Subject:	Great Crested Newt HSI and eDNA Survey

1. Introduction

- 1.1. Stantec UK has been commissioned by Volker Fitzpatrick to undertake surveys for great crested newts in relation to the M3 Junction 9 Improvement Scheme (the Scheme). Further surveys consist of Habitat Suitability Index (HSI) surveys and Environmental DNA (eDNA) surveys.
- 1.2. The Indicative Application Boundary along with the area subject to survey can be viewed on the Great Crested Newt Survey Location Figure in **Appendix A**, and will be referred to as 'the Survey Area' throughout this report.
- 1.3. The Scheme is located to the north-east of Winchester and includes proposed improvements to Junction 9 of the M3 and the A34 around an approximate central grid reference of SU496308.

Background

- 1.4. M3 Junction 9 is a key transport interchange which connects South Hampshire and the wider subregion, with London via the M3 and the Midlands/North via the A34. A significant volume of traffic currently uses the grade separated, partially signalised gyratory (approximately 6,000 vehicles per hour during the peak periods) which acts as a bottleneck on the local highway network and causes significant delay throughout the day.
- 1.5. Highways England is looking to reconfigure the junction to improve the situation for vehicle traffic and non-motorised users.
- 1.6. As part of a wider ecological assessment of the area potentially affected by the Scheme, WSP (on behalf of Highways England) completed an assessment of 10 ponds within proximity of the scheme to determine their suitability to support great crested newts (WSP, 2017). Eight of these ponds were subject to water sampling to detect great crested newt environmental DNA (eDNA), with the results being negative for all ponds sampled (i.e. no great crested newt eDNA was detected). The Indicative Application Boundary of the scheme was updated in December 2018 to include modifications and additions to the design. As a result of this change, Jacobs were commissioned by Highways England to undertake habitat suitability assessment and eDNA surveys of a further three ponds in 2019 (Jacobs, 2020) with 6 other ponds identified determined to have very limited likelihood to provide suitable habitat following a desk-based assessment (with access not provided). Again, the eDNA surveys returned negative results. The WSP and Jacobs surveys indicated great crested newts are likely absent from the area affected by the proposed scheme.
- 1.7. Given the time that has passed since the previous surveys, and further updates to the Indicative Application Boundary, Stantec was commissioned to complete updated surveys from great crested newts across the Scheme. The aim of this was to gather data on the current presence/likely absence of great crested newts.

^{\\}pba.int\cbh\Projects\48176 M3 Junction 9\3000 - Environmental\Ecology\4. Field Surveys\3 Stantec or VFL surveys\6. GCN\HE551511-VFK-EBD-X_XXXX_XX-TN-LE-0010-Great Crested Newt Report.docx

- 1.8. Great crested newts and their habitats are legally protected under the Conservation of Habitats and Species Regulations (the 'Habitats Regulations') 2017 (as amended) and the Wildlife and Countryside Act, 1981 (as amended) (WCA).
- 1.9. In addition, great crested newts are listed as a species of principal importance to the conservation of biodiversity in England. This list was drawn up in response to the requirements of Section 41 of the Natural Environment and Rural Communities (NERC) Act 2006; it is often referred to as the 'S41 list'. The S41 list is used to guide decision-makers such as public bodies, including local and regional authorities, in implementing their duty under the related Section 40 of the NERC Act, to have regard to the conservation of biodiversity in England, when carrying out their normal functions.

2. Method

- 2.1. A desk-based exercise was initially undertaken by Stantec (using online mapping and aerial images) which identified a total of 37 waterbodies within the Indicative Application Boundary or within a 500m buffer (including ponds previously surveyed by WSP and Jacobs). Sixteen of these waterbodies were scoped out of further surveys in 2021, either because of barriers to dispersal between the waterbody and the Scheme (e.g. urban development or major roads), or because of unsuitability for great crested nests (e.g. where the waterbody was part of a trout fishery).
- 2.2. As such 21 waterbodies were taken forward for further field survey. The location of ponds identified for survey in 2021 are shown on **Figure 1 Great Crested Newt Survey Locations**, **Appendix A**.
- 2.3. Following the identification of waterbodies, access permission was sought by Stantec to survey the 21 waterbodies identified. Access permission was not granted for a total of 5 ponds. A further waterbody was identified as a watercress bed, so considered unlikely to provide suitable habitat. For this reason, only a habitat suitability assessment (HSI) was requested with no eDNA sampling undertaken.
- 2.4. This left a total of 15 waterbodies requiring both HSI and eDNA survey, although it was not initially known if all these features were present on the ground.
- 2.5. The eDNA survey (water sampling) was completed by two experienced ecologists over 4th and 5th May 2021. Samples were collected based on the recommended protocol by Natural England (Biggs *et al*, 2014) and were sent to FERA for subsequent analysis. The current survey guidance states that water samples can be collected between the 15th of April and the 30th of June. The survey dates were therefore within this optimal window.
- 2.6. In addition, information on the physical features and characteristics of each of the waterbodies was collected (where found to be present) in order to allow a great crested newt Habitat Suitability Index (HSI) score to be derived (see Oldham *et al.*, 2000, as modified by the Herpetological Conservation Trust (HCT, 2008)). Ten suitability indices (SI) were scored in the field and from maps; these included features such as size, quality of surrounding terrestrial habitat and the potential presence of fish. These scores were then used to calculate the overall HSI for each waterbody, provided as a number between 0 and 1, with 0 being the least suitable and 1 being the most suitable. The HSI score allows the waterbody to be placed in one of five pre-defined categories (HCT, 2008), defining its suitability for great crested newts as follows:
 - <0.5 = poor
 - 0.5 0.59 = below average
 - 0.6 0.69 = average

^{\\}pba.int\cbh\Projects\48176 M3 Junction 9\3000 - Environmental\Ecology\4. Field Surveys\3 Stantec or VFL surveys\6. GCN\HE551511-VFK-EBD-X_XXXX_XX-TN-LE-0010-Great Crested Newt Report.docx

- 0.7 0.79 = good
- >0.8 = excellent
- 2.7. Weather conditions on the 4th and 5th May were cool (13°C) and dry with a gentle to moderate breeze (Beaufort scale force 3 to 4) and partial cloud (4/8 to 6/8 cloud cover).

3. Results and Interpretation

- 3.1. The full summary of the eDNA survey results and HSI scores for each waterbody visited and found to be present are provided in **Appendix B** with photographs of waterbodies provided in **Appendix C**.
- 3.2. During the survey, 4 of the 15 waterbodies identified for possible eDNA survey were found to not be present on the ground (i.e. no feature present or found to be dry). A total of 11 waterbodies were therefore successfully subject to eDNA survey. The analysis by FERA returned a negative result for all of waterbodies surveyed (the DNA Analysis Report is presented in **Appendix D**).
- 3.3. As set out in **Paragraph 2.3**, due to access being refused, it was not possible to undertake detailed survey at a number of waterbodies. However, it is considered that the current level of survey, along with historical survey data, provides reasonable confidence in the likely status of great crested newt within the Survey Area.
- 3.4. Based on the results of the survey (and taking into account the results of previous surveys completed by WSP and Jacobs), great crested newts are considered likely to be absent from the Scheme and surrounding local area, as concluded by the previous WSP and Jacobs surveys. As such there are no known constraints relating to great crested newts associated with the Scheme.

4. Conclusions

- 4.1. Stantec UK has been commissioned by Volker Fitzpatrick to undertake surveys for great crested newts in relation to the M3 Junction 9 Improvement Scheme (the Scheme). Further surveys consist of Habitat Suitability Index (HSI) surveys and Environmental DNA (eDNA) surveys.
- 4.2. Based on the results of the surveys during 2021, and taking into account historical surveys results, great crested newts are considered likely to be absent from the Scheme and surrounding local area, as concluded by the previous WSP and Jacobs surveys. As such there are no known constraints relating to great crested newts associated with the Scheme.

А	1	0.2	0.9	1	1	0.67	0.01	0.39	0.67	0.35	0.402027236	Poor
A2	1	1	0.9	1	1	0.67	0.67	0.65	1	0.7	0.844190287	Excellent
A5	1	0.37	0.9	1	1	0.67	0.33	0.65	1	0.6	0.701148095	Good
A8	1	0.8	0.9	1	1	0.01	0.67	0.39	1	0.4	0.487139325	Poor
A10	1	0.15	1	0.67	1	0.67	0.67	0.39	1	0.4	0.609177742	Average
A15	1	0.8	0.9	1	1	1	0.67	0.39	0.67	0.8	0.794993668	Good ¹

¹ Although the HSI score indicates good suitability for waterbody A15, this feature is an active watercress bed which is not reflected in the calculation. This feature would therefore be very unlikely to be suitable for use by great crested newts given the regular disturbance and flushing through of waters.

DNA Analysis Report - Commercial in Confidence

Customer:	Austin Foot Ecology
Address:	32 Winchester Road Whitchurch Hampshire
	RG28 7HP
Contact: Email: Tel:	Edward Austin
Report date:	21-May-2021
Order Number:	GCN21-1360
Samples:	Pond Water
Analysis requested:	Detection of Great Crested Newt eDNA from pond water.

Thank you for submitting your samples for analysis with the Fera eDNA testing service. The details of the analysis are as follows:

Method:

The method detects pond occupancy from great crested newts (GCN) using traces of DNA shed into the pond environment (eDNA). The detection of GCN eDNA is carried out using real time PCR to amplify part of the cytochrome 1 gene found in mitochondrial DNA. The method followed is detailed in Biggs J., et al, (2014). Analytical and methodological development for improved surveillance of the Great Crested Newt. Appendix 5. Technical advice note for field and laboratory sampling of great crested newt (Triturus cristatus) environmental DNA. Freshwater Habitats Trust, Oxford.

The limits of this method are as follows: 1) the results are based on analyses of the samples supplied by the client and as received by the laboratory, 2) any variation between the characteristics of this sample and a batch will depend on the sampling procedure used. 3) the method is qualitative and therefore the levels given in the score are for information only, they do not constitute the quantification of GCN DNA against a calibration curve, 4) a 'not detected' result does not exclude presence at levels below the limit of detection.

The results are defined as follows:

- Positive: DNA from the species was detected.
- eDNA Score: Number of positive replicates from a series of twelve.
- **Negative:** DNA from the species was not detected; in the case of negative samples the DNA extract is further tested for PCR inhibitors and degradation of the sample.
- **Inconclusive:** Controls indicate degradation or inhibition of the sample, therefore the lack of detection of GCN DNA is not conclusive evidence for determining the absence of the species in the sample provided.

The results indicate that eDNA for great crested newts was not detected in any of the samples submitted. Analysis was conducted in the presence of the following controls: 1) extraction blank, 2) appropriate positive and negative PCR controls for each of the TaqMan assays (GCN, Inhibition, and Degradation). All controls performed as expected.

This test procedure was developed using research funded by the Department of Environment, Food and Rural Affairs.
