7	Appendix 6: A180 / A1173 JUNCTIONS output.....	30

1 Relevant Representation Response

- 1.1.1 National Highways has provided a number of comments relating to the Immingham Green Energy Terminal (“the Project”) in two technical memorandums dated 16 November 2023 [RR-018] and 12 March 2024 [REP1-082]. The points raised in the memorandum are set out below using the same headings as given by National Highways for ease of reference.
- 1.2 Collision data analysis
- 1.2.1 It is noted and welcomed that National Highways agrees with the conclusion that there is no existing road safety issue at the A180 / A1173 junction, as set out in **Environmental Statement (“ES”)** Chapter 11: Traffic & Transport [[APP-053](#)].
- 1.2.2 It is therefore considered that this is now agreed.
- 1.3 ES Chapter 11: Traffic & Transport
- 1.3.1 It is noted and welcomed that National Highways agrees that a separate Transport Assessment is not required as ES Chapter 11: Traffic and Transport [[APP-053](#)] provides sufficient information.
- 1.4 Construction vehicle trip generation and distribution. Vehicle trip generation
- 1.4.1 It is noted and welcomed that National Highways states that the construction vehicle generation has been derived appropriately.
- 1.4.2 National Highways considers that the weekday peak hours periods should be 07:00–08:00 and 16:00–17:00 rather than 08:00–09:00 and 17:00–18:00 as set out in **Paragraph 11.8.17 in ES Chapter 11: Traffic and Transport** [[APP-053](#)] which states “*during the weekday AM peak, 08:00 to 09:00 there is anticipated to be 53 worker trips and during the weekday PM peak 17:00 to 18:00 there is anticipated to be 137 worker trips on the road network*”.
- 1.4.3 The peak hours as specified by National Highways above are noted and agreed. With reference to **Table 11-13 in ES Chapter 11: Traffic and Transport** [[APP-053](#)], during the hours National Highways considers are the peak hours, there are a total of 205 construction worker trips between 07:00 and 08:00 and 53 between 16:00 and 17:00.
- 1.4.4 In their Technical Memorandum dated 16 November 2023 [[RR-018](#)], National Highways has determined the number of car trips on the network during the peak hours by dividing the above number by 1.5 to reflect the assumed level of car sharing. This is not the correct approach as the 205 trips between 07:00 and 08:00 and the 53 trips between 16:00 and 17:00 already take account of car sharing.

1.4.5 National Highways further considers that these trips have the potential to result in a material impact upon the Strategic Road Network (“SRN”). However, as demonstrated in the section below which considers construction worker vehicle trip distribution, there will not be a severe impact on the SRN during the construction phase of the Project.

1.4.6 Within their most recent Technical Memorandum dated 12 March 2024, National Highways has now accepted that the construction trip generation is appropriate. It is therefore considered that this is now agreed.

1.5 Construction worker vehicle trip distribution

1.5.1 It is noted and welcomed that National Highways considers that the methodology adopted for the distribution of traffic is appropriate.

1.6 Overall Impacts

1.6.1 National Highways considers that there will be an impact on the A180 / A1173 junction due to construction worker trips. However, the overall conclusion set out in **Paragraph 11.13.1 in ES Chapter 11: Traffic and Transport [APP-053]** is that the additional level of trips associated with the construction workers during the weekday AM and PM peak periods is not material in terms of junction operation and the impact is not considered to be substantial (National Policy Statement for Ports, Section 5.4) or severe (National Planning Policy Framework, Section 9).

1.6.2 In addition, the results of the capacity assessment of the A180 / A1173 junction as set out in the Transport Assessment submitted in support of the Immingham Eastern Ro-Ro Terminal (“IERRT”) development, shows that this junction is predicted to operate well within capacity in all scenarios up to a design year of 2032, which is beyond the 2026 peak year of THE PROJECT construction.

1.6.3 Any impact from the Project construction phase is temporary, with a peak year of activity in 2026, and given the above, it is not considered that there will be a severe impact upon the SRN. Subject to some further clarifications, as referred to under the heading **Assessments** below, this conclusion has now been accepted by National Highways.

1.7 HGV trip distribution

1.7.1 National Highways has set out the Heavy Goods Vehicle (“HGV”) trip generation and distribution, but as no comment has been made, it is understood that this is acceptable to National Highways.

1.8 Total construction vehicle trip generation

1.8.1 Within their Technical Memorandum dated 12 March 2024, National Highways confirms this has been accepted, therefore no further information is required.

1.9 Assessments

- 1.9.1 National Highways considers that a junction capacity assessment of the A180 / A1173 junction should be provided. Whilst it is considered by the Applicant that there is no requirement for this as stated above, it has been provided as a Sensitivity Test based upon the traffic flows as set out in the IERRT Transport Assessment Addendum Report (“the IERRT TA Addendum Report”) prepared by DTA dated December 2023 (Ref Document 8.4.17(a).1). The IERRT TA Addendum Report was submitted at Deadline 7 of the IERRT Examination and was given the reference REP7-013.
- 1.9.2 The modelling output included within the Sensitivity Test is based on the traffic flow information presented in the IERRT TA Addendum Report. These traffic flows are agreed with National Highways (as reported in the **Statement of Common Ground** [[REP1-049](#)]) and as such include the relevant Passenger Car Units (“PCU”) factors as requested.
- 1.9.3 The results of the modelling output are included with **Appendix 1** of this Relevant Representation Response, with the JUNCTIONS output being included within **Appendix 6** of this Relevant Representation Response. The conclusion of the assessment is that the junction will continue to operate within capacity with the addition of construction traffic from the Project and committed development, including IERRT, in 2026.
- 1.9.4 The following scenarios have been modelled based upon the impact during the construction phase only, and these have been accepted by National Highways.
- Base 2026
 - Base 2026 + Committed Development
 - Base 2026 + Committed Development + IERRT
 - Base 2026 + Committed Development + IERRT + the Project (07:00–08:00 and 16:00–17:00)
 - Base 2026 + Committed Development + IERRT + the Project (Sensitivity Test 06:00–07:00 and 18:00–19:00)

- 1.9.5 National Highways has now accepted, subject to some clarification regarding the derivation of the traffic data used in the assessments, that the A180 / A1173 operates within capacity on all of the arms with negligible increases in queue and delay during the PROJECT construction phase.
- 1.9.6 The traffic flows and turning movements used in the assessment of the A1173 / A180 junction are included in **Appendix 2** of this Relevant Representation Response for reference, with the derivation of these being set out as follows.
- 1.10 Base 2026
- 1.10.1 This has been derived from the IERRT Base 2021 traffic flows and then growthed to the 2026 peak of construction year using the agreed TEMPRO factors.
- 1.10.2 The agreed IERRT 2021 traffic flows are taken from the IERRT TA Addendum dated 8 December 2023, and the traffic flows from Appendix TN2 A from that report are included in **Appendix 3** of this Relevant Representation Response below for reference.
- 1.11 Base 2026 + Committed Development
- 1.11.1 The committed development traffic is taken from the IERRT TA Addendum dated 8 December 2023, and the traffic flows from Appendix TN2 A from that report are included in **Appendix 3** of this Relevant Representation Response below for reference.
- 1.12 Base 2026 + Committed Development + IERRT
- 1.12.1 The IERRT development traffic is taken from the IERRT TA Addendum dated 8 December 2023, and the traffic flows from Appendix TN2 A from that report are included in **Appendix 3** of this Relevant Representation Response below for reference.
- 1.13 Base 2026 + Committed Development + IERRT + the Project (07:00–0800 and 16:00–17:00)
- 1.13.1 The PROJECT construction traffic flows have been taken from ES Chapter 11: Traffic and Transport [[APP-053](#)] with the daily profile of construction workers being shown in Table 11-13 and the HGV profile shown in Table 11-14. Key figures are:
- Construction workers – 190 arrivals and 15 departures between 07:00 and 08:00 and 15 arrivals and 38 departures between 16:00 and 17:00.
 - Construction HGVs – 10 arrivals and eight departures between 07:00 and 08:00 and nine arrivals and nine departures between 16:00 and 17:00.

- 1.13.2 This is illustrated on **Figures 2 and 3** within **Appendix 4** of this Relevant Representation Response.
- 1.14 Base 2026 + Committed Development + IERRT + the Project (Sensitivity Test, Project construction traffic between 06:00 and 07:00 and between 18:00 and 19:00)
- 1.14.1 The PROJECT construction traffic flows have been taken from ES Chapter 11: Traffic and Transport [[APP-053](#)] with the daily profile of construction workers being shown in Table 11-13 and the HGV profile shown in Table 11-14. Key figures are:
- Construction workers – 258 arrivals and 15 departures between 06:00 and 07:00 and 23 arrivals and 266 departures between 18:00 and 19:00.
 - Construction HGVs – zero arrivals and zero departures between 06:00 and 07:00 and zero arrivals and 10 departures between 18:00 and 19:00.
- 1.14.2 This is illustrated on **Figures 1 and 4** within **Appendix 5** of this Relevant Representation Response.
- 1.14.3 As National Highways has not specifically commented on the above in its response of 12 March 2024, it is understood that this element is agreed.
- 1.15 Viking CCS Traffic Flows**
- 1.15.1 Traffic flows for the Viking CCS project have been taken from Table 12-36 in Section 12.7: Construction Traffic Distribution of Chapter 12: Traffic and Transport of the Viking CCS Environmental Statement. They show that at the peak of construction there are anticipated to be:
- 1073 construction vehicles on the A180 (W) per day
 - 471 construction vehicles on the A180 (E) per day
 - 1155 construction vehicles on the A1173 (S) per day
- 1.15.2 It should be noted that these do not necessarily correlate as, with reference to Section 12.7 of the Viking CCS ES, the peak traffic flow at each link has been used, however the peak flow does not necessarily occur at the same time for each link. Therefore, the total peak traffic flows at a junction may not necessarily ‘add up’.
- 1.15.3 With reference to Section 12.6 / Table 12-31, 9% of inbound and 8% of outbound construction trips will occur in the peak hours (0700 to 0800 and 1600 to 1700), and these have then been assigned to the A180 / A1173 junction as follows.
- Where:
- A is A1173 N
- B is A180 E
- C is A1173 S

D is A180 W

Table 1: Viking CCS Traffic Peak Hour Turning Flows at the A180/ A1173 Junction

	A	B	C	D
A	0	1	3	3
B	2	0	260	26
C	7	38	0	114
D	7	38	115	0

The above has then been used to assess the impact of the Viking CCS construction traffic in the following scenarios.

1.16 Committed / Cumulative developments

1.16.1 National Highways recommended that the following emerging developments be considered within the **ES** cumulative assessment, with an additional request received via an email dated 3 April 2024 to also include the Viking CCS scheme.

- IERRT: roll-on/roll-off (“Ro-Ro”) facility at Immingham Port
- Station Road South Killingholme, works on land to the east of Rosper Road, Killingholme (planning reference: PA/SCO/2022/7)
- Viking CCS

- 1.16.2 The IERRT project has been included within the cumulative assessment as set out in ES Chapter 25: Cumulative and In-Combination Effects [[APP-067](#)] and also ES Appendix 11.B: Traffic and Transport Cumulative Effects Assessment [[APP-190](#)]. IERRT is also considered within the assessment of the A180 / A1173 interchange as set out below. It is therefore considered these requests have been addressed within the assessments of the A180 / A1173 junction.
- 1.16.3 National Highways has also requested that enabling works on land east of Rosper Road, Killingholme (PA/2023/502) are considered. As stated previously, it has not been possible to obtain any details regarding the enabling works on land to the east of Rosper Road, Killingholme (PA/SCO/2022/7). However, the Transport Statement and Construction Traffic Management Plan prepared for this scheme (prepared by Sanderson Associates in March 2023) have been reviewed to establish the trip generation, distribution and assignment associated with the development.
- 1.16.4 Based on the information provided all trips will access the site via the A160 / A180 interchange, travel along the A160 and enter Rosper Road via the A160 / A1173 roundabout. Both of these routes are outside of the assessment area for the Project and as such any cumulative impact is not likely to be material.
- 1.16.5 No further comments were received from National Highways in its response dated 12 March 2024 and it is therefore understood that this is now agreed.
- 1.16.6 In terms of the Viking CCS scheme and with reference to the supporting ES Chapter ([APP-054](#)) submitted as part of the application for that project, all construction workers will arrive before 0700 and depart after 1900 and therefore will not be on the highway network during the agreed peak hours of between 07:00 and 08:00 and between 16:00 and 17:00. There will, however, be HGVs using the A180 / A1173 junction, and the impact from these additional trips has been assessed and this is set out as follows.

1.17 A180 / A1173 Junction Assessment WITH Viking CCS

- 1.17.1 As requested an assessment including the peak Viking CCS traffic flows has been undertaken, and the results of the modelling are set out in the table below.

Table 2: A180 / A1173 Modelling Results: Base 2026 + Committed Development + IERRT Development + PROJECT (Actual) + Viking

ARM	Base 2026 + Committed Development + IERRT Development + PROJECT (Actual) + Viking					
	AM (0700 to 0800)			PM (1600 to 1700)		
	Q	Delay	RFC	Q	Delay	RFC
A – A1173 N	0.6	3.00	0.29	2.8	5.60	0.71
B – A180 E	1.2	3.59	0.53	0.7	3.96	0.40
C – A1173 S	2.0	9.35	0.65	0.5	3.82	0.29
D – A180 W	4.6	17.03	0.77	1.1	4.31	0.40

- 1.17.2 As can be seen there are increases in RFC and queuing when compared to the scenarios without Viking CCS, but the junction is still predicted to operate within capacity and therefore is able to accommodate the cumulative traffic flows at the year of peak impact for IGET, 2026.
- 1.18 Operational vehicle trip generation and distribution. Vehicle trip generation
- 1.18.1 It is noted and welcomed that National Highways agrees with the operational vehicle trip generation. An **Outline Operational Travel Plan** [[REP1-067](#)] has been prepared and submitted into the Examination as part of the Deadline 1 submission on the 18 March 2024 and for ease of reference has also been included within this submission of information.
- 1.19 Vehicle trip distribution
- 1.19.1 As set out in Paragraph 11.8.35 of ES Chapter 11: Traffic and Transport [[APP-053](#)] there is anticipated to be a total of 120 staff on site during the operational phase. From the total of 120 staff, 53 will work a normal daytime ‘nine to five’ and 67 will work over two separate 12-hour shifts starting at 07:00 and 19:00 respectively.
- 1.19.2 Based on the above, a daily profile can be set out as follows, assuming a split of 33 and 34 workers across both shift patterns.

Table 3: Operational Staff Daily Profile

Time Period	Arrivals	Departures	Two Way
06:00 to 07:00	33	0	33
07:00 to 08:00	0	34	34
08:00 to 09:00	53	0	53
16:00 to 17:00	0	0	0
17:00 to 18:00	0	53	53
18:00 to 19:00	34	0	34
19:00 to 20:00	0	33	33

- 1.19.3 As illustrated, the number of trips during the agreed network peak hours of 07:00 to 08:00 and 16:00 to 17:00 is 34 in the AM period and zero in the PM period and is therefore not considered to be material.
- 1.19.4 The distribution of the 53 trips arriving between 08:00 and 09:00 and departing between 17:00 and 18:00 is set out below.
- 1.19.5 With reference to **Table 11-23 of ES Chapter 11: Traffic and Transport** [[APP-053](#)], the distribution for operational workers has been based upon the Census Journey To Work data and the impact is given below for ease of reference.

Table 4: Distribution of Operational Traffic

Route	Distribution	Operational traffic arriving between 08:00 and 09:00 and departing between 17:00 and 18:00
Laporte Road	21%	11
Manby Road	8%	4
Pelham Road	20%	11
A180 (W)	9%	5
A180 (E)	26%	14
A1173 (S)	16%	8
TOTAL	100%	53

1.19.6 As can be seen from the above table the operational phase workers on the ‘normal nine to five’ shift will add a total of five trips to the A180 (W) and 14 trips to the A180 (E). This is not considered to represent a material impact and would be well within any daily variation of traffic on the A180.

1.19.7 It is therefore considered that it can be agreed that the operational phase of the IGET development will not result in any material impact upon the SRN.

1.20 Decommissioning phase

1.20.1 It is noted and welcomed that National Highways agrees with the approach to secure a Decommissioning Environmental Management Plan (“DEMP”) by a requirement of the Development Consent Order (“DCO”). An **Outline DEMP** [[APP-222](#)] is included with the DCO Application and the production of a final DEMP is secured by **Requirement 18** in **Schedule 2** of the **draft DCO** [[REP1-016](#)].

1.21 Construction Traffic Management Plan

1.21.1 National Highways has requested that the **Outline Construction Traffic Management plan** (“CTMP”) [[REP1-006](#)] should include the following:

- A dust management plan
- Noise management plan
- Pollution prevention measures
- Contractor parking

1.21.2 It should be noted that the management plans highlighted above have been included within the DCO Application in the Outline Construction Environmental Management Plan (“CEMP”) [[REP2-004](#)] as set out below:

- A dust management plan is included in **Appendix C: Outline Dust Management Plan** of the **Outline CEMP** [[REP2-004](#)].
- Noise and vibration mitigation and enhancement measures are included within **Table 4: Noise and Vibration** of the **Outline CEMP** [[REP2-004](#)].

- Pollution prevention measures are included in:
 - **Table 5: Nature Conservation (Terrestrial Ecology)** of the **Outline CEMP** [[REP2-004](#)]
 - **Table 9: Marine Transport and Navigation** of the **Outline CEMP** [[REP2-004](#)]
 - **Table 14: Marine Water and Sediment Quality** of the **Outline CEMP** [[REP2-004](#)]
 - **Table 15: Water Quality, Coastal Protection, Flood Risk and Drainage** of the **Outline CEMP** [[REP2-004](#)]
- Contractor parking is addressed within **Section 2.5: Parking Provision** of the **Outline CEMP** [[REP2-004](#)], with the Travel Plan Co-ordinator determining the number of spaces provided on site.

- 1.21.3 The development of the Outline CEMP into a Construction Environmental Management Plan is secured under Requirement 6 in Schedule 2 of the draft DCO [[REP1-016](#)]. This Construction Environmental Management Plan requires approval from the relevant planning authority following consultation with the Environment Agency and Natural England on matters related to their function.
- 1.21.4 The above has now been accepted by National Highways, and as such is taken as being agreed with no further information being required.

1.22 Outline Construction Worker Travel Plan

- 1.22.1 It is noted and welcomed that National Highways considers the measures included within the Outline Construction Worker Travel Plan (“CWTP”), which is an appendix to the **Outline CTMP** [[REP1-006](#)], are appropriate.

1.23 Summary and Conclusions

- 1.23.1 A summary of the Applicant’s response to National Highways’ representations dated 16 November 2023 and 12 March 2024 is set out below.

National Highways Comment dated 16 November 2023	Summary of response
After a review of WebTRIS data for the A180, JSJV would consider 07:00-08:00 and 16:00-17:00 as more appropriate weekday peak hour periods than 08:00-09:00 and 17:00-18:00 for the SRN.	This is agreed. ES Chapter 11: Traffic and Transport [APP-053] concludes that there is not considered to be a severe impact upon the SRN during the AM and PM periods. The assessment provided above confirms that the overall conclusion remains the same.
The volume of construction worker vehicle trips has the potential to result in a material impact on the operation of the SRN.	This has been assessed above and it is confirmed that the volume of construction vehicle trips will have no material impact upon the SRN either in absolute terms (with a maximum increase of 49 trips on the A180 E) or proportional terms. The

National Highways Comment dated 16 November 2023
Summary of response

	<p>junction modelling confirms the A180 / A1173 junction is forecast to operate well within capacity.</p> <p>This is now accepted, subject to clarification of the derivation of the traffic flows as set out in this Relevant Representation Response, by National Highways.</p>
The number of workers per vehicle is incorrectly presented and National Highways recommend that construction worker vehicle distribution is reviewed and presents the results on flow diagrams.	<p>It is not clear how National Highways has derived its numbers. The additional number of trips at the SRN set out above is based upon the approach outlined in ES Chapter 11: Traffic and Transport [APP-053] and clarified above.</p> <p>This is now accepted as appropriate by National Highways.</p>
The volume of construction vehicle trips distributed has the potential to result in a material impact on the operation of the SRN. Consequently, National Highways recommend the provision of a junction capacity assessment for the A180 / A1173.	<p>It is not considered that an assessment of the A180 / A1173 junction is required, given the relatively low number of additional trips in the peak hours and the existing capacity of the junction, which operates well within capacity.</p> <p>However, an assessment has been undertaken as a Sensitivity Test, with the junction predicted to operate well within capacity at the peak year of construction, 2026.</p> <p>This is now accepted, subject to clarification of the derivation of the traffic flows, by National Highways.</p>
National Highways request that the PCU equivalent value of 2.5 is used in order to ensure an appropriate assessment of anticipated vehicular traffic associated with the development.	<p>The base traffic has been taken from the IERRT TA Addendum Report, as was agreed with National Highways and reflects the required PCU values.</p> <p>This is now agreed with National Highways.</p>
Subject to the impact at the SRN, there may be a requirement for National Highways to request mitigation measures,	<p>Given the capacity of the A180 / A1173 junction, and the additional number of construction trips, it is not considered that</p>

National Highways Comment dated 16 November 2023	Summary of response
<p>e.g., that the arrivals and departures of construction staff occur outside of the SRN peak periods.</p>	<p>any mitigation measures are required beyond those already set out in the Outline CEMP [REP2-004], Outline CTMP [REP1-006] and Outline CWTP (Appendix A in the Outline CTMP).</p> <p>No additional mitigation beyond those already included has been requested by National Highways; this is therefore considered to be agreed.</p>
<p>National Highways considers that construction traffic associated with the enabling works on land east of Rosper Road, Killingholme (PA/2023/502) should be considered.</p>	<p>This has been considered and assessed above. Based on the information provided in the application, all trips will access the site via the A160 / A180 interchange, travel along the A160 and enter Rosper Road via the A160 / A1173 roundabout. Both of these routes are outside of the assessment area for the Project and as such any cumulative impact is not likely to be material.</p> <p>No further request has been made by National Highways and this is therefore considered to be agreed.</p>
<p>National Highways would typically expect the operational trip generation methodology to be revised to reflect Circular 01/2022 policy. However, considering the predicted operational impact on the SRN as highlighted, it is not anticipated that the proposed development traffic generation will have a significant material impact on SRN junction capacity.</p>	<p>Agreed. The operational phase of the development will have no material impact upon the SRN.</p> <p>Further clarification was sought on derivation of operational trip generation by National Highways in its Technical Memorandum dated 12 March 2024 and further information has been provided in this updated Technical Note.</p> <p>The overall conclusion remains the same, in that no material impact upon the SRN as part of the operational phase is predicted.</p>
<p>National Highways would still expect a Travel Plan to be prepared for the operational stage of the project in order to manage down the traffic impact of</p>	<p>An Outline Operational Travel Plan [REP1-067] was submitted into the Examination at Deadline 1.</p>

National Highways Comment dated 16 November 2023	Summary of response
development and maximise the accessibility of and within sites by walking, wheeling, cycling, public transport, and shared travel.	
National Highways consider the OCTMP should also include the following: – A dust management plan; – noise management plan; – Pollution prevention measures; – Contractor parking.	These measures are included within the Outline CEMP [REP2-004]. This has been accepted by National Highways.

National Highways Comment dated 12 March 2024	Summary of response
Traffic flow diagrams have not been provided, therefore, we cannot confirm whether or not the flows have been extracted from the IERRT TA correctly, or if they align with the modelling. As a result, JSJV would recommend the base and committed traffic flow diagrams are provided for review	Details of the traffic flows used within the assessments have been provided in Appendices 2,3, 4 and 5 of this Relevant Representation Response.
DTA notes the modelling results indicate that in all scenarios, the A180/A1173 operates within capacity at all of the arms, with negligible increases in the total queue and delay as a result of the development construction traffic. Although JSJV would agree with DTA that the modelling results show no significant impact forecast in association with the proposed development, we would note the results presented within the Response to National Highways (IGET Response) are different from those contained within the Junctions 10 output, the reason for this is not known and should be clarified.	There are minor differences due to some typographical errors in the summary tables, and as agreed by National Highways these do not affect any of the results. These have been corrected. The impact at the A180 / A1173 junction is not material during the construction phase, and it is now considered that this can be agreed with National Highways.
JSJV would recommend DTA presents the distribution of the 87 two-way vehicle trips on to the network, in order	There are 53 operational trips arriving between 08:00 and 09:00 and departing between 17:00 and 18:00 have been

to show the anticipated impact of vehicle trips on the SRN	distributed onto the SRN, and result in an additional five trips on the A180 (W) and 14 trips on the A180 (E). This is not considered to result in a material impact upon the SRN and no further assessment is proposed.
--	---

2 Appendix 1: A180 / A1173 Assessment

2.1.1 The following scenarios have been modelled based upon the impact during the construction phase only, and these, along with the geometric data have been accepted as appropriate by National Highways:

- Base 2026
- Base 2026 + Committed Development
- Base 2026 + Committed Development + IERRT
- Base 2026 + Committed + Development IERRT + the Project (07:00-08:00 and 16:00-17:00)
- Base 2026 + Committed + Development IERRT + the Project (Sensitivity Test 06:00-07:00 and 18:00-19:00)

Source: AECOM

- 2.1.2 As illustrated, the junction is predicted to operate well within capacity, with all RFC values below 0.85, which indicates that the junction is operating satisfactorily with limited queue lengths and delay.
- 2.1.3 It is therefore considered that it can be agreed with National Highways that the A180 / A1173 junction will continue to operate within capacity during the construction phase of the IGET development.

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle.

3 - A1173 S	735	✓	34.00
4 - A180 W	976	✓	113.00

Slope / Intercept / Capacity

{same as above}

Traffic Demand

Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically	Relationship type	Relationship
D20	2026 Baseline + Committed + IGET (Sensitivity)	PM	ONE HOUR	17:00	18:30	15	✓	Simple	D16 + D10

Vehicle mix varies over turn	Vehicle mix varies over entry	Vehicle mix source	PCU Factor for a HV (PCU)
✓	✓	HV Percentages	2.00

Demand overview (Traffic)

Arm	Linked arm	Profile type	Use O-D data	Average Demand (PCU/hr)	Scaling Factor (%)
1 - A1173 N		ONE HOUR	✓	1741	100.000
2 - A180 E		ONE HOUR	✓	553	100.000
3 - A1173 S		ONE HOUR	✓	277	100.000
4 - A180 W		ONE HOUR	✓	656	100.000

Origin-Destination Data

Demand (PCU/hr)

From		To			
		1 - A1173 N	2 - A180 E	3 - A1173 S	4 - A180 W
1 - A1173 N		0	872	232	638
2 - A180 E		265	0	288	0
3 - A1173 S		60	169	0	47
4 - A180 W		553	1	102	0

Proportions

From		To			
		1 - A1173 N	2 - A180 E	3 - A1173 S	4 - A180 W
1 - A1173 N		0.00	0.50	0.13	0.37
2 - A180 E		0.48	0.00	0.52	0.00
3 - A1173 S		0.22	0.61	0.00	0.17
4 - A180 W		0.84	0.00	0.16	0.00

Vehicle Mix

Heavy Vehicle Percentages

From		To			
		1 - A1173 N	2 - A180 E	3 - A1173 S	4 - A180 W
1 - A1173 N		0	4	6	38
2 - A180 E		13	0	2	0
3 - A1173 S		33	1	0	5
4 - A180 W		79	0	8	0

Average PCU Per Veh

From		To			
		1 - A1173 N	2 - A180 E	3 - A1173 S	4 - A180 W
1 - A1173 N		1.000	1.037	1.059	1.378
2 - A180 E		1.129	1.000	1.023	1.000
3 - A1173 S		1.331	1.008	1.000	1.048
4 - A180 W		1.786	1.000	1.080	1.000

Detailed Demand Data

Demand for each time segment

Arm	Time Segment	Demand (PCU/hr)	Demand in PCU (PCU/hr)
1 - A1173 N	17:00-17:15	1311	1311
	17:15-17:30	1565	1565
	17:30-17:45	1917	1917
	17:45-18:00	1917	1917
	18:00-18:15	1565	1565
	18:15-18:30	1311	1311
2 - A180 E	17:00-17:15	416	416
	17:15-17:30	497	497
	17:30-17:45	609	609
	17:45-18:00	609	609
	18:00-18:15	497	497
	18:15-18:30	416	416
3 - A1173 S	17:00-17:15	208	208
	17:15-17:30	249	249
	17:30-17:45	305	305
	17:45-18:00	305	305
	18:00-18:15	249	249
	18:15-18:30	208	208
4 - A180 W	17:00-17:15	494	494
	17:15-17:30	590	590
	17:30-17:45	723	723
	17:45-18:00	723	723
	18:00-18:15	590	590
	18:15-18:30	494	494

Results

Results Summary for whole modelled period

Arm	Max RFC	Max Delay (s)	Max Queue (PCU)	Max LOS	Average Demand (PCU/hr)	Total Junction Arrivals (PCU)
1 - A1173 N	0.69	4.78	2.5	A	1598	2397
2 - A180 E	0.35	3.35	0.6	A	507	761
3 - A1173 S	0.19	2.89	0.2	A	254	381
4 - A180 W	0.31	3.62	0.7	A	602	903

Main Results for each time segment

17:00 - 17:15

Arm	Total Demand (PCU/hr)	Junction Arrivals (PCU)	Circulating flow (PCU/hr)	Capacity (PCU/hr)	RFC	Throughput (PCU/hr)	Throughput (exit side) (PCU/hr)	Start queue (PCU)	End queue (PCU)	Delay (s)	Unsignalled level of service
1 - A1173 N	1311	328	205	2889	0.454	1307	659	0.0	0.9	2.596	A
2 - A180 E	416	104	730	2168	0.192	415	782	0.0	0.3	2.199	A
3 - A1173 S	208	52	678	1910	0.109	208	467	0.0	0.1	2.265	A
4 - A180 W	494	124	372	2508	0.197	492	514	0.0	0.4	2.891	A

17:15 - 17:30

Arm	Total Demand (PCU/hr)	Junction Arrivals (PCU)	Circulating flow (PCU/hr)	Capacity (PCU/hr)	RFC	Throughput (PCU/hr)	Throughput (exit side) (PCU/hr)	Start queue (PCU)	End queue (PCU)	Delay (s)	Unsignalled level of service
1 - A1173 N	1565	391	245	2842	0.551	1564	789	0.9	1.4	3.216	A
