1 INTRODUCTION

- 1.1.1 This Appendix provides the detailed results from the assessment of construction and operational-related activities on air quality from the core case scenarios, as described in **Chapter 7** of the Environmental Statement (ES) **[TR020001/APP/5.01]**. These results are summarised in **Section 7.9** of **Chapter 7** of the ES **[TR020001/APP/5.01]**.

2 CONSTRUCTION PHASE RESULTS

- 2.1.1 This section provides the results of the assessment of construction-related activities on air quality. The Proposed Development is split into three assessment phases (Phase 1, 2a and 2b) and these have been assessed separately. Each will require demolition, construction and earthworks, with associated trackout. The Proposed Development also includes requirement for highway intervention works adjacent to the airport, in Luton, at the nearby Junction 10 of the M1 and in Hitchin, which have also been assessed.

2.2 Construction dust

- 2.2.1 The construction dust assessments for each phase and proposed highway interventions have been summarised to indicate potential risk and identify locations which pose the greatest risks to air quality. In reality the construction works are an ongoing process over a number of years and as such are considered as one long construction phase in terms of mitigation where required.
- 2.2.2 There are sensitive receptors located both within and outside of the Proposed Development boundary. The receptors within the boundary such as locations where there is transient exposure such as visitors to the airport, footpaths and car parks would be considered to be low sensitivity receptors for dust soiling and human health. People will remain working on the airport site in offices and shops and in airport operational roles and they would be located there for the duration of the works and as such could be exposed to dust impacts which are relevant to the short term PM₁₀ 24hr standard, these receptors are considered to be medium sensitivity locations for dust soiling and human health. High sensitivity receptors on-site would include locations where dust would affect the business such as food catering facilities, car hire and long term parking locations. Due to the nature of the works occurring across the site on-site receptors (low-high sensitivity) could be located within 20m of works. High sensitivity receptors for dust soiling and human health are also located off-site with >100 homes being within 50m of the main application boundary.
- 2.2.3 There are no designated ecological receptors sensitive to dust soiling and PM₁₀ exposure within 50m of the Proposed Development. The closest sensitive ecological receptor is Dallow Downs and Winsdon Hill SSSI which is located approximately 1.5km from the main airport highway interventions, 2km from the M1 highway interventions and 3km from the main application site. Wain Wood SSSI is the nearest sensitive ecological receptor to the Hitchin highway intervention works at approximately 3km away. Therefore, the construction dust

impacts on ecological receptors have not been considered further in this assessment.

Assessment Phase 1

- 2.2.4 During Phase 1 the majority of the works will be carried out in the centre of the site, including clearance and construction of new car parks, Terminal 1 enhancements, construction of new aircraft stands, and works to add compound locations. Bulk earthworks are required for construction of the new aircraft stands and for the extensive habitat creation and landscaping works proposed in the northeast of the site (Wigmore Valley Park). The main stockpile area will be in the southeast of the site is located approximately 500m from the nearest homes, based on indicated stockpile locations in the Construction Method Statement and Programme Report (provided as **Appendix 4.1** to the ES [TR020001/APP/5.02]). The magnitude of the works during assessment Phase 1 is summarised in **Table 2.1**.

Table 2.1: Dust emission magnitude – assessment Phase 1

Activity	Dust emission magnitude	Reasoning
Demolition	Large	<ul style="list-style-type: none"> - Total volume of demolition > 50,000m³ - Potentially dusty construction material (e.g. concrete)
Earthworks	Large	<ul style="list-style-type: none"> - Total site area for earthworks >10,000m² - Potentially dusty soil types (e.g. clay) - Assumed >10 heavy earth moving vehicles moving at any one time and stockpile bunds >8m in height
Construction	Large	<ul style="list-style-type: none"> - Total building volume >100,000m³ - Potentially dusty construction material - On-site concrete batching
Trackout	Large	<ul style="list-style-type: none"> - >50 HDV trips in any one day - Potentially dusty surface material (e.g. clay, concrete)

- 2.2.5 The sensitivity of the area for dust soiling is defined as *medium* on-site due to the presence of receptors within 20m of works and *high* for off-site locations due to their being between 10-100 high sensitivity offsite receptors within 20m of the boundary. The annual average PM₁₀ concentration estimated by DEFRA for the grid squares within and around the airport are lower than 24µg/m³ which is also reflected by the continuous monitoring data in the area. Therefore, sensitivity of the area to human health has been assigned as *low*.
- 2.2.6 Taking into consideration the dust emission magnitude and the sensitivity of the area, the Proposed Development has been classified as *high* risk to dust soiling and *medium/low* risk to human health impacts from demolition, earthworks, construction and trackout as summarised in **Table 2.2**. Specific mitigation measures to minimise the risk of dust soiling and human health impacts are

provided in the Code of Construction Practice (CoCP) in **Appendix 4.2** to the ES [TR020001/APP/5.02].

Table 2.2: Summary dust risk table – assessment Phase 1

Activity	Dust soiling	Human health
Demolition	High risk	Medium risk
Earthworks	High risk	Low risk
Construction	High risk	Low risk
Trackout	High risk	Low risk

Assessment Phase 2a

- 2.2.7 During assessment Phase 2a significant earthworks and construction works are proposed across the site, including extensive cut and fill activities in the east of the site, construction of a new terminal and aircraft stands, extension of the Luton DART, and demolition and construction of access roads. The magnitude of the works during assessment Phase 2a is summarised below.

Table 2.3: Dust emission magnitude – assessment Phase 2a

Activity	Dust emission magnitude	Reasoning
Demolition	Large	- Total volume of demolition > 50,000m ³ - Potentially dusty construction material (e.g. concrete)
Earthworks	Large	- Total site area for earthworks >10,000m ² - Potentially dusty soil types (e.g. clay) - >10 heavy earth moving vehicles moving at any one time and stockpile bunds >8m in height
Construction	Large	- Total building volume >100,000m ³ - Potentially dusty construction material - On-site concrete batching
Trackout	Large	- >50 HDV trips in any one day - Potentially dusty surface material

- 2.2.8 The sensitivity of the area for dust soiling is defined as *medium* on-site due to the presence of receptors within 20m of works and *high* for off-site locations due to their being between 10-100 high sensitivity offsite receptors within 20m of the boundary. The annual average PM₁₀ concentration estimated by DEFRA for the grid squares within and around the airport are lower than 24µg/m³ which is also reflected by the continuous monitoring data in the area. Therefore, sensitivity of the area to human health has been assigned as *low*.
- 2.2.9 Taking into consideration the dust emission magnitude and the sensitivity of the area, the Proposed Development for the existing area has been classified as *high* risk to dust soiling and *low/medium* risk to human health impacts from demolition, earthworks, construction and trackout as summarised in **Table 2.4**.

Specific mitigation measures to minimise the risk of dust soiling and human health impacts are provided in the CoCP in **Appendix 4.2** to the ES [TR020001/APP/5.02].

Table 2.4: Summary dust risk table – assessment Phase 2a

Activity	Dust soiling	Human health
Demolition	High risk	Medium risk
Earthworks	High risk	Low risk
Construction	High risk	Low risk
Trackout	High risk	Low risk

Assessment Phase 2b

- 2.2.10 During assessment Phase 2a significant earthworks and construction works are proposed across the site, including extensive cut and fill activities in the east of the site, construction of the fire training ground, extension of Terminal 2, and further construction of car parks and access roads. The magnitude of the works during assessment Phase 2b is summarised in **Table 2.5**.

Table 2.5: Dust emission magnitude – assessment Phase 2b

Activity	Dust emission magnitude	Reasoning
Demolition	Large	<ul style="list-style-type: none"> - Total volume of demolition > 50,000m³ - Potentially dusty construction material (e.g. concrete)
Earthworks	Large	<ul style="list-style-type: none"> - Total site area for earthworks >10,000m² - Potentially dusty soil types (e.g. clay) - >10 heavy earth moving vehicles moving at any one time and stockpile bunds >8m in height
Construction	Large	<ul style="list-style-type: none"> - Total building volume >100,000m³ - Potentially dusty construction material - On-site concrete batching
Trackout	Large	<ul style="list-style-type: none"> - >50 HDV trips in any one day - Potentially dusty surface material

- 2.2.11 The sensitivity of the area for dust soiling is defined as *medium* on-site due to the presence of receptors within 20m of works and *high* for off-site locations due to their being between 10-100 high sensitivity offsite receptors within 20m of the boundary. The annual average PM₁₀ concentration estimated by DEFRA for the grid squares within and around the airport are lower than 24µg/m³ which is also reflected by the continuous monitoring data in the area. Therefore, sensitivity of the area to human health has been assigned as *low*.
- 2.2.12 Taking into consideration the dust emission magnitude and the sensitivity of the area, the Proposed Development for the existing area has been classified as *high* risk to dust soiling and *low/medium* risk to human health impacts from

demolition, earthworks, construction and trackout as summarised in **Table 2.6**. Specific mitigation measures to minimise the risk of dust soiling and human health impacts are provided in the CoCP in **Appendix 4.2**to the ES **[TR020001/APP/5.02]**.

Table 2.6: Summary dust risk table – assessment Phase 2b

Activity	Dust soiling	Human health
Demolition	High risk	Medium risk
Earthworks	High risk	Low risk
Construction	High risk	Low risk
Trackout	High risk	Low risk

Highway Interventions

- 2.2.13 Off-site highway intervention works (as described in **Chapter 4** of the ES **[TR020001/APP/5.02]**) are proposed during all three assessment phases of the construction programme. There is limited detail available on the extent of the highway interventions at this time but they will include road and junction improvement works.
- 2.2.14 The dust emission magnitude associated with the highway intervention works is estimated to be small based on the assumptions outlined in **Table 2.7**.

Table 2.7: Dust emission magnitude – Highway Interventions

Activity	Dust emission magnitude	Reasoning
Demolition	Small	- Total volume of demolition <20,000m ³ - Limited to breaking of existing hardstanding
Earthworks	Small	- Total tonnes of material moved <20,000
Construction	Small	- Total volume of construction materials <25,000m ³
Trackout	Small	- <10 HDV trips in any one day

Highway Interventions – Airport

- 2.2.15 Although by itself the dust emission magnitude for the Airport Highway Intervention works is considered to be small, the interventions are proposed immediately adjacent to the main application boundary for assessment Phase 1, 2a and 2b. Therefore, considering the dust emission magnitudes for assessment Phase 1, 2a and 2b are large (see **Table 2.1**, **Table 2.3** and **Table 2.5**), it is considered appropriate (and conservative) to also assume a large dust emission magnitude for the Airport Highway Interventions.
- 2.2.16 The sensitivity of the area for dust soiling is defined as *high* for off-site locations due to there being over 100 high sensitivity receptors within 20m of the boundary. The annual average PM₁₀ concentration estimated by DEFRA for the grid squares around the airport highway interventions are lower than 24µg/m³

which is also reflected by the continuous monitoring data in the area. Therefore, sensitivity of the area to human health has been assigned as *medium*.

- 2.2.17 Taking into consideration the dust emission magnitude and the sensitivity of the area, the Proposed Development for the existing area has been classified as *high* risk to dust soiling and *high/medium* risk to human health impacts from demolition, earthworks, construction and trackout as summarised in **Table 2.8**. Specific mitigation measures to minimise the risk of dust soiling and human health impacts are provided in the CoCP in **Appendix 4.2**to the ES **[TR020001/APP/5.02]**.

Table 2.8: Summary dust risk table – Airport Highway Interventions

Activity	Dust soiling	Human health
Demolition	High risk	High risk
Earthworks	High risk	Medium risk
Construction	High risk	Medium risk
Trackout	High risk	Medium risk

Highway Interventions – Hitchin

- 2.2.18 The proposed highway intervention works in Hitchin are approximately 7km northeast of the main airport and therefore the dust emission magnitudes are considered to be small as outlined in **Table 2.7**.
- 2.2.19 The sensitivity of the area for dust soiling is defined as *high* for off-site locations due to there being over 100 high sensitivity receptors within 20m of the boundary. The annual average PM₁₀ concentration estimated by DEFRA for the grid squares around the Hitchin highway interventions are lower than 24µg/m³ which is also reflected by the continuous monitoring data in the area. Therefore, sensitivity of the area to human health has been assigned as *medium*.
- 2.2.20 Taking into consideration the dust emission magnitude and the sensitivity of the area, the Proposed Development for the existing area has been classified as *low/medium* risk to dust soiling and *low/negligible* risk to human health impacts from demolition, earthworks, construction and trackout as summarised in **Table 2.9**. Specific mitigation measures to minimise the risk of dust soiling and human health impacts are provided in the CoCP in **Appendix 4.2**to the ES **[TR020001/APP/5.02]**.

Table 2.9: Summary dust risk table – Hitchin Highway Interventions

Activity	Dust soiling	Human health
Demolition	Medium risk	Low risk
Earthworks	Low risk	Low risk
Construction	Low risk	Low risk
Trackout	Low risk	Negligible risk

Highway Interventions – M1 Junction 10

- 2.2.21 The proposed highway intervention works at the M1 Junction 10 are approximately 2km southwest of the airport and therefore the dust emission magnitudes are considered to be low as outlined in **Table 2.7**.
- 2.2.22 The sensitivity of the area for dust soiling is defined as *low* for off-site locations due to there being no high sensitivity receptors within 20m of the boundary and only 1-10 high sensitivity receptors within 50m. The annual average PM₁₀ concentration estimated by DEFRA for the grid squares around the M1 highway interventions are lower than 24µg/m³. Therefore, sensitivity of the area to human health has been assigned as *low*.
- 2.2.23 Taking into consideration the dust emission magnitude and the sensitivity of the area, the Proposed Development for the existing area has been classified as *negligible* risk to both dust soiling and human health impacts from demolition, earthworks, construction and trackout as summarised in **Table 2.10**. Specific mitigation measures to minimise the risk of dust soiling and human health impacts are provided in the CoCP in **Appendix 4.2** to the ES [TR020001/APP/5.02].

Table 2.10: Summary dust risk table – M1 Junction 10 Highway Interventions

Activity	Dust soiling	Human health
Demolition	Negligible risk	Negligible risk
Earthworks	Negligible risk	Negligible risk
Construction	Negligible risk	Negligible risk
Trackout	Negligible risk	Negligible risk

2.3 Construction traffic

- 2.3.1 Construction traffic for assessment Phases 1, 2a and 2b has been assessed in combination with the future operational traffic in the same phase as described in **Section 7.5 of Chapter 7** of the ES [TR020001/APP/5.01], to give a reasonable worst case approach. The results are discussed in **Section 7.9 of Chapter 7** in the ES [TR020001/APP/5.01]. Therefore, the impact of construction traffic are captured in the results in the operational results in **Section 3**.

3 OPERATIONAL PHASE RESULTS

- 3.1.1 This section provides the air quality results of the assessment of the impacts on the human and ecological receptors described in **Appendix 7.1** of the ES [TR020001/APP/5.02]. The results presented consider the two sets of traffic data for each assessment phase, provided by the transport team, also described in **Chapter 7** in the ES [TR020001/APP/5.01]. One set includes Local Transport Plans of relevant authorities (LTP traffic data) and one which used Web-based Transport Analysis Guidance (WebTAG) from Department for

Transport (webTAG traffic data). On average, the changes between Do Minimum (DM) and Do Something (DS) using the WebTAG based traffic data results were higher than the LTP based results, for all pollutants, across all core case phases. Therefore, the WebTAG based results were used for the core case assessment summarised in **Section 7.9 of Chapter 7** in the ES [TR020001/APP/5.01].

- 3.1.2 Air quality results at the compliance receptors, described in **Appendix 7.1** of the ES [TR020001/APP/5.02] are provided for comparison against the relevant air quality standards. The summary of the results is provided in the compliance risk assessment in **Chapter 7** in the ES [TR020001/APP/5.01].
- 3.1.3 Air quality results for the ecological receptors are provided for NOx and nutrient nitrogen deposition, which are summarised in **Chapter 7** in the ES [TR020001/APP/5.01].

3.2 Human receptor results

3.5 Odour assessment results

Source pathway receptor assessment results

- 3.5.1 The SPR assessment is a qualitative assessment of the risk of odour nuisance. The risk of an adverse odour impact is determined by examining the source characteristics of the main odours sources on site, how effectively the odours can travel from the Source to a receptor (i.e. the Pathway) and examining the sensitivity of the Receptor. Finally, a qualitative appraisal of the potential impacts from each source is determined by professional judgement. Example risk factors, taken from the IAQM guidance (Ref. 1), are presented in **Appendix 7.1** to the ES [**TR020001/APP/5.02**].
- 3.5.2 The impact at each phase will vary depending on location of potential sources so the SPR assessment has been carried out for each phase. The results of the assessment for Phase 1 show odour risk is medium at worst from the apron and works at the landfill (**Table 3.43**). Similar results are seen for assessment Phase 2b with the apron and landfill being medium risk (**Table 3.44**). For assessment Phase 2b the landfill risk is removed as works would be completed leaving the apron as the main odour source (**Table 3.45**).

Assessment Phase 1 (2027)

Table 3.43: Assessment Phase 1 SPR assessment

Source	Source Odour Potential	Pathway Effectiveness	Receptor	Potential Impact
Fuel storage	High if spills occur or during refilling or works on site.	The site is located 400m to the nearest homes and within 150m of hotels or other areas where nuisance could occur. This distance reduces the pathway effectiveness due to allowing dilution and dispersion of odours. Under typical meteorological conditions the prevailing wind would blow the odour over the airport site.	High sensitivity receptors are located off-site to the north east at a distance of over 400m as such they are considered to be at low risk from odours from the storage site.	Low odour potential due to distance from source.
Engine testing at Engine Run Up Bay (ERUB)	High during testing due to emissions from aircraft.	The site is located over 900m to the nearest homes and within 600m of hotels or other areas where nuisance could occur. This distance reduces the pathway effectiveness due to allowing dilution and dispersion of odours. Under typical meteorological conditions the prevailing wind would	High sensitivity receptors are located off-site to the north east at a distance of over 900m as such they are considered to be at low risk from odours from the engine testing.	Low odour potential due to distance from source.

Source	Source Odour Potential	Pathway Effectiveness	Receptor	Potential Impact
		blow the odour over the airport site.		
Apron (aircraft emissions)	High due to regular aircraft movements.	The site is located over 200m to the nearest homes and within 50m of hotels or other areas where nuisance could occur. Under typical meteorological conditions the prevailing wind would blow the odour towards Wigmore.	High sensitivity receptors are located off-site to the north east at a distance over 200m as such they are considered to be at medium risk from odours from the aircraft emissions.	Medium odour potential due to distance from the source, combined with being downwind from the source and with regular emissions from the aircraft movements.
Fire training ground	Medium due to infrequent use, coupled with potentially odorous emissions.	The site is located over 700m to the nearest homes and over 1km to hotels or other areas where nuisance could occur. Under typical meteorological conditions the prevailing wind would blow the odour towards Wigmore recreational space.	High sensitivity receptors are located off-site to the north east at a distance over 700m as such they are considered to be at low risk from odours from the fire training ground. The open space where people could expect high amenity is at medium risk due to the proximity of emissions.	Low odour risk due to distance from the source for high sensitivity receptors. Medium risk for medium risk receptors.
On-site waste management	Low due to controls in place on-site to manage waste and store waste correctly to avoid odour.	Across the site waste is managed as such there is not an effective pathway for odour from waste.	High sensitivity receptors are located off-site and are at low risk from this source.	Low risk due to the on-site management and containment of waste.
Landfill odour	Unknown risk, landfill can contain odour emissions	The works at the landfill will be managed to	High sensitivity receptors are located	Medium risk from landfill odour with high sensitivity

Source	Source Odour Potential	Pathway Effectiveness	Receptor	Potential Impact
	but it is not known exactly what material will be uncovered. During the works on the landfill there is potential for odour to be released.	control and limit odorous areas. Covering can be used to minimise the time when odorous areas are open to the atmosphere.	within 500m of landfill works.	receptors being located down wind of works which may release odour.

Assessment Phase 2a (2039)

Table 3.44: Assessment Phase 2a SPR assessment

Source	Source Odour Potential	Pathway Effectiveness	Receptor	Potential Impact
Fuel storage	High if spills occur or during refilling or works on site from the existing Fuel Farm and new Fuel Farm to the east of the apron.	The site is located 400m to the nearest homes and within 150m of hotels or other areas where nuisance could occur and the new Fuel Farm will be located 300m to the nearest homes. This distance reduces the pathway effectiveness due to allowing dilution and dispersion of odours. Under typical meteorological conditions the prevailing wind would blow the odour from the existing fuel farm over the airport site.	High sensitivity receptors are located off-site to the north east at a distance of over 400m as such they are considered to be at low risk from odours from the storage site.	Low odour potential due to distance from source.

Source	Source Odour Potential	Pathway Effectiveness	Receptor	Potential Impact
Engine testing at ERUB	High during testing due to emissions from aircraft.	The site is located over 900m to the nearest homes and within 600m of hotels or other areas where nuisance could occur. This distance reduces the pathway effectiveness due to allowing dilution and dispersion of odours. Under typical meteorological conditions the prevailing wind would blow the odour over the airport site.	High sensitivity receptors are located off-site to the north east at a distance of over 900m as such they are considered to be at low risk from odours from the engine testing.	Low odour potential due to distance from source.
Apron (aircraft emissions)	High due to regular aircraft movements.	The site is located over 200m to the nearest homes and within 50m of hotels or other areas where nuisance could occur. Under typical meteorological conditions the prevailing wind would blow the odour towards Wigmore.	High sensitivity receptors are located off-site to the north east at a distance over 200m as such they are considered to be at medium risk from odours from the aircraft emissions.	Medium odour potential due to distance from the source, combined with being downwind from the source and with regular emissions from the aircraft movements.
Fire training ground	Medium due to infrequent use, coupled with potentially odorous emissions.	The site is located over 700m to the nearest homes and over 1km to hotels or other areas where nuisance could occur. Under typical meteorological conditions	High sensitivity receptors are located off-site to the north east at a distance over 700m as such they are considered to be at low risk from odours from	Low odour risk due to distance from the source for high sensitivity receptors. 		the pathway effectiveness due to allowing dilution and dispersion of odours. Under typical meteorological conditions the prevailing wind would blow the odour from the existing fuel farm over the airport site.	risk from odours from the storage site.	
Engine testing at ERUB	High during testing due to emissions from aircraft.	The site is located over 900m to the nearest homes and within 600m of hotels or other areas where nuisance could occur. This distance reduces the pathway effectiveness due to allowing dilution and dispersion of odours. Under typical meteorological conditions the prevailing wind would blow the odour over the airport site.	High sensitivity receptors are located off-site to the north east at a distance of over 900m as such they are considered to be at low risk from odours from the engine testing.	Low odour potential due to distance from source.
Apron (aircraft emissions)	High due to regular aircraft movements.	The site is located over 200m to the nearest homes and within 50m of hotels or other areas where nuisance could occur. Under typical meteorological conditions	High sensitivity receptors are located off-site to the north east at a distance over 200m as such they are considered to be at medium risk from	Medium odour potential due to distance from the source, combined with being downwind from the source and with regular emissions from the aircraft movements.

Source	Source Odour Potential	Pathway Effectiveness	Receptor	Potential Impact
		the prevailing wind would blow the odour towards Wigmore.	odours from the aircraft emissions.	
Fire training ground	Medium due to infrequent use, coupled with potentially odorous emissions.	The site is located over 500m to the nearest homes and over 500m to hotels or other areas where nuisance could occur. Under typical meteorological conditions the prevailing wind would blow the across the airport.	High sensitivity receptors are located off-site to the south east at a distance over 500m as such they are considered to be at low risk from odours from the fire training ground.	Low odour risk due to distance from the source for high sensitivity receptors.
On-site waste management	Low due to controls in place on-site to manage waste and store waste correctly to avoid odour.	Across the site waste is managed as such there is not an effective pathway for odour from waste.	High sensitivity receptors are located off-site and are at low risk from this source.	Low risk due to the on-site management and containment of waste.

Table 3.46: SPR odour risk assessment

Community area	Source odour potential	Percentage wind speeds at low speeds (<3m/s)	Percentage wind speeds at high speeds (<9m/s)	Distance from apron to nearest receptor in community area (m)	Pathway effectiveness	Risk of odour exposure	Receptor sensitivity	Odour risk-based assessment results
Wigmore	Medium	17	8	290	Moderately effective	Low risk	High	Slight adverse
Winch Hill	Medium	12	10	650	Moderately effective	Low risk	High	Slight adverse
St Anns Hill	Medium	12	7	460	Moderately effective	Low risk	High	Slight adverse
South of the runway	Medium	37	0	350	Moderately effective	Low risk	High	Slight adverse

Sniff testing

- 3.5.3 Sniff testing has been carried out on fourteen occasions, visits started in July 2021. Weather conditions during the visits are summarised in **Table 3.47**, only one site was assessed on the 30 September 2021 due to rain during most of the monitoring site trip and only three sites were assessed on 3 November 2021 due to poor weather.

Table 3.47: Weather conditions for the sniff testing visits

Survey	Date	Wind speed (m/s)	Wind direction	Mean temperature (°C)	Conditions
1	14-Jul-21	2.7	WSW	19	overcast dry
2	03-Aug-21	3.6	SW	19	sunshine and cloud
3	02-Sep-21	4.9	SW	16	1% precipitation, cloudy
4*	30-Sep-21	4.7	SW	15	cloudy
5**	03-Nov-21	4.5	NNW	9	cloudy breezy
6	01-Dec-21	8.0	SE	7	cloudy
7	10-Jan-22	2.2	SW	5	cloudy, gentle breeze
8	07-Feb-22	4.5	W	7	sunny
9	31-Mar-22	18.8	SW	4	Sun and cloud
10	04-May-22	3.6	SSW	15	light breeze and cloudy
11	06-Jun-22	3.6	WNW	13	cloudy and light breeze
12	05-Jul-22	5.8	NW	19	cloudy and light breeze
13	05-Aug-22	4.5	NW	19	fair, sunny
14	30-Sep-22	6.7	SSW	12	mostly cloudy

* Site 2 only due to poor weather conditions
** Only 3 sites to poor weather conditions

- 3.5.4 A summary of description of odour intensity and offensiveness scores is provided in **Table 3.48**.

Odour complaints

- 3.5.5 **Table 3.49** shows the odour complaints received by the airport operator between 2019-2022.

Table 3.49: Odour complaints

Date	Individual or Organisation	Location	Type of complaint	Nature of complaint
22.06.2020	Individual	Luton	Odour	Aviation fuel odour in the complainants garden
25.06.2020	Individual	Unknown	Odour	Aviation fuel odour from a plane overflying the complainants property
7.03.2022	Individual	LU2	Odour	Air pollution and odour complaint in the complainants garden
24.06.2022	Individual	Wigmore, Luton	Odour	Aviation fuel odour particularly bad on the day of the complaint
18.07.2022	Individual	Layham Drive, Luton	Odour	Aviation fuel smell
30.08.2022	Individual	Unknown	Odour	Aviation fuel odour complaint
22.09.2022	Individual	Wigmore, Luton	Odour	Overwhelming smell of aviation fuel / fuel dumping
4.10.2022	Individual	Wigmore, Luton	Odour	Overwhelming smell of aviation fuel / fuel dumping
6.10.2022	Individual	Wigmore, Luton	Odour	Overwhelming smell of aviation fuel / fuel dumping
7.10.2022	Individual	Wigmore, Luton	Odour	Overwhelming smell of aviation fuel / fuel dumping
9.10.2022	Individual	Wigmore, Luton	Odour	Overwhelming smell of aviation fuel / fuel dumping
14.10.2022	Individual	Wigmore, Luton	Odour	Overwhelming smell of aviation fuel / fuel dumping

GLOSSARY AND ABBREVIATIONS

Term	Definition
AQMA	Air Quality Management Area
AW	Ancient Woodland
DEFRA	Department for Environment Food and Rural Affairs
DM	Do-Minimum
DS	Do Something = an assessment scenario describing the conditions with the Proposed Development in place
ERUB	Engine Run Up Bay
HDV	Heavy duty vehicle (goods vehicles and buses >3.5t gross vehicle weight)
IAQM	Institute of Air Quality Management
LTP	Local Transport Plans
LWS	Local Wildlife Site
NOx	Oxides of Nitrogen
NO ₂	Nitrogen Dioxide
PEIR	Preliminary Environmental Information Report
PM ₁₀	Particulate Matter 10 micrometres or smaller in diameter
PM _{2.5}	Particulate Matter 2.5 micrometres or smaller in diameter
SAC	Special Areas of Conservation
SPA	Special Protection Areas
SPR	Source, pathway, receptor
SSSI	Site of Special Scientific Interest
