## Tables

Table A-1 Discrete Human Health Receptors Included in the Air Quality Dispersion Model .....	5
Table A-2 Ecological Receptors Included in the Air Quality Dispersion Model .....	29
Table A-3: Comparison of Measured and Mapped Background NO <sub>2</sub> Concentrations (µg/m <sup>3</sup> ) .....	40
Table A-4: Comparison of Measured and Mapped Background PM <sub>10</sub> Concentrations (µg/m <sup>3</sup> ) .....	41
Table A-5: Monitoring Sites Excluded from Model Verification .....	42
Table A-6: Comparison of Unadjusted Modelled and Measured NO <sub>2</sub> Concentrations (µg/m <sup>3</sup> ) .....	43
Table A-7: Comparison of Unadjusted Modelled and Measured NOx Concentrations (µg/m <sup>3</sup> ) .....	48
Table A-8: Model Verification Adjustment Factors .....	52
Table A-9: Comparison of Adjusted Modelled and Measured NO <sub>2</sub> Concentrations (µg/m <sup>3</sup> ) .....	53
Table A-10: Comparison of Modelled and Monitored PM <sub>10</sub> Concentrations (µg/m <sup>3</sup> ) .....	56
Table A-11: Summary of Annual Mean NO <sub>2</sub> Trend Analysis at CMS.....	57
Table A-12: Background Nitrogen Deposition Rates, Habitat Type and Critical Loads for Nitrogen Sensitive Designated Sites – European and National Statutory Designations .....	60
Table A-13: Background Nitrogen Deposition Rates, Habitat Type and Critical Loads for Nitrogen Sensitive Designated Sites – Local Non Statutory Designations .....	60

## Inserts

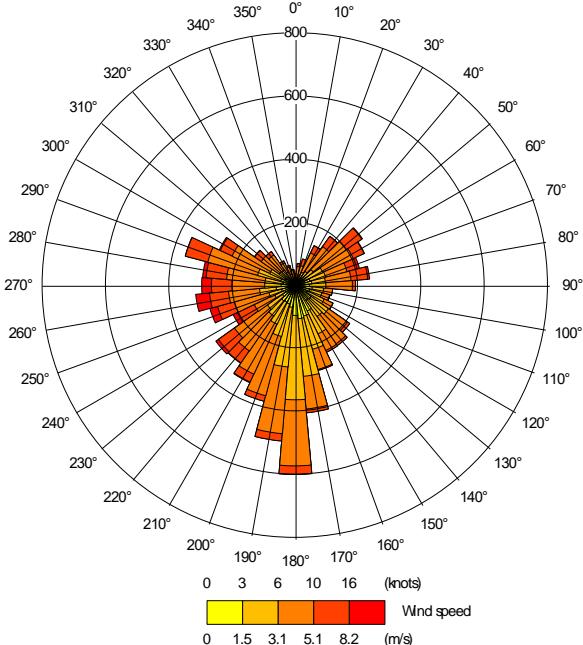

Insert A-1: Wind Rose for Manchester 2018 Meteorological Station .....	4
Insert A-2: Comparison of Modelled and Measured Road NOx Concentrations (µg/m <sup>3</sup> ) before Adjustment .	51
Insert A-3: Comparison of Modelled and Measured NO <sub>2</sub> Concentrations (µg/m <sup>3</sup> ) after Adjustment .....	56
Insert A-4: Annual Mean NO <sub>2</sub> Future Year Roadside Concentration Projections for TAM1 .....	58

## 1. Further Details on Air Quality Modelling

### 1.1 Air Quality Dispersion Modelling Setup

- 1.1.1 The dispersion model was set up based on the following key inputs and assumptions:
- Road sources were modelled using the ADMS-Roads source representation tool.
  - Ordnance Survey Master Map base mapping was used to define the road geometry.
  - A single centreline was entered in the model for modelled roads, with the exception of dual carriageways and motorway links which have a centreline included for both carriageway directions.
  - Road widths have been measured in GIS from Ordnance Survey Master Map data.
- 1.1.2 Hourly sequential meteorological data for 2018 Manchester Airport meteorological station was used. The parameters required by the model included: date, time, wind direction (angle wind blowing from), wind speed (at 10 metres above ground level), surface air temperature (degrees Celsius), and cloud cover (oktas – or eighths of sky covered).
- 1.1.3 A latitude of 53 degrees was selected. This determines times of sunrise and sunset for each day throughout the year, which in turn affects stability calculations.
- 1.1.4 Surface roughness coefficients have been defined as 1.0 metres (representative of cities, woodlands) for the air quality study area and 0.3 metres (representative of agricultural area max) for the meteorological station. The surface roughness is important in the approximation of turbulent conditions within the atmospheric boundary layer and thus in the estimation of pollutant concentrations at receptors.
- 1.1.5 Minimum Monin-Obukhov length (to reasonably limit the occurrence of very stable atmospheric conditions) has been defined as 10 metres (representative of small towns with a population of less than 10,000) for the air quality study area and 30 metres (representative of cities and large towns) for the meteorological station. This parameter limits the occurrence of very stable boundary layer conditions (i.e. when the air is still) to a degree that is appropriate to the general land-use. In general, the potential for very stable conditions is lowest in large urban areas where the ‘heat island’ effect promoting turbulent motion in the boundary layer is strongest.
- 1.1.6 A wind rose for the Manchester 2018 met station is shown below in Insert A-1.

### Insert A-1: Wind Rose for Manchester 2018 Meteorological Station

- 1.1.7 The effects of road gradient are important in some locations within the air quality model area. Following recommendations in analytical assurance work in 2019, the gradient effect on vehicle emissions has been calculated using the latest available tools at the time of the assessment (DEFRA Emission Factor Toolkit (EFT) v10.1) and applied to Highways England speed-band emission factors. Gradients effects have been applied at the following locations in the air quality model area where the road gradient was estimated to be 6% or more:
- Glossop Road at the Dinting Vale junction.
  - Mottram Moor and A6018 Back Moor between Carrhouse Lane and A6018 Roe Cross Road.
  - A6018 Roe Cross Road either side of the junction with Edge Lane.

## 1.2 Air Quality Receptors

### Human Health Receptors

- 1.2.1 There are 621 human health receptors in the air quality study area. All receptors were modelled at a height of 1.5 m above ground to reflect worst case average human exposure. Details of the receptors assessed are presented in Table A-1.

**Table A-1 Discrete Human Health Receptors Included in the Air Quality Dispersion Model**

\* Indicates receptors that are only relevant for the 1 hour AQS objective

### Ecological Receptors

1.2.2 There are 335 ecological receptors included in the air quality model in the air quality study area. All receptors were modelled at a height of zero metres above ground to reflect a worst case situation of vegetation at ground level exposure. Details of the receptors assessed are presented in Table A-2.

**Table A-2 Ecological Receptors Included in the Air Quality Dispersion Model**

### Compliance Risk Receptors

- 1.2.3 As compliance risk receptors are set distances from roads and not specific named properties for the purposes of the 4m validation, a simple table of receptors is not provided here. Details of receptors used in the Compliance risk assessment for qualifying features are given in the table of results in Appendix 5.5 Section 1.3 (Table A-22).

## 1.3 Air Quality Model Methodology

### Background Concentrations

- 1.3.1 Background concentrations have been derived from Defra's background maps (for 2018 from a 2018 reference year) and compared with monitored data at background sites away from major road sources for the wider area around the air quality study area for the Scheme, to ensure the mapped estimates are appropriate. The comparison is shown in Table A-3 for NO<sub>2</sub> and

### 1.3.2 Table A-4 for PM<sub>10</sub>.

**Table A-3: Comparison of Measured and Mapped Background NO<sub>2</sub> Concentrations (µg/m<sup>3</sup>)**

Wigan Centre	GMCA	Urban Background	CMS	357816, 406024	17.0	12.1	-28.8%

### Air Quality Model Verification

#### *Verification for NO<sub>2</sub>*

- 1.3.3 Model verification was undertaken considering monitoring sites within 200 metres of the roads meeting the DMRB LA 105 traffic screening criteria. From the full network of NO<sub>2</sub> diffusion tubes available, only those representative of selected sensitive receptor locations and with sufficient data capture were considered suitable for the purpose of model verification.
- 1.3.4 Following detailed analysis of each monitoring location a total of 75 sites were taken forward in the model verification. The following hierarchies were used when making decisions on which survey data to select at locations where data from two or more surveys were available:
- Scheme specific TPU survey monitoring with data capture greater than 25% was used in preference to High Peak local authority 2018 survey data and to MMLR survey data (which was projected forward from 2015-2016) on the basis that this the most recent survey data and the exact survey locations are known.
  - High Peak local authority 2018 survey data was used in preference MMLR survey data (which was projected forward from 2015-2016).
  - MMLR survey data was used in preference to TPU survey data where the data capture for the TPU survey data was 25% or less.

1.3.5 Table A-5 details the sites removed from the verification process and the justification for removal.

**Table A-5: Monitoring Sites Excluded from Model Verification**

Site Name	Zone	Reason for exclusion
MMLR_047_1215	A57	Site adjacent to a road not included in the Scheme traffic model
MMLR_048_1215	A57	Local authority tube HP14 with 2018 data used in preference
MMLR_049_1215	A57	Local authority tube HP26 with 2018 data used in preference
MMLR_036_1215	A57	Monitoring site roadside to a road not included in modelled network
MMLR_052_1215	A57	Monitoring site roadside to a road not included in modelled network
MMLR_067_1215	A57	Monitoring site roadside to a road not included in modelled network
TPU_28	A57	Less than 3 months of monitoring data
TPU_29	A57	Only three months of data at the time of the assessment and difference in monitored concentrations compared to adjacent sites
TPU_30	A57	Less than 3 months of monitoring data
HP25	Dinting Vale Junction	TPU17 used in preference as exact survey location known
MMLR_027_1215	Dinting Vale Junction	TPU1 used in preference as more recent data
TPU_32	Mottram - N A57	Only 3 months of monitoring data at the time of the assessment - MMLR_054 used in preference
TPU_34	Mottram - N A57	Only 3 months of monitoring data at the time of the assessment - MMLR_064 used in preference
TPU_35	Mottram - N A57	Only 3 months of monitoring data at the time of the assessment - MMLR_013 used in preference
MMLR_025_1215	Mottram - S A57	Kerbside monitor, not representative of receptors
MMLR_069ABC_1215	Mottram - S A57	Co-located with TAM1 CMS
T 45	Mottram - S A57	Co-located with TAM1 CMS
T 46	Mottram - S A57	Co-located with TAM1 CMS
T47	Mottram - S A57	Co-located with TAM1 CMS
TPU_31	Mottram - S A57	Only 3 months of monitoring data at the time of the assessment - MMLR_025 used in preference
TPU_37	Mottram-S A57	Monitoring at this site not undertaken in relevant year
MMLR_020_1215	Mottram Rise	Kerbside monitor at junction, not representative of receptors
MMLR_056_1215	Mottram Rise	Background site
TPU_39	Non A Road / Suburban	Less than 3 months of monitoring data

- 1.3.6 The annual mean NO<sub>2</sub> concentrations for the 2018 base year were verified by means of comparison against available ratified monitoring data. The modelled road NOx concentrations were adjusted where appropriate, with reference to the methodology set out in Defra's LAQM.TG(16).
- 1.3.7 Uncertainty in modelled estimates has been considered by calculating root mean square error (RMSE) and fractional bias statistics. An air quality model can be considered to perform reasonably well where 95% of modelled concentrations are within 25% of monitored concentrations in accordance with Defra's Technical Guidance LAQM.TG(16). The RMSE should ideally be within 10% of the relevant air quality criterion (less than 4 µg/m<sup>3</sup>) but is acceptable where it is within 25% of the relevant air quality criterion (i.e. 10 µg/m<sup>3</sup>). The Fractional Bias (FB) has an ideal value of 0 but is acceptable in the range between +2 and -2.
- 1.3.8 First, unadjusted modelled estimates of total annual mean NO<sub>2</sub> concentrations have been compared against monitored annual means. Out of 75 comparisons, 29 modelled estimates are within +/- 25% of monitored without adjustment, as given in Table A-6. Substantial and systematic underestimates of more than 25% are indicated for 45 sites, with 1 site overestimating by more than 25%. Eight of the comparisons are within +/- 10% of monitored concentrations.

**Table A-6: Comparison of Unadjusted Modelled and Measured NO<sub>2</sub> Concentrations (µg/m<sup>3</sup>)**

- 1.3.9 For unadjusted modelled estimates of NO<sub>2</sub> compared to monitored concentrations, the RMSE is 15.1 µg/m<sup>3</sup>, which is above the target value according to Defra's LAQM.TG(16) (ideal less than 4 µg/m<sup>3</sup>, acceptable less than 10 µg/m<sup>3</sup>). Overall, the unadjusted model tends to underestimate total concentrations of NO<sub>2</sub>, as indicated by a high fractional bias value of 0.39.
- 1.3.10 The second comparison of modelled estimates of road contributed annual mean NOx with the road NOx component derived from monitoring data is presented in

- 1.3.11 Table A-7 and
- 1.3.12 Insert A-2. This analysis requires the estimation of the monitored road NOx component. This has been undertaken using Defra's NO<sub>2</sub> to NOx calculator (version 8.1, August 2020).
- 1.3.13 Modelled road NOx concentrations can be adjusted by taking the slope of the linear regression line that has been forced through zero (as shown in
- 1.3.14 Insert A-2). Due to the model performing differently in different areas, the verification was split into 9 zones (as described in

1.3.15 Table A-7), resulting in 9 different adjustment factors for the full study area (75 sites).

### Insert A-2: Comparison of Modelled and Measured Road NOx Concentrations ( $\mu\text{g}/\text{m}^3$ ) before Adjustment

Comparison of Modelled Road NOx and Monitored Road NOx Concentrations ( $\mu\text{g}/\text{m}^3$ ) before Adjustment

- 1.3.16 The model was split into 9 verification zones. The factors used to adjust the model results in these areas are shown below in Table A-8.

**Table A-8: Model Verification Adjustment Factors**

Zone	Zone Name	Number of Monitoring Sites	Adjustment Factor
1	A57	10	2.55
2	A628	11	2.12
3	Dinting Vale Junction	4	3.46
4	M67	14	1.45
5	Mottram North of A57	9	1.82
6	Mottram South of A57	8	3.91
7	Mottram Rise	6	1.98
8	Non-A road / Suburban	9	1.50
9*	M60	4	0.79 (1.00)

\* An adjustment factor of 1.00 was applied to the M60 zone as a worst case

- 1.3.17 The third comparison of the adjusted modelled estimates of total annual mean NO<sub>2</sub> with monitored concentrations is presented in Table A-9 and

- 1.3.18 Insert A-3. 95% of comparisons are within +/- 25% - that is 71 of 75 modelled concentrations within +/- 25% of the monitored values at the same site. The majority (45 of 75 sites) are within 10% of monitored concentrations. Substantial differences of more than 25% is indicated for just four sites (shown in bold in Table A-9). Overall, this suggests that the model is performing well at most locations in accordance with Defra Technical Guidance LAQM.TG(16).
- 1.3.19 The RMSE for the adjusted modelled NO<sub>2</sub> concentrations compared to monitored concentrations is 4.81 µg/m<sup>3</sup>. Adjustment has therefore improved model performance. Overall, the adjusted model has tended to very slightly underestimate total concentrations of NO<sub>2</sub>, as indicated by a fractional bias value of 0.02.

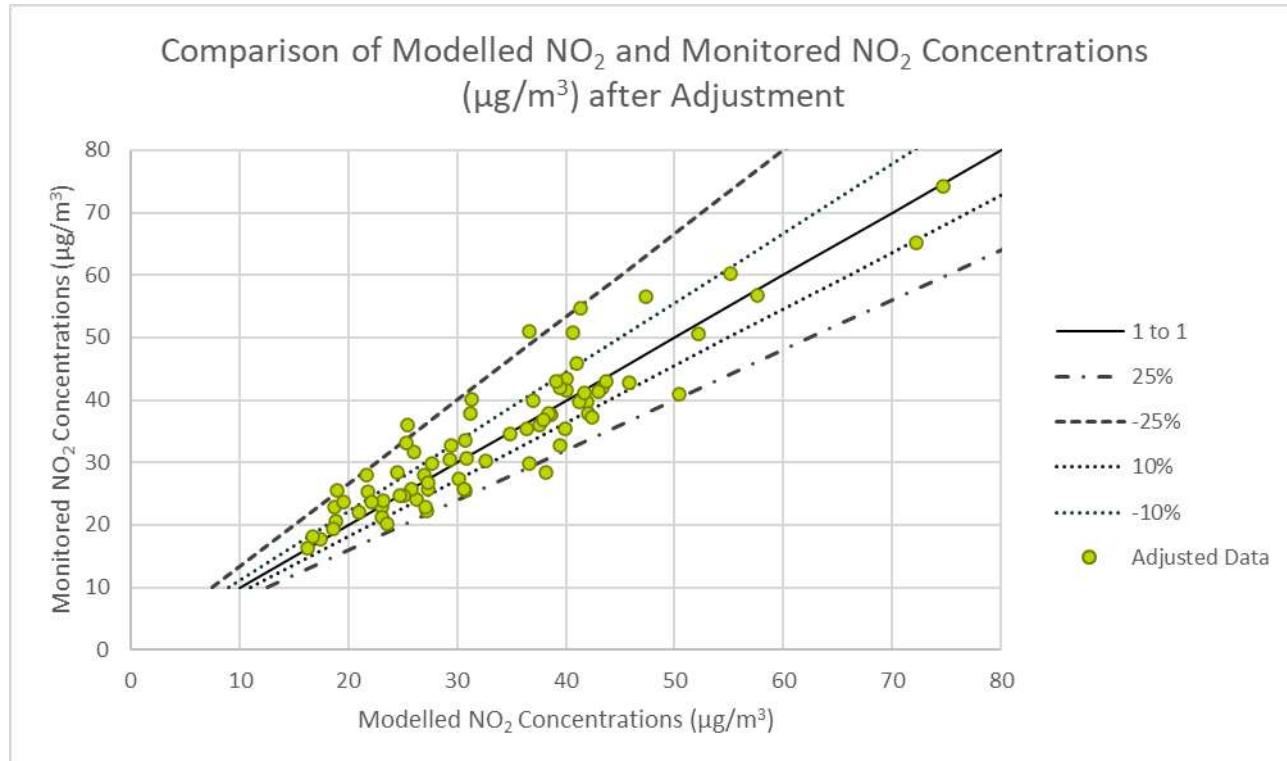

**Table A-9: Comparison of Adjusted Modelled and Measured NO<sub>2</sub> Concentrations (µg/m<sup>3</sup>)**

### Insert A-3: Comparison of Modelled and Measured NO<sub>2</sub> Concentrations ( $\mu\text{g}/\text{m}^3$ ) after Adjustment

#### Verification for PM<sub>10</sub>

- 1.3.20 To assess the base year, verification was undertaken for PM<sub>10</sub> at the TAM1 continuous monitoring site. A comparison of modelled and monitored PM<sub>10</sub> concentrations for 2018 are shown in Table A-10. The modelled road PM<sub>10</sub> concentrations were adjusted by a factor of 1.66, with reference to the methodology set out in Defra's LAQM.TG(16).

**Table A-10: Comparison of Modelled and Monitored PM<sub>10</sub> Concentrations ( $\mu\text{g}/\text{m}^3$ )**

Site ID	Modelled Road PM <sub>10</sub>	Background PM <sub>10</sub>	Total Modelled PM <sub>10</sub>	Measured PM <sub>10</sub>	Modelled - Measured	Modelled / Measured	% Difference	Measured / Modelled
TAM1	1.0	10.4	11.4	19.0	-7.6	0.6	-40%	1.66

## 1.4 Trend Analysis

- 1.4.1 Analysis of trends in annual mean NO<sub>2</sub> has been undertaken using the Finnish Meteorological Institute MAKESENS (v1) spreadsheet using the annual mean time series data for the roadside CMS within the air quality study area for the Scheme (TAM1, operated by TMBC) and seven background CMS sites operated by the local authorities in proximity of the air quality study area. The analysis examines the trend in the annual mean concentrations at CMS where a sufficient number of annual mean data points are available.

- 1.4.2 The statistical analysis undertaken includes a Sen's slope estimate of the linear trend, residual concentrations which indicate the variation year on year and the Mann-Kendall test statistic (S) to indicate the significance of any trend. In order to conduct a Mann-Kendall test, five or more series of data must be presented for each site. Table A-11 summarises the statistical analysis for each CMS.

**Table A-11: Summary of Annual Mean NO<sub>2</sub> Trend Analysis at CMS**

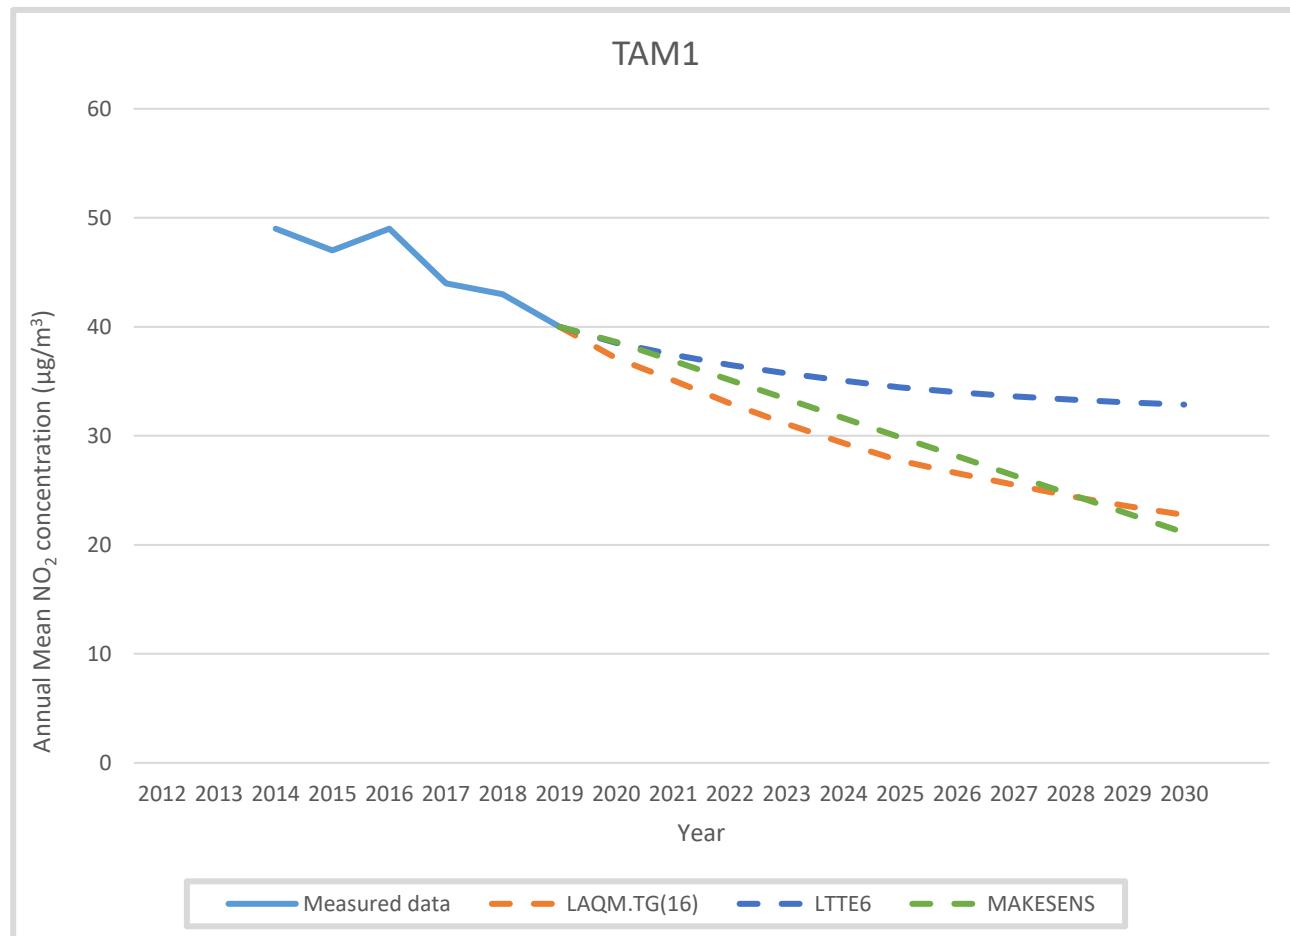

Site ID	Site Type	Local Authority	Number of Data Points	Required S Value	S Value	Sen's Slope	Significant (Y/N)*
GLAZ	Rural Background	Salford	8	+/-16	-8	-0.3	N
MAN3	Urban Background	Manchester	8	+/-16	-17	-0.8	Y (0.1)
MAN8	Suburban Background	Manchester	4	+/-6	-5	-1.2	N
TAME	Urban Background	Tameside	5	+/-8	-1	-0.1	N
Trafford	Urban Background	Trafford	8	+/-16	-20	-1.0	Y (0.05)
WIG5	Urban Background	Wigan	8	+/-16	-19	-1.0	Y (0.05)

TAM1	Roadside	Tameside	6	+/-11	-12	-1.8	Y (0.1)

\* The value in brackets indicates the level of statistical significance

- 1.4.3 The statistical analysis indicates four of the seven background CMS sites for which the requisite series of data are available show statistically significant downward trends in annual mean NO<sub>2</sub> concentration. In addition the roadside CMS also show a statistically significant downward trend in annual mean NO<sub>2</sub> concentration.
- 1.4.4 Where there is a statistically significant trend the following projection methods can be compared to determine the suitability of the projection method used for the air quality modelling:
- The trend determined from the MAKESENS analysis reported above, where a statistically significant trend was identified.
  - The trend assumed in LAQM.TG(16) Defra guidance updated in 2018 (separate trends for roadside and background locations).
  - The trend assumed in Highways England LTTE6 Projection Factors for Annual Mean NO<sub>2</sub> and NO<sub>x</sub> concentrations.
- 1.4.5 Analysis (Insert A-4) shows that the Defra LAQM.TG(16) projections for roadside sites, are the most optimistic and the DMRB LA 105 LTTE6 projections the most conservative.

- 1.4.6 For the roadside CMS within the air quality study area for the Scheme the MAKESENS analysis of the monitoring data is similar to Defra LAQM.TG(16) projections and less conservative than the LTTE6 factors. However the DMRB LA 105 LTTE6 gap factors have been selected for use in the air quality assessment to ensure that the assessment is not overly optimistic, which would have been the case if Defra.TG(16) projections were used.

## 1.5 Designated Habitats Assessment

### Background Deposition Rates

- 1.5.1 Details of designation types, habitat types, lower level of critical loads and background deposition rates used for designated ecological sites included in the air quality assessment are shown in

1.5.2 Table A-12 for European and National statutory designated sites and in Table A-13 for local non statutory designations.

**Table A-12: Background Nitrogen Deposition Rates, Habitat Type and Critical Loads for Nitrogen Sensitive Designated Sites – European and National Statutory Designations**

Site Name	Designation	Species / Habitat Type	Lower Limit of Critical Load (Kg N/ha/yr)	APIS 2016-18 background N-dep rate (max) (kg N/ha/yr)
South Pennine Moors	SAC	Blanket bogs (grassland)	5	32.5
South Pennine Moors	SAC	Acidophilous Quercus-dominated woodland	10	50.6
Peak District Moor	SPA	Pluvialis apricaria [North-western Europe] - European golden plover (A140) - Montane habitats (grassland)	5	31.9
Dark Peak	SSSI	Bogs (Calluna vulgaris - Eriophorum vaginatum blanket mire) (grassland)	5	31.9
Dark Peak	SSSI	Broad-leaved, mixed and yew woodland (Quercus spp.-Betula spp.-Deschampsia flexuosa woodland)	10	45.6

**Table A-13: Background Nitrogen Deposition Rates, Habitat Type and Critical Loads for Nitrogen Sensitive Designated Sites – Local Non Statutory Designations**

Site Name	Designation	Habitat Type	Lower Limit of Critical Load (Kg N/ha/yr)	APIS 2016-18 background N-dep rate (max) (kg N/ha/yr)
Shire Hill	Ancient Woodland	Broadleaved, Mixed and Yew Woodland	10	35.7
Westwood Clough & Longlands Hall	SBI	Broadleaved, Mixed and Yew Woodland	10	34.6
Westwood Clough	Ancient Woodland	Broadleaved, Mixed and Yew Woodland	10	34.6
Grimbocarandrough Woods	Ancient Woodland	Broadleaved, Mixed and Yew Woodland	10	34.2
Melandra Castle and Railway	LWS	Broadleaved, Mixed and Yew Woodland	10	33.5
Dark Peak	NIA	Broadleaved, Mixed and Yew Woodland	10	31.8, 34.2, 34.7, 36.7, 37.8
Dinting Junction Pond	LWS	Broadleaved, Mixed and Yew Woodland	10	33.5
Peak Forest Canal North	SBI	Broadleaved, Mixed and Yew Woodland	10	37.7
Ashes Farm Meadows	(potential) LWS	Broadleaved, Mixed and Yew Woodland	10	33.5
Dinting Vale Wood	Ancient Woodland	Broadleaved, Mixed and Yew Woodland	10	33.5

Site Name	Designation	Habitat Type	Lower Limit of Critical Load (Kg N/ha/yr)	APIS 2016-18 background N-dep rate (max) (kg N/ha/yr)
Elmin Pits Farm Wood	Ancient Woodland	Broadleaved, Mixed and Yew Woodland	10	34.2
Great Wood	LNR	Broadleaved, Mixed and Yew Woodland	10	35
Clought at Matley	SBI	Broadleaved, Mixed and Yew Woodland	10	34.6
Eastwood & Acre Clough	SBI	Broadleaved, Mixed and Yew Woodland	10	34.6
Huddersfield Narrow Canal (South)	SBI	Broadleaved, Mixed and Yew Woodland	10	34.6
Hurst Clough	SBI	Broadleaved, Mixed and Yew Woodland	10	35
Reddish Vale	SBI	Broadleaved, Mixed and Yew Woodland	10	68
Crookilley Wood	SBI	Broadleaved, Mixed and Yew Woodland	10	68
Dunkirk Wood	SBI	Broadleaved, Mixed and Yew Woodland	10	37.7
Audenshaw Reservoir	SBI	Broadleaved, Mixed and Yew Woodland	10	37.7
Roe Cross Quarry	SBI	Broadleaved, Mixed and Yew Woodland	10	34.6
Hurst Clough	LNR	Broadleaved, Mixed and Yew Woodland	10	35
Dinting Vale Reservoirs and Brook	LWS	Broadleaved, Mixed and Yew Woodland	10	33.5
Shire Hill (woodland)	LWS	Broadleaved, Mixed and Yew Woodland	10	35.7
Dinting Wood	LWS	Broadleaved, Mixed and Yew Woodland	10	33.5
Dinting Nature Reserve	LWS	Broadleaved, Mixed and Yew Woodland	10	33.5
Gamesley Sidings	LWS	Broadleaved, Mixed and Yew Woodland	10	33.5
Robin Wood	LWS	Broadleaved, Mixed and Yew Woodland	10	33.5
Marple Road Meadows	LWS	Broadleaved, Mixed and Yew Woodland	10	33.5
Dinting Lodge Grassland	LWS	Broadleaved, Mixed and Yew Woodland	10	33.5
The Bank	(potential) LWS	Broadleaved, Mixed and Yew Woodland	10	33.5
Millbrook Bridge Wood	Ancient Woodland	Broadleaved, Mixed and Yew Woodland	10	31.8
Reaves Stones Plantation	Ancient Woodland	Broadleaved, Mixed and Yew Woodland	10	34.2
Robin Wood	Ancient Woodland	Broadleaved, Mixed and Yew Woodland	10	33.5

Site Name	Designation	Habitat Type	Lower Limit of Critical Load (Kg N/ha/yr)	APIS 2016-18 background N-dep rate (max) (kg N/ha/yr)
Crookilley Wood	Ancient Woodland	Broadleaved, Mixed and Yew Woodland	10	68
Unnamed Ancient Woodland (Clought at Matley)	Ancient Woodland	Broadleaved, Mixed and Yew Woodland	10	34.6
Unnamed Ancient Woodland (Eastwood & Acre Clough)	Ancient Woodland	Broadleaved, Mixed and Yew Woodland	10	34.6
Unnamed Ancient Woodland (A57 Snake Road)	Ancient Woodland	Broadleaved, Mixed and Yew Woodland	10	34.2
Tom Wood	LWS	Broadleaved, Mixed and Yew Woodland	10	35.0
Warrastfold Bridge Complex	LWS	Broadleaved, Mixed and Yew Woodland	10	35.0

## Designated Habitats Assessment Methodology

- 1.5.3 Assessment of the impact of the Scheme on sensitive ecological designations has been undertaken in accordance with DMRB LA 105 (paragraph 2.43 - 2.46 and para 2.97 to 2.102).
- 1.5.4 The assessment has been undertaken based on the following key inputs and assumptions:
- Designated ecological sites with statutory and non-statutory designations within the air quality study area for the Scheme been identified in accordance with DMRB LA 105 (paragraph 2.18 and 2.25).
  - Relevant habitat types have been obtained from APIS where available or in consultation with a competent expert for biodiversity. Critical loads have been obtained from APIS. Where sites did not contain habitats sensitive to nitrogen deposition, then the site was excluded from further assessment.
  - Receptor locations representative of those designated ecological sites with nitrogen sensitive habitats have been included in the air quality dispersion model.
  - Highways England LTTE6 projection factors have been applied in accordance with DMRB LA 105 (paragraph 2.47 – 2.55) to annual mean road NO<sub>2</sub> at ecological receptors.
  - The road NO<sub>2</sub> was converted to dry nutrient nitrogen deposition rates in kg N/ha/year using the conversion rates for “woodland” and “grassland” habitats given in DMRB LA 105 (para 2.44.1). Where habitat information was not available at screening (for the non-statutory designated ecological sites) nitrogen deposition rates were calculated for both “woodland” and “grassland” habitat types.

- The background nitrogen deposition rate at each designated site has been obtained from the APIS website for the base year of 2018. For the Scheme opening year of 2025 it was assumed that there was no reduction in background nitrogen deposition as a conservative approach.
- Background and road nitrogen deposition rates were combined to give a total nitrogen deposition for each ecological receptor location and the change in nitrogen deposition with the Scheme was calculated.
- Each ecological receptor location was screened against the DMRB LA 105 designated habitat screening criteria. The screening criteria were considered to be exceeded where total nitrogen deposition is greater than the relevant lower critical load, and the change in nitrogen deposition is greater than 1% of the relevant lower critical load.

1.5.5 Where ecological receptor locations exceeded the DMRB LA 105 designated habitat screening criteria then further investigation was undertaken. The following steps were applied:

- The habitat type for the designated site was reviewed in consultation with a competent expert for biodiversity.
- The magnitude of change of the nitrogen deposition was considered further to identify if the change in nitrogen deposition was greater than 0.4kg N/ha/yr.
- Where required, additional modelling was undertaken to include transect receptors to determine the distance from the road at which there would no longer be an exceedance of the designated habitat screening criteria and where the change in nitrogen deposition would no longer be greater than 0.4kg N/ha/yr. Also the number of years it would take for the nitrogen deposition to return to the ‘without Scheme’ deposition rate was determined.
- For locally designated non statutory ecological sites, records were requested from the relevant authorities and site visits undertaken by the competent expert for biodiversity to determine:
  - the species present in the area where DMRB LA 105 designated habitat screening criteria were exceeded.
  - whether the site air quality attribute was ‘restore’ or ‘maintain’.
- The resultant air quality modelling data was passed to the competent expert for biodiversity to determine the significance of the changes in nitrogen deposition for the sites where DMRB LA 105 designated habitat screening criteria exceedances remained.
