RSK ADAS Ltd (ADAS) has prepared this report for the sole use of the client, showing reasonable skill and care, for the intended purposes as stated in the agreement under which this work was completed. The report may not be relied upon by any other party without the express agreement of the client and ADAS. No other warranty, expressed or implied, is made as to the professional advice included in this report.

Where any data supplied by the client or from other sources have been used, it has been assumed that the information is correct. No responsibility can be accepted by ADAS for inaccuracies in the data supplied by any other party. The conclusions and recommendations in this report are based on the assumption that all relevant information has been supplied by those bodies from whom it was requested.

No part of this report may be copied or duplicated without the express permission of ADAS and the party for whom it was prepared.

Where field investigations have been carried out, these have been restricted to a level of detail required to achieve the stated objectives of the work.

This work has been undertaken in accordance with the quality management system of RSK ADAS Ltd.

Executive Summary

ADAS was instructed by Amey in consultation with Structural Soils Ltd to undertake an Agricultural Land Classification (ALC) survey on the land take for seven proposed road improvement schemes to the A66 between the M6 Junction 40 in the west to Carkin Moor in the east. The survey work was carried out in February and March 2022. Summaries of the survey results for each scheme are given below.

M6 Junction 40 to Kemplay Bank

Well drained sandy and loamy soils were found across the scheme. Climate limited land quality to respectively subgrade 3a in the west and grade 2 in the east of the scheme. The areas (percentages) recorded of grade 2, grade 3a and urban land were respectively 10.3ha (21%), 2.6ha (5%), 1.8ha (3%) and 29.9ha (61%) with 4.4ha (9%) not surveyed. Considered as a percentage of the agricultural land surveyed for this scheme grade 2 and subgrade 3a land represented respectively 80% and 20% of this area.

Penrith to Temple Sowerby

The soils across this scheme are predominantly well drained sandy soils except for occasional locations where the drainage is imperfect due to a higher clay content. The land across the scheme is predominantly grade 2 due to an overall climatic limitation with occasional locations downgraded to subgrade 3a because of a soil wetness or droughtiness limitation. The areas (percentages) recorded of grade 2, subgrade 3a, non-agricultural and urban land were respectively 65.3ha (62%), 6.8ha (6%), 2.1ha (2%) and 21.2ha (20%) with 10.8ha (10%) not surveyed. Considered as a percentage of the agricultural land surveyed for this scheme grade 2 and subgrade 3a land represented respectively 91% and 9% of this area.

Temple Sowerby to Appleby

The soils across this scheme vary from predominantly well drained sandy soils in the west to imperfectly or poorly drained loamy and clayey soils in the centre and east of the scheme. Climate limits land to respectively grade 2 and subgrade 3a on the western and eastern parts of the scheme. Land is predominantly grade 2 on the western side with the sandy soils and subgrade 3b on the eastern side with clayey soils and a mix of grade 2, subgrades 3a and subgrade 3b in the centre. The areas (percentages) recorded of grade 2, subgrade 3a, subgrade 3b, non-agricultural and urban land were respectively 72.7ha (34%), 46.2ha (22%), 45.9ha (22%), 0.5ha (<1%), 7.5ha (3%) and 30.9ha (15%) with 9.7ha (5%) not surveyed. Considered as a percentage of the agricultural land surveyed for this scheme grade 2, subgrade 3a, subgrade 3b and grade 4 land represented respectively 44%, 28%, 28% and <1% of this area.

Appleby to Brough

The soils across this scheme were found to be very variable ranging from sandy to clayey resulting in drainage status's of well drained, imperfectly drained and poorly drained. Climate limited grade to subgrade 3a in the west and centre and subgrade 3b towards the east of the scheme. Depending on the degree of wetness limitation, land along the scheme is classified as subgrade 3a, subgrade 3b and grade 4 because of wetness. Gradient limits land to grade 4 in some areas and flooding/very poor drainage limits land to grade 5 in a few locations. The areas (percentages) recorded of subgrade 3a, subgrade 3b, grade 4, grade 5, non-agricultural and urban land were respectively 43.9ha (24%), 65ha (36%), 21.6ha (12%), 5.8ha (3%), 13.5ha (8%) and 20.9 ha (12%) with 11.4ha (6%) not surveyed. Considered as a percentage of the agricultural land surveyed for this scheme subgrade 3a, subgrade 3b, grade 4 and grade 5 land represented respectively 32%, 48%, 16% and <1% of this area.

Bowes Bypass

An overall climatic limitation limited the land to subgrade 3b quality across this scheme. The soils are loamy over clayey so soil wetness is also a limitation. The areas (percentages) recorded of subgrade 3b and urban land were respectively 37.5ha (64%) and 21.3ha (36%). Considered as a percentage of the agricultural land surveyed for this scheme subgrade 3b represented 100% of this area.

Cross Lanes to Rokeby

Only a limited number of locations were surveyed across this scheme and all but one of the surveyed locations were at the west of the scheme. The soils for the locations surveyed are loamy over clayey with poor drainage. Wetness limited the land to subgrade 3b. The areas (percentages) recorded of subgrade 3b and urban land were respectively 6.9ha (11%) and 17.1ha (27%) with 40.3ha (63%) not surveyed. Considered as a percentage of the agricultural land surveyed for this scheme subgrade 3b represented 100% of this area.

Stephen Bank to Carkin Moor

Typically soils along this scheme are loamy or clayey topsoils over clayey subsoils with imperfect or poor drainage. Soil wetness limited land to subgrade 3a, subgrade 3b or grade 4 quality. The areas (percentages) recorded of subgrade 3a, subgrade 3b, grade 4, non-agricultural and urban land were respectively 7.8ha (8%), 39.9ha (42%), 22.8ha (24%), 3.4ha (4%) and 18.9ha (20%) with 1.2ha (1%) not surveyed. Considered as a percentage of the agricultural land surveyed for this scheme subgrade 3a, subgrade 3b and grade 4 represented respectively 11%, 57% and 32% of this area.

Summary

The agricultural land land quality varied from predominantly grade 2 (very good) west from the centre of the Temple Sowerby to Appleby scheme and predominantly subgrade 3b (moderate quality) east of the centre of this scheme. Across all schemes the areas (percentages) recorded of grade 2, subgrade 3a, subgrade 3b, grade 4, grade 5, non-agricultural and urban land were respectively 148.3 (19%), 107.2ha (14%), 193.0ha (25%), 44.9ha (6%), 5.8ha (1%), 27.8ha (4%) and 159.1ha (21%) with 77.8ha (10%) not surveyed. Climate precluded any land from being classified as grade 1 (excellent). The land recorded as urban is predominantly existing roads. Considered as a percentage of the agricultural land surveyed for all the schemes grade 2, subgrade 3a, subgrade 3b, grade 4 and grade 5 land represented respectively 30%, 21%, 39%, 9% and 1% of this area.

Introduction

1.1 Background

The Project comprises the improvement of the A66 between the M6 at Penrith and the A1(M) at Scotch Corner, comprising of the following eight individual schemes:

- M6 Junction 40 to Kemplay Bank Penrith to Temple Sowerby Temple Sowerby to Appleby Appleby to Brough
- Bowes Bypass
- Cross Lanes to Rokeby Stephen Bank to Carkin Moor
- A1(M) Junction 53 Scotch Corner.

ADAS were instructed by Amey in consultation with Structural Soils Ltd to undertake an agricultural land classification survey. This report provides information on the soils and agricultural quality of the seven schemes of the A66 Northern Trans-Pennine upgrade project requiring land take. The report is based on a soil survey of the land undertaken during February and March 2022.

The ALC was devised and introduced in the 1960s and Technical Report 11 (MAFF, 1966) outlined the national system, which forms the basis for advice given by the then Ministry of Agriculture, Fisheries and Food (MAFF) and Welsh Office Agriculture Department (WOAD) on land use planning matters. Following a review of the system, criteria for the sub-division of Grade 3 into Subgrade 3a (good quality agricultural land) and Subgrade 3b (moderate quality agricultural land) were published in Technical Report 11/1 (MAFF, 1976). The classification is well established and understood in the planning system and provides an appropriate framework for determining the physical quality of the land at national, regional and local levels as most recently described in the second edition of the Natural England Technical Information Note TIN049 (December 2012).

The report is divided into a number of sections with brief overarching descriptions of the surface and underlying solid geology as well as the likely soil types present using the National Soils Map, a classification showing geographic soil associations identified by both the most frequently occurring soil series and by combinations of ancillary series.

The 'Geology and Soils' desk study has previously identified and characterised the schemes in terms of the likely soil associations present. This report draws from that study to include a brief reference to any existing information which is then followed by details of the field soil survey work carried out including a brief description of the soils in each scheme. This then allows allocation to the relevant grades.

1.2 Site Environment

The A66 Northern Trans-Pennine upgrade project entails the realignment or widening of eight sections of the A66 between Penrith and Scotch Corner. This report describes the soil and land quality ascertained by field soil survey work carried out during February and March 2022.

1.3 Agricultural Use

The land affected by the project is predominantly cropped with grass with small areas of arable cropping. The schemes are described from the west to east. The

western schemes are at lower altitudes with consequent better climate. The agricultural land on these schemes tends to have greater versatility and any areas of cropping are in the western schemes. Those schemes towards the centre and east of the project tend towards higher altitude land with consequent wetter and cooler climate which favours grass production only and at times borders moorland (Appleby to Brough). Heavier soils impact drainage and alongside microrelief and slope tend to reduce cropping versatility and possibilities of growing a wider variety of crops.

1.4 Geology

The 1:50,000 scale BGS¹ geology maps of the area show that the sites are underlain by Stainmore Formation in the west of the project, the M6 Junction 40 to Kemplay Bank scheme, and in the Bowes Bypass scheme as far east as the junction with the A67. This Carboniferous deposit consists of sandstones, siltstones and mudstones and is overlain by a Glacial Till in which the soils have formed.

The Penrith Sandstone deposit lies to the east of Kemplay Bank roundabout in M6 Junction 40 to Kemplay Bank scheme as well as throughout the Penrith to Temple Sowerby, Temple Sowerby to Appleby and Appleby to Brough schemes. These Permian deposits consist of sedimentary and wind blow sands; they are overlain by Glacial Till with some glaciofluvial sands and gravels on the sides of valleys and Alluvium on valley floors.

The Yordale Group limestones occur in Bowes Bypass scheme to the east of Bowes as bands of Great Limestone, Alston Formation Limestone and Four Fathoms Limestone and throughout the Cross Lanes to Rokeby and Stephen Bank to Carkin Moor schemes as Great Limestone and Alston Formation Sandstone. This group consists of limestones, sandstones and mudstones deposited in the Carboniferous Period; they occur at the surface in the west of Cross Lanes to Rokeby scheme and are overlain by Glacial Till in the east. In Stephen Bank to Carkin Moor scheme the solid geology is predominantly covered by Glacial Till but there are isolated pockets where the solid geology occurs at the surface.

1.5 Soils

The published soils information is from the national soils map² published at 1:250,000 scale. The information indicates the western schemes of the project as having soils that are light to medium textured and well to moderately well drained. This potentially high quality land includes the following soil associations:

Newbiggin: typically a well-drained medium textured soil formed in reddish drift overlying limestone. The soils are typically medium clay loam over a clay loam subsoil; they are well drained and fall into WC 1 or 2; Newbiggin occurs in association with Salwick a similar textured but less well drained soil. The medium soil textures hold a good supply of water and the soils are not generally prone to drought. In this part of the country these soils are typically mapped as ALC Grade 3a. They occur throughout M6 Junction 40 to Kemplay Bank scheme.

Wick 1: typically a well-drained light textured soil formed in glaciofluvial and river terrace deposits. The soils are typically medium sandy loam over a medium sandy

¹ <http://mapapps.bgs.ac.uk/geologyofbritain/home.html>

² Soil Survey of England and Wales; 1983. *Soils and their use in Northern England*. Soil Survey of England and Wales; Harpenden.

loam subsoil; they are well drained and fall into WC 1; Wick 1 occurs in association with Arrow a similar textured soil affected by groundwater and with Newport a more sandy soil which is also well drained. The light loam soil textures hold an adequate supply of water and the soils are only slightly prone to drought. In this part of the country these soils are typically mapped as ALC Grade 2 and 3a. They occur throughout the west of the Junction 40 to Kemplay Bank scheme and Cross Lanes to Rokeby schemes and also in parts of Penrith to Temple Sowerby, Temple Sowerby to Appleby, Appleby to Brough and Stephen Bank to Carkin Moor schemes.

Newport 1: typically a well drained light textured soil formed in glaciofluvial drift deposits. The soils are typically loamy medium sand or over loamy sand or sand subsoil; they are well drained and fall into WC 1; Newport 1 occurs in association with Wick (see above) and similar textured soils affected by groundwater e.g. Blackwood. The light sandy soil textures make the soils prone to drought unless they are affected by groundwater but in this cool and wet part of the country these soils are typically mapped as ALC Grade 2 and 3a. They occur throughout Penrith to Temple Sowerby scheme.

Crannymoor: typically a well drained sandy textured soil formed in glaciofluvial drift. The soils are typically medium sand over a sand subsoil and are very acidic; they are well drained and fall into WC 1; Crannymoor occurs in association with Newport (see above) and similar textured soils affected by groundwater e.g. Blackwood. The light sandy soil textures make the soils prone to drought unless they are affected by groundwater but in this cool and wet part of the country drought is not an overriding limitation. However their elevated position is likely to limit their land quality to Grade 3a at best. They occur only at the western end of Appleby to Brough scheme.

In the centre and eastern schemes some of the soils are heavier textured. This potentially lower quality land includes the following soil associations:

Clifton: typically a medium to heavy textured soil, with a slowly permeable subsoil, formed in Glacial Till. The soils typically have a medium textured topsoil over clayey subsoil; typically they are poorly drained and fall into WC 4; Clifton occurs in association with Salwick a similar textured but imperfectly drained soil. The soils hold a good supply of water and are not generally prone to drought. A detailed survey undertaken at the western end of Temple Sowerby to Appleby scheme indicate that they are of a higher quality than is typical, being mapped predominantly as Grade 3a.

Brickfield 2: typically a medium textured soil, with a slowly permeable subsoil, formed in Glacial Till. The soils typically have a medium textured topsoil over medium textured subsoil; typically they are imperfectly to poorly drained and fall into WC 4 or WC 3 if under drained; Brickfield 2 occurs in association with Nercwys and East Keswick soils which are of a similar texture but better drained, typically falling into WC 3 and 1 respectively. The soils hold a good supply of water and are not generally prone to drought. They are likely to be mapped as Grade 3b due to a wetness limitation. They occur over the eastern part of Stephen Bank to Carkin Moor scheme.

Brickfield 3: typically a medium textured soil, with a slowly permeable subsoil, formed in Glacial Till. The soils typically have a medium textured topsoil over clayey subsoil; typically they are poorly drained and fall into WC 4; Brickfield 3 occurs in association with Dunkeswick and Hallsworth soils which are of a similar or heavier texture. The soils hold a good supply of water and are not generally prone to drought. In this cool and wet part of the country wetness is an overriding limitation and the soils are likely to be Grade 3b or 4. They occur over the western half of Bowes Bypass scheme.

Dunkeswick: typically a medium textured soil, with a slowly permeable subsoil, formed in Glacial Till. The soils typically have a medium textured topsoil over clayey subsoil; typically they are poorly drained and fall into WC 4; Dunkeswick occurs in association with Brickfield and Hallswoth soils which are of a similar or heavier texture. The soils hold a good supply of water and are not generally prone to drought. In this cool and wet part of the country wetness is an overriding limitation and the soils are likely to be Grade 3b or 4. They occur over the eastern half of Bowes Bypass scheme.

1.6 Geology and Soils on a Scheme Basis

M6 Junction 40 to Kemplay Bank: Deposits of Glacial Till which were laid down in ice age conditions cover most of the site with glaciofluvial sands and gravels on the southern boundary of the scheme area. These superficial deposits overlie Carboniferous deposits of Stainmore Formation mudstones and sandstones in the west and Permian deposits of Penrith Sandstone Formation in the east. The resulting soils which are mapped as Newbiggin Association in the extreme west and Wick 1 Association over the majority of the site, typically have well drained fine loamy to coarse loamy soils with some rock or gravel at depth. They are typically well to moderately well drained and in this part of the country fall into Wetness Class (WC) 1 or 2 and so into ALC Grade 3a.

Penrith to Temple Sowerby: Deposits of Glacial Till with Alluvium in valleys were laid down in ice age conditions, overlie Penrith Sandstone Formation, Permian wind-blown sands. The resulting soils are mapped as Newport 1 Association. They are typically well drained deep sandy and coarse loamy soils and in this part of the country fall predominantly into WC 1 (ALC Grade 2) but contain 10% of subordinate soils (i.e. Blackwood) which, where drained fall into WC 1 and where undrained fall into WC 3 and 4 (ALC Grade 3a/b). In the north western corner of the scheme areas of Wick 1 Association are mapped. They typically have deep well drained coarse loamy soils and are well to moderately well drained and in this part of the country fall into WC 1 or 2 and so into ALC Grade 2.

Temple Sowerby to Appleby: Deposits of Glacial Till with Alluvium in valleys were laid down in ice age conditions, overlie Penrith Sandstone Formation, Permian wind-blown sands, close to boundary with Eden Shale Mudstone which was laid down in the Permian. The resulting soils are mapped mainly as Clifton Association. They are typically slowly permeable clayey soils and in this part of the country fall into WC 4 (ALC Grade 3b or Grade 4) but contain 30% of subordinate soils (i.e. Salwick and Quarndon), which are better drained and fall into WC 2 and 3 and so ALC Grade 2 and 3a. In the central areas of the scheme Enborne and Wick 1 Association are mapped. Enborne Association are typically slowly permeable clayey soils in valleys, and in this part of the country fall into WC 3 and 4 (ALC Grade 3a/b or 4). Wick 1 Association typically have deep well drained coarse loamy soils and are well to moderately well drained and in this part of the country fall into WC 1 or 2 and so into ALC Grade 2.

Appleby to Brough: Deposits of Glacial Till with Alluvium in the valleys and River Terrace in the south east were laid down in ice age conditions, overlie Permian deposits of Penrith Sandstone.

The soils are mapped as Wick 1 Association across the majority of the scheme. They typically have deep well drained coarse loamy soils and are well to moderately well drained and in this part of the country fall into WC 1 or 2 and so into ALC Grade 3a for the western and central areas of the scheme and Grade 3b for the eastern end of the scheme. A small area to the west is mapped as Crannymore. These soils are well

drained sandy soils and can be affected by groundwater. They typically fall into WC 1 (ALC Grade 3a) when they are drained and the regional watertable has been lowered and WC 4 (ALC Grade 3b) if undrained. To the east of the scheme a small area of Clifton Association is mapped close to Langrigg. These soils are typically slowly permeable clayey soils which fall into WC 4 (ALC Grade 3b or 4) but contain 30% of subordinate soils (i.e. Salwick and Quarndon) which are better drained and fall into WC 2 and 3 (ALC Grade 3b or 4).

Bowes Bypass: Deposits of Glacial Till which were laid down in ice age conditions, overlie Carboniferous deposits of Stainmore Formation mudstones, siltstones and sandstones in the west, and Four Fathom Limestone Member in the east.

The resulting soils to the west are mapped as Brickfield 3 they typically consist of slowly permeable seasonally waterlogged fine loamy over clayey soils and in this part of the country are likely to fall into WC 4 and so into ALC Grade 3b or 4. The soils to the east of the area are mapped as Dunkeswick. They typically consist of slowly permeable seasonally logged fine loamy over clayey soils and are likely to fall into WC 4 and into ALC Grade 3b or 4.

Cross Lanes to Rokeby: Deposits of Glacial Till which were laid down in ice age conditions, overlie Carboniferous deposits of Great Limestone Member with Alston Formation sandstone on southern boundary.

The soils are mapped as Wick 1 Association. They typically have deep well drained coarse loamy soils and are well to moderately well drained and in this part of the country fall into WC 1 or 2 and so into ALC Grade 3a for the majority of the area, ALC Grade 2 in the far east of the scheme and ALC Grade 3b in the far west of the scheme.

Stephen Bank to Carkin Moor: Deposits of Glacial Till which were laid down in ice age conditions, overlie Carboniferous deposits of Yordale Group Limestones including Four Fathom Limestone in the west, Alston Formation limestones, mudstones and sandstones in the centre of the scheme and Alston Formation sandstones in the east.

Across the majority of the area to the west the soils are mapped as Wick 1 Association. They typically have deep well drained coarse loamy soils and are well to moderately well drained and in this part of the country fall into WC 1 or 2 and so into ALC Grade 2. To the far east of Stephen Bank to Carkin Moor (dualling and junctions, bypass) the soils are mapped as Brickfield 2 Association. These soils typically consist of slowly permeable, seasonally waterlogged fine loamy soils and largely fall into WC 4 when undrained (ALC Grade 3b or 4) and WC 3 with artificial drainage (ALC Grade 3a/b).

1.7 Previous Agricultural Land Classification

The Provisional ALC maps do not subdivide Grade 3 land in Subgrade 3a (good) and Subgrade 3b (moderate) quality agricultural land. This division was introduced in 1988.

M6 Junction 40 to Kemplay Bank: The Provisional ALC maps show predominantly urban land uses over much of the site with areas of Grade 3 in the east and to the south of the road. There are no detailed post 1988 ALC surveys undertaken within the study area.

Penrith to Temple Sowerby: The Provisional ALC maps show the Penrith to Temple Sowerby area as urban land over roads surrounded by areas of Grade 2 with small areas of Grade 3 around Swine Gill Plantation and at the eastern end of the scheme. A detailed post 1988 classification of the eastern end of the scheme found an area of

Grade 3a with some Grade 2 and a small area of Grade 3b. This indicates that some of the land mapped as Grade 3 on the Provisional ALC maps is likely to be Best and Most Versatile Land (BMV) land.

Temple Sowerby to Appleby: The Provisional ALC maps show the Temple Sowerby to Appleby area as urban land over roads surrounded by areas of Grade 2 in west and centre of the scheme, with Grade 3 in east and on the proposed bypass to the north of Kirkby Thore. Post 1988 surveys have been undertaken at the western end of the scheme indicating that the majority of the land in this area is Grade 3a with some Grade 2; and to the south of the proposed route, on the eastern outskirts of Kirkby Thore where a mix of Grade 2, 3a and 3b have been mapped.

Appleby to Brough: The Provisional ALC maps show the area as urban land over roads surrounded by areas of Grade 3 with some very small pockets of Grade 4 to the west. There are no detailed post 1988 ALC surveys undertaken within the study area.

Bowes Bypass: The Provisional ALC maps show the area as urban land over roads surrounded by areas of Grade 4. There are no detailed post 1988 ALC surveys undertaken within the study area.

Cross Lanes to Rokeby: The Provisional ALC maps show the area as urban land over roads surrounded by areas of Grade 3. There are no detailed post 1988 surveys undertaken within the study area.

Stephen Bank to Carkin Moor: The Provisional ALC maps show the area as urban land over roads surrounded by areas of Grade 3. There are no detailed post 1988 ALC surveys undertaken within the study area.

2 Methodology

A detailed soil survey was carried out from 7th February to 15th March 2022. The survey was based generally on observations at 100m intervals along the proposed road corridor or on a 100m grid for larger blocks of land, such as road junctions or areas of temporary land take, for example areas for use as compounds during construction. The approximate sampling density was one observation per hectare.

During the survey, soils were examined via a combination of auger borings and soil description pits to a maximum depth of 1.2m. Soils were described using hand texturing to determine the soil type. Texture class is determined by the relative proportions of sand, silt and clay particles and the amount of organic matter in a soil horizon and may be assessed in the field by hand texturing or measured in a laboratory by particle-size distribution analysis.

Soil texture is key in determining the available water capacity of a soil profile.

Soil wetness is assessed in the field by identifying the depth to any slowly permeable soil horizon, which is defined in terms of soil texture, structure and gleying and relating this to the texture of the top 25cm.

A soil wetness limitation exists where the soil water regime adversely affects plant growth or imposes restrictions on cultivations or grazing by livestock. For ALC purposes the soil wetness assessment takes account of: i) the climatic regime ii) the soil water regime and iii) the texture of the top 25cm of the soil.

The influence of climate on soil wetness is assessed by reference to median field capacity days (FCD), the number of days water is likely to drain from the soil profile in a typical year. FCD ranges are specified within which similar soils are expected to have similar degrees of wetness limitation. The spatial distribution of FCD has been mapped at a scale of 1:1 million by the SSLRC (Jones and Thomasson, 1985) and there is also a gridpoint dataset.

Following the initial survey using auger borings every 100m, the land can be mapped according to grade with each grade further characterised by excavation of a soil profile pit in a representative area of the soil type/grade. Soil samples are also taken at this stage on a 'horizon' basis and submitted for sand, silt and clay as well as organic matter content to confirm the soil texture.

The detailed data from both the auger borings and soil pits is then used to map the areas. A log of the details of each observation point and an ALC map showing the distribution of grades across the schemes is given in a separate appendix for each scheme attached to this report.

The Appendices pertaining to each scheme are as follows:-

- 1 M6 Junction 40 to Kemplay Bank
- 2 Penrith to Temple Sowerby
- 3 Temple Sowerby to Appleby
- 4 Appleby to Brough
- 5 Bowes Bypass
- 6 Cross Lanes to Rokeby
- 7 Stephen Bank to Carkin Moor

3 Soils

Details of the auger borings on a scheme basis are provided in Appendix 1 to 7. Brief generic descriptions of the soils found by the field survey for each scheme are given below together with an example detailed soil profile description for a pit, if dug, in the scheme.

3.1 M6 Junction 40 to Kemplay Bank

To the west of the M6 Junction soils with 30-40cm brown or dark brown medium clay loam topsoil over similarly coloured mainly medium or heavy clay loam subsoil sometimes moderately stony below 40-70cm were found. The soils are well drained showing no greyish or pale colours or ochreous mottling.

In the centre of this scheme soils with 25-35cm brown or dark brown sandy clay loam topsoil over similarly coloured sandy clay loam subsoil sometimes moderately stony below 28-60cm were found. The soils are well drained showing no greyish or pale colours or ochreous mottling.

On the east of the scheme soils with variable topsoil as well as variable subsoil texture were found. The topsoil textures identified were dark brown medium sandy loam, coarse sandy loam, sandy clay loam or medium clay loam topsoil over dark brown or brown medium sandy loam, medium clay loam or sandy clay loam upper subsoil over similarly coloured loamy sand, medium sand, coarse sand or coarse sandy loam subsoil. The soils are well drained showing no greyish or pale colours or ochreous mottling except for some ochreous mottling evident in one profile.

Profile Pit Description: Near auger boring 28 (east Penrith) pit to establish subsoil stone content. Wetness Class I, ALC Grade 3a (limitation topsoil stone content >6cm)

Grid Reference: 352900 529300

Crop: Grass

Depth (cm) Description

0-25	Dark brown coarse sandy loam (7.5YR3/3); total hard rounded stone 9% (visual estimate) >2cm 9% >6cm 6%; friable; weakly developed medium subangular blocky; >0.5% biopores >0.5mm diameter; common roots.
25-40	Reddish brown (5YR4/3) coarse sandy loam; 10% hard rounded stones (visual estimate); very friable; weakly developed granular and loose structure; >0.5% biopores >0.5mm diameter; common roots.
40-100	Reddish brown (5YR4/3) coarse sandy loam; total stone 20%; few roots 20-30cm; stopped due to stone.

3.2 Penrith to Temple Sowerby

The soils predominantly have medium sandy loam and occasionally loamy sand or sandy clay loam topsoils which are dark brown in colour and 20-40cm deep. The subsoil texture is predominantly medium sand or medium loamy sand (particularly the upper subsoil). The subsoil colour is predominantly brown and subsoil depth extended to 120cm plus deep. Because of their sandy texture the soils are well drained. The exception is when top and subsoil are sandy clay loam in texture and drainage is imperfect. The topsoil and subsoil are occasionally very slightly stony with occasionally the lower subsoil being moderately stony.

Profile Pit Description: Near auger boring 40 (east of Brougham) to establish soil characteristics below 70cm. Wetness Class I, ALC Grade 2 (limitation climate). The profile would also be limited to Grade 2 by droughtiness (Moisture Balance for winter wheat 13mm and for potatoes 11mm).

Grid Reference: 354600 528700

Crop: Grass

Depth (cm) Description

0-30	Dark brown (7.5YR3/3) medium sandy loam; total hard rounded stone 10% (visual estimate) >2cm 10% >6cm 6%; weakly developed medium/fine subangular blocky; >0.5% biopores >0.5mm diameter; many roots.
30-43	Brown (7.5YR4/4) loamy medium sand; weakly developed fine subangular blocky; few roots.
43-70	Strong brown (7.5YR4/6) coarse sand; total stone 20% hardstones; loose structure
70-110	Strong brown (7.5YR4/6) medium sand; loose structure.

3.3 Temple Sowerby to Appleby

The soils vary across this section with soils in the western half generally being lighter in texture than those in the eastern half. A typical lighter soil has a brown medium sandy loam topsoil 30-43cm deep over upper and lower subsoils extending to 120cm plus depth which have variable textures of brown medium sand, medium sandy loam, sandy clay loam and sandy clay. The topsoil tends to be very slightly stony and the lower subsoil moderately stony. The soils are mostly well drained.

Profile Pit Description: Near auger boring 210 Wetness Class I, Grade 2 (limitation climate)

Grid Reference: 363650 526100

Crop: Fallow after cereal

Depth (cm) Description

0-45	Dark brown (7.5YR3/3) medium sandy loam; total stone content 0-25cm 5% (visual estimate) >2cm 5% >6cm 1%; weakly developed fine subangular blocky; friable; common roots.
45-70	Dark Brown (7.5YR3/3) loamy medium sand; total stone content 20%; occasional large stone below 60cm; weakly developed fine granular; friable; few roots.
70-100	Dark brown (7.5YR3/2) loamy medium sand; total stone content 20%; weakly developed fine subangular block.

Profile Pit Description: Near auger boring 213 Wetness Class III, Grade 3a
 (limitation wetness)

Grid Reference: 363700 526300

Crop: Fallow

Depth (cm) Description

- | | |
|-------|--|
| 0-40 | Dark brown (7.5YR2.5/3) medium sandy loam; stoneless; weakly developed fine subangular blocky; friable; few roots. |
| 40-55 | Reddish Brown (5YR4/4) medium sandy loam; fine subangular blocky; friable. |
| 55-60 | Dark reddish brown (5YR3/4) sandy clay loam; total stone content 10%; large stones present at 60cm 20%; weakly developed medium subangular blocky; porosity >0.5%. |

Profile Pit Description: Near auger boring 249 Wetness Class III, Grade 3a

Grid Reference: 364500 526100

Crop: Ley

Depth (cm) Description

- | | |
|-------|---|
| 0-25 | Very dark brown (7.5YR2.5/2) sandy clay loam; weakly developed fine subangular blocky; friable |
| 25-40 | Very dark brown (7.5YR2.5/2) sandy clay loam; weakly developed fine subangular blocky; friable. |
| 40-50 | Reddish brown (5YR4/3) clay with common (10YR5/6) mottles; 10% small stones; firm; weakly developed coarse angular blocky; few fine roots. |
| 50-55 | Reddish brown (5YR4/3) clay with many (10YR5/6) mottles; 10% small stones; pale (5Y6/3) ped faces; weakly developed coarse angular blocky; porosity <0.5% biopores >0.5mm; dolerite boulders present at 50cm with clay between the boulders (rootable soil); water seeping into pit at 50cm |

A typical heavier soil in the east of the scheme has a grey brown medium clay loam or sandy clay loam topsoil varying in depth from 20-35cm. The upper subsoil is typically grey brown or dark brown sandy clay loam with ochreous mottles extending to variable depth over mainly pale brown or pale reddish brown heavy clay loam or occasionally clay, sandy clay or sandy loam lower subsoil extending to 100cm plus. These soils are either imperfectly or poorly drained.

3.4 Appleby to Brough

The survey found the soils in this scheme to be very variable and it is not possible to give any meaningful generic description of a soil profile in the scheme. The soils vary from well drained to poorly drained. The sandy textures and colours vary in well drained profiles across the scheme as do the clayey textures and colours in imperfectly and poorly drained profiles.

Location:	Appleby to Brough, near auger boring 383
OS Grid Reference:	NY 72547 17451
Land Use:	Permanent Grass (very patchy ground cover)
Aspect:	7-11° slope, south, south west facing
AOD:	145 m
Soil type:	Sandy topsoil overlying a moderately freely draining light and medium textured subsoil (Wetness Class II).
Land Quality:	Limited to ALC Subgrade 3b by slope

Soil Profile	Depth (cm)	Description
	0-30	Dark brown (10YR 3/3) loamy medium sand with few, (1-5%), small and medium rounded sandstones and dolerite erratics; slightly moist; moderately developed surface layer (5-10cm) with fine sub-angular blocky structure, below 10cm weakly developed medium and coarse angular blocky, (mechanical cultivation affected); moderate packing density; friable above 10cm, slightly firm below; common fine fissures above 10cm, rare below, few fine and medium pores; abundant fine fibrous roots becoming common below 10cm; common medium earthworms; clear, wavy boundary.
	30-100	Yellowish red (5YR 4/6) loamy medium sand, probably transitioning to sandy clay loam with depth; many, large and very large sub-rounded dolerite boulders; moist, wet below 75cm; weak, medium and coarse angular blocky structure, moderate packing density, slightly friable; few fine fissures, common fine and rare medium pores; rare fine fibrous roots; rare large earthworms and channels. Sub-surface water channel at 75cm
Large dolerite boulders in subsoil ->		

Location:	Appleby to Brough, between auger borings 456 and 458
OS Grid Reference:	NY 75365 15778
Land Use:	Permanent Grass
Aspect:	Near flat, (exposed stream embankment)
AOD:	145 m
Soil type:	Slightly stony medium silt/sandy loam topsoil over a slowly permeable heavy clay loam subsoil.
Land Quality:	ALC Subgrade 3b, (Wetness Class IV plus possible groundwater effect)

Soil Profile	Depth (cm)	Description
	0-30	Very dark brown (10YR 2/2) sandy silt loam with few, (1-5%), small rounded quartz sandstone gravels; very moist, (recent rain); moderately developed fine and medium sub-angular blocky structure; low packing density; friable; common fine fissures, common fine and medium pores; common fine and medium fibrous roots; common small and medium earthworms; clear, wavy boundary.
	30-55	Reddish yellow (5YR 6/6) medium sandy loam with few, medium and large sub-rounded sandstones; few, fine faint, yellowish brown (10YR 6/8) mottles; moist; weak, medium and coarse angular blocky structure, moderate packing density, slightly friable; common fine and rare medium fissures, few fine and medium pores; rare fine fibrous roots; rare large earthworms and channels, gradual, irregular boundary.
	55-80+	Yellowish brown (10YR 5/4), heavy clay loam with common medium and large hard and soft weathered sandstones; many, coarse, distinct yellowish brown (10YR 5/8) and light yellowish brown (10YR 6/4) mottles with common blackish iron and manganese concretions; moist; weakly developed coarse angular blocky and blocky structure; high packing density; firm, <u>slowly permeable</u> ; rare fine and medium fissures, rare fine and medium pores, very rare fine fibrous roots, rare large earthworms.

3.5 Bowes Bypass

The soils on this scheme have dark or very dark greyish brown medium clay loam, silty clay loam or sandy clay loam, sometimes organic, topsoil varying from 15-30cm deep over brown heavy or medium clay loam upper subsoil with ochreous mottles to 38-50cm depth over greyish brown or grey heavy clay loam or clay lower subsoil with ochreous mottles to 100cm plus depth. The soils are imperfectly or poorly drained.

3.6 Cross Lanes to Rokeby

The limited amount of surveying on this scheme was at the west end with one location towards the east end. The surveyed locations had dark grey or greyish brown medium clay loam or silty clay loam topsoil with a few ochreous mottles which are 24-30cm over yellow brown or light brown medium clay loam upper soil with ochreous, light grey and yellow mottles down to 32-50cm deep over very dark grey heavy clay loam or clay lower subsoil with ochreous and yellow mottles to 100cm plus depth. The soils are poorly drained.

3.7 Stephen Bank to Carkin Moor

The soils on this scheme typically have very dark or dark grey brown medium or heavy clay loam topsoil to 28-30cm depth over light grey and yellow heavy clay loam or clay subsoil with ochreous, grey and yellow mottles to 100cm plus depth. The soils are poorly drained.

Location:	Stephen Bank to Carkin Moor, near to boring 614
OS Grid Reference:	NZ 14100 09600
Land Use:	Permanent Grass
Aspect:	1-3° easterly
AOD:	163 m
Soil type:	Slightly stony medium sandy loam topsoil over moderately stony, sandy clay loam, imperfectly drained subsoil.
Land Quality:	ALC Grade 3a, (Wetness Class III)

Soil Profile	Depth (cm)	Description
	0-27	Dark greyish brown (10YR 3/2) slightly organic medium clay loam with few, (1-5%), small and medium rounded sandstones; moist; moderately developed small and medium sub-angular blocky structure; low packing density; friable; common fine and rare medium fissures, common fine pores; common fine fibrous and rare fleshy roots; common small and medium and rare large earthworms with common channels; clear, smooth boundary.
	27-60	Dark yellowish brown (10YR 4/6) medium sandy loam with common, (6-15%), medium and few large angular sandstones; few, fine faint, yellowish brown (10YR 6/8) mottles; moist; weak, medium and coarse angular blocky structure, moderate packing density, friable; few fine fissures, few fine pores; few, fine fibrous roots; rare medium and large earthworms and channels, gradual, irregular boundary.
	60-100	Yellowish brown (10YR 5/6), sandy clay loam with common medium and large weathered sandstones, locally abundant, (36-70%); many, fine, distinct light brownish grey (10YR 6/2) and brownish yellow (10YR 6/8) mottles with common iron and manganese concretions; moist; weakly developed medium and coarse angular blocky and prismatic structure; moderate packing density; friable, potentially seasonally <u>slowly permeable</u> ; rare fine fissures, rare fine pores, rare fine fibrous roots, very rare large earthworms and earthworm channels.

Location:	Stephen Bank to Carkin Moor, near to boring 644
OS Grid Reference:	NZ 15407 08812
Land Use:	Winter Cereal
Aspect:	1-3° easterly
AOD:	143m
Soil type:	Slightly stony medium clay loam topsoil over moderately stony, heavy clay loam, weakly structured and poorly drained subsoil.
Land Quality:	ALC Grade 3b, (Wetness Class IV)

Soil Profile	Depth (cm)	Description
	0-30	Dark greyish brown (10YR 4/2) medium clay loam with few, (1-5%), small and medium rounded sandstones; moist; weakly developed medium and coarse sub-angular blocky structure; moderate packing density; plastic at the surface where wet, slightly friable below; few fine fissures, rare fine and medium pores; few fine fibrous roots; rare medium earthworms and channels; abrupt, smooth boundary.
	30-42	Gray (10YR 6/1) heavy clay loam with few, medium and large angular sandstones; abundant, distinct, yellow (10YR 7/8) and yellowish brown (10YR 5/8) mottles; slightly moist; moderate, medium and coarse angular blocky structure and slightly prismatic, high packing density, very firm; rare fine and medium fissures, few fine pores; few, becoming rare, fine fibrous roots particularly in fissures and earthworm channels; rare large earthworms and channels, clear, irregular boundary.
	42-100	Very dark grey (2.5Y 3/1), heavy clay loam or clay with common medium and large sandstones with few small shale and coal fragments; abundant, distinct grey (10YR 6/1) and yellowish brown (10YR 5/8) mottles; moist; weakly developed very coarse angular blocky and prismatic structure; high packing density; firm, <u>slowly permeable</u> ; few fine and rare medium fissures, rare fine pores, rare fine fibrous roots, very rare large earthworms.

4 Agricultural Land Classification

4.1 The Agricultural Land Classification System

The land was classified using the system outlined in the Ministry of Agriculture, Fisheries and Food (MAFF, now Defra) publication: 'Agricultural Land Classification of England and Wales - Revised guidelines and criteria for grading the quality of agricultural land' (October 1988). A more recent reference to the classification system was made in a second edition of the Natural England Technical Information Note TIN049 (Dec 2012).

The Agricultural Land Classification (ALC) system provides a framework for classifying land according to the extent to which its physical or chemical characteristics impose long-term limitations on agricultural use. The limitations can operate in one or more of four principal ways. They may affect:

1. The range of crops which can be grown
2. The level of yield
3. The consistency of yield
4. The cost of obtaining the crop

The classification system gives considerable weight to flexibility of cropping, whether actual or potential. The ability of some land to produce consistently high yields of a somewhat narrower range of crops is also taken into account.

The principal physical factors influencing agricultural production are climate, site (including relief) and soil. By assessing these factors, it is possible to assign land into one of five land classification grades, Grade 1 land being the highest quality and Grade 5 the lowest quality land. Grade 3 is subdivided into Grades 3a and 3b, to identify good quality agricultural land from moderate quality land.

The ALC classifications, with reasons, for the schemes are given in separate sections for each scheme.

4.2 Climate

The agricultural climate is an important factor in assessing the agricultural quality of land, and the agricultural climate of this site has been calculated using the Climatological Data for Agricultural Land Classification³.

The climatic data used in the ALC classification of each scheme is given in the sections below for each scheme. Along the A66 route from the M6 Junction 40 to Carkin Moor climate limited the ALC grade at best to Grade 2 with some parts of the route limited to Subgrade 3a or 3b by climate.

4.3 Agricultural Land Classification for the Schemes

The results of the soil survey described in section 3 were used in conjunction with the agro-climatic data given in the sections for each scheme below to classify the land according to the revised guidelines for Agricultural Land Classification issued in 1988 by the Ministry of Agriculture, Fisheries and Food (now Defra)⁴.

³ Meteorological Office, (1989). *Climatological Data for Agricultural Land Classification*.

⁴ MAFF, (1988). *Agricultural Land Classification for England and Wales: Revised Guidelines and Criteria for Grading the Quality of Agricultural Land*.

Along the route the field survey identified agricultural land of Grade 2, Subgrade 3a, Subgrade 3b, Grade 4 and Grade 5 quality. The principal limitation to agricultural use of the land is climate, soil wetness and in limited areas gradient.

4.4 M6 Junction 40 to Kemplay Bank

Agroclimatic data

Grid reference	Altitude (m)	Average Annual Rainfall (mm)	January to June Accumulated Temperature (day °C)	Field Capacity Days (mm)	Moisture Deficit Wheat (mm)	Moisture Deficit Potatoes (mm)	Climatic grade
NY 510 289	150	920	1,223	225	67	47	3a
NY 518 289	130	877	1,246	220	73	54	2
NY 526 293	120	862	1,257	218	76	58	2

The field survey identified land of Grade 2 and Subgrade 3a with some urban and non-agricultural land. Six out of 29 locations could not be surveyed due to access being denied.

4.4.1 Grade 2

The land surveyed (10.3ha) between the M6 Junction 40 and Kemplay Bank was classified as Grade 2. The soils are well drained and medium or sandy textured but limited to Grade 2 by a climatic limitation.

4.4.2 Grade 3a

The land surveyed (2.6ha) to the west of the M6 Junction 40 was classified as Subgrade 3a due to a climatic limitation.

4.5 Penrith to Temple Sowerby

Agroclimatic data

Grid reference	Altitude (m)	Average Annual Rainfall (mm)	January to June Accumulated Temperature (day °C)	Field Capacity Days (mm)	Moisture Deficit Wheat (mm)	Moisture Deficit Potatoes (mm)	Climatic grade
NY542290	110	853	1,268	216	78	62	2
NY591286	120	820	1,255	210	81	64	2

There is an overall climatic limitation limiting the land to at best Grade 2. Eighteen of 130 locations could not be surveyed due to access being denied. After the soil survey was completed nine of the not surveyed locations (138, 142, 143, 145, 147, 150, 151, 152 and 153) plus one other location (136) were designated as out of scope due to a boundary change.

4.5.1 Grade 2

This was the predominant grade across this scheme with 65.3ha being classified as Grade 2. The land with this grade has deep well drained sandy soils. At locations where the subsoil had loamy sand and sand horizons droughtiness limited the grade to 2 as well as the overall climatic limitation (eg see data in 3.2 for pit near location 40).

4.5.2 Grade 3a

Occasional locations across this scheme were classified as Subgrade 3a. This was due to imperfect drainage (Wetness Class III) due to a sandy clay loam subsoil resulting in a slowly permeable layer or a droughtiness limitation at some locations where the subsoil texture was sand immediately beneath a loamy sand topsoil. The total area classified as Subgrade 3a was 6.8ha.

4.6 Temple Sowerby to Appleby

Agroclimatic data

Grid reference	Altitude (m)	Average Annual Rainfall (mm)	January to June Accumulated Temperature (day °C)	Field Capacity Days (mm)	Moisture Deficit Wheat (mm)	Moisture Deficit Potatoes (mm)	Climatic grade
NY 616 264 west / 1	120	847	1256	214	80	62	2
NY 677 215 east / 2	150	891	1223	218	71	52	3a
NY 658 229 central/ 3	140	898	1234	220	74	55	2 on 3a boundary

Land to east of NY658229 is generally too cool and wet to be classified higher than Grade 3a. In the west of the scheme the field survey identified the land as predominantly Grade 2 with limited areas of Subgrades 3a and 3b. In the centre of the scheme the field survey identified the land as a mix of Grade 2 and Subgrades 3a and 3b. In the east of the scheme the field survey identified land of Subgrade 3b quality

4.6.1 Grade 2

This was the predominant grade across the west of this scheme. In the centre of the scheme west of NY658229 Grade 2 land occurs in roughly equal proportion with Subgrade 3a/b land. The Grade 2 land has deep well drained sandy soils covering 72.7ha in total.

4.6.2 Grade 3a

If climate is not the reason for limiting the land to Subgrade 3a (in the east of the scheme) it is imperfect drainage caused by a sandy clay loam upper subsoil overlying a clay lower subsoil leading to a slowly permeable layer (Wetness III when slowly permeable layer starts below 58cm with 214 Field Capacity Days). The area classified as Subgrade 3a was 46.2ha.

4.6.3 Grade 3b

This is the predominant grade across the east of the scheme. The soils are poorly drained (Wetness Class 4) as a result of clayey subsoils causing the soils to be slowly permeable (Wetness IV when slowly permeable layer starts above 59cm with 218 Field Capacity Days). The area classified as subgrade 3b was 45.9ha.

4.7 Appleby to Brough

Agroclimatic data

Grid reference	Altitude (m)	Average Annual Rainfall (mm)	January to June Accumulated Temperature (day °C)	Field Capacity Days (mm)	Moisture Deficit Wheat (mm)	Moisture Deficit Potatoes (mm)	Climatic grade
NY 718 181 west/1	150	908	1223	220	70	51	3a
NY 787 149 east/2	170	1076	1201	246	61	38	3b
NY 757 156 central/3	150	917	1224	222	67	48	3a

The field survey identified land of Subgrade 3a and 3b, Grade 4 and Grade 5 quality. Climate limited the grade to Subgrade 3a at the west and centre of the scheme and to 3b at the east of the scheme. Twelve out of 159 locations were not surveyed due to access being denied.

4.7.1 **Grade 3a**

There are 43.9ha of this subgrade which covers the second largest part of the scheme. It is present throughout and is graded in this way due to climate and imperfect drainage (Wetness Class III) soils with non-calcareous medium or coarse sandy clay loam topsoils over sandy loam, sandy clay loam or heavy clay loam subsoils. The principal limitations to agriculture are climate and soil wetness due to a slowly permeable layer starting below c60cm but above 80cm.

4.7.2 **Grade 3b**

There are 65.0ha of this subgrade which covers the largest part of the scheme. It is present throughout and is graded in this way due to slope in the west and imperfect or poor drainage (Wetness Class III and IV) soils with non-calcareous medium or coarse sandy clay loam topsoils over sandy clay loam or heavy clay loam subsoils. The principal limitations to agriculture are soil wetness due to a slowly permeable layer starting above c60cm and/or high groundwater and slope to the west of the scheme.

4.7.3 **Grade 4**

There are 21.6ha of this grade occurring in patches throughout the scheme due to slope in the west and imperfect or poor drainage (Wetness Class III and IV) soils with non-calcareous heavy clay loam topsoil over clay subsoil. The principal limitations to agriculture are soil wetness due to a slowly permeable layer starting above c60cm and/or high groundwater and slope in the west of the scheme.

4.7.4 **Grade 5**

This grade is restricted to a small number of small patches mainly towards the centre of the scheme covering about 5.8ha. The Grade 5 allocation is due to possible flood risk and/or very poorly drained (Wetness Class 5) soils with non-calcareous clay topsoil over clay subsoil. The principal limitation to agriculture is soil wetness.

4.8 Bowes Bypass

Agroclimatic data

Grid reference	Altitude (m)	Average Annual Rainfall (mm)	January to June Accumulated Temperature (day °C)	Field Capacity Days (mm)	Moisture Deficit Wheat (mm)	Moisture Deficit Potatoes (mm)	Climatic grade
NY986135 West/1	280	928	1,071	227	57	32	3b
NZ014136 East/2	265	901	1,087	223	60	36	3b

The field survey identified land of Subgrade 3b quality. Observations were made at 16 locations.

4.8.1 Grade 3b

There are 37.4ha of this subgrade covering the whole of the scheme. It is graded in this way due to climate and imperfect drainage or poor drainage (Wetness Class III or IV). The soils have non-calcareous medium clay loam, medium silty clay loam or sandy clay loam topsoil over heavy clay loam and clay subsoil. The principal limitations to agriculture are climate and soil wetness due to a slowly permeable layer starting within c61cm (Wetness Class IV) or starting below c61cm but within 80cm depth (Wetness Class III)

4.9 Cross Lanes to Rokeby

Agroclimatic data

Grid reference	Altitude (m)	Average Annual Rainfall (mm)	January to June Accumulated Temperature (day °C)	Field Capacity Days (mm)	Moisture Deficit Wheat (mm)	Moisture Deficit Potatoes (mm)	Climatic grade
NZ 049 138 West/1	210	851	1149	215	68	48	3b
NZ 081 136 East/2	150	812	1217	208	79	62	2
NZ 065 137 Central/3	190	846	1172	214	72	52	3a

The locations surveyed identified land of Subgrade 3b quality. Fifty two out of 61 locations could not be surveyed due to access being denied. Of the 9 locations surveyed 8 were at the west end of the scheme.

4.9.1 Grade 3b

The limited area of this scheme surveyed identified 6.9ha of this subgrade. It is graded in this way due to climate and imperfect or poor drainage (Wetness Class III or IV). The soils had non-calcareous medium clay loam or silty clay loam topsoil over heavy clay loam and clay subsoil. The principal limitation to agriculture is soil wetness due to a slowly permeable layer starting within c58cm (Wetness Class IV) or starting below c58cm but within 80cm depth (Wetness Class III)

4.10 Stephen Bank to Carkin Moor

Agroclimatic data

Grid reference	Altitude (m)	Average Annual Rainfall (mm)	January to June Accumulated Temperature (day °C)	Field Capacity Days (mm)	Moisture Deficit Wheat (mm)	Moisture Deficit Potatoes (mm)	Climatic grade
NZ 123 106 West/1	140	805	1,229	206	84	67	2
NZ 165 080 East/2	150	770	1,218	197	84	68	2

The field survey identified land of predominantly Subgrade 3b and Grade 4 with a very limited area of Subgrade 3a quality. Three out of 85 locations were not surveyed.

4.10.1 Grade 3a

There are 7.8ha of this subgrade which covers a small part of the scheme. This grade is allocated due to imperfectly drained (Wetness Class III) soils with non-calcareous medium clay loam topsoils over variable sandy, medium or heavy clay loam subsoils. The principal limitation to agriculture is soil wetness due to a slowly permeable layer starting below c54cm but within 80cm.

4.10.2 Grade 3b

There are 39.9ha of this subgrade which covers the largest part of the scheme. It is present throughout and is graded as such due to poor drainage (Wetness IV) soils with non-calcareous medium clay loam topsoils over medium or heavy clay loam subsoils which maybe sandy in places. The principal limitation to agriculture is soil wetness due to a slowly permeable layer starting above c54cm.

4.10.3 Grade 4

There are a number of areas totalling to 22.8ha of this grade tending towards the centre of the scheme. The areas allocated this grade have poorly drained (Wetness Class IV) soils with non-calcareous heavy clay loam topsoil over heavy clay loam or clay subsoil. The principal limitation to agriculture is soil wetness due to a slowly permeable layer starting above c54cm.

4.11 Summary

ALC, Non-agricultural, Urban and Not-surveyed Areas by Scheme (Area (ha) and %)

A summary of the land areas. Agricultural land has been classified according to Grades 2-5. Grade 1 is excluded due to a climate limitation.

The % in brackets is the proportion of agricultural land surveyed.

Scheme	Grade 2		Subgrade 3a		Subgrade 3b		Grade 4		Grade 5		Non-agricultural		Urban		Not surveyed

sch	-	schist	occ	-	occasional
ssst	-	soft/weathered sandstones	OB	-	overburden
t	-	tile fragments	OM	-	organic matter
slst	-	soft limestone	SPL	-	slowly permeable layer
zlst	-	siltstone	W	-	Weathering

Colour	Texture	Mottling	CaCO ₃
Bk - black	C - clay	o – unmottled soil;	non - non-calcareous
Br - brown(ish)	ZC - silty clay	x – a few (<2%) <i>ochreous</i> mottles;	v sl ca - very slightly calcareous
Bu - blue(ish)	SC - sandy clay	xx – common (2-20%) to many (20-40%) <i>ochreous</i> mottles <u>OR</u> greyish or pale soil, typically with a few <i>ochreous</i> mottles;	sl ca - slightly calcareous
Dk - dark	CL - clay loam (H-heavy, M-medium)	xxx – greyish or pale colours dominant in matrix and/or ped faces and common to very many (>40%) <i>ochreous</i> mottles <u>OR</u> if reddish colours are dominant in the matrix, > 2% greyish, brownish or <i>ochreous</i> mottles or ferri-manganiferous concentrations, and dominantly pale coloured ped faces (<i>gleyed horizon</i>);	ca - calcareous
Du - dusky	ZCL - silty clay loam (H-heavy, M-medium)	xxxx – dominantly grey soil, often with some <i>ochreous</i> mottles (<i>gleyed horizon</i>).	v ca - very calcareous
Gn - green(ish)	SCL - sandy clay loam	'greyish', 'pale' 'brownish', 'ochreous' and 'reddish' colours are assessed in the field using a Munsell Soil Colour Book and defined according to Appendix 3 of the ALC Guidelines.	Stone lithology
Gr - grey(ish)	SZL - sandy silt loam (F-fine, M-medium, C-coarse)		1 - all hard rocks or stones
Li - light	ZL - silt loam		2 - soft, medium or coarse grained sandstones
Ol - olive	SL - sandy loam (F-fine, M-medium, C-coarse)		3 - soft 'weathered' igneous or metamorphic rocks or stones
Pi - pink(ish)	LS - loamy sand (F-fine, M-medium, C-coarse)		4 - soft oolitic or dolomitic limestones
Pl - pale	S - sand (F-fine, M-medium, C-coarse)		5 - soft fine grained sandstones
Rd - red(dish)	Org - organic (S-sand, L-loam, C-clay)		6 - soft, argillaceous or silty rocks or stones
St - strong	Pty - peaty (S-sand, L-loam)		7 - chalk or chalk stones
V - very	Pt - peat (S-sandy, L-loamy, H-humified, SF-semi-fibrous, F-fibrous)		8 - gravel with non-porous stones
Wk - weak	R - bedrock		9 - gravel with porous stones
SPL		Notes	
yes - a slowly permeable layer. borderline - a borderline slowly permeable layer. no - not a slowly permeable layer.		FMCs – ferri-manganiferous concentrations	
Principal Limitation(s) to Agriculture			
CL - climate	DE - depth	DR - droughtiness	ER - erosion
GR - gradient	MR - microrelief	ST - stoniness	TX - texture
Droughtiness Calculation			
MDW - moisture deficit wheat (mm); MDP - moisture deficit potatoes (mm); MBW - moisture balance wheat (mm); MBP - moisture balance potatoes (mm); Grade W - droughtiness grade for wheat; Grade P - droughtiness grade for potatoes.			
Descriptions and classifications are made in accordance with <i>Soil Survey Field Handbook</i> (Hodgson, J.M., 1997), <i>Technical Information Note TIN037: Soil Texture</i> (Natural England, 2008) and <i>Agricultural Land Classification of England and Wales: Revised guidelines and criteria for grading the quality of agricultural land</i> (MAFF, 1988).			

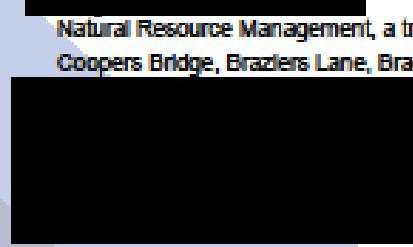

In the auger boring descriptions sometimes the Munsell Soil Colour Code was used to record soil colour. Greyish, pale, brownish, ochreous and reddish colours are relevant to establishing if a soil horizon is gleyed i.e. has greyish, pale and ochreous soil colouring indicative of waterlogging). Munsell colours are defined as follows:-

- Greyish is Munsell soil colour of any hue with a chroma 2 or less and a value more than 3 e.g. in the Munsell colour code 10YR6/1 10YR is the hue, 6 is the value and 1 is the chroma (in a word the soil colour is grey).
- Pale is Munsell soil colour of any hue with either chroma 3 and a value more than 4 or chroma 4 and value more than 5 e.g. 10YR6/4 is light yellowish brown (considered a pale colour for ALC purposes).
- Brownish is Munsell soil colour of hues 7.5YR to 10YR with either chroma 3 and value 4 or chroma 4 and value 4 or 5 e.g. 7.5YR3/3 is dark brown.
- Ochreous is Munsell soil colour of 10YR or redder with chroma more than 4 and value less 7 e.g. 7.5YR4/6 is strong brown.
- Reddish is Munsell soil colour of hue 5YR or redder e.g. 5YR4/3 is reddish brown.

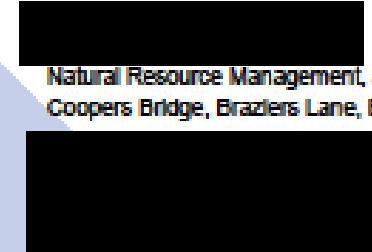

Soil surveyors carry Munsell Soil Colour Charts to assign soil colours whilst carrying out surveys.

Technical Information

ADAS (UK) Textural Class Abbreviations

The texture classes are denoted by the following abbreviations:

Class	Code
Sand	S
Loamy sand	LS
Sandy loam	SL
Sandy Silt loam	SZL
Silt loam	ZL
Sandy clay loam	SCL
Clay loam	CL
Silt clay loam	ZCL
Clay	C
Silty clay	ZC
Sandy clay	SC

For the *sand*, *loamy sand*, *sandy loam* and *sandy silt loam* classes the predominant size of sand fraction may be indicated by the use of prefixes, thus:

- vf Very Fine (more than 2/3's of sand less than 0.106 mm)
- f Fine (more than 2/3's of sand less than 0.212 mm)
- c Coarse (more than 1/3 of sand greater than 0.6 mm)
- m Medium (less than 2/3's fine sand and less than 1/3 coarse sand).

The subdivisions of *clay loam* and *silty clay loam* classes according to clay content are indicated as follows:

- M medium (less than 27% clay)
- H heavy (27-35% clay)

Organic soils i.e. those with an organic matter greater than 10% will be preceded with a letter O.

Peaty soils i.e. those with an organic matter greater than 20% will be preceded with a letter P.

Appendix 10: Description of ALC Grades

The ALC grades and subgrades are described below in terms of the types of limitation which can occur, typical cropping range and the expected level and consistency of yield. The '*best and most versatile agricultural land*' falls into grades 1, 2 and subgrade 3a – which collectively comprises about one-third of the agricultural land in England and Wales. About half the land in England and Wales is either of moderate quality (subgrade 3b) or poor quality (grade 4). Although less significant on a national scale, such land can be locally valuable to agriculture and the rural economy where poorer farmland predominates. The remainder is very poor quality land in grade 5, which mostly occurs in the uplands.

Grade 1 – excellent quality agricultural land

Land with no or very minor limitations to agricultural use. A very wide range of agricultural and horticultural crops can be grown and commonly includes top fruit, soft fruit, salad crops and winter harvested vegetables. Yields are high and less variable than on land of lower quality.

Grade 2 – very good quality agricultural land

Land with minor limitations which affect crop yield, cultivations or harvesting. A wide range of agricultural and horticultural crops can usually be grown but on some land in the grade there may be reduced flexibility due to difficulties with the production of the more demanding crops such as winter harvested vegetables and arable root crops. The level of yield is generally high but may be lower or more variable than Grade 1.

Grade 3 – good to moderate quality land

Land with moderate limitations which affect the choice of crops, timing and type of cultivation, harvesting or the level of yield. Where more demanding crops are grown yields are generally lower or more variable than on land in Grades 1 and 2.

Subgrade 3a – good quality agricultural land

Land capable of consistently producing moderate to high yields of a narrow range of arable crops, especially cereals, or moderate yields of a wide range of crops including cereals, grass, oilseed rape, potatoes, sugar beet and the less demanding horticultural crops.

Subgrade 3b – moderate quality agricultural land

Land capable of producing moderate yields of a narrow range of crops, principally cereals and grass or lower yields of a wider range of crops or high yields of grass which can be grazed or harvested over most of the year.

Grade 4 – poor quality agricultural land

Land with severe limitations which significantly restrict the range of crops and/or level of yields. It is mainly suited to grass with occasional arable crops (e.g. cereals and forage crops) the yields of which are variable. In moist climates, yields of grass may be moderate to high but there may be difficulties in utilisation. The grade also includes very droughty arable land.

Grade 5 – very poor quality agriculture land

Land with very severe limitations which restrict use to permanent pasture or rough grazing, except for occasional pioneer forage crops.
