Detailed Impact Assessment - Effects on current status

Test A: Cause of deterioration at the water body scale

Chelt – M5 to conf. R. Severn GB109054032810												Detailed Impact Assessment Outcome				
Water body type:	River	Watercourse (receptor value):		River Chelt	MW3	Drain 12		Drain 15								
Hydromorphological designation:	Not Heavily Modified or Artificial	Scheme activity:		Drainage discharge	Drainage discharge	New Culvert		Culvert Extension		Drainage Discharge						
Overall Status (2015):	Poor	Description of scheme activity:		*Final receiving water body from S1, S1 South, M5 South of River Chelt, Link Road, and B Rood Outfall.*	*Drainage pathway into the River Chelt from the S1 drainage catchment*	*New culvert 31.85m long.*		*Culvert replacement with new length of 25.89m. Original dimensions unknown.*		*Receiving water body from the Link Road drainage catchment*						
Overall Status Objective:	Good by 2027	Impact type from scheme activity:		Changes in surface water runoff	Changes in surface water runoff	Direct loss of open channel	Habitat severance	Direct loss of open channel	Habitat severance	Changes in surface water runoff		Cumulative effects - effects on quality element from scheme component(s) located in other WFD water bodies	Overall effect on quality element at water body scale	Additional mitigation requirements	Residual effect on quality element at water body scale	WFD compliance outcome - potential for deterioration of current status of quality element at water body scale
WFD Status Element	WFD Quality Element	RBMP Cycle 2 2015 Status	RBMP Cycle 2 Status Objective													
Biological	Fish	N/A	Good by 2027 (disproportionate burdens)	HEWRAT routine runoff assessment passes for all surface water tests. Negligible effect anticipated when balanced against embedded mitigation. No measurable change in quality element anticipated. Embedded mitigation ensures no alteration in quantity within the receiving water body. outfall rates will be no greater than greenfield runoff rates. Additional mitigation not required.	HEWRAT routine runoff assessment passes for all surface water tests. Negligible effect anticipated when balanced against embedded mitigation. No measurable change in quality element anticipated. Embedded mitigation ensures no alteration in quantity within the receiving water body. outfall rates will be no greater than greenfield runoff rates. Additional mitigation not required.	At present Drain 12 is an ephemeral drain which is not considered to provide suitable fish habitat. It's primary function is to facilitate land drainage, and is unlikely to support significant fish movement and recruitment. As such, the feature is not likely to support/contribute to the overall water body fish classification. Direct loss of 34 m of open channel is therefore considered to have a negligible effect on fish. No measurable change in quality element anticipated. Additional mitigation not required.	At present Drain 12 is an ephemeral drain which is not considered to provide suitable fish habitat. It's primary function is to facilitate land drainage, and is unlikely to support significant fish movement and recruitment. As such, the feature is not likely to support/contribute to the overall water body fish classification. Habitat severance associated with the new culvert is therefore considered to have a negligible effect on fish. No measurable change in quality element anticipated. Additional mitigation not required.	At present Drain 15 is an ephemeral drain which is not considered to provide suitable fish habitat. It's primary function is to facilitate land drainage, and is unlikely to support significant fish movement and recruitment. As such, the feature is not likely to support/contribute to the overall water body fish classification. Minor direct loss of open channel is therefore considered to have a negligible effect on fish. No measurable change in quality element anticipated. Additional mitigation not required.	At present Drain 15 is an ephemeral drain which is not considered to provide suitable fish habitat. It's primary function is to facilitate land drainage, and is unlikely to support significant fish movement and recruitment. As such, the feature is not likely to support/contribute to the overall water body fish classification. Habitat severance associated with the new culvert is therefore considered to have a negligible effect on fish. No measurable change in quality element anticipated. Additional mitigation not required.	HEWRAT routine runoff assessment passes for all surface water tests. Negligible effect anticipated when balanced against embedded mitigation. No measurable change in quality element anticipated. Embedded mitigation ensures no alteration in quantity within the receiving water body. outfall rates will be no greater than greenfield runoff rates. Additional mitigation not required.	None	Negligible effect anticipated when Scheme component effects are considered in combination. No measurable change in quality element anticipated. Additional mitigation not required.	N/A	Negligible effect anticipated when Scheme component effects are considered in combination. No measurable change in quality element anticipated. Additional mitigation not required.	Compliant - no deterioration in quality element status anticipated
	Invertebrates	Good	Good by 2015			At present Drain 12 is likely to contain an impoverished invertebrate community adapted to prolonged dry periods. Direct loss of 34 m of open channel is considered to have a negligible effect on invertebrates at the water body scale. No measurable change in quality element anticipated. Additional mitigation not required.	At present Drain 12 is likely to contain an impoverished invertebrate community adapted to prolonged dry periods. Fragmentation of this open channel will result in minor localised change in habitat for invertebrates. However, the embedded mitigation includes the incorporation of embedded culvert invert levels to below the existing channel bed to facilitate natural bed sediments throughout the new culvert. As such, this will reduce severance of the habitat. No measurable change in quality element anticipated. Additional mitigation not required.	At present Drain 15 is likely to contain an impoverished invertebrate community adapted to prolonged dry periods. Direct loss of 34 m of open channel is considered to have a negligible effect on invertebrates at the water body scale. No measurable change in quality element anticipated. Additional mitigation not required.	At present Drain 15 is likely to contain an impoverished invertebrate community adapted to prolonged dry periods. Fragmentation of this open channel will result in minor localised change in habitat for invertebrates. However, the embedded mitigation includes the incorporation of embedded culvert invert levels to below the existing channel bed to facilitate natural bed sediments throughout the new culvert. As such, this will reduce severance of the habitat. No measurable change in quality element anticipated. Additional mitigation not required.		None	Negligible effect anticipated when Scheme component effects are considered in combination. No measurable change in quality element anticipated. Additional mitigation not required.	N/A	Negligible effect anticipated when Scheme component effects are considered in combination. No measurable change in quality element anticipated. Additional mitigation not required.	Compliant - no deterioration in quality element status anticipated
	Macrophytes and Phytobenthos - combined	Poor	Good by 2027			At present Drain 12 supports very limited macrophyte growth. Plants within the channel are dominated by terrestrial herbs, grasses and scrub, with hedgerow trees alongside the drain shading parts of the channel. Direct loss of 34 m of open channel is considered to have a negligible effect on macrophytes at the water body scale. No measurable change in quality element anticipated. Additional mitigation not required.	At present Drain 12 supports very limited macrophyte growth. Plants within the channel are dominated by terrestrial herbs, grasses and scrub, with hedgerow trees alongside the drain shading parts of the channel. Fragmentation of this open channel is considered to have negligible effect on macrophytes at the water body scale. No measurable change in quality element anticipated. Additional mitigation not required.	At present Drain 15 supports very limited macrophyte growth. Plants within the channel are dominated by terrestrial herbs, grasses and scrub, with hedgerow trees alongside the drain shading parts of the channel. Direct loss of 34 m of open channel is considered to have a negligible effect on macrophytes at the water body scale. No measurable change in quality element anticipated. Project Name: M5 Junction 10 Improvements Scheme

Detailed Impact Assessment - Effects on current status

Test A: Cause of deterioration at the water body scale

Leigh Bk – source to conf. R. Chelt GB109054039770

Water body type:	River
Hydromorphological designation:	Not Heavily Modified or Artificial
Overall Status (2015):	Moderate
Overall Status Objective:	Moderate by 2015

Watercourse (receptor value):	Leigh Brook			
Scheme activity:	Culvert extension		Severance of flood flows	Drainage discharge
Description of scheme activity:	*8.45m US and 7.9m DS extension to existing culvert. An approximate 30% increase.*		*Removal of the twin culverts beneath the A4019 and elevation of the A4019 reduces flood flows from the River Chelt catchment to the Leigh Brook catchment in the 1 in 100 year + CC and higher events. As a result of the A4019 elevation and removal of the culverts, the peak flow in the Leigh Brook culvert will be reduced from 9.4m3/s to 3.2 m3/s in the 100 year + CC event.*	*Final receiving water body for J1, S2 and combined basin drainage catchments.*
Impact type from scheme activity:	Direct loss or alteration of open channel	Habitat severance	Changes in flood mechanisms within the surface water bodies	Changes in surface water runoff

WFD Status Element	WFD Quality Element	RBMP Cycle 2 2015 Status	RBMP Cycle 2 Status Objective	Leigh Brook – Direct loss or alteration of open channel	Leigh Brook – Habitat severance	Leigh Brook – Changes in flood mechanisms within the surface water bodies	Leigh Brook – Changes in surface water runoff
Biological	Fish	N/A	N/A	Survey of the Leigh Brook at this location identified the channel as being unsuitable for fish. The channel at this location resembles a ditch and is unlikely to support significant fish movement and recruitment. As such, the feature is not likely to support/contribute to the overall water body fish classification. 10 m direct loss of open channel up and downstream of the existing crossing is therefore considered to have a negligible effect on fish. No measurable change in quality element anticipated. Additional mitigation not required.	Survey of the Leigh Brook at this location identified the channel as being unsuitable for fish. The channel at this location resembles a ditch and is unlikely to support significant fish movement and recruitment. As such, the feature is not likely to support/contribute to the overall water body fish classification. Habitat severance associated with the new culvert is therefore considered to have a negligible effect on fish. No measurable change in quality element anticipated. Additional mitigation not required.	Survey of the Leigh Brook at this location identified the channel as being unsuitable for fish. The channel at this location resembles a ditch and is unlikely to support significant fish movement and recruitment. As such, the feature is not likely to support/contribute to the overall water body fish classification. Changes in flows associated with the removal of the twin culverts and elevation of the A4019 is therefore considered to have a negligible effect on fish. No measurable change in quality element anticipated. Additional mitigation not required.	HEWRAT routine runoff assessment passes for all surface water tests. Negligible effect anticipated when balanced against embedded mitigation. No measurable change in quality element anticipated. Embedded mitigation ensures no alteration in quantity within the receiving water body. outfall rates will be no greater than greenfield runoff rates. Additional mitigation not required.
	Invertebrates	Good	Good by 2015	Biological metrics from invertebrate survey for the project are indicative of an impoverished community with high tolerance to organic pollution (WHPT ASPT 3.96), moderate sensitivity to reduced flow velocity conditions (species LIFE 6.30) and heavy sedimentation (species PSI 10.3). Given the watercourse in this location forms the headwaters of the water body's reportable river it is considered that the invertebrate population at this location may support the overall invertebrate classification for water body. As such, approximately 16 m loss of open channel may result in a localised adverse effect when balanced against embedded mitigation. However, no deterioration in status of quality element anticipated at the water body scale given the small scale nature of the impact. Additional mitigation not required.	Biological metrics from invertebrate survey for the project are indicative of an impoverished community with high tolerance to organic pollution (WHPT ASPT 3.96), moderate sensitivity to reduced flow velocity conditions (species LIFE 6.30) and heavy sedimentation (species PSI 10.3). Fragmentation of this open channel will result in minor localised change in habitat for invertebrates. However, the embedded mitigation includes the incorporation of embedded culvert invert levels to below the existing channel bed to facilitate natural bed sediments throughout the new culvert. As such, this will reduce severance of the habitat. No measurable change in quality element anticipated. Additional mitigation not required.	Biological metrics from invertebrate survey within the Site are indicative of a highly tolerant invertebrate community (WHPT ASPT 3.96), moderate sensitivity to reduced flow velocity conditions (species LIFE 6.30) and heavy sedimentation (species PSI 10.3). During survey the channel was observed to be dry in sections and ponded in other areas. As such, the invertebrate community is adapted to regular drying of the channel. However, further downstream it is likely that the leigh Brook provides more permanent aquatic habitat for invertebrates as it picks up more water from the wider catchment. Changes in flows as a result of the elevation of the A4019 will only be observed during flood events (100 year+CC and higher). As such, the impact will be relatively infrequent and short lived. The Scheme is not expected to impact normal (base) flows within the channel. However, flood flows can provide important flushing of sediments and pollutants. As such, a localised adverse effect is anticipated when balanced against embedded mitigation. However, no deterioration in status of the quality element is anticipated at the water body scale. Additional mitigation not required.	
	Macrophytes and Phytobenthos - combined	Moderate	Moderate by 2015 (Unfavourable balance of cost and benefits)	Macrophyte survey of the Leigh Brook at this location identified a species poor community, with only one macrophyte species (fool's watercress) recorded with <1% cover. As such, this section of the Leigh Brook is not considered to significantly support the overall macrophyte classification for the water body. 10 m direct loss of open channel up and downstream of the existing crossing is therefore considered to have a negligible effect on macrophyte cover. No measurable change in quality element anticipated. Additional mitigation not required.	Macrophyte survey of the Leigh Brook at this location identified a species poor community, with only one macrophyte species (fool's watercress) recorded with <1% cover. As such, this section of the Leigh Brook is not considered to significantly support the overall macrophyte classification for the water body. Fragmentation of this open channel is considered to have negligible effect on macrophytes at the water body scale. No measurable change in quality element anticipated. Additional mitigation not required.	Macrophyte survey of the Leigh Brook within the Site identified a species poor community, with only one macrophyte species (fool's watercress) recorded with <1% cover. As such, this section of the Leigh Brook is not considered to significantly support the overall macrophyte classification for the water body. However, further downstream it is likely that the Leigh Brook provides more permanent aquatic habitat for a more diverse macrophyte assemblage as it picks up from water from the wider catchment. Changes in flows as a result of the elevation of the A4019 will only be observed during flood events higher than 1 in 100 year+CC event. As such, the impact will be relatively infrequent and short lived. The Scheme is not expected to impact normal (base) flows within the channel. However, flood flows can provide important flushing of sediment and pollutants. As such, a localised adverse effect is anticipated when balanced against embedded mitigation. However, no deterioration in status of the quality element is anticipated at the water body scale. Additional mitigation not required.	
Physicochemical	Physico-chemical quality elements comprise: Ammonia, Dissolved Oxygen, pH, Phosphate and Temperature.	Moderate	Moderate by 2015 (Unfavourable balance of cost and benefits)	Element is insensitive to impact. No measurable change to quality element.	Element is insensitive to impact. No measurable change to quality element.	Element is insensitive to impact. No measurable change to quality element.	HEWRAT routine runoff assessment passes for all surface water tests. Negligible effect anticipated when balanced against embedded mitigation. No measurable change in quality element anticipated. Embedded mitigation ensures no alteration in quantity within the receiving water body. outfall rates will be no greater than greenfield runoff rates. Additional mitigation not required.
Specific Pollutants	Copper, Triclosan, Zinc	N/A (high)	N/A				HEWRAT routine runoff assessment passes for all surface water tests. Negligible effect anticipated when balanced against embedded mitigation. No measurable change in quality element anticipated. Embedded mitigation ensures no alteration in quantity within the receiving water body. outfall rates will be no greater than greenfield runoff rates. Additional mitigation not required.
Hydromorphological		Supports Good	Supports Good by 2015	Culvert extension on a watercourse which has minimal flow and is heavily sediment laden. Environmentally sensitive culvert design will reduce any impact to the hydromorphological functioning of the feature and vegetation management will mitigate against additional changes to sediment loads. Negligible effect anticipated when balanced against embedded mitigation. No measurable change in quality element anticipated. Additional mitigation not required.		In the higher events (1 in 100 year+CC and above), flow through the Leigh Brook culvert will be reduced by approximately 60% due to the severance of flood flow over the A4019 and removal of the twin culverts. This may cause reduced flushing of sediments through the system and lower erosion rates within the channel. However, it is expected that the effects are likely to be localised when balanced against embedded mitigation. No deterioration in status of quality element anticipated at the water body scale. Additional mitigation not required.	Embedded mitigation ensures no change in outfall rates as a result in changes to surface water runoff. No alteration in Hydromorphology as a result. Additional mitigation not required.
Chemical	Priority substances	Good	Does not require assessment 2015	Element is insensitive to impact. No measurable change to quality element.		Element is insensitive to impact. No measurable change to quality element.	HEWRAT routine runoff assessment passes for all surface water tests. Negligible effect anticipated when balanced against embedded mitigation. No measurable change in quality element anticipated. Embedded mitigation ensures no alteration in quantity within the receiving water body. outfall rates will be no greater than greenfield runoff rates. Additional mitigation not required.

Watercourse (receptor value):	Drain 22			
Scheme activity:	Culvert Extension		Severance of flood flows	Drainage discharge
Description of scheme activity:	*Extension of 42.24m US and 53.015m DS extension to existing culvert. An approximate 200% increase.*		*Elevation of A4019 and removal of the twin culverts severs flood flows into the leigh brook catchment east of the M5 increasing flood flows through the Piffs Elm culvert. The Scheme (in present day) does not impact events lower than the 1 in 100 year+CC.*	*Drainage pathway for J1 and S2 drainage catchment into the Leigh Brook.*
Impact type from scheme activity:	Direct loss or alteration of open channel	Habitat severance	Changes in flood mechanisms within the surface water bodies	Changes in surface water runoff

WFD Status Element	WFD Quality Element	Drain 22 – Direct loss or alteration of open channel	Drain 22 – Habitat severance	Drain 22 – Changes in flood mechanisms within the surface water bodies	Drain 22 – Changes in surface water runoff
Biological	Fish	The drain associated with Piffs Elm culvert was not visited during survey. However, review of culvert inspection/drainage survey results and photos indicate that this culvert is associated with highways drainage from the M5 and is heavily overgrown with terrestrial vegetation. It therefore is assumed that it is an ephemeral drain which is not considered to provide suitable fish habitat. Its primary function is to facilitate drainage and is unlikely to support fish movement and recruitment. As such, the feature is not likely to support/contribute to the overall water body fish classification. Direct loss of open channel is therefore considered to have a negligible effect on fish. No measurable change in quality element anticipated. Additional mitigation not required.	The drain associated with Piffs Elm culvert was not visited during survey. 	Invertebrates		At present Drain 8 is likely to contain an impoverished invertebrate community adapted to prolonged dry periods. Direct loss a small section of channel associated with widening of a section of Stanboro Lane is considered to have a negligible effect on invertebrates at the water body scale. No measurable change in quality element anticipated. Additional mitigation not required.	At present Drain 8 is likely to contain an impoverished invertebrate community adapted to prolonged dry periods. as the system is already severed due to the existing culvert, the small section of extension due to widening around Stanboro Lane is considered to have a negligible effect on invertebrates at the water body scale. No measurable change in quality element anticipated. Additional mitigation not required.	At present Drain 10 is likely to contain an impoverished invertebrate community adapted to prolonged dry periods. Direct loss a small section of channel associated with widening of a section of Withy bridge Lane is considered to have a negligible effect on invertebrates at the water body scale. No measurable change in quality element anticipated. Additional mitigation not required.	At present Drain 10 is likely to contain an impoverished invertebrate community adapted to prolonged dry periods. as the system is already severed due to the existing culvert, the small section of extension due to widening around Withybridge Lane is considered to have a negligible effect on invertebrates at the water body scale. No measurable change in quality element anticipated. Additional mitigation not required.
	Macrophytes and Phytobenthos - combined		At present Drain 8 supports very limited macrophyte growth. Plants within the channel are dominated by terrestrial herbs, grasses and scrub, with hedgerow trees alongside the drain shading parts of the channel. Direct loss of open channel is considered to have a negligible effect on macrophytes at the water body scale. No measurable change in quality element anticipated. Additional mitigation not required.	At present Drain 8 supports very limited macrophyte growth. Plants within the channel are dominated by terrestrial herbs, grasses and scrub, with hedgerow trees alongside the drain shading parts of the channel. Fragmentation of this open channel is considered to have negligible effect on macrophytes at the water body scale. No measurable change in quality element anticipated. Additional mitigation not required.	At present Drain 10 supports very limited macrophyte growth. Plants within the channel are dominated by terrestrial herbs, grasses and scrub, with hedgerow trees alongside the drain shading parts of the channel. Direct loss of open channel is considered to have a negligible effect on macrophytes at the water body scale. No measurable change in quality element anticipated. Additional mitigation not required.	At present Drain 10 supports very limited macrophyte growth. Plants within the channel are dominated by terrestrial herbs, grasses and scrub, with hedgerow trees alongside the drain shading parts of the channel. Fragmentation of this open channel is considered to have negligible effect on macrophytes at the water body scale. No measurable change in quality element anticipated. Additional mitigation not required.
Physicochemical	Physico-chemical quality elements comprise: Ammonia, Dissolved Oxygen, pH, Phosphate and Temperature.	HEWRAT routine runoff assessment passes for all surface water tests. Negligible effect anticipated when balanced against embedded mitigation. No measurable change in quality element anticipated. Embedded mitigation ensures no alteration in quantity within the receiving water body. outfall rates will be no greater than greenfield runoff rates Additional mitigation not required.	Element is insensitive to impact. No measurable change to quality element.	Element is insensitive to impact. No measurable change to quality element.	Element is insensitive to impact. No measurable change to quality element.	Element is insensitive to impact. No measurable change to quality element.
Specific Pollutants	Copper, Triclosan, Zinc	HEWRAT routine runoff assessment passes for all surface water tests. Negligible effect anticipated when balanced against embedded mitigation. No measurable change in quality element anticipated. Embedded mitigation ensures no alteration in quantity within the receiving water body. outfall rates will be no greater than greenfield runoff rates. Additional mitigation not required.				
Hydromorphological		Embedded mitigation ensures no change in outfall rates as a result in changes to surface water runoff. No alteration in Hydromorphology as a result. Additional mitigation not required.	Culvert extension on a drain which has minimal flow and is heavily sediment laden. Environmentally sensitive culvert design will reduce any impact to the hydromorphological functioning of the feature and vegetation management will mitigate against additional changes to sediment loads which could result for vegetation loss or simplification. Negligible effect anticipated when balanced against embedded mitigation. No measurable change in quality element anticipated. Additional mitigation not required.		Culvert extension on a drain which has minimal flow and is heavily sediment laden. Environmentally sensitive culvert design will reduce any impact to the hydromorphological functioning of the feature and vegetation management will mitigate against additional changes to sediment loads which could result for vegetation loss or simplification. Negligible effect anticipated when balanced against embedded mitigation. No measurable change in quality element anticipated. Additional mitigation not required.	
Chemical	Priority substances	HEWRAT routine runoff assessment passes for all surface water tests. Negligible effect anticipated when balanced against embedded mitigation. No measurable change in quality element anticipated. Mechanism of impact	Description	Element impacted				
		Biological	Physio chemical	Specific pollutants	Hydromorphological	Chemical
Direct loss or alterations to open channel	Any direct loss of watercourse or ditch. This could be from new culverts, culvert extensions, bridges reduced vegetation coverage or installation of hard bed or bank protection which will have a significant impact on the receptor.	✓			✓	
Habitat severance	Disconnection of habitats within the water body due to activities such as weirs, steep hydraulic gradients, or culverts.	✓				
Shading	Loss of light from the channel which is not associated with direct loss of habitat.	✓				
Changes in surface water runoff	Changes in the quantity and quality in the receiving watercourses due to any alterations to the impermeable area and drainage system.	✓	✓	✓	✓	✓
Changes in flood mechanisms within the surface water bodies	Changes in water quality in the receiving water courses due to increased runoff, and pollutants from routine runoff and spillages.	✓	✓	✓	✓	✓
Creation of new habitats	Any additional habitat creation as part of the Scheme. For example, enhancements of water courses or creation of new ditch length.	✓				

Project Name: M5 Junction 10 Improvements Scheme

RAYG traffic light decision matrix for assessing magnitude of effects on surface water quality element status class

Type of effect	Impact of scheme element on WFD element i.e. in individual cells	Impact on WFD element i.e. at end of row	Impact on WFD water body i.e. the combined effect on the water body as a result of all the effect on WFD elements	Examples	Outcome
Moderate Beneficial	Impacts when taken on their own have the potential to lead to significant improvement.	Impacts in combination with others have the potential to lead to the improvement in the class of a WFD element.	Impacts in combination with others have the potential to lead to the improvement in the WFD status of the water body.	Creation of significant areas of riparian habitats (for example, within a river diversion) which enhance the value of the water body. Removal of hard bank protection. Removal of barriers to fish species. Major improvement to groundwater quality or improved quality of GWDTE due to groundwater contributions.	Increase in status class for that water body.
Minor / localised beneficial	Impacts when taken on their own have the potential to lead to a minor localised or temporary improvement.	Impacts in combination with others have the potential to lead to a minor localised improvement of the WFD element.	Impacts in combination with others have the potential to lead to a minor localised or temporary improvement that does not affect the overall WFD status of the water body.	Minor habitat creation measures such as creation of marginal berms up/downstream of a structure. Minor improvement to groundwater quality or improved quality of GWDTE due to groundwater contributions.	Localised improvement, no change in status of WFD water body.
Green (no effect)	No measurable change to any quality elements.	No measurable change to any quality elements.	No measurable change to any quality elements.	Clear span bridge which causes no significant light shading. Changes to flow with no likely impact in macroinvertebrate community/contamination in areas with highly tolerant invertebrate community (e.g. Average Score Per Taxon <4). Minor, temporary encroachment into the channel Improvement in the existing surface water quality through improvement to existing drainage systems. Minor, temporary changes to groundwater levels	No change
Yellow – Localised/ temporary adverse effect	Impacts when taken on their own have the potential to lead to a minor localised or impact.	Impacts in combination with others have the potential to lead to a minor localised or temporary impact on the WFD elements. Consideration will be given to habitat creation measures.	Impacts in combination with others have the potential to lead to a minor localised or temporary impact on the WFD elements. Consideration will be given to habitat creation measures.	Loss of macrophytes/phytobenthos due to shading from a bridge or other structure.. Temporary loss of invertebrates/macrophytes etc. during channel re-alignment Estimated loss in diversity of invertebrates for e.g. <100m of water body (due to habitat loss, changes to flow etc.). Localised loss of fish habitat/numbers of fish. Reduction in water quality with negligible knock on effects to biological elements Localised changes to groundwater levels or quality with no impact to GWDTE or protected water bodies.	No change in status of WFD water body when balanced against mitigation embedded in the scheme.
Amber – adverse widespread or prolonged effect	Impacts when taken on their own have the potential to lead to a widespread or prolonged impact. Consideration will be given to habitat creation measures.	Impacts in combination with others have the potential to have an adverse impact on the WFD element. Additional mitigation will be applied.	Impacts in combination with others have the potential to have an adverse impact on the WFD water body. The current WFD risk category will be taken into account when assessing these combined impacts. Consideration will be given to habitat creation measures.	Loss of macrophytes/phytobenthos for a significant length of water due to shading from a long (e.g. >200m) culvert or other similar structure. Likely significant drop in invertebrate diversity over e.g. >300m of water body (due to habitat loss /siltation or combination of various impacts etc.). Obstruction to upstream migration of fish to spawning grounds in a salmonid river therefore affecting fish in the whole of the WFD water body. Reduction in water quality with potential to cause knock on effects to biological elements. Adverse changes to GWDTE or baseflow contributions to protected surface water bodies.	Adverse effect but risk of status change needs to be considered with any additional mitigation, and taking into account the level of confidence.
Red – adverse impact on an individual quality element and/or overall status of water body	Impacts when taken on their own have the potential to lead to a widespread or prolonged impact even with mitigation in place.	Impacts in combination with others have the potential to have an adverse impact on the WFD element and change its class. Consideration will be given to habitat creation measures.	Impacts in combination with others have the potential to have an adverse impact on the WFD water body and change its status. The current WFD risk category will be taken into account when assessing these combined impacts. Consideration will be given to habitat creation measures.	Loss or extensive change to a fishery Significant loss of hydromorphological diversity likely to impact the water body scale such as channelisation of a natural watercourse using hard engineering for a significant length. Creation of barriers which will inhibit migration and movement of fish within the system. Significant decline in water quality resulting in knock on effects to biological elements at the water body scale. Loss of or extensive change to GWDTE or baseflow contributions to protected surface water bodies. Any significant change in groundwater quality reducing WFD status.	Decrease in status of WFD water body when balanced against additional mitigation. Outcome is considered to be certain.

Environment Statement SMR (water resources and flood risk)	
Relative EIA Receptor Value	**EIA Receptor value criteria**
Major or Moderate Benefit	In addition to below, Contribution to improvement in water body WFD classification. Removal of existing polluting discharge, or removing the likelihood of polluting discharges occurring to a watercourse. Improvement in water body WFD classification.
Moderate or Minor Benefit	HEWRAT assessment of either acute soluble or chronic-sediment related pollutants becomes pass from an existing site where the baseline was a fail condition. Calculated reduction in existing spillage risk by 50% or more (when existing spillage risk is <1% annually).
Negligible	No risk identified by HEWRAT (pass both acute-soluble and chronic-sediment related pollutants). Risk of pollution from spillages <0.5%.
Minor Adverse	Failure of either acute soluble or chronic sediment related pollutants in HEWRAT. Calculated risk of pollution from spillages ≥0.5% annually and < 1% annually. Minor effects on water supplies.
Moderate Adverse	Failure of both acute-soluble and chronic-sediment related pollutants in HEWRAT but compliance with EQS values. Calculated risk of pollution from spillages ≥1% annually and <2 % annually. Partial loss in productivity of a fishery. Degradation of regionally important public water supply or loss of major commercial/industrial/agricultural supplies. Contribution to reduction in water body WFD classification.
Major Adverse	Failure of both acute-soluble and chronic-sediment related pollutants in HEWRAT and compliance failure with EQS values. Calculated risk of pollution from a spillage ≥2% annually (spillage assessment). Loss or extensive change to a fishery. Loss of regionally important public water supply. Loss or extensive change to a designated nature conservation site. Reduction in water body WFD classification.
