1 Air quality receptors

1.1 Human receptors

1.1.1 A total of 106 receptors were included in the assessment. They were selected using professional judgement and the following criteria:

- within 200m of the Affected Road Network (ARN);
- representativeness of the receptor of the maximum effects of the scheme in that region; and
- at risk of exceeding the annual mean NO₂ Air Quality Objective (AQO).

1.1.2 All locations, referred to as 'receptors' are treated as being equally sensitive. The locations are shown in ES Figure 5.3 Human receptors (Document Reference 6.3). The human receptors have been modelled at a height of 1.5m, to be representative of pollution exposure.

1.2 Ecological receptors

1.2.1 There are 29 designated habitat sites¹ within 200m of the ARN, which are sensitive to nitrogen. These sites and their habitat type are shown in Table 1-1. Critical loads² for designated habitat sites are presented in Table 1-2.

1.2.2 The designated habitats have been included in the air quality modelling assessment, and have been modelled at a height of 0m, to be representative of ground level vegetation. Transects have been modelled at ecological sites away from the road. The locations modelled are shown in Table 1-3.

1.2.3 Ecological receptor locations are presented in ES Figure 5.4 Assessed ecology receptors (Document Reference 6.3).

¹ Designated habitats, as defined in The Design Manual for Roads and Bridges (DMRB) LA 105 Air Quality, include Ramsar sites, special protection areas, special areas of conservation, sites of special scientific interest, local nature reserves, local wildlife sites, nature improvement areas, ancient woodland and veteran trees.

² Critical loads have been taken from the Air Pollution Information Site (<http://www.apis.ac.uk>).
