1 Executive summary

1.1.1 This report presents the Generic Quantitative Risk Assessment (GQRA) which incorporates the geo-environmental data collected from the Package B area, over the period of September 2019 to January 2021 as part of the Phase 2 ground investigation and long-term monitoring. As part of the GQRA, environmental samples have been screened against applicable generic assessment criteria (GAC) to highlight the key risks relating to soil, soil leachate, sediment, sediment leachate, groundwater, and surface water contamination, ground gases and soil vapour. The results of the assessment have been summarised in the table below.

Site location: Package B
Summary of exceedances encountered
<p>Soil</p> <ul style="list-style-type: none"> • Soil samples from 53 out of the 105 locations tested recorded exceedances of the GAC for metals and polycyclic aromatic hydrocarbons (PAH). The samples recording exceedances were collected from the made ground (141 samples) and the natural ground (three samples). The majority of locations (51) recording exceedances were found within the Goshems Farm Landfill (HLU0526), except for two locations (BH07073 and BH08010), within a car park and agricultural land, respectively, which is assigned to no credible contaminant source. Most of these exceedances were considered to be marginal, as they fell within the same order of magnitude as the GAC. • Three exceedances were recorded that were greater than one order of magnitude above the GAC. These were all for Lead and were recorded in soil samples collected from within the boundary of the Goshems Farm Landfill (HLU0526). • Asbestos containing materials and fibres were detected in 64 soil samples in 37 locations, with fibre concentrations ranging from <0.001% to 4.015% weight by weight (w/w). The highest asbestos fibre concentration (4.015%w/w) was recorded in OH07036 at a depth of 2.00m bgl. Visible asbestos containing materials were confirmed in six samples from five locations. Chrysotile asbestos was confirmed in 12 samples (seven locations), amosite asbestos in six samples (five locations), and crocidolite asbestos in one sample. The majority of the asbestos fibres detected were in the made ground of the Goshems Farm Landfill (HLU0526), with one asbestos fibre detection (TP08004 at 1.00m) in the made ground of the Low Street Landfill (HLU0535) and one asbestos fibre detection (WS08001 at 0.05m) in made ground associated with agricultural land. • Photo-Ionisation Detector (PID) testing results were generally low, with only one result above 50ppm, recorded in a sample of made ground in BH07094 located within the Goshems Farm Landfill (254.6ppm). Marginal exceedances of PAH compounds were recorded in the soil sample taken from this location and an 'occasional hydrocarbon sheen' were noted during the drilling of this borehole. <p>Soil leachate</p> <ul style="list-style-type: none"> • Leachate analysis was undertaken on 1,107 samples collected from 105 exploratory locations. In total, 1,105 samples recorded at least one exceedance of the GAC. The majority of the exceedances recorded were marginal and within the same order of magnitude as the GAC. • The determinands which exceeded the GAC comprised metals, inorganic compounds and phenol. The samples recording exceedances were mainly collected from the made ground and the Alluvium.

Site location: Package B

- Of the 105 exploratory locations, 84 locations are located within the boundary of a credible source of contamination identified in the Preliminary Risk Assessment Report (Application Document 6.3, Appendix 10.6). These include 77 locations within the Goshems Farm Landfill (HLU0526), five within the Shed Marsh Landfill (HLU0534) and two within the Low Street Landfill (HLU0535).
- It should be noted that soil leachate analysis represents a conservative estimation of risk as the comparison of eluate concentrations (derived from laboratory soil leaching tests) with surface water and groundwater quality standards and does not factor in the potential for attenuation of concentrations in the pathway between the soil source and the receptor, i.e., in the unsaturated zone with potential for dilution at the water table or dilution in the receptor itself.
- The soil leachate exceedances from the made ground within landfills and the Alluvium immediately below them are considered to be reflective of the credible contaminative sources identified in the PRA Report. However, soil leachate exceedances located outside the landfills or within the underlying River Terrace Deposits and Chalk are considered to be representative of natural background concentrations.
- There is visual evidence to suggest that the southern extents of the East Tilbury Landfill (HLU0523) and maybe the Goshems Farm Landfill (HLU0526) are being eroded by the River Thames, during high tide.

Groundwater

- A total of 182 groundwater samples were collected from 73 locations. An additional 35 samples were taken on the day of or prior to the end of drilling their locations, so they may not be representative of true groundwater conditions. As such these 35 samples have not been included in the assessment.
- No exceedances were noted against the internally derived GAC in relation to human health receptors.
- Widespread exceedances of the controlled waters GAC were recorded for heavy metals, inorganics, speciated PAH, TPH, BTEX and phenols. In addition, discrete GAC exceedances were recorded for Di-n-butyl phthalate (BH07056 and OH06008), pesticides (BH07096, OH06008, and OH07035), Tributyltin (BH07010) and PFAS (BH07097).
- The majority of these exceedances were recorded in groundwater samples collected from the made ground. However, the concentrations of TPH groundwater exceedances in the natural ground were generally an order of magnitude greater than those within the made ground.
- The controlled waters GQRA indicates that although the landfill sites have impacted groundwaters in the made ground and the Alluvium, they are not in hydraulic continuity with and are not impacting deeper more sensitive aquifers (River Terrace Deposits and the Chalk) and the River Thames.
- Groundwaters within the River Terrace Deposits and the Chalk appear to have been impacted by saline intrusion and up hydraulic gradient sources of hydrocarbon contamination, rather than the overlying landfill sites.

Sediment from drainage channels

- Sediment samples from two (GS07003 and GS07006) of the 15 locations tested recorded exceedances of the GAC for lead. Asbestos was detected in soil sediment sample at GS07004 at 0.20m depth.
- Two of the above-mentioned locations are present along the boundary of the East Tilbury Landfill (HLU0523) whilst one lies within the Goshems Farm Landfill (HLU0526). The sediment contamination detected is considered to be associated with the adjacent landfills as lead and asbestos are listed as potential contaminants of concern within the Preliminary Risk Assessment for these credible contaminative sources.

Site location: Package B

Sediment leachate from drainage channels

- The sediment samples from the drainage channels were subjected to leachate analysis. All 15 sediment leachate samples recorded at least one exceedance of the GAC. The determinands which exceeded the GAC included metals, inorganic compounds, and phenol.
- The 15 sampled locations recording exceedances are within 10m of a credible source of contamination (East Tilbury Landfill, Goshems Farm Landfill, Tilbury Ash Disposal Site and Shed Marsh Landfill) identified in the Preliminary Risk Assessment Report (Application Document 6.3, Appendix 10.6). Therefore, the sediment leachate results are considered to represent existing baseline conditions which are present in the Package B area.

Surface water

- All of the surface water samples (15 samples from 15 locations) recorded exceedances of the GAC protective of surface water receptors. The determinands which exceeded the GAC comprised metals, inorganics, and organics (PAH).
- Of the 15 surface water sample locations, 10 locations are within the boundary of a credible source of contamination, which includes the Tilbury Ash Disposal Sites (HLU0527 to HLU0530), East Tilbury landfill (HLU0523), the Goshems Farm Landfill (HLU0526) and the Shed Marsh Landfill (HLU0534). The remaining five locations are all between one to 12m from their closest credible source of contamination identified in the Preliminary Risk Assessment Report (Application Document 6.3, Appendix 10.6). Consequently, the surface water samples are considered to be reflective of the existing baseline conditions which are present in the Package B area.

Ground gas (periodic monitoring)

- Periodic ground gas monitoring was undertaken in 50 locations.
- For the purposes of the assessment threshold, values of 1% v/v and 1.5% v/v were adopted for methane and carbon dioxide, respectively. A more stringent carbon dioxide threshold value was selected for the risk assessment, given the conceptually high-risk ground gas regime, and proposed temporary sleeping accommodation on site. Long-term Workplace Exposure Limits (Health and Safety Executive, 2020) were adopted as threshold values for hydrogen sulphide and carbon monoxide. Concentrations of these gases above the threshold are considered to be an exceedance.
- Data from flooded monitoring wells were eliminated from the ground gas risk assessment as the readings are anomalous and not considered to be representative of the true ground gas regime of the surrounding unsaturated ground conditions.
- Methane and carbon dioxide exceedances were recorded in up to 18 locations during the periodic ground gas monitoring programme. The maximum methane concentration recorded was 99%v/v in BH07046 and the maximum carbon dioxide concentration recorded was 36.1%v/v in BH07011.
- Hydrogen sulphide exceedances were recorded in seven locations during the periodic gas monitoring programme, with a maximum concentration of 80ppm recorded in BH07046. Carbon monoxide exceedances were also recorded in eight locations during the monitoring programme, with a maximum concentration of 390ppm recorded in BH07034.
- PID headspace readings recorded during the monitoring programme ranged from <0.1ppm to 30.1ppm, with the highest concentration being recorded in BH07011.
- Steady state flow rates recorded in wells during the monitoring programme ranged from - 14.4l/hr to 26.9/hr.
- Sustained ground gas exceedances over multiple visits were primarily recorded in locations screening the made ground of the landfills and the Alluvium. Therefore, the ground gas exceedances recorded are considered to be representative of the Goshems Farm Landfill (HLU0526), the Shed Marsh Landfill (HLU0534) and the Alluvium. This conforms to the initial CSM outlined in the PRA Report.

Site location: Package B

- The ground gas concentrations and flow rates recorded in the unsaturated zone indicates the landfill sites have a high-risk ground gas regime, equivalent to Characteristic Situation (CS) 5 and the underlying Alluvium has a low-risk ground gas regime, equivalent to CS2.
- Given that the Goshems Farm Landfill and the East Tilbury Landfills are raised landforms built on cohesive Alluvium and located in an area of high groundwater levels, it is considered that ground gases generated within the landfills will not migrate laterally beyond their boundaries.
- The ground gases detected in the Alluvium, particularly the peat, have been generated historically, and are trapped within pore spaces of the soils in this formation. With the addition of high groundwater levels in the area, it is considered that ground gases within the Alluvium are unlikely to migrate laterally any significant distance into the wider area.
- It should be appreciated that the Project has the potential to increase the risk rating of the ground gas regime and create preferential pathways at the site, through dewatering activities and the north portal excavation.

Ground gas (continuous monitoring)

- Continuous ground gas monitoring was undertaken in up to 25 locations, recording both ground gases and dissolved methane. All monitoring wells are located within the boundary of the Goshems Farm Landfill.
- Erratic data was noted on the continuous ground gas monitoring graphs for BH07019, BH07038, BH07063, BH07064, and BH07099. A closer look at the data indicates a data processing error had occurred, resulting in parameters swapping columns in the original excel file. These erratic readings were subsequently removed from the risk assessment.
- Sudden changes in the continuous monitoring data were also attributed to periods when the monitoring instruments were deactivated for maintenance purposes.
- Methane and carbon dioxide exceedances were recorded in 10 locations during the continuous ground gas monitoring programme. The maximum methane concentration recorded was 74.9%v/v in BH06014 and the maximum carbon dioxide concentration recorded was 25.14%v/v in BH07060. Steady state flow rates ranged from -7.58l/hr to 26.32l/hr during the continuous monitoring programme.
- Hydrogen sulphide gas concentrations during the continuous monitoring programme ranged from <0.1ppm to 140.5ppm. Carbon monoxide concentrations during the monitoring programme ranged from <0.1ppm to 395.8ppm.
- VOC headspace concentrations recorded during the monitoring programme ranged from <0.1ppm to 4873.9ppm, with the highest concentration being recorded in BH06014.
- Dissolved methane concentrations ranged from <0.01mg/l to 52.95mg/l during the continuous monitoring programme. The highest dissolved methane concentration was recorded in the Alluvium, but similarly high concentrations were recorded in the made ground, and the Chalk. Negative dissolved methane concentrations were recorded but these were considered to be anomalous and were therefore removed from the risk assessment.
- The continuous ground gas monitoring graphs show that ground gases and flow rate fluctuate with changes in atmospheric pressure and groundwater levels. This suggests that the monitoring well response zones represent gas migration pathways rather than gas generating sources. Guidance states that a monitoring graph for a gas generating source will typically show constant ground gas concentrations that are unaffected by changes in atmospheric pressure. This was not observed in Package B.
- The dissolved methane concentrations have no obvious relationship with other monitoring data parameters but suggest that groundwaters beneath the Package B area have been impacted by the Goshems Farm landfill and the Alluvium.

Site location: Package B

- The ground gas concentrations and flow rates recorded during the continuous monitoring programme conform to the initial CSM and the findings of the periodic monitoring programme.

Ground gas and vapour (gas samples)

- In total, seven gas samples were collected from seven monitoring wells, with three locations potentially targeting the proposed route alignment and north portal, during the ground investigation, and were analysed for ground gases and volatile organic compounds (VOCs). All monitoring wells were located within the Goshems Farm Landfill.
- For the purposes of the assessment threshold, a combination of Workplace Exposure Limits (Health and Safety Executive, 2020) and Environmental Assessment Levels (Environment Agency, 2016) were used to assess the risk from ground gases and VOCs.
- The assessment identified widespread elevated carbon dioxide, methane, and depleted oxygen gas concentrations in all gas samples from the made ground and the Alluvium, with discrete exceedances of the carbon di-sulphide, tetrachloroethene (PCE), benzene and hexane GAC.
- The ground gas concentrations recorded in gas samples conform to the findings of the periodic and continuous ground gas monitoring.
- The VOC exceedances recorded in the gas samples were one order of magnitude greater than their respective GACs. The VOC exceedances are considered to be dissolved VOCs, associated with a series of organic contaminant plumes in the groundwaters of the made ground and the Alluvium, which have come out of solution and collected in the headspaces of monitoring wells.

1.1.2 The Phase 2 ground investigation has targeted the main route alignment and areas where proposed intrusive works are planned as part of the construction phase. Where exploratory locations have recorded an exceedance of the applicable Generic Assessment Criteria (GAC) and fall within a credible source of contamination identified within the CSM, it suggests that the exceedances may be reflective of impacts from that particular source and the presence of a complete pollutant linkage. Where the GAC are exceeded, the results would be evaluated to determine whether the level of risk is acceptable or whether further assessment would be required to be completed at the detailed design stage of the Project. After appropriate assessment and where unacceptable risks are identified, the Contractors would develop proposals for site-specific remediation strategies and implementation plans. The commitment for these requirements is made in the Register of Environmental Actions and Commitments (REAC), items GS001 and if required, GS027.

1.1.3 The results of the GQRA have been assessed in terms of the identified credible sources of contamination and will help to refine the conceptual site model (CSM) for the Project. The review of the 58 credible contaminant sources included a desk-based assessment of the project alignment and proposed works to assess if those sources could be dealt with by standard construction practices as presented and committed to in the Code of Construction Practice (CoCP) and REAC, including the specific requirements of GS001, GS006, GS018, GS026, GS027 and GS028. The sources were given a revised risk rating on this basis. The refined CSM has identified 1 high-risk site, 7 medium-risk sites, and 50 low-risk sites within Package B. Taking into account the proposed construction works and design proposals for the Project, of the 50 low

risk sites identified within Package B, 27 have been assessed as needing no further consideration. For the remaining low risk sources, it is considered that standard construction processes and environmental procedures, as detailed in the REAC, would be sufficient to manage any risks present. As such these sources have been assigned a low-risk rating following the GQRA.

The commitment for these requirements is made in the CoCP and REAC, including the specific requirements of GS001, GS006, GS018, GS026, GS027 and GS028.

- 1.1.4 This assessment is presented in the Generic Quantitative Risk Assessment in Annex B-A.
- 1.1.5 Soil, groundwater, surface water, sediment, ground gas and vapour contamination has been identified within the Goshems Farm Landfill (HLU0526). Given the severity of the identified contamination, nature of the proposed Project, and identified receptors, plausible pollutant linkages are possible. Further assessment, remedial works and specific designs are required to facilitate the proposed Project. Therefore, the Goshems Farm Landfill is to remain as a high-risk site. Mitigation measures to deal with the risks identified are detailed in the Remediation Options Appraisal and Outline Remediation Strategy (Application Document 6.3, Appendix 10.11).
- 1.1.6 The East Tilbury Landfills (HLU0523 and HLU0533) were previously identified as high-risk sites by the Preliminary Risk Assessment Report (Application Document 6.3, Appendix 10.6) owing to the potential for the dewatering works to result in the release of contamination from the landfills. According to the East Tilbury Landfill Risk Assessment (Application Document 6.3, Appendix 10.7), the East Tilbury Landfills (HLU0523 and HLU0533) are raised landforms that were constructed on cohesive Alluvium deposits. Numerical modelling and continuous pumping tests have concluded that the Alluvium acts as an aquitard, confining and creating artesian conditions within the underlying aquifers (the River Terrace Deposits and the Chalk). Pumping tests have also shown that the River Thames has no direct tidal influence on the groundwater within the Alluvium and thus the overlying East Tilbury Landfills. Furthermore, numerical modelling has confirmed that contaminants of concern from the East Tilbury Landfills are unlikely to reach the North Portal structure, within the timeframe of the proposed dewatering exercise. Given the above, it is considered that sensitive receptors within Package B are unlikely to be at an unacceptable risk from contaminants within the East Tilbury Landfills, as a result of the proposed dewatering works at the North Portal. Consequently, the risk rating for the East Tilbury Landfills can be downgraded from high to low.
- 1.1.7 Sediment leachate and surface water exceedances have been identified in perimeter ditches along the boundaries of the Tilbury Ash Disposal Sites (HLU0527 to HLU0531, and HLU0534). These landfills are located adjacent to the main works construction area and are intercepted by proposed utility work areas, thus there is potential that they will be disturbed by proposed construction activities, establishing possible plausible pollutant linkages with receptors on site. Given the nature of the contaminants, it is considered that the commitments outlined in the REAC (GS001, GS027 (if required) and GS028) should be sufficient to mitigate the contamination identified in the Tilbury Ash Disposal sites. The risk rating for the Tilbury Ash Disposal Sites is to remain as

medium because there are areas of the sites that are yet to be subjected to intrusive ground investigation.

- 1.1.8 A single asbestos fibre detection was identified in the made ground of TP08004, within the boundary of the Low Street landfill (HLU0535) during the Phase 2 ground investigation. The landfill is located at the proposed main route alignment where the route is elevated on a viaduct and within an area of proposed intrusive utility works. There is potential that the contaminants identified could be disturbed by proposed construction activities, creating plausible pollutant linkages. Therefore, further consideration at the construction phase of the Project would be required. It is considered that the commitments outlined in the REAC (GS001, GS027 (if required) and GS028) and the precautions detailed in the Remediation Options Appraisal and Outline Remediation Strategy Report (Application Document 6.3, Appendix 10.11) should be sufficient to mitigate the contamination identified at the Low Street Landfill site. Consequently, this site has been downgraded from a high-risk to a medium-risk site.
- 1.1.9 At this stage in the Project, where it is possible to refine the potential pollutant linkages identified in the Preliminary Risk Assessment Report (Application Document 6.3, Appendix 10.6) this has been undertaken. Where it has not been possible a precautionary approach has been adopted which assumes that all the identified pollutant linkages are present on site. The key risks identified within this GQRA will be assessed further where necessary, as part of the ground investigations and site-specific risk assessments to be carried out as part of future detailed design stages.
- 1.1.10 The assessment herein has shown that the route alignment within the Goshems Farm Landfill area is impacted with contamination and requires further assessment at the construction phase to facilitate the Project. However, it is considered the contamination outside this landfill is not as severe and the risks identified can be managed by standard construction procedures and protocols which are detailed as commitments within the REAC (Application Document 6.3).

2 Introduction

2.1 Purpose of document

- 2.1.1 This report presents the Generic Quantitative Risk Assessment (GQRA) which has been carried out in line with the Land Contamination: Risk Management (LCRM) guidance (Environment Agency, 2020). The assessment has been carried out using geo-environmental data collected from the Package B area, over the period of September 2019 to January 2021 as part of the Phase 2 ground investigation.
- 2.1.2 The information presented within this report is based on the laboratory analysis and monitoring data, which comprise the following:
- a. Phase 2 ground investigation and Phase 2 long-term monitoring (LTM) laboratory test results provided in ESdat Electronic Data Deliverable (EDD) format, issued to Cascade by Perfect Circle as of April 2021. This includes information relating to soil, soil leachate, sediment, sediment leachate, groundwater, surface water and gas samples.
 - b. Ground gas monitoring data collected up to January 2021 and other ground investigation (including Photo-Ionisation Detector (PID) testing results) provided to Cascade and uploaded to the Lower Thames Crossing HoleBASE database, accessed July 2021.
 - c. Continuous ground gas monitoring data collected up to March 2021 and downloaded from the Ambisense Ambilytics portal, in March 2021.
 - d. Ground investigation data (i.e., geology encountered), provided to Cascade by Perfect Circle in AGS format and uploaded to the Lower Thames Crossing HoleBASE database, accessed in July 2022.
- 2.1.3 The available chemical laboratory test results have been screened within ESdat, a specialist environmental database system, to highlight any exceedances (non-compliance) of relevant screening criteria for human health and controlled waters. The results of this screening are presented herein, along with an assessment of ground gas and soil vapour data.

2.2 Project background

- 2.2.1 The A122 Lower Thames Crossing (the Project) would provide a connection between the A2 and M2 in Kent, east of Gravesend, crossing under the River Thames through two bored tunnels, before joining the M25 south of junction 29.
- 2.2.2 The A122 road would be approximately 23km long, 4.25km of which is in tunnel. On the south side of the River Thames, the Project route would link the tunnel to the A2 and M2. On the north side, it would link to the A13 and junction 29 of the M25. The tunnel portals would be located to the east of the village of Chalk on the south of the River Thames and to the west of East Tilbury on the north side.

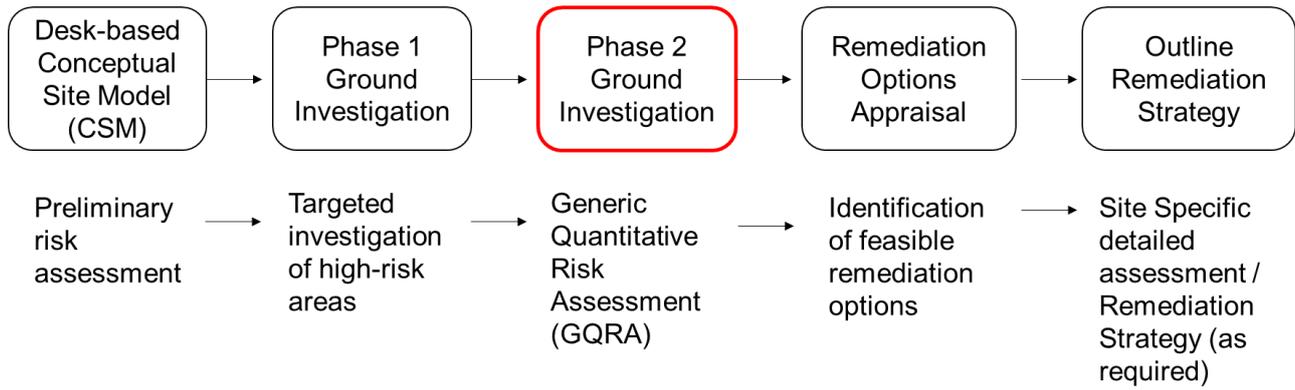

- 2.2.3 For the purposes of the Phase 2 ground investigation, the Project route has been divided into four sections labelled Package A to Package D. The Phase 2 ground investigation for Package B covers the area of the Project route from immediately to the north of the River Thames, around the North Portal and north to the Tilbury and Southend Railway line. The extent of the Package B area is presented on Figure A.
- 2.2.4 The Phase 2 ground investigation within each of the four packages covered varying periods of time due to differing start dates. Generally, the intrusive investigations took place over the period of July 2019 to October 2020. Long-term monitoring of groundwater and ground gas was undertaken for 7 months following completion of intrusive works in Package B, from June 2020 to January 2021. The long-term monitoring data has been included within this report.
- 2.2.5 Prior to the Phase 2 ground investigation, a Phase 1 ground investigation was undertaken which was targeted at the proposed tunnel portals. The assessment is detailed within the Generic Quantitative Risk Assessment for the Phase 1 Investigation (Application Document 6.3, Appendix 10.8). Where appropriate, the findings of the Phase 1 investigation are considered within this report to provide a comprehensive assessment of the available data.

2.3 Land contamination risk management process

- 2.3.1 The land contamination risk assessment presented herein is based upon the process laid out in the LCRM guidance (Environment Agency, 2021). In brief, the assessment is a tiered process with increased site-specific understanding required at each level:
- a. **Stage 1: Risk assessment - The three tiers are:**
 - i. Preliminary risk assessment
 - ii. GQRA
 - iii. Detailed Quantitative Risk Assessment (DQRA)
 - b. **Stage 2: Options appraisal - The three tiers are:**
 - i. Identify feasible remediation options
 - ii. Detailed evaluation of options
 - iii. Select final remediation options
 - c. **Stage 3: Remediation - The three tiers are:**
 - i. Develop a remediation strategy
 - ii. Remediation and verification
 - iii. Long-term monitoring and maintenance, if required

- 2.3.2 The contaminated land risk assessment for the Project falls within Stage 1 of the LCRM guidance (Environment Agency, 2021). For the purposes of the Project, the risk assessment has been separated into various phases of work. The phases and how they relate to the LCRM are presented in Plate 2.1.
- 2.3.3 The first stage of the risk assessment is the production of a CSM which establishes whether there are any potentially unacceptable risks (potential pollutant linkages) and supports the design of the intrusive ground investigations. The subsequent GQRA then utilises the findings of the ground investigations to assess if there are unacceptable or acceptable risks associated with the identified potential pollutant linkages by comparing the contaminant concentrations against appropriate Generic Assessment Criteria (GAC). A precautionary approach has been adopted for the purposes of this GQRA whereby if the assessment of the results of the ground investigation reveals unacceptable risk or uncertainty, then the assumption is that the pollutant linkage remains relevant and further action may be required.
- 2.3.4 This report is based upon the data collected as part of the Phase 2 ground investigation. The main objective of the GQRA is to identify where risks arising from potential contamination exist, so that they can be included within the land contamination mitigation measures for the Project. The results of the GQRA are presented herein.
- 2.3.5 Subject to the findings of the GQRA and any further assessment which may include DQRA, the requirement for remediation or other contamination mitigation measures (such as watching briefs) would be determined. The Contractor would need to develop proposals for site-specific remediation and materials management in consultation with the relevant local authority prior to implementation. The Contractor would have regard to the Remediation Options Appraisal and Outline Remediation Strategy (Application Document 6.3, Appendix 10.11) which identifies specific techniques that could be implemented by the Contractor to remediate or mitigate contamination. Where general mitigation measures are required to manage potential residual risks, this is specified in the Register of Environmental Actions and Commitments (REAC) (Code of Construction Practice (Application Document 6.3, Appendix 2.2) which the Contractor would have regard to prior to the mobilisation to the site. The REAC commitments include the implementation of watching briefs (GS028), materials management (GS006), and the steps outlined by the LCRM, such as supplementary investigations (GS001, GS018), remediation (GS027, GS026 and GS028) and verification (GS016 and GS017).

Plate 2.1 Summary of the main phases of works and their relation to the LCRM process

3 Data available

- 3.1.1 The laboratory data presented in this report was collected over the period between September 2019 and January 2021. The data comprises laboratory contaminant testing of 874 soil and 1,107 soil leachate samples from 105 exploratory hole locations, and 182 groundwater samples from 73 locations, as summarised in Table 3.1 and shown in green on Figure B. This figure also shows the location of the credible contaminant sources.
- 3.1.2 It should be noted that of the 1,107 soil leachate samples analysed, 271 were tested for ammoniacal nitrogen only.
- 3.1.3 The data summary includes 35 groundwater samples which were collected on or before the completion of drilling works and therefore may not be representative of stable groundwater conditions. These samples have not been included in the assessment for groundwater in Section 5.6.
- 3.1.4 The ground investigation also included laboratory testing of 15 surface water and sediment samples from 15 locations collected from the drainage outfall channel known as Tilbury Main and tributary channels, located within the boundaries of East Tilbury Landfill and Goshems Farm Landfill, and the local vicinity, as summarised in Table 3.2 and shown in green on Figure B.
- 3.1.5 Furthermore, 7 gas samples from 7 locations (BH06014, BH07023, BH07046, BH07060, BH07064, BH07065 and BH07066), within the Goshems Farm Landfill were subjected to laboratory analysis for bulk gases and soil vapours. A summary of the bulk gases and soil vapour analysis undertaken is provided in Table 3.8.
- 3.1.6 While summarised in this annex, full details of the investigation and the chemical testing are provided within the Land Based Works - Phase 2A Area 1 Package B Factual Report on Ground Investigation (Perfect Circle, 2020), and Land-based works - Phase 2A Ground Investigation Package B Long-term monitoring Addendum to factual report on post-GI gas and groundwater monitoring and sampling works (Perfect Circle, 2021).
- 3.1.7 For selected locations, no groundwater sample data is presented in this report either due to the laboratory data not being available, or the absence of groundwater within the groundwater monitoring wells which have been installed.

- 3.1.8 Samples were tested for a range of chemical determinands across multiple chemical groups. A summary of the basic chemical groups of those determinands for soil, soil leachate, sediment and sediment leachate are presented in Table 3.3. The selection of determinands for chemical testing of each sample is based upon both field observations and the information provided within the Preliminary Risk Assessment Report (Application Document 6.3, Appendix 10.6). For samples collected at locations where a specific determinand or group of determinands were unlikely to be encountered, those determinands were not included in the analysis suite. Therefore, not all samples were tested for every determinand within each chemical group.
- 3.1.9 Groundwater and surface water samples were analysed for various suites of determinands as both laboratory filtered and laboratory unfiltered samples. Filtering samples prior to metals analysis is good practice as water quality standards typically refer to either ‘total’ or ‘dissolved’ fractions. Filtering for other determinands may be useful where entrainment of fines has occurred but is not specified within water quality standards.
- 3.1.10 Details of the sample collection methodology, including whether samples were filtered onsite, are not available. Therefore, it is not possible to confirm whether the results represent ‘dissolved’ or ‘total’ concentrations at this stage. Where determinands have recorded exceedances in both samples, the higher concentration has been assessed for the purposes of the GQRA. This may be considered to be a conservative approach but ensures the assessment remains robust. The laboratory chemical testing adopted for groundwater samples is provided in Table 3.4.

Table 3.3 Summary of soil/ sediment and soil/ sediment leachate laboratory chemical testing and determinands

Chemical group	Number of determinands	Maximum number of samples analysed
Soil / Sediment		
Anthrax	1 / 0	3 / 0
Asbestos	14 / 2	869 / 14
Benzene, toluene, ethylbenzene and xylenes (BTEX) and methyl tert-butyl ether (MTBE)	8 / 6	552 / 15
Inorganics	5 / 2	859 / 15
Metals	15 / 15	859 / 15
Organotins	7 / 3	333 / 4
Other (conductivity, pH, and organic carbon, etc)	9 / 6	859 / 15
Polycyclic aromatic hydrocarbons (PAH)	18 / 17	859 / 15
Polychlorinated biphenyls (PCB)	36 / 25	333 / 4
Pesticides	98 / 1	7 / 4
Phenolics	6 / 1	728 / 15
Semi-volatile organic compounds (SVOC)	51 / 0	101 / 0
SVOC Tentatively identified compounds (TIC)	4 / 0	30 / 0
Total petroleum hydrocarbons (TPH)	20 / 5	788 / 15
TPH Criteria Working Group (CWG)	30 / 18	499 / 15
Volatile organic compounds (VOC)	48 / 0	92 / 0
VOC TIC	3 / 0	18 / 0
VOC/SVOC**	8 / 0	97 / 0
Soil / sediment leachate		
Inorganics	13 / 10	1,105 / 15
Metals	16 / 15	835 / 15
Phenolics	6 / 4	835 / 15
Other (conductivity, pH)	4 / 2	706 / 15

Note * Represents number of determinands tested in chemical group.

** Grouping adopted for determinands which fall into both VOC and SVOC groups.

Table 3.4 Summary of groundwater and surface water laboratory chemical testing

Chemical group	Number of determinands*	Maximum number of samples analysed
Groundwater		
BTEX and MTBE	8	174
Inorganics	30	182
Metals	25	182
Organotins	1	88
Other (conductivity, organic carbon, pH etc)	13	174
PAH	18	174
PCB	19	88
Pesticides	311	18
Phenolics	8	174
Per- and polyfluoroalkyl substances (PFAS)*	17	5

Other (conductivity, organic carbon, pH, etc.)	8	15
PAH	17	15
TPH	5	15
TPH CWG	18	15
Phenolics	4	15

Note: * PFAS suite includes branched, linear and total Perfluoro-octane-sulfonic acid (PFOS).

** Grouping adopted for determinands which fall into both VOC and SVOC groups.

3.1.11 The data has been cross-referenced against the relevant geological formation, using information obtained from the most recent AGS 4.0 data file “B-AGSF-X-X-X-F-X-X-X-0010 4.0.4” (dated July 2022) provided by Perfect Circle. It should be noted that some samples are from strata which have not been assigned a

geological formation and that not every stratum listed was encountered in each location. This information is presented in Table 3.5.

- 3.1.12 Some installations, detailed in Table 3.5, had a response zone which screened more than one stratum. As noted previously, 35 of the groundwater samples taken during the GI phase were taken prior to or on the day of drilling. These samples may not be representative of groundwater conditions and cannot be reliably assigned to a response zone, therefore these samples have been excluded from Table 3.5.

Table 3.5 Summary of analysed samples and associated strata

Strata	Sample depth range (m bgl) *	Number of samples analysed					
		Soil	Soil leachate	Sediment	Sediment leachate	Groundwater	
						GI	LTM
Made Ground	0.00 - 10.50	551	748	7	7	20	24
Made Ground/Alluvium**	2.75 - 7.25	-	-	-	-	4	7

Alluvium	0.00 – 26.40	190	225	8	8	17	16
River Terrace Deposits/Alluvium**	1.51 - 18.00	-	-	-	-	3	3
River Terrace Deposits	1.23 – 29.70	39	41	-	-	8	16
Thanet Formation	26.10	4	4	-	-	-	-
White Chalk Subgroup	1.33 - 60.00	90	89	-	-	22	41
Total number of samples		874	1107	15	15	75	107

Note: * m bgl – metres below ground level.

** Well installation screens two strata.

*** Sample not assigned to a geological formation in AGS file.

- 3.1.13 The periodic ground gas monitoring dataset available covers the period between September 2019 and January 2021. This comprises spot ground gas monitoring of 50 locations, as summarised in Table 3.6. Some of the ground gas monitoring installations screen more than one geology.
- 3.1.14 Concentrations of methane, carbon dioxide, oxygen, hydrogen sulphide and carbon monoxide were recorded together with groundwater temperature, groundwater depth and atmospheric pressure. Concentrations of VOC were also recorded with a PID.

3.1.15 Continuous ground gas monitoring data is also available for Package B. All of the continuous gas monitoring locations are within the Goshems Farm Landfill (HLU0526), which is situated within the proposed North Portal area. The data comprises continuous ground gas monitoring of 25 locations and covers the period between April 2020 and March 2021. The monitoring data also includes headspace testing of ground gases at all of the locations and measurement of dissolved methane concentrations in groundwater at 24 locations, as summarised in Table 3.7. Some of the ground gas monitoring installations screen more than one geology.

Table 3.7 Continuous ground gas monitoring location information

Exploratory hole ID	Response zone strata	Continuous ground gas testing start date	Dissolved ground gas testing start date
BH06014	Made Ground	02/07/2020	06/05/2020
BH06017		29/09/2020	09/03/2020
BH07019		09/09/2020	-

3.1.16 Seven gas samples were collected from seven monitoring well locations, along the proposed main route alignment and north portal, and delivered to the laboratory on 4 July 2020 for bulk gas and soil vapour analysis. A summary of the laboratory analysis for bulk gases and soil vapour is provided in Table 3.8.

Table 3.8 Summary of bulk gas and soil vapour analysis

Chemical group	Number of determinands	Number of samples/ locations
Made Ground (BH06014, BH07046, BH07060 and BH07064)		
Ground gases*	8	4
Hydrogen sulphide	1	4
Naphthalene	1	4
VOC	68	4
TPH (including BTEX and MTBE)	20	4
Alluvium (BH07023, BH07065 and BH07066)		
Ground gases*	8	3
Hydrogen sulphide	1	3
Naphthalene	1	3
VOC	68	3
TPH (including BTEX and MTBE)	20	3

Note: *Ground gases includes oxygen, nitrogen, carbon monoxide, methane, carbon dioxide, hydrogen, helium, and total bulk gas.

4 Preliminary conceptual site model

4.1 Credible sources of contamination

4.1.1 The Preliminary Risk Assessment Report (Application Document 6.3, Appendix 10.6) was produced to outline the potential risks arising from contaminated soil and groundwater present along the Project route in the form of a Conceptual Site Model (CSM). Credible contaminant sources relevant to the Project were identified. This process provides a robust assessment that aligns with the tiered approach for risk assessment set out in LCRM (Environment Agency, 2021). The CSM is built upon and refined by subsequent tiers of assessment (including GQRA and DQRA, if required) which would be completed during detailed design.

4.2 Potential contaminants and analysis

4.2.1 Key contaminants of concern (COC) were identified in the Preliminary Risk Assessment Report (Application Document 6.3, Appendix 10.6). The COC associated with the credible sources of contamination falling within the Package B area included:

- a. Ammoniacal Nitrogen
- b. Asbestos
- c. Biocides
- d. Chlorinated hydrocarbons
- e. Coal Constituents (PAH, sulphur)
- f. Hazardous gases
- g. Inorganics
- h. Metals
- i. Microbial contamination
- j. Nitrogen oxides
- k. PAH
- l. PCB
- m. Pesticides
- n. Petroleum hydrocarbons
- o. Sewage-related organics
- p. SVOC

- q. VOC
- r. PFAS
- s. Phenolics
- t. Organotin (Tributyltin or TBT)

- 4.2.2 The assessment of land affected by contamination is a continuous process of refinement. This stage of the risk assessment is intended to identify where potential risks arising from potential contamination may exist within the site area, and not to fully delineate the extent or severity of any contamination which may exist. The environmental data presented herein has facilitated a robust assessment of the likely areas which may present a potential risk.
- 4.2.3 The Phase 1 and 2 ground investigations have identified areas where potential risks to receptors may exist. The results of the risk assessment presented herein will be used to support future detailed design and remediation stages of the development.
- 4.2.4 It should be noted that a number of sites highlighted as medium or high-risk sites within the Package B area have not been fully investigated owing to no proposed structures, or earthworks works being located in their respective boundaries. In respect to the East Tilbury Landfills (HLU0523 and HLU0533), a risk assessment (Application Document 6.3, Appendix 10.7) was undertaken to determine if potential plausible pollutant linkages would be created as a result of the dewatering works at the North Portal. The findings of this risk assessment are summarised in paragraph 6.1.8, of the refined conceptual site model Section 6 within this report.
- 4.2.5 Where necessary, the Contractors would complete further ground investigations prior to construction to assess residual contamination risks, address data gaps and uncertainties identified by the PRA and GQRA reports and inform the detailed design of the Project. The commitment for this requirement is made in the REAC (GS001, GS027 (if required) and GS028).

4.3 Refining the conceptual site model

- 4.3.1 The initial stage of assessment as outlined in the LCRM guidance is the production of a CSM. The next stage of assessment is to undertake intrusive investigation. The next stage of assessment is to review and refine the CSM and the 58 credible contaminative sources that fall within the Package B area, and to undertake intrusive investigation.
- 4.3.2 The review of the credible contaminant sources included a desk-based assessment of the project alignment and proposed works in each area to assess if those sources could be dealt with following best practice and taking into account the measures secured within the Code of Construction Practice and REAC (Application Document 6.3, Appendix 2.2). The sources were given a revised risk rating on this basis. This assessment is presented in the Generic Quantitative Risk Assessment table in Annex B-A.
- 4.3.3 The Phase 2 ground investigation has targeted the main route alignment, the north portal, and areas where proposed intrusive works are planned, as part of

the construction phase. Where exploratory locations have recorded an exceedance of the applicable GAC and fall within a credible source of contamination identified within the CSM, it suggests that the exceedances may be reflective of potential impact from that particular source. Where the GAC are exceeded, the results would be evaluated to determine whether the level of risk is acceptable or whether further assessment would be required to be completed at the detailed design stage of the Project.

5 Assessment of data

5.1 Introduction

- 5.1.1 A GQRA has been undertaken to determine the significance of the measured concentrations of contaminants from the chemical analysis. The GQRA comprises a comparison of measured concentrations of contaminants in the soil, soil leachate, sediment, sediment leachate, surface water and groundwater samples with applicable Generic Assessment Criteria (GAC). An assessment of the ground gas and soil vapour has also been undertaken against industry standard screening values.
- 5.1.2 The selection of applicable GAC is described in the sections below, along with the results of the assessment and a discussion of the findings.
- 5.1.3 Following the LCRM guidance and based on the potential pollutant linkages associated with the Project, the assessment of soil, sediment, ground gases and soil vapour is primarily focused on the potential risk to human health receptors. The potential risks to water resource receptors are more accurately evaluated through assessment of concentrations of COC in soil leachate, sediment leachate, surface water, and groundwater. The potential risks associated with contaminants in groundwater are also assessed in relation to human health.
- 5.1.4 For the purposes of this assessment, laboratory analytical results which fall below the GAC are not considered to present an unacceptable risk and are therefore of low significance in relation to the contamination risks associated with the construction of the Project.
- 5.1.5 Exceedances of the GAC are considered further herein. It should be noted that a measured concentration greater than the GAC does not necessarily mean there is an unacceptable risk to a receptor but may indicate the need for further assessment. Based upon future data collection, updated GQRA and discussion with the relevant regulators, the requirement for DQRA will be determined, which would be undertaken during detailed design if required. Where contaminant concentrations in soil samples are below the GAC, they are considered unlikely to pose an unacceptable risk to those receptors and, therefore, warrant no further action.

5.2 Soil

- 5.2.1 In total, 874 soil samples were submitted for laboratory analysis from 105 locations. Samples were taken from a range of depths to provide coverage of the encountered strata. Soil samples were tested for a range of determinands, which are presented in Table 3.3.
- 5.2.2 Headspace tests were undertaken on the soil samples to investigate the potential presence of VOCs, and a total of 1130 readings were recorded from 114 locations. The majority of the readings (1,078) were less than 1ppm. Out of 52 readings recorded above 1ppm, six readings from five locations recorded results above 10ppm.
- 5.2.3 The highest reading of 254.6ppm was recorded in the made ground sampled from BH07094 at a depth of 10.0m bgl, with the boundary of the Goshems Farm

Landfill (HLU0526). An ‘occasional hydrocarbon sheen’ was noted within the made ground sampled from this location. Headspace readings of 2.0ppm and 1.1ppm were recorded at 8.00m and 9.00m depth, respectively, above the highest reading of 254.6ppm at 10m depth. The borehole was terminated at 10.0m depth and therefore no headspace readings below this depth. No explanation is provided on the borehole record for the borehole termination at 10.0m depth, despite the presence of made ground and hydrocarbon soil contamination at the base of the borehole. While summarised in this report, the full results are provided within the borehole logs in the Land Based Works - Phase 2A Area 1 Package B Factual Report on Ground Investigation (Perfect Circle, 2020).

Selection of assessment criteria

- 5.2.4 The assessment of contaminant concentrations in soil is primarily focused on the potential risk to human health. Human health receptors identified in the Preliminary Risk Assessment Report (Application Document 6.3, Appendix 10.6) which are applicable to the Package B area include the following:
- a. Construction workers
 - b. Operations staff
 - c. Road users
 - d. Adjacent land users - residents
 - e. On site and adjacent land users – public open space
 - f. Adjacent land users – industrial, commercial, and agricultural workers
- 5.2.5 The GAC were selected to provide a suitable level of protection to the identified human health receptors from onsite measured soil concentrations. In many cases, the criteria selected may be overly conservative but provide an initial screen.
- 5.2.6 Human health receptors considered in this assessment include b. to f. from the above list. The risk to construction workers has not been specifically considered in this assessment. The potential risk to construction workers would be managed via general construction working practices, suitable for development of a potentially contaminated site, and adherence to the relevant health and safety legislation framework.
- 5.2.7 The soil chemical data has been screened against the current Land Quality Management/Chartered Institute of Environmental Health (LQM/CIEH) Suitable for Use Levels (S4UL) for Public Open Space near residential housing (POSresi) (Nathanail et al., 2015), as this is the most conservative screening scenario which applies to the Project and identified receptors. In the absence of an S4UL for lead, the Category 4 Screening Level (C4SL) for public open space - residential, has also been adopted (Contaminated Land: Applications in Real Environments, 2014).

- 5.2.8 A Soil Organic Matter content of 1% has been used in the assessment – this is the lowest Soil Organic Matter content for which S4UL criteria have been derived. It therefore represents the most conservative of the S4UL criteria.
- 5.2.9 Although there is no specific GAC for asbestos, results have been screened against the presence of asbestos with a detection limit of 0.001%.

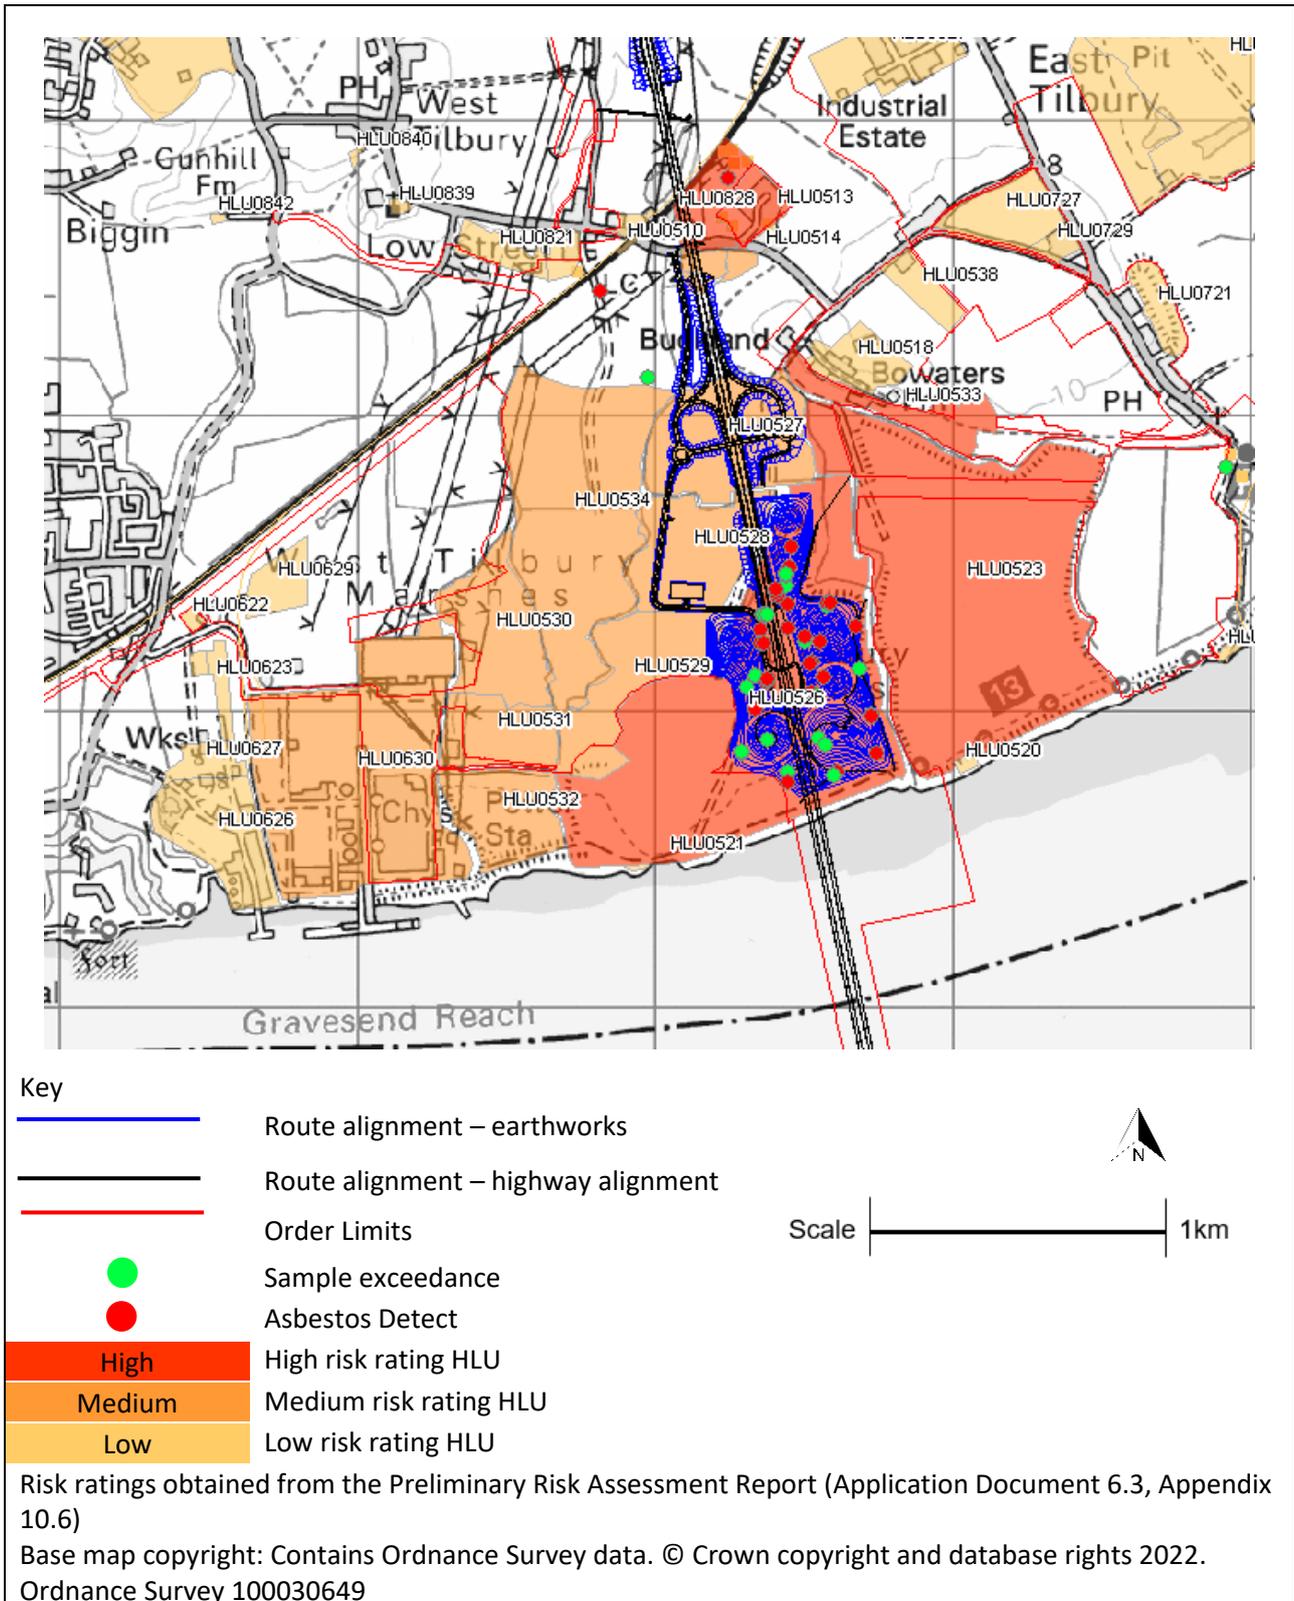

Soil assessment results

- 5.2.10 The Phase 1 Ground Investigation comprised soil samples from 18 locations positioned within the Package B area. The subsequent GQRA identified 6 exceedances of the Lead GAC from 5 locations. All exceedances were located within the boundaries of the Goshems Farm Landfill (HLU0526).
- 5.2.11 Table 5.1 summarises the determinands which recorded exceedances above the GAC in the Phase 2 Ground Investigation. The locations of the exceedances are shown on Plate 5.1.
- 5.2.12 The complete soil analytical results and comparison to the screening criteria are provided in Annex B-B.

Table 5.1 Summary of exceedances recorded from soil samples

Chemical group	Determinand	Result GAC (mg/kg)	Number of samples exceeding GAC	Maximum concentration (mg/kg)
Made Ground				
Metals	Arsenic	79	5	121
	Cadmium	120	2	208
	Chromium	1,500	1	3,068
	Copper	12,000	1	29,300
	Lead	630	129	18,120
	Mercury	16	5	51.6
	Nickel	230	3	819
PAH	Benzo(a)anthracene	29	1	262
	Benzo(b)fluoranthene	7.1	16	438
	Benzo(a)pyrene	5.7	15	335
	Chrysene	57	1	294
	Dibenz(a,h)anthracene	0.57	19	58.7
	Indeno(1,2,3-c,d)pyrene	82	1	330
Natural Ground				
Metals	Cadmium	120	1	128
	Lead	630	3	930

Plate 5.1 Locations of soil samples which recorded exceedances and asbestos detections

5.2.13 It is noted that the dibenz(a,h)anthracene concentration recorded in one sample (BH07073 at 0.10m) had a Method Detection Limit (MDL) which is higher than the GAC. It should be noted that measured concentrations greater than the

GAC does not necessarily mean there is a significant risk to a receptor but may indicate the need for further assessment. Based upon future data collection, updated GQRA and discussion with relevant regulators, the requirement for DQRA will be determined, which would be undertaken during detailed design if required.

- 5.2.14 With the exception of the metals and PAH listed in Table 5.1, contaminant concentrations in soil were either below the MDL or below the GAC.

Asbestos

- 5.2.15 Out of the 874 soil samples collected, 869 were analysed for asbestos. The samples selected for asbestos analysis were based upon both field observations and the information provided in the Preliminary Risk Assessment Report (Application Document 6.3, Appendix 10.6) which identified areas where asbestos was likely to be encountered.
- 5.2.16 The analysis involved an initial screen to determine whether asbestos was identified in the sample. Where asbestos was identified in a sample, the amount of asbestos within the sample was then quantified.
- 5.2.17 The full asbestos analysis results are provided in the soil screening table in Annex B-B, summarised in Table 5.2 and shown on Plate 5.1.

Table 5.2 Summary of asbestos detections in soil samples

Chemical group	Analysis	Number of detections	Maximum concentration
Made Ground			
Asbestos	Asbestos Identification	59	N/A Detect
	Asbestos-containing material	6	N/A Detect
	Asbestos quantification total	49	4.015%
	Asbestos gravimetric quantification	9	0.422%
Natural Ground			
Asbestos	Asbestos Identification	5	N/A Detect
	Asbestos-containing material	0	N/A Detect
	Asbestos quantification total	5	0.0025%
	Asbestos gravimetric quantification	2	0.0019%

5.3 Soil assessment discussion

Chemical contamination

- 5.3.1 A total of 144 samples, from 53 exploratory locations, recorded exceedances of the GAC for metals and PAH compounds. The majority of locations (51) were within the Goshems Farm landfill (HLU0526), except for two locations (BH07073 and BH08010) positioned outside of the landfill, within a car park and agricultural land areas, respectively.

- 5.3.2 The exceedances were predominantly in samples taken from the made ground at depths between 0.05 to 10.00m bgl. Exceedances were also recorded in three samples (BH07053 at 9.00m, BH08010 at 1.00m, and OH07036 at 6.00m) from natural ground (e.g., Alluvium).
- 5.3.3 The Goshems Farm Landfill (HLU0526) is an unlicensed historical landfill understood to contain both historical waste (ash and glass) and more inert construction waste. The exploratory hole records from the Phase 1 and 2 ground investigations show that the made ground is heterogenous, comprising clays, silts, and clays, with fragments of glass, cement, brick, clinker, concrete, slag, ceramic, flint, and rare slate. The lower half of the made ground within the Goshems Farm Landfill occasionally featured more evidence of visual and olfactory ground contamination, in the form of hydrocarbons (odours and stains), plastics, metals, textiles, wood, and asbestos
- 5.3.4 The made ground within the Low Street Landfill (HLU0535) is heterogenous, consisting of clays, silts, sands, and gravels, with fragments of brick, concrete, metal, textiles, wood, glass, ceramics, and plastics. Cobbles and boulders of concrete seem to be more frequent in the upper half of the made ground, within the Low Street Landfill.
- 5.3.5 Pulverised fuel ash (PFA), in the form of sand, made up the made ground within the Tilbury Ash Disposal Sites (HLU0527 to HLU0530), and Shed Marsh Landfill (HLU0534).
- 5.3.6 Outside the landfill sites, made ground beneath agricultural land or car parks typically comprised clays with fragments of brick. That said, decomposed roots, organic odour and clinker were noted in the made ground of BH08022.
- 5.3.7 The borehole logs generally describe the Alluvium as very soft to soft, greenish grey, slightly sandy, silty clay with occasional pockets of plastic brown to black pseudo-fibrous peat. Occasional roots and rare, decomposed wood fragments were also noted.
- 5.3.8 Full descriptions of the geology encountered across the Package B area are presented in the Land Based Works - Phase 2A Area 1 Package B Factual Report on Ground Investigation (Perfect Circle, 2020).
- 5.3.9 The maximum recorded PID reading of 254.6ppm was recorded in the made ground, sampled from BH07094, at a depth of 10.00m bgl. An 'occasional hydrocarbon sheen' was also noted in the made ground on the borehole log, from 6.00m to 10.00m bgl. This location and sample depth also correlates with exceedances of three PAH compounds. However, the PAH compounds detected are not considered to be volatile enough to pose a risk to human health via the vapour inhalation pathway. Furthermore, no soil VOC exceedances were recorded during the GQRA. Consequently, the vapour risk to human health from the soil sampled is considered to be very low. Further assessment of the vapour risk to human health is discussions in sections 5.6 and 5.11.

- 5.3.10 Based on the geology encountered, the exceedances observed within the Goshems Farm Landfill (HLU0526) are most likely to relate to the landfill material present. The metal and PAH exceedances are located within the vicinity of the proposed main route alignment, the north portal, and earthworks. The made ground associated with the landfill are likely to be disturbed by the proposed construction activities and therefore plausible pollutant linkages are likely to be established. The magnitude of the metal and PAH observed are likely to require further assessment and possibly remediation to facilitate the Project. Commitments for the Contractor to undertake further assessment and remediation are outlined in the REAC (GS001, GS006, GS016, GS027, GS028) and specific mitigation measures to be adopted are detailed within the Remediation Options Appraisal and Outline Remediation Strategy (Application Document 6.3, Appendix 10.11).
- 5.3.11 The exceedances observed at BH08010 within agricultural land, included cadmium and lead, were recorded in samples collected from the made ground (0.05m bgl) and Alluvium (1.00m bgl). The exploratory hole is positioned approximately 25.00m north of Shed Marsh Landfill (HLU0534) which is a credible source of contaminated identified in the Preliminary Risk Assessment Report (Application Document 6.3, Appendix 10.6). The concentrations observed at BH08010 suggest the exceedances are unlikely to be associated with background concentrations. The Shed Marsh Landfill is part of the pulverised fuel ash (PFA) landfills associated with the former Tilbury Power Station. Although BH08010 is located in agricultural land, the close proximity to Shed Marsh Landfill suggests that the exceedances observed at this location could be the result of localised sample inclusions from the PFA landfill. BH08010 is located within the main works construction area but not within the boundary of any intrusive work areas. Consequently, it is considered unlikely that the metal soil contamination at this location will be disturbed during the construction phase works. Nevertheless, should the soil contamination be disturbed during the construction phase works, commitments in the REAC (GS006, GS016), in the form of watching briefs and materials management, should be sufficient to reduce the risk to an acceptable level.
- 5.3.12 The final exploratory hole, BH07073, is positioned within a car park approximately 46m from a pumping station (HLU0705) which is the nearest credible source of contamination. The borehole logs from this location noted made ground comprising brick, concrete, clinker, and limestone. This location recorded exceedances of benzo(b)fluoranthene and benzo(a)pyrene, at 0.10m depth within the made ground, which based on the exploratory logs is consistent with the material encountered. Although the location is near a pumping station, the exceedances are more likely to be associated with the presence of clinker within the made ground rather than the source. As samples collected at depth in this location did not record any exceedances within the natural ground, it is unlikely that an unacceptable risk of contamination is present at the location. Furthermore, BH07073 is located outside the main works construction and is unlikely to be disturbed by construction or operational activities and therefore plausible pollutant linkages are unlikely to be established.

Asbestos contamination

- 5.3.13 Asbestos was detected in 64 soil samples collected from 37 locations in the Package B area. The asbestos quantification results, from 54 samples, ranged from <0.001% to 4.015%. The remaining 10 samples that were not subjected to asbestos quantification were either identified as visible asbestos containing materials (five samples) or were soil samples (five samples) where the asbestos fibre type was identified but not analysed for asbestos quantification. The Phase 2 Factual Report on Ground Investigation (Perfect Circle, 2020) does not provide an explanation for why five soil samples containing asbestos fibres were not subjected to asbestos quantification. The types of asbestos detected included chrysotile (12 samples), amosite (six samples), and crocidolite (one sample). Non-asbestos fibres were identified in eight soil samples.
- 5.3.14 Most of the samples (59) containing asbestos were from the made ground, with five samples being from the Alluvium, within BH07023, OH07012, OH07026 and OH07034. Asbestos was detected in natural ground samples at depths ranging from 6.00m to 6.65m. The asbestos detected within the natural ground are considered to be representative of cross-contamination during sampling rather than the ground conditions, as asbestos is unable to move without man-made intervention.
- 5.3.15 A review of the Factual Report on Ground Investigation (Perfect Circle, 2020) shows that visible pieces of possible asbestos containing materials were recorded in the made ground of the Goshems Farm Landfill (HLU0526). The laboratory identified visible asbestos containing materials in six samples, from four handpicked asbestos samples and two soil samples. One of the soil samples (BH07099 at 7.50m depth), containing visible asbestos materials, also contained asbestos fibres, and was subjected to asbestos quantification.
- 5.3.16 In total, 35 of the 37 locations are within the boundary of the Goshems Farm Landfill (HLU0526), including the two boreholes in which the highest concentrations of asbestos fibres were detected in OH07036 (4.015%) and BH07056 (1.092%) at depths of 2.0 and 5.0m bgl, respectively. One location (TP08004) is located within the boundary of Low Street Landfill (HLU0535). The remaining location, (WS08001) is positioned in agricultural land 75m away from its nearest credible source of contamination (Tilbury and Southend Railway, HLU0605). A review of the PRA report (Application Document 6.3, Appendix 10.6) indicates that asbestos was listed as a COC for these credible contaminative sources. Therefore, the findings of the Phase 2 ground investigation confirm the initial CSM in the PRA report.
- 5.3.17 The asbestos detected within the soil samples collected from within Goshems Farm Landfill (HLU0526), and Low Street Landfill (HLU0535) is likely to be related to the made ground associated with the sites' land use. The proposed north portal, earthworks, and main route alignment are planned within the vicinity of the identified asbestos soil contamination. The asbestos soil contamination is likely to be disturbed as part of the construction works in these areas, resulting in a potential plausible pollutant linkage being established. Appropriate asbestos monitoring, mitigation measures and validation sampling will be necessary to facilitate the Project. Further detail of appropriate mitigation measures is provided in the Remediation Options Appraisal and Outline

Remediation Strategy (Application Document 6.3, Appendix 10.11). In addition, the Contractor will develop their own remediation strategy as per the commitments outlined in the REAC (GS027).

- 5.3.18 WS08001 is located within agricultural land and recorded made ground to a depth of 0.40m. The asbestos which was recorded at this location was encountered in the made ground at 0.05m bgl at concentrations <0.001%. Based on the location of the exploratory hole, it is most likely that asbestos encountered here relates to localised sample inclusion. Intrusive utility works are proposed in the vicinity of WS08001 and therefore asbestos impacted soil is likely to be disturbed by construction activities associated with the Project, resulting in a plausible pollutant linkage being established. Given the asbestos fibre soil concentration (<0.001%w/w), it is considered that the mitigation measures detailed in the Remediation Options Appraisal and Outline Remediation Strategy (Application Document 6.3, Appendix 10.11) should be appropriate to manage the identified risks. In addition, the Contractor will develop their own remediation strategy as per the commitments outlined in the REAC (GS027).

5.4 Soil leachate

- 5.4.1 Soil leachate analysis was undertaken on a total of 1,107 samples, collected from 105 locations within the Package B area. The samples were tested for a range of determinands, as detailed in Table 3.3.

Selection of assessment criteria

- 5.4.2 The assessment of soil leachate is primarily focused on the potential risk to water resources, which includes both aquifers and surface water receptors (e.g., drainage ditches, Tilbury Main and River Thames). Criteria used to protect aquifers are based on their resource potential, primarily considered for drinking water, although they may also contribute to surface water baseflow. Assessment on the basis of drinking water quality will provide protection of human receptors. Water resource receptors identified in the Preliminary Risk Assessment Report (Application Document 6.3, Appendix 10.6) include both surface water and groundwater receptors. Soil leachate chemical data has been screened against GAC to provide protection to surface waters and aquifers.
- 5.4.3 The majority of the GAC are adopted from the UK Drinking Water Standards (DWS) and Environmental Quality Standards (EQS), which are considered protective of aquifers and surface waters respectively. The DWS are generally adopted from the Water Supply (Water Quality) Regulations 2016 and the EQS are primarily from the Water Environment (Water Framework Directive) (England and Wales) Regulations 2017. Package B borders the tidal River Thames, so some locations within the Package B area may present brackish water. Therefore, both the UK Freshwater and the Estuarine and Coastal Water EQS have been adopted for the protection of surface waters within the Package B area.
- 5.4.4 The EQS for copper, lead, nickel, and zinc are based on bioavailable values so are considered to be conservative screening values.

5.4.5 The GAC for the remaining determinands (for which UK DWS and EQS are not available) have been adopted based on the sources referenced within Annex B-E.

Leachate assessment results

5.4.6 Within the Phase 1 ground investigation, eight samples from eight locations recorded exceedances of the GAC for metals and inorganics. The samples were collected from the made ground in Goshems Farm Landfill (HLU0526) and Tilbury Ash Disposal Site (HLU0527 and HLU0528).

5.4.7 Table 5.3 summarises the determinands that were recorded above the GAC in the Phase 2 ground investigation. The full soil leachate assessment results are provided in Annex B-C. The locations of the soil leachate exceedances are shown on Plate 5.2.

5.4.8 It should be noted that 274 of the soil leachate samples were analysed for ammoniacal nitrogen only.

Table 5.3 Summary of exceedances recorded from soil leachate samples

Determinand	GAC			Number of samples exceeding GAC	Maximum concentration	Unit
	UK DWS*	UK Freshwater EQS*	Saline EQS*

Phenolic						
Phenol	5,800	7.7	7.7	156	3,949.9	µg/L

Note: NV – no GAC value.

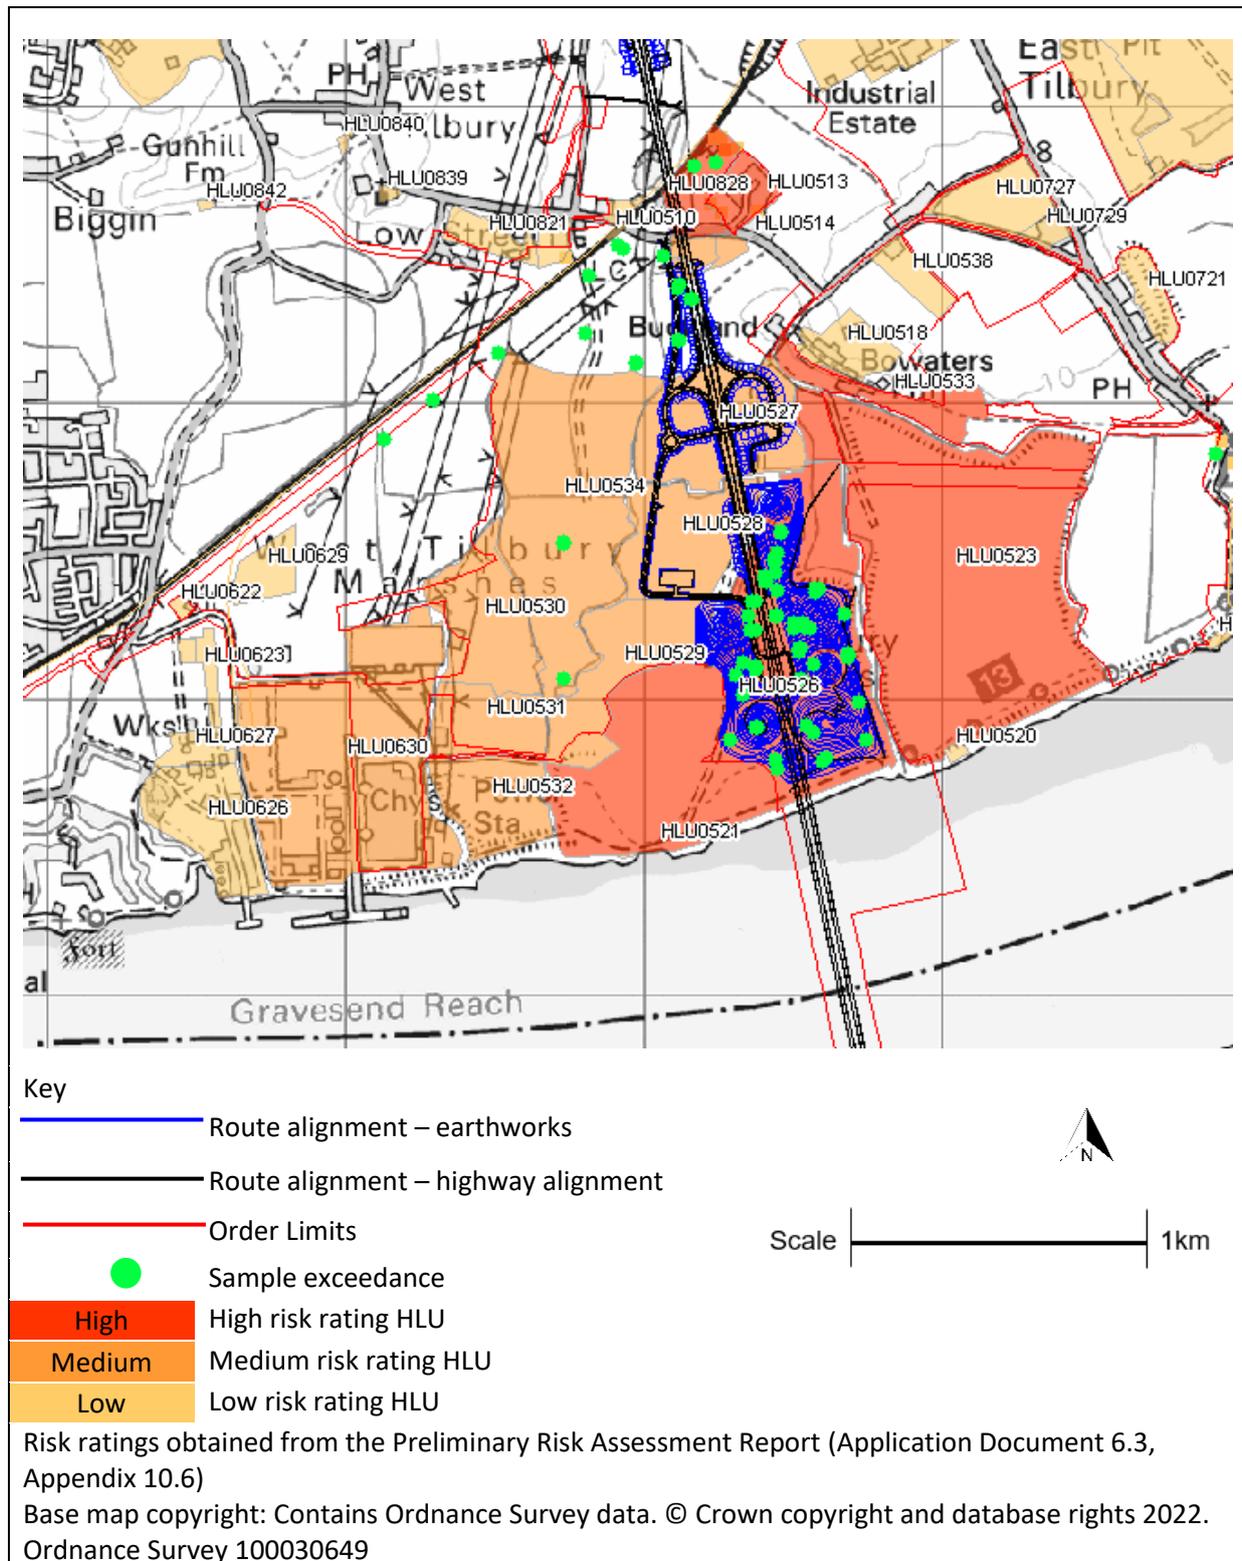

Bold – Concentration exceeded both the DWS and EQS.

Bio – Bioavailable.

MAC – Maximum Allowable Concentration.

* UK DWS, UK EQS and other guideline values as referenced in Annex B-C.

Plate 5.2 Locations of soil samples which recorded exceedances in soil leachate analysis

5.4.9 It should be noted that the laboratory MDL for some of the reported results across several samples is higher than at least one of the GAC values. Although the results have not exceeded the MDL, with the MDL itself being higher than the GAC, it is not clear whether the result has truly exceeded the GAC (or not).

Further explanation of the elevated MDL results is provided in paragraph 7.1.2. The assessment to date is considered precautionary and robust.

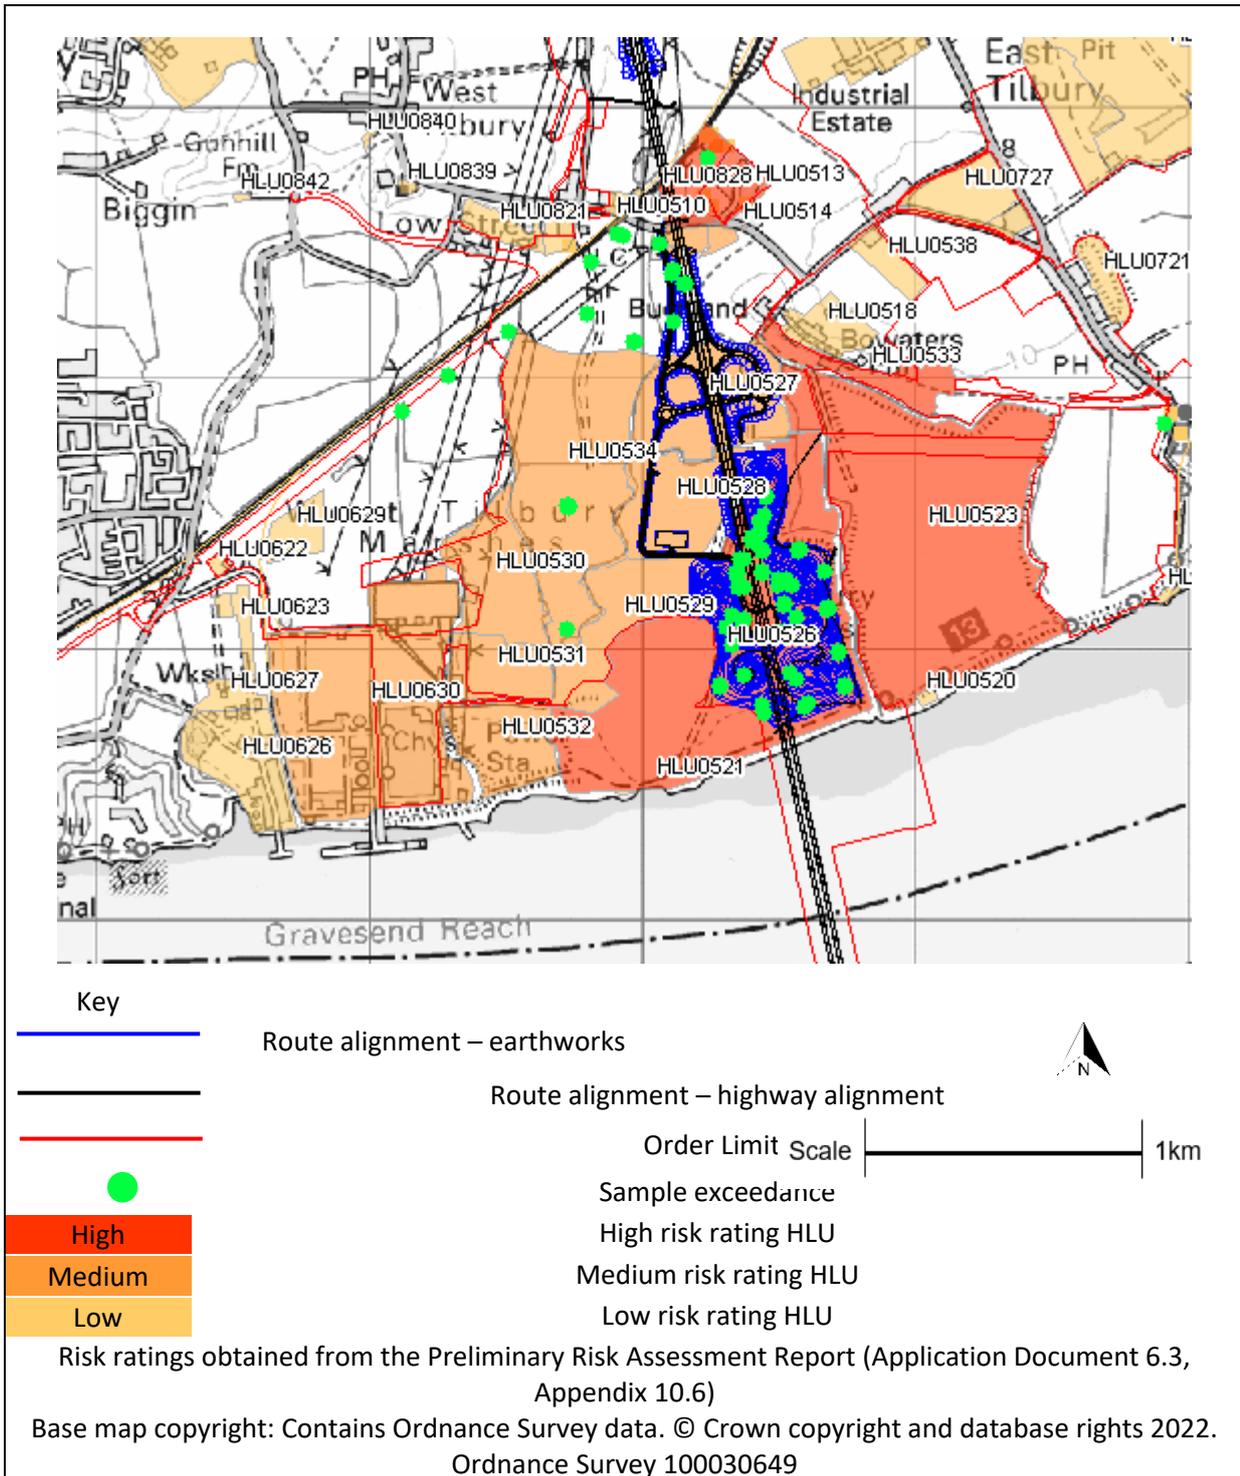

5.5 Soil Leachate assessment discussion

5.5.1 Leachate analysis was undertaken on 1,107 samples. Of these samples, 1,105 recorded exceedances of the GAC. The samples were collected from 105 locations across the Package B area. The majority of the samples with exceedances were collected from the made ground (747 samples), with 358 samples being collected from the natural ground.

Made Ground

5.5.2 The 747 samples of made ground recording exceedances were collected from 103 locations as shown in Plate 5.3. Of these locations, 77 are located within in the Goshems Farm Landfill (HLU0526), 20 are located within agricultural land, five within the Shed Marsh Landfill (HLU0534) and one within in Low Street Landfill (HLU0535).

Plate 5.3 Locations of made ground samples recording exceedances in soil leachate analysis

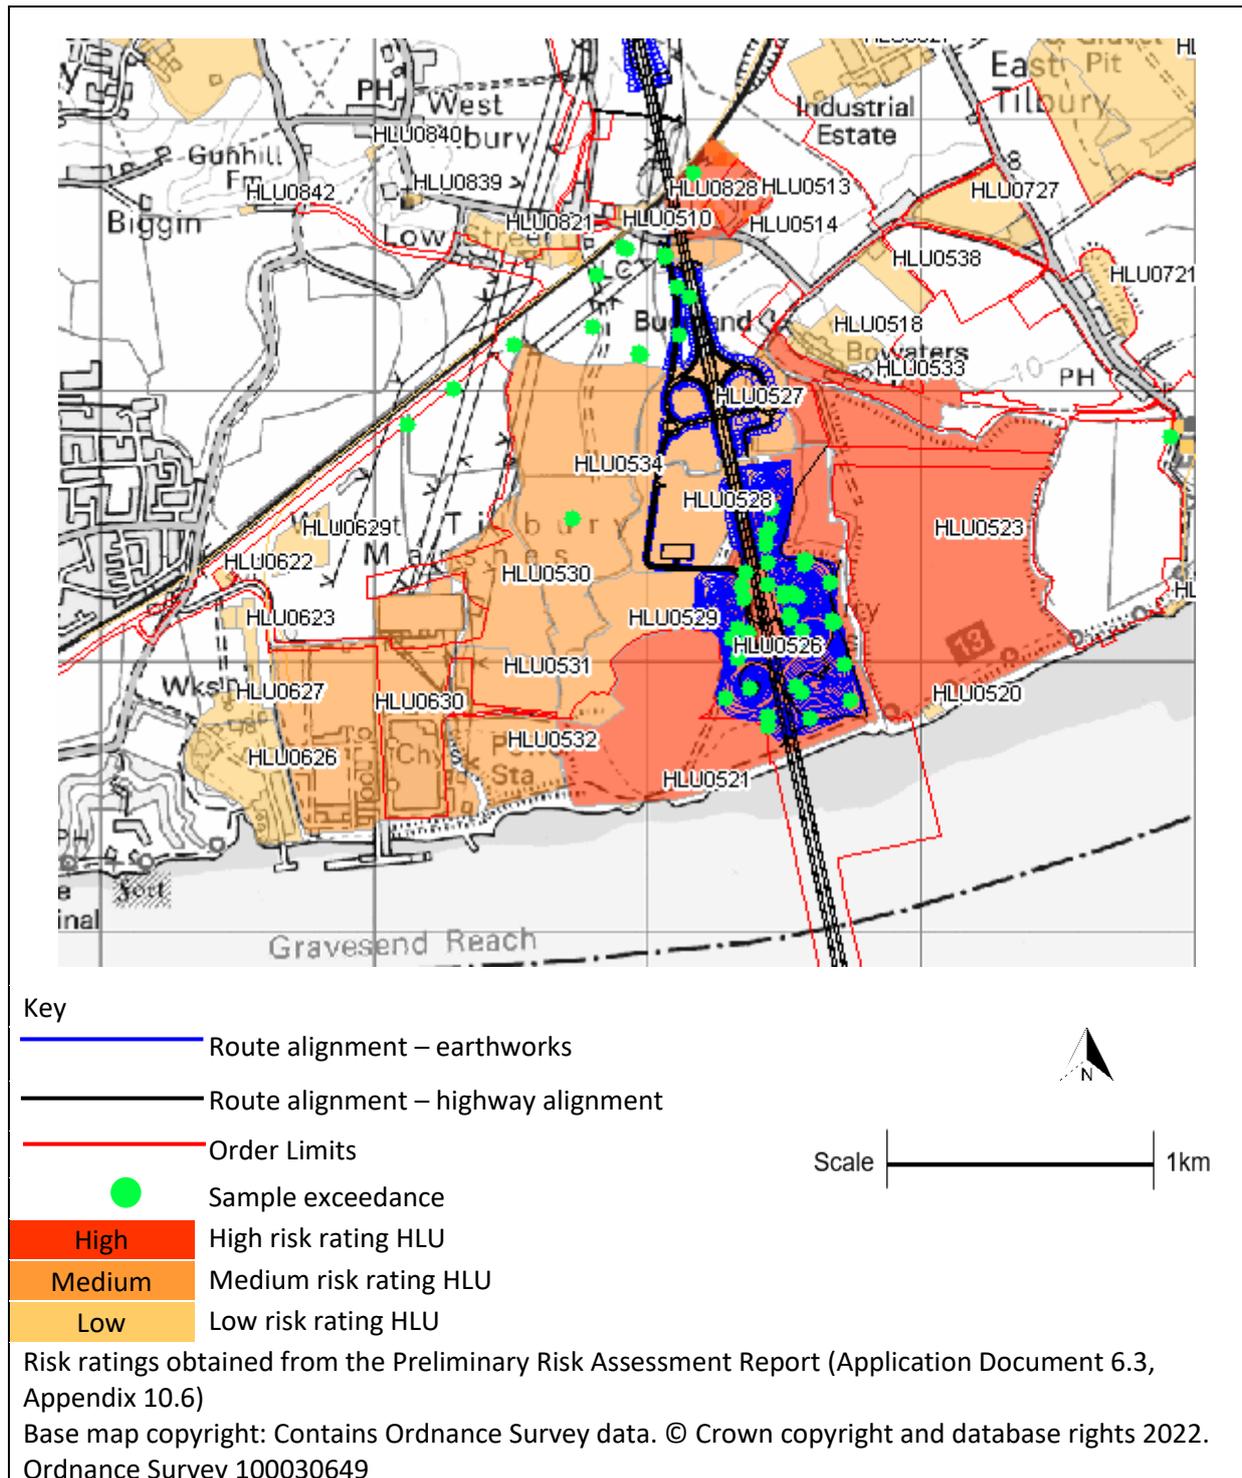

5.5.3 Made ground was encountered in 110 exploratory locations at thicknesses between 0.20m to 6.20m. The made ground is generally associated with the landfill areas within Package B, although shallow made ground has also been encountered in localised pockets in agricultural land to the north of the Shed Marsh Landfill and the Goshems Farm Landfill.

- 5.5.4 The made ground encountered within the landfills were generally described as sandy and slightly gravelly clay, with glass, cement, brick, clinker, concrete, slag, ceramic, flint, and rare slate fragments. The made ground in the Shed Marsh landfill was described as silty clay with occasional pockets of organic material. The made ground which was encountered in the positions located in agricultural land was generally described as sandy gravelly clay with frequent rootlets and occasional red brick.
- 5.5.5 The samples (1019), collected from the 84 locations within the landfills, recorded exceedances against heavy metals including arsenic, copper, lead, nickel, zinc, and inorganics, including ammoniacal nitrogen and sulphate. The Goshems Farm Landfill (HLU0526) was identified in the PRA report (Application Document 6.3, Appendix 10.6) as an early 20th century landfill containing household waste, ash, and possible waste from river dredging. The Shed Marsh Landfill (HLU0534) was noted as containing pulverised fuel ash from Tilbury Power Station and Low Street Landfill (HLU0535) is noted as a non-hazardous industrial and commercial waste landfill. Based on the former land uses of the three sites, the presence of metals and inorganics in soil leachate samples supports the potential COC listed within the PRA report. Therefore, the findings of the Phase 2 ground investigation confirm the initial CSM.
- 5.5.6 The majority of the samples collected from the made ground at Goshems Farm Landfill recorded concentrations which exceeded the GAC by over one order of magnitude. Given the magnitude of the exceedances, this is most likely to reflect the landfill material which was encountered within the made ground at this location.
- 5.5.7 The made ground encountered at the 19 locations outside of the landfills (agricultural land areas) was recorded at thicknesses between 0.20m and 1.00m. The exceedances recorded in the made ground were generally repeated across samples collected at depth within the natural strata. Given that the exceedances have been repeated across the various strata and across several locations of agricultural ground, it is unlikely that they are the result of the made ground encountered. It is considered that the soil leachate exceedances recorded are linked to background concentrations. This theory is supported by the soil leachate results for made ground samples located outside the landfill generally falling within the same order of magnitude as the GAC and the MDL.
- 5.5.8 According to the Hydrogeological Risk Assessment (Application Document 6.3, Appendix 14.5), the made ground within most of Package B is not considered to be hydraulically connected to the deeper River Terrace Deposits (a Secondary A aquifer) and the Chalk (a Principal aquifer) due to the significant thicknesses of continuous cohesive soils, including peat, within the upper part of the underlying Alluvium. Although proposed construction works are expected to disturb made ground soils within the landfills mentioned above, any leaching contaminants are unlikely to impact the groundwaters within the River Terrace Deposit and the Chalk. It should be noted that the Alluvium does reduce in thickness towards the north and is not present beyond the Tilbury and Southend Railway (the northern boundary of Package B).

Natural Ground

5.5.9 The remaining 358 samples which recorded exceedances of the GAC and were collected from the natural ground, across 74 exploratory locations are shown in Plate 5.4. Of the 74 locations, 50 are beneath the Goshems Farm Landfill (HLU0526), 20 are beneath agricultural land, three are beneath the Shed Marsh Landfill (HLU0534), and one beneath the Low Street Landfill (HLU0535).

Plate 5.4 Locations of natural soil samples recording exceedances in soil leachate analysis

- 5.5.10 The locations generally encountered Alluvium overlying River Terrace Deposits and the Chalk. The majority of the natural ground samples were collected from the Alluvium between 0.30m and 25.00m bgl.
- 5.5.11 The majority of the samples recorded exceedances of heavy metals, ammoniacal nitrogen and sulphate. Occasional exceedances were also recorded for free cyanide, total cyanide, and phenol. The majority of these exceedances were over one order of magnitude higher than the GAC.
- 5.5.12 The majority of the exploratory positions recording the exceedances in soil samples were located beneath the Goshems Farm Landfill (HLU0526). The exceedances observed within the natural ground beneath the Goshems Farm Landfill generally reflect those observed within the made ground. The concentrations recorded in samples collected from the natural ground generally decreased with increased depth. Samples collected from the Chalk recorded concentrations which were largely within the same order of magnitude as the GAC. The concentrations of copper and ammoniacal nitrogen consistently exceeded the GAC by over an order of magnitude, but given the depths of these samples, it is most likely that concentrations observed were reflective of background concentrations. The Alluvium consistently recorded concentrations of heavy metals and inorganics which exceeded the GAC by over an order of magnitude. As the Alluvium is overlain by the landfill material in Goshems Farm Landfill and has generally recorded exceedances of the same determinands, it suggests that this material may have been impacted by leachates from the landfill.
- 5.5.13 In respect to the soil leachate exceedances observed in the natural ground beneath agricultural land, the Shed Marsh Landfill (HLU0534) and the Low Street Landfill (HLU0535), the concentrations were within the same order of magnitude as the GAC, suggesting that the exceedances observed at these locations are more reflective of background concentrations, rather than a potential source of contamination.
- 5.5.14 It should be noted that soil leachate analysis is considered to be a conservative estimation of risk as the comparison of eluate concentrations (derived from aggressive laboratory soil leaching tests) with water quality standards does not factor in the potential for attenuation of concentrations in the pathway between the soil source and the receptor i.e., in the unsaturated zone with potential for dilution at the water table or dilution in the receptor itself.
- 5.5.15 As stated in paragraph 5.5.8, the River Terrace Deposits and the Chalk are not considered to be in hydraulic continuity with the made ground within the landfills due to the presence of thick continuous cohesive soils within the Alluvium. This theory is supported by the reduced heavy metal and inorganic concentrations within the River Terrace Deposits and the Chalk, in comparison to the made ground within the landfills and the Alluvium.
- 5.5.16 The proposed north portal and ramps within the Package B area will be excavated through the made ground, the Alluvium, the River Terrace Deposits and the Chalk before travelling beneath the River Thames. Although the soil leachate exceedances in the River Terrace Deposits and the Chalk are considered to be representative of background concentrations, there is potential that the proposed works will create a preferential pathway for leaching

contaminants from the made ground and upper parts of the Alluvium to impact deeper groundwaters. The commitments and mitigation measures outlined in the REAC (GS001, GS016, GS017, GS021, GS022, GS026, GS027 and GS028), and Remediation Options Appraisal and Outline Remediation Strategy (Application Document 6.3, Appendix 10.11) respectively, are considered to sufficient to prevent this risk and should be adopted by the Contractor during the construction phase works.

Conclusion

- 5.5.17 The above discussions suggest that heavy metals and inorganic contaminants from the made ground in the landfill sites, within Package B, are leaching downwards, and impacting the upper part of the Alluvium immediately beneath it. However, the assessment indicates that GAC exceedances recorded in the soils (made ground and natural ground) outside the landfills, in the River Terrace Deposits and the Chalk beneath the landfills are reflective of background soil concentrations.
- 5.5.18 To fully conclude the controlled waters risk assessment and confirm the presence or absence of the pollutant linkages described above, an assessment of the groundwater quality beneath Package B has been undertaken in subsection 5.6.

5.6 Groundwater

- 5.6.1 Groundwater monitoring was undertaken in two phases: the ground investigation (GI) phase and the long-term monitoring (LTM) phase. The GI phase was undertaken, typically at weekly intervals between October 2019 and July 2020. The LTM phase was undertaken across 6 rounds between June 2020 and January 2021.
- 5.6.2 Analysis was carried out on 182 samples collected from 73 locations within the Package B area. Groundwater samples were analysed for a number of determinands as shown in Table 3.4.

Selection of assessment criteria

- 5.6.3 The assessment of groundwater considers the potential risk to water resource receptors (drinking water and ecological receptors) and potential risk to human health. Groundwater chemical data has been screened against GAC in order to provide protection to aquifers, surface waters and humans. The risk to water resource receptors has also been assessed through comparison of soil leachate concentrations (detailed in Sections 5.4 and 5.5).
- 5.6.4 The majority of the controlled waters GAC are adopted from the UK Drinking Water Standards (DWS) and Environmental Quality Standards (EQS), which are considered protective of aquifers and surface waters respectively. The DWS are generally adopted from the Water Supply (Water Quality) Regulations 2016 and the EQS are primarily from the Water Environment (Water Framework Directive) (England and Wales) Regulations 2017. Package B borders the tidal River Thames, so some locations within the Package B area may present brackish water. Therefore, both the UK Freshwater and the Estuarine and Coastal Water EQS have been adopted for the protection of surface waters within the Package B area.

- 5.6.5 The EQS for copper, lead, nickel, and zinc are based on bioavailable values so are considered to be conservative screening values.
- 5.6.6 The controlled waters GAC for the remaining determinands (for which UK DWS and EQS are not available) have been adopted based on the sources referenced within Annex B-E.
- 5.6.7 The potential risk to human health from vapours originating from groundwater has also been assessed, based on the location of the proposed North Portal and temporary accommodation for construction workers within the Package B area. The GAC derived for the protection of residential receptors is based on the inhalation of vapours (primarily the vapour intrusion to buildings) were adopted for the purposes of screening. These GAC are internally produced in line with the Environment Agency methodology, and the derivation and values are included in Annex B-E.

Groundwater human health assessment results

- 5.6.8 No exceedances of the human health groundwater GAC were recorded. The analytical results are presented in Annex B-D.

Groundwater controlled water assessment results

- 5.6.9 During the Phase 1 Ground Investigation, groundwater monitoring sampling was undertaken between September and December 2018 at 13 locations, within the Package B area. The subsequent Phase 1 GQRA report (Application Document 6.3, Appendix 10.8) recorded controlled waters GAC exceedances of heavy metals, inorganics, speciated PAHs and TPH. Details regarding the distribution of GAC exceedances was not provided within the Phase 1 GQRA report.
- 5.6.10 Table 5.4 and Table 5.5 summarise the determinands which recorded exceedances above the GAC. The locations of the exceedances are shown in Table 5.4 and Table 5.5.
- 5.6.11 It should be noted that samples were labelled by the laboratory as both filtered and unfiltered samples for metals. Where determinands have recorded exceedances in both samples, only the higher concentration has been counted in the summaries in Table 5.4 and Table 5.5. The analytical results of both the filtered and unfiltered samples are presented in Annex B-D.

Table 5.4 Summary of exceedances recorded in GI groundwater samples

Plate 5.5 Locations of GI groundwater samples which recorded exceedances

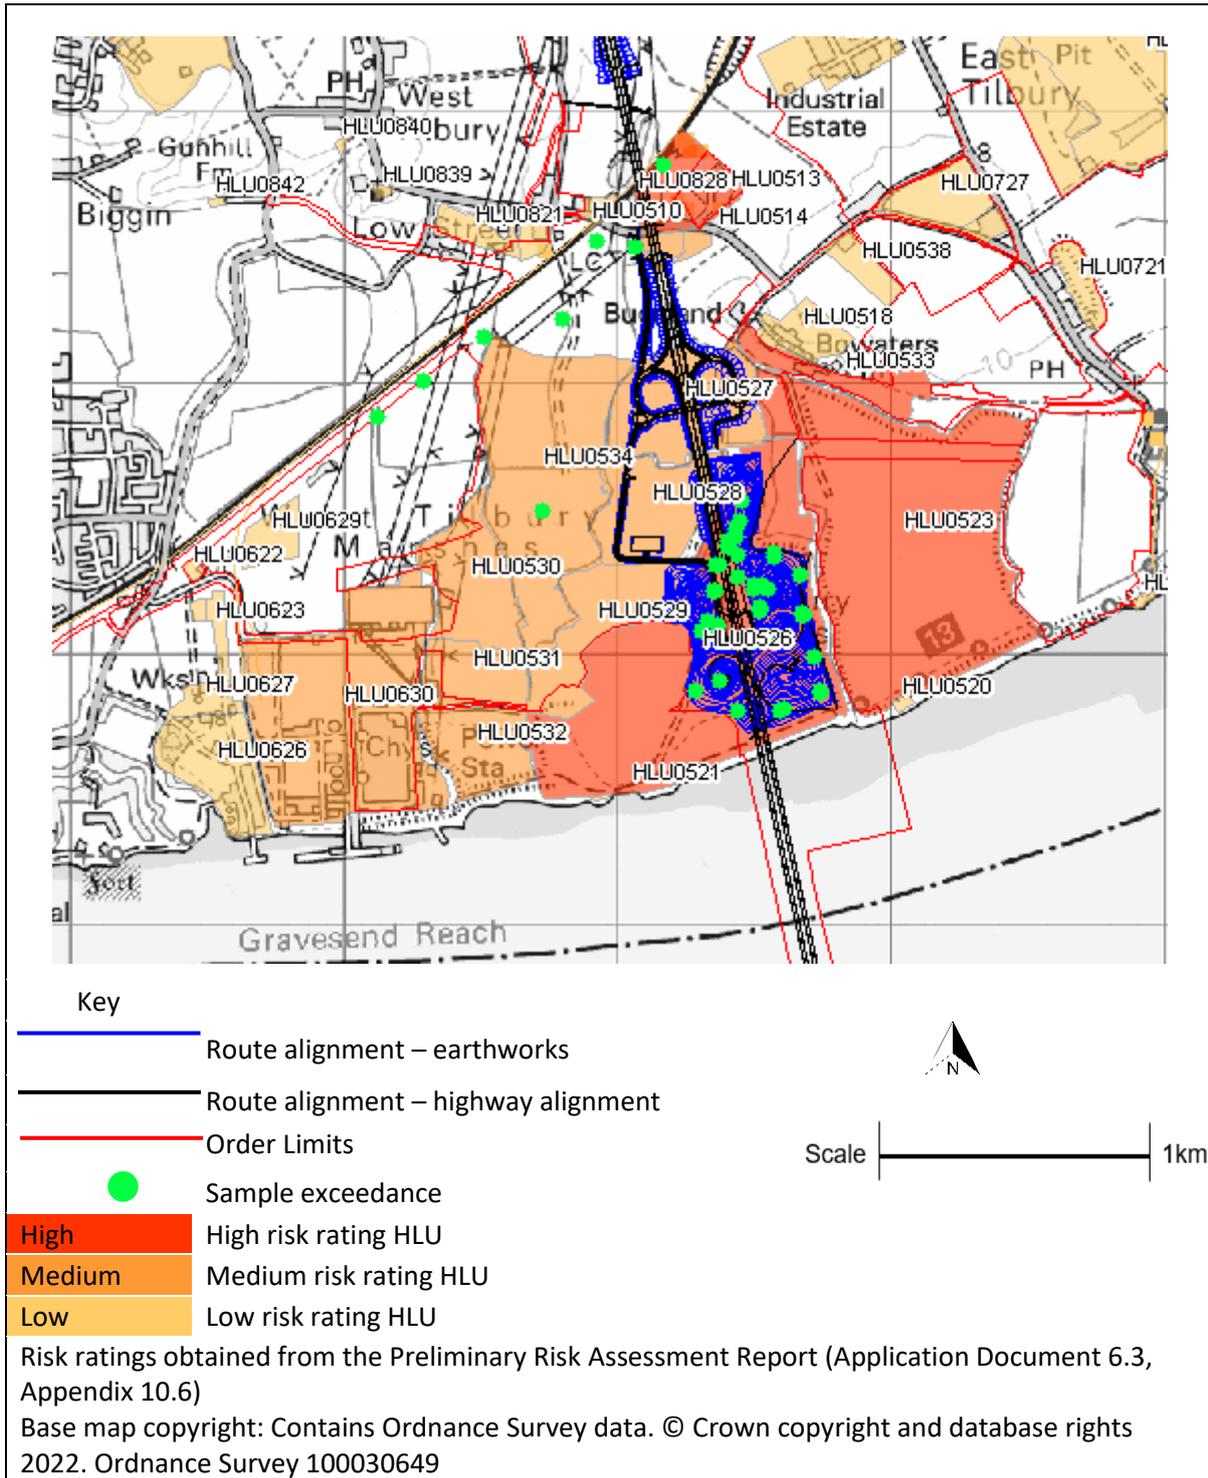

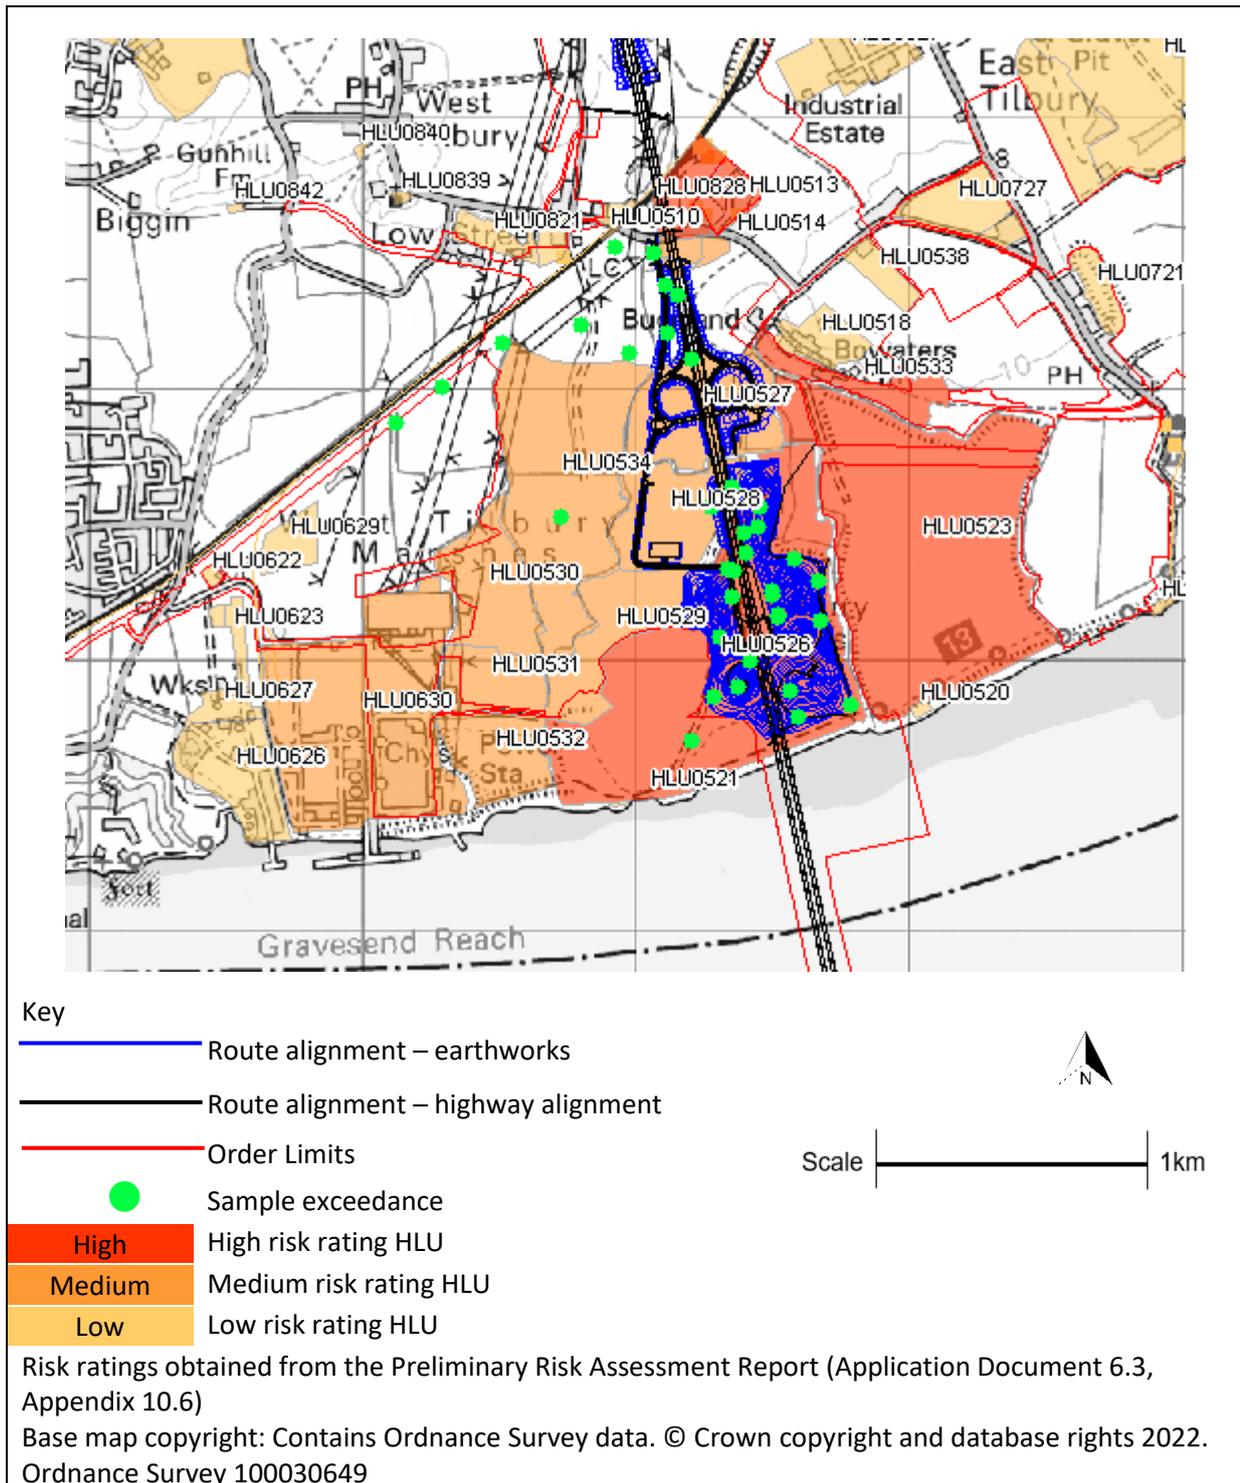

Plate 5.6 Locations of LTM groundwater samples which recorded exceedances

5.6.12 It is noted that the laboratory MDL reported across a number of samples was higher than at least one of the GAC. The assessment of these results will be refined as part of the DQRA which will be undertaken at the detailed design stage of the Project.

5.6.13 With the exception of the contaminants listed in Table 5.4 and Table 5.5, concentrations were measured as below the MDL.

- 5.6.14 All of the groundwater samples taken recorded at least two exceedances against the GAC. No exceedances were noted against the GAC protective of human health.
- 5.6.15 Table 5.6 presents the response zone stratum where exceedances were recorded.

Table 5.6 Summary of GAC exceedances per response zone geology

Response zone geology	Samples	Number of locations	Number of exceedances	Chemical groups
Made Ground	44	17	834	Metals, inorganics, PAH, TPH, BTEX, phenols, PFOS, organotin, pesticides, pH
Made Ground/Alluvium	11	5	188	Metals, inorganics, PAH, BTEX, phenols, pH

Chalk	63	23	627	Metals, inorganics, PAH, TPH, BTEX, SVOC, phenols, pesticides, pH

5.7 Groundwater assessment discussion

Human health assessment

- 5.7.1 Table 5.4 and Table 5.5 show that no groundwater exceedances in respect to human health GAC were recorded. Therefore, the vapour risk to human health from groundwaters beneath Package B area is considered to be low. The human health risk from vapours will be concluded in section 5.11.

Controlled waters assessment

- 5.7.2 According to the Ground Model cross sections (Application Document 6.3, Appendix 10.5), the Package B area is shown to be underlain by made ground (heterogenous) primarily associated with landfills, Alluvium (heterogenous), River Terrace Deposits (predominantly granular) and the Chalk. The Thanet Formation (predominantly granular) is present between the River Terrace Deposits and the Chalk on the northern portion of the Package B area. Given the compositions of the above stratum, it is considered that the River Terrace Deposits, the Thanet Formation, and the Chalk are in hydraulic continuity with each other, thus acting as one aquifer. Furthermore, given Package B's location, it is considered that granular portions of the lower Alluvium, the River

Terrace Deposits and the Chalk are in hydraulic continuity with the River Thames.

- 5.7.3 The Hydrogeology Risk Assessment Report (Application Document 6.3, Appendix 14.5) states that groundwater flow in the Chalk is generally southwards, beneath the Alluvium, towards the River Thames. Perched groundwater tables have been observed in the made ground and the Alluvium, suggested by the presence of 'no water' intervals on exploratory hole records. Water levels in the Alluvium appear to show no tidal fluctuation, compared to those observed within the River Terrace Deposits and the Chalk. The River Terrace Deposits and the Chalk's hydraulic connection with the River Thames appears to be responsible for the tidal variation in water levels and apparent saline intrusion beneath the Package B area. The Phase 2 ground investigation data indicates shallow groundwater tables within the Alluvium, approximately 1.00m to 3.00m AOD. Groundwaters in the made ground and the Alluvium have shown to exhibit localised hydraulic connections with surface water ditches within the Package B area.
- 5.7.4 A total of 182 groundwater samples have been collected from 73 locations across the Package B area. Of those samples, 75 were collected during the GI phase and 107 were collected as part of the LTM phase over 7 months following the completion of the intrusive works.
- 5.7.5 The response zone which each exploratory position screens is provided in Annex B-I. Of the response zones, 17 were installed in the made ground, 17 in the Alluvium, eight in the River Terrace Deposits, 23 in the Chalk, five in the made ground/ Alluvium, one in the made ground/ Thanet Formation and two within the Alluvium/ River Terrace Deposits.
- 5.7.6 Table 5.6 shows that over 35% of the groundwater exceedances of the controlled waters GAC were recorded in the made ground, with 7%, <1%, 18%, 2%, 10% and 26% being recorded in the made ground/ Alluvium, made ground/ Thanet Formation, Alluvium, Alluvium/ River Terrace Deposits, the River Terrace Deposits, and the Chalk, respectively. This degree of contamination in the made ground is expected as it displayed visual and olfactory evidence of contamination in the form of hydrocarbon odours and/or sheens, slags, and clinker, during the Phase 2 ground investigation works. The made ground within the landfill sites is conceptually considered to be the principal source of groundwater contamination within the Package B area.
- 5.7.7 The groundwater samples collected from both the GI and LTM phases have recorded widespread exceedances of the controlled waters GAC for heavy metals, inorganics, speciated PAH, TPH, BTEX and phenols. In addition, discrete GAC exceedances were recorded for Di-n-butyl phthalate (BH07056 and OH06008), Chlorothalonil (BH07096), Chlorpyrifos (OH06008), Mevinphos (OH07035), TBT (BH07010), PFOA and Total PFOS (PFAS) (BH07097). Hereafter, Chlorothalonil, Chlorpyrifos, and Mevinphos will be referred to as pesticides, and PFOA and Total PFOS will be referred to as PFAS.
- 5.7.8 BH07010, BH07096 and BH07097, which contain discrete groundwater exceedances of TBT, pesticides, and PFAS, are located within the boundary of the Goshems Farm Landfill (HLU0526). Their respective well installation response zones are within the made ground, which typically includes fragments

of concrete, brick, glass, metal, and plastics. Organic odours were also noted in the made ground of these boreholes. Ash, clinker, and suspected hydrocarbon contamination in the form of black silt were noted in the made ground of BH07096, from 4.00m to 7.00m depth. The source of the discrete TBT, pesticides, and PFAS groundwater exceedances in these exploratory holes are considered to be the made ground in the Goshems Farm Landfill. Furthermore, the concentrations of these discrete groundwater contaminants are of a similar order of magnitude to their respective GACs and/or MDL, and therefore are unlikely to represent gross contamination within the landfill's groundwater.

- 5.7.9 BH07056, OH06008 and OH07035, which exhibit discrete groundwater exceedances of Di-n-butyl phthalate and pesticide, are also located within the footprint of the Goshems Farm Landfill (HLU0526). However, their respective well installation response zones are within the Alluvium (BH07056) and the Chalk (OH06008 and OH07035). No visual or olfactory evidence of contamination was noted on the respective exploratory hole or groundwater sampling records. The concentrations of the Di-n-butyl phthalate and pesticide groundwater contaminants are also of a similar order of magnitude to their respective GACs and/or MDL, and thus are considered unlikely to represent gross contamination within the natural ground formations. These chemical exceedances could be attributed to the overlying Goshems Farm Landfill or up hydraulic gradient sources of contamination.
- 5.7.10 The majority of the organic groundwater exceedances can be found at locations within the boundary of or immediately down hydraulic gradient of credible contaminative sources, such as the Goshems Farm Landfill (HLU0526), the Tilbury Ash Disposal Sites (HLU0527 and HLU0528), the Shed Marsh Landfill (HLU0534), and the Low Street Landfill (HLU0535). The organic exceedances include TPH, BTEX, SVOC, pesticides and PFAS which are listed of COC for these landfill sites, conforming to the CSM outlined in the PRA Report (Application Document 6.3, Appendix 10.6).
- 5.7.11 Those locations positioned outside the boundary or up hydraulic gradient of credible contaminative sources displayed no organic groundwater exceedances. Only metals, inorganic and PAHs exceedances were recorded in wells located outside the boundary of credible contaminative sources.
- 5.7.12 TPH groundwater concentrations of two orders of magnitude greater than the controlled waters GACs were recorded in BH07018, BH07056, BH08019, BH08022 and OH06004, on more than one occasion, during the groundwater sampling programme. All locations have response zones installed in the natural ground. All locations, except BH08019 and BH08022, are located beneath the Goshems Farm Landfill (HLU0526). However, BH08019 and BH08022 are located down hydraulic gradient of the Low Street Landfill (HLU0535).
- 5.7.13 TPH groundwater concentrations obtained from wells with response zones in the made ground were not two orders of magnitude or more greater than the controlled waters GAC. This suggests that the groundwater in the natural ground has been impacted more by hydrocarbon contamination than the overlying made ground from landfills and agricultural land, in the Package B area.

- 5.7.14 With the exception of BH08008 and BH08013, all BH08000 series monitoring wells, which are generally located the furthest from the River Thames, have recorded chloride groundwater exceedances and/or concentrations in the same order of magnitude as the controlled waters GAC. Chloride groundwater concentrations recorded in all other monitoring wells are at least one order of magnitude greater than the GAC.
- 5.7.15 The groundwater exceedances recorded during the monitoring programme suggest that the groundwater beneath the Package B area has been impacted, as a result of contaminants leaching downwards from the made ground. However, before any decision can be made, the following should be considered in respect to the CSM.
- 5.7.16 The non-petroleum organic groundwater exceedances recorded are considered to be reflective of leaching contaminants from the made ground in landfill sites within the Package B area. This conclusion is supported by the fact that no non-petroleum organic groundwater exceedances were recorded in monitoring wells located outside the footprints of landfill sites.
- 5.7.17 The TPH groundwater contamination appears to be more severe in the natural ground formation than the made ground within the landfill sites. Speciated TPH analysis shows the TPH groundwater exceedances are associated with the aliphatic >C5 to C12 and aromatic >EC8 to EC16 carbon bands. The TPH groundwater exceedances mostly correlated with exceedances in naphthalene and BTEX compounds. These hydrocarbons are reflective of petrol, kerosene, or diesel sources. The overall relative mobility of these hydrocarbon compounds in groundwater are noted to be moderate to high, according to Petroleum Hydrocarbons in Groundwater: Guidance on assessing petroleum hydrocarbons using existing hydrogeological risk assessment methodologies (CL:AIRE, 2017). Thus, the identified hydrocarbon contaminants are likely to have migrated large distances in the groundwater table. The above suggests that a hydrocarbon source, up hydraulic gradient of the landfill sites is responsible for the elevated hydrocarbon contamination in the groundwaters of the River Terrace Deposits and the Chalk.
- 5.7.18 The inorganic groundwater exceedances recorded in BH06000, BH07000, OH06000 and OH07000 series monitoring wells, with response zones in the River Terrace Deposits and the Chalk, are considered to be reflective of saline intrusion, rather than the overlying Goshems Farm Landfill (HLU0526) and Shed Marsh Landfill (HLU0534). This conclusion is supported by chloride groundwater exceedances in monitoring wells close to the River Thames which are at least one order of magnitude greater than the GAC. Furthermore, the Hydrogeological Risk Assessment (Application Document 6.3, Appendix 14.5) states that chloride/bromide concentrations ratios in the majority of groundwater samples from the River Terrace Deposits and the Chalk indicate saline intrusion rather than landfill impact.
- 5.7.19 That said, the average chloride/bromide concentration ratio for the groundwater in OH07035, which is located beneath the Goshems Farm Landfill (HLU0526) and has a response zone within the chalk, tentatively suggests a landfill leachate source. However, a review of the groundwater laboratory results for OH07035 show that the ratios were derived from filtered chloride and unfiltered bromide groundwater concentrations. Thus, the bromide groundwater

concentrations from OH07035 used to derive the chloride/ratios are not considered to be representative of the dissolved groundwater conditions in the Chalk aquifer.

- 5.7.20 The made ground and upper part of the Alluvium are not considered to be in hydraulic continuity with the deeper granular Alluvium, the River Terrace Deposits, the Chalk and the River Thames, due to the presence of continuous cohesive soils in the Alluvium acting as a low permeability barrier, limiting leaching. This supported by pump tests during the Phase 1 ground investigation works which show groundwater levels within the made ground and Alluvium have no relationship with tidal patterns in the River Thames. Furthermore, the Hydrogeological Risk Assessment (Application Document 6.3, Appendix 14.5) states that chloride/bromide concentration ratios in groundwater samples taken from the made ground suggest impact from a landfill leachate source, rather than saline intrusion from the River Thames, which is exhibited by the underlying River Terrace Deposits and Chalk. Chloride/bromide concentration ratios from groundwater within the Alluvium indicate the source is borderline sea water and landfill leachate.
- 5.7.21 There is visual evidence to suggest that the southern extents of the East Tilbury Landfill (HLU0523) and maybe the Goshems Farm Landfill (HLU0526) are being eroded by the River Thames, during high tide (Metro, 2019). Consequently, there is potential for perched contaminated groundwaters within the made ground to be in hydraulic continuity with the River Thames during high tide. However, given the heterogenous nature of the made ground and the poor water quality within the River Thames, due to diffused contamination in the wider area, perched contaminated groundwaters from the made ground is unlikely to directly discharge into the River Thames or significantly alter the water quality within it, during high tide.
- 5.7.22 Based on the discussion above, it is considered that the made ground associated with the Goshems Farm Landfill (HLU0526), Shed Marsh Landfill (HLU0534) and Low Street Landfill (HLU0535) are not in hydraulic connectivity with groundwaters in the River Terrace Deposits and the Chalk, due to the presence of the upper cohesive Alluvium strata. Thus, the dissolved contaminants identified in the made ground are not considered to be impacting controlled waters via the leaching pathway. The contaminated groundwater identified in the River Terrace Deposits and the Chalk are considered to be attributed to a combination of saline intrusion and contaminated sources located up hydraulic gradient of the Package B area.
- 5.7.23 Artesian groundwater conditions are understood to exist in the underlying River Terrace Deposits and the Chalk. Therefore, should leachate from made ground in the overlying landfills bypass the cohesive Alluvium, the upward head of groundwater within these aquifers will restrict downward migration of contaminants into the wider groundwater environment.
- 5.7.24 Furthermore, given the age of the landfill sites, it is considered that the landfill sites were designed (and permitted) to dilute and disperse leachate into the groundwater table beneath the Package B area. Therefore, no significant groundwater remediation would be considered feasible to mitigate the risk to controlled waters in the Package B area.

- 5.7.25 The proposed north portal and earthworks associated with the main route alignment are likely to interact with groundwaters in the made ground, Alluvium, River Terrace Deposits, and the Chalk. Furthermore, the north portal will excavate through the above-mentioned strata before travelling beneath the River Thames, potentially creating a preferential pathway for mobile contaminants to impact controlled waters. The commitments and mitigation measures outlined in the REAC (GS021, GS022, and GS026) and Remediation Options Appraisal and Outline Remediation Strategy (Application Document 6.3, Appendix 10.11) respectively, are considered to sufficient to prevent this risk and should be adopted by the Contractor during the construction phase works.
- 5.7.26 Contaminated groundwaters could be encountered during the excavation and dewatering works to facilitate the north portal, and potentially be mobilised to the environment. The Contractor should make allowances to control, recover, treat, and/or dispose contaminated groundwaters encountered during the enabling and construction works, as per commitments outlined in the REAC (GS021 and GS022) and in accordance with the Remediation Options Appraisal and Outline Remediation Strategy (Application Document 6.3, Appendix 10.11).

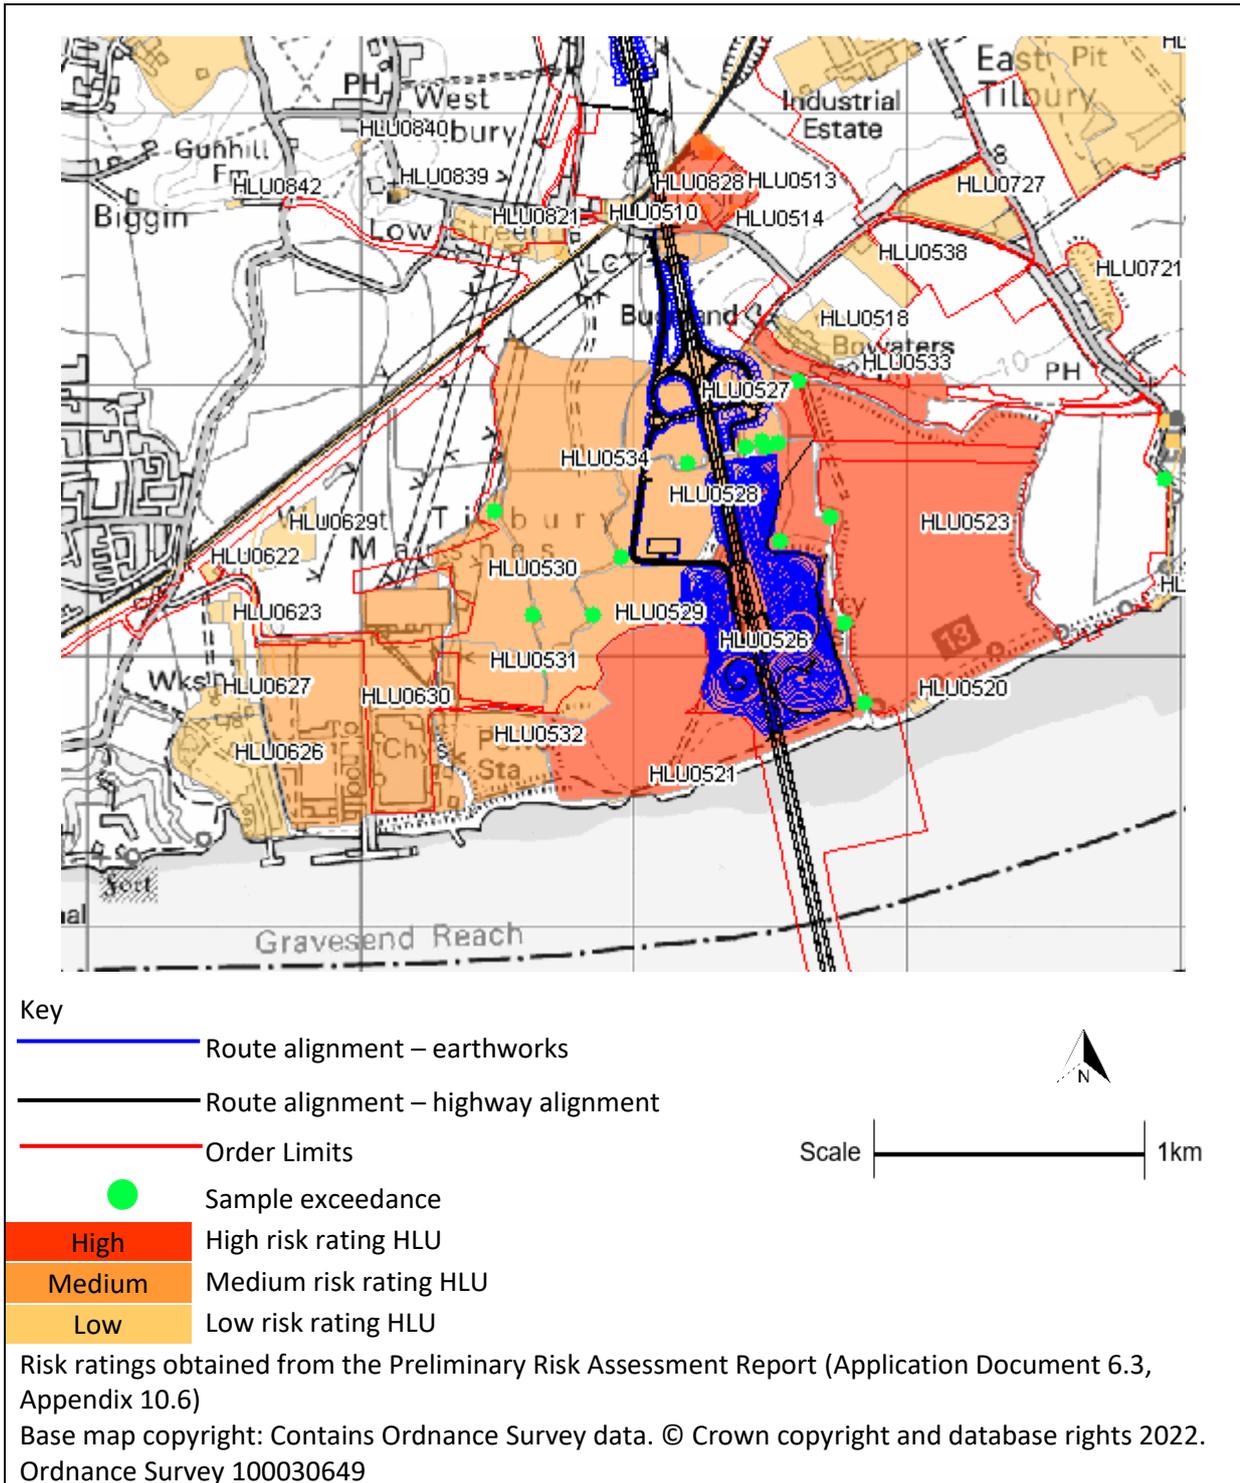

Conclusion

- 5.7.27 The human health GQRA of groundwaters found no vapour exceedances of human health GAC. Therefore, the vapour risk to human health from groundwaters is very low.
- 5.7.28 The controlled waters GQRA indicates that although the landfill sites have impacted groundwaters in the made ground and the Alluvium, they are not in hydraulic continuity with and are not impacting deeper more sensitive aquifers and the River Thames. Groundwaters within the River Terrace Deposits and the Chalk appear to have been impacted by saline intrusion and up hydraulic gradient sources of hydrocarbon contamination, rather than the overlying landfill sites. There is potential that the Project will encounter contaminated groundwaters and create preferential pathways to more sensitive groundwater receptors.
- 5.7.29 Therefore, the commitments and mitigation measures detailed in the REAC (GS021, GS022, and GS026), and the Remediation Options Appraisal and Outline Remediation Strategy (Application Document 6.3, Appendix 10.11) should be adopted by the contractor during the construction phase works, to prevent further entry of pollutants into the water environment. However, given that the landfills were designed to dilute and disperse leachate into groundwaters, no significant groundwater remediation is considered feasible.

5.8 Sediment and Surface water

- 5.8.1 In total, 15 sediment and 15 surface water samples were collected from 15 locations across the Package B area. The locations of the sampling points are shown in Plate 5.7.

Plate 5.7 Location of sediment (GS) samples and surface water (SW) samples

- 5.8.2 The majority of the sediment and surface water samples were collected from drainage channels along the boundaries of the East Tilbury Landfills (HLU0523), Goshems Farm Landfill (HLU0526), the Tilbury Ash Disposal Sites (HLU0527 to HLU0530), and Shed Marsh Landfill (HLU0534). Sediment samples were collected from the surface (0.00m bgl) and at a depth of 0.20m bgl.
- 5.8.3 The sediment and surface water samples were tested for a range of determinands, as detailed previously in Table 3.3.

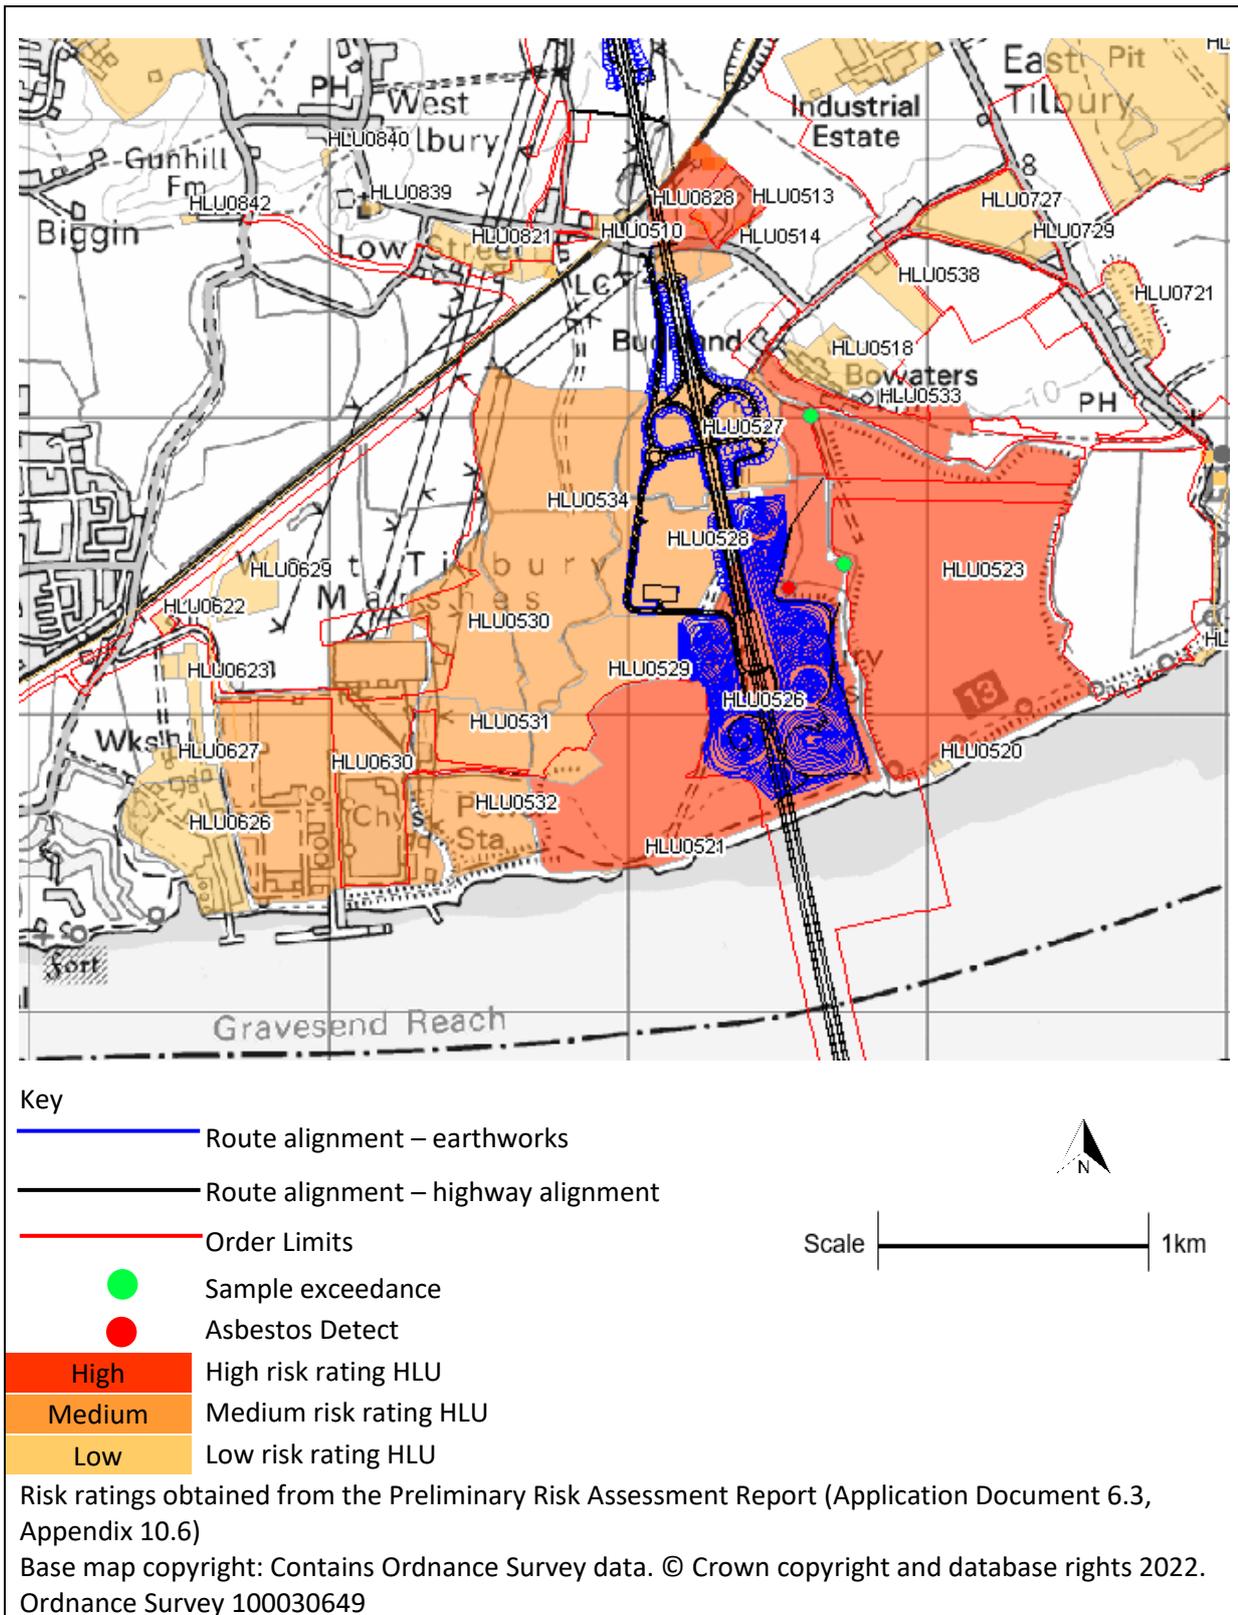

Selection of assessment criteria

- 5.8.4 The assessment of sediment is primarily focused on the potential risk to human health. As per the soil assessment, the sediment chemical data has been screened against the current LQM/ClEH S4ULs for Public Open Space near residential housing (POSresi) (Nathanail et al., 2015), as this is the most conservative screening scenario which applies to the Project and identified receptors. In the absence of an S4UL for lead, the C4SL has been adopted (CL:AIRE, 2014).
- 5.8.5 The assessment of sediment leachate and surface water is primarily focused on the potential risk to water resources. It is considered that the drainage ditches within the Package B area are not in hydraulic continuity with groundwaters due to their low permeability channel and shallow depth. However, a potential plausible pollution linkage may exist between the drainage ditches, the Tilbury Main, and the River Thames. Consequently, the GAC are adopted from the Environmental Quality Standards (EQS), which are considered protective of surface waters respectively. The EQS are primarily from the Water Environment (Water Framework Directive) (England and Wales) Regulations 2017. Package B borders the tidal River Thames, so some locations within the Package B area may present brackish water. Therefore, both the UK Freshwater and the Estuarine and Coastal Water EQS have been adopted for the protection of surface waters within the Package B area.
- 5.8.6 The GAC for the remaining determinands (for which EQS are not available) have been adopted based on the sources referenced within Annex B-E.

Sediment chemical assessment results

- 5.8.7 The assessment identified sediment exceedances of the lead GAC of 630mg/kg in grab samples GS07003 at 0.00m bgl (1,219mg/kg) and GS07006 at 0.00m bgl (2,236 mg/kg).
- 5.8.8 The locations of the exceedances are shown on Plate 5.8.
- 5.8.9 The complete sediment analytical results and comparison to the screening criteria are provided in Annex B-F.
- 5.8.10 With the exception of lead, concentrations were either measured below the adopted GAC or the MDL.

Plate 5.8 Location of sediment (GS) samples which recorded exceedances

Sediment asbestos assessment results

- 5.8.11 All 15 sediment samples were submitted to the laboratory for asbestos analysis. The analysis involves an initial screen to determine whether asbestos was identified in the sample. Where asbestos was identified in a sample, the percentage of asbestos fibres within the sample was then quantified.
- 5.8.12 Asbestos was identified in one sediment sample collected from GS07004 at 0.20m bgl, with an asbestos fibre concentration of 0.004% w/w. The asbestos species/ type was not recorded.
- 5.8.13 The full asbestos analysis results are provided in Annex B-F.

Sediment leachate assessment results

- 5.8.14 Table 5.7 summarises the determinands in sediment leachate that recorded concentrations above the GAC. The complete set of sediment leachate screening results are included in Annex B-G.

Table 5.7 Summary of exceedances in sediment leachate samples

Determinand	GAC		Number of samples exceeding GAC	Maximum concentration	Unit
	UK Freshwater EQS*	UK Saline EQS*			
Metals					
Boron	2,000	7,000	5	5,710	µg/L
Cadmium	0.08	0.2	6	2.9	µg/L
Chromium	3.4	0.6	3	31	µg/L
Chromium (trivalent)	4.7	NV	1	30	µg/L
Cobalt	3	3	2	14	µg/L
Copper	1 (bio)	3.76	13	310	µg/L
Lead	1.2 (bio)	1.3	2	724	µg/L
Mercury	0.07 (MAC)	0.7	3	1.2	µg/L
Nickel	4 (bio)	8.6	12	123	µg/L
Vanadium	20	100	1	36	µg/L
Zinc	10.9 (bio)	NV	5	1,590	µg/L
Inorganics					
Ammoniacal nitrogen as N	0.6	0.021	15	3.1	mg/L
Chloride	250	NV	5	876	mg/L
Cyanide (total)	1	1	2	20	µg/L
Fluoride	1,000	5,000	3	4,600	µg/L
Sulphate	400	NV	2	2,320	mg/L
Phenolic					
Phenol	7.7	7.7	5	14.9	µg/L

Determinand	GAC		Number of samples exceeding GAC	Maximum concentration	Unit
	UK Freshwater EQS*	UK Saline EQS*			
Other					
pH	6 - 9	6 - 8.5	1	8.6	pH

Note: NV – no GAC value.

Bio – Bioavailable.

MAC – Maximum Allowable Concentration.

* UK DWS, UK EQS, and other guideline values as referenced in Annex B-G.

5.8.15 All the samples taken recorded at least one exceedance against the GAC (all locations previously shown on Plate 5.7).

5.8.16 It is noted that some of the results reported across several samples are below the laboratory MDL but higher than at least one of the GAC values. Although none of those results have been recorded above the MDL, it is not possible to determine whether concentrations above the GAC are present given that the MDL itself is higher than the GAC. Further explanation of the elevated MDL results is provided in paragraph 7.1.2. The assessment to date is considered precautionary and robust.

Surface water assessment results

5.8.17 Table 5.8 summarises the determinands in surface water that were recorded above the GAC.

5.8.18 It should be noted that samples were analysed as both filtered and unfiltered samples for a number of determinands. Where determinands have recorded exceedances in both samples, only the higher concentration has been counted. Although this may be considered a conservative approach, it ensures that any potential risks can be identified, therefore ensuring a robust assessment of the data has been carried out.

5.8.19 The full screening results for surface water is presented in Annex B-H.

Table 5.8 Summary of exceedances in surface water samples

Determinand	GAC		Number of samples exceeding GAC	Maximum concentration	Unit
	UK Freshwater EQS*	UK Saline EQS*			
Metals					
Arsenic	50	25	3	59	µg/L
Boron	2,000	7,000	12	46,300	µg/L
Cadmium	0.08	0.2	13	29.77	µg/L
Chromium (total)	3.4	0.6	9	43	µg/L
Cobalt	3	3	5	11	µg/L

Determinand	GAC		Number of samples exceeding GAC	Maximum concentration	Unit
	UK Freshwater EQS*	UK Saline EQS*			
Copper	1 (bio)	3.76	12	711	µg/L
Iron	1,000	1,000	4	4,660	µg/L
Manganese	123 (bio)	NV	15	9,706	µg/L
Mercury	0.07 (MAC)	0.7	5	0.62	µg/L

Sulphate	400	NV	11	3,130	mg/L
PAH					
Fluoranthene	0.0063	0.0063	3	0.06	µg/L
Benzo(a)pyrene	0.00017	0.00017	3	0.06	µg/L
TPH					
TPH >C5-C35 Aliphatics/ Aromatics	50	50	1	62	µg/L

Note: NV – no GAC value.

Bio – Bioavailable.

MAC – Maximum Allowable Concentration.

* UK DWS, UK EQS, and other guideline values as referenced in Annex B-H.

5.8.20 It is noted that some of the results reported across several samples are below the laboratory MDL but higher than at least one of the GAC values. Although none of those results have been recorded above the MDL, it is not possible to determine whether concentrations above the GAC are present given that the MDL itself is higher than the GAC. Further detailed explanation of the elevated MDL results is provided in paragraph 7.1.2. The assessment to date is considered precautionary and robust.

5.8.21 With the exception of the contaminants listed in Table 5.8, concentrations were measured as below the MDL and/or below the GAC.

5.9 Sediment and surface water assessment discussion

Sediment human health assessment

5.9.1 Out of 15 sediment samples which were analysed, two samples (GS07003 at 0.00m and GS07006 at 0.00m) were found to contain lead exceedances of the

GAC. In addition, asbestos fibres were detected in GS07004 at 0.20m depth, with a fibre count of 0.004% w/w.

- 5.9.2 A review of the exploratory hole records shows that lead and asbestos soil contamination were detected in made ground described as gravelly and/or sandy clay with occasional rootlets, roots and/or organic material. No visual or olfactory evidence of contamination, from anthropogenic sources, were recorded on the exploratory hole records. While summarised in this annex, full geological descriptions are provided within the Land Based Works – Phase 2A Area 1 Package B Factual Report on Ground Investigation (Perfect Circle, 2020).
- 5.9.3 The location of GS07006 falls within the boundary of East Tilbury Landfill (HLU0523), GS07003 lies between East Tilbury Landfill and Goshems Farm landfill (HLU05256), and GS07004 is located within Goshems Farm Landfill. Given the proximity, it is considered that the sediment in the drainage channel represents a build-up of suspended solids within surface water runoff or leachate breakouts from the adjacent landfills. Lead and asbestos are listed as COC for the above mentioned credible contaminative sources in the Preliminary Risk Assessment Report (Application Document 6.3, Appendix 10.6). Therefore, the findings of the Phase 2 ground investigation conform with the CSM outlined in the Preliminary Risk Assessment Report (Application Document 6.3, Appendix 10.6).
- 5.9.4 GS07003, GS07004, and GS07006 are not located within the boundary of any proposed structures or earthworks but are within the main works construction area. Although unlikely, the potential of the lead and asbestos sediment contamination being disturbed by construction activities, and thus creating a plausible pollutant linkage, cannot be fully ruled out. However, it is considered that the risks identified will be addressed by the Contractor through the implementation of standards as detailed in the REAC (GS001, GS006, GS016, GS017, GS027 and GS028).

Sediment leachate results discussion

- 5.9.5 Table 5.7 indicates that the Phase 2 ground investigation has detected widespread copper, nickel and ammoniacal nitrogen leachate exceedances of the GAC, with discrete exceedances of metals, inorganics, and phenol. Sediment leachate exceedances were identified in both the made ground and the Alluvium sediments from drainage channels.
- 5.9.6 It should be noted that the EQS for bioavailable metals were derived assuming contaminants would be 100% bioavailable and fully absorbed by the guts of aquatic species. In reality, this is unlikely to be true for aquatic species in surface water environments and therefore the EQS is considered to be a very conservative screening criteria for the controlled waters risk assessment.
- 5.9.7 As the sediment leachate samples have all been collected from the made ground and shallow alluvium soils in and around landfills, the presence of determinands at concentrations above the GAC is in line with the CSM outlined in the PRA report (Application Document 6.3, Appendix 10.6). The determinands which recorded the exceedances in sediment leachate samples were also recorded in the soil leachate samples collected from the made ground and the Alluvium in exploratory locations within the landfills. This

suggests that the exceedances observed are most likely to be reflective of impacts from the landfills.

- 5.9.8 Given the above discussion, the sediment leachate results are considered to represent existing baseline conditions which are present in the Package B area. The proposed construction works within the area are unlikely to increase preferential pathways to the drainage channels or surface water features so the Project is not considered to pose an unacceptable risk to controlled water receptors in this area.

Surface water results discussion

- 5.9.9 All of the surface water samples recorded exceedances against the GAC. The determinands which exceeded the GAC included metals, inorganics, and PAH, as shown in Table 5.8. The identified surface water exceedances suggests that surface water runoff from the adjacent landfills has been impacted.
- 5.9.10 As stated in paragraph 5.9.6, the EQS for bioavailable metals are considered to be very conservative because they assume 100% bioavailability. The derivation of Predicted No-Effect Concentrations (PNEC) from surface water samples and the Metal Bioavailability Assessment Tool (M-BAT) would enable a more realistic controlled waters risk assessment of the bioavailable metals.
- 5.9.11 The determinands that recorded exceedances in surface water samples are similar to those recorded in groundwater samples collected from the made ground within the adjacent landfills. Given the surface water sampling locations are positioned between the landfills, it is likely that the exceedances observed in surface water are reflective of impacts from the landfills and as such represent existing baseline conditions.
- 5.9.12 The proposed construction works within the area are unlikely to increase preferential pathways to the drainage channels or surface water features, so the Project is unlikely to pose an unacceptable risk to controlled water receptors in this area.

5.10 Ground gas

- 5.10.1 Periodic ground gas monitoring was undertaken at 50 locations across the Package B area. A summary of the periodic ground gas monitoring visits undertaken is provided in Table 3.6.
- 5.10.2 Ambisense data, comprising continuous monitoring of ground gases and dissolved methane, as well as other temporal parameters, was also produced for 25 of these locations. All continuous gas monitoring locations are within the Goshems Farm Landfill (HLU0526). A summary of exploratory locations with continuous monitoring devices installed within them is provided in Table 3.7.
- 5.10.3 Gas monitoring wells have largely been equipped with sealed response zones designed to target specific strata horizons in the unsaturated zone. However, some exploratory positions in deeper strata (e.g., River Terrace Deposits and Chalk) were installed principally to monitor groundwaters, and therefore these may have a submerged response zone. The “periodic” and “continuous” monitoring methods record similar data, but ‘continuous’ monitoring methods record the gas regime response to natural variation with time at a higher

frequency, such as the response to change in atmospheric pressures, and groundwater levels.

- 5.10.4 In addition, gas samples collected from seven locations were analysed for bulk gases and soil vapours. A summary of the bulk gases and soil vapours analysed is provided in Table 3.8.
- 5.10.5 In line with the approaches outlined in the guidance documents Construction Industry Research and Information Association (CIRIA) Assessing Risks Posed by Hazardous Ground Gases to Buildings (C665) (CIRIA, 2007) and British Standard (BS) 8485: Code of Practice for the Design of Protective Measures for Methane and Carbon Dioxide Ground Gases for New Buildings (British Standards Institution, 2019), the monitoring results have been reviewed in the context of the CSM for the Package B area.

Sources of Ground Gas

- 5.10.6 Methane and Carbon dioxide can originate from a variety of natural and anthropogenic sources. The main sources which can generate ground gases include organic or alluvial deposits (e.g., Alluvium), landfills, buried waste, made ground or contamination.
- 5.10.7 The area to the north of the River Thames and surrounding the proposed North Portal section of the Project is dominated by the presence of Goshems Farm landfill (HLU0526) and Tilbury Ash Disposal Sites (HLU0527 to HLU0531, and HLU0534). This area includes up to 25m of Pulverised Fuel Ash (PFA)/made ground (historic landfill and recently placed capping layer) or topsoil and Alluvium concealing River Terrace Deposits and the Chalk. In addition, the East Tilbury co-disposal hazardous waste landfill (HLU0523 and HLU0533) is located immediately to the east of the main works construction area.
- 5.10.8 Historical and site-specific ground investigations together with British Geological Survey Mapping, have identified that the Alluvium in the area to the north of the River Thames contains several layers/areas of Peat interspersed with layers of sand and gravel and silt/clay. Given the presence of both the landfills and the Alluvium/Peat within this area, there is a substantial volume of ground which could generate and/or store ground gases.
- 5.10.9 Within the Package B area, the main sources which have the potential to generate ground gases include the list of identified credible sources below.
- HLU0513, HLU0514, HLU0525 – Infilled Ponds (within Order Limit)
 - HLU0515 - Suspected quarry fill (within Order Limit)
 - HLU0518 – Poultry farm (within Order Limit)
 - HLU0526 - Goshems Farm Landfill; Recorded landfill (within Order Limit)
 - HLU0523 and HLU0533 - East Tilbury Landfill Recorded landfill, including Northern extension (within Order Limit)
 - HLU0527 to HLU0532, and HLU0534 - Tilbury Ash Disposal Site Recorded PFA landfill, including Shed Marsh Landfill (within Order Limit)

- g. HLU0535 - Low Street Landfill (within Order Limit)

- r. HLU0729 - Barvills Farm (within Order Limit)

1.1.2 The dates of filling and the location with respect to Order Limits and study area for the identified potential ground gas sources listed above are presented in Table 5.9.

Table 5.9 Summary of details for potential sources of ground gas

Source	HLU Number	Location with respect to Order Limits and study area	Approximate dates of filling	Additional Details
Infilled pond	HLU0513	Within study area	Pre 1991	
Infilled pond	HLU0514	Within Order Limits	Pre 1939	
Suspected quarry fill	HLU0515	Under route alignment	Pre 1991	
Poultry Farm	HLU0518	Within Order Limits	NA	
East Tilbury Landfill and East Tilbury Landfill - Northern extension	HLU0523 HLU0533	Within Order Limits	1932 to 1990	Former hazardous landfill containing industrial, commercial, household, and liquid sludge.
Infilled pond	HLU0525	Within study area	Pre 1991	

Source	HLU Number	Location with respect to Order Limits and study area	Approximate dates of filling	Additional Details
Goshems Farm Landfill	HLU0526	Under route alignment	Late 19th/early 20th century landfill	Contains ash, bottles, dock and river dredgings.
Tilbury Ash Disposal Site – Areas A1 to A3, and Shed Marsh Landfill	HLU0530 HLU0531 HLU0532 HLU0534	Within Order Limits	1968 to 2000s	Contains PFA and potentially unrecorded waste.
Tilbury Ash Disposal Site – Areas B, C and C2	HLU0527 HLU0528 HLU0529	Under route alignment	1968 to 2000s	Contains PFA and potentially unrecorded waste.
Low Street Landfill	HLU0535	Under route alignment	1969 to 1976	Contains industrial and commercial waste.
Low Street Brickworks Landfill	HLU0536	Within Order Limits	1956 to 1977	Contains industrial and commercial waste.
Suspected quarry fill	HLU0537	Under route alignment	Pre 1991	
Sewage treatment tanks	HLU0623	Within study area	Pre-1950 to pre-2022	
Sewage works – aqueduct and water tanks	HLU0624	Within study area	Pre-1950 to pre-2022	
Sewage works – northern extensions	HLU0627	Within study area	Pre-1990 to present	
Sewage tank	HLU0704	Within study area	Pre-1921 to present	First shown on mapping in 1921 and were possibly constructed in a former pond
Pumping station	HLU0705	Within study area	Pre-1990 to present	
Princess Margaret Road Landfill	HLU0724	Within study area	-	Active landfill, accepting industrial and commercial waste.
Love Lane Landfill	HLU0727	Within Order Limits	1934 to 1988	Contains inert, industrial and commercial waste
Saltings Landfill	HLU0728	Within Order Limits	1988 to 1993	Contains inert and liquid sludge waste from river dredging.
Barvills Farm	HLU0729	Within Order Limits	NA	

- 5.10.10 Based on the Ground Gas Handbook (Wilson et al., 2009) areas of infilled land which are around 50 years in age are considered to be past the peak of ground gas generation. With this in mind, the infilled pond (HLU0514), poultry farm (HLU0518), Goshems Farm Landfill (HLU0526) and infrastructure associated with Tilbury Sewage Works (HLU0623 and HLU0624) are, conceptually, unlikely to be generating sustained ground gases.
- 5.10.11 A review of the Preliminary Risk Assessment (Application Document 6.3, Appendix 10.6) shows that the credible contaminant sources of volatile organic compounds (VOC) that are within or close to the footprint of the proposed structures and utility work areas are a metal recycling facility (HLU0512), the landfills (HLU0526 to HLU0531, and HLU0534 to HLU0536), Tilbury Power Station (HLU0630), and former railway sidings at brickworks (HLU0830).
- 5.10.12 Made ground was encountered in 105 exploratory locations across Package B, at thicknesses from 0.20m to 6.20m. The made ground is generally associated with the landfill areas, although some shallow made ground has also been encountered in localised pockets, beneath agricultural land to the north of Shed Marsh and Goshems Farm Landfill.
- 5.10.13 The made ground encountered within the Goshems Farm and Low Street landfills was generally described as sandy and slightly gravelly clay comprising glass, cement, brick, clinker, concrete, slag, ceramic, flint, and rare slate. Occasional fragments of metal, wood, glass, plastics, and domestic fabrics (e.g., carpet and clothing) were also noted within the landfills. The made ground in the Shed Marsh landfill was predominantly described as silty clay, with occasional pockets of organic material. The made ground encountered in positions located in agricultural land was generally described as sandy gravelly clay, with frequent rootlets and occasional red brick fragments.
- 5.10.14 Visual and olfactory evidence of VOCs, in the form of hydrocarbon odours, stains, and sheens, were noted in BH07039 (made ground, 2.20m to 9.00m), BH07060 (made ground, 6.20m to 7.00m), BH07092 (made ground, 7.00m), BH07094 (made ground, 6.00m to 10.00m), BH07096 (made ground, 6.00m to 7.00m), and BH08029 (Thanet Formation, 7.90m to 10.00m). With the exception of BH08029, all exploratory holes exhibiting VOC contamination were located within the Goshems Farm Landfill (HLU0526). BH08029 was located within the boundary of the Low Street Landfill (HLU0535).
- 5.10.15 Onsite headspace tests recorded during the Phase 2 Ground Investigation reveal PID readings from <0.1 ppm to 254.6 ppm, with the highest PID readings recorded in the made ground of BH07094 at 10.00m, which is located within the Goshems Farm Landfill (HLU0526). The highest PID reading of 254.6 ppm corresponds to the hydrocarbon sheen noted in BH07094, from 6.00m to 10.00m depth.
- 5.10.16 The soil and groundwater assessments (see subsections Soil assessment results and Groundwater human health assessment results) identified no human health GAC exceedances of VOCs, including light carbon banded petroleum hydrocarbons and chlorinated solvents. This suggests the absence of VOC contamination in the soil and groundwater samples analysed.
- 5.10.17 The Alluvium was typically encountered beneath made ground or topsoil and above the River Terrace Deposit or the White Chalk Subgroup. The borehole

logs generally describe the Alluvium as very soft to soft, greenish grey, slightly sandy, silty clay with occasional pockets of plastic brown to black pseudo-fibrous peat. Occasional roots and rare, decomposed wood fragments were also noted. The Alluvium is continuous beneath the landfill but rapidly thins towards the north. As the Alluvium is predominantly cohesive, it is said to act as a low-permeability barrier between overlying made ground and underlying River Terrace Deposits and the Chalk.

- 5.10.18 Additional off-site sources of gas generation have been identified in the PRA Report (DCO Application Document 6.3, Appendix 10.6). However, none are considered to be significant compared sources within the Order Limits (e.g., landfills).
- 5.10.19 Based on the ground gas sources, soil descriptions and strata thicknesses, the Package B Area is considered to have a low (Alluvium) to high (landfills) ground gas generation potential, based on guidance outlined in BS 8576:2013: Guidance on investigations for ground gas – Permanent gases and Volatile Organic Compounds (VOCs) (British Standards Institution, 2013).

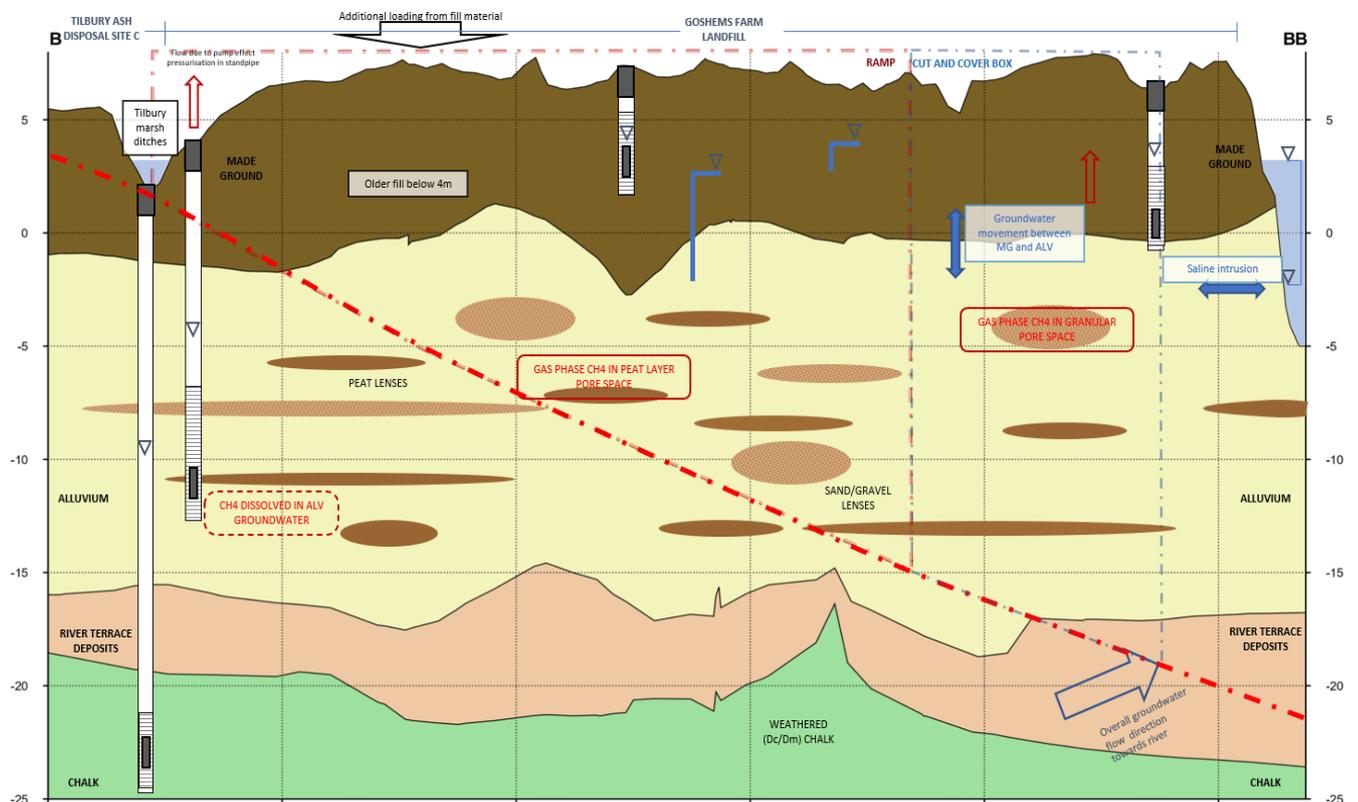

Pathways for Ground Gas

- 5.10.20 The main pathway for ground gas migration is the unsaturated zone, although, there is some potential for ground gas to migrate horizontally (low permeability capping layers) or via preferential routes (e.g., buried services, fissures, etc.). The PRA Report (Application Document 6.3, Appendix 10.6) identified anthropogenic materials and natural strata that have the potential to act as pathways that could allow migration of gases from other sources.
- 5.10.21 As detailed in the Hydrogeological Risk Assessment (Application Document 6.3, Appendix 14.5), groundwater in the Package B area, particularly the area surrounding the North Portal, is relatively high. The cohesive portions of the Alluvium generally act as an aquitard resulting in a perched groundwater table in the made ground and Alluvium strata. The River Terrace Deposits and Chalk are considered to be in hydraulic continuity with each other and groundwater in these strata may be tidally influenced close to the River Thames.
- 5.10.22 The Goshems Farm Landfill is a raised landform and was constructed on top of the Alluvium. The unsaturated zone is generally situated within the made ground and uppermost parts of the Alluvium, ranging in thickness from 0.00m to 10.23m. The unsaturated zone is restricted by the high groundwater table within the lower Alluvium, the River Terrace Deposits and the Chalk. As such, any ground gases generated from the Goshems Farm Landfill are unlikely to migrate laterally via adjacent superficial deposits.
- 5.10.23 According to the East Tilbury Landfill Risk Assessment Report (Application Document, Appendix 10.7), the East Tilbury Landfills are also raised landforms, with similar ground models and hydrogeological regimes to the Goshems Farm Landfill. It is considered that ground gases generated within the adjacent East Tilbury Landfills are unlikely to migrate laterally towards the North Portal as a result of an increased unsaturated zone during the Project's proposed dewatering works. Given the absence of a pollutant pathway between the adjacent landfills and the proposed works, the East Tilbury Landfills can be eliminated as a potential source of ground gas in the CSM.

5.10.24 Plate 5.9 presents a generalised cross-section of the Package B north portal area, the potential sources of gases and their potential migration routes to the tunnel construction.

5.10.25 Where the sources of potential ground gas are located off the main route alignment, away from main construction activities, any ground gas generated are more likely to migrate upwards/ vertically and vent to the atmosphere, rather than to migrate horizontally towards the Project and pose an unacceptable risk. The few exceptions to this are presence of hard surfaces, encouraging lateral migration, or horizontal preferential pathways, in the form of utility corridors. Nevertheless, any offsite sources of ground gas are located significant distances (>250m) from the Project are unlikely to pose an unacceptable risk.

Plate 5.9 Conceptual Site Model for transition of the route at the North Portal area

5.10.26 Intrusive utility works and underground structures proposed within the Package B area may create preferential pathways for ground gases to migrate through the creation of service trenches, north portal and ramps within identified sources of potential contamination. The sources where intrusive utility works, and north portal are proposed within the site boundary include:

- a. Gravel pit (HLU0215)
- b. Goshems Farm Landfill (HLU0526)
- c. Tilbury Ash Disposal Site (HLU0527 to HLU0532, HLU0534)
- d. Shed Marsh Landfill (HLU0534)
- e. Low Street Landfill (HLU0535)

- f. Low Street Brickworks Landfill (HLU0536)
- g. Suspected quarry fill (HLU0537)

Receptors

- 5.10.27 The North Portal and tunnel alignment section are to be excavated through the made ground of the Goshems Farm Landfill, the Alluvium, River Terrace Deposits and then the Chalk. Generated ground gases from historical or current degradation within these formations are likely to be disturbed by the proposed works, posing a risk to human health and property receptors, during the construction and operational phases.
- 5.10.28 Temporary accommodation and welfare facilities are proposed within the Northern tunnel entrance compound, which would service the North Portal construction activities. Ground gas associated with the historical landfill sites, which may be present in the area, could pose a risk to construction workers.
- 5.10.29 In addition, ground gases could accumulate in utilities corridors, and manhole chambers along the proposed route in the Package B area. Where intrusive utility works are proposed, this may require confined space working, as such those involved in this work would also become receptors for ground gas in the Package B area. The risks associated with such work would be managed under the health and safety regulations for the Project.
- 5.10.30 Mitigation measures to reduce the risk of ground gases accumulating are detailed within the Remediation Options Appraisal and Outline Remediation Strategy (Application Document 6.3, Appendix 10.11).

5.11 Ground gas results

- 5.11.1 A summary of the ground gas and soil vapour monitoring and sampling undertaken at the monitoring well locations is provided in Annex B-I. As part of each round of periodic monitoring, methane, carbon dioxide, oxygen, carbon monoxide, hydrogen sulphide, flow rates and temporal parameters were measured and recorded. These ground gases, along with dissolved methane gas and groundwater temperature, were also measured during the continuous ground gas monitoring. Furthermore, gas samples were collected from seven monitoring well locations and analysed for bulk gases and soil vapour.
- 5.11.2 A generic screening of the methane and carbon dioxide results has been carried out against a 1% v/v methane and 1.5% v/v carbon dioxide threshold. In addition, generic screening thresholds of 5ppm and 30ppm have been set for hydrogen sulphide and carbon monoxide, respectively, based on long term workplace exposure limits. This is in line with the guidance from CIRIA Assessing Risks Posed by Hazardous Ground Gases to Buildings (C665) (CIRIA, 2007) and BS 8485: Code of Practice for the Design of Protective Measures for Methane and Carbon Dioxide Ground Gases for New Buildings (British Standards Institution, 2019).
- 5.11.3 A more stringent carbon dioxide screening criteria of 1.5% v/v, based on the converted short-term workplace exposure limit of 15,000ppm (HSE, 2020) has been selected for Package B, in comparison to the screening criteria 5%v/v for Packages A, C, and D. This is because the Package B area conceptually has a

high-risk ground gas regime, due to the landfill sites, temporary sleeping accommodation being present on site during the construction phase works, and workers in close proximity to landfill material.

5.11.4 Furthermore, a combination of the workplace exposure limits, and the Environment Agency’s Environmental Assessment Levels (Environment Agency, 2016) have been used to screen and assess the bulk gas and soil vapour concentrations recorded in gas samples, the results of which are summarised in Table 5.13.

Periodic ground gas monitoring

5.11.5 For the purpose of this discussion, ground gas concentrations and flow rates data from flooded monitoring wells (i.e., groundwater levels above response zones) has been eliminated from this risk assessment. Fluctuating groundwater levels can create a piston effect within the monitoring wells, producing anomalous ground gas readings which are not representative of the ground gas regime in the surrounding geology.

5.11.6 A summary of the periodic ground gas monitoring results within the unsaturated (non-flooded monitoring wells) is provided in Table 5.10. In accordance with BS 8485:2015+A1:2019 (British Standards Institution, 2019), the maximum (peak) ground gas concentrations have been adopted for the ground gas risk assessment, together with steady state values of gas flows, to enable worst case conditions are represented.

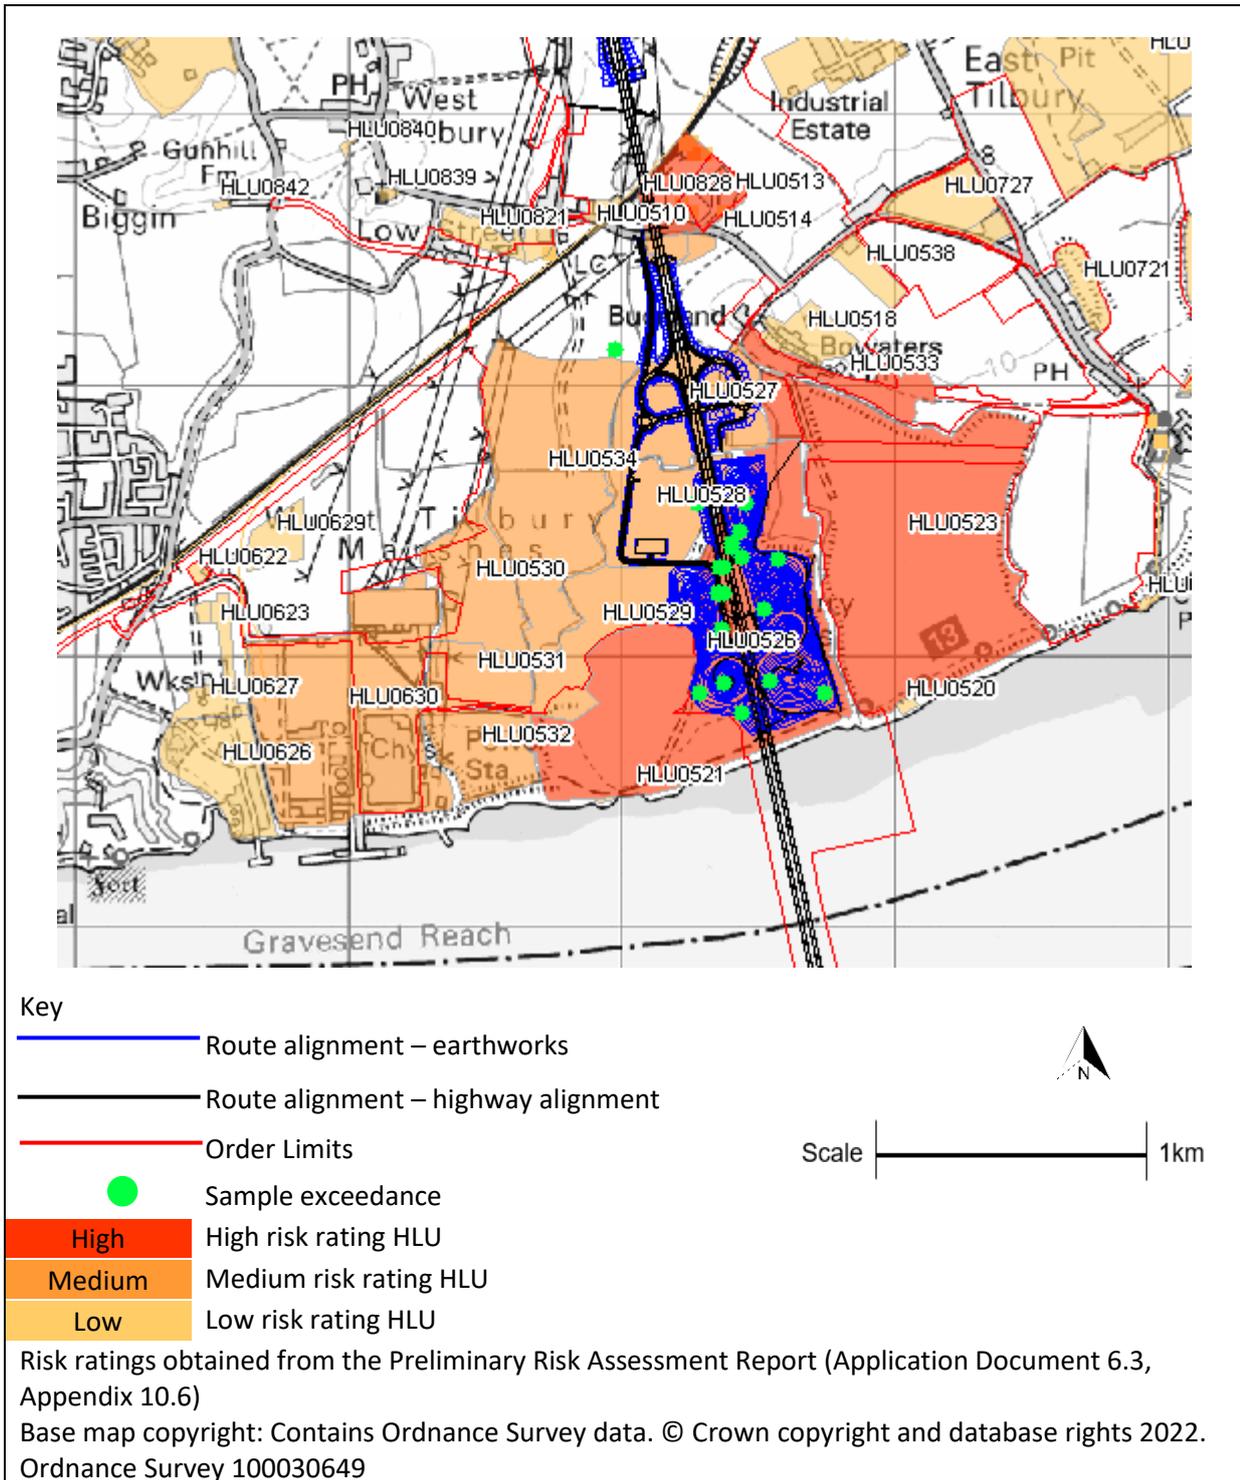

5.11.7 The locations of ground gas exceedances are presented on Plate 5.10.

Table 5.10 Summary of periodic ground gas monitoring results in the unsaturated zone

Response zone geology	Number of locations	Steady-state flow rates (l/hr)	Peak CH4 (%v/v)	Peak CO2 (%v/v)	Min O2 (%v/v)	Peak H2S (ppm)	Peak CO (ppm)	Peak VOC (ppm)
Made Ground	18	-14.4 – 26.9	<0.1 – 99.0	<0.1 – 36.10	<0.1 – 21.7	<1 – 80.0	<1 – 209.0	<0.1 – 30.1
Made Ground/ Alluvium	3	-1.4 – 6.0	<0.1 - 78.0	<0.1 - 18.6	<0.1 – 20.5	<1 – 39.6	<1 – 390.0	<0.1 – 0.9
Alluvium	2	0	<0.1 – 11.05	<0.1 – 3.3	15.8-20.8	<1	<1	0.1

Note: CH4 – methane.
 CO2 – carbon dioxide.
 O2 – oxygen.
 H2S – hydrogen sulphide.
 CO – carbon monoxide.
 Min – minimum.

Plate 5.10 Location of gas monitoring points with ground gas and vapour exceedances during periodic gas monitoring

5.11.8 During the periodic monitoring programme, atmospheric pressures ranged from 984mb to 1052mb, falling on 38 out of 87 monitoring occasions/ visits. Weather conditions varied from sunny and still, to overcast windy and heavy rain. Given the meteorological conditions mentioned, it is considered that worst-case conditions have been recorded during the monitoring programme.

- 5.11.9 Steady state flow rates recorded in wells during the monitoring programme ranged from -14.4l/hr to 26.9l/hr. Negative flow rates were recorded in 15 locations and occurred when atmospheric pressures were both below and above 1000mb. High negative or positive flow rates were recorded in the made ground, whilst negligible flow rates were generally recorded in the Alluvium. The flow rates recorded suggest a low-risk ground gas regime (flow rates <70l/hr) and that some monitoring wells may not be sealed correctly.
- 5.11.10 The screening criteria for methane (1% v/v) was exceeded in 18 locations, during the periodic monitoring programme. The locations of the exploratory positions with methane exceedances are shown in Plate 5.10.
- 5.11.11 Peak methane gas exceedances ranged from 1.1%v/v to 99%v/v. The majority of the methane gas exceedances were recorded in monitoring wells with responses zone in the made ground. The exception to this is BH07034 and BH1309A, with response zones both in the made ground and Alluvium, and BH08010, with response zone in the Alluvium.
- 5.11.12 Monitoring wells which recorded methane gas exceedances on more than three occasions were BH06014, BH06017, BH07010, BH07011, BH07019, BH07046, BH07060, BH07064, BH07071, BH07093, BH07094, BH07096, BH07098, BH07099 and BH1309A. All the response zones for these monitoring wells were installed within the made ground of the Goshems Farm Landfill (HLU0526) and Tilbury Ash Disposal Site – Area C (HLU0528).
- 5.11.13 The carbon dioxide screening threshold (1.5%v/v) was exceeded in 16 locations, during the periodic monitoring. The locations of the exploratory positions where carbon dioxide exceedances were recorded are shown in Plate 5.10.
- 5.11.14 The peak carbon dioxide gas exceedances ranged from 1.6%v/v to 36.10%v/v.
- 5.11.15 The monitoring wells which exhibited carbon dioxide gas concentrations exceeding the threshold on more than three occasions were similar to those that recorded methane gas, as detailed in paragraph 5.11.11. The only exception was BH07071 which recorded no carbon dioxide exceedances.
- 5.11.16 Depleted oxygen gas concentrations (<18% v/v) were recorded in 22 locations during the periodic gas monitoring programme, ranging from <0.1% v/v to 17.3% v/v. The monitoring wells repeatedly displaying depleted oxygen concentrations were the same as those repeatedly exhibiting methane and carbon dioxide exceedances, as detailed in paragraph 5.11.11.
- 5.11.17 Peak hydrogen sulphide gas exceedances were encountered in BH07019 (three occasions), BH07034 (one occasion), BH07046 (six occasions), BH07060 (one occasion), BH07064 (two occasions) and BH07071 (two occasions). The response zones of these monitoring wells, (except BH07034 which was installed in the made ground/ Alluvium) were installed within the made ground of the Goshems Farm Landfill (HLU0526). Peak hydrogen sulphide gas exceedances ranged from 5.7ppm to 80ppm, with the highest concentration being detected in BH07046 on 14 February 2020.
- 5.11.18 Carbon monoxide gas exceedances were recorded in BH07019 (two occasions), BH07034 (two occasions), BH07046 (six occasions), BH07060 (two occasion), BH07071 (two occasions), BH07098 (one occasion) and BH07099

(one occasion), during the periodic monitoring programme. With the exception of BH07034 (made ground and Alluvium), the response zones of the monitoring wells were installed within the made ground of the Goshems Farm Landfill (HLU0526). Carbon monoxide exceedances ranged from 38.7ppm to 390.0ppm, with the highest concentration being detected in BH07034 on 9 March 2020.

- 5.11.19 Volatile organic compounds (VOCs) headspace readings greater than 1ppm were recorded in BH07007 (three occasions), BH07011 (three occasions), BH07060 (one occasion), BH07071 (two occasions), BH07091 (one occasion), BH07093 (one occasion), BH07095 (two occasions) and BH07098 (two occasions), during the periodic monitoring programme. VOC headspace readings ranged from <1ppm to 30.1ppm, with the highest concentration being detected in BH07011 on 7 August 2020. All headspace readings greater than 1ppm were from monitoring wells with response zones installed within the made ground.
- 5.11.20 All the above exploratory holes are located within the Goshems Farm Landfill (HLU0526), a known credible contaminant source of VOCs. The only corresponding evidence of VOC contamination was noted in the exploratory hole record of BH07060, with “possible hydrocarbon” recorded in the made ground, from 6.20m to 7.00m. No corresponding evidence of VOC contamination was observed at the above locations exhibiting headspace readings greater than 1ppm.
- 5.11.21 The ground gas concentrations and flow rates recorded in the made ground of the landfill sites suggest a high-risk ground gas regime, equivalent to Characteristic Situation 5 (CS5) and are typical of modern landfill sites, as outlined in BS 8485:2015+A1:2019 Code of practice for the design of protective measures for methane and carbon dioxide ground gases for new buildings (British Standards Institution, 2019). Although limited valid data is available, the ground gas concentrations and flow rates recorded within BH07066 and BH07068 suggest the Alluvium has a low-risk ground gas regime, equivalent to CS2. The ground gas regimes identified are compatible with the initial CSM outlined in the PRA report (Application Document 6.3, Appendix 10.6).
- 5.11.22 It is considered that ground gases generated from the made ground within the Goshems Farm Landfill and East Tilbury Landfill are unable to laterally migrate beyond their boundaries due to them being raised landforms built on top of cohesive Alluvium. Furthermore, high ground gas concentrations detected in the Alluvium will have generated historically and are trapped or absorbed within the pore spaces of cohesive soils or peat. The low gas generation potential of the Alluvium and current high groundwater table in the wider area means that ground gases in the Alluvium are unlikely to laterally migrate significant distances and impact offsite receptors. That said, penetrative works into and dewatering of the Alluvium may expose the trapped ground gases and present a short-term risk to construction workers and property.
- 5.11.23 It should be noted that ground gas and flow data from monitoring wells with flooded response zones were eliminated from the ground gas assessment, due to the subsequent readings being unrepresentative of the ground gas regime in the unsaturated zone beneath the site. It is considered that the ground gases detected from these monitoring wells represent dissolved gases that have come

out of solution, following the degradation of organic material in the groundwaters of the made ground, Alluvium, River Terrace Deposits and the Chalk. There is potential that the dissolved gases in the saturated zone could come out of solution during dewatering exercises to facilitate the proposed north portal or earthworks and change the ground gas regime within the Package B area. This would pose a potential short-term risk to construction workers during the construction phase works. An assessment of continuous dissolved methane gas monitoring data has been undertaken in paragraphs 5.11.46 to 5.11.61.

- 5.11.24 All monitoring wells with ground gas exceedances are located within the boundary of either the proposed main route alignment, earthworks or utility corridors. Furthermore, the BH07000 series monitoring wells, which exhibit significant ground gas exceedances, are in the vicinity of proposed temporary accommodation and welfare facilities, that will be set up adjacent to the Northern tunnel entrance. Consequently, construction workers and operational staff could be exposed to the high ground gas exceedances and flow rates identified during the periodic monitoring.
- 5.11.25 It is considered the risks identified in the above two paragraphs can be dealt with by the Contractor by implementing the commitments and mitigation measures detailed in the REAC (GS018 and GS025) and in the Remediation Options Appraisal and Outline Remediation Strategy (Application Document 6.3, Appendix 10.11).
- 5.11.26 Ground gas mitigation measures that the Contractor could design comprises a combination of prevention (of gas entry) and adequate ventilation (to dilute and expel the trace gases that do enter). Examples could include the adoption of structural barriers, passive or active dispersal layers, and gas resistant membranes in buildings, or vented manhole covers, and forms of low permeability cut off, such as external clay stanks, to limit lateral migration along utilities lines.

Continuous ground gas monitoring results

- 5.11.27 The results of the continuous ground gas monitoring are presented graphically in Annex B-J. Table 5.11 presents the minimum and maximum ground gas and flow rate values recorded within each geological formation. The continuous ground gas monitoring was undertaken between May 2020 and March 2021, with specific dates for each monitoring well detailed in Table 3.7. The results include data received as of March 2022.
- 5.11.28 As with the periodic monitoring results, the continuous ground gas and flow rate monitoring data from monitoring wells with flooded response zones has been eliminated from the ground gas risk assessment. As previously stated, where a monitoring well response zone is submerged, the only gas that can accumulate within the headspace will be those gases that come out of solution from the groundwater. Pressures changes within the headspace of the monitoring wells, as a result of groundwater level changes will result in artificially high flow rates and gas concentrations that are artefacts of the well construction and not representative of the surrounding ground's true gas regime (CL:AIRE, 2019). Where dissolved gases come out of solution, this is often represented as 'saw-tooth' patterns on continuous ground gas monitoring graphs. These 'saw-tooth'

patterns were observed in BH06015, BH07020, BH07023, BH07024, BH07053 and BH07062.

- 5.11.29 Erratic trends were noted for most of the parameters on the continuous monitoring graphs for BH07019, BH07038, BH07063, BH07064, and BH07099. A closer look at the data confirms the parameters of borehole peak flow, carbon dioxide, methane, oxygen, VOC, humidity, carbon monoxide, hydrogen sulphide, water level, temperature, atmospheric pressure, and wind have been swapped around. This appears to be a data processing error. To ensure the risk assessment utilises data representative of the ground gas regime, the anomalous data outlined above was removed from the above-mentioned wells.
- 5.11.30 Where more than one monitoring device record is available for a given monitoring well, the monitoring device record covering the longest monitoring period was included in the risk assessment, whilst the others were discounted.

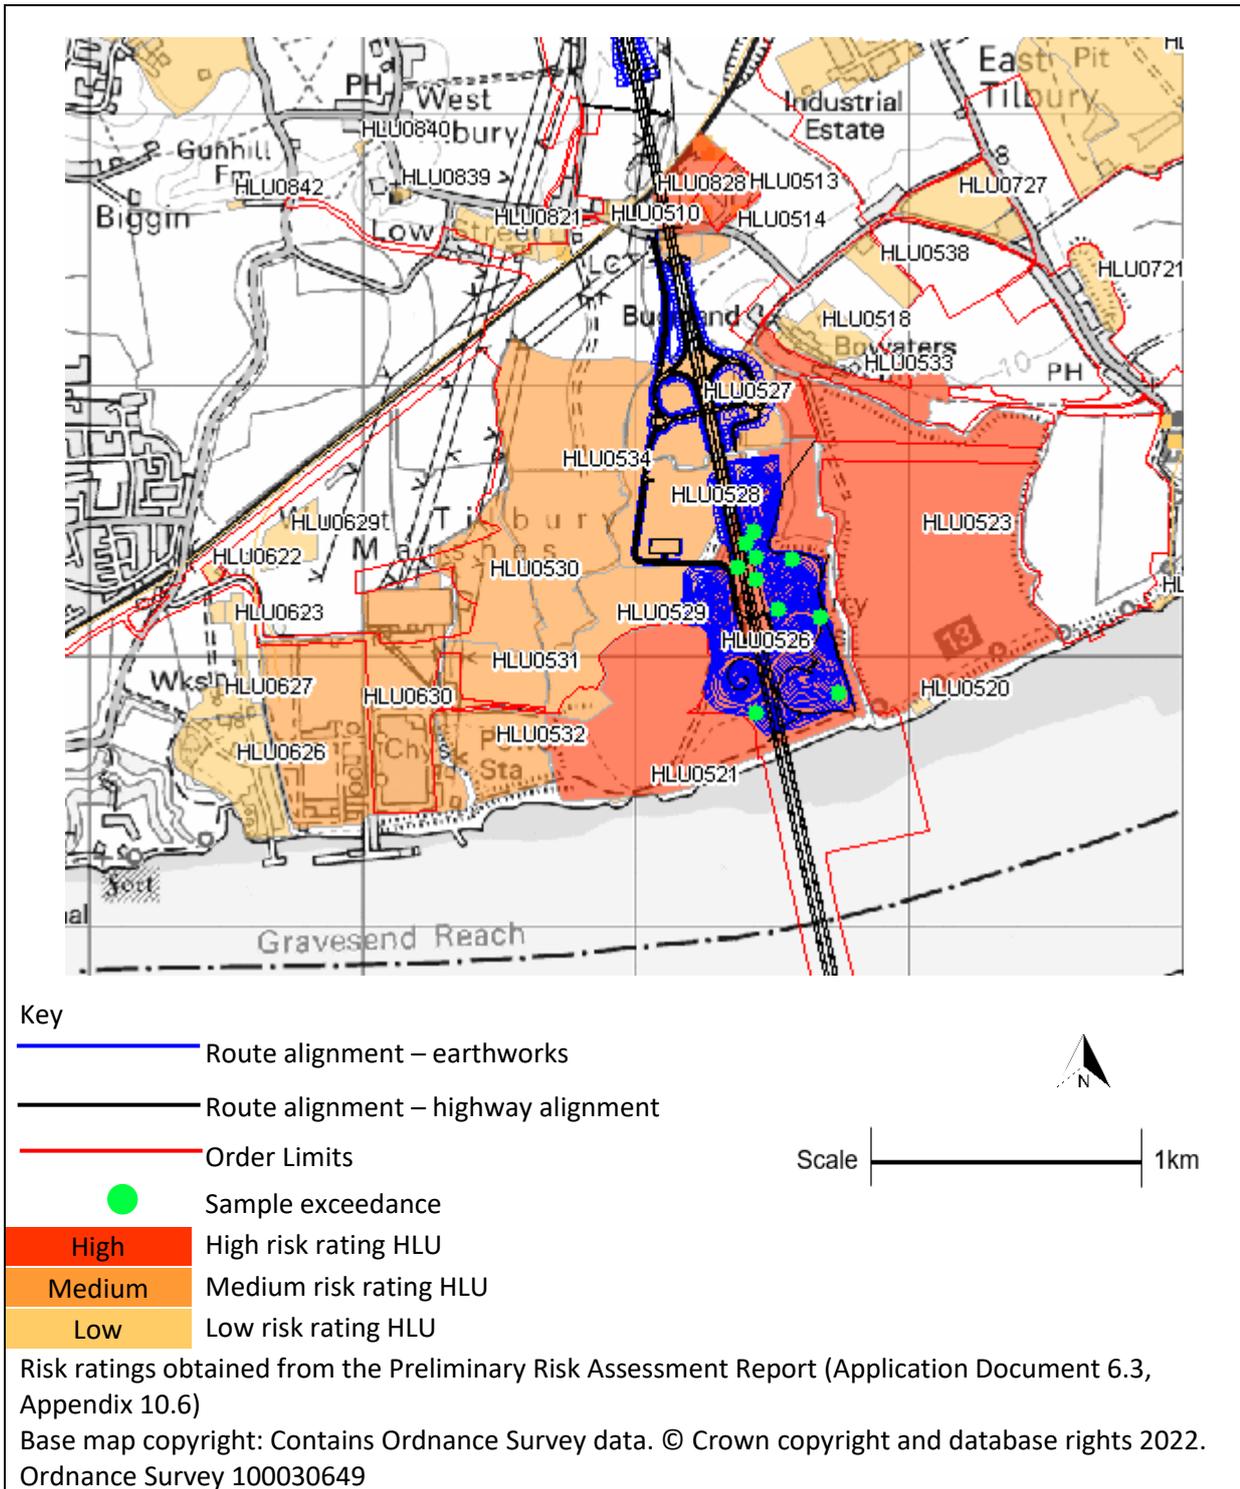

Table 5.11 Summary of minimum and maximum ground gas concentrations and flows recorded during continuous monitoring

Response zone geology	Number of locations	Steady-state flow rates (l/hr)	CH4 (%v/v)	CO2 (%v/v)	O2 (%v/v)	CO (ppm)	H2S (ppm)	VOC (ppm)
Made Ground	8	-7.6 – 26.3	0 – 74.9	0 – 25.1	0 – 25.1	0 – 395.8	0 – 94.8	0 – 4873.9
Made Ground/ Alluvium	2	-3.03 – 5.9	0 – 50.5	0 – 22.8	0 – 25.8	0 – 31.2	0 – 140.5	0 – 24.0

Note: CH4 – methane.
 CO2 – carbon dioxide.
 O2 – oxygen.
 H2S – hydrogen sulphide.
 CO – carbon monoxide.
 VOC – volatile organic compounds.
 Min – minimum.

- 5.11.31 The 10 exploratory hole locations which recorded exceedances of the threshold levels for ground gases during continuous ground gas monitoring, are presented on Plate 5.11.

Plate 5.11 Location of gas monitoring points with ground gas and vapour exceedances during continuous gas monitoring

- 5.11.32 Atmospheric pressures during the continuous ground gas monitoring ranged from 971mb to 1042mb, falling on at least three occasions. An atmospheric pressure drop of 29mb in 55 hours was recorded between 30 September and 2 October 2020. According to CL:AIRE Technical Bulletin 17 (TB17) (CL:AIRE, 2018), the atmospheric pressure drop recorded above (0.5mb/hr) would be considered representative of normal barometric conditions. Atmospheric pressure drops greater than 1mb/hr are considered to be representative of worst-case conditions.
- 5.11.33 Sudden changes in all data parameters were noted in BH07030, BH07046, and BH07060 during the continuous monitoring programme. A closer look at the data suggests these sudden data changes represent periods when the monitoring instruments were deactivated for maintenance purposes.
- 5.11.34 The unsaturated zone exhibited maximum methane and carbon dioxide concentrations of 74.9% and 25.1%, respectively, with maximum hydrogen sulphide and carbon monoxide concentrations of 140.5ppm and 395.8ppm, respectively. Steady state flow rates ranged from -7.4l/hr to 26.3l/hr. Unsaturated zone monitoring wells were generally installed in the made ground, with BH07034 and BH07038 being screened across both the made ground and the Alluvium. The highest methane concentration was recorded in BH06014.
- 5.11.35 VOC headspace readings during the continuous ground gas monitoring programme ranged from <0.1ppm to 4,873.9ppm, with the highest reading being recorded in BH06014. VOC headspace readings greater than 1ppm were recorded in BH06014, BH06017, BH07038, BH07046, BH07060 and BH07064, all of which are located within the made ground or made ground/ Alluvium of the Goshems Farm Landfill (HLU0526), a credible contaminant source of VOCs, according to the PRA Report (Application Document 6.3, Appendix 10.6). Therefore, the VOC headspace readings are considered to be representative of the Goshems Farm Landfill and conform to the initial CSM.
- 5.11.36 On average, 17% of all VOC headspace readings were greater than 1ppm, with 41% of VOC readings in BH06014 and BH07064 being greater than 1ppm. The only corresponding evidence of VOC contamination was noted in the exploratory hole record of BH07060, with “possible hydrocarbon” recorded in the made ground, from 6.20m to 7.00m. No corresponding evidence of VOC contamination was observed at the above locations exhibiting headspace readings greater than 1ppm. An assessment of the risk from soil vapour has been undertaken in paragraphs 5.11.62 to 5.11.81.
- 5.11.37 The methane concentrations and flow rates in the unsaturated zone appear to be heavily influenced by groundwater level and atmospheric pressure changes. This is demonstrated by the graphs for BH06014, BH06017, BH07038 and BH07046.
- 5.11.38 The fluctuating ground gas concentrations observed in the above-mentioned monitoring wells, which have a strong negative relationship with atmospheric pressure, indicate that the response zone geologies represent ground gas pathways rather than ground gas generating sources (CL:AIRE, 2019). The further away from the ground gas source, the less frequent the ground gas concentrations ‘spikes’ are. The fluctuating ground gas concentrations were observed in both the made ground and natural ground stratum.

- 5.11.39 CL:AIRE's Technical Bulletin 18 (CL:AIRE, 2019) states that a continuous ground gas monitoring graph, representing a gas generating source, will be characterised by consistent ground gas concentrations that are unaffected by changes in atmospheric pressure. This was not observed in any of the monitoring wells with response zones within the made ground of the Goshems Farm Landfill (HLU0526). The absence of this trend suggests the Goshems Farm Landfill is not (always) generating ground gas, and is therefore past the peak of ground gas generation, in its landfill lifecycle. This conforms to the statement made in paragraph 5.10.10.
- 5.11.40 A review of the results shows that there appears to be no correlation between the ground gas concentrations and the response zone depth, from the top to the bottom of the made ground in the Goshems Farm Landfill (HLU0526).
- 5.11.41 The geological succession of the landfill sites within the Package B area is considered to comprise a landfill capping layer, fill material and the underlying natural ground. The low permeability capping layer is likely to restrict upward migration and emissions to the atmosphere. Therefore, ground gases within the landfill sites are anticipated to migrate laterally, especially during periods of falling atmospheric pressures and groundwater levels. This is supported by the fluctuating ground gas concentrations that correspond with falling atmospheric pressures and groundwater levels.
- 5.11.42 As previously stated in paragraph 5.11.22, the Goshems Farm Landfill (HLU0526) and the East Tilbury Landfills (HLU0523 and HLU0533) are raised landforms built on Alluvium, featuring thick continuous cohesive soils. Given that the cohesive soils form the upper portions of the Alluvium and groundwater levels are generally shallow beneath the Package B area, it is considered that ground gases generated from the landfills are likely to be restricted from migrating any significant distances laterally within the natural ground strata.
- 5.11.43 The continuous ground gas monitoring of the unsaturated zone indicates the made ground within the Goshems Farm Landfill (HLU0526) has a high-risk ground gas regime (equivalent to CS5), which is typical of a pre-1990s landfill. This conforms to the conclusion indicated by the periodic ground gas monitoring.
- 5.11.44 The ground gas regime within the natural ground (e.g., Alluvium, River Terrace Deposits and the Chalk) cannot be semi-quantitatively determined due to the response zones of corresponding monitoring wells being flooded and the geological formations being present beneath the water table. However, it is considered that organic materials within the saturated zone are degrading and producing large volumes of dissolved gases, evident by the elevated ground gases detected, which have come out of solution within the flooded monitoring wells. There is potential that the dissolved gases in the saturated zone could come out of solution during dewatering exercises to facilitate the proposed bored tunnel or earthworks and change the ground gas regime within the Package B Area. This would pose a potential short-term risk to construction workers during the construction phase works. As stated earlier, an assessment of continuous dissolved methane gas monitoring data has been undertaken in paragraphs 5.11.46 to 5.11.61.

5.11.45 It is considered the risks identified in the above discussions can be dealt with by the contractor, by implementing the commitments and mitigation measures detailed in the REAC (GS018, GS025 and GS027) and in the Remediation Options Appraisal and Outline Remediation Strategy (Application Document 6.3, Appendix 10.11).

Continuous dissolved gas monitoring results

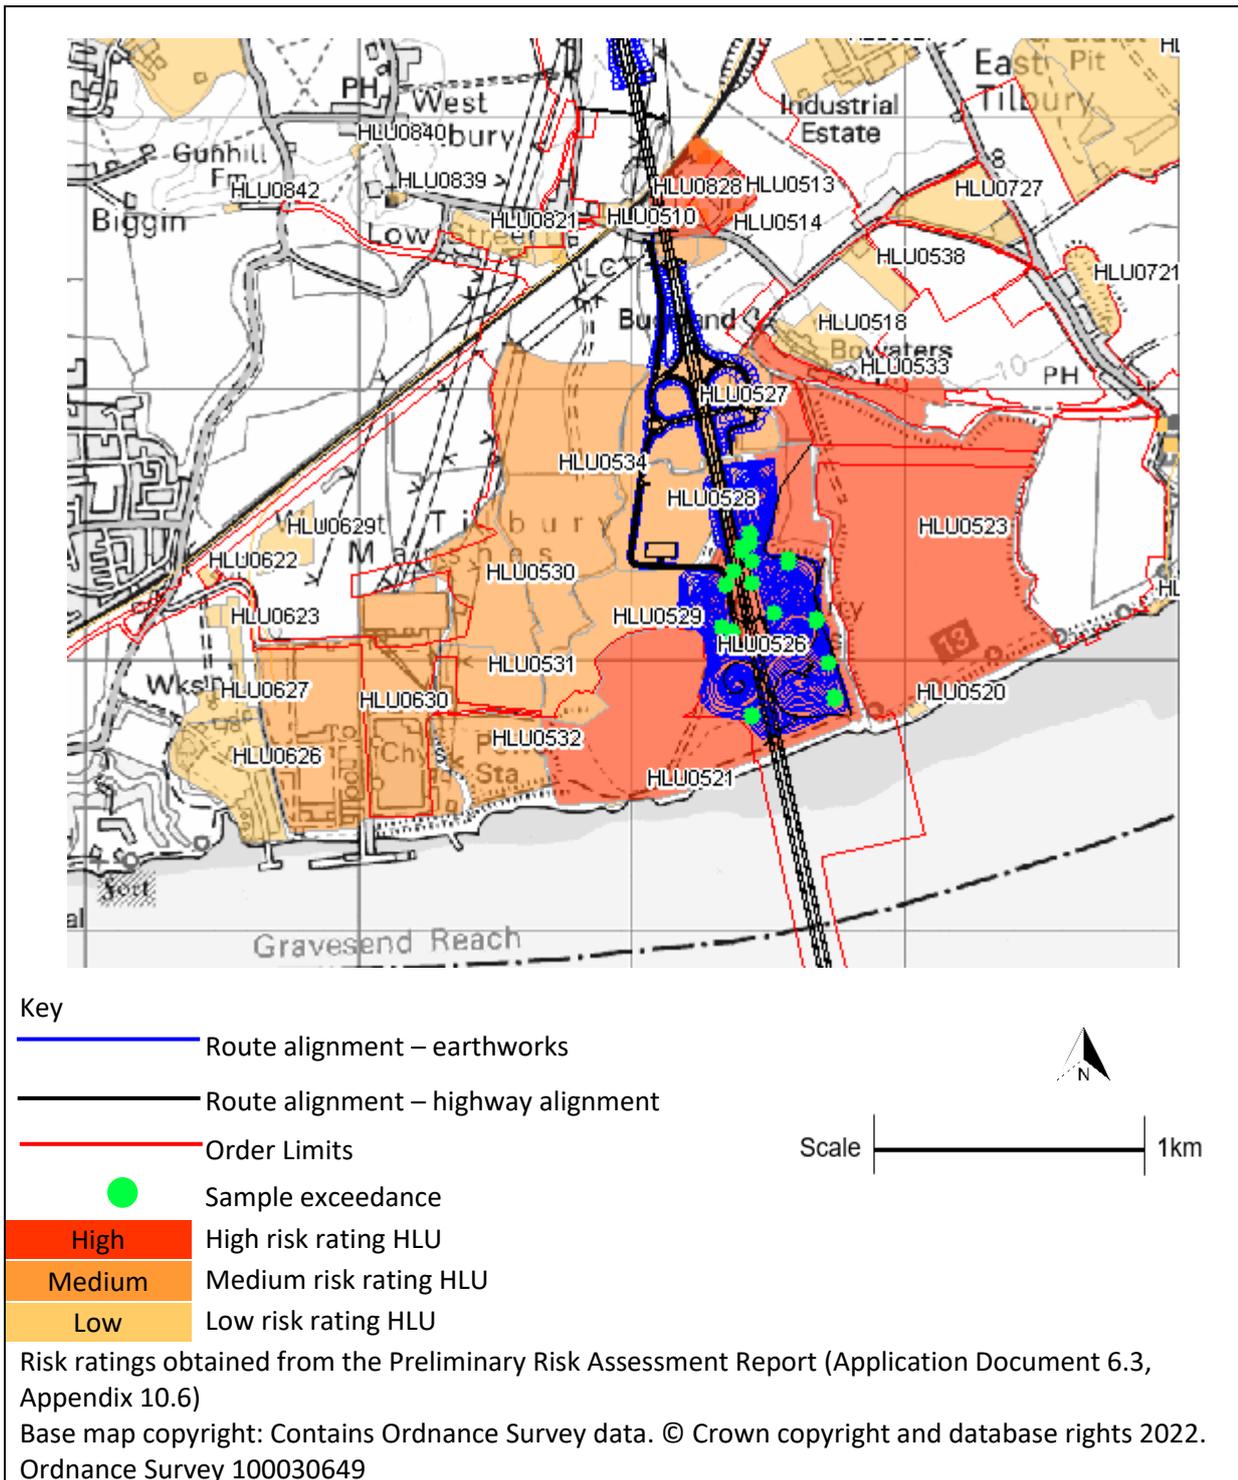

5.11.46 The results of the continuous dissolved gas monitoring are presented graphically in Annex B-K. Table 5.12 presents the minimum and maximum groundwater temperatures and dissolved methane concentrations recorded within the response zones over each geological formation. The results include data received as of March 2021.

5.11.47 The locations of the dissolved methane monitoring points are shown on Plate 5.12.

Table 5.12 Summary of groundwater temperature and dissolved methane

Response zone geology	Number of locations	Minimum groundwater temperature (C)	Maximum groundwater temperature (C)	Minimum dissolved methane (mg/l)	Maximum dissolved methane	
					(mg/l)	Location
Made Ground	9	-10.00	89.60	<0.01	51.72	BH0601 7
Made Ground/ Alluvium	2	-9.99	87.84	<0.01	51.62	BH0703 8
Alluvium	9	-12.49	89.97	<0.01	52.95	BH0706 6
Alluvium/ River Terrace Deposits	1	-9.84	87.63	<0.01	3.58	BH0705 3
Chalk	3	-10.00	87.79	<0.01	51.19	BH0702 1

Plate 5.12 Location of continuous dissolved methane monitoring points

5.11.48 The continuous dissolved gas monitoring results in Table 5.12 show groundwater temperatures ranged from -12.49oC to 89.97oC and dissolved methane concentrations ranged from <0.00mg/l to 52.95mg/l. Negative dissolved methane concentrations were recorded which were considered to be anomalous, and were subsequently removed from the risk assessment.

- 5.11.49 The graphs in Annex B-K show significant increases and declines in both groundwater temperatures and dissolved methane concentrations in July, November, December 2020, and January 2021. A closer look at the data suggests these sudden data changes represent data gaps when the monitoring instruments were deactivated for maintenance purposes. These sudden data changes are not considered to be anomalous and can therefore remain in the data set.
- 5.11.50 The highest dissolved methane concentration was recorded in the Alluvium of BH07066, but similarly high dissolved methane concentrations were recorded in BH06017 (made ground), BH07021 (Chalk), BH07024 (Alluvium) and BH07038 (made ground/ Alluvium). Thus, the highest dissolved methane concentrations are not specific to a formation.
- 5.11.51 There appears to be a cluster of exploratory holes (BH07038, BH07046 and BH07066), which recorded maximum dissolved methane concentrations greater than 10mg/l, in the north-western area of the Goshems Farm Landfill (HLU0526). This cluster does correlate with a cluster of exploratory holes (BH07038, BH07039, BH07046, BH07053, BH07060, BH07062, BH07063, BH07064, BH07065, BH07066, BH07096, BH07098 and BH07099) that recorded maximum methane gas concentrations greater than 10%, during the continuous gas monitoring programme. However, the high methane gas and dissolved methane concentrations were recorded across multiple strata and more continuous monitoring instruments appear to be installed in the north-western area of the landfill than anywhere else. Therefore, the clusters appear to be due to the ground investigation design rather than discrete sources.
- 5.11.52 Organic materials (e.g., black decomposing organic matter, peat, etc) were noted in the monitoring well response zones of BH06017 (made ground, 6.20m to 7.20m), BH07024 (Alluvium, 8.70m to 12.75m), and BH07066 (Alluvium, 12.50m to 14.20m). These organic materials are considered to be the source of the dissolved methane concentrations in the groundwater of these wells.
- 5.11.53 Hydrocarbons are also considered to be a source of dissolved methane in groundwater. Detectable dissolved concentrations of aliphatic and aromatic hydrocarbons were recorded in groundwater samples from all monitoring wells installed with a dissolved methane detection probe. Greater dissolved petroleum hydrocarbon concentrations were recorded in groundwater samples from other wells, not installed with a dissolved methane detection probe, during the monitoring programme.
- 5.11.54 A review of the graphs presented in Annex B-K shows that dissolved methane concentrations have no correlation with groundwater temperature, atmospheric pressures, and groundwater levels. No trend has been identified where (atmospheric or borehole) pressure drops and/or groundwater level rises, and the concentrations of methane gas and dissolved methane increases.
- 5.11.55 The continuous dissolved monitoring confirms the presence of dissolved methane gas within the perched groundwaters of the made ground and the Alluvium, and the groundwater bodies of the River Terrace Deposits, and the Chalk. According to Ground Gas Information Sheet No 2: Dissolved methane monitoring for ground gas risk assessment (Haines et al., 2018), dissolved methane is present in non-polluted groundwaters at relatively low

concentrations, up to 1.50mg/l. However, greater concentrations of dissolved methane are typically associated with landfills, hydrocarbon contamination and Alluvium. Dissolved methane concentrations greater than 1.50mg/l, which is considered a background concentration, have been recorded in all 24 monitoring wells during the continuous monitoring programme. These results suggest the groundwaters, in every formation, are enriched with dissolved methane. This conclusion conforms to the CSM and the groundwater assessment findings which identified hydrocarbon contamination in the groundwaters of the River Terrace Deposits and the Chalk.

- 5.11.56 Evidence of dissolved methane gas coming out of solution was represented by the presence of a 'saw-tooth' pattern on the continuous gas monitoring graphs for flooded monitoring wells BH06015, BH07020, BH07023, BH07024, BH07053 and BH07062, as discussed in paragraph 5.11.28. The peak methane gas concentrations from these exploratory holes ranged from 5.4% to 82.6% during the continuous monitoring programme. However, these methane gas concentrations are considered to be artificially high and unrepresentative of the true gas regime at the site because the headspace has been pressurised by the difference in the water levels within the monitoring well and in the surrounding strata.
- 5.11.57 The elevated concentrations of dissolved methane recorded only pose a risk to human health and properties if groundwater is discharged into confined spaces, such as shafts or tunnels (Haines et al., 2018). As stated previously, dewatering is likely to be required to facilitate the construction of the proposed north portal and earthworks. The dewatering exercises are likely to result in dissolved gases coming out of solution to occupy pores spaces within the unsaturated zone. This may also result in increased surface emissions due to increased gas permeability of partially saturated ground. Gas migration would subsequently occur within the increased thickness of unsaturated soils.
- 5.11.58 Gases may also be present as dissolved phase in the water being abstracted, and these gases may come out of solution as water comes to the surface. This is due to reduction in pressure. In addition, gases may be liberated at the point of surface discharge.
- 5.11.59 Dewatering, along with other proposed construction methods, such as bulk excavation and tunnel boring machines have the potential to create pathways along which the ground gases present in the area could migrate. Such migration could cause the various identified receptors, including construction workers and built structures, to become exposed to the ground gas creating a risk to health, safety, and structural integrity. Some of the potential impacts created from such exposure pathways include asphyxiation, death, explosion, corrosion, and negative impacts to the local air quality.
- 5.11.60 It should be noted that, during the post construction phase, the influence of temporary works measures (e.g. dewatering) should recede, and ground gas regimes are likely to return to approaching pre-construction baselines. Furthermore, the permanent works may result in a slight permanent reduction in groundwater levels, due to scheme drainage. The consequences may be that a greater thickness (of previously saturated made ground) is now within the unsaturated zone, where greater gas permeability and possibly greater rate of gas generation might be established and be sustained.

5.11.61 It is considered that risks identified in the above discussions can be dealt with by the Contractor, by implementing the commitments and mitigation measures detailed in the REAC (GS018 and GS025) and in the Remediation Options Appraisal and Outline Remediation Strategy (Application Document 6.3, Appendix 10.11). The ground gas risks, associated with dewatering works to facilitate the construction of the north portal, should be communicated to the designers of the groundwater control measures early in the Project design and should be an integral part of the Health and Safety file. Groundwater control measures would allow for the ventilation and prevent the build-up of ground gases during pumping.

Bulk gas and soil vapour

5.11.62 The results of the bulk gas and soil vapour analysed are provided in Annex B-L. Bulk gases and soil vapour exceeding the GAC are summarised in Table 5.13.

5.11.63 The locations of gas samples containing bulk gas and vapour exceedances are presented on Plate 5.13.

5.11.64 It should be noted that the Phase 2 Ground Investigation Factual Report (Perfect Circle, 2020) did not appear to detail the VOC/TPH analytical results in ug/m³, only parts per billion by volume (ppbv). However, the factual report does show a list of VOC/TPH determinands analysed, with units recorded as ppbv and ug/m³. Furthermore, Downloaded AGS data presents the VOC analytical results in ug/m², not in ug/m³. Therefore, it has been assumed that there has been a conversion error with the AGS data and that the VOC/TPH determinands were recorded in ug/m³, not ug/m², during the gas sample analysis, as this is considered to be a volumetric unit.

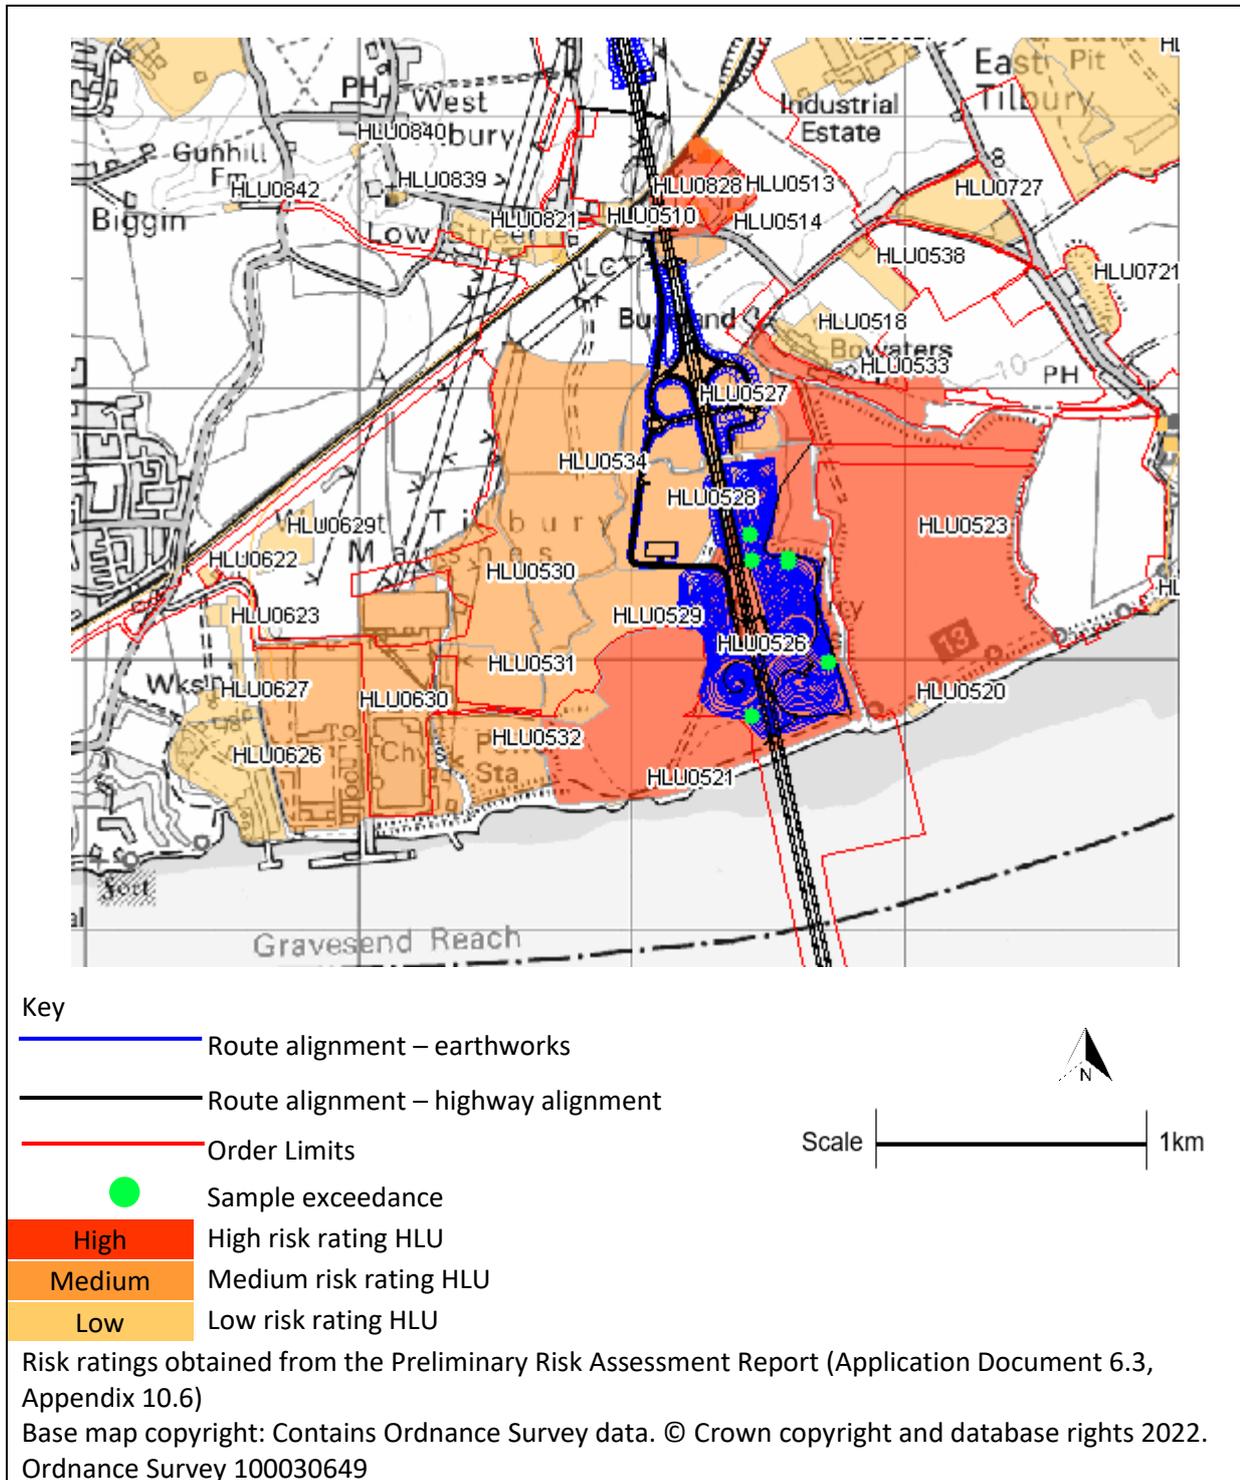

Table 5.13 Summary of bulk gas and soil vapour exceedances

Chemical name	Unit	WEL	AEAL	Number of samples	Number of exceedances	Max (or Min) exceedance	
						Concentration	Location
Made Ground							
Carbon dioxide	%	1.5	n/a	4	4	15.5	BH07064
Carbon di-sulphide	ug/m ³	1500 0	64	4	1	211	BH06014
Methane	%	1	n/a	4	4	29.1	BH07064
Oxygen	%	18	n/a	4	4	1.93	BH07060
Tetrachloroethene	ug/m ³	1380 00	40	4	1	483	BH07064
Alluvium							
Benzene	ug/m ³	3250	30	3	1	126	BH07023
Carbon dioxide	%	1.5	n/a	3	3	10.3	BH07065
Hexane	ug/m ³	n/a	720	3	1	1,620	BH07065
Methane	%	1	n/a	3	2	35.4	BH07065

Chemical name	Unit	WEL	AEAL	Number of samples	Number of exceedances	Max (or Min) exceedance	
						Concentration	Location
Oxygen	%	18	n/a	3	3	11.2	BH07065

Note: WEL – Workplace Exposure Limits.
 AEL – Environmental Assessment Levels.

Plate 5.13 Location of gas sampling points

- 5.11.65 It is noted that the results of some VOC/TPH determinands from all gas samples were below the laboratory MDL but higher than the GAC. Although none of those results have been recorded above the MDL, it is not possible to determine whether concentrations above the GAC are present given that the MDL itself is higher than the GAC. Further detailed explanation of the elevated MDL results is provided in paragraph 7.1.2.
- 5.11.66 Furthermore, no published GAC could be identified for a number of VOC/TPH determinands from the gas sample analysis. The Contractor should give consideration to deriving site-specific assessment criteria in order to assess these VOC/TPH determinands.
- 5.11.67 It should be noted that only one round of seven gas samples were collected from exploratory holes within the Goshems Farm Landfill (HLU0526). Given the heterogenous ground conditions in the made ground and the Alluvium, and variable groundwater levels within monitoring wells, the results collected to date may vary from future gas sampling rounds and may not be a true reflection of the ground gas and vapour conditions.
- 5.11.68 Table 5.13 indicates that there is widespread elevated carbon dioxide, methane, and depleted oxygen in gas samples from the made ground and the Alluvium, with discrete exceedances of the carbon di-sulphide, tetrachloroethene (known hereafter as PCE), benzene and hexane GAC. The VOC/TPH exceedances were generally one order of magnitude greater than their respective GAC.
- 5.11.69 The hazardous gases and vapours identified in the made ground of BH06014, BH07046, BH07060 and BH07064 are located within the boundary of the Goshems Farm Landfill (HLU0526). These contaminants are listed as COC for this credible contaminative source within the PRA Report (Application Document 6.3, Appendix 10.6). Consequently, the findings of the Phase 2 ground investigation conform to the initial CSM detailed in the PRA report.
- 5.11.70 The made ground in all exploratory holes recording elevated ground gases was generally more than 5.00m thick and contained fragments of demolition materials (e.g., brick, concrete, clinker, wood, and glass). Based on guidance outlined in BS 8576:2013 (British Standards Institution, 2013), the ground gases detected in gas samples are considered to be representative of the deep made ground observed.
- 5.11.71 Similar to the made ground locations, the hazardous gases and vapours detected in the Alluvium of BH07023, BH07065, and BH07066 are located beneath the Goshems Farm Landfill (HLU0526). These contaminants are listed as COC for this credible contaminative source within the PRA Report (Application Document 6.3, Appendix 10.6) and therefore the findings of the Phase 2 ground investigation conform to the initial CSM detailed in the PRA report.
- 5.11.72 The gas samples were collected from exploratory holes located on the northern, south-eastern (BH07023), and southern (BH06014) areas of the Goshems Farm Landfill (HLU0526), with BH06014, BH07046 and BH07060 potentially targeting the proposed route alignment and the north portal section. The vapour exceedances were recorded on southern (BH06014), south-eastern (BH07023) and north-eastern (BH07065) areas of the Goshems Farm Landfill, suggesting

the presence of localised VOC/TPH hotspots. However, ground conditions and headspace readings recorded in BH06014, BH07023, and BH07065 were also recorded in other exploratory hole locations within the Goshems Farm Landfill (HLU0526). Therefore, it is anticipated that if further gas samples were collected from exploratory holes outside the proposed route alignment but within the Goshems Farm Landfill (HLU0526), further vapour exceedances would be recorded.

- 5.11.73 No visual or olfactory evidence of VOC/TPH was recorded on exploratory hole or groundwater sampling records for BH06014, BH07023, BH07064, and BH07065, which exhibited elevated concentrations of carbon di-sulphide, PCE, benzene, and hexane, in the gas samples collected. However, evidence of hydrocarbon contamination was recorded on the exploratory hole records for BH07039 (made ground, 2.20m to 9.00m), BH07060 (made ground, 6.20m to 7.00m), BH07092 (made ground, 7.00m), BH07094 (made ground, 6.00m to 10.00m), BH07096 (made ground, 6.00m to 7.00m), which are located within the Goshems Farm Landfill (HLU0526).
- 5.11.74 On site headspace testing of soil samples from these locations recorded PID readings between <0.1ppm and 0.9ppm, suggesting the presence of VOCs at very low concentrations. These very low PID readings were reinforced by the absence of VOC/TPH human health exceedances in corresponding soil samples which were subjected to laboratory analysis.
- 5.11.75 PID readings from the headspace of all monitoring wells during the periodic monitoring programme ranged from <0.1ppm to 33.5ppm, with 2.7% of all readings being greater than 1ppm, and the highest being recorded in BH07098 on 4 May 2020. The continuous gas monitoring programme recorded VOC headspace concentrations between 0.1ppm and 4873.9ppm, with 17% of all readings being greater than 1ppm, and the highest concentration being recorded in BH06014 on multiple dates in December 2020, January, and February 2021. The highest VOC headspace readings (>10ppm) were observed in monitoring wells with response zones in the made ground and/or Alluvium.
- 5.11.76 The periodic monitoring suggests low VOC/TPH concentrations are present in groundwaters beneath the Package B area, whilst the continuous monitoring indicates very high VOC/TPH concentrations are present in the groundwaters beneath the Goshems Farm Landfill (HLU0526). However, no VOC/TPH groundwater exceedances, in respect to human health, were recorded during the laboratory analysis of corresponding groundwater samples.
- 5.11.77 The VOC/TPH results from the laboratory soil and groundwater analysis do not agree with the vapour headspace results from the monitoring programme and the gas sampling. The discrepancy between the datasets is likely to be the loss of VOCs/TPHs, through volatilisation and agitation during the sampling process.
- 5.11.78 The monitoring well response zones of BH06014, BH07023, BH07060, BH07064, BH07065 and BH07066 all experienced flooding during the monitoring programme. During the gas sampling on 4 July 2020, these wells were either partially (contained water in the response zone) or were fully flooded. It is considered that the changing groundwater levels in these wells may have caused dissolved phase gases and vapours to come out of solution

and build up in the headspace of the monitoring wells. Consequently, the ground gases and vapours recorded are considered to be artificially high and reflective of conditions in the saturated zone, not the unsaturated zone. This assumption conforms with the findings of the wider ground gas and the groundwater assessments, which suggests groundwaters in the made ground and Alluvium are enriched with methane and have been impacted by organic contaminants.

- 5.11.79 The discrete nature of organic contaminant exceedances in groundwater and gas samples suggests a series of organic contaminant hotspots/ plumes exist in the saturated zone of the made ground and Alluvium beneath the Goshems Farm Landfill (HLU0526).
- 5.11.80 There is potential that construction workers could be exposed to ground gases and vapours during the excavation works to facilitate the north portal and the main route alignment. Ground gases and vapours could intrude into temporary accommodation via service entry points and cause harm to site users. Dissolved gases and vapours could come out of solution during dewatering exercises, posing additional asphyxiation and explosion risks to the construction workers and property. Thus, plausible pollutant linkages are likely to be established during the construction works of the proposed project.
- 5.11.81 The above risks will be addressed by the Contractor, through commitments and mitigation measures outlined in the REAC (GS001, GS018, GS023, GS025, GS027, and GS028) and the Remediation Options Appraisal and Outline Remediation Strategy (Application Document 6.3, Appendix 10.11), respectively. This is likely to comprise site-specific vapour intrusion assessments, ongoing ground gas and vapour monitoring, and the incorporation of ground gas and vapour protection measures within temporary and permanent structures.

Conclusion

- 5.11.82 Significant ground gas and vapour risks to human health and property have been identified during this risk assessment, which require appropriate remediation. However, it is considered that the ground gas and vapour risks identified will be mitigated by the main works contractors, as per the commitments outlined in the REAC (GS001, GS018, GS023, GS025, GS027, and GS028) and the mitigation measures detailed in the Remediation Options Appraisal and Outline Remediation Strategy (Application Document 6.3, Appendix 10.11).

6 Refined Conceptual Site Model

- 6.1.1 Further to the assessment presented herein, the CSM for Package B has been refined. An updated version of the risk assessment presented in Annex 3 Part C of the PRA Report has been completed which has re-examined the severity and likelihood of the sources initially identified. This assessment has been provided in Annex B-A of this Report.
- 6.1.2 The updated outcomes from the risk assessment take into consideration the findings of the quantitative risk assessment undertaken within this report and the construction works / design proposals for the scheme within the Package B area.
- 6.1.3 The refined CSM has identified one high-risk site, seven medium risk sites and 50 low-risk sites within Package B.
- 6.1.4 Low-risk sites are where an unacceptable risk requiring further assessment has not been identified. Taking into account the proposed construction works and design proposals for the Project, of the 50 low risk sites identified within Package B, 27 have been assessed as needing no further consideration. For the remaining low risk sites, it is considered that for these sources, the measures secured within the Code of Construction Practice and REAC (Application Document 6.3) would be sufficient to manage any risks present.
- 6.1.5 Where sites are considered to be either medium or high risk, a residual or substantial risk remains which would require further consideration at the design or construction phase of the Project as detailed within the assessment in Annex B-A.
- 6.1.6 Widespread soil leachate and groundwater exceedances were recorded during the Phase 1 and 2 ground investigations. The soil leachate and groundwater exceedances observed in the made ground are considered to be attributed to credible sources of contamination discussed below. However, those exceedances observed in the natural ground formations are considered to be reflective of baseline conditions, saline intrusion or sources of contamination located up hydraulic gradient of the Package B area. Consequently, given the diffused nature of the groundwater contamination or the presence offsite sources of contamination, no significant groundwater remediation is considered feasible or is warranted.
- 6.1.7 Soil, groundwater, surface water, sediment, ground gas and vapour contamination has been identified within the Goshems Farm Landfill (HLU0526). Given the severity of the identified contamination, nature of the proposed Project, and identified receptors, plausible pollutant linkages are possible. Further assessment, remedial works and specific designs are required to facilitate the proposed Project. Therefore, the Goshems Farm Landfill is to remain as a high-risk site. Mitigation measures to deal with the risks identified are detailed in the Remediation Options Appraisal and Outline Remediation Strategy (Application Document 6.3, Appendix 10.11).
- 6.1.8 The East Tilbury Landfills (HLU0523 and HLU0533) were previously identified as high-risk sites by the Preliminary Risk Assessment Report (Application Document 6.3, Appendix 10.6) owing to the potential for the dewatering works to result in the release of contamination from the landfills. According to the East Tilbury Landfill Risk Assessment (Application Document 6.3, Appendix 10.7),

the East Tilbury Landfills (HLU0523 and HLU0533) are raised landforms that were constructed on cohesive Alluvium deposits. Numerical modelling and continuous pumping tests have concluded that the Alluvium acts as an aquitard, confining and creating artesian conditions within the underlying aquifers (the River Terrace Deposits and the Chalk). Pumping tests have also shown that the River Thames has no direct tidal influence on the groundwater within the Alluvium and thus the overlying East Tilbury Landfills. Furthermore, numerical modelling has confirmed that contaminants of concern from the East Tilbury Landfills are unlikely to reach the North Portal structure, within the timeframe of the proposed dewatering exercise. Given the above, it is considered that sensitive receptors within Package B are unlikely to be at an unacceptable risk from contaminants within the East Tilbury Landfills, as a result of the proposed dewatering works at the North Portal. Consequently, the risk rating for the East Tilbury Landfills can be downgraded from high to low.

- 6.1.9 Sediment leachate and surface water exceedances have been identified in perimeter ditches along the boundaries of the Tilbury Ash Disposal Sites (HLU0527 to HLU0531, and HLU0534). These landfills are located adjacent to the main works construction area and are intercepted by proposed utility work areas, thus there is potential that they will be disturbed by proposed construction activities, establishing possible plausible pollutant linkages with receptors on site. Given the nature of the contaminants, it is considered that the commitments outlined in the REAC (GS001, GS027 (if required) and GS028) should be sufficient to mitigate the contamination identified in the Tilbury Ash Disposal sites. The risk rating for the Tilbury Ash Disposal Sites is to remain as medium because there are areas of the sites that are yet to be subjected to intrusive ground investigation.
- 6.1.10 A single asbestos fibre detection was identified in the made ground of TP08004, within the boundary of the Low Street landfill (HLU0535) during the Phase 2 ground investigation. The landfill is located at the proposed main route alignment where the route is elevated on a viaduct and within an area of proposed intrusive utility works. There is potential that the contaminants identified could be disturbed by proposed construction activities, creating plausible pollutant linkages. Therefore, further consideration at the construction phase of the Project would be required. It is considered that the commitments outlined in the REAC (GS001, GS027 (if required) and GS028) and the precautions detailed in the Remediation Options Appraisal and Outline Remediation Strategy Report (Application Document 6.3, Appendix 10.11) should be sufficient to mitigate the contamination identified at the Low Street Landfill site. Consequently, this site has been downgraded from a high-risk to a medium-risk site.
- 6.1.11 The ground investigation has not indicated the presence of any unacceptable risks at the remaining 50 sites within Package B so the risk ratings for these sites have been reduced to low. Where sites are considered to be low risk, they take into consideration the commitments outlined within the REAC, such as environmental obligations along with standard construction approaches and actions that would be implemented during the construction and operational phases of the Project. The commitments for these requirements are made in the CoCP and REAC, including the specific requirements of GS001, GS006, GS018, GS026, GS027 and GS028.

7 Limitation analysis

- 7.1.1 There are uncertainties associated with the groundwater sampling and filtering methodology used, so the assessment has adopted a conservative approach by comparing the maximum filtered or unfiltered concentration of each determinand to the applicable GAC. Therefore, the risk assessment is considered robust in relation to evaluation of the risks arising from potential groundwater contamination which may exist within the Package B area.
- 7.1.2 The laboratory MDL for a number of determinands in soil leachate, groundwater, surface water and sediment leachate samples is higher than the EQS (but below the DWS). Elevated MDLs which also exceed the applicable GAC have been recorded. These results are not considered to reduce the reliability of the assessment, as the remaining samples do not have elevated MDL and meet the GAC or provide a more direct representation of the presence of source contamination (where concentrations exceed the GAC). If gross contamination were present, it is to be expected that this would be measured at detectable concentrations or observed during sampling activities. No contamination has been identified to date that cannot be managed using standard remediation/risk management practices.
- 7.1.3 There may be a degree of variability in environmental conditions between exploratory locations along the Project route. Therefore, it is not possible to fully delineate the extent or severity of potential contamination risk. It should be noted that there are areas of the Tilbury Ash Disposal Sites which have not been subjected to any intrusive investigation to date. Intrusive utility works and ancillary highways are proposed through some of the sites, resulting in potential pollutant linkages being created. Although no significant ground contamination was identified by the Phase 1 and 2 ground investigations, the potential for unidentified contamination still exists given the site's landfilling history. Therefore, further assessment and possibly remedial works are required during the construction phase of the Project.
- 7.1.4 Many of the monitoring wells installed had flooded response zones during the monitoring programme, due to perched groundwaters in the made ground and Alluvium or were not specifically installed for ground gas monitoring, such as those within the River Terrace Deposits and the Chalk. This has led to uncertainty around the concentrations of ground gases and flow rates recorded during the ground gas monitoring programme across the Package B area.
- 7.1.5 In addition, some of these flooded monitoring wells (BH08004, BH08008, BH08010, BH08013 and BH08023) were located outside credible sources of ground gas, such as landfills, and consequently the ground gas regime in low-risk areas of Package B has not been fully characterised.
- 7.1.6 Furthermore, equipment malfunctions and errors in data processing have raised questions regarding the reliability and validity of the continuous ground gas monitoring data. Data with errors and from flooded wells were ultimately eliminated from the risk assessment. However, given the high exploratory hole density and monitoring frequency, the remaining information available from field observations, laboratory testing, periodic ground gas monitoring and continuous

dissolved gas monitoring is sufficiently robust to characterise the ground gas regime beneath the Package B area.

- 7.1.7 It should be noted that the majority of ground gas monitoring wells, within Package B, were installed within the footprint of landfills (mainly the Goshems Farm Landfill) and very few were installed outside the landfills. Consequently, and as stated in paragraph 7.1.5, the ground gas regime of low-risk areas in Package B have not been fully characterised in comparison to the high-risk areas (e.g., landfills). The Contractor should consider undertaking a gap analysis of the monitoring in low-risk areas to determine if further ground gas monitoring is required.
- 7.1.8 Gas samples were collected from seven monitoring wells, over one sampling round, during the ground investigation, with three locations potentially targeting the proposed route alignment and north portal. Given the limited coverage of the gas sampling strategy, the reliability of the subsequent risk assessment could be challenged. Furthermore, the soil and groundwater analytical results did not agree with the onsite headspace PID readings, and the gas sampling results. In addition, there is uncertainty regarding the suitability of the GAC (e.g., workplace exposure limits and environmental assessment levels) used to assess VOCs/TPHs from gas samples, as well as the concentration of VOCs/TPHs detected below the MDL. Therefore, the Contractor should undertake further assessment of the vapour inhalation and/or intrusion pollutant linkage, as required, prior to the detailed design stage to confirm if risks to construction workers and property exist.
- 7.1.9 Microbial contamination and sewage-related organics were identified in the PRA as potential CoCs in the Package B area. Testing for these potential contaminants has not been undertaken as part of the ground investigation in the absence of visual evidence of impact observed. The sources of contaminant primarily relate to sewage works. Any impacts are considered to be of low likelihood and localised and can be dealt with as part of the requirements for a watching brief (REAC item GS028).
- 7.1.10 The assessment has not considered waste classification.

8 Conclusions and recommendations

8.1 Conclusions

8.1.1 The objective of this report was to carry out a GQRA of the data collected as part of the Phase 2 ground investigation and long-term monitoring for the Package B area. The report aimed to use the environmental data presented to highlight key risks relating to soil, soil leachate, groundwater, surface water and sediment contamination as well as ground gas and vapour. This GQRA has been undertaken in the early stages of the LCRM guidance, and therefore a precautionary approach has been adopted.

Summary of analysis

- 8.1.2 Out of 105 locations, 53 locations recorded exceedances against the GAC for metals and PAH, in both made ground and natural ground soil samples. Furthermore, asbestos containing materials and fibres were detected in 64 of the soil samples from 37 locations, with fibre concentrations ranging from <0.001% to 4.015% weight by weight (w/w). Visible asbestos containing materials were identified in six soil samples from the made ground. There is potential that the identified metal, PAH, and asbestos soil contamination will be disturbed by the proposed construction works, creating plausible pollutant linkages, in respect to human health, in Package B.
- 8.1.3 Of the 1,107 samples analysed for soil leachate, 1,105 recorded exceedances of the GAC for metals, inorganic compounds, and phenol. Of the samples recording exceedances, 747 were collected from the made ground and 358 were collected from the natural ground. The soil leachate exceedances from the made ground within landfills and Alluvium immediately below them are considered to be reflective of the credible contaminative sources. However, soil leachate exceedances located outside the landfills or within the underlying River Terrace Deposits and Chalk are considered to be representative of natural background concentrations.
- 8.1.4 From a human health perspective, no groundwater exceedances of the GAC were recorded and therefore the vapour risk to humans from groundwaters beneath Package B is considered to be low.
- 8.1.5 Widespread groundwater exceedances of the GAC for metals, inorganics, PAHs, phenol and TPH were recorded during the Phase 2 Ground Investigation, with discrete exceedances recorded for the PFAS, SVOC, organotin, pesticides, and BTEX GAC. The GQRA shows that groundwaters within the made ground of the landfills and the underlying Alluvium have been impacted by landfilling activities. However, given the absence of a hydraulic connection between the landfills and regional groundwaters, it appears the groundwater exceedances in the River Terrace Deposits and the Chalk are reflective of saline intrusion and contaminative sources up hydraulic gradient of the Package B area. There is potential that the Project will encounter contaminated groundwaters and create preferential pathways to more sensitive groundwater receptors.
- 8.1.6 Out of 15 sediment sample locations, two locations (GS07003 and GS07006) were found to contain lead exceedances of the human health GAC. In addition,

asbestos fibres were detected in GS07004 at 0.20m depth, with a fibre count of 0.004%w/w. The sediment contamination at these locations is positioned outside the boundary of proposed structures or earthworks but within main works construction areas. Consequently, a potential plausible pollutant linkage in the future cannot be fully discounted.

- 8.1.7 Widespread and discrete sediment leachate exceedances were recorded for the metals and inorganic GAC. In addition, all 15 surface water samples recorded exceedances of the metals, inorganic, and PAH GAC. The sediment leachate and surface water exceedances recorded are considered to be reflective of impacts from the adjacent landfills and as such represent existing baseline conditions. The proposed construction works are unlikely to introduce new preferential pathways to the drainage channels and surface water features.
- 8.1.8 Measured concentrations of ground gases and soil vapours from monitoring wells installed within the landfills within Package B exceed the screening criteria selected. The ground gases and vapours are considered to pose a potential risk to human health and property during the construction and operational phases of the Project. Furthermore, below ground structures have the potential to increase the unsaturated thickness and create preferential pathways, thus changing the ground gas regime and potentially increasing gas and vapour hazards within Package B. Therefore, further assessment, possible remediation and specific design is considered necessary to mitigate the risks from ground gases and vapours.

Refinement of CSM

- 8.1.9 The data has enabled the key potential risks to be identified and has been used to refine the preliminary risk assessment undertaken in the PRA Report. The refined CSM has identified one high-risk site, seven medium-risk sites and 50 low-risk sites.
- 8.1.10 Low-risk sites are where an unacceptable risk requiring further assessment has not been identified. Taking into account the proposed construction works and design proposals for the Project. Of the 50 low risk sites identified within Package B, 27 have been assessed as needing no further consideration. For the remaining low risk sites, the assessment takes into consideration the mitigation measures commitments outlined within the REAC, such as environmental obligations along with standard construction approaches and actions that would be implemented during the construction and operational phases of the Project. The commitment for these requirements is made in the COCP and REAC, including the specific requirements of GS001, GS006, GS018, GS026, GS027 and GS028.
- 8.1.11 Where sites are considered to a medium or high risk, a residual or substantial risk remains which would require further consideration at the construction phase of the Project as detailed within the assessment in Annex B-A. For medium risk sites, the commitment for this requirement is made in the REAC (GS001 and if required, GS027). For high-risk sites, the remediation measures detailed in the Remediation Options Appraisal and Outline Remediation Strategy report (Application Document 6.3, Appendix 10.11) should be consulted whilst designing proposed construction works and structures.

- 8.1.12 This assessment is presented in the Generic Quantitative Risk Assessment table in Annex B-A.
- 8.1.13 Soil, groundwater, surface water, sediment, ground gas and vapour contamination has been identified within the Goshems Farm Landfill (HLU0526). Given the severity of the identified contamination, nature of the proposed Project, and identified receptors, plausible pollutant linkages are possible. Further assessment, remedial works and specific designs are required to facilitate the proposed Project. Therefore, the Goshems Farm Landfill is to remain as a high-risk site. Mitigation measures to deal with the risks identified are detailed in the Remediation Options Appraisal and Outline Remediation Strategy (Application Document 6.3, Appendix 10.11).
- 8.1.14 The East Tilbury Landfills (HLU0523 and HLU0533) were previously identified as high-risk sites by the Preliminary Risk Assessment Report (Application Document 6.3, Appendix 10.6) owing to the potential for the dewatering works to result in the release of contamination from the landfills. According to the East Tilbury Landfill Risk Assessment (Application Document 6.3, Appendix 10.7), the East Tilbury Landfills (HLU0523 and HLU0533) are raised landforms that were constructed on cohesive Alluvium deposits. Numerical modelling and continuous pumping tests have concluded that the Alluvium acts as an aquitard, confining and creating artesian conditions within the underlying aquifers (the River Terrace Deposits and the Chalk). Pumping tests have also shown that the River Thames has no direct tidal influence on the groundwater within the Alluvium and thus the overlying East Tilbury Landfills. Furthermore, numerical modelling has confirmed that contaminants of concern from the East Tilbury Landfills are unlikely to reach the North Portal structure, within the timeframe of the proposed dewatering exercise. Given the above, it is considered that sensitive receptors within Package B are unlikely to be at an unacceptable risk from contaminants within the East Tilbury Landfills, as a result of the proposed dewatering works at the North Portal. Consequently, the risk rating for the East Tilbury Landfills can be downgraded from high to low.
- 8.1.15 Sediment leachate and surface water exceedances have been identified in perimeter ditches along the boundaries of the Tilbury Ash Disposal Sites (HLU0527 to HLU0531, and HLU0534). These landfills are located adjacent to the main works construction area and are intercepted by proposed utility work areas, thus there is potential that they will be disturbed by proposed construction activities, establishing possible plausible pollutant linkages with receptors on site. Given the nature of the contaminants, it is considered that the commitments outlined in the REAC (GS001, GS027 (if required) and GS028) should be sufficient to mitigate the contamination identified in the Tilbury Ash Disposal sites. The risk rating for the Tilbury Ash Disposal Sites is to remain as medium because there are areas of the sites that are yet to be subjected to intrusive ground investigation.
- 8.1.16 A single asbestos fibre detection was identified in the made ground of TP08004, within the boundary of the Low Street landfill (HLU0535) during the Phase 2 ground investigation. The landfill is located at the proposed main route alignment where the route is elevated on a viaduct and within an area of proposed intrusive utility works. There is potential that the contaminants identified could be disturbed by proposed construction activities, creating plausible pollutant linkages. Therefore, further consideration at the construction

phase of the Project would be required. It is considered that the commitments outlined in the REAC (GS001, GS027 (if required) and GS028) and the precautions detailed in the Remediation Options Appraisal and Outline Remediation Strategy Report (Application Document 6.3, Appendix 10.11) should be sufficient to mitigate the contamination identified at the Low Street Landfill site. Consequently, this site has been downgraded from a high-risk to a medium-risk site.

- 8.1.17 The ground investigation has not indicated the presence of any unacceptable risks at the remaining 48 sites (excluding the East Tilbury Landfill sites) in Package B so the risk ratings for these sites have been reduced to or remain as low. Where sites are considered to be low risk, they take into consideration the commitments outlined within the REAC (GS001, GS006, GS018, GS026, GS027 and GS028).
- 8.1.18 The assessment herein has shown that the route alignment within the Goshems Farm Landfill area is impacted with contamination and requires further assessment at the construction phase to facilitate the Project. However, it is considered the contamination outside this landfill is not as severe and the risks identified can be managed by standard construction procedures and protocols which are detailed as commitments within the REAC.
- 8.1.19 The Contractors would complete further ground investigations prior to construction to inform the detailed design of the Project and where supplementary investigation is required to assess residual contamination risks. The Contractors would provide ground investigation method statements for acceptance of National Highways in consultation with the Environment Agency prior to commencement of the works. The commitment for this requirement is made in the REAC (GS001).
- 8.1.20 The additional data will be used to help further refine the CSM as presented in the Preliminary Risk Assessment Report (Application Document 6.3, Appendix 10.6) and the Generic Quantitative Risk Assessment table within Annex B-A of this report.
- 8.1.21 Where supplementary investigation is undertaken to assess residual contamination risks in line with GS001, appropriate assessment would be undertaken and where unacceptable risks have been identified, the Contractor would develop proposals for site-specific remediation strategies and implementation plans in consultation with the relevant local authorities prior to implementation. The Contractors would have regard to the Remediation Options Appraisal and Outline Remediation Strategy (Application Document 6.3, Appendix 10.11), which identifies techniques that could be implemented by the Contractors for the remediation of contamination. The commitment for this requirement is made in the REAC (GS027).

Metal recycling facility	HLU0512	Current waste processing site including end-of-life vehicles and metal processing.	Metals, inorganics, petroleum hydrocarbons, PAH, VOC, SVOC, phenols, chlorinated hydrocarbons, PCB, asbestos.	Within Order Limits and study area	Taplow Gravel Member (Sand and Gravel)	Thanet Formation (Sand)	x		x	x	x	x	x	x								Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	71	Severe	Likely	High	Potential for unrecorded pollution to soil or groundwater from storage of materials and vehicle and metal processing. Main buildings and processes located off site. Location near north portal increases the potential for adverse effect on the route.	Proposed intrusive utility works are close to the potential source. The potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. Further investigation and mitigation will be required as detailed in the REAC.	Medium	Unlikely	Low	The requirement for further assessment and mitigation is detailed in the REAC.		
Wharves	HLU0521	Wharves and jetties for importing soil and waste materials. Historical railway.	Metals, asbestos, inorganics, petroleum hydrocarbons, PAH.	Within 250m study area	Alluvium (Clay, Silty, Peaty, Sandy). Tidal River Or Creek Deposits (Clay and Silt)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)	x		x				x	x	x							Secondary Aquifer - Undifferentiated; Unproductive Strata	Principal Aquifer	None	0	Minor	Likely	Low	Unlikely to be a significant risk but localised impacts to soil and sediment may be present from historical material storage or spillages.	The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.		
Poultry Farm, Buckland	HLU0518	Poultry farm established approximately 1961 to present	PAH, metals, inorganics, petroleum hydrocarbons, pesticides, asbestos, ammoniacal nitrogen, microbial contamination, hazardous gases.	Within Order Limits and study area	Lynch Hill Gravel Member (Sand and Gravel)	Thanet Formation (Sand)							x	x	x							Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	62	Minor	Likely	Low	Unlikely to be a significant risk due to likely size of potential primary sources and the degradable nature of contaminants. May influence local groundwater quality baseline.	The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.		
Historical Jetty South of East Tilbury Landfill	HLU0520	Former jetty (approximately 1948 to 1991). Potential waste transfer point and infilling related to partial demolition of the jetty.	Metals, inorganics, petroleum hydrocarbons, PAH, SVOC, VOC, chlorinated hydrocarbons, PCBs, ammoniacal nitrogen, PFAS, asbestos.	Within 250m study area	Tidal River Or Creek Deposits (Clay and Silt)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)			x	x	x	x	x	x	x							Unproductive Strata	Principal Aquifer	None	0	Minor	Likely	Low	Unlikely to be a significant risk but localised impacts to soil and sediment may be present from historical material storage or spillages.	The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.		
East Tilbury Landfill	HLU0523	Former hazardous waste landfill. Filling dates approximately 1932 to 1990 with recorded industrial, commercial and household wastes and liquids/sludge wastes	Metals, inorganics, petroleum hydrocarbons, PAH, SVOC, VOC, chlorinated hydrocarbons, PCBs, ammoniacal nitrogen, PFAS, asbestos, hazardous gas.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)	x	x	x	x	x	x	x	x	x	x						Secondary Aquifer - Undifferentiated; Unproductive Strata	Principal Aquifer	SPZ III	0	Severe	Likely	High	Potentially significant source of pollution to surface and groundwaters that could impact the route in the vicinity of the north portal. Potentially significant source of landfill gas. Location near north portal increases the potential for adverse effect on the route.	Potentially significant source of pollution to surface and groundwaters and potentially significant source of landfill gas that could impact the route in the vicinity of the north portal. Wetland habitats are also proposed to the east of the landfill and are a potential receptor. However, no development works are proposed on site. The East Tilbury Landfill Risk Assessment Report has confirmed that no plausible pollutant linkages will be created as a result of the proposed dewatering works associated with the North Portal. Therefore, no further consideration is required.	Severe	Unlikely	Low	No further consideration necessary.		
Goshems Farm Landfill	HLU0526	Former late 19th/early 20th century landfill, reportedly mostly ash and bottles, dock and river dredgings. Currently undergoing restoration.	Metals, inorganics, petroleum hydrocarbons, PAH, PFAS, ammoniacal nitrogen, asbestos, tributyltin (TBT), SVOC, VOC, hazardous gases.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)	x	x	x	x	x	x	x	x	x	x	x					Secondary Aquifer - Undifferentiated; Unproductive Strata	Principal Aquifer	SPZ III	0	Severe	Likely	High	Potential for wide range of contaminants to be present in area of north portal excavation. Adjacent to surface water and within SPZIII. Potential for ground gas generation from organic wastes (dredgings) and natural alluvium. Location near north portal increases the potential for adverse effect on the route.	Potentially significant source of pollution to surface and groundwaters and potentially significant source of landfill gas that could impact the route in the vicinity of the north portal. The potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. Therefore there is a possible plausible pollutant linkage. Results of the ground investigation have indicated the presence of potential heavy metal, asbestos and PAH soil and sediment contamination in the made ground and natural ground. Furthermore, elevated ground gases, and groundwater contamination has been recorded in the made ground and Alluvium beneath the site. Surface water and sediment leachate exceedances in perimeter ditches have also been attributed to the site. Therefore, the potential source requires further assessment and possible remedial works.	Severe	Likely	High	Requires further assessment and/or remedial works.		
Tilbury Ash Disposal Site - Area C2	HLU0527	PFA landfill for Tilbury Power Station (and potential for unrecorded disposal of other materials).	Metals, inorganics, petroleum hydrocarbons, PAH, ammoniacal nitrogen, asbestos, SVOC, VOC, hazardous gases.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk); Thanet Formation (Sand)	x	x	x	x	x	x	x	x	x	x	x	x				Secondary Aquifer - Undifferentiated	Principal Aquifer; Secondary Aquifer - A	SPZ III	0	Medium	Likely	Medium	Potential for a wide range of contaminants to be present but likely dominated by those associated with PFA. Potential impacts to groundwater and surface waters in the area of the north portal.	The potential source is located in the main construction works for the north portal, on the proposed alignment and in an area proposed for utility works. The potential source is likely to be disturbed by proposed construction or operation activities and as such a pathway may be created. Therefore there is a possible plausible pollutant linkage. Surface water and sediment leachate contamination has been recorded in perimeter ditches. Although no significant ground contamination was identified by the ground investigation, the potential for unidentified contamination still exists given the site's landfilling history. The potential source requires further assessment and possible remedial works.	Medium	Likely	Medium	Requires further assessment and/or remedial works.		
Tilbury Ash Disposal Site - Area C	HLU0528	PFA landfill for Tilbury Power Station (and potential for unrecorded disposal of other materials).	Metals, inorganics, petroleum hydrocarbons, PAH, ammoniacal nitrogen, asbestos, SVOC, VOC, hazardous gases.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)	x	x	x	x	x	x	x	x	x	x	x					Secondary Aquifer - Undifferentiated	Principal Aquifer	SPZ III	0	Medium	Likely	Medium	Potential for a wide range of contaminants to be present but likely dominated by those associated with PFA. Potential impacts to groundwater and surface waters in the area of the north portal.	The potential source is located in the main construction works for the north portal, on the proposed alignment and in an area proposed for utility works. The potential source is likely to be disturbed by proposed construction or operation activities and as such a pathway may be created. Therefore there is a possible plausible pollutant linkage. Surface water and sediment leachate contamination has been recorded in perimeter ditches. Although no significant ground contamination was identified by the ground investigation, the potential for unidentified contamination still exists given the site's landfilling history. The potential source requires further assessment and possible remedial works.	Medium	Likely	Medium	Requires further assessment and/or remedial works.		
Tilbury Ash Disposal Site - Area B	HLU0529	PFA landfill for Tilbury Power Station (and potential for unrecorded disposal of other materials).	Metals, inorganics, petroleum hydrocarbons, PAH, ammoniacal nitrogen, asbestos, SVOC, VOC, hazardous gases.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)	x	x	x	x	x	x	x	x	x	x						Secondary Aquifer - Undifferentiated	Principal Aquifer	SPZ III	0	Medium	Likely	Medium	Potential for a wide range of contaminants to be present but likely dominated by those associated with PFA. Potential impacts to groundwater and surface waters in the area of the north portal.	The potential source is located in the main construction works for the north portal and in an area proposed for utility works. The potential source is likely to be disturbed by proposed construction or operation activities and as such a pathway may be created. Therefore there is a possible plausible pollutant linkage. Surface water and sediment leachate contamination has been recorded in perimeter ditches. Although no significant ground contamination was identified by the ground investigation, the potential for unidentified contamination still exists given the site's landfilling history. The potential source requires further assessment and possible remedial works.	Medium	Likely	Medium	Requires further assessment and/or remedial works.		
Tilbury Ash Disposal Site - Area A3	HLU0530	PFA landfill for Tilbury Power Station (and potential for unrecorded disposal of other materials).	Metals, inorganics, petroleum hydrocarbons, PAH, ammoniacal nitrogen, asbestos, SVOC, VOC, hazardous gases.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)	x	x	x	x	x	x	x	x	x	x						Secondary Aquifer - Undifferentiated	Principal Aquifer	SPZ III	0	Medium	Likely	Medium	Potential for a wide range of contaminants to be present but likely dominated by those associated with PFA. Potential impacts to groundwater and surface waters in the area of the north portal. Location near north portal increases the potential for adverse effect on the route.	The site is located near to the main works area for the north portal and in an area proposed for utility works. The potential source is likely to be disturbed by proposed construction or operation activities and as such a pathway may be created. Therefore there is a possible plausible pollutant linkage. Surface water and sediment leachate contamination has been recorded in perimeter ditches. Although no significant ground contamination was identified by the ground investigation, the potential for unidentified contamination still exists given the site's landfilling history. The potential source requires further assessment and possible remedial works.	Medium	Likely	Medium	Requires further assessment and/or remedial works.		
Tilbury Ash Disposal Site - Area A2	HLU0531	PFA landfill for Tilbury Power Station (and potential for unrecorded disposal of other materials).	Metals, inorganics, petroleum hydrocarbons, PAH, ammoniacal nitrogen, asbestos, SVOC, VOC, hazardous gases.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)	x	x	x	x	x	x	x	x	x	x						Secondary Aquifer - Undifferentiated	Principal Aquifer	SPZ III	0	Medium	Likely	Medium	Potential for a wide range of contaminants to be present but likely dominated by those associated with PFA. Potential impacts to groundwater and surface waters in the area of the north portal. Location near north portal increases the potential for adverse effect on the route.	The site is located near to the main works area for the north portal and in an area proposed for utility works. The potential source is likely to be disturbed by proposed construction or operation activities and as such a pathway may be created. Therefore there is a possible plausible pollutant linkage. Surface water and sediment leachate contamination has been recorded in perimeter ditches. Although no significant ground contamination was identified by the ground investigation, the potential for unidentified contamination still exists given the site's landfilling history. The potential source requires further assessment and possible remedial works.	Medium	Likely	Medium	Requires further assessment and/or remedial works.		
Tilbury Ash Disposal Site - Area A1	HLU0532	PFA landfill for Tilbury Power Station (and potential for unrecorded disposal of other materials).	Metals, inorganics, petroleum hydrocarbons, PAH, ammoniacal nitrogen, asbestos, SVOC, VOC, hazardous gases.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)	x	x	x	x	x	x	x	x	x	x						Secondary Aquifer - Undifferentiated; Unproductive Strata	Principal Aquifer	None	0	Medium	Likely	Medium	Potential for a wide range of contaminants to be present but likely dominated by those associated with PFA. Potential impacts to groundwater and surface waters in the area of the north portal. Location near north portal increases the potential for adverse effect on the route.	The potential source is outside the Order Limits and will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Medium	Unlikely	Low	No further consideration necessary.		

Name	Ref. Sewage Works	HLU0626	Sewage treatment works (constructed approximately 1940) with extension to north (approximately 1990).	Metals, inorganics, sewage-related organics, PAH, ammoniacal nitrogen, microbial contamination, asbestos, hazardous gases, PFAS.	Outside both	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)						x	x					Secondary Aquifer - Undifferentiated	Principal Aquifer	None	0	Minor	Likely	Low	Unlikely to be a significant risk due to site encroaching on an area of the route which will be used temporarily for access and utility rerouting only.	The potential is located outside the red line boundary. No intrusive works are proposed. The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.									
Sewage Works - Northern Extension	HLU0627	Sewage treatment works (constructed approximately 1940) with extension to north (approximately 1990).	Metals, inorganics, sewage-related organics, PAH, ammoniacal nitrogen, microbial contamination, asbestos, hazardous gases, PFAS.	Within 250m study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)								x	x	x		Secondary Aquifer - Undifferentiated	Principal Aquifer	None	0	Minor	Likely	Low	Unlikely to be a significant risk.	The potential is located outside the red line boundary. No intrusive works are proposed. The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.									
Sewage Treatment Tanks	HLU0623	Sewage treatment tanks (constructed approximately 1950) disused and removed (by 1992).	Metals, inorganics, sewage-related organics, PAH, ammoniacal nitrogen, microbial contamination, asbestos, hazardous gases.	Within 250m study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)				x	x	x	x	x				Secondary Aquifer - Undifferentiated	Principal Aquifer	SPZ III	22	Minor	Likely	Low	Unlikely to be a significant risk.	The potential is located outside the red line boundary. No intrusive works are proposed. The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.									
Sewage Works - Aqueduct and water tanks	HLU0624	Aqueduct and water tanks constructed approximately 1950. Last shown 1991; no longer present at site.	Metals, inorganics, sewage-related organics, ammoniacal nitrogen, asbestos, micro-organisms, hazardous gas.	Within 250m study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)				x	x	x	x	x				Secondary Aquifer - Undifferentiated	Principal Aquifer	SPZ III	23	Minor	Likely	Low	Unlikely to be a significant risk.	The potential is located outside the red line boundary. No intrusive works are proposed. The potential source will not be disturbed by proposed construction or operation activities and as such no pathway will be created. Therefore there is no plausible pollutant linkage.	Minor	Unlikely	Low	No further consideration necessary.									
Electricity substation	HLU0622	Electricity substation facility north of Station Approach, approximately 1950 to present.	Petroleum hydrocarbons, PCB.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)	x	x				x	x	x			x	Secondary Aquifer - Undifferentiated	Principal Aquifer	SPZ III	3	Mid	Likely	Low	Potential for localised impacts to soil in the case of unrecorded releases of PCBs. Risk to water resources low given limited size of potential impact from hydrocarbons, aquifer classification and low mobility of PCBs.	The substation is located outside the development boundary but adjacent to proposed utility works. Whilst unlikely, the potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. If any localised impacts to soil are present that may be disturbed by proposed construction or operation activities, this can be dealt with by standard protocols including a watching brief and materials management, as required by the project REAC.	Mid	Unlikely	Low	Implementation of standard protocols including watching brief and materials management as detailed in the REAC as required.									
East Tilbury Landfill - northern extension	HLU0533	Former hazardous waste landfill. Filling dates approximately 1932 to 1990 with recorded industrial, commercial and household wastes and liquids/sludge wastes.	Metals, inorganics, petroleum hydrocarbons, PAH, SVOC, VOC, chlorinated hydrocarbons, PCBs, ammoniacal nitrogen, PFAS, asbestos, hazardous gas.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk); Thanet Formation (Sand)	x	x	x	x	x	x	x	x	x	x	x	Secondary Aquifer - A; Secondary Aquifer - Undifferentiated	Principal Aquifer; Secondary Aquifer - A	SPZ III	0	Severe	Likely	High	Potentially significant source of pollution to surface and groundwaters that could impact the route in the vicinity of the north portal. Hazardous materials may be present within landfill. Potentially significant source of landfill gas.	Potentially significant source of pollution to surface and groundwaters and potentially significant source of landfill gas that could impact the route in the vicinity of the north portal. Wetland habitats are also proposed to the east of the landfill and are a potential receptor. However, no development works are proposed on site. The East Tilbury Landfill Risk Assessment Report has confirmed that no plausible pollutant linkages will be created as a result of the proposed dewatering works associated with the North Portal. Therefore, no further consideration is required.	Severe	Unlikely	Low	No further consideration necessary.									
Tilbury Ash Disposal Site - Shed Marsh Landfill	HLU0534	PFA landfill for Tilbury Power Station (and potential for unrecorded disposal of other materials).	Metals, inorganics, petroleum hydrocarbons, PAH, SVOC, VOC, hazardous gases.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)	x	x	x	x	x	x	x	x	x	x	x	Secondary Aquifer - Undifferentiated	Principal Aquifer	SPZ III	0	Medium	Likely	Medium	Potential for a wide range of contaminants to be present but likely dominated by those associated with PFA. Potential impacts to groundwater and surface waters in the area of the north portal.	The potential source is located adjacent to the main works area for the north portal and intrusive utility works are proposed in the northern portion of the potential source. The potential source is likely to be disturbed by proposed construction or operation activities and as such a pathway may be created. Therefore there is a possible plausible pollutant linkage. Surface water and sediment leachate contamination has been recorded in perimeter ditches. Although no significant ground contamination was identified by the ground investigation, the potential for unidentified contamination still exists given the site's landfilling history. The potential source requires further investigation and mitigation will be required as detailed in the REAC.	Medium	Likely	Medium	Requires further assessment and/or remedial works.									
Low Street Landfill	HLU0535	Industrial/commercial landfill (1969 to 1976).	Metals, inorganics, petroleum hydrocarbons, PAH, PFAS, phenols, ammoniacal nitrogen, asbestos, hazardous gases, VOC, SVOC.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Thanet Formation (Sand)	x		x	x	x	x	x	x	x	x	x	Secondary Aquifer - Undifferentiated; Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	0	Severe	Likely	High	Potential for wide range of contaminants to be present in the area. Potential for ground gas generation from organic wastes (dredgings) and natural alluvium. Location near north portal increases the potential.	The site is located at the proposed main route alignment where the route is elevated on viaduct and at proposed intrusive utility works. The potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. Results of the ground investigation identified a single asbestos fibre detection in the made ground of TP08004. Therefore, further investigation and mitigation will be required as detailed in the REAC.	Medium	Likely	Medium	The requirement for further assessment and mitigation is detailed in the REAC.									
Gasworks, gasometer and retort	HLU0608	Gasworks, gasometer and retort are present in 1863. Marked as disused by 1892-1914 map	Metals, inorganics, aromatic hydrocarbons, PAH, phenols, asbestos and hazardous gases, coal dust, spent oxide foul lime, coal tar and ammoniacal liquor.	Within Order Limits and study area	Alluvium	Seaford Chalk Formation and Newhaven Chalk Formation (undifferentiated) (Chalk)	x		x	x	x	x	x				x	Secondary Aquifer - Undifferentiated	Principal Aquifer	None	20	Minor	Low likelihood	Low	Potential for soil and groundwater impacts where gasworks activities were located. Unlikely to be a significant risk as access route is currently in place as a surfaced main road.	The main works construction access route and secondary access route transects the potential source. Whilst unlikely, the potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. Therefore there is a possible plausible pollutant linkage. The potential source is of a scale that can be dealt with by standard protocols including a watching brief and materials management, as required by the project REAC.	Minor	Unlikely	Low	Implementation of standard protocols including watching brief and materials management as detailed in the REAC as required.									
Tilbury Junction railway, engine shed and sidings	HLU0609	Railway and sidings mapped from at least 1863. Engine shed shown on maps from 1944 - 1971	Asbestos, metals, inorganics and organics (including fuel oils, lubricating oils, greases, chlorinated and non-chlorinated solvents, phenols, PAH and PCB) and hazardous gas.	Within Order Limits and study area	Alluvium	Seaford Chalk Formation and Newhaven Chalk Formation (undifferentiated) (Chalk)	x		x	x	x	x	x			x	x	Secondary Aquifer - Undifferentiated	Principal Aquifer	None	10	Minor	Low likelihood	Low	Localised impacts to soil may be present from historical material storage or spillages and potential for encountering historic railway embankment and track ballast of unknown composition. Unlikely to be a significant risk as access route is currently in place as a surfaced main road.	The main works construction access route and secondary access route transects the potential source. Whilst unlikely, the potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. Therefore there is a possible plausible pollutant linkage. The potential source is of a scale that can be dealt with by standard protocols including a watching brief and materials management, as required by the project REAC.	Minor	Unlikely	Low	Implementation of standard protocols including watching brief and materials management as detailed in the REAC as required.									
Low Street Brickworks Landfill	HLU0536	Industrial landfill (1956 to 1977).	Metals, inorganics, petroleum hydrocarbons, PAH, PFAS, phenols, ammoniacal nitrogen, asbestos, hazardous gases, VOC, SVOC.	Within Order Limits and study area	Head (Clay, Silt, Sand and Gravel)	Thanet Formation (Sand)	x		x	x	x	x	x			x	x	Secondary Aquifer - Undifferentiated; Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	47	Severe	Likely	High	Potential for wide range of contaminants to be present in the area. Potential for ground gas generation from organic wastes (dredgings) and natural alluvium. Location near north portal increases the potential for adverse effect on the route.	Proposed intrusive utility works are close to the potential source. The potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. Further investigation and mitigation will be required as detailed in the REAC.	Medium	Unlikely	Low	The requirement for further assessment and mitigation is detailed in the REAC.

Depot	HLU0612	Industrial depot first recorded on maps in 1992. Later replaced with handstanding and warehouse new.	Metals, inorganics, petroleum hydrocarbons, PAH, phenols, VOC, SVOC and asbestos	Within Order Limits and study area	Alluvium	Seaford Chalk Formation and Newhaven Chalk Formation (undifferentiated) (Chalk)	x		x	x	x	x	x	x		x						Secondary Aquifer - Undifferentiated	Principal Aquifer	None	0	Minor	Low likelihood	Low	Potential for soil and groundwater impacts from historical depot material storage or spillages. Site area is currently occupied by a trailer storage company with a surfaced main road to the north.	The main works construction access route crosses a corner of the potential source to the north. Whilst unlikely, the potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. Therefore there is a possible plausible pollutant linkage. The potential source is of a scale that can be dealt with by standard protocols including a watching brief and materials management, as required by the project REAC.	Minor	Unlikely	Low	Implementation of standard protocols including watching brief and materials management as detailed in the REAC as required.		
Coalhouse Point Coal Wharf/	HLU0709	Wharf for coal deliveries constructed prior to 1777, now demolished. Possible timbers remain.	Metals, inorganics, petroleum hydrocarbons, PAH, asbestos, hazardous gases.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Lewes Nodular Chalk Formation, Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)				x			x	x	x							Secondary Aquifer - Undifferentiated	Principal Aquifer	None	0	Minor	Likely	Low	Unlikely to be a significant contaminant source to route due to distance and age of feature.	The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.		
Coal Wharf Tramway	HLU0707	Tramway constructed approximately 1860s, removed approximately 1948-1955.	Metals, petroleum hydrocarbons, PAH, asbestos.	Within 250m study area	Alluvium (Clay, Silty, Peaty, Sandy)	Lewes Nodular Chalk Formation, Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)				x			x	x	x							Secondary Aquifer - Undifferentiated	Principal Aquifer	SPZ III	0	Minor	Likely	Low	Unlikely to be a significant contaminant source to route due to distance and age of feature.	The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.		
Sewage Tank	HLU0704	Sewage tank near Coalhouse Fort, constructed approximately 1921.	Metals, petroleum hydrocarbons, PAH, PFAS, asbestos, microbial contamination, inorganics, hazardous gases.	Within 250m study area	Alluvium (Clay, Silty, Peaty, Sandy)	Lewes Nodular Chalk Formation, Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)				x	x	x	x	x								Secondary Aquifer - Undifferentiated	Principal Aquifer	SPZ III	23	Minor	Likely	Low	Unlikely to directly impact the route but may affect local groundwater quality in this area of the development boundary	The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.		
Pumping station	HLU0705	Sewage pumping station near Coalhouse Fort, constructed approximately 1990.	Metals, petroleum hydrocarbons, PAH, PFAS, asbestos, microbial contamination, inorganics, hazardous gases.	Within 250m study area	Alluvium (Clay, Silty, Peaty, Sandy)	Lewes Nodular Chalk Formation, Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)				x	x	x	x	x								Secondary Aquifer - Undifferentiated	Principal Aquifer	SPZ III	20	Minor	Likely	Low	Unlikely to directly impact the route but may affect local groundwater quality in this area of the development boundary	The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.		
East Tibury Battery	HLU0721	Constructed approximately 1889-1890. Decommissioned approximately 1913, but remains are still present at the site.	Metals, petroleum hydrocarbons, PAH, explosives, sulphates.	Within Order Limits and study area	River Terrace Deposits (Undifferentiated) (Clay and Silt)	Thanet Formation (Sand, Silt and Clay)	x			x			x	x	x		x					Secondary Aquifer - Undifferentiated	Secondary Aquifer - A	SPZ III	105	Minor	Likely	Low	Unlikely to be a significant risk. Localised impacts to soil may be present from historical material storage or spillages.	The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.		
Saltings Landfill	HLU0728	Former landfill for river dredging, inert waste and liquid sludge approximately 1988-1993.	Metals, inorganics, TBT, hazardous gases.	Within Order Limits and study area	Beach and Tidal Flat Deposits (Undifferentiated) (Clay, Silt and Sand)	Lewes Nodular Chalk Formation, Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk); Thanet Formation (Sand, Silt and Clay)							x	x	x							Secondary Aquifer - Undifferentiated	Principal Aquifer; Secondary Aquifer - A	SPZ III	0	Minor	Likely	Low	Potential for range of contaminants to be present. Potential for ground gas generation from organic wastes (dredgings) and natural aluminium. Confined spaces and human health receptors are assumed to be absent. May influence local groundwater quality baseline.	The landfill is located beyond the red line boundary and no intrusive works are proposed on the site. Proposed ecological habitat mitigation is proposed adjacent to the south west of the potential source. Whilst unlikely, there is a possible plausible pollutant linkage. The potential source is of a scale that can be dealt with by standard protocols including a watching brief and materials management, as required by the project REAC.	Minor	Low Likelihood	Low	Implementation of standard protocols including watching brief and materials management as detailed in the REAC as required.		
Goshems Farm	HLU0538	Farmyard and farm buildings.	PAH, metals, inorganics, petroleum hydrocarbons, pesticides, asbestos, ammoniacal nitrogen, microbial contamination, hazardous gases.	Within Order Limits and study area	Lynch Hill Gravel Member (Sand and Gravel)	Thanet Formation (Sand)			x		x	x	x				x	x				Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	408	Minor	Likely	Low	Unlikely to be a significant risk due to likely size of primary sources. Localised impacts to soil may be present from historical material storage or spillages.	Proposed utility works run along the west and south boundaries of the potential source. Though unlikely, the potential source may be disturbed by proposed construction or operation activities. If any localised impacts to soil are present that may be disturbed by proposed construction or operation activities, this can be dealt with by standard protocols including watching brief and materials management, as required by the project REAC.	Minor	Unlikely	Low	Implementation of standard protocols including watching brief and materials management as detailed in the REAC as required.		
Infilled pond adjacent and north of Station Road	HLU0514	Small pond potentially infilled by 1939.	Metals, asbestos, petroleum hydrocarbons, PAH, inorganics, hazardous gases.	Within Order Limits and study area	Head (Clay, Silt, Sand and Gravel)	Thanet Formation (Sand)	x		x	x	x	x	x	x		x						Secondary Aquifer - Undifferentiated	Secondary Aquifer - A	SPZ III	47	Minor	Likely	Low	Unlikely to be a significant risk due to size of source and age of the fill material. Mostly beneath existing Station Road.	The potential source will not be disturbed by proposed construction or operation activities and as such no pathway will be created. Therefore there is no plausible pollutant linkage.	Minor	Unlikely	Low	No further consideration necessary.		
Former railway engine house	HLU0828	Railway cisterns, wells and engine house. Extant prior to 1865. Removed between 1967 and 1973.	Metals, PAH, petroleum hydrocarbons, PCB, inorganics, phenols, asbestos.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Thanet Formation (Sand)	x		x	x	x	x	x	x	x	x	x	x				Secondary Aquifer - Undifferentiated; Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	0	Medium	Likely	Medium	Localised impacts to soil may be present from historical material storage or spillages. Location near north portal increases the potential for adverse effect on the route.	Proposed intrusive utility works cross the potential source. The potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. Further investigation and mitigation will be required as detailed in the REAC.	Mild	Likely	Low	The requirement for further assessment and mitigation is detailed in the REAC.		
Tibury East Railway Sidings	HLU0625	Railway and sidings mapped from 1959 to 1966. Dismantled by 1973.	Metals, petroleum hydrocarbons, asbestos, inorganics, PAH, VOC and SVOC	Within Order Limits and study area	Alluvium	Seaford Chalk Formation and Newhaven Chalk Formation (undifferentiated) (Chalk)	x		x	x	x	x	x	x		x						Secondary Aquifer - Undifferentiated	Principal Aquifer	None	0	Minor	Low likelihood	Low	Localised impacts to soil may be present from historical material storage or spillages and potential for encountering historic railway embankment and track ballast of unknown composition. Unlikely to be disturbed given the access route is currently in place as a surfaced main road.	The main works construction access route and historical material storage or spillages are the potential source. Whilst unlikely, the potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. Therefore there is a possible plausible pollutant linkage. The potential source is of a scale that can be dealt with by standard protocols including a watching brief and materials management, as required by the project REAC.	Minor	Unlikely	Low	Implementation of standard protocols including watching brief and materials management as detailed in the REAC as required.

Former brickworks at Low Street	HLU0524	Brickworks, kiln and gravel pit constructed prior to 1921, and demolished between 1955 and 1961.	Metals, inorganics, phenols, asbestos, PAH.	Within Order Limits and study area	Taplow Gravel Member (Sand and Gravel)	Thanet Formation (Sand)	x						x	x							Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	57	Minor	Likely	Low	Unlikely to be a significant risk due to age and pre-dating the current land use. Localised impacts to soil may be present from historical material storage.	Though unlikely, the potential source may be disturbed by proposed construction or operation activities. If any localised impacts to soil are present that may be disturbed by proposed construction or operation activities, this can be dealt with by standard protocols including watching brief and materials management, as required by the project REAC.	Minor	Low Likelihood	Low	Implementation of standard protocols including watching brief and materials management as detailed in the REAC as required.			
Electricity substation	HLU0802	Constructed circa 1961, still present in 2017.	PCB, petroleum hydrocarbons.	Within Order Limits and study area	No superficial deposits	Thanet Formation (Sand)	x		x				x	x							Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	147	Mild	Likely	Low	Potential for unrecorded releases of PCBs. Risk to water resources low given limited size of potential impact from hydrocarbons, aquifer classification and low mobility of PCBs.	The substation is located in an area adjacent to proposed intrusive works. The potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. If any localised impacts to soil are present that may be disturbed by proposed construction or operation activities, this can be dealt with by standard protocols including watching brief and materials management, as required by the project REAC.	Mild	Low Likelihood	Low	Implementation of standard protocols including watching brief and materials management as detailed in the REAC as required.			
Electricity substation	HLU0803	Constructed circa 1961, still present in 2017.	PCB, petroleum hydrocarbons.	Within Order Limits and study area	No superficial deposits	Thanet Formation (Sand)	x		x				x	x							Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	213	Mild	Likely	Low	Potential for unrecorded releases of PCBs. Risk to water resources low given limited size of potential impact from hydrocarbons, aquifer classification and low mobility of PCBs.	The substation is located in an area of proposed intrusive utility works. The potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. If any localised impacts to soil are present that may be disturbed by proposed construction or operation activities, this can be dealt with by standard protocols including watching brief and materials management, as required by the project REAC.	Mild	Low Likelihood	Low	The requirement for further assessment and mitigation is detailed in the REAC.			
Electricity substation	HLU0804	Constructed circa 1961, still present in 2017.	PCB, petroleum hydrocarbons.	Within Order Limits and study area	No superficial deposits	Thanet Formation (Sand)	x		x				x	x							Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	175	Medium	Likely	Medium	Potential for unrecorded releases of PCBs. Risk to water resources low given limited size of potential impact from hydrocarbons, aquifer classification and low mobility of PCBs.	The substation is located in an area of proposed intrusive utility works. The potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. If any localised impacts to soil are present that may be disturbed by proposed construction or operation activities, this can be dealt with by standard protocols including watching brief and materials management, as required by the project REAC.	Mild	Low Likelihood	Low	The requirement for further assessment and mitigation is detailed in the REAC.			
Electricity substation	HLU0805	Constructed circa 1961, still present in 2017.	PCB, petroleum hydrocarbons.	Within Order Limits and study area	No superficial deposits	Thanet Formation (Sand)	x		x				x	x							Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	126	Mild	Likely	Low	Potential for unrecorded releases of PCBs. Risk to water resources low given limited size of potential impact from hydrocarbons, aquifer classification and low mobility of PCBs.	The substation is located in an area adjacent to proposed intrusive works. The potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. If any localised impacts to soil are present that may be disturbed by proposed construction or operation activities, this can be dealt with by standard protocols including watching brief and materials management, as required by the project REAC.	Mild	Low Likelihood	Low	The requirement for further assessment and mitigation is detailed in the REAC.			
Power Station Works (tanks and hopper)	HLU0629	Constructed c.1967-1973.	Metals, coal constituents (PAH, sulphur), petroleum hydrocarbons, VOC, SVOC, asbestos.	Within 250m study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)	x		x	x	x	x	x	x	x	*	x				Secondary Aquifer - Undifferentiated	Principal Aquifer	SPZ III	0	Minor	Likely	Low	Localised impacts to soil may be present from historical material storage or spillages.	The potential is located outside the red line boundary. No intrusive works are proposed. The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.			
Tilbury Power Station	HLU0630	Former fossil fuel power station 1950s to 2013. Major fire in 2012.	Metals, coal constituents (PAH, sulphur), nitrogen oxides, petroleum hydrocarbons, VOC, SVOC, PCB, PFAS, asbestos.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)	x		x	x	x	x	x	x	x	*	x				Secondary Aquifer - Undifferentiated	Principal Aquifer	SPZ III	0	Medium	Likely	Medium	Potential for soil impacts where power station activities have impacted soil within the development boundary. Impacts to soil may be present from historical material storage or spillages. May impact baseline groundwater quality and indirectly affect soil quality through aerial deposition. Location near north portal.	The main works construction access route transects the potential source. Utilities works are proposed in the north east of the potential source. Given this, and that the potential source is located near to the north portal, the potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. Further investigation and monitoring may be required.	Medium	Low Likelihood	Low	The requirement for further assessment and mitigation is detailed in the REAC.			
Disused P6 to South of Station Road	HLU0515	Suspected partially backfilled disused gravel pit, south of Station Road.	Metals, inorganics, PAH, petroleum hydrocarbons, asbestos, hazardous gases.	Within Order Limits and study area	Taplow Gravel Member (Sand and Gravel)	Thanet Formation (Sand)	x		x	x	x	x	x	x	x	*	x	x	x	x	Secondary Aquifer - Undifferentiated; Secondary Aquifer - A	Principal Aquifer; Secondary Aquifer - A	SPZ III	0	Medium	Likely	Medium	Site is shown on OS map as a disused pit but localised infilling or dumping may have taken place. Location near north portal increases the potential for adverse effect on the route.	The potentially infilled pit is located beneath the main route alignment and intrusive utility works. The potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. Therefore there is a possible plausible pollutant linkage. If occurs, disturbance to the potential source can be dealt with by standard protocols including a watching brief and materials management, as required by the project REAC.	Medium	Low Likelihood	Low	The requirement for further assessment and mitigation is detailed in the REAC.			
Suspected quarry fill	HLU0537	Suspected area of fill south of Station Road.	Metals, inorganics, PAH, petroleum hydrocarbons, asbestos, hazardous gases.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk); Thanet Formation (Sand)	x		x	x	x	x	x	x	x	*	x	x	x	x	Secondary Aquifer - Undifferentiated; Secondary Aquifer - A	Principal Aquifer; Secondary Aquifer - A	SPZ III	0	Medium	Likely	Medium	Site is shown on OS map as a disused pit but localised infilling or dumping may have taken place. Location near north portal increases the potential for adverse effect on the route.	The western half of the potential source is located below the main route alignment. Utilities works are proposed in the central portion and in the north east. The potential source may be disturbed by proposed construction or operation activities. If any localised impacts to soil are present that may be disturbed by proposed construction or operation activities, this can be dealt with by standard protocols including watching brief and materials management, as required by the project REAC.	Mild	Low Likelihood	Low	Implementation of standard protocols including watching brief and materials management as detailed in the REAC as required.			
Princess Margaret Road Landfill	HLU0724	Active landfill taking 'other wastes' (construction, demolition, dredgings). Historical deposition of inert and non-hazardous commercial and industrial waste since the 1980s.	Petroleum hydrocarbons, PAH, PFAS, inorganics, metals, asbestos, VOC, SVOC, ammoniacal nitrogen, hazardous gases, TBT.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Thanet Formation (Sand, Silt and Clay); Thanet Formation (Sand)				x	x	x	x	x	*						Secondary Aquifer - Undifferentiated	Secondary Aquifer - A	SPZ III	0	Minor	Likely	Low	Operational landfill. Potential for wide range of contaminants to be present. Potential wider impacts to surrounding soil. May influence baseline groundwater quality.	Princess Margaret Road landfill is located beyond the red line boundary. The site is adjacent to an area of the route proposed for ecological mitigation. The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.			
Infilled pond at metal recycling facility	HLU0513	Former ponds at metal works, potentially infilled between 1973 and 1991.	Metals, inorganics, PAH, petroleum hydrocarbons, asbestos, hazardous gases.	Within 250m study area	Taplow Gravel Member (Sand and Gravel)	Thanet Formation (Sand)			x	x	x	x	x	*							Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	165	Minor	Likely	Low	Potential for unrecorded pollution to soil or groundwater from infill materials. Potential size of source is relatively small.	No construction or operation activities are proposed at the potentially infilled pond, which is also now the location of a metal recycling facility (HLU0512). The potential source will not be disturbed by proposed construction or operation activities and as such no pathway will be created. Therefore there is no plausible pollutant linkage.	Minor	Unlikely	Low	No further consideration necessary.			
Infilled pond at metal recycling facility	HLU0525	Former ponds at metal works, potentially infilled between 1973 and 1991.	Metals, inorganics, PAH, petroleum hydrocarbons, asbestos, hazardous gases.	Within 250m study area	Taplow Gravel Member (Sand and Gravel)	Thanet Formation (Sand)			x	x	x	x	x	*							Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	87	Minor	Likely	Low	Potential for unrecorded pollution to soil or groundwater from infill materials. Potential size of source is relatively small.	No construction or operation activities are proposed at the potentially infilled pond, which is also now the location of a metal recycling facility (HLU0512). The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.

Electricity substation	HLU0504	Electricity substation, constructed prior to 1961.	PCB, petroleum hydrocarbons.	Within 250m study area	Taplow Gravel Member (Sand and Gravel)	Thanet Formation (Sand)							x			x	x	x											Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	134	Minor	Likely	Low	Potential for unrecorded releases of PCBs. Off-site source reduces potential severity. Human health receptors not identified and risk to water resources low given limited size of potential impact from hydrocarbons and low mobility of PCBs.	The substation is located in an area where no intrusive works are proposed. The land adjacent to the substation is proposed for temporary main works construction area. The potential source may be disturbed by proposed construction activities and as such a pathway may be created. Therefore there is a possible plausible pollutant linkage. If occurs, disturbance to the potential source can be dealt with by standard protocols including a watching brief and materials management, as required by the project REAC.	Minor	Low Likelihood	Low	Implementation of standard protocols including watching brief and materials management as detailed in the REAC as required.			
Electricity substation	HLU0505	Electricity substation, constructed prior to 1961.	PCB, petroleum hydrocarbons.	Within 250m study area	No superficial deposits	Thanet Formation (Sand)							x			x	x	x											Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	153	Minor	Likely	Low	Potential for unrecorded releases of PCBs. Human health receptors not identified and risk to water resources low given limited size of potential impact from hydrocarbons and low mobility of PCBs.	The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.			
Electricity substation	HLU0506	Electricity substation, constructed prior to 1961.	PCB, petroleum hydrocarbons.	Within 250m study area	No superficial deposits	Thanet Formation (Sand)							x			x	x	x											Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	141	Minor	Likely	Low	Potential for unrecorded releases of PCBs. Human health receptors not identified and risk to water resources low given limited size of potential impact from hydrocarbons and low mobility of PCBs.	The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.			
East Tilbury Quarry	HLU0725	Landfill taking other wastes (construction, demolition, dredgings). Possible illegal dumping of asbestos waste.	Petroleum hydrocarbons, PAH, inorganics, metals, asbestos, VOC, SVOC, ammoniacal nitrogen, hazardous gases, TBT.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Thanet Formation (Sand, Silt and Clay); Thanet Formation (Sand)							x	x		x	x	x	x	*								Secondary Aquifer - Undifferentiated; Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	0	Minor	Likely	Low	Operational landfill. Potential for wide range of contaminants to be present. Potential wider impacts to surrounding soil. May influence baseline groundwater quality.	East Tilbury Quarry is located beyond the red line boundary. The site is adjacent to an area of the route proposed for ecological mitigation. The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.				
Low Lane landfill	HLU0727	Landfill operational approximately 1934-1990 for inert, industrial and commercial waste.	Petroleum hydrocarbons, PAH, PFAS, inorganics, metals, asbestos, VOC, SVOC, ammoniacal nitrogen, hazardous gases.	Within Order Limits and study area	Lynch Hill Gravel Member (Sand and Gravel)	Thanet Formation (Sand)										x	x											Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	355	Minor	Likely	Low	Unlikely to significantly impact the route. Assumed no confined spaces or human health receptors to be present. Potential wider impacts to surrounding soil. May influence wider groundwater baseline quality.	The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.				
Former Bata shoe factory and Thames industrial park	HLU0827	Shoe factory constructed approximately 1938 and closed 2005.	VOC, SVOC, metals, petroleum hydrocarbons, phenols.	Within 250m study area	Taplow Gravel Member (Sand and Gravel)	Thanet Formation (Sand)										x	x	x	*									Secondary Aquifer - Undifferentiated; Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	0	Minor	Likely	Low	Localised impacts to soil may be present from historical material storage or spillages.	The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.				
Former railway sidings at brickworks	HLU0830	Constructed between 1898 and 1921, possibly removed between 1955 and 1961.	Metals, petroleum hydrocarbons, asbestos, inorganics, PAH, VOC, SVOC.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Thanet Formation (Sand)	x		x	x	x	x	x	x	x	x	x	x	x	x								Secondary Aquifer - Undifferentiated; Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	24	Medium	Likely	Medium	Localised impacts to soil may be present from historical material storage or spillages. Location near north portal increases the potential for adverse effect on the route.	Proposed intrusive utility works cross the potential source. The potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. Further investigation and mitigation will be required as detailed in the REAC.	Mild	Likely	Low	The requirement for further assessment and mitigation is detailed in the REAC.				
Low Street Railway (Tilbury Loop)	HLU0605	Existing railway line.	Metals, inorganics, petroleum hydrocarbons, PAH asbestos.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy); Taplow Gravel Member (Sand and Gravel)	Thanet Formation (Sand); Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)	x		x		x	x	x	x	*	x	x	x	x	x	x							Secondary Aquifer - Undifferentiated; Secondary Aquifer - A	Principal Aquifer; Secondary Aquifer - A	SPZ III	0	Minor	Low likelihood	Low	Unlikely to be a significant risk. Contaminants of low mobility (hydrocarbons likely heavy end), reducing potential for risk to controlled waters.	The main route alignment crosses over the railway tracks as a bridge. The tracks will remain in place during the works. Intrusive utility works are proposed around and over the railway. The potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. Therefore there is a possible plausible pollutant linkage. If occurs, disturbance to the potential source can be dealt with by standard protocols including a watching brief and materials management, as required by the project REAC.	Minor	Low Likelihood	Low	The requirement for further assessment and mitigation is detailed in the REAC.				
Former Low Street Railway Station	HLU0510	Former railway station 1861 to 1967.	Metals, inorganics, petroleum hydrocarbons, PAH asbestos.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk); Thanet Formation (Sand)	x		x	x	x	x	x	*	x	x	x	x	x									Secondary Aquifer - Undifferentiated	Principal Aquifer; Secondary Aquifer - A	SPZ III	71	Minor	Low likelihood	Low	Unlikely to be a significant risk. Contaminants aged and of low mobility (hydrocarbons likely heavy end), reducing potential for risk to controlled waters.	The former station is located within proposed utility working areas. The potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. Therefore there is a possible plausible pollutant linkage. The potential source is of a scale that can be dealt with by standard protocols including a watching brief and materials management, as required by the project REAC.	Minor	Low Likelihood	Low	Implementation of standard protocols including watching brief and materials management as detailed in the REAC as required.				
Power Station railway branch lines	HLU0606	Branch lines to former Tilbury Power Station.	Metals, inorganics, petroleum hydrocarbons, PAH asbestos.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)	x		x		x	x	x	*	x				x									Secondary Aquifer - Undifferentiated	Principal Aquifer	SPZ III	0	Minor	Low likelihood	Low	Unlikely to be a significant risk. Contaminants of low mobility (hydrocarbons likely heavy end), reducing potential for risk to controlled waters.	Utility networks and a construction access route coincide with the potential source. The potential source may be disturbed by proposed construction or operation activities and as such a pathway may be created. Whilst unlikely, there is a possible plausible pollutant linkage. The potential source is of a scale that can be dealt with by standard protocols including a watching brief and materials management, as required by the project REAC.	Minor	Unlikely	Low	Implementation of standard protocols including watching brief and materials management as detailed in the REAC as required.				
Power Station railway branch lines	HLU0607	Branch lines to former Tilbury Power Station.	Metals, inorganics, petroleum hydrocarbons, PAH asbestos.	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)	x		x		x	x	x	*	x				x									Secondary Aquifer - Undifferentiated	Principal Aquifer	SPZ III	0	Minor	Low likelihood	Low	Unlikely to be a significant risk. Contaminants of low mobility (hydrocarbons likely heavy end), reducing potential for risk to controlled waters.	The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.				
Barvills Farm	HLU0729	Farmyard and farm buildings mapped from 1967. Potential gravel extraction/landfilling	Ammoniacal nitrogen, petroleum hydrocarbons, PAH, pesticides, herbicides, asbestos, metals, inorganics, microbial contamination, hazardous gases.	Within Order Limits and study area	Lynch Hill Gravel Member (Sand and Gravel)	Thanet Formation (sand)							x			x	x											Secondary Aquifer - A	Secondary Aquifer - A	SPZ III	310	Minor	Likely	Low	Unlikely to be a significant risk due to likely size of potential primary sources and the degradable nature of contaminants. May influence local groundwater quality baseline.	The potential source will not be disturbed by proposed construction or operation activities and as such it is unlikely any pollutant pathway will be created.	Minor	Unlikely	Low	No further consideration necessary.				
Ground Gas within Alluvium and Peat Deposits	HLU9901	Ground gas, principally methane, with low oxygen levels, stored within peat layers in Alluvium in soil gas and dissolved phase.	Hazardous gases	Within Order Limits and study area	Alluvium (Clay, Silty, Peaty, Sandy)	Lewes Nodular Chalk Formation, Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)							x	x	x	x	x	x	x									N/A	N/A	None	N/A	Severe	Likely	High	Potential for release of stored geological methane within peat deposits during construction. Sufficient methane release may cause catastrophic damage to buildings or infrastructure. Potential for migration and release of dissolved methane during dewatering or similar.	Refer to the respective Package CLRAs for specific risk assessments where required	Location specific	Location specific	Location specific	Location specific				
Ground Gas within chalk	HLU9902	Ground gas, principally carbon dioxide, with low oxygen levels, within chalk strata in soil gas and dissolved phase.	Hazardous gases	Within Order Limits and study area	Various	Lewes Nodular Chalk Formation, Seaford Chalk Formation and Newhaven Chalk Formation (Undifferentiated) (Chalk)							x	x	x	x	x	x	x										N/A	N/A	None	N/A	Mild	Likely	Low	Potential for encountering high levels of carbon dioxide in confined spaces such as tunnel portals and during dewatering which may require additional controls to be in place.	Refer to the respective Package CLRAs for specific risk assessments where required	Location specific	Location specific	Location specific	Location specific

Env Stds Comments
#1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg may be appropriate for the remaining trivalent chromium (CrIII).
#2:C4SL for lead adopted
#3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury is present in an inorganic form, a value of 120mg/kg for inorganic mercury may be appropriate
#4:Updated S4UL for nickel
#5:S4UL exceeds solubility saturation limit
#6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
#7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
#8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	
36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	
38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	
38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenyl

Legend
 >36.2 Results exceeds GAC.
 <50 Results MDL is greater than GAC.
 NAD No asbestos detected.
 - Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	
8.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	
38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenyl

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenyl

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	Results exceeds GAC.
>50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
#1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
#2:C4SL for lead adopted
#3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
#4:Updated S4UL for nickel
#5:S4UL exceeds solubility saturation limit
#6:Criteria derived for Al>C16-C35 split between Al>C16-21 & Al>C21-35. Requires summation of fractions to use Al>C16-C35 criteria.
#7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
#8:S4UL based on a threshold protective of direct skin contact with phenyl

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adoped
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	
36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

8.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenyl

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adoped
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

35.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

86.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

8.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	
38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	Results exceeds GAC.
>50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	Results exceeds GAC.
>50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenyl

Legend

8.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	
8.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	
38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	Results exceeds GAC.
>50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	Results exceeds GAC.
8.2	Results MDL is greater than GAC.
<50	No asbestos detected.
NAD	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	
38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

8.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	
36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Alⁱ-C16-C35 split between Alⁱ-C16-21 & Alⁱ-C21-35. Requires summation of fractions to use Alⁱ-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenyl

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

8.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	
38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	
38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	
38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	Results exceeds GAC.
>50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	Results exceeds GAC.
>50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

32.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	
38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	Results exceeds GAC.
>50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend	
38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

8.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al³-C16-C35 split between Al³-C16-21 & Al³-C21-35. Requires summation of fractions to use Al³-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CVI) data is available, a value of 1,500mg/kg r
 #2:C4SL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Alⁱ-C16-C35 split between Alⁱ-C16-21 & Alⁱ-C21-35. Requires summation of fractions to use Alⁱ-C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.
 #8:S4UL based on a threshold protective of direct skin contact with phenol

Legend

38.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
NAD	No asbestos detected.
-	Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Annex B-C Soil leachate assessment screening results

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.

Environmental Standards Comments

#1:Water Supply (Water Quality) Regulations 2016.
 #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
 #3:Operational Targets and EQS. EA, April 2018
 #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
 #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
 #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
 #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
 #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5)))
 #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
 #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
 #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
 #12:Operational Targets and EQS. EA, April 2018.
 #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
 #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
 #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
 #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
 #17:Water Supply (Water Quality) Regulations 2016. As SO4.
 #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
 #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes

A range is given where a determinand has been analysed for by more than one method.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfduk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5)))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes

A range is given where a determinand has been analysed for by more than one method.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Environmental Standards Comments

#1:Water Supply (Water Quality) Regulations 2016.
 #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
 #3:Operational Targets and EQS. EA, April 2018
 #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
 #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
 #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
 #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
 #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5)))
 #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
 #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
 #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
 #12:Operational Targets and EQS. EA, April 2018.
 #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
 #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
 #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
 #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
 #17:Water Supply (Water Quality) Regulations 2016. As SO4.
 #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
 #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5)))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5)))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfduk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5)))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5)))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfduk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes

A range is given where a determinand has been analysed for by more than one method.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes

A range is given where a determinand has been analysed for by more than one method.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes

A range is given where a determinand has been analysed for by more than one method.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Environmental Standards Comments

- #1:Water Supply (Water Quality) Regulations 2016.
- #2:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.

- #3:Operational Targets and EQS. EA, April 2018
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
- #6:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #7:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #8:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies (3.76*(2.677*(DOC2+0.5))
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Informal value.
- #12:Operational Targets and EQS. EA, April 2018.
- #13:Operational Targets and EQS. EA, April 2018. Lowest criteria presented (<200mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #16:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
- #17:Water Supply (Water Quality) Regulations 2016. As SO4.
- #18:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>
- #19:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes

A range is given where a determinand has been analysed for by more than one method.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes

A range is given where a determinand has been analysed for by more than one method.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes

A range is given where a determinand has been analysed for by more than one method.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes

A range is given where a determinand has been analysed for by more than one method.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes

A range is given where a determinand has been analysed for by more than one method.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes

A range is given where a determinand has been analysed for by more than one method.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes

A range is given where a determinand has been analysed for by more than one method.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes

A range is given where a determinand has been analysed for by more than one method.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes
A range is given where a determinand has been analysed for by more than one method.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes

A range is given where a determinand has been analysed for by more than one method.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes

A range is given where a determinand has been analysed for by more than one method.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes
A range is given where a determinand has been analysed for by more than one method.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes

A range is given where a determinand has been analysed for by more than one method.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes

A range is given where a determinand has been analysed for by more than one method.

Legend

36.2	Results exceeds GAC.
<50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes

A range is given where a determinand has been analysed for by more than one method.

Environmental Standards Comments

- #1:NVP - No vapour pathway. Contaminant has only a low vapour pressure in groundwater.
- #2:Water Supply (Water Quality) Regulations 2016.
- #3:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #4:Operational Targets and EQS. EA, April 2018
- #5:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #6:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO₃). See 'further assessment' if criteria exceeded and hardness (CaCO₃) data available.
- #7:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #8:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #9:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies $[3.76+(2.677x((DOC/2)-0.5))]$
- #10:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/rivers-lakes-metal-bioavailability-assessment-tool-m-bat>
- #11:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Bioavailable (bio) fraction. M-BAT tool to assess: <http://wfd.uk.org/resources/rivers-lakes-metal-bioavailability-assessment-tool-m-bat>
- #12:GAC presented is for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury is present in an inorganic form, no vapour pathway (NVP) is present.
- #13:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #14:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Based on taste rather than a formal guideline.
- #15:Operational Targets and EQS. EA, April 2018. Dissolved plus ambient background concentration. For saltwater, an Ambient Background Concentration of 1.1 µg/l has been used.
- #16:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #17:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO₃). See 'further assessment' values if criteria exceeded and hardness (CaCO₃) data available.
- #18:Water Supply (Water Quality) Regulations 2016. As NO₃.
- #19:Water Supply (Water Quality) Regulations 2016. As SO₄.
- #20:>SOL - Target acceptable risk not exceeded at theoretical solubility concentration
- #21:Water Supply (Water Quality) Regulations 2016. Value of 0.1µg/l for PAH split between four individual PAH. Requires summation of benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(ghi)perylene and indeno(123cd)pyrene to use 0.1µg/l value.
- #22:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Benzo(a)pyrene can be considered as a marker for other PAH for comparison with the corresponding AA-EQS in water.
- #23:NR - No appropriate inhalation reference dose identified during review of toxicological data
- #24:na - Comprises multiple contaminants - no GAC derived
- #25:No UK DWS for total petroleum hydrocarbons (TPH), or speciated TPH fractions. A value of 10 µg/l is adopted for sum TPH based on the rescinded Private Water Supply Regulations, 1991.
- #26:No UK EQS for total petroleum hydrocarbons (TPH), or speciated TPH fractions. A value of 50 µg/l is adopted for sum TPH protection of surface water based on 50µg/l-1000µg/l (Surface Waters (Abstraction for Drinking Water) Regulations 1989).
- #27:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011
- #28:Proposed Environmental Quality Standard, in absence of legislative standard (Ayscough et al., 2002). https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/291223/sp2-115-tr4-e-e.pdf
- #29:Criteria derived for sum xylenes split between isomers. Requires summation of m,p & o isomers to use sum xylenes criteria.
- #30:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Value of 500µg/l for sum xylenes split between isomers. Requires summation of m,p & o isomers to use 500µg/l value.

#31:Operational Targets and EQS. EA, April 2018. Value of 30µg/l for sum xylenes split between isomers. Requires summation of m,p & o isomers to use 30µg/l value.

#32:The taste and odour threshold of 15µg/l is commonly adopted as a guide.

#33:The taste and odour threshold of 15µg/l is commonly adopted as a guide. In situations where there is no risk to a drinking water supply or aquifer, a PNEC value of 2,600µg/l may be used.

#34:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Value of 140µg/l for tetrachloroethane split between 2 isomers. Requires summation of 2 isomers to use 140µg/l value.

#35:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. In Scotland a value of 200µg/l is used (WAT-PS-10-01).

#36:US EPA Regional Screening Levels, May 2019. <https://www.epa.gov/risk/regional-screening-levels-rsls-generic-tables>

#37:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. In Scotland a value of 7µg/l is used (WAT-PS-10-01).

#38:Water Supply (Water Quality) Regulations 2016. Value of 100µg/l for sum trihalomethanes split between individual compounds. Requires summation of chloroform, bromoform, chlorodibromomethane and bromodichloromethane to use 100µg/l value.

#39:Guidelines for Drinking-water Quality, 4th Edition. WHO, 2011. Value of 50µg/l for sum cis & trans-DCE split between isomers. Requires summation of cis & trans-DCE isomers to use 50µg/l value.

#40:Water Supply (Water Quality) Regulations 2016. Value of 10µg/l for sum of TCE & PCE split between individual compounds. Requires summation of TCE & PCE to use 10µg/l value.

#41:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Value of 0.4µg/l for sum isomers split between 3 isomers. Requires summation of isomers to use 0.4µg/l value.

#42:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Value of 20µg/l for sum isomers split between 3 isomers. Requires summation of isomers to use 20µg/l value.

#43:Position statement (WAT-PS-10-01), SEPA August 2014.

#44:Tier 2. DWI, Jan 21. Guidance on the Water Supply (Water Quality) Regulations 2016 specific to PFOS (perfluorooctane sulphonate) and PFOA (perfluorooctanoic acid) concentrations in drinking water.

#45:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015 for PFOS and its derivatives.

#46:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Value of 0.025µg/l for sum DDT isomers split between 4 isomers. Requires summation of 4 isomers to use 0.025µg/l value.

#47:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Value of 0.005µg/l for sum isomers split between 4 isomers. Requires summation of isomers to use 0.005µg/l value.

#48:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Value of 0.01µg/l for sum isomers split between 4 isomers. Requires summation of isomers to use 0.01µg/l value.

#49:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Relates to p,p-DDT (CAS 50-29-3)

#50:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Annex B-E Human health groundwater GAC values and derivation

INTERNALLY DERIVED GENERIC ASSESSMENT CRITERIA FOR GROUNDWATER

NR
na
NVP

Target acceptable risk not exceeded at theoretical solubility concentration
No appropriate inhalation reference dose identified during review of toxicological data
Comprises multiple contaminants - no GAC derived
Contaminant has low vapour pressure in groundwater

SUMMARY

The purpose of this document is to describe the general principles adopted in the derivation of the Arcadis' Generic Assessment Criteria (GAC). The document and associated GAC underpins the generic quantitative risk assessments Arcadis undertakes for its clients and is not intended for any other use or use by others. Guidance has been provided by the EA to aid development of GAC which are appropriate for a typical England or Wales site, incorporating conservatism where warranted. Arcadis has used the EA guidance to develop in-house GAC to aid assessment of land contamination sites. In particular, to assess risks to human health receptors from chronic health effects from groundwater. The following non-statutory technical guidance has been referred to in deriving the GAC.

- EA Science Reports SC050021/SR2, SC050021/SR3 and SC050021/SR7.
- Related Toxicity and Soil Guideline Value reports
- SP1010: Development of Category 4 Screening Levels for Assessment of Land Affected by Contamination

The GAC used within this report have been derived for "low density residential end use". Low density residential end use assumes small terraced houses without basements, which may include gardens and/or other open areas.

Arcadis has undertaken environmental works on hundreds of potentially contaminated sites across the UK. The typical shallow geology encountered comprises granular soils or made ground, with a low organic matter content. As such, Arcadis has taken the decision to derive in-house GAC for a *sand* rather than sandy loam soil-type used by the EA to derive Soil Guideline Values, with an organic matter content of 0.34% (fraction of organic carbon content 0.002, typical of many sites).

To derive Human Health GAC (HH-GAC), the following exposure pathways are considered active for potential groundwater on-site exposures:

Site End-Use	On-Site Pathways
Low Density Residential (0-6 year old female child)	<ul style="list-style-type: none"> • Inhalation of vapours outside from a groundwater source • Inhalation of vapours inside from a groundwater source

The following modelling tools have been utilised in the derivation of the GAC:

HH-GAC: RBCA Toolkit v2.6

Example model inputs are presented in the following tables.

	Air-water partition co-efficient		Diffusion co-efficient in air		Diffusion co-efficient in water		Relative molecular mass		Vapour pressure		Water solubility		Koc	Notes

RBCA Toolkit EXPOSURE DATA		Age Class
		0-6
Averaging time	yrs	6
Body weight	kg	13.3
Exposure duration	yrs	6
Averaging time (vapour flux)	yrs	6
Exposure frequency (indoors)*	days yr-1	365
Exposure frequency (outdoors)*	days yr-1	16.8

Notes:

Time-weighted average used for 0-6 year old female child

* RBCA Toolkit compares an acceptable air concentration to a predicted air concentration. Only the exposure frequency can be modified (i.e. inhalation rate, time exposed cannot). As such, the TDSI (or ID) was converted to an acceptable indoor air concentration using the time-weighted properties for a 0-6 year old female child as defined within the Category 4 Screening Levels. The exposure frequency for other scenarios was modified to account for the differing exposure scenarios for the remaining pathways, to be equivalent to modifying the inhalation rate and time exposed.

Annex B-F Sediment screening results

Env Stds Comments
 #1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CrVI) data is available, a value of 1,500mg/kg may be appropriate for the remaining trivalent chromium (CrIII).
 #2:CASL for lead adopted
 #3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury is present in an inorganic form, a value of 120mg/kg for inorganic mercury may be appropriate
 #4:Updated S4UL for nickel
 #5:S4UL exceeds solubility saturation limit
 #6:Criteria derived for Al>C16-C35 split between Al>C16-21 & Al>C21-35. Requires summation of fractions to use Al>C16-C35 criteria.
 #7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.

Legend
 36.2 Results exceeds GAC.
 <50 Results MDL is greater than GAC.
 - Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
#1:GAC is only presented as speciated chromium. 7.7mg/kg is used for hexavalent. If hexavalent chromium (CrVI) data is available, a value of 1,500mg/kg may be appropriate for the remaining trivalent chromium (CrIII).
#2:CASL for lead adopted
#3:GAC only presented as speciated mercury. 16mg/kg is used for elemental mercury. If the CSM indicates that elemental mercury is not a CoC and mercury is present in an inorganic form, a value of 120mg/kg for inorganic mercury may be appropriate
#4:Updated S4UL for nickel
#5:S4UL exceeds solubility saturation limit
#6:Criteria derived for Al>C16-C35 split between Al>C16-21 & Al>C21-35. Requires summation of fractions to use Al>C16-C35 criteria.
#7:Criteria presented is for p-xylene. A separate value is presented for o-xylene.

Legend
36.2 Results exceeds GAC.
<50 Results MDL is greater than GAC.
- Determinand has not been tested for.

Notes
A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
 #2:Operational Targets and EQS, EA, April 2018
 #3:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
 #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See 'further assessment' if criteria exceeded and hardness (CaCO3) data available.
 #5:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (Cr(VI)) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (Cr(III)).
 #6:Operational Targets and EQS, EA, April 2018. Dissolved fraction.
 #7:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies [3.76+(2.677x(DOC/2-0.5))]
 #8:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/rivers-lakes-metal-bioavailability-assessment-tool-m-bat>
 #9:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
 #10:Operational Targets and EQS, EA, April 2018.
 #11:Operational Targets and EQS, EA, April 2018. Lowest criteria presented (<200µg/l CrCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
 #12:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
 #13:Operational Targets and EQS, EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See 'further assessment' values if criteria exceeded and hardness (CaCO3) data available.
 #14:Operational Targets and EQS, EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend
 36.2 Results exceeds GAC.
 <50 Results MDL is greater than GAC.
 - Determinand has not been tested for.

Notes
 A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments

- #1:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
- #2:Operational Targets and EQS. EA, April 2018
- #3:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
- #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See further assessment if criteria exceeded and hardness (CaCO3) data available.
- #5:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
- #6:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
- #7:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies [3.76+2.677x(DOC/2-0.5)]
- #8:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Bioavailable (bio) fraction. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
- #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
- #11:Operational Targets and EQS. EA, April 2018. Dissolved plus ambient background concentration. For saltwater, an Ambient Background Concentration of 1.1 µg/l has been used.
- #12:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
- #13:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See further assessment if criteria exceeded and hardness (CaCO3) data available.

assessment values if criteria exceeded and narrows (L&L) data available.

#14:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Benzo(a)pyrene can be considered as a marker for other PAH for comparison with the corresponding AA-EQS in water.

#15:No UK EQS for total petroleum hydrocarbons (TPH), or speciated TPH fractions. A value of 50 µg/l is adopted for sum TPH protection of surface water based on 50µg/l-1000µg/l (Surface Waters (Abstraction for Drinking Water) Regulations 1989).

#16:Proposed Environmental Quality Standard, in absence of legislative standard (Ayscough et al., 2002).
https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/291223/sp2-115-tr4-e-e.pdf

#17:Operational Targets and EQS. EA, April 2018. Value of 30µg/l for sum xylenes split between isomers. Requires summation of m,p & o isomers to use 30µg/l value.

#18:The taste and odour threshold of 15µg/l is commonly adopted as a guide. In situations where there is no risk to a drinking water supply or aquifer, a PNEC value of 2.60µg/l may be used.

#20:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Value of 140µg/l for tetrachloroethane split between 2 isomers. Requires summation of 2 isomers to use 140µg/l value.

#21:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Value of 0.4µg/l for sum isomers split between 3 isomers. Requires summation of isomers to use 0.4µg/l value.

#22:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Value of 20µg/l for sum isomers split between 3 isomers. Requires summation of isomers to use 20µg/l value.

#23:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

36.2	Results exceeds GAC.
>50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes
A range is given where a determinand has been analysed for by more than one method.

Env Stds Comments
 #1:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015.
 #2:Operational Targets and EQS. EA, April 2018
 #3:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction.
 #4:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved fraction. Lowest criteria presented (<40mg/l of CaCO3). See further assessment if criteria exceeded and hardness (CaCO3) data available.
 #5:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If hexavalent chromium (CrVI) data is available, a value of 4.7µg/l may be appropriate for the remaining trivalent chromium (CrIII).
 #6:Operational Targets and EQS. EA, April 2018. Dissolved fraction.
 #7:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. If DOC >1mg/l then a higher criteria applies [3.76+12.677x(DOC/2-0.5)]
 #8:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Dissolved & bioavailable (bio) fraction plus background. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
 #9:Water Framework Directive (Standards & Classification) Directions (England & Wales) 2015. Bioavailable (bio) fraction. M-BAT tool to assess: <http://wfd.uk.org/resources/river-lakes-metal-bioavailability-assessment-tool-m-bat>
 #10:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Dissolved Fraction. MAC adopted in absence of AA value.
 #11:Operational Targets and EQS. EA, April 2018. Dissolved plus ambient background concentration. For saltwater, an Ambient Background Concentration of 1.1 µg/l has been used.
 #12:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Indicator of 'good' status (90%ile) - Ammonia standard for lakes and rivers (total ammonia as nitrogen).
 #13:Operational Targets and EQS. EA, April 2018. Dissolved fraction. Lowest criteria presented (<50 mg/l CaCO3). See further assessment if criteria exceeded and hardness (CaCO3) data available.

assessment, values if criteria exceeded and nariness (L&L) data available.

#14:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Benzo(a)pyrene can be considered as a marker for other PAH for comparison with the corresponding AA-EQS in water.

#15:No UK EQS for total petroleum hydrocarbons (TPH), or speciated TPH fractions. A value of 50 µg/l is adopted for sum TPH protection of surface water based on 50µg/l-1000µg/l (Surface Waters (Abstraction for Drinking Water) Regulations 1989).

#16:Proposed Environmental Quality Standard, in absence of legislative standard (Ayscough et al., 2002).
https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/291223/sp2-115-tr4-e-e.pdf

#17:Operational Targets and EQS. EA, April 2018. Value of 30µg/l for sum xylenes split between isomers. Requires summation of m,p & o isomers to use 30µg/l value.

#18:The taste and odour threshold of 15µg/l is commonly adopted as a guide.

#19:The taste and odour threshold of 15µg/l is commonly adopted as a guide. In situations where there is no risk to a drinking water supply or aquifer, a PNEC value of 2.60µg/l may be used.

#20:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Value of 140µg/l for tetrachloroethane split between 2 isomers. Requires summation of 2 isomers to use 140µg/l value.

#21:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Value of 0.4µg/l for sum isomers split between 3 isomers. Requires summation of isomers to use 0.4µg/l value.

#22:Water Framework Directive (Standards and Classification) Directions (England and Wales) 2015. Value of 20µg/l for sum isomers split between 3 isomers. Requires summation of isomers to use 20µg/l value.

#23:Operational Targets and EQS. EA, April 2018. Maximum Allowable Concentration (MAC) adopted in absence of Annual Average (AA) value.

Legend

36.2	Results exceeds GAC.
>50	Results MDL is greater than GAC.
-	Determinand has not been tested for.

Notes
A range is given where a determinand has been analysed for by more than one method.
