Dear Robert

Thank you for the further information provided to supplement the independent geological report that you supplied which we have now started to study. If we start from the premise that all the information produced and/or provided by Halite or its agents should be of sufficient quality and size to allow it to be read, and measured where appropriate, we have to contend that additional information is required to fully evaluate the seismic sections.

Specifically to allow our working group to fully understand the sections we request the following:-

1. A map showing the ground location of the 8 sections (Fig 2.1 does not do this)
2. A much larger scale version of Fig 3.1 with a key
3. Similar large scale maps showing top and thickness of salt.
4. All the updated documents listed in Tables 2.1 and 2.2

Hopefully the items requested will be readily available; presuming that they have previously been furnished to Senergy for their evaluation, and once again being mindful of the closing date for comments could you kindly confirm if we might have this data by 1st September to allow us time to convene and to fully evaluate the same.

Yours sincerely

Ian Mulroy (Chair PWG)
