Year 1
 The zone of theoretical visibility (ZTV) is a computer generated model that indicates the theoretical visibility of the proposed waste water treatment works (WWTW) in year 1 of operation. Theoretical visibility does not necessarily mean that the WWTW would be visible, because it does not fully take into account the screening effects of existing vegetation, especially narrow tree belts. It does take into account the screening effects of substantial woodland belts, intervening buildings and rising landform.

Year 15

The zone of theoretical visibility (ZTV) is a computer generated model that indicates the theoretical visibility of the proposed waste water treatment works (WWTW) in year 15 of operation. Theoretical visibility does not necessarily mean that the WWTW would be visible, because it does not fully take into account the screening effects of existing vegetation, especially narrow tree belts. It does take into account the screening effects of the proposed planting mitigation, substantial woodland belts, intervening buildings and rising landform. It has been assumed that mitigation planting would have grown to 7.5m high for trees and woodland and 2.5m high for hedgerows in the model. In practice, planting could be taller, depending on seasonal factors after planting.
