.1 Traffic and Transport table of responses (via feedback form) .....                           | 369      |
| E1.16.22.2 Traffic and Transport table of responses (via all other methods) .....                       | 397      |
| E1.16.23 Noise and vibration table of responses .....   | 430      |
| E1.16.23.1 Noise and vibration table of responses (via feedback form) .....                             | 431      |
| E1.16.23.2 Noise and vibration table of responses (via all other methods) .....                         | 457      |
| E1.16.24 Air quality tables of responses .....  | 482      |
| E1.16.24.1 Air quality table of responses (via feedback form) .....                                     | 483      |
| E1.16.24.2 Air quality table of responses (via all other methods) .....                                 | 491      |
| E1.16.25 Seascape, landscape and visual resources table of responses .....                              | 497      |
| E1.16.25.1 Seascape, landscape and visual resources table of responses (via feedback form) .....        | 498      |
| E1.16.25.2 Seascape, landscape and visual resources table of responses (via all other methods) .....    | 523      |
| E1.16.26 Aviation and radar table of responses .....  | 562      |
| E1.16.26.1 Aviation and radar table of responses (via feedback form) .....                              | 563      |
| E1.16.26.2 Aviation and radar table of responses (via all other methods) .....                          | 570      |
| E1.16.27 Socio-economics table of responses .....   | 574      |
| E1.16.27.1 Socio-economics table of responses (via feedback form) .....                                 | 575      |
| E1.16.27.2 Socio-economics table of responses (via all other methods) .....                             | 588      |
| E1.16.28 Human health table of responses .....  | 638      |
| E1.16.28.1 Human health tables of responses (via feedback form) .....                                   | 639      |
| E1.16.28.2 Human health tables of responses (via all other methods) .....                               | 665      |
| E1.16.29 Draft Habitats Regulations Assessment table of responses (via all methods) .....               | 694      |
| E1.16.30 Draft Development Consent Order table of responses .....                                       | 701      |
| E1.16.30.1 Draft Development Consent Order table of responses (via feedback form) .....                 | 702      |
| E1.16.30.2 Draft Development Consent Order table of responses (via all other methods) .....             | 707      |
| E1.16.31 Targeted statutory consultation table of responses .....                                       | 739      |

## **E1.16 Statutory consultation summary of responses and Applicants' regard (Part 2 of 2)**

## E1.16.16 Geology, hydrogeology and ground conditions table of responses

## **E1.16.16.1 Geology, hydrogeology and ground conditions table of responses (via feedback form)**

**Table E1.16.16.1: Geology, hydrogeology and ground conditions consultation responses (feedback form)**

As set out in section 4.7.4 of the Consultation report (document reference E1). Responses have been allocated to the most appropriate topic(s). If a consultee did not provide a response for a question/sub-question this is not recorded. If a consultee included 'N/A', 'none', 'no comment', 'Nil', 'No', in response to a question, this has also not been recorded. Where a consultee provided a response associated with this sub-question (3.1; Geology, hydrogeology and ground conditions) but was not related to this topic, this has been included below, as well as against any other appropriate topic(s). Where a consultee provided a response which stated 'see response above' or similar, the response has been replicated in brackets and italics.

| Unique Reference Identifier | S42/S44 | Feedback method      | Feedback form question | Feedback form sub - question | Statutory consultation response received   | Applicants' response  |
|-----------------------------|---------|----------------------|------------------------|------------------------------|--|---|
| TA_0050_002_231123          | S42     | Online feedback form | 3                      | 3.1                          | There are some SSSI areas for geology in the in/around the area. Superficial deposits in many locations consist have bands of peat which are of value as carbon sink - disturbance, including compression of peat will have a detrimental effect on localised groundwater which is rising in some places and affecting some properties. Compressed, dried out peat oxidises and makes the peat useless and locked in carbon would be released. What mitigation measures are proposed to alleviate this?  | Peaty soils are considered within Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This chapter includes details of soil surveys undertaken. Further detailed information regarding the methodology, scope and results of the soil surveys is provided in Volume 3, Annex 6.2: Soil surveys data technical report of the ES (document reference F3.6.2). The assessment has considered the presence of peaty soils located within the Transmission Assets Order Limits.  |
| TA_0051_001_211123          | S44     | Online feedback form | 3                      | 3.1                          | I strongly object to the proposals to route the transmission cable adjacent to land and properties on REDACTED, Blackpool. The suggested 100+ metre wide corridor, which it has been proposed would be necessary to lay the transmission cable, seems unduly large, and would have a negative effect on the land bordering our properties, with an impact on the already over-stretched natural drainage systems, disturbance during construction with traffic and noise pollution, and a permanent destruction of the natural habitat of the many animals and birds whose home is in the wooded areas surrounding our land. | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The Transmission Assets design has resulted in a reduced construction corridor width, as set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Details of the factors considered during the design evolution are set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |
| TA_0051_002_211123          | S44     | Online feedback form | 3                      | 3.2                          | The natural drainage of the land is already working to its maximum capacity, and any disruption to this natural process would severely impact our properties with an unacceptable risk of flooding. Although it is proposed that the transmission cable corridor would be re-instated, studies have suggested that it could take up to 40 years for the disturbed land to return to its natural state.   | The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).<br>Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).<br>An Outline CoCP (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase.<br><br>The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage.  |
| TA_0056_013_141123          | S44     | Online feedback form | 3                      | 3.1                          | As previously stated<br><i>("This I feel is deliberately written in such language that the regular lay</i>   | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. In order to ensure the   |

| Unique Reference Identifier | S42/S44 | Feedback method      | Feedback form question | Feedback form sub - question | Statutory consultation response received   | Applicants' response   |
|-----------------------------|---------|----------------------|------------------------|------------------------------|--|--|
|                             |         |                      |                        |                              | <i>person cannot possibly understand what it means. Until its explained in plain English, I will object about it. I cannot aggressive to what I don't fully understand may or may not affect me and my property."</i>  | <p>consultation information was available to as many people as possible, many different methods were used, including but not limited to a website, newsletter, postcards, consultation brochure, deposit locations, webinar and in-person events (a full list of materials produced for the consultation can be found in the Consultation Report (document reference E1). The Applicants aimed to ensure that it was clear how people could have their say, but also how to get in touch with the Transmission Assets team to find out more information.</p> <p>The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the Statement of Community Consultation).</p>  |
| TA_0058_001_201123          | S44     | Online feedback form | 3                      |                              | <p>I attended one of the consultation meetings where I was informed that option 1 was your preferred choice and that meant no cables would be required to be laid along Blackpool road north. I live on REDACTED and having read a lot of the information I feel that we were misinformed. In short the cables will be laid down our road no matter which option is chosen. On this basis we fully object to the scheme coming through to st Anne's, it would create far to much disruption and I am agains it due to foundational problems that will be created, health issues that you are unable to give clear evidence that residents will not be affected.</p> <p>Overall there has to be an easier route in which you can connect to the national grid, have you explored other options?</p> | <p>The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p> |
| TA_0058_003_201123          | S44     | Online feedback form | 14                     |                              | <p>Object on the basis of unknown health risks, foundation problems to residential properties on sand based land and total disruption to road traffic and associated delays that will be created.</p>  | <p>The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p>  |
| TA_0059_001_151123          | S44     | Online feedback form | 2                      |                              | <p>I am against the offshore booster station being built on green belt land near my area. This will cause more flooding to the area. The more you build on the green belt land, the less land there is for the water to go. We have seen flooding in the area more since more houses have been built</p>   | <p>The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE) which no longer includes any surface piercing</p>  |

| Unique Reference Identifier | S42/S44 | Feedback method      | Feedback form question | Feedback form sub - question | Statutory consultation response received  | Applicants' response   |
|-----------------------------|---------|----------------------|------------------------|------------------------------|---|--|
|                             |         |                      |                        |                              | on flood land, this is disgusting and should not be allowed. There is also the damage to the near by properties. My house has been shook several times with the fracking, I don't want anymore damage to my property. | <p>structures. This includes the removal of the Morgan Booster Station and associated search areas. The OSPs are to be classed as part of the Generation Assets applications only.</p> <p>The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).</p> <p>Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).</p> <p>An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase.</p> <p>The typical maximum depth of cable installation using trenching methodology is approximately 1.8m. Trenchless, drilling methodologies are to be used locally where crossings are required (e.g. beneath roads/rivers). The installation depths will generally be within shallower geological deposits rather than deep within the consolidated bedrock. The drilling methodologies to be used are designed to minimise the displacement of surrounding materials (therefore minimising instability) and do not involve the injection of significant volumes of liquid into fractured bedrock at depth under the high-pressures that are often attributed to inducing tremors. The installation depths are shallower than those required for fracking. Further detail is provided in Volume 3, Chapter 1: Geology, hydrogeology and ground conditions (document reference F3.1) of the ES.</p> |
| TA_0060_004_151123          | S44     | Online feedback form | 3                      | 3.1                          | Sand dunes are a protected conservation area. So how do you get the right to work on them?  | Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) assesses the impacts on Lytham St. Anne's Dunes SSSI.  |
| TA_0060_015_151123          | S44     | Online feedback form | 7                      |                              | Freckleton area is known for its cause of earth quakes whenever the ground is dug into.   | <p>The typical maximum depth of cable installation using trenching methodology is approximately 1.8m. Trenchless, drilling methodologies are to be used locally where crossings are required (e.g. beneath roads/rivers). The installation depths will generally be within shallower geological deposits rather than deep within the consolidated bedrock. The drilling methodologies to be used are designed to minimise the displacement of surrounding materials (therefore minimising instability) and do not involve the injection of significant volumes of liquid into fractured bedrock at depth under the high-pressures that are often attributed to inducing tremors. | TA_0061_001_161123          | S44     | Online feedback form | 3                      |                              | I object strongly to option two being chosen on the basis that all residential properties are built on sand based foundations. Drilling horizontal tunnels or large trenches so close to residential properties on sand based foundations may create structures to subside, move or crack with various defects that could occur.<br><br>Can you give an assurance that prior to any work being undertaken, if option two is chosen you will carry out a full structural survey of all properties on Blackpool road north and that if during or post any of your works that any defects are identified then you will pay full costs and compensation to all property owners.<br><br>I further object on the basis of unknown health effects that may be caused by a permanent high voltage magnetic field so close to residential properties. Can you provide any evidence that no minor or major health effects have been identified on any similar type projects. Can you also confirm that if any subsequent health issues are observed or identified that you will pay full compensation to any and all those who have been exposed or subjected to such effects of long term high voltage magnetic fields.   | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits.<br>Measures to control construction impacts on the environment and the local community are set out in the Outline Code of Construction Practice (document reference J1).<br>Electro-magnetic fields (EMFs) are part of the natural world, and are also produced wherever electricity is generated, transmitted or used. With regard to EMF impacts, the project will adopt the International Commission on Non-ionizing Radiation Protection (ICNIRP) guidelines and Government voluntary Code of Practice on EMF public exposure. Such considerations are inherent to the detailed engineering considerations of cable specification and routing. Relevant public EMF exposure guideline limits are noted in NPS EN-5 and would be complied with by the project. These guidelines are long standing and have a high safety margin. The levels of exposure that they require would not pose a risk to public health. Volume 1, Annex 5.1 (document reference F1.5.1) has had regard to the risk perceptions associated with EMFs of the Transmission Assets on the local area and this is presented in section 1.11.9 of the Annex.<br>See also the submitted EMF Compliance Statement (Volume 1, Annex 3.4 of the ES, document reference E1.3.4). |
| TA_0062_002_221123          | S44     | Online feedback form | 1                      |                              | I purchased my property back in August 2012, and have spent the last 11 years renovating the house and the grounds. My house will be almost directly opposite the Morecambe option 2 substation.<br>Should option 2 go ahead this will totally devastate our lives.<br>I will, object and campaign to exhaustion against this development ruining our lives.<br>I am REDACTED this month, I had no intentions of moving again and have designed, together with my wife, the property to fulfil our needs for the rest our lives through retirement.<br>I am too old to start all over again and all this is giving me mental health issues making me extremely ill.<br>There is no other property I want to move to, this property is unique to us and there is no other property to replace it with in an area that I have spent my last 60 years, I do not want to move from my village.<br>From the time I considered buying the property and right through to the present I have been assured by Fylde Borough Council that no development would ever be allowed on this greenbelt land, all my outbuildings have been developed from existing footprints of the previous farm, everything I have done has been allowed under the provision it is for private use only, I was not even allowed to rent out a stable as they said lower lane cannot sustain any more traffic so how can a | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits.<br>Host local authorities are all considered to be statutory consultees under the Planning Act 2008. As such, the Applicants consulted all local planning authorities including Fylde Council during the pre-application process.<br>It is acknowledged that the proposed cable route passes through Green Belt land and the proposed onshore substations also fall within Green Belt. A consideration of alternative routes and substation siting is made as part of the Site Selection chapter of the ES (Volume 1, chapter 4, document reference F1.4) which concluded this is the preferred route and location for the cable and the substations. Land within the Area of Separation is no longer required for the onshore substations. An assessment regarding the impact on the purposes and openness of the Green Belt, alongside a Very Special Circumstances assessment is set out within the Planning Statement (document reference J28). The Applicants consider that when assessed on the planning balance that the significant benefits of the Project mean that there are Very Special Circumstances that outweigh any potential harm to the Green Belt.<br>With regard to EMF impacts, the project will adopt the International     |

|-----------------------------|---------|----------------------|------------------------|------------------------------|---|--|
|                             |         |                      |                        |                              | <p>development like this even be considered.</p> <p>We are not prepared to live next to a substation housed in what looks like one the biggest buildings ever constructed, I certainly have never come across a building of this magnitude, and all the noise, disruption, and EMF health issues that come with it.</p> <p>Another grave concern, even if option 1 goes ahead is the drainage problem. The back of my barn becomes flooded in heavy rain, with the dykes not being able to move the water fast enough through to the river. The erection of these two substations would be even more instrumental to this as they are taking over acres of arable land that acts as a soakaway during heavy rain.</p> <p>Another issue you may well have is the sand underneath the land, my single story side extension had to be piled to 10 metres for the footings. All of the money I have spent, the hard work and pain will have been in vain if this projects goes ahead and all my future plans are now on hold until a decision has been made between option 1 and option 2.</p> <p>I have now had to put on hold the final phase of my side extension, therefore cancelling the builders, plumbers, joiners, and bathroom fitters until further notice and it took a years planning to get them all together at the same time.</p> <p>I believe that I am of the same frame of mind as my local councillor and my MP Mark Menzies whom both assure me they are absolutely against this project being sited on our greenbelt.</p> <p>I would also like to comment on the mock photos asked for by Mark Menzies that when offered for viewing at the first consultation meeting did not show any views from Lower Lane itself, which tells its own story, and the lame excuse by your representative at the consultation, and I quote, "we cannot be expected to take Photos from everywhere". This was a diabolical excuse and evidence of a complete lack of concern for the local residents, as well as a cover up, as both substations are going on the edge of Lower Lane and it was blatantly obvious that the photographer would have had to travel down Lower Lane in order to gain access to dirt tracks and fields in order to take some of the other photographs. One photo was taken from Hillock Lane looking over fields, a house, a large housing estate, and showing the Morgan substation slightly peering over the top on the horizon, this was a disgrace and an insult to us all.</p> <p>I would like a response please asap with regards to the choice of option 1 or option 2, and going forward I will be seeking advice from a solicitor and land agent.</p> | <p>Commission on Non-ionizing Radiation Protection (ICNIRP) guidelines and Government voluntary Code of Practice on EMF public exposure. Such considerations are inherent to the detailed engineering considerations of cable specification and routing. Relevant public EMF exposure guideline limits are noted in NPS EN-5 and would be complied with by the project. These guidelines are long standing and have a high safety margin. The levels of exposure that they require would not pose a risk to public health. Volume 1, Annex 5.1 (document reference F1.5.1) has had regard to the risk perceptions associated with EMFs of the Transmission Assets on the local area and this is presented in section 1.11.9 of the Annex.</p> <p>See also the submitted EMF Compliance Statement (Volume 1, Annex 3.4 of the ES, document reference E1.3.4).</p> <p>An assessment on human health is provided at Volume 1, Annex 5.1 (document reference F1.5.1) of the ES.</p> <p>As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p> <p>An Outline Operational Drainage Management Plan for the substation site(s) has been prepared and submitted with the application for development consent. The Operational Drainage Management Plan will include measures to ensure that existing land drainage is reinstated and/or maintained. This will include measures to limit discharge rates and attenuate flows to maintain greenfield runoff rates at the onshore substations It will also include measures to control surface water runoff, including measures to prevent flooding of the working areas or offsite and to ensure any runoff is treated appropriately.</p> |
| TA_0066_004_171023          | S44     | Online feedback form | 3                      | 3.1                          | <p>The excavation process seems to be similar to that used for fracking and which caused such controversy and disruption locally. The project should be held to at least the same standards as were imposed then and monitored accordingly. Work should be carried out over a short period to minimise any disruption and potential tremors.</p>  | <p>The typical maximum depth of cable installation using trenching methodology is approximately 1.8m. Trenchless, drilling methodologies are to be used locally where crossings are required (e.g. beneath roads/rivers). The installation depths will generally be within shallower geological deposits rather than deep within the consolidated bedrock. The drilling methodologies to be used are designed to minimise the displacement of surrounding materials (therefore minimising instability) and do not involve the injection of significant volumes of liquid into fractured bedrock at depth under the high-pressures that are often attributed to inducing tremors. The installation depths are shallower than those required for fracking. Further detail is provided in Volume 3, Chapter 1: Geology, hydrogeology and ground conditions (document reference F3.1) of the ES.</p>   |

| TA_0067_002_221123          | S44     | Online feedback form | 3                      |                              | The whole proposed area where the cables may come onshore is unstable, shifting sand with vibrations and groundworks likely to disturb the sensitive environmental areas and the existing houses either side of the proposed area which are also build in an area predominantly sand. Yet again, as no advisors know the area they couldn't comment. A suggestion that if the project wanted to reach Penwortham then the easiest route would be along the coast and up the River Ribble to arrive directly at Penwortham was deemed 'unworkable' but yet again no specifics were able to be given. | The Ribble estuary has numerous ecological statutory designations protected nationally and internationally. These include the Liverpool Bay Special Protection Area, Ribble and Alt. Estuaries Special Protection Area, the Ribble and Alt Estuary Ramsar site (a wetland of international importance under the Ramsar Convention), and the Ribble Estuary Site of Special Scientific Interest, Ribble Estuary Marine Conservation Zone and Ribble Estuary National Nature Reserve. The tidal nature and shallow water depths of the estuary also create heightened risk to construction as the unstable riverbed conditions are unsuitable for trenching/ cable laying vessels to access. As such, cabling through the estuary would result in significantly protracted construction timeframes, and potentially long-term impacts to sensitive and sensitive features associated with the designated features, whilst also presenting higher risk and potentially unsafe working conditions. As such, the approach to site selection has been based on avoiding direct impacts to Important Ecological Features (IEFs) where practicable, further details can be found in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4). |

| TA_0093_006_211123          | S44     | Online feedback form | 5                      |                              | As a resident of REDACTED with a house on the main road, I (and my neighbours) have serious concerns about the proposed onshore location. The proposed locations between the two REDACTED developments going past the airport or via nature reserve are both so close to our houses that we would find ourselves virtually living and working on a Construction site for the duration of the work. The houses already shake when lorries go past and are not sound-proofed, we hear every car that passes. I worry about serious damage being caused to the houses by the heavy construction traffic and by the drilling or similar activities needed to create the cable corridor. It is quite feasible that you would have to fund house maintenance or costly repairs for every house on the REDACTED estate if cracks start to appear from subsidence. There are other areas along the coastline that are not so heavily populated, we urge you to choose an alternative. Whilst you say the Lytham St Annes Zone has 'less coastal residential density' you will still having a major impact on hundreds of families who live here as well as thousands of car drivers who rely on this road every day as their main route from Lytham or St Annes to Blackpool and vice versa. | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3).<br><br>Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, migration measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |

Any activity involving major drilling under our houses will be met with huge opposition unless you can guarantee there will be no noise pollution or vibration and no damage to houses which already shake when lorries drive past. | <p>The typical maximum depth of cable installation using trenching methodology is approximately 1.8m. Trenchless, drilling methodologies are to be used locally where crossings are required (e.g. beneath roads/streams). The installation depths will generally be within shallower geological deposits rather than deep within the consolidated bedrock. The drilling methodologies to be used are designed to minimise the displacement of surrounding materials (therefore minimising instability) and do not involve the injection of significant volumes of liquid into fractured bedrock at depth under the high-pressures that are often attributed to inducing tremors. The installation depths are shallower than those required for fracking. Further detail is provided in Volume 3, Chapter 1: Geology, hydrogeology and ground conditions (document reference F3.1) of the ES.</p> <p>An assessment of the noise and vibration impacts due to the Transmission Assets are presented in Volume 3, Annex 8.2: Construction Noise and Vibration of the ES (document reference F3.8.2) and Volume 3, Annex 8.3: Operational Noise of the ES (document reference F3.8.3). The cumulative noise and vibration impacts with other proposed developments is considered in section 8.13 of Volume 3, Chapter 8: Noise and vibration of the ES (document reference F3.8).</p> |

|--------------------|---------|-------|---|--|
|                    |         |       | <p>proposed cabling route falls within an area of deep peaty soils, Natural England advises that the developer provides information detailing the presence or absence of peat along the cable route. Further information on the location of deep peaty soils can be found here. Natural England do not support the principle of developing on peat. Peat is an irreplaceable asset that once gone is lost for ever and can never be restored to sequester carbon which is difficult to justify in a climate emergency. Natural England advises that any ground works, such as cutting a trench in the peat or drift deposits, under or adjacent to the peat will have impacts both on ground water and water levels within the peat. Peat habitat is very sensitive to modification to water levels, this means these works can impact a wide area of the peat mass. Natural England therefore advises that either further information is provided to demonstrate the extent of deep peat in these areas or that the proposed developments are amended to avoid any work within these particular areas. Natural England advises that it may be useful to refer to existing borehole data from the British Geological Survey (BGS) but if there is a lack of data across the proposed development site the aa peat survey may be required. A peat survey should be undertaken by a soils scientist and should determine the presence of the peat, its depth and the presence of any spoil/waste materials that would impact the restoration ability. Natural England advise that peat surveys are carried out in line with the IUCN peatland programme field protocol.</p> | <p>Further detailed information regarding the methodology, scope and results of the soil surveys is provided in Volume 3, Annex 6.2: Soil surveys data technical report of the ES (document reference F3.6.2). The assessment has considered the presence of peaty soils located within the Transmission Assets Order Limits. Further detailed information regarding the methodology, scope and results of the soil surveys, which were undertaken by a soils specialist, is provided in Volume 3, Annex 6.2: Soil surveys data technical report of the ES (document reference F3.6.2).</p>  |
| TA_0001_203_231123 | S42     | Email | <p>6.17 N/A –General Comment One of main justification of having less significant impact on ecological receptors is the use of HDD or alternative trenchless techniques, however no evidence is provided within the report why this approach is less intrusive and will have less impact. Further evidence should be provided regarding this approach, to set out why using these techniques will have less of impact including description, predicted noise levels, operation, and methodology. The developer should link to any evidence to support the justification it will be less intrusive and limit impacts on ecological receptors.</p>  | <p>This impact is considered within Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES. Direct pipe trenchless installation is proposed beneath the sand dunes. This technology will ensure there is no open trenching through the dunes. This will avoid any direct loss of vegetation and habitats. Instead, the drill will pass beneath the dunes at depth. Where necessary consideration of any indirect effects on the habitat and measures to avoid, minimise or mitigate these is provided in section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES. Direct pipe or microtunnelling is proposed beneath the River Ribble to ensure that there would be no direct impacts on the river habitats. The risk of bentonite breakout will be controlled through the bentonite breakout plan. An Outline Bentonite Breakout Plan (document reference J1.13) is provided as an annex to the Code of Construction Practice (CoCP) (document reference J1). Crossing techniques are set out within Volume 1, Annex 3.2: Onshore Crossing Schedule of the ES (document reference F1.3.2) which is submitted as part of the application for development consent.</p> |
| TA_0001_211_231123 | S42     | Email | <p>Identified impacts. 6.25 There is a lack of consideration of other impacts to Lytham St Annes Dunes SSSI, particularly with regards to changes to the water table. The SSSI citation highlights “the series of exceptionally large and extensive dune slacks on either side of Clifton Drive North support a wide range of species which vary according to the depth of water and degree of moisture retention in relation to the water table”. Depending on the depth of cable installation the impacts of HDD on the dune water table (i.e., the cable resulting in the dune slacks becoming drier changing the species composition) should be considered. Other impacts such as impacts of dust on the SSSIs (identified in the Air Quality chapter as being features sensitive to dust of medium sensitivity – although ruled out due to HDD methods being used and provided the dust control measures are successfully implemented, the resultant effects of the dust exposure will normally be ‘not significant’). Note nitrogen deposition to SSSIs does not appear to be covered – sand dunes are particularly sensitive to nitrogen deposition which can lead to over stabilisation through the dominance of coarse grasses. An assessment using the Air Pollution Information System (<a href="https://www.apis.ac.uk/">https://www.apis.ac.uk/</a>) should be undertaken. The effects of surface water run-off should also be considered. Consider changes to the water table at Lytham St Annes Dunes SSSI. When considering habitats, it would be good to list all the potential pressures/ impacts considered.</p>                                       | <p>Section 3.11.3 of Volume 3, Chapter 3: Onshore ecology and nature conservation (document reference F3.3) provides an assessment of impacts to the SSSI, including changes in relation to the water table, changes in air quality from emissions of nitrogen, and the impact of surface runoff and pollution. Volume 3, Annex 9.1: Air quality impacts on ecological receptors of the ES (document reference F3.9.1) which states that impacts are insignificant for all pollutants at designated sites</p>  |
| TA_0004_001_161123 | S42     | Email | <p>Notice of publicising a proposed application for a Development Consent Order for the Morgan and Morecambe Offshore Wind Farms: Transmission Assets Thank you for your notification of 12 October 2023 seeking the views of the Coal Authority on the above. I have checked the site location plan against the information held by the Coal Authority and can confirm that the proposed development site is located outside of the defined coalfield. On this basis, the Planning team at the Coal Authority have no comments to make. Please do not hesitate to contact me if you would like to discuss this matter further.</p>   | <p>The Applicants note your response.</p>  |
| TA_0007_028_231123 | S42/S44 | Email | <p>4. |                    |         |       | public water supply purposes. We request that the approach to the assessment of the impact on the groundwater environment is considered and agreed with United Utilities.   | will be made within sections 2.11.4 and 2.11.2 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). In addition, best practice with regard the use and storage of oils, chemicals and other wastes, to remove the risk of causing pollution during construction is outlined within the Outline CoCP (document reference J1). |
| TA_0007_029_231123 | S42/S44 | Email | As a nationally and regionally significant scheme, the applicant should follow 'The Environment Agency's approach to groundwater protection' 1 (hereafter referred to as 'the Environment POF PAgency's approach') in relation to protection of drinking water supply from United Utilities' groundwater abstractions. At the current time we do not have sufficient information in order to be able to assess the impact of the proposed development and associated proposals where these lie within a groundwater source protection zone, or directly overlie an abstracted aquifer, to ensure the proposals 'do not have the potential to cause pollution or harmful disturbance to groundwater flow' and to ensure 'these risks can be reduced to an acceptable level'. We wish to draw attention to Position Statements C1 and C2 of 'The Environment Agency's approach' which state: 'C1 - Nationally or regionally significant schemes The Environment Agency requires the promoters of schemes of national or regional significance to protect groundwater when choosing the location for their activity or development. In the cases where this is not possible due to national or regional interests, the Environment Agency expects to be fully involved in the scheme development to mitigate groundwater risks via EPR where applicable. Promoters are expected (via the environmental impact assessment process) to identify all the potential pollution linkages and apply best available techniques to mitigate the risks. C2 - Non-nationally significant infrastructure schemes In SPZ1 and SPZ2, the Environment Agency will only agree to proposals for infrastructure developments of non-national significance where they do not have the potential to cause pollution or harmful disturbance to groundwater flow or where these risks can be reduced to an acceptable level via EPR if applicable. | The referenced guidance has been used and is listed in paragraph 1.2.3.1 of Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F1.3). Due to linkages between surface water and groundwater, reference to discussions involving groundwater will be made within section 2.6.11.2 of Volume 3, Chapter 2: Hydrology and flood risk of the ES.  |
| TA_0007_030_231123 | S42/S44 | Email | Where the proposed development impacts on a sensitive location within a SPZ, relating to a drinking water abstraction resource (including those not currently in use for public water supply purposes but may need to be activated in the future), United Utilities may require a 'Hydrogeological Risk Assessment' for the specific borehole abstraction and intersection with the cable route. This risk assessment should form part of the Environmental Statement and identify the pollution and ground disturbance impacts on the SPZ and set out pollution prevention mitigation measures that will be needed, both during construction and during the operational life of the proposed development. The risk assessment should fully consider any related development activities and mitigation. The need for a risk assessment reflects the Environment Agency Position Statement N7 of the aforementioned groundwater protection document. This states: 'N7 - Hydrogeological risk assessment Developers proposing schemes that present a hazard to groundwater resources, quality or abstractions must provide an acceptable hydrogeological risk assessment (HRA) to the Environment Agency and the planning authority. Any activities that can adversely affect groundwater must be considered, including physical disturbance of the aquifer. If the HRA identifies unacceptable risks then the developer must provide appropriate mitigation. If this is not done or is not possible the Environment Agency will recommend that the planning permission is conditioned, or it will object to the proposal.'   | Source Protection Zones are described in section 1.6.7 and impacts posed by the Transmission Assets are assessed in section 1.11 of Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F3.1).   |
| TA_0007_032_231123 | S42/S44 | Email | Storage of Hazardous Substances The risks posed by storage and distribution of fuels, chemicals and wastes from the proposed development, should also be assessed for the risk to groundwater abstractions (Environment Agency Position Statement Section D). Confirmation is sought that no storage facilities are proposed within the Groundwater SPZs. Following confirmation from the applicant as to whether the high voltage cables will be filled with fluid, we will require an assessment of the hazards these substances pose to the environment, during installation and maintenance, and following any chemical alteration due high-voltage use. The above Position Statements highlight the importance of including drainage information as part of the Environmental Statement.   | Changes in groundwater quality through accidental release or spillage of potentially polluting substances is assessed in section 1.11.8 of Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F3.1).  |
| TA_0007_033_231123 | S42/S44 | Email | Significant earthworks and excavations The risks posed within a SPZ, by removing Made Ground/ Topsoil and Superficial Deposits from an area up to 120m wide during cable laying operations piling towards Rockhead, or by the tunnelling of the River Ribble should be considered. If these create significant new pathways to the aquifer, a Hydrogeological Risk Assessment may be required for the relevant section of the cable route.  | This is secured by CoT41, which sets out that where required and practicable, a hydrogeological risk assessment will be undertaken. This Commitment is presented in section 1.8 of Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F3.1).  |

|                    |         |       |  |   |
|--------------------|---------|-------|--|---|
| TA_0007_034_231123 | S42/S44 | Email | Groundwater Control Short term dewatering or longer term Groundwater Control may pose a risk of contaminant movement towards aquifer Rockhead, particularly where superficial deposits are shallow, or granular. A desk study should be targeted on proposed areas of tunnelling and the crossings of soft and compressible deposits, sensitive to changes in groundwater levels. Assurance is sought that granular and permeable Artificial and Superficial Deposits do not provide pollutant pathways to the aquifer, for surface contamination. In particular, that Ground Investigation data indicates that Glacial Clay provides adequate protective cover over the abstracted aquifers.  | This is secured by CoT41, which sets out that where required and practicable, a hydrogeological risk assessment will be undertaken. This Commitment is presented in section 1.8 of Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F3.1).  |
| TA_0007_035_231123 | S42/S44 | Email | Construction Environmental Management Plan The applicant should follow best practise in their use and storage of fuels, oils, chemicals and other wastes, to remove the risk of causing pollution during construction and operation of the scheme. This should be included in a Construction Environmental Management Plan (CEMP). This will need to be specific to the environmental setting of the area and should fully reflect the implications of a location within a SPZ.  | This is considered within the Outline Pollution Prevention Plan, CoT04, (document reference J1.4) which is presented in section 1.8 of Volume 3, Chapter 1: Geology, hydrogeology and ground conditions (document reference F3.1) of the ES and forms part of the outline CoCP (document reference J1).   |
| TA_0007_036_231123 | S42/S44 | Email | Contaminated Land United Utilities requests that the assessment of potential environmental impact from contamination fully considers the impact on our assets, water resources and water quality as a result of construction of the proposed development.  | A Preliminary Risk Assessment is provided in Volume 3, Annex 1.1: Phase 1 Geo-Environmental Preliminary Risk Assessment of the ES (document reference F3.1.1). A ground investigation will be completed with an assessment of the potential risks arising from any contamination identified and a remediation strategy prepared as necessary.   |
| TA_0017_010_231123 | S42/S44 | Email | Policy The application should demonstrate that the proposed development will fully comply with the requirements of all relevant national and local planning policy, including (but not limited to):<br>• National Policy Statements, including for example:<br>o Overarching National Policy Statement for Energy (EN-1)<br>o National Policy Statement for Renewable Energy Infrastructure (EN-3)<br>o National Policy Statement for Electricity Networks Infrastructure (EN-5)<br>• The National Planning Policy Framework (NPPF);<br>• Local Plan policies.<br>Section 5.3 of National Policy Statement EN-1 sets out requirements in respect of Biodiversity and geological conservation. National Policy statement EN-1 states that "Where the development is subject to EIA the applicant should ensure that the ES clearly sets out any effects on internationally, nationally and locally designated sites of ecological or geological conservation importance, on protected species and on habitats and other species identified as being of principal importance for the conservation of biodiversity. The applicant should provide environmental information proportionate to the infrastructure where EIA is not required to help the IPC consider thoroughly the potential effects of a proposed project". National Policy statement EN-1 also states that "The applicant should show how the project has taken advantage of opportunities to conserve and enhance biodiversity and geological conservation interests". The NPPF states that planning decisions should contribute to and enhance the natural and local environment by minimising impacts on and providing net gains for biodiversity (See Paragraph 174). The NPPF also states that "if significant harm to biodiversity resulting from a development cannot be avoided (through locating on an alternative site with less harmful impacts), adequately mitigated, or, as a last resort, compensated for, then planning permission should be refused" (See Paragraph 180). In order to meet the requirements of the NPPF, the planning application will therefore need to demonstrate that:<br>• all elements of the development would be located and designed to avoid or minimise harm to biodiversity, and<br>• adequate mitigation/compensation for any unavoidable impacts, as well as net gains for biodiversity, will be provided. | The policy background that has informed the assessment is provided in section 3.2.2 and section 3.2.3 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). The application of relevant policy to the assessment of impacts on onshore ecology and nature conservation is demonstrated through the evaluation and identification of important ecological features, as set out in section 3.6.4. The assessment of impacts is provided in section 3.11. Information on biodiversity net gain is provided in the Onshore Biodiversity Benefit Statement (document reference J11) and information on biodiversity benefit is provided in the Outline Ecological Management Plan (document reference J6).  |
| TA_0017_014_231123 | S42/S44 | Email | Surveys Survey data submitted with the planning application should be current/up-to-date, in line with recognised guidelines (as summarised above). The survey area should include:<br>• The intended location of the development footprint;<br>• Potential working areas, compounds, storage areas and access routes;<br>• Any land that may be used within the mitigation, compensation or biodiversity net gain proposals (on or off-site);<br>• A suitable buffer distance, taking account of the likely zone of influence and relevant survey guidelines.   | The survey area is the area used for site-specific surveys and is generally defined as a 150 m buffer around the Onshore Order Limits. The 150 m buffer was included to take account of protected species that may occur adjacent or close to the Transmission Assets and to allow for evolution of the boundary during the site selection process. A separate survey area was used for GCN surveys. The GCN survey area is defined as a 250 m buffer around the Onshore Order Limits. Volume 3, Annex 3.8: Great crested newt survey and reptile survey technical report of the ES (document reference F3.3.8) provides further details regarding the GCN survey area. Owing to the iterative design process of the Transmission Assets, some surveys were undertaken further than 150 m from the Onshore Order Limits. Nevertheless, information from these surveys have been included in technical annexes because it provides context regarding the ecological sensitivity of the wider area. |
| TA_0029_013_231123 | S42/S44 | Email | Underground Cabling Based on the consultation brochure the cables would appear to be being installed via Horizontal Directional Drilling (HDD). The details describe that the corridor width will be 70m, with up to 18 cables. The trench depth would be 1.8m in depth (1.2m to top of the ducting). Given this suggested depth of 1.8m, this would not be suitable for the canal/brook   | Waterways belonging to the Canal and River Trust located within the Onshore Order Limits include the River Ribble and Ribble Link. As described in Volume 1, Chapter 3: Project description of the ES, several trenchless techniques remain under consideration for the 400 kV grid connection cable crossing of the River Ribble. In addition, trenchless techniques   |

|                    |         |       |  |   |
|--------------------|---------|-------|--|---|
|                    |         |       | crossings. In accordance with the Trust's Third Part\:) Works Code of Practice (CoP) Part 2 <a href="https://canalrivertrust.org.uk/business-and-trade/undertaking-works-on-our-property-and-our-code-ofpractice">https://canalrivertrust.org.uk/business-and-trade/undertaking-works-on-our-property-and-our-code-ofpractice</a> we would expect any waterway crossing {pipes, cables etc) to be installed under the waterway and cross perpendicular to the waterway. We would normally expect such crossings to be constructed via trenchless techniques and the crown of the crossing would need to be at least 3.5m below hard bed level of the waterway to ensure any settlement does not impact the waterway. However, this could crossing require a greater depth, depending on the results of the borehole / geotechnical information provided. This would mean that the launch and reception pits would be set well away from the waterway to allow the Horizontal Directional Drilling (HDD) to achieve the required depth. The route and depth of any such crossing, method statements, construction techniques and associated ground investigations will need to be approved by the Trust's geotechnical specialists, all via the CoP process. We would welcome further discussion in relation to this matter.  | would also be utilised where the onshore export cable corridor and 400 kV grid connection cable corridor are required to cross watercourses, including Ribble Link. The commitment to utilise trenchless techniques during construction of the Transmission Assets would avoid potential impacts to the recreational usage of the River Ribble and Ribble Link (see CoT90 in Table 6.17 of Volume 3, Chapter r6: Land use and recreation of the ES (document reference F3.6)).  |
| TA_0029_016_231123 | S42/S44 | Email | Pollution prevention The canal/brook should be considered as a sensitive receptor as a watercourse. A robust and comprehensive Construction Environment Management Plan (CEMP) would be required to include aspects of how materials, fuels, chemicals and wastes will be stored and where; measures for the prevention of dust generation and windblown litter and debris; measures to prevent run off into the canal and culverts (e.g. of silt water, contaminated water, fuels and chemicals); pollution response emergency procedures and details of any planned water abstractions and /or discharges from or which ma\:) impact upon our waterways. Stockpiles must be kept away from the waterway and drainage Systems to reduce potential sediment laden runoff entering the waterways. Silt curtains should also be used to stop surface water runoff. Where the works require stripping topsoil and removing vegetation, such as grass, silt curtains should be kept in place to protect against surface water runoff until sufficient vegetation has grown back on the reinstated topsoil to stabilise the soil and to act as a natural buffer. Site excavations will likely need to be dewatered, these cannot be discharged to the canal/brook without our consent. Discharges to land will need to be kept away from waterways. We note that a pollution prevention plan is being drafted, this will need reviewing after it is issued. | An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures to maintain and address:• flood protection and control measures;• drainage;• pollution prevention;• geology and ground conditions;• ecology and nature conservation (including protected species and invasive species);• historic environment;• soil management;• traffic and transport;• noise management measures;• air quality and dust management;• landscape and visual; and• bentonite breakout plan.   |
| TA_0035_011_221123 | S42/S44 | Email | Contaminated Land: Contaminated ground conditions are currently an unknown risk. Thus it is not possible to advise on mitigation until further information has been provided.  | Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F3.1) sets out effects in relation to existing areas of contamination. The proposed mitigation is set out in section 1.8 of this chapter.  |
| TA_0035_012_221123 | S42/S44 | Email | Groundwater: The impacts of the proposals on groundwater-dependant habitats of Lytham St Annes dunes SSSI have not been assessed.  | Section 3.11.3 of Volume 3, Chapter 3: Onshore ecology and nature conservation (document reference F3.3) provides an assessment of impacts to the SSSI, including changes in relation to the water table.   |
| TA_0035_053_221123 | S42/S44 | Email | 1.5.1.8 Issue<br>Lack of clarity regarding where details of permanent pollution measures (ie interceptors) at the substations will be included. The Outline Operational Onshore Substation Drainage Management Plans will consider drainage from a flood risk perspective but there is no mention as to whether these wouldalso detail permanent pollution prevention at these sites.ImpactRisk of pollution to the aquatic environment arising fromuncontained incidents (eg fire breakout) from substation sites.SolutionProvide clarity as to how details regarding permanent pollution measures will be considered and covered.  | Information regarding permanent pollution measures is provided within the Outline Operational Drainage Management Plan (document reference J10).  |
| TA_0035_055_221123 | S42/S44 | Email | 1.5.1.14 Issue<br>The section describing HDD does not include clarity regarding which document will consider the management of effluent arising from HDD (potential contamination with soilconditioners etc), or from any subsequent dewatering activity.ImpactLack of clarity may result in pollution risk to the aquatic environmentSolutionIf no such effluent is expected then this should also be clearly stated.   | Details regarding the trenchless techniques and anticipated effluent are provided within Volume 1, Chapter 3: Project Description of the ES (document reference F1.3).The Outline Code of Construction Practice (CoCP) sets out measures to control construction impacts, including best practice with regard to the use and storage of oils, chemicals and other wastes. (document reference J1). The CoCP also includes the following documents as annexes - an Outline Bentonite Breakout Plan (Document reference J1.13) and an Outline Pollution Prevention Plan (document reference J1.4).The impacts and effects are assessed in Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2) with regard to surface waters and Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F3.1) with reference to groundwater. |
| TA_0035_056_221123 | S42/S44 | Email | 1.5.1.17 Issue<br>No reference to the presence of emergency spill kits<br>Impact<br>Risk of pollution to the aquatic environment<br>Solution   | Spill kits and emergency procedures are detailed within the Outline Pollution Prevention Plan (document J1.4) which forms part of the Outline CoCP (document reference J1).   |

|                    |         |       |  |  |
|--------------------|---------|-------|--|--|
|                    |         |       | Ensure that either the Onshore Pollution Prevention Plan or the Spillage and Emergency Response Plan mentions the requirement for emergency spill kits to be provided.   |  |
| TA_0035_058_221123 | S42/S44 | Email | <p>CoT10 Issue</p> <p>Unknown geophysical conditions with the potential for unexpected boulders in the underlying Glacial Till under the River Ribble could result in the HDD process to stop or loosedirection.</p> <p>Impact</p> <p>Lost circulation could result in drilling muds discharged viariver bottom sediments into the River Ribble.</p> <p>Solution</p> <p>Complete geophysical surveys to understand the relationship of the stratigraphy to be penetrated. (NB previous surveys associated with previous pipeline activity may be available to supplement new research).</p>  | The methodology for the River Ribble crossing is set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). The development of the proposed techniques (microtunnelling or direct pipe) has taken into account the known ground conditions. Where the onshore export cable corridor or 400 kV grid connection cable corridor crosses sites of particular sensitivity (e.g. embanked Environment Agency surface watercourses, Sites of Special Scientific Interest or groundwater inner Source Protection Zones) a hydrogeological risk assessment will be undertaken where practicable to inform a site-specific crossing method statement which will also be agreed with the relevant authorities prior to construction.  |
| TA_0035_059_221123 | S42/S44 | Email | <p>CoT30 Issue</p> <p>In the area to the north of the River Ribble continuous landfilling has taken place either with or without containment and/or significant capping. Waste types may have included Low Level Radioactive Waste, therefore detailed and specific investigation and appropriate HSE should be employed as stated, further investigation from historical nuclear disposal may also be necessary. The proximity of landfills to where the cable is proposed to cross the river provides a risk of contaminated groundwater connecting via the bore to the surface waters in the river, depending on the system to be utilised to undertake the drilling. Impact A pathway could be established between contaminated groundwaters and surface waters of the River Ribble. Solution Where HDD is proposed especially on or about the River Ribble, consideration in respect of the 'set back' of the drill pad entry spot should be considered further. The high permeability of shallow formations adjacent to the River corridor may require that the points of penetration and egress are previously treated by cementing with grout to form an impermeable base to aid controlled circulation within the proposed bore. This again to prevent possible contamination</p> | This is considered and assessed in section 1.11.3 of Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F3.1). The methodology for the River Ribble crossing is set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). The development of the proposed techniques (microtunnelling or direct pipe) has taken into account the known ground conditions. Where the onshore export cable corridor or 400 kV grid connection cable corridor crosses sites of particular sensitivity (e.g. embanked Environment Agency surface watercourses, Sites of Special Scientific Interest or groundwater inner Source Protection Zones) a hydrogeological risk assessment will be undertaken where practicable to inform a site-specific crossing method statement which will also be agreed with the relevant authorities prior to construction. |
| TA_0035_060_221123 | S42/S44 | Email | <p>Impact</p> <p>Ground conditions are currently an unknown risk. Thus establishing appropriate mitigation is not possible at this time and the environment is at risk.</p> <p>Solution</p> <p>Code of construction practice will include '...details of appropriate studies (e.g., Site Investigations) proposed to be undertaken where major HDDs (or other trenchless methodologies) are proposed, during the detailed design stage to confirm ground conditions.</p>   | Existing ground conditions are set out in section 1.6 of Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F3.1). The potential for mobilisation of any existing contamination is set out in section 1.11 of that chapter. Where the onshore export cable corridor or 400 kV grid connection cable corridor crosses sites of particular sensitivity (e.g. embanked Environment Agency surface watercourses, Sites of Special Scientific Interest or groundwater inner Source Protection Zones) a hydrogeological risk assessment will be undertaken where practicable to inform a site-specific crossing method statement which will also be agreed with the relevant authorities prior to construction. An Outline Code of Construction Practice is provided as part of the application for development consent (document reference J1).                             |
| TA_0035_061_221123 | S42/S44 | Email | <p>Table 1.12 Issue</p> <p>A current licensed abstraction has been omitted: 2671353003. | TA_0035_090_221123 | S42/S44 | Email | <p>CoT94<br/>The Outline Code of Construction practice (CoCP) will be submitted as part of the application for the development consent. CoCP(s) will be developed in accordance with the outline CoCP. The outline CoCP will include details of appropriate studies (e.g. Site Investigations) proposed to be undertaken where major HDDs (or other trenchless methodologies) are proposed, during the detailed design stage to confirm ground conditions.<br/>Issue<br/>Detailed understanding of localised groundconditions has yet to be completed.<br/>Impact<br/>Unknown ground conditions may impact on HDD activity resulting in detrimental impacts on the environment.<br/>Solution<br/>Secure through DCO requirement</p> | This is a standard approach to project development and for detailed site investigation work to be undertaken post-consent to inform the specific construction approach in any location.   |
| TA_0035_093_221123 | S42/S44 | Email | <p>CoT103 Where suspected contamination is present and piling is proposed, where required a detailed piling risk assessment will be developed prior to the commencement of construction. Consultation with the Environment Agency will be sought.<br/>Issue<br/>Relevant locations, and measures required to prevent pollution of controlled waters have yet to be fully developed<br/>Impact<br/>Potential for groundwaters pollution pathways to be created.<br/>Solution<br/>Secure through DCO requirement</p>  | This is a standard approach to project development and for detailed site investigation work to be undertaken post-consent to inform the specific construction approach in any location.   |
| TA_0035_094_221123 | S42/S44 | Email | <p>CoT104 Where the onshore export cable corridor and/or 400 kV grid connection corridor crosses sites of particular sensitivity, which cannot be avoided and has the potential to impact protected species populations, a mitigation strategy will be devised and agreed with relevant stakeholders.<br/>Issue<br/>Measures to protect water quality and flow during trenched crossing of minorwatercourses have yet to be fully developed.<br/>Impact<br/>Risk of impact on sensitive species orhabitats<br/>Solution<br/>An Outline Mitigation Strategy to be included in DCO submission.</p>  | Measures to protect water quality are set out in the Outline Code of Construction Practice (document reference J1). The potential impacts on habitats and species are set out in section 3.11 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).  |
| TA_0043_003_211123 | S44     | Email | <p>3 My farm soil is heavy, and clay based. It is easily damaged, particularly when worked in the wet. The structure of the clay soil takes thousands of years to develop and has been carefully managed by generations of custodians. The soil structure consists of microscopic fissures and larger peds. This structure is destroyed by working at depth. Genuine reinstatement is impossible. My previous experience on a smaller scale project shows a large reduction in yield of the affected area and close surrounding areas. It is inevitable that there will be some mixing of subsoil and topsoil and this also causes reduction in crop yield.</p>   | The potential impacts of the Transmission Assets on agricultural land use are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes consideration of the effects of all elements of the Transmission Assets, including onshore substations on the viability existing farming businesses. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of this chapter of the ES. Following cable installation, land would be reinstated to its previous condition. An Outline Soil Management Plan is provided as part of the application for development consent. The Applicants are committed to ongoing dialogue with land owners. |
| TA_0043_019_211123 | S44     | Email | <p>19 Water pollution: Aside from the risks from contractors, staff and vehicles, our clay forms a suspension in water when damaged in the wet. This can take weeks or months to settle. This suspended clay is damaging to fish and many forms of riverine and marine life. This will inevitably end up int the River Ribble. In a large body of water suspended clay has a massively deleterious impact on photosynthetic activity – this will damage water-based food chains.</p>  | Impacts and effects on water, including the River Ribble, are set out in section 2.11 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Measures to control runoff during construction are set out in the Outline Code of Construction Practice (document reference J1).  |

|                    |     |       |   |  |
|--------------------|-----|-------|---|--|
| TA_0044_006_211123 | S44 | Email | 6. Huge problems with drainage both in field, and ditches, as this project could last several years, damage to soil structure, compaction, localised flooding etc, etc  | The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. An Outline Operational Drainage Management Plan (document reference J10) for the substation site(s) has been prepared and submitted with the application for development consent. The Operational Drainage Management Plan will include measures to ensure that existing land drainage is reinstated and/or maintained. This will include measures to limit discharge rates and attenuate flows to maintain greenfield runoff rates at the onshore substations. It will also include measures to control surface water runoff, including measures to prevent flooding of the working areas or offsite and to ensure any runoff is treated appropriately. The Operational Drainage Management Plan will be developed in line with the latest relevant drainage guidance notes in consultation with the Environment Agency and the Lead Local Flood Authority (Lancashire County Council). Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes the preparation of a Soil Management Plan in general accordance with the Outline Soil Management Plan (document reference: J1.7), which has been submitted with the application for development consent. The measures to be implemented as part of the Soil Management Plan are in general accordance with the Institute of Quarrying (IQ) Good Practice Guide for Handling Soils in Mineral Workings (IQ, 2021) and British Society of Soil Science (BSSS) Working with Soil Guidance Note on Benefiting from Soil Management in Development and Construction (BSSS, 2022) which seek to minimise impacts on soil health and protect and maintain soil quality during construction. As part of the Heads of Terms, Dalcour Maclaren on behalf of the Applicants, and alongside a drainage consultant will discuss existing drainage systems with interests so that a detailed drainage plan and design can be agreed for both pre and post construction. There will be provisions relating to compensation so as to address any impacts to the farming business. |
| TA_0125_006_181123 | S44 | Email | 10. We are by no means against alternative energy, I can't call it green because it's not, however for you to create so much up-heavel to good agricultural land and farms, for over a 30 mile stretch of land over 120m wide just to link up to the National Grid substation at Penwortham is appalling and very wrong.  | The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes the preparation of a Soil Management Plan in general accordance with the Outline Soil Management Plan (document reference: J1.7), which has been submitted with the DCO application. The measures to be implemented as part of the Soil Management Plan seek to minimise impacts on soil health and protect and maintain soil quality during construction of the Transmission Assets. These measures also comprise the preparation of a Code of Construction Practice in general accordance with the Outline Code of Construction Practice (document reference J1) submitted with the DCO application. The measures to be implemented as part of the Code of Construction Practice seek to limit disruption to the operation of individual farm holdings.   |
| TA_0130_003_191123 | S44 | Email | We also know from past experience disruption to land, digging drilling etc in the area, has driven vermin into our homes! It has also caused flooding and water tables to rise. The question of noise from transmitting that amount of electricity through the corridors is also unclear. A local electrical expert that installs commercially on a large scale doubts it will be silent. | An assessment of the noise and vibration impacts due to the Transmission Assets are presented in Volume 3, Annex 8.2: Construction Noise and Vibration of the ES (document reference F3.8.2) and Volume 3, Annex 8.3: Operational Noise of the ES (document reference F3.8.3). The cumulative noise and vibration impacts with other proposed developments is considered in section 8.13 of Volume 3, Chapter 8: Noise and vibration of the ES (document reference F3.8).  |
| TA_0140_004_201123 | S44 | Email | Also the structural impact on our properties caused by you laying huge cables close to us, subsidence has occurred on the road next to ours and was caused by an excavation.  | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The typical maximum depth of cable installation using trenching methodology is approximately 1.8m. Trenchless, drilling methodologies are to be used locally where crossings are required (e.g. beneath roads/rivers). The installation depths will   |

|                    |     |       |  |   |
|--------------------|-----|-------|--|---|
|                    |     |       |  | generally be within shallower geological deposits rather than deep within the consolidated bedrock. The drilling methodologies to be used are designed to minimise the displacement of surrounding materials (therefore minimising instability) and do not involve the injection of significant volumes of liquid into fractured bedrock at depth under the high-pressures that are often attributed to inducing tremors. Further detail is provided in Volume 3, Chapter 1: Geology, hydrogeology and ground conditions (document reference F3.1) of the ES. An assessment of the noise and vibration impacts due to the Transmission Assets are presented in Volume 3, Annex 8.2: Construction Noise and Vibration of the ES (document reference F3.8.2) and Volume 3, Annex 8.3: Operational Noise of the ES (document reference F3.8.3). The cumulative noise and vibration impacts with other proposed developments is considered in section 8.13 of Volume 3, Chapter 8: Noise and vibration of the ES (document reference F3.8).   |
| TA_0167_005_171023 | S44 | Email | <p>You have stated that (4.3.1.2 of the Non Technical Summary) that the cable (surely you mean the eighteen High Voltage cables) is to be installed beneath the sand dunes and the Golf Course using HDD or other trenchless techniques. Even if this is possible how deep will this tunnelling be and what is the effect of vibration or subsidence in what is already a fragile geological area (e.g. the effects of fracking when previously carried out nearby)? Subsidence is an issue in Lytham St Annes and none of the properties in the area proposed for the onshore assets were built to deal with excessive vibration or soil movement. Are you to be responsible, as the Coal Authority is, for compensating any and all of the property owners adversely affected by your works in respect of subsidence or other detrimental effects? You state that you will simply use HDD or other trenchless methodologies but leave open the possibility of open excavation where this is not possible but give no further detail of the impact of this should it be necessary. I am unconvinced by the statement in 8.9.5.3 of the Non-Technical Summary that effects of noise and vibration, which you admit will occur, may be reduced via the implementation of a bespoke method statement to limit noise and vibration. You give little detail of what or how effective this will be and blandly state with such measures in place no significant effects are predicted. How do you define significant? Where is the evidence showing how such method statements have been used and how effective they have proved? These are almost throwaway statements on the very issues that are likely to cause the most significant upset to residents in all areas of the proposed works. Where are the details of your contingency plans if open excavation becomes necessary and how do you intend to carry this out given that the Sand Dunes and the Nature Reserves are all, or in part, Sites of Special Scientific Interest? Are you proposing to excavate the Golf Course if tunnelling is not practical. Have the owners of members of this Club agreed to this or even to the tunnelling if that takes place?</p> | <p>The EIA methodology is set out within Volume 1, Chapter 5: Environmental assessment methodology of the ES. The chapter describes how significance of effects has been assessed. Professional judgement is used to define the magnitude of impact and receptor sensitivity. The matrix is then used, together with professional judgement, to evaluate the significance of effect. The significance may be one, or a range of, no change, negligible, minor, moderate or major. In general, a significance of effect of moderate or greater is considered 'significant' in EIA terms. For each topic chapter, what is considered 'significant' has been clearly defined. Where further mitigation is not possible a residual significant effect may remain. Within the assessment chapters the justification for determining the significance of effect is described. Where a range is given, the assessment chapter details the reason for the significance that has been concluded. The typical maximum depth of cable installation using trenching methodology is approximately 1.8m. Trenchless, drilling methodologies are to be used locally where crossings are required (e.g. beneath roads/rivers). The installation depths will generally be within shallower geological deposits rather than deep within the consolidated bedrock. The drilling methodologies to be used are designed to minimise the displacement of surrounding materials (therefore minimising instability) and do not involve the injection of significant volumes of liquid into fractured bedrock at depth under the high-pressures that are often attributed to inducing tremors. Further detail is provided in Volume 3, Chapter 1: Geology, hydrogeology and ground conditions (document reference F3.1) of the ES. An assessment of the noise and vibration impacts due to the Transmission Assets are presented in Volume 3, Annex 8.2: Construction Noise and Vibration of the ES (document reference F3.8.2) and Volume 3, Annex 8.3: Operational Noise of the ES (document reference F3.8.3). The cumulative noise and vibration impacts with other proposed developments is considered in section 8.13 of Volume 3, Chapter 8: Noise and vibration of the ES (document reference F3.8).</p> |
| TA_0184_001_221123 | S44 | Email | <p>We totally object to the proposed landfall area for this scheme. We totally object to the disruption this work will cause. The ground that the coastal dunes housing is built on will be badly affected as this land is not stable. Dunes are not stable. We believe this scheme puts the fabric of our house in danger. The area of coastal dunes housing does not have suitable roads for heavy plant either in structure or capacity.</p>  | <p>Direct pipe trenchless installation is proposed beneath the sand dunes. This technology will ensure there is no open trenching through the dunes. This will avoid any direct loss of vegetation and habitats. Instead, the drill will pass beneath the dunes at depth. Where necessary consideration of any indirect effects on the habitat and measures to avoid, minimise or mitigate these is provided in section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Trenchless, drilling methodologies are to be used locally where crossings are required (e.g. beneath roads/rivers). The installation depths will generally be within shallower geological deposits rather than deep within the consolidated bedrock. The drilling methodologies to be used are designed to minimise the displacement of surrounding materials (therefore minimising instability) and do not involve the injection of significant volumes of liquid into fractured bedrock at depth under the high-pressures that are often attributed to inducing tremors. The installation depths are shallower than those required for fracking. Further detail is provided in Volume 3, Chapter 1: Geology, hydrogeology and ground conditions (document reference F3.1) of the ES. Traffic and transport impacts arising during the construction phase of the Transmission Assets have been fully assessed at section 7.11 Volume 3, Chapter 7: Traffic and transport of the ES (document reference E3.7). Details of the operation and maintenance phases are set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Onshore maintenance would be limited to essential maintenance and/or emergency works.</p>  |

(This has been experienced in the past with other schemes).</p>   | <p>farming business. As part of the Heads of Terms and ongoing discussions and negotiations, the safety and welfare of all those working on or within proximity to the works, as well as any livestock will be carefully considered to ensure safety at all times. Working practices will be captured in the Code of Construction Practice (CoCP). The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p>   |
| TA_0186_002_221123 | S44 | Email | <p>We were only notified of the substation locations on the 9th October and a meeting was demanded on the Friday the 13th October 2023 leaving insufficient time to prepare and understand the magnitude of the impact of the substation location on our farm. This was declined and a meeting was held on the 26th October 2023 where we pointed out the following observations: • Running Sand has been found at the Morecambe 2 site in previous years.</p>   | <p>Dalcour Maclaren on behalf of the Applicants will continue discussions and negotiations with regards to any impacts to the farming business. Whilst it is acknowledged that there will be disturbance, it is through this discussion and negotiation that Dalcour Maclaren on behalf of the Applicants will seek to mitigate impacts to the farming business. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p>   |
| TA_0187_001_221123 | S44 | Email | <p>We are writing on behalf of ourselves and our neighbour [REDACTED] who has asked us to express her thoughts as she is away at present. We are all very concerned about the proposed project as it will directly impact our lives and our properties. The scale of this project we think has been totally understated and it is difficult to understand how this can suddenly, with little notice, be thrown upon us. 1. From what we understand we are very worried that the installation of cables will greatly affect our properties by devaluing them not only because of the work but also the very great risk of this work causing subsidence in this area. This would inevitably not only cause structural problems but would seriously devalue our properties. 2. The disruption to our lives is totally unacceptable due to the significant amount of time the installation is going to take, not only immediate to our property but locally as well.</p> | <p>The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The typical maximum depth of cable installation using trenching methodology is approximately 1.8m. Trenchless, drilling methodologies are to be used locally where crossings are required (e.g. beneath roads/rivers). The installation depths will generally be within shallower geological deposits rather than deep within the consolidated bedrock. The drilling methodologies to be used are designed to minimise the displacement of surrounding materials (therefore minimising instability) and do not involve the injection of significant volumes of liquid into fractured bedrock at depth under the high-pressures that are often attributed to inducing tremors. Further detail is provided in Volume 3, Chapter 1: Geology, hydrogeology and ground conditions (document reference F3.1) of the ES. The Transmission Assets will be fully compliant with the compensation code. The code sets out the parameters and evidence needed to substantiate a claim for diminution in value and when this happens. The UK Government has also produced a series of plain English general guides to compulsory purchase and compensation which you may find useful: Compulsory purchase and compensation - GOV.UK (www.gov.uk) Guide books 1 and 4 being the most appropriate. Details of the construction phase are set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Measures to control construction impacts on the environment and the local community are set out in the Outline Code of Construction Practice (document reference J1).</p> |
| TA_0187_003_221123 | S44 | Email | <p>We have been away on holiday but, on speaking to our neighbours, we feel we have to very strongly object to these proposals. We cannot stress our concerns strongly enough and we have the backing also of our MP Mark Menzies who has been very vocal in his opposition of this project. We may also add that locally the fracking was brought to a halt due to minor earthquakes in the area and the size of this project is not only unimaginable but totally unacceptable.</p>  | <p>The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. | TA_0189_010_221123 | S44 | Email | 7. Any land that was used as a cable corridor would be useless from an agricultural perspective for at least 30 years afterwards due to the damage to the soil, despite developers saying that it would be reinstated properly. The land and soil have taken years of improvement and careful management to create the productive land that we farm today.  | The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes the preparation of a Soil Management Plan in general accordance with the Outline Soil Management Plan (document reference: J1.7), which has been submitted with the DCO application. The measures to be implemented as part of the Soil Management Plan seek to minimise impacts on soil health and protect and maintain soil quality during construction of the Transmission Assets. These measures also comprise the preparation of a Code of Construction Practice in general accordance with the Outline Code of Construction Practice (document reference J1) submitted with the DCO application. The measures to be implemented as part of the Code of Construction Practice seek to limit disruption to the operation of individual farm holdings.   |
| TA_0194_001_221123 | S44 | Email | Thank you for attending my client's property on Monday afternoon – my clients are grateful for your time and consultation in relation to the Morgan and Morecambe onshore transmission assets and how they will potentially impact my client's farming business. My clients will be making their own representations within the Statutory Consultation feedback form and I believe they have also given to you in hard copy their background information on their farming system. At our meeting my clients highlighted that they farm in total 350 acres of intensive grassland with a further 40 acres of low input rough grazing which accommodates and carries 250 dairy cows with 430 youngstock and beef cattle, producing in excess of 2,250,000 litres of milk sold on a supermarket contract. The beef cattle are also reared on to finishing weight and sold on dead weight system. The proposed route of the transmission cable cuts through a large proportion of land that my clients occupy under a Farm Business Tenancy with the landlords [REDACTED]. I have assumed the [REDACTED] may make separate representations with regards to the actual route of the cables but my clients wish to put on record their objections to the Morgan and Morecambe transmission cable, as highlighted on the attached plan. The route of the transmission cable goes through some of the most difficult agricultural terrain within the locality. Whilst the agricultural land is high quality Grade 2 productive land, it is moss land which means that the stability of any operations and field work cannot be taken too lightly. The proposed route seemed yet again to prioritise ecological surveys rather than the practicalities of the landowners and the farming operations that it affects.   | The Applicants note your response and through Dalcour Maclaren will be in touch with interests and their appointed agents to discuss Heads of Terms which will include compensation provisions to address any impacts to the farming business and practical elements of the construction. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |
| TA_0202_002_221123 | S44 | Email | All this land you are crossing in the Fylde Basin was drained by the Dutch in 1840. 6000 acres drained at a cost of £3000 and I liken it to Amsterdam with interconnecting water channels to take run off waters out to sea. The towns of South Blackpool, by the airport, St Annes and Lytham the water does not flow out to sea via the conventional method because the land is higher than where we live. The water flows in a loop backwards and out to sea at Dock Bridge by McDonalds at Lytham. It has 3 storm pumps and tidal flaps and is an EA asset as are the main water courses in the area. The water table is too high, and we believe the settings are not low enough and rarely the flap doors are open because of silt in the estuary. We have a fight to keep the channels open out to sea and the legislation between Natural England and the Marine Management Organisation is seriously difficult to obtain. The other issue is the building of houses on flood plains and knowing the water table can't be lowered in these areas due to subsidence. The area is very fragile with the water infrastructure. There is only a 3-metre fall of land, that water flows from the M55 to the pumping station and this onshore is difficult to maintain. Liggard Brook is stationary and full of silt, so it is not functioning so the water from Lytham and Blackpool Airport area, flows from Moss Sluice Liggard Brook across Birks Watercourse to Main Drain. Main Drain is the Main artery for our area. Branch Drain takes water from Marton and if there is any force of water overflows onto the land. Wrea Brook is not fit for purpose because it is not big enough for all the extra developments that have been built in recent years. The brook is poorly maintained and overflows on heavy rainfall. There is constant flooding of properties and road networks within the catchment. Dow Brook is no different. With the construction of 122 metre strip and access roads you may destroy the waterway infrastructure and displace the water table and will cause further flooding both on land and property. | The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). An Outline CoCP (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage.  |

|--------------------|-----|-------|--|---|
| TA_0202_003_221123 | S44 | Email | <p>Land Issues We once built a slurry store at our old farm (REDACTED) and we had to pile down 40ft to maintain some stability. Please tell me how you are going to stone and make access road stable on this type of Moss Land. You will sink. Look at the link road they are building on Wild Road and how many years that has been going on. They are struggling to get it stable. There is very little clay across your routes and some of it is quite tidal underneath the ground. In some places if we leave machinery on the land in places the machine can sink. At Queensway before development took place the Farm manager could put fencing posts in by hand all you had to do was push them in. Cypress point in our books was christened "sinking city". Once you take the topsoil off the land you then hit a soil structure we know as blue billy. It is a grey sort of clay structure which is like a jelly. If you bring this to the surface with a plough it sets like concrete and is unfarmable, so again how are you going to reinstate a field of that calibre. There is also running sand in many of the fields. This land used to be marshy bog land if not tidal. There was boat moorings by REDACTED on the A583. If you are putting a cable in no matter how small or big, please tell me how you are going to stop it from rising to the top. All the cables rise to the surface from a depth. We have often ploughed through the Penwortham communication cable whilst we have farmed this land. The other problem would be Moss Stocks (ancient fallen trees) which invariably rise to the surface. The cable from your literature will be laid at 1.2 – 1.5 meters this is not deep enough and will rise, so think again! Were paid to have good soil structure with SFI payments with no compaction under cross compliance legislation. If you compact the land by driving heavy machinery with roadways on it, this will be lost and maybe lose money for being out of production and not being able to grow food for the country, whatever type of agricultural business you are in.</p> | <p>Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6) includes details of soil surveys undertaken. Further detailed information regarding the methodology, scope and results of the soil surveys is provided in Volume 3, Annex 6.2: Soil surveys data technical report of the ES (document reference F3.6.2). Geology, hydrogeology and ground conditions are assessed in Volume 3, Chapter 1 of the ES (document reference E3.1).</p>   |
| TA_0225_005_231123 | S44 | Email | <p>Unsuitable Ground Conditions There are pockets of running sand to the north of the farmstead in the locality of the proposed Morecambe substation Option 2 site which will also affect any cable route proposed in this area.</p>   | <p>The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p> |

## E1.16.17 Hydrology and flood risk table of responses

## E1.16.17.1 Hydrology and flood risk table of responses (via feedback form)

**Table E1.16.17.1: Hydrology and flood risk consultation responses (feedback form)**

As set out in section 4.7.4 of the Consultation report (document reference E1). Responses have been allocated to the most appropriate topic(s). If a consultee did not provide a response for a question/sub-question this is not recorded. If a consultee included 'N/A', 'none', 'no comment', 'Nil', 'No', in response to a question, this has also not been recorded. Where a consultee provided a response associated with this sub-question (3.2; Hydrology and Flood Risk) but was not related to this topic, this has been included below, as well as against any other appropriate topic(s). Where a consultee provided a response which stated 'see response above' or similar, the response has been replicated in brackets and italics.

| Unique Reference Identifier | S42/S44 | Feedback method      | Feedback form question | Feedback form sub - question | Statutory consultation response received   | Applicants' response  |
|-----------------------------|---------|----------------------|------------------------|------------------------------|--|---|
| TA_0050_002_231123          | S42     | Online feedback form | 3                      | 3.1                          | There are some SSSI areas for geology in the in/around the area. Superficial deposits in many locations consist have bands of peat which are of value as carbon sink - disturbance, including compression of peat will have a detrimental effect on localised groundwater which is rising in some places and affecting some properties. Compressed, dried out peat oxidises and makes the peat useless and locked in carbon would be released. What mitigation measures are proposed to alleviate this?  | Peaty soils are considered within Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This chapter includes details of soil surveys undertaken. Further detailed information regarding the methodology, scope and results of the soil surveys is provided in Volume 3, Annex 6.2: Soil surveys data technical report of the ES (document reference F3.6.2). The assessment has considered the presence of peaty soils located within the Transmission Assets Order Limits.  |
| TA_0050_003_231123          | S42     | Online feedback form | 3                      | 3.2                          | See above<br><i>(There are some SSSI areas for geology in the in/around the area. Compressed, dried out peat oxidises and makes the peat useless and locked in carbon would be released. What mitigation measures are proposed to alleviate this?)</i>  | Peaty soils are considered within Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This chapter includes details of soil surveys undertaken. Further detailed information regarding the methodology, scope and results of the soil surveys is provided in Volume 3, Annex 6.2: Soil surveys data technical report of the ES (document reference F3.6.2). The assessment has considered the presence of peaty soils located within the Transmission Assets Order Limits.  |
| TA_0050_004_231123          | S42     | Online feedback form | 3                      | 3.3                          | What proposals to offset BNG, Carbon and flood mitigation measures need to be made.  | As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0051_001_211123          | S44     | Online feedback form | 3                      | 3.1                          | I strongly object to the proposals to route the transmission cable adjacent to land and properties on REDACTED, Blackpool. The suggested 100+ metre wide corridor, which it has been proposed would be necessary to lay the transmission cable, seems unduly large, and would have a negative effect on the land bordering our properties, with an impact on the already over-stretched natural drainage systems, disturbance during construction with traffic and noise pollution, and a permanent destruction of the natural habitat of the many animals and birds whose home is in the wooded areas surrounding our land. | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The Transmission Assets design has resulted in a reduced construction corridor width, as set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Details of the factors considered during the design evolution are set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |
| TA_0051_002_211123          | S44     | Online feedback form | 3                      | 3.2                          | The natural drainage of the land is already working to its maximum capacity, and any disruption to this natural process would severely impact our properties with an unacceptable risk of flooding. Although it is proposed that the transmission cable corridor would be re-instated, studies have suggested that it could take up to 40 years for the disturbed land to return to its natural state.   | The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).  |

|-----------------------------|---------|----------------------|------------------------|------------------------------|--|--|
|                             |         |                      |                        |                              |  | <p>An Outline CoCP (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase.</p> <p>The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage.</p>   |
| TA_0056_014_141123          | S44     | Online feedback form | 3                      | 3.2                          | <p>As previously stated<br/> <i>("This I feel is deliberately written in such language that the regular lay person cannot possibly understand what it means. Until its explained in plain English, I will object about it. I cannot aggressive to what I don't fully understand may or may not affect me and my property.")</i></p>  | <p>The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. In order to ensure the consultation information was available to as many people as possible, many different methods were used, including but not limited to a website, newsletter, postcards, consultation brochure, deposit locations, webinar and in-person events (a full list of materials produced for the consultation can be found in the Consultation Report (document reference E1). The Applicants aimed to ensure that it was clear how people could have their say, but also how to get in touch with the Transmission Assets team to find out more information. The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the Statement of Community Consultation).</p>   |
| TA_0059_001_151123          | S44     | Online feedback form | 2                      |                              | <p>I am against the offshore booster station being built on green belt land near my area. This will cause more flooding to the area. The more you build on the green belt land, the less land there is for the water to go. We have seen flooding in the area more since more houses have been built on flood land, this is disgusting and should not be allowed. There is also the damage to the near by properties. My house has been shook several times with the fracking, I don't want anymore damage to my property.</p> | <p>The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE) which no longer includes any surface piercing structures. This includes the removal of the Morgan Booster Station and associated search areas. The OSPs are to be classed as part of the Generation Assets applications only.</p> <p>The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).</p> <p>Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).</p> <p>An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase.</p> <p>The typical maximum depth of cable installation using trenching methodology is approximately 1.8m. Trenchless, drilling methodologies are to be used locally where crossings are required (e.g. beneath roads/rivers). The installation depths will generally be within shallower geological deposits rather than deep within the consolidated bedrock. The drilling methodologies to be used are designed to minimise the displacement of surrounding materials</p> |

| Unique Reference Identifier | S42/S44 | Feedback method      | Feedback form question | Feedback form sub - question | Statutory consultation response received   | Applicants' response  |
|-----------------------------|---------|----------------------|------------------------|------------------------------|--|---|
|                             |         |                      |                        |                              |  | (therefore minimising instability) and do not involve the injection of significant volumes of liquid into fractured bedrock at depth under the high-pressures that are often attributed to inducing tremors. The installation depths are shallower than those required for fracking. Further detail is provided in Volume 3, Chapter 1: Geology, hydrogeology and ground conditions (document reference F3.1) of the ES.  |
| TA_0060_005_151123          | S44     | Online feedback form | 3                      | 3.2                          | The sand dunes are a natural projective (sic) barrier from floods from rising sea levels.  | The location of formal flood defences was informed by Environment Agency Spatial flood defences (including attributes), and not the North West Regional Land Drainage Byelaws. The sand dunes are classified as flood defences within the ES. Impacts and effects in relation to flood risk are set out in Volume 3, Chapter 3: Hydrology and flood risk of the ES (document reference F3.2).   |
| TA_0073_001_151123          | S44     | Online feedback form | 3                      | 3.2                          | Because here in REDACTED we are classed as a flood plain as we are very low lying and very poor drainage in the area on to Main River, the water table is very high and will require de watering by the use of well points for the excavation for the cables. We are concerned that this could cause settlement to neighbouring properties should it be close to the rear of REDACTED, and possible flooding | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2) An Outline CoCP (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage. |
| TA_0074_003_211123          | S44     | Online feedback form | 3                      |                              | Not enough detail given but I am concerned that the interference with dunes will pose a flood risk.  | The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase.   |
| TA_0074_005_211123          | S44     | Online feedback form | 3                      | 3.2                          | Any interference in dunes is a flood risk  | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). An Outline Code of Construction Practice (document reference J1)   |

| Unique Reference Identifier | S42/S44 | Feedback method      | Feedback form question | Feedback form sub - question | Statutory consultation response received   | Applicants' response   |
|-----------------------------|---------|----------------------|------------------------|------------------------------|--|--|
|                             |         |                      |                        |                              |  | has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase.  |
| TA_0078_004_051123          | S44     | Online feedback form | 3                      | 3.2                          | The whole of this area is marshy and a flood risk. We are concerned that opening channels for cables will create weaknesses and enable seawater to come inland and magnify these risks.  | Flood risk is considered in the Flood Risk Assessment (Volume 3, Annex 2.3: Flood risk assessment of the ES, document reference F3.2.3). This includes consideration of coastal flood risk. All land used to install cables would be reinstated following construction.  |
| TA_0080_001_201123          | S44     | Online feedback form | 1                      |                              | <p>Concern about noise from the wind farm should the distance to the shore be too close.</p> <p>Concern about contamination of bathing water during the development of the project . This is an area of tourism with swimming, windsurfing and families enjoying the beach .</p> | <p>In regards to noise, this response appears to relate to the Morgan Offshore Wind Project and/or the Morecambe Offshore Windfarm (the generation assets), which are subject to separate applications for development consent.</p> <p>Increased suspended sediment concentrations and associated deposition affecting recreational diving sites and designated bathing water site is assessed in Volume 2, Chapter 9: Other sea users of the ES (document reference F2.9). This assessment concludes a negligible significance.</p> <p>Substantial reductions to the Order Limits have been made to the north of the PEIR boundary at landfall. The areas of beach subject to construction works, including landfall compounds will not be available for public access during this period. However, the Applicants have committed to ensure public access to the east of the works areas will be maintained during construction. This will ensure that, areas to the north and south of the works area would remain accessible for beach-based activities. The Applicants have sought to minimise the duration of beach works by committing to a direct pipe trenchless installation technique in order to limit potential disruption to users of the beach and an Outline Open Space Management Plan has been appended to the Outline Public Rights of Way Management Plan (document reference J1.5), which includes measures to minimise potential impacts.</p> |
| TA_0080_003_201123          | S44     | Online feedback form | 3                      |                              | I am concerned that the installation of the underground cable could compromise sea defences and flood our homes . I am concerned that existing drainage infrastructure could be affected by construction.  | <p>The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).</p> <p>Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).</p> <p>An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase.</p> <p>The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage.</p>   |

| TA_0086_001_211123          | S44     | Online feedback form | 1                      |                              | <p>Strongly object to the proposed off shore wind farm route cabling on shore here on the Fylde coast and the destruction and disruption to our roads, farmlands natural green spaces for many years to come.</p> <p>The meetings I attended could not give a definite plan for the 120m wide cable route crossing Queensway (B5261) and could not determine where along Queensway this would be to the rear of our properties on REDACTED, this could result in property subsidence , Noise, pollution etc for years to come and devaluation of our properties. We have lived here for over 50 years, we actively ran a market garden business until the Dutch ruined that, so we feel we know the local land problems round here and what the size of this proposal would impact on this area</p> <p>We have lots of wildlife around here both on land and in the various watercourses surrounding the farmlands, we can't keep pushing this wild life away from here for this proposal, it has already been pushed away from the development at Richmond Point, and the new EZ sports village. Not happy about the disruption to the sand dunes and traffic congestion along Clifton Drive if the cables cross here, the nature reserve Will be affected also.</p> <p>We have recently had a lot of traffic congestion along Queensway/Common Edge Road and surrounding roads caused by the new EZ development, this being the main route of 2 from Blackpool to St Annes, this congestion was horrendous and could not be avoided, we do not want to go through that again</p> <p>We know the importance of green energy and understand that, but feel this is not the on shore place for it, spoiling green belt and natural habitats, bridleways, traffic congestion, flooding, noise and property devaluation because of it, REDACTED is considered as one of the most expensive Lanes on the Fylde Coast, many residents have horses and chose to live here for that reason.</p> <p>We don't want any interruption to farmlands either, we need them. So I strongly object to these proposals</p> | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, migration measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |
| TA_0087_001_191123          | S44     | Online feedback form | 1                      |                              | <p>Feedback on Transmission Assets Project</p> <p>I wish to object to the proposals for the following reasons</p> <ul style="list-style-type: none"> <li>- There is no explanation as to why zone 1 and zone 2 have been favoured and why they were chosen in the first place. There is no information about why any other areas might have been considered and discounted.</li> <li>- It feels like someone has just looked at a map and decided these are the easiest places, with little other consideration.</li> <li>- Your website is hard to navigate and does not provide large scale detailed maps. It is difficult to determine exact proposed areas.</li> <li>- There has been little consideration of potential flood risks and lack of information to local residents about how this would be managed.</li> <li>- There is no information about why any Fylde or Blackpool Council</li> </ul>  | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3)The Transmission Assets website included all consultation materials and maps to the level of details that was available at the time. This included a dedicated information hub for ease of access to specific consultation materials.<br>The solar farm has been considered as part of the cumulative assessment for the onshore elements of the Transmission Assets. All schemes considered in the cumulative assessment are set out in                    |

Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of</p>   |

|                             |         |                      |                        |                              |  | <p>protected nationally and internationally. These include the Liverpool Bay Special Protection Area, Ribble and Alt. Estuaries Special Protection Area, the Ribble and Alt Estuary Ramsar site (a wetland of international importance under the Ramsar Convention), and the Ribble Estuary Site of Special Scientific Interest, Ribble Estuary Marine Conservation Zone and Ribble Estuary National Nature Reserve. The tidal nature and shallow water depths of the estuary also create heightened risk to construction as the unstable riverbed conditions are unsuitable for trenching/ cable laying vessels to access. As such, cabling through the estuary would result in significantly protracted construction timeframes, and potentially long-term impacts to sensitive and sensitive features associated with the designated features, whilst also presenting higher risk and potentially unsafe working conditions. As such, the approach to site selection has been based on avoiding direct impacts to Important Ecological Features (IEFs) where practicable, further details can be found in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4).</p> <p>The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).</p> <p>Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).</p> <p>An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. ## E1.16.17.2 Hydrology and flood risk table of responses (via all other methods)

**Table E1.16.17.2: Hydrology and flood risk table of responses (via all other methods)**

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received  | Applicants' response   |
|-----------------------------|---------|-----------------|---|--|
| TA_0001_188_231123          | S42     | Email           | 6.2 One of the main justifications of having less significant impact on ecological receptors is the use of HDD or alternative trenchless techniques. However, no evidence is provided within the report as to why this approach is less intrusive and will have less impact. Further evidence should be provided regarding this approach, to set out why using these techniques will have less of impact including description, predicted noise levels, operation and methodology.  | Direct pipe trenchless installation is proposed beneath the sand dunes. This technology will ensure there is no open trenching through the dunes. This will avoid any direct loss of vegetation and habitats. Instead, the drill will pass beneath the dunes at depth. Where necessary consideration of any indirect effects on the habitat and measures to avoid, minimise or mitigate these is provided in section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Direct pipe or microtunnelling is proposed beneath the River Ribble to ensure that there would be no direct impacts on the river habitats. As set out in Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3), The risk of bentonite breakout will be controlled through the bentonite breakout plan. An Outline Bentonite Breakout Plan (document reference J1.13) is provided as an annex to the Code of Construction Practice (CoCP) (document reference J1). Crossing techniques are set out within Volume 1, Annex 3.2: Onshore Crossing Schedule of the ES (document reference F1.3.2) which is submitted as part of the application for development consent. Further information on the proposed approach to construction is provided in Volume 1, Chapter 3: Project description of the ES. |
| TA_0001_193_231123          | S42     | Email           | 6.7 As the proposed installation method for to avoid Lytham St. Anne's SSSI is HDD, it is felt that the developer has not fully considered the Maximum Design Scenario (MDS) for this designated site. Please see comment 6.12 for further detail. A full baseline assessment of Lytham St. Anne's Dunes SSSI should be undertaken, and presented within the submitted ES, so that should the worst-case scenario occur (i.e. HDD is not possible) sufficient ecological data is available to inform/ develop suitable mitigation measures. In addition, it could be used as a baseline for post-construction monitoring (and a means to determine recovery). Please see comment 6.12 for further detail.   | Direct pipe trenchless installation is proposed in this location and is the basis for the assessment of impacts on dune slacks provided in section 3.11.2 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Further data on the distribution and status of SSSI interest features that is necessary to inform the ES has been obtained from existing reports prepared on behalf of Lancashire Wildlife Trust and Our Future Coasts, and project-specific national vegetation classification (NVC) surveys have been carried out to confirm or update the findings of these reports where necessary. Crossing techniques at the sand dunes at Lytham St. Anne's are presented within Volume 1, Annex 3.2: Onshore Crossing Schedule of the ES (document reference F1.3.2) which is submitted as part of the application for development consent.  |
| TA_0001_194_231123          | S42     | Email           | 6.8 There is a lack of consideration of other impacts to Lytham St Annes Dunes SSSI, particularly with regards to changes to the water table. Please see comment 6.27 for further detail. Consider changes to the water table at Lytham St Annes Dunes SSSI.  | This impact is considered within section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).  |
| TA_0001_198_231123          | S42     | Email           | Natural England's Position on Worst Case Scenario or Scenarios 6.12 Vol3; Chp 3 Table 3.11, Table 3:15 The developer recognises Lytham St. Anne's Dunes as a SSSI (Table 3.11) and it has been taken forward as an Important Ecological Feature (Table 3.15). However, as the proposed installation method is HDD it is felt the developer has not fully considered the MDS (Table 3.16) for this designated site. The current assessment for Lytham St. Anne's Dunes SSSI (para 3.9.2.8 - 3.9.2.11) notes "During construction the Transmission Assets will commit to avoiding impacts on the Lytham St Annes Dunes SSSI, as the cables will be installed beneath this habitat via HDD (or other trenchless techniques) and open trenching techniques would not be used within this habitat. Accordingly, there will be no temporary or permanent loss of this habitat type. The magnitude of impact is therefore, considered to be no change." The developer goes on to note that while the sensitivity of the habitat is High, the significance of effect is no effect. However, from experience of similar projects Natural England know that on occasions HDD can fail, or the proposed development design changes and for example Transition Joint Bays need to be moved (which presumably currently will be situated on the beach)/ or additional vehicle access is required. In such scenarios by excluding any effect early in the assessment process there is a lack of detail later on if the installation methods change. Similarly full consideration of impacts should HDD not be undertaken in saltmarsh along the river Ribble (part of the Ribble Estuary SSSI). A full baseline assessment of Lytham St. Anne's Dunes SSSI should be undertaken so that should the worst-case scenario occur (i.e. HDD is not possible) sufficient ecological data is available to inform/ develop suitable mitigation measures. In | Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) assesses the impacts on Lytham St. Anne's Dunes SSSI. Direct pipe trenchless installation is proposed in this location as it's the most appropriate for use in sensitive settings, in part because it reduces the likelihood of collapse that is associated with cable installation using horizontal directional drilling (HDD). The Works Plans submitted with the application for development consent (and accompanying description) allow only for direct pipe in this location. Therefore, the MDS that has been used is considered to be correct. Further data on the distribution and status of SSSI interest features that is necessary to inform the ES has been obtained from existing reports prepared on behalf of Lancashire Wildlife Trust and Our Future Coasts, and NVC surveys have been carried out to confirm or update the findings of these reports where necessary. CoT41 states that where the onshore export cable corridor or 400 kV grid connection cable corridor crosses sites of particular sensitivity, including Lytham St Annes Dunes SSSI, a hydrogeological risk assessment will be undertaken to inform a site-specific crossing method statement which will also be agreed with the   |

|-----------------------------|---------|-----------------|---|--|
|                             |         |                 | <p>addition, it could be used as a baseline for post-construction monitoring (and a means to determine recovery). Baseline surveys of Lytham St Annes Dunes SSSI should include mapping to NVC level of the dune habitats present, with supporting quadrat sampling. Quadrat sampling should be sufficient in coverage to ensure all community types are sampled. The SSSI citation notes that the site support classic features of dune formation and ecological succession including the widest range of foredune, yellow dune, dune grassland, acid dune grassland, dune scrub and dune slack habitats found anywhere along the Fylde Coast. The site is botanically diverse with a number of rare or scarce plant species. Use of up-to-date aerial photography taken at the time of the NVC survey would be preferable. The developer should undertake a cable burial risk assessment for all the HDD work (including Lytham St. Anne's Dunes SSSI and the River Ribble (part of the Ribble Estuary SSSI) informed by geotechnical investigations. This should include an outline burial cable specification and installation plan which has a pollution* and contingency plan. This would help determine the likelihood (degree of confidence) of success of HDD at the given locations. *Note a Bentonite breakout plan is mentioned for the River Ribble but not for Lytham St. Annes Dunes</p>   | <p>relevant authorities prior to construction. The risk of bentonite breakout at Lytham St Annes Dunes SSSI will be controlled through the bentonite breakout plan. An Outline Bentonite Breakout Plan (document reference J1.13) is provided as an annex to the Code of Construction Practice (CoCP) (document reference J1).</p>   |
| TA_0001_203_231123          | S42     | Email           | <p>6.17 N/A –General Comment One of main justification of having less significant impact on ecological receptors is the use of HDD or alternative trenchless techniques, however no evidence is provided within the report why this approach is less intrusive and will have less impact. Further evidence should be provided regarding this approach, to set out why using these techniques will have less of impact including description, predicted noise levels, operation, and methodology. The developer should link to any evidence to support the justification it will be less intrusive and limit impacts on ecological receptors.</p>  | <p>This impact is considered within Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES. Direct pipe trenchless installation is proposed beneath the sand dunes. This technology will ensure there is no open trenching through the dunes. This will avoid any direct loss of vegetation and habitats. Instead, the drill will pass beneath the dunes at depth. Where necessary consideration of any indirect effects on the habitat and measures to avoid, minimise or mitigate these is provided in section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES. Direct pipe or microtunnelling is proposed beneath the River Ribble to ensure that there would be no direct impacts on the river habitats. The risk of bentonite breakout will be controlled through the bentonite breakout plan. An Outline Bentonite Breakout Plan (document reference J1.13) is provided as an annex to the Code of Construction Practice (CoCP) (document reference J1). Crossing techniques are set out within Volume 1, Annex 3.2: Onshore Crossing Schedule of the ES (document reference F1.3.2) which is submitted as part of the application for development consent.</p> |
| TA_0001_211_231123          | S42     | Email           | <p>Identified impacts. 6.25 There is a lack of consideration of other impacts to Lytham St Annes Dunes SSSI, particularly with regards to changes to the water table. The SSSI citation highlights “the series of exceptionally large and extensive dune slacks on either side of Clifton Drive North support a wide range of species which vary according to the depth of water and degree of moisture retention in relation to the water table”. Depending on the depth of cable installation the impacts of HDD on the dune water table (i.e., the cable resulting in the dune slacks becoming drier changing the species composition) should be considered. Other impacts such as impacts of dust on the SSSIs (identified in the Air Quality chapter as being features sensitive to dust of medium sensitivity – although ruled out due to HDD methods being used and provided the dust control measures are successfully implemented, the resultant effects of the dust exposure will normally be ‘not significant’). Note nitrogen deposition to SSSIs does not appear to be covered – sand dunes are particularly sensitive to nitrogen deposition which can lead to over stabilisation through the dominance of coarse grasses. An assessment using the Air Pollution Information System (<a href="https://www.apis.ac.uk/">https://www.apis.ac.uk/</a>) should be undertaken. The effects of surface water run-off should also be considered. Consider changes to the water table at Lytham St Annes Dunes SSSI. When considering habitats, it would be good to list all the potential pressures/ impacts considered.</p> | <p>Section 3.11.3 of Volume 3, Chapter 3: Onshore ecology and nature conservation (document reference F3.3) provides an assessment of impacts to the SSSI, including changes in relation to the water table, changes in air quality from emissions of nitrogen, and the impact of surface runoff and pollution. Volume 3, Annex 9.1: Air quality impacts on ecological receptors of the ES (document reference F3.9.1) which states that impacts are insignificant for all pollutants at designated sites</p>  |
| TA_0002_010_171123          | S42     | Email           | <p>6. Provided Information – Inadequacy As noted, the information provided was lacking in detail such that the landowners affected by the development could not fully appreciate the implications on their own businesses. The team responsible appeared to have little knowledge as to where the landowners are located, in relation to the proposed works on their properties, as reflected in the mess made of establishing the contacts and their addresses properly Experience garnered from those exposed to other developments of a similar nature highlights some of the dangers that have yet to be considered. For example, the proposed underground cable conduits are likely to require access manholes or inspection chambers along the route. In other examples, these have resulted in raised mounds as the disturbed land gradually sinks. This can result in damage to very expensive farm machinery that may be engaged in crop cutting, whether for silage or for arable crops. No definition of such obstacles has been provided as it is considered “premature at this stage”. The implication is that the overall design of the whole system has not yet</p>  | <p>Dalcour Maclaren on behalf of the applicants, obtained landowner information and addresses through HMLR searches, in accordance with the land referencing methodology. Following the identification of landowners, meetings were offered and held where requested (as set on the Consultation Report document reference E1). The design of the Transmission Assets is set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). This includes details of the required joint bays and link boxes. Joint bays will be completely buried, with the land above reinstated. An inspection cover will be provided at the surface for link boxes for access during the operation and maintenance phase. The precise location of these will be identified during</p>   |

|                             |         |                 | achieved an adequate level of maturity to enable meaningful assessment of associated risks and costs of installation, ownership, and finally retirement of the system. Yet in other areas, the progress seems bogged down in unnecessary details, for examples challenges relating to ownership of small parcels of land identified on maps, which are gateways to the fields and properties where the actual gate may be set back from a road to allow a vehicle to stop and gain access to the field in question without blocking the roadway! This appears to be being used to obfuscate the real issues where decent design information is sadly lacking. A further example is the lack of forethought that relates to the predicted changes in sea levels that is the driver for the need for green energy. The Fylde and Ribble estuary are naturally low lying with the EA having provided forecasts of the changes in flood risk in the recent past. This does not appear to have been considered, to date.   | the detailed design phase. Flood risk, including allowances for sea level rise, has been considered in Volume 3, Annex 2.3: Flood Risk Assessment of the ES (document reference F3.2.3).  |

Attachments - Map of Freckleton & Newton with Clifton highlighting the key elements of the proposal in relation to existing developments and population areas<br>2) Environment Agency Prediction of Flood Risk Forecast for 2050 for the Ribble Estuary  | The Applicants note your response.  |
| TA_0007_017_231123          | S42/S44 | Email           | 2. Flood Risk Existing drainage systems are often dominated by combined sewers. This method of sewer infrastructure is a result of the time it was constructed, with combined sewers taking both foul and surface water. If there is a consistent approach to surface water management, it will help to manage and reduce surface water entering the sewer network, decreasing the likelihood of flooding from sewers, the impact on residents and businesses, and the impact on the environment. Whilst we do all that we can to reduce the risk of sewer flooding, there remains a residual risk, which is a source of flooding that should be considered in your Environmental Statement (ES). National policy is clear that flood risk from all sources, including sewers, must be considered in the delivery of new development. As such, it is important to ensure that the assessment of flood risk includes sewer flood risk. It should be ensured that your proposed development does not result in an increase in flood risk from the public sewer as a result of: i) any proposed new drainage connections to the public sewer. This is considered in further detail below; ii) by altering any existing exceedance flood paths of losses from the public sewer; iii) by locating any above ground elements of your proposal in areas where there is an existing risk of sewer flooding. There are a number of locations within the scoping boundary where our modelling data indicates flood water exceedance paths from the public sewer and we would need to liaise with you to assess your proposals in relation to this point and point ii); iv) as a result of any diversions / works to watercourses or existing sewers which could materially affect hydraulic performance and therefore change / increase any risk of flooding; v) as a result of any changes in ground levels which could materially change existing sewer flood risk; or vi) as a result of any changes to land or property currently affected by existing hydraulic sewer flooding incidents. We therefore request the Environmental Statement considers flood risk from the public sewerage system in liaison with United Utilities so that the above matters are fully considered. | A flood risk assessment assessing all sources of flooding, including sewers is presented within Volume 3, Annex 2.3: Flood Risk Assessment of the ES (document reference F3.2.3). The proposed permanent infrastructure associated with the Morgan and Morecambe substations are located within Flood Zone 1 and has a low risk of flooding from all other assessed sources. The conceptual surface water drainage strategy is included within Volume 3, Annex 2.3: Flood Risk Assessment of the ES (document reference F3.2.3). Also refer to the Outline Operational Drainage Management Plan (document reference J10). There is no proposed discharge to public sewers. Where the project is identified to have the potential to impact an asset of interest, the Applicants will seek to consult with all interested parties. This is to be undertaken once the location and type of watercourse crossings are confirmed as well as surface water discharge locations from onshore substations which is to come forward at detailed design stage. |
| TA_0007_018_231123          | S42/S44 | Email           | You should also consider the risk of flooding from reservoirs. You should seek to ensure that reservoir flood paths are avoided in the location of your development. United Utilities manages a large portfolio of statutory and non-statutory reservoirs in the north west of England. It is essential that the ES adequately presents the impact of the development upon dam breach flood inundation mapping, which may affect the statutory dam safety designation of our reservoir assets. UK reservoir safety is regulated by the EA / DEFRA, and consultation with the EA, our Dam safety management team, and any relevant local authorities is required to ensure that any changes to dam safety risk is fully understood, is appropriate and is approved by the regulator and ourselves as reservoir operator.   | A flood risk assessment assessing flood risk from reservoirs is included within Volume 3, Annex 2.3: Flood Risk Assessment of the ES (document reference F3.2.3).   |
| TA_0007_019_231123          | S42/S44 | Email           | Impact on Watercourses<br>United Utilities wishes to liaise with you to confirm the impact on any watercourses that interact with our assets to ensure that there are no detrimental consequences of these works in terms of asset operation, flood risk and changes to fluvial geomorphological processes.   | Where the project is identified to have the potential to impact an asset of interest, the Applicants will seek to consult with all interested parties. This is to be undertaken once the location and type of watercourse crossings are confirmed as well as surface water discharge locations from onshore substations which is to come forward at detailed design stage.  |
| TA_0007_020_231123          | S42/S44 | Email           | 3. Drainage - Foul and Surface Water We would be grateful if you can provide details of any drainage proposals in respect of both foul and surface water. This should include rates of discharge, volumes of discharge, points of connection, the nature and extent of any contaminants, and details of any necessary pre-treatment prior to connection to the public sewer. We request that you provide details of drainage during operation of the windfarm and during the construction period. We request further details of any approach for the storage and disposal of any hazardous fluids. We wish to understand whether there is any intention to connect such flows to our public sewerage network and to ensure any potential impact on water supply assets, including the groundwater environment, is fully considered and mitigated.   | The conceptual surface water drainage strategy is included within Volume 3, Annex 2.3: Flood Risk Assessment of the ES (document reference F3.2.3). Also refer to the Outline Operational Drainage Management Plan (document reference J10). There is no proposed discharge to public sewers. Additional information will come forward with the progression of the detailed drainage design where infiltration testing will inform the discharge location of surface water from onshore substations. If surface water will be discharged to watercourse, the  |

|                             |         |                 |   | discharge point will be set out within the DCO. Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk (document reference F3.2). In addition, best practice with regard the use and storage of oils, chemicals and other wastes, to remove the risk of causing pollution during construction is outlined within Outline CoCP (document reference J1).  |
| TA_0007_021_231123          | S42/S44 | Email           | Surface Water Management Hierarchy We wish to highlight that consistent with the principles of the hierarchy for the management of surface water in national planning policy and the obligations of the Environment Act 2021, no surface water will be allowed to discharge to the existing public sewerage system. Surface water should instead discharge to more sustainable alternatives as outlined in the surface water management hierarchy. This will ensure the impact of development on public wastewater infrastructure, both in terms of the wastewater network and wastewater treatment works, is minimised. We adopt this position as surface water flows are very large when compared with foul flows. By ensuring that no surface water enters the public sewerage system, the impact on customers, watercourses and the environment will be minimised.  | The conceptual surface water drainage strategy is included within Volume 3, Annex 2.3: Flood Risk Assessment of the ES (document reference F3.2.3) and includes assessment of the surface water management hierarchy. Additional information will come forward with the progression of the detailed drainage design where infiltration testing will inform the discharge location of surface water from onshore substations. Refer to the Outline Operational Drainage Management Plan (document reference J10).  |
| TA_0007_022_231123          | S42/S44 | Email           | Please note, United Utilities is not responsible for advising on rates of discharge to the local watercourse system. This is a matter for discussion with the Lead Local Flood Authority and / or the Environment Agency (if the watercourse is classified as main river).  | The conceptual surface water drainage strategy is included within Volume 3, Annex 2.3: Flood Risk Assessment of the ES (document reference F3.2.3). Also refer to the Outline Operational Drainage Management Plan (document reference J10). There is no proposed discharge to public sewers. Additional information will come forward with the progression of the detailed drainage design where infiltration testing will inform the discharge location of surface water from onshore substations.  |
| TA_0007_023_231123          | S42/S44 | Email           | There should be no land drainage, including dewatering proposals, discharged to the public sewer.   | There is no proposed discharge to public sewers.  |
| TA_0007_024_231123          | S42/S44 | Email           | Rights to Discharge to Watercourse or Other Receiving Water Body Given the importance of surface water discharging to an alternative to the public sewer, we request that all land that is necessary to facilitate a discharge to a watercourse is fully identified within the limits of the DCO. This will ensure the site benefits from the requisite rights to discharge to more sustainable alternatives than the public sewer for the management of surface water, e.g., a right to discharge to a watercourse or other water body. For clarity, the extent of land should be sufficient to facilitate a surface water discharge to a watercourse / water body for all elements of your proposal. Ensuring that the extent of land within the site and the supporting Environmental Statement is sufficient for the purposes of the discharge of surface water is important as a sewerage company has limited powers to acquire the right to discharge surface water to a water body under the Water Industry Act. | The conceptual surface water drainage strategy is included within Volume 3, Annex 2.3: Flood Risk Assessment of the ES (document reference F3.2.3). Also refer to the Outline Operational Drainage Management Plan (document reference J10). There is no proposed discharge to public sewers. Updates to the Transmission Assets Order Limits at ES stage incorporates additional land up to the banks of the Dow Brook necessary to facilitate a discharge to the watercourse.   |
| TA_0007_025_231123          | S42/S44 | Email           | Multi-functional Sustainable Drainage Systems We request that surface water is only managed via sustainable drainage systems which are multi-functional and at the surface level in preference to conventional underground piped and tanked storage systems. Wherever practicable, Sustainable Drainage Systems (SuDS) should be implemented in accordance with the CIRIA SuDS manual. Managing surface water through the use of SuDS can provide benefits in water quantity, water quality, amenity and biodiversity. If the applicant intends to offer wastewater assets forward for adoption by United Utilities, their proposed detailed design will be subject to a technical appraisal by our Developer Services team and must meet the requirements outlined in 'Sewers for Adoption and United Utilities' Asset Standards'. This is important as drainage design can be a key determining factor of site levels and layout.   | Attenuation basins SuDS are proposed within the conceptual surface water drainage strategy, which is included within Volume 3, Annex 2.3: Flood Risk Assessment of the ES (document reference F3.2.3). Also refer to the Outline Operational Drainage Management Plan (document reference J10). Additional information regarding SuDS will come forward with the progression of the detailed drainage design. SuDS will be in accordance with the CIRIA SuDS Manual (additional detail included within Volume 3, Annex 2.3: Flood Risk Assessment of the ES (document reference F3.2.3)). |
| TA_0007_026_231123          | S42/S44 | Email           | Acceptance of a drainage strategy does not infer that a detailed drainage design will meet the requirements for a successful adoption application. We strongly recommend that no construction commences until the detailed drainage design, has been assessed and accepted in writing by United Utilities. Any work carried out prior to the technical assessment being approved is done entirely at the developer's own risk and could be subject to change.   | Works to be undertaken within proximity to United Utilities assets will be designed in accordance with the water authorities design standards and will require to be approved by United Utilities prior to the commencement of works (refer to Table 2.20 in Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2)).  |
| TA_0007_027_231123          | S42/S44 | Email           | Management and Maintenance of Sustainable Drainage Systems Without effective management and maintenance, sustainable drainage systems can fail or become ineffective. As a provider of wastewater services, we believe we have a duty to advise the determining authority of this potential risk to ensure the longevity of the surface water drainage system and the service it provides to people. We also wish to minimise the risk of a sustainable drainage system having a detrimental impact on the public sewer   | The conceptual surface water drainage strategy is included within Volume 3, Annex 2.3: Flood Risk Assessment of the ES (document reference F3.2.3) and includes information regarding the management and maintenance of SuDS (also refer to Outline Operational Drainage Management Plan (document reference J10)).   |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received  | Applicants' response   |

|                             |         |                 | network should the two systems interact. We therefore recommend that you include details of a management and maintenance regime for any sustainable drainage system that is included as part of the proposed development. Please note that United Utilities cannot provide comment on the management and maintenance of an asset that is owned by a third party management and maintenance company. We would not be involved in the approval of the management and maintenance arrangements in these circumstances.   |  |
| TA_0007_028_231123          | S42/S44 | Email           | 4. Geo Environmental / Geotechnical Groundwater Environment and Water Resources The application boundary for the transmission assets extends to include sandstone rock, designated as a groundwater source protection zone (SPZ 3). These are used for the abstraction of water for public water supply purposes. We request that the approach to the assessment of the impact on the groundwater environment is considered and agreed with United Utilities.   | Source Protection Zones are described in section 1.6.7 and impacts posed by the Transmission Assets are assessed in section 1.11 of Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F3.1). Due to linkages between surface water and groundwater, reference to discussions involving groundwater will be made within sections 2.11.4 and 2.11.2 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). In addition, best practice with regard the use and storage of oils, chemicals and other wastes, to remove the risk of causing pollution during construction is outlined within the Outline CoCP (document reference J1).  |
| TA_0007_029_231123          | S42/S44 | Email           | As a nationally and regionally significant scheme, the applicant should follow 'The Environment Agency's approach to groundwater protection' 1 (hereafter referred to as 'the Environment POF PAgency's approach') in relation to protection of drinking water supply from United Utilities' groundwater abstractions. At the current time we do not have sufficient information in order to be able to assess the impact of the proposed development and associated proposals where these lie within a groundwater source protection zone, or directly overlie an abstracted aquifer, to ensure the proposals 'do not have the potential to cause pollution or harmful disturbance to groundwater flow' and to ensure 'these risks can be reduced to an acceptable level'. We wish to draw attention to Position Statements C1 and C2 of 'The Environment Agency's approach' which state: 'C1 - Nationally or regionally significant schemes The Environment Agency requires the promoters of schemes of national or regional significance to protect groundwater when choosing the location for their activity or development. In the cases where this is not possible due to national or regional interests, the Environment Agency expects to be fully involved in the scheme development to mitigate groundwater risks via EPR where applicable. Promoters are expected (via the environmental impact assessment process) to identify all the potential pollution linkages and apply best available techniques to mitigate the risks. C2 - Non-nationally significant infrastructure schemes In SPZ1 and SPZ2, the Environment Agency will only agree to proposals for infrastructure developments of non-national significance where they do not have the potential to cause pollution or harmful disturbance to groundwater flow or where these risks can be reduced to an acceptable level via EPR if applicable. | The referenced guidance has been used and is listed in paragraph 1.2.3.1 of Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F1.3). Due to linkages between surface water and groundwater, reference to discussions involving groundwater will be made within section 2.6.11.2 of Volume 3, Chapter 2: Hydrology and flood risk of the ES.   |
| TA_0007_031_231123          | S42/S44 | Email           | Sustainable Drainage Systems The on-shore drainage from the proposed scheme should also be assessed within the Environmental Statement for the risk to groundwater abstractions (G11). G11 - Discharges from areas subject to contamination Discharges of surface water run-off to ground at sites affected by land contamination, or from sites used for the storage of potential pollutants are likely to require an environmental permit. This applies especially to sites where storage, handling or use of hazardous substances occurs (for example, garage forecourts, coach and lorry parks/turning areas and metal recycling/vehicle dismantling facilities). These sites will need to be subject to risk assessment with acceptable effluent treatment provided.'  | Assessment of the impacts of contaminated runoff on the quality of surface waters and ground receptors is presented within section 2.11.2 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). In addition, best practice with regard the use and storage of oils, chemicals and other wastes, to remove the risk of causing pollution during construction is outlined within the Outline CoCP (document reference J10). An Outline CoCP (document reference J1) will be prepared and submitted with the application for development consent. The Outline CoCP will include measures to maintain and address: • flood protection and control measures; • drainage; • pollution prevention; • geology and ground conditions; • ecology and nature conservation (including protected species and invasive species); • historic environment; • soil management; • traffic and transport; • noise management measures; • air quality and dust management; • landscape and visual; and • bentonite breakout plan. An Outline Operational Drainage |

| TA_0007_038_231123          | S42/S44 | Email           | 6. General Advice If you intend to request water and/or wastewater services from United Utilities, you should visit our website for advice. This includes seeking confirmation of the required metering arrangements for the proposed development. If any part of the proposed development site benefits from existing water and wastewater connections, you should not assume that the arrangements will be suitable for the new proposal. In some circumstances we may require a compulsory meter is fitted. For detailed guidance on whether the development will require a compulsory meter please visit <a href="https://www.unitedutilities.com/my-account/your-bill/our-household-charges-20212022/31T">https://www.unitedutilities.com/my-account/your-bill/our-household-charges-20212022/31T</a> and go to section 7.7 for compulsory metering. To avoid any unnecessary costs and delays being incurred by the applicant or any subsequent developer, we strongly recommend the applicant seeks advice regarding water and wastewater services, and metering arrangements, at the earliest opportunity. Please see 'Contacts' section below.   | The Applicants note your response.  |
| TA_0016_001_211123          | S42     | Email           | Morgan and Morecambe Offshore Wind Farms: Transmission Assets Statutory Consultation Lancashire County Council is the Lead Local Flood Authority (LLFA) for area involving this development. We have a role in the planning process as a statutory consultee for major development with surface water drainage, under the Town and Country Planning (Development Management Procedure) (England) Order 2015. We also regulate consentable activities to ordinary watercourses through 'ordinary watercourse consent' under the Land Drainage Act 1991 (as amended). In this instance, the development is classified as a 'Nationally Significant Infrastructure Project' under the Planning Act 2008. Therefore, this development is exempt from applying for 'normal' planning permission from the Local Planning Authority as this will be determined by the Planning Inspectorate. It is also exempt from applying for ordinary watercourse consent from the county council as this will be managed through the Development Consent Order process. Notwithstanding this, the Lead Local Flood Authority wishes to provide the following comments and advice about the development proposals.   | The Applicants note your response.  |
| TA_0016_002_211123          | S42     | Email           | Previous comments made by the Lead Local Flood Authority The Lead Local Flood Authority has been engaged with this project at various stage of development. Through our LLFA Planning Advice Service we have liaised with the project team in relation to onshore matters to provide advice aimed at managing and mitigating the impact on surface water flood risk and ordinary watercourses in Lancashire.  | The Applicants note your response. Lancashire County Council has been included in Expert Working Groups throughout the project. Standard protective provisions for the benefit of the Lead Local Flood Authority have been included in Schedule 10, Part 11 of the draft Development Consent Order (document reference C1).   |
| TA_0016_003_211123          | S42     | Email           | Proposed works to ordinary watercourses Any impact on ordinary watercourses should be identified, assessed, minimised and mitigated appropriately irrespective of whether the works impacting an ordinary watercourse are temporary or permanent and according to site-specific circumstances. Existing watercourses should be protected and, where appropriate, enhanced through the site layout, for example, naturalization, de-culverting, and the creation of riparian habitats. The culverting of any ordinary watercourses should be avoided. When designing a site layout, it is critical to consider the future ownership of and access to any on-site watercourses. The site layout must provide safe access to all on-site watercourses for maintenance purposes. No development should occur within 8 metres from the bank top of any ordinary watercourse to achieve this. This includes the construction of structures such as walls and fences and any activity during the construction phases of development. Failure to provide appropriate access and maintenance arrangements for ordinary watercourses can increase flood risk over the lifetime of the development, contrary to the National Planning Policy Framework | Assessment of the impacts on the quality of surface waters and ground receptors is presented within section 2.11.2 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Measures adopted as part of the Transmission Assets are presented within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Volume 1, Annex 3.2: Onshore crossing schedule of the ES (document reference F1.3.2) presents crossing techniques of Ordinary Watercourses. An Outline CoCP (document reference J1) is submitted as part of the application for development consent. The Outline CoCP (document reference J1) includes measures to maintain and address: <ul style="list-style-type: none"> <li>• flood protection and control measures;</li> <li>• drainage;</li> <li>• pollution prevention;</li> <li>• geology and ground conditions;</li> <li>• ecology and nature conservation (including protected species and invasive species);</li> <li>• historic environment;</li> <li>• soil management;</li> <li>• traffic and transport;</li> <li>• noise management measures;</li> <li>• air quality and dust management;</li> <li>• landscape and visual; and</li> <li>• bentonite breakout plan.</li> </ul> In addition, the Applicants are in discussion with the LLFA regarding protective provisions. |

|-----------------------------|---------|-----------------|--|--|
| TA_0016_004_211123          | S42     | Email           | <p>Ordinary Watercourse Crossings Open trench watercourse crossings should be avoided wherever possible, with trenchless construction methods such as horizontal directional drilling prioritised to minimise any unwanted effects on the bed and banks of the watercourse, and any disruption to existing flora, fauna and/or habitats. Where open trench watercourse crossings cannot be avoided, then effective construction method statements should be produced to detail, in chronological order, how the works will be undertaken from start to finish. Typically the Lead Local Flood Authority would expect this to consider, as a minimum:</p> <ul style="list-style-type: none"> <li>• How the works will be arranged to ensure there is no increase in flood risk to third parties. All reasonable precautions should be taken during the undertaking of the works so as not to obstruct or impede the flow of the watercourse. If over pumping is used, then this should only be undertaken in a manner that minimises bed disturbance, avoids movement of silt and minimises scour. A suitable screen/strainer should also be provided to prevent fish and other material being drawn in.</li> <li>• How any pollution risks will be managed and dealt with should they occur, i.e. the release of fine sediments and other pollutants into the watercourse during the construction works.</li> <li>• How the bed and banks of the watercourse will be restored once the works are complete. Material used for backfilling must be inert and not contain any material that could potentially leach out into the watercourse. Any landscaping of banks must be restricted to native species only, and invasive species such as Japanese Knotweed, if encountered, must be managed and controlled on site.</li> </ul>  | <p>The following features will be crossed by trenchless techniques not including micro-tunnelling and direct pipe as set out in the Onshore Crossing Schedule submitted as part of the application for the development consent (Volume 1, Annex 3.2: Onshore crossing schedule of the ES (document reference F1.3.2)). Trenchless techniques including micro tunnelling and direct pipe will be used to cross the River Ribble where the 400 kV grid connection cable corridor is proposed. Where any trenched crossings are proposed, method statements would be produced.</p>  |
| TA_0016_005_211123          | S42     | Email           | <p>Surface water flood risk and Sustainable Drainage Systems (SuDS) Surface water flood risk should be identified, assessed, minimised and mitigated appropriately in accordance with the National Planning Policy Framework and the Planning Practice Guidance through a flood risk assessment. Findings of the flood risk assessment(s) should be used to inform the design of sustainable drainage systems which serve impermeable surfaces, whether permanent or temporary. Surface water flood risk should also be considered during each construction phase, as heavy machinery can compact ground leading to increased surface water runoff. This can have a negative impact on nearby watercourses, such as increased sedimentation which can lead to siltation, poor water quality and an adverse effect on habitats. Surface water runoff from development should not impact on infrastructure such as roads and other infrastructure. If there is any potential for the development to impact the highway, rail or other network, then the suitability of drainage proposals should be discussed with Network Rail and/or the Highway Authority, to ensure the stability of their assets is not negatively affected. The development should maximise the opportunities presented to reduce the causes and impacts of flooding on and off-site, wherever they would be effective, in line with paragraph 161 of the National Planning Policy Framework and paragraphs 062 to 067 of the Planning Practice Guidance. This should be achieved through the design of the sustainable drainage system and, where appropriate, the use of Natural Flood Management techniques. A comprehensive sustainable drainage approach can help to alleviate flood risk as well as managing the impacts where flooding does occur, for example by:</p> <ul style="list-style-type: none"> <li>• Maximising opportunities for infiltration of surface water through replacement of impermeable surfaces with permeable surfaces;</li> <li>• Maximising opportunities for planting and vegetated areas, in preference to engineered surfaces, to increase evapo-transpiration and provide improvements for biodiversity and wider natural capital benefits; and</li> <li>• Providing additional surface water storage over and above the minimum requirements e.g. an over-sized pond, to accommodate more extreme rainfall events (e.g. 0.5% annual exceedance probability) leading to a more flood/climate resilient electricity infrastructure network. Specifically, appropriate sustainable drainage systems should be incorporated to drain any new impermeable surfaces such as compounds, sub-stations, roads, parking areas etc. SuDS should be designed to be compliant with the requirements set out in the National Planning Policy Framework, the Planning Practice Guidance and the Defra Technical Standards for SuDS. A site-specific 'Operation and Maintenance Manual' for the lifetime of the development of each sustainable drainage component that makes up each sustainable drainage system should be compiled. Typically the Lead Local Flood Authority would expect this to include, as a minimum:</li> <li>• A timetable for its implementation;</li> <li>• Details of the maintenance, operational and access requirement for all SuDS components and connecting drainage structures, including all watercourses and their ownership;</li> <li>• Pro-forma to allow the recording of each inspection and maintenance activity, as well as allowing any faults to be recorded and actions taken to rectify issues;</li> <li>• The arrangements for adoption by any public body or statutory undertaker, or any other arrangements to secure the operation of the sustainable drainage scheme in perpetuity;</li> <li>4• Details of financial management including arrangements for the replacement of major components at the end of the manufacturer's recommended design life;</li> <li>• Details of whom to contact if pollution is seen in the system or if it is not working correctly; and</li> <li>• Means of access for maintenance and easements. Thereafter the sustainable drainage systems should be retained, managed, and maintained in accordance with the approved details. In Lancashire we provide general advice and support on SuDS design through the</li> </ul> | <p>The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). In addition, best practice with regard the use and storage of oils, chemicals and other wastes, to remove the risk of causing pollution during construction is outlined within the Outline CoCP (document reference J1). An Outline CoCP (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. An Outline Operational Drainage Management Plan for the substation site(s) has been prepared and submitted with the application for development consent. The Operational Drainage Management Plan will include measures to ensure that existing land drainage is reinstated and/or maintained. This will include measures to limit discharge rates and attenuate flows to maintain greenfield runoff rates at the onshore substations. It will also include measures to control surface water runoff, including measures to prevent flooding of the working areas or offsite and to ensure any runoff is treated appropriately. The Operational Drainage Management Plan will be developed in line with the latest relevant drainage guidance notes in consultation with the Environment Agency and the Lead Local Flood Authority (Lancashire County Council).</p> |

|-----------------------------|---------|-----------------|--|--|
|                             |         |                 | Lancashire SuDS Pro-forma and accompanying guidance which we recommend are used in finalising SuDS designs and for consistency in expectations in Lancashire.  |  |
| TA_0016_006_211123          | S42     | Email           | Natural Flood Management Opportunities Natural flood management techniques work with natural processes to protect, restore and emulate the natural functions of catchments, floodplains, rivers and the coast. They aim to manage the sources and pathways of flood waters whilst providing wider benefits to people, wildlife and the environment. Examples include:• Land management such as removing impermeable surfacing to maximise infiltration, planting trees to increase evapo-transpiration, or making green space where flood waters are most likely to flow or collect, or where rivers and their meanders are likely to migrate;• Watercourse restoration such as removing culverts and other capacity restrictions, reintroducing meanders to provide additional storage, or naturalising river beds and banks to slow the flow.  | Ecology and landscape mitigation is proposed within the permanent substation sites and these measures are set out in the Outline Landscape Management Plan (document reference J2) and the Outline Ecological Management Plan (document reference J6).An Outline Operational Drainage Management Plan for the substation site(s) has been prepared and submitted with the application for development consent. The Operational Drainage Management Plan will include measures to ensure that existing land drainage is reinstated and/or maintained. This will include measures to limit discharge rates and attenuate flows to maintain greenfield runoff rates at the onshore substations It will also include measures to control surface water runoff, including measures to prevent flooding of the working areas or offsite and to ensure any runoff is treated appropriately. The Operational Drainage Management Plan will be developed in line with the latest relevant drainage guidance notes in consultation with the Environment Agency and the Lead Local Flood Authority (Lancashire County Council). |
| TA_0017_014_231123          | S42/S44 | Email           | Surveys Survey data submitted with the planning application should be current/up-to-date, in line with recognised guidelines (as summarised above). The survey area should include: • The intended location of the development footprint;• Potential working areas, compounds, storage areas and access routes;• Any land that may be used within the mitigation, compensation or biodiversity net gain proposals (on or off-site);• A suitable buffer distance, taking account of the likely zone of influence and relevant survey guidelines.  | The survey area is the area used for site-specific surveys and is generally defined as a 150 m buffer around the Onshore Order Limits. The 150 m buffer was included to take account of protected species that may occur adjacent or close to the Transmission Assets and to allow for evolution of the boundary during the site selection process. A separate survey area was used for GCN surveys. The GCN survey area is defined as a 250 m buffer around the Onshore Order Limits. Volume 3, Annex 3.8: Great crested newt survey and reptile survey technical report of the ES (document reference F3.3.8) provides further details regarding the GCN survey area. Owing to the iterative design process of the Transmission Assets, some surveys were undertaken further than 150 m from the Onshore Order Limits. Nevertheless, information from these surveys have been included in technical annexes because it provides context regarding the ecological sensitivity of the wider area.  |
| TA_0017_036_231123          | S42/S44 | Email           | It should be stated how the necessary maintenance and management will be secured for the lifetime of the anticipated planning obligations.   | An Outline Ecological Management Plan (document reference J6) is provided as part of the application for development consent.  |
| TA_0017_037_231123          | S42/S44 | Email           | Monitoring measures should be sufficient to measure the success of mitigation and compensation measures, to inform the need for remedial measures and to inform establishment maintenance and long-term management.  | Any relevant monitoring measures are set out in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).   |
| TA_0019_022_231123          | S42/S44 | Email           | The RAG status used to down select the zones only takes into account the present flood levels zones. The Climate Change flood zone map for 2030 shows the southern Morecambe substation option in large part to be below the annual flood level. Given the operational life of the substation the RAG status should not be green. Given the long-life span of the proposed developments, the available flood level predictions for the next five decades should be used.   | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3).  |
| TA_0029_013_231123          | S42/S44 | Email           | Underground Cabling Based on the consultation brochure the cables would appear to be being installed via Horizontal Directional Drilling (HDD). The details describe that the corridor width will be 70m, with up to 18 cables. The trench depth would be 1.8m in depth (1.2m to top of the ducting). Given this suggested depth of 1.8m, this would not be suitable for the canal/brook crossings. In accordance with the Trust's Third Part\:) Works Code of Practice (CoP) Part 2 <a href="https://canalrivertrust.org.uk/business-and-trade/undertaking-works-on-our-property-and-our-code-of-practice">https://canalrivertrust.org.uk/business-and-trade/undertaking-works-on-our-property-and-our-code-of-practice</a> we would expect any waterway crossing (pipes, cables etc) to be installed under the waterway and cross perpendicular to the waterway. We would normally expect such crossings to be constructed via trenchless techniques and the crown of the crossing would need to be at least 3.5m below hard bed level of the waterway to ensure any settlement does not impact the waterway. However, this could crossing require a greater depth, depending on the results of the borehole / geotechnical information provided. This would mean that the launch and reception pits would be set well | Waterways belonging to the Canal and River Trust located within the Onshore Order Limits include the River Ribble and Ribble Link.As described in Volume 1, Chapter 3: Project description of the ES, several trenchless techniques remain under consideration for the 400 kV grid connection cable crossing of the River Ribble. In addition, trenchless techniques would also be utilised where the onshore export cable corridor and 400 kV grid connection cable corridor are required to cross watercourses, including Ribble Link. The commitment to utilise trenchless techniques during construction of the Transmission Assets would avoid potential impacts to the recreational usage of the River Ribble and Ribble   |

|-----------------------------|---------|-----------------|---|--|
|                             |         |                 | away from the waterway to allow the Horizontal Directional Drilling (HDD) to achieve the required depth. The route and depth of any such crossing, method statements, construction techniques and associated ground investigations will need to be approved by the Trust's geotechnical specialists, all via the CoP process. We would welcome further discussion in relation to this matter.   | Link (see CoT90 in Table 6.17 of Volume 3, Chapter r6: Land use and recreation of the ES (document reference F3.6)).   |
| TA_0029_016_231123          | S42/S44 | Email           | Pollution prevention The canal/brook should be considered as a sensitive receptor as a watercourse. A robust and comprehensive Construction Environment Management Plan (CEMP) would be required to include aspects of how materials, fuels, chemicals and wastes will be stored and where; measures to the prevention of dust generation and windblown litter and debris; measures to prevent run off into the canal and culverts (e.g. of silt water, contaminated water, fuels and chemicals); pollution response emergency procedures and details of any planned water abstractions and /or discharges from or which may impact upon our waterways. Stockpiles must be kept away from the waterway and drainage Systems to reduce potential sediment laden runoff entering the waterways. Silt curtains should also be used to stop surface water runoff. Where the works require stripping topsoil and removing vegetation, such as grass, silt curtains should be kept in place to protect against surface water runoff until sufficient vegetation has grown back on the reinstated topsoil to stabilise the soil and to act as a natural buffer. Site excavations will likely need to be dewatered, these cannot be discharged to the canal/brook without our consent. Discharges to land will need to be kept away from waterways. We note that a pollution prevention plan is being drafted, this will need reviewing after it is issued. | An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures to maintain and address: <ul style="list-style-type: none"> <li>• flood protection and control measures;</li> <li>• drainage;</li> <li>• pollution prevention;</li> <li>• geology and ground conditions;</li> <li>• ecology and nature conservation (including protected species and invasive species);</li> <li>• historic environment;</li> <li>• soil management;</li> <li>• traffic and transport;</li> <li>• noise management measures;</li> <li>• air quality and dust management;</li> <li>• landscape and visual; and</li> <li>• bentonite breakout plan.</li> </ul> |
| TA_0035_009_221123          | S42/S44 | Email           | Flood risk: We are generally satisfied with the scope and assessment of hydrology and flood risk and consider that the proposed development could be safe without exacerbating flood risk elsewhere if the proposed flood risk mitigation measures are further developed and implemented. A number of areas need to be addressed in order to make these proposals consistent with government policy. In particular the climate change guidance needs to be applied to any assumptions currently made that underpin the Flood Risk Assessment. This should inform the design flood events being considered. You should treat this as a 'sensitivity test'. It will help assess how sensitive the proposal is to changes in the climate for different future scenarios. This will help to ensure your development can be adapted to large-scale climate change over its lifetime.   | Headroom to account for the ages of the Ribble Douglas and Ribble Estuary hydraulic models has been provided within the ES FRA to provide an up to date baseline assessment. Climate change allowances have been applied to permanent development to ensure development can be adapted to large scale climate change over its lifetime.  |
| TA_0035_012_221123          | S42/S44 | Email           | Groundwater: The impacts of the proposals on groundwater-dependant habitats of Lytham St Annes dunes SSSI have not been assessed.   | Section 3.11.3 of Volume 3, Chapter 3: Onshore ecology and nature conservation (document reference F3.3) provides an assessment of impacts to the SSSI, including changes in relation to the water table.  |

| TA_0016_001_211123          | S42/S44 | Email           | <p>Thank you for inviting the Lead Local Flood Authority to comment on the below consultation: Morgan and Morecambe Offshore Wind Farms: Transmission Assets Statutory Consultation Lancashire County Council is the Lead Local Flood Authority (LLFA) for area involving this development. We have a role in the planning process as a statutory consultee for major development with surface water drainage, under the Town and Country Planning (Development Management Procedure) (England) Order 2015. We also regulate consentable activities to ordinary watercourses through 'ordinary watercourse consent' under the Land Drainage Act 1991 (as amended). In this instance, the development is classified as a 'Nationally Significant Infrastructure Project' under the Planning Act 2008. Therefore, this development is exempt from applying for 'normal' planning permission from the Local Planning Authority as this will be determined by the Planning Inspectorate. It is also exempt from applying for ordinary watercourse consent from the county council as this will be managed through the Development Consent Order process. Notwithstanding this, the Lead Local Flood Authority wishes to provide the following comments and advice about the development proposals. Previous comments made by the Lead Local Flood Authority The Lead Local Flood Authority has been engaged with this project at various stage of development. Through our LLFA Planning Advice Service we have liaised with the project team in relation to onshore matters to provide advice aimed at managing and mitigating the impact on surface water flood risk and ordinary watercourses in Lancashire.</p> | The Applicants note your response. Lancashire County Council has been included in Expert Working Groups throughout the project.   |
| TA_0016_002_211123          | S42/S44 | Email           | <p>Proposed works to ordinary watercourses Any impact on ordinary watercourses should be identified, assessed, minimised and mitigated appropriately irrespective of whether the works impacting an ordinary watercourse are temporary or permanent and according to site-specific circumstances. Existing watercourses should be protected and, where appropriate, enhanced through the site layout, for example, naturalization, de-culverting, and the creation of riparian habitats. The culverting of any ordinary</p>   | Ecology and landscape mitigation is proposed within the permanent substation sites and these measures are set out in the Outline Landscape Management Plan (document reference J2) and the Outline Ecological Management Plan (document reference J6). |                             |         |                 | <p>watercourses should be avoided. When designing a site layout, it is critical to consider the future ownership of and access to any on-site watercourses. The site layout must provide safe access to all on-site watercourses for maintenance purposes. No development should occur within 8 metres from the bank top of any ordinary watercourse to achieve this. This includes the construction of structures such as walls and fences and any activity during the construction phases of development. Failure to provide appropriate access and maintenance arrangements for ordinary watercourses can increase flood risk over the lifetime of the development, contrary to the National Planning Policy Framework.</p>   | <p>been prepared and submitted with the application for development consent. The Operational Drainage Management Plan will include measures to ensure that existing land drainage is reinstated and/or maintained. This will include measures to limit discharge rates and attenuate flows to maintain greenfield runoff rates at the onshore substations. It will also include measures to control surface water runoff, including measures to prevent flooding of the working areas or offsite and to ensure any runoff is treated appropriately. The Operational Drainage Management Plan will be developed in line with the latest relevant drainage guidance notes in consultation with the Environment Agency and the Lead Local Flood Authority (Lancashire County Council).</p>  |
| TA_0016_003_211123          | S42/S44 | Email           | <p>Ordinary Watercourse Crossings Open trench watercourse crossings should be avoided wherever possible, with trenchless construction methods such as horizontal directional drilling prioritised to minimise any unwanted effects on the bed and banks of the watercourse, and any disruption to existing flora, fauna and/or habitats. Where open trench watercourse crossings cannot be avoided, then effective construction method statements should be produced to detail, in chronological order, how the works will be undertaken from start to finish. Typically the Lead Local Flood Authority would expect this to consider, as a minimum:</p> <ul style="list-style-type: none"> <li>• How the works will be arranged to ensure there is no increase in flood risk to third parties. All reasonable precautions should be taken during the undertaking of the works so as not to obstruct or impede the flow of the watercourse. If over pumping is used, then this should only be undertaken in a manner that minimises bed disturbance, avoids movement of silt and minimises scour. A suitable screen/strainer should also be provided to prevent fish and other material being drawn in.</li> <li>• How any pollution risks will be managed and dealt with should they occur, i.e. the release of fine sediments and other pollutants into the watercourse during the construction works.</li> <li>• How the bed and banks of the watercourse will be restored once the works are complete. Material used for backfilling must be inert and not contain any material that could potentially leach out into the watercourse. Any landscaping of banks must be restricted to native species only, and invasive species such as Japanese Knotweed, if encountered, must be managed and controlled on site.</li> </ul>  | <p>Assessment of the impacts on the quality of surface waters and ground receptors is presented within section 2.11.2 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Measures adopted as part of the Transmission Assets are presented within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Volume 1, Annex 3.2: Onshore crossing schedule of the ES (document reference F1.3.2) presents crossing techniques of Ordinary Watercourses. An Outline CoCP (document reference J1) is submitted as part of the application for development consent. The Outline CoCP (document reference J1) includes measures to maintain and address:</p> <ul style="list-style-type: none"> <li>• flood protection and control measures;</li> <li>• drainage;</li> <li>• pollution prevention;</li> <li>• geology and ground conditions;</li> <li>• ecology and nature conservation (including protected species and invasive species);</li> <li>• historic environment;</li> <li>• soil management;</li> <li>• traffic and transport;</li> <li>• noise management measures;</li> <li>• air quality and dust management;</li> <li>• landscape and visual; and</li> <li>• bentonite breakout plan.</li> </ul> <p>In addition, the Applicants are in discussion with the LLFA regarding protective provisions.</p>  |
| TA_0016_004_211123          | S42/S44 | Email           | <p>Surface water flood risk and Sustainable Drainage Systems (SuDS) Surface water flood risk should be identified, assessed, minimised and mitigated appropriately in accordance with the National Planning Policy Framework and the Planning Practice Guidance through a flood risk assessment. Findings of the flood risk assessment(s) should be used to inform the design of sustainable drainage systems which serve impermeable surfaces, whether permanent or temporary. Surface water flood risk should also be considered during each construction phase, as heavy machinery can compact ground leading to increased surface water runoff. This can have a negative impact on nearby watercourses, such as increased sedimentation which can lead to siltation, poor water quality and an adverse effect on habitats. Surface water runoff from development should not impact on infrastructure such as roads and other infrastructure. If there is any potential for the development to impact the highway, rail or other network, then the suitability of drainage proposals should be discussed with Network Rail and/or the Highway Authority, to ensure the stability of their assets is not negatively affected. The development should maximise the opportunities presented to reduce the causes and impacts of flooding on and off-site, wherever they would be effective, in line with paragraph 161 of the National Planning Policy Framework and paragraphs 062 to 067 of the Planning Practice Guidance. This should be achieved through the design of the sustainable drainage system and, where appropriate, the use of Natural Flood Management techniques. A comprehensive sustainable drainage approach can help to alleviate flood risk as well as managing the impacts where flooding does occur, for example by:</p> <ul style="list-style-type: none"> <li>• Maximising opportunities for infiltration of surface water through replacement of impermeable surfaces with permeable surfaces;</li> <li>• Maximising opportunities for planting and vegetated areas, in preference to engineered surfaces, to increase evapo-transpiration and provide improvements for biodiversity and wider natural capital benefits; and</li> <li>• Providing additional surface water storage over and above the minimum requirements e.g. an over-sized pond, to accommodate more extreme rainfall events (e.g. 0.5% annual exceedance probability) leading to a more flood/climate resilient electricity infrastructure network. Specifically, appropriate sustainable drainage systems should be incorporated to drain any new impermeable surfaces such as compounds, sub-stations, roads, parking</li> </ul> | <p>The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). In addition, best practice with regard the use and storage of oils, chemicals and other wastes, to remove the risk of causing pollution during construction is outlined within the Outline CoCP (document reference J1). An Outline CoCP (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. An Outline Operational Drainage Management Plan for the substation site(s) has been prepared and submitted with the application for development consent. The Operational Drainage Management Plan will include measures to ensure that existing land drainage is reinstated and/or maintained. This will include measures to limit discharge rates and attenuate flows to maintain greenfield runoff rates at the onshore substations. It will also include measures to control surface water runoff, including measures to prevent flooding of the working areas or offsite and to ensure any runoff is treated appropriately. The Operational Drainage Management Plan will be developed in line with the latest relevant drainage guidance notes in consultation with the Environment Agency and the Lead Local Flood Authority (Lancashire County Council).</p> |

|                             |         |                 | <p>areas etc. SuDS should be designed to be compliant with the requirements set out in the National Planning Policy Framework, the Planning Practice Guidance and the Defra Technical Standards for SuDS. A site-specific 'Operation and Maintenance Manual' for the lifetime of the development of each sustainable drainage component that makes up each sustainable drainage system should be compiled. Typically the Lead Local Flood Authority would expect this to include, as a minimum:</p> <ul style="list-style-type: none"> <li>• A timetable for its implementation;</li> <li>• Details of the maintenance, operational and access requirement for all SuDS components and connecting drainage structures, including all watercourses and their ownership;</li> <li>• Pro-forma to allow the recording of each inspection and maintenance activity, as well as allowing any faults to be recorded and actions taken to rectify issues;</li> <li>• The arrangements for adoption by any public body or statutory undertaker, or any other arrangements to secure the operation of the sustainable drainage scheme in perpetuity;</li> <li>• Details of financial management including arrangements for the replacement of major components at the end of the manufacturer's recommended design life;</li> <li>• Details of whom to contact if pollution is seen in the system or if it is not working correctly; and</li> <li>• Means of access for maintenance and easements.</li> </ul> <p>Thereafter the sustainable drainage systems should be retained, managed, and maintained in accordance with the approved details. In Lancashire we provide general advice and support on SuDS design through the Lancashire SuDS Pro-forma and accompanying guidance which we recommend are used in finalising SuDS designs and for consistency in expectations in Lancashire.</p> |  |
| TA_0016_005_211123          | S42/S44 | Email           | <p>Natural Flood Management Opportunities Natural flood management techniques work with natural processes to protect, restore and emulate the natural functions of catchments, floodplains, rivers and the coast. They aim to manage the sources and pathways of flood waters whilst providing wider benefits to people, wildlife and the environment. Examples include:</p> <ul style="list-style-type: none"> <li>• Land management such as removing impermeable surfacing to maximise infiltration, planting trees to increase evapo-transpiration, or making green space where flood waters are most likely to flow or collect, or where rivers and their meanders are likely to migrate;</li> <li>• Watercourse restoration such as removing culverts and other capacity restrictions, reintroducing meanders to provide additional storage, or naturalising river beds and banks to slow the flow.</li> </ul> <p>We trust you find this response constructive. If you wish to discuss any aspects of this response further with the Lead Local Flood Authority, please do so by contacting us at the email address at the top of this letter. Yours faithfully, Laura Bigley and Chris Dunderdale<br/>Principal Flood Risk Officer and Senior Flood Risk Officer</p>  | <p>Ecology and landscape mitigation is proposed within the permanent substation sites and these measures are set out in the Outline Landscape Management Plan (document reference J2) and the Outline Ecological Management Plan (document reference J6). It will also include measures to control surface water runoff, including measures to prevent flooding of the working areas or offsite and to ensure any runoff is treated appropriately. The Operational Drainage Management Plan will be developed in line with the latest relevant drainage guidance notes in consultation with the Environment Agency and the Lead Local Flood Authority (Lancashire County Council).Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes the preparation of a Soil Management Plan in general accordance with the Outline Soil Management Plan (document reference: J1.7), which has been submitted with the application for development consent. The measures to be implemented as part of the Soil Management Plan are in general accordance with the Institute of Quarrying (IQ) Good Practice Guide for Handling Soils in Mineral Workings (IQ, 2021) and British Society of Soil Science (BSSS) Working with Soil Guidance Note on Benefiting from Soil Management in Development and Construction (BSSS, 2022) which seek to minimise impacts on soil health and protect and maintain soil quality during construction.As part of the Heads of Terms, Dalcour Maclaren on behalf of the Applicants, and alongside a drainage consultant will discuss existing drainage systems with interests so that a detailed drainage plan and design can be agreed for both pre and post construction. There will be provisions relating to compensation so as to address any impacts to the farming business. |
| TA_0046_002_171123          | S44     | Email           | I would also like you to prove to me that you are aware the farms main drain and the water main both of which I wouldn't want damaging.                                | The impact of damage to existing field drainage is assessed section 2.13.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES. In order to manage impacts to field drainage, the Outline CoCP (document reference J1) will stipulate that the contractor will develop field drainage plans in consultation with the relevant landowners. If required, additional field drainage will be installed to ensure the existing drainage of the land   |

|                             |         |                 |   | is maintained during construction. Field drainage will be reinstated once construction has finished.   |
| TA_0046_005_171123          | S44     | Email           | I object to the plans yourselves and BP are proposing on the knowledge I have of the area including the flood risk.   | Flood risk is considered in section 2.11 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Further details are provided in the Volume 3, Annex 2.3: Flood Risk Assessment (document reference 3.2.3). No significant effects in terms of flood risk are predicted  |
| TA_0119_001_071123          | S44     | Email           | <p>I am opposed to your plans to build two substations on greenbelt land in the local area around Freckleton. This surely cannot be the best option for the local environment, given the known flooding issues in the area, and the loss of high-quality farmland. It is also a valuable habitat to much wildlife including bats, newts, and various species of bird including curlews, lapwings, owls and oystercatchers to name but a few.</p> <p>The close proximity to Carr Hill and Strike Lane schools, will also be a major concern for the many parents in the area.</p> <p>I am not against wind farms and green energy, but this must be done in a respectful way for local residents and the community.</p> <p>Surely the land surrounding the existing substation in Penwortham, would be a more viable and appropriate option.</p> | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0121_001_171123          | S44     | Email           | I object to this development of Morgan and Morecambe Offshore wind farms because I am a local resident and feel this will have significant detrimental impact to the area. I do not feel that there has been proper exploration of other sites. Also I feel it should be considered to bring ashore closer to Penwortham by travelling up the river, or it should come ashore where existing sites already come ashore. The proposed site would have a substantial flood risk, as I witness frequently, and would affect the farmers who use the land currently. It is also close to developed residential areas and local schools.   | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3).  |
| TA_0118_007_171123          | S44     | Email           | 9) This area is well known for flooding and if you build these enormous substations on this land you will be creating further flooding problems for households. Do you really want to put families and children out on the streets because their homes have flooded? This could become a reality for many.  | The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. An Outline Operational Drainage Management Plan (document reference J10) for the substation site(s) has been prepared and submitted with the application for development consent. The Operational Drainage Management Plan will include measures to ensure that existing land drainage is reinstated and/or maintained. This will include measures to limit discharge rates and attenuate flows to maintain greenfield runoff rates at the onshore substations. It will also include measures to control surface water runoff, including measures to prevent flooding of the working areas or offsite and to ensure any runoff is treated appropriately. The Operational Drainage Management Plan will be developed in line with the latest relevant drainage guidance notes in consultation with the Environment Agency and the Lead Local Flood Authority (Lancashire County Council). |
| TA_0122_001_171123          | S44     | Email           | I wish to object against the proposals to build two hugh (sic) electricity substations at Kirkham/Newton/Freckleton. The reasons for the objection being that the proposed site is completely inappropriate being on top grade agricultural land, it is close to two schools, it would cause unacceptable noise pollution and would increase the flooding risk.   | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3,  |

| TA_0130_001_191123          | S44     | Email           | <p>As a resident of REDACTED adjacent to Blackpool Airport. I will be directly impacted by a number of the proposals and also I have concerns about those further afield such as the substation locations and size. On a personal level, REDACTED will be impacted as we are surrounded by dykes both at the front and rear of properties so a strong potential for flooding and rise in water table. The cable corridor will be as wide as a 6 lane motorway and at the moment you are still not clear whether you are passing under the airport, under Queensway (adjacent to our land) or using neighbouring roads in St Annes. Given the corridor's expected width it would suggest no matter which you choose you will impact adjacent to REDACTED.</p>  | <p>The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). It is noted that the option presented at PEIR (placement of cables in trenches within the highways) near Blackpool Airport is no longer required. Details of the current design are provided in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage.</p> |
| TA_0130_003_191123          | S44     | Email           | <p>We also know from past experience disruption to land, digging drilling etc in the area, has driven vermin into our homes! It has also caused flooding and water tables to rise. The question of noise from transmitting that amount of electricity through the corridors is also unclear. A local electrical expert that installs commercially on a large scale doubts it will be silent.</p>  | <p>An assessment of the noise and vibration impacts due to the Transmission Assets are presented in Volume 3, Annex 8.2: Construction Noise and Vibration of the ES (document reference F3.8.2) and Volume 3, Annex 8.3: Operational Noise of the ES (document reference F3.8.3). The cumulative noise and vibration impacts with other proposed developments is considered in section 8.13 of Volume 3, Chapter 8: Noise and vibration of the ES (document reference F3.8).</p>   |
| TA_0130_005_191123          | S44     | Email           | <p>I strongly support the following objection drawn up locally; "I would like to use the opportunity during this public consultation period, to unequivocally Object to your proposals and express my concerns over the proposed offshore Wind Farm cable routing and sub station locations within the Fylde coast. I believe this would have a grossly negative impact on the Environment both physically, via the works proposed and visually, damaging an untold amount of wildlife habitat and green belt protected land, conservation areas, highly productive farmland and have a hugely detrimental impact on the wider community and local economy, putting local business, land owners and Farmers out of business. I believe it would create an untold amount of suffering for residents within the Fylde coast for years to come via flooding and disruption i.e. traffic.</p>   | <p>The Applicants are committed to robust and transparent public consultation as part of the development process. The Transmission Assets has undertaken three rounds of consultation with the local community, including two non-statutory periods of consultation (2 November to 13 December 2022 and 19 April to 4 June 2023) and a statutory consultation (12 October to 23 November 2023). Statutory targeted consultations have also taken place (November 2023 to October 2024). The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the SoCC). The Transmission Assets is fully</p>  |

|                             |         |                 |  | <p>committed to delivering a community benefits scheme in line with UK Government guidance, which is due to be published later this year. The Transmission Assets is fully committed to delivering a community benefits scheme in line with UK Government guidance, which is due to be published later this year. Ahead of the guidance being published we have been engaging with local people, businesses and organisations to identify key themes and projects that will deliver strategic benefits and directly support the local community and local priorities. We welcome further input from the local community and encourage you to reach out to the project team in due course. The Applicants provided maps as part of the consultation materials that clearly set out the elements of the Transmission Assets in relation to settlements, roads and geographic features. All maps also included a key to highlight the proposed use of different areas and the relevant aspects of the Transmission Assets' design. The materials were proportionate to the level of information and design detail at the time of consultation, reflecting the information available in the PEIR. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p> |
| TA_0132_001_191123          | S44     | Email           | <p>I wish to register my utter disagreement with the planned wind farm, very close to my property. I believe I am the longest standing resident on REDACTED, having moved to this bungalow in September 1972, fifty one years ago. Many changes, not all for the better, have been made since then, but the thought of the absolute desecration of this rural area that this plan would bring, is devastating. The noise, disruption of traffic (already dreadful in this location), the years it will take to complete, is beyond comprehension. This country area was beautiful and has been encroached upon enough, in recent years. It also has huge drainage problems; properties and dykes are regularly waterlogged, through both Fylde (my council) and Blackpool Council inactivity. Inevitably the situation would be exacerbated should this project go ahead. Kindly register my complete disapproval.</p> | <p>The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |                             |         |                 |  | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).  |
| TA_0139_003_201123          | S44     | Email           | Morecambe & Morgan Wind Farm 3rd November 2023.1.) Please can you explain if these are our properties where the cable corridor will be in relation to these properties.2.) What noise pollution will be created by the installation of these cables and how will affect residents?3.) How will the air quality affect residents close to the cable corridor?4.) What measures will be taken to ensure are properties do not become infested with vermin during the creation of the cable corridor?5.) What is the predicted length of traffic management on Queensway?6.) What is the predicted effect on the water table during the creation of the cable corridor and what your proposal to mitigate the effect on the water table?7.) How and where will the cable corridor cross Queensway?8.) What noise will these cables create once installed and live?9.) What protection for wildlife will be in place. Wildlife on Lytham moss land and land edging Queensway (B5261), there are great crested newts, otters, bats, water voles, etc. as well as birds.10.) How will the dykes be protected from debris?11.) How will residents be update on progress and planned disruption?12.) Can you guarantee Division Lane will not be used to import Cable/equipment?13.) Will the heavy machinery drilling digging etc likely cause any damage to our homes? If so what's in place for the cost of repair?   | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).  |
| TA_0139_004_201123          | S44     | Email           | In additional to the above questions still not answered in writing as of 9th November the residents would like to ask the following questions after Monday 6th November Webinar.14.)Why was the first route for the substations and cables axed, I believe Penwortham was not the first option?15.)How wide is he Indicative onshore export cable corridor? (Light purple on Lytham Moss) and where is it going on an ordnance survey map. If it is 122m wide, where will it be crossing Queensway? Our questions have not been adequately answered on this.16.)What size are the substations and is there only 4? Will there definitely not be a Substation, Booster stations in Blackpool or Lytham St Anne's? If Morecambe substation Sub Station 12500 sq metres roughly 30 acres max height 20 Metres, and Morgan substation is15 acres max height 20 Metres is the sites in Kirkham where they will be located?17.)If your proposed route is a Biologic Heritage Site for migrating birds would the project be stopped during migration? There are great crested newts, otters, bats, water voles, etc. as well as migrating birds such as pink foot geese and Whopper Swans.18.)Why have you asked some residents on the same street of Division Lane for details of people or organisations have interest in the land/ property, Mortgage / Charge, name of lender and mortgage reference and not others? Several residents own more than one piece of land and they have received 2 different letters why when these are generic letters? Is this because you are thinking of using your compulsory acquisition powers to acquire Land/Properties/Part of land in Blackpool, Lytham Moss, Lytham St Anne's? In the webinar on 6th November you stated you have to inform all interested parties but yet you are not asking all residents the same questions, is the mortgagee question because you want to come to a voluntary agreement to purchase land or property? 19.) Will the cabling create noise for residents similar to pylons?20.) How will you mitigate raising the water table?21.) There are only 3 routes in and out of Lytham St Annes from Blackpool and when one is shut you can sit in 45 minutes to an hour each way in delays if the Promenade or Queensway is shut effecting residents and businesses. If you are now proposing using Kilnhouse Lane, Leach Lane, Queensway and Blackpool Road North to install cable ducts, how long do you believe this work will take and how much disruption will it cause to residents and businesses. Queensway - Traffic management. This is the main arterial route into St Annes from Blackpool, extremely busy 40mph road.22.)How will you communicate with residents during construction? Please consider social media for project updates.23.) Can you guarantee Midgeland Road will not be used to import Cable/equipment?24.) Will bridal paths be out of use while installing the cable corridor?25.) Blackpool Council are also doing lots of alterations on Common Edge Road (EZ Zone <a href="https://blackpoolez.com">https://blackpoolez.com</a> ), the drainage off these works are to go into a attenuation basin alongside Blackpool Airport, has this been considered in your planning for the cable corridor ( <a href="https://pa.fylde.gov.uk/Planning/Display/23/0758">https://pa.fylde.gov.uk/Planning/Display/23/0758</a> ).26.) The Lytham moss land is wet and very low lying. - could cause flooding to us on Division Lane how will this be combated.27.) What is the proximity of the cable corridor to properties on Division Lane.28.) How will you stop settlement on properties adjacent to | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE) which no longer includes any surface piercing structures. This includes the removal of the Morgan Booster Station and associated search areas. The OSPs are to be classed as part of the Generation Assets applications only. Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3).Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).Properties on Division Lane border the draft Order Limits and so the Project has a duty to consult with those legal interests as part of the DCO application. To ensure the Applicant has consulted with all land interests, Dalcour Maclaren undertake land referencing to identify these interests through HMLR searches and Land Interest Questionnaires. This includes in some circumstances requesting information for any third-party interests in the land, details of which are outlined in the land referencing methodology. Some parties are asked to provide information about their interest prior to the project order limits being refined. This captures a wider area than ultimately necessary. Being asked for this information does not mean that you will be directly affected. Interest are identified by plot rather than address so any off lying land will be covered. We have a duty to consult all parties with an interest in land, a mortgage is effectively an interest and entitled to notification. |

|                             |         |                 | the projects, path?29.) Fylde size of Division Lane is not connect to main drains and has Dykes and Septic Tanks either on our adjacent to properties, how will these be protected.30.) Is there a provision for cleaning Dykes once the project is finished, as when other project have been completed this has caused problems for residents and we as riparian owners have a responsibility to clear dykes, but we should not be expect to clear your waste into these dykes.On behalf of residents of REDACTED.  |  |
| TA_0143_001_201123          | S44     | Email           | My name is REDACTED of REDACTED and REDACTED. I have lived in Newton for 28 years, my husband and late father-in-law owned and operated a dairy farm on the site of REDACTED, Grange Lane, Newton. I chose to live/reside in this location because it is rural and should remain rural. The siting of the substation on Zone 1 or any one of the proposed locations is extremely worrying. My concerns regarding these proposals are as follows:-Green Belt landPrime agricultural land, potentially rendering the land uselessIn an area of separationWay too close to two schoolsWay too close to residential propertiesFloodingVisual impactNoise, light, vibrationWildlifeCongestionDecreasing the value of land and propertySafety hazard Surely there must be other options available with far less intrusion on the whole of the Fylde. | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0144_001_201123          | S44     | Email           | I would like to take this opportunity during this public consultation period, to unequivocally object to your proposals and express my concerns over the proposed offshore wind farm cable routing and sub station locations within the Fylde coast. I believe this would have a grossly negative impact on the environment both physically, via the proposed work and visually, damaging an untold amount of wildlife and green belt protected land, conservation areas highly productive farmland and have a hugely detrimental impact on the wide community and local economy, putting local business, land owners and farmers out of business. I believe it would create an untold amount of suffering for residents within the Fylde coast for years to come via flooding and disruption to traffic.                                      | The Applicants are committed to robust and transparent public consultation as part of the development process. The Transmission Assets has undertaken three rounds of consultation with the local community, including two non-statutory periods of consultation (2 November to 13 December 2022 and 19 April to 4 June 2023) and a statutory consultation (12 October to 23 November 2023). Statutory targeted consultations have also taken place (November 2023 to October 2024). The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the SoCC). The Applicants have made design changes since the PEIR and further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). This has included refinements of the location and design of the 400 kV grid connection cable corridor and onshore substations, including - selection of a single site for the onshore substation for the Morecambe Offshore Windfarm: Transmission Assets- refinement of the siting and orientation of the onshore substation for the Morecambe Offshore Windfarm: Transmission Assets, to take into account consultation responses received. Details of the design and/or environmental constraints considered as part of the iterative design process, are set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |
| TA_0145_002_201123          | S44     | Email           | The non statutory consultation is also flawed. There was no information as to how the four location search zones were identified or selected. You have also not considered identified enterprise zones and brown field sites as identified by Fylde Borough Council. The PEIR obviously shows that you have predetermined the outcome in favour of zone 1, the RAG assessment is biased in favour of zone 1, with the rating being   | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project,   |

|                             |         |                 |  | <p>avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). In particular, The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. An iterative EIA process has been used to avoid impacts where practicable, in addition to mitigating remaining impacts. The design at the onshore substations is set out in the Outline Landscape Management Plan (document reference J2). The ES describes effects on landscape character and visual resources during construction, operation and maintenance and decommissioning during the day and at night and winter/summer without mitigation and residual effects with mitigation. The landscape and visual assessment (Volume 3, Chapter 10: Landscape and visual resources of the ES) (document reference F3.10) is based on the maximum design scenario to minimise likely effects. Socio-economics is assessed at Volume 4, Chapter 2 of the ES (document reference: F4.2).</p> |
| TA_0151_004_201123          | S44     | Email           | I live on the flood plain and the and have very high concern over the increased potential of further flood as newton already floods regularly.   | <p>The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage.</p>   |
| TA_0154_003_201123          | S44     | Email           | Thirdly the impact of flooding does not seem to have been fully assessed. Again the consultation meeting was unable to fully provide information on this but the little data used was historical and has not taken into account changes from building in the last 2to3 years. Having driven the a road today next to the proposed site on a typical wet day there is significant flooding on the road around the dowbrook area, leading to congestion and road obstruction. There is also significant standing water on the fields. The loss of soak away from building in this area would worsen this futher and lead to flood risk, again not full considered. | <p>The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. An Outline Operational Drainage Management Plan (document reference J10) for the substation site(s) has been prepared and submitted with the application for development consent. The Operational Drainage Management Plan will include measures to ensure that existing land drainage is reinstated and/or maintained. This will include measures to limit discharge rates and attenuate flows to maintain greenfield runoff rates at the onshore substations. It will also include measures to control surface water runoff, including measures to prevent flooding of the working areas or offsite and to ensure any runoff is treated appropriately. The Operational Drainage Management Plan will be developed in line with the latest relevant</p>   |

|                             |         |                 |   | reference F3.2). An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. An Outline Operational Drainage Management Plan (document reference J10) for the substation site(s) has been prepared and submitted with the application for development consent. The Operational Drainage Management Plan will include measures to ensure that existing land drainage is reinstated and/or maintained. This will include measures to limit discharge rates and attenuate flows to maintain greenfield runoff rates at the onshore substations. It will also include measures to control surface water runoff, including measures to prevent flooding of the working areas or offsite and to ensure any runoff is treated appropriately. The Operational Drainage Management Plan will be developed in line with the latest relevant drainage guidance notes in consultation with the Environment Agency and the Lead Local Flood Authority (Lancashire County Council).   |
| TA_0161_011_211123          | S44     | Email           | •Existing flooding issues in the parish will be exacerbated by this scheme. As a minimum land will become compacted from heavy vehicles during construction. However, the enormous sites themselves will displace huge amounts of water. The water has to go somewhere and areas of the scheme are already in flood zones. These zones are set to extend according to the Climate Change Flood Zone Map for 2030. What is the plan to manage this huge amount of displaced water? We haven't seen one as part of this consultation! | The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. An Outline Operational Drainage Management Plan (document reference J10) for the substation site(s) has been prepared and submitted with the application for development consent. The Operational Drainage Management Plan will include measures to ensure that existing land drainage is reinstated and/or maintained. This will include measures to limit discharge rates and attenuate flows to maintain greenfield runoff rates at the onshore substations. It will also include measures to control surface water runoff, including measures to prevent flooding of the working areas or offsite and to ensure any runoff is treated appropriately. |                             |         |                 |  | <p>avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). In particular, The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. An iterative EIA process has been used to avoid impacts where practicable, in addition to mitigating remaining impacts. The design at the onshore substations is set out in the Outline Landscape Management Plan (document reference J2). The ES describes effects on landscape character and visual resources during construction, operation and maintenance and decommissioning during the day and at night and winter/summer without mitigation and residual effects with mitigation. The landscape and visual assessment (Volume 3, Chapter 10: Landscape and visual resources of the ES) (document reference F3.10) is based on the maximum design scenario to minimise likely effects. Socio-economics is assessed at Volume 4, Chapter 2 of the ES (document reference: F4.2).</p> |
| TA_0165_004_211123          | S44     | Email           | <p>Another significant concern is the potential exacerbation of flooding in the area due to the construction of the transformer. Newton is already prone to flooding during heavy rainfall, primarily due to inadequate drainage systems. The absence of a clear plan to address and prevent increased flooding resulting from the transformer building is alarming and requires urgent attention.</p>   | <p>The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). | TA_0165_007_211123          | S44     | Email           | <p>In light of these concerns, I kindly request that the developers provide the following: Detailed design plans and an accurate scale of the proposed transformer building. A comprehensive explanation justifying the selection of the chosen location for the transformer. A thorough study on the potential noise and light pollution, along with proposed measures to mitigate these effects. A clear plan addressing the increased risk of flooding in the area, including improvements to drainage systems. Detailed information on the construction and disruption caused by creating a channel for cables from St Annes to the proposed transformer location. Plans to mitigate the loss of farm land and any compensatory measures. I believe that addressing these issues transparently and responsibly is crucial to ensuring the well-being and safety of the residents of Newton. I appreciate your prompt attention to these matters and hope all residents will be given this information in due course. Thank you for your understanding and cooperation.</p> | <p>The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). |                             |         |                 |  | <p>is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). The Transmission Assets will be fully compliant with the compensation code. The code sets out the parameters and evidence needed to substantiate a claim for diminution in value and when this happens. The UK Government has also produced a series of plain English general guides to compulsory purchase and compensation which you may find useful: Compulsory purchase and compensation - GOV.UK (www.gov.uk) Guide books 1 and 4 being the most appropriate.</p>   |
| TA_0183_002_221123          | S44     | Email           | <p>In connection to the above, not only will your proposals force local farmers out of business, but will also involve cutting through field drainage systems, exacerbating flooding, and potentially affecting local communities as well as farmland. The displacement of water caused by the development will put homes at risk and ruin farmland for decades to come. Your proposed route also disrupts land of ornithological importance. Lancashire County Heritage Sites includes the area of Lytham Moss (Site Ref: 33SEW1) as a Biological Heritage Site, or "local wildlife site". The site comprises 283 hectares of farmland which it categorises as of ornithological importance. The land provides winter feeding ground for flocks of Pink-footed Geese and Whooper Swans with bird numbers exceeding 0.5% of the British wintering population. Furthermore, Lapwings, Corn Buntings and Skylarks are already endangered species which can be found on local farmland. This project would deprive these flocks of their natural habitat, while the prolonged human activity and noise pollution associated with this project would scare these flocks away for good.</p> | <p>The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. | TA_0188_006_221123          | S44     | Email           | Impact on food security Whilst I appreciate that we need to use renewable sources of energy in order to secure our needs for the future, and I am certainly not against the windfarm development in principle, we also need to ensure that the country can continue to produce food to feed the growing population. If this project is to go ahead as planned with the huge destruction of vast areas of the Fylde for burying the transmission cables, I am certain that many farming businesses will cease to exist afterwards. The level of invasive work that will be required will ruin a great deal of the high quality farmland in the Fylde. Field drains will be destroyed by the work, and I doubt very much whether the new drains will ever be as effective as the current system as it has taken years and years of careful management and planning. Soil structure will be massively affected by compaction and it will be impossible to return the land to how it was before no matter how carefully the soil is stored and out back. Surely at a time when food security is so high on the public agenda, the loss of valuable farmland is not a sustainable option. The effects of building on large areas of farmland will also lead to massively increased risk of flooding in the local area. The land is already under huge pressure of flooding as main drains and ditches are no longer maintained meaning that water flow is restricted. The additional run-off from the concrete sites will mean that the current system will be unable to cope and will lead to more regular flooding, not only on the land that we are farming, but also in the towns and villages as the water will have nowhere to go. | The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes the preparation of a Soil Management Plan in general accordance with the Outline Soil Management Plan (document reference: J1.7), which has been submitted with the DCO application. The measures to be implemented as part of the Soil Management Plan seek to minimise impacts on soil health and protect and maintain soil quality during construction of the Transmission Assets. These measures also comprise the preparation of a Code of Construction Practice in general accordance with the Outline Code of Construction Practice (document reference J1)   |

| TA_0194_002_221123          | S44     | Email           | <p>The land is inter-dispersed with high water table ditches which play an intrinsic part of the water management within the Fylde Moss. Any interference with the drainage system within the area will have a huge detrimental impact, not only on the land that it goes through, but also the surrounding area. As I have mentioned previously, the land is moss and therefore doesn't have the subsoil that your clients may expect. If they break the topsoil there is very little sub soil to work with and you are just into moss, which is an unstable soil type.</p>   | <p>An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage.</p>   |
| TA_0194_003_221123          | S44     | Email           | <p>The land is inter-dispersed with Environment Agency controlled ditches and dykes which will mean that directional drilling is required. This will impact our client's greatly over the large areas that will be proposed for reception and thrusting areas. The information is lacking in terms of its technical ability in order for our clients to make any meaningful representations over the route.</p>  | <p>The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage.</p>  |
| TA_0196_001_221123          | S44     | Email           | <p>I would like to use the opportunity during this public consultation period, to unequivocally Object to your proposals and express my concerns over the proposed off shore Wind Farm cable routing and sub station locations within the fylde coast. I believe this would have a grossly negative impact on the Environment both physically, via the works proposed and Visually, damaging an untold amount of wildlife habitat and green belt protected land, conservation area's, highly productive farmland and have a hugely detrimental impact on the wider community and local economy, putting local business, land owners and Farmers out of business. I believe it would create an untold amount of suffering for residents within the fylde coast for years to come via flooding and disruption ie traffic. Your lack of detail on some of the proposed cable routes and sub stations at this late stage and at this public consultation point in proceedings, is highly worrying as this shows either an unprofessional approach to the matter, or highly unprepared, or at worst, both. It is most concerning that at this late stage we are asked to submit our opinions on a body of work that is neither complete nor suggest the possible outcomes thereafter the point of consultation. I feel that you have shown disregard to the community of the fylde coast in your methods up to now. This lack of transparency on your part, sets a precedent when approaching future issues and has created a level of mistrust that is beyond repair. This is another reason why I must whole heartedly Object on all parts of your proposals.</p> | <p>The Applicants are committed to robust and transparent public consultation as part of the development process. The Transmission Assets has undertaken three rounds of consultation with the local community, including two non-statutory periods of consultation (2 November to 13 December 2022 and 19 April to 4 June 2023) and a statutory consultation (12 October to 23 November 2023). Statutory targeted consultations have also taken place (November 2023 to October 2024). The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the SoCC). The Applicants are committed to working with local communities that may be impacted by the Transmission Assets. As the proposals develop further, any ideas for potential community benefits are appreciated. We will continue our engagement with the relevant communities in due course. The Applicants provided maps as part of the consultation materials that clearly set out the elements of the Transmission Assets in relation to settlements, roads and geographic features. All maps also included a key to highlight the proposed use of different areas and the relevant aspects of the Transmission Assets' design. The materials were proportionate to the level of information and design detail at the time of consultation, reflecting the information available in the PEIR. The Transmission Assets has made</p> |

Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p>  |
| TA_0197_005_221123          | S44     | Email           | <p>The development will significantly adversely impact local amenities, change of character from rural to industrial, and potential flooding due to massive displacement caused by the enormous industrial development, ruining farmland for decades and placing homes at risk</p>   | <p>The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). In particular, The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. An iterative EIA process has been used to avoid impacts where practicable, in addition to mitigating remaining impacts. The design at the onshore substations is set out in the Outline Landscape Management Plan (document reference J2). The ES describes effects on landscape character and visual resources during construction, operation and maintenance and decommissioning during the day and at night and winter/summer without mitigation and residual effects with mitigation. The landscape and visual assessment (Volume 3, Chapter 10: Landscape and visual resources of the ES) (document reference F3.10) is based on the maximum design scenario to minimise likely effects. Socio-economics is assessed at Volume 4, Chapter 2 of the ES (document reference: F4.2).</p> |
| TA_0198_001_221123          | S44     | Email           | <p>I would like to use the opportunity during this public consultation period, to unequivocally Object to your proposals and express my concerns over the proposed off shore Wind Farm cable routing and sub station locations within the fylde coast. The Outline CoCP includes measures in relation to flood risk during the construction phase. The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage. Traffic and transport impacts arising during the construction phase of the Transmission Assets have been fully assessed at section 7.11 Volume 3, Chapter 7: Traffic and transport of the ES (document reference E3.7).</p>  |
| TA_0202_002_221123          | S44     | Email           | <p>All this land you are crossing in the Fylde Basin was drained by the Dutch in 1840. 6000 acres drained at a cost of £3000 and I liken it to Amsterdam with interconnecting water channels to take run off waters out to sea. The towns of South Blackpool, by the airport, St Annes and Lytham the water does not flow out to sea via the conventional method because the land is higher than where we live. The water flows in a loop backwards and out to sea at Dock Bridge by McDonalds at Lytham. It has 3 storm pumps and tidal flaps and is an EA asset as are the main water courses in the area. The water table is too high, and we believe the settings are not low enough and rarely the flap doors are open because of silt in the estuary. We have a fight to keep the channels open out to sea and the legislation between Natural England and the Marine Management Organisation is seriously difficult to obtain. The other issue is the building of houses on flood plains and knowing the water table can't be lowered in these areas due to subsidence. The area is very</p> | <p>The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). |                             |         |                 | fragile with the water infrastructure. There is only a 3-metre fall of land, that water flows from the M55 to the pumping station and this onshore is difficult to maintain. Liggard Brook is stationary and full of silt, so it is not functioning so the water from Lytham and Blackpool Airport area, flows from Moss Sluice Liggard Brook across Birks Watercourse to Main Drain. Main Drain is the Main artery for our area. Branch Drain takes water from Marton and if there is any force of water overflows onto the land. Wrea Brook is not fit for purpose because it is not big enough for all the extra developments that have been built in recent years. The brook is poorly maintained and overflows on heavy rainfall. There is constant flooding of properties and road networks within the catchment. Dow Brook is no different. With the construction of 122 metre strip and access roads you may destroy the waterway infrastructure and displace the water table and will cause further flooding both on land and property.   | pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage.  |
| TA_0202_004_221123          | S44     | Email           | Onto manholes 2 metre squared visible to see we will not be able to farm the land as we would normally do with agricultural machinery. This would cause more loss of agri-land trying to work around all the obstacles in the field. The manholes are likely to become tangled in the machinery or working operation. The drainage of fields and surrounding land would collapse with the width of the 122-metre route and the heavy HGV and heavy machinery being placed on it. The consequences of this would displace the water and cause the whole of the Fylde Basin to flood, which eventually over time would back onto those properties built on potential flood plains and flood the properties, which is what we are seeing now. This would have terrible consequences for both rural and urban fringes. You can do all the surveys you wish but from working with various organisations and being a person at ground level I can assure you that the building of properties has had a detrimental effect on the Fylde and the flooding is happening to frequently. We have been known to be 6 months under water during the winter months and this year we were flooded on 23/07/2023 where the cereals were under water and all you could see was the heads of corn. Cuadrilla had a site on Anna's Road and had to reinstate the land following their fracking site. They removed the stone and put the soil back in place and that site has not been able to be farmed since. Where the site is, is a bog. I really don't think you can reinstate a site to its former glory, and I can assure you that it will take 15 – 20 years to become good land again. A reinstated site will need double the amount of fertiliser and double the manure to make it fertile again. You cannot wave a magic wand for that. | Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes the preparation of a Soil Management Plan in general accordance with the Outline Soil Management Plan (document reference: J1.7), which has been submitted with the DCO application. The measures to be implemented as part of the Soil Management Plan seek to minimise impacts on soil health and protect and maintain soil quality during construction of the Transmission Assets. These measures also comprise the preparation of a Code of Construction Practice in general accordance with the Outline Code of Construction Practice (document reference J1) submitted with the DCO application. The measures to be implemented as part of the Code of Construction Practice seek to limit disruption to the operation of individual farm holdings. Further detailed information regarding the methodology, scope and results of the soil surveys is provided in Volume 3, Annex 6.2: Soil surveys data technical report of the ES (document reference F3.6.2). Geology, hydrogeology and ground conditions are assessed in Volume 3, Chapter 1 of the ES (document reference E3.1). |
| TA_0202_008_221123          | S44     | Email           | Kill what little drainage we have on the land which passes onto other fields and other farms. • Kill the drainage in the entire region so pushing the water table onto other people's property. • As a riparian owner on an EA Drain. We would not have access to clean the water courses that need yearly attention of weeding and dyke maintenance and because of the length in years of the project we would not be able to de-silt. • As EA drains the Environment Agency would not be able to perform any of their activities and have the correct accesses to land   | The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. This is another reason why I must whole heartedly Object on all parts of your proposals.</p> | <p>The Applicants are committed to robust and transparent public consultation as part of the development process. The Transmission Assets has undertaken three rounds of consultation with the local community, including two non-statutory periods of consultation (2 November to 13 December 2022 and 19 April to 4 June 2023) and a statutory consultation (12 October to 23 November 2023). Statutory targeted consultations have also taken place (November 2023 to October 2024). The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the SoCC). The Applicants are committed to working with local communities that may be impacted by the Transmission Assets. As the proposals develop further, any ideas for potential community benefits are appreciated. We will continue our engagement with the relevant communities in due course. The Applicants provided maps as part of the consultation materials that clearly set out the elements of the Transmission Assets in relation to settlements, roads and geographic features. All maps also included a key to highlight the proposed use of different areas and the relevant aspects of the Transmission Assets' design. The materials were proportionate to the level of information and design detail at the time of consultation, reflecting the information available in the PEIR. The Transmission Assets has made</p>   |

Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p>   |
| TA_0219_002_231123          | S44     | Email           | <p>No information has yet been given regarding pre and post construction drainage proposals and this will be essential in due course. We understand that the proposed depth of the cables is to give them 1.2m cover however we believe that many of the drains in this area especially on our clients land are at around 1.5m deep and therefore any cabling will need to be substantially below that in order to allow the Landowners to have safe ongoing access for drainage maintenance/repair etc. We also understand that many of the dykes are 2m deep and clearly once again any easement and cabling will have to go below the base of the drainage dykes and give sufficient cover to enable continuing maintenance of the drainage dykes to take place safely.</p> | <p>The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage</p>   |
| TA_0219_006_231123          | S44     | Email           | <p>Severe effect on the land drainage in the area particularly in Parcel REDACTED if the southern route is chosen.</p>   | <p>The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). In addition, best practice with regard the use and storage of oils, chemicals and other wastes, to remove the risk of causing pollution during construction is outlined within the Outline CoCP (document reference J1). An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage.</p> |
| TA_0221_004_231123          | S44     | Email           | <p>4. Flooding The Fylde is low lying and as can be seen driving around the area since August, we have had a wetter than average year, the ground is waterlogged and surface water is lying on farmland, you don't need a lot of rain to fall before the existing watercourses are overwhelmed and will potentially flood residential areas , not just farmland What will happen if watercourses, ditches and field drains are interrupted for the duration of 3 years or more. Have sufficient surveys been done to see if the route is satisfactory for such disturbance, because in our experience as second and third generation farmers , you need to work with the land not abuse it.</p>  | <p>The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). | TA_0234_002_231123          | S44     | Email           | Proposed Substation Footprints The proposed footprints of the Morgan and Morecambe permanent substation sites are approximately 30 acres and 18 acres respectively. These site areas are taken up by approximately 50% BNG (Biodiversity Net Gain). This information was provided by a Flotation Energy engineer. This is wholly unacceptable as in providing on-site BNG purely for financial savings has narrowed the substations site selection process to one only option for Morgan and two only options for Morecambe. It is clear that had the substation sites design concentrated on that area which was wholly necessary to transmission, ie approx. 15 acres for Morgan and 9 acres for Morecambe then suitable substation site locations could have been expanded to present more options and allowed for flexibility during this consultation process. | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). As set out in the Onshore Biodiversity Benefit Statement (document reference J11), the Transmission Assets are not subject to a mandatory net gain requirement under the Environment Act 2021. Nevertheless, the Applicants have worked with statutory consultees to discuss the approach, and to develop the design, to allow the maximum benefit to biodiversity within the parameters of the project. For the Transmission Assets, biodiversity benefit will be delivered within identified biodiversity benefit areas within the Transmission Assets Order Limits: Onshore (referred to as the Onshore Order Limits). Further qualitative benefits to biodiversity are proposed via potential collaboration with stakeholders and local groups, contributing to existing plans and programmes, both within and outside the Onshore Order Limits. Further details of the approach to biodiversity benefit are provided in the Onshore Biodiversity Benefit Statement (document reference J11). The calculation undertaken for the Onshore Biodiversity Benefit Statement (document reference J11) utilises the latest biodiversity metric published by Defra (4.0). |

| TA_255_001_241123           | S44     | Email           | Thank you for forwarding the more detailed land parcels with the indicative 400KVA cable corridor and compounds. My client wishes to object for the reasons detailed below: My client intensively farms 150-180 dairy cows with followers. The main farm buildings are located at REDACTED and the land holding is clearly shown edged and coloured black. The proposed cable corridor route goes through some of the most productive pasture and meadow land that is required for the dairy herd. The proposed route significantly severs the southern land which is going to impact on the ability for the farm to carry the dairy herd and youngstock. The route cuts through at least 5 open ditches which carry all surface water and the drainage system within the area, including surface water from Newton village and surrounding areas. Any damage to the drainage system is going to have a huge impact on the retained land and the surrounding area. The proposed route appears to diagonally cut through the majority of my client's central holding. | Following route refinement, Dalcour Maclaren on behalf of the Applicants will be in touch with interests to discuss Heads of Terms to secure the rights for the compound which will include provisions for compensation of severed land and impact on farming operations. The Transmission Assets will be fully compliant with the compensation code. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints   |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received  | Applicants' response  |
|-----------------------------|---------|-----------------|---|---|
|                             |         |                 | <p>There does not appear to be any weight given to impacting client holding and it seems to be that the route has been chosen for ecological purposes rather than practical purposes. If the route is required from Newton to Penwortham then it seems to take a far more practical route to follow indicative lines as I have suggested, which whilst still travelling through my client's land holding, severely reduces the impact and also reduces the length of the cable route. The compound located north of plot 1132 can then be incorporated into 1132 which then minimises the impact and frees up that field completely undisturbed. The drainage system in the area is very complex and therefore it would be strongly recommended that an independent drainage consultant is employed at the earliest opportunity as it will be likely that directional drilling is required for the whole area to ensure that the drainage system is not affected. A directional drill will also mitigate the need to provide for daily crossing point for my client who will need access to the south land for grazing and mowing throughout the season therefore minimising the impact and inconvenience to the scheme.</p>  | <p>considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage.</p>   |
| TA_256_001_201223           | S44     | Email           | <p>Further to REDACTED email with attached plans, I did speak with my client briefly last week and I think probably the best thing is to arrange for a meeting in the New Year, which would probably cover REDACTED who have affected land holdings. My clients' over-riding concern is to the viability and the impact of running their equestrian and small holding and how they will be able to continue during the constructional phase as the cable route severs their holding in half and it would be extremely difficult to access the southern area, meaning my client will not be able to accommodate the horses that they have. I would be grateful at this early stage if Dalcour Maclaren, your clients, will provide for assurances that where there are equestrian and smallholding properties that these are dealt with on special circumstances and all costs for the relocation of horses and animals will be met in full. As you can appreciate, finding alternative livery facilities within the area is difficult and my clients will need a suitable time period to find alternative accommodation, so the sooner that your clients are able to commit the better. My clients have also suggested that the cable route be swung further south so it then tries to mitigate the impact on their land holding and I have attached a plan for this. You will also be aware of the significant low-lying nature of the land, certainly my client's land holding and the surrounding area is regularly affected by ground water. Any open cut trenching will exacerbate the problems in the area, and also could severely impact the drainage of the local Newton and surrounding area. There are a number of important Environment Agency ditches, and main water courses which affect the area, so I would strongly recommend to your clients that they investigate the idea of directional drilling along this whole stretch running from Dow Brook eastwards. This which would alleviate a number of the practical problems of the equestrian and smallholder land-owners, but more importantly, the drainage and water issues within the wider area. No doubt we will discuss in the New Year.</p> | <p>Following route refinement, Dalcour Maclaren on behalf of the Applicants will be in touch with interests to discuss Heads of Terms to secure the rights for the compound which will include provisions for compensation of severed land and impact on farming operations. The Transmission Assets will be fully compliant with the compensation code. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage.</p> |

## E1.16.18 Onshore ecology table of responses

## E1.16.18.1 Onshore ecology table of responses (via feedback form)

**Table E1.16.18.1: Onshore ecology and nature conservation responses (feedback form)**

As set out in section 4.7.4 of the Consultation report (document reference E1). Responses have been allocated to the most appropriate topic(s). If a consultee did not provide a response for a question/sub-question this is not recorded. If a consultee included 'N/A', 'none', 'no comment', 'Nil', 'No', in response to a question, this has also not been recorded. Where a consultee provided a response associated with this sub-question (3.3; Onshore ecology and nature conservation) but was not related to this topic, this has been included below, as well as against any other appropriate topic(s). Where a consultee provided a response which stated 'see response above' or similar, the response has been replicated in brackets and italics.

|-----------------------------|---------|----------------------|------------------------|------------------------------|--|---|
| TA_0050_004_231123          | S42     | Online feedback form | 3                      | 3.3                          | What proposals to offset BNG, Carbon and flood mitigation measures need to be made.  | As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0050_008_231123          | S42     | Online feedback form | 5                      |                              | Seem to want to take up a large part of the coastline which forms soft defences and SSSI and RAMSAR sites which been heavily invested in over the years.   | An assessment of the potential impact on key receptors, including qualifying features of the SPAs (e.g. Ribble and Alt Estuaries SPA) as identified in section 4.6.2, is presented within section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).<br>Details on the potential impacts on European sites from the Transmission Assets are contained within the ISAA (document reference E2.1, 2.2, 2.3).  |
| TA_0051_001_211123          | S44     | Online feedback form | 3                      | 3.1                          | I strongly object to the proposals to route the transmission cable adjacent to land and properties on REDACTED, Blackpool. The suggested 100+ metre wide corridor, which it has been proposed would be necessary to lay the transmission cable, seems unduly large, and would have a negative effect on the land bordering our properties, with an impact on the already over-stretched natural drainage systems, disturbance during construction with traffic and noise pollution, and a permanent destruction of the natural habitat of the many animals and birds whose home is in the wooded areas surrounding our land.                           | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The Transmission Assets design has resulted in a reduced construction corridor width, as set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Details of the factors considered during the design evolution are set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |
| TA_0051_003_211123          | S44     | Online feedback form | 3                      | 3.3                          | See 3.1 above<br><i>(I strongly object to the proposals to route the transmission cable adjacent to land and properties on REDACTED, Blackpool. The suggested 100+ metre wide corridor, which it has been proposed would be necessary to lay the transmission cable, seems unduly large, and would have a negative effect on the land bordering our properties, with an impact on the already over-stretched natural drainage systems, disturbance during construction with traffic and noise pollution, and a permanent destruction of the natural habitat of the many animals and birds whose home is in the wooded areas surrounding our land.)</i> | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The Transmission Assets design has resulted in a reduced construction corridor width, as set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Details of the factors considered during the design evolution are set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of   |

An environmental diaster.  | An iterative EIA process has been used to avoid impacts where practicable, in addition to mitigating remaining impacts. The design at the onshore substations is set out in the Outline Landscape Management Plan (document reference J2). The ES describes effects on landscape character and visual resources during construction, operation and maintenance and decommissioning during the day and at night and winter/summer without mitigation and residual effects with mitigation. The landscape and visual assessment (Volume 3, Chapter 10: Landscape and visual resources of the ES) (document reference F3.10) is based on the maximum design scenario to minimise likely effects. Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, migration measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the SoCC). |
| TA_0011_007_181023          | S42     | Online feedback form | 3                      | 3.3                          | <p>Impact on agricultural land- Zones 3 and 4 highlighted in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives and in South Ribble appear to have been discounted for ecological reasons, but routes to Penwortham substation would cross through Grade 2 agricultural land (very good) and undoubtedly would impact upon such areas resulting from connection with Zone 1. Any loss, or severance of Grade 2 land is of concern</p> <p>BNG enhancement - this element appears to have been well documented, and subject to relevant enhancement and mitigation where appropriate, the Council has no objection to works in terms of BNG.</p> <p>Visual impact - the assumption on proposals within the South Ribble boundary is that subterranean works between Zone 1 infrastructure and Penwortham substation are likely to result in loss of visual amenity, but that this would be a relatively temporary disturbance, and that in time land remediation would occur as land restores. Although few details are available, works would be assumed to be of sufficient depth that use of open agricultural land would be possible in the long term, and that agricultural land would not be permanently sterilised by the development. Visual impact of the proposed infrastructure at Penwortham substation would be significant when viewed from neighbouring residential properties, and concerns have already been received from residents to the Council relating to the height and proximity of the same infrastructure to adjacent properties, including Grade II listed dwelling, REDACTED. That being said, the proposal does sit against a backdrop of existing substation equipment, and in an extremely secluded, otherwise rural locale. Consideration should however be given to loss of visual amenity generally, but particularly from residential premises.</p> | <p>The impacts and effects of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings, are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6).</p> <p>The Applicants have made design changes since the PEIR and further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). This has included refinements of the location and design of the 400 kV grid connection cable corridor and onshore substations, including</p> <ul style="list-style-type: none"> <li>- selection of a single site for the onshore substation for the Morecambe Offshore Windfarm: Transmission Assets</li> <li>- refinement of the siting and orientation of the onshore substation for the Morecambe Offshore Windfarm: Transmission Assets, to take into account consultation responses received.</li> </ul> <p>Details of the design and/or environmental constraints considered as part of the iterative design process, are set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3).</p> <p>Biodiversity benefit will be provided within the Transmission Assets Order Limits, details of which are set out within the Onshore Biodiversity Benefit Statement (document reference J11).</p>  |

| TA_0069_001_201123          | S44     | Online feedback form | 1                      |                              | <p>The project is highly unsuitable for the Fylde area as a whole and nobody want to live near any electrical cables, buried or otherwise. Anybody needing to move house would be unable to sell their property.</p> <p>The construction period of several years would mean huge disruption to Blackpool Airport and the surrounding roads with road closures and huge tailbacks of traffic.</p> <p>The Nature Reserve on Clifton Drive North, Lytham St Annes is unsuitable for the location of the project landfall area and cable corridor as it is protected as a Site of Special Scientific Interest. The area is unable to accommodate the work involved in constructing temporary construction compounds and of the compounds themselves.</p>                             | <p>The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). The impact on the SSSIs has been provided in section 3.1.2 and section 3.11.3 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).</p> |
| TA_0072_001_231123          | S44     | Consult Online       | NULL                   |                              | <p>Terrible map, secretive, and you are crossing our land in a ziz zag manner, at REDACTED. You have taken no notice of our requests to either route in our land on the north side , or at least keep to a straight line and on our boundary. Your route will take out 40 acres, and render 20 acres unusable for grazing. Why are wildlife(which may or may not be there) be more important than our 270 dairy cows and youngstock, which are definitely here, and need our land to both graze, and produce their winter feed. Your attitude of putting several dairy farms in the area out of business is not acceptable. Our cows produce milk for Tesco. More of a neccessity than wild life. Take issue with Natural England and route up the south side of the Ribble.</p> | <p>The Applicants are committed to robust and transparent public consultation as part of the development process. The Transmission Assets has undertaken three rounds of consultation with the local community, including two non-statutory periods of consultation (2 November to 13 December 2022 and 19 April to 4 June 2023) and a statutory consultation (12 October to 23 November 2023). Statutory targeted consultations have also taken place (November 2023 to October 2024).</p> <p>Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, migration measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). Specifically, the potential impact of the Transmission Assets on the viability and operations of existing farming businesses has been considered in Volume 3, Chapter 6: Land use and recreation of the ES (document reference: F3.6).</p>   |
| TA_0073_004_151123          | S44     | Online feedback form | 5                      |                              | <p>Disruption of sand dunes and of Clifton Drive St Annes, and the nature reserve</p>  | <p>Direct pipe trenchless installation is proposed beneath the sand dunes. This technology will ensure there is no open trenching through the dunes. This will avoid any direct loss of vegetation and habitats. Instead, the drill will pass beneath the dunes at depth.</p> <p>Where necessary consideration of any indirect effects on the habitat and measures to avoid, minimise or mitigate these is provided in section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).</p> <p>Effects in relation to any changes in traffic are set out in Volume 3, Chapter 7 of the ES (document reference F3.7). It is noted that the option presented at PEIR (placement of cables in trenches within the highways) near Blackpool Airport is no longer required. Details of the current design are provided in Volume 1, Chapter 3: Project description of the ES (document reference F1.3).</p>  |
| TA_0074_006_211123          | S44     | Online feedback form | 3                      | 3.3                          | <p>SSSI should not be disturbed at all.</p>  | <p>An assessment of the potential impact on key receptors, including qualifying features of the SPAs (e.g. Ribble and Alt Estuaries SPA) as identified in section 4.6.2, is presented within section 4.11 of Volume</p>   |

|-----------------------------|---------|----------------------|------------------------|------------------------------|---|--|
|                             |         |                      |                        |                              |   | <p>3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).</p> <p>Details on the potential impacts on European sites from the Transmission Assets are contained within the ISAA (document reference E2.1, 2.2, 2.3).</p> <p>The Ribble estuary has numerous ecological statutory designations protected nationally and internationally. These include the Liverpool Bay Special Protection Area, Ribble and Alt. Estuaries Special Protection Area, the Ribble and Alt Estuary Ramsar site (a wetland of international importance under the Ramsar Convention), and the Ribble Estuary Site of Special Scientific Interest, Ribble Estuary Marine Conservation Zone and Ribble Estuary National Nature Reserve. The tidal nature and shallow water depths of the estuary also create heightened risk to construction as the unstable riverbed conditions are unsuitable for trenching/ cable laying vessels to access. As such, cabling through the estuary would result in significantly protracted construction timeframes, and potentially long-term impacts to sensitive and sensitive features associated with the designated features, whilst also presenting higher risk and potentially unsafe working conditions. As such, the approach to site selection has been based on avoiding direct impacts to Important Ecological Features (IEFs) where practicable, further details can be found in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4).</p>   |
| TA_0075_002_071123          | S44     | Online feedback form | 2                      |                              | No, providing any habitat loss is reinstated or kept to a strict minimum.   | <p>Habitats within the Transmission Assets Order Limits have been subject to habitat surveys, where access has been possible. This is reported in section 3.6 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Where there are impacts in relation to birds, these are set out in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).</p>   |
| TA_0076_001_091123          | S44     | Online feedback form | 1                      |                              | <ol style="list-style-type: none"> <li>1. How will it effect the road out side my house</li> <li>2. How will if effect the dunes facing my house</li> <li>3. How will the 'Potential biodiversity net gain, enhancement and/or mitigation areas', how will this affect the front in St Annes</li> </ol> | <p>The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p> <p>As set out in the Onshore Biodiversity Benefit Statement (document reference J11), the Transmission Assets are not subject to a mandatory net gain requirement under the Environment Act 2021. Nevertheless, the Applicants have worked with statutory consultees to discuss the approach, and to develop the design, to allow the maximum benefit to biodiversity within the parameters of the Transmission Assets.</p> |

This technology will ensure there is no open trenching through the dunes. This will avoid any direct loss of vegetation and habitats. Instead, the drill will pass beneath the dunes at depth. Where necessary consideration of any indirect effects on the habitat and measures to avoid, minimise or mitigate these is provided in section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).   |
| TA_0086_001_211123          | S44     | Online feedback form | 1                      |                              | Strongly object to the proposed off shore wind farm route cabling on shore here on the Fylde coast and the destruction and disruption to our roads, farmlands natural green spaces for many years to come.<br>The meetings I attended could not give a definite plan for the 120m wide cable route crossing Queensway (B5261) and could not determine where along Queensway this would be to the rear of our properties on REDACTED, this could result in property subsidence , Noise, pollution etc for years to come and devaluation of our properties. We have lived here for over 50 years, we actively ran a market garden business until the Dutch ruined that, so we feel we know the local land problems round here and what the size of this proposal would impact on this area<br>We have lots of wildlife around here both on land and in the various watercourses surrounding the farmlands, we can't keep pushing this wild life away from here for this proposal, it has already been pushed away from the development at Richmond Point, and the new EZ sports village. Not happy about the disruption to the sand dunes and traffic congestion along Clifton Drive if the cables cross here, the nature reserve Will be affected also.<br>We have recently had a lot of traffic congestion along Queensway/Common Edge Road and surrounding roads caused by the new EZ development, this being the main route of 2 from Blackpool to St Annes, this congestion was horrendous and could not be avoided, we do not want to go through that again<br>We know the importance of green energy and understand that, but feel this is not the on shore place for it, spoiling green belt and natural habitats, bridleways, traffic congestion, flooding, noise and property devaluation because of it, REDACTED is considered as one of the most expensive | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, migration measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |

Nevertheless, the Applicants have worked with statutory consultees to discuss the approach, and to develop the design, to allow the maximum benefit to biodiversity within the parameters of the Transmission Assets.<br>For the Transmission Assets, biodiversity benefit will be delivered within identified biodiversity benefit areas within the Transmission Assets Order Limits: Onshore (referred to as the Onshore Order Limits). Further qualitative benefits to biodiversity are proposed via potential collaboration with stakeholders and local groups, contributing to existing plans and programmes, both within and outside the Onshore Order Limits.<br><br>Further details of the approach to biodiversity benefit are provided in the Onshore Biodiversity Benefit Statement (document reference J11).The calculation undertaken for the Onshore Biodiversity Benefit Statement (document reference J11) utilises the latest biodiversity metric published by Defra (4.0). |
| TA_0092__020_151123         | S44     | Online feedback form | 3                      | 3.3                          | This is important to preserve in this area and particularly across the Fylde Coast  | Onshore ecology is considered within Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).<br><br>Impacts on protected species have been assessed and mitigation is provided for any unavoidable impacts, as described in section 3.8 and assessed in section 3.11 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).  |
| TA_0093_002_211123          | S44     | Online feedback form | 3                      | 3.6                          | As a resident on REDACTED, REDACTED, my house is on the main road opposite the beach. I walk my dog on the beach and nature reserve multiple times per day or week and use the Clifton Drive cycle lane regularly instead of my car. I have been living here almost 8 years and chose this area specifically for the quiet, rural feel. I am extremely concerned about what this project will do to my quality of life, general health and cost of living if I have to sit in construction traffic jams and drive to be able to find somewhere remote to take a walk, especially if it takes years to complete. Many of my neighbours are retired or elderly and chose to live here for a better quality of life in their later years. This will have a huge impact on our wellbeing. | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, migration measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). An assessment considering how the Transmission Assets affects different aspects of the environment that influence population health has been undertaken and reported at Volume 1 Annex 5.1 of the Environmental Statement (ES) (document reference F1.5.1). This includes changes to the social, economic and bio-physical environment and is informed by the results of other assessments as reported in the ES. This assessment Utilises the World Health Organisation definition of health and wellbeing, which includes mental wellbeing. Any effects are assessed to be not significant and appropriately addressed through sharing of non-technical information   |

|                             |         |                      |                        |                              |  | with the public and the project's adherence to health protection standards.  |
| TA_0093_003_211123          | S44     | Online feedback form | 3                      | 3.7                          | As a resident on REDACTED, REDACTED my house is on the main road opposite the beach. When lorries drive past today the houses sometimes shake. The drains under the road regularly (a few times per year) need clearing out when sand build ups are too high, this work normally lasts around 1 week and causes enormous traffic jams, noise pollution, CO2 fumes into our gardens and houses and often continues until after bed time on work / school nights making it difficult for residents to sleep. A project of the size and scale of the Wind Farm would cause traffic jams of immense proportions and severe disruption. Do not underestimate how quickly any roadworks, no matter how small, on Clifton Drive can impact the entire Blackpool and Lytham St Annes area, they quickly cause gridlock and hours of queues especially in summer when tourists also visit.  | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, migration measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). Effects in relation to any changes in traffic are set out in Volume 3, Chapter 7 of the ES (document reference F3.7). It is noted that the option presented at PEIR (placement of cables in trenches within the highways) near Blackpool Airport is no longer required. Details of the current design are provided in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Construction traffic associated with works near the beach will be controlled through a Construction Traffic Management plan. An outline Construction Traffic Management Plan is provided as part of the application (document reference J8).   |
| TA_0094_011_061123          | S44     | Online feedback form | 13                     |                              | Whilst I don't know the costings I find it hard to believe the cost benefit ratio is favourable for all the disruption arising   | The site selection process undertaken by the Applicants aims to avoid and reduce impacts. As set out in every ES chapter, migration measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0095_001_221123          | S44     | Online feedback form | 1                      |                              | <p>We have been to the Consultation Meetings and quite frankly, the situation is disgraceful and we are no wiser. There are no mock photographs to give any indication of the scale of the operation or any idea what the finished substations will look like, and therefore how do you expect constructive feedback for something so vague. We have requested this information to no avail.</p> <p>Our personal situation is with regard to the devaluation of our house if option 2 is chosen, and again no information can be given at present so we are all in limbo. Our house will be opposite the substation and all the building work, and our main objections are the proximity to our house, the loss of Greenbelt and the state of the lane with all the extra traffic that will be involved for such a huge operation on a one track road. Above all, we would have to endure years of stress living next to an enormous building sight and the possible health consequences of a magnetic field. We don't even know if we will receive any compensation for the devaluation of our property so we can escape the ensuing nightmare.</p> <p>To cause such upheaval to everyone's lives in this community will be devastating and unnecessary, as there must be other options. This will be a total disaster for the residents, wildlife, farmland, loss of countryside and we urge you to find alternative sites that will not cause as much harm to the environment, which we thought was the whole point of this project in the first place.</p> | <p>The Applicants have made design changes since the PEIR and further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). This has included refinements of the location and design of the 400 kV grid connection cable corridor and onshore substations, including</p> <ul style="list-style-type: none"> <li>- selection of a single site for the onshore substation for the Morecambe Offshore Windfarm: Transmission Assets</li> <li>- refinement of the siting and orientation of the onshore substation for the Morecambe Offshore Windfarm: Transmission Assets, to take into account consultation responses received.</li> </ul> <p>The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the SoCC).</p> <p>Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p> |

|                             |         |                      |                        |                              |  | See also the submitted EMF Compliance Statement (Volume 1, Annex 3.4 of the ES, document reference E1.3.4).   |
| TA_0096_004_131123          | S44     | Online feedback form | 8                      |                              | I object on the basis of local children growing up with Electromagnetic Radiation all around them, the buzzing noise from the electricity which they will hear more than us and the noise of the construction and the destruction of our peace and quiet. It will be a total eyesore. The value of our houses will plummet. We could easily become a target for a terrorist attack, and so close to the village will be lethal. Also, if you pave 36 acres of good farmland (which can grow crops), you destroy our food security. In addition the Fylde is very flat, so the flooding, which is already bad, will get worse as the runoff from tarmac is far faster than the soil and plants that absorb the rain and take up the moisture in their roots. In the projected area there are endangered and protected species such as bats redshanks, oystercatchers, great crested newts and owls (Tawney and Barn Owls) and buzzards, kestrels, long tailed tits, bar tailed godwits amongst many others. The consultation has not explained to us what we will actually see and experience as residents situated closest to the monstrous constructions being proposed | <p>The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). Visualisations have been presented as part of the landscape and visual assessment within Volume 3, Figure 10.5 (Parts 1-5) (document reference F3.12, Part 3).</p> <p>Electro-magnetic fields (EMFs) are part of the natural world, and are also produced wherever electricity is generated, transmitted or used.</p> <p>With regard to EMF impacts, the project will adopt the International Commission on Non-ionizing Radiation Protection (ICNIRP) guidelines and Government voluntary Code of Practice on EMF public exposure. Such considerations are inherent to the detailed engineering considerations of cable specification and routing. Relevant public EMF exposure guideline limits are noted in NPS EN-5 and would be complied with by the project. These guidelines are long standing and have a high safety margin. The levels of exposure that they require would not pose a risk to public health. Volume 1, Annex 5.1 (document reference F1.5.1) has had regard to the risk perceptions associated with EMFs of the Transmission Assets on the local area and this is presented in section 1.11.9 of the Annex.</p> <p>See also the submitted EMF Compliance Statement (Volume 1, Annex 3.4 of the ES, document reference E1.3.4).</p> |

| TA_0252_001_221123          | S44     | Online feedback form | 1                      |                              | I feel the proposal for the cabling to run across the Fylde has been ill-conceived. Whilst I am not against the principle of having the windfarms in the Irish Sea, I am against the damage to be inflicted on local businesses and the environment.   | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). The Applicants are committed to working with local communities that may be impacted by the Transmission Assets and will continue to work closely with all stakeholders. |
| TA_0252_004_221123          | S44     | Online feedback form | 5                      |                              | I feel there are better options less disruptive to the environment, and local communities and businesses by either taking the cabling up the River Ribble to Penwortham or to Hesham Nuclear Processing Plant which is shortly to be decommissioned and has infrastructure already setup to supply electricity to the national grid. | The Ribble estuary has numerous ecological statutory designations protected nationally and internationally. These include the Liverpool Bay Special Protection Area, Ribble and Alt. Estuaries Special Protection Area, the Ribble and Alt Estuary Ramsar site (a wetland of international importance under the Ramsar Convention), and the Ribble Estuary Site of Special Scientific Interest, Ribble Estuary Marine Conservation Zone and Ribble Estuary National Nature Reserve. The tidal nature and shallow water depths of the estuary also create heightened risk to construction as the unstable riverbed conditions are unsuitable for trenching/ cable laying vessels to access. As such, cabling through the estuary would result in significantly protracted construction timeframes, and potentially long-term impacts to sensitive and sensitive features associated with the designated features, whilst also presenting higher risk and potentially unsafe working conditions. As such, the approach to site selection has been based on avoiding direct impacts to Important Ecological   |

|                             |         |                      |                        |                              |  | <p>Features (IEFs) where practicable, further details can be found in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4).</p> <p>The connection location for the Morgan and Morecambe Offshore Windfarms was determined by the Electricity System Operator's (ESO) Holistic Network Design (HND) process. The HND report was published in July 2022 and assessed potential connection locations and associated transmission network reinforcements for all The Crown Estate (TCE) Round 4 offshore wind lease areas. The Applicants do not have the detailed assessments that ESO produced, however the Heysham and Middleton Substations already connect a number of existing offshore windfarm and additional cabling would likely be difficult to this area.</p>  |
| TA_0252_005_221123          | S44     | Online feedback form | 7                      |                              | Extremely disruptive to the local farming community, the local environment and visual impact especially from the substations and other infrastructure. | <p>The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6).</p> <p>These measures include the provision of an Outline Soil Management Plan (document reference J1.7). In addition, the Outline Code of Construction Practice (document reference J1) seeks to limit disruption to the operation of individual farm holdings. Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). An iterative EIA process has been used to avoid impacts where practicable, in addition to mitigating remaining impacts. The design at the onshore substations is set out in the Outline Landscape Management Plan (document reference J2). The ES describes effects on landscape character and visual resources during construction, operation and maintenance and decommissioning during the day and at night and winter/summer without mitigation and residual effects with mitigation. The landscape and visual assessment (Volume 3, Chapter 10: Landscape and visual resources of the ES) (document reference F3.10) is based on the maximum design scenario to minimise likely effects.</p> |
| TA_0101_001_121123          | S44     | Online feedback form | 1                      |                              | I reject that this be built off the Queensway, this will have a detrimental effect on local wildlife and local residents.                              | <p>Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). |-----------------------------|---------|----------------------|------------------------|------------------------------|---|---|
|                             |         |                      |                        |                              |   | <p>which the Applicants take seriously to engage and understand community views. The Applicants submitted a Consultation Report (document reference E1) that explains how the Applicants complied with the pre-application consultation requirements set out in the Planning Act 2008 and had regard to all the feedback submitted. Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Maximum parameters for the substation have been refined following statutory consultation. It is acknowledged that the proposed cable route passes through Green Belt land and the proposed onshore substations also fall within Green Belt. A consideration of alternative routes and substation siting is made as part of the Site Selection chapter of the ES (Volume 1, chapter 4, document reference F1.4) which concluded this is the preferred route and location for the cable and the substations. Land within the Area of Separation is no longer required for the onshore substations. An assessment regarding the impact on the purposes and openness of the Green Belt, alongside a Very Special Circumstances assessment is set out within the Planning Statement (document reference J28). The Applicants consider that when assessed on the planning balance that the significant benefits of the Project mean that there are Very Special Circumstances that outweigh any potential harm to the Green Belt.</p> |
| TA_0106_007_281023          | S44     | Online feedback form | 3                      | 3.3                          | The proposed routing is directly through a nature reserve and a designated green zone. Has the planning considered all the ordinances surrounding the use of green zone land and airport land in general. | <p>The Applicants have made design changes since the PEIR and further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). This has included refinements of the location and design of the 400 kV grid connection cable corridor and onshore substations. Details of the design and/or environmental constraints considered as part of the iterative design process, are set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, migration measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p>   |
| TA_0106_012_281023          | S44     | Online feedback form | 4                      | 4.2                          | Does the propose development impact ordinances concerning airport/greenbelt land and its use.   | <p>It is acknowledged that the proposed cable route passes through Green Belt land and the proposed onshore substations also fall within Green Belt. A consideration of alternative routes and substation siting is made as part of the Site Selection chapter of the ES (Volume 1, chapter 4, document reference F1.4) which concluded this is the preferred route and location for the cable and the substations. |                             |         |                        |                        |                              |   | Project mean that there are Very Special Circumstances that outweigh any potential harm to the Green Belt.  |
| TA_0106_014_281023          | S44     | Online feedback form   | 9                      |                              | It appears the information is geared to promote Lytham St Annes and downplay other sites. Accordingly there appear bias in the evaluation. Lytham St Annes is a high occupancy residential zone and such developments are not considered suitable. There will be a number of impacts - traffic, noise, health and economic (dropping house prices)  | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3).<br>Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, migration measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).  |
| TA_0110_004_221123          | S44     | Online feedback form   | 4                      |                              | The PEIR and other documents are enormous and realistically the majority of impacted residents will have difficult reviewing the detail. The Project needs to be more upfront and provide clear and readily digestible information about the EMF and other environmental impacts from the onshore assets (cables and substations).  | Electro-magnetic fields (EMFs) are part of the natural world, and are also produced wherever electricity is generated, transmitted or used. With regard to EMF impacts, the project will adopt the International Commission on Non-ionizing Radiation Protection (ICNIRP) guidelines and Government voluntary Code of Practice on EMF public exposure. Such considerations are inherent to the detailed engineering considerations of cable specification and routing. Relevant public EMF exposure guideline limits are noted in NPS EN-5 and would be complied with by the project. These guidelines are long standing and have a high safety margin. The levels of exposure that they require would not pose a risk to public health. Volume 1, Annex 5.1 (document reference F1.5.1) has had regard to the risk perceptions associated with EMFs of the Transmission Assets on the local area and this is presented in section 1.11.9 of the Annex. See also the submitted EMF Compliance Statement (Volume 1, Annex 3.4 of the ES, document reference E1.3.4).       |
| TA_0110_008_221123          | S44     | Online feedback form   | 16                     |                              | The sheer volume of information issued makes it difficult for any lay person to understand the key risks and impacts. A lot of the material relates to environmental issues, which whilst important, are not immediately relevant to the local communities. The human health section impacts assessed are not accompanied by any mitigation measures, nor assurance as to the monitoring of adherence to regulations. | The Applicants are committed to robust and transparent public consultation as part of the development process. The Transmission Assets has undertaken three rounds of consultation with the local community, including two non-statutory periods of consultation (2 November to 13 December 2022 and 19 April to 4 June 2023) and a statutory consultation (12 October to 23 November 2023). Statutory targeted consultations have also taken place (November 2023 to October 2024).<br>In order to ensure the consultation information was available to as many people as possible, many different methods were used, including but not limited to a website, newsletter, postcards, consultation brochure, deposit locations, webinar and in-person events. The Applicants aimed to ensure that it was clear how people could have their say, but also how to get in touch with the Transmission Assets team to find out more information.<br>A full impact assessment on health is presented in Volume 1 Annex 5.1 Human health of the ES (document reference F1.5.1). |
| TA_0111_001_131123          | S44     | Hardcopy feedback form | 3                      |                              | This is the wrong site for landfall. The proposal to go across the Nature Reserve which is an important SSSI is wrong and should not proceed. The impact on the Nature Reserve and the properties nearby is too damaging.   | The approach to site selection has been based on avoiding damage to Important Ecological Features where practicable, as is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4).<br>In addition, during an iterative process of EIA, locations where  |

|                             |         |                        |                        |                              |   | trenchless techniques will be used to avoid impacts on IEFs. have been identified.<br>Where temporary habitat loss is unavoidable, such as where construction accesses need to cross hedges, this will be rectified by reinstating habitats in accordance with the specifications provided in the Ecological Management Plan. An Outline Ecological Management Plan (document reference J6) is provided as part of the application for development consent.<br>Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) assesses the impacts on Lytham St. Anne's Dunes SSSI. Direct pipe trenchless installation is proposed in this location as it's the most appropriate for use in sensitive settings, in part because it reduces the risk of collapse that is associated with cable installation using horizontal directional drilling (HDD).   |
| TA_0111_004_131123          | S44     | Hardcopy feedback form | 3                      | 3.3                          | The Lytham St Annes Nature reserve is an SSSI and should not be used in any way for this project.   | Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) assesses the impacts on Lytham St. Anne's Dunes SSSI.   |
| TA_0111_011_131123          | S44     | Hardcopy feedback form | 4                      |                              | Landfall is at the wrong site, both for damage and access to the beach, and interference to the Nature Reserve (which as an SSSI should not be used). | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3).<br>The impact on Lytham St Annes Dunes SSSI is considered within section 1.11.9 of Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F3.1) and in section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).<br>Substantial reductions to the Order Limits have been made to the north of the PEIR boundary at landfall. The areas of beach subject to construction works, including landfall compounds will not be available for public access during this period. However, the Applicants have committed to ensure public access to the east of the works areas will be maintained during construction. This will ensure that, areas to the north and south of the works area would remain accessible for beach-based activities. The Applicants have sought to minimise the duration of beach works by committing to a direct pipe trenchless installation technique in order to limit potential disruption to users of the beach and an Outline Open Space Management Plan has been appended to the Outline Public Rights of Way Management Plan (document reference J1.5), which includes measures to minimise potential impacts. |
| TA_0111_012_131123          | S44     | Hardcopy feedback form | 4                      | 4.1                          | The landfall site on the beach will obviously damage visually and for access, this part of the beach forever.   | An iterative EIA process has been used to avoid impacts where practicable, in addition to mitigating remaining impacts. The design at the onshore substations is set out in the Outline Landscape Management Plan (document reference J2). The ES describes effects on landscape character and visual resources during construction, operation and maintenance and decommissioning during the day and at night and winter/summer without mitigation and residual effects with mitigation. The landscape and visual assessment (Volume 3, Chapter 10: Landscape and visual resources of the ES) (document reference F3.10) is based on the maximum design scenario to minimise likely effects.   |

## E1.16.18.2 Onshore ecology table of responses (via all other methods)

**Table E1.16.18.2: Onshore ecology table of responses (via all other methods)**

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received  | Applicants' response  |
|-----------------------------|---------|-----------------|---|---|
| TA_0001_187_231123          | S42     | Email           | <p>6.1 The proposed cabling route falls within an area of deep peaty soils as identified here. Further evidence required to determine presence of deep peaty soils. Natural England advises that either further information is provided to demonstrate the extent of deep peat in the area of the cable route, or that the proposed developments are amended to avoid any work within these particular areas. Natural England advise that it may be useful to refer to existing borehole data from the British Geological Survey (BGS) but if there is a lack of data across the proposed development site then a peat survey may be required. A peat survey should be undertaken by a soils scientist and should determine the presence of peat, it's depth and the presence of any spoil/waste materials that would impact the restoration ability. Natural England advise that peat surveys are carried out in line with the IUCN peatland programme field protocol</p> <p>6.1 3.9.3.3 and 3.9.5.8<br/>Both these sections include list of pre- construction surveys to be undertaken for the caballing routes. The caballing routes fall within the deep peaty soils layer – peat can be damaged from cabling works. In Cheshire to Lancashire, for onshore projects, Natural England request that evidence for anyproject which may impact peat needs to demonstrate that a) either peat is not present within the area, or b) it cannot be restored. As the proposed cabling route falls within an area of deep peaty soils, Natural England advises that the developer provides information detailing the presence or absence of peat along the cable route. Further information on the location of deep peaty soils can be found here. Natural England do not support the principle of developing on peat. Peat is an irreplaceable asset that once gone is lost for ever and can never be restored to sequester carbon which is difficult to justify in a climate emergency. Natural England advises that any ground works, such as cutting a trench in the peat or drift deposits under or adjacent to the peat will have impacts both on ground water and water levels within the peat. Peat habitat is very sensitive to modification to water levels, this means these works can impact a wide area of the peat mass. Natural England therefore advises that either further information is provided to demonstrate the extent of deep peat in these areas or that the proposed developments are amended to avoid any work within these particular areas. Natural England advises that it may be useful to refer to existing borehole data from the British Geological Survey (BGS) but if there is a lack of data across the proposed development site then aa peat survey may be required. A peat survey should be undertaken by a soils scientist and should determine the presence of peat, it's depth and the presence of any spoil/waste materials that would impact the restoration ability. Natural England advise that peat surveys are carried out in line with the IUCN peatland programme field protocol.</p> | <p>The EIA process has taken into account both existing information (including details of BGS boreholes) and site survey. Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F3.1) sets out details of ground conditions.</p> <p>Peaty soils are considered within Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This chapter includes details of soil surveys undertaken. Further detailed information regarding the methodology, scope and results of the soil surveys is provided in Volume 3, Annex 6.2: Soil surveys data technical report of the ES (document reference F3.6.2). The assessment has considered the presence of peaty soils located within the Transmission Assets Order Limits.</p>   |
| TA_0001_188_231123          | S42     | Email           | <p>6.2 One of the main justifications of having less significant impact on ecological receptors is the use of HDD or alternative trenchless techniques. However, no evidence is provided within the report as to why this approach is less intrusive and will have less impact. Further evidence should be provided regarding this approach, to set out why using these techniques will have less of impact including description, predicted noise levels, operation and methodology.</p>   | <p>Direct pipe trenchless installation is proposed beneath the sand dunes. This technology will ensure there is no open trenching through the dunes. This will avoid any direct loss of vegetation and habitats. Instead, the drill will pass beneath the dunes at depth. Where necessary consideration of any indirect effects on the habitat and measures to avoid, minimise or mitigate these is provided in section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Direct pipe or microtunnelling is proposed beneath the River Ribble to ensure that there would be no direct impacts on the river habitats. As set out in Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3), The risk of bentonite breakout will be controlled through the bentonite breakout plan. An Outline Bentonite Breakout Plan (document reference J1.13) is provided as an annex to the Code of Construction Practice (CoCP) (document reference J1). Crossing techniques are set out within Volume 1, Annex 3.2: Onshore Crossing Schedule of the ES (document reference F1.3.2) which is submitted as part of the application for development consent. Further information on the proposed approach to construction is provided in Volume 1, Chapter 3: Project description of the ES.</p> |

|-----------------------------|---------|-----------------|---|---|
| TA_0001_189_231123          | S42     | Email           | 6.3 Incomplete surveys with data gaps. The current assessment does not include a range of surveys including reptile and invertebrates. These surveys may change some of the conclusions. For reptile surveys, sand lizard surveys should be undertaken as sand lizards have been successfully re-established within coastal dunes of which the assets will pass through. As this assessment is based on incomplete/ missing surveys, the submitted ES needs to present the assessment with full survey data. Specific Sand Lizard surveys also need to be carried out for the section of coastal dune habitat that the transmission cable corridor crosses. Detail of the methodology that should be followed for the Sand Lizard survey is provided in comment 6.19 Please also see comment 6.12 for further detail on our baseline survey guidance. | As discussed in the Expert Working Group Meetings, further surveys have taken place to support the ES which are detailed in section 3.6.2 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). No surveys for sand lizard are proposed as impacts will be avoided through the use of direct pipe trenchless installation. Data on their distribution in 2022 and 2023, following their introduction to the Fylde dunes in 2018 has been provided by the sand dune project. Further surveys are considered to cause unnecessary disturbance to dune habitats given that the data from would not improve the basis for assessment. The impacts and effects on sand lizards have been included in section 3.11 of Volume 3, Chapter 3: Onshore ecology sand nature conservation of the ES (document reference F3.3).                                  |
| TA_0001_190_231123          | S42     | Email           | 6.4 The assessment of ecological receptors in Volume 3, Chapter 3 does not seem to account for the supporting habitat that some ecological receptors provide to qualifying bird species. This means that some doubt remains around the conclusions for impacts on these ecological receptors. When assessing the habitat within the ecological chapters, as part of the assessment of its value, the developer needs to consider the role it plays in providing this supporting habitat to important bird species, as this contributes towards the overall function and value of the habitat.   | The impact of loss of habitat has been considered separately to that of disturbance in section 4.13.3 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). In addition the functionally linked land at Lytham Moss has been assessed separately.   |
| TA_0001_191_231123          | S42     | Email           | 6.5 There is a lack of assessment on impacts to SSSIs. The documents only seem to assess impacts on notified bird species in SSSIs not other notified features such as various habitats. An assessment is required for all SSSIs, including all direct and indirect impacts on notified features.   | The impact on SSSIs (designated for reasons other than ornithological interest) has been provided in section 3.11.2 and 3.11.3 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).<br><br>Features of internationally and nationally designated sites were considered when identifying the list of Important Ecological Features listed in section 4.6.6 of Volume 3 Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). The potential for impacts from the Transmission Assets has been assessed in section 4.11 of that chapter.   |
| TA_0001_192_231123          | S42     | Email           | 6.6 No detail has been provided for what is happening at the Fairhaven site. From aerial photos, this area appears to be coastal habitats with dunes and saltmarsh (although not designated, this would still be a Priority Habitat). Part of this area falls within the geological site – Lytham Coastal Changes SSSI. Please provide further detail for this area in the submitted ES.  | The referenced site is proposed for ornithological mitigation – details are provided in Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4) and the Outline Ecological Management Plan (document reference J6). Any impacts on designated geological sites are set out in Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F3.1) sets out details of ground conditions.   |
| TA_0001_193_231123          | S42     | Email           | 6.7 As the proposed installation method for to avoid Lytham St. Anne's SSSI is HDD, it is felt that the developer has not fully considered the Maximum Design Scenario (MDS) for this designated site. Please see comment 6.12 for further detail. A full baseline assessment of Lytham St. Anne's Dunes SSSI should be undertaken, and presented within the submitted ES, so that should the worst-case scenario occur (i.e. HDD is not possible) sufficient ecological data is available to inform/ develop suitable mitigation measures. In addition, it could be used as a baseline for post-construction monitoring (and a means to determine recovery). Please see comment 6.12 for further detail.   | Direct pipe trenchless installation is proposed in this location and is the basis for the assessment of impacts on dune slacks provided in section 3.11.2 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Further data on the distribution and status of SSSI interest features that is necessary to inform the ES has been obtained from existing reports prepared on behalf of Lancashire Wildlife Trust and Our Future Coasts, and project-specific national vegetation classification (NVC) surveys have been carried out to confirm or update the findings of these reports where necessary. Crossing techniques at the sand dunes at Lytham St. Anne's are presented within Volume 1, Annex 3.2: Onshore Crossing Schedule of the ES (document reference F1.3.2) which is submitted as part of the application for development consent. |

|-----------------------------|---------|-----------------|---|--|
| TA_0001_194_231123          | S42     | Email           | 6.8 There is a lack of consideration of other impacts to Lytham St Annes Dunes SSSI, particularly with regards to changes to the water table. Please see comment 6.27 for further detail. Consider changes to the water table at Lytham St Annes Dunes SSSI.  | This impact is considered within section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).  |
| TA_0001_195_231123          | S42     | Email           | Project Description 6.9The proposed development description – does not provide detail as to what is happening at Fairhaven (adjacent to RSPB Fairhaven Lakes). The area is shown on the Phase 1 Habitat Survey maps as section 9 (Figure 1.3 I - page 17 of Vol 3. Annex 3.2 Interim Phase 1 Habitat Survey Technical Report). From aerial photos, this area appears to be coastal habitats with dunes and saltmarsh (although not designated, this would be a Priority Habitat). Part of this area falls within the geological site – Lytham Coastal Changes SSSI. Provide further detail for this area in the submitted ES.   | The section of the Transmission Assets Order Limits adjacent to RSPB Fairhaven Lakes is proposed for ornithological mitigation (with no development to take place at this location). Refer to Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES for further details.Consideration of sites with a geological designation present within the study area is set out in section 1.6.2 of Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F3.1) with the assessment for relevant sites, including Lytham Coastal Changes SSSI provided in section 1.11.2. It has however, been concluded that there will be no impact on Lytham Coastal Changes SSSI, which lies outside the Transmission Assets Order Limits.  |
| TA_0001_197_231123          | S42     | Email           | 6.11 5.4.6 This section sets out the mitigation hierarchy. However, from the measures listed that will be implemented, it's not clear if the full hierarchy is being followed.i.e - avoid, minimise, rectify, reduce and off-set.Provide clarification on how the measures adopted will follow the full mitigation hierarchy. In this section, there seems to be a lot of discussion around reducing, off- setting or enhancing but there's not much focus on avoidance or rectifying. Natural England advises that the developer should follow the mitigation hierarchy table and set out how they will avoid and minimise in first instance in their approach.  | The approach to site selection has been based on avoiding damage to Important Ecological Features where practicable, as is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4).In addition, during an iterative process of EIA, locations where trenchless techniques will be used to avoid impacts on IEFs. have been identified. Where temporary habitat loss is unavoidable, such as where construction accesses need to cross hedges, this will be rectified by reinstating habitats in accordance with the specifications provided in the Ecological Management Plan. An Outline Ecological Management Plan (document reference J6) is provided as part of the application for development consent.  |
| TA_0001_198_231123          | S42     | Email           | Natural England's Position on Worst Case Scenario or Scenarios 6.12Vol3; Chp 3 Table 3.11,Table 3:15 The developer recognises Lytham St. Anne's Dunes as a SSSI (Table 3.11) and it has been taken forward as an Important Ecological Feature (Table 3.15). However, as the proposed installation method is HDD it is felt the developer has not fully considered the MDS (Table 3.16) for this designated site. The current assessment for Lytham St. Anne's Dunes SSSI (para 3.9.2.8 - 3.9.2.11) notes "During construction the Transmission Assets will commit to avoiding impacts on the Lytham St Annes Dunes SSSI, as the cables will be installed beneath this habitat via HDD (or other trenchless techniques) and open trenching techniques would not be used within this habitat.Accordingly, there will be no temporary or permanent loss of this habitat type. The magnitude of impact is therefore, considered to be no change." The developer goes on to note that while the sensitivity of the habitat is High, the significance of effect is no effect. However, from experience of similar projects Natural England know that on occasions HDD can fail, or the proposed development design changes and for example Transition Joint Bays need to be moved (which presumably currently will be situated on the beach)/ or additional vehicle access is required. In such scenarios by excluding any effect early in the assessment process there is a lack of detail later on if the installation methods change.Similarly full consideration of impacts should HDD not be undertaken in saltmarsh along the river Ribble (part of the Ribble Estuary SSSI). A full baseline assessment of Lytham St. Anne's Dunes SSSI should be undertaken so that should the worst-case scenario occur (i.e. HDD is not possible) sufficient ecological data is available to inform/ develop suitable mitigation measures. In addition, it could be used as a baseline for post-construction monitoring (and a means to determine recovery).Baseline surveys of Lytham St Annes Dunes SSSI should include mapping to NVC level of the dune habitats present, with supporting quadrat sampling. Quadrat sampling should be sufficient in coverage to ensure all community types are sampled. The SSSI citation notes that the site support classic features of dune formation and ecological succession including the widest range of foredune, yellow dune, dune grassland, acid dune grassland, dune scrub and dune slack habitats found anywhere along the Fylde Coast. The site is botanically diverse with a number of rare or scarce plant species.Use of up-to-date aerial photography taken at the time of the NVC survey would be preferable. The developer should undertake a cable burial risk assessment for all the HDD work (including Lytham St. Anne's Dunes SSSI and the River Ribble (part of the Ribble Estuary SSSI) informed by geotechnical investigations. This should include an outline burial cable specification and installation plan which has a pollution* and contingency plan. This would help determine the | Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) assesses the impacts on Lytham St. Anne's Dunes SSSI. Direct pipe trenchless installation is proposed in this location as it's the most appropriate for use in sensitive settings, in part because it reduces the likelihood of collapse that is associated with cable installation using horizontal directional drilling (HDD). The Works Plans submitted with the application for development consent (and accompanying description) allow only for direct pipe in this location. Therefore, the MDS that has been used is considered to be correct. Further data on the distribution and status of SSSI interest features that is necessary to inform the ES has been obtained from existing reports prepared on behalf of Lancashire Wildlife Trust and Our Future Coasts, and NVC surveys have been carried out to confirm or update the findings of these reports where necessary.CoT41 states that where the onshore export cable corridor or 400 kV grid connection cable corridor crosses sites of particular sensitivity, including Lytham St Annes Dunes SSSI, a hydrogeological risk assessment will be undertaken to inform a site-specific crossing method statement which will also be agreed with the relevant authorities prior to construction.The risk of bentonite breakout at Lytham St Annes Dunes SSSI will be controlled through the bentonite breakout plan. An Outline Bentonite Breakout Plan (document reference J1.13) is provided as an annex to the Code of Construction Practice (CoCP) (document reference J1). |

|-----------------------------|---------|-----------------|--|---|
|                             |         |                 | likelihood (degree of confidence) of success of HDD at the given locations. *Note a Bentonite breakout plan is mentioned for the River Ribble but not for Lytham St. Annes Dunes   |   |
| TA_0001_199_231123          | S42     | Email           | Survey Data Acquisition 6.13 Para 3.8.5.4 (page 60) The report notes that “botanical surveys will be undertaken in 2023 and 2024 for all necessary land parcels to clarify and provide more detailed Phase 1 survey habitat results, as required. In addition, habitat parcels with potential to provide botanical diversity will have National Vegetation Classification (NVC) surveys undertaken by qualified botanists.” Please ensure this includes areas where HDD are proposed. Currently the Phase 1 Habitat Survey report notes that around 63% of the Phase 1 survey area has been surveyed. Some of this has not yet been digitised (including the habitats covering Lytham St Annes Dunes SSSI and saltmarsh along the river Ribble). It is noted that some of the target notes shown in Fig 1.3a-i (Vol 3. Annex 3.2 Interim Phase 1 Habitat Survey Technical Report) are missing i.e., TN233 and TN610. Baseline surveys of Lytham St Annes Dunes SSSI and saltmarsh along the River Ribble (Ribble Estuary SSSI) should include mapping to NVC level of the dune and saltmarsh habitats present, with supporting quadrat sampling. Quadrat sampling should be sufficient in coverage to ensure all community types are sampled. Additional attributes based on the Common Standards Monitoring Guidelines for sand dune ( <a href="https://data.jncc.gov.uk/data/7607ac0b-f3d9-4660-9dda-0e538334ed86/CSM-SandDuneHabitats-2004.pdf">https://data.jncc.gov.uk/data/7607ac0b-f3d9-4660-9dda-0e538334ed86/CSM-SandDuneHabitats-2004.pdf</a> ) and saltmarsh ( <a href="https://data.jncc.gov.uk/data/7607ac0b-f3d9-4660-9dda-0e538334ed86/CSM-SaltmarshHabitats-2004.pdf">https://data.jncc.gov.uk/data/7607ac0b-f3d9-4660-9dda-0e538334ed86/CSM-SaltmarshHabitats-2004.pdf</a> ) should also be included. Botanical surveys for sand dunes should be undertaken in May/ June, while saltmarsh surveys can be undertaken between May and August. Use of up-to-date aerial photography taken at the time of the NVC survey would be preferable. | Volume 3, Annex 3.3: Phase 1 habitat and national vegetation classification and hedgerow survey technical report of the ES (document reference F3.3.3) contains the findings of the phase 1 habitat, NVC and hedgerow surveys, for which coverage for surveys is over 90% and mapping is fully digitised and target notes are complete and consecutive. Further data on the distribution and status of SSSI interest features that is necessary to inform the ES has been obtained from existing reports prepared on behalf of Lancashire Wildlife Trust and Our Future Coasts, and NVC surveys have been carried out to confirm or update the findings of these reports where necessary.   |
| TA_0001_200_231123          | S42     | Email           | 6.14 Table 3:10 Morecambe Bay and Duddon Estuary SPA is missing from the designated site list. Only Morecambe Bay SAC and Ramsar are mentioned. It also does not list the Ramsar qualifying features in the relevant qualifying interest section. Note for correction.   | Information on designated sites for which birds are a reason for designation is provided in Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). Further assessment of internationally designated sites is provided in the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3).   |
| TA_0001_201_231123          | S42     | Email           | 6.15 Table 3:10 For national sites, it mentions Martin Mere, Burscough SSSI – this SSSI is also underpinned by an SPA – Martin Mere SPA which is not included in list. Note for correction.  | Information on designated sites for which birds are a reason for designation is provided in Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). Further assessment of internationally designated sites is provided in the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3).   |
| TA_0001_202_231123          | S42     | Email           | 6.16 Table 3:15 The description for Lytham Moss BHS is wrong – It is not also known as the Queensway Farmland Conservation Area (FCA). The FCA is a specific area within the BHS site which is managed for qualifying bird species as mitigation provided within a planning application, the BHS itself is separate. The BHS site (which has a wider boundary) is a designated by Lancashire County Council using a set of published guidelines. This needs to be updated, the document needs to clearly set out the correct information for Lytham Moss BHS, its correct boundaries and why it has been designated a Biological Heritage Site. The FCA should be defined with information on its purpose. It is specific mitigation land for qualifying bird species and managed as such. It is also secured under Section 106 agreement between developer and Fylde BC.  | The Applicants note your response. All relevant BHSs are considered within Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).   |
| TA_0001_203_231123          | S42     | Email           | 6.17 N/A – General Comment One of main justification of having less significant impact on ecological receptors is the use of HDD or alternative trenchless techniques, however no evidence is provided within the report why this approach is less intrusive and will have less impact. Further evidence should be provided regarding this approach, to set out why using these techniques will have less of impact including description, predicted noise levels, operation, and methodology. The developer should link to any evidence to support the justification it will be less intrusive and limit impacts on ecological receptors.   | This impact is considered within Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES. Direct pipe trenchless installation is proposed beneath the sand dunes. This technology will ensure there is no open trenching through the dunes. This will avoid any direct loss of vegetation and habitats. Instead, the drill will pass beneath the dunes at depth. Where necessary consideration of any indirect effects on the habitat and measures to avoid, minimise or mitigate these is provided in section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES. Direct pipe or microtunnelling is proposed beneath the River Ribble to ensure that there would be no direct impacts on the river habitats. The risk of bentonite breakout will be controlled through the bentonite breakout plan. An Outline Bentonite Breakout Plan (document reference J1.13) is provided as an annex to the Code of Construction Practice (CoCP) (document reference J1). Crossing techniques are set out within Volume 1, Annex 3.2: Onshore Crossing Schedule of |

|                             |         |                 |   | the ES (document reference F1.3.2) which is submitted as part of the application for development consent.  |
| TA_0001_204_231123          | S42     | Email           | 6.18 Table 3.18 As well as BNG Metric 4 calculator, there are other tools that can be used to identify opportunities to enhance wider benefits from nature. Advise that as well as Metric, Natural England's Environmental Benefits from Nature tool may be used to identify opportunities to enhance wider benefits from nature and to avoid and minimise any negative impacts. It is designed to work alongside the Biodiversity Metric and is available as a beta test version.  | The calculation undertaken for the Onshore Biodiversity Benefit Statement (document reference J11) utilises the latest biodiversity metric published by Defra (4.0).   |
| TA_0001_206_231123          | S42     | Email           | Data Gaps 6.19 3.8.5.5 The current assessment does not include range of surveys including reptile and invertebrates. These surveys may change some of assessment conclusions, especially for impacts on Coastal Dune Habitat and Lytham St Annes Dunes SSSI. The ongoing Fylde Dune Project successfully re-established Sand Lizards in these dunes the other year and without the correct surveys being undertaken, the proposed development may impact these species. Sand Lizards are a European Protected Species. Natural England advises that these surveys are undertaken by the developer. This is especially important for Sand Lizard surveys within the section of coastal dune habitat that the cable intersects. The developer needs to undertake the outstanding surveys listed, and an additional sand lizard survey and present these results in the submitted ES. For Sand Lizard surveys, Natural England would expect a minimum of 20 visits carried out in suitable weather conditions, focussing primarily on the months of April and May for adults and late August to October for hatchling observations. After these surveys have been undertaken, the developer will then need to reassess the impacts on ecological receptors to see if there are any changes to the conclusions, especially looking if the species or NVC communities play an essential role in maintaining the functioning/ecosystem of the ecological receptors, and if they will be impacted by the proposed development, especially in relation to the coastal sand dunes. | No surveys for sand lizard have been undertaken as direct impacts will be avoided though the use of direct pipe trenchless installation. Further surveys would cause unnecessary disturbance to dune habitats and the data from would not improve the basis for assessment. Further data on the distribution and status of SSSI interest features that is necessary to inform the ES has been obtained from existing reports prepared on behalf of Lancashire Wildlife Trust and Our Future Coasts, and national vegetation classification (NVC) surveys have been carried out to confirm or update the findings of these reports where necessary. The potential impacts from habitat disturbance are assessed in section 3.11.3 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). |
| TA_0001_206_231123          | S42     | Email           | 6.20 N/A – General Comment This chapter does not account for impacts of ecological receptors providing habitat to supporting bird species. It is acknowledged that a specific chapter has been dedicated to impacts to onshore birds, ecological receptors assessed in this chapter play a supporting role in supporting qualifying and other significant important bird species. Therefore, the role and value that these habitats have in terms of providing supporting habitat to important bird species needs to be assessed here. The role and value that certain habitats have in terms of providing supporting habitat to important bird species needs to be assessed within the ecological chapters. This is important to consider in line with the overall function and value of these supporting habitats, especially in relation to saltmarsh, FLL habitat, and the Lytham Moss area.  | Any areas of terrestrial habitat of importance for birds, including waders and waterbirds, are discussed in Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). This includes discussion of the presence of functionally linked land within the Onshore Order Limits and the potential for adverse effects from the loss and disturbance of this habitat.   |
| TA_0001_207_231123          | S42     | Email           | Analysis, Modelling and Reporting 6.21 3.9.2.9 and 3.9.3.14 Natural England cannot agree with the conclusion that impacts on coastal sand dunes will have no effect. See comments regarding lack of surveys above.  | The assessment of impacts on the sand dunes that form the reason for statutory and non-statutory designated sites is provided in sections 3.11.3 and 3.11 of Volume 3, Onshore Ecology and Nature conservation of the ES (document reference F3.3). Impacts on sand dunes a priority habitat are set out in section 3.11.8. Assessment of impacts on key associated species: reptiles, plants and invertebrates is provided in sections 3.11.11 and 3.11.15 of that chapter.   |
| TA_0001_208_231123          | S42     | Email           | 6.22 3.9.2.15 and 3.9.3.18 Natural England do not agree that the effect for coastal flood plain grazing marsh will be minor adverse. See comments regarding data above.   | The assessment of impacts on priority habitats provided in section 3.11 of Volume 3, Onshore Ecology and Nature conservation of the ES (document reference F3.3). This has been updated to reflect the current design, as well as increased survey coverage.   |
| TA_0001_209_231123          | S42     | Email           | 6.23 3.9.2.21 and 3.9.3.22 Natural England do not agree that the effect on coastal saltmarsh will be minor adverse. | TA_0001_211_231123          | S42     | Email           | Identified impacts.6.25 There is a lack of consideration of other impacts to Lytham St Annes Dunes SSSI, particularly with regards to changes to the water table. The SSSI citation highlights “the series of exceptionally large and extensive dune slacks on either side of Clifton Drive North support a wide range of species which vary according to the depth of water and degree of moisture retention in relation to the water table”. Depending on the depth of cable installation the impacts of HDD on the dune water table (i.e., the cable resulting in the dune slacks becoming drier changing the species composition) should be considered. Other impacts such as impacts of dust on the SSSIs (identified in the Air Quality chapter as being features sensitive to dust of medium sensitivity – although ruled out due to HDD methods being used and provided the dust control measures are successfully implemented, the resultant effects of the dust exposure will normally be ‘not significant’.).Note nitrogen deposition to SSSIs does not appear to be covered – sand dunes are particularly sensitive to nitrogen deposition which can lead to over stabilisation through the dominance of coarse grasses. An assessment using the Air Pollution Information System ( <a href="https://www.apis.ac.uk/">https://www.apis.ac.uk/</a> ) should be undertaken. The effects of surface water run-off should also be considered. Consider changes to the water table at Lytham St Annes Dunes SSSI. When considering habitats, it would be good to list all the potential pressures/ impacts considered. | Section 3.11.3 of Volume 3, Chapter 3: Onshore ecology and nature conservation (document reference F3.3) provides an assessment of impacts to the SSSI, including changes in relation to the water table, changes in air quality from emissions of nitrogen, and the impact of surface runoff and pollution. Volume 3, Annex 9.1: Air quality impacts on ecological receptors of the ES (document reference F3.9.1) which states that impacts are insignificant for all pollutants at designated sites   |
| TA_0001_212_231123          | S42     | Email           | Screening 6.26 N/A – General Comment on Chapter 3 Onshore Ecology and nature conservation Lack of assessment of identified nationally designated sites within chapter. Table 3.10 identifies the proposed development falls near several SSSIs including Newton Marsh SSSI, Lytham St Annes Dunes SSSI, Lytham Coastal Changes and several others, including falling WITHIN Ribble Estuary SSSI. It also identified several EU sites. However, impacts on these sites, except Lytham St Annes Dunes SSSI is not assessed within this chapter, as would be expected. If some sites are not being taken forward for detailed assessment, then Natural England would expect discussion on why they have been ‘scoped out’, including detailed justification.. Ribble Estuary SSSI has different notified features than Ribble & Alt SPA including habitat, so it should be assessed within this chapter. An assessment is required for all nearby nationally designated sites, especially for the SSSIs as they will not be covered within the HRA. The developer needs to undertake an assessment of all direct and indirect impacts on the notified features of the SSSIs (not just birds), especially Ribble Estuary SSSI. If it’s decided that some SSSIs do not need detailed assessment, then the report should clearly state this, and provide justification why this conclusion was reached.   | The impact on SSSIs (designated for reasons other than ornithological interest) has been provided in section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). The impacts on qualifying features of the Ribble and Alt Estuaries Ramsar site and the Ribble Estuary SSSI in terms of ornithological interest are assessed in Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). Please refer to Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES regarding Lytham Coastal Changes SSSI.  |
| TA_0001_213_231123          | S42     | Email           | Assessment 6.27 See earlier comments regarding sand dunes at Lytham St. Anne’s Dune SSSI and saltmarsh along the River Ribble.  | The Applicants note your response and have responded accordingly, see unique reference TA_0001.  |
| TA_0001_214_231123          | S42     | Email           | Biodiversity Net Gain 6.28 Table 3.18 As well as BNG Metric 4 calculator there are other tools that can be used. Natural England advises that as well as the Metric, Natural England’s Environmental Benefits from Nature tool may be used to identify opportunities to enhance wider benefits from nature and to avoid and minimise any negative impacts. It is designed to work alongside the Biodiversity Metric and is available as a beta test version.  | As set out in the Onshore Biodiversity Benefit Statement (document reference J11), the Transmission Assets are not subject to a mandatory net gain requirement under the Environment Act 2021. Nevertheless, the Applicants have worked with statutory consultees to discuss the approach, and to develop the design, to allow the maximum benefit to biodiversity within the parameters of the project. For the Transmission Assets, biodiversity benefit will be delivered within identified biodiversity benefit areas within the Transmission Assets Order Limits: Onshore (referred to as the Onshore Order Limits). Further qualitative benefits to biodiversity are proposed via potential collaboration with stakeholders and local groups, contributing to existing plans and programmes, both within and outside the Onshore Order Limits. Further details of the approach to biodiversity benefit are provided in the Onshore Biodiversity Benefit Statement (document reference J11). The calculation undertaken for the Onshore Biodiversity Benefit Statement (document reference J11) utilises the latest biodiversity metric published by Defra (4.0). |
| TA_0001_215_231123          | S42     | Email           | Soils and Best and Most Versatile Agricultural Land 6.29 Table 3.41 Natural England welcome the reference to the Construction Code of Practice for Sustainable Use on Construction Sites. There is also other standard guidance that Natural England also refer too. Any soils handling methods should also follow the Institute of Quarrying Good  | Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of  |

|-----------------------------|---------|-----------------|---|---|
|                             |         |                 | Practice Guide for Handling Soils in Mineral Workings which provides detailed advice on the choice of machinery and method of their use for handling soils at various phases, which we strongly recommend is followed. The British Society of Soil Science has published the Guidance Note Benefitting from Soil Management in Development and Construction which also contains useful guidance.  | the ES (document reference F3.6). This includes the preparation of a Soil Management Plan in general accordance with the Outline Soil Management Plan (document reference: J1.7), which has been submitted with the application for development consent. The measures to be implemented as part of the Soil Management Plan are in general accordance with the Institute of Quarrying (IQ) Good Practice Guide for Handling Soils in Mineral Workings (IQ, 2021) and British Society of Soil Science (BSSS) Working with Soil Guidance Note on Benefitting from Soil Management in Development and Construction (BSSS, 2022) which seek to minimise impacts on soil health and protect and maintain soil quality during construction. |
| TA_0001_220_231123          | S42     | Email           | 7.5 Natural England do not consider that a 'whole project alone' assessment has been undertaken for the Ribble and Alt Estuaries SPA. For further detail, please see comment 7.46. The submitted ES should contain a 'whole project alone' assessment so the totality of potential impacts on the SPA (and other receptors where relevant) are properly quantified and appropriate mitigation put in place where needed. In particular, the assessment should fully consider how the construction pressures impact both the SPA itself and its functionally linked land.  | The ES includes an assessment of the Transmission Assets alone in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4) and in Volume 2, Chapter 5: Offshore ornithology of the ES (document reference F2.5). Details on the impacts on European sites from the Transmission Assets are contained within the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3). Both the ES and the ISAA consider construction impacts, including impacts on functionally linked land.  |
| TA_0001_221_231123          | S42     | Email           | 7.6 Part of the justification for no adverse impacts on onshore birds is that the cable route will not pass through significant Functionally Linked Land habitat (Lytham Moss BHS). This is not accurate as the final decision of which cable route to use has not been finalised and Option 2 will pass through this habitat. This justification can only be applied once the final decision has been made regarding the cable route. Natural England advises that route Option 1 is chosen to avoid FLL habitat.  | The cable route proposed as part of the application aims to avoid as much of this sensitive area as possible. This has been considered as part of the iterative site selection process, together with design and engineering constraints. Full details of Transmission Assets Order Limits can be found in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). An assessment of effects in relation to birds, including consideration of functionally linked land, is provided in Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).  |
| TA_0001_235_231123          | S42     | Email           | 7.19 Vol 3, Annex 4.2 1.4.3.5 Note that much of the survey area is of significant usage as FLL by SPA species. The assessment of impacts in the submitted ES should ensure that the potential impacts on Functionally Linked Land is fully assessed in terms of impacts to SPA species and apply the mitigation hierarchy as required.  | An assessment of the potential impact on key receptors, including qualifying features of the SPAs, is identified in section 4.6.2 and is presented within section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). This assessment includes the potential impact at areas of functionally linked land identified.<br><br>The findings of the HRA process are set out in the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3).  |
| TA_0001_244_231123          | S42     | Email           | 7.29 1.11.3.31 Part of reasoning for justification for no adverse and loss of habitat for onshore cable corridor is that route will not pass through the area around Lytham Moss. This cannot be justified at this stage as the final route has not been decided. The submitted documents presents two options where option one will avoid this area but option two will not. As the final phase of cable route has not been decided, thereasoning here cannot be applied until the final route is decided. This justification can only be applied once the final decision has been made regarding the cable route. Natural England advises the developer to go with route option 1. Option 1 will have the least ecological impact as it will stay closest towards the current developed areas, without going through significant FLL, and is also the option that will go through the least peat habitat. | The cable route proposed as part of the application aims to avoid as much of this sensitive area as possible. This has been considered as part of the iterative site selection process, together with design and engineering constraints. Full details of Transmission Assets Order Limits can be found in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). An assessment of effects in relation to birds, including consideration of functionally linked land, is provided in Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).  |
| TA_0001_245_231123          | S42     | Email           | 7.30 1.11.3.177 See comments above regarding cable route – cannot be used as justification. See above.  | The Applicants note your response to individual items raised and have provided responses accordingly.   |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response  |
|-----------------------------|---------|-----------------|--|---|
| TA_0001_249_231123          | S42     | Email           | 7.34 1.11.3.4 Without being more specific on the location of the onshore substation, the impact of habitat loss or disturbance impact of the substation cannot be assessed as it is not clear where it is in relation to environmental receptors. The submitted ES should provide more specific detail for the location of the onshore substation in order to fully assess the impact of habitat loss or disturbance.  | The design has been further refined since submission of the PEIR and this is reflected in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). This has been taken into account in the updated assessment provided in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).   |
| TA_0001_250_231123          | S42     | Email           | 7.35 Table 1.374 Natural England notes that impacts from the cable installation will be for 66 months (5yr 6mths) but it is not quantified in the HRA where or when the risk will be, or the likely plant used to assess risks. In the updated assessment, specify where and when the potential impacts risks (to ornithological features) will occur during the cable installation phase. The likely plant used in these assessments should also be outlined.   | The assessment of the effects due to disturbance and displacement from the presence of vehicles and/or heavy machinery associated with construction, operation and maintenance, and decommissioning activities is presented within section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).   |
| TA_0001_251_231123          | S42     | Email           | 7.36 1.11.3.8 It is not possible to meaningfully assess risks without a provisional alignment. Natural England notes that some areas within the development redline boundary have not been surveyed for ornithological risks, and it is not clear if they are in the red line boundary because they are identified as a potential impact site or a possible mitigation or Net Gain area. n/a   | The design has been further refined since submission of the PEIR and this is reflected in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). This chapter also provides details of the areas proposed for construction and those proposed for biodiversity, mitigation and/or enhancement. This has been taken into account in the updated assessment provided in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).   |
| TA_0001_253_231123          | S42     | Email           | 7.38 1.11.3.19 This section identifies the area directly impacted but these impact timings assume instant recovery post works. It will take some time for areas to normalise after impact. The assessment of habitat impact is also spatially framed with reference to the SPA using the whole SPA as the reference measure - not the extent of the habitat affected which will be a better reference frame for species which are closely associated with the specific habitat. The submitted ES should update the impact timings to consider realistic recovery timescales. The assessment of habitat impact should also be framed with reference to the extent of the habitat that is affected, rather than the extent of the whole SPA. | The comments from Natural England are noted. The Applicants have worked to refine the project design with respect to installation of cables in the intertidal and the onshore cable route to address Section 42 comments from Natural England on potential effects on ornithological receptors. This includes further detail on the area, duration and timing of potential impacts on ornithology species and additional information and further justification to address the comments raised. These have been addressed in sections 1.5 and 1.6 of the ISAA Part 3 (document reference E2.3) |
| TA_0001_255_231123          | S42     | Email           | 7.41 1.11.3.29 The assessment does not quantify what proportion of resource will be lost at any one time. The submitted ES should present the information for temporary habitat loss within the onshore export cable corridor in terms of what proportion of resources will be lost at any one time, along with the total area.  | The assessment of temporary habitat loss is included in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).  |
| TA_0001_256_231123          | S42     | Email           | 7.41 1.11.3.32 It is identified that no works are proposed in Newton Marsh SSSI, but it does not rule them out. Natural England note that the SSSI remains in the redline boundary and the disturbance zone as marked on survey maps. If works are not proposed in Newton Marsh SSSI, this should be secured as a condition in the submitted DCO/dML. As they are currently not ruled out, any assessment of features connected to Newton Marsh SSSI should consider the impacts to the SSSI and its features.   | Features of designated sites, including Newton Marsh SSSI, are identified in section 4.6.6 and the potential for impacts from the Transmission Assets has been assessed in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4) and in section 1.5 of the Information to Support Appropriate Assessment (ISAA) report.   |
| TA_0001_258_231123          | S42     | Email           | 7.43 1.11.3.42 Natural England do not agree with the conclusion that there is no risk of an adverse effect on the integrity of the Ribble and Alt Estuaries SPA and Ramsar site as a result of temporary habitat loss/disturbance and changes in prey availability with respect to the construction and decommissioning phases of the Transmission Assets. This disagreement is based on the robustness of evidence provided. The submitted ES Provide further robust evidence to support this conclusion or apply the mitigation hierarchy to ensure adverse effects cannot arise.  | An assessment of the potential impact on key receptors, including qualifying features of the SPA and Ramsar site, as identified in section 4.6.2, is presented within section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). Details on the impacts on European sites from the Transmission Assets are contained within the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3). No adverse effects on integrity are predicted.   |
| TA_0001_259_231123          | S42     | Email           | 7.44 As a general point the separation of the impacts on the working corridor and the disturbance caused during the work period is not particularly helpful as, other than the habitat recovery time, the two pressure pathways are completely linked; and the recovery time lag is not discussed. The impacts on the working corridor and the impacts from disturbance caused during the work period should be considered together in the submitted ES as the two pressure pathways are linked. The recovery time lag should also be considered when assessing these impacts.   | The Applicants note your response.  |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response   |
|-----------------------------|---------|-----------------|--|--|
| TA_0001_260_231123          | S42     | Email           | 7.45 1.11.3.84 Natural England considers the 300m disturbance zone will be reasonable for most species.<br>n/a   | The Applicants note your response.   |
| TA_0001_261_231123          | S42     | Email           | 7.46 1.11.3.85 The statement "The extent of disturbance and displacement from presence of vehicles/heavy machinery will be substantially smaller during the operation and maintenance phase when compared to the construction and decommissioning phases" has no evidence to back it up. If this statement is to be retained, the submitted ES should provide a clear rationale to detail why the disturbance caused by plant will be different during the operation and maintenance phase when compared to the construction and decommissioning phases.   | The assessment of the effects due to disturbance and displacement from the presence of vehicles and/or heavy machinery associated with construction, operation and maintenance, and decommissioning activities is presented within section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). The potential for impacts associated with cable maintenance is minimal. Details of operational activities are provided in Volume 1, Chapter 3: Project description of the ES (document reference F1.3).  |
| TA_0001_272_231123          | S42     | Email           | Screening 8.3 The offshore export cable will be installed from the location at/near Blackpool Airport by Horizontal Directional Drilling (HDD), or equivalent trenchless technique across the sand dunes at Lytham St. Annes Site of Special Scientific Interest (SSSI). Exploring and detailing a maximum design scenario and other environmental constraints for these operations is critical. It is also critical that the methodology for the trenchless technique is determined at the earliest opportunity, and in consultation with Natural England, to ensure that the impact can be avoided in the first instance. Sufficient survey programmes should be planned to allow a full understanding of the operations so a holistic impact assessment can be carried out. The outcomes of this assessment and any mitigation measures required to address potential impacts should be reported in the submitted ES. | Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) assesses the impacts on Lytham St. Anne's Dunes SSSI. Direct pipe trenchless installation is proposed in this location as it's the most appropriate for use in sensitive settings, in part because it reduces the risk of collapse that is associated with cable installation using horizontal directional drilling (HDD).   |
| TA_0001_276_231123          | S42     | Email           | Natural England's Structure/Framework for Attributing Risk The comments provided within this letter and its Annexes have been colour coded using the structure/framework as specified in the risk table in Appendix I of this letter. In this letter, the coloured headings are coded based on the highest risk associated with the topic in question. Natural England would like to highlight that at this stage all comments highlighted as yellow, amber, or red need to be addressed, with the potential for these issues to become more significant if not resolved at application.   | The Applicants note your response.   |
| TA_0001_277_231123          | S42     | Email           | Impacts on the Natural Environment – Natural England's Key Concerns Generic Comments Natural England highlights that for several receptors, the PEIR is based on incomplete data or refers to additional data collection that is not presented or still to be carried out. Natural England cannot therefore make any conclusive judgements based on this PEIR, including the cumulative/in-combination assessments and the HRA. Accordingly, our advice focuses on the methodology used. We emphasise the need to base the submitted ES on robust datasets that meet (and where appropriate exceed) minimum standards.   | As detailed in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) and Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4), further surveys have been carried out since the publication of the PEIR in order to provide a more complete baseline. It is considered that this provides a sufficiently robust basis for assessment.   |
| TA_0001_278_231123          | S42     | Email           | We also highlight the risks associated with further data processing to validate the conclusions and having sufficient time to consult pre-application and sufficiently resolve matters prior to submission. We reserve the right to change our comments and position during the ES consultation, subject to the outcome of further data analysis. Furthermore, Natural England seeks confirmation that the timetable set out for DCO submission allows for evidence standards to be met.   | As detailed in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) and Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4), further surveys have been carried out since the publication of the PEIR in order to provide a more complete baseline. It is considered that this provides a sufficiently robust basis for assessment.   |
| TA_0001_284_231123          | S42     | Email           | From experience on other windfarms, HDD can fail on occasion. Therefore, the applicant should ensure that the worst case scenario at landfall takes this into consideration. This should consider impacts on Lytham St. Annes Dunes SSSI with a sufficient baseline collected to assess impact post construction.  | Impacts to the ecological features of the Lytham St. Annes Dunes SSSI are assessed in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Direct pipe trenchless installation is proposed from the transition joint bays to an exit pit at or above MHWS. This will avoid the loss of vegetation and habitats across the sand dunes at Lytham St. Annes SSSI. This method has been selected to address this issue as it's the most appropriate for use in sensitive geological settings, in part because it reduces the risk of collapse that is associated with cable installation using HDD. Further information regarding the landfall is included within Volume 1, Chapter 3: Project description of the ES (document reference F1.3). |

| TA_0001_302_231123          | S42     | Email           | Onshore and Intertidal Ecology The proposed cabling route falls within an area of deep peaty soils. We therefore advise that either further information is provided to demonstrate the extent of deep peat in these areas, or that the proposed developments are amended to avoid any work within these particular areas. | The EIA process has taken into account both existing information (including details of BGS boreholes) and site survey. Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F3.1) sets out details of ground conditions. Peaty soils are considered within Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This chapter includes details of soil surveys undertaken. Further detailed information regarding the methodology, scope and results of the soil surveys is provided in Volume 3, Annex 6.2: Soil surveys data technical report of the ES (document reference F3.6.2). The assessment has considered the presence of peaty soils located within the Transmission Assets Order Limits.  |
| TA_0001_303_231123          | S42     | Email           | It is noted that the current assessment is incomplete with a range of surveys missing, including those for reptiles and invertebrates. Further notes on these surveys have been provided in Annex 6.  | The Applicants can confirm that comments with Annex 6 have been addressed within these tables, using the unique identifier TA_0001.  |
| TA_0001_304_231123          | S42     | Email           | There is a lack of assessment on impacts to SSSIs. The documents only seem to assess impacts on notified bird species in SSSIs not other notified features such as various habitats.  | The impact on SSSIs (designated for reasons other than ornithological interest) has been provided in section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).<br><br>Features of internationally and nationally designated sites were considered when identifying the list of Important Ecological Features listed in section 4.6.6 of Volume 3 Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). The potential for impacts from the Transmission Assets has been assessed in section 4.11 of that chapter.   |
| TA_0001_305_231123          | S42     | Email           | No detail has been provided for what is happening at the Fairhaven site. From aerial photos, this area appears to be coastal habitats with dunes and saltmarsh (although not designated, this would still be a Priority Habitat). Part of this area falls within the geological site – Lytham Coastal Changes SSSI.       | The section of the Transmission Assets Order Limits adjacent to RSPB Fairhaven Lakes is proposed for ornithological mitigation (with no development to take place at this location). Refer to Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES for further details. Consideration of sites with a geological designation present within the study area is set out in section 1.6.2 of Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F3.1) with the assessment for relevant sites, including Lytham Coastal Changes SSSI provided in section 1.11.2. It has however, been concluded that there will be no impact on Lytham Coastal Changes SSSI, which lies outside the Transmission Assets Order Limits.   |
| TA_0001_306_231123          | S42     | Email           | As the proposed installation method for to avoid Lytham St. Anne's SSSI is HDD, it is felt that the developer has not fully considered the MDS for this designated site. Please see comment 6.15 in Annex 6 for further detail.   | Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) assesses the impacts on Lytham St. Anne's Dunes SSSI. Direct pipe trenchless installation is proposed in this location as it's the most appropriate for use in sensitive settings, in part because it reduces the risk of collapse that is associated with cable installation using horizontal directional drilling (HDD). Because these commitments are in place, the MDS that has been used is considered to be correct. The risk of bentonite breakout at Lytham St Annes Dunes SSSI will be controlled through the Bentonite Breakout Plan as part of the Code of Construction Practice. An Outline Bentonite Breakout Plan is provided as part of the application for development consent (document reference J1.13). |

|-----------------------------|---------|-----------------|---|--|
| TA_0001_307_231123          | S42     | Email           | There is a lack of consideration of other impacts to Lytham St Annes Dunes SSSI, particularly with regards to changes to the water table. Please see comment 6.29 in Annex 6 for further detail.  | This impact is considered within section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).  |
| TA_0001_310_231123          | S42     | Email           | <p>Appendix 1 The following Framework has been used in Natural England's advice to attribute risk to the project:</p> <p>Structure / Framework Risk<br/>Purple<br/>Note for the developer.</p> <p>Red<br/>Natural England considers that unless these issues are resolved it will have to advise that (in relation to any one of them, and as appropriate) it is not possible to ascertain beyond reasonable scientific doubt that the project will not affect the integrity of an SAC/SPA/Ramsar and/or significantly hinder the conservation objectives of an MCZ and/or damage or destroy the interest features of a SSSI and/or comply fully with the Environmental Impact Assessment requirements.<br/>Addressing these concerns may require the following:</p> <ul style="list-style-type: none"> <li>• new baseline or survey data; and/or</li> <li>• significant revisions to baseline characterisation and/or impact modelling and/or</li> <li>• significant design changes; and/or</li> <li>• significant mitigation</li> </ul> <p>Natural England feels that issues given Red status are so complex, or require the provision of so much outstanding information, that they are unlikely to be resolved during the Examination, and respectfully suggests that they be addressed beforehand.</p> <p>Amber<br/>Natural England does not agree with the developer's position or approach and consider that this could make a material difference to the outcome of the decision-making process for this project.<br/>Natural England considers that these matters may be resolved through:</p> <ul style="list-style-type: none"> <li>• provision of additional evidence or justification to support conclusions; and/or</li> <li>• revisions to impact assessment methodology and/or assessment conclusions; and/or</li> <li>• minor to moderate revisions to impact modelling; and/or</li> <li>• well-designed mitigation measures that are adequately secured through the draft DCO/dML and/or</li> <li>• amendments to draft plans</li> </ul> <p>If these issues remain at the time of the application and are not addressed or resolved by the end of the Examination, then they may become a Red risk as set out above.</p> <p>Yellow<br/>Natural England doesn't agree with the developer's position or approach. We would ideally like this to be addressed but are satisfied that for this particular project it is unlikely to make a material difference to our advice or the outcome of the decision-making process. However, we reserve the right to revise our opinion should further evidence be presented.</p> <p>It should be noted by interested parties that just because these issues/comments are not raised as significant concerns in this instance, it should not be understood or inferred that Natural England would be of the same view in other cases or circumstances.</p> <p>Green<br/>Natural England is in broad agreement with the developer's approach and has no significant outstanding concerns. As above, we reserve the right to revise our opinion should new evidence be presented.</p> | Natural England's advice has been noted, specifically in the assessment of effects on ecological receptors (see Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3)). |
| TA_0002_012_171123          | S42     | Email           | 8. Environmental Impact – Assessment and Proposals<br>Great emphasis was being placed on the plans to minimise the impact on the environment by encouraging development of biodiversity off the route of the development. However, no proper account was made for the existing activities being undertaken on the sensitive sites, by farm owners and the owners of the Freckleton and Newton / Clifton marshes, where the efforts already being made are producing a substantial benefit to the local wildlife and protected species to be found in these areas of the Fylde. It did appear as if anything already established here was going to be claimed by the project as an offset to the environmental disaster that would be created by the development of the whole tract of land across the whole of the Fylde, with all the consequence of disturbance that ensues to farms, marshes, drains and watercourses – some of which are protected rivers that feed the Ribble and Alt RAMSAR sites. Nothing seemed to indicate a benefit that would be demonstrated, other than the “green” source of electricity. No firm ideas were presented, despite one of the conditions being that they spend a percentage of their funds on new measures to enhance biodiversity. The only   | Biodiversity benefit will be provided within the Transmission Assets Order Limits, details of which are set out within the Onshore Biodiversity Benefit Statement (document reference J11).                        |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response  |

|                             |         |                 | suggestion to date was the acquisition of bird boxes and this for an area that is primarily populated by ground nesting birds. A lot of boxes would be needed to make up the implied funding levels talked about!  |   |
| TA_0002_014_171123          | S42     | Email           | There have been concerns raised regarding possible electro-magnetic issues associated with the high-power transmissions and the possible impact of this and the need for screening that might result.  | Electro-magnetic fields (EMFs) are part of the natural world, and are also produced wherever electricity is generated, transmitted or used. With regard to EMF impacts, the project will adopt the International Commission on Non-ionizing Radiation Protection (ICNIRP) guidelines and Government voluntary Code of Practice on EMF public exposure. Such considerations are inherent to the detailed engineering considerations of cable specification and routing. Relevant public EMF exposure guideline limits are noted in NPS EN-5 and would be complied with by the project. These guidelines are long standing and have a high safety margin. The levels of exposure that they require would not pose a risk to public health. Volume 1, Annex 5.1 (document reference F1.5.1) has had regard to the risk perceptions associated with EMFs of the Transmission Assets on the local area and this is presented in section 1.11.9 of the Annex. See also the submitted EMF Compliance Statement (Volume 1, Annex 3.4 of the ES, document reference E1.3.4). |
| TA_0003_010_221123          | S42/S44 | Email           | The indicated width of the construction corridor is 122m. Much of this is accounted for by the proposed linear storage of topsoil and subsoil during construction. The utilisation of a series of top and subsoil storage areas could reduce the width of the construction corridor by approximately 40% and reduce the adverse impact not only on agricultural holdings but on ecology, transport infrastructure and reduce the development footprint of the project as a whole.  | The project design has resulted in a reduced construction corridor width, as set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Details of the factors considered during the design evolution are set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4).   |
| TA_0003_014_221123          | S42/S44 | Email           | Impact on Wildlife and Habitat Fylde Council notes that the views of Natural England have been sought as part of the consultation process and so are content that they take the lead in the assessment of any ecological impacts. It is noted that the consultation material includes proposals to use Horizontal Direction Drilling to minimise impact on sensitive habitats. In the event that consent is granted for the development, it is considered essential that this aspect of the proposal is continued through to delivery of the project and is not "watered down" as a result of any future review of the project.  | This commitment remains in place. Trenchless techniques are proposed beneath the sand dunes at Lytham St Annes and beneath the River Ribble, as well as at additional locations identified within Volume 1, Annex 3.2: Onshore Crossing Schedule of the ES (document reference F1.3.2) which is submitted as part of the application for development consent. Further details are provided in the response to comments from Natural England.  |
| TA_0009_002_231123          | S44     | Email           | Biodiversity Net Gain and Use of Land in the MoJ's Ownership The Project proposes the use of land in the ownership of the MoJ, opposite HMP Kirkham and to the south and east of Kirkham Road. The relevant parcels are identified in green below. (Photo in response document) From a review of the consultation material available for review, it appears that this land is proposed to be used for "biodiversity net gain, enhancement and / or mitigation areas". The MoJ object to their land being shown as to be used for this purpose and wish to make clear that they do not, and would not, provide consent for the use of any land in their ownership for any purpose associated with the Project. We therefore request that the scheme is revised to show alternative areas being used for biodiversity net gain, enhancement and/or mitigation. | The areas proposed for biodiversity benefit have been refined further since PEIR. The areas proposed are shown in the Onshore Biodiversity Benefit Statement (document reference J11).  |
| TA_0012_007_221123          | S42     | Email           | We also have concerns about the impact on the sand dunes where these cables come ashore and the eco systems that has been worked on over the years. We feel that there will need to be road closures as the building work is started in an area that has limited access in and out of St Anne's. The town has suffered over the years when roads have been closed, snarling up the town. These construction times will be over years not weeks or months and will have a negative economic impact on our town.   | Direct pipe trenchless installation is proposed beneath the sand dunes. This technology will ensure there is no open trenching through the dunes. This will avoid any direct loss of vegetation and habitats. Instead, the drill will pass beneath the dunes at depth. Where necessary consideration of any indirect effects on the habitat and measures to avoid, minimise or mitigate these is provided in section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Effects in relation to any changes in traffic are set out in Volume 3, Chapter 7 of the ES (document reference F3.7). It is noted that the option presented at PEIR (placement of cables in trenches within the highways) near Blackpool Airport is no longer required. Details of the current design are provided in Volume 1,   |

|                             |         |                 |  | Chapter 3: Project description of the ES (document reference F1.3).   |
| TA_0017_002_231123          | S42/S44 | Email           | I note you have consulted the historic environment record, but not the local environment record; the Lancashire Environmental Records Network should be consulted for records of all statutory and non-statutory designated sites, irreplaceable habitats, habitats of principal importance, protected and priority species that could potentially be affected by the proposed development   | Records from Lancashire Environmental Record Network were obtained in March 2024 and are included in section 3.6.1 of Volume 3, Chapter 3: Onshore ecology and nature conservation (document reference F3.3).   |
| TA_0017_003_231123          | S42/S44 | Email           | Known Ecological Constraints Subject to final route selection, a preliminary desk-based assessment indicates that the proposed scheme could potentially have implications for designated sites and habitats including (but not restricted to):<br><ul style="list-style-type: none"> <li>Statutory Designated Sites: <ul style="list-style-type: none"> <li>SPA§ Ribble &amp; Alt Estuaries§ Liverpool Bayo SSSI§ Newton Marsh§ Ribble Estuary§ Lytham St Anne's Dunes§ Sefton Coasto NNR§ Ribble Estuary o MCZ§ Ribble Estuary§ Fyldeo LNR§ Lytham St Anne's LNR</li> </ul> </li> <li>Non-statutory designated sites: <ul style="list-style-type: none"> <li>Lytham St Anne's Dunes Geological Siteo Lytham Foreshore Dunes &amp; Saltmarsh BHS 32NW01o Lytham Moss Copses BHS 32NW04o St Anne's Old Links Golf Course and Blackpool South Railway Line BHS 33SW02o Lytham Moss BHS 33SEW1o Westby Clay Pit BHS 33SE01o Pippy Lane Banks BHS 42NE01o Savick Bridge BHS 42NE04o Mason's Wood BHS 42NE07o Booths Plantation BHS 42NE09o Freshfield Farm Pond South BHS 43SW05o Freshfield Farm Pond North BHS 43SW06o Black Poplar at Newton Crossroads BHS 43SW07o Mill Brook Valley BHS 52NW01o Howick Hall Ponds BHS 52NW11o Kirkham Prison proposed BHSo Queensway Biodiversity Verge</li> </ul> </li> <li>Habitats of Principal Importance and Irreplaceable habitats: <ul style="list-style-type: none"> <li>Coastal Sand Duneso Coastal Saltmarsho Mudflatso Coastal and Floodplain Grazing Marsho Ponds o Rivers and streamso Deciduous woodlando Traditional orchardo Peat (Great Marton Moss and Lytham Moss)</li> </ul> </li> <li>Mitigation schemes to offset the ecological impacts of earlier infrastructure projects: <ul style="list-style-type: none"> <li>M5 to Heyhouses – Queensway Conservation Area</li> </ul> </li> <li>Important and Sensitive Bird Areas and potential SPA functionally linked land.</li> <li>Amber Risk Zones for great crested newts. There are also likely to be adverse impacts on protected and priority species. Owing to the scale of the proposed development, these preliminary comments do not include a comprehensive review of likely impacts on species populations.</li> </ul> | An assessment of the impacts and effects on key onshore ecological receptors (except birds), including qualifying features of the SPAs and SSSIs, is presented within section 3.11 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). An assessment of the impacts and effects on key onshore and intertidal ornithological receptors, including qualifying features of the SPAs and SSSIs, is presented within section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).  |
| TA_0017_004_231123          | S42/S44 | Email           | As discussed below, in addition to a data search, the impact assessment should be informed by a comprehensive programme of ecological assessments.   | Ecological surveys have been carried out in 2022, 2023 and 2024. The scope of surveys has been informed through consultation (through Expert Working Group meetings), review of desk study records and the results of preliminary surveys that established suitability for protected and notable species. This is discussed further in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) and Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).  |
| TA_0017_006_231123          | S42/S44 | Email           | The Biodiversity net gain areas should be informed by the emerging Local Nature Recovery Strategy for Lancashire and should contribute to its delivery. The strategy will be developed throughout 2024. Preliminary strategic maps are expected to be published in early 2024.   | The status of the Local Nature Recovery Strategy for Lancashire is summarised in section 3.6 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Step 1 of the strategy, to map areas of particular importance for biodiversity, is complete. Accordingly, section 3.11 of the chapter includes assessment of areas of particular importance such as statutory and non-statutory designated sites. Information on biodiversity net gain is provided in the Onshore Biodiversity Benefit Statement (document reference J11). Please also refer to the Outline Ecological Management Plan (document reference J6). |
| TA_0017_007_231123          | S42/S44 | Email           | General Requirements As well as the proposed ecological measures stated within the consultation documents, it needs to be ensured that all of the matters discussed below are fully addressed.   | The Applicants note your response. Responses provided on a comment by comment basis, see unique reference TA_0017.  |
| TA_0017_008_231123          | S42/S44 | Email           | Professional competence The application to the Planning Inspectorate should include evidence that all ecological surveys, assessments and mitigation/compensation proposals have been undertaken and prepared by appropriately qualified, licenced and experienced ecologists.   | Competency standards required for surveyors carrying out ecological surveys are provided in Volume 3, Annex 3.2: Onshore ecology survey methodologies technical report of the ES (document reference F3.3.2).   |
| TA_0017_010_231123          | S42/S44 | Email           | Policy The application should demonstrate that the proposed development will fully comply with the requirements of all relevant national and local planning policy, including (but not limited to):<br><ul style="list-style-type: none"> <li>National Policy Statements, including for example: <ul style="list-style-type: none"> <li>Overarching National Policy Statement for Energy (EN-1)</li> <li>National Policy Statement for Renewable</li> </ul> </li> </ul>  | The policy background that has informed the assessment is provided in section 3.2.2 and section 3.2.3 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES   |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response   |
|-----------------------------|---------|-----------------|--|--|
|                             |         |                 | <p>Energy Infrastructure (EN-3);o National Policy Statement for Electricity Networks Infrastructure (EN-5)• The National Planning Policy Framework (NPPF); • Local Plan policies. Section 5.3 of National Policy Statement EN-1 sets out requirements in respect of Biodiversity and geological conservation. National Policy statement EN-1 states that "Where the development is subject to EIA the applicant should ensure that the ES clearly sets out any effects on internationally, nationally and locally designated sites of ecological or geological conservation importance, on protected species and on habitats and other species identified as being of principal importance for the conservation of biodiversity. The applicant should provide environmental information proportionate to the infrastructure where EIA is not required to help the IPC consider thoroughly the potential effects of a proposed project". National Policy statement EN-1 also states that "The applicant should show how the project has taken advantage of opportunities to conserve and enhance biodiversity and geological conservation interests". The NPPF states that planning decisions should contribute to and enhance the natural and local environment by minimising impacts on and providing net gains for biodiversity (See Paragraph 174). The NPPF also states that "if significant harm to biodiversity resulting from a development cannot be avoided (through locating on an alternative site with less harmful impacts), adequately mitigated, or, as a last resort, compensated for, then planning permission should be refused" (See Paragraph 180). In order to meet the requirements of the NPPF, the planning application will therefore need to demonstrate that: • all elements of the development would be located and designed to avoid or minimise harm to biodiversity, and • adequate mitigation/compensation for any unavoidable impacts, as well as net gains for biodiversity, will be provided.</p> | <p>(document reference F3.3). The application of relevant policy to the assessment of impacts on onshore ecology and nature conservation is demonstrated through the evaluation and identification of important ecological features, as set out in section 3.6.4. The assessment of impacts is provided in section 3.11. Information on biodiversity net gain is provided in the Onshore Biodiversity Benefit Statement (document reference J11) and information on biodiversity benefit is provided in the Outline Ecological Management Plan (document reference J6).</p>  |
| TA_0017_013_231123          | S42/S44 | Email           | <p>Data searchThe planning application should include the results of an ecological data search. This should include data from the local records centre (Lancashire Environmental Records Network). Relevant data sources include:• Lancashire Environmental Records Network (LERN)• NBN Gateway• Multi-Agency Geographical Information for the Countryside (MAGIC)• Risk Zones relating to statutory designated sites• Ancient Woodland Inventory• Centre for Ecology and Hydrology Environmental Information Data Centre• RSPB• Local recorder groups for badgers, bats, amphibians, reptiles, birds etc• Ecological data from earlier or neighbouring planning applications• Risk zones for district level licensing. It should be demonstrated that the data has informed the scope of field surveys, the design of the proposed development and mitigation/ compensation measures. The data search should not be used as a substitute for field surveys. An absence of records should not be taken as absence of species or habitats. Records over 10 years old should not be discounted. These can still provide useful contextual information and an absence of more recent records may only indicate a lack of survey.</p>  | <p>The data sources included in the desk study are identified in section 3.5.1 and section 3.6.1 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Additionally, LERN confirmed that their data for records for onshore ecology and nature conservation was sufficient and no further requests to other organisations were considered necessary. Information gained from planning applications is considered in the baseline for amphibians in section 3.6.1 and in the cumulative assessment in section 3.13. District level licensing is considered in the assessment of impacts on GCN in section 3.11.10. The findings of the data search are provided in Volume 3, Annex 3.1: Onshore ecology desk study technical report of the ES (document reference F3.3.1)..</p>  |
| TA_0017_014_231123          | S42/S44 | Email           | <p>Surveys Survey data submitted with the planning application should be current/up-to-date, in line with recognised guidelines (as summarised above). The survey area should include: • The intended location of the development footprint;• Potential working areas, compounds, storage areas and access routes;• Any land that may be used within the mitigation, compensation or biodiversity net gain proposals (on or off-site);• A suitable buffer distance, taking account of the likely zone of influence and relevant survey guidelines.</p>   | <p>The survey area is the area used for site-specific surveys and is generally defined as a 150 m buffer around the Onshore Order Limits. The 150 m buffer was included to take account of protected species that may occur adjacent or close to the Transmission Assets and to allow for evolution of the boundary during the site selection process. A separate survey area was used for GCN surveys. The GCN survey area is defined as a 250 m buffer around the Onshore Order Limits. Volume 3, Annex 3.8: Great crested newt survey and reptile survey technical report of the ES (document reference F3.3.8) provides further details regarding the GCN survey area. Owing to the iterative design process of the Transmission Assets, some surveys were undertaken further than 150 m from the Onshore Order Limits. Nevertheless, information from these surveys have been included in technical annexes because it provides context regarding the ecological sensitivity of the wider area.</p> |
| TA_0017_015_231123          | S42/S44 | Email           | <p>The ecological surveys/assessments should include a Preliminary Ecological Appraisal, undertaken in accordance with recognised guidelines. This should be used to determine any necessary further surveys/assessments required to inform the planning application.</p>  | <p>A phase 1 habitat survey, including scoping for protected and notable species, was carried out as part of the PEIR and findings have contributed to determine the scope and location of species surveys. Survey has continued since the publication of the PEIR, in areas that were not previously accessible or were originally surveyed at a suboptimal time. Findings have informed the requirement for further surveys. This is further detailed in Volume 3, Chapter 3: Onshore ecology and nature conservation (document reference F3.3)</p>  |

|-----------------------------|---------|-----------------|--|---|
| TA_0017_016_231123          | S42/S44 | Email           | Survey results should include UKHab habitat classifications, condition assessments and all necessary data to inform an assessment of Biodiversity Net Gain. The area of each habitat (or length of linear habitats) and their biodiversity value should be quantified, using the current DEFRA biodiversity metric. Habitats of nature conservation significance, including Habitats of Principal Importance (NERC Act, 2006) and irreplaceable habitats should be identified and clearly mapped.                                      | Habitat survey has been completed for over 90% of the Onshore Order Limits, and within a 150 m buffer where access was granted and was carried out using the JNCC phase 1 habitat survey method. This has been converted to UKHab to provide the baseline for the biodiversity benefit calculation of permanent habitat loss, which has been carried out using the statutory biodiversity metric. Habitats of nature conservation significance, including priority habitats, that represent important ecological features, are identified in section 3.10 and assessed in section 3.11.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation (document reference F3.3). Further information on priority and other notable habitats is provided in Volume 3, Annex 3.1: Onshore ecology desk study technical report of the ES (document reference F3.3.1) and Volume 3, Annex 3.3: Phase 1 habitat, national vegetation classification and hedgerow survey technical report of the ES (document reference F3.3.3). The maps provided in these annexes show the distribution of habitats but maps of priority and notable habitats only are not provided. |
| TA_0017_017_231123          | S42/S44 | Email           | The planning application should also include the results of more detailed phase 2 vegetation/habitat surveys of any semi-natural habitats, priority habitats and other features with the potential to support ecologically significant species. Results should include mapped plant communities and full species lists showing relative abundance. Any quadrat data and locations should be included. Any hedgerows affected by the proposals should be assessed according to the criteria specified in the Hedgerow Regulations 1997. | NVC surveys have been carried out where required, as informed by the desk study, results of the phase 1 habitat survey and predicted impacts of the Transmission Assets. Where necessary, surveys of the Fylde sand dune have been carried out to confirm or update surveys carried out in 2016.  |
| TA_0017_018_231123          | S42/S44 | Email           | Habitat surveys should include an assessment of the potential of habitats to support protected species, species of principal importance and other species of nature conservation significance (for example, red list species). Any evidence of such species should be recorded.  | Phase 1 habitat surveys have identified the potential for habitats to support species of nature conservation interest. The results of this process are provided in Appendix 1 of Volume 3, Annex 3.3: Phase 1 habitat, national vegetation classification and hedgerow survey technical report of the ES (document reference F3.3.3). The findings of habitat evaluation for protected and notable species that has taken place since the production of the PEIR are reflected in the findings of the relevant technical annexes (Volume 3, Annexes 3.4 to 3.14 of the ES, document reference F3.3.4 to F3.3.14).   |
| TA_0017_019_231123          | S42/S44 | Email           | A comprehensive assessment of faunal interest should also be undertaken. This should include necessary species surveys identified during the preliminary ecological appraisal. The planning application should include the results of surveys for species of nature conservation value, including: • Protected species, • Species of Principal Importance (NERC Act 2006), • Red list species, • Nationally or locally rare or scarce species.   | Baseline data for protected, priority, and threatened fauna of relevance to the assessment is provided in section 3.6 of Volume 3, Chapter 3: Onshore ecology and nature conservation (document reference F3.3) and in the following technical Volume 3, Annexes 3.3 to 3.14 of the ES (document reference F3.3.3 to F3.3.14).  |
| TA_0017_020_231123          | S42/S44 | Email           | The planning application should include an assessment of the ornithological interest of the site and the predicted Zone of Influence. This should include breeding and wintering birds.  | This is provided within Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).  |
| TA_0017_021_231123          | S42/S44 | Email           | All surveys should be carried out at an appropriate time of year, in accordance with recognised methodologies and best practice guidelines, and be carried out by suitably competent and experienced individuals. All survey methods used should be detailed in the ES, along with any survey limitations and a rationale for any unavoidable departures from recognised survey standards.   | Survey methods and competency standards required for surveyors carrying out ecological surveys are provided in Volume 3, Annex 3.2: Onshore ecology survey methodologies technical report of the ES (document reference F3.3.2). Limitations relevant to different surveys are identified in the technical reports.   |
| TA_0017_022_231123          | S42/S44 | Email           | Evaluation<br>An evaluation should be provided for all sites, habitats, species populations and other ecological features identified during the surveys, including identification of irreplaceable habitats. A rationale should be provided for the evaluation given to each ecological feature.   | An evaluation of important ecological features considered in the assessment is provided in section 3.6 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).   |
| TA_0017_023_231123          | S42/S44 | Email           | Avoidance of ecological impacts It needs to be demonstrated that measures have been taken to avoid detrimental impacts on sites, habitats, species and features of ecological value, including (but not limited to): • Statutory designated sites and functionally linked land • Non-statutory designated sites • Habitats of Principal Importance •   | Where possible, designated sites, habitats, species and other features of ecological value have been avoided through the route selection process and through the use of direct pipe installation  |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response  |
|-----------------------------|---------|-----------------|--|---|
|                             |         |                 | Irreplaceable habitats• Protected species and their habitats• Species of principal importance and their habitats• Other notable species and their habitats (for example, red list species)• Habitat connectivity.  | or other trenchless techniques. Unavoidable impacts that cannot be addressed through these approaches are subject to other forms of mitigation, or compensation as described in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).  |
| TA_0017_025_231123          | S42/S44 | Email           | The NPPF states that development resulting in the loss or deterioration of irreplaceable habitats should be refused, unless there are wholly exceptional reasons and a suitable compensation strategy exists. Irreplaceable habitats include habitats which would be technically very difficult (or take a very significant time) to restore, recreate or replace once destroyed, for example ancient woodland, ancient and veteran trees, blanket bog, limestone pavement, sand dunes, salt marsh and lowland fen. A definition and definitive list are expected to be published in the near future   | Irreplaceable habitats are now confirmed by The Biodiversity Gain Requirements (Irreplaceable Habitat) Regulations 2024. Of these, coastal sand dunes, ancient woodland and ancient and veteran trees are potentially relevant to onshore ecology and nature conservation. Assessment of impacts is provided in section 3.11 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).   |
| TA_0017_026_231123          | S42/S44 | Email           | Irreplaceable habitats should be identified and it should be demonstrated that detrimental impacts on such habitats will be avoided. If the development would have a detrimental impact on any irreplaceable habitat, then the planning submission will need to include a robust statement of alternatives explored to avoid the loss of irreplaceable habitats and why they were not feasible.  | Measures to avoid loss of irreplaceable habitat have been adopted through the route selection process. The iterative design process has avoided many impacts, for example through amendment of a construction corridor to avoid a veteran tree and direct pipe installation of export cables beneath the Lytham St Annes Dunes SSSI, Ribble and Alt Estuary SSSI and Lytham Foreshore Dunes and Saltmarsh BHS. Further information is provided in section 3.8, with impacts assessed in section 3.11 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).         |
| TA_0017_027_231123          | S42/S44 | Email           | Statutory Designated Sites The planning application should address the possibility of impacts on statutory designated sites, taking account of impact risk zones. Natural England should be consulted if there may be impacts on a statutory designated site. The planning application should include sufficient information to address the requirements of the Habitats Regulations (See Planning Inspectorate Advice Note Ten: Habitats Regulations Assessment relevant to nationally significant infrastructure projects).  | Impacts on statutory designated sites have been assessed and mitigation is provided for any unavoidable impacts, as described in section 3.8 and as assessed in sections 3.11.2 and 3.11.3 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).Information to address the requirements of the Habitats Regulations is provided in Information to Support the Appropriate Assessment report (document reference E2.1, 2.2, 2.3).   |
| TA_0017_028_231123          | S42/S44 | Email           | Non-Statutory Designated Sites The NPPF states that planning decisions should contribute to and enhance the natural and local environment by protecting and enhancing sites of biodiversity value (Paragraph 174). The planning application should address likely direct or indirect impacts on Biological Heritage Sites or other non-statutory designated sites. Impingement onto Biological Heritage Sites should be avoided and it should be demonstrated how impacts on Biological Heritage Sites will be avoided during and after the proposed development. If it can be demonstrated that impacts on designated sites are unavoidable, then the planning application should demonstrate that there will be adequate mitigation/compensation measures to provide an overall net gain in biodiversity value. Mitigation/compensation proposals should be informed by a comprehensive ecological survey of the areas affected, with reference to the qualifying features of each site.   | Impacts on non-statutory designated sites have been assessed and mitigation is provided for any unavoidable impacts, as described in section 3.8 and assessed in section 3.11 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).  |
| TA_0017_029_231123          | S42/S44 | Email           | Protected Species Potential impacts on protected species will need to be fully assessed prior to determination of the application. This should be informed by a desk study, an assessment of habitat suitability and a comprehensive programme of species surveys, including (but not restricted to) consideration of the following species:• Great crested newts• Bats• Otters• Water Vole• Badgers• Reptiles• Breeding birds   | Impacts on protected species have been assessed and mitigation is provided for any unavoidable impacts, as described in section 3.8 and assessed in section 3.11 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).   |
| TA_0017_030_231123          | S42/S44 | Email           | DEFRA Circular 01/2005 (ODPM Circular 06/2005), referenced in Footnote 61 of NPPF 2021, states that “It is essential that the presence or otherwise of protected species, and the extent that they may be affected by the proposed development, is established before the planning permission is granted” and that “the survey should be completed and any necessary measures to protect the species should be in place, through conditions and/or planning obligations, before the permission is granted” (Paragraph 99).The planning application therefore needs to include habitat assessments and survey data for all protected species that could potentially be present and affected by the proposals. The survey methods used should be detailed in the planning submission. These should comply with recognised guidelines. The planning application should demonstrate that relevant species protection legislation will be adhered to and should include mitigation/compensation proposals for unavoidable impacts on such species and their habitats. If any European protected species (such as bats, great crested newts or otters) are present, then | Surveys have been carried out in 2022, 2023 and 2024 in order to confirm the presence or indicate the likely absence of protected species. A precautionary approach to baseline characterization, impact prediction and mitigation has been taken in situations where it has not been possible to complete surveys. See Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).The Applicants will apply for mitigation licenses if there are unavoidable impacts on fully protected species, with the information necessary to allow the application to be determined. |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response   |
|-----------------------------|---------|-----------------|--|--|
|                             |         |                 | the planning application should include measures to avoid any breach of The Habitats Regulations. If such a breach would be unavoidable, then a Natural England Licence would be required before development work could commence. The Conservation of Habitats and Species Regulations 2017 (as amended) state that a competent authority, in exercising any of its functions, must have regard to the requirements of the Directives. The application will therefore need to include sufficient information to enable the determining authority to meet this requirement.   |  |
| TA_0017_031_231123          | S42/S44 | Email           | Other species The planning application will need to include an assessment of likely impacts on species of nature conservation value and mitigation/compensation measures for unavoidable impacts. This should include Species of Principal Importance (NERC Act 2006), red list species and any nationally or locally rare or scarce species.  | Likely impacts on species of nature conservation value and mitigation/compensation measures for unavoidable impacts have been considered and the assessment is provided in section 3.11 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).   |
| TA_0017_032_231123          | S42/S44 | Email           | Invasive/Injurious Weeds Surveys for invasive or injurious weeds should be carried out. If such species are present the planning application should demonstrate how the spread of these species will be avoided during the proposed development works and how the species will be eradicated from the site. This should follow recognised guidelines   | Surveys of Invasive Non-native Species have been carried out and they are considered in section 3.11 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). See also Volume 3, Annex 3.14: Invasive non-native species technical report of the ES (document reference F3.3.14).  |
| TA_0017_033_231123          | S42/S44 | Email           | Impact Assessment Unavoidable impacts on sites, habitats, species and features of ecological value will need to be assessed in accordance with recognised guidelines (see examples above). All temporary and permanent impacts should be stated and assessed, including (but not limited to): <ul style="list-style-type: none"> <li>• habitat loss,</li> <li>• habitat degradation and disturbance,</li> <li>• habitat fragmentation, severance and isolation,</li> <li>• ecological impacts arising from hydrological changes,</li> <li>• potential killing, injury and disturbance of protected and priority species,</li> <li>• destruction or disturbance of habitats used by protected and priority species,</li> <li>• impacts arising from lighting, noise, vibration, dust etc.</li> <li>• Impacts of all construction and related works should be included in the assessment, including the construction footprint, compounds, storage areas, access routes etc.</li> </ul> The area and biodiversity value of each habitat type that would be lost, damaged, re-established, enhanced or brought into favourable management should be quantified in order to illustrate that the impacts of the development will be fully off-set and that overall biodiversity gains will be delivered. The current DEFRA biodiversity metric should be used.  | The scope of impacts considered in section 3.11 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) have been established through consultation with the Expert Working Group and through review of consultation responses.   |
| TA_0017_034_231123          | S42/S44 | Email           | Mitigation, Compensation and Biodiversity Net Gain The results of surveys and impact assessments undertaken should inform the design of the proposed development and associated mitigation, restoration, compensation and enhancement measures. It should be demonstrated that impacts will be mitigated, that compensation will be provided for all unavoidable impacts and that enhancement measures will provide an overall net gain in biodiversity value. It should be demonstrated that mitigation and compensation proposals meet the requirements of legislation, policy and guidance listed above. Mitigation measures should include protection of retained habitats, species and features of ecological value, including tree root protection measures. Evidence of a gain in biodiversity value should be submitted and should include complete DEFRA biodiversity metric calculations (not just headline results), along with supporting plans. Use of the metric will be a statutory requirement when mandatory biodiversity net gain is in force. Current requirements for biodiversity gains, stated within the NPPF are summarised above. It is anticipated that the mandatory requirement for 10% biodiversity net gain, arising from the Environment Act 2021, will come into force during 2025 for national infrastructure projects. It will need to be ensured that the proposed development provides overall biodiversity gains compliant with the requirements in place at the time of the planning submission. The planning application should include proposals for maintaining, restoring and enhancing habitat connectivity within the application area and the wider landscape. Habitat creation should not be at the expense of existing habitats or features of ecological importance. Habitat creation proposals should comprise native plant communities appropriate to the location, soils, hydrology and site conditions. Guidance on native species selection is given on the Lancashire County Council's Ecology webpages: <ul style="list-style-type: none"> <li>• <a href="http://www.lancashire.gov.uk/council/planning/planning-application-process/ecology/ecology-advice-for-developers/habitat-re-establishment.aspx">http://www.lancashire.gov.uk/council/planning/planning-application-process/ecology/ecology-advice-for-developers/habitat-re-establishment.aspx</a></li> <li>• <a href="#">Plant-species-appropriate-for-habitat-creation-in-Lancashire.pdf</a></li> </ul> | The approach to site selection has been based on avoiding damage to Important Ecological Features where practicable, as is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES. In addition, during an iterative process of EIA, locations where trenchless techniques will be used to avoid impacts have been identified. Where temporary habitat loss is unavoidable, such as where construction accesses need to cross hedges, this will be rectified by reinstating habitats in accordance with the specifications provided in the Ecological Management Plan. An Outline Ecological Management Plan (document reference J6) is provided as part of the application for development consent. For the Transmission Assets, biodiversity benefit will be delivered within identified biodiversity benefit areas within the Transmission Assets Order Limits: Onshore (referred to as the Onshore Order Limits). Further qualitative benefits to biodiversity are proposed via potential collaboration with stakeholders and local groups, contributing to existing plans and programmes, both within and outside the Onshore Order Limits. Further details of the approach to biodiversity benefit are provided in the Onshore Biodiversity Benefit Statement (document reference J11). |

|-----------------------------|---------|-----------------|---|--|
| TA_0017_035_231123          | S42/S44 | Email           | Establishment maintenance and long-term management and monitoring proposals for retained, restored and replacement habitats should be provided. The timescale of the management and monitoring commitment should be stated. It is recommended that this should cover a 30-year period. This will be a statutory requirement when mandatory biodiversity net gain is in force.   | An Outline Ecological Management Plan (document reference J6) is provided as part of the application for development consent.  |
| TA_0017_036_231123          | S42/S44 | Email           | It should be stated how the necessary maintenance and management will be secured for the lifetime of the anticipated planning obligations.  | An Outline Ecological Management Plan (document reference J6) is provided as part of the application for development consent.  |
| TA_0017_037_231123          | S42/S44 | Email           | Monitoring measures should be sufficient to measure the success of mitigation and compensation measures, to inform the need for remedial measures and to inform establishment maintenance and long-term management.   | Any relevant monitoring measures are set out in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).   |
| TA_0019_028_231123          | S42/S44 | Email           | The potential biodiversity net gain areas do not provide detail of what will actually be required. They need to be properly specified with some measurable and enforceable results. The protection of existing ecology on the surrounding land needs to be documented and at least maintained. Equestrian landowners and smallholders are concerned about the welfare of their animals in particular with regard to reduction in grazing land and the impact of major disruption including light pollution, noise and vibration potentially causing stress, spread of plants toxic to certain animals and other health impacts. The biodiversity net gain approach can lead to a loss of green spaces, when there is a failure to deliver ecological improvements biodiversity will be lost overall so it is essential that the governance mechanisms regulating these future gains are watertight. Parts of the biodiversity net gain areas are disconnected from each other. In order to adequately support wildlife habitats and the natural spread of native flora and fauna these areas should be joined together to form corridors. | The design of the Transmission Assets has been developed further since the statutory consultation (PEIR). This design evolution has taken into account the findings of the iterative EIA process and feedback from stakeholders. As such the location of key elements of the Transmission Assets and the Order Limits have been refined, as reflected in the application for development consent. This has included development of the approach to biodiversity benefit, as set out in the Onshore Biodiversity Benefit Statement (document reference J11).  |
| TA_0025_003_231123          | S42     | Email           | There is also a 13km radius wildlife zone. The Aerodrome at Warton needs to be consulted on any developments that have the potential to attract wildlife. Birds are the main concern, particularly large, over-wintering birds. In relation to this, BAE Systems have initial concerns about the proposal to develop an "Onshore and Intertidal Net Gain Enhancement Plan...to identify areas where biodiversity net gain is proposed. This will include details of the measures proposed, including details of any enhancement measures proposed for waterbirds." (Preliminary Environmental Information Report Non-Technical Summary, October 2023). BAE Systems is particularly concerned about any enhancement measures in the wildlife zone that will increase the attractiveness of the area for birds (including new areas of standing water) as this has significant potential to negatively affect air safety.   | The Applicants welcome BAE Systems' engagement and proactive approach to the Transmission Assets planning and development. This comment was taken into consideration at the mitigation stage when the project was undertaking site selection activities to locate areas where mitigation could be provided. Due to BAE Systems concerns, any biodiversity benefit, mitigation and enhancement has been sited outside of the wildlife zone.   |
| TA_0029_018_231123          | S42/S44 | Email           | Ecology Savick Bridge Biological Heritage Site contains the Long-stalked orache (which is nationally scarce). The area would benefit from biodiversity enhancement. In terms of the Lea Marsh Biological Heritage Site this is also noted as containing the Long-stalked orache. Otters are also known to frequent the eastern side of the site. We would be happy to discuss further with the promoter the potential for biodiversity enhancement along our waterways.   | The effects on Biological Heritage Sites (including Savick Brook) are set out in section 3.11 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).   |
| TA_0035_010_221123          | S42/S44 | Email           | Biodiversity Net Gain (BNG): Further clarification is required regarding the approach to BNG. It's unclear at this time how this will be implemented. We would urge the applicant to engage with the developing Local Nature Recovery Strategy (LNRS) to explore BNG options that could align with the LNRS strategic approach (further comments in Appendix C).  | The status of the Local Nature Recovery Strategy for Lancashire is summarised in section 3.6 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Step 1 of the strategy, to map areas of particular importance for biodiversity, is complete. Accordingly, section 3.11 of the chapter includes assessment of areas of particular importance such as statutory and non-statutory designated sites. Information on biodiversity net gain is provided in the Onshore Biodiversity Benefit Statement (document reference J11) and information on biodiversity benefit is provided in the Outline Ecological Management Plan (document reference J6). |
| TA_0035_013_221123          | S42/S44 | Email           | Ecological surveys: A number of further ecology surveys are required to ensure suitable baseline assessment of protected habitats and species especially in respect to CRoW assessments for onshore SSSIs, and water voles.   | Surveys have been carried out in 2022, 2023 and 2024 in order to confirm the presence or indicate the likely absence of protected species. See Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). This has informed the assessments set out in section 3.11 of that chapter. This includes details of the effects on SSSIs and other designated sites. No effects on water voles are considered likely.   |

| TA_0035_019_221123          | S42/S44 | Email           | 3.8.1.6 Issue Lack of clarity regarding the works in the area of the sand dunes SSSI. Impact Potential for damage to the physical and ecological integrity of the sand dunes<br>Solution Further clarification regarding use and location of potential cofferdam within sand dunes SSSI.  | Direct pipe trenchless installation is proposed beneath the sand dunes. This technology will ensure there is no open trenching through the dunes. This will avoid any direct loss of vegetation and habitats. Instead, the drill will pass beneath the dunes at depth.<br>Where necessary consideration of any indirect effects on the habitat and measures to avoid, minimise or mitigate these is provided in section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).<br><br>Crossing techniques are set out within Volume 1, Annex 3.2: Onshore Crossing Schedule of the ES (document reference F1.3.2) which is submitted as part of the application for development consent.  |
| TA_0035_020_221123          | S42/S44 | Email           | 3.8.1.8 Issue Lack of clarity regarding the cabling method (Horizontal Directional Drilling or open trench) across the intertidal area Impact Potential for damage to the physical and ecological integrity of the intertidal area. Solution Provide further clarification including entry and exit points for HDD sites if relevant.   | Details of the works in the intertidal area are set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). This includes open trenching works in the intertidal area. The exit point for the direct pipe beneath the dunes is anticipated to be above Mean High Water Springs.  |
| TA_0035_022_221123          | S42/S44 | Email           | 3.11 Biodiversity Net Gain Issue At this time the site does not have a suitable BNG strategy. Impact The proposals do not accord with government policy. There is the potential for missed opportunities for environmental gains from this project. In addition, the delivery of BNG has not been incorporated into the application and implications of this activity have not been assessed.<br>Solution The strategy for Biodiversity Net Gain to be clearly defined and delivery mechanisms to be incorporated into the DCO. The implications of delivering BNG to be incorporated into assessment documents.<br>Applicant advised to consider opportunities in Local Nature Recovery Strategies and any mitigation measures listed for the affected waterbodies under WFD. Lancashire Wildlife Trust have been working on BNG habitat options within this wider area. See Annex D for further consideration | As set out in the Onshore Biodiversity Benefit Statement (document reference J11), the Transmission Assets are not subject to a mandatory net gain requirement under the Environment Act 2021. Nevertheless, the Applicants have worked with statutory consultees to discuss the approach, and to develop the design, to allow the maximum benefit to biodiversity within the parameters of the project.<br>For the Transmission Assets, biodiversity benefit will be delivered within identified biodiversity benefit areas within the Transmission Assets Order Limits: Onshore (referred to as the Onshore Order Limits). Further qualitative benefits to biodiversity are proposed via potential collaboration with stakeholders and local groups, contributing to existing plans and programmes, both within and outside the Onshore Order Limits.<br><br>Further details of the approach to biodiversity benefit are provided in the Onshore Biodiversity Benefit Statement (document reference J11). The calculation undertaken for the Onshore Biodiversity Benefit Statement (document reference J11) utilises the latest biodiversity metric published by Defra (4.0).<br><br>The status of the Local Nature Recovery Strategy for Lancashire is summarised in section 3.6 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Step 1 of the strategy, to map areas of particular importance for biodiversity, is complete. Accordingly, section 3.11 of the chapter includes assessment of areas of particular importance such as statutory and non-statutory designated sites. |
| TA_0035_026_221123          | S42/S44 | Email           | 3.9.2.18-3.9.2.21 Issue The impacts on saltmarsh are considered low magnitude and of minor significance Impact We disagree that loss in coastal saltmarsh habitat be considered as low magnitude/temporary since it takes years (potentially 10+) for saltmarsh to naturally regenerate. Solution Review the impacts on saltmarsh, taking into account the long timescale it takes to establish.  | The assessment of impacts on priority habitats provided in section 3.11 of Volume 3, Onshore Ecology and Nature conservation of the ES (document reference F3.3). This has been updated to reflect the current design, as well as increased survey coverage. No impacts on saltmarsh habitat are anticipated.   |

|-----------------------------|---------|-----------------|---|--|
| TA_0035_027_221123          | S42/S44 | Email           | Section 3.5.3 & Table 3.13 : Site specific surveysIssueWater vole baseline is insufficient. Water vole survey was not carried out in accordance with best practice protocol. Only one survey was undertaken, and the dry spring of 2023 meant survey results were impacted with signs of water voles being more limited in this period – as washighlighted in the survey report.Impact Lack of understanding of protected species in area andresultant ecological mitigation strategy is undermined.Solution There should be at least 2 surveys for each site that has been scoped in as providing suitable habitat for water vole. Surveys should be carried out in accordance with the survey best practice. Results to be presented in Environmental Statement.  | Surveys have provided scattered and unconfirmed evidence of water vole, predominantly in the form of mammal burrows. There is infrequent but widespread evidence of mink Neogale vison, which is a significant predator of water vole, in and near the survey area. Findings of the surveys are set out in Volume 3, Annex 3.9: Water vole technical report of the ES (document reference F3.3.9). Water vole surveys have been carried out with the understanding that the Ribble Estuary SSSI and NNR is considered to be a stronghold for water vole, and all accessible areas in and in the vicinity of the SSSI and NNR were surveyed to establish the current status of the population. Survey data indicates that the population has declined, potentially due to the presence of mink, as there is very little confirmed evidence of water vole. The feeding remains and a nearby unconfirmed burrow near Penwortham indicate the transient presence of water vole rather than an established population. Water vole are therefore considered to be of local importance and have not been taken forward as an important ecological feature for assessment. |
| TA_0035_028_221123          | S42/S44 | Email           | Section 3.7 & Table 3.17 Measures adopted as part of the Transmission Assets Issue The scope of ecological assessment is insufficient. Further assessment of the ordinary watercourses and other waterfeatures will need to be considered.ImpactThe presence of watervole may be underestimated as these smaller water features may still provide habitat for both fish andother species such as water vole.SolutionAll watercourses in the area should be surveyed for water voles not just main rivers.   | Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) provides an assessment of effects for all important ecological features taken forward to assessment, including watercourses and species they support (such as fish). See comment above re water voles specifically.   |
| TA_0035_072_221123          | S42/S44 | Email           | CoT20All temporary working areas for the onshore export cable corridor, 400 kV grid connection cable corridor, temporary compounds and the onshore substation sites will be clearly marked and secured with appropriate fencing. The permanent onshore substation sites will be secured with appropriate fencing.Issue Risks to wildlife associated with site fencing have yet to be addressed ImpactThere remains a risk that wildlife may become entrapped in site fencing Solution In association with CoT17 ensure provision is made to avoid the entrapment of any animals within relevant construction areas. Checks will be made prior to the start of any works to ensure no animals are trapped.Appropriate checks will be made as required by the ecological clerk of works Secure these measures through Outline Fencing Management Plan secured in the DCO submission.                | Measures to protect wildlife during construction are set out in the Outline Code of Construction Practice (document reference J1). This includes an Outline Construction Fencing Plan (document reference J1.10).  |
| TA_0035_076_221123          | S42/S44 | Email           | CoT31 Ponds identified during the route planning and site selection process have been avoided where possible. During construction any newly identified ponds will be avoided through micro- siting of the onshore export cable corridor and 400 kV grid connectioncorridor where reasonably practicable. Issue The potential for route to result in the loss of pondsImpactRisk to the aquatic environmentSolutionSecure as DCO requirement   | Details of the impacts on ponds are set out in section 3.11 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). This includes consideration of the impacts on pond habitats, as well as species supported by this habitat. Section 3.8 of that chapter sets out the measures proposed as part of the project, including provision of new ponds and a commitment to taking part in the District Level Licensing scheme for great crested newts.  |
| TA_0035_077_221123          | S42/S44 | Email           | CoT33 An Outline Code of Construction Practice (CoCP) will be prepared and submitted with the application for development consent. CoCP(s) will be developed in accordance with the outline CoCP. The CoCP will include best practice measures in relation to air quality that will be applied where human receptors reside within 350 m of works, where required, or where sensitive ecological receptors are present within 50 m, as described in Institute of Air Quality guidance Management (IAQM,2014) as appropriate.Issue Measures required to manage dust and airquality have yet to be fully addressed.ImpactRisk to sensitive ecological receptors frompoor air quality.Solution Outline Dust Management Plan setting out dust and air quality control measures to be appended to Outline CoCP and secured in the DCO submission.  | An Outline Dust Management Plan is provided as part of the application for development consent (document reference J1.2).  |
| TA_0035_078_221123          | S42/S44 | Email           | CoT35, An Outline Code of Construction Practice (CoCP) will be prepared and submitted with the application for development consent. CoCP(s) will be developed in accordance with the outline CoCP. The CoCP will include measures to maintain and address:- flood protection and control measures;- drainage;- pollution prevention;- geology and ground conditions;- ecology and nature conservation (including protected species and invasive species);- historic environment;- soil management;- traffic and transport;- noise management measures;- air quality and dust management;- landscape and visual; and- bentonite breakout plan. Issue Measures required to manage environmental risks have yet to be fully addressed. Impact Risk to the environment Solution Outline versions of various Plans to manage environmental risks to be appended to Outline CoCP and secured in the DCO | See the Outline CoCP (document reference J1) and the following plans submitted as part of the application for development consent:•Outline Communications Plan (document reference J1.1)•Outline Dust Management Plan (document reference J1.2)•Outline Construction Noise and Vibration Management Plan (document reference J1.3)•Outline Pollution Prevention Plan (document reference J1.4)•Outline Public Rights of Way (PRoW) Management Plan (document reference J1.5)•Outline   |

| TA_0035_084_221123          | S42/S44 | Email           | CoT73 & CoT78A Biosecurity Protocol will be prepared as part of the Outline CoCP and submitted as part of the application for the development consent. CoCP(s) will be developed in accordance with the outline CoCP. Issue Measures to manage biosecurity have yet to be fully developed. Impact Risk to the environment Solution Outline Biosecurity Protocol to be to be secured in the DCO submission.  | An Outline Biosecurity Protocol has been provided as part of the application for development consent (document reference J1.12).  |
| TA_0035_085_221123          | S42/S44 | Email           | CoT76 Ecological Management Plan(s) (EMP) will be developed in accordance with the Outline Ecological Management Plan (OEMP). The Outline Ecological Management Plan will be submitted as part of the application for the development consent and will include but not be limited to pre-construction, construction and post-mitigation measures relating to habitats and protected or notable species, where relevant. The Outline Ecological Management Plan will also include a Breeding Bird Protection Plan which will set out mitigation measures such as vegetation clearance in winter (e.g., hedgerows), pre-construction breeding bird survey, appropriate protection zones upon confirmation of nest building/breeding taking place of key protected or sensitive species. The Ecological Management Plan will also include details of any long term mitigation and management measures relevant to onshore ecology and nature conservation and in relation to onshore and intertidal ornithology. This will include the management of ecological mitigation areas. The Ecological Management Plan will be developed in consultation with the relevant responsible authorities. Issue Measures to manage ecological risk have yet to be fully developed Impact Risk to habitats and species Solution Outline Ecological Management Plan to be included in DCO submission | This commitment remains in place and an Outline Ecological Management Plan (document reference J6) is provided as part of the application for development consent.  |
| TA_0035_086_221123          | S42/S44 | Email           | CoT83 An Onshore and Intertidal Net Gain Enhancement Plan will be developed and submitted as part of the application to identify areas where biodiversity net gain and/or opportunities for any enhancement are proposed. This will include details of the measures proposed. Issue The identification of areas for mitigation, BNG or enhancement have yet to be fully developed. and may alter the red line boundary on the DCO submission. Impact The clarification of BNG intentions may alter the red line boundary on the DCO submission. Solution An Outline Net Gain Enhancement Plan to be included in DCO submission  | CoT83 has been removed, as the Applicants' approach to undertaking enhancement opportunities is set out the Outline Ecological Management Plan (document reference J6), and the approach to biodiversity benefit is set out in the Onshore Biodiversity Benefit Statement (document reference J11).   |
| TA_0035_096_221123          | S42/S44 | Email           | Sand dune restoration Opportunity Opportunity for targeted sand dune restoration associated with SSSI Suggestion Engage with the Fylde Sand Dune Group which is responsible for sand dune restoration along this section of the coast. This work is part funded by the EA and is a long term ongoing project.   | Noted, the Applicants are in contact with Fylde Sand Dune Group, who have shared previous survey data.  |
| TA_0035_097_221123          | S42/S44 | Email           | Saltmarsh Opportunity Opportunity for targeted saltmarsh creation / restoration along the length of the Ribble and Douglas Estuaries, including consideration of options outside of the area already highlighted for BNG enhancement/ mitigation (i.e. further down the estuary). Suggestion Engage with local partners who have experience of saltmarsh creation from Hesketh Outmarsh and can support discussions around opportunities. Best done through the Ribble Life and Douglas Catchment Partnerships respectively. Potential for managed realignment opportunities along Main Drain where the existing embankment is below required condition. Potential for managed realignment opportunities to the north and south of the River Ribble to the east of Freckleton and west of Higher Penwortham to allow for tidal inundation of the current agricultural land and the formation of saltmarsh.  | Measures to protect habitats are set out in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). The assessment of impacts on priority habitats provided in section 3.11 of Volume 3, Onshore Ecology and Nature conservation of the ES (document reference F3.3). This has been updated to reflect the current design, as well as increased survey coverage. No impacts on saltmarsh habitat are anticipated.  |
| TA_0038_007_181123          | S44     | Email           | 7. What are the potential biodiversity net gain areas to comprise of? Why are they disjointed -they do not appear to provide ecology corridors.?  | An assessment of the impact and effects on affected receptors has been carried out. Mitigation measures committed to by the project are outlined within the ES and the project Onshore Biodiversity Benefit Statement (document reference: J11) and Marine Enhancement Statement (document reference: J12) submitted with the application for development consent.  |
| TA_0039_002_201123          | S44     | Email           | Further to our previous correspondence, as you are aware, I act on behalf of the above landowner who is potentially impacted by the proposed transmission assets of Morgan and Morecambe Wind Farm. Please take this letter as an additional comment for the feedback contained within the Statutory Consultation and I would be grateful if you could  | Following route refinement, Dalcour Maclaren on behalf of the Applicants will be in touch with interests to discuss Heads of Terms to secure the rights for the cables and compound which   |

|                             |         |                 | <p>acknowledge safe receipt and confirm that this will be put forward within the Statutory Consultations and fed through to the contract team. My client's land is identified on the attached plan, running south from REDACTED through sections identified as REDACTED. My client's land is contained within legal title REDACTED. The proposed cable route significantly impacts my client's high quality silage field, cutting diagonally across from Hillock Lane travelling south and then the cable route effectively taking the vast majority of the land. We note within the initial consultations there are potential compound areas identified as REDACTED with an access track leading off REDACTED through my client's land which obviously will be removing significant portion of well-established hedgerow. The loss of well-established hedgerow in our opinion is completely un-necessary. My client's land is going to be severed and the triangle portions between REDACTED are going to be effectively in-farmable during the constructional phase and therefore it makes practical sense for Morgan and Morecambe to occur the area cross-hatched blue for compound areas, rather than the areas identified REDACTED. Access would be directly off REDACTED through the pipeline route giving the contractors far greater flexibility and control. It was also noted at this stage that the land which immediately adjoins REDACTED is identified as longer-term land for alternate purposes – there is a linear residential development along REDACTED with the position of the proposed cables significantly, if not completely, sterilise my client's land holding for any future development which would have to be recognised in the statutory compensation procedures. I trust that you will find the above to be in order and I would be grateful if you could make the necessary amendments to ensure that our client's land is being used to mitigate the scheme and that Morgan and Morecambe will fully indemnify my clients for any severed unfarmable areas throughout the life of the constructional project.</p> | <p>will include provisions for compensation of severed land and impact on farming operations.</p>  |
| TA_0040_001_191123          | S44     | Email           | <p>My name is REDACTED, I am writing to you as Director of REDACTED, a farming business based at REDACTED on land directly based along your proposed cable route. This proposed project would in any case, render my business unviable and unable to continue to operate, effectively closing my business down completely. This would obviously have a massive financial impact on myself and family. I would like to use the opportunity during this public consultation period, to unequivocally Object to your proposals and express my concerns over the proposed off shore Wind Farm cable routing and sub station locations within the fylde coast. I believe this would have a grossly negative impact on the Environment both physically, via the works proposed and Visually, damaging an untold amount of wildlife habitat and green belt protected land, conservation area's, highly productive farmland and have a hugely detrimental impact on the wider community and local economy, putting local business, land owners and Farmers out of business. I believe it would create an untold amount of suffering for residents within the fylde coast for years to come via flooding and disruption ie traffic. Your lack of detail on some of the proposed cable routes and sub stations at this late stage and at this public consultation point in proceedings, is most worrying as this shows either an unprofessional approach to the matter, or completely unprepared, or at worst, both. It is extremely concerning that at this late stage we are asked to submit our opinions on a body of work that is neither complete nor suggest the possible outcomes thereafter the point of consultation. I feel that you have shown disregard to the community of the fylde coast in your methods up to now. This lack of transparency on your part, sets a precedent when approaching future issues and has created a level of mistrust that is beyond repair. This is another reason why I must whole heartedly Object on all parts of your proposals.</p>   | <p>The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). Following route refinement and landowner engagement, the impact has been reduced on this holding and the Applicant through Dalcour Maclaren will work with the landowner to reduce the impact of construction on the holding and business. Dalcour Maclaren on behalf of the Applicants will be in touch with interests to discuss Heads of Terms which will include compensation provisions to address any impacts to the farming business.</p> |
| TA_0041_001_191123          | S44     | Email           | <p>As a trustee and marsh owner of REDACTED I wish to bring to your attention my concerns over the proposed wind farm route and substations . Freckleton marsh with its neighbour Newton marsh are incredibly important conservation areas which have been heavily managed to protect the habitats of extremely rare ground nesting birds which requires local farms to bring on live stock to help manage the biodiversity of these sites, I am very concerned about the futures of the farms which are in the paths of these proposals and the disturbance of the surround farmland which could be detrimental to the marshes management . Both Marsh's are classed in the potential biodiversity net gain areas for the scheme yet we have had very little information on how this could impact the marsh's and their important eco systems including the water courses that feed this land which will have to be crossed by the cables . Dalcour Maclarens biodiversity potential net gain proposals are to vague and incomplete and haven't been conveyed to the relevant land owners thoroughly</p>  | <p>An assessment of the impact and effects on affected receptors has been carried out in Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).. Mitigation measures committed to by the Applicants are outlined within the ES and the project Onshore Biodiversity Benefit Statement (document reference: J11) and Marine Enhancement Statement (document reference: J12) submitted with the application for development consent.</p>   |
| TA_0042_001_191123          | S44     | Email           | <p>I am writing this email as the REDACTED of REDACTED, based on Marton Moss. Also user/owner of some of the land proposed to be affected by the cable route and surrounding bridle paths. If the route chosen includes my land on REDACTED, it would have a catastrophic and ruinous effect on my business. Therefore I am taking the opportunity during this public consultation period, to unequivocally Object to your proposals and express my concerns over the</p>  | <p>The potential impacts of the Transmission Assets on recreational resources, including livery yards, stables and PRow are identified and assessed in section 6.6 and section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES</p>  |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response   |
|-----------------------------|---------|-----------------|--|--|
|                             |         |                 | proposed off shore Wind Farm cable routing and sub station locations within the fylde coast. I believe this would have a grossly negative impact on the Environment both physically, via the works proposed and Visually, damaging an untold amount of wildlife habitat and green belt protected land, conservation area's, highly productive farmland and have a hugely detrimental impact on the wider community and local economy, putting local business, land owners and Farmers out of business. I believe it would create an untold amount of suffering for residents within the fylde coast for years to come via flooding and disruption ie traffic. Your lack of detail on some of the proposed cable routes and sub stations at this late stage and at this public consultation point in proceedings, is highly worrying as this shows either an unprofessional approach to the matter, or highly unprepared, or at worst, both. It is very concerning that at this late stage we are asked to submit our opinions on a body of work that is neither complete nor suggest the possible outcomes thereafter the point of consultation. I feel that you have shown disregard to the community of the fylde coast in your methods up to now. This lack of transparency on your part, sets a precedent when approaching future issues and has created a level of mistrust that is beyond repair. This is another reason why I must whole heartedly Object on all parts of your proposals. | (document reference F3.6). This includes consideration of REDACTED. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes preparation of a PRoW Management Strategy in general accordance with the Outline PRoW Management Strategy (document reference J1.5) submitted with the application for development consent. The measures to be implemented as part of the PRoW Management Strategy seek to minimise impacts on public footpaths, bridleways and other promoted routes (e.g. NCRs, Long Distance Footpaths) during construction of the Transmission Assets.  |
| TA_0043_013_211123          | S44     | Email           | 13 My grandfather planted a windbreak which now consists of 30-40-meter-tall trees. This provides fabulous habitat for farmland birds and will be irreplaceable for decades. The cable route appears to threaten this valuable woodland habitat.   | Habitats within the Transmission Assets Order Limits have been subject to habitat surveys, where access has been possible. This is reported in section 3.6 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Where there are impacts in relation to birds, these are set out in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).  |
| TA_0043_018_211123          | S44     | Email           | 18 Environmental impacts: We are aware there has been an impact survey on our land, but as yet the results have not been shared with ourselves or the wider public. We support large numbers of farmland birds, many of which are with us all year and others are either Summer or Winter visitors. We have, amongst many others- skylarks, curlews, pink footed geese, lapwing, Shoveler ducks, breeding teal, kestrels, sparrow hawks and a wide variety of owls. A variety of mammals, invertebrates and amphibians also make our farmland their home.  | A number of environmental surveys have been undertaken and are reported in the ES. These include, in particular, surveys for ecology, the historic environment, agricultural land quality and tree surveys. These are reported in Volume 3, Chapter 3: Onshore ecology and nature conservation, Volume 3, Chapter 5: Historic environment, Volume 3: Chapter 6: Land use and recreation and Volume 3, Chapter 10: Landscape and visual resources of the ES (document reference F3.3, F3.5, F3.6 and F3.10). These have informed the assessments presented in these chapters.   |
| TA_0046_003_171123          | S44     | Email           | After a planning application I had and the ecology reports I've had done on the same land I would like to see your ecology reports to compare the findings.I have drone footage of the land from Ballam Road to Hillock Lane showing the natural wildlife from barn owls, buzzards, foxes, deer's also pictures of newts, hedgehogs and other small animals that provide food for these larger animals.What will you do to protect these animals.  | Surveys have been carried out in 2022, 2023 and 2024 in order to confirm the presence or indicate the likely absence of protected species. See Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). This has informed the assessments set out in section 3.11 of that chapter. The survey findings are set out in Volume 3, Annex 3.3 to 3.14 of the ES (document reference F3.3.3 to F3.3.14).   |
| TA_0117_004_271023          | S44     | Email           | As a local resident and neighbour of one of the farmers REDACTED, we know how over the years he has developed a farm with many eco-credentials. These include 10 miles of hedge row, set aside, grassland with carbon capture He also has an established amount of great crested newt and we know that migrating eels travel along the river Dow and onward along the ditches where they spawn. He is also one of the last dairy farmers on our Fylde Coast. As I said before there must be an alternative route that can be explored otherwise what is the point of the costly consultation. We really hope that we are listened to.  | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |
| TA_0118_001_071123          | S44     | Email           | As a resident of Freckleton I wish to strongly register my objection to the planned substations in our area. My husband and I chose to retire here 5 years ago because of the access to the open countryside which surrounds this area. It is a valuable habitat to much wildlife including bats, great crested newts and hedgehogs, foxes, etc. We also   | The ES includes an assessment of the Transmission Assets alone in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). Details on the impacts on European sites from the Transmission  |

|                             |         |                 | have curlew, lapwing and oystercatcher in this area. These key species are being displaced at an alarming rate and greatly rely on these coastal resources to overwinter successfully.  | Assets are contained within the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3). Both the ES and the ISAA consider construction impacts, including impacts on functionally linked land.  |
| TA_0119_001_071123          | S44     | Email           | I am opposed to your plans to build two substations on greenbelt land in the local area around Freckleton. This surely cannot be the best option for the local environment, given the known flooding issues in the area, and the loss of high-quality farmland. It is also a valuable habitat to much wildlife including bats, newts, and various species of bird including curlews, lapwings, owls and oystercatchers to name but a few. The close proximity to Carr Hill and Strike Lane schools, will also be a major concern for the many parents in the area. I am not against wind farms and green energy, but this must be done in a respectful way for local residents and the community. Surely the land surrounding the existing substation in Penwortham, would be a more viable and appropriate option. | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0123_001_171123          | S44     | Email           | I have filled in the online forms and completed the paper form and returned. I just wanted to stress how much I object to this proposed project. I feel this is not been done in a safe proximity and is detrimental to the people and wildlife of our area. We chose to live in this area for the peace and quiet and country side. Not to be next to electromagnetic radiation. I hope an alternative site could be used.   | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). Electro-magnetic fields (EMFs) are part of the natural world, and are also produced wherever electricity is generated, transmitted or used. With regard to EMF impacts, the project will adopt the International Commission on Non-ionizing Radiation Protection (ICNIRP) guidelines and Government voluntary Code of Practice on EMF public exposure. Such considerations are inherent to the detailed engineering considerations of cable specification and routing. Relevant public EMF exposure guideline limits are noted in NPS EN-5 and would be complied with by the project. These guidelines are long standing and have a high safety margin. The levels of exposure that they require would not pose a risk to public health. Volume 1, Annex 5.1 (document reference F1.5.1) has had regard to the risk perceptions associated with EMFs of the Transmission Assets on the local area and this is presented in section 1.11.9 of the Annex. See also the submitted EMF Compliance Statement (Volume 1, Annex 3.4 of the ES, document reference E1.3.4). |
| TA_0124_006_171123          | S44     | Email           | 7. In the projected area there are endangered and protected species such as bats redshanks, oystercatchers, great crested newts and owls (Tawney and Barn Owls) and buzzards, kestrels, long tailed tits, bar tailed godwits amongst many others.   | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset  |

|                             |         |                 |   | significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0125_004_181123          | S44     | Email           | 7.This will most certainly impact the environment and wildlife, some of which is protected. However it appears you are not bothered about this, in which case put it down the estuary the most logical place for it to go.  | The Ribble estuary has numerous ecological statutory designations protected nationally and internationally. These include the Liverpool Bay Special Protection Area, Ribble and Alt. Estuaries Special Protection Area, the Ribble and Alt Estuary Ramsar site (a wetland of international importance under the Ramsar Convention), and the Ribble Estuary Site of Special Scientific Interest, Ribble Estuary Marine Conservation Zone and Ribble Estuary National Nature Reserve. The tidal nature and shallow water depths of the estuary also create heightened risk to construction as the unstable riverbed conditions are unsuitable for trenching/ cable laying vessels to access. As such, cabling through the estuary would result in significantly protracted construction timeframes, and potentially long-term impacts to sensitive and sensitive features associated with the designated features, whilst also presenting higher risk and potentially unsafe working conditions. As such, the approach to site selection has been based on avoiding direct impacts to Important Ecological Features (IEFs) where practicable, further details can be found in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4). |
| TA_0127_001_191123          | S44     | Email           | we strongly object to any windfarm along the Queensway. We have a small private stable yard at the top of REDACTED which runs along the Queensway. We originally fenced along the queensway 15 foot in to protect the trees and wildlife and to cause least disruption to the area as possible.we observe bats otters newts ratweasels voles moles to name the least.the end field we own has recently had a tree cut out without our permission?also i turn my horses out along there and one horse is a rescue that does not tolerate any heavy machinery and is very nervous.so any disruption would seriously damage the area animals and wildlife.therefore we strongly object thankyou  | The potential impacts of the Transmission Assets on recreational resources, including livery yards, stables and PRow are identified and assessed in Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6).Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). The potential impacts of the Transmission Assets on protected species and protected habitats are considered in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES.Measures adopted as part of the Transmission Assets to mitigate potential impacts on onshore ecology and nature conservation are provided in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference: F3.3).   |
| TA_0128_001_191123          | S44     | Email           | Good morning, I am a resident of REDACTED freckleton, Preston, (REDACTED),and i am writing to you to let you know how utterly disgusted i am to find out that you are planning to erect two massive substations right near my house!!! bought this house 3 years ago,& was delighted with it, as it was in a peaceful semi rural location.Have you even considered (I think not),the noise, disruption,& the effect you will be putting on the wildlife,& also the increased traffic volumes & the devaluation of most, if not all the properties in the area.If you were to devalue my property, then I would have no other alternative than to seek compensation from yourselves, as, who would want to buy a property right next to two substations, which are going to be so huge.Why the hell would you want to build here in freckleton anyway, on the proposed sites as they are prone to flooding when we have alot of rain.It doesn't make any sense!Why can't you build them in the fields adjacent to the A584,between clifton fields & the warton airbase, where there are clearly no residential properties.I'm asking you,as one human being to another, to please reconsider building in this idyllic green belt land & destroying not only the landscape but people's livelihoods, & their way of life. | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets   |

| TA_0130_005_191123          | S44     | Email           | <p>I strongly support the following objection drawn up locally; "I would like to use the opportunity during this public consultation period, to unequivocally Object to your proposals and express my concerns over the proposed offshore Wind Farm cable routing and sub station locations within the Fylde coast. I believe this would have a grossly negative impact on the Environment both physically, via the works proposed and visually, damaging an untold amount of wildlife habitat and green belt protected land, conservation area's, highly productive farmland and have a hugely detrimental impact on the wider community and local economy, putting local business, land owners and Farmers out of business. I believe it would create an untold amount of suffering for residents within the Fylde coast for years to come via flooding and disruption i.e. traffic.</p> | <p>are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p> <p>The Applicants are committed to robust and transparent public consultation as part of the development process. The Transmission Assets has undertaken three rounds of consultation with the local community, including two non-statutory periods of consultation (2 November to 13 December 2022 and 19 April to 4 June 2023) and a statutory consultation (12 October to 23 November 2023). Statutory targeted consultations have also taken place (November 2023 to October 2024). The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the SoCC). The Transmission Assets is fully committed to delivering a community benefits scheme in line with UK Government guidance, which is due to be published later this year. The Transmission Assets is fully committed to delivering a community benefits scheme in line with UK Government guidance, which is due to be published later this year. Ahead of the guidance being published we have been engaging with local people, businesses and organisations to identify key themes and projects that will deliver strategic benefits and directly support the local community and local priorities. We welcome further input from the local community and encourage you to reach out to the project team in due course. The Applicants provided maps as part of the consultation materials that clearly set out the elements of the Transmission Assets in relation to settlements, roads and geographic features. All maps also included a key to highlight the proposed use of different areas and the relevant aspects of the Transmission Assets' design. The materials were proportionate to the level of information and design detail at the time of consultation, reflecting the information available in the PEIR. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p> |

| TA_0134_003_191123          | S44     | Email           | The farmland and wildlife that will be effected by this concerns me greatly. You have stated in your report that you will replant hedgerows etc... But these can take up to 30 years to regenerate. Where will the wildlife that lives in these hedgerows go? and shocks me that the substation will last 35 years (4.6.1.6)<br>The substation will ruin our rural location and turn it into an industrial site. In this village we are lucky to have lots of wildlife including bats, redshanks, oystercatchers, great crested newts, and seval types of owls and kestrels.  | The potential impacts of the Transmission Assets on protected species and protected habitats are considered in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on onshore ecology and nature conservation are provided in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference: F3.3).   |
| TA_0136_001_201123          | S44     | Email           | I am opposed to the development for the following reasons: Destruction and disruption of important wildlife habitats on Lytham Moss and beyond for birds, bats, newts, deer etc. Destruction and disruption to public rights of way and Bridleways on Lytham Moss and beyond.Major disruption to very busy highways and access routes, including but not limited to Queensway , Kilnhouse Rd and the new Moss Road that is currently under construction. Destruction and disruption to private residences along the route, including potential compulsory purchase of private gardens and grazing land. The devaluing of private dwellings along and surrounding the development, spoiling green views and acreage.                       | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).  |
| TA_0138_001_201123          | S44     | Email           | I would like to formally lodge my opposition to the proposed disruption to the St Annes area from the offshore wind farm.<br><br>I attended the recent consultation at the local Cricket Club and was alarmed by the proposal to take the cables through the roads of St Annes. It will cause untold disruption to local residents and will also lead to the destruction of green spaces (eg on Blackpool Rd) and wildlife. I am a resident of REDACTED and I simply can't imagine how difficult it will be to have trenches running along the nearby roads (especially Queensway) for "weeks". I suspect the "weeks" will become months very easily. Look how long it took to do a very simple road reconfiguration around Common Edge!! | Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Maximum parameters for the substation have been refined following statutory consultation. As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Specifically, the landscape and visual assessment (Volume 3, Chapter 10 of the ES) (document reference F3.10)) and onshore ecology assessment (Volume 3, Chapter 3 of the ES) (document reference F3.3)) set out the respective maximum design scenarios, and identify the likely significant effects during construction, operation and maintenance, and decommissioning, temporally and seasonally (where relevant), with and without mitigation. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |

|                             |         |                 | Can you guarantee Division Lane will not be used to import Cable/equipment? 13.) Will the heavy machinery drilling digging etc likely cause any damage to our homes? If so what's in place for the cost of repair?  | (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).  |
| TA_0139_004_201123          | S44     | Email           | 10th November 2023 In additional to the above questions still not answered in writing as of 9th November the residents would like to ask the following questions after Monday 6th November Webinar.14.)Why was the first route for the substations and cables axed, I believe Penwortham was not the first option?15.)How wide is he Indicative onshore export cable corridor? (Light purple on Lytham Moss) and where is it going on an ordnance survey map. If it is 122m wide, where will it be crossing Queensway? Our questions have not been adequately answered on this.16.) What size are the substations and is there only 4? Will there definitely not be a Substation, Booster stations in Blackpool or Lytham St Anne's? If Morecambe substation Sub Station 12500 sq metres roughly 30 acres max height 20 Metres, and Morgan substation is15 acres max height 20 Metres is the sites in Kirkham where they will be located?17.) If your proposed route is a Biologic Heritage Site for migrating birds would the project be stopped during migration? There are great crested newts, otters, bats, water voles, etc. as well as migrating birds such as pink foot geese and Whopper Swans.18.) Why have you asked some residents on the same street of REDACTED for details of people or organisations have interest in the land/ property, Mortgage / Charge, name of lender and mortgage reference and not others? Several residents own more than one piece of land and they have received 2 different letters why when these are generic letters? Is this because you are thinking of using your compulsory acquisition powers to acquire Land/Properties/Part of land in Blackpool, Lytham Moss, Lytham St Anne's? In the webinar on 6th November you stated you have to inform all interested parties but yet you are not asking all residents the same questions, is the mortgagee question because you want to come to a voluntary agreement to purchase land or property? 19.) Will the cabling create noise for residents similar to pylons?20.) How will you mitigate raising the water table?21.) There are only 3 routes in and out of Lytham St Annes from Blackpool and when one is shut you can sit in 45 minutes to an hour each way in delays if the Promenade or Queensway is shut effecting residents and businesses. If you are now proposing using Kilnhouse Lane, Leach Lane, Queensway and Blackpool Road North to install cable ducts, how long do you believe this work will take and how much disruption will it cause to residents and businesses. Queensway - Traffic management. This is the main arterial route into St Annes from Blackpool, extremely busy 40mph road.22.) How will you communicate with residents during construction? Please consider social media for project updates.23.) Can you guarantee Midgeland Road will not be used to import Cable/equipment?24.) Will bridal paths be out of use while installing the cable corridor?25.) Blackpool Council are also doing lots of alterations on Common Edge Road (EZ Zone <a href="https://blackpool.ez.com">https://blackpool.ez.com</a> ), the drainage off these works are to go into a attenuation basin alongside Blackpool Airport, has this been considered in your planning for the cable corridor ( <a href="https://pa.fylde.gov.uk/Planning/Display/23/0758">https://pa.fylde.gov.uk/Planning/Display/23/0758</a> ).26.) The Lytham moss land is wet and very low lying. - could cause flooding to us on REDACTED how will this be combated.27.) What is the proximity of the cable corridor to properties on REDACTED.28.) How will you stop settlement on properties adjacent to the projects, path?29.) Fylde size of REDACTED is not connect to main drains and has Dykes and Septic Tanks either on our adjacent to properties, how will these be protected.30.) Is there a provision for cleaning Dykes once the project is finished, as when other project have been completed this has caused problems for residents and we as riparian owners have a responsibility to clear dykes, but we should not be expect to clear your waste into these dykes.On behalf of residents of REDACTED. REDACTED REDACTED | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE) which no longer includes any surface piercing structures. This includes the removal of the Morgan Booster Station and associated search areas. The OSPs are to be classed as part of the Generation Assets applications only. Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3).Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).Properties on Division Lane border the draft Order Limits and so the Project has a duty to consult with those legal interests as part of the DCO application. To ensure the Applicant has consulted with all land interests, Dalcour Maclaren undertake land referencing to identify these interests through HMLR searches and Land Interest Questionnaires. This includes in some circumstances requesting information for any third-party interests in the land, details of which are outlined in the land referencing methodology. Some parties are asked to provide information about their interest prior to the project order limits being refined. This captures a wider area than ultimately necessary. Being asked for this information does not mean that you will be directly affected. Interest are identified by plot rather than address so any off lying land will be covered. We have a duty to consult all parties with an interest in land, a mortgage is effectively an interest and entitled to notification. |
| TA_0140_006_201123          | S44     | Email           | There will surely be a negative impact on Blackpool Airport and also the St Anne's Nature Reserve.  | The Applicants have engaged with the airport operators. The impacts on aviation have been considered at Volume 3, Chapter 11: Aviation and radar of the ES (document reference: F3.11).   |
| TA_0142_001_201123          | S44     | Email           | I am writing this email to lodge a complaint about the two massive substations,you are planning to build on green belt farm land in lower lane Freckleton. Having lived in the area for the past 3 years I am very concerned about the impact that this will have on the environment and the wildlife, but also the disruption it will cause to the local residents way of life.We like our way of life,here which is quiet and peaceful & I would like it to remain this way. Also I'm extremely worried about the fact that your buildings could,most likely devalue my property.   | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).The Transmission Assets will be fully compliant with the compensation code. The code sets out   |

The UK Government has also produced or a series of plain English general guides to compulsory purchase and compensation which you may find useful: Compulsory purchase and compensation - GOV.UK (www.gov.uk) Guide books 1 and 4 being the most appropriate.</p>   |
| TA_0143_001_201123          | S44     | Email           | <p>My name is REDACTED of REDACTED and REDACTED. I have lived in Newton for 28 years, my husband and late father-in-law owned and operated a dairy farm on the site of REDACTED. I chose to live/reside in this location because it is rural and should remain rural. The siting of the substation on Zone 1 or any one of the proposed locations is extremely worrying. My concerns regarding these proposals are as follows:-Green Belt land Prime agricultural land, potentially rendering the land useless In an area of separation Way too close to two schools Way too close to residential properties Flooding Visual impact Noise, light, vibration Wildlife Congestion Decreasing the value of land and property Safety hazard Surely there must be other options available with far less intrusion on the whole of the Fylde.</p> | <p>The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p>  |
| TA_0144_001_201123          | S44     | Email           | <p>I would like to take this opportunity during this public consultation period, to unequivocally object to your proposals and express my concerns over the proposed offshore wind farm cable routing and sub station locations within the Fylde coast. I believe this would have a grossly negative impact on the environment both physically, via the proposed work and visually, damaging an untold amount of wildlife and green belt protected land, conservation areas highly productive farmland and have a hugely detrimental impact on the wide community and local economy, putting local business, land owners and farmers out of business. I believe it would create an untold amount of suffering for residents within the Fylde coast for years to come via flooding and disruption to traffic.</p>                            | <p>The Applicants are committed to robust and transparent public consultation as part of the development process. The Transmission Assets has undertaken three rounds of consultation with the local community, including two non-statutory periods of consultation (2 November to 13 December 2022 and 19 April to 4 June 2023) and a statutory consultation (12 October to 23 November 2023). Statutory targeted consultations have also taken place (November 2023 to October 2024). The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the SoCC). The Applicants have made design changes since the PEIR and further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). This has included refinements of the location and design of the 400 kV grid connection cable corridor and onshore substations, including - selection of a single site for the onshore substation for the Morecambe Offshore Windfarm: Transmission Assets- refinement of the siting and orientation of the onshore substation for the Morecambe Offshore Windfarm: Transmission Assets, to take into account consultation responses received. Details of the design and/or environmental constraints considered as part of the iterative design process, are set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of</p> |

|                             |         |                 |  | the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0145_002_201123          | S44     | Email           | The non statutory consultation is also flawed. There was no information as to how the four location search zones were identified or selected. You have also not considered identified enterprise zones and brown field sites as identified by Fylde Borough Council. The PEIR obviously shows that you have predetermined the outcome in favour of zone 1, the RAG assessment is biased in favour of zone 1, with the rating being inconsistent, contradictory, subjective and factually incorrect. Below are some of the points which demonstrate this. High pressure gas main. The high pressure gas main only touches the extreme eastern edge of zone 2, this could be managed. This is not made clear. Flood risk – Inspection of flood zone maps shows there is little difference in flood risk between zones 1 and 2. This is not made clear. Zone 1 and zone 2 are roughly equidistant from SSSI so not a factor to differentiate siting as claimed. Bluefield solar farm development is not in zone 2, it is just in zone 1. Inconsistent treatment of wildlife concerns and surveys. Limited number of ornithological surveys used to inform RAG selection process for sites. Zone 1 lies within Kirkham/Newton area of separation zone and FBC green belt. This is not weighted appropriately in the RAG. Proximity to residential development is not factored in the RAG selection assessment for zones. | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |

| TA_0151_006_201123          | S44     | Email           | My investigations show enormous concerns and implications to the village, not only to the residents but the local wildlife. Owls, hawks, buzzards, redshanks, oyster catchers, long tailed tits, bats, great crested newts and many more.  | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).  |
| TA_0159_001_211123          | S44     | Email           | Good afternoon I am writing with regard to the above proposed Wind Farm. I have no objection to wind farming in general as I believe this is a sustainable source of clean renewable energy. However, as a resident of REDACTED which is halfway between Kirkham & Freckleton, I do have an objection to the route the cables are being laid to the proposed Sub-Stations and to the siting of said sub-stations in our locality to service this Wind Farm. I do not understand why the route for the cables for this wind farm are coming through this locality when your information states that the wind farm will be located in Morecambe Bay some 21 miles away or more. It seems from the scant information received to-date that there has been little or no consideration for the local residents. There will be a detrimental impact and prolonged severe disruption caused by digging up the fields and numerous roads which will have an effect on local schools, nurseries and cause traffic obstructions. Not to mention the impact this will have on the local wildlife. | The siting and design of the substations has been developed through an iterative design process, e.g., the Morgan substation has been moved eastwards since submission of the PEIR to increase the distance between it and residential properties on Lower Lane. In addition, direct impacts are avoided on the public right of way and the footprint seems to respect field boundaries. Similarly, the Morecambe substation has also been located further away from a number of residential receptors. This is described in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4). An Outline Landscape Management Plan (document reference J2) has been developed and is provided within Volume 1, Annex 5.3: Commitments register (document reference F1.5.3) which sets out details of mitigation planting at the onshore substations, including the number, location, species and details of management and maintenance of planting. Where practical, landscape mitigation planting will be established as early as reasonably practicable in the construction phase   |
| TA_0159_002_211123          | S44     | Email           | I am very keen that the impact on local wildlife is kept to a minimum but I fail to understand why these cables cannot be sent down the Ribble Estuary which, although I know there will be some impact on the wildlife, it seems to me that this will be a lesser impact than that caused by the proposals as mentioned above both in the short term and long term.   | The Ribble estuary has numerous ecological statutory designations protected nationally and internationally. These include the Liverpool Bay Special Protection Area, Ribble and Alt. Estuaries Special Protection Area, the Ribble and Alt Estuary Ramsar site (a wetland of international importance under the Ramsar Convention), and the Ribble Estuary Site of Special Scientific Interest, Ribble Estuary Marine Conservation Zone and Ribble Estuary National Nature Reserve. The tidal nature and shallow water depths of the estuary also create heightened risk to construction as the unstable riverbed conditions are unsuitable for trenching/ cable laying vessels to access. As such, cabling through the estuary would result in significantly protracted construction timeframes, and potentially long-term impacts to sensitive and sensitive features associated with the designated features, whilst also presenting higher risk and potentially unsafe working conditions. As such, the approach to site selection has been based on avoiding direct impacts to Important Ecological Features (IEFs) where practicable, further details can be found in |

|                             |         |                 |   | Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4).   |
| TA_0160_001_211123          | S44     | Email           | All Regarding the above project, and your Transmission Assets questionnaire.I am a resident of REDACTEDREDACTED Firstly, I would say I have no objections to wind Farms, they are a source of clean renewable energy, however I do have objections to the proposed route into the National Grid and the unreasonable impact it will have on my community and wildlife. My major concerns is the environmental impact to the area where the proposed substations are to be located. We have 2 villages (Freckleton and Newton) separated from Kirkham Town via High Grade Agricultural Green belt grass land in the summer, and in the winter months when we have rain , it floods and holds water until the natural water courses / dykes empty and it naturally drains away.   | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0162_003_211123          | S44     | Email           | Environmental, local community, sensitivity for agriculture and wildlife, FBC strategy, noise pollution, community health and other critical factors are being pushed aside for BP's profits.The development will significantly adversely impact local amenities, change character from rural to industrial, and cause potential flooding due to massive displacement by the enormous industrial development, ruining farmland for decades and placing homes at risk.   | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0165_005_211123          | S44     | Email           | Moreover, the proposed construction of the transformer will result in the loss of valuable farm land in the Newton area. This loss is concerning not only from an agricultural perspective but also in terms of the environmental impact on our community. I urge the developers to provide detailed information on how they plan to mitigate the loss of farm land and any plans for compensatory measures.  | The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). These measures include the provision of an Outline Soil Management Plan (document reference J1.7). In addition, the Outline Code of Construction Practice (document reference J1) seeks to limit disruption to the operation of individual farm holdings.   |
| TA_0166_001_131123          | S44     | Email           | I am totally opposed to the project that has the intention of landfall through the Fylde coast with Land based stations.The transmission cables are expected to join at the National Grid in Penwortham, Preston which is south of the River Ribble.I strongly suggest the River Ribble is used for channeling of the transmission cables or the land south of the River Ribble. This will avoid channeling through the Fylde's Road, footpaths and agricultural network.Rooting the cables south of the river will avoid human habitation, roads and foot paths and will not interfere with the daily lives of residents.Animal and bird life will recover quickly from trenching of transmission cables south of the River Ribble which will be done easier than by trenching through urban areas.I reject the wind farms proposals please acknowledge receipt of my email in opposition to your plans. | The Ribble estuary has numerous ecological statutory designations protected nationally and internationally. These include the Liverpool Bay Special Protection Area, Ribble and Alt. Estuaries Special Protection Area, the Ribble and Alt Estuary Ramsar site (a wetland of international importance under the Ramsar Convention), and the Ribble Estuary Site of Special Scientific Interest, Ribble Estuary Marine Conservation Zone and Ribble Estuary National Nature Reserve. The tidal nature and shallow water depths of the estuary also create heightened risk to construction as the unstable riverbed conditions are unsuitable for trenching/ cable laying vessels to access. As such, cabling through the estuary would result in significantly protracted construction timeframes, and potentially long-term impacts to sensitive and sensitive features associated with the designated features, whilst also presenting higher risk and potentially unsafe working conditions. |                             |         |                 |  | Features (IEFs) where practicable, further details can be found in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4).  |
| TA_0118_012_151123          | S44     | Email           | I am writing this email to let you know I was informed at one of your consultation events that the National grid suggested 2 options to you one at Penwortham and one at Heysham. I strongly oppose your choice of Penwortham due to you causing major disruptions from Lytham to Freckleton and then onwards to Penwortham when you could use the substation due to end in 2028 in Heysham. If you use Heysham one you will not be using good agricultural land which is currently used by local farmers to make a living, you will not be disrupting homes and families in the process, you will not be deliberately killing wildlife and you will not need to build 2 substations in a rural part of Freckleton one of which is the size of 13 football pitches and 70ft high overlooking peoples properties. Your proposals for doing this are totally unacceptable and in my view immoral when you can use Heysham and save a lot of time and money.  | Under the Offshore Transmission Network Review, the National Grid Electricity System Operator (NGESO) is responsible for assessing options to improve the coordination of offshore wind generation connections and transmission networks and has undertaken a Holistic Network Design Review (HNDR). A key output of the HNDR process was the recommendation that the Morgan Offshore Wind Project and the Morecambe Offshore Windfarm should work collaboratively in connecting the two offshore wind farms to the National Grid electricity transmission network at Penwortham in Lancashire. Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0188_007_221123          | S44     | Email           | Impact on wildlife We have had numerous ecological surveys carried out across our land and, whilst we have not had any feedback on the findings of these yet (despite this being promised at the time when the surveys were being carried out), we know for a fact that the land supports a huge number of bird species and varied wildlife. We regularly see barn owls, bats, swans, geese, brown hares and huge numbers of wild birds, and the destruction of all their habitats will be devastating. We will lose many of our ponds, ditches and hedges, all of which are a haven for wildlife. Whilst I appreciate that remedial work will take place after the building work is completed, I fear that it will be too late and many of these species will never return. When we suggested the viability of using the River Ribble estuary or the adjacent marshland as the cable route we were told that it cannot even be considered due to its status as a SSSI. Are the animals and birds that live at our farm less important than the birds living near the river? | The potential impacts of the Transmission Assets on protected species and protected habitats are considered in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on onshore ecology and nature conservation are provided in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference: F3.3). The ES includes an assessment of the Transmission Assets alone in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). Details on the impacts on European sites from the Transmission Assets are contained within the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3). Both the ES and the ISAA consider construction impacts, including impacts on functionally linked land. The Ribble estuary has numerous ecological statutory designations protected nationally and internationally. These include the Liverpool Bay Special Protection Area, Ribble and Alt. Estuaries Special Protection Area, the Ribble and Alt Estuary Ramsar site (a wetland of international importance under the Ramsar Convention), and the Ribble Estuary Site of Special Scientific Interest, Ribble Estuary Marine Conservation Zone and Ribble Estuary National Nature Reserve. The tidal nature and shallow water depths of the estuary also create heightened risk to construction as the unstable riverbed conditions are unsuitable for trenching/ cable laying vessels to access. As such, cabling through the estuary would result in significantly protracted construction timeframes, and potentially long-term impacts to sensitive and sensitive features associated with the designated features, whilst also presenting higher risk and potentially unsafe working conditions. As such, the approach to site selection has been based on avoiding direct impacts to Important Ecological Features (IEFs) where practicable, further details can be found in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4). |

|-----------------------------|---------|-----------------|--|---|
| TA_0194_001_221123          | S44     | Email           | <p>Thank you for attending my client's property on Monday afternoon – my clients are grateful for your time and consultation in relation to the Morgan and Morecambe onshore transmission assets and how they will potentially impact my client's farming business. My clients will be making their own representations within the Statutory Consultation feedback form and I believe they have also given to you in hard copy their background information on their farming system. At our meeting my clients highlighted that they farm in total 350 acres of intensive grassland with a further 40 acres of low input rough grazing which accommodates and carries 250 dairy cows with 430 youngstock and beef cattle, producing in excess of 2,250,000 litres of milk sold on a supermarket contract. The beef cattle are also reared on to finishing weight and sold on dead weight system. The proposed route of the transmission cable cuts through a large proportion of land that my clients occupy under a Farm Business Tenancy with the landlords [REDACTED]. I have assumed the [REDACTED] may make separate representations with regards to the actual route of the cables but my clients wish to put on record their objections to the Morgan and Morecambe transmission cable, as highlighted on the attached plan. The route of the transmission cable goes through some of the most difficult agricultural terrain within the locality. Whilst the agricultural land is high quality Grade 2 productive land, it is moss land which means that the stability of any operations and field work cannot be taken too lightly. The proposed route seemed yet again to prioritise ecological surveys rather than the practicalities of the landowners and the farming operations that it affects.</p> | <p>The Applicants note your response and through Dalcour Maclaren will be in touch with interests and their appointed agents to discuss Heads of Terms which will include compensation provisions to address any impacts to the farming business and practical elements of the construction. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p>   |
| TA_0196_001_221123          | S44     | Email           | <p>I would like to use the opportunity during this public consultation period, to unequivocally Object to your proposals and express my concerns over the proposed off shore Wind Farm cable routing and sub station locations within the fylde coast. I believe this would have a grossly negative impact on the Environment both physically, via the works proposed and Visually, damaging an untold amount of wildlife habitat and green belt protected land, conservation area's, highly productive farmland and have a hugely detrimental impact on the wider community and local economy, putting local business, land owners and Farmers out of business. I believe it would create an untold amount of suffering for residents within the fylde coast for years to come via flooding and disruption ie traffic. Your lack of detail on some of the proposed cable routes and sub stations at this late stage and at this public consultation point in proceedings, is highly worrying as this shows either an unprofessional approach to the matter, or highly unprepared, or at worst, both. It is most concerning that at this late stage we are asked to submit our opinions on a body of work that is neither complete nor suggest the possible outcomes thereafter the point of consultation. I feel that you have shown disregard to the community of the fylde coast in your methods up to now. This lack of transparency on your part, sets a precedent when approaching future issues and has created a level of mistrust that is beyond repair. This is another reason why I must whole heartedly Object on all parts of your proposals.</p>   | <p>The Applicants are committed to robust and transparent public consultation as part of the development process. The Transmission Assets has undertaken three rounds of consultation with the local community, including two non-statutory periods of consultation (2 November to 13 December 2022 and 19 April to 4 June 2023) and a statutory consultation (12 October to 23 November 2023). Statutory targeted consultations have also taken place (November 2023 to October 2024). The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the SoCC). The Applicants are committed to working with local communities that may be impacted by the Transmission Assets. As the proposals develop further, any ideas for potential community benefits are appreciated. We will continue our engagement with the relevant communities in due course. The Applicants provided maps as part of the consultation materials that clearly set out the elements of the Transmission Assets in relation to settlements, roads and geographic features. All maps also included a key to highlight the proposed use of different areas and the relevant aspects of the Transmission Assets' design. The materials were proportionate to the level of information and design detail at the time of consultation, reflecting the information available in the PEIR. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative</p> |

| TA_0200_008_221123          | S44     | Email           | Impact on Wildlife and Humans  | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0202_005_221123          | S44     | Email           | MitigationIf these supposed mitigation sites, go ahead we most certainly not farm, or use are land as we would like too. We love our wildlife and have all sorts of creatures upon it. We have barn owls, long eared owls, tawny owls, and bats. We have water voles, greater crested newts (in places). Deer, pink footed geese, swans, and a few years ago a puma was sited for several years in our Christmas Trees. We have lapwings, field fares, curlews and many other species. There is no reference or proposals to the type of mitigation you require! | The potential impacts of the Transmission Assets on protected species and protected habitats are considered in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES.Measures adopted as part of the Transmission Assets to mitigate potential impacts on onshore ecology and nature conservation are provided in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference: F3.3)  |
| TA_0211_004_231123          | S44     | Email           | 9 I am concerned about environmental damage to wildlife that has made its home on my land. We have a number of kestrels, lapwing, sparrowhawks and owl species. Shoveler ducks as well as various mammals, invertebrates, and Great Crested Newts. I understand that there is to be 'environmental mitigation' of the damage caused. This may involve taking additional prime agricultural land out of food production and therefore making our arming business potentially even more unviable.  | The potential impacts of the Transmission Assets on protected species and protected habitats are considered in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES.Measures adopted as part of the Transmission Assets to mitigate potential impacts on onshore ecology and nature conservation are provided in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference: F3.3).The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes the preparation of a Soil Management Plan in general accordance with the Outline Soil Management Plan (document reference: J1.7), which has been submitted with the DCO application. The measures to be implemented as part of the Soil Management Plan seek to minimise impacts on soil health and protect and maintain soil quality during construction of the Transmission Assets. These measures also comprise the preparation of a Code of Construction Practice in general accordance with the Outline Code of Construction Practice (document reference J1) submitted with the DCO application. The measures to be implemented as part of the Code of Construction Practice seek to limit disruption to the operation of individual farm holdings. |
| TA_0214_003_231123          | s44     | Email           | I object to any disturbance of local wildlife as there are clearly alternatives available which seem to be ignored due to additional costs. For example, why not continue horizontal drilling further inland? Why not use the soon to be decommissioned power station to the north as a connection point to the national grid?   | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). The potential impacts of the Transmission Assets on protected species and protected habitats are considered in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES.Measures adopted as part of the Transmission Assets to mitigate potential impacts on onshore   |

|                             |         |                 | <p>impact on the diverse wildlife and ecology within Rural Fylde and Rural Preston areas for many years to come. 2.4 The large buildings proposed to house the substation equipment require significant cooling apparatus which will be powered by natural gas which is not sustainable energy and is a huge drain on the UK's already unstable gas reserves. 2.5 35 year projects will not benefit the next generation. This is not sustainable development.</p> | <p>substation siting is made as part of the Site Selection chapter of the ES (Volume 1, chapter 4, document reference F1.4) which concluded this is the preferred route and location for the cable and the substations. Land within the Area of Separation is no longer required for the onshore substations. An assessment regarding the impact on the purposes and openness of the Green Belt, alongside a Very Special Circumstances assessment is set out within the Planning Statement (document reference J28). The Applicants consider that when assessed on the planning balance that the significant benefits of the Project mean that there are Very Special Circumstances that outweigh any potential harm to the Green Belt. The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p> |
| TA_0225_018_231123          | S44     | Email           | <p>7. Up to 50% of each substation site is earmarked for Biodiversity Net Gain (BNG). BNG should not be sourced on the most productive Fylde grassland which is Grade 2 or 3. BNG should be sourced off-site and outside Zone 1 as this whole area is productive grassland or arable land.</p>  | <p>As set out in the Onshore Biodiversity Benefit Statement (document reference J11), the Transmission Assets are not subject to a mandatory net gain requirement under the Environment Act 2021. Nevertheless, the Applicants have worked with statutory consultees to discuss the approach, and to develop the design, to allow the maximum benefit to biodiversity within the parameters of the project. For the Transmission Assets, biodiversity benefit will be delivered within identified biodiversity benefit areas within the Transmission Assets Order Limits: Onshore (referred to as the Onshore Order Limits). Further qualitative benefits to biodiversity are proposed via potential collaboration with stakeholders and local groups, contributing to existing plans and programmes, both within and outside the Onshore Order Limits. Further details of the approach to biodiversity benefit are provided in the Onshore Biodiversity Benefit Statement (document reference J11). The calculation undertaken for the Onshore Biodiversity Benefit Statement (document reference J11) utilises the latest biodiversity metric published by Defra (4.0).</p>   |

An assessment regarding the impact on the purposes and openness of the Green Belt, alongside a Very Special Circumstances assessment is set out within the Planning Statement (document reference J28). The Applicants consider that when assessed on the planning balance that the significant benefits of the Project mean that there are Very Special Circumstances that outweigh any potential harm to the Green Belt. The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |
| TA_0210_009_231123          | S44     | Email           | Morecambe substation Option 2 siting is approx. 800m from Newton Marsh SSSI. This should not be allowable given the permanent disturbance to rare ground nesting birds during construction and operation of a substation.  | Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) has been prepared and will be submitted as part of the application for development consent. The impact on the SSSIs has been provided in section 3.1.2 and section 3.11.3 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). An assessment of the impacts and effects of the Transmission Assets has been undertaken within the ES, including the following with reference to ornithology:- Volume 2, Chapter 5: Offshore ornithology of the ES (document reference F2.5)- Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).   |

|                             |         |                 |   | Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0235_011_231123          | S44     | Email           | Proposed Substation Footprints The proposed footprints of the Morgan and Morecambe permanent substation sites are approximately 30 acres and 18 acres respectively. These site areas are taken up by approximately 50% BNG (Biodiversity Net Gain). This information was provided by a Flotation Energy engineer. This is wholly unacceptable as in providing on-site BNG purely for financial savings has narrowed the substations site selection process to one only option for Morgan and two only options for Morecambe. It is clear that had the substation sites design concentrated on that area which was wholly necessary to transmission, ie approx. 15 acres for Morgan and 9 acres for Morecambe then suitable substation site locations could have been expanded to present more options and allowed for flexibility during this consultation process. | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). As set out in the Onshore Biodiversity Benefit Statement (document reference J11), the Transmission Assets are not subject to a mandatory net gain requirement under the Environment Act 2021. Nevertheless, the Applicants have worked with statutory consultees to discuss the approach, and to develop the design, to allow the maximum benefit to biodiversity within the parameters of the project. For the Transmission Assets, biodiversity benefit will be delivered within identified biodiversity benefit areas within the Transmission Assets Order Limits: Onshore (referred to as the Onshore Order Limits). Further qualitative benefits to biodiversity are proposed via potential collaboration with stakeholders and local groups, contributing to existing plans and programmes, both within and outside the Onshore Order Limits. Further details of the approach to biodiversity benefit are provided in the Onshore Biodiversity Benefit Statement (document reference J11). The calculation undertaken for the Onshore Biodiversity Benefit Statement (document reference J11) utilises the latest biodiversity metric published by Defra (4.0). |
| TA_0236_001_231123          | S44     | Email           | I writing to state my strong objection to the current proposals being put forward regarding the Morecambe and Morgan wind farm. Firstly I want to state I am in-favour of the wind farms and the generation of greener electric. However I believe the current cable route and proposed substation locations will have a grossly negative impact on rural Fylde's residents, ecology and farming businesses for generations to come.  | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0237_001_231123          | S44     | Email           | As a resident of REDACTED I am writing to object to your proposal due to you not giving enough information. This area is semi-rural and I am concerned what impact this will have on the wildlife. I also have concerns how the work will affect my property/home. The delays that will be caused whilst work carried out along queensway, and the length of time these delays will be.   | The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and,   |

|                             |         |                 |  | <p>where appropriate, made strong use of images and graphics (as noted in the SoCC). The Applicants provided maps as part of the consultation materials that clearly set out the elements of the Transmission Assets in relation to settlements, roads and geographic features. All maps also included a key to highlight the proposed use of different areas and the relevant aspects of the Transmission Assets' design. The materials were proportionate to the level of information and design detail at the time of consultation, reflecting the information available in the PEIR. The potential impacts of the Transmission Assets on protected species and protected habitats are considered in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on onshore ecology and nature conservation are provided in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference: F3.3). Traffic and transport impacts arising during the construction phase of the Transmission Assets have been fully assessed at section 7.11 Volume 3, Chapter 7: Traffic and transport of the ES (document reference E3.7) with measures to control impacts set out in the Outline Construction Traffic Management Plan (document reference J8). Details of the operation and maintenance phases are set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Onshore maintenance would be limited to essential maintenance and/or emergency works. Details of the construction phase are set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Measures to control construction impacts on the environment and the local community are set out in the Outline Code of Construction Practice (document reference J1).</p> |
| TA_0239_001_231123          | S44     | Email           | <p>I too would like to use the opportunity during this public consultation period, to unequivocally Object to your proposals and express my concerns over the proposed offshore Wind Farm cable routing and substation locations within the fylde coast. I believe this would have a grossly negative impact on the Environment both physically, via the works proposed and Visually, damaging an untold amount of wildlife habitat and green belt protected land, conservation area's, highly productive farmland and have a hugely detrimental impact on the wider community and local economy, putting local business, landowners and Farmers out of business. I believe it would create an untold amount of suffering for residents within the fylde coast for years to come via flooding and disruption i.e. traffic. Your lack of detail on some of the proposed cable routes and sub stations at this late stage and at this public consultation point in proceedings, is highly worrying as this shows either an unprofessional approach to the matter, or highly unprepared, or at worst, both. It is most concerning that at this late stage we are asked to submit our opinions on a body of work that is neither complete nor suggest the possible outcomes thereafter the point of consultation. I feel that you have shown disregard to the community of the fylde coast in your methods up to now. This lack of transparency on your part, sets a precedent when approaching future issues and has created a level of mistrust that is beyond repair. This is another reason why I must wholeheartedly Object on all parts of your proposals.</p> | <p>The Applicants are committed to robust and transparent public consultation as part of the development process. The Transmission Assets has undertaken three rounds of consultation with the local community, including two non-statutory periods of consultation (2 November to 13 December 2022 and 19 April to 4 June 2023) and a statutory consultation (12 October to 23 November 2023). Statutory targeted consultations have also taken place (November 2023 to October 2024). The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the SoCC). The Applicants are committed to working with local communities that may be impacted by the Transmission Assets. As the proposals develop further, any ideas for potential community benefits are appreciated. We will continue our engagement with the relevant communities in due course. The Applicants provided maps as part of the consultation materials that clearly set out the elements of the Transmission Assets in relation to settlements, roads and geographic features. All maps also included a key to highlight the proposed use of different areas and the relevant aspects of the Transmission Assets' design. The materials were proportionate to the level of</p>  |

## E1.16.19 Onshore and intertidal ornithology table of responses

## **E1.16.19.1 Onshore and intertidal ornithology table of responses (via feedback form)**

**Table E1.16.19.1: Onshore and intertidal ornithology responses (feedback form)**

As set out in section 4.7.4 of the Consultation report (document reference E1). Responses have been allocated to the most appropriate topic(s). If a consultee didn't provide a response for a question/sub-question this is not recorded. If a consultee included 'N/A', 'none', 'no comment', 'Nil', 'No', in response to a question, this has also not been recorded. Where a consultee provided a response associated with this sub-question (3.4; Onshore and intertidal ornithology) but was not related to this topic, this has been included below, as well as against any other appropriate topic(s). Where a consultee provided a response which stated 'see response above' or similar, the response has been replicated in brackets and italics.

| Unique Reference Identifier | S42/S44 | Feedback method      | Feedback form question | Feedback form sub - question | Statutory consultation response received  | Applicants' response   |
|-----------------------------|---------|----------------------|------------------------|------------------------------|---|--|
| TA_0050_008_231123          | S42     | Online feedback form | 5                      |                              | Seem to want to take up a large part of the coastline which forms soft defences and SSSI and RAMSAR sites which been heavily invested in over the years.  | An assessment of the potential impact on key receptors, including qualifying features of the SPAs (e.g. Ribble and Alt Estuaries SPA) as identified in section 4.6.2, is presented within section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).<br>Details on the potential impacts on European sites from the Transmission Assets are contained within the ISAA (document reference E2.1, 2.2, 2.3).   |
| TA_0051_004_211123          | S44     | Online feedback form | 3                      | 3.4                          | The line of established trees and wooded areas bordering the land to the rear of properties on REDACTED is a natural habitat for hundreds of animals, birds and wildlife. There can be no justification for removal of this wooded corridor, which has been in place for years, and is a natural aid to the drainage of land which has an already high water table. | Habitats within the Transmission Assets Order Limits have been subject to habitat surveys, where access has been possible. This is reported in section 3.6 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Where there are impacts in relation to birds, these are set out in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).  |
| TA_0053_003_171123          | S44     | Online feedback form | 1                      | 1.5                          | Will lose migrating birds visiting my land annually   | An assessment of the impacts and effects of the Transmission Assets has been undertaken within the ES, including the following with reference to ornithology:<br>- Volume 2, Chapter 5: Offshore ornithology of the ES (document reference F2.5)<br>- Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).   |
| TA_0056_016_141123          | S44     | Online feedback form | 3                      | 3.4                          | As previously stated<br><i>("This I feel is deliberately written in such language that the regular lay person cannot possibly understand what it means. Until its explained in plain English, I will object about it. I cannot aggressive to what I don't fully understand may or may not affect me and my property.")</i>  | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. In order to ensure the consultation information was available to as many people as possible, many different methods were used, including but not limited to a website, newsletter, postcards, consultation brochure, deposit locations, webinar and in-person events (a full list of materials produced for the consultation can be found in the Consultation Report (document reference E1). The Applicants aimed to ensure that it was clear how people could have their say, but also how to get in touch with the Transmission Assets team to find out more information.<br>The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the Statement of Community Consultation). |
| TA_0060_010_151123          | S44     | Online feedback form | 3                      | 3.8                          | Drilling and other work noise will not only affect residents but also the wildlife birds and sea life.  | An assessment of noise and vibration impacts during the construction and decommissioning phases of the Transmission Assets is presented in Volume 3, Annex 8.2: Construction Noise and Vibration of the ES (document reference F3.8.2). This includes an assessment of all construction activities required, as well as noise impacts due to construction traffic on the local highway network.<br>An assessment of the impact and effects on affected receptors has been  |

|-----------------------------|---------|----------------------|------------------------|------------------------------|--|---|
|                             |         |                      |                        |                              |  | carried out. Mitigation measures committed to by the Transmission Assets are outlined within the ES and the project Onshore Biodiversity Benefit Statement (document reference: J11), Marine Enhancement Statement (document reference: J12) submitted with the application for development consent. The views and feedback of statutory and non-statutory consultees has been sought throughout the environmental impact assessment process.   |
| TA_0083_011_221123          | S44     | Online feedback form | 3                      | 3.4                          | I do not agree to planning permission I do not want project to go ahead  | The Applicants note your response.  |
| TA_0092__021_151123         | S44     | Online feedback form | 3                      | 3.4                          | This is important to preserve in this area and particularly across the Fylde Coast   | The ES includes an assessment of the Transmission Assets alone in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).<br>Details on the impacts on European sites from the Transmission Assets are contained within the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3).<br>Both the ES and the ISAA consider construction impacts, including impacts on functionally linked land.   |
| TA_0096_001_131123          | S44     | Online feedback form | 1                      |                              | I object on the basis of local children growing up with Electromagnetic Radiation all around them, the buzzing noise from the electricity which they will hear more than us and the noise of the construction and the destruction of our peace and quiet. It will be a total eyesore. The value of our houses will plummet. We could easily become a target for a terrorist attack, and so close to the village will be lethal. Also, if you pave 36 acres of good farmland (which can grow crops), you destroy our food security. In addition the Fylde is very flat, so the flooding, which is already bad, will get worse as the runoff from tarmac is far faster than the soil and plants that absorb the rain and take up the moisture in their roots. In the projected area there are endangered and protected species such as bats redshanks, oystercatchers, great crested newts and owls (Tawney and Barn Owls) and buzzards, kestrels, long tailed tits, bar tailed godwits amongst many others. The consultation has not explained to us what we will actually see and experience as residents situated closest to the monstrous constructions being proposed | <p>The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). Visualisations have been presented as part of the landscape and visual assessment within Volume 3, Figure 10.5 (Parts 1-5) (document reference F3.12, Part 3).</p> <p>Electro-magnetic fields (EMFs) are part of the natural world, and are also produced wherever electricity is generated, transmitted or used.</p> <p>With regard to EMF impacts, the project will adopt the International Commission on Non-ionizing Radiation Protection (ICNIRP) guidelines and Government voluntary Code of Practice on EMF public exposure. Such considerations are inherent to the detailed engineering considerations of cable specification and routing. Relevant public EMF exposure guideline limits are noted in NPS EN-5 and would be complied with by the project. These guidelines are long standing and have a high safety margin. The levels of exposure that they require would not pose a risk to public health. Volume 1, Annex 5.1 (document reference F1.5.1) has had regard to the risk perceptions associated with EMFs of the Transmission Assets on the local area and this is presented in section 1.11.9 of the Annex.</p> <p>See also the submitted EMF Compliance Statement (Volume 1, Annex 3.4 of the ES, document reference E1.3.4).</p> |

| TA_0001_188_231123          | S42     | Email           | 6.2 One of the main justifications of having less significant impact on ecological receptors is the use of HDD or alternative trenchless techniques. However, no evidence is provided within the report as to why this approach is less intrusive and will have less impact. Further evidence should be provided regarding this approach, to set out why using these techniques will have less of impact including description, predicted noise levels, operation and methodology.  | Direct pipe trenchless installation is proposed beneath the sand dunes. This technology will ensure there is no open trenching through the dunes. This will avoid any direct loss of vegetation and habitats. Instead, the drill will pass beneath the dunes at depth. Where necessary consideration of any indirect effects on the habitat and measures to avoid, minimise or mitigate these is provided in section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Direct pipe or microtunnelling is proposed beneath the River Ribble to ensure that there would be no direct impacts on the river habitats. As set out in Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3), The risk of bentonite breakout will be controlled through the bentonite breakout plan. An Outline Bentonite Breakout Plan (document reference J1.13) is provided as an annex to the Code of Construction Practice (CoCP) (document reference J1). Crossing techniques are set out within Volume 1, Annex 3.2: Onshore Crossing Schedule of the ES (document reference F1.3.2) which is submitted as part of the application for development consent. Further information on the proposed approach to construction is provided in Volume 1, Chapter 3: Project description of the ES. |
| TA_0001_191_231123          | S42     | Email           | 6.5 There is a lack of assessment on impacts to SSSIs. The documents only seem to assess impacts on notified bird species in SSSIs not other notified features such as various habitats. An assessment is required for all SSSIs, including all direct and indirect impacts on notified features.   | The impact on SSSIs (designated for reasons other than ornithological interest) has been provided in section 3.11.2 and 3.11.3 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Features of internationally and nationally designated sites were considered when identifying the list of Important Ecological Features listed in section 4.6.6 of Volume 3 Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). The potential for impacts from the Transmission Assets has been assessed in section 4.11 of that chapter.   |
| TA_0001_192_231123          | S42     | Email           | 6.6 No detail has been provided for what is happening at the Fairhaven site. From aerial photos, this area appears to be coastal habitats with dunes and saltmarsh (although not designated, this would still be a Priority Habitat). Part of this area falls within the geological site – Lytham Coastal Changes SSSI. Please provide further detail for this area in the submitted ES.  | The referenced site is proposed for ornithological mitigation – details are provided in Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4) and the Outline Ecological Management Plan (document reference J6). Any impacts on designated geological sites are set out in Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F3.1) sets out details of ground conditions.  |
| TA_0001_193_231123          | S42     | Email           | 6.7 As the proposed installation method for to avoid Lytham St. Anne's SSSI is HDD, it is felt that the developer has not fully considered the Maximum Design Scenario (MDS) for this designated site. Please see comment 6.12 for further detail. A full baseline assessment of Lytham St. Anne's Dunes SSSI should be undertaken, and presented within the submitted ES, so that should the worst-case scenario occur (i.e. HDD is not possible) sufficient ecological data is available to inform/ develop suitable mitigation measures. In addition, it could be used as a baseline for post-construction monitoring (and a means to determine recovery). Please see comment 6.12 for further detail. | Direct pipe trenchless installation is proposed in this location and is the basis for the assessment of impacts on dune slacks provided in section 3.11.2 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Further data on the distribution and status of SSSI interest features that is necessary to inform the ES has been obtained from existing reports prepared on behalf of Lancashire Wildlife Trust and Our Future Coasts, and project-specific national vegetation classification (NVC) surveys have been carried out to confirm or update the findings of these reports where necessary. Crossing techniques at the sand dunes at Lytham St. Anne's are presented within Volume 1, Annex 3.2: Onshore Crossing Schedule of the ES (document reference F1.3.2) which is submitted as part of the application for development consent.  |
| TA_0001_194_231123          | S42     | Email           | 6.8 There is a lack of consideration of other impacts to Lytham St Annes Dunes SSSI, particularly with regards to changes to the water table. Please see comment 6.27 for further detail. Consider changes to the water table at Lytham St Annes Dunes SSSI.  | This impact is considered within section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).  |
| TA_0001_195_231123          | S42     | Email           | Project Description 6.9 The proposed development description – does not provide detail as to what is happening at Fairhaven (adjacent to RSPB Fairhaven Lakes). The area is shown on the Phase 1 Habitat Survey maps as section 9 (Figure 1.3I - page 17 of Vol 3. Annex 3.2 Interim Phase 1 Habitat Survey Technical Report). From aerial photos, this area appears to be coastal habitats with dunes and saltmarsh (although not designated, this would be a Priority Habitat). Part of this area falls within the geological site – Lytham Coastal Changes SSSI. Provide further detail for this area in the submitted ES.   | The section of the Transmission Assets Order Limits adjacent to RSPB Fairhaven Lakes is proposed for ornithological mitigation (with no development to take place at this location). Refer to Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES for further details. Consideration of sites with a geological designation present within the study area is set out in section 1.6.2 of Volume 3, Chapter 1: Geology, hydrogeology and ground conditions of the ES (document reference F3.1) with the assessment for relevant sites, including Lytham Coastal Changes SSSI provided in section 1.11.2. It has   |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response   |
|-----------------------------|---------|-----------------|--|--|
|                             |         |                 |  | however, been concluded that there will be no impact on Lytham Coastal Changes SSSI, which lies outside the Transmission Assets Order Limits.  |
| TA_0001_197_231123          | S42     | Email           | 6.11 5.4.6 This section sets out the mitigation hierarchy. However, from the measures listed that will be implemented, it's not clear if the full hierarchy is being followed i.e - avoid, minimise, rectify, reduce and off-set. Provide clarification on how the measures adopted will follow the full mitigation hierarchy. In this section, there seems to be a lot of discussion around reducing, off- setting or enhancing but there's not much focus on avoidance or rectifying. Natural England advises that the developer should follow the mitigation hierarchy table and set out how they will avoid and minimise in first instance in their approach.  | The approach to site selection has been based on avoiding damage to Important Ecological Features where practicable, as is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4). In addition, during an iterative process of EIA, locations where trenchless techniques will be used to avoid impacts on IEFs. have been identified. Where temporary habitat loss is unavoidable, such as where construction accesses need to cross hedges, this will be rectified by reinstating habitats in accordance with the specifications provided in the Ecological Management Plan. An Outline Ecological Management Plan (document reference J6) is provided as part of the application for development consent.   |
| TA_0001_198_231123          | S42     | Email           | Natural England's Position on Worst Case Scenario or Scenarios 6.12 Vol3; Chp 3 Table 3.11, Table 3:15 The developer recognises Lytham St. Anne's Dunes as a SSSI (Table 3.11) and it has been taken forward as an Important Ecological Feature (Table 3.15). However, as the proposed installation method is HDD it is felt the developer has not fully considered the MDS (Table 3.16) for this designated site. The current assessment for Lytham St. Anne's Dunes SSSI (para 3.9.2.8 - 3.9.2.11) notes "During construction the Transmission Assets will commit to avoiding impacts on the Lytham St Annes Dunes SSSI, as the cables will be installed beneath this habitat via HDD (or other trenchless techniques) and open trenching techniques would not be used within this habitat. Accordingly, there will be no temporary or permanent loss of this habitat type. The magnitude of impact is therefore, considered to be no change." The developer goes on to note that while the sensitivity of the habitat is High, the significance of effect is no effect. However, from experience of similar projects Natural England know that on occasions HDD can fail, or the proposed development design changes and for example Transition Joint Bays need to be moved (which presumably currently will be situated on the beach)/ or additional vehicle access is required. In such scenarios by excluding any effect early in the assessment process there is a lack of detail later on if the installation methods change. Similarly full consideration of impacts should HDD not be undertaken in saltmarsh along the river Ribble (part of the Ribble Estuary SSSI). A full baseline assessment of Lytham St. Anne's Dunes SSSI should be undertaken so that should the worst-case scenario occur (i.e. HDD is not possible) sufficient ecological data is available to inform/ develop suitable mitigation measures. In addition, it could be used as a baseline for post-construction monitoring (and a means to determine recovery). Baseline surveys of Lytham St Annes Dunes SSSI should include mapping to NVC level of the dune habitats present, with supporting quadrat sampling. Quadrat sampling should be sufficient in coverage to ensure all community types are sampled. The SSSI citation notes that the site support classic features of dune formation and ecological succession including the widest range of foredune, yellow dune, dune grassland, acid dune grassland, dune scrub and dune slack habitats found anywhere along the Fylde Coast. The site is botanically diverse with a number of rare or scarce plant species. Use of up-to-date aerial photography taken at the time of the NVC survey would be preferable. The developer should undertake a cable burial risk assessment for all the HDD work (including Lytham St. Anne's Dunes SSSI and the River Ribble (part of the Ribble Estuary SSSI) informed by geotechnical investigations. This should include an outline burial cable specification and installation plan which has a pollution* and contingency plan. This would help determine the likelihood (degree of confidence) of success of HDD at the given locations. *Note a Bentonite breakout plan is mentioned for the River Ribble but not for Lytham St. Annes Dunes | Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) assesses the impacts on Lytham St. Anne's Dunes SSSI. Direct pipe trenchless installation is proposed in this location as it's the most appropriate for use in sensitive settings, in part because it reduces the likelihood of collapse that is associated with cable installation using horizontal directional drilling (HDD). The Works Plans submitted with the application for development consent (and accompanying description) allow only for direct pipe in this location. Therefore, the MDS that has been used is considered to be correct. Further data on the distribution and status of SSSI interest features that is necessary to inform the ES has been obtained from existing reports prepared on behalf of Lancashire Wildlife Trust and Our Future Coasts, and NVC surveys have been carried out to confirm or update the findings of these reports where necessary. CoT41 states that where the onshore export cable corridor or 400 kV grid connection cable corridor crosses sites of particular sensitivity, including Lytham St Annes Dunes SSSI, a hydrogeological risk assessment will be undertaken to inform a site-specific crossing method statement which will also be agreed with the relevant authorities prior to construction. The risk of bentonite breakout at Lytham St Annes Dunes SSSI will be controlled through the bentonite breakout plan. An Outline Bentonite Breakout Plan (document reference J1.13) is provided as an annex to the Code of Construction Practice (CoCP) (document reference J1). |
| TA_0001_200_231123          | S42     | Email           | 6.14 Table 3:10 Morecambe Bay and Duddon Estuary SPA is missing from the designated site list.<br>Only Morecambe Bay SAC and Ramsar are mentioned. It also does not list the Ramsar qualifying features in the relevant qualifying interest section.<br>Note for correction.   | Information on designated sites for which birds are a reason for designation is provided in Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). Further assessment of internationally designated sites is provided in the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3).  |

| TA_0001_201_231123          | S42     | Email           | 6.15 Table 3:10 For national sites, it mentions Martin Mere, Burscough SSSI – this SSSI is also underpinned by an SPA – Martin Mere SPA which is not included in list. Note for correction.   | Information on designated sites for which birds are a reason for designation is provided in Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). Further assessment of internationally designated sites is provided in the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3).   |
| TA_0001_202_231123          | S42     | Email           | 6.16 Table 3:15 The description for Lytham Moss BHS is wrong – It is not also known as the Queensway Farmland Conservation Area (FCA). The FCA is a specific area within the BHS site which is managed for qualifying bird species as mitigation provided within a planning application, the BHS itself is separate. The BHS site (which has a wider boundary) is a designated by Lancashire County Council using a set of published guidelines. This needs to be updated, the document needs to clearly set out the correct information for Lytham Moss BHS, its correct boundaries and why it has been designated a Biological Heritage Site. The FCA should be defined with information on its purpose. It is specific mitigation land for qualifying bird species and managed as such. It is also secured under Section 106 agreement between developer and Fylde BC.                       | The Applicants note your response. All relevant BHSs are considered within Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).   |
| TA_0001_203_231123          | S42     | Email           | 6.17 N/A –General Comment One of main justification of having less significant impact on ecological receptors is the use of HDD or alternative trenchless techniques, however no evidence is provided within the report why this approach is less intrusive and will have less impact. Further evidence should be provided regarding this approach, to set out why using these techniques will have less of impact including description, predicted noise levels, operation, and methodology. The developer should link to any evidence to support the justification it will be less intrusive and limit impacts on ecological receptors.   | This impact is considered within Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES. Direct pipe trenchless installation is proposed beneath the sand dunes. This technology will ensure there is no open trenching through the dunes. This will avoid any direct loss of vegetation and habitats. Instead, the drill will pass beneath the dunes at depth. Where necessary consideration of any indirect effects on the habitat and measures to avoid, minimise or mitigate these is provided in section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES. Direct pipe or microtunnelling is proposed beneath the River Ribble to ensure that there would be no direct impacts on the river habitats. The risk of bentonite breakout will be controlled through the bentonite breakout plan. An Outline Bentonite Breakout Plan (document reference J1.13) is provided as an annex to the Code of Construction Practice (CoCP) (document reference J1). Crossing techniques are set out within Volume 1, Annex 3.2: Onshore Crossing Schedule of the ES (document reference F1.3.2) which is submitted as part of the application for development consent. |
| TA_0001_204_231123          | S42     | Email           | 6.18 Table 3.18 As well as BNG Metric 4 calculator, there are other tools that can be used to identify opportunities to enhance wider benefits from nature. Advise that as well as Metric, Natural England's Environmental Benefits from Nature tool may be used to identify opportunities to enhance wider benefits from nature and to avoid and minimise any negative impacts. It is designed to work alongside the Biodiversity Metric and is available as a beta test version.  | The calculation undertaken for the Onshore Biodiversity Benefit Statement (document reference J11) utilises the latest biodiversity metric published by Defra (4.0).  |
| TA_0001_206_231123          | S42     | Email           | 6.20 N/A –General Comment This chapter does not account for impacts of ecological receptors providing habitat to supporting bird species. It is acknowledged that a specific chapter has been dedicated to impacts to onshore birds, ecological receptors assessed in this chapter play a supporting role in supporting qualifying and other significant important bird species. Therefore, the role and value that these habitats have in terms of providing supporting habitat to important bird species needs to be assessed here. The role and value that certain habitats have in terms of providing supporting habitat to important bird species needs to be assessed within the ecological chapters. This is important to consider in line with the overall function and value of these supporting habitats, especially in relation to saltmarsh, FLL habitat, and the Lytham Moss area. | Any areas of terrestrial habitat of importance for birds, including waders and waterbirds, are discussed in Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). This includes discussion of the presence of functionally linked land within the Onshore Order Limits and the potential for adverse effects from the loss and disturbance of this habitat.  |
| TA_0001_216_231123          | S42     | Email           | 7.1 The presented information within the PEIR is incomplete and there are further surveys to be reported. Currently, Natural England disagree that the survey effort is sufficient to rely on 1% rule of thumb as a screening tool. As well as numbers, the frequency of, or period of occupancy is important. The survey areas presented here require further explanation as to why the core survey area was selected as a subset of the red line boundary. Without sufficient reasoning for this, further survey coverage is needed. Provide a full assessment with all complete surveys in the submitted ES. This is particularly important in terms of presenting a minimum of two survey seasons. Provide an updated survey effort along with  | Additional surveys have been completed and reported within the ES. The 1% screening tool has not been used for ES purposes. The survey coverage is reported within Volume 3, Annex 4.1: Breeding birds technical report of the ES (document reference F3.4.1), Volume 3, Annex 4.2: Wintering and migratory birds technical report of the ES (document reference F3.4.2) and Volume 3, Annex 4.3: Intertidal birds technical report of the ES (document reference F3.4.3) and is considered sufficiently robust to fully characterise the baseline used in this assessment.   |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response  |
|-----------------------------|---------|-----------------|--|---|
|                             |         |                 | full survey coverage and data analysis in the submitted ES in order to justify using the 1% rule of thumb as a screening tool. Without this, Natural England do not agree with its use.  |   |
| TA_0001_217_231123          | S42     | Email           | 7.2 It is not clear why the core survey area was selected as a subset of the red line boundary. This is not appropriate unless the developer is committed to avoiding impacts outside this zone. The submitted ES should provide further justification on why the core survey area only covers a subset of the red line boundary.  | Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4) and its supporting annexes set out details of the survey coverage in relation to the Onshore Order Limits and Intertidal Infrastructure Area. The survey coverage is reported within Volume 3, Annex 4.1: Breeding birds technical report of the ES (document reference F3.4.1), Volume 3, Annex 4.2: Wintering and migratory birds technical report of the ES (document reference F3.4.2) and Volume 3, Annex 4.3: Intertidal birds technical report of the ES (document reference F3.4.3) and is considered sufficiently robust to fully characterise the baseline used in this assessment. |
| TA_0001_218_231123          | S42     | Email           | 7.3 Due to the shortcomings in the surveys and assessments, Natural England are not able to rule out adverse effect on the integrity of the Ribble and Alt Estuaries SPA and Ramsar site. For further details on this, please see comments 7.24 and 7.35. The submitted ES should provide further robust evidence to support this conclusion or apply the mitigation hierarchy to ensure adverse effects cannot arise.   | Additional surveys have been completed and reported within the ES. An assessment of the potential impact on key receptors, including qualifying features of the SPA and Ramsar site, as identified in section 4.6.2, is presented within section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). Details on the impacts on European sites from the Transmission Assets are contained within the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3). No adverse effects on integrity are predicted.  |
| TA_0001_219_231123          | S42     | Email           | 7.4 A key part of the HRA assessment is correctly identifying SPA/Ramsar site features as breeding, non-breeding, and assemblage features. With SPA/ Ramsar sites, correctly identify features as breeding, non-breeding and assemblage features throughout the submitted ES.  | Additional surveys have been completed and reported within the ES. An assessment of the potential impact on key receptors, including qualifying features of the SPA and Ramsar site, as identified in section 4.6.2, is presented within section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). Details on the impacts on European sites from the Transmission Assets are contained within the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3). No adverse effects on integrity are predicted.  |
| TA_0001_220_231123          | S42     | Email           | 7.5 Natural England do not consider that a 'whole project alone' assessment has been undertaken for the Ribble and Alt Estuaries SPA. For further detail, please see comment 7.46. The submitted ES should contain a 'whole project alone' assessment so the totality of potential impacts on the SPA (and other receptors where relevant) are properly quantified and appropriate mitigation put in place where needed. In particular, the assessment should fully consider how the construction pressures impact both the SPA itself and its functionally linked land.               | The ES includes an assessment of the Transmission Assets alone in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4) and in Volume 2, Chapter 5: Offshore ornithology of the ES (document reference F2.5). Details on the impacts on European sites from the Transmission Assets are contained within the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3). Both the ES and the ISAA consider construction impacts, including impacts on functionally linked land.  |
| TA_0001_221_231123          | S42     | Email           | 7.6 Part of the justification for no adverse impacts on onshore birds is that the cable route will not pass through significant Functionally Linked Land habitat (Lytham Moss BHS). This is not accurate as the final decision of which cable route to use has not been finalised and Option 2 will pass through this habitat. This justification can only be applied once the final decision has been made regarding the cable route. Natural England advises that route Option 1 is chosen to avoid FLL habitat.   | The cable route proposed as part of the application aims to avoid as much of this sensitive area as possible. This has been considered as part of the iterative site selection process, together with design and engineering constraints. Full details of Transmission Assets Order Limits can be found in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). An assessment of effects in relation to birds, including consideration of functionally linked land, is provided in Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).  |
| TA_0001_222_231123          | S42     | Email           | 7.7 The developer has concluded no adverse effects for impacts via heavy machinery/people to disturbance of qualifying bird species for Liverpool Bay, Ribble & Alt and Morecambe Bay. The assessment has not accounted for visual & noise disturbance for qualifying bird species utilising surrounding area which has potential to be disturbed. Natural England do not concur with these conclusions. These impacts need to be included within the assessment in order to ensure the robustness of the HRA, and determine the scope of any required additional mitigation measures. | The section of the Transmission Assets Order Limits adjacent to RSPB Fairhaven Lakes is proposed for ornithological mitigation (with no development to take place at this location). Refer to Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES for further details. The findings of the HRA process are set out in the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3).  |
| TA_0001_223_231123          | S42     | Email           | Survey Data Acquisition 7.8 Vol 3, Annex 4.1 1.3.1.6 (Table 5) Newton Marsh SSSI (which lies within the red line and adjacent to the core survey area) has a breeding bird assemblage interest feature. This has not been included in the report. Include Newton Marsh SSSI with the breeding bird assemblage feature wherever appropriate in the submitted ES.  | Features of designated sites, including Newton Marsh SSSI, are identified in section 4.6.6 and the potential for impacts from the Transmission Assets has been assessed in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).   |

| TA_0001_243_231123          | S42     | Email           | 7.28 1.11.3.3 and 1.11.3.87 Natural England note the lengthy 77 month (6yr) risk period. This is noted as lengthy as it has implications for the duration of disturbance effects on SPA waterbirds.n/a  | The Applicants note your response. Updated details regarding construction periods are provided in Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).  |
| TA_0001_244_231123          | S42     | Email           | 7.29 1.11.3.31 Part of reasoning for justification for no adverse and loss of habitat for onshore cable corridor is that route will not pass through the area around Lytham Moss. This cannot be justified at this stage as the final route has not been decided. The submitted documents presents two options where option one will avoid this area but option two will not. As the final phase of cable route has not been decided, the reasoning here cannot be applied until the final route is decided.<br>This justification can only be applied once the final decision has been made regarding the cable route. Natural England advises the developer to go with route option 1. Option 1 will have the least ecological impact as it will stay closest towards the current developed areas, without going through significant FLL, and is also the option that will go through the least peat habitat. | The cable route proposed as part of the application aims to avoid as much of this sensitive area as possible. This has been considered as part of the iterative site selection process, together with design and engineering constraints. Full details of Transmission Assets Order Limits can be found in Volume 1, Chapter 3: Project description of the ES (document reference F1.3).<br><br>An assessment of effects in relation to birds, including consideration of functionally linked land, is provided in Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). |
| TA_0001_245_231123          | S42     | Email           | 7.30 1.11.3.177 See comments above regarding cable route – cannot be used as justification.<br>See above.   | The Applicants note your response.  |
| TA_0001_246_231123          | S42     | Email           | 7.3 11.11.3.127 Natural England do not agree with the conclusion of no adverse impacts for the Ribble & Alt Estuaries. Whilst assessment has discussed loss of habitat, and recorded bird distance from habitat it has not assessed noise and visual impacts, these impact pathways can have impacts on species that are not in immediate area but are present in the surrounding areas. No detailed information, such as predicted noise levels, has been provided so at this stage adverse impacts cannot be ruled out See above.   | An assessment of the potential impact on key receptors, including qualifying features of the SPA and Ramsar site, as identified in section 4.6.2, is presented within section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). Details on the impacts on European sites from the Transmission Assets are contained within the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3). No adverse effects on integrity are predicted.   |
| TA_0001_247_231123          | S42     | Email           | 7.3 21.11.3.146 See comments above. It is a similar issue with noise and visual impacts not being fully considered for Morecambe Bay and Duddon Estuaries SPA. This should include assessment for qualifying species utilising area outside and surrounding the corridor such as Golden Plover. For example, section 1.11.3.134 states there will be no impacts from presence of people/machinery on lapwing as the closest significant number was recorded 100m away from proposed corridor. Natural England would advise these still have the potential to be impacted through noise and visual disturbance. Natural England consider any FLL within 200m to be potentially impacted and therefore further evidence is required to demonstrate if certain bird features will be impacted or not.  | An assessment of the potential impact on key receptors, including qualifying features of the SPA and Ramsar site, as identified in section 4.6.2, is presented within section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). Details on the impacts on European sites from the Transmission Assets are contained within the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3). No adverse effects on integrity are predicted.   |
| TA_0001_248_231123          | S42     | Email           | 7.33 1.11.3.149<br>See comments above – same advice applies to Morecambe Bay Ramsar as it does for Morecambe Bay and Duddon Estuaries<br>See above.   | An assessment of the potential impact on key receptors, including qualifying features of the SPA and Ramsar site, as identified in section 4.6.2, is presented within section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).<br>Details on the impacts on European sites from the Transmission Assets are contained within the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3). |                             |         |                 | not clear where it is in relation to environmental receptors. The submitted ES should provide more specific detail for the location of the onshore substation in order to fully assess the impact of habitat loss or disturbance.  | been taken into account in the updated assessment provided in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).  |
| TA_0001_250_231123          | S42     | Email           | 7.35 Table 1.374<br>Natural England notes that impacts from the cable installation will be for 66 months (5yr 6mths) but it is not quantified in the HRA where or when the risk will be, or the likely plant used to assess risks.<br>In the updated assessment, specify where and when the potential impacts risks (to ornithological features) will occur during the cable installation phase. The likely plant used in these assessments should also be outlined.   | The assessment of the effects due to disturbance and displacement from the presence of vehicles and/or heavy machinery associated with construction, operation and maintenance, and decommissioning activities is presented within section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).   |
| TA_0001_251_231123          | S42     | Email           | 7.3 61.11.3.8 It is not possible to meaningfully assess risks without a provisional alignment. Natural England notes that some areas within the development redline boundary have not been surveyed for ornithological risks, and it is not clear if they are in the red line boundary because they are identified as a potential impact site or a possible mitigation or Net Gain area.n/a  | The design has been further refined since submission of the PEIR and this is reflected in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). This chapter also provides details of the areas proposed for construction and those proposed for biodiversity, mitigation and/or enhancement. This has been taken into account in the updated assessment provided in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).   |
| TA_0001_252_231123          | S42     | Email           | 7.37 1.11.3.16 Natural England disagree that the survey effort is sufficient to rely on 1% rule of thumb as a screening tool. As well as numbers, the frequency of, or period of occupancy is important.<br>See also 1.11.3.102.<br>Provide an updated survey effort along with full survey coverage and data analysis in the submitted ES in order to justify using the 1% rule of thumb as a screening tool. Without this, Natural England do not agree with its use.  | Additional surveys have been completed and reported within the ES. The 1% screening tool has not been used for ES purposes.<br>The survey coverage is reported within Volume 3, Annex 4.1: Breeding birds technical report of the ES (document reference F3.4.1), Volume 3, Annex 4.2: Wintering and migratory birds technical report of the ES (document reference F3.4.2) and Volume 3, Annex 4.3: Intertidal birds technical report of the ES (document reference F3.4.3) and is considered sufficiently robust to fully characterise the baseline used in this assessment.                |
| TA_0001_253_231123          | S42     | Email           | 7.38 1.11.3.19 This section identifies the area directly impacted but these impact timings assume instant recovery post works. It will take some time for areas to normalise after impact. The assessment of habitat impact is also spatially framed with reference to the SPA using the whole SPA as the reference measure - not the extent of the habitat affected which will be a better reference frame for species which are closely associated with the specific habitat. The submitted ES should update the impact timings to consider realistic recovery timescales. The assessment of habitat impact should also be framed with reference to the extent of the habitat that is affected, rather than the extent of the whole SPA. | The comments from Natural England are noted. The Applicants have worked to refine the project design with respect to installation of cables in the intertidal and the onshore cable route to address Section 42 comments from Natural England on potential effects on ornithological receptors. This includes further detail on the area, duration and timing of potential impacts on ornithology species and additional information and further justification to address the comments raised. These have been addressed in sections 1.5 and 1.6 of the ISAA Part 3 (document reference E2.3) |
| TA_0001_254_231123          | S42     | Email           | 7.39 1.11.3.23 The logic that impacts are unlikely to be significant because the bird species are 'long lived' has no ecological merit. The works will take a significant timeframe which will affect long lived species every bit as much as shorter lived species. With reference to table 1.377, mudflat/sandflat specialists like bar-tailed godwit, dunlin, ringed plover and sanderling are particularly at risk. The submitted ES should remove all reference to impacts being unlikely to be significant where the reasoning is that a species is 'long lived'.  | The Applicants note your response. Assessments have been amended and updated.   |
| TA_0001_255_231123          | S42     | Email           | 7.4 1.11.3.29 The assessment does not quantify what proportion of resource will be lost at any one time. The submitted ES should present the information for temporary habitat loss within the onshore export cable corridor in terms of what proportion of resources will be lost at any one time, along with the total area.   | The assessment of temporary habitat loss is included in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).  |
| TA_0001_256_231123          | S42     | Email           | 7.4 11.11.3.32 It is identified that no works are proposed in Newton Marsh SSSI, but it does not rule them out. Natural England note that the SSSI remains in the redline boundary and the disturbance zone as marked on survey maps. If works are not proposed in Newton Marsh SSSI, this should be secured as a condition in the submitted DCO/dML. As they are currently not ruled out, any assessment of features connected to Newton Marsh SSSI should consider the impacts to the SSSI and its features.   | Features of designated sites, including Newton Marsh SSSI, are identified in section 4.6.6 and the potential for impacts from the Transmission Assets has been assessed in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4) and in section 1.5 of the Information to Support Appropriate Assessment (ISAA) report.   |
| TA_0001_257_231123          | S42     | Email           | 7.42 1.11.3.24 In this section, it is stated that shelduck and black-tailed godwit can just go somewhere else. This is an unevidenced statement.   | The Applicants note your response. Assessments have been amended and updated.   |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response  |
|-----------------------------|---------|-----------------|--|---|
|                             |         |                 | The submitted ES should remove this statement, unless robust evidence is presented to suggest otherwise.   |   |
| TA_0001_258_231123          | S42     | Email           | 7.43 1.11.3.42 Natural England do not agree with the conclusion that there is no risk of an adverse effect on the integrity of the Ribble and Alt Estuaries SPA and Ramsar site as a result of temporary habitat loss/disturbance and changes in prey availability with respect to the construction and decommissioning phases of the Transmission Assets. This disagreement is based on the robustness of evidence provided. The submitted ES Provide further robust evidence to support this conclusion or apply the mitigation hierarchy to ensure adverse effects cannot arise.  | An assessment of the potential impact on key receptors, including qualifying features of the SPA and Ramsar site, as identified in section 4.6.2, is presented within section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). Details on the impacts on European sites from the Transmission Assets are contained within the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3). No adverse effects on integrity are predicted.   |
| TA_0001_259_231123          | S42     | Email           | 7.44 As a general point the separation of the impacts on the working corridor and the disturbance caused during the work period is not particularly helpful as, other than the habitat recovery time, the two pressure pathways are completely linked; and the recovery time lag is not discussed. The impacts on the working corridor and the impacts from disturbance caused during the work period should be considered together in the submitted ES as the two pressure pathways are linked. The recovery time lag should also be considered when assessing these impacts.   | The Applicants note your response.  |
| TA_0001_260_231123          | S42     | Email           | 7.45 1.11.3.84 Natural England considers the 300m disturbance zone will be reasonable for most species.<br>n/a   | The Applicants note your response.  |
| TA_0001_261_231123          | S42     | Email           | 7.46 1.11.3.85 The statement "The extent of disturbance and displacement from presence of vehicles/heavy machinery will be substantially smaller during the operation and maintenance phase when compared to the construction and decommissioning phases" has no evidence to back it up. If this statement is to be retained, the submitted ES should provide a clear rationale to detail why the disturbance caused by plant will be different during the operation and maintenance phase when compared to the construction and decommissioning phases.   | The assessment of the effects due to disturbance and displacement from the presence of vehicles and/or heavy machinery associated with construction, operation and maintenance, and decommissioning activities is presented within section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). The potential for impacts associated with cable maintenance is minimal. Details of operational activities are provided in Volume 1, Chapter 3: Project description of the ES (document reference F1.3).                                       |
| TA_0001_262_231123          | S42     | Email           | 7.47 1.11.3.89 No rationale for change in the disturbance zone from 300m to 200m with consequent reduction in area identified as being at risk– Is this indicating different plant, different activities, different screening, different species? Although the main habitat affected is agricultural Functionally Linked Land, this also overlaps the SPA wherever the corridor will cross the Ribble, so will likely also affect saltmarsh, mudflat and estuarine open water. If the 200m disturbance zone is not a typo, the submitted ES should provide a rationale for this change in disturbance zone area or revert to 300m. | Details provided in section 10.5 of Part 3 of the Information to Support Appropriate Assessment (ISAA) report.  |
| TA_0001_263_231123          | S42     | Email           | 7.48 Table 1.385 Bullet 2<br>Reference to from 'MLWS to MLWS' is presumably a typo for from 'MLWS to MHWS'<br>Correct typo.  | The Applicants note your response.  |
| TA_0001_264_231123          | S42     | Email           | 7.49 1.11.3.102 As at 1.11.3.16, Natural England disagree that the survey effort is sufficient to rely on 1% rule of thumb as a screening tool. As well as numbers, the frequency of, or period of occupancy is important. The submitted ES should provide an updated survey effort along with full survey coverage and data analysis in the ES in order to justify using the 1% rule of thumb as a screening tool. Without this, Natural England do not agree with its use.   | Additional surveys have been completed and reported within the ES. The 1% screening tool has not been used for ES purposes. The survey coverage is reported within Volume 3, Annex 4.1: Breeding birds technical report of the ES (document reference F3.4.1), Volume 3, Annex 4.2: Wintering and migratory birds technical report of the ES (document reference F3.4.2) and Volume 3, Annex 4.3: Intertidal birds technical report of the ES (document reference F3.4.3) and is considered sufficiently robust to fully characterise the baseline used in this assessment.                   |
| TA_0001_265_231123          | S42     | Email           | 7.5 1.11.3.105 While SPA loss maybe 1.56% loss during works, the proportional loss of the specific foraging habitat will be much higher.<br>The submitted ES should present this percentage loss in terms of loss of specific foraging habitat rather than the percentage of the whole SPA. This will likely result in a higher proportional loss of the specific foraging habitat.  | The comments from Natural England are noted. The Applicants have worked to refine the project design with respect to installation of cables in the intertidal and the onshore cable route to address Section 42 comments from Natural England on potential effects on ornithological receptors. This includes further detail on the area, duration and timing of potential impacts on ornithology species and additional information and further justification to address the comments raised. These have been addressed in sections 1.5 and 1.6 of the ISAA Part 3 (document reference E2.3) |

| TA_0001_267_231123          | S42     | Email           | 7.52 1.11.3.109 Loss of a potentially significant area of key habitat for half a winter period cannot be described as not significant without some evidence base. The submitted ES should provide a referenced evidence base to back this statement up or the assessment revised accordingly.  | The comments from Natural England are noted. The Applicants have worked to refine the project design with respect to installation of cables in the intertidal and the onshore cable route to address Section 42 comments from Natural England on potential effects on ornithological receptors. This includes further detail on the area, duration and timing of potential impacts on ornithology species and additional information and further justification to address the comments raised. These have been addressed in sections 1.5 and 1.6 of the ISAA Part 3 (document reference E2.3) |
| TA_0001_268_231123          | S42     | Email           | 7.53 1.11.3.108 As comment on for 1.1.3.32. Although not anticipated at the current time the area remains in the red line boundary so cannot be excluded. If works are not proposed in Newton Marsh SSSI, this should be secured as a condition. As they are currently not ruled out, any assessment of features connected to Newton Marsh SSSI should fully consider the impacts to the SSSI and its features.  | Features of designated sites, including Newton Marsh SSSI, are identified in section 4.6.6 and the potential for impacts from the Transmission Assets has been assessed in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4) and in section 1.5 of the Information to Support Appropriate Assessment (ISAA) report.   |
| TA_0001_269_231123          | S42     | Email           | In- combination 7.54 This proposal currently presents 4 different construction zones with 2 risk pathways, and 4 different operation zones as one proposal. In particular, for the construction pressures, there is a potential for the 4 construction zones and 2 risk pathways to simultaneously impact both the Ribble and Alt SPA, and its functionally linked land. We note that no 'whole project alone' assessment has been made to consider these impacts. The submitted ES should contain a 'whole project alone' assessment so the totality of potential impacts on the SPA (and other receptors where relevant) are properly quantified and appropriate mitigation put in place where needed. In particular, the assessment should fully consider how the construction pressures impact both the SPA itself and its functionally linked land.   | The ES includes an assessment of the Transmission Assets alone in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4) and in Volume 2, Chapter 5: Offshore ornithology of the ES (document reference F2.5). Details on the impacts on European sites from the Transmission Assets are contained within the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3). Both the ES and the ISAA consider construction impacts, including impacts on functionally linked land.                    |
| TA_0001_272_231123          | S42     | Email           | Screening 8.3 The offshore export cable will be installed from the location at/near Blackpool Airport by Horizontal Directional Drilling (HDD), or equivalent trenchless technique across the sand dunes at Lytham St. Annes Site of Special Scientific Interest (SSSI). Exploring and detailing a maximum design scenario and other environmental constraints for these operations is critical. It is also critical that the methodology for the trenchless technique is determined at the earliest opportunity, and in consultation with Natural England, to ensure that the impact can be avoided in the first instance. Sufficient survey programmes should be planned to allow a full understanding of the operations so a holistic impact assessment can be carried out. The outcomes of this assessment and any mitigation measures required to address potential impacts should be reported in the submitted ES. | Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) assesses the impacts on Lytham St. Anne's Dunes SSSI. Direct pipe trenchless installation is proposed in this location as it's the most appropriate for use in sensitive settings, in part because it reduces the risk of collapse that is associated with cable installation using horizontal directional drilling (HDD).  |
| TA_0001_276_231123          | S42     | Email           | Natural England's Structure/Framework for Attributing Risk The comments provided within this letter and its Annexes have been colour coded using the structure/framework as specified in the risk table in Appendix I of this letter. In this letter, the coloured headings are coded based on the highest risk associated with the topic in question. Natural England would like to highlight that at this stage all comments highlighted as yellow, amber, or red need to be addressed, with the potential for these issues to become more significant if not resolved at application.   | The Applicants note your response.  |
| TA_0001_277_231123          | S42     | Email           | Impacts on the Natural Environment – Natural England's Key Concerns Generic Comments Natural England highlights that for several receptors, the PEIR is based on incomplete data or refers to additional data collection that is not presented or still to be carried out. Natural England cannot therefore make any conclusive judgements based on this PEIR, including the cumulative/in-combination assessments and the HRA. Accordingly, our advice focuses on the methodology used. We emphasise the need to base the submitted ES on robust datasets that meet (and where appropriate exceed) minimum standards.   | As detailed in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) and Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4), further surveys have been carried out since the publication of the PEIR in order to provide a more complete baseline. It is considered that this provides a sufficiently robust basis for assessment.  |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response   |
|-----------------------------|---------|-----------------|--|--|
| TA_0001_278_231123          | S42     | Email           | We also highlight the risks associated with further data processing to validate the conclusions and having sufficient time to consult pre-application and sufficiently resolve matters prior to submission. We reserve the right to change our comments and position during the ES consultation, subject to the outcome of further data analysis. Furthermore, Natural England seeks confirmation that the timetable set out for DCO submission allows for evidence standards to be met.   | As detailed in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) and Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4), further surveys have been carried out since the publication of the PEIR in order to provide a more complete baseline. It is considered that this provides a sufficiently robust basis for assessment.   |
| TA_0001_298_231123          | S42     | Email           | Similarly, Natural England disagrees that the impacts on Liverpool Bay SPA red-throated diver and common scoter features are so low from the project alone that an in-combination assessment does not need to be carried out. A full in-combination assessment of impacts should be carried out for both these species.  | The approach to cumulative assessment has been discussed with stakeholders as part of the EWG. A cumulative assessment taking into account the permanent and temporary nature of associated impacts is provided in Volume 2, Chapter 5: Offshore ornithology of the ES (document reference F2.5) and HRA Stage 2 ISAA: Part 3 SPA and Ramsar Site Assessments (document reference E2.3).   |
| TA_0001_299_231123          | S42     | Email           | Onshore Ornithology Natural England do not agree with the conclusion of No AEol for Ribble and Alt Estuaries SPA based on information provided, due to potential impacts of disturbance, displacement and non-permanent habitat loss. Further information is required to support this conclusion. Based on the presented information, Natural England also does not agree with some of the conclusions for impacts to qualifying bird species of Liverpool Bay SPA, Ribble and Alt Estuaries SPA, and Morecambe Bay and Duddon Estuary SPA.  | Additional surveys have been completed and reported within the ES. An assessment of the potential impact on key receptors, including qualifying features of the SPA and Ramsar site, as identified in section 4.6.2, is presented within section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). Details on the impacts on European sites from the Transmission Assets are contained within the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3). No adverse effects on integrity are predicted. |
| TA_0001_300_231123          | S42     | Email           | The presented information within the PEIR is incomplete and there are further surveys to be reported. Currently, Natural England disagree that the survey effort is sufficient to rely on 1% rule of thumb as a screening tool. The survey areas presented here require further explanation as to why the core survey area was selected as a subset of the red line boundary. Without sufficient reasoning for this, further survey coverage is needed. It is also not clear why the core survey area was selected as a subset of the red line boundary. This is not appropriate unless the developer is committed to only causing impacts within this zone. | Additional surveys have been completed and reported within the ES. The 1% screening tool has not been used for ES purposes. The survey coverage is reported within Volume 3, Annex 4.1: Breeding birds technical report of the ES (document reference F3.4.1), Volume 3, Annex 4.2: Wintering and migratory birds technical report of the ES (document reference F3.4.2) and Volume 3, Annex 4.3: Intertidal birds technical report of the ES (document reference F3.4.3) and is considered sufficiently robust to fully characterise the baseline used in this assessment.                          |
| TA_0001_301_231123          | S42     | Email           | Part of the justification for no adverse impacts to onshore birds is that the cable route will not pass through significant Functionally Linked Land habitat (Lytham Moss BHS). This is not accurate as the final decision of which cable route to use has not been finalised and Option 2 will pass through this habitat. Natural England advises that route Option 1 is chosen to avoid FLL habitat.   | <p>The ES includes an assessment of the Transmission Assets alone in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4) and in Volume 2, Chapter 5: Offshore ornithology of the ES (document reference F2.5).</p> <p>Details on the impacts on European sites from the Transmission Assets are contained within the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3).</p> <p>Both the ES and the ISAA consider construction impacts, including impacts on functionally linked land.</p>      |
| TA_0001_304_231123          | S42     | Email           | There is a lack of assessment on impacts to SSSIs. The documents only seem to assess impacts on notified bird species in SSSIs not other notified features such as various habitats.   | The impact on SSSIs (designated for reasons other than ornithological interest) has been provided in section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Features of internationally and nationally designated sites were considered when identifying the list of Important Ecological Features listed in section 4.6.6 of Volume 3 Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). The potential for impacts from the Transmission Assets has been assessed in section 4.11 of that chapter.        |
| TA_0001_310_231123          | S42     | Email           | <p>Appendix 1</p> <p>The following Framework has been used in Natural England's advice to attribute risk to the project:</p> <p>Structure / Framework Risk</p> <p>Purple</p> <p>Note for the developer.</p> <p>Red</p> <p>Natural England considers that unless these issues are resolved it will have to advise that (in relation to any one of them, and as appropriate) it is not possible to ascertain beyond reasonable scientific doubt that the project will not affect the integrity of an</p>   | Natural England's advice has been noted, specifically in the assessment of effects on ecological receptors (see Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3)).   |

|                             |         |                 | <p>SAC/SPA/Ramsar and/or significantly hinder the conservation objectives of an MCZ and/or damage or destroy the interest features of a SSSI and/or comply fully with the Environmental Impact Assessment requirements.</p> <p>Addressing these concerns may require the following:</p> <ul style="list-style-type: none"> <li>• new baseline or survey data; and/or</li> <li>• significant revisions to baseline characterisation and/or impact modelling and/or</li> <li>• significant design changes; and/or</li> <li>• significant mitigation</li> </ul> <p>Natural England feels that issues given Red status are so complex, or require the provision of so much outstanding information, that they are unlikely to be resolved during the Examination, and respectfully suggests that they be addressed beforehand.</p> <p>Amber</p> <p>Natural England does not agree with the developer's position or approach and consider that this could make a material difference to the outcome of the decision-making process for this project.</p> <p>Natural England considers that these matters may be resolved through:</p> <ul style="list-style-type: none"> <li>• provision of additional evidence or justification to support conclusions; and/or</li> <li>• revisions to impact assessment methodology and/or assessment conclusions; and/or</li> <li>• minor to moderate revisions to impact modelling; and/or</li> <li>• well-designed mitigation measures that are adequately secured through the draft DCO/dML and/or</li> <li>• amendments to draft plans</li> </ul> <p>If these issues remain at the time of the application and are not addressed or resolved by the end of the Examination, then they may become a Red risk as set out above.</p> <p>Yellow</p> <p>Natural England doesn't agree with the developer's position or approach. We would ideally like this to be addressed but are satisfied that for this particular project it is unlikely to make a material difference to our advice or the outcome of the decision-making process. However, we reserve the right to revise our opinion should further evidence be presented. It should be noted by interested parties that just because these issues/comments are not raised as significant concerns in this instance, it should not be understood or inferred that Natural England would be of the same view in other cases or circumstances.</p> <p>Green</p> <p>Natural England is in broad agreement with the developer's approach and has no significant outstanding concerns. As above, we reserve the right to revise our opinion should new evidence be presented.</p> |   |
| TA_0002_012_171123          | S42     | Email           | <p>8. Environmental Impact – Assessment and Proposals</p> <p>Great emphasis was being placed on the plans to minimise the impact on the environment by encouraging development of biodiversity off the route of the development. However, no proper account was made for the existing activities being undertaken on the sensitive sites, by farm owners and the owners of the Freckleton and Newton / Clifton marshes, where the efforts already being made are producing a substantial benefit to the local wildlife and protected species to be found in these areas of the Fylde. It did appear as if anything already established here was going to be claimed by the project as an offset to the environmental disaster that would be created by the development of the whole tract of land across the whole of the Fylde, with all the consequence of disturbance that ensues to farms, marshes, drains and watercourses – some of which are protected rivers that feed the Ribble and Alt RAMSAR sites. Nothing seemed to indicate a benefit that would be demonstrated, other than the "green" source of electricity. No firm ideas were presented, despite one of the conditions being that they spend a percentage of their funds on new measures to enhance biodiversity. The only suggestion to date was the acquisition of bird boxes and this for an area that is primarily populated by ground nesting birds. A lot of boxes would be needed to make up the implied funding levels talked about!</p>  | <p>Biodiversity benefit will be provided within the Transmission Assets Order Limits, details of which are set out within the Onshore Biodiversity Benefit Statement (document reference J11).</p>  |
| TA_0002_014_171123          | S42     | Email           | <p>There have been concerns raised regarding possible electro-magnetic issues associated with the high-power transmissions and the possible impact of this and the need for screening that might result.</p>  | <p>Electro-magnetic fields (EMFs) are part of the natural world, and are also produced wherever electricity is generated, transmitted or used. With regard to EMF impacts, the project will adopt the International Commission on Non-ionizing Radiation Protection (ICNIRP) guidelines and Government voluntary Code of Practice on EMF public</p> |

|-----------------------------|---------|-----------------|---|---|
|                             |         |                 |   | exposure. Such considerations are inherent to the detailed engineering considerations of cable specification and routing. Relevant public EMF exposure guideline limits are noted in NPS EN-5 and would be complied with by the project. These guidelines are long standing and have a high safety margin. The levels of exposure that they require would not pose a risk to public health. Volume 1, Annex 5.1 (document reference F1.5.1) has had regard to the risk perceptions associated with EMFs of the Transmission Assets on the local area and this is presented in section 1.11.9 of the Annex. See also the submitted EMF Compliance Statement (Volume 1, Annex 3.4 of the ES, document reference E1.3.4).  |
| TA_0003_014_221123          | S42/S44 | Email           | Impact on Wildlife and Habitat Fylde Council notes that the views of Natural England have been sought as part of the consultation process and so are content that they take the lead in the assessment of any ecological impacts. It is noted that the consultation material includes proposals to use Horizontal Direction Drilling to minimise impact on sensitive habitats. In the event that consent is granted for the development, it is considered essential that this aspect of the proposal is continued through to delivery of the project and is not "watered down" as a result of any future review of the project.   | This commitment remains in place. Trenchless techniques are proposed beneath the sand dunes at Lytham St Annes and beneath the River Ribble, as well as at additional locations identified within Volume 1, Annex 3.2: Onshore Crossing Schedule of the ES (document reference F1.3.2) which is submitted as part of the application for development consent. Further details are provided in the response to comments from Natural England.  |
| TA_0009_002_231123          | S44     | Email           | Biodiversity Net Gain and Use of Land in the MoJ's Ownership The Project proposes the use of land in the ownership of the MoJ, opposite HMP Kirkham and to the south and east of Kirkham Road. The relevant parcels are identified in green below. (Photo in response document) From a review of the consultation material available for review, it appears that this land is proposed to be used for "biodiversity net gain, enhancement and / or mitigation areas". The MoJ object to their land being shown as to be used for this purpose and wish to make clear that they do not, and would not, provide consent for the use of any land in their ownership for any purpose associated with the Project. We therefore request that the scheme is revised to show alternative areas being used for biodiversity net gain, enhancement and/or mitigation.  | The areas proposed for biodiversity benefit have been refined further since PEIR. The areas proposed are shown in the Onshore Biodiversity Benefit Statement (document reference J11).  |
| TA_0012_007_221123          | S42     | Email           | We also have concerns about the impact on the sand dunes where these cables come ashore and the eco systems that has been worked on over the years. We feel that there will need to be road closures as the building work is started in an area that has limited access in and out of St Anne's. The town has suffered over the years when roads have been closed, snarling up the town. These construction times will be over years not weeks or months and will have a negative economic impact on our town.  | Direct pipe trenchless installation is proposed beneath the sand dunes. This technology will ensure there is no open trenching through the dunes. This will avoid any direct loss of vegetation and habitats. Instead, the drill will pass beneath the dunes at depth. Where necessary consideration of any indirect effects on the habitat and measures to avoid, minimise or mitigate these is provided in section 3.11 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Effects in relation to any changes in traffic are set out in Volume 3, Chapter 7 of the ES (document reference F3.7). It is noted that the option presented at PEIR (placement of cables in trenches within the highways) near Blackpool Airport is no longer required. Details of the current design are provided in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). |
| TA_0017_002_231123          | S42/S44 | Email           | I note you have consulted the historic environment record, but not the local environment record; the Lancashire Environmental Records Network should be consulted for records of all statutory and non-statutory designated sites, irreplaceable habitats, habitats of principal importance, protected and priority species that could potentially be affected by the proposed development  | Records from Lancashire Environmental Record Network were obtained in March 2024 and are included in section 3.6.1 of Volume 3, Chapter 3: Onshore ecology and nature conservation (document reference F3.3).   |
| TA_0017_003_231123          | S42/S44 | Email           | Known Ecological Constraints Subject to final route selection, a preliminary desk-based assessment indicates that the proposed scheme could potentially have implications for designated sites and habitats including (but not restricted to):<br>• Statutory Designated Sites:<br>o SPA§ Ribble & Alt Estuaries§ Liverpool Bayo SSSI§ Newton Marsh§ Ribble Estuary§ Lytham St Anne's Dunes§ Sefton Coasto NNR§ Ribble Estuary o MCZ§ Ribble Estuary§ Fyldeo LNR§ Lytham St Anne's LNR<br>• Non-statutory designated sites:<br>o Lytham St Anne's Dunes Geological Siteo Lytham Foreshore Dunes & Saltmarsh BHS 32NW01o Lytham Moss Copses BHS 32NW04o St Anne's Old Links Golf Course and Blackpool South Railway Line BHS 33SW02o Lytham Moss BHS 33SEW1o Westby Clay Pit BHS 33SE01o Pippy Lane Banks BHS 42NE01o Savick Bridge BHS 42NE04o Mason's Wood BHS 42NE07o Booths Plantation BHS 42NE09o Freshfield Farm Pond South BHS 43SW05o Freshfield Farm Pond North BHS 43SW06o Black Poplar at Newton Crossroads BHS 43SW07o Mill Brook Valley BHS 52NW01o Howick Hall Ponds BHS 52NW11o | An assessment of the impacts and effects on key onshore ecological receptors (except birds), including qualifying features of the SPAs and SSSIs, is presented within section 3.11 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). An assessment of the impacts and effects on key onshore and intertidal ornithological receptors, including qualifying features of the SPAs and SSSIs, is presented within section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).  |

| TA_0017_004_231123          | S42/S44 | Email           | As discussed below, in addition to a data search, the impact assessment should be informed by a comprehensive programme of ecological assessments.   | Ecological surveys have been carried out in 2022, 2023 and 2024. The scope of surveys has been informed through consultation (through Expert Working Group meetings), review of desk study records and the results of preliminary surveys that established suitability for protected and notable species. This is discussed further in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) and Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).   |
| TA_0017_006_231123          | S42/S44 | Email           | The Biodiversity net gain areas should be informed by the emerging Local Nature Recovery Strategy for Lancashire and should contribute to its delivery. The strategy will be developed throughout 2024. Preliminary strategic maps are expected to be published in early 2024.   | The status of the Local Nature Recovery Strategy for Lancashire is summarised in section 3.6 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Step 1 of the strategy, to map areas of particular importance for biodiversity, is complete. Accordingly, section 3.11 of the chapter includes assessment of areas of particular importance such as statutory and non-statutory designated sites. Information on biodiversity net gain is provided in the Onshore Biodiversity Benefit Statement (document reference J11). Please also refer to the Outline Ecological Management Plan (document reference J6).  |
| TA_0017_007_231123          | S42/S44 | Email           | General Requirements<br>As well as the proposed ecological measures stated within the consultation documents, it needs to be ensured that all of the matters discussed below are fully addressed.  | The Applicants note your response. Responses provided on a comment by comment basis.   |
| TA_0017_008_231123          | S42/S44 | Email           | Professional competence<br>The application to the Planning Inspectorate should include evidence that all ecological surveys, assessments and mitigation/compensation proposals have been undertaken and prepared by appropriately qualified, licenced and experienced ecologists.  | Competency standards required for surveyors carrying out ecological surveys are provided in Volume 3, Annex 3.2: Onshore ecology survey methodologies technical report of the ES (document reference F3.3.2).  |
| TA_0017_010_231123          | S42/S44 | Email           | PolicyThe application should demonstrate that the proposed development will fully comply with the requirements of all relevant national and local planning policy, including (but not limited to): <ul style="list-style-type: none"> <li>• National Policy Statements, including for example: <ul style="list-style-type: none"> <li>o Overarching National Policy Statement for Energy (EN-1)</li> <li>o National Policy Statement for Renewable Energy Infrastructure (EN-3);</li> <li>o National Policy Statement for Electricity Networks Infrastructure (EN-5)</li> </ul> </li> <li>• The National Planning Policy Framework (NPPF);</li> <li>• Local Plan policies.</li> </ul> Section 5.3 of National Policy Statement EN-1 sets out requirements in respect of Biodiversity and geological conservation. National Policy statement EN-1 states that "Where the development is subject to EIA the applicant should ensure that the ES clearly sets out any effects on internationally, nationally and locally designated sites of ecological or geological conservation importance, on protected species and on habitats and other species identified as being of principal importance for the conservation of biodiversity. The applicant should provide environmental information proportionate to the infrastructure where EIA is not required to help the IPC consider thoroughly the potential effects of a proposed project". National Policy statement EN-1 also states that "The applicant should show how the project has taken advantage of opportunities to conserve and enhance biodiversity and geological conservation interests". The NPPF states that planning decisions should contribute to and enhance the natural and local environment by minimising impacts on and providing net gains for biodiversity (See Paragraph 174). The NPPF also states that "if significant harm to biodiversity resulting from a development cannot be avoided (through locating on an alternative site with less harmful impacts), adequately mitigated, or, as a last resort, compensated for, then planning permission should be refused" (See Paragraph 180). In order to meet the requirements of the NPPF, | The policy background that has informed the assessment is provided in section 3.2.2 and section 3.2.3 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). The application of relevant policy to the assessment of impacts on onshore ecology and nature conservation is demonstrated through the evaluation and identification of important ecological features, as set out in section 3.6.4. The assessment of impacts is provided in section 3.11. Information on biodiversity net gain is provided in the Onshore Biodiversity Benefit Statement (document reference J11) and information on biodiversity benefit is provided in the Outline Ecological Management Plan (document reference J6). |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response  |
|-----------------------------|---------|-----------------|--|---|
|                             |         |                 | the planning application will therefore need to demonstrate that: <ul style="list-style-type: none"> <li>• all elements of the development would be located and designed to avoid or minimise harm to biodiversity, and</li> <li>• adequate mitigation/compensation for any unavoidable impacts, as well as net gains for biodiversity, will be provided.</li> </ul>   |   |
| TA_0017_013_231123          | S42/S44 | Email           | Data search The planning application should include the results of an ecological data search. This should include data from the local records centre (Lancashire Environmental Records Network). Relevant data sources include: <ul style="list-style-type: none"> <li>• Lancashire Environmental Records Network (LERN)</li> <li>• NBN Gateway</li> <li>• Multi-Agency Geographical Information for the Countryside (MAGIC)</li> <li>• Risk Zones relating to statutory designated sites</li> <li>• Ancient Woodland Inventory</li> <li>• Centre for Ecology and Hydrology Environmental Information Data Centre</li> <li>• RSPB</li> <li>• Local recorder groups for badgers, bats, amphibians, reptiles, birds etc</li> <li>• Ecological data from earlier or neighbouring planning applications</li> <li>• Risk zones for district level licensing.</li> </ul> It should be demonstrated that the data has informed the scope of field surveys, the design of the proposed development and mitigation/ compensation measures. The data search should not be used as a substitute for field surveys. An absence of records should not be taken as absence of species or habitats. Records over 10 years old should not be discounted. These can still provide useful contextual information and an absence of more recent records may only indicate a lack of survey. | The data sources included in the desk study are identified in section 3.5.1 and section 3.6.1 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Additionally, LERN confirmed that their data for records for onshore ecology and nature conservation was sufficient and no further requests to other organisations were considered necessary. Information gained from planning applications is considered in the baseline for amphibians in section 3.6.1 and in the cumulative assessment in section 3.13. District level licencing is considered in the assessment of impacts on GCN in section 3.11.10. The findings of the data search are provided in Volume 3, Annex 3.1: Onshore ecology desk study technical report of the ES (document reference F3.3.1)..  |
| TA_0017_014_231123          | S42/S44 | Email           | Surveys Survey data submitted with the planning application should be current/up-to-date, in line with recognised guidelines (as summarised above). The survey area should include: <ul style="list-style-type: none"> <li>• The intended location of the development footprint;</li> <li>• Potential working areas, compounds, storage areas and access routes;</li> <li>• Any land that may be used within the mitigation, compensation or biodiversity net gain proposals (on or off-site);</li> <li>• A suitable buffer distance, taking account of the likely zone of influence and relevant survey guidelines.</li> </ul>  | The survey area is the area used for site-specific surveys and is generally defined as a 150 m buffer around the Onshore Order Limits. The 150 m buffer was included to take account of protected species that may occur adjacent or close to the Transmission Assets and to allow for evolution of the boundary during the site selection process. A separate survey area was used for GCN surveys. The GCN survey area is defined as a 250 m buffer around the Onshore Order Limits. Volume 3, Annex 3.8: Great crested newt survey and reptile survey technical report of the ES (document reference F3.3.8) provides further details regarding the GCN survey area. Owing to the iterative design process of the Transmission Assets, some surveys were undertaken further than 150 m from the Onshore Order Limits. Nevertheless, information from these surveys have been included in technical annexes because it provides context regarding the ecological sensitivity of the wider area.   |
| TA_0017_015_231123          | S42/S44 | Email           | The ecological surveys/assessments should include a Preliminary Ecological Appraisal, undertaken in accordance with recognised guidelines. This should be used to determine any necessary further surveys/assessments required to inform the planning application.   | A phase 1 habitat survey, including scoping for protected and notable species, was carried out as part of the PEIR and findings have contributed to determine the scope and location of species surveys. Survey has continued since the publication of the PEIR, in areas that were not previously accessible or were originally surveyed at a suboptimal time. Findings have informed the requirement for further surveys. This is further detailed in Volume 3, Chapter 3: Onshore ecology and nature conservation (document reference F3.3)  |
| TA_0017_016_231123          | S42/S44 | Email           | Survey results should include UKHab habitat classifications, condition assessments and all necessary data to inform an assessment of Biodiversity Net Gain. The area of each habitat (or length of linear habitats) and their biodiversity value should be quantified, using the current DEFRA biodiversity metric. Habitats of nature conservation significance, including Habitats of Principal Importance (NERC Act, 2006) and irreplaceable habitats should be identified and clearly mapped.  | Habitat survey has been completed for over 90% of the Onshore Order Limits, and within a 150 m buffer where access was granted and was carried out using the JNCC phase 1 habitat survey method. This has been converted to UKHab to provide the baseline for the biodiversity benefit calculation of permanent habitat loss, which has been carried out using the statutory biodiversity metric. Habitats of nature conservation significance, including priority habitats, that represent important ecological features, are identified in section 3.10 and assessed in section 3.11.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation (document reference F3.3). Further information on priority and other notable habitats is provided in Volume 3, Annex 3.1: Onshore ecology desk study technical report of the ES (document reference F3.3.1) and Volume 3, Annex 3.3: Phase 1 habitat, national vegetation classification and hedgerow survey technical report of the ES (document reference F3.3.3). The maps provided in these annexes show the distribution of habitats but maps of priority and notable habitats only are not provided. |
| TA_0017_017_231123          | S42/S44 | Email           | The planning application should also include the results of more detailed phase 2 vegetation/habitat surveys of any semi-natural habitats, priority habitats and other features with the potential to support ecologically significant species. Results should include mapped plant communities and full species lists showing relative abundance. Any quadrat   | NVC surveys have been carried out where required, as informed by the desk study, results of the phase 1 habitat survey and predicted impacts of the Transmission Assets. Where necessary, surveys of the Fylde sand dune have been carried out to confirm or update surveys carried out in 2016.  |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response   |
|-----------------------------|---------|-----------------|--|--|
|                             |         |                 | data and locations should be included. Any hedgerows affected by the proposals should be assessed according to the criteria specified in the Hedgerow Regulations 1997.  |  |
| TA_0017_020_231123          | S42/S44 | Email           | The planning application should include an assessment of the ornithological interest of the site and the predicted Zone of Influence. This should include breeding and wintering birds.  | This is provided within Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4).   |
| TA_0017_021_231123          | S42/S44 | Email           | All surveys should be carried out at an appropriate time of year, in accordance with recognised methodologies and best practice guidelines, and be carried out by suitably competent and experienced individuals. All survey methods used should be detailed in the ES, along with any survey limitations and a rationale for any unavoidable departures from recognised survey standards.   | Survey methods and competency standards required for surveyors carrying out ecological surveys are provided in Volume 3, Annex 3.2: Onshore ecology survey methodologies technical report of the ES (document reference F3.3.2). Limitations relevant to different surveys are identified in the technical reports.  |
| TA_0017_022_231123          | S42/S44 | Email           | Evaluation<br>An evaluation should be provided for all sites, habitats, species populations and other ecological features identified during the surveys, including identification of irreplaceable habitats. A rationale should be provided for the evaluation given to each ecological feature.   | An evaluation of important ecological features considered in the assessment is provided in section 3.6 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).  |
| TA_0017_025_231123          | S42/S44 | Email           | The NPPF states that development resulting in the loss or deterioration of irreplaceable habitats should be refused, unless there are wholly exceptional reasons and a suitable compensation strategy exists. Irreplaceable habitats include habitats which would be technically very difficult (or take a very significant time) to restore, recreate or replace once destroyed, for example ancient woodland, ancient and veteran trees, blanket bog, limestone pavement, sand dunes, salt marsh and lowland fen. A definition and definitive list are expected to be published in the near future   | Irreplaceable habitats are now confirmed by The Biodiversity Gain Requirements (Irreplaceable Habitat) Regulations 2024. Of these, coastal sand dunes, ancient woodland and ancient and veteran trees are potentially relevant to onshore ecology and nature conservation. Assessment of impacts is provided in section 3.11 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).  |
| TA_0017_030_231123          | S42/S44 | Email           | DEFRA Circular 01/2005 (ODPM Circular 06/2005), referenced in Footnote 61 of NPPF 2021, states that "It is essential that the presence or otherwise of protected species, and the extent that they may be affected by the proposed development, is established before the planning permission is granted" and that "the survey should be completed and any necessary measures to protect the species should be in place, through conditions and/or planning obligations, before the permission is granted" (Paragraph 99). The planning application therefore needs to include habitat assessments and survey data for all protected species that could potentially be present and affected by the proposals. The survey methods used should be detailed in the planning submission. These should comply with recognised guidelines. The planning application should demonstrate that relevant species protection legislation will be adhered to and should include mitigation/compensation proposals for unavoidable impacts on such species and their habitats. If any European protected species (such as bats, great crested newts or otters) are present, then the planning application should include measures to avoid any breach of The Habitats Regulations. If such a breach would be unavoidable, then a Natural England Licence would be required before development work could commence. The Conservation of Habitats and Species Regulations 2017 (as amended) state that a competent authority, in exercising any of its functions, must have regard to the requirements of the Directives. The application will therefore need to include sufficient information to enable the determining authority to meet this requirement. | Surveys have been carried out in 2022, 2023 and 2024 in order to confirm the presence or indicate the likely absence of protected species. A precautionary approach to baseline characterization, impact prediction and mitigation has been taken in situations where it has not been possible to complete surveys. See Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). The Applicants will apply for mitigation licenses if there are unavoidable impacts on fully protected species, with the information necessary to allow the application to be determined. |
| TA_0017_033_231123          | S42/S44 | Email           | Impact Assessment Unavoidable impacts on sites, habitats, species and features of ecological value will need to be assessed in accordance with recognised guidelines (see examples above). All temporary and permanent impacts should be stated and assessed, including (but not limited to): • habitat loss, • habitat degradation and disturbance, • habitat fragmentation, severance and isolation, • ecological impacts arising from hydrological changes, • potential killing, injury and disturbance of protected and priority species, • destruction or disturbance of habitats used by protected and priority species, • impacts arising from lighting, noise, vibration, dust etc. • Impacts of all construction and related works should be included in the assessment, including the construction footprint, compounds, storage areas, access routes etc. The area and biodiversity value of each habitat type that would be lost, damaged, re-established, enhanced or brought into favourable management should be quantified in order to illustrate that the impacts of the  | The scope of impacts considered in section 3.11 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) have been established through consultation with the Expert Working Group and through review of consultation responses.   |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response   |
|-----------------------------|---------|-----------------|--|--|
|                             |         |                 | development will be fully off-set and that overall biodiversity gains will be delivered. The current DEFRA biodiversity metric should be used.   |  |
| TA_0017_034_231123          | S42/S44 | Email           | Mitigation, Compensation and Biodiversity Net Gain The results of surveys and impact assessments undertaken should inform the design of the proposed development and associated mitigation, restoration, compensation and enhancement measures. It should be demonstrated that impacts will be mitigated, that compensation will be provided for all unavoidable impacts and that enhancement measures will provide an overall net gain in biodiversity value. It should be demonstrated that mitigation and compensation proposals meet the requirements of legislation, policy and guidance listed above. Mitigation measures should include protection of retained habitats, species and features of ecological value, including tree root protection measures. Evidence of a gain in biodiversity value should be submitted and should include complete DEFRA biodiversity metric calculations (not just headline results), along with supporting plans. Use of the metric will be a statutory requirement when mandatory biodiversity net gain is in force. Current requirements for biodiversity gains, stated within the NPPF are summarised above. It is anticipated that the mandatory requirement for 10% biodiversity net gain, arising from the Environment Act 2021, will come into force during 2025 for national infrastructure projects. It will need to be ensured that the proposed development provides overall biodiversity gains compliant with the requirements in place at the time of the planning submission. The planning application should include proposals for maintaining, restoring and enhancing habitat connectivity within the application area and the wider landscape. Habitat creation should not be at the expense of existing habitats or features of ecological importance. Habitat creation proposals should comprise native plant communities appropriate to the location, soils, hydrology and site conditions. Guidance on native species selection is given on the Lancashire County Council's Ecology webpages:<br>• <a href="http://www.lancashire.gov.uk/council/planning/planning-application-process/ecology/ecology-advice-for-developers/habitat-re-establishment.aspx">http://www.lancashire.gov.uk/council/planning/planning-application-process/ecology/ecology-advice-for-developers/habitat-re-establishment.aspx</a> • Plant-species-appropriate-for-habitat-creation-in-Lancashire.pdf | The approach to site selection has been based on avoiding damage to Important Ecological Features where practicable, as is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES. In addition, during an iterative process of EIA, locations where trenchless techniques will be used to avoid impacts have been identified. Where temporary habitat loss is unavoidable, such as where construction accesses need to cross hedges, this will be rectified by reinstating habitats in accordance with the specifications provided in the Ecological Management Plan. An Outline Ecological Management Plan (document reference J6) is provided as part of the application for development consent. For the Transmission Assets, biodiversity benefit will be delivered within identified biodiversity benefit areas within the Transmission Assets Order Limits: Onshore (referred to as the Onshore Order Limits). Further qualitative benefits to biodiversity are proposed via potential collaboration with stakeholders and local groups, contributing to existing plans and programmes, both within and outside the Onshore Order Limits. Further details of the approach to biodiversity benefit are provided in the Onshore Biodiversity Benefit Statement (document reference J11). |
| TA_0017_035_231123          | S42/S44 | Email           | Establishment maintenance and long-term management and monitoring proposals for retained, restored and replacement habitats should be provided. The timescale of the management and monitoring commitment should be stated. It is recommended that this should cover a 30-year period. This will be a statutory requirement when mandatory biodiversity net gain is in force.  | An Outline Ecological Management Plan (document reference J6) is provided as part of the application for development consent.  |
| TA_0017_036_231123          | S42/S44 | Email           | It should be stated how the necessary maintenance and management will be secured for the lifetime of the anticipated planning obligations.   | An Outline Ecological Management Plan (document reference J6) is provided as part of the application for development consent.  |
| TA_0017_037_231123          | S42/S44 | Email           | Monitoring measures should be sufficient to measure the success of mitigation and compensation measures, to inform the need for remedial measures and to inform establishment maintenance and long-term management.  | Any relevant monitoring measures are set out in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).   |
| TA_0019_028_231123          | S42/S44 | Email           | The potential biodiversity net gain areas do not provide detail of what will actually be required. They need to be properly specified with some measurable and enforceable results. The protection of existing ecology on the surrounding land needs to be documented and at least maintained. Equestrian landowners and smallholders are concerned about the welfare of their animals in particular with regard to reduction in grazing land and the impact of major disruption including light pollution, noise and vibration potentially causing stress, spread of plants toxic to certain animals and other health impacts. The biodiversity net gain approach can lead to a loss of green spaces, when there is a failure to deliver ecological improvements biodiversity will be lost overall so it is essential that the governance mechanisms regulating these future gains are watertight. Parts of the biodiversity net gain areas are disconnected from each other. In order to adequately support wildlife habitats and the natural spread of native flora and fauna these areas should be joined together to form corridors.  | The design of the Transmission Assets has been developed further since the statutory consultation (PEIR). This design evolution has taken into account the findings of the iterative EIA process and feedback from stakeholders. As such the location of key elements of the Transmission Assets and the Order Limits have been refined, as reflected in the application for development consent. This has included development of the approach to biodiversity benefit, as set out in the Onshore Biodiversity Benefit Statement (document reference J11).  |
| TA_0025_003_231123          | S42     | Email           | There is also a 13km radius wildlife zone. The Aerodrome at Warton needs to be consulted on any developments that have the potential to attract wildlife. Birds are the main concern, particularly large, over-wintering birds. In relation to this, BAE Systems   | The Applicants welcome BAE Systems' engagement and proactive approach to the Transmission Assets planning and development. This comment was taken into consideration at the mitigation stage when the project was undertaking site selection   |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response   |
|-----------------------------|---------|-----------------|--|--|
|                             |         |                 | have initial concerns about the proposal to develop an “ Onshore and Intertidal Net Gain Enhancement Plan...to identify areas where biodiversity net gain is proposed. This will include details of the measures proposed, including details of any enhancement measures proposed for waterbirds.” (Preliminary Environmental Information Report Non-Technical Summary, October 2023). BAE Systems is particularly concerned about any enhancement measures in the wildlife zone that will increase the attractiveness of the area for birds (including new areas of standing water) as this has significant potential to negatively affect air safety.  | activities to locate areas where mitigation could be provided. Due to BAE Systems concerns, any biodiversity benefit, mitigation and enhancement has been sited outside of the wildlife zone.  |
| TA_0030_002_231123          | S42     | Email           | Having examined the consultation documents and in particular the Preliminary Environmental Information Report (PEIR) it is our view, given the scale and extent of the proposal, and in particular its location in relation to West Cumbria (and former South Copeland area), that it is unlikely to have any significant detrimental impact. That said however, it is requested that the potential wider ecological impacts (for example on migratory birds and Haverigg Haws sand dunes which are of national and international nature conservation importance) of the proposal be assessed in the Environmental Statement (ES) accompanying the DCO application with reference to the sensitive ecological designations of the Duddon Estuary SSSI, SPA and RAMSAR and Morecambe Bay SAC.   | The Applicants note your response. Volume 2, Chapter 5: Offshore ornithology of the ES (document reference F2.5) includes assessments for all impacts associated with the project on all relevant offshore ornithological receptors.   |
| TA_0035_010_221123          | S42/S44 | Email           | Biodiversity Net Gain (BNG): Further clarification is required regarding the approach to BNG. It's unclear at this time how this will be implemented. We would urge the applicant to engage with the developing Local Nature Recovery Strategy (LNRS) to explore BNG options that could align with the LNRS strategic approach (further comments in Appendix C).   | The status of the Local Nature Recovery Strategy for Lancashire is summarised in section 3.6 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). Step 1 of the strategy, to map areas of particular importance for biodiversity, is complete. Accordingly, section 3.11 of the chapter includes assessment of areas of particular importance such as statutory and non-statutory designated sites.<br>Information on biodiversity net gain is provided in the Onshore Biodiversity Benefit Statement (document reference J11) and information on biodiversity benefit is provided in the Outline Ecological Management Plan (document reference J6).  |
| TA_0035_013_221123          | S42/S44 | Email           | Ecological surveys: A number of further ecology surveys are required to ensure suitable baseline assessment of protected habitats and species especially in respect to CRoW assessments for onshore SSSIs, and water voles.  | Surveys have been carried out in 2022, 2023 and 2024 in order to confirm the presence or indicate the likely absence of protected species. See Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). This has informed the assessments set out in section 3.11 of that chapter. This includes details of the effects on SSSIs and other designated sites. No effects on water voles are considered likely.   |
| TA_0035_020_221123          | S42/S44 | Email           | 3.8.1.8 Issue<br>Lack of clarity regarding the cabling method (Horizontal Directional Drilling or open trench) across the intertidal area<br>Impact<br>Potential for damage to the physical and ecological integrity of the intertidal area.<br>Solution<br>Provide further clarification including entry and exit points for HDD sites if relevant.   | Details of the works in the intertidal area are set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). This includes open trenching works in the intertidal area. The exit point for the direct pipe beneath the dunes is anticipated to be above Mean High Water Springs.   |
| TA_0035_022_221123          | S42/S44 | Email           | 3.11 Biodiversity Net Gain Issue<br>At this time the site does not have a suitable BNG strategy. Impact<br>The proposals do not accord with government policy. There is the potential for missed opportunities for environmental gains from this project. In addition, the delivery of BNG has not been incorporated into the application and implications of this activity have not been assessed. Solution<br>The strategy for Biodiversity Net Gain to be clearly defined and delivery mechanisms to be incorporated into the DCO. The implications of delivering BNG to be incorporated into assessment documents. Applicant advised to consider opportunities in Local Nature Recovery Strategies and any mitigation measures listed for the affected waterbodies under WFD. Lancashire Wildlife Trust have been working on BNG habitat options within this wider area. See Annex D for further consideration | As set out in the Onshore Biodiversity Benefit Statement (document reference J11), the Transmission Assets are not subject to a mandatory net gain requirement under the Environment Act 2021. Nevertheless, the Applicants have worked with statutory consultees to discuss the approach, and to develop the design, to allow the maximum benefit to biodiversity within the parameters of the project. For the Transmission Assets, biodiversity benefit will be delivered within identified biodiversity benefit areas within the Transmission Assets Order Limits: Onshore (referred to as the Onshore Order Limits). Further qualitative benefits to biodiversity are proposed via potential collaboration with stakeholders and local groups, contributing to existing plans and programmes, both within and outside the Onshore Order Limits. Further details of the approach to biodiversity benefit are provided in the Onshore Biodiversity Benefit Statement (document reference J11). The calculation undertaken for the Onshore Biodiversity Benefit Statement (document reference J11) utilises the latest biodiversity metric |

| TA_0035_085_221123          | S42/S44 | Email           | CoT76 Ecological Management Plan(s) (EMP) will be developed in accordance with the Outline Ecological Management Plan (OEMP). The Outline Ecological Management Plan will be submitted as part of the application for the development consent and will include but not be limited to pre-construction, construction and post-mitigation measures relating to habitats and protected or notable species, where relevant. The Outline Ecological Management Plan will also include a Breeding Bird Protection Plan which will set out mitigation measures such as vegetation clearance in winter (e.g., hedgerows), pre-construction breeding bird survey, appropriate protection zones upon confirmation of nest building/breeding taking place of key protected or sensitive species. The Ecological Management Plan will also include details of any long term mitigation and management measures relevant to onshore ecology and nature conservation and in relation to onshore and intertidal ornithology. This will include the management of ecological mitigation areas. The Ecological Management Plan will be developed in consultation with the relevant responsible authorities. Issue Measures to manage ecological risk have yet to be fully developed. Impact Risk to habitats and species. Solution Outline Ecological Management Plan to be included in DCO submission | This commitment remains in place and an Outline Ecological Management Plan (document reference J6) is provided as part of the application for development consent.   |
| TA_0035_086_221123          | S42/S44 | Email           | CoT83 An Onshore and Intertidal Net Gain Enhancement Plan will be developed and submitted as part of the application to identify areas where biodiversity net gain and/or opportunities for any enhancement are proposed. This will include details of the measures proposed. Issue The identification of areas for mitigation, BNG or enhancement have yet to be fully developed. and may alter the red line boundary on the DCO submission. Impact The clarification of BNG intentions may alter the red line boundary on the DCO submission. Solution An Outline Net Gain Enhancement Plan to be included in DCO submission  | CoT83 has been removed, as the Applicants' approach to undertaking enhancement opportunities is set out the Outline Ecological Management Plan (document reference J6), and the approach to biodiversity benefit is set out in the Onshore Biodiversity Benefit Statement (document reference J11).  |
| TA_0035_096_221123          | S42/S44 | Email           | Sand dune restoration Opportunity<br>Opportunity for targeted sand dune restoration associated with SSSI Suggestion<br>Engage with the Fylde Sand Dune Group which is responsible for sand dune restoration along this section of the coast. This work is part funded by the EA and is a long term ongoing project.   | Noted, the Applicants are in contact with Fylde Sand Dune Group, who have shared previous survey data.   |
| TA_0035_097_221123          | S42/S44 | Email           | Saltmarsh Opportunity<br>Opportunity for targeted saltmarsh creation / restoration along the length of the Ribble and Douglas Estuaries, including consideration of options outside of the area already highlighted for BNG enhancement/ mitigation (i.e. further down the estuary). Suggestion Engage with local partners who have experience of saltmarsh creation from Hesketh Outmarsh and can support discussions around opportunities. Best done through the Ribble Life and Douglas Catchment Partnerships respectively. Potential for managed realignment opportunities along Main Drain where the existing embankment is below required condition. Potential for managed realignment opportunities to the north and south of the River Ribble to the east of Freckleton and west of Higher Penwortham to allow for tidal inundation of the current agricultural land and the formation of saltmarsh.   | Measures to protect habitats are set out in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3). The assessment of impacts on priority habitats provided in section 3.11 of Volume 3, Onshore Ecology and Nature conservation of the ES (document reference F3.3). This has been updated to reflect the current design, as well as increased survey coverage. No impacts on saltmarsh habitat are anticipated.   |
| TA_0040_001_191123          | S44     | Email           | My name is REDACTED, I am writing to you as Director of REDACTED, a farming business based at REDACTED on land directly based along your proposed cable route. This proposed project would in any case, render my business unviable and unable to continue to operate, effectively closing my business down completely. This would obviously have a massive financial impact on myself and family. I would like to use the opportunity during this public consultation period, to unequivocally Object to your proposals and express my concerns over the proposed off shore Wind Farm cable routing and sub station locations within the fylde coast. I believe this would have a grossly negative impact on the Environment both physically, via the works proposed and Visually, damaging an untold amount of wildlife habitat and green belt protected land, conservation area's, highly productive farmland and have a hugely detrimental impact on the wider community and local economy, putting local business, land owners and Farmers out of business. I believe it would create an untold amount of suffering for residents within the   | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). Following route refinement and landowner engagement, the impact |

|                             |         |                 | <p>fyld coast for years to come via flooding and disruption ie traffic. Your lack of detail on some of the proposed cable routes and sub stations at this late stage and at this public consultation point in proceedings, is most worrying as this shows either an unprofessional approach to the matter, or completely unprepared, or at worst, both. It is extremely concerning that at this late stage we are asked to submit our opinions on a body of work that is neither complete nor suggest the possible outcomes thereafter the point of consultation. I feel that you have shown disregard to the community of the fylde coast in your methods up to now. This lack of transparency on your part, sets a precedent when approaching future issues and has created a level of mistrust that is beyond repair. This is another reason why I must whole heartedly Object on all parts of your proposals.</p>  | <p>has been reduced on this holding and the Applicant through Dalcour Maclaren will work with the landowner to reduce the impact of construction on the holding and business. Dalcour Maclaren on behalf of the Applicants will be in touch with interests to discuss Heads of Terms which will include compensation provisions to address any impacts to the farming business.</p>   |
| TA_0041_001_191123          | S44     | Email           | <p>As a trustee and marsh owner of Freckleton marsh I wish to bring to your attention my concerns over the proposed wind farm route and substations . Freckleton marsh with its neighbour Newton marsh are incredibly important conservation areas which have been heavily managed to protect the habitats of extremely rare ground nesting birds which requires local farms to bring on live stock to help manage the biodiversity of these sites, I am very concerned about the futures of the farms which are in the paths of these proposals and the disturbance of the surround farmland which could be detrimental to the marshes management . Both Marsh's are classed in the potential biodiversity net gain areas for the scheme yet we have had very little information on how this could impact the marsh's and their important eco systems including the water courses that feed this land which will have to be crossed by the cables . Dalcour Maclarens biodiversity potential net gain proposals are to vague and incomplete and haven't been conveyed to the relevant land owners thoroughly</p>  | <p>An assessment of the impact and effects on affected receptors has been carried out in Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). . Mitigation measures committed to by the Applicants are outlined within the ES and the project Onshore Biodiversity Benefit Statement (document reference: J11) and Marine Enhancement Statement (document reference: J12) submitted with the application for development consent.</p>   |
| TA_0042_001_191123          | S44     | Email           | <p>I am writing this email as the REDACTED of REDACTED, based on Marton Moss. Also user/owner of some of the land proposed to be affected by the cable route and surrounding bridle paths.If the route chosen includes my land on Division Lane, it would have a catastrophic and ruinous effect on my business. Therefore I am taking the opportunity during this public consultation period, to unequivocally Object to your proposals and express my concerns over the proposed off shore Wind Farm cable routing and sub station locations within the fylde coast. I believe this would have a grossly negative impact on the Environment both physically, via the works proposed and Visually, damaging an untold amount of wildlife habitat and green belt protected land, conservation area's, highly productive farmland and have a hugely detrimental impact on the wider community and local economy, putting local business, land owners and Farmers out of business. I believe it would create an untold amount of suffering for residents within the fylde coast for years to come via flooding and disruption ie traffic. Your lack of detail on some of the proposed cable routes and sub stations at this late stage and at this public consultation point in proceedings, is highly worrying as this shows either an unprofessional approach to the matter, or highly unprepared, or at worst, both. It is very concerning that at this late stage we are asked to submit our opinions on a body of work that is neither complete nor suggest the possible outcomes thereafter the point of consultation. I feel that you have shown disregard to the community of the fylde coast in your methods up to now. This lack of transparency on your part, sets a precedent when approaching future issues and has created a level of mistrust that is beyond repair. This is another reason why I must whole heartedly Object on all parts of your proposals.</p> | <p>The potential impacts of the Transmission Assets on recreational resources, including livery yards, stables and PRoW are identified and assessed in section 6.6 and section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes consideration of REDACTED. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes preparation of a PRoW Management Strategy in general accordance with the Outline PRoW Management Strategy (document reference J1.5) submitted with the application for development consent. The measures to be implemented as part of the PRoW Management Strategy seek to minimise impacts on public footpaths, bridleways and other promoted routes (e.g. NCRs, Long Distance Footpaths) during construction of the Transmission Assets.</p> |
| TA_0043_018_211123          | S44     | Email           | <p>18 Environmental impacts: We are aware there has been an impact survey on our land, but as yet the results have not been shared with ourselves or the wider public. We support large numbers of farmland birds, many of which are with us all year and others are either Summer or Winter visitors. We have, amongst many others- skylarks, curlews, pink footed geese, lapwing, Shoveler ducks, breeding teal, kestrels, sparrow hawks and a wide variety of owls. A variety of mammals, invertebrates and amphibians also make our farmland their home.</p>   | <p>A number of environmental surveys have been undertaken and are reported in the ES. These include, in particular, surveys for ecology, the historic environment, agricultural land quality and tree surveys. These are reported in Volume 3, Chapter 3: Onshore ecology and nature conservation, Volume 3, Chapter 5: Historic environment, Volume 3: Chapter 6: Land use and recreation and Volume 3, Chapter 10: Landscape and visual resources of the ES (document reference F3.3, F3.5, F3.6 and F3.10). These have informed the assessments presented in these chapters.</p>   |
| TA_0118_001_071123          | S44     | Email           | <p>As a resident of Freckleton I wish to strongly register my objection to the planned substations in our area. My husband and I chose to retire here 5 years ago because of the access to the open countryside which surrounds this area. It is a valuable habitat to much wildlife including bats, great crested newts and hedgehogs, foxes, etc. We also have</p>   | <p>The ES includes an assessment of the Transmission Assets alone in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). Details on the impacts on European sites from the Transmission Assets are contained within the Information to Support Appropriate Assessment (ISAA) report</p>  |

|                             |         |                 | curlew, lapwing and oystercatcher in this area. These key species are being displaced at an alarming rate and greatly rely on these coastal resources to overwinter successfully.  | (document reference E2.1, 2.2, 2.3).Both the ES and the ISAA consider construction impacts, including impacts on functionally linked land.   |
| TA_0119_001_071123          | S44     | Email           | I am opposed to your plans to build two substations on greenbelt land in the local area around Freckleton.This surely cannot be the best option for the local environment, given the known flooding issues in the area, and the loss of high-quality farmland. It is also a valuable habitat to much wildlife including bats, newts, and various species of bird including curlews, lapwings, owls and oystercatchers to name but a few. The close proximity to Carr Hill and Strike Lane schools, will also be a major concern for the many parents in the area.I am not against wind farms and green energy, but this must be done in a respectful way for local residents and the community.Surely the land surrounding the existing substation in Penwortham, would be a more viable and appropriate option. | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0124_006_171123          | S44     | Email           | 7.In the projected area there are endangered and protected species such as bats redshanks, oystercatchers, great crested newts and owls (Tawney and Barn Owls) and buzzards, kestrels, long tailed tits, bar tailed godwits amongst many others.   | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0125_004_181123          | S44     | Email           | 7.This will most certainly impact the environment and wildlife, some of which is protected. However it appears you are not bothered about this, in which case put it down the estuary the most logical place for it to go.   | The Ribble estuary has numerous ecological statutory designations protected nationally and internationally. These include the Liverpool Bay Special Protection Area, Ribble and Alt. Estuaries Special Protection Area, the Ribble and Alt Estuary Ramsar site (a wetland of international importance under the Ramsar Convention), and the Ribble Estuary Site of Special Scientific Interest, Ribble Estuary Marine Conservation Zone and Ribble Estuary National Nature Reserve. The tidal nature and shallow water depths of the estuary also create heightened risk to construction as the unstable riverbed conditions are unsuitable for trenching/ cable laying vessels to access. As such, cabling through the estuary would result in significantly protracted construction timeframes, and potentially long-term impacts to sensitive and sensitive features associated with the designated features, whilst also presenting higher risk and potentially unsafe working conditions. As such, the approach to site selection has been based on avoiding direct impacts to Important Ecological Features (IEFs) where practicable, further details can be found in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4). |
| TA_0127_001_191123          | S44     | Email           | we strongly object to any windfarm along the queensway. we have a small private stable yard at the top of REDACTED which runs along the queensway.we originally fenced along the queensway 15 foot in to protect the trees and wildlife and to cause least disruption to the area as possible. We observe bats otters newts rat weasels voles moles to name the least. The end field we own has recently had a tree cut out without our permission? Also i turn my horses out along there and one horse is a rescue that does not tolerate any heavy machinery and is very nervous.so any disruption would seriously damage the area animals and wildlife.therefore we strongly object thankyou  | The potential impacts of the Transmission Assets on recreational resources, including livery yards, stables and PRoW are identified and assessed in Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6).Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). The potential impacts of the Transmission Assets on protected species and protected habitats are considered in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES.Measures adopted as part of the Transmission Assets to mitigate potential impacts on onshore ecology and nature conservation are provided in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference: F3.3).   |
| TA_0128_001_191123          | S44     | Email           | Good morning, I am a resident of REDACTED freckleton,Preston, (REDACTED),and i am writing to you to let you know how utterly disgusted i am to find out that you are planning to erect two massive substations right near my house!!I bought this house 3 years ago,& was delighted with it, as it was in a peaceful semi rural location.Have you even considered (I think not),the noise, disruption,& the effect you will be putting on the wildlife,& also the increased traffic volumes & the devaluation of most, if not all the properties in the area.If you were to devalue my property, then I would have no other alternative than to seek compensation from yourselves, as, who would want to buy a property right next to two  | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles   |

|                             |         |                 | substations, which are going to be so huge. Why the hell would you want to build here in freckleton anyway, on the proposed sites as they are prone to flooding when we have alot of rain. It doesn't make any sense! Why can't you build them in the fields adjacent to the A584, between clifton fields & the warton airbase, where there are clearly no residential properties. I'm asking you, as one human being to another, to please reconsider building in this idyllic green belt land & destroying not only the landscape but people's livelihoods, & their way of life.   | document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0134_003_191123          | S44     | Email           | The farmland and wildlife that will be effected by this concerns me greatly. You have stated in your report that you will replant hedgerows etc... But these can take up to 30 years to regenerate. Where will the wildlife that lives in these hedgerows go? and shocks me that the substation will last 35 years (4.6.1.6) The substation will ruin our rural location and turn it into an industrial site. In this village we are lucky to have lots of wildlife including bats, redshanks, oystercatchers, great crested newts, and seval types of owls and kestrels.  | The potential impacts of the Transmission Assets on protected species and protected habitats are considered in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on onshore ecology and nature conservation are provided in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference: F3.3).  |
| TA_0136_001_201123          | S44     | Email           | I am opposed to the development for the following reasons: Destruction and disruption of important wildlife habitats on Lytham Moss and beyond for birds, bats, newts, deer etc. Destruction and disruption to public rights of way and Bridleways on Lytham Moss and beyond. Major disruption to very busy highways and access routes, including but not limited to Queensway, Kilnhouse Rd and the new Moss Road that is currently under construction. Destruction and disruption to private residences along the route, including potential compulsory purchase of private gardens and grazing land. The devaluing of private dwellings along and surrounding the development, spoiling green views and acreage.  | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0139_003_201123          | S44     | Email           | Morecambe & Morgan Wind Farm 3rd November 20231.) Please can you explain if these are our properties where the cable corridor will be in relation to these properties.2.) What noise pollution will be created by the installation of these cables and how will affect residents?3.) How will the air quality affect residents close to the cable corridor?4.) What measures will be taken to ensure are properties do not become infested with vermin during the creation of the cable corridor?5.) What is the predicted length of traffic management on Queensway?6.) What is the predicted effect on the water table during the creation of the cable corridor and what your proposal to mitigate the effect on the water table?7.) How and where will the cable corridor cross Queensway?8.) What noise will these cables create once installed and live?9.) What protection for wildlife will be in place. Wildlife on Lytham moss land and land edging Queensway (B5261), there are great crested newts, otters, bats, water voles, etc. as well as birds.10.) How will the dykes be protected from debris?11.) How will residents be update on progress and planned disruption?12.) Can you guarantee Division Lane will not be used to import Cable/equipment?13.) Will the heavy machinery drilling digging etc likely cause any damage to our homes? If so what's in place for the cost of repair?  | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0139_004_201123          | S44     | Email           | In additional to the above questions still not answered in writing as of 9th November the residents would like to ask the following questions after Monday 6th November Webinar.14.) Why was the first route for the substations and cables axed, I believe Penwortham was not the first option?15.) How wide is he Indicative onshore export cable corridor? (Light purple on Lytham Moss) and where is it going on an ordnance survey map. If it is 122m wide, where will it be crossing Queensway? Our questions have not been adequately answered on this.16.) What size are the substations and is there only 4? Will there definitely not be a Substation, Booster stations in Blackpool or Lytham St Anne's? If Morecambe substation Sub Station 12500 sq metres roughly 30 acres max height 20 Metres, and Morgan substation is 15 acres max height 20 Metres is the sites in Kirkham where they will be located?17.) If your proposed route is a Biologic Heritage Site for migrating birds would the project be stopped during migration? There are great crested newts, otters, bats, water voles, etc. as well as migrating birds such as pink foot geese and Whopper Swans.18.) Why have you asked some residents on the same street of Division Lane for details of people or organisations have interest in the land/ property, Mortgage / Charge, name of lender and mortgage reference and not others? Several residents own more than one piece of land and they have received 2 different letters why | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE) which no longer includes any surface piercing structures. This includes the removal of the Morgan Booster Station and associated search areas. The OSPs are to be classed as part of the Generation Assets applications only. Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). Properties on Division Lane border the draft Order Limits and so the Project has a duty to consult with those legal interests as part of the |

|                             |         |                 | <p>when these are generic letters? Is this because you are thinking of using your compulsory acquisition powers to acquire Land/Properties/Part of land in Blackpool, Lytham Moss, Lytham St Anne's? In the webinar on 6th November you stated you have to inform all interested parties but yet you are not asking all residents the same questions, is the mortgagee question because you want to come to a voluntary agreement to purchase land or property? 19.) Will the cabling create noise for residents similar to pylons?20.) How will you mitigate raising the water table?21.) There are only 3 routes in and out of Lytham St Annes from Blackpool and when one is shut you can sit in 45 minutes to an hour each way in delays if the Promenade or Queensway is shut effecting residents and businesses. If you are now proposing using Kilnhouse Lane, Leach Lane, Queensway and Blackpool Road North to install cable ducts, how long do you believe this work will take and how much disruption will it cause to residents and businesses. Queensway - Traffic management. This is the main arterial route into St Annes from Blackpool, extremely busy 40mph road.22.)How will you communicate with residents during construction? Please consider social media for project updates.23.) Can you guarantee Midgeland Road will not be used to import Cable/equipment?24.) Will bridal paths be out of use while installing the cable corridor?25.) Blackpool Council are also doing lots of alterations on Common Edge Road (EZ Zone <a href="https://blackpoolez.com">https://blackpoolez.com</a>), the drainage off these works are to go into a attenuation basin alongside Blackpool Airport, has this been considered in your planning for the cable corridor (<a href="https://pa.fylde.gov.uk/Planning/Display/23/0758">https://pa.fylde.gov.uk/Planning/Display/23/0758</a>).26.) The Lytham moss land is wet and very low lying. - could cause flooding to us on Division Lane how will this be combated.27.) What is the proximity of the cable corridor to properties on Division Lane.28.) How will you stop settlement on properties adjacent to the projects, path?29.) Fylde size of Division Lane is not connect to main drains and has Dykes and Septic Tanks either on our adjacent to properties, how will these be protected.30.) Is there a provision for cleaning Dykes once the project is finished, as when other project have been completed this has caused problems for residents and we as riparian owners have a responsibility to clear dykes, but we should not be expect to clear your waste into these dykes.On behalf of residents of REDACTED.</p> | <p>DCO application. To ensure the Applicant has consulted with all land interests, Dalcour Maclaren undertake land referencing to identify these interests through HMLR searches and Land Interest Questionnaires. This includes in some circumstances requesting information for any third-party interests in the land, details of which are outlined in the land referencing methodology. Some parties are asked to provide information about their interest prior to the project order limits being refined. This captures a wider area than ultimately necessary. Being asked for this information does not mean that you will be directly affected. Interest are identified by plot rather than address so any off lying land will be covered. We have a duty to consult all parties with an interest in land, a mortgage is effectively an interest and entitled to notification.</p>  |
| TA_0143_001_201123          | S44     | Email           | <p>My name is REDACTED of REDACTED and REDACTED. I have lived in Newton for 28 years, my husband and late father-in-law owned and operated a dairy farm on the site of North View, Grange Lane, Newton. I chose to live/reside in this location because it is rural and should remain rural. The siting of the substation on Zone 1 or any one of the proposed locations is extremely worrying. My concerns regarding these proposals are as follows:- Green Belt landPrime agricultural land, potentially rendering the land uselessIn an area of separationWay too close to two schoolsWay too close to residential propertiesFloodingVisual impactNoise, light, vibrationWildlifeCongestionDecreasing the value of land and propertySafety hazard Surely there must be other options available with far less intrusion on the whole of the Fylde.</p>  | <p>The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p>  |
| TA_0144_001_201123          | S44     | Email           | <p>I would like to take this opportunity during this public consultation period, to unequivocally object to your proposals and express my concerns over the proposed offshore wind farm cable routing and sub station locations within the Fylde coast. I believe this would have a grossly negative impact on the environment both physically, via the proposed work and visually, damaging an untold amount of wildlife and green belt protected land, conservation areas highly productive farmland and have a hugely detrimental impact on the wide community and local economy, putting local business, land owners and farmers out of business. I believe it would create an untold amount of suffering for residents within the Fylde coast for years to come via flooding and disruption to traffic.</p>  | <p>The Applicants are committed to robust and transparent public consultation as part of the development process. The Transmission Assets has undertaken three rounds of consultation with the local community, including two non-statutory periods of consultation (2 November to 13 December 2022 and 19 April to 4 June 2023) and a statutory consultation (12 October to 23 November 2023). Statutory targeted consultations have also taken place (November 2023 to October 2024). The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the SoCC). The Applicants have made design changes since the PEIR and further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). This has included refinements of the location and design of the 400 kV grid connection cable corridor and onshore substations, including - selection of a single site for the onshore substation for the Morecambe Offshore Windfarm: Transmission Assets- refinement of the siting and</p> |

|                             |         |                 |  | orientation of the onshore substation for the Morecambe Offshore Windfarm: Transmission Assets, to take into account consultation responses received. Details of the design and/or environmental constraints considered as part of the iterative design process, are set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |
| TA_0145_002_201123          | S44     | Email           | The non statutory consultation is also flawed. There was no information as to how the four location search zones were identified or selected. You have also not considered identified enterprise zones and brown field sites as identified by Fylde Borough Council. The PEIR obviously shows that you have predetermined the outcome in favour of zone 1, the RAG assessment is biased in favour of zone 1, with the rating being inconsistent, contradictory, subjective and factually incorrect. Below are some of the points which demonstrate this. High pressure gas main. The high pressure gas main only touches the extreme eastern edge of zone 2, this could be managed. This is not made clear. Flood risk – Inspection of flood zone maps shows there is little difference in flood risk between zones 1 and 2. This is not made clear. Zone 1 and zone 2 are roughly equidistant from SSSI so not a factor to differentiate siting as claimed. Bluefield solar farm development is not in zone 2, it is just in zone 1. Inconsistent treatment of wildlife concerns and surveys. Limited number of ornithological surveys used to inform RAG selection process for sites. Zone 1 lies within Kirkham/Newton area of separation zone and FBC green belt. This is not weighted appropriately in the RAG. Proximity to residential development is not factored in the RAG selection assessment for zones. | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0146_001_201123          | S44     | Email           | I would like to take this opportunity during this public consultation period, to unequivocally object to your proposals and express my concerns over the proposed offshore wind farm cable routing and sub station locations within the Fylde coast. I believe this would have a grossly negative impact on the environment both physically, via the proposed work and visually, damaging an untold amount of wildlife and green belt protected land, conservation areas highly productive farmland and have a hugely detrimental impact on the wide community and local economy, putting local business, land owners and farmers out of business. I believe it would create an untold amount of suffering for residents within the Fylde coast for years to come via flooding and disruption to traffic.  | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). |                             |         |                 |   | are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0151_006_201123          | S44     | Email           | My investigations show enormous concerns and implications to the village, not only to the residents but the local wildlife. Owls, hawks, buzzards, redshanks, oyster catchers, long tailed tits, bats, great crested newts and many more.   | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0183_002_221123          | S44     | Email           | In connection to the above, not only will your proposals force local farmers out of business, but will also involve cutting through field drainage systems, exacerbating flooding, and potentially affecting local communities as well as farmland. The displacement of water caused by the development will put homes at risk and ruin farmland for decades to come. Your proposed route also disrupts land of ornithological importance. Lancashire County Heritage Sites includes the area of Lytham Moss (Site Ref: 33SEW1) as a Biological Heritage Site, or "local wildlife site". The site comprises 283 hectares of farmland which it categorises as of ornithological importance. The land provides winter feeding ground for flocks of Pink-footed Geese and Whooper Swans with bird numbers exceeding 0.5% of the British wintering population. Furthermore, Lapwings, Corn Buntings and Skylarks are already endangered species which can be found on local farmland. This project would deprive these flocks of their natural habitat, while the prolonged human activity and noise pollution associated with this project would scare these flocks away for good. | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). The ES includes an assessment of the Transmission Assets alone in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). Details on the impacts on European sites from the Transmission Assets are contained within the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3). Both the ES and the ISAA consider construction impacts, including impacts on functionally linked land.   |
| TA_0188_007_221123          | S44     | Email           | Impact on wildlife We have had numerous ecological surveys carried out across our land and, whilst we have not had any feedback on the findings of these yet (despite this being promised at the time when the surveys were being carried out), we know for a fact that the land supports a huge number of bird species and varied wildlife. We regularly see barn owls, bats, swans, geese, brown hares and huge numbers of wild birds, and the destruction of all their habitats will be devastating. We will lose many of our ponds, ditches and hedges, all of which are a haven for wildlife. Whilst I appreciate that remedial work will take place after the building work is completed, I fear that it will be too late and many of these species will never return. When we suggested the viability of using the River Ribble estuary or the adjacent marshland as the cable route we were told that it cannot even be considered due to its status as a SSSI. Are the animals and birds that live at our farm less important than the birds living near the river?  | The potential impacts of the Transmission Assets on protected species and protected habitats are considered in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on onshore ecology and nature conservation are provided in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference: F3.3). The ES includes an assessment of the Transmission Assets alone in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). Details on the impacts on European sites from the Transmission Assets are contained within the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3). Both the ES and the ISAA consider construction impacts, including impacts on functionally linked land. The Ribble estuary has numerous ecological statutory designations protected nationally and internationally. These include the Liverpool Bay Special Protection Area, Ribble and Alt. Estuaries Special Protection Area, the Ribble and Alt Estuary Ramsar site (a wetland of international importance under the Ramsar Convention), and the Ribble Estuary Site of Special Scientific Interest, Ribble Estuary Marine Conservation Zone and Ribble Estuary National Nature Reserve. The tidal nature and shallow water depths of the estuary also create heightened risk to construction as the unstable riverbed conditions are unsuitable for trenching/ cable laying vessels to access. As such, cabling through the estuary would result in significantly protracted construction timeframes, and potentially long-term impacts to sensitive and sensitive features associated with the designated features, whilst also presenting higher risk and potentially unsafe working conditions. As such, the approach to site selection has been based on avoiding direct impacts to Important Ecological Features (IEFs) where practicable, further details can be found in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4). |

| TA_0202_005_221123          | S44     | Email           | Mitigation If these supposed mitigation sites, go ahead we most certainly not farm, or use are land as we would like too. We love our wildlife and have all sorts of creatures upon it. We have barn owls, long eared owls, tawny owls, and bats. We have water voles, greater crested newts (in places) . Deer, pink footed geese, swans, and a few years ago a puma was sited for several years in our Christmas Trees. We have lapwings, field fares, curlews and many other species. There is no reference or proposals to the type of mitigation you require! | The potential impacts of the Transmission Assets on protected species and protected habitats are considered in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES.Measures adopted as part of the Transmission Assets to mitigate potential impacts on onshore ecology and nature conservation are provided in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference: F3.3)   |
| TA_0211_004_231123          | S44     | Email           | 9 I am concerned about environmental damage to wildlife that has made its home on my land. We have a number of kestrels, lapwing, sparrowhawks and owl species. Shoveler ducks as well as various mammals, invertebrates, and Great Crested Newts. I understand that there is to be 'environmental mitigation' of the damage caused. This may involve taking additional prime agricultural land out of food production and therefore making our arming business potentially even more unviable.  | The potential impacts of the Transmission Assets on protected species and protected habitats are considered in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES.Measures adopted as part of the Transmission Assets to mitigate potential impacts on onshore ecology and nature conservation are provided in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference: F3.3).The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes the preparation of a Soil Management Plan in general accordance with the Outline Soil Management Plan (document reference: J1.7), which has been submitted with the DCO application. The measures to be implemented as part of the Soil Management Plan seek to minimise impacts on soil health and protect and maintain soil quality during construction of the Transmission Assets.These measures also comprise the preparation of a Code of Construction Practice in general accordance with the Outline Code of Construction Practice (document reference J1) submitted with the DCO application. The measures to be implemented as part of the Code of Construction Practice seek to limit disruption to the operation of individual farm holdings. |
| TA_0222_016_231123          | S44     | Email           | Question 3.4 Our client's development incorporates an undertaking to implement, or procure the implementation of, the Queensway Bird Hazard and Control Plan, mitigating the risk of hazardous bird activity in the flight path of Blackpool Airport. It is considered that the proposed construction of the scheme, and/or the BNG requirements resulting therefrom must not adversely impact on the ability of our clients to deliver their undertakings under the Queensway Bird Hazard and Control Plan, or place additional burden on them in doing so.       | The Transmission Assets design has resulted in a reduced construction corridor width, as set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Details of the factors considered during the design evolution are set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).  |
| TA_0225_025_231123          | S44     | Email           | Newton Marsh SSSI Newton Marsh SSSI does not feature in pretty much any of the PEIR documentation and isn't listed in the table of SSSI Sites ! There is brief mention of breeding godwits but then completely disregarded in any determination in favour of Zone 1 ?Newton and Freckleton Marshes are both managed by RSPB. These wind farm projects highlight both marshes for potential Biodiversity Net Gain which is a ludicrous proposal given their current nature conservation status together with approximately 50% of this land mass being a SSSI.      | An iterative EIA process has been used to avoid impacts where practicable, in addition to mitigating remaining impacts. The design at the onshore substations is set out in the Outline Landscape Management Plan (document reference J2). The ES describes effects on landscape character and visual resources during construction, operation and maintenance and decommissioning during the day and at night and winter/summer without mitigation and residual effects with mitigation. The landscape and visual assessment (Volume 3, Chapter 10: Landscape and visual resources of the ES) (document reference F3.10) is based on the maximum design scenario to minimise likely effects.Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) has been prepared and will be submitted as part of the application for development consent. The impact on the SSSIs has been provided in section 3.1.2 and section 3.11.3 of Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).An assessment of the impacts and effects of the Transmission Assets has been undertaken within the ES, including the  |

## E1.16.20 Historic environment table of responses

## E1.16.20.1 Historic environment table of responses (via feedback form)

**Table E1.16.20.1: Historic environment responses (feedback form)**

As set out in section 4.7.4 of the Consultation report (document reference E1). Responses have been allocated to the most appropriate topic(s). If a consultee did not provide a response for a question/sub-question this is not recorded. If a consultee included 'N/A', 'none', 'no comment', 'Nil', 'No', in response to a question, this has also not been recorded. Where a consultee provided a response associated with this sub-question (3.5; Historic environment) but was not related to this topic, this has been included below, as well as against any other appropriate topic(s). Where a consultee provided a response which stated 'see response above' or similar, the response has been replicated in brackets and italics.

| Unique Reference Identifier | S42/S44 | Feedback method      | Feedback form question | Feedback form sub - question | Statutory consultation response received   | Applicants' response  |
|-----------------------------|---------|----------------------|------------------------|------------------------------|--|---|
| TA_0051_005_211123          | S44     | Online feedback form | 3                      | 3.5                          | Please see 3.3 above<br><i>(I strongly object to the proposals to route the transmission cable adjacent to land and properties on REDACTED, Blackpool. The suggested 100+ metre wide corridor, which it has been proposed would be necessary to lay the transmission cable, seems unduly large, and would have a negative effect on the land bordering our properties, with an impact on the already over-stretched natural drainage systems, disturbance during construction with traffic and noise pollution, and a permanent destruction of the natural habitat of the many animals and birds whose home is in the wooded areas surrounding our land.)</i>  | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The Transmission Assets design has resulted in a reduced construction corridor width, as set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Details of the factors considered during the design evolution are set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |
| TA_0055_002_051123          | S44     | Online feedback form | 3                      | 3.5                          | Blackpool Airport is an historical important airport and a popular airport for local training of pilots.<br><br>The airport is the 20th busiest in the UK and it is not understood how a trench of such size can be accommodated if it is to be over 250 metres from human habitation (ideally at the very least 500 metres). Notwithstanding that the proposed trench is unconventionally shallow , I am not sure if this is cost saving or the fact the land is marsh like in many cases - has the impact to the airport been considered and is the prohibitions/ordinances on the use of airport land fully covered?<br><br>Electromagnetic radiation - has this been considered for usage of this airport? | The effects of EMF on navigation aids are assessed in Volume 3, Chapter 11: Aviation and radar of the ES (document reference F3.11). This includes consideration of impacts on the operation of the airport and impacts in relation to EMF.   |
| TA_0056_017_141123          | S44     | Online feedback form | 3                      | 3.5                          | As previously stated<br><i>("This I feel is deliberately written in such language that the regular lay person cannot possibly understand what it means. Until its explained in plain English, I will object about it. I cannot aggressive to what I don't fully understand may or may not affect me and my property.")</i>   | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. In order to ensure the consultation information was available to as many people as possible, many different methods were used, including but not limited to a website, newsletter, postcards, consultation brochure, deposit locations, webinar and in-person events (a full list of materials produced for the consultation can be found in the Consultation Report (document reference E1). The Applicants aimed to ensure that it was clear how people could have their say, but also how to get in touch with the Transmission Assets team to find out more information.<br>The Applicants provided documents for the statutory consultation,  |

| Unique Reference Identifier | S42/S44 | Feedback method         | Feedback form question | Feedback form sub - question | Statutory consultation response received   | Applicants' response  |
|-----------------------------|---------|-------------------------|------------------------|------------------------------|--|---|
|                             |         |                         |                        |                              |  | including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the Statement of Community Consultation).   |
| TA_0060_007_151123          | S44     | Online feedback form    | 3                      | 3.5                          | The sand dunes and surrounding coastline in this area is a conservation area so must be protected.   | Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3) assesses the impacts on Lytham St. Anne's Dunes SSSI.   |
| TA_0066_005_171023          | S44     | Online feedback form    | 3                      | 3.5                          | Any historic buildings or sites must be protected.   | The Transmission Assets team has worked closely with the HET at Lancashire County Council and with Historic England to ensure that adverse effects on the historic environment have been avoided, reduced or offset wherever possible. The assessment of residual effects is set out within section 5.11 of Volume 3, Chapter 5: Historic environment of the ES (document reference F3.5).  |
| TA_0068_002_231123          | S44     | Hard Copy Feedback Form | 3                      | 3.5                          | Lots of properties are around 100 year old, boundary walls are built with brick (possible Accrington bricks). How will you ensure that you return everything back?   | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The project team has worked closely with the HET at Lancashire County Council and with Historic England to ensure that adverse effects on the historic environment have been avoided, reduced or offset wherever possible. The assessment of residual effects is set out within section 5.11 of Volume 3, Chapter 5: Historic Environment of the ES (document reference F3.5).   |

Specific consultation will need to be carried out for any direct impacts with the local community.  | Under section 42 of the Planning Act 2008, local planning authorities and Historic England are considered statutory consultees and the Applicants consulted them as such. The project team has worked closely with the HET at Lancashire County Council and with Historic England to ensure that adverse effects on the historic environment have been avoided, reduced or offset wherever possible. The assessment of residual effects is set out within section 5.11 of Volume 3, Chapter 5: Historic environment of the ES (document reference F3.5). The Applicants are committed to working with local communities that may be impacted by the Transmission Assets and will continue to work closely with all stakeholders. |
| TA_0098_006_081123          | S44     | Online feedback form   | 3                      | 3.5                          | There is a Roman settlement in Kirkham.<br><br>Very close to the substations supposedly being built.   | The Transmission Assets team has worked closely with the HET at Lancashire County Council and with Historic England to ensure that adverse effects on the historic environment have been avoided, reduced or offset wherever possible. The assessment of residual effects is set out within section 5.11 of Volume 3, Chapter 5: Historic environment of the ES (document reference F3.5). Section 5.6 of Volume 3, Chapter 5: Historic environment of the ES (document reference F3.5) describes the archaeological potential based on current information.   |
| TA_0111_006_131123          | S44     | Hardcopy feedback form | 3                      | 3.5                          | The Nature Reserve is an historic environment enjoyed daily by many people. Apparently according to your staff, the public may not have access during construction. The medieval village of Kilgrimol was in the area of the Nature Reserve and Golf Course.   | The Transmission Assets team has worked closely with the HET at Lancashire County Council and with Historic England to ensure that adverse effects on the historic environment have been avoided, reduced or offset wherever possible. The assessment of residual effects is set out within section 5.11 of Volume 3, Chapter 5: Historic environment of the ES (document reference F3.5). Section 5.6 of Volume 3, Chapter 5: Historic environment of the ES (document reference F3.5) describes the archaeological potential based on current information.   |
| TA_0113_001_151123          | S44     | Online feedback form   | 3                      | 3.5                          | We live in a listed building - REDACTED and do not consider that the proposed compound behind our house or the potential siting of the substations are appropriate for the environs of a listed building. The property was built circa 1777 and we are very concerned that the cable corridor in the field close to our property will have an impact on the structure of the building.   | The project team has worked closely with the HET at Lancashire County Council and with Historic England to ensure that adverse effects on the historic environment have been avoided, reduced or offset wherever possible. The assessment of residual effects is set out within section 5.11 of Volume 3, Chapter 5: Historic Environment of the ES (document reference F3.5).   |
| TA_0115_001_051123          | S44     | Online feedback form   | 1                      |                              | I reside on REDACTED off REDACTED in St Annes. Whilst I am in support of increasing access to renewable energy, I am deeply concerned about the disruption this project will have on where I live, and the negative impact on the value of my property.<br><br>We have had to endure 6 years of living on a building site whilst completing the estate on which I live (which should be complete by year end) to then hear we could be faced with further construction in the immediate area was | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4)  |

| Unique Reference Identifier | S42/S44 | Feedback method | Feedback form question | Feedback form sub - question | Statutory consultation response received  | Applicants' response  |
|-----------------------------|---------|-----------------|------------------------|------------------------------|---|---|
|                             |         |                 |                        |                              | <p>very deflating. Not only that, but REDACTED has had relentless disruption over last few years with the expansion of the cycle lane etc and with clifton drive being just one of two entries into St Annes the impact to residents and tourism has been massive. So to hear drilling would have to go underneath (and therefore road closure) is just something that is going to cause immense frustration to the residents.</p> <p>My property overlooks the airport and an empty space between the 2 coastal dunes sites which was described as a no build zone because of the flight path from the airport. On the other side of our estate (towards St Annes) is a conservation area which we hope is not going to be disturbed. That on top of the sand dunes also being part of a conservation project, I cannot support the laying of the cables in the proposed area.</p> | <p>and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p> |

## E1.16.20.2 Historic environment table of responses (via all other methods)

**Table E1.16.20.2: Historic Environment table of responses (via all other methods)**

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response  |
|-----------------------------|---------|-----------------|--|---|
| TA_0002__007_221123         | S42     | Email           | Further, there is a historic burial ground situated at what is now known as Quakers Wood, which is marked on the Freckleton Tithe map of 1838. The latest burials here took place in the late 19th century. However, on the other side of Lower Lane opposite Quakers Wood, there are two other Burial Yards marked. These are extensions to the Burial Ground that were used to bury members of the Quaker community in Freckleton once the Burial Ground was full.   | The historic area around Quakers Wood has been subject to further review following comments received as part of the statutory consultation. This information is presented within in Volume 3, Annex 5.1: Historic environment desk-based assessment of the ES (document reference F3.5.1). The nature of the proposed works in this area are set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3)  |
| TA_0017_014_231123          | S42/S44 | Email           | Surveys Survey data submitted with the planning application should be current/up-to-date, in line with recognised guidelines (as summarised above). The survey area should include: • The intended location of the development footprint; • Potential working areas, compounds, storage areas and access routes; • Any land that may be used within the mitigation, compensation or biodiversity net gain proposals (on or off-site); • A suitable buffer distance, taking account of the likely zone of influence and relevant survey guidelines. | The survey area is the area used for site-specific surveys and is generally defined as a 150 m buffer around the Onshore Order Limits. The 150 m buffer was included to take account of protected species that may occur adjacent or close to the Transmission Assets and to allow for evolution of the boundary during the site selection process. A separate survey area was used for GCN surveys. The GCN survey area is defined as a 250 m buffer around the Onshore Order Limits. Volume 3, Annex 3.8: Great crested newt survey and reptile survey technical report of the ES (document reference F3.3.8) provides further details regarding the GCN survey area. Owing to the iterative design process of the Transmission Assets, some surveys were undertaken further than 150 m from the Onshore Order Limits. Nevertheless, information from these surveys have been included in technical annexes because it provides context regarding the ecological sensitivity of the wider area. |
| TA_0017_038_231123          | S42/S44 | Email           | Historic Environment The HET will not be providing any detailed comment on the geoarchaeological survey as this is an that lies outside our professional competence, and we would in any case defer to the opinions expressed by Historic England's Regional Science Advisor. The HET's SLA with the relevant LPAs does not include provision to offer advice on the impact of proposals on the setting of designated heritage assets. We would defer in this matter to the relevant LPA Conservation Officers and/or Historic England.            | The Applicants note your response.  |
| TA_0017_039_231123          | S42/S44 | Email           | My comments are therefore as follows:<br>Preliminary Environmental Information Report, Volume 3, Chapter 5: Historic environment<br>• I note the use of both non-designated and undesignated throughout the PEIR, it should be non-designated, except of course where it is being quoted from another document.  | This correct terminology is used throughout the ES, including the Annexes.  |
| TA_0017_040_231123          | S42/S44 | Email           | • p. 5, Table 5.1 in the section How and where considered in the PEIR – Field evaluation has been undertaken should more accurately read "Limited and, as yet, non-intrusive field evaluation has been undertaken".  | Further survey work has been undertaken. Section 5.6 of Volume 3, Chapter 5: Historic environment of the ES (document reference F3.5) sets out the current situation regarding field evaluation. Further details are provided in Volume 3, Annex 5.2: Onshore archaeological geophysical survey report and 5.6: trial trenching report of the ES (document references F3.5.2 and F3.5.6).   |
| TA_0017_041_231123          | S42/S44 | Email           | p. 12 – the lack of a full walkover is a problem. This is an important part of any assessment, as it has the potential to identify previously unknown sites of interest. See my comments below in relation to the DBA.   | Section 5.6 of Volume 3, Chapter 5: Historic environment of the ES (document reference F3.5) sets out the current situation regarding the walkover survey. It is noted that the geophysical survey was agreed to be used as a proxy for the walkover, where access allowed.   |
| TA_0017_042_231123          | S42/S44 | Email           | • p. 19, 5.4.4.4-5.4.4.8 – Site specifics surveys. As the assessment is yet to be finished, it should be acknowledged that the current stated archaeological potential of the proposals may therefore change.  | Section 5.5 of Volume 3, Chapter 5: Historic environment of the ES (document reference F3.5) sets out the current situation regarding field evaluation, whilst section 5.6 describes the archaeological potential based on current information. This takes into account surveys undertaken for the ES.  |
| TA_0017_043_231123          | S42/S44 | Email           | 5.5.1.1. – I have no record of being consulted as to the content of the DBA, and this is the first time we have had sight of the DBA (it is subject to separate comments that follow these).   | The desk-based assessment has been updated following comments received as part of the statutory consultation and also from additional research and fieldwork. It is presented as Volume 3, Annex 5.1: Historic environment desk-based assessment of the ES (document reference F3.5.1) and is summarised in section 5.6 of Volume 3, Chapter 5: Historic environment of the ES (document reference F3.5).   |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response  |
|-----------------------------|---------|-----------------|--|---|
| TA_0017_044_231123          | S42/S44 | Email           | 5.5.5.3 – inconsistent, and therefore incomplete use of PRNs, this doesn't make it easy to cross-check.  | This has been updated within section 5.6 of Volume 3, Chapter 5: Historic environment and also within Volume 3, Annex 5.1: Historic environment desk-based assessment of the ES.  |
| TA_0017_045_231123          | S42/S44 | Email           | p. 40, Table 5.13 – Are the Low & Negligible Sensitivity definition/examples meant to be the same?   | This was an error which has now been corrected within Table 5.12 of Volume 3, Chapter 5: Historic environment of the ES (document reference F3.5).  |
| TA_0017_046_231123          | S42/S44 | Email           | p. 42, Table 5.15 – Surely the negligible column for magnitude of impact on a Very High sensitivity receptor should be Minor or Moderate, not just Minor.  | This has now been corrected within Table 5.13 of Volume 3, Chapter 5: Historic environment of the ES (document reference F3.5).   |
| TA_0017_047_231123          | S42/S44 | Email           | 5.9.2.6 – Why is the potential here considered to be very low?   | This has been reconsidered. Section 5.6 of Volume 3, Chapter 5: Historic environment of the ES (document reference F3.5) describes the archaeological potential based on current information.   |
| TA_0017_048_231123          | S42/S44 | Email           | 5.9.2.12 – preferably ahead of construction, but if as part of construction, still ahead of the actual construction work.  | Yes, other than where the proposed programme of further archaeological work includes archaeological monitoring during construction. The proposed programme of further archaeological work is set out in the Outline Onshore and Intertidal Written Scheme of Investigation (document reference J9).   |
| TA_0017_049_231123          | S42/S44 | Email           | 5.9.2.13 – Surely a permanent and irreversible impact should be assessed as being high, even if the receptor is of a low significance.   | The magnitude of impact includes consideration of the spatial extent of the archaeological site or the deposit of geoarchaeological interest i.e., if a deposit extends or is likely to extend over a wide area and the impact of the proposed development on that deposit it within a small part of that extent, then the magnitude of impact may be low or even negligible. |
| TA_0017_050_231123          | S42/S44 | Email           | 5.9.4.7 – On the basis of what evidence?   | Section 5.6 of Volume 3, Chapter 5: Historic environment of the ES (document reference F3.5) describes the archaeological potential based on current information.   |
| TA_0017_051_231123          | S42/S44 | Email           | 5.9.5.11 – The preparation of the Outline Landscape Management Plan in itself will not reduce the overall impact and effect, but that will rather be achieved through the implementation of the proposed mitigation measures, whatever they might be.  | The embedded mitigation is set out in Table 5.9 of Volume 3, Chapter 5: Historic environment of the ES. See also the Outline Landscape Management Plan (document reference J2).   |
| TA_0017_052_231123          | S42/S44 | Email           | 5.14.1.3 – This statement is considered to be somewhat premature – the non-intrusive archaeological surveys of the site remain to be completed, and no intrusive work has yet to be undertaken. Indeed the word 'unknown' appears 17 times in the document. I would suggest that it therefore cannot be said, at the moment, there will be no significant effects, but rather that none has so far been identified.<br>Consequently I would refer you to 5.9.2.8 "As survey work is ongoing, the potential discovery of features or deposits of national importance during construction cannot be entirely ruled out. At this stage when surveys are yet to be completed, the sensitivity of the receptor is therefore considered to be unknown." The HET would consider this to be a better starting point from which to operate, and could be accompanied by a statement of intent such as "appropriate mitigation measures, such as open-area archaeological excavation and recording, where necessary, will be undertaken to reduce the impact and effects on the receptor(s) to an acceptable level." | The assessment presented within section 5.6 of Volume 3, Chapter 5: Historic environment of the ES (document reference F3.5) has been updated since publication of the PEIR and is based on all available information, including further surveys undertaken during 2024.  |
| TA_0017_053_231123          | S42/S44 | Email           | We would also advise that consideration, even at this early stage, should be given to the wider social benefits of the archaeological works that could be achieved through activities such as educational visits and public open days, if warranted and practicable, being offered to the local public and the results, if necessary, being disseminated to as wide an audience as possible through talks to interested local groups, publication in a regional journal and/or a monograph, such as that produced for the Heysham to M6 Link – From Mesolithic Encampment to Medieval Estate: The Archaeology of the Bay Gateway (OAN, 2018).  | The Applicants agree and further information on this is presented within the Outline Onshore and Intertidal Written Scheme of Investigation (document reference J9).  |
| TA_0017_054_231123          | S42/S44 | Email           | 5.15.1.1 – Given the poor quality of the extant BGS data and the high level of geoarchaeological potential across the proposed development the suggested further works would seem entirely reasonable and necessary.   | The Applicants note your response.  |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received  | Applicants' response   |
|-----------------------------|---------|-----------------|---|--|
| TA_0017_055_231123          | S42/S44 | Email           | 5.15.1.5 – The intention to carry out the works as recommended in 3.2.1.2 of the Intertidal archaeological survey report is noted. Preliminary Environmental Information Report, Volume 3, Annex 5.1 Historic Environment desk based assessment   | The proposed programme of intertidal survey is set out in the Outline Onshore and Intertidal Written Scheme of Investigation (document reference J9).  |
| TA_0017_056_231123          | S42/S44 | Email           | I have no record of the HET being consulted on the content of the DBA, but we had expected that section 3.2.4 would be followed.<br><br>"For desk-based assessment within the planning framework, a brief/project outline will usually be prepared by the planning archaeologist or curator and issued by the commissioning body or their agents. The brief/project outline or a specification may be prepared by the commissioning body or their agents, but should be agreed in advance with the planning archaeologist.", or that the HET would at least be able to see a draft version prior to its publication.                            | This was discussed at the Expert Working Group (EWG) in February 2024. The comments raised and the responses from the EWG are summarised in Volume 3, Chapter 5: Historic environment of the ES (document reference F3.5).   |
| TA_0017_057_231123          | S42/S44 | Email           | 1.2.3.1 – This is not the latest version of the ClfA Standard & guidance for Archaeological Desk Based Assessment, subject to minor revision in 2020.   | The most up-to-date versions of the ClfA guidance documents are now referenced within Volume 3, Annex 5.1: Historic environment desk-based assessment of the ES (document reference F3.5.1).   |
| TA_0017_058_231123          | S42/S44 | Email           | 1.2.3.3 – What is meant by good coverage? Which parts of the redline boundary weren't accessed during the site visit? What records are there for the site visit? Why aren't those areas mapped? A walkover of the whole of the site is usually a standard requirement the HET expects contractors to work to, but in this instance, given the large land-take (and possible access issues) it might be best undertaken once the route has been finalised (see also my comments above in relation to Vol. 3, Chapter 5).   | Land within the onshore export cable corridor, the 400 kV grid connection corridor and the onshore substation sites has now been subject to geophysical survey and/or walkover survey where access was available. Further information on this is set out within Volume 3, Annex 5.1: Historic environment desk-based assessment of the ES (document reference F3.5.1).                                   |
| TA_0017_059_231123          | S42/S44 | Email           | The reproduction of the tithe maps should be such that the numbers are legible, and they should be accompanied by the apportionments. A list of potentially significant sites identified by the field names accompanied by their mapping would be helpful.  | Agreed. The information regarding the tithe maps is set out in Appendix G of Volume 3, Annex 5.1: Historic environment desk-based assessment of the ES (document reference F3.5.1), with the tithe maps reproduced in Appendix G of that annex.  |
| TA_0017_060_231123          | S42/S44 | Email           | 4.1.1.7 – Mesolithic to Bronze Age sites could be of regional or even national significance/importance, but no level of significance/importance has been given to those of an Iron Age/Romano-British date in 4.1.1.9.  | The relevant text within Volume 3, Annex 5.1: Historic environment desk-based assessment of the ES (document reference F3.5.1) has been updated.   |
| TA_0017_061_231123          | S42/S44 | Email           | 4.1.1.10 – We would suggest that Medieval sites should be considered to have the potential to be of regional or national rather than local significance/importance.   | The relevant text within Volume 3, Annex 5.1: Historic environment desk-based assessment of the ES (document reference F3.5.1) has been updated.   |
| TA_0017_062_231123          | S42/S44 | Email           | 4.1.1.11 – Do I take it from the absence of any mention of any potential for sites dating to the Post-medieval or later periods of any significance/importance to be found that none are anticipated?   | The relevant text within Volume 3, Annex 5.1: Historic environment desk-based assessment of the ES (document reference F3.5.1) has been updated.   |
| TA_0017_063_231123          | S42/S44 | Email           | There is no mention of the North West Regional Research Framework (NWRRF) research questions that the project has the potential to address, despite the fact that the NWRRF has been included in the Bibliography.  | The relevant text within Volume 3, Annex 5.1: Historic environment desk-based assessment of the ES (document reference F3.5.1) has been updated.   |
| TA_0017_064_231123          | S42/S44 | Email           | The Figures do not have the full title of the mapping used, e.g. Yates' 1786 map has the title The county Palatine of Lancaster, 1842 Ordnance Survey Map (this is missing whether this is the published or surveyed date, the Sheet No., edition & scale).   | The relevant text within Volume 3, Annex 5.1: Historic environment desk-based assessment of the ES (document reference F3.5.1) has been updated.   |
| TA_0017_065_231123          | S42/S44 | Email           | Preliminary Environmental Information Report, Vol 3, Annex 5.2: Onshore archaeological geophysical survey report<br><ul style="list-style-type: none"> <li>• A1 Table of Survey Considerations – No survey areas 30 &amp; 31</li> <li>• No list of figures</li> <li>• No figures 22 &amp; 23</li> <li>• Figures 20 &amp; 21 – Area 30 shown simply as text</li> <li>• No figures showing area 31</li> <li>• The report is however considered to have identified a number of areas which will require a further stage of archaeological investigation (trial trenching) should they be directly impacted by the proposed development.</li> </ul> | The results of the full programme of geophysical survey are presented within Volume 3, Annex 5.2: Onshore geophysical survey report of the ES (document reference F3.5.2)<br>A programme of archaeological investigation by way of trial trenching has been agreed with the HET at Lancashire County Council. The locations of the trial trenches are informed by the results of the geophysical survey. |

| TA_0017_066_231123          | S42/S44 | Email           | Preliminary Environmental Information Report, Vol 3, Annex 5.3: Intertidal archaeological survey report• The recommendations for further work seem to be both appropriate and necessary.  | The Applicants note your response.   |
| TA_0017_067_231123          | S42/S44 | Email           | Preliminary Environmental Information Report, Vol 3, Annex 5.4: Geoarchaeological desk-based assessment report<br>• The recommendations for further work seem to be both appropriate and necessary.   | The Applicants note your response.   |
| TA_0017_068_231123          | S42/S44 | Email           | The above should however not be taken as an indication that the HET is unhappy with the methodology being followed. The mitigation proposed in Table 5.12 of Volume 3, Chapter 5 is considered to be appropriate and does contain within it the means to ensure that proportionate measures will be employed to mitigate any adverse impacts on the archaeological resource that might result from the proposals.   | The Applicants note your response.   |
| TA_0018_001_061123          | S42     | Email           | Advice These proposed windfarms will not have a direct impact on any historic assets in Wales or in Welsh waters. The nearest any of the masts will be to the Welsh coast is over 50km away. As such it would be only in exceptional circumstances (if then) that the windfarms will be visible from Wales and therefore we do not envisage that the proposed wind farms will have any significant impact on the settings of any designated historic assets in Wales.   | This response appears to relate to the Morgan Offshore Wind Project and/or the Morecambe Offshore Windfarm (the generation assets), which are subject to separate applications for development consent.  |
| TA_0019_019_231123          | S42/S44 | Email           | The character of Newton-with-Scales as a small rural village will be irreparably damaged if consent is given for the proposed development. The character of the village which should be protected was outlined by Fylde Borough Council in its opposition to the residential development at Woodlands Close. This initiative will have a greater impact. There are four Grade 2 listed heritage buildings along Grange Lane to the south of Newton-with-Scales. This would be a major change adversely impacting a rural setting by being surrounded by an industrial landscape. Some listed buildings will have an uninterrupted line of sight to the south substation option. The main footprint of the village will be reduced by the substations, and the construction phase will impact on the lives of villagers for a number of years. The AOS in the Fylde Local Plan was to help protect the character of the village. This large-scale industrial energy generation will indisputably have an adverse impact on the agricultural and rural character of the area.   | Impacts and effects in relation to the historic environment, including listed buildings, are set out in section 5.11 of Volume 3, Chapter 5: Historic environment of the ES (document reference F3.5). No significant effects on listed building have been identified. Impacts and effects on landscape character and views are set out in section 10.11 of Volume 3, Chapter 10: Landscape and visual resources of the ES (document reference F3.10). Land covered by the Area of Separation policy is no longer required for the onshore substations.  |
| TA_0035_077_221123          | S42/S44 | Email           | CoT33An Outline Code of Construction Practice (CoCP) will be prepared and submitted with the application for development consent. CoCP(s) will be developed in accordance with the outline CoCP. The CoCP will include best practice measures in relation to air quality that will be applied where human receptors reside within 350 m of works, where required, or where sensitive ecological receptors are present within 50 m, as described in Institute of Air Quality guidance Management (IAQM,2014) as appropriate.IssueMeasures required to manage dust and airquality have yet to be fully addressed.ImpactRisk to sensitive ecological receptors frompoor air quality.SolutionOutline Dust Management Plan setting out dust and air quality control measures to be appended to Outline CoCP and secured in the DCO submission.   | An Outline Dust Management Plan is provided as part of the application for development consent (document reference J1.2).  |
| TA_0035_078_221123          | S42/S44 | Email           | CoT35,An Outline Code of Construction Practice (CoCP) will be prepared and submitted with the application for development consent. |-----------------------------|---------|-----------------|---|--|
| TA_0046_001_171123          | S44     | Email           | I would like to express my concerns regarding the work that passes our farm on REDACTED. We have 25 horses here and the horses hack out daily around the area the hassle this work is going to cause our business could see us close. I would like to know what efforts you're going to make not to affect the wellbeing of our customers and their horses. From the rare breed of Suffolk Punch and competition horses they need daily exercise, a great deal of care and access to the farm is required at all time.  | Impacts and effects on recreational users (including horse rides) and public rights of way are set out in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Details of the management of these routes during construction are set out in the Outline Public Rights of Way Management Plan (document reference J1.5).   |
| TA_0049_019_231123          | S42     | Email           | <u>Volume 3, Chapter 5 Historic environment</u><br>Table 5.13 (Sensitivity criteria) grade II listed buildings are identified as being of Medium sensitivity. We disagree with this as grade II listed buildings are considered to be nationally significant and, therefore, warrant identification as being of High sensitivity.   | National planning policy as set out in the NPPF (paragraph 206) and in NPS EN-1 (paragraphs 5.9.29 and 5.9.30) makes a clear distinction between designated heritage assets of the highest significance (including grade I and II* listed buildings) and other designated heritage assets (including grade II listed buildings). The sensitivity or value of heritage assets as used within the assessment methodology set out in Table 5.1 of Volume 3, Chapter 5: Historic environment of the ES (document reference F3.5) reflects that distinction.  |
| TA_0049_020_231123          | S42     | Email           | Section 5.5.4 (Site-specific surveys) It is noted that the result of the geophysical surveys presented in Volume 3, Annex 5.2 represent work undertaken up to the end of June 2023. It is also noted that geophysical surveys are ongoing and aim to examine all relevant land as appropriate.  | Magnetometer surveys have been undertaken across land within the onshore export cable corridor, the 400 kV grid connection corridor and the onshore substation sites where the land use is suitable for this technique and where access has been available. The extent of the magnetometer survey is indicated in Volume 3, Annex 5.2: Onshore archaeological geophysical survey report of the ES (document reference F3.5.2).   |
| TA_0049_021_231123          | S42     | Email           | Table 5.4 It is noted that purposive fieldwork will be undertaken leading to the production of geoarchaeological deposit models as appropriate, the results of which will be reported in the ES. It would be beneficial to see the WSI for the proposed works based on the geoarchaeological desk-based assessment (DBA) and subsequent results.  | The WSI for the programme of trial trenching and geoarchaeological investigation was agreed in advance with Historic England. The methodologies for any further fieldwork aimed at retrieving information to assist in the production of geoarchaeological deposit models will be agreed in advance with Historic England.   |
| TA_0049_022_231123          | S42     | Email           | Section 5.4.4.5 It is noted that geophysical survey will be carried out within the export cable route area and that land identified as having potential for geoarchaeological deposit modelling will not be subjected to surface geophysical survey. It would be beneficial to understand the reasoning behind this choice of survey area; for instance, is it highlighting areas of deep alluvium that will form part of the deposit model but made up of sediments that will mask any features normally picked up in the geophysical survey? It is usually advised to carry out geoarchaeological surveys before geophysical surveys in order to understand the geology, sediments and topography of the area before further surveys are chosen. Section 5.15 We support a further phase of intertidal surveys following refinement of the cable route in the form of a borehole survey to examine the potential for deposits of geoarchaeological and/or palaeoenvironmental interest.   | Magnetometer surveys have been undertaken across land within the onshore export cable corridor, the 400 kV grid connection corridor and the onshore substation sites where the land use is suitable for this technique and where access has been available. The extent of the magnetometer survey is indicated in Volume 3, Annex 5.2: Onshore archaeological geophysical survey report of the ES (document reference F3.5.2). Other techniques have been utilised in the investigation of the archaeological and geoarchaeological potential of areas of former wetland. These techniques were agreed with Historic England and the HET at Lancashire County Council. The proposed programme of intertidal survey is set out in the Outline Onshore and Intertidal Written Scheme of Investigation (document reference J9). |
| TA_0049_023_231123          | S42     | Email           | <u>Vol 3 Annex 5.4 Geoarchaeological desk-based assessment report</u> We welcome the thorough Geoarchaeological DBA that has highlighted the potential of palaeoenvironmental organic remains and stratigraphic sequences that could contribute to a deposit model for the study area. It has been identified that much of the existing British Geological Survey (BGS) borehole data is inadequate, reiterating the importance of carrying out further Geotechnical Investigation (GI) works and geoarchaeological prospection across the area. We support recommendations that a watching brief on planned GI works would allow a geoarchaeologist to directly observe the potential of sediment sequences as the two disciplines use different recording methodologies. Therefore, having a geoarchaeologist present will result in more meaningful datasets being generated. Further purposive borehole/trial pit surveys will allow for the development of a deposit model and enable samples for palaeoenvironmental assessments and radiocarbon dating. We look forward to seeing a WSI for planned GI works and a geoarchaeological assessment for the onshore cable route. | An archaeological watching brief was undertaken during planned ground investigation works and the sediment sequences were recorded by a geoarchaeologist. The results of this work are described within the geoarchaeological desk-based assessment (Volume 3, Annex 5.4: Geoarchaeological desk-based assessment report of the ES, document reference F3.5.4) and will be utilised within the programme of geoarchaeological deposit modelling which will be presented ahead of or during Examination of the application for consent.   |
| TA_0049_024_231123          | S42     | Email           | <u>Vol 3 Annex 5.3 Intertidal archaeological survey report</u> The survey has provided some evidence for the potential of archaeological remains within the intertidal zone. There is potential for the survival of peat deposits on the shore and it would be beneficial to carry out further palaeoenvironmental investigations in the form of borehole transects as part of the geotechnical investigations on the onshore cable route phase once the specific route in the intertidal zone has been refined and clarified.  | The proposed programme of intertidal survey is set out in the Outline Onshore and Intertidal Written Scheme of Investigation (document reference J9).  |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response   |

| TA_0049_025_231123          | S42     | Email           | <u>Vol 2 Annex 8.1 Marine Archaeology Technical Report</u> We understand that a stage 1 geoarchaeological assessment has been carried out, identifying a series of sub-glacial and pro-glacial landscape features and deposits. We support a stage 2 to the geoarchaeological recording, though the details of this 'recording' remain unclear and should be in the form of a deposit model and geoarchaeological assessment of deposits. Please refer to the following guidance: Deposit Modelling and Archaeology (Historic England 2020)( <a href="https://historicengland.org.uk/images-books/publications/deposit-modelling-andarchaeology/">https://historicengland.org.uk/images-books/publications/deposit-modelling-andarchaeology/</a> )   | The Applicants note your response.   |
| TA_0160_003_211123          | S44     | Email           | The villages will lose their identity and due to the green belt land being built on, will merge into one industrial town. Kirkham, is a Heritage town, which will also lose its identity.  | It is acknowledged that the proposed cable route passes through Green Belt land and the proposed onshore substations also fall within Green Belt. A consideration of alternative routes and substation siting is made as part of the Site Selection chapter of the ES (Volume 1, chapter 4, document reference F1.4) which concluded this is the preferred route and location for the cable and the substations. Land within the Area of Separation is no longer required for the onshore substations. An assessment regarding the impact on the purposes and openness of the Green Belt, alongside a Very Special Circumstances assessment is set out within the Planning Statement (document reference J28). The Applicants consider that when assessed on the planning balance that the significant benefits of the Project mean that there are Very Special Circumstances that outweigh any potential harm to the Green Belt. The project team has worked closely with the HET at Lancashire County Council and with Historic England to ensure that adverse effects on the historic environment have been avoided, reduced or offset wherever possible. The assessment of residual effects is set out within section 5.11 of Volume 3, Chapter 5: Historic Environment of the ES (document reference F3.5).   |
| TA_0161_013_211123          | S44     | Email           | <ul style="list-style-type: none"> <li>•The substations and the cabling routes will cut into large areas of good quality farmland that will in turn affect food security and the livelihoods and lifestyle of our traditional farming community. If the farms are taken or made financially unviable this area will be losing its rural/ agricultural identity. Some of the farms provide income via the Hornbys Trust for Newton Bluecoat School. What impact will the drop in income have on these children? How can the farmers sustain their farms and families, grow crops and keep cattle?</li> <li>• The substations and cabling routes impact on amenity and leisure activity e.g. walking the existing Public Rights of Way and rural lanes and tracks. Sightlines from historic sites will also be adversely impacted. Why are you using green areas rather than brownfields sites?</li> </ul> | The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). The potential impacts of the Transmission Assets on recreational resources, including PRow are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of this chapter of the ES. This includes preparation of a PRow Management Strategy in general accordance with the Outline PRow Management Strategy (document reference J1.5) submitted with the DCO application. The measures to be implemented as part of the PRow Management Strategy seek to minimise impacts on public footpaths, bridleways and other promoted routes (e.g. National Cycle Routes (NCRs), Long Distance Footpaths) during construction of the Transmission Assets. |
| TA_0225_008_231123          | S44     | Email           | [REDACTED] is a Grade II listed building.  | The Applicants note your response.   |

## E1.16.21 Land use and recreation table of responses

## E1.16.21.1 Land use and recreation table of responses (via feedback form)

**Table E1.16.21.1: Land use and recreation responses (feedback form)**

As set out in section 4.7.4 of the Consultation report (document reference E1). Responses have been allocated to the most appropriate topic(s). If a consultee did not provide a response for a question/sub-question this is not recorded. If a consultee included 'N/A', 'none', 'no comment', 'Nil', 'No', in response to a question, this has also not been recorded. Where a consultee provided a response associated with this sub-question (3.6; Land use and recreation) but was not related to this topic, this has been included below, as well as against any other appropriate topic(s). Where a consultee provided a response which stated 'see response above' or similar, the response has been replicated in brackets and italics.

| Unique Reference Identifier | S42/S44 | Feedback method      | Feedback form question | Feedback form sub - question | Statutory consultation response received   | Applicants' response  |
|-----------------------------|---------|----------------------|------------------------|------------------------------|--|---|
| TA_0050_009_231123          | S42     | Online feedback form | 9                      |                              | Seem to want a huge amount of space what is proposed to offset this green land take?   | As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0050_010_231123          | S42     | Online feedback form | 11                     |                              | See previous comment on level of green land take<br><i>(Seem to want a huge amount of space what is proposed to offset this green land take?)</i>  | As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0051_002_211123          | S44     | Online feedback form | 3                      | 3.2                          | The natural drainage of the land is already working to its maximum capacity, and any disruption to this natural process would severely impact our properties with an unacceptable risk of flooding. Although it is proposed that the transmission cable corridor would be re-instated, studies have suggested that it could take up to 40 years for the disturbed land to return to its natural state.   | The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).<br>Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).<br>An Outline CoCP (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase.<br><br>The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage.  |
| TA_0051_006_211123          | S44     | Online feedback form | 3                      | 3.6                          | See 3.1 above<br><i>(I strongly object to the proposals to route the transmission cable adjacent to land and properties on REDACTED, Blackpool. The suggested 100+ metre wide corridor, which it has been proposed would be necessary to lay the transmission cable, seems unduly large, and would have a negative effect on the land bordering our properties, with an impact on the already over-stretched natural drainage systems, disturbance during construction with traffic and noise pollution, and a permanent destruction of the natural habitat of the many animals and birds whose home is in the wooded areas surrounding our land.)</i> | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The Transmission Assets design has resulted in a reduced construction corridor width, as set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Details of the factors considered during the design evolution are set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |

| Unique Reference Identifier | S42/S44 | Feedback method      | Feedback form question | Feedback form sub - question | Statutory consultation response received  | Applicants' response  |
|-----------------------------|---------|----------------------|------------------------|------------------------------|---|---|
| TA_0053_004_171123          | S44     | Online feedback form | 2                      |                              | Totally unacceptable see Q1<br><br>Land has remained in agriculture and not able to be built upon until this time,now to be used for unacceptable size of substations. Totally out of area characteristics.                                       | The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). These measures include the provision of an Outline Soil Management Plan (document reference J1.7). In addition, the Outline Code of Construction Practice (document reference J1) seeks to limit disruption to the operation of individual farm holdings.  |
| TA_0053_006_171123          | S44     | Online feedback form | 3                      | 3.6                          | Totally unacceptable,we will lose our natural environment and green kand  | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).  |
| TA_0053_012_171123          | S44     | Online feedback form | 5                      |                              | There again will impact on only my own land and business but many others,lanes too narrow,too close to residential area   | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |
| TA_0055_003_051123          | S44     | Online feedback form | 3                      | 3.6                          | The proximity to children's and youth's football and cricket fields and the health effects of the magnitude of magnetic radiation emitted from this project. These are decisions which are made by adults, but how are the young being protected? | Electro-magnetic fields (EMFs) are part of the natural world, and are also produced wherever electricity is generated, transmitted or used. With regard to EMF impacts, the project will adopt the International Commission on Non-ionizing Radiation Protection (ICNIRP) guidelines and Government voluntary Code of Practice on EMF public exposure. Such considerations are inherent to the detailed engineering considerations of cable specification and routing. Relevant public EMF exposure guideline limits are noted in NPS EN-5 and would be complied with by the project. These guidelines are long standing and have a high safety margin. The levels of exposure that they require would not pose a risk to public health. Volume 1, Annex 5.1 (document reference F1.5.1) has had regard to the risk perceptions associated with EMFs of the Transmission Assets on the local area and this is presented in section 1.11.9 of the Annex. See also the submitted EMF Compliance Statement (Volume 1, Annex 3.4 of the ES, document reference E1.3.4).   |

| TA_0056_018_141123          | S44     | Online feedback form | 3                      | 3.6                          | As previously stated<br><i>("This I feel is deliberately written in such language that the regular lay person cannot possibly understand what it means. Until its explained in plain English, I will object about it. I cannot aggressive to what I don't fully understand may or may not affect me and my property.")</i>   | <p>The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. In order to ensure the consultation information was available to as many people as possible, many different methods were used, including but not limited to a website, newsletter, postcards, consultation brochure, deposit locations, webinar and in-person events (a full list of materials produced for the consultation can be found in the Consultation Report (document reference E1). The Applicants aimed to ensure that it was clear how people could have their say, but also how to get in touch with the Transmission Assets team to find out more information.</p> <p>The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the Statement of Community Consultation).</p>   |
| TA_0057_001_231123          | S44     | Online feedback form | 2                      |                              | <p>I am writing to lodge my objection to this proposed development which will have a massively detrimental impact on the local area around Blackpool and St Anne's.</p> <p>This consultation appears to be nothing more than a sham and I have huge concerns concerning the siting of the two enormous substations which it is proposed to establish within close proximity to two local schools. Moreover there will be a loss of grade A farmland which is at the heart of the local Greenbelt. Your proposals will have an extremely lasting and damaging impact on this area and I really do think you need to have a rethink.</p> | <p>The Applicants are committed to robust and transparent public consultation as part of the development process. The Transmission Assets has undertaken three rounds of consultation with the local community, including two non-statutory periods of consultation (2 November to 13 December 2022 and 19 April to 4 June 2023) and a statutory consultation (12 October to 23 November 2023). Statutory targeted consultations have also taken place (November 2023 to October 2024).</p> <p>Statutory consultation is a key part of the planning process, one which the Applicants take seriously to engage and understand community views. The Applicants submitted a Consultation Report (document reference E1) that explains how the Applicants complied with the pre-application consultation requirements set out in the Planning Act 2008 and had regard to all the feedback submitted.</p> <p>The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, migration measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p> <p>As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Specifically, the landscape and visual assessment (Volume 3, Chapter 10 of the ES) (document reference F3.10) and onshore ecology assessment (Volume 3, Chapter 3 of the ES) (document reference F3.3) set out the respective maximum</p> |

| TA_0059_001_151123          | S44     | Online feedback form | 2                      |                              | <p>I am against the offshore booster station being built on green belt land near my area. This will cause more flooding to the area. The more you build on the green belt land, the less land there is for the water to go. We have seen flooding in the area more since more houses have been built on flood land, this is disgusting and should not be allowed. There is also the damage to the near by properties. My house has been shook several times with the fracking, I don't want anymore damage to my property.</p> | <p>The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE) which no longer includes any surface piercing structures. This includes the removal of the Morgan Booster Station and associated search areas. The OSPs are to be classed as part of the Generation Assets applications only.</p> <p>The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).</p> <p>Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).</p> <p>An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase.</p> <p>The typical maximum depth of cable installation using trenching methodology is approximately 1.8m. Trenchless, drilling methodologies are to be used locally where crossings are required (e.g. beneath roads/rivers). The installation depths will generally be within shallower geological deposits rather than deep within the consolidated bedrock. The drilling methodologies to be used are designed to minimise the displacement of surrounding materials (therefore minimising instability) and do not involve the injection of significant volumes of liquid into fractured bedrock at depth under the high-pressures that are often attributed to inducing tremors. The installation depths are shallower than those required for fracking. Further detail is provided in Volume 3, Chapter 1: Geology, hydrogeology and ground conditions (document reference F3.1) of the ES.</p> |

More of a necessity than wild life. Take issue with Natural England and route up the south side of the Ribble.   | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, migration measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). Specifically, the potential impact of the Transmission Assets on the viability and operations of existing farming businesses has been considered in Volume 3, Chapter 6: Land use and recreation of the ES (document reference: F3.6).  |
| TA_0074_007_211123          | S44     | Online feedback form | 3                      | 3.6                          | Restriction to access of beach and dunes in any form for long period is unacceptable  | Substantial reductions to the Order Limits have been made to the north of the PEIR boundary at landfall. The areas of beach subject to construction works, including landfall compounds will not be available for public access during this period. However, the Applicants have committed to ensure public access to the east of the works areas will be maintained during construction. This will ensure that, areas to the north and south of the works area would remain accessible for beach-based activities. The Applicants have sought to minimise the duration of beach works by committing to a direct pipe trenchless installation technique in order to limit potential disruption to users of the beach and an Outline Open Space Management Plan has been appended to the Outline Public Rights of Way Management Plan (document reference J1.5), which includes measures to minimise potential impacts.  |
| TA_0076_001_091123          | S44     | Online feedback form | 1                      |                              | <ol style="list-style-type: none"> <li>1. How will it effect the road out side my house</li> <li>2. How will if effect the dunes facing my house</li> <li>3. How will the 'Potential biodiversity net gain, enhancement and/or mitigation areas', how will this affect the front in St Annes</li> </ol> | <p>The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). As set out in the Onshore Biodiversity Benefit Statement (document reference J11), the Transmission Assets are not subject to a mandatory net gain requirement under the Environment Act 2021. Nevertheless, the Applicants have worked with statutory consultees to discuss the approach, and to develop the design, to allow the maximum benefit to biodiversity within the parameters of the Transmission Assets.</p> <p>For the Transmission Assets, biodiversity benefit will be delivered within identified biodiversity benefit areas within the Transmission Assets Order Limits: Onshore (referred to as the Onshore Order Limits). Further qualitative benefits to biodiversity are proposed via potential collaboration with stakeholders and local groups, contributing to existing plans and programmes, both within and outside the Onshore Order Limits.</p> <p>Further details of the approach to biodiversity benefit are provided in</p> |

|-----------------------------|---------|----------------------|------------------------|------------------------------|--|---|
| TA_0082_001_151123          | S44     | Online feedback form | 3                      | 3.6                          | Lytham Moss is an area used for recreation, I use the area for dog walking and running as do many others. I have also seen the area used by walkers and horse riders. The proposed secondary cable route through Lytham Moss would impact a recreation area for many residents. I would not choose to exercise or dog walk in the area during or after the installation of cables due to the health risks associated with exposure to EMF's.   | The potential impacts of the Transmission Assets on recreational resources, including PRoW are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of this chapter of the ES. This includes preparation of a PRoW Management Strategy in general accordance with the Outline PRoW Management Strategy (document reference J1.5) submitted with the DCO application. The measures to be implemented as part of the PRoW Management Strategy seek to minimise impacts on public footpaths, bridleways and other promoted routes (e.g. National Cycle Routes (NCRs), Long Distance Footpaths) during construction of the Transmission Assets.<br>Electro-magnetic fields (EMFs) are part of the natural world, and are also produced wherever electricity is generated, transmitted or used. With regard to EMF impacts, the project will adopt the International Commission on Non-ionizing Radiation Protection (ICNIRP) guidelines and Government voluntary Code of Practice on EMF public exposure. Such considerations are inherent to the detailed engineering considerations of cable specification and routing. Relevant public EMF exposure guideline limits are noted in NPS EN-5 and would be complied with by the project. These guidelines are long standing and have a high safety margin. The levels of exposure that they require would not pose a risk to public health. Volume 1, Annex 5.1 (document reference F1.5.1) has had regard to the risk perceptions associated with EMFs of the Transmission Assets on the local area and this is presented in section 1.11.9 of the Annex.<br>See also the submitted EMF Compliance Statement (Volume 1, Annex 3.4 of the ES, document reference E1.3.4). |
| TA_0083_012_221123          | S44     | Online feedback form | 3                      | 3.6                          | Do not allow planning permission   | The Applicants note your response.  |
| TA_0085_001_191123          | S44     | Online feedback form | 3                      |                              | I have strong objections to the Onshore corridor element of the project as I live immediately where you are looking at corridor options by Blackpool airport on REDACTED. My objections include:<br><br>Concerns about the following:<br>1) The impact of the wide corridor immediately next to our properties, but also will it go under our land?<br>Questions asked at your webinars and meetings re compulsory purchase, have not been ruled out, inferring this may be an option. So we are unclear as you haven't decided!<br>2) Lack of clarity even at the end of the consultation period that you can't say where the corridor will run - by/under the airport and REDACTED, or under neighbouring roads in St Annes - indeed given it's width the same as a 6 lane motorway, I'd suggest it will impact REDACTED whichever you choose.<br>3) Impact of the corridor activity on dykes and flood risk - dykes at front and rear of our properties (the rear one is by the fields you are looking at using) - activity could cause flooding and or blockages. Also potential rise in the water table which is already a concern in the area.<br>4) Vermin - we know from other local digging, drilling that this has driven vermin into our homes!<br>5) Noise from the amount of electricity being transmitted right by our homes.<br>6) Impact on the local wildlife in the area | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).<br>Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).<br>An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase.  |

This includes preparation of a PRoW Management Strategy in general accordance with the Outline PRoW Management Strategy (document reference J1.5) submitted with the DCO application. The measures to be implemented as part of the PRoW Management Strategy seek to minimise impacts on public footpaths, bridleways and other promoted routes (e.g. National Cycle Routes (NCRs), Long Distance Footpaths) during construction of the Transmission Assets.</p>   |
| TA_0086_001_211123          | S44     | Online feedback form | 1                      |                              | <p>Strongly object to the proposed off shore wind farm route cabling on shore here on the Fylde coast and the destruction and disruption to our roads, farmlands natural green spaces for many years to come. The meetings I attended could not give a definite plan for the 120m wide cable route crossing Queensway (B5261) and could not determine where along Queensway this would be to the rear of our properties on REDACTED, this could result in property subsidence , Noise, pollution etc for years to come and devaluation of our properties. We have lived here for over 50 years, we actively ran a market garden business until the Dutch ruined that, so we feel we know the local land problems round here and what the size of this proposal would impact on this area</p> <p>We have lots of wildlife around here both on land and in the various watercourses surrounding the farmlands, we can't keep pushing this wild</p>   | <p>The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, migration measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission</p> |

|                             |         |                      |                        |                              |   | (document reference F1.5.3). Photomontages have been produced for each of the representative viewpoints identified and are presented (see Volume 3, Figures). Viewpoints have been selected in consultation with relevant statutory consultees and stakeholders prior to submission of the DCO application, including the EIA Scoping Stage.  |
| TA_0092__023_151123         | S44     | Online feedback form | 3                      | 3.6                          | Assume the project will follow its stated aims  | Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). If approved the project will be required to adhere to this.   |
| TA_0093_001_211123          | S44     | Online feedback form | 1                      | 1.9                          | As an open water swimmer and a member of the local outdoor swimming group Lancashire Bluetits I am concerned about how this will impact our ability to train in the sea from Starr Gate and along St Annes beach during construction  | Details of the design of the Transmission Assets, including the landfall area near Lytham St Annes, are set out in Volume 1, Chapter 3: Project description of the ES. This includes a range of measures to avoid or reduce impacts, including measures to ensure that the construction period on the beach will be as short as practicable. Substantial reductions to the Order Limits have been made to the north of the PEIR boundary at landfall. The areas of beach subject to construction works, including landfall compounds will not be available for public access during this period. However, the Applicants have committed to ensure public access to the east of the works areas will be maintained during construction. This will ensure that, areas to the north and south of the works area would remain accessible for beach-based activities. The Applicants have sought to minimise the duration of beach works by committing to a direct pipe trenchless installation technique in order to limit potential disruption to users of the beach and an Outline Open Space Management Plan has been appended to the Outline Public Rights of Way Management Plan (document reference J1.5), which includes measures to minimise potential impacts. |
| TA_0093_002_211123          | S44     | Online feedback form | 3                      | 3.6                          | As a resident on REDACTED, REDACTED, my house is on the main road opposite the beach. I walk my dog on the beach and nature reserve multiple times per day or week and use the Clifton Drive cycle lane regularly instead of my car. I have been living here almost 8 years and chose this area specifically for the quiet, rural feel. I am extremely concerned about what this project will do to my quality of life, general health and cost of living if I have to sit in construction traffic jams and drive to be able to find somewhere remote to take a walk, especially if it takes years to complete. Many of my neighbours are retired or elderly and chose to live here for a better quality of life in their later years. This will have a huge impact on our wellbeing. | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, migration measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). An assessment considering how the Transmission Assets affects different aspects of the environment that influence population health has been undertaken and reported at Volume 1 Annex 5.1 of the Environmental Statement (ES) (document reference F1.5.1). This includes changes to the social, economic and bio-physical environment and is informed by the results of other assessments as reported in the ES. This assessment Utilises the World Health Organisation definition of health and wellbeing, which includes mental wellbeing. Any effects are assessed to be not significant and appropriately addressed through sharing of non-technical information with the public and the project's adherence to health protection standards.   |
| TA_0093_003_211123          | S44     | Online feedback form | 3                      | 3.7                          | As a resident on REDACTED, REDACTED my house is on the main road opposite the beach. When lorries drive past today the houses sometimes shake. The drains under the road regularly (a few times per year) need clearing out when sand build ups are too high, this work normally lasts around 1 week and causes enormous traffic jams, noise pollution, CO2 fumes into our gardens and houses and often continues until after bed   | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, migration measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of   |

|                             |         |                      |                        |                              | time on work / school nights making it difficult for residents to sleep. A project of the size and scale of the Wind Farm would cause traffic jams of immense proportions and severe disruption. Do not underestimate how quickly any roadworks, no matter how small, on Clifton Drive can impact the entire Blackpool and Lytham St Annes area, they quickly cause gridlock and hours of queues especially in summer when tourists also visit.  | the ES (document reference F1.5.3).<br>Effects in relation to any changes in traffic are set out in Volume 3, Chapter 7 of the ES (document reference F3.7). It is noted that the option presented at PEIR (placement of cables in trenches within the highways) near Blackpool Airport is no longer required. Details of the current design are provided in Volume 1, Chapter 3: Project description of the ES (document reference F1.3).<br>Construction traffic associated with works near the beach will be controlled through a Construction Traffic Management plan. An outline Construction Traffic Management Plan is provided as part of the application (document reference J8).   |
| TA_0094_012_061123          | S44     | Online feedback form | 14                     |                              | I understand if the golf course is going to be required you have given assurances underground tunnelling wont affect the use of the golf course. If this is the case I see no reason why the airport can't be used as the preferred route adopting the same tunnelling process.  | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3).  |
| TA_0095_001_221123          | S44     | Online feedback form | 1                      |                              | <p>We have been to the Consultation Meetings and quite frankly, the situation is disgraceful and we are no wiser. There are no mock photographs to give any indication of the scale of the operation or any idea what the finished substations will look like, and therefore how do you expect constructive feedback for something so vague. We have requested this information to no avail.</p> <p>Our personal situation is with regard to the devaluation of our house if option 2 is chosen, and again no information can be given at present so we are all in limbo. Our house will be opposite the substation and all the building work, and our main objections are the proximity to our house, the loss of Greenbelt and the state of the lane with all the extra traffic that will be involved for such a huge operation on a one track road. Above all, we would have to endure years of stress living next to an enormous building sight and the possible health consequences of a magnetic field. We don't even know if we will receive any compensation for the devaluation of our property so we can escape the ensuing nightmare.</p> <p>To cause such upheaval to everyone's lives in this community will be devastating and unnecessary, as there must be other options. This will be a total disaster for the residents, wildlife, farmland, loss of countryside and we urge you to find alternative sites that will not cause as much harm to the environment, which we thought was the whole point of this project in the first place.</p> | <p>The Applicants have made design changes since the PEIR and further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). This has included refinements of the location and design of the 400 kV grid connection cable corridor and onshore substations, including</p> <ul style="list-style-type: none"> <li>- selection of a single site for the onshore substation for the Morecambe Offshore Windfarm: Transmission Assets</li> <li>- refinement of the siting and orientation of the onshore substation for the Morecambe Offshore Windfarm: Transmission Assets, to take into account consultation responses received.</li> </ul> <p>The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the SoCC).</p> <p>Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). This is huge and we want to be contacted immediately to discuss the implications and options we face.</i></p> <p><i>It is just not true to state in your brochure you have looked at environmental sensitivities such as proximity to residential properties! Our house will be in the middle of years of building works and how will we cope with that. We will see the huge building from our front window and be impacted by possible cancer risks, and we cannot escape as nobody will ever buy our house with all that going on. Please contact us immediately.)</i></p>  | <p>process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, migration measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p> <p>The Transmission Assets will be fully compliant with the compensation code. The code sets out the parameters and evidence needed to substantiate a claim for diminution in value and when this happens. The UK Government has also produced or a series of plain English general guides to compulsory purchase and compensation which you may find useful:<br/>Compulsory purchase and compensation - GOV.UK (www.gov.uk)<br/>Guide books 1 and 4 being the most appropriate.</p>  |
| TA_0096_001_131123          | S44     | Online feedback form | 1                      |                              | <p>I object on the basis of local children growing up with Electromagnetic Radiation all around them, the buzzing noise from the electricity which they will hear more than us and the noise of the construction and the destruction of our peace and quiet. It will be a total eyesore. The value of our houses will plummet. We could easily become a target for a terrorist attack, and so close to the village will be lethal. Also, if you pave 36 acres of good farmland (which can grow crops), you destroy our food security. In addition the Fylde is very flat, so the flooding, which is already bad, will get worse as the runoff from tarmac is far faster than the soil and plants that absorb the rain and take up the moisture in their roots. In the projected area there are endangered and protected species such as bats redshanks, oystercatchers, great crested newts and owls (Tawney and Barn Owls) and buzzards, kestrels, long tailed tits, bar tailed godwits amongst many others. The consultation has not explained to us what we will actually see and experience as residents situated closest to the monstrous constructions being proposed</p> | <p>The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). Visualisations have been presented as part of the landscape and visual assessment within Volume 3, Figure 10.5 (Parts 1-5) (document reference F3.12, Part 3).</p> <p>Electro-magnetic fields (EMFs) are part of the natural world, and are also produced wherever electricity is generated, transmitted or used.</p> <p>With regard to EMF impacts, the project will adopt the International Commission on Non-ionizing Radiation Protection (ICNIRP) guidelines and Government voluntary Code of Practice on EMF public exposure. Such considerations are inherent to the detailed engineering considerations of cable specification and routing. Relevant public EMF exposure guideline limits are noted in NPS EN-5 and would be complied with by the project. These guidelines are long standing and have a high safety margin. The levels of exposure that they require would not pose a risk to public health. Volume 1, Annex 5.1 (document reference F1.5.1) has had regard to the risk perceptions associated with EMFs of the Transmission Assets on the local area and this is presented in section 1.11.9 of the Annex.</p> <p>See also the submitted EMF Compliance Statement (Volume 1, Annex 3.4 of the ES, document reference E1.3.4).</p> |

Also, if you pave 36 acres of good farmland (which can grow crops), you destroy our food security. In addition the Fylde is very flat, so the flooding, which is already bad, will get worse as the runoff from tarmac is far faster than the soil and plants that absorb the rain and take up the moisture in their roots. In the projected area there are endangered and protected species such as bats redshanks, oystercatchers, great crested newts and owls (Tawney and Barn Owls) and buzzards, kestrels, long tailed tits, bar tailed godwits amongst many others. The consultation has not explained to us what we will actually see and experience as residents situated closest to the monstrous constructions being proposed</p> | <p>The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). Visualisations have been presented as part of the landscape and visual assessment within Volume 3, Figure 10.5 (Parts 1-5) (document reference F3.12, Part 3).</p> <p>Electro-magnetic fields (EMFs) are part of the natural world, and are also produced wherever electricity is generated, transmitted or used.</p> <p>With regard to EMF impacts, the project will adopt the International Commission on Non-ionizing Radiation Protection (ICNIRP) guidelines and Government voluntary Code of Practice on EMF public exposure. Such considerations are inherent to the detailed engineering considerations of cable specification and routing. Relevant public EMF exposure guideline limits are noted in NPS EN-5 and would be complied with by the project. These guidelines are long standing and have a high safety margin. The levels of exposure that they require would not pose a risk to public health. Volume 1, Annex 5.1 (document reference F1.5.1) has had regard to the risk perceptions associated with EMFs of the Transmission Assets on the local area and this is presented in section 1.11.9 of the Annex.</p> <p>See also the submitted EMF Compliance Statement (Volume 1, Annex 3.4 of the ES, document reference E1.3.4).</p> |

|                             |         |                      |                        |                              |  | <p>possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage. The Operational Drainage Management Plan will be developed in line with the latest relevant drainage guidance notes in consultation with the Environment Agency and the Lead Local Flood Authority (Lancashire County Council). The Ribble estuary has numerous ecological statutory designations protected nationally and internationally. These include the Liverpool Bay Special Protection Area, Ribble and Alt. Estuaries Special Protection Area, the Ribble and Alt Estuary Ramsar site (a wetland of international importance under the Ramsar Convention), and the Ribble Estuary Site of Special Scientific Interest, Ribble Estuary Marine Conservation Zone and Ribble Estuary National Nature Reserve. The tidal nature and shallow water depths of the estuary also create heightened risk to construction as the unstable riverbed conditions are unsuitable for trenching/ cable laying vessels to access. As such, cabling through the estuary would result in significantly protracted construction timeframes, and potentially long-term impacts to sensitive and sensitive features associated with the designated features, whilst also presenting higher risk and potentially unsafe working conditions. As such, the approach to site selection has been based on avoiding direct impacts to Important Ecological Features (IEFs) where practicable, further details can be found in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4).</p> <p>The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).</p> <p>Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2).</p> <p>An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. | TA_0110_003_221123          | S44     | Online feedback form   | 3                      | 3.6                          | See above. Magnetic fields (sic) above and around the cables are threat to Human Health.<br><i>("What are the protection measures for Human Health relating to the extensive onshore cabling and substations. The PEIR seems to conclude that no mitigation is required and does not specify how exposures to EMFs will be assured to be within regulations.</i><br><br><i>In particular, burying underground cables does not, per se, limit magnetic fields into the surface environments. The Environmental Impact Assessment Scoping Report of October 2022. In Part 2: Transmission Assets, section 10.2.1 provides only a short description of the positioning with regards to Human Health and, regarding the onshore transmission cables, paragraph 10.2.1.18, states: "Underground cables do not produce an external electric field at ground level that would be of concern to public health due to the shielding of the cable sheath and burial material". This might be considered misleading as it only refers to the electric field and is silent on the magnetic fields.")</i> | Electro-magnetic fields (EMFs) are part of the natural world, and are also produced wherever electricity is generated, transmitted or used. With regard to EMF impacts, the project will adopt the International Commission on Non-ionizing Radiation Protection (ICNIRP) guidelines and Government voluntary Code of Practice on EMF public exposure. Such considerations are inherent to the detailed engineering considerations of cable specification and routing. Relevant public EMF exposure guideline limits are noted in NPS EN-5 and would be complied with by the project. These guidelines are long standing and have a high safety margin. The levels of exposure that they require would not pose a risk to public health. Volume 1, Annex 5.1 (document reference F1.5.1) has had regard to the risk perceptions associated with EMFs of the Transmission Assets on the local area and this is presented in section 1.11.9 of the Annex. See also the submitted EMF Compliance Statement (Volume 1, Annex 3.4 of the ES, document reference E1.3.4).  |

| TA_0001_215_231123          | S42     | Email           | Soils and Best and Most Versatile Agricultural Land 6.29 Table 3.41 Natural England welcome the reference to the Construction Code of Practice for Sustainable Use on Construction Sites. There is also other standard guidance that Natural England also refer too. Any soils handling methods should also follow the Institute of Quarrying Good Practice Guide for Handling Soils in Mineral Workings which provides detailed advice on the choice of machinery and method of their use for handling soils at various phases, which we strongly recommend is followed. The British Society of Soil Science has published the Guidance Note Benefiting from Soil Management in Development and Construction which also contains useful guidance.  | Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes the preparation of a Soil Management Plan in general accordance with the Outline Soil Management Plan (document reference: J1.7), which has been submitted with the application for development consent. The measures to be implemented as part of the Soil Management Plan are in general accordance with the Institute of Quarrying (IQ) Good Practice Guide for Handling Soils in Mineral Workings (IQ, 2021) and British Society of Soil Science (BSSS) Working with Soil Guidance Note on Benefiting from Soil Management in Development and Construction (BSSS, 2022) which seek to minimise impacts on soil health and protect and maintain soil quality during construction. |
| TA_0002_001_171123          | S42     | Email           | 1. Summary Freckleton Parish Council and the local community has no inherent objections to the principles of establishment of Off-Shore Wind Farms as a means of meeting the Energy Targets from renewable sources. However, there are deep concerns regarding the Proposal that is currently being placed before us because of the potentially disastrous implications for the future of The Fylde as a farming community and as a place of amenity for the residents and the many visitors who enjoy the facilities and environment that the Fylde currently affords. This note attempts to summarise these views and provides the overall conclusion that we must object to the proposals as presented as the impact is too high when compared to both the Local and National Benefit to be accrued. The note provides details of the logic behind this conclusion, especially relating to the programme consultation process, maturity of definition and likely cost issues arising.  | The Applicant notes your response. Responses to detailed comments provided in turn associated to each topic raised (see unique reference TA_0002).   |
| TA_0002_005_171123          | S42     | Email           | 3. Agriculture in The Fylde – A Background Before looking at the issues with this project further, it is worth examining the nature of rural Fylde and its agricultural background. Historically, many farms are small with little of the conglomeration that has happened elsewhere in the UK. Most farms have been family run, self-sufficient, capable of supporting the farm and the family living there. They are characterised by a rich, marl type soil, which is good for grassland for dairy and sheep and winter fodder. Many farms have subsequently been divided between heirs, resulting in the fields being scattered, sometimes over a considerable area. There have been changes of ownership and acquisition which has sometimes brought land together, but not in the original packages, further complicating the land distribution. This can be seen clearly from the air, where the Fylde appears as a patchwork of fields, which in major part adds to the overall character of the area. The track of the proposed development crosses many such farms, where the landowner may not live immediately adjacent to the proposed track of development. There is evidence that not all the affected landowners have been properly and fully consulted about the proposed development across their properties. | Dalcour Maclaren on behalf of the Applicant have been in discussions with landowners and occupiers along the onshore order limits to discuss the impacts on their agricultural operations and ways in which losses can be mitigated. Ownership data has been obtained through HM Land Registry services and where land is unregistered, due diligence including site noticing has been undertaken to establish ownership. Dalcour Maclaren on behalf of the Applicant have been meeting with landowners and occupiers and will continue to do so to secure the land rights being sought.   |
| TA_0002_006_221123          | S42     | Email           | This embedded figure shows an extract from the Fylde Local Plan to 2032. This clearly shows the areas designated Green Belt and Countryside. Much of the proposed route of the underground cabling and the sites of the proposed sub-stations fall within the Green Belt situated between Freckleton and Kirkham. Development of the size and type proposed for the sub-stations is not appropriate in the locations proposed and will create permanent harm to the area, even following the completion of the projected build and restoration of land involved in the project.   | It is acknowledged that the Transmission Assets Order Limits pass through Green Belt land and that parts of the onshore cable routes and the onshore substations fall within the Green Belt. An assessment regarding the impact on the purposes and openness of the Green Belt, alongside a Very Special Circumstances assessment is set out within the Planning Statement (document reference J28). When assessed on the planning balance, in particular regarding the significant benefits of the Transmission Assets in relation to facilitating the connection of two nationally significant offshore wind farms to the national grid, this outweighs the harm to the Green Belt by reason of inappropriateness or any other harm. The assessment also takes into account matters such as visual amenity impact and landscape  |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received  | Applicants' response  |
|-----------------------------|---------|-----------------|---|---|
|                             |         |                 |   | character which relate to the openness of the Green Belt. The scheme design has been developed through an iterative process to achieve a design freeze, including consideration of alternative onshore substation location options. Alternative designs and technology are considered in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4). The Applicants have made design changes since the PEIR and further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). This has included refinements of the location and design of the onshore substations, including - selection of a single site for the onshore substation for the Morecambe Offshore Windfarm: Transmission Assets- refinement of the siting and orientation of the onshore substation for the Morecambe Offshore Windfarm: Transmission Assets, to take into account consultation responses received. |
| TA_0002_015_171123          | S42     | Email           | 9. Conclusions The overall conclusion that the Parish Council has reached is that, with the evidence and status presented, we must object to the proposals. The following reasons support this objection: 1) The consultation process has been flawed in its execution.2) Insufficient information has been provided to enable a proper assessment of the impact of the design on the total environment of the Fylde.3) Consequently, the proposed plan does not have a level of maturity commensurate with presentation for approval.4) The impact on individual landowners has not been determined, relating to both the development and implementation phase and the subsequent in-service life cycle of the system.5) Costs associated with levels of compensation appear to have been underestimated.6) The impression has been created that the programme is underfunded and that any additional costs would have to be sought by access to the public purse, a similar situation to that occurring with the HS2 project.7) The impact of the loss of amenity, for both residents and visitors, is considered too high a price to pay for the proposed development, when all possible alternatives have been summarily dismissed for reasons that are unclear.  | The Applicants note your response. Responses to detailed comments provided in turn associated to each topic raised (see unique reference TA_0002).  |
| TA_0003_009_221123          | S42/S44 | Email           | Impact on Agriculture The cable routing crosses large parts of the rural Fylde that are in active agricultural production. The Department for Environment, Food and Rural Affairs Magic Maps indicate that much of route is classified Grade 2 and so regarded as Best and Most Versatile land (BMV). Agricultural activity in Fylde is characterised by a relatively large number of small agricultural holdings, but taken in combination, their contribution to the rural economy of Fylde is significant. The proposed cable routing crosses numerous agricultural units that would therefore inevitably be subdivided during the construction phase. The width of the construction corridor will have a relatively greater impact on these smaller agricultural holdings than would be the case on larger farms, as the land taken during construction would be proportionally greater. In the longer term, cable easements would mean that the availability of land to site agricultural buildings would be restricted and would have an impact on the sustainability of individual businesses, the rural economy as a whole and ultimately the character of the wider rural area. The siting of access points to the cable joints would also potentially impact on the efficiency of agricultural holdings. It is considered that greater consideration needs to be given to the routing of cables across individual agricultural holdings in order to prevent subdivision and loss of productive land. This is a further example of how the consultation on this project appears to be premature as the necessary design details that would allow more effective consultation are simply not available. | The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). These measures include the provision of an Outline Soil Management Plan (document reference J1.7). In addition, the Outline Code of Construction Practice (document reference J1) seeks to limit disruption to the operation of individual farm holdings.  |
| TA_0003_010_221123          | S42/S44 | Email           | The indicated width of the construction corridor is 122m. Much of this is accounted for by the proposed linear storage of topsoil and subsoil during construction. The utilisation of a series of top and subsoil storage areas could reduce the width of the construction corridor by approximately 40% and reduce the adverse impact not only on agricultural holdings but on ecology, transport infrastructure and reduce the development footprint of the project as a whole.   | The project design has resulted in a reduced construction corridor width, as set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Details of the factors considered during the design evolution are set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4).   |
| TA_0003_011_221123          | S42/S44 | Email           | Finally on this point, as the majority of the agricultural land that the project crosses is regarded as BMV, if the project goes ahead, it is essential that the land be reinstated to a  | Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). These include the commitment to reinstate land to be temporarily  |

|-----------------------------|---------|-----------------|--|--|
|                             |         |                 | high quality that does not impact upon the long term viability and sustainability of the individual agricultural units.  | affected following construction of the Transmission Assets as soon as practicable. Reinstatement would be undertaken in accordance with procedures set out in the Outline Soil Management Plan (document reference J1.7).  |
| TA_0012_006_221123          | S42     | Email           | The consultation meetings left many questions unanswered but losing Grade A farmland at the heart of our precious greenbelt, with the wider impact on homes and infrastructure will do real damage to Fylde and St Anne's in particular.   | The potential impacts of the Transmission Assets on agricultural land use are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes the preparation of a Code of Construction Practice in general accordance with the Outline Code of Construction Practice (document reference J1) submitted with the application for development consent. The measures to be implemented as part of the Code of Construction Practice seek to limit disruption to the community. It is acknowledged that the Transmission Assets Order Limits pass through Green Belt land and that parts of the onshore cable routes and the onshore substations fall within the Green Belt. An assessment regarding the impact on the purposes and openness of the Green Belt, alongside a Very Special Circumstances assessment is set out within the Planning Statement (document reference J28). When assessed on the planning balance, in particular regarding the significant benefits of the Transmission Assets in relation to facilitating the connection of two nationally significant offshore wind farms to the national grid, this outweighs the harm to the Green Belt by reason of inappropriateness or any other harm. The assessment also takes into account matters such as visual amenity impact and landscape character which relate to the openness of the Green Belt. |
| TA_0017_014_231123          | S42/S44 | Email           | Surveys Survey data submitted with the planning application should be current/up-to-date, in line with recognised guidelines (as summarised above). The survey area should include: • The intended location of the development footprint; • Potential working areas, compounds, storage areas and access routes; • Any land that may be used within the mitigation, compensation or biodiversity net gain proposals (on or off-site); • A suitable buffer distance, taking account of the likely zone of influence and relevant survey guidelines.   | The survey area is the area used for site-specific surveys and is generally defined as a 150 m buffer around the Onshore Order Limits. The 150 m buffer was included to take account of protected species that may occur adjacent or close to the Transmission Assets and to allow for evolution of the boundary during the site selection process. A separate survey area was used for GCN surveys. The GCN survey area is defined as a 250 m buffer around the Onshore Order Limits. Volume 3, Annex 3.8: Great crested newt survey and reptile survey technical report of the ES (document reference F3.3.8) provides further details regarding the GCN survey area. Owing to the iterative design process of the Transmission Assets, some surveys were undertaken further than 150 m from the Onshore Order Limits. Nevertheless, information from these surveys have been included in technical annexes because it provides context regarding the ecological sensitivity of the wider area.  |
| TA_0017_036_231123          | S42/S44 | Email           | It should be stated how the necessary maintenance and management will be secured for the lifetime of the anticipated planning obligations.   | An Outline Ecological Management Plan (document reference J6) is provided as part of the application for development consent.  |
| TA_0017_037_231123          | S42/S44 | Email           | Monitoring measures should be sufficient to measure the success of mitigation and compensation measures, to inform the need for remedial measures and to inform establishment maintenance and long-term management.  | Any relevant monitoring measures are set out in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3).   |
| TA_0019_017_231123          | S42/S44 | Email           | RAG evaluation of the 4 zones indicate none are on poor agricultural land. Given that food security is also important why were alternatives, including brownfield sites, not an option? This point was also raised with the developer at the Thursday 26th October 2023 public consultation and it elicited the developer response that given the prevailing constraints no alternatives were large enough. Members consider this statement should be evidenced. Given that it is not yet known if the substations are to be gas or air cooled, and given the importance of securing the correct locations, it is reasonable to request that expert assurance is obtained that demonstrates the preferred location has been properly evaluated and it is evidenced that there are no | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). The Ribble estuary has numerous ecological statutory designations protected nationally and internationally. These include the Liverpool Bay Special Protection Area, Ribble and Alt. Estuaries Special Protection Area,  |

|                             |         |                 | <p>suitable poor quality/brownfield sites, enterprise zones or areas of lower population density between landfall and Penwortham. Consultation documentation makes statements that are also of significant concern relating to the cable corridor widths and trench depths. As part of the suggested expert assurance trenchless technologies need to be assessed in preference to excavating farmland and grazing land. When cables are coming from offshore, and notwithstanding the associated ecological impacts it is considered an assessment should be made of cable installation beneath the River Ribble before connection at Penwortham with an evaluation analysis compared with the existing proposal that adversely impacts food production and security. On the National Grid Pathway to 2030 it was presumed the route would be south of the River Ribble. This lower population density route has been set aside and the north River Ribble route, with all of the complexities of having more commercial facilities, being more densely populated, together with equestrian, farm, and industrial facilities, has been chosen. It is necessary to be able to visibly demonstrate the rationalisation for this decision (e.g. community and environmental constraints, financial benefits etc). A suggested alternative is to expand the footprint of the existing Penwortham substation to accommodate new feeds and therefore require less acreage due to use of existing infrastructure. Land in Penwortham was specified in search Zones 3 &amp; 4. There is great concern within the local farming community about the impact and future viability of farms in Zone 1 and it is unclear whether the viability of farms has been taken into consideration. It is claimed that significant loss of pasture land to dairy farms in Zone 1 will make at least one farm commercially unviable with consequently adverse socioeconomic impact.</p> | <p>the Ribble and Alt Estuary Ramsar site (a wetland of international importance under the Ramsar Convention), and the Ribble Estuary Site of Special Scientific Interest, Ribble Estuary Marine Conservation Zone and Ribble Estuary National Nature Reserve. The tidal nature and shallow water depths of the estuary also create heightened risk to construction as the unstable riverbed conditions are unsuitable for trenching/ cable laying vessels to access. As such, cabling through the estuary would result in significantly protracted construction timeframes, and potentially long-term impacts to sensitive and sensitive features associated with the designated features, whilst also presenting higher risk and potentially unsafe working conditions. As such, the approach to site selection has been based on avoiding direct impacts to Important Ecological Features (IEFs) where practicable, further details can be found in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4).</p>  |
| TA_0019_020_231123          | S42/S44 | Email           | <p>There is a large potential cumulative effect on the village of Newton-with-Scales as the proposal states that the Bluefield solar farm development is accommodated by the selection of substation locations. In the interests of transparent consultation there should have been an outline of the potential Bluefield solar farm on the maps/ diagrams as well. Many residents on the west of the village are potentially viewing a large solar farm, and also windfarm substations with a permanent footprint of 185000m2 in total (size of approximately thirty adult size football pitches) and approximately twenty five metres in height, rather than the Best and Most Versatile (BMV) good quality agricultural land they view now. With the 170-acre solar farm on Clifton Marsh and the expansion of Westinghouse in Clifton and other solar farm developments the area appears to be disproportionately affected. The map below illustrates the point, with Newton-with-Scales outlined in green. The Red lines are existing pylon and overhead cable routes. Existing solar farms and nuclear sites in pale blue (with potential expansion), new proposed solar farms in dark blue, and the substations in orange and yellow. Depending on the option chosen for the Morecambe substation (south or north) one yellow and orange box will no longer be relevant</p>  | <p>The solar farm has been considered as part of the cumulative assessment for the onshore elements of the Transmission Assets. All schemes considered in the cumulative assessment are set out in Volume 1, Annex 5.5: Cumulative screening matrix and location plan of the ES (document reference F1.5.5). Bluefield solar farm has also been considered as a part of route planning and site selection process, documented in Volume 1, Chapter 4 of the ES: Site Selection and Consideration of Alternatives (document reference F1.4), with further detailed provided in Volume 1, Annex 4.3: Selection and Refinement of the Onshore Infrastructure (document reference F1.4.3). The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3).</p> |
| TA_0019_021_231123          | S42/S44 | Email           | <p>Amenity. The consultation has not explained how existing bridleways and public rights of way and access tracks used by many residents will be impacted - is access to be permanently or temporarily denied or restricted? Many parishioners use Parrox Lane, Thames Street, Lund Way bridleway and other routes for their recreational exercise, dog walking etc. The increased type and volume of heavy goods vehicle will severely impact the existing recreational use.</p>   | <p>Impacts and effects on public rights of way are set out in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Details of the management of these routes during construction are set out in the Outline Public Rights of Way Management Plan (document reference J1.5).</p>   |
| TA_0029_014_231123          | S42/S44 | Email           | <p>Visual Impacts Based on the details it would appear that the substations and above ground infrastructure will be set well away from our assets. As the cabling will be installed underground then the longer-term visual impacts would likely be limited. The main visual impact will therefore be during the construction phase in relation to our interests. The Landscape and Visual Impact Assessment (LVIA) needs to consider the impact on boaters/towpath users as sensitive receptors. The waterway users will pass the position of the crossings at a relative low speed so will be susceptible to changes to the local landscape which need to be considered. We would welcome the waterway crossing of Savick Brook to be assessed via the LVIA. Any construction compounds near the river corridor should consider views during the construction phase and efforts should be made to minimise any visual impact. We would ask that the design for the crossing of the waterway are shared with the Trust at an early stage so that we can review the design in principle and its appropriateness within the waterways setting. This should also include any landscape</p>  | <p>The effects of the Transmission Assets on landscape and visual resources, including users of waterways, is considered in Volume 3, Chapter 10: Landscape and visual resources of the ES (document reference F3.10), where appropriate.</p>  |

| TA_0037_001_271023          | S44     | Email           | <p>We attended the drop-in event at Newton Village Hall yesterday, and I am afraid to say it was a total waste of time and energy and any feedback you are going to achieve will all be negative, divided between the residents affected by option 1 or option2. Therefore we can only assume you have already chosen the site for the substation and this is just a tick box exercise.The most important reason for us attending the meeting was to see how the impact of option 2 would affect our property. The photographs of the sites gave us no real indication of the visual effects the substation would have on the closest residents. In fact there was no mock photograph of the site directly opposite our house at all. When we queried this, we were told the photographer could not take photographs of every possible view, but to omit the closest and most obtrusive view of option 2 seems very strange to us. Especially when some of the photographs would have had to be taken by walking across</p>  | <p>The Applicants are committed to robust and transparent public consultation as part of the development process. The Project has undertaken three rounds of consultation with the local community, including two non-statutory periods of consultation (2 November to 13 December 2022 and 19 April to 4 June 2023) and a statutory consultation (12 October to 23 November 2023). Statutory targeted consultations have also taken place (November 2023 to October 2024). Information was available at the statutory consultation,. Including the PEIR, providing details of the viewpoints agreed with stakeholders at that time, including details of the options available regarding the design of the Transmission Assets. Feedback has been considered at each stage of consultation, alongside alongside a range of</p>  |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received   | Applicants' response  |
|-----------------------------|---------|-----------------|--|---|
|                             |         |                 | <p>fields with no road access or dwellings nearby, whereas our house is on a lane with easy access. The substation option 2 and the Morgan substation are both adjacent to Lower Lane, yet no photographs are taken from lower lane. Photographs have been taken from Kirkham road at ground level looking over fields and a housing estate with the substation in the distance beyond. This is totally unacceptable and dishonest to say the least. Nobody wants these substations, so to pretend the feedback is going to assist with your decision is just prolonging the agony for everyone. We need to know as soon as possible which option it is going to be so we can defend our rights, and there is nothing you can say or do to convince us this undertaking is anything other than disastrous for the whole area, and you will be wrecking people's lives and livelihoods with this decision. We had assurances from Fylde Borough Council during a building application process that made clear no development on the greenbelt land we live on would ever be accepted. I was informed my stables could only be used for domestic pleasure and could not be rented out commercially because Lower Lane could not handle any more traffic, and that my development was limited to existing footprints, yet here you are proposing to build some of the biggest building structures in the country. We will be in contact with our MP Mark Menzies regarding this intrusion of our greenbelt land and not least the photographic cover up that was on display at the statutory consultation in Newton on the 25th Oct. Option 2 would destroy 12 years of work to our property and land, destroy the final phase for completion of our house, destroy our dreams and wreck our lives. Has any of the initial development process considered the hurt and misery it will cause to human life, least of all the health impacts, I doubt it very much as we have not been part of any of the consultation process. There must surely have been other options on brown belt land that does not affect residential areas and one can only assume this was the cheapest option. You don't need residents to give you their reasons for the unsuitability of these sites, or you would not have gone this far with the project already, and we would ask that you announce the decision as soon as possible so we can plan for the future as far away from this nightmare as possible. Regards Mary and David Barlow</p> | <p>other factors including potential environmental constraints and engineering considerations. The Applicants have made design changes since the PEIR and further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). This has included refinements of the location and design of the onshore substations, including - selection of a single site for the onshore substation for the Morecambe Offshore Windfarm: Transmission Assets- refinement of the siting and orientation of the onshore substation for the Morecambe Offshore Windfarm: Transmission Assets, to take into account consultation responses received. Details of the design and/or environmental constraints considered as part of the iterative design process, are set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed designs will be developed post-consent. Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). Details of the landscape and visual impacts and effects are set out in Volume 1, Chapter 10: Landscape and visual resources of the ES (document reference F3.10). This includes photography from viewpoints agreed with statutory consultees, as well as landscape visualisations of the proposed substations (Volume 3, Figure 10.5).</p> |
| TA_0038_025_181123          | S44     | Email           | <p>3. The proposal of two very large substations in close proximity, resulting in over intensive development and industrialisation of Zone 1, will have a significant adverse impact on local amenities and a change in the local character from rural/agricultural to industrial.</p>   | <p>Details of the impacts and effects in relation to landscape character are set out in section 10.11 of Volume 3, Chapter 10: Landscape and visual resources of the ES (document reference F3.10).</p>   |
| TA_0038_032_181123          | S44     | Email           | <p>10. These two ESSs will result in significant loss of pasture land to dairy farms in Zone 1. This impacts our food-security and would render them commercially non-viable with consequently adverse socio-economic impact.</p>  | <p>The potential impacts of the Transmission Assets on agricultural land use are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes consideration of the effects of all elements of the Transmission Assets, including onshore substations on the viability existing farming businesses. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes the preparation of a Code of Construction Practice in general accordance with the Outline Code of Construction Practice (document reference J1) submitted with the DCO application. The measures to be implemented as part of the Code of Construction Practice seek to limit disruption to the operation of individual farm holdings.</p>  |
| TA_0038_033_181123          | S44     | Email           | <p>11. If any of the farms that suffer adverse socio-economic impact are owned by the Hornbie Trust then this would reduce the financial support that can be provided to the local Newton Bluecoat Primary School. Was this considered by M&amp;M during their assessment of zones?</p>  | <p>The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6)</p>  |

|-----------------------------|---------|-----------------|--|--|
| TA_0039_001_201123          | S44     | Email           | Further to previous correspondence and telephone calls, I write to confirm that I have spoken with my retained clients again with regard to the proposed Morgan and Morecambe transmission asset which will severely affect my client's land holding, as I have shown on the attached plan. As you can see, the proposed route effectively sterilises my client's complete land holding. My client uses the land for accommodating his livestock and therefore during construction the only part available will be a small area which I have highlighted circled red, which would be the remaining farm building, hardstanding and concrete yard area. If the northern route of the transmission is selected then we would suggest it would make practical sense to occupy the remaining severed area of my client's land holding for constructional compound facilities. I trust that you will find these comments to be of assistance and if you require any further information then please do not hesitate to contact me.  | The Applicants will work with land interests to identify and agree suitable measures for severed land as a result of the project design. Compensation for any losses that arise as a direct result of the project will be provided for in accordance with the compensation code. The Applicants are engaging with the land interest and their agent for the land rights sought.  |
| TA_0039_002_201123          | S44     | Email           | Further to our previous correspondence, as you are aware, I act on behalf of the above landowner who is potentially impacted by the proposed transmission assets of Morgan and Morecambe Wind Farm. Please take this letter as an additional comment for the feedback contained within the Statutory Consultation and I would be grateful if you could acknowledge safe receipt and confirm that this will be put forward within the Statutory Consultations and fed through to the contract team. My client's land is identified on the attached plan, running south from Hillock Lane through sections identified as 10A and 10B running east to Kirkham Road. My client's land is contained within legal title LAN150285. The proposed cable route significantly impacts my client's high quality silage field, cutting diagonally across from Hillock Lane travelling south and then the cable route effectively taking the vast majority of the land. We note within the initial consultations there are potential compound areas identified as 11A and 11B with an access track leading off Hillock Lane through my client's land which obviously will be removing significant portion of well-established hedgerow. The loss of well-established hedgerow in our opinion is completely un-necessary. My client's land is going to be severed and the triangle portions between 10A and 10B are going to be effectively in-farmable during the constructional phase and therefore it makes practical sense for Morgan and Morecambe to occur the area cross-hatched blue for compound areas, rather than the areas identified 11A and 11B. Access would be directly off Hillock Lane through the pipeline route giving the contractors far greater flexibility and control. It was also noted at this stage that the land which immediately adjoins Kirkham Road is identified as longer-term land for alternate purposes – there is a linear residential development along Kirkham Road with the position of the proposed cables significantly, if not completely, sterilise my client's land holding for any future development which would have to be recognised in the statutory compensation procedures. I trust that you will find the above to be in order and I would be grateful if you could make the necessary amendments to ensure that our client's land is being used to mitigate the scheme and that Morgan and Morecambe will fully indemnify my clients for any severed unfarmable areas throughout the life of the constructional project. | Following route refinement, Dalcour Maclaren on behalf of the Applicants will be in touch with interests to discuss Heads of Terms to secure the rights for the cables and compound which will include provisions for compensation of severed land and impact on farming operations.   |
| TA_0040_001_191123          | S44     | Email           | My name is REDACTED, I am writing to you as Director of REDACTED, a farming business based at REDACTED on land directly based along your proposed cable route. This proposed project would in any case, render my business unviable and unable to continue to operate, effectively closing my business down completely. This would obviously have a massive financial impact on myself and family. I would like to use the opportunity during this public consultation period, to unequivocally Object to your proposals and express my concerns over the proposed off shore Wind Farm cable routing and sub station locations within the fylde coast. I believe this would have a grossly negative impact on the Environment both physically, via the works proposed and Visually, damaging an untold amount of wildlife habitat and green belt protected land, conservation area's, highly productive farmland and have a hugely detrimental impact on the wider community and local economy, putting local business, land owners and Farmers out of business. I believe it would create an untold amount of suffering for residents within the fylde coast for years to come via flooding and disruption ie traffic. Your lack of detail on some of the proposed cable routes and sub stations at this late stage and at this public consultation point in proceedings, is most worrying as this shows either an unprofessional approach to the matter, or completely unprepared, or at worst, both. It is extremely concerning that at this late stage   | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). Following route refinement and landowner engagement, the impact has been reduced on this holding and the Applicant through Dalcour Maclaren will work with the landowner to |

|                             |         |                 | we are asked to submit our opinions on a body of work that is neither complete nor suggest the possible outcomes thereafter the point of consultation. I feel that you have shown disregard to the community of the fylde coast in your methods up to now. This lack of transparency on your part, sets a precedent when approaching future issues and has created a level of mistrust that is beyond repair. This is another reason why I must whole heartedly Object on all parts of your proposals.   | reduce the impact of construction on the holding and business. Dalcour Maclaren on behalf of the Applicants will be in touch with interests to discuss Heads of Terms which will include compensation provisions to address any impacts to the farming business.   |
| TA_0042_001_191123          | S44     | Email           | I am writing this email as the REDACTED of REDACTED, based on Marton Moss. Also user/owner of some of the land proposed to be affected by the cable route and surrounding bridle paths.If the route chosen includes my land on Division Lane, it would have a catastrophic and ruinous effect on my business.Therefore I am taking the opportunity during this public consultation period, to unequivocally Object to your proposals and express my concerns over the proposed off shore Wind Farm cable routing and sub station locations within the fylde coast. I believe this would have a grossly negative impact on the Environment both physically, via the works proposed and Visually, damaging an untold amount of wildlife habitat and green belt protected land, conservation area's, highly productive farmland and have a hugely detrimental impact on the wider community and local economy, putting local business, land owners and Farmers out of business. I believe it would create an untold amount of suffering for residents within the fylde coast for years to come via flooding and disruption ie traffic. Your lack of detail on some of the proposed cable routes and sub stations at this late stage and at this public consultation point in proceedings, is highly worrying as this shows either an unprofessional approach to the matter, or highly unprepared, or at worst, both. It is very concerning that at this late stage we are asked to submit our opinions on a body of work that is neither complete nor suggest the possible outcomes thereafter the point of consultation. I feel that you have shown disregard to the community of the fylde coast in your methods up to now. This lack of transparency on your part, sets a precedent when approaching future issues and has created a level of mistrust that is beyond repair. This is another reason why I must whole heartedly Object on all parts of your proposals. | The potential impacts of the Transmission Assets on recreational resources, including livery yards, stables and PRow are identified and assessed in section 6.6 and section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes consideration of REDCATED. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes preparation of a PRow Management Strategy in general accordance with the Outline PRow Management Strategy (document reference J1.5) submitted with the application for development consent. The measures to be implemented as part of the PRow Management Strategy seek to minimise impacts on public footpaths, bridleways and other promoted routes (e.g. NCRs, Long Distance Footpaths) during construction of the Transmission Assets. |
| TA_0043_002_211123          | S44     | Email           | 2 Dairy farming involves regular movements of large number of animals at least twice daily for 9 months of the year. The essential prerequisite to this movement is flexibility. It can be weather dependent. Hedges, gateways, field boundaries and farm tracks are all deliberately positioned to facilitate this. The entire structure of the farm will be damaged during construction of this project.   | Dalcour Mclaren on behalf of the Applicants will be in touch with interests to discuss Heads of Terms which will include compensation provisions to address any impacts to the farming business.   |
| TA_0043_009_211123          | S44     | Email           | 9 Several footpaths on my farm are involved- presumably these will have to be relocated(temporarily?). This will further impact on our farming practices.  | Impacts and effects on agricultural land use and public rights of way are set out in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Details of the management of rights of way during construction are set out in the Outline Public Rights of Way Management Plan (document reference J1.5).   |
| TA_0043_017_211123          | S44     | Email           | 17 All our access tracks are used 365 days a year and we need flexibility to use these tracks – easement contractors cannot simply adopt their use.  | Following route refinement, Dalcour Maclaren on behalf of the Applicants will be in touch with interests to discuss Heads of Terms to secure the rights for the cables and compound which will includes accesses, and provisions for compensation of severed land and impact on farming operations. As part of the Heads of Terms and ongoing discussions and negotiations, the safety and welfare of all those working on or within proximity to the works, as well as any livestock will be carefully considered to ensure safety at all times. Working practices will be captured in the Code of Construction Practice (CoCP).  |
| TA_0117_004_271023          | S44     | Email           | As a local resident and neighbour of one of the farmers REDACTED, we know how over the years he has developed a farm with many eco-credentials. These include 10 miles of hedge row, set aside, grassland with carbon capture He also has an established amount of great crested newt and we know that migrating eels travel along the river Dow and onward along the ditches where they spawn. He is also one of the last dairy farmers on our Fylde Coast. As I said before there must be an alternative route that can be explored otherwise what is the point of the costly consultation. We really hope that we are listened to.  | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter,   |

|                             |         |                 |   | mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).  |
| TA_0118_001_071123          | S44     | Email           | As a resident of Freckleton I wish to strongly register my objection to the planned substations in our area. My husband and I chose to retire here 5 years ago because of the access to the open countryside which surrounds this area. It is a valuable habitat to much wildlife including bats, great crested newts and hedgehogs, foxes, etc. We also have curlew, lapwing and oystercatcher in this area. These key species are being displaced at an alarming rate and greatly rely on these coastal resources to overwinter successfully.   | The ES includes an assessment of the Transmission Assets alone in section 4.11 of Volume 3, Chapter 4: Onshore and intertidal ornithology of the ES (document reference F3.4). Details on the impacts on European sites from the Transmission Assets are contained within the Information to Support Appropriate Assessment (ISAA) report (document reference E2.1, 2.2, 2.3). Both the ES and the ISAA consider construction impacts, including impacts on functionally linked land.  |
| TA_0119_001_071123          | S44     | Email           | I am opposed to your plans to build two substations on greenbelt land in the local area around Freckleton. This surely cannot be the best option for the local environment, given the known flooding issues in the area, and the loss of high-quality farmland. It is also a valuable habitat to much wildlife including bats, newts, and various species of bird including curlews, lapwings, owls and oystercatchers to name but a few. The close proximity to Carr Hill and Strike Lane schools, will also be a major concern for the many parents in the area. I am not against wind farms and green energy, but this must be done in a respectful way for local residents and the community. Surely the land surrounding the existing substation in Penwortham, would be a more viable and appropriate option.   | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |
| TA_0120_001_121123          | S44     | Email           | Whilst I still need a reply in order to be able to consider my full response to the consultation, I would like to ensure that these objections are logged: I object to the use of land within residential areas as construction compounds including the two indicated on Blackpool Rd North. The area with grass and trees must not be used for such a purpose. It would be an eye sore in such a prominent area as well as denying children and dog walkers a valuable green area. I object to any disruption to the use of Blackpool Rd North Playing Fields. These are a valuable community asset used by hundreds of people, including my son who volunteers as a coach for a local football club for children. I object to any trenches being dug or drilling conducted in residential roads. The cables must be installed in the open land of the airport, either by trenches or a continuation of the horizontal drilling. I have not been able to find an explanation as to why this method can be used to run cables under the sea, beach and sand dunes but not all the way to the eastern side of Queensway. | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |
| TA_0121_001_171123          | S44     | Email           | I object to this development of Morgan and Morecambe Offshore wind farms because I am a local resident and feel this will have significant detrimental impact to the area. I do not feel that there has been proper exploration of other sites. Also I feel it should be considered to bring ashore closer to Penwortham by travelling up the river, or it should come ashore where existing sites already come ashore. The proposed site would have a substantial flood risk, as I witness frequently, and would affect the farmers who use the land currently. It is also close to developed residential areas and local schools.   | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3).  |
| TA_0118_003_171123          | S44     | Email           | Reason for Objection- Substations I am writing this email, all of which is my strong objection to your proposals to build 2 enormous substations on greenbelt land where there are many properties in very close proximity. The land you propose to use is good grade A agricultural land which is used by farmers to provide them with a living. I also strongly object to your proposals for the substations on the grounds of: -1) My husband and I chose to retire here 5.5 years ago for a beautiful, large back garden and the peacefulness of the area and   | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2,  |

|-----------------------------|---------|-----------------|--|--|
|                             |         |                 | beautiful front views across open fields with cattle or sheep grazing after moving from the village. Had we known your intentions then we would never have bought the property.  | and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3).   |
| TA_0118_005_171123          | S44     | Email           | 7) I strongly object, also to you proposing to build 2 substations, one the size of 18 football pitches, the other the size of 9 football pitches and 20m in height plus a lightning mast as this will most certainly impact the environment and wildlife some of which is protected. If you aren't bothered about the wildlife put it down the estuary the most logical place for it to go. | The Ribble estuary has numerous ecological statutory designations protected nationally and internationally. These include the Liverpool Bay Special Protection Area, Ribble and Alt. Estuaries Special Protection Area, the Ribble and Alt Estuary Ramsar site (a wetland of international importance under the Ramsar Convention), and the Ribble Estuary Site of Special Scientific Interest, Ribble Estuary Marine Conservation Zone and Ribble Estuary National Nature Reserve. The tidal nature and shallow water depths of the estuary also create heightened risk to construction as the unstable riverbed conditions are unsuitable for trenching/ cable laying vessels to access. As such, cabling through the estuary would result in significantly protracted construction timeframes, and potentially long-term impacts to sensitive and sensitive features associated with the designated features, whilst also presenting higher risk and potentially unsafe working conditions. As such, the approach to site selection has been based on avoiding direct impacts to Important Ecological Features (IEFs) where practicable, further details can be found in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4).   |
| TA_0122_001_171123          | S44     | Email           | I wish to object against the proposals to build two high (sic) electricity substations at Kirkham/Newton/Freckleton. The reasons for the objection being that the proposed site is completely inappropriate being on top grade agricultural land, it is close to two schools, it would cause unacceptable noise pollution and would increase the flooding risk.                              | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0124_008_171123          | S44     | Email           | 9.if you pave 36 acres of good farmland (which can grow crops), you can destroy our food security.   | The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes the preparation of a Soil Management Plan in general accordance with the Outline Soil Management Plan (document reference: J1.7), which has been submitted with the DCO application. The measures to be implemented as part of the Soil Management Plan seek to minimise impacts on soil health and protect and maintain soil quality during construction of the Transmission Assets. These measures also comprise the preparation of a Code of Construction Practice in general accordance with the Outline Code of Construction Practice (document reference J1) submitted with the DCO application. The measures to be implemented as part of the Code of Construction Practice seek to limit disruption to the operation of individual farm holdings. |
| TA_0124_012_171123          | S44     | Email           | 13.The farmers are going to lose vast amounts of land rendering many of them without commercial income. This will have an adverse socio economic impactive spoken with many  | The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and   |

| TA_0125_001_181123          | S44     | Email           | Substations at Freckleton, Kirkham and Newton. Reasons for objection to proposed route and substations from offshore wind farms. Take this email, as my strong objection to your proposals to build 2 substations in and around the Freckleton, Kirkham and Newton area. Reasons for Objection:- 1. These substations are proposed to be constructed on greenbelt land where there are many properties in very close proximity. This land is good grade A agricultural land which is used by the local farmers to provide themselves with a living. 2. The substations will be extremely close to properties and two schools, Carr Hill and Strike Lane, plus a number of nurseries and children's homes. After research, I have found no other areas with substations so close to residential properties, schools, etc. | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0125_006_181123          | S44     | Email           | 10. We are by no means against alternative energy, I can't call it green because it's not, however for you to create so much up-heavel to good agricultural land and farms, for over a 30 mile stretch of land over 120m wide just to link up to the National Grid substation at Penwortham is appalling and very wrong.   | The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes the preparation of a Soil Management Plan in general accordance with the Outline Soil Management Plan (document reference: J1.7), which has been submitted with the DCO application. The measures to be implemented as part of the Soil Management Plan seek to minimise impacts on soil health and protect and maintain soil quality during construction of the Transmission Assets. These measures also comprise the preparation of a Code of Construction Practice in general accordance with the Outline Code of Construction Practice (document reference J1) submitted with the DCO application. The measures to be implemented as part of the Code of Construction Practice seek to limit disruption to the operation of individual farm holdings. |
| TA_0126_004_181123          | S44     | Email           | 5. The proximity of the development to the current residential area shows no sign of consideration. The area would be changed from its current agricultural outlook to an industrial development ruining the character of the area. The loss of the agricultural land in   | The Planning Statement (document reference J28) sets out an assessment on the impact on the countryside and location of the substations. The impacts and effects of the Transmission Assets in terms of noise are set  |

|                             |         |                 | <p>zone 1 will have a negative socio-economic impact to the area. There is no indication of noise, light and EMF emission levels resulting from the development which will affect the immediate area and therefore residents.</p>  | <p>out in Volume 3, Chapter 8 : Noise and vibration of the ES (document reference F3.8). Visual effects, including effects arising from lighting, are set out in Volume 3, Chapter 10: Landscape and visual resources of the ES (document reference F3.10). Electro-magnetic fields (EMFs) are part of the natural world, and are also produced wherever electricity is generated, transmitted or used. With regard to EMF impacts, the project will adopt the International Commission on Non-ionizing Radiation Protection (ICNIRP) guidelines and Government voluntary Code of Practice on EMF public exposure. Such considerations are inherent to the detailed engineering considerations of cable specification and routing. Relevant public EMF exposure guideline limits are noted in NPS EN-5 and would be complied with by the project. These guidelines are long standing and have a high safety margin. The levels of exposure that they require would not pose a risk to public health. Volume 1, Annex 5.1 (document reference F1.5.1) has had regard to the risk perceptions associated with EMFs of the Transmission Assets on the local area and this is presented in section 1.11.9 of the Annex. See also the submitted EMF Compliance Statement (Volume 1, Annex 3.4 of the ES, document reference E1.3.4).</p>  |
| TA_0127_001_191123          | S44     | Email           | <p>we strongly object to any windfarm along the Queensway. We have a small private stable yard at the top of REDACTED which runs along the Queensway. We originally fenced along the queensway 15 foot in to protect the trees and wildlife and to cause least disruption to the area as possible. We observe bats otters newts rat weasels voles moles to name the least. The end field we own has recently had a tree cut out without our permission? also i turn my horses out along there and one horse is a rescue that does not tolerate any heavy machinery and is very nervous. so any disruption would seriously damage the area animals and wildlife. Therefore we strongly object thankyou</p>  | <p>The potential impacts of the Transmission Assets on recreational resources, including livery yards, stables and PRoW are identified and assessed in Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). The potential impacts of the Transmission Assets on protected species and protected habitats are considered in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on onshore ecology and nature conservation are provided in section 3.8 of Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES (document reference: F3.3).</p>  |
| TA_0129_002_191123          | S44     | Email           | <p>The selection of the zones does not seem logical or balanced and seems to have had a predetermined answer. Often exaggerating impacts to achieve the 'desired result', ie Zone 1. For example, stating a high pressure gas main is located in Zone 2, when it is only present in the extreme eastern edge. Similarly for flood risks and assessment of impact on wildlife. The whole scheme goes against strategic development plans for Fylde green belt and the Kirkham separation zone. These are huge structures and will fundamentally change the area from being farming and rural to industrial. This is clearly against the culture of the area and will impact the lives of many, many residents and business owners in the region. Why can't the cables be run further down the estuary and then use brown field sites near the proposed connection point to the national grid, at Pemwortham. In short, building these structures and running associated cables will have a massive detrimental effect on the area and is against the existing democratically agreed development plans for the area and the consultation has not been impartial and considered all factors equally. In short flawed and hence should be disregarded as incomplete and the plan rejected.</p> | <p>The Ribble estuary has numerous ecological statutory designations protected nationally and internationally. These include the Liverpool Bay Special Protection Area, Ribble and Alt. Estuaries Special Protection Area, the Ribble and Alt Estuary Ramsar site (a wetland of international importance under the Ramsar Convention), and the Ribble Estuary Site of Special Scientific Interest, Ribble Estuary Marine Conservation Zone and Ribble Estuary National Nature Reserve. The tidal nature and shallow water depths of the estuary also create heightened risk to construction as the unstable riverbed conditions are unsuitable for trenching/ cable laying vessels to access. As such, cabling through the estuary would result in significantly protracted construction timeframes, and potentially long-term impacts to sensitive and sensitive features associated with the designated features, whilst also presenting higher risk and potentially unsafe working conditions. As such, the approach to site selection has been based on avoiding direct impacts to Important Ecological Features (IEFs) where practicable, further details can be found in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4). The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). These measures include the provision of an Outline Soil Management Plan (document</p> |

|                             |         |                 |   | reference J1.7). In addition, the Outline Code of Construction Practice (document reference J1) seeks to limit disruption to the operation of individual farm holdings.  |
| TA_0130_003_191123          | S44     | Email           | We also know from past experience disruption to land, digging drilling etc in the area, has driven vermin into our homes! It has also caused flooding and water tables to rise. The question of noise from transmitting that amount of electricity through the corridors is also unclear. A local electrical expert that installs commercially on a large scale doubts it will be silent.   | An assessment of the noise and vibration impacts due to the Transmission Assets are presented in Volume 3, Annex 8.2: Construction Noise and Vibration of the ES (document reference F3.8.2) and Volume 3, Annex 8.3: Operational Noise of the ES (document reference F3.8.3). The cumulative noise and vibration impacts with other proposed developments is considered in section 8.13 of Volume 3, Chapter 8: Noise and vibration of the ES (document reference F3.8).  |
| TA_0130_005_191123          | S44     | Email           | I strongly support the following objection drawn up locally; "I would like to use the opportunity during this public consultation period, to unequivocally Object to your proposals and express my concerns over the proposed offshore Wind Farm cable routing and sub station locations within the Fylde coast. I believe this would have a grossly negative impact on the Environment both physically, via the works proposed and visually, damaging an untold amount of wildlife habitat and green belt protected land, conservation area's, highly productive farmland and have a hugely detrimental impact on the wider community and local economy, putting local business, land owners and Farmers out of business. I believe it would create an untold amount of suffering for residents within the Fylde coast for years to come via flooding and disruption i.e. traffic. | The Applicants are committed to robust and transparent public consultation as part of the development process. The Transmission Assets has undertaken three rounds of consultation with the local community, including two non-statutory periods of consultation (2 November to 13 December 2022 and 19 April to 4 June 2023) and a statutory consultation (12 October to 23 November 2023). Statutory targeted consultations have also taken place (November 2023 to October 2024). The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the SoCC). The Transmission Assets is fully committed to delivering a community benefits scheme in line with UK Government guidance, which is due to be published later this year. The Transmission Assets is fully committed to delivering a community benefits scheme in line with UK Government guidance, which is due to be published later this year. Ahead of the guidance being published we have been engaging with local people, businesses and organisations to identify key themes and projects that will deliver strategic benefits and directly support the local community and local priorities. We welcome further input from the local community and encourage you to reach out to the project team in due course. The Applicants provided maps as part of the consultation materials that clearly set out the elements of the Transmission Assets in relation to settlements, roads and geographic features. All maps also included a key to highlight the proposed use of different areas and the relevant aspects of the Transmission Assets' design. The materials were proportionate to the level of information and design detail at the time of consultation, reflecting the information available in the PEIR. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |

| TA_0131_001_191123          | S44     | Email           | I write to reject your proposal for the offshore windfarm at Morecambe. The reasons are as follows, and are mainly based on the cable route: 1) Impact on the land and local farms. 2) The endless disruption on roads and transport in the area of Squires Gate Lane / Clifton Drive North / Queensway which has had constant road works and delays in recent times. I am not prepared to put up with having 1 of only 2 available routes to my house with a long term traffic issue. It is absolutely unbearable. The queues are horrific.   | The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Traffic and transport impacts arising during the construction phase of the Transmission Assets have been fully assessed at section 7.11 Volume 3, Chapter 7: Traffic and transport of the ES (document reference E3.7) with measures to control impacts set out in the Outline Construction Traffic Management Plan (document reference J8). Details of the operation and maintenance phases are set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Onshore maintenance would be limited to essential maintenance and/or emergency works. Details of the construction phase are set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Measures to control construction impacts on the environment and the local community are set out in the Outline Code of Construction Practice (document reference J1). |
| TA_0132_001_191123          | S44     | Email           | I wish to register my utter disagreement with the planned wind farm, very close to my property. I believe I am the longest standing resident on REDACTED, having moved to this bungalow in September 1972, fifty one years ago. Many changes, not all for the better, have been made since then, but the thought of the absolute desecration of this rural area that this plan would bring, is devastating. The noise, disruption of traffic (already dreadful in this location), the years it will take to complete, is beyond comprehension. This country area was beautiful and has been encroached upon enough, in recent years. It also has huge drainage problems; properties and dykes are regularly waterlogged, through both Fylde (my council) and Blackpool Council inactivity. Inevitably the situation would be exacerbated should this project go ahead. Kindly register my complete disapproval.  | The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage.  |
| TA_0133_001_191123          | S44     | Email           | We oppose the following: 1. THE ONSHORE TEMPORARY COMPOUND - AT REDACTED We join all our neighbours in opposing this compound (i) The Compound would affect 2 Horse Riding Schools* The compound would remove the landing site for the Air Ambulance in cases of accident The Compound would affect the day to day running of the Horse Riding Schools- Affect the Indoor Riding School- Affect the Outdoor Riding Paddock The Compound would affect the financial viability of the Horse Riding Schools- Raising Insurance Premiums* The Compound would affect Riding for the Disabled Lessons at Wrea Green Equitation Centre - Any noise would severely disrupt these lessons in both the Indoor School and the Outdoor Paddock- *The Compound would remove the landing site for the Air Ambulance - which is more acute in accidents involving Riding for the Disabled clients (ii) The Compound would affect 2 Farms The Compound would affect the day to day operation The Compound would affect the financial viability | Dalcour Maclaren on behalf of the Applicants will be in touch with interests to discuss impacts to any businesses. As part of the ongoing discussions and negotiations, the safety and welfare of all those working on or within proximity to the works, as well as any livestock will be carefully considered to ensure safety at all times. Working practices will be captured in the Code of Construction Practice (CoCP). In assessing the impact of noise and vibration, ES Volume 3, Chapter 8: Noise and vibration (document reference F3.8) will provide further detailed information on that assessment.   |
| TA_0133_003_191123          | S44     | Email           | (iv) The Compound would destroy an area of the Countryside This would impact the the local countryside and animals   | The potential impacts of the Transmission Assets on protected species and protected habitats are considered in Volume 3, Chapter 3: Onshore ecology and nature conservation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on onshore ecology and nature conservation are provided in   |

Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3).  |
| TA_0136_001_201123          | S44     | Email           | I am opposed to the development for the following reasons: Destruction and disruption of important wildlife habitats on Lytham Moss and beyond for birds, bats, newts, deer etc. Destruction and disruption to public rights of way and Bridleways on Lytham Moss and beyond. Major disruption to very busy highways and access routes, including but not limited to Queensway, Kilnhouse Rd and the new Moss Road that is currently under construction. Destruction and disruption to private residences along the route, including potential compulsory purchase of private gardens and grazing land. The devaluing of private dwellings along and surrounding the development, spoiling green views and acreage.   | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).  |
| TA_0138_001_201123          | S44     | Email           | I would like to formally lodge my opposition to the proposed disruption to the St Annes area from the offshore wind farm.<br><br>I attended the recent consultation at the local Cricket Club and was alarmed by the proposal to take the cables through the roads of St Annes. It will cause untold disruption to local residents and will also lead to the destruction of green spaces (eg on Blackpool Rd) and wildlife. I am a resident of Kilnhouse Lane and I simply can't imagine how difficult it will be to have trenches running along the nearby roads (especially Queensway) for "weeks". I suspect the "weeks" will become months very easily. Look how long it took to do a very simple road reconfiguration around Common Edge!!   | Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Maximum parameters for the substation have been refined following statutory consultation. As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Specifically, the landscape and visual assessment (Volume 3, Chapter 10 of the ES) (document reference F3.10) and onshore ecology assessment (Volume 3, Chapter 3 of the ES) (document reference F3.3) set out the respective maximum design scenarios, and identify the likely significant effects during construction, operation and maintenance, and decommissioning, temporally and seasonally (where relevant), with and without mitigation. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |
| TA_0139_001_201123          | S44     | Email           | I would like to use the opportunity during this public consultation period, to unequivocally Object to your proposals and express my concerns over the proposed off shore Wind Farm cable routing and substation locations within the Fylde coast. I believe this would have a grossly negative impact on the Environment both physically, via the works proposed and Visually, damaging an untold amount of wildlife habitat and green belt protected land, conservation areas, highly productive farmland and have a hugely detrimental impact on the wider community and local economy, putting local business, land owners and Farmers out of business. |-----------------------------|---------|-----------------|---|---|
|                             |         |                 |   | <p>engagement with the relevant communities in due course. The Applicants provided maps as part of the consultation materials that clearly set out the elements of the Transmission Assets in relation to settlements, roads and geographic features. All maps also included a key to highlight the proposed use of different areas and the relevant aspects of the Transmission Assets' design. The materials were proportionate to the level of information and design detail at the time of consultation, reflecting the information available in the PEIR. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p> |
| TA_0140_005_201123          | S44     | Email           | <p>I believe that the substations are going to be on green belt and are absolutely huge. They are going to be close to schools which is appalling.</p>  | <p>It is acknowledged that the proposed cable route passes through Green Belt land and the proposed onshore substations also fall within Green Belt. A consideration of alternative routes and substation siting is made as part of the Site Selection chapter of the ES (Volume 1, chapter 4, document reference F1.4) which concluded this is the preferred route and location for the cable and the substations. Land within the Area of Separation is no longer required for the onshore substations. An assessment regarding the impact on the purposes and openness of the Green Belt, alongside a Very Special Circumstances assessment is set out within the Planning Statement (document reference J28). The Applicants consider that when assessed on the planning balance that the significant benefits of the Project mean that there are Very Special Circumstances that outweigh any potential harm to the Green Belt. The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3).</p>  |
| TA_0143_001_201123          | S44     | Email           | <p>My name is REDACTED of REDACTED and REDACTED. I have lived in Newton for 28 years, my husband and late father-in-law owned and operated a dairy farm on the site of REDACTED, Grange Lane, Newton. I chose to live/reside in this location because it is rural and should remain rural. The siting of the substation on Zone 1 or any one of the proposed locations is extremely worrying. My concerns regarding these proposals are as follows:-<br/>Green Belt land<br/>Prime agricultural land, potentially rendering the land useless<br/>In an area of separation<br/>Way too close to two schools<br/>Way too close to residential properties<br/>Flooding<br/>Visual impact<br/>Noise, light, vibration<br/>Wildlife<br/>Congestion<br/>Decreasing the value of land and property<br/>Safety hazard<br/>Surely there must be other options available with far less intrusion on the whole of the Fylde.</p> | <p>The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p>   |

| TA_0152_002_201123          | S44     | Email           | If wind farms are green energy how can the destruction of green belt land in this local community be classed as "green". Newton is just a little village with a primary school & farms which is very rural/ agricultural which will just be ruined with your intensive development.  | It is acknowledged that the proposed cable route passes through Green Belt land and the proposed onshore substations also fall within Green Belt. A consideration of alternative routes and substation siting is made as part of the Site Selection chapter of the ES (Volume 1, chapter 4, document reference F1.4) which concluded this is the preferred route and location for the cable and the substations. Land within the Area of Separation is no longer required for the onshore substations. An assessment regarding the impact on the purposes and openness of the Green Belt, alongside a Very Special Circumstances assessment is set out within the Planning Statement (document reference J28). The Applicants consider that when assessed on the planning balance that the significant benefits of the Project mean that there are Very Special Circumstances that outweigh any potential harm to the Green Belt.   |
| TA_0154_002_201123          | S44     | Email           | My second objection is the sites proposed sit on an area of grade A agricultural land loss of this seems to be at odds with the need for green energy, particularly when there seems to be no reasons that can be given as to why existing sites at Heysham and Penwortham cannot be used, limiting loss of green field site and minimising community disruption. The land to be built on represents demarcation land between local villages and parishes. Losing this and effectively placing industrial units between them will not only join these villages but cause the loss of "rural fylde", again at odds with the green agenda. | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Land within the Area of Separation is no longer required for the onshore substations. The Planning Statement (document reference J28) sets out an assessment on the impact on the countryside and location of the substations. The Applicants have made design changes since the PEIR and further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). This has included refinements of the location and design of the onshore substations, including - selection of a single site for the onshore substation for the Morecambe Offshore Windfarm: Transmission Assets - refinement of the siting and orientation of the onshore substation for the Morgan Offshore Wind Project: Transmission Assets, to take into account consultation responses received. Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. |
| TA_0158_015_211123          | S44     | Email           | 6. The PEIR proposes two very large substations resulting in over intensified development and industrialisation in Zone 1, which is currently farm land. Furthermore, Bluefield solar farm is also planning for the same location, increasing over-development concerns.   | The solar farm has been considered as part of the cumulative assessment for the onshore elements of the Transmission Assets. All schemes considered in the cumulative assessment are set out in Volume 1, Annex 5.5: Cumulative screening matrix and location plan of the ES (document reference F1.5.5). Bluefield solar farm has also been considered as a part of route planning and site selection process, documented in Volume 1, Chapter 4 of the ES: Site Selection and Consideration of Alternatives (document reference F1.4), with further detailed provided in Volume 1, Annex 4.3: Selection and Refinement of the Onshore Infrastructure (document reference F1.4.3). All schemes considered in the cumulative assessment are set out in Volume 1, Annex 5.5: Cumulative screening matrix and location plan of the ES (document reference F1.5.5).  |
| TA_0161_001_211123          | S44     | Email           | Proposed Morecambe & Morgan Wind Farms – Transmission Assets Comments on and objections to the consultation and project proposals: I am writing as a resident and homeowner in Newton-with-Scales. I am very concerned about the proposals regarding the Morecambe and Morgan Windfarm Transmissions Assets and the negative impact which they will have on our quiet rural village. The proposals to place two enormous substations   | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4:   |

| Unique Reference Identifier | S42/S44 | Feedback method | Statutory consultation response received  | Applicants' response   |

| TA_0161_013_211123          | S44     | Email           | <p>•The substations and the cabling routes will cut into large areas of good quality farmland that will in turn affect food security and the livelihoods and lifestyle of our traditional farming community. If the farms are taken or made financially unviable this area will be losing its rural/ agricultural identity. Some of the farms provide income via the Hornbies Trust for Newton Bluecoat School. What impact will the drop in income have on these children? How can the farmers sustain their farms and families, grow crops and keep cattle?• The substations and cabling routes impact on amenity and leisure activity e.g. walking the existing Public Rights of Way and rural lanes and tracks. Sightlines from historic sites will also be adversely impacted. Why are you using green areas rather than brownfields sites?</p>  | <p>The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). The potential impacts of the Transmission Assets on recreational resources, including PRoW are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of this chapter of the ES. This includes preparation of a PRoW Management Strategy in general accordance with the Outline PRoW Management Strategy (document reference J1.5) submitted with the DCO application. The measures to be implemented as part of the PRoW Management Strategy seek to minimise impacts on public footpaths, bridleways and other promoted routes (e.g. National Cycle Routes (NCRs), Long Distance Footpaths) during construction of the Transmission Assets.</p>  |
| TA_0161_014_211123          | S44     | Email           | <p>•No route has yet been declared for the 400kV cables from the substations to Penwortham. It is still showed as a large tract of land that is potentially impacted. There is still no information about how the cables will cross the River Ribble, though the project team said verbally that there would be no infrastructure above ground. How can you guarantee there will be no further infrastructure above ground for the Ribble crossing if you do not yet know the route or the engineering challenges faced?•All cabling being put in place via wide 120m trenches apart from when crossing the river and major roads. Why can't trenchless technology be used along the whole route? This would be less intrusive and disruptive to the farmers and livestock. Farmers are saying that the land would take tens of years to recover and become productive again after being displaced during trench digging. •There is much talk in the press after the Winsor report about the move to overhead cables to speed the delivery of additional electricity into the National Grid. Is there a possibility that the underground cables will be changed to overhead cables?</p> | <p>The Transmission Assets design has resulted in a reduced construction corridor width, as set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Details of the factors considered during the design evolution are set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). Direct pipe or microtunnelling is proposed beneath the River Ribble to ensure that there would be no direct impacts on the river habitats. As set out in Volume 3 Chapter 3: Onshore ecology and nature conservation of the ES (document reference F3.3), Crossing techniques are set out within Volume 1, Annex 3.2: Onshore Crossing Schedule of the ES (document reference F1.3.2) which is submitted as part of the application for development consent. Further information on the proposed approach to construction is provided in Volume 1, Chapter 3: Project description of the ES. The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are</p> |

|                             |         |                 |   | provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6).  |
| TA_0161_015_211123          | S44     | Email           | <p>•There is little detailed information about how the construction phase will impact the local area. It is likely to last several years causing massive disruption with long noisy working hours. The consultation booklet states construction period of 3 years but the PEIR indicates 60 months. There is no statement that the construction of the substations will be concurrent. If it is not concurrent the construction period could be extended unnecessarily. •Access during and post construction is also an issue. The A583 is a fast and busy road and access along here will cause major delays. Newton has a village shop, post office and access along here will cause major delays. Newton has a village shop, post office and hairdressers. People need to leave the village to work, visit the GP/hospital, do a weekly shop etc. People need to cross the A583 to get from the main village settlement to the Church and Village Hall. These ordinary, everyday activities will become increasingly difficult with the increase in the number of heavy vehicles predicted. There is also a proposal to use small rural roads – roads regularly used recreationally by residents e.g. Parrox Lane, Newton. These single track roads, bordered with historic hedgerows are a totally impractical option. •Removal of our hedgerows and construction in our fields totally destroys our traditional landscape character.</p> | <p>Details of the construction phase are set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Measures to control construction impacts on the environment and the local community are set out in the Outline Code of Construction Practice (document reference J1).Traffic and transport impacts arising during the construction phase of the Transmission Assets have been fully assessed at section 7.11 Volume 3, Chapter 7: Traffic and transport of the ES (document reference E3.7). Details of the operation and maintenance phases are set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Onshore maintenance would be limited to essential maintenance and/or emergency works. Further details regarding construction traffic are provided in Volume 3, Chapter 7: Traffic and transport of the ES (document reference F3.7), with measures to control impacts set out in the Outline Construction Traffic Management Plan (document reference J8).An iterative EIA process has been used to avoid impacts where practicable, in addition to mitigating remaining impacts. The design at the onshore substations is set out in the Outline Landscape Management Plan (document reference J2). The ES describes effects on landscape character and visual resources during construction, operation and maintenance and decommissioning during the day and at night and winter/summer without mitigation and residual effects with mitigation. The landscape and visual assessment (Volume 3, Chapter 10: Landscape and visual resources of the ES) (document reference F3.10) is based on the maximum design scenario to minimise likely effects.</p> |
| TA_0162_003_211123          | S44     | Email           | <p>Environmental, local community, sensitivity for agriculture and wildlife, FBC strategy, noise pollution, community health and other critical factors are being pushed aside for BP's profits.The development will significantly adversely impact local amenities, change character from rural to industrial, and cause potential flooding due to massive displacement by the enormous industrial development, ruining farmland for decades and placing homes at risk.</p>  | <p>Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p>   |
| TA_0165_005_211123          | S44     | Email           | <p>Moreover, the proposed construction of the transformer will result in the loss of valuable farm land in the Newton area. This loss is concerning not only from an agricultural perspective but also in terms of the environmental impact on our community. I urge the developers to provide detailed information on how they plan to mitigate the loss of farm land and any plans for compensatory measures.</p>   | <p>The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). These measures include the provision of an Outline Soil Management Plan (document reference J1.7). In addition, the Outline Code of Construction Practice (document reference J1) seeks to limit disruption to the operation of individual farm holdings.</p>   |
| TA_0165_007_211123          | S44     | Email           | <p>In light of these concerns, I kindly request that the developers provide the following:Detailed design plans and an accurate scale of the proposed transformer building.A comprehensive explanation justifying the selection of the chosen location for the transformer.A thorough study on the potential noise and light pollution, along with proposed measures to mitigate these effects.A clear plan addressing the increased risk of flooding in the area, including improvements to drainage systems.Detailed information on the construction and disruption caused by creating a channel for cables from St Annes to the proposed transformer location.Plans to mitigate the loss of farm land and any compensatory measures.I believe that addressing these issues transparently and responsibly is crucial to ensuring the well-being and safety of the residents of Newton. I appreciate your prompt attention to these</p>  | <p>The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). Specifically, the impacts</p>   |

|                             |         |                 | <p>matters and hope all residents will be given this information in due course. Thank you for your understanding and cooperation.</p>   | <p>and effects of the Transmission Assets in terms of noise are set out in Volume 3, Chapter 8 : Noise and vibration of the ES (document reference F3.8). Visual effects, including effects arising from lighting, are set out in Volume 3, Chapter 10: Landscape and visual resources of the ES (document reference F3.10). The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). The Transmission Assets will be fully compliant with the compensation code. The code sets out the parameters and evidence needed to substantiate a claim for diminution in value and when this happens. The UK Government has also produced a series of plain English general guides to compulsory purchase and compensation which you may find useful: Compulsory purchase and compensation - GOV.UK (www.gov.uk) Guide books 1 and 4 being the most appropriate.</p> |
| TA_0166_001_131123          | S44     | Email           | <p>I am totally opposed to the project that has the intention of landfall through the Fylde coast with Land based stations. The transmission cables are expected to join at the National Grid in Penwortham, Preston which is south of the River Ribble. I strongly suggest the River Ribble is used for channeling of the transmission cables or the land south of the River Ribble. This will avoid channeling through the Fylde's Road, footpaths and agricultural network. Rooting the cables south of the river will avoid human habitation, roads and foot paths and will not interfere with the daily lives of residents. Animal and bird life will recover quickly from trenching of transmission cables south of the River Ribble which will be done easier than by trenching through urban areas. I reject the wind farms proposals please acknowledge receipt of my email in opposition to your plans.</p> | <p>The Ribble estuary has numerous ecological statutory designations protected nationally and internationally. These include the Liverpool Bay Special Protection Area, Ribble and Alt. Estuaries Special Protection Area, the Ribble and Alt Estuary Ramsar site (a wetland of international importance under the Ramsar Convention), and the Ribble Estuary Site of Special Scientific Interest, Ribble Estuary Marine Conservation Zone and Ribble Estuary National Nature Reserve. The tidal nature and shallow water depths of the estuary also create heightened risk to construction as the unstable riverbed conditions are unsuitable for trenching/ cable laying vessels to access. As such, cabling through the estuary would result in significantly protracted construction timeframes, and potentially long-term impacts to sensitive and sensitive features associated with the designated features, whilst also presenting higher risk and potentially unsafe working conditions. As such, the approach to site selection has been based on avoiding direct impacts to Important Ecological Features (IEFs) where practicable, further details can be found in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4).</p>   |
| TA_0167_006_171023          | S44     | Email           | <p>How will you deal with closures of Clifton Drive North a key route to St Annes on the Sea and Lytham towns? What is the effect on tourism, which both towns depend on economically, if access to these is significantly disturbed? How will you cross the Preston to Blackpool South railway line if open excavation is necessary without closing this and severely impacting on its use by both locals and visitors? In 8.7.5.4 of the Non-Technical Summary you talk of some requirement to close the beach to public access during the construction phase. This is surely inevitable given the need to build transition joint bays, tunnel under the Sand Dunes, Clifton Road North and the Nature Reserve, Railway Line, Golf Club and or Blackpool Airport, lay and joint eighteen High Voltage cables, carry out</p>   | <p>Substantial reductions to the Order Limits have been made to the north of the PEIR boundary at landfall. The areas of beach subject to construction works, including landfall compounds will not be available for public access during this period. However, the Applicants have committed to ensure public access to the east of the works areas will be maintained during construction. This will ensure that, areas to the north and south of the works area would remain accessible for beach-based activities. The Applicants have sought to minimise the duration of beach works by committing to a direct pipe trenchless installation technique in order to limit</p>  |

|                             |         |                 | remedial works etc. No timescale for the works in this area is given but it is inconceivable that the works will not be significant or lengthy. The attraction of visitors to St Annes on the Sea (you will hopefully appreciate that Lytham St Annes is a generic term covering the town of St Annes-on-the-Sea, Andsell, Fairhaven and the town of Lytham) lies in its traditional seaside appeal encompassing the town, the beach and significantly the extensive and unspoilt sand dunes. Closures of the beach and the intrusive nature of the proposed works will do nothing to help the economy of St Annes nor its essential visitors on whom local businesses depend for their seasonal spending.  | potential disruption to users of the beach and an Outline Open Space Management Plan has been appended to the Outline Public Rights of Way Management Plan (document reference J1.5), which includes measures to minimise potential impacts. Potential indirect impacts on tourism associated with potential changes to visual amenity of local areas has been assessed within Volume 4 Chapter 2: Socio-economics of the ES (document reference F4.2). Other potential impacts on local amenity and indirect impacts on residents and visitors have been assessed in Volume 1, Annex 5.1: Human health of the ES (document reference F1.5.1), Volume 3, Chapter 7: Traffic and Transport of the ES (document reference F3.7), Volume 3, Chapter 8: Noise and vibration of the ES (document reference F3.8) and Volume 3, Chapter 9: Air quality of the ES (document reference F3.9).  |
| TA_0118_012_151123          | S44     | Email           | I am writing this email to let you know I was informed at one of your consultation events that the National grid suggested 2 options to you one at Penwortham and one at Heysham. I strongly oppose your choice of Penwortham due to you causing major disruptions from Lytham to Freckleton and then onwards to Penwortham when you could use the substation due to end in 2028 in Heysham. If you use Heysham one you will not be using good agricultural land which is currently used by local farmers to make a living, you will not be disrupting homes and families in the process, you will not be deliberately killing wildlife and you will not need to build 2 substations in a rural part of Freckleton one of which is the size of 13 football pitches and 70ft high overlooking peoples properties. Your proposals for doing this are totally unacceptable and in my view immoral when you can use Heysham and save a lot of time and money. | Under the Offshore Transmission Network Review, the National Grid Electricity System Operator (NGESO) is responsible for assessing options to improve the coordination of offshore wind generation connections and transmission networks and has undertaken a Holistic Network Design Review (HNDR). A key output of the HNDR process was the recommendation that the Morgan Offshore Wind Project and the Morecambe Offshore Windfarm should work collaboratively in connecting the two offshore wind farms to the National Grid electricity transmission network at Penwortham in Lancashire. Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0168_001_171123          | S44     | Email           | I have real concerns about your proposal for this project in the Fylde I require full details of the following :1)Effect on the greenbelt areas / farmland around Lytham ST Annes   | It is acknowledged that the proposed cable route passes through Green Belt land and the proposed onshore substations also fall within Green Belt. A consideration of alternative routes and substation siting is made as part of the Site Selection chapter of the ES (Volume 1, chapter 4, document reference F1.4) which concluded this is the preferred route and location for the cable and the substations. Land within the Area of Separation is no longer required for the onshore substations. An assessment regarding the impact on the purposes and openness of the Green Belt, alongside a Very Special Circumstances assessment is set out within the Planning Statement (document reference J28). The Applicants consider that when assessed on the planning balance that the significant benefits of the Project mean that there are Very Special Circumstances that outweigh any potential harm to the Green Belt. The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. |
| TA_0183_001_221123          | S44     | Email           | We are sending this email as part of the public consultation period to strongly OBJECT to your proposals regarding the proposed offshore wind farm cable routing and substation locations across the Fylde area. The proposed route of cables involves the destruction of greenbelt Grade A agricultural land. The land is used by farmers for the growing of crops, the grazing of animals and the spreading of farmyard manure which gives nutrients to the soil. Local farmers, who have been in this area for generations, rely on this land for their livelihoods. The sheer scale of your proposal would rip through the land of numerous farmers; to go ahead with the project would both bankrupt the farmers themselves and have a knock-on effect for local businesses who rely on these farms for goods, sales, and services. It amazes us how you are perfectly willing to tunnel under the golf course, but will                             | The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes the preparation of a Soil Management Plan in general accordance with the Outline Soil Management Plan (document reference: J1.7), which has been submitted with the DCO application. The measures to be implemented as part of the  |

|-----------------------------|---------|-----------------|--|--|
|                             |         |                 | not do similar to avoid impacting upon the livelihoods of farmers and the businesses for which they provide.   | Soil Management Plan seek to minimise impacts on soil health and protect and maintain soil quality during construction of the Transmission Assets. These measures also comprise the preparation of a Code of Construction Practice in general accordance with the Outline Code of Construction Practice (document reference J1) submitted with the DCO application. The measures to be implemented as part of the Code of Construction Practice seek to limit disruption to the operation of individual farm holdings.   |
| TA_0185_001_221123          | S44     | Email           | I am writing to advise that I object to the Morgan and Morecambe Offshore Wind Farm substation, easement and transmission asset proposals as these will have a direct impact on my dairy farm business and leave it unviable. The Farm is an award winning (both locally and nationally) dairy unit. We supply the Cooperative Arla and are part of the Arla Care brand. The farms that supply the Arla Care brand have been selected for the grazing system and have a requirement to produce them against enhanced standards. These enhanced standards include higher welfare and environmental standards and provide a lower carbon footprint. We operate a grassland grazing system, which requires the cows to have grazing access to all of the grazing land. Heavy investment has been made in a track system that allows efficient movement of cows to and from the grazing paddock with minimum labour. In addition, the track system allows the grass crop management (which is measured on a weekly basis) to provide optimum quantity and quality feed for the grazing herd. The proposal of the Morgan substation and temporary site takes a large area of land away from the unit and we await to understand the roads and easements for this substation for the full impact. Then if the Morecambe site is selected as Morecambe 2 this would take away the land and block the usage of the remaining land and this would devastate the whole farm business. If Morecambe 1 is selected as the preferred site this would also impact on the farm as it would take a major amount of land for the access roads and return easements to Penwortham. Either option Morecambe or Morecambe would leave the farm unviable. | Dalcour Maclaren on behalf of the Applicants will be in touch with interests to discuss Heads of Terms which will include compensation provisions to address any impacts to the farming business. As part of the Heads of Terms and ongoing discussions and negotiations, the safety and welfare of all those working on or within proximity to the works, as well as any livestock will be carefully considered to ensure safety at all times. Working practices will be captured in the Code of Construction Practice (CoCP). The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |
| TA_0185_003_221123          | S44     | Email           | In addition to the extremely poor communications, I also site these objections / observations:• The access roads and easements have not been declared and therefore the full extent of the land impact is not fully declared.• Parcels of land that will remain based on the information provided so far, will not be accessible for farming.  | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). Dalcour Maclaren on behalf of the Applicants will be in touch with interests to discuss Heads of Terms which will include compensation provisions to address any impacts to the farming business including any severance and injurious affection.   |
| TA_0185_005_221123          | S44     | Email           | • Running Sand has been found in the area where the Morecambe 2 site has been proposed.• Slurry spreading area would be decreased and create an environmental problem.• The farm employs from the local community a team of 5 people as well as employing local subcontractors which will have a direct impact on the local economy.• The farm is part of a stewardship scheme for managing hedgerows and biodiversity gain.• Bio security issues and contamination between farm units would have detrimental effects.• Management of livestock during the construction period, when contractors come on there is potential hazard of livestock escaping. (This has been experienced in the past with other schemes).  | Dalcour Maclaren on behalf of the Applicants will be in touch with interests to discuss Heads of Terms which will include compensation provisions to address any impacts to the farming business. As part of the Heads of Terms and ongoing discussions and negotiations, the safety and welfare of all those working on or within proximity to the works, as well as any livestock will be carefully considered to ensure safety at all times. As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p>   |
| TA_0188_004_221123          | S44     | Email           | <p>Access to the site and dangerous traffic operations I am particularly concerned about the access which will be required to the sites, as these routes are not detailed in the plans as yet, and so I expect that additional land will need to be taken from us for the construction of access roads. Our farm is down a single-track road, which is also a busy public footpath and bridleway. It is absolutely unacceptable that this lane can even be considered for access to the sites as it simply is not suitable for large construction vehicles and increased traffic. There are young children living here and the thought that we could have an increased volume of traffic coming through our yard is very worrying from a safety perspective. The yard is also a working farmyard and any additional traffic will affect farming operations and disrupt the running of our business. REDACTED is a small country road which is already in a very poor state of repair and regularly floods. If this is used to access the sites this will cause further damage and increased traffic which is dangerous and inconvenient.</p>   | <p>Construction and operational access for the Morgan onshore substation will be taken from a new road access of the Kirkham Bypass. There will be a requirement for access from Lower Lane to facilitate some works in relation to the Morgan mitigation land. Traffic and transport impacts arising during the construction phase of the Transmission Assets have been fully assessed at section 7.11 Volume 3, Chapter 7: Traffic and transport of the ES (document reference E3.7). Details of the operation and maintenance phases are set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Onshore maintenance would be limited to essential maintenance and/or emergency works.</p>  |
| TA_0188_006_221123          | S44     | Email           | <p>Impact on food security Whilst I appreciate that we need to use renewable sources of energy in order to secure our needs for the future, and I am certainly not against the windfarm development in principle, we also need to ensure that the country can continue to produce food to feed the growing population. If this project is to go ahead as planned with the huge destruction of vast areas of the Fylde for burying the transmission cables, I am certain that many farming businesses will cease to exist afterwards. The level of invasive work that will be required will ruin a great deal of the high quality farmland in the Fylde. Field drains will be destroyed by the work, and I doubt very much whether the new drains will ever be as effective as the current system as it has taken years and years of careful management and planning. Soil structure will be massively affected by compaction and it will be impossible to return the land to how it was before no matter how carefully the soil is stored and out back. Surely at a time when food security is so high on the public agenda, the loss of valuable farmland is not a sustainable option. The effects of building on large areas of farmland will also lead to massively increased risk of flooding in the local area. The land is already under huge pressure of flooding as main drains and ditches are no longer maintained meaning that water flow is restricted. The additional run-off from the concrete sites will mean that the current system will be unable to cope and will lead to more regular flooding, not only on the land that we are farming, but also in the towns and villages as the water will have nowhere to go.</p> | <p>The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes the preparation of a Soil Management Plan in general accordance with the Outline Soil Management Plan (document reference: J1.7), which has been submitted with the DCO application. The measures to be implemented as part of the Soil Management Plan seek to minimise impacts on soil health and protect and maintain soil quality during construction of the Transmission Assets. These measures also comprise the preparation of a Code of Construction Practice in general accordance with the Outline Code of Construction Practice (document reference J1) submitted with the DCO application. The measures to be implemented as part of the Code of Construction Practice seek to limit disruption to the operation of individual farm holdings. The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). In addition, best practice with regard the use and storage of oils, chemicals and other wastes, to remove the risk of causing pollution during construction is outlined within the Outline CoCP (document reference J1). An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. An Outline Operational Drainage Management Plan (document reference J10) for the substation site(s) has been prepared and</p> |

|                             |         |                 |  | submitted with the application for development consent. The Operational Drainage Management Plan will include measures to ensure that existing land drainage is reinstated and/or maintained. This will include measures to limit discharge rates and attenuate flows to maintain greenfield runoff rates at the onshore substations. It will also include measures to control surface water runoff, including measures to prevent flooding of the working areas or offsite and to ensure any runoff is treated appropriately. The Operational Drainage Management Plan will be developed in line with the latest relevant drainage guidance notes in consultation with the Environment Agency and the Lead Local Flood Authority (Lancashire County Council).   |
| TA_0189_006_221123          | S44     | Email           | 5. I agree that we need energy security but more importantly we also need food security for our growing population. To go ahead with these proposals on prime agricultural greenbelt land would ruin numerous businesses but bP et al don't seem to care about that as long as they can make even more money.  | It is acknowledged that the proposed cable route passes through Green Belt land and the proposed onshore substations also fall within Green Belt. A consideration of alternative routes and substation siting is made as part of the Site Selection chapter of the ES (Volume 1, chapter 4, document reference F1.4) which concluded this is the preferred route and location for the cable and the substations. Land within the Area of Separation is no longer required for the onshore substations. An assessment regarding the impact on the purposes and openness of the Green Belt, alongside a Very Special Circumstances assessment is set out within the Planning Statement (document reference J28). The Applicants consider that when assessed on the planning balance that the significant benefits of the Project mean that there are Very Special Circumstances that outweigh any potential harm to the Green Belt. The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes the preparation of a Soil Management Plan in general accordance with the Outline Soil Management Plan (document reference: J1.7), which has been submitted with the DCO application. The measures to be implemented as part of the Soil Management Plan seek to minimise impacts on soil health and protect and maintain soil quality during construction of the Transmission Assets. These measures also comprise the preparation of a Code of Construction Practice in general accordance with the Outline Code of Construction Practice (document reference J1) submitted with the DCO application. The measures to be implemented as part of the Code of Construction Practice seek to limit disruption to the operation of individual farm holdings. |
| TA_0189_010_221123          | S44     | Email           | 7. Any land that was used as a cable corridor would be useless from an agricultural perspective for at least 30 years afterwards due to the damage to the soil, despite developers saying that it would be reinstated properly. The land and soil have taken years of improvement and careful management to create the productive land that we farm today. | The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. |                             |         |                 |  | measures to be implemented as part of the Code of Construction Practice seek to limit disruption to the operation of individual farm holdings.  |
| TA_0189_011_221123          | S44     | Email           | 8. We are very concerned that developers may try to use the farm lane for their access to the site. That would be completely unacceptable for health and safety reasons as there are often small children and livestock in the yard. The lane is too narrow and not passable for large vehicles.   | Construction and operational access for the Morgan onshore substation will be taken from a new road access of the Kirkham Bypass. There will be a requirement for access from Lower Lane to facilitate some works in relation to the Morgan mitigation land. Traffic and transport impacts arising during the construction phase of the Transmission Assets have been fully assessed at section 7.11 Volume 3, Chapter 7: Traffic and transport of the ES (document reference E3.7).<br>Details of the operation and maintenance phases are set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3).<br>Onshore maintenance would be limited to essential maintenance and/or emergency works.   |
| TA_0189_012_221123          | S44     | Email           | 9. Any open cut trenches, roads, fences etc on the cable routes would cause massive disruption for cattle movements. We regularly need to move the stock around the farm for welfare reasons and any changes to the layout would upset the cattle and make movement extremely difficult.   | The Outline Code of Construction Practice (document reference J1) seeks to limit disruption to the operation of individual farm holdings. In addition the Outline Construction Fencing Plan (document reference J1.10) provides measures for livestock fencing during construction to ensure farming operations can continue where possible. Dalcour McLaren on behalf of the Applicants will be in touch with interests to discuss Heads of Terms which will include compensation provisions to address any impacts to the farming business. As part of the Heads of Terms and ongoing discussions and negotiations, the safety and welfare of all those working on or within proximity to the works, as well as any livestock will be carefully considered to ensure safety at all times. Working practices will be captured in the Code of Construction Practice (CoCP). |
| TA_0189_013_221123          | S44     | Email           | 10. The map shows the temporary substation compound crossing the farm track, which is also a public footpath and bridleway. This must be kept open at all times to allow livestock movement and tractor access to the land.  | The potential impacts of the Transmission Assets on recreational resources, including PRoW are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of this chapter of the ES. This includes preparation of a PRoW Management Strategy in general accordance with the Outline PRoW Management Strategy (document reference J1.5) submitted with the DCO application. The measures to be implemented as part of the PRoW Management Strategy seek to minimise impacts on public footpaths, bridleways and other promoted routes (e.g. National Cycle Routes (NCRs), Long Distance Footpaths) during construction of the Transmission Assets.                           |
| TA_0192_003_221123          | S44     | Email           | The topography of the land is steeply sloping from west to east and a traditional ridge and furrow permanent pasture grassland which is species rich therefore we cannot understand for the amount of ecology reports and non-intrusive surveys that the design team have not highlighted this as a practical constraint   | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3)   |
| TA_0193_001_221123          | S44     | Email           | Further to our meeting at my client's property a few weeks ago, thank you again for your time attending my client's property in order that they could discuss the potential impact of the transmission and the cable route through my client's holding.<br>To aid, I have just attached a plan that identifies my client's land holding [REDACTED] showing that the cable route completely severs and disrupts the majority of that parcel of land. My client have an intensive dairy herd of approximately 250 Montbeliard dairy cows complete with over 400 head of youngstock, therefore the land to the north of the farm is vital to the dairy business as there is very little land holding to the south with the buildings therefore all of the dairy herd graze the land to the north and it is also the land that the majority of the silage provision is made. | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3).<br>Following route refinement, Dalcour McLaren on behalf of the Applicants will be in touch with interests to discuss Heads of Terms to secure the rights for the compound which will include provisions for compensation of severed land and impact on farming operations. As part of the Heads of Terms and ongoing discussions and negotiations, the safety and welfare of all those working on or within proximity to the works, as well as any   |

|                             |         |                 | The route cuts through the landholding which could make it impractical for crossing for grazing, and the lack of forage, which then brings into the viability of the farming business going forward. The land taken out also creates a slurry disposal issue. My client does not have sufficient land then to spread slurry to meet with necessary guidelines and then would be forced to reduce their dairy herd, increasing the volatility and bringing into question the viability of the farming business.  | livestock will be carefully considered to ensure safety at all times. Working practices will be captured in the Code of Construction Practice (CoCP).  |
| TA_0193_003_221123          | S44     | Email           | The drawings also indicate an access off [REDACTED] which is immediately adjacent to the farm buildings therefore it creates a highways and security risk to the farm buildings which are agricultural and semi-commercial which is occupied by REDACTED for her well established flower business. This access is incidental and not required and any access that is needed can easily be obtained from REDACTED when the cable crosses.  | Operational accesses have where possible utilised existing access routes and tracks to limited the impact on a holding. Details of the operation and maintenance phases are set out in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Onshore maintenance would be limited to essential maintenance and/or emergency works. Following route refinement, Dalcour Maclaren on behalf of the Applicants will be in touch with interests to discuss Heads of Terms to secure the rights for the compound which will include provisions for compensation of severed land and impact on farming operations. As part of the Heads of Terms and ongoing discussions and negotiations, the safety and welfare of all those working on or within proximity to the works, as well as any livestock will be carefully considered to ensure safety at all times. Working practices will be captured in the Code of Construction Practice (CoCP).   |
| TA_0193_004_221123          | S44     | Email           | My client objects to the route and the principles of the transmission cable in its strongest extent. The construction of the cable will materially affect my client's farming business, jeopardising the established dairy herd due to the lack of grazing, silage provisions, lack of land for spreading slurry and day to day inconvenience of severing the land holding and crossing points.   | Dalcour Maclaren on behalf of the Applicants will be in touch with interests to discuss Heads of Terms which will include compensation provisions to address any impacts to the farming business and practical elements of the construction. As part of the Heads of Terms and ongoing discussions and negotiations, the safety and welfare of all those working on or within proximity to the works, as well as any livestock will be carefully considered to ensure safety at all times. Working practices will be captured in the Code of Construction Practice (CoCP).   |
| TA_0194_001_221123          | S44     | Email           | Thank you for attending my client's property on Monday afternoon – my clients are grateful for your time and consultation in relation to the Morgan and Morecambe onshore transmission assets and how they will potentially impact my client's farming business. My clients will be making their own representations within the Statutory Consultation feedback form and I believe they have also given to you in hard copy their background information on their farming system. At our meeting my clients highlighted that they farm in total 350 acres of intensive grassland with a further 40 acres of low input rough grazing which accommodates and carries 250 dairy cows with 430 youngstock and beef cattle, producing in excess of 2,250,000 litres of milk sold on a supermarket contract. The beef cattle are also reared on to finishing weight and sold on dead weight system. The proposed route of the transmission cable cuts through a large proportion of land that my clients occupy under a Farm Business Tenancy with the landlords [REDACTED]. I have assumed the [REDACTED] may make separate representations with regards to the actual route of the cables but my clients wish to put on record their objections to the Morgan and Morecambe transmission cable, as highlighted on the attached plan. The route of the transmission cable goes through some of the most difficult agricultural terrain within the locality. Whilst the agricultural land is high quality Grade 2 productive land, it is moss land which means that the stability of any operations and field work cannot be taken too lightly. The proposed route seemed yet again to prioritise ecological surveys rather than the practicalities of the landowners and the farming operations that it affects. | The Applicants note your response and through Dalcour Maclaren will be in touch with interests and their appointed agents to discuss Heads of Terms which will include compensation provisions to address any impacts to the farming business and practical elements of the construction. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |
| TA_0194_002_221123          | S44     | Email           | The land is inter-dispersed with high water table ditches which play an intrinsic part of the water management within the Fylde Moss. Any interference with the drainage system within the area will have a huge detrimental impact, not only on the land that it goes through, but also the surrounding area. As I have mentioned previously, the land is moss and therefore doesn't have the subsoil that your clients may expect. If they break the topsoil there is very little sub soil to work with and you are just into moss, which is an unstable soil type.   | An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water   |

| TA_0196_001_221123          | S44     | Email           | <p>I would like to use the opportunity during this public consultation period, to unequivocally Object to your proposals and express my concerns over the proposed off shore Wind Farm cable routing and sub station locations within the fylde coast. I believe this would have a grossly negative impact on the Environment both physically, via the works proposed and Visually, damaging an untold amount of wildlife habitat and green belt protected land, conservation area's, highly productive farmland and have a hugely detrimental impact on the wider community and local economy, putting local business, land owners and Farmers out of business. I believe it would create an untold amount of suffering for residents within the fylde coast for years to come via flooding and disruption ie traffic. Your lack of detail on some of the proposed cable routes and sub stations at this late stage and at this public consultation point in proceedings, is highly worrying as this shows either an unprofessional approach to the matter, or highly unprepared, or at worst, both. It is most concerning that at this late stage we are asked to submit our opinions on a body of work that is neither complete nor suggest the possible outcomes thereafter the point of consultation. I feel that you have shown disregard to the community of the fylde coast in your methods up to now. This lack of transparency on your part, sets a precedent when approaching future issues and has created a level of mistrust that is beyond repair. This is another reason why I must whole heartedly Object on all parts of your proposals.</p> | <p>The Applicants are committed to robust and transparent public consultation as part of the development process. The Transmission Assets has undertaken three rounds of consultation with the local community, including two non-statutory periods of consultation (2 November to 13 December 2022 and 19 April to 4 June 2023) and a statutory consultation (12 October to 23 November 2023). Statutory targeted consultations have also taken place (November 2023 to October 2024). The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the SoCC). The Applicants are committed to working with local communities that may be impacted by the Transmission Assets. As the proposals develop further, any ideas for potential community benefits are appreciated. We will continue our engagement with the relevant communities in due course. The Applicants provided maps as part of the consultation materials that clearly set out the elements of the Transmission Assets in relation to settlements, roads and geographic features. All maps also included a key to highlight the proposed use of different areas and the relevant aspects of the Transmission Assets' design. The materials were proportionate to the level of information and design detail at the time of consultation, reflecting the information available in the PEIR. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). | TA_0200_014_221123          | S44     | Email           | Substations & Cabling Routes will cut into large areas of quality Farmland affecting Food Security, Peoples Livelihoods & Leisure Activities.  | The majority of the route is buried cable, thus whilst there is an inevitable amount of disruption during construction the land will be returned to agricultural use post construction maintaining the agricultural units. Where practical and possible the projects sought to align the cable route with field boundaries to help lessen the impact of the temporary works on their farming business. We have sought to work with landowners affected by the proposed to understand their current farming operations and mitigate the impacts along with discussing their future development proposals and avoiding those wherever practicable, in some cases prior to their developments being consented. The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes the preparation of a Soil Management Plan in general accordance with the Outline Soil Management Plan (document reference: J1.7), which has been submitted with the DCO application. The measures to be implemented as part of the Soil Management Plan seek to minimise impacts on soil health and protect and maintain soil quality during construction of the Transmission Assets. These measures also comprise the preparation of a Code of Construction Practice in general accordance with the Outline Code of Construction Practice (document reference J1) submitted with the DCO application. The measures to be implemented as part of the Code of Construction Practice seek to limit disruption to the operation of individual farm holdings. |
| TA_0202_004_221123          | S44     | Email           | Onto manholes 2 metre squared visible to see we will not be able to farm the land as we would normally do with agricultural machinery. This would cause more loss of agri-land trying to work around all the obstacles in the field. The manholes are likely to become tangled in the machinery or working operation. The drainage of fields and surrounding land would collapse with the width of the 122-metre route and the heavy HGV and heavy machinery being placed on it. The consequences of this would displace the water and cause | Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). |                             |         |                 | <p>the whole of the Fylde Basin to flood, which eventually over time would back onto those properties built on potential flood plains and flood the properties, which is what we are seeing now. This would have terrible consequences for both rural and urban fringes. You can do all the surveys you wish but from working with various organisations and being a person at ground level I can assure you that the building of properties has had a detrimental effect on the Fylde and the flooding is happening to frequently. We have been known to be 6 months under water during the winter months and this year we were flooded on 23/07/2023 where the cereals were under water and all you could see was the heads of corn. Cuadrilla had a site on Anna's Road and had to reinstate the land following their fracking site. They removed the stone and put the soil back in place and that site has not been able to be farmed since. Where the site is, is a bog. I really don't think you can reinstate a site to its former glory, and I can assure you that it will take 15 – 20 years to become good land again. A reinstated site will need double the amount of fertiliser and double the manure to make it fertile again. You cannot wave a magic wand for that.</p> | <p>preparation of a Soil Management Plan in general accordance with the Outline Soil Management Plan (document reference: J1.7), which has been submitted with the DCO application. The measures to be implemented as part of the Soil Management Plan seek to minimise impacts on soil health and protect and maintain soil quality during construction of the Transmission Assets. These measures also comprise the preparation of a Code of Construction Practice in general accordance with the Outline Code of Construction Practice (document reference J1) submitted with the DCO application. The measures to be implemented as part of the Code of Construction Practice seek to limit disruption to the operation of individual farm holdings. Further detailed information regarding the methodology, scope and results of the soil surveys is provided in Volume 3, Annex 6.2: Soil surveys data technical report of the ES (document reference F3.6.2). Geology, hydrogeology and ground conditions are assessed in Volume 3, Chapter 1 of the ES (document reference E3.1).</p>  |
| TA_0207_002_231123          | S44     | Email           | <p>3. The land is classified Grade 2 on the Agricultural Land Classification and benefits from a substantial land drainage system which is likely to be severely affected by the scheme and will require full replacement. The disruption to the land will take many years to recover and our experience has been that developers often overlook the need for a full and proper drainage scheme to be installed at the end of the scheme. We feel that alternative routes across lower quality agricultural land should be considered</p>  | <p>The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). These measures include the provision of an Outline Soil Management Plan (document reference J1.7). In addition, the Outline Code of Construction Practice (document reference J1) seeks to limit disruption to the operation of individual farm holdings. The Applicants through Dalcour Maclaren and appointed drainage specialists will engage with landowners regarding pre-construction and post-construction drainage, tying into existing infrastructure where possible. The Outline CoCP and outline surface water and groundwater management plan (document reference J1.9) includes measures in relation to drainage.</p>   |
| TA_0207_005_231123          | S44     | Email           | <p>• The land is classified Grade 2 on the Agricultural Land Classification, is low lying and comparatively level and benefits from extensive land drainage systems. There is a delicate balance in the land drainage systems and the installation of a substantial cable route across the land could very well disrupt the balance and cause losses over an extended period of time far beyond the construction period. We believe alternative routes through lower quality agricultural land should be considered. We believe that any of the above issues would have a serious effect on the viability of the family business but when combined will almost certainly have a major effect on the viability of the family business going forward. This in turn could impact the available facilities for RDA especially during the construction period</p>   | <p>The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). | TA_0214_002_231123          | s44     | Email           | .I would like to ensure that these objections are logged:I object to the building of substations on what is currently agricultural land. This will be a substantial change in the character of this semi-rural area and likely have a detrimental effect on the views enjoyed by so many of the local area and beyond.   | The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES. Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes the preparation of a Soil Management Plan in general accordance with the Outline Soil Management Plan (document reference: J1.7), which has been submitted with the DCO application.An iterative EIA process has been used to avoid impacts where practicable, in addition to mitigating remaining impacts. The design at the onshore substations is set out in the Outline Landscape Management Plan (document reference J2). The ES describes effects on landscape character and visual resources during construction, operation and maintenance and decommissioning during the day and at night and winter/summer without mitigation and residual effects with mitigation. The landscape and visual assessment (Volume 3, Chapter 10: Landscape and visual resources of the ES) (document reference F3.10) is based on the maximum design scenario to minimise likely effects. |
| TA_0214_004_231123          | s44     | Email           | I object to the use of land within residential areas as construction compounds including the two indicated on REDACTED. The area with grass and trees must not be used for such a purpose. It would be an eye sore in such a prominent area as well as denying children and dog walkers a valuable green area  | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).   |
| TA_0214_005_231123          | s44     | Email           | I object to any disruption to the use of REDACTED. These are a valuable community asset used by hundreds of people, including my son who volunteers as a coach for a local football club for children.   | Impacts and effects on public open space are set out in Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). This includes effects on Blackpool Road Playing Fields.  |
| TA_0215_001_231123          | S44     | Email           | I am writing this email as the Director/Proprietor of REDACTED, based on Marton Moss. Also user/owner of some of the land proposed to be affected by the cable route and surrounding bridle paths.If the route chosen includes my land on REDACTED, it would have a catastrophic and ruinous effect on my business.Therefore I am taking the opportunity during this public consultation period, to unequivocally Object to your proposals and express my concerns over the proposed off shore Wind Farm cable routing and sub station locations | The Applicants are committed to robust and transparent public consultation as part of the development process. The Transmission Assets has undertaken three rounds of consultation with the local community, including two non-statutory periods of consultation (2 November to 13 December 2022 and 19 April to 4 June 2023) and a statutory consultation (12 October to 23 November 2023). Statutory targeted consultations have also taken  |

|                             |         |                 | <p>within the fylde coast. I believe this would have a grossly negative impact on the Environment both physically, via the works proposed and Visually, damaging an untold amount of wildlife habitat and green belt protected land, conservation area's, highly productive farmland and have a hugely detrimental impact on the wider community and local economy, putting local business, land owners and Farmers out of business. I believe it would create an untold amount of suffering for residents within the fylde coast for years to come via flooding and disruption ie traffic. Your lack of detail on some of the proposed cable routes and sub stations at this late stage and at this public consultation point in proceedings, is highly worrying as this shows either an unprofessional approach to the matter, or highly unprepared, or at worst, both. It is very concerning that at this late stage we are asked to submit our opinions on a body of work that is neither complete nor suggest the possible outcomes thereafter the point of consultation. I feel that you have shown disregard to the community of the fylde coast in your methods up to now. This lack of transparency on your part, sets a precedent when approaching future issues and has created a level of mistrust that is beyond repair. This is another reason why I must whole heartedly Object on all parts of your proposals.</p>  | <p>place (November 2023 to October 2024) as well as ongoing landowner liaison following route refinements (further details are outlined within the Consultation Report (document reference E1).. The Applicants provided documents for the statutory consultation, including a Preliminary Environmental Information Report (PEIR) highlighting the findings of the environmental and technical assessments at that stage of the Transmission Assets. A newsletter, consultation brochure and PEIR NTS were also available with the aim of simplifying the key elements of the PEIR. These materials were produced using plain English and, where appropriate, made strong use of images and graphics (as noted in the SoCC). The Applicants are committed to working with local communities that may be impacted by the Transmission Assets. As the proposals develop further, any ideas for potential community benefits are appreciated. We will continue our engagement with the relevant communities in due course. The Applicants provided maps as part of the consultation materials that clearly set out the elements of the Transmission Assets in relation to settlements, roads and geographic features. All maps also included a key to highlight the proposed use of different areas and the relevant aspects of the Transmission Assets' design. The materials were proportionate to the level of information and design detail at the time of consultation, reflecting the information available in the PEIR. The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p> |
| TA_0216_001_231123          | S44     | Email           | <p>Having attended the consultation on 3 November at St annes cricket club and reviewed the documents provided, I would like to use the opportunity during this public consultation period, to unequivocally Object to your proposals and express my concerns over the proposed off shore Wind Farm cable routing and sub station locations within the fylde coast. | TA_0219_003_231123          | S44     | Email           | <p>The proposals will cause severe damage to the land within the agricultural holding. The land is classified Grade 2 on the agricultural land classification and we believe alternative routes crossing poorer agricultural land should be considered. The proposed schemes will also have a deleterious effect on the sporting on the property most especially during the construction period and bearing in mind that the proposals would appear to affect some 40 to 50 acres of land (excluding compounds, additional access points and wider working areas at road, rail and ditch crossing and the effect of areas lost due to being severed and unfarmable) this means that somewhere towards 25% of the total area of the farm possibly moving towards 30% or more when the additional areas are added in will be affected and lost to production. This will also have a severe effect on the sporting on the farm especially during the construction period. We also note that substantial areas have been identified for biodiversity net gain but have received no substantive commentary regarding what is required or where and we are therefore unable to comment on that at the present time. There has been no information given as to the proximity to dwelling houses which the cable route can take and whether there is any exclusion zone.</p> | <p>The potential impacts of the Transmission Assets with respect to agricultural land, including the temporary and permanent loss of best and most versatile land and disruption to farm holdings are identified in section 6.6 and assessed in section 6.11 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). Measures adopted as part of the Transmission Assets to mitigate potential impacts on land use and recreation are provided in section 6.8 of Volume 3, Chapter 6: Land use and recreation of the ES (document reference F3.6). These measures include the provision of an Outline Soil Management Plan (document reference J1.7). In addition, the Outline Code of Construction Practice (document reference J1) seeks to limit disruption to the operation of individual farm holdings. Following route refinement, Dalcour Maclaren on behalf of the Applicants will be in touch with interests to discuss Heads of Terms to secure the rights for the compound which will include provisions for compensation of severed land and impact on farming operations. The Transmission Assets will be fully compliant with the compensation code.</p> |
| TA_0222_003_231123          | S44     | Email           | <p>Question 3.6 Again, it is difficult for our clients to provide specific comment on the proposed and take, as this is not defined in the vicinity of their property, which is covered by the 400Kv grid connection cable corridor search area. However, it is our clients' general view that the proposed land take, particularly in respect of mitigation/biodiversity net gain (BNG) is excessive. It is suggested that both this, and the land proposed to be taken for the route corridor, could and should be reduced, potentially through the conjunction of the two schemes, to minimize the impact on agricultural land, and those whose businesses depend thereon.</p>  | <p>As set out in the Onshore Biodiversity Benefit Statement (document reference J11), the Transmission Assets are not subject to a mandatory net gain requirement under the Environment Act 2021. Nevertheless, the Applicants have worked with statutory consultees to discuss the approach, and to develop the design, to allow the maximum benefit to biodiversity within the parameters of the Transmission Assets. For the Transmission Assets, biodiversity benefit will be delivered within identified biodiversity benefit areas within the Transmission Assets Order Limits: Onshore (referred to as the Onshore Order Limits). Further qualitative benefits to biodiversity are proposed via potential collaboration with stakeholders and local groups, contributing to existing plans and programmes, both within and outside the Onshore Order Limits. Further details of the approach to biodiversity benefit are provided in the Onshore Biodiversity Benefit Statement (document reference J11). The calculation undertaken for the Onshore Biodiversity Benefit Statement (document reference J11) utilises the latest biodiversity metric published by Defra (4.0).</p>           |
| TA_0222_006_231123          | S44     | Email           | <p>Question 4 Our clients are of the opinion that, based on the limited site specific information provided to date by Morecambe &amp; Morgan, that is proposed land take for the scheme is excessive, particularly in respect of BNG. It is considered that, save for any such associated directly with any site specific mitigation/landscaping, there is no need for large scale compulsory acquisition under any DCO for BNG purposes, as any necessary BNG credits could be acquired, on commercial terms, in the open market. Please also see the comments made at Question 3 above, concerning the lack of site specific information provided, and</p>   | <p>As set out in the Onshore Biodiversity Benefit Statement (document reference J11), the Transmission Assets are not subject to a mandatory net gain requirement under the Environment Act 2021. |                             |         |                 |   | Limits: Onshore (referred to as the Onshore Order Limits). Further qualitative benefits to biodiversity are proposed via potential collaboration with stakeholders and local groups, contributing to existing plans and programmes, both within and outside the Onshore Order Limits.   |
| TA_0222_025_231123          | S44     | Email           | Question 13 Our clients consider that the proposed quantity of land proposed for BNG or Mitigation is excessive. It is suggested that save for any site specific mitigation, BNG should not be acquired by compulsory means under any DCO, as any such credits which may be required to support the Morecambe & Morgan projects could be obtained commercially on the open market. Notwithstanding this, our clients further believe that should land be acquired for BNG, this should not be acquired in areas where it may conflict with existing undertakings in respect of conservation or biological mitigation purposes, such as those associated with their development. | Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).As set out in the Onshore Biodiversity Benefit Statement (document reference J11), the Transmission Assets are not subject to a mandatory net gain requirement under the Environment Act 2021. Nevertheless, the Applicants have worked with statutory consultees to discuss the approach, and to develop the design, to allow the maximum benefit to biodiversity within the parameters of the Transmission Assets. For the Transmission Assets, biodiversity benefit will be delivered within identified biodiversity benefit areas within the Transmission Assets Order Limits: Onshore (referred to as the Onshore Order Limits). Further qualitative benefits to biodiversity are proposed via potential collaboration with stakeholders and local groups, contributing to existing plans and programmes, both within and outside the Onshore Order Limits.  |
| TA_0223_001_231123          | S44     | Email           | I am writing to lodge my objection to this proposed development which will have a massively detrimental impact on the local area around Blackpool and St Anne's. This consultation appears to be nothing more than a sham and I have huge concerns concerning the siting of the two enormous substations which it is proposed to establish within close proximity to two local schools. Moreover there will be a loss of grade A farmland which is at the heart of the local Greenbelt. Your proposals will have an extremely lasting and damaging impact on this area, and I really do think you need to have a rethink.   | The Applicants are committed to robust and transparent public consultation as part of the development process. The Transmission Assets has undertaken three rounds of consultation with the local community, including two non-statutory periods of consultation (2 November to 13 December 2022 and 19 April to 4 June 2023) and a statutory consultation (12 October to 23 November 2023). Statutory targeted consultations have also taken place (November 2023 to October 2024). Statutory consultation is a key part of the planning process, one which the Applicants take seriously to engage and understand community views. The Applicants submitted a Consultation Report (document reference E1) that explains how the Applicants complied with the pre-application consultation requirements set out in the Planning Act 2008 and had regard to all the feedback submitted.The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). |
| TA_0225_001_231123          | S44     | Email           | This consultation feedback is made on behalf of [REDACTED] who are the owners of [REDACTED] which is tenanted by [REDACTED] [REDACTED] is occupied under the terms of an Agricultural Holdings Act 1986 tenancy, it is a highly productive grassland dairy farm of approximately 200 acres of Grade 2 to Grade 3 land which has a predominantly level aspect which runs north/south over a linear distance of about 1.8 km from the farmstead which is situated at the most southerly end of the farm abutting the A584, to its most northerly extent of farmland which adjoins REDACTED. At its narrowest point which is west  | The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3).The Transmission Assets has made design changes since the PEIR and have  |

|-----------------------------|---------|-----------------|---|--|
|                             |         |                 | <p>from [REDACTED] to it's east boundary is about 100m. [REDACTED] has a current milking herd of 300 dairy cows plus followers. The tenant has invested significantly over recent years in constructing a 1km farm cow track infrastructure which provides direct access from the farmstead to the most northerly block of land which not only improves cow foot health but saves man hours, improves grassland management and prevents any need to use the public highway. In addition, batches of dairy followers as and when required at the farm are walked along the cow track from [REDACTED] [REDACTED] is significantly affected by the Morecambe substation Option 2 site which is proposed to be situated in the middle of the holding, completely severing the farmstead from a large block of land lying to the north of the proposed substation. In addition, there are two temporary construction compounds proposed to facilitate the construction of Morecambe substation Option 2 also wholly located within the farm holding. This Option 2 location abuts the narrowest point of the holding and therefore completely severs the farm in half with no direct access to the northerly block which this substation proposal would create. Morecambe substation Option 2 occupies approx. 16 acres plus approx. 13 acres of temporary construction compound and is wholly within [REDACTED]. In addition to the proposed Morecambe substation Option 2 site the holding is also significantly affected by the proposed Morgan Substation site which permanently takes an additional 15 acres of land from the holding. If my client would have been asked to provide Flotation Energy and BP Morgan with a worse case scenario then this proposed location would be it ! In summary [REDACTED] is a 200 acre of which about 170 acres is ring fenced farm with direct internal track access to all fields from the farmstead. If the projects go ahead with Morgan and Morecambe 2 option then [REDACTED] will become a 169 acres farm of which about 64 acres adjoining the farmstead, 74 acres north of Morecambe 2 and 31 acres on the [REDACTED] This is of course less any additional land required for permanent access. During the construction phase [REDACTED] Would loose approx. 42 acres for cable corridor laying plus 13 acres of temporary construction compound, therefore an additional 55 acres out of production for a minimum of 3 years, plus additional land recovery years. During construction [REDACTED] will become about 114 acres, of which approximately 100 acres farmable which takes half the farm out of production and therefore unviable as a dairy farm. It is wholly unacceptable to consider Morecambe substation Option 2 site in this location as it will completely devastate [REDACTED] and will not be viable as a dairy farm either during the construction phases or thereafter.</p> | <p>updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3). In particular, The assessment of the impact of increased flood risk arising from additional surface water runoff is presented within section 2.11.4 of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). Mitigation measures are discussed within Table 2.20 of of Volume 3, Chapter 2: Hydrology and flood risk of the ES (document reference F3.2). An Outline Code of Construction Practice (document reference J1) has been prepared and submitted with the application for development consent. The Outline CoCP includes measures in relation to flood risk during the construction phase. An iterative EIA process has been used to avoid impacts where practicable, in addition to mitigating remaining impacts. The design at the onshore substations is set out in the Outline Landscape Management Plan (document reference J2). The ES describes effects on landscape character and visual resources during construction, operation and maintenance and decommissioning during the day and at night and winter/summer without mitigation and residual effects with mitigation. The landscape and visual assessment (Volume 3, Chapter 10: Landscape and visual resources of the ES) (document reference F3.10) is based on the maximum design scenario to minimise likely effects. Socio-economics is assessed at Volume 4, Chapter 2 of the ES (document reference: F4.2). Dalcour Maclaren on behalf of the Applicants will continue discussions and negotiations with regards to any impacts to the farming business. Whilst it is acknowledged that there will be disturbance, it is through this discussion and negotiation that Dalcour Maclaren on behalf of the Applicants will seek to mitigate impacts to the farming business.</p> |
| TA_0225_010_231123          | S44     | Email           | <p>[REDACTED] is located within the yet to be identified cable corridor route when it leaves Zone 1 heading in an east direction towards Penwortham. This route will completely sever the main block of silage grassland towards the south end of the farm,</p>   | <p>Dalcour Maclaren on behalf of the Applicants will continue discussions and negotiations with regards to any impacts to the farming business. Whilst it is acknowledged that there will be disturbance, it is through this discussion and negotiation that Dalcour Maclaren on behalf of the Applicants will seek to mitigate impacts to the farming business. Transmission Asset routing can be found within the Works Plans (document reference B7, B8) and the Land Plans (document reference B10). Dalcour Maclaren on behalf of the Applicants will be in touch with interests to discuss Heads of Terms and as part of those discussions and negotiations detailed information will be provided to confirm the rights sought and required easement widths.</p>   |

| TA_0227_006_231123          | S44     | Email           | Proposed Substation Footprints The proposed footprints of the Morgan and Morecambe permanent substation sites are approximately 30 acres and 18 acres respectively. These site areas are taken up by approximately 50% BNG (Biodiversity Net Gain). This information was provided by a Flotation Energy engineer. This is wholly unacceptable as in providing on-site BNG purely for financial savings has narrowed the substations site selection process to one only option for Morgan and two only options for Morecambe. It is clear that had the substation sites design concentrated on that area which was wholly necessary to transmission, ie approx. 15 acres for Morgan and 9 acres for Morecambe then suitable substation site locations could have been expanded to present more options and allowed for flexibility during this consultation process.   | The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). As set out in the Onshore Biodiversity Benefit Statement (document reference J11), the Transmission Assets are not subject to a mandatory net gain requirement under the Environment Act 2021. Nevertheless, the Applicants have worked with statutory consultees to discuss the approach, and to develop the design, to allow the maximum benefit to biodiversity within the parameters of the project. For the Transmission Assets, biodiversity benefit will be delivered within identified biodiversity benefit areas within the Transmission Assets Order Limits: Onshore (referred to as the Onshore Order Limits). Further qualitative benefits to biodiversity are proposed via potential collaboration with stakeholders and local groups, contributing to existing plans and programmes, both within and outside the Onshore Order Limits. | TA_0229_005_231123          | S44     | Email           | <p>Proposed Substation Footprints The proposed footprints of the Morgan and Morecambe permanent substation sites are approximately 30 acres and 18 acres respectively. These site areas are taken up by approximately 50% BNG (Biodiversity Net Gain). This information was provided by a Flotation Energy engineer. This is wholly unacceptable as in providing on-site BNG purely for financial savings has narrowed the substations site selection process to one only option for Morgan and two only options for Morecambe. It is clear that had the substation sites design concentrated on that area which was wholly necessary to transmission, ie approx. 15 acres for Morgan and 9 acres for Morecambe then suitable substation site locations could have been expanded to present more options and allowed for flexibility during this consultation process.</p> | <p>The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). As set out in the Onshore Biodiversity Benefit Statement (document reference J11), the Transmission Assets are not subject to a mandatory net gain requirement under the Environment Act 2021. Nevertheless, the Applicants have worked with statutory consultees to discuss the approach, and to develop the design, to allow the maximum benefit to biodiversity within the parameters of the project. For the Transmission Assets, biodiversity benefit will be delivered within identified biodiversity benefit areas within the Transmission Assets Order Limits: Onshore (referred to as the Onshore Order Limits). Further qualitative benefits to biodiversity are proposed via potential collaboration with stakeholders and local groups, contributing to existing plans and programmes, both within and outside the Onshore Order Limits. Further details of the approach to biodiversity benefit are provided in the Onshore Biodiversity Benefit Statement (document reference J11). The calculation undertaken for the Onshore Biodiversity Benefit Statement (document reference J11) utilises the latest biodiversity metric published by Defra (4.0).</p>  |
| TA_0229_009_231123          | S44     | Email           | <p>2. The projects are not sustainable; 2.1 Given the extensive development impact within the Green Belt and Open Countryside on agricultural businesses which will impact Food Security. 2.2 Significant loss of the most productive grassland in the UK which in turn causes a significant loss in Carbon Sequestration (Carbon Capture). 2.3 Major impact on the diverse wildlife and ecology within Rural Fylde and Rural Preston areas for many years to come. 2.4 The large buildings proposed to house the substation equipment require significant cooling apparatus which will be powered by natural gas which is not sustainable energy and is a huge drain on the UK's already unstable gas reserves. 2.5 35 year projects will not benefit the next generation. This is not sustainable development.</p>   | <p>The Applicants can confirm that following route refinement this interest is no longer within the draft order limits. It is acknowledged that the proposed cable route passes through Green Belt land and the proposed onshore substations also fall within Green Belt. A consideration of alternative routes and substation siting is made as part of the Site Selection chapter of the ES (Volume 1, chapter 4, document reference F1.4) which concluded this is the preferred route and location for the cable and the substations. Land within the Area of Separation is no longer required for the onshore substations. An assessment regarding the impact on the purposes and openness of the Green Belt, alongside a Very Special Circumstances assessment is set out within the Planning Statement (document reference J28). The Applicants consider that when assessed on the planning balance that the significant benefits of the Project mean that there are Very Special Circumstances that outweigh any potential harm to the Green Belt. The route planning site selection process, and consideration of alternatives have been provided in Volume 1, Chapter 4: Site Selection and Consideration of Alternatives (document reference F1.4). Further information on the offshore, landfall and onshore elements of the project, can be found in Volume 1, Annex 4.1; Annex 4.2, and Annex 4.3, respectively (document references F1.4.1, F1.4.2 and F1.4.3). The Transmission Assets has made design changes since the PEIR and have updated the Project Design Envelope (PDE). Further detail is presented in Volume 1, Chapter 3: Project description of the ES (document reference F1.3). Justification for the location of the Transmission Assets, including a description of the design and/or environmental constraints considered as part of the iterative design process, is set out in Volume 1, Chapter 4: Site selection and consideration of alternatives of the ES (document reference F1.4) and the Outline Design Principles document (document reference J3). Detailed assessments are provided within all chapters within Volumes 1 to 4 of the ES (document reference F1 to F4). As set out in every ES chapter, mitigation measures have been developed to primarily avoid, then prevent, reduce or offset significant adverse environmental effects. Mitigation measures adopted as part of the Transmission Assets are provided in Volume 1, Annex 5.3: Commitments register of the ES (document reference F1.5.3).</p> |
