1. Introduction

1.1 The four West of England authorities North Somerset Council (“NSC”), Bristol City Council (“BCC”), Bath and North-East Somerset Council (“B&NES”), and South Gloucestershire Council (“SGC”) are jointly promoting a programme of rail enhancement projects known as MetroWest. The MetroWest programme includes MetroWest Phase 1, MetroWest Phase 2 and smaller projects such as specific new/re-opened stations. MetroWest Phase 1 is being led by NSC on behalf of the four councils as a third party rail project working with Network Rail Infrastructure Limited (“NRIL”). MetroWest Phase 1 involves providing a new train service between Portishead, Pill and Bristol Temple Meads, an upgraded train service for the Bristol to Avonmouth and Severn Beach line, and local stations between Bristol and Bath

1.2 The scope of this drainage strategy is to outline the drainage design works for the MetroWest scheme development sites as detail below:

- Pill station carpark and drop-off area
- Portishead station carparks and associate roads
- Construction compounds:
  - Haul roads (temporary compound)
  - East of Portishead Station (temporary compound)
  - C15 Sheepway (permanent and temporary compounds)
  - C14 The Portbury Hundred (temporary compound)
  - C13 Lodway Farm (temporary compound)
  - C9 Ham Green (permanent and temporary compounds)
  - C4 Clanage Road (permanent and temporary compounds)

1.3 The design approach sets out the rationale behind the development of the surface water drainage strategy.

1.4 The selection and application of SuDS solutions has also been determined with respect to the confines and nature of the proposed development.

2. General Approach

2.1 In developing this drainage design, a number of assumptions have been made to reflect the design development stage at the time of writing. For the construction stage, a conservative approach has been taken. This assumes that any contractor would surface all the construction compounds such that they would be considered impermeable. It is recognised that this may well not be the case with a wide range of options available to contractors which offer more porous surfaces, and that not all the construction areas would be surfaced. Nevertheless, the adoption of this worst-case scenario does mean that generally, the maximum requirements are presented and that actual drainage proposals by contractors are likely to have less in the way of drainage requirements during construction.

3. Design Criteria

3.1 The design criteria used, detailed in table 1 below, are according to North Somerset Council's (NSCs) requirements for a design life of 60 years for the drainage system in the permanent development sites and for a design life of 1-2 years for the temporary development sites.

	Design return period	Exceedance flows return period	Climate change allowance
Permanent development sites	1:30	1:100	40%
Temporary development sites	1:30	1:100	10%

Table 1. Design criteria

3.2 Maximum discharge rates:

- For green-field sites: green-field peak rate or max. of 2.5 l/s
- For pre-developed sites: green-field peak rate or min. of 2.5 l/s if attenuation is possible, otherwise a reduction of 30% for the existing discharge rate.
- For Pill Station and Portishead Station- based on the Concept Drainage, attached on Appendix G.

3.3 Table 2 shows the parameters considered for the greenfield discharge rate calculations. The whole scheme falls within hydrological region no. 8.

Site	SAAR (Standard Average Annual Rainfall) (mm)	SPR (Standard Percentage Runoff)
Portishead Station	889	0.15
Pill Station	882	0.4
Haul Roads	827	0.37
Compound east of Portishead Station	894	0.15
C-15 Sheepway Compound	827	0.37
C-14 Portbury Hundred Compound	841	0.37
C-9 Ham Green Compound	839	0.47
C-13 Lodway Farm Compound	841	0.37
C-4 Clanage Road Compound	836	0.15

Table 2. Parameters for greenfield discharge rate

4. Exceedance flows

4.1 Exceedance flows would normally be expected to inundate the drainage system and therefore the design approach was to convey and store exceedance volumes above ground until there is sufficient capacity within the drainage system to accept inflows again (i.e. after the storm event has passed).

4.2 The management of exceedance flows is an integral part of the overall site design and as such, will be allowed for in the drainage design.

4.3 Exceedance routes up to the 1 in 100-year rainfall event, with an allowance for climate change have been included at the drainage strategy and demonstrate that any exceedance flow will be managed within the site extents.

5. Design Approach

5.1 In accordance with the National Planning Policy Framework and the relevant planning practice guidance[1], surface water runoff will be managed as close to where it falls as possible to mimic natural drainage. North Somerset Sustainable Drainage Developer Guide[2] (NSSDDG) also states that treating the runoff at source is important and their preferred option is to treat and convey the runoff on the surface.

5.2 NSSDDG indicates where infiltration SuDS can be potentially used within the authority's area. The guidance recommends that where soils may be slow draining, have a shallow water table, are located on floodplain deposits, or have some combination of these characteristics, infiltration is not recommended. In this case the preferred storage forms are: ponds, porous pavement layer with impermeable membrane or wetlands. Based on the NSSDDG maps, the proposed development areas in Portishead Station and Haul road have significant constraints for infiltration SuDS since they're located within flood zones 2 or 3.

5.3 Consequently, infiltration is not recommended in the proposed development areas. Instead, a combination of traditional drainage and SuDS including bioretention areas, permeable pavement, detention basins, filter drain and swales, are promoted to ensure pollutants in surface water flows are minimised and exceedance flow paths are managed.

5.4 The drainage provisions promoted to support the development sites (Portishead Station, Pill Station, haul roads and the compounds) are detailed in Section 5, and on the associated drawings presented in Appendix B, C, D, and E.

---

[1] Planning Practice Guidance: [https://www.gov.uk/government/collections/planning-practice-guidance]

[2] North Somerset Sustainable Drainage Developer Guide: [http://www.n-somerset.gov.uk/wp-content/uploads/2015/12/sustainable-drainage-developer-guide.pdf]

5.5 Surface water drainage calculations have been undertaken using MicroDrainage WinDES software. The calculations establish the type and sizing of drainage assets promoted to manage the surface water runoff. These calculations are presented within Appendices B, C, D and E for each development area respectively.

6. Development sites

6.1 Portishead Station

6.1.1 The proposed drainage for the carparks and highways work at Portishead Station have been analysed on a catchment basis. Four catchments have been identified as shown on drawing 467470.BQ.04.20-DS-Portishead of Appendix B.

6.2 Catchment A.1

6.2.1 Catchment A.1 lies to the northwest of the proposed development including the proposed car park and footpaths. The area is currently part of the former railway line and scrub area.

6.2.2 Specifically, the development area will discharge to the watercourse to the north west of the site. This watercourse is a main river, Portbury Ditch, under the EA jurisdiction. The EA has verbally advised that the discharge rate into the ditch shall be set by NSC flood authority. North Somerset Levels IDB has confirmed that all the impermeable areas including the parking should be discharged at greenfield rates and volumes or 2.5l/s as the minimum practicable (refer to Appendix A).

6.2.3 As described in section 4 of this document, infiltration is not considered to be a viable option for this area and thus it is proposed to collect the runoff water through permeable pavement (concrete block paviours) in the southern parking bays (aisles to remain asphalt), with a 300 mm deep clean stone reservoir layer which extends beneath the adjacent footpath.

6.2.4 The runoff will be attenuated within the 300mm depth of clean stone reservoir layer which will also provide treatment as the water flows through the stone and the geotextile membrane. The water will then be conveyed in a linear swale with check dams spaced every 54m (that include an orifice at the invert level of the swale) which will provide storage and attenuation. The connection between the reservoir layer and the swale will be made by a 100mm pipe. The discharge to Portbury Ditch is designed to be limited to 2.5l/s by flow control at the chamber downstream the swale outlet.

6.2.5 For further details, refer to DRG. 467470.BQ.04.20-DS-Portishead in Appendix B.

6.2.6 The suggested dimensions of the swale can be found in Table 3:3 below.

Swale	Approx. length (m)	Depth (m)	Base width (m)	Side Slope (1:x)	Top width (m)	Greenfield runoff (l/s) for 1in30 yr	Admissible peak flow (l/s) for 1in30 yr
1	275	0.450	1	4	4.6	0.6	2.5

Table 3: Dimensions of the proposed swale at Catchment A.1

6.2.7 The analysis of water levels, in vicinity of the proposed Portbury Ditch outfall, for 25 year and 50 year climate change (assumed to be 20%) scenarios are 4.85m and 7.05m respectively. For a 1 in 30 year event this has been interpolated as 5.29m (refer to Appendix A). A capacity check with Microdrainage software has been undertaken and confirms that both the swale and the permeable pavement are suitable for this tide lock level of 5.29m for a 1 in 30 year including an allowance of 40% climate change.

Exceedance flows

6.2.8 Exceedance flow, based on 1:100 return period plus 40% allowance for climate change, is designed to be managed within the footprint of the carpark, to allow the water level to rise from the drainage system up to 16mm above surface at the lowest points of the carpark. The total flooded volume for the 100yr return period is 177m^3. The southern swale top embankment should be raised by 100mm above the footpath level to contain exceedance volumes within the carpark.

Further work

6.2.9 The existing ditch should be surveyed (connectivity and levels) to investigate connection for discharging.

6.2.10 The Environment Agency should be contacted to agree discharge point.

6.3 Catchment A.2

6.3.1 Catchment A.2 lies to the north of the proposed Portishead railway station and includes the diversion of an existing road and roundabout. The diverted road and new roundabout will tie into Harbour Road to the west and Phoenix Road to the east of the existing roundabout.

6.3.2 There is an existing surface water drainage network in this catchment area, which is identified on Wessex Water services plan as a highway drain. The existing highway runoff discharges via 225mm pipe into 'The Cut' watercourse on the north-east of the area (shown on the Appendix B drawings as the proposed discharge point). This approach is based on the Concept Drainage Report attached in Appendix G.

6.3.3 For determining the discharge flow rate from this catchment, an assessment has been carried out to calculate the existing discharge rate for the pre-development site (impermeable catchment of 3,130 m^2). A MicroDrainage model was created for this purpose to simulate the existing drainage system, based on the assumption that the existing drainage system was designed for no-surcharge during 1:1 year rain event with no climate change allowance (See Calculations at

Appendix B). The model results showing existing peak flow of 65 l/s for 1:30 return period. As recommended in the North Somerset Sustainable Drainage Developer Guide, a reduction of 30% has been applied to restrict the proposed drainage discharge to 45.5 l/s.

6.3.4 It is proposed that the road area will fall into three bio-retention areas, where the runoff water will settle and infiltrate into porous layer which will outfall to proposed drainage pipe. This system will include an overflow set to 150 mm below road level. For the areas where draining into the bio-retention areas is not viable, trapped-gullies are proposed to collect the run-off discharging into the proposed sewer. For attenuation, off-line storage of 9 m^3 and 22.5 m^3 are proposed to be located beneath the bio-retention areas. The proposed drainage pipeline of 225mm diameter will convey the runoff from the bio-retention areas along Phoenix Way to discharge into the existing watercourse, as shown in Drawing 467470.BQ.04.20-DS-Portishead on Appendix B.

6.3.5 For limiting the outfall flow rate, an orifice flow control is proposed before the discharge point.

6.3.6 The proposed runoff will be treated by a combination of filtration through the bio-retention areas (vegetation, soil and filter material), or in other locations by trapped-gullies and a subsequent bypass oil separator before discharge.

Exceedance flows

6.3.7 The proposed drainage system will surcharge during 1:100 years rain event without flooding to the highway.

Further work

6.3.8 During detailed design, survey should be included to assess the capacity of the existing drainage highway network, to include the existing discharge structure.

6.3.9 As depth of the drainage system might be limited due to tide-lock level of 5.29m, alternatives of slot-drain or beany blocks should be considered during detailed design to replace the drain sewer at the upstream of the system.

6.4 Catchment A.3

6.4.1 Catchment A.3 lies to the south of the proposed railway station and includes a new road and footways that tie into Quays Avenue. The impermeable area for this catchment is 2,918m^2.

6.4.2 There are no available Wessex Water sewer records of an existing surface water drainage network on Quays Avenue, other than gullies. Therefore, it is assumed that a highway pipe network is present. The existing impermeable area for this catchment is 2,166m^2.

6.4.3 For determining the discharge flow rate from this catchment, an assessment has been carried out to calculate the existing discharge rate for the pre-development.

A MicroDrainage model was created for this purpose to simulate the existing drainage system, based on the assumption that the existing drainage system was designed for no-surcharge during 1:1 year rain event with no climate change allowance (See Calculations at Appendix B). The model results showing existing peak flow of 52 l/s for 1:30 return period. As recommended in the North Somerset Sustainable Drainage Developer Guide, a reduction of 30% has been applied to restrict the proposed drainage discharge to 35 l/s.

6.4.4 An option is that the highway runoff would be captured by a dry swale on the west side of the highway as shown in Drawing 467470.BQ.04.20-DS-Portishead. The carriageway would be profiled to drain to the west side of the catchment into the proposed swale with filter drain.

6.4.5 An alternative would be to capture the highway run-off to the east and into the open space to the south of the station building.

6.4.6 Site constraints would mean this catchment would be drained through a mix of filter drain and swale. On the west side for example, between the proposed bus stop and the catchment boundary, the upper part of the catchment will need to be drained by a filter drain as there is not enough room to accommodate a swale. On the east side the area available for a swale is constrained by the footpath at the junction at Galingale Way needing a pipe connection into the existing highway drainage.

6.4.7 The filter drains would be generally 1.5m deep by 1.5m wide and incorporates a 225mm perforated pipe to convey the runoff. Where sufficient space is available, a dry swale would be proposed. The swale slopes would be set to 1 in 4 as recommended in the SuDS Manual to prevent erosion channelling from lateral inflows, thus giving a swale of generally 0.35m deep. The width and depth would vary depending in the space available. The swale would be the fall of the proposed highway with a longitudinal gradient ranging from 1 in 50 at the top to 1 in 80 at the end.

6.4.8 The swale would be a lined under-drained swale, which will allow the infiltration of the runoff into the filter trench beneath the base during the more frequently occurring storms to provide treatment of the most contaminated runoff. The swales sides and infiltration trench would be lined with an impermeable membrane to ensure that flows are treated before discharge and not infiltrated directly to the ground.

6.4.9 Check dams are promoted along the swale to restrict peak flows and enhance infiltration to the filter trenches. The check dams would be spaced every 20m and set at 0.15m below the top level of the swale to keep a reasonable freeboard.

6.4.10 The swale would discharge into the existing drainage network on Quays Road. A flow control system will be included in the most downstream chamber to restrict flows at 35l/s as calculated before.

Exceedance flows

6.4.11 Exceedance flow, based on 1:100 return period plus 40% allowance for climate change, is designed to be managed within the footprint of the dry swale and the adjacent footpath without affecting the proposed highway. The hydraulic model showed that the total flooded volume is $14m^3$. The flooded volume will exceed the system from the downstream end and will be temporally stored on the surface of the system and the adjacent footpath until the drainage system has enough capacity to deal with those flows.

Further work

6.4.12 Existing manholes and drainage system to be surveyed (CCTV, connectivity and levels) to investigate connection for discharging.

6.4.13 Assess the capacity of the existing highway drainage network.

6.5 Catchment A.4

6.5.1 This catchment is located at the north east of the development area and includes the station car parking and hardstanding by the Portishead station. The site's impermeable area is 3,689 m^2.

6.5.2 Runoff will be collected via linear drainage channels, which will feed into a shallow (300mm deep) geocelullar crate system located beneath the parking bays. The runoff will be treated in several steps as it passes through the drainage network as set out below;

1. Runoff passes into the Permachannel unit which traps silt and coarse particles.
2. Runoff leaves the Permachannel by a diffuser unit which provide a further filtration of oils.
3. Runoff then reaches the first geocellular crate which is fitted with a 'Biomat'. The Biomat geotextile traps oils and other hydrocarbon based floatable contaminants and biodegrades these.
4. Runoff will then leave the Permavoid geocellular crates by an orifice plate flow control before discharging into a watercourse.

6.5.3 The run-off discharge from the car-park will be restricted to max flow rate of 2.5 l/s as there is enough room available to attenuate flows at greenfield runoff peaks or a minimum practicable of 2.5l/s.

6.5.4 Proposed discharge point is to the proposed highways drainage system for Catchment A.2, which outfalls into 'The Cut' watercourse to the north east of the compound as shown in drawing no. 467470.BQ.04.20-DS-Portishead in Appendix B.

6.5.5 For modelling purposes, the car-park has been divided into three sub-catchments – therefore, three sets of calculations are attached in Appendix B.

Exceedance flows

6.5.6 Exceedance flow, based on 1:100 return period plus 40% allowance for climate change, is designed to be managed within the footprint of the carpark, to allow the water level to raise from the Geo-cellular storage and up to 3-11 mm above surface at the lowest points of the carpark. This volume of water is designed to be held by the pavement kerbs. During an exceedance event, the discharge flow rate can reach a peak of 4 l/s for a duration of 500 minutes.

Further work

6.5.7 During detailed design, the existing drainage system should be surveyed (CCTV, connectivity and levels) to assess the capacity and consider discharging to it.

6.6 Pill Station Carpark

6.6.1 Pill station carpark is located between the railway line, Monmouth Close and Avon Road. The catchment area of the carpark is 1,488 m^2.

6.6.2 Surface water runoff from the car park up to the 30 year return period plus a 40% allowance for climate change will be collected through permeable pavement (concrete block paviours) in the parking bays (aisles to remain asphalt), with a clean stone reservoir beneath (this does not extend beyond the parking bays). The runoff will be attenuated within 330mm depth of clean stone (reservoir layer) which will also provide treatment as the water flows through the stone and the geotextile membrane. The reservoir layer will outfall through an orifice flow control limited to 5 l/s (based on the Concept Drainage Design Report Rev 01 from January 2017 refer to Appendix G).

6.6.3 The proposed discharge from the reservoir layer will connect into the existing highway drainage system on Avon Road.

6.6.4 The drop-off area located at Station Road is proposed to be drained in a similar approach with permeable pavement and reservoir layer beneath the three disabled parking spaces. Discharge will be into the existing highway drainage on Station Road.

Exceedance flows

6.6.5 Exceedance flows, based on 1:100 year return period plus 40% allowance for climate change, are designed to be managed within the footprint of the carpark. During an exceedance event, water level will surcharge the subbase pavement layer but it will emerge on the carpark surface. The discharge will reach a peak of 5.2 l/s for a duration of 100 minutes.

Further work

6.6.6 Existing manholes and drainage system in Avon Road and Station Road to be surveyed (CCTV, connectivity and levels).

6.7 Haul roads

6.7.1 Surface water runoff from haul roads up to the 30 year return period plus a 10% allowance for climate change will be captured by ditches, with no exceedance flows occurring up to 100 year return period. In case of blockage, exceedance will be temporarily stored on the surface of the haul roads until sufficient capacity is available within the drainage network.

6.7.2 The temporary haul roads will lie alongside the railway for 1,290m between Portishead and Portbury Hundred construction compound. The haul roads will be approximately 8m wide and the running surface is assumed to be constructed of a Clause 803 (SHW) Type 1 sub-base. Although this granular material is not totally impermeable, the catchment areas of the haul roads have been assumed to be 100% impermeable for the calculations.

6.7.3 Check dams will be promoted along the proposed ditches to capture sediment and minimise contaminated runoff being discharged to downstream watercourses. The accumulated silt will need to be removed and disposed of periodically. The spacing of check dams will depend on the longitudinal slope of the ditches which is still uncertain due to the absence of proposed ground model. The calculations to size the ditches have assumed a relatively flat gradient of 1 in 400 for all the ditches draining the haul roads. The design will need to be checked to confirm that it is adequate when the proposed ground levels are available.

6.7.4 It is recommended to undertake a survey of the conditions and capacity in the receiving watercourses prior to works commencing onsite and on completion in order to confirm there is no larger silt deposits due to the works.

6.7.5 Discharge from the ditches need to be attenuated at greenfield runoff rates or 2.5l/s as the minimum practicable. Vortex flow controls (VFCs) or other types of flow control will be used to achieve the discharge requirements. As runoff peaks are going to be attenuated at greenfield rates, the removal of contaminants through settling and adsorption will be enhanced.

6.7.6 The haul roads will cross existing drainage ditches that will need to be culverted during the duration of the works and subsequently reinstated on completion. A hydraulic assessment should be carried out to estimate the culvert diameter with the minimum requirement being 750mm diameter.

6.7.7 The suggested dimensions of the ditches can be found in Table 4: and the alignment and discharge points are presented in Drawing 467470.BQ.04.20-DS-Haulroads in Appendix D.

Ditch	Approx. length (m)	Depth (m)	Base width (m)	Side Slope (1:x)	Top width (m)	Greenfield runoff (l/s) for 1 in 30 yr	Permissible peak flow (l/s) for 1 in 30 yr
D1	376	0.8	0.8	1	2.4	2.2	2.5
D2	297	0.8	0.7	1	2.3	2	2.5
D3	187	0.7	0.5	1	1.9	1.2	2.5
D4	343	0.9	0.5	1	2.3	2	2.5
D5	87	0.6	0.5	1	1.7	0.7	2.5
D6	297	0.8	0.7	1	2.3	2	2.5

Table 4: Dimensions of the proposed ditches for Haul roads

6.7.8 During detail design, if there is not enough room to accommodate the proposed ditches alongside the haul roads, shallower and narrower ditches could be promoted, with attenuation taking place in detention basins before the discharge to the receiving watercourses, subject to sufficient space being available at the discharge points to accommodate the basins. Runoff from the haul roads will be conveyed by the ditches and piped to the detention basins. The discharge from the basins would be restricted by flow controls. The suggested dimensions of the ditches and detention basins can be found in Table 5 and Table 6 below.

	Approx. length (m)	Depth (m)	Base width (m)	Side Slope (1:x)	Top width (m)	Pipe outlet (mm)
D1 and D2	673	0.4	0.5	1	1.3	300
D3, D4, D5 and D6	617	0.4	0.5	1	1.3	Twin 300

Table 5 : Dimensions of the alternative proposed haul roads ditches

Basin	Approx. base area (m^2)	Approx. base area (m^2)	Volume available (m^3)	Depth (m)	Side Slope (1:x)	Greenfield runoff (l/s) for 1 in 30 yr
D1 and D2	201	452	326.5	1	4	4.3
D3, D4, D5 and D6	361	680	512.2	1	4	5

Table 6 : Dimensions of the proposed detention basins for alternative haul roads ditches

6.7.9 There is an option to connect the runoff from the Haul roads to the adjacent track drainage, subject to Network Rail consent, rather than constructing a new drainage system. At this scenario, the proposed ditches (No.1 – 6) will not be required. In addition it is like that the surfaced width of the haul road would be reduced.

6.8 Temporary Construction Compounds

6.8.1 Introduction

6.8.1.1 This section includes the drainage strategy for the construction compounds. The compounds listed below are not included in the scope of this report:

- Compound to the north of Portishead station (refer to sheet 1 of Appendix H). For this area, it is assumed the car park would be implemented and used as a compound with its drainage design as described above (refer to Drawing 467470.BQ.04.20-DS-Portishead of Appendix B).
- M5 compound (refer to sheet 6 of Appendix H). This area is already a hardstanding area.
- Compound located between Lodway Farm compound and Pill station car park (the garages by Avon Bridge, refer to sheet 7 of Appendix H). This area is an existing highway.
- Small compound located to the south-east of Pill station car park, next to Station Road (refer to sheet 8 of Appendix H). Only the design of the drainage of the car park will be undertaken (refer to Drawing 467470.BQ.04.20-DS-Portishead of Appendix B).
- Small compound located to the west of Watch House Road (refer to sheet 8 of Appendix H). This area was already developed.
- Compound to the west of Winterstoke Road (refer to sheet 19 of Appendix H). This area is an existing car park.

6.8.2 Compound located to the east of Portishead Station

6.8.2.1 The compound to the east of Portishead Station is a temporary site for the construction of Trinity footbridge that will cross over the railway. The compound has an approximate proposed footprint of 0.106 ha. The surface material for the hardstanding of the temporary compound is assumed to be type 1 aggregate.

6.8.2.2 It is assumed that the terrain will fall from south-west to north-east. Surface water runoff from this compound up the 30 year return period plus an allowance for climate change of 10% (since this compound is temporary) will be captured by a filter drain installed along in the southern edge of the compound and then then discharge into the Cut at the greenfield runoff rate of 2.5l/s (minimum practicable).

6.8.2.3 The suggested dimensions of the filter drains can be found in Table 7 and the alignment and discharge points are presented in Drawing 467470.BQ.04.20-DS-East_of_Portishead in Appendix E.

Approx. length (m)	Depth (m)	Width (m)	Pipe diameter (mm)	No. of pipes at the bottom of the trench
150	1.4	0.45	150	1

Table 7: Filter drains for compound to the east of Portishead Station

6.8.2.4 The calculations to size the filter drain assumed a gradient of 1 in 200. The design will need to be checked to confirm that it is adequate when the proposed ground levels are available.

6.8.2.5 For pollution control purposes, the filter drain provides water treatment and sediment removal as runoff percolates through the granular material. Additionally, filter drains will be lined with a geotextile for further water treatment and to avoid infiltration of runoff into the ground. It is recommended that at the beginning of the run of the filter drain, a chamber with a grated gully is installed to allow for maintenance. It is recommended to install a bypass separator in case oil handling is proposed within this compound.

Exceedance flows

6.8.2.6 The construction of a bank surrounding the compound is proposed to control the exceedance flows. The proposed filter drain present flooding for the 1 in 100 year return period event (see Table 8):

Drainage Elements	Exceedance flood volume (m^3)	
	30 year return period; 10% allowance for climate change	100 year return period; 10% allowance for climate change
Filter drain	0	7.6

Table 8: Exceedance flood volume

Exceedance routes are proposed to be located along the northern edge of the compound towards a green area located to the north-east of the compound. This area has a surface of 1512m^2.

6.8.3 C15 Sheepway Compound

6.8.3.1 Sheepway compound is located at the junction between the railway line and Sheepway Road. The site will include 0.042ha temporary compound and 0.065ha permanent compounds. The design of the compound includes green areas and hardstanding for parking and welfare facilities.

6.8.3.2 This compound will include a small amount of parking, welfare facilities and materials storage.

6.8.3.3 Only existing topographic data was available at present. The drainage system has been designed to drain from south to north and it should be checked when the proposed ground model is available.

6.8.3.4 Surface water runoff from the permanent area of the compound up to the 30-year return period plus 40% allowance for climate change will be captured by a french drain and discharge either to the Network Rail drainage system to the south or to an existing ditch to the west of the site as shown in Drawing 467470.BQ.04.20-DS-C15 in Appendix E. The discharge will occur at greenfield runoff rates or 2.5l/s as the minimum practicable.

6.8.3.5 The suggested dimensions of the French drain can be found in Table 9 and the alignment and discharge point are presented in Drawing 467470.BQ.04.20-DS-C15 in Appendix E.

Approx. length (m)	Depth (m)	Width (m)	Pipe diameter (mm)	No. of pipes at the bottom of the trench
113	1	0.7	150	1

Table 9: Dimensions of the French drain for the permanent area for Sheepway Compound

6.8.3.6 Surface water runoff from the temporary area of the compound for the 30 year return period plus 10% allowance for climate change will be captured by filter drain and then conveyed by pipes to discharge into existing ditches at the greenfield runoff rate.

6.8.3.7 The suggested dimensions of the filter drain can be found in Table 10.

Approx. length (m)	Depth (m)	Width (m)	Pipe diameter (mm)	No. of pipes at the bottom of the trench
139	1	0.3	150	1

Table 10: Filter drains for the temporary area for Sheepway Compound

6.8.3.8 The calculations to size the filter drains assumed a gradient of 1 in 400. The design will need to be checked to confirm that it is adequate when the proposed ground levels are available.

6.8.3.9 The proposed footpath shall be drained to the adjacent field. The area at the east side of the compound is recommended to be discharged to the track drainage.

Exceedance flows

6.8.3.10 For the permanent area, the French drain will flood for the 1 in 100 return period event but there is no flooding for the 1 in 30 return period. There is no flooding for the temporary area in either the 1 in 30 return period event or for the 1 in 100 return period event (see Table 11).

Drainage elements	Return Period (yr)	Climate Change (%)	Exceedance flood volume (m^3)
French Drain	30	40	0
French Drain	100	40	4.2
Filter drain	30	10	0
Filter drain	100	10	0

Table 11: Exceedance flood volume for the temporary and permanent areas

6.8.3.11 Exceedance routes are proposed to be located at the northern side of the compound as shown in drawing 467470.BQ.04.20-DS-C15 in Appendix E.

6.8.3.12 During detailed design, there might be opportunities to propose flooded volumes to be managed within the compound site, once the layout of the compound has been designed.

Further recommendations

6.8.3.13 Historic borehole logs undertaken in the vicinity of the compound available in the BGS viewer were used to investigate the ground water flood risk. The highest ground water level encountered in the area was at 4.5m BGL. If during the construction ground water is found close to the surface (ie: 2m BGL), the drainage system will need to be revised to suit the ground water conditions.

6.8.3.14 Further consultation with the EA will be undertaken during the detailed design phase to check if compensatory flood storage is required.

6.8.4 C14 Portbury Hundred Compound

6.8.4.1 Portbury Hundred compound is located south of Sheepway, between the railway line and the A369 Portbury Hundred highway and to the west of the crossing of Station Road and the A369. It has a proposed footprint of 11.4 ha and the surface is assumed to be constructed of Type 1 aggregate. Although this granular material is not totally impermeable, for the scope of this report it has been assumed that it is completely impermeable for the calculations.

6.8.4.2 This construction compound could include a large amount of parking spaces for staff vehicles, storage of materials, offices and welfare facilities. The materials stored could be sleepers, drainage, troughing, energy recovery units for vegetation removal, spoil, ballast and track formation. Plant vehicles will circulate in the area, including dumpers, excavators, dozers and lorries.

6.8.4.3 No topographical data was available at present. Therefore, since the existing ditches SG1 and D4 are flowing from north to south, it was assumed the terrain is falling from north to south in this area.

6.8.4.4 With the aim of not posing any flood risk to the new railway and to the access track located in the southern edge of the compound, the proposed fall of the ground will be towards the south-west and south-east, having a watershed along the axis of the access track up to the northern edge. In case of flooding, only the lower-western and lower-eastern corners of the compound would be affected, keeping the access track and the majority of the compound free of flooding.

6.8.4.5 The compound will be then divided into four sub-catchments: A and B and C and D (see drawing 467470.BQ.04.20-DS-C14 in Appendix E for reference).

6.8.4.6 Sub-catchments A and B would fall towards south-west, making the ditch in sub-catchment A and the pipe in sub-catchment B tend towards the south. C would fall towards the south-east, making the pipe in this area lean towards the south. D would fall towards the south, making the ditch in sub-catchment D falling towards the south-west, in order to convey the runoff towards the basin located in the southeast corner of sub-catchment C.

6.8.4.7 In the scenario set out below, surface water runoff from this compound up the 30-year return period plus an allowance for climate change of 10% (since this compound is temporary) could be captured by filter drains installed in each sub-catchment and then conveyed by ditches or pipes to two attenuation basins, which will then discharge into two existing ditches at the greenfield runoff rate. Obviously a contractor may wish to adopt a different approach.

6.8.4.8 The suggested dimensions of the filter drains can be found in Table 12: and the alignment and discharge points are presented in Drawing 467470.BQ.04.20-DS-C14 in Appendix E.

Approx. length (m)	Depth (m)	Width (m)	Pipe diameter (mm)	No. of pipes at the bottom of the trench
100	1.4	0.45	150	1

Table 12: Filter drains for Portbury Hundred Construction Compound

6.8.4.9 The calculations to size the filter drains assumed a gradient of 1 in 200. The design will need to be checked to confirm that it is adequate when the proposed compound ground levels are available.

6.8.4.10 For pollution control purposes, filter drains provide water treatment and sediment removal as runoff percolates through the granular material. Additionally, filter drains can be lined with a geotextile for further water treatment and to avoid infiltration of runoff into the ground. It is recommended that at the beginning of the run of each filter drain, a chamber with a grated gully is installed to allow for maintenance.

6.8.4.11 In the case of fuel and oil handling occurring, a separate drainage system will be installed including oil separator to treat flows. All fuel and oil storage tanks would be installed within a bunded area with 110% storage volume of the tank available, should the tank be ruptured or a spill occur.

6.8.4.12 The results from the hydraulic modelling show that a filter drain with such dimensions is able to drain a contributing area of 0.27 ha. Considering this the number of filter drains necessary to drain each catchment are shown in Table 13:

Sub-catchment	No. of filter drains
A	13
B	13
C	10
D	8

Table 13: No. of filter drains needed in each sub-catchment.

6.8.4.13 In sub-catchments A and D, runoff conveyed by filter drains would be collected by two ditches flowing along the western and southern edges of the compound respectively. It is proposed that these ditches are grass-lined and that they include an impermeable lining. The proposed indicative dimensions for these ditches are the following:

Ditch	Approx. length (m)	Depth (m)	Base width (m)	Side Slope (1:x)	Top width (m)
Catchment A	386	1	1	3	7
Catchment D	230.5	1	1	3	7

Table 14: Dimensions of the proposed ditches for Portbury Hundred construction compound.

6.8.4.14 The calculations to size the ditches assumed a gradient of 1 in 500. The design will need to be checked to confirm that it is adequate when the proposed ground levels are available.

6.8.4.15 It is proposed to include check dams to be installed just upstream of each filter drains connection. This will provide attenuation of peak flows and pollution control, allowing for sediment settling. Also, it must be noted that the grass lining in the ditches provides water treatment as well.

6.8.4.16 In sub-catchments B and C, runoff conveyed by filter drains would need to be collected by two pipes flowing along the western and eastern edges of these catchments respectively. The proposed dimensions for these pipes are shown in Table 15:

Pipes	Approx. length of total run (m)	Longitudinal slope (1:x)	Pipe diameter (mm)
Catchment B	222	100	525

Pipes	Approx. length of total run (m)	Longitudinal slope (1:x)	Pipe diameter (mm)
Catchment D	144	100	525

Table 15: Dimension of the proposed pipes for Portbury Hundred construction compound.

6.8.4.17 The calculations to size these pipes assumed a gradient of 1 in 100. The design will need to be checked to confirm that it is adequate when the proposed ground levels for the compound area are available. Due to the large diameter of these pipes, they may have limited cover. If this is the case during detailed design, it is recommended to install protection to these pipes or prevent heavy loads being placed on them. Chambers will need to be included every 100m maximum for maintenance purposes.

6.8.4.18 Two attenuation basins would be constructed in this compound in this scenario: Basin 1 could be located in the south-western corner and Basin 2 could be located in the southern edge of the compound, close to the right boundary of sub-catchment C (see drawing 467470.BQ.04.20-DS-C14 in Appendix E for reference). Basin 1 is proposed to discharge into the existing ditch SG1, located to the west of the construction compound, while Basin 2 is proposed to discharge into existing ditch D4, which crosses the compound in its central part. Therefore, the portion of ditch D4 within Portbury Hundred Compound is proposed to be culverted. Discharge into the existing D4 culvert is subject to IDB consent (see Appendix A). The indicative dimensions for the basins are displayed in Table 16:

Basins	Depth (m)	Top area (m^2)	Base area (m^2)	Total volume available (m^3)	Greenfield runoff (l/s) for 1 in 30 yr
Basin 1	1.5	2850	1968	3493	45.5
Basin 2	1.5	2000	1271	2433	31.6

Table 16: Dimensions of the proposed attenuation basins for Portbury Hundred compound.

6.8.4.19 Regarding pollution control, the detention basin would provide water treatment within a forebay that allows for sediment settling. The sedimentation forebay will be at least 10% of the total basin area as recommended in the SuDS Manual. In addition, it is recommended to install gabion baskets within the basins to provide additional sediment catching. If the compound is to be used to store ballast, it is recommended the installation of bypass separators at the outlets of both basins.

Variable impermeability scenarios

6.8.4.20 The dimensions of the proposed attenuation basins (Table 17) are indicative for the 1 in 30-year return period flood event and assuming that the site is 100% impermeable.

6.8.4.21 The maximum volume of the basins has also been calculated considering the 1 in 5 and the 1 in 10-year return period flooding for the two basins with 100% permeability.

6.8.4.22 Additionally, in order to test differing impermeability scenarios, the maximum volume of the basins has been calculated considering 75% and 50% impermeability for the two basins for the 1 in 30-year return period. Results are presented in Table 17 below.

Basins	Return Period (yr)	Permeability (%)	Maximum Volume (m^3)
Basin 1	**30**	**100**	**2,623**
Basin 1	5	100	1,746
Basin 1	10	100	2,043
Basin 1	30	75	1,902
Basin 1	30	50	1,218
Basin 2	**30**	**100**	**1,816**
Basin 2	5	100	1,203
Basin 2	10	100	1,410
Basin 2	30	75	1,313
Basin 2	30	50	836

Table 17: Basin's volumes for different return periods and permeabilities

Exceedance flows

6.8.4.23 The construction of a bank surrounding the compound is proposed to control the exceedance flows.

6.8.4.24 The filter drains and the ditch for sub-catchment D are the only elements of the drainage system that flood during the 1 in 100 return period event (see Table 18:).

Drainage Elements	Exceedance flood volume (m^3)	
	30 year return period; 10% allowance for climate change	100 year return period; 10% allowance for climate change
Filter drain	0	7
Ditch for catchment D	0	2.3
Total flooded volume	0	308

Table 18: Exceedance flood volume

6.8.4.25 It has to be noted that the exceedance flooded volume shown in Table 18: for filter drains corresponds to one filter drain. Considering all the filter drains to be installed in this compound would give a total exceedance flooded volume of 308 m^3.

6.8.4.26 Exceedance routes are proposed to be located in the south-western corner of sub-catchment A towards the green area located to the west of Portbury 6.8.4.27 Hundred compound and in the southern edge of sub-catchment D towards a green area located between the compound and the A369 (see drawing 467470.BQ.04.20-DS-C14 in Appendix E for reference).

6.8.4.27 During detailed design, there might be opportunities to propose flooded volumes to be managed within the compound site, once the layout of the compound has been designed.

Further recommendations

6.8.4.28 Historic boreholes logs undertaken in the vicinity of the compound available in the BGS viewer were used to investigate the groundwater flood risk. The highest level at which groundwater was encountered in the area was at 1.7 m bgl, which is the reason why all drainage is proposed to have a depth of 1.5 m or less. It must be noted that one of the boreholes available in the BGS viewer, undertaken to the south-east of the site, water was encountered at 2.13 m bgl after what it rose up to 0.91 m bgl. The SUDS Manual recommends investigating groundwater levels to ensure the base of the proposed drainage system is at least 1 m above the maximum anticipated groundwater level. Prior to construction it is therefore recommended that piezometers are installed to monitor groundwater levels over a 6 month period taking in April and May which are typically expected to be the peak for groundwater levels in the UK. If groundwater is encountered less than 1 m below the invert level of the proposed drainage system, the drainage design should take this into account and be amended accordingly.

6.8.4.29 Topographical survey is required in order to finalise the drainage system design, as described above, for the Portbury Hundred construction compound. If the existing ditches are found to be at a higher level than the proposed attenuation basins, the drainage proposals will need adjusting if feasible, or alternatively a pumping system may be required.

6.8.4.30 Further consultation with the EA will be undertaken during the detail design phase to check if compensatory flood storage will be required.

6.8.5 C13 Lodway Farm Compound

6.8.5.1 Lodway Farm compound is located adjacent to the M5, to the south of the railway line immediately North of Pill. It has a proposed footprint of 8.2 ha and the surface is assumed be constructed of Type 1 aggregate. Although this granular material is not totally impermeable, for the scope of this report it has been assumed that it is completely impermeable for the calculations. Within the compound there are archaeological and reptile areas and these areas have been excluded from the drainage system of the compound. The total contributing area of this compound after the exclusion of these areas is 6.36ha.

6.8.5.2 This construction compound will include a medium amount of parking spaces for staff vehicles, storage of materials, offices and welfare facilities. The materials stored will be sleepers, drainage, troughing, energy recovery units for vegetation removal, spoil, ballast and track formation. Plant vehicles will circulate in the area, including dumpers, excavators, dozers and lorries, and a short section of temporary track may be constructed to allow trains onto the area for ballast removal and delivery.

6.8.5.3 Surface water runoff from this compound up the 30 year return period plus an allowance for climate change of 10% (since this compound is temporary) will be captured by filter drains in this scenario, and then conveyed by a runoff collector along the northern edge of the compound to an attenuation basin. This would will then discharge into an existing culvert to the north, subject to confirmation by Network Rail, at the greenfield runoff rate. The existing ground falls towards the railway and therefore the proposed location of the drainage collector is inevitable. The drainage collector would need to be of a sort which allows vehicles to pass over it onto the track works.

6.8.5.4 The suggested dimensions of the filter drains can be found in Table 19 and the alignment and discharge points are presented in Drawing 467470.BQ.04.20-DS-C13 in Appendix E.

Approx. length (m)	Depth (m)	Width (m)	Pipe diameter (mm)	No. of pipes at the bottom of the trench
Varies	1.4	0.45	150	1

Table 19: Filter drains for Lodway Farm Construction Compound

6.8.5.5 The calculations to size the filter drains assumed a gradient of 1 in 200. The design will need to be checked to confirm that it is adequate when the proposed ground levels are available.

6.8.5.6 For pollution control purposes, filter drains provide water treatment and sediment removal as runoff percolates through the granular material. Additionally, filter drains will be lined with a geotextile for further water treatment and to avoid infiltration of runoff into the ground. It is recommended that at the beginning of the run of each filter drain, a chamber with a grated gully is installed to allow for maintenance.

6.8.5.7 In the case of fuel and oil handling occurring, a separate drainage system will be installed including oil separator to treat flows. All fuel and oil storage tanks will be installed within a bunded area with 110% storage volume of the tank available, should the tank be ruptured or a spill occur.

6.8.5.8 One attenuation basin would need be constructed in this compound drainage scenario, located in the north-western corner of the compound (see drawing 467470.BQ.04.20-DS-C13 in Appendix E for reference). The basin is proposed to discharge into the existing culvert at the northern part of the compound. The exact location of the existing culvert is to be confirmed by Network Rail. The proposed dimensions for the basin are displayed in Table 20:

Basins	Depth (m)	Top area (m^2)	Base area (m^2)	Total volume available (m^3)	Greenfield runoff (l/s) for 1 in 30 yr
Basin	1.5	2,601	1,728	3,224	43.2

Table 20: Dimensions of the proposed attenuation basin for Lodway Farm compound.

6.8.5.9 Regarding pollution control, basins provide water treatment allowing for sediment settling. In addition, it is recommended to install gabion baskets within the basin to provide additional sediment catching. Since the compound will be used to store ballast, it is recommended the installation of bypass separators at the outlet of the basin. In addition, the basin should be constructed with a forebay at the inlet, and a micropool at the outlet to aid sediment control.

Further work

6.8.5.10 Historical borehole logs undertaken in the vicinity of the compound available in the BGS viewer were used to investigate the groundwater flood risk. The highest level at which groundwater was encountered in the area was at 1.7 m bgl, which is the reason why all drainage is proposed to have a depth of 1.5 m or less. The SUDS Manual recommends investigating groundwater levels to ensure the base of the proposed drainage system is at least 1 m above the maximum anticipated groundwater level. Prior to construction it is therefore recommended that piezometers are installed to monitor groundwater levels over a 6 months period taking in April and May which are typically expected to be the peak for groundwater levels in the UK. If groundwater is encountered less than 1 m below the invert level of the proposed drainage system, the drainage design should take this into account and be amended accordingly.

6.8.5.11 Topographical survey is required in order to finalise the drainage system design for the Lodway Farm compound.

6.8.5.12 Further consultation with the EA will be undertaken during the detail design phase to check if compensatory flood storage will be required.

6.8.6 C9 Ham Green Access point and compound

6.8.6.1 Ham Green Access point and compound is located to the north of the eastern portal of Pill Tunnel. Ham Green Lake is located just to the east of the access point compound. This compound has a proposed footprint of 0.491 ha, from which 0.286 ha are the temporary compound and 0.204 ha will be the permanent construction. The permanent construction comprises a Network Rail pedestrian and vehicular access road, as well as some space for parking and landscaped areas. Low loaders to drop off RRVs will be using the entrance area to the access point. Network Rail is proposing a permeable solution for the temporary compound.

6.8.6.2 Surface water runoff from the permanent areas of the compound up to the 30 year return period plus an allowance for climate change of 40% will be captured by a linear ditch (0.172ha) that will be connected to a filter drain at the eastern edge of the turn area. Discharge from filter drains will be attenuated in a Geo-cellular storage or similar, with 34.2m^3 required storage volume. It is recommended the discharge from the Geo-cellular storage to be connected to the existing Network Rail silt trap before outfall to Ham Green Lake. The system will discharge into the silt trap at greenfield runoff rates or 2.5l/s as the minimum practicable.

6.8.6.3 Network Rail has been informed of the discharge flow rate and volumes arriving to the silt trap (see Appendix A) from the access point. Since the capacity of the silt trap is unknown it has been agreed that the drainage will be treated prior to discharging to the silt trap. Therefore, a bypass oil separator is recommended before the connection with the existing outfall to provide water treatment. During detailed design, survey of the silt trap is required to identify its capacity.

6.8.6.4 The suggested dimensions of the ditch for the permanent areas is shown in Table 21: and the alignment and discharge points are presented in Drawing 467470.BQ.04.20-DS-C9 in Appendix E.

Approx. length (m)	Depth (m)	Top width (m)	Base width (m)	Side slope (1inX)
190	0.8	2.1	0.5	1

Table 21: Dimensions of the proposed ditch for the permanent areas Ham Green Compound

6.8.6.5 In terms of pollution control, several measures are proposed to prevent any sediment from reaching Ham Green Lake. Check dams will be installed along the proposed ditch to capture sediment. The accumulated silt will need to be removed periodically. The spacing of check dams will depend on their height and the longitudinal slope of the ditch which is still uncertain due to the absence of a detailed proposed ground model.

6.8.6.6 A silt pollution control (i.e. straw bale barrier) has been proposed to be placed during construction at the eastern edge of the site (as shown in 467470.BQ.04.20-DS-C9) to protect the Ham Green Lake from runoff and to provide temporary pollution control.

Exceedance flows

6.8.6.7 Exceedance routes from the Geo-cellular storage location towards the green areas are located to the east of the compound, between the compound fence and the Ham Green Lake (see drawing 467470.BQ.04.20-DS-C9 in Appendix E for reference).

6.8.6.8 Since the proposed drainage system is discharging into the lake, exceedance events could cause the Ham Green Lake to spill. Then, exceedance flows were checked for 100 yr return period. For the permanent areas, the pipeline running from the Geo-cellular storage towards the existing silt trap from Network Rail presents flooding for the 1 in 100 year return period:

Drainage Elements	30 year return period; 40% allowance for climate change	100 year return period; 40% allowance for climate change
Outlet Pipeline	0	1.9m^3

Table 22: Exceedance flood volumes

Further recommendations

6.8.6.9 Historical boreholes logs undertaken in the vicinity of the compound available in the BGS viewer were used to investigate the ground water flood risk. The highest ground water level encountered in the area was at 22m BGL. If during construction ground water is found close to the surface, the drainage system will need to be revised to suit the ground water conditions.

6.8.6.10 Survey of the existing silt trap in the Railway Network drainage system outfall into the Ham Green Lake to be undertaken to check if it can accommodate the runoff from the compound.

6.8.6.11 Further consultation with the EA will be undertaken in the detail design phase to check if compensatory flood storage will be necessary.

6.8.7 C4 Clanage Road Compound

6.8.7.1 C4 Clanage Road compound is located to the west of Bristol, between the A369 and the railway line. This compound has a proposed footprint of 0.6137 ha, from which 0.312 ha are the permanent construction and 0.3017ha are the temporary compound. The surface material for the hardstanding of the temporary compound will be type 1 aggregate.

6.8.7.2 This site will be the main compound for construction activities through the Avon Gorge, including track works, earthworks, underbridge strengthening, signalling and telecoms. The site will be used as a medium-sized parking area, for materials storage, offices and welfare facilities. RRAP will be installed to allow RRVs access into the gorge, for which the construction of a ramp will be required to facilitate this.

6.8.7.3 The site is in flood zone 3 and is prone to waterlogging. It is understood that this will mean that the compound may be occasionally flooded and it is accepted that it not be possible to use for periods of time. In addition, it is proposed that materials and equipment will only be stored there for immediate maintenance activities.

6.8.7.4 No topographical data is available at present. Therefore, for the purpose of the drainage design of the temporary areas, it is proposed that the ground falls south-east, to allow for a low point in the south-eastern corner of the temporary extents.

6.8.7.5 Surface water runoff from the temporary areas of the compound up to the 30 year return period plus an allowance for climate change of 10% would be captured by a runoff collector and then discharge unattenuated via a pump supplied by Network Rail to the River Avon, subject to Environment Agency's consent (refer to Appendix A). The runoff collector is proposed to run along the southern edge of the temporary compound, ending in the south-eastern corner.

6.8.7.6 In terms of pollution control, a bypass separator is recommended before the discharge to the River Avon to provide water treatment.

7. Contributing areas & Runoff assessment

7.1 As any additional runoff up to the 30yr return period is to be managed in a sustainable way through the implementation of SuDS, there should be no increase to flood risk posed from surface water, including during exceedance events up to the 100yr return period. Pre- and post-development areas are presented in Table 23: to Table 26: below.

Portishead Station						
	Pre - development			Post - development		
Catchment Area	Permeable area (m^2)	Impermeable area (m^2)	Total (m^2)	Permeable area (m^2)	Impermeable area (m^2)	Total (m^2)

8. Modelling

8.1 The hydraulic modelling results show that runoff up to a 1 in 30-year return period (which has 3.33% chance of occurring in any given year) will be contained in the proposed drainage features without flooding. A list of the assets for the development site, with corresponding references to the drawings and calculations, are shown in Table 27. It should be noted that calculations and drawings are presented in Appendices B, C, D and E for each development area respectively.

Table 27: Calculations and associated drawing number for the proposed drainage options of the development areas

9. Pollution Control & Water Quality

9.1 Due to the diverse nature of the developments covered in this drainage strategy, each site has been assessed independently.

9.2 SuDS have been promoted where possible as recommended on the National Planning Policy Framework and the North Somerset Sustainable Drainage Developer Guide as one of the most appropriate methods to provide the adequate water treatment before the discharge to the environment.

9.3 The Simple Index Approach, in line with Section 26.7.1 of the CIRIA C753 SuDS Manual 2015, has been undertaken for the developments classified as medium pollution hazard and mitigation measures have been consulted to the environmental regulator for the higher risk sites to ensure effective pollution control. The process and results are presented in appendix F.

9.4 Pollution hazards were identified and measures proposed in accordance to relevant legislation and best practices. Measures proposed for each site have been outlined in their correspondent sections of this report. This includes dry swales, bioretention areas, filter drains, ditches with check dams, detention basins and Class 1 bypass separator that has been sized to fully treat the more frequent flows.

9.5 Refer to Appendix F for details about pollution control and water quality.

10. General Recommendations and Missing Information

- Existing drainage system to be surveyed (CCTV, connectivity and levels)
- Topographical survey is recommended to be undertaken.
- Due to lack of gradient in the existing ditches, pumping might be required.
- Existing watercourses to which discharge is proposed should be surveyed to assess conditions and capacity.
- Outfalls should be monitored on a regular basis and only clear and uncontaminated water should be discharged from site. Outfalls will be equipped with shut-off valves to stop water flow in case any contamination event occurs.

APPENDICES

APPENDIX A

North Somerset Levels Internal Drainage Board (IDB) Drainage Advice and Pollution Mitigation Measures, Analysis of Portbury Ditch Water Levels

<u>North Somerset Levels Internal Drainage Board Pre-application Response No. 2</u>

<u>Response to emails 20/3/2018</u>

Email dated 13 April 2018 from Dario de Frutos Subtil

Compounds:

There are two main compounds to discharge to IDB watercourses: sheepway compound and the portubury 100 compound. The design of the compounds is still on progress and the only available information we have at the moment is that both construction compounds will be used for storage of materials (sleepers, troughing, spoil, ballast and track formation), welfare facilities and parking. Heavy vehicles will be using the compounds such as dumpers, excavators, dozers and lorries.

NSLIDB response:

The Board expects that all compounds and in particular any culverting to be removed post construction and as a minimum returned to their pre-development condition. If included in a remedial landscape scheme the watercourses should not be planted with anything other than a standard grass seed mix to prevent erosion. Any other vegetation should be left to colonise naturally.

Note that the Board requires that any open watercourses within the compounds should be fully culverted for the duration of the works, min 750mm dia (subject to final approval on receipt of detailed proposals) and all to be removed on completion to prevent construction runoff from entering the watercourse.

Measures to minimise and control the risk of contaminated runoff from the compounds should be implemented as part of site set-up. The main risks in term of water pollution hazard and how they will be mitigated below:

Sediments:

Filter drains will be proposed as the conveyance system for most part of the compounds. The flows from the filter drains will be then directed to ditches located around the perimeter of the compounds that will also allow sedimentation. Additionally, catchpits with sumps will be also promoted to capture the silt.

NSLIDB Comment:

That seems a reasonable approach, the outfall should be monitored on a regular basis and only clear and uncontaminated water should be discharged from site. This should be the driving factor for the design of the onsite features and additional measure introduced if required throughout the construction period.

Detention basins will be proposed as the most downstream before the discharge (at the greenfield runoff peak) to the watercourses to provide water storage but also a secondary water treatment (sedimentation and pollution removal).

Storage materials areas should be under cover to prevent wash down.

NSLIDB Comment:

Agree that basins at final outfall points are essential. All basins and discharge points should have means of shutting off outlets in case of spillage etc. Discharge rate liable to be academic – outfalls will almost certainly be submerged owing to lack of gradients in local ditch network and getting the water away will be the challenge. It may be found necessary to pump in order to maintain satisfactory ground conditions within the compounds. We comment elsewhere on the suitability of the offsite ditches to convey the compound drainage.

Fuel and oil:

For the areas of fuel and oil handling, oil separators will be provided to remove hydrocarbons from high-risk areas of runoff. In addition, penstock chambers will be proposed downstream of the oil separators and at other locations of the network to enable shut down of the surface water drainage network in case of a spill occurs. *NSLIDB Agreed*

Water from wash down areas:

Wash down areas should be isolated and appropriate water treatment to be provided as required. *NSLIDB Agreed*

Haul roads

The main pollution hazard for the haul roads is likely to be silt.

The runoff generated is currently proposed to be conveyed in ditches with checkdams to capture the sediment. The accumulated sediment will need to be digged and disposed periodically. As runoff peaks are going to be attenuated at greenfield peak, the removal of contaminants through settling, adsorption will be enhanced.

NSIDB response:

As mentioned above any discharge from the site should be clear and uncontaminated. A survey of silt levels in receiving watercourses should be undertaken prior to works commencing onsite. Any silt that does end up in adjacent watercourses should be disposed of post construction by the main contractor.

Email from Dave Bellamy dated 10 April 2018

I made a note during the meeting in February that the discharge into the Portbury Ditch Main river from the Portishead car park could be unattenuated. Is that still correct?

NSLIDB response:

Only discharge from the actual platform and station building can be discharged unattenuated, all other areas including parking, should be discharged at greenfield rates and volumes.

Email from Gloria Rigual Muñoz dated 12 April 2018

I'm writing to you regarding the ditch D4 that crosses the proposed location for Portbury Hundred Construction Compound. I wanted to ask you if this ditch could be culverted to allow for the construction of the compound above it.

Also, referring to Dave's email early this week, if you could come back to us as soon as possible with your preferred discharge points and the greenfield runoff rates, that would be really helpful for us. For now, we're assuming a minimum discharge rate of 5 l/s since controlling flow at lower discharge can be technically unfeasible.

NSLIDB response:

As discussed above the Board would require any open watercourses within compounds should be culverted to prevent contamination by construction run-off. Therefore we wouldn't have any issues with the culverting of ditch D4.

The Board believes that with modern vortex flow controls flows can be restricted to 2.5 l/s without an unnecessary risk of blockages.

Email from Dave Bellamy dated 5 April 2018

We are currently looking at the Drainage Strategy for the reinstatement of the railway between Bristol and Portishead. At the meeting I attended on 8th April it was stated that haul road and construction compound drainage could discharge to the local rhyne network at greenfield run-off rate. For a lot of these areas, we are calculating very low rates (0.6-0.9l/s) and I am wondering if there is a practical minimum rate that we can use in our design to reduce storage requirements?

Also, could you please let me know typical maximum and minimum water levels for the area between the M5 and Portishead?

NSLIDB response:

As discussed above flow control structures should be set to a minimum of 2.5 l/s.

With regard to discharge points our marked up plans associated with our official consultation response may help. They will be sent under separate cover.

All of the watercourses, outside of those maintained by the IDB, in the area are in need of maintenance to bring them into a suitable condition to discharge into. This should include works to ensure a drainage route to an IDB maintained watercourse or main river. Localised pumping maybe required to ensure a suitable contractors compound if land raising is not undertaken.

The Board do not have any records of water levels in the area.

The requirement for any compensatory flood storage will be an EA requirement and consultation should be had with them in this regard.

NSLIDB Draft Meeting Notes 8th February 2018

Comments:

It is important to refer to the marked up drawings which we supplied and which were displayed at the meeting. They clarify many of the points made in the minutes.

Note 1. Should read - The IDB currently have about a 4m width for clearing the cut which is barely adequate and involves the machine slightly overhanging the railway fence

Note 5 – Sheepway Low Loader Access

Back in 2007 the Board had a great deal of difficulty sorting out the low loader / machine access arrangement off Sheepway and in the end a practical trial was carried out with our low loader before the alignments for the fencing and gates etc were finalised. The final arrangement has turned out to be satisfactory but the Board never did receive as built drawings. The only drawings the Board have on file are for a number of (unsatisfactory) previous draft proposals. Please send us a copy of the basic survey on which your current proposal drawing is based and we will mark this up as requested.

Note 6 – Culvert Headwalls

Attached is a suggested sketch arrangement SK 1 which might allow open watercourse clearance without a need to work inside the railway fence, whilst still permitting access to the headwalls without leaving railway property. Comments invited.

Note 9 – Temporary Culvert Sizes

All temporary culverts to be a minimum of 750mm (subject to final approval on receipt of detailed proposals)

Note 12 - Port of Bristol owns land and ditch north of railway and need to be involved in this point.

Also attached is out high level tracking plan. When detailed fencing and compound drawings have been produced we will be able to mark up our tracking requirements.

Penny

Thank you for your enquiry.

Following the location of points on the scan sent to me and Robert Bird on 16/01/2017 13:13 by Robert Cooper, I can say that the water levels for the 25 year and 50 year events (climate change scenario) are as follows:

The **left point** as per the scan referenced above (please also find it attached) (near the drain , the location is to the south of Harbour Road):

50 year event: 7.05m
25 year event: 4.85m

The levels are the same for both pre-development and post development situation for each of the return periods listed above.

It looks like the water stays within the ditch or is not overtopping the planned ground levels (in post development situation).

There is no water level information in the model for the **right point** (to the north of Phoenix Road).

In order to provide some estimate for this point we looked at the downstream end of this drain (at its confluence with the Portbury? Drain, the location is to the east of Newfoundland Way, see the red star on the map below). These levels will provide a very conservative approximation of levels at the right point on the scan provided. Taking this information from the downstream end of this drain allows us to estimate levels further upstream of this drain as this drain is not represented in a model.

The downstream side of the brook that flows by the r**ight point**:

50 year event:
7.06m (post development situation)
7.05m (pre-development situation)
25 year event:
5.24m (both pre and post development situation)

It looks like the water stays within the ditch or is not overtopping the planned ground levels (in post development situation).

Hope it helps.

Please let us know if there are more questions.

Many thanks.

Kind regards

Kostya

Penny

Please can you send a sketch showing outfall location(s) - or describe with words if easier….. I will then consult Kostya to review coastal model results.

We have coastal flood model results for the 25 year and 50 year events but not the 30 year event – so we may have to work with the 50-year event?

regards

Robert

Happy New Year Robert

Following our meeting in Dec, we have now received guidance from the local council (NSC) for drainage design.

They have said we need to demonstrate the drainage system maintains a 1 in 30 year capacity with climate change capacity under tide locked conditions.

Just wondering if you could provide guidance on the tide locked level? From my notes at our Dec meeting a level of 7.9m for 200 return was mentioned?

regards

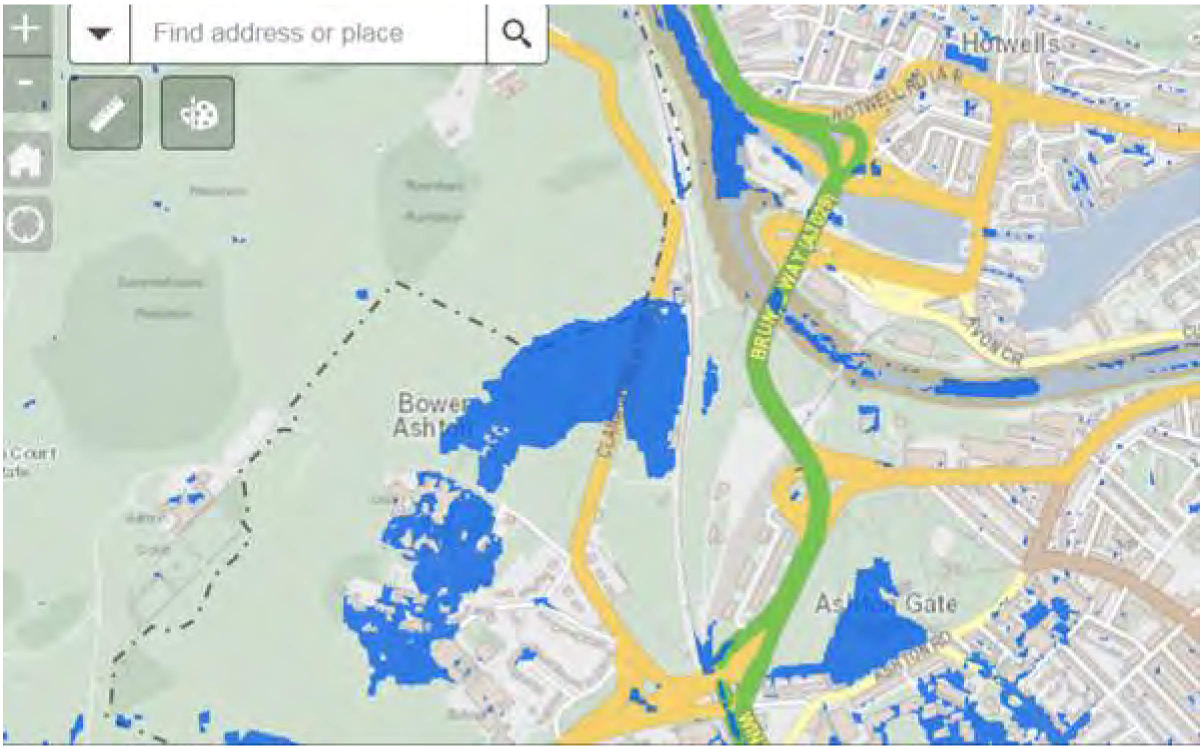
Subject:	[EXTERNAL] RE: Metrowest inquiry - runoff rate from a temporary compound to the Avon

Hi both,

If this site is draining directly into the River Avon then an unrestricted discharge is fine - this is likely to need approval from the EA via the environmental permit. You also need to make a reasonable consideration of tide locking.

The proposal to pump is not preferred – are you able to drain the site via gravity?

Also note that some areas around Clanage Road is a known are of high risk from surface water flooding so your drainage strategy/FRA must address this. The below screenshot of http://maps.bristol.gov.uk/bfrm/ shows the risk area. We have many recent records of flooding here that verify the mapped risk.



I hope that helps, let me know if you have any more questions

Thanks

Hi Patrick,

I'm not sure what to respond to this one, they have been asking for a response today. I think they are preparing an FRA for the works.

My initial thoughts were to let it go unrestricted into the Avon, but our discharge zones map indicates that it will be in the Ashton Gate area and discharge rates should be limited.

Thanks,
Abi

Subject: Metrowest inquiry - runoff rate from a temporary compound to the Avon

Hello,

We are preparing the drainage strategy for the temporary construction compounds for Metrowest project. Could you please confirm us if the discharge rate to the Avon should be restricted to the greenfield runoff rate for the temporary site? The design life of the temporary site is 1-2 years.

This concerns a temporary compound (Clanage Road) where there is no presence of any existing drainage system and we are proposing to temporarily pump the runoff from the compound.

Kind Regards,

Subject: [EXTERNAL] Re: MetroWest - query about ditch D4

Dear Gloria,
We are trying to sort out responses to the multiple queries your team has recently sent us. As they are mostly interdependent I will be routing all my answers via Simon Bunn.
One trouble is that we are still waiting for the info we were promised at the meeting held on 8th Feb, viz, details of the proposed fencing, especially around Portishead Station adjacent to the IDB watercourse, a basic survey of the existing Sheepway access point as we cannot tell from the drawings supplied whether what is proposed will be adequate, and a list of key contacts with who does what. If you could chivvy those along we will be able to get back to you sooner.
Sorry I can't be more helpful at the moment.
Regards,
Dan Alsop

Subject: MetroWest - query about ditch D4

Hi Dan,

I'm writing to you regarding the ditch D4 that crosses the proposed location for Portbury Hundred Construction Compound. I wanted to ask you if this ditch could be culverted to allow for the construction of the compound above it.

Also, referring to Dave's email early this week, if you could come back to us as soon as possible with your preferred discharge points and the greenfield runoff rates, that would be really helpful for us. For now, we're assuming a minimum discharge rate of 5 l/s since controlling flow at lower discharge can be technically unfeasible.

Thank you.

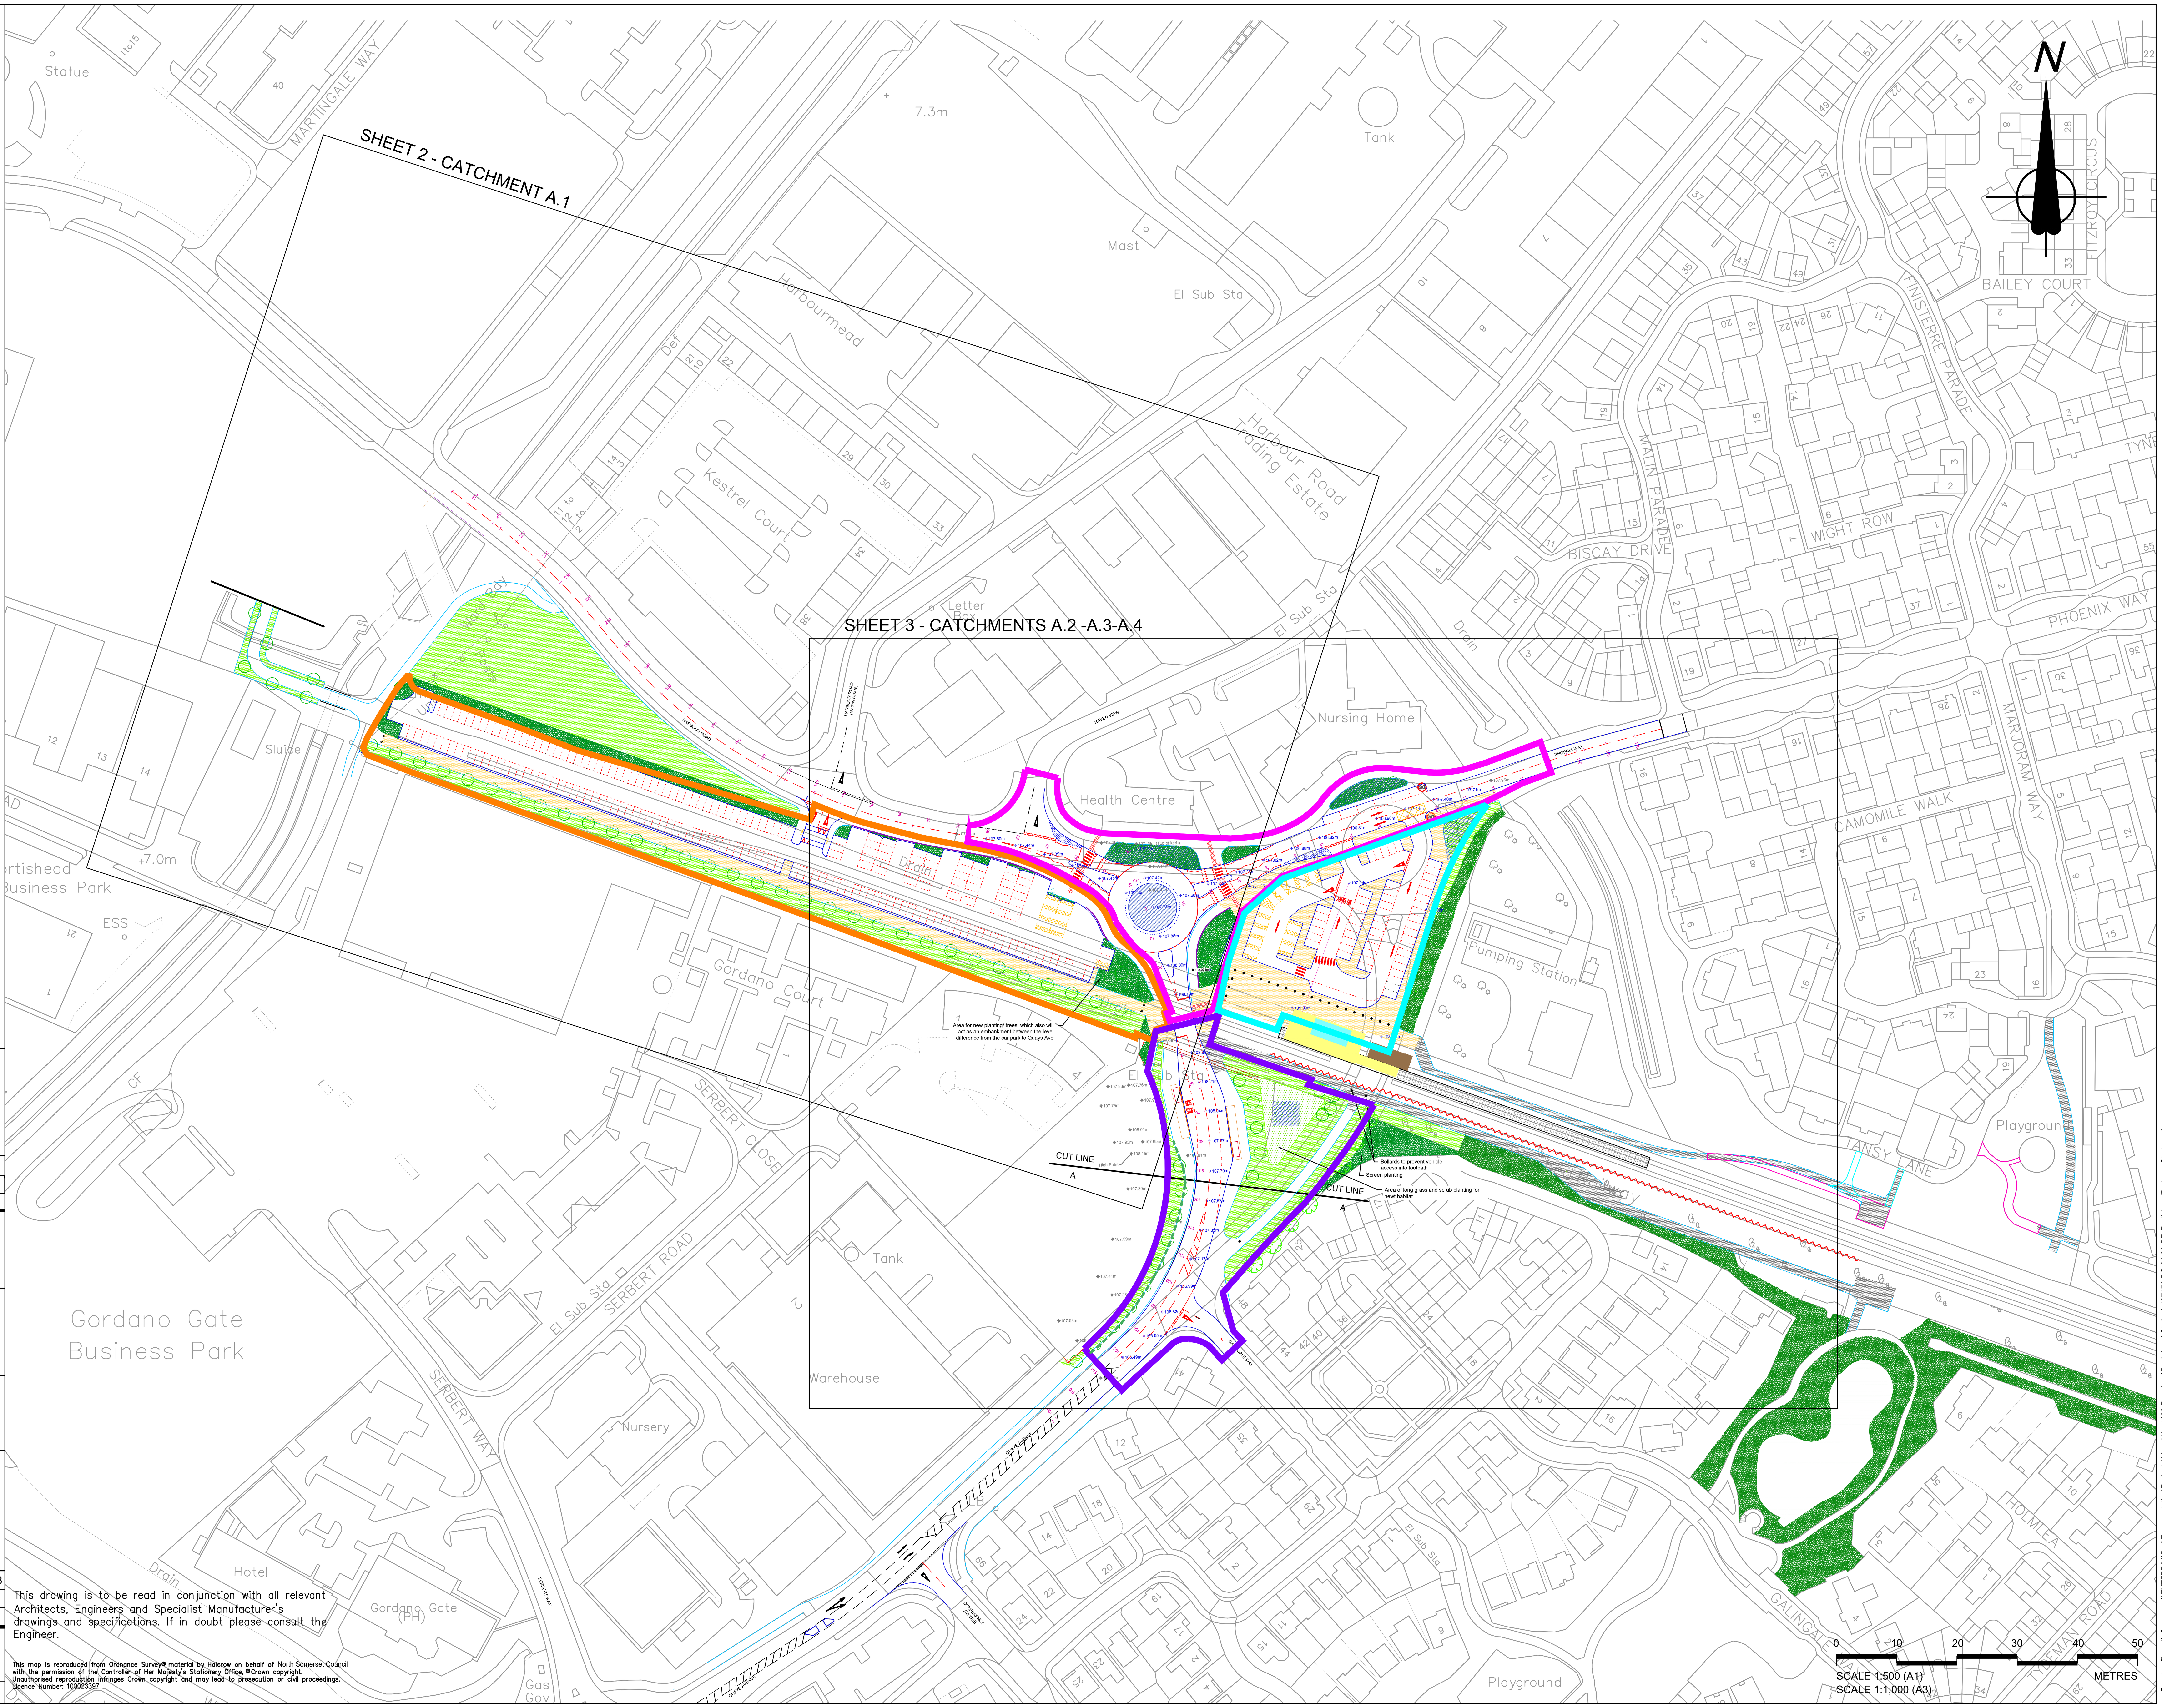
APPENDIX B

Portishead Station Drainage Strategy Drawings and Calculations

NOTES

1. This drawing should be read in conjunction with the Drainage Strategy Report.
2. Drainage system design based on 1:30 year return period plus climate change allowance.
3. Exceedance flow design based on 1:100 year return period plus climate change allowance.
4. All dimensions are in meters unless noted otherwise.
5. The indicative layout based on available OS or topographical survey.



This drawing is to be read in conjunction with all relevant Architects, Engineers and Specialist Manufacturer's drawings and specifications. If in doubt please consult the Engineer.

KEY

- Catchment Area 1 (CAT A.1)
- Catchment Area 2 (CAT A.2)
- Catchment Area 3 (CAT A.3)
- Catchment Area 4 (CAT A.4)

Approved by: - Date: -

Drawing No.: 467470.BQ.04.20-DS-PORTISHEAD
Revision: A

Drawing Scale: AS SHOWN

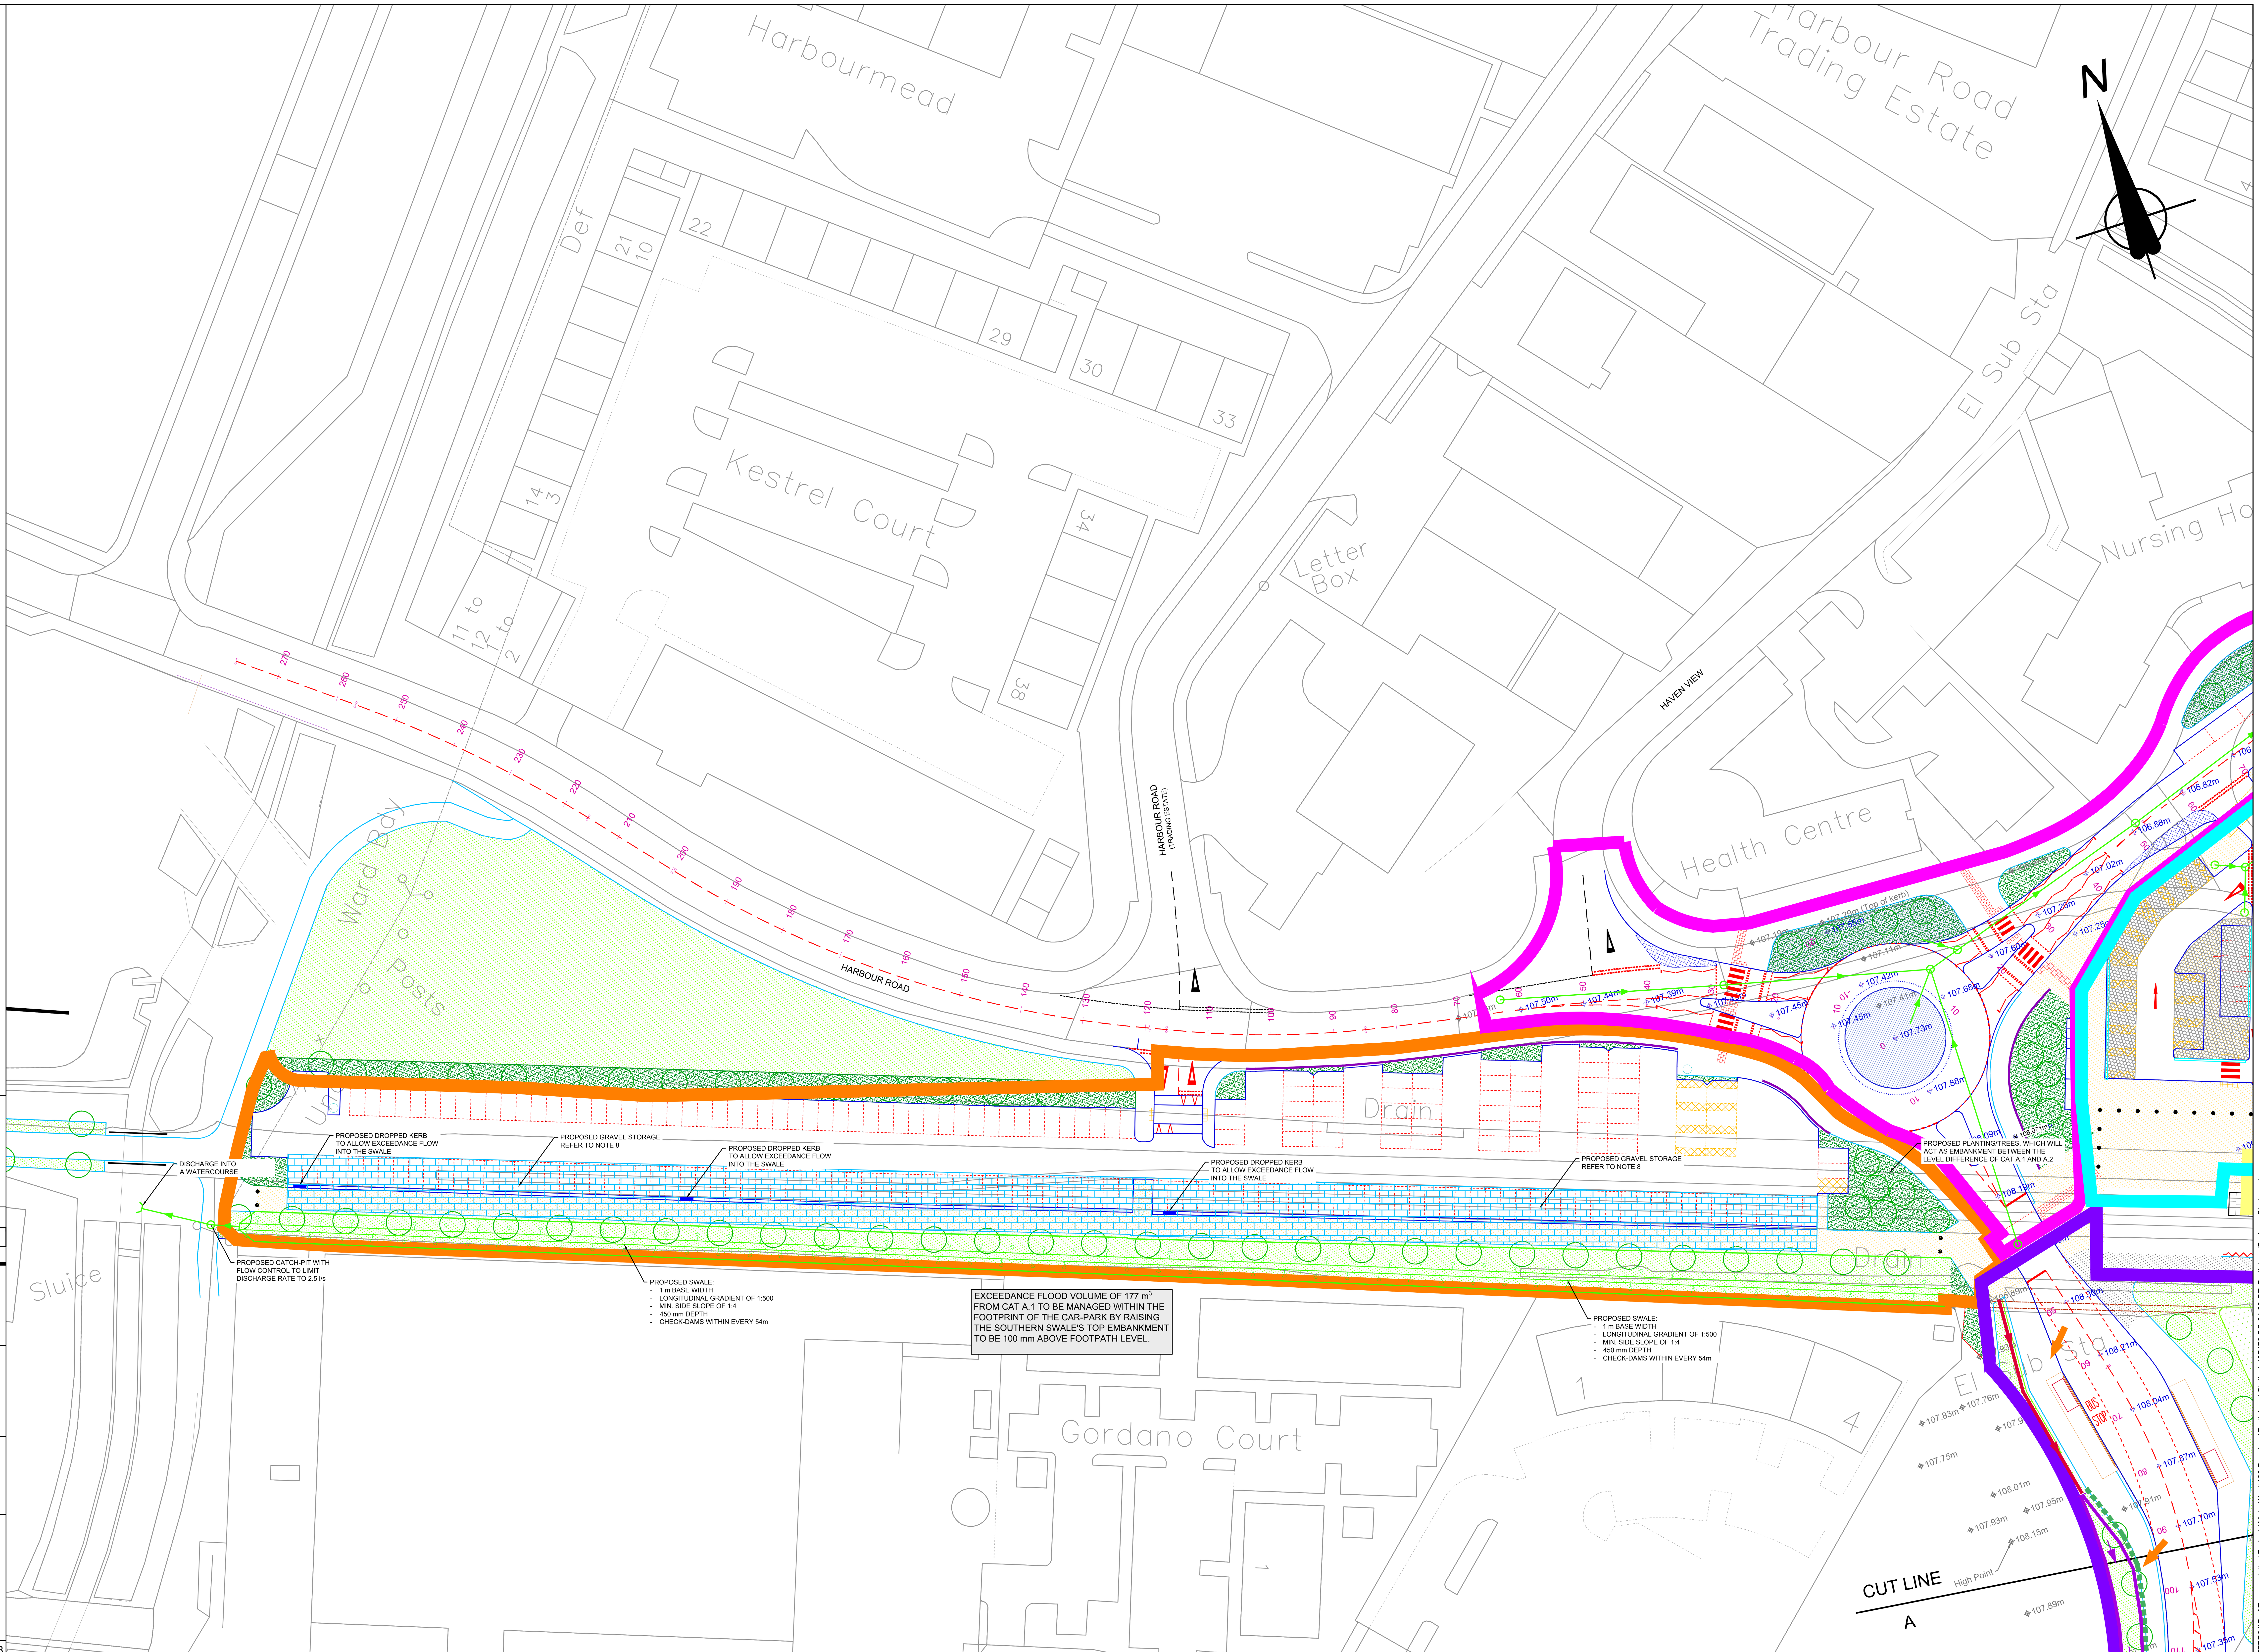
Drawing file path & name : \\EXTFPP01\Proj\Transportation\Projects\MetroWest\100 Drawings\Portishead Station\ 467470.BQ.04.20-DR-PortisheadDrainageStrategy.dwg

NOTES

1. This drawing should be read in conjunction with the Drainage Strategy Report.
2. Drainage system design based on 1:30 year return period plus climate change allowance.
3. Exceedance flow design based on 1:100 year return period plus climate change allowance.
4. All dimensions are in meters unless noted otherwise.
5. The indicative layout based on available OS or topographical survey.
6. Outfalls should be monitored on a regular basis and equipped with shut-off valves.
7. Tide-lock level of 5.29mAOD has been considered during the drainage design.
8. Proposed drainage strategy for Cat A.1 based on collecting the runoff water through permeable pavement (concrete blocks) on the parking bays. The runoff will be attenuated within 300 mm height of clean stone reservoir beneath the parking bays and the footpath. From the gravel reservoir the water will be discharged into a swale. The proposed swale includes check-dams to control the flow rate and use the gravel storage for attenuation.

KEY

- Catchment Area 1 (CAT A.1)
- Catchment Area 2 (CAT A.2)
- Catchment Area 3 (CAT A.3)
- Catchment Area 4 (CAT A.4)
- Proposed drainage pipeline
- Proposed MH/Catchpit
- Proposed Gravel Storage
- Proposed Linear Drainage Channel
- Proposed Filter Drain
- Proposed Swale with Filter Drain
- Exceedance Route



This drawing is to be read in conjunction with all relevant Architects, Engineers and Specialist Manufacturer's drawings and specifications. If in doubt please consult the Engineer.

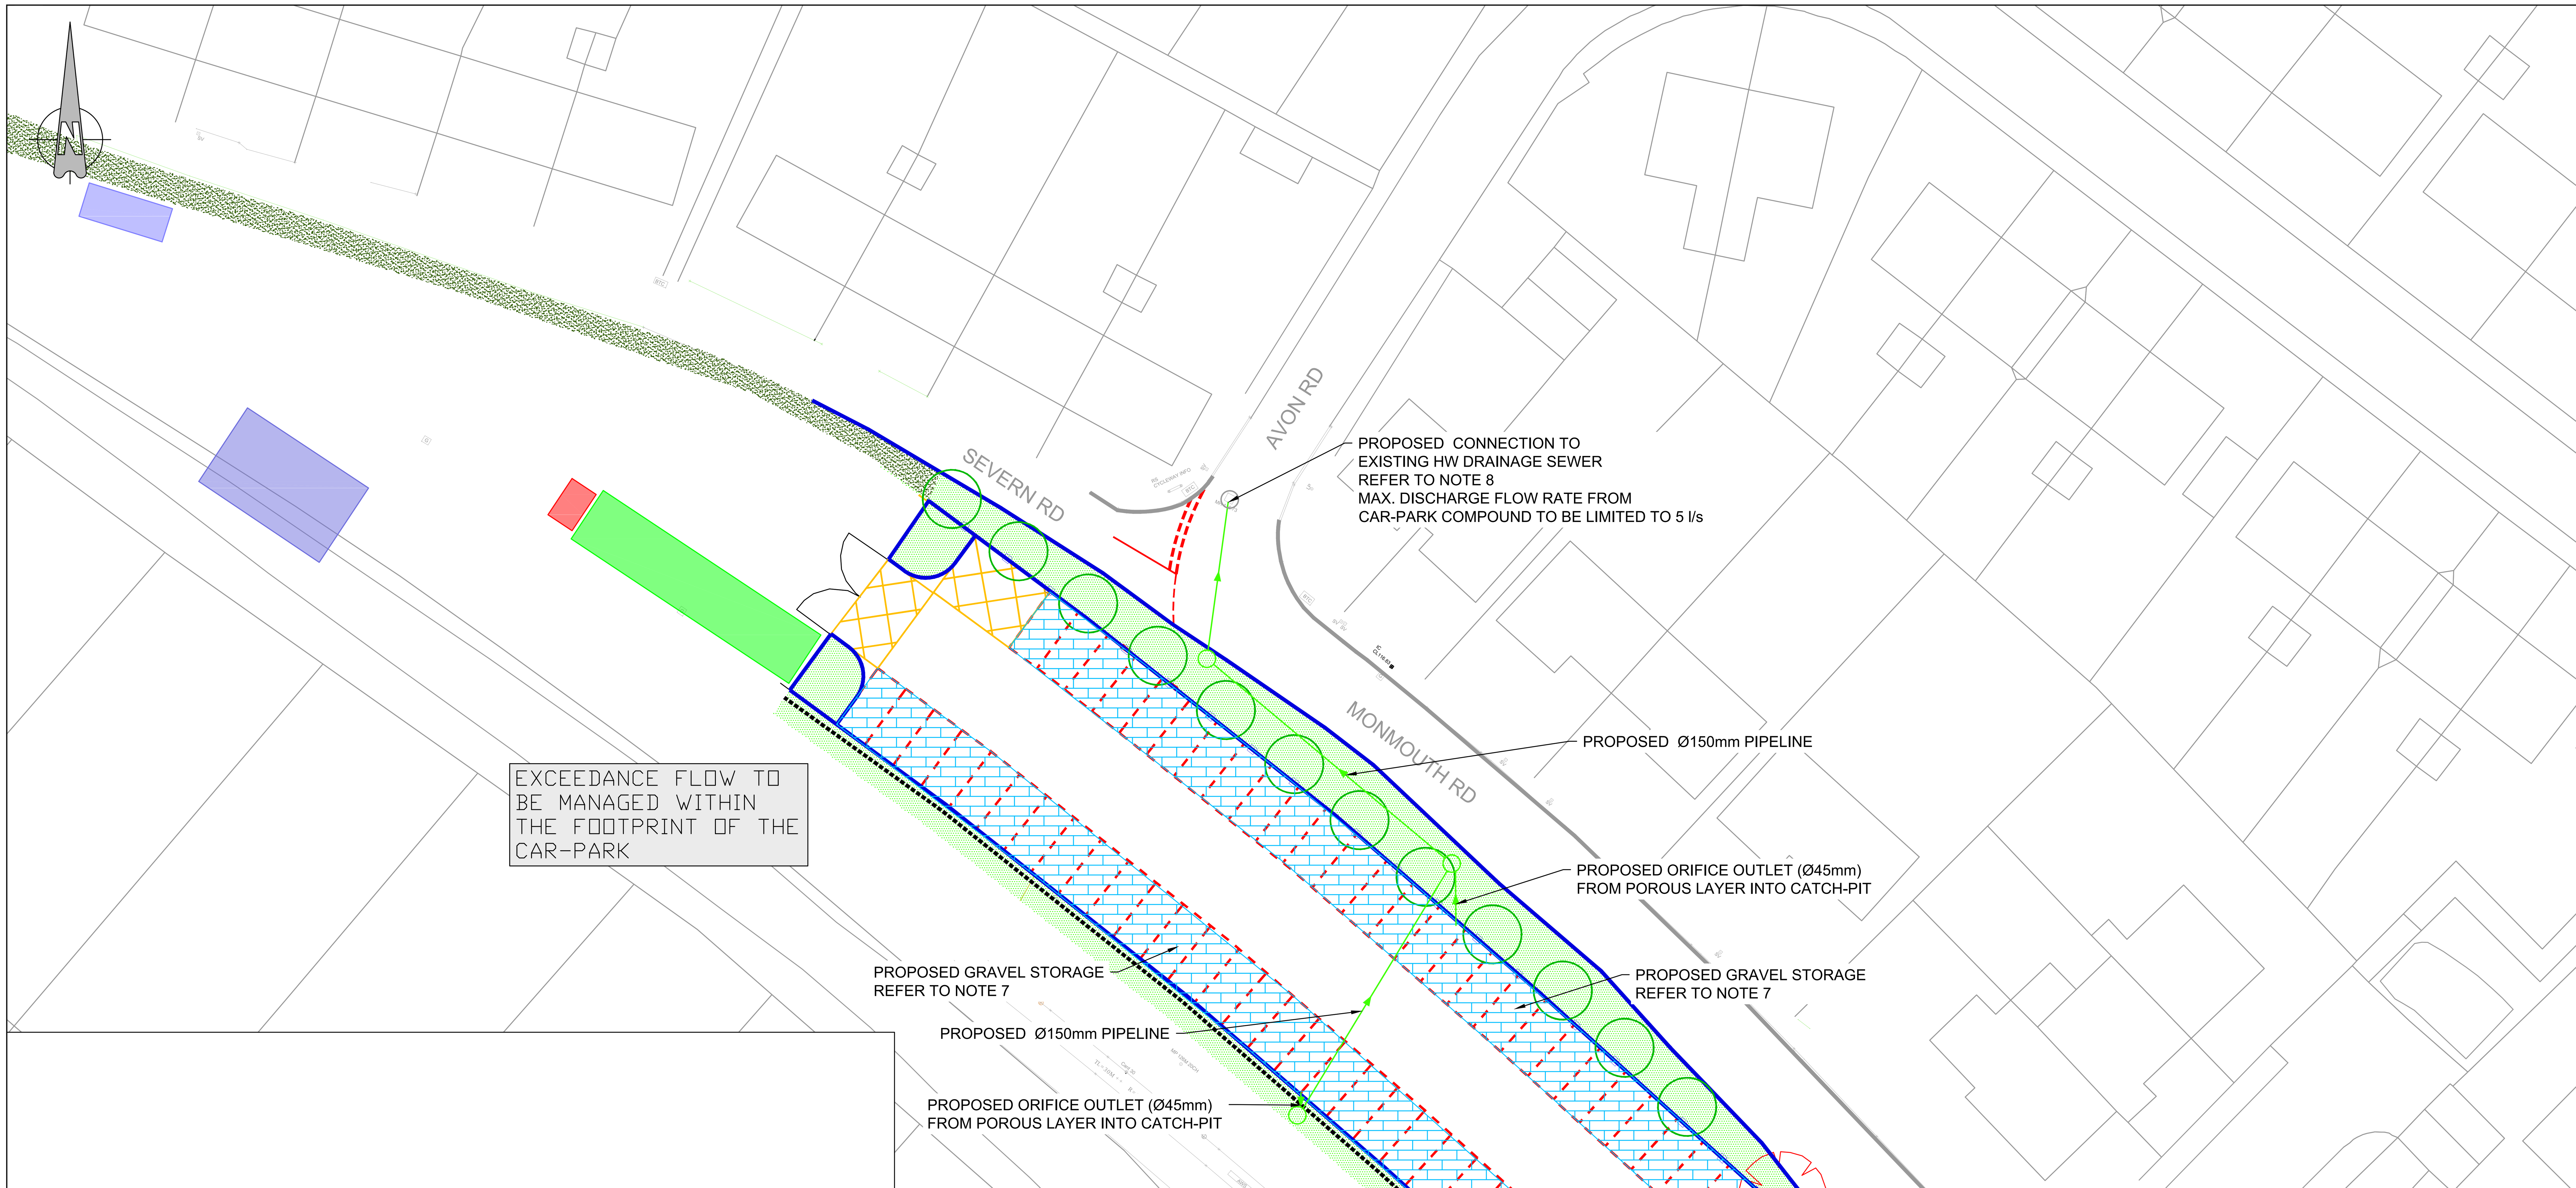
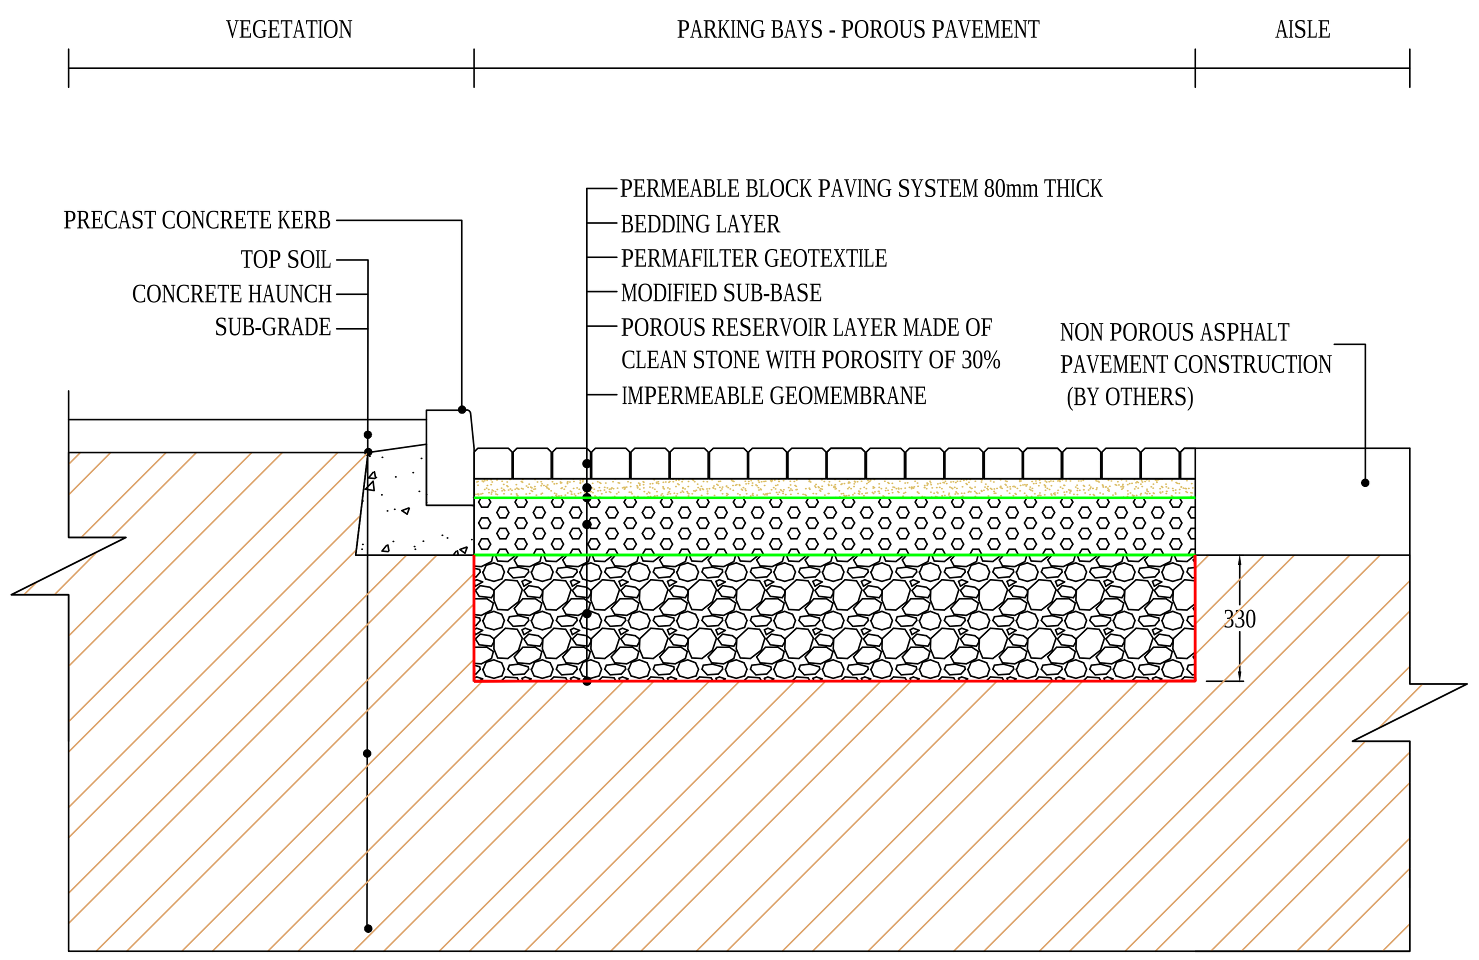
APPENDIX C

Pill Station Drainage Strategy Drawings and Calculations





PERMEABLE PAVEMENT WITH RESERVOIR LAYER DETAIL

Scale (1:20)

This drawing is to be read in conjunction with all relevant Architects, Engineers and Specialist Manufacturer's drawings and specifications. If in doubt please consult the Engineer.

NOTES:

1. This drawing should be read in conjunction with the Drainage Strategy Report.
2. Drainage system design based on 1:30 year return period plus climate change allowance.
3. Exceedance flow design based on 1:100 year return period plus climate change allowance.
4. All dimensions are in meters unless noted otherwise.
5. The indicative layout is based on available OS or topographical surveys.
6. Outfalls should be monitored on a regular basis and equipped with shut-off valves.
7. Proposed car-park drainage system based on collecting the runoff water through permeable pavement (concrete bolcks) on the parking bays. The runoff water will be attenuated within 330mm height of clean stone reservoir layer before discharging into the HW drainage system. See Detail for further information.
8. During detailed design, existing HW drainage system on Avon Road to be surveyed to ensure it has the capacity for receiving the discharge rate of the car-park runoff.

KEY:

- Proposed drainage pipeline
- Proposed MH/Catchpit
- Proposed porous reservoir
- Proposed vegetation
- Existing vegetation retained
- New footpath surface
- Trees to be removed
- Trees to be retained
- Proposed trees
- Vehicle restraint barrier
- Proposed fence
- Existing kerb retained
- Proposed new kerb

Invert Level (m)	9.200	Cap Infiltration Depth (m)	0.000
Base Width (m)	0.7		

Orifice Outflow Control

Diameter (m) 0.036 Discharge Coefficient 0.600 Invert Level (m) 9.200

Notes:

1. This drawing should be read in conjunction with the Drainage Strategy Report.
2. Drainage system design based on 1:30 year return period plus climate change allowance.
3. Exceedance flow design based on 1:100 year return period plus climate change allowance.
4. All dimensions are in meters unless noted otherwise.
5. The indicative layout is based on available OS or topographical surveys.
6. Outfalls should be monitored on a regular basis nd equipped with shut-off valves.

KEY:

- Order limits
- Nationally Significant Infrastructure Project (NSIP)
- Construction compound
- Permanent access
- Haul Road
- Proposed ditch
- Proposed pipeline
- Proposed catchpit

SCALE 1:250 (A1)
SCALE 1:500 (A3)
METRES

Notes:

1. This drawing should be read in conjunction with the Drainage Strategy Report.
2. Drainage system design based on 1:30 year return period plus climate change allowance.
3. Exceedance flow design based on 1:100 year return period plus climate change allowance.
4. All dimensions are in metres unless noted otherwise.
5. The indicative layout is based on a topographical survey.
6. Outfalls should be monitored on a regular basis and quipped with shut-off valves..
7. Proposed drainage concept to be subjected to Railway Network consent for discharge points.

KEY:

Proposed catchpit
Proposed pipeline
Proposed Runoff collector
Temporary compound
Proposed fence
Red line boundary
Proposed road kerb

Notes:

1. This drawing should be read in conjunction with the Drainage Strategy Report.
2. Drainage system design based on 1:30 year return period plus climate change allowance.
3. Exceedance flow design based on 1:100 year return period plus climate change allowance.
4. All dimensions are in metres unless noted otherwise.
5. The indicative layout is based on a topographical survey.
6. Outfalls should be monitored on a regular basis and quipped with shut-off valves..
7. Due to possible lack of gradient in existing watercourses, pumping might be required for the proposed compound.

This drawing is to be read in conjunction with all relevant Architects, Engineers and Specialist Manufacturer's drawings and specifications. If in doubt please consult the Engineer.

Notes:

1. This drawing should be read in conjunction with the Drainage Strategy Report.
2. Drainage system design based on 1:30 year return period plus climate change allowance.
3. Exceedance flow design based on 1:100 year return period plus climate change allowance.
4. All dimensions are in metres unless noted otherwise.
5. The indicative layout is based on a topographical survey.
6. Outfalls should be monitored on a regular basis and quipped with shut-off valves.
7. Due to possible lack of gradient in existing watercourses, pumping might be required for the proposed compound.
8. GSM-R mast to be located in compound

KEY:

- Proposed catchpit
- Proposed pipeline
- Proposed french drain
- Proposed timber fence
- Exceedance route
- Existing fence
- Proposed fence
- Red line boundary
- Trees to be retained

This drawing is to be read in conjunction with all relevant Architects, Engineers and Specialist Manufacturer's drawings and specifications. If in doubt please consult the Engineer.

Obtain pre-permitting advice from the environmental regulator. Risk assessment is likely to be required[5].</td></tr>
</table>

Notes

The minimum water quality management requirements for discharges to receiving surface waters and groundwater are presented here. (For Northern Ireland, this guidance should be considered as interim until such time as Northern Ireland publishes its own legislation/policy/guidance.)

1. These are not required in Scotland and Northern Ireland. For England and Wales, see Step 3 of the simple index approach (Section 26.7.1).
   Protected surface water resources will include those designated for drinking water abstraction or for other environmental protection reasons. Protected groundwater resources are represented by SPZ1s in England and Wales.
2. In Scotland, the Water Environment (Controlled Activities) (Scotland) Regulations (CAR) 2011 General Binding Rules, Rule 10 (d) (iv) effectively provides an exemption from requiring SuDS for coastal discharges. However, control of any contaminants likely to be present in surface water runoff is still required, but can be delivered using alternative methods such as proprietary treatment products. As the term 'SuDS' in this manual includes proprietary treatment products, this exemption is not valid in this context.
3. The application of the simple index approach should follow the approach outlined in Section 26.7.1 (or equivalent approved).
4. Risk screening is an assessment to identify high risk scenarios where the Environment Agency or Natural Resources Wales (NRW) would wish to be consulted regarding infiltration of water from surface runoff in order to agree the proposed design approach. The risk screening method is provided in Section 26.7.2.
5. The risk assessment should determine the appropriate design approach to mitigate risk to acceptable levels following the guidance outlined in Section 26.7.3. This assessment should be approved by the environmental regulator.

Figure 1: Minimum water quality management requirements; reproduced from p63 of the SuDS Manual 2015 (C753).

Due to the different land use of the proposed sites, each development has been assessed independently as shown in Table 1 below.

Development	Description	Pollution hazard level – SuDS Manual	Assessment method
Carparks Portishead Station	The Portishead carparks are considered as commercial areas. Additionally, the traffic estimation for the carparks and drop off area showed that 225 users will arrive by car seeking to park at the station and 106 users will use the drop off areas. These figures, together with the users using taxis or public transport, reveal that more than 300 traffic movements/day are expected[1]. Therefore, they are classed as medium hazard level.	Medium	Simple Index Method
Roads and roundabout Portishead Station	The traffic forecast showed that up to 1905 turning movements are estimated for the peak hours at the realigned roundabout (Phoenix Way/ Quays Avenue/Harbour Road). Consequently, these roads do not correspond to low traffic roads and are classified as medium hazard level.	Medium	Simple Index Method
Carparks Pill station	The traffic forecast for the carpark showed that only 60 traffic movements per day are expected which less than the 300 traffic movements limit indicated in the SuDS Manual. However, the carpark is to serve the new Pill Station (which is considered as 'commercial yard and delivery areas') and is the access to the attached Railway Network Depot next to the carpark. Hence, the carpark is classed as medium hazard level.	Medium	Simple Index Method
Haul roads	The haul roads will be used by heavy vehicles, therefore high pollution hazard level is anticipated.	High	Consultation to environmental regulator
Compounds	The compounds will be used by heavy vehicles, therefore high pollution hazard level is anticipated.	High	Consultation to environmental regulator

Table 1: Pollution hazard level and risk assessment method

2. Portishead and Pill Stations

As the development within these sites will be discharged to surface water, and is classed as medium (non-residential car parking with frequent change (eg hospitals, retail), the Simple Index Approach has been used to identify the pollution hazard and mitigation measures appropriate for the site based on land use.

The steps followed are as outlined in Box 26.2 of Chapter 26 of the SuDS Manual 2015 (C753), as reproduced in Figure 2 below:

[1] Based on *467470.BQ.04.20_MetroWest Phase 1 - Harbour Rd-Quays Ave Options Modelling_April 2015.docx and 467470.BQ.04.20_MetroWest Phase 1 - Harbour Rd-Quays Ave Modelling_June 2015 Update.docx*

BOX 26.2 **Steps of the simple index approach**

Step 1 – Allocate suitable pollution hazard indices for the proposed land use

Step 2 – Select SuDS with a total pollution mitigation index that equals or exceeds the pollution hazard index

Step 3 – Where the discharge is to protected[1] surface waters or groundwater, consider the need for a more precautionary approach

Note:

1 Designated as those protected for the supply of drinking water (Table 4.3).

Figure 2: Steps of the simple index approach; reproduced from p567 of the SuDS Manual 2015 (C753).

Step 1: Allocate suitable pollution hazard indices for the proposed land use

The pollution hazard indices are presented in Table 26.2 of C753. This has been reproduced in Figure 3 below:

TABLE 26.2 **Pollution hazard indices for different land use classifications**

Land use	Pollution hazard level	Total suspended solids (TSS)	Metals	Hydro-carbons
Residential roofs	Very low	0.2	0.2	0.05
Other roofs (typically commercial/ industrial roofs)	Low	0.3	0.2 (up to 0.8 where there is potential for metals to leach from the roof)	0.05
Individual property driveways, residential car parks, low traffic roads (eg cul de sacs, homezones and general access roads) and non-residential car parking with infrequent change (eg schools, offices) ie < 300 traffic movements/day	Low	0.5	0.4	0.4
Commercial yard and delivery areas, non-residential car parking with frequent change (eg hospitals, retail), all roads except low traffic roads and trunk roads/motorways[1]	Medium	0.7	0.6	0.7
Sites with heavy pollution (eg haulage yards, lorry parks, highly frequented lorry approaches to industrial estates, waste sites), sites where chemicals and fuels (other than domestic fuel oil) are to be delivered, handled, stored, used or manufactured; industrial sites; trunk roads and motorways[1]	High	0.8[2]	0.8[2]	0.9[2]

Notes

1 Motorways and trunk roads should follow the guidance and risk assessment process set out in Highways Agency (2009).

2 These should only be used if considered appropriate as part of a detailed risk assessment – required for all these land use types (Table 4.3). When dealing with high hazard sites, the environmental regulator should first be consulted for pre-permitting advice. This will help determine the most appropriate approach to the development of a design solution.

Figure 3: Pollution hazard indices; reproduced from p568 of the SuDS Manual 2015 (C753).

Based on this, the development proposed within the stations has been assessed and Table 2 shows the associated pollution hazard Level/ Indices for each land use type.

Development site	Catchment	Pollution hazard level	Total suspended solids	Metals	Hydro-carbons
	Cat A.1	Medium	0.7	0.6	0.7

Development site	Catchment	Pollution hazard level	Total suspended solids	Metals	Hydro-carbons
Portishead Station	Cat A.2	Medium	0.7	0.6	0.7
	Cat A.3	Medium	0.7	0.6	0.7
	Cat A.4	Medium	0.7	0.6	0.7
Pill Station	Carpark	Medium	0.7	0.6	0.7

Table 2. Pollution hazard level/ indices for proposed development

Step 2: Select SuDS with a total pollution mitigation index that equals or exceeds the pollution hazard index

The total SuDS mitigation indices should be equal to or exceed the pollution hazard indices. Where multiple components are proposed to provide mitigation, it is suggested that a factor of 0.5 is applied to secondary or tertiary components to account for a reduction in performance due to already reduced inflow concentrations.

As the runoff will be discharged to surface water, Table 26.3 in Chapter 26 of the SuDS manual is recommended to determine the mitigation indices/ SuDS components that will provide sufficient water quality improvement. Table 26.3 has been reproduced in Figure 4 below:

TABLE 26.3 Indicative SuDS mitigation indices for discharges to surface waters

	Mitigation indices[1]		
Type of SuDS component	**TSS**	**Metals**	**Hydrocarbons**
Filter strip	0.4	0.4	0.5
Filter drain	0.4[2]	0.4	0.4
Swale	0.5	0.6	0.6
Bioretention system	0.8	0.8	0.8
Permeable pavement	0.7	0.6	0.7
Detention basin	0.5	0.5	0.6
Pond[4]	0.7[3]	0.7	0.5
Wetland	0.8[3]	0.8	0.8
Proprietary treatment systems[5,6]	These must demonstrate that they can address each of the contaminant types to acceptable levels for frequent events up to approximately the 1 in 1 year return period event, for inflow concentrations relevant to the contributing drainage area.		

Notes

1 SuDS components only deliver these indices if they follow design guidance with respect to hydraulics and treatment set out in the relevant technical component chapters.

2 Filter drains can remove coarse sediments, but their use for this purpose will have significant implications with respect to maintenance requirements, and this should be taken into account in the design and Maintenance Plan.

3 Ponds and wetlands can remove coarse sediments, but their use for this purpose will have significant implications with respect to the maintenance requirements and amenity value of the system. Sediment should normally be removed upstream, unless they are specifically designed to retain sediment in a separate part of the component, where it cannot easily migrate to the main body of water.

4 Where a wetland is not specifically designed to provide significantly enhanced treatment, it should be considered as having the same mitigation indices as a pond.

5 See Chapter 14 for approaches to demonstrate product performance. A British Water/Environment Agency assessment code of practice is currently under development that will allow manufacturers to complete an agreed test protocol for systems intended to treat contaminated surface water runoff. Full details can be found at: **http://tinyurl.com/qf7yuj7**

6 SEPA only considers proprietary treatment systems as appropriate in exceptional circumstances where other types of SuDS component are not practicable. Proprietary treatment systems may also be considered appropriate for existing sites that are causing pollution where there is a requirement to retrofit treatment. SEPA (2014) also provides a flowchart with a summary of checks on suitability of a proprietary system.

Figure 4: Mitigation indices; reproduced from p570 of the SuDS Manual 2015 (C753).

Table 3 provides a summary of the proposed drainage components that will be used to provide water quality mitigation.

As can be seen from a review of Table 2 and Table 3 mitigation measure/ proposed drainage features are sufficient to offset the pollution hazard level for each land use.

Development site	Catchment	Proposed drainage component	Total suspended solids	Metals	Hydro-carbons
Portishead Station	Cat A.1	Permeable pavement	0.7	0.6	0.7
		Swale	0.25 = (0.5x0.5)	0.3 = (0.6x0.5)	0.3 = (0.6x0.5)
		Total	0.95	0.9	1
Portishead Station	Cat A.2	Bioretention system	0.8	0.8	0.8
		Total	0.8	0.8	0.8
Portishead Station	Cat A.3	Swale	0.5	0.6	0.6
		Filter drain	0.2 = (0.5x0.4)	0.2 = (0.5x0.4)	0.2 = (0.5x0.4)
		Total	0.7	0.8	0.8
Portishead Station	Cat A.4	Permeable pavement	0.7	0.6	0.7
		Total	0.7	0.6	0.7
Pill Station	Carpark	Permeable pavement	0.7	0.6	0.7
		Total	0.7	0.6	0.7

Table 3. Mitigation indices for chosen components for the proposed developments.

Step 3: Where the discharge is to protected surface waters or groundwater, consider the need for a more precautionary approach

As the discharge of the sites is at locations very close to the coast, no water abstraction for drinking water purpose is expected, therefore a more precautionary approach is not required (see note 1 of Table 4.3, which is reproduced in Figure 1 for information).

3. Compounds

The design of the compounds is still on progress and the only available information at the moment was abstracted from the document 'MetroWest 1 Construction Strategy' and is shown on Table 4. Details of construction compounds below.

Compound	Description - facilities
C-15 Sheepway compound	Additional localised storage and welfare. There will be a small amount of parking, materials storage and toilets.
C-14 The Portbury Hundred Compound	Large amount of parking for staff vehicles, materials storage, toilets, changing facilities, canteen and offices. Space for storage of sleepers, drainage, troughing, energy recovery units for vegetation removal, spoil, ballast and track formation. Dumpers, excavators, dozers, lorries will be using the compound.
Turning area for construction vehicles east to C-14	Approximate 500m^2 of turning area available for construction vehicles

Compound	Description - facilities
C-13 Lodway Farm	A medium level of parking will be provided for staff, materials storage, toilets, changing facilities, canteen and offices. Personal vehicles, small vans, minibuses and HGV access will be using the compound.
C-9 Ham Green Compound	Low loaders to drop off RRVs will be using the compound. Mitigation measures may be necessary to ensure run off and sediment does not enter the lake.
C-4 Clanage Road	Medium sized parking area, materials storage, toilets, changing facilities; canteen and site offices.

Table 4. Details of construction compounds

As the development within these sites will be discharged to surface water, and is classed as high risk (sites with heavy pollution (e.g. haulage yards, lorry parks, highly frequented lorry approaches to industrial estates, waste sites), sites where chemicals and fuels are to be delivered, handled, stored, used or manufactured, industrial sites), the pollution hazard has been identified and consultation with North Somerset Levels Internal Drainage Board has been undertaken to agree the appropriate mitigation measures. Those measure will need to be accepted by the Environmental Regulator prior to detail design. See appendix A for further details.

The water pollution hazards identified in relation to the compounds use and how they are mitigated are described in Table 5. Nevertheless, the potential hazards should be examined when the detail design of the compounds is completed.

Pollution hazard	Mitigation measure
Sedimentation	Filter drains are proposed as the conveyance system for most part of the compounds. The flows from the filter drains will be then directed to ditches located around the perimeter of the compounds that will also allow sedimentation. Additionally, silt trap chambers are promoted to capture the silt. Detention basins are proposed as the most downstream drainage feature before the discharge (at the greenfield runoff peak) to the watercourses to provide water storage but also a secondary water treatment (sedimentation and pollution removal). Storage materials areas should be under cover to prevent wash down.
Fuel and oils	For the areas of fuel and oil handling, oil separators will be provided to remove hydrocarbons from high-risk areas of runoff. In addition, penstock chambers will be proposed downstream of the oil separators and at other locations of the network to enable shut down of the surface water drainage network in case of a spill occurs. Besides, the legal requirement when the capacity of the storage tank is more than 200 litres and there is risk of an oil spillage reaching a public water source, the tank needs to be bunded.
Water from wash down areas	Wash down areas should be isolated and appropriate water treatment to be provided as required.

Table 5. Mitigation measure for compounds

4. Haul roads

The proposed haul roads between Portishead and Portbury Hundred construction compound sites will discharge to existing watercourses, and are classed as high risk (sites with heavy pollution (eg haulage yards, lorry parks, highly frequented lorry approaches to industrial estates, waste sites). the pollution hazard has been identified and consultation with North Somerset Levels Internal Drainage Board has been undertaken to agree the appropriate mitigation measures. Those measure will need to be accepted by the Environmental Regulator prior to detail design. See appendix A for further details.

The main pollution hazard for the haul roads is the silt derived by the construction vehicles movements. Runoff will be collected by ditches with check dams to capture sediment and prevent any contaminated water being discharged to the watercourses. The accumulated silt will need to be removed periodical basis. As runoff peaks are going to be attenuated at greenfield rates, the removal of contaminants through settling, adsorption will be enhanced.

1 Introduction

This report covers the concept drainage design for the proposed Portishead and Pill station car parks and associated new highways for the Metrowest scheme.

2 Design Constraints and Parameters

The drainage design life for the car parks and new road drainage systems shall be 60 years.

The drainage system for all the new roads and parking areas shall be designed to North Somerset Council (NSC)requirements for a 1 in 30 year rainfall event with an allowance for climate change (refer to Appendix A) . Exceedance routes up to the 1 in 100 year rainfall event, with an allowance for climate change will be required to demonstrate that no flooding to property occurs. Tide locking will need to be taken into account in the drainage design.

The NPPF Planning Practice Guidance states that “Generally the aim should be to discharge surface runoff as high up the following hierarchy of drainage options as reasonably practicable:

1. into the ground (infiltration);

2. to a surface water body;

3. to a surface water sewer, or other drainage system;

4. to a combined sewer.

Following this hierarchy, NSC would like to see the drainage from both the car parks and the new sections of road discharging either via infiltration or to the existing / new ditch network, rather than going into the highway drainage system.

If this is not possible, the capacity of the existing highway system will need to be checked and potentially upgraded to ensure no flooding for up to the 1 in 30 year event with an allowance for climate change.

Car park drainage systems should include pollution control and NSC would like to see this achieved through the use of bio-retention where practicable.

The normal requirement would be to restrict flows to greenfield rates on previously undeveloped land, or as close to greenfield as practicable, but not exceeding existing rates on previously develop land.

As the Portishead site is so close to the coast, NSC do not require restriction to the discharge rate, however a capacity check will be required to demonstrate that the drainage system maintains a 1 in 30 year with climate change capacity under tide locked conditions.

For Pill Station car park, the standard principles will apply, which is assumed to be greenfield rates or a minimum 5 l/s.

3 Portishead Station

The proposed drainage for the carparks and highways work have been analysed on a catchment basis. Four catchment areas have been identified as shown on drawing SK105 Drainage Catchment Areas (refer to Appendix B)

3.1 Cat A.1

This is catchment the area to the west of the proposed rail station and includes the proposed main car park and footpaths. This area is an existing field.

Without GI results it is assumed that the soil is heavy clay , WRAP class 4 potentially 3 and with a shallow groundwater level (ie 1 to 2m below ground level). As such it is assumed that infiltration is not an option and therefore impermeable surfacing shall be proposed for the car park and footways. Total impermeable area is 5,825m^2.

The drainage proposal for this catchment area is for the car park to discharge via gullies to a swale (refer to Appendix B drawing SK106 –Drainage Strategy) . The footpaths shall have filter drains along the edge which shall also discharge to the swale.

The swale shall be located along the southern edge of the site and have a French drain with check dams. Rye grass shall line the swale to provide pollution control.

The proposed outfall for the swale shall be the Portbury ditch, which is an open watercourse, under the EA jurisdiction. The EA has verbally advised that the discharge rate into the ditch shall be set by NSC flood authority (refer to Appendix A).

The analysis of water levels, in vicinity of the proposed Portbury Ditch outfall, for 25 year and 50 year climate change (assumed to be 20%) scenarios are 4.85m and 7.05m respectively (refer to Appendix A). For a 1 in 30 year event this has been interpolated as 5.29m. It is therefore recommended that a microdrainage design is undertaken to confirm the required size of swale for this tide lock level of 5.29m.

The outfall structure to the Portbury Ditch will require a flood defence permit from the EA. This shall be subject to more detailed design but a precast concrete headwall is considered by the EA to be an appropriate solution.

3.2 Cat A.2

This catchment area lies to the north of the proposed rail station and includes new roads and footways The new roads shall tie into Harbour Road to the east and Phoenix Road to the west. This shall be an impermeable area of 3966m^2.

There is an existing surface water drainage network in this catchment area, which is identified on Wessex Water services plan as a highway drain, suggesting it is owned by NSC. The existing highway runoff discharges to “The Cut” via a 225mm pipe and the existing impermeable area that is drained by this system is approximately 5000m^2 (refer to Appendix B drawing SK107 – Existing Drainage).

Given the proposed impermeable area is less than the existing, it is proposed that this catchment area discharges into the existing highway system. A swale is also proposed along the west side of the new roundabout and entry /exit arm, which shall discharge in to the existing highway drainage (refer to Appendix B drawing SK106 –Drainage Strategy).

Bio-retention areas are proposed in vicinity of the new road including the centre island of the new roundabout.

3.3 Cat A.3

This catchment area is to the south of the proposed rail station and includes a new road and footways that tie-into Quays Avenue. The impermeable area for this catchment is 2982m^2.

There are no available records of an existing surface water network or outfall on Quays Avenue, other than gullies so it is assumed that a highway pipe network is present. The existing impermeable area is 2235m^2.(Refer to Appendix B drawing SK107 – Existing Drainage)

For the new section of Quays road , drainage shall be provided with positive drainage network with a filter drain along the toe of the embankment (refer to Appendix B drawing SK106 –Drainage Strategy). This system shall outfall into the existing drainage network on Quays road.

A bio-retention area is proposed in vicinity of the green space to the east of the re-aligned Quays Road.

The proposed footway that shall run along the existing Quays Avenue , shall drain into the proposed green space.

3.4 Cat A.4

This catchment area is the car parking and hardstanding by the Portishead station which covers an area of 3690m^2 . It is proposed that permeable pavement is used, with a gravel tank system and membrane under the car park . This shall discharge to an existing manhole and outfall to The Cut (refer to Appendix B drawing SK106 –Drainage Strategy)

4 Pill Station

4.1 Cat B.1

The catchment area for Pill Station is the car park area B.1 (Refer to Appendix C drawing SK10 Pill Station Drainage Strategy). This area is currently an informal private car park with a mix of grass, asphalt and gravel surfacing.

Existing drainage records of the area have not been received but a streetview visual suggests no existing gullies on Monmouth Road. This is supported by anecdotal evidence of localized flooding on the Monmouth Road. Gullies are found further down Avon Road, where Monmouth road changes name.

The proposed drainage strategy for this catchment area of 1488 m^2 is for a permeable pavement with a gravel tank system and membrane under the car park . This shall discharge into a proposed new highway drainage system to be provided on Monmouth Road and shall connect into an existing system on Avon Road.

5 Recommendations

5.1 Portishead

1 Review drainage options once GI information is available

2 Carry out further design work to size the swales to meet NSC requirements

3 Assess the capacity of the existing highway network of catchment area A.2.

4 Assess capacity of the outfall system to "The Cut"

5 Carry out a survey of existing highway drainage in catchment area A.3 and assess the capacity of the network

5.2 Pill Station

1 Carrry out a survey of existing highway drainage on Monmouth and Avon Road and assess the capacity of the network.

To: Lillie, Penny/UKS
Subject: RE: Proposed Portishead MetroWest Station

Hi Penny,
I spoke with Dave Pring earlier regarding the Portishead Metrowest station drainage discharge to the main river. Discharge rate will be set by the Lead Local Flood Authority, in this case North Somerset Council. As I said to you on phone last week, this will almost certainly be restricted to the greenfield run-off rate.
The only consultation required with the Environment Agency is in obtaining a flood defence permit for the outfall structure. I asked when would be a good time to talk with them about this and he advised that once we have a design for the structure we can run it past them. I mentioned that it would likely be a precast concrete headwall, and his opinion was that there would be no issue with obtaining a permit on this basis.
The number to phone once we have a design is 03708 506506
Hope this helps.
Kind regards
Dave

Subject: RE: highway drainage designs

Hi Jenny / Richard,

Sorry it's taken me so long to get back to you on this – I 've been completely overwhelmed by Town centre and other planning issues!

Unfortunately we do not hold very much information on the highway drainage networks, all we have is a GIS layer showing the location of gullies (attached for each of the locations in your email) but there is no information on pipe connections or dimensions etc.

The drainage system for all the new roads and parking areas should be designed to manage a 1 in 30 year rainfall event with an allowance for climate change. Exceedance routes up to the 1 in 100 year rainfall event, with an allowance for climate change will be required to demonstrate that no flooding to property occurs. Tide locking will need to be taken into account in the drainage design.

The NPPF Planning Practice Guidance states that "Generally the aim should be to discharge surface runoff as high up the following hierarchy of drainage options as reasonably practicable:
1. into the ground (infiltration);
2. to a surface water body;
3. to a surface water sewer, or other drainage system;
4. to a combined sewer.

Following this hierarchy we would like to see the drainage from both the car parks and the new sections of road discharging either via infiltration or to the existing / new ditch network, rather than going into the highway drainage system.

If this is not possible, the capacity of the existing highway system will need to be checked and potentially upgraded to ensure no flooding for up to the 1 in 30 year event with and allowance for climate change.

Car park drainage systems should include pollution control and we would like to see this achieved through the use of bio-retention where practicable.

The normal requirement would be to restrict flows to greenfield rates on previously undeveloped land, or as close to greenfield as practicable, but net exceeding existing rates on previously develop land.
As the Portishead site is so close to the coast, we do not need to restrict the discharge rate, however a capacity check will be required to demonstrate that the drainage system maintains a 1 in 30 year with climate change capacity under tide locked conditions.

For the other locations the standard principles will apply.

Hope this makes sense, let me know if you have any queries.

Kind regards

Hi Lucy

They would like any details you have on the existing highway drainage at Pill and Ashton as well. They haven't asked, but I'll send you the draft drawings showing where we have permanent compounds too.

Thanks
Jenny

Subject: Portishead : highway drainage designs

Hi Jenny
I'm assisting Andrew and yes thank you that would be very helpful.

We are looking to outfall the carpark catchment area to the Portbury Ditch as shown on the attached. The EA advised, on Tuesday, that the discharge rate will be set by the Lead Local Flood Authority. The only consultation required with the EA will be in obtaining a flood defence permit for the outfall structure.

Also for the remaining new highway catchment areas we propose to tie-in to the existing surface highway drainage system. We have details of the system north of the proposed rail line but not on south side. Wessex water do not own this system so we are assuming it belongs to NSC?

Grateful if you can advise or put me in touch with someone that can.

kind regards

Lillie, Penny/UKS

From: Vasilyev, Kostya/UKS
Sent: 18 January 2017 13:36
To: Lillie, Penny/UKS
Cc: Cooper, Robert/UKS; Bird, Robert/UKS
Subject: RE: Portishead -tide locked level
Attachments: Scanned from a Xerox Multifunction Printer.pdf

Penny

Thank you for your enquiry.

Following the location of points on the scan sent to me and Robert Bird on 16/01/2017 13:13 by Robert Cooper, I can say that the water levels for the 25 year and 50 year events (climate change scenario) are as follows:

The **left point** as per the scan referenced above (please also find it attached) (near the drain , the location is to the south of Harbour Road):

50 year event: 7.05m
25 year event: 4.85m

The levels are the same for both pre-development and post development situation for each of the return periods listed above.

It looks like the water stays within the ditch or is not overtopping the planned ground levels (in post development situation).

There is no water level information in the model for the **right point** (to the north of Phoenix Road).

In order to provide some estimate for this point we looked at the downstream end of this drain (at its confluence with the Portbury? Drain, the location is to the east of Newfoundland Way, see the red star on the map below). These levels will provide a very conservative approximation of levels at the right point on the scan provided. Taking this information from the downstream end of this drain allows us to estimate levels further upstream of this drain as this drain is not represented in a model.

The downstream side of the brook that flows by the r**ight point**:

50 year event:
7.06m (post development situation)
7.05m (pre-development situation)
25 year event:
5.24m (both pre and post development situation)

It looks like the water stays within the ditch or is not overtopping the planned ground levels (in post development situation).

Hope it helps.

Please let us know if there are more questions.

Many thanks.

Kind regards
